PARTIAL LIST OF CONTRIBUTORS TO VOLUME XVIII

ALDEN, RAYMOND M., Ph.D., Litt.D.
Professor of English, Leland Stanford Jr. University

MARMION

BABASIMIAN, V. S.
Professor of Chemistry, Lehigh University

MENTHOL

METHANE

BARRUS, GEORGE H., C.E.
Expert and Consulting Steam Engineer, Boston

MECHANICAL ENGINEERING

BAXTER, JAMES PHINNEY, Litt.D.
Editor of "The Documentary History of Maine"

MAINE

BENNETT, CHARLES E., Litt.D.
Professor of Latin, Cornell University

METAMORPHOSES

BERRY, GEORGE RICKER, Ph.D., D.D.
Professor of Old Testament Interpretation and Semitic Languages, Colgate University

MALACHI, BOOK OF

BREWSTER, W. T., A.M.
Professor of English, Columbia University

MEREDITH, GEORGE

BROOKE, TUCKER, M.A., Litt.B.
Professor of English, Yale University

MEASURE FOR MEASURE

MERRY WIVES OF WINDSOR, THE

BRUBACHER, A. R., Ph.D.
President of State College for Teachers, Albany, N. Y.

MANUAL TRAINING

MECHANICS' INSTITUTES

BRYCE, GEORGE, LL.D.
Founder of Manitoba College and a Founder of the Manitoba University

MANITOBA, UNIVERSITY OF

BUCHANAN, MILTON A., B.A., Ph.D.
Professor of Italian and Spanish, University of Toronto

MAYOR OF ZALAMEÀ, THE

CAIRNS, WILLIAM B., Ph.D.
Associate Professor of American Literature, University of Wisconsin

MARBLE FAUN, THE

Caldwell, Howard W., Ph.B.
Head Professor American History, University of Nebraska

Mexican War

Callahan, James M., Ph.D.
Professor of History and Political Science, West Virginia University

Mexico—Diplomatic Relations of the United States With

Canfield, Arthur G., Ph.D.
Professor of Romance Languages, University of Michigan

Magic Skin, The

Maxims

CARMAN, E. A.*
General United States Army

Malvern Hill, Battle of

Mark's Mills, Engagement at

Maryland Campaign of September, 1862

Maryland Heights

Mechanigsville, Battle of

Carroll, Henry K., LL.D.
Author of "Religious Forces in the United States," etc.

Mennonites

Methodist Churches of the World

Cochrane, Charles H.
Author of "Wonders of Modern Mechanism," etc.

Machine Forging

Mechanical Movements, Powers and Appliances

Cornyn, John Hubert, B.A., LL.B.
Professor of History, National University of Mexico

Mayapan

Mexico

Coumbe, Clement W.
Technical Art Expert

Madonna in Art, The

Majolica and Mezza-Majolica

Creighton, James E., Ph.D., LL.D.
Professor of Logic and Metaphysics, Cornell University

Materialism

Cutler, Frances W.
Instructor in English, Vassar College

Maud

* Deceased
Contributors to Volume XVIII — Continued

DEARBORN, GEORGE VAN NESS, M.D., Ph.D.  
Medical Corps, United States Army  
MEDICAL PEDAGOGY  
MEDICINE AND PSYCHIATRY

DODGE, CHARLES RICHARDS  
Textile Fibre Expert  
MATING

DOOLITTLE, ERIC, G.E.  
Director of Flower Astronomical Observatory, University of Pennsylvania  
MARS  
MERCURY

DRUM, WALTER, S.J.  
Professor of Scripture, Woodstock College, Woodstock, Md.  
MANUSCRIPTS, ILLUMINATED  
MANUSCRIPTS OF THE BIBLE

DUNN, WALDO H., M.A., Lit.D.  
Professor of English, College of Wooster, Wooster, Ohio  
MACAULAY, TREVELYAN’S LIFE OF

DUTTON, GEORGE B., Ph.D.  
Assistant Professor of English, Williams College, Williamstown, Mass.  
MANSFIELD PARK

EGGERT, CARL E., B.Ph., Ph.D.  
Assistant Professor German, University of Michigan  
MACAULAY’S ESSAYS  
MESSIAH, THE

ELLWOOD, CHARLES A., Ph.B., Ph.D.  
Professor of Sociology, University of Missouri  
MARRIAGE, HISTORY OF

ESTES, DAVID FOSTER, D.D.  
Professor of New Testament Interpretation, Colgate University  
MARK  
MARK, GOSPEL ACCORDING TO  
MATTHEW  
MATTHEW, GOSPEL ACCORDING TO

FARROW, EDWARD S., C.E.  
Consulting Military and Civil Engineer  
MACHINE GUN TACTICS

FELTER, HARVEY WICKES, M.D.  
Professor of Materia Medica and Therapeutics, and Medical History, Eclectic Medical College, Cincinnati, Ohio  
MEDICINE, ECLECTIC

FERRIS, RICHARD, C.E., D.Sc.  
Editorial Staff of The Americana  
MACHINE GUN  
METALS

GARNER, JAMES W., Ph.D.  
Professor of Political Science, University of Illinois  
MEDIATION  
MERCHANT VESSELS, NEUTRAL RIGHTS OF  
MERCHANT VESSELS, TRANSFER OF, FROM BELLIGERENT TO NEUTRAL FLAGS

GEDDES, JAMES, JR., Ph.D.  
Professor of Romance Languages, Boston University  
MEMOIRS OF CARLO GOLDONI  
MEROPLE

GEHRING, ALBERT, A.M.  
Author of "The Basis of Musical Pleasure," etc.  
MENSURAL MUSIC

HALE, EDWARD EVERETT, Ph.D.  
Professor of English, Union College, Schenectady, N.Y.  
MARIUS, THE EPICUREAN

HALL, LOUIS D.  
Specialist in Marketing Livestock and Meats, Bureau of Markets, United States Department of Agriculture  
MEAT

HANFORD, JAMES H., Ph.D.  
Associate Professor of English, University of North Carolina  
MANPRED

HARRY, JOSEPH E., Ph.D.  
Author of "The Greek Tragic Poets," etc.  
MEDEA

HARTMANN, JACOB WITTMER, Ph.D.  
Assistant Professor, Department of German Language and Literature, College of the City of New York  
MANN, HEINRICH  
MANN, THOMAS  
MEHRING, FRANZ

HENNEMAN, JOHN B., Ph.D.  
Late Professor of English in the University of the South  
MACAULAY, THOMAS BABINGTON

HOWARD, WILLIAM G., A.M.  
Assistant Professor of German, Harvard University  
MAGDA

*(prime), *(secondary) accents, to indicate syllabic stress
the thirteenth letter of the English and most of the other West European languages, is one of the four liquids, or semi-vowels; it is also classed as a labial. Its sound is produced when with lips closed and the whole uvula lowered the breath makes a humming noise as it issues through the nostrils. The lips play the same part in the pronunciation of m as in that of b, but in pronouncing b the nasal passage has no part. Hence when that passage is obstructed or closed the sound produced is that of b not of m.

The M as a capital letter has the same form in the Greek and the Latin alphabets and in all the alphabets derived from them, and in all those alphabets generally the same sound value.

In English there are a few words of Greek origin, mostly technical, in which m begins a syllable or a word: in such cases the m is silent, for example, mnemonic, nomenclature.

In many words derived from other languages the m of the original word is changed to n in English; examples: Comitatus (Lat.) county, or contrariwise n is changed to m; Anglo-Saxon hemep becomes hemp. Often p is added after m to give that letter greater distinctness, for example, exumit, exemptus, un kemned, unkempt.

M. QUAD. See LEWIS, CHARLES BERTRAND.

MAARTENS, Maarten, mär‘ten, pseudonym of the Dutch author, JOOST MARIUS WILLEM VAN DER POORTEN SCHWARTZ: b. Amsterdam, 15 Aug. 1858; d. Zeist, Holland, 4 Aug. 1915. He passed his early life in England; was educated in Germany and at the University of Utrecht, was admitted a barrister but chose literature as a profession, and in 1890 published his first work, 'The Sin of Joost Aveling,' which at once arrested the attention of critics and of the reading public. This, like all his volumes, was written at first hand in English, not, as has been sometimes supposed, translated from Dutch MS. Maarten thus presented the curious instance of an author electing to address wholly a foreign public. Indeed it was only with reluctance, to safeguard himself against unsatisfactory translations, that he consented to the publication of his books in Dutch. His further works are 'An Old Maid's Love' (1891); 'A Question of Taste' (1891); 'God's Fool' (1892); 'The Greater Glory' (1894); 'My Lady Nobody' (1895); 'My Poor Relations' (1903); 'Dorothea' (1904); 'The Healers'; 'The Woman's Victory' (1906); 'The New Religion' (1907); 'Brothers All' (1909); 'The Price of Lis Doris' (1909); 'Harmen Pols, Peasant' (1910); 'Eve' (1912). In America 'The Greater Glory' first appeared serially in 'The Outlook.' 'God's Fool' is perhaps Maarten's best, but 'The Sin of Joost Aveling' and 'The Greater Glory' have had the greatest popular success. These books afford a by no means flattering picture of the Dutch bourgeoise, but are admirably accurate.

MAASIN, mä‘z'in, Philippines, (1) a pueblo of the province of Leyte, island of Visayas, situated on the extreme southeastern coast, 75 miles southwest of Tacloban. It is a handsome, well-built city, and has a large trade, mostly in hemp. Pop. 18,500; (2) a town of the province of Iloilo, Panay, on a tributary of the Sultan branch of the Salaver River, 18 miles northwest of Iloilo. Pop. 9,700.

MAASTRICHT. See MAESTRICHT.

MAAT, or MÅT, in ancient Egypt, the goddess of truth and justice. She is said to have guided the souls of the dead to Osiris (q.v.).

MAB, the fairy queen of Connaught and a familiar name in Celtic folklore. Mab has been celebrated by Shakespeare and other English poets. The name is of uncertain origin, being variously derived from the Midgard of the Eddas, the Hubandia or Dame Abonde of Norman fairy lore, and from the Cymric mab, a child. According to Voss, Mab was not the fairy queen, the same as Titania, this dignity having been ascribed to her only by mistakes the use of the old English word queen, which originally meant only a woman. Queen Mab is mentioned in Shakespeare's 'Romeo and Juliet,' Ben Jonson's 'Satyr,' Randolph's pastoral of 'Amynatas,' Drayton's 'Nymphidia' and Milton's 'L'Alegro.'

MABALACAT, mä-bä-läkat, a pueblo of the province of Pampanga, Luzon, 16 miles north of Bacolor, the provincial capital. It is on the main road, and on the Manila and Dagupan Railroad. Pop. 10,600.

MABERY, mä‘ber-i, Charles Frederic, American chemist: b. North Gorham, Me., 13 Jan. 1850. He was graduated at the Lawrence Scientific School, Harvard, in 1876, and was assistant instructor in chemistry there from 1875 to 1883, when he became professor of chemistry in the Case School of Applied Science of Cleveland, Ohio, and emeritus professor since that date to 1901. In the investigation of the composition of American petroleum his work has brought him into special prominence. He
has also done valuable work in connection with electric smelting. The results of his original investigations since 1876 were published in the Proceedings of the American Academy of Arts and Sciences and in various chemical journals at home and abroad.

**MABIE, Hamilton Wright**, American editor, critic, and essayist: b. Cold Spring, N. Y., 13 Dec. 1846; d. Summit, N. J., 31 Dec. 1916. He was graduated at Williams College in 1867 and from the Columbia University Law School in 1869. He joined the staff of the Christian Register (now Christian Century) in 1879 and later became associate editor. He was a member of the American Academy of Arts and Letters and received honorary degrees from Williams, Union, Western Reserve and Washington and Lee universities. In his lectures and papers he constantly advocated the reading of good books, and his own works on literature, etc., have done much to cultivate a good taste in the American reading public. Among others he published 'Norse Stories Retold from the Edda' (1888); 'Nature in New England' (1890); 'My Study Fire,' first series (1890); 'Short Studies in Literature' (1891); 'Under the Trees and Elsewhere' (1891); 'Essays in Literary Interpretation' (1892); 'My Study Fire,' 2d series (1894); 'Nature' (1897); 'Books and Culture' (1897); 'Work and Culture' (1898); 'The Life of the Spirit' (1899); 'William Shakespeare—Poet, Dramatist and Man' (1900); 'Works and Days' (1902); 'Parables of Life' (1902); 'Backgrounds of Literature' (1903); 'Myths Every Child Should Know' (1905); 'Fairy Tales Every Child Should Know' (1905); 'The Great Word' (1905); 'Heroes Every Child Should Know' (1906); 'Legends Every Child Should Know' (1906); 'Christmas To-day' (1908); 'Introductions to Notable Poems' (1909); 'American Ideals, Character and Life' (1913); 'Japan, To-day and To-morrow' (1914).

**MABILLEAU, Léopold**, French economist: b. Beaulieu (Indre et Loire), 1856. After teaching in a number of institutions he became in 1906 professor at the National Conservatory of Arts. He held many positions for the improvement of social conditions and lectured in the United States on social and economic questions. Mabilleau was made an officer of the Legion of Honor and a number of his works have been crowned by the Academy of Moral and Political Sciences. He has edited the works of several authors, has contributed to French magazines and has published 'Victor Hugo' (Paris 1893; 5th ed., 1911); 'Histoire de la philosophie atomistique' (1895); 'La prévoyance sociale en Italie' (1898); 'La co-operation en France' (1900); 'La mutualite francaise, doctrine et applications' (1904); 'Notions elementaires d'instruction civique de droit usuel et d'economie politique' (1912). The latter was in collaboration with E. Levassor and E. Delacourie.

**MABILLON, Jean, zhōn má-bé-wôⁿ**, French ecclesiastic and author: b. Saint Pierre du Mont, Champagne, 23 Nov. 1632; d. Paris, 27 Dec. 1707. Having joined the Benedectines of Saint Maur, he was chosen to assist Dom Jean d'Achery in the compilation of his 'Spicilegium VETERUM SCRIPTORUM,' and subsequently edited the works of Saint Bernard (1690) in the series of the fathers published by his congregation. In 1683 he was sent to Germany by Louis XIV to collect documents relating to French history; and the applause with which his 'Iter Germanicum,' a narrative of the journey, was received, induced the king to send him to Italy in 1685 to make purchase of the Church and royal library. A result of this tour was his 'Musewm Italicum' (1687-89), a work of great value. Later he was selected by his superiors to refute Rancé, abbot of La Trappe, who had condemned the custom of permitting monks to study. His 'Essay on Monastic Studies,' which appeared in consequence in 1691, was equally remarkable for sound argument and good temper. His most important other works are 'Vetara Analecta' (1675-85); 'De Re Diplomatica' (1681); and 'De Liturgia Gallicana' (1685). He edited and published with Ruinart 'Acta Sanctorum Ordinis Sancti Benedicti' (1668-1702) and prepared the first four volumes of the 'Annales Ordinis Sancti Bene dicti' (1703-39). A collection of his 'magasins posthumes' appeared in 1724, and his 'Inedite Correspondence with Montfaucun, Magliabecchi, etc.', was edited by Valery (1847). Consult Baëckner, A., 'Mabillon's Reise durch Bayern im Jahre 1863' (Munich 1910); Denis, P., 'Dom Mabillon en so Methode historique' (Paris 1910).

**MABINI, mā-bē-nē', Apollonio**, Filipino insurgent: d. Philippine Islands, 1903. He was educated in the Catholic College of Manila, entered the public service under Spanish rule, became advocate of the treasury, resigned in 1896, and entered the insurgent service. He was imprisoned for nine months by the Spaniards and then associated himself with Aguinaldo, Rizal and Aguinaldo. Although a sufferer from paralysis he was the soul of the revolutionary movement and by many is considered the ablest man produced in the revolution. He became privy councillor of Aguinaldo and for a time was Minister of Foreign Affairs and chief of the Supreme Court in the latter's so-called government. In 1899 he surrendered to the United States, was sent into exile, and was allowed to return in 1903 when he took the oath of allegiance. He was the brains of the Malolos government but opposed the Malolos constitution because he believed that the Islands needed a strong centralized government and also because it did not provide for a separation of Church and State. He was of the Tagalog tribe. Consult Worcester, Dean C., 'The Philippines, Past and Present' (2 vols., New York 1914) and 'Philippine Insurrection Records' in the Archives of the War Department, Washington, D. C.

**MABINOGEN, mā-bi-nô-gên-ôn**, The name generally but incorrectly applied to all medieval Welsh stories. Of the general title 'Mabinoigion,' which Lady Charlotte Guest's English version (1838-49) has made familiar, John Rhys gives an explanation. 'An idea prevails,' says Principal Rhys, 'that any Welsh tale of respectable antiquity be called a mabinog; but there is no warrant for extending the use of the term. ... For, strictly speaking, the word mabinog is a technical term belonging to the hardic system, and it means a literary apprentice. In other words, a mabinog was a young man who had not yet acquired the art of
making verse, but who received instruction from a qualified bard. The inference is that the 'Mabinogion' meant the collection of things which formed the mabinog's literary training — his stock in trade, so to speak; for he was probably allowed to relate the tales forming the four branches of the 'Mabinogion' at a fixed price established by law or custom. If he aspired to a place in the hierarchy of letters, he must acquire the poetic art. In Lady Charlotte Guest's later edition in one volume (1877), the most convenient edition for reference, 12 tales in bound. Of these, the most natively and characteristically Welsh in character are such tales as the vivid, thrice romantic 'Dream of Rhonabwy,' which owes little to outside sources. 'The Lady of the Fountain,' on the other hand, shows in a very striking way the influence of the French chivalric romances that Sir Thomas Malory drew upon so freely in 'Morte d'Arthur.' In the admirably edited Oxford text of the Welsh originals by Rhys and Evans (1897-90), the Lady of the Fountain appears under the title of 'Owain and Lunet:' and Lunet's name at once recalls Tennyson's 'Idylls of the King.' The old manuscript volume of the 'Mabinogion,' known as the 'Llyfr Coch o Hergest,' is the 'Red Book of Hergest' in the collection of South Wales, is in the famous library of Jesus College, Oxford, the one college in the older English universities which has a time-honored connection with Welsh scholarship and Welsh literature. The tales, though in their present form, not older than the 13th century, embody traditions that were afoot prior to that date. Consult John, I. B., 'The Mabinogion' (London 1901); and Lloyd, E. J., 'The Mabinogion as Literature' (in the Celtic Review, Edinburgh 1911).

MABLY, Gabriel Bonnot de, gă-bré-èl bôn-ô de mà-blë, French eclesiastic and publicist; b. Grenoble, 14 March 1709; d. Paris, 23 April 1785. His family name was Bonnot. Like his younger brother, the philosopher Condillac (q.v.), he was destined for the Church, and after the seminary of Saint Sulpice in Paris was ordained subdeacon. He showed little liking for theology, and for some time was secretly employed in affairs of state by his relative Cardinal de Tencin, minister of Louis XV, consulting on most difficult negotiations and writing elaborate reports with an ability for which the minister received all the credit. Later he applied himself to literature, and in 1748 published his 'Droit public de l'Europe,' which achieved a remarkable success. It was followed by 'Observations sur les Grecs' (1749); 'Observations sur les Romain' (1751); 'Entretiens de Phocion' (1753); 'Observations sur l'histoire de France' (1755); 'Principes des negociations' (1757); 'De la maistere d'escrire l'histoire' (1773); 'De la legislation' (1776); 'De l'idee de l'histoire' (1778); and 'Principes de morale' (1784). Having been requested by the government of Poland to prepare for them a code of laws, he visited that country in 1771, and published in 1779 a work 'Du Gouvernement de la Pologne.' He was also consulted by the American Congress in 1783 on the preparation of the Constitution, and embodied his views in his 'Observations sur le gouvernement et les Lois des Etats-Unis d'Amérique' (1784). In this work he foretold the speedy downfall of the United States. He was an idealiser of ancient Rome and was enamored of the socialistic state and the communism of wealth, and from his pessimistic views on modern social organization was known as the 'prophet of woe.' Consult Guerrier, 'L'Abbé Mably, moraliste et politi- que' (1886); de la Sénac, 'Mably et les physiocrates' (1111).

MABUCHI, má-boö-chë, Japanese writer and religious teacher; b. 1693; d. 1769. He was distinguished as a scholar, and utilized his great learning in the endeavor to purify the native religion, Shinto, from the accretions of Chinese and Buddhist philosophy, etc., whereby he regarded it as having been corrupted. His love and knowledge of antiquity enabled him to present the native faith in its original simplicity, and his teachings were exemplified in his own life. To him modern students are largely indebted for direct access to ancient Japanese poetry. He added greatly to the knowledge of the past. He was the first of the three great scholars (Motoo and Hirata being the others) who dedicated themselves to this work, simplifying the ancient faith of the country.

MABUSE, mà-büs', Jan, Flemish painter; b. Maubeuge, Hainault, in 1472; d. Antwerp, 1 Oct. 1552. His real name was Jean Gossart (or Gossaert). When he became a member of the Guild of Saint Luke at Antwerp in 1503, he signed the register as Jann van Hegenouwe (John of Hainault). He signed his early pictures Jannen Gossart and those of his middle and last period Joannes Malboiis (John of Mauberge). In the register of the Guild of Our Lady at Middleburg he is entered as Jan de Waele (John the Walloon). It is not known from whom he learned his art, but at Antwerp he fell under the influence of Quentin Matsys (15th century). In 1508 Mabuse, as he is familiarly known, went to Rome with his patron, the magnificent Philip of Burgundy, visiting Verona and Florence on the way. He stayed in Rome a year and returned to the court of Burgundy in November 1509. He then was employed at the Duke of Burgundy's castle of Zuytborg painting for Philip. After Philip's death in 1524, he entered the service of Adolphus of Burgundy. When Christian II of Denmark visited the Low Countries he asked Mabuse to paint his dwarfs and in 1528 he requested the artist to design the tomb for his queen, Isabella, in the abbey of Saint Pierre, near Ghent. Mabuse also painted the children of Christian II — John, Dorothy and Christine, which came into the collection of Henry VIII of England. Mabuse also designed and erected the tomb of Philip of Burgundy in the church of Wyck. Van Mander, his biographer, accounts him of habitual drunkenness, but the great works produced by him, as well as their number, prove that he was a hard-working and painstaking artist, perfectly in command of his powers. In 1527 he accompanied Lucas of Leyden on a pleasure trip to Ghent, Mechlin and Antwerp. Mabuse was to be the first of the Netherland painters to go to Italy. He brought back a new style; and from his time to that of Rubens and Van Dyck it was considered the proper thing for all Flemish painters to go to Italy.
The best specimen of his early and purely Netherland is the famous ‘Adoration of the Magi,’ long at Castle Howard, England, and purchased by the National Gallery, London, in 1911 for the extraordinary sum of $192,000. This great picture was painted in 1500 for the abbey of Grammont in eastern Flanders and was sold by the monks in 1605 to the Archduke Ferdinand, who placed it in a private chapel in Brussels. In the 18th century Charles of Lorraine acquired it and at his death in 1775 the picture passed to England. The signature of Jan Gossart appears in golden letters on the band of the crown on the negro king. In this great work there are 30 figures with an architectural background, much in the style of Memling and Roger van der Weyden.

The National Gallery (London) contains five other precious works by Mabuse, including the portrait of Jacqueline of Burgundy; the portrait of a man holding his gloves; the portrait of a man with a rosary. Hampton Court has the ‘Three Children of Christian II,’ a Saint Bavo; ‘Adam and Eve in Paradise;’ a portrait of ‘Holbein;’ ‘Eleanor of Austria;’ and a ‘Holy Family.’ The Louvre has a magnificent portrait of Jean Carondelet, chancellor of Flanders; a ‘Virgin and Child;’ a portrait of ‘Benédicte;’ and a ‘man and his wife.’ Saint Luke painting the Blessed Virgin and Child, formerly in the cathedral of Mechlin but now in that of Prague, painted in 1515, is a fine example of Italianized Netherland art. Another celebrated picture was a large triptych, ‘The Descent of the Cross,’ painted for Maximilian of Burgundy for the monastery of Our Lady and Saint Nicholas at Middleburg, which perished when that building was burned in 1568. Durer saw it in 1520 and admired it extremely, although he said ‘the composition was not as good as the execution.’ Mabuse excelled in portraiture. Occasionally Mabuse turned to mythological subjects, such as ‘Neptune and Amphitrite’ (1516) in the Berlin Museum. His architecture is beautifully drawn and his painting of rich materials—damasks, embossments and tapestries—is superb. Consult Segard, Achilles, ‘Mabuse, Jan’ (in Les Arts, No. 123, p. 1, with illustrations including ‘Adoration of the Magi,’ Paris 1912); Weisz, Ernst, ‘Jan Gossart’ (Freis 1913).

MAC, or MC, a Gaelic prefix, as MacGregor, MacDonald, McKinley, etc. It corresponds with son in surnames of Teutonic origin, Fitz in those of Romance origin, or Ap or Ab in Welsh surnames.

MACA, a tribe of people living in the forests of the eastern slope of the Andes in central Ecuador. They live in huts of palm leaves, make pottery, hunt and cultivate yucca, corn and tobacco. The various tribes, not yet classified as to language, frequently war with one another. Their weapons are spears, blowguns and poisoned arrows. They dry the heads of slain enemies.

MACABEBE, mā-kāḇāḇāḇ, Philippines, a pueblo of the province of Pampanga, Luzon, situated at the head of the Pampanga River delta, nine miles from Manila Bay and seven miles southeast of Bacolor. Pop. 10,400.

MACABER (mā-kāḇər) DANCE. See Dance of Death.

MACADAM, māk-kādām, John Louden, Scottish engineer; b. Ayr, 21 Sept. 1756; d. Moffat, Dumfriesshire, 26 Nov. 1836. In 1770 he was sent to an uncle at New York, where he remained during the War of Independence, and realized a considerable fortune as agent for the sale of prizes. At the close of the war he returned to Scotland, and in 1798 was appointed agent for revictualing the navy in the western ports of Great Britain, and took up his residence at Falmouth. He afterward resided for many years at Bristol. It was here, in 1815, on being appointed surveyor-general of the Bristol roads, that he resumed experiments he had made in Scotland, and first had full scope for putting in practice the important improvements in road-making which had long before occupied his thoughts. By 1823 his general success was admitted; and in 1827 he was made general surveyor of roads. In carrying out his improvement he had expended several thousand pounds from his private resources; and the House of Commons, having been satisfied of the fact by the investigation of a committee, both reimbursed the actual outlay and presented him with an honorary tribute of £2,000, presenting to him a total of £10,000. His invention was rapidly introduced throughout the civilized world, and his own name was made synonymous with it.

MACADAM, a modern system of road-making invented by J. L. Macadam (q.v.), which consists in forming the roads out of hard materials such as granite, or basalt broken into pieces, none of which are too large to pass through an iron ring 2⅞ inches in diameter, and then deposited evenly in a bed of from 6 to 12 inches in thickness. The bed thus laid becomes perfectly compact and smooth, and in proportion as it is worn away or cut into ruts by traffic can easily be restored by a new casting of materials. See Roads and Road-Making.

McAadoo, māk-a-doō, William Gibbs, American jurist; b. near Knoxville, Tenn., 4 April 1820; d. 1894. He was graduated in 1845 from the East Tennessee University at Knoxville, sat in the Tennessee legislature 1844-46 and served in the Mexican War in 1847. He was afterward admitted to the bar and was attorney-general of the Knoxville judicial district, 1851-60. He removed to Georgia in 1862, served in the Confederate army during the Civil War and in 1871 became judge of the 20th judicial district of Georgia. He published a volume of poems and, with H. C. White, 'Elementary Geology of Tennessee.'

McAadoo, William Gibbs, American cabinet minister and railroad official; b. near Marietta, Ga., 31 Oct. 1863. Descended from a distinguished Southern family, his father, Judge William Gibbs McAadoo, a jurist and soldier of the Mexican and Civil wars, became attorney-general of Tennessee some years after losing his wealth in the general devastation in the South caused by the Civil War. The subject of this sketch was educated at the University of Tennessee and admitted to the bar in 1888, notwithstanding that circumstances obliged him to leave the university in his junior year and earn his living as a clerk of the United States Circuit Court. He practised law in Chattanooga till 1892, when he came to New York and opened a law office. In 1898 he
formed a law partnership with Mr. William McAdoo (a native of Ireland and no relation whatever), who since 1910 has been chief city magistrate, and was formerly Assistant Secretary of the Treasury under President Cleveland. In his leisure days Mr. McAdoo had gained some practice in railroad work by running a street railway in Knoxville, an undertaking that proved a failure. His railroad propensities revived during his first years in New York City and he conceived the plan of tunneling the Hudson River with the aid of a confidence of capitalists he succeeded in carrying that great undertaking to a successful issue. In 1902 he organized the New York and New Jersey Railroad Company (now the Hudson and Manhattan, of which he was elected president and director), and completed the Hudson tunnel scheme. He was vice-chairman of the Democratic National Committee in 1912, and in the following year Mr. Wilson, on his accession to the Presidency, invited him to take the office of Secretary of the Treasury. Mr. McAdoo canceled his railroad connections and devoted himself to a task that was destined to become historic in the annals of national finance. The enormous financial transactions in which the United States government was involved owing to the European War are a matter of common knowledge. The raising of huge war loans and the financing of Allied belligerents were only the more conspicuous events of Mr. McAdoo's tenancy of the Treasury. He was a leading architect of the Federal Reserve System and an active promoter of the Federal Farm Loan System. Throughout the vast network of national finance — taxation, distribution of government funds, war-risk insurance and the insurance of soldiers and sailors, economic problems of trade and agriculture, etc., Mr. McAdoo handled the complex ramifications and details with remarkable faculty and judgment. When the United States government took over the entire railroads of the country in January 1918 Mr. McAdoo was appointed Director-General of Railroads. Up to the end of the close of the war he performed the duties of both offices — Treasury and Railroads. He tendered his resignation to the President on 22 Nov., 1918. Mr. McAdoo was married in 1885 to Miss Sarah Fleming of Chattanooga; she died in 1912, leaving three sons and three daughters. On 7 May 1914 he married Miss Eleanor Wilson, daughter of President Wilson.

McADOO, Pa., a borough on the Lehigh Valley and Pennsylvania railroads, five miles south of Hazleton and 78 miles northwest of Philadelphia. There are rich deposits of anthracite coal in the vicinity, and, consequently, coal-mining is one of the chief industries. Shirts are also manufactured here. In this borough are situated the picturesque Silver Brook Hollow and Tresckow water falls. Pop. 3,289.

MCAFEE, mák'ık-fé, Cleland Byod, American clergyman: b. Fulton, Mo., 25 Sept. 1866. He was educated at Park College, Union Theological Seminary, New York, and Westminster College, Missouri. He was ordained a Presbyterian minister in 1888, and from that date to 1891 he was professor of mental and moral philosophy in Park College. In 1901 became pastor of the Forty-first Street Presbyterian Church, Chicago, which he held until 1904, when he became pastor of the Lafayette Avenue Church, Brooklyn. In 1912 he was made professor of didactic and polemical theology at the McCormick Theological Seminary, Chicago. He received the degree of Ph.D. in 1892. His books are: 'Where He Is' (1898); 'Wherefore Did Thou Clippe My Wings' (1900); 'Faith, Fellowship and Freedom' (1902); 'The Growing Church' (1903); 'The Worth of a Man' (1903); 'The Tenth Commandment' (1903); 'The Mosaic Law in Modern Life' (1906); 'Studies in the Sermon on the Mount' (1910); 'The Greatest of These' (1910); 'His Peace' (1913); 'Westminster Confession of Faith' (1914); 'The Old and the New in Theology' (1914), and 'Psalms of the Social Life' (1917).

MCAFEE, Joseph Ernest, American clergyman: b. Louisiana, Mo., 4 April 1870. He is a brother of Cleland Byod McAfée and was graduated from Park College in 1889, after which he studied in Union, Auburn and Princeton theological seminaries from 1889 to 1890. At Park College he taught Greek, the history of religion and ethics until 1905, when he became associate secretary of the Presbyterian Board of Home Missions of the Presbyterian Church in the United States of which he has been secretary since 1914. He has been engaged in educational work since his graduation as a professor. He has published 'Missions Striking Home' (New York 1908); 'World Missions from the Home Base' (1911); 'Religion and the New American Democracy' (1917).

MACAIRE, má-kär (Le Chevalier Richard), a French chanson de geste of the 12th century, and one of the great poems of the Middle Ages, the theme of which is the false accusation brought against the queen of Charlemagne, called Blanchefleur. Macaire is a fusion of two legends: that of the unjustly repudiated wife, and that of the dog that detects the murderer of his master. Macaire, a French knight, aided by Lieutenant Landry, murdered Aubry de Montdidier (q.v.) in the forest of Bondy. Montdidier's dog, named Dragon, showed such aversion to Macaire that suspicion was aroused and Macaire and the dog were summoned to a single combat. The result was fatal to Macaire, who died, confessing his guilt. Dragon was called the Chien de Montargis because the murderer took place near the castle of Montargis. The encounter was depicted over the chimney of the great hall in the castle in the 15th century. Macaire is only preserved in the Franco-Venetian geste of Charlemagne (Bibl. St. Mark MSS. XIII.), in a mixed form of French and Venetian dialects. It has been reprinted several times. Consult 'Macaire' (Paris 1866), by Guigassard in the series of Anciens poètes de la France; Paris, Paulin, 'Hist. litt. de la France' (Vol. XXXIII., 1873); Gautier, L., 'Épopeées françaises' (Vol. III., 3d ed., 1860); Paris, G., 'Hist. poët de Charlemagne' (1865); Jean de la Trille, 'Discours notable des ducs' (Paris 1607), says the encounter with the dog took place under Charles V. The story was also told in another chanson de geste of the 12th century, called 'La Reine Béatrice', which exists in fragments. There are two French plays on the subject: one 'La Chien de Montargis' by Guibert de Pipercourt (1814), which was translated and played at Covent Garden, London (1814); and the other, 'Le chien d'Aubry'.

MACAIRE — McALLISTER

A manuscript in prose of 'Macaire' was found in the Bibliothèque de l'Arslan in Paris about 1860.

MACAIRE, Robert, name of the villain in the French melodrama, 'Auberge des Adrets' (1823), in which Frédéric Lemaitre made his reputation. The character was modified by Lemaitre in his comedy 'Robert Macaire,' a sequel, in collaboration with Benjamin Antier. It was performed at the Théâtre des Folis-Dramatiques, Paris, in 1834. In this, which Theophile Gautier calls "the great triumph of the revolutionary art" which followed the "Revolution of July," is expressed audacity and wit. It is an attack against social order. Frédéric Lemaitre," says Gautier, "created in the personage of Robert Macaire a kind of humor that is almost Shakespearean. In it we find terrible gaiety, sinister laughter, bitter derision, pitiless raillery and a biting sarcasm, mingled with elegance, suppleness and astonishing grace. Robert Macaire and Bertrand are Don Quixote and Sancho Panza in crime." Consult Alphonse, Maurice, and Huart, L. "Les cent Robert Macaire, composés et dessinés par R. Daumier" (Paris). Roger and W. E. Henley wrote a play 'Robert Macaire' (Stevenson's Works, Vol. XX). Consult The New Review (Vol. XII, p. 665).

McALESTER, ma-käl's-tar, Miles Daniel, American general: b. New York, 1833; d. 1869. He was graduated from the United States Military Academy in 1856 and entering the engineer service became chief engineer of the Department of the Ohio in 1862. He served under Grant before Vicksburg and took part in the operations against Mobile.

McALESTER, Okla., city and county-seat of Pittsburg County. It is situated on two main trunk lines of railway — the Missouri, Kansas and Texas and the Chicago, Rock Island and Pacific railways, and has an interurban railway connecting with the coal mines in the outlying district. McAlester is surrounded by rich agricultural land and stock-raising is an extensive business, thousands of cattle being shipped every year from McAlester. It is in the midst of the immense coal fields of eastern Oklahoma. Almost 50 companies are now operating in this new field with an annual output of 3,500,000 tons, all having their main offices in the city. McAlester also has extensive wholesale interests with an annual business of $6,000,000 in southwest Oklahoma, western Arkansas and northeastern Texas. The city has a high school, which cost $350,000, seven ward schools and two business colleges. The chief public buildings are the Bushy Hotel, Federal Building, Masonic Temple, Mine Rescue Station and Bushy Theatre. The Oklahoma State Penitentiary is located near the city. McAlester has the city manager form of government. Pop. 20,504.

MCALESTER COLLEGE, Saint Paul, Minn., a coeducational institution, founded in 1885 under the auspices of the Presbyterian Church. A four-years' college course is divided into the degrees of bachelor of arts and bachelor of science, and a conservatory of music grants the degree of bachelor of music. The average annual enrolment of students is 360, and its faculty 38. Its total endowment is $500,000. It has seven buildings and total resources of $960,000. Its library has over 15,000 bound volumes. Its total income (tuition and endowment interest) is $60,800.

McCALL (ma-käl') MISSION, a Protestant association founded in 1871 by Robert Whitaker McCAll and his wife for religious work among the working people of France. On 17 Jan. 1872 the first station was opened in Bellegarde, one of the manufacturing suburbs of Paris. The work consists largely in striving to interest people in the questions pertaining to salvation of souls and then urging them to affiliate with some one of the nearby Protestant churches. No effort is made to establish churches, but some educational work has been begun in the large cities. Friends of the movement in America founded an American McCAll Mission in 1883 with Philadelphia as headquarters, and there are also auxiliary societies in Great Britain and Canada. It was a McCAll missionary who introduced the Boy Scout movement into France. During the Great War its agents served as chaplains and in other capacities, and its establishments were converted into hospitals. The expense of the work in France in 1916 was $60,000.

McALLISTER, Addams Stratton, American engineer: b. Covington, Va., 24 Feb. 1875. He was educated at the Pennsylvania State College and at Cornell University. In 1898 he became electrical engineer for the Berwind-White Coal Mining Company and in 1899 held a similar position in the Westinghouse Electric and Manufacturing Company. In 1901 he was assistant in physics in Cornell, instructor in 1902-03 and acting assistant professor of electrical engineering there in 1903-04. He then was lecturer on engineering at the Pennsylvania State College in 1909-14. In 1905 he became associate editor of the Electrical World and in 1912 was made full editor of this publication. In 1917 he became secretary of American Engineering Service of the Foreign Service of the United States government and a member of its lighting committee of the Advisory Commission of Council of National Defense and also a member of the War Committee of Technical Societies. In 1914-15 he was president of the Illuminating Engineering Society becoming its chairman and secretary. He is also president of the New York Electrical Society. Cornell gave him the degree of Ph.D. in 1905. He is the inventor of alternating-current machinery. Dr. McAllister has contributed more than 100 articles on engineering to various technical journals and is the author of 'Alternating Current Motors' (1906; 3d ed., 1909), and 'Standard Handbook for Electrical Engineers' (1907). He is a member of a number of clubs and societies, including Engineers' Club of New York and the New York Southern Society.

McALLISTER, Ward, American society leader: b. Savannah, Ga., about 1830; d. 1895. He came of a family several of whose members were conspicuous at the bar. With his father, in 1850, he went to California, where he remained three years and attained the degrees of bachelor of arts and bachelor of science, and a conservatory of music grants the degree of bachelor of music. The average annual enrolment of students is 360, and its faculty 38. Its total endowment is $550,000. It
tages of personal qualifications and family prestige. As a raconteur as well as an accomplished gourmet he had already attained prominence within a select circle when, by a well-timed remark, he became the leader of leaders in New York society, which, according to his strict limitation, included but 400 persons. The popular expression "The Four Hundred" originated from this assertion of McAllister's. He made contributions to the press, which, however, impaired rather than strengthened his unique position, as did also his volume 'Society as I Have Found It' (1890).

McAllister, Fort. See Fort McAllister.

McCallum, Archibald Byron, Canadian educator: b. Belmont, Ontario, in 1859. After receiving his education in the Toronto and Johns Hopkins universities he became lec-
turer on physiology (1887) and professor in the medical faculty of Toronto University (1890-92). From 1902 to 1910 he was assistant professor in the arctic faculty there and full professor after 1901. In 1895-97 he was president of the Canadian Institute. In 1901 he was made a Fellow of the Royal Society, Canada, and in 1906 of the Royal Society of London. In 1914 he was elected president of the American Society of Biochemists. He has published scientific articles in the Journal of Physiology, Proceedings of the Royal Society Quarterly Journal of Microscopical Science, American Journal of Anatomy and Journal of Physiology.

McAlpine, Mā-kā-πin, William Jarvis, American engineer: b. New York, 1812; d. New Brighton, Staten Island, N. Y., 16 Feb, 1890. He took up engineering in 1827 under J. B. Jer-
vie, with whom he continued till 1839, and suc-
cceeded him as engineer of the Erie Canal en-
largement. In 1851 he became State engineer of New York and State railroad commissioner in 1855-57. He was subsequently engineer of several important railways, constructed the city waterworks at Albany and Chicago, and in 1870 his plans for improvement of the cataracts of the Delaware were adopted by the Austrian govern-
ment. While engineer of the department of parks, 1879-80, he constructed the Riverside drive in New York.

McAneny, George, American civic admin-
istrator: b. Greenville, N. J., 24 Dec, 1869. He was graduated at the Jersey City High School in 1885 and entered journalism, serving on the staff of several New York newspapers from 1885 to 1892. From 1892 to 1894 he was assistant secretary of the Civil Service Reform League, of which he became secretary in 1894. He held this position until 1903, serving on committees that drafted the municipal home-
rule section of the State constitution in 1894 and the State Civil Service Law in 1899. In 1902 he was a member of the New York Civil Service Commission and also of the commission to revise the city charter in 1908. In 1908-09 he was president of the Board of aldermen (fusion ticket), and was active in obtaining municipal tickets for New York City. In 1902 he drafted the civil service rules now in force in New York City; was a member of the commission appointed by the governor to revise the New York City charter (1908); chairman of the transit committee of the New York board of estimate and ap-
portionment, which, with the Public Service Commission, developed the $361,000,000 subway system, and chairman of com-
mittee on city plan 1914-16. In national politics he is a Democrat. In 1913 Paris gave him the medal of the Société des Architectes Diplômés par le Gouvernement Français for city planning and architecture in the United States. In 1915 he received the medal of the Architectural League in New York. Hobart gave him the degree of L.L.D. in 1914. He is chairman of board of trustees of College of the City of New York; a trustee of the Tuske-
gee (Alabama) Institute and of Jeanes Fund for Negro Education; vice-president Hampton Association National Municipal League, and president of the New York Kindergarten Asso-
ciation. In 1914 he was Dodge lecturer at Yale. The lectures were published under the title of 'Municipal Citizenship' (New York 1915).

Macao, mā-kōw' or mā-kā-o, China, a Portuguese settlement and seaport on the west shore of the mouth of the Canton River, 40 miles west of Hongkong. It occupies a high peninsula, formerly the island of Macao, now united by a narrow isthmus north of the town with the island of Hlang-shan, and, with the small islands of Taiipa and Calão, forms a province. The settlement is about eight miles in circuit, and its limits landward are defined by a barrier wall stretching across the isthmus, where a guard of Chinese troops is stationed to prevent foreigners from trespassing on the Inner Land. The town occupies a slope gradually descending to the sea, backed by a range of lofty hills, and having an extensive plain stretching east. It is nearly surrounded with water, and is open to the sea-breezes on every side. The houses occupied by the foreign popu-
lation are large, roomy and open, and the shops are numerous. The city is divided, one inhabited by Chinese and the other by non-Chinese, each with its own adminis-
trator. The quay or "Praya Grande" is com-
modious, forms a pleasant drive and is protected by a battery. The harbor is formed be-
tween the peninsula on which the town stands and the large island of Twee-lien-shan, to the west. Macao is considered the healthiest resi-
dence in southeast Asia with a mean annual temperature of 74°. Near it, in a beautiful garden, is the grotto in which the poet Camoens is said to have finished the 'Lusiad.' The principal exports are tea, cassia and cassa oil, anise and anise oil and opium. The commerce (mainly in the hands of the Chinese), which is chiefly carried on with Hongkong, Canton, Batavia and Goa, has greatly declined since the opening of the rival free ports, and a consid-
erable part of the colonial revenue is drawn from a tax on the gambling tables for which Macao is notorious. In 1913, 4,110 merchant steamers entered, with a gross tonnage of 1,008,814 tons, and 13,389 junks, totaling 303,764 tons. The Portuguese first obtained permission to form a settlement and to trade at Macao in 1557. From 1563 they were required to pay a yearly tribute to the Chinese government, and their trading privileges were much restricted
till 1844, when they were allowed to carry on commerce with the five ports then open to foreigners. Macao was then declared a free port, but the Chinese continued to ignore the territorial claims of the Portuguese until 1887, when a treaty was concluded. Macao from its convenient situation was the place of retreat for European merchants and missionaries when threatened by uprisings of race or religious feelings in China. Robert Morrison, the first Protestant missionary in China, was buried here in 1834.

MACAPA, mä-ka-pa, Brazil, town on the delta of the Amazon, 110 miles from the mouth of that river. It has a fine harbor with fortifications. The exports are chiefly timber and fine woods for the furniture trade. Pop. 4,000.

MACAQUE, mä-käk', one of the small, short-tailed Asiatic monkeys of the genus Macaca and family Cercopithecidae, which are so docile, intelligent and interesting as a rule that they are common in menageries and frequently kept as pets; their gentleness and playfulness disappears as they grow old, however, and they are then likely to become morose and savage. They move about in troops, keeping by themselves and differing from other monkeys in most of their actions and cries. Some of the best known are the quaintly crested capuchin or bonnet-monkey (M. sinica), excessively common and pestiferous in southern India; the entellus monkey (q.v.) of northern India; the large-tailed (M. leoninus) of Japan, whose likeness is seen in numberless Japanese drawings and carvings. Ranging over so wide a variety of countries their habits and food differ greatly. Besides the fruit, juicy leaves and insects eaten by most monkeys they devour small reptiles, young birds, frogs and crabs, the last-named forming the principal diet of a Malay species (M. cynomolgus). One species is isolated in the mountains of Algeria and Morocco, whence they were long ago carried, no doubt, to the island of Gibraltar, where they are known to the English of the garrison as "Barbary apes" (M. inuus), and the small band upon the Rock are carefully protected from harm.

MACARONI (Ital. maccheroni), a peculiar paste or dough prepared from wheat flour and either poured into tubes or ribbons. It is an Italian invention, and, though made by a simple process, has never been produced with so great success in any other country. The grain grown in the more southern countries of Europe is said to possess a greater amount of gluten, and is therefore better adapted to this manufacture. The wheat, after being washed, is freed from the husks and ground in water mills, when hot water is added till it is of the consistency of stiff dough. Five different qualities of flour are obtained by an equal number of siftings, the last giving the finest and most delicate that can be made. To reduce the dough to tubes or ribbons a hollow cylindrical cast iron vessel is used, having the bottom perforated with holes perforated with holes. When this is filled with the paste a heavy iron plate is driven in by a powerful press, which forces the paste through the holes and gives it the shape of the perforations, the workman cutting off the pieces of the desired length as they come through. During this process it is partially baked by a fire made under the cylinder. Sometimes the flat pieces are formed into tubes by uniting the edges before they are thoroughly dry. After being hung up for a few days they are ready for use. The largest tubes are called maccheroni, the smaller vermicelli and the smallest fedelini. Macaroni was introduced to Europe by the Venetians, who took it from the Turks. It is now eaten by all classes. Numerous macaroni factories have been established in New York and elsewhere. The United States imports annually from Italy over 500,000 boxes of macaroni.

MACARONIC VERSE, a kind of facetious poetry in which foreign words are distorted and jumbled together; so called by Teofilo Folengo, a Mantuan monk of noble family, who published a book entitled 'Libre Macaronicorum,' a poetical rhapsody, made up of words of different languages. The first macaronic poem was called macaronic, because it was mixed up of Latin and Italian, as macaroni is mixed up with cheese. Consult Morgan, 'Macaronic Poetry.'

MacARTHUR, Arthur, American soldier: b. Springfield, Mass., 2 June 1845; d. Milwaukee, Wis., 5 Sept. 1912. Having enlisted in the United States volunteer service in 1861, he served through the Civil War period, being promoted lieutenant-colonel and brevet-colonel in May 1865, for gallant and meritorious conduct in the battles of Perryville, Ky., Stone River, Tenn., Mission Ridge and Danridge, Ga., Franklin, Tenn., and in the Atlantic campaign. He was mustered out of the volunteer service in June 1865 and entered the regular army with the rank of lieutenant in the 17th United States Infantry the following year. In the Spanish-American War he was appointed brigadier-general of volunteers and assigned to the Philippine expeditionary forces. He was promoted brigadier-general in the regular army, 2 Jan. 1900; commanded the Military Division of the Philippines, major-general, 14 Jan. 1901, and lieutenant-general, 15 Sept. 1906. He returned in 1901, and in 1902 commanded the Eastern department, 1902-03 the Lakes, 1903-04 of California, and 1904-07 the Pacific division. He was retired by operation of law 2 June 1909.

MacARTHUR, Duncan, American pioneer: b. Dutchess County, N. Y., 14 June 1772; d. Ohio, 1839. His family removed in 1780 to the western frontier of Pennsylvania, and at 18 years of age he went to seek his fortune in the wilderness, and participated as a ranger or scout in the warfare with the Indians in Kentucky and Ohio, until the victory of General Wayne in 1794 gave peace to the Western country. About the commencement of the present century he settled in Ohio as a surveyor, and in 1805 became a member of the Ohio legislature, and was appointed to the Senate. When this was filled with the paste a heavy iron plate is driven in by a powerful press, which forces the paste through the holes and gives it the shape of the perforations, the workman cutting off the pieces of the desired length as they come through. During this process it is partially baked by a fire made under the cylinder. Sometimes the flat pieces are formed into tubes by uniting the edges before they are thoroughly dry. After being hung up for a few days they are ready for use. The largest tubes are called maccheroni, the smaller vermicelli and the smallest fedelini. which was ratified in 1818. He served again in the Ohio legislature 1815–21, and in 1823–25 was a representative in Congress from that State. In 1830 he was elected governor of Ohio.

**MacARTHUR, Robert Stuart, American Baptist clergyman:** b. Dalesville, Quebec, 31 July 1841. He was graduated from the University of Rochester, N. Y., in 1867, and from the Rochester Theological Seminary there in 1870, and from May 1870 to September 1871 was pastor of Calvary Baptist Church, New York, where he resigned, having been elected president of the Baptist World Alliance. He went to Russia to secure from the Tsar's government permission to buy land on which to erect a Baptist Bible College. He later went to Burma as president of the Alliance to assist in celebrating the centennial anniversary of Adoniram Judson's mission work in Burma. He was for a long period connected editorially with the Christian Inquirer and Baptist Review, and lectured on foreign travel. His publications include "Calvary Pulpit"; "Current questions for Thinking Men"; "Lectures on the Land and the Book"; "Around the World"; Old Testament Dilemmas and Other Sermons; "Royal Messages of Cheer and Comfort"; "The Christic Reign"; "The Old Book and the Old Faith"; "Divine Balustrades"; "The Celestial Lamp"; "The Question of the Centuries," and "Quick Truths and Quaint Texts."

**MACASSAR, Celebes, the capital of a district of the same name in the island of Celebes on the west coast of the southern peninsula near the southern end of Macassar Strait separating Celebes from Borneo. It is the chief town of the Dutch government of Celebes. Macassar consists of the Dutch town and port, Vlaardingen, where the governor of Celebes resides, and the Malay town, which lies inland. The Portuguese claim to have visited Macassar in 1512; but there was no permanent Portuguese settlement until the 17th century when the English and Dutch also appeared on the scene. In 1600 the Dutch, after decisive victories on land and sea, succeeded in driving the Latins from Celebes and establishing themselves. All attempts of the English to supplant the Dutch were unsuccessful and the Dutch have been masters for two centuries and a half, with the exception of one short period of British occupation in the early 19th century. The important buildings are the official residence of the governor of Celebes; the new museum, containing a valuable collection of objects illustrative of the native arts and industries, arms, armor, costumes, choice fabrics and jewels; and Fort Rotterdam, a relic of the time of Portuguese supremacy and its capture by the Dutch. "Aside from the military forces quartered in Fort Rotterdam," writes A. S. Walcott, "Macassar has a population of about 27,000, including about 1,000 Europeans and 5,000 Chinese; but so many of the inhabitants live in the outlying kampungs to the north and south of the city proper, that it is hard to realize that the figures have not been greatly exaggerated. The houses are usually built with ordinary materials taken from those to which we have become accustomed in Java. They are generally raised several feet above the ground on poles, and have gabled roofs, shuttered windows and considerable ornamentation in the way of carved woodwork. The walls are of matting or of neatly plaited bamboo, the roofs of mud or palm-leaf thatch. The people of this southern end of Celebes are nearly all either Macassarese, or Bugis. They resemble the Javanese in face and figure, but are more sturdily built and are decidedly less polite and pleasing in bearing and manners. The Bugis are the seamen of the Archipelago, the greatest navigators and the most enterprising traders to-day and in times gone by the greatest pirates as well. All the people of the coast districts of southern Celebes are in religious proclivities Mohametan-Animists — Mohametan in their profession of faith, Animists and fetish-worshippers in their practices." Macassar trades in coffee, rice, copra, trepang, spices, gum, rubber, pearls, mother-of-pearl, cocoa oil, maize, sandal wood and valuable timber. Pop., about 27,000. Consult Gervaise, N., "Description historique du royaume de Macassar" (Ratisbon 1700); Walcott, Arthur S., 'Java and her Neighbours' (New York 1914).

**MACASSAR OIL, the trade name for an unguent that made its appearance in England early in the 19th century, manufactured by one Rowland. It took its name from the port of Macassar, where it was first produced, being pressed from the fruit, or seed, of the Schleichera trijuga, the East Indian kusum tree. This fixed vegetable oil is used by the natives for cooking, illuminating and for medicinal purposes. The name is now given to a pomade made of almond, olive or peanut oil, to which other substances are added to give color and perfume. The original Macassar oil became so well known that Byron spoke of it as "Thine incomparable oil, Macassar," and Lewis Carroll alludes to it in the Song of the Man sitting on the Gate in 'Alice Through the Looking-glass.' So general was its use that in England a covering was specially made to throw over the back of a chair or sofa as a protection from the grease in the hair; and to these coverings the name Anti-macassar was given. Anti-macassars were at first made of white cotton in crochet-work. They were stiff, hard and uncomfortable; but in the third quarter of the 19th century they were simpler and were more artistically worked in colored wools or crevels, or colored silks in pretty patterns. The Lady's Newspaper (1852) describes anti-macassar materials as "crotchet cotton," "pink and drab crochet twine," etc. All the Year Round (1879) "the anti-macassar on the arm chair;" and Miss Braddon's 'Vixen' (1879) "To sit alone by the fireside and work anti-macassars in crewel" shows that the word was still familiar in England to a comparatively recent period. In the United States the word 'tidy' was used to describe the same thing.

**MACALAY, Catherine Sawbridge, English historian:** b. Wye, Kent, 2 April 1731; d. Binfield, Berkshire, 22 June 1791. In 1760 she was married to George Macalay, a London physician. She was an ardent Republican and a great admirer of Washington, with whom she corresponded, and whom she visited in 1785. She published a 'History of England from the Accession of James I to the Revolution' (8 vols., 1763-71), once very popular and eulogised by Pitt in the House of Commons, but now neglected.
MACAULAY, James, Scottish novelist: b. Edinburgh, 22 May 1817; d. there, 20 June 1902. He was educated at the University of Edinburgh and for 35 years was in the service of the Religious Tract Society as editor-in-chief. In 1851-57 he was joint editor of the Literary Gazette and in 1858 became editor of the Leisure Hour Sunday at Home. The Boy's Own Paper and The Girl's Own Paper were founded by him. He was a voluminous writer, and among his published works the following may be mentioned: 'Across the Ferry; First Impressions of America and its People' (1871); 'Memory Helps in British History' (1875); 'All True: Records of Adventure' (1879); 'Luther Anecdotes' (1883); 'Gordon Anecdotes' (1885); 'Livingstone Anecdotes' (1886); 'Wonderful Stories of Daring, Peril and Adventure' (1887); and 'Victoria, Her Life and Reign' (1897).

MACAULAY, Sir James Buchanan, Canadian jurist: b. Niagara, Ontario, 5 Dec. 1793; d. Toronto, 20 Nov. 1859. He was an ensign in the British army during the War of 1812, and subsequently studying law was admitted to the bar in 1822. In 1829 he was appointed a judge of the King's Bench, from 1849 to 1856 he was Chief Justice of the Court of Common Pleas, and just prior to his death became judge of the Court of Error and Appeal. He was knighted in 1859.

MACAULAY, Thomas Babington, English essayist, historian and statesman: b. Rothley Temple, Leicestershire, 25 Oct. 1800; d. Holy Lodge, Kensington, 28 Dec. 1859. Macaulay was the son of Zachary Macaulay, a Scotchman of remarkable character, who achieved distinction by his life-long advocacy of the abolition of slavery and by his efficiency, as a young man, in the governorship of Sierra Leone, the colony of African freedmen. The family removed to Clapham, then a suburb of London, where much of Macaulay's youth was spent. Hannah More was a friend of the family and she encouraged the lad as a writer and presented him with books to start his library. Very early by the age of eight and his memory was something startling. He attended school near Cambridge under a Mr. Preston; his range of reading, particularly in poetry and fiction, was immense, but his taste for mathematics and the exact sciences steadily declined. In October 1818 he entered Trinity College, Cambridge, and in the citadel of mathematics his aversion for this study became pronounced. Twice he gained the Chancellor's medal for poetry, and he displayed classical attainments, but was "gulped" in mathematics. However, after a third trial, he won a Fellowship in 1824. His mental training was thus one-sided; and a certain lack of philosophical grasp and a dislike of facing abstruse intellectual problems became thus characteristic.

He associated with his college mates, rather than his studies, left the deepest impression upon Macaulay. His great friend was Charles Austin, whose influence converted the young Tory into an uncompromising Whig. He shone in the Union Debating Society, a debating society that afterward became conspicuous in the House of Commons. Politics he had heard discussed from early childhood in the circles which gathered round his father's table, and along with literature politics was his abiding passion. At college he had competed for a prize in history on the subject which he developed into his first book: "The Conduct and Character of William III." Before leaving the university he began writing for publication in Knight's Quarterly Magazine (1823). Two lyrics, 'Ivy' and 'Nasbey' still live; but the most important contribution was the ingenuity of his correspondence between Mr. Abraham Cowley and Mr. John Milton, touching the great Civil War. It seems likely enough that the freshness and delicacy revealed in this early work became injured by the author's entrance into the rougher world of political strife. On the other hand, it may be maintained that Macaulay's gifts were predominantly those of the man in public life, and to him literature, always a delight, was nevertheless really but an avocation. Macaulay's father unexpectedly became financially involved. Full of courage, the son began tutoring while still at Cambridge, and cheerfully assisted in supporting his sisters. Ultimately, together with his brother, he paid off all his father's obligations.

Macaulay was called to the bar in 1826 and joined the Northern circuit; but soon gave up the law for politics. Interestingly enough, his entrance into politics came by way of literature. In August 1825 appeared the essay on 'Milton,' the first of the series that Macaulay contributed to the Edinburgh Review, which, for the next 20 years, made both him and the Review famous. Jeffrey, the editor, expressed his frank wonder as to where Macaulay "picked up that style." Upon Jeffrey's resignation Macaulay was offered the editorship, but he was not willing to leave London. Papers on 'Machiavelli' (1827), 'Dryden,' 'History' and 'Hallam's Constitutional History' (1828), followed, and soon after controversial articles on James Mill, Sadler and Southey, which revealed the declared Whig. Their reputation introduced him into both social and political life. He was made commissioner of bankruptcy in 1828 and in 1830, Lord Landsdowne, who had been favorably impressed as a public speaker, secured Macaulay a seat in Parliament for Calne in Wiltshire which he held until in 1832 he was elected for Leeds.

His time of entrance into the House of Commons was propitious. It was just before the death of George IV and the accession of William IV, and consequently on the eve of the battle for the reforms of 1832. Macaulay was 30 years of age, was widely read in history and literature and was a ready and fluent speaker at a time when questions were asked. In 1824 he had made a notable speech at a meeting of the Anti-Slavery Society; later, in the discussion for Catholic emancipation, he headed a coachload of M.A.'s from London to Cambridge, arriving in time to vote down a petition in the university senate against the act. He now threw himself ardently into the struggle for reform and took an honorable part in the fight from beginning to end. His Parliamentary success was immediate. Whenever he rose to speak a hushed silence fell. His eloquence was like a trumpet-call to fill the benches. His earliest effort was on the removal of the civil disabilities of the Jews, which he followed by an essay on the subject in the
Edinburgh Review (January 1831). On the emancipation of slaves in the colonies he never wavered, but stood unfinishingly true to his father's principles. He offered to resign his position with the ministry rather than yield his views on this subject; but the question was satisfactorily settled and his resignation not accepted.

Meanwhile he found time to write. The essays on 'Byron,' 'Johnson' and 'Hampden' appeared in 1831; 'Burleigh' and 'Mirabeau,' in 1832; 'War of the Succession in Spain' and 'The Race of Mahomet,' in 1834. He added the first essay on 'Chatham,' January 1834.

His appointment in 1832 as a commissioner of the Board of Control was followed by absorption in East Indian affairs, and in 1833, when the charter of the East India Company was renewed, he was offered a position on the East Indian Council with a salary of £10,000 per annum for five years. His brilliant career in Parliament was seemingly permanently endangered; but Macaulay did not hesitate. He estimated that he could not be satisfied and in five years have a competence. He needed money on account of his father's poverty, for the sake of his two sisters, as well as for his own career; and he accepted, going out in 1834 and returning in 1838. The genius for government which the father had displayed at Sierra Leone, the son now manifested at Calcutta. His important permanent reforms were the creation of the Indian Penal Code and the Code for Criminal Procedure, achieved in the face of bitter local opposition, and the organization of a sound educational system.

Macaulay's family ties were very strong and there is no record of any love affair in his life. A sister, Jane, had died in 1830, and his mother in 1831. One of his favorite sisters, Margaret, was married in 1832, an occurrence which he accepted as a source of personal distress. The other, Hannah, accompanied him to India, and there she met and was shortly married to Charles Trevelyan, an officer in the government service. Macaulay was much pleased with the match, and the two households lived together under the same roof. Ever afterward, as the young Trevelyans, his nieces and nephews, grew up, they became a very real part of his life. Margaret, and particularly for these, was a marked trait, and one of them afterward filially wrote his uncle's biography. Meanwhile his sister Margaret had died in England, and likewise his father died. Macaulay and the Trevelyans were on their homeward voyage. These deaths affected him deeply, and the home-coming was a sad one.

While in India he made opportunity for an immense amount of reading, particularly of the Latin and Greek classics, to which he returned with increasing delight. He also read widely in Italian and French, and did some German on the return voyage. His love for the great poets, dramatists, orators and historians affected his culture, his style and his ideals. The lists of his reading from now to the end of his life became a part of his biography and would stock a good library. His long walks with a copy of Homer or Virgil, from which he was reading or quoting, became an accustomed sight. Thenceforward he determined that he would write a history in emulation of Thucydides and Tacitus and Livy, and his set speeches caught something of the spirit ofLyias and Cicero.

Upon his return to England he left for a tour in Italy, revelling in its beauties and associations with the enthusiasm of a first visit and the eye of an historian and student of Latin and Italian literatures. The literary fruits were the 'Lays of Ancient Rome.'

Returned home, he sincerely hoped to begin his 'History of England,' which he had planned to write from the Revolution of 1688 to the death of George III. Had he begun it then, with 20 years of life to devote to it, he might easily have left 10 or more volumes-covering the century instead of the first five extending through but 15 years—a brilliant fragment. But he was again dragged into politics and Macvey Napier, editor of the Edinburgh Review, made heavy draughts upon his time.

In India he had contributed but two essays to the Review, that on 'Mackintosh's History' and the very long one on 'Bacon.' Hereafter his experience furnished him the material for the brilliant narratives on 'Clive' (1840) and 'Warren Hastings' (1841). Besides these in the six years after his return he contributed 'Sir William Temple' (1838)—written in an entirely fresh spirit by Gladstone on Church and State (1839); 'Von Ranke's History of the Popes' (1840); the 'Comic Dramatists of the Restoration' and 'Lord Holland' (1841); 'Frederick the Great' (1842); 'Mme. d'Arblay' and 'Addison' (1843); 'Barre' and the second essay on the 'Earl of Chatham' (1844). This, perhaps his noblest essay, proved to be his last. He was forced to give up writing in order to find time for his 'History.' His complaisance in continuing to write for the Review had undoubtedly worked to his detriment. But the entrance into politics was only in part due to the exigencies of his friends; for public life exercised a subtle fascination over him.

In 1839 he was elected member of Parliament for Edinburgh and was made Secretary at War with a seat in the Cabinet. Unfortunately the ministry soon expired, and his freedom from official duties gave him some leisure. He retained, however, his seat for Edinburgh, and his most important work was the Copyright Bill, which, after much difficulty and discussion, passed in almost the exact terms in which he advocated it.

In 1842 the 'Lays' appeared and achieved a great success despite the natural fears of friends. *Christopher North* of Blackwood's, who had attacked Macaulay on account of the Southey reviews, made up——on poetry they could agree. In 1843 the 'Essays' were collected and published. There had been a constantly growing demand for them in a permanent form, which their author at first resisted. They had been written at odd moments of leisure, and he regarded them as ephemeral, but copies were being introduced from America, and Macaulay had to consent. The sale proved their popularity to be a permanent one. Macaulay's Essays stand as a monument of their kind, as condensed booklets of knowledge. An analysis of their contents shows how their author's mind was revolving constantly upon a definite period of English history—the Revolution and the constitutional development under constitutional government, the subject set
MACAULAY'S ESSAYS

for himself in writing his 'History'—and these are uniformly among his best. Those on foreign subjects and the controversial ones are less satisfying.

The 'History' had been delayed year after year for lack of leisure to begin actual work. At length the first two volumes appeared in 1849. They comprised the reign of James II and the Revolution, but reproduced the setting as a whole and included details at once picturesque and dramatic such as could only be drawn by a supreme master of narrative. He wished to be read and to be understood; he sought to give a series of brilliant mental pictures; and he achieved what he set out to do. He is weakest, perhaps, on the side of ethical interpretation, in searching out the causes and setting forth the nexus of events; his narrative is brilliant and effective, but it has the supreme fault in a history of being entirely lacking in detachment of view. In opinions he represented the great middle class and the world of Wapping and its models of thinking; in many things, Philistine; in some things, even vulgar; where mysticism and all esoteric systems of philosophy and kindred schools of poetry were accounted as foolishness.

The lesson of 'History' was something enormous, surpassing even that of Byron's poems and of Scott's and Dickens' novels. In 1849, in consequence of this success, Macaulay was made rector of the University of Glasgow and Fellow of the Royal Society. He had been appointed trustee of the British Museum in 1847. He declined a professorship of history at Cambridge, and steadily refused positions under the government which would take up his time.

He had represented Edinburgh in Parliament for eight years, when in 1847, on account of his characteristic independence in voting for the Maynooth grant—for the maintenance of a Catholic university in Ireland—he offended many Edinburgh electors, and was not returned as he policed. He accepted his defeat with relief, and turned the more eagerly to the 'History.' In 1852, without any solicitation on his part and with a steady refusal to give pledges, he was returned voluntarily by the electors of Edinburgh to his present seat. Under such circumstances he felt he could not refuse election; but the duties it involved aided in sapping his strength, and that year he had a spell of illness from which he never wholly recovered.

In 1853 his speeches were collected and published. In 1855 the third and fourth volumes of his 'History' appeared. Macaulay feared for their success after the splendid reception accorded to the former two; but the new subject was the life and career of William of Orange, his favorite hero; he had worked hard to sustain himself and 26,500 copies were sold in 10 weeks. In 1856 he withdrew from the House of Commons; and in 1857 he was made a peer, and chose the title, Baron Macaulay of Rothley, from his birthplace. Likewise this year he was made a fellow of the Royal Academy, member of the Prussian Order of Merit and high steward of Cambridge. In 1858 he wrote five short biographies for the eighth edition of the Encyclopedia Britannica—Atterbury, Bunyan, Goldsmith, Johnson and Pitt. These show greater compactness and maturity in judgment than his earlier treatment of the same themes.

In 1856 he left his bachelor quarters in town, at The Albany, and leased a pleasant villa, Holly Lodge, Campden Hill, Kensington. In 1859 his brother-in-law, now Sir Charles Trevelyan, was appointed governor of Madras, and the thought of the separation bore heavily upon him. Fortunately his sister and the children remained behind a while longer. Macaulay had not been well for some time, and he died at Holly Lodge, 28 December. On 1 Jan. 1860, he was buried in Westminster Abbey in the Poets' Corner at the foot of Addison's statue.

A fifth volume of the 'History,' concluding the reign of William III, had been completed, was edited posthumously by Lady Trevelyan and appeared in 1861. See MACAULAY'S ESSAYS; LAYS OF ANCIENT ROME.

Bibliography.—The official life, written by George (afterward Sir George) Otto Trevelyan (his nephew), appeared in London in 1876, and is generally conceded to be one of the best biographies ever written in the English language. Consult also Lord Avebury, 'Essays and Addresses' (London 1903); Bagehot, Walter, 'Literary Studies' (ib. 1879); Canning, 'Lord Macaulay and his History' (ib. 1822); Hughes, D. Late Professor of English in the University of the South.

MACAULAY'S ESSAYS. Macaulay did not originate the essay of literary and historical criticism. But Macaulay's essays so far surpass all others in brilliancy, style and solidity of matter that his name ranks with those of Bacon and Montaigne, each a master in his own special field. Macaulay's first published articles, written while he was still in residence at Cambridge University, appeared in Knight's 'Quarterly Magazine' in 1823 and 1824. Under such circumstances he felt he could not refuse election; but the duties it involved aided in sapping his strength, and that year he had a spell of illness from which he never wholly recovered.

In 1853 his speeches were collected and published. In 1855 the third and fourth volumes of his 'History' appeared. Macaulay feared for their success after the splendid reception accorded to the former two; but the new subject was the life and career of William of Orange, his favorite hero; he had worked hard to sustain himself and 26,500 copies were sold in 10 weeks. In 1856 he withdrew from the House of Commons; and in 1857 he was made a peer, and chose the title, Baron Macaulay of Rothley, from his birthplace. Likewise this year he was made a fellow of the Royal Academy, member of the Prussian Order of Merit and high steward of Cambridge. In 1858 he wrote five short biographies for the eighth edition of the Encyclopedia Britannica—Atterbury, Bunyan, Goldsmith, Johnson and Pitt. These show greater compactness and maturity in judgment than his earlier treatment of the same themes.

In 1856 he left his bachelor quarters in town, at The Albany, and leased a pleasant villa, Holly Lodge, Campden Hill, Kensington. In 1859 his brother-in-law, now Sir Charles Trevelyan, was appointed governor of Madras, and the thought of the separation bore heavily upon him. Fortunately his sister and the children remained behind a while longer. Macaulay had not been well for some time, and he died at Holly Lodge, 28 December. On 1 Jan. 1860, he was buried in Westminster Abbey in the Poets' Corner at the foot of Addison's statue.

A fifth volume of the 'History,' concluding the reign of William III, had been completed, was edited posthumously by Lady Trevelyan and appeared in 1861. See MACAULAY'S ESSAYS; LAYS OF ANCIENT ROME.

Late Professor of English in the University of the South.
literature. Pick up the essay on Addison and you are delighted with the tender sympathy of the critic who can set forth a good man's character in so generous and beautiful a manner. Read that on Croker's edition of 'Boswell's Johnson,' and you not only derive pleasure from him, rank admiration for Johnson, but you also get a lively idea of what the editor of a biography should not do. Take up any essay you please and you find knowledge, wit, sympathy, admiration; you are delighted to find with what ease you acquire information, and how your horizon rapidly reaches out as if you were going up in a balloon, how places and things once so dark become enveloped in light as if the sun were rising, how great historical events seem to have been familiar to you from boyhood and how eminent personages, hitherto unknown, leap into your sudden intimacy.

Thus to delight, in form, and exhilarate the reader is a wonderful feat, and for nine men out of 10 Macaulay's essays are wholly satisfactory. The busy man who wants to get to history and literature; but the 10th man finds himself not wholly satisfied. He feels oppressed by the arts of rhetoric. These animated pages, paragraphs, sentences that advance from rank to rank, marshaled according to the most brilliant rules of tactics and strategy, trouble his spirit. Not a single sentence, here or there, appears in undress uniform. Such prose affords no room for subtleties. And the author's dogmatism rings in our ears like a trumpet in a room; this world of ours so full of perplexities, uncertainties, obscurities, cannot be truly expressed in opinions of absolute definiteness. History, literature, art, are not mathematics; a column of figures adds up the same for all; but William of Orange, James the Second, Archbishop Laud, Alexander Pope, Francis Bacon, must seem different to different people. We need, in literature, in history, light and shade, we need twilights and even nights; high noon all the time is intolerable. It seems unlikely that all right views on English politics, during the 17th, 18th and 19th centuries, were embodied in the Whig creed, that all the good in religion is with the Protestants and none with Roman Catholics, that estimate of national characters summed up in the phrase "as the Italian is to the Englishman, as the Hindoo is to the Italian, as the Bengali is to other Hindoos," etc., should not need explanations and qualifications. And why should a historical writer, all the time, be giving his personages good or bad marks for conduct, like a village schoolmaster? Such faults certainly exist. Macaulay had the temperament and the manner of an orator. He took, or rather he inherited, a view, he accepted it unquestioningly with enthusiasm, even with passion, he expressed that view in as absolute and as lucid a manner as possible. He had the method of an orator whose oration will be heard but once, and who must be positive in order to convince. This may be a merit in an advocate but it is a grave fault in a writer; and one would say that with such a fault it would be impossible for a man to be a great writer. But this very fault is proof of Macaulay's extra dramatic ability; with such an immense fund of information, with his obvious honesty and his contagious enthusiasm, he is able to cover up and conceal what in any other writer would be fatal defects.

A man without doubts, without metaphysics, without high imagination, without dreams, cannot be one of the world's greatest writers; but Macaulay was a great English writer and occupies a place in which he not only has no rival, but no competitor who can be compared with him. T. E. Edgeworth.
tration. Morley was giving high yet just praise when he expressed the belief that this *Life of Macaulay* would be read throughout the world with a curiosity and an interest only to be surpassed by the success of Macaulay's own writings. Consult the review of the *Life* by John Morley (in the *Edinburgh Review*, Vol. 143); and that by Gladstone (in the *Quarterly Review*, Vol. 142).

WALDO H. DUNN.

**MCALEY, Catherine,** Irish founder and first superior of the Sisters of Mercy: b. Stormont House, County Dublin, Ireland, 29 Sept. 1877; d. Dublin, 11 Nov. 1884. In childhood she was adopted by a wealthy Protestant family who allowed her to remain in the church of her father, the Roman Catholic, and left her a large fortune which she wished to use for the benefit of the poor. She first erected a commodious house wherein might be taught a number of poor children, and where homeless young women might find lodging and board. This institution was opened in Dublin, 24 Sept. 1827; but the religious order was not established until 12 Dec. 1831. The members of the order take the vows of poverty, chastity and obedience; and the works which they perform are visiting the poor, sick and imprisoned, teaching, establishing hospitals, orphanages, homes for the friendless and other works of mercy. There are houses of their order in nearly all parts of the world. In the United States it comprises over 4,700 members. The order includes a college for young women, at Mount Washington, Md., a large number of academies, high and elementary schools and hospitals and orphanages in nearly every State in the Union. Consult Hartnett, *Memoir of Mother McAuley*; Murphy, *Sketches of Irish Nunneries*; Member of Order of Mercy, *Life of Catherine McAuley.* See MERCY, SISTERS OF.

**MCALEY, m'käl'i, *Jerry,* New York City missionary to b. Ireland, in 1839; d. New York City, 15 Sept. 1884. He came to New York in 1852 and became a thief and prize-fighter. In 1857 he was sent to Sing Sing prison on a false charge of highway robbery, but was pardoned in 1864. He returned to his evil life. In 1872, having reformed, he opened a mission in the *Heart of the City,* a criminal neighborhood in New York. In 1882 he opened another mission, *The Jerry McAuley Cremorne Mission* and in 1883 began the publication of *Jerry McAuley's Newspaper.* He appealed with the greatest success to outcasts considered beyond redemption. After his death the work was continued by Samuel H. Hadley and John H. Wyburn. In 1912 a modern sanitary building was erected on the site of the first mission in Water street. Consult *Jerry McAuley: His Life and Work,* autobiography edited by the Rev. Robert M. Offord (New York 1885).

**MACAW,** mä'ka', name given to 15 or more species of large, long-tailed and strong-flying parrots of gaudy coloring. They belong to the genus *Ara,* and are natives of the Western Hemisphere. They live on the mainland of America from Mexico to Paraguay, being especially abundant in Bolivia, where no fewer than seven (or nearly one-half) are found. They are also in Colombia and in Cuba. In the true macaws (*Ara*) the bony orbital ring is complete and the lore (space between the eye and the upper mandible) and, to a greater or less extent, the cheeks are naked. One of the handsomest and best known is the Blue and Yellow Macaw (*Ara ararauna*), which enjoys an extensive range in South America from Guiana in the east to Colombia in the west and from Panama to Bolivia. A little over 30 inches long it has the upper parts blue, the forehead olive-green and the ear-coverts, sides of neck, breast and abdomen, while the wings and long tail are blue above and golden olive-yellow below. This bird is seen in almost every zoological garden and is often kept in private houses. It possesses a fairly good temper and grows much attached to those who tend it; but, like other macaws, it persists in violent screaming. Salmon-fishers use its feathers for the making of artificial flies. Larger and even more gorgeously plumaged is the great Red and Blue Macaw (*Ara macao*), which is mainly scarlet-red both above and below, but with the back and upper and lower tail coverts pale blue, as are the wing-quills, while the shoulders and greater coverts are chestnut yellow. The tail feathers are scarlet, the two central ones scarcely tipped with blue, the blue tips increasing in extent on the outer feathers, the three outermost being almost exclusively blue. The home of the Red and Blue Macaw extends from Mexico, through Central America, to Bolivia, Guiana and the Amazon Valley. It is usually seen in pairs, or in companies of pairs. It is also a common bird in captivity. The Red and Green Macaw (*Ara chloroptera*), ranging from Panama to Brazil, has a shorter tail than the other two and is not so frequently seen with in zoological gardens. It does not extend north of Panama. It differs from the Red and Blue in being of a darker red, or crimson, and having the middle wing coverts olive-green instead of yellow. The Green Macaw (*Ara militaris*), green throughout, except for the presence of a scarlet patch on the forehead and blue on back, rump, wings and tail. It is 27 inches long and ranges from Mexico to Peru and Bolivia,—the most northern of all in distribution. It is well known in captivity. Colonel Grayson and other writers explain that this macaw is called "guacamayo" by the *Yagua,* a tribe of the Guiana district, in South America, because they believe that it descends to the ground only once a year, and this in the month of May, when it searches the ground for a very hard-shelled palm-nut of which it is fond. This rather surprising statement is probably substantially true, as there seems no other reason why it should ever alight on the ground, where it would be exposed to much more danger than in the tree-tops, where it finds abundant food the year round. The tree of this nut the Mexicans call Ara, a species of *Nux comica.* Both the milky sap of the tree, as well as the fruit, are deadly poison to any other creature but this parrot. It is exceedingly hard, but the enormous bill and powerful jaws of the Guacamayo enables it to split the nut with ease. When going to some distance these birds pass at a great height, flying in pairs and uttering harsh and discordant cries.

The Hyacinthine Macaw (*Ara hyacinthus*) of the central provinces of Brazil is a splendid bird. It is about three feet long, the plumage being nearly uniform cobalt blue, relieved by
bright yellow skin about the eyes and at the base of the lower mandible and a black bill which is of enormous size. This appears to be a rare species, occurring, according to Riker, about the inland ponds in the dense forests of the interior, where it feeds chiefly upon the fruit of a palm peculiar to these localities. Some of these palm fruits are of extraordinary hardness, but these birds crush them to pulp by their bills. The nesting habits of the Hyacinthe differ from those of other macaws in that they excavate a hole in the river bank for their nest instead of placing it in a hollow tree. In Spixi Macaw (Cyanopsittacus Spixi), of the province of Bahia, Brazil, the lores are naked and the general color also blue; but parts of the head are more or less grayish.

All macaws live well in captivity and are often kept chained to a perch. Few persons are acquainted with their strong, wonderful and graceful flight. They all scream harshly. They are gregarious and apparently monogamous, and lay two large white eggs in nests in hollow trees. One of their characteristics is a long and graduated tail with the individual feathers tapering to a point and the middle pair always the longest. The bill is powerful and usually deep blue. Consult Greene, William Thomas, 'Parrots in Captivity,' with notes (3 vols., London 1884-87); id., 'Parrots in Captivity,' colored illustration (London 1884); Lear, Edward, 'Illustrations of the Family of Psittacidae, or Parrots' (folio, London 1832); Page, Charles N., 'Parrots and Other Talking Birds: their Foods, Care and Training' (Des Moines 1906).

MACAW TREE (Acrocomia sclerocarpa), a palm of the same family as the cocoaanut. It is a native of the West Indies and of the warm parts of America. It grows from 20 to 30 feet high with pinnated leaves from 10 to 15 feet long. The fruit yields oil of a yellowish hue, sweetish taste and with an odor like violets. This oil is about the consistency of butter. In the native regions of the tree the inhabitants use this oil as an emollient for affections of the joints. It is extensively imported and is used in the manufacture of toilet soaps as palm oil. The leaves yield a fine, soft fibre. In Guiana the tree is called Macaya, in Brazil it is called Macauba, in Jamaica Grapua. In southern California this palm is cultivated as an ornamental tree.

MACAYO, mà-su-ō, Brazil. See MACAO.

Macbeth, or Macbethad, MacFinlegh, king of Scotland, who reigned from 1040 to 1057. The facts of his life, so far as known, are these. During the reign of Duncan he was ‘mormaer’ of Moray by inheritance, and by his marriage with Gruch, granddaughter of Kenneth IV. Duncan, in his attempt to subdue the independent chiefs of the north, was defeated in a battle with the Earl of Orkney and Shetland at Burghhead, near Elgin in 1040; but was murdered at Fitgaveny, nine miles from the battlefield, by Macbeth, his general. By this means Macbeth became king, and, according to accounts, his reign was fairly successful. He was finally defeated in battle and slain by his son Malcolm, in 1057. Of this clan, at Lumphanan, Aberdeen (1057). The legends which gradually gathered round the name of Macbeth were collected by John of Fordun and Hector Boece, reproduced by Holinshed in his ‘Chronicles’ (1577) and made use of by Shakespeare for his great tragedy. These writers appear to have overlooked the excellent qualities of Macbeth as king, and regarded him with horror and a tamer. Consult Robertson, ‘Scotland under her Early Kings’ (1862); Skene, ‘Celtic Scotland’ (1876-80), and Rhy, E., ‘Celtic Britain’ (3d ed., London 1904).

MACBETH. This play was not published until 1623, though it was probably written several years before Shakespeare’s death. A reference to it in 1610 by Dr. Simon Forman, the probable reference to the accession of James the First (1603) that brought about the union of two crowns, and the proportion of rhyme, blank verse and prose, point to 1605-06 as the probable date. Because of its late publication the text is one of the most corrupt of Shakespeare’s plays. It may have been taken down from the play as acted, or it may be a transcript of the author’s manuscript which was in great part not copied from the original but written to dictate. Act 1, scene 2, and part of scene 3 may be an interpolation, but the Porter Scene, which was long considered to be the work of a collaborator, is now justified by reason of its dramatic contrast with the preceding scene and by the amazing felicity of such lines as, ‘go, the prunrose way to the everlasting bonfire.’ With the exception of a few lines and scenes Macbeth is an example of amazing concentration—it has neither underplot, nor, with the exception of the Porter Scene, such comic scenes as are found in nearly all of the other tragedies of Shakespeare. It is shorter by some thousand lines than any other tragedy and moves along with the swiftness of a tempest. The 20 years of history become nine days of dramatic time, and so swift is the passage of time that it seems but a few hours.

Shakespeare was indebted for the main events of the play to Holinshed’s ‘Chronicles of Scotland.’ The character and the story of Macbeth, partly historical and partly legendary, were drawn largely from this source, but the witches were the creation of Shakespeare’s genius from the shadowy creatures of a crude folklore. There is just enough of the popular conception of supernatural creatures of evil to satisfy the demands of the age in which he lived, but he informed this popular and somewhat vulgar superstition with a moral significance suited to all ages alike. These invisible, unearthly creatures do not create the evil in Macbeth’s mind; they only serve to bring into life-like reality the evil that is already there. They are an embodiment of the same forces as the thunder, lightning, rain—nature red in tooth and claw—that constitute the background for the evil forces that are at play in this drama. While the minor characters of the play, and especially Banquo, are adequately presented, the interest centres in Macbeth and Lady Macbeth, who while engaged in the same evil deeds yet reveal differences of temperament and character that afford the most significant dramatic contrasts. Lady Macbeth before the murder of Duncan displays firm, sharp, wiry, matter-of-fact intellect and energy of will; she becomes for the time being possessed by one thought, one ambition. She has no imagination to represent
McBRIDE—McCABE

for her the inevitable consequences of the murder. As soon, however, as the deed is done, her womanly nature asserts itself; her amazing self-control gives way, and remorse wells up in her conscience-tortured heart. She had denied the quality of her sex, only to find that the woman was stronger than the queen or the wife. Macbeth, on the other hand, is possessed from the beginning by a vivid imagination that visualizes the deed itself and falters at its contemplation. Deeper and deeper he plunges into guilt until a sort of world-weariness and sick despair settle upon his brooding spirit. In words as eloquent as Shakespeare ever wrote he pronounces a requiem upon his wife and summarizes his pessimistic indictment of old age and of life; life is to him but ‘a tale told by an idiot, full of sound and fury,signifying nothing.’ He dies with the harness on his back, the intrepid soldier that he has always been, but with a sigh that pierces to the depths.

EDWIN MIMS.

McBRIDE, Māk-brid, Sir Richard, Canadian statesman: b. New Westminster, British Columbia, 15 Dec 1870, where his father held office under the Crown. He was educated at Dalhousie University, Halifax, Nova Scotia, graduating in 1890, called to the bar in 1892, he practiced his profession in Victoria. Entering politics he was elected in 1896 a Conservative of the provincial legislature. In 1900-01 he was Minister of Mines in the Provincial Ministry; in 1902-03 a leader of the Conservative opposition; in 1903 Premier and Minister of Mines; in 1906 a delegate to the Interprovincial Conference of Ottawa; and in 1907 in delegate to the Colonial Conference at London (England). In 1912 he was knighted. Consult Gregg, T. A., ‘Richard McBride,’ with portrait, Canadian Magazine (July 1904).

MABRIDE, Thomas Huston, American educator and botanist: b. Rogersville, Tenn., 31 July 1848. After graduation at Monmouth College in 1860 he taught mathematics and modern languages at Lenox College from 1870 till 1878, in which year he became assistant professor of natural sciences. In 1884 he was made professor of botany and held this post until 1916, when he retired. Since 1916 he has been president emeritus. His specialty is fungi. Dr. McBride has had many degrees: Monmouth gave him A.M. in 1873; the University of Bonn the same in 1891; Lenox gave him Ph.D. in 1895; Monmouth that of LL.D. in 1914, and the same in 1915. He is a member of many scientific societies, of the American Forestry Association, Iowa Park and Forestry Association and of the Society of Botanists of the Central States. He is also a Fellow of the Botanical Society of America. He has published many of his lectures and addresses, and contributed to the Popular Science Monthly, Science, etc., and is the author of a textbook on Botany, (1893) and ‘North American Slime Molds’ (1899).

McBURNLEY, Māk-ber‘ni, Charles, American surgeon: b. Roxbury, Mass., 17 Feb 1845; d. 1913. He was graduated at Harvard in 1866; and from the Columbia Medical School in 1870, and thereafter practiced his profession in New York. He was professor of surgery in the College of the City of New York and was visiting and consulting surgeon at Saint Luke’s, the Presbyterian, Roosevelt, New York Orthopedic and other hospitals. He became widely known as a very skillful operative surgeon, and was Fellow or member of many medical societies of this country and Europe. He discovered “McBurney’s point,” which is pathognomonic of appendicitis. He was a world-wide authority on appendicitis. When President McKinley was shot, Dr. McBurney was summoned to Buffalo as consulting surgeon. He was a great teacher as well as a great surgeon.

McBURNLEY, Robert Ralke, American reformer worker: b. Castleblaney, Ireland, 11 March 1837; d. Clifton Springs, N. Y., 27 Dec. 1898. He came to the United States in 1854, and from 1862 was the general secretary of the New York Young Men’s Christian Association. He was devoted to his work, and with the progress of years came to be recognized as the leading Y. M. C. A. secretary in the world.

McCABE, ma-kāb‘, Charles Cardwell, American Methodist bishop: b. Athens, Ohio, 11 Oct. 1836; d. New York, 19 Dec. 1906. He was educated at Ohio Wesleyan University. In 1850 he entered the Methodist Episcopal ministry, and in 1852 was appointed chaplain of the 122d Ohio Infantry. At the battle of Winchester he was captured, and held in Libby prison for four months, and soon after his release entered the service of the United States Christian Commission and succeeded in raising a large amount of money for its work. Later he became financial agent for Wesleyan University; and in 1884 was made secretary of the Methodist Episcopal Missionary Society. He was remarkably successful in raising large amounts of money for missionary purposes. He became a bishop of his Church in 1896, and in December 1902 was elected chancellor of the American University at Washington, D. C.

McCAVE, James Dabney, American author: b. Richmond, Va., 30 July 1842; d. Germantown, Pa., 27 Jan. 1883. He was the son of James Dabney McCabe (1808-75), a Protestant Episcopal clergyman and writer, and was educated at the Virginia Military Institute. He began to write very early. At the beginning of the Civil War he published a pamphlet entitled ‘Fanaticism and Canvassing’ (1861). Then as Southerner (Richmond 1860) and throughout the war he employed his pen effectively in the cause of the Confederates. Three martial plays were performed in Richmond in 1862-63 and his war-story, ‘The Aide-de-Camp,’ was issued in 1863. In 1863 he published a Christmas compilation called ‘The Bohemian’ and in 1863-64 edited the Magnolia Weekly. His war-poems were very popular, particularly ‘The Burden of Harry Lee. He wrote several biographies, including ‘Life of General Lee’ (New York: Thomas, Jackson (1863); ‘Memoir of Gen. Albert S. Johnston’ (1866); and ‘Life and Campaigns of Gen. Robert E. Lee’ (New York 1867). His other works are ‘Planting the Wilderness’ (Boston 1869) ‘History of the Late War between Germany and France’ (1871); ‘Lights and Shadows of New York Life’ (New York 1872); ‘History of the Grange Monument,’ published under the name of Edward Winslow Martin (Chicago 1874); ‘Paris and its Surgeoins, New York, and was visiting and consulting surgeon at Saint Luke’s, the Presbyterian, Roosevelt, New York Orthopedic and other hospitals. He became widely known as a very skillful operative surgeon, and was Fellow or member of many medical societies of this country and Europe. He discovered “McBurney’s point,” which is pathognomonic of appendicitis. He was a world-wide authority on appendicitis. McCABE — MACCAEBS

States (Philadelphia 1875); 'Pathways of the Holy Land' (1877); 'History of the Turko-Russian War' (1879); 'Our Young Folks Abroad' (Philadelphia 1881), and 'Our Young Folks in Africa' (1882). Besides these he was the author of several hundreds of short stories, essayed translations, but made a contribution of the romance and humor of the war called 'The Grayjackets' (1867).

McCABE, Joseph, British rationalist; b. England, 1867. He was educated at Saint Francis's, Manchester, at Saint Anthony's, Forest Gate and at the University of Louvain. In 1883 he became a Franciscan was ordained a priest in 1890 and in 1895 became rector of Buckingham College. In 1896 he left the Roman Catholic Church and became a lecturer and writer on rationalistic subjects. His books include 'Twelve Years in a Monastery' (London 1897); 'Modern Rationalism' (1897); 'Abelard' (1901); 'Saint Augustine and his Age' (1902); Talleyrand (1906); 'The Martyrdom of Ferrer' (1909); 'The Decay of the Church of Rome' (1909); 'The Evolution of Mind' (1911); 'The Emperors of Rome' (1912); 'The History of Evolution' (1912); 'Goethe' (1912); 'The Emperors of Constantinople' (1913); 'A Candid History of the Jesuits' (1913); 'The Sources of the Morality of the Gospel's' (1914); 'George Bernard Shaw' (1914); 'The Soul of Europe' (1915); 'The Kaiser' (1915); 'Crises in the History of the Papacy' (1916); 'The Romance of the Romanoffs' (1917); 'The Bankruptcy of Religion' (1917); 'The Pope and the Church' (1918). He has also published translations of Haeckel, Dumas, and Günter. Under the heading 'Mr. McCabe and a Divine Frivolity' Chesterton devotes a chapter to him in 'Heretics' (London 1909).

MACCAEBS, a famous family which battled for liberty in the 2d century a.d. when the Jews were persecuted by the Syrians under Antiochus IV, Epiphanes. Originally applied to Judas, the V son of Matthias, who began the revolt, the name was widened to include the family of Judas and his followers, in due course to be applied to all wrestlers for freedom in the Greek period of Jewish history. The word's origin has received various explanations. The closest probable etymology is from the Aramaic magqua (Judges iv, 21 and elsewhere) meaning 'Hammer.' The story of the Maccabean struggle belongs to the history of heroism in all ages. When Antiochus of Syria (175-164 B.C.) strove to impose Hellenism in its crassest form upon the Jews under his sway and Jerusalem was overrun, while pagan rites were ordered to be substituted for Jewish, a sacrifice to Zeus being offered (168) on the Temple altar, an aged priest at Modin, Matthias, spurred the mandate, killed the royal messenger, and destroyed the altar. Then escaping with his five sons to the mountains, he raised the standard of revolt. Two years later he died, and Judas, the third son and oldest of the five, a man of considerable energy, in his persistent conflicts to extend and defend his realm. His sympathies were with the Sadducees, and once when officiating as high priest, some of the Pharisees in their anger threw at him the attending Sadducees citrons which had been supplied for the Feast of Tabernacles. As punishment, he attacked them with his troops, killing 6,000. On his death his widow, Salome Alexandra, ruled (78-69), reversing his policy and making the Pharisees her favorites, the land enjoying peace and prosperous growth. Her eldest son, Hyrcan II, who lacked capacity, was made high priest. The younger, Aristobulus, stronger and ableer, coveted the succession and organized an army to conquer Jerusalem, when Alexandra died and Hyrcan was willing to retire in his brother's favor.

At this moment a new factor appeared in the person of Antipater of Idumæa who sought to further his own designs. An appeal to Rome was made. Pompey returned to Syria at the request of his own fashion, at some slight which Aristobulus offered, entered Jerusalem and made Hyrcan II high priest and ethnarch, while his father was carried a captive to Rome. And now the Roman yoke became firmly fastened, Antipater was made procurator in 47, with his
sons Phasael and Herod governors of Jerusalem and Galilee. In 41 they became tetrarchs of Judea. In 40, Antigonus, the sole surviving son of Aristobulus, was appointed king by the Parthians, in the swift changes of the day. Both Herod's who had been killed from prison, whose brother had committed suicide, was given the throne by the Romans (37 B.C.). In the same year Antigonus was put to death by Mark Antony and the Maccabean-Hasmonean dynasty ended.

Abram S. Isaacs.

MACCABEES. Book of the, a name given to several Apocryphal books of the Old Testament. Of the four or five thus termed, two were declared canonical by the Council of Trent (1546), are contained in the Vulgate, and among the Apocrypha of the English Bible. The three other books may be summarized: Book III is found in the Septuagint but not in the Vulgate. Book IV is included in some manuscripts of the Septuagint and of Josephus. Book V is merely a Syriac reproduction of the sixth book of Josephus' 'Jewish War' and is of no historical value.

First Book was the record of 40 years from the accession of Antiochus (175 B.C.) to the death of Simon (135 B.C.), and is composed after the model of the Old Testament historical style, terse, simple, and at times poetic and impassioned. The narrative is written with due proportion and in sympathetic tone. All events are dated in terms of the Seleucid era. It is generally admitted that the original was in a Semitic language, most probably Hebrew, to which both Origen and Jerome bear testimony. However, it is not impossible that they were acquainted with an Aramaic version or paraphrase. The Greek translation of the Hebrew was made at an early date and has alone survived. It bears all the marks of a literal translation, preserving the Semitic and at times the Hebrew idiom. The author, to judge from the book itself, was a pious and patriotic Jew: a Palestinian, to infer from his evident familiarity with the Holy Land and his want of knowledge as to the foreign lands mentioned. An admirer of the Maccabees and their military skill, he shows the influences of his day by omitting the words 'God' and 'Lord' as in the book of Esther, substituting 'He' and 'Heaven.' Owing to his omission of the disloyal priests, Jason and Menelaus, in striking contrast to the attitude of the Second Book, Geiger claims a Sadducee as its author, a view held by later authorities, even if Geiger's views as to its being a partisan document are not upheld. Opinions differ as to its precise date. Schürer places it to the first or second decade of the 1st century B.C., while Torrey dates it early, in the reign of Simon, a little after 135 B.C. The book is one of the most vivid and valuable sources extant for Jewish history.

Second Book has a peculiar opening—two letters written by Jews of Palestine to brethren in Egypt, held by some to be spurious. The work itself, an abridgment of five books written by Jason of Cyrene, covers Jewish history from a period a year earlier (176 B.C.) than its predecessor to the death of Nicanor (161 B.C.). It is of special interest as picturing the situation in Parthia before the revolt of Mattathias and furnishing other data that are lacking in the First Book. The author, probably a Hellenistic Jew, writes largely from the religious point of view, is a Pharisee, with a direct partisan tendency. Greek was the original language. Its exact or approximate date cannot be fixed. Among its characteristics are allusions to angels and spirits, to resurrection and immortality—that the book concludes with the victory of Judas over Nicanor, indicates its aim—to arouse the Jew to observe the two Maccabean feasts, that of Dedication and of Nicanor. The incident of the mother and her seven sons, and other stories of martyrdom have given the book a value and power of its own, which appealed with special force to the Christians of the first four centuries, as Bevan states in his 'House of Seleucu's' (1902, II 175).

Third Book describes the escape of the Jews from martyrdom in Alexandria in the reign of Ptolemy IV, Philopator (222-204 B.C.). It has no relation to the Maccabees, but doubtless its title was given later when all who suffered for the olden faith were called by that name. It was written by an Alexandrian Jew to give courage and endurance to his brethren in Egypt. In view of the fact that early Jewish settlements in the Fajum have been discovered. Both I. Abrahams and A. Büchler claim the book has distinct reference to a persecution in the Fajum—a theory that is disputed.

Fourth Book has been aptly described by Freundenthal (Breslau 1869) as a homily delivered probably on the Feast of Dedication to a Greek-speaking Jewish community. It is a sermon not history, to prove how the passions can be controlled by the reason, by which term he means reason enlightened by religion and the Mosaic Law. This thesis is illustrated by many examples, notably from the Maccabean struggle. A Hellenist to a certain extent, he was nevertheless an earnest, loyal Jew, eloquent and convincing. His precise date is unknown. He supplied the model for similar homilies by Christian writers in the early centuries, with their thrilling martyrdoms. In the Church the book was attributed to Josephus and added to his writings, with whose style and language it is wholly incompatible.

Without historical value is the so-called Fifth Book which Cotton gives in his 'Five Books of the Maccabees' (1832), and known also as the Arabic 'Book of Maccabees' which claims to be the history of the Jews from 186 B.C. to the end of Herod's reign, but which in reality is nothing but a compilation from First and Second Books of Maccabees and Josephus. The manuscript of a 'Fifth Book' which Sixtus Senensis (1566) states that he saw in Lyons and which was subsequently lost by fire, is characterized by Schürer as a reproduction of Josephus, the style being changed for a purpose.

ABRAM S. ISAACS.

MACCABEES, Knights of the Modern. See Maccabees, THE.

MACCABEES, The Ladies of the, a fraternal beneficiary association, founded in 1886, formerly the Ladies of the Modern Maccabees. Until 1914 it formed a species of auxiliary organization to the Knights of the Maccabees and the latter exercised over it a kind of guardianship. It has about 50,000 members and since its institution has distributed about $7,000,000 in benefits and insurance.

MACCABEES, Ladies of the Modern. See Ladies of the Maccabees.

MACCABEES, The, a secret fraternal beneficiary association having its general offices at Port Huron, Mich. An association bearing this name and the initials of the name of the Maccabees of the World was first organized in 1878 by W. D. McLaughlan and several other gentlemen of that city. The Association grew rapidly, and its tents, as its local lodges were called, sprung up all over the Canadian provinces and in many of the States of the American Union. In 1914 it united with the Knights of the Modern Maccabees, long a rival organization under the general title of the Maccabees. The Association takes its name from the Maccabees, a chivalrous and religious people whose history is given in the apocryphal writings of the Old Testament. The leading character in this history was Judas Maccabaeus, a valiant soldier and one of the foremost generals of the period in which he lived. During the wars in which the Maccabees were engaged and in which he was their leader he required that a portion of the fruits of all their victories should be set aside for the benefit of the widows and orphans of those who had fallen in battle. It was this particular practice and characteristic that probably suggested to Mr. McLaughlan and his co-laborers the name for their new society, because the purpose of this society, as set forth in their laws, was to unite fraternally all white male persons of sound body and health and good moral character, between the ages of 18 and 70 years of age, and to provide for such members benefits in case of disability, and to the beneficiaries of such members benefits in case of their death.

The main purpose of this Association is to provide social and fraternal intercourse for its members, and benefits in the way of insurance to the families of deceased members. The constituent organizations have distributed about $80,000,000 among the disabled members and the beneficiaries of the deceased members. The assets of the new united organization amount to $20,000,000. There are more than 300,000 members.

Its work is conducted on the lodge system under the Masonic system. Its form of government is thoroughly representative, every member having a voice in the conduct of its affairs, making of its laws, the election of its officers and the fixing of their compensation.

The general meeting of the law-making body (The Supreme Tent) is held once in three years, at which the members are represented through delegates chosen from tents, conventions and great camps. In the interim between the meetings of its governing body its affairs are administered by a board of seven trustees, consisting of the supreme commander and six others elected by the Supreme Tent. The board of trustees has the general custody and management of the funds of the Association; under its direction all investments are made, the laws of the Association requiring that all investments shall be made in government, State, and municipal bonds.

MACCABEES, The Woman's Benefit Association of the, an adequate rate fraternal order for women with headquarters at Port Huron, Mich. Miss Bina M. West is the founder and present supreme commander and Miss Frances D. Partridge is the matron and keeper. Organized in 1892, as the Ladies of the Maccabees of the World, reorganized under its present name in 1915 and established in the United States and Canada, the order has 3,000 local bodies with 192,000 members and a reserve fund of $12,000,000; in 1911 it paid benefits about $15,500,000; provides whole life, term and disability protection; 20-year plans; junior protection for children of members; sick, last illness and burial; and maternity benefits. It maintains a free hospital service in every State for needy sick, and a patriotic service for the aid of members affected by the war. It is the first society of its kind to own a home-office building, erected at a cost of $250,000 without extra cost to its members through the advance value of its building and property. The order is founded, officered and managed solely by women for home protection, mutual fellowship and fraternal aid.

McCALL, Edward Everett, American jurist: b. Albany, N. Y., 6 Jan. 1863. He was educated at the Albany High School and the New York University, was admitted to the bar in 1884 and practised in New York from 1884 till 1902. From that year until 1913 he was justice of the Supreme Court of New York (1st district) and Democratic candidate for mayor of New York in 1913, but was defeated by the late John Purroy Mitchel (qq.v.). Judge McCall is a member of various New York clubs, including the Lotus, Manhattan, Catholic, Democratic and Athletic.

McCALL, mj-kal, George Archibald, American soldier: b. Philadelphia, 16 March 1802; d. 25 Feb. 1868. He was graduated at West Point in 1822, in which reached the rank of captain, and that of colonel in 1850. Having served against the Seminoles in Florida, he won distinction in the Mexican War; in 1850 he became inspector-general, resigning from the army three years later. In 1861 he was given command of the Pennsylvania Reserves, with the rank of brigadier-general of volunteers, and participated in the work of the Army of the Potomac, particularly in the Peninsula campaign of 1862, in which he was engaged with his troops at Mechanicsville, Gaines' Mill and Frazier's Farm (qq.v.). At Frazier's Farm, 30 June, he was taken prisoner and was confined for several weeks in Libby prison. In August he was exchanged, but impaired health pre-
vented him from returning to the army, and in 1853 he resigned. He wrote "Letters From the Frontiers" (1858).

**McCall, John Augustin,** American insurance official: b. Albany, N. Y., 2 March 1849; d. Lakewood, N. J., 18 Feb. 1906. He was educated in his native city and served for several years as clerk in the Connecticut Mutual Life Insurance Company. In 1877 he entered the New York State insurance department, in which he served as clerk, deputy superintendent and superintendent. In 1887 he was made comptroller of the Equitable Life Assurance Company and in 1892 became president of the New York Life Insurance Company. In 1905 the Armstrong insurance investigation led to his resignation in 1906 and he died two months after resigning.

**McCall, Samuel Walker,** American public official: b. East Providence, Pa., 28 Feb. 1851. In 1874 he graduated at Dartmouth College, studied law and was admitted to the bar in 1876, since when he has practised in Boston. He was editor-in-chief of the Boston Daily Advertiser in 1888-89 and served as delegate at the Republican National Convention of 1888, 1900 and 1916. He was a member of the Massachusetts legislature in 1889, 1890 and 1892 and was a member of Congress from 1893 to 1913 from the Eighth Massachusetts district. He was an unsuccessful candidate for the governorship of Massachusetts in 1914. He was successful the following year, being elected governor for the two successive terms of 1917 and 1918. He has published (Life of Thaddeus Stevens) (1899); (Dartmouth Centennial Address on Daniel Webster) (1902); (The Business of Congress) (1911); (Life of Thomas E. Reed) (1914); (The Liberty of Citizenship) (1915), and magazine articles. He received honorary degrees from Dartmouth, Oberlin, Tufts, Maine, Trinity, Columbia and Williams.

**McCalla, Bowman Hendry,** American naval officer: b. Camden, N. J., 19 June 1844; d. New York, 26 May 1900. He was graduated at the United States Naval Academy in 1864 and rose to captain in 1898. In 1890 he was court-martialed on charge of cruelty to his subordinates and was suspended for three years, but in consideration of previous acts of gallantry was restored to active service in 1891. He commanded the Marblehead during the war with Spain in 1898 and was subsequently restored to the place he held on the list of officers previous to his suspension. In 1899 he commanded the New York and aided in the pacification of the Philippines. In 1900 he cooperated with Vice-Admiral Seymour in putting a stop to the Boxer troubles at Peking. In 1901 he was given command of the Kearny; in 1902 he became commander of the Mare Island navy yard and was retired 19 June 1906.

**MacCameron, Mākārēn, Patrick Henry,** American politician: b. East Cambridge, Mass., 1849; d. Brooklyn, 22 Oct. 1905. In 1851 he removed to Williamsburg (Brooklyn, N. Y.) and was apprenticed to a cooper, but soon left trade and entered local politics. Before he was 21 he had been defeated for the leadership of his district. In 1881 he was elected to the New York assembly and was re-elected in 1883 and 1887. In 1889 he was elected to the State senate and was continuously a member of that body until his death. In 1893 he became virtually the leader of the Brooklyn Democracy. He broke with Charles F. Murphy, the leader of Tammany Hall, and from that time a bitter fight was kept up between these two politicians for the control of the Brooklyn Democracy. In 1904 one of the bitterest chapters in the history of New York politics occurred. McCarron also opposed W. J. Bryan and Charles E. Hughes. McCarron was a keen intellect and an aggressive fighter. He was identified with the Standard Oil Company and the American Sugar Company.

**McCarter, Margaret Hill,** authoress: b. Charlottesville, Ind., 2 May 1860. She began teaching in elementary schools in Indiana 1876; she illustrated a series of newspapers and studied under William M. Chase. She then went to Paris and studied at the Beaux Arts under Gérome and Collin. She became a successful portrait painter and for several years before his death kept studios in London, Paris and New York. For his "Macréme" he received honorable mention in the Paris Salon, and in 1912 he was made a chevalier of the Legion of Honor. He was a member of several foreign and American art societies. Among his best portraits are President Taft, President McKinley, Archbishop Ryan, Justices of the Supreme Court, Harlan and Brewer, Nellie Melba and Augousti (Metropolitan Museum, New York). MacCameron also achieved reputation for his café and scenes in theatres. "A Group of Friends," also called "Wormwood," painted in 1908, is in the Corcoran Gallery, Washington; "The Daughter's Return," in 1909, is in the Metropolitan Museum, New York. "Les Habitues (The Old Customers)" hangs in the Wistack Gallery, Philadelphia. He also painted a religious picture, "The Last Supper," in 1909. His last work was "The People of the Abyss" (1912). Review Harper's Weekly (February 1913).

**McCannon, Joseph Kay,** American lawyer: b. Philadelphia, 13 Oct. 1845; d. 2 Jan. 1907. He graduated at Princeton in 1865; studied law; became register in bankruptcy in 1879; was special counsel of the United States in Washington 1871; president of the board for investigation of the Indian service, 1877; Assistant Attorney-General of the United States 1880-85, and in 1881 was appointed United States commissioner of railroads. Under Presidents Garfield and Arthur he conducted treaties with various Indian tribes. Among his writings are "Report on Indian Service" (1878); "Report of Councils with Bannock and Shoshone Indians" (1881); "Report of Councils with Flathead and Other Indians" (1882); "Arguments in Cases Affecting Pacific and Other Railroads."
Education. She married, 5 June 1890, William Arthur McCarter, D.D.S., of Topeka, Kan. She became widely known by her fiction which is as popular in her State as that of William Allen White of Emporia. Her publications include 'The Overflowing Waters' (1903); 'The Country of the Storytellers' (1903); 'Cuddy's Baby' (1907); 'The Old Quirra' (1908); 'Cuddy and Other Stories' (1908); 'The Price of the Prairies' (1910); 'The Peace of the Solomon Valley' (1911); 'A Wall of Men' (1912); 'Major's Daughter' (1913); 'Winning of the Wilderness' (1914); 'The Corner Stone' (1915); 'Vagrants of the Plains' (1917).

McCARTHY, D'Alton, Canadian politician: b. near Dublin, Ireland, in 1836; d. Canada, 11 May 1898. He was the son of an Irish barrister who found a home for his family on the shores of Kempenfeldt Bay, Ontario, after a six weeks' voyage in a sailing vessel. Educated at the Barrie Grammar School, he studied law and was called to the bar in 1858. In 1872 he was made queen's counsel, and attained high rank both in jury cases and appeal cases. In 1876 he was elected to the House of Commons as a Conservative and held this seat until his death, which was occasioned by a railway accident. He seceded from the Conservative party and aided the Liberals in opposing special legislation in the interest of Roman Catholic education. He was for a time president of the Canadian branch of the Imperial Federation League and a member of the Council of the British Empire League. Consult 'The Late D'Alton McCarthy, Q.C., M.P., an Appreciation,' by Amicus, Canadian Magazine (May 1903).

McCARTHY, Hamilton Thomas, Canadian sculptor: b. London, England, 1847. He studied under his father and in Europe, and in 1885 removed to Canada. He lived in Toronto until 1898, when he took up his residence in Ottawa. He is distinguished for his capacity for expressing contemporary thought. The Royal Canadian Academy elected him a member in 1880 and councillor in 1906. Among his works are 'Burns and Highland Mary' (1877); the statue of Sir John S. Macdonald in Toronto; the bronze monuments for the South African War in Halifax, Ottawa, Charlotte-town, Quebec and Brantford.

McCARTHY, mä-kär-thi, Justin, Irish author and politician: b. Cork, Ireland, 22 Nov. 1830; d. 24 April 1912. He became connected with the Liverpool press in 1853 and in 1864 was made editor-in-chief of the Morning Star. He sat in Parliament as a Home Ruler from 1879-1900 and was chairman of the Irish Parliamentary party 1890-96. His stay in the United States extended from 1868 to 1870, during which period he was some time connected editorially with the New York Independent. His main work is 'History of our Own Times' (1879-80), which, rejected by one publishing house, was purchased by the first firm it was offered to as well as for the author. He also wrote 'History of the Four Georges' (1889), and his novels include 'Lady Judith' (1871); 'A Fair Sixon' (1875); 'Dear Lady Disdain' (1875); 'The Right Honourable' (1885); 'Mrs. Campbell's Dilemma' (1887); 'The Story of Gladstone's Life' (1898); 'Modern England' (1898);

'Reminiscences' (1899); 'The Reign of Queen Anne' (1902), and 'The Story of an Irishman' (1904).

McCARTHY, Justin H Huntly, Irish journalist and author: b. 1860. He was graduated at University College and from 1884-92 was a member of Parliament. He has been a prolific and versatile author, following in the footsteps of his father, Justin McCarthy (q.v.). Among his works are 'Outline of Irish History' (1883); 'Serapiam, and Other Poems' (1883); 'England Under Gladstone' (1884); 'Camila, a Girl with a Fortune' (1885); 'History of the French Revolution' (1897); 'The History of the United States'; 'The Dryad' (1905). He has also written plays, such as 'The Candidate'; 'The White Carnation'; 'If I Were King,' and 'The Proud Prince.'

McCaul, mä-käl', John, Canadian scholar: b. Dublin, Ireland, 1807; d. 1880. He was appointed president of Toronto University in 1848 and was prominent in educational matters in Canada. He edited Horace, Longinus, Lucian and Thucydides as college textbooks, and among his valuable archaeological works are 'Britannico-Roman Inscriptions' (1863), and 'Christian Epitaphs of the First Six Centuries.'

MacCAULEY, mä-käl', Clay, American Unitarian clergyman and author: b. Chambersburg, Pa., 8 May 1843. He was graduated at Princeton in 1864 and at the Theological Seminary of the Northwest, Chicago, in 1867, and read philosophy and divinity at Heidelberg, 1873. In the Civil War, 1862-63, he was a lieutenant in the 126th Pennsylvania Volunteers, and served on the staff of Gen. S. D. Sturgis, and in 1864-65 was a member of the Christian Commission in the United States army. In 1880-81 he was a collaborator of the Bureau of Ethnology among Indians east of the Missis- sippi. Entering the Unitarian ministry he was pastor of the First Church, Waltham, Mass., 1869-72, and of All Souls Church, Washington, D. C., 1876-81. From 1890 to 1900 and again after 1909 he served as director of the Japan mission of the Unitarian Association, and from 1891 to 1899 was president of the College for Advanced Learning at Tokio and professor there of philosophic and historic theology. He lectured on Japan in 1904-09. He has written 'Christianity in History' (1891); 'The Religious Problem of Japan—How to Solve it?' (1894); 'Introductory Course in Japanese' (1896; 1905); 'Japanese Literature' (1899); 'A Day in the Very Noble City, Manila' (1899); and has published 'Single Songs of a Hundred Poets' (1899) and other translations from the Japanese; 'Florida Seminole from 1880'; 'The Current Religious Condition of Japan' (1902); 'Unitarian Mission to Japan' (1909); 'A Daughter of the Samurai' (1910); 'Thought and Fact for To-day,' also in Japanese (1911); 'The Memorial Most Worthy of Our Patriotic Dead' (1911); 'The Enigma that grows in the New Georgian Era' (1911); 'Charles Dickens: An Appreciation' (1912); 'The Faith of the Incarnation' (1913); 'Memories and Memorials' (1914); 'The American-Japanese Problem as a Race Question' (1915), and contributions to periodicals in Japan and the United States.
McCAUSLAND'S RAID, an incursion of the Confederate general McCausland into Maryland and Pennsylvania, the chief incident of which was the burning of Chambersburg, Pa. General Early having defeated General Crook in the battle of Kernstown (q.v.), 24 July 1864, and driven him and Averell across the Potomac at Williamsport, ordered General McCausland with his brigade and that of Bradley T. Johnson, with four guns, in all about 2,500 men, from the Potomac to raid Pennsylvania, which they did to Cumberland, Md., to destroy the machinery of the Cumberland coal-pits and the repair shops, stations and bridges of the Baltimore and Ohio Railroad. Early says he wished to open the eyes of the people of the North to the enormities of its armies, by an example in the way of retaliation, and that Chambersburg, Pa., was selected as the town on which retaliation should be made. The sum of $100,000 in gold, or $500,000 in currency was to be the default of which McCausland was ordered to burn the town. Under cover of demonstrations at Williamsport and other points along the Potomac, McCausland crossed the river at McCoy's Ferry, near Clear Spring, above Williamsport, on the 27th, and made straight for Chambersburg, about 25 miles northeast. He met with but little opposition and, on the morning of the 30th, rode into the fated town and demanded the sum fixed by Early. It could not immediately be raised; he knew that General Averell was close upon him, and setting fire to the place, leaving a greater part of it in ashes, he hastily marched westward to McConnellsburg and encamped. Averell, who was in Hagerstown when he heard that McCausland had crossed the Potomac, started in pursuit with about 2,600 cavalry, went through the burning town and, a few miles from McConnellsburg, struck McCausland's rear, diverting him from his intended march on Bedford and forcing him back to the Potomac at Hancock, which was reached by noon of the 31st. Here McCausland formed for battle, but upon Averell's appearance and prompt attack he withdrew westward by the National road to Cumberland, where, 1 August, he found General Kilgore to oppose him, whom he attacked in the afternoon, and, after a battle lasting until night, when he retreated toward Old Town, on the Potomac, leaving 30 of his killed and wounded on the field. At Old Town he forced a crossing at daylight, 2 August, capturing or dispersing a regiment of New York troops from Ohio, and then moved south into the valley of the south branch of the Potomac, by way of Springfield and Romney. From Romney, 4 August, he moved on New Creek and attacked the garrison, but another Union attack was repulsed, leaving 25 dead on the field, the Union loss being 30 killed and wounded. McCausland then withdrew to near Moorefield, where the south fork joins the south branch of the Potomac, and considering himself safe from pursuit went into camp. Averell, who had remained at Hancock, when McCausland drew off toward Cumberland, crossed the Potomac on the 4th, and, after a forced march through Bath, Springfield and Romney, before sunrise of the 7th surprised McCausland and his command, capturing his four guns, nearly all his wagons, several hundred horses, three battle-flags, many small arms and 420 prisoners, including 38 officers. McCausland's loss in killed and wounded was about 100. Averell's loss was 41 killed and wounded. McCausland's shattered command fled to the mountains and made its way in squads to the Shenandoah Valley, finally assembling at Mount Jackson. This affair, says Early, 'had a very damaging effect upon my cavalry for the rest of the campaign.' Consult Official Records (Vols. XXXVII, XLIII); Pond, 'The Shenandoah Valley in 1864; Early, 'The Last Year of the War for Independence.'

MaccHESNEY, mäk-chē'ne, Clara T., American artist: b. Brownsville, Cal., 1861. She studied at the San Francisco Art School, at the Gotham Art School, New York, and at the Colarossi School in Paris. Her genre work has received favorable recognition. At the World's Columbian Exposition in 1893 she was awarded two medals and she received the Dodge prize, New York, in 1894. Since then she has also received three medals from the Colarossi School, a gold medal from the Philadelphia Art Club and the second Halgarten prize from the National Academy of Design, New York. At the Paris Exposition of 1900 she exhibited 'Pomegranates' and 'The Old Blind Fiddler.'

MccHESNEY, Dora Greenwell, American author: b. Chicago, 1 Oct. 1871. She was privately educated, chiefly by her mother, in whose company she traveled and read widely, making special acquaintance with German literature, Italian art and Roman antiquities, also becoming deeply interested in studying the English Civil War, with characters and incidents of which her writings largely have to do. Among these are 'Kathleen Clare,' Her Book (1867-1864) (1895); 'Miriam Cromwell, Royalist: a Romance of the Great Rebellion' (1897); 'Beatrix Infelix: a Summer Tragedy in Rome' (1898); 'Rupert, by the Grace of God: the Story of an Unrecorded Plot' (1899).

MacCIAVelli, Niccolo. See MacCIAVELLI, Niccolo.

MacCHORD, mä-kör'd, Charles Caldwell, American lawyer: b. Springfield, Ky., 3 Dec. 1859. He was educated at Centre College (now Central University), Danville, Ky., and was admitted to the bar in 1882, engaging in practice at Louisville, Ky. He was a member of the law firm, McChord, Hines and Neimmune, from 1894 to 1911. He was prosecuting attorney of Washington County, Ky., in 1886-92, and was chairman of the Kentucky Railroad Commission in 1892-95 and in 1899-1907. He served in the Kentucky senate in 1895-99 and introduced the railroad rate bill enacted by the legislature. He was president of the National Association of Railroad Commissioners in 1906-07, and from 1910 was a member of the Interstate Commerce Commission, serving as chairman in 1915.

McClain, ma-klän. Emlen, American jurist: b. Salem, Ohio, 26 Nov. 1861; d. 25 May 1915. He was graduated at the State University of Iowa in 1871, later studying law there, and until 1881 he practised law in Des Moines. He was appointed professor of law at the University of Iowa in 1881 and was subsequently vice-chancellor and chancellor there. He served as judge of the Supreme Court of Iowa in 1901-12, and was its chief justice in 1906-12.
From 1913 until his death he was professor of law at the Leland Stanford, Jr., University. He was a contributor to the 'American Encyclopedia,' 'Lacon's Law Dictionary,' 'Lacon's Statutes,' 'Law Procedure,' and wrote extensively for the law magazines and was author of 'McClain's Annotated Statutes of Iowa' (1880); 'A Treatise on Criminal Law as Now Administered in the United States' (1897); 'Constitutional Law,' and 'The United States' (1905; 2d ed., 1910), etc.

McCLELLAN, ma-kel'lan, George Brinton, American soldier: b. Philadelphia, 3 Dec. 1826; d. Orange, N. J., 29 Oct. 1885. He was educated at the University of Pennsylvania and at West Point where he was graduated in 1846. He was brevetted second lieutenant of engineers and immediately ordered to Mexico, where as lieutenant of a company of sappers, miners and pontoniers he rendered valuable service. He was at the siege of Vera Cruz, at Cerro Gordo and in the attack on the City of Mexico; in Churubusco he was with the brevet of first lieutenant and was brevetted captain for gallantry at Chapultepec. After the war he was ordered to West Point as captain of field labs and instructor in bayonet exercise. In 1853 he was ordered to Fort Delaware to superintend its construction. The next year he accompanied Capt. Randolph B. Marcy (later his father-in-law) on an expedition to explore the Red River, and in September 1852 was ordered as senior engineer to Texas, to survey the rivers and harbors of that State. In 1853 he was detailed for the examination of the western part of the proposed route for a Pacific railroad; and explored the Yakima Pass and various portions of the Cascade Range, and the most direct route to Puget Sound, his report forming the first volume of the 'Pacific Railroad Surveys' published by the government. He was soon afterward detailed to investigate the railroad system of the United States, with a view to obtain all the necessary data on construction, equipment and management for the successful operation of the Pacific railroad. Of the result of his proceedings he presented a full report in November 1854. In March 1854 he was promoted to captain in the 1st Cavalry. In May he was sent to Europe to study the organization of European armies and observe the war in the Crimea. He wrote one volume of the report of the commission, which was republished in Philadelphia under the title of 'The Armies of Europe' (1851). He resigned his commission in January 1857, and was for three years vice-president and engineer of the Illinois Central Railroad, at the end of which time he became general superintendent of the Ohio and Mississippi Railroad, and two months later president of the eastern division of the same road. He held this office when the Civil War broke out in 1861. He then received a commission as major-general from the governor of Ohio and proceeded to organize the volunteers of the State; the States of Ohio, Illinois, Indiana, the western part of Pennsylvania and western part of Virginia were united to form the Department of the Ohio under his command. About 1 June his army began to cross the Ohio River into Virginia; on the 18th McClellan left Cincinnati to take the field, and by the middle of July the whole northwestern part of the State had been cleared of Confederate troops and the Wheeling legislature left free to organize a loyal government.

On 22 July, McClellan was summoned to Washington to take command of the Army of the Potomac, and commissioned as major-general of the United States army. On his arrival at Washington he found everything in disorder and the troops badly demoralized in consequence of the defeat at the first battle of Bull Run and devoting himself to the organizing and disciplining of his army, he soon brought order out of chaos and had his troops well equipped and in excellent condition. On the retirement of General Scott from active service, McClellan was appointed general-in-chief of the armies of the United States. Plans were then taken under discussion for an attack upon Richmond, and here difference of opinion arose between the President and the Secretary of War and McClellan; the plan finally accepted made the base of supplies on Chesapeake Bay, with lines of march upon Richmond from the Peninsula. The army did not move until March 1862, and in the meantime discontent had arisen at Washington on account of the delay. On 10 March the army advanced toward Manassas. The Confederates had evacuated that place and had fallen back upon Richmond, the real campaign was begun by transporting the troops to Fortress Monroe. On 11 March, some two weeks before leaving Washington, McClellan was deprived of the chief command, leaving him the command of only the Army of the Potomac; McDowell's corps and other reinforcements on which he had relied were also removed from his army for the defense of Washington. He besieged Yorktown for a month, though opposed by a much inferior Confederate force, whose numbers he greatly overestimated; when Yorktown was evacuated 4 May, he advanced toward Richmond, defeating the Confederates at Williamsburg and Hanover Court House. After reaching the Chickahominy, he found his lines too extended to protect from attack and advance upon Richmond, and decided to retreat to the James River; then followed the Seven Days' Battles which ended when the Federal forces reached Hampton's Ferry. From here McClellan had planned to retreat from their position and following them as far as the Potomac. He did not, however, cross the Potomac in pursuit, as he was awaiting supplies; this failure to follow up his victory caused him to be deprived of his command and he was ordered to Trenton, N. J. He took no further part in the war.

In 1864 he was Democratic nominee for President of the United States, and was defeated, the electoral vote stood 212 for Lincoln against 21 for McClellan. McClellan's popular vote was 1,800,000. He remained abroad from 1864-68, and on his return had charge of the construction of the Stevens' floating battery,
McCLELLAN — MCCLINTOCK

which, however, was not completed on account of financial difficulties. In 1870 he was appointed chief engineer of the department of docks for New York City, in 1877 he was elected governor of New Jersey, and during his administration reduced and finally abolished the State tax, improved the system of public education and in doing so he declined renomination. As a general, McClellan won the confidence and aroused the enthusiasm of his soldiers to an unusual degree; he excelled as an organizer of armies and had a thorough knowledge of the science of tactics, as shown in his plans of campaign, but in actual campaigning lacked aggressiveness and the power to act quickly and take advantage of his enemy's mistakes. He wrote besides the reports mentioned 'Manual of Bayonet Exercise' (1852) and 'Report on the Organization and Campaigns of the Army of the Potomac' (1864). Consult 'McClellan's Own Story,' edited by W. C. Preine (New York 1887); Michie, P. S., 'General McClellan' (in 'Great Commander' series ib. 1901); Rhodes, J. F., 'The Seven Weeks of McClellan's Peninsula Campaign' (Boston 1896); Ropes, J. C., 'Story of the Civil War' (Vol. II, New York 1895); Webb, A. S., 'Peninsula: McClellan's Campaign of 1862' (ib. 1881), and Bradford, Gamaliel, 'Union Portraits' (in 'Atlantic Monthly' Vol. CXIV, Boston 1914).

McClellan, George Brinton, American politician: b. Dresden, Saxony, 23 Nov. 1826. He is the son of Gen. G. B. McClellan (q.v.). He was graduated from Princeton in 1846; and took up journalism, working as a reporter and in editorial positions for several of the New York City dailies. He studied law and was admitted to the bar in 1849. From 1889 to 1892 he was treasurer of Brooklyn Bridge. Early active in politics as a Democrat, he was elected president of the board of aldermen in 1893 for a term of two years. He was elected to Congress in 1894 and for four succeeding terms, and was a member of the House Committee of Ways and Means. In Congress he has been an advocate of tariff reform, and though opposed to an imperialistic policy did not sympathize with the attacks on the conduct of the United States army in the Philippines. In 1903 he was nominated for mayor of Greater New York by the regular Democratic organization (Tammany Hall), and was elected by 63,000 majority. In 1905 he was again elected mayor by 3,472 plurality. In 1908 he succeeded Grover Cleveland as Stafford Little lecturer on public affairs in Princeton University, and in 1912 he was elected professor of economic history in Princeton University, a chair which he still occupies. He is the author of 'The Oligarchy of Venice' (Houghton-Mifflin & Co., 1904); 'The Heel of War' (G. W. Dillingham & Co., 1916) and of numerous magazine and newspaper articles on political, historical and economic subjects. He has received the honorary degree of L.L.D. from Princeton, Union and Fordham universities.

McClernand, mā-kler'nand, Edward John, American soldier: b. Jacksonville, Ill., 29 Dec. 1848. In 1870 he was graduated at West Point and was stationed on the Western frontiers for the next nine years, in which he did rescue work after the destruction of Custer's command, and had a share in the capture of Chief Joseph and the Nez Percés Indians. In 1898 he was appointed lieutenant-colonel and adjutant-general of volunteer army of Santiago de Cuba in 1898, and was ordered to the Philippine Islands, where he routed the insurgents at Cebu, 8 Jan. 1900. He was subsequently put in command of the second district in the department of the Visayas, including the islands of Cebu, Mactan, Boulahan and the Camotes. He was acting military governor from 19 April 1900 to 28 May 1901. In 1905 he went as attaché with the Japanese army in Japan and Manchuria. Later he was successively commander of the 12th United States Cavalry, president of the Cavalry Equipment Board, Rock Island Arsenal. He retired from active service 29 Dec. 1912.

McClernand, John Alexander, American lawyer: b. Breckinridge County, Ky., 30 May 1812; d. Springfield, Ill., 20 Sept. 1900. He was admitted to the Kentucky bar in 1832, but in the same year volunteered for military service against the Sac and Fox Indians. Five years later he was elected to the Illinois legislature, and subsequently sat for two terms in Congress. During the Civil War he served with distinction at the battle of Fort Donelson as brigadier-general of volunteers, and was promoted major-general. He led a division at the battle of Shiloh, relieved Sherman before Vicksburg in 1863 and was in command of the 13th Army Corps until 1864, when he resigned. In 1870 he was appointed circuit judge for the Sangamon, Ill., district. He presided at the National Democratic Convention in Saint Louis, 1876, and was appointed by President Cleveland member of the Utah Commission.

MacClesfield, mā-kles'-feld, England, market town and municipal borough in Cheshire, 166 miles northwest of London, on the river Bollin and on the London and Northwestern, North Staffordshire and Great Central railways. In the Domesday Survey it is recorded as the estate of the Earl of Chester and is reputed to have become a free borough in the beginning of the 13th century. The first recorded charter, however, dates from 1261. The church of Saint Michael was founded in 1278 and was partially rebuilt and considerably enlarged in 1656. A grammar school was erected in 1840 from the funds of the free grammar school founded in 1502. There are slate and stone quarries in the vicinity and brewing is carried on; but the chief manufactures of the town are in silk and cotton textiles. The first silk mill was set up in 1775, while the manufacture of cotton was begun in 1785. The town has modern water and gas works, an insane asylum, public library, parks, baths and markets. Pop. about 34,797.

McClintock, mā-klin'tök, Emory, American actor: b. Carlisle, Pa., 19 Sept. 1840. He was graduated from Columbia University in 1859, and afterward took special studies in chemistry. He was tutor in mathematics at Columbia 1859-60. He was consul agent at Bradford, England, 1863-66, actuary of the Ashby Life Insurance Company, New York, 1867-77, and of the Northwestern Mutual Life Insurance Company, Milwaukee, 1871-89. From 1889 to 1911 he was actuary of the Mutual Life Insurance Company, New York, of which he was vice-president in 1905-
11, trustee after 1905 and consulting actuary after 1911. He was president of the American Mathematical Society in 1890-94 and of the Actuarial Society of America in 1895-97. He is a Fellow of the American Academy of Arts and Sciences and Fellow of the Institute of Actuaries of the United Kingdom. He has contributed to mathematical journals.

McCLINTOCK, Sir Francis Leopold, English admiral: b. Dundalk, Ireland, 1819; d. 17 Nov. 1907. He entered the British navy in 1831 and was commissioned lieutenant in 1845. He sailed on four Arctic voyages, being sent out in 1848 to search for Sir John Franklin, and again in 1850 and 1852, without discovering any traces of the explorer. In 1857 he renewed the search as commander of the Fox and brought back documentary and other evidence of Franklin’s death. For 26 years as an Arctic explorer he was knighted in 1860, and in 1884 made admiral. He wrote ‘Voyage of the Fox’ (1859).

McCLINTOCK, John, American scholar: b. Philadelphia, Pa., 27 Oct. 1814; d. Madison, N. Y., 3 Mar. 1864. He was graduated at the University of Pennsylvania in 1835. He entered the ministry of the Methodist Episcopal Church and from 1836 to 1851 was professor of mathematics and of Greek and Latin in Dickinson College. From 1848 to 1856 he edited the Methodists Quarterly Review. He was delegate to several conferences abroad and in 1857 became pastor of Saint Paul’s Church, New York. Three years later he was appointed preacher of the American Chapel in Paris. He advocated the policy of sending colored preachers to Africa, and after his return to America in 1864 was again pastor of Saint Paul’s, New York, but failing health compelled his resignation and he retired to Germantown, Pa. He removed to New Brunswick, N. J., in 1866 and became chairman of the Central Consistory Committee of the Methodist Episcopal Church. For the last three years of his life he was president of the Drew Theological Seminary. He was joint editor and compiler with James Strong of the ‘Cyclopedia of Biblical and Theological Literature’ (1847), which goes by its name, the last volume of which was published in 1895. Among his other works are ‘An Analysis of Watson’s Theological Institutions’ (1850); and ‘Temporal Power of the Pope’ (1853). He also issued a translation of Neander’s ‘Life of Christ’ (1847); ‘Sketches of Eminent Methodist Ministers’ (1863); a translation of Bunyan’s ‘History of the Council of Trent’ (1851); ‘Living Words,’ sermons (1871) and ‘Lectures on Theological Encyclopedia and Methodology’ (1873). Consult ‘The Life’ by Crooks (New York 1876).

McCLOSKEY, ma-klösk’ki, John, American Roman Catholic Prelate: b. Brooklyn, N. Y., 10 Nov. 1823; d. 17 Sept. 1909. Upon completing his studies at Mount Saint Mary’s College, Emmitsburg, Md., he entered the law, but subsequently entered Saint Mary’s Seminary, where he pursued a six years’ course in philosophy and theology, being ordained priest 6 Oct. 1852. His first appointment was as assistant in the church of the Nativity. In 1853 he was named professor of Latin and Sacred Scriptures at Mount Saint Mary’s College and in 1857 became director of the theological seminary. When the American College was formally opened in Rome Pope Pius IX chose Dr. McCloskey its first president, 8 Dec. 1859, a position which, for eight years, he filled to the utmost satisfaction. In 1865 he visited America in the interests of the institution under his charge and succeeded in collecting funds sufficient for its permanent endowment. Upon the death of Bishop Lavigie, Pope Pius IX appointed Dr. McCloskey to the see of Louisville, Ky., and he was consecrated at Rome 24 May 1868. During his 36 years’ administration numerous churches, schools and religious institutions were built throughout his diocese.

McCLUNG, mä-klung, Clarence Erwin, American zoologist: b. Clayton, Cal., 5 April 1870. He was graduated at the University of Kansas in 1892 and later studied at Columbia and at the University of Chicago. He was a member of the faculty of the School of Medicine at the University of Kansas in 1897-13 and since then has been professor of zoology and director of the zoological laboratory at the University of Pennsylvania. He was a member of the embryological staff at Wood’s Hole, Mass., in 1893, and headed scientific expeditions to Oregon, Washington and western Kansas. He is the author of articles, he was made its first president, but in the next year he returned to parish work. In 1844 he was appointed coadjutor to Bishop Hughes of the diocese of New York, and consecrated titular bishop of Axiere; and three years later was appointed bishop of Albany, a diocese just created from a part of the diocese of New York. For 17 years he worked for the upbuilding of the Albany diocese and the good of its people. He built the cathedral of the Immaculate Conception at Albany, Saint Joseph’s Theological Seminary at Troy, established several new parishes and founded educational and charitable institutions, including hospitals, orphanages, homes for the aged and reformatories. He succeeded Archbishop Hughes in the archiepiscopal see of New York, 6 May 1864. The result of his labors in the archdiocese of New York remains his greatest monument. He was made a cardinal in 1875, under the title of Santa Maria Supra Minervam. He was in attendance at the Vatican Council (q.v.) and a member of the committee on discipline. He was summoned to Rome February 1878 to attend the concclave for the election of a new pope. Too late to cast a vote, Leo XIII having been elected a few hours before his arrival. Cardinal McCloskey was noted for his gentleness, firmness, profound scholarship and great executive ability. Consult ‘The Life of John Cardinal McCloskey, First Prince of the Church in America: 1810-85.’
McCLURE—MACCOLL

McCLURE, ma'köör', Alexander Kelly, American jurist; b. Sherman's Valley, Perry County, Pa., 9 Jan. 1828; d. 1909. He was reared on a farm, educated at home and apprenticed to a Tanner in 1842, soon after began to write for the Perry Freeman and edited and published the Juniata Sentinel at Mifflin, Pa., 1840-45. He then published (1850-56) the Chambersburg Repository, which he made influential in the cause of anti-slavery. He was State superintendent of printing in 1855; a member of the State convention of 1855 which met at Pittsburgh to organize the Republican party; in 1855 was admitted to the bar and was a delegate to the first Republican National Convention in Philadelphia. In 1857-58 he sat in the legislature as a Republican and was State senator in 1859. As leader of the Pennsylvania delegation in the Republican National Convention of 1860 he aided in the nomination of Abraham Lincoln. In 1862-64 he again published the Chambersburg Repository, and in the latter year served as assistant adjutant-general in charge of the draft in Pennsylvania. Two years later he was again a member of the legislature, and in 1868-73 practised law in Philadelphia. He was chairman of the State delegation to the Liberal Republican Convention in 1872, and of the Liberal Republican State Committee, and in that year entered the State senate. In a close election in 1873 he was defeated as an independent candidate for mayor of Philadelphia. In 1875 he established the Philadelphia Times, of which he was editor-in-chief till 1901. He published "Three Thousand Miles Through the Rocky Mountains" (1891); "Our Presidents and How We Make Them" (1901); "Recollections of Half a Century" (1902); "Old Time Notes of Pennsylvania" (2 vols., 1906), etc.

McCLURE, James Gore King, American Presbyterian clergyman; b. Alliance, N. Y., 24 Nov. 1848. He was graduated at Yale in 1870; at the Princeton Theological Seminary in 1873 and ordained as a Presbyterian minister in 1874. He was settled (1874-79) at New Scotland, N. Y., and at Lake Forest, Ill., 1881-1905. From 1897 to 1901 he was president of Lake Forest University. Since 1905 he has been president of McCormick Theological Seminary, Chicago. He has written "Possibilities" (1896); "The Man Who Wanted to Help" (1897); "The Great Appeal" (1898); "Environment" (1899); "For Hearts that Hope" (1900); "A Mighty Means of Usefulness" (1901); "Living for the Best" (1903); "The Growing Pastor" (1904); "Loyalty, the Soul of Religion" (1905); "Supreme Things" (1907), etc.

McCLELLAN, Robert John Le Mesurier, English vice-admiral; b. Wexford, Ireland, 28 Jan. 1807; d. London, 17 Oct. 1873. He began his naval career in 1824, and in 1836 under Sir John Ross made his first voyage to the Arctic regions. Again he joined an expedition sent to discover the Northwest Passage in 1848, that of Sir James Clark Ross. Two years later he was made a Franklin search expedition, discovered Prince of Wales Strait which connects the Atlantic and Pacific and thus accomplished one object of the expedition, the discovery of the Northwest Passage. He was forced, however, to abandon his ship, and completed the Northwest Passage by land. On his return he was knighted. From his journals was published "From Discovery to the Northwest Passage" (by Capt. Sherard Osborn, 1855). McCLELLAN, Samuel Sidney, American editor and publisher: b. Pocoes, County Antrim, Ireland, 17 Feb. 1857. He was graduated at Knox College, Galesburg, Ill., in 1882. In 1882-83 he was editor and manager of the Wheelman for the Pope Manufacturing Company, and in the following year was connected with the De Vinne Press, New York. In 1884 he established a newspaper syndicate which has grown to great proportions and assumed distinctive importance in the publishing world. In 1893 he founded McClure's Magazine, which through his able administration soon stood in the front rank of American periodicals. In 1899 he established the publishing house of McClure, Phillips and Company, New York, and was its president until the business was acquired by Doubleday, Page and Company. The magazine was taken over by the McClure Publications, Incorporated. Since 1893 Mr. McClure has been president of the S. S. McClure Company and since 1894 he has been a trustee of Knox College. Consult Mr. McClure's very interesting "My Autobiography" (New York 1914).

McCLURG, ma'köor', Alexander Caldwell, American publisher: b. Philadelphia, 1834; d. Saint Augustine, Fla., 15 April 1901. He was graduated at Miami University, Oxford, Ohio, in 1853, engaged in business with S. C. Griggs and Company, publishers, in Chicago and in 1862 entered the Union army. He was captain in the 88th Illinois regiment of infantry, rose to the rank of colonel, was made brevet brigadier-general, and in the Atlanta campaign and during Sherman's great march served as chief of staff to the 14th corps. Returning from the war, he was admitted to partnership in the publishing house above mentioned, and some years later established the firm of Jansen, McClurg and Company, afterward A. C. McClurg and Company. The business of the house prospered, and in 1899 the company published, on the co-operative principle adopted and the employees, among whom the stock was largely distributed, were granted easy terms for increasing their investments.

MCCLYMONT, mák-klümont, James Alexander, Scottish theologian: b. Girvan, Ayrshire, 26 May 1848. He was educated at the universities of Edinburgh and Tübingen, entered the ministry and in 1874-1913 he was in charge of Holburn Church, Aberdeen, when he retired. He was a member of the general committee of the Church of Scotland, and was a chaplain in the territorial force, retired with the rank of colonel. He collaborated in translating Beck's "Pastoral Theology of the New Testament" and was author of "The New Testament and its Writers" (1892; 2d ed., 1895); "The Church of Scotland" (1893); "New Testament Criticism" (1913), etc.

MacCOLL, ma'köl', Evan, Canadian poet: b. Kenmore, Argyllshire, Scotland, 21 Sept. 1808; d. Toronto, 1898. He emigrated to Canada in his 42d year and became known as the poet of the Scottish colony at Kingston. He wrote with fluency in Gaelic and his "Clàireach nam Beann" created much enthusiasm among
his compatriots. He is also author of many English poems, such as 'My Rowan Tree'; 'The Mountain Minstrel' (1887); and 'Poems and Songs' (1888).

**MacCOLL, Malcolm**, British theologian and author: b. Glenfinnan, Inverness-shire, Scotland, 27 March 1831; d. London, 5 April 1907. He studied at Trinity College, Glenalmond, and at the University of Naples and was ordained in the Scottish Episcopal m'istry in 1857. He filled curacies at different London churches, was chaplain to the British Ambassador at Petrograd in 1862-63, in southern Italy in 1867-69, and at Addington, Bucks. His hearty support of Gladstone won for him in 1871 recognition in the form of the living of Saint George's, Botolph Lane, and he was further rewarded with a canonry at Ripon in 1884. He was a keen controversialist in both ecclesiastical and political fields, and was actively engaged in newspaper and pamphlet writing in support of High Church doctrines and of Gladstone's Irish policy. He traveled extensively and was prominently concerned with the airing of Bulgarian and Armenian affairs after a visit to those countries in 1876. Author of 'High Church and Oxford' (1865); 'Lawlessness, Sacerdotalism and Ritualism' (1875); 'Reasons for Home Rule' (1886, nine eds.); 'The Reformation Settlement' (10th ed., 1901); 'The Royal Commission and the Ornaments Rubric' (1906), etc.

**McCOMB, má-köm, John**, American engineer and architect: b. New York, 17 Oct. 1873; d. there, 25 May 1883. He was of Scottish descent and became prominent for his designs for both public and private buildings in New York, Philadelphia and the Eastern States. He designed the front of the old government house in New York in 1790, Saint John's Church, the Murray and Bleecker Street churches in that city, and was supervising architect of the city of New York at the time of the erection of the city hall. He is supposed to have designed the city hall with the assistance of a Frenchman named Mangin.

**McCONNELL, má-konn-él, Francis John**, American Methodist Episcopal bishop: b. Trinway, Ohio, 18 Aug. 1871. He was educated at the Ohio Wesleyan University and entered the ministry in 1894. He held pastorates in Massachusetts at West Chelmsford; Newton Upper Falls; Ipswich; Harvard street, Cambridge; and New York avenue, Brooklyn. In 1898 he was elected president of De Pauw University, and in 1912 he was elected bishop. Author of 'The Diviner Immanence' (1900); 'Religious Certainty'; (1910); 'Personal Christianity' (1914), etc.

**McCONNELL, Samuel D.**, American Protestant Episcopal clergyman and author: b. in Westmoreland County, Pa., in 1846. He was graduated at Washington and Jefferson College in 1868, and was ordained a priest in 1873; was rector of Saint John's Church, Erie, Pa., 1872-73; held rectories at Watertown, Conn. (1873-76), and Middletown, Conn. (1876-82); became rector of Saint Stephen's Church, Philadelphia, in 1882; of Holy Trinity Church, Brooklyn, N. Y., in 1890; and from 1897 to 1905 was rector of All Souls' Church, New York City. He retired in the latter year. He has published a 'History of the American Episcopal Church' (1890); 'Sons of God' (1891); 'Sermon Stuff' (1888, 1895); 'A Year's Sermons' (1896); 'The Open Secret'; 'The Next Step in Christianity'; 'Essays, Practical and Speculative' (1900); and 'The Evolution of Immortality' (1901); 'Christ' (1902); 'Christianity' (1905).

**McCOONNSVILLE, Ohio, village and county-seat of Morgan County, on the Muskingum River, 27 miles below Zanesville and 30 miles northeast of Marietta, on the Baltimore and Ohio Railroad. It is situated in a fertile agricultural region, has extensive undeveloped coal resources, and has flour and lumber mills, a sash and door factory and tobacco manufactories. Pop. 1,831.

** McCook, ma-kuk, Alexander McDowell**, American soldier: b. Columbiana County, Ohio, 22 April 1831; d. Dayton, Ohio, 12 June 1903. He was graduated at West Point in 1853, and with the commission of second lieutenant of the 3d Infantry was ordered to New Mexico. In 1861 he gained his captaincy and saw much service during the Civil War. He commanded the Ohio volunteers at Bull Run and rapidly gained promotion, being appointed major-general of volunteers in 1862. His brilliant military reputation was made at the battles of Shiloh, Murfreesboro, Chickamauga, etc., and in 1865 he was brevetted brigadier-general in the regular army. He was subsequently placed in command of the military school at Fort Leavenworth, was commissioned major-general in 1869, and retired the following year. He represented the United States at the coronation of the Tsar in 1896 and in 1898-99 was a member of a commission appointed by President McKinley to investigate the work of the War Department during the War with Spain. General McCook came of a fighting family. He was the son of Daniel McCook (q.v.) who was killed by Morgan's guerrillas in 1863. Seven of the general's brothers took part in the War for the Union, three of whom, like their father, were killed. Four of the eight McCook brothers attained the rank of general. Consult Hosmer, J. K., 'The Appeal to Arms' (New York 1906); id., 'Outcome of the Civil War' (ib. 1906); Rhodes, J. F., 'History of the United States' (ib. 1907).

**McCOOK, Anson George**, American soldier and politician: b. Steubenville, Ohio, 10 Oct. 1835. He took part in the Civil War as captain in 2d Ohio Infantry. Became sergeant within three months and was at the first battle of Bull Run. He subsequently served as major, lieutenant-colonel in the Army of the Cumberland, after which he was in the 149th Ohio Infantry and at end of the war was brevetted brigadier-general. He was United States assesser of internal revenue at Steubenville, Ohio, and removed to New York in 1873. In 1876 he was elected as a Republican to the
McCORMICK

45th Congress and re-elected to the 46th and 47th Congresses from the old 8th (city) district. Was elected secretary to the Senate of the United States, December 1883, and served as such until August 1893. On 1 Aug. 1895, he was in Washington, S.C., and returned to Carrollton, Georgia, and was re-elected to the United States Senate in November 1893, and served until the expiration of the latter's term of office, 1 Jan. 1898. He is president and director of the New York Law Publishing Company.

McCORK, Daniel, American soldier: b. Canonsburg, Pa., 20 June 1798; d. near Burlington's Island, Ohio, 21 July 1863. Having received a college education, he removed from Pennsylvania to Ohio and settled at Carrollton. Although 63 years old at the outbreak of the Civil War, he entered the Union army, in which he served as major of volunteers. During one of the Morgan raids (q.v.), he received a wound from which he died shortly after. Eight sons of his served as officers in the Federal army, three of whom were killed in battle.

McCORK, Henry Christopher, American clergyman and entomologist: b. New Lisbon, Ohio, 3 July 1837; d. 1911. He was graduated at Jefferson College (now Washington and Jefferson) in 1859, studied at the Western Theological Seminary, and in the Civil War he served as first lieutenant and chaplain in the 41st Illinois regiment, 1861-62. In 1862-63 he was minister of a church at Clinton, Ill.; from 1863 to 1870 labored in Saint Louis as a home missionary, and subsequently became pastor of the Tabernacle Presbyterian Church in Philadelphia, a charge he long retained. He served as chaplain of the 2d regiment of Pennsylvania volunteers in the Spanish-American War, and was chaplain of the Pennsylvania Commandery of the Loyal Legion, president of the American Entomological Society, vice-president of the Academy of Natural Sciences, Philadelphia, and president of the American Presbyterian Historical Association. His writings include 'The Gospel in Nature'; 'The Mound-Making Anis of the Alleghanies' (1877); 'The Agricultural Ants of Texas' (1879); 'Honey Ants and Occident Ants' (1882); 'Tenants of an Old Farm' (1884); 'The Women Friends of Jesus' (1885); 'American Spiders and Their Spinning-Work' (1889-93); 'The Latimers, a Scotch-Irish Historic Romance of the Western Insurrection' (1898); 'Martial Graves of Our Fellow Heroes in Santiago de Cuba'; 'Nature's Craftsmen: Popular Studies of Ants and Other Insects' (1907); 'Ant Communities and how they are Governed' (1909).

McCORK, Neb., city, county-seat of Red Willow County, on the Republican River, and on the Chicago, Burlington and Quincy Railroad, about 230 miles west by south of Lincoln, the capital of the State. It is in a rich agricultural region. McCook owes much of its prosperity to the fact that it is the headquarters of the railroad and the rail and stage lines in the surrounding country. The sugar beet, alfalfa, wheat and corn are the principal productions of the surrounding farms. A number of cattle are raised and a large number of livestock from Willow County and vicinity is shipped from McCook. The city has a Carnegie library and a Federal courthouse and owns the waterworks. Pop. 3,765.

McCORMICK, John, Irish operatic tenor: b. Athlone, 14 June 1884. He was educated at Summer Hill College, County Sligo, Ireland, where he received a large share of his vocal training, finishing under Sabatini at Milan. He was awarded the Mayor's Prize at the Sligo Festival in 1904, and in 1907 made his London début as Turiddu in 'Cavalleria Rusticana.' He soon afterward sang with Tetzunini in 'Rigoletto.' He appeared at the Metropolitan Opera House in New York in 1909, last the sang with the Chicago-Philadelphia Opera Company and with the Chicago Grand Opera Company. While highly successful in grand opera his favorite field is the concert stage where his honors and awards have rarely been equaled. He retains his operatic connection, however, appearing occasionally at the Metropolitan Opera House. He was active in raising funds for various purposes during the European War and sang frequently under the direction of the Y. M. C. A. His income tax under the war levy of 1918 was $75,000. His principal operatic roles are Rodolfo in 'La Bohème'; Pinkerton in 'Butterfly'; Count in 'Don Giovanni.'

McCORMICK, D. Alexander Hugh, American naval officer: b. in the District of Columbia, 9 May 1842; d. 21 Aug. 1915. He was acting midshipman at the United States Naval Academy in 1859; in April 1861 entered into active service and served in blockading squadrons throughout the Civil War. He became captain in 1892. Since the Civil War he has performed various sea duties, and has served in the department of mathematics and in that of astronomy and navigation at the Naval Academy. He was inspector of ordnance, 1876-81; made a cruise around the world, 1881-85; was assigned to the ordnance department, 1885-92; to the Asiatic station, 1892-94; was captain of the Norfolk navy yard, 1894-97; member of the armor and personnel board, 1897-98; and commandant of the Washington navy yard in 1898. In 1899 he was raised to the rank of rear-admiral, and was retired 26 March 1900.

McCORK, Cyrus Hall, American inventor and manufacturer: b. in Virginia, 1809; d. Chicago, 13 May 1884. He removed from his native State to Cincinnati in 1845, and two years later went to Chicago. In 1831 he invented an improved reaping-machine, which was patented and further improved, and which brought him great wealth and world-wide fame, with many decorations, medals, etc. He contributed liberally in 1859 to the establishment of the Presbyterian Theological Seminary of the Northwest, in Chicago, later called McCork Seminary. He also endowed a chair in Washington and Lee University, Virginia.

McCORK, Joseph Medill, American journalist and legislator: b. Chicago, 16 May 1877. In 1900 he was graduated at Yale University. He became vice-president and publisher of the Chicago Daily News in 1907, and served as president of the City Press Association. He opposed William Lorimer and was one of the leaders in the movement to oust the latter from his seat in the United States Senate. In 1912-14 he served as a vice-chairman of the Progressive National committee and supported Roosevelt's candidacy for the Presidency at the
CYRUS HALL McCORMICK

Inventor of the Reaping Machine
McCORMICK — McCoy

Chicago Convention of 1912. In the same year Mr. McCormick was member of a committee of his party which went abroad to study social legislation. He was twice elected to the general assembly of Illinois and was a member of the 65th Congress, 1917-19, as Congressman-at-large from Illinois. In 1918 he was elected to the United States Senate.

McCormick, Leander James, American inquirer: b. in Virginia, 1819; d. Chicago, 20 Feb. 1900. In early life he worked with his father in manufacturing reaping-machines; removed to Chicago in 1848, and entered into partnership with his brother, Cyrus Hall McCormick (q.v.), and superintended the manufacturing department of their reaping-machine plant until 1879, when the firm was incorporated as the McCormick Harvesting-Machine Company. Ten years later he retired from active business. Many of the improvements in the famous McCormick reaping-machine were made by him. In 1871 he gave an observatory with a powerful telescope to the University of Virginia.

McCormick, Robert Sanderson, American diplomat, father of Joseph Medill McCormick and Robert Rutherford McCormick: b. Rochbridge, Conn., 26 July 1849; d. Chicago, 16 April 1919. He was educated at the University of Virginia and entered the diplomatic service as secretary of the American legation at London in 1889-92. He was appointed first Ambassador to Austria-Hungary in July 1902; was Ambassador to Russia from December 1902 to 1905; and Ambassador to France in 1905-07. He was decorated with the Order of the Rising Sun, Japan, 1907. During the Russo-Japanese War Mr. McCormick represented the interests of Japan in Russia.

McCormick Observatory. See Leander McCormick Observatory.

McCormick Theological Seminary, in Chicago, Ill.; opened in 1830 under the auspices of the Presbyterians, as a department of Hanover Academy, at Hanover, Ind. Ten years after its opening the school was removed to New Albany, Ind. Cyrus H. McCormick (q.v.) offered the institution a liberal endowment, which generous gift caused the removal of the school to Chicago, in 1859. It was for a time known as the Presbyterian Theological Seminary of the Northwest. In 1886 the present name was taken in honor of its liberal benefactor. No fees are charged for lodging or tuition, and some of its income is used in assisting worthy and needy students. In 1917 there were connected with the seminary 18 professors and instructors and 206 students. The library contained about 41,000 volumes. The total income on productive funds and from other sources, but excluding benefactions, was about $98,000. Its buildings and grounds were valued at nearly $1,000,000 and its endowment fund at about $800,000.

McCosh, m-kosh, James, Scotch-American author and educator: b. Carskoeoch, Ayrshire, 1 April 1811; d. Princeton, N. J., 16 Nov. 1894. He was educated at the University of Glasgow, which he entered at 13, and at the University of Edinburgh, where he went in 1829. He became a minister of the Church of Scotland; was settled at Arrochar in 1835, and at Brechin in 1839; but at the disruption of the Scottish Church joined the Reformed Church, whose organization he was active in promoting. In 1850 he published 'The Method of the Divine Government, Physical and Moral,' in which he applied the philosophy of Sir William Hamilton to questions of theology with such skill as to elicit from him the highest commendation. This work at once gave McCosh wide fame as a philosophical thinker, and in 1851 he was appointed professor of logic and metaphysics in Queen's College, Belfast, where he remained 18 years, not only discharging his professional duties, but also entering earnestly into work of religious and social improvement, through which his spirit of benevolence and his enlightened zeal for general education accomplished lasting results. In 1866 he was elected president of the College of New Jersey (now Princeton University), having previously visited this country and become impressed with its educational promise. This promise was especially bright when he assumed the presidency of Princeton, but the conditions of transition in the sphere of higher education were such as to demand consummate powers of leadership. Such powers McCosh, although a foreigner, brought to his work with most satisfying success. During the 20 years of his administration at Princeton he saw the number of faculty and professors more than doubled and prosperity increased in all departments. His resignation in 1888 was due to the advance of years, and he was able to continue in the chair of philosophy beyond that period. As a philosopher he maintained the principles of the Scotch metaphysicians against all empirical methods, but went beyond his predecessors in the direction of intuitionalism, although he once declared that this "rose out of rationalism as a frogs rise out of the melted ice," and few orthodox theologians were abreast of him in welcoming the evolutionary features of the new biology. His writings on theology, philosophy and psychology are very numerous and include "Typical Forms and Special Ends in Creation," in collaboration with Dickie; "The Inculcations of the Mind Inductively Investigated" (1860); "The Supernatural in Relation to the Natural" (1862); "An Examination of Mill's Philosophy" (1866); "Laws of Discursive Thought" (1869); "Christianity and Positivism" (1871); "The Scottish Philosophy, Biographical and Critical" (1874); "The Development of Hypothesis" (1876); "The Emotions" (1880); "Psychology of the Cognitive Powers" (1886); "Psychology of the Motive Powers" (1887); "Realistic Philosophy Defended" (1877) and "Our Moral Nature" (1892). Consult Dulles, J. H., 'A McCosh Bibliography' (Princeton 1895), and Sloane, W. M., 'The Life of James McCosh' (New York 1896).

McCoy, Isaac, American missionary and Indian agent: b. near Uniontown, Pa., 13 June 1784; d. Louisville, Ky., 21 June 1846. His early life was spent in Kentucky. Reared on the frontier, his educational advantages were very limited, but he was of a studious disposition. He was married at the age of 20 and was ordained to the ministry of the Baptist Church at 24, settling in Indiana about the same time. After serving eight years as pastor, he entered the mission field among the Miami
Indians, in the valley of the Wabash River, in 1817. He subsequently labored among the people of the Pottawatomie and Ottawa tribes in Michigan. During the course of his work among the Indians he became impressed with expediency of removing the Indians from the contaminating influences of the white settlements. In June 1824 he submitted the matter to the consideration of the Baptist Mission Board at Washington, D. C., and was authorized to present the matter to the attention of the President of the United States. He failed to secure an audience with President Monroe, but he was successful in interviewing the Secretary of War, John C. Calhoun, under the jurisdiction of whose department was included all matters pertaining to the administration of Indian affairs. Secretary Calhoun approved of the scheme thus proposed for the establishment of an Indian Territory west of the Mississippi and became its champion. Although several tribes had removed to the West prior to that time, the plan so proposed settled policy in regard to the matter until after Secretary Calhoun took it up officially after the suggestion was made by Mr. McCoy. In 1827 he again visited Washington, where he interviewed President John Quincy Adams and Secretary Barbour of the War Department. In 1828, Mr. McCoy and Capt. George Kennerly of Saint Louis were appointed by the Secretary of War as commissioners to conduct negotiations representing the Choctaw, Creek, Pottawatomie and Ottawa tribes on an inspection of the region to be included in the proposed Indian Territory, in the performance of which duty they made two tours of the wilderness region west of Missouri and Arkansas during the late summer and autumn of 1828. During the ensuing 10 years Mr. McCoy was almost constantly in the Indian Territory (i.e., the present States of Kansas, Nebraska and Oklahoma), selecting and surveying locations for immigrant Indian tribes for the government, and, at the same time, aiding in the location and establishment of missions and schools throughout. He published a bi-annual pamphlet entitled The Annual Register of Indian Affairs within the Indian (or Western) Territory, during the years 1835 to 1838 inclusive. Previous to that he had published a pamphlet, The Practicality of Indian Reform. He was also the author of A History of Baptist Indian Missions. His last years were spent at Louisville, Ky., where he had charge of the work of the American Indian Mission Association.

McCoy, Joseph G., American pioneer in the overland cattle trade: b. Springfield, Ill., 20 Dec. 1837; d. Kansas City, Mo., 19 Oct. 1913. Reared on a farm, he made a specialty of feeding cattle for the beef market. At the conclusion of the Civil War the scarcity and high price of beef and the seeming impossibility of transporting the cheap cattle from the well-stocked ranges of Texas to the Northern markets, because of the introduction of splenetic fever which was certain to follow among native herds, appealed to the typically American genius of McCoy for achieving that which had been repeatedly attempted. He was instrumental in the establishment of a shipping point on one of the new railways, which were then being built westward across the great plains, to which the beef stock of Texas might be slowly driven northward during the grazing season, keeping well to the westward of the frontier settlements, and shipped thence by rail to the market at Chicago for immediate slaughter. This proposal, though simple, was so novel that railway managers opposed it vigorously. McCoy finally induced one of the railway companies to back him in the enterprise and he arranged to build shipping pens at Ablilene, Kan. As the result of a diligent advertising campaign he persuaded a few Texas ranchmen to undertake to drive herds across the Indian Territory to the designated shipping point on the Kansas Pacific Railway, during the season of 1867. Thirty-five thousand head of beef cattle were thus marketed that season. The next year the number thus driven overland to the shipping point was increased to 75,000 head; in 1869, this number was doubled, and in 1870 the number was doubled again. When the overland cattle trade was well established the railway companies claimed the granted royalties to McCoy, but he continued his active interest in the live-stock business until old age forced his retirement. He published Historic Sketches of the Cattle Trade in the West and Southern States (1874). He was a pioneer settler at El Reno, Okla., in 1889, and was nominated as the candidate for Territorial delegate to Congress by the convention of the Democratic party in 1890.

McCracken, mā-krākˈən, William Denison, American author and lecturer: b. Munich, Germany, 12 Feb. 1864. He is of American parentage, but received his earliest education at the Latin Gymnasium, Stuttgart, Germany, Saint Paul's School, Concord, N. H., and was afterward graduated at Trinity College, Hartford, Conn., in 1885. He has written The Rise of the Swiss Republic (1892); Romance and Teutonic Switzerland (1894); Swiss Solutions of American Problems; Little Idyls of the Big World (1895); The Huntington Letters (1897); Pair Land Tyrol (1905); The Italian Lakes (1908); Christian Science, Its Discovery and Development (1912). From 1901-04 he was a member of the Christian Science Committee on Publication.

McCracken, Henry Mitchell, American Presbyterian clergyman and educator: b. Oxford, Ohio, 28 Sept. 1840; d. Orlando, Fla., 24 Dec. 1918. He was graduated at Miami University in 1857; for four years was a teacher and school superintendent; studied at the United Presbyterian Theological Seminary, Xenia, Ohio, and at the Princeton Theological Seminary, and later at Tubingen and Berlin universities. He was minister of the Westminster Church, Columbus, Ohio, 1853-67, and of the First Presbyterian Church at Toledo, Ohio, 1869-81. In 1867 he was deputy to the General Assembly of the Free Church of Scotland, and to that of the Free Church of Ireland in 1884. From 1880 to 1884 he was chancellor of the Western University, Pittsburgh, Pa., and in the latter year became vice-chancellor and professor of philosophy in the University of the City of New York, of which he was made chancellor in 1897. Since then the name of the institution has been changed to New York University, and the seat of the University College and School of Applied Science has been re-
moved to University Heights, New York City. Under his administration the Hall of Fame for Great Americans (q.v.) was added to the university, its growth and prosperity greatly increased and the extension of its work and influence has given it a leading position in the field of American education. During Dr. MacCracken's active connection with the institution it grew from a college with 91 students to a university with 4,113 students, and the property increased in value from $547,000 to $5,211,000. He resigned the chancellorship in 1910. Besides numerous papers on subjects of education, religion and philosophy, he published 'Tercentenary of Presbyterianism' (1870); 'Popular Sermons' (1875); 'Leaders of the Church Universal' (1879); 'John Calvin' (1888); 'Cities and Universities' (1882); 'The Scotch-Irish in America' (1884); 'A Metropolitain University' (1892); 'Educational Progress in the United States' (1893); 'Lives of Church Leaders: or Heroes of the Cross' (1895); Three Essentials' (1901); 'The Hall of Fame' (1901); 'Urgent Eastern Questions' (1912).

MacCRACKEN, Henry Noble, American educator: b. Toledo, Ohio, 19 Nov. 1880. He was the son of Henry Mitchell MacCracken (q.v.) and was educated at New York and Harvard universities. He was instructor in English at the Syrian Protestant College in 1900–03; Harvard Fellow in 1907–08; instructor and afterward assistant professor of English at the Sheffield Scientific School at Yale in 1907–13. He was president of Smith College in 1913–15, and since 1915 has been president of Vassar College. Since 1917 he has been national director of the junior membership in the American Red Cross. He has written for the magazines on philology; has edited 'The Serpent of Division' (1910); 'The College Chaucer' (1913); 'Shakespeare's Principal Plays' (1914), etc. He is author of 'First Year English' (1902); and part author of 'English Composition in Theory and Practice' (1909).

MacCRACKEN, John Henry, American educator: b. Rochester, N. Y., 30 Sept. 1875. He is the son of Henry Mitchell MacCracken (q.v.), and was educated at the New York University, the Union Theological Seminary and the University of Halle. He was associated with New York University as Fellow, instructor and assistant professor of philosophy in 1894–99; president of Westminster College, Missouri, in 1899–1903; syndic and professor of politics at New York University in 1903–15; and since 1915 has been president of Lafayette College, Easton, Pa.

McCRAVE, ma-krä'di, Edward, American soldier and historian: b. Charleston, S. C., 8 April 1833; d. there, 2 Nov. 1903. He was graduated at Charleston College, admitted to the bar in 1855, and joined the movement which led to the secession of his State. He took part in the capture of Castle Pinckney, 27 Dec. 1860, and was present at the bombardment of Fort Sumter in the following April. As part of the Yankey company raised in South Carolina for the whole war, he entered the Confederate army, 27 June 1861, was made major and then lieutenant-colonel, was badly wounded at the second battle of Bull Run (or Manassas), 30 Aug. 1862, and in January 1863 received an injury in camp from a falling tree, in consequence of which he was transferred from field service to command of a camp of instruction at Madison, Fla., in 1864. He remained at that post until the end of the war. Later he became major-general of State troops and a member of the South Carolina legislature (1880–90), where he proposed the South Carolina Election and Registration Law. Among his more important writings may be mentioned 'The History of South Carolina Under the Proprietary Government, 1670–1719' (1897); 'The History of South Carolina Under the Royal Government, 1719–1776' (1899); 'The History of South Carolina in the Revolution, 1775–1780' (1901); and 'The History of South Carolina in the Revolution, 1780–83' (1902).

McCRAE, John David, Canadian physician, soldier and poet: b. Guelph, Ontario, 30 Nov. 1872; d. of pneumonia in France, 28 Jan. 1918. The second son of Lieut.-Col. David McCrae (who organized and took over a battery to France), he was educated at the University of Toronto and took his M.D. degree in 1910. He became Governor's Fellow in Pathology at McGill University; afterward lecturer in pathology and in medicine. After attaining the M.R.C.P. he was appointed assistant physician to the Royal Victoria Hospital, Montreal, and physician to the Alexandra Hospital. With Professor Adami he was co-author of a textbook on pathology and also contributed to the 'System of Medicine' by Osler and McCrae, the latter being his elder brother (see McCRAE, THOMAS). He served as a lieutenant of artillery in the South African War, taking part in several important engagements. At the outbreak of the European War he volunteered for service and crossed the sea in September 1914 with the Canadian Field Artillery. He served in the field till after the second battle of Ypres, when he was placed in charge of medicine and second in command of the hospital unit provided by McGill University. Shortly before his death he had been appointed consultant to the British Army, but had not yet entered upon that post. McCrae attained the rank of lieutenant-colonel; besides achieving military, professional and academic distinction, he had earned a creditable reputation as a poet. He did not write much, yet his verses have obtained a permanent place in modern anthologies. One of his best-known works is the now famous lyric, 'In Flanders' Fields,' written during the battle of Ypres and originally contributed to Punch. The style is peculiarly his own:

In Flanders' Fields the poppies blow
Between the crosses, row on row,
That mark our place, and in the sky
The larks still bravely sing fly.

In Flanders' Fields the poppies blow
Between the crosses, row on row,
That mark our place, and in the sky
The larks still bravely sing fly.

In Flanders' Fields the poppies blow
Between the crosses, row on row,
That mark our place, and in the sky
The larks still bravely sing fly.

The Torch — be yours to hold it high;
If you break faith with those who die.
We shall not sleep, though poppies grow
In Flanders' Fields.
McCRAE, Thomas, American physician: b. Guelph, Ontario, Canada, 16 Dec. 1870. He was educated at the universities of Toronto and Göttingen, and in 1904–12 was associate in medicine at Johns Hopkins Hospital, serving as associate professor of medicine of the university in 1906–12. He has been professor of medicine at Jefferson Medical College, Philadelphia, and physician to the Jefferson and Pennsylvania hospitals since 1912. He was associate editor of Osler’s ‘System of Medicine’; is co-author, with Sir William Osler, of ‘Cancer of the Stomach’ (1900); and assistant author of Osler’s ‘Practice of Medicine’ (1912; new ed., 1918).

McCRARY, George Washington, American justice and legislator: b. Evansville, Ind., 29 Aug. 1835; d. Saint Joseph, Mo., 23 June 1890. He went with his family to the Wisconsin Territory, now a part of Iowa, when a year old, studied law in Keokuk, Iowa, and was admitted to the bar in 1856. He was elected to the State legislature in 1857, and in 1861–65 served in the State senate where he was chairman of the committees on military affairs and the judiciary. He was a member of Congress from 1869–77, and was appointed to the committees on naval affairs, revision of laws, elections, railways and canals, and the judiciary. He proposed the formation of a joint committee for the purpose of determining the electoral vote in the Hayes-Tilden Presidential election, and was connected with the preparation and passing of the Electoral Bill. He was Secretary of War under President Hayes, 1877–79, when he was appointed Secretary of the United States Circuit Court. He resigned in 1884 and removed to Kansas City, Mo., where he acted as general consulting attorney for the Atchison, Topeka and Santa Fe Railroad until his death. He is author of ‘American Law of Elections’ (1875).

McCREA, Dorothy Frances, Australian poet and story writer. See McCrea, George Gordon.

McCREA, George Gordon, Australian poet: b. Anchorfield, near Edinburgh, Scotland, 29 May 1833. His father went to Australia in 1841 as warden of the Gold Fields of Australia, taking his family with him. Young McCrea was educated at private schools and entered the Audit Office in 1854. After serving in the office of the chief secretary and the registrar-general, he became senior examiner of patents and deputy registrar-general. He was retired on a pension after 40 years’ service. Among his published works are ‘Ballade in Mamma’ (1866–67); ‘Karakorum’; ‘The Man in the Iron Mask’ (1873); ‘A Rosebud from the Garden of Taj’, ‘Afloat and Ashore’ and a vast amount of material on the greater part of which still remains unpublished. Among this are two dramas and ‘A History of Seychelles’ in two volumes. His son, Hugh Raymond McCrea, is an artist and poet well known in Australia; and his daughter, Dorothy Frances, is a clever story writer and a poet of some reputation in Australia.

McCREA, Hugh Raymond, Australian artist. See McCrea, George Gordon.

McCrea, ma-krə, James Bennett, American lawyer: b. Madison County, Ky., 8 July 1838. He was graduated at Centre College, Danville, Ky., in 1857, and from the Law School of Cumberland University, Tennessee, in 1859. He entered the Confederate army in 1862 as major of cavalry and served until close of war, being then lieutenant-colonel of the 11th Kentucky Cavalry, C. S. A. He was a member of the Kentucky house of representatives in 1869, 1871 and 1873 (being Speaker 1871–73); governor of Kentucky 1875–79; and a member of Congress in 1885–97. He was a delegate to the International Monetary Conference at Brussels, Belgium, in 1891, and in 1903 became United States senator. In 1911–13 he was governor of Kentucky. He was delegate at-large to the Kansas City National Democratic Convention and to the Baltimore Convention of 1912.

McCreery, James, American merchant: b. Ireland; d. Aiken, S. C., 1856. He came to the United States when about 20 and entered in the dry goods business in Baltimore, and at the beginning of the Civil War removed to New
York, where he soon established a business of his own which made him ultimately one of New York's leading merchants. He was a member of many public boards, one of the founders of the silk industry in America and director of numerous commercial enterprises. He was one of the Chamber of Commerce delegation sent to England three years before his death, and was a leading member of various clubs, chiefly of an educational or public character.

McCulloch, mā-kūlō, Benjamin, American soldier: b. Rutherford County, Tenn., 11 Nov. 1811; d. 7 March 1862. He became a skilled hunter and boatman and joined other frontiersmen in settling Texas. In 1835 he served in the Texan war for independence, being in the battle of San Jacinto. Later he settled as surveyor at Gonzales and was elected to the Texas Congress in 1839. In the following year he was engaged in fighting the Comanches and operating against Mexican raiders. He also commanded a company of rangers in the Mexican War under Taylor and Scott, did important work as a scout, and was specially distinguished at the battles of Monterey and Buena Vista, and in the siege of the City of Mexico. He was appointed United States marshal in Texas. In 1857 he was one of the commissioners appointed to settle the Mormon difficulties in Utah. During the Civil War he served in the Confederate army, was appointed brigadier-general and sent into Missouri, where he was killed at the battle of Dug Spring, but later united his forces with those of General Price and then defeated the Federals under General Lyon (q.v.) at Wilson's Creek. He commanded a corps at the battle of Pea Ridge, Ark., where he was killed by a sharpshooter while making a reconnoissance. (Scouting Expeditions of McCulloch's Rangers) (Philadelphia 1859).

McCulloch, mā-kūlō, Hugh, American financier: b. Kennemunk, Me., 7 Dec. 1825; d. near Washington, D.C., 24 May 1865. He was educated at Bowdoin College and went in 1833 to Fort Wayne, Ind., where he established a law practice which he continued until 1835 when he entered a branch of the State Bank of Indiana. He was chosen director in 1836 and in 1857 became president of the newly incorporated State Bank of Indiana. He was appointed Comptroller of the Currency in 1863 and in 1865 became Secretary of the Treasury under President Lincoln. Owing to the enormous expenses incurred by the Civil War, the finances of the country were in a critical condition; in six months the large sum due 500,000 soldiers and sailors was paid together with other heavy expenses, and a reduction of the national debt was begun. McCulloch converted $250,000,000 of short-term obligations into a funded debt, and in less than two years had succeeded in putting the finances of the country on a sound basis. Congress approved his course and his plan for a speedy resumption of specie payment, but he met with opprobrium to retain the legal tender notes. He occupied the office until 1869 and in 1871 opened a banking business in London where he remained until 1878. He was reappointed to the Secretariatship of the Treasury by President Arthur in 1884 and continued in office until the close of the administration. He wrote 'Men and Measures of Half a Century,' and many of his speeches together with a large share of his correspondence have been published. He was the last living member of Lincoln's distinguished cabinet.

McCulloch, John Ramsay, English political economist: b. Whithorn, Wigtownshire, 1 March 1789; d. London, England, 11 Nov. 1864. He was educated at Edinburgh; became editor of The Scotman, at Edinburgh newspaper, 1818–20, and from 1818 wrote many articles for the Edinburgh Review. He was professor of political economy in London University, 1828–32, and in 1838 was appointed comptroller of the stationery office. Among his many books may be mentioned 'The Principles of Political Economy' (1825); 'Historical Sketch of the Bank of England' (1831); 'Dictionary of Commerce' (1832); 'Geographical Dictionary' (1841); 'A Treatise on the Principles and Practical Influences of Taxation and the Funding System' (1845); 'The Literature of Political Economy' (1845), etc. He was one of the earliest advocates of free-trade in Great Britain.

MacCulloch, mā-kūlō, John Edward, American tragedian: b. Coleraine, Ireland, 2 Nov. 1837; d. Philadelphia, 8 Nov. 1885. He came to the United States in 1853, studied for the stage and made his début in Philadelphia, 1857. He played with Edwin Forrest, who left him at his death all his manuscript plays. In 1869 he managed, with Lawrence Barrett, the Bush Street Theatre in San Francisco, Cal. His appearance in England in 1881 was not successful, but his popularity in America remained unbroken. Despite his lack of literary education, a serious handicap, he won high rank in his profession. He played De Mauprat to Edwin Booth's Richelieu, and Richmond to his Richard III. His interpretation of Virginius was unexcelled during his day. Among his leading roles were Hamlet, Macduff, Richelieu, Spartacus, etc. In 1884, at the height of his brilliant career, he collapsed, both physically and mentally; he died a year later in an insane asylum in Philadelphia. Consult Clark, 'John McCullough as Man, Actor, and Spirit' (Boston 1865).

McCULLOUGH, John Griffith, American politician: b. Welsh Tract, near Newark, Del., 16 Sept. 1835; d. 29 May 1915. He was graduated from Delaware College in 1853 and from the law department of the University of Pennsylvania in 1858. He removed to California in 1859, engaged in law practice in Mariposa County, was elected to the State legislature in 1861, to the senate in 1863 and in 1863–65 was attorney-general. In 1867–73 he practised law in San Francisco and then removed to Bennington, Vt., where he became director and president of several railway systems and prominently connected with various banking and commercial enterprises. He was elected to the Vermont senate in 1898 and in 1902 was elected governor of the State.

McCUMBER, mā-kūm-bər, Porter James, American legislator: b. Crete, Will County, Ill., 3 Feb. 1838. He was graduated at the University of Michigan in 1880 and engaged in the practice of law. He has been senior mem-
MacCUNN — McCUTCHEON

member of the law firm of McCumber and Bogart at Wahpeton, N. Dak., since 1881. He served in the Territorial house of representatives in 1881-83; was state's attorney, Richland County, in 1896-97; and in 1899 took his seat in the United States Senate where he was re-elected three times, his present term expiring in 1923.

MacCUNN, mä-kün', Hamish, Scottish composer: b. Greenock, Scotland, 22 March 1868. He was educated in Greenock and at the Royal College of Music, London, made his debut in the musical world in 1887, and in 1888 became a junior professor of harmony in the Royal Academy of Music, which position he resigned in 1894. As a composer he has attained high rank; his productions are rich in melody, and his command of the orchestra is remarkable. His work is typically Scottish in character and in choice of subject. Among the more important of his numerous works are overtures, etc., 'The Land of the Mountain and the Flood'; 'Chlor Mhor'; 'The Dowie Dens o' Yarrow'; 'The Ship o' the Fiend'; dramatic cantatas, 'Lord John's Daughter'; 'Bonny Kilmeny'; 'Lay of the Last Minstrel' and the operas, 'Jeanie Deans' and 'Darticd.'

MacCURDY, George Grant, American anthropologist: b. Warrensburg, Mo., 17 April 1863. He was graduated at the State Normal School at Warrensburg in 1887, at Harvard in 1893 and subsequently studied at the universi- ties of London and Paris. He was instructor in anthropology at Yale in 1898-1900, and was later lecturer and curator of anthropological collections there, becoming assistant professor of prehistoric archaeology in 1910. Author of 'The Eolithic Problem' (1905); 'Antiquity of Man in Europe' (1910); 'A Study of Chiriquian Antiquities' (1911).

McCURDY, my-kär'ë-di, James Frederick, Canadian Orientalist: b. Chatham, N. B., 18 Feb. 1847. He was educated at the University of New Brunswick, Princeton Theological Seminary and in Germany. He was assistant professor in Oriental languages at Princeton, 1873-82; and Stone lecturer there in 1885-86.

In 1886 he was appointed lecturer in University College of Toronto, and from 1888-1914 was professor of Oriental languages in that college. Among his works are 'Arroyo-Semitic Speech' (1881); 'History, Prophecy and the Monu- ments' (3 vols., 1894-1901); 'Life and Work of D. J. Macdonnell' (1897); an original commentary on Haggai, and various translations for the American edition of 'Lange's Commentary,' etc.

McCURDY, Richard Aldrich, American capitalist: b. New York City, 29 Jan. 1835; d. Morristown, N. J., 6 March 1916. He was graduated at Harvard University in 1856, and engaged in the practice of law in New York. He became attorney for the Mutual Life Insurance Company in 1860, vice-president in 1865 and was president in 1885-1906. The investigation of his company in 1905 revealed mismanagenent and gross extravagance, particularly in the matter of salaries for the officials. He resigned and retired in 1906.

McCUTCHEON, mà-kisch'-än, George Barr, American novelist: b. near Lafayette, Ind., 26 July 1866. He was educated at private schools and at Purdue University. After leaving college, before graduation, he became a reporter on the Lafayette Morning Journal, at a salary of $6 a week. Prior to that time he had written a series of dialect letters for the Sunday Leader, of Lafayette, under the caption 'Waddleton Mail,' published in that paper in 1890. After three years on the Journal, he became city editor of the Lafayette Daily Courier, serving in that capacity until June 1902, when the newspaper was abandoned for novel-writing alone. While with the Courier, he contributed to that newspaper a serial story entitled 'The Wired End,' which has never been published in book form; and also contributed short stories to various magazines during these years. He went to Chicago to reside in 1902, and in July 1910 moved to New York City.

His novels include 'Graustark' (1901), dramatised; 'Castle Cranecrow' (1902); 'Brewster's Millions' (1903), dramatised; 'The Sherrods' (1903); 'Day of the Dog' (1904), novellette; 'Beverly of Graustark' (1904), dramatised; 'The Purple Paradox' (1905), novellette; 'Nodra' (1905); 'Cowardice Court' (1906), novellette; 'Jane Cable' (1906); 'The Flyers' (1906), dramatised, novellette; 'The Daughter of Anderson Crow' (1907); 'The Husbands of Edith' (1908), novellette, dramatised; 'The Man From Brodneys' (1908); 'The Alternative' (1909), novellette; 'Truxton King' (1909), dramatised; 'The Butterfly Man' (1910), novellette; 'The Rose in the Ring' (1910); 'What's-His-Name' (1911), novellette; 'Mary Midhorne' (1911); 'Her Weight in Gold' (1912), novellette; 'The Hollow of Her Hand' (1912); 'A Fool And His Money' (1913); 'Black is White' (1914); 'The Prince of Graustark' (1914); 'Mr. Bingle' (1915).

McCUTCHEON, John Tinney, American cartoonist: b. near South Raub, Ind., 6 May 1870. He is a brother of G. B. McCutcheon (q.v.). He was graduated from Purdue University in 1889 and has been connected with the leading newspaper offices in the United States. He worked as a cartoonist becoming famous in the campaign of 1896. He started around the world on dispatch boat McCulloch in January 1898; was on board that vessel, during the war with Spain, in battle of Manila Bay 1898. In 1899 he made a tour of special service in India, Burma, Siam and Cochin China and later in northern China, Korea and Japan, returning to the Philippines during the fall campaign there. He followed the various campaigns on the islands until April 1899 when he was sent to the Transvaal. He joined the Boers in the interest of his brother and furnished political cartoons for the Chicago Record during the campaign of 1900. In 1909-10 he visited Africa, the while contributing articles and cartoons for the Chicago Sunday Tribune. He went to Mexico as special correspondent in 1914; was with the Belgian and German armies in the autumn of the same year, and in France, Saloniki and the Balkans in 1915-16. He has published 'Stories of Filipino Warfare' (1900); 'Cartoons by McCutcheon' (1903); 'Bird Centre Cartoons' (1904); 'The Mysterious Stranger and Other Cartoons' (1905); 'Congressman Pumphrey the People's Friend' (1907); 'In Africa' (1910); 'T. R. in
Cartoons (1910); ‘Dawson II — Fortune Hunter’ (1912).

McDaniel, Henry Dickerson, American lawyer: b. Monroe, Ga., 4 Sept. 1830. He was graduated from Mercer University, Macon, Ga., 1856, and admitted to the bar in 1857. He attended as delegate the Georgia Secession Convention in 1861, and served in the Confederate army until the end of the war, attaining the rank of major in the 11th Georgia Infantry. In 1865 he was a member of the Georgia Constitutional Convention. His disability to hold office having been removed in 1872 by the United States Congress, he served in the State legislature, 1873–74; was State senator, 1874–83, and in 1883 he was elected governor of Georgia, which office he occupied for three years. He has been trustee of the University of Georgia since 1884, and chairman of the board since 1899. He is also director in several industrial enterprises.

McDaniel, Walton Brooks, American philologist and educator: b. Cambridge, Mass., 4 March 1871. He was graduated at Harvard in 1893. He was assistant in Latin and Greek at Harvard in 1892 and there and at the Radcliffe College in 1899–1901, and from 1909 was professor of Latin at the University of Pennsylvania. He is associate editor of Classical Weekly, and author of numerous magazine articles on philological subjects.

McDonald, Andrew Archibald, Canadian statesman: b. Three Rivers, 15 Feb. 1829; d. 21 March 1912. He entered public life in 1853 as member of the Island assembly, serving until 1858, and again in 1863–74. He was a delegate to the Quebec Conference on the Union of the Provinces in 1864; and in 1873 became provincial postmaster-general, also serving as acting post-office inspector until 1884. In 1884–89 he was lieutenant-governor of the province, and from 1891 he was a member of the Dominion Senate.

McDonald, Arthur, American criminologist and educator: b. Caledonia, N. Y., 4 July 1856. He was educated at the University of Rochester, the Princeton and Union Theological seminaries, and later studied medicine at Berlin, Leipzig, Paris, Zürich and Vienna. He was connected with the United States Bureau of Education in 1892–1904 as a specialist in possibilities of education for the abnormal and weakling classes. He represented the United States at the three International Psychological and Criminalological Congresses, and was honorary president of the Congress of Criminal Anthropology in Europe. He made a special study of American and European prisons and asylums for the insane and for inebriates, and of slums for the United States Bureau of Education. Author of 'Abnormal Man' (1893); ‘Education and Patho-Social Studies’ (1896); ‘Statistics and Crime, Suicide and Insanity’ (1903); ‘Juvenile Crime and Reformation’ (1908); ‘Mentality of Nations and Social Pathology’ (1912).

MacDonald, Charles, American civil engineer and bridge-builder: b. Gananoque, Ontario, Canada, 26 Jan. 1837. He studied at the military and engineering schools of Queen's College, Kingston, engaged in surveysing on the Grand Trunk Railway and later entered the Rensselaer Polytechnic Institute, Troy, N. Y., where he was graduated in 1857. He returned to railroad work after graduation and upon the completion of the Grand Trunk Railway's extension from Windsor, Ont., to Detroit, Mich., in 1863, he was engaged by the Philadelphia and Reading Railroad. He was for a short time engaged with the Union army on the threatened invasion of Pennsylvania, and was taken prisoner; but was held for only a brief period. In 1868 he definitely turned his attention to bridge building, forming a partnership with A. B. Burton. The firm constructed the bridges between Hoboken and Dover, N. J., on the Boonton branch of the Delaware and Lackawanna Railroad, and in 1872 MacDonald designed and constructed Point Bridge at Providence, R. I., which has a 250-foot draw span. He was senior partner of the Union Bridge Company which constructed the Hawksbury Bridge, Australia; the Leavenworth Bridge, Kansas; the Poughkeepsie Bridge over the Hudson River; and the Merchant's Bridge, Saint Louis. He is a trustee of the Rensselaer Polytechnic Institute and in 1908-9 he was president of the American Society of Civil Engineers.

MacDonald, Duncan Black, American philologist: b. Glasgow, Scotland, 9 April 1863. He was graduated at the University of Glasgow in 1885 and later studied at the University of Berlin. He came to the United States in 1892 and has since been professor of Semitic languages at the Hartford Theological Seminary. He was Haskell lecturer on comparative Semitic language at the University of Chicago in 1906; special lecturer at Wellesley College in 1907, 1909, and at the Episcopal Theological School, Cambridge, in 1912. He is head of the Mohammedan department at the Kennedy School of Missions, Hartford, and in 1912 was Haskell lecturer at Oberlin College. He was lecturer at the O. T. Berkeley Divinity School in 1917–18. He discovered in the Bodleian Library the only known Oriental manuscript of 'Ali Baba and the Forty Thieves' which he published in the Journal of the Royal Asiatic Society of Great Britain, of which society he is a member. He contributed to the 'Encyclopaedia Britannica', the 'Encyclopaedia of Islam' and is author of 'The Development of Muslim Theology' (1903); 'Selections from Ibu Kaldun' (1905); 'Aspects of Islam' (1911)

MacDonald, Etienne Jacques Joseph Alexandre, a-té-en zhah zhoh-zif al-êks-ândr mâk do-nâl, DUC DE TARENTE, French soldier: b. Sancerre, France, 17 Nov. 1765; d. Courcelles, France, 24 Sept. 1840. He served in the French Revolution as colonel, brigadier-general and general, and in 1798 was made governor of the Roman states, and of Naples in 1799. In 1805 he lost the favor of Napoleon, but four years later was given command of the right wing of the army in Italy, and was made a marshal for his services at Wagram 6 July 1809. He served in Spain and in the Russian campaign, assisted in covering the retreat from Leipzig, advised Napoleon's abdication, was made a peer by the Bourbons and during the Hundred Days supported them.

MacDonald, Flora, Scottish heroine: b. Milton, island of South Uist, Hebrides, 1720; d. there, 4 March 1790. She was brought up
by the chief of her clan, MacDonald of Clanranald, her father having died in her early childhood, and was partly educated in Edin-
burgh. After the battle of Culloch, in 1746, her assistance was sought in securing the escape of Prince Charles Edward who had taken refu-
uge at Benbecula where Flora MacDonald was then living. The Prince was disguised as a woman servant and the party succeeded in
reaching Skye in safety. Flora's assistance to the Prince became known, however, and she was imprisoned in the Tower of London, but
was soon afterward permitted to live outside the prison, although under charge of a gaoler. The Indemnity Act of 1747 secured her com-
plete liberty. She was married to Allan Mac-
Donald in 1750, and in 1774 they emigrated to
America, settling in Fayetteville, N. C. Her
husband served in the British army in the Revo-
cutionary War and was taken prisoner. Flora
returned alone to Scotland and was later
rejoined by her husband. She was a woman of
great beauty and charm of manner, Dr. John
son, among others, being warm in her praises.
Five of her sons served in the British army or
navy. Consult 'Life and Times of Prince Charles Edward' (1886); Yonge, C. J., 'Seven Heroines of Christendom' (1879); Macgregor,
'Flora MacDonald and Her Adventures with
Prince Charles' (1882).

MACDONALD, George, Scottish poet and
1824; d. Ashtead, Surrey, 18 Sept. 1903. He
was educated at Aberdeen University and at
King's College, London, and entered the Inde-
pendent ministry, from which he afterward re-
tired and became a lay member of the English
Church. MacDonald's work comprises poetry,
novels, religious and juvenile books and is
marked by deep religious feeling and devotion
to lofty ideals of life. His novels deal chiefly
with Scottish character and scenery, in which
they hold the place of classics. The best known
of his many books are 'David Elginbrod'
(1862); 'Alec Forbes of Howglen' (1865);
'Annals of a Quiet Neighborhood' (1866);
'Roderick MacLeod' (1868); 'The
Miracles of Our Lord' (1870); 'Malcolm'
(1875); 'The Marquis of Lossie' (1877); 'Sir
Gibbie' (1879); 'Castle Warlock' (1882).

MACDONALD, Sir Hector, British gen-
eral: b. Urquhart, Scotland, 13 April 1853;
d. Paris, France, 25 March 1903. In 1870 he en-
listed and served in the ranks nine years. He
first saw active service in the Second Afghan
War in 1879, was with Sir F. Roberts in the
march from Candahar to Cabul, and for brilli-
ant service was made 2d lieutenant. He
served in the Boer War of 1881 and was cap-
tured at Majuba Hill. He was conspicuous in
the Suakim campaign of 1888-91; was at the
capture of Tokar in 1891; in 1896 commanded
a brigade in the Dongola campaign; served in
the Nile expedition of 1897-98, and by his adroit
handling of his troops at the battle of Omdu-
rain his army proved disaster into victory.
In 1899 he held the rank of brig-
adier-general in India, and after the battle of
Magersfontein succeeded to the command of
the Highland Brigade. He was made K.C.B.
and in 1902 was placed in command at Ceylon,
but the following year while traveling back to
England to answer a charge, subsequently
found to be false, he committed suicide in
Paris. He was popularly known as 'Fighting
Mac,' and a tower 100 feet high at Dingwall,
since 1907, commemorates his brilliant career.
Consult Coates, T. F. G., 'Hector MacDonald'
(London 1891).

MACDONALD, Sir Hugh John, Canadian
statesman, son of Sir John A. MacDonald
(q.v.): b. Middlesex County, Ontario, 13 March
1850. He was educated at Queen's College and
at the University of Toronto, became a barris-
ter in 1872, practising in Toronto until 1882,
when he removed to Winnipeg. He was a
member of the Canadian House of Commons in
1891-93 and in 1896-97, and in 1896 was Min-
ister of the Interior. He was Premier and At-
torney-General of Manitoba in 1900. Since 1911
he has been police magistrate of the city of
Winnipeg and he has also served as Commis-
sioner and Commissioner of Railways in Mani-
toba. He served in the Fenian Raid of 1866; the
Red River Expedition of 1870; and in the
Northwest Rebellion he was captain of the 19th
Regiment. He was knighted in 1913.

MACDONALD, Hunter, American civil
engineer: b. Winchester, Mass., 1843. He
studied at the Washington and Lee Univer-
sity and in 1879 became assistant engineer for
the Louisville and Nashville Railroad. Later
in 1879 he became connected with the Nash-
vile, Chattanooga and Saint Louis Railroad, and in 1891-92 he was resident engineer for the
Western and Atlantic Railroad. After 1892 he
became chief engineer of the Nashville, Chattanooga and Saint Louis Railroad, and thereafter
he was president of the American Railroad
Engineering Association in 1904-05 and of the
American Society of Civil Engineers in 1914.

MACDONALD, James, American physician:
b. White Plains, N. Y., 18 July 1803; d. Flush-
ing, L. I., 5 May 1849. He was graduated at
the College of Physicians and Surgeons, New
York, in 1825, and was appointed resident phy-
sician at Bloomingdale Asylum, where he re-
mained until 1837 with the exception of a
year's absence in 1831 when he was sent by
the New York hospital governors to visit insane
asylums in Europe. He was appointed visiting
physician to the New York Hospital in 1837,
and in 1841 he established a private insane
asylum at Murray Hill, subsequently removing
it to Flushing, L. I. He began in 1842 his lec-
tures on mental diseases at the College of Phy-
sicians and Surgeons, the first to be delivered
in the United States. Author of 'Reports on the
Condition of Blackwell's Island' (1835); 'Con-
struction and Management of Insane Hospitals'
(1837); 'Puerperal Insanity' (1845).

MACDONALD, James, Canadian statesman
and jurist: b. East River, Nova Scotia, 1 July
1828; d. 1912. He was educated at New Glas-
gow, was admitted to the bar in 1851 and be-
came queen's counsel in the legislature of Nova Scotia in 1859-67 and in 1871-72, when he resigned; and was a mem-
ber of the Canadian Parliament in 1874-81. He
was chief railway commissioner for Nova
Scotia in 1865-67, and financial secretary from
1864 until the union. He was Minister of Jus-
tice of Nova Scotia in 1878-81, and chief jus-
tice in 1881-1904, when he was retired. He was
a member of the commission appointed to facilitate trade relations between Canada and Central America.

**McDonald, James Alexander**, Canadian jurist: b. 1858, Huron County, Ontario. He was educated at the University of Toronto, became a barrister in 1890 and king’s counsel in 1906. He engaged in practice in Toronto until 1896 when he removed to Rossland, B.C., where he practiced until 1909. He was a member of the Rossland legislature in 1903-09, when he resigned to become chief justice of the Court of Appeals, British Columbia.

**McDonald, James Alexander**, Canadian clergyman and journalist: b. Middlesex County, Ontario, 22 Jan. 1862. He studied at Hamilton College and the universities of Toronto and Edinburgh, and was graduated from Knox College, Toronto, in 1887. He was ordained a minister in the Presbyterian Church in 1881 and became pastor of Knox Church, Saint Thomas, Ontario. He resigned in 1896 to become the first pastor of the Westminster, a religiously non-partisan church. He afterward edited the Presbyterian; and in 1902-16 he was managing editor of the Globe. He was a delegate to the Imperial Press Conference, London, England, in 1909, one of the founders of the Canadian Author’s Club in 1889, and has been a member of the board of governors of the University of Toronto since 1906. Author of ‘The Significance of Lincoln’; ‘What a Newspaper Man Saw in Britain’ (1911); ‘Democracy and the Nations,’ etc.

**McDonald, James Ramsay**, British politician: b. Losiemouth, Scotland, 1866. He early entered politics, became secretary of the Labor party in 1900-11, and in 1906-09 was president of the Independent Labor party. He was the leader of the Labor party in 1911-14. In 1901-04 he was a member of the London county council. Author of ‘Socialism and Society’ (1905); ‘Socialism and Government’ (1909); ‘The Social Unrest’ (1913); ‘National Defence.’

**MacDonald, James Wilson Alexander**, American sculptor: b. Steubenville, Ohio, 25 Aug. 1824; d. 14 Aug. 1908. He studied under Washington Allston in Boston and over Moore in New York in 1849. Among his numerous works are statues of ‘Joan of Arc’; ‘Italia’; Edward Bates (1876) in Forest Park, Saint Louis; General Custer, at West Point; Fitz-Greene Halleck in Central Park, New York; equestrian statue of Gen. Nathaniel Lyon; numerous busts, including that of Washington, in Prospect Park, Brooklyn, and those of Bryant, Cooper and Weed. He owned Houdon’s original model, and from it prepared several busts of Washington. He also painted portraits and landscapes and lectured on art, etc.

**MacDonald, Sir John Alexander**, Canadian statesman: b. Glasgow, Scotland, 11 Jan. 1815; d. Ottawa, Ontario, 6 June 1891. In early youth he emigrated with his father to Canada. At 21 he was a practising barrister at Kingston, Upper Canada, and in 1844 he was elected to the Canadian Parliament for that constituency. While repudiating the name of Tory, throughout his career Macdonald was the most conspicuous figure in the Conservative party in Canada. He became a cabinet minister in 1847, and, after various vicissitudes of his party, Prime Minister in 1857. Macdonald’s most important work is connected with the federation of Canada. The French and the English provinces, previously independent, had been united under one Parliament in 1841, and during the next 25 years each party had both an English and a French leader. Ministries changed rapidly, and in 1864 there was felt a need for some wider union; and in that year a conference of delegates met at Quebec to consider the federation of British North America. Directed largely by Macdonald’s tact and resource this conference led to the establishment of the Dominion of Canada in 1867, under the British North America Act, passed by the British Parliament. Macdonald became the first Prime Minister of the Dominion. At first there were only four provinces, but he carried through successfully the negotiations by which the Hudson Bay company ceded its interests in the northwest to Canada; he secured also the entrance of British Columbia on the condition of building rapidly a transcontinental railway. During an election in 1872 Macdonald accepted large sums for party expenses from Sir Hugh Allan, one of the chief promoters of the Pacific railway, and in 1873 owing to this “Pacific Scandal” he was forced to retire from office. In 1878 he again became Prime Minister with a policy of protection and he may be regarded as the father of that system in Canada. He remained Prime Minister until his death in 1891. The confederation of Canada, the acquisition by Canada of the Northwest, the building of the Intercolonial and the Canadian Pacific railways, and the policy of protection were all effected under Macdonald’s lead. His brilliant intellect and ready wit made him a really great leader. In 1867 he was created K.C.B., in 1884 G.C.B., and on his death his widow was created Baroness Macdonald in her own right. Consult Pope’s ‘Memoirs of Sir John A. Macdonald’ (1894); Parkin, ‘Sir John A. Macdonald’ in ‘Makers of Canada’ (1908).

**George M. Wrong**, Professor of History, University of Toronto.

**McDonald, John Bartholomew**, American engineer and contractor: b. Ireland, 7 Nov. 1844; d. 17 March 1892. He emigrated to the United States in 1847, and received his education in the public schools of New York. Among his successful undertakings may be mentioned the Fourth avenue improvement for sinking the New York Central Railroad tracks in New York City from 42d street to Harlem; West Shore Railroad from Weehawken to Buffalo; Baltimore and Ohio Railroad from Baltimore to Philadelphia; Illinois Central Railroad from Elgin, III., to Dolgeville, Wis.; the Georgian Bay branch of the Canadian Pacific Railroad; the Trenton “cut-off” Pennsylvania Railroad; the Baltimore Belt Railroad, which carried the great Baltimore and Ohio Railroad under the city of Baltimore, etc. He constructed the Jerome Park reservoir, New York City, the largest artificial storage reservoir in the world. His greatest contract was for the construction, equipment, operation and maintenance of the Rapid Transit Railroad (the “Subway”) in New York City.

**MacDonald, John Sandfield**, Canadian statesman: b. Saint Raphael’s, Canada, 12 Dec.
1812; d. Cornwall, Ontario, 1 June 1872. He was self-educated and admitted to the bar in 1840, practising successfully in Cornwall. In 1841 he was elected to the Canadian Parliament as member from Cornwall. Macdonald was solicitor-general in 1849–51; 1852–54 was speaker of Parliament; Attorney-General in the brief Brown-Dorion administration in 1858, and Premier in 1862–64. He was the first Premier of the province of Ontario, 1867–71.

**MacDONALD, Joseph Ewing,** American lawyer; b. Butler County, Ohio, 29 Aug. 1819; d. Indianapolis, Ind., 21 June 1891. He was educated at Ashbury (now De Pauw) University; studied law and was admitted to the bar in 1844, and established a practice in Crawfordsville, where he was county prosecuting attorney, 1845–47. In 1848 he was member of Congress and from 1856-60 attorney-general of Indiana. He then practised law in Indianapolis and in 1864 was an unsuccessful candidate for governor being defeated by Oliver P. Morton. In 1872 he was chairman of the Democratic State Committee and in 1876 was elected to the United States Senate, serving until 1881, when he returned to Indianapolis where he resumed the practice of law.

**MacDONALD, William,** American educator and historian; b. Providence, R. I., 1 July 1863. He was educated at Harvard in 1892, and in 1892–93 was professor of history and economics at Worcester Polytechnic Institute. He was professor of history and political science at Bowdoin in 1893–1901 and since 1901 has been professor of history at Brown University. He edited 'Select Documents Illustrative of the History of the United States' (1898); 'Johnston's High School History of the United States' (1901); 'Documentary Source Book of American History' (1908); Parkman's 'Oregon Trail' (1911). Author of 'History and Government of Maine' (1902); 'Jacksonian Democracy' (1903); 'From Jefferson to Lincoln' (1913).

**MacDONALD, Sir William Christopher,** Canadian capitalist and philanthropist; b. County Tipperary, Co. Tipperary, Ireland, 1831; d. Montreal, 11 June 1917. He early engaged in business in Montreal and achieved a large financial success as importer, merchant and tobacco manufacturer. He was a director of the Bank of Montreal, a governor of McGill University and of the Montreal General Hospital, and also served as president of the Legislative Council of Prince Edward Island. His gifts to McGill University and the MacDonald Agricultural College connected with it amounted to more than 12,500,000. He also made large gifts to the school at Sainte-Anne de Bellevue, province of Quebec, the Ontario Agricultural College and to different hospitals. He was knighted in 1898.

**MacDONALD, Pa.** borough of Washington County, 18 miles southwest of Pittsburgh, on the Pittsburgh, Cincinnati, Chicago and Saint Louis Railroad. It is situated in a coal and oil district and there are flour mills, bottle works and tool factories. Pop. about 2,543.

