The term moment enters into several other phrases, all of which relate either directly or indirectly to rotation. Thus, there is the moment of momentum, or angular momentum, whose rate of change is the measure of the moment of the force producing the change. To obtain it for any body rotating with angular speed ω about an axis, we first imagine the body broken up into a great many small portions of masses mi, mi, etc., at distances ri, r2, etc., from the axis, multiply the momentum (miω) of each mass by its distance, and then take the sum of all these products. The angular speed being the same in every position of the moment of momentum takes the form \( \Sigma mr_i \), which is the moment of inertia about that axis. It is the factor in the moment of momentum which depends upon the distribution of matter in the body. It enters into all questions of mechanics in which rotation is involved, from the spinning of a top or the action of an engine governor to the stability of a ship. By an obvious extension, the word moment is also used in such combinations as moment of velocity and moment of an acceleration. Such phrases correspond to nothing truly dynamic, unless we regard velocity as meaning the momentum of unit mass and acceleration as the rate of change of that momentum.

If the mass of every small portion of matter in a body be multiplied by the square of its perpendicular distance from a straight line, the sum of all such products is called the moment of inertia of the body about the line regarded as an axis. The radius of gyration of the body by the distance = \( \sqrt{r^2} \), and the matter of the body might be concentrated without altering the moment of inertia. Thus, if l is the moment of inertia of the body, M its whole mass and k its radius of gyration, l = Mk^2. We see that the moment of inertia of a body about a line is for a great number of products of small masses and squares of distances; if the body can be defined mathematically as to shape, size and density, finding its moment of inertia is a problem of the integral calculus.

MOMENT OF INERTIA. See Mechanics.

MOMENTUM, in mechanics and physics, the product of the mass and velocity of a body. Like velocity, momentum is usually regarded as having a definite direction, as well as a definite numerical magnitude. The momentum generated by a constant force acting upon a material particle for a definite length of time is numerically equal to the product of the force by the time during which it acts, and has the same direction as the force. See Mechanics.

MOMIERS, mō'myär, from the French term for miller. It was a nickname given in derision to the followers in Switzerland (1814) of the Baroness von Krüdener (qu. v.), who charged the State Church with apostacy, held great conventicles and lived as aesthetes. They were led by the Genevan clergyman, H. L. Empetaz, César Malan, L. Gausson, Merle d'Aubigny and F. Monod. From this sect arose the Evangelical Society at Geneva (1832), the Free Evangelical Church (Eglise libre) of 1848 that, in 1833, divided and went into even severer directions. Consult G. G. Tractat in voll. of formierte Kirche Genfs in 19 ten Jahrhundert? (Basle 1864).

MOMMSEN, mômzēn (Christian Matthias) Theodor, German epigraphist and historian: b. Garding, Schleswig, 30 Nov. 1817; d. Charlottenburg, near Berlin, Prussia, 1 Nov. 1903. He was a student of jurisprudence and Theology at the University of Kiel; took his Ph.D. in 1842; published with his brother Tycho and his friend Storm a volume of verse which was scathingly condemned by the reviewers (1843); became more successful his career as historian with the treatise "De Collegis et Societatis Romanorum," (1843), commended by its thoroughness and a clarity of style new to German works of this kind; and in 1844-47 was in France and Italy under commission of
the Berlin Academy, collating manuscripts and inscriptions. On his return he edited for a short while the Schlesung-Holsteinische Zeitung, and in 1848 became professor of Roman law at Leipzig. He entered politics as an advocate of constitutional progress, was arrested for inciting to revolt, and though acquitted by the court was deprived of his professorship. From that time he was an eager if not invariably judicious disputant in many political controversies. He was appointed to the professorship of Roman law at Zürich in 1852, at Breslau in 1854, and from 1858 until his death was professor of ancient history in the University of Berlin. In 1873 he was elected perpetual foreign secretary of the Berlin Academy; but this post he resigned in 1895. For 10 years (1873–82) he was a liberal member of the lower house of the Prussian parliament, where he bitterly attacked Bismarck’s domestic policy. In an election speech at Charlottenburg in 1882 he characterized the Iron Chancellor’s tariff measures as a “Politik von Schwindel.” Such boldness cost him dear. He was unseated, and Mommsen was brought to trial for slander. His acquittal by both a lower and an appeals court was one of his great triumphs. He sternly advised the Teuton element in Austria in the struggle with the Czechs; made some cautious observations in a North American Review article on British treatment of minor nations; to the last was quite belligerent as ever.

But he was only incidentally the politician. He was pre-eminently what Freeman called “the greatest scholar of our times, well nigh the greatest scholar of all times” (“Methods of Historical Study”). He was distinguished as an epigraphist, historian, jurist, numismatist and philologist. None in the 19th century, which he almost spanned, has, as Freeman goes on to say, “taken in so wide a range of subjects, all brought with the happiest effect to bear upon and to support one another.” To the educated reader at large he will probably continue to be best known for his Römische Geschicht (3 vols., 1854–56; 8th ed., 1889), to the battle of Thapsus; together with Vol. V on the provinces from Caesar to Diocletian (1885). Volume IV, on Imperial Rome, was unfinished at his death. There are English renderings by W. P. Dickson (Vols. I, II, 1865–66; Vol. V 1886). This work opened a new epoch in historiography. Though written with great spontaneity, without even references to original sources, it was based on unrivaled knowledge, and presented its material with extraordinary clearness and at times with brilliance. It is of course somewhat dogmatic, is certainly unfair to Cicero, and has been blamed, by Freeman among several, for undue glorification of mere power and success. To scholars Mommsen is above all the editor of the great Corpus Inscriptionum Latinarum (1863 et seq.; Vols. I, III, VIII, IX, by himself; others under his immediate supervision). Every inscription of this monumental collection was taken down from the original. The errors and falsities of predecessors were cleared away, and a scientific foundation was supplied for the study of Roman antiquities. Mommsen’s preface to the series is said to be thought by critics one of the finest specimens of Latin prose written in modern times. For a complete list, see W. Zangemeister’s Mommsen als Schriftsteller (Heidelberg 1887; new edition by Jacobs, with additions, 1905) should be consulted. Mention may be made of Römisches Münzweisen (1850), Römische Chronologie (1859) and Römisches Staatsrecht (1871–88). All are standard, but the last, particularly, by the breadth and completeness of his exposition of the Roman constitution, places Mommsen among the foremost of constitutional writers. He also edited the Res Gestae Divi Augusti ex Monumentis Ancyrano et Apolliniensi (1865; new ed. 1883); the Digesta in Vol. I of the Corpus Juris Civilis (6th ed., 1893), and many other publications. His library, when partially burned in 1880, was replenished by gifts from foreign scholars. In 1902 he was awarded the Nobel prize in literature. Consult Hirschfeld, O., Gedächtnisrede auf Theodor Mommsen (1904); Sandys, J. E., A History of Classical Scholarship (Vol. III, Cambridge 1908); Wachsmuth, C., Worte zum Gedächtniss an Theodor Mommsen (Leipzig 1904).

Momordica, a genus of plants of the gourd family, remarkable for their strangely marked seeds. Two or three species are cultivated in the United States as ornamental plants, one of which (M. charantia) produces a food for the Chinese in the pulp about the sculptured seeds; another Oriental food, the gokokra of India, is the fruit of M. cochinchinensis; and the balsam-apple (M. balsamina) furnishes a healing principle which is infused in oil to form a liniment highly esteemed in the Levant.

Momotombo, mōmō-tōmō’bō, Nicaragua, an active volcano rising 4,250 feet from the northwestern shore of Lake Managua. Eruptions took place in 1852, 1902 and 1905. The nearby village of Momotombo is connected by rail with Chinandega.

Mompox, mōmpō’s, Colombia, a town of the province of Bolivar on an island formed by the Rio Magdalena about 180 miles south of the deltaic mouth. The streets, which extend parallel to the river, are well laid out, but the houses are badly built. Mompos is a depot of foreign goods destined for consumption in the valley of the Magdalena; but the navigation in the river’s course rendering it un navigable have seriously injured its prosperity. Pop. 11,000.

Momus, in Greek mythology, the god of satire and mirth. He is generally represented raising a mask from his face and holding a small figure in his hand. His mother was Nyx, the goddess of night. As a mocking censor and carping critic Jupiter cast him out of heaven.

Mona, mō’na (1) a West Indian islet belonging to the United States since 1898. It lies 42 miles east of Porto Rico, in the middle of Mona Passage, to which it gives its name; seven miles long by two miles wide, its area is nearly 10,000 acres. It is connected with a peninsula, with a general level about 60 feet above the sea. A range of hills on the east side of the island runs from north to south, the highest peak of which is 175 feet above the water. The island is well watered and well drained, has a luxuriant vegetation and all kinds of tropical fruits grow in profusion. It is the
THE HARBOR OF MONACO

Showing the New Oceanographic Museum at the Tip of the Mainland
nesting place of thousands of green turtles, and the surrounding waters teem with the finer varieties of fish. The only residents belong to the lighthouse establishment; off the northwest point is Monita islet; (2) the ancient name mentioned by Tacitus for the island of Anglesey (q.v.), Wales, also applied by other ancient writers to the island of Man.

MONA, a West African monkey (Cercopithecus mona), remarkable for its brilliant coloration, the head being olive-yellow, with a black stripe on the forehead; yellowish whiskers and a purple face. The back is chestnut-brown, the undersurface is white and there is a white spot on each side near the root of the tail, which is black. It is constantly seen in menageries.

MONACO, món‘à-kō, the smallest independent European principality, bordering on the Mediterranean, nine miles east of Nice, and enclosed on its land borders by the French department Alpes-Maritimes. It had an area of 53 square miles till 1861 when the Prince of Monaco ceded Mentone and Roccabruna to France for 4,000,000 francs. The principality has since been confined to the towns of Monaco, Condamine and Monte Carlo with the surrounding districts, having an area of about eight square miles, and a population of about 23,000. The expenses of government, municipal and other, are defrayed by a joint-stock company, which carries on the famous gaming establishment at Monte Carlo (q.v.), and which also pays a handsome yearly sum to the Prince for the concession. The capital, Monaco (pop. 2,247), situated on a lofty promontory overlooking the sea, in the midst of olive, orange and lemon groves, is a renowned watering-place. Here are the palace and cathedral. There are numerous hotels and an English church at Monaco. In the 10th century the Emperor Otto I conferred Monaco on a prince of the house of Grimaldi, a scion of which (through a female branch) still continues to rule.

MONAD, in biology. See INFUSORIA.

MONADNOCK, món‘à-nôk, New Hampshire, an isolated mountain of a typical erosion character, near the southwest corner of the State, in Sullivan County, 10 miles southeast of Keene. The base covers an area of five miles by three, and the altitude is 3,186 feet above the level of the sea; it is composed of slate, talc and mica. The summit commands a fine view, and it is a conspicuous landmark, visible even from the dome of the state house at Boston.

MONADNOCK. See PENELAINE.

MONAGAS, món‘à-gas, José Tadeo, Venezuelan soldier; b. Maturin, Venezuela, 28 Oct. 1784; d. El Pao, Nov. 1868. He served in the War of 1813-21 under Bolivar and rose to the rank of brigadier-general and was afterward engaged in various military measures until 1830 when he became a member of Congress. Bolivar's death in 1831 Monagas retired but was soon called to the command of the Orient. In 1835 he supported a revolution but made his peace with the government a few months later and in 1847 was elected President. His administration was at first marked by liberal measures, but his policy becoming arbitrary he was deserted by his party, whereupon he abolished Congress and assumed a dictatorship. He defeated Paez who led a revolutionary movement against him and disregarding his treaty, imprisoned him, and in 1851 took command of the army, the presidency being held by his brother. In 1855 he was re-elected, but a revolution followed and he was compelled to leave the country in 1858, after resigning the presidency. He returned in 1864 and in 1866 headed a successful revolution and was elected President by Congress, but died before being installed in the office.

MONAGHAN, món‘à-han, John James, American Roman Catholic prelate; b. Sumter, S. C., 23 May 1856. He was educated at Saint Charles College, Md., pursued a theological course at Saint Mary's Seminary, Baltimore, and was ordained to the priesthood in 1880. He held several pastorates in Charleston, S. C., and elsewhere, was chancellor of the diocese 1887-88, and assistant to Bishop Beaudette at Saint Patrick's, Charleston, 1888-97. In May of the last-named year he was consecrated bishop of Wilmington.

MONAL, or MONAUL, a name among Anglo-Indian sportsmen for any of several Himalayan pheasants, especially the gorgeous species of the crested genus Lophopterus. See IMPYAN PHEASANT.

MONAMINE, in chemistry, an amine that is derived by replacing one or more of the hydrogen atoms of a single molecule of ammonia by an equal number of monovalent organic radicals. Amines that are derived by joining two, three or four molecules of ammonia, through the partial replacement of their hydrogen by a single polyvalent radical, are called ditri-, and tetra- amines respectively; and the monamines are known as primary, secondary or tertiary, according as one, two or three of the hydrogen atoms of the ammonia molecule have been replaced. See AMINE; AMIDE.

MONARCH BUTTERFLY. See Danaeis; Milkwode BUTTERFLY.

MONARCHS, a sect in the early Church who asserted the oneness and singleuess of the divine person, as at variance with the orthodox doctrine of the Trinity, three persons and one God. The supremacy of God the Father, they maintained, was impugned by those who said that the Son was coeternal. If there was but one God, they taught, and Jesus Christ was God incarnate, then the Father must have suffered and died. Hence they were called Patripassians (q.v.). Christ was therefore merely one form or mode of the Father's manifestation; and the Father might also manifest himself through the Holy Spirit. This theory was called Modalism or Monarchical Modalism and its teachers Modalists. Praxeas (q.v.), a Christian of Asia, brought this doctrine to Carthage in the 2d century and was controverted by Tertullian (q.v.). The most noted of Patripassians was Sabellius (q.v.), and Modalism was widely known as Sabellianism in both the Eastern and Western Churches. There were other Monarchs called Dynamic Monarchs who taught that Christ became Son of God dynamically, by having certain powers bestowed upon him in his adoption by
MONARCHY

baptism. Pope Victor I in the 2d century ex-communicated Theodotus the Tanner who pro-
styled this theory, and an Asiatic synod (265)
condemned and anathematized the view as
tauistic. In the 3d century Plutarch of Smyrna (q.v.),
the minister of Zenobia (q.v.), queen of Pal-
myra. Monarchianism was revived in the 16th
century by Socinus, and is in some form or
other the essential basis of certain Unitarian
creeds. Casaubon, Nat. Hist., A.D. 1618. History of
Dooms, Vol. III, Book 1, 1687.

MONARCHY (Fr. monarchie, from Lat.
monarchia, from Greek monarchoia, rule of one,
sole power). In the course of history, the
word monarchy has been subjected to so many
interpretations and has been applied to so many
different kinds of governments that an exact
definition or a classification of its main divi-
sions is difficult. Strictly speaking, the word
means undivided sovereignty or rule of a single
person, and hence it has been used to describe
states in which the sovereign or supreme au-
thority is vested in a single individual, the
monarch, who in his own right is the permanent
head of the state. The king or chief magis-
trate of a state may properly be termed a mon-
arch only when he possesses the entire ruling
power, but the term monarchy has outlived this
original meaning and in popular language is
used to designate any government in which the
political head is called king or prince, regard-
less of the authority he may exercise or the
manner in which political power is distributed.
The changes in the power exercised by the
monarchs of Europe have necessitated the in-
vention of new terms for general use in de-
scribing the various forms of government, but
these terms in themselves are a contradiction of
the true meaning of monarchy. We now have
"limited" or "constitutional monarchy," as op-
posed to "absolute" or "autocratic monarchy,"
and a distinction is also made between "heredi-
tary" and "elective monarchy," though the distinc-
tion is unimportant since these terms do not
indicate the nature of the government.

As stated above, the absolute monarchy is
the only real monarchy in the strictest inter-
pretation of the word, since it is the only govern-
ment in which the ruler is absolutely supreme.
(See ABSOLUTISM). A mixed or limited mon-
archy is one in which the ruler, though still
possessing the status and dignity of royalty,
shares the supreme governmental powers either
with a body of nobles, or with a popular repre-
sentative body, or with both. A constitutional
monarchy is one in which the power of the
ruler is restrained by a constitution. Woolsey
says: "Mixed monarchies are something more
than limited ones. There may be a limited
monarchy where king and people, the former
restricted by a constitution, the latter organized
and invested with certain means of preventing
illegal government, have the only legal forces.
This may be called mixed, perhaps, yet the term
rather inclines to embrace only such states as
have three or more political powers, as king,
nobles and people, united in the government, or
the same powers with the clergy, as in many
medieval states. Thus all mixture contains
limitations but all limited governments are not
mixed." There are now no constitutional or
limited monarchies in existence. A monarch
possesses power to legislate by decree and in such
a monarchy the democratic element is the only
authority directly exercising any great degree
of actual power. Monarchies are usually
hereditary though they sometimes have been
elective; but in the latter case they have gener-
ally been attended with disastrous results, and
great confusion in the elections, as in Poland.
Of the elective monarchies the most conspicu-
ous were the papal states, the Pope being
elected by the cardinals; but the states of the
Netherlands were termed republics even though
in some of them the office of stadtholder was
hereditary. In Europe all monarchies were
originally elective, within certain limits; and
subsequent to the introduction of the introduc-
tion of the introduction of the introduction of
kinship with the reigning family did not count
so much as the essential condition of the as-
sumption of sovereign power as the "sacring"
by the divine authority of the Church. Con-
stitutional monarchs in their origin must have
been elective or they may combine both systems, as
when one family is disinherit and the supreme
power under certain conditions declared hered-
itary in another. The purely hereditary prin-
цип is of comparatively late origin, the out-
come of obvious convenience which became a
religious or quasi-religious dogma. The abso-
lute monarchies of the present day are Abys-
sinia, Afghanistan and Siam; and the limited
monarchies are Belgium, Great Britain, Den-
mark, Greece, Italy, Japan, Montenegro, The
Netherlands, Norway, Persia, Rumania, Serbia,
Spain and Sweden.

The conception of monarchy was derived
through Christianity from the theocracy (q.v.)
which was the earliest form of state and which
was developed in Asia and northern Africa.
The theocracy was ruled by a high priest or by
a king or prince who represented within the
limits of his dominions the monarchy of God
over all things; hence religion was the bond of
union and the idea culminated in the 17th cen-
tury in the doctrine of divine kings. Therefore,
when later transformed from a divine
ruling state into one with a human king,
the distinguishing mark was despotism.
But this barbarous form of monarchy was re-
jected by the people of Aryan origin who gave
some recognition to individual and class rights
apart from the rights of kings and princes.
Though at first the monarchies were absolute,
yet the absolute monarchs were not always
tyrannical but in many cases ruled for the good
of their subjects. Among monarchs of this class
were Henry IV, Saint Louis, Canute, Charle-
magne and others of the early centuries of
European history and the "enlightened," or
"benevolent" despots of the 18th century.
The essential basis of the feudal monarchy (which
followed the decline of Carolingian authority)
was the bond of fealty between the king or
supreme lord and his vassals, who derived
from him their rank, power and property. The
mediating arms forces were the only forces that
held the absolutism which first made its
appearance in France, proclaiming the doctrine
of divine right of kings and culminating in the
absolutism of Louis XIV. The Stuart's

England held this doctrine but the monarchical principle was shaken to its foundation by the execution of Charles I and the English revolution of 1688, and was completely shattered by the French revolution of 1789. Since that time the monasteries of western Europe have been transformed into constitutional or limited monarchies, the growth of democratic ideas having infringed upon and greatly reduced the former powers of the king or emperor. *Monarchists,* strictly speaking, have long been a minority in a nation dwelling in provinces and districts.

See King; Absolutism; Sovereign; State; Government; Theocracy; Republic; Feudal System; and the descriptions of the governments of the various nations. Consult Brougham, H. P., 'Political Philosophy,' Pt. I (London 1842); Bluntschli, J. K., 'The Theory of the State' (6th ed., trans. Oxford 1885); Woods, F. A., 'The Influence of Monarchs' (New York 1913); Woolsey, T. D., 'Political Science' (Vol. I, pp. 487-585, New York 1878); articles on divine rights in The Outlook, 10 Sept. 1910; Living Age, 26 July 1913; and Current Literature, October 1910; and articles on modern kings and rulers and their influence as listed in the guides to periodical literature.

**MONASTERY. See Monasticism.**

**MONASTERY.** The, a novel by Sir Walter Scott, published in 1820, the scene of which is in Scotland in the 16th century. In this tale Scott for the first time introduces a supernatural element, as in the mysterious appearances of the 'White Lady of Areniel,' and for this reason the book was never so popular with English readers as his other tales. Its sequel, 'The Abbot,' appeared the same year.

**MONASTIC ARCHITECTURE.** East Indian. — The Buddhist priests' monasteries, known as vihāras, either adjoined or were included in the chaitya-house (building surrounding the shrine). The most ancient (ilmovīya) erections are no longer in existence, but we know that the Jetavana monastery of Śrāvasti in the 5th century A.D. had splendid buildings seven stories high. The existing ancient monasteries are those cut into the living rock. Of these perhaps the following are of greatest interest: Those on the hills of the Upper Godaveri River, at Nasik; the Gautamā-putra monastery ('Cave III'), belonging to the 2d century A.D. One of the grandest extant monastic structures is the Mahāyāna chaitya of Ajantā, but the magnificent chaitya-house at Kārlī carved in the rocks of the Western Ghats, between Bombay and Poona, is considered to show the Hinayāna School in its best light. The Buddhist rock-cut vihāra at Bedśā, a 2d century B.C. work, has its cells round a chaitya-house, an apse around the chaitya and a domed barrel roof. The usual form of Indian monastery consisted of rows of cells ranged about the shrine, which was surmounted by its heavy mound (stūpa). The architectural plan somewhat resembles the basilica with its interior lined with pillars and the shrine formed in the dome or barrel roof. At the opposite façade. The style of the Drāvīḍa religious edifice, with its pyramid-crowned gateway (gopura), choultries, etc., belongs to the subject Architecture. See Architecture — Sasanian and Mohammedan.

**Eastern Church.** — The early Basilian monks attempted no special style or application of architecture, using the Byzantine, Greek or Eastern plans as best suited for their allocations. From 306 to 322 the ascetics were withdrawing in bodies to the deserts, and under such leaders as Paul, Anthony and Pachomius, they established monasteries. To such belong those of Mount Athos (Konstamonitou), in the Balkans, in Armenia, the Libyan Desert ("Coptic"). Many of these of Levantine monasteries were devoid of all external architecture, rendered as inconspicuous as possible to avoid drawing the attention of the passing marauding bands of natives. They were usually surrounded by a high blank wall. The 4th and 5th century monasteries established under Pachomius rule in the Libyan Desert had small buildings, called 

**Canobites. They were governed by an abbas (father), hegumenos (leader), or archimandrite (superintendent).**

**Western Church.** — Benedictine Monasteries. — Saint Benedict published his 'Rules' and established his monastery at Monte Casino about 520, but the first positive and complete information we have on monastic architecture of his Order is the plan (designed in 822) for the construction of the monastery of Saint Gall. The precept of Saint Benedict demanded that all the workers of the monastery should find their workshops inside the walls of the enclosure. In the Saint Gall plan the grounds form a long rectangle in which the church is about the centre. Annexed to the church are the dwellings of the monks, the chapter-house, cloister and refectory. In a wider circle are grouped the residence of the abbot, the school house, the lodgings for strangers, the stables, brewery, bakery, mill, workshops and barn. Behind the church are located the hospital with residence for physicians and a garden for cultivating medicinal herbs. Here are also an acolyte's school, cemetery, horticultural and vegetable gardens and a pond. The ambitious plan was not carried out in its entirety and few of the buildings are now in existence.

**Cistercian Monasteries.** — While the Benedictines aimed at richness in architectural effect, especially in their church edifices, the Cistercians held to strict simplicity. Their mother monastery was at Clairvaux, but the abbey of Maulbronn, Württemberg, founded 1146 and finished in the 13th century, has come down to us in such a good state of preservation as to serve best for model. It is (according to periods of construction) in Late Romanesque, Transition and early Gothic. The cloister forms the central point connecting on the south with the church, on the east with the chapter-house and on the north with the men's refectory. To the west lies the lay refectory and, somewhat separate, we find the residence of the abbot and the farm buildings. When pressed for space the refectory served as a chapter-house, where the abbot offered mass and was to hear a chapter read from the 'Rules' and in which the more important affairs were discussed. The monks slept at first in a common...
dormitory but later received separate cells. The dormitory was usually located in an upper story and the cell contained only a bedstead, table, stool, and a window. The superiors, however, had more spacious and better furnished rooms.

Premonstratensian and Grandmontine Monasteries.—In these the central point of the enclosure is occupied by the cloisters, which in most orders are separated from the church by a wall and enclosed entirely of galleries under which the doors of the different apartments are located. In the centre of the court are a well and a cistern. The abbey church occupies one entire side of the square, either the north or south side. The western side of the cloisters is attached to the building which forms the exterior façade of the abbey and is composed of cells or stores of provisions surrounded by the dormitory of the menial servants. On the side of the square facing the church is the kitchen, communicating with the refectory by a wicket. The refectory has an elegantly carved chair for reading. On the east, following the refectory, come the workroom or several apartments serving as library, scriptorium, shops, etc. On the east side of the cloisters, between the work- ing quarters and the church choir is a passage affording access to the gardens, then comes the chapter-hall, generally several steps downward from the cloisters with which it communicates by a great portal flanked by two richly adorned windows. It is generally vaulted and nearly decorated; the abbots were often interred under its pavement. The sacristy is usually located between the chapter-hall and the church, also the vestment room and chart room; sometimes a prison cell for delinquents. Above these compartments extends the dormitory of the monks, communicating by a staircase with the church choir. Opposite the stairway is the cell of the abbot overlooking his monks. The collection of buildings is closed in by a water-course or walls with an entrance on the east facing the façade of the abbey. The porter's lodge is located alongside. Within this enclosure are the lodgings for the laity; eastward are the apartments for ecclesiastical guests and the agricultural buildings (near a stream) and the mill and factories are scattered on the sides, the infirmary being carefully isolated.

The monastic housing plans of the Jesuits differed greatly from those of the mediæval monasteries. They rivaled one another in beautifying and enlarging their buildings and grounds. The church, of course, showed the chief magnificence, but the libraries and refectories boasted all the ornamentation the architectural periods afforded. They set aside special spaces for festivities and for the entertainment of distinguished guests, even furnishing (in Austria) a theatre, Imperial hall and ducal hall. Good examples exist at Ottobeuren, Salem, Etal, St. Florian near Linz, Münz (Lower Austria). The Carthusians adopted a plan differing in many respects from other Orders; the Knights Templar united military architecture with that of the monastery. The Franciscans and Dominicans of the 13th century dropped tradition in modifications, and by the 17th century followed no style entirely. The Cistercians (from 1191) developed the Romanesque style in their monasteries. The Cistercians (from 1098) adapted the Gothic to their needs, and the Trappists also utilized the Gothic style. In Italy the Renaissance period (of course) furnishes the finest specimens of monastic architecture. Of such perhaps the most prominent is the Certosa, near Pavia (Carthusian), built 1473, with its celebrated church façade, considered to be the most magnificent monument of the Italian early Renaissance. The Carthusian monastery, built by Michelangelo, which adjoins the Santa Maria degli Angeli church at Rome (now the Musco Nazionale delle Terme), is noted. The cloister of Santa Croce, Florence, contains the greatly admired portal of Brunelleschi. Consult Havell, E. B., Ancient and Mediaeval Architecture of India (London 1915); Ju bainville, d'Arbois de, Essai de l'état intérieur des abbayes cisterciennes (Troyes 1863); Lenore, 'Architecture monastique' (Paris 1852-56). See Architecture; Byzantine Art; Christian Architecture.

Clement W. Coumbe.

MONASTIC ART. In its final analysis art is the visible, concrete proof of the development and stage of advance or decay of civilization. And the most prominent fact in connection with the history of art of the Christian era is that the holy flame of the Christian art effort was kept burning for numerous centuries solely by the aid of the Catholic Church (Eastern and Western), while all outside of the monasteries was in a riot of barbarism, devastation, murder and rapine.

Art in the Eastern Church.—The basilicas (q.v.) of the early Christians, themselves designed on pagan lines but adapted to their needs, used for internal decoration the art of mosaics, which flourished in the 6th and 7th centuries. The monks produced manuscripts from the hands of their miniaturists, wonderful in their lovely illumination and calligraphy, beautiful creations in ivory, impressive examples of gold and silver-smithing, enamel work, embroidery, etc. These are in the style termed Byzantine. (See Byzantine Art). The conquering barbarians, with some knowledge of their own or knowledge of the antique, quickly absorbed the prevailing style, adopting it together with the religious influences of the Christian Church. With the fall of the Roman Empire workers in the arts were driven to the Orient for their existence and art flourished in the churches of Constantinople and Jerusalem. The Basilians, an order founded by Saint Basil (d. 380), had, among their "rules," the mandate that work was part of their monastic life; and art was one of the chief "works" done in producing the decorative elements of the churches. In this mediæval period we find the monastic life spreading from its centre (Constantinople) to Mount Athos (from 960). Greek monasteries were founded at Rome in the 6th and 7th centuries, the cult reaching to south Italy, Sicily and Calabria. From the monastic art standpoint of great importance is the fact that Baslian monachism spread into Russia, and, its art accompanying it, was absorbed by the Russians (Kiev c. 1030). The Byzantine miniaturists worked to the zenith of their fame up to the 11th century.
Art in the Western Church.—All the above art work was under Oriental (Mohammedan) influence. In the 11th century commences the true Christian monastic art of Europe, but we must look to Constantinople and the East for the first results. The early Christian art of the monasteries of the Irish and the Anglo-Saxons (about the 5th century) remains a source of bewilderment and mystery when we consider its marvelous (exquisite illuminated manuscripts, art jewels inlaid with emeralds, etc.) character. It is not difficult to see that the artist-monks had but just been converted to the Christian faith. And it was Wilfrid (633–755), an English priest who went as a missionary to Friesland and established successful monasteries and the adjunct art cult through North Germany, to be canonized as Saint Boniface after his martyrdom. From the 6th century the Benedictine Orders, starting from Monte Casino, Campania, carried on the entire culture of Europe for 500 years, the arts being a large and valuable part of the work. The Rules of Saint Benedict, disclosed in his Regula Monachorum, show the system required of the monks in their work. Cassiodore followed Saint Benedict soon with his monastery at Viviers in Calabria and its library, were a talent center for the man, the calligraphists and illuminators did their copying of manuscripts, illuminating and painting as well. And we now come to the great crowd of painters, sculptors and architects as well as calligraphers and illuminators that were trained by the orders to radiate their influence and example through all classes of society. And it is to these disciples that the world owes all it owned of art from the 7th to 12th centuries. Great centres of Benedictine work, beside Monte Cassino, were the Alsatian abbey of Saint Gall and Reichenau, later Hirsau and Fulda, in Germany. In France led the Cluny (from 912); in England York and Canterbury were great monastic art centres. In this interesting period we find hard at work as a coemeterius (stone-mason) on the great abbey church founded by Hugo; Count Frederick at Verdun, as a monk at Saint Vannes, in 1000, dug the foundation to the dormitory with his own hands. The ranks of the monks of that day contained a remarkable number of versatile artists. Tutilo of Saint Gall (end of the 9th century), Ekkehard tells us, was painter, sculptor, poet and teacher; Abbot Mannius of Evesham, England, was noted as painter, musician, calligraphist and goldsmith; Fulco, the praecensor of Saint Hubert's monastery in the Ardennes, was architect and miniature painter, besides being mentioned as an efficient stone-mason and carpenter; the Allemannic chronicler Herman the Lame, at Reichenau, so much further back for its manuscripts, while he was practised in astronomy and mechanics, at the same time being busy in making musical instruments and clocks. Bernward (b. 933, d. 1022), who rose from monk to bishop of Halberstadt, did a great deal of art work in metal and precious stones, some of which exist at the present day. He worked hard introducing the arts and crafts into Germany, and established schools and studios in his palace, sending pupils abroad to learn the differentByzantine arts, secrets and styles. Thiemon, monk at Altheim and later archbishop of Salzburg, was painter (as he himself claimed when suffering martyrdom in Palestine) as well as architect and goldsmith. And we come, in the 12th century, to the great monastic influences over the arts in France. The prelates of that period greatly enriched the monasteries (especially with goldsmithing work) with beautiful utensils for the cult. Of such monastic art patrons we find the name of Lambert, abbot of Saint Bertain at Saint Omer; of Gerard, bishop of Angouleme (d. 1136). But touting above all others would appear to have been Suger, who was abbot of Saint Denis (d. 1152), minister of Louis the Lusty and regent under Louis VII. Suger was censured by Saint Bernard for his rich beneficence to the artisans in embellishing his church. To his fine vessels in the precious metals he added furniture of great artistic refinement, also beautiful bronze doors with bas-reliefs of the Passion, etc. The episcopal and monastic schools of this century were producing more numerous and more beautifully illuminated manuscripts. But in the preceding century, specimens of which are still extant. The abbey of Saint Denis created also lovely stained glass windows and mosaics. Some idea of the perfection of mechanical technique reached by the monks is afforded us by the work, Diversarum artium schedula, written by Theophilius, a monk or priest (10th or 11th century), in which he defines the manipulation and gives the formulae used by the practitioners of the arts among the monks and lay workers. He gives perfect and practical information on painting on canvas, wood, vellum, glass, encaustic and fresco, mosaic work, goldsmithing, etc. While to the Rules of Saint Benedict and the assistance later of the Cistercians and Cluniacs in their establishments was due the propagation of art in the Middle Ages, the citizen class arising from the rapid growth in wealth of the civic communities together with the Crusades made a great change in the propagation of the arts. The clericals had not relinquished their old artistic talent, for they maintained the closest relationship with the arts at least till the Rococo period and practised the work extensively. But the civic lay element, from the 13th century, became stronger and more and more distinguished. Thus, while the monastic orders held supreme domain in the building of churches, the lay body took up the leadership of the plastic arts and painting in the persons of Niccolo of Pisa, Giotto, etc. And with Brunelleschi and Alberti on the scene we find the field of architecture also falling into the hands of civilians, displacing permanently the monastic talent. This was the Trecento period of the early Renaissance. Consult Labarte, J., Histoire des arts industriels au Moyen âge et à l'époque de la Renaissance (Paris 1864); Freiburg im Breisgau 1896; Springer, A. H., Klosterleben und Klosterkunst (Bonn 1888); Zouche, R. C., Visits to Monasteries of the Levant (London 1916). See Christian Architecture; Manuscripts, Illuminated. CLEMENT W. COUMBE.
MONASTIC ORDERS—MONASTICISM

MONASTIC ORDERS, Costume of. See Costume, Ecclesiastical.

MONASTICISM, or MONACHISM, is a state of life in retirement from the world adopted for motives of religion. It is peculiar to Christianity, for in many religions, as that of Israel, and in those of India, China and Tibet, the same motive has led men to withdraw themselves wholly or in part from contact with worldly society and to seek in seclusion and retirement opportunity to lead a purer or higher life. The Nazarites, the Rechabites, the Essenes, the Therapeutes were separatists from society in a greater or less degree, and in this respect were the precursors of the ascetics of the earliest Christian age and of the hermits or anchorites and the cenobites of the 3d and 4th centuries.

In the middle of the 3d century, during the persecution of the Christians by Decius, Flavius Theodosius, the Egyptian (Saint Paul the Hermit), withdrew to a wilderness, and during the remainder of his long life lived in absolute solitude in a cavern of a mountain, deriving his food and his vesture from a neighboring grove of palm trees. Many others fleeing from persecution came to the contamination of a profoundly corrupt society, flocked to the wildernesses of the Nile country; among them was Antony (Saint Antony), who after many years of the strictly solitary life of an anchorite was in a manner compelled by circumstances to adopt the cenobite rule. He was by choice an anchorite like Saint Paul the Hermit, but the fame of his virtues and his miracles brought to his cell in a remote wilderness many who desired to devote themselves to the service of God under such a master; and as he could not refuse their prayer he became, in fact if not in name, the Father or Abbot of a pretty numerous cenobium; hence he is called the Father of Monachism, that is, of the life-in-common of those who retire from the world for reasons of religion; they retain the title of monk, monachus (a solitary), though since Saint Antony's day they are no longer solitary but cenobites.

Antony's cenobites occupied each a separate hut or a separate grotto; but Saint Pachomius, a contemporary of Antony, introduced a further development of the community life. The cells or huts were now to hold three brethren; meals were eaten in common; the labor of the monks was regulated; the brethren were graded according to their spiritual proficiency; the community was presided over by an abbot, with inferior officers; in addition to the primitive industries of petty agriculture, basket-making and mat-weaving, the monks practised the trade of the smith, the tanner, etc.; there were daily assemblies of the community for prayer and conference. When Saint Pachomius died, about the middle of the 4th century, 7,000 monks were subject to his rule.

From Egypt monachism soon spread into Syria, Palestine, Mesopotamia, Asia Minor and Armenia.

The introduction of monachism in the Western countries of the Roman Empire dates from a little after the middle of the 4th century when a few small communities of monks, under the Pachomian rule, were founded at Rome and in Northern Italy. Later, when the rule of Saint Basil had been translated into Latin, communities of Basilian monks sprang up in Southern Italy. Saints Jerome, Augustine and Ambrose were zealous promoters of monachism in Italy and Africa, Saint Martin of Tours in Gaul; when Saint Martin died (397) his body was followed to the tomb by 2,000 monks.

Whether under the Pachomian or the Basilian rule or under modifications of these, monastic establishments multiplied rapidly in the West. But the disorder which attended the decline of the Western Empire and the barbarian invasions, had its effects upon monachism, and the monastery exhibited the same anarchy as did civil society.

Early in the 6th century Benedict of Nursia, who had already led for three years the life of a strict recluse in a cave at Subiaco, about 40 miles distant from Rome, was chosen by the monks of a monastery in the same place as their abbot; but very soon, his new subjects having deposed him, he returned to his solitude and commenced the reform of Latin monachism which made his name illustrious. He gave to his monks a rule which, variously amended and modified, has been the law of the monastic life of Western Europe ever since. In its preamble Benedict recognizes two and only two classes of monks—cenobites and anchorites—those who lead the life in common and those who live in solitude—usually now called hermits.

Two other classes he names, but only for condemnation, namely, sarabates—professing monks who live two or three together without any superior or any fixed rule; and gyrovagi or circulatores, tramps, wandering beggars who wear the cloak of a religious profession. To do away with these scandals of the monastic life, Benedict's rule required that the postulant for admission to a monastery shall take in addition to the usual monastic vows of poverty, chastity and obedience, a further vow that he will remain all his days in the community in which he makes his profession, and never absent from the monastery save by leave of this superior.

Besides monasteries for men Benedict instituted also monasteries for women, and the first abbess of a community of Benedictine nuns was his sister Scholastica.

The Benedictine order was for a long time a powerful agency in the civilization and Christianization of the barbarian nations of Europe. Wherever a Benedictine foundation was made there the face of the country was quickly changed: forests were cleared, marshes drained, the arts of husbandry developed, peace and civil order maintained, science and learning fostered, schools, hospitals and refuges established.

Monastic institutions of Latin monachism in France, Switzerland, Italy and Germany by Celtic monks prior to Benedict's reform conformed to the Benedictine rule. The Carthusian order, founded in the end of the 11th century, was a reversion to the anachoretic type of monachism—the solitary or eremitical instead of the cenobitic life. In the same century arose the order of the Camaldoli, another order of hermits.

The beginning of the 12th century saw the rise of that singular development of monachism, the knightly orders, the members of which besides the usual three vows of the monk took a fourth vow, of making war on the infidels for the defense of Christendom. The Knights Hos-
MONASTICISM

Pilgrims were originally a religious society bound by vow to harbor in health in and disease pilgrims visiting the holy places in Jerusalem; their house in the holy city was a "hospital" or guest-house. The full title of the Knight's was "paupers commilitones Christi templique Salomonis"—poor knights-companions of Christ and of Solomon's temple. Another military order contemporary with these was the Teutonic order. History records the titles of over 90 military orders or of bodies standing orders. The chronic state of war between Christendom and the Mohammedan power led to the institution of the order of Trinitarians and that of Our Lady of Mercy. The mission of these orders was the redemption out of slavery among the Mohammedans of Christian captives. Bearing the alms and gifts contributed by the charity of Europe, the members of those orders visited the Mohammedan countries on the Mediterranean and procured the liberation of the enslaved Christian captives and restored them to their native countries. The Trinitarians had at one time 250 houses; the Christians redeemed by them, from first to last, numbered over 30,000. The order of Mercy was at first a military order, but in 1218 it put off its military character and devoted itself to the charitable work of redeeming the captives.

There seemed to be now a sufficiency of religious orders to satisfy all needs. But at this very time, the beginning of the 13th century, two new orders were instituted — one by Pope Innocent III, who in the Lateran Council had procured the enactment of a decree forbidding the creation of new monastic orders. The new institutes were the order of the Friars Minor (Franciscans) and that of the Friars Preachers (Dominicans); and to these very soon were added two more—the order of Austin Friars (Augustinians) and that of the Carmelites. These are the four mendicant orders, so called because by their rule they renounce all property and endowments and submit to the authority of the faithful.

The membership and the establishments of these mendicant orders increased with astonishing rapidity throughout the whole of Europe. Dominican and Franciscan friars were soon the great lights of the theological schools—Albertus Magnus, and Doctor Universalis, as he was styled by his contemporaries, and Thomas of Aquinum, the Angelic Doctor, being the foremost of the Dominican divines, and Duns Scotus, the Doctor Subtilis, and Roger Bacon holding the first rank among the Franciscans. The friars were also effective missionaries both among the poor and the rural populations at home and among the heathen and the infidels.

The Company of Jesus is the latest of the great religious orders; it was founded in 1534 and its mission was to resist the onward march of Protestantism, directly by combating the Protestant assault on the Catholic Church and by instructing the Catholic populations in the grounds of their religious faith and practice; indirectly by promoting education for Catholic youth, and offering educational advantages superior to those afforded by Protestant universities and academies. The Company of Jesus took also as its special field of labor the evangelization of the heathen.

Nearly all the later religious orders and institutes have had for their object the Christian education of the young, the reformation of the fallen, or the relief of the poor and distressed; among the orders established for these ends are those of the Nuns of the Good Shepherd, the Sisters of Charity, and of Mercy, the Brothers of the Christian Schools, and numerous other congregations.

The reformation was hostile to monasticism, and in those countries where it obtained, the monasteries were suppressed and the monastic life disappeared. Henry VIII seized upon the monastic properties throughout his realm and applied them for his own religious or secular purposes. In Protestant Germany, Scandinavia and Switzerland, the monastic institution ceased to exist shortly after the triumph of the Reformation. In the 18th century a concerted hostile movement against monasticism took shape in all the countries under Bourbon rule. The governments of Portugal, France, Spain, Sicily and some of the Italian principalities expelled the Jesuits and reduced them to the Christian countries against the religious orders manifested itself. In Spain, France, Italy, Mexico and some of the South American republics expulsion for some orders and hampering restrictions upon freedom have been imposed that have been calculated to retard their growth and development. The reasons usually alleged for these coercive measures by these governments are political and economic, the merits of which it would be out of place to discuss here. In the opening decade of the 20th century the French government aimed a deadly blow at monasticism in that country in its Associations Law. Germany admits all the religious orders except the Jesuits. In Great Britain full freedom is now given in the establishment and development of monastic institutions. In the United States, where there are absolutely no legislative restrictions upon the freedom of monastic life, the religious orders are in a flourishing condition. In this country there are 8,400 male and over 50,000 female members of religious orders.

In the Church of England within the last 50 years there has been a revival of the monastic idea with no inconsiderable results. Dr. John Mason Neale and Canon Carter promoted the establishment of sisterhoods (of Saint Margaret and of Saint John Baptist), in which life vows of poverty, chastity and obedience were taken, and a motherhouse of the Sisters of Saint John Baptist was founded in New York as a branch of the mother house in England. There is also the Protestant Episcopal sisterhood of Saint Mary and many others in the United States. Among the male orders of Protestant monasticism must be mentioned the Cowley Fathers, founded by Dr. Benson, and in the United States the Holy Cross, a preaching order founded by J. O. Huntington, son of Bishop Huntington. An order of monks was also founded by Rev. Joseph Leycester Lyne in 1870 at Llanthony Abbey, Wales, and the strict rule of Saint Benedict was adopted. It is no exaggeration to say that
monastic movement is now flourishing, both in the Church of England and in its daughter church, the Protestant Episcopal Church in the United States. For further details see the articles on the various orders, Benedictines, Cistercians, etc.

MONASTIR, mohn'-stehr, Africa, a seaport town on the east coast of Tunis on a peninsula in the Gulf of Hammamat. It is strongly fortified with surrounding walls surmounted by towers and has its Kasha (castle), 13 mosques, a high school for the natives and beautiful gardens in the vicinity. Its chief industries are soap-making and oil trade. The town is known locally as Mistir and is the ancient Rustipa. Its population is about 6,000, most of the Europeans being Italians and Maltese.

MONASTIR, or BITOLJA, be-toh'-li-a, Turkey, a city and vilayet of Macedonia (q.v.). The city, 86 miles by rail northwest of Saloniki, is attractively built at the west edge of a plain, in a recess formed by two lofty mountains, and is intersected by a river, crossed by numerous bridges. The streets are wide and well-paved; the houses neat and clean; the mosques and minarets picturesque; and the bazaars handsome. As an important central situation for all military operations relating to this part of Turkey, it was a scene of considerable activity during the Balkan Wars 1912-13 and after the outbreak of the European War in 1914. The majority of the inhabitants are Greeks and Bulgarians, the Turkish residents being mostly soldiers or officials. It carries on a large trade with Constantinople, Saloniki, Vienna and Trieste. Pop. about 45,000. The vilayet has an area of 10,690 square miles. Pop. about 850,000.

MONAZITE (Greek, "solitary," in allusion to its rare occurrence), a native phosphate of the metals of the cerium group, often also containing more or less thorium silicate. It is reddish or brownish in color, with a resinous lustre, and crystallizes in the monoclinic system, though it also occurs in massive and granular forms. It is commonly translucent and brittle, with a hardness of from 5 to 5.5, and a specific gravity of about 5.0 to 5.2. It is found at Norwich, Conn., and also in the Ural district, as well as in Australia, Brazil and other parts of the world. The chief commercial supply, however, comes from North Carolina and from certain parts of Brazil. In these regions monazite is a constituent of the granitic rocks, and is obtained by washing the gravels and sand that have been formed by the disintegration of those rocks. The Brazilian monazite is controlled by a German syndicate since 1902, and practically all of it now goes to Europe. The monazite produced in the United States comes chiefly from Burke and Cleveland counties, North Carolina, and this material has industrial importance to the cerium and thorium that it contains, the former being utilized for the preparation of cerium oxide, which is used in medicine and in the arts, while the thorium is employed in the manufacture of mantles for incandescent gas-lights.

MONBODDO, James Burnett. See BURNET.

MONCHEUR, mohn-shur', Ludovic, Baron, Belgian diplomat: b. Brussels, 12 May 1857. He was educated at Louvain, entered the diplomatic corps, became attaché to the Belgian legation at The Hague in 1883; held posts in the legations at Washington (1885), Berlin (1887), Rome (1892); became minister to Mexico in 1898; and in 1901 became minister to the United States. He has written on the geography of Mexico and is a member of the Antwerp Geographical Society.

MONCLOVA, mohn'-klo-vah, Mexico, a town of Coahuila, the terminus of a branch line of the Mexican International Railroad to Ciudad Cienegas, 100 miles northwest of Saltillo. Monclova dates from the 17th century and was formerly the capital of the dual state of Coahuila and Texas. It has railroad works, cotton factory, stock raising interests, and a trade in the agricultural produce of the region. Pop. 7,000.

MONCRIEFF, mohn'-krih夫, Sir Alexander, British ordnance expert, inventor of the disappearing gun system: b. Edinburgh, 17 April 1829; d. Bandirran, 3 Aug. 1906. He was educated at Edinburgh and Aberdeen; appointed to a cadet in the 30th Regiment, he served in the Scottish Royal Artillery; during the Crimean War planned the Moncrieff ordnance system, also called the protected barbette, or the disappearing system, for the invention of which he received $50,000 from the British government. The important point in this system is that the recoil of the gun is utilized to drop it out of sight after firing and to raise it again when necessary, a contrivance
which did away with the cumbersome and expensive system of steel-plated forts. It substituted for them the simple, inexpensive Moncrieff pits, made by slight excavations for the masking of coast batteries. He received the honor of Knighthood in 1890.

**MONCTON**, munk'ton, Canada, a city and port of entry in Westmoreland County, New Brunswick, at the head of navigation of the Petitcodiac River, a tidal stream entering the Bay of Fundy; the Atlantic terminus of the National Transcontinental Railway, 86 miles northeast of Saint John, and 185 miles northwest of Halifax. It has a good harbor and an extensive trade in lumber and produce. The tide in the Petitcodiac estuary is one of the most remarkable in the world, coming in with a bore from four to six feet high and rising (in spring tides) to a maximum height of 60 feet. The offices and chief workshops of the Canadian government railways are here, employing 2,000 men. Enormous quantities of natural gas have been discovered in the vicinity, which is used for light, heating and power, the street railways being run by this means. Moncton was celebrated for its shipbuilding in the days of wooden vessels. Pop. 11,345.

**MOND, münd, Ludwig, English manufacturing chemist; b. Cassel, Germany, 7 March 1839; d. 11 Dec. 1909. He was of Jewish parentage, and educated at the Cassel Polytechnic and the universities of Marburg and Heidelberg; went to England in 1862, to enter the employ of the Leblanc soda works, where he introduced his method of recovering sulphur from alkali waste; in 1873 introduced the Solvay process of manufacturing ammonia soda, into England; and continually improved this process. His alkali works at Northwich are the largest in the world. He invented a means of chlorine as a by-product of the ammonia soda process, and devised new gas-batteries, new processes for manufacturing nickel based upon his discovery of nickel carbonate, and a new method of producing gas for power purposes. His work, a magnificent product. In 1896 Mond endowed the Davy-Faraday Research Laboratory at the Royal Institution. His remarkable collection of paintings, bequeathed mainly to the National Gallery, London, has been described by J. Thomson in 'The Mond Collection' (London 1910).

**MONDAY** (moon and day; Saxon, Mōnandæg; German, Montag; Latin, lunae dies), the second day of the week, formerly sacred to the moon. See CALENDAR.

**MONDE (LE) OU L'ON S'ENNUTE, le mond oo lón sónn'vè' (The Society that Bores) 1881, by Édouard Pailleron, is still, what after 15 years it seemed, "on the whole the most brilliant comedy of modern days" (The Literary World Jan. 1903). Not only is it a keen and witty satire on the modern Parisian blue-stocking, the counterpart for its day of Molière's 'Femmes savantes,' but its individual characters stand out so clean-cut that 'keys' to it are once more in vogue, and many thought to recognize unmistakably some at least of the originals. The outstanding characters are all types easily recognizable in modern counterparts of this society of literary, intellectual, political and social pretense. First is Bel-
MONETARY CONFERENCES

this series is exhibited the beholder can follow, led by the magic of his brush, the history of light. As we look at these compositions with their dazzling display of luminous atoms, a presentation of atmospheric vitality. The shadows, true to nature, are lights where certain tones—blue, purple, green or orange—predominate exactly as happens in optic science.

Usually his subjects or motifs are simple; a hay-rick, some slender trees, a cluster of shrubs or group of rocks. No one knows better than he how to place a rock amidst tumultuous waves, how to construct an enormous cliff or how to give the sensation of a group of pine-trees blown and bent by the wind. Most unexpected tones play in the foliage and on the ground. On close inspection the beholder sees the canvas striped with orange, red, blue and yellow touches of the brush, but seen from a distance the freshness of the green foliage appears as in nature. The eye of the beholder recomposes what the painter’s brush has analyzed and dissociated. Monet is now considered one of the greatest of all landscape painters, ranking with Claude Lorrain and J. W. M. Turner. He understands and depicts with equal facility the true character of every soil and the true character of every kind of vegetation. Monet is also able to turn like all great artists from demonstrations of power to displays of tender charm. His studies of the austere rocks of Belle-Isle en mer where heavy waves and blinding spray dash with fury over the granite rocks are unparalleled, while his series of Water-lilies express the melancholy and quiet beauty of sequestered pools where the water is thick with tangled stems and sleepy blossoms. Monet has also painted the woods in autumn where the sunlight plays on tones of bronze and gold and red; chrysanthemums, dazzling sun-flowers, tulip-gardens in Holland; sailing boats on sunny rivers; and many portraits and other studies. The series called ‘The Cathedrals’ is famous. It consists of 17 studies of the west front of Rouen Cathedral, the towers of which fill the whole space of the picture. The gray stone, worn by time and blackened for centuries, is for 17 times made the theme for the painter’s vision. Pale and rosy at sunrise and differently rosy and glowing at sunset, being played in the mist or ethereal under the moonlight, the superb façade is reconstructed in the boldest way, yet producing the effect of its thousand details of architectural beauty and exhibiting the most dazzling and poetic atmospheric harmonies. Whatever subject he treats Monet creates an aesthetic emotion in the beholder. Consult Duret, ‘Le peintre Claude Monet’ (Paris 1878); Van Dyke, John C., ‘Modern French Masters’ (New York 1890).

MONETA, in Greek mythology, a name applied to Juno, known as the goddess of coin or money. A temple was dedicated to her in this capacity on the Capitoline Hill, in which the mint was located.

MONETARY COMMISSION OF THE UNITED STATES CONGRESS, a commission appointed in August 1876, by the 44th Congress, to inquire into the causes and economic effects of the decline in silver, the best means for controlling silver, and other important monetary questions. The commission consisted of three senators, three representatives and three monetary experts. Meetings were held in Washington and New York, during a period of six months. The results of these conferences were published by the government in monographs issued by the Treasury Department.

MONETARY CONFERENCES, International. In addition to the monetary conventions (q.v.) held among European nations, four great International Monetary Conferences have been held, three at Paris 1867, 1878 and 1881, and one at Brussels in 1892. Encouraged by the success of the Latin Union (q.v.), France invited all the powers to participate in a general conference for the purpose of relieving the problems of international exchange. The conference was attended by 18 European nations and the United States, and was presided over by the French Minister of Foreign Affairs. Eight sessions were held, the principal topics of discussion being the uniformity of coinage and the larger problems attendant upon such proposed uniformity. Two important decisions were reached: (1) that it would be more expedient and less expensive to the several nations to adopt as a uniform standard for existing monetary systems than to invent a new standard; and (2) that gold was the only standard which was adapted to international money. The standard of fineness was set at nine-tenths, and the five-franc piece was recommended as the common denominator. It was likewise agreed that all gold coins having this common denominator should have legal circulation in the states mutually bound by the conference. Since no treaties were contracted to bind the members of the conference to their decisions, little was really accomplished. The principal value of the first conference lay in the fact that it opened the way to further discussion.

The second conference was called by the United States by Act of Congress, 28 Feb. 1878, under which the President was directed to invite the nations of Europe to join in a conference to adopt a common ratio between gold and silver for the purpose of establishing international uniformity of bi-metallic money, and securing the necessity of revaluing silver and gold. This determination was occasioned by the fact that the silver production of the United States had assumed immense proportions. Also Germany’s use of the gold standard threatened the value of silver money, and it was deemed advisable to establish the ratio between gold and silver before serious depreciation of the value of silver might set in. Twelve countries participated, Germany alone of the great powers refusing to enter into the conference. The United States submitted two propositions, one covering the desirability of the unrestricted coinage of silver and its use as money of unlimited legal tender; and the second, advocating a double standard of gold and silver on the basis of the establishment of a fixed ratio between them. The European powers with the exception of Italy, after much discussion, made answer as follows: ‘That it is necessary to maintain in the world the monetary functions of silver as well as those of gold, but that the selection for use of one or the other of the two metals, or of both
MONETARY CONVENTIONS — MONEY

simultaneously, should be governed by the special position of each state or group of states. It must be carried also that bi-metallicism must be determined by the discretion of the individual states chiefly in relation to the country's relation to the silver market; and that, in lieu of the fact that a mutual agreement on the question of ratio between the two metals could not be reached, the question had better be dropped for the time being. The conference therefore produced no effective results.

The French and United States governments joined in calling the third conference. The decline of gold prices again brought up the problem of bi-metalism. England and France met with seriously diminished gold reserves, and the United States was forced to import gold, which upset the European market. Germany was unable to find a satisfactory means of disposing of her stock of silver. Nineteen countries attended the conference. It recommended the establishment of the 13¾ to 1 ratio, and then adjourned for the purpose of giving the various nations time to consider the proposals. With the invention of recognition, May 12 April 1882. However, the conference was not reassembled on that date, and was therefore fruitless.

The fourth conference was called by the United States for the purpose of conferring as to what measure, if any, can be taken to increase the use of silver as money in the currency system of nations. Twenty countries were represented. A delay was caused by the fear of a cholera epidemic, and in November 1892, the sessions were finally held. England and the United States were the most enthusiastic members of the group. Political factors began to play also on the interests of these two countries, and the discussion though lengthily, was altogether unprofitable. Various schemes for a bi-metallic standard and for the wider circulation of silver through some cooperative system were brought forward. There was no unanimity and the conference finally adjourned; 30 May 1893, was the date set for its reconvention, but this never took place. 

MOON^TETTE, a native acid phosphate of calcium, CaHP04, occurring massive and in small, tritric crystals, in the islands of Madeira and Mona, in the West Indies. The mineral is found in limestone, beneath a deposit of guano. (Also spelled "monitite").

MONEY, Walter, English author: b. Donnington, Berkshire, 21 Aug. 1836. He received his education in a private school and early began to study on historical and archaeological subjects, and for a number of years was the local secretary of the Berkshire Society of Antiquarians, London, and of the British Archæological Association. From 1889-97 he was a member of the Berkshire County Council. Among his publications are 'The History of Newbury'; 'The History of Hungerford'; 'The History of Speen — the Roman Spine'; 'Church Goods in Berkshire'; 'The Two Battles of Newbury, 1643-44'; 'The Story of the Siege of Donnington Castle'; 'The Siege of Basing'; 'A Royal Purveyance in the Elizabethan Age'; 'A Popular History of Newbury and the Neighborhood' (1905); and many memoirs on historical and archaeological subjects.

MONEY. Money is a term used to describe the standard of value and a very important part of the medium of exchange of a country. By a standard of value is meant any commodity, which is used to measure and express the ratios in which other commodities exchange for each other. For example suppose wheat has been traded for wood, cattle, sheep and plows on the following terms: 1 cord of wood for 5 bushels; 1 ox for 20 bushels; 1 sheep for 20 bushels; and 1 plow for 10 bushels. The figures 5, 20 and 10 express the market values of these commodities and the ratios at which they should exchange for each other, and, since each refers to bushels of wheat, wheat may be called the standard of value.

Standards of Value. In a community in which barter was the only method of exchange each person would trade the commodity he produced or the service he rendered for the other commodities and services of the community. Each would express their values in terms of the commodity or service thus bartered, no other method of expressing their values being available to him. Standards of value in such a community would therefore be individual and would be as numerous as the individual traders, and difficulty would be experienced in discussing values because each person would speak a language not intelligible to others or only intelligible after a mathematical calculation. For example, one man would express the value of a given commodity, say a horse, as so many bushels of wheat, another as so many cords of wood, another as so many yards of cloth, another as so many days of labor, etc. The only method of removing this difficulty would be the acquisition by each member of the community of the ability and the habit of quoting values in terms of the same commodity; that is, by the acquisition of a community standard.

Such community standards were early established in every trading group of which history furnishes any record, and, as trade developed
between different communities, standards common to wider and wider areas and to larger and larger groups appeared, until, with worldwide trade, we have standards common to many nations. Indeed, at the present time all the nations in which commerce has been highly developed use the same standard, gold, and only two standards, gold and silver, are used throughout the civilized world. Commodities which possesses a high degree of utility for purposes of ordinary consumption can serve as a community standard since only for such a commodity would every person barter his commodities or services, and such barter, as we have seen, is a condition necessarily precedent to service as a community standard. Since several commodities in the same community and at the same time, however, may possess this essential quality of universal exchangeability, other qualities are also important in determining the ratio of exchangeability: bullion. These are high value in proportion to bulk, divisibility, durability, fitness for coinage and steadiness or stability of value. The first four of these are important, because, as will appear later, it is desirable that the standard value should be an element of the medium of exchange, and the fifth because of the relation between the standard of value and prices which will also be explained later. Among several commodities, therefore, for which every person has frequently bartered his commodities or services, the one which possesses these other qualities in the highest degree of perfection will become the community standard. This fact explains the almost universal use of gold and silver for this purpose, and the possession of the first of these qualities, relatively high value in proportion to bulk, and possibly the last one, steadiness and stability of value, in a higher degree than silver, account for the use of gold as a standard in the most important commercial nations of the world.

The numerical expression of the ratios in which goods exchange for the standard of value is called prices. Thus in the United States when we say that the price of a bushel of wheat is one dollar, we express the fact that the wheat is exchanging on our markets for standard gold at the ratio of one bushel of the former for 25.8 grains of the latter, which amount of gold has been declared in our statutes to constitute a dollar. This being the case, the causes of change in prices may be grouped under two heads, namely, those affecting the value of the standard commodity and those affecting the value of the commodity the price of which is under consideration, value in this connection meaning not the ratio of exchangeability, but that quality of a commodity which is changed in magnitude by changes in the relations between its demand and supply. The price of wheat, for example, will change when the relation between its demand and supply changes, or when the relation between the demand and supply of gold changes, unless the change in the value of one commodity exactly offsets that in the value of the other.

The phrase standard of value, as used in the preceding sections, should be qualified by the adjective primary, in order to distinguish it from standards occasionally used which may be described as secondary. In the United States a secondary standard was in use from 1852 to 1879. In the former year the United States government, in order to assist in paying the expenses incident to the war then in progress, issued its notes promising payment to bearer in gold; and for this purpose they coined the money and made them legal tender in payments between individuals, i.e., decreed by law that the tender of these notes in the payment of financial obligations would constitute discharge of such obligations.

These notes speedily depreciated. That is to say, the people of the United States, and of other countries as well, did not consider them worth, and would not give for them on the open market, the amounts the payment of which was promised on their faces. As a result of this depreciation these notes took the place of coin in the circulating medium of the country, because people could melt down the coins and exchange the bullion for these notes at their depreciated value and with them meet a much greater volume of financial obligations than they could have met by tendering the coins directly. When everybody thus came to tender depreciated notes in the payment of all their obligations, prices were universally quoted in these notes as an element of the medium of exchange, and it became the standard of value of the country.

The dependence of prices upon the value of gold was not, however, thereby in any way broken. What the government promised to pay in these notes was dollars, and dollars meant a certain amount of gold carefully specified in laws enacted by Congress. The value of the notes themselves, i.e., what people were willing to pay for them on the open market, was daily quoted in terms of the gold standard. The notes, therefore, were a secondary standard only, gold continuing to serve as the primary standard. Under these conditions prices fluctuated, not only because of changes in the relative value of gold and of commodities, but also because of changes in the degree of depreciation of these notes.

The phrase medium of exchange describes the go-between in exchanges now almost universally used in place of barter. Instead of exchanging the good or service we have directly for the one we want, we express it for a third thing which we in turn exchange for what we want and this third thing is called a medium of exchange. A farmer, for example, who comes to market with a load of grain and wants an overcoat does not search for a clothier who not only has for sale the coat he wants, but also wants the grain he has, but he exchanges his grain for coin, or government notes, or bank checks, and transfers these to the clothier in exchange for the coat.

Medium of Exchange.—The explanation of the almost universal practice of using a medium of exchange is found, in the difficulties of barter. One of these is to find two persons each of whom has the thing which the other wants and wants the thing which the other has, and is willing to take the precise amount of the thing desired which the terms of the exchange agreed upon would bring him. There would be little commerce if this difficulty could not be overcome, and in overcoming it a medium of exchange has rendered a service essential to the progress of civilization.

In a state of barter also the process of saving is so difficult and expensive as to be practically
impossible as a general practice and on a large scale. It is that of hoarding surplus products. In such a state the farmer saves by storing his surplus grain and allowing his herds to grow and accumulate, the manufacturer by piling up goods in his warehouse, the wage-earner, not being able to accumulate his services, could only save by exchanging them for such commodities as he might desire to consume in the future and hoarding these. In all these cases, however, the risk that the product hoarded would lose during the savings period, that it could be sold at the end of that period, and that the terms of the sale would be such as to render the sacrifice of saving worth while, would have to be assumed. In the vast majority of cases, these risks would be so great as to more than offset the inducement to save. The losses experienced by people who had attempted saving under these conditions would discourage others, and it is safe to say that few would ever make the attempt. A proper medium of exchange removes all these risks and thus renders saving possible and attractive.

A medium of exchange also promotes borrowing and lending. Without it a person with an unused surplus and no need for its immediate use will not be able to dispose of it except by transferring his surplus to him, but unless this happened to be in the precise form needed, which would rarely be the case, it would do the borrower little or no good. On the other hand, with a proper medium of exchange the lender can transfer to the borrower the means of purchasing at any time anything the market supplies, thus enabling him either to satisfy his own immediate wants or to purchase the means of producing wealth.

In order that exchanges may be accurately, conveniently and safely made under all conditions, that is, when the commodities to be exchanged differ widely in quality and value or when they differ very little, when the exchange is to be completed without delay or after a delay of days, weeks, months or years, when the persons between whom the exchange is to be made are face to face or separated widely in space or time, etc., the medium of exchange must represent every conceivable combination or fraction of it, must be easily, cheaply and safely transportable from place to place; must be easily recognizable, durable, and certain in value; must be acceptable to all the parties involved in the trade, and must be automatically adjustable in volume to the fluctuating needs of commerce.

In the United States at the present time the medium of exchange must render it possible to make trades in values as low as one cent and as high as millions of dollars, and in every possible combination of amounts between those limits. It must be possible also to make up these amounts in a very short space of time, without long and difficult calculations and without danger of loss. The medium of exchange would be imperfect and quite incapable of meeting the public needs if it did not measure up to this requirement.

Since commerce takes place between people living far apart, in different cities, states and even nations, the medium of exchange must be of such a character that it can be sent through the mails and by express, over the railroads and on steamships, and be carried about in bags, pockets and purses, and it must be possible without danger of loss to transport in these ways all amounts large and small.

The importance of being easily recognized is well illustrated in a busy station where change must be made with great rapidity, where difficulty of distinguishing one element of the medium of exchange from another would render impossible the transaction of the necessary business.

Without elements of great durability a good medium of exchange would be impossible, because the wear and tear necessarily involved is great, and as an instrument of saving it frequently needs to be kept for long periods of time. Certainty of value is also absolutely essential. If there is any uncertainty regarding the value of any element of the medium of exchange, people will either refuse to accept it, in which case it will cease to be a medium, or they will protect themselves against possible loss by charging a higher price for the goods or services exchanged. In either case commerce is obstructed or made impossible.

In order that people may be willing to part with their commodities in return for the medium of exchange, they must be assured that it in turn will serve them with ease in making purchases — that is, that the persons who have the goods they want will be willing to accept it in exchange for such goods. This requirement implies the possession of practically universal acceptability in some of the elements of the medium of acceptability among wide circles in all of them, and of interchangeability between all, such interchangeability enabling the holder of any element which does not possess universal acceptability to exchange it for one which does.

The volume of exchanges in any community varies from time to time. In this and most other countries it varies with the seasons, being greatest in the spring and fall and least in midsummer and midwinter. The medium of exchange should adjust itself to these changes increasing automatically in volume as the volume of exchanges increases, and decreasing automatically under the opposite conditions.

The qualifications required in a good medium of exchange are: (1) divisibility, or the composition of the currencies of modern nations, and for the changes which have taken place in the past and which are still in progress. Every such currency consists of elements which from different points of view may be classified as follows: (1) hand-to-hand money, written or printed orders of one party to pay specified sums to another, and book accounts; (2) coin, government notes and bank currency, the latter sub-classified into bank notes and checking accounts; and (3) standard money and credit currency.

By hand-to-hand money is meant those elements of the medium of exchange which perform their service by mere transfer from hand to hand without endorsement or any other formality. In the United States at the present time it includes all our coins, several varieties of governmental notes and bank notes. Under the head of written or printed orders to pay specified sums to specified persons belong bank checks and drafts, through the mails and by express money orders and other similar devices. Some of these can be transferred between other than the original parties by the formality
of endorsement. Book accounts are widely used and constitute much the most important element of the medium of exchange of modern nations. Any book account serves as a medium of exchange if directly or indirectly it enables purchases and sales of commodities to be balanced against each other, for example, that of a grocer who credits farmers with the proceeds of eggs, butter, vegetables, and other produce purchased and debits them with their purchases from him, or that of the farmer himself who credits his hired man with the wares agreed to be paid for his services and debits him with house rent, milk, butter, eggs, potatoes, wood and other produce advanced him. Indirectly the checking accounts of commercial banks balance against each other on a large scale the purchases and sales of individuals, communities and nations, and thus constitute the largest element of the medium of exchange of all highly developed commercial nations.

The second of the above classifications is based in part upon the form and in part upon the source of the medium of exchange. The most important element of the medium usually takes the form of gold or silver, and is also used in Government notes are those issued by the government and for the payment of which it is responsible, while bank currency originates with banks, which are responsible for meeting the obligations involved in its issue. The name paper money is frequently applied to government and bank notes to distinguish them from coins. Coins may be sub-classified on the basis of the metals employed in their manufacture into gold, silver, nickel, or amalgam and copper, and on the basis of their relation to each other, into standard and subsidiary.

The basis of the third classification is the presence or absence of the element of credit. Standard coins, that is, those made from the standard of value, are the only ones in which this element is entirely absent. All other coins, all paper elements of the currency and all book accounts which serve as a medium of exchange contain the element of credit in some degree. Our silver coins, for example, are actually worth as bullion much less than the amount stamped upon them and government and bank notes are in and of themselves worth practically nothing. People take them at the value indicated by the stamp upon them only because somebody in whom they have confidence is under obligation to make that value good, the government in some cases, banks in others, specified persons or corporations in others. The term credit currency is properly applied to all elements of the medium of exchange which circulate at a value greater than the market value of the substance of which they are made because the credit of some government or bank or person or corporation is an essential factor in such circulation.

The maintenance of a medium of exchange consisting of coins made of different substances and of paper elements issuing from different sources is only possible when complete elimination has been made of anybody and everybody to discriminate in favor of one element and against others. If such discrimination is for any reason profitable, those elements which alone can with profit be used as a medium of exchange will soon be the only ones so used. The others will be devoted to other uses which are more profitable and on this account will disappear from circulation. It was brought into operation many times by the circulation in large quantities of worn and clipped coins. When the proportion of such coins becomes large, full weight coins will either be melted down and sold as bullion or clipped and sweated. It was cases of this kind which Sir Thomas Gresham had in mind when he used the adjectives good and bad in the statement of his law, bad money referring to worn and clipped coins and good money to full weight coins.

The operation of this law has also been frequently illustrated by the substitution of silver for gold coins and vice versa. In the early part of our history five silver dollars contained 15 times as many grains of silver as did a five-dollar gold piece grinding gold down to 1 in 1793. At the time these coins were first minted, being about the relative values of the same weight of silver and gold. Subsequently the value of silver relatively to gold fell so that it required nearly 16 ounces of silver to sell upon the markets for as much as an ounce of gold. The result was that gold coins completely disappeared from circulation, because they were worth more as bullion than as coin. For the opposite reason, silver remained in circulation and silver bullion was taken to the mint and coined. Later still in our history, on account of a great fall in the value of gold relative to silver, gold coins took the place of silver, the latter being melted down or exported and sold as bullion.

The disappearance of coin as the result of the circulation of depreciated notes is another form in which the truth of Gresham's Law has been frequently demonstrated. During the war between our northern and southern States, both the Federal and the Confederate governments paid a portion of their bills in their own notes payable to bearer, made legal tender and issued in denominations suitable for circulation as money. They very soon depreciated and became a secondary standard of value, and coin of all kinds disappeared from circulation, since on the bullion market they could be sold for these notes at a good premium, and a five-dollar note would pay as many debts or buy as many things as five silver dollars or a five-dollar gold piece.

The terms in which Sir Thomas Gresham stated his law may be objectionable because the phrases bad money and good money are not accurate descriptions of the forces which crowd some of the elements of the medium of exchange out of circulation and hold others in, but the law itself is as certain in its operation as those of the Medes and Persians. It is really only one form of the expression of a law of much broader application, namely, that all men are prone to make the most of their possessions.

The device of making some coins subsidiary to others which are called standard and of making the paper elements of the currency redeemable in coin prevents the operation of
Gresham's law has, therefore, been incorporated into the practice of all commercial nations. (See article Currency.) This practice renders it desirable that bank and coin circulation constitute an element of the medium of exchange, since the stamps on the other coins and the paper elements of the medium refer to definite amounts of the standard of value, and their exchange on the markets, rapidly and conveniently. But all needs and places for precisely these amounts requires that this commodity should be put up in convenient sized and conveniently labeled packages and be widely spread throughout the commercial world. These ends can only be attained when the standard of value is put up in the form of coins and used as a medium of exchange.

The money of a country, which consists of its standard of value and of those elements of its medium of exchange which pass freely from person to person by way of transfer and without endorsement and which are accepted without question by everybody, is a historical product, and can, therefore, be explained only by reference to its history. Of his first administration it is said that

"The United States.—The foundation of the monetary system of the United States was laid in 1792 in which year Congress passed our first coinage act. That act provided for the manufacture of gold coins of the denominations of 10 cents, of the eagle, to contain respectively 247 1/2, 123 1/2, and 61 1/2 grains of pure gold; of silver coins of the denominations dollar, half-dollar, quarter-dollar, dime and half-dime, to contain, the dollars, 37 1/2 grains of pure metal, and the other proportionate amounts; and of copper coins of the denominations one cent and one-half cent. It further provided that the gold and silver coins authorized should be manufactured without charge by the United States mint for any persons who would supply gold and silver bullion of the requisite degree of fineness and that all such coins should "be a lawful tender in all payments whatsoever."

While the mint ratio of 15 to 1 between gold and silver coins established by this act drove the half-dollar, or silver coin of the two metals in 1792, it no longer did so in 1794 when the mint at Philadelphia was ready to begin operations. At that time the bullion ratio was about 15.37 to 1, and it never again fell to so low a point as 15 to 1. Gresham's law, therefore, operated almost from the beginning and the gold coin disappeared from circulation. Unfortunately the new silver coins did not circulate freely. Pending the construction of a mint and the manufacture of a sufficient quantity of new coins to supply the needs of the country, Congress had authorized the use of several kinds of foreign coins, including the Spanish milled dollars. Since these latter contained more silver than the New American dollars and since both the Spanish and the American dollars were marketable, the foreign face value in both the United States and the Spanish West Indies, with which we were at the time carrying on an active trade, the merchants of Boston, New York, Philadelphia and Baltimore were enabled to trade satisfactorily by the profit in shipping American dollars to the West Indies and in bringing West Indian dollars home and transforming them into American dollars at the mint.

A remedy for this condition was not successfully applied until 1834, and in the meantime the currency of the country consisted chiefly of notes issued by the banks. Of these there were two varieties—state institutions and the United States banks—the first operating in the period 1791-1811 and the second in the period 1816-36. The number of state banks were issued in small as well as large denominations, thus in part supplying the need for small change which the scarcity of coin frequently rendered urgent. In the interval between the first and the second United States banks, 1811-16, our second war with England was fought, and the conditions thus created, aggravated by the liquidation of the first United States Bank forced the state banks into a state of suspended specie payments. Their notes depreciated in consequence and coin of all kinds, foreign as well as domestic, disappeared from circulation. This was the authorization of the second United States Bank which was charged with the task of securing a resumption of specie payments. President Jackson's war against this bank started during its administration and terminated by 1834, which foreshadowed the certain end of that institution so soon as its charter should expire in 1836 and that fact, together with the discovery of gold in North Carolina and a recollection of the events of 1816, resulted in the liquidation of the first United States Bank accounts for the passage in 1834 of another important coinage act.

That act lowered the weight of the gold coins by decreasing the amount of pure metal in the eagles from 247 1/2 to 232 grains, and that in the other gold coins proportionately thus changing the mint ratios between gold and silver coins from 15 to 1 to 16 to 1. The bullion ratio of that time being about 15.73 to 1 gold coin was slightly overvalued at the mint and, therefore, was restored to circulation, but for the same reason, silver disappeared, and a new problem was created, namely that of supplying the country with small change. That problem was solved in 1853 by an act which reduced the half-dollar, or silver coin of the two metals in 1854, the mint at Philadelphia was ready to begin operations. At that time the bullion ratio was about 15.37 to 1, and it never again fell to so low a point as 15 to 1. Gresham's law, therefore, operated almost from the beginning and the gold coin disappeared from circulation. Unfortunately the new silver coins did not circulate freely. Pending the construction of a mint and the manufacture of a sufficient quantity of new coins to supply the needs of the country, Congress had authorized the use of several kinds of foreign coins, including the Spanish milled dollars. Since these latter contained more silver than the New American dollars and since both the Spanish and the American dollars were marketable, the foreign face value in both the United States and the Spanish West Indies, with which we were at the time carrying on an active trade, the merchants of Boston, New York, Philadelphia and Baltimore were enabled to trade satisfactorily by the profit in shipping American dollars to the West Indies and in bringing West Indian dollars home and transforming them into American dollars at the mint.

The acts of 1834 and 1853 together with the increased production and falling value of gold occasioned by the discoveries of new mines in California and Australia gave the country for the first time an adequate supply of specie. The greater part of the circulating medium even during this period, however, was supplied by the state banks, which, owing to the demand in number, especially after the removal of the competition of the second United States Bank in 1836. This portion of the currency was defective on account of wide differences in the
character of the banks which were issuing notes. There was no uniformity in the laws passed in the various States for the regulation of banks, nor in the practices of the banks themselves. The notes of most banks, therefore, enjoyed a local circulation only and the country lacked a uniform credit medium.

The Civil War inaugurated a new era in American monetary history. In February 1862 an act was passed authorizing the government to issue legal tender inconvertible notes in denominations suitable for circulation as money and within a few months these notes had depreciated to such an extent that gold and silver of all denominations disappeared from circulation. The National Banking Act, passed in 1863, provided another form of currency in the form of national bank notes secured by government bonds. These notes, being redeemable in the depreciated legal tender notes of the government, shared their depreciation. State bank notes were forced out of circulation by a 10 per cent tax levied on them in 1865 and have not formed an element of our circulating medium since that time. This combination of government and national bank notes constituted the currency of the country until 1879, on 1 January which year specie payments were resumed by the government in pursuance of an act passed in 1875.

While the problem of resuming specie payments was being considered in Congress two important coining acts were passed. That of 1873 dropped the silver dollar from the list of coins authorized to be manufactured, thus completely depriving private persons of the privilege of transforming silver bullion into silver coin at the United States mints, that privilege in the case of half-dollars, quarters and dimes having been taken away from them by the Act of 1853. Silver having fallen greatly in value in 1876 and subsequent years on account of greatly increased production from recently discovered mines in Nevada, the loss of this privilege seriously affected the fortunes of the owners of these mines, and agitation for the restoration of the free coinage of the silver dollar was started by them in combination with the opponents of the resumption of specie payments, politicians and speculators who saw in the free coinage of silver an opportunity to further their own ends. The act of the New York legislature was not strong enough to force through Congress the free coinage act they wanted, but it was strong enough to force the passage of a compromise measure in 1878 known as the Bland Act which compelled the Secretary of the Treasury to purchase each month not less than two and not more than four million dollars worth of silver bullion and to coin it into silver dollars. This act also originated the silver certificate which has been an element of our currency since that date.

Like all compromises, the Bland Act was unsatisfactory to both parties to the controversy. The advocates of free silver continued their agitation both in and out of Congress, and in 1890 secured a further concession in the form of the Sherman Act, which directed the Secretary of the Treasury to purchase each month 4,000,000 ounces of silver and to pay for it in Treasury notes redeemable on demand either in silver dollars or gold coin at the option of the Secretary of the Treasury. However, since the act declared it to be the policy of the United States to maintain a parity between the two metals consistent with the laws of the United States, the Secretary was practically compelled to redeem these notes in gold so long as the mint ratio remained above 16 to 1.

The steady injection of a stream of overvalued silver into our currency combined with the obligation of the government to redeem on demand in gold the United States and the Sherman notes helped to create the crisis of 1893 and seriously embarrassed the Treasury during that crisis. The result was that the silver purchase clause of the Sherman Act was repealed at a special session of Congress called by President Cleveland in the summer of 1893 and in 1900 an act was passed providing among other things for the gradual retirement of the Sherman notes and for the establishment of a gold reserve of $100,000,000 to be used for no purpose except the redemption of the United States notes, such notes when redeemed to be retained in the Treasury until they should be withdrawn in exchange for gold coin.

The gold standard under the Gold Coinage Act of 1900 was the result of the establishment of our Federal Reserve system in 1913. Under the operation of that system a new element has been added to our currency in the form of Federal Reserve notes issued in exchange for rediscounted commercial paper. This new element has supplied the necessary element of elasticity which our currency previously lacked, since these notes automatically expand and contract in volume in response to the changing needs of commerce. The other elements of our currency are either stationary in volume or fluctuate in response to other influences than currency needs. See BANKS AND BANKING—FOREIGN EXCHANGE, COMMERCIAL PAPER, FEDERAL RESERVE SYSTEM, NATIONAL BANKING SYSTEM, ETC.; Bimetallism; Coin; Coinage; Currency; Gold; Gold Coinage in the United States; Gold Standard and Gold Production; Legal Tender; Money; Paper; Silver.

WILLIAM A. SCOTT,
Professor of Political Economy, University of Wisconsin.

MONEY, Coin. See COINAGE; NUMISMATICS.

MONEY, Paper, a money issue of a nation or government; a stamped sheet of paper or parchment, given an official value and used as a medium of exchange. Although coins were used before paper money, the latter was known among the ancients. Corn, cattle, iron, leather, cocoa, shells, tobacco and other commodities.
were all, in point of fact, used as money, in different ages and different countries; but they have long ceased to be so used, by commercial nations. The high estimation in which the precious metals have been held, in nearly all ages and all regions, made it practicable to use them as money. The scarcity of gold and silver, the need of bills of exchange and the want of a sufficient means of exchange, naturally suggested the idea of paper money, and it was, in fact, the general solution of the problem of exchange from the English.

Provincial Paper Money.—In the earliest days of America paper money was first issued by Massachusetts in 1690. The object was not to supply any supposed want of a medium for trade, but to satisfy the demands of some clamorous soldiers. Other issues were subsequently made, partly with a view of defraying the expenses of government and partly with a view of making money plenty in every man's pocket. The ill-judged expedition of the Carolinas against St. Augustine, in 1702, entailed a debt of $6,000 on that colony, for the discharge of which a bill was passed by the provincial assembly for stamping bills of credit, which were to be sunk in three years by a duty laid upon liquors, skins and furs. For five or six years after the emission the paper passed in the country at the same value and rate as the sterling money of England. To defray the expenses of an expedition against the Tuscaroras and to accommodate domestic trade the legislature of South Carolina established a public bank in 1712 and issued $48,000 in bills of credit, called bank-bills, to be lent out on interest on landed and personal security, and to be sunk gradually at the rate of $4,000 a year. Soon after the emission of these bank-bills the rate of exchange and the price of produce rose, advancing in the first year to 150 and in the second to 200 per cent. By the year 1731 the rate of exchange rose to 700, at which it continued with little variation upward of 40 years. In the year 1723 the province of Pennsylvania made its first experiment of a paper currency. It issued in March $15,000 on such terms as appeared likely to be effectual to keep up the credit of the bills. It made no loans but on land security or plate deposited in the loan office; obliged the borrowers to pay 6 per cent for the sums they took up; made its bills a tender in all payments, on pain of confiscating the debt, or forfeiting the commodity; imposed sufficient penalties on all persons who presumed to make any bargain or sale on cheaper terms in case of being paid in gold or silver, and provided for the gradual reduction of the bills by enacting that one-eighth of the principal as well as the whole interest should be annually paid. These early specimens of provincial paper money were large notes, printed from copper-plates, having engraved borders on three sides. The inscriptions on the bills were in type, with arms or monograms in the left division of the centre. The signatures of the province officials were signed in red ink.

Continental Money.—The first issue of paper money under the authority of the Continental Congress was dated 10 May 1775, but the notes were not actually placed in circulation until the August following. On 31 May 1781 the continental bills ceased to circulate as money, but they were afterward bought on speculation at various prices, from 400 for one, up to 1,000 for one. The value of continental paper was not the same in different parts of the country. The exchange was, for example, at 35 for one in New England, New York, the Carolinas and Georgia, and at 50 for one in Pennsylvania, New Jersey, Delaware, Maryland and Virginia. An account taken from the books of merchants in Virginia shows that the depreciation there regularly followed that in Philadelphia, though, toward the close, it sometimes lagged a month or two behind. The exchange was in Philadelphia at 100 for one, in January 1781 it was in Virginia at 75 for one. As late as May 1781 speculations were entered into at Philadelphia to purchase continental money at 225 for one and sell it at Boston at 75 for one. It is worthy of remark that the depreciation of continental money never stopped the circulation of it. As long as it retained any value at all it passed quickly enough, and would purchase hard money or anything else as readily as ever when the exchange was 200 for one, and when every hope or even idea of being ultimately redeemed at nominal value should have entirely vanished. The facility of raising ways and means, in the early part of the Revolutionary War, by issues of paper, led to much extravagance in the commission department and prevented the establishment of a sound system of finance. It is said that when a proposition was before Congress to establish a regular revenue system one member exclaimed, "Do you think, gentlemen, that I will consent to load my coe bidents with taxes, when we can send to our printer and get a wagon load of money, one quire of which will pay for the whole!"

Connecticut.—Under date of 4 March 1782, Connecticut issued a series of colonial notes in the following values: 9 penny-shillings and 6 pence, and 10, 20, 30 and 40 shillings. There were 19 regular issues, the last being dated 1 July 1780. There were also three single bills in the nature of treasury notes, the last dated 26 Jan. 1780. Over 100 different bills were issued by this colony. The smaller values were for 2, 3, 4, 5 and 7 pence, issued 11 Oct. 1777. In Connecticut the 6 shilling bill was not infrequently raised by clever counterfeiters to the value of 10 shillings.

Delaware.—In this colony paper money was issued in 1734. One value only of these notes has been preserved; the denomination is 10 shillings. The designs of the early issues are all about the same, a type body with a border of the same and wood cut of the royal arms. On 28 Feb. 1746 a new series was issued of the same general design, but noteworthy from having been printed by the celebrated Benjamin Franklin and his partner D. Hall. On bills of this colony we first get the information that counterfeit is death, which is repeated in every possible form. The 2 shilling 6 pence bill of January 1776 issue is adorned with pillars, and probably to show that the edifice supported can stand any sort of usage, one is placed upside down. The last series issued, May 1777, contains bills from 3 pence to 20 shillings, and changed the cut of the royal arms.
MONEY, PAPER

for that of the State. Sixty bills emitted by this colony are known.

Georgia.—The earliest bill printed in Georgia was of the value of 2 shillings 6 pence and was issued 7 March 1749. The Georgia bills were printed on one side of white paper and were usually made attractive by copper-plate vignettes printed in various colors. The vignettes represented figures of liberty, soldier, deer, squirrel, dog, rooster, pomegranate tree, etc. The last issue was dated 16 Oct. 1780. There are over 110 varieties from 3 pence to £5.

Maryland.—The first bill of this colony is dated 1740 and of the value of one shilling. This was followed by a series of five values in 1748 and from then a regular succession of issues until their final extinction in 1781. The design of the early issues may be described as the arms of Lord Baltimore supported by two men in the costume of the day, one with a file of nails and the other with a space. This is differently placed on the various bills. The lettering or form of contract is in the following words, "This indented Bill of Eight Dollars shall entitle the bearer to receive Bills of Exchange payable in London or in any part of the United States of America for Four Shillings and Six Pence Sterling per Dollar for the said Bill, according to Directions of an Act of Assembly of Maryland, Dated in Annapolis, this 1st day of January, Anno Domini 1769," followed, of course, by two signatures. The quaint idea of scabbling the end of a legal document to show that it has been prepared with due care and thought and not cut off in a hurry is carried out on these bills. In some values even the word "indented" is printed in a wavy line, and that there should be no mistake as to what is meant by a dollar a minute representation of a Spanish dollar is inserted in the text. The values of the Maryland bills were 3, 4, 6 and 9 pence, and so on up to £3. There were over 100 varieties issued.

Massachusetts.—Prior to 1775, some 13 examples of paper money were issued in this colony. One of these is a copper-plate engraving said to have been the work of the noted patriot, Paul Revere, of Boston. The series was dated 1767 in order of the general assembly of the Colony of Massachusetts Bay, 7 Dec. 1775. The reverse of these bills bear the figure of a man in continental dress, with a drawn sword in one hand and a copy of the Magna Charta in the other, above "Issued in defence of American Liberty," below in Latin, "He seeks by the sword calm repose under Freedom." The series of 16 Oct. 1776 repudiates the title of Colony for that of State. Coin must have become scarce, as more than half of the denominations are under one shilling. The design was the principal design on these bills. The next issue of eight values was of interest-hearing notes which are guaranteed by the United States. Upward of 135 bills were issued by Massachusetts.