**MACDONELL, måk-'dōn-əl,** Alexander, Canadian Roman Catholic prelate; b. Inverness-shire, Scotland, 7 July 1762; d. Dumfries, Scotland, 14 Jan. 1840. He was educated at the Scots College, Spain, entered the priesthood in 1789, and was for several years a missionary. He assisted in the organization of the Glengarry Fencibles and was their chaplain, and in 1803 established for its disbanded members a colony in Glengarry County, Ontario, Canada. He also assisted in raising the Cana- dian regiment of Glengarry Fencibles, which was actively engaged in repelling the American invaders in the War of 1812–14. In 1819 he was made vicar apostolic of Upper Canada and through his influence 48 parishes were established in Upper Canada. He was the first Roman Catholic bishop in Upper Canada, being consecrated bishop of Kingston, 14 Feb. 1826. He was called to the Legislative Council in 1831. He died in Scotland while on a mission to obtain funds for the founding of Regiopolis College, Kingston, and is buried in his episcopal city.

**MacDONELL, Arthur Anthony,** English philologist; b. Lochgarry, 11 May 1854. He was educated at Göttingen and at Corpus Christi College, Oxford. He was Taylorsian teacher of German at Oxford in 1880-99 and professor of Sanskrit in 1888-99, since when he has been Boden professor of Sanskrit at Oxford. He has made a tour of study and research in India in 1907–08, and in 1914 received the Campbell Memorial Gold Medal for Oriental Research from the Royal Asiatic Society of Bombay. He is keeper of the Indian Institute; and a Fellow of Balliol College and of the Royal Asiatic Academy. Author of 'Sanskrit-English Dictionary' (1892); 'A History of Sanskrit Literature' (1900); 'The Brhaddevata' translated and critically edited (2 vols., 1904); 'Vedic Grammar' (1910); 'A Vedic Grammar for Students' (1916).

**MacDONELL, Daniel James,** Canadian clergyman; b. Bathurst, New Brunswick, 15 Jan. 1843; d. 1896. He was educated at Queen's College, Kingston, in 1858 and later studied at Glasgow, Heidelberg and Edinburgh universities. He was ordained in the Presbyterian ministry, at Edinburgh, in 1860, returned to Canada and served as minister of Saint Andrew's Church, Peterborough, until 1870, when he removed to Toronto to take charge of the imposing new Saint Andrew's Church which had been built for him there. His expression of doubt in regard to certain doctrines of the Church, particularly that of eternal punishment, led to his being tried for heresy. While not subscribing to a personal belief in the doctrines upon which he had expressed doubts he formally endorsed them and agreed not to discuss them in the pulpit. His influence generally was regarded as having contributed appreciably to a broader trend of thought in the Church. He took an active part in bringing about the union of the different branches of the Presbyterian Church in Cana- dana, which was effected in 1875. He was noted for his sound learning and for his eloquence. He was one of the editors of the 'Canadian Presbyterian Hymnals' (1895).

**MacDONELL, Anthony Patrick,** 1st Baron, British administrator; b. 17 March 1844. He was educated at Queen's College, Galway, and entered the Indian Civil Service in 1865. He was appointed acting chief commissioner of Burmah in 1889, chief commissioner of the
Central Provinces in 1891, acting lieutenant-governor of Bengal in 1893, and served on the council of the viceroy of India in 1893-95. He was governor of the north-western Provinces and chief commissioner of Oudh in 1895-1901, was a member of the Council of India in 1902, and Under Secretary of State in Ireland in 1902-08. He was created a baron in 1908.

McDONELL, Charles Edward, American Roman Catholic prelate: b. New York, N. Y., 1 Feb. 1854. He studied at the De La Salle Institute and Saint Francis Xavier's College in that city, but finished his theological course at the American College, Rome, Italy. While there he received the degree of D.D., and was ordained priest by Bishop Chatard 18 May 1879. Returning to America the same year, he was appointed assistant priest at Saint Mary's Church, New York City, and in 1879 was transferred to Saint Patrick's Cathedral. On the death of Bishop Loughlin, Dr. McDonnell, who, at the time was Archbishop Corrigan's secretary, was named bishop of Brooklyn, being consecrated by Archbishop Corrigan 25 April 1892. At his invitation the Benedictine Fathers have come from the Bahamas Islands to establish themselves in his diocese, and the Redemptorists also have made a foundation in Brooklyn. On the passage of the French law separating Church and State, Dr. McDonnell invited a number of French communities of men and of women to take up their residence in his diocese. He is spiritual adviser of the Catholic Bishop of New England, and also honorary president of the International Catholic Truth Society.

McDONOUGH, mäk'd ön' o, John, American philanthropist: b. Baltimore, Md., 29 Sept. 1779; d. McDonogh, La., 26 Oct. 1850. He was educated at an academy in Baltimore and entered the mercantile business there, removing in 1800 to New Orleans, where he rapidly acquired great wealth. He was deeply interested in the problem of slavery and devised a system through which its slaves were enabled to earn their freedom; he educated those among them who desired it, and sent to Africa ship-loads of those who had earned their freedom. He was president of the American Colonization Society and was a generous contributor to its support. The bulk of his fortune of more than $2,000,000 he bequeathed to the cities of New Orleans and Baltimore for the establishment of free schools. The will was adjudged valid after years of litigation and Baltimore established the McDonogh schools while New Orleans invested its portion of the bequest in its public schools.

MACDONOUGH, mäk'd ön' o, Thomas, American naval officer: b. Newcastle County, Del., 23 Dec. 1783; d. at sea, 18 Nov. 1823. He entered the navy as midshipman in 1800 and in 1803 was attached to the frigate Philadelphia, one of the squadron employed against Tripoli. On 26 Aug. 1803 the Philadelphia captured of Spain the Moorish frigate Mesboa and MacDonough, being left at Gibraltar with the prize, escaped the subsequent capture which befell the officers and crew of the Philadelphia. In 1804 he participated in the various attacks made upon Tripoli and under Decatur assisted in the capture and destruction of the Philadelphia, 16 Feb. 1804. In 1810 he was furloughed and for a while commanded a vessel in the meridian northwest, and in the Provinces and chief commissioner of Oudh in 1895-1901, was a member of the Council of India in 1902, and Under Secretary of State in Ireland in 1902-08. He was created a baron in 1908.

MACDOUGALL, mak-doo' gal, Daniel Trembly, American botanist: b. Liberty, Ind., 16 March 1865. He was graduated at De Pauw University in 1889 and studied in Germany. In 1891-92 he was engaged in explorations in Arizona and Idaho for the United States Government, and in 1893-99 was instructor in plant physiology at the University of Minnesota. He was appointed director of the laboratories of the New York Botanical Gardens in 1899, and after 1910 was director of the botanical research department of the Carnegie Institution. He was president of the American Society of Naturalists in 1910. Among his books are 'Nature and Work of Plants' (1900); 'Practical Text-book of Plant Physiology' (1902); 'Elementary Plant Physiology' (1902); 'Influence of Light and Darkness upon Growth and Development' (1903); 'Botanical Features of North American Deserts' (1908); 'The Water-Balance of Succulent Plants' (1910); 'The Condition of Parasitism in Plants' (1910); 'Organic Response' (1911); 'The Salton Sea' (1913), etc.

MACDOUGALL, Alexander, American soldier: b. Island of Islay, Scotland, 1731; d. New York, 8 June 1786. He emigrated with his father to America in 1755 and later became a merchant in New York. He devoted himself to the cause of the colonies and was imprisoned for a time for writing an address called 'A Son of Liberty to the Betrayed Inhabitants of the Colony.' At the outbreak of the Revolution he enlisted in the American army, serving as colonel, brigadier-general, and in 1777 was promoted major-general. He commanded at Long Island, White Plains and also attained distinction in the action at Germantown. He was elected member of the Continental Congress in 1781 and was appointed Minister of Marine. Re-elected in 1784-85 he served for a time and then resigned, preferring active service in the field. He was elected Minister of Marine and thereby became the first Secretary of the United States Navy. He was a member of the New York State senate at his death.

MACDOUGALL, George Millward, Canadian pioneer missionary: b. Kingston, Ont., 1820; d. Canadian North West, January 1876. He removed to Georgian Bay with his parents when a child, later studied at Victoria College,
and in 1850 entered the Wesleyan Methodist ministry. He was deeply interested in the welfare of the Indians, whose habits and character he knew thoroughly, and spent his life as a missionary among them. His field covered different times a considerable portion of the Northwest Territory and his experience made him often a valuable aid to the government in dealing with Indian affairs. He made a tour of eastern Canada and visited New York and Great Britain in 1875. His career was suddenly ended by his death on the plains within a short distance of his camp. He is commonly reputed to have perished in a snowstorm; but his son, who was with him on the journey toward camp, ascribes the end to some unknown physical infirmity as the weather was favorable and his father a master woodsman. McDougall is among the most famous of the pioneer missionaries of Canada. Consult McDougall, J., "George Millward McDougall, Pioneer, Patriot and Missionary" (Toronto, 1888).

McDOUGALL, John, Canadian missionary, son of George Millward McDougall (q.v.): b. Owen Sound, Ontario, 27 Dec. 1842. He was educated at Victoria University, entered the Methodist ministry in 1866 and was ordained in 1872. He was reared among the Indians of the Georgian Bay and Lake Superior regions and entered the ministry he taught school in the North Western Territory. As a clergyman his work was chiefly among the Indians, where his knowledge of their language and customs made his work unusually effective, and he was also able to render important services to the government in connection with Indian affairs. He was peace commissioner after the uprisings of 1869-70 and 1885. He was also closely associated with the treaties made with the Indians in his district. He was chairman of the Saskatchewan district in 1876 and of the Indian district in 1897. Author of 'A Cree Hymn Book' (1888); 'Forest, Lake and Prairie' (1895); 'Saddle, Sled and Snowshoe' (1896); 'In the Days of the Red River Rebellion' (1900); 'On the Western Trail in the Early Seventies' (1902).

McDOUGALL, Sir Patrick Leonard, British general and military author: b. Boulogne-sur-Mer, France, 10 Aug. 1819; d. Kingston, Ontario, 28 Nov. 1894. He was educated at the military academies of Edinburgh and Sandhurst and received his commission as second lieutenant in 1836. He served as regimental officer with the Royal Canadian Rifle regiment at Toronto and at Kingston in 1844-54; served as superintendent of studies at Sandhurst the following year, and in 1855 was sent on a special mission to the Crimea. He was again superintendent at Sandhurst in 1856-58. He was appointed adjutant-general of the Canadian militia in 1855, took an active part in the suppression of the Fenian Raid of 1866 and received high commendations for his skilful organizing of the militia. In 1873-78 he was head of the intelligence branch of the War Office. He accompanied the command in Canada in 1878, at the time when relations were strained between England and Russia. He volunteered to organize a body of 10,000 trained soldiers for use wherever and whenever they might be needed, and the acceptance of his offer established the precedent of colonial military aid to the empire in time of need. He retired from active service in 1885. Author of 'The Theory of War' (1856); 'Modern Warfare as Influenced by Modern Artillery' (1864); 'The Army and Its Reserves' (1869), etc.

McDOUGALL, William, Canadian journalist and statesman: b. Toronto, 1822; d. Ottawa, 29 May 1905. He studied at Victoria College, Cobourg; was admitted as a solicitor in 1847; in 1849 established the Canadian Agriculturist; in 1850 founded the North American, afterward united with the Toronto Daily Globe, for which he wrote until 1870. He was commissioner of Crown lands, 1862-64, and provincial secretary, 1864. From 1867-69 he was Minister of Public Works, and was lieutenant-governor of Rupert's Land, 1869-70. On his entrance into the Red River district to assume formal possession on behalf of the Dominion government of the newly-acquired territories, he was defrocked by Louis Riel, and this episode marked the beginning of the Red River Insurrection.

McDOUGALL, māk'dō-wał, Edward Alexander, American composer: b. New York, 18 Dec. 1880; d. there, 23 Dec. 1908. McDowell was Scotch-Irish by birth, if not by training and temperament. It was from his father, a man of pronounced artistic tastes, that the composer inherited or acquired that fine aesthetic sense and that highly sensitive artistic tendency which played so great a part in his life and practically determined the character of his work. McDowell's musical education was begun at the age of eight, when Jean Buitrago, a friend of the family, gave him his first piano lessons. But not being at all precocious — McDowell was no musical prodigy — his early progress was neither rapid nor encouraging. It was not until he came to receive instruction from the professional piano teacher, Paul Des-vernine, with occasional supplementary lessons from the famous virtuoso, Teresa Carreño, that McDowell's great musical gifts became manifest. Then, at the age of 15, the lad was taken abroad by his devoted mother for a thorough musical education. Entering the Paris Conservatory, young McDowell studied for two years under the two eminent masters, Marmontel (piano) and Savard (theory and composition). Going next to Germany, he continued his musical studies at the Stuttgart and Frankfort conservatories, studying piano with Karl Heymann and composition with Joachim Raff, the well-known German composer. McDowell's unusual talent so impressed both his German teachers that in 1881 they warmly recommended their American pupil for the university chair left vacant by Heymann's own resignation. Nothing but his extreme youthfulness (McDowell was only 20 at the time) seems to have kept from him this much coveted Frankfort professorship. Failing of this, McDowell accepted an instructorship at the Darmstadt Conservatory. But his duties as principal piano instructor there were not too onerous and his compensation so inadequate that he soon had to resign from this position. Returning to Frankfort, McDowell devoted himself to composition and private teaching.

It was there, at Frankfort, during his student days, that his career as a composer really began. His 'First Modern Suite
for Piano* so impressed the great Liszt, whom MacDowell was induced by Raff to visit at Weimar in 1882, that he had it performed the same year at the Allgemeiner Deutscher Musikverein festival held at Zürich. This and its successor, The Second Modern Suite, were published by the famous Leipzig music publishers, Breitkopf and Härtel. Thus encouraged by his early success, and more especially by the sincere praise of Raff, Liszt and others, MacDowell resolved to settle in Germany permanently. And, save for a short visit to America in 1884 (when he married a former pupil of his, Marian Nevin), he did live there uninterruptedly for 12 years. In 1886 MacDowell returned to America and settled in Boston, which marks a turning point in his life. His European recognition, both as pianist and as composer, naturally had paved the way for his American successes. Almost immediately on his arrival MacDowell made his first public appearance in America in the double capacity of pianist and composer, performing one of his own compositions at a Kneisel Quartet concert (19 Nov. 1888). Shortly after he played his Second Piano Concerto under Theodore Thomas in New York, winning popular success with this composition and its performance that he soon repeated it with the Boston Symphony Orchestra. Thenceforth MacDowell’s rise to fame was phenomenal. His services as pianist were in great demand — far greater than his virtuoso ambitions — while his orchestral compositions were performed almost as soon as they were written. Between 1890, when his symphonic poem, Lancelot and Elaine, was performed by the Boston Symphony Orchestra, and 1896 when the same organization placed both his Indian Suite and his Piano Concerto on the same program — which was a most signal honor for a new composer — MacDowell’s name appeared prominently and frequently on American orchestral programs. In 1891-92, too, he gave his first piano recitals which further enhanced his American fame. A couple of years later (14 Dec. 1894) MacDowell achieved unprecedented success by his performance, with the Philharmonic Society of New York, of his own Second Concerto for Piano and Orchestra. By 1896, then, his name and fame as pianist and composer were fully established in America, if not also in Europe.

That year another important turning point in MacDowell’s life was reached. Accepting the chair of music in the then newly-created music department at Columbia University, MacDowell plunged into teaching with such zeal and energy — devoting almost all his time and vitality to this arduous task — that the eight years of it (1896-1904) was enough to undermine his health beyond repair. In 1905, one year after MacDowell had resigned his Columbia professorship (owing to a disagreement with the faculty as to the proper place of music in the college curriculum), alarming symptoms of a mental disorder appeared, which soon culminated in hopeless insanity. In this sad state MacDowell lingered till 23 Jan. 1908, when he died in New York, in his 47th year.

The list of MacDowell’s compositions is a long one. His works (the composer himself, in a moment of ruthless self-criticism, destroyed a number of his compositions) include two suites for orchestra (the ‘Indian Suites’ Nos. 1 and 2), which are his most pretentious and best-known orchestral compositions; two concertos for piano and orchestra, which rank among the best of their kind; four sonatas for piano alone; (None, the Eroica and the Tragic), which alone would have made any composer famous; five symphonic poems (Hamlet and Ophelia, The Saracens, Lamia, Lovely Alda and the Lancelot and Elaine already mentioned), which possess much originality and color, and melodic charm; two most delightful piano suites (the ‘Woodland Sketches’ and the ‘Sea Pieces’), which contain some of MacDowell’s most popular and fascinating shorter pieces, and numerous songs of charming simplicity and melodiousness.

As may be inferred from his musical titles, MacDowell is a romantic composer. His music is program music of the poetic, not the descriptive kind; for MacDowell does not delineate objects, but rather the moods aroused by them. A pupil and disciple of Raff, MacDowell frequently gives his music the woodland flavor. Such titles as ‘Forest Idyls’, ‘New England Idyls’ and ‘Woodland Sketches’, among others too numerous to mention, clearly indicate this. His lyrical pieces show the unmistakable influence of Grieg, whose music the American composer greatly admired; while as a romanticist he should be classed with Schumann and Mendelssohn, Consul Gilman, Lawrence, Edward MacDowell* (New York 1909), and Page, E. F. ‘Edward MacDowell; His Work and Ideas’ (ib. 1910).

McDowell, Ephraim (*Father of Ovariotomy*), American surgeon: b. Rockbridge County, Va., 11 Nov. 1771; d. Danville, Ky., 20 June 1830. He studied medicine at Staunton, Va., and at the University of Edinburgh, then the most famous medical institution in the world. He established himself in practice at Danville, Ky., and became known throughout the Southern and Western States as the best surgeon in his part of the country. In 1809 he performed the hitherto unknown operation of extirpation of the ovary with complete success, and twice repeated the feat before he made an official report of the cases in 1816. His delay in reporting the first case and the seeming impossibility of the performance subjected him to considerable criticism in high quarters both at home and abroad. However, the fact of the success of the operation, several times repeated, is fully substantiated and the method he conceived and carried out has been but little modified, with the exception of asepsis and the use of anesthetics. In lithotomy he had operated 22 times before 1828 without a fatality. Author of a report of his most famous cases in the Eclectic Repertory and Analytic Review (1817). See Cooper, ‘Origin of Ovariotomy’ (1853); Jackson, J. B., ‘Biographical Sketch of Ephraim McDowell’ (1873); Letcher, J. H., ‘Memoir of Ephraim McDowell’ (1875).

McDowell, Irvin, American soldier: b. near Columbus, Ohio, 15 Oct. 1818; d. San Francisco, Cal. 5 May 1847. He entered the College de Troyes, France, and was graduated at West Point in 1838. During the Canadian troubles he was stationed on the Niagara
and on the Maine frontiers, and in 1841 served at West Point as assistant instructor in tactics, becoming adjutant in 1845. In 1847 he went to Mexico as aide-de-camp to General Wood and for gallant conduct at Buena Vista in 1847 was promoted brevet captain, shortly afterward attaining the rank of assistant adjutant-general. Subsequently he was stationed at the War Department in Washington, and in 1850 was raised to the rank of brevet major. He was on General Wood’s staff at the outbreak of the Civil War and assisted in inspecting and organizing the volunteer troops at Washington. In May 1861 he was made brigadier-general of the volunteers and given command of the Army of the Potomac. Constrained by the impatience of the North, McDowell moved in July to meet the enemy and despite his carefully laid plan met a disastrous defeat at Bull Run, 21 July 1861, owing to the imperfect organization of his raw recruits. Shortly after McClellan was given command of the army and McDowell was retained at the head of one of its divisions. In 1862 he was promoted major-general of volunteers and placed in command of the First corps of the Army of the Potomac, stationed to guard Washington. In August 1862 he received command of the Third corps of the Army of Virginia and fought under General Pope at the battles of Cedar Mountain, Rappahannock Station and the second battle of Bull Run, where he performed especially good service. He was removed from the field in September 1862. Considering this action of the War Department a direct reflection upon his military services, he asked for an investigation, the result of which was favorable to him. From May to July 1863 he was president of a board appointed to investigate alleged cotton frauds, and during the following 10 months presided over the board for retiring disabled officers. In July 1864 he was placed in command of the Department of the Pacific Coast, and in March 1865 was made brevet major-general in recognition of his gallant services at Cedar Mountain. In 1872 he succeeded General Meade as major-general in the regular army and was in command of various military departments until 1882, when he was retired. The last years of his life were spent in California.

McDowell, James, American statesman: b. in Rockbridge County, Va., 1796; d. 1851. He was graduated at Princeton in 1817; in 1831 was elected to the Virginia legislature; was governor of that State, 1842-44, and from 1847 to 1851 represented it in Congress. He favored the gradual abolition of slavery, although advocating the claim of State rights. As orator and debater in Congress he bore a prominent part in the proceedings of that body leading up to the Compromise of 1850.

McDowell, William Fraser, American Methodist Episcopal bishop: b. Millersburgh, Ohio, 4 Feb. 1858. He was educated at the Ohio Wesleyan and Boston universities and ordained in the Methodist ministry in 1886. He held charges in Ohio, Indiana, Florida, and in 1890-99 he was chancellor of the University of Denver. He was corresponding secretary of the board of education of the Methodist Church in 1899-1904 and was elected bishop in 1904. He was Cole lecturer at Vanderbilt Uni-

versity in 1910, has served as international commissioner of the Y. M. C. A. since 1899 and since 1906 has been a member of the board of trustees of Northwestern University. He made an official tour of India, China, Japan and the Philippines in 1910-11. Author of 'The School of Christ' (1910); 'A Man's Religion' (1913); 'Good Ministers of Jesus' (1917).

McDuffie, mák-dúf’i, George, American statesman and orator: b. in Columbia (now Warren) County, Ga., 1788; d. in Sumter District, S. C., 11 March 1851. He was graduated at South Carolina College in 1813, admitted to the bar in 1814 and in 1823 to the South Carolina legislature. From 1821 to 1834 he was a member of Congress, and from 1834 to 1836 governor of South Carolina. In 1843 he took his seat in the United States Senate, resigning on account of impaired health in 1846. In his political views and in his Congressional career, he was a close follower of J. C. Calhoun (q.v.), being at the outset a liberal constructionist in constitutional questions, but afterward becoming a strong opponent of the tariff and other economic policies of the government, and also a bold advocate of nullification. Although a supporter of Andrew Jackson (q.v.) in 1828, he became bitterly antagonistic to him, not only in respect to the tariff and State rights, but especially so on the question of the United States Bank, which, as chairman of the Committee on Ways and Means, he strongly defended against the hostile policy of the President. In 1832, as a member of the South Carolina Nullification Convention, he drafted the address of South Carolina to the people of the United States. He was one of the ablest orators of his day, and his prominence in public affairs was maintained in spite of an early wound received in a duel, from which he suffered for the remainder of his life.

Macé, Jean, zôn mài-sá, French educator and writer: b. Paris, France, 22 April 1815; d. there, 13 Dec. 1894. He was educated at the Collège Stanislas, served in the French army, 1842-45, was editor of La République in 1848 and as such was a strong supporter of the Revolution of that year. In 1851, on the death of his friend, he had to withdraw from Paris, and subsequently taught school in Alsace for 10 years. In 1866 he founded a league of instruction in the Belgian manner. He was decorated with the Legion of Honor in 1880, and decorated with the Grand Cross of the Legion in 1883. He was the author of many popular books for young people, the aim of which was mainly educational, among them his best-known work, 'Contes de petit-chateau' (1862), called in the English translation 'Home Fairy Tales'; 'History of a Mouthful of Bread' (1861);
'Servants of the Stomach' (1866); 'France Before the Franks' (1881).

MACE. Lat. māce, Greek μάκαρ, an East Indian spice, is an aromatic spice made from the arilolode or false aril which covers the seed of a nutmeg (Myristica fragrans). The yellow external covering of the nutmeg (q.v.) being removed, the red, rather fleshy, arilolode which contains the mosaic of the nutmeg is thinned.

Ayer in the sun for several days this becomes more or less translucent and usually orange yellow and waxy. In this form it is largely exported from the Spice Islands, where it is native, and from the West Indies, where it has been introduced into cultivation. The powerful but agreeable nutmeg-like odor and flavor characteristic of it are due to a volatile oil which is obtained by distillation for use in perfumery and culinary articles. A bitter fixed oil obtained by expression is used after the admixture of the volatile oil under the names nutmeg balsam and nutmeg butter. White mace is obtained from M. oltoba and red mace from M. tinges; also a low grade from M. fatica, but this is rarely found in the market. Mace is also largely used whole or ground in cookery.

MACE, a weapon of war formerly in use in Europe, chiefly among the cavalry, as late as the 16th century, and still used among savage tribes. It consists merely of a staff about five feet long, with a knob at the end made of iron or some other hard substance. The knob was sometimes covered with spikes. In England the mace is used as an emblem of the officers of state, before whom it is carried. It is made of the precious metals, or of copper, gilt and ornamented with a crown, globe and cross.

MACEDO, Joaquim Manoel de, hó-á-kén mā-noo-el dā má-sa-dó, Brazilian poet, novelist and statesman: b. São João d'Itarobari, 24 June 1820; d. Rio de Janeiro, 11 April 1882. He studied medicine, but presently began to write and became professor of national history in the College of Dom Pedro at Rio de Janeiro. He was one of the most illustrious authors in the 19th century, and being keenly interested in politics was elected to the Brazilian Chamber in 1854. His works include 'Moreninha,' a novel (1844; 5th ed., revised, 1877); 'O Moço Louro,' a novel of the early stages of the Portuguese conquest (1845); 'O Dono Amoros' (1848); 'Vicentina' (1853); 'A Nebulosa,' a poem (1857), his greatest work, consisting of six cantos in unrhymed hexameter syllables; 'Cobê,' a drama; 'Fantasma Branco,' a comedy (1856); 'Nociones de colonización do Brasil' (1873; translated into French by Halbout).

MACEDO, José Agostinho de Padre, Português poet and author: b. Beja, 1761; d. 1831. He received his education in Latin and rhetoric under the Oratorians at Lisbon and became a member of the Augustinian Order in 1778. Temperamentally unfitted for a monastic life he failed to conform to the discipline of the order and in consequence was imprisoned in one convent or another the greater share of the time. He eventually abandoned the monastic life and was expelled from it in 1792. Intercession on the part of influential friends, however, secured for him a papal brief which secularized him but restored his ecclesiastical status. He then entered journalism and his preaching gained for him a foremost position among the orators of his day. In 1802 he was appointed a court preacher. He established and contributed to a large number of journals and was famous for his keen satire and wit. He thus gained the reputation of being the 'chief libeller of Portugal.' He was a staunch adherent of absolutism and seriously advocated the massacre of all opponents of Miguel. He was censor of books in 1824-29, when he resigned upon being threatened with proceedings by his own political party, his support having become harmful to its interests. He had gained a considerable reputation through his verse, which introduced into Portuguese didactic and descriptive poetry, and his 'Meditação' (1813) was a notable production. His ambition then led him to covet the place held by Camoens as Portugal's leading poet, and in 1814 he published 'Oriente' for which he unwisely chose the subject of Camoens' 'Lusádidas,' the discovery by Gama of the sea route to India. While the verse itself was not without strength and grace the epic, as a whole, was flat and insipid, and failed utterly to cause his author to outshine Camoens. Macedo then published his 'Censura dos Lusíadas,' in which he bitterly attacked Camoens, and brought upon himself Bocage's scathing 'Pena de Talião.' His 'Os Burros' is no less pitiless in its betrayal of his own evil character than shameless in its exhortation of men and women in all grades of society, living or dead. He translated the 'Ódes' of Horace and made several attempts at drama but these are not particularly notable. He was at his best in his odes to Wellington and to Alexander, and in the verse in his 'Lyra anacrónica.' There is some doubt concerning 'A Demonstration of the Existence of God' as being from his pen, but it is usually credited to him and shows high ability. He was notorious for his ingratitude, and merciless in his satire, but he died with many friends and a great reputation, although his name is not mentioned in the brief duration. Consult T. Braga's edition of 'Memorias para la vida íntima de José Agostinho de Macedo' (1889); 'Cartas e opúsculos' (1900).
Macedonia was applied only to the district situated south and west of the Lydias, another river which falls into the Thermia Gulf, and which flows from the two already mentioned. Philip of Macedonia extended his kingdom as far as the Lake of Lychnitis, in Illyria, in the west, Mount Scardus and Mount Orbelus in the north (so as to include the whole of Epirus), and the river Nestus on the northeast. He added also the peninsula of Chalcedon. The part which he conquered from Thrace, lying between the Strymon and Nestus, was called Macedonia adjecta. The provinces of Macedonia were, in general, known by the name of Macedonia, before the time of Herodotus. In the time of Philip there were 19. Macedonia was inhabited by two different races — the Thracians, to whom belonged the Paeonians and Pelagonians, and the Illyrians. The language of the southern Macedonians shows that there must have been a large admixture of Dorian settlers among them. Piny of the Pyli, who composed the History of the Greeks, estimated the number of these settlers in the world at 150,000, who dwelt there at an early period. They were divided into several small states, which were incessantly at war with the Thracians and Illyrians, till Philip and Alexander gave the ascendency to one and made it the most powerful in the world. The first of these princes who came to the throne in 359 B.C., taking advantage of the strength of the country and the warlike disposition of its inhabitants, reduced Greece, which was distracted by internal broils, in the battle of Chaeronea, 356 B.C. His son, Alexander, added the limits of Asia, and by an uninterrupted series of victories for 10 successive years made Macedonia in a short time the mistress of half the world. After his death this immense empire was divided. Macedonia received every one of its ancient limits, and after several battles lost its dominion over Greece. The alliance of Philip V with Carthage during the Second Punic War gave occasion to this catastrophe. The Romans delayed their revenge for a season; but when Hannibal was conquered they sent over to the consul Flaminius, who defeated Philip at the battle of Cynoscephalae (197 B.C.) and compelled him to sue for peace, which was only granted upon his agreeing to acknowledge the independence of Greece, to surrender his vessels, to reduce his army to 300 men and defray the expenses of the war. Perseus, the successor of Philip, having taken up arms against Rome, was totally defeated at Pydna by Paulus Aemilius, 168 B.C., and the Romans took possession of the country. Indignant at their acts of oppression, the Macedonian nobility and the whole nation rebelled under Andronicus. But after a long struggle they were overthrown by Quintus Caecilius Macedonicus; the nobility were exiled, and the country became a Roman province, 148 B.C. As such it is mentioned in the New Testament, and St. Paul's letters to the Thessalonians and Philippians are addressed to Macedonian Christians. In 395 A.D., after the dissolution of the Roman Empire, Macedonia became part of the Byzantine Empire. It came under Turkish domination in the 15th century. While the name has no modern territorial significance, it has come into considerable political prominence in connection with the conflict of nationalities in European Turkey and the races of the Balkans Peninsula, among whom the only object in common is a desire to throw off Turkish rule, the Bulgarians there desiring to be governed from Sofia, the Serbians from Belgrade, and the Greeks from Athens, and the Turks by the Young Turk party when it shall be established in Constantinople.

In addition to this question of nationality is one of religion, which complicates matters considerably. There are seven chief religious sects in Macedonia; the Greek Church, the original Greek Church; those of the schismatic Bulgarian Church; those of the New Greek Church, who recognize the patriarch in Constantinople; those Bulgarians and Serbians, who convert to American missionaries, who call themselves Protestants; the Wallacks, who are an offshoot of the ancient Greek Church, those who practice the Jewish faith; and the Mohammedans.

The Turkish government, in administering the affairs of Macedonia, adopted the principle of assisting and protecting the weak and of snubbing and persecuting the strong or predominant party; thus, in a certain district where the Greek was strongest he was least popular with the Turkish authorities. Near the Bulgarian frontier, where the Bulgarian element was practically held in subjection, several public offices were held by Greeks, and so on.

This mode of government led in 1895 to a Bulgarian uprising and in 1896 to a Greek revolt, but would probably long since have proved its success from a Turkish point of view were it not for the fact that the Macedonian Committee in Sofia, a society formed for the purpose of conducting a nationalist campaign in Macedonia to effect freedom from Turkish rule, discovered its real nature and set about to disrupt it. The result was the insurrection in 1903 headed by Boris Sarafoff, the avowed aim of which was to provoke the Turks to massacre Christians and to commit acts that would arouse Christendom and compel the Great Powers to expel them from Europe. The insurrection was crushed by the Porte, with a comparative absence of the atrocity and cruelties that formerly characterized Turkish warfare. Autonomous institutions had been provided for Macedonian Christians by the Berlin Congress of 1878, and Austria and Russia, acting with the authority of Europe, drew up a drastic reform scheme which provided that civilian agents of the two governments must accompany the Turkish inspector-general, to direct his attention to the needs of the population, and to report to their governments what is done and what left undone. The reorganization of the police in the disturbed vilayets was put under the charge of a foreign officer. Mixed commissions of Mohammedans and Christians were to report on crimes and outrages. The sultan was absolutely prevented from allotting funds for the repatriation of exiles, for the immediate needs of the population and for the rebuilding of their homes. Taxation of the expelled Christians was remitted for a year, while the formation of bands of Bash-Bazouks was absolutely prevented.

The Balkan Wars of 1912-13 were waged largely for the possession of Macedonia, and the access to the sea it would afford, by the younger Balkan powers. As a result of the first war, waged in 1912 by members of the
Balkan League, which included Montenegro, Serbia, Bulgaria and Greece, Turkey was deprived of considerable territory, and division of which among the mutually contending Christian states of the peninsula was left unsettled by the unsatisfactory treaty of peace signed on 30 May 1913. War again broke out in the succeeding month: Bulgaria attacking Serbia and Greece, Austria, and Rumania joining forces with the latter on 9 July. Three days after Turkey stepped into the field and Adrianople (taken by Bulgaria from Turkey in the former war) was recaptured. This war ended with the humiliation of Bulgaria; and when the treaty of peace was signed at Bucharest (29 September) the net result of the two wars for her was the handing back to Turkey of territory won in the preceding year, and (apart from a very small part) the division of Macedonia between Serbia and Greece. See War, European.

Macedonian, The. See United States and Macedonian, Battle of.

Macedonians, followers of Macedonius, author of the Macedonian heresy; also called Pneumatomachi, or "Adversaries of the Spirit." The Macedonians came into existence toward the decline of the Arian controversy, when Macedonius became patriarch of Constantinople (341), and taught that the Holy Ghost was "subordinate to the Father and to the Son, unlike to them in substance, and a creature." He was a semi-Arian; was deposed by the Arians in 360; and his special tenets condemned at the Council of Constantinople in 381. In that council the clauses defining the nature of the Holy Ghost were added to the Nicene Creed.

Maceió, mä-sä'yo', Brazil, formerly Macau, city and capital of the state of Alagoas, on the Atlantic Coast, 135 miles southwest of Pernambuco. The city has a cathedral, lycueum, government and other buildings. It has manufactures of machinery and cotton goods, and considerable ship-building is carried on here. Cotton, corn and hides are the chief items of export. At the head of a United States consular agent. Pop. 33,000.

McEntee, Jervis, American painter: b. Rondout, N. Y., 14 July 1828; d. there, 27 Jan. 1891. He was educated at the Liberal Institute, Clinton, N. Y., and later studied under F. E. Church. He also visited Europe in 1869, studying in the principal galleries and sketching in Italy and Switzerland. He made his first contribution to the American Academy of Design in 1853, was elected associate of that institution in 1860 and academician in 1861. After his return from Europe he took a studio in the famous Studio building in West 10th street, New York, and devoted himself to landscape painting, although in later years he executed a number of figure canvases. He belonged to the Hudson River School of artists and his favorite subject was the autumn type of landscape, although his work is by no means confined to one phase or season. A sale of his work in New York in 1888 disposed of 75 of his pictures which he considered the best of the preceding 10 years' work, and after his death 100 more were sold. Among his paintings are 'The Melancholy Days Have Come' (1860); 'Sea From Shore' (1873); 'Old Mill in Winter' (1874); 'Chords' (1879); 'Glimpse of Hunter Mountain' (1886); 'A Child in the Catskills' (1888). His 'Autumn Landscape' hangs in the Metropolitan Museum, New York.

Maceo, mä-sä'yo, Antonio, Cuban patriot: b. Santiago de Cuba, 14 July 1848; d. near Mariel, 2 Dec. 1896. He joined the insurgent army as a private in 1868 and though without martial training his natural military ability and personal magnetism as a leader soon won him to the front, making him second only to Gomez. Under his skilful leadership Martinez Campos was defeated at Demajayabo and at La Galleta; his campaign in Baracoa in 1878 evidenced masterly generalship, as did also his utter rout of Santacledes at San Ulpiano. Maceo alone of all the Cuban generals refused to sign the Peace of Zanjón and made for two months a brave effort to reanimate the exhausted revolutionary spirit. Finding his compatriots thoroughly disheartened, he abandoned the struggle and still refusing to sign the peace, made a tour of the United States and other countries in America seeking support for the cause of Cuban independence. He was the first of the Cuban leaders to land in 1895, and in the revolution which followed took an active part. His achievements in the campaign in Pinar del Rio province, and his battles at Paralejo, Jobito, Mal Tiempo and Candelaria are among the most brilliant feats in the history of Cuba's long struggle for independence. While crossing the trough between Majana and Mariel, attended only by his staff, he was surrounded by a Spanish force and killed.

Maceo, José, hô-sä', Rafael, Cuban patriot: b. Santiago de Cuba, 1846; d. La Loma del Gato, Cuba, 5 July 1896. He was a brother of Antonio Maceo (q.v.) and took a conspicuous part in the Rebellion of 1868–78. He remained in Santiago de Cuba after the Peace of Zanjón, which he with his brother refused to sign. He was prominently connected with the uprising of 1879 in which he was captured and sent to Spain. An attempted escape to Gibraltar resulted in his deportation to the little Peñon de Mola at Mahon, in the Balearic Isles, whence he succeeded in making his escape to Algiers. He lived in Costa Rica from 1885 until the outbreak of the rebellion in Cuba in 1895, when he at once joined the insurrectionary army. He raised a large force which he commanded with signal success at Jobito and later was victorious over Canellas at Sao del Indio. He was killed in a furious engagement at La Loma del Gato in which the Cubans were finally victorious. For an adequate account of the importance of the Maceo brothers consult General Weyse, 'Mi Mando en Cuba, 10 Febers 1896 á 31 Octubre 1897' (5 vols., Madrid 1910–11).

Macerata, mä-chä-rä'tä, central Italy, (1) an episcopal city, capital of the province of the same name, picturesquely situated on an eminence 1,207 feet high, between the Apen- nines and the sea, 21 miles southwest of Ancona. It is encircled by walls, pierced by six gates, has a cathedral, provincial palace and theatre on the central public square, town-hall (13th century), a college founded in 1290, museum, etc. Terra cotta, chemicals and matches are among its manufactures. Pop. of commune
22,940. (2) The province has an area of 1,087 square miles.

**McEwen, māk-əˈɛn, Walter, American painter, Chicago, Ill., 1860. He studied under Corron and Tony Robert-Fleury in Paris, afterward living chiefly abroad. His work includes landscapes, portraits, decorative panels and figure subjects and is marked by excellent sense of line and strong feeling for color. He exhibited from the Liberal Arts Building at the Columbian Exposition, Chicago, and for the Congressional Library, Washington. He has been awarded numerous prizes, including gold medals at Berlin, Vienna and Munich, the Lippetoff for Art in 1904. He is at Philadelphia, member of the Harvard prize at Chicago. He is an officer of the Legion of Honor and of the Belgian Order of Leopold. He served on the International Jury of Awards at the Panama Exposition in 1915. Many of his paintings have been acquired by public galleries. Among them are 'Sunday in Holland' (Luxembourg); 'An Ancestor' (Corcoran Gallery, Washington); 'Judgement of Paris' (Art Institute, Chicago).

**McFarland, māk-ˈfär-lənd, John Horace, American master printer and civic improve-
ment expert, b. Altoenville, Juniata County, Pa., 24 Sept. 1859. He was privately educated, learned the printing business and in 1878 established his own business, which after several changes was incorporated as the J. Horace McFarland Company in 1891. In 1890-93 he printed and was a contributor to *American Gardening*, and in 1901-04 he printed *Country Life in America*, also contributing articles and photographs. He edited the 'Beautiful America' department in *The Ladies' Home Journal* in 1918; furnished photographic illustrations for Mabel Osgood Wight's *Flowers and Ferns in their Haunts,* and assisted in illustrating and printed Bailey's 'Standard Cyclopedia of Horticulture.' He has contributed to *The Arts* and *The Printers* and is author of *Photographing Flowers and Trees* (1902); *Laying Out the Home Grounds* (1915); *My Growing Garden* (1915).

**McFarland, John Thomas, American Methodist clergyman: b. Mount Vernon, Ind., 2 Jan. 1851; d. 22 Dec. 1913. He was educated at the Iowa Wesleyan University, Simpson Col-
lege, Iowa, and at Boston University, and was ordained in the Methodist ministry in 1873. He filled pastorates at Millersburg and Sweetland Centre, Iowa; Portsmouth, R. I.; Elmwood and Peoria, Ill.; was president of the Iowa Wesleyan University in 1884-91; pastor of Grace Church, Jacksonville, Ill., of New York Avenue Church, Brooklyn, and First Church, Topeka, Kan. He was editor of the Sunday School literature of the Methodist Church from 1894 until his death. *Authority of Observation vs. The Rescue of the Child*; 'The Book and the Child'; 'Etchings of the Master.'

**MacFarlane, Alexander, American mathemati-
cian: b. Blairgowrie, Scotland, 21 April 1851; d. 28 Aug. 1913. He was gradu-
ated at Edinburgh University in 1875, taking his D.Sc. in 1878, and in 1881 was appointed examiner in mathematicians there. He became professor of physics at the University of Texas in 1885 and from 1887 was lecturer in mathemat-
ics at Lehigh University. He was a Fellow of the Royal Society of Edinburgh and a mem-
er of the Washington Academy of Sciences. Author of 'Algebra of Logic' (1879); 'Physical Arithmetics' (1888); 'Patent Office Patent Office Science Analysis' (1894); 'Biography of Quaternions and Allied Mathematics' (1904), etc.

**MacFarren, Sir George Alexander, English composer: b. London, England, 2 March 1813; d. there, 31 Oct. 1887. He was educated at the Royal Academy of Music, where his 1837 he became a professor of harmony and composition and in 1875 principal. In the same year he was elected professor of music in Cambridge. Among his compositions are the operas 'The Devil's Opera' (1838); 'Roi Hood' (1840) and the oratorios 'St. John the Baptist' (1873); 'King David' (1883), etc. He also wrote several valuable treatises: 'Harmony' (1860); 'Counterpoint' (1879), etc. He was knighted in 1883. In 1860 he became blind and his wife thereafter wrote his compositions from his dictation.

**McFaul, James Augustine, American Roman Catholic prelate: b. Larne, County Antrim, Ireland, 6 June 1850; d. 16 June 1917. At an early age he attended Saint Vincent's Col-
lege, Beatty, Pa., finishing his classical studies at Saint Francis Xavier's College, New York City, and subsequently pursuing his theological course at Seton Hall, South Orange, N. J. He was ordained priest 25 May 1877, Orange, Paterson, Jersey City, Newark and New Bruns-
twick, N. J., being in turn assistant in the ministry. In 1878 he was named assistant at Saint Mary's Church, Trenton, N. J., and afterward pastor of the church of Our Lady Star of the Sea, Long Branch, N. J. Some years later he assumed the rectorship of the Cathedral at Trenton, and then became se-
cretary, chancellor and vicar-general of the diocese. On the death of Bishop O'Farrell in 1894 Father McFaul was chosen his successor, and was consecrated at Trenton 18 October of that year. Noteworthy among his duties were the erection of an orphans' asylum at Hope-
well and of a home for the aged at Lawrence-
ville, N. J., also a day nursery in Trenton. He is the author of some excellent articles on *American Citizenship,* published a volume of *Pastoral Letters,* etc., and was a leading power in forming the Saint Michael's Diocesan Union. However, he is perhaps best known as the founder of the Federation of Catholic Societies and the reorganizer of the Ancient Order of Hibernians, American branch.

**Mackenzie, or M. Satire Upon the True-Blew Protestant Poet. T. S., a satire by John Dryden (q.v.), published in 1682, in which Thomas Shadwell has the principal part. Dryden here introduced the name of Richard Flecknoe (1660-1678), who by the author is represented as an Irish priest famed for his bad verse, but who is described by Andrew Marvell as *an English priest at Rome.* Flecknoe was disliked by Dryden because of the former's abuse of the players and his attacks on their morality or rather absence of it. The name served also as a
stalking-horse from behind which Shadwell might be pilloried as the adopted son and heir of Flecknoe. The nature served Pope as model for his 'Dunciad.' The authorship of 'MacFlecknoe' long disputed. N. M. S. Green, in Dryden, was called in question in 1718 when there appeared a possibility that it might have been written by John Oldham, Dryden's friend. A manuscript of the latter's poems in the Bodleian Library contains 'MacFlecknoe,' but Dryden's letters and other evidence attributed to his friend Oldham never did. Consult Belden, H. M., 'The Authorship of MacFlecknoe' (in Modern Language Notes, December 1918).

McFILMSY, māk fīmz', Flora, the heroine of the once famous poem 'Nothing to Wear,' by William Allen Butler (q.v.). It was published in 1857 and became immediately popular.

MacGAHAN, māk-gā'hān, Januarius Alysius, American journalist and war correspondent: b. near New Lexington, Ohio, 12 June 1844; d. Constantinople, 9 June 1878. He followed the different wars in Western States, then went to Europe and studied law in Brussels. Upon the outbreak of the Franco-German War in 1870 he went to the field as correspondent of the New York Herald, and was with Bourbaki's army. He visited Bordeaux and Lyons and his interviews with clerical, monarchical and republican leaders attracted wide attention. He was the only newspaper correspondent in Paris during the whole period of the Commune and narrowly escaped death. In 1873, after heroic exertions, with extreme hardships, he reached the Russian army before Khiva, and sent to the Herald reports of the campaign which won for him high admiration both here and in Europe, his account of the capitulation of the city being regarded as a masterpiece of military journalism. Returning to America, he went to Cuba to report on the Virginian affair, then to Spain, upon the Carlist uprising, where he spent 10 months with the army of Don Carlos, was captured by the Republicans, mistaken for a Carlist, condemned to death and saved by the intervention of the United States Minister. He then went to England, and in 1875 accompanied the Arctic expedition on the Pandora. In 1876 he joined the Turkish army, in the service of the Naps, and did memorable work in his description of the Bulgarian atrocities, his accounts standing approved before the world in face of all attempts to discredit them. In behalf of Bulgaria he appealed to Russia, was at the front in the Russo-Turkish War that followed, and was hailed as a chief instrument of Bulgaria's resulting independence. While nursing a friend he contracted a fever which in a few days caused his death. In 1884 the Ohio legislature secured the removal of his body from its foreign grave to its final resting-place at New Lexington. He wrote 'Campaigning on the Oxus, and the Fall of Khiva' (1874); 'Under the Northern Lights' (1876), and 'Turkish Atrocities in Bulgaria' (1876).

McGEE, māg'ē', Anita Newcomb, American physician: b. Washington, D. C., 4 Dec. 1892. She was educated at Newnham College, Cambridge, England, at the University of Geneva and at other institutions in Europe; also graduated in medicine at Columbia (now George Washington) University, 1892, and took a post-graduate course in gynecology at the Johns Hopkins Hospital. From 1892 to 1896 she practised in Washington. In 1888 she married W. J. McGee (q.v.). She has held prominent positions in the Daughters of the American Revolution, and from April to September 1898 was director of its hospital corps, which selected women nurses for army and navy. In August 1898 to December 1899 she was acting assistant surgeon in the United States army, being the first woman to hold such a position, and was assigned to duty in the surgeon-general's office, where she organized the army nurse corps. When the Congress approved this work by making the nurse corps of trained women a permanent part of the army the pioneer stage was passed, and she resigned 31 Dec. 1900. In 1904, acting as president of the Society of Spanish-American War Nurses and as representative of Philadelphia Red Cross Society and by agreement with Japanese government, took a party of trained nurses formerly in United States to serve in the Japanese army for six months gratuitously. She was appointed by the Japanese Minister of War as supervisor of nurses, which placed her in the same rank with officers of the Japanese army, and inspected and reported on relative nursing conditions. She is a recipient of the Japanese Imperial Order of the Sacred Crown and of a special Japanese Red Cross decoration and two Russo-Japanese War medals. She is a member of the Association of Military Surgeons of the United States and of the Spanish War Veterans, being the only woman eligible. She lectured on hygiene at the University of California in 1911, and has lectured throughout the United States and written for various magazines.

McGEE, Thomas D'Arcy, Canadian journalist and politician: b. Carlingford, Ireland, 13 April 1825; d. Ottawa, Ontario, 7 April 1868. In 1842 he emigrated to the United States. In 1845 he returned to Ireland, but complicity in the Young Ireland movement and an abortive attempt to raise rebellion among the Glasgow Irish caused him to seek refuge in the United States in 1848. McGee wrote the national song of the United States, the New York Nation for two years, became converted to constitutional methods for the redress of Irish grievances and went to Canada in 1857 where he was editor of the The New Era. He entered Parliament in 1857; was president of the Council 1864–67; g. l. minister; i. agriculturist on the carrying through of confederation, which his eloquence and persuasiveness had done much to popularize. His assassination was the result of his opposition to the Fenian movement. He published 'History of Ireland' (1862); 'Speeches and Addresses of the British-American Union' (1865), etc.

McGEE, W J, American scientist: b. in Dubuque County, Iowa, 17 April 1853; d. Washington, D. C., 4 Sept. 1912. He was self-educated, and from 1873 to 1875 surveyed land and practised in the courts. He also improved several agricultural implements, some of which he patented. In 1877–81 he made geologic and topographic surveys of northeastern Iowa, and for the United States Geological Survey he surveyed and mapped 300,000 square miles in the southeastern part of the country, and performed many other important services in the depart-
ments of geology, ethnology and anthropology. From 1893 to 1903 he was ethnologist in charge of the Bureau of American Ethnology. He was president of the American Anthropological Association, chief of the Department of Anthropology and Ethnology of the Louisiana Purchase Exposition and associate editor of the "American Magazine." He wrote 'Geology of Chesapeake Bay' (1888); 'Pleistocene History of Northwestern Iowa' (1891); 'The Lafayette Formation' (1892); 'Potable Waters of the Eastern United States' (1894); 'The Siouan Indians' (1897); 'Primitive Trephining in Peru' (1898); 'The Seri Indians' (1899); 'Primitive Numbers' (1901); 'Soil Erosion' (1911); 'Wells and Subsoil Water' (1913), and many scientific memoirs.

McGiffert, ma-gif'ert, Arthur Cush- man, American theologian and author: b. Sauquoit, N.Y., 4 March 1861. He was graduated at the Western Reserve College in 1882, and at Union Theological Seminary in 1885, and continued his studies at the universities of Berlin and Marburg, Germany, and in France and Italy. In 1888-90 he was instructor in Church history at Lane Theological Seminary, Cincinnati, and professor there 1890-93, since when he has been professor of Church History in the Union Theological Seminary, New York. In 1897 he published 'A History of Christianity in the Apostolic Age,' and in consequence of criticism and threatened denominational disturbance, involving his own probable trial for heresy, to which this book gave rise, he withdrew from the Presbyterian ministry, and later, while still retaining his professorship, joined the Congregational Church. His other publications include 'Dialogue Between a Christian and a Jew,' doctor's thesis (1889), and a translation of Eusebius' 'Church History,' with prelomomina and notes (1890); 'The Apostles Creed' (1902); 'Protestant Thought Before Kant' (1911); 'Martin Luther, the Man and his Work' (1911); 'The Rise of Modern Religious Ideas' (1915).

McGiffin, ma-gif'n, Philo Norton, American naval officer: b. Washington County, Pa., 1863; d. New York, 11 Feb. 1897. He was graduated in 1882 at the United States Naval Academy and was stationed in China, and at the outbreak of the war between China and France was permitted to resign from the United States navy to enter the service of China. He established a naval academy at Wei-hai-wei, of which he had charge. When the China-Japan War broke out he was in command of the Chhen Yuen, and was the first American or European to command a modern warship in action. He was in command at the battle of Yalu River, in which action he was so severely injured that he afterward shot himself at a hospital in New York.

McGill, ma-gil', James, Canadian philanthropist: b. Glasgow, Scotland, 6 Oct. 1744; d. Montreal, 19 Dec. 1813. He was educated in Glasgow and went to Canada, where he also engaged in the northwest fur-trade, afterward becoming a merchant in Montreal. McGill was a member of the Parliament of Lower Canada and held the rank of brigadier-general in the War of 1812. He spent much of his wealth in philanthropic work and at his death founded McGill College (q.v.) in Montreal.

McGill College and University, in Montreal, Canada, was founded in 1851 by James McGill (q.v.). By will he left an estate known as the "Brockman Acres," which contained 47 acres of land and a fine manor house, near Montreal, and $10,000 to the "Royal Institution for the Advancement of Learning," for the establishment of a university in Lower Canada (province of Quebec). The bequest was valued at about $120,000. It was stipulated that one of the colleges of the university should be known in perpetuity as McGill College. McGill University includes a group of schools or colleges and is affiliated with Cambridge, Oxford and Dublin universities. Many generous benefactors have supplied means for the foundation of various departments or faculties. The late Lord strathtona and Mount Royal erected and endowed the Royal Victoria College for Women. This is a residential college, and is only one of many gifts from the same donor, the last of which was a donation of $620,000 for the erection of a medical building. Sir William Macdonald erected, equipped and endowed the Macdonald Chemistry and Mining Building, the Macdonald Physics Building and the Macdonald Chemical Building, and gave $200,000 endowment to the Law School, besides other large donations. He has been the chief benefactor of the university. Peter Redpath gave the University Library and the Peter Redpath Museum. The degrees conferred by the university are B.A. and B.Sc. in the Facul- ty of Arts, and to both men and women; B.C.L. and D.C.L. in the Faculty of Law; B. Arch. and B.Sc., in the Faculty of Applied Science; M.D., C.M. and D.S., in the Faculty of Medicine; B.S.A. in the Faculty of Agriculture; Mus. Bach. and Mus. Doc. in the Department of Music and M.A., M.Sc., D.Sc., and D.Litt. in the Graduate School. There are four affiliated theological colleges which adjoin the university grounds. The supreme authority rests with the Crown and is exercised by the governor-general of Canada. The governors, 25 in number, manage the finances, appoint professors, pass statutes for the general government of the university and attend to other important matters. The president of the board of governors is ex officio, the chancellor. The vice-chancellor is the principal, who is the head of the academic department and chief administrative officer. The fellows number 43 and are chosen from all the faculties, affiliated colleges and other bodies, with due regard to the representation of each. They constitute the corpora- tion, the highest academic body, which deals with courses of study, matriculation, discipline, degrees, etc. There are connected with the university about 1,500 students and 200 professors and lecturers, besides a large number of demonstrators. The Library contains about 154,000 volumes. The grounds and buildings are valued at more than $8,000,000. The uni- versity is increasing its fine plant and equipment as fast as its finances will permit.

MacGILLICUDDY'S REEKS, (ma-gil-i-kud') Ireland, a picturesque mountain range, in County Kerry, etc., 13½ miles from the lakes of Killarney on the east to Lough Carra on the west, and covering an area of 28 square miles. It is the loftiest moun-
taint range in Ireland, culminating in Carran-
tuohill, 3,414 feet high.

McGILLIVRAY, ma-gil'vr, Alexander, chief of the Creek Indians: b. in Alabama about 1740; d. Pensacola, Fla., 17 Feb. 1793. His father was a Scottish merchant of good fam-
ily and his mother a half-breed. He received a good education at Charleston, S. C.; was placed in a mercantile establishment in Savannah;
but soon returned to the Creek country, where he became partner in a large trading house and rose to a high position among the Indians. After the death of his mother, a mem-
ber of the ruling stock, he became chief of the Creeks, having received a call from a formal council, and styled himself Emperor of the Creek Nation. During the Revolution the Mc-
Gillivrays, father and son, were zealous adherents of the royal cause, the former held the rank of a colonel in the British service. After
the war Alexander McGillivray, in behalf of the Creek confederacy, entered into an alli-
ance with Spain, of which government he was made a commissioner with the rank and title of colonel. In 1790 he was induced by President Washington to visit New York, where he eventually signed a treaty yielding certain dis-
puted lands lying on the Oconee. He was also persuaded to withdraw from Spanish service and was rewarded with an appointment as agent for the United States, with the rank and pay of brigadier-general.

McGILVARY, Evander Bradley, American
linguist and philosopher: b. Bangkok, Siam, 19 July 1864, of American parents. He was graduated from Davidson College in 1884 and from Princeton in 1888. He was appointed
as instructor in the classics at Bingham School in 1884, and in 1889-90 studied at Princeton
Theological Seminary. From 1891 to 1894 he was translator for the Presbyterian Board of
Foreign Missions in Siam, and in 1894 began graduate work at the University of California,
where he later became assistant professor. In 1899 he was appointed Sage professor of ethics
at Cornell. In 1905 he was appointed professor of philosophy at the University of Wiscon-
sin. In 1910 he was president of the Western Philosophical Association and in 1912-13 of
the American Philosophical Association. He has translated the Gospels of Matthew, Luke and John, and the Acts of the Apostles into the
Lao dialect of Siamese. He has contributed to various philosophical journals and to encyclo-
depias.

McGLYNN, ma-glin, Edward, American
was educated at the College of the Propaganda in Rome, and from 1862 was pastor of Saint
Stephen's Church in New York. He favored the education of children by the State rather than in parochial schools and in 1866 warmly
supported the candidacy of Henry George for the mayoralty, thereby bringing upon himself the
censure of the Church. He was summoned to Rome to exculpate himself, but refused to
go, pleading his ill-health. Persisting in his re-
frual he was excommunicated in 1887. He
was one of the founders of the Anti-Poverty So-
ciety and was its presiding officer.

McGOWEN, ma-gwén, John, American
author: b. Troy, N. Y., 18 Feb. 1850. He was
connected for 16 years, from 1874 to 1890, with the New York Tribune, and since 1880 has been engaged in literary
work and lecturing, chiefly on great writers and historical characters. In the action of S. E.
Gross, author of the play 'The Merchant Prince of Cornwall,' against Edmond Rostrand, au-
thor of 'Cyrano de Bergerac,' he acted as literary
expert for the former, furnishing in the case over 700 exhibits containing innumerable
parallels between the two dramas. The United States Court at Chicago issued a decree in 1902
sustaining the claim of Gross to priority of au-
thorship and forbidding the representation of 'Cyrano de Bergerac' in this country. Mc-
Govern's numerous writings include 'The Em-
pire of Information' (1880); 'A Pastoral Poem' (1882); 'The Empire of the Child' (1885);
'Under the Open Sky' (1890); 'King Dar-
win,' a novel (1894); 'American Statesmen'
(1895); 'Famous Women of the World' (1895); 'John McGovern's Poems' (1902); 'The
Golden Legacy'; 'History of Grain' (1913); 'Trees' psychologically considered; 'Hospitality'; 'In Bohemia,' etc.

McGRATH, ma-gráth, Harold, American
journalist and novelist: b. Syracuse, N. Y., 4
Sept. 1871. He was educated in Syracuse and
has been engaged in journalism since 1890. He
has written 'Arms and the Woman' (1895);
'The Puppet Crown' (1901); 'The Green
Cloak' (1903); 'The Princess Elopés' (1905);
'Enchantment' (1905); 'Hearts and Masks'
(1905); 'Half a Rogue' (1906); 'The Wat-
to Shepherdess,' an operetta (1906); 'The
Best Man,' (1907); 'The Enchanted Hare'
(1908); 'The Lure of the Mask' (1908); 'The
Goose Girl' (1909); 'A Splendid Hazard'
(1910); 'The Carpet from Bagdad' (1911); 'Place of Honeymoons' (1912); 'Parrot and
Co.' (1912); 'Deuces Wild' (1913); 'Adventures of Kathlyn' (1913); 'Million Dollar
Mystery' (1914); 'Piggin Island' (1914); 'Voice in the Fog' (1915).

McGRATH, Patrick Thomas, British-
American journalist: b. Saint John's, New-
foundland, 16 Dec. 1868. He was educated at the Christian Brothers' School, Saint John's,
and in 1889 became a reporter on the Saint
John's Evening Herald. He was promoted act-
ing editor in 1893, and in 1894-1907 was editor.
He established the Evening Chronicle, which in 1912 was united with the Herald, and became president of the company. He has acted as Newfoundland correspondent of the London Times since 1904 and is an extensive contributor to both British and American periodicals.
He has been president of the Legislative Coun-
cil of Newfoundland since 1915. He assisted in the preparation of the colony case concern-
ing the French and American fisheries and was the colony's secretary on the occasion of the
Dominion's Royal Commission visit to New-
foundland in 1914. He has been honorary sec-
tetary of the Newfoundland Regiment Finance
Committee and the Newfoundland War Pensions
Board since 1914; and chairman of the High-Cost-of-Living Commission since 1917. Author of 'From Ocean to Ocean' (1911); 'Newfoundland in 11.'

McGREGOR, ma-gṛḍ'ẹr, John ('Roy Roy'), Scottish traveler, writer and philanthropist; b. Gravenden, 21 Jan., 1825; d. Boscombe, 16 July 1892. He studied at Trinity College, Dublin, and was graduated from Trinity College, Cambridge, in 1847. He was called to the bar in 1851, but after a brief period in which he devoted himself to the law of patents he abandoned the profession and spent his time in travel and in works of philanthropy. He traveled in Europe, Egypt, Palestine, Russia, Algeria and America. He was deeply interested in the history and theory of marine propulsion and was largely instrumental in the introduction of sailing into British sports. He constructed a canoe which he christened Rob Roy, and in which he made extended journeys. His books giving accounts of these expeditions were widely and deservedly popular. He was possessed of ample resources and gave liberally to philanthropic purposes. He sketched cleverly and illustrated his own books, and in early days occasionally contributed sketches to Punch. Besides numerous magazine articles he was author of 'Three Days in the East' (1850); 'Our Brothers and Cousins, A Tour in Canada' (1859); 'A Thousand Miles in the Rob Roy Canoe' (1866); 'The Rob Roy on the Balltice' (1867); 'The Rob Roy on the Jordan, Red Sea and Gennesareth' (1869), etc.

McGUIRE, ma-gwir', Hunter Holmes, American surgeon; b. Winchester, Pa., 11 Oct. 1835; d. near Richmond, Va., 19 Sept. 1900. He was graduated from the Winchester Medical College in 1855, and from the Medical College of Virginia in 1856, studying in schools of New Orleans and Philadelphia. He was professor of anatomy at the Winchester Medical College in 1856-58 and afterward practiced in Philadelphia. He enlisted in the Confederate States of America in 1861, became medical director of the Army of the Shenandoah Valley and later of the Second Army Corps. He was in attendance upon General 'Stonewall' Jackson at the time of his death in 1863. In 1864 he was professor of surgery at the Virginia Medical College, Richmond. He organized Saint Luke's Home for the Sick in Richmond, with a training school for nurses. He was president of the American Medical Association in 1893.

MACH, mã'h, Ernst, Austrian physicist and philosopher; b. Turos, Moravia, Austria, 18 Feb. 1838; d. 9 Feb. 1916. After a partly private secondary education he studied at the University of Vienna, taking his doctor's degree in physics in 1860. After spending several years as private assistant he was appointed professor of mathematics at Graz, and in 1867 was called to the chair of physics at the University of Prague. Here he published in 1883 his first important work, 'Die Mechanik in ihrer Entwickelung historisch-kritisch dargestellt,' which has run through several German and several English editions. Having turned his attention to the relation of physiological and physical processes, he next produced his equally epoch-making 'Analyse der Empfindungen' (1880; 6th ed., 1911). Owing to his increased interest in epistemological and historical problems, Mach gladly accepted in 1895 the offer of a philosophical chair at Vienna, where he read on the history and theory of the inductive sciences. The following year appeared his 'Principien der Wärmelehre,' while his university lectures ultimately took the shape of a substantial volume in 1905 under the caption 'Erkennthinis und Irrtum.' A paralytic stroke suffered in 1898 reduced the remainder of his life to a cripple's martyrdom, though it did not interfere with his mental activity. In spite of his liberal position in politics he was honored with the title of a court chancellor and was made a member of the upper chamber of the Austrian Parliament.

Mach's aim was to liberate science from metaphysical conceptions and thus he became in a sense a precursor of pragmatism. His general trend of thought exerted a profound influence on men like William James, Jacques Loeb, Karl Pearson and Wilhelm Ostwald, and his attempt to substitute the mathematical notion of function in place of the time-honored concept of causality has recently found an ad-
vocate in Bertrand Russell. His definition of science as an economical description rather than an explanation of the universe aroused considerable discussion in philosophical circles. Sympathetic insight, impartiality, a singularly sane judgment and an almost complete freedom from preconceptions render Mach an ideal historian of science and one of the trustworthy leaders of advanced thought. His principal works are accessible in English translations. For a brief exposition of his philosophy with biographical notes consult Carus, Paul, 'Professor Mach and his Work' (in The Monist, January 1911, pp. 18-42).

ROBERT H. LOWIE,
American Museum of Natural History.

MÁCHA, má'ka, Charles Ignace, Czech poet; b. Prague, 10 Nov. 1810; d. Leitmeritz, 5 Oct. 1836. His style of poetry is full of sentiment and reflection, a forerunner of the present Czech school of poetry, strongly influenced by Byronic 'Weltschmerz,' i.e., the spirit bred by the realization of disharmony between ideals and concrete facts of reality. He studied in Vienna and Prague. Extreme poverty caused pulmonary trouble, from which he died after a lingering illness. His chief work, 'Máj' (Prague 1836), is a lyrical epic. His historic tales, such as 'The Gypsies,' etc., are in the style of Walter Scott. His collected works were published in Prague (1862).

MACHERODUS, má'kêrô-dûs, a genus of huge extinct cats, fossil in the Miocene and sub-Miocene formations, and including the largest of the Nimravidae. See SABRE-TOOTHED TIGER.

MACAIRODONTINE, má-kêrô-dôn'ti, an extinct subfamily of Felidae, including the sabre-toothed cats and their allies. This group became separated from the typical cats (Felinae) in the Oligocene epoch, and remained a numerous and powerful element of the carnivora of the world until the close of the Pleistocene. The general form and structure were catlike, and produced an equally effective armament, except, perhaps, in speed, for the limbs were shorter and heavier as a rule than in the feline cats of similar size, and the hind foot had five toes, instead of four. Another difference was in the comparative shortness of the tail. Mainly, however, the specialization of this subfamily was in the dentition, which differed from that of the cats in many particulars, and especially in the extraordinary development of the upper canines into huge stabbing-tusks, especially striking in Smilodon, one of the most modern and widely distributed American genera. Other genera are Hoplophones, a primitive genus of the White River beds, with species of small size; Machairodus, Equusmus and Dimictis were other White River genera of importance, while later forms illustrate the genera Arctocyon and Nimrurus.

MACAR, má-kâr, Agnes Maule (FIDELIS), Canadian author; b. Kingston, Ontario, about 1856. She was educated at Kingston and at an early age her contributions began appearing in the magazines of Canada, England and the United States. She is author of a volume of verse, 'Lays of the True North'; her historical works, 'Memorials of Rev. Dr. Macar'—the author's father; 'The Story of Old Kingston' (1908); 'Stories of the British Empire' (1913); and the novels, 'Katie Johnston's Cross'; 'Lost and Won'; 'Roland Graeme, Knight' (1892); 'The Heir of Fairmount Grange,' etc.

McHENRY, mák-hên'ri, James, American military surgeon and politician; b. Baltimore, County Antrim, Ireland, 1753; d. 1816. He had studied at Dublin, when, about 1771, he came to America, and in Philadelphia soon entered upon the study of medicine under Dr. Benjamin Rush (q.v.). On the outbreak of the Revolution he became surgeon of the 5th Pennsylvania regiment; in November 1776 was taken prisoner at Fort Washington; was paroled in the following January, and in March 1778 exchanged. In May of that year he was made assistant private secretary to Washington, and held that position until October 1780, when as major he was appointed to a place on the staff of Lafayette. Elected in 1781 to the Maryland senate, he continued a member of that body until 1786, being also during the second half of that period a delegate to the Confederation Congress. In 1787 he was made a member of the Constitutional Convention; in 1789 was elected to the general assembly of Maryland, and sat in the senate of that State, 1791-96, when he was appointed by Washington as assistant secretary of war, retaining that position in the cabinet under John Adams' administration until 1800. As an ardent Federalist he used his influence in favor of a strong national defense, and was a zealous partisan of Alexander Hamilton. His partisanship in favor of Hamilton led to a request for his resignation from President Adams. After resigning from Adams' Cabinet he spent the rest of his life in Maryland. Fort McHenry (q.v.) was named after him.

McHENRY, James, American physician and author; b. Larned, County Antrim, Ireland, 20 Dec. 1785; d. there, 21 July 1843. He was educated in Dublin and Glasgow, practised his profession for a time in Ireland and in 1817 emigrated to the United States and finally settled in Philadelphia, where he practised medicine and was engaged in literary work. In 1842 he was appointed United States consul at Londonderry and held that post until his death. Among his works are 'The Usurper; an Historical Tragedy' (played in Philadelphia 1820); 'The Wilderness, or Braddock's Times; A Tale of the West' (2 vols., 1823); 'Jackson's Wreath' (1829); 'O'Halloran or the Insurgent' (1824); 'The Betrothed of Wyoming' (2d ed., 1830), etc.

McHENRY, Fort. See Fort MCHENRY.

MACHETE, má-chê'tâ, a short sword-like tool, half knife, half cleaver, used in Cuba and other countries of tropical America for cutting cane and as a weapon in war. It was first brought into prominence during the Cuban revolution.

MACHIAS, má-chî'as, Me., town, county-seat of Washington County, on the Machias River, and on the Washington County Railroad, about 120 miles east by north of Augusta. It is about 12 miles from the mouth of Machias River is. A trading post was established here in 1633, by Englishmen, but a few months after they were forced by the French to abandon the place. The first permanent settlement was made in 1763, and in 1784 it was incorporated
MACHIAVELLI, Niccolo, né-koh-lo' mā-kē-ā-vēll'ē or māk-tā-vēll', Italian historian and statesman, possibly the greatest prose writer of the Italian Renaissance; b. Florence, 3 May 1469; d. there, 22 June 1527. Of Niccolo's early life and education we know nothing. No trace of him remains previous to his 26th year. But of his times and the scenes amid which he grew up, we know much. It was the calm but demoralizing era of Lorenzo the Magnificent. Machiavelli was a true child of his time. He too was thoroughly imbued with the spirit of the Renaissance; and looked back, fascinated, on the ideals of that ancient world that was being revived for the men of his day. But philosophy, letters and art were not the only heritage that the by-gone age had handed down; politics—the building of states and of empires—this also had engaged the minds of the literati of that age, and it was this aspect of their activity that fired the imagination of the young Florentine. From his writings we know he was widely read in the Latin and Italian classics. But Virgil and Horace appealed to him less than Livy, and Dante the poet was less to him than Dante the politician; for he read his classics, not as others, to drink in their music or be led captive by their beauty, but to derive lessons in statecraft and penetrate into the secrets of the successful empire-builders of the past. It is equally certain, from a study of his works, that he had not mastered Greek. Like Ariosto, Machiavelli was indebted for his superb literary technique solely to the study of the literature of his own nation.

With the expulsion of the Medici from Florence, Machiavelli, at 38, emerged from obscurity to play a most important rôle in the Florentine politics of the succeeding decade and a half. In 1498 he was elected secretary to the Ten of War and Peace. and from 1498 to 1512 was a zealous, patriotic and indefatigable servant of the republic. His energy was untried; his activity ceaseless and many-sided. He conducted the voluminous diplomatic correspondence devolving upon his bureau, drew up memorials and plans in affairs of state for the use and guidance of the Ten, undertook the reorganization of the Florentine troops and went himself on a succession of embassies, ranging in importance from those to petty Italian states up to those to the court of France and of the emperor. He was by nature well adapted to the peculiar needs of the diplomacy of that day; and the training he received in that school must in turn have reacted on him to confirm his native bent and accentuate it until it became the distinguishing characteristic of the man. His first lessons in politics and statecraft were derived from Livy's history of the not over-scrupulous Romans; and when he comes to take his lessons at first hand, it is in the midst of the intrigues of republican Florence, or at the court of a Caterina Strozzi, or in the camp of a Cesare Borgia. Small wonder that his conception of politics should have omitted to take account of honesty and the moral law; and that he conceived the idea of giving to politics and statecraft the name of Machiavelism as having a proper and distinct value of their own, entirely apart from their moral value. During this period of his political activity we have a large number of state papers and private letters from his pen, and of literary cast. These are his 'Decennale': historic narratives, cast into poetic form, of Italian events. The first treat of the decade beginning 1494; and the second, an unfinished fragment, of the decade beginning 1504. They are written in easy verse, and are noteworthy as expressing the sentiment for a united Italy. When in 1512 the Medici returned to Florence in the train of her invader, Machiavelli was dismissed from his office and banished for a year from the confines of the city. Later, on the suspicion of being concerned in the death of the Medici, he was thrown into prison and tortured. He was afterward included in a general pardon granted by Leo X. But Machiavelli did not return to public life until 1525; and this interval of enforced leisure was the period of his literary activity. A number of comedies, minor poems and short prose compositions did not rise above mediocrity. But in one dramatic effort he rose to the stature of genius. His 'Mandragra' achieved a flattering success, both at Rome and in Florence. It has been pronounced the finest comedy of the Italian stage; Macaulay rated it as inferior only to the greatest of Molière's. In its form, its spontaneity, vivacity and wit, it is not surpassed by Shakespeare; but it is a biting satire on religion and morality, with not even a hint of a moral to redeem it.

His lesser prose works are the 'Life of Castruccio Castracani,' and the 'Art of War,' a treatise anticipating much of our modern tactics. A more ambitious undertaking, and his largest work, is the 'History of Florence.' At the suggestion of the Cardinal de' Medici, the directors of the studio of Florence commissioned Machiavelli to employ himself in writing a history of Florence, from whatever period he might think fit to select, and either in the Latin or the Tuscan tongue, according to his taste. He was to receive 100 florins a year for two years to enable him to pursue the work. He chose his native tongue; and revised and polished his work until it became a model of style, and in its best passages justifies his claim to the title of the best and most finished of Italian prose writers.

But though Machiavelli had the historical style, he lacked historical perspective; he arranged his matter not according to objective value, but placed in the bolddest relief those events that best lent support to his own theories of politics and statecraft. He makes his facts to be as he wishes them, rather than as he knows them to be. To Machiavelli history was largely to be written as a 'Tendensromaus,'—manufactured to point a preconceived moral,
MACHINE COMPOSITION — MACHINE FORGING

Though Machiavelli wrote history, poetry and comedy, it is not by these he is remembered. The works that have made his name a synonym, and given it a place in every tongue, were written in the first years of his retirement from political life: 'The Prince' and the 'Discourses on the First Ten Books of Titus Livius.' Each is a treatise on statecraft; together they form a complete and unified treatise, and represent an attempt to formulate inductively a science of politics. The 'Discourses' study republican institutions, 'The Prince' monarchial ones. The first is the more elementary and would come first in logical arrangement. But in the writing of them Machiavelli had in view more than the foundation of a science of politics. He was anxious to win the favor of the Medici; and as these were not so much interested in how republics are best built up, he completed 'The Prince' first, and sent it forth with the request that it be presented to Lorenzo, son of Piero de' Medici. In the 'Discourses,' the author essays a 'new science of statesmanship, based on the experience of human events and history.' In that day of worship of the ancient world, Machiavelli endeavors to show that the study of politics is as it was in the days of Livy he finds the field for this study.

In his commentary on the course of Romulus in the founding of Rome, we find the keynote of Machiavelli's system of political science. His aim is the building of a state; his one thought, how best to accomplish his aim. Means are therefore to be selected, and to be judged, solely as regards their effectiveness to the business in hand. Ordinary means are of course to be preferred but extraordinary must be used when needed.

In 'The Prince,' a short treatise of 26 chapters, and making little more than a hundred octavo pages, Machiavelli gives more succinct and emphatic expression to the principles of his new political science. It is the best known of all his works. It is the one always connected with his name, and which has made his name famous. For the model of his prince, Machiavelli took Cesare Borgia and cites him as an example of plutocratic ambition; and he has shared in the execration that posterity has heaped upon Borgia. The strongest moral contradictions abound throughout 'The Prince,' as they do in all Machiavelli's writings. He is saint or devil according as you select your extracts from his writings.

Shakespeare, reflecting English thought, uses his name as the superlative for craft and murderous treachery. But later years have raised up defenders for him, and his rehabilitation is still going on. He has been lauded as the noblest and purest of patriots, and more ardent admirers could even praise his generosity, nobility, and exquisite delicacy of mind, and go so far as to declare him an incomparable model of public and private virtue.

His rehabilitation proceeds from two causes. Later research has shown that perhaps he only reflected his time; and his works breathe a passionate longing for that Italian unity which in our day has been realized. He may be worthy cancellation of national sentiment: but those who are more interested in the integrity of moral standards than in Italian unity will doubtless continue to refuse beatification to one who indeed knew the Roman virtus, but was insensible to the nature of virtue as understood by the followers of Christ. And no amount of research into the history of his age can make his principles less vicious in their effects. A longer interval of time can only lessen the boldness of the relief in which he has heretofore stood out in history. He was probably no worse than many of his fellows. He only gave a scientific formulation to their practices. He dared openly to avow and justify the principles that their actions implied. They paid to virtus the court of hypocrisy, and like the Pharisee of the earlier time, preached righteousness and did evil; but Machiavelli was more daring, and when he served the devil, disdained to go about his business in the livery of heaven. (See PRINCE, THE.) Among the editions of the collective works of Machiavelli may be mentioned those of Milan, 1810-11; Florence, 1813; Milan, 1821-22; Florence, 1855-56; London, 1873-77; Boston English translation (1891). The rendering of the 'Art of War' and 'The Prince' (in the 'Tudor Translations Vols. XXXIX and XL, London 1905), with Cast's introduction, is an admirable piece of work. Consult also 'Modern State' (Boston 1904); Morley, John, 'Machiavelli' (London 1898); Murrison, 'Machiavelli' (Paris 1883); Tommasini, 'La vita e gli scritti di Niccolo Machiavelli' (Turin 1882); Villari, 'Niccolo Machiavelli e i suoi tempi' (Florence 1877-82), and Burd's study (in the 'Cambridge Modern History' Vol. 1, Cambridge 1902), with bibliography.

MACHINE COMPOSITION. See COMPOSING MACHINES.

MACHINE DESIGN. See DRAWING, MECHANICS.

MACHINE ENGRAVING, a mechanical process for engraving on wood, metal or stone. Since 1880 numerous machines have been invented to produce regular tints, geometrical and other designs and patterns, far more rapidly than by hand work. The most complex engraving is now executed wholly by machinery. Engraving by mechanical means is generally employed in the making of bank-notes, diplomas, stock certificates and other papers and documents, where special designs are required. Elaborate gearing systems have been introduced whereby the cutting tools execute a certain number of symmetrical motions and thus produce elaborate geometrical patterns. The first engraving machine was the invention of Wilson Lowry and was employed to engrave the plain background, skies, etc., of a plate. Most modern machines are so fitted that the cutting tool may be moved a certain definite distance after each cut so that the succeeding cut will be a line parallel to and at a regular distance from the last. The cutting tool is also fitted so that the depth and breadth of the cut may be easily regulated. The cutting edge of the tool is held or guided by a highly-tempered steel for metal work, except in the case of copper, which is often coated with varnish, next scratched with the design and afterward etched by acid. For stone work, the cutting tool has a diamond point or a bit on the holder regulate the depth of the cut. See BANK NOTES, MANUFACTURE OF.

MACHINE FORGING. The art of the blacksmith, working by hand at the forge and
anvil, has almost wholly disappeared, and the shaping of wrought iron and steel is now performed by machines. The exact duplication of parts of machinery began in the United States about 1854, and it became necessary to have forgings of uniform size so that they could be properly handled in special fixtures or holders while being machined to exact dimensions.

**Drop Forging.—** In the first attempt to obtain uniform forgings the smith hammered by hand the rough stock into a rude suggestion of the shape wanted so as to properly distribute the material and then placed it in an impression cut in a block of steel or cast to shape and forced it into the cavity by a series of blows from hand hammer and sledge.

The growing demand for firearms and other accurately made mechanisms developed the necessity for improvements in this line which kept pace with the requirements of the times, until the drop-hammer was produced. These hammers are named invariably by the weight of the hammer-head or ram and they range in sizes from 50 to 5,000 pounds.

Hammers are also constructed to operate by steam power of heavier types. They lift the ram or hammer head and drive it downward by steam power in a manner similar to the regulation steam-hammer. The regular belt-driven drop-hammer, as used in drop-forging, is operated usually by a treadle which the workman trips with his foot. This movement releases a clamp or catch which holds up the hammer-head and allows it to fall or drop. It is raised by the friction of two rolls which revolve rapidly, gripping the surface of a board which is wedged into a slot in the top of the hammer-head or ram. The hammer-head is clamped or latched at the end of the stroke by an automatic attachment and released at the will of the operator.

The hammer-head or ram is made usually with a dovetail opening at its bottom, into which is placed the upper die. It is held firmly in position by a key driven into place by sledge-hammering. The base or anvil of the drop-hammer is made of cast iron or cast steel, and a forged steel seat or holder for the lower die is keyed into the base in a similar manner. This seat or holder is frequently called a "sow" or "shoe," and is adapted merely to save useless wear of the base. It can be renewed at a small cost.

A similar dovetail opening is made in this holder into which the lower die is placed. This is keyed into exact position to match the upper die so that when the faces of the dies meet at the end of the blow stroke the complete impression is formed.

Drop-hammers are made generally of cast iron, i.e. the base or anvil, the side rails or guides and the lifter frame. The working parts are made from forged steel. Various heights of the fall or drop of the hammer-head can be had by shifting a "latch" or "dog" on the operating rod. From six inches to five feet fall can be obtained if desired. Foundations are best made of solid concrete. In connection with the drop-hammer a press is used to remove by punching out or breaking away a "flash" or surplus metal which spreads out between the dies after the impression therein is filled. This "flash" is sheared off either hot or cold as the character of the work permits.

**Making the Dies.—** A model of the part to be forged is made, usually of wood, if it be a form not clearly shown by a drawing. When given to the United States, the required weight of the finished forging, the die-sinker has the principal data required by him to make the dies. After selecting the proper size blocks which have been planed smooth and made with dovetails or shanks, the die-sinker determines the form. Also the best parting line for the forging in much the same way as does the pattern-maker on a pattern for a casting, but the analogy between the two is comparatively slight as the conditions are radically different.

The pattern-maker can use cores and loose pieces to make cavities and overhanging parts, but the die-sinker is practically limited to a die opening in two parts, which must be made to stand the roughest usage. The outline of the piece to be forged is drawn on the surface of the die which has been copedper with a blue vitriol solution, this causing the lines to stand out sharply. The metal is then removed in a manner that is most expedient for that particular example. If the outline be circular the stock is turned out on a lathe. If the shape of the forging be square, other means are required for removing the metal from the die, the profiling machine readily furnishes a way for following the most complicated forms by means of milling cutters of various shapes and sizes. The shaper and milling machines are also impressed into service as well as the planer and drill.

Chipping by hand is commonly done, and in nearly every case a file, rifle, scraper and some emery cloth are required to finish the impression to the required smoothness and regularity.

The forming of an irregular cavity in the face of a high carbon steel die so that when its mating die is matched to it the shape of the space enclosed will not vary from the specified dimensions more than 2-1,000ths of an inch either way is an operation requiring skill and patience.

After the complete impression is made a proof can be taken by filling the cavity with melted lead. A shallow space is cut in the face of each around the impression. This is technically called the flash of the die. As it is practically impossible for the drop-forging to form the bar or billet of steel into just the shape and size required for the forging, this space must be left for the overflow of surplus metal.

If the article to be forged is of a simple form only one pair of forging dies is necessary as the "roughing" or "breakdown" impressions can be cut in the same pair of blocks which contains the finishing impressions. If the piece be more complicated, separate "roughing" or "breakdown" dies are necessary.

Trimming dies, to be used in the press, are necessary to remove the flash. They are made in male and female form; the upper part being the male die and the lower one the female. The male die is made of the outline of the forging through the parting line, and with its face conforming to all the irregularities of the upper part of the "flash" or surplus metal which is cut away at the bottom so that the trimmed forging can fall through it into a receptacle under the press. It is also made with its cutting edge conforming to the parting line.
MACHINE GUN

The dies are then heated carefully in furnaces, the heat of which is usually determined by a pyrometer, to a temperature, and are then hardened and tempered. Any warping in hardening which may occur is remedied by grinding the surfaces with an emery wheel. See DIES AND DIE MAKING.

The operation of drop-forging consists of first heating the bar or piece to a proper temperature. The heat depends entirely on the quality of the metal used. It is then placed in the "roughing" or "breakdown" impression and given a number of blows which shape it roughly into form and it is finally placed in the finishing impression and forged to the exact size. The flash is then trimmed off in the press and the forging is practically complete.

The number of blows required depends entirely on the shape and size of the forging. Some pieces can be made by two or three blows while others may require as many as 100. If the forgings are made of high carbon steel it is frequently necessary to anneal them so that they can be readily machined, and in many cases pickling in a weak solution of sulphuric acid is resorted to, so as to remove the scale or oxidation which forms on the surface of each forging while cooling.

Drop-forgings can be made from iron, steel, copper, brass or aluminum, or from any metal which will not disintegrate during heating or while being worked. The uniformity of temperature cannot be forged successfully. They can vary in weight—from a fractional part of an ounce to over 100 pounds each.

Upsetting and Forging Machines.—Towards the close of the 19th century it became recognized that upsetting could be accomplished by pressure as well as by blows, and this idea was developed into the commercial upsetting and forging machines which now handle the bulk of small parts and a good many large parts of modern machines. Hammer-blows cause jamming and vibration which are destructive to the machine itself, and require heavy foundations, heavy bed-plates, etc. The pressure machines do their work with less noise and more scientifically. The very much reduced cost of building automobiles and a great variety of duplicate machines made the number of machines increase. This is due largely to the quick shaping made possible by machine forging. An upsetting and forging machine is made with a very heavy steel bed. The opposed dies for gripping the work are gripped in the machine, and the pressure is applied by a toggle-joint mechanism.

In all such machines it is necessary to limit the pressure, else excess would break the machine. This limitation is accomplished in two ways—by placing heavy springs in the machine which give when a certain pressure is attained; and by locking the back of one of the die supports with a bolt of a given strength, arranged between hard square edges which will cut or shear off the bolt when the pressure reaches above a given point.

The method of making a common hexagonal nut in such a forging machine consists in (1) placing the dies in the forging machine; (2) heating a bar of iron between 1,400° and 1,600° F.—the temperature varying with the character of the iron; (3) thrusting the red-hot end of the bar into the lower die in the forging machine, and throwing the lever to cause the machine to squeeze, which upsets the end of the bar and shapes it for a nut; (4) withdrawing the bar quickly and placing in the upper die; (5) repeating the squeeze, which forces the hole through the nut, leaving the removed metal on the bar, and separating the nut. The nut is delivered with a slight fin, which has to be removed, when it is ready to go to the thread-cutter.

The front axle of an automobile may be forged in one of these pressure forging machines in about seven operations. The last squeezing operation delivers the completely formed axle. Any quantity of more or less intricately formed parts are now made of wrought iron and steel in this manner, the heavier operations being done on the steam-hammer, as a rule.

The forging machine is also used for welding or joining separate pieces by pressure. It is just as easy to apply a flux to assist the joining in the forging machine as on the anvil. The Ajax universal forging machine not only compresses the dies, but has an independent vertical press that can be used for any operation within its capacity; also a punching device and a trimmer.

A variety of special forging machines are made for forming common articles, or parts required in large quantity. Many of them are named after the work they accomplish. The hot-pressed centre-feed nut machine is simply a small forging machine designed for making nuts. Bolt-heading machines and bolt and rivet headers are other examples of special forging machines.

Pressed steel is made by great hydraulic presses at the steel works. Pieces requiring but slight shaping are pressed in the cold; more or less complicated forms are heated to a cherry red and then light-pressed. Modern railway steel cars are made in this manner. Armor plates are formed in hydraulic presses under immense pressures which are maintained for a considerable time.

CHARLES H. COCHRANE.

MACHINE GUN, a firearm of small calibre fitted with mechanism by which it may be fired successively with great rapidity. Two distinct classes have been developed: (1) That in which the firing is done by turning a crank by hand; and (2) an automatic form which utilizes the recoil of the gun, or a part of the force of the exploding charge to operate the firing and reloading mechanism. The first class has been practically abandoned. In the automatic class the first shot is fired by working a lever, and the gun then continues to fire until the ammunition is no longer supplied—leaving the sufferer free to give his whole attention to the aiming of the gun.

As to the relative merits of the two existing types of the automatic machine gun, expert opinion is divided, with perhaps a preponderance in favor of the gun operated by the recoil, as a technically better design: the recoil has to be provided for in any case and is thus made to do necessary work. In this type the breech block is separated from the barrel and linked to it by multiplying cam levers. The recoil is taken up and partly stored by a powerful spring, which thus becomes the source of the
other movements—which eject the empty shell, bring a new cartridge into position, insert it in the firing chamber of the gun and explode it; this cycle continuing as long as there is a recoil to keep up the energy. In the gun operated by the gas pressure of the discharged, a very small channel leads out of the interior of the gun barrel, and this is opened to the pressure of the explosion gases as the bullet passes. In some guns the gas is taken from very near the firing chamber; in others it is from near the muzzle where the air leaves the gun. In both cases the channel leads to a piston which is thrust backward by the force of the explosion against a powerful coiled spring, which stores a part of the energy and returns the piston to its original position the instant the pressure is released by the bullet leaving the muzzle. In this type of gun the recoil is taken up by a buffer spring which does not do any work. The amount of force taken from the propelling gases of the charge is so minute that it is negligible, especially when it is taken from close to the muzzle, when the bullet has acquired its full velocity. It may be added that both methods work perfectly. The Maxim, Schwarzlose and Browning guns are for the recoil; the Colt, Hotchkiss and Lewis guns and the Browning rifle by explosion gases.

The great mechanical difficulty to be overcome in a machine gun is the heating up of the barrel due to the rapidly recurring explosions, the cumulative effect being so to expand the barrel that the rifling grooves no longer grip the bullets, which fly out helter-skelter as from a smooth bore, falling to the ground after a very short flight. Two methods of keeping the gun cool while in action have been utilized: air-cooling and water-cooling. In the former, thin "fins" of metal are affixed to the gun barrel so as to expose a comparatively very large surface to the air which is expected to disperse the heat by radiation and convection. When the air is moist this device is quite successful, but the drier the air the less it absorbs the heat and the quicker the gun will go out of commission. In practice it has been found that an air-cooled gun cannot be fired continuously for longer than three and one-half minutes, when it must be allowed to cool down, or another barrel must be substituted. Tests have shown that 7,000 rounds fired without respite will destroy the gun barrel; but if the firing it stopped at the end of two minutes, and the gun cooled, the same barrel will fire 50,000 shots before a new one need be put in. On aircraft, however, the air-cooled gun never gets overheated owing to the swiftness of the passage through the air and the generally cooler air currents in which the aircraft move. Special mention may be made here of the Lewis gun, which is air-cooled in an unusual fashion. The aluminum "fins" in this gun lie lengthwise along the barrel and are about two inches in depth. The whole is encased in a shell of light steel; the forces are operated by a spring at both ends. When the gun is fired the explosion acts so as to draw air from the next bend the breech through these air channels at a speed of 100 feet per second, proving a thoroughly effective cooling device. The Colt gun is designed so that a puff of air is sent through the barrel after each shot.

In the water-cooled guns the barrel is encased in a jacket filled with water, and the heat generated by the explosions is absorbed in the heating of the water to the boiling point (which takes but two and one-half minutes) and keeping it boiling. The steam is led by a flexible tube into a reservoir of cool water standing on the ground beneath the gun, and is there condensed. The water from this reservoir is used to replenish the supply in the jacket as it boils away. The Maxim, Gardner, Schwarzlose, Vickers and Browning machine guns are water-cooled. When used in aeroplanes however, water jackets are not needed, and are removed, the stripped guns operating satisfactorily as air-cooled guns. The water-cooled guns show greater endurance than the air-cooled type. The Schwarzlose (Austrian) gun, which is essentially a modified Maxim, is notable as having fired continuously 35,000 rounds before the mechanism required repair. The Browning gun at its official trial fired 39,500 rounds before the mechanism gave out. Most machine guns have their ammunition arranged in pockets of belts made of fabric, with 250 cartridges on each belt; these are attached to metal bands from 25 to 30 cartridge to each band. The Lewis gun carries its cartridges in a drum-shaped magazine. Formerly the machine gun was mounted on a carriage, but a stout tripod is now preferred and the gun is normally placed so as to be about two feet from the ground. The method of transporting it is by pack-horse, though in the Great War these guns were usually carried on automobile trucks to the nearest point possible and carried by hand or dragged on a sled-mounting to the position where they were to be used. The German machine gun has a stand with four legs which may be extended like the poles of a stretcher, and the gun thus carried by two strong men, in case of emergency and easily by four men. Some types have adjustable skeleton wheels.

The principle of the machine gun has been applied to weapons of larger than rifle calibre and with a measure of success. The Maxim "pompons" or 37-millimetre gun, throws one-pound shells at 1,700 feet, and 300 in a minute. The Hotchkiss gun is also made for one-pound shells. The Maxim combination automatic nine-pounder gun fires 60 shots per minute, but cannot be aimed at this speed. It is arranged to fire also as slowly as desired.

The machine gun is regarded from a tactical point of view as an infantry gun—as distinguished from artillery. That is, its effect is that of concentrated infantry fire. It is considered as equivalent to 100 rifles, is far more easily concealed and is much more effective, due to the elimination of the human factor. It can deliver a sweeping fire over a wide front, or a concentrated fire upon a small area. While it is wasteful of ammunition, the effect of之 is so much more effective against enemy troops in the field. It is primarily a defensive weapon most useful in stopping advancing forces; but, given the attainment of a commanding position, it is supremely effective in putting hostile artillery out of commission. It is of comparatively little use against an enemy in line directly in front, but is invaluable in
enfilade. For this reason machine-gun placements often occupy salients, and have loopholes that open obliquely. In the field the machine guns are moved forward with the attacking troops to hold the ground won by advance and are often used in firing over the heads of a force advancing to an attack. It is effective up to 2,800 yards. As used in aeroplanes it sprays solid formations and supply trains on the march with a most deadly and demoralizing fire besides being the chief weapon in air battles.

In 1917 the Maxim gun was in use by the armies of Great Britain, Russia, Italy, Spain, Portugal, Norway, Sweden, Holland, Turkey, which had fewer barrels and in the latest style; the Hotchkiss gun in France, Japan, Spain and Portugal; the Schwarzlose gun in Germany, Austria and Bulgaria. Norway, Sweden and Denmark also used the Madsen automatic rifle. The Browning guns of both light and heavy types were introduced in 1899 in the United States army and Lewis automatic rifles in the navy and the aeroplane service. The Lewis rifle is used also by the armies of Great Britain and France.

History.—The first machine gun to be produced was the Gatling gun, invented by Dr. R. J. Gatling of the United States. It had 10 rifled barrels arranged in the form of a hollow cylinder and was fired by turning a crank. The several barrels were discharged in succession, and delivered 500 shots per minute, scattered over the field at any angle. As each barrel fired only one shot out of 10, there was no difficulty from overheating. This gun was adopted by the British army in 1875. The Gatling gun was followed by the Gardner gun, and in 1891 two guns were put in a water jacket. The Nordenfelt gun was the next (1878), and worked on the same principle as the Gatling. In 1885 Hiram Maxim first exhibited his automatic machine gun, and this was followed by the Hotchkiss gun. The chief differences were that the Maxim gun was water-cooled and the Hotchkiss air-cooled, and that the former operated by the recoil, and the latter by gas pressure. The Colt machine gun followed. In 1906 the Schwarzlose gun created a sensation. It was modeled upon the Maxim gun, but remarkably simplified. The Lewis gun, or, more correctly, automatic rifle was adopted by the British army in 1909. It weighs 25 1/4 pounds, and can be fired from the shoulder. Its magazine holds 40 cartridges. The Madsen automatic rifle is similar in type, but weighs only 15 pounds, and its magazine holds from 20 to 30 cartridges. In 1916 the Browning guns were invented especially for the United States army. The Browning automatic rifle resembles closely the Madsen rifle in appearance, weighs 15 pounds, and its detachable magazines carry generally 20 rounds although special magazines holding 40 rounds are also provided. The Browning machine gun resembles the Colt gun in some respects, and the Schwarzlose gun in others. Its ammunition is carried in belts holding 250 cartridges, which feed into a magazine mounted above the tripod. The Browning gun can be stripped of its water-cooling jacket for aeroplane work, and in that form weighs only 22 1/2 pounds.

RICHARD FERRIS.

MACHINE GUN TACTICS. Machine guns are preferable to infantry whenever fire alone is sufficient for the purpose. Infantry is indispensable when both fire and movement are required. The machine gun delivers a very effective grazing fire up to 900 or 1,000 yards; its fire is effective upon important targets at ranges over 1,100 provided the range is accurately estimated. The two chief uses of machine guns are in flank fire and surprise fire. The sheaf of bullets is dense and deep, but narrow; its maximum effect will be obtained upon a target having a narrow front and considerable depth—for example, a thin line taken in flank. It should be the rule to employ machine gun fire in a direction parallel to the probable front of the enemy; that is to say, in flanking positions. The sweeping movements should be employed in firing frontally on a thin line, but its density then becomes insufficient and its effectiveness is small. The machine gun is easily concealed; it should be kept out of sight and neglect targets of little importance; it should deliver bursts of fire which will come as a surprise; in this manner it may gain important results.

Any commander who has a machine gun and who uses it only to reinforce his firing line makes use of only part of the power at his disposal. He uses his machine gun to the best advantage in flanking positions, and he should select in advance several positions from which the machine gun can be used under various conditions, depending upon the probable course of the action.

In trench warfare machine guns are ordinarily grouped in platoons and are posted in strong positions. If the enemy is preparing for an attack he makes special efforts to destroy the machine guns. Fortify them strongly, screen them from view and shelter them in the direction of depth. Machine gun positions without overhead cover are to be invariably rejected, unless they have been concealed from the commencement of the operation of entrenching. Gun pits with strong overhead cover cannot be used, on account of their relief, unless they are screened by favorable conditions, such as being on a second slope, by woods, underbrush, etc. Positions of low relief and well concealed should be prepared instead and nearby shelters should be dug from which the men of the gun detachment can come quickly to the gun. Gun pits in the form of howitzer shell funnels, in front of the trench, and connected with the shelter by a tunnel. The number of these positions should be increased and access provided to them by sheltered and concealed trenches, and firing frequently from positions which are to be used in repulsing attacks should be avoided. All of the machine guns should not be exposed at one time to the danger of being destroyed by placing them all in the first line.
It is best to echelon them beforehand and distribute the greater part of them between the lines of supports and the several batteries of reserves, in such an order that they may be able to crush an enemy who has penetrated the first-line trench at the conclusion of a bombardment or of an attack with asphyxiating gas. In no case should a machine gun detachment abandon its post; if need be it will permit itself to be besieged there and will defend itself to the last. The tenacity and heroism of a few machine gun men has often enabled the retaking of lost positions. To make it possible for them to do this, place the machine gun in a small earthwork, surrounded by well-hidden wire entanglements, and provided with several firing positions and furnished with food and water and an abundance of ammunition.

In maneuver warfare the machine gun company often fights as a unit and is frequently placed near the head of the column behind the security detachments in order to support the infantry at the beginning of the action. When it has no special independent mission the machine gun company should be placed at first under the orders of a battalion commander, who may assign one or more platoons of it to companies. In maneuver warfare machine guns are used in pits without head cover. On the offensive machine guns deploy with the advance guard and cover the deployment of the main body; they reinforce lines temporarily halted; and gain time for a preparation for continuing the advance; they assist in the artillery preparation with rapid and concentrated fire, and take the place of artillery in a very rapid pursuit or in completing a victory; they advance on the flank of a body of troops in an attack, and cover their flank from the counter attack which will probably be made against it; and they cover with fire intervals which have been left intentionally or accidentally between two units of the attacking line. On the defensive they provide along the front several successive barriers of flanking fire, which can be opened instantly by day or night, (1)

Generally speaking, there are two kinds of machine gun tactics: the tactics of long range, rendered possible by the conditions of the entrenchment battle, and the tactics of medium and short ranges, which have their place in the course of the battle and the assault during the entrenchment battle. Long range fire is rendered practicable and effective in the entrenchment battle by the fact that the enemy's position is fixed and easily defined. Systematic and effective reconnaissance renders it possible to map out most accurately the position of the advanced trenches which form the enemy's firing line, the trenches farther back, where he keeps his supports and reserves, and the lines by which these supports and all supplies of ammunition must be brought up to the advanced trench. Reconnaissance of the enemy's position can reveal the areas where it is vulnerable to machine gun fire, and this fire can be directed on these areas with certainty. Thus the fire from the guns hampers the enemy, impedes his movements and inflict loss upon him.

It is obvious that the longer the range the more chance there is of selecting lines of trench that are open to enfilade. The machine gunner can pick out lines of trench far away to the right or left, on which he can bring diagonal indirect fire. The beaten zone is so moderate in extent that several guns have to be used together to enfilade the enemy's lines. But in frontage or depth, though the single section of two or four guns is sufficient when firing on a narrow target, such as a communication trench.

Machine guns effectively cover the reorganization or retirement of the infantry they are supporting. Some guns are used to create a screen of fire between the infantry and the enemy; others use high angle fire against the reserves which the enemy is bringing up for the counter attack. In a prolonged retirement a rear guard should be well provided with machine guns. The approved plan is to divide the machine gun force into two portions, one of which is in action while the other is taking up a second position farther to the rear.

In the case of cavalry against cavalry, the action of machine guns is analogous to that of horse artillery. They must endeavor to take up a flank position, from which they can bring their fire to bear upon the enemy's cavalry while their own cavalry is advancing to the attack. The guns have to provide for their own protection, and be able to take up a position where they are practically safe from mounted attacks. Armored cars have provided a new field for machine guns; they can be fired from the car in which the gun is permanently mounted in a kind of turret, operates on the roads. It gives invaluable support to patrols and detached parties, the men working the gun being themselves fairly safe from rifle and machine gun fire. The drawback of the car is that it is rather a prominent target for artillery. In another type the gun is merely carried up by the car and is then taken out and placed in position.

Motor machine guns are successfully used to close a gap in a line or support troops who are rapidly driven in. In covering a retreat along a good road, they are invaluable. Their normal work, however, is to support patrols and advanced parties, and to operate against enemy patrols. (2) To this end, they should be used liberally to save the infantry, (3) the machine guns should be concealed in order that their fire may come as a surprise, and (4) they should be echeloned in depth and sheltered so as to prevent their being destroyed early in the action.

Edward S. Farlow,
Consulting Military and Civil Engineer.

MACHINERY-MANUFACTURING INDUSTRY IN AMERICA. Owing to the restrictive measures of Great Britain this industry made a late start in America; but when a beginning was made, the very laws by which the States were made dependent in her proved more stimulating to the development of our machinery-manufacturing industry than the most rigid system of protective tariff would have been. Great Britain wished to confine manufactures to her shores and compel the American colonists to buy their manufactured articles from English factories. At first the colonists were not allowed either to manufacture or to import machinery. In the year 1774 a statute was enacted instituting the restrictive system as to textile machinery. This statute was made more strin-
gent in 1781, and it was not actually repealed till 1845. This act prohibited the exportation of any machine, engine, tool, press, paper, utensil, or implement whatever, which now is, or may at any time be, used in or proper for the preparing, working, pressing, finishing, or working of wool, linen, cotton, wool or silk manufactures of this kingdom, or any other goods wherein wool, silk, or cotton is used, or any part of such machine, etc., or any model or plan of any such machine, under penalty of forfeiture of the tools or machine, the payment of a penalty of £200 and the imprisonment for 12 months, or seducing artificers, and others employed in the manufactories, to depart out of this kingdom; and if any artificer has promised or contracted to go into foreign parts to practise or teach his trade, such artificer may be obliged to give security, at the discretion of the court, that he shall not go beyond the seas, and may be committed to prison until he give such security.

These laws were rigidly enforced; and it was seldom that they were evaded. It was impossible even to smuggle a textile machine into this country; and the models that were surreptitiously imported were imperfect. Tench Coxe, the founder of Alexander Hamilton in the Treasury Department, made arrangements with Messrs. Brown and Almy, of Providence, R. I., to construct for them textile machinery on the English plan. He made most of the machinery with his own hands and set it up at Pawtucket, R. I. This was the first textile mill in the country to use the Arkwright system. It was opened 20 Dec. 1790. It must be remembered that Slater brought with him from England no implements to work with, and no plans or models. He had to depend entirely upon his memory. Alexander Hamilton called him the father of American manufacturers; but, in the first place, he was the father of American machinery. Up to the time of his coming there were no machines in this country, with the exception of the rude saw-mill, grist-mill and fulling-mill; some rolling was done at mills, foot-lathes, and a few home-made carding and spinning appliances. The first carding-machine worked in the United States was constructed at Newburyport, Mass., in 1793, by John and Arthur Smithsonian. Until then the household looms were the only domestic source of supply of woolen cloth.

At this time the manufacture of metal working machinery was in its infancy. The lathe was known only in its simplest form, i.e., two dovetails supporting the work, as in the rotator, the end one attached to a spring-pole above it, the other end to the foot of the operator, who held the turning-tool in his hand. Even after the lathe had been provided with a revolving spindle and centre to support and rotate the work, the tools used for turning both wood and iron were still manipulated by hand. The increasing demand for accurately-cut cylindrical iron pieces, which could not be made by hand, led to the general use of the slide-rest. Formerly used only by the opician and the maker of mathematical instruments, it now became a necessary adjunct of the mechanic's lathe. This gave the lathe practically unlimited capacity to turn out exact cylindrical work; but in order for the slide-rest to do its work, it had to be manipulated by hand. The next step was naturally the introduction of the slide-lathe, by which the rotation of the work and the advance of the cutting tool are accomplished automatically. Owing to the lack of suitable tools to make the long flat surfaces required in such a machine, the slide-lathe had a curious development. The hammer, file, cold-chisel and straight edge were the only tools at hand. The planing-machine was the development of the slide-rest. It worked an era in the life of the mechanic as great as that of the slide-rest itself. It is doubtful when the first planing-machine was made in the United States; but we know that there were only four such machines in this country in 1838. With this machine the rough and uneven surfaces of casings could be smoothed and reduced to true planes. Up to this time the drill had been limited to a revolving vertical spindle. The boring-mill or vertical lathe was now possible and took its place in the machine-shop for the execution of a large class of turned work that did not require the support on centres, such as wheels to be keyed upon their shafts. In fact, the first development of the planing-machine was the key- seatering machine. It was soon recognized that such a machine could be turned to other work, and further changes were made accordingly. It was provided with compound slide-rests, with a revolving table mounted thereon and in this form it took its place as a standard tool in the machine-shop under the name of the cutting-machine. This planer, with its vertically movable tool, was the progenitor of a machine with similar attachments, but with its tool moving horizontally, upon which work could be conveniently shaped in a great variety of forms; and the shaping-machine, as it was called, soon became one of the standard tools of the machine-shop. Meanwhile, the old vertical spindle drill, with its compound tables, movable vertically and adjustable horizontally, in two directions at right angles with each other, had been supplemented by the horizontal drill, with similar tables, but with its drill-spindle parallel to the table; and the further requirements in this direction had been supplied by the radial drill, in which the vertical drill-spindle is movable about a vertical axis, to which it is adjustable radially.

However, there were other factors entering into the development of our machinery industry. There were other requirements beside these machine-tools, and which these supplied inadequately. Screw-bolts were want of the machinery for putting the machines together. Originally iron screw-bolts had been made by means of a split die provided with spiral threads, by rotating either the bolt or the die backwards and forwards until the thread was partly cut, while a
taper-tap was screwed into the nut first from one side, then the other, until the bolt was found to fit into the nut. These bolts were not inter-
changeable. This primitive system of bolt-
manufacture continued until 1847, when the
solid die with sectional threads patented by
Philetus W. Gates was generally introduced. This
die cut the thread at one pass, then the rotation
was reversed to unscrew it from the bolt, which
marked the thread and was liable to mutilate the
die. No compensation for wear was possible.
Nothing approaching perfection was attained
until 1857, when William Sellers devised a bolt-
machine in which dies to cut the thread at one
pass, and adjustable to size, could be opened
and closed while running continuously in one di-
rection. Since then ordinary screw-bolts have been
made interchangeable. In a few years this
method of Sellers' was introduced into Eng-
land and also continental Europe. The first
 turret lathe was built by Stone in 1854. It
was provided with automatic mechanism for turning
the turret in 1855, and perfected to its present
condition in 1858. The gear-cutter was another
of the early machine-shop tools. This was
simply a revolving milling-cutter, mounted upon
a spindle above the dividing-plate. The wheel
to be cut was forced against this. The machine
was adjusted by hand. Such work was slow
and expensive; and up to 1867 the teeth of
nearly all wheels, even for fine machines, were
cast. In this year a machine was devised by
William Sellers which limited the work of the
operator to adjusting the wheel to be cut to
the cutter. The machine was otherwise auto-
matic; and it was now possible for one work-
man to attend to several machines, thereby
greatly diminishing the cost of such work.
From that time cast wheels have been no longer
allowable in first-class machines. Another
typical machine-tool that deserves mention is
the planing-machine. It has received its great-
est development in this country. The manufac-
ture of metal-working machinery has become
highly specialized, and only the older establish-
ments produce a number of different types of
machines. New establishments usually make
only one type of machine, or at most one class
embracing tools of similar type. Some estab-
lishments make only engine-lathes, others only
planers, others nothing but milling-machines.
The effect of specialization has been to make
machine-tools more efficient, and, it may be
added, more varied. If, for instance, a new
construction is designed, as in the automobile,
or airplane, and strangely fashioned parts are
required, a machine that will make these parts
is always forthcoming.

The development of more accurate machin-
ery, as indicated above, led to the system of
interchangeability. In the manufacture of
machinery this is an economic principle of the
greatest importance. Under more primitive
methods individual parts had to be fitted to-
gether with great difficulty and at much expense.
Now all these parts are made by machines with
such exactness that they are completely inter-
changeable; and there is no longer any ques-
tion as to their fitting. This method of manu-
facture has increased the output of the indi-
vidual workman and reduced the cost of pro-
duction tremendously. Though first applied in
Europe, it remained for the United States to
demonstrate its feasibility and actually put it
into successful operation, and it is generally
referred to as the American system. For the
economical manufacture of any kind of ma-
achinery in which many parts are to be inter-
changeable certain definite conditions must be
met; and success economically requires that
every part shall be finished without the inter-
vention of a skilled workman. The machine
must be so designed that it will not only work
automatically but work with a high degree of
accuracy. Reference standards are provid-
ed with which to compare the several parts
in order to determine the amount of variation
permissible between the standard and the pro-
duced; every part must come from the machine in
the final finished form. Such are some of the
details that make necessary a careful study of
every part in order to design a machine that will
perform each operation with the most efficiency.

The principle of interchangeability was first
suggested and put into operation in a small way
by Le Blanc, in France. Its importance and
possibilities were not recognized by the Amer-
ican inventors, and its first application in the
United States was in the manufacture of fire-
arms in our government arsenals under the di-
rection of Eli Whitney, the inventor of the
pike-shot-gun. Simeon North, a maker of pistols,
and a neighbor of Whitney, also adopted the
system. By 1818 both of these men were using
drilling and filing jigs. The growth of the sys-
Blem was slow, being confined for a time to the
principal parts; but even in this undeveloped
condition it proved successively economical. In
1822 Calhoun, who was then Secretary of War,
reminded to Whitney that his improvements
were saving the government $25,000 a year at
the two public armories. The drop-hammer
and drill were first used by Hall, at Harper's
Ferry in 1827. Whitney adopted this machinery
and thus was able to cut from red-hot metal all
the smaller parts of a gun in a form closely ap-
proximating the finished article. These forged
parts were then subjected to the more accurate
milling-machine, which turned out the parts in
uniform condition, no matter how varied their
shape may have been when they came from the
forging-press. It only remained for the drill
to fashion the bearings for the working parts
and bore the holes to secure the parts together.
This was a comparatively simple matter when
once the order of procedure had been deter-
mined and the guiding templates or jigs pro-
vided. The wooden stocks of the gun were
also made by machinery and with sufficient
accuracy to make them interchangeable. This
was accomplished by means of a turning-lathe
designed by Thomas Blanchard and patented by
him in 1830. After the stock came from the
lathe the groove for the barrel and the cavity
for the lock were hollowed out by special
machinery. Measured by the standards of to-
day all this work was crude; but the problem of
to-day was itself crude, and these roughly inter-
changeable parts served their purpose. Machine-
tools were then both inaccurate and limited in
variety, so that they could not be expected to
turn out the various parts with mathematical
accuracy. But out of the idea at that time grew
such delicate measuring instruments as we have
to-day. The most refined measuring instrument
known then was the vernier caliper; and the
smallest deviation from the standard that could
be detected with this contrivance was, at best, perhaps the thousandth part of an inch. In 1848 the interchangeable system was applied to sewing-machines. The profiting machine was developed between 1848 and 1852 by F. W. Howe and E. K. Root. Since then have come great developments in the quality and cheapness of tools and in their wonderful adaptability to changing needs. Measuring instruments have been so highly developed that a variation of the twenty thousandth part of an inch can be detected immediately and with perfect accuracy.

Foreign countries did not remain indifferent to the success of the United States in the employment of the principle of interchangeability of parts. Various commissions were appointed to investigate the system; and, as remarked above, the economic success of the system in producing interchangeable parts led to the adoption of this method in Europe. In 1854 the Colt factory was established at Hartford, and shortly afterward a British commission bought from the Colt firm machinery for making the Enfield rifle on the interchangeable system. Between 1870 and 1880 our large machine manufacturers were kept busy filling foreign orders, especially for gun machinery. Large orders for such machinery were received from the German government, and it was even stipulated in the contract that the manufacturers should send over men to set up the machinery and instruct native workmen how to run it. Other governments began to look to us for their machinery, and thus our system for the manufacture of interchangeable parts was gradually established in England and continental Europe.

This principle of interchangeability, first applied to the manufacture of fire-arms, then to pistols, has now been extended to practically every kind of machine. The sewing-machine, the typewriter, the bicycle, the various kinds of agricultural machinery, the gasoline engine, and notably in the automobile, may be mentioned as types showing the economic value of the principle of interchangeability. All our large machine manufacturers represent in foreign countries, and certain types of American typewriters, sewing-machines, cash registers, mowing-machines, reapers, etc., are as well known there as they are here. American textile machinery and shoe-making machinery play an equally important part.

It is impossible to give statistics for our machine-manufacturing industry as a whole, since, with a few exceptions, the United States census does not separate it from foundry and machine-shops in general. The following figures from the Special Census of Manufacturers taken in 1914 afford the best available survey of the present condition of the machinery-manufacturing industry in the United States. Of the 17,027 establishments included as foundries and machine shops, 10,640 are grouped as making machinery of some sort. These shops operated in the year, quoted with a combined capital of $1,246,042,694, and with $564,610 wage earners, who received in that year $244,146,380 in wages. The value of the product amounted to $866,544,679, of which $658,429,690 was applied to manufacture. In the following table is given the number of establishments making the machinery named, and the aggregate value of the output in 1914.

The manufacture of electrical machinery is also very large and of great aggregate value, but no separate figures are available, the census grouping the machinery of this class with electrical apparatus and supplies.

By far the largest group of all is the agricultural machinery. In this case also the census fails to separate the machines from the tools—such as spades, rakes, and ploughs. However it is certain that by far the greater value is in the drills; the mowing, reaping and binding machines and other harvesters. The figures as given for this industry in 1914 are as follows: 601 establishments reported a capital aggregating $338,531,673; and the value of their product for the year was $104,907,535, of which sum $90,578,190 was added by manufacture.

The exports of American machines and machinery in 1914 amounted in value to $91,818,-
064, to which should be added most of the value of agricultural implements exported, $10,394,970, a decrease owing to the war from $31,965,789 in 1913.

Since the beginning of the European War the exports of other types of American machinery have enormously increased. This increase has been most remarkable in the case of electrical locomotives and engines. In 1913, the latest year in which the figures can be regarded as quite normal, the exports of such machinery were valued at $16,097,315. By 1916 they had risen to $61,315,032. Steam locomotives exported in 1913 were valued at $31,965,789 and were exported in 1916 at $12,665,877. The export values of electrical locomotives, automobile engines, marine engines and sugar-mill machinery also show an increase of 100 per cent between the two years quoted.

See HARDWARE INDUSTRY; FARM MACHINERY; and articles on special types of machinery.

MACHPELAL, mā-kēpə'lä, Cave of, Hebron, Palestine; in Old Testament history the burial place of the patriarchs. Upon the traditional site stands a superb mosque which only Mohammedans are permitted to enter, although by a special firman of the sultan the Prince of Wales visited it in 1862, the Marquis of Bute in 1866 and the Crown Prince of Prussia in 1869.

MACHRAY, mă-krai, Robert, Canadian Anglican archbishop: b. Aberdeen, Scotland, 17 May 1831; d. Winnipeg, Canada, 9 March 1904. He was graduated at King's College, Aberdeen, in 1851, and from the Sidney Sussex College, Cambridge, in 1855. He was of Presbyterian stock, but joined the Church of England and was ordained deacon in 1855 and priest in 1856.
MACHUELó—MacINTOSH

He was appointed vicar of Madingley, near Cambridge, in 1862, and in 1865 he was Ramsden's successor. He was appointed a bishop of Rupert's Land, Canada, in 1865, and was consecrated in May of that year. His diocese covered 2,000,000 square miles of territory with headquarters at the then hamlet of Winnipeg, and but 18 clergy to assist him. He was active in the promotion of education, renewed and reorganized the defunct Saint John's College at Winnipeg, and himself lectured in ecclesiastical history, liturgiology and mathematics. He was one of the founders of Saint John's Ladies' College; and upon the establishment of the University of Manitoba in 1877 he became chancellor, retaining the office until his death. He had meantime organized his diocese with a view to serving the fast increasing population. He became metropolitan of Canada under the primacy of the archbishop of Canterbury in 1875, and upon the union of the Canadian Anglican churches in 1893, he became archbishop of Rupert's Land and primate of all Canada. Consult Machray, Robert, 'Life of Archbishop Machray' (1889).

MACHUQUE, mák'yo-kwê, Spanish name current in the West Indies for the thread herring (q.v.), an inedible, shad-like fish (Opisthonaagium) of the Atlantic coasts of the United States and the waters of the West Indies.

McILHENNY, Charles Morgan, American landscape painter; b. Philadelphia, 4 April 1858; d. 1904. Having studied under Frank Briscoe, he continued his training at the Academy of Fine Arts in Philadelphia, and soon began to win recognition in his chosen field. Among his best-known works are 'A Gray Summer Noon' (1884), and 'The Passing Storm' (1887); 'Old Friends' (1891); 'On the Beach' (1891); 'Grey Morning' (1892); 'September in the Marshes' (1893). In 1893 he was awarded medals at the Columbian Exposition and won the first Hallgarten prize.

McILVAINE, mák'ël-ván, Charles Petitt, American Protestant Episcopalian bishop; b. Burlington, N. J., 18 Jan. 1799; d. Florence, Italy, 13 March 1873. He was graduated at the College of New Jersey (now Princeton University), in 1816; entered the Princeton Theological Seminary in the same year, and was ordained deacon in 1820 and priest in 1821. His first pastoral charge was at Georgetown, D. C., which he left in 1825 to become professor of ethics at the United States Military Academy, West Point. He became rector of Saint Ann's Church, Brooklyn, in 1830, and in 1831 undertook the duties of the professorship of the evidences of religion and sacred antiquities in the New York University. He did not long hold the chair, however, as he was the next year preacher at Cambridge, and then succeeded Bishop Chase, who had resigned the see. The question of the legality of such a resignation excited considerable interest in the General Convention of that year, but in the interest of the diocese both houses agreed in approving Dr. McIlvaine's action. In 1837 he was consecrated in Saint Paul's Chapel, New York. Upon his removal to Ohio he was elected president of Kenyon College, Gambier, founded by Bishop Chase, and held the position until 1840, acting also for some years as president of the theological seminary in the same place. During his long episcopate he came to be recognized as one of the most influential leaders of the Evangelical or Low Church party before the English civil war, people what was considered in the North the real significance of the War. He published various sermons, addresses and more important theological works, mainly directed to defending the positions of his party in the Church.

McILWRAITH, mák'ël-râth, Jean Newton, (Jean Forsyth), Canadian author, daughter of Thomas McIlwraith (q.v.); b. Hamilton, Ontario, 1871. She was educated at Ladies College, Hamilton, and studied English literature in the correspondence classes of Queen Margaret College, Glasgow, for 10 years, and engaged in editorial work in New York in 1902. She is a frequent contributor to magazine and newspapers' and is author of 'A Book About Shakespeare' (1898); 'History of Canada' in 'Children's Study Series' (1899) (jointly with William McLennan) 'The South' (1899); 'The Curious Career of Roderick Campbell' (1901); 'A Dame of Quebec' (1912), etc.

McILWRAITH, Thomas, Canadian ornithologist; b. Ayreshire, Scotland, 1824; d. 1903. He was educated in Scotland and emigrated to Hamilton, Ontario, where he spent the remainder of his life. He became known through his classification of the birds of Canada and his study of their habits, which subject he pursued as a recreation. He was a member of the conference of American ornithologists held in New York in 1873, out of which came the American Ornithologists' Union. He served for many years as superintendent of the district of Ontario for the Migration Committee of the American Ornithologists' Union. His first report on Canadian birds was published in the Canadian Journal in 1861, and his 'Birds of the Ontario' was published by the Hamilton Association (1886; author's ed., 1887; 2d ed., 1894).

McINTOSH, Lachlan, American soldier; b. near Inverness, Scotland, 17 March 1725; d. Savannah, Ga., 20 Feb. 1806. He came with his father to Georgia in 1736, received there an ordinary English education, became a clerk in the mercantile establishment of Henry Laurens at Charleston, S. C., and was later employed as a land surveyor. At the opening of the Revolution he was made colonel of the 1st Georgia battalion, and became a brigadier-general in 1776. In 1777 he fought a duel with Button Gwinnett (q.v.), who was fatally wounded. In 1778 McIntosh was selected by Washington to lead a small force against the Western Indians, whom he subdued. In the siege of Savannah, 1779, he bore an active part. When Charleston surrendered to Sir Henry Clinton 12 May 1780 McIntosh was taken prisoner, and he never resumed his command. He was a member of the Continental Congress in 1784, and the next year as commissioner to the Indians he finished his public services.

MacINTOSH, William, a half-breed Creek chief, son of a Scottish trader; b. about 1780; d. 1 May 1825. In 1802 the United States undertook to extinguish the Indian title to
lands within the borders of Georgia and in 1805
milled acres of Creek lands were trans-
ferred to Georgia. The Creeks, having
become alarmed at the prospect of being deprived of
all their lands, on the motion of MacIntosh,
now a chief, made a law in general council in
1811 forbidding the sale of any of the remain-
ing lands. MacIntosh led the Creek allies of the Ameri-
cans in the War of 1812 with the rank of major and took
the chief part in the massacre of 200 hostile
Creeks at Atasi on 29 Nov. 1813. He also took
part in the battle at Horseshoe Bend, Ala., 27
March 1814. More lands were acquired by
treaty in 1818 and in 1821 another treaty was
negotiated by the Georgians with MacIntosh,
who was in the pay of the whites, and other
chiefs controlled by him, while 30 chiefs re-
fused to sign and demanded a general council.
In 1824 about 10,000,000 acres still remained in
the hands of the Creeks and in that year they
re-enslaved the law punishing with death any
Creek who ceded land. In 1825 the whites, with
brides, invaded MacIntosh and the chiefs under
his control to sign a treaty ceding the remain-
ing Creek lands. The treaty was approved by
President Adams, but the Creeks did not rise
in rebellion; they passed formal sentence of
death on MacIntosh, which a party of warriors
carried out.

MACK, Norman Edward, American politi-
cian and newspaper publisher: b. Buffalo,
N. Y., 24 July 1858. He received a public
school education, engaged in business and in
1879 established the Buffalo Sunday Times. In
1884, on the publication of the Daily Times,
of which he continues owner and editor.
He was a delegate to the Democratic National
Conventions from 1892, has served as a member of the
Democratic National Committee since
1900 and became its chairman in 1908.

MACK, Donald, American shipbuilder: b.
Nova Scotia, 1810; d. 1880. He went to New
York and learned shipbuilding, and began the
business at Newburyport, Mass. At East Bos-
ton, in 1845, he established a shipyard where he
built many large trading ships of the clipper
model, in which he made great improvements.
The Great Republic, which he built in 1853, a
ship of 4,500 tonnage was a larger vessel than
had ever before been seen.

MACKAY, George Eric, English poet, son of
1851; d. 2 June 1898. Among his best known
works are 'Songs of Love and Death' (1865); 'Ad Re-
ginam' (1881); the popular 'Love Letters of a
Violinist' (1886); 'A Lover's Litanies' (1888);
'Nero and Actaea,' a tragedy (1891); 'My
Lady of Dreams' (1895); 'Arrows of Song'
(3d ed., 1890); 'A Lover's Missal' (1898).

MCKAY, Gordon, American inventor and
manufacturer: b. Pittsfield, Mass., 1821; d.
Newport, R. I., 19 Oct. 1903. He was the son of
a cotton manufacturer, and at 12, on the
death of his father, learned civil engineering,
at which he worked for some time. Before he
was 21 he built a machine-shop in Pittsfield
which employed 100 men, and later became
treasurer and manager of the Lawrence Ma-
cine Company. He was the first successful
inventor of machinery for making boots and
shoes; he perfected a shoe sewing-machine, in-
vented, but not made practicable, by L. R. Blake,
of Ashington, Mass.; afterward invented the
heeler, lasting-machine, nailing-machine, etc.,
which came into general use; and by these in-
ventions revolutionized the boot and shoe indus-
try of the world. At the close of the Civil
War he offered to make the shoes for the Union
army, and within three years had leased his
laborated in the preparation of mathematical
textbooks.

MACKAY, māk'ē, Alexander Charles, Can-
adian educator: b. Beamsville, Ontario, 2 June
1860. He was a graduate of the Universities of
Toronto and Cambridge, England. He became
professor of mathematics and physics at Mc-
Master University in 1890, later holding the
offices of dean of arts and registrar, and in 1912
became chancellor of the university.
Since 1911 he has been principal of the New
Technical School, Toronto. He has col-

MACKAY, Clarence Hungerford, Ameri-
can capitalist: b. San Francisco, 17 April 1874.
The son of J. W. Mackay (q.v.), he succeeded
on the death of his father to his vast business
interests. Much of his boyhood was spent in
France, and he was educated at Vaugirard Coll-
lege, afterward studying at Beaumont College,
Windsor, England. He is president of the Com-
mercial Cable Company, the Postal Telegraph-
Cable Company, the Commercial Pacific Cable
Company, the Mackay Companies, the Com-
mercial Cable Building Company, the Postal Tele-
graph Building Company and the Commercial
Cable Company of Cuba. He is also a director
of the North American Telegraph Company
and the Metropolitan Opera Company. As
treasurer of the Lincoln Farm Association, he
was one of the prime movers of the effort to
raise funds for the purchase of the log cabin
in which Abraham Lincoln was born.

MACKAY, Donald, American shipbuilder: b.
Nova Scotia, 1810; d. 1880. He went to New
York and learned shipbuilding, and began the
business at Newburyport, Mass. At East Bos-
ton, in 1845, he established a shipyard where he
built many large trading ships of the clipper
model, in which he made great improvements.
The Great Republic, which he built in 1853, a
ship of 4,500 tonnage was a larger vessel than
had ever before been seen.

MACKAY, George Eric, English poet, son of
1851; d. 2 June 1898. Among his best known
works are 'Songs of Love and Death' (1865); 'Ad Re-
ginam' (1881); the popular 'Love Letters of a
Violinist' (1886); 'A Lover's Litanies' (1888);
'Nero and Actaea,' a tragedy (1891); 'My
Lady of Dreams' (1895); 'Arrows of Song'
(3d ed., 1890); 'A Lover's Missal' (1898).

MCKAY, Gordon, American inventor and
manufacturer: b. Pittsfield, Mass., 1821; d.
Newport, R. I., 19 Oct. 1903. He was the son of
a cotton manufacturer, and at 12, on the
death of his father, learned civil engineering,
at which he worked for some time. Before he
was 21 he built a machine-shop in Pittsfield
which employed 100 men, and later became
treasurer and manager of the Lawrence Ma-
cine Company. He was the first successful
inventor of machinery for making boots and
shoes; he perfected a shoe sewing-machine, in-
vented, but not made practicable, by L. R. Blake,
of Ashington, Mass.; afterward invented the
heeler, lasting-machine, nailing-machine, etc.,
which came into general use; and by these in-
ventions revolutionized the boot and shoe indus-
try of the world. At the close of the Civil
War he offered to make the shoes for the Union
army, and within three years had leased his

MACKAY, māk'ē, Alexander Charles, Can-
adian educator: b. Beamsville, Ontario, 2 June
1860. He was a graduate of the Universities of
Toronto and Cambridge, England. He became
professor of mathematics and physics at Mc-
Master University in 1890, later holding the
offices of dean of arts and registrar, and in 1912
became chancellor of the university.
Since 1911 he has been principal of the New
Technical School, Toronto. He has col-

MACKAY, Clarence Hungerford, Ameri-
can capitalist: b. San Francisco, 17 April 1874.
The son of J. W. Mackay (q.v.), he succeeded
on the death of his father to his vast business
interests. Much of his boyhood was spent in
France, and he was educated at Vaugirard Coll-
lege, afterward studying at Beaumont College,
Windsor, England. He is president of the Com-
mercial Cable Company, the Postal Telegraph-
Cable Company, the Commercial Pacific Cable
Company, the Mackay Companies, the Com-
mercial Cable Building Company, the Postal Tele-
graph Building Company and the Commercial
Cable Company of Cuba. He is also a director
of the North American Telegraph Company
and the Metropolitan Opera Company. As
treasurer of the Lincoln Farm Association, he
was one of the prime movers of the effort to
raise funds for the purchase of the log cabin
in which Abraham Lincoln was born.

MCKAY, Gordon, American inventor and
manufacturer: b. Pittsfield, Mass., 1821; d.
Newport, R. I., 19 Oct. 1903. He was the son of
a cotton manufacturer, and at 12, on the
death of his father, learned civil engineering,
at which he worked for some time. Before he
was 21 he built a machine-shop in Pittsfield
which employed 100 men, and later became
treasurer and manager of the Lawrence Ma-
cine Company. He was the first successful
inventor of machinery for making boots and
shoes; he perfected a shoe sewing-machine, in-
vented, but not made practicable, by L. R. Blake,
of Ashington, Mass.; afterward invented the
heeler, lasting-machine, nailing-machine, etc.,
which came into general use; and by these in-
ventions revolutionized the boot and shoe indus-
try of the world. At the close of the Civil
War he offered to make the shoes for the Union
army, and within three years had leased his

machines to more than 60 firms, and shortly became a millionaire. In 1878 he formed the McKay Sewing-Machine Association, a strict monopoly which exacted commissions on all sales made in the United States by the aid of his inventions, and also brought profit through European royalties. In 1893 he placed $4,000,000 in a trust fund for Harvard University. He made many other liberal donations for benevolent and educational objects, and established numerous chairs for the McKay Institute for the manual training of colored youth. By his will the greater part of his estate was left to Harvard.

Mackay, Jessie, Australian poet and prose writer: b. Cambridgeshire, New Zealand, 15 Dec. 1864. She combined teaching with literary work and has been a voluminous contributor to the Australian press, with the readers of which she is a favorite. Among her published works are 'The Spirit of the Rangatira and Other Ballads' (1810); and 'The Sitter on the Rail and Other Poems' (1891).

Mackay, John William, American capitalist: b. Dublin, Ireland, 26 Nov. 1831; d. London, 20 July 1894. His parents brought him to New York in 1840, and he learned shipbuilding. He went to California as a miner in 1851, and afterward to Nevada, where he continued mining with great perseverance in the face of many disappointments. In 1872 he was one of the discoverers of the Bonanza mines of the Comstock Lode (q.v.), in which mines he obtained a two-fifths share and became very wealthy. He and his partners, Fair, Flood and O'Brien, founded the Bank of Nevada, of which Mackay was president for years. His relations with Jay Gould were unfriendly, in a spirit of opposition to him, and to the Western Union Telegraph Company, Mackay in 1884 joined with James Gordon Bennett in forming the Commercial Cable Company and the Postal Telegraph Company. He succeeded in laying two cables, overcoming great obstacles, and afterward won in a long rate-war with the old lines. The Roman Catholic Orphan Asylum at Virginia City, Nev., founded by him, is noteworthy among his many public benefactions.

Mackay, mą-kə', James Steele, American playwright: b. Buffalo, N. Y., 1844; d. Nipt's, Colo., 25 Feb. 1894. In 1869 he went to Paris to study painting; but having there met Delsarte (q.v.) became interested in the latter's theories, and studied dramatic expression. In 1870-71 he gave in New York and Boston lectures on the art of expression. He opened the Saint James Theatre at New York in 1872, and appeared there in 'Monaldi,' adapted by himself from the French. In 1873-75 he was studying the drama in Paris and England, and at the Crystal Palace, London, he played the title-role in 'Hamlet.' His adaptation of Blum's 'Rose Michel' in 1872 ran for 122 nights at the Union Square Theatre, New York. He established in New York the Lyceum School of Acting, which later became the American Academy of Dramatic Arts. For several years he was a part of the Madison Square Theatre, and in 1885 built the Lyceum. Among his further plays were 'Won at Last'; 'Through the Dark'; 'Hazel Kirke'; 'A Fool's Errand'; 'In Spite of All'; 'Paul Kauvar.'

Consult Mackay, Percy, 'Steele Mackaye: A Memoir' (New York 1911).

Mackaye, Percy, American dramatist and poet: b. New York, 16 March 1875. He was graduated from Harvard in 1897 and studied at the University of Leipzig in 1899-1900. He engaged in European travel in 1898-1900, residing in Rome, Switzerland, Leipzig, and London. He was an instructor in a private school in New York in 1900-04, after which time he joined the Cornish Colony in New Hampshire and devoted his time entirely to dramatic work. He has lectured on the theatre at Harvard, Yale, Columbia, and other American universities, and is a member of the National Institute of Arts and Letters. He is a leading exponent of poetic dramatic art in America and handles both tragedy and comedy with grace and surety of touch. Author of 'The Canterbury Pilgrims,' a comedy, produced by the Coburn Players in the open air at Harvard, Yale and other universities in 1909-13, and given as a civic pageant in honor of President Taft at Gloucester, Mass., 4 Aug. 1909; 'A Modern Rendering into Prose of Chaucer's Tales' (1904); 'Phou and Phon,' a tragedy (1905); 'Jeanne d'Arc,' a tragedy, produced by Julia Marlowe and E. H. Sothern in America and England in 1906-07 (1906); 'Sappho and Phan,' a tragedy (1907); 'The Scarecrow' (1908); 'Lincoln Centenary Ode' (1909); 'Mater,' an American comedy (1908); 'The Playhouse and the Play,' essays (1909); 'A Garland to Sylvia' (1910); 'Anti-Matrimony,' a satirical comedy produced and acted by Henrietta Crossman (1910); 'The Civic Theatre' (1912); 'Uriel and Other Poems' (1912); 'Beauty and the Beast,' a lyric drama (1912); 'Sanctuary, A Bird Masque,' produced for President Wilson at Meriden Bird Club Sanctuary, New Hampshire (1913); 'The Immigrants,' a lyric drama (1915); 'Coburn Pilgrims,' a comedy, produced by the Coburn Players (1917), etc. See SCARECROW, TJE.

McKean, mą-kən', Thomas, American patriot and jurist, signer of the Declaration of Independence: b. New London, Chester County, Pa., 19 March 1734; d. Philadelphia, 24 June 1817. He was privately educated at Newcastle, Del.; having settled there, he studied law and was admitted to the bar in 1758. In 1768 he became register of probate and was soon made assistant attorney for Sussex County. With Cesar Rodney (q.v.), in 1762, he entered upon a revision of Delaware laws up to 1752, and was chosen in the same year to the Delaware assembly, in which his membership continued till 1779. Elected in 1765 to the Stamp Act Congress, he took a strong position in defense of colonial rights and as judge of the Common Pleas in the same year permitted no stamped paper to be used in his court. About 1771 he began to practise law in Philadelphia, although retaining a Delaware residence, and from Delaware, in 1774, he was elected to the Continental Congress, in which he served nine years, including the entire period of the Revolution, and took a prominent part in its deliberations. He was president of the Congress in 1781. He was not present at the signing of the Declaration of Independence, which he had advocated, but added his signature some years afterward. The
Articles of Confederation, which he aided in drafting, were also signed by him. In Pennsylvania he had become well known, and he was made chairman of the Committee of Safety in 1776, and from 1777 to 1799 was chief justice of the State. He became a strong supporter of Jefferson, and a leader of the Republican party of that day, and was governor of Pennsylvania from 1779 to 1808. With James Wilson he wrote 'Commentaries on the Constitution of the United States' (1790).

McKean, Thomas, American philanthropist: b. Philadelphia, Pa., 23 Nov. 1842; d. there, 16 March 1898. In 1862 he was graduated at the University of Pennsylvania and entered upon a successful business career, becoming an officer in many railroad and financial corporations. He acquired a large fortune, which he spent freely in endowing educational and charitable enterprises, his various gifts to the University of Pennsylvania alone amounting to $300,000.

McKee Rocks, Pa., borough in Allegheny County, on the south bank of the Ohio River, opposite Allegheny and three miles northwest of Pittsburgh, on the Pittsburgh and Lake Erie and the Pittsburgh, Charlers and Youggheny railways. There is an abundance of bituminous coal and natural gas in the district, and there are large iron and steel industries with their kindred smaller manufactories. The town ships lumber and there are manufactures of wall plaster and concrete. The land was originally conveyed to Alexander McKee in 1764, a settlement was formed in 1830 and the town was incorporated in 1892. There is a considerable foreign population. The town is growing rapidly. Pop. 14,702.

McKeesport, Pa., city in Allegheny County, at the junction of the Monongahela and the Youggheny rivers, and on the Pennsylvania, the Pittsburgh and Lake Erie, the New York Central and the Baltimore and Ohio railroads, about 14 miles southeast of Pittsburgh. The first permanent settlement was made in 1795 by Dr. McKee, after whom the place was named. It was only a small village until 1829, when coal mining began on an extensive scale. It was incorporated as a borough 1 Sept. 1842, and chartered as a city 1 April 1890. McKeesport is situated is a region noted for its extensive fields of bituminous coal and its natural gas. The chief industrial establishments are steel and iron works, one of which, the National Tube Company, has 6,000 employees. The McKeesport Tin Plate Company has recently developed into the biggest plant of the kind in the world. There are numerous smaller manufacturing concerns, including various lines of the steel industry and more diversified interests. The large industrial plants in the city proper employ about 11,000 persons with an annual payroll of approximately $8,000,000. Smaller industries employ about 1,000 persons with an annual payroll of $600,000. Within five miles of the city limits large manufacturing plants employ another 25,000 persons, receiving over $18,000,000 in wages a year. The city has a large trade in its own manufactures and in coal and lumber. The principal educational institutions are the 14 public and the parish schools, the Douglass Business College, the Duff's Business College and the Carnegie library. Some of its principal buildings are those of the schools mentioned (the new high school cost about $260,000), the Young Men's Christian Association; 50 churches and offices and store buildings. There are 18 different religious denominations and 50 congregations in the city. The church property is valued at over a million and a half dollars. There are three national banks, two State banks, one trust company and one bank of savings; total capital aggregating $1,407,100; surplus, $1,608,290, and deposits, $9,000,000. The city officials include the mayor, serving for four years, and four city commissioners, elected for two years. The city has the commission form of government under the Clark Act of Pennsylvania. The city owns and operates the waterworks, the plant being valued at over $1,000,000. The annual municipal expenditures are about $480,000; the chief items of expense are, for police department, $32,000; fire department, $35,000; street department, $37,000; water department, $95,000; health department, $10,000. Pop. over 47,000. A large number of the people are foreign born, chiefly from Austria, Sweden, Germany and Italy, but the native born predominate.

McKeever, William Arch, American educator: b. Jackson County, Kan., 12 April 1868. He was graduated at the University of Kansas in 1898, and later studied at the University of Chicago and at Harvard. He was professor of philosophy at the Kansas State Agricultural College in 1900–13, and since 1913 has been professor of child welfare at the University of Kansas. He originated the 'Home Training Bulletins' which have circulated widely among all English-speaking peoples; organized the playground movement and is a director of the National Institute of Child Life, Philadelphia. Author of 'Psychology and the Higher Life' (1898); 'The Pioneer, a Story of the Making of Kansas' (1911); 'Training the Boy' (1913); 'Training the Girl' (1914); 'The Successful Sunday School Teacher' (1915).

MacKellar, Thomas, American poet: b. New York, 12 Aug. 1812; d. 29 Dec. 1899. Having learned the printer's trade in the publishing house of the Harpers, he went to Philadelphia as a proofreader in the stereotype foundry of Lawrence Johnson and Co., in time became a partner in the business and finally its head, the new firm being styled MacKellar, Smiths and Jordan. Among his works may be mentioned 'Droppings from the Heart' (1844); 'Tarn's Fortnight Ramble' (1847); 'The American Printer' (1866); 'Rhymes Atween-Times' (1873), and 'Hymns and Metrical Psalms' (1853).

McKelway, Saint Clair, American journalist: b. Columbia, Mo., 15 March 1845; d. 16 July 1915. In 1853 he was apprenticed and was educated in New Jersey, studied law and was admitted to the bar in New York in 1866, but never practised. In 1868 he became Washington correspondent for the New York World and the Brooklyn Daily Eagle and in 1870 a member of the editorial staff of the latter paper. From 1877 to 1884 he was the editor of the Alton Argus, and in the latter year returned to Brooklyn to become editor-in-chief of the Eagle.
which under his editorship maintained a high standard of excellence. He was a regent of the University of the State of New York since 1883, holding the vice-chancellor in 1900 and chancellor in 1913. Member of the historical societies of Long Island and Suffolk County, was director of the American Social Science Association and has lectured frequently on educational and political subjects.

McKendree, mæk-ən-dri. William, American Methodist bishop: b. King William County, Va., 7 July 1757; d. near Nashville, Tenn., 5 March 1835. He served in the Continental army during the American Revolution, entered the Methodist ministry in 1787 and became a presiding elder nine years later. In 1801 he made a missionary tour beyond the Alleghenies and was an important factor in the evangelization of that region. In 1808 he was elected bishop, being the first American-born person to hold that office in the Methodist Church. McKendree College (q.v.) was named in his honor. Consult "Life" by Paine (1869).

McKendree College, in Lebanon, Ill., founded in 1828 under the auspices of the Methodist Episcopal Church and first called Lebanon Seminary. In 1830 the name was changed, in honor of William McKendree, who gave his estate to the college. In 1839 a new charter was obtained whereby the school was granted university privileges. Abraham Lincoln rendered valuable services in securing the new charter. Students are admitted on certificates from approved schools or on examinations. It has classical, scientific, music, law and graduate departments. The degrees to which the courses lead are A.B. and B.S. In 1918 there were 15 instructors, 115 students and 10,000 volumes in the library.

McKenna, mæk-ən-ə, James Andrew Joseph, Canadian public service commissioner: b. Charlottetown, Prince Edward Island, 1 Jan. 1842. He was educated at Saint Dunstan's College, Charlottetown, was connected for a time with the Prince Edward Island Railway and afterward engaged in journalism. In 1886 he entered the Indian Department of the Dominion Civil Service, and for a brief period was private secretary to Sir John Thompson. In 1892 T. G. Rothwell he effected a settlement with British Columbia concerning the administration of the railway belt lands in 1897, and in 1899 he was a royal commissioner for the negotiation of a treaty with the Indians whereby the Peace River and Athabaska country were surrendered to the Crown. He likewise secured the surrender by the Indians of the country around Buffalo Lake, Churchill River and Reindeer Lake in 1906. He was chairman of the royal commission which was appointed to adjust the claims of the half-breeds of the Northwest, and in 1901 was the sole commissioner. Since 1909 he has been inspector of Indian Catholic schools in Manitoba, Keewatin and the Northwest provinces and territories. Author of "Sir John Thompson" (1895), and "The Hudson Bay Route" (1907).

McKenna, Joseph, American jurist: b. Philadelphia, 10 Aug. 1843. In 1855 he went to California and was graduated from the Benicia College Institute in 1865, and admitted to the bar the same year. He was district attorney of Solano County in 1866-68, and in the sessions of 1875 and 1876 served as a Republican in the lower house of the California legislature. In 1885-93 he was a California representative in the 50th, 51st and 52d Congresses, resigning from the House in 1893 to accept the appointment to the office of United States circuit judge in the Ninth Federal judicial district. This post he resigned to become Attorney-General in the cabinet of President McKinley in 1897. On 16 Dec. 1897 he was made an associate justice of the United States Supreme Court to succeed Justice Field, retired, and on 26 Jan. 1898 took his seat.

McKenna, Reginald, English statesman: b. London, 6 July 1863. He was educated at King's College, London, and at Trinity Hall, Cambridge, and became a barrister in 1887. He engaged in law practice until his election to Parliament for North Monmouthshire by the Liberal party in 1895. He soon acquired a reputation as one of the hardest workers on the Liberal benches as well as for a sound knowledge of national finance and of parliamentary procedure. The Liberal party, led by Campbell-Bannerman, formed in 1905. McKenna was appointed Financial Secretary under Chancellor of the Exchequer Asquith. In 1907 he received cabinet place as president of the Board of Education. He instituted medical inspection of the children in the schools, and reorganized the secondary school system. When the Asquith cabinet was organized in 1908 he was appointed First Lord of the Admiralty, and in 1911 he was transferred to the office of Home Secretary, where the problems incident to the crusades of the militant suffragettes caused him considerable difficulty. The so-called "Cat-and-Mouse Act" brought severe criticism from the supporters of the suffrage movement and from the Opposition. He was also prominently connected with the Welsh Church Bill, the Mental Deficiency Act, and the administration of Criminal Justice. Upon the formation of the coalition cabinet under Asquith, in May 1915, McKenna became Chancellor of the Exchequer, succeeding Lloyd George, who was appointed to the new post of Minister of Munitions. McKenna introduced the first heavy war tax measure and elicited high praise upon its brevity and lucidity as well as its careful distribution of the burdens of taxation. With the progress of the war, however, McKenna was thought to lean too much toward economy and not sufficiently to favor the stringent measures public opinion deemed necessary to bring the war to a speedy and definitely victorious conclusion. When the new coalition cabinet was organized under the premiership of Lloyd George, December 1916, McKenna was succeeded by Bonar Law. In the elections of 1918 he lost his re-election from North Monmouthshire, interrupting a continuous Parliamentary career of 23 years.

MacKenty, John Edmund, American laryngologist: b. Richmond, province of Quebec, Canada, 1869. He was educated at Ottawa and McGill universities, subsequently studying in Europe. He specialized in the laryngology, rhinology and rhinology; became professor of otology at the New York Polyclinic Medical School, and professor of laryngology and rhinology at
the Manhattan Eye, Ear and Throat Hospital and Medical School. He is a contributor to medical journals.

MACKENZIE, ma-kên'zi, Sir Alexander, Scottish explorer: b. Inverness, Scotland, 1755; d. near Dunkeld, 12 March 1820. He went to Canada when young, where he entered the employ of the London & West India Company. In 1799 he explored the great river named after him from the western end of Great Slave Lake to the Arctic Ocean, made another expedition to the western coast (1792) and was the first white man to cross the Rocky Mountains and reach the Pacific Coast. He returned to Britain in 1801, and for his explorations received the honor of knighthood in 1802. He published 'Voyages from Montreal through the Continent of North America to the Frozen and Pacific Oceans in 1789 and 1793' (1801).

MACKENZIE, Alexander, Canadian statesman: b. Logierait, Perthshire, Scotland, 28 Jan. 1822; d. Toronto, Ontario, 17 April 1892. He emigrated to Canada in 1842. For five years he worked at the trade of a stonemason at Kingston, but then removed to Sarnia, where he became a contractor. But his chief interests were political, not commercial. In 1852 he began the publication of the Lambton Shield, and soon became conspicuous as one of the Liberal leaders. He entered the Canadian Parliament in 1861, and after the Confederation of Canada, in 1867, sat both in the Ontario legislature at Toronto and in the Dominion Parliament at Ottawa. When Edward Blake (q.v.) became Prime Minister of Ontario in 1871 Mackenzie joined his cabinet and became Provincial Treasurer, but in consequence of the passing of a law forbidding membership of more than one legislature, he elected in 1872 to sit in the Dominion Parliament. In 1873, when the government of Sir John Macdonald was overthrown, Mackenzie, now the leader of the Liberal party, became Prime Minister of Canada and held office for five years. His administration of public affairs was marked by rigid integrity. He himself took the great spending Department of Public Works, and contrariously found in him a vigilant watchdog of the treasury. His too great devotion to the details of his office broke down his health. In 1878 his government was defeated by the advocates of protection, and in 1880 he was obliged by ill-health to hand over the leadership of the Liberal party to Mr. Blair. Though he remained in Parliament for some years he was never again able to take a prominent part in public affairs.

MACKENZIE, Sir Alexander Campbell, Scottish composer: b. Edinburgh, 22 Aug. 1847. He received his musical education at Sondershausen, Germany, and at the Royal Academy of Music, London, where he won the King's Scholarship in 1862. He established himself as a teacher in Edinburgh in 1865 and soon became known as a violinist of merit. He became precentor of St. George's Church in 1870 and was appointed conductor of the Scottish National Music Association in 1873. He was a member of the orchestra at the Birmingham Festivals in 1864-73. He had composed several notable pieces for the piano at this time, and at the solicitation of friends he abandoned his work as a teacher and devoted the greater part of his time from 1875 to 1885 engaged in composition. From 1888 he was principal of the Royal Academy of Music. He conducted the Philharmonic concerts in 1892-99, and was knighted in 1894. Author of 'Overture, Cervantes'; the cantatas 'The Bride' (1881) and 'Jason' (1882); the operas 'Colombo' (1883); 'The Troubadour' (1886); the oratorios 'The Rose of Sharon' (1884); 'Bethlehem' (1894); incidental music for several plays among them 'The Little Minister,' 'Coriolanus' and 'Ravenswood,' and many concertos, songs, violin pieces and works for violin and orchestra.

MACKENZIE, Alexander Slidell (originally Slidell), American naval officer: b. New York, 6 April 1803; d. Tarrytown, N. Y., 13 Sept. 1848. He was a brother of John Slidell (q.v.) and assumed the name 'Mackenzie' for an uncle in 1837. He entered the navy in 1815 and became a commander in 1841. While in command of the Somers the next year a mutiny among the naval apprentices on board was supposed to have been detected, and three of them, including a son of the Secretary of War, were hung from the yardarm on 1 Dec. 1842. He was a popular writer and among his works are 'A Year in Spain by a Young American' (1829-31; enlarged ed., 1836), which attained great popularity in England and the United States; 'Popular Essays on Naval Subjects' (1833); 'The American in England' (1835); 'Life of John Paul Jones' (1841); consultant 'The Case of the Somers: Defense of A. S. Mackenzie' (New York 1843); Cooper, 'The Cruise of the Somers' (ib. 1844).

MACKENZIE, Arthur Stanley, Canadian educator: b. Pictou, Nova Scotia, 26 Sept. 1865. He was graduated at Dalhousie University in 1885, and in 1885-87 was assistant master at the Yarmouth Academy, Nova Scotia. He was scholar in physics at Johns Hopkins University in 1889-90 and Fellow there in 1890-91. He was connected with the staff of physics at Bryn Mawr College in 1891-1905, was professor of physics at Dalhousie University in 1905-10 and at Stevens Institute of Technology from 1911, since when he has been president of Dalhousie University. Author of 'The Laws of Gravitation' (1900).

MACKENZIE, Charles Frederick, Anglican bishop: b. Portmore, Pembrokeshire, Scotland, 10 April 1925; d. Malo, in the Manganja country, Africa, 31 Jan. 1962. He was graduated at Cambridge in 1848, was elected a fellow there and was ordained a deacon in 1851. He was appointed to a curacy at Haslingfield, Cambridgeshire, in 1851, which office he filled without discontinuing his work as Fellow and tutor at Cambridge. In December 1854 he accompanied Bishop Colenso to Natal as his archdeacon, and returned to England after a severe illness in 1859. He became the head of the Universities' Mission to Central Africa in 1860 and in 1861 consecrated bishop of Central Africa. He was assisted by Livingstone in penetrating certain remote districts in his diocese. He died of a fever while on his way to a conference with the explorer. Consult Goodwin, 'Memoir of Bishop Mackenzie' (2d ed., 1865); Livingstone, 'Narrative of an Expedition to the Zambezi' (pp. 348-364, 400, 410-412, 1865).
MACKENZIE, Compton, English novelist and playwright: b. West Hartlepool, 17 Jan. 1883. He was educated at Saint Paul’s School and Magdalen College, Oxford, where he took the second class in modern history in 1904. He was a founder of the Oxford Point of View, and was its editor from 1902 to 1904. He has since occupied himself in writing novels and plays. He holds a commission as a lieutenant in Royal Marines. His chief publications are "The Passionate Ellopement" (1911); "Carnival" (1912); "Sinister Street" (Vol. I, 1913; Vol. II, 1914); "Guy and Pauline" (1915); "Kensington Rhymes" (1912); "Plashers Mead," and a volume of poems. His plays are "Carnival" (1912) and "The Gentleman in Grey" (1900).

MACKENZIE, Sir George, Scottish lawyer: b. Dundee, 1636; d. Westminster, 8 May 1691. He was a grandson of Kenneth, 1st Lord Mackenzie of Kintail, and a nephew of the 1st and 2d Earls of Seaforth. He was educated at the universities of Saint Andrew’s and Aberdeen, later studied civil law at the University of Bourges, France. He was called to the bar in Scotland in 1659 and speedily rose to distinction. In 1661 he conducted the defense for the Marquis of Argyll in his trial for high treason, and soon afterward was appointed a justice-depute, or judge of the Criminal Court. In 1669 he sat for Ross-shire and rendered himself conspicuous by his opposition to Lauderdale and by his support of popular measures. He was knighted in 1674 and in 1677 succeeded Sir John Stewart, his King's Advocate. From this time Mackenzie’s principles seemed wholly subverted, and in his endeavor to force submission to the king he earned for himself the appellations "Bloody Mackenzie" and "the blood-thirsty advocate." He opposed the abrogation of the penal laws against Catholics in 1686 and was removed from office until 1688, when for a year he was again King’s Advocate, relinquishing the office at the outbreak of the Revolution. He founded the Advocate's Library at Edinburgh in 1689, and in 1690 he retired to Oxford where he was admitted as a student and spent the remainder of his life engaged in literary pursuits. Author of "A Vindication of the Government of Charles II" (1691); "The Moral History of Frugality" (1691); "Methods of Proceeding against Criminals and Fanatical Covenanters" (1691); "Vindication of the Presbyterians of Scotland from the Malicious Aspersions Cast upon Them" (1692), and many other works of earlier date. His collected works were published (2 vols., Edinburgh 1716-22).

MACKENZIE, George Henry, American chess player: b. near Aberdeen, Scotland, 24 March 1837; d. New York, 13 or 14 April 1891. He was appointed an ensign in the 60th Rifles in 1856, served at the Cape of Good Hope and in India and was promoted lieutenant. He returned to England and in 1861 sold his commission. He came to the United States in 1863, joined the Federal army and rose to the rank of captain. He thereafter devoted himself to chess as a professional, already having won first prize in the London Tournament of 1862, defeating the Dutch champion, Anderssen. Settling in New York in 1865 he became a member of its chess club and won first prize in the tournaments of 1865, 1866, 1867, 1868. He won first prize at the Second American Chess Congress in Cleveland in 1871; fourth prize at the International Congress at Paris in 1878, and in 1887 he won the championship of the world at Frankfort. He was found dead in bed.

MACKENZIE, Henry, Scottish novelist and essayist: b. Edinburgh, 25 Aug. 1745; d. there, 14 Jan. 1831. He was a lawyer at Edinburgh, and in 1771 published anonymously "The Man of Feeling," which the booksellers had declined as a gratuitous offering, and which gained him a conspicuous place among 18th century writers. Other novels of his are "The World" (1773), and "Julia de Rouhigne" (1777). He edited "The Mirror, 1779-80" (the first Scottish paper founded on the plan of "The Spectator"), and "The Lounger, 1785-97.

MACKENZIE, James Cameron, American educator: b. Aberdeen, Scotland, 15 Aug. 1852. He was graduated at Lafayette College in 1878, at Princeton Theological Seminary in 1882 and was ordained in the Presbyterian ministry in 1885. He founded the Academy, Wilkesbarre, Pa., in 1882, and also organized the Lawrenceville (N. J.) School in that year, acting as its head master in 1882-99. In 1899 he reorganized the Jacob Tome Institute, Fort Deposit, Md., and was its director until 1901. Since 1901 he has been director of the Mackenzie School, Monroe, N. Y.

MACKENZIE, John Joseph, Canadian pathologist and bacteriologist: b. Saint Thomas, province of Quebec, 1865. He was educated at the universities of Toronto, Leipzig and Berlin. He was a Fellow in biology at Toronto and later was bacteriologist to the Ontario Provincial Board of Health. Since 1900 he has been professor of pathology and bacteriology at the University of Toronto. He has contributed to various scientific magazines. He is a Fellow of the Royal Society of Canada, and member of the American Public Health Association, the Society of American Bacteriologists and of the American Association of Pathologists and Bacteriologists. He is secretary of the Canadian Institute. During the European War he was attached to No. 4 Canadian General Hospital. Author of "Recent Theories in Regard to the Causes of Immunity to Infectious Disease" (1907).

MACKENZIE, John Stuart, British educator: b. near Glasgow, 21 Feb. 1860. He was educated at Glasgow and Cambridge universities and later studied at the University of Berlin. He was a Fellow at the University of Glasgow in 1882-84, at the University of Edinburgh in 1884-89 and at Trinity College, Cambridge, 1890-96. He was professor of logic and philosophy at the University College of South Wales and Monmouthshire in 1895-1915, then becoming professor emeritus. He was a vice-president of the Institut International de Sociologie. He sold his collection to the Finnish Education League in 1908-16. Besides magazine articles and contributions to the "Encyclopedia of Religion and Ethics" he is author of "An Introduction to Social Philosophy" (1890; 2d ed., 1895); "A Manual of Ethics" (1893; 8th ed., 1913); "Lectures on Humanism" (1902; 2d ed., 1906); "Lectures on Humanism" (1907); "Elements of Constructive Philosophy" (1917).
MACKENZIE, Sir Morell, English laryngologist: b. Leytonstone, Essex, 7 July 1837; d. London, 3 Feb. 1892. He was educated at the London Hospital, Paris and Vienna. In 1859 he met Czernak in Budapest and learning from him the use of the laryngoscope he introduced its use into London. Later he became physician to the London Hospital and lecturer on diseases of the vocal organs. In 1870 he founded the Throat Hospital in London. In 1887-88 he was associated with specialists of Berlin and Vienna in the treatment of the larynx disease of the Crown Prince, subsequently Emperor Frederick of Germany, and for these services was knighted. He was present at Queen Victoria and received the Grand Cross and Star of the Hohenzollern Order of Germany. He was the author of 'The Use of the Laryngoscope' (1866); 'Diseases of the Throat and Nose' (1880), etc.

MACKENZIE, Ronald Slidell, American soldier: b. Westchester County, N. Y., 27 July 1840; d. Staten Island, N. Y., 19 Jan. 1889. He was son of Alexander S. Mackenzie (q.v.). Graduated from West Point in 1862, he was assigned to the engineer corps, was wounded at Manassas and brevetted 1st lieutenant for services. He was engineer of Sumner's division at Fredericksburg (13 Dec. 1862), and received the successive brevets of captain and major for his conduct at Chancellorsville and Gettysburg. Promoted captain of engineers 6 Nov. 1863, he took part in the Richmond campaign as commander of the 2d Connecticut Artillery. On 18 June 1864 was brevetted lieutenant-colonel for services in the Petersburg siege and commanded the 2d Connecticut Heavy Artillery in the Shenandoah campaign. He was present at Lee's surrender at Appomattox (9 April 1865), and was mustered out of the volunteer service 15 Jan. 1866. In 1882 he was made brigadier-general and in 1884 placed on the retired list.

MACKENZIE, Robert Tait, American sculptor and physician: b. Almonte, province of Ontario, Canada, 1867. He graduated at McGill University in 1889 and took his M.D. there in 1892. He engaged in the practice of medicine; was connected with the medical faculty of McGill in 1892-93, 1900-01, and was appointed professor and director of the department of physical education at the University of Pennsylvania. He was appointed temporary major in the R. A. M. C. in 1915, and in 1916 was inspector of physical training of Kitchener's armies, and medical officer in charge of Heaton Park Command Depot. He is a Fellow of the College of Physicians at Philadelphia, and in 1912-15 he was president of the American Physical Education Association. His fame as a sculptor has been achieved without artistic training, his guide being his thorough knowledge of anatomy and his unusual ability in interpretation. He has exhibited at the Society of American Artists, New York; the Royal Academy, London, and the Paris Salon. Among his works as a sculptor are 'The Sprinter' (Fitzwilliam Museum, Cambridge); 'The Athlete' (Ashmoleum Museum, Oxford); the statuettes, 'The Competitor' and 'The Juggler' (Metropolitan Museum, New York); 'The Youth Benjamin Franklin' (University of Pennsylvania). Author of 'The Barnum Barrell Drill,' and 'Exercise in Education and Medicine.'

MACKENZIE, William, Canadian financier: b. Kirkfield, Ontario, 30 Oct. 1849. He was educated at the local schools and became a public school teacher. Gaining up this occupation he contracted for the construction of a portion of the Victoria Railway—now the Midland division of the Grand Trunk Railway—and later executed contracts for the Cobocoon, the Credit Valley, the Canadian Pacific, the Fort McDou and Edmonton, the Regina, the Hudson Bay and Dauphin railways and other roads. He controls and is president of the Toronto Street Railway, is also interested in the Montreal and Winnipeg street railways, and with others controls the Birmingham Street Railway and other European lines. His great achievement was the construction of the Canadian Northern Railway (q.v.), of which he is president. He was knighted in 1911.

MACKENZIE, William Douglas, American Congregational clergyman: b. Fauresmith, Orange River Colony, South Africa, July 1859. He graduated from Edinburgh University in 1881, studied divinity in Edinburgh and Göttlingen, was professor of theology in the Chicago Theological Seminary, 1895-1903, and since 1903 has been president of Hartford Theological Seminary. He published 'The Revelation of the Christ' (1896); 'Christianity and the Progress of Man' (1897); 'South Africa: its History, Heroes and Wars' (1900); 'John Mackenzie, South African Missionary and Statesman' (1902); 'The Final Faith' (1910); 'Galatians and Romans' (in Westminster New Testament,' 1912).

MACKENZIE, William Lyon, Canadian journalist and political reformer: b. Dundee, Scotland, 12 March 1795; d. Toronto, Ontario, 28 Aug. 1861. In 1820 he came to Canada and conducted a drug and book store at Little York (now Toronto), and later at Queenstown, where in 1824-26 he published the Colonial Advocate. He transferred the Advocate office to Toronto in 1826, and there continued the paper until 1833, attacking the office-holding class and demanding governmental reforms. In 1828 he entered the provincial Parliament; and having been expelled for 4 and in 1832 for 3, was appointed temporary major in the R. A. M. C. in 1915, and in 1916 was inspector of physical training of Kitchener's armies, and medical officer in charge of Heaton Park Command Depot. He is a Fellow of the College of Physicians at Philadelphia, and in 1912-15 he was president of the American Physical Education Association. His fame as a sculptor has been achieved without artistic training, his guide being his thorough knowledge of anatomy and his unusual ability in interpretation. He has exhibited at the Society of American Artists, New York; the Royal Academy, London, and the Paris Salon. Among his works as a sculptor are 'The Sprinter' (Fitzwilliam Museum, Cambridge); 'The Athlete' (Ashmoleum Museum, Oxford); the statuettes, 'The Competitor' and 'The Juggler' (Metropolitan Museum, New York); 'The Youth Benjamin Franklin' (University of Pennsylvania). Author of 'The Barnum Barrell Drill,' and 'Exercise in Education and Medicine.'
prisoned for a year in Rochester jail. Later he was a journalist in the United States, in 1849 took part in the insurrection against the government of Mackenzie, and was there a member of Parliament from 1850-58, and at Toronto published the weekly "Mackenzie’s Messenger" from 1858 until shortly before his death. The reforms for which he so persistently contended were in the main achieved in his lifetime. He wrote "Sketches of Canada and the United States" (1833), Consult the Life by Lindsey (1862); Lindsey’s Life in ‘The Makers of Canada’ (1910); Dent, ‘Story of the Upper Canada Rebellion’ (1885); Read, ‘The Canadian Rebellion of 1837’ (1896).

MACKENZIE, Canada, a district in the Northwest Territories, bounded north by the Arctic Ocean, east by Keewatin, south by Athabasca, and separated on the west by Yukon by the northernmost spur of the Rocky Mountains. The district created in 1895 and administered by the government of the Northwest Territory is the largest in Canada, having an estimated area of 563,200 square miles, of which 82,000 square miles are water. The surface generally is diversified; in the northwest it is a sterile waste; along the river valleys and on the western mountain slopes it is well forested with fir, pine, spruce and other northern trees, while coal and other minerals, although unexploited, are found. The principal lakes are Great Slave, Great Bear, Pelly and Clinton Colden. The chief rivers are the Mackenzie, the Coppermine, and the Great Fish or Back River. The soil is comparatively unproductive, the climate being arctic and inhospitable except for the few summer months. The population, about 5,400, inhabit the trading settlements of the Mackenzie and its tributaries. The pelts of the fur-bearing animals of the region are practically the only developed item of commerce.

MACKENZIE RIVER, Canada, a large river in the Northwest Territories, which flows from the Great Slave Lake, and after a northwesterly course of about 1,000 miles enters the Arctic Ocean by numerous mouths at the island-studded Mackenzie Bay. Its ultimate source is in Thutake Lake, the headwaters of the Pinlay in northern British Columbia; its total length from Thutake Lake to the sea is 2,525 miles. Its tributary head-streams are the Great Peace River, which rises in British Columbia beyond the Rocky Mountains, and the Athabasca or Elk River, which has its source in the Rockies; these two rivers flowing into Lake Athabasca are discharged by the Great Slave River into Great Slave Lake whence issues the Mackenzie. The principal affluent of the Mackenzie is the Laird or Mountain River. With the exception of a slight obstruction in the rapids near Fort Good Hope, in lat. 66° N., the Mackenzie and its tributaries are navigable for a distance of over 1,800 miles, and from June to October steamboats of the Hudson’s Bay Company ply from Great Slave Lake almost to the Arctic Ocean. Forts Providence, Norman and Good Hope are trading stations along its banks, while Forts McPherson, Franklin, Enterprise, Reliance, Resolution, Chipewyan, Nelson and Graham are along its tributaries. The valley is well-wooded with spruce, pine, poplar and birch, while coal, salt and other minerals abound in the region. The river is named to return to Canada from Mackenzie (q.v.), who first explored it in 1789.

MACKEREL, mäk’è-rēl. The common mackerel (Scomber scombrus) is the best-known and most important member of the family Scombridae and one of the most valuable of food-fishes, ranking in this respect behind the cod and herrings only. The mackerel is a compactly built fish of small size. Its outline, the fusiform figure tapering accurately to the pointed snout, so that it cleaves the water easily. The large, deeply-forked tail is supported on a slender peduncle, provided with two small keels on each side, and preceded by a dorsal and a ventral series of teeth of five each. A soft dorsal and a counterpart anal fin are placed exactly opposite each other and behind the level of the vent, and the anterior dorsal fin is supported by usually 11 delicate spines. Very numerous and small scales cover the body and move along it northward as the head. The large mouth is provided with numerous small sharp teeth. The gill-rakers are long and the air-bladder is wanting. The color of the back is deep blue, marked by about 35 nearly vertical wavy black lines; the belly of the fish is silvery white. A recent close study of the species on the European side of the Atlantic establishes the existence there of local races, as in the herring, but it appears that the American representatives, while constituting a race distinct from the European, are more homogeneous.

The mackerel is an abundant fish on both sides of the north Atlantic, on the American side ranging from Cape Hatteras to the Straits of Belle Isle, and on the European from northern Norway to the Canary Islands and through out the Mediterranean. While a true pelagic fish of wandering and migratory habits and, like most such, capricious in its movements, the great body of mackerel approaches the American coast and moves along it northward as the temperature of the water rises to about 45° F. On the approach of winter they retire to a greater distance from the land, but a few remain throughout the year near the coast. Mackerel swim in great schools at or near the surface; one such covering an area of 10 square miles, and another estimated as containing 1,000,000 barrels, have been observed. The local movements of the schools are largely regulated by the food-supply, which consists of small pelagic fishes, various kinds of small crustaceans, etc., which are pursued with great eagerness. On the other hand, the bluefish and other carnivorous fishes, porpoises, squids and fish-eating birds, are relentless enemies. Spawning takes place in the open sea, not far from the coast from Vineyard Sound to the Gulf of Saint Lawrence, and during the months of May, June and early July. The eggs are about one millimeter in diameter, contain an oil-drop and float at the surface, where the young fish develop and live. They grow rapidly and are about five inches long by the end of the first half-year, when they are known as "spikes"; "blinkers" are about one year old and six or seven inches long; "tinkers" are seven to nine inches long and are supposed to be two years old. At the age of three or four
years the mackerel is mature and from 12 to 18 inches long. The very largest specimens weigh about four pounds and have a length of 22 to 23 inches.

The mackerel fishery is of the greatest importance in the New England States and Nova Scotia, and in Norway, Ireland and Great Britain. In Europe the fishery is prosecuted almost exclusively by means of small boats and hand lines, but in America is chiefly carried on in staunch sea-going schooners, most of which hail from Gloucester, Mass., and which are equipped with purse seines, by means of which entire schools are surrounded and captured. The fishing begins off Cape Hatteras in March or April and the schools are followed northward as they appear successively on the New Jersey, New England and Canadian coasts. In addition to the operations of this mackerel fleet, local fisheries are carried on along much of the coast, with pound-nets, gill-nets and hand-lines. The spring and local catches are generally sold fresh, the summer catch being split and salted. The product of the fishery has been peculiarly subject to fluctuations, due in large part to alternating periods of abundance and scarcity of the fish. Colonial writers refer to its great plenty, and statistics of the catch inspected in Massachusetts show a somewhat regular recurrence of such periods at intervals of from 18000 barrels in 1880 to 395,000 in 1881, the catch steadily declined to 75,000 in 1886, and 18,000 in 1891, since which time it has greatly fluctuated.

For 1914-15 the number of fry distributed was 4,847,000, and in the succeeding year 1,946,000. In 1915 the returns for salted mackerel were 19,691 barrels, exceeding the previous year by 4,170 barrels, while the total catch of fresh mackerel was 71,564 barrels against 6,682 in the previous year. The returns for New England up to 30 June 1916 show an increase of 63 per cent in quantity and on a cent or $259,354 in value. In the spring of 1916 mackerel reached the unheard-of price of 40 cents apiece for the larger fish. The Canadian provinces in 1914-15 gave 143,712 hundredweights, as against 215,416 hundredweights in the previous year, a decline in values of $453,473; the quantity in 1915-16 was 180,990 hundredweights, representing an increased value $180,990 over 1914-15. An elaborate account of the American mackerel fishery will be found in Brown-Goode’s ‘Materials for a History of the Mackerel Fishery’ (Report of the United States Fish Commission, 1884) for some recent views see Moore, ‘Report National Fishery Congress’ (Washington 1898); and for methods of preservation, Stevenson, ‘The Preservation of Fishery Products for Food’ (Bulletin of United States Fish Commission, 1898).

Mackerel Shark, or Porbeagle, a shark of the family Lamnidae, allied to the man-eater (q.v.), and like it sometimes called blue shark, on account of its color, which is frequently seen on both sides of the north-east Atlantic Ocean; it is the Lamna cornubica of ichthyologists, which reaches about 10 feet, and they become very abundant in summer, when the mackerel are running, along the New England coast, and also about Great Britain, where they are called porbeagles. They are a nuisance to fishermen by destroying their nets, through which several will often tear their way (for they roam about in bands) in pursuit of captured fish. Formerly considerable quantities of oil were saved from their livers, but at present the value of this commodity does not pay for the trouble of taking them.

MACKEN, Albert Gallatin, American writer on Freemasonry: b. Charleston, S. C., 12 March 1807; d. Fortress Monroe, Va., 20 June 1881. He was graduated from the Medical College of South Carolina in 1832 and was demonstrator of anatomy there in 1838, but after 1844 devoted himself to studies of Freemasonry and became a standard authority on the subject. Among his works are ‘A Lexicon of Freemasonry’ (1845); ‘The Mystic Tie’ (1849); ‘Book of the Chapter’ (1858); ‘A Manual of the Lodge’ (1862); ‘A Textbook of Masonic Jurisprudence’ (1869); ‘Encyclopedia of Freemasonry’ (1874).

MCKIBEN, Chambers, American soldier: b. Pittsburgh, Pa., 2 Nov. 1841. He enlisted as a private in the volunteer service 22 Sept. 1862, was brevetted captain for gallant services in the battle of North Anna River (Va.) and in the operations on the Weldon Railway, and on 1 May 1866 attained the rank of lieutenant-colonel of the 21st United States Infantry. At the beginning of the war with Spain he went to Cuba with Shafer’s army, fought at Santiago (1 July 1898), and was made brigadier-general of volunteers and appointed military governor of Santiago. On 12 May 1899 he was mustered out of the volunteer service. Retiring in the same year, he was put in command of the Department of Texas, and two years later was transferred to the command of an infantry regiment. In 1902 he retired with the rank of brigadier-general.

MCKIM, Charles Follen, American architect: b. Chester County, Pa., 24 Aug. 1847; d. 14 Sept. 1909. He studied at the Lawrence Scientific School in 1866, at the Beaux-Arts of Paris in 1867-70, and shortly afterward entered into partnership with Seth O. Weatherby. He was a founder of the American Institute of Architects. Among notable examples of his work are the buildings of Columbia University, and the Public Library of Boston. In 1903 McKim received the royal gold medal from the Royal Institute of British Architects in recognition of his services to architecture. He was the second American to obtain this honor, R. M. Hunt (q.v.) having been the first. On the occasion of the presentation he made an able speech reviewing the progress of his profession in the United States. He was elected president of the American Institute of Architects.

MCKIM, James Millar, American abolitionist: b. near Carlisle, Pa., 14 Nov. 1810; d. Llewellyn Park, West Orange, N. J., 13 June 1874. He was educated at Dickinson College (Carlisle, Pa.) in 1833, then studied at the University of Pennsylvania and theology at Princeton (1831) and Andover (1832), and in 1835 was ordained a Presbyterian pastor in Womelsdorf, Pa. An original member of the American Anti-Slavery Society, he became its
lecturing agent in October 1836, and spoke throughout Pennsylvania, often at great personal danger. In 1840 he removed to Philadelphia, where he was publishing agent of the Pennsylvania Anti-Slavery Society, and corresponding secretary until 1862. In November 1862 he called a public meeting in Philadelphia to provide for 10,000 slaves suddenly liberated by the capture of Port Royal, S. C. As a result, the Philadelphia Port Royal Relief Committee was formed. This Committee was expanded in November 1863 into the Pennsylvania Freedman's Relief Association, of which McKim became the corresponding secretary. In that capacity he was active in the establishment of negro schools in the South. In 1865–69 he was corresponding secretary of the American Freedman's Commission, which his motion was disbanded in July 1869. In 1865 he assisted in founding and became a proprietor of the New York Octly Nation. During the Civil War he was an advocate of the enlistment of negro troops, and as a member of the Union League of Philadelphia assisted in the recruiting of 11 colored regiments.

MACKINAC (mækˈɪ-ˌnæk or mækˈɪ-ˌnä) ISLAND, Mich., in Mackinac County, at the entrance to Straits of Mackinac, in the northwest part of Lake Huron, about 255 miles north by west of Detroit. The island is about three miles long and two wide. It is rocky, and covered with trees, shrubs and flowers. The island has been prominent since the early missionaries and explorers mentioned it in connection with its command of the channel entering the straits. An interesting historic point on the island is Fort Mackinac, one of the oldest fortifications in the United States. The city of Mackinaw on the southeast shore was chartered in 1900. Pop. of the city 720.

MACKINDER, ma-kinˈdər, Halford John, English author and educator; b. Gainsborough, 15 Feb. 1861. He was educated at Christ Church, Oxford; in 1883 was president of the Oxford Union; Burdett-Coutts University school, 1884; Parrister, Inner Temple 1886; reader in geography, Oxford University 1887–1905; and from 1903–08 director of the London School of Economics and Political Science. He was leader of the Mount Kenya Expedition 1899; and has been member (Unionist) for the Camlachie division of Glasgow since 1910. He has written 'Britain and the British Seas' (1902); 'The Rhine' (1908); 'Elementary Studies in Geography' (12th ed., 1914); 'Eight Lectures on India' (1910), etc.

MCKINLEY, ma-kinˈli, William, American statesman, 25th President of the United States: b. Niles, Trumbull County, Ohio, 29 Jan. 1843; d. Buffalo, N. Y., 14 Sept. 1901. He was educated at Union Seminary, Poland, Mahoning County, Ohio, and Alleghany College, Meadville, Pa. (1860–61). Forced by illness to discontinue his college course, he taught in the public schools, was a clerk in the Poland post-office and on 11 June 1861 enlisted for the Civil War as a private in Company E of the 23d Ohio Volunteer Infantry. His first battle was that of Carnifex Ferry (10 Sept. 1861), and on 15 April 1862, while in camp at Fayetteville, western Virginia, he was promoted commissary sergeant. For conspicuous service at Antietam (17 Sept. 1862) he was made second lieutenant of Company D. His subsequent appointments were, first lieutenant, Company E (7 Feb. 1863); captain Company G (25 July 1864); and brevet major (14 March 1865). When mustered out, 26 July 1865, he was acting adjutant-general on the staff of Gen. S. C. Carroll, commanding the veteran reserve corps stationed at Washington. Among other actions in which he participated were those of South Mountain (14 Sept., 1862), and Leetown (20 June 1864), Kernstown (24 July 1864), Opequon Creek (Winchester, 19 Sept. 1864), Fisher's Hill (22 Sept. 1864) and Cedar Creek (19 Oct. 1864). During his subsequent political career he was generally known, especially in Ohio, as Major McKinley. At the close of the war he began the study of law at Youngstown, Ohio (1865–66), continued it at the Albany (N. Y.) Law School (1866–67), in March 1867 was admitted to the bar at Warren, Trumbull County, and at once entered practice at Canton. In 1870–71 he was prosecuting attorney of Stark County, and during the campaign between R. B. Hayes and William Allen for the governorship of the State, spoke effectively against the "greenback" craze. He was elected to Congress as Republican in November 1873 from the 17th Ohio district in 1877, and served continually in the 45th, 46th and 47th Congresses (1877–83). It was asserted by the Republicans that he was elected in 1882 to the 49th Congress by a majority of eight ballots; but, although he had received the certificate of election, his seat was successfully contested by J. H. Wallace, who was not, however, seated until June 1884. He represented the 20th district in the 49th Congress (1885–87), and the 18th in the 50th and 51st Congresses; but in 1890 was defeated in the 16th for the 52d Congress by 300 ballots by J. G. Warwick, Democrat, lieutenant-governor of the State a short time previously. His defeat was attributed to the gerrymandering of the district by a Democrat legislature. His service was not noteworthy. In 1877 he was appointed a member of the Judiciary Committee, and in December 1880 of the Ways and Means Committee to succeed James A. Garfield; and in 1881 was chairman of the committee on legislation providing for Garfield memorial exercises in the House. In 1889–90 he was chairman of the Ways and Means Committee. He was a candidate for speaker of the 51st Congress, but was defeated by T. B. Reed on the third ballot in the Republican caucus. He was known among the fore- most orators of the House; and his speeches on arbitration as a solution of labor troubles (2 April 1886) and in support of the civil service laws (24 April 1890) were most favorably received. But his principal efforts were made in connection with the tariff, which, from his first appearance in the House, was the chief object of his study. On 6 April 1882 he spoke in advocacy of protection; on 30 April 1884 in opposition to the Morrison tariff bill, making what was esteemed the best argument against that measure; and on 7 May 1890 in support of the general tariff bill, now known by his name, which, as chairman of the Ways and Means Committee, he had introduced before the House on 15 April. The bill was passed by the House on 21 May, by the Senate on 11 September; and on 6 October became a law. His bill obtained for him an international reputation, and
eventually the Presidency. In 1884 he was delegate-at-large from Ohio to the Republican National Convention at Chicago, where he supported Blaine's candidacy, and where, as chairman of the committee on resolutions, he helped to determine the platform of his party, which he read before the convention. In the Republican National Convention at Chicago in 1888, he was again a delegate and chairman of the committee on resolutions. He supported the candidacy of John Sherman, although, when it was finally learned that Blaine would decline the nomination, he was himself the most satisfactory of delegates and was strongly urged to permit the use of his name. At the Minneapolis convention of 1892 he was once more a delegate and was elected permanent chairman of the assembly. He supported the renomination of President Harrison, and though refusing the use of his own name, received the ballots of 182 delegates. He then left the chair and moved to make Harrison's nomination unanimous, which was accordingly done. In the ensuing campaign he traveled actively, and on one trip, estimated, more than 16,000 miles and speaking to more than 2,000,000 voters. In 1892-96 he was governor of Ohio, having been elected in 1891 by 21,500 plurality, and in 1893 by the unusual plurality of 80,995. Labor riots occurred during his administration, necessitating the placing of 3,000 militia troops in active service, but the difficulties were successfully adjusted. McKinley also personally directed the relief work for the starving miners of the Hocking Valley district. He was nominated for the Presidency by the Republican National Convention which met at Saint Louis 16 June 1896, and was elected by a plurality of 601,854 over W. J. Bryan, receiving a popular vote of 7,104,779, and in the electoral college a vote of 271 to 176 for Bryan. Throughout the campaign he remained in Canton, where he made over 300 speeches to more than 750,000 visitors. Under his administration decided increase in business prosperity followed the passage of the Dingley tariff measure. The most important event of his term was the Spanish-American War (q.v.), which he had believed might be prevented and had done all in his power to avert. When hostilities broke out on the part of certain inhabitants of the Philippine Islands, the President appointed a commission to study the situation and report on the most suitable mode of government for the new territory. On 7 July 1898 he approved the joint resolution of Congress for the annexation of the Hawaiian Islands, and in 1898 he also selected a delegation to represent the United States in The Hague peace conference which convened in May 1899. The original Philippine commission having rendered a report (31 Jan. 1900), the President appointed a new commission, known from its head, Judge W. H. Taft, as the Taft commission, under whose direction civil government was instituted in the islands on 1 Sept. 1900. (See PHILIPPINES, History.) In 1900 the President stood conspicuously for justice in the settlement of the dispute with the commission to study the situation and report on the most suitable mode of government for the new territory. He was renominated for the Presidency by the Republican National Convention which met at Philadelphia on 25 June 1900, receiving the entire vote of the 930 delegates. He was elected by a popular vote of 7,206,677 to 6,374,397 for W. J. Bryan, receiving till then, the largest popular majority ever given a candidate for the Presidency. He obtained 292 electoral votes and carried 28 States. On 5 Sept. 1901 he delivered at the Pan-American Exposition, Buffalo, N. Y., an important address, summarizing at once the problems then before the nation and his policy for their solution. On 6 September, while holding a reception in the Music Hall of the Exposition, he was twice shot by Leon Czolgosz (q.v.), an anarchist. He died on 14 September; and 19 September was appointed by his successor, President Roosevelt, a day of mourning and prayer throughout the United States. Unprecedented honors were paid to McKinley's memory in foreign capitals, notably in London, where memorial services were held in Westminster Abbey and Saint Paul's Cathedral. A statue was erected in his honor at Columbus, Ohio, and unveiled in 1906. Consult Smith (editor), 'Speeches and Addresses of William McKinley' (1893); Porter, 'The Life of Major McKinley' (1896), and 'Speeches and Addresses of William McKinley' (1900). See also UNITED STATES, History. 

McKINLEY, Mount, United States, a peak of the Rocky Mountains, the highest in North America, south of the central part of Alaska, about 155 miles north of Cook Inlet. The Indian name for this peak is Traleyka and the Russian name, Bolshaya. The fact that this is the highest land on the continent was not known till 1896 when Mr. Dickey explored the Sushitna River and the land near its source. He estimated the height of the peak at 20,000 feet, and named it McKinley, in honor of William McKinley (q.v.). In 1903 it was visited by members of the United States Geological Survey. The mountain is a great dome-shaped mass, over 20,000 feet above the sea. Consult Balch, E. S., 'Mount McKinley and Mountain Climbers' Proofs' (Philadelphia 1914); Browne, A., 'The Conquest of Mount McKinley' (New York 1914).

McKINLEY ACT, a name popularly given to a tariff bill reported to Congress, 21 May 1890, by the Ways and Means Committee of the House of Representatives, of which William McKinley was chairman. It became a law in October 1890 and was repealed in 1894. It increased the duties on wool, cotton manufactures, on tin-plate, barley and some other agricultural products and remitted the duty on raw sugar. The reciprocity feature was an important part of the bill, providing for the remission of duties on certain products from those countries which should remove duties on American imported products. See Tariff.

McKINLEY, Mrs. Glen Ford. See WEBSTER, JEAN.

McKINNEY, ma-kin'-i, Tex., city, county-seat of Collin County, on the Missouri, Kansas and Texas and the Houston and Texas Central railroads, about 30 miles north by east of Dallas. It is situated in a rich agricultural region, served by the Texas Traction Company in which cotton is cultivated quite extensively. The chief industrial establishments are cottonseed-oil mills, cotton gins, cotton compresses, wagon and carriage shops and flour mills. It is the seat of the McKinney Collegiate Institute, has five schools and a courthouse, a fine
building, cost $100,000. The waterworks are owned and operated by the city. The commission form of government has been adopted. Pop. 10,000.

MACKINTOSH, mākˈɪn-tōsh, Sir James, Scottish historian and philosophical writer: b. Airdourie, Inverness-shire, 24 Oct. 1765; d. London, 30 May 1832. He was educated at Aberdeen and Edinburgh; studied medicine and took the M.D. degree in 1787; published his 'Vindication of Burke' in answer to Burke's 'Reflections on the French Revolution'; quitted the medical profession and was called to the English bar in 1795. By reason of his brilliant lectures on the 'Laws of Nature and Nations,' and his defense of Pelier, who was prosecuted for a libel on Napoleon Bonaparte, he acquired fame at the bar, and in 1804 was appointed recorder of Bombay and received the honor of knighthood. After an honorable career in India he returned to England, entered Parliament for Nairn and afterward for Knaresborough; was professor of law at Haileybury College (1818–24), a member of Privy Council and in 1830 commissioner of the Board of Control. Among his writings may be mentioned his 'History of England,' a fragment, extending only to the reign of Elizabeth; 'Dissertation on the Progress of Ethical Philosophy' in the Encyclopædia Britannica; a 'Life of Sir Thomas More' in Lardner's 'Cyclopaedia,' and nine chapters of an unfinished work on the Revolution of 1688.

MACKINTOSH, a water-proof overcoat, or outer garment, one of the products of modern rubber manufacture. It derives its name from the inventor, Charles Mackintosh of Manchester (1766–1843). See INDIAN RUBBER.

MACKLIN, mākˈlın, Charles, Irish actor and dramatist: b. Ireland, 1 May 1697; d. London, 11 July 1797. He was the son of an Irish gentleman named McLaughlin and in 1733 appeared in minor parts at Drury Lane, London. He steadily rose in public favor, till 1741 he appeared in his greatest rôle, Shylock. He was accounted from this period among the best actors of the time. His last performance was at Covent Garden in May 1789, at past the age of 90. In 1733 he adopted as a son a brother actor in a quarrel and was tried for murder, and was frequently afterward engaged in disputes and actions at law. Of his own plays only 'The Trueborn Irishman'; 'Love a-la-Mode' (1759), and 'The 34th of the World' (1781) have been printed. Consult 'Life' by Parry (1891).

MACKUBIN, mākˈkəb̩n, Florence, American artist: b. Florence, Italy, 19 May 1861. She was of American parentage, and studied under Louis Deschamps and Julius Rolshoven in Paris and Herterich in Munich, also for her miniature painting under Mrs. J. Devina in Paris. Since completing her studies she has lived chiefly at Baltimore, Md. She has specialized in portrait and miniature painting, and her work was exhibited at the Columbian Exposition, 1893; the Tennessee Exposition in 1897; at Paris, 1900; at Buffalo, 1901; Charleston, 1902, and Saint Louis, 1904. She was officially commissioned to execute various portraits for the Executive Mansion and State House, Maryland, among them a copy of Van Dyck's portrait of Queen Henrietta Maria, and portraits of Governors Calvert and Eden of Maryland, Scott Ad. 12 Aug. 1818; d. Orangeville, Ontario, 20 March 1896. He removed to Canada in 1841; was Canadian immigration agent to Scotland in 1862, and in 1874 delivered in Scotland a series of lectures on Canadian life. He lectured also in Canada and the United States. He was a man of broad and democratic sympathies and was deeply interested in the betterment of conditions among the working classes. Author of 'Poems, Chiefly in the Scottish Dialect' (1855); 'Lyrics' (1858); 'The Emigrant and Other Poems' (1861); 'Poems and Songs' (1874).

MACLAGAN, William Dalrymple, English archbishop: b. Edinburgh, 18 June 1826; d. 19 Sept. 1910. He was educated at Edinburgh and was graduated in mathematical honors at Cambridge University. He served in the Indian army (1847–49); was ordained deacon (1856) and priest (1857). He was appointed Lichfield (1878) and archbishop of York in 1891. He published 'Pastoral Letters and Synod Chables' (1892).

MCLEANE, McLanen, Allan, American soldier and jurist: b. 8 Aug. 1746; d. Wilmington, Del., 22 May 1829. In 1774 he settled in Kent County, Del., and in the Revolution he took a prominent part. He became a lieutenant in Thomas Rodney's regiment of Delaware militia, where he rendered important service at Long Island and White Plains and also in the New Jersey campaign. In 1777 he was made captain and was in command of the American guard about Philadelphia, taking active part in the battle of Monmouth. With the rank of major under Gen. Henry Lee he participated in the capture of Stony Point and Paulus Hook and attained colonel's rank in 1818; d. Orangeville, 27 Dec. 1829. He was appointed justice of the Delaware Court of Appeals. In 1790–98 he was United States marshal of Delaware under Washington's appointment, and from 1808 until his death collector of Wilmington (Del.) port. He also served in the army of the United States, being for a time speaker of the lower house.

MCLANE, James Woods, American physician: b. New York, 19 Aug. 1839; d. 25 Nov. 1912. He was graduated at Yale University in 1861 and took his M.D. at the College of Physicians and Surgeons, Columbia, in 1864. He was thereafter for many years connected with the medical faculty of the university. He was professor of materia medica and therapeutics 1866–72, adjunct-professor of obstetrics, diseases of women and children and medical jurisprudence 1872–79, professor of gynecology in 1882–85 and of obstetrics in 1891–98. He became professor emeritus in 1898; and in 1898–1903 he was dean of the medical faculty. From 1903 until his death he was president of Roosevelt Hospital.
McLANE, Louis, American statesman: b. Smyrna, Kent County, Del., 28 May 1786; d. Baltimore, 7 Oct. 1857. He was the son of Allan McLane (q.v.), and entering the navy at an early age, served as a midshipman under the elder Jones. He may be mentioned in the Antidote of Doubt (1884); 'Analysis of Pantheism' (1885); 'The Holy Priest' (1889); 'The Essence of Prayer' (1901).

MCLAUGHLIN, māk-lār'lin, Andrew Cunningham, American historical writer: b. Beardstown, Ill., 14 Feb. 1861. He graduated from the University of Michigan in 1882, and from its law school in 1885, was professor of history there 1891–1906 and since 1906 at the University of Chicago. He was director of the bureau of historical research of Carnegie Institution, Washington, D.C., 1903–05, and managing editor of the American Historical Review, 1901–05. He has written 'Lewis Cass' (in American Statesmen series 1891); 'History of Higher Education in Michigan'; 'Civil Government in Michigan' (1892); 'History of the American Nation' (1899); 'The Constitution and the Constitution' (1905); (with Van Tyne) 'History of United States for Schools' (1911); 'The Courts, The Constitution and Parties' (1912); and (with Hart) edited 'The Cyclopaedia of American Government' (1914).

MCLAUGHLIN, Mary Louise, American artist: b. Cincinnatti. She began to decorate pottery in 1877 and made Losantiv porcelain (1898), exhibiting for the first time in the Paris Exposition of 1900. She has been awarded several public honors for her work. Among her published writings are 'Pottery Decoration'; 'Suggestions to China Painters'; 'Painting in Oil'; 'The Second Madame'.

MACLAURIN, māk-làr'ün, Colin, Scottish mathematician and philosopher: b. Kilmodan, Argyllshire, February 1698; d. 14 June 1746. He was educated at Glasgow University, and in 1717 became professor of mathematics in Marischal College, Aberdeen, and two years after was chosen Fellow of the Royal Society. In 1720 he published 'Geometria Organica,' a work on curves. In 1725 he was elected professor of mathematics at Edinburgh, where his lectures contributed much to the character of that university as a school of science. A controversy with Bishop Berkeley led to the publication of MacLaurin's great 'Treatise on Fluxions' (1742). He also wrote a 'Treatise on Algebra'; 'Account of Sir Isaac Newton's Philosophical Discoveries,' etc.

MACLAURIN, Richard Cockburn, American educator: b. Lindean, Scotland, 5 June 1870. He took his M.A. at the University of Cambridge in 1897, was elected a Fellow at Saint John's College, Cambridge, in 1897 and was professor of mathematics there in 1898–1903. He was dean of the faculty of law at the New Zealand University in 1905–07; and in 1907–09 he was professor of mathematics at Columbia University, New York. Since 1909 he has been president of the Massachusetts Institute of Technology. Author of 'Title to Realty' (1909); 'Theory of Light' (1909); 'Lectures on Light' (1909).

MACLAWS, māk-lāz', Lafayette, American military officer: b. Augusta, Ga., 15 Jan. 1821; d. Savannah, Ga., 24 July 1897. He was grad-
uated at West Point in 1842; served in the Mexican War till the surrender of Vera Cruz; and at the beginning of the Civil War was congratulated on a letter from the Confederate army. He was promoted major-general 23 May 1862, and during the march of Sherman to the sea commanded the defenses of Savannah and had charge of the military dist-

ect of Georgia. He was appointed collector of the internal revenue at Savannah in 1875 and postmaster there in 1876.

MACLAY, ma-kli', Edgar Stanton, American author: b. Foochow, China, 18 April 1863. He was graduated at Syracuse University in 1885; was reporter on the Brooklyn Times, 1886-90, and on the New York Tribune 1891-

93; served on the editorial staff of the Tribune, 1893-95, and on that of the New York Sun, 1895-96. In 1896 he was appointed lighthouse-keeper at Old Field Point, and in 1901 received an appointment at the New York navy yard. He was the 'Journal' of William Maclay (q.v.), and is the author of a `History of the United States Navy,' which occasioned much controversy and brought about his dismissal from government employ, by order of President Roosevelt, in 1901. The ground of this action, and the following Maclay's refusal of an official request for his resignation, was a passage in the `History' stigmatizing Rear-Admiral Schley as a `cautious, poltroon and coward' for his conduct in the naval fight off Santiago, Cuba, 3 July 1898. Maclay also wrote `Recollections of the Old Navy' and `The History of American Privateers.'

MACLAY, Robert Samuel, American Methodist Episcopal clergyman: b. Concord, Franklin County, Pa., 7 Feb. 1824; d. 1907. He graduated at Dickinson College in 1845 and entered the Methodist ministry in 1846. He sailed as a missionary to Foochow, China, 13 Oct. 1847. He was a member of the committee which translated the New Testament into the Foochow dialect; and in 1852-72 he was superintendent of the Foochow Mission. He was transferred to Japan in 1872, becoming secretary and treasurer of the mission there; and assisted in translating the New Testament into Japanese. He was a delegate from Japan to the General Methodist Conference at London in 1881. He was one of the founders of the Anglo-Chinese College at Foochow in 1881; and in 1884 he secured from the king of Korea permission to establish Christian missions in that country. He was instrumental in founding at Tokyo in 1883 the Anglo-Japanese College, of which he was president in 1883-87; and the Philander Smith Biblical Institute in 1884, serving as dean in 1884-87. He was dean of the Maclay College of Theology at San Fernando, Cal., from 1888 until his retirement in 1893. Author of `Life Among the Chinese' (1861); coauthor with Rev. C. C. Baldwin `Dictionary of the Chinese Language in the Dialect of Foochow' (1871).

MACLAY, William, American soldier and politician: b. New Garden, Chester County, Pa., 1737; d. 1814. He was lieutenant in the expedition against Fort Duquesne in 1758 and afterward serving under General Bouquet. He studied law, was admitted to the bar, went to England on behalf of militia officers serving in the French and Indian War, to confer upon their claims for land-grants with the proprietors of Pennsylvania, and was attorney for the Penn family. In the Revolution he raised troops and equipped them, was assistant commissary of purchase and performed some field service. In 1781 he was elected to the Pennsylvania assembly, afterward held other offices in the State, and with Robert Morris (q.v.) was elected to the United States Senate, Pennsylvania's first representatives in that body. His service there ended in 1791, but in the Senate he had shown deep-seated hostility to Washington and his administration, which was the chief distinction of Maclay's senatorial career. In his later years he was a member of the Pennsylvania legislature and his last public office was that of a county judge. Consult his `Journal,' edited by Edgar Stanton Maclay (q.v.).

MACLEAN, mäk-län', George Edwin, American educator: b. Rockville, Conn., 31 Aug. 1850. He was graduated at Williams College in 1871 and at Yale Theological Seminary in 1874; from 1877 to 1881 was pastor at Troy, N.Y.; studied in Germany; and in 1883 became professor of English language and literature at the University of Minnesota. He was chancellor of the University of Nebraska, 1895-99, and from 1899 to 1911 was president of the University of Iowa. In 1913 he was sent by the United States Bureau of Education to make a study of the English universities and colleges. His writings include `A Chart of English Literature' (1892); `Old and Middle English Reader' (1893); and `A Decade of Development in American State Universities' (1896); `Present Standards of Higher Education in the United States' (1913); `Studies in Higher Education in England and Scotland, with Suggestions for Universities and Colleges in the United States' (1916). He has edited `olfie's English Version of Aulicen Interrogationes Sigewulfi Presbyteri in Genesis' (1883); `An Introductory Course in Old English,' by Wilkin and Babcock (1888); and `An Old and Middle English Reader,' by Zupitza (1889).

MCELEAN, George Payne, American lawyer and politician: b. Simsbury, Conn., 7 Oct. 1857. He was for a time a reporter on the Hartford Evening Post, then studied law, and was admitted to the bar in 1881, and immediately commenced practice in Hartford. In 1883-84 he was a member of the general assembly, where he soon became distinguished for facility in debate and was considered one of the leaders of the Republican party. In 1888 he was elected State senator and in 1900 nominated by his party as governor of Connecticut and elected in his next term. In August 1888, at the time of his election, his independent position in regard to constitutional reform soon made him prominent; both in his first governor's message and before the constitutional convention, he advocated representation in the
legislature according to population instead of by towns. Though in this he opposed certain elements in his own party, he gained support from a considerable number of the legislature and great personal popularity in the cities. In 1902 he was offered renomination, but declined; in 1903-04 he was a prominent candidate for United States senator. He was elected to the United States Senate in January, 1911 and took off for a two-month vacation. He was the author of what is known as the "Federal Migratory Bird Bill," which became a law on 4 March 1913.

MacLEAN, James Alexander, Canadian educator: b. Mayfair, Ontario, 2 Aug. 1868. He was educated at the University of Toronto in 1882 and took his A.M. at Columbia in 1893. He was professor of political science at the University of Colorado in 1894-1900; president of the University of Idaho in 1900-13; and since 1913 he has been president of the University of Manitoba, Canada. Author of essays in 'The Financial History of Canada' (1894).

MacLEAN, John, American jurist and statesman: b. Morris County, N. J., 11 March 1785; d. 4 April 1861. He removed with his parents to Warren County, Ohio, in 1799, later went to Cincinnati, where he studied law, and was admitted to the bar in 1801, and commenced practice at Lebanon, Warren County, Ohio. He was a member of Congress 1812-16, and from 1816-22 judge of the Supreme Court of Ohio. In July 1823 he was appointed Postmaster-General, the Post-office Department being then in a very disordered and inefficient condition. Under his administration this branch of the public service was restored to order, and managed with a vigor, method and economy that soon secured an almost unexampled degree of applause and public confidence. In 1829 he became associate justice of the Supreme Court of the United States. In this capacity his charges to grand juries while on circuit are distinguished for ability and eloquence. In the Democratic party he dissented from the decision of the court as given by Chief Justice Taney, and expressed the opinion that slavery has its origin merely in power, and is against right and in this country is sustained only by local law.

MacLEAN, John, American educator: b. Princeton, N. J., 1800; d. there, 1886. His whole life was spent in Princeton. He graduated from the college there in 1816, became tutor in the institution in 1818 and was a member of the faculty till 1868, when he resigned the presidency, which he had held from 1854. He published 'Lecture on a Common School System for New Jersey' (1829), which in later years had much influence in the establishment of such a system; 'History of the College of New Jersey' (1877), and 'The True Relations of the Church and the State to Schools and Colleges' (1833).

MacLEAN, John, Canadian Methodist clergyman and author: b. Kilmarnock, Scotland, 2 Oct. 1851. He was educated at Victoria University, Cobourg, Ontario, and at the Wesleyan University, Bloomington, Ill. He served as a missionary to the Black Indians near Macleod, Alberta, in 1889-89, and was pastor at Moose Jaw, Saskatchewan, in 1889-92; later filling pastorates at Port Arthur; and at Neepewa and Carman, Manitoba. In 1902-06 he edited The Week,' and has since been stationed at Morden, Manitoba. In 1888 he was appointed a member of the Northwestern Board of Education. Author of 'The Indians of Canada' (1892); 'The Destiny of the Human Race'; 'The Hero of the Saskatchewan'; 'Better Lives for the Common People'; 'Science and the Bible,' etc.

MacLEAN, Norman, British Orientalist: b. Lanark, Scotland, 2 Oct. 1865. He was educated at the University of Edinburgh and at Christ College, Cambridge. He was examiner in classics at Edinburgh University in 1891-94; examiner for Oriental Languages Tripos in 1895-96, 1899-1900, 1909-11, and for theological Tripos in 1896-97, 1901-02, 1908-09, 1911-12. He was Fellow, senior tutor and Hebrew lecturer at Christ's College, Cambridge, and university lecturer in Arabic. He is engaged with Rev. A. E. Brooke in the preparation of a larger Cambridge edition of the Sentuagint. He was one of the editors of 'Ecclesiastical History of Eusebius' (1896).

MacLEAN, Sarah Pratt. See Greene, Sarah Pratt MacLEAN.

MacLEAN, William Findlay, Canadian journalist and legislator: b. Ascutney, Ontario, 10 Aug. 1854. He was educated at the University of Toronto and in 1890 founded the Toronto World of which he is still editor and proprietor. He was elected to the Canadian Parliament for East York in 1892 and since 1904 has been returned from South York. He is an advocate of government ownership of railways and of a two-cent passenger rate on certain Canadian railways. He was a delegate to the Imperial Press Conference at London in 1908.

MacELLAN, James Alexander, Canadian educator: b. Shubenacadie, Nova Scotia, 1832; d. 1902. He was educated at the University of Toronto and spent many years in teaching. He was appointed high school inspector for Ontario in 1871 and was credited with considerably improving the standards of the schools under his care. He became director of inspection for Ontario in 1875 and of teachers' institutes in 1885. From 1890 he was principal of the School of Pedagogy, subsequently the Ontario Normal School. Author, with Prof. John Dewey, of 'Applied Psychology'; 'The Psychology of Numbers' (1896; 4th ed., 1909).