New Hampshire.—The design of the New Hampshire bills was usually the British arms with inscriptions in elaborate frames. The earlier issues were type-set. About 60 varieties are known.

New Jersey.—The issues in this colony began in March 1724 and continued regularly to May 1786. In shape the bills were a small, narrow oblong. The high value notes were printed in blue and red. In 1781 the royal arms became the arms of the State, the type reading as follows: "State of New Jersey, Five Shillings, This bill shall pass for Five Shillings agreeable to an Act of the Legislature of the State, passed January 1, 1781. One Thousand Seven Hundred and Eighty-one." An entire collection of New Jersey bills would number 185.

New York.—The first bill issued was in 1709, and then followed a series of four dated 18 Dec. 1737. In the next issue the form reads "By a Law of the Colony of New York this Bill Shall Pass current for Three Pounds New York the 20th April 1756. A set of United States guaranteed notes appeared 15 June 1780.

North Carolina.—The earliest notes were dated 1748, and upward of 120 varieties were printed up to 1780. The most of the North Carolina bills bore motto inscriptions such as "Virtuous Counsels the Cement of States," "A Righteous Rule," "A Lesson to arbitrary Kings and wicked Ministers," "Liberty and Peace the Reward of Virtuous Resistance," "Persecution the Ruin of Empires," "Union of Hearts the Strength of States," "An Interest," "American Virtue Triumphant," etc.

Pennsylvania.—The earliest known bill was dated 10 Aug. 1723 and was printed by Benjamin Franklin. The general style of the notes is the same as used in Delaware, bearing the royal arms, or in 1756 those of William Penn, with his motto, "Mercy Justice." In 1764 a curious notion was adopted of spelling the name of the colony differently on each bill, thus on the series we find Pennsylvania, Pennsylvania and Pensilvania. This was perhaps designed as a protection against counterfeiting. On some of the notes issued in 1771 is the signature of Francis Hopkinson, and on the bills of April of the following year that of John Morton, both signers of the Declaration of Independence. In 1777 the shape of the bill changed to the oblong form, and the arms of Pennsylvania took the place formerly devoted to those of Great Britain. This series are found both in black and red with black type. By general assembly of the United States, of the same design as issued for other States, was put in circulation, and on 16 March 1785 the last of the series saw the light, the denominations running from 3 pence to £4, 16 values in all. The varieties issued by this colony were over 250.

Rhode Island.—The paper money of Rhode Island was similar in design and value to that of Connecticut. The first issue was in 1715 and the last in 1786. There were about 75 varieties.

South Carolina.—There were 50 varieties of bills issued in this colony from 1712 to 1770. The bills dated 6 March 1776 were supposed to have the value of silver, equivalent in currency is given thus, 6 Spar.sh milled dollars = £9 15s. currency. In 1779, appeared the handsomest notes heretofore used in the country, the backs of the $50, $70 and $90 bills representing Atlas, Prometheus and Hercules being especially noteworthy. The total number of bills for South Carolina was 1055.

Vermont.—In this colony there were but two series, the first issued in February 1781 is an ordinary type-printed note, with engraved border on three sides with the State seal about the centre. This consists of a pair of scales
1 New York Province Half-dollar. 1775
2 Connecticut Colony 5 shillings. 1776
3 U. S. Continental Currency, $3. 1776
4 Vermont State Currency, 1 shilling. 1781
5 New Jersey State Currency, 1s. 6 pence. 1781
6 North Carolina Currency, $6. 1776
and a chain of 14 links (the only instance where the number is carried above the original 13) enclosed in a circular band inscribed "Vermont 1775." Two second issue is in the form of treasury notes, the amounts being filled in with ink.

**Virginia.**—The first issue for this State was in 1755. The notes are of two varieties, the first a fine, large bill after the English style, and the second a half and a bank-bill, being probably made to fill a pressing want. The bills are copper-plate engravings filled out in ink. On the issue of 1775 are the royal arms of Virginia in an engraved frame. The lettering reads "Three Pounds Current Money of Virginia Pursuant to Ordinance of Convention Passed 17 July 1775." The following year introduces the "sic semper tyrannis" in place of the arms.

**Bank Notes.**—From the Revolutionary period to the days of the Civil War and to the present time many issues of paper money have been made by the government and by national, State and local banks. See **Banks and Bankers**.

**Confederate Paper Money.**—During the Civil War the Southern States in secession issued millions of dollars in paper money, beginning in July 1861, with bills of from $5 to $100. On these were designs of the Confederate flag, a train of cars, cotton bales, etc. In September 1861 appeared at least 50 varieties of bills in value from $5 to $100. They were of various designs. A $20 bill showed a head of Alexander H. Stephens in one corner; a $10 bill pictured General Marion offering a breakfast of sweet potatoes to a British officer. Portraits of Davis, Hunter, Memminger, Stephens, Mrs. Pickens, Mrs. Davis, Benjamin, General Jackson and others appeared on the high value notes. There was an issue of $1 and $2 bills in 1862 and in April 1863 appeared a series in value from 50 cents to $100. Some of these bore designs of the capitol buildings at Richmond, Nashville, Montgomery, etc. The last issue of bills from 50 cents in value to $500 appeared 17 Feb. 1864. Many of these are still in circulation. In 1917 some with an accumulation sold them on the streets of downtown New York at five cents a bill.

**Postage Currency.**—The United States government printed a paper money as a substitute for fractional currency during the Civil War, owing to the scarcity of silver. This was the suggestion of General Spinner, United States Treasurer under Lincoln, and was commonly known as "shin-plaster" money. The issue was in small scraip of the denominations of 3, 5, 10, 25 and 50 cents. It disappeared from general circulation about 1870.

**Greenbacks, Silver and Gold Certificates.**—The more recent issues of American paper money in circulation at the present day are printed at the Bureau of Engraving and Printing at Washington. The engravers are specialists, and the figures and intricate designs of their work are often marvels of artistic skill. Portraits of living persons are never put on the notes, and all the figures, vignettes, borders, lettering, etc., are engraved separately before they are put on the plates. First the engraver works out his design and after transferring it by hand to a plate of soft steel the plate is hardened and a soft steel roller takes the impression from it. After this roll is chilled another impression is taken on another steel plate, and after this latter has been hardened it is ready for use. Beyond this the border is a complete and wonderful piece of mechanism. The lines for the borders, backs and other conventional designs seen on the notes are made by this machine. The paper for printing the bank-notes is manufactured under the supervision of government officials. It has various lines of short, uneven colored silk threads running through it.

**Foreign Paper Money.**—The notes of the Bank of England are five by eight inches in dimensions and are printed in black ink on Irish linen water-lined paper, plain, white with ragged edges. The notes of the Bank of France are made of white water-lined paper, printed in blue and black, with numerous mythological and allegorical pictures. South American currency is about the size and appearance of the American, but is commonly inferior in appearance and easier to counterfeit, being produced by a cheaper lithographic process. The German notes are printed in green and black. The Chinese paper money is white and yellow, with gilt lettering and various devices. Italian notes are printed on white paper in pink, blue and carmine and ornamented with a vignette.

**Money Order Service.** See **Postal Money Order Service**.

**Moneywort, Creeping Charlie, Creeping Jenny, or Herb-Twopence,** are popular names for *Lysimachia nummularia* of the primrose family. The plant, which is a native of Europe, is a perennial with roundish leaves and axillary flowers borne from early summer until autumn. It is very popular for planting in rookeries, vases, hanging-baskets and shady situations, and has become naturalized in the eastern United States. Propagation by seedlings is very simple, and the plants seem to thrive in any moist, shaded garden soil, cool greenhouse, or window. Several other plants are sometimes called moneywort; for example, Anagallis tenella, *Diascoria nummularia*, and *Thymus chaemaphyllo.* See **Loosestrife**.

**Monge, monzh, Gaspard, French mathematician and physicist; b. Beaune, France, 10 May 1746; d. Paris, 18 July 1818. He was educated at Beaune and Lyons and at 16 was a teacher. He made rapid progress and some valuable discoveries in engineering and in 1783 was called to the professorship of hydrodynamics in the Paris Lyceum. He was a supporter of the French Revolution, became Minister of Marine and was temporary Minister of War and one of the signers of the death warrant for Louis XVI. He resigned soon after the king's death and was engaged in manufacturing arms and gunpowder for the army. He founded the Ecole Polytechnique under the Directory and was professor of mathematics there, but was later sent to Italy to assist in the removal to France of the art treasures captured by French..."
armies, and there gained the friendship of Napoleon whom he accompanied to Egypt in 1798, continuing his scientific researches. He resumed his position in the École Polytechnique upon his return to France and in 1805 was elected senator. Napoleon gave him an estate in Westphalia, and the title of Count of Pelusium, but the downfall of the emperor resulted in reverses for Monge who was expelled from his positions in 1815. He is renowned principally as the founder of descriptive geometry, and one of the earliest scientists in modern geometry. He published ‘Traité élémentaire de statique’ (1788); ‘Leçons de géométrie descriptive’ (1795); ‘Essai Historique sur les services et les travaux scientifiques de Monge’ (1819); Obenrauch, ‘Monge des Begründer der darstellenden Geometrie als Wissenschaft’ (1893-94).

MONGHYR, môn-gèr’, or MONGHIR, India, the capital of a district in the Bharatpur division of Bahar, Bengal, on the right bank of the Ganges, 80 miles east of Patna. It communicates by steam ferry with Sultan Sagor on the opposite bank. It is of great antiquity, and has an elevated fort, enclosing the district administrative offices. Monghyr still enjoys a local reputation for its former important manufactures of swords, firearms and hardware. Pop. 36,000.

MONGOLIA, China, a vast northern central and eastern colonial territory, between lat. 35° and 52° N., and long. 82° and 123° E., bounded on the north by Asiatic Russia, east by Manchuria, south by China proper, and west by Sunkara and East Turkestan; estimated area, about 1,367,600 square miles.

The central portion, nearly a fourth of the whole, is occupied by the Desert of Gobi, an extensive sandy plateau, with a few spots of pasture and brusshwood. Other parts are intersected by lofty granite chains, the principal of which are the Altai, the Thian-shan, the Khiinghan, and the Iin-shan. The largest rivers are— in the north the Salenga, in the south the Shiramuren, and in the west the Irrish. The climate presents the opposite extremes of intense winter cold and summer heat. Agriculture is but little developed, and that only in the south on the borders of China proper; cattle raising, a few domestic industries and the transportation of goods are the chief occupations of the inhabitants. There is a considerable transit trade with Russia and China; the principal commercial centres are Kuku-Khoto, Kalgan, Biru-Khoto, Dolon-nur, and Kuku-erghi, in southern and southeastern Mongolia; Kerulen in the northeast, Kobdo, Ulusutai and Urga, in the northwest. Urga is the principal town, a populous frontier emporium for the caravan trade across its steppes from China to Kjakhta, Siberia, 170 miles to the north and 100 miles east of Lake Baikal. The chief exports are wool, skins, hides, furs, horns, etc., to an annual value of nearly $5,000,000; while the varied imports amount in value to $7,800,000 annually. There are 124 pueri in the STEPPES. The steppes are divided into tribes chief of which are: (1) the Khalkas, or Mongolians properly so called, who occupy the entire north of Mongolia; (2) the Ouryantai and the Darkhat, who are Mongolized Turks; (3) the Ordoss of pure Mongolian blood; (4) the eight tribes of the Tsaktar, of Mongolian blood. The Khalkas are divided into four "aimaks," or principalities, the creation of which, it is said, dates back to Genghis-Khan. These are Touchetson, Tsatsen, Sain-Noin, and Tsatsatko. Each aimak is divided into "hoshuns," which are subdivided into "sumuns." Such distribution of the empire was very ancient. Although the Mongolians are vassals of China they govern themselves. In each administrative subdivision there is elected a chief, whose election is ratified by the Chinese government, and who receives from Peking a title of honor of slight importance, along with a button or peacock's feather for his cap. At Urga, the seat of the Bogdo Khan the Mongolian prince in charge (theoretically) of the administration of the affairs of the Khalkas has for adjunct (theoretical) a Manchu envoy, the "amban," who is really the master of the situation; and the decisions made in common (or that are supposed to be) by the two exalted persons are those dictated by the amban, that is to say, the Peking sentinels.

The Khalkas are nomads, but only relatively so. Within the limits of their hoshun and sumun they periodically shift their quarters in search of "pastures new" for their herds of camels, horses and sheep, but they never travel very far, and it is always possible to find an encampment within a radius of a few miles.

They live under the "youyte," which consists of a light circular framework covered with pieces of felt. The form is that of a dome supported by a small sub-basement, and about 10 feet in height. In order to render it habitable, it suffices to cover it with pieces of felt and close the central orifice above with a movable piece of the same material. Through this orifice the smoke of the "pot a feu" escapes. The fireplace is situated in the centre of the abode, the household gods are placed opposite the door, and the housekeeping utensils are arranged along the walls. Around the fireplace are spread out, in lieu of seats, pieces of felt, for which the well-to-do substitute carpeting. The princely youytes are furnished with board floors and decorated with silken hangings.

In summer the men wear wide trousers and a shirt of calico, in most cases blue. Over this they place a long robe, which is buttoned upon the shoulder and side. This is of blue or brown cotton, but sometimes of red or dark green silk. The lamas, or church people—the religion being Buddhism—affect yellow. This robe is gathered in at the waist by a cloth girdle, whence to the right, hangs a knife, and to the left a tobacco bag and tinder box.

Boots with pointed upturned toe and high heel, generally of red leather with a thick sole, complete the accoutrement. The fact that the Mongolians shoemakers make but one size of footwear explains why the boots of his father, and why the Mongolian (who also is naturally lazy) does not like to take even the shortest walks afoot. He strides his horse in order to travel a distance of a day at a stretch. In the coldest weather that he decides to dismount from his steed in order to walk half a mile or more. The Mongolians shave and wear a cue. The headgear or national hat consists of a small cone of figured silk or damask, which forms the
skull-cap. The rim, which is of black velvet, is turned up so as to describe an acute angle with the central cone. Behind, float two long wide ribbons, which are invariably of red silk. The button or the tuft that crowns the cone is likewise always red. When it rains (a rare event in the Khalka country) the velvet rim is turned down, and the hat assumes the form of an extinguisher that protects the ears and neck. In winter, these hats are replaced by a head-gear trimmed with fur, squirrel among the poorer classes and sable among the nobility. The change of hat is accompanied with a change of costume. The long cotton or silk tunic is replaced by a mantle of sheep or deer skin, or among the rich, by a long coat of silk trimmed and lined with costly fur.

The majority of the Mongolians are thin and emaciated. Although they are not strong, they are wiry and capable of withstanding considerable fatigue on horseback. But they object to muscular work. It takes two or three to lift a weight that could be easily handled by one Cock sack. To the European eye, they are, with their broad, flat noses, their high cheek-bones, and their little, beady eyes, intensely ugly. They are generally of a low stature, and sometimes have a certain nobility of countenance. Almost all have a kind, benevolent expression to which one soon becomes habituated.

In their youth, the women are prepossessing. Their lineaments are refined, their eyes languishing and their faces plump and smiling like those of the Japanese. They wear the same style of underclothing that the men do; the same boots and the same hat. But the married women wear a long tunic with very narrow sleeves that are generally red from the middle of the arm to the wrist, which is covered by a small point of the sleeve, if the latter is not rolled up. The robe may be blue, brown, violet, or red, but the sleeve is always red. Above the shoulder the sleeve is padded to a considerable height. A tucker of this same red color covers the top of the throat. Maidens, whose robes resemble those of men, wear their hair in a single braid hanging down the back. The children go nude during the summer season, and it is not till they have reached the age of 10 that they are clad in the long national tunic. The head of the Mongolian is square; the face flatish, nearly as broad as long, the parts not well distinguished from each other; the eyelids narrow, obliquely turned up at their outer angle; the space between the eyes flat and broad, the nose flat, the cheeks projecting, the chin somewhat prominent. The hair is straight, the color black, that of the face and body yellowish (sometimes inaccurately called olive, which implies an admixture of green). The race includes not merely the natives of Mongolia properly so called, but the Tartars, the Chinese, the Japanese, the Cosschin Chinese, the Burmeze, the Tamuls, the Turks, and the Finns. See ETHNOLOGY.

MONGOLIAN SUBREGION. In zoogeography, a subdivision which includes the tablelands of central Asia, from the Caspian Sea to Japan. Its separation from other Asiatic faunal regions is mainly on ornithological grounds, and is neither distinct nor important.

MONGOOSE, MONGUSE, etc. See MUNGOS.

MONICA, Saint, mother of Saint Augustine (q.v.); b. Africa 332; d. Ostia 387. A Christian who, in accordance with the wishes of her parents, also Christian, converted a pagan. She devoted nearly all her life to the conversion of her husband and son Augustine. Her self-
sacrifice was at last rewarded; her husband, Patricius, became a Christian, and Augustine, seeing the error of his ways, reformed. After the baptism of Saint Augustine at Easter, 387, she set out with her two sons for Africa. Arriving at Ostia she became ill and here died. A friend asked her in Ostia if she were not afraid to be buried in a place so far from her own country. She replied: "Nothing is far from God." Her eminent son preserved many of her holy sayings which he often repeated in his sermons. In the Roman Catholic Church she is regarded as the model and patroness of wives and mothers. Her feast is 4 May. In 1430 her relics were brought to Rome, and were later deposited in the Church of Saint Augustine. Consult 'Saint Augustine's Works' edited by Tillimon; Butler, 'Lives of the Saints.'

MONIER-WILLIAMS, Sir Monier, English Sanskrit scholar: b. Bombay, 12 Nov. 1819; d. Paris, 6 Oct. 1881. He was son of Monier-Williams, surveyor-general. He was educated at Oxford, and was for a short period a student at the East India College, Haileybury. He was professor of Sanskrit at Haileybury from 1844 until the extinction of the college in 1858, and in 1860 became Boden Sanskrit professor at Oxford, a post which he held till his death. Among his numerous works are: 'Practical Sanskrit Grammar' (1846); 'English-Sanskrit Dictionary' (1851); edition with notes, translations, etc., of the Sakuntalà (1853); 'Introduction to Hindustani' (1858); 'Indian Epic Poetry' (1863); 'Sanskrit-English Dictionary' (1872; 2d edition 1899); 'Indian Wisdom' (1875); 'Hinduism' (1877); 'Religious Life and Thought in India' (1883); 'The Holy Bible and the Sacred Books of the East' (1886); 'Brahmanism and Hinduism' (1889); 'Reminiscences of old Haileybury College' (1894). He traveled extensively throughout India in order to study the native religions, and to further his scheme of an Indian institute, which he succeeded in getting established at Oxford.

MONISM, a philosophical term which may be briefly translated by "doctrine of unity." The word was coined by Christian von Wolff, a German philosopher of the first half of the 18th century, and is derived from the Greek monos, "one," by adding the suffix -ismos, "a doctrine." It is unique; existing in only one copy. Wolff, the inventor of many happy terms that acquired currency in philosophy, introduced the word to characterize such philosophies as recognized the existence of one ultimate form of reality only, be it spirit or matter, and he contrasted it with "dualism," that is, the doctrine upheld by all those thinkers who believe that both spirit and matter are ultimate forms of existence. Monism is also opposed to a view like that of Leibnitz, which maintains the existence of many substances; the latter is called pluralistic. The word "monism" has come to be applied to views maintaining a unity of a non-substantial nature. It has been adopted as the label of a certain type of positivistic theory that emphasizes the owners of things. (See DUALISM AND PLURALISM.) Consult Haeckel, E. H., 'Riddle of the Universe' (New York 1900); Walker, W. L., 'Christian Theism and Spiritual Monism' (New York 1906); Worsley, A., 'Concepts of Monism' (London 1907).

MONITEUR, mō-nē-tər, Le, French journal, established 5 May 1789 by Panckoucke under the name Gazette Nationale, ou le Moniteur Universel. Under the title of L'Ancien Moniteur it continued to appear until 1794. From 1870, when the Journal Officiel was published, the name was changed to Moniteur Universel. A four-year periodical that began on the government official Actes du gouvernement. The name in 1811 was changed to Journal Officiel. Its policy again changed and it continued as the government organ until 1968, when the Journal Officiel was again published separately.

MONITITE. See MONETITE.

MONITOR, The, an ironclad, the first of a class of naval vessels designated as monitors (see 'Warships'). It was designed and built for the United States government in 1861-62 under direction of the engineer John Ericsson (q.v.), who adopted as the most essential feature of its construction the revolving gun-turret devised by the American inventor, Theodore Ruggles Timby (q.v.). The Monitor was launched at Greenpoint, L. I., 30 Jan. 1862, only 100 days after the laying of her keel. She put to sea 6 March following, under command of Lieut. John L. Worden (q.v.), arriving on the night of the 8th at Hampton Roads, Va. Extraordinary energy had been displayed by the builders to meet a grave emergency of the government, then weak in naval resources, for making effectual the blockade of Southern ports.

Theodore R. Timby's Model sent to China by Caleb Cushing in 1843, which suggested to J. Ericsson the Low Freeboard.
which President Lincoln had proclaimed, as well
as for aggressive action and coast-defense.
This emergency soon became a dire peril which
threatened the destruction of the Union through
superior sea power acquired by the Confederacy
with foreign aid or connivance. How this dan-
ger was first averted is shown in the account
of the famous action in Hampton Roads (see
MONITOR AND MERRIMAC).

The Monitor was built by a company of
men, John F. Winslow and John A. Griswold of
Troy, N.Y., and their associates, who were ac-
tuated by patriotic motives. With T. R. Timby,
who had taken out patents for revolving
towers for offensive or defensive warfare
whether placed on land or water, they entered
into a contract for the use of his inventions
covering the revolving turret, paying him $5,000
as royalty on each turret constructed by them.
They built the Monitor at their own risk, Wins-
low and Griswold furnishing 40 per cent and
C. S. Bushnell of New Haven, Conn., 10 per
cent of the cost. Ericsson, for his services as
engineer, received 5 per cent of the gross sum
paid to the company for the Monitor and kindred vessels built by them. A contract with the
government was made by the company and
Ericsson, and the government paid for the
Monitor $275,000, the actual cost being $195,000.

In all the models, drawings and plans of his
invention made by T. R. Timby himself, the
pilot house or "lookout" was placed on top of
the turret. For some inapplicable reason, he
has said, "the Monitor had her pilot-house
placed upon the deck, forward of the turret, in
the way of her own guns."

The success of the Monitor aroused much
interest in all maritime nations, and was the
direct cause of many modifications in the con-
struction of vessels in the navies of Europe,
though nowhere except in the United States
navy was the monitor adopted as a distinct
type of warship. During a gale off Cape Hat-
teras, 31 Dec. 1862, the Monitor was sunk.

JOHN H. CLIFFORD.

MONITOR LIZARD, the type of a family of
pleurodont lizards (Varanidae). They are
found in Africa, the Eastern Archipelago, etc.,
and are the largest of modern lizards, some
species attaining a length of 9 feet. The skin
is covered with very small juxtaposed scales
and tubercles dorsally, while ventrally the
scales are square and arranged transversely.
The tail is long, cylindrical in the terrestrial,
but compressed laterally in the aquatic forms,
and possesses a sharp underride or keel. The
limbs are well developed and the toes provided
with claws. Most of these great greenish-gray
lizards inhabit rivers and ponds, and are active
and fierce enemies of all lesser aquatic life.
They feed upon eggs and young of crocodiles,
turtles and aquatic birds; and on fishes, amphibi-
s, swimming-birds, anything in fact, small
eough to be mastered. There is one genus
and nearly 30 species. The most familiar
species, probably, is that of the Nile and other
African rivers (V. niloticus). The English name
"monitor" was first fastened by a ridiculous
misinterpretation of the Arabic word ouaran
(lizard); it is aquatic and frequently
ceeding five feet in length. An
equally well known kind is the East Indian
monitor (V. salvator), which is to be met with
from Ceylon and western India to the Philip-
pines, and is equally at home in the water, on
land or in trees. Its rapacity is great and
varied; and it is connected with many extraor-
dinary rites and superstitions among the na-
tives, some of which are given in Fennett's
'Sketches of the Natural History of Ceylon'
(1861). Australia has a large species (V.
gouldi).

MONITOR AND MERRIMAC. The
contract for the construction of the Monitor
was entered into by the Navy Department in
the hope that she could be completed before
the Merrimac, then building by the Confederate
navy at the Norfolk navy yard, could be
finished, and that the Monitor would be able
to cope with this formidable ironclad. The
Merrimac, called by the Confederates the Vir-
ginia, was being reconstructed upon the hull
of the United States frigate Merrimac, of
3,200 tons, which had been sunk, when the
Norfolk navy yard was abandoned, by the
Union forces, and was subsequently raised by
the Confederates. Her armament was two
7-inch rifles, two 6-inch rifles and six 9-inch
smooth-bore.

Each side was aware of the effort of the
other to be first ready for active service. The
Confederates won by a day. At noon 8 March
1862, the Merrimac, attended by two gunboats,
Raleigh and Beaufort, each one gun, was dis-
covered coming out of the Elizabeth River into
Hampton Roads (q.v.) and standing toward the
Union fleet off Newport News and Fort Mon-
roe, composed of the steam-frigates Minnesota,
Roanoke and Congress, each 50 guns; the sail-
ing-frigate Saint Lawrence, 12 guns, and the
sloop Cumberland, 24 guns. Their armament
was mainly 8-inch and 6-inch guns, with several
10-inch pivot guns. These vessels had the
MONITORIAL SYSTEM — MONK

heaviest batteries which the government had been able to assemble was the Merrimac. The latter bore down directly upon the Congress and Cumberland. At less than a quarter of a mile the Congress delivered her broadside, her heaviest shot making no impression. The return-fire of shells crashed through her sides with terrible effect. Passing the Congress at 300 yards, the Merrimac received the fire of the heaviest guns of the Cumberland without the slightest harm resulting, and without replying she drove her iron prow through the side of the Union frigate, causing her and the Monitor for a time pouring in a fire of shells. Leaving the Cumberland rapidly sinking, the ironclad steered for the Congress, which had been run ashore, and from a point 150 yards astern raked her decks with shells which caused general destruction and set the ship afire. The Congress was obliged to surrender. The Cumberland fired a broadside as the water reached the gun-deck, and went down with her flag flying. As she sank, the Confederate steamers Patrick Henry and the James Wasp, two, came out of the James River and joined the Merrimac. The Minnesota had grounded where the Merrimac could not approach within a mile, and her firing was so bad that only one shot struck the frigate. The other Confederate vessels were finally driven off after inflicting much damage with their rifled guns. After several hours ineffectual attempts to reach the Minnesota, the Merrimac and attending gunboats returned to Norfolk. Several shore-batteries which had attempted to help proved as useless as the batteries of the frigates had been. The Congress continued to burn, and finally blew up. Over half the crew of the Cumberland were lost. The crew of the Congress were made prisoners, but, with the exception of the officers, were released. The total loss was some 250, the Confederate loss was nominal. The battle of an afternoon had ended the day of wooden navies.

The reports of the destruction by the Merrimac caused consternation at Washington, and in the coast cities and, indeed, throughout the North. Secretary Stanton ordered all preparations made for obstructing the channel of the Potomac far below the capital, and warned those in charge of coast-defenses to use every man and gun at their disposal.

Meantime the Monitor, in command of Lieut. John L. Worden, had left New York and after a rough voyage entered Hampton Roads at 9 o'clock the night after the battle. At 2 o'clock on the morning of the 9th she had anchored alongside the Minnesota. At 6 o'clock the Merrimac appeared bearing down on them, but at first passed by, gained the channel in which the Minnesota lay, and then steamed directly toward her. The Monitor swerved in between the two and steered for the Merrimac. At close quarters the latter brought her bow-guns to bear and missed. There was little to fire at except the low turret with a cross-section of 20 feet. The first reply of the Monitor was a solid 11-inch shell which knocked the Merrimac from stem to stern. The answer was a broadside, some of the shot of which struck the turret, either glancing or falling as harmless as the shot of the frigates the day before had proved against the Merrimac. Then followed broadside after broadside with producing the slightest effect on this "cheese-box of a raft," as spectators described it. At every opportunity of maneuver the Monitor closed in and smote with her 11-inch solid shot, bending the heavy armor and straining the timbers of her adversary. Finally the Merrimac left the Monitor and crowded steam for the Minnesota. Upon reaching point-blank range she received a full broadside, and a shot from a 10-inch pivot gun, without suffering the slightest damage. In reply she raked the Minnesota with a shell, set her afire, blew up a tug alongside, and but for the timely intervention of the Parliament, raked under full steam, and now swept in between the two, the Minnesota would have share the fate of the Congress and Cumberland. In changing position to meet the Monitor the Merrimac grounded, and the Monitor continued her hammering with 11-inch shot. As soon as the Merrimac was floated she started rapidly down the bay, pursued by the Monitor. Suddenly she turned and attempted to run the Monitor down. The blow she struck with her prow glanced, and the Confederates flung the Merrimac then started for the Minnesota for the purpose of ramming her; but when within easy range the Merrimac, with all the Confederate ships, changed course at noon headed for Norfolk. Her officers subsequently gave as a reason that in attempting to ram the Monitor, her iron prow was broken, and her vessel was leaking. The armor was reported damaged, the stem twisted, the muzzles of two guns shot away and the steam-pipe and smokestack riddled. The casualties were only two killed and 19 wounded. The consternation of the day before at Washington and the North was transferred to Richmond and the South. Preparations were hastily made by the Confederates for blocking the channels in the Elizabeth and Nansemond rivers, and to obstruct the channel of the James. The Merrimac did not again engage the Monitor, and after the evacuation of Norfolk, which occurred 9 May, she was destroyed by the Combatant at the James.

The Monitor had hurried direct from her shipyard to Fort Monroe and fought without a previous trial-trip, and before she had been accepted by the government. Her five hours' battle settled many questions, and once again in American history had been fired a "shot heard round the world."

MONITORIAL SYSTEM. See LANCAS-TERIAN SYSTEM.

MONK, münk, or MONCK, George, Duke of Albemarle, English general and naval commander; the restorer of the Stuart dynasty:
b. Potheridge, Devon, 6 Dec. 1608; d. Newhall, Essex, 3 Jan. 1670. At 17 he enlisted and served in the Cadiz expedition under Sir Richard Grenville, a relative; then entered the Dutch army; and returned to England in 1639, fought brilliantly in Scotland and after 1640 in Ireland, and on the outbreak of the Civil War kept his commission in the king's army. But in 1648 took the Merrimac and commanded the Parliamentary forces, and after two years' imprisonment in the Tower, joined the victors, for whom he went to Ulster as governor. Accused of exceeding his powers by arranging a truce (which was almost an alliance) with Owen O'Neill, he was recalled to England in 1649 and repri
MONK — MONKEYS

Mandated at the bar of the House of Commons.

At the victory of Dunbar in 1650 he did good service; a year later he was made lieutenant-general of the ordinance and in Cromwell's absence was commander-in-chief of Scotland. In 1652 he was made a general of the fleet. He introduced the elements of land tactics into naval formation and administered two crushing defeats to the Dutch, van Tromp being killed in the latter battle. In 1654 he again was sent to Scotland on the Royalist rising as commander of the army, and acted there with much more prudence and success. After Oliver's death and Richard Cromwell's resignation Monk set himself to effect the Stuart Restoration, quietly shifted the forces in England until all was so arranged that there was no chance of armed resistance, and then (1660) brought back Charles II — a bloodless revolution meeting with general favor. He was made Duke of Albemarle, received other high honors, maintained order and showed rare courage in London during the Plague, but with an empty treasury in 1667 could not keep the Dutch from burning the ships in the Thames. Short, fat, fair and wrinkled, Monk was not a winning personality, being cold, prudent past a virtue and rather unprincipled; but he was a wonderfully able general, with technical skill rare in one so lacking in theoretical training. He was one of the first to adopt the Indian meal by Thomas Gumble (1671). Consult also the biographies by Guizot (1838 and 1850); and that by Corbett, J., in the 'English Men of Action' series (New York 1889).

MONK, a bird. See FRIAR-BIRD.

MONK. See MONACHISM.

MONK-FISH, ANGEL-FISH, or FIDDLER-FISH, a broad, flattened fish (Squatina anguills), closely allied to the sharks, but more like a ray in appearance, five or six feet long, having enlarged, wing-like pectoral fins. It is found near the coast in the warm seas of Europe and North America; it usually stays near the bottom, is from three to four feet long, slow-moving, voracious and useless, except that some shagreen may be obtained from its skin.

MONK-SEAL, a seal of the genus Monachus, so called from a humorous suggestion in colors to the habit of a monk, the species properly so called is that (M. albiventer) of the Mediterranean; but the West Indian seal (M. tropicalis) is very similar to it, and is of interest as being almost extinct. See SEALS.

MONKEY-BREAD, the fruit of the baobab tree (q.v.).

MONKEY-FLOWER, any of many plants of the genus Mimulus (bignonia family), so called because the face of the fox-glove-like corolla suggests that of a cheerful monkey. They are erect, tall herbs, with opposite, clasping, lanceolate dentate leaves, which bear in late summer solitary, axillary irregular blossoms of showy colors. The genus contains some 50 North American species, of which the most familiar is the showy-stemmed of the Eastern and Central States (M. ringens). Its flower is violet. A common species in California and on the Pacific Coast (M. guttatus) has the corolla yellow, often blushed with red or purple.

MONKEY-POT, the fruit of a forest tree of Brazil. See BRAZIL NUT and SAPUCIA NUT.

MONKEYS, a general name for the animals of the highest mammalian order, the Primates (q.v.), excepting mankind and the lemurs; ordinarily also excepting the anthropoid apes (see Ape) and the baboons (q.v.). The term in fact, then, is suitably limited to three families, considered in their broadest sense, the Hapalidae, Cebidae and Cercopithecidae. The New World monkeys are as follows: the short hallux, or great toe, is opposable to the other digits of the foot, so that the feet become converted functionally into hands. The pollex, or thumb, of the fore limbs may be absent, but when developed it is usually opposable to the other fingers. These animals may thus be called 'four-handed' or quadrumanous; hence the old designation Quadrumanous.

The limbs are nearly of equal length. There is only one pair of mammary glands, which are preorbital in position. In many cases the claws are dilated into pouches. The teeth consist of two incisors in each side of each jaw. The premolars, or false molars, vary in number. The true molars number three in each side of each jaw, the latter teeth being furnished with tubercles of various sizes and shapes, adapted for crushing fruits and vegetables. The canine teeth are generally strong and of large size. A diastema or interval exists between the lower canine and the first lower premolar tooth, and between the upper canine and outer incisor teeth; this interval admitting of the large canines being brought into apposition when the jaws are closed.

For information as to the probable descent and geological history of monkeys, see PRIMATES.

The small American monkeys of the family Hapalidae, more usually called marmosets (q.v.), seem to be lowest in the scale of structure and nearest the lemurs, and are by some naturalists separated from the Cebidae in a group Arcto-pithecini. They are least in size, have the tail long, hairy and not prehensile; no cheek-pouches or natal callosities; the fore limbs shorter than the hind ones; the thumb not opposable; the ears hairy and of large size; the body covered by a close fur. Their dental formula gives four incisors, two canines, two premolars and four molars in each jaw — this dentition resembling that of the Old World monkeys, and also that of man himself. The molars are provided with blunt processes. They are confined to tropical America, and wholly arboreal, feed on insects and fruit, and are tamable, gentle and intelligent. See MARMOSET.

Next to these come the Cebidae, called New World monkeys, because the family is confined to the American continent, and also known as Platyrrhini, because of the broad partition in the nose, which widely separates the nostrils and causes them to open somewhat laterally, though this term is often applied to the Hapalidae also. They are characterized by the possession of an extra premolar on each side of each jaw; and by the length and strong prehensility of the tail in most forms — an arrangement by which the end of the tail (naked there on its underside) curls without effort around a limb and clings firmly to it, giving so great assistance in climbing that many of these monkeys exhibit wonderful agility among the trees, grasping and
swinging by their tails alone, leaving all four feet (or hands) free. The ears are rounded and with most of the face are destitute of hair, there are no cheek-pouches or callosities on the buttocks, so characteristic of the Old World forms. The hind limbs are generally the longer in this section. In the spider monkeys, however, the fore limbs are longer than the hinder members. The thumbs are not generally opposable, and may be wanting; and the thumb in these monkeys nearly approaches the other fingers in size and form when present. Unlike other monkeys, they have the thumb placed in nearly the same plane as the other fingers, so that the mere position of the thumb renders it unfit. The great toe is generally of large size, and is more capable of being opposed to the other digits than the thumb. The diet is mainly of a vegetable nature, and their life almost exclusively arboreal, a fact which, more than any question of climate, seems to limit them in range to the region of the tropics, between the plains of northern Mexico and those of southern Brazil, since several species dwell in the cold regions of high mountains. Of the Cebidae the spider-monkeys (Atelidae) present the most typical example. In these forms the tail reaches its greatest development as a prehensile organ. The limbs are exceedingly slender, and the thumb is rudimentary. (See Spider-Monkey.) The capuchin monkeys, or Sapajous (q.v.) form the type of the genus Cebus, and include many species, as also does the genus Callithrix (see Squirrel-Monkey). The howling monkeys (Mycetes) are so named from the loud howling noises they are capable of producing, through the possession of a bony "drum," which opens into the larynx, and which greatly increases the resonance of the voice. Other genera are Pithecia, the sakis, or hooded monkeys; Uacaria, the woolly monkeys; Chrysotithes or golden monkeys; and Necipitheus, the Dorocoull monkey. The last and highest section of the monkeys (next to the anthropoid apes) is that of the Old World tribe Cercopithecidae, if that family name is used, as is recently the custom, to cover all the formerly called "carrhina" monkeys, distinct from the catarrhina, with generally-set nostrils, the nostril apertures being placed close together, and the nasal septum being narrow. Opposable thumbs and great toes exist in all, except the genus Colobus, the members of which want thumbs. The incisors are arranged to exhibit four incisors, two canines, four premolars and six molars in each jaw; the incisors are prominent, and the canines are especially large and strong — the latter teeth being separated by an interval or diastema from the upper outer incisor, and from the first lower premolar. The tail may be rudimentary or wanting, but in no case is it prehensile. Check-pouches, or pocket-like cavities excavated in the cheeks, which are used as receptacles for food preparatory to its mastication, are present in many; and the skin covering the prominences of the buttocks is frequently destitute of hair, becomes hardened and thus constitutes the so-called natal callosities of these animals. Sometimes these callosities exhibit brilliant colors, and the skin in the neighborhood of the aperture as the animal grows and grows, may be striped with gay hues. In their distribution all the carrhina monkeys inhabit Asia and Africa, a macaque inhabiting the Rock of Gibraltar, and called Barbary ape (q.v.).

Many of these monkeys are small or of moderate size, handsome and graceful. Such are the African guenons, green monkeys and mangabeys (q.v.) of the genera Cercocebus and Cercopithecus. Nearly related to them are the macaques (q.v.); and the baboons (q.v.). These have cheek-pouches, and the fore limbs the longer. The genera without cheek-pouches and with the hind limbs longer than the fore limbs are the African thumbless genus Colobus, which contains the guerezas (q.v.); and the East Indian tribe Semnopithecus which contains the Hindu sacred monkey or entellus (q.v.), the proboscis monkey, negro monkey and several others described elsewhere under their names, some of which are large and extraordinary.

These Old World monkeys are more varied in their food and activities than are those of America, and are far superior to them in intelligence; consequently they furnish nearly all the pets, circus-performers and servants of wandering musicians that we see from time to time. Many of them breed in captivity, adapt themselves well to civilized life and betray a surprising ability to learn in various directions. They are, however, prone to be melancholy and morose, and are often bad-tempered and surly in old age. Few, however, when taken into cold climates live long, even when most carefully treated, as they seem peculiarly susceptible to diseases of the lungs, which usually have a fatal issue. Excellent accounts of the monkeys of the world exist in "The Standard," "Royal," "Cassell's," and "Allen's Natural Histories"; the last and most recent being a monograph by Forbes. Otherwise information must be gleaned mainly from the books of scientific travelers.

MONKHOUSE, William Cosmo, English author, poet and art critic; b. London, 18 March 1840; d. Skegness, Lincolnshire, England, 2 July 1901. He received his education at Saint Paul's School in London and in 1857 became a junior clerk in the Board of Trade office with which he was connected with advancement for the remainder of his life. Although not a great poet his work enjoys a high reputation among the works of the minor poets and as an art critic he won considerable attention. His work for the "Dictionary of National Biography" is within its scope practically all of British art. He published "A Question of Honor," novel (1868); "The Works of John Henry Foley" (1875); "The Italian Pre-Raphaelites" (1887); "British Contemporary Artists" (1899), etc. Among his poetical works are "A Dream of Idleness" (1865); "Corn and Poppies" (1890); "The Christ upon the Hill" (1895); and "Patisoltes the Elder," published after his death.

MONKSHOOD. See Aconite.

MONLUC, mónluk', or MONTLUC, French marshal and military writer; b. Sainte Gemme, near Anch, 1502; d. Estillac, near Agen, July 1577. He entered the army as an archer; fought (1525) at Favia, accompanied the campaign of Francis I against Charles V and aided much in the outcome by improvements in tactics and in the artillery and engineering. His defense of Siena (1555) was brilliant, but he became hagard, as also he became a satirist, and gave rise to the severest against the Protestants. He was first to recommend the introduction of caring for the wounded and the testing of officers. His "Memoirs," which takes in 1521 to 1574
OLD WORLD MONKEYS

1 Hanuman Monkey (Semnopithecus entellus)
2 Negro Monkey (Semnopithecus maurus)
3 Green Monkey (Cercopithecus callitrichus)
4 Pig-tailed Monkey (Macacus leoninus)
5 Bonnet Macaque (Macacus cynomolgus)
6 Diana Monkey (Cercopithecus diana)
and Henry IV, and called the 'Soldier's Bible,' has considerable value in the history of warfare. The best issue is by A. de Ruble (5 vols., Paris 1865-72); 'Les Guerres d'Italie' (ib. 1880), was edited by Baudrillard; 'Consul Büstow, McPatty's Cob' (Zürich 1858); Nolte, 'Les mémorialistes, Monluc' (Paris 1892); Courteault, Paul, 'Blaise de Monluc, historien' (ib. 1908), contains a bibliography.

MONMOUTH, mōnˈmouθ, James, Duke of, royal pretender and claimant to the English throne: b. Rotterdam, 9 April 1649; d. London, 25 July 1685. He was the natural son of Charles II and of Lucy Walters, as seems certain from the king's open recognition of him, although he so closely resembled Robert Sidney, whose mistress his mother had been, that Sidney has been supposed his father. Placed under the guardianship of Lord Crofts, he assumed the name of James Crofts and was brought up in France under the care of Henrietta Maria, the queen-dowager; was recognized and summoned to England by his father after the Restoration; was married to Anne Scott, heiress of Buccleuch, and made Duke of Monmouth and served in Holland in 1673. His Protestant sympathies, his clemency to the Scottish Covenanters whom he defeated at Bothwell Bridge (1679), and a story persistently circulated (and denied before Privy Council by the king) that Charles had secretly married his mother in Holland, made him popular with the Protestant party; and Shaftesbury repeatedly urged the king to legitimize him and ensure a peaceable Protestant succession. He did his best to exclude James from the throne. After the Rye House Plot he escaped to Holland. Thence after the accession of James II he invaded England, possibly with the complicity of William of Orange, called the people to arms, raised a large force of Protestants, was proclaimed king at Taunton, but was defeated by Faversham at Solemancroft. Taken prisoner he begged for his life from the king to no purpose, and was executed at the age of 36. He was handsome, weak, fickle, and in his claims to the throne no doubt entirely unworthy of the title. The 'Diaries' of Evelyn and Pepys give the setting of Monmouth's career; his rising is sketched with some historical verisimilitude in Doyle's 'Micah Clarke' (1888), a romance. Consult also Roberts, 'Life of Monmouth' (1844) and Fern, A., 'King of Monmouth' (New York 1902); the latter work outlines the popular legend that Monmouth was not executed, a substitute having taken his place, and tells how the country people long expected his return.

MONMOUTH, Ill., city, county-seat of Warren County, on the Chicago, Burlington and Quincy Central railroads, about 95 miles north by west of Springfield. It is in an agricultural region, and nearby are coal fields and valuable clay deposits. It was settled in 1836, and in 1852 was incorperated, receiving a new charter in 1874. The chief manufactures are flour, stoneware, boxes, agricultural implements, stempullers, soap, flour and dairy products. The trade is principally in coal, grain, flour, poultry, dairy products and livestock. Monmouth College, founded in 1856 under the auspices of the United Brethren in Church, is here, also the Warren County Library. The chief city officers are the mayor, who holds office two years, and the council. The waterworks are owned and operated by the municipality. Pop. 10,000.

MONMOUTH, Battle of, in American history, a celebrated engagement between the American and British forces, the former commanded by General Washington and the latter by Sir Henry Clinton, which took place at Freehold, Monmouth County, N. J., 28 June 1778. On 18 June Sir Henry Clinton, acting under peremptory orders from the British Ministry, evacuated Philadelphia, which had been occupied by his army since the preceding September, and proceeded across New Jersey toward Brunswick, with a view of embarking on the Raritan. On hearing of this movement, Washington broke up his camp at Valley Forge, and having sent forward some light troops to harass the enemy started in pursuit. The English did not expect the march of both armies was slow. At Allentown, Clinton turned to the right by a road leading through Freehold to Sandy Hook, to embark at the latter place; and Washington, who had halted to be detained by the loss of his officers, and particularly of Gen. Charles Lee, from attacking the enemy, determined at once to give him battle. The evening of the 27th found the main body of the enemy encamped on high ground near Monmouth court-house, while the American advance, about 4,000 strong, under Lee, was posted at Englishtown, five miles distant, with the main body about three miles in the rear. The command of the advance had originally been given to Lafayette, with the consent of Lee; but the latter subsequently applied for and obtained the command. Gen. Lee engaged the rear division of the enemy, his orders being to hold it in check until the main body under Washington could come up. The Americans were at first successful, but owing to causes which have never been satisfactorily explained, the whole body soon after fell into a confusion and commenced a disorderly retreat, closely followed by the British. Washington, who was advancing hastily with the main body, received the first intimation of this movement in the second division poured along the road. Exasperated at the failure of Lee to execute his orders he rode up to that general and reprimanded him. Then he reformed them, and hastened back to bring up the main body. Lee, resuming his command, held his position with spirit until compelled to retire and brought off his troops in good order. The main body, which had meanwhile taken a favorable position on an eminence, with a morass in front and a wood in the rear, opened an effective cannonade upon the British. The latter, after an ineffectual attempt to turn the American left under Lord Stirling, directed their chief efforts against the right commanded by Greene, where Wayne, under cover of an orchard, was harassing their centre by a severe fire. To dislodge him Colonel Moncton advanced with a column of redcoats; but fell at the head of his troops, who were repulsed with considerable loss. The enemy at length fell back to the ground occupied by Lee in the morning, whither Washington was preparing to follow them when the approach of night and the exasperation of the command induced him to defer the execution of his plan until the morning. During the night Clinton effected a
noiseless retreat, and at daybreak was many miles away from the scene of battle. The excessive heat of the weather and the fatigued condition of the troops rendered a pursuit impracticable, and the royal army was suffered to proceed un molested to the place of embarkation. The American losses were 99 killed and 160 wounded; the British 300 killed and 100 prisoners including wounded. Their total loss by desertions and the casualties of battle during their march through New Jersey has been estimated at 2,000. For his conduct in this battle Lee was court-marshaled and suspended for one year from his command. Consult Carrington, H. B., 'Battles of the American Revolution' (New York 1876); Dawson, H. B., 'Battles of the United States' (New York 1888); 'Lee, C., Trial of, 4 July 1778' (New York 1864).

MONMOUTH COLLEGE, in Monmouth, Ill., a coeducational institution, under the auspices of the United Presbyterians. It was founded in 1856, and in 1915 there were connected with the school 26 professors and instructors and 451 students. There were about 12,000 volumes in the library; the grounds and buildings were valued at $340,000; the productive funds amounted to $284,000; and the annual income was about $49,000. The departments are the preparatory, music and art and graduate. The college courses consist of nine groups which lead to the degrees of B.A. and B.S.

MONNA LISA, or 'La Gioconda,' the famous masterpiece of Leonardo da Vinci, disappeared from the Louvre in Paris 21 or 22 Aug. 1911. The picture had been taken out of the frame, which was found on a back staircase of the building. For over two years the mystery remained unsolved. On 12 Dec. 1913 the Italian Minister of Education announced that the painting had been recovered in Florence. It had been stolen from the Louvre by an Italian workman named Vincenzo Perugia, who, as his reason for the theft, that he wished to retaliate on France for taking so many Italian masterpieces from Italy. On 5 June 1913 Perugia was sentenced to one year and 15 days' imprisonment with payment of costs.

MONNA VANNA. In 1902 Maurice Maeterlinck, who for a dozen years had been composing teneous dramas of the imagination, expressive of vague fears, and symbolic of the coming of death, turned in 'Monna Vanna' to a more usual type of play. In place of an airy plot but half suggested, he developed a close-knit story; in place of shadowy figures uttering childlike phrases and implying as much by their silence as by their talk, he presented living figures engaged in a practical debate; and in place of the merest impressionism of mood, he displayed a sudden practical interest in problems of conduct. Two such problems, in particular, he considered: first, as to whether a woman might ever honorably sell her honor; and second, as to whether her husband's old belief in the purity of her motives might ever justify her leaving him for one who could understand her. Monna Vanna, in order to save the lives of 30,000 starving Pisans, beseeched by the Florentines, consents to yield her honor to the commander of the enemy forces. But the latter, her boyhood lover, refuses to profit from the advantage he had taken of her, and, assailed by the state he serves, returns with her to Pisa as her guest. Her husband, who has raged against her decision to go to Prinzivalle in the first place, refuses to believe that this warrior has spared her. She can rescue in his engagement, his claim that her guilt and her own desire for vengeance, thus gaining possession of the keys to his dungeon, from which she will flee with him at the earliest opportunity. Thus Maeterlinck, like Shakespeare in 'Measure for Measure' and Phillips in 'Pietro of Siena,' though he raises the question of a woman's right to bar her honor for the life or lives of others, does not venture to exact of her the price. Such is his procedure, also, in two other plays, 'Monsieur A' and 'The Chaff.' Neither of these has been so successful upon the stage as 'Monna Vanna,' which may be read in the English versions of A. I. du Pont Coleman (1903), Charlotte Porter (1904) and Alfred Sutro (1907). The piece is discussed in the monographs on Maeterlinck by Gerard Harry, M. J. Moses, Edward Thomas and Una Clark.

FRANK W. CHANDLER.

MONO, mō'nō, a lake or 'sink' in Mono County, Cal., on the eastern slope of the Sierra Nevada, in a gold and silver mining region, about 180 miles only by land from San Francisco, and about 150 miles by railroad from Sacramento. The lake is circular in form, nearly 15 miles across; area, about 200 square miles, contains almost as a central point, Mono Island. A short railroad passes along the eastern shore, chief village station, Monolake. A number of streams enter the lake, but it has no apparent outlet. The waters are alkaline and contain no fish. A species of insect deposit their ova on the surface of the waters, and sometimes so great are the numbers that they look like islands. The Digger Indians collect the insects and ova and prepare from them an edible delicacy. See KOO-CHAA-BEE.

MONO, the common name in Guatemala for the Central American howling monkey (Mycetes vulpis). Mono, a lake or 'sink' in Mono County, Cal., on the eastern slope of the Sierra Nevada, in a gold and silver mining region, about 180 miles only by land from San Francisco, and about 150 miles by railroad from Sacramento. The lake is circular in form, nearly 15 miles across; area, about 200 square miles, contains almost as a central point, Mono Island. A short railroad passes along the eastern shore, chief village station, Monolake. A number of streams enter the lake, but it has no apparent outlet. The waters are alkaline and contain no fish. A species of insect deposit their ova on the surface of the waters, and sometimes so great are the numbers that they look like islands. The Digger Indians collect the insects and ova and prepare from them an edible delicacy. See KOO-CHAA-BEE.

MONOCACY, mō-nō'kā-sī, Battle on the, an engagement during the Civil War when on 4–5 July 1864, General Early with 20,000 Confederate troops, after driving the United States forces, under General Sigel, from the lower Shenandoah Valley, crossed the Potomac into Maryland north of Harper's Ferry, on his march to Washington, demonstrated on Sigel, who had retreated to Ma'Jand Heights and, crossing South Mountain by Turner's and Crampton's Gaps, concentrated his main body on the night of the 8th near Middletown in the Catoctin Valley, his cavalry, after some sharp skirmishing during the day, being in advance, between Middletown and Frederick. Meanwhile Union forces had gathered to oppose his march. Gen. Lew Wallace, commanding the Middle Department, with headquarters at Baltimore, on the 6th collected a mixed force, numbering 2,700 men, under Gen. E. B. Tyler, at Monocacy Junction, near Frederick, and disposed it to cover the Baltimore and Ohio Railroad and its bridge, and the Baltimore Pike with its stone-pier bridge. Cavalry was sent out on the road beyond Frederick, which ran into Bradley T. Johnson's cavalry and fell back. On the 8th Wallace was joined by a part of Ricketts' divi-
MONOCEROS — MONOCLINE

MONOCEROS, mō-nō-sér’-dōs, or UNICORN, from the Greek mónos, monos (single), and kéras, keras (horn), a constellation in the astronomical chart lying between Canis major and Canis minor, south of Gemini and Cancer, and introduced (1624) by Bartsch. It is made up of multiple stars, clusters and nebulae but has no star brighter than fourth magnitude.

MONOCHORD, a musical instrument with one string, invented by Pythagoras, and much employed by the ancients for the theoretical training of the voice and ear. The modified form of the instrument used in natural philosophy lecture-rooms is often called a sonometer; it consists of one or more strings stretched over a sounding-box. A string is fastened at one end of the box, and passes at the other end over a fixed pulley, which enables it to be stretched by means of weights; it passes over two fixed bridges near the ends of the box, and there is a movable bridge between to alter the length of the vibrating portion of the string. Strings are employed to produce musical sounds in the violin, harp, guitar, piano, etc. The sonometer is an indispensable piece of apparatus to lecturers on acoustics not only for the proof of the law of vibrating strings, but also to illustrate the relations of harmonics and the fundamental ideas of undulations.

MONOCHROMATIC LIGHT, in physics, a light which consists of a single color which is so pure and so definite that when it is examined by the spectroscope it gives but a single bright line. An approximately monochromatic light may easily be obtained by volatilizing salt, or some other sodium compound, in the flame of a Bunsen burner. An orange-yellow color, of great purity, results. Viewed by this light, everything white or yellow looks bright, while vermillion, ultramarine and other colors that do not contain any sensible proportion of yellow appear black. Monochromatic light is greatly used in physics, for the study of certain kinds of phenomena in opics.

MONOCHROME (Greek, mónos, single, and chroma, color), in ancient art, a painting executed in a single color. The word is generally applied to painting in the various shades of the same color. The first specimens of the art of painting were of one tint only, which was most commonly red, made either from na- nahir or mignon. Instead of red, white paint was sometimes used. The first four plates in the first volume of the paintings of Herculaneum contain several monochromes upon marble. The most numerous monuments existing of this kind of painting are on terra cotta.

MONOCLINE. See FOLDS.
MONOCOTYLEDONS—MONOLITHS

MONOCOTYLEDONS, plants of that great division of angiospermous plants whose embryos sprout in only one seed-leaf or cotyledon, which springs from one side of the axis of the growth; the opposite of Dicotyledons (q.v.). The term was employed as a synonym of Endogens, but this use is obsolete.

MONOD, mònô, Adolphe, French Protestant theologian: b. Copenhagen, 1802; d. Paris, 6 April 1856. He studied at Geneva, was minister there (1825-27), where he founded an Evangelical congregation; then at Lyons (1828-31). From 1836 he was a professor at Montauban, and from 1844 he was minister of the Reform Church. He wrote: 'Sermons' (Paris 1836; 3d ed. 4 vols.); 'La Femme' (Paris, 11th ed., 1894); 'Les adieux à mes amis et à l'Eglise' (1856; 12th ed., 1894). Consult Monod, S., 'Life and Letters of A. Monod' (London 1885); Stapfer, 'La grande préfication chrétienne en France. Bossuet, Adolphe Monod' (Paris 1898).

MONOD Frédéric, French Protestant clergyman: b. Monnaz, Switzerland, 17 May 1794; d. Paris, 30 Dec. 1863. He was educated at Geneva, but came under the influence of Robert Haldane and was ordained in 1818. He then went to Paris in service of the Bible Society, then assisted (1820) his father, a pastor at Paris, becoming (1832) titular pastor of the Oratoire. As editor of the 'Archives du christianisme au xixéme siècle sicle for 43 years, he became prominent (1848) when religion was menaced by the revolution. He favored the separation of Church and State and a Reformed Church creed; he, opening the synod, in September, found his motion for formulation of a creed lost. Thereupon he decided on, establishing a free church on orthodox basis in spite of the persuasion of his brother Adolphe (q.v.), the synod and the Paris Consistory. Resigning from his Oratoire pastorate (1849) he opened a small chapel and founded the Eglise Libre. He was successful in uniting the Protestant congregations who had left the State Church, and established a constitution the first clause of which stated: 'We believe that the entire Scripture of the Old and New Testament is inspired by God, and that constitutes the sole and infallible rule of faith and life.' At the Third Biennial Synod (1852) evangelization commenced and 22 posts exist at present besides affiliations, but the number of congregations (73 in 1873) has fallen off to 30 recently, many returning to the Reformed Church. Consult Monod, G., 'La Famille Monod' (Paris 1890); Péderez, J., 'Cinquante ans de souvenirs religieux' (Paris 1896).

MONODELPHIA, a name formerly applied to all mammals esteemed higher than marsupials (Didelphis) considered as a group distinguished primarily by the fact that the uterus or womb is single and shows a single uterine cavity. It has been shown that this distinction does not hold and the term has consequently been abandoned.

MONODY, from the Greek monodia, a solo in contradistinction to the polyphony, the song of several or many voices. The term has been brought down to modern times as conveying a sense of melancholy or sadness in its diction. Thus in literature a monody is a composition dwelling on some single emotional subject. In poetry the monody of the Greeks was a lyric solo in tragedy, an ode voiced by an actor on a painful motive, hence, when of a funeral or dirge character, it closely approached threnody. In music monody is a song for a single voice with musical accompaniment; monodies have been introduced into opera, Peri's 'Dafne' (1597) being probably the first occasion, and they have found a regular place in the growth of operatic composition as well as in oratorios. The term is also used recently as synonymous with monotony as "the monody of the waves," etc.

MONGEUS INFLORESCENCE. See DIOECIOUS FLOWER.

MONOGRAM (monos, single or only, and gramma, meaning "a single mark"), a character or cipher composed of one, two or more letters interwoven, being a sort of abbreviation of a name, used as a seal or badge, in coats of arms, etc. Monograms were much used on coins by the Greeks and the Romans. They were also used on standards, walls and tapestry, seals and documents, in which they were used not only by princes and ecclesiastical dignitaries, but also by magistrates and notaries. At the commencement of the Christian period their use was universal. The titles and rubrics of Greek manuscripts are frequently monographic, and numerous and diversified monograms are found in Latin manuscripts. Alphabetized like the Roman, of an angular character, have many letters corresponding parts; and the upright strokes, the horizontal lines and the curves are easily made by arranging them so that similar portions shall coincide, to produce numerous combinations. Monograms are generally combinations of more than two letters; when only two were incorporated they were generally designated ligatures. After the 12th century they gradually went out of use. The use of them remained longest in France, which was formally abolished by the Diet of Worms in 1495. The knowledge of monograms of this public kind is of great importance for the illustration of the monuments and documents of the Middle Ages, and therefore forms a particular branch of diplomatie; for they were much employed in the mediaeval diplomatic art. The term was subsequently applied to all sorts of ciphers and signs, with which artists, particularly painters and engravers, were accustomed to designate their works. The mediaeval seal-engraver, to economize as much as possible the annular space available for the legend, favored both ligatures and monograms. Many of those seals had the initials of their owners blended and incorporated with the devices, called merchant-marks, corresponding somewhat to the modern trade-marks, which were the stamp, as it were, by which the work of each artist was known. Many of the modern monograms are copied from mediaeval examples. Consult Bruillot, 'Dictionnaire des Monogrammes' (1832-34); Duplessis and Bouchot, 'Dictionnaire des Marques et Monogrammes de Graveurs' (1886-87); Bouvenne, 'Les Monogrammes Historiques' (1870); Fagan, 'Collectors' Marks' (1883).

MONOLITHS. See STONES, STANDING.
MONOMANIA—MONOPOLI

MONOMANIA, from the Greek μόνος, monos (single), and μονία, monia (madness). That form of mental derangement which distinguishes itself by an abnormal conception or action on one subject only, leaving the mind sane on all other points. The eccentricity of delusion does not extend to any other subject or object. The term craze is often used to cover mild forms of monomania.

MONOMETALLISM, the principle of having only one metallic standard in the coinage of a country, opposed to bimetallism. See BiMETALLISM; COINAGE; CURRENCY.

MONONA, mō-nō′nah, a lake in Wisconsin, one of a group of lakes near Madison in Dane County. See FOur LAKES.

MONONGAHELA, mō-nōng-ga-bē′lə, a river which has its rise in the northwestern part of West Virginia, and flows north into Pennsylvania, where it unites at Pittsburgh with the Allegheny to form the Ohio River. The two head-streams of the Monongahela are in the Alleghany Mountains near the headwaters of the Potomac. The two head-streams of the Monongahela unite near Fairmont in Marion County, Va., and from the point of junction on the north become a swiftly flowing stream, furnishing water power for several manufacturing towns and cities. The whole course is very irregular; the length is about 300 miles. It was made navigable about 106 miles from its mouth to Morgantown, in Monongahela County, W. Va., by a system of locks, nine in number, and other locks above Morgantown now make the river navigable as far as Fairmont. The largest tributary is the Youghiogheny, a navigable river, which has its source in the mountains in the southwestern part of Garrett County, Md., and enters the Monongahela near Pittsburgh. The Cheat River, the next largest tributary, is a stream in the northeastern part of West Virginia. It joins the Monongahela in Pennsylvania, a few miles north of the border. The river flows through a country which has fertile farm lands in the valley and the whole section is rich in coal. Near Pitts- burgh, then Fort Duquesne, on the banks of the river, on 9 July 1755, the French and Indians won a victory over Braddock's Anglo-American troops.

MONONGAHELA CITY, Pa., city, in Washington County, on the Monongahela River, and on the Pennsylvania, and the Pittsburgh and Lake Erie railroads, about 32 miles south of Pittsburgh. It is in a coal region, in which the chief industries are coal mining and manufacturing. It was settled in 1792 by Joseph Parkison, was incorporated as a borough 3 April 1833 and chartered as a city 24 March 1873. It has large industrial establishments, employing about 60,000 persons, or about 600 more than the whole population as given by the federal census of 1900. The chief manufactures are glass, foundry and machine-shop products, flour, lumber, chemicals and paper. It has considerable trade in the homogeneous and in coal and farm products. The principal buildings are 15 churches, six public schools, an academy, government building, memorial hospital and municipal building. The four banks contain a combined capital of $2,500,000. The government is administered under a third-class city rule. The
government provides for a mayor, comptroller and a board of commissioners, four in number, the mayor being president of the board. All are elected every four years. The majority of the inhabitants are American born, but there are quite a number of Italians and Slavs. Pop. 9,600.

MONOPHYSITES (from Greek monos, single, and physis, nature), those followers of the opinion in the early Church of the Oneness of the Godhead but one nature to Christ in contradistinction to the orthodox doctrine that he was both divine and human, true God and true man. The Monophysites were mainly confined to the Eastern Church and obtained no footing in the West. The edict called Henoticon, issued by the Emperor Zeno in 482, was not able to quiet the long and often bloody contests incident to this controversy, and the orthodox Church, by its sentences of excommunication, occasioned a formal secession on the part of the Monophysites. This separation took place in the first half of the 6th century. Nor did they remain united among themselves. In 519 controversies arose among them respecting the question whether the body of Christ was corruptible or not. About 560, a Monophysite, Askunnges, and after him Philoponus, a noted Alexandrian philosopher of that century, conceived the idea of stoning the three persons of the Deity three Gods. These Caerites and their adherents, even in the eyes of the Monophysites, were heretics, and were the occasion of many Monophysites turning Catholics. In Egypt, Syria and Mesopotamia the Monophysite congregations, however, remained the strongest, had patriarchs at Alexandria and Antioch, existing without interruption, by the side of the imperial orthodox patriarchs; and after the Syrian, Jacob Baradeus had, about 570, established their religious constitution, formed the independent churches of the Jacobites and Armenians, which separated from the Greeks as well as the Romans, and have for that reason been able to maintain themselves since the 7th century, even under the dominion of the Mohammedans. Ex- cepting their doctrine of one nature in Christ they coincide, in the main points of belief, with the Greek Church; their worship also resembles the Greek rather than the Roman, but has, from their national character and their superstition, received variations, which are most striking in the religious constitution of the Egyptian Jacobites (q.v.). See JACOBITES; ARMENIAN CHURCH under ARMENIA.

MONOPLEGIA, mōn-ō-plē′ji-ə, a paralysis limited to one organ or part, e.g. one arm or one leg. If both arms or legs are stricken the condition is called paraplegia; while if arm and leg and other organs on one side are affected it is called hemiplegia. It is caused by circumscribed lesions of the nervous system, in brain, spinal cord or nerves. An example of monoplegia is Bell's palsy (q.v.). See BRAIN, DISEASES OF.

MONOPOLI, mō-nōp′ō-lē, Italy, town, in the province of Bari, on the Adriatic Sea and on the Bari-Brindisi Railway. It is the site of the ancient Minopolis and the present seat of a bishopric. Its old castle and remains of the encircling wall and its prehistoric graves lend it considerable archaeological interest. It has a 12th century cathedral, a gymnasium, technical
school, open harbor, and its industrial activity extends to oil-pressing, soap-making and trading in oil and wines. In 1911 it had a population of 24,104.

MONOPOLY (Greek, monopolia, single or sole selling) is an exclusive right, secured to one or more persons, to carry on some branch of trade or manufacture, in contradistinction to a freedom of trade or manufacture enjoyed by all the world. The most frequent monopolies formerly granted were the right of trading to certain foreign countries, the right of importing or exporting certain articles, and that of exercising particular arts or trades. Such exclusive rights were very common in Great Britain previous to the accession of the house of Stuart, and were carried to an oppressive and injurious extent during the reign of Queen Elizabeth. The grievance at length became so insupportable that, notwithstanding the opposition of government, which looked upon the power of granting monopolies as a very valuable part of the prerogative, they were abolished by an act of 1623. However, various companies for the exploitation of the colonies and possessions of Great Britain, such as the Honourable East India companies (q.v.), of an essentially monopolistic nature, continued to exist until well on in the last century. Nevertheless this act secured the freedom of industry in Great Britain, and has done more perhaps to excite a spirit of invention and industry and to accelerate the progress of wealth than any other in the statute book. Government monopolies, however, are common on the Continent, and constitute one of the chief means of obtaining revenue. There is one species of monopoly sanctioned by the laws of all countries that have made any advances in the arts, namely, the exclusive right of an invention or improvement for a limited number of years. It is, in fact, a kind of property created by law for the benefit of the inventor, and which he could not effectually acquire or secure without the aid of the law. The exclusive right of an author to the publication of his own work is hardly a monopoly, but rather a species of property resting upon the same principle as the right to lands or chattels. The law, therefore, by giving an author the exclusive right to the publication of his own work for a limited number of years makes no grant; it is only allowing him what is his own for a limited time. But the exclusive right to the use of an invention or improvement is a monopoly, since it deprives others, for that period, of the chance of the advantage of making the same improvement, discovery or invention themselves. Capitalists, either single or combined, may produce commodities so much better and cheaper than others can do as practically to command the entire sale, and are in popular language called monopolists. But having no legal rights or advantages that are not open to all, they are not in the legal sense in possession of a monopoly. In the oldest sense of the term they are monopolists; but since the term is now used in an unfavorable sense, its distinction is applicable to these by only just. It may be assumed as an economical axiom that every interference with absolute freedom in acts of exchange can be defended only on the highest grounds of public policy. Any advantage given to a particular interest is not only a wrong to the general public, but will in time bring a just retribution to the favored class.

In the United States the only monopolies that the laws and the individual states look on with favor consist of the post office, which is a government monopoly, and the rights granted to individuals under the patent and copyright laws. Monopolies commonly known as trusts are looked on with aversion, and various States have enacted laws making a trust an illegal combination of individuals. See TRUSTS; COPYRIGHT; PATENT.

Bibliography.—Ely, R. T., 'Monopolies and Trusts' (New York 1900); Levy, H., 'Monopoly and Competition' (New York 1911); Schäffer, 'Theorie der ausschliessenden absatzverhältnisse' (Tübingen 1867).

MONORAIL, a single-rail type of railway designed for economy of construction, increased speed and for mountainous regions. The first idea of a single-rail railway dates back to 100 years ago, and many such are now being used in various parts of the world. The first car run on a single rail, the invention of M. Charles Martigues, has been in practical operation for many years in Djibon, a French-African port. The car is kept vertical by its attachment to a laterally placed horse, which balances the car as a hansom is balanced by attaching the horse in front. The development of this primitive idea attracted the genius of all great civilized countries, and aided by government patronage, individual effort and fortunes, made great progress.

An early type of monorail was one where all the different resistances to a swiftly moving car or train, except the atmospheric resistance, was concentrated in the vertical plane of the centre of gravity of the car or train, being par-
stability is almost entirely preserved naturally and automatically, and only slight strain is on the dependent tension members. The magnitude of the downward forces is a matter simply of weight of cars; the upward forces are a matter of mechanical moments or leverages; the upward forces may amount to 10 per cent of the downward forces for usual cases. The downward force is delivered through the medium of the main central wheel, bearing on the two central rails as on a single rail. The side clutch wheels, that bear against the inverted girders or rails, guide, clutch and secure the car truck to its normal plane or path, forcing the truck to follow precisely any assigned inclination; for example, around curves. The central bearing rails and the inverted side clutch rails being laid with precision as to line, grade and inclination, the lateral and top-heavy swaying and recurrent oscillation now observ-

able in locomotives in motion can never obtain; nor can the truck derail, as it is clutched to the track.

The propulsion of cars is effected by electric motors, two or four motors to each truck, the number of motors being dependent upon the starting pull, acceleration and speed required.

William B. Mack's design, shown here, appears to have been awarded more consideration among engineers than any of the many similar plans patented. As far back as 1872 a charter was granted in the State of New York for the building of a hanging railroad which had the general mechanical principles of the hanging roads more recently exploited in Germany, France and Russia, but the Cook system, shown here, appeared to be the only serious effort made to date at hanging cars on the side of the structure in place of underneath.

E. Moody Boynton patented plans for a monorailway which were approved by such experienced railroad men as Austin Corbin. Several short test roads were built and operated. The Tunis plan, here illustrated, is a modification of Boynton's. As will be seen, the single rail is laid on the ground like the rails of steam roads and trolley lines. Over the single rail at fixed intervals are trusses, or bents, joined by cross pieces at the top and supporting the guides which prevent the car from toppling over. The car itself also embodies some unique and interesting features. It is narrower than the standard trolley or railroad car and rests on a single pair of wheels, or, in the full-size coach, on two trucks of two wheels each, arranged tandem, just under the centre of the floor, the platform and superstructure being balanced on them. The car is balanced on the single rail; the wheels being of the grooved pattern. So accurately are the weights adjusted that a slight lurch of the body will sway the car from side to side. At first some apprehension was expressed that in going around curves the centrifugal motion of the car would impose too great a strain on the bents, but this fear has proved wholly groundless. By allowing for the centrifugal force by the slant toward the inner side of the circle which is accomplished on ordinary roads by raising the other rail the weight is thrown off the bents and approximately equalized.

The English monorail known as the Behr System, here illustrated, has been in operation for a number of years at Ballybunnion, Ireland,
and was successfully tested by the Belgian government, securing a speed of 83 miles per hour with a car weighing 70 tons. In 1901 and 1902 the English Parliament granted Mr. Behr's company the right to construct a road between Manchester and Liverpool, after the plans had been examined and approved by many eminent engineers.

The track is a single rail of the same shape and weight as generally used on steam roads. This rail is fastened at the top of an A-shaped structure made of steel. The structure is riveted to steel ties firmly imbedded in cement and rock ballast. The triangular supports for the rail are only four feet high, and one is placed every three feet three inches. At each side and 18 inches from the ground is placed a light guide rail to keep the moving car in position. The entire weight of the car rests upon large grooved wheels which travel upon the large rail at the top of the framework. As electric motors are used to propel the train, each of these wheels is a "driver." Current is conducted on rails placed upon the ties, but insulated from them.

The car consists of two compartments, one on each side of the structure, and are 60 feet long, weighing four tons each.

The monorail idea has been exploited in Germany, France and Russia in its application to hanging cars, but Germany alone has secured results. A suspended overhead railway system of rapid transit is now in operation between the three manufacturing towns of Vohwinkel, Eberfeld and Barmen, near Cologne, Germany. The road is built on a system of latticed longitudinal girders, one vertical and two horizontal, assembled in the form of an I-section. The main girders form the web of the I, and the lateral girders, which give the requisite lateral stiffness, serve as the top and bottom flanges of the I. Diagonal tie-rods extend from the upper panel points of the central girder to a connection with the chords of the bottom lateral girder. The last mentioned chords consist of steel I-beams, and upon their upper flanges is laid the single T-rail, from which the cars depend and on which they run. The girders, which vary in span from 21 to 33 metres (68.88 feet to 108.24 feet), are carried upon supports varying in structure with the locality where they are used. Where the railway is constructed above the Wupper River the A-frame style of pier is used, while in the towns through which the line passes the trusses are carried upon substantial U-frames. The A-frame consists of two rectangular latticed struts, which are united at the top by a rectangular plate yoke.

The cars are 37.7 feet long, 8.5 feet high and 6.88 feet wide; are therefore fairly long and narrow, and are slightly tapered at the ends. They have a seating capacity of 50, and are built with two side doors opening inwardly, and two auxiliary doors on the rear of the car. The total weight of each car is 12 tons. The cars are freely suspended from two trucks spaced eight metres apart and having a diameter of 0.9 metres. The wheels are mounted in tandem to run on a single rail and are driven by two electric motors of 30 horse power each, through the medium of transmission gearing. The motor trucks receive current by means of a slipshoe and a contact rail, which is carried on the bottom of the lateral girder, somewhat to the inside of the main supporting beam. The truck-frames embrace the rail-girders and the rails so closely that a play of seven millimetres is allowed and that derailment is impossible. If a wheel or axle should break the cars would be held up by the frames.

Oscillation of the car is limited by two projections on the lower part of the hook-shaped frame. The cars swing around the curve in a slightly-inclined position and spontaneously re-assume their normal vertical position when a straight part of the rail is reached. To the passengers the change in equilibrium is imperceptible. Since a sudden change in equilibrium causes an oscillation proportionate to the velocity and the angle determined by the radius of the curve, which oscillation lies within twice the value of this angle, comparatively long transitional curves have been provided by reason of which the equilibrium is gradually changed, with the result that almost inappreciable oscillations are produced.

A Russian electric engineer named Hippolyte Romanoff has invented a monorail of some merit. The invention consists of a monorail hanging car as shown here. The rails are supported by T-shaped columns, the carriages being suspended in the air and propelled by wheels running along the rails. These wheels are without flanges, which Romanoff claims travel speed by clinging to the rails while rounding curves, but are prevented from leaving the rails by means of smaller wheels which grip the rails horizontally. An auxiliary track runs parallel with the rail. The cars have three supports each. If the first is broken the second comes into play automatically, and then the third. Should any one of the cars be stopped by an accident or for any reason other than the natural one of stopping at a station, all the cars behind would stop also, thus preventing any rear-end collisions.

In May 1907, with a gyroscope monorail car Mr. Louis Brennan, C. B., the inventor of the Brennan torpedo used by the British government, demonstrated before the Royal Society of Great Britain that he had discovered a practical application of the gyroscope.

The invention is, briefly, a system by which a vehicle or a train of vehicles supported by a single low floor rail and suspended by flexible wires maintains a perfect equilbrium in motion regardless of the distribution of the load, wind pressure, etc. Automatic stability mechanism carried by the vehicle itself endows it with this power. The mechanism consists essentially of two flywheels rotated directly by electric
monotonicism in opposite directions at a very high velocity and mounted so that their action can be utilized. These flywheels are mounted on high-class bearings and are placed in exhausted casing so that the friction among them is reduced to a minimum, and consequently the power required to keep them in rapid motion is very small. The stored up energy in the flywheels when revolving at full speed is so great and the friction so small that if the current is cut off altogether they will run at sufficient velocity to impart stability to the vehicle for several hours, while it will take from two to three days before they come to rest. The model car, while running on a curved monorail, leans and so automatically balances the effect of centrifugal force, while a single wire hawser stretched across a river or ravine is all that is necessary in the shape of a bridge.

In 1909 Froelich, a German, developed another type of gyroscopic car with a so-called "precession motor," which did not pass beyond the experimental stage, and about two years later the Schilovsky system was brought out in which the gyroscopic principle is also employed. The Schilovsky Institute (Vols. CLXIX and CLXXIV) and files of the Scientific American, the Engineer and Engineering (London).

**MONOTHEISM** (Greek μόνος single θεός god), *in religion*, the belief that God is one or that there is only one God. Several religious beliefs are in opposition to this tenet: polytheism, which holds that there are many gods; atheism, which denies the existence of God altogether; and scepticism or agnosticism, which doubts the existence of a supreme being. The historical opinions of monotheism are very ancient and involved, and need not be dealt with here. However, in the history of religious thought, three philosophical types of monotheism have developed which are distinct enough logically, if not practically, to make analysis possible.

The first type is exemplified in the later monotheism of the Israelitish tribes. The unity of God is derived from an ethical concept of the universe. God is one, holy and the righteous judge of the world. He is the dispenser of justice, the giver of the law. He derives his power from the fact that he is the creator and, therefore, he enjoins upon his creatures ethical responsibility and heightened moral consciousness. Apart from the world, he sits in supreme jurisdiction over it.

In Greek philosophy we find the second type of monotheism, in which God as a unity or unifying principle is the source, the explanation of the order and rational coherence of the universe. According to Aristotle, he is at once the commanding general of the universe and the rational order of it. The Hindu philosophy represents the third type. In its teaching, a distinction is maintained between the reality of the world and the reality of God. The earth on which man lives and his phenomena are of the "stuff that dreams are made of"; it is ephemeral, transitory, unreal. God, who is imminent in all things, is at the same time transcendental, superior — the ultimate reality. Knowledge of God cannot be obtained by intellectual reasoning alone, it must come as a direct revelation by insight to those souls who are best prepared to receive it. Therefore, the contemplative life is to be desired and commended in preference to the practical. Logically, this mysticism argues that, since knowledge obtained through experimental experience is at best defective and limited, some comprehensive perfect reality partaking of the nature of all things must exist somewhere — and this is the one God.

These various types of monotheism did not exist as pure concepts practically, however. The continued study of the problem of the relation of the world to God brought about interesting syntheses of these several philosophies. The intellectualism of Greek monotheism which conceived the Logos or divine essence of things to be the ruler and the order of things at the same time, soon found its position besieged by ethical questioning. How establish the proper relationship between a remote, righteous God who orders all things in the world? How reconcile, in other words, the Greek rational and the Jewish ethical monotheism? The Neo-Platonic school turned to mysticism for the solution. Likewise, early Christianity found itself beset with similar problems, and in its attempts to find recourse to transcendental philosophy necessary. In Christian monotheism, a curious synthesis of all three monotheistic concepts is found, together with the doctrine of the personality of God. The ethical and mystical concepts predominate. The existence of a rational world is acknowledged to the point of fixing the ethical responsibility of human relationships. But beyond that, the things of the earth are untrue, imperfect, unreal. The whole truth is in God, of whom knowledge is obtained through insight and revelation. The concept of immortality solves the problem of injustice and evil, for in the after life all ethical readjustments are made. The Hellenistic concept of the universe as a well-ordered system capable of being fathomed by the intellect also survives in Christianity in the attempt to rationalize its doctrines and to build up a definite convincing system to establish the unity between the finite world and its infinite ruler.

Constant revivals of the third type of monotheism arise also out of the problem of synthesizing all three forms. The escape from the difficulties attendant upon the acceptance of any of the three per se is generally in transcendentism of some form or in scepticism. True monotheism must take into just consideration the ethical, rational and intuitional elements of religious philosophy.

**MONOTHELETES** (Greek, monotheletai, from mones, and thelo, I will), a sect who maintained that though Christ had two natures co-existing distinctively in the unity of the person, yet these natures possessed or acted by but a single will — the divine, which so predominated over or absorbed the human as to deprive it of all action or efficiency. They have been regarded.
as an offshoot of the Monophyist, though they themselves denied all connection with them. The doctrine originated with the Emperor Heraclius, who in 630, by adopting a middle course, attempted to reconcile the Monophyists to the orthodox church. The attempt was for a time successful. Heraclius confirmed Sergius I., patriarch of Constantinople, on the new dogma, and he not only approved of it, but became its most active propagandist. At his instance, and mainly in consequence of his representations, Pope Honorius I. addressed two letters to Sergius, which according to some interpreters would seem to favor Monotheism. The successors of Honorius condemned the Monothelites, and Martin I., in 649, issued a bull anathematizing them. For this he was sent prisoner to the Chersonesus by the Emperor Constantius, who protected the Monothelites. The sixth ecumenical council, that of Constantinople (680), condemned this heresy, and with this the early controversies on the incarnation became gradually fainter, till the disputes among the Iconoclasts and their opponents.

**MONOTREMATA.** An order of mammals belonging to the subclass Prototheria (q.v.) and represented by the duckbill (q.v.) of Australia and Tasmania, and the spiny anteaters (see Echidna), the range of which extends into New Guinea. In many respects they recall the Sauropsida and especially the birds, a fact reflected in the name Ornithodelphia sometimes applied to them. The most marked of these peculiarities are the obliteration of the skin of the skull, the possession of a terminal canal (cloaca) into which both the digestive tract and the urogenital organs empty; the possession of a well developed coracid bone; and the fact that they do not, like other mammals, bring forth living young, but lay eggs. After the eggs are laid they are transferred to a temporary pouch beneath the abdomen, where they hatch and the young are nourished by the mammary glands.

**MONOTYPE.** See Composite Ma-chinists.

**MONOXIDE.** In chemistry, a compound consisting of one atom of oxygen united to one atom of another divalent substance, or of one atom of oxygen united to two atoms of some other monovalent substance. The word is used when it is necessary to distinguish two or more states of oxidation of the same substance. Thus CO is called "carbon monoxide," in distinction CO₂, which is called "carbon dioxide." Similarly Na₂O is "sodium monoxide," while Na₂O₂ is "sodium dioxide." See Oxide.

**MONREALE.** mòn-rä’-ä’-lå’. Italy, town in the Sicilian province of Palermo, five miles southwest of Palermo city and connected with it by surface car tracks. It is the seat of an archbishopric, has a well-preserved cathedral (built 1174-89) with old bronze doors and beautiful mosaics, monumental graves of Norman kings; also there is a Benedictine abbey dating from the 12th century with a magnificent cloister of 216 mosaic pillars and large library. Among its other public edifices are a gymnasium and a lyceum. In 1911 it had 20,103 inhabitants.

**MONRO, mön-roe’,** Alexander, Scottish anatomist: b. London, 8 Sept. 1697; d. Edinburgh, 10 July 1767. He studied at Edinburgh, afterward in London under Cheselden, and still further under Bouquet, and at the latter under Bell. He attended the wounded on the field at Prestonpans (21 Sept. 1745), and was an accurate observer, having studied the effect of the presence of solid bodies in the vermiform appendix, and otherwise anticipated later views. He resigned his professorship in 1764. His principal work is "Observations on the Anatomy of the Human Bone" (1726), once a popular textbook.

**MONRO, Alexander, known as Secundus,** Scottish anatomist: b. Edinburgh, 20 May 1733; d. there, 2 Oct. 1817. He was son of Alexander Monro, called Primus (1697-1767) (q.v.). Educated at Edinburgh University (M.D. 1755), he also studied on the Continent, and in 1759-1808 lectured at Edinburgh. In 1783 he described the communication between the lateral ventricles of the brain, known as the foramen of Monro. He published "Three Treatises on the Brain, the Eye, and the Ear" (1797) and other medical works.

**MONRO, Alexander, known as Tertius,** Scottish anatomist: b. Edinburgh, 5 Nov. 1773; d. Craiglockhart, near Edinburgh, 10 March 1859. He was the son of Alexander Monro (1733-1817) (q.v.). He obtained his M.D. at Edinburgh in 1797, the same professor with Monro Secundus of medicine, surgery, and anatomy, and in 1817-46 was sole professor. His works include "Observations on Crural Hernia" (1803), and other publications.

**MONRO, Dana Carleton,** American historian: b. Bristol, R. I., 7 June 1866. He was graduated (1887) at Brown University, then studied (1889-90) at the universities of Strassburg and Freiburg. He was instructor and assistant professor of Roman and mediaeval history (1893-1902) at the University of Pennsylvania, and professor of European history (1902-15) at the University of Wisconsin. In 1915 he accepted the chair of mediaeval history at Princeton University. He received the degree L.H.D. from Brown University in 1912. From 1894-1902 he was editor of "Translations and Reprints from Original Sources of History," and has written "Mediaeval History" (1902); "A Source Book of Roman History" (1904); "Syllabus of Mediaeval History" (7th ed., 1913); "German War Practices" (1917), and was a collaborator on "Essays on the Crusades" (1902) and "Mediaeval Civilization" (1914).

**MONROE, Harriet,** American author: b. Chicago, Ill., 23 Dec. 1860. She was graduated from the Visitation Academy, Georgetown, D. C., in 1879 and has since devoted herself to literature. In 1889 she wrote the text of the cantata given at the opening of the Chicago Auditorium and in 1891 of the committee the "Columbian Ode," which was sung at the dedication ceremonies at the World's Columbian Exposition in 1892. She has published "Valeria and Other Poems" (1892); "John Willborn Root—a Memoir" (1896); "The Passing Show—Five Modern
MONROE

Plays in Verse (1903); The Dance of the Seasons (1911); You and I — Poems (1914). In 1912 she established and became editor of Poetry, a magazine of verse.

MONROE, James, fifth President of the United States: b. in Westmoreland County, Va., 28 April 1758; d. New York, 4 July 1831. His father, Spence Monroe, was descended from Hector Monroe, an officer of Charles I; while his mother, Eliza Jones, of King George County, was of Welsh descent. Monroe attended William and Mary College, but with the outbreak of the Revolutionary War he became a lieutenant in a Virginia regiment (1776). He was with his troops at the battle of Harlem Heights, White Plains and at Trenton, where he distinguished himself, being wounded in the shoulder. During the campaign of 1777–78 Monroe served on the staff of Lord Stirling with the rank of major, taking part in the battles of Brandywine, Germantown and Monmouth. As staff officer Monroe lost his place in the Continental army, and failing to raise a new regiment authorized by the legislature of Virginia, Monroe withdrew from active military service, devoting himself to volunteer efforts in defense of his State. In this capacity he attained the rank of lieutenant-colonel in a new regiment to be raised in Virginia. In 1780 his military services were definitely interrupted and concluded by his undertaking the study of law under Thomas Jefferson, then governor of the State. So began the life-long friendship and intimacy between these two representative Virginians. In 1782 he was elected to the Virginia legislature, and although still a very young man, was appointed to the executive council. From 1783 to 1786 he served in the Congress of the Confederation where he played a conspicuous part in endeavoring to strengthen the Confederation's powers for the regulation of commerce, and the favorable report of the special committee appointed as the result of his motion on this topic contributed to the ultimate alteration of the articles. Monroe also disclosed a lively interest in the development and division of the West, on the right of the United States to the navigation of the Mississippi, on the subject of trade between the States and in the public lands. On retiring from Congress he began the practice of law at Fredericksburg, Va.; but in 1787 he was chosen a member of the Virginia legislature and in 1788 a member of the State convention to ratify the Federal Constitution. In this convention Monroe sided with the opponents of the new draft, and in the two main speeches which he made—characterized as dull and weighty—he objected to the ratification on account of the power of direct taxation, absence of a bill of rights, the lack of legislative and executive responsibility, and the re-eligibility of the President. In 1790 he was selected by the legislature United States senator to fill the vacancy caused by the death of William Grayson. From 1790 to 1794, as United States senator, he was classed as one of the most decided Anti-Federalists of the administration of Washington. Yet, in 1794 he was appointed Minister to France to succeed Governor Morris, at the same time Jay was sent to England. These were troublesome days for American commerce when the United States endeavored to preserve its strictly neutral attitude in the death struggle between France and England. Morris had made himself unpopular to the Republican government of France, and undoubtedly one reason for Monroe's appointment was his well-known opposition to England. In other words, Monroe's selection was "forced by the exigencies of the situation." It was hoped that Monroe's well-known French inclinations would harmonize the strained relations between France and the United States. He was instructed to assure France of the firm friendship of the government; the determination of the United States to maintain strict neutrality; to help adjust outstanding disputes between the two lands over spoliations, but to refrain from negotiating a treaty of commerce; and to quiet French suspicions regarding the Jay mission. Monroe was not informed of the wide latitude of Jay's instructions toward negotiating a treaty of commerce with Great Britain. Trouble therefore ensued, due to the fact that Monroe's French sympathies caused him to act indiscreetly on certain occasions; and also, it is said, he was not fully in the confidence of his home government concerning the Jay negotiations. Accordingly, in 1796, he was recalled because the Federalists criticized his republicanism and his failure to appease the French. In 1797, he had accomplished almost all the points set forth in his instructions by securing the recall of the French decree injuring American commerce, by protecting the interests of American citizens in France, by securing treaties with Algiers and Spain and by maintaining peace between the United States and France. On his return to America, Monroe published, in December 1797, a defense of his conduct in a pamphlet of 500 pages entitled A View of the Conduct of the Executive in the Foreign Affairs of the United States as connected with the Mission to the French Republic during the years 1794–96. The pamphlet was widely circulated and aroused much discussion throughout the nation. In 1799 Monroe was chosen governor of Virginia and occupied this office until 1803, when he was appointed by President Jefferson as Envoy Extraordinary and Minister Plenipotentiary to France to aid the resident Minister, Robert R. Livingston, in obtaining the territory at the mouth of the Mississippi, including the island of New Orleans, as an outlet for the traders of the West, and to cooperate with Charles Pinckney, our Minister at Madrid, for cession of the Floridas. By the secret treaty of San Ildefonso (October 1800), Spain had ceded Louisiana to France, and in 1801 the Spanish intendant had given notice that New Orleans "would no longer be a place of deposit." This had aroused the inhabitants of the West and had occasioned the appointment of Monroe. However, by the time Monroe had reached Paris, Napoleon had given up his scheme of a colonial empire, and through one of his ministers had offered all of Louisiana to Livingston. On the arrival of Monroe, the two Ministers determined to exceed their instructions and so negotiated the purchase of Louisiana. In the same year he went as Minister to England and while there he met Nicholas Biddle of Philadelphia, who was then touring Europe. A friendship sprang up between the young man and the Minister which continued
throughout their lives and ultimately resulted in Biddle's appointment by President Monroe as one of the directors of the Second Bank of the United States. In 1804 he proceeded to Spain to help Pinckney define the boundaries of Louisiana and acquire the Floridas. Failing to accomplish his purpose, Monroe returned to England where, assisted by William Pinckney of Maryland, a treaty was drawn up (December 1806) between England and the United States. But the treaty failed to provide against the impression of American seamanship and to secure indemnity for the losses, and accordingly Jefferson "pigeon-holed" it. In 1807 Monroe returned from England only to find his conduct the subject of much discussion; this called forth a pamphlet in defense, and for a time caused an estrangement between Monroe and Jefferson. In 1810 he was elected to the Virginia legislature, and in 1811 governor of the State, which office he held from January to November, when he resigned to become Secretary of State under Madison. He held this office until his elevation to the President's chair during part of the time acting as Secretary of War. In both offices he displayed energy and diligence.