McLEMORE'S COVE, Ga., Military Operations at. While there was little fighting in the cove, the operations there in September 1863 were vital to the success of General Rosecrans' campaign for Chattanooga. The failure of General Bragg's excellent combinations immediately increased the difficulty of intercepted his army between the Union army and Chattanooga and, in the end, made it impossible. Lookout Mountain bounds the cove on the west. Following its eastern base from Chattanooga southward, it is 24 miles to Stevens' Gap, over which the Fourteenth corps, General Thomas', which constituted the centre of Rosecrans' army, crossed Lookout from the west into the cove. Eight miles beyond is Dougherty's Gap, from which point Pigeon Mountain, run-
McLEMORE'S COVE

ning northeastwardly, forms the eastern bound-
ary of the cave. The triangular area thus
enclosed is from five to eight miles wide, the
mouth opening toward Chattanooga, and con-
tains from 80 to 100 square miles. General
Bragg, in evacuating Chattanooga, because of
Rosecrans' flank movement, had conducted his
army by way of Rossville and Lee and Gordon's
Mill and established it behind Pigeon Mountain,
from a point near Lee and Gordon's to La-
fayette, 13 miles beyond. From this position of
his army there were four gaps through which
roads led into McLeMores' Cave. Opposite
Lafayette was Dug Gap, to the south of it Blue
Bird and to the north Cattlett's and Wrother's.
Dug Gap was directly opposite Stevens' Gap.
The Chickamauga Creek rises near Dougherty's
Gap and runs northward through the cave.

The right of the Union army, A. McD.
McCoo's Twentieth corps, with the cavalry corps,
Gen. D. S. Stanley, crossed Lookout at Valley
Head, 42 miles south of Chattanooga, and des-
descended south of Dougherty's Gap. The left of
this army, Crittenden's Twenty-first corps, had
crossed the north point of Lookout near Chat-
tanooga and, leaving one brigade in that city,
had advanced to the vicinity of Lee and Gor-
don's Mill. If there formed the left of the Union
army. The centre corps was at Stevens' Gap,
15 miles distant, the right corps about 25
miles beyond that point, with the cavalry still
farther south. This separation of Rosecrans'
army was made necessary by the fact that
there were no roads practicable for wheels
crossing Lookout Mountain in closer proximity.

General Bragg was fully informed of the
movements, and the isolation of the several
Union corps. These movements, which placed
each corps beyond supporting distance from
either of the others, were immediately rendered
still more precarious by reports received from
General Sheridan on the extreme right that the
enemy was retreating toward Rome, which led
General Rosecrans to order pursuit. General
Thomas urged active concentrations instead, but
was overruled.

General Bragg, from his position behind
Pigeon Mountain, commanding the four gaps
opening directly upon the advance of the centre
across the cave, was in position for first striking
General Thomas with effect,
and then turning upon either of the wings be-
fore they could attain supporting distance. Had
Bragg's orders been promptly and vigorously
executed the situation of the Union army would
have been critical.

The night of the 9th, Negley's division,
forming the Union advance from Stevens' Gap
along the road leading through Dug Gap to
Lafayette, encountered the enemy in the gap,
and later in the night it was ascertained that
a strong force was concentrating there.

General Bragg, in developing his plan, had
advanced Hindman's division from the Lafayette
side of the mountain, and ordered General Hill
to send Cleburne to co-operate. Late at night
Hill sent word that Cleburne was sick, the
position blocked with felled trees and that the move-
ment was, therefore, impracticable.

Early the next morning General Buckner
from the extreme right was ordered to advance
into the cave to support Hindman. This move-
ment was not effected until the afternoon of the
10th. Meantime, Negley had withdrawn his
division from Dug Gap and was maneuvering
in defense. Hindman, instead of attacking as
ordered, sent a staff-officer to Bragg at Lafay-
ette to suggest a change of plan. This officer
reached Bragg at midnight and was at once
directed to return and notify Hindman to carry
out the orders he had received. Cleburne was
then in Dug Gap and had promptly cleared
away obstructions. Walker's reserve corps was
ordered forward to join Cleburne in the at-
tack, and impatiently waited for Hindman's
guns. Bragg had ordered seven divisions to
co-operate in this movement against Thomas'
three which composed the Union centre. Hind-
man did not attack until afternoon. At that
time Baird's division had arrived from Stevens' Gap to support Negley, and by brilliant move-
ments in retreat, with some sharp fighting by
T. R. Stanley's and Starkweather's brigades,
the two divisions with their trains were with-
drawn in perfect order to Bailey's crossroads,
a strong strategic position in front of Stevens'
Gap, where Bramman's division, which had com-
pleted the crossing of Lookout, was within easy
supporting distance. Thus Bragg's attempt to
crush the Union centre failed. For this failure
he held Hill and Hindman responsible.

Bragg then ordered a large part of the army operating
against the Union army to Lafayette, and at
once dispatched Polk's and Walker's corps with
orders to attack Crittenden's corps in the vi-
cinity of Lee and Gordon's Mill. This corps at
the time was known to Bragg to be divided,
with one of its three divisions near Ringgold.
Polk was urged to attack with the greatest
promptness. He, however, was led to believe
that a general attack on his column was about to
be delivered. Instead of carrying out Bragg's
orders, he therefore awaited attack and sent for
the whole of Buckner's corps as reinforce-
ments. This delay enabled Crittenden to unite
his forces, cross the Chickamauga, and take a
strong position on the bluffs overlooking that
stream at Lee and Gordon's. Thus Bragg's
attempt to crush the Union left failed as his
movement on the centre had miscarried.

For this Polk was held responsible.

Meantime the Union right was withdrawing
under orders to join the centre at Stevens' Gap.
Rosecrans, fearing a Federal attack instead of
stepping back, was concentrated for battle,
and that Johnston from Mississippi and Long-
street from Virginia were about to join him.
General Rosecrans in his report says: "It then
became a matter of life and death to effect the
concentration of the army." The flanks of
the army were 40 miles apart by the nearest practi-
cable roads, and the centre was obliged to e-
main near Stevens' Gap until the right corps
arrived.

General Bragg's third plan, for which orders
were promptly given, was to move his army
down the valley of the Chickamauga, cross at
the bridges and fords below Lee and Gordon's
Mill, sweep up the valley, attack Crittenden, the
left of Rosecrans' army drive it back on the
centre, and the intervening forces between the
Union army and Chattanooga, push it back into
the mountains and regain that most important
city. Rosecrans, however, by an undiscovered night
march moved his centre and right from the
cave to support Hindman. This junction of 19 September had interposed between Bragg
and Chattanooga on the field of Chickamauga.
These movements of the opposing armies brought on the battle of Chickamauga (q.v.).

**McLENNAN, John Cunningham**, Canadian physicist: b. Ingersoll, Ontario, 14 April 1867. He was educated at the universities of Toronto and Cambridge. From 1889 he was connected with the faculty in physics at Toronto, and since 1907 he has been professor of physics and director of the physical laboratory there. He was president of section III of the Royal Canadian Society in 1910; was elected to the Royal Society, London, in 1915; and in 1916-17 he was president of the Royal Canadian Institute. He was Dominion lecturer on the metric system in 1906; and is author of papers on radaractivity, electrical conduction of gases and spectroscopy.

**McLENNAN, mäk-lên'an, John Ferguson**, Scottish sociologist: b. Inverness, 14 Oct. 1827; d. Hayes Common, Kent, 16 June 1881. He was educated at King's College, Aberdeen, and Trinity College, Cambridge. Two years spent in journalism in London returned to Edinburgh, and was called to the bar in 1857. His first important publication was the article on 'Law' in the eighth edition of the 'Encyclopaedia Britannica' (1857), and in 1865 he elaborated some of its implications in 'Primitive Marriage: an Inquiry into the Origin of the Form of Capture in Marriage Ceremonies.' In 1876 his 'Primitive Marriage' was republished with 'Kinship in Ancient Greece' and other matter under the title of 'Studies in Ancient History.' An unfinished work by him, directed against Sir H. S. Maine's patriarchal theory, was completed and published in 1885 by his brother under the title of 'The Patriarchal Theory.' In 1896 a second series of 'Studies in Ancient History,' treating of the origin of exogamy, was edited by his widow and Arthur Platt. Though his views are still and probably will remain matter of controversy, the study of primitive society received a powerful impetus from his investigations.

**McLEOD, mäk-loud', Alexander**, American Presbyterian and theologian: b. Island of Mull, Scotland, 12 June 1774; d. New York, 17 Feb. 1833. He came to the United States in 1792 and was graduated at Union College in 1798. He was licensed to preach in 1799 and was ordained in charge of the First Reformed Presbyterian Church of New York and of a church in Wallkill, N. Y. He soon resigned from the Wallkill charge, but retained his New York pastorate the remainder of his life. He was for a time an editor of the *Christian Magazine*. Author of 'Negro Slavery Unjustifiable' (1806); 'Ecclesiastical Catechism' (1807); 'View of the Late War' (1815); 'The American Christian Expositor' (2 vols., 1832-33, etc.).

**McLEOD, Archibald Angus**, American railway official: b. Compton County, Quebec, Canada, 1848; d. 1902. Early in life he came to the United States, where he became a rodman on the docks of the Northern Pacific Railway at Duluth, and in 1885 manager of the Elmira, Cortland and Northern line. He then was successively acting general manager (1886), vice-president and general manager (1887) and president (1890) of the Reading system. His consolidation of the Lehigh Valley and Jersey Central with the Reading, under Reading control, for the purpose of controlling the carrying trade of the coal fields, built a network of trackage passing into the hands of three receivers, of whom McLeod was one.

**MacLEOD, Donald**, Scottish Presbyterian clergyman and author: b. Campsie, Stirlingshire, 18 March 1831; d. 17 Dec. 1911. He was a brother of Norman MacLeod (q.v.), whom he succeeded as editor of Good Words, 1892-1905. He was educated at the University of Glasgow. He held pastures at Lauder (1858), Linlithgow (1862) and Glasgow (1869-1909), and, like his brother, was chaplain to Queen Victoria. He published 'Sunday Home Servicel (1885); 'Christ and Modern Society' (1893), etc.

**MacLEOD, Fiona**, pseudonym of William Sharp (q.v.), Scottish poet and novelist: b. Paisley, 12 Sept. 1856; d. Sicily, 13 Dec. 1905. A part of his youth was spent in the Hebrides and in the islands of Iona and Arran. His stories and poems attracted great attention by reason of their freshness of treatment and originality of conception. Under his own name he published a number of works, including poems, stories, and biography, beginning with a life of Rossetti in 1882. In 1893 he began writing a physiological prose and verse under the pen name of 'Fiona Macleod,' and cleverly concealed his identity, going the length of supplying a fictitious biography of the lady, to 'Who's Who,' and corresponding, through his sister, with her admirers. He also wrote concurrently, under his own name. Among works published as Fiona Macleod are 'Pharaiss' (1895), a romance; 'The Mountain Lovers' (1895); 'The Sin-Eater and Other Tales' (1895); 'The Washer of the Ford' (1895); 'Green Fire' (1895); 'From the Hills of Dream' (1896); 'The Laughter of Peterkin' (1897); 'Through the Ivory Gate' (1901); 'The Silence of Amor' (1902).

**McLEOD, Hugh**, American soldier: b. New York, 1 Aug. 1814; d. Dumfries, Va., 2 Jan. 1862. He was graduated at West Point in 1835 and served on frontier duty in the Camps of the Ohio and La., until June 1836, when he resigned. He then joined the Texans in their struggle against Mexico, and afterward practised law at Galveston, Tex. As brigadier-general of the Texas militia he was appointed by President Mirabeau B. Lamar of Texas to the command of an expedition planned to secure an establishment of trade between Texas and Mexico in 1841, but was taken prisoner by the Mexicans and not released until the following year, when the United States government intervened in his behalf. He served in the Texas Congress in 1842-43, fought through the Mexican War and was a member of the State legislature after the annexation to the United States. He joined the Confederate army in 1861 and served on the Rio Grande and in the first Virginia campaign.

**McLEOD, John**, Canadian pioneer: b. Stornaway, Island of Lewis, Scotland, 1788; d. Montreal, 24 July 1849. He was engaged in the service of the Hudson Bay Company in 1811, mustering men for the company's service in the Hebrides and conducting them to Canada. In 1812-16 he built the trading posts of the company for 500 miles westward of the Red River.
establishment. He was the first man known to have traversed the continent from Hudson Bay to the Pacific coast. He was in charge of Nor-
way House, the most important fur-trading es-
{} establishment in that part of the country, in 1826-
30. He was afterward in charge of the Saint Ma
rice district, extending from Hudson Bay to
the Saint Lawrence. He was of wide
fluence among both the whites and the Indians and
accomplished an important work in opening the
northwest for settlement.

**McLEOD, Malcolm,** Canadian lawyer, son
of John McLeod (q.v.); b. Green Lake Saska-
tchewan, 21 Oct. 1821; d. Ottawa, September
1898. He was educated at Edinburgh, Scotland,
later studied law in Montreal and in 1845 was
admitted to the bar. He engaged in practice, was
district judge for the counties of Pontiac and
Ottawa in 1873-76 and in 1887 he became
Queens counsel. He was prominently con-
ected with the projects of annexation of the
Northwest territory to Canada and the building of
a railroad to the Pacific. He was instru-
mental in securing the revocation of the Hud-
son Bay Company's charter, taking the matter
to the Canadian Parliament when the Cana-
dian Parliament refused to act. Author of
'The Peace River' (1872); five pamphlets on
'The Pacific Railway' (1874-80); 'The Prob-
lem of Canada' (1880).

**MacLEOD, Norman,** Scottish Presbyterian
gentleman; b. Campbeltown, Argyshire, 3
June 1812; d. Glasgow, 16 June 1872. Educated
at Glasgow, Edinburgh and in Germany, he be-
came minister first of London. At the Scottish
Church Disruption in 1843 he remained in the
Establishment, and became minister of Dalkeith in
the same year. There he published his first
work, 'The Earnest Student;' and became edi-
tor of the *Edinburgh Christian Magazine.* In
1851 he became minister of the Barony parish,
Glasgow, where he labored with increasing popu-
larlity for the rest of his career. In 1857 he
was appointed one of the queen's chaplains for
Scotland. He became editor of *Good Words*
in 1860 and continued in that post till his death.
In 1867 he visited India, and in 1871 published
'Peeps at the Far East.' In 1869 he was mod-
erator of the General Assembly of the Church of
Scotland. Consult MacLeod, D., 'Memoir of
Norman MacLeod' (1872).

**MACLEOD, Canada,** village and capital of
Macleod District, Alberta, on Old Man's River,
about 100 miles south of Calgary, and on the
Canadian Pacific Railway. It is situated in a
rich agricultural and coal-mining region, has
numerous gas, stone quarries, and deposits fur-
sishing materials for the manufacture of cement
and of bricks. It has a considerable trade in
grain. The village is growing rapidly and is a
post of the Royal North West Mounted Police.
Pop. 2,000.

**MACLEISH, ma-kles', Daniel,** English
painter; b. Cork, 1806; d. Cheyne Walk, Chel-
sea, 25 April 1870. He became a student at the
Royal Academy in 1828, and began to exhibit in
1829, but it was not until 1833 that he estab-
lished his reputation with his picture of 'Snap
Apple Night.' Three years after he was elected an
associate, and in 1840 he became a full mem-
ber of the Royal Academy. Macleise was com-
missioned to paint for the new Houses of Par-
lament, and produced 'The Spirit of Chivalry';
'The Spirit of Religion,' and the two great paintings of the 'Meeting of Wellington and
Blücher after Waterloo,' and the 'Death of
Nelson' (1858-64), for which patriotic paint-
ings he refused all remuneration. Among his
best-known pictures are 'Merry Christmas in the
Barber's Hall'; 'The Ordeal of the Jews'; 'The
Marriage of Strongbow and Eva'; the
'Play Scene in Hamlet'; the 'Banquet Scene in
Macbeth,' etc. His sketches, book illustrations,
humorou drawings and outline portraits were
very numerous. He declined the presidency of
the Academy in 1866. His works show great
fertility of invention, skill in composition and
elegance in drawing, but his color is coarse,
and his pictures are sometimes disagreeable un-
less seen from a distance. His mural paintings
are now recognized to be the greatest historical
paintings of his kind ever produced in Eng-
land. Consult O'Driscoll, 'Memoir of Daniel
Macleish' (1871).

**McLOUGHLIN, mák-lók'lin, John, Cana-
dian pioneer and fur trader; b. Rivière du Loup,
Lower Canada, 19 Oct. 1784; d. Oregon City, 3
Sept. 1854. Born in 1824 he founded and was
at Edinburgh, Scotland, studied medicine and in
early manhood returned to Canada, where he
entered the Northwest Company and was placed
in charge of Fort William, the chief depot of the
company, situated at the mouth of the
Kaministiquia River on Lake Superior. Upon the
consolidation of the Northwestern and the
Hudson Bay companies, in 1821, Dr. McLo-
glin was appointed chief factor of the company
in the Oregon country. Arriving overland at
Astoria in 1824 he founded the Oregon Post,
which, situated advantageously near the conflu-
ence of the Columbia and Willamette rivers,
became the headquarters of the company beyond
the Rockies. When Dr. McLoughlin established
the fort the Indians were so hostile that it was
unsafe for parties of less than 60 men to travel
the Columbia River, but under his management
of the company's affairs it became safe for two
men to traverse the distance between Oregon
City and Fort Hall. In the entire period of his
administration, from 1824 to 1846, the Indian
wars in the Oregon country, although they broke out in 1847, the year after his resi-
ignation. He made Fort Vancouver a haven of
refuge to emigrants arriving after the perilous
journey overland, furnishing goods and provi-
sions on credit and caring for their sick in
direct opposition of the company's policy, which
was to keep the land wild for the wild fur-
bearing animals. During McLoughlin's admin-
istration the Oregon country was in the con-
dition of joint occupancy by the United States
and Great Britain. His courageous and human-
itarian method of dealing with the situation,
recognizing the equal rights of the American
settlers with those of the British Fur-trading
Association, undoubtedly went far toward pre-
venting war between the two nations. How-
ever, the strictures upon his methods by Sir George Simpson, governor-in-
chief of the Hudson Bay Company, culminated
in an order to render no further aid to immi-
gants, and McLoughlin resigned rather than
obey, although it cost him his income of $12,000
a year. His resignation took effect in 1846, and
he then retired to Oregon City where he had
extensive and partially improved land claims. Litigation over his claims embittered his last years, but after his death the land was restored to his heirs. He was a native of Ireland, and a citizen of 1848. The McLoughlin Institute was dedicated to his memory at Oregon City in 1907, and he is generally known as the "Father of Oregon." Consult the "Reports" of the Washington Historical Society, the Oregon Historical Society and the Oregon Pioneer Association; Dye, E. E., "McLoughlin and Old Oregon" (1900: 8th ed., 1913); Holman, F. V., "Dr. John McLoughlin, the Father of Oregon" (1907).

McLOUTH, Maurice Evans, American tennis champion; b. Carson City, Nev., 1890. He won the championship of the Pacific Coast, played in the East in 1908-09 and in 1909 and 1911 he competed for the Davis cup in Australia, but unsuccessfully. He won the national championship at Newport in 1912; and in 1913 was leader of the American team that captured the Davis cup from England. He was a winner at Longwood and won the New York State championship in 1914. His defeat of Brookes and Wolding in singles made him world champion. Author of "Tennis as I Play It" (1915).

McLOUTH, mák-lóoth', Lawrence Amos, American educator and author; b. Otonagon, Mich., 19 Oct. 1863. He was educated at the universities of Leipzig, Heidelberg and Munich. He was instructor in German at the University of Michigan in 1892-95; and since 1895 has been professor of Germanic language and literature at New York University. He has edited German texts, is author of numerous articles on literature, philology and pedagogy, and of "Verses" (1910).

MACLUD, mák-für', William, American geologist; b. Ayr, Scotland, 1763; d. San Angel, near the city of Mexico, 23 March 1840. In 1796 he visited the United States, and in 1803 was in Europe as one of the commissioners to settle the claims of American citizens against France for spoliations during the revolution in that country. On returning to America he engaged with zeal in the extraordinary private underground survey of the whole country. Depending on his own resources and observations at a time when geology was unknown as a science, and few could appreciate his motives, he visited almost every State and Territory, crossing and re-crossing the Alleghanies no fewer than 50 times. His first communication to the public was a memoir entitled "Observations on the Geology of the United States, explanatory of a Geological Map," read before the American Philosophical Society, 20 Jan. 1809, and published in Vol. VI of their "Transactions." He still continued his explorations, and on 16 May 1817 presented another memoir to the society, published in their "Transactions," and also in a separate volume. The former publication was six years prior to that of the geological map of England prepared by William Smith, a production which gave him the title of father of English geology. To Maclure is equally due the title of father of American geology. His publications attracted much attention to the science in this country, and in 1873 was awarded a gold medal and gave his books and collections to the Academy of Natural Sciences of which he was president from 1817 till his death. He lived in Spain, 1819-24, where he attempted to found an agricultural college, and returning in 1824 to the United States attempted to carry out a similar scheme in the New Harmony settlement in Indiana. Several distinguished naturalists from Philadelphia joined him in this enterprise, but the scheme failed. After 1828 he lived in Mexico, always, however, with the intention of returning to the United States, and with his interest in the progressive scientific education there unabated. While in Mexico he wrote "Opinions on Various Subjects," devoted mainly to political economy (1837).

McMAHON, mák-má'hón, Sir Arthur Henry, British soldier and administrator; b. 28 Nov. 1802. He was educated at the Royal Military College at Sandhurst, joined the 8th Regiment in 1833 and in 1885 entered the Indian Staff Corps and joined the 1st Sikhs, Punjab Frontier. He became affiliated with the Indian Political Department in 1860 and served as political agent on various missions until 1901, when he became Revenue and Judicial Commissioner at Beluchistan. He was an arbitrator on the boundary between Persia and Afghanistan in Seistan and also served as British Commissioner to the Seistan Mission in 1903-05. He was Foreign Secretary to the Government of India in 1911-14; was British Plenipotentiary for the treaty regarding Tibet between England, China and Tibet in 1913-14. In 1914-16 he was High Commissioner of Egypt. He was knighted in 1906.

McMAHON, James, American mathematician; b. County Armagh, Ireland, 22 April 1856. He was graduated at the University of Dublin in 1881. In 1897-1902 he was professor of science at Central College, Huntington, Ind., and in 1902-05 he was president of that institution. Since 1905 he has been president of the Illinois President Lincoln College.

McMAHON, Marie Edme Patrick Maurice de, Duke of Magenta and Marshal of France; b. Sully, Saône et Loire, 13 June 1808; d. near Montargis, 17 Oct. 1893. He was descended from an Irish family that went into exile with James II, and was educated at the military college of Saint Cyr; served in the First, Second, and Third Armies in Algeria; became brigadier-general in 1848; received command of a division during the Crimean War, and assisted in storming the Malakoff; was appointed to the Senate in 1856; took part in the campaign of 1859 against Austria, and won the battle of Magenta by his prompt handling of the left wing and was rewarded by a marshal's baton and a dukedom; and in 1864 became governor-general of Algeria. At the outbreak of war between France and Germany (1870) MacMahon was placed in command of the First army corps, which was defeated at Weissenburg and Wörth, and finally fell back upon Châlons. Here he rallied his forces, and proceeded northeastward to relieve Metz. He was pursued by the Germans, shut up by them in the town of Sedan and wounded in the battle before the final surrender with 81,000 men. After the armistice with Germany he was employed by the Versailles government in putting down the commune, and in 1873 was appointed to the post of minister of the interior, a position which he occupied until 1879. Consult Daudet, "Souvenirs de la présidence du Maréchal de MacMahon" (Paris 1880); 'Le maréchal de MacMahon' (ib. 1883);
LaFarge, "Histoire complète de MacMahon, maréchal de France, duc de magenta" (ib. 1899).

MacMANUS, milk-man's, Seumas, Irish novelist and writer of short fiction and verse: b. Donegal, 1868. He was educated at a mountain school in Donegal and engaged in teaching. He soon became known for his prose and verse contributions to periodicals, dealing with the traditions and folklore of Ireland. He visited America in 1899 and afterward his contributions appeared in many leading American periodicals. He has since made frequent lecture tours in America. Author of "Through the Turf Smoke" (1899); "Donegal Fairy Tales" (1900); "Ballads of a Country Boy" (1905); "The Leadin' Road of Donegal" (1900); "Irish Nights"; "Yourself and the Neighbors" (1914); "Ireland's Case" (1917), etc. Among his plays are "The Woman of Seven Sorrows"; "Orange and Green"; "Rory Wens"; "Nabhy Harren's Marriage." "

McMASTER, John Bach, American historian: b. Brooklyn, 29 June 1852. He was graduated from the College of the City of New York in 1872, studied civil engineering, and 1877 became instructor of civil engineering at Princeton University, where he published his first volume of his "History of the People of the United States," and the same year was appointed professor of American history in the University of Pennsylvania. His "History," of which eight volumes were published in 1913, has become a standard work. It covers a period reaching from the close of the Revolution (1783) to the outbreak of the Civil War,—less than 100 years, but a crucial time for the shaping of the country. The account of the formative time, the days of the pioneer and the settler, engages his particular attention and receives his most careful treatment. He strives to give a picture of social rather than constitutional and political growth; and tells the story of national evolution with admirable lucidity and simplicity of style, and always with an appeal to fact preceding the danger of the subjective writing of history to fit a theory. His other works are "Benjamin Franklin as a Man of Letters" (1887); "With the Fathers, Studies in American History" (1886); "Origin, Meaning and Application of the Monroe Doctrine" (1897); "A School History of the United States" (1897); "A Primary School History of the United States" (1901); "Daniel Webster" (1902); "Brief History of the United States" (1903); chapters 9, 11 and 12, Vol. VII, "Cambridge Modern History" (1903); "Struggle for the Social, Political and Industrial Rights of Man in America" (1903); "Life and Times of Stephen Girard" (1917); "The United States in the World War" (1919).

McMaster, William, Canadian senator and philanthropist: b. Tyrone, Ireland, 24 Dec. 1811; d. Toronto, Canada, 22 Sept. 1887. When 22 years of age he emigrated to Canada, and after several years' experience in a large wholesale firm in Toronto commenced business of his own account. He was elected a member of the legislative council for the Midland division of Canada in 1862, and held this seat until he was called to the Senate by royal proclamation in 1867. He was prominently identified with many public institutions, notably as president of the Canadian Bank of Commerce, member of the senate of the University of Toronto, chairman of the Canadian board of the Great Western Railway and became widely known by his liberal donations to educational and religious institutions, especially those of the Baptist denomination, of which sect he was a member. McMaster University, Toronto, is named in his honor.

McMASTER, UNIVERSITY. Toronto, Canada, is controlled by the Baptist Convention of Ontario and Quebec. It came into existence through the gift of about $1,000,000 by the late Senator William McMaster, of Toronto, but it is really a development of educational work formerly conducted at Woodstock, Ontario. In 1857, under the leadership of the Rev. R. A. Fyfe, D.D., subscribers to the funds of a projected college secured from the Canadian Parliament an act to incorporate "The Canadian Literary Institute," to be located at Woodstock. This school aimed at coeducation and provided both literary and theological courses. In 1875 it secured affiliation with the University of Toronto. In 1881, through the liberality of Mr. McMaster, the Toronto Baptist College was constituted and to it was transferred the first volume of his "History of the People of the United States," and the same year was appointed professor of American history in the University of Pennsylvania. His "History," of which eight volumes were published in 1913, has become a standard work. It covers a period reaching from the close of the Revolution (1783) to the outbreak of the Civil War,—less than 100 years, but a crucial time for the shaping of the country. The account of the formative time, the days of the pioneer and the settler, engages his particular attention and receives his most careful treatment. He strives to give a picture of social rather than constitutional and political growth; and tells the story of national evolution with admirable lucidity and simplicity of style, and always with an appeal to fact preceding the danger of the subjective writing of history to fit a theory. His other works are "Benjamin Franklin as a Man of Letters" (1887); "With the Fathers, Studies in American History" (1886); "Origin, Meaning and Application of the Monroe Doctrine" (1897); "A School History of the United States" (1897); "A Primary School History of the United States" (1901); "Daniel Webster" (1902); "Brief History of the United States" (1903); chapters 9, 11 and 12, Vol. VII, "Cambridge Modern History" (1903); "Struggle for the Social, Political and Industrial Rights of Man in America" (1903); "Life and Times of Stephen Girard" (1917); "The United States in the World War" (1919).

McMECHEN, měk-měk'ën. W. Va., city in Marshall County, five miles south of Wheeling, on the Baltimore and Ohio Railroad. It is a residential town and practically a suburb of Benwood. Pop. 2,921.

After education in the public schools, he studied law at the University of Pennsylvania and became a member of the Philadelphia Bar. The year previously he became editor of the Saturday Evening Post, and as an active politician served for several years on the aldermanic bench in Philadelphia. From 1831 to 1836 he was editor-in-chief of the Saturday Courant, later known as the Evening Post, the Saturday Gazette, the North American and United States Gazette, in 1847 consolidating the last two in one journal, of which he was sole proprietor from 1854 until his death. He was mayor of Philadelphia from 1866 to 1869; president of the park commission from its organization in 1867 until his death; and in 1873 was appointed a delegate to the Fourth Constitutional Convention of Pennsylvania. His speeches on public occasions were renowned as models of oratory. A large statue was erected to his memory in Fairmount Park.

MCMICHAEL, William, American soldier and lawyer: b. Philadelphia, Pa., 4 March 1841; d. New York City, 20 April 1893. The third son of Alexander Macmillan, he attended the University of Pennsylvania in 1859, but left his law studies in April 1861, to enlist as a private when President Lincoln issued his first call for troops. He attained rapid promotion to the grade of colonel and served under Generals Thomas and Grant. He resumed his interrupted law studies after the war and in 1863 became a member of the Philadelphia bar. During General Grant's first tenure of the Presidency he was appointed solicitor of the interior. He was mayor of Philadelphia from 1866 to 1869; president of the park commission from its organization in 1867 until his death; and in 1873 was appointed a delegate to the Fourth Constitutional Convention of Pennsylvania. His speeches on public occasions were renowned as models of oratory. A large statue was erected to his memory in Fairmount Park.

1st and 2d brigades of the Nineteenth Army corps, served with Butler in the Gulf campaign, and captured the blockade runner For, one of the richest prizes of the Civil War.

McMILLAN, Thomas, American Roman Catholic priest of the Missionary Society of Saint Paul the Apostle; b. Ayr, Scotland, 13 June 1851. He is of Irish descent, and when three years old came with his parents to America. In 1874 he entered the Missionary Society of Saint Paul the Apostle. His church work has been in Sunday schools. In 1886 he instituted a "reading circle" movement, which has extended over all the country. In 1889 he was largely instrumental in bringing together, at New York, a large number of editors, journalists and authors from different parts of the United States to discuss ways and means of making the press more effective in uplifting humanity. This meeting was known as that for the promotion of the "Apostolate of the Press." In 1892 he was made chairman of the board of studies of the Catholic Summer School of America. In 1897 he was the prime mover in the organization of the "Child Study Congress" held in New York City.

MacMillanites. See MacMillan, John, and Cameronians.

MacMullen, Francis, American violinist; b. Marietta, Ohio, 14 Oct. 1885. He entered the Chicago College of Music at the age of seven, afterward studying at Berlin, Brussels and Saint Petersburg, under Joachim, César Thomson, Flesch, Auer and others. He received first prize and the Van Hal cash prize at the Brussels Royal Conservatory when 16 years of age. He made his first public appearance in Brussels in 1903, afterward touring England, Belgium, France and Germany. He made his American début at Carnegie Hall, 7 Dec. 1906, and made concert tours of the principal cities of the United States in 1905-07, 1907-08, 1910-11, 1914-15, 1915-16.

McMinnville, māk-mīn'vīl, Ore., city, county-seat of Yamhill County, on the Yamhill River, and on the Southern Pacific Railroad, about 55 miles southwest of Portland. It is situated in an agricultural region, in which hay, fruit and dairy products are raised extensively. The city has considerable trade in agricultural products, livestock, lumber, wool and some dairy products. The electric-light plant and the waterworks are owned and operated by the city. Pop. 2,400.

McMinnville, Tenn., town, county-seat of Warren County, on the Nashville, Cincinnati and Saint Louis Railroad, about 80 miles southeast of Nashville. It is in the midst of an agricultural region, and in the vicinity is found excellent building stone. Its manufactures are cotton and woolen goods, flour and lumber, foundry and machine-shop products, furniture and dairy products. It is the seat of the Cumberland University Training School. Pop. 2,300.

MacMonnies, māk-mōn'iz, Frederick William, American sculptor; b. Brooklyn, N. Y., 20 Sept. 1863. In his 17th year he became pupil and assistant to Augustus Saint Gaudens, and in 1884 was granted a scholarship. In 1884 he studied at Munich, and later was admitted to the studio of Falquière at the École des Beaux-Arts, and also studied with Antonin Mercie. In 1887 there opened a studio of his own. In 1889 his statue of 'Diana' was honorably mentioned in the Salon, and his 'Nathan Hale' at the City Hall Park, New York, and 'James S. T. Stranahan' in Prospect Park, Brooklyn, were much admired in the Salon 1891. His 'Bacchantes' (Salon 1894) was purchased for the Luxembourg. He has been prolific in the creations of the chisel, and his work is to be seen in Washington Memorial Arch, New York City, the Soldiers and Sailors' Monument in Indianapolis, in the statues of Prospect Park, Brooklyn, and the Battle Monument at West Point. He executed a number of statues for the Columbian Exposition in the Court of Honor (Chicago 1893). Since 1900 he has devoted himself more and more to painting, in which he exhibits delicacy, freshness of design and a brilliant technique. In 1913 he resumed his work in sculpture. He has received numerous medals. In 1898 he was elected Chevalier of the Legion of Honor, and two years later won the grand prize at the Paris Exposition. He is a member of various national art associations. Consul Taft, L., 'History of American Sculpture' (New York 1903).

MacMullen, Wallace, American Methodist Episcopal clergyman; b. Dublin, Ireland, 31 Aug. 1860. He came to the United States with his parents in 1862 and was graduated from the Drew Theological Seminary in 1888, entering the Methodist ministry in that year. He was pastor at Springfield, Mass., in 1888-93; at Grace Church, Philadelphia, in 1893-98; at Park Avenue Church, Philadelphia, in 1898-1902; and at the Madison Avenue Church in 1902-13. Since 1913 he has been professor of homiletics at the Drew Theological Seminary. He is president of the board of managers of foreign missions. Author of 'Captain of Our Faith' (1904).

McMurrich, James Playfair, Canadian scientist; b. Toronto, Ontario, 16 Oct. 1859. He was graduated from the University of Toronto in 1879, and received his Ph.D. from Johns Hopkins in 1885. From 1884-88 he instructed at that institution in mammalogy. He then held a professorship in biology at Ontario Agricultural College (1882-84); at Haverford (1886-89); at Cincinnati (1892-94). From 1889-92 he was docent and assistant professor of morphology at Clark University; professor of anatomy in the University of Michigan (1894-1907), and since then has been at Toronto University. He has published 'Invertebrate Morphology' (1894); 'The Development of the Human Body' (1902), and has edited Sobotta's 'Atlas and Textbook of Human Anatomy' (1906-07); Morris, 'Human Anatomy' (4th ed., 1906).

McMurray, Charles Alexander, American educator; b. Crawfordsville, Ind., 18 Feb. 1857. He was graduated at the Illinois Normal University in 1876 at the University of Michigan in 1880 and at the University of Hallie in 1887. He was principal of the Practice School at the Illinois State Normal University and lecturer at Teachers' College of Chicago in 1899-1900; principal of the Practice School at the Northern Illinois Normal School in 1900-01; and since 1915 he has been professor of elementary education at the George Peabody
College for Teachers, Nashville, Tenn. Author 'Method of Recitation' with his brother, F. M. McMurry (1898); 'Special Method in Reading' (1898); and a series of 'Special Method' textbooks including 'Literature and History' (1898); 'Geography' (1898); 'Natural Science' (2nd ed., 1899); 'Manual Arts', 'Arithmetic' (1900); 'Course Study in the Eighth Grades' (1900); 'Teacher's Manual in Geography' (1904); 'Pioneer History Stories' (3 vols.); 'Conflicting Principles in Education' (1914); 'Handbook of Practice for Teachers' (1914), etc. He has edited the 'Year Books' of the Herb Society.

McMURRY, Frank Morton, American educator, brother of Charles Alexander McMurry (q.v.): b. near Crawfordsville, Ind., 2 July 1862. He studied at the universities of Michigan, Halle, Jena, Geneva and Paris. He was professor of pedagogy at the normal school, Normal, Ill., in 1891-92; and at the University of Illinois in 1893-94. He was principal of the Franklin School, Buffalo, N. Y., in 1894-95, and was professor of pedagogy and dean of Teachers' College, University of Buffalo, in 1895-98. Since 1898 he has been professor of elementary education at Teachers' College, Columbia University. He was associate editor of the 'Student's Reference Work' (1909). Author of 'Tarr and McMurry Common School Geographies,' with Ralph S. Tarr (1900); 'Method of Recitation,' with C. A. McMurray (1898); 'How to Study and Teaching How to Study' (1909); 'Elementary School Standards' (1913).

McMURRY, Lewis S., American surgeon: b. Harrodsburg, Ky., 14 Sept. 1850. He was educated at Centre College, Kentucky, and at Tulane University. He specialized in gynecology and abdominal surgery, becoming professor of those subjects in the medical department of the University of Louisville, where he afterward became president of the medical faculty. He is surgeon at the Louisville City Hospital. He is a member of various foreign and American scientific societies and was president of the American Medical Association in 1906-07. He was a contributor of various journals and also contributed to the International Text Book of Surgery.

McNAB, Sir Allan Napier, Canadian statesman: b. Niagara, Ontario, 19 Feb. 1798; d. 8 Aug. 1862. He entered the navy as midshipman in 1813, but soon abandoned the navy for the army; was present at the capture of Fort Niagara, and commanded the advance guard at the battle of Plattsburg. At the close of the war he studied law and practised in Hamilton, and in 1829 was elected a member of the assembly, and speaker 1837-41. During the insurrection of 1837-38 he commanded the militia on the Niagara frontier, routed the insurgents near Toronto 7 Dec. 1837, and a party of American sympathizers having occupied Navy Island in the Niagara River, whence they were cannonading the village of Chippewa, Canadian side, sent a party to seize the steamer Caroleine, employed to convey them supplies, and having driven the crew ashore, set fire to it and sent it over the Falls. Although the seizure was made on the American side of the river, the act was approved by the British government, and for his services to the Crown during this insurrection McNab was knighted. In 1854 he was Prime Minister under the Earl of Elgin, retaining office for a few months under his successor, Sir Edmund Head. On retiring from the premiership in 1856 he was made a baronet.

McNAIR, mák'nár', Frederick Vallette, American naval officer: b. Jenkintown, Pa., 13 Jan. 1839; d. 1900. He was educated at the United States Naval Academy and served in the Minnesota 1857-59. In 1861 he became lieutenant, and during the Civil War took part in the bombardment of Forts Jackson and Saint Philip, the capture of Orleans and the destruction of the Confederate ram Arkansas. He was instructor at the naval academy 1867-68, in 1872 became commander and in 1887 was placed in command of the Omaha in the Asiatic squadron. In 1890 he became superintendent of the Naval Observatory. In 1895 he was made admiral, a member of the lighthouse board in 1898, and in July of the last-named year was appointed to take charge of Admiral Cervera and other Spanish prisoners of war. Upon their return to Spain he was appointed superintendent of the naval academy.

MACNAMARA, mák'nám-rá, Thomas James, British statesman, educator and author: b. Montreal, Canada, 23 Aug. 1861. He was sent to England at an early age and was educated at Saint Thomas School, Exeter, and at the Borough Road Training College for Teachers. He was engaged in teaching in 1876-92 and was president of the National Union of Teachers in 1896. He was elected to Parliament for Berthier Camberwell in 1900; served as Parliamentary Secretary of the Local Government Board in 1907-08 and to the Admiralty in 1908-15, when he was appointed Financial Secretary to the Admiralty. He has contributed extensively to the periodical press, is author of numerous textbooks and of 'Schoolmaster Sketches' (1896); 'School-room Humor' (1905); 'The Gentle Golfer' (1906); 'Tariff Reform and the Working Man' (1910), etc.

MacNEIL, Carol Brooks, American sculptor, wife of Hermon Atkins MacNeil (q.v.): b. Chicago, Ill., 13 Jan. 1890. She studied at the Art Institute and under Lorado Taft, Chicago, and under MacMonnies and Injalbert, Paris. She exhibited at the Chicago Exposition, 1893; at the Paris salons in 1894, 1895 and 1900; received honorable mention at the Paris Exposition of 1900 and the bronze medal at Saint Louis in 1904.

MacNEIL, Hermon Atkins, American sculptor: b. Chelsea, Mass., 1866. He was graduated at the Massachusetts State Normal School in 1886; and later spent two years in study under Chapu at Julian Academy, and four years under Falguiere at the Ecole des Beaux Arts in Paris. He afterward taught for three years at Cornell, and three years also at the Art Institute, Chicago. He won the Roman Rhinehart scholarship in sculpture for 1894-1900. He was awarded the medal in design at the Chicago Exposition in 1893; received the silver medal at the Paris Exposition in 1900; the gold medal at the Buffalo Exposition in 1901; silver medal at the Charleston Exposition in 1902; commemorative medal at Saint Louis in 1904; and the gold medal at the Panama Exposition in 1915. He was engaged in important decorative work for
the expositions at Chicago, Paris, Buffalo and Panama. He executed the spandrels on the portico of the National pavilion at the Paris Exposition, where he exhibited the groups 'The Sun Vow' and the 'Last Act of the Moqui Squaw.' During the Saint Louis Exposition was his work, and he served on the jury of awards. He is a teacher of modeling at the National Academy of Design, New York. Among his other works may be mentioned: 'The Coming of the White Man,' of Indiana Park, Pittsburgh, Pa.; 'MacNevan Memorial' (Columbus, Ohio); 'Soldiers and Sailors Memorial' (Whittinsville, Mass.); 'Orville Hitchcock Platt Memorial' (State Capitol, Hartford, Conn.); 'General Washington' (Washington Arch, New York), etc. He was elected to the National Academy in 1906. His work is represented at the Art Institute, Chicago; Peabody Institute, Baltimore; Cornell University; the Metropolitan Museum, New York; and the Johns Hopkins University.

MacNEVIN, or MACNEVEN, William James, American physician: b. Ballynahowne, County Galway, Ireland, 21 March 1763; d. New York, 12 July 1841. When 12 years old he was placed in the care of his uncle, Baron O'Kelly MacNevin, court physician in Austria, and he received his education at the universities of Prague and Vienna, taking his medical degree at Vienna in 1784. He then returned to Ireland and engaged in practice at Dublin. He was a member of the secret society of United Irishmen and his activities in this connection caused his arrest with Thomas Addis Emmet in 1788, and for four years thereafter he was imprisoned. He then joined the Irish Legion under Napoleon in the hope of French intervention in Ireland. After three years he abandoned this hope and emigrated to the United States, establishing himself in practice in New York. He became professor of obstetrics in the College of Physicians and Surgeons in 1808, and was professor of chemistry and materia medica there in 1811. He established in connection with his work as a teacher the chemical laboratory in New York. He resigned in 1826 and together with several leading physicians founded a new medical school on Duane street, in which he held the chairs of materia medica and therapeutics until the school closed in 1830. He was president of the "Friends of Ireland" and belonged to most of the Irish societies in New York. He was coeditor and contributor to the New York Medical and Philosophical Journal. He edited 'Brand's Chemistry' (1831); and was author of: 'Rambles through Switzerland' (1803); 'Chemical Examination of the Mineral Waters of Schooley's Mountains' (1815); 'Exposition of the Atomic Theory of Chemistry' (1819), etc.

McNICHOLAS, ( Rt. Rev. ) John T., O.P., American Catholic prelate: b. County Mayo, Ireland, 1877. He came to the United States when a child; began his studies in the Gesu, Philadelphia, continued them in the Dominican establishments of Kentucky and Ohio and completed them in the University of Minerva, Rome, where, specializing in canon law, he attained the degree of D.D. Returning to America he became minister general for the Dominican novitate, Somerset, Ohio, acting also as professor of philosophy, canon law and homiletics. After holding this office for five years, he became director of the Bureau of the Holy Name in New York City and editor of the Holy Name Journal, for eight years devoting himself energetically to the organization of branches and the Holy Name Society in every State of the Union. He is an accomplished linguist, and authoritatively has contributed much to the literature of canon law. In 1916 Dr. McNicholas became assistant to the Dominican General in Rome, where, 18 July 1918, he received the appointment as second bishop of Duluth, Minn.

MACOMB, Alexander, American general: b. Detroit, Mich., 3 April 1872; d. Washington, D. C., 25 June 1841. He entered the United States army in 1799 as a cornet of cavalry, and at the commencement of the war with Great Britain in 1812 held the rank of lieutenant-colonel of engineers and adjutant-general of the army. In January 1814 he was promoted to be a brigadier-general and placed in command of that part of the northern frontier bordering on Lake Champlain. At Plattsburg, on 11 Sept. 1814, he sustained the attack of a greatly superior British force under Sir George Prevost, which, after the defeat of the British squadron on Lake Champlain on the same day, retreated to Canada. For his firmness and courage in that action he was appointed a major-general, and received the thanks of Congress and a gold medal. In 1835 he succeeded to the office of commander-in-chief of the army, which he held until his death. He wrote a 'Treatise on Martial Law and Courts Martial, as Practised in the United States' (1809). Consult Richards, 'Memoir of Alexander Macomb' (New York 1833).

MACOMB, Ill., city, county-seat of McDonough County, on the Chicago, Burlington and Quincy Railroad, about 65 miles northwest of Springfield; it is situated in an agricultural region and in the vicinity are extensive deposits of fire-clay. The first permanent settlement was made about 1841, and the place was incorporated in 1857. The chief manufactures are sash, pipe, stoneware and pottery. There is considerable trade in farm products, coal and lumber. The Western Illinois State Normal School is located here, and the free public library contains about 10,000 volumes. The government is administered, under a charter of 1872, by a mayor who holds office two years, and a council. The city owns and operates the waterworks. Pop. 5,774.

MACON, mä-ko'n, Nathaniel, American statesman: b. Warren County, N. C., 17 Dec. 1758; d. there, 29 June 1837. He was educated at the College of New Jersey, now Princeton; in 1776 he left college and served during the summer in the New Jersey militia. During the following three years he studied law; then from 1780 he served as a common soldier in the Continental army till the provisional treaty of peace in 1781; refused any pay of military distinction. When the Constitution of the United States was submitted to the vote of the people of North Carolina, he firmly opposed it, on the ground that it bestowed too much power on the government, and made it in effect independent of the States, of like 1776; he never lost this dislike of the Constitution, and had unlimited confidence in the capacity of the people for self-governmen;
his favorite saying being that “if left alone they would do what was right.” He was a member of the United States House of Representatives 1791–1815, and in 1816 was elected to the Senate, where he served till 1828, when he resigned his seat, having been then a member of Congress for 37 successive years.

**MACON**, France, capital city of the department of Loire, on the Sône River, 45 miles north of Lyons on the Paris-Lyons Railway. A bridge of 12 arches crosses the river to the opposite suburb, Saint Laurent. The cathedral of Saint Vincent, built in the 12th and 13th centuries, was destroyed at the time of the Revolution, but a portion of it is still used as a chapel and the façade and towers remain. There is the modern church of Saint Pierre, a Romanesque structure with two fine spires and a three-naved basilica. Mâcon was the Roman *Mât se Aedumum* and in the 16th century was a stronghold of the Huguenots. It suffered severely in different invasions. It is the seat of a prefecture, and has tribunals of the first instance and of commerce. It has excellent schools and training colleges, and important commercial and manufacturing interests, as well as being a railway centre. It has a large trade in wine, and manufactures supplies for the wine trade as well as being engaged in copper-making, and making machinery, tools and paper. Its stone quarries border the town commemorates the birth there of Alphonce Lamartine, the poet. Pop. about 19,059.

**MACON**, Ga., city and county-seat of Bibb County, popularly known as the “Heart of Georgia.” 80 miles by rail from Atlanta, 191 from Savannah and 125 from Augusta.

It lies on the southeastern side of the Appalachian mountain range on both sides of the Ocmulgee River which pours from the upper plateau with a fall of 90 feet in seven miles above the city. An immense concrete dam 103 feet high spans the river 36 miles up, furnishing hydro-electric current for power and lights, operating street cars and factories and lighting the city. An auxiliary steam plant is located in the city for emergency use. The Ocmulgee is spanned by four steel bridges. The river is navigable to the ocean, is open all year round, and low water steamers and three feet draught operate to Brunswick and Savannah, making connection at those points with coastwise and ocean shipping. Macon is the most important railroad centre in the State; six trunk lines with radiating lines give 14 outlets, north, east, south and west; it is the concentration point for tourist trains during the winter season enroute to Florida. A new union passenger station, opened October 1916, cost over a million dollars; it faces Cherry street, the principal thoroughfare of the city.

Macon is in the midst of the cotton section of the State and is the fourth inland cotton market in the United States, well equipped with warehouses and compress, annual receipts over 200,000 bales, a considerable portion of which is manufactured or taken in numerous cotton mills into cloth, yarns, twine, duck, knitted underwear, hosiery, automobile tire fabrics.

Macon is also the clearing-house for the great fruit belt in central Georgia. Within 30 miles of the great peach orchards; an annual average of 4,000 carloads of peaches, plums, pears, cantaloupes and other fruits pass through the city. Three large factories furnish the ice for refrigeration. Within a radius of 50 miles, lies inexhaustible supplies of kaolin, feldspar, fire clays and clays for making brick and terra cotta. The largest brick manufacturing plant in the southeast is located in Macon; every style of brick, tile, sewer pipe and terra cotta is produced here. The Central of Georgia Railroad maintains a $2,000,000 shop at Macon where cars are built and locomotives for 2,000 miles of line are maintained. The Georgia, Southern and Florida Railway also has extensive shops at their headquarter stations of main line. Other railroads also have shops here. The Census Bureau's summary concerning the city, period 1909–14, gives the number of manufacturing establishments in 1914 as 70; persons engaged in manufactures, 4,491; wage earners, 4,047; primary horse power (closed), 15,883; capital invested, $11,552,000; services, $2,395,000; salaries, $594,000; wages, $1,801,000; materials, $14,025,000; value of products, $18,867,000; value added by manufacture, $4,842,000.

The actual number is greater than stated, one owner is reported for several establishments owned or controlled by one concern. There are a number of establishments manufacturing fertilizer, hardwood, agricultural implements, located outside the city limits which are not included in the foregoing, which are properly Macon investments. The principal manufactures are cotton goods, cloth, yarns, underwear, hosiery, duck, twine and automobile tire fabrics. Cottonseed oil, cake, meal, etc., for food and provender, and the planter nearly as much as the cotton fibre. Brick, sewer pipe, tile, terra cotta, granite paving block, foundry and machine shops, railroad shops, products, harness, saddlery, agricultural implements, carriages, wagons, furniture, office fixtures, confectionery, barrels, handles, four iron factories, one of them capacity of 500 tons per day.

Macon has eight banks and trust companies with a total capital of $1,695,000; surplus, $958,500. The annual deposits reach $7,495,000. The largest annual clearance in 1912 ($193,000,000), show a slight decrease on account of general depression and European War. Average deposits per capita, $170; average for the United States is only $35.

No city in the country has wider or better parked streets and it is noted for having been the first city in the United States to employ an all auto-fire department. The National and Dixie highways, eastern, western and central routes, all centre in Macon and is the grand central point for State and Interstate tours. Her up-to-date hotels and splendid roads are fast making Macon the mecca of the tourists traveling North and South in summer and winter.

There are two public libraries: Mercer University (for men, Baptist, 1831); Wesleyan Female College (1836, the oldest chartered female college in the world); Saint Stanislaus (Roman Catholic, preparatory for the priesthood); Mount DeSales (Roman Catholic); Masonic Home (widows and orphans); State Academy for the Blind (1892), with a valuable library of several thousand volumes; and a
modern granite public building. Macon is the
home of the Masonic Order in Georgia and
maintains a handsome home for widows and
orphans on a 100-acre farm one mile from the
city. All other orders are represented:
Knights of Pythias Castle is valued at $50,000;
Elks Hall, $20,000; Odd Fellows, $25,000.

Recreation facilities include the home of the
Georgia State Fair, located in Central City
Park, good buildings for agricultural and in-
dustrial exhibits, cattle, swine and poultry.
Annual attendance, 125,000; Idle Hour Country
Club with modern club house and golf links;
several resorts for swimming and dancing; four
playgrounds with up-to-date apparatus; splen-
did mile-track; half-mile jog track and winter
quarters for circuses and racing stock; the
Y. M. C. A. building, four stories, with gym-
nasium, dormitories and swimming pool; Grand
Opera House and four splendid moving picture
theatres. All of the principal resorts are
reached by street cars and taxi lines. One
park is maintained for colored people exclu-
sively.

Tatnall Park, with playground, covers 18
acres. There are numerous street parks all
over the city, with shade trees, cement walks
and seats. The city has been the recipient of
200 acres of beautiful woodland on the bank
of the river two miles out, reached by a boule-
vard, where a first-class hotel and golf links are
about to be built. This gift is a part of the late
Senator Bacon's estate. There are 29 churches
for white people with 14,000 members; many
of them handsome buildings, with annexes for
Sunday schools, and homes for widows and
orphans. The colored population is also well
represented in church work and have substantial
churches.

The cemeteries include Rose Hill, 150 acres,
established in 1840; Riverside, and other smaller
ones located on the river bank and famed for
their natural beauty, handsome monuments and
mausoleums.

The city is governed by a mayor and council
of 12 aldermen, with separate commissions of
three each in charge of police and fire depart-
ments, and a water commission of three. Ma-
con has a modern water plant valued at over
$1,000,000, supplying water from the Ocmulgee
River, above navigation, on one side, and
Tuft Springs on the other. Macon was settled
in 1822, incorporated in 1823 and received a city
charter in 1832 and was named after Nathaniel
Macon, a patriot and statesman of North Caro-
olina. Macon's population in 1900 was 23,000;
in 1910, 42,000; in 1915, over 50,000, and this
does not include at least 5,000 people who live
in the immediate vicinity, enjoying street car,
electric light and water service, while within
a 50-mile radius of Macon there is a popula-
tion of nearly 800,000 people who reach the
city over a system of the best roads in the
county.

MACON, Miss., city, county-seat of Nox-
ubee County, on the Ocmulgee River, and on
the Mobile and Ohio Railroad, about 108 miles
east by north of Jackson. The agricultural
lands surrounding the city are almost wholly
used for the cultivation of cotton. It has cot-
toned-oil mills, cotton gins and cotton
compress. Its trade is chiefly in cotton. Pop.
2,024.

MACON, Mo., city, county-seat of Macon
County, on the Wabash and the Chicago, Bur-
lington and Quincy railroads, about 60 miles
west of the Mississippi River and 60 miles
south of the Iowa line. Surrounding the city
is a fertile agricultural region, well watered
and well wooded; and in the vicinity are the
largest producing coal fields in Missouri. The
industrial establishments are foundries, machine
shops, flour mills, wagon and automobile fac-
tories, brick yards, cigar factories and works
where agricultural implements are made. Here
is located the Still-Hildreth Osteopathic San-
torium, the only institution of its kind in the
world, where nervous and mental diseases are
brought by osteopathy. Some of its public
buildings are the courthouse, the county insane
asylum, public and private school buildings, the
public library, Federal building, hospital and
10 churches. The city owns and operates the
electric-light plant and the waterworks and
filtration plant. Pop. 3,584.

MACORIS, ma'kôr'ës', Santo Domingo,
seaport on the southern shore of the island of
Haiti on Macoris Bay, about 40 miles east of
Santo Domingo. The manufacture of sugar
and a considerable import and export trade con-
stitute the town's chief activities. A United
States consular agent is located here. Pop.
about 7,000. Macoris is also the name of a
smaller town in northern Santo Domingo, near
Santiago.

MACOUN, ma-koon', John, Canadian bot-
anist: b. Ireland, 1832. He removed to Canada
at 18 and from 1868 to 1879 was professor of
botany and geology in Albert College, Belle-
ville, Ontario. In 1882 he became botanist to the
Geological and Natural History Survey of Can-
da and was appointed in 1887 assistant director
of the survey. He has published 'Manitoba and
the Great North-west' (1882); 'The Forests of
Canada and their Distribution' (1895); an ex-
haustive report on the Yukon country; and
catalogues of Canadian plants and birds.

MACPHAIL, mäk'fäl', Andrew, Cana-
dian physician, author and editor: b. Orwell,
Prince Edward Island, 24 Nov. 1864. He was
educated at the Prince of Wales College, Mc-
Gill University and at the London Hospital.
He was principal of the Beaver College
School in 1882-85; was engaged in journalism
in 1889-93; afterward traveling in the East.
In 1895-1906 he was pathologist to the Western
Hospital and Verdun Hospital for Insane.
In 1906 he became professor of the history of
medicine at McGill University. Author of
'Essays in Puritanism' (1905); 'The Vine of
Silmab' (1906); 'Essays in Polities' (1909);
'Essays in Fallacy' (1910); 'The Book of Sor-
row' (1916).

MACPHEE, John Joseph, American neu-
rologist: b. Prince Edward Island, Canada, 8
July 1860. He was educated at Prince of
Wales College and at the University of Ver-
mont where he took his M.D. in 1890. He was
pathologist at the Post-Graduate Medical Col-
lege of New York in 1891-94; after which he
became professor of nervous and mental dis-
orders at the New York Polyclinic Medical
School and Hospital. He is also consulting
neurologist at Saint John's Hospital, Brook-
lynn; Beth Israel Hospital, New York; and at Saint Francis' Hospital, New York.

McPherson, mik-fər-'son, Sir David Lewis, Canadian statesman; b. Inverness, Scotland, 12 Dec. 1818; d. 16 Aug. 1896. He was educated at the Royal Academy in his native town, removed to Canada in 1835 and after becoming in 1842 a partner in a forwarding firm in Montreal secured in 1851, with others, a charter for a railway from Montreal to Kingston, the beginning of the Grand Trunk Railway. In 1872 he became president of the Interocanec Railway Company, the rival to the Canadian Pacific, in competing for the transcontinental railway charter. He sat in the Legislative Council of Canada 1864-67, and in the last-named year entered the Dominion Senate and was elected its speaker in 1880. He was Minister of the Interior 1883-85 and was created K.C.M.G. in 1884.

McPherson, Edward, American journalist; b. Gettysburg, Pa., 31 July 1830; d. there, 14 Dec. 1885. In 1849 he was graduated from the University of Pennsylvania, and although he studied law soon gave it up for journalism. He sat in Congress 1858-66, was clerk of the House of Representatives 1860-63, 1881-83, and 1889-91, in 1876 permanent president of the National Republican Convention, and was chief of the Bureau of Engraving and Printing in Washington 1877-88. He edited the Philadelphia Press 1877-80, was for some years the American editor of the 'Almanach de Gotha'; edited from 1873 to a biennial 'Handbook of Politics'; and the 'New York Tribune, Almanac' from 1877 till his death. He was the author of a 'Political History of the United States during the Great Rebellion' (1865); and 'The Political History of the United States during Reconstruction' (1870).

MacPherson, James, Scottish author and translator; b. Inverness-shire, 1736; d. 1796. He studied at Aberdeen and Edinburgh. Having published 'Fragments of Ancient Poetry,' translated from the Gaelic or Erse language, a subscription was raised to enable him to collect additional specimens of national poetry. He produced, as the fruit of his researches, 'Fingal, an Ancient Epic Poem,' translated from the Gaelic (1762, quarto); 'Temora and other Poems' (1763), professedly translated from originals by Ossian, the son of Fingal, a Gaelic prince of the 3d century, and his contemporaries. The question of the poet's authenticity gave occasion for violent controversy. It may be concluded that Macpherson's prose epics were founded on traditional narratives current in the Highlands; but the date of the oldest of the lays is comparatively modern, and it is now impossible to ascertain the precise extent of his obligations to Gaelic bards. Macpherson himself never made any serious attempt to vindicate himself against the charge of forgery. He had a life allowance from the government, and was agent to the Nahob of Argot, having also a seat in the House of Commons, 1790-96. He was also the author of a very inadequate prose translation of Homer's 'Iliad' and of some other works.

McPherson, James Birdseye, American soldier; b. Sandusky, Ohio, 14 Nov. 1838; d. Atlanta, Ga., 22 July 1864. He was graduated from West Point in 1853. Appointed brevet ad.-lieutenant of engineers, he was assistant instructor of practical engineering at West Point, 1853-54, and after serving on fortifications and construction duty on the defenses of the harbor of New York and the improvement of the Hudson River (1854-57), was given charge of the construction of Fort Delawar (1857-58), and of the defenses of Alcatraz Island, San Francisco, Cal. He applied for active employment in the field at the opening of the Civil War. In May 1862 he was appointed brigadier-general of volunteers and was with Halleck at the siege of Corinth. For his services on this occasion he was made major-general of volunteers in the following October. He took an important part in the siege and capture of Vicksburg and was in consequence promoted to brigadier-general in the regular army, 1 Aug. 1863. In March 1864 he was made commander of the Department and Army of the Tennessee and performed distinguished services in the campaign of Georgia. In the following July he commanded in the engagement around Atlanta and was killed during a reconnaissance. A statue has been erected in his honor at Washington, D. C., by the men who fought with him in the Army of the Tennessee.

McPherson, Kan., city, county-seat of McPherson County, on the Union Pacific, the Atchison, Topeka and Santa Fé, the Missouri Pacific and the Chicago, Rock Island and Pacific railroads, about 150 miles west by south of Topeka. The city is the trade centre of an extensive agricultural region in which the chief products are wheat and corn. It has flour-mills, creameries, grain-elevators, brick and lumber yards. Its trade is chiefly in farm and dairy products and in livestock. Its principal buildings are a courthouse, high school and opera-house. It is the seat of the McPherson College, under the auspices of the German Baptists. The city owns and operates its waterworks and electric-light plant. Pop. 3,546.

McPherson College. This institution was established at McPherson, Kan., in 1897, and opened its doors for the first time 5 Sept. 1898. Dr. S. Z. Sharp, then a professor in Mount Morris College, Ill., was the first promotor. The college is the property of the Church of the Brethren (sometimes called the Dunkers) and is controlled by a board of trustees representing the 11 church districts which make up Kansas, Nebraska, Missouri, Oklahoma, Colorado, Utah and Idaho. A local committee of five, in connection with the president of the college, actively supervise the work of the college. While the college is denominational, there are no religious tenets required for admission. The number of students usually ranges from 300 to 400. There are the following departments: college, academy, bible, expression, business, agriculture, domestic science, music, manual arts. The alumni number about 600. There are 22 faculty members. The endowment of the school was small until in 1916, when largely through the efforts of President Kurtz it was raised to over $225,000. This sum is productive. Other gifts are contingent. Each year the contributory congregations observe the anniversary on which offerings are raised to sustain scholarships in McPherson College for prospective
ministers and missionaries. There are already some 14 alumni on the mission fields of China and India. The material equipment consists of six buildings, a 10-acre campus and two farms which have been secured for agricultural purposes. On the campus there are Sharp Administration Building, Fahnestock Hall, Arnold Hall, Carnegie library, alumni gymnasium and central heating plant.

McQUAID, M'kwad', Bernard John, American Roman Catholic prelate: b. New York City, 18 Dec., 1833; d. Rome, Italy, 27 Mar., 1909. After studying in Canada, he completed his course at Saint John's College, Fordham, N. Y., where he was graduated in 1843, and for the next three years held the position of tutor. He studied theology first with the Lazarists of New York City and later at Saint John's College, Fordham, being ordained priest January 1848. Having built churches at Morris-town and Springfield, N. J., he was engaged upon one at Menloham when summoned to the newly erected diocese of Newark, N. J., 1853. In 1856 Father McQuaid founded Seton Hall College at Madison, N. J., and was its first president, retaining the office for 10 years, and its subsequent success has been eminently due to his indefatigable efforts. He was consecrated first bishop of the diocese of Rochester, N. Y., by Archbishop McCloskey in New York City, 12 July 1868. With characteristic energy he discharged his episcopal duties, the cause of Catholic education ever appealing to him as one of paramount importance. With a view to advancing it he invited the Sisters of Saint Joseph to conduct new parochial schools in his diocese and likewise founded Saint Andrew's Preparatory Seminary.

MACQUARIE (mä-kwär′i), ISLAND, British island, the largest of a small group of islands off the south coast of New Zealand and belonging to that country. It is about 4 by 20 miles in extent, is well covered with grassy vegetation and has trees and shrubs in sheltered sections. It was formerly a good seal-hunting ground but the seals were practically exterminated through lack of restrictions in hunting them. Penguins and other sea fowl abound and there are large herds of sea elephants. The island was discovered in 1810 and until the destruction of the seals was visited by numerous sealers. Its only inhabitants at the time it was made a base of the Mawson Expedition of 1911-14 were a few men stationed by a New Zealander for the purpose of rendering sea elephant and penguin blubber. The island is the crest of a submarine mountain, soundings taken 10½ miles east of its shore recording 2,745 fathoms and no bottom. There are several anchorages, but no harbor. There is now a permanent weather and relief station on the island, equipped with a wireless apparatus. Consult Mawson, Sir Douglas, 'The Home of the Blizzard' (2 vols., 1914).

MacQUEARY, Mä-kwär′i, Thomas Howard, American educator: b. Charlottesville, Va., 27 May 1861. He was graduated from the Episcopal Theological School at Alexandria, Va., in 1886, took orders in the Episcopal Church and in 1887 became rector at Canton, Ohio. His religious views having undergone a radical change he was tried by an ecclesiastical council for denial of miracles and suspended from the ministry for six months. He accordingly resigned from it in September 1891, and was for some time in the Universalist ministry. He returned to college for special work and in 1896 took his M.A. degree at the University of Minnesota, later (1901) finishing the work for the Ph.D. degree in political economics at the University of Chicago, although he did not publish his thesis and take the degree. He founded Unity House Social Settlement in Minneapolis; from 1900-06 was superintendent of the Parent School in Chicago, and since 1906 has been head of the department of history and head assistant in Soldan High School, Saint Louis, Mo., and teacher of political science in Benton College of Law. He is the author of 'The Evolution of Man and Christianity' (1889); 'Topics of the Times' (1890). He has done considerable lecture work for Chautauquas and other societies.

McQUILLEN, John Hugh, American dentist: b. Philadelphia, Pa., 12 Feb. 1826; d. there, 3 March 1879. He began the study of medicine and dentistry in 1847, engaged in the practice of dentistry in 1849, took his M.D. at Jefferson Medical College in 1852 and his D.D.S. at the Philadelphia College of Dental Surgery in 1853. He became professor of operative dentistry and dental physiography at the Pennsylvania College of Dental Surgery in 1857. In 1863 he was instrumental in securing a charter for the Philadelphia Dental College and he was from that time until his death its dean and professor of physiography. He was president of the American Dental Association, the State Odontographic Society, the State Dental Cosm in 1859-71.

MACRAE (mä-kär′). A three-toed genus of fossil South American herbivorous animals, forming a connecting link between the paleotherium and the camel family; in form they nearly resemble the llama, but were as large as a hippopotamus. Their remains have been gathered nearly completely from the pampas formation of Argentina and Bolivia.

MACREADY, Mä-kre′d, William Charles, English tragedian: b. London, 3 March 1793; d. Cheltenham, 27 April 1873. He received his education at Rugby, and originally had the intention of adopting one of the learned professions. The change in his career was brought about by his father, a theatrical manager, having fallen into embarrassed circumstances, to relieve which he joined his father's troupe, then acting at Birmingham. He appeared there for the first time in 1810 in the character of Romeo, in which he was successful. On 16 Sept. 1816 he made his first appearance on the London boards, acting Orestes in 'The Distressed Mother,' at Covent Garden Theatre. He did not achieve an immediate triumph in London, but gradually rose in popular favor. His Virginibus was the first of his London successes. From the time when he appeared in this part he continued steadily to improve as an actor, and his amateurs were no longer confined to the lower walks of the profession. In 1836-27 he made his first tour in the United States, making his début at New York on 2 Oct. 1836 as Virginibus, and again visited America in 1843.
In 1841 he became a theatre manager of Drury Lane, but met with no success, so that he resigned at the end of the second season. His managership at Drury Lane had brought upon him considerable financial loss, to repair which he made his third visit to America (1848–49). There he was involved in an unfortunate quarrel with the American actor, Forrest, which in May 1849 culminated in a riot at the Astor Place Opera House, New York, at which Macreedy was appearing as Macbeth, and in consequence was obliged to leave the country. On his return to London he gave some farewell performances, and then retired from the stage in 1851.

**MCREYNOLDS, mák-rényóldz, James Clark,** American lawyer, cabinet officer and jurist; b. Elktown, Ky., 3 Feb. 1862. He was graduated at Vanderbilt University in 1882 and from the law department of the University of Virginia in 1884. He engaged in law practice at Nashville, Tenn., attaining a distinguished reputation; and in 1900–03, without relinquishing his practice, he was professor at the Law School of Vanderbilt University. While in political party affiliations he was appointed Assistant Attorney-General under the Roosevelt administration in 1903–07, after which he engaged in law practice in New York. He was on several occasions retained as counsel by the United States in service connected with the application of the anti-trust laws, his part in dealing with the tobacco trust and with the anthracite coal dealers and the railroads being especially prominent. In 1913 he was appointed United States Attorney-General by President Wilson, succeeding Attorney-General Wickersham. While in office the cases of the Union and Southern Pacific Railroad merger, the International Harvester Company, the American Telephone and Telegraph Company, the Reading Company and the New York, New Haven and Hartford, under the Sherman Antitrust Law, came under his direction. He was appointed associate justice of the Supreme Court of the United States in August 1914 and took his seat in October.

**MACROBIUS, má-kro’bi-ús, Ambrosius Aurelius Theodosius,** Latin author of the 5th century A.D. The country of his birth is uncertain, but it is inferred from the fact that he speaks of Latin as a foreign tongue to him that he was probably a Greek. He was the author of a miscellaneous work entitled Saturnalia, curious for its criticisms, and valuable for the light it throws upon the manners and customs of antiquity; a commentary on Cicero’s Somnium Scipionis, in two books, valuable for the exposition it affords of the doctrines of Pythagoras with respect to the harmony of the spheres; and a treatise, De Differentiis et Societatis Graeci Latinae Verbi, Consult Von Jan, ‘Macrobius’; and Eyssenhardt, ‘Macrobi Opera’; also Wissowa, G., ‘De Macrobi Saturnaliorum Fontibus’ (Breslau 1880).

**MACROCOSM.** See Microcosm.

**MACROCYSTIS, mák-ró-sistz, a genus of brown seaweed of the family Laminariaceae, generally known as giant kelp.** It is common through the subtropical zone along the Pacific Coast of the United States. It has a much-branched root from which rises many filiform simple or branched stems without leaves below, but bearing numerous lance-like leaves above. The stems reach the greatest length known in the vegetable kingdom. Observations by Hooker near the Crozet Islands report specimens fully 700 feet long; and other authorities state that a length of 900 feet is sometimes attained.

**MACROTHERIUM,** a genus of extinct ungulate mammals, in some cases of gigantic size, found most completely in the Miocene deposits of Europe, but also known from China and western North America. It represents the primitive group Ankylopoidea, which had a wide geographical range in the Miocene and Pliocene epochs when it became extinct. The structure of the curiously twisted feet so much resembles that of the ground-sloth that for a long time the macrotheres, as well as their companion, but more generalized, genus Homalodontothereum, were regarded as edentates. Consult Woodward, ‘Vertebrate Palaeontology’ (1898).

**MACURA.** See Decapoda.

**McYTEIRE, mák-tir,** Holland Nimmons, American Methodist Episcopal bishop; b. Barnwell County, S. C., 28 July 1824; d. Nashville, Tenn., 15 Feb. 1889. He was graduated at the Randolph-Macon College, Virginia, in 1844, and in 1845 entered the ministry, joining the Virginia Conference. In 1846 he was assigned to Saint Francis Street Church, Mobile, Ala., and after serving in the churches at Demopolis, Ala., and Columbus, Miss., he was transferred to the Louisiana Conference. He was a founder of the New Orleans Christian Advocate in 1851–58, and from 1858 until its publication was interrupted by the Civil War he edited the Nashville Christian Advocate. During the war he served as pastor of the church at Montgomery, Ala. He was elected bishop in 1866, and in 1873 he became president of the board of the newly-founded Vanderbilt University. He was senior bishop for some time before his death. Author of ‘Duties of Church Masters’ (1851); ‘Catechism on Church Government’ (1869); ‘Manual of Discipline’ (1870); ‘History of Methodism’ (1884); ‘Passing Through the Gates’ (1899), etc.

**MACÜ, má-koo,** a nomadic Indian tribe of the Amazon region. They range through northwestern Brazil, more particularly along the Rio Negro. They are of the lowest of the savages of South America, provide neither shelter nor clothing and plant no crops. They live by hunting and fishing, are hostile and apparently have no connection with other tribes. A report of their conduct was made by Theodor Koch-Grundberg in ‘Anthropos’ (Vol. I. pp. 877–906, 1906).

**MacVEAGH, mák-vá,** Franklin, American cabinet officer, brother of Wayne MacVeagh (q.v.); b. near Phoenixville, Chester County, Pa., 1837. He graduated at Yale in 1862 and took his LL.B. at Columbia University in 1864. He was admitted to the bar in 1864; and in 1864–66 was engaged in practice in New York. His health failing he went to Chicago in 1866 and there engaged in the wholesale grocery business. After the panic of 1874 he established the firm of Franklin MacVeagh and Company, wholesale grocers, and he also became connected with various banking and
MacVEAGH—MAD MULLAH

manufacturing interests. He became president of the Citizens' Association of Chicago in 1874 and was largely responsible for many important reforms. He was Democratic candidate for United States senator against Senator Culom in 1894 but was defeated. From 1896 he was associated with the Republican party, and in 1909 he was appointed Secretary of the Treasury by President Taft, serving throughout the Taft administration. He was vice-president of the American Civic Association in 1905; served as president of the Chicago bureau of charities and of the Municipal Art League; and was a founder and member of the executive committee of the National Civic Federation.

MacVEAGH, Wayne, American lawyer and diplomat: b. Phoenixville, Pa., 19 April 1833. He was graduated from Yale in 1853 and after studying law was admitted to the bar in 1856. He was district attorney of Chester County, Pa. 1859-60. prominent as a Republican leader, and conspicuous in his profession, and in 1870-71 was Minister to Turkey. He was an active opponent of "machine politics" and in 1872 led the Republican opposition to Simon Cameron, his father-in-law. He was chairman of the "MacVeagh Commission" sent by President Hayes to Louisiana in 1877 to act as the President's unofficial representative and aid in adjusting political differences there. He was Attorney-General of the United States, March to September 1881, and was Ambassador to Italy 1893-97. In 1903 he was chief counsel of the United States in the Venezuela arbitration before The Hague Tribunal.

McVICKAR, William Neilson, American Protestant Episcopal bishop: b. New York, 19 Oct. 1843; d. 28 June 1910. He was graduated at Columbia College (1865) and at the General Theological Seminary (1868). He was ordained deacon (1867) and priest (1868). Being elected coadjutor bishop of Rhode Island, 19 Oct. 1897, he was consecrated 27 Jan. 1898, and on the death of Bishop Clark, September 1903, succeeded to the see.

MACWHIRTER, mäk-werp'ter, John, Scottish landscape painter: b. Slateford, near Edinburgh, 27 March 1839; d. London, 28 Jan. 1911. He entered the Trustees' Academy, conducted by Robert Scott Lauder at Edinburgh, when 13 years of age, and at 15 made his first exhibition. 'Old Cottage at Braid,' at the Royal Scottish Academy. At 16 he began his annual tours of Europe in search of material for his canvases, his travels eventually covering all parts of Europe and the United States as well. In 1867 he exhibited six pictures at Edinburgh and was elected to the Royal Scottish Academy. He made his first exhibition at the Royal Academy, London, in 1865, and in 1869 he settled permanently in London. He painted some effective landscapes in California in 1877; was elected associate of the Royal Academy in 1879 and Academician in 1893. His landscapes are naturalistic and their popularity doubtless was enhanced by the tinge of literary significance he succeeded in giving them, together with a certain felicity in the selection of their titles, and an edge of poison administered at the hands of a woman he had outraged. His successor, Abd-Allah, carried on the struggle, until the power of Mahdism was finally broken at the battle of

(Macy, Jesse, American historian: b. Henry County, Ind., 21 June 1842. He was graduated from Iowa (now Grinnell) College in 1870. From 1871 to 1885 he was principal of the academy of Iowa College; in 1883-85 was acting professor of history and political science; in 1885-1912 professor of political science, and professor emeritus since 1912. In 1913 he was Harvard Foundation lecturer in French provincial universities. He received the degree of LL.D. from Brown University in 1898, from Grinnell in 1911 and from Oberlin in 1915. He has written 'Civil Government in Iowa' (1881); 'Institutional Beginnings in a Western State' (1883); 'Our Government' (1886); 'The Government of the Southern States' (1873); 'North Carolina Schools' (1887); 'The English Constitution' (1897); 'Political Parties in the United States, 1846-61' (1900); 'Party Organization and Machinery' (1904); 'Comparative Free Government,' with J. W. Gannaway (1915).

MAD ANTHONY, a nickname given to the Revolutionary general, Anthony Wayne (q.v.), on account of the seeming recklessness of his brilliant military feats.

MAD APPLE, the fruit of an American nightshade, especially that called Sodom apple (Solanum sodomita), the eating of which produces poisonous intoxication.

MAD MULLAH, term supplied to Mohammed Ali, the Mandi, or Moslem Messiah: b. Somaliland, 1843; d. Omdurman, 22 June 1885. In his youth Mohammed was initiated into the mysteries of the occult sciences and sorcery. A study of the Koran and the Arab writings followed in the Marabout school. When quite young the future Mullah conceived the idea of making the pilgrimage to Mecca, and not content with one journey made the sacred visit three or four times. After his last pilgrimage Mohammed returned to Berbera, but met with small success. Establishing himself in a powerful inland tribe, his ascetic practices and bold demeanor gained for him a reputation for sanctity and spiritual gifts. In 1880 he proclaimed himself Mahdi ("the guide," i.e., in the way of salvation), and in 1881 he proclaimed a Jehad or holy war against the infidel and speedily aroused all the latent fanaticism of the fierce Sudanese tribesmen. From 1881-83 he destroyed nearly every force sent against him; and so threatening did his power become that the foundation of the Sudan was ordered by the Egyptian government. Wulff's expedition for the relief of Khartum was too late to effect its purpose, the city was stormed in January 1885 and General Gordon murdered. His death is said to have occurred through the poison act, 'The Lady of the Woods' (1876); 'The Three Graces' (1878); 'The Lord of the Glen' (1880); 'The Three Witches' (1886); 'Crabbed Age and Youth' (1899); 'The Fallen Giant' (1901). His work is represented in the Royal Academy diploma gallery; the Walker Art Gallery, Liverpool; and in the municipal galleries at Manchester, Dundee, Aberdeen and Hull. Author of 'Landscape Painting in Water Colors' (1901). Consult Spilsman, H. M., 'The Art of John MacWhirter'; Sir C. W. M. Synge; Shelfer, R. A. (Art Journal Annual, Christmas, 1903).
MAD TOM — MADAGASCAR

Omdurman in 1898. Consult Darmesteter, 'The Mahdi' (London 1885); Hoffmann, 'Mahdism' (Kiel 1899); Muller, E., 'Beiträge zur Historie und Literatur des Islam' (Heidelberg 1901); Wingate, 'Mahdism and the Sudan' (London 1901).

MAD TOM, local name in eastern United States for any of several types of small catfish native to fresh waters. They are long and slender, with mottled skin entirely naked, and have sharp pectoral fin spines with which a woman might be as painful as a bee sting may be inflicted. There are several varieties, ranging from a few inches to nearly a foot in length. They are known also as stone-cat, owing to their resemblance to the rocky or pebbly bottoms they frequent.

MADÁCH, mōďăch, Emeric, or Imre, Hungarian poet: b. Alsó-Szegred, 21 Jan. 1823; d. there, 5 Oct. 1864. He studied law, was a notary in his native country and was also active as an orator and journalist. He wrote on archaeology and aesthetics; and both lyric and dramatic verse. His principal works are the dramatic poems 'Moses' (1856); and 'The Tragedy of Man' (1860). The latter owes much to 'Paradise Lost,' and to 'Faust,' but is yet a remarkable performance. Though strongly contemplative in character, it was successfully rendered in German by von der Lech (1888). Consult Fischer in 'Auf der Höhe' (Vol. XVI, 1885).

MADAGASCAR, mā́dā-gā́skār, an island in the Indian Ocean, since 1896 a French colony. It is separated by the Mozambique Channel from the southeast coast of Africa, the nearest point being 240 miles distant. It is 975 miles long from Cape Saint Mary in the south to Cape Amber in the north, has an average breadth of 250 miles, greatest breadth 360 miles, and an estimated area of 227,750 square miles, being after Greenland, New Guinea, Baffin Land and Borneo, the fifth largest island in the world. The Comoro Archipelago (1,357 square miles) was attached to the island as a province for administrative purposes in 1914.

Topography. — Madagascar consists of an elevated plateau or the average height from 3,000 to 5,000 feet overlooked by mountains rising in some cases to nearly 9,000 feet above the sea-level. This plateau occupies a much larger proportion of the surface in the north and east than in the west and south, and the greater portion of the island south of lat. 23° S. belongs to a much lower region which does not consist entirely of plains, but is interrupted toward the west by three prominent chains of hills stretching from north to south, one of them apparently in a continuous line about 600 miles in length. The coast exhibits a number of indentations, mostly small, but few good harbors, being in great part rock, though in some places low and sandy.

Hydrography. — The rivers are numerous; few are navigable, except in their lower courses and in the interior. The chief rivers have their courses on the west and northwest side of the island. The Betisoeka with its affluent, the Ikopa, unitedly measuring 300 miles, may be ascended by light steamers for 100 miles; the Tsiribihina has a somewhat shorter course, but drains by its numerous tributaries a much larger area. The eastern rivers descend from the high land through magnificent gorges, forming a succession of rapids and cascades, the falls in some instances having a descent of 300 feet. There are few lakes of any size as yet known to explorers; one of the largest is Alaotra Lake, measuring 25 miles long; the others do not reach a length of 10 miles. A long chain of lagoons having very short distances between each and often expanding into wide sheets of water stretches for nearly 300 miles along the coast.

Geology. — Geologically the elevated region consists almost entirely of granite and other igneous rocks, while the lower regions is composed chiefly of secondary formations. The former region is traversed by a line of extinct volcanic craters, some of which show signs of comparatively recent activity. Among the more remarkable fossils are remains of a huge struthious bird, the Epiornis, whose egg, measuring 12 by 9 inches, is larger than that of any other known bird. The minerals include iron in abundance, gold, lead and copper, all more or less worked, while in the northwest coast is found.

Climate. — The climate is varied; the heat on the coast is often very intense. In the high lands of the interior the temperature is moderate. On the coast the rains are nearly constant, beginning in the evening and sometimes lasting all night; in the interior the winter is dry and agreeable. The greatest amount of rainfall takes place on the east coast, and especially on the northeast, the part directly exposed to the summer monsoon. The elevated region of the interior and the districts on the west coast are tolerably healthy for Europeans, but owing to the large extent of marsh and lagoon on the east, malaria fever prevails, and is frequently fatal to natives from the interior as well as to Europeans. Snow is never found on even the loftiest mountains.

Ethnology. — The inhabitants, known by the name of Malagasy, belong to the Malayo-Polynesian stock and speak a Malayan language. They appear to form substantially a single race, though they have received a considerable intermixture of African blood and a certain amount of Arab intermixture. They are divided into numerous tribes, each having a distinctive name and customs. The Hova's are the predominant tribe; their proper country is the elevated region of the interior, but they extended their sway over nearly the whole island. Among the other chief tribes are the Betsimaraka on the east coast, the Betiako in the south central region and the Sakalava on the west and north. The people were socially divided into three classes: Admirals or nobles, Hovas (in a special and restricted use of the word) or free commoners, and Andevos or slaves: the nobles and island classes have been abolished by the French. In the coast districts the houses of the better class are built of framed timber with lofty roofs covered with shingles or tiles; the dwellings of the lower classes are constructed of bamboo, rushes, or even of clay. In former and more unsettled times the villages were almost always built on the tops of hills, but during the 19th century this precaution has not been deemed so indispensable.

Flora. — The most striking feature in the
vegetation is a belt of dense forest with an average breadth of 15 to 20 miles passing round the whole island, and broken only by a gap in the northwest, where the two ends of the forest overlap. It is found at all levels from 6,000 feet to the water's edge, which it touches on the northeast, where it reaches its greatest breadth of 40 miles. The trees of this forest include many species of lofty palms, hardwoods, and a variety of beautifully veined and durable timber and a large number of trees remarkable for the splendid character of their blossoms. Of all the trees of Madagascar the most striking is the ravinala or traveler's tree (Urania speciosa): it resembles a palm, its stem being crowned by a semi-circle of oblong leaves spread out vertically in a fan shape. It owes its name to the fact that the traveler may supply himself with water from it by piercing or breaking the lower end of the leaf-stalks.

Fauna.—Madagascar has a singularly local fauna which, although upon the whole related to Africa, is so peculiar to itself that, with a few neighboring islets, it forms a very distinct sub-province of the African region. Its characteristics are plainly this: first, the separation of the island from the continent occurred at a very ancient time. Another singular feature is the presence of various forms of animal life represented elsewhere only in Oriental Australian regions, with a marked resemblance in a few animals, for example, the hoas, to South America. From this it is plausibly argued that in early Tertiary times there was a land connection between Madagascar and India and the region thence to Australia, now presented only by the islands of the Malayan Archipelago. (See Lemuria). In its mammals Madagascar is singular in what it lacks, as well as in what it possesses. It has none of the cattle, equine animals, elephants, rhinoceroses, hogs or even rodents of Africa, except a mouse or two; no lice or ticks, but dog of any kind; and no monkeys. On the other hand it has several small insectivora, closely allied to tropical American species; the great majority of all the lemurs, the few outsiders being in Africa and the Orient; and several viverrine quadrupeds, which take the place of the predators of cats. The modern birds are less striking in their peculiarities, but in the zoological era immediately preceding the present the island possessed those huge rattle birds, the epicorina, and its relatives, which gave rise to the story of the roc. Many forms of huge land tortoise were also members of this singular fauna. The fishes, amphibians, reptiles and lower forms are largely peculiar. Crocodiles are numerous in the rivers and lakes, and many species of lizards, chameleons and tree-frogs abound in the forests. Among the insects are numerous brilliantly colored beetles, butterflies, moths, flies, locusts and spiders, venomous species of the latter as well as scorpions and centipedes being present. See ZOOGRAPHY.

Agriculture.—Of the vegetable products grown for food by far the most important is rice, the staple food of the inhabitants; next in importance came manioc or cassava, sweet-potatoes, beans, tomatoes, ground-nuts and yams. Ginger, pepper and indigo grow wild in the woods; cotton, sugarcane, coffee, tobacco and hemp are cultivated. Humped cattle are found in immense herds, and form a large part of the wealth of the inhabitants; they appear to have been introduced from Africa at a remote period, as the fat-tailed sheep, goats, swine and horses have been more recently. Under French administration agriculture and cattle-raising are undergoing considerable extension. A great variety of crops are raised, including grains, sugar, cotton, tobacco, rice, tea, and fruits. The chief exports are cotton goods, wines and spirits, metals, rice and flour. The imports in 1915 were valued at £1,750,694, the chief items for that year being cottons, £531,629; beverages, £134,807; and cloth £48,639. The exports for that year were valued at £2,642,644; the chief values being hides, £542,644; and rice £148,196. In 1915, 4,050 vessels entered, totaling 1,706,293 tons, of which 2,971 were French (1,617,479 tons), and 666 (66,426 tons) British. In general the Malagasy show much aptitude for the manual arts. As silversmiths, gunsmiths and carpenters they rapidly acquired the skill of Europeans; and with hand looms of the rudest construction, the only ones as yet in use, they make excellent and handsome cloths. The principal article of native dress with both sexes is the lambo, a piece of cloth about three yards long and two broad, which is folded round the body above the arms, one end being thrown over the shoulder.

The island is being rapidly opened up by the building of highways and carriage roads. A railroad has been completed between Tananarive, the chief port and capital, and Antananarivo the ancient capital (229 miles long) and branch lines are under construction. Automobile services have been established on the 1,000 miles of tolerable road.

Government.—Prior to 1895 the government was a native absolute monarchy. A French resident, however, with a military escort, resided at the court and controlled foreign relations, so that the country was virtually a French protectorate. Much friction prevailed in 1893-94, between the government and the French authorities, and finally France decided to make her protectorate of the island effective. An expedition easily overcome the resistance of the Hova troops, and after some changes in the formation of the administration, the island was made a French colony, and General Gallieni was appointed first governor-general (1896-1905). His vigorous and determined policy made a great improvement in the condition of the country. The governor is assisted by an administrative council, and natives are largely employed in the civil and military administration. Forced labor was abolished in the public service in 1901. Education is free and compulsory, and instruction in French is obligatory. In the primary schools in 1910 there were 13,108 pupils. Instruction is also given in higher
schools in practical agriculture, industries and medicine. Numerous Catholic and Protestant missions and mission schools have long been established, and in 1895 it was estimated that there were 435,000 French and 50,000 Catholics in Madagascar. The army of occupation is composed of 2,411 French soldiers and 6,376 natives. The religion of the great bulk of the people is a kind of fetishism or worship of charms. The Court of Appeals and tribunals throughout the province provide for native justice, while there are special courts for the administration of French justice. The local revenue is derived chiefly from direct taxation, from customs and other indirect taxes, from colonial lands, posts and telegraphs, markets, etc., and from subventions granted by France. The local budget for 1916 balanced at £1,284,928, and there is a standing debt of £4,200,000.

Population.—According to the census of 1911 the population amounted to 3,153,531, of whom 2,690,381 were natives, 569,404 European, 1,004 Asiatic and African; 1916 estimate, 3,512,690 (14,390 French, and 2,710 foreigners). The Hovas, the chief native tribe, numbered 847,480; the Betseile, 408,024, the Betsimasarakas, 268,159.

History.—Madagascar was known to the Portuguese at the end of the 13th century and had been visited for several centuries by the Arabs. In 1506 it was visited by the Portuguese, who gave it the name of Saint Lorenzo. Toward the end of the 17th and during the most of the 18th century the French endeavored to form military stations on the east coast, but with no lasting results. A settlement was established at Fort Dauphin in the southeast and held for some time, but in consequence of the tyrannical behavior of the French settlers they were massacred by the natives and the place destroyed. The French, however, struggled hard and successfully to retain the islands of Saint Marie on the east coast and Nosibé on the northwest. Previous to 1810 Madagascar might be said to have been divided among numerous petty chief almost at war with each other. In that year, however, Radama I, a prince of remarkable intelligence, became king of the Hovas, and began to enforce a claim by right of conquest to the sovereignty of the whole island. He saw that if his people were to be prosperous they must first be educated and civilized. In return for the promise of co-operation in putting down the slave-trade on the coast of Mozambique, he received arms and other assistance from the British, by which he was enabled to carry on his conquests. Christian missionaries began to teach in the capital in 1820, many converts were made, the Bible was translated into the Malagasy tongue, the language was reduced to a systematic written form and printing was introduced. Great improvements took place in the manners of the people when Radama died in 1828, and was succeeded by his chief wife, Ranavalona, a woman of cruel disposition, and opposed to all innovation. The native converts were persecuted, many of them being put to death, and the island was closed to Europeans. This reign of terror ended at last in 1861, when Radama II, who, himself a Christian, reopened the island to European missionaries and traders, and proclaimed the emancipation of the African slaves. He appears, however, to have been a weak prince easily swayed by native and foreign favorites, and he unwisely granted extensive territories and privileges to an enterprising French company, an institution which lost him the affection of his nobles, and led to his assassination in 1863. His wife Rasohenina was placed on the throne, and the government repudiated the concessions made to the French, offering 1,000,000 francs as compensation. A quiet and prosperous reign of five years this queen died, and was succeeded by Ranavalona II in 1868. After she had been elected queen she and a great number of her courtiers became Christians, and many reforms favorable to enlightenment and humanity were peremptorily carried out. She was succeeded in 1882 by Ranavalona III, when the French brought forward their claims on the Malagasy territory, which, being refused, led to hostilities in 1883-85. This war was terminated by a treaty, under which France acquired protectorate rights over Madagascar; but hostile feeling toward the French again led to war in 1895, with the result that the queen was deposed and exiled first to the island of Réunion, and thence in 1899 to Algiers, while Madagascar became a French colony.

MADAME BOVARY. ‘Madame Bovary,’ the first and best-known novel of Flaubert, a type and model for the fiction of the next generation, was the first and is probably still the best of minute reproductions of the platitude of modern life. It was published in 1857 when Flaubert was already 35, the fully matured and laboriously executed expression of his effort to make writing a means of emancipation from self. The French literary historian Lanson thinks it may well prove ‘the masterpiece of contemporary fiction.’ Flaubert’s own education had been out of key with his provincial surroundings, and he chose natures similarly out of tune with their environment for the first object of his study, with a painstaking accumulation of ‘significant little facts’ quite in the spirit of Taine’s psychology and literary criticism. Flaubert had worked on ‘Madame Bovary’ at least since 1845. In the last year of the twenty-four, he tells George Sand, and adds, ‘I seek something better than success, I seek to please myself.’ The novel attracted immediate and wide attention, presently stimu-
lated by a prosecution of the author for alleged immorality, a celebrated case, ending in a curiously qualified acquittal. The court pleadings and judgment, printed at Flaubert's instance with subsequent additions, throw strange light on the moral ideas of the last decade of the Second Empire.

'Madame Bovary' marks the transition from the fiction of romantic fancy to that of close realistic observation, preferably of the petty, the puerile and the commonplace. The theme is the banality of provincial life, as Flaubert saw and felt it; the lesson is the futility and danger of a sentimental revolt from the commonplace when vulgar souls indulge in romantic aspirations. Briefly the story is this: Charles Bovary, a 'medical man,' though not an M.D., unusually good, timidly banal, is shown us first as a dull pupil, then unsympathetically married, then a widower attracted to a farmer's daughter, Emma, the chief subject, who he marries, apparently the less initiated of the two. Emma's convent education beyond her station had been supplemented by romantic poetry and fiction, in Flaubert's opinion a deliberate perversion, whose degrading and immoral results he propitiates to show. Charles was happy; Emma ever restlessly reaching out toward a fulfillment of her romantic aspirations. Chance brought her to an aristocratic ball. Dormant emotions were awakened. She desired at the same moment to die and to live in Paris. Léon, a law student, served her for a platonic attachment, presently to succeed by Rodolphe, after Emma had sought sentimental consolation in religion, quite in vain. Rodolphe's carnally-minded courtship, a bitterly ironically parody of romanticism, is successful; but from dreams of bliss Emma is relentlessly drawn down to and below the commonplace. Both weary, Emma again seeks refuge in religion, but meeting the now more sophisticated Léon yields once more, and plunges Charles into debt while still seeming to him more charming than ever, as she descending the last steps of dissimulated corruption. Abandoned by Léon, once more rejected by Rodolphe, she endures life by poison, holding even beyond death the infatuated love of Charles, who, even though at last undeceived, dies with a lock of her hair in his hand.

Incidental to the story are some admirable character studies of provincial types, notably M. Homais, d'Artagnan and materialist, incarnation for Flaubert of Triumphant democracy, a by-word for the narrow, provincial philistine, who has given his name to a social species. His counterpart is the parish priest, Bournisien, whose career as a perfunctory, well-meaning, uncomprehending fatuity. More subordinate but strongly individual are the sacristan Lestiboudois, the notary Guilaumin, and the merchant-money-lender Lheureux.

Apart from its subtle psychology 'Madame Bovary' won and holds admiration for its phrases of flashing irony, its vivid narration and fine descriptive passages, but no less for its linguistic euphony, a matter to which Flaubert gave untiring study and immense patience. Ethically it reflects its author's sombre pessimism. To Flaubert all spiritual aspiration seems foredoomed to failure. For himself he sought forgetfulness in the pursuit of art for art's sake. In this book he presents neither a character to imitate nor an act to admire. Yet 'Madame Bovary' is, in Bourget's phrase, 'the very ideal of the literary artist.' There are French editions by W. Walton and others. Consult Whitehouse, H. R. 'The Life of Lamartine' (2 vols, New York 1919).

Benjamin W. Wells, Author of Modern French Literature.

MADEN, Frederic William, English numismatist: b. London, 27 April 1821; d. Brighton, 20 June 1904. He is a son of Sir Frederic Madden, a noted antiquary, and was chief librarian of the Brighton Public Library, 1888-1902. He published Handbook of Roman Numismatics (1861); History of Jewish Coinage (1864), republished in enlarged form as The Coins of the Jews (1881), and (jointly with S. W. Stevenson) Dictionary of Roman Coins (1889).

Madder, (1) in botany, the English name of the plants of the genus Rubia, especially R. tinctorum. It is a trailing or climbing annual, supporting itself by its delicate tendrils, not prickles. It is supplied chiefly from Holland, France, Italy and Turkey. The roots are kilndried and then threshed; they are then dried a second time, and afterward pounded and stamped in a mill. Indian madder, called also madder of Bengal, is R. cordifolia. (2) In chemistry, the root of R. tinctorum is extensively used in dyeing for the production of a variety of colors, namely, red, pink, purple, black and chocolate. Other species of Rubia are also used. It would appear that madder contains a colorific principle—ruhian—which, under the influence of a peculiar ferment, termed erythrozym, breaks up into alizarin, purpurin, etc. The colors produced from madder are very stable, the well-known turkey-red being one of them. Madder also contains certain yellow coloring matters, but they are useless, if not injurious, in the process of dyeing. (See Dyes; Dyeing). (3) In pharmacy, madder is a tonic, diuretic and an emmenagogue. Brown madder, a rich red-brown pigment, prepared from the roots of R. tinctorum.

MADDOX, Richard Leach, English physician and chemist: b. Bath, England, 4 Aug. 1816; d. Portswod, Southampton, 11 May 1902. He studied medicine at University College, London, but was graduated M.D. at Edinburgh. In early life he settled and practised his profession in Constantiopole, and here first took up the study of photography. He subsequently left the Bosphorus for Smyrna and was a civil surgeon in the military hospitals at Scutari during the Crimean War, and finally settled at Woolston, near Southampton, England. It was during his residence at Woolston, which lasted until 1874, that he worked out the process which has revolutionized the art of photography, by substituting the gelatine-hormide plate for the collodion plate. With him originated the gelatino-hormide dry plates to take the place of the wet collodion plates which, besides other inconveniences, sometimes produce an atmosphere which is dangerous to the operator's health. There has been more than one claimant to the credit of this discovery, but it has been decided by the Scientific American that Dr. Maddox is entitled to all the honor of the invention.
MADEIRA, ma-dë’rã (Port. ma-dâ’rã), a group of Atlantic islands belonging to Portugal, opposite to and about 360 miles distant from Morocco, on the west coast of Africa, and about 355 miles southwest of Lisbon. Madeira, the principal island, and the islets of Porto Santo, Dezeria Grande and Bugio, comprise the group with an area of 314 square miles, and a population of about 169,783. The main island (309 square miles) consists of a collection of mountains of volcanic origin, the most elevated of which is upward of 6,000 feet high. Through the west half of the island runs a central ridge about 5,000 feet high, on which is an extensive plain called Paul de Serra. The east portion of the island, though elevated, is less so than the west. From the central mass steep ridges extend to the coast, where they form perpendicular precipices of from 1,000 to 2,000 feet high. These cliffs are indented by a few small bays, where a richly cultivated valley approaches the water between abrupt precipices or surrounded by an amphitheatre of rugged hills. These narrow bays are the sites of the villages of Madeira. The most striking peculiarity in the mountain scenery of the island is the jagged outline of the ridges and the deep precipitous gorges which cut through the highest mountains almost to their very base. The road round the island is in many places exceedingly picturesque, being led often between lofty cliffs or along the front of precipices overhanging the sea. The Madeiras were known to the Romans under the name of Purpuroria Insula. They were rediscovered by the Portuguese in 1420, and the name Madeira was given to the principal island from the magnificent forests of building timber (in Portuguese, madeira) which then covered it. It was settled by the Portuguese in 1431. From 1580 to 1640 the islands, with Portugal itself, were under Spanish rule, and have twice (1801, 1807–14) been under the British flag. Funchal, the capital (pop. 24,697), is an episcopal see. The inhabitants are devout Roman Catholics. The mean annual temperature of Madeira is 65° and the climate, from its constant and temperate warmth, is well known for its favorable effects on those suffering from pulmonary and other complaints, which renders the island a favorite resort of invalids from Great Britain and elsewhere. Large and well-appointed hotels exist at Funchal. The islands are connected with Great Britain, France and Belgium, and with the United States, by steamship lines. The staple product of Madeira is wine, the quantity of which in good years prior to the appearance of the vine disease in 1852 amounted to 2,750,000 gallons. The annual export is now about 700,000 gallons. Sugar-cane, and the cactus for the rearing of cochineal, are cultivated, fruit and vegetables are grown, fisheries are actively engaged in, linen, woolens, leather, straw hats, baskets, soap, sugar, spirits, butter, etc., are manufactured. The chief import is coal, the most important of the others being wheat, rice, Indigo, and dry goods.

MADEIRA, or CAYARI, Brazil, a large navigable affair in the Amazon, about 1,500 miles long, formed by the united streams Beni and Mamore on the frontiers of Brazil and Bolivia. The length from the source of the Mamore is 2,000 miles.

MADELEINE, Marie Angélique, de Saints, French abbess, prioress of the convent of Port Royal, Paris. See under baptismal name, ARNAULD, JACQUELINE MARIE.

MADELEINE, mad-lân, lá, France, a prehistoric station in the valley of the Vézère, midway between Moustier and Les Eyzies. The Madeleían, or Magdalenian, Epoch was named from this cave by the French anthropologist, Gabriel de Mortillet.

MADELEINE, mad-lân, la, a church in Paris, in a square of the same name, commenced in 1764. It was remodeled and changed after the Revolution, and in 1832 was completed at a cost of $3,000,000. The church is built in the form of a Roman temple and is 100 feet high, 354 feet long and 141 feet wide. The bronze doors by Triqueti are 35 feet high and 16 feet in width. The building, which has no windows, is lighted from above.

MADEMOISELLE DE MAUPIN, mô-pân, 'Mademoiselle de Maupin,' a novel written by Théophile Gautier with Jean-François, 24 years of age (1835), expresses the most salient features of romanticism. In the somewhat long prologue is found the key to the interpretation of this highly imaginative work. Gautier cries out against the shammed respectability of that period and condemns the prudery and the prudishness of the critics who according to him are merely hypocrites actuated by envy. Violently opposed to classical traditions and ideas, Gautier, who had been trained as a painter, keeps in this work the painter's vision, and emphasizes primarily form and color, while defending art for art's sake. Digresses on the supreme value of beauty are found frequently throughout the pages, and the vivid imagination of the author is fruitful to the point of exaggeration. The heroine, brought up according to tradition, rebels against it, and, disguised as a man, like the Amazons of old, resolves to study life at first hand. After many unusual adventures she becomes for one day the long-sought ideal of a romantic poet who had sent her in vain until then for the "woman" of his dreams and who found her only to lose her immediately. As a novel the work is crude both in subject matter and in development, showing that it comes from a young man whose passions were not yet calm. It is, however, essentially artistic; the style is full of color and abounds in beautiful descriptions and lyric passages. While the novel did succeed in amazing placid citizens and is still classed as dangerous reading, it must not be considered as a study of any type of French character, but as a flight of imagination, a descriptive fantasy artistically worked out by a talented writer of the Romantic school.

LOUIS A. LOISEAUX.

MADEMOISELLE DE LA SEIGLÈRE, sâ-glyâr, novel by Jules Sandeau (q.v.), published in 1848 and dramatized in 1851.

MADEIRO, ma-dâ’rô, Francisco Indalecio, President of Mexico: b. San Pedro, Coahuila, 18 Oct. 1873; d. Mexico City, 1 Feb. 1913. He came of a wealthy family and was a grandson of a former governor of Coahuila. He was educated at a Jesuit college in Mexico and at the University of California and spent the years

vol. 18 — 7
1899-95 in France. He returned to Mexico, engaged in cotton-planting and in banking and materially increased his fortune. He took up his residence in Mexico City in 1900 and became keenly interested in political reform. Of a somewhat ascetic disposition, he displayed an initiative that surprised his most intimate friends, and by 1905 he was the unquestioned leader of the reform element. He actively opposed the rule of Diaz, and in 1906 he published his "La Sucesion Presidencial en 1910," a strikingly well-balanced attack on the evils existing in the political and social life of Mexico. He advocated suffrage reforms, a single term for the Presidency and opposed the absolutism which characterized the rule of Diaz, while crediting him with the many achievements of his administration. The book caused a sensation and was promptly suppressed by the government. However, Madero was nominated for the Presidency in 1910, running against Diaz on a platform advocating a single term for the President, and was defeated. He was arrested on a fabricated charge in July 1910 and imprisoned until it was too late for him to interfere with the re-election of Diaz. Madero then headed a plot for a revolution against the government, advocated reforms in suffrage, land distribution, freedom of the press and the single presidential term among other measures. The uprisings began at Puebla, 20 Nov. 1910, spread through Sonora and Sinaloa, and upon capturing Juarez, Madero set up his government and appointed a cabinet, 11 May 1911. The Diaz government then entered into a conference with the revolutionists and peace was declared 21 May. Madero was elected President 1 October. Temperamentally a dreamer and idealist, Madero found himself checked upon every hand in his attempts to carry his projected reforms into effect. He was unable to manage the politicians of the old régime, or the insurgent element, and in 1912 revolts broke out under Zapata in the south and under Felix Diaz, nephew of ex-President Diaz, in the north. He was charged with being slow and irresolute in his administration of public affairs, of favoring his relatives and of personal peculation from the public treasury. The Diaz revolution was suppressed, and the President Diaz was imprisoned. Madero, however, was of a forbearing disposition and suspended the death sentence pronounced against the revolutionist. An uprising among the soldiers in Mexico City took place 9 Feb. 1913 and released Diaz and another enemy of Madera, General Bernardo Reyes. The Federal troops for a time resisted the revolutionists but on 17 February General Blanquet with a force of 1,200 arrived in the city and joined General Huerta, Maderos cousin-in-chief, in overthrowing the government. Madero was arrested and imprisoned 19 February and plans for his exile were under way when it was decided to bring him to trial. Together with the Vice-President, Pino Suarez, Madero was being conducted from the National Palace to the penitentiary when both were shot. No reports except those of the government were available and the official version was that an intervention in behalf of the prisoners was made by Madero sympathizers, whereupon the president-in-chief was telegraphed to escape and were shot. Huerta was generally held responsible for their deaths and was eventually forced from office because of them although he persistently denied complicity in the affair.

**MADHAVA**, māḍhā-va, another name of the Hindu god Vishnu (q.v.).

**MADIA OIL**, oil expressed without heat from the seeds of *Mada sativa*. It is transparent, yellow, odorless and may be used on the table as a substitute for olive oil, for cake for cattle. The plant is a composite, native to southern South America, but has long been cultivated in Europe for its oil-bearing seeds.

**MADISON, James**, American Protestant Episcopal bishop: b. Rockingham County, Va., 27 Aug. 1749; d. March 6, 1826. He was graduated at William and Mary College in 1772, studied law and was admitted to the bar, but soon after abandoned law for divinity. In 1773 he was chosen professor of mathematics in William and Mary College, and in 1775 went to England and was admitted to orders by the bishop of London. In 1777 he was elected president of the college, and during the American Revolution succeeded in keeping the college in active operation. Having been chosen as bishop of Virginia He was consecrated by the archbishop of Canterbury, in Lambeth Palace, 19 Sept. 1790. He continued to discharge the duties of president of the college and professor of natural and moral philosophy, international law, etc., with those of the bishop. His only publications were several occasional discourses and a "Eulogy on Washington" (1800).

**MADISON, James**, fourth President of the United States: b. Port Conway, Va., 1751; d. Montpelier, Va., 28 June 1836. Madison was the eldest of eight children of James Madison, a planter, and of Nelly Conway, daughter of Francis Conway, of King George County, Va. His father, a man of independent means, lived on an estate now known as Montpelier in Orange County. James was born at Francis Conway's home on the Rappahannock while his mother was on a visit to her parents. His educational advantages were excellent for the times; he attended the school of a Scotchman, Donald Robertson, was an excellent pupil, and was admitted to college by the clergyman of the parish, the Rev. Thomas Martin, and entered Princeton in 1769. His application to his studies was excessive, and was in part the cause of later ill health; he succeeded, however, in taking the studies of the last two years in one year and took his B.A. degree in 1771. He remained at Princeton for another year doing special work in Hebrew under Dr. Witherspoon, the president. After his return home he tutored his younger brothers and began a systematic course of reading in theology, philosophy and law. At this time his study of Hebrew and theology seem to indicate a desire to enter the ministry, but he soon abandoned this and prepared himself for the legal profession and for public service. His theological studies bore good fruit later as is evidenced by the stand he took for religious liberty.

Madison was by instinct a politician and not a soldier; he took no active part in the Revolutionary War, but as early as 1774 he was appointed the inspector of public safety for Orange County, and in 1776 was elected delegate to the convention which framed the constitution of Virginia. From that time
JAMES MADISON

Fourth President of the United States
rightly called the "Father of the Constitution." His arguments in favor of the proposed government were exhaustive and convincing, and his private notes of the work of the Convention and of his debates purchased from his widow and published by Congress form a valuable addition to our knowledge of this stormy period. While the Constitution was before the people for consideration Madison, Hamilton and Jay wrote a series of papers called in collected form *The Federalist,* in which they discussed government in general, defined the character of the proposed union, met objections and proved the advantages to be derived from effective central government. Madison was a member of the Virginia Convention which met to consider the ratification of the Constitution and by his keen analysis and clear-cut argument contributed more than any other man to secure its adoption. His chief opponent was Patrick Henry; his ablest ally, John Marshall. Owing to Henry's antagonism, Madison was defeated as candidate for the Senate, but to retain the States the right of navigation on the Mississippi. Madison saw clearly that a government so organically weak that it could not enforce its requisitions and could pay its debts only by increasing its debt could never be effective; hence he labored unceasingly to enlarge the power of the central government. The office of delegate was limited to one term, so Madison was not returned to Congress in 1784, but the high esteem in which he was held was shown by his immediate election to the State assembly. Virginia was a very influential State and her attitude toward national questions was of great importance. In the assembly Madison tried to indoctrinate the people of Virginia with his ideas concerning the Federal power. His bill to regulate trade in Virginia and to provide ports of entry led first to the conference between Virginia and Maryland with reference to trade on the Potomac and later to the Annapolis Convention which met in 1786 to consider the trade and commerce of the United States. This Convention at Annapolis urged upon the States the appointment of commissioners to meet in convention at Philadelphia "to devise such further government as shall appertain to the Constitution of the Federal Government adequate to the exigencies of the Union." The summoning of the Philadelphia Convention was largely due to the wise bills introduced by Madison in the Virginia assembly and to his direction of public sentiment, and it was eminently fitting that he should be one of the delegates of the Virginia Commission at whose head was George Washington. Madison's views on government are clearly defined in his "outline system" which formed the basis of the Virginia plan proposed to the Convention. His system demanded that there should be a due supremacy of national authority without the exclusion of local authority, that the national authority should extend to the judiciary and to the militia; that the national legislature should be composed of two bodies, the larger elected for a short, the smaller for a longer term; that Congress should have certain coercive powers; that a national executive should be provided and that the basis of representation in Congress should be changed. Madison's plan was rejected. The "Virginia plan" was the germ of the Constitution and Madison is
Madison became Secretary of State. He was thoroughly in sympathy with the President's views and shared the popularity of that brilliant administration. The last years of Jefferson's second term were clouded by the insulting actions of England and France with reference to the American navy. The orders of the British and the decrees of Napoleon concerning the seizure of neutral vessels were ruining American commerce. Vessels were seized by the British and by the French, American seamen were on all sides and ports blockaded. Jefferson was opposed to war in his efforts to coerce France and England by commercial restrictions he induced Congress to lay an embargo on British trade. Instead of injuring England this seriously crippled American commerce and was soon repealed. In this troubled condition of affairs Madison became President in 1809. Like Jefferson he was opposed to war and tried diplomacy. He attempted through Erskine, the British Minister, to have the British Orders in Council withdrawn. Erskine agreed, but the British government repudiated the action of its envoy. Negotiations with another British Minister, James Jackson, were also fruitless. Continued insults were heaped upon American ships and men; the American economy demanded definite action against the aggressors; even the peace-loving President, weary of the offensive attitude of England, at last gave his consent to war. On the 18th of June 1812 war was declared and continued with varying success until the Peace of Ghent in 1814. After nearly three years of fighting, after ruinous loss of money and property, the country was practically just where it stood in 1812, "its boundary unchanged, its international rights still undefined, the people still divided." Madison lacked vigor as a war President, nor had he sufficient determination to secure advantageous terms of peace. He was far greater as a framer of the Constitution than as an executive.

In 1817 Madison retired from office and settled on his estates of Montpellier. He had married in 1796 Mrs. Todd, afterward the celebrated Dolly Madison, and with her he enjoyed 20 peaceful years in his country home. He was interested in farming, he thought and wrote much of public interest. He discussed social and moral questions, slavery and education. "Education," he maintained, "was the true foundation of civil liberty." The last public appearance of the venerable statesman was in the Virginia Convention of 1829 which met to amend the State constitution. In character Madison was thoughtful, reserved and cautious; in a time of hard drinkers he was notably abstemious. Moderation characterized all his habits. He was gifted and kindly and an excellent conversationalist. Among those he knew well, he made and retained warm friends. His knowledge was profound and accurate, and he was considered an authority on all constitutional matters. His literary style was labored, but his arguments were keen, comprehensive and convincing.

Consult Lives of Madison by J. Q. Adams (1850); Rives (1859-68); Gay (1844); also "Letters and Writings of Madison" edited by Henry, 3 vols. (1900-10); "Adams and Henry, "History of the United States from 1801 to 1817" (1889-90). Consult also Hunt, G. "Life of James Madison" (New York 1902);

EMILIE McVEA OF THE UNIVERSITY OF TENNESSEE
Revolution, but was not incorporated until 1889. The principal industry is floriculture, especially the cultivation of roses. Madison is the seat of the Drew Theological Seminary; and Convent Station nearby is the seat of Saint Elizabeth's College. The borough has an excellent public library and a splendid public park, well laid out and kept in good order. It is governed by a mayor and council. The term of office of the mayor is two years. The electric-light plant and the waterworks are owned and operated by the borough. Pop. 4,638.

MADISON, S. Dak., city, county-seat of Lake County, on the Chicago, Milwaukee and Saint Paul Railroad, about 400 miles northwest of Sioux Falls. The surrounding region has good farming land, wheat and corn being the principal crops. Considerable attention is given to stock raising. Madison is an important division point on the Milwaukee system, and has flouring mill and large poultry and egg houses. The trade is chiefly in grain and livestock, but there are also a gasoline engine factory, a large creamery and marble works. Madison is the seat of a normal college and also has a Carnegie library. It also has an excellent system of public schools fashioned largely after the Gary plan yet not so exclusively material in all respects. The electric-light plant and the waterworks are owned and operated by the city. The city is under the commission form of government. Pop. 4,300.

MADISON, Wis., city, capital of the State, county-seat of Dane County, on the Chicago, Milwaukee and Saint Paul, the Illinois Central and the Chicago and North Western railroads, about 80 miles west of Milwaukee and 139 miles northwest of Chicago. It is between Lakes Monona and Mendota and near two other beautiful lakes, Kegonsa and Waubesa; it is 974 feet above the sea and 210 feet above Lake Michigan. The place was named in honor of James Madison. The first house was erected in 1837; and after Wisconsin, in 1836, had been organized as a Territory, this site was chosen for the capital, and work on the Capitol was begun in 1837. The place was chartered as a city in 1856. Madison is situated in an agricultural region, has commercial interests with a number of the larger cities, also with the small towns and villages in Dane and adjoining counties. Its chief manufactures are boots and shoes, agricultural implements and tools, flour, electrical machinery, wagons and carriages, blank books and law books, hospital furniture and fixtures, horse collar pads, dry batteries, cement stave silos, rennet extract, art glass, relief maps and models, boats, candy, cigars, beverages, lantern slides. It is a famous summer resort because of its climate, lakes and scenery. The drives are remarkable — about 30 miles of road in the vicinity are macadamized, kept in repair and beautified by popular subscription. Madison is noted for its educational institutions, chief of which is the University of Wisconsin. Opposite the university is the State Historical Society headquarters, the most beautiful building in the city next to the Capitol. It is Renaissance-Ionic, of Bedford limestone, and the original cost was $1,000,000. It contains a valuable collection of historical mementoes and the famous reference library of the society, about 245,000 volumes. It is considered one of the best historical libraries in the United States. The libraries of the Wisconsin Academy of Sciences, Arts and Letters and of the State University are also in this building. The city free public library is housed in a building of its own, a gift from Andrew Carnegie. Just outside the city limits are the Sacred Heart Academy (a boarding school for girls), a branch of the Battle Creek Sanitarium, the State Fish Hatchery and the State Hospital for the Insane. The public and parish schools maintain a high standard. Some of the other prominent buildings are the new State Capitol, just being completed at a cost of between $6,000,000 and $7,000,000, which is surrounded by a beautiful 14-acre park, a building of Bethel granite, in the Italian-Renaissance style, with the second highest dome in the United States; the county courthouse and jail, a government building, soon to be replaced by a new one, for which Congress has appropriated $550,000; and some 24 churches. It is a favorite educational convention city. The university summer school, held each year, attracts a number of students. The government is vested in a mayor, whose term is two years, and a council. The city owns and operates the waterworks. Pop. about 30,000.

MADISON BARRACKS, N. Y., United States military post in Jefferson County, on Black River Bay, near Sackett's Harbor, and 70 miles from Lake Ontario, about 108 acres and possesses in addition a rifle range of 868 acres at Stony Point. It was established in 1813.

MADISON RIVER, a stream in Montana which has its rise in the Rocky Mountains, at an elevation of 8,300 feet. It flows north through Madison County and unites with the Jefferson Fork of the Missouri, at Three Forks. It flows through several picturesquely valleys and deep canyons; its whole course is about 230 miles.

MADISON SQUARE GARDEN, a large building in New York City, occupying a block or square between Madison avenue and 4th avenue, and 25th and 26th streets. It contains an amphitheatre seating 20,000 people, and is popular for horse shows, dog shows, and political and public meetings. The building also contains a concert hall, restaurant and roof-garden. It is built of buff brick and terra-cotta and is surmounted by a great tower 300 feet in height, modeled after the Giralda at Seville. It is one of the largest buildings in the city devoted to amusement.

MADISONVILLE, Ky., city, county-seat of Hopkins County, on the Louisville and Nashville and the Kentucky Midland railroads, about 125 miles southwest of Louisville. It is in a rich agricultural region, tobacco being one of the principal productions. Coal and natural gas are in the near vicinity. Manufacturing establishments are a tobacco factory, tobacco stemmeries, lumber and planing mills and flour mills. A coal mine nearby and the natural gas contribute to the prosperity of the city. The city owns the electric-light plant, the waterworks and the sewage system. Pop. 4,956.

MADISONVILLE, Ohio, former village in Hamilton County, now absorbed by Cincinnati, and forming a residential suburb of that city.
MADLER, ma’dler, Johann Heinrich, German astronomer: b. Berlin, 29 May 1794; d. Hanover, 14 March 1874. He was educated at the University of Berlin. He became a professor at the University of Göttingen, and was associated with William Beer in an extended series of lunar observations. He was professor at the Observatory of Berlin in 1836–40, and from 1840–55 he was professor and director of the observatory at Odessa, Russia. The superb equipment of the observatory enabled him to make observations with an accuracy never before attained and he now devoted himself principally to the fixed stars. He published a map of the moon in four sheets which surpassed anything then published, and which still retains a high reputation, in 1834–36. Author of 'Populäre Astronomie' (1841); 'Die Centralsonne' (1846); 'Die Eigenbewegungen der Fixsterne' (1854); 'Allgemeine Selengraphie' (1857); 'Geschichte der Himmelskunde' (2 vols., 1872–73). etc.

MADNESS. See INSANITY.

MADOC, ma’dák, Welsh prince, who, in consequence of some civil dissensions, went to sea with 10 ships, and 300 men, in 1170, and discovered America. He made a second voyage to and from this unknown land, but finally was lost to the knowledge of his countrymen. The story is to be found in Lloyd and Powell's 'Cambría' (1584), and Hakluyt gives an account of the voyages in his collection. In Owen's 'British Remains' the legend is referred to. Later travelers have imagined that they had discovered traces of these early immigrants in different parts of the country, and we have had stories of white Indians and Welsh Indians, etc. (Consult Humboldt's 'Personal Narrative,' Book IX, note A). Southey made Madoc the subject of an epic poem. Stephens, in 'Madoc, an Essay on the Discovery of America in the 12th Century' (1893), asserts that the story of Madoc is a baseless fable.

MADONNA IN ART, The. In the early days of Christianity the teaching of the Church was largely carried on by the medium of pictures. There was no literature. The translation of the Bible was in Latin and examples of the book were produced in parchment manuscripts emanating from the monastery scriptoria. They were very few and therefore costly. Hence it is not surprising that the clergy utilized the graphic abilities of their more talented members and other available artistic sources to portray biblical scenes in mosaics and wall paintings to impress on the minds of the populace (practically all illiterates) the teachings of their creed. The subjects to be treated were largely selected by the patrons (the clergy), and those subjects naturally were the ones most likely to appeal to the masses. The relation of Mother and Child viewed from the aspect of Divine Inspiration could not but be foremost of the subjects selected as most certain to gain popular attention and to reach the innermost sentiments of humanity. And, from the limner's standpoint, no theme could better enhance and inspire genius to perfection of execution and the bringing forth of ecstatic pictorial expression. Again, admiration of a master's presentation of the subject obviously was cause of emulation of contemporaries and future artists to produce, if possible, more inspired conceptions of the subject. A natural sequence of these accumulated impulses was the prolific production and reproducing faculty of the Madonna in as many aspects and forms as the differences in genius itself. Hence the innumerable examples of the lovely theme which have present existence. No single subject has been treated so prolifically and from so many viewpoints as this divine Madonna. In order to bring within a limited space some intelligible review of such a vast and profound subject the examples are usually divided into different classifications according to the method of treatment of the theme, the different episodes of the entrancing story, etc. Thus we get the Madonna enthroned, the Madonna in Gloria, and the Annunciation, the "Nativity," the "Adoration of the Magi," Flight into Egypt, etc. The earliest depiction of the Madonna is a subject of controversy. Legend tells us Saint Luke, Evangelist, painted pictures of the Holy Virgin, and there are several extant drawings which are claimed to be from his pencil. The Virgin as orans, usually termed the "Intercessor," with arms outstretched in prayer and supplication, is most generally accepted as the first method of treatment as found in mosaics and on glasses of the 4th or early 5th century, some with the name Maria inscribed. An early Assyrian manuscript of the 5th century in the chapel of Venantius has such an orans depiction. On ancient Christian sarcophagi the representation of the Holy Virgin is very rare, but in the mosaics of Santa Maria Maggiore (middle of the 5th century) we have the Virgin and Child in medallions on the triumphal arch, and on the spandrels of the arch are the Annunciation, Presentation in the Temple, Adoration of the Magi, Journey of Christ with Mary and Joseph to Jerusalem. Of about the same date is a painting seen in Saint Agnes catacomb, in which the Virgin seated stretches forth her hands in prayer. By 736 the Iconoclasts created much destruction of all kinds of biblical depiction from Byzantine artists, but by 787 comes the revival and the Virgin again in the pictures. In the early representations of the Virgin appears a golden background representing glory and majesty; this gives way later to backgrounds of the angelic host. With the advance in development of the Madonna theme Cimabue (13th century) produced the "enthroned" Madonna, and this great early Florentine master was soon followed with Guido's Siena picture of the subject. And with the arrival of these talented masters the Byzantine stiffness and prescribed rigid renderings of the Greek Church forbidding natural depiction disappears and the human form and garb take on the suppleness of flesh and clothing. It is the beginning of free and highly-developed art, and as such is usually the phase chosen as the first classification with which to deal with detailed descriptions of the theme of the Madonna in Art.

The Madonna Enthroned.—In its early conception the subject depicts the "Queen of Heaven" (Regina Coeli), seated in the sky, surrounded by the saints and angels. An early example is Simone's picture in the Siena Council Hall; the Virgin in Campo Santo, Pisa, is another. As Queen of Heaven, having homage
paid her, she is crowned first then veiled. In this conception of the subject the throne is supposed to be a heavenly throne and symbolic of dignity and divinity. Mary is usually dressed as if to 15th century glory, except for a blue mantle signifying Heaven. The Child is vested in a tunic till the 15th century, but then generally appears undraped. The Babe generally holds up a hand in blessing, but in the 15th century mosaic of the enthroned Madonna in the Basilica of San Apollinare Nuovo, Ravenna, Mary raises her hand in blessing. The first human figures we see around the throne are the saints, especially John Baptist, the Apostles and the patrons of the particular church to which the work of art is dedicated. Saint John is represented as a child generally bearing a reed cross; at times, as messenger, he has wings. Later patriarchs, prophets, sibyls are in attendance about the throne. Well-known examples are very many and but few can be mentioned. That of Fra Bartolommeo (Baccio della Porta, 1469–1570) is in the Pitti Gallery, Florence; Andrea del Sarto’s Madonna di San Francesco in the Uffizi Gallery there stands on a pedestal throne with harpies at its corners and inlaid marble architectural throne. Pinturicchio’s Madonna in the chapel of San Andrea, Perugia, has the child Saint John standing at the throne’s foot. Raphael’s Ansidei Madonna (London National Gallery) is reading a book while Saint Nicholas and Saint John Baptist are in attendance on the two sides. The English government paid £72,000 in 1885 for this wonderful painting. Other enthroned Madonnas of Raphael are the Madonna of Saint Anthony (owned privately) and the Baldacchino Madonna (Pitti Gallery, Florence). Among the early exponents of the enthroned depiction were Vivarini, Bellini and Cima; Giroldo da Libri’s altar-piece in San Giorgio Maggiore, Verona, is noteworthy, and Venice is perhaps richest in Madonna creations. Late in the 16th century Botticelli Annunciation Titian, Tintoretto and Veronese. Of the early type Cima’s picture in the Venice Academy takes about first position; the Madonna is seated on a marble throne having a pillared portico. Palma’s beautiful altarpiece of Vicenza is noteworthy among enthroned Madonnas. Bellini excelled in this style and the examples deserve their renown. Ruskin calls his painting in the Venice Academy “One of the greatest pictures ever painted in Christendom in her central art power.” The Virgin is accompanied by three saints on each side and three choristers below. His Frari Madonna (Venice) has three compartments, the Virgin occupying the central one. His San Zaccaria Madonna, in spite of its fine execution and beauty of conception and grouping, was greatly neglected till the last 30 years. Next we come (late in the 15th century) to Giorgione (who lived only 34 years) who has two Madonnas, one in the Madrid Gallery, the other in Castel Franco. In the latter the Pope and Virgin occupy the upper step being above the heads of the accompanying Saints Liberale and Francis. This shows great depth and refinement of feeling in the drooping head and dreaming eyes. While the queenly aspect of these Italian pictures is never displayed with a crown as is frequent on the mosaics dating from the 9th to the 11th century, except in Giovanni da Murano and Carlo Crivelli (Venetian school), the Holy Virgin in German art is frequently crowned when enthroned, as in Holbein’s Madonna at Darmstadt, that by Van Eyck at Frankfort and that by Memling at Bruges, and Schongauer’s at Munich. In the enthroned Madonna of Quintin Matsys in the Berlin Gallery the Virgin is kissing the Child and the northern tendency is vividly displayed in the accessory of the stand containing food. Of modern artists whose enthroned Madonnas creations are worth of mention should be cited Bouguereau, Ittenbach, etc.

The Annunciation.—The angel’s announcement to the Spiritual Bride is a subject as prolifically depicted in Christian art as another of other. It was a theme displayed everywhere, in every village, street, church or dwelling, in painting or carving. Early we find it in the mosaics, as on the arch of the Santa Maria Maggiore. The attitudes of the Virgin differ in periods or in accordance with the conception of the artists. In some the angel stands before the young virgin who kneels in pious submission, or the angel kneels in some; or again, as in Giotto’s work, in Padua, both kneel. Later artists picture Our Lady in the Annunciation often as a crowned queen, bowed, but in modern work the Virgin and surroundings are treated with simplicity and mystic symbolism is given to the subject. While it is usual that but one announcing angel appears on the scene, Andrea del Sarto, Tintoretto, Francesca and Fra Bartolommeo give an angelic choir. Usually the Holy Dove is seen flying toward Mary from the Father. Pisanello’s Annunciation in Verona pictures the most beautiful innocence in girlish beauty. Beautiful purity is expressed in the works of Fra Angelico; that in the Oratorio del Gesù, at Cortona, accompanied by the colonade and scene of Eve’s expulsion as accessories, is extremely impressive. In the Uffizi Gallery is a rich Annunciation of Ghirlandaio representing the deepest obeisance at Mary’s feet while the Holy Maid stretches out her hands in surprise humility. Other well-known Annunciations are by Simone Martin in the Uffizi, Fra Filippo Lippi, Carlo Crivelli (National Gallery, London), where the scene is produced in a surrounding of magnificent architectural decoration, while Perugino (in Montefalco picture) shows utter simplicity. Paolo Veronese depicts fear as the Virgin shrinks back at the message. Northern creations reveal their source by bringing in such accessories as a spinning wheel, couches, etc. Jan van Eyck places the Holy Virgin by an altar in an alcove with an open book to rest her arm on, her face averted toward the heavenly messenger, who is in a cope and carries with him the richly embroidered coat of the life of the Virgin depicts in the Annunciation Mary as a German Hausfrau, surrounded by many architectural accessories. In the National Gallery, London, we find Rosetti’s work adrift in modern depiction, and Burne-Jones gives the scene in a finely constructed painting.

The Nativity.—In the works of the masters
on this subject we find Mary beside her Son’s cradle in the act of adoration. Even the early pictures show angels attendant but the veil found in earlier depiction is discarded later. The scene is cast in a cave or cleft in a rock generally transformed into a stable, but there are variations to suit the conceptions of the artists. In Santa Maria, Trastevere is a mosaic displaying Mary reposing on a couch in the cleft of a rock. Giotto’s school makes the scene a stable of wooden construction; some place the theme in the open with perhaps a ruin or fragment of some structure as accessory. The swaddled Babe of the Italian school is, of course, the bambino of that country. Orcagna (church of Assisi) places Mary sitting beside the cradle arranging the covering, while Giotto has the Child before her while she is seated on the ground. Perugino’s Nativities (in Perugia and Rome) display Mary and Joseph kneeling in adoration of the Babe with angels present. Well known is the Nativity in the London National Gallery by Raphael. The Madonna (unfinished) in which the Child is lying on the ground with the mother kneeling beside while angels are playing on lutes and singing. That depiction by Luca Signorelli in the same place also shows the Infant on the ground, Mary kneeling beside Him. In the same gallery we have Botticelli’s depiction of the scene enacted in a shed, and Carlo Crivelli uses the same surroundings. In Luini’s picture an angel holds the Child while Mary kneels with folded arms, her face one of the most beautiful of any of the Madonnas. In most of the above and in others the shepherds are portrayed in more or less proximity. In some cases the painting is properly called Adoration of the Shepherds on account of their close presence to the Virgin and Child, but later works generally place them in the foreground of the scene frequently (with Rembrandt, Correggio, etc.) emanates from the glowing rays passing from the Holy Babe.

Adoration of the Magi.—This was a favorite subject with the Catacomb dwellers and we find over and over again the original of the scene in these subterranean galleries. Mary is seated on a throne and the Magi in their tunics and Phrygian caps bring gifts of dishes and baskets. Their number runs from three to six. The early method of treatment makes the Babe rest in the mother’s arms, but in the Santa Maria Maggiore (Rome) mosaic the Child is seated on a pedestal with hand upraised in benediction. Usually we find Him in His mother’s lap. The emanating glory of the Babe frequently is the source of light and the benediction act is repeated by the Magi. An Adoration of the Magi mosaic (about 6th century) is in the chapel of San Apollinare Nuovo at Ravenna, in which the Magi lead a procession of female martyrs bringing their crowns as votive offerings to the Madonna. Giotto’s painting in Padua places the scene in a stable with a true Nativity (National Gallery, London) chooses the entrance of a cave as the scene of the King’s devotions. In Filippo Lippi’s ‘Adoration of the Kings’ in the Uffizi, Florence, Mary is located in a wide landscape in which figure a host of persons surrounding her. Other noted Adorations are by Baldassare Peruzzi (London National Gallery), Pinturicchio, Mehling (Bruges), Rogier van Weyden (Munich), Rembrandt; Rubens; painted in 15 of which one is in Madrid, another in the possession of the Duke of Westminster.

Flight into Egypt.—In pictures brought under this title Mary is sometimes seen seated on an ass with Joseph and the ox which tradition says accompanied them rarely appears in the paintings. Sometimes an angel leads the ass. Well-known depictions of this scene are by Giotto (Padua), Fra Angelico (Florence), Pinturicchio, Memling (Munich).

Riposo.—This phase of the Madonna series is more popular with artists of the past than the ‘Flight’. It depicts the Holy Family after the tedious journey through the desert resting in a fertile country surrounded by fruit trees, Mary bathing the Child. It was greatly favored by German and Flemish masters (Albrecht Altdorfer’s in Berlin, Lucas Cranach, Martin Schongauer’s in Vienna, etc.).

Pastoral Madonnas.—From the 15th century a new style of treatment of the Madonna theme arrives. It is the placing of the Virgin in a landscape surrounding. There are but few, such as Raphael’s earliest Madonnas. Three most noted are La Belle Jardinière (Beautiful Gardener) in the Louvre; Madonna in the Meadow (Madonna in Grünen) in Belvedere Gallery, Vienna; and the Cardellino Madonna (Madonna of the Goldfinch) in the Uffizi, Florence. All three among the most prized paintings in the world and too popularly multiplied to need description. Raphael’s later work, the Casa di Madonna, is less well known with its turbanned Roman patrician depiction of the Virgin. Leonardo da Vinci’s Madonna of the Rocks gives the Holy Virgin, in the foreground of a grotto, grouped with the Child and the infant John. Luini painted a pastoral Madonna (in the Brera, Milan), but very noted is Correggio’s ‘La Zingarella’ (Gipsy) or ‘Madonna del Corniglio’ (Naples) which is posed in a lovely landscape as is also his kneeling Madonna in the Uffizi, both of which always call forth admiration. Palmieri’s Conversazioni in Naples, Dresden, Munich and Vienna are public favorites. In the pastoral class of Madonnas must be included the three “enclosed garden” examples by Francia (Munich), Filippino Lippi (Florence) and Schongauer, in which the Virgin and Child are surrounded by a hedge of roses with a landscape in the rear perspective.

Domestic Groups.—This method of depiction of the biblical scene was vogue among painters of the middle 15th century. They consisted of the Holy Virgin and Child associated with Saint Joseph, Saint Elisabeth and her son, and frequently other attendants. A number depict Saint John Baptist child playing with the Holy Infant; Saint Ann, mother of the Holy Virgin, appears in some; da Vinci even depicts (in a cartoon) a lady seated on Saint Ann’s knees Girolamo dai Libri (London National Gallery) painted such a group, and Perugino has a work in which Saint Ann rests her hand on the Virgin’s shoulders while boys and women relatives are grouped about. Very popular are the groups that include the infant Saint John playing with the Child (as Raphael’s in National
Gallery, London). Both Botticelli and da Vinci created pictures of Saint John adoring the Infant. In the same inspiration is Luini’s ‘Madonna dell’Agonello’ at Lugano. Another popular group subject adopted in pictures by Titian, Perugino, Correggio, Parmigianino, Memling, etc. is the ‘Marriage of Saint Catherine,’ in which the Child is placing a ring on the finger of the saint. Good modern representations of such groups are by P. A. J. Dagmar-Nielsen, Salome (Munich), in which the holy mother, depicted as a peasant, is seated on a bench in the carpenter’s shop and the Child at her breast, under her mantle, illuminates and pierces with rays of glory the coarse texture. But, though numerous, both French and German modern paintings of the Madonna lack the devotion or even inspirational features which give such glory and beauty of conception to the early Italian masters and those of the Renaissance.

*Madonna in Domestic Surroundings.*—These include the ‘Holy Family’ series. The worldly environment in depiction of this mystic religious subject has found few exponents, and those confined largely to northern artists. To the German and Dutch the maternal dignity of the Hausfrau appeals so strongly as to call for their limpid interpretations of Madonnas in everyday household surroundings. Of such we have pictures by Quintin Matsys (Munich) with its Flemish sleeping apartment, having the Virgin and Child as occupants; the 15th century German artist Solimengr (Butterseefriede Gallery, Vienna) gives Joseph feeding the cattle from hay in his arms looking with fondness in the doorway at the Virgin holding a bunch of grapes while the Child nestles in her lap. But in Italy, Giulio Romano in his Madonna del Calice (Paris) portrays the Divine Babe in a basin (caïma), ready for the bath, while the infant Saint John pours water from a ewer. The Madonna dell’Impanata (of the papered window), formerly considered as Raphael’s and later ascribed to Romano, pictures Elisabeth Mary with Child and Saint John beautifully grouped with the Virgin and Child. The picture of the French artist Mignard (Louvre) called ‘La Vierge à la Grappe’ is well known. Salembini’s Holy Family (Pitti Palace) depicts the symbols of the Child Jesus and Saint John with puppies. Rembrandt’s two ‘Ménage du Menuisier’ (carpenter’s home), in the Louvre and Petrograd, picture a combined living and workroom with Joseph at his bench and Mother and Child as central subjects; his painting in the Munich Gallery also brings Saint Joseph as carpenter into the scene.

*Madonna in Art.*—The Madonna of Love. Some consider this the most popular type of the Madonna in Art. The depiction of a mother’s love is one of the most recurring themes of the artist for all humanity. Raphael’s sublime depictions, of course, lead in this type with his Madonna Tempi (Munich), in which the Virgin Mother presses her lips to the Child’s cheek. His Conestabile (Petrograd) and Ambrosio Madonna and Babe peering in companionship into the Book of Wisdom belong here, also the Holy Family of Francis I, in which she stoops to lift the Child from the cradle and the Madonna della Sedia (chair of the Madonna) in the Pitti Gallery, Florence, embracing the Infant. Correggio’s painting in the Uffizi really belongs to this series with the Virgin stooping over the Babe, and his Madonna del Cesta (of the basket) in the London National Gallery, named after the basket (cesta) lying on the floor; and his Madonna del Latte (Petrograd), also his Madonna della Scala (of the Staircase) in Parma are surely of this category. Titian sometimes created such a Mother of Love as, for example, the Madonna in the Louvre (Louvre) in which she is calming a rabbit for her Child to play with, also the Madonna with Saints Ulfo and Brigida (Madrid) in which the Child is accepting a gift of flowers from the latter saint, and another in the Uffizi Gallery. Of pictures portraying the Holy Mother suckling her Babe there are a number, best known perhaps being the Madonna of the Green Cushion (Louvre) by Andrea Solario. And the Mother watching the sleeping Babe is another phase of the theme treated by masters of art, such as Raphael’s Madonna della Scala (Louvre), others by Guido Reni (Rome), Sassoferrato, Carlo Dolce, etc. And among northern artists the Mater Amabilis has been pictured by Dürer, Holbein (Meyer-Madonna), Rembrandt, Rubens, van Eyck, Schongauer. Among modern artists, which have treated fine pictures of this theme are Gabriel Max, Bouguereau, Carl Müller, N. Barabino, Dagnan-Bouveret, Guay, Macomber, Bodenhausen.

*Madonna in Gloria.*—The Madonna in the Sky. These usually venerate below and the Madonna in the upper sky. In the Madonna dell Stella by Fra Angelico, in San Marco, Venice, a star is located over the head posed on the veil, the figure is full length surrounded by a mandorla of golden rays. The Madonna of Saint Sebastian (Dresden) has a surrounding of cherubs and clouds with saints below. Moretto (Brescian school) treated the theme traditionally, but very lovely is his Madonna of San Giorgio Maggiore, Verona, which shows very naturalistic effects in atmosphere above and depicts Saints Cecilia, Lucia, Agnes and Barbara beneath; another of his is in the Berlin Gallery, a mandorla encompassing Mother and Child. Three paintings on this subject are in Venice by Gianfrancesco Caroto, also one by Cavaol (Morando); these are all of the Brescian school. Tintoretto and Titian produced creations of this theme. Raphael gave us the Foligno Madonna (Vatican), which is greatly admired, but his Sistine Madonna (Dresden) brings us to the apex of highest inspiration with its majestic full-length figure in perfect poise and the charm of the cherubs surpasses all found in other depictions. Later came the selection of the crescent moon on which artists posed the Madonna in Glory; the exponents of this style are Albrecht Dürer, Sassoferrato (Vatican), Tiepolo, Tintoretto (Berlin). Modern painters of the theme are Bouguereau, Bodenhausen, Defregger, etc.

*Pietà.*—This is probably the most popular and touching conception of the Madonna in Art. Every Roman Catholic church has one. It is the representation of the Virgin laying the complete sacrifice. France’s beautiful conception of the theme is shown in his painting in the London National Gallery, in which the outstretched limp body of the Crucified
One lies across the lap of the Holy Virgin while an angel on either side attends, Luni portrays the Head, crowned with thorns, falling back on the Mother's brow while she supports Him. The same scene with Saint John and Mary Magdalen attending is often termed a Pietà but currently the groups should consist of Mother and the lifeless Savior, perhaps with angel or angels attending, Giovanni Bellini's painting in the Ducal Palace, Venice, shows the Crucified One being raised from the tomb by Mary. His head resting on her face, Saint John holds up His arm; another by this master is in the Uffizi Gallery. Crivelli painted two very pathetic Pictas, one of which is in the Vatican. In the Pitti Palace is a Pietà by Fra Bartolommeo of most touching aspect. But Michelangelos great group in the Vatican is said by many to be unsurpassed in its sublimity.

Mater Dolorosa.—The Divine Mother in anguish. This theme has called forth from the great painters facial expression of excruciating horror in the most touching and pathetic depiction ever accomplished. The true pathos of sorrow displayed by the Spanish school is very prominent, Murillo's depictions excelling in their pictured anguish and tears. Tradition poses the hands clasped, the veil casting a shadow on the Virgin's head, the face, with its welling tears, glowing upward. At times the Madonna is placed at the foot of the Cross. For the most part the face is of middle age, except as with Michelangelo, who depicts youth and to a critic declared spurious enjoys eternal youth; Reni and later artists frequently depict a young maiden. Many of the paintings of the Mater Dolorosa type are but the head, others half-length figures. A beautiful example of Quintin Matsys is in the London National Gallery. Many of the creations are disfigured by the unnecessary words depicted as piercing the Virgin's bosom, referring, of course, to Simeon's prophesy. They are supposed to emphasize the pathetic subject—Van Dyck uses the weapons.

Other phases of the Madonna theme pictured by masters are many but space forbids further description. Of such are the subjects known in the art world under the titles: "Purification," "Presentation to the Temple," "Assumption," "Last Judgment," "Seven Joys and Seven Sorrows of the Virgin," etc.

MADOQUA, mādō-kwā, a diminutive antelope (Cephalopholus abyssinicus), one of the duiker-hocks (q.v.), common in Abyssinia. The fore-parts are Rufous, but gray is the prevailing hue. The same name is sometimes applied to other very small northern African antelopes, as the Beni Israel.

MADRAS, British India, the capital of the presidency of Madras, on the Coromandel coast, lies on an open, sandy shore, exposed to the swell of the Bay of Bengal, which breaks upon the beach with great violence. It is 335 miles southwest of Calcutta. A modern harbor formed by two piers obviates the former dangerous passage through the surf. The city is built on level ground and with its nine suburbs occupies 27 square miles. The chief commercial portion is Black Town, about a mile square, closely and irregularly built, containing the native and East Indian (or mixed) population, with a few European merchants and their families. On the south is the ancient Portuguese settlement Saint Thomé founded in 1504, with a Roman Catholic cathedral. One of the chief objects of interest is Fort Saint George, which commands the Black Town and the network of roads, and may be considered the nucleus of the city. It was built in 1639, and is admirably situated for the defense of the town and shipping. It contains 155 barracks, and an arsenal. The government-house, the cathedral of Saint George and some of the other churches and public buildings, are handsome structures. Besides the university, the Presidential College and a medical college, supported by government, there are large missionary institutions. The public park, containing a small zoological collection, is the chief recreation ground of the city. From the meridian of the observatory connected with the university all India takes its time. Madras is the chief seat of the provincial government offices, of the Supreme Court, a board of revenue, marine board, etc. Notwithstanding the disadvantages of its position it is a place of great trade, and a new harbor has greatly tended to increase traffic. The landing and shipping of goods is effected partly by lighters to the pier-head inside the harbor, and partly by the old massula or surfboats, which land their cargoes on the beach. The imports are chiefly manufactured goods from the United Kingdom, especially cottons, wines, spirits, metals, stationery, etc. Among the principal exports are cotton, grain, indigo, coffee, tea, hides, oil-seeds, dye-stuffs, pepper, etc. The chief industries are connected with the preparation of goods for export, such as coffee pressing and cotton cleaning. Cotton-spinning factories have been established at Madras. The country at a short distance from the city presents a remarkable contrast to its barren sandy shore, having the appearance of a fine park. The mean annual temperature is 82°, which rises in the hot weather to 96° in the shade. The city has railway communication with all the principal places of India, has good water supply and sewerage systems, is lighted by electricity and gas and is administered by a body of 32 commissioners.

Madras was founded in 1639 by the English, who obtained the grant of a piece of ground for the erection of a town and fort (Fort Saint George) from the Raja of Chettinaderry. It soon became a flourishing city and the chief station of the English on the Coromandel coast. In 1746 it was taken by the French, who kept it until 1749, when peace was made and the place was restored to the English by the Treaty of
Aix-la-Chapelle. In 1758 it was again besieged by the French under the celebrated Lally, who was obliged to retreat after a siege of two months. Pop. about 518,660, of whom 79 per cent are Hindoos, 11 per cent Mohammedans and 8 per cent Christians.

MADRAS, ma-drä's, British India, a presidency occupying the southern portion of the Indian Peninsula. It stretches from the Bay of Bengal to the Arabian Sea, almost enclosing Travancore and Mysore, while a long, narrow portion extends along the west side of the Bay of Bengal till it meets the Bengal province about 70 miles from the mouth of the Mahanadi. It has a total area, excluding native states, of 141,075 square miles, the area of the native states being 10,087 square miles. Jaipur and Haidarabad bound it on the northwest, while the west borders for a short distance with Bombay. The chief mountain ranges are the Western Ghâts, the Eastern Ghâts and the Nilgiri Mountains. The principal rivers are the Godâveri and Kista, with their tributaries; and the North Penner, South Penner, Palar, Kaveri, Coleroon and Vaiga. There are no large rivers of importance, but many salt lagoons or inlets of the sea. Extensive forests yield teak, ebony and other valuable timber trees. The wild animals are those common to other parts of India, the elephant, tiger, cheetah, bear, bison, elk, spotted deer, antelope, jackal, wild hog, jungle sheep, etc. The climate generally is reckoned the hottest in India, but differs wildly in different localities according to elevation. Of the population, 68 per cent is engaged in agriculture, and 36 per cent of the cultivated area is under food crops. The soil along the coasts, particularly that of the Carnatic, is for the most part light and sandy; inland it consists of a decomposed syenite impregnated with salt, which in dry weather covers the ground with a saline efflorescence. The district of Tanjore on the banks of the Coleroon is esteemed the granary of southern India. The principal vegetable productions are rice, wheat, barley, maize and all the other grains common in India; sugarcane, areca, yam, plantain, jack-fruit, mango, melons, coconuts and a variety of other fruits; ginger, turmeric, pepper, tobacco, hemp and cotton, for the growth of which the soil seems to be particularly well adapted. Tea is grown to some extent. Weaving is the only indigenous art of any consequence, and cotton cloth, muslins, carpets and silks are manufactured to a limited extent. The grand total of seaborne trade for 1913-14 was rupees 581,593,000. Of external trade 63 per cent is with the British Empire, and 42 per cent with the United Kingdom. The government of the presidency is vested in a governor subordinate to the governor-general of India. The revenue usually exceeds the expenditure, but the apparently healthy condition of the finances is largely illusory, as the presidency has been encroaching on windfalls in the shape of grants from the Indian government. At the head of the educational institutions is the Madras University, an examining body, granting degrees in arts, law, medicine and engineering. About 600 students annually graduate in arts. There are various schools and colleges affiliated to the university.

The province is divided into 22 districts with a population of about 41,402,000. The native feudatory states of Travancore, Cochin, Banaganapalle, Puddakotai and Sandur, had a total population of about 4,813,000. The languages are Tamil, Telugu (which are spoken by the great majority of the inhabitants, Cantonese and Malayalam, with some lesser dialects spoken by the more barbaric tribes on the mountains; Marathi and Gujerathi prevail in the northern and northwestern parts of the presidency; Urdu in the northeast; while Hindustani is the language spoken everywhere by the Mohammedans. Capital, Madras (q.v.). See also INDIAN.

MADRAS HOUSE, The, is not only an admirable example of the work of Granville Barker as a dramatist but also of the modern type of play written by, and for, those who conceive of the theatre as a place where it is permissible, even enjoyable, to think as well as to feel. It does not deal in the the effect on the illing situations, violent emotions or cunningly devised mystery but depicts the dramatic interplay of character and circumstance under normal conditions with a skill, insight and humor which afford even more pleasure, perhaps, to the reader than to the spectator. But it deals with all the wide variety of human relations involved in the play, none are dealt with, so to speak, in actual crisis and there is a resulting lack of dramatic tension, but the author succeeds, nevertheless, in making one acutely conscious of the intensity and force of the emotions that underlie the surface not only of the play but of life. The two main themes are business and sex. The particular aspect of business which is presented is one that is unfamiliar in America, namely, the "living-in" system, inherited from the days of guilds and apprentices in England, under which clerks and other employees receive board and lodging as part of their wages. It is obvious that in a large "drapery establishment" employing both men and women, like the Madras House, such an arrangement would be likely to give rise to social complications. The business theme, therefore, although open to the reproach of being local in its application, may boast the charm of novelty for Americans. The sex interest, on the contrary, is of the familiar, universal, all-pervading variety. It inter-penetrates the life of the conventional suburban family, into which we are introduced in the first act; it comes frankly to the fore in the second, in the case of Mr. Brigstock, "third man in the hosiery, and one of the lady shop assistants; it pulls the strings during the sale of Madras House to an American millionaire in the third act; it looms largest of all in the last act, in which that unconscionable old lady-killer, Constantine Madras, finally renounces his family and the trammels of conventional morality and turns Mohammedan. In this, as in his other plays, Barker, following Bernard Shaw's lead, omits the customary list of dramatis persona and introduces his characters in a sort of literary preface to each act which is no less interesting and illuminating than the dialogue. "The Madras House" was first published in 1914 and was first produced at the Duke of York's Theatre in London on 9 March of the same year under the direction of the author.
MADR AZO, máˈdrə-thō, Raimundo de, Spanish painter: b. Rome, Italy, 24 July 1841. He studied art under his father, Federigo de Madrazo, and Léon Cogniet in Paris. He has been very successful in portrait and genre and numbered many prominent Americans among his sitters. He is equally happy in pastel and oil, and his "Fête during the Carnival" in Mrs. W. K. Vanderbilt's collection is as brilliant in conception as in technique. Among his most celebrated portraits are those of the Queen Regent of Spain; the Countess Pillet-Will; Mrs. Cornelius Vanderbilt; Mrs. Whitney; Miss Anne Morgan; Madame Madrazo; Samuel P. Avery. 'The End of a Masked Ball' was awarded a first class medal at Paris in 1878 and was subsequently purchased by W. K. Vanderbilt. Other genre works all of a high order are 'Fête during the Carnival'; 'Girls at a Window' (both in Metropolitan Museum, New York); 'Lady with a Parrot' (purchased by W. A. Clark, New York); 'Lady with Guitar'; 'Déjeuner de l'Infanta'; 'Pierrette.' Madrazo was made commander of the Legion of Honor. His brother, Ricardo (b. 1828), was also a pupil of his father and achieved some success as a portrait and genre painter.

MADR AZO Y KUNT, Federigo de, Spanish painter: b. Rome, 12 Feb. 1815; d. Madrid, 11 June 1894. His father, José de Madrazo y Agudo (1781–1859), was a painter of note and from him Federigo received his early instruction. Subsequently he studied under Winterhalter at Paris. His early works are 'The Resurrection of Christ' (1829); 'Achilles in his Tent'; 'The Continence of Scipio' and portraits of Baron Taylor and Ingres; 'Godfrey Proclaimed King of Jerusalem' (1837). Thereafter he went to Rome and while there painted 'Maria Christina' (1843); 'Queen Isabella'; 'The Duchess of Medina-Celi'; 'Countess de Vilches' (1847), and several portraits. In 1873 he was elected foreign member of the Paris Academy of Fine Arts. After his father's death he became director of the Prado Gallery and director of the Academy of San Fernando. He founded El Artista, the pioneer of Spanish art journals; it was followed by El Renacimiento and El Semanario pintoresco. Of his later works the best known are the genre pieces, 'The New Song'; 'The Cigarette'; 'The Musical Matinee,' etc. His brother, Louis de Madrazo, was also a painter. His best work is 'The Burial of Saint Cecilia' (1855).

MADRE DE DIOS, māˈdrel deˈdsōs, or AMARU-MAYU, Bolivia, a river, the chief affluent of the Beni, rising in the Carabaya Mountains, Peru, about 50 miles east of Cuco, and after an easterly course, south by north, of 900 miles, chiefly through the Bolivian department of La Paz, uniting with the Beni at Rivera Alta, where it is 1,500 yards wide. It was explored in 1865 under the auspices of the London Geographical Society, and since 1881 has been the highway for the exploitation of the rubber forests along its course.

MADREPORE, a genus of coral-forming polyps (see CORAL AND CORAL ISLANDS) containing numerous species from the warmer and tropical parts of the world. At true Madre pores increase by budding, the result being usually large branching colonies in which the coral between the cups containing the polyps is perforate and spiny. The different species frequently attain large dimensions and constitute one of the most important elements in the formation of coral reefs. The polyps have 12 septa and 12 tentacles, 6 being everted. As a peculiar feature is the presence of 6 U-shaped tubes connected with the esophagus at either end. The term Madrepora is sometimes used to include all polyps in which the parts are arranged in multiples of six, and which secrete coral on the external surface of the body.

MADRID, máˈdrɛd (Sp. máˈdrɛd), Spain, the capital of the kingdom and of the province of Madrid, a part of New Castile, situated near the centre of the country, on the left bank of the Manzanares, a sub-affluent of the Tagus. It is built on several low and irregular sandhills on a plateau, and is surrounded by a barren and extensive plain, treeless save in the vicinity of the city, and stretching northward to the snow-capped Sierra de Guadarrama. In winter the climate is exceedingly severe, and even in summer, when the heat is excessive, piercingly cold winds descend from the mountains. The prevailing winds are the parching southeast Solano, and the icy north wind from the Guadarrama. The climate is described in a Spanish proverb as "three months of winter and nine months of hell." The temperature ranges from 18° to 105° F.; is subject to frequent and sudden changes; and between the sunny and shady sides of a street the difference of temperature is sometimes as great as 20°. Madrid was until recently surrounded by a wall 20 feet high, pierced by 3 large and 11 small gates; of these gates 3 remain: the Puerta de Alcalá on the east, the Puerta de Toledo on the south, and the Portillo de San Vicente on the west. The streets are distributed somewhat irregularly around the Puerta del Sol, which is in the centre of the capital. The principal streets are broad, long and airy; and the houses are in general well constructed, substantial, and of good appearance.

In common with most European capitals, Madrid has undergone much modern improvement; the streets are traversed by electric and horse car lines; are lighted by gas and electricity; the telephone system is efficient; and sanitation has been much improved. The former abundant and pure water supply, is, however, inadequate to the demands of the growing population. Madrid has no edifices of great antiquity. The royal palace, situated at the western extremity of Madrid, is one of the most magnificent in the world. It occupies the site of the original Alcazar (castle) of the Moors, and is of enormous extent, being 470 feet each way, and 100 feet high. The architecture is a combination of Ionic and Doric. It contains a small but splendid Corinthian chapel, and a library of nearly 100,000 volumes, and the armory is one of the finest in the world. The House of Deputies, which occupies an area of 42,700 square feet, has a hexastyle Corinthian portico on the grand façade, destined for the entrance of royalty on state occasions. On the lateral façades are the entrances for the members of the royal family. The Bank of Spain are two modern imposing buildings.
Madrid stands far behind many provincial towns as regards its churches, which are, with exception of a few attached to conventual establishments, not a sound and almost independent for their merit. The church of San Jeronimo el Grande is probably the most distinctive. The most important of the charitable institutions are the military hospital, an extensive building in the northwest corner of the city, and the Hospital de San Fernando, with schools for both sexes, the pupils being taught various handicrafts. At the southeastern corner of the city stands the general hospital. There are also hospitals for orphans and for foundlings, and numerous charities, mainly of a religious kind.

Madrid has 2, which generally irregular both as regards their form and their edifices, as well as deficient in decorative monuments. Of these the Plaza Mayor is one of the largest and most regular. The Plaza de Oriente is adorned with 40 statues of kings, as well as those of the Asturias, Leon, Castile and Aragon. In the centre is a fine equestrian statue of Philip IV. Among places of amusement the most popular is the Plaza de Toros (bull-ring), a building which is about 1,100 feet in circumference, and capable of containing 12,000 spectators. The Prado, a sort of wide boulevard, about two miles long, running north and south on the east of the city, is the chief promenade, and beyond it is the chief public park, including the Buen Retiro gardens, near which is the new Palace of Justice, built for various ministerial departments and the new station of the Southern Railway Company. The Royal Picture Gallery which stands on the Prado contains more than 2,000 pictures, including a great many by all the best masters, especially the Spanish masters. There are also some good pictures in the Academy of Fine Arts. The National Library, founded by Philip V, contains 650,000 volumes. The Library of San Isidoro consists of 66,000 volumes. The University of Madrid (the most important in Spain) is, out of that of Alcalá de Henares, founded in the 15th century, has an average attendance of 5,000 students. There are besides numerous other schools, academies and colleges, public and private, including a normal school, a deaf and dumb institution, a normal school for the blind, a commercial school, schools for engineers, a conservatory of music, an academy for the fine arts with a picture gallery, a veterinary college, an academy of medicine and surgery, etc. The famous monastical and palatial Escorial (q.v.) is 27 miles northwest of the city.

The industries have shown a remarkable development during the last decade, the chief manufactures being tobacco, leather goods, chocolate, beer, shoes, boots, plated ware, coaches, gloves and fans. There is a royal carpet and embroidery factory in the Pacifico suburb. The commerce is important, as Madrid is the entrepôt for all the interior provinces. Retail business is mainly in the hands of foreigners, mostly French, but most of the wholesale trade is carried on by native houses. Madrid has railway communication with Paris and Lisbon, and the chief cities of the Peninsula.

Madrid in the Roman period probably was the insignificant hamlet Majoritum. Under the name Majorit it appears as a Moorish outpost of Toledo when captured in 932 by Ramiro II of Leon. Henry IV about 1461 made some additions to the older town, which was placed on the western eminence over the river. Madrid only began to be a place of importance under Charles V. Declared the seat of the court by Philip II in 1560, the city rapidly grew up at the expense of the older and better situated capitals. It was the creation of a century, and its increase was very slow after the age of Philip IV. The growth of Madrid, a position which has no' single advantage except the fancied geographical merit of being in the centre of Spain was soon felt, and on Philip III's death his son, in 1601, endeavored to move the court again to Valladolid, which, however, was found to be impracticable, such had been the creation of new interests during the outlay in the preceding reign. Madrid was entered by the French under Murat, 23 March 1808, but they were soon obliged to evacuate it. It was again held by the French from 1808 to 1812, when the Duke of Wellington entered it and restored it to the Spaniards. After the deposition of the crown by King Amadeus in 1873, Madrid, along with the rest of Spain, suffered greatly from the anarchy caused by the struggle between the Republicans, Carlists and Socialists. Pop. about 599,807. The province of Madrid covers an area of 3,084 square miles, and has a population of about 920,493.

MADRIGAL, a short lyric poem generally on amatory subjects. Those of Tasso represent the finest specimens of Italian poetry.

MADRONA, a large and ornamental tree of California (Arbutus menziesii), of the heath family, which often grows nearly 100 feet in height. It has a wide-spreading head, small evergreen leaves and the limbs and large parts of the trunk, where the thin outer bark easily peels off, are bright red. It grows in the foothills, and up to a moderate elevation, but not naturally in the valleys. It is a near relative of the strawberry tree of Europe.

MADSTONE, a vegetable substance or stone which when applied to a wound caused by the bite of a mad dog is said to prevent hydrophobia. The most famous madstone in the United States is owned by the descendants of a family named Fred, in Virginia. This stone was brought over from Scotland in 1776. It is said to be the one spoken of by Sir Walter Scott in 'The Talisman' and has been religiously preserved as one of the most valuable relics of the age. It is about two inches long by one inch broad, and about half an inch thick, and is of a chocolate color. When applied to the wound it adheres till all the poison is absorbed, when it drops off. It is then soaked in warm milk or water for a time, and when removed the liquid is found to be full of a greenish-yellow scum. It is said that of the 130 cases in which it has been applied for the bite of a mad dog, none ever suffered from hydrophobia. It is said to be three authenticated madstones in the United States.

The belief in a madstone was common hundreds of years ago in the East, and travelers in India in 1677 and 1685 make mention of it. Tradition said it grew on the head of certain snakes. George F. Kunz, a New York expert in gems, identifies the madstone, or snakestone, of the East, with the stone known as tabersheer, which is a variety of opal found in the joints
of the bamboo in Hindustan and Burma. This stone is formed of juice which, by evaporation becomes mucilaginous, then a solid substance, and when placed in the mouth will adhere to the palate or cause water to boil. Sir David Lindsay found it is found in the joints of diseased corn-stalks and is formed by sap depositing silica.

**MADURA**, mā-doo'rā, southeastern Asia, an island of the Malay Archipelago, Dutch East Indies, off the east end of Java, from which it is separated by the Strait of Madura. The island is about 105 miles long east to west, and 30 miles broad, with an area of 1,770 square miles. Madura forms one of the 17 Dutch residences or provinces into which Java and Madura are divided, and is administered by a governor or resident. The Dutch first landed in Madura in 1747. It is undulating but not mountainous, and though in general well watered, in some places, especially on the coast, there is a want of water, and the soil is unfertile. The interior, however, is fertile, though not so productive as Java. Maize, cacao, tobacco, Jamaica pepper, tamarinds and salt are the chief products; stock-raising is an important industry; and the exports include also birds' nests, country cloths, white and striped, poppy-oil, ratten-mats and baskets, etc. The chief towns are Bangkalang, Pamckasan (the capital, pop. 8,407), and Sumanap (pop. 22,110). Pop. 1,843,601, of whom 4,734 were Chinese and 621 Europeans.

**MADURA**, southern India, the capital of a district of Madras, 344 miles by rail southwest of Madras, is the capital of the ancient Pandyan kingdom, for over 2,000 years was the political and religious capital of southern India, and is noted for its interesting architectural monuments, chief of which is the Temple of Minarchi, dating from almost prehistoric times, restored and added to by Tirimulla Nayak (1622–62). It ranks fourth among the seven strongholds of Hinduism, and occupies a parallelogram of 56,000 square feet containing 50 buildings. The city was known to the Greeks and Romans as Cottam and tobacco manufactures and coffee mills, are the principal industries. Madura is the seat of Catholic and American Protestant and other missions, and has several high-grade educational institutions. Pop. 134,130.

**MADVIG, mãv'ig**, Johan Nikolai, Danish scholar; b. Svanike, island of Bornholm, 7 Aug. 1804; d. Copenhagen, 13 Dec. 1886. Educated at Frederiksborg and Copenhagen, he was from 1829 till 1879 professor of Latin in the University of Copenhagen. He took a profound interest in the politics of his country, and from 1848 till 1851 was Minister of Education and Religion. He is best known by critical editions of Latin classics and by his Latin grammar translated into English and most European tongues. His chief works are 'Emendationes in Ciceronis Libros Philosophicos' (1829); 'Ciceronis De Finibus Honorum et Malorum' (1839, amended 1876); 'Ciceronis Orationes Selectae Duodecim' (1830); 'Ciceronis Cato Major and Laelius' (1835); 'Opuscula Academica' (1834–42; new ed., 1887); 'Emendationes Livianae' (1860); 'Livi Opera' (with Ussing, 1860–66); 'Adversaria Critica' (1871–84); 'Latin Grammar' (1841); 'Greek Syntax' (1846); 'Constitution and Administration of the Roman State' (1881–82); 'Autobiography' (published posthumously, 1887). Consult Sandys, J. E., 'A History of Classical Scholarship' (Cambridge 1908).

**MEANDER, mē-ān'der**, now MENDES, Asiatic Turkey, a river which rises in Phrygia not far from Celene. It forms the boundary between Caria and Lydia and flows into the Icarian Sea between Priene and Mys, opposite Miletus. It covers a course about 20 miles long, is deep and narrow, and navigable only for small vessels. It was celebrated among the ancients for its winding course, and gave its name to the intertwined purple borders on mantles and other dresses, as well as upon urns and vases.

**MEANDRINA, mē-ān-drī'nə**, one of several genera of brain corals, so called from the elongate and meandering cups containing the polyps, which give a spherical mass of these corals an appearance strikingly like the human brain with its convolutions. This appearance is due to the fact that the polyps in their growth do not completely divide, but stretch out into long bands, frequently branching, with many mouths and tentacles, and a common body and digestive cavity. Brain corals occur in all tropical seas, several species being found in Florida and the West Indies. Their solid masses make them important factors in the formation of coral reefs.

**MACENAS, mē-ē'nəz, Gaius Cinna** Roman nobleman: b. between 73 and 63 B.C.; d. 8 B.C. He was the friend of Augustus, and patron of Virgil and Horace. It is unknown when he received his education, but he was intimate with the literatures both of Greece and Rome, and was himself an occasional writer in prose and verse. We first hear of him authentically (40 B.C.) as negotiating a marriage between Octavianus and Scribonia; and in the same year he contributed materially to bring about the Peace of Brundisium, by which Octavian and Antony were reconciled. Two years later he was again employed in reconciling these self-willed potentates; and 36 B.C. he was twice dispatched by Octavian from Sicily to Rome to quell disturbances which had broken out there. He was for these services entrusted with the administration not only of Rome, but of all Italy, when Octavian became emperor with the title of Augustus. His palatial residence and gardens on the Esquiline were the rendezvous of all the literati of Rome, and of numerous Parsons. But those admitted to his intimacy were the greatest geniuses and scholars of Rome, among them being Virgil and Horace. To the intercession of Macenas, Virgil was indebted for the recovery of his farm; and Horace also owed to him many favors. See also BACHRENS, 'Fragmenta Poetarum Romanorum' (Leipzig 1886); Harder, F., 'Fragmenta des Macenas' (Berlin 1899).

**MAELAR, Lake of.** See MALAR.

**MAELSTROM, målstrōm, or MOSKOESTROM.** Norway, a rapid current or tidal whirlpool off the northwest coast immediately south of Moskenes and north of the Lofoten Isles. The current runs with the tides alternately, six hours from north to south and six hours from south to north, producing
immense whirls. The depth of the water around, supposed at one time to be too great to admit of soundings, has been ascertained not to exceed 35 fathoms, with a bottom of rocks and white sand. Immediately to the west the soundings are from 100 to 200 fathoms. The whirlpool, idealized by mediaeval and later writers, including Edgar Allan Poe, is greatest at high or low water. When the wind is northwest and counter to the current, the reflex of the waves it attains its greatest fury, and becomes extremely dangerous, but in ordinary circumstances it may be traversed without difficulty.

MAES, or MAAS, mās, Nicolas, Dutch painter: b. Dordrecht, 1632; d. Amsterdam, December 1693. He entered the studio of Rembrandt at Amsterdam about 1650 and studied there about four years, attaining a style of execution and coloring so similar to that of his master that many of his paintings were for a long time believed to be Rembrandt's work. He returned to Dordrecht in 1654 and in the succeeding 10 years did his best work, which retained the influence of Rembrandt, particularly in coloring. From the time of his going to Antwerp in 1665 his style changed and he abandoned the domestic genre type of work for that of portraiture, and his subsequent pictures show the influence of Van Dyck. So different were the characteristics of the two periods that at one time it was believed that there were two artists of the same name, 20 years his elder and both of whom notable examples are 'The Reverie' (Ryks Museum, Amsterdam); 'Card Players' (National Gallery, London); 'The Eavesdropper' (Six Gallery, Amsterdam); 'Young Girl Peeling an Apple' (Metropolitan Museum, New York); 'Hagar's Departure,' long believed to be a Rembrandt (Earl of Denbigh's Collection); 'The Listening Girl' (Buckingham Palace). Numerous other examples exist in the galleries of Berlin, Brussels, Munich, The Hague, Frankfurt, Hanover and Petrograd.

MAESTRICTH, mās'trēkt, Netherland, the capital of the province of Limburg, on the left bank of the Maas, at the confluence of the Geer, lies on the Belgian frontier, 19 miles north-northeast of Liège, 56 miles east of Brussel, and west of Cologne. Among the chief buildings are the church of Saint Servais, partly Romanesque and partly Gothic, dating from the 10th century, the townhall, the courts and general prison and the arsenal. The fortifications were dismantled between 1871 and 1878; it it, however, still a considerable garrison town. Maestricht carries on an active transit trade with Belgium, and has manufactures of glass and earthenware, firearms, shot, cloth and paper-hangings; also ironfoundries, beetroot sugar refineries, tobacco and cigar factories, tanneries and breweries, the latter producing very noted beer. About three miles from the town is the Pietersberg (Peters Hill), on which stands the fort of Saint Pierre, and under which are extensive subterranean mines of extraordinary interest, the excavation of which is supposed to have been begun by the Romans. Maestricht was besieged and taken 8,000 of its inhabitants were massacred in 1579 by the Spaniards under the command of Don Luis XIV, and again by the French in 1748 and 1794. William III of England failed to capture it and in 1830 its garrison resisted successfully the attacks of insurgent Belgians. Pop. 38,661.

MAESTRICHT BEDS, in geology, a series of calcareous beds 100 feet thick, on the banks of the Meuse, near the Dutch city of Maestricht. The Maestricht calcareous rock contains Belemnitella, mucronata, Pecten quadricostatus, etc., also the genera Brachitites, Hamites, etc., which are only Mesozoic. It is a connecting link between the Cretaceous and the Tertiary rocks, but in all essential respects it belongs to the former.

MAETERLINCK, mēt'ər-lînk, Maurice (Gallicized from the original MOORES MATÉR-LINK), Belgian author: b. Ghent, 29 Aug. 1862. He was educated in a Jesuit school in Belgium, then studied law, was admitted to the bar in 1887, but was from the first more interested in letters, and in 1896 settled in Paris as an author. His work may be divided into three parts,—his lyric verse, his dramas and his philosophical essays. Of the first an interesting example is 'Sœurs Charmes' (1889) and 'Douze Chansons' (1896) are representative. Maeterlinck's verse is imaginative, but lacks in any strong degree the melodic quality. His dramas are 'La Princesse Maleine,' (1888); 'Les Aveugles' (1890); 'L'Intruse' (1890); 'Les Sept Princesses' (1891); 'Péleas et Mélisande' (1892); 'Alladine et Palamîde' (1894); 'La Mort de Tintagiles' (1894); 'Aglavaine et Sélîsette' (1896); 'Ariadne et Barbehute' (1899); 'Sœur Béatrice' (1899); and 'Monna Vanna' (1902); 'Javzel' (1903); 'The Blue Bird,' a sublimated Fairy Tale (1909); 'Mary Magdalené' (1910); 'The Death of Tintagiles' (1913). Several of these were translated into English by Richard Hovey (q.v.), and 'Monna Vanna' was rendered by Alexis I., du P. Coleman. The dramas are Maeterlinck's most striking work. Their eerie symbolism can hardly be explained, but must be appreciated at first hand. Though they inaugurated a new theatrical school—the 'Drame Intime'—they are properly speaking, and lose their subtle poetic qualities and impressiveness in presentation. 'Péleas et Mélisande was given in the United States by Mrs. Patrick Campbell. To many the essays are his ultimate test as a force in literature, the most interesting things that Maeterlinck has done. The volumes are 'Le Trésor des Humbles' (1896); 'La Sagesse et la Destînée' (1898), and 'La Vie des Abîmes' (1902); 'Le double jargon' (1904); 'Mon chien' (1906); 'L'Intelligence des Fleurs' (1907), 'La Mort' (1913); 'The Unknown Guest' (1914). The first is somewhat mystical, all are somewhat diffuse; but he has been called by virtue of them a true successor of Swedenborg and Böhme. See Blue Bird, The; Monna Vanna; Péleas and Mélisande Consult Courtnev, 'Development of Maurice Maeterlinck' (1904); Harry, 'Maurice Maeterlinck; a Biographical Study' (1910); Thomas, 'Maurice Maeterlinck' (1911); Sturgis, 'The Philosophy of Maeterlinck' (1914); Clark, 'Maurice Maeterlinck: Poet and Philosopher' (1915); 'The Wrack of the Storm' (1916).

MAEVIAI AND BAVIAI. See BAVIAI.

MAFKING, mā-fä'kîng or mā'fē-kîng, Cape Colony, a former Bechuana settlement now a town, the administrative seat of the
Bechuanaland protectorate, close to the borders of the Transvaal, 870 miles by rail northeast of Cape Town and about 200 miles west-southwest of Pretoria. The town stands near the upper Malopo River. It is 4,194 feet above sea-level and contains several substantial buildings, including a Masonic temple, a town-hall and a hospital and there is a good water-supply and a race-course. Mafeking sustained a protracted siege during the South African War of 1899-1901. It was isolated in October of the former year and was brilliantly defended by a small force under Colonel (now General) Baden-Powell, until relieved by Colonel Mahon in May 1900.

MAFFEI, Francesco Scipione, Marchese di, Italian dramatist and scientist: b. Verona, 1 June 1675; d. there, 11 Feb. 1755. He studied at the Jesuit College, Parma, for five years and from 1698 at Rome. He was present at the battle of Hochstadt in 1704, taking part in the Bavarian campaign as a volunteer under his brother, Gen. Alessandro Maffei. He commenced a literary career by the publication of 'Della scienza cavallerescia,' noted for a censure of duelling; became associated in founding the Giornale dei letterati; and edited with introductions some of the best plays of the 17th century. He also appeared his 1713 play 'Merope,' since frequently reprinted, one of the most brilliant successes achieved in the history of dramatic literature. While it lacks a love motif, it is considered a masterpiece of Italian tragedy. Voltaire adapted it for the French stage, declaring it "worthy of the most glorious days of Athens," and it inspired Home's celebrated English drama 'Douglas.' His versatility and scientific attainments are shown in subsequent work which include 'Teatro italiano' (1723-25); 'Istoria diplomatica' (Venice, 1729); 'Le Cerimonie,' a comedy (1728); and 'Verona illustrata' (1732). From 1732 he spent four years in travel in France and England, returning by way of Holland and Germany, and wrote 'Gazette Annuale' (Paris 1733); 'Istoria teologica' (Trent 1742); 'Dell impianto del derraro' (1745); justifying loans on interest; and 'Arte magica' (1749-54). He was also associated with Maratori in the great collection of the 'Rerum italicae scriptores,' which occupied 15 years and was published in 25 folio volumes (1723-38). A complete edition of Maffei's works were published in 21 volumes (Venice 1790) and selected 'Opuscoli litterari' (Venice 1829; Milan 1844). See Merope.

MAFFITT, John Newland, American clergyman: b. Dublin, Ireland, 28 Dec. 1794; d. Mobile, Ala., 28 May 1850. He was a Wesleyan preacher in Ireland and in 1819 emigrated to the United States, where he became a member of the New England Methodist Episcopal conference. He founded the 'Western Methodist' in Nashville in 1833 and conducted revivalist meetings throughout the South and West. In 1837 he became professor of elocution and belles-lettres at La Grange College, Louisiana, and in 1841 he was elected chaplain to Congress. He published several religious works, also an autobiography.

MAFFITT, John Newland, American naval officer: b. New York, N. C., 6 Oct. 1866. He enlisted in the United States navy in 1832 and in 1861 entered the service of the Confederacy where he took rank as commodore. In command of the Florida he rendered himself valuable to the Confederate cause, taking many prizes and damaging seriously United States commerce. In 1862, he obtained a letter of marque for the health he resigned before the end of the war.

MAFIA, mä-lë'ë, a Sicilian secret society similar to the Camorra (qv.), which has long existed in Naples, but much more powerful. The Mafia is essentially a form of organized lawlessness, but its organization is sufficiently elastic to enable it to appear as the government to suppress it. It is generally said to have had its origin in the compagni d'armi, a kind of police organized in Sicily early in the 19th century and dissolved by Garibaldi in 1860. Its members, who are required to prove their daring in a knife duel, are bound never to carry their suits to the regular courts or to give evidence before them. Murder and robbery are dismembered under ordinary circumstances, but they are resorted to without hesitation in the course of informers or specially obnoxious persons. Blackmail is levied from landowners, who are required to employ only mafion in certain occupations. Criminals are protected and elections controlled by this infamous group. It is far more than that of the law among the lower classes in Sicily. The Chinese highbinder societies are similar to the Mafia. Within recent years these murderous organizations have secured a footing in the United States and murdering and directly chargeable to the Mafia have been committed in New York, New Orleans, Chicago and other large cities. Consult Alongi, G., 'La Mafia' (Turin 1886); 2d ed., Palermo 1904); Calou, E. C., 'La Mafia' (Madrid 1905); Patton, W. A., 'Picturesque Sicily' (1908); Vezzini, A., 'La Mafia' (Rome 1880).

MAGALHAES, ma-ga-lê'ë, Domingos José Gonçalves de, Visconde de Araguaya, Brazilian poet and diplomat: b. Rio de Janiero, 13 Aug. 1811; d. Rome, Italy, 10 July 1882. He was educated in medicine; but entered upon a diplomatic career, which he has entered at the Brazilian embassy at Paris. He was Minister to Austria in 1859-67, and Ambassador to the United States in 1867-71. At the time of his death he was Ambassador at Rome. He began the writing of verse in an early age and attained a considerable reputation, being regarded as the leader of the romantic school of Brazilian poetry. Among his more important works are 'Suspiros poeticas' (1836); and 'A confederação dos Tamoyos' (1857). His 'Obras completas' were published (Paris 1864).

MAGALHAES, Fernão de. See MAGELLAN, FERDINAND.

MAGALLANES, mä-gä-gä'yä'ës, Chile, a territory lying south of the department of Chiloé, and including the many islands, large and small, along the western and southern coasts of Chile. Its entire area is about 65,335 square miles. Among the more prominent islands in the territory are the Wellington group, Hanover group, Queen Adelaide Archipelago, Madre de Dios and a part of Tierra del Fuego. The mainland is a narrow strip of mountainous coast. The islands are barren, but there are extensive forests on the mainland, but very little agricultural land. The climate
is disagreeable and stormy. The animal life is not abundant; the seal and sea-ottar frequent the coast and in the sheltered regions east of the Andes cattle, horses and sheep are raised. Coal has been found in the southern part and there are also copper and gold mines. The capital is Punta Arenas. Pop. 30,623.

MAGDA. Sudermann's 'Heimat' ('Home') was the sensation of the theatrical season 1889-90 in Berlin, and the play, either in the original German or in translations commonly bearing the title 'Magda'—the name of the heroine—is probably to be regarded as the most widely known and the most successful drama of the end of the century. Its success is traceable to at least four causes: its theme of revolt against paternal tyranny is one to which the times were sympathetic, its construction is skilful and in every sense theatrical, it contains a number of picturesque episodes and amusing characters, and is distinguished for animated dialogue; but most of all, its heroine is an unconventional, self-assertive, and emotional "new woman" who affords an actress an unusual opportunity for temperamental display. The technique is a clever combination of the naturalism of Ibsen and the methods of the drame à thèse familiar in the works of Dumas fils. The conventional raisonner—in the person of the Pastor Heffterdamg—mediates between Magda and her father, and debates with each the problems presented by the situation of a prodigal daughter who returns home after a life of moral irregularity but operatic success. We are bidden to despise respectability and admire independence. But the representative of each side is far from being an acceptable champion. Magda's father fails to recognize the difference between a child with duties and a human being with rights, and Magda reveals no conception of the fact that duty is only in part a social obligation and is in its innermost essence an obligation of self-respect. Translated by C. E. A. Winslow (Boston 1896); edited by F. G. G. Schmidt (Boston 1909).

William G. Howard, Assistant Professor of German, Harvard University.

MAGDALA, mág'dé-la, or MAKDALA, Abyssinia, fortified town on the plateau of Taitano in Shoá, 72 miles northeast of Debra Tabor. The original fort was built on an isolated rock 3,300 feet above the Beshilo, and was stormed and wholly destroyed by the British troops under Sir Robert Napier 13 April 1868. Sir Robert becoming Baron Napier of Magdala in recognition of the achievement. The natural strategic advantages of the position, however, caused the fort to be rebuilt and the town has acquired considerable importance. Altitude, 9,110 feet. Pop. about 4,000.

MAGDALEN, mág'da-lén, a name applied to one of the Marys in the Gospels, derived from her place of birth, or former residence, in order to distinguish her from other women of that name (Matt. xxvii, 56, 61; Mark xv, 40, 47; Luke viii, 2; John xix, 25).

MAGDALEN (mód'lén) COLLEGE, Oxford, England, originated in Magdalen Hall, founded in 1448 by William Patten, commonly called William of Waynbeke, from the place of his birth, bishop of Winchester and Lord High-chancellor of England, who 10 years later added the College of Saint Mary Magdalen. In some respects Magdalen is the most noteworthy college of the university. Five of the fellowships are attached to five Waynflete professorships, of moral philosophy, chemistry, mineralogy, physiology and pure mathematics, established in lieu of the three former lectureships of divinity, moral philosophy and natural philosophy. There is also a professorship of botany. The buildings are noted for their beauty and occupy extensive grounds. Among Magdalen's celebrated alumni are Addison, Camden, Focx, Gibbon, Hampden, John Lylly, Sacheverell, Selborne, Tyndale and Cardinal Wolsey. Consult Wilson, 'Magdalen College' (1899); Glasgow, 'Sketches of Magdalen College' (1901).

MAGDALEN (mág'da-lén) ISLANDS, Quebec, Canada, near the centre of the Gulf of Saint Lawrence, 54 miles northwest of Cape Breton, Nova Scotia, and 100 miles southwest of Newfoundland. Amherst, Alright, Coffin, Wolf, Grindstone, Deadman, Entry and Byron islands compose the group which is officially attached to the district of Gaspó, Quebec. The inhabitants exist chiefly by the fisheries of the adjacent waters; gypsum which is found in veins and hollows, and grindstones from Grindstone Island, are exported. House Harbor on Alright Island, and Amherst, where there is a custom house, are the chief settlements. Pop. about 5,000.

MAGDALENA, mág-dá-lá'ná, a river of Colombia, South America, which has its rise in the Andes Mountains in the southwestern part of Colombia, and flows north to the Caribbean Sea. A short distance from the sea, at the city of Barranquilla, the river divides and discharges its waters through two channels. It is about 1,000 miles in length. It is navigable for ocean steamers to La Dorada, 592 miles from Barranquilla, and for small steamers to about 300 miles from its mouth. Magdalena River is the principal route from the sea to the interior of the country, and the work of clearing and canalizing both the upper and lower parts of the stream has greatly increased its importance and value as a means of communication and transportation. Bogota (q.v.) is largely dependent upon this river for means of communication with places on the coast. The largest tributary is Cauca, whose source is near that of the Magdalena, and part of its course is almost parallel with the main river. Short railroads connect some of the interior towns with the river and its tributaries.

MAGDALENA (mág-da-lé'ná) BAY, an inlet on the west coast of Lower California, in Mexico, one of the best harbors on the Pacific Coast. The inlet or arm of the sea is about 40 miles long and 12 miles wide and is protected by a long, low sand-bar. A town of the same name is situated on the harbor.

MAGDALENE (mág'da-lén) COLLEGE, Cambridge, England, was founded in 1542 by Thomas, Baron Audley of Walden, in place of Buckingham College, established by Edward, Duke of Buckingham, in 1519, which had succeeded a monks' hostel for students founded in 1428. There are seven open fellowships on the foundation, and 12 open scholarships.
are also several exhibitions. The annual Pepsian benefaction, value £50, is in the master's gift, and is usually bestowed upon poor and deserving students. The buildings consist of two courts, restored and altered in 1880, a chapel, and hall dating from the 15th century and the Pepsian Library, built in 1688. Samuel Pepys, Charles Kingsley and Charles Stewart Parnell were educated at Magdalene College.

MAGDALENIAN STAGE, a period in the history of Palaeolithic man in southwestern Europe when humanity lived largely in caves (wherefore these people are called "cave men"). They had attained a remarkably high degree of skill in the graphic arts, and adorned the interior of caverns with paintings and many objects with engravings of animals and other subjects. See Stone Age.

MAGDEBURG, màg'dé-boorg, Germany, city, capital of the Prussian province of Saxony, on the Elbe, and 88 miles southwest of Berlin. The manufacturing and trade of Magdeburg are extensive, and its facilities for transportation by water and railroad are excellent. Among its industrial establishments are the Grusen Works, noted for their connection with the "Grusen Works, the beet-sugar factories and a number of other establishments. It has a large number of excellent schools, gymnasium, a pedagogical seminary, art schools, industrial schools, etc. Magdeburg is a place of great antiquity, being a trading centre in the 9th century. It early distinguished itself in the Reformation. During the Thirty Years' War the town was besieged, stormed and sacked by Tilly, when 20,000 persons are said to have been murdered. Pop. about 279,685. Consult Wolter, "Geschichte der Stadt Magdeburg" (3d ed., Magdeburg 1901); Dodge, "Gustavus Adolphus" (New York 1906).

MAGDEBURG CENTURIES, a Protestant history of the Christian Church by centuries, written in Latin in 1562 by Matthias Flacius of Magdeburg and other Lutheran theologians. It first appeared as "Historia ecclesiae Christi" (7 vols., Basel 1559-74); a German translation of the earlier part also appearing (Jena 1560-65). German Protestant princes bore the cost of publication. The "Ecclesiastical Annals" of Baronius (q.v.) were a Catholic reply to the Magdeburg Centuries. See Protestantism.

MAGDEBURG HEMISPHERES, a celebrated invention of two Lollow hemispheres, made of copper or brass, with their edges accurately fitted to each other, and one of them furnished with a stopcock. When the edges are meet over with a glass, pressed tightly together and the globe thus formed exhausted of air through the cock, the hemispheres, which fell asunder before exhaustion, are now pressed together with immense force. If they are one foot in diameter they will, after exhaustion, be pressed together with a force of nearly a ton. This experiment was first performed by Otto von Guericke of Magdeburg, in 1654, at the imperial Diet at Ratisbon, to the astonishment of the Emperor Ferdinand III and the royal family.

MAGELLAN, mà-jèl'an, Ferdinand (Port. Fernão de Magalhães; Sp. Fernando Magal­lanes), Portuguese navigator. b. probably at Villa de Sabroza, Traros-Montes, about 1480; d. Philippine Islands, 27 April 1521. He served in the Indies with distinction, especially at Malacca, and in 1514 saw service in Morocco. In resentment at his treatment by the king, who had not, he thought, taken any interest in his exploits, he, with Ruy Falerio, a geographer and astronomer, renounced his nationality and offered his services to Spain. Magellan's proposal to seek a western route to the Moluccas was accepted by Charles V, and on 20 Sept., 1519, he set sail from San Lucar de Barrameda with a command of five vessels. He passed through the strait which bears his name (see Magellan, Strait of), and on 28 Nov., 1520, reached the great ocean which he called the Pacific from its abodes. With his vessels he sailed by way of the Ladrones Islands to the Philippines, discovering Samar on 16 March, 1521. He caused the king of Zebu to swear allegiance to Spain, but was killed in a fight with the natives of Mactan. His vessel, the Victoria, under Sebastian del Cano completed this, the first circumnavigation of the globe. The chief authority for the voyage is a work by Pigafetta, an Italian who accompanied Magellan. Consult Lord Stanley, "The First Voyage of Magellan and Elcano" (1873); and Guillelme, "Ferdinand Magellan" (1891).

MAGELLAN, Strait of, the channel which separates the continent of South America from Tierra del Fuego and thus forms a communication between the southern Atlantic and the southern Pacific oceans. It is about 850 miles long and of difficult navigation. Its breadth varies exceedingly, the maximum being somewhat over 70 miles. There are a number of bays along the shore and at the southwestern end a group of several small islands. Punta Arenas is the best harbor. The strait was discovered in 1520 by Fernão de Magalhães or Magellan.

MAGELLANIC CLOUDS, in astronomy, called the Nebulceus, Major and Minor, from their cloud-like appearance, two oval masses of light in the southern hemisphere near the pole; often both visible to the naked eye. Sir J. Herschel describes them as "a countless swarm of stars, clusters and nebulae of every description.

MAGENDIE, François, frān-swà màzhôn-dé, French physician and physiologist; b. Bordeaux, 15 Oct., 1783; d. Paris, 8 Oct., 1855. He was the pupil of the celebrated surgeon Boyer, and at 20 was appointed successively asse­cier d'anatomie in the faculty of medicine and demonstrator. He, however, subsequently devoted himself principally to the practice of medicine, was in 1819 elected a member of the Academy of Sciences and in 1831 succeeded Récamier in the chair of anatomy in the College of France, which he retained until his death. As an experimenter in physiology he occupied a high position and his experiments on living animals were at one time so numerous and involved so much suffering to the animals that the French government deemed it necessary to interfere. The results obtained, however, were of great importance, if they do not absolve him from the charge of cruelty. Among them may be named an original demonstration that the two roots of the spinal nerves are due to two separate functions; that the veins are organs of absorption; that striychnine acts upon the
spinal cord and contracts by tetanic spasm the nerves of respiration, thus inducing asphyxia; that food destitute of nitrogen is not nutritious, and that prussic acid is a valuable remedy in certain forms of cough arising from irritation in the lungs. He was a prolific author of medical works, the most important of which are "Précis de la physiologie de la vie" (1826-17), for many years an important manual for students; "Leçons sur les phénomènes physiques de la vie" (1836-42); "Leçons sur les fonctions et les maladies du système nerveux" (1839); "Leçons sur le Sang" (1839); "Recherches philosophiques et cliniques sur le liquide cephalorachidien ou cérébrospinal" (1842).

MAGENTA, má-jēn'tā, Italy, town in the province of Milan, 16 miles west of Milan, is situated in a grape region, in which the cultivation of grapevines and the manufacture of wine are the principal industries. Considerable raw silk is exported. It was the scene of a famous engagement 4 June 1859 between the French and Sardinian forces and the Austrians. The Austrians were defeated, largely through the superior tactics of General MacMahon of the French army. Pop. about 10,137.

MAGENTA, or ANILINE RED, a coal tar dye, which consists of a mixture of the hydrochlorides of rosaniline and para-rosaniline. (See ROSANILINE.) It may be prepared from aniline oil by digesting the aniline with arsenic acid or with nitrobenzene and ferrous chloride. When the oxidation is complete the rosaniline hydrochloride is precipitated by the addition of common salt in large excess, the hydrochloride being formed by double decomposition and thrown down because it is but sparingly soluble in salt solutions. Consult Benedikt, 'Chemistry of the Coal-Tar Colors.'

MAGGIORE, mä́ddоор'ē, Lake, one of the largest lakes in Italy, the Lacus Verbanus of the Romans, is situated for the most part in Italy, but also partly in the Swiss canton of Ticino. It is 30 miles in length and varies in breadth from one-half mile to five and one-half miles. It is 646 feet above the level of the sea and has a maximum depth of 1,158 feet. The river Ticino flows through it. In the southwestern expansion of the lake are the Borromean Isles (q.v.). On the north and west it is surrounded by granitic mountains, 7,000 feet high, on the south and east by vineyard-covered hills. On its shore are a large number of villages and cities noted for beautiful scenery and historic connections.

MAGGOT, the larva of a fly. (See FLIES.)

MAGI, má'jī (Lat. Magnus, Gr. Mágos), an Accadian term, as lighted by the Assyrian scholars; Accadian being the language of the people of Babylon and Media. The word signifies "august," "reverend," and was the title of their learned and priestly caste. The Oriental nations afterward dominant in Babylonia and Persia, and many of the religious observances of the early inhabitants, as also the name for the learned caste; and out of the Semitic form the Greeks made magos. Under the Persian Empire the magi were not only the "keepers of the sacred things, the learned of the people, the philosophers and servants of God," but also diviners and mantics, augurs and astrologers. They were held in the highest reverence, and no transaction of importance took place without or against their advice. Hence their almost unbounded influence in both private and public life. Apart from the education of the young princes being in their hands, they were the constant companions of the ruling monarch. Zoroaster, in the course of his great religious reform, reorganized the body of the magi chiefly by reinforcing the ancient laws as to their manner and mode of life, which was to be one of the simplest and severest, befitting their sacred station, but which had become one of luxury and indolence, and by re instituted the original distinction of the three classes of herbeds ("disciples"), mobeds ("masters") and destur mobeds ("complete masters"). The food, especially of the lower class, was to consist only of flour and vegetables; they wore white garments, slept on the ground and were altogether subjected to the most rigorous fasts. Their initiation consisted of the most awful and mysterious ceremonies, and was preceded by purification of several months' duration. As far as we can learn the principle of good and evil, as represented by Ormuzd and Ahriman, was recognized, and belief in the coming of a savior, in the resurrection and in a future life was held. Gradually, however, their influence, which was all-powerful during the epoch of the Sassanian kings of Persia, began to wane, and, from being the highest caste, they sank to the rank of wandering jugglers, fortune-tellers and quacks, and gave their name to sleight-of-hand and conjuring tricks. But the name seems to have been also current as a generic term for astrologers in the East, as is evidenced by the New Testament narrative of the Magi to the Infant Christ. According to the narrative (Matt. ii, 1-12) the three wise men came from the East to Jerusalem, led by a star, which at length guided them safely to the place of the Nativity at Bethlehem, where they offered their gifts of gold, frankincense and myrrh. As the "Three Kings" their names became celebrated in the Middle Ages, and Bede designates them as Kaspar, Melchior and Balthasar. (See also PARSES; ZOROASTER.)

MAGIC, or BLACK ART, was formerly the means of producing supernatural effects with the assistance of evil spirits. Doubtless in very remote time magic and religion were practically one, but the development of mentality brought about a differentiation. The fundamental fact was a strong belief in what was considered supernatural. Magic is of a more positive nature, but it carries with it the idea of taboo (q.v.). Supernatural effects were at an early period naturally associated with the exercise of the hearing and power of the stage of society this was confined to the women, and naturally arrived at the dignity of a profession in the hands of the older, whom
experience had gifted with superior skill. As their art was for the most part a mystery to themselves, they gradually came to be regarded as objects of fear as much as of hope, and magic medicines became synonymous with poison. The sorceress, poisoner and witch were in time reckoned identical. (See Witchcraft.) Medea, Persia and the neighboring countries, famous for their knowledge of astronomy and astrology, are described as the chief seats of the ancient Magi, whose doctrine seems to be, in part, of great antiquity. This doctrine represented opposition or strife as the parent and original cause of all things. After the opposition between light and darkness, Ormuzd and Ahriman, was established, the whole series of finite beings, the whole sensual world, proceeded from this constant struggle of light and darkness; good and evil. The change of day and night, light and darkness, the whole series of ages, time itself, is only a consequence of this struggle, in which sometimes light, sometimes darkness, appears victorious, until finally light is to prevail for ever. If all finite things stand under the influence of preserving and destroying powers in nature, it is clear that he who could master these powers could dispose at his pleasure of the things subject to them; and the doctrine of the Magians was that by prayer and a true knowledge of those laws of opposition, love and hatred, light and darkness, such power could be obtained; and that thus also it was possible to pry into futurity. But it was believed that as the world became sinful the light of the ancient doctrine of the Magi was obscured, and those who bore the name became at last only evil-disposed sorcerers. One important branch of their art was now the excitement of love by potions and enchantments. Their love-potions consisted partly of ingredients which are still known to the physicians as stimulants, partly of parts of animals who had died long ago for food or air, or the saliva of hungry dogs, and other still more disgusting substances. Magic at this period also covered itself with fortune-telling, calling up the dead and bewitching by the look—a superstition which we find existing in the processes against witches in modern times. It can hardly be doubted that the art of the ancient magicians was founded to a considerable degree upon a knowledge of the powers of nature superior to that of the general public. At one time magic was greatly studied in Europe, and many distinguished names are found among its students and professors. The most famous of these are Artesius, Bacon, Renan, Agrippa, Michael Nostradamus, John Dee, William Lilly, etc. While magic is a thing of the past there are still many survivals to be found to-day among the superstitions held by a large number of individuals. L., 'History of Magic' (trans. by Waite, Philadelphia 1914); Enmemoser, 'History of Magic'; Lang, A., 'Magic and Religion' (New York 1901); Scott, 'Demonology and Witchcraft'; Mackay, 'Memoirs of Extraordinary Popular Delusions'; Jeanne Larroque, 'La Sorellete, ses Rapports avec les Sciences biologiques' (1897); Lehmann, 'Aberglaube und Zauberei' (1898).

MAGIC CIRCLE. See Circle, Magic.

MAGIC LANTERN. See Circle, Magic.

MAGIC LANTERN, an optical instrument for the projecting of enlarged images upon a screen or other adapted surface. This title is commonly given to the type of instrument employed for home amusement, the more elaborate types used for public exhibition and educational work being known as stereopticons or optical lanterns (q.v.). In its simplest form the instrument consists of a lantern, generally of tin, and cucurbit-shaped, having a folt as powerful Argand lamp, the pencils of light issuing from which pass through a convex lens to a screen or a white wall a few feet away. It is most commonly used as a toy. The principle of its construction is very simple. A lamp is placed within the closed lantern with its burner in the focus of a concave parabolic mirror, the reflected light from which passes through a horizontal tube on a level with the flame. This tube contains two lenses; the one a hemispherical illuminating lens, of short focus, to condense a strong light on the picture, and the other a double convex lens, which receives the rays after they have passed through the picture, and throws them on the screen. The picture, known as the lantern slide, is inserted through a transparent slit into the tube between the lenses. The screen must not be too far removed from the lantern, otherwise the image will become indistinct and distorted. The tube is made to slide in and out, so that the distance of the lens from the slide being capable of being increased or diminished, an image of any moderate size, larger or smaller, may be focused after the desired size is secured by increasing or diminishing the distance between the lantern and the screen. Where an electric lighting current is available the pictures may be much improved in illumination by the use of a 60-watt Mazda lamp in place of the Argand lamp (which is often dangerous from overheating if run too long without cooling down). A still more brilliant illumination may be had with the nitrogen lamp. Further improvement may be secured by using a regular condenser, formed of two plano-convex lenses of four or five inches diameter, set with the convex sides toward each other and quite close together. Far better results as to sharpness and clearness on the screen will be secured by the use of a lens of the standard portrait type as the projector. For a small house picture, say from six to nine feet in diameter, the lens known as "quarter-size" will give very satisfactory results. The accompanying diagram represents conventionally a longitudinal section through a magic lantern fitted with a nitrogen lamp (N), attached to the house lighting wires (E), and provided with a pair of plano-convex condensing lenses (C). The reflector is indicated at R; the slot in which the slides are inserted at S; the double-
convex projecting lens at $P$; and the ventilating chimney, to carry off excessive heat, at $V$.

The objects exhibited with the magic lantern are usually pictures drawn, painted or photographed on glass strips or plates of appropriate size, the light passing through them from the condenser and thence through the projecting lens. The size of the image upon the screen depends chiefly upon the brilliancy of the light, and hence the circle which it is capable of illuminating. Secondarily the size will depend upon the distance of the lantern from the screen, and the ability to focus the image thereon. These three conditions must be skilfully adjusted to secure the best results. See Stereopticon.

MAGIC MIRROR OF JAPAN, some few specimens of the small, round bronze mirrors made in Japan which differ from others by reflecting upon a white screen the raised figures on the back of the mirror when a strong beam of light is thrown upon the polished convex surface. The mirrors are made of bronze with a polished, slightly convex face and the backs are decorated with raised ornaments. The characteristics of the magic mirrors was long a mystery, as much to the makers as to others, the peculiarity being apparently accidental. The Japanese themselves, while possessing a reverence for all mirrors, placed no undue value upon the magic mirrors. The Chinese noticed the phenomenon as early as the 11th century and gladly paid fabulous prices for such as possessed the trait. The physical nature of the mystery was first revealed by the French physicist, Charles Céphas Persan, in 1847. He observed that the convex surface of the magic mirrors was not uniform, the portions in front of the ornamental figures being plane, and therefore reflecting direct rays while the convex portions gave divergent rays and so made the reflection of the images indistinct. The theory was worked out by W. E. Ayrton and J. Perry, who discovered the phenomenon to affect the reflection under ordinary light, but plainly apparent when thrown on a screen by a bright light. Consult 'Proceedings of the Royal Society of London' (Vol. XXVIII, 1878).

MAGIC SKIN, The, or 'WILD ASS' SKIN,' as the French title 'Peau de chagrin' is also translated, is one of the most famous of the novels making up the imposing series of the 'Human Comedy' of Balzac, where it may be found in the group of 'Philosophical Studies.' It was also one of the earliest (1831). While it offers abundantly that penetrating observation of human conduct and character, and that minute record of the incidents and events of everyday life in detail of circumstance and environment that condition and explain them, that mark the realism of Balzac and make his work so full of what Taine has called 'human documents,' it is essentially an allegory and enforces, under the form of a magic symbol, a profoundly moral truth. The magic skin is a piece of shagreen bearing this inscription: 'Possessing me thou shalt possess all things, but thy life is mine, for God hath so willed it. Wish and thy wishes shall be fulfilled; but measure thy desires, according to the life that is in thee. This is thy life, with each wish I must shrink even as thy own days. Wilt thou have me? Take me. God will hearken unto thee. So be it.' The young man who becomes the possessor of this talisman in a moment of suicidal desperation demands of it a princely fortune, and sees himself with the power to have every wish gratified. But with each exercise of his power he observes with horror that the magic skin shrinks and shrinks; and less and less do his demands on its power bring with them satisfaction. The story is not of even interest throughout, and the narrative of the youth of the hero, which takes up a half of the book, may seem somewhat long drawn out. But it is one of the best examples of Balzac's peculiar power of seeing facts and illuminating them with ideas. There are English translations by Ellen Marriage, with a preface by George Saintsbury (Philadelphia 1897), and by Katharine P. Wormeley (Boston 1896). 

ARTHUR G. CANTFIELD.

MAGIC SQUARES. A magic square is a square divided into equal smaller squares, each containing a term of a series of integers, the sums of the numbers in any horizontal, vertical and diagonal line being the same.

The construction of such squares is an amusement of great antiquity. They were known in India and China before the Christian Era, and a knowledge of them was introduced into Europe by Moschopius who flourished in
MAGIC SQUARES

Constantinople; early in the 15th century. Talismanic virtues and occult properties were ascribed to them by the ancients. They were engraved on metal and stone and worn as amulets, as in India at the present day. A magic square of the fourth order is engraved on the gate of the fort at Gwalior in that country. Mediaeval astrologers and physicians were filled with superstitions in regard to magic squares. They associated the squares of the orders 3, 4, 5, 6, 7, 8 and 9 with the astrological planets Saturn, Jupiter, Mars, the Sun, Venus, Mercury and the Moon. A square containing one cell symbolized the unity of the Deity; one of the second order, not being possible, signified the imperfectness of the elements air, earth, fire and water. Albert Dürer’s well-known painting, ‘Melancholy,’ contains a magic square of the fourth order, doubtless because of its supposed mystical significance. They have been made the subject of elaborate research by various investigators, but the world is indebted chiefly to the French mathematicians for the development of the theory of magic squares.

In this article general rules for the construction of magic squares of any order will be given, illustrated by particular examples. The squares produced by these methods by no means exhaust all possible arrangements, but the rules furnish squares in great number and variety.

Magic squares are divided into two general classes according as the numbers of cells on a side is odd or even. Even squares are subdivided into doubly even, i.e., when the root is divisible by 4, and singly even, when the root is divisible by 2 but not by 4. A horizontal line of cells is called a row, and a vertical line a column. Two cells in a row equidistant from the ends are termed a horizontal pair, and two cells in a column equidistant from the ends are termed a vertical pair. In a series of natural numbers any two equidistant from the ends are said to be complementary.