In 1816 Monroe was elected President by the Republican party, receiving 183 electoral votes against 34, for Rufus King, the Federalist candidate. His administration marks the advance of what is erroneously called the "era of good feeling," when political rancor is supposed to have ceased. As a matter of note during his administration the first crisis of the slavery issue took place, resulting in the Missouri Compromise and the Seminole Campaign of 1817, laying the foundation for the political strife of the Jacksonian era. In 1820 he was re-elected, receiving all the electoral votes but one, and this was cast by an elector of New Hampshire for J. Q. Adams; in order, it is said, that no one might share with Washington the honor of a unanimous election. The important events of Monroe's two administrations are the Seminole Campaign, 1817-18; the acquisition of Florida, 1819; the Missouri Compromise, 1820; the passage of the Cumberland Road bill on constitutional grounds in 1822, and his celebrated message of 2 Dec. 1823, setting forth the Monroe Doctrine (q.v.). In 1825 Monroe retired to private life and took up his residence in Loudoun County, Va. He took part in the Constitutional Convention in 1829 called to revise the State constitution. In his later years, owing to financial difficulties, he was forced to seek aid from Congress, which body in 1826 authorized the payment of $30,000 to him, and after his death the purchase of his papers. He died in New York in 1831, and in 1858, the centennial year of his birth, his remains were re-interred with solemn ceremonies at Richmond, Va.

Theodore Roosevelt has characterized Monroe as "a very amiable gentleman, but distinctly one who comes in the category of those whose greatness is thrust upon them." This statement is undoubtedly true. Monroe was not a good speaker, he lacked tact and was often indiscr et, and he often allowed party feelings to guide the better of his own judgment. Yet he was highly respected by his associates, and retained their friendship and admiration until his death.

R. C. McGraw, Assistant Professor of History, University of Cincinnati.

MONROE, La., city, parish-seat of Ouachita Parish, on Ouachita River, and on the Missouri Pacific and the Vicksburg S. and P. railroads, Arkansas and Louisiana Midland Railway and L. R. and Monroe Railway, about 155 miles north by west of Baton Rouge and 97 miles east of Shreveport. It has steamers connection with New Orleans and way towns on the bay. It is in an agricultural section in which raising cotton, corn, oats, cattle and hogs and lumbering are the chief industries. There are cotton-seed oil, cotton, corn, cotton presses, brick yards, lumber mills and woodenware factories. Pop. 17,500.

MONROE, Mich., city, county-seat of Monroe County, on the Raisin River, and on the Michigan Southern, the Pere Marquette, the Michigan Central and the Lake Shore railroads, about 40 miles southwest of Detroit and 85 miles southeast of Lansing, the State capital. Was settled in 1784 by people from Canada, and was first called Frenchtown. In 1815 the name was changed to Monroe in honor of James Monroe (q.v.). It was chartered as a city in 1836. Here took place 22-23 Jan. 1813 the "Battle of Raisin River" (See Frenchtown, Battle of). The city is in a fertile agricultural region and a trade centre for a large section of the southeastern part of the State. Its principal manufactures are flour, lumber, paper, paint, brick, agricultural implements, stoves, furniture products, furniture and canned goods. The nurseries nearby and the fisheries give employment to a number of people. The chief buildings are the courthouse, opera-house, armory and two orphan asylums, a home for the aged, St. Mary's Academy, a public library and a convent. It has the mother house of the Sisters of the Immaculate Heart of Mary, a teaching order of sisters who have schools in various parts of the country, and whose pupils number about 10,000. In connection with the convent and academy are a large library and a fine museum. Pop. 6,893.

MONROE, N. C., city, county-seat of Union County, on the Seaboard Airline Railroad, about 120 miles in direct line southwest of Raleigh. It is in a cotton-growing region, and nearby are gold mines. Municipal enterprise includes waterworks and electric-lighting plant. The chief industries are cotton mills, cotton gins, lumber mills and iron works, with an active trade in their products, and tobacco. Pop. 4,500.
MONROE, Wis., city and county-seat of Green County, on Chicago, Milwaukee and St Paul and Illinois Central railroads, 40 miles south by west of Madison. It is situated in a cheese-making and dairy cattle-breeding region, Green County manufacturing more cheese than any other, and the county having the largest cheese factory in the Union. Over 15,000,000 pounds of cheese are shipped annually. Industrially the condensing of milk and manufacturing of carriages, wagons, lumber and foundry products lead. Telephone, gas and electric companies are privately owned and waterworks are operated by municipality. It has excellent public schools and a fine library, which contains 8,000 volumes. In 1859 Monroe was incorporated as a village and chartered as a city in 1882. Pop. 5,200.

MONROE DOCTRINE. The term "Monroe Doctrine" has been popularly used for a variety of principles intended to explain or to define the policy of the United States toward Latin-American countries. The same words have had very different meanings at different periods of our history, but are now generally used to declare that it is contrary to the interest of the United States that any European powers should establish new settlements or colonies in any part of the Americas, or should exercise preponderant influence in Latin America. The whole subject may best be taken up under the following topics: (1) Conditions of the doctrine from 1775 to 1823. (2) Monroe's Doctrine as stated in his message of 1823 and applied down to 1845. (3) Theories as to Latin America put forward by Presidents and Secretaries of State from 1845 to 1900. (4) The modern doctrine of "the paramount interest" of the United States in American affairs, as developed since 1901. (5) The present status of the doctrine in our relations to European, Asiatic and American powers.

I. Conditions of the Doctrine (1775-1823).—The prime reason for the Monroe Doctrine was the rise of a new kind of nation in the western hemisphere. Down to the American Revolution all the occupied parts of both continents and the Caribbean basin were simply outlying parts of European countries and shared in the religion, institutions, law, foreign policy and wares of their mother countries. They were in the same situation as Africa at the present time, a group of dependencies, incapable of direct influence upon the world at large.

The Revolution, with its theories of the right of every people to choose their own government, resulted in the creation of the first American state. The new United States had no territory, claims or ambitions outside of the continent of North America. During the French Revolution and Napoleonic wars it stood aside as a neutral and insisted on several new principles of neutral rights in trade and citizenship. Europe quickly saw that this example was likely to be followed elsewhere and was not surprised when in 1806 the colonies of Spain and Portugal in the New World began to drop off. In 15 years the process was completed, the 16 Spanish colonies remaining loyal except Cuba and Porto Rico; and Brazil was forever lost to Portugal.

These new communities appealed to the example of the United States, imitated its government and expected its friendship. By 1823 there appeared on the map the independent states of Mexico, Colombia, Peru, Chile, La Plata, Haiti, Paraguay and Brazil. In the West Indies and on the north coast of South America small colonies remained to Great Britain, France, Holland, Sweden and Denmark with Canada and the British plantation of Belize, were the only American colonies remaining to Europe. America boasted no longer a single star of liberty, but a brilliant constellation of independent republics.

The people of the United States felt a natural and deep interest in what seemed a repetition of their own experience of breaking away from a mastering European government. They welcomed the liberal trade opened up to them in regions where for centuries Spain had restricted communication. They enjoyed the sensation of being the pioneers and leaders in what they hoped was a world movement in democracy.

The new states at once demanded recognition by their elder sister. In 1822 President Monroe, under powerful pressure from Henry Clay and other statesmen, received authority to recognize the new countries, and soon exchanged ministers with Colombia, Chile, Mexico, Brazil and La Plata. This step gave the certificate of the American Republic to the new freedom of her neighbors. It committed the United States to the principle that they were self-sustaining, self-governing, genuinely independent and entirely separated from their former European connections. They were too confidently accepted as equal sister states, a part of a free America.

II. Monroe's Original Doctrine (1823-1826).—This feeling of confidence in the continuance of the new governments received a severe shock when the combination of central European powers, commonly called the Holy Alliance (q.v.), after crushing several attempts at liberal government in Europe, turned its attention to Spain and to the Spanish colonies. A French army, with the mandate of the Holy Alliance, in 1823 overran Spain and restored the royal despot to power. The Bourbon monarch naturally asked for the application to these revolted colonies of this principle of supporting the legitimate sovereign. Metternich, the grand master of the Alliance, thought well of the idea, and it was discussed at the Congress of Verona of 1822. The United States feared that France would undertake this commission also, and would claim Cuba as the price of the service to Spain, thereby securing a broader foothold in America and gaining a rich island almost overlooking the American coast. The tension was increased by the attitude of Russia on the northwest Pacific Coast, where the tsar claimed exclusive ownership of the mainland and islands as far south as the 51st parallel by an imperial ukase dated 4 Sept. 1821. The Russians also asserted the right to keep the vessels of other powers out of the north Pacific Ocean.

The United States was thus pressed in two directions by what looked like an effort of several European powers to come in and occupy the territories wrested from Spain and the unsettled part of North America. For many years the government had been practising the
MONROE DOCTRINE

"Policy of Isolation," which was early laid down by Washington, Hamilton, Jefferson, John Adams and other statesmen. Its purport was that the United States had no share in European political combinations, was not a party to European wars and would pursue the policy of developing itself as an American state. From this policy it was an easy transition to the complementary doctrine that European powers ought not to interfere in American affairs.

The time seemed to have come in 1823 for some sort of action that would head off the threatened invasion of Latin America by third parties in behalf of Spain. Something was also needed to check the Russian advance into North America; and the opportunity was convenient for expressing the undying love of Americans for the popular government that they had chosen. At this moment George Canning, Foreign Minister of Great Britain, stepped into the controversy. England was interested in unrestricted trade with the Spanish-American countries and was extremely opposed to the constricting policy of the Holy Alliance, both in Europe and America. In August and September 1823, Canning four times proposed to Richard Rush, our Minister in London, that the United States join England in a declaration against intervention, and Monroe was inclined to accept the proposition. After long Cabinet discussions John Quincy Adams, Secretary of State, convinced the President that it would be better to make an independent declaration.

Adams' papers show that he not only suggested but formulated most of the important presidential message of 2 Dec. 1823, several passages in which, construed together, constitute the original and genuine Monroe Doctrine.

The principal points in this declaration, which is the original form of the Monroe Doctrine, are substantially as follows: (1) The two spheres. The whole statement is based upon the theory that there were two natural spheres of world influence, separated by a meridian drawn through the Atlantic Ocean; and that the European and the American regions had different sets of political and commercial interests. Since the United States took no part in the affairs of the European sphere it was common sense that European powers should keep out of American affairs. (2) Intervention. The message assumed that the Latin-American states were permanently independent and capable of conducting civilized governments; and it explicitly and strongly protested against "any interposition for the purpose of oppressing them, or controlling in any manner their destiny, by any European power." (3) Colonization. "The American continents, by the free and independent condition which they have assumed and maintain, are henceforth not to be considered as subjects for future colonization by any European power." This was directed against Russia but had a general bearing and has often been cited as applying to all European powers. (4) Political system. Monroe held that it would be hostile and dangerous to the United States if "allied powers should extend their political system to any portion of either continent." This clause plainly refers to the mutual assistance given by members of the Holy Alliance; but history shows that Adams and Monroe both meant to protest against the principles of absolutism in government — and were replying to a reference to the European "political system" in a proposal to the Latin Americans that the United States as a "protector." (5) Protection of the United States. The fundamental reason for setting forth the principles just stated was not America's interest in the Latin Americans but in the United States. Many statesmen then felt an apprehension that, after having subdued the Latin Americans in the South, the Holy Alliance might move its forces northward. (6) Geographical extent. The doctrine in terms excepts from its application the then existing European colonies, which meant Canada, Cuba, Porto Rico, the English and French West India islands and the three South American plantations. From that day to about the time of the Spanish War of 1898 there was little objection to the continuance of the old colonies. (7) Peace. Clearly the Monroe Doctrine was intended to keep the peace — to prevent wars from breaking out in other parts of America and to avoid dangers to our own republic. In that respect the doctrine has been an eminent success. With the exception of the War between Mexico and the United States, no serious or devastating wars have taken place between Latin-American and European countries.

The original Monroe Doctrine was at once effective. Canning was so much interested in the result that he claimed it for himself and said (21 Dec. 1826): "I looked another way . . . I sought for compensation in another hemisphere . . . I called the new world into existence to redress the balance of the old." In reality it was John Quincy Adams who struck out the policy and clothed it in a set of appropriate phrases for his country. European intervention was abandoned; but when our Latin-American neighbors asked for a more distinct promise of military protection, at the Panama Congress of 1826, the United States took the ground that our neighbors must protect themselves in case of a fight with European powers; that the Monroe Doctrine was only a pledge by the United States to itself. (See Annexation, 1825-1845.) In the 75 years from 1826 to 1900 a variety of official statements were made on Latin America by Presidents, Secretaries of State and other statesmen; and from time to time new questions were raised as to the application of the Monroe Doctrine to new circumstances. Out of these may be selected the following, as the principle attempts to state and apply the doctrine: (1) Van Buren, Webster and other statesmen, from 1829 to 1843, gave public notice that the United States would not permit the transfer of Cuba to any other European power; an extension of the doctrine to prevent the transfer of colonies from one European power to another. (2) President Polk in 1845 and 1848 favored the annexation of parts of America which might be in danger of European dominion. This statement was backed up by the Mexican War, as a practical demonstration that the United States was not bound by the Monroe Doctrine to refrain from enlarging her territory at the expense of Latin-American states. (3) In the disputes over the Clayton-Bulwer Treaty in the fifties, the principle of the Monroe Doctrine was invoked against the British colony in Honduras, on the ground that it was an exten-
sion of European influence. (4) Secretary Seward, undoubtedly in accord with President Lincoln, from 1861 to 1865 warned the French not to force a foreign empire upon unwilling Mexico, and in 1865 Seward gave formal notice that the French must leave Mexico, which was backed up by a display of military force on the border. Though Seward avoided the term Monroe Doctrine, he applied its principles very effectively. (5) President Grant in 1879 repeated Polk’s warning by announcing that no territory in America could be transferred to any European power, whether the inhabitants were willing or unwilling. (6) Secretary Fish in 1870 proposed that the United States should take the lead in a general political and commercial policy for the republics of America. This is the first distinct statement of a policy of leadership by the United States, which had undeniably been in the mind of John Quincy Adams. (7) Secretary Evarts in 1880 was the first American statesman to see the relation of the Isthmus Canal to the Monroe Doctrine. He claimed “paramount interest” for the United States in any land or water communication across the American isthmus. President Hayes added the significant declaratory that any “acquired” canal “would be virtually a part of the coast line of the United States.” (8) Secretary Blaine in 1881 made the position of the United States more precise by stating that for any European power to share in the construction and control of the canal would be an introduction of the European political system. (9) Secretary Blaine drafted for the Panama Congress of 1889 the statement that the “principle of conquest” should not be considered as admissible under American public law. This was intended to apply to the wars between Latin-American powers, and also to foreign invasion. (10) Secretary Olney in 1895 went to the farthest point in a protest addressed to Great Britain, in relation to a boundary dispute between that power and Venezuela. He stated that the Monroe Doctrine “has been the accepted public law in this country ever since its promulgation”; he thought “any permanent political union between an European and an American state unnatural and impossible”; and that the United States is practically sovereign on this continent and its law is law upon the subjects to which it confines its interposition. President Cleveland restated the same principle in the words “The Monroe Doctrine finds its recognition in those principles of international law which are based upon the theory that every nation shall have its rights protected and its just claims enforced.”

This series of utterances, along with others of a similar nature, clearly show a steady growth of responsibility and authority in American affairs. The Panama Canal brought out many rival interests between the United States and European powers, and the State Department at Washington insisted that it was for this government and not for any other nation to decide when the canal should be constructed. Secretary Olney and President Cleveland pushed the doctrine far beyond any previous statement. Their doctrine was certainly not the original Monroe Doctrine, nor was it a real aid down the new principle that Great Britain, which for nearly three centuries had been one of the lead-
The Venezuelans finally agreed to arbitrate and the fleets were withdrawn.

The episode led the mind of President Roosevelt to consider what ought to be done in cases where Latin American countries were beyond the negative refusal to execute contracts and advanced to attacks on the persons, property or diplomatic representatives of a foreign country. He, therefore, in various public speeches and messages declared that the Monroe Doctrine was intended to be one of peace, and that to keep the peace the United States might be forced in flagrant cases to the exercise of an international police power. This is the so-called "policy of the Big Stick," and President Roosevelt and his successors proceeded to apply it in various cases.

(1) In 1902, Cuba which had been released from Spain by the Spanish War, was obliged to consent to the Platt Amendment, to the effect that the United States must not incur any obligations to foreign countries which would interfere with the interests of the United States. This virtually made Cuba a protectorate of the United States. (2) In 1903 the infant nation of the Panama ceded the canal strip to the United States and entered into a treaty which left it also a dependency. (3) In 1905 President Roosevelt made an agreement with the government of the Dominican Republic to administer its customs, setting apart a portion of the proceeds for the public debt service. Santo Domingo thus ceased to be a really independent country. (4) In 1911 President Taft made a similar arrangement with Nicaragua. (5) In 1913 Haiti entered into a financial arrangement which virtually placed it under United States control and provided for an American receivership of customs.

In every instance the reason for this assumption or acceptance of authority over Latin-American republics was based upon belief that otherwise some foreign country would come in and interfere with American interests and threaten the future of the country affected. That is, the United States acquired six protectorates lest some European power might have use to them and then use them by armed force. A supposed attempt of Japan in 1912 to secure a footing at Magdalena Bay on the west coast of Mexico led to the adoption by the Senate of a resolution introduced by Senator Lodge against such occupation for naval or military purposes. Ex-Secretary Root in 1914 attempted to show that the Monroe Doctrine did not require the United States to exercise a domination over its neighbors. President Wilson also in public statements and addresses in 1913 pointed out that American foreign policy was to extend its territory in America. The only way to reconcile these statements with the facts of our protectorates is to admit that the Monroe Doctrine is a check to the territorial greed of European powers but does not restrain the United States from bringing portions of Latin America under her influence.

V. Present Status.—The war of 1898, including the annexation of the Philippine Islands by the United States, was a frank admission that there were world spheres in modern world politics. Eastern Asia is honeycombed with European settlements and interests, and the occupation by the United States, of the Philippine Islands, near China, makes us near neighbors of Russia, France, and Great Britain. On the other side, at the conference of Algeciras in 1906, the United States accepted membership on the pressing international arbitration tribunal to determine in voice in the result. It was therefore, no longer possible for our government to insist that European powers must keep out of America because we keep out of European affairs. The Japanese have been thought to have some designs on the western coast of North or South America which would be contrary to the Monroe Doctrine. At the other extreme was the danger, which for a time was feared, of German occupation of a part of Brazil or other South American countries. Should either danger ever occur the Monroe Doctrine would presumably become active.

As respects the Latin Americans themselves, they have always welcomed whatever protection the United States affords that they might escape domination. An influential neighbor might give against foreign aggression; but many of them fear that the United States will eventually seek extensive annexations to the southward. The taking over of some of the six protectorates by the great interest of the United States in the Mexican silver heighten that apprehension. The growth and steadiness of the ABC powers—Argentina, Brazil and Chile—with half the total Latin-American population, give a more positive basis for permanent alliances and relations. It has been suggested that the Monroe Doctrine will naturally develop into some kind of Pan-American Union (q.v.) in which the United States will be the most populous and strongest member of a great American federation. The difficulties in the way of a permanent union between a country of 100,000,000 and 20 other countries which together aggregate 75,000,000 are hard to surmount.

The question of the right of a nation to exercise foreign authority over its neighborhood was raised in another form by the steady growth of Japanese power in Eastern Asia. On 30 Nov. 1906, by the Root-Takahira agreement, the United States recognized this special interest and consented to it. The Ishii agreement, when entered, still further in approving practically the doctrine of special interest, it being tacitly understood that Japan would in like manner respect the American Monroe Doctrine.

The negotiations of 1919 at the end of the Great War seemed for a time likely to weaken the Monroe Doctrine by substituting a system of world peace organization which would take the place of the earlier method, inasmuch as the League of Nations might hear complaints and settle controversies such as were likely to arise between Latin American and European powers. A strong protest was made in public discussions on the subject in the United States. In the final form the covenant of the League of Nations included the following limitation: "The covenant does not affect the validity of international engagements, such as treaties of arbitration or regional understandings like the Monroe Doctrine, for securing the two spheres of American influence."

This clause would seem to be a guarantee of the special relation of the United States to Latin America; and so far as ratified by those States would bind them to accept the doctrine
as a "regional understanding." It is likewise a reaffirmation of the Japanese Monroe Doctrine, and is likely to be claimed in support of spheres of interest in the Mediterranean, Asia and Africa. Acceptance of the treaty by most world nations is therefore an assertion of the right of powerful nations in various parts of the earth to exercise a general protection over groups of small or weak powers, and at the same time to exclude external powers from interfering with the leadership of the strongest power in such a combination.

**MONROIA.** Cal., town in Los Angeles County, on the Atchison, Topeka and Santa Fe Railroad, about 19 miles east of the city of Los Angeles and 10 miles east by south of Pasadena. It has a healthful climate and a beautiful situation near the southern border of the San Gabriel National Forest. It has extensive fruit-growing interests and is a thriving commercial town with modern improvements. Pop. 1,600.

**MONROIA, mún-ró-vi-a,** Liberia, the capital of the West African Republic, a commercial and seaport town, on Cape Mesurado near the mouth of the Saint Paul's River. It has regular steamship service by British and Spanish vessels, direct cable communication with Europe and New York, and two wireless stations. It exports rubber, palm kernels and oil, plassara fibre, cocoa, coffee, ivory, ginger, camwood and annatto. A college is maintained by the government and one by Methodists; missions are carried on by Catholics and American Protestants, and the city is the see of a Protestant Episcopal bishop. Monroia was named after James Monroe, President of the United States, 1817-1825, and 1825-1829. 6,000.

**MONS, mônz, Belgium, the capital of Hainault, on the Trouille, 38 miles by rail southwest of Brussels. An encircling belt of promenades occupies the site of the fortified ramparts demolished in 1862. The Canal de Conde connects Mons with the Meuse. The church of Notre Dame (1450-1880) is a magnificent specimen of the art of French Gothic. Outside the town is a belfry (1652) 275 feet high, a good library, etc. The manufactures include woolen and cotton goods, cutlery, hardware and sugar; while in the vicinity is the extensive coal field of Borinage. Mons, occupying the site of one of Caesar's camps, was made the capital of Hainaut by Charlemagne in 804. France, Spain and Austria often contended for its possession. The battlefields of Malplaquet and Jemappes are in the neighborhood. In 1914 Mons was captured by the Germans in their advance on Paris, and around Mons some of the severest fighting occurred during the progress of the war. See _War, European_. Pop. about 28,000.

**MONS.** See _Mensa._

**MONSEIGNEUR, món-sah-nyé, (French my lord), a title of dignity in France. Before the Revolution the king's oldest brother was styled monseigneur. Princes, dukes and peers, archbishops, bishops, cardinals, marshals of France, presidents of Parliament, etc., were addressed by this title.

**MONSELL, món-sél, James Samuel Bewley, Anglican clergyman and hymn-writer: b. Londonderry, Ireland, 2 March 1811; d. Guildford, England, 9 April 1875. He was graduated at Trinity College, Dublin, in 1832, and took orders in the Church of England in 1835. As a writer of hymns he became famous, over 100 of his hymns still continuing in popular use. Among his publications are _Parish Musings_; _Simon the Cyrenian and Other Poems_; _Spiritual Songs_; _Our New Vicar_ (1867; 13th ed., 1900).

**MONSIGNORE, món-sé-nôr-ô, a title of honor given to prelates of the Roman Catholic Church. Prior to the Revolution in France the corresponding title of Monseigneur was allowed to all high dignitaries of the Church, but its use was forbidden in 1801 by a law of the French Convention.

**MONSIGNY, món-sé-ni, Pierre Alexandre, French composer: b. Fauquemberg, 17 Oct. 1729; d. Paris, 14 Jan. 1817. He went at an early age to Paris and was appointed, under the influence of the Duke of Orleans, major-domo. He studied counterpoint under Gianotti and composed a series of comic operas which were highly successful, to be followed, with equal success, by grand opera plays. But the Revolution, having robbed him of his position and his fortune, he lived his later days on a pension from the Opera Comique, becoming (1815) a member of the Academy. Among his most popular operas were _Les aveux indiscrets_ (1759); _Le cadi dupe_ (1760); _Le roi et le fermier_ (1762); _Le déserteur_ (1769); _Le plus pauvre des trois_ (1772), which was very popular. Consult Pougain, A., _Monsigny et son temps_ (Paris 1908).

**MONSON, mónzön, Sir Edmund John, British diplomat: b. Chart Lodge, Kent, 6 Oct. 1834; d. 29 Oct. 1909. He was educated at Eton and Balliol College, Oxford; was Fellow of All Souls, Oxford, 1858; had entered diplomacy in 1856; held various minor posts, as attaché or under-secretary, until 1876, when he was sent on special service to Dalmatia and Montenegro. He was Minister to Uruguay (1884), to Denmark (1884), to Greece (1888), was appointed arbitrator of the Butterfield claims be-
of one sex organ upon the other. (4) True monsters, where there are either more or less than the normal number of legs, arms or there are no legs, or other extraordinary heads or two or more. This group also contains what are called omphalositic monsters which are embryos attached to an original fetus and depending on it for what nourishment and development they can get. The best-known type of monsters, those which have been frequently exhibited in the composite monsters of which the Siamese Twins and the Tocci Brothers are examples. Other illustrations are of children with two bodies joined together at the pelvis but having no legs, and the bodies pointing in opposite directions. There are also terata with two heads and two faces or with one head and two faces like the ancient conception of the god Janus.

It is almost impossible to imagine any deviation in form, function or size which has not been recorded, since the curiosity of mankind has been such as to be attracted from time immemorial to anything in the nature of the marvelous. The composite monsters on record have shown almost anything in the union of lower extremities and of reduplication of both lower and upper; and of the partial or total reduplication of the entire body, the climax being reached in the twins which are united by only a comparatively small cartilage. Double monsters are either parasitic or independently nurtured as was the case of the Siamese Twins, who lived to the age of 63 years. There are also known triple monsters, one case being recorded by Saint Hilaire of a three-headed child who was born in Italy in 1832.

The very unpleasant side of anatomic teratology has its more cheerful compensation in the records of extraordinary developments in vitality and fecundity and in the recovery of many persons who have suffered accidents or other misfortunes ordinarily found fatal, or who have shown remarkable abilities of adaptation to apparently impossible conditions. For not only do we see the monstrities of fetus and learns the case of the bearded women, etc., but there have been recorded a large number of cases of extraordinary ability to function in spite of adverse circumstances. Examples of teratology of function are seen in suspensory anomalies, a case being recorded of a man who could, apparently at will, cause his heart to stop beating. He succeeded once in prolonging this inactivity of the heart for about 30 minutes. The function appeared to be restored automatically. A post mortem examination of his heart showed nothing extraordinary. Other illustrations of purely physiologic wonders without, however, showing any other abnormality are seen in very high temperature. One case is on record of a man whose temperature ran up to 143° and was between 120° and 125° for five days in succession.

Among anomalies of excess in function are to be included also mental prodigies such as extraordinary memory and other mental functions of which one of the most remarkable was Jacques Inaudi born in 1869 in Piedmont. He had an extraordinary mathematical ability which enabled him to perform mentally operations with numbers in the billions and trillions.
He had no other unusual ability. Many prominent men such as Edmund Burke, John Locke, Pascal, Liebnitz and Euler were noted for super-normal memory. Another mathematical prodigy was a Swane named Rube Fields of Johnson County, Mo., who added columns of figures as rapidly as they were read to him, and performed incredibly enormous operations in multiplication. He was an uncultivated boorish man with no other mental ability worth mentioning.

These facts are of importance from the point of view that the average individual probably possesses powers of endurance, toleration of disease and of mental development far above that which the ordinary person acquires, and that the mine of human abilities has up to the present age not merely not been worked but has probably not even been more than sampled. What may be the cause of this relatively undeveloped mentality in men in general is suggested by the recent investigations into the unconscious mental activity.

MONT BLANC, mōn bōlā (white moun-tain), France, a mountain, the loftiest of Europe, belonging to the Pennine chain of the Alps, and rising 15,781 feet above sea-level, the main portion and the highest summit being in France (Haute Savoie), seven miles south of the Switzerland frontier. It forms a huge mass stretching northeast and southwest, in which direction the boundary line between France and Italy runs along it. Its northeastern extremity enters Switzerland. In this latitude the snow line is at 8,000 feet; consequently 7,700 feet of the mountain are within the region of perpetual snow and ice. Its shape, when seen on the north or south, is pyramidal. On the southeast it presents an immense wall-face, on which few glaciers can be formed. These, of which 18 in all are counted, are chiefly on the northwestern slope, where the glaciers Des Bossons, Bois, Talèfre and Mer de Glace are seen. The mass of the mountain consists almost entirely of granite. In 1700 the scientist, Sauvage, offered a prize for the discovery of a practicable passage to the summit, which was reached by Jacques Balmat, a guide, June 1786. The “Grande Ascente” in the 19th century became an ordinary tourist excursion, regularly made every season by great numbers and is now facilitated by the railway built up to a short distance from the summit by French engineers. In 1893 an observatory was erected on the summit of the mountain by Pierre Janssen.

MONT CERNIS, mōn sēnē (or MONTE CENISIO). See CENIS, MONT.

MONT CERVIN, mōn sēr-vān. See CERVIN, MONT.

MONT PELÉE, mōn pā-lē. See Pelée, MONT.

MONT-DE-PÊTÉ, mōn-de-pē-tē (in Italian Monte di Pietà), an authorized licensed or government pawnshop; a bank of charity which lends money on pledges at a low rate of interest, and whose aim is purely philanthropic. The chief customers of such institutions, which exist in France, Italy, Germany and other Continental countries, are workmen pressed by a temporary failure of employment; small tradesmen without a bank account; or travelers in a large town whom some accident has subjected to a momentary strait; to all of whom it is a matter of necessity to conceal any compromise of their position in procuring money for present necessities. These institutions were established to prevent the scandal and abuse of usury. They date their origin from the Middle Ages, when the loan of money on pledges was almost exclusively in the hands of the Jews. They originated in Italy about 1450, and not long after were approved by several papal bulls. Several French and Italian cities possessed monts-de-piété in the latter half of the 15th century, among others, Mantua, Parma, Milan, Rome, Padua, Trèves, Boulogne, etc. The French monts-de-piété, with the exception of those of Montpellier, Toulouse, Grenoble and Angers, which lend without interest, exact interest at the rate of from 4 to 12 per cent. The chief mont-de-piété in France is that of Paris, which transacts a greater amount of business than all the rest together. In the United States and Great Britain pawnbrokers take the place of monts-de-piété, which were introduced in the beginning of the 18th century, but failed. See also GOVERNMENT PAWNSHOPS IN FRANCE; PAWNBROKERS.

MONT-SAINT-MICHEL, mōn-sān-mē-shē, France, a famous seat of learning and pilgrimage resort of Normandy as early as the 12th century, now an equal, but slightly inferior, resort. It consists of a collection of medieval houses, hosteries, ecclesiastical buildings, and fortifications, grouped on a conical rock in the Bay of Cancale or Saint Michel, at the mouth of the Couesnon River, here forming the boundary between Normandy and Brittany, 15 miles southeast of Granville. Anciently a lofty hill in the forest of Scissy which was submerged in the 7th century by a tidal cataclysm, the rock in prehistoric times was crowned by a Celtic temple; it was the Roman Mont Tumba and the “mons in periculo mari” — the mount in danger of the sea — of the monastic chronicles. The Bay of Saint Michel, 15 miles wide at its mouth, and 8 miles long from north to south, is nearly dry at low water, but fills with treacherous rapidity at flood tide. In 1820 a dyke nearly a mile long was completed which connects the Mont with the mainland. Ramparts, towers and bastions of the 16th century incircle the base of the rock which has a circuit of about two miles, and the entrance is through a gate which opens on the single, narrow, winding street of a small village (pop. 250) built around the southern slope and leading by several flights of stone steps to the fortified abbey on the summit. Crowning the abbey is a superb 15th century Gothic basilica, a fine statue of the Archangel Michael capping the spire, which towers conspicuously 250 feet above the wide expanse of sandy bay and low-lying country around. Saint Aubert, bishop of Avranches, founded the abbey in 709 and his first chapel, restored, is on a promontory on the north side of the Mont. In 1203 the abbey was destroyed by Philip Augustus, and the present buildings date from that period. It was an important fortified post during the English occupation. It was defended against all assaults by the Knights of the Order of Saint Michael. At the Revolution it was converted into a prison for political offenders, and now ranks as one of the protected
historical monuments of France. An elaborate process of restoration since 1863 has renewed its ancient strength and beauty. Among the chief features of the Mont are the abbey church of the decorated cloisters, La Mervelle, "the marvel," or massive north wall of the abbey, the Salle des Chevaliers, the Châtelet or guardhouse, the crypts with their remarkable columns, the cellars, the dungeons, the medieval elevator with its enormous hoist, once operated by a donkey, etc., and in the village the ancient parish church, a museum, the famous Porte du Roi and Duguesclin's Tower.

MONTAGNA, Bartolommeo, bär-tō-lom-mä'ō mōn-tān'yā, Italian painter: b. Orzinovi, near Brescia, about 1430; d. Vicenza, 11 Oct. 1523. He settled at Vicenza in 1460, was influenced by Bellini, Carpaccio and Andrea Mantegna, worked in Padua and Verona, and from 1496 until his death was again in Vicenza, being the first great master resident there. His work in general resembles the earlier Venetian school in being marked by distinctness, precision and severity of drawing, and has harmonious coloring in which a brown gleaming tint is noticeable. The human form is almost always shown as over-muscular. His principal works are the 'Madonna and Child' at the Venice Academy, 'Ecce Homo' at the Louvre, frescoes in the church of San Nazaro at Verona and an altar piece in the Brera, Milan. In the Johnson collection at Philadelphia he is represented by a 'Madonna with Saints' and in the New York Metropolitan Museum by 'A Lady of Rank, Santa Bibiana' and a 'Madonna and Child.'

MONTAGNAIS (mōn-tān-yā) INDIANS, a general name applied to several American Indian tribes. One of these, the Athapaskan family in British North America, were Christianized by Roman Catholic missionaries. Another, best-known tribe of this name, was of the Algonquian family, and resided along the shores of the Saint Lawrence River. They have practically disappeared in recent years.

MONTAGNARDS, mōn-tān-yār (Fr. mountaineers), a popular name in French history applied in 1789 to the radical democratic party, the leaders in the French Revolution and its excesses. Soon after the fall of Robespierre the denominations of "Montagnard" and "Montagnes" gradually disappeared from party nomenclature. After the Revolution of 1848 an abortive attempt was made by the same party in the National Assembly, under Louis Blanc and Rollin, to revive the title.

MONTAGU, mōn'țā-gū, Andrew Jackson. American lawyer and statesman: b. Campbell County, Va., 3 Oct. 1802. He was graduated at Richmond College in 1852 and studied law, taking the degree of LL.B. at the University of Virginia, 1885. He was admitted to the bar and began the practice of law in 1885; from 1894 to 1898 he was United States district attorney for the western district of Virginia, and in 1898-1902 attorney-general of the State. In 1902 he was elected governor of Virginia for a term of four years. He became one of the foremost advocates of direct primaries to prevent party machine rule. He was also active in the movement for improved popular education in the South, and gave many public addresses throughout the State, advocating the increase of educational facilities for all without regard to race or color.

MONTAGU, Edwin Samuel, British statesman: b. 1879. He became Under-Secretary of State for India under Lord Morley in 1910, and his first budget speech a few months later in the House of Commons created a highly favorable impression. He entered the Cabinet as Chancellor of the Duchy early in 1915. He was Minister of Munitions in the first Coalition Government but retired with Mr. Asquith on the accession of Mr. Lloyd George. When Mr. A. Chamberlain resigned the Indian secretariat in the summer of 1917, Mr. Montagu was chosen for the post. He proceeded to India to investigate the political situation of the country in association with the viceroy, with a view to the gradual development of self-government for India. In July 1918 their joint report on Indian constitutional reforms was issued. In the new Lloyd George Cabinet of January 1919 Mr. Montagu was reinstalled Secretary for India with a native under-secretary in the House of Lords, Sir S. P. Sinha (q.v.).

MONTAGU, Elizabeth Robinson, English author and society leader: b. York, 2 Oct. 1720; d. London, 25 Aug. 1800. In 1742 she married Edward Montagu, grandson of the first Earl of Sandwich, who died leaving her a fortune. To wealth she added literary accomplishments, and these, joined to other personal qualities, enabled her to secure her social leadership. Among her visitors and associates were Lord Lyttelton, Samuel Johnson, Horace Walpole, Burke, Sir Joshua Reynolds, Garrick, Hannah More and other celebrated persons. To the gatherings at her house the term blue-stocking (q.v.) is said to have been first applied. Three of the dialogues in Lord Lyttelton's 'Dialogues of the Dead' were written by her in 1760. She also wrote an 'Essay on the Writings and Genius of Shakespeare, compared with the Greek and French Dramatic Poets' (1769). Much of her correspondence was published (1809-13). Consult the 'Memoirs' of Elizabeth Carter (London 1816); Doran, 'A Lady of the Last Century' (London 1873); 'Elizabeth Montagu, the Queen of the Bluestockings; Her Correspondence from 1720-1761' (2 vols., New York 1906); Huchon, R., 'Mrs. Montagu and her Friends' (New York 1907).

MONTAGU, Mary Wortley, English lady: b. 1689; d. 21 Aug. 1762. She was the eldest daughter of Evelyn Pierrepont, afterward Duke of Kingston. She learned Latin very early, and also became versed in English literature, especially its romance and drama. The Kit-Cat Club (q.v.) by acclamation admitted her to membership in 1712, without the consent of her father, she married Edward Wortley Montagu, a wealthy Whig scholar, with whom the former had quarreled. On the accession of George I in 1714 Montagu ob-
tained an official position in London, and Lady Mary came out from the seclusion in which she had been compelled to remain through ill health. She gained her admiration and influence, and she became familiarly acquainted with Addison, Congreve, Pope and other distinguished writers. In 1716 her husband was appointed Ambassador to Turkey, and Lady Mary accompanied him to the East, remaining there until January 1717 to May 1718. During this period her famous 'Turkish Letters' were written. On her return to England she re-entered the world of wit and fashion. She had a quarrel with Pope, and a long and keen literary warfare ensued, which did honor to neither. In 1739, for reasons never satisfactorily explained, she left England to live on the Continent. This she did with the full concurrence of her husband. She lived chiefly in Italy until her husband's death in 1761, and soon after her return to England she herself died. Her letters are marked by great sprightliness, combined with graphic power and keen observation, and with independence of judgment. Lady Mary has another claim to remembrance in her country's adoption for her own a变更 in the Turkish practice of inoculation (q.v.) for smallpox, and for her energy in introducing its introduction to England in the face of violent prejudice. Consult her 'Works,' edited by Lord Wharncliffe, her great-grandson (1837; latest ed., 1893); and Symonds, E. M., 'Lady W. M. Montagu and her Times' (New York 1907).

MONTAGUE, Francis Charles, English historian: b. London, 31 Aug. 1858. He was educated at University College, London, and graduated (M.A.) at Balliol College, Oxford, became (1881) Fellow of Oriel and was called to the bar in 1884. He has been, since 1893, professor of history at University College, London; lecturer in modern history since 1897 at Oriel College, Oxford. He was curator to the Indian Institute, Oxford (1900-13). He wrote 'Limits of Individual Liberty' (1885); 'Life of Sir Robert Peel' (1888); 'Elements of English Constitutional History' (1894). He contributed to Cambridge Modern History 'The House of Burgundy from the Accession of James I to the Restoration,' in Vol. VII; and to Longman's 'Political History of England' (1907). He edited Macaulay's 'Essays' (1903).

MONTAGUE, Mass., a town including several villages, in Franklin County, on the Connecticut River and on the Central Vermont and the Fitchburg railroads, about 35 miles north of Springfield. The most important village in the town is Turners Falls, the location of a large electric-power plant. Montague was settled about 1716, and in 1753 was incorporated as a district. It is in an agricultural and manufacturing region. The chief industrial establishments are large cotton mills, paper and pulp mills, brick, water-wheels, hardware, cutlery, pumps, toilet articles, soap and machinery. There are three public libraries. The government of the town is determined by popular vote at regular town meetings. Pop. 6,866.

MONTAGNE, món-tán' (Fr. mōn-tân-yä), Michel Eyquem de, French essayist: b. Château Montaigne, Périgord, 28 March 1533; d. there, 11 Sept. 1592. He was educated by his father after a fashion all his own, learning Latín from house servants who never spoke French, and being roused from bed every morning by soft music and violets. He was a member of the Collège de Guayenne in Bordeaux, where he stayed for seven years, apparently under the charge of the great classical scholars, Buchanan and Muretus. Thereafter he probably studied law at Bordeaux and Toulouse, and when he came of age, six months after the death of the Cour des Aides at Périgueux. This court was abolished three years afterward and Montaigne with the other members was appointed counsellor to the Bordeaux parliament, a body in which he made the acquaintance of La Boétie about 1559. For the next few years he was at court, now at Paris, now at Bar-le-Duc—where we know that in 1562 he swore allegiance to the Catholic Church on his own motion; that in 1565 he married Françoise de la Chassaigne, daughter of one of his fellow-counsellors, and that the death of La Boétie in 1563 and that of his father in 1568 had greatly lessened Montaigne's interest in public affairs. These events had also no doubt sobered him—admits that his youth had been wild; in 1571, having prepared La Boétie's posthumous works for the press, having received himself the Order of Saint Michel for a rather mediocre version of the 'Theologia Naturalis' of Raymond de Sebonde, his only literary venture so far, after selling his post as counsellor, he retired to Montaigne. There he began, and in the next nine years completed, the first two books of his essays, whether purposing them for publication or not is unknown, though their style seems to point to the fact that in their earliest form they must have been mere fittings in a commonplace book. By the middle of 1580 his health had so much failed that he left Château Montaigne for the first time since 1557, save for an occasional trip to Paris, and traveled through Switzerland, Germany and Italy, meeting Tasso at Florence. His 'Journal' of this trip, discovered and published in 1774, adds nothing to his literary fame and not much more to our knowledge of his personality. During this absence from France, and apparently quite against his will, Montaigne was elected mayor of Bordeaux; he served in this office from 1581 to 1583 and then was re-elected for another two years; at the close of this successful administration, in which with no small skill he had steered safely the king's lieutenant in Guayenne and the king of Navarre, governor of the province, he refused to be present in the city as was required for the election of his successor, because of the plague—one of the few lights on his personal character and not a pleasant one. The three years immediately following (1585-88) were occupied in the revision of his two books of essays and the addition of a third. He received the rites of the Church upon his death-bed. His wife bore him several children; two or three, he says, died in infancy; and one, a daughter of whom he was very fond, survived him. But his family ties were not strong; his life with his wife seems to have been a philosophic make-shift; and his love for his daughter can be explained only by his attachment to Mlle. de Gournay, a Parisian, who was attracted to him by his literary fame, was called by him his adopted daughter and was fortunate enough to receive from Montaigne's widow a copy of his 'Essays' with
Montaigne's literary reputation is safe, though in the words of the few not the skeptical, essentially typical of his time, and it was not for nothing that his study at Château Montaigne was decorated with texts from Ecclesiastes, Ecclesiasticus, Lucretius and Horace, akin to these ancient writers who proclaim the vanity of all things. His theme is varied, his treatment discursive and his charm largely due to this very variety, together with a quaintness and raciness of style that did much for French prose and was mostly original even if patterned on Amyot. His manner of approaching the questions of life and criticism is apparently purely subjective; indeed, his delightful egotism that makes his own life, experiences and thoughts the theme of his essays, was quite independent of so serious a purpose. But this subjective manner brings him nearly as close to the analyst of universal problems as does the dramatic objectivity of a Shakespeare. His entire attitude is skeptical, but he is not to be ranked as the champion of the rationalism in religion. He is the curious, interested skeptic, not the doubting cynic. Professor Saintsbury well says that the nearest spiritual parallel to Montaigne in literature is Charles Lamb.