**Magic Squares of an Odd Order**—La Hire’s method for constructing odd magic squares requires the formation of two auxiliary squares A and B. For a square of the fifth order diagram A is formed with the series of natural numbers 1, 2, 3, 4 and 5 as follows: First, put 3 (the mean of the numbers) in the top left-hand corner cell, and the numbers 1, 2, 4 and 5 in the cells of the top row in any order. Next, the number in each cell of the top row is repeated in the cells of a diagonal sloping downward to the right. The cells filled by the same number form a broken diagonal. Form a new square by making the left-hand column of A (beginning with its bottom number) the first row in the new square, and so on. Next, instead of the numbers 1, 2, 3, 4 and 5, substitute respectively the numbers 0, 5, 10, 15 and 20, thus producing square B. In each cell of square C place the sum of the numbers in similarly situated cells of squares A and B. The result is a magic square of the fifth order. Any magic square of an odd order can be constructed in a similar manner.

**La Loubère’s Method.**—In order to construct a magic square of an odd order by this method, place 1 in the middle cell of the upper row, and using the series of natural numbers (any arithmetical series will answer) proceed always diagonally upward to the right, except when the edge of the square or a cell already filled is reached. When a number would fall outside the square, carry it to the extreme cell in that row or column in which the cell outside would fall. When a cell is reached that is already filled or when the righthand upper corner cell is reached, place the number in the cell just below. The magic square D is formed by this rule. It may be remarked here that from any magic square, whether odd or even, a number of other magic squares can be formed by the mere interchanging of the row and column which intersect in a diagonal with the row and column which intersect in some other cell in the same diagonal. In this way from each magic square of the fifth order 48 other magic squares can be formed.

**Magic Squares of an Even Order**—To construct a magic of the sixth order proceed according to the following rule which is a modified form of a method due to La Hire.
As in his rule for odd squares two auxiliary squares are employed. For a square of the sixth order the first auxiliary square \( \text{E} \) is constructed as follows: First, fill the cells of the two diagonals with the numbers 1, 2, 3, 4, 5 and 6, beginning on the left-hand side. Second, fill each of the remaining cells of the first column with the same number as that already in two of them or with the complementary number, i.e., with 31 or 36 in any way, provided that there are the same number of these numbers in the column. Third, cells horizontally paired with those in the first column are filled with the complementary numbers. Fourth, the remaining cells in the second and third columns are filled in an analogous way to that in which the cells in the first column were filled; and then the cells horizontally paired with them are filled with the complementary numbers. Observe that in the case of a singly even magic square it will be necessary in constructing \( \text{E} \) to take care in the second step that in every row at least one cell which is not in a diagonal shall have its vertically paired cell filled with the same number as itself.

The second of the auxiliary squares \( \text{F} \) is constructed as follows: Rewrite square \( \text{E} \), making another square \( \text{F} \) in which the left-hand column of \( \text{E} \) (beginning with its top number) becomes the top row of the new square. The result is square \( \text{G} \). Next, if in each cell of \( \text{G} \) the sum of the numbers in the corresponding cells of squares \( \text{E} \) and \( \text{F} \) be placed, the required magic square is formed.

The following method is applicable to the construction of doubly \( \text{G} \) in magic squares only. Imagine the square to be divided into squarelets of four cells each, the four central cells comprising one; and conceive these squarelets to be of two kinds, alternating with each other. Place 1 in the left-hand upper corner cell, and proceed horizontally to the right counting a number to each cell, but filling successively the squarelets of one kind only. When the end of one row is reached turn to the left-hand cell of the next row and again advance, filling cells of one kind as before, and so on. For the squarelet of this operation is seen in diagram \( \text{H} \).

Next, begin with the right-hand lower corner cell, considering 1 as falling on it but not writing the number, and proceed regularly to the left, row after row, filling the empty cells with the numbers belonging to them but not writing numbers in the cells already filled. The result of the two operations is the magic square \( \text{I} \). This is the most perfect magic square of the fourth order. Not only do the horizontal, vertical and diagonal lines of numbers sum up 34, but there are 33 other ways in which sets of four numbers may be selected whose sum is 34, making 48 ways in all. By the interchange of rows and columns according to the rule enunciated above, other squares may be formed, but none so perfect as this.

The above methods for the construction of magic squares are, in the writer's opinion, the simplest of all those proposed. Limited space permits only two other methods to be noticed, which, however, are applicable to only a limited class of cases. The first relates to the construction of composite magic squares. For example a square of 81 cells may be considered as made up of 9 smaller squares each containing 9 cells. The magic square in diagram \( \text{K} \) is built up by this method.

The other method consists in surrounding a magic square with a border of cells, constituting what is termed a concentric square. In
this way from the magic square of the third order can be built up squares of any odd order; and similarly even magic squares of any order may be built up from the magic square of the fourth order. Diagram L is constructed this way.

To Dr. Franklin is due the construction of diagram M which he called The Magic Circle of Circles. (See the illustration herewith.) It is composed of a series of numbers from 12 to 75, inclusive, placed in eight concentric circular spaces and arranged in eight radii, with the number 12 in the centre. Like the centre this number is common to all the circular spaces and to all radii. The numbers are so placed that the sum of all those in any of the circular spaces, together with the central number 12, is 360, the number of degrees in a circle. The numbers in each radius together with the central number make 360. The numbers in half of any of the circular spaces taken above or below the horizontal diameter, with half the central number, make 180, the number of degrees in a semi-circle. If any four adjoining numbers be taken, as if in a square, in the radial division of the circular spaces, the sum of these with half the central number is 180. There are, moreover, included five sets of other circular spaces bounded by circles which are eccentric with respect to the common centre. The centres of the circles which bound them are at A, B, C and D. The numbers in these eccentric circular spaces possess the same magic properties as the numbers in the first-mentioned circular spaces.

Magic squares have been developed into figures of three dimensions termed magic cubes. Diagram N is a magic cube of the fourth order. 1, 2, 3 and 4 are horizontal sections of N.
MAGIC WOOD

numbered from the top down. There are 52 ranks of numbers in this cube which sum up 130, namely, 16 vertical columns, 16 horizontal rows from front to back, 16 horizontal rows from left to right, and four diagonal lines uniting four pairs of opposite corners. The sum of any two numbers which are diametrically opposite each other and equidistant from the

\[
\begin{array}{cccc}
30 & 21 & 6 & 15 \\
7 & 16 & 29 & 20 \\
22 & 81 & 6 & 35 \\
9 & 56 & 17 & 26 \\
32 & 38 & 2 & 11 \\
1 & 10 & 53 & 24 & 3 & 12
\end{array}
\]

centre of the cube equals 65; and the sum of the numbers in the 48 sub-squares of four cells each is 130.

Among curiosities in magic construction may be mentioned the following: The square in diagram O is filled with the natural numbers in the path of a knight returning to its starting cell, and possesses the property that the difference of any two numbers equidistant from and on opposite sides of the centre is 18. It is due to Euler, the famous mathematician.

W. S. Andrews in his Magic Squares and Cubes gives a magic cross filled with 145 numbers, with the statement that it contains the almost incredible number of 160,144 different columns of 21 numbers whose sum is 1,471.

A certain class of magic squares has received much attention in recent years. They are called Nasik squares in England, and in France diabolic squares. They are formed so that the sums along certain lines, such as all the rows, columns, diagonals and broken diagonals are the same. Diagram P is a unique example, as it is composed entirely of prime

\[
\begin{array}{cccccc}
103 & 251 & 449 & 91 & 881 \\
839 & 1301 & 941 & 113 & 311 \\
41 & 173 & 701 & 1229 & 1361 \\
1091 & 1289 & 461 & 101 & 563 \\
521 & 491 & 533 & 1151 & 389
\end{array}
\]

numbers. It is due to the ingenuity of C. D. Schuldhorn and appeared in a recent number of The New York Sun.

This square possesses the Nasik properties above mentioned, and in addition the sum of any two numbers equidistant from the centre and opposite each other is 1,402, or twice the central number.

Magic rectangles, crosses, stars, cylinders, etc., have been constructed, but want of space forbids any further notice of them.

Varying estimates have been made of the possible number of magic squares of a given order have been made by different investigators. W. W. Rouse Ball in his Mathematical Recreations thinks that those of the fifth order probably exceed half a million. Theodor Hugo in his Die Magischen Quadrate has calculated how one paper required to contain all the magic squares of the 13th order would cover the whole surface of the earth about 348 times.

As to the scientific value of magic squares the following paragraph is quoted from a paper by Maj. P. A. McMahon, F.R.S., published in Proceedings of the Royal Institution of Great Britain, 1892. "What was at first merely a practice of magicians and talisman makers has now for a long time become the serious study of mathematicians. Considered possible that some new properties of numbers might be discovered. . . . This has in fact proved to be the case, for from a certain point of view the subject has been found to be intimately connected with great departments of science such as the Infinitesimal Calculus, the Calculus of Operations, and the Theory of Groups." A. B. Nelson.

MAGIC WOOD, a wood used in cups which were sent to Spain in the 10th century as presents to princes, and were highly valued first as curiosities and later as a means of health. The "magic" consisted in the fact that water put into the cup speedily turned a rich blue. Although it has been a subject of inquiry ever since it is not until lately that the wood has been identified botanically, and the cause of its effect on water is still unknown. The identification was made by William E. Safford, of the United States Department of Agriculture, who described the result of his investigation in The American Museum Journal (New York, Vol. XVIII, p. 48, 1918) with a colored illustration. He has discovered that two separate kinds of wood are involved. The cause of this matter. The description of the early writers mostly refer to a shrub of Mexico called sweet-wood (Eyesenhardtia polysclasta); but the cups were made of wood of the gigantic narra tree (Pterocarpus indicus) of the Philippines. Although very different botanically, both cause effects on water virtually indistinguishable; and as in early times most of the communication between Spain and the Philippines was by way of Mexico, the double confusion as to origin easily arose. When water was poured into the narra cups, or chips of the Mexican sweet-wood were infused in a glass, the water became fluorescent in beautiful colors. In the early accounts of the cups (Pterocarpus) it was said that the water at once turned blue, which deepened if left to stand for some time. When this water was poured into a flask and held to the light it appeared perfectly clear, but if you move this glass phial toward a more shady place the liquid will assume a most delightful greenness, and if to a still more shady place, a reddish color. In the dark, however, or in an opaque vase of the same size once more assume its blue color. As was customary in those days this changeably tinted
water was regarded as having medicinal value, especially in any disorder of the kidneys, and was carried to Europe in great quantities and there the undeserved name lignum nephriticum. Mr. Safford got similar colors from the Mexican shrub. A few small chips in ordinary tap-water tinged it a golden yellow, which soon deepened to orange. When the glass was held against a dark background the liquid glowed with a fluorescent light not unlike that seen in quinine. Placed partly in a sunbeam, half of the liquid appeared yellow and the other half blue; and when the sunlight was focussed upon it by the lens of a common reading-glass the vial seemed to be filled with radiant gold penetrated by a shaft of pure cobalt. The most ingenious investigation has failed thus far to reveal the cause of this fluorescence.

MAGIE, ma-g'è, William Francis, American physicist: b. Elizabeth, N. J., 14 Dec. 1858. He was graduated at Princeton in 1879 and afterward studied at the University of Berlin. He was instructor in physics at Princeton in 1879–84, became professor in that branch upon his return from Berlin, in 1885, and has been dean of the faculty since 1912. He is a member of the American Philosophical Society, and in 1910 served as president of the American Physical Society. Author of 'The Second Law of Thermodynamics' (1899), 'A Course of Lectures on Physics' (1904), 'Principles of Physics' (1911). He also translated Christiansen's 'Elements of Theoretical Physics' (1896); and revised Anthony and Brackett's 'Physics' (1896).

MAGINN, ma-gi'n, William, Irish author: b. Cork, Ireland, 11 Nov. 1793; d. Walton-on-Thames, 20 Aug. 1842. He was graduated from Trinity College, Dublin, in 1811, and was for some years a schoolmaster. In 1819 he became a contributor to Blackwood's Magazine and was in turn Paris correspondent of the Representative, junior editor of the Standard and one of the founders of Fraser's Magazine, his contributions to which made it famous. He was a man of superb classical education, excelled as a critic and his literary work abounded in rich fancy and the genuine Irish wit. Unfortunately he had no financial ability and he died in extreme poverty notwithstanding the large sums his pen had earned. His collected works were published in five volumes in 1855–57. Consult Krans, 'Irish Life in Irish Fiction' (New York 1903).

MAGINNIS, Charles Donagh, American architect: b. Londonderry, Ireland, 1867. He was educated at Cusack's Academy, Dublin, and won Queen's prize in mathematics at South Kensington, London, in 1883. He came to the United States in 1885, engaged in practice as an architect at Boston in 1886 and became a member of the firm Maginnis and Walsh. He is especially interested in ecclesiastical architecture. He is a member of the Municipal Art Commission, Boston, and of the Massachusetts State Art Commission. He has written and illustrated articles on architecture for professional magazines and is author of 'Pen Drawing' (1898).

MAGISTRATE. See Court.

MAGLIABECCHI, Antonio, an-to'ne-ō mäl-yä-hēk'ē, Italian bibliographer: b. Flor-
houses for the royal assent. The king, according
to the custom which then and long after prevailed, directed that the articles should be read publicly twice a year. To secure the execution of the charter John, who was considered the ruler of the city and Tower of London, to be held by the barons till 15 August, or until he had completely executed the charter. King John, though he signed the charter, had no intention of keeping it; he appealed to the Pope, who in a bull denounced Magna Charta "null and void" and excommunicated the barons who had obtained it; and he was conducting a war against his barons when death overtook him in May 1216. Many parts of the charter were pointed against the abuses of the power of the king as lord paramount: the tyrannical exercise of the provisions of the forest laws was checked, and many grievances incident to feudal tenures were mitigated or abolished. But besides these provisions it contains many for the benefit of the people at large, and for a just government, applicable to all places and times, of which it is hardly possible to overrate the importance of the first promulgation by the supreme authority. One of these provided that taxes should not be imposed without the consent of the Common Council of the realm. The 39th article contains the celebrated clause which forbids arbitrary imprisonment and punishment without lawful trial. This article contains the writ of habeas corpus and the trial by jury, the most effective securities against oppression, which for which the wisdom of man has devised, and the principle that justice is the debt of every government, which cannot be paid without rendering law cheap, prompt and equal. The provision which directs that the Supreme Civil Court shall be nominated by the ecclesiastics of the land, and that every person, an important safeguard of the regularity, accessibility, independence and dignity of public justice in Great Britain. Confirmation of the Great Charter was frequently made by English monarchs. Consult Stubbs, 'Constitutional History of England' (1897).

MAGNA GRACIA, grēsh'-i-a, "Great Greece," the name commonly given in ancient times to that part of southern Italy which was inhabited by Greek colonists. Apparently the name was in use as early as the time of Pythagoras (586-506 B.C.). Strabo includes the Greek cities of Sicily under the appellation, but the name refers generally only to the Greek cities in the south of Italy, including those on the shores of the Tarentine Gulf and the Bruttian Peninsula, with Veii, Posidonia and Laxis, on the west coast of Lucania. The name was not at first territorial or coextensive with any region, but applied merely to the Greek cities on the coasts, Cumae was the most ancient of all the Greek settlements in Italy, but from its remote position it was in a great measure isolated from the later Greek settlements. The Achaeans were the first colony of southern Italy, their first settlement being Sybaris (720 B.C.). A few years later (708 B.C.) Spartan colonists founded Tarentum, and to counteract their encroachments the Achaeans founded Metapontum, on the frontier of the territory of the Tarentines, between 700 and 680 B.C. The Locrians founded further south the city of Locri Epizephyri, which was contemporary with Crotona (710 B.C.). The Chalcide colony of Rhegium, on the Sicilian Strait, claims to have been more ancient even than Sybaris. The Greek cities on the shores of Bruttium and Lucania were, Vela, adopted (540 B.C.) offshoots from the earlier settlements, and not founded by colonists direct from Greece. The arrival of Pythagoras at Crotona (530 B.C.) produced a marked change in the cities of Magna Graecia, and led to the introduction of great political changes. He and his followers were ultimately expelled from Crotona. Very little of the early history is known. The coast cities were essentially mercantile. Trade was well developed, and in the 6th century there was an extensive commerce, especially with Greece. The colonists who pushed to the interior subdued the opposing natives and developed the fertile plains into agricultural settlements. There was a high development of intellectual life. At various times there were temporary alliances among the cities, but not a permanent federation. Warfare was common and bitter and to this fact is largely due the decline of the territory. Magna Graecia comprised the provinces of Campania, Apulia, Tappia, Lucania and Bruttium.

MAGNALIA CHRISTI AMERICANA, māg-nāl'-i-a kris' ti å-mer-ik'-ān'a, an 'Ecclesiastical History of New England, from 1620 to 1682,' published by Cotton Mather in 1702. It treats more extensively of the early history of the country than its title seems to indicate, and it is divided into seven books: the first treating of the early discoveries of America and the voyage to New England; the second is 'Lives of the Governors'; the third, 'Lives of many Reverend, Learned and Holy Divines'; the fourth, 'Of Harvard University'; the fifth, 'Of the Faith and Church of New England'; the sixth, 'Discoveries and Demonstrations of the Divine Providence in Remarkable Mercies and Judgments on Many Particular Persons'; the seventh, 'Disturbances Given to the Churches of New England.' In the sixth book the author gives accounts of the wonders of the invisible world, of worthy people succored when in dire distress, of the sad ending of many wicked ones and of the cases of witchcraft at Salem and other places.

MAGNENTIUS, māg-nēn'-tēs, Flavius Popilius, Roman imperial usurper of the West: d. 11 Aug. 353. Having been entrapped by a high military command he availed himself of his office to plot the emperor's overthrow. On 18 Jan. 350, presenting himself in imperial purple at a great banquet given by one of the conspirators at Autun, he was saluted with the title of Augustus; and assassins sent for the purpose having dispatched Constans, Magnentius was acknowledged as emperor by all the western provinces except Illyria. Constans, on hearing of his brother's murder, hastened from the confines of Persia and defeated Magnentius (351), who was defeated Magnentius (351). These disasters led to the defection of all the countries that had recognized the usurper, with whom he committed suicide. Constans then became master of the entire empire.
MAGNESIA, the oxide of magnesium, MgO. See Magnesium.

MAGNESIAN LIMESTONE, a rock consisting of the mixed carbonates of lime and magnesia. Mineralogically it is known as Dolomite (q.v.).

MAGNESITE, a white, porcelain-like mineral (magnesium carbonate, MgCO₃; carbon dioxide 52.4 per cent, magnesium oxide 47.6 per cent), with a hardness of 3.5 to 4.5, and a specific gravity of 3.0 to 3.1. It is usually found associated with serpentine, talcose slates and dolomite. The magnesite of commerce comes from several localities, notably, Veitsch in Styria, Austria, where it occurs in conformable beds in a Silurian formation; at Frankensteine in Silesia, where a very pure variety is found; at Bolton, Canada, there is a ledge 60 feet wide which is tinged with green by chromium. The quality, however, is not good. In the Red Mountain mining district, Santa Clara and Stanislaus counties, Cal., is found the largest known deposit in the world. Here there are several veins from 20 to 60 feet wide and of very pure quality. It is also found in Napa, Sonoma, Fresno, Placer, Mariposa, Monterey and San Luis Obispo counties, Cal. Magnesite is used as a bleaching agent in paper-making and for making an excellent artificial stone for interior decoration. Its chief use, however, is in the manufacture of firebrick. In brick-making it is calcined, the gas CO₂ being collected and sold for charging mineral water and for use in cold-storage plants, instead of ammonia, and the resulting magnesium oxide mixed with a binding material and pressed into brick. From the pure mineral metallic magnesium and salts, as Epsom salts and magnesium chloride, are manufactured. See Mineral Production of the United States.

MAGNESIUM, a metallic element whose compounds are abundant and widely distributed, but which does not occur, in nature, in the metallic form. Magnesium resembles calcium in its chemical deportment, and the oxides of the two metals were long confused with each other. Metallic magnesium was first prepared by Davy, in 1808, both by electrolysis and by the reduction of white-hot magnesia in an atmosphere of potassium vapor. In 1830 Bussy obtained a larger and purer yield of the metal, by heating a mixture of potassium and anhydrous magnesium chloride to redness. It is best prepared by the electrolysis of the fused anhydrous chloride or of a mixture of magnesium chloride with the chlorides of sodium, potassium and ammonium. Pure magnesium is silvery-white in color, lustrous and moderately hard. It may be hammered, rolled, filed and polished. Its specific gravity is about 1.75 and its specific heat about 0.245. Its melting point is 1120° C. Its cohesive force ranges from 850° C to nearly 1,500° C. When raised to a bright-red heat (out of contact with the air) it volatilizes, depositing upon cool surfaces again in the form of lustrous silvery crystals which belong to the hexagonal system, and are isomorphous with those of zinc and cadmium. It expands by 0.00015 of its own length, per Fahrenheit degree of rise of temperature; and at 32° F. its electrical resistance is 0.0438 of that of mercury.

Chemically, magnesium is a dyad. It has the symbol Mg, and an atomic weight of 24.36 if O = 16, or 24.18 if H = 1. Its most important compounds are the oxide, MgO, the chloride, MgCl₂, the sulphate, MgSO₄, and the carbonate, MgCO₃. Metallic magnesium is not altered upon exposure to dry air, but ordinary air oxidizes it superficially. It dissolves readily in dilute acids, with the formation of the corresponding salts. Chlorine, bromine, iodine, fluorine, sulphur, phosphorus and arsenic combine with it directly. Red-hot metallic magnesium also slowly combines with free nitrogen to form a solid nitride. In the isolation of argon, helium and the other rare gases of the atmosphere advantage is taken of this fact for separating these gases from the nitrogen of the air. (See Argon). When strongly heated in the air, metallic magnesium takes fire and burns with an exceedingly brilliant white light that is rich in chemical rays; the products of the combustion being magnesium, MgO. Advantages is taken of this property in photography, most of the "flash-light" powders that are used consisting essentially of pulverized magnesium, either alone or mixed with a small quantity of some explosive or oxidizing agent; it will also burn when sufficiently heated in steam, carbon dioxide or sulphur dioxide.

Magnesium oxide, or "magnesia," MgO, is usually prepared by heating the nitrate or carbonate of the metal; and on a smaller scale by a method of preparation it is commonly known as "calcined magnesia." Magnesia is a white substance, without taste or odor. It does not have a strongly alkaline reaction, but it acts as a powerful base, reacting with acids to form the magnesium salts. It is scarcely soluble in water, but it slowly absorbs moisture and carbon dioxide from the air, becoming converted into a mixture of the hydrate and carbonate. When made into a paste with water, magnesia sets to a hard, white mass, consisting partly or wholly of the hydrate, Mg(OH)₂; but this action does not occur if the magnesia has been previously heated to whiteness. One of the most distinctive characteristics of magnesia is its infusibility. Even when heated in the flame of the oxyhydrogen or oxyacetylene it does not melt, but gives out a bright white light, somewhat similar to that emitted by lime. (See Calcium Light). In the fiercer heat of the electric furnace, magnesia has been melted. On account of its insusceptibility it has been used in the manufacture of crucibles and of firebrick. It occurs native as the mineral periclase, which crystallizes in the isometric system.

Magnesium chloride, MgCl₂ is prepared by dissolving magnesia in hydrochloric acid, and evaporating the solution after the addition of a certain quantity of sal ammoniac. Upon subsequent fusion the sal ammoniac volatilizes and the magnesium chloride is left behind. This substance is largely used as a preventive of mildew, in the sizing of cotton cloth. The mineral carnallite contains magnesium chloride, having the composition MgCl₂·KCl·6H₂O. Magnesium sulphate occurs native (in combination with one molecule of water) as kieserite, and it may also be prepared artificially by dissolving magnesium oxide or carbonate in dilute sulphuric acid. When combined with seven molecules of water, magnesium sulphate constitutes the familiar substance known as Epsom salts (q.v.), which is largely used in medicine. Magnesium carbonate, MgCO₃, is a white sub-
MAGNESIUM — MAGNETISM

stance, insoluble in water, but soluble in a solution of ammonium chloride, and also in water that contains carbon dioxide in solution. It occurs in nature as the mineral magnesite, which crystalizes in rhombohedral forms, isomorphous with calcite. Dolomite, which occurs in nature in enormous quantities, is a carbonate of magnesium and calcium.

Magnesium salts are used to a considerable extent in medicine. The name “magnesium” is derived from “magnesia,” which substance is said to have been obtained from the province of Magnesia in Thessaly.

MAGNETIC MOMENT. See Magnetism.

MAGNETIC POLE. See Magnetism.

MAGNETIC SEGREGATION, a process or processes in the preparation of ore by which the more valuable minerals are separated from the waste material and from each other by the use of magnets. A usual type of segregator consists of a belt conveyor carrying the ores below the magnet which attracts the magnetic ore to another belt traveling at right angles to the first. As it passes out of the magnetic field the segregated ore drops into a receptacle. By weakening or strengthening the magnetic field it becomes an easy matter to separate the non-magnetic from the magnetic, and the weakly magnetic from strongly magnetic.

MAGNETISM, the name applied to a peculiar force action first observed in connection with certain iron ores. This ore, often called lodestone, is supposed to have been discovered in Magnesia, a part of Asia Minor. It is not possible to state just when this discovery was made, but certain passages in Lucretius show that something was known concerning it before the beginning of the Christian era. About the year 1200 we have the statement by Neckham that a lodestone could be made by a definite position in space. Some further details were noted by Peregrinus (1269) and Ferrara (1629) but the greatest of the early works is that of Dr. Gilbert, a physician, who published his De Magnete in 1600. Those interested in the history of the subject may consult the ‘Intellectual Rise of Electricity’ by Park Benjamin, in which an excellent historical sketch may be found.

The only direct evidence that a body is magnetic is its ability to exert a force on certain substances, which, by reason of their susceptibility to this action, are called magnetic substances. A lodestone brought in contact with several small bodies will select those of iron or steel, if such be present, but show no appreciable influence on copper, lead, wood or in fact on any except iron, nickel, cobalt, certain rare metals and certain alloys, discovered by Hensler, of relatively non-magnetic metals, and a few others to a lesser degree. Of even greater interest and importance is the fact that the lodestone is able to endow steel or iron with the ability to exert this force. Soft iron loses its external magnetic qualities when removed from the immediate neighborhood of the exciting source, but hard steel or iron will retain this property for a long time. If a bar or rod of hard steel is drawn across a piece of lodestone or other permanent magnet and is then suspended so as to be free to turn about a vertical axis it will take up a definite position, usually its line of greatest length will be approximately north and south. If it be plunged into a box of iron filings, little magnetic action will be manifested near the middle of the bar, but near the ends considerable quantities of filings will be attracted and may be lifted against the action of gravity. These facts led to the naming of the regions of greatest external action the poles of the magnet and since the lines joining these regions would, in the case of a freely suspended magnet, lie in many places nearly north and south, the pole which seeks the north is often called the north-seeking or positive pole, the other which turns toward the south is correspondingly named the south-seeking or negative pole.

If we suppose two long magnets placed as shown in Fig. 1 a study of their mutual force action would indicate that each is exerting a push tending to increase the distance between them, and that the amount of this repulsion will vary with the distance between the magnets. If one of the bars be replaced by another whose magnetic quality is different the force action will be modified. If one of the magnets be reversed in position a corresponding force tending to reduce the distance between the bars would be observed. It is convenient to use as a preliminary definition the statement that a unit pole is one which will exert unit force upon a precisely equal pole at a distance of one centimeter. The law of pole action can then be stated by saying that the force is equal to the product of the two poles strengths divided by the square of the distance between the poles.

If a freely suspended magnet is brought into the neighborhood of a large bar magnet as indicated in Fig. 2 it will be observed to take up a position somewhat as indicated in the lower
part of this diagram, as its point of suspension is moved along the line. The region where this directive force is noticeable is called the field of the magnet. (Gilbert's "orb of virtue"). If continuous lines are drawn, which at each point have the direction taken by the free magnet, these lines are called lines of magnetic force, and they offer a very convenient method for a general study of magnetic action. While these lines have no objective existence, it is, nevertheless, desirable to imagine that they are real and that they possess certain definite qualities. They should always be considered as being directed away from the north-seeking or positive pole. In the early conception of magnetic action these lines would have been regarded as the lines of flow of the magnetic material, and the word flux, still in use, bears evidence of this conception. It is convenient also to regard the lines of force as being under tension and capable of repelling each other. The number of actual lines of force which could be drawn about a magnet placed in an infinite region of space is infinite. For purposes of comparison, however, it is customary to represent the force action at a point upon the unit pole placed at that point by the number of lines drawn per square centimeter on a surface perpendicular to the lines of force. A unit field is one in which a force action upon a unit pole is one dyne, about the weight of 1-1000 of a gramme.

In order to compare magnets and to facilitate magnetic computations, certain methods of measurement have been devised. Only a brief sketch can be given here, as full details of these operations may be found in books devoted to this subject, some of which will be mentioned at the end of this article. When a bar magnet is placed at right angles to the lines of a uniform magnetic field, it will experience a twist tending to place it along these lines. The amount of this twist will depend upon three things. First: The pole strength of the magnet in question. Second: The distance between the poles. Third: The strength of the field where it is placed. The product of the pole strength by distance between poles is called the magnetic moment of the magnet. When a magnet is suspended freely and slightly displaced from a position parallel to the lines of force it will vibrate about this position. The time required for a complete swing is found to depend upon the magnetic moment, the moment of inertia and the strength of the field where the magnet is placed. The vibration period may be directly observed and the moment of inertia computed from the dimensions and weight of the magnet. In this way the product of the magnetic moment by the field strength may be found. If the same magnet is held with the line joining its poles east and west it will cause a small freely suspended magnet some distance to the east or west to turn slightly from its equilibrium position. The amount of this deflection depends on the distance between the magnets and the ratio of magnetic moment to field strength. If we denote the magnetic moment by \( ml \) and the field strength by \( H \), the product of \( ml \) times \( H \) is found from the time of vibration, and by means of the deflection of the small auxiliary magnet \( \frac{ml}{H} \) may be determined. When \( ml \) times \( H \) or \( ml \) divided by \( H \) is known either \( ml \) or \( H \) is readily computed. When the field at any point is known, a comparison of the time of vibration of a magnet at the known point with its period when vibrating at any other point enables us to compare the two fields without further measurement. The law of change being that if periodic time is doubled the field strength would be four times as great; or the period varies inversely as the square root of the field in which the magnet vibrates.

The facts mentioned above regarding the ability of a magnet to cause pieces of neutral iron or steel to show magnetic properties is frequently spoken of as magnetic induction. The general phenomena can be readily remembered if we imagine that it is easier for lines of magnetic force to pass through iron than through air. Small pieces, as shown at \( P \) Fig. 2, would have lines entering at \( S \) and leaving at \( N \) and would behave as small magnets placed in corresponding positions. Owing to the tension of the lines of force these small pieces would tend to set themselves nearly parallel to the undisturbed direction of the lines. If a sheet of glass or other non-magnetic material is placed over a magnet and iron filings are sprinkled on its surface, a slight tapping, sufficient to overcome friction, will enable the lines of force to arrange the small temporary magnets parallel to the field. In this way maps of magnetic fields may be readily found, and their study throws considerable light upon many details of these peculiar phenomena. Such fields are shown in Figs. 3 and 4. If a sphere of iron or cobalt is free to move in a magnetic field which is not uniform, a tendency is always observed for the iron to place itself in the strongest part of the field, or so that as many of the magnetic lines pass through it as possible. Such a substance is called paramagnetic. Some substances, as for example a sphere of oxide, will tend to move to the weaker portions of the field, indicating that it is more difficult for magnetic lines to pass through the material than through air. These are called diamagnetic bodies.

The importance of magnetic action in both theoretical and practical affairs is due largely
to its intimate connection with the phenomena of the electric current. In fact it is absolutely impossible under any conditions to have an electric current without producing a magnetic field. In the case of a long straight wire carrying current the magnetic lines are circular in form, concentric with the wire, and their planes are perpendicular to its axis. If a wire is wound in a long, straight, cylindrical coil, frequently called a solenoid, and a current be passed through it, the field produced will be nearly identical with that of a bar magnet, the difference being that the lines of force are entirely in air and are not modified by the peculiar properties of iron. By increasing the strength of the current and the number of turns of wire, a comparatively strong magnetic field may be produced at the centre. A piece of soft iron or steel inserted in the coil becomes a powerful temporary magnet, while strips of bar magnet iron or steel would in the same way become permanent magnets. The requirements of modern electrical processes have led to very careful investigations of the magnetic behavior of iron in connection with the production and the measurement of electric energy. Only a brief sketch of the fundamental features can be given here. If we suppose an electric current flowing in a long solenoid, which does not contain an iron core, the intensity of the magnetic field through the inside of the solenoid may be readily computed from a knowledge of the number of turns of wire and the strength of the current. The symbol $H$ is generally used to indicate the field strength when iron is absent. If now a bar of iron be inserted it will be found that the magnetic field is greatly increased. The new field will depend partly on the original value of $H$ and partly on the quality and previous magnetic history of the iron inserted. The symbol $B$ is generally used to denote the intensity of the field when iron is present. It may then be stated that $B = \mu H$, where $\mu$ is a variable factor depending on the nature of the iron and the field strength; this factor is called the permeability. The original field $H$ is frequently spoken of as the magnetizing field and the new one as the induction. $H$ stands for the number of lines per square centimeter where iron is absent and $B$ stands for the number of lines per square centimeter in the iron. If iron, in a neutral magnetic condition, is placed in a solenoid and the electric current is gradually increased from zero the iron will be subjected to a steadily increasing magnetizing field. A comparison of corresponding values of $B$ and $H$ in such a case leads to very important results. The relation between these values is best explained by reference to a curve drawn by using these quantities as co-ordinates. Such curves, usually called the curves of magnetization, are shown in Fig. 5. It should be observed that when $H$ is almost zero, the induction is very small, then $B$ increases more and more rapidly with a rising field until at point two the rate of increase of $B$ with $H$ begins to fall off rapidly, and shortly a value of $B$ is reached which cannot be materially increased no matter how strong a magnetizing field is used. For example in the specimens shown it is useless to extend the value of $H$ much above 70, and in actual practice this limit would be taken much lower. When as many lines as possible are carried through the iron it is said to be saturated. The exact shape of the magnetization curve will depend upon the nature and previous magnetic history of the specimen, but the ratio $B/H$ at any point gives the ability of the iron to multiply magnetic field strength for that particular field. If, however, any definite state of magnetization is attained as at the point $M$, Fig. 6, it will be found that upon reducing the field, $H$, the values of the induction, $B$, will not agree with those found for the same value of $H$ when the field was increasing. In fact if $H$ be changed to zero and then to negative values and back again to the former condition the value of $B$ will form a loop as indicated. This peculiar lag of the induction when the field is reduced is called hysteresis, and the hysteresis loop as shown is of practical importance because its area enables one to find the work converted into heat when the magnetization is carried through one complete cycle. The line ON measured the residual magnetism, which is
semi-permanent, and will be greater in hard than in soft iron or steel. No matter where the process of magnetization is stopped a series of cyclic changes of the magnetic field always gives corresponding loops.

A theory due to Weber and later improved by Maxwell which is useful in the correlation of the various phenomena observed in the magnetic behavior of iron is at once suggested by a simple experiment. Take a magnetic steel needle and which shows distinct polarity. Upon being broken into two parts it will be found that instead of securing two isolated poles, that each piece possesses a plus and a minus pole practically identical with the poles of the original needle. Carry this process to any length and each little piece, however small, will be found to possess two poles, one positive and the other negative. If we assume that this process could be carried on to the smallest conceivable particle of the iron we should say that each molecule of the iron is by itself a magnet. We may further suppose that the molecular magnets in a neutral piece of iron are entirely devoid of regular arrangement as regards position of the poles; such a chaotic condition may be indicated roughly by Fig. 7. It may be supposed that these molecular magnets are partly held in position by the action of forces analogous to friction, which also tend to hold them in any new position to a greater or less extent in case the original arrangement is disturbed. Under the action of a weak magnetic field these friction forces would prevent the turning of the molecular magnets into parallelism with the field lines. As soon as the field is strong enough to overcome this sort of friction we might expect the same tendency to arrangement of these minute magnets that is observed in the case of iron filings in the mapping of magnetic fields. As long as a considerable number of the axes of these molecular magnets make fairly large angles with the field lines the leverage by which turning is produced would be considerable; if however they approach parallelism with each other and the field lines, the effective twisting would be very materially reduced. This would correspond to the approximate saturation of the iron and no considerable change in position could be produced by increasing the field strength. The general arrangement may be indicated approximately in Fig. 8, where it will be observed that there is a tendency for free positive poles to appear at one end, namely, where the field lines leave the iron, and for uncompensated negative poles to appear at the other end.

The facts in favor of this sort of explanation may perhaps be briefly summarized as follows: (1) The general shape of the magnetic curve is explained. (2) As friction or other molecular forces tend to prevent a return to the original chaotic condition after magnetization this arrangement would in part persist after removal from the field, or permanent magnetism would be explained. (3) Soft iron should be easier to magnetize and less permanent than hardened iron or steel. (4) Jarring as by blows tends to reduce friction and to assist in the process of magnetization and also to reduce permanent magnetism. (5) Fluctuations in molecular activity consequent on rise of temperature decreases magnetic action, in fact, at a dull red heat iron is non-magnetic. (6) Rapid reversals of magnetism involves work against molecular forces and the production of heat, this heat is proportional to the area of the loop. (7) A tube of iron filings or a set of pivoted magnets shows the same behavior in a rising or falling magnetic field as a solid bar. The precise agreement between experimental facts and the indications from theory shown above makes this conception extremely useful. Just why molecules of iron should be permanently endowed with magnetic properties is a subject for speculation which has been indulged in by numerous prominent scientists. It has been suggested on example that electrical currents flow around these molecules, that they consist of vortex rings or that small electrically charged parts are in vibration in such a way as to produce the phenomena of permanent molecular magnetism. The general usefulness of the hypothesis is of no way connected with the truth or falsity of such speculations any more than the facts regarding free fall are dependent on our view of gravitation.

The general statements noted above regarding magnetism of iron are of importance in the manufacture and utilization of magnets for various purposes. Where a considerable amount of permanent magnetism is undesirable, soft iron or steel is always used. For the manufacture of permanent magnets special steel is selected and hardened and is then magnetized by its insertion into a solenoid carrying a powerful electric current. Severe shocks or blows are frequently given in order to assist in the molecular rearrangement. The induced magnetism is of all the elementary magnets together with temperature changes and mechanical shocks will tend to weaken a magnet. This loss is very considerable at first but finally an almost permanent state is reached. When used in electrical measuring instruments magnets are artificially aged by subjecting them to considerable changes of temperature and a series of mechanical shocks. It should be noted in this connection that the permanence of the magnet will be somewhat increased by joining its poles, when not in use, by a piece of soft iron. The induced magnetism at the ends of the iron helps to hold the poles of the small molecular magnets in position, and counteracts the tendency of these poles to demagnetize the bar.

Aside from the extended use of permanent magnets in electrical instruments their practicable application is comparatively limited. The electro-magnet is widely used where it is desired to cause a temporary force action at a distance from the operator, as for example in the telegraph, etc. Powerful electro-magnets are now frequently used to lift large masses of iron during manufacturing processes. It may
be noted in this connection that the lifting force of a magnetic piece of iron depends on the square of the number of lines per unit area at the contact face. Only so large an area should be used in contact as can be very highly magnetized by the current available. In the construction of dynamos, motors and transformers, the magnetic quality of the iron used is of great importance. The total number of lines set up (flux) must be sufficient for the operations involved and saturation should not be approached in any part. Where the cross section may be made large, cast iron can be used, but where the flux must be concentrated, special soft iron or steel is required. All air gaps are made as small as mechanical and electrical considerations of construction will permit, in order that the required flux may be more easily set up by the electro-magnets. Or as electrical engineers say, the magnetic reluctance is made small by use of properly proportioned iron parts and small air gaps in order that the magnetic motive force required may not be excessive.

Terrestrial Magnetism.—The statement usually made that a freely suspended magnet needle, remote from magnetic masses, tends to point north and south is not correct except for a few localities at certain times. The actual nature of the earth’s magnetic field must be found by extended experiments which are being carried on by numerous observers largely under the direction of various governments. (See methods of magnetic measurements above). If a steel needle be suspended by a silk fibre and carefully balanced so as to hang horizontal and is then magnetized it will be observed to finally come to rest in a certain vertical plane and to be inclined to the horizontal. The angle between a horizontal line and the direction of the needle is called the dip, and the angle between the true vertical and south plane and that in which the needle lies is called the declination. The values of the dip, declination and intensity of the earth’s field at a point are called the magnetic elements at that point. The use of the compass both by the surveyor and mariner over nearly the entire surface of the earth makes an accurate knowledge of these elements indispensable. In order to convey this information, in a practical way, recourse is had to maps on which places having the same declination, for example, are joined by lines. Such maps bring into view many interesting features as regards the earth’s magnetism. For example, Fig. 9, published by the United States Coast and Geodetic Survey for 1900 shows that in northern Oregon, Idaho and Montana the compass pointed approximately 20 degrees east, while in the extreme northeastern part of Maine it pointed about 20 degrees west. Along an irregular line crossing Michigan, South Carolina and passing east of Cuba the declination was 0, or the needle pointed due north. It is evident from an inspection of these maps that the poles of the earth considered as a magnet do not coincide with the geographic poles. The line of no dip follows the equator only approximately. North of this line the north end dips down, while at the south it is reversed. Some of the minor variations are no doubt caused by local causes, such as masses of magnetic material, but it is a general belief among observers that the earth’s magnetism is largely due to outside agencies. Another very important point for the mariner, who depends on the compass to find his way in safety across trackless seas or the surveyor anxious to locate landmarks, is that these magnetic elements are continually changing even during the day, as well as month by month and year by year. In London during 232 years the declination changed 35 degrees. A street one mile long laid out in London parallel to the compass direction in 1800 would have its terminus seven-tenths of a mile too far east according to the compass in 1812. Since 1812 the declination at London has changed from about 24 degrees west to 16 degrees west. In 1850 it was 11 degrees east. In fact it would seem that the magnetic poles of the earth are slowly vibrating. The periods of some of the components of this vibration are astronomical in origin—the day, the year, the lunar month, the sun-spot period, etc. The variation during the day must be taken into account in accurate work as a mile run in the morning and repeated in the afternoon may vary by 5 to 20 feet at its terminus. Sudden changes called magnetic storms also frequently occur, which seem to be associated with atmospheric electrical conditions, sun spots, etc. In order to secure data for the study of these complex phenomena, magnetic observatories are maintained where delicate instruments record, day and night, the countless fluctuations of the magnetic forces.

The problem of the navigator is still further complicated by the use of iron ships which are always sources of disturbance, both because of their permanent as well as their variable magnetism. The continual jarring and changes of temperature during a voyage enables the earth’s field to continually change the distribution of magnetism in the vessel. The means to be used for the correction of this deviation have received the attention of many skilful investigators. The limits of this article will hardly allow a discussion of the matter which may be found in special books noted at the end. The contrast between the state of knowledge regarding magnetism before 1600 and its present development is one of the most striking indications of the growth of scientific investigation. Instead of vague speculations, partial truths veiled in mysticism, more or less direct references to dogma, and the mere organized knowledge based on experience and constantly checked by experiment and ap-
MAGNETISM. Animal. See Animal Magnetism.

MAGNETITE, or MAGNETIC IRON ORE, native magnetic oxide of iron, Fe₃O₄. It sometimes has part of its iron replaced by titanium or magnesium, and occasionally by nickel. It is very abundant (the production of the United States in 1914 being 1,610,203 long tons, or about 3 per cent of the iron ore produced). When pure it constitutes a valuable ore of iron, 72 per cent of its weight consisting of that metal. Magnetite crystallizes in the isometric system, commonly in octahedra, but also in dodecahedra, with striated faces. It also occurs, and very generally, in massive and granular forms. It is black in color, with a metallic or submetallic lustre. It is brittle, and has a hardness of from 5.5 to 6.5; the crystals having a specific gravity of about 5.17. It may be readily distinguished by the fact that it is strongly magnetic. Specimens are found which manifest quite a strong, permanent magnetic polarity, this variety of the mineral being known as lodestone. Magnetite occurs in vast beds in Canada and in the northern and eastern parts of the United States. Abundant deposits of it are also known in California and Washington. It is a common result of segregation in magmas during cooling. See Iron Ores; Magnetic Segregation.

MAGNETO, a device, consisting essentially of a magnet and interrupter, for sending sparks into the ignition system of an automobile. The Eisemann, Bosch and Splitdorf are well-known types. See ELECTRIC-BATTERY MACHINES.

MAGNETO-ELECTRIC MACHINES. See Electro-Therapeutics.

MAGNETO-ELECTRICITY. See Electro-Magnetism.

MAGNETOMETER, in its customarily restricted sense, an instrument employed in observatories to determine the intensity of terrestrial magnetism. Essentially the instrument consists of a magnet swinging in a horizontal plane within a circular scale. The magnet may be supported on a fine vertical pivot, or by suspension on a fine untwisted silk thread. Bifilar suspension is more to be depended upon; the magnet is supported by two parallel threads and screws enable the tensions in the threads to be equalized and their distance asunder to be adjusted. For delicate readings the instrument has been highly refined, a mirror being attached to the magnet, reflecting a beam of light upon a graduated scale. To prevent possible oscillations due to air currents the magnet is enclosed within a box with glass sides, through which it may be observed. A tall tube above the box encloses the suspending thread. The unifilar magnetometer is set up with its magnet lying in the direction of the magnetic meridian. The bifilar instrument is set with the magnet at right angles to that meridian—a much more sensitive position. To fill the needs of traveling observers, portable magnetometers have been devised. These are more comprehensive, comprising within a single unit an astronomical telescope with a magnetometer—for the determination of both the magnetic declination and the horizontal intensity; and also a dip circle for the determination of inclination and total intensity. Consult Terrestrial Magnetism, Vol. VI, page 7, 'Two New Types of Magnetometers'; and Vol. XVIII, page 105, 'Description of the CIW (Carnegie Institution, Washington) Combined Magnetometer and Earth Inductor' (September 1913). See MAGNETIC Terrestrial.

MAGNIFICAT. The words which Mary pronounced when she visited Elizabeth (Luke i, 46-55) begin, 'Magnificat anima mea dominum' ('My soul doth magnify the Lord*). Hence the whole of her thanksgiving on this occasion has been called the Magnificat. The present usage of the Roman Catholic Church is to chant or pronounce the Magnificat every day at vespers.

MAGNOLIA, Ark., town, county-seat of Columbia County, on the Louisiana and North-west and the Saint Louis Southwestern railroads, about 150 miles southwest of Little Rock. It is in an agricultural and lumbering region. Considerable cotton and fruit are raised in the vicinity. It has a large trade in lumber, fruit, cotton, cottonseed products, corn, oats and potatoes. Its chief buildings are the county buildings, the schools and church. It is also the seat of the State agricultural college. Pop. 2,045.

MAGNOLIA, a genus of ornamental, deciduous or evergreen trees and shrubs of the family Magnoliaceae. The 35 species are natives
mostly of the United States, India, China and Japan. They are characterized by large, alternate entire leaves, large white, purple or pink, sometimes yellowish, solitary, terminal flowers, which are often highly fragrant; and coneshaped, often red, decorative fruits. They are widely planted for ornament in parks and gardens; most of the deciduous species being tolerably hardy as far north as Massachusetts, some even farther north, but the evergreen kinds tender even at Washington, where, however, one species (M. grandiflora) can withstand the winter if in protected situations. The wood is close-grained, generally soft, spongy, light and satiny. It is little used because it is not durable, but in Japan one species (M. hypoleuca) is used for lacquering. The bark and the fruits of a few species were formerly employed as stimulants and tonics, but have fallen into disuse.

As a rule, magnolias thrive best in rather rich, fairly open, moist, peaty or sandy loams, but generally prove satisfactory upon any garden soil. The tree, especially the beaver (M. glauca), which is also popularly known as sweet, swamp or white bay, are natives of very wet grounds and must be naturally well supplied with water, when planted for ornament. They may be propagated by means of layers, by grafts or by seeds planted as soon as ripe or stratified in sand and kept out of doors where they cannot become dry. The plants should be transplanted when the new growth is commencing, otherwise the operation is frequently unsuccessful.

The following species are among the most generally planted in the United States. The bull bay or big laurel (M. grandiflora) is found naturally from North Carolina to the Gulf States. It is a pyramidal, evergreen tree which usually attains heights of 75 feet or more, and is especially conspicuous when in blossom, its fragrant white flowers often attaining a diameter of a foot. The swamp sassafras or sweet bay (M. glauca) ranges from the coast region of Massachusetts to Florida and irregularly southward. It reaches a height of 20 feet and bears fragrant cream-colored flowers. The cucumber trees (q.v.) are natives of the southeastern United States and are particularly attractive because of their pink fruits. Of the exotic species the yulan (M. dewudata), a native of China, where it has been cultivated for more than a thousand years, and M. coco, M. liliflora and M. hypoleuca are popular, the first and last particularly. By crossing, hybridizing and selecting a large number of choice horticultural varieties have been produced.

MAGOFFIN, ma-gôf'n, Beriah, American statesman: b. Harrodsburg, Ky., 18 April 1815; d. there, 28 Feb. 1885. He was graduated from Centre College (Danville, Ky.), in 1833, from the law school of Transylvania University (Lexington, Ky.) in 1838, entered the practice of law in 1839, but in the same year returned to Harrodsburg. In 1840 he became police judge, in 1848, 1856 and 1860 was a delegate to the Democratic national conventions, in 1850 was elected to the State senate of Kentucky and in 1853-62 was governor of Kentucky. He refused, 15 April 1861, to comply with Lincoln's call for 75,000 troops; in May 1861 by proclamation warned both the Confederate and Federal governments against occupying Kentucky soil, and the citizens of the State against entering hostilities; and, in August requested Lincoln to withdraw United States troops. He vetoed a resolution of the legislature directing him to proclaim the evacuation of Kentucky by the Confederates; but the resolution was passed over his veto. In August 1862 he resigned without taking his seat, and was elected to the lower house of the State legislature.

MAGOG, ma-góg, Canada, town in Stanstead County in the province of Quebec, on Lake Memphremagog at its outlet, and on the Canadian Pacific Railroad, about 19 miles southwest of Sherbrooke. It has regular daily communications with Newington and other places in Vermont. Its industries include textile prints, lumber and butter and cheese making. Magog is a favorite resort for anglers. Pop. about 4,000.

MAGOG. See GOG AND MAGOG.

MAGOON, mà-goon, Charles E., American lawyer and administrator: b. Steele County, Minn., 5 Dec. 1861. He was educated at the University of Nebraska, was admitted to the bar in 1882 and engaged in the practice of law at Lincoln, Neb., in 1882-99. He was appointed judge-advocate of the Nebraska National Guard, with rank of major, and in 1899-1904 was law officer of the Bureau of Insular Affairs at the War Office. He served as general counsel for the Isthmian Canal Commission in 1904-05, and was a member of the commission in 1905-06. He was governor of the Canal Zone from 25 May 1905 until 12 Oct. 1906. He was also Envoy Extraordinary and Minister Plenipotentiary to Panama from 7 July 1905 until 12 Oct. 1906. He acted as provisional governor of Cuba from 12 Oct. 1906 until 28 Jan. 1909. Author of 'The Law of Civil Government Under Military Occupation' (1902).

MAGOT. See BARBARY APE; MACAQUE.

MAGPIE (originally pie, the pied or variegated bird, a bird of the genus Pica, closely related to the jays. The genus is distinguished by the extremely long wedge-shaped middle feathers of which equal the entire length of the head and body, while the outer feathers are less than half as long. The notorious magpie of Europe (P. rustica) is represented in North America by the variety hudsonia, which is rather larger but otherwise similar. The color is a lustrous black with a varied and changing iridescence and sharply contrasting white under parts and patches on the shoulders and wings, the latter being conspicuous as the bird flies. The yellow-billed magpie (P. nuttalli) of California is precisely similar except that the bill and a naked area at its base are yellow instead of black. Other species inhabit Asia and Africa. In America the common magpie is confined to the west, its range reaching from Alaska to Arizona and from the plains to the Cascade Mountains, being especially common in the Rocky Mountains. The magpie is a handsome bird of saucy, vivacious habits and is chiefly noted for its thieving habits and general rascality. It is always engaged in mischief, either in stealing brightly colored or glittering objects from the habitations of man or in robbing the nests of other birds, but because of its pert, merry manner is
usually forgiven for the former class of offenses. The caged birds seen in the East give but a faint idea of the beauty and activity of these birds in the wild state. Like the jays the magpies are omnivorous, but are less strictly arboreal than they. The nest, which is built in a tree, is usually elaborately elaborately elaborately elaborately constructed. It is a large domed structure protected outwardly by a thick, bristle-like layer of thorns and twigs, through which a narrow passage opening on one side leads to the interior, covered with mud and lined with fibres. Six to nine greenish drab eggs, much spotted and dashed with various shades of brown, are laid. The American magpie is occasionally taken young and made a pet, but it has not the reputation for talking and amusing, albeit thieving, manners, which has made the European bird a favorite from ancient times. Descriptions of its many interesting habits will be found in the books of Coues, Ridgway, Merriam, Cooper, Keysor and other writers upon the birds of the western United States.

MAGRATH, mag-grath, Andrew Gordon, American Confederate governor: b. Charleston, S. C.; d. there, 9 April 1893. Magrath was the son of an Irish revolutionist of 1798 who escaped to South Carolina. He was educated at South Carolina College (1831) and at the Harvard Law School. He served two terms in the State legislature (1840-44), practised law in Charleston and in 1856 was made Federal district judge by President Pierce. In 1861 he resigned, was elected to the South Carolina convention which adopted the ordinance of secession and was then appointed Confederate judge. In December 1863 he became governor of South Carolina. After the war he was imprisoned for several months. He later resumed the practice of law in Charleston.

MAGRATH, William, American painter: b. Cork, Ireland, 20 March 1838. He emigrated to the United States in 1855, and was elected National Academician in 1876. He has produced many excellent landscapes and his genre pictures are full of character. Among them may be mentioned 'The Road to Kennan' (1871); 'The Reveille' (1872); 'Rustic Courtship' (1873); 'The Circular' (1877); 'On the last Box' in the New York Metropolitan Museum; 'Paddy on his own Land' (1900); 'Sheep Pasture' (1902); 'The Killarney Country' (1910); 'The Bog of Allen, Ireland' (1911); 'Bog Lands' (1913).

MAGRUDER, mag-roo'der, John Bankhead, American soldier: b. Winchester, Va., 15 Aug. 1810; d. Houston, Tex., 19 Feb. 1871. He was graduated at West Point in 1830, served for a short time in the 7th Infantry, then in the artillery. In 1836 he was made first lieutenant, saw service in the Seminole War 1837-38, and became captain in 1846. He took an active part in the Mexican War, rising to the rank of lieutenant-colonel, 1847. In 1861, while in garrison at Washington, D. C., he resigned from the United States Army, accepted a Confederate colonelcy and commanded the artillery at Richmond. In the same year he won the battle of Big Bethel (q.v.), and was made brigadier-general and major-general. Assigned to the Yorktown district, he fortified the Peninsula and with a force of 12,000 held it against the Army of the Potomac in April 1862. In the Seven Days' Battles (q.v.) he commanded the Confederate left. In October 1862 he was appointed commander of the Department of Texas. He recaptured Galveston 1 Jan. 1863, and broke the blockade of that port. After the war he served as major-general in the army of the Confederacy until the end of the empire, but finally in 1869 he settled at Houston for the rest of his life.

MAGRUDER, Julia, American novelist: b. Charlottesville, Va., 14 Sept. 1854; d. Richmond, Va., June 1907. Her literary career began in 1885 with 'Across the Channel,' published anonymously. She wrote 'A Magnificent Plebeian'; 'The Violet'; 'Miss Ayre of Virginia'; 'A Manifest Destiny'; 'Princess Sonia' (1895), etc.

MAGUAGA, Battle of. See DETROIT, SIEGE AND CAPTURE OF.

MAGUIDANAO, mā-gēn-dā'nōw, a tribe of Moros who inhabit the valley of the Rio Palangui, island of Mindanao; the Moros of the Sarangani Islands, and some of those of Davao Bay belong also to this group. See PHILIPPINE ISLANDS.

MAGYAR MUSIC. See HUNGARY, Mus.

MAGYARS, mō'gérz, the original name of the Hungarians, which they still use in preference to any other. See HUNGARY.

MAHA-KASYAPA, mā-hā kā'shē-pā, one of Buddha's first converts and one of his 80 great disciples who was favored by Buddha as his successor. After the death of Buddha he seems to have taken an active part in the work of organizing and propagating the faith. It was at his instance that the first Buddhist council of a general nature assembled. He gave considerable attention, according to tradition, to the organization and arrangement of the canonical books of the Buddhist faith. Playing such a prominent part at the dawn of the Buddhist religion, and being the beloved and trusted disciple of the master and, in a sense, his successor, it is natural that he should enter largely into the legendary and traditional religious lore of the Buddhists, as he does, in fact, in 'Consul Bour monuments, 'Introduction à l'histoire du bouddhisme' (Paris 1871); 'Le lotus de la bonne loi' (Paris 1852); Kern, 'Manual of Hindu Buddhism' (Strassburg 1896); Rhys, Davids, 'Buddhism' (London 1890).

MAHĀBHĀRATA. The name of this, the great national epic of the Hindus, etymologically considered, consists of the word *mahā,* meaning 'great,'*great,'* and 'bhārata,' one of the several names of a powerful Indian tribe, but has reference more to the story itself, than the great title of Bhārata.* In the shape in which the Mahābhārata has come down to us it is enormous in bulk, comprising some 100,000 cakas (couplets), and as its author is cited one Vyāsa. But the word *vyāsa* stands for 'reviser,'*reviser,'* *editor,* and this alone, irrespective of the fact that a description of this Vyāsa has existed, seems clearly to prove that the Mahābhārata represents a gradual growth and gathering of poetic material finally given a collective name and figuring as an entity. In the poem itself the number given (distichs) is given as 24,000, while there is
rather strong literary proof that the original core was even much smaller than that, namely, counting but 7,800 closing lines. The colossal remainder represents accretions and superimpositions that were at last included in the whole — many episodes, much legendary lore, lengthy and detailed ethical precepts, such as the Kshatras, the warrior caste, to guide their better path. The total cast of the temples, shrines at least fragments and selections from it. Thus we do know that the "Mahabharata" is a work of great antiquity; but the exact period of birth, the whole story of its genesis, we cannot even guess. It is certain, however, that much of the epic, describing the war between the Kurus (or Bharatas) and the Pandavas, must have antedated the Vedic epoch. The archaic language shows this. This simple tale gives us as heroes Durvõdha, son of blind King Dhirtarashtra, Drõna, Kama, Çalya among the Kurus, and among the Pandavas the five sons of Pandu, Ardjuna, Jishthihira, Bhima, and the Vrishnic incursion, their wise counselor, Krishna, the ruler of Yãdava, the "spinners of all ruses and deceptions." The circumstances that the five Pandava brothers havejointly but one wife, Drûpâdi, and the fact that the caste, marriage and inheritance customs, as exemplified in the poem, are in strong contrast with later practices, of itself bespeaks great antiquity of this, the core of the epic. Brahmanism had not yet crystallized when it originated. At very different periods extraneous matter has been interposed and amalgamated with this primary portion of the Mahabharata. In fact, all that ran riot in the earlier Hindu mind in the shape of folklore, legend and myth was, one after the other, added to the first text and gradually coalesced with it. Hence, too, the enormous size of this lay as we have it now. But even as it is, the Mahabharata is by no means a unit accepted by all. We see it subdivided in the north of India into 18 books (Purânas), sometimes including the 19th, the Harivamça; in the south it exists in 24 books, and the various chapters differ materially in sundry versions, both in text and size. The most comprehensive and enlightening critical work in this line has been done by the Danish philologist, Søre Sørensen, in his comprehensive Hинди literature (Copenhagen 1843). A careful examination of the whole text unavoidably betrays the mixed origin of the Mahabharata, shows plainly the earmarks of having been worked over, revamped, added to, and that numberless scribes have probably been busy at this task for a period exceeding 10 or 12 centuries. The composite character of the poem is also shown by the different metres, contents and spirit. By some scholars, such as Hopkins and Dhalmeier, the conclusion has been reached that there were earlier portions of the epic than now remain; perhaps, as Grierson holds, describing an initial struggle for the possession of northern India between the Aryans and the Persians. As it stands at present the poem — meaning its oldest core — is somewhat puerile, since it starts with an account of a gambling match, at which the Kurus cheat the Pandavas, and rob them of the kingdom, and exiled them for 12 years. While spending this exile in the forests and groves, tales are told to while away the dreary hours. When the exile draws to a close the Kurus are utterly routed during an 18 days' battle. This story furnishes no more; it is crude and in a literary sense sadly deficient, but it doubtless derives from the hoary past. The 20,000 stanzas of rules and instructions to the warrior caste are jumbled, often contradictory. From an artistic point of view the best parts of the whole are episodes like that of Damayantî and Nâla, of Savitri, etc., which have been successfully dramatized. Like all of Hindî literature, even the best, there is a palpable lack of proportion. But there are eminently strong passages, interlarded here and there in the whole and showing pathos, tenderness, descriptive powers. The student may be referred to a good summary of the poem, "Mahabharata, the Epic of Ancient India," condensed into English verse by Ramesh Dutt (London 1898), to "Geschichte der indischen Literatur" (Leipzig 1908), by M. Winternitz; to "Das Mahabharata" (Kiel 1892-95), by Adolf Holtzmann; or to the English translation of the original work by a Hindû scholar, Protap Chandra Roy (Calcutta 1883).

WOLF VON SCHIERBAND.

MAHADEVA, mä-hā-da'vä, in Hindu mythology, a deity who shares the attributes of Siva in the Indian Trinity, Mahadeva being regarded as a generator as well as a destroyer.

MAHAPPY, mä-häf't, John Pentland, Irish Greek scholar: b. Chaponnaire, near Vevey, Lake Geneva, Switzerland, 12 July 1839; d. Dublin, Ireland, 1 May 1919. He was educated in Germany and at Trinity College, Dublin, from which he graduated in 1859; and became professor of ancient history in the college in 1871. In 1873 he was Donnellan lecturer. His first publication was a translation of Kuno Fischer's "Commentary on Kant" (1866); and on philosophical subjects he has since issued several volumes. The greater number of his works, however, treat of the history, literature and everyday life of ancient Greece, among these being the following: "Prolegomena to Ancient History" (1871); "Greek Social Life from Homer to Menander" (1874); "Greek Antiquities" (1876), a work much used in Continental schools; "Rambles and Studies in Greece," a record of antiquarian research (1876); "Old Greek Education" (1879); "History of Classical Greek Literature" (1880; 3d ed., 1891); "Greek Life and Thought from Alexander to the Roman Conquest" (1887), a continuation of the work of 1874; "The Greek World under Roman sway" (1890), a continuation of the foregoing; "Age of Alexander's Empire" (1890); "Greek Pictures" (1890); and "Problems in Greek History" (1892); "The Progress of Hellenism in Alexander's Empire" (1905); "The Silver Age of the Greek World" (1909), "What have the Greeks done for Modern Civilization" (1909). He writes with special interest and authority of the post-Alexandrian period; and has discovered interesting parallels between that and modern civilization. Among
his other writings are 'Twelve Lectures on Primitive Civilization' (1868); 'Report on the Irish Grammar Schools' (1880-81); 'The Decay of Modern Preaching' (1882), and 'The Art of Conversation' (1889); 'An Epoch in Irish History' (1904).

**MAHALEB**, a kind of European cherry (Cerasus mahaleb), whose fruit affords a violet dye and an aromatic liquor. Its flowers and leaves are used by perfumers, and its wood by cabinet-makers. See CHERRY.

**MAHAN, mā-hān', Alfred Thayer**, American naval officer: b. West Point, N. Y., 27 Sept. 1840; d. 1 Dec. 1914. He was graduated from the United States Naval Academy in 1859, and served during the Civil War, rising to the rank of lieutenant-commander in 1865. In 1885 he was promoted captain, and in 1886 was appointed president of the Naval War College at Newport, a position which he held till 1888, and again 1892-93. In 1893-95 he was commander of the *Chicago*, and in 1896 was retired after 41 years' active service at his own request. In 1898 during the war with Spain he was a member of the Naval Board of Strategy; and in 1899 one of the United States delegates to The Hague Peace Conference. In 1906 he was advanced to the rank of rear-admiral on the retired list. In 1890 he published his chief work, 'Influence of Sea Power upon History'; the continuation, 'Influence of Sea Power upon the French Revolution and Empire,' appeared in 1891; his other writings include: 'The Gulf and Inland Waters' (1883); 'Life of Admiral Farragut' (1892); 'Life of Nelson' (1897), highly commended by English critics; 'The Interest of America in Sea Power' (1897), a compilation of his magazine articles; 'Lessons of the War with Spain' (1898); 'The Problem of Asia' (1900); 'The South African War' (1900); 'Types of Naval Officers' (1901); 'Retropect and Prospect' (1902); 'Seapower in its Relations to the War of 1812' (1903); 'Some Neglected Aspects of War' (1903); 'From Sail to Steam' (1907); 'Naval Administration and Warfare' (1908); 'The Harvest Within' (1909); 'The Interest of America in International Conditions' (1910); 'Arms and Arbitration' (1912); 'Major Operations of the Navies in the War of American Independence' (1913).

As a historian he made a distinct contribution to historical science as the first writer to demonstrate the determining force which maritime strength has exercised upon the fortunes of individual nations, and consequently upon the course of general history. Technically, his representative work, the 'Influence of Sea Power upon History,' is but a naval history of Europe from the restoration of the Stuarts to the end of the American Revolution. But the freedom with which it digresses on general questions of naval policy and strategy, the attention it pays to the relation of cause and effect between maritime events and international politics, and the author's literary method of treatment, place this work outside the class of strictly professional writings and make it a recognized leading authority. His prime object, in establishing the thesis that maritime strength is a determining factor in the prosperity of nations, was to reinforce his argument that the future interests of the United States require a departure from the traditional American policy of neglect of naval-military affairs. Captain Mahan was president of the American Historical Association in 1902-03; and received honorary degrees from several universities, including D.C.L. from Oxford and LL.D. from Cambridge (Mass.), Harvard, Yale, Columbia and McGill universities.

**MAHAN, Asa**, American Congregational clergyman and educator: b. Vernon, N. Y., 9 Nov. 1800; d. Eastbourne, Sussex, England, 4 April 1889. He was educated at Hamilton College, Clinton, N. Y., and Andover Theological Seminary, and after holding pastorates at Pittsford, N. Y. and Cincinnati, Ohio, was president of Oberlin College 1838-50; and also professor of philosophy there. He was president of Cleveland University 1850-56; and of Adrian College, Michigan, 1860-71. After the last-named date he lived mainly in England. Among his works were 'Doctrine of Christian Perfection' (1839); 'System of Intellectual Philosophy' (1845); 'The Will' (1846); 'Science of Logic' (1857); 'Mental Philosophy' (1882); 'History of Philosophy' (1883).

**MAHAN, Dennis Hart**, American military engineer: b. New York City, 2 Feb. 1813; d. near Stony Point, N. Y., 16 Sept. 1871. He was graduated at West Point in 1824, where in 1825 he was appointed assistant professor of mathematics and of engineering. He was stationed in Europe four years on professional duty and in 1832 returned to West Point as professor of military engineering, where he remained until his suicide, which was caused by temporary insanity. His textbooks are generally recognized authorities and include 'Treatise on Field Fortifications' (1836); 'Descriptive Geometry' (1846); 'Military Engineering' (1865); 'Permanent Fortifications' (1867); 'An Elementary Course of Civil Engineering' (1837, rewritten 1868), etc. Consult Abbott, H. L., 'in Biographical Memoirs of the National Academy of Sciences' (Vol. II, Washington 1886).

**MAHAN, Milo**, American Protestant Episcopal clergyman, brother of Denison H. Mahan (q.v.); b. Suffolk, Va., 24 May 1819; d. Baltimore, Md., 3 Sept. 1870. He was educated at Saint Paul's College, Flushing, L. I., and in 1845 was ordained in the Protestant Episcopal Church. He was called to the charge of Grace Church, Jersey City, N. J., and became assistant at Saint Mark's, Philadelphia, in 1850. In 1857-64 he was professor of ecclesiastical history at the General Theological Seminary, New York. He became rector at Saint Paul's, Baltimore, Md., in 1864 and spent the remainder of his life there. Author of 'The Exercise of Faith' (1851); 'History of the Church During the First Three Centuries' (1860; enlarged to cover seven centuries, 1872); 'Palmoni, a Free Inquiry' (1864); 'The Comedy of Canonization' (1869); 'Collected Works' (3 vols., 1872-75).

**MAHANADI, mā-hānādī'**, or MAHA-

**MAHANUDY ("The Great River"), a river in British India. In the upper part of its course it drains the fertile plain of Chhattisgarh in the Central Provinces; flows southeast and then east through the province of Orissa, past Sambalpur and Cuttack, into the Bay of Bengal, by two months, after a course of about 530 miles.
During the rains it is navigable 30 miles from its estuary, but a large portion of its channel is dry during five or six months of the year, and since the opening of the Bengal and Nagpur Railroad it has been little used for navigation. It is estimated that the Mahanoy drains an area of nearly 44,000 square miles, and during the rainy season about 1,500,000 cubic feet of water passes every second through the Maraj gorge, which amount decreases in dry weather to 1,125 cubic feet. The stream and the irrigation canals connected with it areuvous. Diamonds are found in this river and in several of its tributaries.

MAHANOY (mā-hā-noi) CITY, Pa., borough, in Schuylkill County, on Mahanoy Creek, and on the Lehigh Valley and the Philadelphia and Reading railroads, about 55 miles northeast of Harrisburg. The first settlement was made in 1859, and it was incorporated in 1863. It is in the anthracite region, and in the vicinity is fire-clay and an excellent building-stone. Its chief manufactures are pottery, foundry products, and glass. There is a paper mill and lumber. In the vicinity are many collieries, all of which are operated by residents of Mahanoy City. The city has excellent public and parish schools and a church. Pop. 15,935.

MAHARAJAH, mā-hā-rā′ja, a title used in India; applied in courtesy to every rajah, or to any person of high rank or deemed holy.

MAHASEER, mā′ha-sēr, a large and ravenous barbel (Barbusitor) of India, which reaches six feet in length and in the early part of the rainy season affords the best sport known to the anglers of India and Ceylon, as they take a fly readily, and struggle with the ganniness and energy of a salmon to get free, pleasantly taxing the skill of the angler to bring them to land without breaking rod and line. They spawn at the heads of the hill-rivers, and then descend before the young are hatched. They then have an opportunity to grow in comparative safety to a size which enables them, the following season, to descend the rivers and take care of themselves; otherwise they would be devoured in infancy by their elders.

MAHATMA, a Hindu word meaning the great-souled one, and applied among the Brahmans to one who has attained the highest possible point of spiritual enlightenment. It is also the name of a high priest or "wise leader" of the theosophists.

MAHĀYĀNA ("The Great Vehicle"), the name of one of the principal divisions of Buddhism (q.v.). It originated in northern India about the beginning of the Christian era through a gradual synthesis of tendencies already manifest in earlier Buddhism, possibly with some admixture of ideas from the West.

In its philosophy the Mahāyāna goes beyond primitive Buddhism's denial of the real existence of a soul or ego, and maintains the doctrine of the utter unreality of all experience. This is expressed in the formula "everything is void," which is interpreted by the Mahāyānaka, or sceptical, school as meaning that it is impossible either to affirm or to deny anything concerning reality, whereas the Viśnūvādins, or idealists, declare "the void" to be pure thought, without distinction of subject or object. Both schools admit that the illusion of the phenomenal world is invincible for even the wisest man, and that only the Buddhas are perfectly free from it, so that the practical validity of experience is not impaired.

The idea of the Buddha, or "Enlightened One," has received a great extension in the Mahāyāna, and the human traits of the historic Gautama have been lost in the radiance of divinity. There are countless Buddhas throughout the worlds, and they are not themselves through infinite periods of time in the celestial heavens, as well as by appearing on earth in the guise of human teachers. In their function of enlightening all creatures they are aided by the celestial Bodhisattvas, or Buddhas-to-be, who are more actively beneficent. Among the Buddhas the most worshiped is Amitābha, "He of Boundless Light," the ruler of the Western Paradise called Sukhāvati, "Happy Land." This deity, who is quite unknown in the earlier Buddhism, is presumably of solar origin. The merciful Avalokitēśvara, and Mahāvīra, the fount of wisdom, are especially prominent Bodhisattvas. The belief in female Bodhisattvas, such as Tārā and the Chinese Kwan-yin, is a later development, as is also the notion of a "primordial Buddha," or First Cause. All this luxuriant polytheism is harmonized with the doctrine of "the void" through the belief that a Buddha has three "bodies" or modes of being, the "body of the Law," identical with the void, the "body of bliss," an appearance manifested to the celestial beings, and the "body of fabrication," the illusory form of an earthly Buddha such as Gautama.

The Mahāyānist belief in the powerful and merciful Buddhas and Bodhisattvas is accompanied by a new conception of the religious life. Instead of the older self-centred system of monastic discipline, by which the individual was to obtain final deliverance, Nirvāṇa, at the close of his present existence, the Mahāyānists made it their goal to become Buddhas themselves, after practising all the virtues through numberless existences, for the sake of the salvation of all beings. Everyone who consecrates himself to this aspiration is a Bodhisattva, or potential Buddha, although he will not attain the rank of a celestial Bodhisattva until toward the last of the 10 stages in his career. Self-sacrifice, rather than self-restraint, is therefore the keynote of the ethics of the Mahāyāna, and though the institution of monasticism is preserved, the discipline is relaxed, and laymen also may follow the career of a Bodhisattva. Prayer and confession of sins to the Buddhas are commanded, and forgiveness is believed to be secured through their superabundant merits.

The broadly human quality of the Mahāyāna religion involved a certain sacrifice of the distinctive features of Buddhism, and its later development, particularly in the form of the Tantra (q.v.) system, shows a gradual approximation to the contemporary Hinduism. Hence in India the Mahāyāna ultimately gave way to the Vedānta philosophy and the popular religions of Vishnu and Siva; but it still survives in the countries to the north and east, whether it had been carried by missionary activity. In Tibet and Mongolia it has assumed the form of Lamaism (q.v.), while in China and Japan it shows more of its primitive character, although
in the latter country especially it has split into numerous sects, some of which hold a decidedly theistic belief.

CHARLES J. OGDEN.

MAHDI, mā’dē. See Mad Mullah.

MAHE, mā-hē, Indian Ocean, the largest island of the Seychelles Archipelago, belonging to Great Britain. It is 17 miles long by 4 miles broad, has an area of 55½ square miles and attains an elevation of 2,000 feet above sea-level, from which it rises in most places nearly perpendicularly. It contains Victoria, the administrative centre, and a coal mining station with a good harbor. Pop. 20,000. See Seychelles.

MAHOL. See Machol.

MAHI KANTHA (mā-hē kān’tha) AGENCY, India, a group of native Gujarat states, administered since 1820 by a British political agent of the province of Bombay. The chief state, Ídār, occupies about one-half of the combined area of 3,125 square miles. There are 11 other states of much importance. The climate is fair, April and May being the hottest months, and January the coolest. The average annual rainfall at Ídār is 34 inches. About one-fourth of the area is capable of cultivation. During the famine of 1899–1900 a great number of the people perished. Pop. about 375,000, consisting largely of wild Bhil and Khoil tribesmen.

MAHICAN, mā-hik’ān (meaning “wolf’), an Algonquin tribe of American Indians formerly occupying the Hudson River Valley. They were related to the Delawares and the Mohegans, the collective tribes being known as the Lwop or Wolf Indians. At one time there was a settlement of 40 villages near the site of the present city of Albany. The assaults of the Iroquois and the white settlers diminished the tribe until the remnants of the race became merged with the Delawares. In 1736 those who still remained in Massachusetts, whither they had removed some years before, came together as a unit at Stockbridge and assumed the name of Stockbridge Indians. Later they removed to New York, but now, together with a part of the Munsee, they are located upon a reservation near Green Bay, Wis.

MAHMOD (mā-mood’) I, or MOHAMMED, Turkish sultan: b. Constantinople 1296; d. 1754. He was the son of Mustapha II and succeeded his uncle Achmet III in 1730. He was a well-disposed but incapable monarch and his reign is of little importance. See MOHAMMED.

MAHMOD II, Turkish sultan: b. 20 July 1785; d. 1 July 1839. He was the second son of Abd-ul Hamid I, and under the reign of his uncle Selim III he received an education exceptionally broad for a prince of his station. He succeeded his brother Mustapha in 1808 and organized his government on a reform basis. He conducted a war against Russia and Serbia until 1812, when by the Treaty of Passarowitz Moldavia and a greater part of Wallachia were restored to the Ottoman government, even though the Russian frontier was somewhat advanced. He subjected the Wahabees and quelled the insurrection of Ali Pasha of Janina in 1822. In his war with the Greeks he incurred the intervention of the powers with disastrous results to his forces and by the Treaty of Adrianople (q.v.) he was obliged to yield so much that his power was greatly weakened. Mahmud was a progressive monarch, he introduced modern ideas of warfare, a regular police system and founded schools. Against serious obstacles he crushed the janissaries, but a second rebellion of Mehmet Ali in 1839 was followed by a defeat which shortly preceded the broad-minded monarch’s death.

MAHMOD, sultan of Ghazni, the founder of the Mohammedan empire in India: b. Ghazni, about 970; d. 29 April 1030. His father, Sabuktagin, governor of Ghazni, owed a nominal allegiance to Persia, but was really independent. On his death Mahmud put aside his brother Ismail, whom his father had appointed to succeed him, took the title of sultan, then overthrew the Persian monarch, and laid the foundation of an extensive empire in central Asia. He then turned his attention to India, which he invaded repeatedly. His earlier expeditions into the country were directed against successive rajahs of Lahore, on whom he inflicted repeated defeats. In 1008 the Rajah of Lahore, Anangpal, with the assistance of a powerful coalition of rajahs, had assembled one of the largest armies yet seen in the Punjab, but Mahmud was again victorious and carried away enormous spoils from the temple of Nagarott. On his return he celebrated a triumph at Ghazni. In 1010, after subduing Ghur in the Hindu-Kush, he resumed his conquests in India, captured Multan, plundered the temple of Taxus, and continued for a number of years to extend his conquests in successive expeditions. These for a time were interrupted by his conquest of Transoxiana, effected in 1016. In 1017 he set out at the head of an army of 100,000 foot and 20,000 horse, passed the Jumna and turning to the south appeared before Caneo, the largest and most magnificent Indian city of the day, the rajah of which took precedence of all the Indian rajahs. As the Rajah of Caneo at once submitted, it was spared from pillage, a fate to which Mattr, a famous religious city, was subjected without restraint for 20 days. In 1023 he annexed the territories of Feinal II who had revolted and established for the first time a permanent occupation in Lahore. His last, which is usually called his 12th, expedition into India (1024–26) was directed against Gujar. He took the capital and changed the government, but the chief attraction was Somadji. The magnificence of its temple filled him with wonder and the descriptions of it suggest images of the palace of Aladdin. Its lofty roof was supported by 56 pillars carved and glittering with
precious stones. It was lighted by a lamp suspended from the centre by a gold chain. A huge idol, which Mahmud broke hollow and disclosed immense treasures in diamonds and precious stones. The pieces of the idol were sent to Mecca, Medina and Ghazni. The remainder of his enterprises were confined to Western Asia. Mahmud was avaricious and loved war. He was the most frightful of his warlike expeditions. Consult Elliot, "History of India"; Lane-Poole, "Medieval India under Mohammedan Rule" (London 1903).

MAHMUD, Shevket Pasha, Turkish soldier and statesman: b. Bagdad 1857; d. 11 June 1913. At 24 he came under the influence of the German general von der Goltz, then reorganizing the Turkish army and by whom he was sent to purchase war material in Germany and France. After 10 years' sojourn in Western Europe, Mahmud Shevket returned home with advanced ideas. As governor of the vilayet of Kossovo he threw in his lot with the Young Turk revolution in 1909. The new ministry placed him in command of an army corps at Salonica. He suppressed the counter-revolution at Constantinople and in 1910 became Minister of War until 1912. In January 1913 he was appointed Grand Vizier and War Minister combined, in which capacity he concluded peace with the Balkan League (q.v.). He was murdered while motoring to the Porte.

MAHO, or MAHAGUA. The West Indian names of an important fibre plant. Hibiscus tiliaceus or Linden hibiscus, lemon hibiscus or corkwood, a member of the mallow family. It is a handsome woody shrub or small tree with large lemon-yellow flowers and entire broadly ovate leaves which are like a linden. Low banks and river banks is its favorite habitat and it is widely distributed over tropical America, Polynesia and the shores of the Indian Ocean. In some of the Pacific islands it grows spontaneously in large areas which have been abandoned after previous cultivation. The bark contains a strong flexible fibre used for many purposes, especially by the aborigines who also used the wood for making fire in the primitive fashion. The dark green heart wood is very tough and durable. The plant has remarkable properties of renewing fertility of soil which has been exhausted by crops. The maho is considered indigenous to America and apparently on account of its useful character it was distributed widely over the islands and shores of the Pacific and Indian oceans before the arrival of Europeans. The etymology of its names in various regions gives some important clues as to the history of its distribution.

MAHOGANY. A popular name for the timber of several unrelated trees, among which are various species of eucalyptus (q.v.), natives of Australia and members of the family Myrtaceae; two species of Cercocarpus, of the family Rosaceae, C. montanus being known as valley mahogany and C. ledifolius as mountain mahogany in the Rocky Mountain region where they are native and used for fuel. African mahogany (Khaya senegalensis), East Indian mahogany (Swietenia macrophylla), Cederela toona, an East Indian tree equally well known also as the toona, all belong to the family Meliaceae, but are less important timber trees than the true mahogany (Swietenia mahagoni) of the same family. This species is a native of tropical America, occasional small specimens being found in extreme southern Florida. It was formerly abundant in the West Indies, reaching altitudes of 1,500 feet or more in Jamaica, but on account of the demand it is now scarce. Cuba and Santo Domingo formerly supplied the choicest; Honduras the lower grades; now practically all grown in Central America. The wood is generally some shade of brown, fine grained, easily polished and durable except under lateral strain. It is highly valued for furniture, musical instruments, interior house-finishings, etc., and is one of the most popular woods of the world. Formerly it was used for ship-building but now very little. The tree, which sometimes attains heights exceeding 100 feet, and diameters of six feet, has abruptly pinnate leaves with usually four pairs of leaflets, and small white or yellowish flowers in axillary or nearly terminal panicles. As an ornamental tree it is planted in southern Florida and southern California in rich soil. A few other related species of this genus are occasionally found in commerce.

MAHOMET. See MOHAMMED.

MAHOMMEDAN LAW. See MOHAMMEDANISM.

MAHON, mā-hōn', or PORT MAHON (ancient Portus Magnonis), Spain, city and port, on the island of Minorca, of which it is the capital, at the head of a bay which forms one of the best harbors on the Mediterranean. Fishing, fish-curing, agriculture and stock raising are the chief occupations. In the bay are several rocky islets, on one of which stands an arsenal, on a second a lazaretto and on a third a naval hospital. There are also a fine church, the consistorial palace, a theatre, museum and library. The harbor is strongly fortified. The exports are brandy, wine, dried fruits, agricultural produce, etc., and the imports, grain, wearing apparel, tobacco, sugar, coffee, cacao, leather, hats and other manufactured goods. Its trade amounts to about $1,000,000 annually. Mahon is believed to have been founded by the Carthaginian general Mago in its ancient name. It was occupied by the English in 1708. It was taken from them, after a memorable siege, by the French under Marshal Richelieu on 28 June 1756. Admiral Byng was shot for failing to relieve it. It was restored to the English in 1763; and taken by the Spaniards in 1782. It was retaken in 1798, and finally given to Spain by the Treaty of Amiens in 1802.

MAHONE, mā-hōn', William, American soldier and politician: b. in Southampton County, Va., 1 Dec. 1826; d. Washington, D.C., 8 Oct. 1895. He was graduated at the Virginia Military Institute in 1847, and became a civil engineer and railroad constructor. At the opening of the Civil War he entered the Confederate army; took part in the Peninsula and Rappahannock campaigns, and by bravery at Petersburg acquired the sobriquet of the Crater. (See Petersburg, Military Operations Against). In 1864 he was made brigadier-general and major-general. The war over, he accepted the presidency of the Norfolk and Tennessee Railroad, and also became active in politics. He was the principal organizer (about
MAHYON, mā'hō-nl, Francis Sylvester, "Father Prout," Irish author: b. Cork 1804; d. Paris, 1860. Educated at a Jesuit seminary at Amiens, he studied theology at Paris, was admitted into the Order of the Jesuits and taught for some time in a Jesuit college in Ireland, but for some irregularities was deprived of the position of a member of the order. He received clerical ordination and officiated for a short time at Cork and in London, but soon adopted the profession of literature. In 1834-36 he contributed the "Prout Papers" to Fraser's Magazine, published as the "Reliques of Father Prout" in 1836. In 1846 he became Rome correspondent of the London Daily News; his letters being afterward republished as "Figures and Facts from Italy" (1847). In his later years he was Paris correspondent for the Globe. The "Reliques of Father Prout" in a revised and enlarged form were published in 1860, and "Final Reliques of Prout" in 1876. In 1880 Charles Kent published a collective edition with a memoir. He will be longest remembered by his poem "The Bells of Shandon."

MAHRRATAS, mā-ṛṭaṣ, a native Hindu race, supposed to be descendants of the Persians, and occupying a large tract of central and western India. They have always been a distinct nation or people, and still consider themselves as such, even though now largely under British or Mohammedan jurisdiction. They came into prominence about the middle of the 17th century, under their chief, Sawaiji, extended his conquests in various directions, had himself crowned king in 1674 and established the Mahrratta Empire. After his death long minorities and the incompetency of the sovereigns caused the state of the country to fall into the hands of the Peshwa or Prime Minister, who became the acknowledged head of a Mahrratta confederacy. The first trouble with the British broke out in 1775 and was not settled until 1782. This happened during the administration of Warren Hastings (q.v.). The next outbreak came in 1803-05 and resulted not only in the acquisition of territory by the British but also in strengthening their power. Meanwhile the confederacy had held together till 1795, but internal wars and disturbances reduced the Peshwa to the position of a British dependent, and Scindia, Holkar and the Rajah of Berar were able to take the position of independent sovereigns. The confederacy came to a final end in 1818, after the third collision with the Peshwa himself took up arms against the British, and Scindia, Holkar, the Guicowar of Baroda, and the Rajah of Kolapore became dependent princes under British protection. The state of Gwallor came under British control in 1844. Though devout worshippers of Brahma, no distinction of caste exists among them. Consult Grant-Duff, "History of the Maharrattas" (Bombay 1863); Kincaid, C. A. and Parsons, R., "A History of the Maratha People," (Vols. I. and II., London 1912); Radhakrishnan, "Rise of the Maratha Power" (ib. 1900); "Imperial Gazetteer of India" (Oxford 1909).

MAI, an'ja-lō maē' or mi, CA'NIAI, Italian classical scholar: b. Schilpario, near Bergamo, Italy, 7 March 1782; d. Albano, 8 Sept. 1854. His abilities attracted the notice of Father Mozzì, a Jesuit, who introduced him to Latin, Greek and mathematics. On the establishment of a Jesuit college at Colurno, in the duchy of Parma, he accompanied Father MozzÌ thither in 1799, and a few years afterward was made professor of Latin and Greek in the Jesuit college at Naples (1804). He was transferred to Milan (1808), where he became an associate of the Ambrosian College, and one of the curators of the Ambrosian Library. One special department to which he devoted himself was the examination of the palmsestis (q.v.) and through his industry in deciphering the three volumes of fragments of Cicero's orations, of Lysimachus and of Iues, a fragment of the "Vidularia" (a lost comedy of Plautus), and a collection of the letters and other writings of Cornelius Pronto, the preceptor of Marcus Aurelius, were recovered and given to the world. In 1819 he was appointed chief keeper of the Vatican Library at Rome, and discovered beneath a manuscript of Saint Augustine's "Enarrationes in Psalmis" a obliterated fragment of Cicero's treatise "De Repub" amounting to about a fourth of the original, which he published in 1822 with a critical commentary. A colossal work was then undertaken by Mai, the editing of the various unpublished manuscripts in the Vatican, sacred and profane. It comprises 14 quarto volumes, under the title of "Scriptorum Veterum Nova Collectio e Vaticanis Codicibus Edita" (1828-38), and consists of numerous fragments, previously believed to be lost, of the ancient historians, such as Polybius, Dio Cassius, Suetonius, Dionysius of Halicarnassus, Dion Cassius, Appian and others, besides the various writings of the Fathers. In 1838 he was created a cardinal. A new collection, "Scriptilegium Romanum," was published in 10 volumes in 1839 and 1844, and a patriotic series, called "Nova Patrum Bibliotheca," issued between 1845 and 1853, closed his list of publications. Consult his life by G. Poletto (Siena 1887); also Prina, B., "Biografia del cardinale Angelo Mai" (Bergamo 1882); Sandys, J. E., "A History of Classical Scholarship" (Vols. I., III., Cambridge 1908).

MAIÀ, mā'ya, in Greek mythology, the eldest daughter of Atlas and Pleione. She was placed with her six sisters among the stars, where they have the common name of Pleiades. The Romans also worshipped a Maià, who was also called Majesta, and was afterward identified with the daughter of Atlas. The Tuscans called their principal deity Majus. The month of May is said to have received its name from them.

MAID OF ATHENS, immortalized by Lord Byron, was Theresa Macri, who 25 years after Byron's poem was written had lost her beauty, lived in a hovel in dire poverty and had reared a large family.
MAID MARÍAN, a name given Matilda, daughter of Fitz-Walter, baron of Bayard and Dumcow. She eloped with Robert Fitz-Oo, an outlaw, and lived with him in Sherwood Forest. It is supposed that she was married by Friar Tuck to Fitz-Oo, who was more commonly called Robin Hood (q.v.).

MAID OF THE MIST, (1) the name of a small steamboat formerly used on the Niagara River below the Falls, to carry passengers close to the cataract. (2) A name given to the heroine of Sir Walter Scott's 'Anne of Geierstein.'

MAID OF ORLEANS, a name given Jeanne d'Arc (1412–31) (q.v.).

MAIDEN, or THE WIDOW, an instrument of capital punishment used in Scotland during the 16th century, the prototype of the French guillotine (q.v.). It consisted of an upright frame and a broad piece of iron a foot or more wide, sharp on the lower part and loaded above with lead. At the time of execution this was pulled up to the top of the frame, in which was a groove on each side for it to slide in. The prisoner's neck being fastened to a bar underneath, on a sign given the cutting iron was let loose, and the head instantly severed from the body. Its first victim is said to have been Thomas Scott, executed 3 April 1565, one of the agents in the assassination of Rizzio. In 1881 it was used in the execution of the Earl of Morton, the alleged inventor.

MAIDEN QUEEN, in England, a popular title bestowed upon Queen Elizabeth.

MAIENHAIR FERN. See FERNS AND FERN ALLIES.

MAIDENHEAD, England, market town and municipal borough in Berkshire, on the Thames, 24 miles west of London, on the Great Western Railway. It is an ancient town and was formerly known as Maydenhurst, or Maydenhith, and while its stone bridge which takes the London road over the Thames dates only from 1772 there are records of earlier bridges as early as 1297. It was incorporated as a guild to maintain the bridge by Henry VI, in 1451. It had formerly a large carrying trade in malt, meal, and timber, but this is now principally a residential town and pleasure resort for boating parties. The Wednesday market is still held under the charter of Queen Elizabeth, dating from 1582. Pop. about 15,219.

MAIDSTONE (Saxon Mæddgestun) England, municipal and Parliamentary borough and the county town of Kent, 34 miles east-southeast from London, on the banks of the Medway. The town consists chiefly of four principal streets, which cross each other at the market-place, with smaller ones branching off at right angles. Its fine old Collegiate Church of All Saints is supposed to be of the 14th century, and is one of the largest parish churches in England. It has historical associations with the rebellions of Jack Cade and Sir Thomas Wyatt, and was stormed by the Parliaments at the battle of Tewkesbury in 1648. It has excellent educational institutions; schools, libraries, science and art institutions, museums, play grounds and parks. The chief industries are paper-making (for which there are several large mills), brewing, iron founding and the manufacture of agricultural implements. It is the centre of a great hop district. The Medway is navigable for 15 miles above the town. Pop. about 34,000. Consult 'Cave-Browne, 'Maidstone'; Russell, 'History of Maidstone'; Gilbert, 'The Collegiate Church of All Saints.' Maidstone returns one member to Parliament. Pop. about 35,475.

MAIDU PEOPLE, an aboriginal Pijuan group of Indians of southern California, of which the chief tribe, the Concow, inhabited the region of the Upper Sacramento River. Their descendants are to be found in the Round Valley Reservation. Their communities comprised rough dwelling-places or hogans built of boards, large circular halls or town-houses for assemblies and ceremonials and wicker store-houses for the winter supply of acorns which with pilons formed their staple food supplies. Their clothing was of the scantiest description; the chief of their numerous dances was the acorn dance; and they had a secret male society in which the initiatory age was 12. Consult Dixon, R. B., 'Maidu' (in Boas, 'Handbook of American Indians,' Washington 1911); id., 'Maidu Texts' (in American Ethnological Society Publications, Vol. IV, Leyden 1912).

MAIGNAN, Albert, al-bár mä-nyaän, French painter; b. Beaumont, Sarthe, 14 Oct. 1845; d. Paris, 29 Sept. 1908. He studied at Paris under Noël and developed a strong and original manner in historical and landscape painting. At the Salon of 1879 he was awarded a first class medal. Amongst the most striking of his pictures are 'Dante's Meeting with the Countess Matilda' (1881) now in the Luxembourg; and 'Assault on Pope Boniface VIII at Amagni' in the New York Metropolitan Museum of Art.

MAIGRE, mà-ger, or MEAGRE, a large European drum-fish (Sciaena aquila), common in the Mediterranean, where it forms one of the most important local food-fishes. It may attain a length of six feet, and its flesh has always been a favorite with epicures. Yarrell says that anciently on account of its large size it was always sold in pieces, and that the fishermen of Rome were accustomed to present the head, considered the finest part, as a sort of tribute to the three local magistrates who acted for the time as the conservators of the city.

MAIL-SHELL. See CTERNAL.

MAILDUN, mal'doon, MAELDUIN, or MAELDUNE, hero of Irish romance, 'Voyage of Maldun.' He was the son of Ailill Ocar Agha, of the tribe of Owenaht of Ninus, in County Clare, and before his birth his father was killed by pirates. He grew up handsome and accomplished, but had scarce reached manhood before he set sail with a crew of 60 men to find his father's murderer. For three years and seven months he voyaged on the Western Ocean seeing marvels as no eyes had seen before. At length he found the murderer of his father, but pardoned him his wrong in gratitude to the great mercy of God who had delivered him from so many perils. Consult Joyce, P. W., 'Old Celtic Romances' (tr. from Gaelic, 3d ed., New York 1898); Tennyson, 'The Voyage of Maeldun.'

MAILLY, William, American Socialistical journalist; b. Pittsburgh, Pa., 22 Nov. 1871; d. 4 Sept. 1912. He was educated in the common schools of Scotland and England, and in 189-
96 was editor of the Birmingham Labor Advocate. He returned to the United States and in 1898 organized the Social Democratic party of New York. He edited the Social Democrat at Haverhill, Mass., in 1899-1900; was associate editor of The Worker in New York in 1901 and in 1906-07; and managing editor of New York Evening Call in 1908-09. He was one of the organizers of the Social Democrat, now Socialist, party at Chicago in 1898; one of the first secretaries of the Socialist party of Massachusetts in 1902; and in 1905-06 he was a member of the National Executive Committee of the Socialist party.

MAIMON, mi'môn, Salomon, German philosopher: b. near Mir in Minsk, 1754; d. Siegersdorf, Lower Silesia, 22 Nov. 1800. He was trained for a rabbi, but having become acquainted with the philosophy of Maimonides, he made his way to Berlin, and studied modern philosophy, languages and some science. Besides cultivating his own mind, and teaching a little, he wrote some philosophical treatises and literary hack-work. Yet he had Mendelssohn, the philosopher, among his friends, was admired by Kant and attracted the attention of Goethe. This led to his (the author's) Philosophy of Transcendentalism (1790), in which he set out to supplement Kant's system with truths gleaned for the most part from Spinoza, Leibnitz, Hume, Locke and others. Consult Witte, 'S. Maimon' (Berlin 1876).

MAIMONIDES, mi-mon'ids, properly Mosé ben Joseph ibn Maimon (Arabic, Abu Amr Musa ibn Maimun Obeid Allah al Kutobi), Jewish scholar: b. Cordova, Spain, 30 March 1135; d. 13 Dec. 1204. At an early period he developed a taste for the exact sciences and for philosophy. He read with zeal not only the works of the Mohammedan scholastics, but also those of the Greek philosophers in such dress as they had been made accessible by their Arabian translators. In this way his mind, which by nature ran in logical and systematic grooves, was strengthened in its bent; and he acquired that distaste for mysticism and vagueness so characteristic of his literary labors. He went so far as to abhor poetry, the best of which he declared to be false, since it was founded upon pure invention — and this too in a land which had produced such noble expressions of the Hebrew and Arab muse. It is strange that this man, whose character was that of a sage, and who was revered for his person as well as for his books, should have led such an unquiet life, and have written his works so full of erudition with the staff of the wanderer in his land. For his peaceful studies were rudely disturbed in his 13th year by the invasion of the Almorahades, or Mohammedan Unitarians, from Africa. They not only captured Cordova, but set up a form of religious persecution which happened to suit their variety. Maimonides' father wandered to Almeria on the coast; and then (1159) straight into the lion's jaws at Fez in Africa,— a line of conduct hardly intelligible in one who had fled for the better exercise of the dictates of conscience. So that the importunities of the Almohad fanatics became, that together with his family Maimonides was compelled to don the turban, and to live for several years the life of an Arabic Marrano. This blotted upon his fair fame — if blot it be — he tried to excuse in two treatises, which may be looked upon as his Apologia pro vita sua; one on the subject of conversion in general (1160), and another addressed to his coreligionists in southern Arabia on the coming of the Messiah. But the position was untenable and in 1165 we find Maimonides again on the road, reaching Accho, Jerusalem, Hebron and finally Egypt. Under the misfortune of his belief was necessary, Maimonides settled with his brother in old Cairo or Fostat, gaining his daily pittance first as a jeweler, and then in the practice of medicine, the while he continued in the study of philosophy and the elaboration of his treatises, upon which his fame repose. In 1177 he was recognized as the head of the Jewish community of Egypt, and soon afterward was placed upon the list of court physicians to Saladin. When he died, his body was taken to Tiberias for burial.

Perhaps no fairer presentation of the principles and practices of rabbinical Judaism can be cited than that contained in the three chief works of Maimonides. His clear-cut mind gathered the threads of Jewish ethics, theology and life had spun since the closing of the Biblical canon, and wove them into such a fabric that a new period may fitly be said to have been ushered in. The Mishnah had become the law-book of the Diaspora; in it was bound the system of ordinances and practices which had been developed up to the 3rd century A.D. In the scholastic discussions in which the Jewish schoolmen had indulged their wit and their ingenuity, much of its plain meaning had become obscured. At 23 Maimonides commenced to work upon a commentary to the Mishnah, which took him seven years to complete. It was written in Arabic, and very fitly called 'The Illumination'; for here the philosophical training of its author was brought to bear upon the dry legal mass, and to give it life as well as light. The induction of philosophy into law is seen to even more peculiar advantage in his 'Mishnah Tôrah' (Revised Law). The scholastic discussions upon the Mishnah had in the 6th century been put into writing, and had become an object of thought, that kaleidoscope of schoolroom life, known by the name of Talmud. Based upon the slender framework of the Mishnah, the vast edifice had been built up with so little plan and symmetry that its various ramifications could only be followed with the greatest difficulty and with infinite exertion. In turn, the Talmud had supplanted the Mishnah as the rule of life and the directive of religious observance. Even before the time of Maimonides, scholars had tried their hand at putting order into this great chaos; but none of their efforts had proved satisfactory. For 10 years Maimonides worked and produced this digest, in which he arranged in scientific order all the material which a Jewish jurist and theologian might be called upon to use. Though this digest was received with delight by Jews of Spain, many were found who looked upon Maimonides' work as an attempt to crystallize into unchangeable law the fluctuating streams of tradition. The same objection was made to his attempt to formulate into a creed the purely
theological ideas of the Judaism of his day. His 'Thirteen Articles' brought on a war of strong opposition; and though in the end, the fame of their author conquered a place for them even in the Synagogue Ritual, they were never accepted by the entire Jewry. They remained the presentation of an individual scholar.

But his chief philosophical work, his 'Guide of the Perplexed' (Dallāt al Ḥārin), carried him 1111:1 and for centuries divided the Jewish camp into two parties. The battle between the Maimonists and anti-Maimonists waged fiercely in Spain and Provence.

In the 'Guide of the Perplexed' Maimonides has also produced a work which was epoch-making in Jewish philosophy. It is the best attempt ever made by a Jew to combine philosophy with theology. Aristotle was known to Maimonides through Al-Farabi and Ibn Sinā (Avicenna); and he is convinced that the Stagirite is to be followed in certain things, as he is that the Bible must be followed in others. In fact, there can be no divergence between the two; for both have the same end in view,—to prove the existence of God. The aim of metaphysics is to perfect man intellectually by showing him reasons (noṣr āmmihī) and Judaism. Reason and revelation must speak the same language; and by a peculiar kind of subtle exegesis—which provoked much opposition, as it seemed to do violence to the plain wording—he is able to find his philosophical ideas in the text of the Bible. But he is careful to limit his acquiescence in Aristotle's teachings to things which occur below the sphere of the moon. He was afraid of coming into contact with the foundations of religious belief, and of having to deny the existence of wonders. The Bible teaches that matter was created, and the arguments advanced in favor of both the Platonic and Aristotelian views he looks upon as insufficient. The Jewish belief that God brought into existence not only the form but also the matter of the world, Maimonides looks upon much as an article of faith. The same is true of the belief in resurrection. He adds so little proof for this dogma that the people of his day were ready to charge him with atheism.

Maimonides is able to present 25 ontological arguments for his belief in the existence, unity and incorporeality of God. What strikes one most is the almost colorless conception of the Deity at which he arrives. In his endeavor to remove the slightest shadow of corporeality in this conception, he is finally led to deny that any positive attributes can be posited of God. Such attributes would only be "accidentia"; and any such "accidentia" would limit the idea of oneness. Even attributes which would merely show the relation of the Divine Being to other beings are excluded; because he is so far removed from things non-Divine, as to make all comparison impossible. Even existence, when spoken of in regard to him, is not an attribute. In his school language, the "essential" of God involves his "existence." We have therefore to rely entirely upon negative attributes in trying to get a clear concept of the Deity.

Now this Deity is so far removed, how then is he to act upon the world? Maimonides supposes that this medium is to be found in the world of the spheres. Of these spheres there are nine: "the all-encompassing sphere, that of the fixed stars, and those of the seven planets." Each sphere is presided over by an intelligence which is its motive power. These intelligences are called angels in the Bible. The highest intelligence is immaterial. It is the noûs poieïtikós, the ever-active intellect. It is the power which gives form to all things and makes that which was potential really existent. "Prophecy is an emanation sent forth through the medium of the active intellect, in the first instance to man's rational faculty and then to his imaginative faculty. The lower grade of prophecy comes by means of dreams, the higher through visions accorded the prophet in a waking condition. The symbolic actions of the prophets are nothing more than states of the soul." High above all the prophets Maimonides places Moses, to whom he attributes a special power, by means of which the active intellect worked upon him without the mediation of the imagination. The psychological parts of the 'Guide' present in a Jewish garb the Peripatetic philosophy as expounded by Alexander of Aphrodisias. Reason exists in the powers of the soul, but only potentially as a latent reason (noûs àmmihī). It has to assimilate immaterial forms which come from the active reason. It thus becomes acquired or developed reason (noûs epikhtetos) and by still further assimilation it becomes gradually an entity separable from the body, so that at death it can live on unattached to the body. In ethics Maimonides is a strong partisan of the doctrine of the freedom of the will. No one moves him, no one drives him to certain actions. He can choose, according to his own inner vision, the way on which he wishes to walk. Nor does this doctrine involve any limitation of the Divine power, as this freedom is fully predetermined by the Deity. But Maimonides must have felt the difficulty of squaring the doctrine of the freedom of the will with that of the omniscience of God; for he entrenches himself behind the statement that the knowledge of God is so far removed from human knowledge as to make all comparison impossible. Again, in true Aristotelian style, Maimonides holds that those actions which he has defined as virtuous which follow the golden mean between the extremes of too much and too little. The really wise man will always choose this road; and such wisdom can be learned; by continued practice it can become part of man's nature. He is most truly virtuous who has reached this eminence, and who has eliminated from his own being even the desire to do wrong.

The daring with which Maimonides treated many portions of Jewish theology did not fail to show its effect immediately after the publication of the 'Guide.' His rationalistic arguments about revelation, his allegorizing interpretation of Scripture, his apparent want of complete faith, in the doctrine of resurrection, produced among the Jews a violent reaction against all philosophical inquiry, which lasted down to the times of the French Revolution. Even non-Jews looked askance at his system. In Montpellier and in Paris, his own Jewish opponents, not content with having gotten an edict against the use of the master's writings, obtained the aid of the Church (for the Jewish community was translated into Latin in the 13th century), and had it publicly consigned to the flames. But all
this was only further evidence of the power which Maimonides wielded. The Karaites copied it; the Kabbalah even tried to claim it as its own. Many who were not of the house of Israel, as Thomas Aquinas and Albertus Magnus, acknowledged the debt they owed the Spanish rabbis; and Spinoza, though in many places an opponent, shows clearly how carefully he had studied the 'Guide of the Perplexed.' Consult Yellin and Abrahams, 'Maimonides,' and the authors mentioned above; Neumaier, 'Geschichte der jüdischen Philosophie des Mittelalters' (Vols. I-II, Berlin 1907-10).

GUSTAV GOTTHEIL

MAIN, män, Hubert Platt, American composer and editor: b. Ridgefield, Conn., 17 Aug. 1839. He was educated in the public schools and for 59 years has been editor of song collections and other publications for church, Sunday school and college use, besides composing many songs and hymns. His latest works include 'Gems of Song for the Sunday School' (1901); 'Gloria Deo' (1901); 'Devotional Songs' (1913); 'Hallowed Hymns' (1900); 'Biblical Home Songs' (1909); 'Hebrew Hymnal' (1910); 'Ode Book, 'Eastern Star' (1911); 'Mission Hymnal' (1911-14); 'Quartettes and Choruses—Male Voices' (1912); 'Hamilton College Songs' (1915). He has also in preparation, 'A Dictionary of American Musicians and Poets.'

MAIN, män (Ger. min), or MAYN, a river of Germany, which has its source in the northeastern part of Bavaria, about 13 miles northwest of Bayreuth. It flows northwest to the border of Bavaria, and then makes a succession of remarkable zigzags, continuing, however, in a westerly direction, till it reaches the border of the grand-duchy of Hesse, which it enters. It then flows circuitously west, partly forming the boundary between Hesse and the Prussian province of Hesse-Nassau, and joins the Rhine a little above the town of Mainz, after a course of over 300 miles. The principal cities which it passes are Würzburg, Aschaffenburg and Frankfurt. It is navigable for about 200 miles, and by improvements the largest Rhine steamers can ascend to Frankfurt. By means of King Ludwig's Canal it affords through navigation to the Danube.

MAINE, män, Sir Henry James Sumner, English jurist: b. Caverham Grove, Reading, England, 15 Aug. 1822; d. Cannes, France, 3 Feb. 1888. He was educated at Cambridge, where he was regius professor of civil law 1847-54. He was in India as legal member of the Council, 1862-69. On his return, in 1869, he was appointed professor of jurisprudence at Oxford, and held this post till 1878. He was appointed master of Trinity Hall, Cambridge, 1877, and professor of international law at Cambridge, 1887-88. Among his more noted works were 'Ancient Law' (1861), an epoch-making book; 'Village Communities' (1871); 'Popular Government' (1885). Consult Duff, 'Sir Henry Maine: a Brief Memoir of his Life' (1892).

MAINE DE BIRAN, män de bér-răn, François Pierre Gonthier, French philosopher: b. Bergerac (Dordogne), 24 July 1756; d. Paris, 16 July 1824. He entered the Life Guards of Louis XVI in 1785, was present at Versailles on 5-6 Oct. 1789, but was not concerned in the Revolution. He opposed Napoleon in the latter part of his reign, and became a legitimist at the Restoration. His chief philosophical essays are 'Influence de l’habitude' (1800); 'Sur la décomposition de la pensée'; 'Sur l’aperception immédiate,' and 'Rapports du physique et du moral.' Very little of his writing appeared during his lifetime, but in 1834 some of his essays were published by Victor Cousin who in 1841 published a most complete edition. The publication of his important writings by E. Naville in 1859 made possible the first connected study of his philosophical development. Maine de Biran's importance as a philosopher is chiefly due to his giving the direction to philosophical speculation afterward developed in the school founded by Cousin. Consult Naville, E., 'Maine de Biran' (3d ed., Paris 1874); Couailhac, M., 'Maine de Biran' (Paris 1905).

MAINE, the name given as early as 1622 to distinguish the main land from the islands. It was called in the Mason and Gorges Patent 'the Mayn Land of New England,' and in the great charter 'Province of Maine'; it was separately organized as one of the New England group of North Atlantic States and the most easterly State of the Union. It is between lat. 43° 4' and 47° 28' N., and between long. 66° 57' and 71° 7' W. It is bounded on the north by Quebec and New Brunswick, provinces of Canada, on the east by New Brunswick and the Atlantic Ocean, on the south by the Atlantic and on the west by the State of New Hampshire and the province of Quebec. Its greatest extent is from north to south; its greatest length about 30 miles and its greatest width about 212 miles; area, 33,040 square miles, of which 3,000 square miles are water surface. Maine is as large as all the rest of the New England group lacking 385 square miles, and it is the 37th in size among the States of the Union.

Topography.—While its northeastern and a portion of its southwestern boundary lines are straight, its others are irregular, especially its coast line, which, fringed by islands, is indented by numerous bays, giving it a shore length of over 2,000 miles, though a direct line drawn from its two extremities would be but about a tenth of its real length. This irregular coast line, bold and rugged from its eastern extremity until it reaches Penobscot Bay, becoming lower as it approaches the south, is most picturesque throughout its entire length, much of it being bordered by sandy beaches and thick forests reaching to the water's edge. There are more good harbors on the coast of Maine than on that of any other State on the Atlantic seaboard.

There are two general mountain slopes in Maine, the highest part extending across the State from north of the source of the Megaway River in the west, northeast to Mars Hill. South of the main divide is Mount Katahdin, 5,385 feet in height; Mount Katahdin, 3,387; Saddleback, 4,000, and Mount Blue, 3,900 feet in height, all in Franklin County. Green Mountain on Mount Desert Island is 1,800 feet high, and is one of the numerous peaks more or less conical in form, isolated or in clusters, comparatively low, but densely wooded about their bases. There is no long range of mountains in the State.
### MAINE.

Hydrography.—That portion of the State north of the main divide is drained almost wholly by the Penobscot, the Androscoggin, the Kennebec, the Penobscot and the Saint Croix rivers. The basin of the Saint John River has an area of about 7,425 square miles. The head-waters of the Saint John river are in the northwestern part of Maine and the eastern part of Quebec, and it flows north by east for some distance past Saint Francis on the north to the extreme northeastern boundary, where it makes a turn and flows generally southeast through New Brunswick to the Bay of Fundy. The largest Maine tributaries of the Saint John are the Aroostook and the Allegash. The waters of a large number of the lakes of Maine find their outlet through the Saint John. The rivers south of the main divide flow generally south to the ocean. The source of the Kennebec is about 2,000 feet above the sea, of the Penobscot over 2,300 feet, of the Androscoggin about 3,000 feet and of the Saco in the southwest nearly 2,800 feet. All these streams are swiftly flowing streams, in many places passing over rocky beds which form rapids and falls and furnish extensive water powers. From the report of the Maine State Water and Storage Commission it appears that Maine ranks third among the States of the Union in developed horse power which is estimated to be in excess of 400,000 horse power. Its storage facilities are estimated at 400,000 horse power more, which, with over 1,000,000 undeveloped horse power, make a total of over 1,800,000 horsepower, possible water horse power in the State. It is without doubt among the greatest of the State's assets, and has excited the cupidity of men in and out of the State to exploit it for their own enrichment. The so-called Octopus Bill of 1911 was designed to enable these interests to transmit this power by converting it into electricity beyond the State's limits, but attracting attention aroused so much opposition that it was defeated. It is only by getting control of the political machinery of the State that the interests responsible for the measure can accomplish their designs which would result in immense loss to the people of the State. The flow of the tide is so great on the coast that it has been estimated that with but one wheel it can be operated 16 hours out of the 24. There are about 1,620 lakes in Maine, a large number of which are near the sources of the rivers. The surface of the lakes and rivers constitutes nearly one-tenth of the whole area of the State. Moosehead Lake is the largest in the State. (For description of rivers, see separate articles.)

Geology.—The nature of the geological formation of Maine shows that it belongs to one of the oldest parts of the United States. The rocks are at present clearly plainly traced in several parts of the State; the changes in extent and form of the river beds and lakes are shown by the rock formation of the vicinities and the nature of the deposits which were brought from the mountains to the valleys. The northern portion of the State belongs to the Devonian period and the region about Penobscot Bay to the Silurian. In the southern part of the State are fossiliferous days. There are a number of low ridges which evidently were once portions of mountain ranges, but which usually formed angles with the two great ranges that at one time extended across the State. Granite, slate and marble exist in large quantities.

Soil.—The soil of the State shows the effects of the Glacial period as much as the rocks; the greater part of the surface is till and various forms of glacial débris. The old lake bottoms, now dry land, are largely alluvial and in these places the soil is very fertile. In such localities there are extensive agricultural lands.

Minerals and Mining.—Granite is one of the most important wealth producing minerals of the State. Along the coast, and inland for some distance there are large areas of granite outcrop. It is found in such quantities near tide water that quarrying and shipping are comparatively easy and inexpensive. The feldspar and quartz are easily separated. Hallowell, Dix Island, Vinal Haven and Freeport furnish the largest quantity. The capitol at Albany, N. Y., and the Metropolitan Museum of Art, New York City, are built of granite from Hallowell. Crystalline limestone and marble are found in several places; in the southwestern part of the State the deposits are quite extensive. Slate of good quality is found in the central part of the State. It is quarried for table tops, blackboards, roofing and for mantels. The slate from Piscataquis County is remarkably pure, capable of being split into thin plates, and in color a deep blue-black. Silica and feldspar of an excellent quality are found in several places. Some of the products made in whole or in part from silica and feldspar are glass, porcelain, scouring soap, sandpaper, earthenware and wood filler. The silica is found in vein-quartz in some of the crystalline rocks. Tourmaline is found in Oxford County in large and beautiful crystals. Some of the other minerals are iron, copper, zinc, arsenic, manganese, tin, silver, gold, antimony, pyrites and beryl. The annual value of the mineral output is about: granite, $1,000,000; limestone and marble, $1,000,000; slate, $180,000; silica, $50,000; other mineral products, $60,000, making the total amount for quarry purposes of about $2,600,000. Maine ranks second among the States in the output of granite; fourth in the output of slate and sixth in the output of limestone and marble.

There are in the State nearly 30 mineral springs which are known and used; 10 of them are in Androscoggin County. The State reports about 30 springs with an output of about 1,850,000 gallons. The most noted of these is the Poland spring situated in the town of that name.

Climate.—The climate is cold a considerable part of the year; snow covers the ground from three to five months. The summers are short; in the southern part of the State there is not more, usually less, than five months for the maturing of crops. The extensive forests have been a protection, and with the good river drainage and the sea breezes have tended to make the climate most healthful. A fair average of the mean temperature in January is 15° F.; in May, 56° ; in July, 70° ; in October, 51° ; in December 22°. The average temperature in the whole State is in summer about 62.5° F. and in winter 20° F.

Flora.—The trees and plants common to the northeastern part of the United States flourish
here. In the southern part are fine grasses, hardy fruits and a varied shrubbery. The strawberry, blackberry, raspberry, blueberry, thorn-apple and gooseberry grow in all parts of the State. (See Forests and Agriculture.)

Forests.—Maine is known as the "Pine Tree State" because of the large extent of pine forests which once existed within its limits. The majestic "mast pine," which the State once furnished for many ships, has almost become a thing of the past, yielding to the demands of commerce. The greatest part of the State is covered with forests; about 65 per cent of the State's land area is woodland. The northern and central parts are forest; in the southern part along the coast and along the navigable streams the land is cleared and cultivated. Trees grow rapidly. Denuded tracts, unless cultivated soon, send up an undergrowth of seedlings which become trees of fair size in the course of a few years. Most of the lumber of Maine used in the manufacture of pulp and paper has been taken from the drainage of the Androscoggin, Kennebec and Penobscot rivers, in about the following proportions: 42 per cent from the Androscoggin; 25 per cent from the Kennebec and 33 per cent from the Penobscot. The total area from which the whole pulp lumber consumed in the State has been taken has been estimated at 4,741,000 acres, leaving more than one-half the entire region from which no pulp wood of any consequence has ever been removed. There has been estimated standing 21,239,000,000 feet of spruce alone, besides an almost equal quantity comprising pine, cedar, hemlock, poplar and various species of hard wood. The annual growth is considered sufficient to warrant the cutting of 600,000,000 feet of spruce timber, and the total lumber consumed by the supply. The forest commissioner states that it is safe to reckon that there will be 11,000,000 to 12,000,000 acres of land in the State that will be lumber producing for all time. There are now being taken annually upwards of 30,000,000 feet of white birch from Maine forests. The white birch area is a wide belt extending entirely across the State. Though used for many purposes its greatest utilization is by spool factories which produce about 800,000,000 spools, valued at more than $1,000,000. Besides being used in the production of spools a large quantity is shipped to Europe in spool bars. A variety of small articles are also manufactured from it, as baskets, furniture, office equipments, etc. The science of forestry is being amplified extensively and the preservation of timber by private corporations.

Fisheries.—The rivers and lakes are well stocked with fish; the State is considered the sportsman's paradise. Some of the varieties are white perch, pickerel, salmon, bass and broom. Lobsters, clams and mussels are in large quantities along the coast, and in the bays and inlets are bluefish, rock-cod, sculpins, cutters, flounders and others. In the off-shore waters there are cod, herring, mackerel, haddock, hake, porphy, menhaden and pollock, which are caught in large quantities. One species, a large number of which furnishes a large portion of the fish used in the sardine-canning establishments of Lubec, Eastport and other places. The fisheries of Maine rank second in value among the fisheries of New England, but men are coming in this industry in Maine than in any other New England State except Massachusetts. The commissioner of sea and shore fisheries for 1914 estimates the number of persons dependent upon the fisheries at $8,000,000 and the value of the product at $5,750,000.

In 1892 the lobster fisheries product was $992,855, this amount being greater than for all lobsters in all the other New England States. The law passed in 1895 for the protection of the lobster fisheries greatly curtailed this branch of the fishing industry, as it prohibited the keeping of lobsters less than 10¾ inches in extreme length. This caused the removal of canning establishments to Nova Scotia, New Brunswick and the Magdalen Islands. The government experiment stations plant large quantities of lobster fry along the coast. The value of the catch for the year 1913-14 was $3,277,860. Clam fishing ranks next in importance; canning clams is a prominent industry, also the preparation of smoked herring. Salmon fishing is largely in the Penobscot and Kennebec rivers. The fishery trade is centred chiefly at Portland, Rockland and Vinal Haven. The sardine fisheries are located in Washington, Hancock, Lincoln and Cumberland counties. The following quantity of fish cured and canned was, according to last report, 8,751,392 pounds of sardines and 2,173,277 pounds of clams. During the 10 years preceding 1909 this industry grew from 74,022,141 pounds to 116,289,900 pounds, and increased in value from $4,753,071 to $5,738,685.

Agriculture and Stock Raising.—The soil of a considerable portion of the State is not adapted to agriculture, owing to the large acreage of forest land. But a little over 33 per cent is farm land and of that nearly one-third is not in use, while the Chief of the State, the river valleys, the largest acreage being in the northeastern part of the State in the Aroostook Basin. The farms average in size about 105 acres, and less than 5 per cent of the farms are occupied by tenants. (Government Census Bulletin for 13 Dec. 1910). The owner living on the farm means more intensive methods of cultivation, a systematic enrichment of the soil and a careful rotation of crops. The cereal crops, especially wheat, have decreased in extent owing to Western competition, but in Aroostook County they are increasing. The Federal census of 1910 shows that in this county the cereals occupied one-half the total of the cereal acreage of the State. The crop of oats, once large, has also decreased; yellow corn, formerly cultivated on all the farms, never occupied much area and is now raised principally for fodder. The finest sweet corn in the world is raised in Maine for canning and goes to all parts of the country.

The paper industry originated with Isaac Winslow who invented the process in 1838-39. On 8 March 1853 he applied for a
patent for preserving fresh green corn by hermetically sealing process. In suits against infringers of the patents it appeared that the canning of corn originated in Maine at the early dates mentioned, and Maine-packed sugar corn still leads in all markets. In 1915 Maine packed 999,000 dozen green corn, valued at $1,470,750.

Buckwheat, which produces excellent flour in a soil and climate like Maine, is still cultivated. The returns from the potato crop are greater than from all the cereals. Hay of an excellent quality is marketed at good prices. Farmers living near markets are giving considerable attention to market gardening and dairying. Fine grated vegetables, sweet corn, small fruits and apples flourish and bring excellent returns. Apple orchards are increasing in number and increased attention is being given to their care and cultivation. The raising of horses is increasing, but the number of neat cattle and sheep is decreasing. The number of milk cows is increasing, and 1915 statistics show that nearly 30 per cent of the farms derived more income from dairy products than from all other sources. However, such statistics are sometimes unreliable as a large part of the living of the farmer’s family comes from the farm crop, and only is regarded as income which is sold from the farm. The amount received in 1900 for dairy products was about $5,605,000. The Federal Census Reports of 1910 gave the following statistics: 39,735 farms, covering 6,291,000 acres, of which 3,933,000 acres were unimproved. The total value of the farm property of the State was $199,271,998. The value of the products for 1899 was $37,104,735. For the year ending 1 June 1910 some of the farm products were as follows:

<table>
<thead>
<tr>
<th>Quantity</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hay</td>
<td>2,750,000 tons</td>
</tr>
<tr>
<td>Potatoes</td>
<td>27,560,000 bushels</td>
</tr>
<tr>
<td>Oats</td>
<td>5,554,000 bushels</td>
</tr>
<tr>
<td>Buckwheat</td>
<td>719,000 bushels</td>
</tr>
<tr>
<td>Corn</td>
<td>782,000 bushels</td>
</tr>
<tr>
<td>Barley</td>
<td>249,000 bushels</td>
</tr>
<tr>
<td>Wheat</td>
<td>267,000 bushels</td>
</tr>
</tbody>
</table>

In 1917 the chief crops were oats, 4,930,000 bushels; corn, 780,000 bushels.
In 1910 the farm animals were:

<table>
<thead>
<tr>
<th>Number</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Horses</td>
<td>107,574</td>
</tr>
<tr>
<td>Sheep</td>
<td>206,458</td>
</tr>
<tr>
<td>Milk cows</td>
<td>156,819</td>
</tr>
<tr>
<td>Other cattle</td>
<td>99,704</td>
</tr>
</tbody>
</table>

In 1918 the farm animals comprised 109,000 horses, 170,000 milk cows, 127,000 other cattle, 163,000 sheep and 100,000 swine. In 1916 the wool clip amounted to 850,000 pounds of wool.

New Sweden.—In 1876 a Swedish colony consisting of 50 persons was located in the northern part of Aroostook County by the Hon. W. W. Thomas, Jr., Commissioner of Immigration. That portion of Township No. 15 upon which they were located was named New Sweden. By present number it is estimated that there are now in Maine 5,000 Swedes, a large number being descendants of the Thomas colony. The success of the settlement, owing to the high character for thrift and industry of the colonists, has been so great that Mr. Thomas is planning to establish another colony in Aroostook County if the land can be obtained. Aroostook County leads all others in the value of its potato crop.

Manufactures.—The extensive water power has been a great aid in developing manufacturing industries. Ship-building was among the first manufacturing industries of the State. The first vessel built in Maine was the Virginia. She was built by the Popham colony 1607-08, and under command of Capt. James Davis sailed from Plymouth with the Somers and Gates Colony for Jamestown, 1 June 1609. Bath was the chief ship-building center of the United States for over 100 years and is yet a ship-building centre of importance. Prior to the construction of steel vessels, the Maine forests supplied a large amount of the timber used in ocean vessels built in the United States and nearly half the ocean vessels of the nation, up to 1900, were made in Maine. Bath builds now many steel vessels. The manufacture of leather is another of the leading industries. The bark of the hemlock is used in leather tanning. The manufacturing of cotton and woolen goods began the latter part of the 18th century and has been continued. Lewiston is the chief centre of cotton manufacturing. There is a tendency now to remove the cotton manufacturing industry to the Southern States or nearer the supply of raw material. Biddeford and Saco are extensively engaged in manufacturing cotton goods. Woolen mills are scattered throughout the State. The oil-cloth industry was first started in Maine in 1805 by C. M. Bailey of Winthrop. Nearly all the factories are located near the coast, or in localities where abundant water power and good transportation lessen the cost of production and shipping. Lime and cement are important manufacturing products: large quantities of lime are made in Knox County.

The Paper Industry.—Samuel Waldo, Thomas Westbrook and Richard Fry were pioneers in the paper industry of Maine, having built a mill at Presqueipoit Falls, Falmouth, in 1731, and a second mill at Southworth in 1733. At this time there were but three paper mills in the country, two being in Philadelphia and one in Milton, Mass. R. H. Gardiner and John Savlens built the third mill about 1810. In 1816 Harris and Cox Brother added another near North Yarmouth, and the same year another mill was built at Union by Josiah Day which was destroyed by fire in 1843. In 1823 George Cox and Company built a mill at Vassalboro which was burned in 1848 and not rebuilt. In 1845 Day and Lyon built a paper mill at "Connor" (now Cumberland Mills, Westbrook) which was burned in 1852, and was rebuilt by the firm of S. D. Warren and Company on the site of the old mill.

The paper industry in Maine received a great impetus by the introduction of wood pulp, and the State now ranks among the first of pulp-producing States. Wood pulp was first produced in this State in 1868-69. The second pulp mill was established in 1872 at Yarmouth. Sulphite pulp was first produced in Maine in 1889. Other sulphite, soda pulp and ground wood mills have followed in rapid succession since these dates.

The paper pulp industry has increased greatly during the past 10 years. There are now 115 pulp mills in the State, with aggregate
capital of $75,000,000, and an annual product valued at $70,000,000. Their daily output is about 5,000 tons, divided according to return 1916, as follows: For news, 1,319 tons; board wrap, 433 tons; book writ, 483 tons; specialty, 652 tons; mechanical pulp, 980 tons; mechanical pulp, 1,657 tons.

The last public report gives the value of products of the following industries:

<table>

</tbody>
</table>

Political Divisions.—Maine is divided into 16 counties, as follows: Androscoggin, Aroostook, Cumberland, Franklin, Hancock, Kennebec, Knox, Lincoln, Oxford, Penobscot, Piscataquis, Sagadahoc, Somerset, Waldo, Washington, York. Top. 742. 731.

The principal cities of Maine are Portland, the metropolis, founded in 1632; Lewiston, Bangor, Bath, Augusta, Saco and Biddeford, each of which is treated in a separate article.

Banking Institutions.—There were in 1915 69 national banks doing business in this State, having capital stock of $7,765,000; surplus fund, $3,879,500; undivided profits, $2,756,231.48; loans and discounts, $39,240,311.42. Forty-eight savings banks, having 238,300 depositors and $97,679,384 savings deposits. Forty-six trust companies, having 157,590 depositors; capital stock, $3,690,400; surplus, $2,620,665.56; savings deposits, $52,605,216.62; assets, $69,707,168.45. Total number of banks in State was 165. Thirty-seven loan and building associations; number of loans, 5,814; amount of loans, $5,706,062.59; total assets, $3,957,696.22.

Insurance Companies.—There are 61 insurance companies, with total assets of $222,602.54.

Newspapers.—There are published 136 newspapers; 25 Republican; 8 Democratic; 19 independent; 5 religious; 3 temperance; 7 literary and educational; 3 agricultural; 36 local and 30 miscellaneous.

Finances.—On 1 Jan. 1917 the State Treasury reported a balance of $1,473,118 from 1916. The receipts in 1917 amounted to $8,185,344; payments amounted to $7,796,254, leaving a balance on 1 Jan. 1918 of $1,862,208. The bonded debt in 1917 amounted to $3,021,224.

Government.—The State Constitution, under which the laws of the State are administered, was adopted by the people in town meetings held throughout the State December 1819. To amend or change the constitution it is necessary to have in favor a two-thirds vote of both houses of the legislature and a majority of the votes cast at the next biennial election or meeting of the people not涯 of the State; that is, no one has the right of suffrage but males, 21 years or over, citizens of the United States, who have resided in the State, county, town and voting district three months. Men of 21 years and over who are excluded from voting are paupers, Indians who are not taxed and persons under guardianship. Voters who are soldiers in the State militia or regular United States army or serving outside the State. An amendment was made to the Constitution in 1884 to prohibit the manufacture and sale of intoxicating liquors. Severe penalties were attached to the violation of the law. State, city and town officials supervise the sale of liquors and permit such sales only for medicinal, manufacturing and mechanical purposes. The capital city is Augusta, on the Kennebec River in Kennebec County; its population is about 11,683.

Executives.—A plurality of the votes cast is necessary for the election of the governor, who holds office for a term of two years. His council consists of seven members elected biennially on joint ballot of the legislature, but any district prescribed for the election of senators can furnish only one councillor. The governor and council have power to grant pardons, commutations and reprieves, and to remit penalties. They also have the appointment of judges of the Supreme Court. In case of vacancy the office of governor, the president of the senate and speaker of the house are respectively in line of succession. The secretary of state and the treasurer are elected on joint ballot of the legislature and for two years.

Legislature.—The legislature is composed of a senate and house of representatives. There are 31 members of the senate and 131 members of the house, all elected biennially on the second Monday in September. They met in session on the first Wednesday in January following their election. The senators are elected from senatorial districts into which counties of the State are divided. The representatives are elected from towns. All bills relating to revenues must originate in the house of representatives. The house has power of impeachment; but the senate conducts the trial of impeachments. The legislature may overcome the governor's veto by a two-thirds vote of each of house and senate. The State has four congressmen.

Judiciary.—The eight judges who compose the Supreme Judicial Court are appointed for a term of seven years by the governor and council. The judges of the Superior Court of Cumberland County, which includes the city of Portland, the judges of the inferior courts, of municipal and police courts, are also appointed by the State executive and his council. The term of appointment of the judges of the inferior courts is seven years, and of the judges of municipal and police courts, four years. Probate judges are chosen by the people by election and for a term of four years. The attorney-general is elected on joint ballot of the legislature for a term of two years.

Local Government.—There is a general law providing for the election and duties of State, county, town and city officers, and penalties for non-fulfilment of their duties. The county officers are trial justices, county attorney, county poor officer, county treasurer, sheriffs, county commissioners, judges of probate, sheriff, county clerks, and register of deeds, treasurers, clerks, commissioners,
of disclosure, stenographic commissioners and coroners. The town officers are selectmen, clerk, treasurer, collector of taxes, constables, road commissioners, school committees, health officer. Justices of the peace have jurisdiction throughout the State.

Militia.—The National Guard of the State numbers 1,382 organized militia, with 116 commissioned officers and 14 general staff officers. The unorganized reserve militia numbers 103, 376—a very able-bodied male citizen, aged 18 to 45, being included. The organized militia is both commissioned and enlisted.

Religion.—The denominations rank in numbers as follows: Baptist, 20,016; Protestant Episcopal, 4,800; Free Baptist, 12,963; Congregational, 21,483; Methodist Episcopal, 10,585; Universalist, 3,003; Unitarian, 4,500; Roman Catholic (population), 106,000; Lutheran, 1,445; Presbyterian, 423; Advent Christian, 5,000; Friends, 1,800; Swedenborgian, 173; Christian, 3,600; Disciples, 500; Church of God, 250. In 1900 there were 2,020 Evangelical Sunday schools, with 13,600 teachers and officers and 111,290 pupils. Sunday schools are maintained in connection with all the Roman Catholic churches.

Education.—By the last census the school population was 161,600; enrolment in public schools was 132,948; and average daily attendance, 97,132; enrolment in parish schools, 11,000. There were 4,218 buildings used for school purposes, 6,447 teachers; school property valued at $4,690,475; receipts for the previous year, $1,507,345, and expenditures, $1,513,125. For the higher education there were 200 public high schools; 40 private secondary schools; 5 public and 2 private normal schools; Bowdoin College at Brunswick; Bates College at Lewiston; University of Maine at Orono; Colby College at Waterville; Westbrook Seminary at Deering; and Maine Wesleyan Seminary and Female College at Kent's Hill. There are academies at Houlton, Hampden, Lee, Bridgton and other towns. The illiterate of 10 years and over were 51.5 per cent, but this per cent would have been lower if the test had been made from the standpoint of those who could read or write in any language. A school for the deaf was opened in 1878 at Portland, and special schools for the blind were opened in 1879. The city of Portland and the county of York have each two public libraries. The city of Portland has one and the county of York has three public health nurses. The city and county of York have each an observatory, and the University of Maine, a botanical garden. The city of Portland has a public museum and the county of York has a public library.

History.—Maine is supposed to have been visited by the earliest explorers: Corte-Real in 1501 and Verrazano in 1524 reported a coast, the description of which corresponds with that of Maine. Gomez in 1528 sailed along the coast and named the Penobscot River. Rio de las Gamas, or Sagadahoc, became a French fort known as Norumbega, to settle a colony under a patent from Elizabeth. Bartholomew Gosnold, an Englishman (one of the founders of Jamestown, Va.), explored the coast in 1602. Maine was visited by Martin Pring, in 1603, by De Monts in 1604 and by Weymouth in 1605. The first attempt to settle on the territory was made by the French under De Monts, who, having received a patent from the French king, planted a small colony on Neutral Island in the Saint Croix River in 1604. The first colony settlement attempted by the English was at the mouth of the Sagadahoc by George Popham and Raleigh Gilbert in 1607. A fort was erected and a number of buildings and here the Memphremagog, the first vessel built in the country, was launched and subsequently formed one of the fleet of the Somers and Gates Colony in 1609. The colony at Sagadahoc was broken up by the death of Popham and great hardships endured by the colonists. They returned to England in the autumn of 1608. The French Jesuits then established a mission on Mount Desert Island, but they were expelled by the English the next year.
year. In 1614 the coast was visited by John Smith, who found a few scattered settlers around Pemaquid Bay and on the island of Monhegan, off the coast now included in Lincoln County. In 1616 Sir Ferdinando Gorges, "The father of American Colonization," who had sent Pring and Popham to Maine, sent his agent, Richard Vines, to Saco to remain during the winter to explore the country and test the climate. In 1620 the king of Great Britain made a division of the grand charter of 1606 and granted to the Plymouth Company in England the whole country lying between 40° and 48° N., and to the Virginia Company the southern portion of the original patent. On 10 Aug. 1622, Gorges received a patent of territory between the Merrimac and Kennebec rivers, and the next year he sent his son Robert as governor and lieutenant-general of the country, accompanied by several counselors and the chimney of the Church of England to establish worship. In 1629 another division of lands was made giving to Sir Ferdinando Gorges the country between theiscataqua and Kennebec rivers, to which he gave the name of New Somersetshire, and the remainder to John Mason. The first court in the province was convened by William Gorges, nephew of Sir Ferdinando, at Saco, 21 March 1636. Charles I granted to Gorges in 1639 a charter under which in 1641 Gorges established the first chartered city in the United States, under the name of Gorgeana, and constituted it the capital of the province. What was then Gorgeana is now New York. Its original name was Agamenticus. A fort was built here and efforts made to protect the people against the Indians. From 1630 to 1632 settlements were commenced in Saco, Biddeford, Scarborough, Cape Elizabeth and Portland, all of which continued to prosper until the Indian War of 1675, when they were overthrown. Massachusetts claimed a portion at least of the territory of Maine on the ground that its charter included the lands as far north as three miles above the source of the Merrimac; but those to whom other charters had been given resented her interference. In 1675 its purchase from the heirs of Gorges all their interest in the province of Maine. A new charter, issued by William and Mary, in 1691, combined the provinces of Massachusetts, Plymouth, Acadia, Maine and Sagadahoc into one province, called "The Royal Province of Massachusetts Bay." Maine was now a part of Massachusetts. Remote from the centre of white settlements of any great size, Maine suffered from attacks by Indians, especially during the French and Indian wars. When the British were off Minut Chronicled events 163 in its chairman now within its boundaries only five settlements.

Among the first soldiers in active service in the Revolutionary War were men from Maine, who fought as Massachusetts troops. A regiment of Maine was present at Bunker Hill. The British fleet, in 1775, attacked and destroyed Portland and Falmouth. Off Machias was fought the battle in which the Margaretta, a British ship, was captured. At the close of the war Massachusetts still retained possession of the country and called it the "District of Maine." The people of Maine were divided in their allegiance to Massachusetts; one party desired to remain a part of the "Bay State" and another party wanted independent government.

The separatist movement gained ground during the War of 1812. Maine was admitted into the Union as a State 13 March 1820.

The northern boundary continued a source of dissension with Great Britain, or between the people of Maine and New Brunswick until after the ratification of the Ashburton Treaty (q.v.), which practically settled the eastern boundary between the United States and Canada.

The legislation of the State has been usually marked by conservatism and sound judgment. In 1851 Maine adopted a prohibitory liquor law which has since been embodied in the constitution of the State. During the Civil War Maine furnished 70,107 soldiers, of whom 9,398 died during the war and a large number returned to their homes disabled invalids.

The State went Democratic at State elections (except 1840) till 1855, when Anson P. Morrill was elected governor as the candidate of the "Know-Nothing" party and also of those who favored a prohibitory law. From 1856 to 1910 the State has gone Republican except in 1878 and 1890, when the Democrats and Greenback fusion ticket elected their candidates.

In 1879 a dispute arose as to the legality of the election of some of the members of the legislature and of the governor. For a time a disturbance was feared, but the militia preserved peace until the Supreme Judicial Court rendered a decision making the Republican candidates legal members of the legislature. The State has had no serious internal troubles except the "Know-Nothing" agitation in 1854, and the dispute about the legislature in 1879. In 1910 and 1914 the State went Democratic. The present governor (1919) is Carl E. Milliken. The Australian ballot law was passed in 1891.

Since Maine became a State there have been 48 different governors, some of whom have held the office for more than one term.

John F. Hill, Republican 1901-05
William T. Cole, Republican 1905-09
Bert M. Fernslik, Republican 1909-11
Frederick W. Plaisted, Democrat 1911-13
William P. H丰收, Republican 1913-15
Oakley C. Curtis, Democrat 1915-17
Carl R. Milikolin, Republican 1917-21

* There were two acting governors, Williamson and Ames. With Butler and Joshua Hall, acting; there were two in 1839-1840.

JAMES PHINNEY BAXTER.

MAINE, France, an old province having Normandy on the north, Brittany on the west and Anjou and Touraine on the south and Orleans on the east. It corresponded to the modern departments of Sarthe and Mayenne. The ancient capital was Le Mans.

MAINE, The. A battle of the United States navy, mysteriously destroyed by explosion in Havana Harbor, Cuba, on the night of 15 Feb. 1898. The revolt of the Cubans in 1895 against Spanish misrule had brought the island in 1897-98 to the verge of ruin. General Weyler had been recalled and General Blanco was sent as governor-general to endeavor to bring order out of chaos, but his plans failed and January 1898 witnessed serious disturbances. The American government, believing the lives and property of American citizens in Havana in danger, the Maine, which had been for some time at Key West, was ordered to Havana and arrived at that port 24 Jan. 1898. She was piloted into the harbor by an official pilot of the Spanish government and was moored to a government buoy. The usual official and international calls and salutations were exchanged between the Spanish authorities and the commander of the Maine, Captain Charles D. Sigsbee, and outwardly there was no evidence of the impending disaster. The Maine carried 26 officers and 328 men, all of whom were on board when the explosion took place, except an assistant engineer, two naval cadets and a gunner. Two men were killed and 250 badly wounded, and 8 men died afterward in hospital. Only 16 of the crew wholly escaped injury. Of the dead, 166 were buried in Colon Cemetery, and 25 at Key West. In 1899 the dead buried at Colon Cemetery were brought to the United States and buried at Arlington with military and naval ceremonies. A court of inquiry, Capt. W. T. Sampson presiding, was held, and after a month's investigation expressed the opinion that the vessel was destroyed by the explosion of a submarine mine, but responsibility could not be fixed upon any person or persons. Shortly afterward war was declared. (See United States—The War with Spain.)

There was a very general demand throughout the United States that the Maine should be raised, and on 9 May 1910 Congress authorized operations and the matter was placed in charge of the War Department, and assigned specifically to the engineer corps of the army. An elliptical coffer-dam, composed of a series of huge contracted cylinders that were constructed of interlocking steel piles and filled with mud and stone, was placed around the wreck. It was a wonderful piece of engineering, reflecting great credit on every army engineer connected with its inception and execution. The coffer-dam was completed 5 June 1911, and the entire wreck exposed 2 November following. A joint army and navy board, of which Rear Admiral Charles E. Wrenland was president, was then sent to Havana to reinvestigate the wreck. It reported 15 Dec. 1911, confirming the verdict of the Sampson court except in the non-essential detail that the centre of the explosion was a little farther aft than was reported by that court. The after part of the hull, all that was not shattered, was floated 13 Feb. 1912, 14 years, lacking two days, after the Maine's destruction. On 16 March 1912 this relic of the once powerful battleship was towed to sea, with attendant ceremonies, afloat and ashore, and sunk in 600 fathoms of water. Concurrently 34 coffins, estimated to contain the bones of 64 of the Maine's dead, were placed on board an American war vessel and dispatched to Arlington, where, on 23 March, they were buried in the Maine plot.

MAINE, University of, The, a coeducational institution, located at Orono, Me., on the Penobscot River, eight miles above Bangor. It is one of the institutions that owes its existence to the Act of Congress of 1862, commonly known as the Morrill Act. The 210,000 acres of land which were, by this act, conveyed to the State for the purpose of establishing a college of agriculture and mechanic arts, were sold at a low price, and there resulted an endowment for the college of $118,300. The income of the institution is derived from interest on this endowment fund and on other bequests of private nature, an annual appropriation by the State, student fees and the income of the second Morrill Act of 1890. The total income from all sources for the year 1915, exclusive of special appropriations for buildings, was about $267,416.78.

From the day of opening, in 1868, when 12 students enrolled themselves, the institution has prospered. Until 1897 the institution was known by the name "State College of Agriculture and Mechanic Arts. The legislature of 1897 changed the name to the University of Maine. The number of students (1915-16) was 1,299. The faculty number 154. There are 30 departments in which instruction is given.
These departments are divided into colleges of Arts and Sciences, Agriculture, Technology and Law.

In the College of Arts and Sciences instruction is given in the departments of Greek and classical archaeology, Latin, French, German, education, English, Spanish and Italian, philosophy, economics and sociology, history, mathematics and astronomy, physics, chemistry and biology. In the College of Agriculture instruction is given in agriculture, animal and poultry husbandry, forestry, home economics and horticulture. In the College of Technology instruction is given in chemistry, chemical engineering, civil engineering, mechanical engineering, electrical engineering and pharmacy. The degree of B.A. is given for the completion of courses in the College of Arts and Sciences. The degree of B.S. is given for courses in the colleges of Agriculture and Technology. The degree of LL.B. is given those who graduate from the College of Law.

Student interest is taken by the student body in all branches of athletics. The students maintain an excellent band, an orchestra, glee and instrumental clubs and debating clubs. Twelve fraternities maintain houses of their own, in which they live as families and frequently entertain their friends. The College of Law, located in Bangor, was established in 1868. It has an excellent library, maintains a three-year course and has a few more than a hundred students, a large percentage of whom are college graduates.

MAINE BOUNDARY TREATY. The year 1910 witnessed the final settlement of the long-standing dispute as to the boundary line between Maine and New Brunswick. Secretary of State Knox, acting for the United States, and Ambassador Bryce, on behalf of Great Britain, signed a treaty which establishes the exact boundary of Maine for all time.

At the close of the Revolutionary War in 1783 the first attempt was made to fix a satisfactory boundary, but it resulted only in hopeless dissatisfaction. Ever since that time the matter has remained one for ceaseless wrangling and dispute. Scarcely a diplomat has been sent to this country from England but has been called upon to familiarize himself with the Maine-New Brunswick boundary situation; while the State Department of this country has gone over the ground so many times that that performance has almost come to be regarded as one of the regular duties of the department.

Most boundary lines are fixed by nature; those which are not do not as a rule amount to a great deal, and an amicable settlement can usually be reached at once. With the Maine-New Brunswick line, however, neither of these conditions have ever applied, particularly in that part which has so long been in dispute. This particular line runs through Passamaquoddy Bay, along the little islands at the mouth of the Saint Croix River. As a result of its indefinite character there has been endless dispute and strife among the fishermen who frequent these parts; dispute which had had an industrial significance since both the Eastport and Lubec canneries have sent their men to this point and it marks a wide frontier of difference whether they are fishing in American or Canadian waters.

The source of all the trouble was the looseness with which the first treaty, that of 1783, was drawn up. Article II of that document reads: "And that all disputes which might arise in future on the subject of the boundaries of the said United States, and the said British provinces, have been agreed and declared that the following are, and shall be, their boundaries, viz.: From the north-west angle of Nova Scotia, viz.: That angle which is formed by a line drawn due north from the source of the St. Croix River to the Highlands; along the said Highlands which divide those rivers that empty themselves into the river St. Lawrence from these which fall into the Atlantic Ocean, to the northwesternmost head of the Connecticut River, etc.

Thus, while the Saint Croix was plainly named as the beginning of the eastern boundary, the only point mentioned was the source of the river, and not a word was said about its mouth or the numerous islands of the great bay into which it empties, nor was there any question as to what was the Saint Croix River. The trouble started at the very start. The first action toward a settlement was taken in 1794 when John Jay was charged to adjust the matter. All he was able to accomplish, however, was a prescription in his treaty of that year for the appointment of three commissioners to determine just what was the Saint Croix River. These commissioners met at Halifax in 1798 and determined the river, but neglected to mention its source and made no disposition of the islands at its mouth. Subsequently there were treaties, conventions and declarations between the United States and Great Britain relative to this subject in 1814, 1818, 1827, 1842, 1846 and in 1870, but in every instance there was something still left to be adjusted around the mouth of the river.

The Treaty of Ghent in 1814 provided for commissioners to settle the matter and they decided that Moose, Dudley and Frederick islands belonged to the United States, while all the other islands, including Grand Manan, were the property of Great Britain. This was very good so far as it went, but it left unsettled the status of several small islands in the Saint Croix and of the line itself through the bay. The channel thus remained.

In addition to this, trouble soon arose over the boundary line northward and westward from the source of the Saint Croix. The original treaty had been exceedingly vague on this subject, and finally in 1827 the long of the Netherlands was named as referee to conclude the dispute. After failing for a long time to satisfy either party with any of his suggestions, he drew a line to suit himself, awarding part of the disputed territory to Maine and part to New Brunswick. The United States rejected this arrangement, while in the meantime the disturbances on the border kept becoming more and more serious. Operations of the 1830 census takers in the contested area created much feeling, and eight years later an American lumber dealer was thrown into jail by New Brunswick officials — the act having much to do with the precipitation of the Aroostook war. Although no blood was spilled in this it came very near to maturing into a third war with England. A joint occupation was agreed upon as a temporary compromise, before Daniel Webster and Lord Ashburton came together in 1842.
and drew up the famous treaty which settled all dispute as to that particular part of the boundary line.

It has been related as an historical fact that in these negotiations both nations withheld maps which were unfavorable to their claims. The Americans had one map which had been discovered but a short time before in Paris, and was supposed to have been drawn up by Benjamin Franklin, while in the possession of the English was one made by Richard Oswald, who was one of the commissioners who negotiated the treaty which gave the United States its independence. Later both nations showed these maps to their own people in evidence of how conclusively they had got the best of the bargain. Up to the present time, however, the United States has always regarded the signing of this treaty of 1842 as a diplomatic triumph.

The treaty of 1842, however, made no mention of any part of the boundary south of the monument which had been erected at the source of the Minas. Mr. Tower and Ambassador Bryce signed their treaty of 1910 the lower part of the line in places was still contested. But with the signing of this latest treaty and the final settlement of the whole chaotic matter no point now remains between the United States and Canada which is in the slightest dispute.

MAINS. See Electrical Terms.

MAINTANCES, in its legal signification, the interference by a person in litigation in which he is not primarily interested, by assisting either party with money or otherwise. It includes champerty (q.v.), which consists of maintenance for reward or for a share in the proceeds of the litigation promoted. An agreement of this kind is illegal and void, and at common law is punishable as an offense tending to obstruct justice. To-day where the common law prevails the wrongful intention with which the assistance is given is regarded as the gist of the offense. In many jurisdictions maintenance is no longer recognized as a criminal offense and in many States is not regarded as a civil cause of action by the injured party against a maintainer of the suit against him. See Criminal Law and consult the authorities referred to under that title.

MAINTENON, mahn-te-nohn, Françoise d'Amboisné, Marchioness de, French queen; b. Niort, Poitou, 1635; d. Saint-Cyr, 1719. Her birthplace was the prison in which her parents were confined because of religious trouble. After her father's death in her 10th year she became the ward of her guardian and aunt, Madame de Neuffant, who gave her a somewhat limited education and through whose efforts she became converted to the Catholic faith at about the age of 14. She was then returned to her mother, whose income was insufficient for the child's support. Her humiliating situation did not embitter her bright and cheerful disposition, however, and when at 16 the famous wit and man of letters, Scarron, deformed, old and infirm as he was, became her husband, and she was soon the centre of the clever literary people. When her husband Scarron died, her good sense and delightful disposition recommended her to many friends, who pointed her out to Louis XIV as a fitting person to take charge of the education of the children born to him by Madame de Montespan. She undertook the office of governess to the royal children, won their affection and respect as well as that of the king, who married her in 1685 when she was 50 and he 47. There can be no doubt that she exercised a beneficial influence over the king's private life. She was undoubtedly disinterested and charitable, her character above stain in a profligate age, and her mind clear and resolute in pursuing the course she thought to be right. She survived the king four years and died at the nunnery at Saint Oy by which she had changed into a place of education for the poor daughters of families, having enjoyed to the end all the honor and position of a royal widow. Consult Blennerhassett, C. J. 'Louis XIV and Madame de Maintenon' (New York 1911); Dyson, C. C., 'Madame de Maintenon: Her Life and Times, 1635-1719' (London 1910); Geffroy, 'Mme. de Maintenon d'apres sa correspondance authentique' (Paris 1897 by Knauff); and P. Mme. de Maintenon' (ib. 1848-58); Pilastre, E., 'Vie et caractére de Mme. de Maintenon' (ib. 1907).

MAINZ, mints, Germany, a town in the grand-duchy of Hesse-Darmstadt, on the left bank of the Rhine, opposite the mouth of the Main, 20 miles by rail southwest of Frankfort. It is a fortress of the first rank, an episcopal see and a river port. The town rises gradually from the Rhine in an amphitheatre. A railway bridge spans the Rhine a little above its junction with the Main, and a stone bridge connects with the opposite suburb of Kastel. A handsome quay, 330 feet wide, extends along the Rhine for a considerable distance, and large modern harbors have been constructed. The principal edifices are the cathedral, recently restored, a vast building of the 11th century; the former electoral palace, now containing the city library (230,000 vols.), picture gallery, museum of Roman and Roman-German antiquities, etc., the old collegiate church of Saint Stephen, occupying the highest site in the town, the church of Saint Peter, the German House, or grand-ducal palace with the arsenal adjoining, the courts of justice, the government buildings, public hall, two new concert halls, central railway station, etc. One of the most interesting objects in the town is the house of Gutenberg which contained his first printing office. A bronze statue of Gutenberg, by Thorwaldsen, stands in an open space near the theatre. The great open-air resort is the Neue Anlage, outside the gates, consisting of extensive public gardens, and commanding fine views of the town and surrounding district. The manufactures consist chiefly of leather, furniture, hardware, carriages, carpets, tobacco, beer, chemicals, musical instruments, gold and silver wares, machinery, soap, hats, etc. The trade, particularly transit, is extensive. The principal articles are Rhenish wine, flour, oil, coal and wood. Mainz owes its foundation to a Roman camp which Drusus pitched here. On the decline of the Roman power it was almost entirely destroyed, but was afterward rebuilt chiefly by Charlemagne, and became the most ecclesiastical city of the German Empire, of which its archbishop-elector ranked as the premier prince. Pop. 110,634.
MAIPO, mṭ'po., or MAIPU, a river in Chile, having its rise in the Andes Mountains and flowing almost due west into the Pacific Ocean. It is 120 miles in length. The falls and rapids furnish valuable water power, which has not been utilized to any great extent. The city of Santiago is a few miles north of the river. On 5 April 1818 was fought on the banks of the Maipo the battle which decided the independence of Chile.

MAIR, mār, Charles, Canadian writer: b. Lanark, Ontario, 21 Sept. 1840; d. 1906. He was educated at Queen's University, Kingston, and enteredjournalism. He aided in quelling the Riel insurrections and was one of the organizers of the "Canada First" party. Among his works are 'Dreamland and Other Poems' (1868); 'Tecumseh,' a drama (1866).

MAISON CARRÈES, mā-zōn’ kār-rē, Roussillon, France, the most perfect of its type remaining. It was probably built early in the Christian era, its inscription dedicating it to the adopted sons of Augustus, Gaius and Lucius Cæsar, although by some authorities its date is placed at about the 2nd century. It is built on the plan of the Parthenon although its dimensions are smaller. It stands on a podium 11 feet high, measures 40×82 feet and is entered by a flight of 15 steps. There are 30 columns, of which 20 are in the side and rear walls while 10 form the portico. The temple now houses collections of antique sculpture and coins.

MAISONNEUVE, mā-zōn-nēv, Paul de Chomedey, Sieur de, French colonizer: b. Champagne, France; d. Paris, 9 Sept. 1676. He enlisted in the French army at 13 and later organized a band of colonists with whom he landed at Quebec in 1641. In 1642 he founded Montreal and was for 22 years its governor but was absent for a time in 1652 when he returned to France to conduct a new party of settlers. He displayed great administrative ability, but through the jealousy of De Mésy, governor-general of Canada, was in 1664 recalled to France by De Tracy. Though no charges were made against him he found no possibility of reinstatement in office and resigned in 1669.

MAISTRE, māstr, Joseph Marie, Comte de, French philosopher and savant: b. Chambéry, 1 April 1754; d. Turin, 26 Feb. 1821. He was of French extraction and was a senator of Montpelay at the time of the French invasion (1792). He left his country in consequence of that event, and afterward followed his king to Sardinia. In 1813 he was sent ambassador to Saint Petersburg, and returned finally to Turin in 1817. De Maistre was familiar both with Greek and Latin literature, and his writings in French have obtained the highest praise of critics. He was a conservative in politics, religion and philosophy, a supporter of absolute monarchy and of the infallibility of the Pope. His 'Mémoires politiques et correspondance diplomatique' (published posthumously, 1858), however, shows him in the light of a much more discerning politician than his formal treatises, and indicates a large and liberal appreciation of the revolution which he opposed. As a diplomatist he exerted himself to effect the restoration of all his former possessions to his master, and to obtain the transfer of Genoa. Among his political writings are his ' Eloge de Victor Amadée III'; 'Considérations sur la France' (1796); 'Essai sur le principe générateur des constitutions politiques' (1810); in which he maintains the divine origin of sovereignty; 'Du Pape' (1819); 'Soirées de Saint Petersbourg' (1821; new ed., 1888); 'De l'Eglise gallicane' (1821-22); and 'Du Congrès de Rastadt' (the last with the Abbé de Pardi). 'Quatre chapitres inédits sur la Russie par le comte de Maistre' was published by his son in 1839. Consult Descotes, 'Joseph de Maistre avant la révolution' (Paris 1893); Lessure, 'Joseph de Maistre et sa famille' (ib. 1893); Paulhan P., 'Joseph de Maistre et sa philosophie' (1893).

MAISTRE, Xavier de, French soldier, essayist and novelist, brother of Joseph de Maistre (q.v.): b. Chambéry, October 1763; d. Petrograd, 12 June 1852. He served in the Piedmontese army when very young, and his literary career began with his writing, 'Voyage autour de ma chambre' ('Journey Around My Room,' 1794), while in prison at Turin for participation in a duel. When Savoy was annexed to France he went to Russia and there secured a commission in the army, where he rose to the rank of major-general. He lived for a time in Naples after the restoration of the Piedmontese dynasty, but eventually returned to his adopted country and died there. His style was graceful and his work was marked by strong delineation of character and exceptional descriptive power. (See Joseph Aouchon My Room.) He also wrote 'Le Lépreux de la cité d'Aoste' (1811); 'Les prisonniers du Caucase' (1815); 'La Jeune Siberienne' (1815); 'Expédition nocturne' (1825). His complete works were published in three volumes (Paris 1825).

MAISUR, mā-soor. See MYSORE.

MAITIN, mā-tin. José Antonio, Venezuelan poet: b. Porto Cabello, 1797; d. Choroni, Venezuela, 1874. In 1824 he returned from Havana to his own country whence he had fled on account of persecution, and made his home in the valley of Choroni. In 1844 his best poems were collected and published with the title 'Echoes from Choroni,' and in 1851 a collected edition of all his works appeared.

MAITLAND, Edward, English mystic and writer: b. Ipswich, 27 Oct. 1824; d. Tonbridge, 2 Oct. 1897. He was educated at Caius College, Cambridge, and was destined for the ministry, but declined to take holy orders, because of incompatibility of religious beliefs. He was one of the "Forty-niners" in California and later went to Australia where he became a commissioner of Crown lands. He was married and widowed in Australia and in 1857 returned to England, where he engaged in literary work of humane tendency. He made the acquaintance of Mrs. Anna Kingsford in 1874 and with her crusaded against materialism, vivisection and the use of animal food. In 1876 he announced that he had acquired a new sense which enabled him to perceive the inner meanings, as well as those of trees and animals, and likewise revived his memory of his own previous incarnations. He joined the Theosophical Society in 1883, but shortly afterward withdrew from
it and with Mrs. Kingsford founded the Hermetic Society which was of mystic rather than occult character. After the death of Mrs. Kingsford in 1888 he maintained that they remained in communication. In 1891 he founded the Essex Christian Union. He wrote for the Spectator and the Examiner; reviewed books for the Athenæum; and collaborated with Mrs. Kingsford in writing 'The Key of the Creeds' (1875), and 'The Perfect Way; or the Finding of Christ' (1883). His Pilgrim and the Shrine' (1867); 'The Higher Law' (1869); 'By and By: an Historical Romance of the Future' (1873); 'Clothed with the Sun: Being the Book of the Illuminations of Anna (Bonus) Kingsford' (1889); 'The New Gospel of Interpretation' (1892); 'Anna Kingsford, Her Life, Letters, Diary and Work, By her Collaborator, with a Supplement of Post-Mortem Communications' (2 vols., 1896). After the completion of the 'Life' of Mrs. Kingsford, which, like most of his writings, was largely autobiographical, his mental powers failed rapidly.

MAITLAND, Frederic William, English historian: b. London, 28 May 1850; d. 19 Dec. 1906. He was graduated from Trinity College, Cambridge, and studied law; in 1884 was made reader of English law at Cambridge and from 1888 was professor of the same branch there. He read widely on legal history, founded the Selden Society in 1887 for the study of the history of English law and was a generally recognized authority. Among his works are 'Gloster and the Estates' (1879); 'A History of English Law,' with F. Pollock (1895); 'Canon Law in England' (1898); 'English Law and the Renaissance' (1901), etc.

MAITLAND, J. A. Fuller. See FULLER-MAITLAND, J. A.

MAITLAND, Sir Peregrine, British soldier: b. Hampshire, England, 1777; d. London, 30 May 1854. He enlisted in the army in 1792 and was promoted rapidly, serving in Spain and at the battle of Waterloo, where he was a major-general. In 1818 he was appointed lieutenant-governor of Upper Canada and in 1828–34 was the first governor of the Madras army, 1836–38. From 1843–47 he was governor and commander-in-chief at the Cape of Good Hope.

MAITLAND, Sir Richard, Lord Lethington, Scottish poet and antiquary: b. Scotland, 1496; d. Edinburgh, 20 March 1586. He was educated at Saint Andrews and was one of the great lawyers of his day, and although he became blind in 1561 was nevertheless made a member of the Privy Council, and in 1562 keeper of the great seal. His manuscript collection of early Scottish poetry is preserved at Magdalene College, Cambridge. A selection from his collection, together with his own poems, was published in 1780, and his poems were reprinted in 1830 by the Maitland Club, a literary organization founded in his honor in 1828.

MAITLAND, William, Scottish statesman: b. Scotland, about 1528; d. Leith, 9 June 1573. He was a son of Sir Richard Maitland, Lord Lethington (q.v.), and was educated at Saint Andrews and on the Continent. He early entered political life and was interested in the Knox reform movement; in 1558 he was appointed Secretary of State by Mary of Guise, and is commonly called "Secretary Lethington." He was one of the commissioners who concluded the Treaty of Berwick and in 1550 was speaker of the Scottish Parliament. He was one of Mary's ministers on her return from France, but was suspected of having betrayed her to Queen Elizabeth. In 1563 Maitland conducted a prosecution for treason against Knox whom he had earlier supported, and in 1565 he became lord of the sessions but was removed from office for implication in Rizzio's murder; he was also connected with the murder of Darney. He contrived Mary's escape from Lochleven but fought against her at Langside. After the assassination of Moray he became the leader of the queen's party and was active in her support. He joined Kirkcaldy at Edinburgh Castle, and encouraged him to hold out until the last. He was taken prisoner at its surrender and died in prison. Consult Skelton, 'Maitland of Lethington and the Scotlant of Mary Stuart' (1887–88).

MAITLAND, Australia, town, in Northumberland County, in New South Wales, on the Hunter River, about 119 miles north of Sydney by rail. It is connected by rail with Newcastle, about 13 miles distant. The Hunter River divides the town into East and West Maitland, two distinct municipalities, West Maitland being the larger. The Hunter River frequently overflows its banks and floods the town and surrounding country. Although serious devastation results, the soil has been enriched by this flooding, and so fertile is this section that Maitland is called the "garden of New South Wales." Grapes, grains, tobacco and vegetables grow in abundance. Large coal fields are near the town. Considerable manufacturing is carried on, especially in West Maitland. Pop. of East and West Maitland, 11,313.

MAIZE. See CORN, INDIAN.

MAIZEROU, René, Baron (real name René Jules Jean Toussaint), French novelist: b. Metz, 2 May 1856. He was educated at the Jesuit College of Saint Clement, the Toulouse Lycee and the Saint Cyr Military School, becoming second lieutenant in the 53rd regiment of Infantry. He resigned from the army in 1881 and entered upon a literary career. He contributed to Le Gaulois, Figaro, Gil Bias, La Vie Moderne and Clarion, and became a voluminous writer of fiction, also producing several pantomimes, ballets and dramas. Author of 'Le Capitaine Bric-a-brac' (1880); 'Souvenirs d'un officier' (1888); 'L'Adorée,' 'P'ti-Mi'; 'Le Rellet'; 'En Volupté'; 'Gloria, fille et marquise'; 'Ville d'Amour'; 'La Mer' (1895); 'La Remplaçante' (1906); 'L'Amour en danger' (1912), etc.

MAJESTY (Latin, majestas). Majestas, in a collective sense, was used in republican Rome to signify the highest power and dignity, the attribute of the whole body of citizens, the populus. The majestas was also ascribed to the dictator, consuls, and even Senate, though in the case of the last the word auctoritas was used in preference. At a later period,
under the Roman emperors, majestas was the name of the imperial dignity, whilst that of a magistrate was called dignitas. To kings the attribute of majesty was given much later. The courtiers introduced the title into France under Henry II. In the Treaty of Crespy (1544) Charles V is styled his royal majesty; and in the Peace of Cateau-Cambrésis (1559) the titles of most Christian and Catholic majesty are found for the first time. In England Henry VIII first adopted the title majesty, giving the magnificence being given the titles formerly employed. At present this title is given to all European emperors and kings.

MAJOLICA AND MEZZA-MAJOLICA.

Spelled also maiolica. It is generally claimed that the word was derived from the island of Majorca, whence the first pieces of this ceramic ware were imported to Italy. The majolica has become very confused and indefinite expression and use by writers with different meaning. The term, in its first application, referred only to the early Italian lustre-ware made (15th century) with transparent or milky glazes and outer surface of metallic sheen in imitation of the lustre-ware of Hispano-Moresque creation. Later, the early enamel-covered and color-decorated wares of Italy were called majolica regardless of the use of a metallic lustre surface, and the lustre-ware having Oriental style of form and decorative treatment was termed mezza-majolica. But the term majolica has in modern times been vulgarized into a broader definition by including practically everything in ceramics having glaze coating and painted decoration. Leading experts retain the more distinctive terms. Lustre decoration consists of imparting a metallic or pear-like (nacreous) sheen to the outer surface of the ceramic ware by coating over the already decorated and fired piece with a thin layer of a pigment containing either gold, silver, copper, etc., and then firing under moderate heat. The effects are very delicate and beautiful and are known, according to the different sheens produced, as ruby (rubino), gold, silver, mother-of-pearl (madrepérola), etc.

Mezza-Majolica.—The earliest production of this ware was in Persia and Turkey, but it is only in quite recent years that the actual fabrique have been located. To this Turkish ware belong the pieces heretofore labeled “Lindos” and “Rhodian” ware from the location of the sites where examples have been excavated. The actual sites of production now satisfactorily proven and dates of discovery of these prototypes of mezza-majolica are as follows: Rekka (1896), Sultanabad (1905), Rhaiges, quite recently. The ware formerly termed “Siculo-Arabian” is now said to have had its home in Syria or Egypt, and so-called “Rhodian” ware in Osmanli-Turkey. The latter has most brilliant coloring (blue, grayish-black, green, etc., and, later, red) and ornamentation as well as most masterly technique in execution. At Fostat, in Lower Egypt, lusted and unlusted ware was produced before the 12th century. We find among the Persian examples cylindrical vases, pear-shaped bottles, plates, tiles, bowls, mosque lamps, etc. In the Persian polychrome enamelled-decorated ware of the 17th century we find dark blue, yellow, green, purple, red, black, turquoise, all on very white ground, with typical Persian decoration (arabesques, flowers, turbaned heads, figures, etc.). Such 17th and 18th century ware was produced in northeest Persia, Bokhara, Kirman, Kashan, etc. Practically all this was hard-paste body coated (en-gobe). The Mohammedan tiles (known in Arabic as rojolos) were very beautiful and utilized in covering outside spaces of the mosques as well as the internal walls. Grand effects are those presented in the Blue Mosque, Cairo, the Tabriz (15th century) and at Khoda Bende Khan shrine at Sultanieh (14th century), etc. Spain produced glazed ware as early as the 8th century (mosque of Cordova has examples). Through its Moorish artists Spain produced lustre-ware, an industry doubtless derived from Oriental sources, at an early date, Calatayud having both domestic and export trade in the 12th century. This same gold-lustre ware was produced in Malaga during the 14th century, and, by the end of the 15th century, Manises, near Valencia, was the centre for the lustre ware industry, retaining its pottery kilns to the present day. The yellowish glaze on Spanish majolica covers both the inside and underside of vessels. Color is mostly cobalt blue, but coats-of-arms show a sparse use of brown and violet. The great Alhambra vase and pieces of a similar character belong to the 14th century and were produced in Granada. This Hispano-Moresque art was continued by the Christians after the Moors were expelled, but it soon became decadent in its style. For some time, at least, Patera, Quarte, Villelonga, Alicata, Carcer, Moncada, etc., produced gold-lustre ware. The quality of the gold-lustre remained good into the 17th century though other ware became inferior long before. And the modern lustre shows coppery effect instead of the earlier pale gold tones. Alcora produced the best pieces. Sicilian (Siculo-Arabian) mezza-majolica ware dates back to the 9th century.

Majolica.—Italy imported her lustre-ware from Spain and the island of Majorca, apparently, till about the 15th century, but, by the middle of the 14th century she had started her own mezza-majolica fabrickes and by the first half of the 16th century the industry was in its zenith, to become thoroughly decadent by the end of the 19th century. The recent discovery in Faenza of the piece decorated with Astorgio Manfredi (1393-1405) coat-of-arms and the documentary statement of the contemporary writer Pietro del Bono (1380) make it appear that Italy was producing opaline under-glaze majolica in the 14th century besides its silicious transparent colored glazes (mezza-majolica). By the 16th century Italian majolica was being made in Pesaro, Urbino, Gubbio,
MAJOLICA

1 The Rape of Proserpine, Urbino Gubbio Lustres (Italy 1544)
2 The Death of Achilles, Urbino (Italy 1540-1545)
3 Coat of Arms of the Medici of Florence, Hispano Moresque Valencia (1479-1500)
4 Bowl, Rhages, Persia (18th Century)
Italian tin-glazed majolica was being produced by the 14th century at least.

Mexican Majolica.—Until about 10 years ago the fine specimens of old opaque tin-glazed majolica found in Mexico and sought for by collectors were supposed to be Spanish creations and imported by the colonists. Mrs. Robert W. deForest, with her fine collection of this ware (now donated to the New York Metropolitan Museum of Art), was led to take a generous interest in investigating the source of the product. And the late Dr. Atlee Barber of the Pennsylvania Museum, Philadelphia, by his researches disclosed the following facts:

About 1525 the Spanish and Mexican painters were being taught to the colonists by Dominican friars from the Talavera potteries. In 1531 Pueblo de los Angeles started a pottery with Spanish artisans and became the centre of a large industry. Mexican-made glazed Majolicas were used, instead of the imported articles, to decorate the insides of the walls and also the exteriors of churches, hospitals, convents and even private houses. By 1653, as is shown by documents, the Mexican-made glazed pottery was equal to the imports from Spain; from then on there were no longer in demand, and a potters' guild was established, to protect the industry in that year. By 1750 there were 30 prosperous potteries making three qualities of wares that they termed fine, common and yellow. Five colors of glazes were used in fine ware, three in common ware. The best period was from 1650 to 1750. Specimens show two kinds of body—the white, soft, porous and the harder-baked red. The process used was that of baking the clay body first, then dipping it in the tin enamel engobe, and finally covering it with a transparent lead enamel. The piece was then subjected to a second firing. The ware has been classified as follows: (1) Hispano-Moresque phase, up to the end of the 17th century. (2) "Spanish" or "Talavera" phase, from beginning of the 17th century to about the end of the 18th century (showing Talavera influence). (3) "Chinese taste," done by copying pieces of imported Chinese porcelain, started 17th century and continued to end of 18th century. (4) "Hispano-Mexican" or "Pueblo" type, about 1800 and lasted beyond 1850. Decadence followed, then extinction. The four styles have green, yellow, purple, brown, red, black and later rose and mauve, in the decoration. Tiles have only three colors, blue, green and yellow, generally. The product consisted of chocolate or vanilla jars, vases, albarelli (drug pots), barrel-shaped flower jars, circular dishes, bowls, saltcellars, inkstands, basins, cup-holders, tiles, etc.

Clement W. Coumbe.

MAJOR, Charles (Edwin Caskoden), American novelist: b. Indianapolis, Ind., 25 July 1856; d. 1913. He was educated in the public schools and studied law, establishing a practice at Shelbyville. He contributed to various magazines and published 'When Kindness was in Flower' (1898); 'The Bears of Blue River' (1901); 'Uncle Tom Andy Bill' (1908); 'Dorothy Vernon of Haddon Hall' (1902); 'Youla and the Burgundys' (1903); 'Gentle Knight of Old Brandenburg' (1909); 'The Little King' (1910); 'Touchstone of Fortune' (1912).

MAJOR, (1) in music, a term applied to imperfect concords, but chiefly to the interval of the third. It also denotes that one of the two modern modes in which the third is four semitones above the tonic or key note. (2) In military science, the major is a field officer ranking next below a lieutenant-colonel and above a captain. He has generally the command of a battalion, the exercises of which he superintends, and in action or on parade carries into effect the orders of his superior officer. The term in the French service has been superseded by that of chef d'état-major. A brigade major is an officer who performs for a brigade, or in garrison, the duties ordinarily discharged by a major in a regiment or battalion. A major-general ranks next above a lieutenant-general. In other cases, the term major, when applied as an epithet to the several denominations of men in an army, signifies the superior of the department; as sergeant-major, the chief non-commissioned officer in a regiment, who assists the adjutant; drum major, the chief of the drum corps, etc.

MAJORCA, ma-jo'rik-a (Spanish Mallorca; Latin, Balearis Major), Spain, an island in the Mediterranean, the largest of the Balearic group; area, 1,330 square miles. It is about 120 miles distant from Spain. It is very irregular in shape, and deeply indented, particularly in the northeast. The scenery is picturesque, the climate mild and agreeable, and in many of the valley regions vegetation is luxuriant. There are quarries of marble of various grades; lead and iron have been obtained, and coal to a considerable amount is mined. The olive and vine are extensively cultivated and there are large orchards of figs and oranges. The principal exports are bricks, lime, plaster, olive oil, light wines, and wine for dry. There is a less station with a 500-mile range located on Soller, not only for ship and shore traffic, but also for international service. The capital is Palma. Pop. of island, 264,231.

MAJORITY. See ELECTIONS; PRIMARY, DIRECT; PRIMARY, PRESIDENTIAL PREFERENCE; VOTE, VOTERS, VOTING.

MAJUBA (mə-joo'ba) HILL, an eminence in the extreme north of Natal, about 7,000 feet above the sea, the scene of the defeat of 648 British troops, with the loss of their leader, Sir George Colley, by a superior force of Transvaal Boers, 27 Feb. 1881. The attack was unexpected, and the Boers found the British resting after a night march and a climb of eight hours. The loss of the Boers was the death of the British more than 200 in killed and prisoners, besides many wounded and some missing. To the British nation the name Majuba Hill became a synonym for disaster. The anniversary of this fight was marked by the success of Lord Roberts, commander of the British forces in the campaign of 1900, when he received the surrender of the Boer commander, General Cronje.

MAKAROV, Stepan Osipovich, Russian vice-admiral: b. 1848; d. 13 April 1904. He entered the navy in 1864 and was promoted for distinguished services. During the Russo-Turkish War 1877–78, he commanded the gunboat Grand Duke Constantine, and for a series of daringly successful attacks upon Turkish ports, which earned him the title of "The Cossack of the Sea," he was promoted captain of the second rank, aide-de-camp to the late Tsar Alexander II, was decorated with the orders of Saint Vladimir and Saint George and received a golden sword of honor. In 1881 he took part with the legion of Skobelev in the capture of Geok Tepe in which General Kuropatkin also figured prominently. The same year he commanded the cruiser Taman, the station guardship of the Russian embassy at Constantinople, and made a careful and complete study of the defenses of the Bosporus. In 1882–83 he was chief of staff of the offensive squadron in the Baltic under Admiral Chichachev, Minister of the Navy. From 1891 to 1894 he was engaged in improvements of ordnance; among his inventions were the so-called cap guns possessing 20 per cent greater power of penetration into the newest superimposed armor; and the Ermak ice-breaker, the first of the ice-breaking vessels now used in Baltic and northern Asiatic waters. After the disastrous attack of the Japanese on the Russian fleet at Port Arthur in February 1904 Vice-Admiral Maka-rov was sent to the Far East to direct the Russian naval operations, and arrived at Dalny 8 March. He repaired and converted the blockaded squadron into an active aggressive naval force, but on 13 April was lured out of harbor by a decoy squadron. Discovering the Jap- nese main fleet trying to intercept him he at once returned and was about to enter the harbor, when his flagship, the Petropavlovsk, was destroyed by one of the sunken mines laid by the Japanese across the passageway, and Vice-Admiral Makarov, his guest, Vasily Verechagin (q.v.), the famous war-artist, 16 staff officers and over 800 sailors perished.

MAKART, mäk'art, Hans, Austrian painter: b. Salzburg, 19 Mar. 1840; d. 3 Oct. 1884. He began his art studies in the Academy of Vienna. In 1859 he went to Munich, and painted in the studio of Piloty, under whose teaching (1861–65) he developed remarkable tal-
ent as a colorist. His earliest success was a Rembrandtesque picture of ‘Lavoisier in Jail’ (1862). His first work to gain him wide fame was his three-paneled picture, ‘The Seven Deadly Sins’ or ‘The Plague in Florence,’ which aroused a storm of adverse criticism, wonder and admiration in Paris and Germany. In 1869 the Emperor Francis Joseph built him a fine studio in Vienna, and he produced his series of ‘Abundantia’ pictures; ‘Fruits of the Earth;’ ‘Fruits of the Sea.’ In 1873 followed the picture which attracted so much attention in the Exhibition of Philadelphia (1876), his ‘Venus: Doing Homage to Caterina Cornaro,’ now in the National Gallery at Berlin. He traveled in the East during the winter (1875-76), and his Egyptian sketches materialized in his ‘Cleopatra;’ ‘Antique Hunt on the Nile,’ etc. His ‘Entry of Charles V into Antwerp’ (1875-76) gained a medal at the Paris Exposition of 1878 and his ‘Dianna’s Hunting Party’ is one of the most successful of his larger paintings, combining superb coloring and modeling of the nude with the most refined landscapes. It is in the Metropolitan Museum of New York and is most characteristic of the gorgeous sensuousness of a painter who wove the intellectualism of German art to a sense of color, and broke free from the traditions of somewhat stiff, academic method, gaining in life and intensity what he sacrificed of academic correctness. Consult Lützow, Hans Makart (1886); Stiasny, Hans Makart und seine bleibende Bedeutung (1886).

MAKAW, or MACKAH, MACCAW, MAKHAY, MACKAY, MACKAYE, Cape People. Indian tribe of Cape Flattery, Puget Sound, Washington. They are the southernmost tribe of the Wakashan stock and the only one within the boundaries of the United States. They are of the Nootha branch. They claimed a considerable territory between Flattery Rocks and Hoko, but ceded to the government all these lands except that in the immediate vicinity of Cape Flattery in 1855. The Makaw reservation was defined in 1873, and an added reservation for the use of the tribe was established in 1893 and 1902. On the reservation there were in 1905, 465 Indians, and their numbers are diminishing. In 1800 Lewis and Clark estimated the tribe to number 1,000. They are of peaceful habits, are skilful fishermen and expert at water craft.

MAKEMIE, Francis, pioneer of the Presbyterian Church in the United States; b. Rathmelton, County Donegal, Ireland, 1638; d. Accomac County, Va., 1708. He was a born missionary and zealot, and on being licensed by the presbytery of Laggan sailed for the British West Indies, and began work in Barbados. In 1684 he sought a wider field in Maryland and organized the first Presbyterian congregation at Snow Hill, capital of Worcester County, Md. After 10 years' labor as an itinerant preacher in most of the Southern States he returned to England and induced two other ministers to accompany him to America. He was the first moderator of the presbytery of Philadelphia (1706), which he assisted in forming; and visited New York (1707), where he was imprisoned for preaching, though when brought to trial was acquitted of all charges. See Briggs, ‘American Presbyterianism’ (1885); Sprague, W. B., ‘Annals of the American Pulpit’ (Vol. III, New York 1858).

MALABAR, mā-lā-bār, British India, in the presidency of Madras, in the southwest, bordering on the Arabian Sea. It occupies an area of 5,795 square miles. A great portion is low land along the coast, rising abruptly at the east where it is bounded by the Western Ghats. The western part is intersected by long, narrow ravines, and the whole is covered with vegetation, in many places large forests. About 38 per cent of the total area is under cultivation and 33 per cent is forest. The average annual rainfall is 116 inches. The climate, though damp, is fairly healthful. There are a number of tea and coffee plantations and a large amount of rice is raised. The principal towns are Cochin, Calicut, Tellicherry, Kanamur and Mangalore. The name Malabar is often applied to the whole extent of coast country from Cape Comorin as far north as Bombay. Pop. including the Laccadives, 3,015,119, of which 68 per cent is Hindu, 30 per cent Mohammedan and 2 per cent Christian.

MALABAR NIGHTSHADE, a succulent edible vine. See BASELLA.

MALABON, Santa Cruz de, sán-t̪a krooth dá mā-lā-bān, Philippines, a pueblo of the province of Rizal, Luzon, also known as Tambobong. See TAMBOBONG.

MALABUYOC, mā-lā-bū-yōk, Philippines, a pueblo of the province of Cebu, situated at the mouth of the Malabuyoc River on the strait of Talion, 60 miles southwest of Cebu, the provincial capital. Pop. 13,120.

MALACCA, mā-lāk̪ a. See STRAITS SETTLEMENTS.

MALACCA, Strait of, the channel between the Malay Peninsula and the island of Sumatra, extending from lat. 1° to about 6° N. Entire length, about 520 miles; breadth, varying from 25 miles to 250 miles.

MALACCA CANE, an erect, slender-stemmed palm (Calamus acuminatus) which, when dressed, is of a brown color, sometimes mottled or clouded. It is used principally for walking-sticks, and is brought from Singapore and Malacca, but is chiefly produced in Sumatra.

MALACHI, māl̪ a-k̪ i, one of the 12 minor Hebrew prophets, after whom the last canonical book of the Old Testament is named. The date of the book is assigned to 460-450 B.C. Nothing definite is known of the author whose name in Hebrew signifies "My Messenger." Jerome supports a tradition given in the Hebrew targum of Jonathan which identifies Malachi as a pseudonym of Ezra (q.v.) "The Scribe." In general style, the character of the arguments and preachments against the evils of the times, of the book of Malachi (q.v.), are in favor of the tradition.

MALACHI, Book of. The book is perhaps actually anonymous. The author's name appears only in 1, i., which is probably an editorial addition. The word Malachi means "My messenger," and may have been taken from iii, 1.

There is no serious question affecting the authorship of more than a few verses in the book. It has often been thought that i, 11f expresses a spirit of narrow Judaism which is
inconsistent with i, 11. This is so upon one interpretation of the latter passage which makes it refer to the turning of the nations to Yahweh either in the present or the future. That, however, is probably not the correct interpretation. The verse in the context, particularly in relation to the following verse, seems to be clearly present and not future. At present it is not susceptible of the broader meaning given; that could not have been true at any probable time of writing. Hence the probable meaning is rather that worship is offered by Jews who are scattered widely among the nations; the reference is to the faithfulness of the Jews of the diaspora. Thus understood it is not inconsistent with ii, 11f.

Verses 4–6, chap. iv, are quite certainly a later addition. Verse 4 is a legal gloss, quite different from anything else in the book; verses 5–6 are a gloss upon verses 1–3, a restatement of the same information but from a different standpoint, one that is out of harmony with the book.

The mention of Edom, i, 2–4, gives a general indication concerning the date of the book. There is some recent crushing disaster to Edom, which is narrated in a spirit of hatred to Edom. This hatred began, the history shows, with the treacherous violence of Edom at the destruction of Jerusalem in 586. The disaster here referred to was doubtless one that came from the invasion of the Nabateans, and might have taken place at any time during a considerable period before 312 b.c. The general time between 586 and 312 is thus indicated. The temple had been rebuilt after the exile, i, 10; iii, 1, 10, and the enthusiasm of the time of its rebuilding had passed away. This indicates a time considerably after 516 b.c. The general condition of the people is that of the time of Ezra and Nehemiah, with the temple service in disorder and disrepute, i, 6–8, 12–13; ii, 1, 8, 17; iii, 7–10, 14, see Nehemiah x, 32–39; xiii, 10–13. Also, the divorce of Jewish wives and the marrying of foreign wives were found frequently, ii, 10–16, see Ezra, ix–x; Nehemiah x, 28–30; xiii, 23–31.

There is in the book, however, no reference to the work of Ezra and Nehemiah. Hence the book is to be assigned to the period before their activity, and presumably not long before, perhaps about 460 b.c.

The message of Malachi was intended to be primarily one of encouragement to the discouraged people in Palestine. The principal comprehensive thought of the book is that Yahweh still loves Israel, in spite of appearances to the contrary. This is stated at the beginning of the book, in i, 2–3. The reason assigned for the adversity which the people were suffering was the failure of the people to do their duty toward Yahweh. This was particularly a failure in relation to the outward national service. The outlook of the prophet is, therefore, in a considerable measure, formal. Yet this formal side is accompanied by a real ethical interest, as appears in ii, 27. A high standard for priestly activity is set up in ii, 7. The assurance of further prosperity for the people if they amend their ways is in connection with the coming of the day of Yahweh.

GEORGE RICHER BERRY, Professor of Old Testament Interpretation and Semitic Languages, Colgate University.

MALACHITE, a native basic copper carbonate and hydrate, having the composition Cu₂CO₃·Cu(OH)₂, crystallizing in the monoclinic system, but commonly occurring in massive form, or as an inclusions. It is brittle and has a specific gravity of about 4, and a hardness of from 3.5 to 4. Malachite is commonly subtranslucent, with an adamantine lustre. It is beautifully green in color, often banded with other colors and it occurs in many parts of the world, usually in connection with other ores of copper. Specially fine pieces are found in the Ural district, and at the Nizhne Tagilsk copper mines a deposit is known which contains at least half a million pounds of pure malachite. In the United States, the best-known deposits are those of Malachite has been much prized as a gem stone and it is extensively used for panels, clock cases, table tops and other ornamental work.

MALACHY, Saint, Irish bishop: b. Armagh about 1094; d. Clairvaux, France, 1116. He belonged to the noble family of O'Morgan, was educated by his father, an anchorite, and ordained priest in 1119. He afterward studied at Lismore, and returning to Armagh was chosen bishop of Down and Connor (1125). His subsequent election to Armagh having been disputed (1129) he eventually, after a satisfactory settlement of the disputed questions as in accordance with his own desire, returned the less important diocese, where he labored to secure for the Church a stronger foothold. In 1139 he set out on a mission to Rome. On his way thither he visited at Clairvaux and then began a lifelong friendship with Saint Bernard. He was commissioned in 1148 to go to Rome a second time, but was stricken on the journey and the last moments of his life were spent with Saint Bernard, at whose monastery he had stopped. He was a zealous preacher and to him is given the distinction of having opened the first Cistercian monastery in Ireland. The document known as 'Prophecy of Saint Malachy,' containing a Latin motto for each of the popes, is now considered not to be his production. He was canonized in 1190. Consult O'Hanlon, 'Life of Saint Malachy' (1859); Migne, J. P., 'Patrologia Latina' (Vols. CLXXXII, CLXXXIII).

MALACOLOGY. See CONCHOLOGY.

MALACOPTERYGI, mál-a-kópt-e-rej'-i or MALACOPTERI, a group of fishes, in former systems of classification, including those with jointed and spineless or *soft* fin-rays. Compare Acanthopterygi; and see Ichthyology.

MALACOSTRACA, one of the two primary divisions of the Crustacea to which all of the larger and more highly organized forms belong. The number of pairs of appendages and of segments is definite, the former being always 19 and the latter 19, except in the order Lepidostroca which have also two abdominal
segments limbless. The boundary between
head and thorax is not always clearly defined
but the two always comprise 13 segments, of
which five almost always belong to the head;
the abdomen has six limb-bearing segments and
is terminated by the telson which is probably a
seventh segment. The head bears a pair of
eyes, usually stalked, two pairs of antennae, a
pair of crushing jaws or mandibles and two
pairs of maxillae, to which a pair of maxillipeds
is sometimes added (Arthrostraca). Of
the typically eight thoracic segments from one
to three bear maxillipeds and the remainder
walking feet. In most cases the thorax is more
or less completely covered by a carapace.
The mode of development is varied, sometimes,
as in the crayfish, it is direct, sometimes with
a nauplius, but usually through the larval form
called zoea (see LARVA), which possesses
paired eyes as well as a median eye, a swim-
maintaining tail and usually seven pairs of appendages.
The subdivisions are:
Order Lepopostra (Nebalia).
Order Arthrostraca:
| Amphipoidea (branch foot) | Decapoda (crabs). |
| Isopoda (wood lice) | Brachyura (crabs). |
| Cumacea (Dzáyidi) | Stomatopoda (Squilla). |
| Thalassinidea (Scylla). |
| Isopoda (Myxus). |
| Decapoda (lobsters and
shrimps). |

See CRUSTACEA.

MALADE IMAGINAIRE, mä-läd é-mä-
zhé-när, Le, a comedy in five acts by Molière.
It was produced in Paris (1673), was the
last work of its author and the last in which, as
Argan, he appeared on the stage. See MOLIÈRE.

MALAGA, mä-lä-gä (Sp. mä-lä-gä, ancient
MALACA), Spain, capital of the province of
Malaga, on a small arm of the Mediterranean,
about 65 miles northeast of Gibraltar. It was
a Phoenician and afterward a Carthaginian
colony, was a flourishing city under the
Romans and its long occupation by the Moors has
left distinct marks in the older parts of the
town; the Gibralfaro, or Moorish castle, on a
hill overlooking the town, and considerable por-
tions of the ancient fortifications, yet remain.
Among the important buildings are the cather-
dral, a highly decorated structure in the com-
poste style with a spire 300 feet high; the
episcopal palace, custom-house and several hos-
pitals and charitable institutions, etc. The
manufactures consist chiefly of iron, the ore of
which is obtained from rich mines in the vicin-
ity; soap, cottons, linens, machinery, etc. Won-
derful gardens lie outside the town, like the
Haciendas de la Concepción and De San José,
where marvelous effects are produced by care-
fully tended sub-tropical vegetation. Along
the coast in the direction of Vélez-Malaga are
ancient Moorish works that date from after the
fall of Granada, against the Moors themselves,
who often descended upon the coast to plun-
der and destroy. The harbor is excellent and the
trade is of importance, the principal ex-
ports being olive oil, lead in bars, wine and
fruit, particularly raisins, oranges and al-
monds. There used to be a great export of
raisins to the United States, the consumption of
which, however, declined in favor of the
California product. The climate, mild, dry and
equable, makes Malaga one of the finest resorts

MALAGA WINE, a sweet Spanish wine
produced in the province of Malaga. It is one of
the "muscatel" wines, and is rich, luscious
and full of body. See also WINES.

MALAGASY SUBREGION, a faunal di-
vision of the Ethiopian Region in Zoogeog-
raphy which embraces Madagascar and some
small neighboring islands. See MADAGASCAR;
ZOOGEOGRAPHY.

MALAKOFF, má-lä-köf, See SERTASTOPOL.

MALAMPAYA, mä-läm-pä-yä, a sound on
the northwest coast of the province of Paňaga,
island of Palawan, Philippines; it is an arm of
the China Sea, extending 24 miles northwest to
southeast, and from three to six miles wide.
It is entirely landlocked, Tuluran Island pro-
tecting it from the China Sea, and is entered by
Blockade and Embankment straits. Its depth
varies from 36 to 54 feet, it is free from sun-
ken dangers to navigation, is one of the finest
harbors in the Philippine Archipelago and has
been suggested as one of the best locations for
a naval station between Balabac and Manila.

MALANAO, mä-lä-nöw, the name com-
monly given the Moros, especially Ilanos, who
live on the shores of Lake Malanao, island of
Mindanao. See PHILIPPINE ISLANDS.

MALAPROP, Mrs., a character in the
'Rivals' of Sheridan. Like Shakespeare's Dog-
berry she is made to employ words of the same
length, accent and more or less similar vowel
and consonantal value, interchangeably. Hence
her well-known "Allergory on the Banks of the
Nile": "Derrangement of Epithets": "A Bar-
barous Vandyke," etc.

MALAPTERURUS. See ELECTRIC FISHES.

MALAR, málär, Lake of, Sweden, a lake
running inland from the Baltic about 81 miles,
with an average breadth of 13 miles and an
area of 450 square miles. It contains upward
of 1,200 islands. Its east end is closed by
Stockholm, where its waters are poured into
the Baltic by various channels, the difference of
level being about six feet. It is surrounded by
the populous districts of Stockholm, Nykioping,
Uppsala and Westeria, and the shores are varied
with bays and hills, woods, lawns and fields,
and are adorned with many castles, country
seats and villas, including the royal palaces of
Drottningholm and Gripsholm.

MALARIA, an infectious disease due to
animal parasites and which is characterized by
intermittent attacks of chills and fever, so-
called intermittent fever, or a continued fever
with remissions; or by a chronic malarial ca-
chezia. Malaria is a disease which is very
widely distributed. It is found throughout Eu-
rope, particularly in the more southerly regions,
Italy and Spain, but is absent in the more nor-
therly parts of the Continent, where the tempera-
ture prohibits the development of the mosquito,
the chief carrier of the disease. In Asiatic
countries, particularly in India, malaria is very
frequent; and in Africa districts of ma-
laria fever constitute a feature most obvi-
sous to colonization. In the United States, par-
cularly in the Southern States, malaria prevails.
Along the New England coast, where it at one
time was very common, it has become much
diminished in prevalence and in severity. The
Pacific Coast region is free from the disease,
and the Northwest States are comparatively free. In the region of the Saint Lawrence River malaria is unknown.

It is essential to understand clearly the different forms of malarial fever, it is important to bear in mind that the different types are due to minute animal parasites which enter the blood, usually by the bite of one of a particular genus of mosquitoes (Anopheles) (See MOSQUITOS AND THE PROPAGATION OF DISEASE). The parasite develops after its introduction into the blood and, according to the individual type that is introduced, certain variations in the developmental history of the disease result. The parasites themselves, which are thought to be low forms of animal life, protozoa, develop, for the most part, in the red blood-corpuscles and have many allies in the red blood-corpuscles of other animals, as frogs, fish, birds, monkeys, cats, etc.

These organisms were first clearly demonstrated by Laveran, a French army surgeon, in 1880, and his early observations were enlarged and amended by Golgi, Marchiafava and Celli, Manson and Ross, and a host of others. The most recent time at least three ranges of the parasite Hematozoa malariae are known, the parasite of tertian fever, the parasite of quartan fever and the parasite of astivo-autumnal fever. These parasites have two cycles of development, one taking place in the body of man and the other in the body of the mosquito. Thus a patient with malarial fever infects a mosquito with a parasite which undergoes certain transformations within the body of the mosquito, and is then in turn introduced into the body of another patient, to cause typical attacks of fever according to the type of parasite introduced. Occasionally two different parasites are introduced into the patient's body and a mixture of the two forms of the disease results.

The commonest form of malarial fever (the so-called chills and fever, or ague) is due to the tertian and quartan parasites. In these, after an unknown period of incubation, probably from 24 to 120 hours, the patient has a feeling as though he were going to be sick, sometimes with headache, sometimes a feeling of lassitude and a desire to yawn and to stretch. Occasionally the patient has nausea and vomiting. At the same time the temperature has begun to rise and a chill commences. He begins to shiver, the face becomes drawn, thin and cold, the body shakes, the teeth chatter and the skin may be cold and blue, although the internal temperature is known to be gradually rising. After from 10 to 15 minutes, or perhaps a longer time, the chill is followed by a hot stage. The coldness of the surface disappears and the face becomes congested and flushed, the skin is red, the pulse is full and the patient may have a throbbing headache, with mental excitement. Thirst is excessive. Then the period of sweating begins, the whole body being covered with perspiration; the temperature drops, the headache disappears and in an hour or two the paroxysm is over.

The number of variations from this typical form are known. In the tertian type of fever the chill and fever usually occur every other day. This is due to the fact that the cycle of development of the tertian parasite is about 48 hours and that the stage of full development of the parasite, or sporulation, which is more or less coincident with the attack, occurs at these times. Thus every third day the patient has an attack, hence the term tertian. In mixed infections, when two sets of parasites develop on alternate days, the paroxysms of chills, fever and sweating may occur every day. In the quartan type of fever the cycle of development of the parasite is completed every fourth day. Mixed infections also occur in this form of the disease. In the northern United States these are the types of malaria which are more common, but below Mason and Dixon's line a much severer form of the disease is present. This is the astivo-autumnal type, which gives rise to the so-called bilious remittent fevers and typho-malarial fevers of the South. In these the symptoms are extremely irregular. The paroxysms occur every 24 or 48 hours, and longer remissions are known. The length of the paroxysms is usually longer, lasting 20 hours, instead of 10 or 12 as in the tertian form; the onset of the disease is usually slow and gradual; and there may be no chill. Occasionally there is a continuous fever with a pulse which is not high, the temperature ranging from 102° to 103° F. Jaundice is not infrequent, and this, with the fever and a furled tongue and mental disturbance, often gives rise to the suspicion of typhoid fever. In the simpler types the patient may get well after 10 days or two weeks without any special medication. The more severe forms may be fatal unless prompt diagnosis and medication are instituted. The diagnosis of malaria should always include an examination of blood and the demonstration of the parasite. In the vast majority of untreated cases the parasite can be found. Occasionally, however, repeated examination fails to show it.

Treatment should be prophylactic as well as actual and attention should be paid to the avoidance of infection no less than to care of the disease itself. Rigid protection of houses by means of screens to keep out the Anopheles is one of the most important procedures. Furthermore, it is highly essential that the mosquitoes themselves should be protected from the infection by screening all patients suffering from malarial fever. In order to do this the patient's couch should be surrounded by mosquito-netting and all mosquitoes in the room of the malarial patient should be killed by means of pyrethrum-powder. Further measures for destroying malaria should be taken by draining off swamps and employing proper engineering methods in order to get rid of the mosquitoes themselves. The planting of swamps with leafy trees often dries them up and thus prevents the formation of breeding-places for mosquitoes. Finally the specific, quinine, should be used in all cases. It is a prompt and sure parasiticide and in its varied forms can be used by almost every patient, despite individual idiosyncrasies.

In the consideration of some of the chronic forms of the disease a number of perplexing conditions are met. Thus, following constant exposure to malaria and repeated attacks of the disease, symptoms of anemia, weakness, swelling of the feet and ankles, bleeding in different parts of the body and enlarged spleen may be found. This is a type of infection known as malarial cachexia. It is found in southern countries and should be distinguished.
from the cachexia due to various forms of intestinal parasites. See Mosquito; Miasma; Microscopy, Clinical.

MALARIAL FEVER. See Malaria.

MALASPINA GLACIER, Alaska, glacier extending from Mount Saint Elias, at an elevation of 18,000 feet, to Yakutat Bay, a distance of 90 miles, while its front on the Pacific is between 60 and 70 miles wide. It was named in honor of the Spanish explorer, Alejandro Malaspina, who traversed the region in 1789-94 in search of the northwest Passage. With its tributaries, Malaspina, Seward, Agassiz, Tyndall and Glacier, the Malaspina covers over 1,500 square miles of ground, and has a depth of more than 1,000 feet. As it reaches the Pacific it breaks into dangerous icebergs which threaten navigation, but leaves a front of great ice palisades.

MALATESTA, a noble Italian family, leaders of the Guelfs in Romagna and rulers in Rimini from 1216-1328. Giovanni I and Malatesta of the Malatesta tribe entered Rimini in 1216 and were granted citizenship in consideration of their aid against Cesena. The family rapidly gained in power and in 1237 Giovanni was named podestà. He was succeeded upon his death in 1247 by his son, Malatesta de Verrucchio, who became supreme ruler in 1295 and who steadily increased his power until his death in 1312 at the age of 100 years. He also increased the power of the Guelfs and enjoyed the favor of Pope Boniface VIII. Of his four sons, two were Giovanni and Paolo, husband and lover of Francesca da Rimini, whose story is told in Dante's 'Inferno.' Malatestino, the eldest son of Malatesta, succeeded him upon his death in 1312, maintained the power of the Guelfs, annexed Cesena and dying without issue in 1317 was succeeded by his youngest and only surviving brother, Pandolfo. The power of the Malatestas was extended over neighboring territories in succeeding years and the family became one of the most influential of the Renaissance. Carlo (b. 1394; d. 1429) was an ardent supporter of the popes, represented Gregory XII at the Council of Constance and was named vicar of the church in Romagna. His nephew, Sigismondo (b. 1417; d. 1468), was a valiant soldier, a writer of art and letters as well as a poet and renowned antiquarian. He built the church of Saint Francis, or temple of Malatesta, one of the most beautiful structures of the Renaissance. He made war for and against Pope Eugenius IV; against Venice and Florence with the Aragonese, then against the Aragonese at Piombino. He afterward fought with and against the Sienese, supported the cause of the Angevins and was excommunicated and burned in effigy by Pope Pius II. He was afterward restored to the Church but before his death he was practically stripped of his powers and possessions. He was succeeded by his wife, Isotta, and his son, Salustio, but both were murdered by an illegitimate son, Roberto. Roberto's son, Guido's IV was the last Malatesta to rule Rimini, and he sold his rights to the Venetians in 1503. Thereafter the Malatestas at various times endeavored to regain control of Rimini until 1528 when it was incorporated in the papal states. The Malatestas became citizens of Venice and the Rimini branch became extinct in 1716. Consult Battaglini, 'Memorie storiche di Rimini e de suoi signori' (Bologna 1789); Fossati, 'I tempi di Malatesti de Rimini' (Foligno 1794); Hutton, 'Sigismondo Malatesta' (1906).

MALATIA, MALALIETH, or AZPUZU, Asiatic Turkey, chief town and military post in a sanjak of the same name in the vilayet of Mamuret el-Aziz, on the Samsun-Sivas-Diirberek Road, 10 miles southwest of the junction of the Tokhma-Su with the Ephruffs and 100 miles northeast of Marash. The town is modern, being practically rebuilt since the earthquake of 1850; and it was thus that dating to the middle of the 19th century when the old Malatia was abandoned after its destruction in the military operations of Hafiz Pasha, the new town being built on the site of the former summer colony Azpuzu. The old town of Malatia (ancient Melitene) lies five miles to the northeast of the present town and is now known as Eskisehir. It has many inhabitants, extensive gardens and interesting ruins. It was the station of the 12th, or 'Thundering Legion,' under Titus and was raised to a city under Trajan. It was capital of Armenia Tertia under Justinian. It changed hands between the Greeks and Saracens several times, was reputed to possess 60,000 fighting men at the opening of the 11th century and in 1102 was returned to Saracen control. Malatia is an important trading centre and the district is famous for its orchards and vineyards. A fine grade of opium is also produced. There are Roman Catholic and Protestant missions. The population includes a number of Christians and Armenians besides the Turks and Kurds. There was a massacre of Christians in 1895. Pop. (estimated) 30,000.

MALAUEC, ma-lów-ék, a provincial language, used largely in commerce in Luzon, Philippine Islands (q.v.).

MALAY (má-lá) ARCHIPELAGO. See EAST INDIES OF MALAY ARCHIPELAGO.

MALAY PENINSULA (Malay, Tanah Malayu, or Malay Land), a long strip of land extending from Indo-China south and southeast toward the island of Sumatra, the most southern part of the Asiatic continent. The peninsula begins properly at the head of the Gulf of Siam, and would thus include part of Siam proper and the British province of Tenasserim; but it is usual to limit the name to the portion south of the river Pakstan, the frontier of Tenasserim. In the larger sense, the length of the peninsula is about 870 miles long and its area 83,000 square miles; the population is estimated at about 2,000,000. The width varies
from 45 miles to 210. The interior consists mainly of magnificent wooded granite mountain ranges, some of whose peaks attain a height of 7,000 feet; while along the coast there is almost everywhere a flat and fertile belt, fringed with numerous islands. There are numerous small rivers. The mean annual temperature near the sea is about 80°. There is no winter, but rains are frequent through the year. The humidity of the climate renders it very trying to foreigners. Tigers and leopards are numerous and of great size. The Indian elephant, the rhinoceros and several species of monkeys are found; also the vampire bat, poisonous snakes and many beautiful and brilliant birds. Tin abounds and is largely worked. Silver and gold are also found in paying quantities. There are over 40 varieties of palm in the peninsula and the vegetation is that of the luxuriant tropical kind. In physical features the peninsula resembles rather the islands of Sumatra and Java than Indo-China. The inhabitants are mainly Siamese in the north and civilized Malays (q.v.) along the coast and uncivilized Malays, mixed with aboriginal Negrito tribes, in the interior. Politically, the northern part of the peninsula is occupied by small states tributary to Siam (as far south as Narathwich); the southern part by Malay states under British protection (as Perak, Selangor, Negri Sembilan, and Pahang, known as the Federated Malay States) and the British Crown colony of the Straits Settlements, comprising Singapore, Malacca and Penang. (For the commerce, industries, education, transportation facilities of the peninsula see articles on the individual states or groups of states, as Federated Malay States; Burma; Perak; Pahang; Singapore; Straits Settlement.) Consult Bishop, *The Golden Chersonese* (London 1883); Clifford, Hugh, *Studies in Brown Humanity* (ib. 1898); id., *In a Corner of Asia* (ib. 1899); Lucas, *Historical Geography of the British Colonies* (Oxford 1894); Rathbone, *Camping and Tramping in Malay* (ib. 1898); Skan, W. W., *Malay Magic: An Introduction to the Folklore and Popular Religion of the Malay Peninsula* (ib. 1900); Skeat and Blagden, *Pagan Races of the Malay Peninsula* (New York 1906); Oldham, W. F., *India, Malaysia and the Philippines* (ib. 1914); Wright and Reit, *Malay Peninsula* (ib. 1912).

**MALAY STATES.** See Federated Malay States.

**MALAYALAM.** An independent Dravidian dialect of southern India, originally allied to Tamil and spoken on the Malabar Coast by between six and seven million inhabitants called Malayalim or Malabarans. The language is said to have developed since the 9th century and now differs from it in pronunciation and in idiom, and in the retention of old Tamil forms obsolete in the modern languages. Sanskrit words are more numerous in Malayalam than in Tamil, and the language of the 13th century epic Ramacharitam, the oldest poet in the language, and a collection of 1,000 Malayalam proverbs published in Managlore in 1850 are notable examples. See *Daviddian.* Consult Ellis, F. W., *Dissertation on the Malayalam Language*; Gundert, *Malayalam Dictionary* (1872); Frohmeyer, *Progressive Grammar of the Malayalam Language for Europeans*; Menon, T. K. K., *Notes on Malayalam Literature* in *Royal Asiatic Journal* (London 1900).

**MALAYAN BEAR, or SUN BEAR,** a small bear (*Ursus malayanus*), found in the Malay Archipelago, Borneo, Sumatra and Java. It is about four and a half feet in length; the fur is black, fading into brown on the nose which is remarkably broad and blunt. The chest bears a crescentic white mark, or an orange-colored, heart-shaped patch.

**MALAYAN SUBREGION,** a faunal division of the Oriental Region, composed of the southern end of the Malay Archipelago and all the islands of the Malay Archipelago as far as the Philippines and to the Straits of Malacca, where this district is separated from the Australian and Papuan subregions by Wallace's line (q.v.). The fauna of this subregion is composed of animals adapted to a uniform but not extreme heat, coupled with abundant moisture. The orang-outang and the birds of paradise are its most characteristic groups. See Distribution of Living Mammals; Zoogeography.

**MALAYS,** a race of people inhabiting the Malay Peninsula and the Malay Archipelago, and claiming to have their native country in the highlands of Sumatra. The civilization of India appears to have extended to the Malays at an early date. In the 13th century the Malays were on the peninsula of Malacca, where they built a city of the same name, and founded an empire. The sultans had subdued Sumatra previously to their setting in Malacca. They afterward possessed themselves of the rest of the Sunda Isles, of the Philippines, the Moluccas and some of the Australian groups, where Malay tribes are found resembling, in their features, religion and government, the Malays of Malacca, but at that time they acted a splendid part in Asia; they carried on commerce, in part with their own ships, and planted colonies. Great numbers of ships from China, Cochin China, Hindustan and Siam filled the harbors of Malacca. The Malays are now divided into distinct tribes, without any general head. This is partly owing to the superiority which the Europeans, particularly the Dutch, have obtained in the Indian seas, and partly to the feudal system of the Malays, by which the national power has been divided and a common spirit prevented by the increasing power of the vassals. The civilized Malay profess the Mohammedan religion. Besides the Koran, the Malays have various local laws. They are fierce and warlike, always bearing arms, and much addicted to the use of force, treacherous in their alliances and were formerly addicted to piracy. The Malay language is widely used as the language of commerce throughout in any other Dravidian tongue. Malayalam appears about A.D. 1150 in inscriptions of the rulers of Kerala from Travancore and has an extensive literature, of which the 13th century epic Ramacharitam, the oldest poet in the language, and a collection of 1,000 Malayalam proverbs published in Managlore in 1850 are notable examples. See *Daviddian.* Consult Ellis, F. W., *Dissertation on the Malayalam Language*; Gundert, *Malayalam Dictionary* (1872); Frohmeyer, *Progressive Grammar of the Malayalam Language for Europeans*; Menon, T. K. K., *Notes on Malayalam Literature* in *Royal Asiatic Journal* (London 1900).

K., *Notes on Malayalam Literature* in *Royal Asiatic Journal* (London 1900).
and black, the complexion yellowish. In various respects they bear a close resemblance to the Mongolians of eastern Asia, but differ from them in the structure of the body, and in their complexion and blackness, belonging to a distinct Malayo-Polynesian family which is widely distributed throughout the Indian and Pacific oceans. The Malays long pursued a piratical career, darting from hidden streams in their well-manoned pros on any vessel that approached too near the coast, or more boldly lying in wait in fleets in the open sea, for any expected rich prize. Of late years the lessons taught them by European and American war vessels have forced the Malays to desist from piracy, their old laws and violent habits being largely abandoned for their more settled occupations of trade and agriculture. Among the many Malay tribes are the Sakais, or tree-dwellers, who build their houses in forked trees, 8 to 12 feet above the ground, reached by bamboo ladders which are hoisted at will. The tree-dwellers formerly made use of long blow-guns shooting poisoned arrows. The bamboo furnishes most of their articles of ornament and utility. The blow-gun was a bamboo tube several inches in diameter and six and a half feet in length. The bore, drilled most accurately, was a quarter of an inch, and the darts nine inches in length, about the circumference of a heavy darning-needle, sharpened at one end and poisoned. With these they secured all the meat they eat in the jungle—birds, monkeys, snakes and lizards. They also have knives made of bamboo.

The Malay intellect varies from that of savagery in the uncivilized tribes of the interior to a rather high degree of culture among the coast tribes. Much of their civilization is due to foreign influences, chiefly Hindu and Arab. The Malay language, which is soft and harmonious and of simple structure, is written in the Arabic character, which is ill suited for the purpose. Lately the Roman system has been largely adopted, especially in the Dutch and English dependencies. The literature, which is copious, comprises poetical compositions, such as rhyming-proverbs, love-songs and dialogues, some originality, but little imagination. The prose writings are mostly based on Arab or Persian models.

MALBAIE, Canada. See Murray Bay.

MALBONE, mahl-bon, Edward Greene, American painter: b. Newport, R. I., August 1777; d. Savannah, Ga., 7 May 1807. As a boy he was in the habit of frequenting the theatre at Newport to watch the painting of the scenes. At that early age he executed an entire scene, a landscape for the stage, the success of which encouraged him to devote his attention exclusively to painting. At 17 he established himself in Providence as a portrait painter. Meeting with success, he removed in 1796 to Boston, and during the next four years pursued his art in various cities. In 1800 he went to Washington Allston (q.v.) to Charleston, and in the succeeding year the two young artists sailed for Europe. Malbone when in London was urged by Benjamin West to take up his permanent residence there with the prospect of ample professional employment; but he returned to Charleston in December 1801. For several years he painted miniatures in the chief cities of the United States with great reputation. His principal imaginative work is 'The Hours,' in which the divisions of the day are personified by female figures.

MALBROUK, mahl-bruck', a yellowish, grizzled monkey of West Africa (Cercopithecus cynocephalus), distinguished from other species of the genus (called guenons) by its wide flesh-colored face with a band across the forehead, the bristly whiskers and ventral part whitish.

MALCOLM, mahl-kum or mahl-kum, the name of four Scottish kings: Malcolm I reigned from 943 to 954, and during this period occurred the cession of Cumbria to the Scots by Edmund I, the English sovereign. Malcolm II (d. Glems 1034), succeeded Kenneth II in 1005 and in his reign Lothian and Strathclyde were secured to Scotland. Malcolm III, sur- named Canmore (Great Head) (b. about 1024; d. near Alnwick, Northumberland, 13 Nov. 1093. After the murder of his father, Duncan, by Macbeth, he was assisted by Siward of Northumbria, and Edward, the Confessor. After the death of Macbeth he was crowned at Scone in 1057. In 1067 he granted asylum to Edgar Atheling, his mother, and two sisters (one of whom, Margaret, he married in 1068), with a number of Saxon exiles. His reign, though largely concerned in warring with England, had nevertheless an important bearing on the civilization and consolidation of Scotland. Malcolm IV (the Maiden), d. Jedburgh, 9 Dec. 1165, succeeded his grandson David I in 1153. He suppressed two rebellions in his realm and surrendered Northumberland and Cumberland to Henry II in 1157.

MALCOLM, Sir John, British administrator and diplomatist: b. Burnfoot, Dumfriesshire, 2 May 1769; d. London, 30 May 1833,
MALCZEWSKI — MALEBRANCHE

He entered in 1782 the service of the East India Company, in 1797 was made captain, and till 1799 was engaged in various important services, terminating at the fall of Seringapatam. He was three times Ambassador to Persia, and in 1822 was made major-general. He was governor of Bombay, 1826–30, when he finally retired to Britain. His principal works are: "A Sketch of the Sikhs"; "The History of Persia" (1815); "Sketches of Persia"; "Life of Lord Clive" (1836). Consult Kaye, "Life and Correspondence of Sir John Malcolm" (1856–57).

MALCZEWSKI, mäl-chêür'skë, Antoni, Polish poet: b. Warsaw, Poland, 3 June 1792; d. there, 2 May 1826. He entered the Polish army in 1811 but resigned in 1816 and traveled on the Continent, where he met Byron. He settled in Warsaw and there wrote "Marja" (1825), an epic poem which after his death was recognized as a literary work of great merit, and has since been translated into several languages. None of his work brought him fame or recognition during his life, and he died in wretched poverty. A tomb "To the author of Marja" was erected in Varsovia.

MALEN, mäl'dën, Mass., city, in Middlesex County, on the Malden River, and on the Boston and Maine Railroad, about four miles north of Boston. It is connected by electrical railway with Boston, Lowell, Haverhill, Lynn, Salem and a number of other cities and towns. Malden includes several villages. The first settlement was made in 1641, but the place remained a part of Charlestown until 1649, when it was made a separate, incorporated municipality. It was chartered as a city in 1881. It is a manufacturing city, having over 60 manufacturing establishments, representing nearly 50 different industries. The chief products are rubber boots and shoes, boot and shoe lasts and boot-trees, wire cord, leather, cotton goods, fibre goods, hosierly and hosierly supports, kerosene, soap and picture frames. The manufactories have a combined capital of nearly $8,000,000, and the annual output is nearly $21,000,000. The number of employees is about 6,200. The municipal expenditures are annually about $564,000, of which amount, $282,300 are for schools, $46,000 for fire departments, $69,000 for police, $86,000 for municipal lighting, $34,000 for water supplies and $55,000 for charitable and similar purposes.

MALEBRANCHE, mal'brân'sh, Nicholas French philosopher: b. Paris, 6 Aug. 1638; there, 13 Oct. 1715. He studied philosophy at the Collège de la Marche, theology in the Sorbonne, and was ordained a priest in 1658. He was made a member of the Academy of Sciences. He was an original thinker, with a mind of great fertility in new and original ideas, and a power of expression that is rare in philosophers. He was one of the first to use the word "philosophie" in its modern sense. His philosophy is a sort of mystical idealism. The essence of his philosophy is as follows: According to him we have cognizance of things as well objective realities, as subjective thoughts and feelings, through the idea which resides in us; but this idea is in God, so that we perceive everything in God (vision in Dei) as the primal cause of all existences and things. Hence the famous doctrine of "Occasionalism" or "Interference," in accordance with which the objective thing and the subjective impression are made on every occasion to coincide, by the direct interposition of God, in whom alone we think and feel. In the history of philosophy Malebranche may be styled the connecting link between Descartes and Spinoza, the difference between his philosophy and that of the pantheist Spinoza consisting in the fact that to him the Universe was in God, and to Spinoza God was, in fact, in the Universe. Among his other works are to be mentioned "Conversations chrétiennes" (1677); "Traité de la nature et de la grâce" (1680); "Traité de la morale" (1684); "Entretiens sur la métaphysique et sur la religion" (1668); "Entretiens d'un philosophe chrétien et d'un philosophe chinois sur l'existence et la nature de Dieu" (1708). Consult Blamont, "Etude sur Malebranche" (1861); Ollé-Laplane, "La philosophie de Malebranche" (1870); André, "La vie du Révérend Père
MALESHERBES — MALICE

Malebranche (1886); Farny, ‘Etude sur la morale de Malebranche’ (1886).

MALESHERBES, Christien Guillaume de Lamoiignon de, krâ-te-âän gê-yôn de lå-moi-
ôn de mäl-ê-ârb, French statesman: b. Paris, 6 Dec. 1721; d. there, 22 April 1794. He was
educated at the Jesuits’ College, entered the
legal profession and in 1745 became counselor
of the parliament of France; in 1750 he was
president of the Court of Aids. He was broad-
minded and liberal in his policy, favoring the
publication of the ‘Encyclopédie’ and owing to
his protestation against different measures of
Louis XV was removed from office. Under Louis
XVI he was Minister of the Interior, but
resigned in 1776 and until the Revolution spent
his time upon his estates and in travel, with the
exception of 1787–88, when he was again Minis-
ter. At the outbreak of the Revolution he
came loyalty to Louis XVI and was leading counsel in his defense. He re-
mained with the monarch until almost the last
and 11 months later was guillotined for treason.
He was the author of essays and pamphlets on
financial questions, etc.

MALET, Charles Francesco de, klôf frän-
swä de, French conspirator: b. Dôle, Franche-Comté, France, 28 June 1754; d. Paris,
29 Oct. 1812. He entered the army in 1771 and
became a brigadier-general in 1779. Suspected
of conspiracy against Napoleon, he was dis-
missed from the army in 1807 and confined in
La Force. While there he laid new plots and
was thenceforward confined in a state prison
from 1808 till 1812. During Napoleon’s campa-
in in Russia Malet made his escape from
prison on the night of 22–23 October, and by cir-
culating the letter he wrote, won over some of the
National Guards. While the latter secured the principal offices in his
name, Malet liberated his fellow conspira-
tors, Generals Gudal and Laborie, from prison. He
himself was himself taken prisoner by Laborde, chief of the military police of Paris,
and was shot with his fellow conspirators.

MALET, Lucas. See Harrison, Mary
Saint Leger.

Malfath, Giovanni Francesco Gii-
seppe, Italian mathematician: b. Ala di Trento,
1731; d. Ferrara, 1807. He was educated at the
Jesuit College at Verona and later studied un-
der Riccatti at Bologna. For 30 years from 1771 he was professor of higher mathematics
at Ferrara and attained high rank among the
mathematicians of his time. He is best re-
membered for his publication of a mathematical
problem known as ‘Malath’s problem,’ of which
he gave the first solution. It was pub-
lished in a memoir, ‘Tentativo per la risolu-
zione delle equazioni di quinto grado’ (Favia
1772).

MALFORMATION IN PLANTS. See
PLANTS, MALFORMATION IN.

Malherbe, François de, frän-swä de mäl-ê-ârb, French poet: b. Caen, France, 1555;
d. Paris, 16 Oct. 1628. He was educated in
Heidelberg and was engaged in the wars of the
League. In 1605 he became court poet under
Henry IV, but his work as a critic was of
growing value, which was lack-
ing in poetic feeling and originality, though
metically perfect. He was the founder of the
French school of classicism and must be cred-
ited with arousing a critical sense among the
thinkers of France. His works consist of translations from the Latin and of original verse. Consult Allais, ‘Malherbe et la
Poesie française à la fin du XVI. Siècle’ (1892); Brunot, ‘La Doctrine de Malherbe’ (1891).

Malibran, Maria Félicité, mezzo-so-
prano singer: b. Paris, 1805; d. Manchester,
England, 1836. She was early trained for the
operatic stage by her father, Manuel Garcia
(g.q.v.), the Spanish tenor, and made her début in London (1825). She had lived in that city
since 1817 as a teacher of singing, and her suc-
cess in Rossini’s ‘Barber of Seville’ was such
that she was induced to follow her father to
New York, where he had an engagement to
establish grand opera. Here she married a
French merchant named Malibrán. She re-
turned to the stage on her husband’s failure in
business, and in the spring of 1828 appeared on
the Parisian boards in Rossini’s ‘Semiramide.’ She subsequently was welcomed with great enthuiasm in London, Naples, Vienna, Milan and
Venice, and traveled with the violinist de Bériot,
whom she married shortly before her early
death. She was a great actor as well as a
marvelous songstress, and the irresistible
charm of her person, added to the generosity
of her mind and disposition, made her during
her brief career one of the most fascinating
operatic singers that had ever won the applause
of the European public. In 1838 a statue was erected to her in Brussels, which had been her
last place of residence. Consult Nathan, ‘Life
of Madame Maria Malibrán de Bériot’ (1846);
Teneo, M., ‘La Malibrán, d’après des documents
inédits’ (in ‘Sammelbände der internationalen
Musik-Gesellschaft,’ Leipzig 1906).

MALIC ACID, an organic acid discovered
in 1785 by Scheele, and now known to be
widely diffused throughout the vegetable
kingdom, occurring sometimes in the free state, and
sometimes in the form of its potassium, magnes-
ium or calcium salts. It occurs abundantly,
for example, in the gooseberry, cherry, straw-
berry and barberry, and also in unripe apples, from which latter fact it derives its name (Latin malum, an apple). It may be conve-
iently prepared by boiling the juice of moun-
tain ashberries with enough milk of lime to
almost neutralize it, and pouring the precipitate into boiling dilute nitric acid. Acid malate of calcium crystallizes from the nitric acid upon
cooling, and this is dissolved in water, and pre-
cipitated by acetate of lead, the lead malate that
is thrown down being subsequently decomposed
by sulphuretted hydrogen gas. Malic acid has
the formula C7H6O7 or C7H4(OH)3(COOH),
is dibasic, and can be obtained in the form of
colorless prisms or needles, which are hygro-
scopic and dissolve readily in water and in al-
cohol. Malic acid kills algae, and when present in a solution in any considerable amount it pre-
vents the precipitation of cupric and ferric salts
by the alkalies. With bases it forms compounds known as ‘malates,’ which are mostly soluble. See Succinic Acid.

MALICE, in law, a premeditated or formed
design to do mischief or injury to another,
called also ‘malice prepense’ or ‘aforethought.’
Blackstone says that malice prepense is not so
properly spite or malevolence to the deceased
in particular, as any evil design in general; the dictate of a wicked, depraved and malignant heart; which may be either express or implied, and is gathered from the overt act, and expressed by the same; when one, with a sedate, deliberate mind and formed design, doth kill another. In many cases where no malice is expressed, the law will imply it; as where a man willfully poisons another; in such a deliberate and as the law presumes malice, though no particular enmity can be proved. A spiteful, malignant, vindictive or revengeful disposition is apt to commit acts of malice both in the ordinary and the legal sense, and may be guilty in the former and not in the latter sense. An injurious act emanating from a weak mind, a lack of caution or a sudden, unaccountable impulse, may have all the force of ordinary malice, but in the absence of a designed, intentional injury, it will not come within the strict limits of criminal malice. The law infers an intent to kill from the deliberate use of a deadly weapon, and it has been held that a burglar intended murder when he broke into a dwelling because he would commit it if necessary to escape.

MALICIOUS MISCHIEF, in law, any injury done to the person or property of another with specific intent. This is an indictable offense both in Great Britain and the United States. The comprehensive English Black Act (so-called from its preamble that “several ill-designing and disorderly persons have of late assembled themselves under the name of blacks”) with others of a like kind were in 1861 codified (24 and 25 Vict., ch. 97) into an act which extends malicious mischief to buildings, fish ponds and other real estate, as well as to most classes of personal property. To constitute this offense, real or merely moral malice must be proved, such as is defined by Blackstone, “a spirit of wanton cruelty or blood and diabolical revenge”; or, as defined by the Supreme Court of Massachusetts, “a spirit of cruelty, hostility or revenge.” This spirit must be cherished by the offender not against a third party, but against the party whose person or property has been injured. Some States of the Union make secrecy a necessary element in the offense, others generalize the offense as implying merely the infliction of unlawful injury. If the injury was inflicted in the discharge of official duty, or under a honest sense of justice, this is sufficient defense to secure acquittal. The offense may be either a misdemeanor (q.v.) or a felony (q.v.) according to its circumstances. Consult Bishop, ‘Commentaries on the Law of Statutory Crimes’ (3d ed., Chicago 1901); McClain, ‘Treatise on Criminal Law, as Now Administered in the United States’ (Chicago 1897); and Harris, ‘Principles of the Criminal Law’ (London 1899).

MALICIOUS PROSECUTION, prosecution of a person unsuccessfully, maliciously and without cause. To constitute this offense it must be proved (1) That the prosecution averred to be malicious was instituted by the defendant named. (2) That it was decided against the prosecutor. (3) That the suit was without probable cause. (4) That the defendant was guilty of such malicious prosecution.

Quod facti per alium facti per se is fully applicable to the defendant in a suit for malicious prosecution; hence a corporation may be liable though they acted through their agents. See Tort; Neill, M. L., ‘Malicious Prosecution, False Imprisonment and Abuse of Process’ (Chicago 1892).

MALIGI, má-le-′he, Philippines, an island lying southeast of Talim Island in the Bay Lagoon (q.v.); it is the seat of the United States military prisons.

MALIGNANT POSTULE. See ANTHRAZ.

MALIGNANTS, in English history, a name applied in 1643 by members of Parliament to designate those whom they considered to be the evil advisers of Charles I. Afterward the name was extended to all who sided with the king against the Parliament.

MALINO, má-le-′no, Philippines, (1) a pueblo of the province of Albay, Luzon, situated on the Lagoons of the Gulf, 18 miles north by west of Albay, the provincial capital, and three miles north of Tabaco. It is on the main road, and is the shipping point for the large hemp product of the surrounding region. There is an extinct volcano nearby and also mineral springs. Pop. 12,437.

MALINES, má-lén. See Mechlin.

MALINGERING, má-lín-gg-′är-ing, a term denoting feigning disease on the part of a soldier, sailor, prisoner, etc., in order to obtain discharge from service, or escape from duty or labor. It implies some overt act, such as previous application of a ligature, or the taking of some drug, which produced the appearance of the disease said to exist. A worse form of the same crime, “willfully maiming,” is erroneously called malingerering. Consult Callie, J., ‘Malingering and Feigned Sickness’ (New York 1913); and Smith, W. R., ‘Medical Jurisprudence’ (London 1913).

MALL, Franklin Paine, American anatomist: b. Belle Plaine, Iowa, 1862. He took his M.D. at the University of Michigan in 1883, later studied at Heidelberg and Leipzig and in 1886–88 was a fellow at Johns Hopkins, acting as instructor in pathology at that institution 1888–89. He was adjunct professor of vertebrate anatomy at Clark University in 1889–92, and was professor of anatomy at the University of Chicago in 1892–93. He has been professor of anatomy at Johns Hopkins University since 1893 and since 1915 has also served as director of the department of embryology at Carnegie Institute, Washington, D. C. He is a trustee of the Marine Biological Laboratory, Woods’ Hole, Mass., and has written extensively for scientific publications.

MALL, màl or màl, The, (1) a promenade in Central Park, New York, regarded as one of the most successful landscape effects in the United States. (2) An avenue in London, on the north of Saint James Park.

MALLALIEU, màl-là′-he, Willard Francis, American Methodist bishop: b. Sutton, Mass., 11 Dec. 1828; d. 1911. He was graduated from Wesleyan University in 1857 and became a Methodist minister in 1858. He held many important charges and in 1872, 1876, 1880 and 1884 was a member of the general conferences. He was presiding elder of the district of Boston in 1882–84 and in 1884 was
elected bishop. He retired in 1904. He published his "Divine Wholeness, and Law of Revivals" (1901); "The Fullness of the Blessing of the Gospel of Christ" (1903); "Words of Cheer and Comfort" (1907).

MALLARD. See DUCK.

MALLARME, Stephane, stá-fán mál-ár-má, French poet: b. Paris, 18 March 1842; d. Valvins, Fontainebleau, 9 Sept. 1889. Most of his life was passed as an instructor in English at the lyceum of the three sisters of Paris. He is known as the founder of the curious poetic school of the "Decadents," in whose organ, Le Decadent, as well as in Le Parnasse Contemporain, he published much. Incomprehensibility appears to have been the object of his study, and he entirely attained it in his preface to an edition (1880) of Beckford's "Vathek." Others of his works are "L'Apres-midi d'un Faune" (1876); "Petite Mythologie" (1878); "Les Dieux antiques" (1880); "Pasieges" (1887), a translation of Poe's poems (1888), perhaps his most satisfactory performance; and "Vers et prose" (1893).

MALEABILITY, in metallurgy, the property of extending under the blow of a hammer. For every metal there is a temperature of greatest maleability. The following is the order of maleability of the metals: Gold, silver, copper, platinum, iron, aluminum, tin, zinc, lead.

MALEABLE GLASS. See GLASS, MALEABLE.

MALLECO, mál-yákó, Chile, a province bounded by Argentina, Cautin, Bio-Bio and Arauco. It has an area of 3,303 square miles. The capital city is Angol. The province is mountainous and well wooded in the eastern and western parts. About one-half of the population is composed of Indians of the Arauco tribe. Wheat is the staple agricultural product of the country. The other industries of importance are cattle raising and timber cutting. Pop. 133,212.

MALLEE-BIRD, or MALEO, a name for the Australian mound-bird (q.v.), derived from a native language.

MALLERY, Garrick, American ethnologist: b. Wilkesbarre, Pa., 23 April 1831; d. Washington, D. C., 24 Oct. 1894. He was graduated from Yale College in 1850 and was admitted to the bar in 1853; he practised law in Philadelphia until 1861, when he enlisted and served through the war in the Federal army, attaining the rank of lieutenant-colonel. He was executive officer of the Signal Service Bureau until 1876, when he was engaged in a geological survey in Dakota, and in 1879 was reired from the army and appointed chief of the bureau of ethnology. Among his books are "A Calendar of the Dakota Nation" (1877); "Tahleite and Indian, a Parallel in Planes of Culture" (1889); "Greeting by Gesture" (1891); "Picture Writing of the American Indians" (1893), etc.

MALLERSON, George Bruce, English soldier and historical writer: b. London, 8 May 1825; d. there, 28 Feb. 1898. He was educated at Winchester College, and from 1842 till 1877 served in India, at first in the army, and subsequently in government posts. His chief work, "History of the Indian Mutiny" (1878-80) commenced where the second volume of Kaye's "Seyop War" left off, and in 1890 there appeared a joint edition of the two histories in six volumes, the third volume of Kaye's work being omitted and a new sixth one added. Other works by him are: "The Mutiny of the Bengal Army" (1857); "History of the French in India" (1858); "Sketch of the Native States of India" (1875); "Final French Struggles in India and Indian Seas" (1878); "History of Afghanistan" (1879); "The Decisive Battles of India" (1883), and lives of: "Clive"; "Eugene of Savoy"; "Prince Metternich"; "Wellesley"; "Dupleix"; "Akbar" and "Warren Hastings."

MALLET, John William, American chemist: b. Dublin, Ireland, 10 Oct. 1832; d. 1912. He was educated at Trinity College, Dublin, and at Gottingen, and emigrating to the United States in 1853 became assistant professor in chemistry at Amherst 1854-56 and later chemist to the United States geological survey of Alabama. In 1856-60 he was professor of chemistry at the University of Alabama. He entered the service of the Confederacy and was paroled in 1865 as lieutenant-colonel of the artillery. The chair of sciences at the University of Louisiana was occupied by him in 1865-68 and after 1868 he was professor of chemistry in the University of Virginia, becoming professor emeritus in 1908. He contributed valuable scientific articles to the leading chemical journals and published "Cotton" (1862); "Chemistry Applied to the Arts" (1868); "Syllabus of a Course of Lectures on General Chemistry" (1890; rev. ed., 1901).

MALLET, a wooden hammer used in carpentry and also in the game of croquet (q.v.). The gavel is a variety of mallet. Various small mallets are used by gold beaters, jewelers, dentists and other artisans.

MALLIAN, mäh-yen', Julien de, West Indian dramatist: b. Le Moule, Guadeloupe, 1805; d. Paris, France, 1851. He gained wide reputation as a writer of comedies and dramas, many of which have been presented on the metropolitan stage. The most popular are "Two Roses" (1831), a historical drama of the civil wars in England; "The Carpenter" (1831), a comedy; and "The Wandering Jew" (1834).

MALLOW, William Hurrell, English author: b. Devonshire, 1849. He was graduated from Balliol College, Oxford, and won the Newdegate prize in 1872. He has never entered a profession but has devoted himself entirely to literary work. His philosophical and sociological writings include "Is Life Worth Living?" (1879); "Social Equality, a Study in a Missing Science" (1882); "Atheism and the Value of Life" (1884); "Property and Progress" (1884); "Labour and the Popular Welfare" (1893); "Studies of Contemporary Superstition" (1895); "Classes and Masses" (1896); "Aristocracy and Evolution" (1898); "Doctrine and Doctrinal Disruption" (1900); "Religion as a Credible Doctrine" (1902); "The Reconstruction of Belief" (1905); "The Nation as a Business Firm," and "Social Reform" (1914). He has also written several works of fiction, most of which deal with the same social and religious problems as the above works, including "The New Republic" (1877), in which he introduces many
well-known contemporaries under thin disguises; 'A Romance of the Nineteenth Century' (1881; new ed., 1894); 'The Old Order Changes' (1886); 'A Human Document' (1892); 'The Heart of Life' (1895), and 'The Individualist' (1899), and has published two volumes of verse, 'The Veil of the Temple' (1904); a translation of Lucretius' 'On Life and Death' (1878), and 'An Immortal Soul' (1908). His philosophical works deal with the fundamentals of religion, arguing for supernaturalism and aiming to show that science alone supplies no basis for religious belief; in his political and economic writings he has attacked the radical and socialistic theories and tendencies of the age. In 1916 he was awarded a Civil List pension.

MALLOPHAGA, a name used for an extensive and varied assembly of feather-eating and hair-eating bugs, usually called lice. They are very small, oval, delicate and of swift motion, of light-brown, some with oval-shaped heads, others with horn-like appendages on the head. One delicate kind vexes the canary, gluing eggs to its feathers and in the cracks of its perch. Gnomicolus is a large form, as much as an inch long, with bristled shield-like head, and is one of the pests of domestic fowls. One species, colored with bands of yellow and brown, infests the turkey and the peacock. Another great family, Liotheidea, contains species which resemble white ants and preys upon the feathers of falcons and owls as well as the birds. Gyropus infests guinea-pigs, massing thickly about their neck and ears.

MALLOW, a genus of herbs (Malva), of the family Malvaceae. The species of which there are less than a score, are widely scattered and are characterized by angled, lobed or dissected leaves and solitary or clustered axillary flowers. They include four species cultivated in America and one very well-known weed, M. rotundifolia, popularly known among children as 'cheese-plant' because of the shape of the fruits, which also suggested another popular name, "shirt-button plant." The plant is a perennial, very persistent of life and rather difficult to eradicate except by constant clean cultivation. Marsh-mallow (M. tomentosa) is cultivated for its large, showy pink or white flowers; M: alcea is also popular. M. crispa furnishes a useful fibre, as probably other species could be made to do. Its leaves are often used for garnishing but are not eaten. This species and others are known as the "altheas" and their nectar are extensively used in the candy industry. The flowers are used in many drinks and in their vicinity as escaped plants, but are not offered for sale by seedsmen. The name mallow is loosely applied to many plants of the mallow family, but not of the genus Malva; for instance, marsh-mallow (Althea officinalis), rose-mallow (Hibiscus moscheutos) and Indian mallow (Abutilon hybridum); also, more loosely still, to unrelated plants, as Jeff's mallow (Corchorus olitorius) and Jeff's capularis). See CORCHORUS; HOLLYHOCK; Hibiscus.

MALMAISON, mahl-mahl-zoat, a celebrated French château on the Seine, 10 miles west of Paris. It was the favorite residence of Josephine, wife of Napoleon I, and here she died. The château belonged to Richeleau, and was restored in 1861 by Napoleon III. In 1870 a sortie from Ducrot from Paris was repulsed here by the Germans.

MALMESBURY, mahl-zer, James Harris, 1st Earl of, English diplomatist; b. Salisbury, England, 21 April 1746; d. London, 21 Nov. 1820. He was educated at Merton College, Oxford, afterward studied at Leyden and in 1768 became secretary of legation at Madrid. He was Ambassador at Berlin 1772, in 1777 at Saint Petersburg and in 1784 at The Hague. In 1786 he created Baron and in 1800 Earl of Malmesbury. In 1793, with other writers, he deserted Fox for Pitt, and in 1795 was the Prince of Wales' proxy at the marriage ceremony in Germany of the Princess Caroline of Brunswick. Consult 'Diaries and Correspondence' (1845); 'Lord Malmesbury and His Friends' (1870). (Both works edited by J. R. Harris, his grandson).

MALMESBURY, William of. See William of MALMESBURY.

MALMESBURY, England, market town and municipal borough, Wiltshire, 94 miles west of London, on the Great Western Railway. It is built on a ridge of land almost surrounded by the river Avon and one of its small tributaries. Its site was chosen by a Scottish or Irish monk named Maildulphus for a hermitage in 635. He later gathered a colony of disciples about him. One of whom, Adhelm, became abbot of the abbey founded there, ruins of which still remain. Athelstan rebuilt the monastery and was buried there. The town grew around the abbey, but was not incorporated until 1645, the charter then granted remaining in force until 1865. The modern town has a considerable agricultural trade, manufactures silk and cotton and great lottery tickets, and has tanneries and breweries. Two miles distant is the manor-house of Sir Lawrence Washington, and the church at Gardson where many members of the Washington family are buried. Pop. 2,650.

MALMIGNATE, mahl-mahl-neat, a spider. See LATROIDEUCTUS.

MALMÖ, mahl-mahl, Sweden, a seaport and the third largest town of the country, on the Sound, almost opposite Copenhagen, 17 miles distant, with which it has steam-ferry communication, a channel being maintained in wet weather by an ice-breaker. Malmö is a busy industrial centre with important manufactures, is the terminus of several railroads and is 384 miles by rail southwest of Stockholm. The town and its harbor have been considerably improved and modernized, and an extensive export and import traffic is seen in old gothic and modern buildings and in their vicinity as escaped plants, but are not offered for sale by seedsmen. The name mallow is loosely applied to many plants of the mallow family, but not of the genus Malva; for instance, marsh-mallow (Althea officinalis), rose-mallow (Hibiscus moscheutos) and Indian mallow (Abutilon hybridum); also, more loosely still, to unrelated plants, as Jeff's mallow (Corchorus olitorius) and Jeff's capularis). See CORCHORUS; HOLLYHOCK; Hibiscus.

Malmö dates from the 12th century, but until 1500 it was little more than a poor fishing village. It again suffered a period of decline but revived after the improvements to the harbor effected in 1773. Pop. 111,823. It has an interesting city hall, Saint
Peter's Gothic Church and an ancient castle. The industries include iron works and foundries, manufacture of railroad cars, shoes, gloves, tobacco, chocolate, etc.

MALMSEY, mål'm'sə, a sweet wine made from a grape grown on rocky ground, in Madeira, exposed to the full influence of the sun, and not gathered until partially withered.

MALOLOS, mà-lo'los, Philippines, a pueblo and the capital of the province of Bulacan, Luzon, situated at the head of one of the inlets of the Pampanga River delta, five miles northwest of Bulacan, the former capital. It is a telegraph and military station, is near a station of the Manila-Dagupan Railroad and is the centre of an important trade. It is in a region which was a stronghold of the insurgents, and immediately after the close of the Spanish war was made the capital of the insurgent government. Rice is extensively cultivated in the vicinity. Pop. 12,573.

MALON, màl'an, Benoît, French Socialist: b. Figeac, Lot, 11 Oct. 1844; d. Asnières, 13 Sept. 1893. He early entered upon a journalistic career and his activities in behalf of Socialist agitation caused his enforced absence from France for a time preceding the founding of the French Socialist Society, which he edited until his death. He attained considerable influence through the breadth of his teachings, which advocated the necessity for an inclusion of certain high religious, ethical and moral considerations with the purely socialistic principles. Author of 'L'Internationale, son histoire et ses principes' (1872); 'Histoire du Socialisme et des prolétaires' (1881-84); 'Le socialisme intégral' (1890-91, etc.

MALONE, màl'an, Edmund, Irish Shakespearean scholar: b. Galway, Ireland, 25 Apr. 1746; d. London, 25 Apr. 1812. He was educated at Trinity College, Dublin, and was called to the Irish bar in 1767, but henceforth devoted himself entirely to literary pursuits. His most important and permanent critical works are 'Remarks on the Plays of Shakespeare' (1774), which still carries authority; his edition of the poet in 10 volumes; and the edition known as the Third Variorum, which was prepared after his death by James Boswell, the younger, out of material left by the critic, and published in 21 volumes. This last is still the best of all complete critical editions. He also published 'Remarks on the Rowley (Chatterton) Controversy'; 'An Inquiry into the Ireland Shakespearean Forgeries'; and biographical memoirs of Sir Joshua Reynolds, Dryden, W. Gerard Hamilton, etc. Consult Prior, James, 'Life of Edmund Malone' (London 1884); Leslie and Taylor, 'Life of Sir Joshua Reynolds' (ib. 1865); and Boswell, James, 'Life of Johnson,' edited by G. B. Hill (Oxford 1887).

MALONE, Walter, American poet and jurist: b. Desoto County, Miss., 10 Feb. 1866; d. Memphis, 18 May 1915. He was graduated at the University of Mississippi and subsequently engaged in the practice of law and in literary work. He contributed to the periodicals of the day and published 'Claribel and other poems' (1882); 'The Outcast' (1886); 'Marian' (1893); 'Dusk and Dawn' (1895); 'December and June' (1896); 'Coming of the King' (1897); 'Songs of North and South' (1900); 'Poems' (1904); 'Songs of East and West' (1906); 'Hernando DeSoto,' an epic poem highly praised (1914).

On 29 March 1905, on petition of practically all members of the Memphis bar, he was appointed judge of the Circuit Court of Shelby County and held the position until his death. An association composed of the lawyers of the United States has been formed to erect a bronze portrait statue to Walter Malone in the principal park of Memphis; while another association has for its object to have his 'Opportunity' cast into a bronze tablet to be erected in Court square, in the heart of Memphis.

MALONE, N. Y., village, county-seat of Franklin County on the Salmon River, and on the New York Central and the Rutland railroads, about 275 miles north by west of Albany, and 12 miles from the boundary between the United States and Canada. It is situated at the northern foot-hills of the Adirondack Mountains, in an agricultural region, the chief products of which are hops, hay and potatoes. The dairy products and poultry are important. The chief manufactures are paper, pulp, flour, lumber, leather, woolen goods, foundry supplies and machine-shop products, public blind, men's clothing, cigars and dairy products. The electric-light and gas plants are owned by private companies, the waterworks by the village. The local lighting companies have harnessed the Salmon River eight miles south of Malone, and furnish an enormous supply of power. Malone is the commercial centre for the greater part of Franklin and parts of the adjacent counties, a section having a population of about 50,000. There are two national banks, six fine churches, a high school building (formerly Franklin Academy), several grammar and primary schools, a new federal post office and customs building, county courthouse, jail, a State armory, good hotels and several wholesale establishments. The educational institutions of public schools, are State School for Deaf-Mutes and Saint Joseph's Academy. There are three public libraries; the Wead Library, 7,000 volumes, free to the people of the school district, is housed in a beautiful building donated by Mrs. S. C. Wead; the Wadham's Library, 2,000 volumes, established and maintained by a literary society, free to all the people of the town of Malone (several school districts), and the Franklin County Historical Society Library, established in 1902. There is a well-kept park. The place was named in honor of Edmund Malone (q.v.), an Irish barrister and writer, by his friend, William Constable, who, together with his wife, named many of the places located within the limits of the large tract of land in the northern part of New York known as "The Macomb Purchase." The first settlement of the place was made in 1802, and its first inhabitants were mostly from Vermont and Ireland. In 1829-30 the people began considering the founding of an academy, and a number of the farmers pledged their farms as security for the payment of the debt incurred for the erection of the building, and Franklin Academy was established in 1831. The Northern Railroad, now Rutland Railroad, entered the town in 1851, and
the New York Central in 1892. Malone figured prominently in the War of 1812; and furnished a large number of soldiers, private and officers, in the Civil War. The village was the scene of two Fenian (q.v.) gatherings. Pop. 4,500.

MALOO CLIMBER. See BAHUMINT.

MALORY, Sir Thomas, author of the English prose romance 'Morte d'Arthur.' The work was finished in the ninth year of Edward IV's reign and published by Caxton in black-letter folio, in 1485. Little is known of the author; he may have been a priest; Caxton calls him a "servant of Jesus both day and night," and priests frequently were accorded the title "Sir." Probably he was a Welshman. See ARTHURIAN ROMANCES; MAHT D'ART;

GRAIL, THE HOILY; LANCELOT OF THE LAKE; MERLIN; TRISTAN.

MALOT, mà-lo, Hector Henri, French novelist: b. La Bouillé, near Rouen, France, 20 May 1830; d. Vincennes, 18 July 1907. He studied law, but abandoned it for a literary career, and in 1859 issued the first of a long series of successful novels. He was for a time a newspaper correspondent in London, and literary critic of L'Opinion Nationale. He wrote 'Victimes d'amour' (1859); 'Sons famillle,' published in English as 'No Relations' (1876); 'Conscience' (1888); 'Complices' (1880); 'Les familles' (1883); 'Amours de jeune; Amours de vieux' (1896); an autobiogra-

phy, 'Le Roman de mes Romans' (1896).

MALPIGHI, màl-pì'gu, Marcello, Italian anatomist: b. Crevalcore, Italy, 10 March 1628; d. Rome, 29 Nov. 1664. He received a medical education in Bologna and was granted a doctor's degree in 1653. In 1656 he became professor of medicine at Pisa, where he formed a friendship with the mathematician Borelli, who encouraged him to proceed with researches in anatomy. His health failing he returned to Bologna and continued his investigations, which resulted in discoveries which established fact undisputed in the modern world of science and placed the world's knowledge of physiology on a new footing; his researches in botany and entomology were highly important. In 1691 he was summoned to Rome as first physician to Innocent XII, in which office he died. He published numerous scientific works of great value, a complete edition of which was published in Venice 1743. The principal of these are 'Observations Anatomicae' (1661) and 'Epistole Anatomicae' (1665).

MALPLAQUET, màl-pla-kà, Battle of, the bloodiest in the war of the Spanish Succession, gained by Marlborough and Eugene, the commanders of the allies, against the French under Villars, 11 Sept. 1709. The French lost 10,000; the allies more than 20,000. Malplaquet is a village in the department of the Nord, near the Belgian frontier, 20 miles east of Valenciennes. After the victory there the allied armies soon took Mons and Douai.

MÅLSTROM. See MAELSTROM.

MALT AND MALTING. See BREWING AND MALTING.

MALSTATT-BURBACH, Prussia, town in the Rhine province, on the Saar and opposite Saarbrücken. It is situated in a coal-mining district and is almost entirely given over to factories and workmen's dwellings. There are manufactories of iron, steel and cement, machinery, boilers and safes. It has a large wharf for handling the exports in coal. Malstatt received municipal rights in 1718; these were later surrendered. The town began to grow in middle of the 19th century and in 1874 it joined with Burbach to form a city. Pop. about 38,554.

MALT REFUSE, MALT SPROUTS. See NUTRITION OF FARM ANIMALS.

MALTA, màlt'a, an island in the Medi-

terranean, belonging to Great Britain, with its dependencies, Gozo, Comino and Cominotto, forming the elevated portions of the plateau that extends north-westward to Sicily, 62 miles, and southward to Africa, 197 miles, and divides the Mediterranean into two basins. The Maltese group has a total area of 118 square miles, of which 91 square miles belong to Malta. Malta is of irregular oval shape, 17 miles long, with a central breadth of nine miles; its greatest elevation is over 750 feet. It is of limestone formation, and is deeply indented on all sides except the south, where the coast forms a continuous and almost unbroken line. Of great strategic importance, it is very strongly fortified, especially Baletta, the capital, which is the headquarters of the British Mediterranean fleet and the principal naval and mercantile connection in the Mediterranean. Since the recent regrouping of the British fleet consequent on the rise of Germany as a sea power and the concentration of the main battle-ships strength in home waters, Malta has declined to a more secondary place. The island is a valuable sanatorium for troops employed in the Orient. The climate is hot in summer, and enervating when under the influence of the humid sirocco blowing from Africa, but generally is mild and healthful. There are only a few small streams, but the springs are so numerous and copious that no deficiency of water is felt, and since 1880 an extensive system of waterworks has greatly improved sanitary conditions. Malta has a bare, stony appearance owing to the absence of trees. The soil is thin but remarkably fertile; and its fertility is increased by the skilful cultivation and the diligent toil of the inhabitants. Large crops of wheat and potatoes are raised, early varieties of the latter being largely exported to England; maize, barley, cotton, cloves, oranges, figs, grapes, carob beans and peaches and other fruits are also grown. Filigree ornaments and a little cotton are manufactured. Sheep and goats are kept, with smaller numbers of cattle, mules, asses and horses. The language of the people is a dialect of Semitic origin derived from the Carthaginian and Arabic tongues with a strong admixture of Italian. The native population believe themselves to be of Phoenician descent. Italian is the language of the law courts. Most of the educated Maltese speak Italian, and commonly speak English, but it is not understood as a rule know neither the one nor the other. The Maltese are a sober, industrious race of people, though quick-tempered and ignorant. They are proud of their island home — they love to call it "the flower of the world" — and are devout Roman Catholics. The administration is vested in a governor and an executive council of which the governor is president, and
there is also a legislative council, partly elective. The number of vessels entered in 1914–15 was 2,204, with a tonnage of 3,852,767. The imports were valued at £2,069,817, and the exports £224,412. Pop., including British troops and their families, 228,334. Malta possesses a considerable historical, archaeological and architectural interest. Saint Paul's Bay is accepted as the scene of the wreck of the Apostle Paul... (A.D. 58), as recorded in Acts xxvii, xxviii. It passed successively through the hands of Phoenicians, Greeks, Carthaginians, Romans, Byzantines, and Saracens, and was finally attached to Rome during the Second Punic War. Relics of these various occupations exist throughout the island. After the fall of the Roman Empire it was seized at different times by Vandals, Goths and Saracens. From the last it passed to Sicily, and followed its fortunes till 1522, when Charles V granted it to the order of Saint John of Jerusalem, the Knights of Saint John of Malta being distinguished during successive centuries for their bold resistance against Moslem assaults. In 1798 the grand-master surrendered Valetta without defense to Napoleon. Shortly afterward the inhabitants regained it and asked for a British protectorate, which was confirmed in 1814 by the Congress of Vienna. Consult Ballou, 'The Story of Malta' (1893).

MALTA, Knights of. See JOHN, ORDER OF.

MALTA FEVER (also MEDITERRANEAN FEVER, NEAPOLITAN FEVER, ROCK FEVER, etc.), a disease occurring near the Mediterranean shores, in which the fever symptoms are accompanied by intense pain, enlargement of the spleen, swelling of the joints, excessive perspiration and other conditions tending to bring about extreme weakness and loss of functional activity. Its cause is now assigned to Micrococcus melitensis. Treatment thus far is not specifically determined. Hygienic care, such as is normal in fevers, with special attention to diet and bathing, together with ordinary applications for reducing swellings, is all that can be recommended.

MALTBE, malt'bl, Milo Roy, American municipal and public utility expert. B. Hinckley, Me., 22 June 1871. He was graduated from the upper Iowa University in 1892 and took the degree of Ph.D. at Columbia in 1897. He was professor of economics and mathematics at Mount Morris College, Illinois, in 1893–95; from 1897–1902 was secretary of the Reform Club Committee on City Affairs; from 1897–1903 was editor of Municipal Affairs; from 1902–07, secretary of New York Art Commission. In 1906 he investigated public utilities in Great Britain for the National Civil Federation; from 1907–19, was member of Public Service Commission for the 1st district, New York; since 1915, public utility expert and member of Advisory Board to the Interstate Commerce Commission on Railroad Valuation. Has devoted himself to the study of municipal and utility questions, going abroad in 1899 to investigate foreign cities and their problems. He was lecturer on municipal government at Columbia University in 1900. He has written 'English Local Government of To-Day' (1897); 'Municipal Functions' (1898); 'Street Railways of Chicago' (1901), and numerous reports upon various matters.

MALTE-BRUN, mäl't-brûn, Conrad (properly MALTE BRUNN), Danish geographer: b. Thisted, Jutland, 12 Aug. 1775; d. Paris, 14 Dec. 1826. He devoted himself to literature and politics in Copenhagen, but having given offence to the government, the liberty of the press and the enfranchisement of the peasants, was banished to Sweden in 1800. He went later to Paris, where he became famous as a geographer. He edited the foreign political department of the Journal des Débats, but is best known works are 'Some History of Universal Geography' (8 vols., 1810–29). The first six volumes only were completed by Malte-Brun. Among his other works are 'Ancient and Modern Poland': 'History of Travel,' and 'Mathematical, Physical and Political Geography.'

MALTESE (mål-tèz' or -tèz') CROSS. See Cross.

MALTESE DOG. See Dog.

MALTHA, (1) according to Pliny, a name used for an inflammable mud which flowed from a pool at Samosata, Commagene, North Syria, and resembled naphtha. (2) A mixture of wax and pitch for caulking ships; mineral tar is another name for maltha, which is found oozing from rocks in certain localities, particularly in California.

MALTHUS, Thomas Robert, English political economist: b. near Guildford, Surrey, 14 Feb. 1766; d. Bath, 29 Dec. 1834. He studied theology at Cambridge and was ordained in the Church of England, continuing to pursue his profession as a teacher while holding a small living in Surrey. In 1805 he was appointed professor of history and political economy at Haileybury College. In his famous 'Essay on the Principles of Population' he propounded (1798) what is known as the Malthusian Doctrine, namely, that the increase of population advances at a geometrical, the increase of the means of life at an arithmetical, ratio that this condition of things renders the condition of the poor more and more hopeless, that unless famine or war interfere to diminish population the means of life will eventually prove inadequate; that discouragement of early and improvident marriages and the cultivation of self-restraint must be employed to avert the danger. These positions have been the subject of long and widespread discussion. His other writings include 'An Inquiry into the Nature and Progress of Rent' (1815); 'Principles of Political Economy' (1820); 'Definitions in Political Economy' (1827). Consult Bonar, 'Malthus and His Work' (1885); Soetbeer, 'Die Stellung der Sozialisten zur malthussischen Bevölkerungsllehre' (1886); Molinari, 'Malthus, Essai sur le Principe de Population' (1889); Cossa, 'Il principio di popolazione di T. R. Malthus' (1895). See Economics.

MALS, Etienne Louis, à-té-'ên loo-'e mâl's, French physicist and military engineer: b. Paris, 23 June 1775; d. there, 23 Feb. 1812. He was educated at the École Polytechnique, and upon leaving the school received a captain's commission in the corps of engineers, and served during the campaign of 1797 with the army of the Sambre and Meuse. Subsequently he participated in the campaigns of Egypt, and in 1804 superintended the construction of forti-
MALVACEÆ — MALVERN HILL

fications at Antwerp and Strassburg. Whatever
time could be spared from his professional
labor was devoted to scientific pursuits. His
chief publications consist of a mathematical
"Traité d'Optique," first published in the
'Mémoires présents à l'Institut' in 1810, in
which he promulgated some valuable discoveries
respecting the refraction of light in transparent
media; and the "Theory of Double Refraction"
(Mémoires prises à l'Institut, Vol. II) dealing
mainly on the subject of his discoveries respecting
the polarization of light, which consisted in
showing that light may acquire properties identi-
cal with either of two rays yielded by refraction
through Iceland spar by the process of simple
refraction at a particular angle from any trans-
parent body. This discovery gained for its
author his election to the Institute and the
biennial medal of the Royal Society of London.
He also published an "Essay on the Measure-
ment of the Refractive Force of Opaque Bodies."

MALVACEÆ, a family of flowering plants,
the mallows and their allies, in the order Colum-
iferæ, with the calyx gamosepalous; petals
contorted in a bud, stamens numerous, mona-
delphous; anthers extrorse, monothecous;
pollen-grains spiny. They are herbaceous or
woody plants, mucilaginous in their juices, and
usually densely hairy, especially when young.
The leaves are palmately nerved and frequently
deeply five-lobed. The flowers are large, fun-
nel-shaped, conspicuously and beautifully col-
ored, attracting the aid of insects in fertilization.
The fruit is schizocarpous. This family con-
tains many important genera and species of
plants elsewhere described, such as the mallows
(Malva, Lavatera, etc.), hollyhocks (Althaea),
cotton-plants (Gossypium), the rose-mallows
(Hibiscus), etc. About 60 genera and 900 spe-
cies are accredited to this family by systematic
botanists.

MALVERN, mäl-vérn, Ark., town, county-
seat of Hot Springs County, on the Saint Louis,
Iron Mountain and Southern Railroad, about
20 miles southeast of Hot Springs. It is in an
agricultural region, in which the principal pro-
duction is cotton and fruit. The chief manufac-
tures are flour, lumber, chairs, doors, windows,
ices and bricks. The trade is principally in lumb-
er, cotton and fruits. Pop. 2,778.

MALVERN, mäl-vérn, Great, Englad, a
fashionable inland watering-place in Worcesters-
shire, on the east side of the Malvern Hills, at
the foot of the Worcestershire Beacon. 1,395
feet high, the summit of which commands mag-
nificent views. A restored 11th century priory
church and Malvern College are the chief edifi-
ces. Malvern is widely celebrated and greatly
frequented owing to its salubrious climate and
the efficacy of its mineral springs. Pop. of
urban district about 16,513.

MALVERN HILL, Battle of. After the
close of the battle of Glendale (q.v.), 30 June
1862, the Army of the Potomac was put in posi-
tion on Malvern Hill, an elevated open plateau
on the left bank of James River, 60 feet high,
and about 1½ miles by ½ mile in area. On this
plateau the south foot and part of the eastern
flanks resting on the river and pro-
tected by gunboats. Porter's Fifth corps was
on the left, Couch's division of Keyes' corps
on the right of Porter, Heintzelman's two
divisions — Kearny and Hooker — on the right
of Couch, Sumner's corps on the right of
Heintzelman, and Franklin's corps on the right
of Sumner's. 500 yards south of Sumner's divi-
sion was on the right of Franklin and was the
extreme right of the army, and it and the left
of Porter's line stood back to back. There
were numerous batteries of artillery along and
in rear of the line. The position was a very
strong one. At 5:30 p.m., after the division of
Kearny's corps had fallen back from Glendale
during the night, Lee gave orders for immediate pursuit. Jack-
son marched by the Willis road, and when in
sight of Malvern Hill he formed line, with
Whiting's division on his left and D. H. Hills
on his right, of Ewell's brigades occupying
the interval. The rest of Ewell's division and
Jackson's own division were held in reserve
Expected to take position on
Jackson's right, but before his arrival two of
Huger's brigades came up and took
Hill. The Confederates felt the Union line
with infantry and artillery, and when Magruder
came up, about 2 p.m., Huger's two brigades
— Armer and Wright — with four batteries
were ordered forward. The batteries, as they
emerged in succession from the woods, were
promptly knocked to pieces by the fire of over
60 guns brought to bear upon them, and the
two brigades were repulsed with loss. The
attack fell upon the right of Porter and left
of Couch, and the latter was now reinforced
by Caldwell's brigade of Summer's corps. No
serious advance had been made on other
parts of the line, but Hill had suffered severely from
artillery fire in getting his troops in position
opposite Couch's right. At 5:30 p.m. Magruder
assaulted Porter's line and the left of Couch
with the five brigades of Ewell's division. Cobb,
Wright, Mahone and Barksdale. All were met
by such a terrific fire of artillery and musketry
which swept the slope of the hill, that they
could make no headway, though gaining tem-
porary advantages, and fell back with great
loss. Toombs', G. T. Anderson's and Ran-
som's brigades were now ordered in; Toombs
lost got lost in the thick woods; Anderson and
Ransom shared the fate of those preceding
them, and fell back. Magruder's right ended
before dark. While Magruder was thus en-
gered with Porter and the left of Couch, D. H.
Hill, on his left, advanced against Couch's right,
which, as the action progressed, was reinforced
by Caldwell's brigade, three regiments of
Hooker's division under Sickles and some of
Kearny's division. Hill's division was com-
manded by Generals Garland and Ripley
andCols. J. B. Gordon, A. H. Colquit and
C. C. Tew. The slope to Couch's line was
about 800 yards, without cover, and the advance
directly in the face of guns on the slope and
bristling on the summit, from which bursts such
as disposed in a large
army. The eastern
flanks resting on the river and pro-
tected by gunboats. Porter's Fifth corps was
on the left, Couch's division of Keyes' corps
on the right of Porter, Heintzelman's two

Later in the evening Taylor's brigade of Ewell's division, on Hill's left, moved against the left of Kearny's division, and was repulsed by artillery fire alone. Half an hour after Hill had been disastrously repulsed and his troops scattered, McLaws' division of two brigades—Semmes and Kershaw—came up and assaulted Porter's right. Semmes made some headway up the slope, but was met by the 69th and 88th New York of Meagher's brigade, which Summer had sent to Porter's assistance, and was repulsed after a hand-to-hand encounter. Kershaw, on Semmes' left, was likewise repulsed, and his repulse at twilight marked the close of the battle, but it was 9 o'clock before the firing ceased and quiet settled down on the bloody field. Sixteen Confederate brigades had heroically thrown themselves against the Union left, but were repulsed by the artillery and nine brigades. Advanced regiments were forced back, but generally recovered ground; batteries or parts of batteries were withdrawn, but again run forward; yet "never for an instant was the Union line broken or the guns in danger." The Confederate loss was over 5,500; Jackson's four divisions had 2,301 killed, wounded and missing. The Federal loss was under 2,000. Consult "Official Records" (Vol. XI); Webb, "The Peninsula"; McClellan's Own Story; Allan, "History of the Army of Northern Virginia"; The Century Company's "Battles and Leaders of the Civil War" (Vol. II).

E. A. CARMAN.

MALVERN (má'l vér'n) HILLS, England, a range of picturesque hills on the borders of Worcestershire and Herefordshire. It extends north and south for about nine miles, and attains an altitude of 1,395 feet in the Worcestershire Beacon.

MAMANUA, mā-mānoo-ā, a Negrito people of the Philippines living in the interior of Surigado Peninsula, island of Mindanao. Large numbers of them have been converted to Christianity by the Jesuit missionaries.

MAMARONECK, má-má're-nék, N. Y., town, in Westchester County, on Long Island Sound, and on the New York, New Haven and Hartford Railroad, about 11 miles east of New York and 21 miles from Grand Central Station, New York City. The town includes the village of Larchmont and part of the village of Mamaronke. It is a residential section, in which many New York City people have homes. There are but few industrial establishments; the principal are the National Machine Company, manufacturing sewing machines and sewing machine attachments, rubber goods factory, pumice-stone mill and a grist mill. It is the headquar ters of the Larchmont Yacht Club. Pop. 5,669. The population of Larchmont is about 2,000.

MAMARONECK RIVER. See BOUNDARIES OF THE UNITED STATES.

MAMBAYAO, mān-bǎ-hōw, a town of the province of Misamis, Mindanao, situated on the northwestern coast of Camiguin Island, which lies off the northeast coast of Mindanao. Pop. 14,500.

MAMBER, a widely diffused colloquial name, for the common wild goat (Capra aegagrus) of southwestern Asia. See GOAT.

MAMBUSAO, mām-boo'sā-ō, Philippines, a pueblo of the province of Capiz, island of Panay, on the Capiz River, opposite Iba city and 17 miles southwest of Capiz, the provincial capital. Pop. 8,300.

MAMELUKES, māmālūk's-lūk, MAMELUKES, or MAMELUKES (from the Arabic memaliık, a slave), in Egypt, slaves from the Caucasian countries, who from menial offices were advanced to dignities of state. When Genghis-Khan made himself master of the greatest part of Asia in the 13th century, and carried vast numbers of the inhabitants into slavery, Nedjmeddin (Malek Salah), sultan of Egypt, bought 12,000 of them, including natives of Circassia, but chiefly Turks, from Capchak (Kizpak), had them instructed in the military exercises and formed a regular corps of them. They soon exhibited a spirit of insubordination and rebellion. Under his successor they interfered in the government, assassinated the sultan, Turan Shah, and in 1254 appointed 1bgeh, one of their own number, sultan of Egypt. The domination of the Mamelukes in Egypt continued 263 years. During this period they made some important conquests, and in 1291 they drove the Franks entirely out of the East. From the middle of the 18th century the number and wealth of the Mamelukes gradually decreased, and the superiority over the Turks in Egypt that the pasha appointed by the Porte was obliged to conform entirely to their wishes. This superiority was owing, principally, to Ali Bey, who ruled with unlimited power from 1766 to 1773, when he was assassinated. The Mamelukes, especially Murad Bey, played an important part at the time of the French invasion. The Mamelukes, who were scattered throughout Egypt, and estimated at 10,000 or 12,000 men, maintained their numbers, principally by slaves brought to Cairo from the regions lying between the Black and Caspian seas. These were compelled to embrace the Mohammedan faith, and were all educated as soldiers. After a time they obtained a share in the government, and some of them even became bey, for none but Mamelukes were capable of holding this office. They formed a fine body of cavalry, and attacked the French, when they landed in Egypt, with the greatest fury; but they were unable to withstand the European artilly, and many of them soon joined the French. The pasha of Egypt, Mehmet Ali, destroyed the Mameluke bays March 1811, by a perfidious stratagem, and immediately afterward ordered a general massacre of the Mamelukes in every province of Egypt. Some hundreds managed to escape into Lower Nubia, where they built a small town, and endeavored to keep up their force by disciplining negroes in their peculiar tactics. They did not succeed, however, and shortly afterward dispersed. (See Egypt.) Consult Makrizi, History of the Mameluke Sultan translated by Quatremere (3 vols., Phil., 1837-41); and Muir, William, "The Mameluke or Slave Dynasty of Egypt, 1260-1517" (New York 1906).

MAMEY, or MAMMEE-APPLE. See MAMMEE APPLE.

MAMEY SAPOTE, a large tree (Calocarpum mammosum) of the family Sapotaceae, native of tropical America. The leaves are large, obovate, glabrous, the flowers small and
inconspicuous and the fruit glebese or egg-shaped, russet brown, and three to seven inches long, with a single large seed. The fruit is very popular in the tropics, especially in Cuba, and is sometimes shipped to the United States. It is eaten fresh, or used for sherbets or marmalade.

The tree is native in Florida and California, but so far not very successfully.

MAMMALIA. See Mammals.

MAMMALS, a class of animals, known also as beasts, or quadrupeds, the highest of the vertebrate group in the sense that it comprises forms whose organization is on the whole the most efficient on account of the complexity, or perfection, of the various organs and parts. The diagnostic character of the class is the possession of cutaneous glands, which secrete a complex fluid, called milk, for the nourishment of the young. The lower jaw articulates directly with the cranium, without the mediation of a quadrate bone. The occipital condyles are two in number, form part of the exoccipitals. The internal ear contains a series of three or four separate small bones, which are concerned in audition. The heart is four-chambered, with two aortae and two ventricles; a left aortic arch; blood warm; red blood discs, not nucleated. A muscular diaphragm separates the heart and lungs from the abdominal cavity.

With few exceptions, mammals are clothed with hair, a special outgrowth of the epidermis, and even in those exceptional cases isolated hairs are found at some stage of their life.

Mammals as a class are extremely diversified in size, appearance and habits. The structure of some is modified for a purely aquatic life, of others for burrowing in the earth, for flying, for leaping, for running, etc. Some live entirely in the sea, others pass their lives in the treetops and others in subterranean caverns, which they excavate.

All mammals possess limbs, which are normally four in number, but the hind pair is suppressed in the whales and sea-cows. The limbs assume the form of legs for terrestrial progress, wings for flight or paddles for swimming. The class includes man, and the majority of the animals most useful to man, such as the horse, ox, sheep, goat, dog, cat, etc.; the whales, the largest of existing animals. About 600 genera and 5,000 species of mammals (exclusive of fossil forms) are known, of which about 200 genera and 1,200 species occur in North America, north of Panama.

Integuments.—The skin of mammals consists of two principal layers, a superficial one, called the epidermis or cuticle, and a deeper layer, the dermis or corium. The epidermis is again divided into two layers, an external horny layer and a deeper one, called the Malpighian layer. The epidermis is usually quite smooth, and is beset with hairs which are a special outgrowth of this part of the integument peculiar to the class. The cetacea are without hairs, except a few about the mouth. In the pangolins, the epidermis develops large scales which cover the greater part of the body. Epidermic scales of smaller size are found on the tails of various rodents, insectivores and marsupials. The horns of ruminants, the nasal horn of the rhinoceroses and all claws, nails and hoofs are also epidermic structures.

The dermis or corium is generally thicker than the epidermis and contains blood-vessels, tactile nerve endings, sweat glands which open on the surface of the body and fatty tissue. In the whales and seals the fat cells are enormously developed immediately below the dermis and constitute the “blubber.” In the armadillos and fleshy plates occur in the dermis, forming a carapace or shell. They are covered by horn sheaths.

Hair.—True hairs are found only on mammals. They are simple epidermic structures growing from papillae sunk in the dermis. They consist of central cellular pith, enclosed in a bony sheath. In some mammals the sheath is rough, and the hair is then capable of beingemeled together to form “felt.” In the majority of mammals the hairy covering consists of coarse long hairs and fine short hairs intermingled, forming the fur. In the porcupines the coarse hairs assume the form of large stiff spines, or quills; in the horses two aortic arch; blood warm; red blood discs, not nucleated. A muscular diaphragm separates the heart and lungs from the abdominal cavity.

With few exceptions, mammals are clothed with hair, a special outgrowth of the epidermis, and even in these exceptional cases isolated hairs are found at some stage of their life.

Mammals as a class are extremely diversified in size, appearance and habits. The structure of some is modified for a purely aquatic life, of others for burrowing in the earth, for flying, for leaping, for running, etc. Some live entirely in the sea, others pass their lives in the treetops and others in subterranean caverns, which they excavate.

All mammals possess limbs, which are normally four in number, but the hind pair is suppressed in the whales and sea-cows. The limbs assume the form of legs for terrestrial progress, wings for flight or paddles for swimming. The class includes man, and the majority of the animals most useful to man, such as the horse, ox, sheep, goat, dog, cat, etc.; the whales, the largest of existing animals. About 600 genera and 5,000 species of mammals (exclusive of fossil forms) are known, of which about 200 genera and 1,200 species occur in North America, north of Panama.

Integuments.—The skin of mammals consists of two principal layers, a superficial one, called the epidermis or cuticle, and a deeper layer, the dermis or corium. The epidermis is again divided into two layers, an external horny layer and a deeper one, called the Malpighian layer. The epidermis is usually quite smooth, and is beset with hairs which are a special outgrowth of this part of the integument peculiar to the class. The cetacea are without hairs, except a few about the mouth. In the pangolins, the epidermis develops large scales which cover the greater part of the body. Epidermic scales of smaller size are found on the tails of various rodents, insectivores and marsupials. The horns of ruminants, the nasal horn of the rhinoceroses and all claws, nails and hoofs are also epidermic structures.

The dermis or corium is generally thicker than the epidermis and contains blood-vessels, tactile nerve endings, sweat glands which open on the surface of the body and fatty tissue. In the whales and seals the fat cells are enormously developed immediately below the dermis and constitute the “blubber.” In the armadillos and fleshy plates occur in the dermis, forming a carapace or shell. They are covered by horn sheaths. The presence of small hard tubercles in the skin of certain porpoises gives ground for the belief that the ancestors of the cetacea were covered with a bony armor, somewhat like that of the armadillos.

Hair.—True hairs are found only on mammals. They are simple epidermic structures growing from papillae sunk in the dermis. They consist of central cellular pith, enclosed in a bony sheath. In some mammals the sheath is rough, and the hair is then capable of being emmeled together to form “felt.” In the majority of mammals the hairy covering consists of coarse long hairs and fine short hairs intermingled, forming the fur. In the porcupines the coarse hairs assume the form of large stiff spines, or quills; in the horses and certain other mammals the hairs consist mainly of the cellular pith and hence are easily broken.

The color of mammals is chiefly due to the pigments contained in the hair, which belong to the class known as melanins. Black, white and brown in various mixtures and shades are the commonest colors. The coloration is chiefly protective, but some such sharp contrast of black and white as those of the skunks are thought to be warning colors, and the clear white of the under side of the tail of deer, certain hares, etc., to be directive, or distinguishing, marks for the young.

Skin. It includes the skin proper, which consists of an axial portion, comprising the skull, the backbone or vertebral column, the ribs and the sternum; and an appendicular portion or the skeleton of the limbs. In the skull the bones are bound firmly together by the overlapping or interdigitation of the edges, except the lower jaw, the ossicles of the internal ear and the hyoid, or tongue, bones. In adults most of the sutures are usually obliterated. The snout or rostrum consists of the premaxillary, maxillary, palatine and pterygoid bones below, and on the sides, and the nasals above, while within are the median vomer and the ethmoid bones. The rostrum abuts against the brain-case or cranium, which is vaulted, and comprises three segments, an anterior one, consisting of the prefrontal, orbito-sphenoids and frontal; a middle segment, consisting of the basi-sphenoid, alisphenoids, squamosals and parietals; and a posterior segment, consisting of the basi-occipital, exoccipitals and supra-occipital. The exoccipitals bear the two condyles for articulation with the vertebral column. At the base of the skull, between the occipital and squamosal, are

4 Ape, Arborial Type
the periotic bones, containing the organ of hearing or internal ear, and the tympanics, which form the bony walls of the orifice of the ear. In all mammals, whatever the length of the neck, the only exceptions being the manatees, which have six, and the sloths, which have six, eight or nine. In certain whales, the majority of porpoises and some rodents, the cervical vertebrae are more or less united; in the right whales they form a single bony mass. The dorsals vary in number from 9 to 22. Articulated with each is a pair of ribs. The ribs terminate below in cartilages, which sometimes ossify, forming what are called "sternal ribs." By means of these cartilages the anterior pairs of ribs are connected with the breastbone or sternum, which may consist of a single piece, as in the whalebone whales, or of several segments arranged longitudinally. The posterior pairs of ribs are sometimes called "floating ribs" because their cartilages do not meet the sternum, but are attached to those of the more anterior pairs, or are quite free. The lumbar vertebrae follow the dorsals and are without ribs. In number they vary from 2 to 30 in different forms. The number of dorsal and lumbar vertebrae combined is quite constantly 23 in the odd-toed ungulates (horse, rhinoceros, tapir, etc.), 19 in even-toed ungulates (deer, ox, sheep, etc.), and 20 or 21 in carnivores and most insectivores. Man, the higher apes and many bats have 17. Following the lumbar is the sacrum, consisting usually of three vertebrae joined together and connected with the pelvis. This region is not distinguishable in the whales and sea-cows, which lack hind limbs. The caudals, or tail-vertebrae, complete the column. In man and in certain apes and bats they are three in number and rudimentary, but as many as 46 are present in the long-tailed pangolins. In the intervals between the anterior caudals below are situated small V-shaped bones, called chevrons, whose chief function is to protect the larger blood-vessels of the tail. They are especially well developed in the whales and edentates.

In many groups of mammals the anterior limbs are connected with the axial portion of the skeleton through the pectoral girdle, consisting of the shoulder blades, or scapulae, and the collar-bones or clavicles. The scapula is not attached directly to the vertebral column, but its acromion process is joined to the anterior end of the breastbone, or sternum, by means of the clavicle. Clavicles are wanting in all seals, whales, sea-cows and ungulates, and are rudimentary in various representatives of several other orders. They are present in man and, with one or two exceptions, in all monkeys, bats, insectivores and marsupials. The upper-arm bone, or humerus, articulates superiorly with the scapula, and below with the proximal ends of the two bones of the forearm and hand. In the majority of mammals the radius, or outer bone, is permanently crossed over the ulna at the lower end, as is especially well seen in the elephants. In man and a few other forms the radius can be rotated. Following the fore-arm is the wrist or carpus, consisting of three rows of small bones, which, however, are variously expanded in whales and some other mammals, forming shell-shaped bulle.

The vertebral column comprises five sections, the cervical, dorsal (or thoracic), lumbar, sacral and caudal. The cervical vertebrae are seven in number. In all mammals, whatever the length of the neck, the only exceptions being the manatees, which have six, and the sloths, which have six, eight or nine. In certain whales, the majority of porpoises and some rodents, the cervical vertebrae are more or less united; in the right whales they form a single bony mass. The dorsals vary in number from 9 to 22. Articulated with each is a pair of ribs. The ribs terminate below in cartilages, which sometimes ossify, forming what are called "sternal ribs." By means of these cartilages the anterior pairs of ribs are connected with the breastbone or sternum, which may consist of a single piece, as in the whalebone whales, or of several segments arranged longitudinally. The posterior pairs of ribs are sometimes called "floating ribs" because their cartilages do not meet the sternum, but are attached to those of the more anterior pairs, or are quite free. The lumbar vertebrae follow the dorsals and are without ribs. In number they vary from 2 to 30 in different forms. The number of dorsal and lumbar vertebrae combined is quite constantly 23 in the odd-toed ungulates (horse, rhinoceros, tapir, etc.), 19 in even-toed ungulates (deer, ox, sheep, etc.), and 20 or 21 in carnivores and most insectivores. Man, the higher apes and many bats have 17. Following the lumbar is the sacrum, consisting usually of three vertebrae joined together and connected with the pelvis. This region is not distinguishable in the whales and sea-cows, which lack hind limbs. The caudals, or tail-vertebrae, complete the column. In man and in certain apes and bats they are three in number and rudimentary, but as many as 46 are present in the long-tailed pangolins. In the intervals between the anterior caudals below are situated small V-shaped bones, called chevrons, whose chief function is to protect the larger blood-vessels of the tail. They are especially well developed in the whales and edentates.

In many groups of mammals the anterior limbs are connected with the axial portion of the skeleton through the pectoral girdle, consisting of the shoulder blades, or scapulae, and the collar-bones or clavicles. The scapula is not attached directly to the vertebral column, but its acromion process is joined to the anterior end of the breastbone, or sternum, by means of the clavicle. Clavicles are wanting in all seals, whales, sea-cows and ungulates, and are rudimentary in various representatives of several other orders. They are present in man and, with one or two exceptions, in all monkeys, bats, insectivores and marsupials. The upper-arm bone, or humerus, articulates superiorly with the scapula, and below with the proximal ends of the two bones of the forearm and hand. In the majority of mammals the radius, or outer bone, is permanently crossed over the ulna at the lower end, as is especially well seen in the elephants. In man and a few other forms the radius can be rotated. Following the fore-arm is the wrist or carpus, consisting of three rows of small bones, which, however, are variously expanded in whales and some other mammals, forming shell-shaped bulle.

The vertebral column comprises five sections, the cervical, dorsal (or thoracic), lumbar, sacral and caudal. The cervical vertebrae are seven in number. In all mammals, whatever the length of the neck, the only exceptions being the manatees, which have six, and the sloths, which have six, eight or nine. In certain whales, the majority of porpoises and some rodents, the cervical vertebrae are more or less united; in the right whales they form a single bony mass. The dorsals vary in number from 9 to 22. Articulated with each is a pair of ribs. The ribs terminate below in cartilages, which sometimes ossify, forming what are called "sternal ribs." By means of these cartilages the anterior pairs of ribs are connected with the breastbone or sternum, which may consist of a single piece, as in the whalebone whales, or of several segments arranged longitudinally. The posterior pairs of ribs are sometimes called "floating ribs" because their cartilages do not meet the sternum, but are attached to those of the more anterior pairs, or are quite free. The lumbar vertebrae follow the dorsals and are without ribs. In number they vary from 2 to 30 in different forms. The number of dorsal and lumbar vertebrae combined is quite constantly 23 in the odd-toed ungulates (horse, rhinoceros, tapir, etc.), 19 in even-toed ungulates (deer, ox, sheep, etc.), and 20 or 21 in carnivores and most insectivores. Man, the higher apes and many bats have 17. Following the lumbar is the sacrum, consisting usually of three vertebrae joined together and connected with the pelvis. This region is not distinguishable in the whales and sea-cows, which lack hind limbs. The caudals, or tail-vertebrae, complete the column. In man and in certain apes and bats they are three in number and rudimentary, but as many as 46 are present in the long-tailed pangolins. In the intervals between the anterior caudals below are situated small V-shaped bones, called chevrons, whose chief function is to protect the larger blood-vessels of the tail. They are especially well developed in the whales and edentates.

In many groups of mammals the anterior limbs are connected with the axial portion of the skeleton through the pectoral girdle, consisting of the shoulder blades, or scapulae, and the collar-bones or clavicles. The scapula is not attached directly to the vertebral column, but its acromion process is joined to the anterior end of the breastbone, or sternum, by means of the clavicle. Clavicles are wanting in all seals, whales, sea-cows and ungulates, and are rudimentary in various representatives of several other orders. They are present in man and, with one or two exceptions, in all monkeys, bats, insectivores and marsupials. The upper-arm bone, or humerus, articulates superiorly with the scapula, and below with the proximal ends of the two bones of the forearm and hand. In the majority of mammals the radius, or outer bone, is permanently crossed over the ulna at the lower end, as is especially well seen in the elephants. In man and a few
jaw is the same as for those of the upper jaw, their character being determined by their relation to the latter and by their form and mode of development. With the greatest dilatation, exists as to the form of the individual teeth, and the development of the dentition as a whole, there are rarely more than 44 in all. The exceptions are among the marsupials, where the number rises to 54 in the marsupial anteater, Myrmecobius, and to 64 in a fossil form Amphitherium; also among the cetaceae, one species of which has as many as 246 simple teeth. The true anteaters, Myrmecophagidae, and the spiny anteaters of Australia, Edentata, are without teeth at any time, but many mammals which do not possess them when adult have rudimentary teeth in the facial stages. Such is the case with the whalebone whales, and with the platypus, Ornithorhynchus. The rudimentary teeth in these disappear early and are replaced by whalebone in the case of the whales, and by horny plates resembling teeth in the platypus.

Teeth consist of two portions, the root and the crown. When most complex they contain three structural elements, the dentine and the cement. The enamel is hardest and is restricted to the crown, while the dentine makes up the mass of the tooth, and the cement usually surrounds the root, or fills spaces between the enamel-folds of the crown. The enamel develops from the epithelial tissue of the jaws, the dentine from the deeper-lying areolar tissue and the cement from the walls of the tooth-capsule. Some teeth, such as the incisors of rodents, the tusks of the elephant, etc., grow continuously during life; others complete their growth early. Especially remarkable forms of teeth are the tusks of elephants, which are incisors, and the tusks of the narwhal, the boar and the babirusa, which are canines. When the crowns of the teeth greatly exceed the roots in height, as in the horse, the teeth are said to be hypsodont or hypselodont; when the reverse is the case, the teeth are called brachydont. Teeth having the crown in the form of tubercles, as in the hog, are called buccateeth; those with transverse ridges, as in the ox, many rodents, etc., are called lophodont.

Alimentary Canal.—The mouth, or entrance to the alimentary canal, contains the tongue, which in the majority of mammals is so attached below that it can be protruded for a short distance, but is often sufficiently free to be used in grasping food and turning it about in the mouth during the process of mastication. In those mammals which feed upon ants and termites, such as the anteaters, pangolins, etc., and also in certain fruit-eating bats, the tongue is very long and slender and can be extended far beyond the mouth. On the posterior surface of the tongue are the organs of taste, and the upper surface is often roughened by horny papillae. A number of large glands, called the salivary glands, open into the mouth. Their function is to moisten the food and initiate the process of digestion. The glands most constantly present are the parotid, situated at the base of the ear, and opening inside the cheek, and the submaxillary, situated near the angle of the lower jaw, and opening upon the apex of the tongue. At the back of the mouth is the entrance to the cesophagus or gullet, usually a simple tube, leading to the stomach. The stomach is an oblong, curved sac, usually enlarged at the cardiac end where the cesophagus is attached, and smaller at the pyloric end, and where it joins the intestines. It is usually simple, but in the ruminants and the cetaceae consists of several chambers. The intestines join the stomach at the pyloric end. They are usually of great length, and divided into two distinct portions. The portion nearest the stomach, called the small intestine, is joined below by one of larger diameter called the large intestine. The upper end of the latter is usually dilated, forming a pouch called the cæcum, which in herbivorous mammals, and notably in rodents and many ungulates, is greatly enlarged or elongated. In man, the higher apes and the marsupial wombat it terminates in a narrow prolongation called the vermiform appendix. Different sections of the small intestine have received the names duodenum, jejunum and ileum; and of the large intestine, colon and rectum. The inferior orifice of the intestines is the anus or vent. Generally speaking, the intestines and cæcum are shortest in carnivorous mammals and longest in the enamel, the dentine and the cement.

Besides the numerous glands situated within the intestine are two large ones, the liver and the pancreas, which open ducts open into the intestines near the stomach. The liver is a large, flat gland, which may be divided nearly into a right and a left lobe as in man, the cetacea and ruminants, or may have these lobes again subdivided into two by a longitudinal fissure. Two smaller lobes, called the Spigelian lobe and the caudate lobe, are commonly added. Attached to the liver is the gall-bladder, which is, however, absent in the cetacea and some other orders.

Kidneys.—The kidneys, whose function is to secrete urine, are situated in the upper part of the abdominal cavity near the vertebral column. They are two in number, oblong and usually simple, but in the cetacea, and also in bears and seals, are divided into separate lobules. The transverse ridges, as in the ox, many rodents, etc., are called lophodont.

Lungs.—The lungs are situated in the thorax, which is cut off below from the abdominal cavity by a muscular diaphragm whose action assists in the process of breathing. The lungs consist of two spongy lobes, a right and a left, which are free below, but attached above to the two principal divisions of the windpipe. In the cetacea and sea-cows, the lobes are simple externally, but in other orders are more or less subdivided. A third median lobe, called the azygos lobe, is present in some groups. Air breathed through the nostrils reaches the lungs through the trachea or windpipe, the upper end of which, the larynx, lies in the throat. Its orifice, the glottis, is protected by a cartilage, called the epiglottis, which prevents particles of food from entering the windpipe. The larynx is made up of cartilages, of which the largest are the thyroid, the cricoid and the arytenoid. Within the larynx are the vocal cords, two parallel elastic, fibrous bands, whose
vibrations produce the voice. The lower end of the windpipe divides into two smaller tubes, or bronchi, each of which enters a lobe of the lungs and subdivides into numerous smaller branches. A third bronchus, which enters the right lung, occurs in some cetaceans and ruminants.

Heart.—The heart in mammals is four-chambered, consisting of two thin-walled auricles and two ventricles, both with thick walls, but the right, which supplies only the lungs, thinner than the left. There is no direct communication between the left and right sides of the heart at birth. The valve between the right auricle and the right ventricle is tendinous, except in the monotremes.

The aorta, or principal artery, bends toward the left immediately beyond its connection with the heart and gives off the innominate, left common carotid, and subclavian arteries, which, with their branches, supply the head and anterior limbs. The method of branching of these arteries from the aortic arch and from one another varies widely. Blood is carried from the alimentary canal to single veins, except in Echidna, in which as in lower vertebrates the abdominal vein is present. The kidneys are supplied with blood only by the renal arteries.

Brain.—Except for certain fossil forms, the brain of mammals is characterized by its relatively larger size as compared with that of lower vertebrates, and especially by the magnitude of the cerebral hemispheres and the perfection of the connections between them. In most mammals the surface of the brain is divided by numerous irregular fissures and convolutions. They are absent only in small bats, rodents and insectivores, and in Ornithorhyncus. The largest forms in each order, generally speaking, exhibit the greatest complexity, and there has been a remarkable development in the class in this direction since Tertiary times. The cetacea have very large and complex brains, though they are small relatively, when compared with the size of the body.

Sense Organs.—The organs of sense, except that of touch, are located in the head. The sense of touch is generally distributed over the skin, but is most acute in the snout, and in the extremities, except when used merely in locomotion. The wings of bats and the prehensile tails of monkeys are also especially sensitive. Some burrowing mammals, such as the mole, have imperfect eyes, the optic nerve being more or less atrophied. The Indian river-dolphin, Platamona, is a blind form, having rudimentary eyes, without crystalline lenses. The mammalian ear is characterized, besides the chain of ossicles, already mentioned, by the complex cochlea, which is usually spirally convoluted. The tympanic membrane, or eardrum, seals the auditory chamber from without. In the majority of mammals the external orifice of the ear is surrounded by a fold of skin, called the pinna or external ear. These are absent in cetaceans, sea-cows, seals, etc., which live in the water, and also in some burrowing mammals.

Reproductive System.—In mammals the female reproductive organs comprise the ovaries, Fallopian tubes or oviducts, uterus and vagina. The ovaries are two in number, a left and a right. Approximated to them are the Fallopian tubes, which widen below and form the uterus. In the lower mammals the uterus of each side is separate, but in the two below in a common vagina, while in the higher groups, the uterus and vagina are both single. The male organs comprise the testes, spermatic cord and penis. In cetaceans, sea-cows and seals, which are aquatic, and in the elephants, conies and many edentates, the testes are internal in position, but in most other forms they descend periodically, or permanently, into a pouch of the integument, called the scrotum. The structure of the penis in mammals is peculiar to the class. An ovipositor is present in the majority of bats, insectivores, rodents, carnivores and primates.

During development the mammalian fetus is nourished through a complex structure, called the placenta, formed in part by the internal wall of the uterus of the mother and in part by the membranes of the fetus itself. The placenta is characteristic of the class as a whole, but is not found in the monotremes, nor in most marsupials. The form and other characteristics of the placenta differ in the several orders of mammals and are regarded as of importance in classification.

Distribution.—The geographical distribution of existing mammals, as of other animals, is the result of varied conditions and influences, some transient and others of long continuance, beginning in the relatively remote geological times when the class first made its appearance. Among the principal factors in the problem of distribution may be included changes in the extent and configuration of the land areas of the globe, changes in climate and in food supply, the appearance and disappearance of enemies, and latest, but by no means least, the interference of man. These and other factors in distribution are considered under the heading Distribution of Living Mammals. It is only possible here to mention some of the more important facts in the distribution of mammals. Of widest distribution are the purely aquatic orders, the cetacea and pinnipedia, whose range covers all seas and reaches from pole to pole, but it should be noted that the seals occur in the north Atlantic. Next follow the bats, whose range is nearly world-wide, but they do not enter the Antarctic zone, and only very few species cross the Arctic Circle. On the other hand, they are found in New Zealand and in oceanic islands where no terrestrial indigenous mammals occur. Of the purely terrestrial orders, the rodents have the widest range, covering every continent and reaching from the Arctic zone to Patagonia and Tasmania. Carnivores, like rodents, have an almost world-wide distribution, but in Australia only one species of the order occurs, the dog known as the "dingo," Canis dingo; and it is uncertain whether this may not have been introduced by man at a remote date. The monotremes (comprising only the genera Ornithorhynchus, Echidna and Proechidna) are limited to Australia, Tasmania and New Guinea. Marsupials occur only in Australia, Tasmania, New Guinea and America. The American marsupials, with the exception of one genus, all belong to the family Didelphidae, or the opossums. Edentates occur only in America, southern Asia and Africa. They have their greatest development in South America. One genus, Tain, extends northward.
into Texas. Ungulates inhabit all continents except Australia, but two or three species enter South America. Of the two groups forming the order Primates, the lemurs and lemuroïds occur only in Madagascar, Africa and southern Asia, while monkeys inhabit only Africa, southern Asia and South and Central America. One apt, Macacus inwus, is found at Gibraltar, but it is only doubtfully indigenous.

**Fossil Mammals.**—Mammals are believed to have originated as an offshoot from certain Permian and Triassic reptiles called Theromorpha or Anomodontia. The earliest recognizable remains of mammals are certain small teeth and jaw-bones found in the Triassic formations. They belonged to forms resembling monotremes and marsupials in some characters, but are usually placed in a separate order, called Allotheria or Multituberculata. Representatives of the Allotheria continued on through the Jurassic and Cretaceous. The existing orders of mammals first appear in the Eocene, the lowest formation of the Tertiary period, being foreshadowed in the lowest beds of that period by certain generalized groups such as the Creodonita and Condylarthra. The Eocene also contains remains of several groups, or suborders, of ungulate mammals, which have no living representatives. These are the Ancypodida, Typhotheria and Toxodonida.

The later Tertiary and the Quaternary periods show a greatly increased number and diversity of forms. Many of them represent families which persisted for only a relatively short period and are now extinct; others have continued to the present. Among the oldest of existing genera are Didelphus (opossum), Sciurus (squirrel), Myoxus (dormouse), Sorex (shrew), Vesperilus and Vesperugo (bat) and Viverra (civet), which originated in the Eocene. Tapirus (tapir), Rhinoceros, Giraffa (giraffe), Elephas (elephant), Sus (pig), Taupa (mole), Erinaceus (hedgehog), Mustela (marten), Lutra (otter), Hyena, Felis (cat) and Phoca (seal), which originated in the Miocene. Classy of the Tertiary. The class Mammalia was divided by Linnaeus into three principal sections, Unguiculata, Ungulata and Mutilia. The last comprises the cetaceans, the second all the ungulates except the elephant, and the first, the remaining ungulates. This classification was replaced by Blainville, who proposed on embryological grounds to divide the class into Monodaphia, or mammals with a placenta; Didelphia, or mammals without a placenta (the marsupial) and Ornithodelphia, or the monotremes. Richard Owen combined the last two subclasses under the name of Eplactalia and gave the placental mammals the name of Placentalia. Speculation as to the origin of the class as a whole led Huxley to propose as the source a hypothetical group which he named Hypotheria, the characters assigned being the absence of milk glands and of a corpus callosum in the brain and the presence of a quadrate bone for the articulation of the mandible. Existing mammals were divided into Prototheria, comprising the monotremes, Metatheria, the marsupials, and Eutheria, the so-called placental mammals. Cope in 1889, while retaining the subclass Protatheria for the monotremes, placed the entire remainder of the class in the subclass Eutheria. Flower and Lydekker (1891) adopt Huxley's divisions, while Beddard (1902) make use of those of Cope.

**Flower and Lydekker's arrangement of families and higher groups is as follows (fossil groups printed in italics):**

**Subclass 1. Protatheria.**

**Order 1. Monotremata (Monotremes).**
- Families: Ornithorhynchide, Echidnidae.
- (Group, Multituberculata or Allotheria. Families: Plagiaulacida, Polyomastodonida, Tritylodonida)

**Subclass 2. Metatheria.**

**Order 2. Marsupialia (Marsupials).**

**Subclass 3. Eutheria.**

**Order 3. Edentata (Edentates).**
- Families: Bradyopidae, Megatheridae, Myrmecocophidae, Dasyopidae, Glyptodontidae, Manidae, Orycteropodidae.

**Order 4. Sirenia (Sea-cows).**
- Families: Manitidae, Rhyniidae, Halicoriidae, Halyphoridae, Toxodonidae.

**Order 5. Cetacea (Cetaceans).**

**Order 6. Ungulata (Hoofed mammals).**

**Suborder 3. Toxodontia.**
- Families: Toxodonidae, Typhotheria.

**Suborder 4. Condylarthra.**
- Families: Periplocoidea, Phenocondonta, Memicotheriidae.

**Suborder 5. Hyracoidea (Conies).**
- Families: Hyracidae.

**Suborder 6. Amblypoda.**
- Families: Palaebontidae, Corythodontidae, Uintatheridae.

**Suborder 7. Proboscidea (Elephants).**
- Families: Dinotheriidae, Elephasidae.
- (Group Tenthodonida) Families: Anchiptodontidae, Calamodonidae.

**Order 7. Rodentia (Rodents).**
MAMMARY GLANDS—MAMMON

MAMMARY GLANDS, the milk-glands of mammalian animals (see Bovast). They are present in all mammals, in both sexes, but in the male are usually rudimentary, their functional activity being limited to the female, who secretes in these glands the milk for nourishing her young during a natural period after birth. In all mammals they are placed outside the breast, but vary much in position and number in different groups. Zoologists give them names according to their position near the armpits (axillary), on the chest (pectoral), on the belly (ventral or abdominal), or near the groin (inguinal). They are never situated on the back. The number in an individual may be from 2 to 12 or more, and is usually even. The structure of the cow’s udder is due to the uniting of the same number of mammas as there are of teats, the number of which, when more than two, increases rapidly to that of the young produced at each birth. The mammary glands of Marsupialia (q.v.) are contained in the pouch. In monotremes—duck-bills and echidnas—the nipple is not present. (See A.M.M. Flora.)

Diseases of the Mammary Glands.—The common inflammation of the glands (mastitis) is often attended by much swelling, with fever and painful tenderness. The formation of pus is apt to result in a slowly point- ing abscess. Great care in diet and regulation of the bowels should be observed. Purgatives and fomentations may be necessary, also in many cases the placing of the arm on the affected side in a sling. Drawing off the milk and evacuating the pus may be practicable and will afford great relief. Pain in the breasts (mastodynia) may result from many causes, of which sore nipples is one of the most frequent. The nipples are also subject to cracks, ulcerations, etc., which occasion much difficulty and pain to the mother when suckling the child. Lotions of antiseptic character, as tannin, etc., have a remedial effect in such disorders, as have also collodion and lunar caustic (nitrate of silver), when applied to the sore nipple. Metallic shields are used in severe cases for protection of the affected point. Among many specific disorders to which the mammary glands are liable are cancer and galactoceele and other forms of tumor. See MILK FEVER.

MAMMEE APPLE, or SOUTH AMERICAN APRICOT, the fruit of a clusiacous tree, bearing white, showy, fragrant flowers, growing naturally in tropical America, but largely cultivated in tropical parts of the Old World. The fruit is several inches in diameter, with a double rind and a yellowish pulp like that of an apricot, which is sweet and nourishing and is eaten raw or with wine and sugar or is boiled. A spirituous liquor called Eau Créole is distilled from its flowers; and the gum exuding from the bark is used by the Central Americans for destroying chigoes in the feet. This gum-resin is similar to the “gamboge” derived from a closely related West African tree (Carissa hamburghii).

MAMMON, a term popularly held to be a mere personification of riches. It is used in...
MAMMOTH — MAMMOTH CAVE

MAMMOTH, an elephant (Elephas primigenius) which inhabited the temperate parts of the northern world during the Glacial period, and at its close spread northward with the retreat of the ice, and survived until the Neolithic period of human history. Some account of the origin and probable wanderings of the species is given in the paragraph relating to fossil elephants under ELEPHANT. Mammoth remains have been found in intimate association with the handiwork of savage man; and upon a piece of bone a portrait of this animal was found scratched, the accuracy of which shows a close acquaintance by the Cave-dwellers of France with the animal in life, and much artistic skill. This elephant, although the word "mammoth" has become an expression for hugeness, was little if any larger, on the average, than the modern Asian elephant. So much is its kind related. Its remains are abundant and enable us to reconstruct its form and features completely, especially since the remarkable discovery, first in 1799, of carcasses frozen into the icy cliffs along the Arctic coast of Siberia. One of the most important discoveries of this kind occurred in 1801. Since the earliest known times ivory from buried tusks of these animals has been obtained from northern Siberia and Alaska, and many curious stories were invented to account for its origin, especially among the Chinese, who had never seen an elephant; but the specimens above mentioned contained not only the tusks still in their sockets and every bone in its place throughout the skeleton, but a great part of the flesh was in a condition fit for sledge-dogs to eat and enjoy, and was covered with thick skin still clothed with long dark hair, beneath which was a dense woolly fur, well fitted to protect the animal against arctic cold. The ears were much smaller than those of modern elephants. This specimen of 1801, which is preserved in the Natural History Museum at St. Petersburg in the attitude in which it was found buried, measured 16 feet 4 inches from the forehead to the extremity of the tail; its height was 9 feet 4 inches, and the tusks, along the outer or greater curve, measured 9 feet 6 inches. Of the other specimens, that in the Chicago Natural History Museum is one of the largest known, and its tusks measure 9 feet 8 inches. The largest tusks on record are a pair found in Alaska which measure 124 feet in length. All mammoth tusks show an outward and upward sweep very distinct from the growth of elephant tusks. The mammoth seems to have been extremely numerous all over northern Europe, Asia, and North America, especially during post-glacial times, when northern Asia was the only part of the world to which they did not occur. These mammoths probably foraged along the coasts of the Arctic Sea, affording plentiful food in their leaves and twigs upon which these animals browsed. The disappearance of these forests, due to slow climatic changes, is supposed to be the principal influence which led to the extermination of the species, a fact otherwise not easily to be explained. It is probable that human hunting had much to do with the mammoth's final disappearance. (See also ELEPHANTS; FOSSILS.) Consult Beddard, F. E., 'Mammalia' (New York 1902); Lucas, F. A., 'Animals of the Past' (ib. 1901); Scott, W. B., 'History of Land Mammals in the Western Hemisphere' (ib. 1913); Herz, O. F., 'From Mammoth of Siberia' (Washington 1904). See MASTODON.

MAMMOTH CAVE, Ky., a remarkable American cavern, in Edmonson County, 6 miles southwest of Louisville, reached by a small branch line connecting at Glasgow junction with the Louisville and Nashville Railroad. Its areal diameter is about 10 miles, and about 100 miles of passages have been explored, including avenues, chambers, pits, domes and rivers. What is termed the Main Cave is three miles long, varying in width from 40 to 175 feet and in height from 40 to 125 feet. Its greatest enlargement is known as the Chief City (or Temple), an oval room 541 feet long, 287 feet wide and 125 feet high; anciently a rendezvous of the Indians, whose torches and other relics have been found in abundance. The Star Chamber mimics the starry heavens by reason of its lofty ceiling of black and of manganese flecked by snowy crystals of gypsum. The cavern exists in five successive tiers, through which, at various points, shafts have been cut, which are styled pits or domes. According to the map, the Bottomless Pit, Gorin's Dome, the Mammoth Dome and the Maelstrom, and their average depth is about 100 feet. Ovate depressions locally known as "sink-holes," drain through the pits and form subterranean lakes and rivers; which finally find an exit to the neighboring Green River. The largest of the Echo River, gets its name from the wonderful reverberations of sound along its course. Boats are provided for short voyages. Eel, trout and fish abound, of which there are three or four species; besides, blind crayfish, blind crickets, flies, beetles and spiders and other abnormally faunal fauna are found on the walls and under the rocks. The structure and habits of these animals have been studied with great care. The Bend River Hall, long avenues extend, many adorned by marvelous gypsum rosettes and brilliant arches of crystal efflorescence is the most fantastic diversity. Cleveland's Cabinet is frequently mentioned as a treasure-house of cave flowers, but some of the smaller flowers for innumerable specimens, that are not on view or finer displays. The great cavern is said to end at Croghan's Hall, where is the Maelstrom already mentioned, but the few who have dared go to the bottom of this profound abyss report wide and long avenues beyond, which are yet to be explored. Everywhere, even in the deepest pits, the atmosphere is both chemically and optically pure; the temperature is uniformly about 54° F. all the year around, as has been determined by a long series of exact scientific observations, with the temperature of the crust of the earth.

The discovery of the Mammoth Cave is usually credited to a hunter named Hutchins, in 1809; but the present manager of the estate finds that the county records, in 1797, fix the entrance to this cavern as a landmark for a piece of real estate. The locality first gained notoriety by reason of its immense deposits of saltpeter, which were used in the manufacture of gunpowder during the War of 1812. After passing through the hands of several owners, the cave was bought by Dr. John Croghan, who
willed it to his nephews and nieces, with instructions that at their death it should be sold at auction. An earnest wish has been expressed by many that the famous cavern should eventually become a State or national park. See also Cave; CAVE ANIMALS.

MAMMOTH HOT SPRINGS. See YELLOWSTONE NATIONAL PARK.

MAMO, a bird (Drepanis pacifica) of the Hawaiian Islands, related to the creepers, and now nearly extinct because of the great demand in past years for their yellow feathers for making the feather-cloaks formerly worn as insignia of royalty by the chiefs. Other birds supplied certain other required feathers. Very few of these cloaks remain in museums.

MAMORE, mä-mö-rä', a river of Bolivia which has its rise in the Cordillera Real, near Sucre, and flows first east by south, then south-along the semi-circle toward the north to Trinidad, from where its course is nearly north to where it unites with the Beni and forms the Madeira River. In the first part of its course it is called Rio Grande. The Mamore is about 1,300 miles in length, not including the 100 miles, with some obstructions. About 40 miles above its junction with the Beni are the Guajara Falls, above which navigation is free for about 400 miles to places where fallen logs have filled in between the banks and formed dams.

MAMPALON, an aquatic animal (Cymogale bennetti) of Borneo, of the civet family. It is otter-like in form, is about 18 inches long, has stout webbed plantigrade feet and is thoroughly adapted to an aquatic life while retaining purely viverrine characteristics of structure.

MAN. See ANTHROPOLOGY; APE; ARCHEOLOGY; ETHNOLOGY; PRIMATES.

MAN, Christian Anthropology. The thorough discussion of the theory of evolution for the past two generations has served to make it clear just what contributions to the problems of man's origin and place in the universe have been made by modern science. For a time it was felt that the whole mystery of man's existence and destiny to be solved. Science and faith that in spite of our great advance in knowledge, to use Bryce's expression the “mists that hang around man's origin and man's destiny are so far as scientific knowledge goes just as deep as ever.” Only those who fail to appreciate that science does not solve mysteries, but multiplies them, are of the opinion that biology, notwithstanding all its contributions to our knowledge of man, has furnished the key to the problems of anthropology. More now than ever those who know our modern condition of science, that for any reasonably adequate understanding of man's nature and place in the universe a reference to the records of man's religious experience must be made. The time for the synthesis of Christian and scientific views with regard to man has come to them, not with the purpose of reconciliation, for no reconciliation is needed, but for a proper understanding of the philosophy of life that lies behind both science and faith.

The enthusiastic reception which always greets a novelty in thought even in the serious domain of science led many to exaggerate the significance of the theory of evolution (q.v.) through natural selection which came to occupy so much attention in the biology of the second half of the 19th century. As a result a widespread impression prevailed that evolution had accounted so completely for all of the living beings from the lowest to the highest as they exist around us that the idea of creation and a Creator was no longer tenable. The closing words of Darwin's 'Origin of Species' makes it very clear that the great English scientist himself had not, as a result of the elaboration of the theory of natural selection as an explanation for evolution, given up his belief in creation or the Creator nor felt that his scientific work had any tendency to produce disbelief in religious traditions in this matter. He said: "There is grandeur in this view of life with its several powers having been originally breathed by the Creator into a few forms or into one; and that, while this planet has gone cycling on according to the fixed law of gravity, from so simple a beginning, forms most beautiful and most wonderful have been and are being evolved." What Darwin thus brought to be the basic thinking of scientists in the latter half of the 19th century was the theory of derivative creation, that is, creation of one or more simple forms of life to which were given the power of developing with the production of higher forms. This teaching of derivative creation is not modern in origin, but on the contrary very old. Christian philosophers from the earliest times formulated opinions clearly expressive of this view. Saint Augustine suggested that the original creation was of semina rerum, the seeds of things. These seeds once brought into existence went on developing until the universe of living things which we see around us came into existence. This teaching of Saint Augustine became the Christian tradition down the centuries. Saint Thomas Aquinas (13th century), whose writings by the special direction of the Pope are the accepted authority in the Catholic theological schools of the world today, was a close disciple of Saint Augustine in this as in most other questions. Cornelius a Lapide (1567-1637), looked up to as an authority scarcely less than Saint Augustine on religious matters, followed Augustine's teaching. When St. George Mivart not long after the publication of Darwin's 'Origin of Species' pointed out in his 'Genesis of Species' that Suarez, the great Spanish theologian, taught this doctrine of derivative creation, it made quite a sensation among those who had been inclined to think of certain narrow literal interpretations of scriptural expressions as the constant Church tradition. The sensation subsided, however, when it came to be recognized that this teaching of Suarez far from being exceptional represented the most conservative Christian opinions since the time of the Fathers. Suarez actually wrote "a separate section of his metaphysics in opposition to those who maintained the distinct creation of the various kinds or individual forms — of organic life" (Mivart). The crude anthropomorphic notion which had gained popular credence, that the Creator had as it were fashioned each of the species directly out of earthly materials, had not been accepted by earlier philosophic thinkers. So far as it came to be the belief of those who gave any attention to the subject, it was a late gloss on the scriptural account of creation
founded on the narrower views which became common only after Luther's movement made the literal interpretation of the Bible the sole rule of faith.

The knowledge of the genuine Christian tradition in the matter was needed to dispel the idea of any incompatibility between the theory of evolution in the true scientific sense of the term and creation. It is just as much creation, if but a single form of life were evoked from nothing, the great law of evolution being impressed upon it so that it gradually grew more complex until the whole series of living beings that we see around us came into existence, as if each being were created by a special act. The creation of species would under that explanation be the granting of power to any particular form of life to lift itself above what it was by inheritance from its progenitors. The special creation of man would then be the grandeur of the fact of the human being through a long series of ever-developing living beings until the organism had reached a stage of development capable of providing the mechanism suitable for a rational soul to act in the body. Only when the living matter had become suitable for co-ordinate activities with man's spirit was the rational soul breathed into the body, which by this inspiration was made like to its Creator.

The Scriptural description of Creation is summed up in the words, 'Let the earth bring forth each living creature in its kind, cattle and creeping things, and beasts of the earth according to their kind, and it was so done.'

And He said let us make man to our own image and let him have dominion over the fishes of the seas and the fowls of the air and the beasts and the whole earth and every creeping creature that moveth upon the earth.

'And God created man to His own image.'

It is the rational spirit of man that is Divine and there is no good reason to forbid the thought that God may have created the body to receive that spirit by a long succession of evolutionary steps. To many there would seem to be more reverence in that idea than if God had made all at once (Adam, in Hebrew) and then fashioned the body directly and then breathed the spirit into it. Wasmann in his 'Modern Biology and the Theory of Evolution' reminded us that the taunt that orthodox believers imagined the God of the Bible as a sort of carpet in human form fashioning for Adam a body of clay was utterly unjustified by any real knowledge of Christian tradition. Saint Augustine described any such imagination as minimus purissim cogitatio — entirely too polite a conception.

Newman called attention to the Scriptural expression in Genesis (ii, 7): 'The Lord God formed man of the dust of the ground and breathed into his nostrils the breath of life and man became a living soul.' and comments: 'There are two acts on the part of the Creator — the forming the dust, and the breathing the life. . . . Man was made rational after he was made corporeal.'

Wasmann said, quoting Saint Augustine once more, 'It would seem more fitting to believe that in producing the first man as in producing all other creatures, God employed natural causes as far as they were capable of cooperating toward this aim.' Wasmann continues, 'We must, therefore, admit that it would be possible for anyone to account for the origin of the human body by assuming God to have created a primitive cell and to say that the earliest ancestors of manisms living as simple cells; later on as the organs were differentiated and the nervous system was formed and a sensitive soul came into existence they developed into animals. The organism gradually increased in perfection and as the brain developed this soul in course of time prepared a human body suited to be the dwelling of a rational soul and, through possessing highly developed brain cells, able to satisfy the conditions of spiritual activity and its verbal expression. Assuming this theory to be true we may still say that man certainly only became man at the moment of the creation of his rational soul.' He adds that 'any objection to this theory on the score of lack of dignity in the body from the earth is met by a reminder that man's body even now is produced by germinal development from a fertilized ovum.'

The question as to whether man's body came by the slow process of evolution through the animals still remains open. It is now confessed by scientists to be quite absurd to suggest that man is descended from the monkey, and Klaatsch went so far as to say that man is not descended from the monkey because the monkey is degenerate man. The generally accepted idea is that both the monkey and man came from a remote ancestor, one branch of whose progeny continued an upward course in the direction of the human body, while the other degenerated into that of the monkey. This is, however, entirely theory. There is no evidence for it and though Zittel gives no fewer than 30 genera of fossil pro-simina and 18 genera of fossil apes not one connecting link has been found between their hypothetical and ancestral form and man of the present time.

'The whole hypothetical pedigree of man is not supported by a single fossil genus or single fossil species.' (Wasmann). The pithecanthropus erectus or so-called Trinil man of Java has all of his scientific relatives. On the other hand, the word anthropus, the name forced upon him at the beginning, for he does not belong to the pedigree of modern man, but to that of the modern apes.

A great many people in our time are of the impression that it was not until the serious discussion of the theory of evolution came up that man's intimate relations to the animals was recognized. It has been the teaching of Christian philosophers from the very beginning that man is an animal, and the question for man adopted from the Greeks by all Christian writers was that he is a rational animal. As to where his body came from Christians are manifestly free to believe — if they think there is evidence for it — that the animality of man is the result of a process of evolution by which in the course of biogenesis the human body developed through the animals and then was raised by special creation to the highest species by the introduction of a soul. Those who argue that there is no need for this special creation of man are as a rule scientists whose interests have been largely centred on man's relation to the animals rather than on his superiority to them. The zoologist, intent on the
MORPHOLOGY OF THE HUMAN BODY AND ITS INTIMATE RELATION TO ANIMAL BODIES, EASILY MINIMIZES THE EXTREMELY GREAT DIFFERENCE THAT HIS MIND CONFRONS UPON MAN. ZOOLOGISTS HAVE SUGGESTED THAT MAN MAY BE GREATER INNATE TOOL-MAKING AND TOOL USING ANIMAL.

If there was all that man really is, then there would be no need for the special creation of a soul. Man looked on as merely a higher animal is "a tool-making, tool-using animal," but as a rational animal, man is a tool-making and tool-using being, and this places an immense gap between him and the other animals. There can be no question of any process of evolution from the animal accounting for the being which produced the 'Iliad,' or the 'Divine Comedy,' or Shakespeare's 'Hamlet,' or created Hagia Sophia or Saint Peter's, or painted the Sistine Madonna. To comprehend their origin we recur to the introduction of some great new force from without. The necessity for a definite series of renewed impulses putting new powers of development into living beings becomes clearer the more biology is studied. That evolution could have occurred by a series of very slight changes for which chance might be appealed to has now been definitely given up. Such genesis of species as science has been able to trace has come by rather large jumps for which there is no sufficient cause in the conditions of preceding life. Manifestly some new force has been introduced into nature and it cannot be thought seeing the results that this occurred without design. As we shall see tool making or the place of design in the world has come back into biology with renewed force in recent years.

Many seem to think that the more careful study of the significance of natural selection in the world of life had entirely done away with any necessity for an appeal to forces outside of nature to account for evolution. Any such thought, however, is due to failure to recognize the real place of natural selection as a factor in evolution and to hand over natural processes to the influence of chance. Almost needless to say, changes is only a word used to indicate our lack of knowledge of the factors at work in any problem. Creative direction was the phrase that Lord Kelvin preferred to use as descriptive of the forces at work bringing about whatever development there is in nature. Darwin himself did not believe that natural selection did away with the necessity for creation and expressed himself to this effect in the last sentence of his book. He realized very clearly that though his book was called the 'Origin of Species' it did not discuss origins, but, on the contrary, presented only a tool making or the idea of an over-ruling Providence, and particularly of any fostering relationship on the part of a Supreme Being. In this once more as in so many other departments of evolution the Darwinians, so-called, went ever so much farther than he did, but he clearly emphasized the fact that the struggle for life did not mean any personal conflict between animals to the death, but on the contrary such reaction of vital forces to the environment in which the animal was placed has brought out all its powers and gave it a higher vitality than it would otherwise have had. As Huxley said, man is infinitely more complicated than chess and the player on the other side is hidden from us.

"We know that his plays are always fair, just and patient. To the man who plays well the highest stakes are paid with that sort of overflowing generosity with which the strong shows delight in strength." This is a much better picture of the struggle for life than many of those given by the Darwinians and even Ly Huxley himself when he was in ultra-Darwinian mood.

Biological developments have served to minimize the place of the struggle for life and to emphasize mutual aid as a factor in the process of evolution. While the idea of the struggle for life dominated biology it seemed to many as though evolution had been handed over to blind forces, largely composed of strength and the advantage which might give to the stronger animal. An exaggeration of the significance of the struggle for life against which Darwin had warned, but which was taken up by the Darwinians as representing the most important chapter in biology, made a great many people believe that the law of nature was that the stronger survived and that the weakest must go to the wall; that nature had no care for the individual, but only for the race, and that life was just a huge going spectacle of death inflicted on living things by other living beings that happened to have secured the advantage over them. Even Huxley, usually so careful, was carried away by this view and in his essay on "The Struggle for Existence in Its Bearing upon Man" suggested that "From the point of view of the moralist the animal world is about on the same level as a gladiator's show. The creatures are fairly well treated and set to fight; the strongest, the swiftest and the cunningest live to fight another day. The spectator has no need to turn his thumb down as no quarter is given."

Russian biologists, in the face of the immense difficulties for living things provided by the severe climate of their country, came to recognize early that it was not the individual of greatest strength that always survived, but that nature provided a great law of helpfulness among the animals. They called attention then to the principle of mutual aid as of probably more importance than the struggle for life as a factor in evolution and it has now come to be recognized that practically all living things have instincts of mutual aid that are extremely precious for them. The smallest living beings, the insects, frankly live community lives for mutual protection, not only against enemies but against the vicissitudes of climate and for the conservation of food. The smaller mammals often live in villages, so-called, or groups that prove distinctly helpful. Even the larger mammals possess the same precious instinct, and wild horses herd together for protection against packs of wolves which hunt together but because they are unable to use the very large animals. A drove of wild horses, when attacked by a pack of wolves, gather in a circle, heads toward the centre,
leaving a space on the inside for the foals and presenting on the outside to their enemies only a battery of heels.

Cows herd together and practically all the ungulates and among such immense beasts as the elephants protect the young by traveling in groups sometimes containing as many as 20. When attacked by one of the big cats, the lions and the tigers, which find baby elephants particularly a toothsome morsel, the old bull ele-

phants on the outside of the herd firmly fix their tusks capable of affording protection. Far from competition within the species being the law of biology, mutual aid is a deeper instinct in most cases, and very rarely does it happen that animals of the same kind struggle with each other for sustenance, except in cases of famine or when a mother under difficulties is seeking food for her young. Under these conditions the moral law does not bind among men, though the exceptions only prove the rule of the existence of law, and among animals these rather striking exceptions prove that there is a law or instinct of mutual aid by which the animals help each other very materially.

Two things are necessary for the preservation, species. One is food provision and the other is propagation of the race. Food provision under certain circumstances may necessi-
tate the struggle for existence, but the propaga-
tion of the race involving as it does the exist-
ence of small weak animals necessitates a law of mutual aid and such is actually found to exist. The overemphasis on food provision and the failure to appreciate at their true value the conditions necessary for raising the young weak animals led to an unfortunate misunder-

standing in biological science. As Prince Kro-
poklin suggests that "one came to conceive the animal world as a world of perpetual struggle among half starved individuals, thirsting for one another's blood. They made modern literature resound with the war cry of "woe to the vanquished" as if it were the last word of modern biology. They raised the "pitiless" struggle for personal advantages to the height of a biological principle which man must sub-
mit to as well, under the menace of otherwise succumbing in a world based upon mutual ex-
clusions. What was wrong with "nature red in claw and tooth" is the great principle of charity, or the dearness of fellow-beings existing all over nature. The animals help each other, many of them delight to play with each other and animal sports are common, they care above all for the young and the weaklings and for whatever of evolution has come this has been a prominent factor. The struggle for existence is incidental to life but the great law of mutual aid is a fundamental instinct in living beings, a basic anticipation of the law of charity among men which though often violated remains deep in human hearts as the impress of brotherhood.

The theory of evolution and of descent was very seriously disturbed by Weismann's in-

juction into the discussion of the principle of the non-inheritance of acquired characters. It was easy to theorize that anything acquired by an animal in its struggle for existence would make it more likely to be preserved and this would give the next generation a better chance and would be passed on in ever more favorably modified forms to succeeding generations until

a new species would result. Once it came to be acknowledged however as it had to be, that acquired characters are not transmitted, or so rarely as to be quite an exception to the order of nature, then the scaffolding would lapse, leaving some other explanation of the gradual improvement of living things to be evolved. As pointed out by Driesch the only thing that would explain the upward steps in descent is that definite heightening impulses were laid in the germ plasm without the purpose that they should improve in order of being. In this too modern science finds itself self under the necessity of recurring to a creative impulse, a creative evolution, such as was included in the explanations of the great philosophic fathers of the Church. Darwin in his 'Descent of Man' said "The birth both of the species and of the individual are equally parts of that grand sequence of events which our minds refuse to accept as the result of blind chance" (Vol. II, p. 35).

The argument from design in the world for the existence of a Creator is now actually stronger than ever in scientific minds, and a re-

view of all the purposes that exist among living things is quite impossible to believe that they were developed without a Designer. The telling arguments against ultra-Darwinism, the evidence that the struggle for existence and natural selection are not only not exclusive factors, but not even important elements in the differentiation of species, have been found in those domains of creation which exhibit the strongest proofs of design. The story of the complex instincts of many animals and particularly the insects make it very clear that the could not have come into existence by any mer-

chance, that is, purposeless succession of events and least of all by any accumulation of minimal fortuitous changes which finally modified func-
tion and organ to the extent needed for the per-
flecting of instincts as we know them. Insects would have avoided the last word of modern biology. They raised the "pitiless" struggle for personal advantages to the height of a biological principle which man must submit to as well, under the menace of otherwise succumbing in a world based upon mutual ex-
clusions. What was wrong with "nature red in claw and tooth" is the great principle of charity, or the dearness of fellow-beings existing all over nature. The animals help each other, many of them delight to play with each other and animal sports are common, they care above all for the young and the weaklings and for whatever of evolution has come this has been a prominent factor. The struggle for existence is incidental to life but the great law of mutual aid is a fundamental instinct in living beings, a basic anticipation of the law of charity among men which though often violated remains deep in human hearts as the impress of brotherhood.

The theory of evolution and of descent was very seriously disturbed by Weismann's in-

juction into the discussion of the principle of the non-inheritance of acquired characters. It was easy to theorize that anything acquired by an animal in its struggle for existence would make it more likely to be preserved and this would give the next generation a better chance and would be passed on in ever more favorably modified forms to succeeding generations until
another Architect — the Author of the plan according to which life labors.  

Regeneration is the other phase of biology which after instinct has served to make it very clear that any chance result of the struggle for life could not serve as an explanation of biological developments. Professor Thomas Hunt Morgan of Columbia University did not hesitate to say that there are "insurmountable objections to the view that the process of regeneration can have been produced by natural selection." He quotes Driesch that "we can only speak of biogenesis (of ontogeny) when we introduce the word purpose. This means that we must look upon ontogeny as a process carried out in its order and quality as though guided by an-intelligence." Teleology then has come back with redoubled force, and anyone who is not willing to stop short of our ordinary processes of reasoning in matters of science must recognize the existence of design and the constant manifestation of purpose in living things around us. 

Weismann as would be indicated by his adherence to the old Christian doctrine of Creation and of conservation in the sense not only of preservation but of the provision of such additions to energy as may be needed for developmental purposes becomes imperative. These are really successive creations beyond nature's usual store. It is true that many scientists refuse to take the logical step in this direction, but it seems clear also that their determining reason for doing so is that they cannot bring themselves to revert to the conservative position of the older time. Weismann for instance suggested that if there was no such thing as spontaneous generation scientists would have to admit creation. He confesses frankly that all the scientific evidence of the present time is distinctly against the occurrence of spontaneous generation, yet he insists that it is the duty of scientists to accept abiogenesis rather than to concede the necessity for creation. With creation as the beginning of life and this origin of "the seeds of things" with the absolute necessity for some extraordinary intervention to bring about the differentiation of man the thinker from the animals, the necessity for a creator is affirmed by science; hence the declarations to this effect made by many distinguished scientists of the 20th century. Indeed the greater the scientist the more conservative is his position in this matter as a rule. Evolution so far from contradicting Christian teaching has simply served to make clearer the process by which man's origin was brought about and his relationship to the world around him. Absolute freedom is left for further research in speculation along these lines and Catholic biologists particularly have never felt themselves hampered in the slightest degree by their faith or by the teaching of the Church in the matter.

Many students of science and particularly readers of popular science have become persuaded that the so-called biogenetic law gave absolute assurance not only of man's descent from the animals but of his origin from a single cell of being through the various forms of life up to his present physical status. The human, like other embryos, is supposed to pass through stages which indicate very clearly that it follows the law "ontogeny recapitulates phylogeny." As Koken remarked very justly, the so-called biogenetic law originated in a superficial view of facts. The more embryology has been studied the less scientists have been willing to accept it. Oscar Hertwig insists that in any statement of the law we must leave out the words "recapitulation of forms of extinct ancestors" and substitute for them "repetition of forms regularly recurring in organic development and advancing from the simple to the more complex." Almost needless to say this destroys the original significance of the law. There is scarcely any question now among biologists that human beings are descended from animals and not from plants. As we have noted in the embryonic development of man, or of any other animal, there are not because they serve to record a repetition of ancestral forms, but it is definitely taught that they are there because they are needed for the existence and development of the particular individual at that time. It happens that they resemble similar stages in other and sometimes much simpler creatures, but that does not justify the leap to the conclusion that there is any such connection between the law of causation and effect between such similar forms. About all, as pointed out by Weismann, "the resemblances between the human embryo and that of the other vertebrates are so superficial that His, W. von Bischof, Karl Vogt, and many other recent and thorough students of comparative embryology, have protested against Haeckel's views regarding these resemblances as phylogenetically significant identities." He concludes "Nothing but gross want of knowledge can excuse a man at the present day in bringing forward this argumentum ex ignorantia in support of the descent of man from beasts." The recapitulation theory has been a favorite source of arguments in education, the social sciences and other scientific modes on which the theory of evolution was thought to throw great light. On it has been made to depend many of the unfortunate applications of the evolutionary theory. Professor Kellogg suggests that the recapitulation theory of Fritz Muller and Haeckel is chiefly consigned now as a skeleton on which to hang innumerable exceptions.

Conservative Christian views with regard to the origin of man have been still more strongly confirmed by the recent immense developments of the science of archaeology and the increase of our knowledge of the story of man's existence, not from theory, but from actual remains obtained in the course of excavation. Under the influence of the theory of evolution as a background of their knowledge the last generation of the 19th century were persuaded that human beings were in process of making wonderful progress which could be traced almost from generation to generation and surely from century to century. Scientific archaeology has made it very clear that man at any time in his history when he was interested in any work was capable of doing wonderful things which stamped him as separated by a very great gap from the animal. Succeeding generations of men have often utterly failed to advance above their forebears as we see them by actual remains, but on the contrary degeneration has been at least as common a rule in history as progress. The whole question as to whether mankind has ever made any progress has come up and Flinders Petrie, acknowledged as the authority in Egyptology, does not hesitate to
say that "what strikes us most is how very little man's nature or abilities have changed in 7,000 years, for what he admired we admire; what he felt his limit is ours. ... So far as human nature and taste go man is essentially unchanged in this interval."

If man's origin was an act of creation due to the breathing of something Divine that made him like his Creator even his animal body, he might expect to find in him something like this permanency of status. This rather surprising contradiction of the ordinarily accepted idea of facile progress has been strikingly confirmed by the further advance made in archaeology in the study of the cave man. The excavations in the Dordogne and in western and southern France and northern Spain have completely contradicted the idea that man began low down in the scale of being, scarcely above the beasts, and gradually climbed up. They have shown that man was a full-fledged original man, that the very first man of whom we have any definite records many thousands of years ago was the intellectual and the spiritual brother of man as we know him now.

In the search which has traced man's gradual development from a status just above that of the beast to his present high state of civilization has been due to neglect of the real significance of human life. In the utilities man began low down in the scale and had to develop gradually the things that would help him in his physical life. The notion that this was the only side of man that could possibly have been developed in those early days and that his higher aesthetic evolution could only come much later was entirely an assumption. It led scientists to conclude that the history of man as a toolmaker and a tool-user represented the progress of humanity. What was revealed by the discoveries made in the cave dwellings was that man cultivated first the arts and gave play to his sense of beauty and only later turned to the development of the utilities. Before man was a carpenter and made himself artificial houses to live in, dwelling in the caves that he found so convenient, and before he was a tailor and fashioner of his garments, did he begin his tasks to cultivate the soil and give himself leisure between sowing and harvest, he was an artist and an artistic craftsman whose work now revealed to us commands the reverent regard of the modern world.

When it was first discovered that there were many remains indicating that a number of generations of man had dwelt in the caves of what are now France and Spain the conclusion was jumped to at once that the cave man stage of existence must represent the lowest period in which men were just a little higher than the animals. They were crafty enough to dispose the beasts from their lairs in the hillsides and cunning enough to keep them out. Scientists in their eagerness to confirm the theory of evolution went much further even in this assumption. They represented the cave man as the lowest of savages, quarrelsome, utterly selfish, with no interests except those of his body, ruthlessly ready to fight with his kind on the slightest provocation or even without provocation if he felt that he had the strength or the chance to kill without danger. A favorite theme was that he dragged his female home by violence to keep her as his own, to bear his burdens and his children, the one saving quality in the picture being his care for his children, though even this was supposed to be neither consistent nor continuous.

This was the supposedly scientific picture of the cave man that was popularized and the general public has as yet no idea apparently that the discoveries of actual remains in the cave completely contradict this theory. Three modes of art were found in the caves, the parietal art, consisting of various utensils decorated prettily, the mural or parietal art of pictures made on the walls of the caves to which more recent discoveries have added the plastic art of rock sculpture and molded clay. The engravings on bones and horns and sometimes on stone implements revealed that a real artist was at work in this olden time. He was a man who saw clearly and could reproduce with fine fidelity often by means of a very few lines what he saw. It was crude, but anticipated in many ways modern impressionistic art, the latest phase of artistic development. There must have been a good many men of the time capable of doing excellent work of this fine line for room decoration in many places and even at different horizons, which indicate intervals of generations, have been found.

What is extremely interesting is that the cave man should have tried to make beautiful even the everyday utensils that he handled and that he was willing to spend a good deal of time and care in their decoration. One suggested criterion of cultural advance among men has been that "there is no culture in the heart of a people until the very utensils in the kitchen are beautiful as well as useful." The cave man, judged by this criterion is rather in advanced than behind most of the peoples of history's higher human development. His cave home have come to recognize especially after treatment of the great majority of the human race at the present time, not alone the poor, but the rich. He tried to make his home a place of beauty for himself and his family. If we are to judge from the things that have come down to us in the history of art, that the caves have been so much more at home at home than the cave man himself.

If there had been nothing but the movable art of the caves that in itself when properly appreciated would have completely corrected the notion of the cave man as in any way near to the animal a period in which men were just a little higher than the animals. He would have been the only modern man in his interest in beautiful things. The discovery of the parietal or mural art emphasized this very strongly. The walls of the caves were found to be decorated in many places with pictures of the animals which the cave man hunted. The evolution of this art has now been traced and it manifestly began in black and white, that is, the gray wall of the limestone cave as the background for deep jet black made with a sharp piece of flint and then filled with lamp black as the outline of the picture. The surprise is to find the boldness and sureness of the drawing, the almost complete absence of corrections and the thoroughgoing confidence with which the cave artist must have made his
pictures. He knew exactly what he wanted to reproduce and there was no halting or hesitation about his execution of designs. The primitive artists have not hesitated to declare that some of this drawing must be counted among the best that has ever been done, especially when the circumstances in which it was accomplished are considered.

The cave man was not satisfied with these line drawings vivid and expressive as they are. He wanted to reproduce the colors of the animals as he saw them and succeed in doing so. At first he used only the reds and browns, but after a while also the yellows and many shades of colors. His color sense was evidently exactly like ours and he reproduced the animals as he saw them. The reason why his colors lasted so well during all these years is that they were ground in oil. This inventor of oil painting has made some of the most vivid pictures of animals that have ever been made. He pictures them in all positions, standing, lying down, in all kinds of motion and at bay. He even took advantage of certain somewhat rounded passages of his caves and to fit his pictures of animals to these surfaces in such a way as to give the impression of plastic work. His power to accommodate his painting to the cramped conditions necessary for this, show what fine command he had over his artistic powers. The men who did this work far from being close to the beasts are quite as high as the men of our time, indeed if anything on the average higher. It is not at all surprising to find that they were magnificently developed and had a much larger than the average of the men of our time.

These pictures were often made on the cave walls at such a distance from the entrance that the darkness was complete. Just what kind of light the cave man used has not been found. It was not torches, for there are no marks of smoke on the walls or ceiling. Sir Arthur Evans, who was president of the British Association for the Advancement of Science, did not hesitate to say in 1916 in his presidential address that the cave man had probably discovered some means of lighting his cave, or otherwise he would not have been able to do the painting that is actually found there. It would not be surprising if the inventor of painting in oil should have invented other inventions. He used fire in many ways and fire is, after all, one of man's greatest inventions.

The savage cave man of theory then so close to the beasts gives place when his actual remains are critically appreciated to a man the equal of any in the history of the race. An artist is at all times the flower of our civilization and evidently many of the cave men were artists. Further discoveries give indications of rather happy domestic life, his wife being pictured as rounded and fat though the cave man himself is muscular and athletic, evidently fitted for the difficult task of hunting the animals. Had his wife been the slave that she is pictured in theory she would not have been anything like the portraits that we have of her. There are manifest signs in some of the drawings of her liking for dress and already in various places there are various fashions with longer and shorter skirts and higher and lower corsages and ribbons and other adjuncts of fashion (Sir Arthur Evans). Above all the cave man carefully buried his dead with some of their weapons and utensils near them and with other evident indications of his belief that death was not the end of life, but that there was another life. He was perfectly willing to sacrifice some of the finely decorated and well-fashioned utensils that had taken a good deal of time in the making, in order that his dead ones might have near them the other favorite implements of this. In a word archeology has shown us the first man of whom we know anything definitely, as a reasoning being with a highly developed sense of beauty, with a belief in immortality, with a feeling for others, with a compelling tendency to surround himself with beautiful things as far as he could and not with that supposed tendency to occupy himself exclusively with utilities which instead of representing development always indicates a tendency at least to degeneration.

The one question that remains then is whether there is room in Biblical chronology for the record of man as worked out by science. Here once more the conservative views of the early Fathers as to the origin of the Church are not at all important in enabling us to understand what should be looked upon as the prevailing belief in these matters. The supposed incompatibility of science and faith in the matter is entirely due to a comparatively recent misunderstanding of the Scriptures. Some of the early Fathers of the Church took the days of creation literally, but the Alexandrian Fathers who faced these problems in true philosophic temper interpreted the days of creation ideally, taking the words of Genesis as a human mode of speaking so that men might understand what was expressed in terms of their previous knowledge. Such distinguished Christian philosophers as Clement, Athanasius, Cyril and Origen, as well as Saint Augustine, taught that creation was a single act. Augustine as we have seen declared that "the seeds of things" were first created and then went on developing because of the living power put into them.

The Fathers manifestly did not feel that a definite date for the creation of man was set by the account in Genesis. It was Archbishop Usher under post-Reformation influences who first calculated that the creation of Adam was 4004 B.C. Indeed the literal interpretation of the rather vague wording of Scripture with regard to many things is quite modern as a rule. As in the question of a universal deluge, which is not Biblical, more careful study of the scriptural text shows that there is no good reason for any such limitation of time as Usher suggested. There is absolute freedom to discuss the age of man on earth as far older than any such date. Rev. Father Obermaier and Abbé Breuil, to whom we owe more of our exact knowledge as to the cave man and our earliest ancestors than any others, have discussed the probable date of this dwelling in caves very fully. Obermaier thinks that 50,000 years might be necessary to include all phases of development that have thus far been unearthed. Abbé Breuil is of the opinion that 20,000 years would be quite sufficient for all that recently discovered facts as to man's development would demand. Their opinions deserve the highest consideration from students of science. The lower figure is confirmed by the conclusions of Prestwich, a well-known authority on geology, who
limits the time since the Glacial period to 25,000 years and man is surely post-glacial.

Many presume that at least modern science has obliterated the old-fashioned notion that man was the centre and the culmination of creation for whom other parts were made and to whom their activities were mainly directed. Alfred Russel Wallace, however, in his volume 'Man's Place in The Universe' has re-established that old idea on the firmest of modern scientific and evolutionary bases. Surely no one can talk with more authority in the matter than the man who with Darwin discovered the principle of natural selection. Wallace goes so far as to say 'and is it not in perfect harmony with this grandeur of design (if it be design), this vastness of scale, this marvelous process of development through all the ages, that the material universe needed to produce this cradle of organic life and of being destined to a higher and a permanent existence, should be on a corresponding scale of vastness of complexity and of beauty? During the whole process of the rise and growth and extinction of past forms the earth has been prepared for the ultimate man — much of the wealth and luxuriance of living things, the infinite variety of forms and structure, the exquisite grace and beauty in bird and insect, in foliage and flower, may have been mere by-products of the grand mechanism we call nature — the one and only method of developing humanity.'

MAN, Prehistoric Races of. Until nearly the middle of the 19th century, the dawn of human history was commonly assumed to have been coincident with the beginning of recorded history, roughly some 6,000 or 7,000 years ago. Though even in the preceding century some evidence had been adduced which indicated that a stone-using age had antedated the use of metals, it was not until 1833 that the discovery in the caves of Engis, near Liege, Belgium, of human bones mingled with those of mammoth, rhinoceros and cave-bear proved (though the proof was not universally recognized for several years) that man must have been a contemporary of these extinct creatures of the remote Diluvial epoch, or, as it is called to-day, the Glacial or Pleistocene period. Together with this discovery came out as prominent landmarks in the history of palaeoethnology. One was the finding, in 1856 of the famous Neanderthal skeleton, which demonstrated that a low type of mankind, physically very different from any modern race, had existed in western Europe in some distant prehistoric time, now known to have been earlier in the Pleistocene than the period of the Engis men. A few years later a fragment of mammoth tusk was found on which was scratched a realistic portrait depicting the hairy mammoth in the flesh, showing that considerable artistic ability had been achieved by man before the extinction of these great Pleistocene elephants, at a time antedating recorded history. Since these pioneer discoveries, evidence has accumulated greatly and we have come to regard the man who made this engraving some 15,000 or 20,000 years ago was fairly recent in comparison with the low-browsed Neanderthal, and that the latter was antedated in turn by a still more primitive and probably ancestral type, the Heidelberg man, of vastly more remote antiquity. It may be stated here that our knowledge of Pleistocene ethnography is based very largely on European material with a few exceptions to be mentioned below, but this does not imply that Europe is to be regarded as the cradle of the human family, for the consensus of competent opinion is that the earliest hominid diverged from their simian relatives in central Asia, probably in Miocene times, and that from this centre the family gradually radiated, its branches becoming geographically isolated, some dying out during the Pleistocene, and others finally becoming differentiated into the several great divisions of mankind — Australian-African, Polynesian-European and American, and their racial subgroups. See MAN.

This is not the place for a discussion of Pleistocene geology or of the much-disputed Ice Age chronologies; it must suffice to say that the duration of the Pleistocene, according to the estimates of Penck, one of the leading authorities, was between 500,000 and 1,500,000 years, and other investigators usually make it near his minimal figure. There is evidence that there were in the northern hemisphere not less than four glaciations, with three warmer interglacial periods, the beginning of the recession of the fourth and last ice sheet dating back perhaps 17,000 to 25,000 years. As to the time of the earliest appearance of actual man, the genus Homo, we are probably well within the limit of likelihood if we assign to the Heidelberg man, the oldest known type, an antiquity of 250,000 years. Contrasted with such age as this the so-called historic period of some 7,000 years seems a brief span indeed. The comparison becomes most graphic if we represent the duration of man's past by the length of a yard-stick, in which case the extent

of recorded history will be fairly measured by the terminal inch.

Any discussion of the earliest types of man must include some mention of Pithecanthropus, "the ape-man of Java," though the relation of this most famous of fossils to mankind is still dubious. In 1891-92 Dr. Eugène Dubois of Holland, while conducting geological explorations in central Java, unearthed in the dry bed of the Solo or Bengawan River, near Trinil, a fossilized skull-cap or calvaria, two molar teeth, and at a distance of some 50 feet from the skull-cap a thighbone, all clearly of primate character and presumably from a single individual. The thighbone was more man-like than that of any ape, its conformation indicated erect gait and its size a creature some five feet six inches tall. The cranium had an extremely narrow, low and retreating forehead with a prominent transverse ridge above the orbits and a capacity of 850 to 900 cubic centimeters, or about midway between the lowest normal human and the gorilla, it is perhaps best to regard his race as the minimal human measure.

In 1894 Dubois published a careful study of these remains to which he assigned the name Pithecanthropus erectus (erect-standing ape-man), and which he hailed as the long-hoped-for missing link between ape and man. The exceptional importance of the fossil was generally recognized at once, but authorities have never unanimously agreed with Dubois' view concerning its intermediate position. A considerable number of anthropologists place it within the human family, and the literature contains many references to Trinil Man. Elliott Smith, following Dubois, believes that certain brain-impressions in the skull suggest the power of articulate speech. On the other hand, some able anatomists incline to regard the creature as more closely allied to the apes, and it has even been considered a giant gibbon. In view of the incompleteness of the remains and the slightly uncertain association of the femur with the skull, it is perhaps best to regard this species tentatively, simply as an extinct primate of erect gait, much higher as to brain volume and presumably as to intelligence than any known ape; hence a sort of "super-ape," but much lower in mentality than the early Homo. Thus it is quite possible that the assumption that it is necessarily a direct ancestor of Homo is unwarranted, for it may equally well belong to a collateral branch of the hominid family which became extinct,—"an uncle instead of a grandfather of man"—but it must be admitted that Pithécanthropus admirably fills the specifications for a "missing link." Unfortunately, its geological age is somewhat uncertain; it is either late Pliocene or early Pleistocene. Osborn tentatively estimates its antiquity at 500,000 years. (Figures 1 and 1A.)

The earliest remains which are unquestionably human consist of a remarkable lower jaw found in 1907 in the Mauer sands, ancient river deposits near Heidelberg, Germany. Proof of the vast antiquity of the specimen is afforded by the fact that it is about 35 feet from the river. Two other strata contain nearly 30 feet in thickness, and by the associated mammalian fossils, including species of elephant, rhinoceros, etc., which had previously been assigned to the second (some by the same) warm interglacial epoch. This human relic is not only vastly ancient, but more primitive, in some respects more ape-like, than any other indubitable human remains. The jaw is exceedingly massive and large and entirely lacks the chin projection of modern races, which gives it a remarkably ape-like appearance (Fig. 5), but the teeth and the form of the dental arch prove it to be quite human. Professor Schoetensack, who described the fossil, makes it the type of a new species, Homo heidelbergensis, the Heidelberg man. It resembles the Neanderthal type somewhat and may be ancestral to it. No cultural remains were found associated with the jaw and opinion is divided as to whether this type had attained even the level of culture represented by the earlier Palaeolithic flints, though some anthropologists place the "eoliths" still earlier. As the second interglacial period is believed to have extended over some 150,000 years and to have merged into the third glacial some 150,000 or 200,000 years ago, it seems not unlikely that Heidelberg man may have flourished some 200,000 or 250,000 years ago and for aught we know to the red man of the present day. Indeed, on the ancient river-bank to which the remains of Neanderthal man was probably vastly longer than that between Neanderthal times and our own day. Nevertheless it must be understood that estimates of Pleistocene chronology vary greatly and are all highly conjectural.

Perhaps the greatest event in the history of anthropology was the discovery, in a limestone cave in the Neanderthal, a small gorge near Dusseldorf, Germany, in 1856, of the fragmentary skeleton of a man apparently contemporaneous, like the men of Engis, with the well-known mammoth and woolly rhinoceros, the bones of which were found later in similar caves nearby. Examination of the human bones revealed surprising differences from modern Europeans or indeed any rather close relationship to the Engis man. This was especially striking in the calvaria or skull-cap, which was marked by an excessively low crown and heavy supra-orbital ridges extending the entire width of the forehead. This skull, described by the Englishman Huxley, spoke of it as "the most pithecid (ape-like) of known human skulls," and in 1864 King ventured to make it the type of a new species of man, Homo neanderthalensis. The names H. primigenius and H. moensteriensis have since been applied to this race of living man, or even German and French writers. Since this pioneer discovery numerous remains of the species have come to light and Neanderthal man is known to have ranged from the lower Rhine region to southern Spain and eastward at least to Austria. A nearly complete skull was found at Gibraltar in 1848, thus antedating the Neanderthal discovery by eight years, but it was inadequately described and its significance remained unrecognized for half a century. The two skulls from Spy, Belgium, found in 1887, a large number of bones and teeth found in 1899 and later at Kratina, Austria, two nearly complete skeletons in France, namely, the old Man of La Chapelle-aux-Saintes (Fig. 2), and a youth from Le Moustier, Dordogne, both discovered in 1908, and three
still more recent discoveries of partial skeletons, not to mention numerous jaws and teeth. The Neanderthal custom of burial in caves is largely responsible for the preservation of some of the finest of these remains. They have been found associated with various culture levels of the Paleolithic or Old Stone Age, but chiefly identified with the flaked flints of the Mousterian industry. It seems highly probable that a species so widely distributed endured throughout a long period, possibly the greater part of the third interglacial and the fourth glacial, upwards of 100,000 years in all, and there is some reason based on differences of cranial form to suspect that the type became split up into sub-species or races. The skeletal anatomy is now well known, and much can be inferred with certainty regarding the muscles and other soft parts. They were a people of rather small stature, the men five feet three or five inches tall, of extremely robust build, with large bones, and heavily muscled. Hands and feet were large, the thighs somewhat curved forward and the knees always slightly bent. The forearm and leg are remarkably short in proportion to arm and thigh. The skull was characterized by its large size, especially greater length, the low-crowned but capacious cranium marked by a projecting transverse ridge above the eyes. The orbits were cavernous, and the eyes probably deeply set, the nose very wide but prominent, not flat as in negroes. The face was of grey length with some prognathism, though the anterior teeth were nearly vertical. The cheeks sloped backward obliquely from the nose, quite unlike any modern race, and there was the merest suggestion of a chin (Fig. 2A). This huge head was supported on a very short neck, directed somewhat forward. Altogether the appearance of the Neanderthal was such as to suggest the adjective "bestival" and admirably fulfills the popular conception of a brutal, low-browed cave man. Regarding such superficial features as complexion and hair, of course nothing is known. A few ethnologists regard the Neanderthals as a degenerate type. As to culture, we know that he flaked the flint implements of the Mousterian phase (probably also the still earlier Acheulean and Chellean), of which our own species is said to be a derivative, and the characteristic form is the "coup de poing" or fist-hatchet, and others are obviously for cutting up game, scraping skins, etc. The charred bones found about the rock-shelters of the limestone cliffs show that he possessed the art of making fire and that he roasted the flesh of the wild horse, wild ox and reindeer. Several of the skeletons had been carefully buried, together with stone implements and parts of game animals, a practice usually considered to indicate some idea of posthumous existence. As to the origin of the Neanderthals, it has usually been supposed that they migrated into Europe from Asia, but the recent discovery of the earlier and more primitive but somewhat similar Heidelberg man, suggests that the Neanderthals may have evolved in Europe. Before the end of the fourth and last glacial phase, the species seems to have become extinct, and to have been replaced rather suddenly by at least two races of Homo sapiens, early representatives of our own species, but the relation of the Neanderthal to these higher types, and whether or not he has any share in the ancestry of modern Europeans, is still questionable. The weight of opinion seems to favor the view that he was exterminated by higher immigrant races, but in such cases there is crossing and no less an authority than Hrdlicka believes that slight traces of Neanderthal blood are still discernible in certain regions of Europe.

Among the successors of Neanderthal man, and possibly contemporaneous with him during the later centuries of his epoch, was the highly developed race first known from several skeletons discovered in 1868 in a grotto at Cro-Magnon, near Les Eyzies, Dordogne, and named from the site of discovery of this stock the Cro-Magnon race. The half century since has witnessed a considerable accumulation of data relative to the physical features, distribution and culture of this people. In many characters the Cro-Magnon men closely approximate certain modern types. The head form is dolichocephalic, with vertical forehead, prominent narrow nose and strong chin (Figs. 3 and 3A). The orbits are low and elongate transversely; the cheek-bones very wide in proportion to cranial size. The characters of this race are of great height, over six feet, and, apparently of the same race, are much shorter, and the women seem to have been much smaller than the men. In general this race had well-formed heads and fine physiques. Plainly, the Cro-Magnons are of our own species, Homo sapiens, and their likeness to certain modern types in southwestern Europe suggests that a strong strain of the blood of this ancient race still exists. Verneau has also adduced evidence for the belief that the Guanches, the aborigines of the Canary Islands, were of this stock, or two recent writers have asserted that the Cro-Magnons show negroid affinities, but except for the relative proportions of the limb bones, the evidence is all opposed to this view. The range of the race was so sudden and is so different physically from the Neanderthal as to preclude descent from the latter; hence it is generally believed to have migrated from Asia. In early postglacial time the Cro-Magnons attained a wide distribution in western Europe, from the Mediterranean to Britain, and thus one of the earliest of our own species, but primitive predecessors. In a number of localities remains have been found associated with rich cultural data, and the race is identified with those late phases of the Old Stone Age known as Aurignacian, Solutrian and Magdalenian. Beginning with a great variety of flint implements, knives, spear-heads, chisels, borers, scrapers, etc., of delicate workmanship, and tools of bone and antler such as needles, spear-throws and harpoons, as well as incised car-

ings on reindeer-antler and stone depicting the great mammals which still survived - the mammoth, woolly rhinoceros, wild horse, reindeer, lion and others. The Cro-Magnons were a race of troglodytes, more truly cave men than were the Neanderthals, and to this race belonged the mural artists whose brilliant polychrome paintings of contemporary animals still adorn the walls and roofs of caverns in southern France and northern Spain. Ceremonial burial of the dead was practiced and some of the burials show that ornaments were worn. Clothing, doubtless of skins, is in-
dicated by the bone needles. On the whole, these people had attained a considerable degree of culture, whether or not they had practised agriculture, or kept herds, or that they had achieved the domestic arts of pottery or weaving. They were a race of hunters, apparently with more or less fixed abodes and some organized social structure. Geological evidence indicates that the early postglacial period, during which the Crô-Magnons flourished, was some 10,000 to 20,000 years ago. It seems improbable that this race was exterminated; it is more likely that it became intermingled with other immigrant stocks, progenitors of Neolithic men, and there are indications that a Crô-Magnon strain still persists in the population of certain localities in France.

A considerable number of skeletal remains of late Pleistocene Age have come to light in Europe, some of which are doubtfully to be assigned to the Crô-Magnon race (e.g., those of Engis and Combe-Capelle) while others, notably the Brûnn and Galley Hill crania, seem to belong to a different physical type, but clearly in the stage of the late postglacial period (Fig. 7). The latter was made in one of the caves in southern France which had previously yielded several Crô-Magnon skeletons. This was the disinterment, from a slightly lower level of two skeletons, a woman and a youth, which strikingly resemble certain negroid types, especially the South African Bushmen. The name Grimaldi race has been given to these ancient negroids, but it is impossible, as yet, to account for the origin of the race except to say that they were early postglacial immigrants. It is significant that several small sculptured statuettes from France, and one from Austria, appear to represent female negroid types in whom certain physical features are exaggerated in Bushmen women. Presumably these are the handiwork of the Grimaldi negroid race. These discoveries are important as demonstrating the early differentiation of a negroid stock, and they suggest interesting questions as to its prehistoric migrations.

The "Pitmeddown skull" found in Sussex, England, in 1911-12, has perhaps evoked more vigorous discussion and more divergence of opinion than any similar discovery. The bones were found in a shallow gravel-bed, are unquestionably human, and show a cultural level scarcely higher than that of the Neanderthals. Their closely segregation from other races is generally admitted, but this was the only Australian discovery of great antiquity is a cranium, the Talga skull, found in a Pleistocene formation in Queensland, and described in the Transvaal, by Arthur Smith. This skull, though badly crushed, shows the essential features of the most distinctive Australian type, but is remarkably primitive, almost ape-like, in the rectangular form of the palate, and the enlarged canine teeth; just such a skull as one might posit as a Pleistocene progenitor of the Australian race. This discovery is highly significant as proving the early human invasion of the continent, and the differentiation at a time so remote of the Australoid type.

Though actual remains of Pleistocene man in the western hemisphere are extremely rare, and the antiquity of most of these somewhat questionable, there are excellent reasons for believing that a branch of the negroid species had become established in America before the last glacial, an offshoot from the same eastern Asian division which gave rise to the Mongoloid peoples. These first American immigrants probably entered the continent in the region of Alaska, when that part of the world
enjoyed a more genial climate than was later the case and spread eastward and southward, finally extending to the southern extremity of South America. This view, however, is not universally held, and some competent ethnologists maintain that the migration of the Eskimo has been westward from Greenland. The idea of American to Mongolid peoples is generally admitted, as is also the racial unity of all the Americans from the Eskimo to the Fuegians. Prehistoric remains, both skeletal and cultural, are of course extremely abundant, but all of the former, including even those believed to be Pleistocene, exhibit the essential characters of the American Indian type. Among the more important discoveries of possible pre-glacial (i.e., before the last ice advance) or glacial age are several fragmentary skeletons from the Trenton gravels of New Jersey, and some bones of two large mammals found at Vero Fl., in 1913-15. A skeleton discovered in the famous asphalt pits of Rancho La Brea near Los Angeles, Cal., in 1914, and at first hailed as a Pleistocene man, is not different from the modern type, and is almost certainly post-glacial. Various discordant remains described by Ameghino as Tertiary (Miocene and Pliocene) prehuman remains, to which he assigned the generic names of *Tetrapsathomos* and *Diprothomo*, have been entirely discredited. It may be held in general that the essential Indian character of the prehistoric remains found in America, and the likeliness of this type to the Asian Mongols, indicate that the first American immigrants were already highly developed, and very similar physically to the Indians of to-day.

In this brief review of the ethnology of earliest man, the reader must have observed that the somatic evidence is extremely meagre, except in the cases of the Neanderthal and Cro-Magnon types. In several cases a race or even a sub-race is based on a few bones from a single individual, but it must be understood that a few skeletal fragments, especially of the skull, may convey a great amount of information to the skilled anatomist, also that the location, associated animal remains and cultural evidences all aid largely in solving the riddles of mankind's remote past. It has not been possible to make more than a hasty survey of the physical characters of the earliest types of the human family. The late Palaeolithic migrants into Europe,—the long-headed Nordic (northern) and Mediterranean (southern) races, and the broad-headed Alpine race, of great importance as the chief stocks from which the present peoples of Europe have descended, must perforce be omitted. For the consideration of the cultures of the Palaeolithic, as well as of the Neolithic and Bronze Age, see *ARCHAEOLOGY*. Bibliography.—Of general works the following may be especially recommended: Sol- las, W. J., 'Ancient Hunters' (2d ed., London 1915); Osborn, H. F., 'Men of the Old Stone Age' (2d ed., New York 1918); Kibb., A., 'Ancient Types of Man' (New York 1911); Hrdlička, A., 'The Most Ancient Skeletal Remains of Man' (*Smithsonian Report* for 1913, 2d ed., Washington 1916). On prehistoric man in American consult two critical surveys by Hrdlička, A.: 'Early Man in South America' (Bul. 52, Bureau of American Ethnology, 1912), and 'Recent Discoveries attributed to Early Man in America' (Bul. 66, 1918). Extensive monographs have been published on most of the important discoveries, somatic and cultural, references to which will be found in the general works named above.

JAMES H. MCGROR. Professor of Zoology, Columbia University.  

MAN WITHOUT A COUNTRY. The Few, if any, short stories written with a purpose have achieved that purpose so completely as did "The Man Without a Country," by Edward Everett Hale. Written during the Civil War, it did much to inculcate patriotism at a critical period in the fortunes of the Union. The story centres about Philip Nolan, a lieutenant in the army of the United States, who came under the influence of Aaron Burr, foreshowed his country, and as a punishment was condemned never again to hear its name. To effect this, he is kept prisoner all through his long life, first on one ship, then on another, until at last he dies during the Civil War. Though the idea of life-long imprisonment on shipboard is in itself novel and striking, and the novel sets in Argentina emphasizes the attention to detail, the chief interest of the story lies in the development of the character of the hero, who, from hating his country, grows through suffering to love her with passionate devotion. All this is told so convincingly, with such a mingling of fact and fancy and with such a wealth of contemporary allusions, that thousands of readers believed it to be an account of fact. The germ of the plot was suggested to the author through the reading of Scott's "Life of Napoleon." It occurred to him that if Napoleon had been passed from ship to ship instead of being confined on Saint Helena, England would have been spared much calamity and the French would not have turned Saint Helena into a shrine. The "local color," which adds so much to the story, was gained from reading the records of the navy and the proceedings in the trial of Aaron Burr. Immediately upon its publication in the *Atlantic Monthly* of December 1863, "The Man Without a Country" became famous, was copied everywhere and was soon translated into foreign languages. It remains one of the most famous of American short stories, and among all the author's voluminous publications, it is the one most likely to retain its place in literature.

MARION TUCKER.  

MAN-OF-THE-EARTH, a local name in the Southern States for the wild potato-vine (*Ipomoea ponderosa*). See *IPOMOEA*; *MORNING-GLORY*.  

MAN-EATER, a term applied to any fierce animal which has acquired, or is believed to have acquired, a habit of killing human beings as food. Lions, tigers, leopards and other great cats are accused of it, and undoubtedly a man or woman among East Indian or African villagers may be a 'man-eater' in a flimsy hut, make their lairs near settlements and for a time regularly subsist upon human victims. Such are sometimes, but not always, old cattle-thieves, whose teeth are worn, and which feel unable or unwilling to undertake the execution of tracker and pulling down wild animals; but this is not always the case. When
such a beast has taken his residence in a district no pains must be spared to kill him, for he will not cease his depredations. Horses, elephants, camels, etc., sometimes become man-eaters in effect, understanding and exercising their power over him for harm.

A man-eater shark is the great white or blue shark (Carcharodon carcharias), which is one of the largest and most formidable of fishes. See SHARKS.

MAN IN THE IRON MASK, The. See IRON MASK, THE MAN WITH THE.

MAN AND NATURE, a work of great research written in 1864 by George Perkins Marsh (q.v.). Its full title was Man and Nature, or Physical Geography as Modified by Human Action. The work became at once a standard with international recognition; a considerably enlarged Italian edition was issued at Florence in 1870; and a second American edition, with further changes, appeared in 1874.

MAN AND SUPERMAN. In his sub-title Bernard Shaw announced this work as *A Comedy and a Philosophy*. He might, with equal pertinence, have added *A Sermon on the Dangers of Romanticism and a Treatise on Biology, Anthropology and Social Psychology.* It is all these and it is none of the less, a successful play which has been greeted with almost continuous explosions of delighted merriment by theatre audiences on both sides of the Atlantic and has entertained still larger audiences in its printed form. The accepted canons of dramatic criticism break down before the audacious genius of a Bernard Shaw; as his American biographer, Archibald Henderson, says, "He violates all the rules yet turns the trick."

That *Man and Superman* is a thesis play goes without saying. The difficulty is that there are so many theses, so brilliantly, keenly and paradoxically expounded, that one leaves the play-house, or lays down the book, in a state of high mental exhilaration tempered with an irritating sense of mental confusion. The play is, however, easily distinguishable; it is the contention, presented also in several other of Shaw's plays (notably *The Philanderer*, *You Never Can Tell* and *Missalliance*), that in the perennial love chase it is the driven by the Life Force, who is the pursuer and man, the quarry. This contention is made to seem more arrestingly unorthodox by associating it with the Don Juan story. In the preface, addressed to the well-known English critic, Mr. A. B. Walkley (who figures in the prologue to *Pannie's First Play* as *Trotter*), Shaw says, "You once asked me why I did not write a Don Juan play . . . The day of reckoning has arrived: here is the play."

The modern Don Juan, as represented by the hero, John Tanner, is a personification of the most virile and honest of social revolutionist, irreplaceable in his private conduct, but implacable in his revolt against false and outworn conventions, determined to save himself from the bondage of love and marriage, but such play is for the individual exorable demands of the Life Force as exemplified by Ann Whitefield. The half dozen other characters are sharply drawn: Octavius, the lover for love's sake; his sister, Violet, who conducts her love affairs on business principles; Hector Malone, the straightforward young American who sees only black and white; his millionaire father, hard-headed and soft-hearted; Roe-buck Ramsden, orthodox Philistine; Mrs. Whitefield, the helpless and bewildered mother, and, best of all, "Enry Straker, chauvinist and "New Man." The dialogue is Shaw at his best and there are no long monologues as the strictly philosophical discussion of the theme is segregated in the third act. Shaw himself says—again in the preface—"I have . . . thrust into my perfectly modern three-act play a totally extraneous act in which my hero, enchanted by the air of the Sierra, has a dream in which his Mozaritan ancestor appears and philosophizes at great length in a Shavio-Socratic dialogue with the lady, the statue and the devil."

By many critics *Man and Superman* is regarded as Shaw's most important play since it combines some of his most cherished philosophical and social theories with the elements of popular success. It has been customary to identify Shaw himself with the character and opinions of Tanner, and Granville Barker, who played the part in the original production, was actually made to resemble Shaw who, however, asserts that he had a certain popular Socialist orator in mind as Tanner's prototype. The play was first produced in May 1905, under the direction of Vedrenne and Barker, at the Court Theatre, London, where so many other Shaw plays have been introduced to the public. Its first American production was in September of the same year at the Hudson Theatre in New York with Robert Lorraine as director and also playing the part of Tanner. In the acting version the Don Juan interlude is always omitted but it has been given separately at the Court Theatre in London. For critical reference see bibliography given in article on CANDIDA; also Dickinson, Thomas H., *The Contemporary Drama of England*.

MAN-OF-WAR, an armed naval vessel regularly employed in the service of a government for war purposes.

MAN-OF-WAR HAWK, or FRIGATE-BIRD, a tropical web-footed bird (Fregata aquila), of the family Pelecanidae. The color of the adult bird is shining black, glossed with green, the female being duller in hue. Including the long tail the male bird reaches three feet in length, but the body is extremely small. The bill is longer than the head, strong, hooked at the point and sharp. In proportion to their size their wings are longer than in any other bird and have an extent of seven feet or more. Their flight is so powerful that they are seen more than a thousand miles from shore. They move with great difficulty on land, and rarely alight on the water. Possessing great strength and superior power of wing, the frigate-bird pursues terns or gulls which have secured a fish, and by beating them with wings and beck forces them to drop or disgorge it; then seizes the prey before it reaches the water. It also catches flying-fish for food. The usual place for breeding is the summit of some rocky cliff, but breeds among trees where there are no rocky shores, making a rough platform of sticks. There is only one chalky white egg. This species is found throughout the tropics.
and a second species (F. minor) ranges about the Indian and South Pacific oceans.

MAN-YSHU, mán-yó-shóo', or MANY-OUSHU (Japanese, COLLECTION OF ONE THOUSAND PAGES), Japanese anthology, the most ancient in the language. It is believed to have been completed early in the 9th century; it comprises about 4,000 poems which form a valuable index to the history, customs and literary attainments of the time. Among its hundreds of authors, the most able are Hitomito and Akahito. The poems form a record of about 130 years, covering the latter part of the 7th and the early part of the 8th centuries.

MANACLE ROCKS, England, a dangerous reef on the south coast of Cornwall, not far from Lizard Head and seven and one-half miles from the town of Falmouth. They are barely visible, except at low water, and there is no warning of their presence to the mariner except a bell buoy. Many wrecks have occurred here.

MANAGER, City. See City Manager, Plan of Government.

MANAGUA, má-ná-gwá, Nicaragua, (1) the capital of the state, near the southwest shore of Lake Managua, 32 miles south-southwest of León, consists of long rows of huts, and a large square lined with houses of two stories. The centre of the square is occupied by a large church, and there is another large church with a conspicuous white arched portal. The inhabitants, chiefly Indians, are industrious. A railway connects Managua with Corinto on the Pacific. Pop. about 30,000; (2) the lake, about 38 miles long, discharges itself into that of Nicaragua, above which it has an elevation of 16 feet, while its elevation above the Pacific is 156 feet. It has attracted a good deal of attention in connection with a proposed navigable communication between the Atlantic and Pacific.

MANAKINS, a rather undefined group of South American tropical birds, mostly of the family Pipridae, related to the North American tyrant-flycatchers. They are small, brightly colored (but the females are usually much plainer than the males), and the wings often bear curiously modified and often highly ornamental feathers. They are of terrestrial habits, staying up or near the ground in wooded places, clinging to herbs and twigs of bushes like chickadees, and subsisting upon insects largely caught on the wing. Some of the species, called "dansadors" in Brazil, gather in little parties in the breeding season, and go through queer active motions, called dancing. Consult Evans, "Birds" (1900).

MANAOAG, má-ná-wág, Philippines, a pueblo of the province of Pangasinán, Luzon, situated on the Malabolo River, 18 miles east of Lingayén, an important road centre. Pop. 16,700.

MANAOS, mā-ná’oos, Brazil, city and capital of the state of Amazonas, on the Rio Negro, 12 miles above its confluence with the Amazon. A whitewashed cathedral rises in the centre of the town, which also has a custom-house, a small fort and a military barracks and hospital. The city is a steamboat station, and has a considerable trade in various forest products, but principally in india-rubber. Pop. about 20,000.

MANAR, má-nár, or MANAAR, Gulf of, southern India, an ocean inlet between Ceylon and the Madras coast with an extreme width of 150 miles. It is almost closed at Palk Strait on the north by Adam's Bridge, a low reef of rocks and islands. The gulf has celebrated pearl fisheries.

MANASAROWAR, má-nā-sā-rō’wār, Tibet, a sacred lake and pilgrimage resort north of the main Himalayan range, near Darchan, between the sources of the Brahmaputra and the Indus. It is almost circular in form, about 15 miles in diameter. Another lake in the same locality is the source of the Indus.

MANASSAS, má-nā’sas, Va., town and county-seat in Prince William County, near a creek named Bull Run, on the Chesapeake and Ohio and the Southern railroads. It is about 35 miles southwest of Washington. Eastern College and the Manassas Industrial School are located here. The electric-lighting plant, sewage system and water-supply system are the property of the municipality. Twice during the Civil War Manassas was the scene of engagements. Pop. 1,217. See Bull Run, Battle of.

MANASAS, First and Second Battles of. See Bull Run.

MANASSAS GAP, Engagement of. General Lee, in retreat from Gettysburg, crossed the Potomac at Williamsport, into the Shenandoah Valley, and 15 July 1863 marched to Bunker Hill, and occupied the gaps of the Blue Ridge. On 19 July he marched Longstreet up to march next morning to Culpeper Court House, by way of Front Royal and Chester Gap. General Meade crossed the Potomac at Harper's Ferry and Berlin, on the 17th and 18th, and moved up the Loudoun Valley along the eastern side of the Blue Ridge; and on the 21st Merritt's brigade of Buford's cavalry division, pushing well up into Manassas Gap, skirmished with the 17th Virginia Infantry, and took 20 prisoners, from whom it was ascertained that Lee was moving up the valley with the evident intention of passing to the east of the Blue Ridge. Meade ordered the Third, Fifth and Second corps to march upon Manassas Gap, directing General French, commanding the Third corps, then guarding Ashby's Gap, to hasten to Buford's support. Before dark of the 22d French reached Piedmont, and Birney's division was pushed forward to Buford's aid followed by the remainder of the corps, and at daylight of the 23d entered the Gap and relieved Merritt's cavalry, which moved up to Chester's Gap. Meanwhile, at dawn of the 23d Hood's division of Longstreet's corps had marched from Front Royal and, relieving the 17th Virginia, was deployed in the Gap where it was relieved during the morning by Wright's brigade of about 600 men of R. H. Anderson's division, under orders to hold the Gap until relieved by Ewell, then marching from Winchester. Wright's brigade was deployed at the west end of the Gap, and Rodes' division, with two batteries of artillery, coming to its support, drew up about 600 yards in rear, and sent 250 sharpshooters to take position on its left. These dispositions were completed about 2 P.M. Meanwhile Birney's division had advanced, steadily driving in the Confederate outposts and from Wapping Heights beyond which
MANASSEH was Wright’s line. About 4 P.M. Spinola’s Excelsior brigade and two regiments of Ward's went forward at a charge and, sweeping past Wapping Heights, engaged Wright’s men in a close and severe fight, driving them back upon Rodgers, who stood firm, the artillery checking the Union advance about dark, Rodgers’ line not being engaged, and losing but 15 killed and wounded. Wright’s loss was 19 killed, 83 wounded and 66 missing. French’s loss was 21 killed and 84 wounded. Ewell fell back to Front Royal during the night. Next morning the Union advance marched to Front Royal, but all of Lee’s army had passed and, marching swiftly through Chester and Thornton’s gaps it took position on the south side of the Rapidan.

MANASSEH, the older but less important of the two sons of Joseph, whose name is derived from the word "to forget," and explained as signifying "he who causes one to forget." He was the son of Jacob, Gen. xii, 31. Although in Jacob’s blessings, he was secondary to his younger brother, Ephraim (Gen. xlvi, 14), he was to be protected by the Redeemer and to become a great people (Gen. xlvi, 16, 19). As the next verse reads, "in thee shall Israel bless, saying God make thee as Ephraim and Manasseh," the phrase forms the benediction which Jewish parents utter over their sons on the eves of Sabbaths and holidays. The name is held by one of the tribes of Israel, to which was allotted a position in the land of Canaan. It was the sixth in numerical strength (Num. xxvi, 34). During the journey through the desert of Sinai, its station was with Ephraim and Benjamin west of the Tabernacle, and it took a prominent part in the battle and later Israel’s strongest chiefs, Gideon and Jephthah, belonged to Manasseh. Its territory was situated on both sides of the Jordan. With the centuries, the tribe fell behind Ephraim in power and prominence, and like Reuben and Gad it carried assimilation so far that the name died out, and the idiosyncrasies of the people among whom it lived.

MANASSEH, king of Judah, Hezekiah’s successor, boy of 12 on his father’s death (2 Kings xxi, 1), and reigning 53 years. In the inscriptions of Assyria, he is mentioned as a vassal king during the reigns of Esarhaddon and Assurbanipal, who were aggressive monarchs, plundered Egypt and Phoenicia as well. Further light is thrown on the calamitous rule of Manasseh by the statement (2 Chron. xxxiii, 11) that the Assyrian captains took him in chains to Babylon, as punishment for Judah’s disloyalty to God. On his repentance, however, he regained his throne and showed a genuine religious spirit which gave a new character to his nation. Ezekiel in a memorable chapter (viii) describes the spread of religion during Manasseh’s reign and how the popular worship was a shameless blend of foreign idolatries, the influence of which was not quickly overcome, and against which the prophets declared at the peril of their lives. A prayer in Mic. 6:6 is attributed to Manasseh, which is edifying in Babylon, Mic. 7:19, 20, but never recognized as canonical by the Church. Jewish tradition makes no reference to it. Late critics claim that the prayer was originally in Hebrew.

MANASSEH, son of Johanan, the high priest and brother of Jaddua, and who married Sanballat’s daughter. In Nehemiah (xii, 28) he is referred to without name, and he is further declared as having begun the priesthood on account of being Sanballat’s son-in-law. In Josephus (Antiq. xi, 8, 2-4), a fuller account is given. Incensed at Manassah’s marriage with a foreign woman, his brother Jaddua, the high priest, placed before him the alternative of divorcing his wife or giving up the priesthood. When he went to Sanballat and frankly declared his preference for the priesthood, despite his love for his wife, his father-in-law assured him if he would retain his wife that the king would give him the rank of high priest. Sanballat added that when he built with the king’s approval a temple on Mount Gerizim, Manasseh should be its high priest. Hence he remained with his father-in-law, and became high priest in the Samaritan temple on Gerizim.

MANASSEH ben ISRAEL, Hebrew scholar; b. La Rochelle, 1604; d. Middleburg, Netherlands, 26 Nov. 1657. His parents had resided at Lisbon but persecution rendered it prudent for them to remove to the north, and after a comparatively brief sojourn at La Rochelle, the family settled in Amsterdam, where the subject of this sketch was educated. In 1620 he became rabbi of the Messiah Synagogue in Amsterdam, and soon became a noted preacher. He started the first Hebrew press in Holland in 1627, published a prayer-book, a Hebrew grammar and an edition of the Mishnah. In 1632 appeared the first volume of his great work, "El Conciliador," a commentary and discussion of the discordant passages of the Old Testament. This work, written in Spanish, brought Manasseh great fame among the learned of his time and he maintained a correspondence with Grotius, Baruates and others. He sought the readmission of Jews to England but although favored by Cromwell his project did not receive the approval of Parliament. Other works from his pen are "Hope of Israel" (1650); "Pedro Glorioso" (1655); "Vindiciae Judaeorum" (London 1656); "De la fragilidad humana"; "Thesoro dos Dirim," etc.

MANATEE, an aquatic mammal or "sea-cow" of the order Sirenia (q.v., for general structure), several species of which inhabit the fresh waters along the eastern coasts of tropical America and of western Africa. The body is somewhat seal-like in shape, reaches a length of 8 or 10 feet, has a large round head with bristly, tumid lips, no apparent neck, no external ears, the forelimbs converted into paddles, no hind limbs, and the tail square-shaped, like that of a beaver. The thick wrinkled skin is blackish, and almost hairless, but a coat of short, seal-like fur clothes the fetuses, indicating descent from furry ancestors. Structurally the manatee differs from other sireniens in having only six cervical vertebrae, and in the large number of molar teeth, with as many as fifteen increasing indefinitely during the animal's life,—the suggestion being, as Beddard points out, that
they are worn away by the attrition resulting from so much sand being mixed with the daily food. The cleft lip to be mentioned hereafter is also a generic peculiarity. The manatees are stupid, gentle, defenseless and harmless creatures, showing great affection for their young, one or two in number, which are nursed at pectoral udders, often while the mother stands erect upon her tail enfolding the calves with her broad arms. They never come ashore, but spend themselves amid aquatic vegetation where the only enemies they need fear are the larger alligators and the jaguar. Their food consists of fresh-water weeds and their roots, and these are procured by means of the curious form of the upper lip: "this is split in two, and the two halves, which are furnished with strong bristles, can play upon each other like the points of a pair of forceps." This cleft-lip is only suggested in the case of the dugong, but the forepart of that animal shows the structure plainly, indicating that the manatee is the more primitive form of the two. The flesh is excellent for food. The American manatees have been nearly exterminated. They formerly abounded in the Indian River and other marshy waters about southern Florida, but by the end of the 19th century had been reduced to a small, carefully protected band near Biscayne Bay in the Miami River. They still survive in small numbers along the coast of the Caribbean Sea and about the mouths of the Orinoco. The Florida manatee is called by American zoologists *Manatus latirostris*, and is regarded as different from those of Central and South America, long known as *M. americanus*. The African species is *M. senegalensis*. Consult Beddard, 'Mammals' (1901); Alston, 'Biologia Centrali-Americana' (1875); 'Standard Natural History' (Vol. V, 1885); Townsend, C. H., 'Notes on the Manatee' (in New York Zoological Society's Eighth Annual Report, New York 1904).

MANAYUNK, män-â-yünk. See PHILADELPHIA.

MANBY, George William, English inventor: b. Denver, Norfolk, 28 Nov. 1765; d. Southtown, Great Yarmouth, 18 Nov. 1854. He was educated at the military college of Woolwich, and became in 1803 barrack master at Great Yarmouth. His attention having been drawn to calaminities resulting in cases of shipwreck, from the difficulty of establishing communication with the shore, he attempted casting a rope from the shore to the wreck by the agency of gunpowder. Chains were unable to stand the shock of the discharge, but stout strips of rawhide closely plaited together were found to answer, and on 12 Feb. 1808 the entire crew of the brig Elizabeth, wrecked within 150 yards of the beach, were rescued by the simple contrivance of Captain Manby. In 1810 his invention was brought before a committee of the House of Commons, and having been favorably reported on, he received a grant of money, and all the dangerous stations on the British coasts were supplied with his apparatus. He also contrived shells filled with luminous matter, in order to enable the crew to perceive the approach of the rope, in the manufacture of which he suggested several improvements.

MANCHESTER, Conn., town, in Hartford County, on the Hockanum River, and on the New York, New Haven and Hartford Railroad (formerly New England Railroad), about eight miles east of Hartford. Until 1823, when it was incorporated as Manchester, it formed a part of East Hartford; it includes the villages of Highland Park, Buckland, Manchester, Manchester Green and South Manchester. The town has extensive manufacturing plants, the most important being the Cheney Silk Mills. It has also cotton and woolen mills, paper mills, textile factories, and electrical and mechanical works. A large amount of tinware is made in Manchester. There are two public libraries, one in the village of Manchester and one in South Manchester. The town was reincorporated in 1907 and the government is after the commission model, seven men being elected as supervisors. Pop. 14,935.

MANCHESTER, England, an episcopal and university city, inland port and Parliamentary and county borough of Lancashire, 18 miles north of London and 31 miles east of Liverpool, on the Irwell, an affluent of the Mersey, since 1894 connected with the sea at Eastham, on the Mersey, by the Manchester Ship Canal, 35½ miles long. It is one of the principal manufacturing cities of the world and the cotton trade centre of Great Britain. It covers over 21,645 acres. Railways and electric street tramsways communicate with the surrounding towns and villages of the most populous industrial region of England.

Geology.—Manchester is built on a plain, within easy distance of breezy hills at moorland, which are clearly visible from the outskirts of the city. The surface of the ground is composed of thick deposits of clay drift—boulder clay, sands and gravels beneath which are Triassic, Permian and Carboniferous rocks. Rich coal-fields are found in the neighboring parts, some of which extend under a portion of the city.

Industries and Finances.—Though Manchester is the chief seat of the cotton trade, it is no longer that of its manufacture; much of that industry being carried on in towns beyond its borders. A considerable number, however, remain of cotton mills, printing works, dyeing and bleaching concerns and factories concerned with other branches of textile manufacture. Engineering and machine works are exceedingly numerous, as are the manufactories of electrical appliances. It is calculated that there are about 700 different industries carried on here, some of the chief among them, apart from those named above, being chemical, India rubber, paper and glass works. The membership of the Royal Exchange is over 7,000 and the Grocery Exchange about 3,000. There are also stock, corn, provision, coal and cotton-waste exchanges. The vegetable and fruit market serves for the plate of Cheshire and part of Lancashire, while the fish market is second only to Billingsgate. There are nearly a score of banks, with numerous branches. The business of the post office exceeds that of any other out of London.

Bridges and Railway Terminals. The bridges are of no engineering importance, as the Irwell is here but a narrow river. The terminal railway stations are six in number: (1) London Road, 1842, rebuilt 1881; (2) Victoria, 1844, since greatly enlarged; (3) Oxford...
Road: (4) Central, 1877, near which the Mid-
land Railway Company have erected a great 
house, erected by Charles Bannister, Dering, in 1856, for the goods traffic of the Great Nor-
thern Railway. The oldest railway station in the 
world is still to be seen in Liverpool Road, 
though not used for its original purpose. It 
was opened in 1830.

Buildings.—The principal public building is 
the town-hall, commenced in 1818 and 
completed in 1877, at a cost, including land, of up-
wards of a million pounds. It covers an area of 
8,648 square yards. The clock-tower is 286 feet 
high and contains a peal of 21 bells. In the 
great hall is a series of frescoes by Ford Madox 
Brown, illustrating incidents in the history of 
Manchester. The old town-hall, erected in 
1825, is now occupied as a Free Reference Li-
brary. It is a classical building, and another 
of the same style and period is the City Art 
Gallery, formerly known as the Royal Institu-
tion. The Royal Infirmary, which originated in 
1752, is situated in one of the finest positions 
in the centre of the community, but has been 
removed to a more commodious and healthful 
spot on the outskirts. The Free Trade Hall 
(1856), built in the Italian style, will hold 5,000 
people and has been the scene of many great 
political meetings and of the renowned con-
certs conducted by Sir Charles Hallé and Dr. 
Hans Richter. In a similar style is the Royal 
Exchange (1868–74), one of the most spacious 
creations of its kind. The area of the great 
hall is 5,170 square yards. The Assize Courts 
by Alfred Waterhouse, the architect of the 
town-hall, were built in 1894, at a cost of 100,000. 
Immediately to their rear is the county 
Jail. The university buildings are also by 
Waterhouse. The John Rylands Library, by 
Basil Champneys, is perhaps the chief archi-
tectural gem of the city. Other examples of 
street architecture worthy of attention are the 
Gy Police Courts, the Corn Exchange, the 
Inland Revenue Offices, the Post Office, new Fire 
Brigade Station, Reform and Conservative 
cubs, and many of the banks, insurance offices and 
gardens. The Municipal School of Technology is one of the most striking examples 
anywhere of a well-equipped school in an im-
posing building.

Educational Institutions.—Manchester Uni-
versity, which became a free corporation in 1903. It was originally 
founded as the Victoria University in 1880, with 
a federation of the Owens College, Manchester, 
and the University College, Liverpool, as its 
colleges, to which the Yorkshire College at 
Leeds was afterward added; but in 1933 a separ-
ate university charter was granted to each 
city. The Owens College, which has now been 
incorporated with the university, was founded in 1850 by the aid of nearly £100,000 left by 
Mr. John Owens. It began work in a large 
house formerly occupied by Richard Cobden 
and was removed to the present fine buildings 
in 1873. Since then the Museum, Christie Li-
brary, medical school, physiological and other 
laboratories and the Whitworth Hall have been added to, and the institution has received 
many large gifts and bequests. The splendid 
Municipal School of Technology is affiliated to 
the university, and the subjects in the faculty of 
technology are taken there. The faculty of 
technology was instituted in 1904, and the co-
operation of the various theological colleges was 
obtained. These include Baptists, Free Meth-
dest, Independent, Primitive Methodist, Roman 
Catholic, Unitarian and Wesleyan colleges. The 
oldest educational institution in the city is the 
Grammar School, founded by Bishop Hugh Oldham in 1515. It has now 1,070 scholars. 
Many distinguished names appear in the records of its alumni. Chetham's Hospital is named 
below. The following may be added: The 
Girls' High School, the Hulme Grammar School 
(founded by the Hulmean trustees), the Nich-
olls Hospital, Warehousemen and Clerks' 
School and the Royal Manchester College of 
Music, founded in 1893, as well as the numer-
umous elementary and other schools.

Libraries.—Of libraries, the most recent, 
the John Rylands Library, is the most widely 
known, on account of its marvelous collection 
of rare and costly books and manuscripts. Its 
100,000 volumes embrace the Althorp Library, 
purchased from Earl Spencer, and Lord Craw-
ford's collection of manuscripts. It was 
founded and endowed by Mrs. Rylands in mem-
ory of her husband and opened on 9th May 1890. 
The Chetham Library dates from 1656, from 
whose name it has been open free to all, and is 
part of the foundation of Humphrey Chetham, 
the other part being a hospital or school for 
poor children. The Public Free libraries were 
established in 1852 and are supported by a pub-
lic rate, which now yields over £35,000 a year. 
The chief or reference library contained (1913) 
174,931 volumes and the 24 branch or lending 
libraries some 253,000 volumes. The Christie 
Library at the university was built by the late 
Mr. R. C. Christie, and on its shelves are the 
entire libraries of Mr. Christie, of Bishop Prince 
Lee, Prof. E. A. Freeman, in addition to other 
special and general collections. The Medical 
and Law libraries belong to the members of 
those professions, and there are other public 
and semi-public libraries of importance.

Art Galleries.—The City Art Gallery has 
been maintained by the corporation since 1882 
and contains many fine examples of the British 
school, particularly works of Millais, Loughton, 
Holman Hunt, G. F. Watts and other modern 
artists. In this gallery, which formerly be-
longed to the Royal Institution, annual exhibi-
tions have been held since 1827. The Man-
chester Academy of Fine Arts also holds annual 
exhibitions here. Attached to the Municipal 
School of Art is a well-arranged art museum, 
and in the Whitworth Institute galleries in 
Whitworth Park will be found a rich collection 
of pictures, including a nearly complete series of specimens of the best English water 
colors, from those of Sandby, Girtin and Tur-
ner onward. The institute is one of many bene-
factions enjoyed by Manchester from money 
left by Sir Joseph Whitworth.

Churches.—When the diocese of Man-
chester was founded in 1847 the Collegiate 
Church became the cathedral. It is of 
unknown origin, but the present perpendicular 
Gothic building was raised, on an earlier 
foundation, about 1422. A large part has been 
rebuilt, mainly on the old foundations in recent years, 
yet many interesting portions of the earlier 
building remain. The ancient stalls in their 
chapel have exquisitely carved canopies. The 
ancient parish consisted of 29 townships, in-
cluding Salford, and some of them had chapels
of their own. In 1850 the ancient parish was divided into independent parishes by Act of Parliament. Next to the cathedral the oldest church is Saint Ann's (1712), which contains some beautiful woodwork by the Sleighs, and there are separate workhouses and other necessary establishments. It is a court of record for the trial of civil actions, established in 1838 and constituted in 1858, and now amalgamated as the Court of record of the hundred of Salford, and since 1839 there has been a separate commission of the peace and separate quarter sessions. The Assize, County, Chancery and other law courts held in the city are not under local control.

History.—Manchester was in prehistoric times occupied by the Britons, as proved by urns and implements that have been unearthed, and abundant Roman relics bear evidence to a long period of Roman occupation. Little is known of the law, except of Saxons, but among other traditions is that of Queen Ethelbega, wife of Ina, king of Wessex, having lived here in 689, and of the Danes sacking the town in 863. In 923 King Edward the Elder, son of Alfred the Great, rebuilt and fortified Manchester and the Red Church of the Danes; in the Domesday Book, 1086, as possessing two churches, one of which is now conjectured to have been at Ashton-under-Lyne, originally in the parish. The barony of Manchester was held by the Lacy family, 1086 to 1313, and the last of that family granted a charter to his burgess in 1301, and it was by this charter that the town was governed for over five centuries. The manor was afterward held by the De la Wars and the Wests until 1579, when it was sold to John Lacy, a London mercer, for £3,000, and was disposed of in 1596 for a profit of £500 to Sir Nicholas Mosley, a Manchester merchant, who had become a prosperous London merchant destined to fill the office of lord mayor five years after his purchase of the manor. In his family the manor remained until 1845, when the whole of the manorial rights were sold to the corporation for £200,000. One of the lords of Manchester, Thomas la Warre, entered the priesthood, became rector of St. Mary's, and in 1418 had the permission of collegiate the church, and gave his manor-house as a residence for the clergy of the college. This house, now known as Chetham's Hospital, is, apart from the church, almost the sole architectural relic of feudal Manchester. After the Reformation the building was confiscated by the Crown, and in the reign of Edward VI passed by purchase to the Earl of Derby. In his family it remained until the Commonweal, when it was seized by the Crown and placed in the possession of the royalist Earl of Derby. In 1656 it was purchased by the executors of Humphrey Chetham and turned to its present uses. Manchester was visited in 1495 by Henry VII. It is unknown when the town began to be established as a trading and manufacturing centre, but it is clear from the Act of 1541 that a considerable commercial position had by that time been attained. Manchester holds an important position in the earlier history of the civil wars. At the outset the townsmen took the side of the Parliament, and made an effort to avert the conflict by presenting a petition to King Charles. The town was besieged by Lord Strange, who was repulsed. Prior to the actual
siegè he demanded the delivery of the magazine, and in an affray which ensued a man was killed. This was on 15 July 1715, and the fact that the leading member of the town occurred in the wars. The town was represented in Cromwell's first and second parliaments. In 1715 there were many Jacobites among the influential townsmen, and in the rising of 1745 the Young Pretender found a number of adherents here. Some of them, on the failure of the rebellion, were executed for their treason. The Duke of Bridgewater opened his canal from Worsley to Manchester in 1761, and the extension to Runcorn was completed in 1795. Distress, caused by the wars and high taxation, was a main cause of the political discontent which marked the first two decades of the 19th century, and are remembered by a weavers' riot in 1808, the "blanketeers" meetings in 1817 and the disastrous Peterloo affair of 1819, when, at a meeting to petition Parliament for the redress of grievances, several people were killed and many more injured during a charge of the military, after the reading of the Riot Act. The Manchester Railway was opened in 1830, marking a new era in internal communication. Manchester was disfranchised by the Reform Act of 1832, getting two members. (Under the redistribution of 1917, members are allocated to the city.) The Anti-Corn Law League was established in 1839, and prosecuted a vigorous campaign throughout the country, culminating in the repeal of the Corn Laws in 1846. In 1847 the bishopric of Manchester was created and the collegiate church converted into a cathedral. Queen Victoria paid three visits to Manchester, the first in 1851, the second in 1857 and the last in 1894, when she opened the Ship Canal. The great Art Treasures Exhibition was held in 1857 and the Jubilee Exhibition in 1857. Both were remarkably successful, the latter yielding a profit of $428,300, which was devoted to public uses. From 1862 to 1865 there was a great distress throughout the cotton manufacturing districts, owing to the American War; a relief fund of over $1,000,000 of money was raised on behalf of the operatives. The Ship Canal was projected in 1882 and opened in 1894. In March 1902 the city was visited by the Prince and Princess of Wales, who came to open the Whitworth Hall at Owens College; in July 1902 King Edward VII opened a new dock at the Ship Canal.

Population.—The population of Manchester is about 714,333. In 1841 it was 242,983; in 1871, 351,189; in 1891, 505,368; in 1901, 644,873. The great increase is partially accounted for by the extensions of the city boundaries which took place in 1885, 1890, 1904 and 1909.

H. Ray (1902), and the 'Victoria History of Lancashire' (Vols. II, IV, London 1908, 1911).

Charles W. Sutton, Chief Librarian, Manchester Public Free Libraries.

MANCHESTER, Iowa, city, county-seat of Delaware County, on the Maquoketa River and on the Illinois Central Railroad, about 130 miles northeast of Des Moines and 45 miles west of Dubuque. It is situated in an agricultural region and its excellent water power is utilized in manufacturing industries. The chief manufactures are woolen goods, tiles, brick, fencing, flour, wagons, carriages and dairy products. Manchester is the trade centre of a large part of Delaware and the adjoining counties, and ships farm produce, dairy products and livestock. A United States fish hatchery is in the vicinity. Pop. 2,758.

MANCHESTER, Mass., town, in Essex County, on Massachusetts Bay and on the Boston and Maine Railroad, about seven miles southwest of Gloucester. The first settlement was made in 1630, and until 1645 the place was called 'Jeffrey's Creek.' When the name was changed to Manchester and the town was incorporated. Since 1845 Manchester has been a favorite summer resort, one of the attractions being a singing beach. In addition to good public schools the town has a fine public library in the Coolidge Memorial. Pop. 3,000. Consult Lamson, 'History of the Town of Manchester.'

MANCHESTER, N. H., city, one of the county-seats of Hillsborough County, on the Merrimack River at the mouth of the Piscataquag and on branches of the Boston and Maine Railroad, about 17 miles south of Concord, the capital of the State, and 56 miles north of Boston. The first settlement was made in 1722 and for a number of years it was called Amoskeag and Harrytown. In 1751 the name was incorporated as 'Derryfield,' and in 1810 the name was changed to Manchester. It was chartered as a city in 1846. The Amoskeag Falls (54 feet) in the Merrimac, above the city, provides extensive water power which by means of canals is made available for manufacturing. The city's prosperity is largely dependent upon this water power, which for years has been controlled by the Amoskeag Manufacturing Company. The city has over 400 manufactories, representing about 60 different industries. The capital invested is about $26,000,000 and the number of employees about 25,000. The chief industrial establishments are the cotton mills, which turn out annually about 250,000,000 yards of cotton. Other manufactures are foundry and machine shop products (especially locomotives and engines), hosiery, paper, boots and shoes, wooden-ware, needles, woolen goods, knit goods, leather, lumber, cigars, brushes, wagons, carriages and furniture. The system of water works, owned by the city and furnishing about 16,000,000 gallons capacity which is fed from Lake Masabesic, a body of pure water about four miles from the city. The works were completed in 1874 at a cost of $1,500,000. Some of the principal public buildings are the govern-
ment building, the Roman Catholic cathedral, the county courthouse, Sacred Heart Hospital, Hospital of Our Lady of Lourdes, Elliott Hospital, Women's Aid Home, Weston Observatory, Holy Angels' Convent and a public library, which contains about 46,000 volumes. The several public parks are well maintained and add much to the attractive features of the city. The city has the State Industrial School, Saint Joseph's and Saint Patrick's orphanages and Saint Patrick's and Saint Vincent's homes for the aged. The educational institutions are a public high school, parish high schools, a number of grammar and elementary public and parish schools, a training-school for teachers, Saint Augustine's and Saint Mary's academies and Saint Anselm's College. The yearly income of the municipality is about $3,000,000. Pop. 75,635.

MANCHESTER, Va., a former city of Chesterfield County, on the James River and on the Atlantic Coast Line, the Seaboard Air Line and the Southern railroads. It is opposite Richmond, with which it is connected by several railroad lines. It is situated in an agricultural and coal region, and its industries are connected largely with the products of the farms and mines. At Manchester there is a fall in the James River of 100 feet in about six miles. The extensive water power is used for manufacturing in both Richmond and Manchester. Its chief manufacturing establishments are foundries, cotton mills, flour mills, woodenware factories, paper mills, glass works, brick yards and the repair shops of the Southern Railway. The city, with its population of nearly 10,000, was annexed to Richmond in 1906.

MANCHESTER, Va., town, one of the county-seats of Bennington County, on the Battenkill River and on the Rutland Railroad, 32 miles south by west from Rutland. Manchester was one of the disputed places in the early days, when what is now Vermont was nearly all owned by New Hampshire, but a part by New York. The town of Manchester was incorporated in 1761 and the village in 1800. It is in a beautiful locality at the foot of Mount Equinox, which is 3,847 feet above the sea. The village is in a fertile farming section. An excellent quality of marble is found in the vicinity and the forests furnish a large amount of timber for several lumber mills. The water from mineral springs nearby is shipped to many parts of the country. Fishing-rods and ginger champagne are manufactured extensively. It is the seat of Burr and Burton Seminary and has the Mark Skinner Memorial Library, which contains about 21,000 volumes. Manchester has been a favorite summer resort for over 125 years, and for the past 60 years this business has been the largest single business in town and is steadily growing. Pop. 2,044. Consult Munson, 'The Early History of Manchester' (Manchester 1876).

MANCHESTER CANAL, England, a great ship canal, by which Manchester (q.v.), an inland town, was virtually converted into a seaport. See Ship Canals, under CANALS.

MANCHESTER UNIVERSITY. This university, officially styled the Victoria University, was founded in 1858 and was the outgrowth of Owens Colleges, which was founded under the will of John Owens, a Manchester merchant who died in 1846, leaving £6,654 for the foundation of a college which should be free from religious tests. It was opened on 12 March 1851 in a house in Quay street, formerly the residence of Richard Cobden, with a staff of five professors and two teachers. It was originally governed by trustees under the founder's will, but by acts of Parliament, passed in 1870 and 1871, a new governing body was formed. The first principal was Mr. A. J. Scott, who resigned in 1857, and was followed by Dr. J. G. Greenwood, who held the office for 32 years. In 1889 Dr. A. W. Ward was appointed, at the end of 1897 he was succeeded by Dr. (now Sir Alfred) Hopkinson, Prof. F. E. Weiss in 1913 and Sir Henry A. Miers in 1915.

About 1870 a movement was started to provide a new site and buildings for the college and a fund of about £100,000 was raised. The new college in Oxford road, built from the designs of Mr. Alfred Waterhouse, was opened in 1873. Many subsequent additions have been made, including the medical school, the Bower laboratories (natural history), the museum, the Whitworth engineering laboratory, the Schorlemmer laboratory (organic chemistry), the Christie Library, the physical laboratory, the Schuck chemical laboratory, the Whitworth Hall, the new engineering department, the John Morley chemical laboratories and the bacteriological laboratory in connection with the department of public health.

In 1872 the Manchester Royal School of Medicine was amalgamated with the college and has become a most important department, being now one of the greatest medical schools in the country. Frequent extensions have been made.

The library contains about 143,723 volumes and includes the entire collections of Dr. R. C. Christie, Dr. E. A. Freeman, Prof. Milnes Marshall and other eminent scholars. The library building was erected by the munificence of Dr. Christie, who had been professor of history in the college.

The museum building was erected in 1884-88. It originated in the gift of the collections of the Manchester Natural History Society and the Manchester Geological Society, together with the proceeds of the sale of the museum building. It is one of the completest and best arranged natural history museums in Great Britain. It is open free to the public and its management is vested in a committee of representatives of the city council and of the subscribers as well as of the university.

There are five halls of residence, three for men and two for women, for the benefit of students living at a distance from Manchester.

By the generosity of benefactors the students are provided with a gymnasium and a spacious athletic ground.

A striking instance of the popularity of the college was shown in 1902, when its jubilee was commemorated, by the raising of a fund of £102,500, out of which the debts of the college were paid and the general endowment increased.

The idea of elevating the college to the rank of a university was first broached in 1875 by Professors Greenwood, Morgan, Roscoe and Ward, but the petition was in 1877 presented to the Privy Council; opposition was made by the Yorkshire College, Leeds,
and by other bodies in order to prevent a university charter being conferred on Owens College alone. It was finally agreed that the new university should bear the title of the Victoria University, and that while Owens College should be the first college of the university, yet provision should be made for the admission from time to time of other colleges. The royal charter creating the university was granted on 20 April 1890. University College, Liverpool, was admitted as the second college on 5 Nov. 1884, and the Yorkshire College as the third college on 3 Oct. 1887. It provided that the university should have its seat in Manchester and that the meetings of the university court and council and of the convolution should be held in that city. A subsequent charter, dated 20 March 1883, gave power to confer degrees in medicine and surgery.

A movement began in 1902 in Liverpool for the foundation of a separate university for that city, and thereupon the Owens College presented a petition for the reconstitution of the Victoria University as an independent university for Liverpool, with favor by the Privy Council and the new charter of the Victoria University of Manchester was granted on 15 July 1903, and on 24 June 1904, an act for the incorporation of the Owens College with the university received the royal assent. Leeds obtained its own university charter on 25 April 1904.

Under the present constitution the authorities of the university are (1) the chancellor; (2) the vice-chancellor; (3) two pro-vice-chancellors; (4) the court of governors, which consists of 89 members; (5) the council, which is an executive body and consists of 24 members, including four representatives of the senate; (6) the senate, 50 members; (7) the board of faculties; (8) convolution, which now consists of 1,530 members.

The following are the various faculties: Arts (degrees B.A., M.A., Litt.D.); science, with a special department of education (degrees B.Sc., M.Sc., D.Sc.); law (degrees LL.B. and LL.D.); music (degrees Mus.B. and Mus.D.); commerce (degrees B.Com. and M.Com.); theology (degrees B.D. and D.D.); technology (degrees B.Sc.Tech. and M.Sc. Tech.); medicine (degrees M.B., Ch.B.—i.e. bachelor of surgery—M.D. and Ch.M.). In the dental department there are degrees of B.D.S. and M.D.S., and in the department of public health diplomas are granted (D.P.H.) as well as D.V.S.M., i.e., Diploma in Veterinary State Medicine.

There were 1,415 students in the several faculties of the university in 1914–15, marking a decrease from the previous year, owing to war conditions, of 25 per cent.

The capital of the university amounts to about £1,060,000, including £416,000 value of buildings, etc., and the annual income to over £60,000, derived from endowments, government grants, grants from the city of Manchester and other municipal bodies, and from fees.

MANCHURIA, män-choo'ri-a, China, comprises the northeasternmost portion of the empire, called by the Chinese "the Eastern Provinces," from its administrative divisions, Hilung Kiang, the northern province; Kirin, the central province, and Sheng-King, the southern province. It lies mainly between lat. 40° and 53° N. and long. 118° and 135° E., and is separated from Asiatic Russia on the north and northeast by the Amur, on the east by the Usuri and on the west by the Argun. On the west it is bounded by Mongolia and China proper, part of the boundary being the Palisade Barrier, separating it from the province of Pe-chi-li; on the south the boundaries are the Liao-tung Gulf, the Strait of Pe-chi-li, Korea Bay, the Yalu River and Korea. The estimated area is 363,610 square miles. Vast chains of mountains ramify all over the country, one of them forming the south limits of the valley of the Amur. The principal rivers are the Amur; the Argun; the Sungari, the vast basin of which occupies a great part of the territory; the Usuri, like the Sungari, a tributary of the Amur; and the Liao-ho, flowing south into the Gulf of Liaotung. The Nonni is an important southward-flowing tributary of the Sungari and the Hurka or Khurkha joins the same river from the south. The climate is in most parts healthful and invigorating. In the northern and more elevated parts it is winter of intense, the thermometer sometimes falling to 48° below zero and the snow lying for six months in the year. The summer temperature reaches about 90° in the shade. There are no roads in the modern sense of the word, transportation being best in winter on the frozen rivers.

The vast forests of the north are rich in useful timber of all kinds, such as walnut and oak, together with the soft pine and fir. They abound in wild animals, the tiger, panther, bear, wolf and stag, as well as the eagle and other birds of prey. The rivers abound with fish. The soil is exceedingly fertile, especially in the valleys of the Liao and Nonni rivers. In the summer the southern part looks to an American much like Illinois, and one may find on its most northern hills lilacs-of-the-valley, pink peonies, white and yellow daisies and the fragile dog roses, as in Wisconsin and Minnesota. With the exception of four ice-locked months its fields are luxuriant with wheat, barley and millet, so that it has come to be called the "Garden of China."

It has one of the richest soils in the world and with the development of the Loya bean industry has grown more rapidly than any other Chinese province. Not one-fifth of the arable land is under cultivation. In the warmer portions the grape vine, indigo, cotton, opium, tobacco, sorghum, rice, ginseng, etc., are cultivated, the opium poppy being a valuable crop. The silk worm also is reared. The mineral wealth of Manchuria is great, but as yet is little developed. Iron, gold, silver, coal, lead, etc., occur in abundance. Not more than 10 per cent of the people of Manchuria are Manchus, Chinese forming 90 per cent of the population. The Manchus are a Tungusian race. They are of a lighter complexion and a more powerful build than the Chinese, but same conformation of the eyelids, but their countenances are far more expressive and intellectual. In the 17th century they invaded China and placed their leader's son upon the throne. Since that time the Manchu dynasty has continued to reign in China, the Manchu language being the court and official language. Manchuria possesses a probable native population of 20,000,000, of whom 10,000,000 inhabit the
southern province of Sheng-King, 8,000,000 the central province of Kirin, and 2,000,000 the wild northern province of Hilung Kiang; but estimates of total population vary from 5,750,000 to 29,400,000.

A great influx of the Chinese and Russian peoples into China, Korea and Japan took place especially after the Russian occupation in 1900. See CHINA.

For a considerable time prior to 1891, when the first sod was turned for the construction of the great Siberian Railroad, the Russian government was anxious to secure control of this territory. When Japan in 1895 occupied the Lia-Tung Peninsula of Manchuria and began to fortify Port Arthur as its southern tip, Russia, with two other powers protested. Weak, though victorious, Japan withdrew, shortly afterward to learn of the secret treaty of Count Cassini, by which Russia leased Port Arthur from China for 26 years. Having obtained this for nothing, it turned its vast covetous eyes on the vast territory which lay between, and under the commanding influence of Admiral Alexeef, generalissimo of the Russian military and naval forces in the Far East, who, in 1903, for his services was proclaimed by imperial ukase viceroy of the Greater Russian. The Russian forces in this land, which lie between Baikal and the Pacific and which extend from the Arctic to the Yellow Sea, they accordingly began a pacific conquest by colonization on an unparalleled scale. The route of the Siberian Railroad was originally surveyed with Vladivostok on the Pacific coast of Russian Asia as the terminus. Port Arthur, however, washed by the warmer waters of the Yellow Sea, now became the coveted goal.

A corporation known as the Russo-Chinese Bank was established, which to all appearances was a mutual combination of Russian and Chinese capital, but was actually only another name for the Department of Finance of the Russian Empire.

There were times when China was short of ready cash, and the Russo-Chinese Bank each time went to her aid. Therefore, when China was asked to grant a concession for a railroad from the Siberian trunk line to Liao-Tung Bay, to be called the Russo-Chinese Railroad, and the Russo-Chinese Bank offered to furnish the necessary $250,000,000, China could not well refuse. This railroad penetrated the most fertile as well as the most densely populated districts of Manchuria and had as its terminus the Russian fortress of Port Arthur. On the north it joined with the Siberian trunk line at Harbin, on the mighty Sungara. It passed through the cities of Tsitsihar, Kirin and Mukden, capitals of the three Manchurian provinces. It tapped the Gulf of Usur, by means of the port of New-Chwang, and skirted the whole eastern coast of this arm of the Yellow Sea.

When the other powers became alarmed at the armed forces which kept pouring in from Siberia and European Russia, the officials of the Tsar pointed to a clause in the railroad's charter which permitted Russia to guard the railway with troops, but did not limit their number. There followed a vigorous colonization policy; free transportation (with a land grant of 100 acres to each male of a household, besides agricultural improvements) was offered; free admission of immigrants; and families migrated from all parts of the Tsar's western dominions. Notwithstanding this influx amounting to 200,000 a year, it did not penetrate far from the railroad. The region is too vast.

Consequent on the Boxer massacres and troubles of 1900 a Russian military force occupied the northeastern portion of Manchuria and declared it to be Russian territory and established a provisional Russian administration. On 8 April 1902, the Manchurian convention between China and Russia was signed, wherein Russia agreed to evacuate Manchurian territory within a year. But Russia could not then voluntarily withdraw. The civilization of the Slav had rooted itself too firmly in this soil to be eradicated except by a political cyclone. One could see everywhere, from Port Arthur at its extreme southern end to the Amur River, the old Russian boundary, on the north, evidences of the Muscovite occupation. Under the direction of Russian engineers native laborers were building railroads and military highways, constructing waterworks, drains and garbage pits. The Russian army surrounded the east and west of the Liao-Tung Peninsula.

The population grew rapidly, and the lines of steamships which load here directly from the cars of the Siberian Railroad increased in number and in frequency of service, while hundreds were received at Port Arthur by the Russian authorities for the construction of electric streetcars and electric railways for Mukden, Harbin and New-Chwang.

On 8 Oct. 1903 the Russian government pledged to evacuate Manchuria, yet when the day came she only poured in more soldiers and made a great naval demonstration, her actions creating international uneasiness for Japan and Great Britain from political as well as commercial motives, and for the United States on account of commercial rights obtained by the Shanghai treaty to trade with Manchuria. Furthermore, Russia added to the troubles which was brewing over her continued occupation of Manchuria by opposing Japan in her refusal to allow Korea to open the port of Wi-ju to foreign trade, or to permit Japan to lay a telegraph line from Liao-Tung Bay to the Russian. Russia, moreover, obtained from the Korean government a timber-felling concession south of the Yalu, and also had a telegraph line in working order in Korean territory. Japan had great interests at stake. Russia in Manchuria was a constant menace to the independence of Korea, over the suzerainty of which Japan had successfully fought China in 1894-95. Japan, in assimilating all that was best of Occidental civilization had learned all that was worth learning of European diplomacy, and by treaty revision and her correct attitude during the Chinese War by the Boxer troubles had raised herself and been admitted to the rank of a civilized world power.
Soon after Russia, with the aid of France and Germany, had secured a diplomatic victory over Japan in obliging her to withdraw from the Pescadores, Manchu, or Ching, China in 1894–95, Japan had effected a defensive and offensive alliance with Great Britain, whereby that power was pledged to intervene in any future conflict, should any third party again interfere with Japan's political arrangements. In July 1893, Japan had opened negotiations with the Russian government "with a view to a friendly definition of the interests of the two countries in Manchuria and Korea, where those interests meet, and thereby to remove every cause of conflict between Japan and Russia." She now redoubled her efforts in that direction. Russia, it is alleged, unduly delayed her replies, or proposed such amendments as were altogether inconsistent with Japan's idea of an amicable settlement, thus making the situation more and more complicated. Besides, Russia made great naval and military preparations, dispatching all her most powerful war vessels to the extreme Orient and sending military reinforcements to Manchuria. The Manchu, believing further delay would increase her danger, broke off negotiations with Russia on 6 Feb. 1904. On the 9th, without any formal declaration, war was begun by Japan. (See JAPAN; RUSSO-JAPANESE WAR). By the Treaty of Portsmouth, signed 5 Sept. 1905, which concluded the war, the Russian lease of Port Arthur and Talien-wan, and the southern extremity of the Liao-Tung Peninsula and the South Manchurian Railway were transferred to Japan 22 Dec. 1905. China gave official sanction to the transfer and granted Japan the right to extend the railway from Mukden to Autung at the mouth of the Yalu River, where it joins with the Korean Railway. Since the war there has been noted a disposition on the part of Russia and Japan to work together. A proposal made on behalf of the United States by Philander C. Knox in 1909 for the neutralization of the Manchurian railways was met by cooperation between the old enemies. In 1913, there were 2,102 miles of railway: the Russian lines (Chinese Eastern Railway) extending to 1,075 miles, the Japanese (Southern Manchuria Railway) to 684 miles, and the Chinese (Northern Chinese Railway) to 514 miles. Extensions are being made, the most important being the line projected by Russia in 1916, from Harbin directly across Manchuria to the near Russian frontier, with a branch to Tsitikar (662 miles). This railway would give control to Russia in northern Manchuria in return for rights already secured by Japan in southern Manchuria. Consult Christie, D., 'Thirty Years in Moukden' (London 1914); Hosie, A., 'Manchuria; Its Peoples, Resources and Recent History' (ib. 1901); Kemp, E. G., 'The Face of Manchuria, Korea and Russian Turkestan' (ib. 1912); Little, A., 'The Far East' (Oxford 1903); Pozdnoukh, 'Manchuria' (Saint Petersburg 1897); Ross, J., 'The Manchus; or the Reigning Dynasty of China, their Rise and Progress' (London 1880); Weale, T., 'The Reshaping of the Far East' (ib. 1905); 'The Truce in the East and its Aftermath' (ib. 1907); 'The Commercial Struggle in the Far East' (ib. 1908).