Montaigne affected English literature scarcely less than he did French. His essays, translated by Florio (1603), seem to have been known to Shakespeare in their English form, and this same version, revised by Hazlitt (1893), is still the standard in English. The best editions of the original are those by Aubury-Duval (1820) and Le Clerc (1865). (See Montaigne's Essays, Florio's Translation of). Consult the appreciations by Emerson, "Representative Men" (1850); Church, "Miscellaneous Essays" (1888); Pattison, "Essays" (1889); later, "Gaston de La Touche" (1896); also Bonnefon, "Montaigne et ses amis" (1892); Stapfer, "Montaigne" (1894); Lowndes, "Michel de Montaigne" (1898); Guizot, "Montaigne" (1899); Champion, "Introduction aux Essais de Montaigne" (1900); Dodelin, "Michel de Montaigne" (Philadelphie 1905); Woodberry, G. E., "Great Writers" (Garden City 1907); Sichel, E., "Michel de Montaigne" (New York 1911).

Montaigne's Essays, Florio's Translation of. The interest of Florio's translation of the essays of Montaigne is manifestly due in the first place to Montaigne and only very secondarily to Florio. The world has never failed to find the good-natured and wise father of the modern essay both amusing and interesting, and Montaigne, in whatever dress he might wear, would be sure of a welcome in any reflecting but not too serious society of men and women. Yet it is no small credit to Florio that he has not only kept Montaigne alive and to the fore in his translation, but has also managed to slip in by the way some considerable flavor of himself. His translation of his French original is not a word-for-word in detail, though it is perhaps not less accurate than translations customarily were in the days when it was made. It has something better, however, than simple verbal accuracy, it has color and life. Like most Elizabethan translators, Florio was seldom content to let a single English word stand as the equivalent of a significant word of his original. In order to be sure to get the full content and color of his French source, he amplified by the addition of intensifying modifiers and synonyms. The result is that the translation is often more wordy and more highly colored stylistically than the original, in often quaint and colloquially picturesque when Montaigne is simple and direct. Florio was above all a lover of the ingenious style, and his ingenuity not infrequently betrayed him into the grotesque. He was fond not only of strange words, but also of puns, alliteration and the other trifles of the courtly writing of his day. When it suited his convenience he did not hesitate to Anglicize a French word, with the result that though he put Montaigne "in English clothes" it was done "many times with a jerk of the French jargon." Yet when one compares his 'Epistle Dedicatoire' of the translation, addressed to his "best-best Bene-factors and most-most honored Ladies, Lucre Countesse of Bedford; and her best-most loved Mother, Ladie Anne Harrington," and his preface where he calmly describes himself as an "Artificer of the body of the translation, one notes with gratitude that Florio has not done his worst in the way of verbal ingenuity. His original exerted a salutary restraining influence when he came to the actual task of translating, and few readers will cavil at him for being occasionally Florio, since he really gives us Montaigne.

George Philip Kapp.

Montalembert, Charles Forbes de Tryon, shâr-ôh förb de trê-ôn mohn-tâ-lôn-bâr, Comte de French publicist and historian; b. London, England, 29 May 1810; d. Paris, 13 March 1870. He received a university education at Paris; identified himself with the Liberal Catholic movement of Lamennais (q. v.) and Lacordaire (q. v.), whom he assisted in establishing (18 Oct. 1830) and editing L'Avenir, and in efforts to obtain the freedom of education at that time impossible under the state system, and in 1831 went with these two leaders to Rome to present their cause. On his return he opened with Lacordaire and De Coux at Paris a free Catholic school, which was promptly closed by the police, while the directors were arraigned for infringement of the laws respecting instruction. Montalembert made a notable defense before the Chamber of Peers, but the directors were sentenced to pay the costs and 100 francs apiece in fines. When the doctrines of L'Avenir were condemned by Gregory XVI in an encyclical of 15 Aug. 1832, Montalembert duly submitted and did not proceed with Lamennais to final revolt. He entered the Chamber of Peers in 1835, spoke much and eloquently on ecclesiastical matters, and in 1836 published his Histoire de Sainte Elizabeth de Hongrie, which appeared in an English rendering by Hackett and Sadlier (1854). His Catholic zeal was combined with liberal ideas and after the Revolution of 1848 he was elected a member of the Constituent Assembly to the Legislative Assembly, where he sat from 1849 to 1857, he became more and more conservative. In June 1851 he debated against Victor Hugo in opposition to the proposed constitutional re-
vision. He found himself unable to support the measures of the Empire; was known as one of the most determined opponents of Napoleon III.; and for an article, "On 12th sur l'Inde au Parlement Anglais," unfavorably contrasting French and British institutions, was sentenced to six months' imprisonment and a fine of 3,000 francs, though the penalty was remitted. His chief work was, however, lost as the dogma was published. Consult the memoir by Mrs. Oliphant (London 1872); the study by De Meaux (Paris 1897); Craven, 'Le Comte de Montalembert' (London 1873); Lecanuet, 'Le comte de Montalembert et ses apologies par ses correspondants' (3 vols., Paris 1895-1905).

MONTALEMBERT, Marc René, Marquis de, French military engineer: b. Angoulême, 16 July 1714; d. Paris, 29 March 1800. He took part in a number of campaigns (1736-41) in Italy, Flanders and Germany and wrote during the following peaceful years several dissertations for the Academy, of which he became a member (1747). In the Seven Years' War he was chief of commissary, and directed the fortifying of Anklam and the strengthening of Stralsund. Later he fortified Oléron Island after his own system, newly worked out. He invented the low-framed gun-carriage. He wrote 'La fortification per pendiculaire' (Paris 1776), and this, his chief work, was severely criticized, which caused him in self-defense to write 'L'art défensif supérieur à l'offensif? (1796, 11 vols.).

MONTALVÁN, mōn-tal-vān, Juan Perez de, Spanish dramatist and novelist: b. Madrid, 1630, and d. June 1638. He was already making success as dramatist at 17 years of age and was soon working with Lope de Vega. In 1625 he was ordained to the Church and became apostolic notary of the Inquisition. A collection entitled 'Comedias' which distinguish themselves through their national attitude appeared in two volumes (Madrid 1635, Alcalá 1638 and 2d ed., Valencia 1652); seven plays are in Biblioteca de autores españoles, and eight novels of his in 'Sucesos y prodigios de amor' (Madrid 1624, with frequent new editions), and others in Ochoa's Tesoro de novelistas españoles (Paris 1847); in 'Paratodos' (Huesca 1633) are novels on morals and dissertations. His 'Orfeo' (Madrid 1624) is a poem in octaves. On the death of Lope he wrote in postuma an article on Lope de Vega (Madrid 1636). Consult Bacon, G. W., 'Life and Dramatic Works of Dr. J. F. de Montalván' (in Revue Hispanique, Vol. XXVI, Paris 1912); Fitzmaurice-Kelly, James, in Bibliographie de l'histoire de la littérature espagnole (1891).

MONTALVO, García Ordóñez De. See Ordóñez De Montalvo, García.
are variously named. In the extreme northwestern part is the Kootenay, which extends northwest into British Columbia. Between the Kootenay and the Bitter-Root Range are the Cabinet Mountains, extending approximately southeast and northwest, and continuing westward into Idaho. The Mission Range extends almost due north and south for about 100 miles, the northern arm and a portion of the valley at the upper end of Flahate Lake, rising higher toward the southern end, containing McDonald (10,100), Sinayalein (9,500) and McLeod (8,500). East of the Mission Range lies the Swan range, extending almost parallel with the former, and continuing much farther north. Like the Mission Mountains, the Swan Range is highest at the southern end, culminating in Swan Peak (over 10,000), and Baptiste. East of the main range are many small ranges, in some cases quite isolated, and in others connecting the Great Plains to the Continental Divide. The Big Belt Mountains form the boundary line between Meagher County on the east side, and Lewis and Clark and Broadwater counties on the north; they extend from northwest to southeast for more than a hundred miles. Between Chouteau and Cascade counties are the Highwood Mountains, a range of beautiful summits, including Highwood (7,600), Middle (7,000) and Arrow (7,420). The Little Belt Mountains are between Meagher and Cascade counties. The highest summit is Neihart (9,000); Thunder Mountain is 8,000. Between the Little Bells and the Crazy Mountains, farther south are the Blue Mountains, the Elk Range and the Castle, a series of crows with an elevation of 8,606. The Crazy Mountains, the first mountains the traveler is likely to see as he speeds along the railroad near Bigtimer, lie partly in Meagher and partly in Park counties. They contain some beautiful mountains, Crazy Peak (11,178), Sunlight (10,087), Conical (10,731), Loco (9,187) and Fairview (8,400). In Fergus County, which is about as large as the State of Massachusetts, are three small ranges called the Big Snowy, the Little Snow and the Moccasin mountains. In the southern part of the State, just north of Yellowstone Park in Park County, are the Absaroka Mountains, also called the Snow Range, with some high summits, which contain the snows. The Beartooth Range, with some high summits, is the most prominant of the northern ranges. Among these are Pyramid (10,760), Haystack (10,990), Emigrant (10,969), Cowan (11,190), The Needles (10,939), Douglas (11,300), and Sheep (10,620). East of the Absarokee Range and bordering the State line, are the highest mountains in the State, the Beartooth Range, culminating in Granite Peak, with an elevation of 12,850. Extending north and south in Gallatin County is the Gallatin Range, with many lofty and beautiful summits. Among these are Blackmoon (10,196), Hyalite (10,110), Tvin (10,246), Bighorn (10,000) and Gallatin, between the Gallatin and Madison ranges (10,967). Also in Gallatin County, and north of the Gallatin Range, is the Bridger Range, with Bridger Mountain (10,246). Also in Gallatin County, and north of the Gallatin Range, is the Bridger Range, with Bridger Mountain (10,246). This range also contains a mountain named for the Indian Bird Woman who accompanied the Lewis and Clark expedition, Sacajawea. West of the Gallatin Range, in Madison County, are the Snow Crest Range, the Ruby Mountains, the Tobacco Root Mountains and the Madison Range. The last named contains the Sphinx (10,000), and the Wedge (10,600). South of the Gallatin Range, east of Yellowstone Park, are the Pryor Mountains, in Big Horn County, and still farther east are the Rosebud Mountains. In the extreme southeastern part of the State is the High Plateau Ridge. Southeast of Billings is a long and thin valley at the upper end of the Yellowstone Park, which in the high level countries would be called mountains, but which in comparison with the high ranges is not so called. In the central part of the State near the eastern boundary, in Wibaux and Dawson counties, is a series of high wooded hills called the Blue Hills. In the central portion, Sweet Grass County, is a range called the Sweet Grass Hills. In the eastern and northern part of the State is a series of isolated buttes, some of them of sufficient size and extent to be called mountains. Among these are Mountain Sheep Bluffs, nearly 100 miles long. Between the Yellowstone and Missouri rivers, and between Yellowstone and Musselshell counties, are the Bull Mountains, the location of a great field of igneous rocks. They are not as large as some of the other ranges, although they are a series of small mountains, although the larger portion of the country is in the plains county. Where Chouteau, Hill and Blaine counties join is located the Bear Paw Range, culminating in Mount Garfield (5,794), Hancock (5,078) and Centennial (6,074). Much of the mountainous region is yet unexplored, save by the hardy trapper and prospector. The transcontinental rail road gives the traveler a poor idea of the sublimity of the scenery which the mountain ranges afford. Many of the peaks, lakes, glaciers and creeks are unnamed. Owing to the varied topography and elevation of the State there is great variation in the soil and climate, resulting in corresponding variation in occupations of the people.

River Systems and Lakes.—Montana is unique in one respect; unlike any other State or country, the waters from the mountains are carried by different river systems to the three oceans, the Arctic, the Pacific and the Atlantic, through the Gulf of Mexico. In the eastern part the Bitter-Root River gathers the waters from the snow crests of the Bitter-Root Range and from the spurs of the Rockies, and unites with the Missouri near the city of Missoula. The Missouri is the largest stream in the State. The Missouri gathers the waters from a large portion of the western slope of the main range, including that which is used in the great smelters of Anaconda, and that which comes from the rich mines of Butte. Further north, the North Fork, Middle Fork and South Fork of Flathead River receive the drainage from the Mission and Swan ranges, the west slope of the main range and a part of the Kootenai. These unite to form the Flathead River, which first pours its waters into the greatest reservoir of the State, Flathead Lake, and later joins the Missouri in the beautiful but narrow Paradise Valley to form Clark's Fork of the Columbia. The Kootenay River takes the drainage from the extreme northern part of the Columbia drainage system. The rivers on this western side are clear and swift, with rocky and picturesque canions. The Belly and Saint Mary rivers in the northern part of the main range carry the ice-cold water from the glaciers of the Continental Divide, Cheney, Swift Cur-

rent, Grinnell, Sexton, Blackfeet and Red Eagle glaciers, and from Cleveland, Merritt, Wilbur, Gould, Piegans, Going-to-the-Sun, Citadel and Red Eagle mountains, and the adjacent region in Glacier National Park, on to the Arctic Ocean. The sources of these two rivers are in the wildest and most picturesque region of the State. By the plans of the Federal government mesa of the Yellowstone is new and diverted by canal to the Milk River, and used in the vast system of irrigation for the northern part of the State. Triple Divide Peak (8,001) claims the proud distinction of sending its waters to three oceans. By far the greater portion of the State is in the Missouri River drainage system. The Madison, Gallatin and Jefferson rivers gather the waters from the many small ranges adjacent to the Yellowstone Park and unite at Three-Forks to form the Missouri. Near the city of Great Falls are the *Falls of the Missouri* from Fort Benton, a short distance below the Great Falls, the river is navigable to its juncture with the Mississippi. The Yellowstone River rises in Yellowstone Lake in the Yellowstone Park, and after taking its two mighty courses in the park and flowing through its magnificent cañons as a restless river, continuing in swift descent until its waters merge with the muddy Missouri. The Yellowstone is the most rapid navigable stream in the world, but it has long since ceased to be used by boats as a commercial highway. From the north the Missouri receives the waters of the Marias, Teton, Sun and Milk rivers, all of which flow through valleys of great fertility. The scenery along the rivers is varied and exhibits some striking antitheses. The country adjacent to the Yellowstone is remarkable beauty. The river, as it winds back and forth like a stream of silver, when viewed from Mount Lolo, Ward's Peak or Saint Mary's in the Bitter-Root Range, is probably equaled in quiet and peaceful grandeur only by the Yellowstone as it flows through the Valley of the Vandal in the park. The three branches of the Flathead present to the few travelers along their course many gorges and canyons. The South Fork in one place in the Lewis and Clarke Forest reserve has cut its way through solid rock, making a cañon so narrow that pack horses may be and are forced to leap from brink to brink, while the river sooths and boils many feet below, its ominous roar announcing certain death if the leap is short. The Missouri has made the famous *Gateway of the Mountains*, its splendor first told by Lewis and Clark, and later made famous by the brush of artists. At the city of Great Falls, it hastens its speed before tumbling over the beautiful Black Eagle Falls, spanned by a bridge on the Great Northern Railroad, and does not diminish its speed until the bottom of the Great Falls is reached. The valleys of these rivers and their smaller tributaries make rich farming soil, suitable for grain, vegetables and fruit. The Bitter-Root Valley in the West was settled first, and is a great farming and fruit raising region because its soil is thickly settled, and produces abundant harvests without irrigation. The Gallatin Valley has become famous for its bountiful harvests, and the Yellowstone is being largely used for agriculture and fruit. The Musselshell River takes its first waters from the crests of the Crazy, Castle, Little Belt and Big Snowy mountains. It flows eastward, through the central portion of the State, turns northward, emptying into the Missouri. The Judith takes its rise on the northern slopes of the Little Belt and Big Snowy mountains, flows north and gives its waters to the Missouri. The Milk River heads in the Judith Bay Divide east of Upper and Lower Saint Mary lakes, turns north into Canada, flows east for over 100 miles, returns to the State for another 200-mile stretch before it reaches the Missouri. The Dearborn, Sun and Teton rivers are short but important streams which head in the main range of the Rockies and flow eastward to the Missouri in the Great Falls Region. They furnish the water for large irrigation systems. The Bighorn River rises far south, in the mountains in middle Wyoming, and flows north into the Yellowstone near Custer. The Little Bighorn is a tributary of the former, famous in history because of the Custer massacre on its banks by the Indians. The Powder River also rises far south in middle Wyoming, flowing north with a tortuous course, emptying into the Yellowstone east of Tongue River heads in northern Wyoming and flows into the Yellowstone at Miles City. There are many smaller streams designated as rivers, of greater or less importance, depending upon their location and usefulness in irrigation. There are several large lakes and many small ones. In the Glacier Park alone (q.v.) are some 250 lakes, large and small. Other sections have numerous lakes, many of which are unnamed. Flathead Lake, in the western part, is about 36 miles long, has an area of 189 square miles and is 289 feet deep. The size and depth of lakes in Glacier Park are given under that heading. The larger ones are Upper and Lower Saint Mary, Kintla, Logging, Bowman and McDonald. Georgetown Lake, near Philipsburg, has an area of 262 square miles. Several miles, Hauser Lake, a widening of the Missouri River near Helena, was made by the construction of the Hauser Dam.

**Climate and Rainfall.**—The climate of the State is exceedingly varied, and is much more salubrious than is generally supposed. West of the main range the winters are mild, the summers and falls are delightful. The rainfall at Missoula and Kalispell averages about 16 inches, while at Cuberston and Glendive in the eastern end the rainfall is about 13 inches. Rain and snow prevail during the spring until early July. July, August and September are largely without rain, although in many places there is no need of irrigation. During the last decade, possibly due to increased irrigation and to the tilling of many millions of acres that formerly were used only for range, theState during summer months has increased. In many sections of the State large crops have been raised without irrigation. It must be remembered, however, that there is no certainty of summer rains, and most lands without irrigation are liable to suffer from drought. Being to the different altitudes, snow may fall later in the spring at some places than at others. An area of 40,700 square miles is below 3,000 feet elevation above the sea; this is equivalent to a State the size of Georgia. About 10,200 square
miles exceed 8,000 feet altitude. The climate on
the Pacific slope is milder and less changeable
than that of the Atlantic side. The majorities
of the areas of high barometer, and accompanying
cold, originate in the Arctic Region, and are
deflected southward or eastward by the
Rocky Mountains. While eastern Montana and
the Dakotas may be in the throes of a blizzard
the western end may be enjoying balmy weather.
As in any extreme northern state, the ther-
ometer occasionally records a low midwinter
temperature, but the cold spells are short. While
they remain there is practically no wind. The
air is dry and the sunshine clear. Ordinary
outdoor occupations may be carried on with
little inconvenience. Summer temperatures are
not oppressive, and heat prostrations are un-
known. In 1916 Missoula, on the west side of
the range, had maximum temperature of 98° F.
and minimum of 12° F.; east of the moun-
tains Havre, from which the climate of Mont-
tana seems to be determined, because it is the
first weather bureau station in the United States
to record advancing cold waves, had maximum
92° F. and minimum of 33° F. These are
merely typical of the greatly varying tempera-
tures. The mean temperature in the western
end is 44° F. At Helena, altitude 4,500, the
mean temperature is 43°. Chinook winds may
occur over the entire State, melting large quan-
tities of snow in a short period of time. Owing
to the usual absence of a high percentage of
humidity, the cold weather is not extremely
agreeable, nor the warm days smotheringly
agreeable. The hot days may blister the skin,
while the nights following will be cool enough
to require blankets. Rarely does one sleep with-
out considerable covering, and some people
wear the same clothing summer and winter,
donning extra coats or wraps in winter. This
may be given as the general summary: the
springs are rainy; the summers are clear
and dry; the autumns are delightful; the winters
are clear and bracing. Owing to the absence
of high humidity the climate is very beneficial
to health, as statistics will show. It is especially
beneficial to those suffering with pulmonary dis-
ases. Malaria is entirely absent. The central
Weather Bureau Station is located at Helena.
There are stations at Kalispell, Havre and
Miles City.

Agriculture and Husbandry.—In the early
days of Montana's history it was not thought
possible to grow crops in the State to much ex-
tent. Nearly everything was shipped in from
the outside. As the mines developed the
demand for food became so great as to stimulate
agriculture, and fruit raising was also attempted.
Marked success attended the efforts, and large
acreages of grain and orchards were put out
annually until agriculture and husbandry have
developed in rank above the mineral wealth.
In 1902, nearly 250,000 fruit trees were set out;
the number was almost doubled the next year.
At the close of the year 1903 nearly 1,500,000
fruit trees had been set out in various parts of
the State. Since then the acreage has been very
greatly increased. The trees in the orchards in-
clude apples, cherries, plums, apricots and
peaches. Small fruit, such as goosberries
strawberries, blackberries, currants and the like,
produce enormous crops from small acreage,
while to describe the size and weight of the
fruit is almost beyond belief. Apples are
shipped to all parts of the country and to
Europe. As they are quite free from insect
pests, owing to the strong legislation and
watchful care in orchard inspection, home-
grown apples are always in demand, the demand
being far in excess of the supply. The Bitter-
Root Valley, in the western part of the State on
the Pacific slope, is the oldest orchard sec-
ton, and has become famous as a fruit-growing
valley. But the orchards are not confined to
this beautiful and fertile valley. The valley
to the north of Flathead Lake is filled with
orchards, already breaking beneath their loads
of fruit. The Yellowstone Valley is developing
rapidly as a fruit-growing region, even growing
grapes. The most recent observations show
that fruit trees may be grown and that apples
will mature in every portion of the State. Since
the portion of the State east of the Rocky
Mountains is much greater than on the west the
fruit-growing possibilities of the State may
be readily understood when it is known that
the great majority of the fruit trees of the
State are on the Pacific side. About 10,000,000
acres of fruit have been planted, with about
40,000 acres in crops in 1918. This does not include pasture.
In the last 10 years the State has had such a
large increase of farmers that no safe compari-
sions with former periods can be made. Great
stretches of former prairie land that was given
over to grazing and stock raising have been
taken by homesteaders, and used for farming
purposes. The former prairie wilderness has
become a settled country, with farmhouses,
schoolhouses, towns, and even cities of good
size. The total acreage in farms in 1910 was
about 85 times that reported in 1870, and the
increase since 1900 has been tremendous. In
the extreme eastern part are the "Bad Lands,"
a continuation of the "Bad Lands" of the Da-
kotas, Wyoming and Nebraska, practically non-
irrigable because of the uneven surface. The
Yellowstone Valley has become famous for its
growth of alfalfa. Two or three cuttings, a
total of four to seven tons per acre, are had. The
Gallatin, Madison and Jefferson valleys in the
southeast have rich harvests of cereals, never
failing through irrigation. In the western Bit-
ter-Root, Missoula and Flathead valleys, while
less extensive, produce as abundant harvests,
often without irrigation. The lands are of three
general classes—the bottom lands, near the
streams, with rich, black, alluvial soil; the bench
lands, whose soil is a sandy loam, capable of
wide range of cultivation; and the high bluffs,
suitable largely for grazing. The crops in 1918
were, wheat, 31,963,000 bushels; oats, 19,040,000
bushels; rye, 121,000 bushels; barley, 1,829,000
bushels; flax, 3,487,000 bushels; great quantities
of corn, hay and forage, potatoes, and
vegetables. During the past few years, many
small fruit and truck farms have been started,
promising greater returns per acre and greater
variety of farm products, as ready market awaits
all kinds of farm products. Montana leads the
Union in the number of sheep, there being more
than 5,500,000 in 1910. The sheep industry has
proven profitable in the eastern portion where
there is much range. In 1918 there were there
925,000 cattle and 319,000 horses, the as-
sessed valuation of the former being about
$3,700,000, and of the latter $6,061,000. Since
then the increase has been enormous.

Forests and Lumber.—Twenty-nine per
percent of the total area of the State is covered with timber, which is 8 per cent less than for the average of the entire United States. The timber growth is largely of coniferous trees, yellow pine, tamarack and Douglas spruce (red fir), comprising the most of the commercial product. Along the streams occur forests of cottonwood. In the drier portions of the State, stunted red cedars often grow along the smaller water courses, of great value to settlers, as they supply posts and wood. Forests of white cedar or arbor-vitae, white pine and Engelmann's spruce occur in the western part. On the higher slopes and summits the alpine species thrive; but as they have limbs to the base of the tree and inaccessible, they are not of value commercially. They are useful in preventing the rapid melting of the snow in the spring, holding it until later in the season when it is needed in irrigation. A considerable portion of the State's timbered area is included in government forest reserves. The area embraced in each as follows:

The annual output of lumber from Montana mills is quite large. The cut for 1916 is considerably above the average for the 10-year period, 1906 to 1915, and also higher than the 1917 cut. The total lumber cut for 1916, based upon mills cutting 50,000 feet board measure or more per year, was 383,884,000 feet board measure. A conservative estimate of the total cut for 1916 was in round numbers at least 383,000,000 feet board measure. The lumber production by species for 1916 is shown below:

In addition to the lumber produced in 1916 there were 25,522,000 pieces of lath and 16,866,000 shingles. Figuring that 7,000 lath is equal to 1,000 feet board measure and that 10,000 shingles is equal to 1,000 feet board measure of lumber, the lath and shingles produced are equal in round numbers to approximately 5,200,000 feet board measure. The total forest products amount to 594,740,000 feet board measure. In 1916 there were 138 sawmills in the State, 157 in 1915. The annual increment of all timber in the State and the annual cut are approximately equal at present. Under proper management, Montana has sufficient timber land to supply the present annual consumption of the State indefinitely with a surplus for disposal elsewhere. It is roughly figured that with proper protection and management, the United States Forest Service is the only organization in Montana growing and plant-
is approximately 80. In addition to the timber resources of the national forests of Montana, they yield each year an abundant crop of forage for the production of livestock. In the fiscal year ending 30 June 1918, 193,108 cattle and horses and 810,355 sheep and goats grazed on the 10 national forests of Montana, mainly during the summer period, and yielded a revenue to the United States of $136,478.68. The revenue, however, represents merely a nominal charge for the forage used. The true commercial value would perhaps reach approximately $500,000 annually.

Mines and Mining.—In the early years of the State’s history Montana was known principally on account of her mines. Although mining has taken second place to agriculture the State is still a mining section, with vast expenditure and enormous returns. A thousand million dollars worth of precious and semi-precious metals is a fair estimate of the mineral products, extending over half a century. The early history is the search for gold, and many of her towns and cities are built in gulches where placer gold was mined. Rich Helena and Virginia City are illustrations, the latter being the oldest camp in the State. Although Butte is the greatest mining camp in the State, and indeed the greatest in the world, there are many other places where mining is carried on. Gold was discovered in Montana in paying quantities in 1862. The find was in Grasshopper Creek, where later the town of Bannock was built, and where the first seat of government was established in 1864. The diggings of Alder Gulch and Last Chance Gulch, where Helena now stands, followed. It is estimated that in the first 20 years of placer mining $200,000,000 in gold was taken, although no accurate system of determining is possible. Montana Bar in Confederate Gulch, Broadwater County, yielded $1,600,000 in 1867 and this was packed in kegs, hauled in freight wagons to Fort Benton and taken thence by boat to Sioux City, the nearest railroad. The men of the Lewis and Clark Expedition probably stirred big values in gold, unknowingly, as they laboriously pole and dragged their boats up the Missouri past this bar. The true source of the gold found in the placer mines is yet a mystery. Following the discovery of free gold came gold quart mining. The first mine was the Ore Cache at Summit in Alder Gulch. Other discoveries were made rapidly. In the 60’s every reef and outcrop in Madison County was staked and recorded. Then came the attempt to mine and smelt silver-lead ores. Long before a railroad reached the State lead-silver bullion was shipped to Crinne, Utah, in freight wagons, for smelting. Copper ore of value was not discovered in Butte until about 1880. Ore was found in seemingly inexhaustible quantities. Smelting works were erected, big plants being constructed. In later years zinc deposits have been developed and an electrolytic zinc-reducing plant has been constructed at Great Falls. Manganese ores, which have heretofore been of a negligible quantity, have been found in the Butte mines. The Philipsburg region is also rich in manganese. The high price for this ore on account of the war caused great activity in manganese production in 1917 and 1918. Other mineral producing regions are Jardine, Park County, which produces gold, silver, selenite and tungsten; Emigrant Gulch, placer gold; Hell Gate, copper ore; Radersburg, gold and other ores; Silver Camp, at the headwaters of the Big Blackfoot, silver, copper and zinc; Ellchorn, in Beaverhead County, several ores; Neihart, Cascade County, silver-lead ore; Castle, Meagher County, lead; mines near Helena, gold. The total value of all minerals produced in 1914 was about $478,000,000. In 1915 the output was almost doubled, reaching $87,000,000. In 1916 this was again almost doubled, $145,300,000. Production in 1917 and 1918 was still enormously increased. The output of the different counties is given for the year 1916, showing the distribution of the mineral wealth.

†Includes placer production.
Montana is one of the richest coal States in the West, although much of it is undeveloped. The cretaceous, bituminous and semi-bituminous coal areas in the State cover about 13,000 square miles, and the total coal deposits are estimated at 25,000,000,000 tons. Not all of this territory contains coal, of course, but the deposits are found quite abundantly throughout the State. The quality varies from anthracite to low grade lignite. Anthracite is present but in small commercial quantity. The inferior lignite is in the Great Plains section. The grade of coal improves as the mountains are approached, culminating, usually, in highest grade in or near the mountains. Tests show the bituminous coal to be little inferior to Pennsylvania anthracite coals. Lignite is not yet extensively used because methods of making briquettes are as yet commercially expensive, and without briquette moisture and gas rapidly leave the coal. But lignite is a natural resource with great future value. One lignite field near Miles City is 40 feet thick. Over 1,810,000 tons of coal were mined in the State in 1910. In 1916 the output was doubled, having risen to nearly 3,700,000 tons. New mines are being opened annually. Bituminous coal or lignite has been found in nearly every county in the State. The undeveloped coal industry will, without doubt, be a prominent factor in the future expansion of other industries of the State. In addition to its coal, the State has extensive beds of clay, of different grades and qualities. Stones for building purposes are quarried in many sections. Montana leads the States of the Union in the production of sapphires, the actual mining of which began in 1891. Four mining regions may be mentioned: A belt 12 miles north of Helena on the Missouri River; the Rock Creek region, 30 miles west of Anaconda; the Cottonwood Creek fields, 10 miles east of Deer Lodge, and the Yago mines in Fergus County, 13 miles west of Utica. The last is the most productive region. In 1917 the last two reported mines were both in and had been found in the State. Oil was first discovered in the Elk Basin, Carbon County, near the Wyoming line, 11 Nov. 1915. Since then seven Montana fields are producing in this district. The first well was a gas well, 1,494 feet, with a production during the first 24 hours of 150 barrels. The flow continued about 200 barrels daily after the first day. In October 1917 two oil prospects were discovered near Laurel in Yellowstone County. Exploratory work is conducted in the Dry Creek Basin in Carbon County, near Bridger and Laurel in Yellowstone, in Toole and Sweet Grass counties, in Musselshell County, near Lavina and Roundup, in Deer Lodge, Lewis and Clark, Cascade and Dawson counties. The Montana oil wells marketed in 1916 44,917 barrels. Gas has been discovered in the northern, the central, the southern and eastern parts of the State. A number of gas wells near Havre were brought in in 1915, with a supply more than ample to heat the city. A field of 1,494 feet, with a production during the first 24 hours of 150 barrels and the gas has been piped to the town for use. About 70 miles from Billings, near the State line, a well was blown in in 1916 with a flow of 100,000,000 cubic feet of gas every 24 hours and was extremely difficult to plug and control.

Manufactures.—The predominating industry is the smelting of ores. The largest smelter of the world, the Washoe, is located at Anaconda. For the treatment of ores water is brought from Silver Lake, some 13 miles away, in the mountains. Ores from Butte and elsewhere are treated at the Washoe. The ores are transported by an electrically operated railroad 28 miles in length. The smelter reduces about one-fourth of the copper mined in the United States. In connection with the smelter is a large sulphuric acid plant. Another great smelter is built on the sloping bank of the Missouri River at Great Falls, securing an abundance of water from the river. The third great smelter of the State is at East Helena. In 1916 about $8,000,000 worth of lumber was cut by the mills of the State. The larger mills are located at Hamilton, Missoula, Bonner, Saint Regis, Somers, Eureka and Libby. At most of these places there are, in connection with the mills, factories for the manufacture of sash, doors, windows and various forms of cabinet work. Considerable furniture is made from native lumber. Large flour mills have been built in practically every section of the State. With the increase in grain growing in the undeveloped coal industry will, without doubt, be a prominent factor in the future expansion of other industries of the State. In addition to its coal, the State has extensive beds of clay, of different grades and qualities. Stones for building purposes are quarried in many sections. Montana leads the States of the Union in the production of sapphires, the actual mining of which began in 1891. Four mining regions may be mentioned: A belt 12 miles north of Helena on the Missouri River; the Rock Creek region, 30 miles west of Anaconda; the Cottonwood Creek fields, 10 miles east of Deer Lodge, and the Yago mines in Fergus County, 13 miles west of Utica. The last is the most productive region. In 1917 the last two reported mines were both in and had been found in the State. Oil was first discovered in the Elk Basin, Carbon County, near the Wyoming line, 11 Nov. 1915. Since then seven Montana fields are producing in this district. The first well was a gas well, 1,494 feet, with a production during the first 24 hours of 150 barrels. The flow continued about 200 barrels daily after the first day. In October 1917 two oil prospects were discovered near Laurel in Yellowstone County. Exploratory work is conducted in the Dry Creek Basin in Carbon County, near Bridger and Laurel in Yellowstone, in Toole and Sweet Grass counties, in Musselshell County, near Lavina and Roundup, in Deer Lodge, Lewis and Clark, Cascade and Dawson counties. The Montana oil wells marketed in 1916 44,917 barrels. Gas has been discovered in the northern, the central, the southern and eastern parts of the State. A number of gas wells near Havre were brought in in 1915, with a supply more than ample to heat the city. A field of 1,494 feet, with a production during the first 24 hours of 150 barrels and the gas has been piped to the town for use. About 70 miles from Billings, near the State line, a well was blown in in 1916 with a flow of 100,000,000 cubic feet of gas every 24 hours and was extremely difficult to plug and control.
MONTANA

with these main trunk lines. It terminates at Butte. The Burlington enters the State south of Billings, giving a short route to all points toward the south and west. The Great Northern and Northern Pacific operate nearly 4,600 miles of track in the State, including sidings, spur and sidetracks. The Chicago, Milwaukee and Saint Paul operates by electricity all its trains from Harlowton, Mont., to Avery, Idaho, a distance of 450 miles. Powerful electric locomotives requiring neither coal nor water, and making no smoke nor cinders, draw the heavy trains over the Rocky Mountains. The engines are so constructed that on down grade electricity is generated, the current thus produced being transmitted to the feed wire. This electrical generation acts as a brake. It requires 24 hours or more to go the entire length of the State by rail. The Northern Pacific follows the Yellowstone River from Glendive to Livingston. At this place a branch line goes to Yellowstone Park. At and near Bozeman the road crosses the famous Gallatin Valley. It then follows the Missouri River to Townsend, where the ascent to the main range of the Rockies really begins. In the western part of the State, the beautiful scenic character of Clark's Fork of the Columbia. The Great Northern follows the Missouri for a long distance after it enters the State, and then along the Milk River for several hundred miles. Continuing westward across beautiful prairie country towards the Rockies it crosses to the Pacific side, giving superb view of some of the beautiful peaks in Glacier Park. Near the western border it follows the Kootenay River with majestic mountains on either side. The Milwaukee enters from Dakota in the eastern prairie region, crosses the Yellowstone River at Terry, follows this river about 75 miles to Forsyth, continuing westward from here to the Musselshell River, and further west to the Three Forks of the Missouri. Here the ascent of the main range begins. On the west the road turns to the strikes of Root Mountains, over the pass with beautiful view in every direction, and down hill to Spokane. During the past few years not much construction has been undertaken, although prior to that many hundred miles were built in a short time. In 1917 and 1918 more than 100 miles of new road were built and put in operation. The rapid development of the State agriculturally has made great demand for railroad construction. The immediate future will doubtless see a great increase in railroad mileage.

Finances.—The total assessed valuation of the State in 1917 was $582,286,529. The valuation for 1918 was approximately $596,000,000. The valuation of railroads was a little more than $52,000,000. The total wealth production of the State in 1917 was $317,000,000, of which $113,000,000 came from the mines.

Politics.—Montana was admitted as a Republican State 8 Nov. 1889. It was organized as a Territory in 1864. Owing to the silver question it was divided for a time very unequally. In 1896 the State legislature who distinctly for free silver. In 1900 the fusion of Democrats, Laborites and Socialists carried almost everything. In 1902 a Republican was elected to Congress. In 1912 the Progressive party carried the State, which went for Wilson in 1916. The State has two Congressional districts, and is represented in Congress (1919) by two congressmen and two senators. In 1916 Montana elected the first woman to Congress, Miss Jeannette Rankin, a graduate of the State University in her home town, Missoula.

State Government.—The Constitutional Convention met at Helena 4 July 1889, concluding its labors 19 August. The constitution was approved by the people at a special election in October, and the proclamation making Montana a State was issued 8 November. Women are now possessed of the full franchise and may vote at all elections and hold office. In 1919 women filled every position for county superintendent of schools. The office of State superintendent of public instruction is filled by a woman. Women are elected to different county offices. Two women sat in the State legislature in 1917. The governor and State officers hold office four years, elected by a plurality vote. The Territorial and State governors and their terms of office are as follows:

The governor is a member of the State board of prison commissioners, State board of examiners, State board of land commissioners, State board of equalization, State board of education, State board of commissioners for the insane, State board of commissioners for the deaf, dumb and blind, State board of horticulture, State board of farmers' institutes, State board of livestock commissioners. By and with the advice and consent of the State legislature he appoints the members of the various boards where the law does not particularly specify. He appoints the State land agent, the register of lands, the veterinarian, the forester, the engineer, the commissioner of labor and industries, the dairy commissioner, the recorder of marks and brands, the mine inspectors and some other appointive officers. The legislature has biennial sessions in odd-numbered years. The State senate is composed of one member from each county. The State house of representatives has such apportionment as is made by the legislature. There are 43 in the senate, four years, one-half holding over, and 97 in the house, making a total legislative assembly of 120. The State has two representatives in Congress with one seat, the other left vacant. There are three judges of the State Supreme Court, for a term of six years. There are 18 judicial districts, the judges elected for four years. The term of county commissioners is four years, each county having three members. State officials
are elected for four years, county officials, except commissioners, for two years.

**Banks and Banking.**—At the close of the fiscal year ending 30 June 1917, Montana led the great nation in the number of banks chartered during the year. Thirty new banks brought the total of national banks to nearly 100. There were at that time 264 State banks and 13 private banks. The total capitalization of banks is about $11,200,000; loans and discounts, $9,000,000; cash on hand, 11 Sept. 1917, $2,400,000.

**Education.**—Although young among the States, Montana ranks high in the efficiency of her educational system. When Montana was admitted to the Union the common schools received as an endowment from the national government one-eighth of all the public land in the State. When fully surveyed and the land's total will be approximately 1,234,000 acres. Up to 1918 the total amount of 794,914 acres netted the common school fund $14,539,887. More than one-third of this is invested in bonds, warrants, and farm loans, bearing interest. Nearly $8,000,000 is represented by deferred payments, drawing 5 per cent interest. The State treasurer held in cash $1,247,576 in cash awaiting investment. The total income from this source in 1917 was $877,536, a total of $5.50 per capita for school children. Land grants to the State institutions for higher learning aggregate 668,080 acres, much of which has been sold. The fund accumulating from sales is loaned at interest. In 1917–18 there were 122,000 children enrolled in the schools of the State, an increase in nine years of 88 per cent. In the same year there were 5,781 teachers, an increase in 10 years of 203 per cent. The greatest increase in teachers and children was in the northeastern part, where heavy immigration had taken place. Summer school attendance of all Montana teachers in 1918 was 1,227. The average salary of superintendents and principals in the county seats was $2,282.67. All of the county superintendents in the State are women. All but five county superintendents have supervision of territories larger than Rhode Island, and six counties have territories to travel that are larger than Delaware and Rhode Island together. The public schools of the State are under the supervision of the State department of public instruction. Under the State superintendent there is a deputy, and two rural school inspectors. The legislature in 1918 made provision for an inspection of high schools. The control of the higher State institutions is in the hands of the State board of education. This board consists of the governor, the attorney-general, and the State superintendent of public instruction, ex-officio members, and seven other members appointed by the governor. The University of Montana, composed of its four schools, as well as the State School for Deaf, Dumb and Feeble-Minded, at Boulder; the State Industrial School, at Miles City, and the State Orphans' Home, at Twin Bridges, all come under the jurisdiction of the State board. Each of these institutions has a minimum board, composed of five members, charged with the duty of carrying on its work, and the four schools composing the University of Montana have, in addition to the local board, a chancellor of the university, located at Helena, whose duty it is to correlate and unify the work. The State has a system of county high schools, under a separate board of trustees and with separate administration from city schools. These schools are maintained by national banks chartered during the year. Thirty new banks brought the total of national banks to nearly 100. There were at that time 264 State banks and 13 private banks. The total capitalization of banks is about $11,200,000; loans and discounts, $9,000,000; cash on hand, 11 Sept. 1917, $2,400,000.

The State Normal School at Dillon has 535 in attendance. The State Agricultural and experiment station at Bozeman (1892) has about 1,000 students. The State School of Mines (1899) is at Butte, with about 100 students. The State University (1895), at Missoula, has about 1,000 students. The university established a summer school for science at Flathead Lake in 1899, known as the University of Montana Biological Station. It has continued in successful operation since, and has drawn many from the State and from Eastern States. The Montana Wesleyan College (Methodist) is at Helena. The College of Montana (Presbyterian) was for years the only institution for higher education in the State. Financial difficulties caused its suspension about 1898. The Billings Polytechnic Institute is at Billings.

Many private schools are maintained by the Catholic Church. The Sacred Heart Academy at Missoula has an attendance of several hundred, as have also the academies in Butte and other places. In accordance with an act of the legislature approved 8 March 1915, teachers who have taught 25 years, the last five of which have been in Montana, may retire on an annual retirement salary of $600. School officials are required to deduct $1 every month from the salary of every teacher in their employ for the benefit of the retirement salary fund. This applies to all teachers except those actually in the employ of Montana schools at the date of the approval of the act, who were allowed till 1 Jan. 1916 to decide whether to avail themselves of the law or not. There are 18 county high schools. The number of accredited high schools (1918) is 194; for one year, 55; for three years, 10; for two years, 38; for one year, 18. There are nine academies and private schools accredited for four years. The number of county libraries (1918) is four; high schools with normal training courses, 11; school nurses in city schools, 11.

**Charitable and Penal Institutions.**—The penitentiary is located at Deer Lodge. Convicts are given outdoor work on the public highways in different parts of the State, on parole. The system gives highest satisfaction both to the inmates and to the guards. It is no uncommon sight to see from 50 to 100 convicts at work, absolutely unguarded. Of the inmates a small proportion is native born, the remainder being from other States. Many criminals flee to the mountains, and Montana undoubtedly helps care for the criminal population of many other States. Charities and reform are placed in the hands of a board of three members, appointed by the governor for four years. The reform school for boys is located at Miles City. The school for deaf, dumb and blind, and for delinquents, is located at Boulder. The soldiers' home is at Columbia Falls. The asylum for the insane is at Warm Springs. A sanatorium for tuberculosis patients
with capacity for 80, is located at Galen near Deer Lodge.