MANCHUS, a Tartar people of Tungusic origin, descendants of the Jurchin or Niu-chi, who overran northern China in the 12th century and established the Kin or Golden dynasty, latter overthrown by the Mongols, and of the tribes who followed them. The Manchus (Mancioi, Manchus, etc.) and his successors in his conquest of Liao-Tung and Liao-si, in the first half of the 17th century, who aided the Chinese general, Wu-san-kwee, in suppressing the rebel Li-tse-Ching, and who retained the country for themselves, establishing in 1644 the Ta-Tsing, or "Great Pure" dynasty which ruled China down to the establishment of the republic in 1912. They form a very small minority of the population of China to-day; they are a quiet, inoffensive people noted for their politeness. They now speak the Chinese language, their own tongue being well-nigh extinct. Physically they are rather tall, with mesocephalic head. The famed Chinese queue, but recently abolished, was introduced by the Manchus and was at first an insignia of the subjection of the Chinese to the Manchus. Buddhism in the Chinese form of to-day also dates from the Manchu conquest. For the history of their conquest and rule in China see CHINA, HISTORY. Consult Giles, 'China and the Manchus' (Cambridge 1912); Kent, P. H. B., 'The Passing of the Manchus' (London 1912); Ross, 'Manchus; or The Reigning Dynasty of China, their Rule and Progress' (London 1891).

MANCINI, män-chê'në, a name borne by the five nieces of Cardinal Mazarin. They were born in Rome and summoned by their uncle to Paris, where they played a conspicuous part in the court of Louis XIV during the early years of his reign. They were: (1) LAURE (b. 1636; d. 1657), the amiable and pious companion of Louis XIV's boyhood. She became the mother of Louis, Duke of Vendôme, one of the greatest generals of the Grand Monarque. (2) MARIE (b. 1639; d. about 1715), for whom the king conceived a violent affection, but in 1661 Mazarin gave her in marriage to Prince Colonna, constable of Naples. (3) OLYMPE (b. 1640; d. 1708), a witty and attractive woman, who became wife of Eugène de Savoie-Carignan, Count of Soissons, and mistress of the queen's household. (4) HORTENSE (b. 1640; d. 1699), the most attractive and beautiful of the Mancini. In 1660 she left the Duke de Mazarin, and became one of the chief beauties of King Charles II's court. The king pensioned her, and after the Revolution of 1688 she lived in retirement in Chelsea. (5) MARIE ANNE (b. 1649; d. 1714) was the Wittiest and most vivacious of the sisters. In 1662 she married the Duke de Bouillon, and her salon became the centre of social and intellectual life at Paris. She patronized La Fontaine, Corneille and Molière. She died in Chichy. Consult Chateauneuf, Louis, "Les Filles de Mazarin," "Les Filles de Mazarin" (Paris 1880); René, "Les nieces de Mazarin" (ib. 1856); Williams, A. N., "Five Fair Sisters" (New York 1906).
 zarro. Shortly afterward Manco appeared in the Spanish camp to announce his pretensions to the throne and claim Pizarro’s protection. The conqueror received him cordially, and made him his first lieutenant, in the hope, no doubt, of securing him to place him on the throne. After in vain petitioning for power to exercise the sovereignty, he withdrew secretly from Cuzco, but was brought back and imprisoned. Again escaping, he roused the whole nation to arms against the invaders. He was retaken, and appeared before Cuzco (February 1536) with a countless host of Indians who covered the surrounding hills. He destroyed a large part of the city by fire and reduced the Spaniards to extremities; but after the siege had lasted over five months, had to withdraw on account of the scarcity of food. Defeated subsequently by Almagro and forsaken by most of his warriors, he fled to the Andes, and for several years maintained his independence, sallying forth as occasion offered at the head of a few brave followers, always eluding pursuit in the wilds of the Cordilleras, and in the event of civil war among the foreigners throwing his weight into the weaker scale in order to prolong their contests. He was killed by a party of Spaniards belonging to the younger Almagro’s faction, who on the defeat of their leader had taken refuge in the Peruvian camp.

MANDÉANS, mân’dè-anz, an ancient Oriental religious sect of mixed Christian, Jewish and heathen elements. They are still found on the east shore of the Tigris, working as jewelers, blacksmiths, carpenters, etc. Their religion is a kind of Gnosticism, retaining various Jewish and Parsee elements. They worship a number of personifications, particularly of the attributes or names of God. They publicly call themselves Sabians (Sâbâ, "baptists"), and thus professing to identify themselves with the Sabaeans tolerated in the Koran. They were formerly called Christians of Saint John the Baptist from their habit of baptism or ablation. They have five important sacred books: "Sidrâ rabbâ ("the great book"), called also "ginza," "treasure"; "Sidrâ de Yahâyâ ("Book of John"); the "Qolasta," a collection of hymns; "Diwân," a ritual; and "Asfar Malwâsá," a manual of astrology. The Mandaeans have had three degrees in the priesthood, with a supreme official (Rish ammâ) as the source of both civil and ecclesiastical authority. The priests officiate in white robes, barefooted, and women may be admitted to their order.

MANDAITES. See NAZARENES.

MANDALAY, mån’dâ-lâ, East India, capital of Upper Burma, two miles from the left bank of the Irrawaddy, a little north of Amaungpura (q.v.), the former capital, and about 410 miles north of Rangoon. It was founded in 1860, was the capital of independent Burma until its capture by the British in the end of 1885, and since the treaty by which (1886) the king lost his throne it has been the capital of Upper Burma. The area is six square miles. The most famous shrines in Mandalay are the Arakan Pagoda, containing brazen image of Buddha, 12 feet high, and the Kuthodaw Pagoda, 110 feet high, surrounded by 720 others, each inscribed with a part of the Buddhist scriptures. In the centre of the town stands what was once King Theebaw’s palace. Outside the enclosures of the city was, until the British conquest, a crowded, dirty native town, now cleared away to make room for a British cantonment (Fort Dufferin). The present native quarters lie outside the former fortifications, on the raised plain, again, on the slopes of the hills that border the valley of the Irawady, are numerous fine monasteries. The use of machinery is almost unknown; except for some rice and timber mills and brewing the industries are all conducted by hand. Gold mining is the most important; some of the others are gold and silver work, ivory and wood carving, bell and gong casting, and knife and sword making. In 1886 and in March 1892 much damage was done by fire and by an inundation of the river. In 1886 a meteorological observatory was built. Kipling (q.v.) called special attention to this ancient city by his poem "Mandalay." Pop. 138,289.

MANDAMUS, in law, a writ issued by a superior court and directed to some inferior tribunal, or to some corporation or person exercising public authority and requiring the performance of some specified duty. In general practice in the United States a mandamus issues where a party has a right to have a thing done, and has no other remedy, and in some cases where he has another but a tedious and inadequate one; and must be applied for without delay. It is either in the alternative, ordering the court, corporation or party to which or whom it is directed to do the thing specified or to appear and show cause why it should not be done; or absolute, commanding the thing specified to be done without any condition or alternative. The writ is usually first issued as the alternative, and in case of there being no appearance, or no sufficient cause to the contrary being shown an absolute mandamus is issued. The cases enumerated for the issuance of this writ are — to compel the party applying to be restored to some office or franchise of a public nature, whether temporal or spiritual; for the production, inspection or delivery of public books and papers: to oblige bodies corporate to affix their common seal; or to compel the holding of a court. It may be directed to an inferior court, ordering it to proceed in the hearing of a cause, or to enter up a judgment. Consult Bailey, W. E., "Treatise on the Law of Habeas Corpus and Special Remedies" (2 vols., Chicago 1913); Spelling, T. C., "Treatise on Injunctions and Other Extraordinary Remedies" (2d ed., Boston 1901) and Wood, H. G., "Treatise on the Legal Remedies of Mandamus and Prohibition" (3d ed., Albany 1896).

MANDAN, a tribe of American Indians of the Siouan family, the remnants of which number less than 300, are settled upon the Fort Berthold Reservation in North Dakota. In 1778 the Mandans occupied nine villages upon both sides of the Missouri River near Saint Louis, but wasted by smallpox and decreased by numerous battles with the Sioux, they removed further up the Missouri. In 1804 they were found by the Lewis and Clark Expedition (q.v.) occupying two villages at the mouth of the Kettle River. In 1837 when a smallpox epidemic destroyed thousands of American Indians the Mandans were still further reduced in numbers from 1,700 to less than 400. In
1846 the remaining families of the tribe took up their residence at the Fort Berthold Reservation. The Mandans were not a nomadic people, but resembled the Pawnees, living in log houses with village administration and local government. They were an agricultural people, raising corn, tobacco and other crops.

MANDAN, N. Dak., city, county-seat of Morton County, on the Missouri River and on the Northern Pacific Railroad, about five miles above Bismarck. In the vicinity are extensive coal mines, and on the large ranches are raised cattle and sheep. Considerable wheat is cultivated on the farming lands. Nearby are a number of the ancient mounds somewhat similar to those in Ohio and other parts of the United States. The State Reform School and Indian schools are located here. The city is the headquarters of a railroad division and has large railroad shops. In 1907 the commission form of government was adopted. The waterworks are the property of the municipality. Pop. 3,873.

MANDARIN, the term usually applied in China by foreigners to government officials of every grade. It is supposed to be derived from the Portuguese mandar, to command, or from the Sanskrit mantrin, counsellor; the Chinese equivalent is kwan, which signifies literally a public character. There are nine ranks, distinguished by different buttons.

MANDARIN DUCK, a small Chinese duck (Aix galericulata) closely related to the American wood-duck (A. sponsa), and dressed in an exceedingly beautiful plumage of metallic green, purple, chestnut, white and black. It has long been domesticated by the Chinese, and as it is said to pair for life, is held up by them as a model of marital virtues; and it has been introduced upon park waters and ornamental grounds in America and Europe.

MANDAT, mân-dâ, the name given to a kind of paper-money in the French Revolution. After the assignats, which had been kept in circulation by the violence of Robespierre, had lost all credit, a new money was created—the mandats. The owner, like the assignats on the credit derived from the confiscated property, but with the essential difference that specific pieces of property, enumerated in a table, were pledged for the redemption of the bills, while the assignats furnished only a general claim. These mandates were issued in accordance with the law of 1796, to the nominal value of $480,000,000. A forced circulation was given to them, by which the government was enabled to defray the expenses of the approaching campaign.

MANDATE, in law, a term derived from the Roman civil law. It may be defined as a bailment (delivery) of a chattel or chattels to a person who is to do something with or about the things bailed, entirely without compensation. The essential element of the contract lies in the fact that there is not paid or promised, in law or in fact, any compensation whatever for the service to be rendered. The person delivering the chattels is called a mandator; and the person receiving them and undertaking the service is called a mandatory. As it must be a service or an act, the whole benefit of which rests with the mandator, this, by the ordinary principles of bailment, determines the amount of care to which the mandator is bound, and the degree of negligence for which he is answerable. For negligence in a bailee has in law three degrees: slight negligence, which makes the bailee responsible where the bailment was wholly for his benefit; ordinary negligence, for which he is responsible if the bailee be for the benefit of both parties; and gross negligence, for which only the bailee is responsible where the contract is for the exclusive benefit of the bailor. And as it is not a mandate if the bailee derives any benefit whatever from the service, it follows that a mandatory is responsible for loss of or for injury to the thing delivered to him, only when it is caused by his gross negligence. There is no especial form for the contract of mandate; it may be in writing or by word only, and made very solemnly or in the simplest way; in either case the law is the same. No man can be held in the United States for a breach of any promise, whether that breach be partial or total, if the promise rests upon no consideration. But if he who has made a promise, afterward does some injury to the promisee (and this would be the case if he does something which is positively injurious because it is not completed), he is liable for the injury he has caused, as he would be if there were no promise between the parties. Banks and bankers are so far mandataires, that they receive notes for collection, and render, or engage to render, by agreement or by mercantile usage, these and similar services without any especial or specific compensation. But it is understood that they do this as a part of their business, and for the general and indirect benefit they derive from doing it; and this is undoubtedly consideration enough to make them liable for any injury to their customer caused by their negligence; and it is sufficient to make them liable that their negligence was ordinary, or consisted in the want of common care. And a bank has, as bailee, a lien on its deposits for i a general balance against the depositor.

MANDAUE, mân-dâwâ, Philippines, a pueblo of the province of Cebú, in the east coast, on the north shore of Cebú Channel, five miles northeast of the town of Cebú; it is on the coast road. Rice-growing is the principal industry. Pop. 11,000.

MANDAYA, mân-dâ-yâ, a Philippine tribe of the Malay race living in the commandancia of Bislig, and the district of Dávao, island of Mindanao. They are bloodthirsty and head-hunters, mostly heathen, though Jesuit missionaries have converted some to Christianity. (See PHILIPPINE ISLANDS.) Consult Cole, F. C., "Wild Tribes of Davao District, Mindanao" (in 'Field Museum Publication 170,' Chicago 1913).

MANDEL, mân-dël, Eduard, German engraver: b. Berlin, 15 Feb. 1810; d. there, 20 Oct. 1882. He studied in Paris with Henrique Dupont, and in 1842 became professor of engraving at the Berlin Academy and director there after 1856. He was among the creators of modern German engravers, the most important work of his being the plate of Raphael's 'Madonna di San Sisto,' his latest effort. Other works are the plate after Hildebrandt's 'Warrior and Child' (1835); plate of Bega's

'Lorelei' (1837); Van Dyck's 'Portrait of Himself' (1841); 'Titian's Portrait of Himself' (1843); Van Dyck's 'Charles I' (1850); Raphael's 'Madonna Colonna' (1855); 'Frederick the Great'; 'Madonna della Sedia' (1865). Consult Fielich, 'Eduard Mandel und seine Werke' (Berlin 1883).

MANDERSON, Charles Frederick, American lawyer and politician; b. Philadelphia, 9 Feb. 1837; d. 1911. He received his early education in Philadelphia, removed to Canton, Ohio, in 1856, studied law and was admitted to the bar in 1859. He was city attorney in Canton, 1860-61; at the outbreak of the Civil War he enlisted as a private in the Union army, served in the campaigns in the Middle West and rose through the intermediate grades to the rank of brigadier-general of volunteers. He was severely wounded at the battle of Lovejoy's Station, Ga., and resigned from the army in 1865 on account of his wounds. He resumed his law practice in Stark County, Ohio, but removed to Omaha, Neb., in 1869. Here he soon became prominent in public affairs, was city attorney for more than six years and a member of the Nebraska Constitutional Convention in 1871 and 1874. In 1883 he was elected to the United States Senate, serving until 1895, and being chosen speaker pro tem in two Congresses, 1889-93. After 1895 he was solicitor for the Burlington system of railroads, west of the Mississippi; and was president of the American Bar Association in 1900-01. He published 'The Twin Seven Shooters' (1902), and several addresses on political and legal subjects.

MANDEVILLE, Bernard de, English writer; b. Dort, Holland, c. 1670; d. London, 21 Jan. 1732 or —33. He was educated at the Erasmus School, Rotterdam, and at the University of Leyden, where, in 1691, he received the degree of doctor of medicine. The date and occasion of his removal to England are unknown; but he appears soon to have settled in London where with but small success he practised his profession. He lived obscurely, with distillers and Dutch merchants as his acquaintances. Franklin, in his 'Autobiography,' records that in 1725, at "the Horns, a pale-ale house in— Lane, Cheapside," he was introduced to Dr. Mandeville, author of the 'Fable of the Bees,' who had a club there, of which he was the soul, being a most facetious, entertaining companion. Franklin at this time was merely a struggling young printer. unknown to fame: Mandeville gained no honor from his acquaintance. Mandeville had, however, a few acquaintances outside his tavern circle. Of these, the most important was Lord Macclesfield, the chief justice, at whose house Mandeville also met Addison. Of their world, however, Mandeville was never a real part, socially or intellectually.

Mandeville wrote much both in verse and prose; but his chief claim to notoriety was the authorship of the 'Fable of the Bees.' This, in its earliest form, consisted solely of a rude poem, in octo-syllabic couplets far from Miltonian, entitled, 'The Grumbling Hive, or Knaves turned honest.' In it, he related how, so long as they remained unscrupulous, the bees increased in numbers and prosperity, and how by their moral reformation the bees gained only their material ruin. He concluded that

"To enjoy the world's conveniences,
Be fain in war, yet live in ease,
Without great voice in a Utopia,
Seated in the brain.

Fraud, Luxury, and Death must live,
While we the benefits receive."

Of this piece, the earliest known edition is that of 1703. Mandeville's assertion that an earlier edition was printed is unsupported by evidence. In 1714, Mandeville reprinted the poem with prose additions, the whole bearing the new title 'The Fable of the Bees, or Private Vices Public Benefits.' This he further enlarged in the edition of 1723.

At this point, the grand jury of Middlesex interfered, and, in July 1723, presented the 'Fable' as a nuisance. Immediately the book became a subject of general attack. Richard Fiddes and John Dennis in 1724, William Law, Francis Hutcheson in 1725-27, Archibald Campbell in 1728 and Bishop Berkeley in 1732, all assailed Mandeville in turn. By law and by Berkeley, Mandeville was twice over-classed; but he held up his side of the argument, adding to his 'Fable,' in successive editions, tract after tract. That the 'Fable' should be thus attacked is not surprising. Its fundamental thesis, that private vices are public benefits, was as subversive of morality as its illustrative material was foul and its style plausible and forceful. Whether Mandeville was sincere or ironical in his argument is in dispute. He that thoroughly enjoyed his own foolhardiness cannot be doubted. But at least he accomplished one good thing; he pricked the sham morality of Shaftesbury. Other works by Mandeville are 'Esof, Dressed, or a Collection of Fables Writ in Familiar Verses' (1714): 'Free Thoughts on Religion' (1720); 'Enquiry into the Causes of the Frequent Executions at Tyburn' (1725). Consult Robertson, J. M., 'Pioneer Humanists' (London 1907).

MANDEVILLE, Sir John. The alleged author of a mediæval book of travels which enjoyed great popularity. A large number of manuscripts are in existence, the most important of which are in the Bodleian Library, Oxford, and the British Museum. The earliest version is in French, dating from the latter part of the 14th century, and upon this all the others appear to be more or less directly based. There is no English manuscript antedating the 15th century. The statements in the prologue regarding the translation are to be distrusted, and the autobiographical matter is contradictory. An exaggerated importance has sometimes been attached to the compiler of the work as the father of English prose, because of the statement in one of the English manuscripts that he had translated it out of French into English in order that every man of his nation might understand it. Errors in the translation prove that the man who wrote the French version and the man who made the English rendering cannot have been one and the same person.

The travels consist, in the main, of an account of the Holy Land and the routes thither, followed by a description of various parts of Asia. The narrative is almost wholly spurious, being made up of travel-books taken from various sources—travel-books, bestiaries, works on Eastern manners, legends, romances,
etc. The first half of the book is chiefly de-
pendent upon the travels of William of Bolden-
sele, a German who flourished in the 14th cen-
tury, and the adventures and marvels, related
with an air of sober truth. There are accounts
of monsters and curiously misshapen men, of
regions haunted by devils, of the Fountain of
Youth, of the Phoenix, of the realm of Prester
John, etc. The narrators have been a man of
wide reading, and he certainly displays con-
siderable skill in the selection and arrange-
ment of his materials.

In the prologue the author states that his
name is *John Maundeville, knight*, b. at Saint
Albans, England, and that he *passed the see,* in
1322 (1332), whereupon he traveled through
various countries. The epilogue asserts that
the gout forced him to return, and that he
occupied his leisure in writing his expe-
riences. It has been found impossible to identify
him with the historical John Mandeville.

The tomb of the reputed author of the
*Travels* was long shown at Liége, with an in-
scription to *Joannes de Mandeville, alias dic-
tus ad barbam.* Important in this connection
is the testimony of one Jean d'Outremeuse, in
a *Myreux des Historis,* now lost, to the effect
that there died in Liége, in 1372, a physician
named Jean de Bourgogne, *dit à la barbe,*
who declared himself on his death-bed to be
*Jean de Mandeville, chevalier, comte de Mont-
fort en Angleterre,* his real name having been
concealed because of a crime committed in
England. The veracity of D'Outremeuse is open to
suspicion, but it has been thought that this Jean
de Bourgogne may have been one John de
Burgoyne, who was forced to leave England in
1322, and that he compiled the *Travels,* bor-
rowing the name of one John de Mandeville,
who was concerned in the murder of Gaveston.
At all events, Jean de Bourgogne was known in
medieval times as the author of a treatise on
the plague, which is bound up in one instance
with a version of the *Travels.* It seems prob-
able, then, that this man, whatever his past
history may have been, was the real author of
the latter work, and that he preferred to con-
ceal his identity under the pseudonym of
Mandeville.

*Bibliography.*—Texts edited by Halliwell
and by G. F. Warner ( Roxburghe Club); arti-
cles in *Dictionary National Biography* by
Warner, and in *Encyclopedia Britannica* by
Yule and Nicholson.

Professor of English, Columbia University.

MANDINGOES, män-déng'göz, a linguistic
group of West Africa, remarkable for their
intelligence. The original country of these
people was the north slope of the high table-land
of Senegambia, between the head-waters of the
Niger and Gambia. Their language is more
widely diffused, and more employed by trans-
lators than that of any of the other languages
of West Africa. They formed at one time
a single large empire, but are now widely scat-
tered. The hair is woolly but other facial

negro characteristics are absent. From the
Arabs they have derived a high degree of cul-
ture and are far removed from savagery. Their
religion is Mohammedan. Consult Johnston,

MANDIOCA, the staple food of Brazil. See
CASSAVA.

MANDOLIN, a musical instrument, be-
longing to the lute species, played with a quill
or plectrum as well as with the finger. It is
of Italian origin, but latterly has become com-
mon in all civilized countries. In the usual
form it has four pairs of metallic strings and
a finger-board or neck with numerous frets
across it. Operatic composers have occasion-
ally employed the mandolin to obtain charac-
teristic effects. The commonest form of this
instrument is the Neapolitan with a range
G—E.* Other varieties are the Milanese with
six strings, the Spanish with six double strings
and the Turkish with seven double strings.
There are four double strings in the Neapolitan.

MANDRAGORA. See MANDRAKE.

MANDRAKE, a genus of perennial herbs
(*Mandragora*) of the order Solanaceae.
The species, of which only three are described,
are almost stemless, thick-rooted and large-leaved,
with rather large whitish or bluish bell-shaped
flowers, followed by globular berries. The plant
is chiefly interesting from the numerous allu-
sions to it in old writings, the superstitions re-
lying to it being mainly in connection with its
fetid, reputedly poisonous root of which, from a
fanciful resemblance of its roots to the human
figure, was considered an aphrodisiac.

The May-apple (*Podophyllum pellatum*), of
the order Berberidaceae, is often called *man-
drake* in the United States, where it is com-
mon east of the Mississippi River. It is a peren-
nial herb which sends up umbrella-shaped
leaves, usually two at the summit of a stem and
bearing one or two creamy, fragrant flowers in
the axil. A mawkish yellow fruit about the
size of a large cherry develops during early
daytime. The fruits are relished by pigs and
boys.* The creeping rootstock have been used
medicinally.

MANDRILL, the largest and one of the
most repulsive and savage of the African ba-
boons. (See BABOON). Consult DRILL.

MANED WOLF, a long-legged, slender-
bodied, long-nosed, brightly reddish wolf (*Canis
jubatus*) of eastern South America, which may
be regarded as one of the *aguas* or fox-
dogs (q.v.). It is a denizen of forests, not
being known south of the northern edge of the
Argentine pampas; and goes about alone at
night and secretly, seeking its food, which con-
sists mainly of small rodents, frogs and the
like, and even some fruit. It will some-
times attack sheep, but is remarkably timid, and
no one fears it.

MANES, mã'nez, among the Romans, the
souls of the dead. The good spirits were also
called *laries*, and the evil *larvae*. The manes
were reckoned among the internal ghosts; but
a belief was prevalent that they sometimes ap-
peared upon the earth in the form of ghosts,
particularly on the 30th of August, 4th of Oc-
tober and 7th of November; whence the Romans
considered these unlucky days.
MANES WORSHIP, from Roman *Manes* (q.v.), a term to denote the worship of the dead, whether of an ancestor of the particular worshiper or of some deified hero of his race. Herbert Spencer thinks it developed from the belief in an other self, which survived after death; and in this sense it was the outcome of a desire and endeavor to propitiate the ghost. Sir John Lubbock says of manes worship that it "is natural development of the dread of ghosts."

**MANET, ma'nà'.** Edouard, French artist: b. Paris, 23 Jan. 1832; d. Paris, 30 April 1883. Originator of the Impressionist movement, which finds its greatest expression in Claude Monet, Manet worked in an original manner before Impressionism was thought of. He rendered great service to the movement, not solely by his works, but by taking upon himself the criticisms directed upon the whole Impressionist School. Degas, Monet and Renoir, bold in art but timid of nature, resigned themselves to the misunderstanding and hostility of the public; but the more courageous Manet defended the movement with a strong controversial pen. He fought valiantly for himself and all the artists associated with his name.

Manet studied with Couture about 1850 and traveled throughout Europe, growing enthusiastic over Rembrandt, Titian, Velasquez, and Goya, painted some fine works such as the "Buvier d'absinthe" and the "Vieux musicien" and in 1861 exhibited at the Paris Salon portraits of his parents and the "Guiterero." His "Déjeuner sur l'herbe" attracted much attention. "Olympia" (in the Luxembourg) attracted more hostile criticism. It was a technical experiment significant for the period of its composition. "Angels at the Tomb of Christ," "Lola de Valence," "Toréador tué," "Acteur tragique," "Jesus insulté," the "Gitanos," "Rouviere" and portraits, by Eva Gonzales appeared before 1870. About this time Manet cast his lot with the Impressionists. The "Fight of the Kearseage and the Alabama" announced this transformation of his style and was followed by "Musicians," "Soldier," "Patrouille," "Opéra," the "Bon Bock" and the "Liseur." "Argentenil" (1875) shows his atmospheric researches. Next came a portrait of "Desboutin" and the "Linge" (1876), a portrait of "Fauve" as "Hamlet" (1877); "La Serre," a symphony in blue and white in which George Moore, the author, appears in boating costume (1878); the scene in the "Père Lathuile Restaurant" (1880); "Portrait of Rochefort" (1881); and the "Bar des Folies Bergere" (1882).

This work of Manet,* writes a French critic, "so much discussed and produced under such tormenting conditions, owes its importance beyond all else to its power and frankness." Ten years of developing the first manner, tragically limited by the war of 1870; 13 years of developing the second manner, as well as the efforts of the Impressionists. The period from 1860 to 1870 is logically connected with Hals and Goya; from 1870 to 1883 (when he died) the artist's work is complicated by the study of light. He had all the pictorial gifts which make the glory of the masters — full, true, broad composition; coloring of great power; blacks and greys, which cannot be found often elsewhere than in Velasquez and Goya; and a profound knowledge of values. He tried his hand at everything: portraits, landscapes, seascapes, scenes of modern life, still life and under each in turn served his ardent creative brush. His pictures will always remain documents of the greatest importance on the manners and customs of the Second Empire. A beautiful painter is what he was before everything else. It is almost inconceivable that the juries of the Salons failed to understand him. They waxed indignant over his subjects which offer only a restricted interest and they did not see the altogether classic quality of this technique without self-gratification, without tricks, without bitumen; of this vibrating color; of this rich paint; of this passionate design so suitable for expressing movement and gestures true to life; of this simple composition where the whole picture is based upon two or three values with the straightforwardness one admires in Rubens, Jordains and Hals. Manet occupies an important place in the French School. He is its master of the second half of the 19th century; the one who has really created a great movement. His work, the fecundity of which is astonishing, is unequalled.

**MANETHO, or MANETHO SEBENYTA,** Egyptian historian: native of Sebenty, in the Delta, and of the priestly order. He is believed to have lived in the reigns of Ptolemy I and II and to have written in the reign of Ptolemy I (323-285 B.C.), or of Ptolemy II (285-247 B.C.). According to some he was priest of Diospolis or Heliopolis; others contend that he was high-priest of Alexandria. His name has been interpreted variously as "Beloved of Thoth" or "Beloved of Néth." Scarcely anything is known of the history of Manetho himself, and he is renowned chiefly for his Egyptian annals. On the occasion of Ptolemy I dreaming of the god Serapis at Sineope, Manetho was consulted by the monarch, and in conjunction with Timotheus of Athens, interpreter of the Eleusinian mysteries, declared the statue of Serapis, brought by orders of the king, "the Baal of the Jews," the "Baal of Pluto;" whereupon the god had a temple and his worship inaugurated at Alexandria. The fame of Manetho was much increased by his writing in the Greek language, and so being enabled to communicate from Egyptian sources a more correct knowledge of the history of his native country than the Greek writers who had preceded him. Of this history, only extracts given by Josephus in his work against Apion, and an epitome by Eusebius and other ecclesiastical writers, remain. It appears to have been written in a compendious annalistic style of narrative, resembling the accounts given by Herodotus. The work of Manetho was in three books, the first began with the mythic reigns of gods and kings and ended with the 11th dynasty of mortals; the second continued the history from the 12th to the 19th dynasty; the third from the 20th to the 30th dynasty, when Egypt fell under the dominion of Alexander the Great. The reigns of the gods are given as amounting to 24,900 years, and the epoch of Menes, founder of the monarchy, commenced 3,555 years before Alexander (332 B.C.). The difficulties attending the
reconciliation of this chronology with the synchronic history of the Hebrews, Greeks and other nations, have given rise to numerous speculations and chronological systems since the revival of learning. The accession of newer and better information from the original sources of Egyptian monuments, papyri and other documents, has considerably enhanced the general value of the history of Manetho, which, prior to their discovery, had fallen into discred. But the restoration of the history of Manetho, notwithstanding all these resources and the passive epoch of the monarchy, are still to be sought, though certain dynasties, in the second and third books of his works, can be reconciled with monumental evidence. Besides the true work of Manetho above cited, another work, 'Sothis,' or the 'Dogstar,' (in allusion to the cycle of heliacal rising of that star of 1461 years) dedicated to Sebasteo or Augustus, the title of the Roman emperors, has been handed down; but there is considerable support for the opinion that it is spurious, and was added by the epitomizers; and another work, called the 'Chronicle,' in which the history was arranged according to cycles, was compiled by them. Besides the history, Manetho wrote 'Tōn Phisikōn Ἐπόμενος,' treating on the origin of gods and the world and the laws of morality; and another work on the preparation of the sacred kyphi, a kind of frankincense. The astronomical work called 'Apotelesmata' is a spurious production of the 5th century after Christ. Consult Boeckh, Manetho. (Berlin 1845); Bunsen, 'Egypt's Place in Universal History,' 1856-67; Müller, C., 'Historiaa Graeci Minores' (2 vols., Leipzig 1870-71).

MANEY, George, American soldier and diplomat: b. Franklin, Tenn., 24 Aug. 1826; d. Washington, D. C., 9 Feb. 1901. He was educated at the University of Nashville, fought in the Mexican War (1846-47) and served in the War of the Rebellion (1861-65), and was stationed at Shiloh (6-7 April 1862) he commanded first his regiment and later the 2d brigade of the 2d division. Promoted to major for his conduct at Shiloh, he commanded the 3d brigade of Cheatham's division in Hardee's army at Murfreesboro (31 Dec.-3 Jan. 1863) and Chickamauga (19-20 Sept. 1863), subsequently was appointed to the command of Cheatham's division and participated in the battle of Atlanta (22 July 1864). In 1876 he was nominated by the Republican party for the governorship of Tennessee, but before the election retired from the contest. He was Minister to Colombia in 1881-83, and to Paraguay and Uruguay in 1889-93. In 1884 and 1888 he was a delegate to the Republican National conventions of those years. In 1868-77 he was also president of the Tennessee and Pacific Railway.

MANFRED, king of Naples and Sicily, 1258-66: b. about 1251; d. 26 Feb. 1266. He was son of the Emperor Frederick II, on whose death, in 1250, he became Prince of Tarentum, and acted as regent in Italy in the absence of Conrad IV, his half-brother. After the death of Conrad he was regent of the kingdom during the minority of his nephew Conradin. At the instigation of Pope Alexander IV a crusade was preached against him, and Manfred was temporarily driven from his kingdom, which, however, he succeeded in recovering, and on the rumored death of Conradin had himself crowned king of Palermo, 10 Aug. 1258. The Pope at once excommunicated him and his followers, but Manfred marched into the papal territory and compelled acknowledgment as master of Tuscany. Through matrimonial alliances for himself and his daughter he sought to increase his power, and his administration of the government was efficient, benign and for a time prosperous. But the excommunication was renewed by Pope Urban IV, who also bestowed his kingdom on Charles I of Anjou, and a war ensued in which Manfred was finally defeated and killed at Benevento. After his death imprisonment and extreme cruelty were visited upon his widow and children.

MANFRED. Lord Byron's powerful and imaginative "witch-drama." 'Manfred,' (1817), was composed under the spell of the awe-inspiring scenery of the Alps, which Byron had visited in 1816 on the tour through Germany and Switzerland recorded in the third canto of 'Childe Harold.' The hero is a portrait combination of Faust and of the Byronic type portrayed in the earlier verse tales, a lofty and defiant spirit, dwelling alone in a dark castle among the higher Alps, haunted by remorse for an act the nature of which we are left to guess. Seeking to interview the spirit of the dead Astarte, the victim of his crime, and to obtain her forgiveness, he calls up the spirits over whom he has control and at length resorts to the abode of the evil principle itself. The ghost is evoked, but returns an ambiguous answer to his question. On the morrow Manfred expires, after resisting a summons to repent from the old abbot of Saint Maurice and denying the demons who have come to possess his soul. Some biographers have seen in the poem a reflection of its author's relation with his half-sister, Aurora Leigh. In any case Byron has made his hero in his own image, infusing into him the characteristic Byronic spirit of proud rebellion and passionate despair. In style the poet aims at and partly succeeds in achieving an imaginative grandeur commensurate with his superhuman theme. Manfred attracted the favorable notice of Goethe, to whom 'Faust,' translated in his presence by Monk Lewis in 1816, Byron is indebted for some of the essential elements in his drama. Consult 'The Works of Lord Byron' (edited by R. H. Prothero); and 'Cambridge History of English Literature' (Vol. XII).

JAMES H. HANFORD.

MANGABEY, mān-gābē, one of the odd West African monkeys of the genus Cercocebus, nearly related to the guenons and to the macaques. They are distinguished by the whiteness of the eyeballs and the backward growth of the hair on the crown of the head. Some of the species are well known, especially the sooty mangabey (C. fuscus) which sometimes carries its long tail turned over its back. There are three or four species and they make docile pets.

MANGALDAN, mān-gäldän', Philippines, a pueblo of the province of Pangasinán, Luzon, situated 12 miles northeast of Lingayén, the
province. Capital. It is on the coast road and is the
meeting point of several roads extending to towns in the interior, and is on the route of the railroad from Dagupan to Manila. Pop. 15,800.

MANGALORE, mán-gá-ló'r, India, a sea-port town, on the Malabar coast, capital of the district of South Canara, Madras presidency. It is clean and well built, surrounded by groves of coconut palms and stands on the edge of a fine salt-water lake or back-water formed at the mouths of two rivers. The port will not admit of vessels drawing more than 10 feet of water, except in spring tides; but there is good anchorage off the mouth of the river, in five to seven fathoms. Tile-making is an im-
portant industry. The exports are principally coffee, rice, sandal-wood, cassia and turmeric; the imports sugar, salt and piece-goods. There is a Roman Catholic college, and the Basel Luthern mission in India has its headquarters here. The Roman Catholics have a bishop and several churches, a considerable number of the natives belonging to this faith. It was captured by the Portuguese in 1596 A.D., and by the English in 1668, finally falling into British pos-
session in 1799. Pop. about 48,412.

MANGANESE, máng-ga-nés', a metallic element which is widely distributed in nature, though it never occurs except in combination with other elements. The dioxide was believed to be a compound of iron until 1774, when Scheele proved it to be a compound of a pre-
viously unknown metal; and in the same year Gahn prepared the element in its metallic form. It was first called "magnesium" from the fact that it was prepared from a compound then called "magnesia nigra" (and now known as magnesium peroxide and dioxide); but in 1808 the name was arbitrarily changed to "manganese," by Buttmann.

Manganese may be prepared in the metallic form by reducing any of its oxides with carbon at a white heat, and this is the method followed commercially. For experimental pur-
poses, however, it is easier to obtain it by redu-
cing the chloride with metallic sodium or magnesium. The physical properties of man-
ganese vary somewhat according to the precise way in which the metal is obtained. Its melt-
ing-point may be taken as 3500° F., its specific gravity as 7.4 and its specific heat is 0.122. It is a gray, hard, brittle, lustrous metal, suscep-
tible of taking a high polish, and resembling iron in most respects, both physically and chemi-
tically. It is not magnetic, however. The pure metal does not appear to be affected by dry
air, but moist air oxidizes it, at least super-
ficially. Some authorities describe it as oxidiz-
ing readily in common air, and as decomposing water with almost as great a facility as potas-
sium, but it appears probable that the specimens from which these results were obtained con-
tained impurities of some sort. Metallic man-
ganese is not used in the arts, but some of its alloys with iron, aluminum and copper are valu-
able. It is particularly valuable in steel, its presence in small amount increasing the tenac-
ity, tenacity and elasticity of the metal. It is added to the molten steel, in the process of manu-
facture, in the form of an iron-manganese alloy containing from 10 to 80 per cent of the latter metal, and known in the arts as "spiege-
lesen" or "ferromanganese." The "manganese" of commerce is usually not the metal itself, but a mixture of its oxides. Manganese is used in the steel industry almost entirely in the form of two alloys, ferromanganese and spiegeleisen. These are both alloys of iron, manganese and carbon. Ferromanganese may contain as much as 80 per cent of manganese, but averages in this country about 70 per cent; whereas the percentage of manganese is much lower; the standard figure upon which the price is based is 20 per cent. The average manganese content is about 18 per cent. Both alloys are high in combined carbon, the amount of which runs up to 7 per cent. The manganese alloys are added to molten steel from the converter, or open hearth furnace, for the purpose of in-
roducing both manganese and carbon. The
manganese cleanses the steel by combining with the contained oxygen and, to some extent, with the sulphur, and then carries these impurities into the slag. The carbon is for the purpose of giving the steel the required hardness and strength. By adding larger amounts of the alloys, manganese steel is wrought which is noted for its hardness, tenacity and durability. It is much used in the wearing parts of heavy 
machinery. In recent years the tendency has been to use more ferromanganese and less spiegeleisen, on account of the much smaller amount of ferromanganese that it is necessary to add to the steel. Spiegeleisen usually has to be melted in a cupola furnace before using, but ferromanganese can be added direct. The latter also introduces less carbon, which some-
times is an advantage. Ferromanganese and spiegeleisen are produced by smelting a mixture of manganese ore and iron ore in an ordinary blast furnace. A high temperature is required, and the amount of fuel used is much grea-
ter than in iron smelting. A considerable amount of the manganese goes into the slag. The slag from a ferromanganese furnace may contain as much as 10 per cent of manganese. A con-
siderable tonnage of the iron-manganese alloys is now produced in the electric furnace.

Chemically, manganese is a dyad. It has the symbol Mn, and an atomic weight of 55 if O=16, or 54.6 if H=1. It forms numerous oxides, the best known of which are (1) the monoxide, MnO, from which the manganeous salts may be prepared, and which is itself ob-
tained by heating manganese carbonate out of contact with the air; (2) the sesquioxide, Mn2O3, which exists in nature as the mineral braunite, and which is also formed when the monoxide is heated in air to a red heat; (3) the red or mangano-manganic oxide, MnO, which corresponds to the magnetic oxide of iron, does not form salts, and exists in nature as the min-
eral hauynsmellite; (4) the black oxide, or di-
oxide, MnO2, which occurs in nature as pyro-
lusite and varvactite, and which is largely used in the arts in the preparation of oxygen and chlorine; (5) the trioxide, MnO3, which is diffi-
cult of preparation and very unstable; and (6) the heptoxide, MnO7, a heavy, dark green liquid, prepared by treating potassium permanganate with cold water, is combustible and is largely used in the form of its oxides also occur in a hydrated form, as minerals. Of the soluble manganese salts, the chief representatives are the sulphate and the chloride. Manganous sulphate, MnSO4, is pre-
pared by treating the dioxide with sulphuric
acid, oxygen being liberated at the same time in 
accordance with the equation MnO₂ + H₂SO₄ → 
MnSO₄ + O₂ + H₂O. It crystallizes with five 
moles of water, as a pink water-soluble salt, and 
is used in dyeing and in medicine. The chloride, 
MnCl₂, crystallizes with four molecules of water, 
and is obtained as a by-product in the manu-
facture of chlorine by the action ofhydrochloric 
acid upon manganese dioxide. It is used in cal-
tico printing. Of the insoluble manganese salts, 
we may specially note the sulphide and the car-
bonate. The sulphide, MnS, is thrown down as 
a flesh-colored precipitate, when a soluble man-
ganese salt is precipitated by an alkali sul-
phide. The carbonate, MnCO₃, occurs native as 
the mineral rhodochrosite, and it may also be 
obtained as a white precipitate by adding an 
alkaline carbonate to a solution ofmanganese 
sulphate or chloride.

Two other important classes of manganese 
compounds are known, in which the manganese 
does not act as a base, but as an acid-forming 
former. These are the manganates and per-
manganates, which may be regarded as the salts 
or "manganic acid," H₃MnO₄, and "permanganic 
acid," H₅MnO₈, respectively. The potash 
salts of these acids are by far the 
most important ones. Potassium manganate, 
K₂MnO₄, may be prepared by melting mangan-
ese dioxide with caustic potash and a little pot-
asium chlorate, dissolving the bright green 
mass so obtained in a small quantity of water, 
and crystallizing by evaporation in a vacuum. 
Potassium manganate is used in laboratory 
operations, but it is very unstable, taking up 
ingen and with great readiness, and depositing hy-
drated dioxide of manganese. If the green solu-
tion containing potassium manganate is allowed 
to stand in the air, it absorbs oxygen, changes 
in color to a bright purple and deposits hy-
drated manganese dioxide. The purple color is 
due to the presence of potassium permanganate, 
K₂MnO₄, which may be obtained, by crystalliza-
tion, in the form of purple prismatic crystals. 
Potassium permanganate is a powerful oxidizing 
agent, and is extensively used in chemistry, 
in the arts and in medicine, on account of the 
facility with which it parts with oxygen, espec-
ially in the presence of organic matter. It 
forms the basis of Condyl's fluid, which is 
largely used as a disinfectant.

The chief ores of manganese are the black 
oxide pyrolusite (MnO₂, 63.2 % Mn); psilomel-
ane (MnO·H₂O, 60.5 % Mn); braunite (Mn₂O₃, 
MnSiO₄, 69.7 % Mn); wardite (MnO·6H₂O, 
earthly oxide (Mn 15-40 %); manganite 
(MnO·H₂O, 62.4 % Mn); rhodochrosite 
(MnCO₃, 61.7 % Mn), and franklinite 
(Fe₃Mn₂)O(O·Fe₃Mn)₂O₆). The ores are often 
associated with other metals, particularly with 
iron oxides, and with silver ores. Like residual 
limonite (see Iron Ores) manganese ore is usu-
ally secondary, resulting from the removal of 
more soluble substances during the weathering 
of slightly manganiferous rocks. For many 
years until 1914 Russia was by far the great-
est producer of high grade manganese ores. 
Most of this output came from one locality near 
Chiatouri, south of the Caucasus Mountains. 
Some engineers have estimated the total 
reserves of high grade manganese in this 
one district to be upward of 100,000,000 tons, 
although this has been disputed. For some time 
before the war Russia's production averaged 
more than half a million tons yearly. Next in 
importance to Russia as sources of manganese 
are Brazil and India. In Brazil there has been 
a very rapid development of the industry and 
the production of manganese in 1914 was esti-
ated to have been about 500,000 tons. As 
the war has practically stopped the exportation 
of manganese from Russia and India, the 
deposits in Brazil have assumed very great 
importance. The United States is also a 
producer of manganese ore. A writer in the 
Mineral Industry some years ago stated 
that the manganese output of the country was 
"insignificant because of the trifling character 
of the deposits." In 1914 the total production 
in the United States of ore containing 40 per 
cent or more of manganese was only 2,635 long 
tons. In the production of ferromanganese and 
spiegeleisen and in the other arts using man-
ganese compounds it is desirable to have an ore 
containing at least 40 per cent of the metal. 
Before the late war it was almost impossible 
to find a steel maker willing to buy a lower 
grade. During the war some steel makers 
bought ore containing only 28 per cent man-
ganese and were glad to do so. The manganese 
bearing ores mined in the United 
States are classified as manganiferous iron 
ores, which may or may not contain silver and lead. 
These ores the manganese is mainly valuable 
as a flux in smelting operations, although it can 
sometimes be used for making spiegeleisen. 
The recent high prices have resulted in a 
material increase in the domestic production 
of high grade ore and the output for 1917 is esti-
imated at about 120,000 tons. This amount is 
still much below the requirements. The United 
States Geological Survey has recognized the 
importance of the manganese situation and has 
recently issued a bulletin giving a list of all the 
shippers, prospective shippers and purchasers 
of manganese ores in the United States, 
completed up to 1 Oct. 1917. This list was re-
printed in the Engineering and Mining 
Journal for 26 Jun. 1918. It included the names of 171 
individuals and companies producing or about 
to produce manganese ores, and 47 companies 
that are listed as purchasers. The shippers 
are located in 21 different States, of which 
the most important are Arizona, Arkansas, Cali-
ifornia, Colorado, Georgia, Minnesota, Mont-
ana, Tennessee, Utah and Virginia. In 1910 
The United States Geological Survey issued a 
very excellent monograph, Bulletin No. 427, 
titled 'Manganese Deposits of the United States,' by Edmund Cecil Harden, giving very 
complete data in regard to ores, alloys, production 
and uses. The same author contributed a 
paper entitled 'Manganese Ores of Russia, India, 
Brazil, and Chile,' to the Transactions of 
The American Institute of Mining Engineers 
(Vol. LVI, p. 31). In the same volume there 
is an article by Joseph T. Sine, Jr., and 
Benjamin Leroy Miller on 'The Manganese 
Ores of the Lafayette District, Minas Geraes, 
Brazil.' In the Engineering and Mining 
Journal (issue of 9 Feb. 1918) is a popular article by Henry V. Maxwell entitled 'Prospecting for 
Manganese.' See MINERAL PRODUCTION OF 
THE UNITED STATES.

MANGANESE BRONZE, a metallic ele-
ment in which the copper forming the base of 
the alloy is mixed with a certain proportion of 
ferro-manganese, and which has exceptional
qualities in the way of strength and hardness. Various qualities are manufactured, each suited for certain special purposes. One quality, in which the zinc alloyed with the treated copper is considerably in excess of the tin, is made into rod and wire supports when simply cast is said to have a tensile strength of about 24 tons per square inch. Another quality has all the characteristics of forged steel without any of its defects. Another quality is in extensive use for toothed wheels, gearing, brackets and all kinds of machinery supports. From its non-liability to corrosion it is largely employed in the manufacture of propellers.

MANGANITE, native hydrated oxide of manganese, MnO (OH), or MnO·H₂O. It crystallizes in the orthorhombic system, but also occurs in columnar and stalactic forms. It is brittle, and has a hardness of 4 and a specific gravity of about 4.3. It is steel gray to iron black in color, and opaque with a submetallic lustre. It occurs in the Harz region, in Norway and Sweden and in the British Isles. In the United States it is found in the Lake Superior mining district, and in Douglas County, Colo. It also occurs in Nova Scotia and New Brunswick. Manganite is used as a source of manganese for the preparation of spiegelisen and other alloys, and also in the manufacture of pigments and dyes.

MANGASARIAN, Mangasar Mugurditch, American author and lecturer: b. Mashgerd, Armenia, 29 Dec. 1859. He was educated at Robert College, Constantinople, 1872-76 and at Princeton Theological Seminary. He entered the Presbyterian ministry in 1886, and held a pastorate in Philadelphia 1882-85, when he resigned to become an independent preacher and lecturer. In 1900 he organized the Independent Religious Society, Rationalist, at Chicago, and has been its lecturer since that time. He is the author of 'A New Theism' (1901); 'The Truth about Jesus' (1909); 'How the Bible was Invented' (1910), and numerous other works.

MANGATAREN, män-gä-tär'en, Philippines, a pueblo of the province of Pangasinan, Luzon, 18 miles south of Lingayén; it is on the Agno River road. Pop. 10,150.

MANGE, a cutaneous disease to which dogs, horses, cats, etc., are liable. It resembles in some measure the itch in the human subject, ordinary mange being due to the presence of a burrowing parasite. Both local application and internal remedies are used in its cure. Frequent washing of the skin is essential. See FLEA.

MANGEL-WURZEL. See BEET.

MANGIN, Joseph, French general: b. 1865. Descended from a distinguished Lorraine family, he served from his 24th year in Tonkin and in every part of Northern Africa, and accompanied Marchand on his historic journey from the Congo to the Nile in 1858. He first commanded a regiment in 1911, when a military instructor to the Moroccon forces of Sultan Mulai Hafid, he defended Fez against the rebellious Berber tribes. In August 1912 he led a flying column of 4,000 men from Fez to Marakesh, effecting a dramatic rescue of nine French prisoners held by the pretender El Hiba. He received the congratulation of his government and was made a commander of the Legion of Honor. At the outbreak of the European War he was given a brigade command in the 5th Army, which took the shock of the first German onset at Charleroi. At the Marne he led a division and was heavily engaged at the battle of the Aisne. After participating in various other battles he arrived at Verdun with his division in March 1916. Here he led his men to the recapture of La Caillette Wood and (22 May) to the brilliant but shortlived reconquest of Domont. He was placed in command of the new 3d Colonial Corps in June and given charge of the crucial sector on the right bank of the Meuse. In October his command recaptured Douaumont and also Fort Vaux, with nearly 5,000 prisoners. He deprived the Germans of a wide sweep of territory around Verdun in December, and in the spring, conducted a big offensive between Soissons and Rheims, which was suddenly stopped. Mangin was relieved of his command and relegated to an oblique line of post through a cabinet crisis, the accession of Clemenceau, Mangin was sent back to the field. In the summer of 1918 he commanded the French-American forces operating between the Aisne and the Marne, delivering smashing blows against the German lines which contributed enormously to ultimate victory.

MANGLE, a machine for smoothing lines and cotton goods. See LAUNDRY MACHINE.

MANGO, mân-gô, a genus of trees (Mangifera) of the family Anacardiaceae. The 30 species are natives of southeastern Asia, where some of them have been distributed by man throughout the tropics of both hemispheres. The wood of various species is used for boat and canoe making, for house building and for boxes. It is gay, rather soft and easily worked. The trees are valued also for shade, being of large size and attractive form, and very leafy, the leaves large, leathery and evergreen. It is for their fruits, however, that they are most esteemed. These are widely used for human food, especially in the East, either ripe, in which condition they are eaten raw, with or without wine, sugar and spices, or unripe as preserves, jellies or pickled. They are also used for making sugar and glucose. The finer varieties are considered equal to the choicest pineapples and even to the mangoes.

The most commonly planted and most widely distributed species is the common mango (M. indica), a native of India. It often exceeds 40 feet in height, bears terminal panicles of rather small pinkish or yellow flowers, followed by smooth kidney-shaped yellow or reddish fruits which often weigh more than half a pound. Each fruit contains one large flattened seed almost as long and often nearly as wide as the fruit, but flattened like the seed of a melon. The kernel is often roasted and eaten like chestnuts. The pulp of the fruit is soft, luscious in the finer varieties but very fibrous in the inferior sorts. These have a more or less pronounced flavor, suggestive of turpentine, which is characteristic of all parts of the tree. Since 1782, when the mango was introduced into Jamaica with a lot of other plants taken from a French vessel captured on the Spanish coast, the fruit has spread throughout the West Indies and southern Florida. In Florida, however, the
freeze of 1886 destroyed all trees except those in the extreme southern part, where the mango is now confined. The market, which seems to be growing but is somewhat limited because of the prevailing ignorance regarding the fruit, is supplied mainly from the West Indies. California supplies little more than its home market.

The trees do best upon well-drained sandy land, and should be well supplied with potassic manures. They quickly fail to bear upon wet soils. They may be propagated by grafting, but since a large proportion of the varieties reproduce practically without change by seed this method is widely employed.

Several other species of mangoes are cultivated. For instance, the horse mango (M. fatida), a native of Malacca, is cultivated in India, and M. sybeatica, whose fruits are dried and used like prunes.

MANGO-BIRD. Several birds are called mango-birds in various parts of the world because they frequent mango-trees. The East Indian one is an oriole (Oriolus kundoo); the West Indian one, so called in Jamaica, is a hummingbird (Lampornis volacauda), which may occasionally visit Florida.

MANGO-FISH, one of the threadfishes, a small perch-like sea-fish (Polynemus plebius) which is numerous along Oriental coasts, and approaches the shore and is caught at the time when mangoes ripen. The same name is sometimes given to a relative in the West Indies (Polydactylyus virgineus), called barbudo in the Cuban markets.

MANGOSTEEN, a tree (Garcinia mangostana) of the family Guttiferae, native of the East Indies, sometimes cultivated in tropical America. It is one of the best-known fruits of the East Indies, and by many people is considered the finest fruit known. The fruits are about the size of a mandarin orange and of similar shape, with a thick, red-purple rind; the flesh is snow-white or cream-colored, so delicate that it melts in the mouth, and of delicious flavor. Attempts to grow the tree in Florida have been unsuccessful, and as the fruit does not bear shipping well it is little known outside the regions where it is grown.

MANGROVE, mán-gro?v, a genus of trees and shrubs (Rhizophora) of the family Rhizo-phoraceae. The species, of which there are less than half a dozen, are all natives of the tropics, where they inhabit tidal marshes and the mouths of streams. They are remarkable for their aerial roots, which extend from the branches to the mud and then become trunks for the extension of the trees, which gradually advance even to low tidal mark; and also for their peculiar method of seed germination, the seeds sprouting while still attached to the twigs. The wood, which in some species is close-grained and durable, is used for fuel and to a small extent for other purposes; the bark, which is rich in tannic acid, is employed in tanning; the fruit of some species is edible and is used for wine making. The trees are important soil builders, their numerous roots serving to catch debris and by checking the current enhance the settling of mud from the water. Hundreds of acres of arable land have thus been formed in Florida. The best-known species is R. mangle.

MANGROVE HEN, a West Indian clapper-rail (Rallus longirostris), which seeks its food in the mangrove swamps.

MANGROVE SNAPPER, the gray snapper, an excellent food-fish, which abounds among the mangroves along the coasts of Florida and the Bahamas, and thence to Brazil. See SNAPPER.

MANGUANGAS, mán-gwán-gás, a collective name for a number of Negrito tribes living in the forests of the island of Mindanao, Philippines. They are of the Malay race. See PHILIPPINE ISLANDS.

MANGUANES, mán-gwán-é-
ánz', the natives of the interior of Mindoro, Rambon and Tablas (qq.v.), Philippines; they are divided into four branches, one of which is of Negrito blood, another is Mongoloid and the other two are of the Malayan race. There are several tribes, including the Banogt, the Buquil, etc. The term is also used in the island of Palawan to designate all wild natives of unknown origin. See PHILIPPINE ISLANDS.

MANGUM, mán-gúm, Willie Person, American legislator: b. Orange County, N. C., 1792; d. Red Mountain, N. C., 14 Sept. 1861. He was graduated from the University of North Carolina in 1815, was admitted to the bar in 1817, in 1818 was a member from Orange County of the lower house of the State legislature and in 1819 became a judge of the Superior Court. From 1 Dec. 1823 to 18 March 1826 he was a Whig representative in the 18th and 19th Congresses; but this post he resigned, and again he was elected a judge of the Superior Court. He retired from the court in 1826, but filled the office a third time in 1828-30. He was a United States senator from 5 Dec. 1831 to 1836, when he resigned, and from 9 Dec. 1840 to 3 March 1853, and in 1842-43 was president pro tempore of the Senate. Throughout nearly his entire term of service in Congress he was a leader of the Whigs; and in 1837 he received the 11 electoral votes from South Carolina for the Presidency of the United States.

MANGUM, Okla., village and county-seat of Greer County, on a fork of the Red River, about 150 miles southwest of Oklahoma city at a junction of the Chicago, Rock Island and Pacific, and the Wichita Falls and Northwestern railroads. It is situated in a rich agricultural district, and has cotton gins, grain elevators and flour and lumber mills. Pop. about 3,000.

MANHATTAN, one of the boroughs comprising the city of New York. See NEW YORK CITY.

MANHATTAN, Kan., city, county-seat of Riley County, on the Kansas River at the junction of the Big Blue, and on the Chicago, Rock Island and Pacific and the Union Pacific railroads, about 50 miles northwest of Manhattan, the surrounding region is mainly agricultural; lime-stone quarries are in the vicinity. The chief industrial establishments are a foundry, machine shops, flour mills, lumber and brick yards. Manhattan is the trade centre for a large section, and ships livestock, grain and vegetables. The city is operated by the commission form of government, and owns and operates the waterworks. Pop. about 5,772.
MANHATTAN COLLEGE, an institution in Manhattan borough of New York City directed by the Christian Brothers. It was opened originally (1849) as an academy for young men, under the name of the Academy of the Holy Name, but the constant increase of the student body and the consequent demand for higher branches of study forced the academy to adopt the college courses, which was done in 1853, the academy being then incorporated under the name of Manhattan College. The courses lead to the degrees of B.A., M.A., B.S., and C.E. The resources of the college are derived from tuition only, there being no endowment. The institution reported at the end of 1917: professors and instructors, 26; students, 350; volumes in library, 14,000; value of ground and buildings, $25,000; income, $49,000; number of graduates, about 1,000.

MANHATTAN ISLAND. See New York City.

MANI, mā-nē, the founder of the sect of Manichaeans. See Manichaeans.

MANI', mā-nē', the indigenous peanut of Cuba, Peru and Chile. In Mexico and Central America it is called cacahuate (q.v.).

MANIA. See Insanity.

MANICALAND, mā-nē-ka-lānd, South Africa. Former territory of southern Rhodesia, situated on the border of Portuguese East Africa, east of Mashonaland, between the parallels of 18° and 21° S., and the meridians of 30° 30' and 33° 34' E. It is now divided between Portuguese East Africa and Rhodesia. Manica is the name of a small distiller fuel on board steamer. See Rhodesia.

MANICHÆANS, mān-i-kē'anz, the followers of Manes, Mani or Manichæus, as he is variously styled, a Gnostic teacher, whose opinions prevailed in western Asia and eastern Europe during the 4th and 5th centuries of our era. Manichæism is generally considered to be the Persian type of gnosis, as it is distinguished by Zoroastrian dualism, and other features of that system. Hebrew elements of religion and Buddhistic doctrines were also found in Manichæism, which appears to have been a eclectic jumble of wild fancies, among which the soberest and strongest dogmas of the Christian creed were sometimes seen to be embedded. The Dualism of Manes was conceived of by him as manifested in two contiguous realms of light and darkness, good and evil. The kingdom of light included a heaven and an earth, the latter guarded by æons, or good spirits, and presided over by a spirit of goodness. From the kingdom of darkness sprang Satan and his evil angels. This confusion and mixture, in the universal, of light and darkness, originated before the creation of man, a creature of light and darkness combined in proportions varying in each individual. The human race is finally to be judged of darkness and sin. Jesus Christ was looked upon as dual in nature; there was Jesus who did not and could not suffer, Jesus imparibilis, a sort of phantom or immaterial personage, and Jesus patibilis, who suffered death upon the cross.

The practical side of Manichæism appears in the condemnation of marriage, or sexual indulgence of any sort, and the ascetic purification of hands, mouth or bosom, which kept the initiated from eating animal food, contracting ceremonial defilement through the touch and indulging the flame of human passion in the heart. There were two classes of disciples, the initiated, or perfects, and the auditores, hearers, or novices. Saint Augustine of Hippo was, for nine years before his conversion to Christianity, a Manichæan hearer. These hearers lived a much more strict life than the perfect, and constituted by far the majority of the Manichæan sect. The clergy of this sect were organized after the model of the Christian ministry; their rite of baptism was performed with oil instead of water; they had also a eucharistic meal among their public ceremonies. The system spread rapidly through the Roman Empire and competed with Neo-Platonism in hostility to the Church. Diocletian persecuted the Manichæans and under Justinian the profession of Manichæism was a capital crime. The system, however, flourished in Asia beyond the 10th century and has reappeared in some shape or other, and under different names at different times in subsequent periods of European history. Routh, 'Acta Disputationis Archelai' (1868); Eusebius, 'Ecclesiastical History'; De Beausobre, 'Histoire critique du Manichæisme' (1754), and Harnack, 'History of Dogma' (1897).

MANIFEST, in law, a written instrument delivered by the captain of a ship to the custom officers setting forth in detail the goods shipped, the consignors, etc. If there are passengers on board, this must be stated, and if the ship is about to proceed to a foreign port, the coal or provisions on board must be set forth.

MANIFESTO, in international law, a declaration publicly issued at the commencement of a war by a contending power to show the cause which justifies such a measure. Manifesto is a term in the form of public letters; they contain a short address to the public in general and are signed with the name of the person who issues them. See Law, International.

MANIFOLDS. Theory of. See Abstrac-

MANIGAULT, Arthur Middleton, American soldier. b. Charleston, S. C., October 29,-
d. 16 Aug. 1866. In 1846 he was elected first lieutenant of the Charleston company in the "Palmetto" regiment for the Mexican War, throughout which he served. In June 1861 he was elected colonel of the 10th regiment, South Carolina infantry, and in 1861-62 was in command of the 1st South Carolina military district. From the early part of 1862 he served in the army of the West successively under Bragg, Johnston and Hood, in 1862 was placed in command of a brigade, and in 1863 made brigadier-general. At Chickamauga he distinguished himself by his repeated assaults, and in the retreat before Sherman's invasion he did some vigorous fighting. His death was hastened by a wound received in the battle of Franklin, Tenn. (30 Nov. 1864). Subsequent to the war he was elected by the Democrats adjutant-general of South Carolina, serving until his death.

MANIHOT. See Cassava.

MANILA, mā-nil’a or mā-nil’ī, the capital of the Philippine Islands, the principal city of Luzon as well as of the archipelago, situated in lat. 14° 35’ 31” N. by long. 120° 58’ 8” W., lies
1 Magellan Monument by the Pasig River, Manila
2 A Street of Nipa Huts in Manila
on both sides of the Pasig River, and has a frontage of four miles on the bay of Manila. The police precinct extends three miles from the shore over Manila Bay, making the total area under the police jurisdiction of the city 32 square miles or 20 square miles on land, and 12 on the bay. The name of the city is a corrupt form of a Tagal word meaning "Maymila," and means a species of shrub or brush which formerly grew on the site of the city. It is now applied not merely to the town within the walls, but to the whole region and the inhabitants included within the corporate limits. The most important divisions of the city are the walled town, particularly known as Manila, on the left bank of the river and Binondo on the right bank. Other districts, formerly more independent than at present, have retained their names and some degree of individuality. Immediately south of the walled town lies Ermita; farther on along the shore is Malate; and inland directly east of these lie Paco, Pandacan and Santa Ana. The most northern district on the shore of the Pasig is Quiapo, with the Punta de la Peña and the lower part and mouth of the river lies San Nicolas. The other districts north of the Pasig are Quiapo, San Miguel, Sampaloc, Santa Cruz and Trozo.

The walled town was occupied chiefly by the members of the Spanish colony. Its streets are straight and run at right angles with one another, dividing the area within the walls into 54 blocks. The buildings have usually two stories, and are built like the houses of Spanish cities. It contains the cathedral, the principal religious houses and churches of the ecclesiastical orders, various schools, the University of Saint Thomas, the hospital of San Juan de Dios, the mint and the new city hall. This building was started by the Cosmopolitan Hospital Association in 1901 but owing to lack of funds remained unfinished and was purchased and completed by the city authorities. The cathedral is an imposing building.

The north wall of the town extends along the bank of the Pasig. The moat outside of the rest of the wall runs a moat receiving water from the river just east of the town and emptying into the river just west of it. Until 1852 the drawbridges across the moat at the several gates were raised every evening at 11 o'clock, and lowered in the morning at 4. Since then it has not been customary to close the gates.

Only a few of the streets of Manila, of which there are about 80 miles, are paved. The rest are macadamized. European and American retail shops occupy the Escolta, in Binondo. The street called Rosario is almost entirely given up to Chinese shops. The wholesale houses and the banks occupy the district north of the Pasig and west of the Bridge of Spain.

Miguel Lopez de Legaspi established Spanish authority in the city in 1571, and was joined with Lacandola, Rajah of Mavnila, which was confirmed by the compact of blood made between the contracting parties. On 3 June 1571, he conferred upon Manila the title of "distinguido lugar," and others, and was subsequently confirmed by royal decree. He also gave the city a municipal organization, by appointing two alcaldes, one aquacit mayor and 12 regidores. He also appointed one notary for the cabildo, or corporation, and two notaries public for the court of the alcaldes. Later there were only eight regidores, but in addition a registrar and a constable. The alcaldes were justices, and were elected annually by the householders by the corporation. The regidores were aldermen and with the registrar and constable held office permanently as a proprietary right. The permanent positions in the cabildo could be bought and sold or inherited. This form of organization was maintained throughout the Spanish period.

In 1578 the church and all the inhabitants of Manila were separated from the jurisdiction of the archbishop of Mexico, and the church was erected into a cathedral, but the new bishop was subject to the archbishop of Mexico. On account of the long time needed to communicate between Spain and the Philippines the king ordered the governor of the islands to fill vacancies in the cathedral whenever they might occur.

As early as the beginning of the 17th century the city of Manila was surrounded by a wall of hewn stone about three miles in circuit. It contained a college district, the lower part and mouth of the Pasig, and the smaller" school for girls called the Santa Potenciana, two hospitals, one for Spaniards and one for Filipinos, a house of mercy for receiving sick slaves and furnishing lodgings to poor women and a hospital for Chinese. At this time there were within the walls about 600 houses built of stone and mostly occupied by Spaniards. There were also about 2,000 Chinese, with 200 shops, and a garrison of 200 soldiers.

In the war between England and Spain, in 1762, Vice-Admiral Samuel Cornish was ordered to proceed against Manila. He carried British and Sepoy forces under Sir William Draper. On 6 Oct. 1762 Archbishop Rajao, as acting governor, surrendered the city, agreeing to pay the British an indemnity of $6,000,000. Only a part of this was paid. The affairs of Manila were administered by the British military authorities until 10 Feb. 1763. After this Manila remained uninterruptedly under the control of the Spanish until 13 Aug. 1898, when it was surrendered to the authorities of the United States. On 20 August the military government opened the custom-house for business, continuing in force the Spanish tariff and customs regulations. In 1899 the Filipinos in insurrection made several attempts to destroy the city. The attempts on 4 and 22 February resulted disastrously to the insurgents. A similar undertaking was planned for the occasion of General Lawton's funeral.

The political relation of Manila to the central government of the islands is not greatly unlike that which Washington holds to the Federal government of the United States. The city was incorporated by an act passed by the United States Philippine Commission on 31 July 1901. The government is vested in a municipal board of five members appointed by the civil government, with the advice and consent of the Commission. The municipal board has certain legislative and executive authority. The regular act provides also for a secretary and other officers, with salaries and duties. The insular government contributed to the municipality 30 per cent of the city's net expenditure, and the balance is met by funds derived from city taxes. To illustrate: the expenses for the fiscal year 1907 were
$3,871,064.92. Of this sum the insular government contributed 30 per cent, or $1,161,589.48. The total receipts, including this contribution, were $4,103,220.80 leaving $231,255.88 as excess of receipts over expenditures. The population of Manila, reported by the census published in 1905, was 219,928.

During recent years the city has been in a large measure transformed. An elaborate system of electric street railways has been constructed, and has been in operation for a number of years. The waterworks provided by the foundation made by Carriedo had been made inadequate by the growth of the city, and a new system has been constructed. The old sewers, or such as existed, discharged into the moat about the wall or into open estuaries. They furnished a very imperfect means for disposing of the sewage of the city, and have been superseded by a new and elaborate system. The harbor which afforded vessels little or no protection from typhoons has been made safe and convenient. Large ships were obliged to lie in the bay two or three miles from shore, and among the statues, spires and freight to land in lighters. An enclosed harbor has been constructed by building a long breakwater southward from the mouth of the Pasig River, and by dredging the bottom of the sea in front of it. The material thrown out has been deposited behind a bulkhead, making 200 acres of new land. The largest ships can now dock at piers constructed within this secure harbor. The construction of this harbor has cost somewhat more than $4,000,000, and the work was founded in 1908. A general plan for the development and improvement of the city was formed by Mr. D. H. Burnham, who was engaged by the Commission to visit Manila for this purpose.

The Luneta is an elliptical drive and promenade on the shore of the bay between the city wall and the houses of Ermita. It has been greatly enlarged by the American government, and it has ceased to be a place for public executions. A military band gives a concert here nearly every evening.

Among the statues adorning public places the most noteworthy are that of Charles IV in the square in front of the "Palace" or Ayuntamiento building, that of Isabella II in the plaza of Malate and that of Legazpi and Urdaneta near the Luneta. Other monuments are the Magellan column standing on the south bank of the river just below the Bridge of Spain, and the Anda monument on the same bank nearer the mouth of the river. The division of the city into two parts by the Pasig and the presence of numerous estuaries has necessitated the building of a large number of bridges. The most noteworthy of these are the Bridge of Spain and the Ayala Bridge. Among the noteworthy establishments or institutions in the city are the Philippine General Hospital, the university and the special schools, the public library, the government laboratories, the government printing office and the government cold storage and ice plant.

Vessels approaching Manila by sea from the northwest first sight the Capones Grande light off the southwest coast of Zambales. Vessels of Indochina first sight the Corregidor light. Vessels from Singapore, Java, India, Borneo, and all the southern ports of the Philippine Islands sight the Cabra Island light. All converge on the Corregidor light at the entrance of the bay.

BERNARD MOSES,
University of California.

MANILA, University of, founded in 1856 by Philip II of Spain. Later branches or affiliated schools were founded in different parts of the island. A seminary for the sons of Spanish nobles was opened in 1601, and 10 years later departments were added for the sons of those not belonging to the nobility and for the natives. The university was reorganized in 1857, and again after the American occupation. The departments are science, classics, law, medicine, theology, philosophy, engineering, pharmacy, arts and music. The usual degrees are granted. In 1918 there were about 800 students in attendance.

MANILA BAY, the largest bay in the Philippine Archipelago, indenting the western central coast of the island of Luzon. Its greatest dimensions are from the minor bay of Pampanga in the northwest to Point Kalumpao on the south, about 38 miles; from the delta of the Grande de la Pampanga River southwest to Corregidor Island is 31 miles; circumference about 120 miles. The entrance between Point Kalumpao and Corregidor is about seven miles in width; that between Corregidor and Manive about two miles. There are lighthouses on either side of the larger entrance. The bay, surrounded by five provinces, and receives waters of many rivers, including the Grande de la Pampanga, with its large delta, and the Pasig at Manila, which communicates with Laguna Bay, to the southeast, and has been dredged for navigation. The lands on both sides of the bar at the entrance are high and covered with vegetation, but the shores at the head of the bay are low and marshy, intersected by numerous small rivers, estuaries and tidal lakes. It is one of the finest harbors in the East, being free of obstructions to navigation, and affording excellent anchorage. But the water is so rough at times that it was necessary to construct large breakwaters to protect the shipping. Point Luzon is at the mouth. Submarine telegraph lines are laid in the bay which runs from San Francisco to Hongkong and to Iloilo. Manila, the capital of the archipelago, and Cavite, the United States naval headquarters in the Philippines, are on its shores; an artificial port is being constructed at Manila. In this bay Admiral Dewey won a victory over the Spanish fleet 1 May 1898.

MANILA BAY, Battle of. See SPANISH-AMERICAN WAR.

MANILA HEMP, or ABACA, Musa Textilis. This species belongs to the plantain or banana family, the commercial fibre being derived from the stalk or trunk of the wild plantain of the Philippine Islands, and is classed as a structural fibre. The strongest and best of our hard cordage fibres, it is employed in the United States for standard binder twine and for all sizes of rope from the smallest dimensions to hawsers and cables. The old rope and the waste are employed as paper stock. The fibre is creamy white to reddish white, lustrous, easily separated, stiff and resistant, while its...
MANILA

1 La Escolta

2 The Bridge of Spain
lightness makes it advantageous for employment in cordage for the rigging and running ropes of ships. Structurally, the bundles of fibres are very large, but easily separated into fibre by even a diameter, the walls of the cells are of uniform thickness, and the ends gradually and regularly. In breaking tests for textile strength, with English hemp — made by the British government — Manila stood a strain of 4,069 pounds against 3,885 pounds for hemp, ropes three and one-quarter inches in circumference and two fathoms long being used in each test. In the Philippine Islands the finer grades of the fibre are extensively used for fabric manufacture, the product being worn by the natives of both sexes throughout the archipelago. Mixed with cotton a durable fabric is produced well adapted to the climatic conditions of the islands. According to a recent report of the Philippine Bureau of Agriculture, the manila hemp plant was introduced into India in 1859 and into the Andaman Islands in 1873. The plant is also said to be found in Borneo and Java, and attempts have been made to introduce it into other countries. It remains a fact, however, that the commercial fibre is produced only in the Philippines. The culture has been attempted without success in the West Indies, and seed was imported for trial in Florida only a few years ago; it was planted but it failed to germinate. Several species of banana yielding fine fibre are successfully cultivated throughout tropical and sub-tropical America, and in many other portions of the world. Banana fibre bears no comparison, however, with the Manila hemp of commerce, although the fibre of Musa basjoo is produced commercially in Japan where it is employed for undergarments for summer wear, as well as for light dresses for the higher classes of Japanese.

Manila hemp first attracted attention commercially early in the last century, and was imported into Salem, and Boston, Mass., about 1824; samples of the fibre, however, were brought to this country by naval officers as early as 1820. The production of the textile had reached about 8,000 tons in 1840, 30,000 tons in 1860 and 50,000 tons in 1880. In 1900 the production was nearly 90,000 tons. At the present time (1918) it is in excess of 120,000. The United States in 1916 took 19,000 tons of the value of $14,067,000, and the total export was $24,974,000, or 40 per cent of the total Philippine exports.

Regarding the specific localities of production and details of cultivation, preparation, etc., the student is referred to Bulletin of the Royal Gardens Kew (August 1894), to a Descriptive Catalogue of Useful Fibre Plants of the World (Washington 1897), and to the latest issues of the Farmer's Bulletin published by the Philippine Bureau of Agriculture, Manila.

The extraction of the fibre is a simple proposition. The abaca is cut near the roots when the plant is two to four years old, and just before blossoming; if cut earlier the fibre is finer but shorter. After striking off the leaves the trunk or stem is slit from end to end, and the sheathing layers of cellular matter, which form the petioles of the leaves, are separated, dried a day or two and then cut into strips three inches wide, and partly soaked until the fibre has been cleaned of all extraneous matters, soft cellular tissue, etc. The bundles of wet fibre are shaken into filaments, washed, dried and sorted. This is the export fibre for cordage purposes, the fabric fibre necessitating further treatment by beating, which softens and subdivides the filaments. The export fibre is wrought into hanks and made into bales, of about 270 pounds, when it is ready for shipment. Attempts to use machinery for extracting the fibre have not been successful, partly because the machines have not been adequate, and partly on account of native prejudice. There is a demand for the hand methods of preparation which it is thought machine extension would obviate. See Fibre; Hemp; Jute; Ramie; Sisal Hemp.

MANIN, mân-nên', Daniele, Italian patriot: b. Venice, 13 May 1804; d. Paris, 22 Sept. 1857. He studied at the University of Padua, was admitted to the doctorate of laws and practised at the bar. In politics he became the leader of the liberal class, and by 1847 had secured a solid reputation as a political economist. For anti-Austrian utterances made during that year and the next he was twice imprisoned, and after awaiting trial was set free by the populace upon arrival of news of the revolution of 1848 in Italy and France, was made President of the Republic of Saint Mark and given supreme power as head of the patriotic revolt. The Austrians were driven out, and a republic was formed, which began in the autumn of 1848 and lasted 12 months. Manin was at the head of the civil government, and to his counsels and patriotic spirit it was mainly owing that the Venetians maintained so long and brilliant a defense. After the capitulation Manin retired to Paris, where he maintained himself by giving lessons in Italian, and continued in various pamphlets and through the press to advocate the cause of Italian independence. Consult Martín, 'Daniel Manin and Venice in 1848-9'; Mortinengo, Cesareo, 'Italian Characters' (1901).

MANIOC, or MANDIOC. See CASSAVA.

MANIPLE, (1) one of the divisions of the ancient Roman army. It consisted of 60 rank and file, two officers called centuriones and one standard-bearer called vexillarius. (2) In the Roman Catholic ritual a sacred vestment attached to the left arm, to leave the right at liberty for ministering. See COSTUME, ECCLESIASTICAL.

MANIPUR, mân-l-poor', northeast India, a thinly populated native state now more frequently called Assam State, which is confusing because there is Assam province (q.v.). It consists principally of an extensive valley situated in the heart of the mountainous country which lies between Assam, Cachar, Burma and Chittagong; area, 8,456 square miles. The greater part of the state is covered with forest and jungle, and the wild animals include the elephant, rhinoceros, tiger, leopard, bear, deer and buffalo. The people belong to the Mongolian race, and are known as Manipuris. They are governed by a rajah, whose court resides a British political agent under the control of the chief commissioner of Assam. The capital is Manipur, also called Imphal, lying in the Namkathay on Manipur River, which is tributary to the Irrawaddy, almost 250 miles north by west of Mandalay; pop. about 75,000. Most of the work is done by the Manipuri women, who are considered lazy. The chief crop is rice. There is a special breed of ponies in the country, which are much
employed in the game of polo, the national sport of Manipur. There has been a political agent in the state since 1831. In 1891 an outbreak headed by a member of the reigning family, the chief commissioner of Assam and the political agent were murdered; but the disturbance was soon put down and avenged. Pop. 346,222, of whom 1,361,394 are Muslims, 134,093 Animists, and a few Mohammedans. Consult Johnstone, 'Experiences in Manipur' (1896).

**MANIS, PANGOLIN, or SCALLY ANT-EATER**, an edentate mammal, belonging to the group Squamata, coextensive with which is the family Manidae. The body and long, thick tail are covered with horny, imbricated scales. The legs are short and very strong, and the toes are armed with powerful claws, enabling the animals to burrow rapidly. These animals can roll themselves into a ball, and are protected by their scales, and they exhibit remarkable strength in holding their bodies in this protective attitude. The scales are regarded as formed of agglutinated hairs; and in the Asiatic species true hairs grow between the scales and extend beyond them. All dwell in burrows, come abroad only at night and subsist almost entirely on ants and termites, which they capture by means of their long, rope-like, sticky tongues. They have no trace of teeth; and in general structure show a close resemblance to the American ant-eaters. They range in size from the African *M. gigantea*, six feet, to one and one-half feet. They are comparatively common in some rocky districts of India and China. The latest review of the family shows that it contains seven species.

**MANISTEE, mān-īs-tḗ,'' Mich., city, county-seat of Manistee County, on Lake Michigan and the Manistee River, and on the Manistee and North-Eastern and the Pere Marquette railroads. A mission house is said to have been built here in the year 1826, but not until 1830 have we positive proof of the white man's presence, when a party of white men landed and proceeded up the river. In 1840 John and Joseph Stronach landed here and selected a site for a saw mill in the dense pine forest and the following spring John Stronach and his son Adam chartered a schooner, and came here with machinery, supplies and about 15 men. They arrived at the mouth of the river 10 April 1841. From that date dates the first permanent settlement of Manistee County. In 1848 a mill at the mouth of the river was built by John Canfield, and for several years thereafter business had a tendency to settle west of what is known as "the big sandhill." In 1855, by the passage of a bill in the legislature, Manistee County became organized, having the townships of Stronach, Brown and Manistee, and at the first county election 136 votes were cast. In 1861 Manistee's population was 1,400 persons, and between the Civil War and a disastrous fire its progress was greatly retarded. After the close of the War things became more prosperous. In 1869 the town outgrew itself and became a city, with 3,943 inhabitants. Manistee was again visited 8 Oct. 1871, and the fire that destroyed it was an entire destruction. On the southeast is Lake Michigan, five miles in length and one and one-half miles wide. Passing through the centre of the city, a distance of one and one-half miles and unifying the two lakes, is Manistee River, 475 feet wide with a minimum depth of 174 feet, and a current running about four miles an hour. Its waters, never closed by ice, are navigable the entire year, making the best winter harbor on Lake Michigan a shipping port. Manistee's chief industries are the manufacture of salt and lumber. Underlying the city is a strata of rock salt 32 feet in depth, and from wells 2,000 feet deep, with an opening of but six inches in diameter, is pumped brine, from which immense quantities of salt are manufactured. About 2,500,000 barrels of salt are shipped from here annually. Lines of passenger steamers connect the city with Chicago, Milwaukee and points north and south. There are two telegraph lines, a telephone exchange, a system of waterworks, with over 30 miles of mains, an electric street railway, over 30 miles of streets, daily papers and weeklies, one of which is printed in German. There are six modern and well-equipped public school buildings, and six parish schools, a Carnegie library, 16 churches and one mission. Orchard Beach, situated twentysix miles north of the city, is one of Manistee's chief beauty spots. Among the attractions of this park is a theatre 70 by 102 feet, which seats comfortably about 700 persons. Resort Park is on a high bluff overlooking Lake Michigan.

**Suburbs.—** Situated on Lake Manistee are Oak Hill, Filer City, Stronach, Eastlake and Parkdale. In 1914 the commission form of government was put in operation. Population of Manistee is 12,381, including suburbs, 18,073.

**MANISTIQUE, mān-īs-tḗk,' Mich., city, county-seat of Schoolcraft County, at the northern end of Lake Michigan, at the mouth of the Manistique River, and on the Manistique and Northern and the Minneapolis, Saint Paul and Sault Sainte Marie railroads, about 75 miles southeast of Marquette. It is in the vicinity of the forests which furnish considerable of the marketable lumber. Iron ore and limestone are abundant in this region. The chief manufacturing establishments are foundries, lime-kilns, lumber mills, chemical works and distilleries. Charcoal is one of the important products made just outside the city, and fishing is a prominent industry. Lake West Manistique is near by. The opportunities for trade are excellent, and Manistique is a commercial centre for a large portion of the Upper Peninsula. The city was incorporated in 1901, has good public and parish schools and a public library established in 1894. Pop. 4,400.

**MANITOBA, mān-ī-tōbā,' Canada, occupies among the provinces of the Dominion a central position between the Atlantic and Pacific. It extends from the international boundary line on the south to the 60th parallel of north latitude on the north. It is bounded on the west by the province of Saskatchewan and on the east by Hudson Bay and the province of Ontario. It thus lies between the 40th and 60th parallels of north latitude and the 90th and 102d meridians of west longitude. The maximum length is 1,760 miles, the maximum breadth east and west, 495 miles. The present area is computed at 251,832 square miles, of which 19,906 are water. Pop. (1870) 11,963; (1881) 62,260; (1891) 152,560; (1901) 253,211; (1911) 461,630;
a third channel of communication was opened up from Saint Paul—at first by *Red River cart* or river-boat down the Red River, and eventually by rail in 1878. With the completion of the Canadian Pacific Railway in 1885 the direct route to the Canadian route by rail or the Great Lakes. It is seen therefore that the province lies at the headwaters of the three greatest waterways systems of the continent, the eastern by the Great Lakes and the Saint Lawrence, the southern by the Mississippi and the northern to Hudson Bay. This strategic importance was the occasion of Selkirk’s choice of this district for colonization in 1811, for the movement in the United States during the sixties for the annexion of the Red River district to the American Union and for the more successful movement in Canada culminating in 1870 in the incorporation of the Hudson’s Bay territories into the Canadian Confederation. Recent developments tend to confirm these considerations. The resources of water power, the fertility of the prairie and the prospective maritime outlet on Hudson Bay almost from the centre of the continent (see Resources) tend to unite the interests of the factory, the prairie and the sea at a point where the transcontinental lines of the Red River and the Assiniboine. (c) In 1870 at the transfer of the Hudson’s Bay territories to Canada, the new province of Manitoba extended from the international boundary to 50° 30’ N. latitude and from 96° to 99° W. longitude. From its limited area and shape it was long known as “the postage stamp province.” (d) In 1877 the eastern and western boundaries were slightly changed from meridians of longitude in order to conform to the system of land surveys in township, etc. (e) In 1881 the province was enlarged westward to the 30th range (nearly 101° 31’ W. longitude), northward to the 12th base line (nearly 53° N. latitude) and eastward almost to 95° W. longitude, though this was fixed only after extended litigation with Ontario in 1884. The area was now 73,732 square miles. (f) In 1912 the province was enlarged north and northeast to the present boundaries, including a littoral of 1,550 miles on the lake and 178,000 square miles of new territory. The northern boundary is now 60° N. latitude and Hudson Bay and the northeastern boundary runs from the northeast angle of the old province to the eastern end of Island Lake, and thence to the shores of Hudson Bay at the 89th meridian of W. longitude.

**Geographical Position and Climate.**—The importance of this district has been determined throughout its history largely by geographical considerations. For the French fur-trade from Canada and for the British trade from the same source after 1763, the Winnipeg, Red and Saskatchewan river systems formed the links between the Great Lakes and the Athabasca fur districts. Meanwhile from 1670, the date of the Hudson’s Bay charter, to the transfer of the Hudson’s Bay territories to Canada in 1870, the fur-trade by way of Hudson Bay came to follow the Hayes River route to Lake Winnipeg, thence the Red and Saskatchewan Rivers to the areas south and west. The intersection of the two channels occasioned the long and bitter conflict between the Hudson’s Bay and North-West companies. With American expansion up the Missouri and Mississippi rivers the climate exhibits high variability of temperature, both daily and seasonal, together with a good average temperature for the year. The humidity, however, particularly in winter, is low. For the 23-year period, 1888–1907 at Winnipeg the mean daily range of temperature has varied from the maximum of 26.4° for May to the minimum of 18.1° for November. The mean annual range of temperature has been 68°, though the highest absolute range of temperature recorded has been 153°. The mean mean monthly temperature has been 77.6° in July, the lowest —13.4° in February. The annual rainfall has averaged 20.42 inches, but it is a remarkable fact that 10.9 inches of this have fallen during the four months May to August. The percentage of possible sunshine during the same period has averaged about 55.5 per cent—nearly double that of Edinburgh. The growth of vegetation is thus remarkably rapid. The climate is healthful and invigorating, though the winters are severe and the changes from winter to summer and vice-versa are unusually sudden.

**Geology and Topography.**—The geological formations encountered in Manitoba are Cambrian, Ordovician, Silurian, Devonian, Creaceous, Pleistocene and Recent. Of these the early formations are found in ascending order from east to west, except that in the north-eastern angle of the province adjacent to Hudson Bay there is a belt of Silurian with another of Ordovician adjoining it. The Precambrian area, comprising practically the whole district east and southeast of Lake Winnipeg, extends roughly in a northwesterly direction, including
nearly the whole of the central and northwestern part of the province. Outcroppings of Huronian and Keewatin are numerous (see Resources) though but limited areas have been as yet carefully prospected. The topography of the province is very rugged with numerous lakes and wooded ridges of granite and gneisses largely denuded of soil by glacial action. The term "prairie province" long applied to Manitoba thus applies only to the southern and southwestern areas of the province, and the prairie covers less than two-fifths of the whole. The Ordovician, Silurian and Devonian belts, extending also in a general northwest and southeasterly direction, underlie the great lake districts of Lakes Winnipeg, Manitoba, Dauphin and Winnipegosis. Valuable limestone, gypsum, shale and sandstone deposits outcrop at many points over these areas (see Resources). The Cretaceous area directly underlying the Devonian in the southwestern district of the province exhibits soft shales and basal sandstones. The escarpment which forms the eastern edge of this area extends from the Pembina Mountains, near the international boundary, to the Pasquia Hills just south of the Saskatchewan River. The Pleistocene deposits of the older formations, particularly in the south, are due, like the highly composite nature of the surface soils of this area, to the action of the great glacial lakes Agassiz, Souris and Saskatchewan—probably 110,000 square miles in area (Uphammer) of which considerably more than three-quarters lay within the present boundaries of the province. The original outlet of this great lake, the receding shores of which are marked by no fewer than 28 beaches (Uphammer), was toward the south until the melting of the ice-barriers opened up the natural outlet into Hudson Bay. To the rich composite deposits of surface soils during this process, particularly where the early recession of Lake Agassiz permitted adequate "weathering" of surface molds, the fertility of southern Manitoba may largely be attributed, though more recent alluvial deposits of both clay and humus are traceable in the Red River Valley. In the northern areas of the Lake Agassiz district the drainage is still very defective and the "weathering" of the soil correspondingly incomplete.

Perhaps the most striking topographical feature of the province is the surviving lake area of Lakes Winnipeg, Manitoba, Dauphin and Winnipegosis. Lake Winnipeg particularly (approximately 9,500 square miles) is the repository of the Winnipeg River system from the southeast, the Red and Assiniboine River systems from the south and the Saskatchewan River system together with the Winnipegosis, Manitoba and Dauphin Lakes system from the west. The outlet is by Nelson River into Hudson Bay. The Churchill River flowing also into Hudson Bay drains a largely unexplored area in the northwestern part of the province. This variety of surface features is found with a very limited range of altitudes. The highest hills are found in the escarpments of the Cretaceous area—Pembina Mountains, Tiger Hills, Riding Mountain, Duck Mount (2,600 feet) and the Pasquia Hills. Manitoba Flora.—The wild life was at one time prolific and is still justly famous, though game is now carefully preserved. The fur-trade was the first historic industry of the country. The buffalo, once found in almost incredible numbers on the prairie, is now extinct in its wild state, but the wapiti or elk, the antelope and the moose are still plentiful. Among fur-bearing animals are the otter, beaver, mink, muskrat, skunk, martin, musk-rat (so called and "prairie"), bear, fox, lynx, ermine and wolverine, with the rabbit in great abundance as the basis of carnivorous life. Bird life is plentiful, including prairie chicken, wild duck, mallard duck, wild goose and partridge among game birds, and more than 250 other species of wild birds. Among fish the whitefish, pickerel, pike, sturgeon, tilelure and goldeye have considerable commercial value.

The flora of the province includes tamarac, spruce (white and black or "bog"), jack pine, trembling poplar and balsam fir over most areas of the Precambrian district, with less plentiful growths of oak, elm, cottonwood and "Manitoba maple" in southern districts of the province. Small fruits such as strawberry, raspberry, blueberry, cranberry ("high-bush") and "low-bush" and Saskatoon berries, the wild plum, cherry and black currant are indigenous. Wild flowering plants (more than 750 species of Phanerogamia) are remarkable during the summer months for their profusion of variety and color.

History and Political Development.—Manitoba was admitted as a province to the Canadian Confederation only in 1870, but there is a sense in which the Hudson Bay district is the oldest continuously British territory upon the continent. The charter granted to the Hudson's Bay Company in 1670 by the Treaty of Utrecht provision was made for a commission to determine the boundaries between Canada and the Hudson's Bay territories, but no settlement was ever reached. After Canada also became British in 1763, traders from Montreal under the name of the North-West Company sought to revive the validity of the old French claims in order to vindicate their refusal to recognize the Hudson's Bay charter. This conflict in trade was accentuated rather than assuaged when the fifth Earl of Selkirk obtained control of the Hudson's Bay Company in 1811 in order to carry out his third project of colonization from the Scottish highlands. The company granted him for the purpose the district of Assiniboia, comprising 116,000 square miles and controlling the most important strategic waterways of the west. The first band of settlers reached "the Forks" of the Red and Assiniboine rivers, the site of the city of Winnipeg, on 30 Aug. 1812. From the first, however, the North-West Company had determined to disperse or destroy the settlement of the half-breeds under threat of the official management of the part of the officials of the colony facilitated their purpose. In 1815, 134 of the settlers were induced to leave the Red River Settlement for Upper Canada. The rest were driven off toward Hudson Bay. Reinforcements re-established the colony in the autumn of 1816, following spring Governor Semple and 20 of his men were killed at Seven Oaks, near the settle-
ment, by an armed band of "half-breeds" or Metis in the employ of the North-West Company. This act of violence at last aroused the British government from its policy of "salutary neglect," but Selkirk, who was on his way from Canada to the settlement when he received the news of Seven Oaks, made the fatal mistake of turning aside to retaliate upon the North-West partners at Fort William. The rest of his life was filled with bootless litigation; for though he visited the settlement in 1817 and spent both health and fortune upon it, he died in 1820 with the news that the British government had brought pressure to bear in order to bury the blunders of the past by a coalition between the rival companies. This was effected in 1821 under the name of the Hudson's Bay Company, and the old "North-westers" became the stanchest exponents of all the rights of the charter.

The Red River Settlement, meanwhile, had suffered a series of natural as well as deliberate calamities. A plague of grasshoppers in 1818 and 1819 was succeeded by 1820, as Governor Simpson wrote, to prove "an extinguisher to the hope of Red River ever retaining the name of a settlement." The colony was firmly re-established, however, by a succession of treaties and an increased provision of natural resources for primitive settlement. (Sheriff Ross records the slaughter of 2,500 buffalo in a single "hunt," and no fewer than 16,000 whitefish were taken by the settlers on their retreat after Seven Oaks). By 1830 the Red River Settlement was beginning to put an appearance of "peace and plenty." In 1834 it reverted by purchase from the Selkirk family, in whose possession it had remained after the fifth Earl of Selkirk's death, to the direct control of the Hudson's Bay Company.

After the coalition in 1821 the company's trade in Rupert's Land, as the "chartered" territory came to be called, had responded rapidly to the enterprising management of Gov. George Simpson. By license issued successively in 1829 and 1838, for periods of 21 years, the company was granted a monopoly of the fur-trade for the whole district westward to the Pacific. A new Fort Garry with walls and bastions of stone was built at the Forks (1836-38) but the Red River Settlement remained for more than a generation a primitive and secluded community. The primitive "council" at the settlement gave place after 1834 to the regularly constituted "Council of Assiniboia." After 1841 the "Municipal District of Assiniboia" came to include only the area within a radius of 50 miles from the Forks of the Red River and the Assiniboine. Colonization was overshadowed by the opulence and mystery of the fur-trade, and though the company can scarcely be charged with neglect, Selkirk's original plan of establishing a stable and ready market for agricultural produce in the expanding trade of the company was only partially realized. With the advent of the American trader from the south and the enterprise of the "free-traders," even the settlement itself, even the company's cherished monopoly of the fur-trade was subject to challenge.

The original Scottish settlers, reinforced by many of the retiring servants of the company, formed a thrifty and contented community. The French Metis, however, though served by a devoted Roman Catholic priesthood, formed a much less stable element of the population. Accustomed to live by the buffalo chase or by fishing, they were readily susceptible to influences with which the primitive patriarchal authority of the company soon proved powerless to cope. The process of "smoothening" the indigents by adroit management postponed the conflict without averting it. In 1849 the primitive judiciary at the settlement was openly intimidated into acquitting one of the "free-traders" in furs. Thereafter the monopoly of the fur-trade was partially removed. The Red River Settlement began to attract attention in Canada and in the United States. In 1857 the Committee of the British House of Commons drew up its famous "reports" on the Hudson's Bay Company, and it became apparent that Canada had the ear of the British government in the dream of expansion to the Pacific.

From 1857 to the transfer of the Hudson's Bay territories to Canada in 1870, the development of the Red River Settlement was rapid and at times turbulent. In 1855, Governor Head as "the manifest destiny" of the Red River district. The Canadian party, however, though enterprising and aggressive, bitterly antagonized the company and many of the older inhabitants. The improvident and credulous French Metis, particularly, were suspicious and resentful. Generous "reserves" of land and scrupulous tact on the part of Canadian officials might have allayed their fears of the impending change. In 1859 the purchase of the Hudson's Bay territories by Canada for $500,000 ($1,500,000) was arranged under the auspices of the British government. The company had changed hands in 1853, and the "present officials in Rupert's Land could not be expected to be enthusiastic either to the new directorate or to Canada. The Scottish settlers readily acquiesced in the change, but the fears of the French Metis were fomented by a few agitators into open insurrection against the transfer.

The Dominion of Canada had been formed only in 1867, and the Riel Insurrection at Red River reflected largely the attitude of Quebec in the Canadian Confederation. The establishment of a smaller Quebec on the banks of the Red River had long been the policy of the French clergy. The prospect of union with Canada without guarantees for their race, language and religious control over the Metis occasioned the bitterest resentment. During Archbishop's Tache's absence from the Red River settler of Metis led by Louis Riel received the support and for a time submitted largely to the guidance of French clerical influence in touch with Canadian politics. Riel seized Fort Garry and dominated the settlement for 10 months until the arrival of a military expedition under Colonel Wolseley on 24 Aug. 1870. "Land In this was issued for the Metis, and clauses intended to safeguard the French language and separate schools found their way into the Manitoba Act by which the province was formally
incorporated into the Dominion; but the violence of Riel and his confederates, and particularly the violent death of Thomas Scott, a Canadian, on 4 March 1870, embittered provincial and even federal politics for many years. The ruthless repeal of these special privileges for the French minority a few years later was accused in no small measure to resentment against the methods employed in seeking to obtain them during the Riel Insurrection. The total population of the new province was less than 12,000, of whom but 1,565 were white. The first provincial government of 1870 consisted of an assembly of 24 members (with an executive council of five) and a legislative council (abolished in 1876) of seven members. The new province inherited from the past a series of problems which kept public feeling at high tension. Cross-currents of race and religion — a Fenian raid in 1871, the "amnesty question" and the trial of Lépine for the death of Scott — complicated for many years the work of provincial government. The chronic poverty, moreover, of the province proved a strain upon administration after administration to a degree of economy bordering upon parsimony. The agitation for "better terms" and "provincial rights" became increasingly insistent with the responsibilities attendant upon rapid immigration. Within a decade the population grew from 12,000 to 60,000. The railway from Saint Paul was completed in 1878; with the Canadian Pacific Railway in prospect east and west the province began in 1879 to experience a "boom" which added $5,000,000 to buildings and doubled the population of Winnipeg within a single year. After 1882 the return to normal conditions was slow and difficult. Under the Norquay administration particularly (1879-87) the provincial government was found to be struggling against intolerable disabilities. The control of natural resources had been retained by the federal government. The provincial treasury was dependent chiefly upon meagre grants from the Dominion under the form of direct allowance for government, per capita 20% allowance for institutions, "debenture allowance" for Dominion indebtedness in 1870, subsidy in lieu of public lands, etc. The national importance of the Canadian Pacific Railway was held to justify a "monopoly clause" against the granting of provincial charters to competing railways. The grant of one-twentieth of settled land to the Hudson Bay Company by the terms of the transfer in 1869, and the generous grants of land to the Canadian Pacific Railroad had created a "land-lock" which interfered seriously with settlement. An increase of federal subsidy to $227,000 in 1882 and the extension of the boundaries proved quite inadequate concessions. The Canadian Pacific Railroad was completed in 1885 but the province proceeded to contest the "monopoly clause" by undertaking the Red River Valley Railway as a government work. The New Greenway administration (1888-99) forced the Dominion at last to repeal the objectionable "monopoly clause." This first substantial victory for "provincial rights" was regarded as the advent of a new era.

"The Manitoba School Question" which dominated provincial politics and eventually even federal politics in 1896 is dealt with elsewhere. The Roblin administration, from 1900, was marked by few fundamental political issues.

In 1908 the government announced the first complete system of government-owned telephones on the continent. Four years later it was announced that there were nearly 4,000 miles of completed railway lines within the province, of which about 1,000 miles had been built in the province, and that railway bonds ($25,000,000) have since been practically abrogated by the Dominion (1918) in taking over the Canadian Northern Railway. In 1912, almost exactly a century after the beginning of settlement in Assiniboia, the boundaries of the province were extended northward over a new district estimated at 106,304,000 acres, with a lottor of 500 miles on Hudson Bay (see Boundaries). The sum of $2,178,648 was granted for arrears of claims by the province, and the total federal subsidies were increased from less than $844,000 in 1911 to nearly $1,350,000 pending the control of the natural resources by the province. The Norris administration which was strongly supported at the polls after the resignation of the Roblin government in 1916 is carrying forward a very comprehensive policy of education. The Hudson Bay Railway for which $25,000,000 have been appropriated by the Dominion is now under construction from The Pas to Port Nelson — 410 miles, of which 320 have been completed. For the province of Manitoba, the prospect of a shorter water route to the British market, for at least four months of the year, than that from New York, marks a curious recurrence to historic conditions. Not less important will be the prospect of opening up eventually under provincial control the natural resources of the vast northern areas of the province. The chief interests of Manitoba, however, remain agricultural. By far the most remarkable development of recent years in western Canada has been agrarian organization — the Manitoba Grain Growers' Association with similar organizations in other western provinces — for co-operative and educational purposes. The United Grain Growers, Limited (an analogous commercial organization formed in 1917 by the union of the Grain Growers' Grain Company and the Arctic Elevator Company), with headquarters in Winnipeg, has achieved by far the most signal success in Canada both in the marketing of wheat and in the purchasing of agricultural supplies through co-operative agencies.

**Natural Resources, Manufactures and Transportation.**—The following official statistics will indicate the relative returns from natural resources (as tabulated for 1916 by Commissioner Wallace of northern Manitoba), the estimated value of manufactures and the railway mileage within the province:

**Natural Resources.**

- **Agriculture:**
  - Field Crops: $76,749,000
  - Live Stock Sold: 11,326,137
  - Produce Sold: 4,607

- **Water Power:**
  - 1,259,789

- **Mineral (non-metalliferous):**
  - 1,025,309

- **Forest Products:**
  - 1,807,320

- **Fur and Game:**
  - 1,684,474

- **Fisheries:**
  - 1,390,003

**Manufactures (Census, 1911):**

- **Capital:**
  - 41,941,490

- **Output:**
  - 15,073,009

Railway mileage (1916, exclusive of Hudson Bay), 4,310 miles. Agriculture is by far the chief productive
industry of the province, representing 89.5 per cent of total production from natural resources. The wheat of Manitoba, grown chiefly in the southwestern areas of the province (maximum production of 662,912 bushels in 1915), is justly famous, giving its name ("No. 1 Manitoba hard") to the highest "contract" grade of wheat fixed by statute, though the next grade (No. 1 Northern) has now become the standard of world trade. Barley (maximum production in 1915, 35,423,485 bushels) and potatoes, too, are grown in considerable quantities in the province.

The yield of garden vegetables is prolific. Stock raising and mixed farming are on the increase; the numbers of horses, milch cows, sheep and swine showing an increase of 20.8 per cent, 32 per cent, 10.5 per cent and 17 per cent respectively for the years 1911-1926. In the province, nearly 4,000,000 horse power of available water power (Commission of Conservation) is on the Nelson River and 555,900 on the Winnipeg River. Of this only 76,000 horse power has been developed, chiefly by the Winnipeg Electric Railway Company (Pinawa Channel) and the city light and power (Point du Bois). With the exception of building materials, brick, cement, building stone (Tyndall stone is pre-eminent), gypsum, etc., of the southwestern areas of the province, mining, like the water power, is as yet in its infancy. Vast districts of the Precambrian area which comprises three-fifths of the province have yet to be prospected, though deposits of copper and gold in Keewatin-Huronian formations are awaiting facilities for transportation and treatment. Upon conservational estimates (Wallace) the Hudson Bay Railway to Port Nelson following the course of the chief water powers of the province (Nelson River) is a distinct advantage for metallurgical and other processes such as electric smelting and the manufacture of fertilizers from limestone and atmospheric nitrogen by the electric process.

The chief manufacturing industries of Manitoba as yet are grain and meat products, electric power and products of lumber, brick and tile. The total output for 1915 was estimated at $61,594,284, an increase of 118 per cent in 10 years. The Dominion now controls more than half the total railway mileage of the province.

Government and Judiciary.—The provincial government consists of a legislative assembly of 49 members with an executive council of seven members directly responsible to the lieutenant-governor. A lieutenant-governor is appointed by the Dominion for a term of five years. The legislature for which both men and women are eligible is elected for a period of four years unless dissolved in conformity with principles of British parliamentary procedure. The province has a representation of 14 members in the Dominion House of Commons, based pro rata, like that of other Canadian provinces, upon the fixed number of 65 from the province of Quebec.

The judiciary comprises (a) the Court of King's Bench, consisting of a chief justice and five puisne judges with original civil and criminal jurisdiction, and until 1906 with jurisdiction also, when sitting en banc, as the ultimate court of appeal. (b) In 1906 a Court of Appeals was established, consisting of a chief justice and six puisne judges with appellate jurisdiction from other courts of the province. (c) County Courts in the various judicial districts of the province, with jurisdiction over civil and criminal cases. (d) Surrogate Courts, one in each judicial district of the province. The County Court is the trial court under the direct administration of the judge, or his judge of the Surrogate Court, with jurisdiction over administrations and probates. Minor courts in the province are presided over by stipendiary justices of the peace.

Education.—Manitoba possesses, under the control of a Minister of Education, assisted by an Advisory Council, a comprehensive system of non-sectarian public education from the primary school to the provincial university, including among other progressive features compulsory education, consolidated schools, residences for teachers in 127 outlying districts of the province, special school organization under an official trustee for communities of new Canadians, well built and equipped technical high schools in Winnipeg, etc. The total annual expenditure upon public education (Report, 1917) was nearly $6,000,000, of which $1,072,816 was contributed directly by the provincial government. In the public school system in 1917 there were 106,506 pupils enrolled, with an average attendance of 64.93 per cent daily and of 135.05 days during the year. (The average for Wisconsin during 1914 was 123.4 and for the United States 117.8.) There were 3,254 teachers and 1,625 school buildings. Of these more than 100 were secondary, high or collegiate schools.

The University of Manitoba is under the management and control of a board of governors consisting of nine members appointed by the provincial government, three each year for periods of three years. The university gives instruction and grants degrees in arts, science, agriculture, engineering (civil and electrical), medicine, pharmacy, law, architecture and home economics. Both the arts and the cultural and medical colleges are in affiliation with the university, together with four affiliated denominational colleges (Anglican, Roman Catholic, Presbyterian and Methodist) with representatives (two each) upon an academic council of 28 members. A Baptist college at Brandon is not affiliated with the provincial institution. At the outbreak of the war there were 917 students registered for instruction at the university.

Bibilography.—Documentary authorities are "Selkirk Papers" (manuscripts), (Dominion Archives, Ottawa); "Papers Relating to the Red River Settlement" (1819); "Report of Select Committee" (1857); "Recent Disturbances" (1870); "The Canadian North-West," ed. Oliver (Dominion Archives, Ottawa); Consult also "Canada and Its Provinces" (Vol. XIX and XX); Ross, "Red River Settlement" (1856); Hargrave, "Red River"; Martin, "History of the North-West"; Bryce, "Manitoba"; Schofield, "Story of Manitoba."
MANITOBA, Canada, a lake situated in Manitoba province, to which it gives its name, about 59 miles southwest of Lake Winnipeg. It is of irregular shape, 119 miles long, with a maximum breadth of 29 miles, a shore-line of 553 miles, an area of 171 square miles and an average depth of 12 feet; it is 810 feet above sea-level, and 40 feet higher than Lake Winnipeg, into which it drains through the Saskatchewan or Dauphin River.

MANITOBA, University of. The Canadian province of Manitoba, which was formed out of Rupert’s Land in 1870, was the outgrowth of the Red River Settlement founded by Lord Selkirk and his immigrants under Hudson’s Bay Company auspices in 1812-15. The Scottish settlers were joined from time to time by the Métis, the descendants of French-Canadian voyageurs, who married Indian women, and also by the children of company officers and Orkney employees of the Hudson’s Bay Company who had taken Indian wives. This mixed community in 1870 numbered 12,000 souls.

To the Métis came from Lower Canada Priest (afterward Bishop) Provancher, who in 1818 established a school, which grew in later times into Saint Boniface Roman Catholic College. The English-speaking half-breeds belonging to the Church of England were educated at Saint John’s College, which was reorganized in 1866 by Bishop (afterward Archbishop) Machray. Just as the new province of Manitoba was forming there was established during the year 1871 in Kildonan, near Winnipeg, among the Selkirk Scottish settlers, a Presbyterian college, known since as Manitoba College. This last-named college was in 1874 removed to Winnipeg. These three denominational colleges were all in or near the new city. In 1875 an important meeting was held in the courthouse, Winnipeg, by Manitoba College, in which a union of the three colleges under a provincial university was suggested. Governor Morris favored this plan, and in 1877 an act was passed in the legislature of Manitoba establishing the University of Manitoba, to which the three colleges, Saint Boniface, Saint John’s and Manitoba, were affiliated. The university was at first to be only an examining body, the teaching being done entirely by the colleges.

The new university was unique. It brought together the largest religious bodies of the province and kept up the standard of education, it being the only source of degrees. Its first examinations took place in May 1878, when seven candidates; presented themselves. In 1878 application was made to the Dominion government for a land grant, and at length, in 1885, under the “Better Terms Settlement” of that year, 150,000 acres of good agricultural wild land was given to the university. This endowment is now valued at $1,250,000. In 1883 a native of Red River Settlement living in England, Mr. A. K. Ishbister, who like many others was attracted by the broad and cosmopolitan spirit of the young university, bequeathed $83,000 toward the endowment fund to the university.

In 1882 the Manitoba Medical College was founded and became affiliated to the university. In 1888 a new member of the sisterhood of Colleges—Wesley College of the Methodist Church was affiliated to the university; a college of pharmacy was affiliated in 1902.

In 1893 the University Act was changed to allow teaching to be done by the university in natural science, mathematics and modern languages, the affiliated colleges taking up the other departments. In 1898 a site of seven acres in the heart of Winnipeg, valued at $120,000, was given by the Dominion government to the university, and in 1900 the first building was erected.

In recent years on the erection of new government buildings, two commodious law buildings contiguous to the university grounds have been transferred to the university for its increasing needs. In 1903 the University Act was changed to permit teaching in the classics, natural science, mathematics and modern languages, engineering and business training, still depending on the denominational colleges for teaching in the other arts subjects. Degrees are now given by the university in arts, law, medicine and agriculture. The several affiliated denominational colleges have the power to bestow degrees in theology only and are passed certain arts requirements in the university. These degrees on being reported to the university become as also pharmacy and dentistry ipso-facto degrees of the university.

In the first decade of the agricultural group of buildings was erected on a site contiguous to Winnipeg costing some $4,000,000. On a provincial farm this cluster is equipped under a large staff representing the many phases of agriculture. It is said that its complete group is not surpassed by any set of similar buildings on the continent. The Manitoba Agricultural College is affiliated to the university. A university library growing to be worthy of recognition is now established in the university.

In the last decade of its history a very large addition has been made to the work of the arts and sciences in the university, including a law school, to civil, electrical and mechanical engineering departments, and to the branches of pharmacy, commercial education and architecture. There are upward of 50 instructors now on the university faculty.

Not only has this great development taken place in the University of Manitoba, but it is to be remembered that in less than three provincial universities of western Canada, viz., those of Saskatchewan province at Saskatoon, of Alberta at Edmonton and of British Columbia at Vancouver, have been established and are developing greatly, thus cutting off a vast field of supply from Manitoba University. Under the new act of 1917 Manitoba University has become strongly supported by the provincial government, and still retains the support of the denominational colleges, which cling to their former affiliation. Not withstanding the great demands of the European War, the number of university students in the year 1917-18 reached 932, but during the war the enrollment fell to 500.

GEORGE BYE,
Founder of Manitoba College and a Founder of the Manitoba University.

MANITOBA SCHOOL QUESTION. In 1871, shortly after the colony of Assiniboia had become a province of Canada under the name of Manitoba, a law was passed establishing a dual system of denominational and public schools, serving respectively the needs of the French
MANITOU — MANITOULIN ISLANDS

(Roman Catholic) and English-speaking (Protestant) population in the province. At this time these racial and religious components were quite distinct, and in 1877 a separate school district was established in the town of Manitoulin. The district soon became known as the "English District," and the schools were exclusively English schools. In 1890 the town of Manitoulin was incorporated as a town, and the school district was incorporated as a village.

The schools in Manitoulin were established by the government of Ontario in 1844, and by 1850 there were 10 schools in the township. By 1860, the number of schools had increased to 25, and by 1870 to 35. The schools were primarily financed by local taxation, and the curriculum was based on the British educational system.

MANITOULIN, män′i-too, a name given, among the American Indian tribes, to any spirit or supernatural being, good or evil; also applied to any object of religious awe and reverence. If the Indian word manitou, says Palfrey, appeared to denote something above or beside the common aspects and agencies of nature, it might be natural, but it would be rash and misleading to confound its import with the Christian, Mohammedan, Jewish, Egyptian or Greek conception of Deity, or with any compound of a selection from some or all of these ideas. The word was applied to any object used as a fetish or an amulet. It was common among all Western and Mississippi tribes.

MANITOU SPRINGS, Colo., a noted scenic, health and pleasure resort of the Rockies, picturesquely situated at the confluence of Englemian's Cañon, Ute Pass and Wilham's Cañon, at the foot of Pike's Peak. It is in El Paso County on the Rio Grande and Colorado Midland railways, at an altitude of 6,336 feet, and is famous for its health-giving, highly radioactive mineral springs, wells, geysers and gushers, of soda and iron, 24 in number, saturated with carbonic acid gas and flowing a quarter million gallons daily. The unique Garden of the Gods with the colossal Gateway; the Seven Falls; ancient Cliff Dwellings; Pike's Peak Cog Road, highest, pass-all-standard-gauge railroad in the world; the Pike's Peak auto highway, to the summit of Pike's Peak — elevation, 14,109; the wonderful Cave of the Winds; Crystal Park auto highway with its succession of inspiring views at varying elevations; the Mount Manitou scenic line, the highest, steepest cable line known, are among the many notable attractions in the neighborhood. As a health resort Manitou is open the year round, the climate and waters having a wonderfully stimulating effect on blood formation and nutrition. All modern facilities abound. Resident population, 1,357. During the height of the season, July and August, Manitou is thronged with visitors averaging from 10,000 to 15,000.

MANITOULIN (män′i-to̱l′in) ISLANDS, Canada, a group of islands in the northern part of Lake Huron, separating the waters of the lake from Georgian Bay, and east of the famous "Soo" Canal. The name is a corruption of the Indian word Mani- town, which means divinity. Except Drummond Isle, about 25 miles long and 9 miles

VOL. 18 — 15
wide, which belongs to the State of Michigan, the group is a part of the province of Ontario. The largest island of the group is Grand Manitoulin, or Sacred Isle; about 80 miles long and 30 miles at the widest. The coast is very irregular. Cockburn, or Little Manitoulin, is nearly circular, and about eight miles in diameter. All the islands are well wooded; Grand Manitoulin and Cockburn have large pine forests. The shore waters abound in fish. Fully half the inhabitants are Indians of the Algonquin race. The springs are clear and cool and the striking natural features add to the attractions of the islands and make them a favorite summer resort. Pop. 2,000.

MANITOWOC, mán-tō-wōk', Wis., city and county-seat of Manitowoc County, on Lake Michigan, at the mouth of the Manitowoc River and at the point where the Chicago and Northwestern railroads join the Lake Michigan railroad, about 77 miles north of Milwaukee. The city, picturesquely surrounded by a semi-circle of low hills, was chartered in 1870. It has a good harbor and regular steamer connection with all of the important lake ports; large grain elevators, shipbuilding and repair yards, and an extensive export trade in wheat and other grain, lumber, leather, beer, dairy products, etc., and imports of groceries, cloth and clothing. The manufactures are important, the census of 1900 returning 80 establishments, with $6,764,000 capital stock, employing 1,824 persons at $1,007,000 annual wages, using materials valued at $3,963,000 and with a product valued annually at $5,939,000. These figures are now estimated to be about 15 per cent higher. There are three large breweries; the other industries were brick-yards, hay presses, creameries and cheesefactories, saw-and-planing-mills, and manufactories of leather, flour, furniture, foundry products, machinery, agricultural implements, edge tools, cigars, canned goods and glue. The city has national, savings and other banks, waterworks, gas and electric light; and daily and weekly newspapers, several of which are published in the German language. Manitowoc is the seat of the St. John's Hospital, Saint Joseph's Hospital, Saint Felix Industrial and Reform School, Holy Family Hospital and the James Library, and has a courthouse, a high school, public and parochial schools and several handysome churches. Pop. 14,000.

MANIZALES, män-nē-saⁿ-las, Colombia, town, south of Antioquia and capital of Caldas, about 95 miles northwest of Bogota. The altitude is about 7,000 feet. It was founded in 1848 and its situation at the junction of main passes over the Corderilla Central range of mountains and near valuable gold mines has contributed to its rapid growth. In the valleys, in the vicinity, stock-raising is an important industry. It has fine churches and schools, a good library and a number of comfortable homes. During the civil war of 1877-78 the town was the headquarters of the rebels. The climate is not severe, although in a high altitude, as higher mountains in the vicinity are a protection. Pop. about 35,000.

MANKATO, män-käťō, Minn., city, county-seat of Blue Earth County, on the Minnesota River at the mouth of the Blue Earth River and on the Chicago, Milwaukee and Saint Paul, the Chicago Great Western, the Chicago and Northwestern and the Chicago, Saint Paul, Minneapolis and Omaha railroads, about 85 miles southwest of Saint Paul. It is situated in an agricultural region and in the vicinity are valuable plans to create a park. The city Park is located four miles from the city. Nine miles south is the Rapidan dam, furnishing hydro-electric power for numerous southern Minnesota cities and villages. Its chief manufactures are stone, knit goods, lime, cement, beer, butter, candy, flour, brick, concrete culverts, tile and building blocks, traction engines, trip hammers, shirts and overalls, interior hardwood fixtures, cigars, incubators, brooms, paper boxes, foundry and machine-shop products. There are in manufacturing business about 2,000 employees. The principal buildings are: Normal School, Catholic and Lutheran colleges, a government building, a Carnegie public library, Saint Joseph's and Immanuel hospitals. The city has 20 churches, good public and parish schools, a commercial college and the schools mentioned. There are six banks with a combined capital of $450,000. The deposits amount to over $6,000,000. The manufactures of the city are about $4,500,000 annually.

The city was first settled in 1852 by Eastern people. It was incorporated 15 July 1858, and chartered as a city 6 March 1868. The present government is by commission, Mankato being the first Minnesota city to adopt this form. Mankato was the scene of the hanging, 26 Dec 1862, of 38 Sioux Indians, having been convicted of murdering white settlers during the massacre of the preceding summer, west of the city. Pop. 10,365.

MANLEY, män'li, John, American naval commander: b. 1734; d. Boston, 1793. At the outbreak of the Revolutionary War he had command of the armed schooner Lee, with which he cruised along the coast of Massachusetts Bay, making captures of great value to the American army then investing Boston. In July 1778 his ship, the Hancock, was captured by a British frigate and after a rigorous action in the Channel he was exchanged and in 1782 was put in command of the Hackme frigate, which, after lying in a perilous position on a sand bank off Guadeloupe for three days, exposed to the fire of four British ships of the line, contrived to effect her escape. This exploit closed the regular maritime operations of the United States during the Revolutionary War.

MANLEY, Joseph Homan, American journalist and politician: b. Bangor, Me., 13 Oct 1842; d. Augusta, Me., 7 Feb. 1905. He was graduated from the Little Blue Abbott Academy at Farmington, Me., in 1858 and in 1862 from the Albany Law School. He was admitted to the bar in 1865. In 1866 he was president of the city council of Augusta and in 1881 was appointed postmaster of Augusta by President Garfield, which office he held for two years. Acquiring a half interest in the Maine Farmer he joined hands with James G. Blaine in aggressive local and national politics, dictating the editorial policy of that paper for three years. He was a delegate to the Republican conventions of 1880 and 1884, and for many years chairman of the Maine Republican State Committee and a member of the Republican National Committee, and was a notable figure in
the executive committees of 1896 and 1900, which aided in the election of McKinley.

MANLEY, Mary de la Rivière, English author: b. in the Island of Guernsey about 1663; d. London, 11 July 1724. She succeeded Swift as editor of the Examiner in 1711. She is known for her 'Secret Memoirs and Manners of Several Persons of Quality of Both Sexes: from the New Atlantis' (1709), a licentious satire reflecting on politicians of the day, that caused the arrest of both the author and the publisher, though they were subsequently discharged. This work was continued in the 'Memoirs of Europe' (1710). She also published 'Letters Written by Mrs. Manley' (1696); 'The Secret History of Queen Zarath and the Zarazians' (1702); 'The Adventures of Revella' (1714); 'The Power of Love: in Seven Novels' (1720), and other unimportant books.

MANLIUS, män'li-ús, Marcus, Roman legendary hero, of the 4th century b.c., called Capitolineus because of his successful defense of the Capitoline Hill. Tradition says he was aroused to action by the cackling of Juno's sacred geese which came to prevent the surprise of the citadel by the Gauls (390 B.C.). Two years before he defeated the Equi; and in six years after (384 B.C.) was thrown from the Tarpeian rock, having been declared guilty of plotting to become king or dictator. This judgment, almost certainly unjust, was due to the envy of the patricians, who distrusted Manlius' philanthropic endeavors to free plebeians sold for debt.

MANLY, Basil, American clergyman and educator: b. Pittsburgh, Chatham County, N. C., 23 Jan. 1796; d. Charleston, S. C., 25 Jan. 1865. He was graduated at South Carolina College in 1821, and, after fulfilling several charges, in 1837 he became president of the University of Alabama, remaining there nearly 20 years.

MANLY, John Matthews, American educator and author: b. Sumter County, Ala., 2 Sept. 1865. He was graduated at Furman University in 1883 and at Harvard in 1889. He obtained the degree of D.Phi. at Harvard in 1890 and from 1891 to 1898 was associate professor and professor of English at Brown University and since 1898 has been professor and head of the department of English at the University of Chicago. In 1909 he was Chicago exchange professor at the University of Göttingen. He is a member of the Modern Language Association. He contributed to the 'Cambridge History of English Literature' and to the 'Encyclopædia Britannica' and to various periodicals. He edited 'Macbeth' (1896); 'Specimens of the Pre-Shakespearean Drama' (1897); 'English Poetry' (1907); 'English Prose' (1909); 'Lessons in English,' with E. R. Bailey (1912); 'A Man's Manual for Writers,' with J. A. Powell (1914); 'English Prose and Poetry' (1916). He is also managing editor of 'Modern Philology.'

MANN, Sir Donald D., Canadian contractor and financier: b. Acton, Ontario, 23 March 1853. In the later 70's he went West, became manager for a firm of contractors who had a sub-contract on the Canadian Pacific line and became President of a contracting company until the completion of the main railway. Between 1881 and 1883 he completed various contracts for railroads and in the two following years began railroad-building in the mountains. He also undertook contracts for construction and tunnels in Columbia Cañon and in the Selkirk Range of the Rocky Mountains. Together with Sir William Mackenzie (q.v.) he constructed the Canadian Northern Railway (q.v.). In 1887 and a part of 1888 they constructed the Canadian Pacific short line through Maine. In December 1888 Mr. Mann visited Panama, Ecuador, Peru and Chile with a view of building railways for the Chilean government, but was not satisfied with the prospects there and declined the contract offered. Later he visited China. He was associated with the building of the Qu'Apelle, Long Lake and Saskatchewan Railway, and was one of the original syndicate which built the Winnipeg Electric Street Railway. He is also interested in many other enterprises. He was knighted in 1911.

MANN, Heinrich, German novelist, brother of Thomas Mann (q.v.): b. Lübeck, 27 March 1871. He attended the Kaiserswerth School in his native city and then entered business. In 1893 he moved to Munich, later changing his abode to Berlin, with frequent sojourns in Italy, particularly Florence. His permanent home he finally fixed at Munich. Like his brother Thomas, Heinrich is a reserved, unsociable character, who has developed a feeling almost of hostility for the types of German life with which he is surrounded. His mother was partly of creole origin, and this circumstance is taken by some German critics, as is also mentioned by Martens in his essay in 'Literatur in Deutschland,' 1910) as explaining Heinrich's predilection for the life and literature of the Romance countries as opposed to those of the Germanic countries. His first works were volumes of short stories: 'Das Wunderbare' (1897); 'Ein Verbrechen und andere Geschichten' (1898). Next came novels: 'In einer Familie' (1898); 'Im Schlafafflen' (1901); 'Die Götinnen, oder die drei Romane der Herzogin von Assy' (3 vols., 1902-1911); 'Die Jagd nach Liebe' (1904). 'Die Götinnen' represent a profound investigation of womanhood in three different phases (Diana, Minerva, Venus) and is a brilliantly constructed hymn of joy in the Romance style. Again he turns to the short story: 'Flöten und Dolche' (1905); 'Professor Unrat' (1905); 'Eine Freundschafft' (1906). 'Zwischen den Rassen' (Between the Races, 1908) is a novel dealing with the affection of a young girl, Lola Gabriell, for a German and an Italian, who are supposed to incorporate the virtues of their respective races. It has met with great popularity, but the attempt to capitalize racial characteristics in this way is too great a task for all but the greatest men. Heinrich Mann has also tried his hand at the drama, in 'Die Schauspielerin (1911), but with no particular success.

MANN, Horace, American educator: b. Franklin, Mass., 4 May 1796; d. Yellow Springs, Ohio, 2 Aug. 1859. He was graduated from Brown University in 1819, studied law at the Litchfield (Conn.) Law School and in offices at Dedham, Mass., in 1822 he was admitted to the bar, and practised at Dedham. In 1827 he was elected to the Massachusetts General Court, 1833, when he removed to Boston. In 1827-33 he was a representative in the State legislature, in 1833-37 State senator and in 1836-37 presi-
dent of the senate. From the first he identified himself with philanthropic interests. His first speech in the assembly was on religious liberty; and one of his enterprises was the establishment of the State lunatic hospital at Worcester (1833). In 1837, he was chairman of the board of commissioners and later of the board of trustees. In 1837, upon the appointment by the State of a board of education to revise and reorganize the Massachusetts common-school system, Mann became secretary of the board (19 June). He withdrew from politics and from a lucrative practice at the bar, and devoted himself entirely to a work which proved of the greatest significance not for Massachusetts only but for the entire United States. This work he accomplished largely in spite of opposition often pronounced. 

For the reform of State education he founded and edited the monthly Common-School Journal, held teachers' conventions, published 12 most valuable annual reports and established normal schools. In 1843 at his own expense he visited Europe for the study of Continental methods. He was successful in arousing throughout the country an unprecedented interest in educational affairs. In 1845 he was elected to Congress to succeed John Quincy Adams, deceased; and he served until March 1853. He was strongly opposed to slavery, and fearlessly attacked Webster's course. On 15 Sept. 1852, he declined the nomination for the governorship of Massachusetts, and on the same day accepted the presidency of Antioch College, Yellow Springs, Ohio, in which post he served until his death, greatly influencing the educational development of Ohio. He was a Fellow of the American Academy of Arts and Sciences. In addition to his annual reports he published "Report of Educational Tour" (1846); "A Few Thoughts for a Young Man" (1850); "Slavery: Letters and Speeches" (1852); "Lectures on Intemperance" (1852); "Powers and Duties of Woman" (1853); and "Sermons" (1861). Consult the "Life" by Mary P. Mann (1865); and Boone, "Education in the United States" (1890); "Report" (United States Commission of Education, 1895–96); Hubbell, G. A., "Life of Horace Mann" (1910).

MANN, James Robert, American congressman: b. near Bloomington, Ill., 20 Oct. 1809. He was graduated at the University of Illinois in 1876 and at the Union College of Law, Chicago, in 1881. He was admitted to the bar in 1881 and thereafter practised law at Chicago. He was attorney for the Village of Boys Park in 1886 and upon its annexation to Chicago he became alderman of the 32d ward, serving in 1893–96. He was temporary chairman of the Republican State Convention in 1894. He was master in chancery of the Superior Court in Cook County in 1892–96, and general attorney of the South Park District in 1885. He was elected to Congress in 1896 and has served continuously since. He was leader of the Republican minority in the House during the years 1913–19 of the Wilson Administration.

MANN, Matthew Derbyshire, American gynecologist: b. Utica, N. Y., 12 July 1845. He was graduated at Yale in 1867, from College of Physicians and Surgeons, Columbia, in 1871, and later studied in Europe. He practiced medicine in New York in 1873–79; was established as a specialist in obstetrics at Hartford, Conn., in 1879–82; and in 1880–82 he was clinical lecturer on gynecology at Yale. He was professor of obstetrics and gynecology at the University of Buffalo, from 1882 to 1907, and is now consulting gynecologist and obstetrician at the Buffalo General Hospital. He was president of the American Gynecological Society in 1894. He edited "American System of Gynecology" (1888). Author of "Manual of Prescription Writing" (1879).

MANN, Thomas, German writer of novels and short stories: b. Lübeck, 6 June 1875, of a wealthy family of merchants, whose traditions of solidarity and solvency surrounded him in his youth and gave him the material for his treatment of the family life of the Hanseatic patricians in "Buddenbrooks" and other works. After his father's death (1893) the family settled in Munich, where Mann joined them later (1894), and where he became an apprentice in the offices of the South German Fire Assurance Bank, a position of work that nearly wearied him. He attended lectures on aesthetics and literature at the University of Munich, later lived at Rome, returning to Munich in order to join (1899) the staff of "Simplicissimus" (av.), to which he remained attached for a number of years. Mann has a delicate and refined style of observation that are unparalleled in German literature. In his only long novel "Buddenbrooks" (1901), which established his literary reputation, as well as in his short stories, he captivates by a psychologic naturalism which is enhanced by the fact that the feelings depicted are those of well-to-do middle class persons in comfortable, if not luxuriant, surroundings. Henry James, whose attention is usually devoted to a higher social class, in the English novelists whom Mann's delicate and refining treatment most resembles, and the two men are also similar in their scrupulous precision and artistry of language. "Der Tod in Venedig" ("A Death in Venice," 1913), which has the proportions of a German novella (about 100 pages), describes the last hours of an elderly German writer, who, during a sojourn in Venice at a time when that city is visited by a plague, discovers abysses of his sexual life which he has hitherto not suspected, and is carried off by the plague before he is fully ready to accept the implications of his newfound knowledge. Mann's other works include short stories: "Der kleine Herr Friedmann" (1898); "Tristan" (H. G. Menzel, 1896); "Bühne und Bühne" (1900); "Königliche Hoheit!" (novel, 1909).

MANN, Tom, English Socialist: b. Foleshill, Warwickshire, 15 April 1856. His boyhood was spent in farming and mining and from the age of 14 he served an apprenticeship of seven years at a colliery, where his father worked. In 1877 he went to London, where he was prominent in connection with various trade-union affairs, and in 1885 he became a Socialist. Among his works are "A Socialist's View of Religion" (1896); "The Position of the Dockers and Sailors" (1897); "The International Socialist Movement," etc.

MANN, William Julius, American Lutheran clergyman, educator and author: b.
Stuttgart, Germany, 29 May 1819; d. Boston, Mass., 20 June 1892. He was educated at Stuttgart and Tubingen universities and entered the Lutheran ministry in 1841. He came to the United States in 1845 with Dr. Philip Schaff. He was assistant pastor at Saint Michael's and Zion's congregation, Philadelphia, in 1850-63, pastor in 1863-84 and thereafter pastor emeritus. He was prominent in Hebrew ethics and symbolism at the Lutheran Theological Seminary at Philadelphia from the time of its establishment. Author of 'Plea for the Augsburg Confession' (1856); 'The Lutheran Church and its Confessions' (1880); 'Life and Times of Henry Melchoir Mühlenberg' (1887), etc.

MANNA, a name for several substances, especially a saccharine matter which exudes naturally or from incisions made in the trunk and branches of a species of ash (Fraxinus ornus). It first appears as a whitish juice, thickens on being exposed to the air and when dried forms a whitish or reddish granular substance, which is the manna of commerce. The tree is a native of Italy and is cultivated extensively in Sicily. June and July are the two months in which the manna is collected. It is detached from the trees with wooden knives and is afterward exposed to the sun for drying. A little rain, or even a thick fog, will often occasion the loss of the collections of a whole day. The taste is sweet and slightly nauseous. It is a mild purgative and is principally administered to children. The finest kind of manna is called flake manna; it is white or yellowish-white in color, light, porous and friable. Sicilian manna is generally found in small, soft, round fragments; its color is yellowish-brown and it is generally mixed with more or less impurities. The principal constituent is mannite, chemically separable as a white crystalline substance of a sweetish taste, which also appears as a whitish efflorescence on certain edible seaweeds and fungi. To this and the saccharine elements, the nutritiousness of manna is due.

Many other sweet-tree-juices go by the name of false manna, since they contain no mannite, but depend for their peculiar qualities upon the possession of melitose or meletiote. In many cases the exudation of the sap is due to the irritation produced by insects or is the product of the insects themselves. These exudations are obtained from the Oriental teatree, sandalwood and an Australian grass (Andropon); in Europe from the larch and an oak, and in Persia from the camel's thorn. American manna is derived in California from the sugar pine and from a rush (Phragmites); while in India a species of bamboo secretes it so copiously as to form an important food-resource for the people in periods of famine.

The tamarisk manna, derived from the tamarisk trees about the eastern end of the Mediterranean, is not a direct product of the tree, but of a scale-insect, the manna-insect (Jossypfraria manni), which abounds upon the tamarisk and secretes the substance, which sticklers consider as the manna of the Bible. In Australia the waxen larval cases of several species of flea-lice (Psiilida) that feed upon the gum-trees (Eucalyptus) are gathered and eaten by the natives under the name of ererp.

The Scriptural manna (Heb. Man-hu, what is it?) is described in Exodus (xvi, 15) as covering the ground in such quantities as to supply food for the vast multitude of the Israelites. It was small and round like coriander seed, white and tasting like honey and water. It was of the color of beryl (Num. vi, 7). According to the Biblical narrative it was the food of the Children of Israel for 40 years. They complained of the diet (Num. xi, 6). In Rabbinical literature there are a vast number of stories about the manna hard to accept except as myths. It cannot be identified with any of the substances known nowadays, but is called in the Bible "bread from heaven," while the Jewish doctors taught that it became to each person who ate it that meat of whatever kind he liked best.

MANNAIA. See Guillotine.

MANNHEIM, măn'nhim, Germany, a large town of Baden on the Rhine, at the confluence of the Neckar, 45 miles south of Frankfort. It lies in the administrative district of Mannheim, of 1,386 square miles area and 641,454 population. Dikes protect it from floods and there are extensive harbors and modern docks. A bridge across the Rhine, here 1,200 feet wide, connects with Ludwigshafen, Bavaria, and there is also a bridge across the Neckar. Mannheim is the first commercial town in the grand duchy and on the upper Rhine. This it owes to its admirable position on two important navigable rivers and its railway communications. The arrivals of freight here in 1912 were 4,664,-763 tons, and the departures 729,129 tons. During the World War it was a distributing point for the German army. The principal articles of trade are corn, flour, wood, petroleum, coal, tobacco, cattle, sugar, iron, goods, etc. The manufactures consist chiefly of iron-castings, machinery, chemicals, cigars, carpets, woolen goods, paper, tiles, celluloid and rubber wares, mirrors, carriages, trinkets, sugar, liqueurs, starch, glue, etc. Mannheim was once strongly fortified and lying not far from the French frontier and near the centre of military operations, suffered severely during the wars between France and Germany. In a decree by the Austrians in 1795 only 14 houses remained unburned. Hence, notwithstanding the antiquity of its foundation, it has become an entirely modern town with regular, straight streets, known as in America, by numbers, and with fine public squares. The principal buildings are the former Palatine palace, with a museum and picture gallery in one of its wings, a public library of 75,000 volumes and good gardens behind it; the Jesuits' church, an imposing edifice, a profusely decorated interior; the former observatory building; the theatre, one of the best in Germany; several gymnasium and schools, conservatory of music, hospitals and orphanage, town-house, railway station, etc. Pop. about 97,980; in 1899 the suburb of Neckar was incorporated with it. Pop. 150,000.

MANNING, măn'ning, Daniel, American journalist and financier; b. Albany, N. Y., 16 May 1831; d. there 24 Dec. 1887. At 10 he entered the printing office of the Albany Atlas which shortly after was merged in the Argus, upon which paper he became a reporter and in time an authority in State politics. He was as-
sociate editor in 1865 and later was part owner of the paper which in his hands was a strong political power and instrumental in breaking up the Tweed ring. He strongly supported Governor Tilden's administration and through his membership of the New York State committee he was intimately connected with the leaders of his party. Upon Cleveland's inauguration in 1885 Manning was appointed Secretary of the Treasury, the affairs of which office he conducted with great ability. He resigned in 1889 as a result of ill health, though he was connected with several commercial and banking enterprises until his death in the same year.

MANNING, Henry Edward, cardinal of the Roman Catholic Church and archbishop of Westminster: b. Totteridge, Hertfordshire, 15 July 1808; d. Westminster, 14 Jan. 1892. He was educated at Harrow and Balliol College, Oxford, became a Fellow of Merton College in 1832 and in that year he was ordained and appointed curate of Woollavington-cum-Graffham in Sussex. In 1833 he became rector of Woollavington and was appointed archdeacon of Chester in 1840. In 1842 he was select preacher to the University of Oxford. He took very little part in the tractarian movement and did not write any of the tracts, but he formed friendships with some of the leaders of the movement. In 1851, after the decision in the "Gorham case," he joined the Roman Catholic Church and was ordained priest. He founded the Congregation of the Oblates of Saint Charles at Bayswater, London, in 1857, and upon the death of Cardinal Wiseman was consecrated archbishop of Westminster in 1865. At the Ecumenical Council in 1870 he was an ardent supporter of the infallibility doctrine, and in 1875 was made a cardinal by Pius IX. Manning was an esteemed leader of the Ultramontane party in his Church, and he commended himself to the world in general by his zeal on behalf of temperance, education and the betterment of the working-classes. He is the author of four volumes of sermons published before 1850; and his other writings are: "The Temporal Mission of the Holy Ghost" (1865 and 1875); "Petri Privilegium" (1871); "The Vatican Decrees" (1875); "The Catholic Church and Modern Society" (1880); "The Eternal Priesthood" (1883); "Characteristics" (1885); "Miscellanies" (1877-88); "Religio Viatoris" (1889). Consult Lives by Hutton (1892); Purcell (1896); Ward (1897); De Pressensé (1903); Fitzgerald, "Fifty Years of Catholic Life and Progress" (1901). Consult his Memorials (1892).

MANNING, James, American Baptist educator, first president of Brown University: b. Elizabeth, N. J., 22 Oct. 1738; d. Providence, R. I., 29 July 1791. He was graduated at Princeton College in 1762, in 1763 became pastor of a Baptist church at Morristown, N. J., and about a year later pastor of a church in Warren. The occupation of the American armies almost immediately commenced a Latin school, which seems to have been in some sense the germ of Rhode Island College. He had previously proposed to several influential men in his denomination, assembled at Newport, the organization of a seminary of divinity; but the government of the Baptists and had drawn up a plan for such an institution. In 1764 the legislature granted them a charter, and in 1765 he was appointed president and professor of languages and other branches of learning, with full power to act in these capacities, at Warren or elsewhere. The organization of the new college was in operation at Warren in 1766, and the first commencement was held there in 1769, when a class of seven was graduated. In 1770 it was determined to remove the college to Providence, and during the Revolution, when the college edifice was occupied as a military barrack, and afterward as a hospital, he was actively engaged in clerical duties and also rendered important services to the patriotic cause. In 1783 he resumed his duties at the college, and in 1786 represented Rhode Island in Congress, where he exerted himself to secure the adoption of the national Constitution. From 1770 till the year of his death he was also pastor of the first Baptist church in Providence. He resigned the presidency of the college in 1790. Consult Guild, "Life and Times of James Manning and the Early History of Brown University" (1894). See Brown University.

MANNING, Robert, American pomologist: b. Salem, Mass., 19 July 1784; d. there, 10 Oct. 1842. He established a pomological garden at Salem in 1823 with the purpose of establishing the identity and classifying the various varieties of fruit. His efforts accomplished a great public benefit in introducing to general use the best varieties of fruit and in standardizing the nomenclature. At the time of his death his fruit garden contained more than 1,000 varieties of pears and many hundreds of apples, peaches, plums and cherries. He was an uncle of Nathaniel Hawthorne. Largely through his efforts the Massachusetts Horticultural Society was established and he was a generous contributor to its support. Author of "Book of Fruits" (1838).

MANNING, Thomas Courtland, American jurist: b. Edenton, N. C., 1831; d. New York city, 11 Oct. 1887. He was graduated from the University of North Carolina, admitted to the bar and for a time practiced law in his native place, but in 1855 he went to Alexandria, La., and there established himself in a large practice. He was a delegate to the Secession Convention and at the outbreak of the war entered the Confederate army as lieutenant. He served as adjutant-general in Louisiana, attained the rank of brigadier-general. In 1864 he was associate judge of the Supreme Court of Louisiana. He was a presidential elector in 1872 and 1876, and in 1877 he was chief justice of the State Supreme Court. He was denied admission to the Senate upon his appointment to that body in 1880, and in 1882-86 he again filled the office of justice of the Supreme Court. He was appointed Minister to Mexico in 1886 and died in office.

MANNING, William Thomas, American Protestant Episcopal clergyman: b. 1806. He was graduated at the University of the South in 1839. He was ordained deacon in 1889 and priest in 1891; and in 1892 he was rector at Redlands, Cal. He was professor of dogmatic theology at the University of the South in 1893-95; and was rector at Landsdowne, Pa., in 1896-98, and at Nashville, Tenn., in 1899-1903. He became vicar of Saint Agnes' Chapel, New York, 1903; was appointed assistant rec-
tor of Trinity Parish, New York, in 1904, and in 1908 became rector there.

MANNING, S. C., town, county-seat of Clare County, on the Atlantic Coast Line Railroad, about 30 miles southeast of Columbia and 70 miles north of Charleston. It is situated in an agricultural region and in the vicinity are large pine forests. Some of the manufactures are flour, lumber and knit goods. Pop. about 2,000.

MANNING, or MANNYNG, Robert, English poet: b. 1624; d. 13407. See BAUNNA, ROBERT OF.

MANNINGTON, W. Va., village in Marion County, 45 miles southeast of Wheeling, on the Baltimore and Ohio Railroad. It is situated in a rich coal-mining district and has extensive oil and gas interests. There the manufactures of pottery, glassware, tools and machinery and flour. There is a municipal water-supply system. Pop. 2,672.

MANNITE, or MANNITOL, a singular chemical compound which has the formula C₄H₁₂(OH)₄ and constitutes from 30 to 60 per cent. of the weight of the dried juice which exudes from the manna ash (Frasinus orinus), a tree growing in the Mediterranean regions. It also occurs in many other plants and is formed in the lacteal fermentation of sugar, and also in the spontaneous fermentation of the juice of the sugar-cane, in tropical countries. It may be prepared by boiling manna with dilute alcohol, the manna crystallizing out upon cooling. The crystals are then purified by recrystallization from water. It is a white compound, crystallizing in needles or four-sided prisms, and is readily soluble in water, insoluble in ether and but slightly soluble in alcohol. It melts at 329° F. and begins to sublime at about 400° F. Manna has a pleasant, sweet taste and in some respects resembles the sugar. It is not a sugar, however, but a hexatomic alcohol. (See ALCOHOL). Chemically, it is derived from the hydrocarbon hexane, C₆H₁₄, by the replacement of six atoms of hydrogen by six molecules of hydroxyl (OH). Sorbit (or sorbitol) and dulcitol (or dulcitol) have the same chemical formula as manna and resemble it very closely. They are, in fact, isomers of mannie. Sorbit is prepared from mountain ashesberries, and dulcitate from Madagascar manna. See MANNA.

MANNLICHER, mahn-lee-cher, Ferdinand, Ritter von, Austrian engineer and inventor: b. Mainz, 30 Jan. 1848; d. 1904. He was chief engineer of the Northern Railroad for many years, and after the success of the needle-gun at Sadowa in 1866 began experiments which ultimately produced a magazine rifle which was adopted by the Austrian army in 1885. He has become famous for his numerous inventions in small arms and was elected to the Upper House of Austria in 1899 in recognition of his distinguished services.

MANNY, Walter Baron de, English soldier and philanthropist: b. 1372. His memory is perpetuated as the founder of Charterhouse School (q.v.), and by his military exploits as recorded by his friend Froissart in his 'Chronicles.' Scion of a noble family of Hainaut, he arrived in England in 1327 in the train of Queen Philippa, rose to high rank in the Scottish wars of Edward III, became a commander of the English fleet, and of the army in France, and both in military commands and in diplomatic negotiations received the commendation of the king. He was created a baron and knight of the garter in 1335. He married the Countess, later the Duchess of Norfolk. Consult 'Froissart's Chronicles' (Globe ed., Eng. trans., London 1895).

MANOBAS, mah-noh-bahs, a native tribe of the Philippines, living chiefly in the valley of the Rio Agusan, island of Mindanao, and at some places in the district of Davao, Mindanao. They are of Malay race, head-bunners, and largely heathen, though the work of the Jesuits among them has resulted in a considerable portion becoming Roman Catholics. The name in earlier times was often applied to other heathen tribes of Mindanao.

MANOEUVRES, mah-noo-vwerp. See ARMY and NAVY MANOEUVRES.

MANOMETER (Greek, 'refraction measure'), an instrument for measuring the pressure exerted by gas or liquid. It may have many forms, of which the mercurial barometer is one. (See BAROMETER). One of the commonest designs, for the measurement of pressures not greatly different from that of the atmosphere, consists of a U-tube, one leg of which is open to the air, while the other is in communication with the gas or liquid whose pressure is to be measured. The lower part of the U is filled with some non-volatile liquid of known density, and the difference between the pressure of the fluid under examination and that of the atmosphere is found by observing the difference between the levels of the manometric fluid in the two branches of the U-tube. If the absolute pressure of the fluid is desired, it is necessary to add the atmospheric pressure to the differential pressure as read from the manometer. In rough work it may be sufficient to assume the atmospheric pressure to be 14.7 pounds per square inch; but in more refined observations the atmospheric pressure must be determined by reading the barometer, simultaneously with the manometer. Mercury is commonly the liquid that is used in the U-tube, but when the differences in pressure that are to be read are very small, some less dense liquid may be used with advantage. Sulphuric acid is often employed in such cases; and when (as in the measurement of chimney draft) a slight amount of evaporation from the manometric fluid is unimportant, water may be employed. When the pressure to be measured materially exceeds one atmosphere, the siphon manometer, as just described, is modified by sealing one of the ends of the U-tube, instead of leaving it open to the air. In this case the pressure is determined by observing the amount of compression that it produces in the air that is confined in the sealed portion of the siphon, by the manometric fluid; for it is known, by Boyle's law, that the volume of the air in this arm is sensibly proportional to the reciprocal of the absolute pressure, so long as the temperature remains constant. Boyle's law is not rigorously exact, however, and when a high degree of precision is required from the compression manometer, it is necessary to make allowances for its error. Data for this purpose have been given by Amagati, up to 85 atmospheres, when the temperature of the manometer is maintained at 10° C. (60° F.). Consult;
MANON LESCAUT—MANRIQUE

Amagat, "Comptes Rendus," Vol. XCIX, p. 1153; Preston, "Theory of Heat," p. 403). In steam engineering the commonest form of manometer is the "Bourdon gauge," which depends for its action upon the elastic deformation of a flat- ended tube, exposed to an internal pressure. In practice the flattened tube is bent into a circular form, one end of it being fixed while the other communicates, by means of a multiplying gear, with an index hand which travels over the face of a graduated dial. A tube, carefully constructed and straightened out sufficiently when subjected to an internal pressure, returning again to its original form when the pressure is removed. The deformation is approximately proportional to the magnitude of the pressure (so long as the tube is not strained beyond its elastic limit), and hence the dial may be graduated, without difficulty, so as to indicate true pressures, at least to a degree of precision quite sufficient for the purposes of steam engineering. All such gauges should be carefully constructed with a standard mercury column, however, before great reliance is placed upon them; for it is found that they are sometimes seriously in error in some parts of the scale, even when sensibly correct in other parts. In using them in connection with steam boilers, care should also be taken to prevent steam or highly heated water from coming into direct contact with the curved tube, since the elastic properties of the tube are injured by overheating. To ensure the proper protection of the gauge, a siphon, or a complete circular bend, should be placed in the pipe between the gauge and the boiler. The trap so formed will fill with water of condensation the first time the boiler is fired up, and thereafter it will be impossible for steam to enter the gauge directly.

MANON LESCAUT, a short novel of 200 pages, the seventh volume of a larger work, "Memoirs of a Nobleman," has sufficed to assure the reputation of its author, Prévost d'Exiles (1697-1763), better known as L'Abbé Prévost. After a life of adventure in France, England, Holland and Germany when he was in turn soldier, monk, journalist, teacher and later chaplain of the Comte de Corte, Prévost became a professional writer and composed more than 100 volumes. He also translated many English works, and among those, his adaptations rather than translations of "Pantela," "Clarissa Harlowe" and "Grandison" gave to Richardson a great popularity in France during the second half of the 18th century, to the detriment of Prévost's own works. Of all Prévost's novels, critical articles in the periodical Pro and Con and pseudo-scientific travel stories, Manon Lescaut alone survives. Published in Holland in 1731, it "took like wild fire" according to contemporary testimony and more than 30 editions were printed before the end of the century, that of 1753 revised and corrected by the author being considered the best. This novel is the story of the passionate love of the young Chevalier des Grioux for the courteous Manon. It is told in a simple narrative style and with a sincerity which leads us to believe that Prévost relates at least in part some episodes of his own life. The novel presents a realistic and painful picture of the sufferings which uncontrolled passion brings upon those who lack the will power to resist it, and while Prévost does not attempt to excuse or justify the faults of his heroes, he shows passion as a terrible force whose victims are to be pitied rather than blamed. Prévost had many imitators even in his own time, and the theme of Manon, dealing with rehabilitation through love and sufferings, is found later in "Marion Delorme" (Hugo), "La Dame aux Camélias" (Dumas), "Sapho" (Daudet) and in the works of several Russian novelists.

LOUIS A. LOISEAUX.

MANOR (old French manoir, maner, from L. manere, to remain, being the residence of the owner), a piece of territory held by a lord or great personage, who occupied a part of it, as much as was necessary for the use of his own household, and granted or leased the remainder to tenants for stipulated rents or services. No manors, with all their incidents and franchises, have been granted in England since the reign of Edward III. One of the most important incidents to these ancient manors was the right to hold a court, called a court-baron, which was held within the manor, and had jurisdiction of misdemeanors and nuisances within the manor, and disputes arising between the tenants. The manor system was in vogue in the United States only during the British occupation, but many old manor names like Briarcliff manor, Pelham manor, etc., are still retained by the present owners of large estates. See also TENURE.

MANOURY, General. See MAUNOURY.

MANRIQUE, man-reh-kah, Angel, Spanish poet and ecclesiastic: b. Burgos, 1577; d. Badajos, 1649. He rose to high rank in monastic life, becoming finally head of the Cistercians throughout Spain, and finally bishop of Burgos (1645). He wrote a history of the Cister order which had considerable reputation throughout Europe. He also wrote many devotional and other works of a religious or devotional nature.

MANRIQUE, Gomez, Spanish poet and dramatist. b. about 1415; d. 1491. He was son of Pedro Lord of Amusco, and a younger brother of Rodrigo Manrique, master of Santiago and Alcaldes de Corte, the troops of Castile, viz. the crown of John II. He became a soldier of some note and took part in wars against the Moors. He sided with the Infante, Don Enrique, against Alvaro de Luna and the royal court. He was very active and seems to have taken part in almost every political disturbance and warlike expedition of Spain in his day. He was very much mixed up in the political move which forced the marriage of Ferdinand of Aragon and Isabel of Castile, which was of great significance since it ultimately led to the expulsion of the Moors from the country and the political and national unity of all Spain. He attained to numerous high offices under the king of Aragon and later under the united crowns of Castile and Aragon, becoming finally a member of the royal council and the confidant of the joint sovereigns. Gomez Manrique, notwithstanding his tempestuous and warlike life, was one of the greatest orators of his age and a talented poet. He was one of the set of writers who were the disciples of the Virgin Mary and their love for devotion to her. He was a satirist with a keen sense of humor, and he attempted nearly every class of literature known in his day in Spain.
He played his part in helping to introduce into Spanish poetry the poetical forms of Italian literature. He also wrote religious dramas, in the form in which they appeared in his age. For this reason and for the fact that he introduced more than customary life into these dramatic pieces, his work had considerable influence on the development of Spanish, both religious and, subsequently, profane, in Spain.

The best of his religious dramas, all of which are of a liturgical caste, is 'Representacion del nacimiento de Nuestro Señor.' He also wrote on political and philosophical subjects and on matters of ethics and vices such as gluttony, envy, laziness, and of virtues, such as reason (in human actions), faith, prudence and honesty of purpose in government. His poem on the death of the Marques de Santillana became immensely popular and Gómez Manrique rose to be the most quoted writer and most recited lyrical poet of his day. His 'Cancionero' has been published several times and poems of Gómez Manrique have appeared in various other cancioneros. Consult Menéndez y Pelayo, 'Antología de poetas líricos castellanos' (Vol. VI, Madrid 1886); Pas y Meła A., 'Cancionero de Gómez Manrique' (Madrid 1885); Rios, Amador de los, 'Historia crítica de la literatura española.'

MANSARD, Jérôme, Spanish poet: b. about 1440; d. 1479. He was son of Rodrigo Manrique, grand master of Santiago. He early took a prominent part in the troubles of the reign of Henry IV, taking sides with Don Alfonso. Notwithstanding the fact that most his life was passed in active military duty and that he died in battle in the attack on the fortress of Garci-Muñoz, he yet attained such an eminence as a poet that he is still classed among the great writers of Spain, and a worthy nephew of Gómez Manrique (q.v.) and heir of his father, Rodrigo Manrique, who was one of the successful troubadours at the court of John II, one of the foremost patrons of lyrical poetry. Jérôme Manrique has written satires, love songs and poems of a like nature common to the age in which he lived; but his most noted poem and the one to which he owes his lasting fame is 'Corts de Jorge Manrique por muerte de su padrí. This is one of the finest lyrics in the Spanish language, instinct with true poetic form and thought and sympathy. This poem has been imitated and praised by some of the greatest writers of Spain and it has found universal favor in the eyes of the critics. Longfellow has made a worthy translation of it into English; and it was set to music as far back as the 16th century by Venegas de Henestrosa. (See COPLAS DE MANRIQUE; HENESTROSA, DON JUAN DE; LONGFELLOW'S translation and FITZMAURICE-KELLY, James, 'A History of Spanish Literature' (New York 1898); MENENDEZ Y PELAYO, MARCELINO, 'Antología de poetas líricos castellanos' (Vol. VI, Madrid 1896). 'Biblioteca de autores Españoles' (Rivadeneyra, Vols. XXXII and XXXV) contains his works and notices thereof.

MANS, mão, Le, France, the capital of the department of Sarthe, on a height above the Sarthe, here crossed by three bridges, 115 miles southwest of Paris. It consists of a lower and an upper town. The principal edifice is a fine Gothic cathedral of the 11th century. It has a seminary, excellent schools, a public library of 60,000 volumes and several museums. The chief manufactures are metal works, railway cars, tobacco, canned goods, chemicals, cordage, leather and woolen and linen goods; being a railway centre it is a distributing point for farm produce, canned goods, wines, etc. Le Mans existed in the time of the Roman under the name of Cenomani, a tribe who inhabited the district. Numerous vestiges of Roman structures (subterranean aqueducts, walls, etc.) still remain. It was long in the possession of the English, and Henry II, the first Plantagenet, was born here. During the Franco-German War (1870-71) General Channy was defeated here by Prince Frederick Charles and the Grand-duke of Mecklenburg. A monument commemorates the battle. Pop about 69,361.

MANSARD, mān-sār, or MANSART, François, fran-swā, French architect: b. Paris, 23 Jan. 1598; d. there, 23 Sept. 1666. He designed many important buildings in Paris, as well as provincial chateaux and country seats. The chateaux at Bolois are partly his work, and he built the church of Val de Grâce and the Hotel Carnavalet. The mansard roof is called after him.

MANSARD ROOF, in architecture (so called from François Mansard, or Mansart (q.v.), a French architect to whom the invention is attributed), a roof formed of two sets of rafters, of which the upper set are more inclined to the horizon than the lower set, and form an obtuse angle at the ridge. The transverse beams connecting the lower ends of the under set of rafters are called as in ordinary roofs tie-beams; the corresponding beams at the union of the upper and under rafters are called collar-beams.

MANSART, Jules Hardouin, zhul är-deu-än mān-sār, French architect: b. Paris, 16 April 1645; d. Versailles, 11 May 1708. He was a nephew of François Mansart, or Mansard (q.v.). He directed all the great building operations of Louis XIV, who heaped favor and wealth upon him. His works include the palace at Versailles; the Maison de Saint-Cyr; the Grand Trianon; the triple dome of the Invalides, and the Chateau de Clagny, the residence of Madame de Montespan. He also designed the Place Vendôme and the Place des Victoires.

MANSE, in Scotch law, a name given the dwelling-house of the minister of the Established Church. In popular use the term is often applied generally to the dwelling-house of any minister of a dissenting congregation. In the Established Church every first minister of a rural parish is entitled to a manse, which the heritors or landed proprietors in the parish are bound to build and uphold. When a manse has
MANSFIELD, Richard, American actor: b. Heligoland, 24 May 1857; d. New London, Conn., 30 Aug. 1907. He first studied art, opening a studio in Boston for a time, but later returned to England, and entered the theatrical profession as an actor, and as a writer of comic opera, and first appeared in America as Drome in 'Les Manteaux Noires' at the Standard Theatre, New York. He afterward was very successful in a wide variety of plays, and became the head of his own company.

He created such parts as Beau Brummel, Baron Chevrier, Dr. Jekyll and Mr. Hyde and Monsieur Beauchaire; among his other most successful roles were Cyrano de Bergerac, Shylock in 'The Merchant of Venice,' Henry V, Brutus in 'Julius Caesar,' Prince Karl in 'Old Heidelberg,' and Peer Gynt in Ibsen's play. His own acting, as well as the work of his company which he carefully oversaw, was of a high artistic standard, carefully worked out in detail. Consult Strong, 'Famous Actors of Today in America,' and his 'Life' by William Winter.

MANSFIELD, William Murray, Earl of British jurist: b. Scone, Scotland, 2 March 1705; d. London, 20 March 1793. One of the youngest sons of Viscount Stormont, he was educated at Christ Church, Oxford; studied law; was called to the bar in 1730; won a large Scotch practice and many literary friends, the foremost being Alexander Pope, and in 1742 was made solicitor-general and entered Parliament. Though of Jacobite descent he unflaggingly upheld the Hanoverian interest in 1745; did special service in 1748 by his defense of the Treaty of Aix-la-Chapelle, and was admitted leader of the House. An attempt to prove him guilty of treason or disloyalty to the Crown was unsuccessful, though often repeated. He was made Attorney-General in 1754 and Chief Justice and Baron Mansfield in 1756. He was a member of the cabinet, without office, for 15 years, but his part in politics waned after he went on the bench. He was still a typical Tory, however, and in 1770 sided violently with the government in the political libel trials and was sharply attacked by Junius. His unpopularity steadily increased because of his opposition to Wilkes, whose sentence, however, he greatly lightened because of a technical flaw which he discovered himself, and in general because of his contention in various famous cases of libel that the jury could decide only on the facts and not on any question of law. In 1774 in the case, Campbell v. Hall, he declared that the chief justice's questions were governed by the general principles of the British constitution; but in regard to the American colonies he insisted that their complaints could not be considered until they had submitted themselves to Parliament. He became Lord of Mansfield in 1776; proposed the coalition of 1779, and in 1780 suffered at the hands of the Gordon rioters because of his sympathy with Catholic emancipation. In 1788 he retired from the bench. Though so unpopular, and though constitutionally a believer
in royal prerogative. Mansfield was a great judge, whose work was not too conservative, and an able, calm, logical debater. Possibly his greatest labor was his revision of the mercantile law.

MANSFIELD, England, a market town and municipal borough in Nottinghamshire, 16 miles north by west of Nottingham, in a deep valley, in the midst of a rich coal district, surrounded by vestiges of Sherwood Forest. There are cotton mills, manufactures of silk and cotton hosiery, lace thread-mills, boots and shoes and cigar-making. It is supposed to mark the site of a Roman station. Pop. 36,888.

MANSFIELD, Mass., town in Bristol County, 24 miles southwest of Boston, and 20 miles northeast of Providence, on the New York, New Haven and Hartford Railroad. The town has an excellent high school and modern water and lighting systems. Manufactures include cutlery, jewelry, straw goods, baskets, electrical supplies, and ranges. Pop. 5,183.

MANSFIELD, Ohio, city and county-seat of Richland County, on the Pennsylvania, the Erie and the Baltimore and Ohio railroads. Situated 1,200 feet above sea-level, it is said to be the highest city in the State. Only a short distance from the coal fields, it is a modern business and residential city; has eight banks with clearings for 1915 amounting to $28,986,256.59; terminal grain elevators, being the distributing centre for a grain-raising region, and does a large jobbing business in groceries. It is supplied with natural gas, also artesian well water for both fire and domestic purposes. Among the principal buildings are Municipal Library, opera-house, Y. M. C. A., the County Children's Home and also 27 churches of the various denominations. It is the seat of the Ohio State Reformatory. The fire department is paid by the city, and there is also a complete sewage disposal and garbage crematory plant. The industries include the manufacture of watch cases, mattresses, packing, tobacco, tires and rubber goods, chains, agricultural implements, electrical machinery, stoves, electric mine equipment, artificial stone products, house furnishings, women's clothing, etc. Pop. 24,818.

MANSFIELD, Pa., borough, in Tioga County, on the Tioga River, and on the Erie Railroad, about 108 miles north by west of Harrisburg and 25 miles southwest of Elmira, N. Y. It is in the midst of an agricultural region and near the coal fields and bituminous coal region. It is the seat of a State Normal School and has two libraries, one of about 6,000 volumes belonging to the Normal School, and a City Library containing 5,000 volumes. Pop. 1,800.

MANSFIELD, Mount, in Vermont, one of the highest elevations of the Green Mountains, 4,405 feet; in the northwestern part of the State, about 23 miles east of Burlington. The view from its summit includes the Adirondack and White mountains, Lake Champlain, a large portion of the northern part of Vermont and some of New Hampshire. See Green Mountains.

MANSFIELD COLLEGE, Oxford, England, a theological institution, established in 1886 for the education of men for the Nonconformist ministry. It owes its inception chiefly to Congregational support. Its students must be graduates of some recognized university, or undergraduates of Oxford who have passed Moderations. The staff consists of a principal, a vice-principal, three lecturers and a bursar. Mansfield House, at Canning Town (West Ham), is a settlement in connection with the college.

MANSFIELD PARK. This quietly charming novel of manners, published in 1814, is perhaps less popular than some of the other works of Jane Austen, but it is regarded by more than one critic as even superior to them in richness and maturity. As the title implies, the story is built around English country-house life. Fanny Price, an indigent niece, is taken into the family of Sir Thomas Bertram. Overlooked for the most part by Sir Thomas and his wife, subjected to the capricious control of the odious Mr. Norris, Lady Bertram's sister, and neglected or patronized by three of her cousins, Fanny finds her chief consolation in the casual kindness of her remaining cousin, Edmund, whom she grows to love. But Edmund is attracted by the dash and sophistication of Mary Crawford, with whom her brother, Henry, is visiting at the neighboring rectory. Henry, in turn, after various flirtations with the Bertram sisters, pays suit to Fanny. The unfolding of these several relationships by means of seemingly insignificant incidents—dances, excursions, amateur theatricals—constitutes some of Miss Austen's most skillful work and affords her opportunity for those delicately humorous, mildly ironical accounts of the life she knew best, that have made her immortal. Of course in the end Henry and Mary Crawford are eliminated and Edmund loves and marries his Cinderella-like cousin. No single character in this novel is as well known as Mr. Collins of 'Pride and Prejudice' or Miss Bates of 'Emma'; yet the various personages are excellent examples of the author's nice discrimination and marvelous insight. Each character is clearly portrayed though not unduly simplified; each exhibits in varying proportions that mixture of good and evil common to all mankind. In a word, the characters are not types or Elizabethian "humors," but are richly human. "Mansfield Park" appeals to many classes of readers. It is the best kind of historical novel, for it records vividly the manners and customs of ordinary folk in the Napoleonic era. It is a superb example of a serene, balanced realism, avoiding alike the rose-pink and the dirty drab that Meredith later reprehended. It is an almost flawless instance of pure comedy in fiction. Consult Howells, W. D., 'Heroines of Fiction'; Cornish, Francis Ware, 'Life of Jane Austen'; Smith, Goldwin, 'Life of Jane Austen.'

GEORGE B. DUTTON.

MANSHIP, Paul, American sculptor; b. Saint Paul, Minn., 25 Dec. 1885. He received his early education at the Saint Paul Institute of Arts, where he evolved his early interest in sculpture, and later studied at the American Academy in Rome. His first achievement was the winning of the Helen Barnet prize, in the National Academy of Design in 1913, and he won this again in 1917. He was also awarded a gold medal at the San Francisco World's Ex-
position in 1915. His statues are to be seen in
the Metropolitan Museum in New York, Pratt
Institute, Art Institute, Chicago, and other
leading institutions.

MANILLA DE GARCIA, Eduarda,
á-doo-ar'dá má-nen-sel'yá dá-gar-se'á Argentine
novelist: b. Buenos Aires, 1838. Her maiden
name was Mansilla; at 16 she married Manuel
R. Garcia, a diplomat, and at 19 published 'El
Infierno de San Lito,' possibly her best
work. It was followed by 'Lucia Miranda,' a his-
torical novel on the discovery of La Plata, and
by 'Pablo, o la Vida en las Pampas,' which
with its fresh description of Argentine life
made a great impression in Paris and was
praised by Hugo. She was a musician of much
talent and wrote, besides novels, several plays.

MANSION HOUSE, in London, England,
the official residence of the lord mayor, built
on the site of the Old Stock Market in 1739
from designs by George Dance, at a cost of
$213,900. It is an oblong building and contains
an Egyptian banquet hall accommodating 400
guests.

MANSLAUGHTER, the killing of a hu-
man being; in criminal law the second degree of
felonious homicide. Murder and manslaughter
are distinguished from each other by the intent
which causes or accompanies the act. If a
homicide be not justifiable nor excusable, and
yet be not committed with malice aforethought,
it is manslaughter and not murder. It is quite
certain that the intent need not be to kill; for
while there must be a criminal intent to make
a person amenable to law as a criminal, yet if
one crime be intended, and in the act of com-
mitting it another of a higher character be
also committed without intent, the criminal is
responsible for this higher crime. The general
principle laid down in respect to manslaughter
is, that not only a positive intention to commit
some crime, but mere negligence, may make one
guilty. If any one take upon himself an office
or duty requiring care or skill, he is liable for
the want of either; and if death be the con-
sequence of his ignorance or carelessness, he
is guilty of manslaughter. So if one driving
furiously run over and kill a person whom
he did not see, or if one in command of a
steamer or sailing-vessel by reason of gross
negligence run down a boat and some one in
it be drowned, this would be manslaughter.
So, if any one, whether medical by profession
or not, deal with another as a physician, and
through gross want of care or skill kill him,
or if any one charged with building a house
of any kind construct it so badly that it falls
and kills persons within or near it; or if in
building he drop a stone upon some one pass-
ing below and kill him; in all these cases he
would be guilty of manslaughter, provided he
were grossly negligent in the act causing the
death. This is the essential question.

The judicial treatment of this crime, being
regulated by statute, varies in the several States.
The element of premeditation is not essential
to conviction of this crime. There are cases
which the law regards as only manslaughter,
without evidence of momentary excitement;
partly because the law infers that from such a
provocation there must be some premeditation; and
partly, perhaps, because the party killed brought
his death upon himself by his outrageous wrong.
Thus, if a husband detects his wife in adultery,
and instantly and purposely takes either her life
or the adulterer's, it is only manslaughter.
Not so, however, if he waits for a subsequent
opportunity, for then the first reason wholly
fails, and the killing becomes murder.

In New York State four degrees of man-
slaughter are defined. The first carries a pen-
alty of not over 20 years' imprisonment, the
second degree not over 15 years. The first de-
gree, briefly stated, consists of killing without
the purpose of death, when the deceased was
engaged in perpetrating or attempting a crime
less than felony, and where such killing would
be, at common law, murder. Assisting in self-
murder is manslaughter in the first degree, as
also willfully killing an unborn quick child
by injury to the mother if it would be murder in
case the mother died from the injury. The
second degree consists in killing by negligence
otherwise; killing in the heat of passion without
the intent of death, but in a cruel and unusual
manner; or killing unnecessarily one attempt-
ing to commit felony. The third degree is kill-
ing in heat of passion, without intent of death
but with a dangerous weapon; involuntary kill-
ing, by procurement or negligence of another
while the person killed is engaged in committing
a trespass on property; suffering an animal
known to be mischievous to go abroad without
care, or keeping it without care, and thereby
causing death; receiving wilfully or negligently
so many persons in a boat or vessel as to cause
death; racing while in command of a steam-
boat carrying passengers, bursting the boiler,
and so killing; killing by a physician while in
a state of intoxication. The fourth degree may
be said to include all other modes or forms of
manslaughter, known as such at common law,
and of a milder kind than the preceding. There
is much difference between the States in the
penalities prescribed. Connecticut, Rhode
Island, Maine and Maryland, assign "not over 20
years" to both first and second degree man-
slaughter, thus practically leaving the penalty
to the judge's discretion; other States, as New
Hampshire and South Carolina, call for not
over 30 years, while Texas, West Virginia and
Delaware place five years as the greatest punish-
ment. Several States make second degree man-
slaughter "not over one year" in prison. See
HOMICIDE.

MANJURA, MANJOURAH, or MAN-
SURAH, má-nsoor'á, Egypt, a town on the
Damietta branch of the Nile, 34 miles southwest
of Damietta. It has railway connection with
Zagazig and Cairo and is the chief depot of
the bread-stuffs, cotton, indigo, hemp and flax
which this part of the Delta produces. There
are large linen and cotton factories. Man-
surah was founded in 1221 and here in 1250,
during the Crusades, Louis IX of France was
captured and imprisoned. Pop. about 45,304.

MANTA, mánt'tá, Ecuador, city, port of en-
try on the Pacific Coast, about 155 miles south-
west of Quito. It has an excellent harbor and
steamer connection with nearly all the Pacific
Coast towns of South America. It was founded as early as 1534–35, and for many years its im-
potence has been surpassed only by the May-
triatic, which is about 10 miles inland. The
chief exports are coffee and rubber. Pop. 4,000.

MANTALINI, mān-tä-le'ne, a low and af-
fected character in Dickens’s ‘Nicholas Nickleby’
who lives on the labors of his wife, mantua-
maker.

MANTARO, mān-tā'ro, a river in Peru
which has its rise in the mountains in the west-
ern part of the province of Junin. Its source
is about 13,000 feet above the sea. It flows
south and east to Huanta, near which it breaks
through the mountains and turns northwest
which course is continued for about 60 miles,
when it has changed its name to Illan and
joins the Pisquini, where it joins the Apurimac
River and forms the Ené. The Mantaro is nearly
300 miles long and navigable only a short dis-
tance above the junction with the Apurimac.
It has extensive water power which is not used
except in a few cities.

MANTEGAZZA, Paolo, pā'o-lō mān-tā-
gät'sā, Italian author and physiologist: b.
Monza, Italy, 1831; d. 1910. He was educated
at the universities of Pisa and Milan, spent sev-
eral years in traveling, visiting almost every
portion of the globe, after which he returned
to Milan and practised medicine there. He was
appointed professor of physiology at Pavia in
1860 and in 1870 became professor of anat-
omy at Florence, where he founded the Museum
of Anthropology, also a society and a review
of anthropology. He was a member of the
Italian Parliament 1865–76 and then became
senator. He is the author of many medical and
philosophical books; among them are ‘Elementi
di gineica’ (1875); ‘Fisiologia del piacere’
(1881); ‘Le istasi umane’ (1887); ‘L’anno
3000’ (1897); ‘L’amore’ (1898), etc. He has
also written books of travel and has devoted
a share of his attention to political affairs.

MANTEGNA, Andrea, Italian painter: b.
Vicenza 1431; d. Mantua, 13 Sept. 1506. His
master, Squarcione, was induced by the talents
which he displayed to adopt him as a son. The
younger principally in drawing from antiques, and at the age of 16 painted a
picture for the grand altar in the church of
Saint Sophia at Padua. About 1468 Mantegna
entered the service of Ludovico Gonzaga,
at Mantua, where he opened a school. Here he
painted his great picture, the ‘Triumph of Julius
Cæsar,’ for the tapestry of a palace erected in
Mantua. It consists of several cartoons, which
have since been transferred to Hampton Court.
Gonzaga conferred on him the honor of knight-
hood in reward for his merit. Innocent VIII
invited the artist to Rome to paint in the Belvi-
dere. One of the best of this artist’s works is the
‘Madonna della Vittoria,’ now in the
Louvre at Paris, in which Giovanni Francesco
Gonzaga is seen returning thanks for the vic-
tory gained by him in 1496 over the forces of
Charles VIII. The genuineness of this picture
is, however, sometimes doubted. There are
several others of his works in the Louvre, and an
‘Annunciation’ in the Dresden Gallery. The
New-York Historical Society has his ‘Cru-
cifixion,’ the Metropolitan Museum of Art’s
‘Holy Family,’ the Johnson Gallery in Philadelphia.

his ‘Adoration of the Magi.’ He was also noted
as a line engraver, and left many notable cop-
ied plates of both religious and historical sub-
jects. Consult Bell, N. R. E., ‘Mantegna’
(New York 1911).

MANTELL, Gideon Algernon, English
geologist: b. Lewis, Sussex, 1790; d. London,
10 Nov. 1852. For many years he practised as
a medical man, and employed his leisure time
in studying the strata and fossils of the
weald district, by which he was surrounded.
Through his investigations the fossilized skeleton
of the Iguanodon and Hylaeosaurus were
discovered, the fresh-water origin of the
wealden beds demonstrated and many other
important facts established in regard to the
geology of that district. He published ‘The
Fossils of the South Downs’ (1822); ‘Illustra-
tions of the Geology of Sussex’ (1822),
and the very popular ‘Wonders of Geology’ (1838);
and ‘Medals of Creation’ (1839). His magnifi-
cent collection of fossils was purchased in 1839
for the British Museum.

MANTELL, Robert Bruce, American
actor: b. Irvine, Scotland, 7 Feb. 1854. He
made his début upon the stage at Rochdale,
England, in 1876, and in 1878 played in juvenile
rôles with Modjeska in the United States. He
then spent three years in England as leading
man, returning to New York to play with Fanny
Davenport. He became a star and plays at the
head of his own company, presenting the leading
classical and romantic roles, including Ham-
et, Macbeth, Romeo, Richelieu, etc.

MANTES, mānt, France, a town in the
departement of Seine-et-Oise, on the left bank of
the Seine, opposite Limay, with which it com-
 municates by two handsome bridges connecting
the banks with an island in the river, 29 miles
west-northwest of Paris. It contains a fine
Gothic church, with two lofty towers; a beauti-
ful Gothic tower, the only remains of the
church of Saint Maclou; and has manufactures of
leather and saltpeter, famous breweries,
numerous mills and a trade in leather, corn
and wine. William the Conqueror received his
death-wound at Mantes. Pop. 8,821.

MANTEUFFEL, mān'tōf-fēl, Edwin
Hans Karl, Baron von, German field-marshal:
b. Dresden, 24 Feb. 1809; d. Karlsbad, 17 June
1885. He entered the army in 1827 and ad-
vanced rapidly, becoming lieutenant-general of
cavalry 1861. He took part in the Danish
War of 1864, and next year was appointed gov-
ernor of Schleswig. During the war between Prussia
and Austria he commanded the army of the
Main, and fought at Hemstedt, Vettingen,
Rosbrunn and Würzburg. He served with
distinction in the Franco-German War, especially
in several actions around Metz, at Amiens, and
from June 1871 to July 1873 he commanded the
army of occupation in France, and was made
field-marshal. In 1879 he was appointed gov-
ernor-general of Alsace-Lorraine, and in this
capacity showed singular want of skill and tact
in ruling a conquered people.

MANTI, mān'tī, Utah, city, county-seat of
Sanpete County, on the Rio Grande, and on the
Denver and Rio Grande Railroad, about 105
miles south of Salt Lake City. Manti was set-
tled in 1849 and incorporated in 1851. It is
situated in an agricultural region, where sheep

287
MANTINEA — MANTRAPS

raising is one of the principal industries. Large coal mines are in the vicinity. The chief industrial establishments are creameries, flour mills, lumber mills and machine-shops. The principal buildings are the Mormon temple which cost $1,500,000, and the public school building. Pop. 2,432.

MANTINEA, mán-tí-né-a, Greece, one of the most ancient and important cities of Arcadia, on the frontier of Argolis on the little river Ophis. The site is now known as Paleopolis, and excavations and explorations by the French school at Athens have disclosed the foundations of the walls and buildings of the ancient city. Mantinea was known for its wealth, and famous for the battles fought near it, in 418 B.C., when the Argives, Athenians and Mantineans were defeated by the Spartans, in 385 B.C., when the city was taken and destroyed by the Spartans, and in 362 B.C., when the Thebans under Epaminondas defeated the Spartans, although the victory of the Thebans was purchased with the life of their commander. Mantinea was, in 226 B.C., surprised by Aratus; and in 222 B.C. taken by Antigonus Doson; on this occasion the town was sacked, and the inhabitants sold as slaves. Another battle was fought near Mantinea 207 B.C., between Machanidas, tyrant of Lacedemon, and Philopoemen, general of the Achaean League. The latter was victorious, and slew the tyrant with his own hand. The French school at Athens financed an archeologist, G. Fougeres, in uncovering a large area here in 1888. The ancient city was walled, with towers about 80 feet apart. A large mound-shaped theatre was disclosed, a square market hall and paved roads of different eras. Consult Fougeres, G., 'Mantinée et l'Arcadie Orientale' (Paris 1898).

MANTIQUEIRA, mán-tí-ké-e-ra, Serra Da, Brazil, a mountain range which is in the southeastern part of the republic. It is about 75 miles from the Atlantic and extends nearly parallel with the coast for about 200 miles. The eastern end is near Rio de Janeiro. Ranges connected with the Mantiqueira are often included in this range and the name Mantiqueira applied to the whole. Mount Itatiaia, the highest peak, is 9,790 feet above the sea. Several large rivers have their sources in this range.

MANTIS, an orthopterous insect of the family Mantidae. These curious insects, allied to grasshoppers, abound in many parts of the world, and have always excited popular notice, and have been endowed with many supernatural qualities by the ignorant and superstitious of all countries. They are slender, with long, locust-like legs, oval wings, and a long neck-like prothorax, terminating in an angular head with large protruding eyes. The front legs are stout, spiny, fitted for grasping their prey, and are held up in front of them in an attitude that to some suggest prayer. Hence the names praying insect, prophet and the like often given to the more familiar species; to others they suggest other ideas, as of a horse pawing the air, whence our common species of the Southern States (Stegomantis carolina) is known as the "rear-horse," and in Europe these insects are called "camel-crickets." Why it should also be called "scorpion-killer" is harder to explain, probably it is by confusion with a scorpion also so called. These insects in tropical countries have come to assume various forms and hues similar to the flowers near which they lurk to catch the insects visiting the blossoms. The most deceptively one, which comes under the head of mimicry. A large proportion of the insects upon which they feed are injurious to crops, so that they may be regarded as beneficial to man. Among the Japanese and Chinese they are made to minister to human amusement also, being kept in cages and made to engage in contests upon which the spectators bet money. The eggs of the mantis are laid in an oval mass upon the stem of a plant, and covered with a tough case of hardened mucus, which shows a curiously braided pattern of surface, and is easily recognized.

MANTIS SHRIMP, a large crustacean (Squilla empusa) of the order Stomatopoda, which dwells in burrows between tide-marks along our Eastern coast, and seizes marine worms, and the like, that come within its reach. Its general shape is shrimp-like, but it has strong claws on the second pair of legs, which much resemble the forelegs of a mantis (q.v.), are provided with sharp spines, and are so joined that they can be folded back upon themselves like the blade of a clasp-knife, and so take a firm grip upon the struggling captives. It is quite blind, although the eyes appear to be well formed. A well-known European species is gathered for food by the coast people.

MANTLE, (1) a kind of cloak or loose garment to be worn over other garments. (2) In heraldry the name is given to the cloak or mantle which is often represented behind the escutcheon. (3) A fabric-like covering of salts easily rendered incandescent, for placing over a gas flame to increase the light diffused. See Gas, ILLUMINATING.

MANTLE ROCK, also called REGOLITH, the loose unconsolidated debris that results from rock weathering. It includes all soils except those of strictly organic origin. If they have resulted from weathering in place, without removal, the soils are called residual if they have been carried from their place of origin by wind, glaciers or running water, they are said to be transported. The mantle rock varies greatly in thickness. In some places it is entirely absent, in others it is hundreds of feet deep. See Soil.

MANTLING, in heraldry, an ornament depicted as hanging down from the helmet, and behind the escutcheon. It is considered to represent either the cointise, an ornamental scarf which passed around the body, and over the shoulder; or the military mantle, or robe of estate. When intended for the cointise, it is cut into irregular strips and curls of the most capricious forms, whose contortions are supposed to indicate that it has been torn into that ragged condition in the field of battle. When the mantling is treated as a robe of estate, the bearings of the shield are sometimes embroidered on it. A mantling adjusted so as to form a background for the shield and its accessories constitutes an "achievement of arms."

MANTRAPS, engines for the terrifying of trespassers and poachers (formerly indicated by the warning notice "man-traps and spring-guns set here"), resembled gigantic rat-
traps several feet long. They may be seen in museums; it has long been illegal to set them (save indoors between sunset and sunrise), as a defense against burglars.

MANTUA, mán'tü-à, Italy, a fortified northern town, capital of the former duchy, and now of the province of Mantua, 80 miles by rail southwest of Milan, on an almost insular site on the Mincio, which here divides into several arms ending in a marshy and insalubrious lake. Communication is maintained between the islands and mainland by several bridges, the chief of which is Ponte di San Giorgio, 800 yards long. Mantua is written Mantova by the Italians; it is the see of a bishop, the seat of a civil, criminal and mercantile court, and the residence both of a military governor and of a provincial delegate. The most remarkable edifices are the cathedral, after an elegant design by Giulio Romano; the church of Saint Andrea, conspicuous from a distance by its majestic cupola and Gothic tower; the church of Santa Barbara, containing the mausoleum of Carlo Gonzaga; the château of Brignano, formerly the ducal palace of the Gonzagas, a huge irregular pile, now partly used as barracks; the Castello di Corte or old castle of the Gonzagas; the Torre della Gabbia, the Torre del Orologio, and the Torre dello Zuccaro; the Beccheria and Peschiera, or shambles and fish market, both built by Giulio Romano; the house of Giulio Romano, the Palazzo Colloredo, with enormous caryatides supporting its façade; the Palazzo del Te, outside the walls of the town, also built by Giulio Romano; and the oldest, and perhaps the most beautiful of all, that master's largest frescoes; the Accademia Virgiliana di Scienze e Belle Arti; the Liceo, the military arsenal, two theatres, one called the Teatro Virgilio, employed for open-air performances in summer, situated in a fine piazza also named after Virgil, and containing a marble pillar surmounted by a bronze bust of the poet; the library, containing 80,000 volumes; the civic and two foundling hospitals; the Monte di Pietà, the principal house of correction for the whole of Lombardy. The manufactories are silk and linen. The silk industry is carried on mainly in the hands of the Jews, who live in a separate quarter. The principal article of trade is silk. There are machinæ works, oil and flour mills, tanneries and breweries; there is also a considerable trade in timber, which is floated down the Mincio. Mantua was an ancient Etruscan settlement, and in the time of Virgil, a native of the region, was a Roman town. Charlemagne built its first fortifications. Soon after 1115 Mantua succeeded in making itself independent, and continued so till 1276, when it fell under the iron rule of Buonacolsi or Bonacossi. In 1328 it found better masters in the Gonzagas, who, first as captains, then (from 1432), as marquises, and finally (from 1530) as dukes of Mantua, governed it with great ability, and distinguished themselves by the splendor of their court and their patronage of literature and art. The last of the Gonzaga family who reigned in Mantua was Ferdinando Carlo, or Carlo IV, who, having taken part with the French in the War of Succession, was declared to have forfeited his allegiance from his liege lord the emperor of Germany. The Mantuan territory was accordingly annexed to the Austrian possessions in Lombardy, and the remaining part of Montferrat was assigned to Savoy (1708). The fortifications of the town, previously formidable, were completed and put into their modern form by the Austrians and have been kept up to date by the Italian government. In 1796 Napoleon, apparently hopeless of reducing it by any other means, contented himself with keeping it under strict blockade, till famine compelled the garrison to capitulate. After the cession of the western part of Lombardy to Sardinia in 1859, Mantua, with what else of Lombardy remained to Austria, was united to Venetia, and with it was given up to Italy in 1866. The area of the province is 903 square miles, and the population (1915 est.) 330,409. The communal population is 34,507.

MANU, mân'oo, the reputed author of the most renowned law-book of the ancient Hindus, and likewise of an ancient Kalpa work on Vedic rites. It is matter, however, of considerable doubt whether both works belong to the same individual, and whether the name Manu, especially in the case of the author of the law-book, was intended to denote a historical personage. The chief topics of its 12 books are the following: (1) creation, (2) education and the duties of a pupil, or the first order; (3) marriage and the duties of a householder, or the second order; (4) means of subsistence and private morals; (5) diet, purification and the duties of women; (6) the duties of an anchorite and an ascetic, or the duties of the third and fourth orders; (7) government and the duties of a king and the military caste; (8) judicature and law, private and criminal; (9) continuation of the former and the duties of the commercial and servile castes; (10) mixed castes and the duties of the castes in time of distress; (11) penance and expiation; (12) transmigration and final beatitude.

Bühler has proved that Max Müller was right in regarding the extant or ascetic recast of an ancient law-book, the manual of a particular Vedica school, the Māṇavas; and holds that the work, the date of which used to be given at 1200 B.C., was certainly extant in the 2d century A.D., and seems to have been composed between that date and the 2d century B.C. There are many remarkable correspondences between this work and the Mahābhārata, suggesting the use in both of common materials.
MANUAL ACTS — MANUAL TRAINING

MANUAL ACTS, in ecclesiastical and Church history, acts performed by the hands of the celebrant in the mass, chiefly the fraction of the host, and making the sign of the Cross over one'sself before consecration. Both were objected to at the Reformation.

MANUAL ALPHABET, the deaf and dumb alphabet; the letters made by deaf and dumb persons with their fingers.

MANUAL BLOCKING. See Block Signal System.

MANUAL TRAINING. As an educational term, manual training includes all handwork used as a means in general education. It differs from trade education through the apprenticeship system in that it emphasizes the educational element rather than the commercial or industrial element. This "hand-training," however, differs from education in its broader meaning, in that it emphasizes manual skill, and makes such by-products as judgment, accuracy, habits of observation, language, etc., more or less important incidents in the results to be attained. The more recent development of vocational training has tended to cast doubt upon the validity of manual training as a part of education, while the advocates of the traditional features of education—literature, history, mathematics, science, philosophy—have never admitted it to a place in their educational scheme. The term has therefore become restricted to those forms of handwork which are used as agencies in general education as distinct from vocational, trade and industrial education. The manual training advocates continue to hold that habits of accuracy, judgment and observation and sincerity, formed through manual activities, will contribute to these same mental habits as permanent life characteristics. In this they return under peculiar circumstances to the doctrine of formal discipline, approaching the matter in reverse order from the early devotee to this doctrine. Nevertheless it is on this theory that manual training is now holding its place in American public education. When it surrenders this position it must become provocative of something else.

History of Manual Training. — Finland holds the honor of the earliest use of handwork as an agency in education. Between 1858 and 1866 a plan was developed for teaching handwork in the primary schools, and for training handwork teachers for the public schools.

Sweden established handwork as a part of its educational system in 1872. This included carpentry, wood-turning, wood-carving, cooper's work, book-binding, etc., activities selected from the fields of skilled occupations in which the hand of the master has always been the dominant factor. Sweden was concerned with the physical health of its people as well as the passing of the old system of house industries. It was hoped that this manual work would invigorate the physical and moral health of the people, whoever the cost of factory conditions; and that industry would be stimulated by a wide diffusion of manual skill. The Swedish nation has now made handwork an integral part of its public school program and has thus laid a broad and sure foundation for the excellent technical and trade schools above.

France adopted handwork in 1873 in the Ecole Salicis, and in 1882 made such work compulsory in all elementary schools. From its very beginning drawing has been emphasized and mathematics has been a closely related subject. Because of this academic work the French have drawn the registered teacher into this handwork movement side by side with the other teacher who gives the practical work. This relationship between the academic teacher and the trade-teacher has been adopted by other countries and has apparently proved its usefulness.

England opened its first handwork classes in 1880 and to-day all the large centres of population require such work in their schools. The government awards special financial grants to municipalities who give manual training to boys and girls of 11 years and older.

Germany has long emphasized manual instruction for the artisan classes in her population but her emphasis has been on trade or vocational features. Skill of hand has been the purpose, rather than such moral qualities as were sought, for example, in the Gymnasium. In fact, there has been no general scheme adopted by any country in Germany. This is probably due to the fact that trade and occupational training were efficiently carried on. Recently, since 1887, some schools have adopted typical manual training courses and the Manual Training Seminary at Leipzig is the principal source of manual training teachers within the Empire.

Manual training in the United States has depended on private and local initiative. There had been no national movement prior to 1917. The Ethical Culture Society of New York City made the first step by opening handwork classes for small children in 1878 in connection with its workingmen's school. This was followed in 1880 by Washington University, Saint Louis, Mo., under the direction of Calvin A. Woodward. This experiment consisted of a fully equipped manual training high school with a variety of workshops in wood and metal, mechanical drawing, and in such appropriate academic work as science and mathematics as a pioneer school and its success was noticed by many of the large American cities. By 1900 a majority of American municipalities had adopted some form of manual training. Work for girls as well as boys was included in the program. The courses for girls included sewing, dressmaking, millinery, burnt wood, leather and art jewelry; for boys it included joinery, wood-turning, pattern-making, forging, machine-shop, foundry, sheet-metal, printing, electrical wiring, etc. In the elementary school this work has likewise found a large place on the program, beginning in the kindergarten and continuing through the elementary grades. The activities include paper folding and paper cutting, basketry, clay-modeling, wood-carving, rafta work, etc. Correlation with drawing is more and more the rule. The best practice in the public schools now relates drawing to the experiences of the child. Design is the basis of the work and the design of the drawing-class is the project of the handwork-class in the upper grades. Manual training in the American high school early developed into a distinctive institution. Its handwork or shop-work program is only remotely
related to industry. The projects are often impractical because they are chosen, not because of their utility or industrial significance but because they illustrate fundamental processes of industry. Type constructions are used as analytical studies of various manufacturing processes. A complete product is not sought nor are such elements as time, commercial value and shop atmosphere made a part of the instruction. The purpose of this typical Manual Training High School is vaguely educational, remotely industrial. As such, it fails to meet the needs of many industrial communities.

The Vocational Motive.—A change of sentiment became apparent immediately after the Saint Louis Exposition of 1904. Educators who had investigated the subject in Europe and America, who saw the display of the nations’ handwork, seemed to feel the need of training that related more closely to life motives. Manufacturers demanded industrial efficiency and appeared to have no confidence in the vague results of the typical Manual Training High School which was a traditional school with shop facilities. A demand arose for “shops with schools attached” or with school facilities. Manual training was soon modified so as to add the vocational appeal to boys and girls of 14 years of age and upward. The handbook of the seventh and eighth grades has come to be known as “pre-vocational” in the sense that the processes of many vocations are taught with the purpose of giving the child an opportunity to choose wisely with the aid of vocational advisers among teachers, parents and industrial or vocational experts. The logical step to follow this pre-vocational work is the trade school so that the advance of the vocational and industrial motives makes the old manual training ideal recede.

Industrial Education and Manual Training.—Industrial education is a more comprehensive term than manual training. It includes all that was at first expected from manual training as a stimulus to efficient workmanship; all that vocational and “pre-vocational” training propose; all that trade education seeks to secure. The emphasis is now on training and the specialized education pertaining to special industries, while the vague educational results of manual training on which so many were based would come by transfer of faculties, drop below the horizon.

The great demand for skilled workmen in the army and navy has led to the adoption of a national program of industrial education under the direction of the War Department. Colleges and technical schools in all parts of the country are teaching trades indispensable in warfare, using the equipment of former manual training and industrial schools. Thus is impressed on men’s minds the utility of industrial skill in sharp contrast with the relative inutility for the work in hand of much of the traditional education, including the typical manual training schools. The organization of industrial education on a national basis is thus assured. It supersedes manual training and takes its place side by side with technical education. See Education, Industrial; Education, Technical; Vocational Education.

A. R. Brubacher,
President, State College for Teachers, Albany, N. Y.
obtained honorable terms. This broke his health and he died of a slow fever.

MANUEL II, Palaeologus, pá-lé-ó-ló-gús, a Byzantine emperor, born in 1350, succeeded his father, Joannes V., in 1391, died in 1425. At the death of his father he fled from the court of the sultan Bajazet, with whom he had been left as a hostage. The consequence was a war with Bajazet, in which Manuel was supported by an army of Hungarians, Germans and French. The allies, under the command of Sigismund, king of Hungary and afterward emperor of Germany, were defeated at Nicopolis in 1396, with the loss of 10,000 men. Constantinople was besieged, and its fall seemed impending when the conquests of Tamerlane diverted the arms of the sultan. Manuel visited Italy, France and Germany, vainly seeking assistance from the Western princes. In the conflict between the Tartars and the Turks, he acted with diplomatic skill, and secured peace to his empire. He sent ambassadors to the Council of Constance with instructions to urge a union of the Latin and Greek churches; but his real object was only to obtain aid from the kingdoms of the West, and to alarm the Turks by the negotiations with those kingdoms.

MANUEL II, ex-king of Portugal, younger son of Carlos I: b. Lisbon, 15 Nov. 1889. He was known as the Duke of Beja and scandalous reports of his life in Paris were circulated before it was thought he would succeed to the throne. Consequently his accession on the assassination of his father and the Crown Prince on 1 Feb. 1908 was not the occasion of great popular rejoicing. He took the oath as king on 6 May 1908. His private life continued to attract the attention of the people and on 5 Oct. 1910 the Republicans overthrew his throne and proclaimed a republic. Manuel fled to England where he resided at Twickenham with his uncle, the Duke of Orleans. From there in 1911 he directed uprisings in Portugal with the object of abolishing the republic. These proved unsuccessful as did others in succeeding years and the entrance of Portugal into the war of 1914–18 as a member of the Entente appeared to put an end definitely to Royalist uprisings in that country despite huge sums spent by the Germans in propaganda to that end. Manuel married Princess Augustine Victoria of Hohenzollern-Sigmaringen in 1913; the union proved unhappy and a separation resulted.

MANUEL, Don Juan, Spanish prince and author: b. Escalon, Spain, 5 May 1282; d. 1349. He was a nephew of Alfonso X, and cousin of Sancho IV. His public life was a restless and turbulent one, but his chief claim to remembrance comes from the fact that he was one of the first and one of the best of Spanish prose writers. He wrote in a style of singular simplicity and charm, and few Spanish authors have succeeded so well in giving to their words the calmness, the weight, the richness which come only from long experience and reflection. His principal work that remains is Life of the Patron, more commonly known as "El Conde Lucanor," which has been translated into the French and German languages.

MANUFACTURERS. National Association of, an American association organized in Cincinnati in 1895. It had three primary ob-
jects—increasing the export trade; influencing State and national legislation; and arbitrating labor disputes. The Association maintains a general office in New York City and issues numerous confidential reports and bulletins for the exclusive use of its members. The Association is opposed to all boycotts and blocards, but is not opposed to labor organizations, though it has resisted many of their rulings, and is popularly considered as antagonistic, because of the vigor with which it pushed the now famous suit against the American Federation of Labor, for its boycott of the Bucks Stove and Range Company. This was a long-fought test case, and the manufacturers won, stopping all official boycotting. Since 1913 the Association has directed its attention largely against the Independent Workers of the World, generally with success. The Manufacturers' Association has given considerable effort to promoting constructive legislation to aid manufacturers, and has made some gains in patent law, but signally failed in securing better terms from the Post-Office Department. It publishes Industrial Outlook (monthly), which has 35,000 circulation, and is edited by F. W. Keough; and The American Trade Index (monthly).

MANUFACTURES IN THE UNITED STATES. See United States, commercial and industrial development of.

MANUL, má-núl, the common wildcat of Siberia and Tibet. It is smaller than the European wildcat, stockily built, has a moderately long tail and a coat of long hair. The general color is yellowish white, with a blackish mark on the chest and upper part of the fore legs, and some dark lines across the haunches and ringing the tail. Two black lines on the cheeks and a black spot behind the short ear are other distinguishing marks. There is a very curious similitude of appearance between this animal and the pampas cat of Patagonia.

MANUMISSION, in Roman law, the solemn act of freedom by which a slave was emancipated. Constantine the Great allowed the Christian masters to emancipate their slaves before the altar on festival days, and especially at Easter, by placing the deed of emancipation on the head of the freedman in the presence of the congregation. See Emancipation: Emancipation Proclamation.

MANURES AND MANURING. See Agricultural Chemistry; Fertilizers.

MANUSCRIPTS (Latin, manu scriptus, written by the hand), are literally writing of any kind, whether on paper or any other material, in contradistinction to printed matter. Previous to the introduction of printing all literature was contained in manuscripts. All the existing ancient manuscripts are written on parchment or on paper. The paper is sometimes Egyptian (prepared from the reed or brick shrub), sometimes cotton or silk paper (charia bombycina), which was invented in the East about the year 706 A.D., and used till the introduction of linen paper, and in common with this till the middle of the 13th century; sometimes linen paper, the date of the invention of which, though ascribed to the first half of the 13th century, on the authority of a document of the year 1243, written on such paper, is
nevertheless exceedingly doubtful. The earliest mention of quill pens is in the 7th century. The most common ink is the black, which is very old. The oldest, however, was not mixed with vitriol, like ours, but generally consisted of soot, lamp-black, burnt paper, or charcoal, etc. Red ink of a dazzling beauty is also found in ancient times in manuscripts. With it were written the initial letters, the first lines, and the titles, which were thence called rubrics, and the writer rubricator. More rarely, but still quite frequently, blue, green, purple, and charcoal, etc. Red ink of a dazzling beauty is also found in ancient manuscripts; yet more rarely green and yellow. Gold and silver were also used for writing either whole manuscripts (which, from their costliness, are great rarities), or for adorning the initial letters of books. With respect to external form, manuscripts are divided into rolls (volumina, the most ancient way, in which the troubadours in France wrote their poems at a much later period) and into stitched books or volumes (properly codices). Among the writers of manuscripts, the majority were freedmen or slaves (scribe librarius). Some of the professional copyists in Rome were women. When Origen undertook the revision of the Old Testament (231 A.D.), Saint Ambrose sent to his assistance a number of deaconesses and virgins skilful in calligraphy. Subsequently the monks, among them the Benedictines in particular, were bound to this employment by the rules of their Order. In all the principal monasteries was a scriptorium, in which the scriptor or scribe could pursue his work in quiet, generally assisted by a dictator, who read aloud the text to be copied; the manuscript was then revised by a corrector, and afterward handed to the miniator, who added the ornamental capitals and artistic designs.

It is more difficult to find a correct judgment respecting the age of Greek manuscripts from the character of the writing than it is respecting that of Latin manuscripts. In general it is to be remarked that in a Greek manuscript the strokes are lighter, easier and more flowing the older it is, and that they become stiffer in the progress of time. The absence or presence of the Greek accents is in no respect decisive. Some Greek papyri are earlier than the Christian era, but most are not earlier than about the 6th century. The characters in Latin manuscripts have been classified partly according to their size (majuscula, minuscule), partly according to the various shapes and characters which they assumed among different nations or in various periods (scriptura Romana antiqua, Merovingica, Longobardica, Carolingica, etc., to which has been added since the 12th century the Gothic, so called, which is an artificially pointed and angular character); and for all of those species of writing particular rules have been established, after the method of estimating the age of a manuscript. Before the 8th century punctuation marks rarely occur: even after the introduction of punctuation, manuscripts may be met with destitute of points, but with the words separate. Manuscripts which have capitals or other divisions are always old. The catch-word, as it is termed, or the repetition of the first word of the following page at the end of the preceding, belongs to the 12th or subsequent centuries. The fewer and easier the abbreviations of a manuscript are, the older it is. Finally, in the oldest manuscripts the words commonly join each other without break or separation. The division of words first became general in the 9th century. The form of the Arabic ciphers, which are seldom found in manuscripts earlier than the first half of the 13th century, also assists in determining the age of a manuscript. Some manuscripts have at the end a statement when, and commonly also by whom, they were written (dated codices). But this signature often denotes merely the time when the book was composed, or refers merely to a part of the manuscript, or is entirely spurious. The most ancient manuscripts still preserved are those written on papyrus which have been found in Egyptian tombs. Next to them in point of age are the Latin manuscripts found at Herculaneum, of which there is a rich collection in the Naples Museum. Then there are the manuscripts of the imperial era, among which are the Vatican Terence and Septuagint and the Biblical codices in the British Museum. Since the middle of the 19th century many manuscripts of Greek writings have been found in Egypt, among the chief being those containing the orations of Hyperides, several containing parts of the works of Homer, Plato, Dositheus, etc., that in which occurs a portion of the Antiope of Euripides, and the almost complete text of Aristotle's work on the constitution of Athens. It was the custom in the Middle Ages to obliterate and erase writings on parchments for the purpose of writing on the materials anew, and these manuscripts, many of them of great value, are known as "palimpsests." "This custom ceased in the 14th century, probably because parchment was put into use. See Libraries; Manuscripts Illuminated; Manuscripts of the Bible; Paleography; Papyrus.

MANUSCRIPTS, ILLUMINATED, are those whose text is heightened and brightened by vignettes and other decorations in colors, gold and silver. The verb to illuminate first occurred in the beginning of the 18th century; and means to decorate an initial letter, a word, or a text of a manuscript with gold, silver or brilliant colors, or with elaborate tracery, miniature illustrations and designs. The older verb was to enlumine (Old French enluminer; late Latin, inluminare; classic Latin, illuminare). It occurs, A.D. c. 1366, in Chaucer, A. B. C. 73, "Kalenderes enlumyned ben"; A.D. c. 1400, 'Roman de la Rose,' 1605, "For it so welles was enlumyned"; A.D. 1430, Lydgate, "Chron. Troy." Prol. "For he enlumyeth by craft and cadence this noble storie with many freshe coloure of Rhetorik." Illumination differs from painting, according to Ruskin, Modern Painters (1856, V., viii, sec. 9) in that "illumination admits no shadows, but only gradations of pure colour." The earliest writing of many peoples was by means of pictures. Witness the pictographs of Sumeria, that later evolved into Babylonian cuneiform script; the hieroglyphic writing of Egypt; the crude scrawls of our American Indians; and...
the Aztec picture-writing, which still defies epigraphists. It was but natural that an art arose of embellishing these pictographs. Fifteen centuries before Christ the papyrus rolls that contain the ritualistic 'Book of the Dead' were illuminated with brilliantly colored scenes. In due time the art of illumination passed over to peoples whose script was alphabetic; it always remained an art of beautiful writing. There is truth, though characteristically narrow and dogmatic in expression, in the saying of Ruskin, 'Lectures on Art' (1870, v. 138): 'Every form of writing, as soon as it is made lovely, the moment it passes into picture making it has lost its dignity and function.'

I. Illumination in the East. 1. In Egypt.—The earliest specimens of illumination are on Egyptian papyrus rolls. Ritual directions are in red; hence the medieval rubric. Profile portraits are inserted into the text. Agricultural and household scenes are interspersed between hieroglyphic signs. From the Egyptians the art of illumination reached the Hellenistic East. A 4th-century A.D. papyrus manuscript of the poems of Timotheus, found at Abydos, has a bird as a punctuation mark. Not until the Christian era do miniatures adorn the text. A 1st century A.D. Greek papyrus (Bibliothèque Nationale de Paris) shows a text that is adorned with miniatures in bold relief. A Berlin papyrus, Kaiser Friedrich Museum, illustrates the cure of a demoniac by Jesus. While in Hellenic Egypt the art of illumination thus progressed, the Coptic artists created a separate tradition from their ancient Egyptian forebears. A Coptic chronicle, dated 392 A.D. (Golenischev collection) has a wealth of miniatures illustrative of the months, the provinces of Asia, the rulers of Rome, Lydia and Macedonia, together with the destruction of the Serapeum under the direction of the patriarch, Theophilus. The Morgan collection of Sahidic manuscripts, of the 9th and 10th centuries, contains a dozen manuscripts with miniatures of the Virgin and her Son, angels, magi, saints, hermits; and almost all of the 58 manuscript volumes of this remarkable Coptic library are illuminated with marginal decorative schemes of animals and plants.