**Government Reservations.**—Notwithstanding the large area of the State much of it was not declared a reservation by Congress as a reservation. The Glacier National Park includes 915,000 acres, or about 1,450 square miles. The forest reserves, with about 16,000,000 acres, or nearly 15,000 square miles, are mentioned elsewhere. In the early days the Northern Pacific Railway Company obtained a grant from Congress for a road every other section for a distance of 50 miles on either side of the railroad, approximating 15,000,000 acres in Montana, or nearly one-sixth of the area. Of this amount much has been sold. Approximately 3,500,000 acres are yet in the hands of the company. There are several large Indian reservations in the State. In recent years the only reservation west of the divide, the former Flathead Reservation, was opened for settlement. Each Indian was given an amount, and the remainder was opened for settlement, the homesteader paying a stipulated amount per acre. This money was placed in a fund for the Indians. This reservation covered 2,240 square miles, and is now largely in use. In the northwestern part of the State, with its southern boundary made by the Missouri River, is the former Fort Peck Reservation, comprising 2,775 square miles. This, also, has been opened to settlers, and has been homesteaded. Four Indian reservations are left: the Crow, in Yellowstone and Custer counties, covering an area of 5,475 square miles, larger than the State of Connecticut; the North Cheyenne, in Rosebud and Bighorn counties, 765 square miles; the Fort Belknap, in Blaine and Phillips counties, 840 square miles; and the Blackfeet, which includes about a third of Teton County, or about 2,000 square miles. The total land now comprised by Indian reservations is about 3,700,000 acres, and about 3,800,000 have been opened for settlement. There are about 300,000 acres in military reservations. The State lands comprise about 3,000,000 acres. The National Bison Range, under the control of the United States Biological Survey, located at Ravalli, a few miles west of Butte, has about 20,000 acres. In it are buffalo, antelope, elk and deer. The Willow Creek Bird Reservation, about one section, is near Augusta, in Lewis and Clark County, and is for the protection of plover and avocets. The Flathead Lake Reserve consists of two small islands in Flathead Lake.

**History.**—The first explorations are believed to have been made by Pierre and Chevalier Verendrye, who, with two Canadians and a party of 25, are supposed to have entered Montana about 1743. The route they took and the points to which they reached are puzzling and the records conflicting. It was at first thought they had gone as far west as the Gate of the Mountains, and is so recorded in the '60's. In the '70's, History records they were in Montana. It seems to be generally agreed by later investigators that the party went only into the southeastern part of the State, and it is doubtful if they came into Montana at all. While in the country nearly 30,000 acres of land they planted on an eminence a leaden plate on which were engraved the arms of France, and erected a monument of stones. In 1913, 170 years later, this leaden plate was found by some school children, but this was in Pierre, S. D., much farther east than had been supposed, as it was supposed to have been burned when the City of Pierre was ceded to Missouri. For 50 years the country remained unknown to history. The whole territory was ceded to Spain by France along with Louisiana in 1764. In 1800 the country again passed to France by treaty. In 1803 the Louisiana grant, embracing a large part of what is now Montana, was ceded by France to the United States for a consideration of $15,000,000. The portion of the State west of the Rocky Mountains was embraced in the Territory of Oregon, when Oregon was organized in 1848. In 1863 a new Territory of Idaho was formed, including Montana. In 1864 the Territory of Montana was organized with its boundary the same as that the State now has, except that about 2,000 square miles have been added in the southeast. In 1840 President Jefferson sent an expedition to explore the northwestern territory. The expedition was under the direction of two army captains, Lewis and Clark, and has become famous in history as the Lewis and Clark Adventure. While exploring the Missouri, explored some of its tributaries, crossed the range to the Pacific Ocean, and returned in safety to Saint Louis. The first trading post was that of Manuel Lisa, built in 1807 on the Big Horn River. In 1823 another was established on the Missouri at the mouth of the Milk River. In 1829 Alexander Mackenzie, for the American Fur Trader Company, built Fort Union on the Missouri above the mouth of the Yellowstone. In 1832 the steamboat *Yellowstone* ascended to this point. Previous to this all supplies were taken overland, a distance of nearly 2,000 miles. In 1835 a steamboat went 60 miles up the Yellowstone. In 1846 Fort Benton was built. Steamboats ascended the Missouri to the fort in 1860, and the property was turned over to the United States in 1869. On the western side Father DeSmet established Saint Mary's Mission at Stevensville in 1845, still standing in 1919. Later he founded Saint Ignatius' Mission in the valley of the Pend d'Oreille and in 1857 founded the mission at the shadow of the beautiful Mission Mountains, which for 50 years was a great power for good among the Indians. From 1840 to about 1890 the history of Montana is occupied mainly with the missionary labors of Father DeSmet and his associates among the Flathead Indians. About 1855 there were rumors of gold. In 1852 a half-breed named Francois Pinlay, commonly known in Indian as Benetese, found gold in the sands of Gold Creek in Deer Lodge County. Rich discoveries were found in 1861. By 1862 Grasshopper and White's Bar were discovered, and Bannack in January 1863. Gold dust to the amount of $25,000,000 was taken from Alder Gulch in a few months. Last Chance Gulch, where Helena now stands, produced many fortunes. In 1867 mining companies were formed to placers, but the introduction of machinery made the treatment of ores of silver, gold and copper very productive, and made the permanent prosperity of Butte. The introduction of so many settlers was a shock to the Indian, but his resistance to the advance of the white men. Many minor conflicts occurred, but two are worthy of special mention. The war with the Sioux
1 Senate Chamber, Montana State Capitol

2 House of Representatives, Montana State Capitol
opened in 1876, and was a desperate conflict. General Custer was detached against the Sioux, under the leadership of Sitting Bull, numbering 6,000 warriors. Pushing up the Rosebud to its headwaters Custer found the Indians encamped on the Little Big Horn. Custer was surrounded and his entire command, except his own, was destroyed. Within a year a series of victories under General Miles had destroyed the power of the Indians. In 1877 Chief Joseph, of the Nez Perces in the western part of Idaho and his tribe prepared to cross the Bitter Root Mountains against the orders of the government. They crossed the mountains and passed up the Bitter Root, pursued by soldiers under the command of General Gibbons. At the Big Horn a bloody and indecisive battle was fought. Chief Joseph passed through up the Madison, through the Yellowstone National Park, across the prairie to Snake Creek and was captured only a few miles from the Bear Paw Mountains—a trail of over 1,500 miles, more than half of which was a running battle. A convention met in Helena in 1864 which adopted a State Constitution. This was approved by the people in November of the same year. Congress refused to sanction the request for statehood, and this was not granted until 1889. Since then immigration has brought many citizens from other States. The former restless population has changed into people who are desirous of making permanent homes. Agriculture and fruit culture, through irrigation, has added a new industry to the State, and the people of the farm join hands with the toiler beneath the surface in the mines, in an exchange of products, to the advantage of both and for the material advancement of the State.

Population.—The first Territorial census in 1860 shows but 288 people in the Territory, exclusive of the Madison. The population, as given by the census for each decade is as follows: (1860) 288; (1870) 20,595; (1880) 39,159; (1890) 132,159; (1900) 243,329; (1910) 376,056; (estimated 1919) 750,000. Illiteracy is low. There are 50 counties in the State, as follows, with their county seats:

* Established by the legislature in 1919, without county seat, which was to be determined by county commissioners of each county.

The following is the population of cities with more than 10,000 population, as given by the 1910 census: Butte, 39,165; Great Falls, 13,948; Missoula, 12,869; Helena, 12,515; Anaconda, 10,134; Billings, 10,031. Cities of over 2,000 population are Glendive, Miles City, Red Lodge, Roundup, Dillon, Hamilton, Glasgow, Havre, Kalispell, Walkerville, Bozeman, Livingston, Lewistown. Nearly all of the cities and towns are growing rapidly. Many important business places have appeared within a few years, as Baker, Hardin, Roundup, Valier, Polson and Hysham. Many small places far inland from railroads do very large business. Butte, the largest city in the State, is situated on the Pacific side of the main range, at an altitude of 3,700 feet, a few miles from the summit of the range. It is noted for the wonderful richness and extent of its mines. It is a railway centre, the transportation facilities making it an important wholesale and distributing centre. The State School of Mines is located at Butte. Great Falls, the second city in the State, was located and plotted by Paris Gibson, yet living, and James J. Hill, in 1883, before the coming of the railroad or the building of a house. It is a beautiful city, with parks and boulevarded streets. It is the present commercial centre and the several falls in the river make it a great source of electrical power. A large smelter is located on the bank of the Missouri River. It has many factories and is the centre of a large agricultural country. Missoula, the Garden City, is on the west side of the range, at the mouth of Hell Gate Cañon. It has a large surrounding agricultural, fruit-growing and lumber country. The Milwaukee and Northern Pacific transcontinental roads pass through the city and there are branch roads up the Bitter Root, over the Cœur d'Alene Mountains to Idaho and up the Big Blackfoot River. It has a beet sugar factory, erected in 1917, flour mills and other factories and is the seat of the State university. A few miles out is the government armory post, Fort Missoula. Helena, the capital of the State, owes its existence to the discovery of gold in Last Chance Gulch. The capitol is a beautiful building, constructed from sandstone from Anaconda, costing $1,100,000. The elevation of Helena, 4,700 feet, and its location near the summit of the main range of the Rockies, give it a delightful climate. The Montana Wesleyan and Mount Saint Charles College are located in Helena. The State Fair is held annually near the city. Anaconda, the Smelter City, was
MONTANA BISON RANGE

founded by Marcus Daly as a suitable place for the erection of smelter works. The Washoe Smelter, employing between 3,000 and 4,000 men, is the largest in the world. Anaconda is on River Mining Creek in the Deer Lodge Valley, elevation one mile above sea-level. A State fish hatchery is located in Anaconda. Billings is the largest city in eastern Montana and is in a rich agricultural region, with extensive live- stock interests. It has excellent railroad facilities, and is a large distributing centre. In the centre is a beet sugar factory is located at Billings and near the city is the Billings Polytechnic Institute. Miles City is the greatest primary horse market in the world. Bozeman is the home of the State College of Agriculture and Mechanic Arts and of a United States fish hatchery. Livingston is the gateway to the Yellowstone National Park. Red Lodge has great coal mines.

MORTON J. ELROD

Director of Biological Station, University of Montana.

MONTANA NATIONAL BISON RANGE AND HERD.—The range is in western Montana, along the Northern Pacific Railroad between Ravalli and Dixon. The tract set apart for the home of the herd contains approximately 20,000 acres, with both grazing land and timber. In the centre is a mountain about 2,500 feet high, with grassy slopes and wooded ridges. On the north side of the range several miles of Post Creek are included. On the south side the range takes in about a mile of the Jocko River. In the interior are several large springs. The place is ideal for buffalo. It is estimated the food supply is sufficient for a herd of from 1,500 to 2,500 animals. The selection was made by Prof. M. J. Elrod, of the University of Montana, for the American Bison Society, with W. T. Hornaday, then president. In 1908 Senator Dixon of Montana introduced in Congress a bill to provide for the purchase of the range and for fencing. This became a law in May 1908. The American Bison Society raised a fund of $10,560 for the purchase of bison for the range. Thirty-seven animals made the nucleus of the present herd, about 300 (spring of 1919). In addition, elk, antelope and white-tailed deer have been added since, and are doing well. The selection of the range was a part of the plan of the American Bison Society to save the bison from extinction. Mr. Hornaday expressed the opinion that this herd alone, one of several now in the United States, is sufficient to save the herd of the State. The location is ideal, the surface is sufficiently undulating to afford protection from storms from any direction, there is abundance of bunch grass, it is easy of access and the animals subsist summer and winter upon the vegetation of the range. Consult Report of the American Bison Society (1908) and subsequent reports.

MONTANA STATE SCHOOL OF MINES, made one of the component parts of the University of Montana by act of legislature in 1913, founded in 1899, is located at Butte, the greatest mining centre in the world. Its work is confined exclusively to the preparation of mining engineers. It was endowed by a land grant of 100,000 acres, of which 33,085 acres have been sold, cash and deferred payments amounting to $661,192.93. This amount draws interest. The number of students in 1917 was 85, in 1918, 52. The number of alumni was 135. There were 8 professors, one of whom acted as president. The total value of all property (1918) was $134,735. The total income was $38,500. The-departments include chemistry, geology, mineralogy, mathematics, mechanics, metallurgy, mining engineering and mining law. The course of instruction covers four years.

MONTANA STATE COLLEGE OF AGRICULTURE AND MECHANIC ARTS, made one of the component parts of the University of Montana in 1913, founded in 1893, is located at Bozeman. It was endowed by a land grant of 140,000 acres, of which 41,543 acres have been sold, the cash and deferred payments amounting to $668,637.50. This asset draws interest. The number of students in 1917-18 was 789—382 men and 407 women. Several hundred additional students were enrolled in the short courses for farmers and their wives, and ministers. The total number of instructors, not including Experiment Station workers and members of the extension service, was 66. The alumni numbered 353. The State Experiment Station, with its director and staff of workers, is connected with the college. The college receives the benefit of the Federal land grants of 1862 and 1890, also State and Federal appropriations. The
in 1918 was, for the college, $241,668; for the station, $106,250; for extension service, $93,023. The total endowment fund from land grants amounted to $680,250. The college course is offered under the following groups: College of Agriculture, College of Engineering, College of Applied Science, College of Household and Industrial Arts, School of Home Economics, School of Agriculture, School of Music and Vocational Education. The degree of Bachelor of Science is given for the completion of the various courses, and graduate work is offered. Short courses are offered in some lines of work. Farmers' Week brings several hundred people for intensive work. Ministers' Week has brought together nearly 50 each year. The buildings are modern and of permanent construction, and include the Main Hall, Hamilton Hall (dormitory for women), Agricultural Hall, Chemistry (new), Drill Hall and Engineering, with many smaller buildings and barns for experimental and laboratory work.

MONTANA STATE NORMAL COLLEGE, The. One of the four components of the University of Montana. The institution is located at Dillon and was created by act of the State legislature in 1892. In March 1913, made effective 1 July 1913, the several higher institutions of the State were constituted the University of Montana. The first chancellor was appointed and assumed his duties on 1 Feb. 1916, on which date the Normal College really became a part of the university through methods of administration. There were 19 members of the faculty on the instructional force. The number of students was 535. The income from all sources in 1918 was $105,600. The land grant of the institution totals 100,000 acres, 33,000 of which have been sold. The proceeds of sales, invested in bonds, amount to $423,625, with deferred payments of $119,599 in 1919. The Shakespeare Club Loan Fund, to aid seniors, the Alumni Loan Fund, to aid seniors, and the S. P. Wells Loan Fund, to aid juniors and seniors, total more than $1,000. For high school graduates two courses of instruction are provided, one two years in length, the other three years in length leading to the degree bachelor of pedagogy. Special courses for the preparation of rural school teachers and for supervision of domestic science, manual training and music in elementary schools are also offered. The public elementary schools of Dillon are utilized as a training school. This training school enrolls 600 pupils.

MONTANA STATE UNIVERSITY, originally the University of Montana, made one of the component parts of the latter by legislative act of 1913, is located at Missoula. It was endowed by a grant of land, 46,560 acres, from Congress in 1892. Of this amount 30,608 acres have been sold, the sales amounting to $539,715. The doors of the institution were opened September 1895 with a few students and six members of the faculty. In November 1918, the faculty included 65 professors, assistant professors and instructors, 19 lecturers and 7 librarians, a total of 91. The total number of students was 941,— 304 men and 637 women. The total number of alumni was 489. The income from all sources was $309,409.78. Courses are offered in the College of Arts and Sciences in biology, botany, chemistry, economics, education, English, fine arts, geology, history and political science, home economics, Latin and Greek, mathematics, music, philosophy, psychology, public speaking, physical education. There are professional schools in forestry, journalism, law, music and pharmacy. Provision is made for graduate work. A biological station is maintained at Flathead Lake. The work of the university continues throughout the year, on the four-quarter system. The degrees conferred are A.B. and B.S., and the corresponding masters' degrees. Women are admitted on equal terms with men. Their is derived in part from the sale of land, in greater part from legislative appropriation. The campus contains about 50 acres, with an adjoining portion of Mount Sentinel of 560 acres. This beautiful mountain rises from the level plain 3,200 feet high. The birds were main hall, science hall, Craig hall (women's dormitory), library, natural science building (new), gymnasium, two barracks buildings constructed for the Student Army Training Corps, a hospital building for patients, and the Y. M. C. A. hut. Legislative appropriation was made for a new library building. The library contains about 40,000 volumes and 18,000 pamphlets, and receives over 400 periodicals.

MONTANAR, mōn-ta-nār, Valentine Hilaire, French-American missionary: b. Marignane, France, 14 Feb. 1870. He was educated at the seminaries of Aix, France, and the Paris Seminary for Foreign Missions. In 1889 he joined the Society for Foreign Missions, was ordained priest in 1893 and the same year was sent on the Kwang-tong mission, China. While in that province he was stationed successively at Linchow and San Ning. From 1908 to 1912 he was in New York in charge of the Chinese Catholics of that city and from 1912 to 1915 he was in charge of the Catholic missions in Canada. In 1915 he went to Montreal, Canada. He was persecuted during the Boxer uprising in China and saw many of his Christian chapels and villages laid waste. In 1905 he was accused by Chinese officials at San Ning of implication in the massacre that took place there that year. He was exonerated of all blame, however, upon investigation by Mr. Lay, American consul at Canton, and Commander Evans of the United States navy. He compiled a Chinese-French dictionary, for use in the missionary schools conducted by him and is the author of 'Method of Learning the Cantonese Language'; 'Fifteen Years in China,' and contributions to 'The Catholic Encyclopedia,' the Bulletin de Notre Dame de Boureard, and various American and French periodicals.

MONTANELLI, moⁿ-ta-nil′li, Giuseppe, Italian author and patriot: b. Fuucechio, January 1813; d. there, 17 June 1862. He studied law. He became counsel, writing at the same time on philosophical subjects and (1836) issued a volume of lyric poetry. In 1840 he was made professor of Italian and commercial law at Pisa. He founded the Society of Fratelli Italiani (1844), started (1847) the periodical L'Italia, fought at Curtatone (1848) and was made (1849) a member of the triumvirate with Garzelli and Mazzini. He was given a mission in
Paris, from whence he issued a series of works of a striking character such as 'Memorie sull' Italia e specialmente sulla Toscana dal 1814–1850' (Turin 1853–55); 'La sensazione' (Paris 1856), a dramatic poem; 'Camma,' a gripping tragedy; also the political works, 'Il partito nazionale italiano' (Turin 1856); 'L'impero, il papato, la democracia in Italia' (Florence 1859). In 1859 he was again called to arms and (1862) was elected to Parliament. Consult Provenzal, 'La cara memoria di Giuseppe Montanelli' (Leghorn 1882); Redi, Ricardo, 'Biografico di Giuseppe Montanelli' (Florence 1883); Orlando, 'Il Montanelli poeto,' in Varco (ib. 1910).

MONTANISM, mon', the religious system of Montanus (q.v.).

MONTANITE, a mineral consisting of the hydrated oxides of bismuth and tellurium, and having the formula BiOxTeOy2H2O. It occurs as an incrustation, frequently in connection with the mineral teradymite, from which it is often formed by alteration. It is soft and opaque with a waxy lustre, and is variable in color. Montantite is found at Highland, Mont, and also in Davidson County, N. C., and at Norongo, N. S. W.

MONTANUS, mōn-tā-nūs, Phrygian sectary of the middle of the 2d century A.D. Of him practically nothing is known save in connection with his sect, the Montanists. He was a heathen priest, a native of Ardahan; was converted to Christianity about 156; and about 171 A.D., proclaimed himself the Paraclete or Comforter promised by Jesus. He soon gathered around him a group of followers who believed with him that he was the mouthpiece of the Holy Spirit, as were his companions Prisca, or Priscella, and Maximilla, each of whom had left her husband to join Montanus. Both these women uttered prophecies, but like Montanus claimed to be only the passive agents of the Holy Ghost. Montanus' principal tenets, apart from his belief that every believer may be the means of special revelation, were largely millenarian; in view of the approaching end of the world he enjoined asceticism, strict church discipline with the exclusion of all offending members, the total abstinence from meat, and the incompetency of the Church to forgive it. He and his followers counted it sin to attempt escape from persecution. He was excommunicated with his followers about 175, and died soon after; Maximilla, the last of the prophets, died in 179. His teaching spread after his death, l.is most notable disciple being Tertullian (q.v.). The sect soon died out in the West, but survived in the East until the time of Justinian, when it was suppressed. Consult Bonwetsch, 'Geschichte des Montanismus' (1881); Erlangen, De Lyres F., 'Montanism and the Primitive Church' (Cambridge 1878).

MONTARGIS, mōn-tār-zhē, France, a town in the department of Loiret, 47 miles east by north of Orleans. It is a manufacturing town with an important trade in paper, cotton goods, leather goods, chemical products, and sugar. Mirabeau was a native; the castle anciently a favorite residence of the reigning family was called "The Royal Cradle," and here in 1371 occurred the famous judicial combat between the dog of Montargis and Macaire, its master's murderer. The dog not only showed the spot in the forest of Bondy where its dead master was buried, but singled out the murderer, and when Charles VI granted the ordeal of battle to test his guilt, the dog flew at his throat and so proved its charge upon his body. Pop. 13,000.

MONTAUBAN, mōn-tō-bōn, France, capital of the department of Tarn and Garonne, on the Tarn, 342 miles south by west of Paris. It is situated on a plateau surrounded by the Tarn, the Tescou and a deep ravine. The cathedral, episcopal palace, hotel de ville and the bridge over the Tarn are its principal features. Montauban has manufactures of silk bolting cloths, of common cloths, colors, porcelain, starch, candles, etc.; silk and wool spinning-mills, dyeworks, potteries, etc. During the religious wars in France, Montauban was a stronghold of the Huguenots, and was besieged in 1580 by Montluc, and in 1621 by the troops of Louis XIII, without success; but it was taken in 1629 by Richelieu, and its walls razed to the ground. The Protestants maintain both schools and a theological college. The artist Ingres was born at Montauban; many of his pictures are in the museum and his celebrated "Vow of Louis XIII" hangs in the cathedral. Pop. 30,000.

MONTAUK INDIANS, an American tribe of the Algonquin family formerly occupying the extreme eastern end of Long Island, N. Y. They were formerly a powerful people, but a pestilence in the 17th century reduced their number to less than 1,000. Since 1903 only about a dozen of the Montauk tribe survive on Long Island.

MONTAUK POINT, N. Y., the eastern peninsular promontory of Long Island, in Suffolk County, with lighthouse and life-saving stations, the lighthouse, in long. 41° 4' N.; lat. 71° 31' W., being built of stone, 170 feet high, and its light visible 19 miles. The peninsula has a height of from 50 to 100 feet above the sea, is rolling and wooded and noted for its bracing healthful climate. Here in 1898 Camp Wikoff was established for the sick, wounded and convalescent soldiers who had served in the Spanish-American War. Montauk Point is noted for its strong winds and severe storms.

MONTAUISER, mōn-tō-zē-zā, Charles de Stainte-Mauve, Marquis de, French diplomat: b. 6 Oct. 1610; d. 17 May 1690. He entered the army young, distinguished himself in Italy and Lorraine and in his 28th year became major-general. After seceding from the Reformed Church and subscribing to the Catholic faith (1645) he was created lieutenant-general and governor of Saintonge and Angoumois. He remained true to the court during the Fronde war and, in 1665, he was raised to marquis and peer, being appointed guardian of the Dauphin in 1668. In 1680 he was made chief chamberlain. Under his supervision Bossuet and Huet edited the classical writers in Usur Delphini. He was distinguished for strict morality and love of the truth, in fact his character was so incorruptible that from which fact he was used by Molière as the original Misanthrope. He married Julie Lucine d'Angennes, daughter of Marquis de Ramboillet, a lady of great beauty and whose talents made their home the centre of the most noted sages

MONTÉLÉMUR, mohn-tek-lé-mehr, France, capital town and fortress in the department Doubs, located on the Allaine, into which the Lisaine discharges at this point. It is on the Rhine and on the Lyons Railway and has a lofty castle dating from the 15th and 16th centuries, a Protestant church (Saint Martin’s), erected 17th century, and a modern Catholic church. There are monuments to Cuveu, who was born here, and Denfert-Rochereau, also a natural history and an archaeological museum, a college, trade school, library, Chambers of Agriculture and Trade, also manufacturers of hardware, clocks, tools, cotton goods. Considerable trade is done in building lumber and cheese. It was formerly the capital of the dukedom of Burgundy, by marriage but was repeatedly occupied by the French (1674–97 and 1723–48), becoming French territory as the Treaty of Lunéville. Pop. (1911) 10,392, mostly Protestants.

MONTÉLUC, mohn-te-lük’ (Fr. mohn-lyak’), Louis Joseph de Saint-Véran, loc’-o zhoh-zef de sah vah-rah, MARQUIS DE, French soldier: b. near Nimes, 1712; d. Quebec, Canada, 14 Sept. 1759. He entered the army at 14, distinguished himself in the war for the Austrian Succession and gained the rank of colonel in the battle of Piacenza, Italy, in 1746. In 1756, being then a brigadier-general, he was appointed to command the French troops in Canada, where he began operations against the English with great activity and success. Fort Ontario at Oswego was carried on 14 Aug. 1756, after a well-conducted attack. The next year he took Fort William Henry, at the head of Lake George, which was held by a garrison of over 2,500 men, and then became possessed. It was guned and large stores of ammunition and provisions. In the campaign of 1758 he occupied the strong position of Fort Carillon (Ticonderoga), made it still stronger by entrenchments, and on 8 July held it with 3,600 men against a British force of 1,300. His personal bravery had gained him great popularity among his soldiers, but the want of energy on the part of the home government, the scarcity of food all over New France and personal dissensions between himself and the civil governor forbade him to look for much assistance; and he expressed his conviction that in a few months the English would be masters of the French colonies in America; yet he prepared as best he could for the campaign of 1759. The English had sent strong reinforcements and were preparing for an attack on Quebec. As the success of the whole campaign and indeed the conquest of Canada depended upon the taking of that city, Montcalm had concentrated his principal forces on the banks of the Montmorency, to defend it. In the first attack, 31 July, the English general, Wolfe, was repulsed; he later succeeded in landing his troops above Quebec, and on 13 September brought his whole force to the Heights of Abraham; Montcalm joined the battle; however, though he led the attack in person, his troops soon broke before the fire of the British. Wolfe fell in the moment of triumph; Montcalm was mortally wounded and died the next morning.

Consult Bonnechose, ‘Montcalm et la Canada Française’ (1877); Parkman, ‘Wolfe and Montcalm’ (1885); Falcariolle, ‘Montcalm devant la Postérité’ (1886); Doughty, ‘The Siege of Quebec and the Battle of the Plains of Abraham’ (1901).

MONTÉLUC-LES-MINES, mohn-sor-lay-meen’, France, town in the department Saône-et-Loire, on the Canal du Centre and the Lyons Railway. It is the centre of coal mining, limeburning and copper foundries and has woodenware factories. Pop. (1911) 26,830.

MONTCHRISTIEN, mohn-kray-shen’, Antoine de, French dramatic author: b. Falaise, about 1755; d. near Tournai, 1621. Having killed his adversary in a duel he had to flee to England but was pardoned by Henry IV and was killed in a Huguenot uprising. Of his tragedies which notice are ‘Sophonisba’ (1594); ‘Aman’ (1599); ‘L’Écossoise, ou Marie Stuart’ (1601). He was also the first to give a conception of political economy in his ‘Traité d’économie politique’ (1615; new ed. by Funck-Brentano, Paris 1899). ‘Les Tragédies de Montchrestien’, (Paris 1686); Funck-Brentano, ‘Montchrestien, sa vie et son œuvre’ (ib. 1889); Julleville, Louis Petit de, ‘Les tragédies de Montchrestien’ (ib. 1891); Lavalle, Paul, ‘L’œuvre économique d’Antoine de Montchrestien’ (Caen 1903).

MONTCLAIR, mohn-klye’r, N. J., a town in Essex County, five miles northwest of Newark, on the Lackawanna and Erie railroads. The upper portion was originally called Speertown when settled by Hollanders from Hackensack, and the lower portion was first called Cranetown, then West Bloomfield, by its English settlers from Newark. It was at first included in Newark, and afterward in Bloomfield. It received its present name in 1865 and received its charter of incorporation in 1866. Montclair is situated on the first range of the Orange Mountains, at an average altitude of 300 feet, its highest point at 650 feet embracing an extensive view. It is noted for its healthful climate, and is principally a residential place, the home of many New York society people. It has a hospital, military academy, two orphan asylums, high schools, public library, national and State and savings banks. Its industrial establishments include electric construction works, printing establishments, etc. Pop. 25,029.

MONT-DÉ-MARSAN, town, capital department Landes, France, 65 miles south of Bordeaux. It has a mineral spring, manufactures of resin and oil, and a trade in lumber, wine and cattle. Pop. 12,000.

MONTE, Saint Angelo, mon-tay sant an’jel-oh, Italy, town in the province of Foggia, located on the southern slope of Monte Gargano near the Gulf of Manfredonia. Its noted 11th century grotto church dedicated to Saint Michael is much visited by pilgrims. The inhabitants of the entire commune were 23,012 in 1911.

MONTE CARLO, mon-tay kahr-lo, Monaco, a town of the principality about one mile north-east of the capital, being the most luxuriously appointed gambling establishment in the world, founded in 1858. Monte Carlo is also noted for its scenic surroundings, its mild and healthful climate and its attractive
appointments of perfect roads, magnificent gardens, handsome promenades and elegant residences. Its situation on an isolated elevation overlooking a bay of the Mediterranean is particularly beautiful. The "Association of the Watering-Place and Strangers Club of Monaco," with a capital of $6,000,000 in 60,000 shares, holds the contract, which was made with the late M. François Blanc to expire in 1913, whereby the reigning prince was paid annually the sum of $350,000 for the concession to play. The society in 1898 was granted an extended concession to 1947, for a cumulative decennial increase in its annual payment; it practically bears also the cost of the temporal and spiritual government of the principality, its annual expenditure alone amounting to over $4,000,000. Roulette and trente et quarante are the principal games played. Pop. 10,000. See MONACO.

MONTE-CASINO. See CASINO, MONTE.

MONTE CRISTO, mōnt′ krīs′tō, or kris′tō, a small island in the Mediterranean belonging to the Italian province of Leghorn, 28 miles south of Elba. In the 16th century it was ravaged by pirates, and as it is rocky and has a base of 2,000 feet above the sea, it long remained uninhabited. Since 1874 there is a penal agricultural colony here. The elder Dumas gave the name of this isle as title of the hero of one of his most popular romances, 'The Count of Monte Cristo.'

MONTE ROSA, rō′sä, on the Italian-Swiss Boundary, is an Alpine mountain mass of the Pennine ridge, with numerous peaks, eight of which are over 13,000 feet high. Dufour Spitze, the principal peak, is second to Mont Blanc as the highest peak of the Alps, reaching an altitude of 15,217 feet, 564 feet less than its rival, 50 miles to the southwest. Monte Rosa is covered on all sides with glaciers, chief of which is the Gorner Glacier on the west, six and one-half miles long. The peak was first ascended—a most difficult feat—in 1855. Copper and iron mines are worked in the mountain.

MONTE SAN GIULIANO, mōnt′a san joo′lya′nō, Italy, town in the Sicilian province of Trapani and located 2,540 feet above sea level on an isolated mountain, the Eryx of the ancients. Remains of the old Phoenician walls still exist and a few remnants of the ancient temple of Aphrodite as well as the cistern (Venus spring). It has a 14th century church and a castle affording a magnificent panoramic view. Its industrial life consists of olive culture and marble quarries. In 1911 it had 28,664 inhabitants.

MONTEBELLO, mōnt′a-bēl′lo, Italy, village in the province of Pavia, situated on the Coppa. It is noted through two battles fought here. The first occurred 9 June 1800, and is frequently called the battle of Casteggio, in which Napoleon defeated the Austrian army thereby gaining the title Duke of Montebello. The second, fought 20 May 1859, was won by the French under Forey, while the Austrians were commanded by Stadion. Pop. 2,183.

MONTECUCCI, mōnt′-koo′-lē, or MONTECUcoli, Raimondo, Austrian military commander, born at Modena, 21 Feb. 1699; d. Linz, 16 Oct. 1680. He entered the Austrian service and served during the Thirty Years' War with great distinction. After the Peace of Westphalia (1648) he visited Sweden and England in a diplomatic capacity; and in 1657 the emperor sent him to the aid of the king of Poland against Rakoczyp and the Swedes, and next year he assisted the Danes against the latter, achieving a great victory over the Turks after having driven them out of Transylvania. In 1673 he was placed at the head of the imperial troops and checked the progress of Louis XIV by the capture of Bonn and by forming a junction with the Prince of Orange in spite of Turrene and Condé. Montecucci's subsequent advance into Alsace was repulsed by the Prince of Condé. His last military exploit was the siege of Philipburg. The Emperor Leopold II made him a prince of the empire and the king of Naples gave him the duchy of Meli. His memoir on the Turkish war, written in Italian (1703), was translated into several languages. Consult Campori, 'Raimondo Montecucci, la sua famiglia e i suoi tempi' (Florence 1877); Grevemann, 'Raimund Montecuccil' (Vienna 1878).

MONTEFIASCONE, mōnt′a-fyas′-kōnä, Italy, town in the province of Rome and circuit of Viterbo, situated on a hill to the southwest of Lake Bolsena and on the Attigliano-Viterbo Railway. It is the seat of a bishopric and has among its most prominent buildings a beautiful cathedral, a Romanesque church (San Flaviano), a 16th century castle, etc. The muscatel wine cultivated here is known as Est, Est, Est, which has some connection with the grave inscription here dedicated to the Canon John von Fugger. Its population in 1911 was 9,563 for the commune. Consult Buti, L. Pieri, 'Storia della città di Montefiascone' (Montefiascone 1870).

MONTEFIORE, mōnt′-fē-ôrē, Claude Joseph Goldsmid, English author and Jewish communal worker: b. London, 1838. He studied at Balliol College, Oxford; identified himself with Hebrew charities and educational movements in London; was president of the Jewish Historical Society (1899-1900); and is head of the Anglo-Jewish Association's Jews' Infant Schools, etc. With Israel Abrahams he edited The Jewish Quarterly Review and wrote a series of sermons, 'Aspects of Judaism' (1895). He has published besides the Hibbert Lectures for 1892, 'The Origin of Religion, Illustrated by the Prominent Hebrews' (1903); 'The Synoptic Gospels' (1909); 'Some Elements of the Religious Teachings of Jesus' (Jowett Lectures, 1910).

MONTEFIORE, Sir Moses Hayim, Jewish philanthropist: b. Leghorn, Italy, 24 Oct. 1794; d. Ramsgate, England, 28 July 1855. He was descended from a family of wealthy Anglo-Italian bankers; was educated in London; became a leading member of the Stock Exchange; and retired from active business in 1824. From that time he devoted himself to the service of his race, working for the mitigation of disabilities and oppression under which the Jews in England and elsewhere had suffered great hardship. His wife, whom he married in 1812, was Judith Cohen, a relative of the Rothschilds, and in her Monteferre found a companion who entered ardently into his philanthropic undertakings. He was for a time high sheriff of Kent, and after long exclusion and repeated
re-election was legally recognized as sheriff of London in 1837. In that year he was knighted and in 1846 raised to a baronetcy in recognition of his meritorious public services. He distinguished himself by his practical sympathy for his race in various countries, chiefly in Poland, Russia, Rumania and Damascus. He made seven journeys to the East, the first in 1827, and the last in 1874, mainly for the amelioration of the condition of the Jews. At Bucharest during an anti-Jewish tumult, he boldly faced the mob at the risk of his life. In 1886 he endowed a Jewish college in memory of his wife, who died three years before, at Ramsgate, where he passed the last years of his life, dying there in his 101st year. In his 100th year he was a type of pale and venerable manhood.

MONTEGO BAY, West Indies, harbor on the north coast of the island of Jamaica. It contains a teachers' seminary, hospital, etc., and has a considerable export trade in fruits and other produce. It is the seat of an American consular station and had 6,616 inhabitants in 1911.

MONTELEONE DI CALABRIA, mòntē-lēōnē di kalābria, Italy, capital of a circuit in the province of Catanzaro, near the Gulf of Sant Eufemia and located on the Naples-Reggio Railway. It contains the ruins of the castle built by Frederick II, and also of the 15th century San Michele Church, besides a lyceum and grammar school. Its commerce consists chiefly of silk and oil production. The town was utterly destroyed by earthquake in 1783, and again much injured in 1905. In 1911 it had 13,666 inhabitants. Consult Pignataro, "Sunto di notizie storiche intorno alla città di Monteleone" (Monteleone 1896).

MONTÉLIMAR, mòn-tē-lēmär, France, capital town of the arrondissement in department Drôme, located at the junction of the rivers Roubion and Jahnron on the Mediterranean Railway. It contains an ancient castle, now a prison, with a Romanesque chapel, a college, library, museum, gymnasia, etc. Among its manufactures are hats, silks, paper goods, agricultural instruments and its noted almond candy (nougat). It has also considerable trade in silk, wine, truffles, lime, etc. The town receives its name from Adémar de Montel who rebuilt it after its destruction, in the 10th century, by the Saracens. In the 15th century the town fell into the possession of the French Crown. It withstood the siege of Coligny heroically in 1570 but was taken by the Huguenots in 1587.

MONTEMAYOR, mòn-tē-máyôr, Montemor Jorge, Spanish-Portuguese poet and novelist, b. about 1520; d. 1561. His real name was Montemór, but it assumed the Spanish form Montemayor in Spain. There is little definitely known of the life of Montemayor. He was one of the poet musicians of his day who found refuge and welcome at the Spanish court, where he held on already on familiar terms in 1548. Six years later he accompanied Juana, the Infanta, to Lisbon where she was to be married to Dom João. He seems to have visited England and Holland with Philip II, and he may have been in Turkey in 1552, as stated in the Life. His most famous work is a pastoral novel entitled "Diana Enamorada" (Madrid, between 1545 and 1559). Influenced in style, artificial in its depicting of character, indifferent in poetical value yet, as Cervantes had said, "it has the honor of being the first of the books of its class." Partly in verse and partly in prose, the latter is much the superior. The "Diana" is written principally in Spanish, but it contains songs and prose passages in Portuguese. It became immensely popular and was widely imitated not alone in Spain but in the other countries of southern and western Europe. It was translated into English by Bartholomew Young in 1583 and published in 1598 and was very widely read in England. Sidney's "Arcadia" probably owed its existence to the "Diana" and it was certainly strongly influenced by it; and Shakespeare, in "Two Gentlemen of Verona" and in parts of other plays shows the effect that the "Diana" had already had upon English literature. Montemayor's work, being modeled on the Italian pastoral novel which had, to a certain extent, already had its influence upon English literature, is the "Diana" found the proper soil in which to implant itself. Montemayor, who had not finished the "Diana Enamorada" at the time of his death, left instructions that it should be completed by Dr. Alonso Pérez of Salamanca who wrote accordingly "Segundo del Salamanco" in 1584. In the same year Gil Ponce wrote a second "Diana Enamorada." Both of these books are patent imitations of Montemayor's novel. Scores of other imitations followed, among the authors thereof being no less personages than Cervantes and Lope de Vega. "Cancionero" of Montemayor (2 vols., Antwerp 1544-58) contains some of his own lyrics. An edition of Montemayor's works was published in Barcelona in 1886.

MONTENEGRO, môn-tê-nègro (native, Tsarnegora; Turkish, Karadağ, Black Mountain), a former kingdom northwest of Turkey, bounded north by Bosnia and Herzegovina, east by Bosnia, south by Albania and west by the Adriatic Sea and a strip of Dalmatia. Its area was increased by the Treaty of Berlin of July 1878, from about 1,710 to about 3,630 square miles, and after the Balkan War in 1913 to about 5,603 square miles. The country is a succession of elevated ridges, diversified here and there by a lofty mountain peak, some of them attaining elevations of 5,000 or 6,000 feet, or even 8,000
feet on the borders of the country, with a few beautiful and verdant plains and valleys, in which the soil is tolerably fertile; chief of these are the department of Tzernita and the valleys of Bielopavlich, watered by several streams, the most important of which is the Moroza, which falls into the Lake of Scutari. The climate is healthful. Forests of oaks and holly, ash, beech, firs, walnuts, hazel, wild pears, poplars, willows, alders and the sumach, used for dyeing and tanning, cover many of the mountain sides. The culture of the following vegetables are also generally grown: cabbage, cauliflower and tobacco, with several kinds of fruit-trees, including the peach, olive, pomegranate, mulberry and others. In the department of Tzernita, already mentioned, apples, vines, carobs, almonds, figs, quinces, walnuts, etc., also grow in abundance. Agriculture is in a rude state, though every cultivable piece of land, even if only a few feet square, is planted with corn, potatoes or some other useful plant. Sheep, goats and pigs are reared in large numbers; the hay furnished a profitable supply of wool and cheese for exportation. Game is not abundant, but fish are taken in great quantities, and are of excellent quality, particularly the trout, which are celebrated, and some of them of immense size; and a kind of carp is caught in large quantities, and dried and salted for export to Vienna and Trieste. Manufactures, with exception of a coarse woolen stuff, are unknown. The chief occupations of the inhabitants are agriculture and fishing; the latter carried on principally in the Lake of Scutari, which lies partly in Albania. The exports of Montenegrin are smoked mutton-hams, salted fish, wax, honey, hides, tallow, cheese, butter, cattle and other agricultural produce. The chief imports are cattle, tobacco, salt, wine, brandy, coffee, sugar and manufactured goods. The Montenegrins belong to the Serbian branch of the Slavonic family of peoples. They are generally of tall stature and well proportioned, with singularly powerful voices, which enable them to carry on conversations at incredible distances: foreheads good, face rather square, moderately aquiline or straight nose and animated eyes. Both men and women are robust: the latter are often beautiful when young but soon lose their good looks by laborious and unfeminine occupations. The people generally are cheerful and courteous and extremely brave and hospitable and courteous to all except the Turks, whom they hate. The men go at all times fully armed. The houses are of stone, generally with thatched roofs but many are covered partly or entirely with wooden shingles. There are few towns in Montenegro, but there are some 300 villages; Cettinje (q.v.) is the capital; Podgorica (pop. 14,000); and the seaports Dulicino and Antivari are the principal towns. The language of the Montenegrins is a Slavonic dialect. In religion they are all of the Greek Church. Education, which was formerly much neglected, is now becoming freely diffused, the public schools having increased from one in 1851 to about 100 in 1870. Montenegro, until 1851, was a theocracy, governed by a Vladika or prince, who was at once a bishop, a judge, a legislator and a commander-in-chief. The office was hereditary in the family of Petrovitch from 1670. But as the Vladika could not marry, the duchy was afterwards transmitted through brothers and nephews. In 1851 the civil and ecclesiastical offices were disjoined, the Vladica confining himself to the latter, while the former devolved on the Hospodar. The revenue of the principality was estimated for 1914 at about $390,000. Montenegro has no coinage of its own. Pop. about 500,000.

Montenegro formed a part of ancient Illyria, and in the Middle Ages belonged to the great Serbian kingdom. The origin of the sacerdotal power dates from 1516, when the secular prince, having no children, withdrew to Venice, and transferred the power of the kingdom to the Archbishops of Germanos. In the reign of Peter the Great the Montenegrins placed themselves under the protection of Russia, both sharing in a common enmity against the Turks. In 1796 the Prince-bishop, Pietro I, inflicted such a loss on the Pasha of Scutari, who had invaded Montenegro, that for many years they left it un molested. Pietro II (1830-51) made strenuous efforts to improve the condition of his people by liberalizing the constitution, and attempting to reclaim his subr former affording freedom of worship. His successor, Danilo I, separating the civil and ecclesiastical offices, Russia withdrew her subsidy of 8,000 ducats, but subsequently resumed payment of it. In 1876, the Montenegrins excited a rebellion against the Turkish sway in the Herzigovina, the result of which was the infliction of such punishment on them that they were compelled (1862) to accept a disadvantageous peace, in which it agreed to the occupation of several points on the road from Herzigovina to Scutari by Turkish troops. In 1870, however, the principality managed to get these troops withdrawn. In 1876 Montenegro joined Serbia in a war against Turkey, and on the conclusion of the Russo-Turkish War of 1877-78, and the Balkan War in 1913, it received, as already mentioned, an accession of territory. On the 50th anniversary of his accession, 28 Aug. 1910, Nicholas I, in request of the National Assembly, assumed the title of king. When the European War began in 1914, Montenegro allied herself with Serbia, and in 1915 was overrun by the Teutonic forces. Inek was captured, 6 Dec. 1915, and the capital, Cettinje, occupied, 13 Jan. 1916, the Montenegrin government retiring to Neulilly-sur-Seine, near Paris. For later history see W.R., European. Consult Denton, W., 'Montenegro: Its People and Their History' (London 1877); Murray, W. S., 'The Making of the Balkan States' (London 1912); Stevenson, F. S., 'A History of Montenegro' (London 1912); Trevor, R., 'Montenegro, a Land of Warriors' (London 1913).