2. In Syria.—The monks of Syria show the traditions of the Semitic orient in the illumination of manuscripts. Saint Augustine, 'Adv. Faustum' (xiii, 6, 18), refers to the miniature illustration of Persian parchments. From the 5th century, there were monastic schools for illumination in Mesopotamia and Syria. The Syriac Evangelists, 5th-6th century, the work of Rabbel Musaytzi at Baghja in Mesopotamia, now in the Laurentian Library, Florence, is an exquisite work of art; the miniatures represent the Crucifixion, etc.; the marginal schemes are geometrical, and contain flowers, birds, etc. Some Hellenistic influence is noticeable; but Semitic traditions dominate in the Syriac school of illuminating. This school belong also the extant Armenian illuminated manuscripts. Three evangelaries, books of pericopic readings from the Epistles and Gospels, show the most beautiful work of Armenian miniaturists. An example is Byzantine, 10th century, copied from a 6th century model; that of Queen Mike, 902 A.D. Monastery of the Mechitarists, Venice; and the Tübingen Evangelary, 1113 A.D. Mohammedan illumination copied Syriac in many Arabic, Turkish and Persian manuscripts, chiefly of the Qur'an. The decorative work is often rich in its red, blue and gold cubic characters.

3. The Byzantine School.—In the Hellenistic speaking parts of the Byzantine Empire, the traditions of ancient Greece held sway; although iconoclasm interfered for a while with the forms of miniature painting, and Syriac influences were strong. Previous to the destructive vandalism of the iconoclasts, Byzantine miniaturists beautified the great 6th century purple parchment, Biblical codices: L, Viennana, silver letters; N, Cod. Purpureus, silver letters, Gospels, most of manuscript at Petrograd; Z, Cod. Rossanensis, silver letters, Matthew and Mark, at Rossano, in Calabria; 2b, Cod. Sinopesis, gold letters, Matthew, in the Bibliothèque Nationale de Paris; 9, Cod. Beratinus, Matthew and Mark, at Berat, Albania. These illuminated manuscripts contain Biblical scenes, the bearded face of the Christ, etc.—all in miniature. To this period of Byzantine illumination belongs the 'Roll of the 4th century' papyrus manuscript of the poems of Timotheus, found at Abydos, a bird as a punctuation mark. Not until the Christian era do miniatures adorn the text. A 1st century A.D. Greek papyrus (Bibliothèque Nationale de Paris) shows a text that is adorned with miniatures in bold relief. A Berlin papyrus, Kaiser Friedrich Museum, illustrates the cure of a demoniac by Jesus. While in Hellenic Egypt the art of illumination thus progressed, the Coptic artists created a separate tradition from their ancient Egyptian forebears. A Coptic chronicle, dated 392 A.D. (Golenischev collection) has a wealth of miniatures illustrative of the months, the provinces of Asia, the rulers of Rome, Lydia and Macedonia, together with the destruction of the Serapeum under the direction of the patriarch, Theophilus. The Morgan collection of Sahidic manuscripts, of the 9th and 10th centuries, contains a dozen manuscripts with miniatures of the Virgin and her Son, angels, magi, saints, hermits; and almost all of the 58 manuscript volumes of this remarkable Coptic library are illuminated with marginal decorative schemes of animals and plants.

The triump of image-worship, 842 A.D., brought about a return to the painting of figures. The 10th to the 12th centuries were the most glorious period of Byzantine miniaturists. About 40 years after the restoration of image-worship, the 'Sermons of Saint Gregory of Nazianzen' (Bibliothèque Nationale de Paris, Gr. 510), 880 c. A.D., were executed, and embellished by a series of large, beautiful miniatures. The 'Paris Psalter,' dating from the end of the 10th century (Bibliothèque Nationale de Paris, Gr. 139), has scenes of the life of David, reproduced from 3d or 4th century models, that vie with the frescoes of Pompeii in freshness and brilliancy. The 'Homilies of Saint John Chrysostom,' Paris, a manuscript which belongs to Nicephorus III (1075-81 A.D.) is likewise a good example of Byzantine illumination at its maturity. The Psalter and the Menologion, a brief sketch of the lives of the saints for each day, were at this time most frequently decorated. The 'Vatican Syriac' (1075-81 A.D.) is likewise a good example of Byzantine illumination at its maturity. The Psalter and the Menologion, a brief sketch of the lives of the saints for each day, were at this time most frequently decorated. The 'Vatican Syriac' (1075-81 A.D.) is likewise a good example of Byzantine illumination at its maturity. The Psalter and the Menologion, a brief sketch of the lives of the saints for each day, were at this time most frequently decorated. The 'Vatican Syriac' (1075-81 A.D.) is likewise a good example of Byzantine illumination at its maturity.

Between the 12th and 16th centuries, a national style appeared, which is characteristic of many of the numerous and richly illuminated manuscripts of the libraries and museums of Petrograd and Moscow.
EXAMPLES OF ILLUMINATED (13th-16th CENTURY), FROM MSS. IN THE BRITISH MUSEUM

1 Psalter (about 1470)
2 Gospels (1275 A.D.)
3 Psalter and office (14th century)
4 Office of the Dead (Early 16th century)
II. Illumination in the West. 1. Early Italian.—As manuscript writing, so illumination began in the East, and was thence taken over by the West. Flavio, 'Historia Naturalis' (xii, 169 A.D.), describes a miniature painting in the Vatican Library, Rome, during the 1st century A.D. Martial (xviii, 1855) speaks of a parchment containing a portrait of Virgil. Varro had some 700 such miniature portraits. The most ancient illuminated manuscripts probably of western provenance are: The fragment of a miniature painting in the Ambrosian Library, Milan; the Vatican Virgil, the 'Schedae Vaticane,' 4th century, Vat. Lat. 3225, with 50 miniatures; the 'Codex Romanus,' another Vatican Virgil. Here be it noted that Latins illuminators gave us the word miniature, from the Latin minimum, which means red lead or cinnabar,—the vivids—red lead oxide used as a pigment. Hence also is minis, to paint in miniature; together with miniator, the miniature-painter. Early Italian illuminators, and probably to the historian of art, Byzantine art reacted on Italian; and this reaction is marked in mosaics, early Italian painting, and the earliest illumination of manuscripts in southern and central Italy. The 5th-century illuminated manuscripts of the Frankish Empire.

2. Celtic Illumination.—It was during this period of decline of illumination in the West that the Irish school, as early as the 7th century, broke completely away from the copying of ancient models and inaugurated its own style of book-ornamentation. The individuality of the artists, the civilization and character of their race, were expressed in an art that reached the very height of perfection and made its influence felt in continental Europe. The Celtic initials, margins, and full-page designs are easily recognized by their great intricacy of interlacing spirals, zigzags, and ribbons, that entangle animal and human shaped fancies, knots, and other designs,—all executed with a marvellous precision of utmost accuracy, graceful delineation, delicate touch, brilliant coloring, and most fecund imagination. Irish illumination is decided oriental in conception and execution; and seems to have been copied by Count Vivien, abbot of the race, before the Celtic migration from the steppes of Asia, across Asia Minor, by way of Austria, Switzerland, Spain and France. No trace is found of classic influences. Foliage is absent. Kinship with the sculpture on stone and jewels in barbaric Ireland is marked. The wonderful decorative schemes are more like the Arabic than to any other; and the human form is depicted with a geometrical symmetry that is characteristic of Celtic workmanship. The finest example of Celtic illumination is in Q, 'Codex Kenanensis,' the Book of Kells, 8th century, Vulgate Gospels, in Trinity College, Dublin. Its pages are replete with brilliant, exquisite designs, testifying to a minuteness and delicacy of precision that are marvel of art and accuracy. The Celtic art of illumination reached Iona through Saint Columba's foundation there; and the monks of Iona (635 A.D.) brought their faith and their art to Lindisfarne, or Holy Isle, off the Northumberland coast. Here was executed in Celtic style the 'Lindisfarne Gospels,' 8th century, now in the Cottonian collection of the British Museum. Other fine works of the Celtic school of illuminators are the 'Book of Deir'; A, 'Codex Sangallensis,' 9th or 10th century, Gospels in Greek and Latin, at Saint Gall, Switzerland. In England, the Celtic school of illumination continued, although manuscripts brought by Saint Augustine from Rome introduced a classic influence. The 'Utrecht Psalter' (800 A.D.) is representative of the Celtic style in transition. It shows rude attempts at drapery effects. In Anglo-Saxon miniatures, from the 6th to the 10th century, the draperies become characteristic. The 'Benedictionale' of the see of Devonshire is the most elaborate specimen of 10th century Anglo-Saxon miniatures. The Norman Conquest saved Anglo-Saxon illumination from the fantastic exaggerations into which it was sinking.

3. Carolingian Illumination.—When Charlemagne became emperor of the West (800 A.D.) illumination was rapidly revived. The Celtic style provided to this new school its ingredients; Byzantine art was drawn upon for the painting of the human figure. Gold was used profusely in letters as well as illustrations. Large initials were almost the rule. Ormamentation was luxurious and represented historical characters, symbolic themes, the arts, signs of the zodiac, virtues, vices, etc. Notwithstanding the gorgeous effect of purple vellum, a dazzling abundance of gold, and a brilliancy of decoration, the Carolingian illuminated manuscripts show a tendency to coarseness of workmanship and clumsiness of figure-painting. This tendency is in part offset by the purer style of the Celtic influence. The best examples of early Carolingian illumination are: the 'Evangeliarium' of Charlemagne, at Vienna; the 'Bible of Theodulf,' bishop of Orleans, at Mainz; the 'Office of St. Denis' and Le Puy; the 'Sacramentary,' written for Drogon, son of Charlemagne and bishop of Meiz; the 'Evangelary of Lothair,' Paris; and the 'Bible of Charles the Bald,' presented by Count Vivien of the House of Tours. It was about the time of Charles the Bald, second half of the 9th century, that Carolingian illumination reached its greatest perfection.

4. Gothic Illumination.—The 10th to the 12th centuries show a decadence of Frankish illumination. After the 'Regensburg Gospels' (11th century) miniatures become more coarse and clumsy, colors are dull. Toward the end of the 12th century, a renascence of illumination is visible in both Germany and France. Gold is now laid on in leaf, and not in liquid; brightening makes the illumination most brilliant. The old illuminators were monks; now laymen take up the art. The initials are smaller, but more artistic; they often contain miniatures of illustration or interpretation of the Biblical text. Hundreds of miniatures beautify the 'Picture Bibles' of the 13th century, or interpret the 'Sermon Bibles' of the period. Gothic features are introduced,—gables, pinnacles, rose and quatrefoil decorations. The human figure is painted with realism; 13th century costumes are preserved to us in an accuracy of coloring. During the 14th century, there is a departure
MANUSCRIPTS OF THE BIBLE

from conventional foliage, and a reproduction of garlands and flowers from nature. And with the flowers are intermingled peasants, birds, animals, butterflies, etc.—all true to life. The Bibliothèque Nationale de Paris, Lat. 10483-4) the work of the famous Parisian illuminator, Jean Pucelle, together with Mahiet Ancelot and J. Chevrier; the Book of the Miracles of Our Lady, Soissons; Queen Mary’s Psalter (British Museum); and for Mary Tudor are all exquisite works of 14th century craft. The golden age of illumination continues during the early 15th century. Even at the outset of the Renaissance, the Gothic manner prevails. Books of Hours are the special feature. Such is the Très Riches Heures of the Duke of Berry, Musée Condé, Chantilly, by Pol de Limbourg, containing miniatures of the various châteaux of the duke, and portraying marvelous aerial perspectives in landscape scenery,—the effects of snow, starlight, blazing sunlight and dull autumn shades. Other beautiful Hours are the Grandes Heures, by Jacquesmart de Hesdin; Très Belles Heures, and Heures de Turin, of the same Flemish school; and the Hours of Anne of Bohemia. This last work marks the end of the art of illumination. The Renaissance, together with the invention of printing, were fatal to miniature painting of books, and to the illumination of their carefully written pages.

WALTER DRUM, S.J.,
Professor of Scripture, Woodstock College, Maryland.

MANUSCRIPTS OF THE BIBLE are written as opposed to printed copies of the whole Bible or a part thereof. All these manuscripts are copies of the original text or of an ancient version, so long as they were done before the invention of the art of printing, are important in the science of the textual criticism of Holy Writ. This article will contain a brief introduction on Bible manuscripts in general, followed by a summary account of the chief Hebrew, Greek, Latin, Syriac, Armenian and Coptic manuscripts of the Bible. Manuscripts of the Arabic, Ethiopic, Slavic and other early versions of Scripture do not witness to the earliest type of New Testament text; they are amply treated in technical dictionaries of the Bible.

I. Bible Manuscripts in General.—There are three classes of Bible manuscripts—papyrus, vellum and palimpsest—to which attention should be called.

1. Papyrus Manuscripts.—While Babylonian scribes were impressing upon endurable clay the cuneiform, or wedge-shaped, ideographic records of the style, Egyptian reed-writing with ink upon papyrus developed almost at the same pace. The name of this primitive paper is that of the plant which provided its raw material. The papyrus, πάπυρος, probably an Egyptian loan-word,—was a rush of thick triangular stalk.

Its main root, Theophrastus tells us, was about 15 feet long and as thick as a man’s wrist. Likely the pith ball, the pith out of which was plaited the ark that contained the infant Moses, was the Nile papyrus. The outer coat of this Egyptian water-plant was peeled off, the pith was cut into strips and these were glued together transversely to form the firstknown writing paper. The strips of papyrus were very fragile, became brittle in air, crumbled with use, could not resist the disintegrating force of moisture and were quite impracticable for book-form. Hence all papyrus manuscripts have been lost to us, save such as were burned in the exceedingly dry soil of Upper and Middle Egypt. For many years, the ignorant Völker, wantonly destroyed these precious records of the past. Now scientific excavators are preventing this ruthlessness, and constantly adding to the world’s various copies of papyrus manuscripts. The most ancient papyrus document is a record of the reign of the Egyptian King Assa, B.C. 3580-3536; and the earliest literary papyrus work extant is the Priese papyrus of Paris, written a. d. 280. During the first three centuries of Christianity papyrus was the ordinary writing paper of the Roman Empire. It was used by the Arabs until the 8th century, when modern paper was invented. The sacred writers or their scribes most likely used ink and rolls of fragile papyrus for the autographa of the New Testament (2 Corinthians iii, 8; 2 John, xii). These pre-Christian documents seem to have perished during the early 2d century. No trace of them is found in the writings of either the Apostolic or Apocryphal Fathers,—unless we except Tertullian’s words, “the authentic letters of the Apostles themselves,” which are now generally set aside as rhetorical.

2. Vellum Manuscripts.—Pliny (‘Historia Naturalis’ xiii, 1) is witness to the use of vellum for documentary purpose before the time of Christ. Saint Paul (2 Thess. iv, 13) employed both papyrus-rolls, ῥάβδος, and parchment, μητριβώνας. In the 3d century, vellum began, outside of Egypt, to supersede papyrus; and in the early 4th century, the codex or parchment book-form gained complete victory over the papyrus-roll. To this century belong the earliest extant Bible manuscripts of any thing but fragmentary size.

3. Palimpsests.—Some of our most important vellum manuscripts are palimpsests (Lat. palimpsestum, ραβδομετριης, i.e., manuscripts that were scraped a second time with pumice-stone and written upon anew). The reckless charge of wholesale destruction of Biblical manuscripts by the monastic scribes of palimpsest works has not been substantiated. Wiederhbach (‘Das Schreibern im Mittelalter,’ 1896, pp. 299 ff), a leading authority on the subject, notes that a Greek synod, A.D. 691, forbade the use of any but ut-
terly unserviceable. Biblical or Patristic manuscripts for palimpsest-writing. According to Wattenbach, "more precious manuscripts, in proportion to the existing supply, have been destroyed than all the experiments of our time than by the much abused monks of old." The deciphering of a palimpsest may at times be accomplished by merely soaking it in clear water. The "learned experimenters" use some chemical reagent, in order to bring back the original writing. Such chemical reagents are an infusion of nutgalls, Goberlit's tincture and hydrosulphuret of ammonia; all do harm to the manuscripts.

II. Hebrew Manuscripts.—Certain parts of the Hebrew Bible.—Daniel ii, 40-72, 26, and Ezra iv, 8-18, together with vii, 12-20,—are not in Hebrew, but in Aramaic. These Biblical Aramaic portions, in the language that the exiled Jews adopted during their Babylonian captivity (A.C. 586-536), are here treated conjointly with the Hebrew text into which they have been received. We shall briefly sum up the age, number and worth of the Hebrew manuscripts of the Bible.

1. Age.—Textual criticism divides the Hebrew text of the Bible into the Masoretic and pre-Masoretic. The Masoretic text is that of our complete Hebrew manuscripts. It represents the Masorah. This authoritative textual tradition was begun in the 1st century A.C.; was fixed in its consonantal readings during the Talmudic period (A.D. 300-500); and received the vowel points about the 8th century of our era. The pre-Masoretic text includes chiefly the readings that are not witnessed to by Masorah. The earliest manuscript of the Hebrew Bible, and probably the oldest extant Biblical manuscript, is the Nash papyrus. There are four fragments, which, when pieced together, give 24 lines of a pre-Masoretic text of the 10 commandments and of the shema (Exod. xx, 2-17; Deut. v, 6-19, and vi, 4-5). The writing is written with the taw, and some of the words belong to not later than the 2d century. Another witness to the pre-Masoretic text is the Samaritan Pentateuch, which is probably pre-exilic in origin. The earliest Samaritan manuscripts, however, are of a later date. The Masoretic text is the authoritative text; the Masorah is the exegesis, and now assigned to the 12th or the 13th century. The newly-discovered Hebrew 'Ecclesiasticon,' represented by fragmentary manuscripts of the 10th or 11th century, preserves parts of the pre-Masoretic text of a book until recently thought to have been written in Helenistic.

All other Hebrew manuscripts of the Bible are Masoretic, and belong to the 10th century or later. At most 9 or 10 are earlier than the 12th century. The earliest are Codex Petropolitanus, dated A.D. 916; the Saint Petersburg Bible, dated A.D. 1009; and Codex Oriental, 4445, British Museum, which Ginsburg assigns to A.D. 820-850.

2. Numer notation.—Kennicott ('Dissertatio Generalis in Vetus Testamentum Hebraicum,' 1780), collated 16 Samaritan and 638 Masoretic manuscripts. De Ross; ('Variae Lectiones,' 1784), brought the number of Masoretic manuscripts up to 1,375. No one has since surpassed this learned work of De Ross on the Masoretic text. Some 2,000 Masoretic manuscripts gathered in the Crimea by Firkowitsch, await critical study in the Imperial Library of Petrograd. Consult Strack, 'Die bibliischen und masoretschen Handschriften zu Tschufut-Kale' (in Zeits. für lüth. Theol. und Kirche, 1873).

3. Worth.—This rich store of some 3,375 manuscripts promises no very important critical results. For they all depend on an archetypal text of the 2d century A.D.; and are singularly alike in accuracy of reproduction. The Masoretes were most detailed in their painstaking efforts to hand down the text of this archetypal text. The Scribes counted words and consonants of each book; noted the middle words and middle consonants; retained peculiarities of script,—such as broken letters, inversions, consonants that were too small or too large, dots out of place, etc. All these oddities were handed down as God intended, and received mystical interpretations. Here is an instance. In Genesis ii, 4, behibare 'am, "when they were created" the letter k is unduly small. The rabbis handed down this peculiarity as God inspired; translated the word, "In the letter k he created them"; and then disputed what that meant. Hence the importance of manuscripts of the early versions of the 2d and 3d Testament, so as to reach a pre-Masoretic text.

Bibliography.—Kraft and Deutsch, 'Die handschriftl. hebräischen Werke der k. k. Hofbibliothek' (1857); Strack and Harkavy, 'Catalog der hebr. Bibelhandschriften der kaiserlichen Bibliothek' (1875); Schubart-Stern, 'Catalogue of the Hebrew Manuscripts' (in the University Library, 1876) Assemani, 'Bibliothecae Apostolicae Vaticanae Codices Orientales' (1756); Mâ, 'Appendix to Assemani' (1851); Neubauer, 'Facsimiles of Hebrew Manuscripts' in the Bodleian Library (1886), and 'Catalogue of the Hebrew Manuscripts' in the Bodleian Library and in the College Libraries of Oxford (1886).

III. Greek Manuscripts.—Textual critics divide Greek manuscripts of the Bible into uncials and minuscules. Uncials are written in large disconnected letters that vary in force so as to indicate the time and place of provenance. Words are not separated; accents and punctuation marks are not used; no great variety of script is adopted. Minuscules are employed for the most ordinary words; paragraphs are marked off by small lacunas. The decadence of elegant uncial writing begins in the 6th century; twists and turns are given to certain letters. In the 7th century manuscripts still greater freedom of flourish is allowed the scribe; accents and breathings are introduced, and the script leans to the right. By the 10th century the writing in Biblical manuscripts begins to be more or less cursive; these manuscripts are called minuscules. The letters are now small, connected and written with a running hand. Cursive writing holds sway in Biblical manuscripts until the 16th century. In A.D. 1514, the Greek New Testament was for the first time printed.
7th century, giving parts of Psalm xxii.— Cf. Taylor, ‘Cairo Geniza Palimpsests’ (1900); (4) the Cairo fragments of the 4th and 5th centuries: three palimpsests (containing 1 Kings xx, 7–17, 2 Kings xxviii, 11–27), published by B. Schick in the Bibliotheca Orientalis, x, 63–70, 1900; (5) the 4th century papyrus fragments of Genesis i, 1–5, published by Grenfell and Hunt in 1900. Our few manuscript traces of the version of Psalms and the 4th and 5th centuries toward the end of the 2nd century, may be found in the same Hexaplaric fragments that witness to the text of Aquila. Theodotion’s Daniel is preserved in the Septuagint manuscripts.

The Septuagint version of the Old Testament is extant in many manuscripts. These represent three textual families,—the Hexaplaric, Hesychian and Lucianic. The Hexaplaric text takes its name from the Hexapla of Origen. This colossal critical work, completed by Origen about 240, is preserved in six columns of the Hebrew text, the Greek transliteration thereof, Aquila, Symmachus, the Septuagint and Theodotion; and, for certain books, two other Greek translations that are named Quinto and Serto. Pamphilus, a disciple of Origen, preserved manuscripts of the Hexapla at Caesarea. In the 4th century, Pamphilus and his disciple, Eusebius of Caesarea, reproduced the fifth column,—i.e., Origen’s Hexaplaric Septuagint text,—together with all its critical signs. By these critical signs, Origen had marked off passages, which he had found wanting in the Septuagint and had supplied from either Aquila or Theodotion. Unfortunately the scribes were not faithful in handing down the critical signs of Origen. In this wise the Caesarean text of the Septuagint was evolved into a hopeless commingling of Origen’s Septuagint together with his interpolations from Aquila and Theodotion. Meanwhile two other editions of the Septuagint got a vogue,—those of Hesychius at Alexandria and of Lucian at Antioch. From these three editions of the Septuagint text, all of our extant manuscripts are descended, but by ways that have not yet been accurately traced. The Hexaplaric, Hesychian and Lucianic texts acted and reacted on each other, and most of the extant manuscripts contain readings from each of the three textual families. Criticism is at work to trace the respective influences of each text upon the manuscripts now to hand. Consult Field, ‘Origenis Hexaplorum Quo supersunt, sive vete rum interpretum Graecorum in totum Vetus Testamentum fragmenta’ (1875).

A. Papyrus Manuscripts.—About 40 papyrus manuscripts of parts of the Septuagint have been found in recent years. Of these the most important are (1) Oxyrhyncho Papyri 656, early 3d century, preserving parts of Gen. xiv–xxvii, wherein most of the great vellum manuscripts are defective; (2) British Museum Pap. 73, called U, 7th century, Psalms 10–33; (3) a London Pap. in the British Museum, 4th and 5th century, Psalms 52–54; (4) a Heidelberg Papyrus, 7th century, Zachary iv, 6–Malachi iv, 5; (5) a Berlin Papyrus, 4th or 5th century, containing some 30 chapters of Genesis.

B. Vellum Uncial Manuscripts.—Parsons (‘Vetus Testamentum Gracorum cum Varitis Lectio nibus,’ 1798), designated uncial manuscripts of the Septuagint by Roman numerals, minuscule by Arabic. Lagarde inaugurated the now common usage of Roman and Greek capitals for uncial. Von Soden’s system of manuscript symbols, though illuminating, has not been widely adopted. The important vellum uncial manuscripts of the Septuagint text are here subjoined:

Aleph, Cod. Sinaiticus (c. 350), 43 leaves at Leipzig, 156 together with New Testament at Petrogad; contains fragments of Genesis and Numbers. Theodotion’s text is preserved in the New Testament, Epistle of Barnabas, and part of Shepherd of Hermas. The text is mixed; in Tobit it widely differs from A and B. Two correctors are of the 7th century. The first writes, at the end of Esther, that he compared the manuscript with a copy of the Hexaplaric text, authenticated by Pamphilus.

A. Cod. Alexandrinus, 5th century, in British Museum, complete Bible (excepting Psalms 50:20–80:11 and smaller lacune); includes deuterocanonical books and fragments, apocrypha 3 and 4 Macc., also 1 and 2 Clement; of Egyptian provenance, and likely Hesychian in text; differs much from B, especially in Judges.

B. Cod. Vaticanus, c. 350, in Vatican Library, complete Bible; the Old Testament lacks Gen i-xlvi, 28, 1 and 2 Macc., parts of 2 Kings i, Psalms 105–137; the New Testament lacks Hebr. 13:14, and 1, 2 Thess., Titus, Apoc.; provenance, Lower Egypt; text deemed by Hort to be akin to the Hexaplaric.

D. Cotton Genesis, 5th century, British Museum; fragments of Genesis: almost destroyed by fire in 1731, but previously collated.

Q. Cod. Marchalianus, 6th century, Vatican, Prophets complete; provenance, Egypt; text, Hesychian; marginal notes from Hexapla contain Hexaplaric signs.

The Florin 5th or 6th century, Smithonian Institution, Denderonomy to Joshua.

Among uncial manuscripts of the Septuagint are also listed 17 codices, some of the 5th and 6th century; 44 Psalters of the 9th or 10th century; and 18 fragments.

C. Vellum Minuscule Manuscripts.—More than 300 are known but not classified. Few bear witness to the entire Old Testament; the greater part are Psalters. The most critical use of the minuscules of the Septuagint is evidenced by Brooke and Mclean, ‘The Old Testament in Greek’ (Vol. I, The Octateuch, 1906–17).

Bibliography.—Swete, ‘Introduction to the Old Testament in Greek’ (1900), and ‘The Old Testament in Greek’ (1905); Psalms of the 4th ed. of Vol. III, 1912); Kenyon, ‘Our Bible and the Ancient Manuscripts’ (1898); Nestle, ‘Septuagintstudien’ (1890–1907).

2. New Testament Greek Manuscripts.—According to Von Soden (‘Die Schriften des Neuen Testaments in ihrer ältesten erreichbaren
MANUSCRIPTS OF THE BIBLE

Textgestalt; 1902), 2,328 Greek New Testament manuscripts are extant; only about 40 contain, either entire or in part, all the books; 1,716 are of the Gospels, 531 of Acts, 628 of the Pauline Epistles, 219 of Apocalypse.

A. Papyri. About 31 papyrus fragments, of which six belong to the 3rd century, bear most important witness to parts of 12 books of the New Testament. Consult Milligan, "Greek Papyri" (1912), and "The New Testament Documents" (1913).

B. Vellum Uncials.—Besides Aleph, A. B. C, already described, there are some 160 vellum uncial manuscripts of the New Testament; 110 contain the Gospels or a part thereof. The most important of these manuscripts are:

1. Cod. Bezae, 5th or 6th century, Cambridge; Gospels and Acts in Greek and Latin, excepting Acts xxii, 29 to end; text, Western, i.e., that of Old Latin and Old Syriac.

7. Cod. Augien. 9th century, Trinity Col., Cambridge. Pauline Epistles in Greek and Latin, same family as D, 46, Gs.

Washington. Manuscripts, called W and I by Gregory, giving a 5th or 6th century text of Gospels and Pauline Epistles, Smithsonian Institution.

C. Vellum Minuscules. — The vast number of minuscules to the New Testament text would seem to indicate a rich field of research for the critic. Such is not the case. Ninety-five per cent of these manuscripts are of little moment; they represent an inferior type of text,—that called the textus receptus. Only those minuscules attract attention which approach to one of the great uncial. Thus the *Ferrar Group" resemble the text of D.

Bibliography. — Kenyon, "Textual Criticism of the New Testament" (1912). "Paleography of Greek Papyri" (1899); Warfield, "Textual Criticism of the New Testament" (1886); Tischendorf, "Novum Testamentum Graece" (1869), together with Gregory's Prolegomena thereto (1894); Gregory, "Canon and Text of the New Testament" (1907); "Textkritik des Neuen Testamentes" (1909), and "Die Griechischen Handschriften des Neuen Testaments" (1908); Von Soden, "Griechisches Neues Testament" (1913), and "Die Schriften des Neuen Testaments" (4 vols. 1911-13); Nestle, "Textkritik des Griechischen Testamentes" (1910); Hutton, "Atlas of Textual Criticism" (1911).

IV. Latin Manuscripts. — Epigraphists find far greater variety of script in Latin than in Greek manuscripts. Hence the former are divided into uncials, semi-uncials, capitals, minuscules and cursives; and these divisions are subdivided. The time, place and even the monastery of the抄写ist may often be traced by the very distinct script of the text.

1. Old Latin Manuscripts. — The origin of the Old Latin text is wrapped in obscurity. Three distinct types are recognized,—the African, European and Italian. The African text is that used by Tertullian (c. 150-220), and Saint Cyprian (c. 200-230); it is the crudest in style, and apparently the earliest to be made. The European text is less crude in style and vocabulary; and may be an independent translation. The Italian text, probably the Italica which Saint Augustine preferred to all others, is the version used by Saint Jerome in his revision. About 40 manuscripts preserve this pre-Hieronymian Latin text,—27 manuscripts of Gospels, seven manuscripts of Acts, six manuscripts of Paul's Epistles, fragments of Catholic Epistles and Apocalypse. All show the influence of the Vulgate on the Old Latin.

The most important Old Latin manuscripts are the bilinguals already noted: D, Ds, De, Ea, Es, Gs. Besides there are the codices Vercellensis, 4th century; Veronensis, 5th century; Palatinus, 5th century; Brixianus, 6th century; Corbeiensis, 8th century; Cassian, 13th century; Palimpsest de Fleurieu, 6th century; Bobiensis, 4th century. Cf. Burkitt, "The Old Latin and the Italica" (1896); Wordsworth, Sunday and White, "Old Latin Biblical Texts" (1883-97); Buchanan, "Old Latin Biblical Texts" (1897-99) and "Sacred Latin Texts" (1912-14).

2. Vulgate Manuscripts. — More than 8,000 manuscripts of the Vulgate are extant, most of which are later than the 12th century and of little use in the reconstruction of the sacred text. Wordsworth and White, in their critical text (1889-1905), collate 40 of the most important Vulgate manuscripts. The Benedictine Commission for the Revision of the Vulgate, established by Pope Pius X, is at work on the collation of this vast store of manuscripts. Its task is to reconstruct the various families of the Vulgate text,—the Spanish, Italian, Irish, French, etc.—to sift out the Old Latin readings and other interpolations, and to reach back as nearly as possible to the text that was issued by Saint Jerome. Chief among the Vulgate codices are Amiatinus, 8th century; Censure, 9th century; Fulda, a.d. 541-546; Krenanen, Book of Kells, 8th century; Stonyhurstensis, 7th century.

V. Other Versions. — Syriac manuscripts represent six distinct Syriac versions of the New Testament. The Old Syriac version, made about the middle of the 2d century, is represented by two important manuscripts of the 5th century. The Curetonian Syriac manuscript was discovered in 1844 and was brought to the British Museum from the monastery of St. Maria Deipara, in the Nitrian Desert, Egypt; and was published by Cureton in 1888. The Sinaic Syriac manuscript was found by Mrs. Lewis and Mrs. Gibson, in 1892, at the monastery of Saint Catherine, on Mount Sinai; cf. Bensley, Harris and Burkitt, "The Four Gospels in Syriac transcribed from the Sinaic Palimpsest" (1894); Lewis, "Light on the Four Gospels from the Sinai Palimpsest" (1913);

The *Diatarom* is a Syriac harmony of the Gospels, made about A.D. 170 by Tatian, an African disciple of St. Justin Martyr. The only manuscript records thereof are two Arabic versions, discovered one in Rome and the other in Egypt, which were published by Ciasca in 1888.

The *Peshitta*, or Syriac Vulgate, was made by Rabban Jacob A.D. 411–435. The Peshitta Pentateuch, dated A.D. 464, in British Museum, is the earliest dated biblical manuscript. The Peshitta Gospels number 125, Acts 58, Paul's Epistles, 67; two of these New Testament MSS. are of the 5th century.

The Philoxenian Syriac version has reached us only in a manuscript of Apocalypse at Trinity College, Dublin, and in the four minor Catholic Epistles.

The *Harkelion* Syriac version is witnessed by 35 manuscripts dating from the 7th century, and later; its text is like that of D.

The *Palestinian Syriac* version is found in lectionaries and fragmentary manuscripts; these latter date from the 11th century and later.

The Manichaean Manuscripts date from A.D. 887, are very numerous and have not yet been accurately collated.

3. Coptic Manuscripts.—By the time Egypt became Christian, the 3rd or 4th century, its ancient language had been evolved into the following dialects: Sahidic, or Theban, of Upper Egypt; Akhmimic, a dialect that was later superseded by Sahidic: Fayumic, the dialect of Fayum; Middle Egyptian; Bohairic, or Memphitic, the dialect of Bohairi, i.e., of the northwestern province of the Delta. The chief Sahidic manuscripts of the Bible, that have been collated, are among the 58 volumes, discovered (1910) in the Fayum and now called the Morgan Collection,—six books of the Old Testament and the entire New Testament except the Apocalypse. The British Museum also has parts of the Old Testament, Acts and Apocalypse. Moreover, the bilingual *T. Cod. Borgianus*, 5th century, in the Vatican, preserves fragments of Mark, Luke and John in both Greek and Coptic. The suggestion of the Prince of Persia established by manuscripts of the same character as Aleph-B. The *Curzon Catena*, dated A.D. 889, is the earliest extant Bohairic manuscript and is in the Parkham Library. Cf. Crum, *Catalogue of Coptic Manuscripts in the British Museum* (1895); Wallis Budge, *Coptic Biblical Texts of Upper Egypt* (1912).

WALTER DRUM, S.J.,
Professor of Scripture, Woodstock College, Maryland.

MANUTIUS, ma-nu'ti-us, Aldus (Ital. Manuzio, Manuzzi and Manucci), Italian printer (b. Sermoneta, near Belletri, in the neighborhood of Rome [and hence sometimes known as Romanus], 1450; d. 6 Feb. 1515. He began his studies at Ferrara, and continued them at Rome where he was tutor to princely families. He learned Greek in Ferrara under Guattus, and the suggestion of the Prince of Persia di Carpi established a printing-press at Venice 1489. He gained the reputation of being learned in Greek, Hebrew and Latin and entertained in his house many scholars of the day, forming his "Neacademia" or New Academy, which later was styled "Academia della Fama." He was the author of "Dictionarium Graecum" (1497); "Institutiones Graeco-Latine" (1501–08): "Grammaticae Institutiones Graecae" (1514); "De Magistratibus" (1518). His son Paulus (b. 12 June 1512; d. 6 April 1574) continued (1533) to manage the printing-press at Venice, and subsequently (1561) presided over the papal press, Typographia Vaticana, at Rome. He wrote a commentary to Cicero's Letters, and *Epistulae Selectae*. His younger son (b. 13 Feb. 1547; d. Rome, 28 Oct. 1597), was a scholar and author from his earliest youth. He continued his father's work at Venice and Rome. Consult Renouard, "Annales de l'Imprimerie des Aldes" (1834); Diodot, "Aldo Manuce et l'Hemmennie à Venise" (1873); Goldschmidt, "A Biographical Sketch of the Aldine Press at Venice" (1887); Ohmont, "Catalogues des Livres Grecs et Latins, imprimés par Aldo Manuce à Venise" (1892); Consult De Vinne, T. L., "Notable Printers of Italy During the Fifteenth Century" (1910). See ALDINE EDITIONS.

MANX CAT, a breed of house-cats, originating in the Isle of Man, which are characterized by very high hindquarters, and, as a rule, by a very short tail. See CAT.

MANX LITERATURE. The Celtic dialect of the Isle of Man, one of the sub-division of the Gaelic language, is closely related to the Irish and the Scottish Gaelic, and nearer to the latter than the former. (See CELTIC LANGUAGES; GAELIC LITERATURE.) The language of the literature consisted mainly of ballads and carols (or Christmas carols). The earliest monument of the vernacular is "The Book of Common Prayer," translated by Bishop Phillips in 1610 (reprinted in 1895). In later times the orthography closely followed English. In the middle of the 18th century English was a foreign tongue to about two-thirds of the common people but since that time the decline in the use of Manx has been very rapid, and only two or three thousand of the islanders now speak it. The last edition of the Bible published in Manx was dated 1819, and the last edict in Manx was published in 1840. Consult Rhyd, "Outlines of the Phonology of Manx" (1895); Kelly, "Practical Grammar of Manx" (1803; reprinted 1839); Goodwin, "First Lessons in Manx" (1866); Jenner, "The Manx Language," (July, Grammar, Literature and Present State" (Trans. London Philol. Soc. 1875); Moore, "Surnames and Place Names of the Isle of Man" (1890); "Vocabulary of the Manxman" (1891); "Manx Carols" (1891); and History of the Isle of Man" (1900).

MANZANILLO, mán-than-nil'yó, Cuba, city, port of entry, in the western part of the province of Santiago de Cuba, on the Gulf of Guanabaco on the southern shore. It has a large harbor which is protected by a number of small islands. The city is the port for Bayamo, an inland city about 40 miles east by north from Manzanillo. From the low lands of the lower part of the Manzanillo ital swamps around the place make it very unhealthy. It is well built and has a number of fine churches, hospitals, and schools,—among the schools four are high schools. Urban pop. about 15,115; municipal 62,845.
MANZANILLO, Mexico, seaport, in the state of Colima, on the Pacific at the entrance to the Bay of Cuyutlan, about 40 miles west of Colima, the capital of the state. A railroad connects Manzanillo and the capital, and the city has steam connections with the principal ports on the Pacific Coast. In normal times its imports total $1,500,000 annually.

MANZANITA, a popular name for various species of Arctostaphylos of the family Ericaceae, especially A. purpurea and A. manzanita. They are shrubs or small trees which sometimes exceed 20 feet in height, and often form impenetrable thickets in the region, Pacific Coast of North America from Oregon southward. They have alternate, evergreen, entire leaves, usually white or pinkish flowers in panicked racemes, and generally smooth berry-like drupes. Another well-known species often called by this name is the bearberry (Rea.), a trailing evergreen shrub which extends from the Arctic region to the mountains of Mexico, whose red berries form one of the principal foods of parr Morgans and other related birds. The great spreading Manzanita (A. glauca), a California species, bears fruit more than half an inch in diameter. Of the 30 species of the genus, probably a dozen are used for ornamental purposes; some Central American con in greenhouses where the climate prevents outdoor use; the shrubby western kinds in mild climates; and only the trailing kinds in cold localities. The gnarled roots are an important source of fuel in the uninhabited parts of California.

MANZANO, Juan Francisco, hoo-ân’ frän-thê’ bo-ha-vâ, August 1797; d. there, 1854. A negro slave he wrote and published several volumes of verse before he was manumitted (1837), gaining especial fame by ‘Mis treinta Años’ (1836), translated into French, German and English, and by ‘Africanos’, which was never printed in Spanish, but was published in English by Richard Robert Madden in 1840 under the title ‘Poems by a Slave in the Island of Cuba recently Liberated.’ Manzano’s other works include ‘Cantos’ (1821), several excellent lyrics reprinted in Calcagno’s ‘Poetas de Color’ (1866), and a drama ‘Zafra’ (1842).

MANZANO MOUNTAINS, a range on the east side of the Rio Grande Valley in Bernalillo, Torrence and Valencia counties southeast of Albuquerque, N. Mex. It extends from Tijeras Canyon on the north to Abo Pass on the south, a distance of 45 miles. The very steep western front of the mountain is granite and schist, capped by a thick sheet of limestone which dips east and constitutes the long sloping plateau of the summit and east side. The highest summits are Manzano Peak, 10,086 feet; Osha Peak, 10,023 feet, and Mosca Peak, 9,723 feet, which are about 5,000 feet above the Rio Grande. To the east is the Estancia Valley, long famous for its salt lakes. Near Bosque Peak is a large spring. The range rises from the Rio Grande and is joined by the juniper, and is included in the Manzano Forest Reserve, Deer, bear and wild turkeys and many minor wild animals remain in these mountains. Ores of gold, lead and silver are mined on the mountain.”

mostly Mexicans who have occupied the region for several centuries. Their small plazas or settlements are Chilili, Tejique, Torreon, Escabrosa, Punta del agua and Manzano. The latter has given name to the mountain, the plaza taking its name from a grove of apple trees (Manzano in Spanish) of prehistoric origin. The old ruins of Abo and La Cuara are near the south end of the range.

MANZANOS, män-zà’nos, a natural park in Lincoln, Bernalillo and Santa Fé counties in New Mexico, southeast of Albuquerque. The Manzano Range, the highest peak of this section, numerous table-lands and valleys, with many springs and small streams, are the chief features of this park. The Rio Grande is on the west side; the base of the mountains is about 1,000 feet above the river and about 11,000 feet above the level of the sea. The almost perpendicular, stupendous red cliffs which rise above the plain and form the western face of the mountains are almost unscalable. South of the red-cliff region is the canyon of Las Medoyas, and south of the canyon los Bisbres, the highest point of the range. Near the summit of the peak is a spring which gushes up in a lake about 50 feet wide.

The view from the summit of the range at some points includes the green valley of the Rio Grande, mountains west of Albuquerque and north to the walls of Santa Fé, and intervening valleys and mountains. On the west of the park, or the western border, are the white Manzano salt lands, on the southeast the gypsum desert. On the level mountain tops are stretches of clear grass where the air is clear and refreshing. Between Hell Canyon and Chilili is a region of immense pine and piñon forest. Some of the animals found here are deer, bear and wild turkey. Grains, vegetables, alfalfa, fruit and other farm products are raised. Sheep, horses and cattle are raised extensively.

MANZONI, män-zô’né, Alessandro, Italian poet and novelist: b. Milan, 7 March 1785; d. there, 22 May 1873. He studied at Milan and Pavia, and published in 1806 his poem on the death of his friend Imbonati, which was followed in 1815 by his ‘Sogni’ (The Dream of the Sacri). In 1819 appeared his first tragedy, ‘Il Conte di Carmagnola,’ the first drama in which an Italian defied the unities. This play was reviewed and praised by Goethe, who took a warm interest in every subsequent production of Manzoni. The death of Napoleon inspired one of the finest odes of the century, ‘Il Cinque Maggio’ (‘The Fifth of May’). In 1823 his second tragedy, ‘Adelchi,’ appeared. This, as well as its predecessor, finds more favor in personal reading than on the stage. After this Manzoni divided his time between literary pursuits at his residence in the neighborhood of Milan and the composition of his romance ‘I promessi Sposi’ (‘The Betrothed’), a Milanese story of the 17th century, published in 1827, and which has been translated into all the European languages (except in Bohn’s Library 1883). He strove earnestly to make Tuscan the universal language in Italy. As a poet he out-rivalled all his Italian contemporaries. Verdi’s ‘Manzoni Requiem’ is a magnificent musical tribute to his memory. Manzoni’s works on the eastern slope contain streams from large springs. The water is utilized by many settlers.
MAORIS—MAP

Bersezio, 'A. Manzioni, studio biografico e critico' (1873); Cambu, 'A. Manzioni, reminiscenze' (1885); Waille, 'Le romantisme de Manzioni' (Paris 1890; Eng. trans. by Geddes-Williams, Boston 1911).

MAORIS, māorī or mow'ūrē, native inhabitants of New Zealand, a people of Polynesian race, as is attested not only by ethnological considerations, but by their own legend that they came from Hawaiki (Hawaii or Samoa). Their carefully kept genealogies go back less than a score of generations, so that it seems probable that their coming to New Zealand was four or five centuries ago. Remains of a previous population with Papuan characteristics have been found. The Maoris are well built, with longer bodies and shorter legs than the European type; they have black hair, little whisker on the face, and smooth bodies, wide open, straight black eyes, heads slightly macrocephalic, the index being 77, rose straight and color slightly brown. Their costume, no doubt adopted only upon the coming to a colder country than their early home, was a loose garment, woven from the fibre of Fornum tenax. Tattooing they brought with them to New Zealand and perfected it. They tattooed the face, decorating in this way the young warrior after his first successful fight, and adding fresh designs for each new exploit. They also knew how to make carvings of great delicacy, and armed themselves with stone weapons. Their religious beliefs were crude, but tinged with animism; they recognized the soul as distant from the body and surviving it; but connected an enemy's cunning and bravery so closely with his dead body that they ate it, thus to win his warlike virtues, locating intelligence in the brain and courage in the heart. Their worship combined ancestral cult with delegation of natural forces and some fetishism. They were divided into tribes, six of these representing the divisions among the original settlers. A warlike people, their chief had absolute power and could pronounce tapu or taboo (q.v.) at will. Before the coming of the English they were mostly vegetarian, caught some fish, lived in bark or bough huts and made canoes. Polygamy was practised, and the ariki or priest-chiefains acted as physicians, having some knowledge of herbs. Both their numbers and physique have suffered sadly since the introduction of civilization. For the history of the Maoris since British occupation (see New Zealand, Government and History). Consult Cowan, James, 'The Maoris of New Zealand' (in 'Makers of Australasia' by Melbourne 1910); Beel, J. N., 'Wilds of Maoriland' (London 1914).

MAP, or MAPES, maps, Walter, English scholar and poet of the 12th century. He was probably a native of Herefordshire. He studied at the University of Paris and became a favorite at the court of Henry II. He attended the Latin Court of 1150, and was appointed archdeacon of Oxford in 1157. Map is now generally believed to have been probably author, or in large part, author of 'Lancelot' in the Arthurian cycle. It is extremely probable, at any rate, that Map did contribute to the bringing about the cycle, but it is uncertain to what extent his work has survived. He is undoubtedly the author of a curious book 'De Nugis Curialium,' a notebook of the events of the day and of court gossip. It was edited for the Camden Society in 1850 by Thomas Wright. To Map is attributed the famous drinking-song beginning:

"Meum est proprium in taberna mori"

MAP. The term map is derived from the Latin word mappa, meaning a napkin. During the Middle Ages the name 'mappa mundi,' signifying world napkin, was applied to geographical representations of the world on account of the fact that the maps made during that period, at least, were painted on cloth. The possession of maps and charts is to accurately exhibit to the eye by suitable methods of representation, on a reduced scale, and on a plane surface, the relative position of points, lines and other objects situated on the spherical surface of the earth. As commonly used the term chart is synonymous with map, but the former is usually applied to navigators' maps relating to the sea rather than the land; also to diagrams delineating the positions of the stars in the celestial vault, and to the mapping of hydrographic data; while the term map is almost exclusively applied to maps of the surface of the earth. For example, there are the "star charts" compiled and published by the various observatories, the "maps" of the United States Geological Survey, which represent the land areas, and the "charts" of the United States Coast and Geodetic Survey, which show the depths of the waters along the coast line of the United States.

History.—The earliest maps consisted of simple drawings which merely represented the relative positions of a few known points on the earth's surface and defined in a general way the partly known and partly conjectured limits of the land and water areas. Map-making undoubtedly originated among the wandering tribes of mankind and not among those who inhabited permanent locations such as towns and villages, and were used by those tribes to perpetuate for the benefit of posterity landmarks identifying the regions traveled over by them during their wide excursions to unsettled parts of the world. This is the well-known fact that the American Indians and the Eskimo and many of the Polynesian tribes, customary wanderers, are very acute in apprehending the meaning of maps, while the majority of the settled Negro tribes are absolutely lacking in this respect. It is stated that a map drawn by an Eskimo woman enabled Sir Edward Parry to discover Fury and Hecla Strait, while the experience of many pioneer surveyors and topographers, derived from their work through the extensive wildernesses of the American continent, will attest to the general accuracy of elementary Indian charts and of the capacity of those Indians to understand the maps made by others.

Among civilized peoples, the earliest examples of map making were those of the Egyptians. According to Apollonius of Rhodes (230 B.C.) the Egyptians of Colchis, a colony which dated from the time of Rameses II (1340 B.C.), possessed maps engraved on wooden tablets which had been handed down from the preceding period. These maps defined with considerable accuracy the known limits of land and water areas and the positions of roads and towns. Other ancient Egyptian maps are the
route maps which were prepared under the direction of King Sesostris, probably during the 12th dynasty; certain old maps in the Alexandrian Library referred to by Strabo and probably collected by Eratosthenes, and the map on papyrus in the museum at Turin, which represents the topographical features of a gold mining district in Nubia. Maps of equal if not greater antiquity are recorded among the ancient Babylonians, who originated the idea of dividing the ecliptic into the 12 signs of the zodiac and also the sexagesimal system of numeration which led to the custom of dividing the circle into 360 degrees of 60 minutes each, with each minute subdivided into 60 seconds, and also to the corresponding divisions of the hour.

Among the Greeks the first map appears to be that of Anaximander about 500 B.C. His work was followed about 100 years later by that of Democritus of Abdera, whose work appears to have been based upon data obtained by him self in his travels, which extended to Persia and perhaps as far as India, and added considerably to the east and west dimensions of the known world areas. These circumstances probably led to the depiction of the world disc in the form of an oval, a distinct departure from the circular form employed by Anaximander and others. About 150 B.C. Hipparchus introduced among the Greeks the Babylonian system of numeration, and discarding the unreliable geographical data of Eratosthenes and others, which were mainly obtained from travelers, suggested the use of only actual astronomical determinations of the latitudes and longitudes of the various points as the true basis for checking distances and directions. His suggestions were practically carried out by Marinus of Tyre, whose work was subsequently corrected by Ptolemy about the 2nd century A.D. into a map which is generally considered to be the most complete summary of geographical in-

Among the Romans the art of map-making was confined to various kinds of sketch maps valuable for military and political purposes. They did not apply the scientific methods of the Greeks, and although both Cicero and Seneca mention general and topographical maps, and it is a fact that a survey of the whole Roman Empire was made during the reign of Augustus, the grave errors of Ptolemy’s maps in all of the Mediterranean countries awaited rectification until the later Middle Ages.

During the earlier Middle Ages cartography, together with all the other branches of scientific culture, took a step backwards. The ban of the Church was laid heavily on the doctrine of the sphericity of the earth and resulted in the resurrection of the ancient Greek idea of a flat circular earth surrounded by an ocean limited by the edge of the celestial vault. In this way the few maps constructed during this period assumed the form shown in the accompanying
figure, and toward the close of the 14th century the entire science of map-making actually fell below the level of that attained by the Ionic Greeks in the days of Anaximander and Democritus. It is a fact worth noting, however, that during the 13th century a form of great revival in the art of map-making, which was materially aided by the newly perfected arts of wood and copper engraving. Furthermore, Furbach, Regiomontanus and others introduced trigonometry, and attempts were made to construct maps based on systematic geographical triangulations. Map-making became a favorite occupation with the Germans, French and Italians, and many valuable editions of maps were produced at Strassburg, Ulm, Basle, Cologne, Paris, Lyons, Vicenza, Venice, Bologna and Rome, representing the work of numerous eminent map-makers, among which those of Joh. Ruysch, Nicolaus Donis and Jacob Angelus de Scarpinia were of especial prominence and value.

During the 16th century the number of map-makers increased greatly and brought forward such illustrious cartographers as Johann Werner of Nuremberg, Sebastian Cabot and Gerhard Kramer (more commonly known as Mercator). The general endeavor of the Germans during this period was directed toward the improvement of the methods of projection originated by the Greeks, and led in the case of Mercator to the development of the projection which bears his name, and which is even at the present time very extensively used in the construction of nautical maps. About the latter part of the century the centre of map-making effort was transferred to Holland, mainly through the influence of the collection of maps published by Abraham Ortelius of Antwerp, under the title ‘Theatrum Orbis Terrarum,’ which included new engravings of the best maps from all countries. This great work passed through many editions, each successive edition being characterized by an increased number of maps. The 12th edition contained 92 maps. The earlier editions were printed in Latin, but later editions in German, French, Dutch, Italian and English were produced and obtained world-wide circulation.

The beginning of the 17th century inaugurated a still further improvement in the art. The important inventions, such as the telescope, the sextant and the chronometer, provided means for the taking of more accurate observations relative to time, latitude and longitude, while the application of trigonometry to geometry by Snellius and Picard’s measurement of a degree of the meridian between Paris and Amiens introduced more precise methods of computation. Some of the most important productions of this epoch are those of Johann Baptist Homann of Nuremberg, and the work of Nicolas Sanson, Guillaume de l’Isle and Jean Baptiste Bourignon d’Anville and other eminent geographers of France working under the royal patronage, and ‘Dowets Atlas’ published in England under the patronage of the Duke of Argyle.

These important works carry the art of map-making through a period of over 200 years and bring it to a point where instead of being treated as a matter of private business enterprise it was taken up as a governmental matter, and the original surveys, together with the maps based thereon, were executed at the cost of the state. The first step in this direction was taken by France, the object being the production of a series of maps for military purposes and as a cadastre for the land tax. For this purpose the entire country was covered with a network of
The science and art of modern map-construction may be considered most conveniently and usefully under three headings—theoretical projections, practical methods of construction and duplication of reproduction.

Theoretical Projections.—Since the object of maps and charts is to accurately represent by suitable symbols on a plane surface the relative position of objects, etc., on the spherical surface of the earth, the problem requiring solution is one that is geometrically impossible, and therefore any map, no matter how accurately constructed, must necessarily be only an approximation to the truth. Yet by the assumption of certain lines of reference which correspond to the actual latitudes and longitudes on the surface of the earth according to certain assumed or fixed geometric laws, the approximation to the truth may be so nearly attained as to be quite as useful as the truth itself for all practical purposes. Such a system of lines of reference constitutes a projection by means of which any point or line on the surface of the sphere may be plotted on the map from its known co-ordinates, or from which the co-ordinates of any plotted point may be ascertained.

There are two general classes of such projections—the "true" or "perspective" projections which depend upon the actual position of the spectator's eye, and the "developed" projections in which the eye is assumed at the centre of the sphere, or else occupies an arbitrary position.

Perspective Projections are of three kinds: (1) the "orthographic," with the eye supposed at an infinite distance, and the plane of projection perpendicular to the line of sight; (2) the "stereographic," with the eye supposed upon the surface of the sphere and occupying the pole of a great circle, the plane of which is the plane of projection, and (3) the "gnomonic" or "central" projection, with the eye assumed at the centre of the sphere and the plane of projection tangent to its surface. To this class belongs also the globular or equidistant projection designed to avoid to a certain extent the contraction of the orthographic and the exaggeration of the stereographic projections near their respective outer edges. In this projection the eye is supposed at a distance of $\sqrt{2}$ times the radius above the surface of the sphere. The perspective projections, in their astronomical and geographical application, are generally used for representing large areas and hemispheres and are seldom used in the construction of maps of small extent on large scales, in which case they are too laborious of construc-
tion and cannot be made to satisfy any special conditions not included within the scope of their inherent characteristics. The three principal perspective projections were known to the ancients, the orthographic and the stereographic being accredited to Hipparchus and the gnomonic to Thales. The globular projection was devised by Nicolaus. They served to introduce projection methods, but with the exception of the gnomonic, which is still used for the construction of star charts and some classes of nautical charts, they have been superseded in the construction of modern maps by the developed projections.

Developed Projections are obtained by the substitution of a cylindrical or a conical surface for the ordinary plane of projection, and that surface, being subsequently developed or rolled out in a plane, gives the projection. The application of this results in two general classes of developed projections—those employing a cylinder tangent to the sphere, usually at the equator, and those employing a cone tangent, usually at the middle parallel of latitude of the area mapped. Of these, the two most commonly used at the present time are the Mercator and the polyconic projections, the former employing a tangent cylinder and the latter an infinite number of tangent cones. The Mercator was purposely designed for the use of nautical maps and is principally employed for that purpose at the present time. On a map based on this projection the loxodromic curve, that is, the course of a vessel which intersects the successive meridians at a constant angle, is represented on the map as a straight line, thus facilitating the plotting of that course from day to day during the progress of the voyage, and materially assisting in determining the true distance and bearing of the objective point. The polyconic projection appears to have been devised for the purpose of providing a suitable base for the mapping of the Atlantic coast line of the United States by the United States Coast and Geodetic Survey. The direction of this coast line being nearly diagonal to the meridians and parallels, and having a great north and south amplitude, required for its representation a projection which avoided the inherent distortions of the various conic projections due to the great obliquity of the intersections of the meridians and the parallels in the higher latitudes. This projection on account of the close similarity of the figures on the surface of the earth to the corresponding figures on the projection, and the uniformity of scale over the whole map is now extensively used for mapping not only areas of comparatively limited extent, but also for the representation of continental areas of large extent.

For the mathematical operations involved in the computation of the elements of these projections and for illustrations showing how they are plotted in the actual construction of maps, see article under the title PROJECTION in this Encyclopedia.

Practical Methods of Construction.—As a rule, and with but a few exceptions, the drawing of an accurate map is necessarily preceded by an accurate survey of the things to be mapped, and the character of those things together with the purposes for which the survey is made, not only define the methods of surveying to be employed, but also the character of the map and its relative scale. The various methods of surveying are described under the title Surveying in this Encyclopedia. The various kinds of maps may be grouped into the following named general classes: "Geographical," "physiological," "topographical," and "geological" maps. The representations of astronomical, hydrographical, nautical and statistical data belong more properly to the category of charts. The various forms of railroad maps are merely diagrams only useful for consultation with the accompanying railroad schedules. The amount of distortion required to fit them for the purposes for which they are used makes them entirely unreliable for any other purpose. The military maps are of various types and differ greatly according to the purposes for which they are used. Staff maps usually show every feature, natural and artificial, on the surface of the country mapped in the minutest detail and with the greatest accuracy. The differences of elevation of the various points are a matter of the greatest moment, and, therefore, are usually treated in the most complete manner both as to graphic effect and accuracy of information. The sketch maps are much simpler.
in character and represent in the most elementary way the most important features which have a direct bearing on the particular kind of military operations involved.

In the construction of original maps the principal points to be considered are the scale, the projection, the topographical representation and the method of duplication or reproduction for publication.

Scale.—The scale will depend upon the character of the survey and the data obtained thereby; the extent of the area to be represented on the map, and the process by which the map is to be reproduced. The original map should always be drawn on a scale sufficiently large to allow the draughtsman to plat the field notes easily and accurately. The difference between a large scale and a small scale and their relative effect on maps may be explained as follows:

Suppose the fractional scale of a map is given as $\frac{1}{4}$, it indicates that an interval of one inch on the map is equivalent to an interval or distance of 43,300 inches or one mile on the ground. Suppose the map to be 10 inches square, it would include an area of 100 square miles. Now suppose that while the size of the map remains the same the scale is reduced to $\frac{1}{16}$, it would then include an area of 10,000 square miles. Any map scale which requires that the plotting of measurements be made by the use of a scale with finer divisions than one-hundredths of an inch is about the minimum limit for plating original work, although measurements requiring an accuracy of one two-hundredths of an inch are commonly made in the construction of accurate projections for the mapping of exact trigonometrical surveys. The scale should be made larger directly in proportion to the increase in the amount of details to be shown on the map. The scale for maps in railroad work should always be large—1 inch to 1, 2 or 300 feet. For the platting of plane table and other triangulations, and for work requiring the filing in of a great amount of topographical detail, the scale should not be less than one inch to one mile. All surveys such as the townships and sections of the Public Land Surveys, in which the measurements are made by chain or by stadia, should not be platted on a scale less than 1 inch to 40 chains or half a mile.

In all cases the original maps may be subsequently reduced to any desired scale by hand, by pantograph or by photographic methods. Reduction by pantograph is satisfactory and useful only for the roughest classes of work. Photographic reductions of maps of limited size and prepared as copies for engravings may be made with fair accuracy and very slight distortion. Map sheets exceeding 15 to 20 inches square in the size of the final reduction cannot be reduced photographically with sufficient accuracy to satisfy the demands of absolutely accurate copper, steel and stone engravings. For such engravings the reductions should always be made by hand. The method of hand reduction usually employed is the simple but effective one of dividing the original and the copy into a system of equivalent squares and then drawing in all the details by hand. The very simplicity of the method demands the services of the most skilful and experienced draughtsmen, so that the resulting maps possess a far greater accuracy than any reductions that may be obtained by photo-mechanical methods. There are examples of hand-made maps in the office of the United States Coast and Geodetic Survey which are actually superior in accuracy, execution and beauty to the prints from the very fine copper engravings for which they served as a copy.

If the maps are to be reproduced by being engraved on copper, steel or stone the reductions furnished the engravers should always be upon the "final scale" or scale of publication. This is also applicable to wax engravings when photographic methods of reduction are not available to the engraver. When the maps represent a great diversity of physical characteristics it is convenient to avoid confusion of details by using various conventional colors so as to distinguish the land from the water areas, the rivers and creeks from the roads, railroads, contour lines, etc. If the maps are to be reproduced by any of the photo-mechanical processes such as photo-engraving, photo-lithography or the half-tone process, the use of colors should be strictly avoided, and the map made in black and white on a scale that will allow about one-third reduction to the scale of publication.
Projection.—At the present time the construction of the basic projection for a map is a very simple matter and consists merely in the laying off of the proper tabular values which have been computed for the use of map draughtsmen. The most useful tables of this kind in this country are those published by the United States Coast and Geodetic Survey and the Hydrographic Office of the Navy Department. The Mercator and the polyconic are the two principal projections employed at the present time, but many others are often employed where their special characteristics satisfy the particular requirements of the maps. It is in such cases that an intimate knowledge of the various projections is valuable to the mapmaker.

For information relative to the particular characteristics of the various projections see article under the title Projection.

Topographical Representation.—The differences of elevation between the various points on the surface of any region, that is, the hills, mountains and valley formations together with other natural features such as the river systems, plains, tablelands, etc., constitute the topography of that region. The term "topography" is applied to the aspect furnished by those natural features the existence of which are due solely to differences of elevation—the valleys, hills and mountains. These are represented on maps either by a system of horizontal lines drawn at right angles to the slopes called "contours," or by a system of vertical lines called hachures which follow the directions of the slopes and are drawn at right angles to the "contours." The best idea of the nature of contours may be had by supposing a dam built across a river and flooding the country above it. Suppose the height of the dam to be increased at uniform intervals of 10 feet. At each increase in the height of the dam the water will reach a new level, and the irregular horizontal line where it intersects the surface of the ground is the contour for that particular height of the dam and connects all the points of the same elevation on the surface of the whole region. In the actual determination of contours the datum, zero or point of beginning of the vertical intervals is the level of the sea, and the value of an interval adopted—10, 20, 50 or more feet—depends upon the purpose for which the survey is made, and the scale of the final map. In surveys for hydraulic purposes such as the construction of dams and reservoirs, the laying of water and sewer systems and the digging of canals, many cases occur which require the adoption of a contour interval as small as one or two feet. In such cases the areas surveyed are small and are mapped on a large scale. On the other hand, when the areas are large with great differences of elevation, larger contour intervals are adopted, and the maps are made on a small scale. The maps of the United States Geological Survey are among the best examples of orographic delineation by the method of contours, for detailed information of which see article under the title Geological Survey.

The delineation of orographical features on
represent the finest class of lithographed maps in this or any other country, are engraved on stone, from which impression prints are taken on hand presses and transferred to smooth stones from which the final prints are made on power-driven cylinder presses. A great many of the maps which make up the best classes of atlases published for scientific and other purposes in foreign countries are reproduced in the same manner. For detailed information relative to the various processes enumerated, see articles under the titles ENGRAVINGS, LITHOGRAPHY, PHOTO-ENGRAVING, etc.

MAPES, maps, Victor, American playwright: b. New York, 10 March 1870. He was graduated from Columbia in 1891, was Paris correspondent of the New York Sun 1892-96 and dramatic critic of the New York World 1900-14. He has written 'Duse and the French' (1897); and among plays by him may be named 'A Flower of Yeddo' (1898); 'The Tory's Guest' (1900); 'Don Caesar's Return' (1901); 'The Detective' (1908); 'The New Henrietta' (1913); 'The Lasso' (1917).

MAPLE, a genus (Acer) of trees, together with a few shrubs of the family Aceraceae. The species of which are about 100, are indigenous to the north temperate zone, being best represented in China, Japan, United States and Canada. They are characterized by opposite, palmate or lobed, exstipulate leaves; small polygamo-dioecious flowers in axillary corynbs or racemes; and compound, one- or two-seeded, long-winged nuts (samaras). The maples constitute one of the most widely useful genera of trees, being extensively employed for ornamental and street planting and for windbreaks, while the wood serves well for tool handles, furniture, flooring and many other purposes. As fuel, they are especially valuable, being considered superior to almost all other woods except hickory. Because of their popularity for street planting are great number of horticultural varieties have been produced, especially in Japan, and nearly all, but particularly the Japanese and American species and varieties, are noted for their brilliant autumnal colorings, which in the various shades of yellow, orange, and red, are characteristic of northern trees. The flowers are rich in nectar and are sought by bees. Most of the species thrive best upon rich moist land suitable for agricultural purposes and are considered an indication of the type of soil. A few grow in wet land, and many upon mountain sides. They are readily propagated by means of seeds which, in the case of the early maturing kinds, should be sown as soon as ripe, and in autumn or spring, being stratified in sand during the winter. Some choice varieties are grafted or budded and others may be increased by cuttings and layers.

In America, the best known, most widely planted and otherwise most important species is probably the rock or sugar maple (A. saccharum), a stately round-headed, gray-barked tree, often attaining heights of 120 feet. It is especially characteristic of rich woods from Maine to Michigan and southward in the mountains to Georgia, everywhere being prized for the rich colors of its leaves in autumn. Besides great popularity for all the purposes mentioned above, some of the trees are highly prized for their wavy-grained wood, which, being of satiny appearance and capable of high polish, is used under the name of curly maple, often as veneers for choice furniture. It is further the most important of the species which yield a saccharine sap, and is a chief source of maple syrup and sugar, to obtain which the trees are tapped, the sap collected and evaporated. A yield of three pounds per tree annually is considered very profitable; six pounds or even more is often obtained from many specimens whose sap is either especially abundant or particularly rich in sugar. If properly done no injury results to the trees. A form of the sugar maple, the black maple (A. saccharinum var. nigrum), so called from its very dark bark, is considered a distinct species (A. nigrum) by some botanists. It has the same range and habitats as the preceding and in nearly every respect the same uses, including sugar production. This form is more abundant than the preceding in the Central States.

The silver maple (A. saccharinum) is a widely spreading tree which attains a height of 120 feet throughout the same range as the above species. Being very ornamental in form and particularly also because of its graceful leaves, which are silvery white beneath, this tree is widely planted where rapid growth and quick effects are desired. Its chief fault is its brittleness; it quickly succumbs to high winds. It will succeed upon a wide variety of soils. Its sap, though rather sweet, is less useful for sugar than the above-mentioned species.

The red, scarlet or swamp maple (A. rubrum) attains heights similar to the above, has about the same range, but is most frequently found in wet ground. It is named from the brilliant color of its flowers, which are borne profusely in early spring before the leaves appear and from its red fruits which appear soon after. Being of poor habit it is widely planted for ornamental purposes upon all kinds of soils. Its wood is used for most of the purposes enumerated above.

The Norway maple (A. platanoides) is somewhat smaller than the preceding species, being more compact and umbrageous. It is widely planted in private grounds and in parks, but is less valuable for street planting than the above because of its shorter trunk. It is a native of Europe. The sycamore maple (A.
MAPLE SUGAR INDUSTRY—MAPLESON

pseudoplatanus), another European species, is smaller still, attaining only about 70 feet. It is also widely planted in America as well as in Europe, being a vigorous, rapid grower and succeeding upon a great variety of soils. The common maple (A. campestre) occasionally attains 50 feet, but is usually a smaller tree or even a shrub. It is of European origin and is widely planted.

The Japanese maple (A. japonicum, A. palmatum and other species) are small trees or shrubs which because of the great diversity of form of their leaves and their dainty habit have become widely popular in the parks and gardens of the United States and Europe. Their exceptionally brilliant autumnal coloring is taken advantage of in Japan where in the fall they approach the chrysanthemeum in popularity.

The maples furnish food for a large number of insects, some of which live upon the green parts and others upon the wood. Several species of scale insects (q.v.) are very abundant enough to do considerable damage. The cottony maple scale (Pulvinaria innumerabilis), Pseudococcus aequi, a European insect, and the "gloomy" scale (Aspidiotus tenellus), a southern species, are among the most troublesome. Several caterpillars live upon the leaves, the forest tent caterpillar (Malacosoma disstria), the fall web-worm (Hyphantria cunea), and the larvae of the tussock moth (Orgyia leucostigma), being the most generally important. The maple worm (Anisota rubicunda) is frequently very destructive. It is the larva of a moth. Of the borers, the larvae of Dicerca diversicata and Glycybius speciosus, which are beetles in the adult state, and those of Aegeria acerina, a clear-winged moth, are among the best known. The second beetle mentioned is known as the sugar maple borer. Consult Bailey, 'Standard Cyclopaedia of Horticulture' (New York).

MAPLE SUGAR INDUSTRY, a trade term, in common use, pertaining to the manufacture of sugar and syrup from the sap of the sugar maple, Acer saccharum. This production is classed under "Agriculture" by the United States Census Bureau, and note was made of its importance at a very early day in the history of the government. The product is strictly confined to North America and the greater part to more or less limited areas in each of the geographical divisions known as New England, Middle Atlantic and Central-Western States, and Canada bordering on the North. Twenty-three States reported maple sugar or syrup in 1900. Of the 11,928,770 pounds of sugar made that year in the United States, 87.8 per cent, or 10,478,240, were produced in the North Atlantic States. The three States of Vermont, New York and Pennsylvania reported over 80 per cent of the total. On the other hand, the States of the North Central division were credited, in 1900, with 1,211,334 gallons of syrup, out of a total of 2,056,611 for the entire country. Since 1900 the production has steadily declined, and what is marketed is subject to so much adulteration with unrefined sugar that the real of the is inaccessible.

It is, however, a decadent industry, as the trees have largely been exterminated.

In Canada the manufacture of maple sugar and syrup assumed a relatively high importance compared with the production in the United States. The Dominion census of 1901 gives the entire volume as 17,762,630 pounds (syrup being reduced to equivalent pounds of sugar for the purpose of this enumeration); of this aggregate, the province of Quebec is credited with 13,643,672 pounds of maple sugar, the province of Ontario following with a production of 3,791,398 pounds. Maple sugar is reported from other provinces and territories as follows: New Brunswick, 207,450 pounds; Nova Scotia, 112,496 pounds; others light.

History.—Maple sugar and syrup was made at an early day by the pioneers of New England and Canada. It may have been a product of "necessity, the mother of invention," or an inheritance from the Indians, who had a spring-date of "sugar-making moon"; but, in either event, the first methods employed were crude, and the article was dark in color and not attractive. Moreover, tapping trees with an axe tended to denude the forest of its maples, and the whole modus operandi was wasteful in the extreme. The sap was caught in troughs, hewed out of logs, thence carried in pails to the boiling place and reduced to syrup in potash kettles. If the boiling was not carried on earlier, would be a curiosity at this day. They were suspended by chains from a horizontal pole, supported by forked or crossed sticks at each end, and surrounded by a blazing open fire. The camp-kettle, captured from General Burgoyne at the battle of Saratoga, 17 Oct. 1777, preserved in the Bennington Battle Monument, is a fine illustration of what these kettles resembled. Primitive ways, however, did not long continue. Improved methods, both as to tapping the maples—leading up to the use of metal spouts— and refining sap, followed one another, until now modern scientific principles prevail; and it is possible to reduce the sap to sugar or syrup, using evaporators, almost immediately, so that its color is nearly white, flavored only with the delightful aroma of the maple.

Production and Adulteration.—The supply in the United States, being much below the demand, has led to the "manufacture" of an article of commerce in which the pure maple product plays a very inconsequential part. Federal authorities assert that sugar refiners make much more sugar and syrup, labeling it "maple," than the entire natural production; that the refuse sugar of the real maple enters into the artificial combination of glucose, cane or beet sugar, and chemicals—to a very large degree creating a ready market for black American and Canadian sugars and the "late runs," of the maple sugar-producing sections of both countries.

MAPLESON, mā'pl-sōn, James Henry, English operatic impresario: b. London, 4 May 1830; d. there, 14 Nov. 1901. He was educated at the Royal Academy of Music, London, and went to Italy for vocal instruction, but was compelled to abandon his career as a singer, owing to throat trouble. He then entered an orchestra, playing the viola, and in 1861 he became manager of the Lyceum Theatre. In 1862 he married Miss Ada, the real of the is notable. His was Her Majesty's Theatre where he made himself famous. In 1871, after the burning of Her Majesty's Theatre he managed Drury Lane but returned to the new Her Majesty's upon its completion.
In 1878 he conducted the tour of an Italian opera in America and subsequently made tours with the greatest singers of the day, including Patti, Nilsson, etc.

MAPPA, Adam Gerard, Holland-American soldier and pioneer type-founder: b. Delft, Holland, date unknown; d. Olden Barneveld, N. Y., Apr. 1828. As a young man he entered the military service of his native country, gaining marked distinction as a brave and enterprising officer. About the time of his marriage (1780) he left the Dutch service and engaged in the business of type founding. This business was interrupted by political storms which disturbed the province of Holland in 1786-87. Colonel Mappa again took up the sword and became one of the leaders of the Dutch Patriots, being commander of the armed citizens in the Province of Holland. "After keeping The Hague in a state of alarm with his small band of patriots alone, he was overwhelmed with numbers." And on 9 Oct. 1787 he was obliged to disband his men. With 14 others he was banished forever from Delft.

At the request of his republican friends he went to the court of Versailles to solicit compensation and co-operation. But Louis XVI had troubles enough of his own, and as the prospects of the civil liberty being established in his own country grew fainter, Colonel Mappa decided to move with his family to America. On 1 Dec. 1789 they arrived in New York. The time between his expulsion from Holland and his landing in America was spent with other Dutch political refugees at the Chateau de Waris near Saint Omer.

While in Paris, Colonel Mappa became acquainted with Thomas Jefferson, then American Ambassador to France, who advised him to take to America a type-founding plant, there being then no such industry on the western side of the Atlantic. Accordingly Colonel Mappa brought with him a complete "letter foundry" embodying not only the Western but Oriental languages as well. The outfit was valued at something like $5,000 New York currency. Up to this time all printers had been obliged to purchase their type in England or Scotland. The following January (1790) Francis Adrian van der Kemp, a fellow refugee, wrote to his friend, John Adams, then a political power and later President, suggesting that the Congress impose a tax on all foreign type to encourage and protect Mappa's infant industry.

Where he set up his type foundry at first is perhaps impossible to say. A New York directory of 1792 makes mention of him as doing business at 22 Greenwich Street. The infant industry was not prosperous as letters from Mrs. Mappa to her friends plainly indicate. So on 1 Feb. 1794 he advertised his "type foundry for sale. In the following summer, 1794, Colonel Mappa moved to Olden Barneveld, now Barneveld, and became the resident agent for the Holland Typographical Land Company, for more than 30 years until the time of his death. Here he built the stone mansion which still stands unharmed for the years and which in his day was often the gathering place of noted pioneer families of central New York.

MAPU, mā'pō, Abraham, Hebrew novelist: b. Kovno, 1808; d. 1867. At an early age he became noted as a Talmudist. He studied Latin and the classics of that language exerted a lasting influence on his literary endeavors. He was also well acquainted with French literature and in 1848 was appointed professor in a Jewish school at Kovno. From this dates his devotion to Hebrew literature. In 1852 appeared his novel "Ahabat Ze'yon" (Love of Zion), the forerunner of the romance movement in 19th century Hebrew literature. It became very popular although orthodox rabbis assailed it as a profanation of the Lesbon Quodesh or Holy Tongue. In 1865 Mapu published another historical novel, "The Transgression of Samaria." In 1867 an English translation entitled "Ammon, Prince and Peasant" was published by F. Jaiffe. Other works of Mapu are: "The Hypocrite" (1859-60); Hebrew manual; Hebrew grammar; a Hebrew textbook for the study of French. Consult Slouschz, N., "The Renaissance of Hebrew Literature" (1909).

MAPURITO, mā-poo-řē'ō, one of the Mexican white-backed skunks. See Skunk.

MAQUI, mā-kē', an evergreen shrub of the family Elaeocarpaceae, found in Chile, from the juice of whose acid fruit the Chileans make a wine given to persons ill with a fever. Its wood is employed in making musical instruments and its bark furnishes strings for them. It is the best-known species of the genus Aristotelia (A. maqui), and is cultivated as an ornamental shrub in Europe.

MAQUOKETA, mā-kō'kē-ta, Iowa, city, county-seat of Jackson County, on the Maquoketa River and on the Chicago, Milwaukee and Saint Paul and the Chicago and Northwestern railroad, about 42 miles north of Davenport. It is in an agricultural section; valuable limestone quarries are in the vicinity and not far distant are forests which furnish excellent hard-wood timber. Its chief manufactures are flour, lime, woolen goods, brick, tile, foundry and machine-shop products and wooden-ware. It has an extensive trade in manufactured articles, farm products and livestock. It has county buildings, several churches and schools and the Boardman Library Institute. There are two semi-weekly newspapers and good banking facilities. The city owns and operates the waterworks. Pop. 4,776.

MARA, mā'rā, in old Runic, a goblin that seized on men asleep in their beds and took from them all speech and motion. In Russian it was called kiki-mara, "ghosts." In Hindu mythology Mara is the ruling spirit of evil; the tempter mentioned by Edwin Arnold in his "Light of Asia." Mara is also frequently identified with the incubus and with nightmare (q.v.)

MARABOU, mār-a-boo', a large African pink-white pouched stork (Leptoptilus crumenifer), which resembles the adjutant of India in appearance and habits. It gives its name to the soft and drooping feathers (coverts) which cover the root of the tail and are prized for millinery and other ornamental purposes; a large part of the "Marabou feathers" sold, however, are derived from the Indian adjutant.
MARABOUTS, măr-a-boots, MARABOOTS, or MARABOUTS, Mohammedan Arab hermits or devotees, leading a secluded religious life or occupying a religious station in northern Africa. They have great influence among the Berbers and distribute amulets, affect to work miracles and are thought by their followers to exercise the gift of prophecy. Throughout the Barbary States the tombs of the Marabouts are conspicuous objects, being generally built in the open country and regarded by the people with much reverence. Some of them have degenerated into religious tramps.

MARACAIBO, măr-rä-kë’bô, Venezuela, capital of the state of Zulia, situated on the strait that connects Lake Maracaibo with the Gulf of Venezuela. It has a large and safe harbor, and maintains commercial relations with foreign markets, with the interior and with Colombia. The Red "D" Line Steamship Company, of New York, sends a vessel on regular trips to Maracaibo and hundreds of small craft, suitable for shallow waters, carry on the trade of the coast and rivers tributary to the lake. This city is also the starting point for passenger and freight steamers and the railway lines of sections of the state of Los Andes. The most important buildings are the Executive Mansion, the public market, Legislative Palace, municipal building, Baralt Theatre, university, six churches and the new jail. There are five hotels, two clubs, 24 restaurants, etc. The public places contain statues of the patriot, Gen. Rafael Urdaneta, and Don Rafael Baralt, author of a history of Venezuela, who was born in Maracaibo and became a member of the Royal Spanish Academy. There is a dockyard for the construction of sailing-vessels and the city has electric lighting, telegraph and telephone service, submarine cable, street railways, etc. Coffee, cocoa and hides are the chief exports, which have an average annual value of $2,300,000. Maracaibo, at first called Nueva Zamora, was founded in 1571 by Alonzo de Pacheco. Pop. about 50,000.

MARACAIBO, Gulf of. See VENEZUELA, GULF OF.

MARACAIBO, Lake of, Venezuela, in the northwestern part, connected with the Gulf of Venezuela by a strait about 50 miles long and from 8 to 15 miles wide. The lake lies between 9° and 11° S. lat. and 71° and 72° W. long., and is about 100 miles long from north to south and 80 miles across the widest part. At the mouth it is about 500 feet deep, but at its head it is shallow and the land near the shore is marshy. Large vessels cannot enter because of a bar at its mouth which leaves only from 8 to 13 feet of water. A number of rivers flow into the lake and keep it fresh, but when strong north winds prevail it becomes brackish. The tides do not affect the lake to any very great extent although it is a marine inlet. It was once much larger than at present, as the shore-marks indicate, but the basin has been filled in, leaving this one large lake and several smaller lakes which are connected by creeks. See VENEZUELA.

MARAKJ, măr-ăr-zhë’ (called also Joannes), Brazil, an island at or between the delta that form the mouths of the Amazon and Para rivers; area, about 14,000 square miles. From east to west the greatest dimension is 162 miles and 110 miles north and south. The greater part is low; in the centre are several lakes. In the north and west are swamp lands and in the south are tests, the rubber tree predominating. The chief settlement is Saure on the eastern coast. There are not many residents, as in the rainy season nearly the whole island is flooded. Cattle raising and gathering rubber are the chief occupations.

MARAL, the red deer of Persia.

MARANHAM, mär-rän-yân, or MARANHÃO, Brazil, a maritime state, just south of the Equator, bounded on the north by the Atlantic Ocean; area, 177,566 square miles. The surface is uneven, but there is no range of mountains. There are numerous rivers flowing into the Atlantic, large forests, extensive plains where cattle are reared; the climate is fine and the soil fertile. The Paranhoba is the principal river, being 700 miles long, with several large tributaries. The Gurupy, the Mearim and the Itapicuru are each about 500 miles in length. Agriculturally, the emancipation of the slaves, on whose labor the state had depended, was followed by a period of great depression. Cotton, sugar and rubber are the principal products. Coffee, rice, corn, cacao and tropical fruits grow luxuriously. The population is not great and it slowly develop the rich natural resources, there being only 2.8 persons to the square mile. Efforts are being made to colonize different sections but the hot climate is not attractive. The present inhabitants are chiefly of Portuguese descent; but there are about 20,000 Indians and a few hundred negroes and mulattos. The capital is Maranhon. Pop. about 683,645.

MARANHAM, or SÃO LUIZ DE MARANHÃO, sän lōo-ezh’ dô mär-rän-yân, Brazil, capital of the state of Maranhon, on an island on the bay of São Marcos and between the mouths of the Itapicuru and Mearim rivers. The first settlements were made by the French in 1612. The ground is low and the climate warm but the place is healthful. The harbor, once good, is filling with sand, and little or nothing is done for its improvement. It has considerable trade, the imports and exports totaling $600,000 annually. The chief exports are cotton, sugar, hides, rubber, cotton-seed and the skins of goats. Wool is woven and rugs and felt manufactured. The chief imports are machinery and clothing. The city has many fine buildings, public and private. Pop. including the suburbs, about 45,000.

MARANHÃO. See MARANHAM.

MARAŞCHINO, măr-ăs-kë’no, or MARASQUINO, a fine liqueur prepared from the sour cherry of southern Europe (Prunus mahaleb). The best-known kinds come from Dalmatia and from Corsica. There are other brands that use the name.

MARASMUS, a vague term denoting general emaciation or atrophy with no special cause apparent; now used in relation to the wasting of infants due to malnutrition combined with unhygienic surroundings. See CHILDREN, DISEASES OF.

studied medicine in Paris, traveled widely and
practised in London and later in Paris. The
first breath of the Revolution converted the in-

Professor of German Language and Literature;
Formerly Secretary to American Minister to
Tehran, Persia.

MARATHON, már’a-thôn, Greece, an an-
cient village in Attica, about 20 miles northeast
of Athens. It was situated on a plain which ex-
ceeds for about six miles along the sea shore,
with a breadth of from one and a half to three
miles. The site of the ancient village was not
probably that of the present Marathona, but at
a place now called Vrana, a little farther south.
Through the centre of the plain runs a small
brook. Here was fought the great battle be-
tween the Athenians and Persians, 490 B.C.
(See MILITADES). A tumulus or "soros" on
the plain marks the burial-place of the Athenians
who died in battle. It was excavated by the
Greek Archaeological Society in 1890-91, and
yielded many interesting relics.

MARATTA, má-rát’tâ, or MARATTA,
mâ-rät’â, Carlo, Italian painter and draughts-
1713. While a child he amused himself with
painting all sorts of figures drawn by himself on
the walls of his father’s house. In his 11th
year he went to Rome, studied the works of
Raphael, of the Caracci and of Guido Reni in
the school of Sacchi, and formed himself on
their manner. His Madonnas were particularly
admired. Louis XIV employed him to paint
his celebrated picture of Daphne. Clement IX,
whose portrait he painted, appointed him over-
seer of the Vatican Gallery. We are much in-
derited to him for the preservation of the works
of Raphael in the Vatican and of the Caracci
in the Farnese Palace. He also erected monu-
ments to those masters in the church Della
Rotonda. As an artist in landscapes he added
the title given him by Richardson, of the "Last
Painter of the Roman School."

MARATTALES. See FENS and FERN-
ALLIES.

MARAVEDI, má-râ-ved’dî, the lowest de-
nomination of old Spanish copper coins in use.
from 1474 to 1848, varying in value from one-seventh to one-third of a cent. There were also, at an earlier period, maravedis of gold weighing 60 grains.

MARBEAU, Jean Baptiste Firmin, zhǒn bā-těst fé-rán-mā rār-bō, French philanthropist, founder of the daily nursery: b. Brives, 18 May 1798; d. Saint Cloud, 10 Oct. 1873. He practised in law in Paris, and in 1841 being deputed to inspect the charitable institutions of the first arrondissement of the city, planned the crèche or day nursery for the care of children of working mothers. The first crèche was opened 14 Nov. 1844 at Châtillon: a Société des Crèches was founded in 1846; and his plan was described in his book, 'Des Crèches' (1845). Marbeau played a less prominent part in other charities and wrote on various problems of pauperism. Consult the 'Life' by Roussel (1876).

MARBLE, mär′bəl, Manton, American journalist: b. Worcester, Mass., 16 Nov. 1834; d. New York, 24 July 1917. He was educated at the Albany Academy and the University of Rochester, being graduated from the latter in 1855. After spending seven years in the employ of Boston and New York newspapers he became the New York World, on the staff of which he had been employed from 1858 to 1860. Marble was engaged in a controversy with President Lincoln concerning the publication of certain dispatches in the World. The latter journal was temporarily suspended from publication. Marble was one of the first to recognize and give publicity to the writings of Herbert Spencer. In 1885 President Cleveland sent Marble to the British, French and German governments as special envoy to discuss the subject of international bimetallism. On his return, after conferences with various European authorities, he advised the President that upon the co-operation of the United Kingdom, for which neither Tory nor Liberal leaders were prepared, depended the German and French resumption of free bimetallc coinage, and advised that United States purchase of silver should cease. Marble was one of the founders of the Manhattan Club and at one time the president of that organization. He belonged also to many literary and scientific societies, among them the Century Association, the Round Table, the Cohden Club and Metropolitan Club. He was the author of 'Letter to Abraham Lincoln,' 'The Presidential Counties,' 'A Secret Chapter of Political History' and a memoir of Alex. G. Mercer, which prefaces his 'Notes of an Outlook on Life.'

MARBLE (from the Greek marmarino, to sparkle), a compact rock which, in its pure form, is composed entirely of carbonate of lime or limestone. In its best form it is a variety of calcite, the tiny crystal facets sparkling and flashing in the sunlight; hence its Italian name. It is seldom found in perfect purity, the tractable qualities of the limestone allowing the introduction of many foreign substances during its formation. Thus there will be seen marble with streaks of various colors, caused by the action of oxide of iron or other chemicals. Almost any limestone rock is commonly called marble, even certain varieties of granite, onyx, porphyry and rock largely composed of gneiss and mica-schist. True marble is a metamorphic equivalent of limestone, from which it has been produced by heat or pressure, or both.

Marble has been a favorite stone for forming into statuary and for decorative work in buildings and monuments, from the very earliest ages. The Greeks, who were the first to endow this lifeless stone with marvelous genius in their statuary and bas-reliefs, were blessed with an almost inexhaustible supply of the very finest and purest marble yet discovered, on the island of Paros, in the Aegean Sea. This marble, so celebrated as Periander, possesses a peculiar wax-like attribute which gave it a luster distinguishable from it a beautiful polish. The 'Venus de Medicis' was made from this stone, which is almost perfectly white. The Parthenon was built of marble of Pentelicus, which was a little more finely grained. The marbles of Carrara, were even then known but not generally put in use till later years, being still among the finest marble in the world, though having some gray streaks.

In many other parts of Continental Europe and in Great Britain are quarries of fine grained marble. America has a large supply of this useful stone. Each year new occurrences of it are found in the Rocky Mountains, some of them pure white, others with variegated colorings. Perhaps the finest example of these wonderful marbles of the Rockies is found in the new State capitol building of Colorado, at Denver. In the eastern part of the United States there are many quarries of marble which have been in use for many years. Vermont is probably the seat of the largest quarries. Little of this marble is finely grained and white enough to answer for the sculptor's use, but it is admirably adapted for ornamental purposes in architecture and for monuments for the dead. American sculptors still generally use the marbles from Carrara, though the merits of the American product are becoming known. Vermont, although one of the smallest States in the Union, exports more stone for commercial purposes than any other State, except one. Pennsylvania standing first. The money value in 1903 of Vermont's stone product was in excess of $6,000,000, a large part of it being in marbles of various grades.

The quarrying of marble is now carried on extensively, the use of machinery largely taking the place of the ancient hand-workers. Fifty years ago the quarries of Rutland, Vt., still the largest in the world, were operated by ox teams and hand work of the crudest form. To-day, these vast quarries have an extensive outfit of electric cranes and derricks, which move the blocks of marble in any desired direction, easily and quickly, one of these traveling cranes having a carrying capacity for 100,000 pounds. The stone is too easily broken to permit the use of blasting powders of any kind. This method is used in some of the Italian quarries, but causes great waste of material and is most unsatisfactory. In the Vermont quarries, a machine called a "channerel" has been found the best for economical work and has been exclusively adopted. It consists of a strong, traveling framework. This gang of chisels vibrate up and down, cutting a channel in any direction desired in the face of the marble ledge. The channel can be made any reasonable depth, according to the size of block desired. When this channel, or groove, is suf-
sufficiently long and deep, the machine is reversed and cross channels are cut and the bottom portions are carefully driven in behind the block of stone fastened to the table, or hoisted by a crane to the railroad cars or to that part of the quarry devoted to further treatment of the output. As a rule, the stone is sent in its rough state to the purchaser, who dresses it himself. When the order is for ornament work or some special design in architecture, the marble is treated at or near the quarry. In the latter case further treating the product, a toothless saw, or gang of saws, is used. The block of stone is placed on a horse, or platform, and the saws set at work, the size of the cut being gauged by setting the saws close together, or far apart, as needed. A stream of water in which is mixed sea sand or other sharp, hard sand, falls upon each saw. The friction of the iron blade, aided by the sand and water, quickly cuts the marble into any desired shape. Some marble cutters use saws of wire, but the best seem to be those made of strips of soft iron—one-sixteenth of an inch thick and, when new, four inches wide. The moving half of the saw blades were removed rapidly. When the blocks are thus sawed into the requisite shapes by the power gang-saws, they are then placed on tables and ground down to size, a small piece of marble being rotated over them by hand or power, water flowing over the surface being ground. With surprising facility, the marble yields to this treatment. Polish, in the final stages, is given by rubbing with wood or other soft material, and finally cloth.

One ancient method of mining this delicate stone, still used entirely by the Mexicans in mining opals, is to drill holes in a line, insert plugs of some porous wood, pour in water and allow the wood to swell. This gently forces the precious stone free, without the least injury.

One quality of marble, not usually recalled, is its ability to withstand great heat safely. In the devastating fire of 1863 at Paterson, N. J., buildings built of granite crumbled and perished. Those of marble still stand, almost as good as ever. Its use is, therefore, becoming more and more general in erecting fireproof buildings in the large cities, the floors and often the entire inside wall and ceiling being overlaid with it.

Some really fine marble and sandstone monuments in this line are found in the public buildings of New York City and elsewhere in America, notably the new buildings of the Hall of Records and the Appellate Division of the Supreme Court in New York. In the making of monuments for the dead, marble is most extensively used. The floors of bathrooms, tops of toilet tables, basins for washing hands and clothes, tiling of various sorts—all these and a thousand other household purposes find in marble their chief exponent. Probably more than $25,000,000 worth of finished marble products are used in the United States annually made from domestic quarries entirely. See also Rocks.

**MARBLE FAUN, The.** The "Marble Faun" was begun by Nathaniel Hawthorne during his visit to Italy in 1858 and was published in 1860. In England it was issued as the "Transformation." The scene is rural Italy and Rome, but two of the four chief characters are Americans. The most interesting person in the story, however, is Donatello, a young Italian of noble birth who bears a strong resemblance to the statue of a faun by Praxiteles, and who, according to a tradition in his family, numbered a faun among his early progenitors. There are two women characters, of different types. Miriam is of a rich, full-blooded nature, and her past is bound up with some terrible mystery. Hilda, who is said to have been drawn with the writer's daughter in mind, Donatello, evidently intended as an example of the pure and self-contained New England maiden, but she has been aptly characterized by one critic as an "admirable little icle." The romance is a study of the effects of a great guilt, of these persons, and especially on Donatello, in whom it brings about the change referred to in the English title of the book. Hawthorne here seems to be considering the great question of the mission of sin in the world, but in the end the explanation which he allows one of the characters to suggest he makes Hilda reject with horror. The romance has serious technical defects. It contains an excess of traveler's descriptions, which, however excellent in themselves, have little to do with the story; and it fails to satisfy the curiosity which the author persistently arouses regarding Miriam's past. Dissatisfaction with the ending was so great that in a later edition the author added a chapter of explanation, which, however, he justly regarded as no improvement. The chief merits of the book lie in the conception of Donatello, in the elusive symbolism and suggestiveness which characterize all Hawthorne's best work, and in several impressive scenes. Some of these, like the meeting with the model in the catacombs and the visit to the church of the Capuchins where the murdered monk lies, have a more dramatic quality than is usual with Hawthorne.

**Marblehead, móbr’bl-héd, Mass., town, in Essex County, on Massachusetts Bay and on the Boston and Maine Railroad, 18 miles north-east of Boston. The town is on a peninsula which has Massachusetts Bay on the east and south and Salem harbor on the north, and includes the villages of Marblehead, the "Neck," Clifton and Devereaux. It was settled by immigrants from Guernsey and Jersey in 1629, and was a part of Salem until 1649. Its good harbor gave it advantages for fishing and for coast trade that made it for a time the second settlement in importance in the colony. Salem being the first. The leading industry is shoemaking,
MARBLES AND MARBLE PLAYING — MARBURY v. MADISON

and seed-growing is carried on, but the town is famous as a yachting resort, for its boat-building and the excellent fishing grounds. Whittier immortalized the place in one of his poems. Judge Story and Elbridge Gerry were born here. It is a part of the town meeting government prevails. There are excellent municipal waterworks, banks and a newspaper. There are still, in a good state of preservation, a number of pre-Revolutionary buildings. The well-kept garden and Abbott Hall, which contains the town library, art gallery and records. Consult Agge, 'Sketches of Marblehead'; Roads, 'The History and Traditions of Marblehead.' Pop. about 7,500.

MARBLES AND MARBLE PLAYING.
Marbles are small balls of baked clay, marble, agate or spheres of glass, used as toys and playthings for children. They are manufactured in large quantities in Saxony for exportation to the United States and to India and China. They were first manufactured in the agate mills at Oberstein on the Nahe, in Germany, for the American market. The material used in Saxony is a hard calcareous stone, which is first broken up into square blocks with a hammer. These are then thrown 100 to 150 together into a mortar, which is tamped flat by a slab of stone, with a number of concentric furrows upon its face. Over this a block of oak of the same diameter, partially resting upon the small stones, is kept rotating, while water flows upon the stone slab. In 15 minutes the marbles are worn completely round and are fit for sale. An establishment with three mills will manufacture 60,000 marbles in a week. Agates are made into marbles at Oberstein by first chipping the pieces nearly round with a hammer and then wearing them down upon the face of large grindstones.

The game of marbles is variously played; usually with a circular ring marked on the ground, the player taking one marble between the thumb and forefinger and dexterously shooting it at other marbles within the circle, striking them with sufficient force to throw them outside the limits of the ring. This form is called ring-taw, and the marbles placed in the ring are apt to be clay ones, called "commys," which is probably short for "commens." A larger and better grade of marble is used for the "shooter." When a player misses a shot, it is then the turn of his opponent. Sometimes he also loses his turn when he drives his shooter outside of the ring. Play is often for "keeps," each boy winning what he knocks out. Another game of marbles is called "nine holes," though it may be played with a less number of holes. A row of small cup-shaped depressions are made in the ground, and the object is to toss or bowl one marble into each hole in succession, the one accomplishing it with the fewest plays winning. Very likely golf had its fundamental idea in this simple game of marbles. In a variant form the boys shoot at other marbles to knock them into the holes, but their own shooter must not follow, under forfeit, suggesting the basic principle of the game of pool. "Hit and span" is another game much played. One player tosses his marble to a distance, and the other player tosses his marble as close to it as he can; if he hits it, it is kept; if he comes within a handsbreadth or span he makes a hit and scores one. Then they reverse, and his opponent tries, the one making the most hits or points winning. This game can be played in walking along a country road, and appears to have been invented by boys who wanted to play on their way to school. In some parts of marble it is a play to toss or bowl the shooter; and in others the player must touch the large knuckle of his forefinger to the ground when shooting, and this the boys call "knuckling down fairly." These games are subject to infinite changes, according to the whim of the boys of a locality who play them. They make their own rules and pass them along to the smaller boys as they grow up. Girls seldom play marbles and adults are not supposed to play at all. Marbles can be played indoors in bad weather, one way being for the players to sit on a carpet, with their legs apart, so as to stop the rolling marbles; one places a marble between his feet and the other player shoots at it.

MARBLING, in bookbinding, the process of coating paper or the edges of books, by imitation of the veining of variegated marble. In the case of a book, after the volume is formed, but before the cover is put on, the book leaves are trimmed and tied between two boards and taken to a trough or vessel, perhaps two inches deep, which is tamped flat by a slab of stone, with a number of concentric furrows upon its face. Over this is thrown a sheet of oak of the same diameter, partially resting upon the small stones, is kept rotating, while water flows upon the stone slab. In 15 minutes the marbles are worn completely round and are fit for sale. An establishment with three mills will manufacture 60,000 marbles in a week. Agates are made into marbles at Oberstein by first chipping the pieces nearly round with a hammer and then wearing them down upon the face of large grindstones.

The game of marbles is variously played; usually with a circular ring marked on the ground, the player taking one marble between the thumb and forefinger and dexterously shooting it at other marbles within the circle, striking them with sufficient force to throw them outside the limits of the ring. These games are subject to infinite changes, according to the whim of the boys of a locality who play them. They make their own rules and pass them along to the smaller boys as they grow up. Girls seldom play marbles and adults are not supposed to play at all. Marbles can be played indoors in bad weather, one way being for the players to sit on a carpet, with their legs apart, so as to stop the rolling marbles; one places a marble between his feet and the other player shoots at it.

MARLBURG, mar'boorg, Austria, a town in Styria, 38 miles south of Graz, on the left bank of the Drave and on the Southern Railways, whose repair shops are a leading industry. Quantities of lumber, grain, wine and poultry are shipped. There are also shirt factories, cement works, flour mills and machine shops. Pop. about 23,000.

MARLBURG, Prussia, a town of Hesse-Nassau, on the slopes of an acclivity above the Lahn, 46 miles north of Frankfurt. It dates from the 12th century. The principal buildings are the castles of the landgravies of Hesse, now partly used as a prison; the 13th century church of Saint Elizabeth; the town house and the celebrated Marburg University, founded in 1527, and having, in 1914, 118 professors and 2,049 students, and a library of 275,000 volumes. Here Luther and Zwingli debated on transubstantiation in 1529. It became a part of a Prussian province in 1866. The town has manufactures of machinery, leather, carpets, tobacco, pottery and toys. Pop. about 22,000.

MARBURY v. MADISON, a well-known decision in law: The late decision of 1819 by the United States Supreme Court. It is important as affording the earliest instance of the decla-
ration by the court that a Congressional statute is null and void by reason of its repugnance to the Constitution of the United States. Marbury was appointed justice of the peace in the District of Columbia by President Adams, but the commission, though drawn up, signed and sealed, had never been delivered. Madison, when he became Secretary of State, refused to deliver it. He brought the case before the United States Supreme Court to issue an execution against the officers as mandamus to force them to attend to their duties, and on the basis of this act Marbury brought suit. Now the Constitution nowhere mentions the right to issue a writ of mandamus among the cases of original jurisdiction by the Supreme Court. Chief Justice Marshall therefore decided against Marbury, and his argument, admittedly the only accurate one, established an important precedent which is found only in the courts of the United States.

MARCABRUN, már-kā-brēⁿ, a French troubadour: b. in Gascony, about 1140; d. toward the end of the 12th century. He was a special favorite at the court of Alfonso VIII of Castile, where he seems to have been the chief of the royal troubadours. He was an extensive writer of love songs of which quite a number have survived to the present and have been printed.

MARCASITE, in mineralogy, an iron disulfide (FeS₂), differing from pyrites in that it crystallizes in the orthorhombic system. It was formerly known as white pyrites, cellular pyrites, cockscomb pyrites, hepatic pyrites or leekvee, etc. It is usually a pale yellow, being thus lighter than true pyrites, but it has gray to brown-black streaks. When arsenic is present it is known as kyrosite. It is often found in clays, but is far less common than iron pyrites.

MARCEL, Étienne, a-tē-en már-sēl, French political leader: b. Paris, 31 July 1358. From December 1355 he was provost of the Paris merchants and actual ruler of the city. He put to death two officials of the Crown and finally persuaded the Dauphin Charles to act as regent while King John was held by the English. Concluding the Dauphin properly, he obtained assistance from Charles the Bad of Navarre. He was killed during an uprising of the wealthy and conservative citizens against his power. Consult Lazard, 'Un Bourgeois de Paris au XIVè Siècle' (1890).

MARCELNE, már-sē-lēⁿ, Mo., city, of Linn County, on the Atchison, Topeka and Santa Fé Railroad, 105 miles northeast of Kansas City. The neighboring region is rich in coal, oil and natural gas. The city has extensive coal and oil interests, railroad repair shops and artificial stone works. The electric-lighting plant and water-supply system are the property of the municipality. Pop. 3,920.

MARCELLINUS, már-sē-lē-nūs, Saint: d. probably 25 Oct. 304. He was a pope who succeeded Caius in 296. The Donatists alleged that during the Diocletian persecution he sacrificed to idols. He was, however, vindicated by Augustine of Hippo from this charge.

MARCELLUS, már-sēl'-ēs, Marcus Claudius, Roman general: b. before 268 B.C.; d. near Venusia, 208 B.C. In 222 being consul with Scipio he twice defeated the Insurbrians in northern Italy, and with his own hand killed their king, thus winning the spolia opima. After the disaster of Cannae in the Second Punic War (216), Marcellus took command, gained several slight victories over the Carthaginians and hence was named "the sword of Rome." Fabius Cunctator being called "the shield of Rome." His third consulship (214) was spent in Sicily, where he attacked Syracuse, and after a two years' siege prolonged by the skill of Archimedes captured the city. In his fifth consulate after two years of varying success against Hannibal in Italy he was killed in a skirmish near Venusia.

MARCELLUS I, Pope: d. 310. He succeeded Marcellinus and did not take office until 308. The Emperor Maxentius banished him from Rome for excommunicating an apostate and according to some authorities forced him to serve as a slave on the public highway. He suffered martyrdom under Maxentius.

MARCELLUS II (Marcello Cervini, már-kell’lo chérv-e-ne’), Pope: b. in Tuscany, 6 May 1501; d. Rome, 6 May 1555. He was cardinal legate at Trent of Julius III. He succeeded in the pontifical chair. Although originally opposed to polyphonic music, he at once withdrew his opposition to it after listening to Palestrina's famous 'Missa Papae Marcelli.' His pontificate lasted only 22 days.

MARCELLUS STAGE, in geology, a term introduced by the New York State Geological Survey for the thin rock, mostly shale, which is the lowest group of the Upper Devonian System, and which is most typically seen in New York State at the little village of Marcellus, whence the stage is named.

MARCH, Alden, American surgeon: b. Sutton, Mass., 1795; d. 1869. He was educated at Boston and at Brown University, receiving the degree of M.D. from the latter in 1820. From 1825 to 1831 he was a professor in the Vermont Academy of Medicine, from 1831 to 1833 at the Albany Medical Seminary, and in 1833–34 at the Albany Medical School. In the latter year he founded a school of practical anatomy in Albany and in 1839 founded the Albany Medical College, in which he was professor of surgery from the foundation until his death in 1869. Dr. March also founded the Albany City Hospital; was president of the New York State Medical Society in 1857 and founded the American Medical Association. Dr. March invented several surgical appliances and improved others. He published 'Wounds of the Abdomen and Larynx' (1854), and numerous papers in medical journals.

MARCH, Francis Andrew, American philologist: b. Millbury, Mass., 25 Oct. 1825; d. 1911. He was graduated from Amherst in 1845, studied law in New York in 1849–50, was admitted to the bar in 1850, in 1856 became adjunct professor of belles-lettres and English literature in Lafayette College (Easton, Pa.), and in 1857 professor there of the English language and comparative philology. In 1873–74 and 1895–96 he was president of the American Philological Association, in 1876–1903 of the Spelling Reform Association, and in 1901–03 of the Modern Language Association. He was among the earliest advocates of a historical study of the English language and of a philological study of the classic works of that lan-
MARCH — MARCH TO THE SEA

guage. His contributions to the transactions and proceedings of the American Philological Association and other learned societies have been extensive. He was a consulting editor of the 'Standard Dictionary,' and decided many spellings and forms for that work. He also edited the Douglass series of Christian Greek and Latin classics (1874-76), was director of the American readers for the 'Historical and Dictionary of English' of the Longdon Philological Society, and published 'A Method of Philological Study of the English Language' (1865); 'Parser and Analyzer for Beginners' (1869); an 'Anglo-Saxon Grammar' (1870); an 'Anglo-Saxon Reader' (1870), and an 'Introduction to Anglo-Saxon' (1871). Consult 'Publications' (Modern Language Association of America, Vol. XXIX, 1914).

MARCH, Peyton Conway, American soldier; b. Easton, Pa., about 1862. He is a son of Francis A. March, the philologist. Graduating from Lafayette College in 1884, he determined upon a military career, and graduated from the military academy in 1888. The same year he entered the army as a lieutenant of artillery. Later he graduated from the Fort Monroe Artillery School. When the Spanish War broke out he volunteered, and commanded the Astor Battery in 1898; the following year he was major of the 33d Volunteer Infantry. He served in Luzon, in the Philippine campaign, and received several promotions for gallantry. He obtained the surrender of General Venancio Aguinaldo’s chief of staff. For a time after the close of active hostilities he was a military and later a civil governor in Ilocos. In 1911 he was commissary-general in the Philippines; in 1916 he was a lieutenant-colonel of field artillery; the next year he was made brigadier-general, and 5 Aug. 1917 he was raised to the rank of major-general. In 1918, the active chief of staff of the United States army.

MARCH, March, Austria-Hungary, the principal river of Moravia, rising on the Silesian boundary, and flowing 214 miles southwest to Děčín, by which it joins six miles above Presburg. It is navigable for small boats from Göding, 50 miles from its mouth. In its lower course it forms the boundary between Austria and Hungary. Its chief affluent is the Thaya.

MARCH, in Europe, a frontier or boundary of a territory; especially applied to the boundaries or confines of political divisions; as, for example, the frontiers between England and Scotland, and England and Wales. Geneva is situated in the Marches of France, Savoy and Switzerland. See MARCHES, THE.

MARCH (Latin Martius), (1) the third month of the Roman year; so named in honor of the Roman deity Mars. Prior to 1752 the 25th of March was the first day of the legal year; hence, in all records, January, February and the first 24 days of March have frequently two years appended, as January 1, 1704 or 1701-2. (See CALENDAR). Until late in the 19th century, the custom of leasing dwellings from the 25th of March persisted in some localities. (2) A movement by regular steps in the manner of soldiers; also a journey performed by a body of soldiers either on foot or on horseback. Soldiers on a march are subject to certain rules very necessary to keep them in good order, and fit to meet the enemy. The march in the first sense of regular step differs on different occasions. In the parade-march from 75 to 95 steps, each of about 30 inches, differing in different armies, are made in a minute; in the quick-march from 108 to 115 steps; and in the double quick 150 running paces. This last cannot be sustained for any length of time, and is only used in a charge, or in storming a commanding position, and in a few internal movements of regiments. (3) A musical composition, chiefly for military bands, with wind instruments, primarily intended to accompany the marching of troops. There are slow and quick marches, and marches peculiar to different countries. Marches are also introduced into oratorios, the best known examples being the 'Dead March' from the oratorio of 'Saul' and Mendelssohn's 'Wedding March.' See MUSIC.

MARCH FLIES, small, hairy, scavenging flies of the family Bibionidae, seen numerous in early spring, often before the snow has disappeared. The species are over 300, and some appear in swarthy swarms. The maggots hatch in refuse or manure upon the ground, and are believed to feed upon grass-roots.

MARCH TO THE SEA. There were two plans for a march to the sea by Sherman’s army, the first General Grant’s, the second General Sherman’s, modifying the first. A campaign to the sea to divide the Confederacy was decided upon by General Grant in January 1864, when he was in command of the Military Division of the Mississippi, with headquarters at Nashville. His objectives on the coast were first Mobile, second, Savannah, Atlanta being the intermediate objective for both. Sherman’s army was then in the vicinity of Chattanooga, Tenn., and Ringgold, Ga.

In a letter to General Halleck, dated at Nashville, 15 Jan. 1864, General Grant wrote: "I look upon the next line for me to secure, to be that from Chattanooga to Mobile, Montgomery and Atlanta being the important intermediate points." This he repeated on 19 January to General Thomas, then in command of the Army of the Cumberland at Chattanooga, and this officer immediately began to gather information, which General Grant desired, of the number of troops necessary to guard the roads and bridges from Nashville to Atlanta. These preparations were entrusted to General Thomas, as General Sherman was engaged with his Meridian campaign. In this connection, General Thomas expressed his confidence in being able with the Fourteenth and Fourth corps in advance, covered with a strong division of cavalry, and the Eleventh corps in reserve, to overcome all opposition as far as Atlanta.

When Grant was made lieutenant-general and ordered east to command all the armies, he called Sherman to Nashville, and they traveled together as far as Cincinnati. General Sherman was then made acquainted with the plans already set forth. As part of these plans, before leaving Nashville General Grant ordered Banks to concentrate at least 25,000 men to move against Mobile in the spring in co-operation with General Sherman.

In addition to letters to each of the commanders interested — Halleck, Sherman, Thomas and Banks — General Grant, 26 March 1864, sent all army commanders a map upon
MARCH TO THE SEA

which was indicated by red lines the territory occupied by the Union forces at the beginning of the war, and at the opening of the campaign of 1864. The territory which it was proposed to occupy by the campaign about to begin was indicated by the black. The map reached General Sherman 4 April, and its receipt was acknowledged by him. This map is reproduced in the Atlas of the ‘Official Records’ of the war, being plate 135 A of that publication. For Sherman’s proposed campaign the blue lines extended from Chattanooga to Atlanta, and from this latter point both to Mobile and Savannah.

General Sherman, in acknowledging the map, said: “That map to me contains more information and ideas than a volume of printed matter. Keep your retained copies with infinite care, and if you have occasion to send out to other commanders any more I would advise a special courier. From that map I see all, and glad am I that there are minds now at Washington able to devise; and for my part, if we can keep our counsels, believe I have the men and ability to march square up to the position assigned me, and to bold it.”

As the result of the campaign for Atlanta General Slocum occupied that city 2 September. Meantime Farragut had taken possession of Mobile Bay 5 August. Sherman telegraphed Sherman from City Point as follows:

“As soon as your men are properly rested, and preparations can be made, it is desirable that another campaign should be commenced. We want to keep the enemy continually pressed to the end of the war. If we give him no peace while the war lasts, the end can not be far distant. Now that we have all of Mobile Bay that is valuable, I do not know, but it will be the best move for Major-General Canby’s troops to act upon Savannah, while you move on Augusta. I should like to hear from you, however, on this matter.”

To this Sherman telegraphed in reply: “If you can manage to take the Savannah River as high as Augusta, or the Chattahoochee as far as Columbus, I can, believe I have the whole army by going too far from Atlanta.”

In a letter from Atlanta, dated 20 September, Sherman gave Grant the conditions under which he could successfully co-operate in a movement on Savannah: “If you will secure Wilmington and the city of Savannah from your centre, and let General Canby have command over the Mississippi River and the country west of it, I will send a force to the Alabama and Apalachicola, provided you give me 100,000 of the drafted men to fill up my old regiments; and if you will fix a day to be in Savannah I will insure our possession of Macon and a point on the river below Augusta.”

General Grant thereupon conferred by letter with Sherman on the possibility of a base on the coast for General Sherman and providing supplies, giving his own opinion that Savannah could be captured by troops from the East assisted by those in the Department of the South, and that the line of Augusta and Savannah would be a better one than Montgomery, Selma and Mobile. Grant further said in this letter 4 October: “Whichever way Sherman moves he will undoubtedly encounter Hood’s army, and in crossing to the sea-coast will sever the connection between Lee’s army and his section of the country.”

General Sherman fixes the day after his letter of 20 September as the date when his plan of a march to the sea came first into his head. It differed from Hood’s plan in first disposing of Hood’s army, in that it involved leaving Hood in his rear, to be taken care of by Thomas, and marching through to Savannah with no enemy in his front. Upon this plan a discussion arose with Grant, who for some time held to the view of dealing with Hood. This discussion between Grant and Sherman lasted for several weeks. While it was in progress Hood became active. On 20 September Forrest’s cavalry began vigorous operations about Athens and Decatur, Al., and Pulaski, Tenn. Sherman at once sent troops to Chattanooga and 28 September General Thomas was ordered to proceed to Nashville to organize a force to meet a possible northward move of Hood. The first attempt of the latter was to break Sherman’s communication with Mobile by heavy movements upon his railroad. These met with only temporary success, as Sherman promptly pursued. The fighting at Allatoona 5 October was the most prominent affair. Hood then moved to the westward, and occupied Gadsden, Ala. Sherman again followed as far as Gaylesville. Sherman, 10 October, again proposed to Grant to leave Hood and march to the sea. Grant replied the same day. “If you are satisfied the trip to the sea-coast can be made, holding the line of the Tennessee firmly, you may make it, destroying all the railroad south of Dalton or Chattanooga as you think best.” This condition of firmly holding the line of the Tennessee held Sherman for a time. Although this conditional permission had been given by Grant, he telegraphed Sherman 1 November: “Do you not think it advisable, now that Hood has gone so far north, to entirely settle with him before starting on your proposed campaign? With Hood’s army destroyed you can go where you please with impunity.” Sherman learned, State of Georgia, otherwise I would risk our whole army by going too far from Atlanta.”

In a letter from Atlanta, dated 20 September, Sherman gave Grant the conditions under which he could successfully co-operate in a movement on Savannah: “If you will secure Wilmington and the city of Savannah from your centre, and let General Canby have command over the Mississippi River and the country west of it, I will send a force to the Alabama and Apalachicola, provided you give me 100,000 of the drafted men to fill up my old regiments; and if you will fix a day to be in Savannah I will insure our possession of Macon and a point on the river below Augusta.”

General Grant thereupon conferred by letter with Sherman on the possibility of a base on the coast for General Sherman and providing supplies, giving his own opinion that Savannah could be captured by troops from the East assisted by those in the Department of the South, and that the line of Augusta and Savannah would be a better one than Montgomery, Selma and Mobile. Grant further said in this letter 4 October: “Whichever way Sherman moves he will undoubtedly encounter Hood’s army, and in crossing to the sea-coast will sever the connection between Lee’s army and his section of the country.”

General Sherman fixes the day after his letter of 20 September as the date when his plan of a march to the sea came first into his head. The first attempt of the latter was to break Sherman’s communication with Mobile by heavy movements upon his railroad. These met with only temporary success, as Sherman promptly pursued. The fighting at Allatoona 5 October was the most prominent affair. Hood then moved to the westward, and occupied Gadsden, Ala. Sherman again followed as far as Gaylesville. Sherman, 10 October, again proposed to Grant to leave Hood and march to the sea. Grant replied the same day. “If you are satisfied the trip to the sea-coast can be made, holding the line of the Tennessee firmly, you may make it, destroying all the railroad south of Dalton or Chattanooga as you think best.” This condition of firmly holding the line of the Tennessee held Sherman for a time. Although this conditional permission had been given by Grant, he telegraphed Sherman 1 November: “Do you not think it advisable, now that Hood has gone so far north, to entirely settle with him before starting on your proposed campaign? With Hood’s army destroyed you can go where you please with impunity.” Sherman learned, State of Georgia, otherwise I would risk our whole army by going too far from Atlanta.”

In a letter from Atlanta, dated 20 September, Sherman gave Grant the conditions under which he could successfully co-operate in a movement on Savannah: “If you will secure Wilmington and the city of Savannah from your centre, and let General Canby have command over the Mississippi River and the country west of it, I will send a force to the Alabama and Apalachicola, provided you give me 100,000 of the drafted men to fill up my old regiments; and if you will fix a day to be in Savannah I will insure our possession of Macon and a point on the river below Augusta.”

General Grant thereupon conferred by letter with Sherman on the possibility of a base on the coast for General Sherman and providing supplies, giving his own opinion that Savannah could be captured by troops from the East assisted by those in the Department of the South, and that the line of Augusta and Savannah would be a better one than Montgomery, Selma and Mobile. Grant further said in this letter 4 October: “Whichever way Sherman moves he will undoubtedly encounter Hood’s army, and in crossing to the sea-coast
already been deported; the various divisions of the army designed for the march were ordered to concentrate at Atlanta; all mills and factories at Rome were burned; the surplus stores, the sick convalescents, and many thousands whose terms of service were about to expire were rushed to Chattanooga; the garrisons south of that place were withdrawn, and the railroad destroyed. Every command was carefully inspected, and soldiers found in any degree physically unfit were discharged. The Nashville care was taken that every man’s accoutrements were complete. In the same way the horses, mules and trains were inspected. Wilson’s cavalry was dismounted to make Kilpatrick’s division perfect, and the remnants sent with Wilson to Nashville.

The march to the sea began on the morning of 15 November. As General Sherman wrote: “It surely was a strange event — two armies marching in opposite directions, each in the full belief that it was achieving a final and conclusive result in a great war.” Hood’s army, which had required the active work of three armies from May until September to push it back to Atlanta, had crossed the Tennessee at Decatur, strengthened by Forrest’s cavalry and alight 35,000 men on the banks of the Ocmulgee River. The situation at Nashville was thus described by Sherman: “General Thomas was at Nashville, with Wilson’s dismounted cavalry and a mass of new troops and quartermaster’s employees amply sufficient to defend the place. The Federal and Twenty-third corps, under Generals Stanley and Schofield, were posted at Pulaski, Tennessee, and the cavalry of Hatch, Croxton and Capron, were about Florence, watching Hood. Smith’s (A.J.) two divisions of the Sixteenth corps were still in Missouri, but were reported as ready to embark at Lexington for the Cumberland River and Nashville. Of course, General Thomas saw that on him would likely fall the real blow, and was naturally anxious.”

Sherman started with 62,204 officers and men. Of his army he wrote: “The most extraordinary efforts had been made to purge this army of non-combatants and of sick men, for we knew well that there was to be no place of safety save with the army itself; our wagons were loaded with ammunition, provisions and forage, and we could ill afford to haul even sick men in the ambulances, so that all on this exhibit may be assumed to have been able-bodied, experienced soldiers, well armed, well equipped and provided, as far as human foresight could, with all the essentials of life, strength and vigorous action.”

The artillery, wagon and ambulance trains were perfect. Each gun, caisson and forge was drawn by eight horses. There were 2,500 wagons with six mules to each, and the ambulances each had two horses. Each soldier carried 40 rounds, and in the ammunition wagons were 200 rounds for men and artillery.

The right wing, Gen. O. O. Howard, was composed of the Fifteenth and Seventeenth corps; the left wing, Gen. H. W. Slocum, of the Fourteenth and the Twentieth.

The war had not produced a more thoroughly organized and equipped army, or one in which more men had passed a thorough physical inspection. As it started for the sea, General Sherman in his ‘Memories’ thus describes the feelings of the men, and his own: “There was a devil-may-care feeling pervading officers and men, that made me feel the full load of responsibility, of responsibility, should we fail. This was a matter of course, whereas, should we fail, this march would be adjudged the wild adventure of a crazy fool.” This question was to be decided at Nashville, as General Sherman wrote the day after he entered Savannah: “Thom’s complete success at Nashville has wrecked my plans for this campaign.” The march to the sea cannot, therefore, be fully understood without considering the Nashville campaign as one of its essential parts. See Nashville, Campaign and Battle of. Sherman’s army was composed of 55,329 infantry, 5,063 cavalry, and 1,812 artillery. There were two corps, 13 infantry divisions, one cavalry division, 36 brigades of infantry, two of cavalry and 16 batteries. There was no Confederate army between Atlanta and Savannah. Wheeler’s cavalry was active on the flanks guarded by Kilpatrick’s cavalry, and a considerable force of militia was encountered at Griswoldville.

The order for this historic march clearly presents its organization, its order of daily movement, its methods of living upon the country, the restrictions placed on its dealings with citizens, in short, the whole military machinery of the campaign. It, therefore, deserves a place in every history of the March to the Sea. General Sherman himself holding that no account of that event could be perfect without it. It was as follows:

(Special Field Orders, No. 120.

Headquarters Military Division of the Mississippi. In the Field, Kingston, Georgia, November 9, 1864.

1. For the purpose of military operations, this army is divided into two wings, viz:  
The right wing, Major-General O. O. Howard commanding, composed of the Fifteenth and Seventeenth corps; the left wing, Major-General H. W. Slocum commanding, composed of the Fourteenth and Twentieth corps.

2. The habitual order of march will be, wherever practicable, by four roads, as nearly parallel and converging at points hereafter to be indicated in orders. The cavalry, Brigadier-General Kilpatrick commanding, will receive special orders from the commander-in-chief.

3. There will be no general train of supplies, but each corps will have its ammunition-train, distributed habitually as follows: Behind each regiment should follow one wagon and one ambulance; behind each brigade should follow a due proportion of ammunition-wagons, provision-wagons, and ambulances. In case of danger, each corps commander should change this order of march, by having his advance and rear brigades unencumbered by wheels. The separate columns will start habitually at 7 A.M., and make about fifteen miles per day, unless otherwise fixed in orders.

4. The army will forage liberally on the country during the march. To this end, each brigade commander will organize a good and sufficient foraging party, under the command of one or more discreet officers, who will gather, near the route traveled, corn or forage of any kind, meat of any kind, vegetables, corn-meal, or whatever is needed by the command, amoung at all times in the neighborhood at least ten days’ provisions for his command, and three days’ forage. Soldiers must not enter the homes of the inhabitants, or commit any trespass; but, during a halt or camp, they may be permitted to gather turnips, potatoes, and other vegetables, and to drive in stock in sight of their camp. To regular foraging-parties must be entrusted the gathering of provisions and forage, at any distance from the main army.

5. To corps commanders alone is entrusted the power to destroy mills, Holmes, cotton-gins, etc.; and for them this general principle is laid down: In the event the army is unencumbered, no destruction of such property should be permitted; but should guerrillas or bushwhackers molest our march, or should the inhabitants turn brooks, obstruct roads, or otherwise manifest local hostility, then army commanders should order and enforce a devastation more or less relentless, according to the measure of such hostility.
6. As for horses, mules, wagons, etc., belonging to the inhabitants, the cavalry and artillery may appropriate freely and without demur, the same; but it is understood, however, between the parties, that those who are usually hostile, and the poor and industrious, usually neutral or friendly, foraging parties may also take mules or horses, to replace the jaded animals of their trains, and also serve as pack-mules for the regiments or brigades. In all cases of whatever kind, the parties engaged will refrain from abusive or threatening language and manner, and may, where the officer in command thinks proper, give written certificates of the fact to the injured persons, and they will endeavor to leave with each family a reasonable portion for their maintenance.

7. Negroes who are abed-bodied and can be of service to the soldiers will not be taken along; but each army commander will bear in mind that the question of supplies is a very important one, and that his first duty is to see to those who bear arms.

8. The organization, at once, of a good pioneer battalion for each army will be provided for, to forestall raiders, or others, who might be attended to. This battalion should follow the advance-guard, repair roads and double them if possible, so that the columns will not be delayed after reaching bad places. Also, army commanders should provide the halting of giving the artillery and wagons the road, marching their troops on one side, and instruct their troops to assist wagons at steep hills or bad crossings of streams.

9. Captain O. M. Poe, chief-engineer, will assign to each wing of the army a pontoon-train, fully equipped and organized; and the commander thereof will see to their being properly protected at all times.

By order of Major-General W. T. Sherman.

M. D. Davison, Adj. Gen. Corps of Engineers.

Leaving Atlanta in ruins, 15 November, the left wing, which General Sherman accompanied, marched by Decatur, Stone Mountain and Covington. At this point it turned toward Milledgeville, the capital of Georgia, which was the first objective. It was reached on the 22d. Meanwhile, the wing had marched by Jorrisboro, McDonough and Monticello, and was in communication with Sherman at Gordon. Kilpatrick's cavalry, which was operating on the right of the advance, kept in contact with Wheeler's cavalry, and reached the defenses of Macon. The right wing marched by Griswoldville, while Walcutt's brigade of Wood's division was halted as a rear-guard. Gen. G. W. Smith attacked Walcutt, but was repulsed (see GRISWOLDVILLE, BATTLE OF). Governor Brown, the State officers and members of the legislature left the capital on Sherman's approach. The arsenal and various public buildings were destroyed.

The march was resumed 24 November, with Millen as the next objective. The two wings followed the general line of the railroad. Millen was reached 3 December. From Millen the army proceeded by the four main roads for Savannah. The effort of the Confederate authorities to organize a force at Augusta to attack Sherman in flank failed, and the march to Savannah was only slightly disturbed by the persistent skirllishing of Wheeler's cavalry. McLaw's division of Hardee's force had advanced to Ogeechee Church, but fell back to the city upon Sherman's approach. The several corps reached the defenses of Savannah 9 and 10 December, and occupied a line from the Ogeechee River on the right to the Savannah River on the left. Hardee occupied the city with something less than 10,000 men. Sherman's effective force numbered a little over 60,000. Hood held the Savannah River below Sherman's lines.

The march had cut a swath of many miles in width through the richest part of Georgia. The heads of the columns and the flanks swarmed with foraging parties, and a country which a week before was hungry and marching column of 60,000 soldiers was of necessity stripped of provisions, and of everything else that could contribute to the use or comfort of an army. Railroads had been destroyed for long distances, and all factories and other buildings burned which could contribute to army purposes. There had been no fighting worth mentioning, Griswoldville excepted, and that had only involved one Union brigade.

General Sherman had left Atlanta with 62-204 officers and men of all arms. He reached Savannah with 60,057. On the march were killed, 428 wounded, 278 missing and 1,338 captured. Of those captured, a large proportion were foragers, better known in army vernacular as "hummers."

The night of 12 December a bridge had been completed over the Ogeechee, and the next morning Hazen's division crossed and marched at once to assault Fort McAllister (q.v.) and open the way to the sea. An hour before sunset the assault was delivered and the fort taken.

This success gave Sherman communication with the fleet which was awaiting him with supplies, and mails for the army at Camp.

General Slocum, upon establishing his flank on the Savannah River, had captured two steamboats and sent a force to Hutchinson and Argyle islands just above the city, and sought permission to transfer a corps to the left bank of the river to close Hardee's only line of escape, General Slocum having already sent a brigade under Col. E. A. Carman to the South Carolina shore. General Sherman did not deem this prudent, and as a result Hardee later withdrew his entire force intact and without molestation.

On 17 December General Sherman sent in a flag of truce demanding Hardee's surrender on the ground that he (Sherman) had received guns that could "cast heavy and destructive shot as far as the heart of the city;" that he controlled all avenues by which the city could be supplied with food; that he would grant liberal terms, but if forced to assault he should "feel justified in resorting to the harshest measures, and should make little effort to restrain his army.

General Hardee returned a defiant reply, saying he was not shut in, but had free and constant communication with his department. To the specific call for surrender he replied: "Your demand for the surrender of Savannah and its dependent forts is refused."

General Sherman then proceeded by boat to General Foster's headquarters at Hilton Head to request that a division be sent to occupy the road north of the Savannah River, which line of communication was still open to Hardee. On his return he received the news that during his absence Hardee had put down his bridges and withdrawn with his entire force. The next day General Sherman's forces occupied Savannah.

MARCHAND, mär-shǟn, Félix Gabriel, Canadian legislator and author: b. Saint John's, prince-bishopric of Qubec, 9 Nov. 1834; d. 901. He was educated at Saint Hyacinthe College, was admitted a notaire public in 1855, entered practice at Saint John's, and from 1867 sat for the county of Saint John's in the legislative assembly of the province of Quebec. From 8 March 1878 to 19 March 1879 he was provincial secretary, from 19 March to 30 Oct. 1879 was commissioner of Crown lands, and from 29 Jan. 1887 to 1892 speaker of the assembly. In 1897 he became Premier, with the Treasury portfolio. Subsequent to the invasion at Eccles Hill during the Fenian troubles (1870), he commanded a militia brigade. He did much to improve Canadian journalism, and for many years was proprietor and editor of Le Franco-Canadien. He published a Manuel et Formulaire du Notariat; and also the comedies 'Patenville' and 'Erreur n'est pas Compte' in prose, and 'Un Bonheur en Attire un Autre' and 'Les Faux Brillants' in verse.

MARCHAND, Jean Baptiste, French officer and explorer: b. Thoisy, Ain, 1863; d. 16 May 1917. He entered the army in 1883 and after four years as a corporal in a corps of the French army in Africa he won fame as an explorer, particularly in Africa. He sought an improved route from the valley of the Niger to the Gulf of Guinea. He became one of the most notable figures in the French public life because of his clash with Lord Kitchener in 1898. Marchand had established the post of Fashoda on the White Nile and had resisted several attacks of the devishes, when General Kitchener appeared at the head of a British force and requested Marchand to withdraw. The latter refused and soon after departed for France to make his report but the French government receded from its position and the threatened clash between England and France was averted. Marchand was present at the relief of Peking in 1900 and resigned his commission in 1904, when his government refused him permission to enter the Russian army in the war with Japan. He was made Commander of the Legion of Honor, was again in the French army with rank of general in the Great War and was killed in action on the western front. Consult Murphy, 'Le commandant Marchand et ses compagnons d'armes à travers l'Afrique' (Paris 1900).

MARCHANT, mär-chǟnt, James, English reformer: b. 18 Dec. 1867. He was educated in private and public schools and for some years was engaged as social writer and worker in East London and the provinces. In 1899-1904 he was an evangelical lecturer to the bishop of Saint Albans; in 1895-97 preacher-in-charge of the Trinity Presbyterian Church, London; and in 1900-02 was civil minister of Saint Andrew's Church, Chatham. From 1903 to 1906 Mr. Marchant was secretary of Dr. Barnardo's Homes and Memorial. In 1905 he traveled on the Continent with Dr. Barnardo's successor investigating conditions of child-life and rescue work. In November 1911 he was dedicated to the work of the Municipal Council of Public Morals in the private chapel of the dean of Westminster Abbey by the bishop of Durham and Rev. F. B. Meyer. His writings include 'Life of Dr. Paton' (1909); joint-author of 'The Memoirs of Dr. Barnardo' (1907); 'Letters and Reminiscences of Dr. A. Russell Wallace' (1916); 'History of the House of the Red Letters' (1917); 'The Master Problem' (1917); 'Crises or Cradles' (1916); 'Birth-Rate and Empire' (1917); 'The Person of Christ'; 'Theories of the Resurrection' (1899). He is editor of Prevention, a scientific and religious journal devoted to the cause of public morals.

MARCHESI, mär-kǟ-'šî, Mathilde, German singer: b. Frankfort-on-Main, 26 March 1826; d. 17 Nov. 1913. Her maiden name was Graumann; she studied under Nicolai in Vienna, and in Paris under Garcia, whose assistant she became. A splendid mezzo-soprano she toured Europe for several years, married, in 1852, the Marchese della Rajata Castrone, a political Italian refugee of 1848, also a singer, who had adopted the nom de théâtre of Salvatore Marchesi in 1854 became professor at the Vienna Conservatory. She removed to Paris in 1861, where she published her École de Chant. In 1865 she accepted a professorship in Cologne, but resigned in 1868 and returned to Vienna, staying at the Conservatoire 10 years. She settled in Paris again in 1881, and prepared many of the greatest singers of the younger generation, including Melba. Her later years were spent in London, where she conducted a singing academy with her daughter. She was a teacher of rare merit, and author of a method of singing, of two volumes of personal recollections in German (1877; 1888), and of Marchesi and Music (1897). She received decorations and medals from the rulers of Italy, Great Britain, Germany and Austria.

MARCHIALI, mär-ka-lë, or MARCHIALY. See Iron Mask, MAN WITH THE.

MARCHING THROUGH GEORGIA, a popular ballad sung during the American Civil War, and commemorating Sherman's March to the Sea. It was written by H. C. Work (q.v.) 16 Nov. 1864.

MARCIL, mär-sél', Charles, Canadian statesman and journalist: b. Sainte Scholastique, Quebec, 1 July 1860. He was educated in the common schools and at Ottawa University. In 1879 he became a member of the staff of the Montreal Gazette, and subsequently was successively member of the staffs of the Herald, the Post, La Patrie, and the Star, all of Montreal. In 1897 Mr. Marcil was an unsuccessful candidate for the Quebec legislative assembly for Gaspé County. In 1900 he was elected to the Dominion Parliament as Liberal member for Bonaventure; in 1905 he became deputy speaker and in 1909-11 was speaker of the House of Commons. Mr. Marcil became a member of the Privy Council for Canada in 1911.

MARCION, mär-shi-'ôn, founder of a Gnostic sect, called Marcionites: b. Sinope about the beginning of the 2d century, A.D. d. about 160. He became a wealthy shipowner, was very liberal, and went to Rome about 140 where he
MARCO BOZZARIS—MARCONI 273
gave generously to the Church but his views were so unusual that he was not warmly re-
cieved. He attached himself while there to the Gnostic teacher Cerdo of Antioch, and founded a system antagonistic in many respects to Christi-
nianity. Its principal feature was the irreconcil-
able opposition upon which it supposed to exist be-
tween the Creator and the Christian God, and be-
tween the religious systems, the law and the ges-
ampil, which it believed they respectively found.
The sect held the existence of three original principles—the supreme and invisible, 
whom Marcion called the Good; the visible 
God, the Creator; and the devil, or perhaps 
matter, the source of evil. Marcion could not 
perceive in nature, or in the Old Testament, 
the same love which was in the gospel of Christ. 
He accordingly made the Creator, the God of 
the Old Testament, the author of suffering. 
Jesus was not the Messiah promised by this 
being, but the son of the Good one, who took 
the form but not the substance of man. 
Marcion denied the resurrection of the body; 
he condemned marriage, thinking it wrong to 
increase a race born in subjection to the harsh 
rule of the Creator. He rejected the whole of 
the New Testament; he took from the Pseudo-
apostolic a few epistles and a mutilation of the 
Gospel of Luke. He lead quite a following, which is 
traced for 500 years, and then disappeared. 
Consult Tertullian, 'Contra Marcionem'; Har-
nack, 'History of Dogma.'

MARCO BOZZARIS. See Bozzaris, 
MARCO.

MARCO POLO. See Polo, Marco.

MARCOMANNI, már-kô-mán'ni ("men of the marches," "borderers"), ancient German 
brige, belonging to the federation of the Suevi. 
About 10 B.C., under their King Marobod or 
Marobodus, they retired from their territory 
between the Elbe and the Oder before the ad-
vancc of the Romans, settled in Bohemia, and 
there built up a powerful state, with which Ti-
berius made a treaty 6 A.D. Thirteen years 
later Marobodus was defeated by Hermann, or 
Arminius, leader of the Cherusci, who also 
drove from Cataulus, Marobod's suc-
sor. About the middle of the 2d century the 
Marcomanni, with other Teutonic tribes, at-
tempted to make inroads into Pannonia; they 
were defeated by Marcus Aurelius in 178; Com-
modus made peace with them in 180; they fur-
nished Roman troops and were heavily sub-
sidized till the time of Aurelian, when in 270 
they were again rebellious and again driven 
across the Danube. In the 4th century the 
Marcomanni drop out of history.

MARCONI, Guglielmo, gool'-ë-él'mô már-
kô'ne, Italian inventor and electrical engineer; b. Marzabotto, near Bologna, Italy, 23 Sept. 
1875. He was educated at the universities of 
Bologna and Padua, and so early as 1890 under-
took experiments in demonstration of his theory 
that the electric current readily passes through 
any substance, and with the startled discovery 
that direction follows a direct course without 
the assistance of any sort of conductor. After 
various experiments in Italy, he finally in-
vented an apparatus for wireless telegraphy, 
which was successfully tested in both Italy and 
England, and in 1894 he established a wireless 
eengineer and electrician-in-chief of the English 
postal-telegraph service. Marconi was the first 
to perfect the appliances used in space tele-
graphy or radiography, and the first to patent 
the application of the electric waves discovered by 
Heinrich Hertz to the purposes of actual tele-
graphy as distinguished from mere signaling. 
This remains true in spite of all the discussion 
respecting the originality of Marconi's work. 
It was he who combined the important elements 
of the wireless telegraphy that had previously 
been invented, and to him the invention of so-called "wireless" telegraphy is due. 
He came to the United States in 1899, there con-
tinued his experiments, and in 1900 employed 
his method in reporting the presidential election 
of that year. He had sent (27 March 1899) 
messages across the English Channel from the 
vicinity of Boulogne, France, to the South Fore-
land, England, 32 miles distant. In December 
1901 he began his first experiments in transatlantic 
telegraphy without wires at Signal Hill, near 
the entrance to the harbor of Saint John's, 
N. F. He succeeded with these because of an 
exceedingly sensitive magnetic detector, that 
was affected by the very faint etheric vibrations. 
When his success became apparent through his 
receiving and plainly distinguishing signals 
from the Poldhu Station, in Cornwall, of the 
American Cable Company, which holds a monop-
opoly from Newfoundland, compelled him to with-
draw, and he selected another station at Table 
Head, on the east of Glace Bay, Cape Breton 
Island. On 25-26 Feb. 1902, Marconi, on his 
way to the United States on board the steamship 
Philadelphia, received signals at a distance of 
2,099 miles and worded messages at a distance of 
1,551.5 miles. On 21 Dec. 1902 the first offi-
cial transatlantic telegrams were sent from 
Table Head. Marconi later (18 Jan. 1903) sent 
from the South Wellfleet station, Cape Cod, 
Mass., direct to Poldhu (3,000 miles), a mes-
sage from President Roosevelt to King Edward. 
In 1910 the Argentina station received messages 
of 5,600 miles transit, and since then South 
American stations have sent 8,000 and 7,000 
miles. The Italian government early in-
troduced the Marconi system on its warships, 
and granted an annual subsidy of $200,000. The 
English government also paid a royalty for the 
because of the system on its warships, and the 
Marconi system between Nova Scotia and 
Ireland was formally opened for commercial 

He has continued his experiments and in-
ventions, continually improving radiography 
and the methods employed. In 1906 his new 
persistent wave system was introduced, and 
devices developed for giving desired forms to 
the wave energy sent out. In 1910 his detector 
was radically improved, and he also brought 
into use a new receiver. A little later he de-
veloped a duplex by which two wires could be 
sent and received at the same time by the same 
apparatus, without conflict, as is done in regular 
wire telegraphy. Mr. Marconi has received 
umerous honors, in Italy, England, America 
and also in Continental Europe. In 1909 he 
was given the Nobel prize for physics with Ferdinand 
Braun in 1909. He has been decorated in 
Britain, Russia and Spain, and received the 
Grand Cross of the Crown of Italy. The great 
universities of the world have showered de-
greses on him; Edison accepted official position 
in one of his companies; he was nominated a 
Senator in the kingdom of Italy, and given the 

VOL. 18—18
freedom of Rome. When Italy joined in the World War, he hastened to offer his services to his country, and was promptly placed in charge of its war relief service.

**MARCOU,** már-koo', *Jules,* American geologist: b. Salins, France, 20 April 1824; d. Cambridge, Mass., 17 April 1898. He studied at Besançon and the Collège de Saint Louis in Paris; devoted himself to geology after several journeys through Switzerland, in which he made the acquaintance of Jules Thurnmann, to whom he owed an introduction to Louis Agassiz. In 1846, after taking part in the geological survey of the Jura Mountains, he was appointed assistant mineralogist in the Sorbonne; in 1848 having been appointed traveling geologist to the Jardin des Plantes came to America, explored the Lake Superior Country together with Agassiz and made wide and important geological studies in Virginia, Pennsylvania and New Jersey, and after several trips back to Europe settled in Cambridge, where he assisted Agassiz in the Museum of Comparative Zoology. From 1853 to 1855 he was in government employ, and from 1873 till shortly before his death was again in the service. MarcoU made a section map of the 45th parallel from the Mississippi to the Pacific, and published 'Geological Map of the United States and British Provinces of North America' (1853); 'A Catalogue of Geological Maps of America' (1854); 'Geology of North America' (1858); 'Life, Letters and Works of Louis Agassiz' (1886).

**MARCOUX, Joseph,** Canadian missionary: b. Canada, about 1770; d. 1855. He was educated after the usual manner of the Roman Catholic priesthood of which he became a member. Soon after his ordination his ecclesiastical duties took him among the Iroquois. In 1819 he settled among these Indians at Caughnawaga, on the Saint Lawrence, near Montreal. His labors were eminently successful and under his guidance the Indians reached a high degree of civilization. The school and church at Caughnawaga are monuments to the zeal of this modern apostle. Father MarcoU acquired a perfect mastery of the Iroquois tongue, of which he published a grammar and dictionary. Other works by him in Iroquois are 'Life of Christ'; 'Letters to Iroquois Chiefs' (1848-49); 'Prayer Book' (1852); 'Catechism' (1854).

**MARCUS AURELIUS ANTONINUS,** màr'kús à-re'li-ús, often called simply Marcus Aurelius, a distinguished Roman, and according to Canon Farrar "the noblest of pagan emperors"; b. Rome, 29 April 121 A.D.; d. Vienna, — the modern Vienov — 17 March 180 A.D. He was descended from an illustrious line which tradition declared extended to the good Numa, the second king of Rome. In the descendent Marcus were certainly to be found, with a great increment of many centuries of noble life, all the virtues of his illustrious ancestor. Doubtless the cruel persecutions of the infamous emperors who preceded Hadrian account for the fact that the ancestors of Aurelius left the imperial city and found safety in Hispania. The emperors of this period were not far from the present city of Cordova — the empire during his reign of 20 years. Among his good works were these: the establishment, upon eternal foundation, of the noble fabric of the civil law — the prototype and basis of Justinian's task; the founding of schools for the education of poor children; the endowment of hospitals and homes for orphans of both sexes; the creation of trust companies to receive and distribute legacies and endowments; the government of all the provinces; the complete reform of the system of collecting taxes; the abolition of the cruel of the criminal laws and the mitigation of sentences unnecessarily severe; the regulation of gladiatorial exhibitions;
the diminution of the absolute power possessed by fathers over their children and of masters over their slaves; the admission of women to equal rights to succession to property from their children; the rigid suppression of spies and informers; and the adoption of the principle that merit, as distinguished from rank or political friendship, alone justified promotion in the public service. But the greatest reform was the reform in the imperial dignity itself, as exemplified in the life and character of the emperor. It is this fact which gives to the 'Meditations' this heavenly place among the immortal gods. As his body passed, in the pomp of an imperial funeral, to its last resting-place, the tomb of Hadrian,—the modern Castle of Saint Angelo at Rome,—thousands invoked the divine blessing of Antoninus. His memory was sacredly cherished. His portrait was preserved as an inspiration in innumerable homes. His statue was almost universally given an honored place among the household gods. And all this continued during successive generations of men. Marcus Aurelius has been censured for two acts: the first, the massacre of the Christians which took place during his reign; the second, the selection of his son, Commodus, as his successor. In extenuation of his persecution of the followers of Christianity, it has been alleged in his behalf that he was deceived by evil counselors, who misrepresented the conduct of the Christians to him. This excused impingings upon his wisdom as a ruler and his admittedly wide knowledge of the conditions of the empire. It is rather urged that when we take into consideration the environment of the emperor, no just cause for condemnation of his course remains. He imbibed a bitter prejudice against the new religion from his beloved friend and instructor, Fronto. In the writings of Epictetus, whom he greatly admired, he found severe condemnation of the Christians as fanatics. With such a profound natural bias, it is urged, it is no wonder that he was led to regard the new creed with aversion. But the reason of his course is to be found rather in his deep-rooted attachment to the heathen beliefs of his ancestors and of the empire. It was rather his fear that the ancient cult, bound up as it seemed in the character of Roman rule, was seriously menaced by the progress of Christianity, which actuated him to the severities which he inflicted upon the Christians. He regarded Christianity as a "pernicious sect," a "secret conspiracy" against the empire, an "immoral superstition," whose poison was eating into the social life, and himself as the conservator of the empire and its traditions. Therefore some extenuation might be conceded to such fierce zeal in persecuting the Christians as in almost any other emperor than Marcus Aurelius. But there is a glaring inconsistency in his character in the adoption of so cruel and monstrous a course by one who appears otherwise so admirable. In this signal instance he is as bloody and heartless as a Domitian, a Nero or a Caligula; in all other things merciful, in this pitiless; in his general administration, just and humane; in this, singularly unjust and even vindictive. Whatever extenuating circumstances may seem to condone it, his policy in this instance was utterly inconsistent with his general character.

His first edict against the Christians was published in 177. Multitudes perished in the fierce persecutions which followed. Notable amongst the victims were Saint Polycarp in Smyrna and Saint Cecilia at Rome. The manner in which they were tortured before being relieved from sufferings by death was more befitting a savage chief than a civilized ruler.

Of the appointment of Commodus as his successor, it may be said that the paternal heart hoped against hope for filial excellence. Marcus Aurelius believed, as clearly appears from many passages in the 'Meditations,' that men did not do evil willingly, but through ignorance; and that when the exceeding beauty of goodness had been fully disclosed to them, the depravity of evil conduct would appear no less clearly. The emperor who, when the head of his rebellious general was brought to his feet, was grieved because that general had not lived to be forgiven; the ruler who burned unread all treasonable correspondence, would not, nay, could not believe in the existence of such an inhuman monster as Commodus proved himself to be. The appointment of Commodus was a calamity of the most terrific character; but it testifies in trumpet tones to the nobility of the emperor's heart, the sincerity of his own integrity in the triumph of right and justice. Compare Farrar, 'Seekers after Gold' (1888); Renan, 'Marc Aurele' (1881); Pater, 'Marcius the Epicurean'; Arnold, M., 'Essays in Criticism' (First Series, New York 1888); 'Marcus Aurelius Antoninus to Himself' (English tr. by G. H. Randall, London 1910); 'The Communings with Himself of Marcus Aurelius Antoninus, Emperor of Rome, together with his Speeches and Sayings' (tr. C. R. Haines, London 1916); 'The Thoughts of the Emperor Marcus Aurelius Antoninus' (tr. George Long, illusr. W. Russell Flint, London 1909); consult also Robinson, Ellis, 'Correspondence of Fronto and Marcus Aurelius' (Oxford 1904).

MARCUS GREGUS, Gregius, alchemist, who lived not later than the 11th century, since he is cited by an Arabian physician of that date. In the National Library at Paris are two manuscript copies of a small treatise, entitled 'Liber Ignium' ad Comhrendos Hostes, Authore Marco Greco; one of which is from the 14th and the other to the 15th century. The work contains an account of an explosive substance the ingredients of which are the same as those used in making gunpowder, though differently proportioned. It may have been that Schwartz, the reputed inventor of gunpowder,
MARDONIUS, már-dón-é, Persain general, was the son of the Satrap Gobryas, and
MARDUK — MAREY

son-in-law of Darius Hystaspes. He commanded the first Persian armament sent against Greece, 492 B.C., when a storm at Mount Athos destroyed his fleet, and his army was beaten in Macedonia. He accompanied Xerxes in his invasion of Greece, of which he had been the chief gromoter; and after the battle of Salamis, and the return of Xerxes to Asia, Mardonius was left in occupation at Athens, which he held for 10 months. According to Herodotus he was defeated by Pausanias, and probably killed at the battle of Platea, 479 B.C.

MARDUK. See MERODACH.

MARE CLAUSUM, mār'ē klā'sōm, a Latin phrase meaning closed sea, or that portion of the sea under the jurisdiction of a particular nation or government, as distinguished from the high sea. For many years it was held that a nation had no authority over waters more than three miles from its shores. But in the great World War these theories were cast to the winds, and each side held what sea it could. See INTERNATIONAL LAW.

MARE ISLAND, Cal., in San Pablo Bay, and a part of Solano County, 28 miles north of San Francisco, and opposite the city of Vallejo. A United States naval station, one of the largest in the country, is on this island. It is two miles long and has wet and dry docks, ordnance yards, marine barracks, a hospital, an observatory, repair shops, and at the southern extremity of the island a lighthouse. See NAVY YARD.

MAREE, Loch, lō俱 mā're, Scotland, a lake in the west of Ross-shire, forming a long and comparatively narrow expance, stretching south-east to northwest for 121/2 miles with a breadth of from one-half to two miles. Its depth in most places is 60 fathoms; it has never been known to freeze. The scenery along its shores is bold and picturesque, and its surface is studded with 32 wooded islands, on one of which are found the remains of an ancient chapel, with a graveyard. One is Saint Swithin’s Isle, shaped like a doughnut, enclosing a lake 750 feet long. The Loch discharges itself into Loch Ewe by a small river of the same name.

MAREA, mā'rā, Lake. See MAREOTS, LAKE.

MAREMA, mā-rē'mō, Italy, low swampy tracts extending along the west coast of Tuscany from the mouth of the Cecina to Orbetello, length, 92 miles; breadth, 15 miles; area, about 1,000 square miles. Formerly these regions were fruitful, healthful and populous; but after the 15th century the neglect of the water-courses of the district allowed the formation of marshes and now they generate insects and fever and present an aspect of dreary desolation during the summer months, when the inhabitants flee from the pestilences. In winter, on the other hand, the Maremma are inhabitable and afford a luxuriant pasturage for cattle, which graze in summer on the Apennines. The district is gradually being reclaimed and improved.

MARENGO, Iowa, city, county-seat of Iowa County, on the Iowa River, and on the Chicago, Rock Island and Pacific Railroad, about 85 miles east by north of Des Moines. It is in a fertile agricultural and stock-raising locality. The chief manufactures are dairy products, agricultural implements and flour. It has banks and three newspapers. It is the trade center for a large part of Iowa County. Pop. 2,037.

MARENGO, mārēn'gō, Italy, a northern village, near the Bermida, three miles southeast of Alessandria. Its name is connected with the defeat of the Austrians by Napoleon 14 June 1800. The Austrians under Melas were at first successful, but French reinforcements arriving, the cavalry charge of the younger Kellermann turned what looked like certain defeat into a decisive victory. The forces engaged were 33,000 French and 30,500 Austrians; the French loss is variously stated as totaling in killed and wounded 4,000 to 7,000, the Austrians 9,000 to 10,000.

MAREOTIS, mārē-ō'tīs, or MARIUJT, mārē-'ōo't, Egypt, a lake separated from the Mediterranean on the west by the long narrow belt on which Alexandria stands and communicating on the north with Lake Madicel. It is the most westerly of the Nile Delta. In the southwest it terminates in a long narrow creek; the main expance is about 28 miles long by 20 broad. It was at one time deep enough for inland navigation, and had its shores covered with beautiful gardens and vineyards; but having been cut off from the Nile, which supplied its water, it became dry and its area was cultivated. During the siege of Alexandria in 1801 the British let the sea into it, and it now yields much salt by evaporation.

MARE’S TAIL, a genus (Hippuris), of plants with whorled narrow leaves and small inconspicuous flowers set in their axils. They are aquatic or marsh plants. _H. vulgaris_ is very common in Europe and in some parts of North America.

MARETZEK, mā'rē tēk, Max, American musician: b. Brunn, Austria, 23 Jan. 1821; d. Pleasant Plains, Staten Island, 14 May 1859. He was educated at the University of Vienna, but desirous of a wider field went to London and was connected for a time with its Italian Opera as chorus-master, writing in addition some music; in 1848 he came to the United States, where he was appointed leader of the orchestra at the Italian Opera and subsequently at the Astor Place Theatre and the Grand Opera House. He wrote the operas of ‘Hamlet,’ ‘Sleepy Hollow,’ and an interesting book on contemporary life entitled ‘Travels and Quavers’ (1858). Under his management many notable operas and artists, among the latter Adelina Patti and Pauline Lucca, were presented to American audiences.

MAREY, mā're, Étienne Jules, French physiologist: b. Beaune, Côte-d’Or, 1830; d. 1904. In 1859 he removed to the capital and took his degree in medicine there in 1860. In the same year he began his connection with the physiological department of the Collège de France; founded a physiological laboratory in 1864 and in 1867 became adjunct professor of physiology there. In 1872 he was elected member of the Academy of Medicine and of the Institute six years later. He made important investigations on the physiology of circulation and the heart, on the action of poisons, on animal heat, motion in animals, etc. He invented the
MAGARRET, queen of Germany, married to Henry in 1445. The imbecility of the king made her practically regent, and her power being contested by the Duke of York, a claimant to the throne by an older line, she was forced into exile. In 1440, she was married to the Duke of York, and the release of the king. Her son, however, was soon afterward annihilated at Towcester (1461), and Edward, the son of the late Duke of York, was declared king. She succeeded in obtaining assistance from Louis XI of France, but was once more defeated, and took refuge in that country. Warwick then became embroiled with the young king, and determined to replace Henry on the throne. Edward was then obliged to escape to the Continent, but obtaining assistance from the Duke of Burgundy, returned and defeated War-wick at Barnet (1471). Margaret, collecting her partisans, fought the battle of Wakefield (1471), and was totally defeated. She and her son were made prisoners, and the latter, when led into the presence of the royal victor, was called, "Henry soon after death in the Tower, and Margaret remained in prison four years. Louis XI ransomed her for 50,000 crowns. See Henry VI; ROSES, WARS OF THE.

MARGARET OF AUSTRIA, governor-general of the Netherlands, and daughter of Maximilian I of Austria: b. Brussels, 10 Jan. 1490; d. Mechlin, 1 Dec. 1530. She was educated at the French court; was betrothed to the Dauphin Charles, who married Anne of Brittany; married John, the Spanish Crown-Prince, in 1497; and, after his death in the same year, married Philip of Savoy in 1501, only to be widowed again in 1504. Three years afterward her father made her regent of the Netherlands, where she ruled with much ability although a bitter enemy of the Reformation. She took a prominent part in the peace of Cambrai in 1529, which is called, because negotiated by her and Louise of Savoy, the "Paix des Dames."

MARGARET OF FLANDERS, Countess of Flanders and Hainault, sometimes called Margaret of Constantinople: b. Valenciennes about 1200; d. Lille, 1279. She was a daughter of Baldwin IX of Flanders and Hainault, who was succeeded by Margaret's older sister, Jeanne. Margaret's husband, Bouchard, was seized and killed by Jeanne, upon whose death Margaret came to the crown in 1244. Her reign was peaceful, save for the quarrels between her children by Bouchard and those by Guillaume of Dampierre.

MARGARET OF NAVARRE, or OF VAUDE, or OF FRANCE, French princess, daughter of Henry II and Catherine de' Medici, born at Tours, France, 14 May 1553; d. Paris, 27 March 1615. She married in 1572 Henry of Navarre, afterward Henry IV of France. It was entirely a marriage of policy, and on Henry's accession to the throne their marriage was dissolved by mutual consent. She resided thereafter in Paris where her house became the rendezvous of the learning and fashion of the time. Some very agreeable poems by her are extant and her 'Memoirs' (1842) are extremely curious. See HEPTAMERON, TH.
MARGARET OF PARMA, regent of the Netherlands, a bastard of Charles V of Spain by a Flemish woman: b. Oudenaarde, 1522; d. Ortona, 1586. Brought up in Brussels, she married Antonio de Medici in 1536, and in 1538 to Ottavio Farnese, Duke of Parma, to whom she bore the great general, Alexander Farnese. In 1559 Philip II made her staetholder of the Netherlands. There she sided with the invader, the Emperor Charles V, and provoked the provinces to revolt by her strong, masculine policy. She resigned in 1567 when Alva was sent to the Netherlands.

MARGARET TUDOR, queen of Scotland, wife of James IV and daughter of Henry VII of England: b. Westminster, 29 Nov. 1489; d. Methven Castle, 18 Oct. 1541. She was married to the king of Scotland when 14; bore three children, of whom two, James, later fifth king of Scotland of that name and father of Mary Stuart, and Margaret, mother of Lord Darnley, survived her; and after the king's death (1542) married Douglaston, Earl of Angus, from whom she was divorced in 1527, to marry soon after Henry Stewart, Lord of Methven. By descent from Margaret Tudor her great-grandson, James VI of Scotland, was Elizabeth's successor as James I of England.

MARGARET, or MARQUERITE OF VALOIS, vá-wa, queen of Navarre: b. Angoulême, 11 April 1492; d. Paris, 27 March 1549. (Variously known as Margaret of Angoulême, of Alençon and of Navarre). She was the sister of Francis I of France, was brought up at the court of Louis XII, married the Duke of Alençon in 1509, became a widow in 1512 and in 1527 married Henry d'Albret, titular king of Navarre. She never reigned over Navarre, but resided at the French court or kept a court of her own at Nérac and Pau. She was acquainted with the principles of the Protestant reformers, and not only afforded protection to reformed divines, but used her influence with her brother Francis to the same purpose, and was a great patroness of men of letters. In 1533 she published a religious poem, ʻLe Miroir de l'Âme Pêcheresse,ʼ introducing the name of Serbonne as heretical. In 1547 a collection of her poems and other pieces was printed under the title of ʻMarquesites de la Marquesite des Princesses.ʼ The ʻHeptaméron, ou sept Journées de la Reine de Navarre,ʼ a famous collection of tales long attributed to her, is at present regarded as of composite authorship. She left one child, Jeanne d'Albret; afterward mother of Henry IV. Her letters have been published in modern times. Consult Comtesse d'Haussonville, ʻMarquise de Valois,ʼ (1870); E. Rotheisenger, ʻKönigin Margot von Navarreʼ (1885); Freer, ʻLife of Marquise d'Angoulêmeʼ (1805).

MARGARET SIDNEY. See LOTHROP, HARRIET MULFORD STONE.

MARGARETTA, The, a British armed schooner, captured by Americans near Machias, Me., 12 June 1775, in the first naval contest of the Revolution. In April 1774 Capt. Ichabod Jones sailed into the harbor of Machias, and there, on account of complications caused by the Boston Port Bill (q.v.), he remained for a year, with his vessel hauled up. When news of the battle of Lexington reached Machias, Jones was loading two sloops, the Unity and the Polly, for Boston, whither he soon sailed. The whole country was now excited over the Port Bill, and in Boston it had caused much distress.

Jones wished to return to Machias with provisions, of which the people there were in want. Admiral Graves, the British officer in charge of Boston harbor, granted him permission to sail on condition of his bringing back lumber for the use of the British troops, and the admiral ordered the Margaretta, a cutter of about 100 tons, carrying about 40 men, to accompany Jones to his destination to see that this condition was fulfilled; also that the American skipper should convey to Boston the stores of an armed vessel lately cast away. Jones is said to have been favorable to the British, whose protection at this time he may have solicited. His two sloops, convoyed by the Margaretta, arrived at Machias, 10 July, but many of the citizens, declaring that he should carry no lumber to Boston, organized for resistance to the enforcement of Graves' order.

The leader of this opposition was Benjamin Foster, a colonial soldier, who had been present at the capture of Louisburg from the French. A secret meeting was called, and on Saturday, 10 June, men of Machias and neighboring settlements gathered in the woods to consider the advisability of attempting to take the sloops, capture the Margaretta and make prisoners of the cutter's officers and crew. Among those that assembled was Jeremiah O'Brien, who, with several brothers, participated in the subsequent capture. During the discussion Foster stepped across a small brook running near and called on all in favor of the attempt to follow. The majority followed him, and then a "unanimous declaration of war" was made.

On Sunday, 11 June, Jones and the principal officers of the Margaretta being at church, Foster and others started to take them into custody; but, getting the alarm, they escaped by jumping from the windows — Jones fleeing to the woods, while the British officers returned to the Margaretta and weighed down; the American crew, firing on any who should interfere with Jones' sloops.

In spite of this threat the Americans determined to carry out their purpose. When the enemy was sighted, on Monday, the 12th, Jeremiah O'Brien was chosen to lead the movement, and while he took 40 men on board the Unity, Foster, with another party, boarded the Fullmouth Packer, a schooner lying at hand. The bold defiers of British force had only "a few charges of powder and ball for 20 fowling-pieces or muskets, 13 pitchforks and 10 or 12 axes," the powder and balls being nearly all on O'Brien's vessel. As they approached the Margaretta she was ready for action, and her commander, Moore, gave warning that he would fire if they came nearer. O'Brien called upon him to surrender, while Stevens, O'Brien's lieutenant, told Moore to "fire and be damned." To avoid action, Moore crowded all sail and stood out to sea. But the Unity was the better sailer, and as she overhauled them the British opened fire, which the heroics, and the "tow-and-peep," returned with effect. The vessels coming together, a short musketry fight ensued. Moore himself threw hand-grenades, but was shot down. The Americans — O'Brien at their head.
MARGARIC ACID—MARGHERITA

—boarded the cutter and soon had complete possession of her.

The surface is broken by two mountain chains, the highest point, peak of Macanao, being 4,484 feet. Near the centre is a lagoon, surrounded by low land. Much of the soil is fertile, but the chief industries are fishing, preparing salt for market and cattle-raising. The capital of the province is Asuncion; the chief port Pampatar. The inhabitants are nearly all Indians who have long been civilized. Pop. about 40,000.

MARGARITE, or PEARL MICA, a native hydrous silicate of aluminum and calcium, having the formula H₃CaAl₃Si₅O₁₈, and usually occurring in laminated forms. It crystals, when they occur, belong to the monoclinic system. Margarite is translucent or sub-translucent, with a vitreous or pearly lustre. It occurs in various colors, but predominantly in gray, with perhaps a pinkish tint. It has a hardness of from 3.5 to 4.5, and a specific gravity of about 3. Margarite usually occurs in connection with emery or corundum, from which it is obviously often derived.

MARGARITE, or MARGUERIT, Berengen, a Spanish general, who lived in the 12th century. In command of a fleet he was sent by William II, king of Sicily, to succor Tyre, besieged by Saladin in 1188. Margarit, with a fire-ship, burned several of the enemy's ships, while Conrad, governor of Tyre, made a sortie. Attacked on both sides at once, Saladin only just managed to find shelter on an undamaged ship, and escaped. The brilliant conduct of Margarit on this occasion gained for him from Saladin the names of King of the Sea and the New Neptune.

MARGARIT, or MARGUERIT, John, a Spanish cardinal: b. Gerona, 1415; d. Rome, 1484. Succeeded bishop of Eline, of Gerona and of Patti (Sicily), he received several important missions under Alphonse V, and became Ambassador to Rome under John II, who appointed him Archbishop of Aragon. He quelled troubles which were disturbing Catalonia, and received the cardinal's hat in 1483. He was the author of 'Paralipomenon Hispania' (Granada 1545), a history of Spain from the fabulous arrival of Hercules in the Peninsula, to the reign of Theodosius the Great.

MARGARIT, or MARGUERIT, Peter, a Spanish navigator who lived at the end of the 15th century. He was the nephew of Cardinal Margarit, and left the court of Ferdinand V in 1492 to embark with the fleet of Christopher Columbus, from whom he separated after some dissensions. According to Blasius he discovered the Marguerite Islands, and gave to them his name. Other authors aver these islands were named after the pearls which are found on their shores.

MARGARITA, már-gā-reťā, Venezuela, an island off the northeast coast, in the Caribbean Sea, about 35 miles north of Cumana. In 1599 it was made a province and is known by the name of Nueva Esparta. Its area is 450 square miles. This island was discovered by Columbus in 1499; it was settled by the Spanish about 1525. The name Margarita, meaning "pearl," was given to it because of the pearl fisheries still existing in surrounding waters.

MARGARITE, or MARGARITE, or MARGARITE, a fatty substance, obtained from land and from certain vegetable oils. It was formerly believed to be a distinct fat or compound of glycerin with "margaric acid" (q.v.), but it is now known to be merely a mixture of stearin and palmitin. See OLEOMARGARINE.

MARGARITONE, Italian painter, architect and sculptor: b. Arezzo, about 1219; d. 1280. Called MARGARETONE D'AREZZO after his native place, he attained the first rank as an artist of the Greek school, and was held in high esteem by Pope Urban IV. Jealousy at the success of Cimabue is said to have shortened his days. He painted a great number of frescoes, none of which now exist. Among the few remaining pictures from his brush are Saint Francis in the museum at Siena; a Madonna in the church of Saint Francis at Arezzo; Christ, in the church of San Croce at Florence; the Eternal Father with the angels in the church of San Bernardino at Perugia. Painting and sculpture are mingled in his tomb of Pope Gregory X at Arezzo; his sculptured works are chiefly of wood. Among his architectural works are the cathedral of his native city and the governor's palace at Ancona.

MARGATE, már-gāt, England, a seaport and popular summer watering resort of Londoners, in Kent, in the Isle of Thanet division, 64 miles by rail east of London. The restored parish church of Saint John the Baptist dates from 1050. It was originally a fishing village, but began to develop as a resort about the year 1800. Margate is patronized annually by about 200,000 visitors. Its sea-walks are continuous with those of Westgate and Broadstairs.

MARGATE-FISH, a handsome, pearly white, brown-striped fish (Hemulon album) of West Indian waters, important as a food-fish and ordinarily weighing about five pounds. It is caught about rocky reefs, in deep water, where it spawns in summer; and at night it comes inshore to obtain the small animals which swarm in the shallows. It is called jalo by Spanish-speaking fishermen, and market-fish, margaret-grunt, etc., by the English-speaking fishermen of the West and the Bahamas.

MARGAY, már-gā, a small, yellowish, profusely and beautifully spotted cat of the American tropical forests (Felis tigrina), also known in one of its varieties as "chati."

MARGHERITA, már-gā-reťā, queen dowager of Italy: b. Turin, 20 Nov. 1831. She is
MARGOLIS, Max Leopold. American Hebrew philologist: b. Merech, Vilna, Russia, 15 Oct. 1866. In 1889 he was graduated at the Leibniz Gymnasium, Berlin, and in 1890 received the degree of A.M. at Columbia University and the degree of Ph.D. the following year. In 1892 Dr. Margolis was winner of the Bunsen prize of the university. He was professor of Jewish literature at the Glenmore School for Culture Sciences, Keene, N. Y. From 1892 to 1897 he was connected with the Hebrew Union College, Cincinnati, as assistant professor of Hebrew and Biblical exegesis. In 1897 he became professor of Semitic languages and literatures at the University of California, where he was associate professor from 1898 to 1905. In 1905-07 he held the chair of Biblical exegesis at Hebrew Union College. In 1907-08 Dr. Margolis visited European libraries and in the following year was editor-in-chief of Bible translation for the Jewish Publication Society of America. Since 1909 he has been professor of Biblical philology at the Dropsie College for Hebrew and Cognate Learning, Philadelphia. He is the author of Commentary Isaacidis quaestiones talmudicam adhiberi possit tractatu Erubin ostenditur? (1891); 'The Columbia College Manuscript of Megilla' (1892); 'An Elementary Text-Book of Hebrew Accidence' (1893); 'The Theological Aspect of Reformed Judaism' (1904); 'The Holy Scriptures with Commentary on Micah' (1908); 'A Manual of the Aramaic Language of the Babylonian Talmud' (1910); 'The Story of Bible Translations' (1917) and contributions to philological and theological publications. Since 1914 Dr. Margolis has served as chairman of the editorial committee of the Journal of Biblical Literature.

MARGRAVE (German, Markgraf), in mediæval times, in continental Europe, a border count or commander entrusted with the protection of a mark, or district on the frontier. As early as the times of Charlemagne marks and margraves appear. The margraves stood immediately under the German kings and emperors. In the 12th century margraviates became hereditary and at last the margraves acquired the rank of princes of the empire, between counts and dukes.

MARGRY, mär'græ', Pierre, French historian: b. Paris, 1818; d. 1894. He received the appointment of adjutant curator of archives in the Ministry of Marine. He was, in 1842, appointed to study the history of the French in America. The result of his labors was included in several volumes, including 'La navigation du Mississippi et les précurseurs de Fultons aux Etats-Unis' (1859); 'Les Normands dans les vallées de l'Ohio et du Mississippi' (1869); 'Les navigateurs français et la révolution maritime du XVIIème au XVIème siècle' (1867); 'Relations et mémoires pour servir à l'histoire de la France dans les pays d'outre mer' (1867); 'Les seigneurs de la Martinique' (1879); 'Découvertes et établissements des Français dans l'Amérique septentrionale' (1879-88); 'Le conquérant des îles Canaries' (1880). Margry also was editor of 'Les souvenirs d'un homme de lettres' (1877).

MARGUERITE, mär'gær-e, a popular name for several flowers of the family Asteraceae. The blue marguerite (Felicia amelloides),
or blue daisy, is a native of southern Africa, and has long been popular in greenhouses and window gardens because of its simple culture and large solitary flower-heads. The Paris daisy or marguerite (Chrysanthemum frutescente), a native of the Canary Islands, was introduced into cultivation in Great Britain about the close of the 18th century and has continued a popular flower because of its quality. It is one usually obtainable throughout the year in the stores, but especially during the winter. Because of a close resemblance, the name is applied to its near relative, the ox-eye daisy (C. leucanthemum), which is common in mismanaged pastures and fields, especially in New England and adjacent states. The Reine marguerite (Callistephus hortensis) is better known in America as China aster (see Astra) and is one of the most popular out-of-door annuals of the garden, being easily grown from seed and readily adaptable to any garden soil. The English daisy (Bellis perennis) is also called marguerite, but less frequently. See Daisy.

MARIÀ CHRISTINA, ma-rè' a krís-te'nà, queen of Spain: b. Naples, 27 April 1806; d. Madrid, Spain, 22 Aug. 1879. She was a daughter of Francis I, king of the Two Sicilies, and was married to Ferdinand VII of Spain in 1829. Upon Ferdinand’s death in 1833, Maria Christina by her husband’s will became regent until the death of Queen Isabella, should she come 18. A civil war which was waged until 1840 ensued, its purpose being to place Don Carlos on the throne, and its outcome was for a long period doubtful, but the queen-regent appeared to care only for her chamberlain, Don Fernando Muñoz, with whom she secretly contracted a morganatic marriage. Her policy as regent was entirely subject to the will of the minister of the day which naturally resulted in a reign alternately liberal and despotic. When she affixed her signature to the law concerning the Ayuntamientos the public protested so strongly that she was obliged to resign the regency to the Prime Minister, Espartero, in 1840. In 1843, after the fall of Espartero, she returned to Madrid and in 1844 publicly married Don Leopoldo, who was made Duke of Rianzares. A revolution in 1854 compelled her to flee the country and her return to Spain in 1864 was followed by the revolution which dethroned Queen Isabella in 1868 and she was again exiled and though allowed to return to Madrid after the accession of Alfonso XII, she died in exile.

MARIÀ CHRISTINA, queen of Spain: b. Austria, 21 July 1858. She was an Austrian archduchess, daughter of Archduke Karl Ferdinand of Austria, and was married by proxy to Alfonso XII of Spain in 1879. At the death of Alfonso XII in 1885, she was appointed queen-regent during the minority of her daughter, Queen Mercedes, who was succeeded six months later by Alfonso XIII, a posthumous son. The queen-regent faced a difficult problem; she was a foreigner, the people were unenthusiastic and the financial condition of the country was in a precarious state. She formed a new cabinet with Sagasta, the Liberal leader at its head, and soon won the hearts of her people by her wise and able rule. Throughout the time of her regency she commanded the respect and admiration of the world as well as her own country for her clear, far-sighted administration of the affairs of state and her personal trait of always encouraging the young woman whom she endeavored to inspire with her own high sense of the responsibilities of his position. Even the disastrous outcome of the Spanish-American War failed to unsettle the stability of her government which on 17 May 1902 she surrendered into the hands of her son, Alfonso XIII.

MARIÀ II DA GLORIA, dà glo'r'é, queen of Portugal: b. Rio de Janeiro, 4 April 1819; d. Lisbon, 15 Nov. 1853. She was a daughter of Dom Pedro I of Brazil and on the death of her grandfather, John VI of Portugal in 1826, her father ceded to her the succession to the throne. Her uncle, Dom Miguel, to whom she was betrothed was appointed regent, but in 1828 upon the sailing of the young queen for Spain he usurped the throne and barred the landing of the queen. In 1832-33 Dom Pedro instigated a civil war against his brother and, through the intervention of England and France, Maria was placed on the throne in 1834. She married Duke Ferdinand of Saxe-Coburg and though retaining her throne had a troubled and rather unsuccessful reign. Upon her death her son, Pedro V, ascended the throne.

MARIÀ LESZCZYNSKA, lès-chin'ska, queen of France: b. Breslau, 23 June 1703; d. Versailles, 24 June 1768. She was a daughter of Stanislas Leszczynski, king of Poland, and shared the obscurity which followed upon his exile. Her marriage to Louis XV in 1723 was arranged by the regent Duc de Bourbon and the minister Fleury and was regarded as an intrigue to further their interests since it antagonized Spain by sending back the young infanta with whom an alliance had been projected. The queen after a brief period in which she tried to control state matters lived very quietly and was noted for her charities. Consul d’Armaille, ‘La Reine Marie Leszczynski’ (1870); Des Reaux, ‘Le Roi Stanislas et Marie Leszczynska.

MARIÀ LOUISA, lo-è' zà, second wife of Napoleon 1: b. 12 Dec. 1791; d. Vienna, 17 Dec. 1847. She was the eldest daughter of the Emperor Francis I of Austria and Maria Theresa, daughter of Ferdinand, king of Naples. Her marriage with Napoleon in 1810, after his divorce from Josephine, seemed to promise permanency to his dynasty and peace to the Continent, and her progress toward Paris through the different provinces of the kingdom was carried out like a triumph. In 1811 she bore him a son, to whom was given the title of king of Rome. In 1813, during Napoleon’s absence at the war, he named her regent of the kingdom. After his overthrow she returned to Vienna, and remained there during the Hundred Days. In 1816 she received, with the title of Imperial Majesty, the Duchies of Parma, Piacenza and Guastalla, and at a later period made a morganatic marriage with her chamberlain, Count Neipperg. Upon his death (1829) she took another chamberlain, Count Bombelles, and in 1833 secretly married him. She governed her duchies generally with mildness, but the latter part of her reign was much disturbed by revolutionary outbreaks and the very violent means taken to repress them.
MARIA LOUISA—MARIANA

MARIA LOUISA, Order of, See Orders and Decorations of Honor.

MARIA MAGDELENA, by C. F. Hebbel, (Maria Magdelena,) which Hebbel called a "tragedy of life," is more important as the forerunner of the peasant tragedies of Ibsen and Hauptmann than for any outstanding virtue of its own. It lacks the grandeur, the large stage and large feeling, which give its special quality to "Herod and Maria Magdalen," "Jedermann," and "Gyges and his Ring." It exaggerates the aside and the soliloquies whose dramatic fitness Hebbel defended; it cannot pass the final test of tragedy, which is inevitability. And yet it is the work of a master-dramatist, and the history of realistic drama is not complete which does not include it. For it is one of the first dramas in which the tragedy is centred, not upon a situation but upon the character of a group; in which the conflict is not between the rights of the classes, but between individuals for a family for their personal rights as against "the cruelest of tyrants, the commonplace man in the home circle." It has been called a "tragedy of the fallen woman," and, as such, its weaknesses are apparent. But it is not of the play is peculiarly unsuitable. It is the tragedy of narrow vision, the tragedy of that fear of what people will say which actuates the life of Master Anton, of Clara, his daughter, and Carl his son, and of their friends and neighbors. (Maria Magde- lena,) was one of the most popular of Hebbel's creations, and is still played in the repertory theatres, 70 years after its writing.

EDITH J. R. ISAACS.

MARIA PIA, queen of Portugal: b. Turin, 1847; d. Italy, 1911. Her father was Victor Emmanuel II of Italy. At the age of 15 she was married to Luiz I, king of Portugal. She became dowager queen on 9 Oct. 1899, when her son, Carlos I, ascended the Portuguese throne. The latter and his son, Crown Prince Luiz, were assassinated in Lisbon 1 Feb. 1908, and the aged Maria Pia saw a family for their personal rights as against "the most popular of Hebbel's creations, and is still played in the repertory theatres, 70 years after its writing.

EDITH J. R. ISAACS.

MARIA THERESA, têr'-zê'-ra (Ger. têr'-zê'-ra), German empress, queen of Hungary and Bohemia, Archduchess of Austria: b. Vienna, 13 May 1717; d. there, 29 Nov. 1780. The oldest daughter of the Emperor Charles VI, she was carefully educated, was named heir to the throne by the Pragmatic Sanction, and in 1720 married Stephen, Duke of Lorraine, who became Grand Duke of Tuscany in the next year, and who in November 1740, a month after Maria's accession to the throne of Hungary, Austria and Bohemia, was at the head of a joint regiment with her. France and Bavaria invaded Bohemia; and at the same time she was betrothed to Frederick the Great in Silesia, by Spain and Naples in Italy, and by the counterclaims of Charles Albert, who was proclaimed first Archduke of Austria and then German emperor. She fled from Vienna to Plessburg, convoked the Diet, raised a Hungarian army, won the alliance of England, made a secret peace with Prussia, surrendering Silesia and Glatz, and gained peace by the Treaty of Aix-la-Chapelle, October 1748,

securing the election of her husband as German emperor in return for the cession to Spain of Parma, Piacenza, and Guastalla. To revenge herself on Frederick she formed a league with Russia, and, by the help of her chancellor, Kaunitz, with France. With the further help of Sweden and Saxony she was preparing to strike at Prussia, when Frederick forestalled her by striking the first blow and starting the Seven Years' War (q.v.). This terrible struggle availed Austria nothing and Maria Theresa had to admit Prussia's right to Silesia in the Peace of Hubertusburg 15 Feb. 1763. Francis I, her husband, died 18 Aug. 1765, and Maria associated with her as emperor her oldest son, Joseph II, but kept in her own hands everything save military administration. Seven years afterward, upon the first partition of Poland, she received Galicia and Lodomeria; and in 1775 Bukovina was granted to Austria by Turkey. The Peace of Teschen, closing the War of the Bavarian Succession, brought Austria the Inn Valley in 1779; but the Prince's League (Fúrtvántbund), under the lead of Frederick II, struck a heavy blow at Austrian supremacy. Though best known for her political policies, Maria Theresa was equally great in interior administration; Austrian finance was revived, agriculture encouraged and higher education fostered. The empress was a strict Catholic and an enemy of the Protestant Reformation, but in this latter part of her reign under the influence of her free-thinking son's policies, she was induced to enact some anti-ecclesiastical legislation, which she subsequently developed into persecutions. She was a pure and noble woman, strikingly beautiful in her youth. Ten of her 16 children survived her. Monuments to Maria Theresa are to be found in Klagenfur, Vienna and Plessburg. Her letters to her children and her friends were edited by Arneith (1881), who wrote Maria Theresa (1888). Consult also de Broglie, Marie Thérèsse (1888); de Villermont, Marie Thé- rèse (1895); Wolf and Zwiedineck-Südenhorst, Oesterreich unter Maria Theresa (1884); Bright, Maria Theresa (1897).

MARIA THERESA, Order of, See Orders and Decorations.

MARIAMNE, má-ri'-män', granddaughter of Aristobulus and Hyrcanus, the high-priest, and wife of Herod the Great. Her history is related by Josephus from whom we learn that Herod was devotedly attached to her. She was condemned to death through the machinations of Salome, her husband's sister, on a false charge of adultery, 28 B.C. She met her fate with an intrepidity worthy of her noble ancestry, and was bitterly deplored by the king after her decease. Several plays have been based on the story.

MARIANA, Juan, hoo-án' má-ri'-ä-nâ, Spanish historian, b. Talavera, 1536; d. Madrid, 17 Feb. 1623. Taking holy orders he entered the Society of Jesus. To his training at the University of Alcala he owes the pure taste and elegance of his writings. He taught theology for 13 years with the Jesuits in Rome, Seville, and Paris, returning to the Jesuits' College at To- ledo in 1574, where he wrote his Historia de Rehus Hispanie (1st ed., Toledo, 1592), in elegant Latin, but afterward translated it into Castilian. His tone is impartial, though he
loves Spain and admires Spanish virtue. Though a Jesuit he complains of Pope Alexander VI. Though a Spaniard he is not blindly prejudiced in favor of his king. He describes with sorrow the conquest of Naples; and his censure of Ferdinand is moderated only by considering his good qualities as personal, his bad ones as common to all princes. He has pointed, however, much claim to originality and borrowings largely from Zurita (q.v.). Four editions of the translation appeared during his lifetime, each with corrections and additions. An English translation was made by Stephens, the continuator of Dugdale's 'Monasticon' (London 1609, folio).

MARIANA, má-re-'nà, in American colonial history, a name given by John Mason to the tract or territory granted to him between the Salem River and the Merrimac. Here he founded an agricultural settlement and formed the Laconia Company in 1620. He returned to England in 1633 and died there two years later. In 1691 his heirs sold all his lands and rights in New Hampshire to Governor Allen.

MARIANA (má-re-'nà), or MARIANNE ISLANDS. See LADROON ISLANDS.

MARIANNA, má-re-'nànə, Ark., town, county-seat of Lee County, on L'Anguille River, at the head of navigation, and on the Salt River. It is on the railroad, about 25 miles north-northwest of Helena. It is in a fertile agricultural region in which cotton is one of the principal crops and in the vicinity are large forests. The chief industrial establishments are lumber-mills, cotton-gins, cotton-compresses and cottonseed-oil mills. The town is at the head of navigation and has considerable trade by steamers and railroad. The town owns and operates the waterworks. There are banks and newspapers. Pop. 4,810.

MARIAZELLE, má-re-'ázlə, Austria, a picturesque mountain village in the north of St. Moritz, 60 miles southwest of Vienna. It is a noted pilgrim resort, annually visited by about 200,000 persons, attracted by the celebrated image of the Virgin and Child, enshrined in a handsome church founded in 1563, and rebuilt in 1827. Pop. about 1,500.

MARIBOIS. See NAGRDIANS.

MARIBOJOC, má-re-'bō-hōk', a pueblo of the province of Bohol, situated on the southwestern coast of Maribojoc Bay, eight miles north of Tagbiliran, two miles from the mouth of the Abalán River. It is an important road centre. Pop. 10,900.

MARICOPA, má-re-köpà, or COCO-MARICOPA, an Arizona tribe of Indians, a branch of the Yumas, formerly inhabiting the region around the confluence of the Gila and Colorado rivers. Their descendants and the Pimas, with whom they subsequently confederated, are now to be found in the Gila River Reservation to the number of about 400. In their aboriginal state their dress was of deerskin, with short white collar and a face-painting of white and red. Their dwellings were of woven straw and cornstalks over a pole framework. They were an agricultural people and raised large crops by irrigation. Under missionary influence they have been civilized and are now noted for their industry, their efforts at self-improvement and their manufactures of cotton cloth, baskets and pottery.

MARIE ANTOINETTE, mä-ré å-tō-né-têt' (Fr. mä-ré å-twä-ne-tét'), queen of France: b. Vienna, Austria, 2 Nov. 1755; d. Paris, 16 Oct. 1793. She was the daughter of the Emperor Francis I and the celebrated Marie Theresa. She left Vienna for Versailles in 1770, when only 15, to marry the young Duc de Berri, afterward Louis XVII of France. When her husband ascended the throne in 1774, she gained the affections of the people by repeated acts of generosity. It was, however, soon observed that her natural freedom of manner brought on her the criticism of enemies about the court. It was thought, too, as many believe, with reason, that she was to a certain extent controlled by her mother as an Austrian spy. An extraordinary occurrence added fresh force to calumny and tarnished the fair name of the queen, who was not to Mason returned to England in 1633 and died there two years later. In 1691 his heirs sold all his lands and rights in New Hampshire to Governor Allen.

MARIE ANTOINETTE had great influence over the king, and her duchesse, who opposed such measures of reform and economy as had been proposed. Her extravagance was regarded by the people as one of the chief causes of their poverty. Her unpopularity increased, and the general indignation was raised to the highest pitch by the enthusiastic reception given her at the banquet on 1 Oct. 1789, where the white Bourbon cockades were worn and the national cockade trampled under foot. The arrest of women, the attack on Versailles and the transfer of the royal family to Paris followed in a few days. It was the queen who advised the flight of the royal family from Paris to join Bouille's army in June 1791, which ended in their capture at Varennes. From that time they were viewed as traitors. On 10 Aug. 1792, the last day of the royalty, the queen exercised all her power to induce the king to resistance. This he thought was vain, and he was led with his consort before the Legislative Assembly. She heard his deposition announced, and then accompanied him to the prison of the Temple. There, deprived of every semblance of liberty, she displayed magnanimity and patient endurance. In August 1793, she was removed to the Conciergerie, and in October was brought before the revolutionary tribunal. She was charged with having dissipated the finances, exhausted the public treasury, corresponded with foreign enemies of France and favored its domestic foes. She replied with firmness and decision, and heard her sentence pronounced with perfect calmness. On the same day she was guillotined. Marie Antoinette's faults were due in great measure to her defective education and difficult position. Her expiation of them made her a general object of pitying interest. Consult Lesure, 'La vraie Marie Antoinette' (1853); Campan, 'The Private Life of Marie Antoinette' (1887); Bicknell, 'The Story of Marie Antoinette' (1897); Belloc, H., 'Marie Antoinette' (1909); Heidenstam, O. G., 'Marie Antoinette, Person et Bernave: leur Correspondance' (Paris 1913).

MARIE DE FRANCE, má-re de frah, French poetess of the 12th century, a native of Île-de-France, whence her surname, who spent
her life in England, where she was well known at the court of Henry II. Her "Lais," largely based on Breton stories, and full of Celtic spirit and magic, was a repudiation of the title "Isopé" (that is, "Isop") of an English collection; and a tale, "Le Purgatoire de Saint Patrice," make up the body of her work. The "Lais" are edited by Warnke (1900), and the "Purgatoire" by Jenkins (1894); each edition has a valuable preface.

**MARIE GALANTE**—MARIETTA

**MARIE GALANTE**, gá-lant, West Indies, an island, one of the Lesser Antilles, belonging to France, about 15 miles southeast from Guadeloupe. The area is about 60 square miles. The chief productions are sugar, coffee, tobacco, indigo and cotton. It is a dependency of Guadeloupe. Columbus discovered it in 1493, and named it from his vessel, the Santa Maria. The French occupied it in 1647, and lost it several times. In 1825 it suffered severely from the hurricane which isolated it from the rest of the island. Pop. 14,268, chiefly negroes.

**MARIE DE MÉDICIS, de má-de-sé**, queen of France: b. Florence, 26 April 1573; d. Cologne, 3 July 1642. She was the daughter of Francis I, Grand-Duke of Tuscany, and was married by proxy, 5 Oct. 1590, to Henry IV of France, with whom she constantly quarrelled, partly because of his inconstancy and his open favor to the Marquise de Verneuil, and partly because of her own haughty, obstinate character, which was not unmixed with ambition. For years she urged him to have her crowned queen; the ceremony took place 13 May 1610, and on the next day the king was assassinated. Marie was accused of complicity in the plot, but the charge is not proven. For seven years she acted as regent and showed a strong friendship for Spain, and the Catholic Church being advised by the nuncio and the Spanish Ambassador as well as by such favorites as the Concinis. She quarreled with her son, later Louis XIII, was reconciled to him by Richelieu, and upon her return from England was received with a magnificent banquet by the king. She was compelled to leave court in 1630. Her last years were spent in exile in Belgium, England and Cologne. The story of her poverty during these years is untrue. Consult Miss Pardee, Life and Memoirs of Marie de Médicis (1832); Lord, "The Regency of Marie de Médicis" (1903).

**MARIE PAULINE, Princess Borghese.** See Borghezio, Marie Pauline.

**MARIENBAD, má-reén-bád, Austria, one of the most frequent and picturesque of the Bohemian watering-places, near the western frontier, in a triangular basin formed by several morainic ridges, about 32 miles northwest of Pilsen. The village, built on a slope, surrounded with woods of pine and fir trees, except in front, has a town-house with assembly-room and reading-rooms; several bathing establishments, theatres, etc. The springs utilized are eight in number and are cold; some are alkaline and containing Glauber's salts, others alkaline and chalybeate, etc. Seven are used externally and internally, one is used for bathing alone. Great quantities of the water are exported in times of peace.

**MARIETTA, má-ré-tá, Ga., city, county-seat of Cobb County, on the Nashville, Chattanooga and Saint Louis Railroad, about 20 miles north by west of Atlanta. Kenesaw Mountain (q.v.) is west of the city. It was settled about 1840-41 and incorporated as a city charter was granted in 1888. It is in a fertile agricultural region in which stock-raising is one of the prominent occupations. Large marble quarries are in the vicinity. The chief manufactures are chairs, dressed marble and machinery, and church products. The chief religious denominations are the churches and schools. The Clarke Library, which contains about 5,500 volumes, is in Marietta. A national cemetery located here contains the graves of 10,279 soldiers; the unknown dead number 2,967. The mayor and council are chosen at a popular election. Pop. 5,949.

Marietta was an intermediate objective point in General Sherman's campaign for Atlanta, and when he crossed the Etowah 23 May 1864, his columns were headed for that place by way of Dallas and New Hope Church, but Gen. J. E. Johnston threw his army in his front and checked him at New Hope Church and Dallas. After many hard-fought battles and constant severe skirmishing, Johnston abandoned his Dallas lines (see DALLAS, GA. ART) on 4 June, and took position covering Marietta. His left on Lost Mountain, his right beyond the railroad and behind Noonday Creek, with a strong advanced position on Pine Mountain. Sherman repaired the railroad, established a secondary, fortified base at Allatoona Pass, and joined by Blair's Seventeenth corps advanced 10 June and confronted Johnson in his new and strong position, and by the 14th was strongly intrenched before it in a continuous line of 10 miles. Johnston abandoned Pine Mountain on the night of the 14th, and Sherman advanced his lines, bringing on the engagement at Pine Mountain (q.v.) 15 June. The general movement was continued on the 16th and the right thrown forward to threaten the railroad below Marietta. Johnston was forced by the great pressure of Sherman's forces to abandon the city the 18th. Johnston fell back to a new line, including Kenesaw Mountain, which was strongly fortified, and Sherman pressed in closely on the centre and left, north of Marietta, still continuing the extension of his line to the right, south of it. Johnston, making movement by his left, encountered Sherman's right at Kolb's Farm (q.v.) on the 22d. Sherman assaulted Kenesaw Mountain (q.v.) on the 27th, and was repulsed. Flanking operations were then renewed to the right to reach the railroad, and Johnston, finding it in danger and his communications with Atlanta threatened, after being 26 days under an uninterrupted cannonade and infantry fire, abandoned Marietta on the night of 2 July and fell back to a new line, previously selected and intrenched, 10 miles south of Marietta, and covering the railroad and his pontoon-bridges across the Chattahoochee, with an advanced position at Smyrna Campground. Sherman occupied Marietta on the morning of 3 July. The Union loss in the operations around Marietta was 1,790 killed and missing, and 5,740 wounded, an aggregate of 7,530. Johnston reported a Confederate loss of 468 killed and 3,480 wounded. Consult "Official Records" (Vol. XXXVIII); Sherman, Memoirs (Vol. II); Van Horne, "History of the Army of the Cumberland" (Vol. II); Johnston, "Narrative."
MARIETTA, Ohio, city, county-seat of Washington County, on the Ohio River at the mouth of the Muskingum, and on the Baltimore and Ohio and Pennsylvania railroads, about 95 miles, in direct line, southeast of Columbus. The city is in a coal, iron, petroleum and gas region with fertile agricultural lands in the valleys. Seven hundred carloads of vegetables and 400 carloads of fruit are shipped from this county annually to other markets. The manufacturing establishments include chair factory, glassworks, oil machinery and tool works, brick plant, foundries, saddle and harness plant, sheet and tin plate mill, five chemical plants, button plant, safe-cabinet works, paint and color plant, automobile devices plant. There are five banks with combined assets of over $5,000,000. The principal buildings are the Marietta College, the public schools, the churches, the county courthouse, the city hall, the post office, the chamber of commerce, the armory, the public library, club houses, three office buildings, etc. The government is vested in a mayor and council and is administered according to the "Ohio Municipal Code." The city is part of a remarkable group of ancient works which consisted of two sections, one containing about 40 acres, the other about 30 acres. The remains of mounds, truncated pyramids, walls, walls and other ancient works still exist, although the city covers a larger area than the former enclosures. The first settlement was made in 1788 by people from New England, under Gen. Rufus Putnam, acting for the "Ohio Company" who had secured a grant of lands on both sides of the Muskingum River. The place was named in honor of Marie Antoinette, Arthur Saint Clair organized here July 1788 the Northwest Territory. In 1800, Marietta was incorporated as a town. Fort Harmar, built in 1788, was opposite Marietta, and in 1800 the village of Harmar, once a site of the fort, was annexed to the city. The building used as the land office for the "Ohio Company," the old Block House, and the mansion of the first governor of Ohio, are still standing here and in good condition. The museum contains many things of historic interest. Many of the pioneers of New England as well as of Ohio, and many of the Revolutionary soldiers, were buried in the Marietta cemetery. Pop. approximately, 16,000. The city limits have been extended and several large plants have been established. Consult King, "History of Ohio," Hoar, "Oration at the Celebration of the Centennial of the Founding of the Northwest at Marietta."  

MARIETTA COLLEGE, in Marietta, Ohio, founded in 1835 for men and women. It has college and preparatory departments; the latter is known as Marietta Academy. The courses lead to the degrees of A.B., Ph.B. and B.L. Courses are provided for work in music, art and military science, and short summer schools are given for work in the arts and sciences. The library, which has about 76,000 volumes and 30,000 pamphlets, is noted for its books on the history of the Northwest. In 1917 there were over 200 instructors and about 225 students. The grounds and buildings were valued at $300,000, the productive funds at $587,000, and the total income $49,354.

MARIETTE, mar'ret, Auguste Edouard, French Egyptologist: b. Boulogne-sur-Mer, 11 Feb. 1821; d. Cairo, 19 Jan. 1881. He was educated at the Boulogne Municipal College and in 1839 went to England as professor of French and drawing. He returned to France in 1840, took his degree at Douai in 1844, and then became professor at his alma mater, the Boulogne Municipal College. While so engaged he became interested in archaeology and in 1847 published "Lettres à M. Bouillet," an essay on the history of Boulogne. In 1848 he received a position in the Egyptian museum of the Louvre and in 1850 was sent by the government to gather Coptic, Syriac, Arabic and Ethiopic manuscripts in Egypt. His excavations and discoveries in connection with his search for the true site of Memphis led to the finding of many important remains, such as the Serapeum, the first Memphian temple discovered, near the three great pyramids. Beginning to excavate four miles west of the accepted site of Memphis, Mariette came first upon an avenue of sphinxes, which led up to the temple of Ptah, and alabaster temple of Serapis mentioned by Strabo, which contained the sarcophagi of the sacred bulls ofApis from the 19th dynasty to the Roman supremacy. Besides these he found no less than 2,000 sphinxes, and over 4,000 statues, bas-reliefs and inscriptions, some evidently of Greek construction; and various streets, colonnades, and other structures belonging to a great city. His excavations around the base of the sphinx near Gizeh not only disclosed the entrance to it, but proved it to be sculptured out of the solid rock. In 1854 he returned to Paris and was made assistant conservator of the Louvre; and in 1855 was sent to Berlin to study Egyptian remains in the museums there. On his return to Egypt, in 1858, the vicerey made him conservator of the monuments and antiquities of the land, with the title of bej, later promoted to pasha, with an annual appropriation for the prosecution of his researches, and the foundation and maintenance of the museum of Boulak. His discoveries at Tanis revealed the tombs of the princes and the monuments of the Hyksos; the books and libraries at Thebes explain the chronology of the various dynasties. In 1860 he made the important discovery of the mummy of Queen Aahhotep, of the 18th dynasty, with a wealth of jewels of exquisite workmanship belonging to her. In 1873 the Institute of France awarded him the biennial prize of 20,000 francs. His discoveries have been of utmost importance for the light that they have thrown upon the earliest periods of Egyptian history. His chief published works are "Mémoire sur la mère d'Apis" (1856); "Aperçu de l'Histoire d'Egypte" (1864); "Nouvelle table d'Abydos" (1856), account of a second tablet found in Abydos which supplies the vacancies of the first and gives a list of the kings of the first six dynasties, corroborating that of Manetho; "Le Sérapéum de Memphis" (1857-64); "Fouilles exécutées en Egypte, en Nubie, et au Soudan d'après les ordres du vice-roi d'Egypte" (1857); "Notice des principaux monuments du musée de Boulak" (1870); "Les Palettes d'Apis" (1870); "L'Album du musée de Boulak" (1873); "Les Mastabas de l'Antiqu Empire" (1881-89).
MARIETTE lies buried in the museum-garden at Boulak, inclosed in an ancient Egyptian sarcophagus. Consult Mariette, Edouard, 'Mariette Pacha' (Paris 1904) and Maspero, G. C. C., 'Notice biographique sur Auguste Mariette' (ib. 1905).

MARIIGNOLI, maar-en-yol'le, Giovanni de, an Italian traveler: b. Florence, probably about 1260; date of death unknown, but subsequent to 1357. Entering the priesthood, he was appointed one of the four legates sent by Benedict XII to the great Khan of Cathay in 1338. The four legates accompanied by about 46 followers traveled east via Constantinople, whence in June 1339 they sailed across the Black Sea to Kaffa. They spent the winter of 1339 at Sarai on the Volga, enjoying the hospitality of Mahomed Uzbek, Khan of the Golden Horde. From his court the party traversed the steppes to Almalig (Kulja), in the modern Illi. They reached Peiking via Kamul about June 1342, and were well received by the Khan. The arrival of this embassy is chronicled in Chinese annals. Mariignonli remained three or four years in Peiking, after which he wandered through eastern China to Amoy Harbor. In 1348 he reached Kaulam (Columbus) in Malabar, where he founded a Latin church. He stayed 18 months there after which he appears to have visited the coast near Madras, thence journeyed to Java, and on a voyage to Europe was wrecked at Bernawala (Pervily), Ceylon, where he was detained four months by the native ruler, Khoja Jahan. Mariignonli returned via Armuz, Bagdad, Mosul, Aleppo, Damascus and Jerusalem, arriving at Avignon in 1353 and delivering a letter from the Khan to Pope Innocent VI. In 1354 the emperor, Charles IV, made Mariignonli one of his chaplains, and soon afterward he was consecrated bishop of Bisignano. It does not appear, however, that he ever took possession of his see. About 1355 he removed in the retinue of the emperor to Prague and was papal envoy to Florence in 1356. In 1357 he was at Bologna. The lasttrace of Mariignonli is a letter to him from Richard Fitz Ralph, archbishop of Armagh, in which he wrote objects to the sending of Mariignonli as papal envoy to Ireland. In 1768 Mariignonli's work appeared in volume II of 'Monumenta historiae Bohemica,' edited by Dobner. Modern readers were first attracted by the account published by J. G. Meinert (1820). Consult Beazley, C. R., 'Dawn of Modern Geography' (Vol. III, 142, 180-181, 184-185, 215, 231, 288-309, 1906).

MARIGOLD, a popular name for several unrelated plants. The pot marigold (Calendula officinalis) is one of the most widely popular of garden plants. It is grown for its brilliant flowers which range from white to rich orange, and for its flower-heads, which are often used to flavor soups, stews and dressings. The African marigold (Tagetes erecta) and the French marigold (T. patula) are also widely used for ornament. Their flowers are usually some shade of yellow. The petals are brown and some striped. The Cape marigold (Dimorphotheca sp.) is also grown for ornament but is less popular than the above. The corn-marigold (Chrysanthemum segetum) is a weed especially common in Europe grain-fields, but also cultivated for its flowers. For much of the time the plant is sometimes forced in greenhouses. All these belong to the family Asteraceae. The marsh marigold (Caltha palustris) is a member of the family Ranunculaceae. It is a well-known plant in the marshes and wet meadows of North America. The leaves, gathered before flowering, are widely used as a pothder under the name of dew slip greens. The name is also applied to various members of the genus Mesembryanthemum, several of which are cultivated for their grotesque forms, their peculiar foliage, etc.

MARIKANA, maar-i-kè'na, a Brazilian name for a marmoset (N. v.).

MARINDUQUE, maar-i-doo'kè, Philippines, an island lying southwest of the province of Tayabas, Luzon, and 30 miles southeast of Lipa; it is circular in shape, being 24 miles north and south and 23 miles east and west; area, 667 square miles. A mountain range runs from north to south across the island, and near its center are short spurs running east and west. The staple products are rice, coconuts, and hemp; the island is heavily wooded, and fruits are abundant and an important article of food among the natives. The chief industry is the raising of rice, of which large quantities are exported; the hemp of Marinduque is of a peculiar fine quality, and is used for weaving. At the southern end of the island there is excellent pasture, and horses and cattle are raised. It is in the route of steamers in the local trade between Manila and the Visayan Islands and Mindanao, and its two chief towns are ports of call for these steamers. In the winter of 1898-99 Marinduque was occupied by the United States troops, it being the first important position in the south taken after leaving Verde Passage. In 1901, with the small islands adjacent, it was created a province under civil government; 23 June 1902 the provisions of the Provincial Government Act were extended to the island of Mindoro and the Lubang group by incorporating them with the province of Marinduque. Pop. about 32,000, mostly Tagalogs.

MARINE ANIMAL OILS. See OIL.

MARINE CITY, Mich., city in Saint Clair County, situated on the Saint Clair River and the Rapid Railroad, 45 miles north of Detroit. It enjoys considerable reputation as a summer resort, but is also a busy manufacturing centre with salt works, beer sugar factories and ship yards. The city owns the water-supply system. Pop. 3,770.

MARINE CORPS. See NAVY OF THE UNITED STATES.

MARINE ENGINE. See INTERNAL COMBUSTION ENGINE.

MARINE HOSPITAL SERVICE. See HOSPITALS, MILITARY; HOSPITAL SHIPS.

MARINE INSECTS. Insects have not only invaded rivers and lakes, they have established themselves to some extent at least, along the margin of the sea. On a sunny day by the shore myriads of flies may be seen hovering over the seaweed cast up by the tide. These have been developed from grubs which live and feed in the decaying weed, and are able to bear immersions twice daily. Around the rock-pools many midges may be noticed. Their grubs feed on growing green seaweed, and spend their
whole life in the salt water, breathing the dissolved air, as do their fresh-water relations, by means of gill-filaments, or by paired air-sacs in the hind-body which are believed to act as reservoirs for breathing while the tide is up. Several kinds of very small springtails may be seen on the surface of the rock-pools at low-tide; probably when the water rises they retire into crevices of the rocks. They are covered with a very fine, dense pile, and it seems impossible to wet them.

The absence of wings is a common character among the sea-shore insects. The beetles of the genus Aephus are wingless, and so is the small bug Aepolophillus often found in their company, as well as the females of the midge Clunio, whose male, though winged, appears not to fly, but to use his wings as sails as he skims over the surface of the water. The tenebrionid insects of oceanic islands to lose their wings has often been noticed says Carpenter, and the loss of the power of flight explained as an advantage, since insects which do not fly cannot be blown out to sea. Possibly the absence of wings in so many sea-shore insects can be explained in like manner. Several genera of pond-skaters have one or two species which frequent the water of estuaries and harbors; these are in all cases wingless, though their flight-water requirements are similar.

The extreme of adaptation to marine life is shown by the bugs of the genus Halobates, also belonging to the family Hydrometrida, with their short anchor-like fore-legs and their immensely long and slender middle and hind-legs, the middle shin and foot being fringed with long hairs. The elongate wingless fore-body of these insects and the greatly reduced hind-body give them a most peculiar and characteristic appearance, and the dense pile wherewith they are covered keeps them dry. They have been observed gliding over the calm seas of the tropics, often hundreds of miles from land, or clinging to drifting substances whence they could not escape. Consult Carpenter, G. H., 'Insects, their Structure and Life' (1899); Millia, 'Natural History of Aquatic Insects' (1895).

MARINE INSURANCE. See INSURANCE, MARINE.

MARINE SEDIMENTS, those laid down in the ocean, in contrast to terrestrial deposits laid down on land. They are usually characterized by uniformity in thickness and character over rather large areas, and commonly contain fossils of animals known to live only in the sea. The common types are conglomerates, sandstones, shales and limestones. See OCEANS, section on Ocean in article on GEOLOGY, and section on Sedimentary Rocks in article on Rocks.

MARINER'S COMPASS. See COMPASS, MARINER'S.

MARINES. See MARINES, UNITED STATES.

MARINES, United States.—The oldest branch of the United States military service, inaugurated in 1775. While until recent years the services of this corps did not receive special notice, through recent foreign expeditions their conspicuous bravery under the most trying conditions (Peking, Vera Cruz, etc.) brought them a prominent place in the public eye, a condition reaching its climax during the World War in 1918 (Belleau Wood, etc.). The marines have a number of humorous sobriquets conferred upon them among them might be mentioned "Webfoot soldiers"; "Soldiers of the Sea," while Kipling called them "Soldier and sailor, too." The Hon. Josephus Daniels, Secretary of the Navy, prefers to term them "the efficient fighting, building and landing force of the Navy." To be known as "the first line of defense of naval bases and stations; they are used for the protection of American lives and interests in foreign countries, besides acting as landing parties with expeditionary forces and on advanced base duties.

The equipment of the Marine Corps contains at present: Infantry, field artillery, machine-gun companies, defensive artillery, engineers, signal corps, etc. An aviation branch used heavier and lighter than air crafts in efficient service on the Allies western front in 1918. The corps is then a complete army in itself, lacking only cavalry. And on several recent expeditions horses have been brought into play as mounts for some officers. Every man in the ranks obtains a perfect training and practice in marksmanship, and their officers, after the full course at the Annapolis Naval School, which constitutes the naval officers course, have to pass through two years' vigorous study and drill at the Norfolk School for Marine Corps Officers.

History.—The first record of American marines in this country dates back to 1740 when three regiments were organized in New York for service under the flag of Great Britain. On 10 Nov. 1775 a Marine Corps was organized under a resolution of the Continental Congress with one colonel, two lieutenant-colonels, two majors, etc., as "First and Second Battalions of American Marines." Already by February 1777 a battalion of 300 marines and landsmen, under Maj. Samuel Nichols, captured the English forts of New Providence, Bahamas—United States marines' first battle. Throughout the Revolutionary War the marines did an appreciable share of the fighting which brought victory and freedom in its train. Conspicuously active were they under John Paul Jones, in the battle between the Ranger and the Drake, Lieutenant Wallingford losing his life commanding his marines. Forty-nine out of 137 marines in the great battle between the Bon Homme Richard and the Serapis were killed or wounded. The State of Pennsylvania fitted out the Ryder Ally
with a crew of 110 seamen and marines with Captain Barrow in command, in 1782, which fought the first combat in Delaware Bay, capturing the British ship General Monk, generally looked upon as one of our most brilliant actions. With the Revolution ended, both army and navy were disbanded, the new Navy Department being created April 1798, and the Marine Corps organized and established 11 July of the same year.

The next noteworthy marine engagement was in 1803 in the War with Tripoli when the Philadelphia's Lieutenant Osborne and guard were taken prisoners after the most gallant exertions. It was the marines who rendered such valuable service to General Eaton (q.v.), consul at Tunis, in his remarkable march of about 600 miles across the desert of North Africa, from Alexandria to Derne, in our arriving at which latter place native fortifications were stormed and captured by the marines under Lieutenant O'Bannon. They hauled down the Tripolitan flag and hoisted that of the United States of America, this being the first time the American flag was raised over a town in the Old World. "Tripoli" has appeared inscribed on the banners of the Marine Corps ever since. When, in the War with Great Britain (1812), the Constitution defeated the Guerriére, it was the commander of the marine guard, Lieutenant Bush, who was the first officer killed, while repelling boarders during a critical phase in the action. In the capture of the frigate Macedonion by the United States (Commodore Decatur) the marines, under Lieutenants Anderson and Biddle, in our history, Lieutenant Brown and 11 of his men were killed and 20 wounded. In the battles of Lake Champlain and Lake Erie the marines actively participated, also in the engagement between the Constitution and the Guerriére in the battle between the President and Endymion, and in the battle on Lake Ponchartrain. They were with the army under Scott in Canada, with General Winder at Bladensburg, at New Orleans with General Jackson, at North Point, Baltimore, and in minor actions on Maine's coast and the shores of Chesapeake and Delaware bays. The Indian outbreak in Georgia (1836) found the army unprepared and Colonel-Commandant Archibald Henderson, of the marines, quickly volunteered for service with the Indians, and was made an active participant under General Jessup, through southern Alabama and the Florida Everglades against the guile of the Creeks and Seminoles. Previous to this they had been engaged against Spanish pirates in the West Indies and in Matamoros, and in the great fire in New York (1835) they had guarded private and public property.

In 1845 Mexico declared war against the United States and (to 1848) the marines were active in all sections, making a brilliant record. They were on the Pacific Coast under Commodores Sloat, Shubrick, Stockton; on the East Coast they fought under Commodores Connor and Perry; on shore under Generals Scott, Taylor and Worth. At the capture of Monte-
(1898) Guantanamo, Cuba, was occupied by a detachment of marines and, assisted by the ships, successfully defended the place against 6,000 Spanish soldiers, creating a base for the navy. The marines, at the secondary batteries, are credited with doing more damage to the Spanish cruisers than the other gunners at the battle (3 July 1898) of Santiago, and it was the marines that Dewey in May of that year landed and turned over the occupation of Cavite as fort and naval station after the battle of Manila Bay. In 1899 marines from Manila (later reinforced by marines from the United States) landed in China and did their share in the fighting at Tien Tsin, and on the march to the relief of the besieged American legation at Peking in the Boxer Rebellion.

Spectacular was the expedition commanded by Captain Thorpe, in 1903, when, accompanied by a company of marines mounted on camels, they crossed the African deserts into the heart of Abyssinia, as escort of an American repre sentative, and brought about a conference with King Menelik in his capital. In the same year, marines were protecting the American legation at Seoul, Korea, where insurrection existed. Four battalions of marines were sent to Cuba in 1906 and, later in conjunction with the army, became the 2nd Army of Cuban Pacification, successfully pacifying the incident Cuban revolution, with a two-year occupational service. In 1908 the marines were policing at election polls in Panama, and the next year were protecting American citizens and property against Nicaraguan revolutionists at Corinto, and (1909) in Bluefields, Nicaragua. Back to the same place came the marines in 1912 during another Nicaraguan intense revolutionary spasm; a battalion, under Major Butler, to Corinto, a regiment, under Colonel Pendleton, followed. The regiment fought several engagements but pacified the country, with a loss of four lives and several wounded. A regiment of marines under Colonel Moses, on the Froust, was dispatched to Fort au Prince to protect American interests, and was succeeded by another under Major Smith, on the Pororop. In 1914, under the present major-general commandant, George Barnett, marines landed in Haiti, where they did their share in the military occupation of that place. That day and the next they lost five lives and a number were wounded, facing a desperate resistance. They occupied the town till November. Intermittently the marines were doing duty in Santo Domingo or Haiti in the disturbances of the island republics up to 1917.

Marines, Activities in France in 1918 — Belleau Wood, Soissons, etc.— On 30 May 1918, the Second Division of the United States Marines was selected under its commander, Maj.-Gen. Omar Bundy, go to the relief of the French army in retreat before the German drive. The Fifth and Sixth regiments and the Sixth Machine-Gun Battalion, forming the Fourteenth Infantry, were commanded by Brig.-Gen. James G. Harbord (made major-general end of June), were in reserve in a rest area at Montdidier, when the order to the front arrived. Jubilant at the thought of active service they crowded onto their trucks and traveled 30 wearying hours (72 miles) to the scene of battle. Reaching their destination stiff and sore in the early morning of 2 June, but without delay they moved into line as support division to the rear of the French (Les Mares Farm, Bois de Veuilly, Voie de Chatel, etc.). The Germans renewed their thrust that afternoon pushing the French before them till the poilu filtered through the unwavering line of marines, and the rear had become the front. It was the opening of the battle of Chateau Thierry, and found a vicious wedge of the German advance facing the Americans. Hill 165 was the objective as the enemy advanced through a wheatfield, but the alert marines as expert riflemen "calmly set their sights and aimed with the same precision that they had shown upon the rifle ranges at Paris Island, Mare Island and Quantico." Their machine guns also took up the fire. The accuracy of the rifle fire took heavy toll of the German ranks. The artillery soon backed the staying powers of the riflemen and, with shrapnel, impossible to the killing power of the German machine guns to cover raked by the American fire. A French airplane was aiding the artillery. The aviator was so astonished at the marines' cool deliberate setting sights and adjusting ranges (the French ranks always emptied their magazines at random without raising their rifles to aim) and seeing each man select his human target, he signaled "bravo" to the sharpshooters. The German drive for Paris was stayed with this day's resistance. Then followed attacks and short advances and counterattacks and heavy bombardments that thinned the German ranks sadly and forbade either rest or renewing the stock of rations. Cold rations and sleepless nights, shortage of food and absence of water often, for the terrific barrage killed most of the runners. But nothing could dull the courage and fortitude of those two regiments. However, 6 June found them still outside the woods, and with Bois de Belleau in the grip of the Germans it was impossible to recapture Lea zeau des Thiers. The villages of Bourkesches, on the right, and Torcy on the left, must also needs be taken to gain Belleau Wood, which was a rocky jungle protected by hundreds of machine guns and considered by the H. 27th Army, Mexico, to do their share in the military occupation of that place. That day and the next they lost five lives and a number were wounded, facing a desperate resistance. They occupied the town till November. Intermittently the marines were doing duty in Santo Domingo or Haiti in the disturbances of the island republics up to 1917.
sions were so exhausted that the crack Fifth Guards Division had to be called in. The 28th had to be called. Thus one American division (the Second) wore out five German divisions. By the 10th the line was advanced 900 yards on a front of one and one-half miles and 500 prisoners, 30 machine guns, and two platoons of 2.8 mm ammunition, etc., were captured. By the 28th the last of the German nests were captured together with guns and prisoners, after the artillery had torn the wood to pieces. Then the attack on Chateau Thierry became practicable. And the French have renamed the Bois de Belleau “Bois de la Brigade de Marine” (Wood of the Marine Brigade).

July brought relief and rest, also replacement of the depleted ranks. But already on the 18th we find the indomitable marines at the “grand offensive” in the neighborhood of Soissons, near Tigny and Vierzy, where they advanced facing a terrific fire from a machinegun centre. Their losses enforced digging in and holding the ground taken. In the battle for Montdidier, the French occupied a line from Remenauville to Limay, night of 11 September, starting an attack of two days’ objectives on the night of the 14th. They rushed over the rivulet Rupt de Mad, occupied Thiacoit, scaled its heights beyond and formed a line from Zonneville—Jury Ridge to the Bivon Forest, finishing the two days’ objectives by 2.50 p.m. of the first day. Casualties about 1,000 with 134 killed; participating in the capture of 80 German officers, 1,200 men and 300 and 800 guns. The next came (early October) to the marines the honor of capturing “the bald, jagged ridge” 20 miles due east of Rheims, known as Blanc Mont Ridge. It was a German “keystone” position. The commanding officer of the United States Marine Corps, Maj. Gen. John A. Lejeune, considered the victory so valuable as (11 October) to command the Second Division and to add: “As a direct result of your victory, the German armies east and west of Rheims are in full retreat, and by drawing on yourselves several times the front you greatly assisted the victorious advance of the Allied armies between Cambrai and Saint Quentin.”

And the toll paid for these acts of unparalleled heroism gave the following sad figures: Of 8,000 men engaged in these fierce battles, this Marine Corps had as casualties by the end of June 126 officers and 5,073 enlisted men killed or wounded; over half the original quota. And but 57 United States marines were taken prisoner by the enemy, these wounded far in advance of their lines. As a mark of honor for the many individual acts of heroism of the corps 644 Distinguished Service Crosses were awarded to the members of the Second Division, more than any other division. Of this total the marines won as follows up to 17 March: Fifth Regiment Marines, 206; Sixth Regiment, 137.

MARINETTE, mär-i-net’, Wis., city, county-seat of Marinette County, at the mouth of the Menominee River, on Green Bay, and on the Northwester and Northwestern, the Wisconsin and Milwaukee, and the Chicago, Milwaukee and Saint Paul railroads, about 50 miles north east of Green Bay (city) and opposite superior’s Mich. The harbor is large and safe, and the river affords opportunity for bringing logs from the forests along its upper course in both Wisconsin and Michigan. Marinette was settled about 1849–50 and in 1887 was incorporated. The water power is extensive and the lumber industry of Marinette is most important. The large lumber mills are the chief manufacturing establishments of the city. The four largest have a daily output of 1,000,000 feet of lumber. Other industrial establishments are saw factories, paper and pulp mills, box and broom factories, gas and traction engine and iron works, threshing machine factories, knitting mills, flour mills, furniture factories, cabinet shops and fruit canneries. The city carries on a lake commerce with all the important lake ports. The chief buildings are the county and county buildings, two hospitals, a public library, 20 churches, fine public and parish school buildings and Our Lady of Lourdes’ Institute. In the vicinity is large assembly ground where various religious and educational conventions are held each summer. Pop. 14,610.

MARINI, Giambattista, jäm-bá-têst’a ma-re’në, Italian poet: b. Naples, 18 Oct. 1569; d. there, 25 March 1625. He was assisted by the Cardinal Pietro Aldobrandini at Rome, with whom he went to Turin, where he became secretary to the Duke of Savoy, Charles Emmanuel, but the envy of his enemies and his satirical humor involved him in various disputes. Marini’s most famous work is the long epic ‘Adone’ (1623). His other works include ‘La Lira’ (1602–14); and a great collection of miscellaneous poems. Some of his sonnets are among the most perfect in the Italian language. He is the founder of the Marinisti school of poetry, of which false, overstrained imagery, far-fetched metaphors and forced conceits are characteristic features. Consult Menghini, ‘La vita e le opere di G. B. Marini’ (1888).

MARINONI, Hippolyte, ē-pô-lët mahr-nô-në, French inventor: b. Paris 1825; d. 1904. He has invented many articles of manufacturing which have been of world-wide adoption among them are a rotary printing-press which has been much used in France, another which printed in six colors, 20,000 copies an hour, and at the Paris Exhibition he exhibited a press which printed at a rapid rate two colors on each side of a sheet at one revolution.

MARIO, Giuseppe, joo-so-së’pë mahr’ë-ô, MARQUIIS DI CANDI, Italian tenor: b. Cagliari, Sardinia, 18 Oct. 1810; d. Rome, 11 Dec. 1883. After serving in the Sardinian army he went to Paris, where after two years of musical study he was appointed first tenor of the opera, changing his name at the same time from Di Candia to Mario. He made his début 2 Dec. 1838 as Robert in ‘Robert the Devil,’ and soon became the leading tenor of the world. His répertoire embraced all the great works of Rossini, Bellini, Donizetti and Verdi. He married the famous singer, Giulia Grisi, in 1854 and made an operatic tour of the United States. In his later years after his retirement from the stage in 1871 he lost his fortune through speculations, and the next year made a concert tour in this country.

MARINOTE——MARIO
MARION, Ala., town, county-seat of Perry County, on the Southern Railroad, about 60 miles west by north from Montgomery. It is situated in a fertile agricultural region, and its industries are connected with cotton pressing, etc. It is the seat of the Marion Female Seminary, established in 1836; the Judson Female Institute (Baptist), established in 1839; Lincoln Normal School for colored pupils (Congregationalist), and the Marion Military Institute. Pop. 1,834.

MARION, Ill., city, county-seat of Williamson County, on the Illinois Central, Chicago and Eastern Illinois and Missouri Pacific railroads, about 150 miles south by east of Springfield. It is situated in an agricultural region in which are large deposits of coal. The chief industries which contribute to the support of the city are coal-mining, fruit-raising, manufacturing, pianos, gloves, flour and raising cattle and mules. Marion is the chief trade centre of a large portion of Williamson and adjoining counties. Pop. 7,093.

MARION, Ind., city, and county-seat of Grant County, situated 73 miles northeast of Indianapolis on the Mississinewa River, in the heart of the Indiana agricultural country. It is served by four railway systems, the Pennsylvania, Big Four, Clover Leaf and Chesapeake and Ohio, also has three traction lines running north, east, south and west. Marion classes as a manufacturing city, the chief products being flour, paper and pulp, foundry products, bottles, furniture, rolling-mill products, auto trucks, motors, shoes, electric specialties, insulated wire, druggist wares, gloves, both heating stoves and ranges. The exports are extensive, about 350,000 tons per year. Marion has 30 churches, Y. M. C. A. and Y. W. C. A. Some of the public buildings are the public library, Masonic temple, courthouse, Normal College, new high school, costing $180,000. A National Soldiers' Home is situated at Marion, which cost about $1,500,000. The water plant is owned and operated by the city. Pop. 23,000.

MARION, Iowa, city, county-seat of Linn County, on the Chicago, Milwaukee and Saint Paul Railroad, about 110 miles northeast of Des Moines. It was settled in 1839 and in 1852 was incorporated. It is situated in a rich agricultural region in which the chief products are corn, oats, hay, wheat and vegetables. Considerable attention is given to stock-raising. Marion is the headquarters of a railroad division and has large railroad repair shops, freight yards and a round-house. Other industrial establishments are greenhouses, flour mills, cigar factory, cement block and tile factories, wholesale bakery and wholesale produce house. Saint Berchman's Seminary, Catholic boarding school for boys, is located here. Pop. 4,660.

MARION, Kan., city, county-seat of Marion County, on the Cottonwood River, and on the Chicago, Rock Island and Pacific and the Atchison, Topeka and Santa Fe railroads, about 85 miles s. of Kansas City, 277 miles from Chicago, is situated in a fertile agricultural region in which considerable attention is given to stock-raising. The chief manufactures are flour and dairy products. Pop. 1,951.
MARION, Ohio, city and county-seat of Marion County, on the Erie and Cincinnati, Chicago and Saint Louis, the Hocking Valley and the Pennsylvania railroads, 49 miles north of Columbus and 77 miles from Toledo. Marion was settled in 1815 by people from Rhode Island, and was incorporated in 1820. It is the centre of a rich agricultural and limestone country. There are five big quarries on the outskirts of the city. There are 39 factories in the city, employing 4,200 people. The products of the main industries are steam shoveling machinery, silk and re-rolled steel. Marion is a division point of the Erie railroad, and the transfer point for all eastern and western shipments; many employees of this road reside in Marion. There are five banks and four building and loan companies. The government is vested in a mayor and a council, chosen biennially. The percentage of foreign population is very small. Pop. 25,100.

MARION, S. C., city, county-seat of Marion County; on the Raleigh and Charleston, and the Atlantic Coast Line railroads, about 100 miles west of Columbia. It is surrounded by rich farm lands, the chief products of which are tobacco and cotton. It has large cotton mills, cottonseed-oil mills, lumber and flour mills and foundries. It ships to the large markets considerable tobacco and cotton products. Pop. about 5,020.

MARION, Va., town, county-seat of Smyth County, on the Marion and Rye Valley, and the Norfolk and Western railroads, about 140 miles southwest of Lynchburg. Marion was settled in 1832 and in 1871 was incorporated. The chief industrial establishments are flour and lumber mills, wagon and table factories, foundry and machine works and pulverized limestone plant. Mining and quarrying in the vicinity contribute to the industrial wealth of the town. It is the seat of the Marion Female College (Lutheran) and the Southwestern State Hospital for the Insane. The water for drinking and domestic purposes is brought from springs in the hills about three miles distant, and the waterworks plant is owned and operated by the town.

MARIOTTE, Edme, ed-mé mä-ré-ött, French physicist; d. 12 May 1684. He lived for the most part at Dijon, and was made prior of Saint-Martin-sous-Beaune. He became a member of the Académie des Sciences upon its formation, and was one of the founders of experimental physics. "It is Mariotte," said Condorcet, "who first in France introduced into physics a spirit of observation and of doubt. He discovered independently the law known by his name—also discovered by Robert Boyle (q.v.) and known as Boyle's law—that if the temperature remain constant, the volume of a gas will vary inversely as the pressure. Mariotte's Law, in physics, the principle that the volume of a gas, under constant, that is, unchanging, temperature and pressure, varies inversely as the pressure. It is identical with the latter name being applied to it in the United States and England, and the former in continental Europe. See liquefied and compressed gases.

MARIPOSA GROVE, a State park of 2,560 acres, situated in Mariposa County, Cal. It contains about 465 trees of the Sequoia gigantea, some of which are thousands of years old. The largest specimen is the Grizzly Giant, with a main limb over six feet in diameter at 200 feet above the earth and a circumference of 94 feet. The tallest tree is 272 feet high, and several are over 250 feet. A roadway 9½ feet wide has been cut through the heart of one of the giants.

MARIPOSA LILY, or BUTTERFLY LILY, popular names for various species of Calochortus of the family Liliaceae. The numerous species, all of which are natives of western United States and British Columbia, are characterized by coated corms; rather leaft, generally branched stems; and showy, six-segmented flowers. Almost all the species are in cultivation for ornament, some, natives of the Colorado Desert, being suited to arid conditions, others to fairly moist soils, still others to very cold localities, as species indigenous to the Sierra Nevada. All will stand extreme cold, but not alternate freezing and thawing, hence their failure under such conditions. The bulbs should be planted in late autumn in any kind of soil. After the tops have become yellow subsequent to flowering the following year the bulbs should be taken up, divided, and kept dry until planting time. They are often grown in pots under glass.

MARIPOSAN, or YOKUT, a linguistic stock of North American Indians, which once included about 40 tribes in southern California, in the region of Tulare Lake. See Yokuts.

MARIQUINA, P. I. town in the province of Rizal, Luzon, eight miles northeast of Manila. It is situated at the intersection of several main highways, has shoe and leather factories and medicinal iron springs. Pop. 8,180.

MARIS, mà'ris, Jakob, Dutch painter: b. at The Hague, 25 Aug. 1837; d. 8 Oct. 1899. He began his art studies at the Royal Academy, choosing landscape as a specialty, and receiving instruction from Ströbel and Van Hove, which latter he followed on his removal to Antwerp. He studied also under Keyser, director of the Antwerp Academy. Going to Paris he became under the influence of the Barbizon school, and reached his full power as a painter of figures and landscape in combination. In 1871 he returned to his native town. His brush work and use of chiaroscuro are essentially French. Among his numerous works are 'View of Schiedam'; 'View of a Town in Holland'; 'On the Sea Shore'; 'Mother and Children.' Examples of his work may be seen at the Metropolitan Museum, New York.

MARIS, Mathew, Dutch painter, brother of Jakob Maris (q.v.): b. The Hague, 1839; d. London, 22 Aug. 1917. In his youth he traveled and worked with his elder brother; in 1855 they lived in Antwerp sharing quarters with a young student named Alma-Tadema (q.v.); in 1860 the brothers studied and sketched in Germany and Switzerland; in 1870, in Paris, Mathew was enrolled in the National Guard and performed military duties during the siege. Shortly after he settled in London, where he remained till his death. He was a striking example of the so-called "artistic temperament"; he painted what he liked and when he liked, with the result that his works
are extremely scarce. His work is characterized by fine qualities of color and "imaginative wizardry." At sales his pictures brought very high prices; two of them fetched $33,075 in London in 1906; one produced $17,850.

William Maris, a younger brother, was also a painter of note (b. 1843; d. The Hague, 10 Oct. 1910). He received his training from his brothers and was the most truly Dutch in his brothers’ artistic sympathies. A sunny optimism pervades his work, expressed in wide skies, brilliant sunsets and gay groups of people, most of his life at Rysswijk, near The Hague. At the Alexander Young art sale in London in 1910, five of his studies were sold for $12,400; while nine pictures by his eldest brother fetched $51,425, mostly purchased by Dutch collectors.

MARISCAL, Ignacio M., Mexican statesman; b. Oaxaca, 5 July 1829; d. Mexico City, 16 April 1910. He received his diploma as a lawyer in 1849, and practised his profession until 1857, when he was elected a member of the Federal Congress. Two years later he was made justice of the Supreme Court of Oaxaca, and in 1860 circuit judge of the states of Oaxaca, Vera Cruz and Puebla. In 1861 he was again elected to the Federal Congress, being assigned the additional duties and responsibilities of government assessor of church properties; served as justice of the Supreme Court in 1862; as sub-secretary of foreign affairs in 1863, and was appointed first secretary of the Mexican legation at Washington in August of that year; chargé d’affaires 25 Oct. 1867, Secretary of Justice and Public Instruction in 1868; Envoy Extraordinary and Minister Plenipotentiary at Washington 1 June 1869; Secretary of Foreign Affairs 10 March 1871; Envoy Extraordinary and Minister Plenipotentiary at Washington 1 June 1872; justice of the Supreme Court of the Federal District and director of the National School of Jurisprudence 1 July 1879; Secretary of Foreign Affairs 22 Nov. 1880; special envoy to Great Britain May 1883 and Envoy Extraordinary and Minister Plenipotentiary October 1884; Secretary of Foreign Affairs June 1885. He was a member of the Geographical and Statistical Society of Mexico. He was closely associated with President Juarez throughout the War of the Reform, was secretary and legal counsel to the Mexican legation at Washington during the War of Intervention, and was the author of several historical and other works.

MARISTS, mà’ristz, either of two modern religious congregations in the Roman Catholic Church. The Marist Fathers, or Society of Fathers of Mary, originated in Lyons (1816), where a number of religious devoted themselves to missionary work, which extended over the Pacific islands and in 1845 passed on to Australia. The Marist Brothers, whose object was the education of youth, were founded a year later at Marisles, and chose for its field of labor the south of France. The Marist Fathers have 156 members in the United States which they entered 1849. Their headquarters is at Brookland, D. C. They have schools at Manchester, N. H.; Lowell and Lawrence, Mass.; and New York.

MARITIME LAW. Broadly speaking, the subject matter of any action over which an Admiralty Court could take jurisdiction should be considered a topic of the Maritime Law. In this definition prize cases would be included; but the right of capture and other belligerent rights on the high seas in time of war, the immunities of neutral shipping and cargoes, contraband, truce, flag of truce, and piracy are topics of International Law (q.v.). However, overseas commerce being international there is little in the lex maritima which has not an international aspect. The maritime law of Great Britain and the United States is rooted in the usages and customs of merchant seafarers, shipmasters and seamen, which are of remote antiquity and have been preserved in the Code and Digest of Justinian and other compilations hereafter mentioned. The oldest repository in England of this law was the 'Black Book of the Admiralty,' written in Norman French and dating partly from the reigns of Edward III and Richard II and partly from the reigns of Henry IV, Henry V and Henry VI, long before any controversies arose between the Admiralty and King's courts and foreign courts. The contracts, whereby they had been in peaceable possession time out of mind (Prynne's 'Animalis', version on the Fourth Part of Coke's Institutes, 1668). An early record of the administration of maritime law in England is found in the Domesday of Ipswich, 17 Edward I (A.D. 1289). The 'Black Book' has disappeared but an English manuscript, which was in the library of the College of Advocates at Doctors' Commons until the dispersal of the college in 1838, has in recent years done service for the lost original. The substantive sea law of the 'Black Book' is contained mainly in a transcript of the Laws of Oleron. This last-named compilation, which takes its name from an island off the west coast of France, near Rochefort, is extant in several manuscripts. The oldest of these, written in a mixture of Old French and Gascon, and now in the Guildhall at London, where it was brought from the archives of Bordeaux, probably dates from the end of the 13th century. The compilation is much older, no doubt, for the Laws of Wisby, by which the merchants of the Hansa towns and other foreign trading communities on the Baltic and North Sea regulated their conduct are mere condensations of the Laws of Oleron—and the Hanseatic League was formed in 1252.

A more complete code of sea laws than either of those mentioned is the 'Consolato del Mare,' of uncertain age and pedigree. Grotius asserts that it was compiled at the order of the ancient Kings of Aragon, whereas Armi and others claim it to have been the work of Pisan lawyers. Both may be right. The Consolato del Mare was evidently not compiled at one sitting; its matter is drawn from many sources, including the Roman corpus juris and the laws and customs of Italian, French and Spanish markets of commerce. While not complete until the 14th century, the extant form is apparently the resultant of accretions to a nucleus dating back possibly to the 11th century. Anyhow, a lex maritima had become generally recognized in Europe toward the end of the 12th century and its distinction from the common law of England, by Prynne, who is quoted above, is testified to by an early rescript of the 'Black Book' providing.
that "all those who sue any merchant, mariner or other person whatsoever in common law of the land for any thing of auitent right belonging to the maritime law, shall be fined the king his unlawful and vexatious suite." The extent to which the ancient complications have maintained their authority may be estimated from the fact that a fragment of the law of Rhodes, embodied in the Digest of Justinian and transcribed into the Consolato, states as correctly as any recent textbook the modern law of jettison and general average, while the rubric de nautico foenore (Dig. 22, 2; Code 4, 33) gives the present rules on bottomry and respondenda with absolute exactness.

The principal topics of Maritime Law (see articles under separate titles) are: Affreightment, under which head may be included the law governing contracts of shipmasters to carry freight and their resulting responsibilities as common carriers; Barratry, a sea crime which is committed when a master or crew do any unlawful act to their advantage and to the detriment of the owner of a vessel; mutiny is an extreme form of barratry; Bill of Lading (q.v.; also COMMERCIAL LAW AND NEGOTIABLE INSTRUMENTS); Bottomry, a form of contract whereby, figuratively, the keel or bottom of a ship, but in reality the entire vessel, is hypothecated to secure the repayment of money loaned, or to pay for repairs done or materials or supplies furnished and necessary to enable the vessel to complete a voyage; Charter-party, a contract of affreightment whereby the owner agrees, not to carry a particular consignment, but to let the whole or part of his ship to a merchant or other person for a particular voyage; Collision, under which title the rules for the assessment and apportionment of damage resulting from careless navigation are collected; Demurrage, the money required to be paid by the charterer for a vessel in compensation to the owner for her detention beyond the time agreed to for the loading or unloading of a cargo; General Average may be defined as contributions to be made by all parties interested in a cargo to make up the value of the salvage from the wreck in which the death occurred and to the freight money earned makes the statutory relief granted practically valueless. The English law on the subject is more liberal, though, where a calamitous loss occurs and the claimants are many, the total amount of damages recoverable is too small to be compensatory in any proper sense. In fact, it is possible that the limitation by law and distribution by insurance of the risks incident to maritime operations has thoroughly eliminated the motive of self-interest as a factor in the promotion of efficiency and safety. When a ship is lost its owner may make a profit, receiving more than its value from the insurance; similarly, the merchant may, and often does, get more from the underwriter than the value of a cargo lost; the underwriter averages his losses and, on the whole, makes a profit out of his business. The laws for the inspection of vessels, the licensing of masters and other officers, the rules of navigation and concerning lights and other statutes prescribing imprisonment and other heavy penalties for neglect to observe these laws and regulations or supply the minimum life-saving equipment do not seem to provide an incentive equal to that which would be provided by the risk of an unsurmountable sole loss or unlimited liability for carelessness in the operation of vessels. The statutes, moreover, have been proven deficient in many respects—for instance, it appeared from the inquiry into a recent celebrated case that the inspection of hulls did not include a test of stability.

The rights and duties of masters and seamen toward each other, the vessel owner, the shipper or receiver of cargo and passengers are in part regulated by usage. By far the larger part of this department of the maritime law however is statutory. The administration of ports, the issue of clearance and other papers and similar police regulations affecting shipping are, generally, in the form of prescriptions made by the highest legislative authority, though they may be the subjects of more municipal ordinances. These regulations have become internationalized by commercial treaties on a basis

out of the relations between insurer and insured or shipper and carrier or owner and charter-party, the common-law courts as well as the courts of admiralty might take jurisdiction. But in a case of bottomry, collision, general average or salvage, where the common law of the land and the law of the place where the loss diverge, the jurisdiction of the maritime tribunals is paramount. Obligations ex delicto are justiciable in courts of admiralty when the wrong was committed within their territorial jurisdiction. This jurisdiction extends to the high seas, the national territorial waters where the tide ebbs and flows and other navigable water connects with and leading to tidewater. In the United States admiralty jurisdiction may extend even to navigable waters disconnected from the sea and situated entirely within a single State. The Federal District Courts exclusively have original jurisdiction in admiralty cases. Under the maritime law no more than under the common law could there be a recovery of damages for death negligently caused. Such recovery is now permitted by statutory enactment; but the limitation of owner's liability to the value of the salvage from the wreck in which the death occurred and to the freight money earned makes the statutory relief granted practically valueless. The English law on the subject is more liberal, though, where a calamitous loss occurs and the claimants are many, the total amount of damages recoverable is too small to be compensatory in any proper sense. In fact, it is possible that the limitation by law and distribution by insurance of the risks incident to maritime operations has thoroughly eliminated the motive of self-interest as a factor in the promotion of efficiency and safety. When a ship is lost its owner may make a profit, receiving more than its value from the insurer; similarly, the merchant may, and often does, get more from the underwriter than the value of a cargo lost; the underwriter averages his losses and, on the whole, makes a profit out of his business. The laws for the inspection of vessels, the licensing of masters and other officers, the rules of navigation and concerning lights and other regulations prescribing imprisonment and other heavy penalties for neglect to observe these laws and regulations or supply the minimum life-saving equipment do not seem to provide an incentive equal to that which would be provided by the risk of an unsurmountable sole loss or unlimited liability for carelessness in the operation of vessels. The statutes, moreover, have been proven deficient in many respects—for instance, it appeared from the inquiry into a recent celebrated case that the inspection of hulls did not include a test of stability.

The rights and duties of masters and seamen toward each other, the vessel owner, the shipper or receiver of cargo and passengers are in part regulated by usage. By far the larger part of this department of the maritime law however is statutory. The administration of ports, the issue of clearance and other papers and similar police regulations affecting shipping are, generally, in the form of prescriptions made by the highest legislative authority, though they may be the subjects of more municipal ordinances. These regulations have become internationalized by commercial treaties on a basis
MARITZA — MARIUS

of reciprocity, foreign shipping at practically all the ports of the world sharing burdens and advantages equally with domestic vessels. Domestic regulations with respect to life-saving equipment also have international scope, because no vessel will not leave a port unless its clearance and ship’s papers will not be granted until the local safety rules have been complied with. The International Marine Conference held at Washington in 1894 evolved a set of "Regulations for Preventing Collisions" and the "Rule of the Road." Articles 15 and 16 of the convention agreed to this conference, prescribing a system of sound signals and "moderate" speed in fog or thick weather, were considered the most important and innovatory of the regulations then adopted; but shipmasters have continued to act on the principle, "when in a place of danger, get out as quickly as possible." The Seaman’s Act of 1914 and the Safety at Sea Conference held in Berlin in the spring of the same year are indicative of progress, though under existing world conditions their effect has not been appreciable.

Proceedings in Admiralty Courts are quite informal. Usually they are in rem, that is to say, the ship or cargo or some part of either are proceeded against rather than the master or owner in person. The initiation of an action takes the form of posting a libel, i.e., attaching the same to the mast or some conspicuous place on the vessel, or to that part of the cargo against which a claim is made. The attachment of a lien which can be discharged only by the entry of a bond, or the deposit in court of adequate security, or the payment of the claim. See DANISH SOUND DUES.

Bibliography.—The principal modern Codes of Maritime Law are the following: Belgium Code of Commerce; Egypt, Code of Maritime Commerce; France, Code of Commerce; Germany, Mercantile Code; Book IV; Holland, Commercial Code; Portugal, Commercial Code; and Spain, Commercial Code. Demski, V., Europe and the New Sea Law (London 1912); Duckworth, "Encyclopædia of Marine Law" (London 1907); Parsons, "Shipping and Admiralty" (2 vols., Boston 1869); Saunders, "Maritime Law" (London, 1880); Smith, David Wright, "Rule of the Road at Sea" (Glasgow 1910); Twiss or Sir Travers, "Black Book of the Admiralty" (4 vols., London 1871).

STEPHEN PFEIL.

MARITZA, már’ít-sá, Turkey, a river of Adrianople, the ancient Hebrus, rising as the Topolnitsa, near the Bulgarian frontier, in the Balkan Mountains, and flowing through eastern Rumelia, southeast to Adrianople, where it bends to the southwest and falls into the Aegean Sea by the Gulf of Eon. It is over 300 miles long and navigable to Adrianople, about 100 miles from its mouth.

MARIUS, má’r-é-ús, GAUSS, Roman general: b. about 156 B.C., in Cereatia, in the Volscian territory; d. Rome, 13 Jan. 86 B.C. He won his first military repute at Numantia in 134, beginning his rapid rise from the ranks; was made tribune of the people in 119; increased his political importance by putting Julius Caesar’s auxilia; became praetor in 115; went to Spain in the next year, suppressing brigandage there; and in 109 accompanied Metellus to Africa. Two years later he was chosen consul, displaced his superior officer and made a brilliant campaign. His success was so great that he was elected consul four times in succession (104—101 B.C.)—a proceeding counter to law and entirely unparalleled—so as to meet the invasion of Italy by the Cimbri and Teutons. He defeated the latter tribe at Aquae Sextiae in 102, and the Cimbri at the Raudian Fields in 101. In 100 he was again elected consul. He made the fatal mistake of placing Metellus on the supreme command, castigated himself with the most disreputable leaders of the popular party, and, in his envy of the rising fame of the patrician Sulla (q.v.), attempted to remove him from his command in the Jugurthine War. Civil war broke out in 88; Sulla was victorious. Marius fled to Africa, whence he returned to Italy on the successful rising in Rome under Cinna. The first great proscription followed and many of Marius’ opponents were killed. Marius was elected consul for the seventh time in 85, but declined to enter upon the office. Consult Beesly, 'Marius and Sulla' (1878).

MARIUS THE EPICUREAN, the chief work in fiction of Walter Pater. It is the story of a young Roman of the days of Marcus Aurelius, but in the problems and experiences of young Marius in ancient Rome, Pater has given also something of the problems and experiences of a young man at the end of the 19th century. In the days of Marcus Aurelius the ancient world was changing into the medieval. Another such period was the Renaissance, in which the medieval world was changing to the modern. In our days it may be civilization may be changing to something very different from the last few hundred years. Of the first of these great changes Pater wrote in 'Marius the Epicurean.' Of the second he began to give a picture in 'Gaston de Latour,' a later novel of which he wrote only the first part. To the last period, his own, Pater devoted critical rather than creative thought. 'Marius the Epicurean,' therefore, is deeply informed with ideas; in fact the very titlepage names "Sensations and Ideas." Pater became known as a critic; in this novel he turned to express in the form of life the ideas which he had previously presented as matter of thought. A good many of Pater’s ideas will be found in 'Marius': the fundamental conception of Epicureanism is a restatement of the theory of life which had already been presented in the conclusion of the Renaissance and had since been much and sometimes severely criticised. Plavian’s plans for a career in literature have much in common with the ideas of the later essay on style. The work is characteristic of its author not only by its ideas, but by its general form. After this novel Pater published several shorter pieces which he called 'Imaginary Portraits.' In each of these he presented a figure which embodies some idea or position in the philosophy of art and life, sometimes an actual character like Watteau, sometimes an ideal figure like Sebastian von Ströck. He subsequent wrote several other things of the same sort which is now generally thought of as very characteristic of art and thought. 'Marius the Epicurean' is an earlier, longer and more fully developed imaginary portrait. Its interest is not in the
story, but in the idea, or in this case in the progress of the idea. Marius grows up in the old world, where he is brought up by his guardian, the pictures and refinement of the ancient civilization, weighs the older philosophies of life and art and finally devotes himself to the new and growing religion of Christ. Like all of Pater's fiction the story is most sedulously careful of its surroundings and environment, and the pictures of life on the great old Roman family estate, the popular festival, the interview with the emperor, the lecture on rhetoric from Fronto are among his best known. In fiction in general there is an especial place for those books which present adventures and experiences of the soul rather than of the man as seen in the everyday world. There were a number of such at the end of the 19th century. Among the most famous of these studies of the religious life are ‘John Inglesi’ and ‘Robert Elamere,’ ‘Marius the Epicurean’ is quite as interesting as either of these to those who follow the workings of the spirit, and quite as characteristic of the time which it presents and of the time in which it was written.

EDWARD EVERETT HALE.

MARIUT, mārē-oot', Lake, Egypt. See MARROTTIS.

MARIVAUX, Pierre Carlet de Chamblain de, pé-ar kär-là dé shám-blá dé mā-rē-vō, French dramatist and novelist; b. Paris, 4 Feb. 1688; d. there, 12 Feb. 1763. He lost his patrimony in the Mississippi scheme, and also a young wife to whom he was deeply attached, and took up literature. He was so successful that he became an Academician in 1742 or 1743. He wrote essays in periodical form, the 'Spectateur Français' having a hint of English influence in both matter and name. His novels, especially the unfinished 'Vie de Marianne' and 'Paysan parvenu,' were a protest against the literary morals of contemporary fiction. But he is best known for such plays as 'Les Jeux de l'Amour et du Hasard' (1730), 'Les Fausses Confidences' (1738), 'Les Leçons' (1736) and 'La Mère confondue' (1735), which are marked by a total opposition to the style and manner of Molière, by much skill in intrigue and in portraying women and by the peculiarly artificial and elaborate style, which takes its name 'Marivauxesque' from the author. Consult Savolée, 'Marivaux inconnu' (1880); Fleury, 'Marivaux et la Marivaude' (1881); Gosset, 'Marivaux Moraliste' (1881); Larroumet, 'Marivaux, sa Vie et ses Œuvres' (1894); Deschamps, 'Marivaux' (1897).

MARJORAM, a genus of annual or perennial herbs and a few shrubs (Oregano) of the family Menthaeae. The species of which there are about 25 are mostly natives of the Mediterranean region and southwestern Asia. They have several-flowered whorls of lobe-shaped flowers arranged in spikes. Two species are widely cultivated in gardens for culinary purposes, being used fresh, dried or in decoction for flavoring soups, stews, dressings, sauces and salads. Common or pot marjoram (O. vulgare) is a hardy perennial with pink or purple flowers and highly aromatic leaves. It succeeds best upon soils well exposed to the sun, and may be propagated by seeds, divisions or cuttings. Sweet marjoram (O. marjorana) is also a perennial, but is tender and consequently treated as an annual, hence the popular name annual marjoram. It is usually raised under a green-house and transplanted to ground like the above.

MARK. The original Jewish name of Mark was John (Acts xii, 12, 25; xv, 37), and it is not known when he was given or assumed the second, Latin, name by which he has always been known. Of his early life nothing is positively known. It cannot be said to be more than an attractive possibility that it was at the house of his mother, Mary, that Jesus met his disciples for their last supper, and that in consequence this upper room became the permanent meeting place of the Jerusalem disciples, and also that Mark was the youth who followed the crowd to the arrest of Jesus in Gethsemane. Peter later called him his 'son' (1 Peter, v, 13), from which title it is commonly inferred that he began his Christian life under the influence of that apostle. The first mention of Mark in history is as an attendant of Paul and Barnabas, the latter being his cousin (Col. iv, 10, not 'nephew,' as the Greek word has been erroneously translated). The party went from Antioch to Cyprus and then to Perga, on the mainland of Asia, where Mark deserted, returning to Jerusalem. Because he did this Paul refused to take him on his second missionary tour and a break with Barnabas resulted, after which Mark accompanied the latter to Cyprus again. A reconciliation with Paul must have later come about, since Mark is favorably spoken of in Paul's letters to the Colossians and to Philemon, as again still later in the second letter to Timothy. More uncertainty attaches to the mention of Mark in First Peter. Perhaps the most satisfactory conclusion is to take 'Babylon' as designating Rome and for this and other reasons (see article PETER, EPISTLES OF) to give to this mention a still later date. On this view, after the death of Paul, Mark would have remained in Rome and have attached himself to Peter. This would be in harmony with the language of Papias who asserted a relation between the two. Any further details rest on more or less uncertain tradition. The reported visit of Mark with Alexandria is in no way improbable, but whether he was a martyr there or died a natural death is unknown. The tradition that he was connected with the church at Aquileia, which is the basis of the honor paid in Venice to his memory, is no more to be depended on. It may have been the result of personal reminiscence that the epithet kolobuduktos was attached to him. This word means stunted or mutilated in the fingers ("stub-fingered"), but its application in Mark's case is now distinctly and many explanations have been proposed, such as, that his fingers were unnaturally short; or, as the Greek word would equally apply to toes, that they were shortened, perhaps causing lameness, or that he had mutilated himself to evade priestly service; or, finally, that the word is used figuratively to suggest the comparative brevity of his gospel and its failure to contain much that is found in Matthew and Luke. For the connection of Mark with the second Gospel and bibliography, see article MARK, GOSPEL ACCORDING TO.

MARK, Edward Laurens, American anatomist: b. Hamlet, Chautauqua County, N. Y., 30 May 1847. In 1871 he was graduated at the University of Michigan, and in 1876 took the degree of D.P.H. at the University of Leipzig. Dr. Mark was instructor in mathematics at the University of Michigan in 1871-72 and in the following year was astronomer of the United States Northwest Boundary Survey. From 1877 to 1883 he was instructor in zoology, from 1883 to 1886 assistant professor and since 1886 Hersey professor of anatomy at Harvard University. Since 1900 Dr. Mark has also served as director of the Harvard Zoological Laboratory. Since 1903 he was director of the Bermuda Biological Station for Research. He was United States delegate to the Fourth International Zoological Congress at Cambridge, England, in 1898. He has translated from the German, O. Hertwig's 'Text-Book of the Embryology of Man and Mammals' (1892); Korschelt und Heider's 'Text-Book of the Embryology of Invertebrates,' and published contributions to the Bulletin of Comparative Zoology. He edited contributions from the Zoological Laboratory, Harvard Museum of Comparative Zoology, since 1894. Consult Parker (ed.), Mark's Anniversary Volume (New York 1904).

MARK, Gospel According to. Character and Purpose of. Of the four little books called "Gospels" the second is the briefest and simplest. In the most direct fashion possible salient events of the Galilean ministry of Jesus are set forth in the first two-thirds of the book, while the last third is mainly occupied with the events of the last week of Christ's life and of his death and resurrection, the second part being given with much more of detail than the first. The book may be analyzed as follows: Introductory, the ministry of John the Baptist, the baptism and temptation of Jesus (i, 1-13). I. The early Galilean ministry of Jesus, marked both by wide attention and by increasing hostility which culminated in the charge that Jesus was in league with Satan, this part of Christ's work ending with the choice of the 12 apostles (i, 14-iii, 55). II. Later ministry in Galilea and its neighborhood, introducing pastoral teaching and consisting largely of the training of the 12 (iv, 1-x, 52). III. The entry into Jerusalem and the Jerusalem teaching, mainly controversial, in the Temple (xi, 1-x, 45). IV. The Eschatological Discourse (xiii, 1-37). V. The closing scenes, anointing at Bethany, last supper, agony in Gethsemane, death and resurrection (xiii, 1-xvi, 20 (87)). No purpose appears except to bring the events recorded as clearly before the reader's minds as possible, so that we might know such much, at least, of what Jesus did and said. The book manifestly is not a missionary tract with the intent to persuade the unconverted, but rather one who is himself a disciple tells these things to his fellow-disciples for their instruction. It has been overlooked that the author presents as himself accepting the stuff handed down as claims of Jesus to be the supreme master of men and their destiny and his corresponding demands for their supreme allegiance. But while these are carefully and sympathetically recorded, the main conclusion gathered from this record of the ministry of Jesus is that of a mighty, unresting, triumphant worker, who yet evokes the intensest hostility of the religious leaders of his nation. But the primary purpose to be recognized throughout is narration.

Authorship and Sources.—No name has ever been connected with this book except that of Mark. Presumably because of its brevity which might seem perhaps to involve incompleteness, this Gospel was for a long time less quoted than Matthew or Luke. But as it was included in the 'Diatessaron' of Tatian it must have been in general acceptance for some time before the year 150; in fact, there is no reason to doubt that from the time of its composition wherever known it was accepted as authoritative. The earliest tradition which has come down to us, connecting itself with the name of Papias who was acquainted with a number of apostles and others who had seen Jesus, makes Mark the author of a narrative which embodied the reminiscences of Peter. The second Gospel answers well to this description. There are many touches which imply the remembrance of an eyewitness, such as that the grass was green (vi, 29); the look of Jesus (iii, 5); or his turning to look (v, 32). The tradition that this eyewitness was Peter is confirmed by the character of many details of events in which Peter had a share or in which he would be specially interested. It is not, however, to be thought that Peter was Mark's sole authority or even that the principal share of the book is due to him. It may well be held that it is from which Mark drew his material was the common stock of apostolic reminiscence and preaching, what must at first have been an oral gospel, which presumably took a somewhat stereotyped form both in content and in language for catechetical purposes (Luke i, 4), and which may have been committed to writing before Mark used it. It has been held by some that Mark also shows knowledge of the "Logia" document (also called "Q," see article GOSPELS), but in our ignorance of the scope of this document Mark's knowledge of it cannot safely be asserted.

Date and Place of Composition.—No date can be positively set for the composition of the Gospel according to Mark. It has been commonly dated immediately after the destruction of Jerusalem and thought to have been written at Rome. The latest conclusion of critics, notably of Harnack, based on his view of the early date of Luke's writings, sets the date decidedly before the year 60 and makes Jerusalem the place of original composition. There, or at Rome later, it might have been seen by Luke in his earliest form, while it is possible that additions were made to it before it was given to the world in its present form, which probably happened at Rome. (The "Latinisms" in its language are, however, no proof of relations to Rome, as they are merely such as had been everywhere in the empire adopted into the "Koine," the common Greek of the time.) It has been suggested that Mark's repeated revision of what he had received in what may be called three editions, the first, Palestinian and used by Luke, the second, made at Alexandria (with which city tradition associates Mark in his work), and used by the Author of Romans, the third, completed at Rome. (See
MARK — MARKHAM

article Gospels). Much of this theory, however, is undemonstrable. But it seems safe to assert that the substance of the work belongs decidedly before the year 60 and was very possibly composed in Palestine, while in its final form it is connected with Rome.

Integrity. — It is the verdict of textual criticism that the last verses of the Gospel (xvi, 9-20) and a part of chap. xvi belong to this period. These are lacking in only two manuscripts, the Vatican and the Sinaitic, but these are the most valuable of all. A manuscript of the Old Latin replaces these verses with another, shorter ending for the genuineness of which no one contends, and four Greek uncials, one cursive, and also manuscripts of early translations into Syriac and other languages give both endings. An Armenian manuscript gives the name Aristion as the author of the verses in question. There is, further, a notable lack of quotation of these verses by the Fathers, while several Fathers assert that in their time they were not to be found in the best copies of the Gospel. On the basis of the merely textual evidence, however, the genuineness of these verses might be questioned, but there is general agreement among scholars that the internal evidence is decisive against their genuineness. The vocabulary, the style, the thought of these verses are sufficiently unlike the rest of the Gospel so that the great majority of competent critics hold that they are not by Mark. Various explanations have been proposed for the abrupt close of the original text at the end of the eighth verse, as that the author might have been interrupted in some way and never finished his book as he intended, or that the last leaf was lost from the text which was the source of all our copies and that some one (Aristion?) later attempted to make good the loss, but while any of the proposed explanations may be possible, it cannot be said that any of them are probable.

Authenticity and Value. — While, as has been said, for many centuries both Matthew and Luke were more used and valued than Mark, this judgment has of late been reversed. As it is the oldest of the three Synoptics, or at any rate preserved in the original traditions of the Palestinian Church in their most primitive and unmodified form, it is of the highest value as a record. This value is of course enhanced by the fact of Mark’s association with so many of the early leaders of the Church, and still more by the contribution which Peter, in particular, is recognized to have made to the materials employed. The modern critical estimate may be relatively unfair to the value of the other Synoptics, but is doubtless absolutely correct in its high estimate of the authenticity and value of this Gospel.

David Foster Estes,
Professor of New Testament Interpretation,
Colgate University.

MARK, an old English term for a money of account, and in some other countries for a coin. The English mark originated in the 12th century and was valued at £3.33, and the Scotch mark, or merk, of the 19th century was £3.42. In the coinage of the German Empire the mark is a coin of nearly the same value as the English shilling. A mark banco used to be a money of account in Hamburg equal to 37 cents, nearly. The mark was also used as a weight in several parts of Europe, being divided into 24 carats.

MARK, Order of Saint, a Venetian order of knighthood. The doge, lord of an elected senate, elected knights of Saint Mark, who enjoyed a pension. Foreigners also, particularly scholars, were elected. Saint Mark the Evangelist was the patron saint of the Venetian Republic.

MARK ANTONY. See Antonius, Marcus.

MARK TWAIN. See Clemens, Samuel Langhorne.

MARKED TREE, Ark., town of Poinsett County, 40 miles northwest of Memphis, Tenn., on the Frisco Lines. It is within a few miles of Saint Francis Lake and is located in a thriving lumber district. It contains lumber factories, cooperage works and a hardware factory. It has also a district high school and two banks. Pop. 2,500.

MARKETS AND RURAL ORGANIZATIONS, Office of. See Agriculture, Department of.

MARKHAM, märk′hăm, Albert Hastings, English admiral and Arctic explorer, cousin of Sir Clements Markham (q.v.): b. Bagnères, 11 Nov. 1841. He entered the navy in 1855, saw active service in the China seas for several years, took part in the Polar expeditions of Adams (1873) and of Nares (1875), and in the latter expedition attained what was then the farthest north, 83° 20' 26". With Sir Henry Gorn-Booth he attempted to reach Franz Joseph Land in 1879, but was unsuccessful; in the same year Markham explored the Galapagos Islands. Rear-admiral in 1892 and second in command of the Mediterranean fleet in 1893, he was made a vice-admiral, and later admiral. His last command was at Nore. He retired in 1906. He has written ‘The Cruise of the Rosario amongst the New Hebrides’ (1873); ‘The Great Frozen Sea’ (1878); ‘The Voyages and Works of John Davis’ (1884); ‘A Polar Reconnaissance’ (1879); and ‘Life of Sir John Franklin’ (1891).

MARKHAM, Sir Clements Robert, English geographer and traveler: b. Stillingfleet, Yorkshire, 20 July 1830; d. 30 Jan. 1916. He was educated at Westminster School, entered the navy in 1844, accompanied the Franklin Search Expedition of 1850 and then retired from the service. He traveled in Peru in 1852-54 and 1860-61, the second journey being undertaken to get cinchona seeds for planting in India, an experiment described in his ‘Peruvian Bark; Cinchona Culture in British India, 1860-1880’ (1880). After spending 1865-66 in Ceylon and India, he became undersecretary in the India Office from 1867-77, and curator of its geographical department in 1868. From 1858-87 he was secretary of the Hakluyt Society, of which he became president in 1890. From 1863-88 he was secretary of the Royal
Geographical Society, and in 1893 became its president. His more important works, several of which were translated into German, are 'Cuzco and Lima' (1856); 'Travels in Peru and Chili' (1862); 'The Arctic Navy List' (1877). At all ages, John Daniel Richard Hakluyt, Lord Fairfax, Major Rennell and Sir Leopold McClintock; 'Quichua Dictionary' (1908); 'The Incas of Peru' (1910). He rendered distinguished service to the nation by his discoveries and by editorial work for the Hakluyt and other societies. Was created K.C.B. in 1896.

MARKHAM, Edwin. American poet. b. Oregon City, Ore., 23 April 1852. He spent his boyhood on a ranch in central California, herding cattle and sheep, and later graduated from the California State Normal School at San José and from Santa Rosa College. He studied law, but did not practice; subsequently took up educational work and was superintendent and headmaster of schools in California and principal of the Observation School of the University of California in Oakland. He had for some time been an occasional contributor to some of the leading American magazines, but first gained wide reputation through the publication of his poem, 'The Man with the Hoe,' suggested to him by Millet's picture of the same name. This first appeared in the San Francisco Examiner and was later published in a collection entitled 'The Man with the Hoe and Other Poems' (1899). This poem, which had a wide influence and caused much discussion, is intended by the author not merely as a picture of the peasant but as a symbol of the toiler brutalized through long ages of industrial oppression. His other publications include 'Lincoln and Other Poems' (1901); and 'Field Folk, Interpretations of Miller' (1901); 'The Poetry of Jesus' (1914); 'California the Wonderful' (1914); 'The Children in Bondage' (1915); 'Remarkable Writings of Thomas Lake Harris' (5 vols., 1918).

MARKHAM, William. English colonial governor in America. b. England, about 1635; d. Philadelphia, 12 June 1704. When William Penn obtained a charter for Pennsylvania, he made Markham, a first cousin of his, his deputy. Markham had all rights granted to Penn save that of convoking a legislative assembly. On 3 Aug., 1681 he established a council, later chose the site for Philadelphia and conferred with Lord Baltimore as to the Maryland-Pennsylvania boundary. Penn himself arrived on 27 Oct., 1682, and Markham, whose commission accordingly lapsed, was elected to the council. In 1684-90 he was secretary to the province, in 1685 became land commissioner and in 1689 an auditor of accounts. When in 1691 the territory now constituting the State of Delaware was detached from the province, he was appointed its deputy-governor, and in 1694-99 a lieutenant-governor and administered both this territory and the province.

MARKHOR, már-kör or -kör, a remarkable goat (Capra falconeri) of the mountains of Afghanistan and northwestern India, where it keeps among the highest wooded valleys, ascending and descending with ease. Its horns are very different from those of other goats, rising straight up from the forehead, spreading sideways, so as to form a V when seen from in front, and spirally twisted. Specimens have a body weight of 500 kilograms and a well-developed keel. Several distinct local varieties of markhor are known to the Himalayan hunters, who regard this animal as one of the most excellent objects of sport in that region of prime game animals. Unlike the ibex, which keeps to the rugged crags and steep ravines above the limits of the forest, the markhor delights in rocky forests, and although it occasionally comes out into the open glades, it seeks concealment as much as possible. Hence its hunting calls for the greatest skill as well as endurance. This goat is obtainable on importation by domestic goats; and it is believed to have had some influence in originating the Angora breed. Consult Lydekker, 'Wild Oxen, Sheep and Goats of All Lands' (1898).

MARKIEWICZ, Countess. Irish artist and revolutionist. b. Lissadel, Sligo, Ireland, about 1876. A daughter of the late Sir Henry Gore-Booth, closely connected with several of English titled families, she has been described by the Dublin bourgeoisie as the stormy petrel of Dublin life. Her husband, a Pole, was employed in the Russian consular service, and both had been prominent figures in the social life of Dublin. Before the countess became involved with the Sinn Fein party she had made a name both as an artist and an actress, and she had frequently acted in her husband's plays at the Abbey Theatre. As a young girl the countess, then Miss Constance Gore-Booth, was presented at court and spent several seasons in London, after which she went to Paris as an art student. She came into prominence during the election in Northwest Manchester in 1908 as an opponent of Charles Gill. The Licensing Bill was then the issue and she went to Manchester to plead the cause of the barmaid's. Her sister, Miss Eva Gore-Booth (q.v.), a leading English suffragette, was then the secretary of the Barmaid's Political Defence League. In 1911 the countess was charged in Dublin with assaulting a policeman at the breaking-up of a Socialist meeting. During the labor troubles in Dublin in 1912 she came into conflict with the police on several occasions. On the memorable Sunday at the end of August 1912 when Larkin's dramatic arrest was the prelude to wild disorder in O'Connell street, she and her husband came upon the scene when the excitement was at its height, and as Larkin was being escorted to the police station by a body of police with drawn batons. The countess stood up on the car she was driving and led the cheers of the mob for the captured labor leader. For many months afterward, when a large section of the Dublin working classes was in dire poverty caused by the protracted lock-out, she acted as a constant attendant at Liberty Hall, the headquarters of the Transport Workers' Union. Here she was engaged in preparing and distributing meals to summer and light gray in winter. The magnificent beard, extending in the adult males on to the chest and shoulders, and sometimes reaching nearly to the knees, is black in front and gray behind; in the young bucks and the does at all ages it is often reddish to the entire body. The horns are very different from those of other goats, rising straight up from the forehead, spreading sideways, so as to form a V when seen from in front, and spirally twisted. Specimens have a body weight of 500 kilograms and a well-developed keel. Several distinct local varieties of markhor are known to the Himalayan hunters, who regard this animal as one of the most excellent objects of sport in that region of prime game animals. Unlike the ibex, which keeps to the rugged crags and steep ravines above the limits of the forest, the markhor delights in rocky forests, and although it occasionally comes out into the open glades, it seeks concealment as much as possible. Hence its hunting calls for the greatest skill as well as endurance. This goat is obtainable on importation by domestic goats; and it is believed to have had some influence in originating the Angora breed. Consult Lydekker, 'Wild Oxen, Sheep and Goats of All Lands' (1898).
the impoverished wives and families of the strikers. A few weeks before the abortive revolution in April 1916 her house was raided by the police, who found a printing plant there and many documents. At the outbreak of the revolt she apparently accompanied the party who captured Saint Stephen's Green, and when the troops got the upper hand she retired with her detachment into the Royal College of Surgeons, one of the principal buildings on the green. Eventually she hosted the "white flag" and intimated that she would surrender at noon. At the appointed hour the countess marched out of the college, followed by 120 rebels walking two abreast. She was dressed entirely in green, with green tunic, green hat with green feather, green putties and green shoes. She marched to where the opposing force was waiting and, going to the officer in command, saluted, kissed her revolver and handed it over with her bandolier, and announced that she was ready. The men were disarmed and marched off under armed escort to the castle. For complicity in the uprising the countess was sentenced to death by a court-martial, the sentence being afterward commuted to imprisonment for life. She was liberated with the other Irish prisoners in June 1917. She continued her activity in the Sinn Fein party, however, and the general elections held in December 1918 was returned member of Parliament for a Dublin constituency, being the first member of her sex to be sent to Westminster and the only successful woman candidate. See under Ireland—Revolution.

MARKING-NUT, an East Indian tree (Semecarpus anacardium) of the cashew family, having a fruit the receptacle of which is roasted and eaten. The black juice of the unripe fruit serves with quicklime to make an indelible marking-ink.

MARKINGS OF ANIMALS. See Coloration, Protective.

MARKLE, John, American coal operator: b. Hazleton, Pa., 15 Dec. 1858. He was graduated in the mining engineering department of Lafayette College in 1880 and in the same year was appointed general superintendent of mines of G. B. Markle and Company, his father's firm. Upon his father's death he succeeded him and is now president of the G. B. Markle Company, successor to G. B. Markle and Company, and one of the largest of the independent companies in the anthracite coal industry. Mr. Markle is also president and chief engineer of the Jeddo Tunnel Company. He was one of the leading figures and represented the independent operators in the negotiations with President Roosevelt and in the inquiry by the President's commission in connection with the anthracite coal strike of 1902. Mr. Markle is a director of the Industrial Finance Corporation, the Morris Plan Company of New York, member of the American Institute of Mining Engineers, the New York Chamber of Commerce and Franklin Institute, Philadelphia, and a trustee of Lafayette College.

MARKOE, Thomas Masters, American surgeon: b. Philadelphia, Pa., 1819; d. 1901. In 1836 he graduated from the College of Physicians and Surgeons. He was appointed to the chair of anatomy in Castleton Medical College, Vermont; in 1852-54 was professor of pathological anatomy at the medical department of the University of the City of New York. He was appointed adjunct professor of surgery at the New York College of Physicians and Surgeons in 1860; became chair of that department later and in 1879 was appointed to the chair of the principles of surgery. He published "Treatise on Diseases of the Bone" (1872).

MARKS' MILLS, Engagement at. On 23 April 1864, a train of 240 wagons, escorted by 1,200 infantry, 400 cavalry and five guns, all under command of Lieut.-Col. F. M. Drake, 77th Ohio Infantry, left Camden, Ark., for Pine Bluff, to get supplies for General Steele's army, then co-operating with Banks' Red River expedition. At 10 a.m. of the 25th, when at Marks' Mills, on the Camden and Pine Bluff road, about eight miles beyond Saline River, Drake was attacked, front and rear, by General Fagan's force of 3,000 men—cavalry, mounted infantry and two batteries—and after a hard fight of more than three hours, during which Drake was severely wounded and had 250 in killed and wounded, the entire train, guns and the greater part of the cavalry and infantry were captured. About 300 escaped and made their way to Little Rock and Pine Bluff. Incomplete Confederate returns show a loss of 41 killed, 108 wounded and 144 missing. Fagan's entire loss was about 420. When Steele heard of the disaster he immediately abandoned the idea of joining Banks, left Camden on the night of the 26th for Little Rock, was followed by Sterling Price, had a rear-guard fight at Jenkins' Ferry on the 30th and continued his retreat to Little Rock. Consult "Official Records" (Vol. XXXIV).

E. A. CARMAN.

MARL, a mixture of carbonate of lime and clay in various proportions. If the lime predominates the marl is called calcareous; if the clay predominates it is called argillaceous marl, or argillaceous marl, has a larger proportion of clay. As marl is hard or not it is called indurated or earthy. Even the more solid marls crumble soon on exposure to the atmosphere, and form a paste if dipped in water; they effervesce in acids, because of the presence of carbonate of lime. Marl occurs in masses and beds, is associated with chalk, gypseum, sand, clay or compact limestone and contains important fossil remains. To the presence of carbonate of lime in its composition, marl owes its use in the manufacture of Portland cement and as a fertilizer. Many natural mixtures used as manures are called marls, such as the New Jersey green sand-marls, which contain as their principal constituents clay and green sand and usually only 1 or 2 per cent carbonate of lime. The latter use of the word is scarcely justifiable, especially as it is sometimes applied, notably in England, to substances containing no lime at all. Marl is accumulating at the present time in many lakes and bays of our Northern States, in part as a result of the grinding up of small shells, in part as a result of the activity of algae known as chara, which cause the deposition of lime carbonate. Marl may sometimes be a direct chemical precipitate. See Mineral Production of the United States.
MARLATT, Charles Lester, American entomologist: b. Atchison, Kan., 26 Sept. 1863. In 1884 he was graduated at the Agricultural College of Manhattan, Kansas, where he remained assistant professor for two years. In 1889–94 he was assistant entomologist and since 1894 has been first assistant and chief entomologist of the Bureau of Entomology of the Department of Agriculture. He made entomological investigations in Japan, China, Java, etc., for the department in 1901–02. He directed the effort to secure a national law to prevent importation of infested and diseased plants into the United States, which resulted in the Plant Quarantine Act of 20 Aug. 1912. Since 1912 he has served as chairman of the Federal Horticultural Board to supervise the enforcement of the act. Marlatt has had charge of tropical and sub-tropical fruit insect investigations and of branch stations in Florida, Louisiana, California and Hawaii. His publications have been confined to papers and bulletins on professional topics.

MARLBOROUGH, mär'bür-ō, Mass., city, in Middlesex County, on the Boston and Maine and the New York, New Haven and Hartford railroads, about 28 miles west of Boston and 15 miles east of Worcester. Marlboro was settled in 1656 by a colony from Sudbury, Mass., and four years after was incorporated as a town. In 1890 it was chartered as a city. During King Philip's War (1676) the Indians destroyed nearly the whole town. The chief manufactures are boots and shoes, shoe-making machinery, automobiles and automobile-tires, bicycles, carriages and wagons, lamps, electrical machines and supplies, boxes, hose-pipe, woodenware, cigars and machine-shop products. The principal buildings are the high school, city-hall, Saint Ann's Convent and Academy, a public library, a F. A. X. building and a number of churches and schools. The mayor is elected annually and has power to appoint, subject to approval by the council, the police and the members of the street and fire departments. He also appoints the members of the license department. The council elects the members of the health, poor and water departments. The waterworks are owned and operated by the city. Pop. 5,250. Consult Hudson, 'History of the Town of Marlboro, Massachusetts.'

MARLBOROUGH, mär'bür-ō, or mäl'bär-ō, John Churchill, Duke of, English general and statesman: b. Ashe, Devonshire, 1650; d. Blenheim, 16 June 1722. At 12 he became page to the Duke of York (afterward James II), by whom at 16 he was appointed an ensign. He was present at the siege of Tangiers and soon after his return rose to the rank of captain. In 1672 he accompanied the Duke of Monmouth to assist Turenne against the Dutch. At the siege of Maestricht he distinguished himself so highly as to obtain the public thanks of the king of France. On his return to England he was made lieutenant-colonel and his advancement was rapid. He had a regiment of dragoons presented to him and strengthened his influence at court by his marriage with Sarah Jennings, an attendant upon the princess, afterward Queen Anne. In 1682 he obtained the title of Duke of Marlborough and on the accession of James II was sent Ambassador to France and soon after his return created Baron Churchill of Sandbridge and raised to the rank of general. The same year he suppressed the rebellion of the Duke of Monmouth. On the arrival of the Prince of Orange he joined him at Axminster and was rewarded by the earldom of Marlborough and the appointment of commander-in-chief of the English army in the Low Countries. The following year he served in Ireland, where he reduced Cork, Kinsale and other places. In 1691 he was suddenly dismissed from all his employments and committed to the Tower; but soon obtained his release; though it appears that the suspicions against him were not without foundation. On the death of Queen Mary he was made a privy councillor and appointed governor to the young Duke of Gloucester; and in 1701 was created by King William commander-in-chief of the English forces in Holland and Ambassador Plenipotentiary to the States-General. On the accession of Queen Anne in 1702 he was created captain-general of all the forces at home and abroad and sent Plenipotentiary to The Hague. He was also made captain-general by the States. In the campaign of the same year he drove the French out of Spanish Guelders and took Liege and other towns, for which he was created Duke of Marlborough. In 1704 he stormed the French and Bavarian lines at Donauwörth, and in the same year, with Prince Eugene, gained the victory of Blenheim (13 August) over the French and Bavarians, headed by Marshal Tشارl and the Elector of Bavaria. The nation testified its gratitude by voting him the manor of Woodstock and Blenheim Palace, one of the finest seats in the kingdom. In the campaign of 1707 his antagonist was the famous Duc de Vendôme, over whom he gained no advantage; and on his return he found that his popularity at court was on the decline, this being said to be due to his avarice. In 1708, with Prince Eugene, he gained the battle of Oudenarde. In 1709 he defeated Marshal Villars at Malplaquet (11 September) though at a cost ill repaid by the capture of Termonde. In 1710 with Prince Eugene gained another victory over Villars. During his absence a new ministry, hostile to himself, was chosen, and on his return his command was taken from him and a prosecution commenced against him for applying the public money to private purposes. He went in disgust to the Low Countries in 1712, but returned a short time before the queen's death, and on the accession of George I was reinstated in the supreme military command. Consult Coxe, 'Memoirs of the Duke of Marlborough' (1847-48); Alison, 'Military Life of the Duke of Marlborough' (1879); Saintsbury, 'Marlborough' (1879).

MARLBOROUGH, N.Y., town of Ulster County, situated on a high bluff on the right bank of the Hudson, 65 miles north of New York. Capt. Annivy Smith, after whom it is named, lived here and his house was shelled by the British in 1777. The region is noted for its small fruits, especially the Marlborough raspberry. Pop. of the town 2,700; of the borough about 1,100.

MARLBOROUGH, New Zealand, the northeastern provincial district of South Island, bounded by the sea and the provincial district of Nelson. Its extreme length is 130 miles,
breadth 60 miles; area, 4,753 square miles. The coast is deeply indented by bays and natural harbors, from which the hills rise abruptly, clothed with magnificent forests. The district is generally hilly or mountainous, with splendid scenery. The region round the town is restricted; in the south are the Wairau Plains, one of the finest sheep tracts in New Zealand. Mining is carried on, gold, copper and coal being found. Blenheim, the capital, is connected by rail with the seaport of Picton on Queen Charlotte Sound. Pop. 17,612.

MARLIN, Tex., city and county-seat of Falls County, on the Houston and Texas Central and the International and Great Northern railroads, about 150 miles north of Houston and 26 miles southeast of Waco. It is situated in an agricultural region in which cotton is the chief product. The industrial establishments include a large cotton-seed-oil mill, three cotton gins, a cotton compress, a large brick plant, ice and electric-light plant, planing mill and marble works. The trade is in cotton, livestock and vegetables. In 1870 the cotton gins and flouring mills of Marlin had a water power of 3,350 feet, with a temperature of 147°F. The waters possess medicinal properties which attract a large number of health seekers to the city. Some of the principal buildings are a central school building, hotels, sanatoriums, bathhouses, opera-house, modern business houses and courthouse. Pop. 6,000.

MARLIN, a sportman's name for the godwits (q.v.).

MARLINGSPIKE, or MARLINE SPIKE, an iron pin tapering to a point, and principally used by sailors to separate the strands of a rope in splicing or knotting. A large wooden pin used for the same purpose is called a fd. A bird, the jæger or boatswain, of New England, bears the same name, in allusion to the pointed tail-feathers.

MARLIT,T, E. See JOHN, EUGENIE.

MARLOWE, Christopher, English poet and dramatist; b. 1564; d. 1593. In 1583 he took the A.B. degree at Benet College, Cambridge, and in 1587 the degree of M.A. Perhaps in the same year, the first part of his ‘Tamburlaine’ was acted in London; and the rest of his life was spent in active connection with the theatres. His life seems to have been somewhat dissipated and the daring of his theological opinions gave color to an accusation of atheism. In 1593 he was killed in a tavern brawl and was buried at Saint Nicholas, Deptford.

Numerous plays have been assigned to Marlowe, including a share in the three parts of ‘Henry VI’; and he may very likely have had some part in others besides the following, which can with certainty be ascribed to him: ‘The Tragedy of Dido,’ of uncertain date of acting, printed in 1604; ‘Leander’ (two parts), acted 1587–88, printed 1590; ‘Dr. Faustus,’ acted 1588–89, printed 1594; ‘The Jew of Malta,’ acted about 1590, printed 1594; ‘Edward II,’ acted 1591, printed 1594; ‘The Massacre of Paris,’ acted after 1591, printed about 1595. His ‘Hero and Leander’ was incomplete at his death and was finished by George Chapman and published in 1598. Marlowe’s plays attained a sudden and great popularity and his poetic reputation is testified to by numerous tributes from his contemporaries. Marlowe’s dramatic activity came at a time of great emotional stir and stress. In England the ideas and ideals of the Renaissance and the Reformation were under great stress. The struggle over the control of the Middle Ages. The struggle with Spain, which was just ending in the destruction of the Armada, had brought a triumphant consciousness of national greatness. From this newly-discovered England as well as from the newly-discovered America and the rediscovered works of Greece and Rome, came countless incentives for multiformal activities. In literature as in life opportunity seemed boundless, experiment and innovation easy, voyages of discovery sure of rich reward. The drama had already become in some measure an expression of this national activity, but it still awaited the services of great literary genius. After two generations of precariously successful, the professional companies had become firmly established in the public theatres and it was already plain that the main development of the drama was to be popular and professional rather than scholarly and amateur. In comedy, indeed, the plays of Lyly and Peele had already supplied refinement and a literary flavor, but in the popular drama in the main, and in tragedy in particular, there was neither refinement nor poetry.

Marlowe created English tragedy anew. He threw aside Senecan traditions and devoted himself to meeting the demands of the London theatres, but the prologue to his first play was a declaration of reform, announcing the adoption of blank verse, heroic themes and ‘high astounding terms.’ His themes were novel, and his treatment of them seems to have been dictated by a conception of tragedy formed independently of his predecessors,—the heroic struggle of a great personality doomed to inevitable defeat. ‘Tamburlaine’ is hardly a tragedy at all but rather a chronicle of the hero’s greatness; but in ‘Dr. Faustus’ and ‘The Jew of Malta,’ heroes with ambitions as boundless and passionate as Tamburlaine’s are overwhelmed in the end by the limitations that forever bound human aspiration. These plays mark the formation of the Marlovian type of tragedy, often imitated and long influential in the English drama. A protagonist distinguished by great passions and many crimes absorbs the interest of a series of scenes, brutal and sensational, full of violent action, ranting declamation, bloodshed and villainy affording opportunity for elaborate theatrical spectacles and adorned by passages of profound intellectual suggestiveness and extraordinary beauty of diction and melody. ‘Edward II,’ the most mature of his plays, illustrates these characteristics and also testifies to his growing power both as a playwright and as a poet. The characterization is less melodramatic; the structure more coherent and organized; the style less bombastic, more even and more dramatic. Shakespeare, who clearly imitated Marlowe in ‘Richard III’ and produced ‘Richard II’ in rivalry of ‘Edward II’ did not in these two plays surely surpass his master.

Marlowe’s faults and deficiencies are apparent and they cannot all be credited to the
immaturity and experimental nature of his art. The banalities that mar his noblest scenes and the absurdities that appear in every phase of his work, theatrical, dramatic or poetic, would doubtless have disappeared in the rapid development of dramatic art which the next 30 years witnessed. But there are no indications that had Marlowe's life been prolonged, he would ever have excelled in humor or the individualization of character. His achievement is, nevertheless, among the most remarkable and enduring of the Elizabethan era. His poetry remains forever impressive with its fine impecuosity, its splendors of diction and melody. His tragedies, of immense influence on the theatre of his day, continue to rank among the greatest of English literature in their expression of passionate ambition and aspiration. He was the first great English dramatist, and he prepared the way for Shakespeare. See FAUST, DA.; JEW OF MALTA, THG.

Bibliography.—The best collected editions of his works are by Rev. Alexander Dyce (1850 and 1870), and by A. H. Bullen (3 vols., 1890). His works are in one volume of Mermaid Series of Old Dramatists with introduction by J. A. Symonds. For biography and criticism: Ward, A. W., 'History of Dramatic Literature' (Vol. I); Fleay, F. G., 'Biographical Chronicle of the Drama' (Vol. II); Ingram, J. H., 'Christopher Marlowe and His Associates'; Fischer, O., 'Zur Charakteristik der Dramen Marlowe's' (Munich). Marlowe's life has been the theme of two modern tragedies, R. H. Horne's 'The Death of Marlowe' (1870), and Mrs Josephine Peabody's 'Marlowe' (1901).

ASHLEY H. THORDIKE, Professor of English, Columbia University.

MARLOWE, Julia (Mrs. SOthern), American actress: b. (Sarah Frances Frost), Coldbeck, Cumberlandshire, England, 17 Aug. 1870. She came with her parents to the United States in 1875. In 1882 she joined the Juvenile Opera Company, which presented 'Pinocchio,' 'The Chimes of Normandy' and other light operas, in which she was known as Frances Brough. Subsequently she took a child's part in 'The Winkel.' She then retired, studied painting in New York for three years and then made her metropolitan début as Parthenia in 'In gomar.' Her later rôles include Viola in 'Twelfth Night'; Rosalind in 'As You Like It'; Highland Mary in 'For Bonnie Prince Charlie' (1897); Barbara Frietchie in the play of that name by Clyde Fitch (1899), and Charlotte Durand in Cable's 'Cavalier' (1902). Other plays in which she has taken the title rôles are 'Colin' and 'When Knighthood was in Flower.' On 28 May 1894 she was married to Robert Taber, who had been her leading man in her first appearance in 'Romeo and Juliet' in 1888. They starred together for a season, but owing to a disagreement were later separated and in 1899 were divorced. The next great success was as Barbara Frietchie in Clyde Fitch's play. In 1904 she joined E. H. Sothern, and for several years they were joint stars in Shakespearean rôles. In 1911 they married, and in 1916 Mrs. Sothern retired from the stage. Their presentations of Shakespearean plays are reckoned as some of the best ever given in America. Consult Strang, 'Famous Actresses of the Day in America' (Boston 1899); Browne and Austin, 'Who's Who on the Stage' (New York 1906).

MARMADUKE, John Sappington, American soldier: b. Saline County, Mo., 14 March 1833; d. Jefferson City, Mo., 28 Dec. 1887. He studied at Yale and Harvard and graduated from West Point in 1857, and served in the United States army in the West. At the outbreak of the Civil War he entered the service of the Confederate States and rose to the rank of major-general. In 1864 he was captured and was not released until after the close of the war, when he went abroad for a time, and on his return engaged in business and also in journalism. He was defeated for the governorship of Missouri in 1880, but in 1884 was elected and served until his death.

MARMALADE, a jellied or gelatinous preparation made from quinces, peaches, apricots or oranges and portions of their rinds, with a mixture of sugar and spice. It is made like the ordinary jam and set in warm pots or jars and sold as a confection. The marmalade tree (Tucuma mammosa) is of the star-apple family, producing a large egg-shaped drupe, tasting like marmalade.

MARMETTE, Joseph, Canadian novelist: b. Montmagny, Quebec, 1844; d. 1895. After receiving a good general education he determined to devote himself to literature. He wrote several historical novels dealing with the main events in French-Canadian history. These include 'Charles et Eva' (1867); 'François de Bienville' (1870); 'L'Intendant Bigot' (1872); 'Le Chevalier de Morrac' (1873), and 'Le tomahawk et l'épée' (1877).

MARMIER, Xavier, French author: b. Pontarlier, Doubs, 24 June 1809; d. Paris, 11 Oct. 1892. He engaged in journalism and later traveled extensively in Switzerland, Holland, Germany, Russia, Algeria, America and the East. In 1835 he accompanied the scientific voyage of the Research to the Arctic regions and then acquired a wide knowledge of the Scandinavian and Finnish languages and customs. In 1839 he became professor of foreign literature at Rennes and in 1841 occupied a position under the Minister of Public Instruction. In 1846 he was appointed librarian at Saint Geneviève in Paris and in 1870 was elected a member of the Academy. Among his publications are 'Histoire de l'Islande' (1838); 'Langue et Littérature Islandaises' (1838); 'Histoire de la littérature en Danemark et en Suède' (1839); 'Leetres sur la Russie, la Finlande et la Pologne' (1843); 'Du Rhin au Nil' (1846); 'Leetres sur l'Amérique' (1852); 'Voyage en Suisse' (1861); 'Voyages et Littérature' (1888), and the 'Études du Spitzberg' (1858); 'Gazida' (1860); 'Cimara' (1867); 'Les drames du cœur' (1868); 'Une grande dame russe' (1876), etc.

MARMION, Scott's 'Marmion,' published 1805, is the second of his metrical romances, and the first—after the preliminary experiment of the 'Lay of the Last Minstrel'—in which he developed the full possibilities of the form. Because of the success of the earlier poem, he was offered £1,000 for this one before he had begun to write it—a circumstance
MARMOL — MARMOSET

which enabled Byron to barb his satire with the taunt:

"And think'st thou, Scott! by vain conceit perchance, On public taste to frit thy stately romance, To yield the laurel with thy Miller may combine."

To yield the laurel with thy Miller may combine.

Like most of Scott's fiction, in prose or verse, the story of 'Marmion'? is based on the fundamental impulse to revivify the past, especially in connection with the historic associations of picturesque scenes. Hence he weaves a romance about the lives of some historic Romans, imaginative, but always with an eye toward the climax, the account of the battle of Flodden Field. It is significant, too, that the famous scene describing the quarrel between Marmion and Douglas (canto vi) was an afterthought, due to a suggestion from one of Scott's friends that he should plan Marmion's journey from England to Edinburg so as to introduce the Douglas castle of Tantallon. Critical opinions have varied concerning the romantic plot of this poem, and Scott himself spoke severely of his having based it in part on the crime of forgery, characteristic of a commercial rather than a proud and warlike age.2 But there can be no difference of view as to the splendid movement and glow of the more stirring scenes of the story - those of the kind in which Scott's genius was always at its best - especially the account of the battle of Flodden, culminating in the death of Marmion. The work also contains some interesting personal poetry, in the epistles, addressed to different friends, which Scott presented to the several cantos, and in the eulogy of one of his most popular narrative ballads, 'Lochinvar.'

RAYMOND M. ALDEN.

MARMOL, José, hó-sá' már-mōl', Argentine author: b. Buenos Aires, 5 Dec. 1818; d. there, 12 Aug. 1871. He was a pronounced Democrat, was banished by Rosas, led the opposition against his dictator and on its successful termination became senator and librarian of Buenos Aires. A fervent orator Marmol is better known as the author of 'La Amalia' (1866), a historical novel dealing with Rosas' dictatorship, of the popular patriotic poem 'Nuestra bandera' (5 de Mayo, 1843), and the poems 'El poeta' (1842); 'El Peregrino' (1846) and 'El Cruzado' (1851). 'La Amalia' has long been familiar to European readers through French and German translations. An English translation has appeared recently (New York 1919).

MARMONT, Auguste Frédéric Louis Viesse de, o-gust frā-de-rēk loo-ē vē-ēs de már-mōn, Duke of Ragusa and Marshal of France: b. Chatillon-sur-Seine, France, 20 July 1774; d. Venice, 2 March 1852. He entered the army as a lieutenant of infantry in his 15th year. In 1792 he changed to the artillery, and at Toulon became acquainted with Bonaparte, who chose him for his aide-de-camp. For several years after 1805 he was military and civil governor of Dalmatia, where he initiated important public works. Being called to aid the Austrian campaign in 1809 he assisted so efficiently that Napoleon made him a marshal and governor-general of the Illyrian provinces. He was again called upon in the Spanish campaign of 1811, was severely wounded at Salamanca (q.v.) and laid up for some time. In the campaign of 1813 he held the command of an army corps in Germany, and fought in the battles of Lutzen, Bautzen and Dresden. In 1814 he fought a final battle under the walls of Paris, but opposition appearing fruitless surrendered to the allies. This proceeding was one main cause of Napoleon's immediate abdication, and brought Marmont into favor with the Bourbons. After the Restoration Louis XVIII made him a peer of France, but he was compelled to withdraw from Paris by the Revolution of 1830, and his name was struck off the army list.

MORMONTE, Jean François, zhōn fran- swā már-mōn-tel', French writer: b. Bort, Limousin, France, 11 July 1723; d. Abbeville, Eure, 31 Dec. 1799. He was educated for the Church, but turned to letters, and became a journalist and dramatist at Paris. In 1758-59 he edited Le Mercure, and in 1763 was elected to the Academy. He wrote tragedies, including 'Denys le Tyran' (1748) and 'Aristomène' (1749); 'Contes moraux' (1761), and the works of fiction 'Béhavie' (1767) and 'Les Incas' (1778). His Poétique Française (1763) and 'Eléments de l'Art Poétique' (1785) have perhaps a more permanent worth. A collected edition of his writings appeared in 1786-87. In 1771 he was appointed historiographer of France, and in 1783 was made secretary of the French Academy.

MARMORA, már-mō-rə, or MARMARA, Sea of (anciently Propontis), an inland sea lying between southeastern Europe and the westernmost part of Asia, communicating with the Mediterranean by the narrow strait called the Dardanelles, and with the Black Sea by the Bosphorus. Length from Gallipoli to the head of the Gulf of Izmid, 170 miles; greatest breadth, which is near the centre, about 45 miles; average depth, over 600 feet; maximum depth, 4,000 feet. The gulls of Izmid and Moudania, on the Asiatic side, are the chief indentations. The largest of several islands is Marmora, famous for its quarries of marble and alabaster, situated near its western end; at the eastern end, on the Asiatic coast, and not far from Constantinople, is a group called the Princes Islands. A current sets from the Black Sea to the Sea of Marmora, which in turn runs into the Archipelago. The tides are hardly perceptible and the navigation is easy.

MARMOSET, a small American monkey of the family Hapalidae. They inhabit the Brazilian forests, possess long, non-prehensile tails, have a thick woolly fur and bear a close resemblance to squirrels in appearance and movements, having long hind legs and prehensile ears. They are notable, further, for the relatively large size of the brain and the few teeth (32), likening the family more to the monkeys of the Old World than to those of the other American family (Cebidae). They are favorite pets, not only on account of their quaint prettiness, but because of their small size, their gentleness and intelligence; but they are exceedingly delicate and rarely survive a change of climate. Their food is varied. The family includes many species, made up of two divisions — the genus Hapale and the genus Midas. The former contains the typical marmosets, or ouistitis, as the French call them, of which one species (H. jacchus) has long been a familiar pet; and the latter, the silky marmo-
sets or tamarins, which are larger and more varied in their colors and in their ornamental tufts. They also differ in their teeth and are without ring-colors on the tail. The best-known species is the marikina (M. rosatia). The pinche (M. edipus), found at the Isthmus of Panama, has bushy gray hair on the head, giving a quaint "old man" appearance.

MARMOT, a large ground-squirrel of the genus Marmota, having terrestrial habits, rather coarse fur, no cheek-pouches, short limbs and powerful digging claws. In size they vary from about 15 to 25 inches in length, the tail adding from 3 to 12 inches. Several species inhabit the northern Asia. A third species is found in the Himalayan ranges; and a fourth (A. caudatus), the largest and handsomest of the family, dwells in the valleys of their southern slopes. These little animals are of great value to the wandering natives of northern and central Asia, who utilize both their skins and flesh. America has two marmots, one of which is the siffler or whistler of the tops of the northern Rocky Mountains, and the other the familiar Eastern woodchuck. The former takes its name from the loud whistles it utters, and the latter for the sound the echoes of the crags make when resonating with the coarse pastures above timber-line, where it is found. It was of great service to the mountain Indians. Other species or varieties occur in the southern mountains of the Western States. The woodchuck, or ground-hog (A. monax), is a heavy, broad-headed, grizzled animal of the woods and fields, yellowish to whitish gray in color, blackish on the back and crown and chestnut on the belly; with the feet and tail brownish black. It abounds throughout the whole country of the dry plains, and flourishes in spite of civilization, as the farmers' meadows and gardens supply it with an increased supply of good food, and mankind thins out its worst enemies, such as wildcats, foxes, wolves, and the larger serpents and birds of prey; none of these save the first is much to be feared by the full-grown woodchucks, but may kill many of the young.

MARNE, märn, France, a river, the chief affluent of the Seine, rising in the Monts Langres, flowing northwest past Châlons to Epernay, thence westward, joining the Seine at Charenton, four miles above Paris. Its length is 326 miles, 120 of which are navigable to Saint Dizier. It is connected by canals with the Rhine, the Aisne and the Seine. The Marne was the crucial fighting line of the Western Front during the Great European War, 1914-18. During a six-days battle from 5 Sept. 1914 the march of the Germans on Paris was checked along its banks. Fighting continued between the Aisne and the Marne until the Germans began their fifth drive on 15 July 1918. American troops counter-attacked, drove the German troops back across the rivers, and with the Allied troops continued the onslaughts which led to the German request for the armistice which ended the war 11 Nov. 1918. See War, European.

MARIAN EPOCH, name given to the period known in France as the Gallic, in England the late Celtic and in Switzerland as La Tène. It extends from about 500 B.C. to the conquest of Gaul by Julius Caesar. It is named Marrian from the French department of the Marne where the richest deposits of the period have been found.

MAROC, mär-ôk'ö. See Morocco.

MORONITÉS, mar'ô-nîts, a sect of Eastern Christians, whose origin was a consequence of the Monothelite controversy. In the 7th century the opinion that Christ, though united in himself the divine and human natures, had one will arose among the Eastern nations. But when their last patron, the Emperor Philippicus Bardanes, was deposed and exiled in 713, the Monothelites were condemned and banished by his successor, Anastasius. The remnant of this party survived in the Maronites (so named from their founder, Maron)—a society of monks in Syria, about Mount Lebanon, which is mentioned as early as the 6th century. Another monk, John Maro, or Marum, also preached Monothelitism but was considered as a heretic by the Melchites (q.v.), or Christians who adhered to the opinions of the emperor, they became, in the country of Lebanon, which is now called Kesrawan, a warlike mountain people, who defended their political as well as their religious independence boldly against the Mohammedans, and who even now, under the Turkish government, resist the payment of a tribute, like the Druses. The political constitution of the Maronites is that of a military commonwealth. Governed by their ancient customs, rights, defended from external attacks, they support themselves among the mountains by husbandry and the produce of their vineyards and mulberry-trees. The revenue of all their orders of ecclesiastics is very small, but a common spirit unites them, and in simplicity of manners, temperance and hospitality they resemble the ancient Arabian. Revenge for murder is permitted among them, and as a sign of nobility they wear the green turban. Their Church constitution resembles very much that of the old Greek Church. Since the 12th century they have several times submitted to the Pope and joined the Roman Catholic
Church, without giving up their own peculiarities. At last Clement XII induced them to accept the decrees of the Council of Trent, a synod held in 1736 at their convent of Maronhanna. After this synod their priests still retained the right to marry, after the manner of the Greek Church; and they continued to administer the sacrament under both forms. The use of the Arabic language was preserved in the church service. Mass was read only in the ancient Syriac. Their head is called the patriarch of Antioch, although his residence is in the monastery of Kanobin, upon Mount Lebanon; and he gives an annual assembly every 10 years to the Pope of the condition of the Maronite Church. Under him are the bishops and other clergy-men, who form seven degrees of rank. In Kessrawan are over 200 Maronite convents and nunneries, containing in all from 20,000 to 25,000 members who profess the rule of Saint Anthony and devote themselves to agriculture and gardening. Since 1584 there has been a Maronite college established at Rome for the education and training of their clergy. At present the Maronites number about 300,000, and these are distributed into 150 parishes throughout Syria, Palestine, Egypt and Cyprus. In consequence of the sanguinary conflicts between the Maronites and Druzes, June 1859, both communities are now subject to one governor appointed by the Porte, with the title of governor of the Lebanon. Consult Bless, F. J., "Religions of Modern Syria and Palestine" (1912). See Druzes.

MAROONS, the name given to runaway negro slaves in Jamaica and in some parts of South America. The name seems to be equivalent to mountaineers, being derived from Spanish, cimarron, a fugitive negro or maroon, from cima (same as French cime), a summit or hilltop. In many cases runaway negroes, taking to the forests and mountains, rendered themselves formidable to the colonists and sustained a long and brave resistance against the whites. When Jamaica was conquered by the English in 1655 about 1,500 slaves retreated to the mountains. They continued to harass the island till 1795, when they were finally reduced by the aid of bloodhounds. Some of them were removed to Nova Scotia, and afterward to Sierra Leone. Consult Dallas, "History of the Maroons."

MARQUIN, mär′ō-kōn. See MOROCCO (leather).

MAROS, mór′ōsh, river of Hungary. It rises in eastern Transylvania and flows westward for about 550 miles, joining the Theiss at Szegedin to form the Danube. Its watershed is about 30,000 square miles. It is navigable to Karlsburg, about 300 miles.

MAROT, Clement, French poet: b. Cahors, Quercy, winter of 1496-97; d. Turin, 1544. His father was escribain, or historiographer to Anne of Brittany. He went to Paris in 1506, was educated at the university there and studied for the bar. Through his father's interest, he entered the service of Francis I; and in 1519 was attached to the suite of Margaret d'Angouleme, the king's sister. In the heat of battle he was cut down and taken prisoner, but on his return to Paris became a member of the royal household. Imprisoned once as a Protestant heretic, and coming again into serious risk, he fled to Navarre and to Italy; returning, he had to flee finally in 1543. Being as much a freethinker as a Calvinist, he found no shelter in Geneva, and the first he loved himself and went to Turin, where he died. His early poems are stiff; his later ones are almost unsurpassed for ease and grace, in which qualities his only rival is La Fontaine. He wrote many rondeaux, epigrams, epistles and ballads; also the poem 'L'Enfer.' His famous translation of the Psalms in poetry—superior to the inadequate French prose translation of the Scriptures at that time—is said to have promoted the cause of the Reformers and was sung at the court and was widely popular in the country. Consult Morley, Henry, "Clement Marot, and other Studies" (London 1871); Tilley, A. A., "Literature of the French Renaissance" (Vol. I, New York 1904).

MAROT, Helen, American labor leader: b. Philadelphia, 1865. She became interested in labor problems in her native city and after a few years of activity in labor circles there moved to New York. In the latter city she became executive secretary of the Woman's Trade Union League. Meanwhile she made important investigations into the most deplorable child labor in New York. She has published 'Handbook of Labor Literature' (1899); and 'American Labor Unions' (1914).

MAROZIA, mä-tō-zē-ə, Roman lady of infamous reputation, known for her influence at the papal court: d. Rome, 930 a. D. She was the daughter of Theodore (q. v.). She deplored Pope John X, and probably caused his death. As mother of John XI and grandmother of John XII and Leo VII, she exercised great influence on the political affairs of her time in Italy. She had more ability than character, but repented and died in a convent.

MARQUAND, mär-kand′, Allan G., American archæologist: b. New York, 10 Dec. 1853. In 1874 he was graduated at Princeton University and studied subsequently at the universities of Berlin and Johns Hopkins. In 1881-83 he was engaged as tutor and lecturer and from 1883 to 1905 was professor of archaeology and the history of art at Princeton. Since 1905 he has been professor of art and archæology at the same institution. Since 1890 Dr. Marquand has also been director of the Princeton Museum of Historic Art, and in 1896-97 was professor of archæology at the American School of Classical Studies, Rome. Since 1885 he has been associate editor of the American Journal of Archaeology. Dr. Marquand is the author of 'Greek Architecture' (1909); 'Della Robbins in America' (1912); 'Luca Della Robbins' (1914); joint author of 'History of Sculpture' (1896-99), and archæological articles in various journals.

MARQUAND, Henry Gurdon, American banker and philanthropist: b. New York, 11 April 1819; d. 20 Feb. 1902. He was educated in Pittsfield, Mass., and for 20 years was in the real estate business, afterward becoming a banker and acquiring interest in various railways and other commercial enterprises. He was a generous patron of the Metropolitan Museum of Art, to which he gave valuable paintings, etc., and among his other benefactions are a pavilion to Bellevue Hospital and a gymnasium and a chapel to Princeton University.
MARQUE, mark, Letter of, a commission granted to the commander of a merchant ship or privateer to cruise against and make prizes of the enemy's ships and vessels, either at sea or in their harbors, under pretense of making reprisals for injuries received. The ship so commissioned was also called a letter of marque or comart. In the naval history of the 16th and 17th century, privateering was common, but tended to degenerate into piracy, any state at war, when hard pressed, being willing to issue letters of marque to anybody who would prey upon their enemy. The term is in disuse except with historical reference, as no government has issued such licenses since the Declaration of Paris, at the close of the Crimean War in 1856.

MARQUESAS, or MARQUEZAS (mär-kä'äs), or MENDANA (män-dä'na) ISLANDS, or LES MARQUISES, Polynesia, an island group in the south Pacific Ocean, lat. 8° to 11° S; long. 138° 30' to 141° W, belonging to different colors since 1686 and composed of 12 islands and islets divided into two groups, the northern and southern, with a total area of 480 square miles. The largest islands are Nuka-hiva, or Marchand, and Hiva-oa, or Dominica. The coasts are generally inaccessible, rising from water like walls; but in Nuka-hiva there are some excellent natural harbors. The islands are generally high, some of their mountains reaching an elevation of over 4,000 feet; the intervening valleys are fertile, picturesque and copiously watered by streams which form numerous cascades. The principal food productions are pulse, yam, cocoaanuts, sugar-cane, cotton and bamboo; hogs are also numerous. The men are well-formed, active, powerful and all tattooed. The women have regular features, good complexions, fine teeth and neat hands, and are the finest of the sex to be met with in Polynesia. The people of these islands were formerly cannibals and though this practice has been discontinued cruelty and ferocity are prevailing characteristics, and the efforts of the missionaries have met with but little success. The Marquesas were discovered in 1595 by Alonza Mendaña de Neyva. They were subsequently visited and described by Cook and the Forsters in 1774, when Hood's Island was added to the group. In 1797 three more were discovered by I Reader, an American captain, and were named Washington Islands. In 1842 they acknowledged the sovereignty of France. The population steadily decreased during the 19th century, in 1876 being 5,420; in 1910, 4,000; in 1915, 3,424.

MARQUETRY, mär'kret-rë (French, marqueterie), inlaid cabinet-work in which thin slices of different colored wood, sometimes of ivory, pearl, shell or metal, are inlaid on a ground usually of oak or fir, well seasoned to prevent warping. The marquetry of Italy possesses much artistic merit. The work of Foulet, Oeben and Riesener in France during the 18th century was conspicuous and their manufactures are still sought by lovers of antiques. (See INLAYING; MOSAIC; PARQUETRY). Consult Jackson, F. H., 'Intarsia and Marquetry' (1905).

MARQUETTE, Jacques, French Jesuit missionary and explorer: b. Laon, France, 1 June 1637; d. near site of the present Ludington, Mich., 18 May 1675. His family was of good social position in his native city. It is evident that he must have had some advantages of early education, as he entered the Jesuit College at Nancy, in 1654, with the intention of joining the Society. He studied and taught, as Jesuit scholastics usually do, at Pont-à-Mousse, Rheims, Charleville and Langres. In 1666 he was to go as a missionary to French India. He arrived at Quebec, 20 Sept. 1666. In the next month he began his preparation for life among the savages by the study of the Indian languages, at Three Rivers, under the direction of Father Bruillettes who knew all the ways of missionary life. He spent two years in the wilderness, with Father Bruillettes' log house as his "home," learning the forest and lake and living, as near as possible, the life of the redmen. In 1668, Father Marquette was ready to begin work among the Ottawas. From Montreal, he went to Sault Sainte Marie, known to-day as the "Soo," then marked in French records "Santa Maria" of the Algonquins. The term "Ottawa," as used by the Jesuits, included the Siouxs, the Miamis, the Sacs, the Winnebagoes, the Foxes, Pottawatoes, Beavers, Creeks, Ottawas, Hurons, Menominees and Illinoises. From Sault Sainte Marie, he was sent to La Pointe Mission in Lake Superior. The place selected for his work was at Chequamegon Bay. From 14 Sept. 1669, until 1671, when the mission was given up because of the inability of the Hurons to defend themselves against the Siouxs, he served and learned much. Father Marquette probably did not foresee that this abandonment meant that there would be no Christian mission in Lake Superior "for over a hundred years"; as the Rev. Samuel Hedges remarks, "There can be little doubt that the Blackrobe sat in their council circle, and took part in their deliberations, which determined their flight." He says Marquette joined the Hurons in their retreat to the south toward the Island of Mackinac, then Mackinillatorackinac. The little town of Saint Ignace—named in honor of the founder of the Jesuits, Saint Ignatius Loyola, on Moran Bay,—claims the honor of being the spot where Father Marquette built his first chapel. In 1671, Mackinac Island disputes with Saint Ignace the right of precedence, but there can be no doubt, whether a previous mission existed in Mackinac Island or not, that it was from Saint Ignace. Father Marquette set out in his search for the Mississippi,—of the existence of which traditions and rumors lived among the tribes.

The quarrels that had deflected the course of Sieur René de la Salle did not, in the end, prevent him from tracing the course of the Mississippi to the sea, and De Soto, earlier, had crossed the valley near its mouth, but it was Marquette who, having equipped himself with the Indian lore, added to such scientific knowledge as he could acquire, actually discovered the wonderful stream of the Indian legends. Count Frontenac was the devoted friend of La Salle, but he could not overcome the jealousies raised by the Governor's commercial interests. It has been the fashion to accuse the Jesuits of merely mercenary motives in opposing the opening of the territory of their missions in New France to all trappers and traders. It is plain, human,—putting aside
all imputed motives,—that Jesuits like Jogues, Albour, Drulllettes and a hundred others did not lead lives of unspreakable depravations and amazing self-sacrifice merely for temporal gain for their Society or their country. When it is known that they were French, it is at once known that they were patriots. And if the Jesuits opposed the mercantile designs of the supporter of La Salle, it must be admitted, in overseeing the furthering of the Northwest. Dr. Shea, in his 'Discovery and Exploration of the Mississippi Valley,' estimates the distance traveled by Marquette and Joliet from Saint Ignace to Green Bay (Mission Saint Francis) to be 757 miles, making the whole distance traveled 2,549 miles, but he omits the distance from Saint Ignace to Green Bay. Marquette and Joliet explored the Mississippi for 300 miles in solitude. Marquette describes the river at its junction with the Missouri as turbulent in the extreme. Marquette was pleased by the treatment received at the first village of Illinois Indians. They met Indians who showed some traces of civilization, and at the mouth of the Arkansas, they met with great kindness from the Indians. From the Illinois—believing the route to be shorter—they went, it is asserted, to a point near Chicago. By portage, at Sturgeon Bay, they saved time and strength, and from the Green Bay they went to St. Joseph. They reached the Mission Saint Francis—having spent, from the beginning of their ascent of the newly-discovered river, on 17 July, about two months—four months, in all, of almost incessant hardship since they began their voyage on 17 May 1673. Further investigation was out of the question. Marquette and Joliet had not much strength left. A journey of nearly 3,000 miles, in birch canoes, had told on them, hardly as they were. Marquette spent 13 months at De Pere, endeavoring to regain his health. He knew well the stupendous importance of what he had done for France and for the world; but his business was with souls. While Joliet went to Montreal to report, Marquette started to found a new mission in Illinois. He left the Mission Saint Francis on 16 July with 16 canoes; he arrived at the Chicago River, 4 December. The description of the carrying of the canoes through the forests gives a glimpse of the difficulties the missionaries expected to encounter. The inundations of 29 March had destroyed their hovel. At Kaskaskia, Marquette's heart was filled with gratitude by the kindness he received. His desire for exploration led him, while using his strength in ministering to the Indians, to explore Lake Michigan farther. He grew weaker, and turned to the north. Through the river—now Pere Marquette—he made his homeward way. On Saturday, 18 May 1675, he died. The Ottawa—under that name were included the tribes under the Jesuits in the Lake regions—had among them several Hiskakumpens who had been much devoted. These, going northward in the spring, raised his body, reverently prepared it according to the mode of their tribe, took it to the Mission Saint Ignace, where Fathers Nource and Pierron awaited it. On Tuesday, 9 June 1676, Marquette was buried in the centre of the chapel of Saint Ignace, a building which was destroyed by fire in 1706. In September 1877, Father Edward Jacker, pastor of Saint Ignace, discovered the grave and remains of the missionary, and they rest under a monument erected by the citizens of Saint Ignace in 1882. MAURICE F. EGAN
Formerly Professor of English Language and Literature, Catholic University of America.

MARQUETTE, mär-kêt', Mich., city, county-seat of Marquette County, on Lake Superior, and on the Duluth, South Shore and Atlantic and the Lake Superior and Ishpeming railroads, 13 miles northeast of Ishpeming, and about 58 miles north by west of the principal city on Lake Michigan. The first permanent settlement was made about 1845 and a little later it was called Worcester after public accounts had been given of the mineral wealth of the Upper Peninsula. It was incorporated in 1851 and chartered as a city in 1869. It was named after Père Marquette (q.v.) who had visited this section as a missionary to the Indians. It has a fine harbor with a breakwater 3,000 feet in length, and the best of facilities for loading steamers with the minerals of the iron ore, which are shipped from here in large quantities. The ore docks are the largest and best fitted of any in the country. It has steamers communication with all the important lake ports. Near the city are large quarries of brownstone which furnish employment to a number of people. The chief industrial establishments are a planing-mill, two blast furnaces, steam-engine works, and the stone quarries, all employing about 800 men. Other smaller industries are the manufacturing of electric light, sash, door and blinds, and bricks. The principal buildings are a government building which cost $150,000; a county courthouse, cost $250,000; Peter White Library, the building cost $75,000, and the 15,000 volumes are valued at $30,000; a city hall, cost $60,000. The educational buildings are a State Normal School, which cost $150,000, eight public schools, cost $500,000, a manual training school and Saint Joseph's Academy. It has Protestant Episcopal and Roman Catholic cathedrals, Saint Mary's Hospital, the Upper Peninsula State Prison and a house of correction. The Federal government presented to the city Presque Isle, about 400 acres, a short distance north of the city proper. The place has been improved and made into a beautiful park. A statue of Père Marquette is in a city square, near the shore. It is a port of entry, a vast amount of iron ore passing through. The three banks have a combined capital of $400,000, and the annual business amount to $7,500,000. The government since 1813 has been of the commission type.

The electric-light plant and waterworks are owned and operated by the city. Pop. 12,117.

MARQUETTE RANGE. See IRON ORES—Iron Ore Districts.

MARQUETTE UNIVERSITY, Milwaukee, Wis., comprises the following departments: college of arts and sciences; college of applied science and engineering; school of dentistry; the R. A. Johnston College of Economics; school of journalism; school of law; school of music; school of pharmacy; training school for nurses; and Marquette Academy, the university high school. The faculty numbers 240; the average annual attendance of students is over 1,500; tuition fees range from $60 to $170; living expenses from $128 to $190. The different courses lead to the degrees of bachelor of arts, bachelor of science, doctor of medicine, bachelor of laws, doctor of dental surgery, bachelor of commerce, bachelor of journalism, bachelor of literature, pharmaceutical chemist and bachelor of science in pharmacy. The grounds of the university consists of five tracts on which are the buildings housing the various departments. Owing to the great increase in enrollment of students the erection of several new buildings is projected. In March 1916 a building and endowment campaign was carried on in Milwaukee and in the state of Wisconsin resulted in a $533,471 fund. The college library contains nearly 13,000 volumes and there are supplemental libraries connected with the departments of law, medicine, dentistry, engineering and economics, while students have access to the neighboring city public library which contains over 340,000 volumes and to the city museum, one of the largest and most complete in the United States, containing hundreds of thousands of zoological, botanical, mineralogical and other specimens. The history of Marquette University begins with the arrival of Jesuit fathers in 1855 when the first college opened St. Aloysius Academy. In 1864 a new building known as Saint Gall's Academy was erected and incorporated as Marquette College. In 1906 it celebrated its silver jubilee with the erection of a new building and a new charter creating Marquette University. Its progress has been one of continuous growth due to administrative economy, encouraging although inadequate laic support and tutorial service without salary, the Jesuit professors of the faculty giving their time, training and ability to the city with no material recompense beyond personal support.

MARQUEZ, José Arnaldo, ho-sa' ar-nal'do mar-kéth, Peruvian poet; b. Peru, about 1825; d. Lima, 15 Jan. 1881. For participation in civil wars he was several times banished in the earlier part of his career and he lived variously in Chile, Cuba and the United States. Among modern Peruvian poets he held a high rank. He published 'Lost Notes' (1862); 'Flor de Abel,' etc., and in prose 'El Peru y la Espana moderna,' and 'Recuerdos de un viaje a los Estados Unidos de America.' He lost his life in the defense of Lima against the Chileans.

MARQUEZ, Leonardo, Mexican soldier; b. Mexico, about 1820. In 1849 he appeared as the leader of a movement in support of Santa Anna, and under Santa Anna's last administration he had important posts in the army (1853-55). He fought against Juarez in the Reform War, and favored the establishment of Maximilian's empire. In October 1866 Maximilian made him a division commander, and in March 1867 sent him to Mexico City to form a cabinet and raise troops for the relief of Querétaro. But he was hemmed in by Diaz, and after Maximilian's execution resigned and went to the United States. He frequentedly called the tiger of Tacubaya, from his execution there of a large number of prisoners (11 April 1859); though he alleged the express order of Miramon as an explanation. He was exempted from the amnesty of 1870.
MARQUEZAS ISLANDS.—MARRIAGE

MARQUEZAS ISLANDS. See FRENCH ESTABLISHMENTS IN OCEANIA.

MARQUIS, márkwis, or MARQUESS (Italian, marcese; French, marquis; German, markgraf), a title of honor next in dignity to that of duke. Marquises were not known in England till King Richard II, in the year 1385, created his great favorite, Robert Vere, the Earl of Oxford, Marquis of Dublin. In 1397 the same king raised John de Beaufort, Earl of Somerset, to the rank of marquis, a dignity which he afterward refused to bear from its being an innovation. The title fell into disuse until the reign of Edward VI, who created the marquisate of Winchester in 1551. The title given a marquis in the style of the heralds is most noble and potent prince.

MARQUIS, Thomas Guthrie, Canadian author: b. Chatham, New Brunswick, 1864. He received his education at Queen’s University, Kingston; was made English master at the Stratford High School and subsequently at the Kingston Collegiate Institute. Later he became principal of the Collegiate Institute at Brockville. After 1901 he devoted his entire time to literature. In 1905 he was chief editorial writer on the Ottawa Free Press. Subsequently he edited ‘Canada and its Provinces’ (22 vols., 1914–15). He also published ‘Stories of New France’ (1896); ‘Stories from Canadian History’ (1893); ‘Marguerite de Roberval: A Romance of the Days of Jacques Cartier’ (1899); ‘Canada’s Sons on Kopje and Veld’ (1900); ‘Life of Lord Roberts’ (1901); ‘President of the United States’ (1903); ‘Brock: The Hero of Upper Canada’ (1912); ‘The War-Chief of the Ottawas’ (1914); ‘The Jesuits Missions’ (1915). He edited the Canadian biographical collection entitled, ‘The Builders of Canada’ (1903).

MARRAKESH. See MOROCCO.

MARELLA, a genus of fossil Crustacea found in the Cambrian shales of British Columbia. See STEPHEN FORMATION.

MARRIAGE, History of (Latin, maritas, from mare, a sea, or from maris, a male). In the natural history sense marriage may be defined as a more or less durable union between male and female lasting till after the birth and rearing of offspring. In the ethical and legal sense marriage is a union between man and woman living in complete community of life for the establishment of a family. See article on the FAMILY, HISTORY OF.

The Origin and Social Function of Marriage.—In the natural history sense of the word marriage may be said to exist among many of the animals below man. Pair marriage is common among the birds and some of the higher mammals. It especially characterizes the anthropoid apes, the pair marriage of the chimpanzee being monogamous and durable, probably not unlike that of primitive man. The origin of marriage is therefore to be sought in the family, rather than the origin of the family in marriage. See article on family above referred to.

The social function of marriage in human society is twofold: (1) to regulate the relations between the sexes and (2) to determine the relation of the child to the community. This latter function is often overlooked, but is quite as important in any scientific consideration of marriage as the former.

Practically all forms of marriage may be found among human beings if we consider all peoples and all historical periods, though the primitive or original form of marriage seems to have been that of a simple, pairing monogamy, similar to the pair marriage which is common among the higher animals. The reasons for rejecting the hypothesis of a primitive state of promiscuity have already been given in the article on the family just cited. Whether such a form as communal or group marriage (limited promiscuity) has ever existed among any people has been much debated by anthropologists and sociologists. The nearest approach to this form of marriage is found in certain aboriginal Australian tribes, where a man who takes a wife from a certain group has sexual access to all the other women of that group, though he lives with only one of them. A similar form is to be seen in the Punahuan Inhabits of the Polynesians, the marriage of a group of brothers with a group of sisters, though this form was rare even among the Polynesians. Most anthropologists and sociologists believe that such forms of group marriage were not primitive, but were relatively late historical developments. Setting these aside as exceptional forms, the main types of marriage in the human species may be grouped under the heads of polygyny, polyandry and monogamy.

Polygyny (Greek, "many wives").—A common form of marriage in barbarian and lower civilization is the union of one man with several women, scientifically known as polygyny, but popularly called polygamy. It is possible that this form of marriage existed to some extent in primitive times, as the gorilla among anthropoid apes is said to practise it. In general, however, it presupposes a considerable accumulation of wealth and is therefore among strictly savage peoples very rarely practised. As a human institution it received its chief development in the period of barbarism and seems to have been an accompaniment of the development of dominantly militant life and of slavery in that period of human culture. Among people who practise polygyny, therefore, the practice is largely confined to the wealthy and ruling classes, as only these can afford the luxury of having more than one wife. In polygynous countries of the present rarely over 5 per cent of the families are of polygynous type. Owing to the fact that the number of males and females in any given population under normal conditions is relatively equal even in polygynous lands, the mass of the families are necessarily monogamic.

The causes of polygyny are complex. Besides the animal instincts of the male we must place especially the military honor of wife capture and the economic value of women (or wives) as laborers. In barbarism the outward and visible sign of a man’s wealth and power is frequently the number of his wives. A contributory cause among some peoples is the high valuation set upon children, especially under the patriarchal system in which the male is said to have been the main cause in the case of the Hebrew patriarchs.

The practice of polygyny has been widespread among practically all peoples from the
stage of barbarism up, though limited to the prosperous and well-to-do. Where it failed of legal sanction it frequently existed in the more or less illegal form of concubinage. It is not surprising, on this account, that in many cases it has received the explicit sanction of religion as in the cases of Mohammedanism and Mormonism. But among all peoples it has tended to die out with the coming of higher civilisation, for the reason that it obviously involves the subjection and degradation of woman, the lack of paternal care of the children and the placing of a premium upon the more brutal instincts of human nature, especially in the male.

Polyandry (Greek, "many husbands").—The union of one woman with several men is a rare form of marriage found at present practically only in Tibet and among some of the mountain tribes of India, though within historic times it existed in China. Apparently polyandry has never been a widespread form of marriage in the human species, as the instinctive jealousy of the male works against it; and there is no reason for supposing, as McClellan supposed, that polyandry was universal. On the contrary, it seems to exist only under such economic and social conditions as might lead to the suppression of male jealousy. Thus the difficulty of one man supporting a family has in the barren regions of Tibet led to the toleration of polyandry. In the same region there seems to be a scarcity of women, which also favors the practice of polyandry.

The most common form of polyandry is the fraternal or Tibetan form, in which a group of brothers have a common wife, the oldest brother being the head of the household and the putative father of all the children. Among the Nairs of India, however, a non-fraternal form of polyandry exists.

Monogamy (Greek, "single marriage").—Polygyny and polyandry, as we have seen, have always been exceptional forms of marriage. The prevalent form of marriage among all peoples and in all ages has been some form of monogamy, the union of one man and one woman. This has been so largely by biological necessity, as under normal conditions the number of males and females in any given population is relatively equal. The instincts of man have also to some extent favored monogamy, especially the instinct of sex jealousy. Economic conditions also have rarely made it possible for a man to support more than one wife and her children. Besides such biological and economic reasons for the existence of monogamy, however, it has manifest social superiors in any other form of marriage. It is much more favorable to superior care and upbringing of children, as under monogamy both husband and wife commonly unite in the care of the child. It develops affections and emotions of a more altruistic type, and it makes the bonds of the family life more definite and strong. For these reasons monogamy favors the development of higher types of morality and of civilization generally. Its association with higher types of civilization is, therefore, not an accident. At its best, the monogamic family provides such superior unity and harmony that it is best fitted of all the forms of marriage to work in harmony with higher civilisation.

The Marriage Ceremony.—Among all peoples, savage as well as civilized, legal marriage is usually accompanied by some form of ceremony, the sanction of the group upon the union. This ceremony is usually of a magical or religious character, though in a few peoples it is apparently purely social. Betrothal is also, among the more advanced peoples, frequently an occasion for some sort of religious or social ceremony.

The Freedom of Choice in Marriage.—Westmarck presents considerable evidence to show that among primitive peoples marriage was originally based on the mutual attraction and consent of the parties. Almost always the male is the wooer. The female accepts or rejects her lover, and thus plays the decisive role in sex selection. The same phenomena of courtship also appear very generally among the animals. There is no reason for supposing that different conditions existed among primitive men. The common practices of wife capture and wife purchase must be regarded as exceptional conditions developed in later stages of civilization. Marriage thus began in free choice, but later it was usually the stages of wife capture, and of wife purchase, under the dominance of family or tribal interests, becoming more gradually in modern times again a matter of free individual choice.

Marriage by Capture and by Purchase.—Among predatory and warlike tribes marriage by capture is often common; indeed, on account of the social and military honor attached to wife capture, it sometimes comes to be the favorite form of marriage. We know of no people, however, among whom wives are regularly captured outside the tribe. Manifestly such a social state would be practically impossible, even though wife capture was socially favored.

Much more common than wife capture, but at a much later stage, of cultural development, was wife purchase. This stage comes in particularly in early barbarism with the development of slavery and the idea of property in persons; and among most peoples it has survived to the present day. It has been developed. It was particularly important in developing polygyny and the patriarchal form of the family. Many survivals of wife purchase exist among even relatively highly civilized peoples.

Child Marriage.—Another result of wife capture and wife purchase among some peoples was the practice which we know as "child marriage," that is, the uniting in formal marriage of children under 15 years of age, usually the marriage of a girl under 15 with a much older man. As a custom, child marriage is not unknown among warlike savage and barbarous tribes. It developed, especially in India, however, under the influence of the caste system and the custom of wife purchase. More than one-half of the total female population of British India are married before 15 years of age, sometimes while they are mere infants. In the western provinces of India the girl remains at home with her parents until sexual maturity is reached; but in Bengal, girls commence their married life at the age of nine years. The British government has made ineffectual attempts to check child marriage, but the practice continues, as it is supported by the higher as well as by the lower Hindu castes.
Exogamy and Endogamy.—Among practically all peoples, custom forbids the marriage of very near kin. A limited number of tribes among savage and barbarous peoples do not forbid the marriage of brothers and sisters, but all view with social disapproval sexual relations between parents and children. Indeed, the larger number of uncivilized peoples not only condemn sexual relations between blood relatives, but forbid marriages between members from the same clan, or totem group. As clans may be metronymic or patronymic, this restriction prevents marriage between maternal or paternal relatives as the case may be, even to the most remote degrees of kinship, but makes it possible for a man to marry a near relative in a clan to which he does not belong, on the ground that no kinship tie exists between them. This custom forbidding marriage within the clan is known as exogamy. It is nearly always correlated with endogamy, as respects the tribe. Thus in the clan or totem stage of social organization, in which most of the North American Indians were at the time of their discovery, a man must take a wife outside of his clan or totem-kin group, but usually must marry within his tribe or related tribes.

While the question of such customs of exogamy and endogamy have been much debated, McLennan held that exogamy was the outgrowth of the custom of female infanticide, but there is little or no evidence in support of such a theory. Westermarck's explanation is that exogamy arises from the extension to the whole clan of the natural instinct of aversion to incest. It may be pointed out, however, that exogamy and endogamy are not customs peculiar to uncivilized peoples. Similar rules are found regarding forbidden degrees of relationship among civilized peoples. While there is possibly a natural aversion to incest, there is even more pronouncedly instinctive attraction between persons of the opposite sex who are relatively strange and unfamiliar. This leads naturally among all peoples to marrying outside of the close social group; and among the uncivilized all members of a clan are regarded practically the same as very near relatives. The main difference in the practice of exogamy among the uncivilized and among the civilized is that, in the clan stage of social organization it is not blood relationship in our sense which counts, but the type of social organization itself.

Marriage Among the European Peoples.—Among the early Aryan peoples of Europe marriage was universally regarded, so far as we can discover, as a religious bond, since their family life was based upon ancestor worship. This early Aryan view of marriage gave way in later Rome to the view that marriage was a private contract, to be made and dissolved by the parties at their pleasure. The early Christian Church combatted this view of the marriage relation and sought to restore the view that marriage was a religious bond, which it finally did by making marriage one of the sacraments of the Church. It was forced, however, to still recognize that consent or contract was the essential means of entering the marriage relation. "Consent marriages" continued to be recognized, therefore, though they could not be broken except through the authority of the Church. The Protestant reformers put forth the idea that marriage was a civil relation, rather than a religious bond or sacrament, to be created by the state and broken by the state. In reaction to this view the Roman Catholic Council of Trent in 1563 declared that a valid marriage could only be created by the Church and only annulled by the Church. This still remains the Roman Catholic view of marriage.

The later Roman view that marriage is a private contract, to be created and broken by individuals as any other contract, has shown a tendency to revive in modern nations among many elements of their population. The present problem of the family, therefore, centres about the question of divorce and the toleration of other forms of marriage than that of permanent monogamy. (See article on Family, History of). The last three theories mentioned are evidently held alongside of one another by different elements in the population of modern nations. Which of these competing theories of marriage will become established in the moral standards of the future it is too early yet to say.

CHARLES A. ELLWOOD, Professor of Sociology, University of Missouri.

MARRIAGE, The Law of. When the cave man wanted a mate he took her, and he was not very particular where he got her. His next neighbor's cave, indeed, would be the most convenient and likely place. It was a mere question of brute strength; the man of greater physical power had his way. As social evolution progressed and families were established and organized into clans, the man who preferred to gain a wife by his own efforts went further afield. To have forcibly taken a woman of an allied family, or from an affiliated clan, would have brought down upon the offender the vengeance of the entire community, and, against this, individual force could not prevail. Wife capture had to be practised against hostile tribes, from whose vengeance the robber would be protected by the whole of his own community. The Roman legend of the rape of the Sabine women points to a time when wife capture from unrelated and, therefore, enemy communities was a common practice. Probably robber-marriages persisted, to some extent, even in the home circle, so to speak. Among a number of semi-barbarous nations marriages still take the outward form of abductions. Before the leveling influence of civilization had almost completely obliterated their tribal customs, wife captures were regularly staged by the Kirghis of the steppes. The bride, mounted on a swift horse and carrying her dowry, rode furiously out of her father's camp and the bridegroom's got there just expected to catch her before dark, and he always did—that was part of the comedy. The whole performance was camouflagé for the pur-
pose of covering up the real transaction, which was nothing else than a bargain and sale. Marriage by purchase was evolved, almost inevitably, from the necessity of capture; the prospective husband paid a price to the family of the prospective wife for the privilege of carrying her off. Sometimes the abduction preceded the payment of the purchase price, the latter being disguised as a fee subsequently to be tendered to the officials. In the great except under the early Roman law, the woman was adopted; she came under the fatherly power of the husband and, theoretically, became his daughter. In other times and places marriage was freely a sale. In all cases the wife became the property of her husband and, at the worst, she was his drudge or slave. The tute-lage, which was exercised over a woman throughout her life (even after her marriage) by the males of the family in which she was born, was intended to be protective of her honor and that of her family, as well as of her share of the patrimony of family property. An instance in point is the Levitical law, which permitted the father of a bride, put aside by her husband on charge of unchastity, to proceed against the accuser. If the accusation by was disproved, compelled the offender to expiate the wrong by keeping the woman as his wife all the days of his life. The actual condition of the wife was not as hard as might be implied from her legal status, or lack of legal status. The marriage or purdah was coupled with the injunction to honor the mother. In the great Oriental monarchies of antiquity marriages were undisguisedly commercial transactions; the bought wife of a citizen of Babylon, how ever, was the manager of her husband’s house and she was habitually consulted in serious matters of business. She was conferred with even in affairs of state if her husband happened to be a public official. A free woman, though married, might occupy a public position and hold separate property. Primitive communities do not clearly distinguish between custom and law or religion and morals; but in course of time a strictly religious form of marriage might be substituted for contractual marriage in any given community. The marriage or purdah or Concubine has a tendency to become symbolical and dramatic. The pledge given by the wooer to bind the bargain might originally have been a cow (domestic animals were real money, cattle or chattels and decennias were words of identical meaning). This was later on represented by a gift to the bride—a bracelet, jewel or other token. The *giving in marriage,* i.e., the consumption of the sale of the woman, would be accompanied by conventional words and gestures, dancing and music. Sometimes a wooer made payment in personal services, as Jacob toiled with father Laban’s sheep seven years for Rachel; and in this, as in other cases without number, the marriage was a matter of mutual inclination. The bride usually received from her father a dowry or dowry which passed to the husband and remained under his control during the continuance of the conjugal relation. Among the Jews and Oriental nations in general marriages were terminable by divorce at the will of the husband. Among the Romans they were terminable at the will of the wife’s father or by mutual consent of the parties. In either case the bride’s dowry was returned. The remarriage of widows was not forbidden, but was disguised as a fee subsequently to be tendered to the officials. In some instances, acts by the courts had to be obtained and provision made for the care of the children and household of the deceased husband. Monogamy and polygamy often existed side by side, even in highly developed human societies. Of the two systems the latter was given distinct legal sanction to plurality of wives. Polygamy was practised by the Hebrews in the patriarchal stage, though the practice fell into abeyance in later times. Among the Aryan nations monogamy must be the usual state in all communities, whatever may be the law. Relatively few members of a community have the power to gain or the ability to maintain more than one wife. While a man individually might capture a woman of a hostile tribe and make her his lawful wife, captives of war became slaves. Among Oriental nations the children born to free men of their slave women or *hand maidens* were considered legitimate and free. Among the Aryan nations monogamy was the prevalent rule. The marriage by appropriation and the resulting guardianship—or, more plainly speaking, ownership—of the wife by the husband, does not comport with the sociological thesis that the institution of the patriarchy was preceded by the matriarchate as a form of family organization. The practice of polyandry is rare, even among savages, and where it is observed among people of culturally higher stage it indicates degeneracy more probably than primitiveness. In Tibet polyandry is evidently an outgrowth of the group marriage—the marriage of all the daughters of one family as a group with all the sons of another family. The plural husbands of polyandrous Tibetan women are allegedly brothers. A rather frequent form of primitive marriage is that where the husband is adopted into the tribe of the wife. That in such case the patriarchal authority would be less pronounced than otherwise is not evident, however. The male adopted into a tribe and his marriage itself he can be on the same footing with the males born therein. Within a clan blood kinship is traced through females; but it is not necessary to presume the matriarchate as an antecedent social order to account for this. The maternity of a child is determinable with so much greater certainty than its paternity that the tracing of kinship through the mother would commend itself for its convenience. Moreover, in those clans where this method of reckoning is customary the family and tribal organization is invariably patriarchal. Practically all the nations which have become the leaders in culture have erected their social structure on a basis of monandrous marriages and agniclatic kinship. The wife is taken into the husband’s own, clan house, and her children become members thereof by the family name of their father. In the matter of inheritances cognizance was usually taken only of relationships in the male line. A daughter might inherit from her father, but if she died before he did her children would take nothing by
MARRIAGE

815

representation; hence the importance of the dos or marriage settlement. By neither the Roman nor Teutonic rule of consanguinity was a man's sister's husband of kin to him and the suggestion of a prohibited degree of relationship between himself and a deceased wife's sister would have sounded queer to Caesar or Cicero. The Levitical law took more account of blood relationship through females and made even a man's stepmother his cognate in blood. Stepbrothers and stepsisters could not intermarry, though they had no parent in common. It also forbade marital connubium between certain other persons whose affinity was merely legal—as between a man and his uncle's widow or with his daughter-in-law. It forbade marriages of near relations to the third degree of blood kinship on either the maternal or paternal side—and this rule has prevailed throughout the Christian world. According to the Levitical law a man should not bring his sister-in-law into his house as a rival to his wife, but there was no prohibition with a deceased wife's sister and a man was expected to be a husband to the childless widow of his brother.

In the earlier period of their history the Romans recognized three kinds of formal marriage. The religious form, conferratio, or "marriage with the bride," was solemnized by the Pontifex Maximus in the presence of 10 witnesses and was reserved to themselves by the old patrician families. Among the plebeians espousals took the form of a purchase, coemptio, which is defined by Gaius as a mutual stock sale of the parties whereby the wife was freed from tutela legitima and sacris familiis—tutelage to her male relatives and contributions for the maintenance of certain religious rites in her husband's household. The third form, nuptia, though held in little respect in the earlier period, ultimately became prevalent in all social ranks. Either by conferratio or coemption the woman given in marriage passed in manum evert, literally into the hands of the man, her husband, who acquired rights of ownership over her. The wife was to be opened into a perfect matrimonial bond only by prescription and after continued cohabitation for an entire year. In the meanwhile the husband's marital despotism was in abeyance. By simply absenting herself from the matrimonial domicile for one day in each year the wife could indefinitely postpone and defeat the acquirement of tutelary and possessory rights by the husband. On the other hand, the later law reduced the tutelage of the male kin law rights of the husband. In fact, at the most splendid period of Roman greatness married women enjoyed a freedom with respect to their persons and property such as they have not enjoyed anywhere since then. Most important of all was the establishment of the principle that marriage rested upon the consent of the parties—consensus, non concublias, fetic nuptias—and might, therefore, be dissolved at the pleasure of either party. While the marital union was admitted to involve a sharing of all for life—consoritum omnis vitae—this was declared not to mean a voluntary, not a forced, partnership. To hinder a separation when a consensus had ceased to exist was regarded contra bonos mores, in plain English, "immoral."

Early Teutonic marriage law did not differ greatly in fundamentals from that of Rome. Though disguised by ceremonials the transaction was essentially a barter. In the original and crudest form the custom was to give the father so much for his daughter, the price being fixed in accordance with the wealth and rank of the families participating in the treaty. The contract was made handfast, just like any other bargain, by a pledge or part payment. In progress of time this pledge, vadium, took the form of an ornament of more or less value presented to the bride at the betrothal—a modern practice an engagement ring. In time also the arrha (purchase money) became a gift to the bride instead of a payment to her father, though the latter retained it in trust for his daughter. The payment of the marriage settlement—and this the arrha was in effect—might be postponed until the lifetime of the husband, on his giving security for the transfer of an equivalent out of his estate to his widow. The purchase price for the bride thus became dower in form as it had always been in essence and intent. Some early Teutonic laws distinctly sanctioned such a "robber-marriage," which was nothing more than an abduction, or, the bride being willing, was simply an elopement. The penalty the abductor was required to pay to the outraged father was usually identical in amount with the prescribed amount of the settlement or dower in the more orderly form of wedding—indicating that barter marriage and robber marriage stood on about an equal footing of respectability. The Teutonic maiden when given in marriage was usually of a fit for housekeeping and a dowry. Possibly an abducted bride would receive neither, which may be the reason why abductions were sometimes accomplished by connivance of the bride's family. In modern days elopements are often similarly motivated. There is nothing under the sun, even in marriages. Betrothals in a regularly arranged ancient Teutonic marriage were attended by festivities on a scale comparable with those attending the wedding itself. Indeed, some investigators of primitive law insist that the troth-plighting was not a mere promise to marry but was, in verity, the contract of marriage. The giving of a pledge (vadium) to bind the bargain would indicate to a person exercising ordinary common sense that the betrothal was more than a mere action of charity or contract. It created an obligation to wed but did not actually establish a marital relation. The disputations on the subject have the appearance of mere quibblings with words. To be sure, if one buys a thing to be delivered to-morrow and pays part of the price, a sale has doubtless taken place. Of course, a delivery is necessary to complete the transaction; and, if the thing purchased be a cow, it might be said that she is not under complete dominion.
of the new owner until he has put her into his stable and locked the door. Possibly some state official was responsible for the suggestion of other investigations of ancient Teutonic customs that concubitus was a legal essential to the consummation of a marriage. Be that as it may, the idea of a threefold stage in the process of acquiring a wife—the trothplight, the wedding, and the consummation—has persisted in legal phraseology and has colored even very modern legal conceptions. Early Teutonic law permitted a husband to put aside his wife for adultery or barrenness, and it seems to have countenanced dissolution of the marital bond by mutual consent.

From the very outset Christianity sets its face against the looseness of the later Roman law respecting marriage. The legislation of the Christian emperors shows a reaction against the extremely liberal doctrines of the Antonine jurisconsults. The prevalent state of public opinion explains why, in the fusion of patriarchal practices, Roman jurisprudence and barbaric usages, so many retrogressive customs of the latter respecting the position of women should have filtered down to the new faith. The principles of the Roman law prevailed in so far that unmarried women were relieved of bondage to the family after attaining their majority. But the position of married women became fixed in barbaric archaisms and the husband drew to himself all the powers that had belonged to the wife's male kindred. The Church declared marriage to be a sacrament and the consequence was the enunciation of the doctrine of the indissolubility of the matrimonial union except by death. Through the decretals, through its influence on the customary law in the matter of dower and through the assumption of jurisdiction by the ecclesiastical courts over matrimonial questions, the Church established a universal marriage law throughout the Christian world. The canonists accepted the principle of the Roman law that the consent of the parties is essential to the making of a legal contract of marriage, just as it is to the making of any other contract. The law regarded such a contract as a nullity in fact or because of physical or moral duress, or because of natural or legal incapacity of one or both of the parties (impotency, insanity or minority) were declared insuperable impediments to the execution of the contract, and grounds for its annulment if executed. From the Roman law also the canonists carried over into their system the age of consent—14 for males and 12 for females—but they rejected the requirement of parental consent. In seeming contradiction to this, the father still "gives away" the bride in the marriage service. The Roman idea, that betrothal ( sponsalia) was merely a promise to marry, was modified under the influence of Teutonic usage, by which the troth-plight was considered to have created the relation of husband and wife. Ultimately the canonical law made a distinction between sponsalia de futuro and sponsalia de presenti. The former was declared a mere promise; but a present agreement (accipio) was held to constitute a valid marriage. Such a marriage if not consummated might be dissolved, however, either by a vow of celibacy taken by one of the parties, or by special dispensation. The troth-plighting in the marriage service and the wedding of the bride with a ring may be reminiscences of the Teutonic hand-fasting and the payment of the pudium or pledge, while the marriage settlement looks very much like a modern variation of the transfer to the bride of the arrha. Formidable impediments to marriages within the family, even between very distant relations, were created by the union of the consanguineous and affinity. The degrees of kinship were measured from the common male or female ancestor downward in collateral lines of descent. Each successive generation being but one degree further removed from the source of the blood, persons might stand in close relation to each other, though wide apart collaterally. Second cousins, for instance, were akin in the third degree by the canon, though the Levitical and Roman law would both place them in the seventh degree. The earlier Church canon forbade intermarriage down to the seventh degree, so that sixth cousins could not enter into matrimonial relations with one another. In the later Church law the prohibition ended with the third degree canonical, or with second cousins. Relations by the side of the family were accorded the same disabilities as blood relations. Sisters-in-law and brothers-in-law were as incapable of contracting marriages as natural brothers and sisters; likewise the children of husbands and wives by former marriages. These prohibitions conform to a sense of expediency and they accord with a not unreasonable interpretation of the Levitical canon. But a reason for tracing relationship of any person to an uncle by marriage and to his children by a former wife and these children's children is hard to discover. Nevertheless, these canonical restrictions were not without salutary effect. The practice of intermarriage between kindred, in order to keep property within the family, had become prevalent not only among the nobility but in all ranks. Near relationship in blood or by marriage might exist among the entire population of a small commune, and such cases were not exceptional under conditions of life that did not encourage travel or change of social status. As everywhere and women sought mates outside their own little circle, the Church set a wholesome limit to inbreeding. The habitual shifting of population and the great freedom of locomotion in modern times have made the extreme restrictions of the canon law quite dispensable. The Reformation produced important changes in the law of marriage. The Council of Trent pronounced clandestine marriages of minors to be nullities and required the presence of two witnesses in all cases. The Protestant ecclesiastical law denied the indissolubility of the matrimonial bond and regarded all betrothals as, presumably, sponsalia de presenti. The words, "I will," Luther remarked, did not, in the Teutonic language, express a future intention but a present purpose unless qualified so as to introduce an element of uncertainty any promise to marry, followed by cohabitation, was to be considered a valid marriage. Indeed, cohabitation in conjugal relation was quite generally regarded presumptive evidence of a marriage previous to present, though the presumption was not conclusive. By acts of Parliament passed in the second half of the 18th and the first part of the 19th centuries,
church weddings were required in all cases and all marriages not thus celebrated were declared void. Informal marriages, however, were still good in Scotland; and this circumstance explains how Gretina Green became a Mecca for runaway lovers. The statute of George II also made the parent's or guardian's consent essential; but this requirement was rescinded later on. An statute of Henry VIII had adopted the Levitical canon as the rule for reckoning degrees of consanguinity in England. This permitted marriages between first cousins and persons of more distant relationship in blood, and it abolished, or was intended to abolish, all disabilities growing out of affinity or relationship by marriage. The Church of England, however, continued to the last in opposition to marriage with a deceased wife's sister, and still insists upon the indisposability of the matrimonial bond except by the death of one of the parties.

In the eye of the modern law marriage is primarily a civil relation. Most of the European codes and, with one or two exceptions, even those of the common law countries, recognize marriage and the registration thereof in the public records indispensable. A religious ceremony may follow at the option of the contractants, but is not legally essential. A relation established by the civil authority can, of course, be dissolved by the same authority. Adherence to the doctrine of the sacramental character of marriage has become a matter of conscience; the law will not force obedience to the same. The modern law has generally raised the age of consent and has made the consent of parents or guardians necessary to the validity of the marriages of minors. All marriages must be publicly contracted. In England the requisite publicity may be obtained either in accordance with the rites of the Established Church or under other religious denomination, or in accord with the rules made by the public registrar or by statute. Betrothal almost everywhere is now considered merely a promise to marry, and actions to recover damages for a breach of the promise are permitted in only a few countries. The dissolution of marriages by consent of the parties is, generally speaking, disallowed, but almost everywhere divorces may be obtained by process of law—in Austria only between non-Catholics. The powers of married women to deal with property vary considerably. In some of the French provinces the pre-Revolutionary coutumes gave to married women, below the rank of nobility, nearly all the independence which Roman jurisprudence in its final stages had allowed them. These local customs together with parts of the Roman law become the basis of corresponding provisions of the Code Napoleon and through the latter and to some extent the Spanish law have affected the law of Louisiana and a few other States of the Union. Much later and wife by this law acquired no general interest in each other's property on marriage. The only property the wife brought into the matrimonial pot was her dot, or dowry, which is in the nature of a wedding gift from her family. While the husband did not become the owner of the dot, he had the use of the same during the continuance of the marriage. The husband could even sue the wife if she hindered him in the enjoyment of the usufruct thereof. Every species of property owned by the wife at the time of marriage or subsequent thereto could become the subject of a dotal gift. The most interesting dispensation of property permitted to husbands and wives, however, was the creation of a communio honorum. The principle of the communio honorum is that husband and wife shall have no property apart from one another. All the either of them owned at the time of marriage and all that either or both together acquired while living in the marital relation, was included in the communal property. As in the case of a partnership in business, the community property could not be made answerable for the individual obligations of the parties to a communio honorum until all joint obligations had been satisfied out of the same. The husband became the managing partner or curator, however; the wife is excluded from every case in which her acts cannot be referred to an express or implied authority of the husband. The latter incurs all debts or charges for the community. The community ceases on termination of the marriage relation either by agreement, divorce or death; in the last case the value of the estate of the survivor are fixed by law. The communio honorum is a form of marital partnership recognized not only in Louisiana, but in Texas, Florida, Missouri, California and other States carved out of territory once in French or Spanish possession. The principle has been greatly modified under influence of the common law and the modern statutes respecting the separate property of married women. The communio honorum exists by legal presumption only with respect to property acquired during marriage, or in the name of either husband and wife, including the produce of their reciprocal industry and labor. The presumption may be rebutted by proof that any property so acquired was intended to be acquired as separate estate. Separate property brought into the marriage by either party forms no part of the community, except by express agreement; nor does property acquired after marriage by gift or inheritance.

In the United States a marriage may be either religious, civil or quite informal. Civil marriage was authorized, or required, in all the New England colonies. Milton's tractate on divorce and his denunciation of ecclesiastical "meddling" with marriage had borne fruit in the Civil Marriage Ordinance of Cromwell, passed in 1653. By this ordinance obligatory celebration before a justice of the peace was instituted, and a system of lay notice, certification and record was established. The action of the Puritans and Independents in England found ready followers in America. The Star-Genera of the United Netherlands in 1656 adopted the principle of an older law of the provinces of Holland and Friesland, which had established a permissive form of civil marriage soon after the independence of Spain was achieved, and this naturally passed over into the law administered in New Amsterdam. For years the celebration of a marriage before a clergyman, as such, was illegal. Religious marriages were sanctioned later on throughout New England, and long before the close of the colonial era the dual civil and religious system was established, which has since prevailed. The "common-law" marriage, still recognized in most of the States, is nothing more than the canonical
sponsa in de praesenti under another name. Any agreement to marry per verba de praesenti, which is followed by cohabitation as man and wife, is a marriage. A presumption of marriage is raised when the parties have lived together in marital relations, have acknowledged themselves (or have been generally reputed) to be husband and wife. This presumption, of course, is not conclusive and may be rebutted. A relation, originally meretricious, will not be transformed into a marriage by a mere informal agreement. This also is in accord with the canonical law. In all the States formalities attending marriage are prescribed by statute. Licenses to marry must be obtained, and the publication of the issuing of a license gives some sort of publicity, as does the requirement of the presence of witnesses and the making of marriages matters of public record. The persons who may perform the ceremony, clergymen or civil officials, are designated. The clerk issuing the license must be satisfied, by affidavit or otherwise, that there are no legal impediments to the marriage, and, in cases of minors, the consent of parents or guardians is usually required. In Massachusetts, however, the statutory requirements have been held by the courts to be merely directory and not mandatory. Non-conformity may involve the non-conformers, and the officials and ministers concerned, in legal penalties; but the marriage is not invalidated. In most of the States, however, the courts have always insisted upon the observance of the statutory formalities, declaring such observance to be essential to the validity of a marriage. The Massachusetts rule has been followed in some States and in others the courts have been lenient. For either of these reasons the "common-law marriage" may be deemed to have been abolished in California, Illinois, Kentucky, Massachusetts, Missouri, Maryland, North Carolina, Vermont and West Virginia. In New York (since 1901) non-ceremonial marriages must be evidenced by a written agreement, signed in the presence of two witnesses and acknowledged in the same manner as a conveyance. The effort to secure the adoption by the States of a uniform marriage law has, therefore, been unsuccessful, and the greatest diversity continues to exist. Moreover, the general rule, that a marriage which is legal in the place where it is established will be regarded as formally perfect everywhere, permits the parties to evade inconvenient requirements of the laws of the place of their domicile by going out of the State to make the contract. The age of consent varies in the States, ranging from 16 to 21 years for males and from 14 to 18 years for females. Where the statutes are silent, the canonical prescription of a minimum of 12 years for females and 14 for males still holds good. Infant marriages are voidable at the option of parents or guardians, if contracted without their consent. When any of the essential ingredients of a contract are lacking the marriage agreement, like any other contract, is a nullity. Consent being an essential, when one party or both have insufficient mental capacity to give intelligent assent no valid marriage can result. A misunderstanding as to a vital fact will annul a contract but only a material mistake was of such a character that there could have been no real consent. Duress excludes volition, and there is no such thing in law as involuntary consent. Impossibility of performance avoids the contract. Impotence, meaning want of physical capacity, makes marriage a nullity; but sterility only if the party having a living and undivorced former spouse is a nullity. Null and void also are marriages between persons in the prohibited degrees of consanguinity. All States forbid marriages between blood relations in the direct line of descent or ascent and between brothers and sisters of the half blood as well as of the full blood. All States forbid marriage between uncles and nieces or nephews and aunts and in 20 States the prohibition extends to consanguinity within the fourth degree. A marriage between first cousins. Affinity through marriage among collaterals is usually disregarded, but in the ascending or descending line, as between step-father and step-daughter or between father-in-law and daughter-in-law the prohibition is frequent. In 25 States whites and negroes are forbidden to intermarry, the law often defining to a nicety the fractional part of African blood which vitiates the marriage. In five States the prohibition extends also to the marriage of whites with Chinese or other Mongolians, and in four States marriages between whites and Indians are forbidden. In recent years legislation on the subject of marriage has been affected greatly by eugenic considerations. In Connecticut and Minnesota epileptics in mental institutions are not permitted to marry and similar statutes have been enacted in other States. Michigan prohibits the marriage of persons afflicted with venereal diseases and the eugenic marriage law of Wisconsin made a physical examination by, and a certificate of health from, a physician a prerequisite to the obtaintance of a license to marry. A woman on marriage acquires the nationality of her husband.

STEPHEN PFEIL.

MARRIAGE OF FIGARO, The ('Le Mariage de Figaro'), Beaumarchais' most popular play, possibly the wittiest and politically the most daring, and the most famous of all dramatic works for the stage in 1778, three years after the success of 'The Barber of Seville' (q.v.), to which it was a sequel. But even while in manuscript it
became the centre of intensely active and complicated political intrigue. Louis XVI rightly discerned in it danger to his throne, and it was not publicly presented till 1784, when it achieved a success till then unparalleled, being by strange irony most applauded by the aristocratic class whose it portended. To Napoleon, after the event, it seemed "the Revolution already in action," and it certainly contributed greatly to hasten and provoke by its leveling tendencies the disintegration of the conventions and even the foundations of the old social régime, though this seems the result rather of Beaumarchais' delight in his own wit, of mere wantonness, than of a realization whither his work was tending or of any deliberate revolutionary purpose. Figaro in 'The Marriage' is still the light-hearted, versatile, philosophic scapegrace of 'The Barber'; Almaviva and Rosine are what that play would lead one to expect they would be after some matrimonial disillusion. Of the new characters Suzanne on whom Almaviva has set his vengeful fancy and Figaro his heart, is generically conceived, and Chérubin, the page andquisquiously precocious gallant, was a really daring creation, provoking reprobation and inviting controversy. Figaro is successful in defending his beloved from the wiles of Almaviva, but it has been not unjustly said that if the object of comedy is to make vice ridiculous or odious or contemptible 'The Marriage' can hardly claim to attain it. Universal mockery, supremely vivacious, a wit whose brilliancy puts morality off its guard, mar ethically a drama whose sustained excellence in dialogue had been hardly attained even by Molière. The best edition of 'Le Mariage de Figaro' is in 'Théâtre de Beaumarchais, edited by d'Heyli and Marescot (Vol. III). For the circumstances of its writing, prohibition, reception and contemporary criticism, consult Loménic, 'Beaumarchais and His Times' (Vols. III and IV), also 'Le Centenaire du Mariage de Figaro', edited by A. Paër (Brussels 1884). The play furnished the text for 'Le Nozze di Figaro,' a popular opera by Mozart (1789).

BENJAMIN W. WELLS.

MARRIED WOMEN, Legal Status of. See HUSBAND AND WIFE.

MARRIED WOMEN, Right to Conduct Business. See HUSBAND AND WIFE.

MARROW, a substance of soft vascular tissue filling the cells and cavities of the bones of mammals. It contains fat and both red and white blood corpuscles and is a valuable constituent of soups. The bone contents of mammals show wide variation. The largest constituent is usually water, but some marrows, as of the long bones, are mostly a yellow oil. Traces of albumen, fibrin and salts are also found. Red bone-marrow is highly nutritious and is recommended for anaemia. (See Bone). The vegetable marrow is a species of squash (Cucurbita oovifera), of oval form, ribbed and greenish-yellow color.

MARRYAT, mant-ur-at, Florence, English novelist; b. Norwich, Eng., Oct. 30, 1815, and Frederick Marryat, m. Brighton, 9 July 1838; d. London, 27 Oct. 1899. She was successively Mrs. Church (1854-90) and Mrs. Francis Leam. Her many novels, although not at all remarkable, were popular, and were published in various versions throughout Europe. They include 'Nelly Brooke,' 'Fighting the Air,' 'Facing the Footlight' and more than 80 others, many being devoted largely to spiritualism. She published and edited her father's 'Life and Letters' (1872).

MARRYAT, Frederick, English naval officer and novelist: b. London, 10 July 1792; d. Langham, Norfolk, 9 Aug. 1848. In 1806 he entered the navy, served on the coast of North America in 1811 in the ‘Eolus,’ and in 1823 was commander of the ‘Larne’ during the first Burmese War, in 1825 had the naval command of a successful expedition up the Bassein River, and in the same year was made captain of the ‘Tecum. From 1825 until his resignation in 1830 he commanded the ‘Ariadne.’ He received the gold medal of the Royal Humane Society (1818) for saving life at sea; adapted to the mercantile marine Sir Home Popham’s system of signaling; was elected Fellow of the Royal Society in 1819, and was also something of a caricature artist. He is best known, however, for his stories of the sea, beginning in 1829 with ‘The Naval Officers.’ The most familiar of them is ‘Midshipman Easy’ (1836), in which his chief characteristics, life and death, and an almost substan­tial narration and a rollicking humor, appear perhaps at their best. Others of the series are ‘The King’s Own’ (1830), probably the best constructed of his works; ‘Newton Forster’ (1832); ‘Peter Simple’ (1834); ‘Jacob Faithful’ (1834); ‘The Pacha of Many Tales’ (1835); ‘The Pirate, and the Three Cutters’ (1836); ‘Snarleyyow’ (1837); ‘The Phantom Ship’ (1839); ‘Poor Jack’ (1840); ‘The Privateer’s Man’ (1846). He wrote also a series of juveniles, chief of them ‘Masterman Ready’ (1841). He visited Canada and the United States in 1837-38; and recorded his impressions in ‘A Diary in America’ (1839), which gave some offense to the people of the nation, then hypersensitive to foreign criticism. In 1832-35 he edited the Metropolitan Magazine, in which he published a review of N. P. Willis’ ‘Pencillings by the Way,’ which the latter, then in England, considered abusive. Willis challenged Marryat, and they exchanged shots at Chatham without injury. See ‘Marryat, F. (Midshipman Easy, Mr.). Consult Marryat, F., ‘Life and Correspondence’ (1872); Hannay, ‘Life’ (in ‘Great Writers’ series).

MARS, Anne Françoise Hippolyte Bou­tet Monvel, à frän-swa-zÉ-pô-le-t É-bo-tà mÉn­vÉl mÉrs, usually called MADEMOISELLE MARS, French actress; b. Paris, 5 Feb. 1779; d. there, 20 March 1847. As Clémence in Mollière’s ‘Misanthrope,’ and Elmira in ‘Tartuffe,’ as well as in several similar characters in the plays of Marivaux, she was very great. Louis XVIII settled on her, as well as on Talma, a pension of 30,000 francs a year in 1819.

MARS, in astronomy, the outermost of the four earth-like planets revolving about the sun. Its orbit lies completely outside that of the earth, its mean distance from the sun being 141,500,000,000,000, and with the single exception of the orbit of Mercury, it has the most eccentric orbit of the solar system. The distance of the planet from the sun exceeding its least distance by 26,400,000 miles. Mars occupies 687 days in completing the circuit of its path, so that this is the length of the year on this planet. As the orbits of Mars and of the
earth both approximate to circles, having the sun near their centres, it follows that the distance apart of these planets varies enormously. When Mars, Earth and the sun are in a straight line, Mars and the earth being on the same side of the sun, this distance may be so little as 35,500,000 miles, while if the former planet is beyond the sun in the most remote part of its orbit, the distance may be so great as 298,500,000 miles. In the former case Mars is more favorably situated for observation from the earth than any other planet in the solar system; the planet Venus when nearest us is, indeed, much less far away, but at this time it is the dark, or night-side of Venus that is turning away from us, while when we are nearest to Mars it is the fully illuminated, day side of the planet upon which we look. On account of the eccentricity of the orbit of Mars, its distances from the earth differ greatly at different oppositions; if an opposition occurs while Mars occupies that part of its orbit which is nearest the sun, the distance may be so small as 35,500,000 miles, while if at this time Mars is at the point of its orbit most remote from the sun, even at the instant of nearest approach the distance may exceed 61,000,000 miles. The interval between successive close approaches of Mars and the earth is 780 days, much the longest synodical period in the planetary system, — while the usually favorable close approaches occur in groups separated by 15 or 17 years. These favorable oppositions always occur during the months of August or September; the date of the last one was 1909, while the succeeding ones will be seen in the years 1924, 1939 and 1941. It is at these times that very unusually favorable opportunities are afforded for studying the surface of the planet. The day on Mars is 24 hours, 37 minutes, 22.67 seconds in length, being thus but little longer than our own; the axis of the planet is inclined at an angle of 24° 0' to the axis of its orbit, so that spring, summer, autumn and winter succeed one another there in almost precisely the same way as with us, but the Martian seasons are each of nearly twice the duration of ours since the year is nearly two of our years in length. (The inclination of the earth's axis is 23° 27'.)

In 1877, Asaph Hall, of Washington, discovered that Mars is attended by two minute satellites to which he gave the names Phobos and Deimos. Both of these bodies are very minute objects, and as may be seen from the following table their motions are in many respects unique among the satellites of the solar system.

The distance away of each of the moons from the planet is remarkably small; thus, even Deimos is less than one-seventeenth as far away from Mars as our own moon is from the earth, while Phobos is separated from the planet's surface by less than one diameter of the planet. The latter moon is, in fact, so close to Mars that it would remain forever invisible to any observers on the planet in higher latitudes than 69 degrees, being hidden by the curvature of the planet's surface. But still more striking is the apparent motion of these bodies as it would be witnessed from the surface of Mars itself. As Phobos completes a revolution in 7 hours 39 minutes, which is far less than the time of the rotation of the planet, it follows that this moon would be seen to rise in the west, run rapidly eastward among the stars and finally set in the east. Eleven hours later it would again appear in the west, to repeat the same retrograde motion. Deimos, though rising in the east in the usual way, would mount the sky very slowly: the various constellations would be seen to drift past it and the moon would not finally attain the western horizon until about 66 hours after rising. Both moons would be seen to go through their phases in the course of their peculiar motions. With such minute objects it is impossible for us to discern any measurable diameter, but we know that of light which their surfaces reflect, their diameters can be, at least approximately, determined. The figures of the above table are those found in this way at the Lowell Observatory. These indicate that Phobos, as seen from the nearest point on Mars, would appear somewhat larger than our moon does to us, though its surface would be but one-half as bright, while the apparent diameter of Deimos would be but three minutes of arc. This satellite would therefore only be visible as a disc with difficulty to the naked eye; it would have merely the appearance of a very brilliant star.

In many ways Mars resembles our earth; it has atmosphere, seasons, storms, clouds and mountains. Vast white patches which have the appearance of snow and ice cover both poles; these are found to vary in size with the seasons, being largest during the Martian winter, and sometimes even completely disappearing during the summer. The "Canali," or channels, which have become known through the incorrect English translation of Canali, were first mapped in large numbers by the Italian astronomer, Schiaparelli, although a few of them had been previously observed by other astronomers. They consist of narrow, dark lines, generally straight, forming a network over the whole surface of the planet. Some of the observers, however, deny the extreme regularity of these curious features, describing them as of varying widths and of a somewhat irregular appearance. At their junctions we often find small dark areas known as oases. Large darkish green and gray areas of the planet have

been named seas, but it is now certain from the amount of permanent detail which is detected in them that they are not bodies of water. In fact, the course of many of the canals can be traced in the desert where the atmosphere is extremely light, in the interpretation of what has been seen. It is to be hoped that at the very favorable oppositions of 1924, 1939 and 1941 a more definite basis may be acquired for extending our knowledge in this fascinating field. The reader will find tolerably complete statement of the known and supposed facts and of the various inferences drawn from them among the titles given below. Consult Flammarion, Camille, La Planète Mars et ses conditions d'habitation (1892); Lowell, Percival, Mars and its Canals (1906); and Mars as the Abode of Life (1909); Wallace, Alfred Russell, 'Is Mars Inhabited?' (1907).

ERIC DOULTILE,
Director of Flower Astronomical Observatory,
University of Pennsylvania.

MARS, the typical god of war; in Roman mythology, contracted from Maves or Mavors, in the Sabine or Oscan language Mamers, was at an early period identified by the Romans with the Greek Ares. As the Italian Mars was originally a divinity of a very different nature, the two conceptions must be treated separately. Originally Mars was an agricultural deity summerman Sulmnns, and propitiatory sacrifices were offered to him as the tutelary god of fields and flocks. As the Italian shepherds were familiar with war, the transition from the idea of Mars as an agricultural to that of a warlike deity was natural and easy. He was regarded as the father of the Roman people; for, according to tradition, Romulus and Remus, the founders of Rome, were the fruit of his intercourse with Rhea Sylvia. Several temples in Rome and the Campus Martius were dedicated to him, the most important of which was that outside the Porta Capena, on the Appian Road, and that of Mars Ultor, but by Augustus in the forum. His service was celebrated not only by particular flamines devoted to him, but by the College of the Salii, or priests of Mars. The month of March (q.v.), the first month of the Roman year, was sacred to him and his festivals were celebrated every year in the Circus on the 1st of August. The Campus Martius, where the Roman youth engaged in athletic and military exercises, was named after him. (See Aries.) Consult Fairbanks, A., 'Mythology of Greece and Rome.' (1907).

MARSALA, mār-sā′lā, Sicily, a seaport town, near the mouth of a river of the same name, on the low promontory of Cape Boco, 18 miles southwest of Trapani. It was known as Lilybeum in the time of the Carthaginian supremacy. It obtained its present name from the Saracens, who valued the port so highly that they called it Marsa Alla, or Port of God. It has now excellent schools of technology and agriculture and a large port. The harbor has been greatly improved. The most important export is Marsala wine, which resembles sherry; grain, soda and salt are also exported. Pop. of commune, 65,451.

MARSDEN, mār′den, Samuel, Anglo-Australasian missionary: b. Horsforth, near Leeds, 28 July 1764; d. Windsor, New South Wales, 12 May 1838. After study at Cambridge and ordination in 1793, he went in 1794 as chaplain to the convict settlement at Parramatta, Australia, where his model farm became self-supporting and contributory to the development of local schools and missions. In 1814 he extended his work to New Zealand among the Maoris who through his efforts became Christianized, received a dictionary and grammar of the Maori language and adopted a fixed form of government. Consult Marsden, J. B., 'Life of Samuel Marsden' (London 1859).

MARSEILLAISE, La, the French national anthem, a revolutionary song, composed by an engineer officer, Rouget de Lisle, during the night of 24-25 April 1792 in Strassburg. The song quickly spread. The people of Marseilles adopted it to be sung at the meetings of their clubs. It was they who carried it all over France, and hence from them it received its name. De Lisle was a proscribed royalist at the time. His mother wrote to him in alarm, asking, 'What is this revolutionary hymn, sung by bands of brigands who are prowling through France and with which our name is linked?' He had originally given it the name of 'Le chant de guerre pour l'armée du Rhin' ('Battle Song of the Rhine Army'). Lamartine wrote that De Lisle himself was too sensible to attach too much importance to the tremendous effect of his composition: 'It was the fire-water of the Revolution, which instilled into the senses and soul of the people the intoxication of battle.' Carlyle describes it as "the luckiest musical composition ever promulgated, the sound of which will make the blood tingle in men's veins; and whole armies and assemblages will sing it, with eyes weeping and burning, with hearts defiant of Death, Despot and Devil." On 8 Jan. 1795 the Directory ordered the air to be played at all theatres. Its inspiring strains are known throughout the world more than perhaps any other melody. During the Empire and the Restoration the Marseillaise was suppressed as a revolutionary demonstration, but was revived with the July Revolution of 1830. The original consisted of only six couplets; the seventh was added when it was dramatized for the Fête de la Fédération, in order to complete the characters among whom the verses were distributed, namely, an old man, a soldier, a wife and a child. The original was "Nous entrons" the one added, intended for the child part. It was written by Dubois, editor of the Journal de la Littérature. The complete version follows, with a strict translation.
LA MARSEILLAISE.

Come, children of the fatherland,
The day of glory now is here;
By tyranny against us,
The bloody banner is raised:
Do you hear in the land
Those ferocious soldiers roar?
Up to our arms they come,
Strangling our sons, our women!
To arms, citizens, form your battalions,
Let us march, let us march;
That the foul blood may drench our furrows!

1

What seeks this horde of slaves,
Of traitors and conspiring kings?
For whom these base mercenaries,
These iron already long prepared?
For us, Frenchmen, ah, such outrage!
What passions it must raise!
Tis us whom they dare purpose
To restore to former slavery.

2

What shall these foreign cohorts,
Make the law in our homes?
What shall these hireling phalanxes
Throw our proud warriors down?
Great God! with lettered hands,
Our heads bowed down beneath the yoke!
And despots vile become
The masters of our destinies.

3

Tremble, ye tyrants and traitors,
The shame of every faction,
Tremble! if your parricidal projects
 Shall at last gain their reward!
Each one is soldier to fight you,
And if our young heroes fall,
The land shall produce them afresh
All ready to struggle against you!

4

Frenchmen, as magnanimous warriors,
Restrain or deal your blows;
Spare those sad victims
Who reluctantly armed against us.
But those bloody despots —
Those accomplices of Boulard —
All those tigers who pitilessly
Lacerate the bosoms of their mothers!

5

We shall begin our career
When our elders are no more;
Ye shall find their ashes
And the trace of their virtues;
Less eager to survive
Than to share their tomb,
It shall be our sublime pride
To avenge or follow them.

6

SACRED LOVE OF FATHERLAND,
Guards, sustain our brave avenger;
Liberty, dear Liberty,
Fight with thy defenders!
That victory over our flags
Shall hasten to thy noble call;
And may thy dying enemies
Behold thy triumph and our glory!

7

Monte Cristo.
The city is strongly defended
by various works, and lies in the form of an
amphitheatre round a natural harbor of
moderate size (about 70 acres), known as the
Old Harbor. From the Old Harbor one of the
finest of the city thoroughfares, called the
Cannebiére, runs inland in a straight line;
while at right angles to this another great
thoroughfare traverses the city, planted with
trees, lined with fine edifices and bearing dif-
f erent names at different points. In the older

MARSEILLES, or MARSEILLE, mär-säl', is the principal
commercial and naval station, the second city of
France as regards population, and the capital
of the department of Bouches-du-Rhône, 508
miles southeast of Paris. It stands on the
northeastern shore of the Gulf of Lyon, and
on a bay containing a group of islets, one of
which, the Château d'If, has world-wide celeb-
ity in connection with the elder Dumas'

MARSEILLES, mär-säl', or MAR-

393
part of the town the streets are narrow and irregular, but in general the streets are spacious and regular and lined with handsome houses. Marseilles, however, is not rich in public edifices. The chief are the large cathedral, in the Byzantine style, consecrated in 1893; the church of Notre Dame de la Garde, a modern Romanesque building, on a hill of same name, whence a splendid view is obtained; the church of Saint Victor, a building of great antiquity, but much restored; the Palais des Arts de Longchamp, containing a picture-gallery and natural history museum; the exchange; the public library (120,-000 vols.); the palace of justice or law courts; the episcopal palace, etc. Marseilles is the seat of a bishop and possesses a court of first instance, a mint, an Academy of Sciences, Belles-lettres and Arts, various learned societies and educational institutions.

Marseilles improved greatly in regard to street architecture, sanitary matters, etc., and made great progress in extent, population and commerce. It is the gateway to Algeria and the opening of the Suez Canal. Including Old and New Harbors, the total water area is 414 acres; there are seven wet docks, with depths at ordinary tides ranging from 25 to 66 feet, six dry docks and 13 miles of quayage. Vessels entered in 1913, 4,621, of an aggregate of 8,308,165 tons. The traffic in merchandise has grown from 4,372,000 tons in 1870 to 21,590,000 tons in 1913. From the Durance an abundant water supply has been derived. A canal irrigates the neighboring slopes and plains and has transformed them from arid tracts into fruitful fields. The surrounding districts are now occupied by new population, employed in raising vegetables, fruit, etc., on the reclaimed and improved lands. The Marseilles-Rhone Canal, intended to open up waterways from Marseilles to the interior of France and central Europe, was authorized in 1903, and is expected to be completed in 1919. The canal, which is 50 miles long, has no locks and is at sea-level throughout its entire course, and will, with its tributaries, form a series of navigable canals by heavy barges. The most important manufactures are soap, soda and other chemical products; also olive and other oils, sugar, machinery, iron and brass work, matches, candles, glass, earthenware, Oriental horsetail, etc. In the building-docks a great number of war and other vessels are built. The trade consists chiefly of soap, olive-oil, wine, brandy, corn, flour, dried fruits, oranges and other products of the southern departments; salt provisions, tobacco, wool, skins and hides, iron, raw cotton, cotton twist, dye-woods and American novelties. Marseilles is the headquarters of the 15th army corps and is the seat of a United States consulate. During the European War 1914-18 it was a center of great naval activity by day and night. Several centres here served Christ. Its progress for centuries was rapid and almost without interruption. Having taken the part of a 

Pompey in the great contest for supremacy between him and Caesar, it was besieged by the latter and taken in 49 B.C. On the decline of the Roman Empire it became a prey to the Goths, Burgundians and Franks. In 735 it fell into the hands of the Saracens, who completely destroyed all the ancient monuments which the barbarians had spared. In the 10th century it fell under the dominion of the counts of Provence and for some centuries after followed the fortunes of that house successively; the

MARSEILLES, Ill., city in La Salle County, situated on the Illinois River and Michigan Canal and on the Chicago, Rock Island and Pacific and the Chicago, Ottawa and Peoria railroads. It has coal mines and numerous industrial establishments, including paper-box factories, roofing material works, paper-board works, agricultural implement works, concrete block yards and cigar factories. The Illinois River is crossed at this point by a great railroad bridge. The commission form of government was instituted in 1913. Pop. 5,290.

MARSH, George Perkins, American scholar and diplomat: b. Woodstock, Vt., 15 March 1801; d. Vallombrosa, Italy, 23 July 1882. He was graduated at Dartmouth in 1820; studied law at Burlington; was elected to the Supreme Executive Council of Vermont in 1834; sat in Congress from 1842 to 1849, when he went to Constantinople as Minister for four years, and in 1852 was sent on a special mission to Greece. In 1861, after seven years in the United States, he went to Italy as Minister, and held that post until his death. An able English philologist, Marsh wrote: 'Lectures on the English Language' (1861); 'The Origin and History of the English Language' (1862); 'Man and Nature,' in which he urged forest planting and forest preservation (1864), etc. He edited Wedgewood's 'Ezymology,' and translated Raske's 'Icelandic Grammar.' Consult the 'Life and Letters' edited by his widow (1888).

MARSH, Othniel Charles, American paleontologist: b. Lockport, N. Y., 29 Oct. 1831; d. New Haven, Conn., 18 March 1889. He was graduated from Yale in 1856, studied in 1860-62 at the Yale (now Yale) School of Medicine, in 1862-65 at the German universities of Berlin, Heidelberg and Breslau, and from 1866 until his death was the first professor of paleontology at Yale. From 1882 he was vertebrate paleontologist to the United States Geological Survey, his field-work for the survey ceasing in 1892. His investigations in regard to extinct vertebrates are very important and were declared by Charles Darwin to furnish some of the most satisfactory evidence of the evolutionary theory. He made particular study of the Rocky Mountain region, and from 1868 almost annually organized and conducted expeditions into that district. In these explorations he discovered over 1,000 new fossil vertebrates, of which he classified and described more than one-half. Among his discoveries were those of the Odontonithes, a subclass of Cretaceous birds, with teeth; the Dinocerata, ungulate animals of the Eocene period, elephantine in size; the first known American pterodactyls, or flying lizards, and several new families of Dinosaurs. Perhaps his best known study of the primitive horse, the Eohippus, Orychoparus and Eohippus. In 1890-99 he made
MARSH — MARSH-WREN

researches in the geology of the region between the Appalachian range and the Atlantic. He was curator of the geological collection of the Yale Museum of Natural History in 1867-99, and in 1898 presented to the university his own collections. He was a nephew of George Peabody (q.v.), and it is said to have been at his suggestion that the Peabody Museum at Yale was established. In 1887 he was made honorary curator of vertebrate paleontology in the United States National Museum, and in 1895 received the Cuvier medal of the French Academy of Sciences. He was president of the American Association for the Advancement of Science in 1878 and of the National Academy of Sciences in 1883-95. From a bibliography of 237 titles these works by him may be cited: ‘Odontornithes: A Monograph of the Extinct Toothed Birds of North America’ (1880); ‘Dinocerata: A Monograph of an Extinct Order of Gigantic Mammals’ (1884), and ‘The Dinosaurs of North America’ (1896). Consult memoir by C. E. Beecher in the American Journal of Science, June 1899.

MARSH, Sylvester, American engineer: b. Campton, N. H., 30 Sept. 1803; d. Concord, N. H., 30 Dec. 1884. In 1826 he established a provision business in Boston, in 1833 in Chicago, and from 1837 was in the grain trade at Chicago. He originated the meat-packing industry and is regarded as one of the founders of Chicago. From 1864 he resided in New Hampshire. On 25 June 1858, he obtained a charter for a railway to the summit of Mount Washington, a project deemed so impossible that he was called “crazy Marsh.” The railway, 281 miles long, with an ascent of 3,625 feet, was completed in July 1869. The chief feature in the operation of the road is a central cog-rail. The principle proved so practicable that literally hundreds of similar railways have been constructed on the sides of famous mountains all over the world.

MARSH CROCODILE, or MUGGER, the common inland crocodile of India, locally venerated by the Hindus, to whom it is known as “Mugger.” It inhabits the tanks and marshes of India and Ceylon, and suitable places westward almost to the Persian coast and eastward throughout the Malay Peninsula and islands. It is dark, olive-brown in general color above, lighter on the ventral surface; the young are paler, with black spots. A specimen 12 feet long is considered large, but instances of a length of 18 feet have been recorded. The head is rough-coated, but has no ridges; the snout is broad and the teeth number 76. These crocodiles swim in river-marshes, weedy ponds and artificial reservoirs, throughout their range, feeding on fish and small animals, and little feared by horses, cattle or human beings, for in general they are cowardly and reluctant to attack men or even to resist injury. In case the water of their home dries away, they migrate to other pools, and in seasons of drought are likely to be met with anywhere wandering in search of water; as a last resort they will bury themselves in the mud and remain in torpor until revived by the coming of rains. These reptiles display considerable cunning in avoiding enemies and in avoiding harm, feigning death very cleverly. They are kept in a semi-domesticated condition in many parts of India by pious Hindus, whose priests build temples near the great ponds, protect and feed the reptiles and imagine the service pleasing to the gods as well as profitable to themselves. Extensive descriptions of the animal and of its worship may be found in zoological works of Blanford, Jerdon, Tennent, Gadow and others and in such volumes as Adams, ‘Wanderings of a Naturalist in India’ (Edinburgh 1867) and Hornaday, ‘Two Years in the Jungle’ (New York 1885).

MARSH GAS. See METHANE.

MARSH HARE. See HARES.

MARSH HAWK, or HARRIER, a migratory hawk (Circus cyaneus) of medium size, commonly known in one or another of its varieties throughout the north temperate zone, which frequents marshy meadows, where it makes its nest upon the ground in a tussock of grass, and lays five to seven roundish, dirty white eggs. In such places it finds its food, chiefly mice and frogs, and sails slowly back and forth close to the ground watching keenly for movements in the grass and ready to pounce upon its prey. Its wings are long and its flight may be swift and powerful on occasion, but demands, but it was accounted “ignoble” among falconers. It rarely seizes birds or even young poultry, although one of its names is “hen-harrier,” and should be protected and encouraged by farmers as one of the most useful and persistent mousers. This hawk may be readily recognized by the broad patch of white on the rump displayed by both sexes. The male is dull grayish-blue, in general tint, and the female rusty brown, both streaked with white. The American harrier (C. hudsonicus) is generally brown, though the adult males are blue-gray on the back; the tail-covers are white. Consult Coues, ‘Birds of the North-west’ (1874).

MARSH-HEN. See Mod-Hen.

MARSH MALLOW, a coarse, large-leaved herb (Althaea officinalis) of the Old World, but naturalized in marshy places along the eastern coast of the United States, which is related to the hollyhocks (q.v.); the flowers are pale rose-color, some in a terminal spike and some axillary. Its root is mucilaginous and of service as a demulcent in medicine, but it is mainly used as a basis for the concoction called “marsh mallow.” See MALLOW.

MARSH-MARGOLD. See COWSLIP.

MARSH-WREN, either of two species of American wrens that inhabit reedy marshes. They have the diminutive brown bodies, short wings and tails, the latter often held cocked up over the back, awl-like bills and inquisitive activity characteristic of wren (q.v.) generally. One is the long-billed (Cistothorus palustris), most numerous in the salt-marshes along the Atlantic coast; and the other the short-billed, better known about inland lakes and rivers. The former is somewhat the larger, has a decidedly longer bill and lays eggs dark chocolate in color, while the eggs of the short-billed species are pure white. Both make elaborately nests in the form of ball-like baskets, with a little entrance at the side, woven of leaves of wild rice, or marsh grasses and fastened to the stems of the reeds. A curious habitat of the species is that each pair will make several nests
each season, only one of which serves the purposes of incubation. These wrens give in the spring an exceedingly pretty clattering song and when singing together in a patch of reeds the effect is most pleasing.

MARSHAL, a Federal officer appointed by the President in each judicial district and corresponding to the sheriff of a county. His duty is to execute all precepts directed to him, issued under the authority of the United States, and is usually a full-time position. In 1897 Stetson D._D._ was District and Circuit Courts. The United States government maintains marshals in its principal dependencies, as the Philippines, Alaska, Porto Rico, Hawaii, etc. They are appointed by the President for four years, and in addition to serving the courts have certain duties regarding internal revenue, public lands and the postal service. Sometimes the chief of police in American towns is known as marshal. In some European countries the title of marshal confers the highest military distinction, that of Marshal of France being especially prized. The word is derived from the Old High German word marah, a horse; and seald, a servant; hence Marascali, a man appointed to take care of horses. The marshal of the German Empire derived his title from the monarchical, and was equivalent to the comes stabuli or connétable. He was bound to keep order at the coronation of the emperor, and to provide lodgings for the persons connected with the ceremony. He was called a arch-marshall, a dignity belonging to the electorate of Saxony. At the coronation it was his duty to bring oats in a silver vessel from a heap in the open marketplace, and to present the vessel to the emperor. His duties were discharged by a hereditary marshal (Erbmarschall). In Prussia general field-marshall is the highest military honor. In England field-marshall is given as an honorary rank to general officers who may have no immediate command. Marshal also signifies a person who regulates the ceremonies of certain solemn celebrations or, as in the United States, at parades, street processions, etc.

MARSHALL, Frank, American chess champion: b. Brooklyn, N. Y., 1877. He acquired fame when a mere boy by winning the championship of the famous Brooklyn Chess Club. Next he took the championship of the Manhattan Chess Club. Thereafter he became a professional player and entered in most of the international tournaments. In 1908 he won the International Chess Tourney at Cambridge and challenged Lasker for the World's championship, but was defeated. In all he won first prize in seven international tournaments. He won the Pan-American championship by defeating Copeland in Cuba in 1912, though he lost a set match to Copeland a year or two previous. He succeeded Showalter as United States champion.

MARSHALL, már'shal, Alfred, English economist: b. London, 26 July 1842. He was educated at Saint John's College, Cambridge, and in 1877 was principal of University College, Bristol. In 1883-84 he was lecturer at Balliol College, Oxford. From 1884-90 he was Professor of political economy at Cambridge University, and a member of the Royal Commission on Labor in 1891. He has published 'Economics of Industry' (1879); 'Principles of Economics' (1890); 'Elements of Economics' (1891); 'Fiscal Policy of International Trade' (1903), etc.

MARSHALL, (Davis) Edward, American author and journalist: b. Enfield Centre, Tioga County, N. Y., 31 May 1868. He was educated at Benedict's Preparatory School, Rochester; was news editor of the American Press Association at Buffalo and New York in 1885-89; Sunday editor of the New York Press 1890-95. In 1897 Stetson D. was District and Circuit Courts. The United States government maintains marshals in its principal dependencies, as the Philippines, Alaska, Porto Rico, Hawaii, etc. They are appointed by the President for four years, and in addition to serving the courts have certain duties regarding internal revenue, public lands and the postal service. Sometimes the chief of police in American towns is known as marshal. In some European countries the title of marshal confers the highest military distinction, that of Marshal of France being especially prized. The word is derived from the Old High German word marah, a horse; and seald, a servant; hence Marascali, a man appointed to take care of horses. The marshal of the German Empire derived his title from the monarchical, and was equivalent to the comes stabuli or connétable. He was bound to keep order at the coronation of the emperor, and to provide lodgings for the persons connected with the ceremony. He was called a arch-marshall, a dignity belonging to the electorate of Saxony. At the coronation it was his duty to bring oats in a silver vessel from a heap in the open marketplace, and to present the vessel to the emperor. His duties were discharged by a hereditary marshal (Erbmarschall). In Prussia general field-marshall is the highest military honor. In England field-marshall is given as an honorary rank to general officers who may have no immediate command. Marshal also signifies a person who regulates the ceremonies of certain solemn celebrations or, as in the United States, at parades, street processions, etc.

MARSHALL, Emma Martin, English novelist: b. North Repps, near Cromer, Norfolk, 29 Sept. 1830; d. Clifton, near Bristol, May 1899. She was married to H. G. Marshall in 1851, and her life thereafter was mainly spent in the cathedral cities of Wells, Exeter, Gloucester and Bristol. She wrote more than 200 stories, nearly all of them intended mainly, though not entirely, for young people. In spite of their number the even excellence of the tales is remarkable; they possess high moral tone, and they may be called historical pictures rather than historical tales. It was her ambition to introduce into each story several historical personages, as secondary characters, the principal figures being imaginary. Her books have had a wide reading in the United States and still continue popular. Among them are 'Life's Aftermath' (1876); 'Under Salisbury Spire' (1880); 'Haunts of Ancient Peace'; 'Penshurst Castle' (1894); 'Under the Dome of St. Paul's' (1898). Consult Marshall, B., 'Life of Emma Marshall' (1900).

MARSHALL, Henry Rutgers, American author and architect: b. New York, 22 July 1852. He was graduated at Columbia in 1874, and in 1878 entered practice as an architect. He was lector on aesthetics at Columbia in 1894-95 and at Princeton in 1915-16. He was president of the New York Chapter of the American Institute of Architects 1902-04, and president in 1907 of the American Psychological Association. While eminent as an architect he has become more widely known through his psychological writings. In 1902 he was appointed a member of the Art Commission of the city of New York. Besides contributions to literary, philosophical and psychological periodicals he wrote 'Pain, Pleasure and Aesthetics' (1894); 'Aesthetic Principles' (1895); 'Instinct and Reason' (1898); 'Con-
scion of the minor battles of the Civil War. In May 1862 he surprised Gen. J. D. Cox at Princeton, Va., and was thus of much service to the Union through the relief of the Lynchburg and Knoxville Railway. Having resigned his commission in 1862 he represented Kentucky in the Congress of the Confederate States (1863-65). From 1867 he practised law with much success at Louisville.

MARSHALL, John, chief justice of the United States: b. Germantown (now Midland), Fauquier County, Va., 24 Sept. 1755; d. Philadelphia, 6 July 1835. He was the eldest son of Col. Thomas Marshall of Westmoreland County, Va., a distinguished officer in the French War and in the War of Independence, and of Mary Keith, a member of the well-known Randolph family. Thomas Marshall removed from Westmoreland County to Fauquier County soon after his marriage; this community was sparsely settled and the education disadvantages which he could give his children were meager; consequently he became their earliest teacher and succeeded in imbuing them with his own love of literature and of history. For two years John Marshall had, as tutor, James Thompson of Scottsville, and later he taught at the academy of the Messrs. Campbell of Westmoreland County, where James Monroe was also a pupil. He had no college training except a few lectures on law and natural philosophy at William and Mary in 1778. He was always fond of field sports and excelling in running, leaping and quoit throwing. He loved the free natural life of the country, and his long tramps through the woods around his father's home, Oak Hill, together with his athletic exercises gave him great strength and agility. At 18 he began the study of law, but soon left his studies to enter the Revolutionary army. He was active in endeavoring to enlist men for the service and helped to form and drill a company of volunteers. As a member of his father's regiment he took part in the battle of Great Bridge where he displayed signal valor. In 1776 he became a lieutenant in the 11th Virginia, and the next year was made captain. He served in Virginia, New Jersey, Pennsylvania and New York, always displaying great courage and valor and a cheerful acceptance of hardship and privation. This experience was of untold value to Marshall, it broadened his views and quickened his insight in governmental questions. As he says, he entered the army a Virginian and left it an American. In 1780 during a period of military inactivity he attended a course of law lectures at William and Mary and in 1781, after leaving the army, was granted a license and began the practice of law in Fauquier County. The next year he was elected to the Virginia assembly, and shortly after was made a member of the executive council. He served his State as legislator during eight sessions. In 1784, although he had then removed his residence to Richmond, he was again elected delegate from Fauquier County, and in 1787 served as member from the county of Henrico. When the city of Richmond was granted a representative in the legislature Marshall had the honor of this office which he held from 1788 to 1791. He was also a member of the Federal Convention which met in 1788 to discuss the ratification of the Constitution of the United States,
JOHN MARSHALL

Chief Justice United States Supreme Court
and it was largely due to his convincing arguments that ratification was carried, as the question was hotly debated and the anti-Constitution party had able and determined representatives. For several years he held no public office and bought a house on the outskirts of Washington and attempted to practice law, but in 1795 was again elected to the legislature. During this session he defended the unpopular "Jay Treaty" with England, and by his overwhelming arguments completely rebutted the theory of his opponents that the executive had no power to negotiate a treaty without the concurrence of the legislature. Marshall's attitude during his service as legislator toward all questions concerning Federal power demonstrated his increasing belief that a strong central government is necessary to national efficiency. In 1783 he had married Mary Ambler, daughter of Jacqueline Ambler, treasurer of the State, and soon after his marriage made his permanent home in Richmond. The honors bestowed on him testify to the esteem in which he was held by the State and by the nation. His administration of the Admiralty and the Ministry to France, in 1789 accepted the office of Special Envoy to France with Charles Cotesworth Pinckney and Elbridge Gerry. This mission related to the dignities which the French Republic had bestowed upon American navy and attempted to adjust the commercial relations between the two countries. It failed on account of the arrogant attitude of France, but "Marshall's dignified correspondence added greatly to the prestige of America," and on his return he was welcomed with many evidences of approbation from his grateful countrymen. Yielding to the earnest solicitation of Washington he became a candidate for Congress and was elected a member of that body in 1796. In Congress he was the leader of the Administration party and the greatest debater in the House on all constitutional matters. In one of his most noted speeches he defended the action of President Adams in the case of Jonathan Robbins and proved conclusively that this case was a question of executive and not of judicial cognizance. In 1800 he was made Secretary of State, and in 1801 appointed chief justice of the United States, which office he held until his death in 1835. In 1829 he, like Chief Justices Madison and Johnson, was a member of the Virginia convention which met to alter the State constitution, and by his wisdom and moderation did much to prevent radical changes and to thwart the attempts of politicians against the independence of the judiciary. In 1831 his health, hitherto unusually vigorous, began to fail; he underwent a severe surgical operation in Philadelphia and was seemingly restored, but the death of his wife was a great shock and a return of the disease in 1835 proved fatal. He died in Philadelphia, whether he had gone for medical relief, and was buried by the side of his wife in the New-Burying-Ground, now Shockhoe Hill Cemetery, Richmond. The sorrow over the country was deep and widespread; even his bitterest enemies mourned for the kindly, upright man.

Though somewhat ungainly, Marshall was always dignified in appearance; his tall, loosely jointed figure gave an impression of strength, while his finely shaped head and strong, penetrating eyes bespoke intelligence and power. Directness and simplicity were his dominant characteristics. He was freo from any display of pomp, air of office or studied effect. His un-failing good humor, his benignity, his respect for women, his devotion to wife and family and his well-known reverence for religion made him loved and admired even by those who heartily disliked his political tenacity. In more than thirty years he rendered numerous decisions which were of prime importance to a nation in process of formation. The faculty which made Marshall invaluable as a jurist was his power of going directly to the core of any matter. No subtle or intricate questions confused him, his analysis was unerring, his logic incontrovertible; he cared nothing for the graces of rhetoric and made no appeal to the emotions; his power lay in his deep conviction and in his illuminating and progressive arguments. At a period when the powers of the Constitution were ill-defined, when our government was experimental, Marshall's decisions in constitutional and international cases were invaluable factors in forming a well-organized Federal government. He made the Constitution live, he imparted to it the breath of immortality, and its vigorous life at the present hour is due mainly to the wise interpretation he gave to its provisions during his long term of office. Marshall was the author of a number of articles and papers, of a history of the colonies and of "Life of Washington," a book of small literary merit, but containing a mass of valuable authentic information. Consult Cooley, "Constitutional History of the United States" (1889); Margruder, "John Marshall" (1885); Thayer, "John Marshall" (in "Beacon Biographies" series, 1901); Beveridge, A. J., "Life of John Marshall" (1916).

EMILIE W. McVea,
President of Sweet Briar College.

MARSHALL, Louis, American lawyer: b. Syracuse, N. Y., 14 Dec. 1836. He was educated in the Syracuse public and high schools and at the law school of Columbia University. In 1878 he began practice at Syracuse. He is now member of the firm of Guggenheim, Untermyer and Marshall. He has argued many important causes in the highest courts, specializing especially in constitutional and corporation law. Mr. Marshall was a member of the New York Constitutional conventions of 1890, 1894 and 1915; served on the commission appointed by Mayor Low, in 1902, to investigate East Side conditions; chairman of the State Immigration Commission appointed by Governor Hughes in 1908 and counsel for William Sulzer in his impeachment trial. Mr. Marshall was also counsel for Leo M. Frank in the United States Supreme Court. He was prominent in the movement for the abrogation of the treaty of 1832 with Russia. He was mediator in settling the cloakmakers' strike in 1910, and prepared the protocol of settlement which has since been the basis of numerous strikes. Cooperating with others he has taken an active part in Jewish charitable work and has lectured before many learned and philanthropic societies. Mr. Marshall has been a trustee of Syracuse University since 1910.

MARSHALL, Orsamus Holmes, American lawyer and author: b. Franklin, Conn., 1813; d. 1884. In 1831 he was graduated at Union College, studied for the bar, to which he was admitted in 1834. He was one of the founders of the Buffalo Female Academy and
of the Buffalo Historical Society. He also served several years as chancellor of the University of Buffalo. He wrote much in connection with the Iroquois dealings with the whites. Posthumously there appeared a volume entitled 'Historical Writings of Orsamus H. Marshall Relating to the Early History of the West' (1887).

MARSHALL, Thomas Riley, American lawyer and politician: b. North Manchester, Ind., 14 March 1854. He was graduated from Wabash College in 1873 receiving the degree of A.B., and was admitted to the Indiana bar in 1875, practising his profession at Columbia City. In 1908 he was elected governor of Indiana. His administration was progressive, and several laws were sponsored by him, including an employers' liability law, an anti-gambling law and direct nomination of senators. In 1912 he was chosen by the Democratic National Convention at Bosanshe to be the candidate of the Democratic party for Vice-President of the United States. He was a consistent supporter of the Wilson administration and in 1916 was again nominated and elected Vice-President. Some of his public utterances in 1915, in which he advocated radical ideas in regard to the inheritance of property, caused much criticism. Wabash, Pennsylvania and Notre Dame universities conferred on him the degree of LL.D.

MARSHALL, William Louis, American soldier: b. Washington, Ky., 11 June 1846. He was educated at Kenyon College in 1869-61, served in the Union army in 1862-1863 and in 1868 was graduated at the United States Military Academy. He was promoted through the various grades, reaching that of brigadier-general, chief of engineers of the United States army, 2 July 1908. In 1870-71 he was acting assistant professor of natural and experimental philosophy at West Point and from 1872 to 1876 had charge of the Colorado section of the explorations west of the 100th meridian. He discovered Marshall Pass over the Rockies in 1873, also gold placers of Marshall Basin, San Miguel River, Colo., in 1873. In 1881-84 he was in charge of the construction of levees in Mississippi, Louisiana and Arkansas, and improvement of the Mississippi River, of harbors on Lake Michigan in 1884-1900. He also superintended the construction of the Hennepin Canal 1890-1900 and subsequently was engineer in charge of the construction of fortifications at eastern and western entrances to New York harbor. He constructed the 40-foot Ambrose Channel entrance to New York harbor. As chief of engineers he had charge of river, harbor and fortification works of the United States from 1908 to 1910. In 1914-15 he had charge of the protection of the Imperial Valley, Cal., against the overflow of the Colorado River. General Marshall has invented automatic movable dams, lock gates and valves for canals.

MARSHALL, Ill., city and county-seat of Calhoun County, on the Kalamazoo River and on the Michigan Central railroads, about 38 miles southwest of Lansing and 100 miles west of Detroit. The surrounding country is devoted chiefly to agriculture. The principal industries are railway shops, school furniture, hot-air furnaces, patent medicines and foods and stone works. The marble and granite works employ a number of men. There are municipal waterworks and a lighting plant. The grounds of the County Agricultural Society are located in Marshall. There are two daily newspapers. Pop. 4,249.

MARSHALL, Minn., city and county-seat of Lyon County on the Redwood River and on the Chicago and North Western and the Great Northern railroads, about 150 miles west by south of Saint Paul. It is in an agricultural section in which wheat is the principal product. The industrial establishments are a flour mill, grain elevators, saw and door factory and a creamery. Municipally owned electric light and water works are established. Pop. 2,800.

MARSHALL, Mo., city and county-seat of Saline County, on the Missouri Pacific and the Chicago and Alton railroads, about 80 miles east of Kansas City and 40 miles west of Shreveport, La. It was settled in 1830 by people from Virginia and Kentucky, and was incorporated as a city in 1866. It is situated in an agricultural region; in the vicinity are valuable deposits of coal and salt, and nearby are stone quarries. The manufactures are lumber, tile and brick, flour, canned goods, creamery products, wagons and carriages. It is the seat of the State Institution for Feeble-Minded and Epileptics, the Missouri Valley College (Cumberland Presbyterian), established in 1889, San Saviour Academy (Roman Catholic). There are eight churches and public and parochial schools, a Carnegie library and an opera-house. Marshall has four banks with a combined capital of $300,000. The government is of commission form. It has a daily newspaper and good banking facilities. Pop. 4,889.

MARSHALL, Tex., county-seat of Harrison County, is situated about 14 miles north of Sabine River, 40 miles west of Shreveport and 67 miles south of Texarkana. The city was founded in the year 1840. Marshall is situated in the midst of a fertile agricultural region which has heretofore engaged mostly in cotton raising, but recent developments show that this section is well adapted to truck growing and the raising of fruits, especially peaches, and large orchards are being planted. The city is largely supported also by lumber interests, there being large areas of pine timber contiguous to the city, which is rapidly being marketed. The land from which the timber is taken is quickly occupied for agricultural and orchard purposes, some orchards containing as high as 6,000 acres. Stock raising is also carried on and the city receives considerable support from this source. The Texas and Pacific Railroad runs through the city, west to El Paso, north to Texarkana and southeast to Shreveport and New Orleans. The Texas Southern Railroad has its terminus at present at Marshall, but will be pushed farther south. The shops of the Texas and Pacific Railroad, located at Marshall, are the finest
to be found anywhere in the Southwest. Locomotives and all kinds of rolling-stock are manufactured. These shops have a local payroll of $50,000 a month. The local shops and general offices of the Texas Southern Railroad are also located in Marshall. Marshall has also a 50-ton cotton-seed-oil mill, the Marshall car-wheel and wagon factory, a soda water apparatus factory and 22 factories in all, giving employment to 1,200 people, using a capital of $1,700,000 and producing annually $1,800,000 worth of goods. The city has installed complete sewerage and waterworks plants.

There are excellent churches and schools. The total value of the city school property is $100,000. There are, also, a number of private schools. There are three Catholic schools in the city—one for girls and one for boys, and an industrial school for boys. In the city are also located the Wiley University and Bishop College, institutions for the education of the negroes; the former with 493, and the latter with 500 students annually. The property of the former is valued at $65,000 and the latter at $150,000.

The city has two national banks with a total capital of $200,000, a daily, semi-weekly and weekly newspapers. Marshall and vicinity is noted for the medicinal properties of its many springs and wells, and many people annually, especially during the summer season, visit these places as health resorts. Pop. 13,000.

MARSHALL, College of, Marshall, Tex., The College of Marshall was chartered 22 Oct. 1912 by some citizens of the city of Marshall, who to maintain an institution of Christian learning of collegiate grade. There should be 16 trustees, at least 10 of whom should be members of regular Baptist churches. This charter was amended on 14 Nov. 1916, whereby the control and management of the college was transferred to the Baptist General Convention of Texas. It was proposed not to open the institution until an administration building and suitable dormitories could be built. On 4 June 1917 the college opened with a summer session and summer normal. The enrollment before the end of the first year was 533. The College of Marshall meets a long felt need in East Texas and sections of Oklahoma, Arkansas and Louisiana. There is no educational institution of collegiate grade in a distance of some 200 miles. It already has the most costly plant between Dallas and New Orleans. Its buildings consist of one three-story and basement fireproof administration building, two three-story brick dormitories, a dining hall, central heating plant and a magnificent campus of 55 acres. The whole plant is worth $300,000. The quota for the student's army training corps was 150 men. After de-mobilization of the students' army training corps an officers' reserve camp was installed. The institution is coeducational.

MARSHALL ISLANDS, Polynesia, an archipelago in the western Pacific Ocean, belonging to Germany from 1885 until she lost her colonies in the World War, when the Japanese took control. They are situated eastward of the Caroline and northward of the Gilbert Islands, and lie between 5° and 12° N. lat., and 165° and 171° W. long. The group consists of two parallel chains, the Ratak group of 15 islands in the east and the Ralik group of 18 islands in the west; total area, 154 square miles. The islands rise nowhere more than 10 feet above the sea and are not very fertile, the chief vegetable productions being the coconuot palm, the breadfruit and the pandanus. The natives are Micronesians. The women are skilled in weaving mats and in the construction of large canoes. Copra is the only commercial product. Pop. about 16,000, including, in 1913, 179 Europeans.

MARSHALLTOWN, Iowa, city and county-seat of Marshall County, on the main lines of the Chicago and North Western and Chicago, Great Western and Minneapolis and Saint Louis railroads, 68 miles northeast of Des Moines. It was settled in 1859, incorporated in 1863 and received a charter as a city of the second class in 1868. It is located in the heart of a rich agricultural and stock-raising district, in which corn and hogs are the chief farm products. The industrial plants include Minneapolias and Saint Louis shops, packers of grocers' sundries, meat-packing, furnaces, heating specialties, foundry and machine shops, bottling works, agricultural implements, as well as large independent oil jobbing. The Iowa State Soldiers' Home, covering 160 acres of ground, is located here. The city is governed on the commission plan. It operates its own waterworks and electric-light plant. Pop. 16,065.

MARSHALSEA, mär'shäl-se'a, a jail in London, attached to the Marshalsea Court, originally established under the earl-marshal of England for the trial of servants of the royal household. Later it was used as a prison for debtors and defaulters, as well as persons convicted of piracy on the high seas. It stood near the church of Saint George, Southwark, and existed in the reign of Edward III. It was abolished in 1849. The Marshalsea will be longest remembered as the home of 'Little Dorrit.' Dickens' father was for some time an inmate of the Marshalsea, and in 'Little Dorrit' the novelist has given us a vivid picture of the life of a debtor and his family in this prison.

MARSHBUNKER, MARSBUNKER, etc. See MOSSBUNKER.

MARSHFIELD, Ore., town in Coos County, on Coos Bay and on the Coos Bay, Roseburg and Eastern Railroad, 10 miles north of Coquille. It contains a Carnegie library, coal mines, lumber yards, pulp and paper mills, veneered wood works, saw and door factories, etc. The harbor has a channel 300 feet wide with a depth of 25 feet. The vessels of the Inter-Ocean Transportation Company, the Northern Pacific Steamship Company and the Southern Pacific Steamship Company call at Marshfield. Pop. 5,780.

MARSHFIELD, Wis., city of Wood County, on the Chicago, Saint Paul and Milwaukee and the Chicago and North Western railroads, almost in the centre of the State, about 160 miles northwest of Milwaukee. It was settled in 1871 by Louis Rivers and was incorporated as a village in 1875, and chartered as a city in 1883. It is situated in an agricultural region and near extensive forests. The industries of the city are chiefly connected with manufacturing and farming. The chief industrial establishments are a furniture factory which employs...
MARSHMAN — MARSUPIALIA

300 persons; veneer factory, 125; bed and mattress factory, 40; lumber-mills, 50; brick yards, 25; cooperage and excelsior factory, 40; other establishments employing about 30 persons. The city has a fine city-hall, a public library, seven churches, four newspapers, a high school, four public and two parish schools. The two banks hold a combined capital of $800,000. The government is vested in a mayor and 12 aldermen, who are elected every two years. About two-thirds of the inhabitants are of German descent. Pop. 5,783.

MARSHMAN, Joshua, English Baptist missionary and Orientalist: b. Westbury, Leigh, Wilts, 20 April 1768; d. Serampore, India, 5 Dec. 1837. He was, like his father, a weaver, but had an insatiable thirst for learning and always kept a book on his loom. Thus he fitted himself to teach in a Baptist school in Bristol; and thence, in 1799, he went to Serampore as a Baptist missionary, and there founded, in 1810, a missionary college. He was an able linguist, and published 'The Works of Confucius, containing the Original Text' (1809); 'Clavis Sinica' (1814); a Chinese version of the Bible, etc. He co-operated with Carey in the preparation of Telugu version of the Bible, a Bengali-English dictionary and a Sanskrit grammar. Consult Carey, 'Marshman and Ward' (1864).

MARSILEACEAE, a natural order of acotyledonous plants, nearly allied to Lycopodiaceae, but differing in the lack of a stem, and in the usually stalked leaves. The species are inhabitants of ditches and pools, chiefly in temperate regions. No species was known to be of any importance till the discovery of the Nardoo of Australia.

MARS-LA-TOUR, France, village in the department of Meurethe-et-Moselle, 15 miles west-southwest of Metz, on the road to Verdun. In the Franco-Prussian War of 1870-71 it was the scene of part of the battle of Gravelotte. The 38th German brigade was annihilated here.

MARSTON MOOR, England, in Yorkshire, is celebrated for the defeat there in 1644 of the royal forces numbering about 18,000 under Prince Rupert by the Parliamentary troops and Scots, totalling about 27,000 under Fairfax (Earl of Manchester) and Cromwell. Rupert escaped with only 6,000 followers into Lancashire and later rejoined King Charles. As a result, the whole north of England was left to the Parliamentary troops. Consult Kennedy, J. W., 'Scottish Borderers at Marston Moor, 1644' (1902).

MARSUPIAL FROG, any of several small tree frogs (Hyliidae) of the South American genus Nototrema, which incubate their eggs in broods formed by infolding of the skin on the back of the female. The eggs are few, of large size and abundantly provided with food-yolk, and the young sometimes remain in the pouches after hatching until they have completed their metamorphoses and attained considerable growth; but the species vary in the respect. In one case the opening is a longitudinal slit along the middle of the back, with a broad-pouched on each side; but in the other species the double pouch opens cross-ways, near the caudal extremity of the body and may be closed by a splinter muscle. About half a dozen species are catalogued, all natives of the forests of tropical America, and none is common or thoroughly well known. Gadow ('Amphibia and Reptiles,' 1901) concedes that the best account of them is still that of Weinland in ' Archives für Anatome und Physiologie' for 1854.

MARSUPIAL MOLE, a small burrowing marsupial of southern Australia (Notoryctes typhlops), called 'Army-mammal,' which has a remarkable similarity to a true mole in appearance (except its reddish color), adaptations of structure to an underground life and habits. It feeds upon ants and other insects and often emerges and travels above ground, though the front feet have been lost transformed into digging organs as to make them of little service for walking. It represents a family (Notoryctidae) first described by Stirling in the 'Transactions' of the Royal Society of South Australia for 1891.

MARSUPIALIA, the marsupial mammals, a group ranked as an order, yet embracing the whole of the superior group Metatheria or Diphylia, as it has been variously named. The latest investigations, however, tend to invalidate the distinctions upon which these groups were formerly sharply separated. These marsupials include mammals and to cause the marsupials to be regarded only as an order of Eutheria (q.v.), now distinguished chiefly by their extremely local distribution and degenerate non-placental type of reproduction. Their origin was extremely ancient and their sources are not known; but the group appears to have risen to Mesozoic times among the earliest of mammalian forms and to have begun, even before the advent of the Tertiary period, a course of special modification and degeneration, especially in the group which has survived to the present. The former belief that the marsupials stood in the direct line of ancestry of mammals generally, which were thus considered as modified and diversified offshoots from the stock, is no longer held; on the contrary, the marsupials are regarded as a branch from some very early generalized stock, if not a group of independent origin. It is noteworthy, according to Woodward ('Vertebrate Palaeontology,' 1898), that the earliest known complete mammalian skeletons, which pass upward by insensible modification into the undoubted Eutheria, are scarcely distinguishable from the skeletons of the more generalized existing marsupials (for example, Thylacinus). In the later Mesozoic Age the marsupials were apparently scattered over all the land-area of that time, as their remains have been discovered in many parts of both hemispheres; but even previous to the Eocene epoch they had disappeared entirely from north of the equator. From the first they are divisible into two branches, the one consisting of Tachyglossidae and Diprotodontia. The former, characterized by numerous small incisor teeth, includes a majority of the most ancient forms and such modern groups as the opossums and desyures; while the latter, characterized by only one or two upper incisors and two of the lower, contain, besides some ancient forms, the majority of modern representatives of the order, as the kangaroos, phalangers, wombats, etc.

The marsupials take their name from the ventral pouch of skin, covering the mammary glands, in which the young are nourished or
1 Sugar Squirrel (Belideus sciurus)
2 Mouse-phalanger (Tarsipes rostratus)
3 Wombats (Phascolomys wombat)
4 Tasmanian Wolf (Thylacinus cynocephalus)
5 American Opossum (Didelphys virginiana)
6 Koala (Phascolarctos cinereus)