MONTENOTE, món'tà-nòt'tà, Italy, village in the province of Genoa, in the district of Savona, and located on the Cairo-Montenotte-Alessandria Railway. It is noted on account of the battle in which Napoleon won his first victory here, 12 April 1796, over the Austrians under Argenzio. It has but about 400 inhabitants.

MONTEPIN, món'tà-pán, Xavier Aymon, Count de, French writer: b. Aprmont, 18
March 1824; d. Paris, 30 April 1902. He was one of the most fertile and successful representative writers of the strung-out feuilleton novel writers of small literary merit. Most of his novels appeared in fragments in the Petit Journal before being brought out in volume form, when they were dramatized by his friend Dornay for use on the Ambigu stage. Among the best-known works are 'Confessions d'un Bohème' (1843); 'Lettres de Feuilleton' (1853); 'Les vveleurs de Paris' (1852-56, 14 vols.); 'La maison maudite' (1857); 'Les tragédies de Paris' (1874); 'La Majesté l'Argent' (1877); 'Trois millions de dot' (1891), etc. Successfully placed on the stage were 'Le Connétable de Bourbon' (1830); 'La Sirene de Paris' (1860); 'Le médecin des pauvres' (1865); 'La porteuse de pain' (1889); and 'La joneuse d'orge' (1896).

MONTEPULCIANO, mon-ta-pul-chä-no, Italy, a district capital in the province Siena, located on one of the tributaries of the Arno River and on the Empoli-Chiusi Railway. It has churches and palaces dating from the 14th to the 17th centuries, among which are the cathedral with its funeral monuments by Donatello and Michelozzo, and the beautiful cupola church of Santa Maria di Spina outside the town, started by Antonio da Sangallo the Elder (1518); an ancient castle, 14th century townhall, gymnasium, technical school, library, collection of ancient Etruscan antiquities, etc. It has became a well-known resort. Much oil and silk. It is the birthplace of Cardinal Bellarmin and the sage and poet, Angelo Ambrogini (Poliziano). Its population in 1911 was 15,994 in the entire commune.

MONTEREAU, mon-te-ro, France, a town in the department Seine-et-Marne and arrondissement Fontainebleau, located on the left bank of the Seine which is here joined by the Yonne. It is the junction of the Lyons and East railways and has a church dating from the 13th-16th centuries, a statue of Napoleon I on the bridge, a military college, Saint Viagro outside the town, started by Antonino da Sangallo the Elder (1518); an ancient castle, 14th century townhall, gymnasium, technical school, library, collection of ancient Etruscan antiquities, etc. It has become a well-known resort. Much oil and silk. It is the birthplace of Cardinal Bellarmin and the sage and poet, Angelo Ambrogini (Poliziano). Its population in 1911 was 15,994 in the entire commune.

MONTEREY, món-te-rays, Cal., city in Monterey County, on Monterey Bay and on the Southern Pacific Railroad, about 100 miles south by east of San Francisco. The site of the city was first discovered by Juan Rodriguez Cabrillo in 1542. It was named Monterey, after Juan Rodriguez Cabrillo's friend, Jeronimo Rodriguez, who assisted him in his first voyage to the California coast. The city was founded in 1777 by Gaspar de Portolà, the second in California. From 1774 to 1825 it was the capital of the Spanish province. On 26 March 1825, the constitution of the republic of Mexico was ratified and the city remained the capital of California during Mexican rule. Commodore Jones, of the United States navy, captured the place in 1842 and held it for one day, under the erroneous impression that war had been declared against Mexico. On 7 July 1846 Monterey was captured by Commodore Sloat. The American flag was raised over the custom house, which still stands, and California passed to American rule. In 1849 the State Constitutional Convention was held here and the Constitution of the State of California was adopted. In 1850 the place was incorporated. The section in which the city is located consists of farmlands upon which are raised grains and fruits. Fishing and stock-raising are prominent industries. Over 10,000,000 pounds of fish are packed here annually and many tons shipped to the market. The total annual value of the combined catch is estimated at $1,500,000. The capital of the Monterey Savings Bank amounts to $1,193,386; the combined deposits to $999,625. Monterey is a favorite resort for summer and winter. Here is located the famous hotel and resort, Del Monte, with its 134 acres of beautiful gardens, groves, and points of interest are San Carlos Mission, Carmel Mission, home of Robert Louis Stevenson, home of Thomas O. Larkin, first American consul, headquarters of Generals Sherman and Halleck, ruins of the old Spanish fort, first brick house in California, and the presidio of Monterey. It has good public and parochial schools and a public library. The harbor at Monterey is the only undeveloped deep-water port on the Pacific Coast. It is the only harbor where vessels can enter in all kinds of weather and drop anchor without the aid of a pilot. Governmental appropriations aggregating $900,000 have been made for the construction of a breakwater to destroy the currents which make it dangerous for large vessels to lay alongside at times and which is the harbor's only defect. Pop. 5,000.

MONTEREY, Mexico, capital of the state of Nuevo Leon, situated at the foot of the Sierra Madre Mountains at an altitude of 1,800 feet above sea-level, an important railroad centre for trade and commerce with the United States, 168 miles from the Texas boundary. The most notable industry is an extensive iron and steel mill, which employs a great number of men and produces large quantities of heavy iron and steel manufactures, both rolled and cast. Over $25,000,000 are represented by the manufacturing and industrial enterprises of the city. No other point in Northern Mexico is so important commercially, as Monterey. There are two local financial institutions, the Bank of Nuevo Leon, with a capital of $2,000,000 and the Mercantile Bank, with a capital of $2,500,000. The National Bank has a branch here and the Bank of London and Mexico an agency. The principal educational institutions are the School of Jurisprudence, Normal School for males, Normal School for females and the Academy of Drawing. There is a Natural History Museum and a well-equipped library. The principal buildings of the city are the Juaréz Theatre, the cathedral and the churches of San Francisco and the Purisima. The streets are well paved. In the centre of the city there...
is a large spring of clear water. Four miles distant are the Topo Chico Hot Springs, the hourly output of which is 65,000 gallons. The waters of these are much like those of the famous hot springs of Arkansas. The prevailing style of architecture is Moorish. Pop. 78,500. The city was founded by the Spaniards in 1585 as Ciudad de Leon but renamed Metropolitan City of Our Lady of Monterey in 1590. The city was besieged in 1846 by General Taylor and compelled to capitulate. See MONTEREY, BATTLE OF.

MONTEREY, BATTLE OF, in American history; in the early part of the war between the United States and Mexico, Monterey, which occupied a strong natural position and was well fortified by art, was held by the Mexican General Ampudia, with about 10,000 regular troops. In August 1846, General Taylor (q.v.) with a force of 6,625 men, mostly volunteers, marched from Matamoras to attack Monterey; and on 9 September he encamped within three miles of the place. Ten days were spent in reconnoitring, and on the afternoon of 19 September General Worth was ordered to march with his division around the hill occupied by the bishop's palace to take a position on the Saltillo road and to carry the enemy's detached works in that quarter, while the main body of the army were to make a diversion against the centre and left of the town by batteries erected during the night. In the morning these batteries opened fire upon the city, which replied by a heavy fire from the citadel and other works. The lower part of the city was assaulted and entered by the Americans, and a Mexican work of great strength captured after hard fighting by a brigade under General Quitman. General Butler also entered the town at and very point with the 1st Ohio regiment. Meanwhile General Worth carried the heights south of the river and the Saltillo road, and turned the guns of the Mexican works in that quarter upon the bishop's palace. The Mexicans evacuated the lower part of the city during the night, and early next morning General Worth stormed the height overlooking the bishop's palace; and by noon that stronghold itself was taken by the Americans and its guns turned upon its Bying defenses. The houses of the city being solidly built and capable of defense, and the streets strongly barricaded, the Americans were forced to take each house in succession by breaking through the walls till they reached the principal plaza. The conflict lasted till the 23d, the Mexicans contesting desperately every foot of ground till nothing remained in their possession but the citadel. On the morning of the 24th General Ampudia capitulated and was allowed with his army to march out with the honors of war. The loss of the Americans in these operations at Monterey was 120 killed and 368 wounded. That of the Mexicans was not ascertained, but was probably much greater. See MEXICAN WAR. Consult Howard, O. O., 'General Taylor,' New York (1891); Ladd, H. O., 'The War with Mexico' (New York 1883); McElroy, R. M., 'The Winning of the Far West' (New York 1914).

MONTESA, món-té'sá, Order of Our Lady of, one of the Spanish military orders established by James II of Aragon (1319) after the fall of the Knights Templar (1311) and endowed with the latter's estates. The town and castle of Montesa also came into their possession as residence. The order followed the rule of the Premonstratensians. In 1587 it became united with the Spanish Crown and in 1872 was abolished, to be re-established in 1874. The decoration of the order is a golden lozenge with a red cross in the field surmounted by a trophy on a red ribbon. The garb is a white mantle with red cross. The knights are divided into Caballeros profesos and Caballeros novicios.

MONTESANO mont-é-sa-no, Wash., town, county-seat of Gray's Harbor County, on the Chehalis River, at the head of tide-water navigation and on the Northern Pacific Railroad about 45 miles west by south of Olympia. It is in a region in which the chief occupations are farming, lumbering and fishing. It manufactures considerable lumber and lumber products and has creameries and important salmon fisheries. Three miles above the town on the Chehalis River is a salmon hatchery. Pop. 2,500.

MONTESPAN, Françoise Athénais, frán-swás áth-é-ná món-té-s-pán, MARQUISE DE, mistress of Louis XIV of France: b. 1641; d. Bourbon-l'Archambault, 27 May 1707. She was the 2d daughter of the Duke of Mortemart, and was, in 1663, married to the Marquis de Montespan. To great beauty she added a natural liveliness and wit, and a highly-cultivated mind. Soon after her appearance at court she attracted the king's attention and from 1668 till 1674 shared his favor with Mlle. de la Vallière, but supplanting her in 1674; M. de Montespan after a detention in the Bastile had already been ordered to retire to his estate. Mme. de Montespan bore eight children to the king, four of whom died in infancy. The others were entrusted to the care of Mme. Scarron, afterward De Maintenon. The Mme. de Montespan was often exercised in public affairs, and her sway over the king continued until about 1679, when a growing attachment to Mme. de Maintenon finally estranged his affections from Mme. de Montespan. She rarely appeared at court after 1668. In 1691 entirely quitit her. Her last years were devoted to religious exercises, acts of benevolence and penitence. The regent Orleans married Madeleine de Blois, one of her daughters by the king.
MONTESQUIEU—MONTESQUIOU-FEZENSAC

MONTESQUIEU, Charles Louis de Secondat, Baron de la Brède et de, French philosophical historian: b. at La Brède, near Bordeaux, 18 Jan. 1689; d. La Brède, 10 Feb. 1755. He was of a noble family, received an excellent education and studied law which was the family traditional profession. From his father and his mother he inherited talent, industry, and position, and his uncle, who died in 1716, left him his whole fortune, his very important judicial office of "président a mortier" and his old and noble family name of "Montesquieu." The office thus bequeathed him he held for 12 years, but his serious occupation was writing on philosophy, politics, natural science and various other subjects. In 1721 his "Lettres persanes" were published at Amsterdam anonymously. In these Montesquieu satirizes the follies of his age in literature, society, politics and religion. So popular were these letters that the public called for several editions in the first year following their publication. They pointed the way to a new field in literature and are credited with being the first book in the so-called "Philosophie" movement. Montesquieu became a sort of literary lion in Paris and he enjoyed his reputation and the peculiar advantages it brought him to the full. But to do this he sold the life tenure of his office in Brède and removed to the capital in 1726, and 8 months later he was elected a member of the Académie Française. He suddenly resolved upon an extensive tour of Europe with the purpose of observing the life of the various countries visited. His tour took him to Austria, Hungary, Italy, England and the Rhine, and occupied nearly four years which were very fruitful in the life of the author. Returning to La Brède he set up a great study hall and library 60 feet long by 40 feet wide. The result of his work here was, in part, "Considérations sur les causes de la grandeur et de la décadence des Romains" which was published anonymously in Amsterdam in 1734. This became at once popular, not alone in France, but all over Europe, and was probably the most widely read of all Montesquieu's wide field of philosophy of history. In the meantime he was carrying on deep and original researches for a still greater work. But he loved the literary salons and the brilliant life of Paris and much of his time was spent in the capital, however, not to the neglect of his literary investigations, for the "Esprit des lois," the most original book of its age, appeared in Geneva in 1748. It was published in two volumes comprising in all 31 books. Though the "Esprit" met with considerable opposition at first, in France, it became popular in other European countries, and France soon also fell into line and Montesquieu was looked upon as the greatest literary man of his day. His passion for literary work continued; but most of his subsequent writings remained on the "La Brède" side. His fame continued long after his death and for more than a century he was the one great authority of the moderate reform party, not alone in France, but also in other countries where the spirit of reform was abroad. Of all the early writers on the "La Brède" side, in politics and history he easily stands first on account of the actual excellence of the work done, the originality of thought which he constantly displays and the deep and lasting influence he had upon the thought of his own day and upon succeeding generations. In France, however, Montesquieu's enemies and detractors have accused him of being more English than French in literary form and in manner of thought; and, in fact, so great an admirer was he of everything English, that he was looked upon, during his lifetime and long afterward as an Anglomaniac. Montesquieu is a much more rational thinker than Voltaire, though the latter far outran him in popularity. The two were men, however, so far apart in their modes of thought that neither was able to appreciate the greatness of the other. The cool, moderate reasoning of Montesquieu was not only in every way fitted for the age in which he lived, but it was couched in language that attracted and commended itself to all men of liberal tendencies. Thus it was a preparation for the work that Voltaire himself was called upon to do; and both Montesquieu and Voltaire, though working along different lines and imbued each with a different spirit, were both on the broad road to the Revolution of 1789 and the rejuvenation of France. In an age when the real spirit of all just law was hidden from the sight of most men, the original, truthful and clear-cut views of Montesquieu on politics and their relation to law came as an inspiration and took hold of the imagination of thinking Europe. He made men think clearly and powerfully along lines that they had been unaccustomed to think rightly for centuries. His masterly genius for generalization may be said to have created the science of politics. His plain, unadorned, forceful language and withal beautiful composition is in marked contrast to the spirit that ruled the literature of his own and the following generation. To this simplicity of language and directness of thought he owed much of his popularity. Montesquieu was well known to the more inquiring spirits of the English colonies in America and his work had a strong influence over the revolutionary spirit that began to make itself felt among the colonies early in the latter half of the 18th century, where, during the struggle for independence, it became a veritable textbook of the Revolutionary party. There have been many editions of Montesquieu's works published in French and in all the languages of Europe. (See LES LETTRES PERSANES; SPIRIT OF THE LAWS.)

Consult Sorel (translated by Masson), 'Montesquieu' (London 1887); Vian, 'Histoire de la vie et des ouvrages de Montesquieu' (Paris 1879); K. G. J. Lowel, 'Eye of the French Revolution' (Boston 1833); Ilbert, C. P., 'Montesquieu' (Oxford 1904); Dargen, E. P., 'Aesthetic Doctrine of Montesquieu' (Baltimore 1867).

MONTESQUIOU-FEZENSAC, mohn-tse-koo-fay-zan-sak, Robert, Count de, French poet: b. Paris, 9 March 1823. He was well known as an art collector and as an author of goldsmith and enameler in 1892, when he published 'Les Chauves-souris,' a volume of verse symbolizing the mystery of night. It was followed by 'Chef des Odeurs suaves' (1893), of which the theme was warp and woof of life; 'Les Horticcius Bleus' (1896) and 'Perles Rouges' (1899), the latter a series of sonnets.
reviving Versailles at its glory; by 'Les Paons' (1901), on precious stones and their mystic meanings; and by two volumes of essays, 'Roseaux pensants' (1897) and 'Autels privilégiés' (1899), both attempting to appreciate some wronged artist. Later works include 'Fêtes' (1905); 'Altesse sérénissime' (1907); 'Assemblée de notables' (1909); 'La petite mademoiselle' (1911); 'L'inextricable graveur Rodolphe Bresdin' (1913). He appeared in New York in the winter of 1902-03 as a lecturer and reader. His style is hyper-aesthetic, with much weird beauty, and his themes strangely far-fetched.

**MONTESSORI, mon-teh-soh-reh, Maria, Italian educator:** b. Rome, about 1872. She was educated to be a physician, and while studying applied herself especially to the investigation of nervous diseases in children, and to the problem of evolving a form of training that would transmute the capabilities of those diseased and abnormal temperaments. She was the first woman to be graduated in medicine at the University of Rome (1894), and for some time she acted as an assistant in the Psychiatric Clinic and later as a lecturer on anthropology in that institution. Then for six years she was in charge of one of the hospitals for defective children in Rome. Having acquired a familiarity with the systems of Pestalozzi, Frobel, Seguin, Iard and other early masters, she now developed therefrom a method of educating feeble-minded children under more modern conditions. In 1898-1900 she was director of the Scuola Ortofrenica, or mind-strengthening school, with marked success in applying the methods, particularly of Seguin and Iard to the education of defectives. She then devoted herself to the study of experimental psychology, pedagogic anthropology and the methods of modern education. An occasion offered in 1907 for putting her theories to practical test, when a school was established in connection with the tenants erected by the Roman Association for Good Building. The first house (Cora dei Bambini) was opened in January 1907, and was soon followed by three others. Dr. Montessori maintained her connection with these schools until 1911 when she devoted her time to the extension of her methods to older children. Both professional educators and laymen have taken a deep interest in her work, the principles of which she has set down in 'Antropologia pedagogica' (Eng. trans. by F. T. Cooper, 'Pedagogic Anthropology,' New York 1913) and 'Il metodo della pedagogia scientifica applicato all’educazione infantile' (Eng. trans. by A. E. George, 'The Montessori Method,' New York 1912).

**MONTEVERDE, mon-teh-ver-den, or MONTEVERDI, Claudio, Italian composer:** b. Cremona, May 1367; d. Venice, 29 Nov. 1643. He was a pupil of Ingegneri at Mantua, became (1590) a violinist and singer at the Mantuan court and was appointed (1602) bandmaster. In 1613 he was appointed bandmaster of Saint Mark's, Venice, in which position he served till his death. His is one of the most interesting personalities in the history of modern music. He was a pioneer in opera and became noted as composer of madrigals before entering (1583) the operatic field. Among his operas are 'Orfeo' (1607); 'Arianna' (1608); 'Proserpina rapita' (1630); 'Adone' (1639); 'Enna e Lavinia' (1641); 'Ulisse' (1641); 'L'incoronazione di Poppaea' (1642). He also composed a ballet, 'Tirsi e Clori' (1615) and the dramatic scene 'Il combattimento di Tancredi e Clorinda' (1624), besides numerous religious works as masses, psalms, motets, etc. Consult Vogel, Emil, 'Claudio Monteverdë' (in Vier- teljahrschrift für Musikwissenschaft 1889); Goldsmit, 'Studien der geschichte der Italienischen Opera in 17 Jahrhundert' (Leipzig 1904); Mitjana, Rafael, 'Claudio Monteverde' (Malaga 1911).

**MONTEVERDE, Giulio, Italian sculptor:** b. Bistagno, 8 Oct. 1837. He was at first wood-carver, but went to the academy at Genoa (1859) and won (1865) the Prize of Rome. His first works were a statuette of 'Columbus as a Boy' and a group of children playing with a Cat,' the Genius of Franklin,' copies of which are found everywhere. He became noted outside Italy by his group 'Jenner inoculating his own Child,' a work showing great refinement and sentiment. Of his more recent works should be mentioned 'Crucifix' in a marble memorial to Bellini for Catania; King Victor Emanuel for Bologna (1888). From 1874 he has been professor of San Luca Academy at Rome.

**MONTEVIDEO, Minn., village, county-seat of Chippewa County, at the junction of the Minnesota and the Chippewa rivers, on the Chicago, Milwaukee and Saint Paul Railroad, about 125 miles west of Saint Paul. It is in a fertile agricultural region where wheat is one of the important products. The chief industrial establishments are flour-mills, grain elevators, a creamery, cheese factories and a cooperage. It is the seat of Windom Institute (Congregational) and it has a high school, a public library and a town-hall. Near the village is a monument erected to commemorate the surrender of Little Crow, the Sioux chief, in 1862. Pop. 3,100.

**MONTEVIDEO, mon-teh-vi-deh-o, Uruguay, capital of the department of the same name; also capital and emporium of the republic; situated on the northern coast of the Rio de la Plata (see LA PLATA, Rio de). Founded in 1726, its inhabitants numbered only 3,500 in 1818, and 9,000 in 1829; indeed, it was scarcely more than a fortress until 1834, and at various times the governments of Argentina, England and Brazil attempted to gain possession of this stronghold commanding the great waterway of the south. Montevedo was taken by a British force of 4,600 men on 2 Feb. 1807, after a vigorous assault by land and sea (English fleet under Commodore Popham). Subsequently the combined English forces in the river, under command of General Whitelocke, were defeated at Buenos Aires, and, withdrawing from Montevedo, abandoned the Rio de la Plata. The demolition of the walls, the opening of new streets, and (1836) the beginning of foreign immigration, transformed the place. In the years from 1838 to 1841, about 28,000 European immigrants entered the port. There were 45,000 inhabitants in 1860; 105,000 in 1872; 258,080 in 1892; and at the beginning of 1902.
About 278,186 in the territory of 256 square miles embraced in the department. Immigrants arriving in 1901 were: Italian, 3,777; Spanish, 2,708; Brazilian, 715; French, 512; German, 349; and Russian, 271. It is 90 miles on the Rio de la Plata; but formerly was far from satisfactory. An elaborate system of moles and docks, projected for harbor improvement, began in July 1901. The water at the harbor's entrance being but 15 to 17 feet deep, vessels of great draught formerly anchored in the outer roadstead and discharged their cargoes on lighters. Since 1913 further improvements have increased the port's facilities. The city is built on a chain of hills of moderate elevation with a gradual slope toward the shore; the conditions are therefore favorable for efficient drainage. An active commerce is maintained with foreign countries and towns of the interior. As it is the only port of entry it furnishes nearly all of the revenue of the government, receiving or forwarding about 90 per cent of the importations of the entire country and about 67 per cent of the total exportations. The imports in a recent year amounted to $21,876,967, and the exports to $32,760,259. Among importers of 20 different companies, including 12 British and three French, visit the port periodically. Conspicuous buildings are the Parliament House, Government Palace, National Bank, Soils and San Felipe theatres, Uruguay Club and School of Arts and Sciences. There are commercial houses of every class, street railways, telegraph and telephone service, electric-light works, printing establishments and foundries. The streets are wide, straight and generally well kept. The water supply is obtained from the Saint Lucia River, at a point about 12 miles distant. Plaza, 16 in number, occupy high ground in the middle of the city, the most attractive of these public squares being the Zabala, Independencia and Constitucion. The University of Uruguay has more than 400 students and a relatively very large number of native and foreign professors; there are also normal and elementary schools, a military college, etc. Banks are: English (2), and Italian, Spanish, and American (1 each). No city in South America is more cosmopolitan in character; nearly all the languages of the civilized world are heard in its streets. The environs contain beautiful residences surrounded by gardens; at a distance of three miles from the city is the fine park called El Prado.

MARRION WILCOX.

MONTEVIDEO, Department of. See Uruguay.

MONTEZ, Lola (assumed name of Marie Dolores Eliza Rosanna Gilbert), adventureress: b. Limerick, Ireland, 1818; d. Astoria, N.Y., 17 Jan., 1842; killed in battle at Pahlala (now called Pahala), 20 Aug., 1841, in the war of Paksa and China, against the original confederates of the Continent, and in 1846 went to Munich, where she fascinated the old artist-king Louis I of Bavaria who made her his mistress, created her Countess of Landsfeld and granted her a large annuity. For a while she also exercised great political power, which she directed against the Jesuits and in favor of liberalism; but with the outbreak of the Revolution of 1848 she was once more set adrift. In London she married a guardsman, Stafford Hald, was soon divorced, and then sailed from him and in 1851 sailed for the United States. After touring through this country with a play called 'Lola Montez in Bavaria,' she went to Australia, returned here, was twice married in California, and finally moved to New York where she settled and spent her last days in rescue work among women. Her writings include 'Lectures,' with an autobiography, and "The Arts of Beauty." (1858).

MONTEZUMA, món-te-zúom-a (Aztec Montehtzuoma, the severe or sad one; found written also Montehtzoma, Montehtzuma, Montehtzoma, Motetza, Motezuma). surnamed Ilhuicamina (archer of heaven) and called Montehtzuma I, chief, or emperor, of ancient Mexico: b. about 1390; d. 1440. He succeeded his brother Itzcoatl in the chieftainship in 1436, but was not inaugurated until 1440, and his success was such that neighboring tribes was great, and he is said to have extended Mexican conquest to the Gulf. With Netzahualcoyotl, chief of Texcoco, he built, to prevent inundations from Lake Texcoco, huge dams, the ruins of which in the San Lorenzo Valley have shown them to have been a marvelous feat of engineering. He also rebuilt Tenochtitlan (on the site of the modern Mexico), the chief Aztec city, substituting for the primitive buildings others of lime and stone; established a severe code of law and developed the ceremonial and influence of the tribal religion. Consult Bancroft, H. H., 'Native Races' (San Francisco 1874-82).

MONTEZUMA, surnamed Xocoyotzin and called Montehtzoma II, chief, or emperor, of ancient Mexico: b. 1479 (authorities say Ethel Diaz); d. Tenochtitlan, Mexico, 30 June 1520. He is well known as the ruler of the Aztecs at the time of the Spanish invasion. He succeeded his uncle Ahuizotl as chief in 1503. Almost constant wars were carried on by him with the Tarascans and Tlascalans, and his life is said to have led an expedition as far south as Hondurases. His internal policy was in many respects wise. He severely enforced the laws, introduced valuable changes in the courts and built many public works, including temples, a new conduit for the water supply and a hospital for invalid warriors. But by his arrogance and pomp, his seclusion, his restriction of appointments to those only of noble rank and his heavy taxation he made himself greatly disliked. His conquests enlarged the empire but the various parts were without cohesion, and insurrections were frequent. When news was brought in 1518 that ships and white men (of Jean de Grijalva's expedition) had been seen off the coast, Montehtzuma was greatly alarmed, because an ancient prophecy foretold that Quetzalcoat, the white god, would at some time come to reign over Mexico. He sent presents to Cortez, who had landed at Vera Cruz in April 1519, and tried to prevent him from marching to Tenochtitlan. Cortez arrived there in November and was well received. Fearing an outbreak of the people, who did not agree with the conciliating policy of the monarch, Cortez then took Montehtzuma prisoner and retained him as a hostage in the
quarters of the Spaniards. The Aztecs finally made an attack upon the quarters (June 1520). Montezuma, at the request of Cortez, attempted in a speech from the wall to end hostilities, but was wounded by a volley of stones and died four days later. The Indians came to regard him as a deity, and indeed called him their chief god, though this reverence did not include worship. Cortez, Prescott, W. H., 'Conquest of Mexico' (1843); Bancroft, H. H., 'Mexico,' Vol. I (Vol. IX of his 'Works' 1883-90); Diaz, B., 'Historia verdadera de la conquista de la Nueva España.'

MONTEZUMA, Iowa, town, county-seat of Poweshiek County, on the Chicago, Rock Island and Pacific and the Iowa Central railroads, about 60 miles east of Des Moines. Agriculture and stock-raising are the principal industries of the surrounding region. Bituminous coal-fields are in the vicinity. The chief industrial establishments are a pearl-button factory, wagon factory, foundry, machine-shop and limestone quarry. Pop. 1,200.

MONTEZUMA CASTLE. A remarkable prehistoric dwelling situated in an alcove in a high cliff on the west bank of Beaver Creek, three miles from old Camp Verde, near Prescott, Ariz. It is accredited to Aztecs and even supposed to have been occupied by Montezuma, but ethnologists doubt the validity of this claim, or especially the existence of any evidence to sustain it. The building consists of five stories, with walls two feet thick at base. It contains about 20 rooms, most of them extending along a cliff which supports the higher stories. The structure shows evidence of having been occupied a long time. It was repaired by the Arizona Antiquarian Society in 1895, and in 1906 was made a National Monument. Consult description by Mearns in Popular Science Monthly, 1890.

MONTFACON, Bernard de, bár-nár dé mohn-fa-kon, French critic and classical scholar: b. Languedoc, France, 18 Jan. 1655; d. Paris, 21 Dec. 1741. He entered the army but resigned to become a Benedictine monk and devoted himself to classical studies. His 'Palæographia Graeca,' published in 1708, made him famous, and constituted him the founder of scientific palaeography. He traveled in Italy where he was honored by Innocent XII, and in 1719 was elected a member of the Academy of Inscriptions. In the course of his work he examined thousands of manuscripts and his books are a storehouse of classical archaeology. Among them are 'L'Antiquité expliquée et représentée en Figures' (15 vols., 1719-24); 'Monuments de la Monarchie française' (5 vols., 1729-33). Consult De Broglie, 'Bernard de Montfaucon et les Bernardins' (Paris 1891).

MONTFERRAT, mohn-ferr-ää, Italy, a former independent duchy, bounded by Piedmont, Genoa and the Milanese territory. It lay in two detached portions between the Maritime Alps and the Po and had an area of about 1,800 square miles. The chief town was Civate. Mention is made of a Marquis of Montferrat in 980. In 1305 the marquisate was inherited by a branch of the imperial family of the Palaeologoi, and in 1536 was granted by Charles V to Federico II, duke of Mantua. It was erected into a duchy by Maximilian in 1573 or

1574. In 1631 a considerable part of it was ceded to Savoy by the Duke of Mantua, to whose ancestors Charles V had granted it in 1536, and in 1703 the remainder was annexed to the same duchy. See Savoy.

MONTFORT, mohn-fört (Fr. mon-för), Simon de, EARL OF LEICESTER, English political reformer: b. France, about 1208; d. Evesham, 4 Aug. 1265. His father was Simon, the Conqueror of the Albigenses, his mother, Alice of Montmorency; the former had been disinheritcd of his English estates by King John in 1207 and hence had joined the more readily the orthodox French party in fighting the Albigenses, who were led by John's brother-in-law, Raymond of Toulouse. But the younger and greater Simon in 1229 was forced to leave France and throw himself on the mercy of the English king, Henry III, who restored him his lands in Leicester and married him to his own sister Eleanor, the young widow of Lord Pembroke, secretly and without dowry in 1238. The irregularity of this marriage, the testimony of Simon to the nobles, who had not been consulted; almost immediately afterward he quarreled with the king and was only saved by his crusader's vow, which he fulfilled under Richard of Cornwall in 1217 when he fought under Henry III (1242-48), who made him commander of the army in Gascony. There he crushed successive rebellions, but another quarrel between the monarch and his subject followed and Simon was removed from office. Henry soon had to recall Simon, who in 1257 and 1258 quarreled hotly with William of Valence, one of the king's foreign favorites and his half-brother. Simon's boldness in this matter put him at the head of the movement among the barons for administrative reform. In June 1258 the 24 commissioners, of whom he was one, drew up the famous Provisions of Oxford, signed in October of the same year, but repudiated in 1262 by the king. Simon de Montfort had been actual head of the reforming party since the conclusion of the peace with France (4 Dec. 1259) which had made reform possible. Now, after the cause of the nobles had been submitted to the king of France to arbitrate and his sentence had been entirely favorable to the king, setting aside the Oxford Provisions entirely and restoring to the people only such rights as they had before possessed, Simon put himself at the head of the party which was eager to fight for the privileges of the nobles. On 16 May 1264, after a brilliantly conducted engagement, Simon captured the king; a new constitution was formed giving the power to a council of nine, over whom were three electors, removable by Parliament; and in this new régime Simon was practically master of the kingdom. He summoned a Parliament 30 Jan. 1265, which was not the actual basis of the present English Parliament and of British constitutional freedom. But the Parliament was marked by a quarrel between Simon and the Earl of Gloucester; the latter went over to the barons, and encouraged him with splendid fearlessness; made a sudden peace with the Welsh king, and turning to meet Gloucester failed to effect a juncture with his son. At Evesham on 4 Aug. 1265, fighting to the last and scorning to retreat, he was slain, his forces being so outnumbered by the troops
with Gloucester and Prince Edward that at sight of the enemy Simon is said to have exclaimed, "Let us commend our souls to God, for our bodies are theirs." Personally haughty and high tempered, but sober, simple, pious, and cultured, he was a great general, one who stood firmly by the right, the ideal of the people, who made his tomb a shrine and carried on the work he had begun. To call him the creator of the House of Commons, however, is a misapprehension of his work, which was rewarded rather than fathered representative government. Consult Pauli's life which treats primarily of the constitutional bearings of Montfort's career and is translated into English by Miss Goodwin (1876); the English Life by Prothero (1877); the French biography by Bémont (1884), which first untangles Montfort's continental career; the Song of Lewes (edited by Kingsford, 1890); the Miracles of Simon de Montfort (edited by Halliwell for the Camden Society, 1840), showing the popularization of the hero; and such general works as Stubbs, Constitutional History (Vol. II, 6th ed., Oxford 1897), and Green, History of the English People (Vol. I, new ed., London 1908).

MONTGFIFER, mōnt-gōl,-fī-er (Fr. mōng-gōl-fé-er), two French inventors, Joseph Marie (b. Vidalon-les-Annion, France, 1740; d. Balareue-les-Bains, 26 June 1810); and Jacques Etienne (b. Vidalon-les-Annion, 7 Jan. 1743; d. Servières, 2 Aug. 1799). They were sons of a paper-maker and devoted themselves to the study of mathematics, mechanics, physic, and chemistry. As their scientific labors were always carried on in combination it is not easy to decide to which of the two the credit of their several inventions is due. The first idea of the balloon seems to have arisen in the mind of Joseph, but Jacques Etienne suggested many improvements upon it. Joseph was also the inventor, among other things, of the water-ram which raises water to the height of 60 feet, and Jacques Etienne of vellum paper, which he was the first to make in the manufactury formerly carried on by his father. See BALLOON.

MONTGOMERY, moň-gōm-ĕ-ri, Gabriel, Court of Admiralty captain: b. about 1530; d. Paris, 26 June 1574. He was son of the commander of the Scottish troops in the service of the French court, but in 1559 he accidentally wounded King Henry II with whom he was tilting and killed him. Montgomery was condemned to retirement in the country where he read many religious books, and was soon led to join the Protestant party. In 1562 he entered Condé's army, serving with much bravery and ability. He saved himself by the swiftness of his horse during the Massacre of Saint Bartholomew. In 1574 he led a band of Huguenots and began war in Normandy, was captured at Domfront, taken to Paris, tried and beheaded.

MONTGOMERY, moň-gōm-ĕ-ri, George, American Roman Catholic archbishop: b. Da- viess County, Ky., 30 Dec. 1847; d. San Francisco, Calif., 10 Jan. 1907. He was educated at Fordham College, Fordham Seminary, New York, and at Mary's Seminary, Baltimore, and was ordained to the priesthood in 1879. He officiated as a priest for 15 years in San Francisco and in 1894 was consecrated coadjutor bishop of Los Angeles. He was elevated to the rank of coadjutor archbishop of San Francisco in 1902.

MONTGOMERY, James, British poet and journalist: b. Irvine, Ayrshire, 4 Nov. 1771; d. Sheffield, Yorkshire, 30 April 1854. The son of a Moravian divine, he was educated for the ministry at the Fulneck Moravian School near Leeds, but in 1792 he procured an engagement with a bookseller in Sheffield the proprietor, editor and publisher of the local Register. Montgomery succeeded Lim later as editor and publisher of the paper, the name of which he changed to the Sheffield Iris. The publication of a liberal journal was at that period fraught with manifold dangers. He was twice prosecuted for trivial offenses and condemned on the first occasion to three and on the second to six months' imprisonment. During his confinement he composed a volume of poems, 'Prison Amusements,' published in 1797. In 1806 appeared his 'Wanderer in Switzerland,' his first popular effort. It was followed in 1809 by the 'West Indies,' a poem exposing the iniquities of the slave trade. Later volumes were 'The World before the Flood' (1813); 'Greenland,' a missionary poem (1819); and 'The Pelican Island' (1827). In 1823 he resigned the editorship of the Iris and passed the remainder of his life in religious and literary work. To the world of to-day he is known as a hymn writer. Over 100 of his hymns still keep their places in hymnals, their authorship frequently and unfortunately confounded with the work of Robert Montgomery (q.v.). Consult Carruthers, ed., Political Works of James Montgomery (1840); Holland and Everett, 'Memoirs' (London 1854-56); King, 'Life of James Montgomery' (London 1858).

MONTGOMERY, John Berrien, American naval officer: b. Allentown, N. J., 17 Nov. 1794; d. Carlisle, Pa., 23 March 1873. In 1812 he entered the navy as midshipman and was on board Perry's flagship at the victory on Lake Erie in 1813 where for gallant service he received the thanks of Congress. He was later engaged at Mackinaw in 1814 and in 1815 served in the Algerine war. In 1839 he became commander. In 1840 he was sent aboard the Portsmouth, established United States authority on the coast of California, blockaded Mazatlan and assisted in the capture of Guaymas. In 1849-51 he was executive officer of the navy-yard at Washington and he commanded the Pacific squadron in 1851-62. He was made a commodore in 1862 and rear-admiral on the retired list in 1866. Consult Montgomery, T. H., 'A Genealogical History of the Montgomery Family' (1863).

MONTGOMERY, Richard, American soldier: b. Convoy House, near Raphoe, Ireland, 2 Dec. 1726; d. Quebec, 31 Dec. 1775. At 18 he obtained a commission in the British army, in 1757 began his career of active service in America, and at the siege of Louisburg in 1758 and elsewhere gave evidence of his high military capacity. After a period of residence in England from 1765, in 1773 he was given a commission and, emigrating to New York, settled in Rhinebeck, Dutchess County. In 1775 he represented Dutchess County in the provincial Congress, and in the same year was appointed
MONTGOMERY

one of the eight brigadiers to serve in the newly organized army of the United colonies of the young Republic. He was immediately attached to a junction of the two divisions sent to Canada in the summer of 1775 and by a series of well-directed movements successively acquired possession of Chambly, Saint John's and Montreal, thereby becoming in the middle of November master of a great part of Canada. Effecting on 4 December with Arnold's troops, then recently arrived, he immediately proceeded to take a position before Quebec. At a council of officers it was determined to attempt to capture the place by a coup de main, and accordingly, on 31 December at 2 A.M., an attack on the town was begun. Montgomery, who headed the attack on the Cape Diamond bastion, fell dead at the first and only discharge by the British artillerymen. His men, panic-stricken by the loss of their leader, began a disorderly retreat, and the assault on the city ended in failure. He was interred within the city walls. British statesmen vied with Americans in their praise of Montgomery. Congress testified "their grateful remembrance and bound remembrance" by placing a monumental tablet to his memory in the front of Saint Paul's Church, Broadway, New York. In 1818 the State of New York had his remains transferred from Canada and buried with imposing solemnities beneath the monument. Consult Armstrong, "Life of Richard Montgomery" (in 'American Biography,' Sparks, J., ed., Boston 1834).

MONTGOMERY, Robert, English versifier and Anglican clergyman; b. Bath, 1807; d. Brighton, 3 Dec 1855. His name survives chiefly through the merciless criticism and ridicule of his work by Lord Macaulay in the Edinburgh Review. Having taken orders in the Church of England, he officiated at Percy Street Chapel in London till his death in 1855, with an interval of four years as pastor of Saint Jude's Episcopal Chapel in Glasgow. His chief works, overrated by uncritical sentiment for their popular vein, amply justify Macaulay's strictures, though hardly their offensively dogmatic tone. They include 'The Omniscience of the Deity' (1828); 'Satan' (1841), whence his sobriquet of "Satan Montgomery," and 'The Messiah.'

MONTGOMERY, Ala., State capital and third city of the State in population, and seat of Montgomery County, 52 miles southeast of the centre; on the left bank of the Alabama, 410 miles above the Gulf by water and 180 by rail. It is the greatest railroad centre in the State, seven lines converging there, the Louisville and Nashville, Mobile and Ohio, Atlantic Coast Line, Central of Georgia, Seaboard Air Line, Union Springs and Northern and Western of Alabama; 62 passenger trains a day arrive and depart from its union station. The city is a leading Southern trade and social centre.

Commerce and Industry. — Montgomery lies in the heart of the famous Black Belt, the band of rich dark soil which stretches across and beyond Alabama, 120 miles wide, and one of the largest of its kind in the world. As well as a great producer of grain, fruit and vegetables. It is the great central market of all this territory, and one of the foremost trucking centres for the supply of vegetables to the northern markets; its wholesale grocery business amounts to some $14,000,000 a year, and in total the value of the chief cotton and distributing points of the South, handling 150,000 to 175,000 bales a year in its extensive warehouses. The export of this is, to some extent, sent in barges down the river to Mobile, and there reloaded for foreign shipment. The Alabama is one of the best rivers in the United States for steamer navigation, having a deep, broad channel open as high as Montgomery for eleven months in the year. Lying between the coal and iron fields on the north and the vast forests of yellow pine on the south, as well as in the midst of the cotton belt, the city has great natural advantages for manufacturing; and a dam across the Tallapoosa at Tallahassee, 30 miles away, furnishes 25,000 horse power applied to its manufactories, and used for trolley and lighting. An English syndicate, the Alabama Power Company, has developed other water power in this section with a potentiality of 500,000 horse power. Already electricity is sold in Montgomery as low as one cent a kilowatt-hour. The city's interests are considerable and varied. There are 181 manufacturing enterprises, employing $12,000,000 capital and 6,000 employees. Carshops and foundry work for the numerous railroads, with boilers, and other iron goods, are the largest items; but there are also cotton factories and a cordage factory; four ginning and compress plants, five cotton-seed oil and cake works and 11 great fertilizer plants; 13 woodworking and lumber concerns, besides cooperage works (mainly for the oil and allied products), carriages, cabinets, show cases, furniture, confectionery, crackers and brushes and paper boxes, saddlery and harness, brick and tile, paving and roofing materials, etc. The aviation depot, or aeroplane construction plant, of the United States government is located at Montgomery. It employs 600 civilian mechanics and is the only plant of its kind in America.

Finance and Government. — The city's banking facilities have kept pace with its commercial increase. In 1919 Montgomery had four national banks, and three State banks, having a combined capital of $2,500,000; surplus, $635,000; individual deposits, $13,000,000. The post-office receipts had increased 35 per cent within five years. There are trolley systems covering the city and suburbs, and electric light, good sewerage and artesian water almost chemically pure; the streets are well paved and the country roads of remarkable excellence. Assessed valuation about $35,000,000. Out of about $150,000 yearly expenditure, aside from interest on debt, $90,000 is spent for schools. Montgomery has commission government.

Public Buildings, Institutions, Etc. — The city is handsomely built on a high red clay bluff bordering the river, and stretching back to undulating hills; it has many fine old gardens, and 50 acres of public parks. The centre is Court Square, and the foundation streets are Court, Commerce, toward the river, and Dexter avenue to the capitol. The Union Station, the courthouse, the Young Men's Christian Association and the Young Women's Christian Association buildings, the Masonic temple and the Carnegie
MONTGOMERY, ALA.

1 Montgomery County Courthouse
3 Court Square. Exchange Hotel and First National Bank
2 A Residential Street in Montgomery
library are the chief structures in the centre. The capitol dates from 1846; in its grounds is a large Confederate monument. There are 86 church societies of all denominations; several of them with handsome, modern edifices. There is a State Normal School for the colored here with 1,500 students, the Montgomery Industrial School for Girls and charitable institutions. Montgomery is the home of the Women's College of Alabama. There are three daily newspapers and several institutional libraries. There are 19 public school buildings, the same provision being made for colored as for white students.

History.—Montgomery was founded in 1817 by Andrew Dexter, of Rhode Island, on the site of the legendary Indian village of Eunchatta; it was part of the Creek Lands. Dexter named the place New Philadelphia; the situation was tempting, and in 1818 two more settlements were made—East Alabama Town closely adjoining, divided by the present lower Court street (whence the streets on its two sides are different from the town), and Alabama Town, a mile or more distant. On 3 Dec. 1819, the former was consolidated with it as Montgomery, named after the Indian fighter Lemuel Montgomery or the Revolutionary hero Richard Montgomery. The early society was like many pioneer communities, and vigilance committees had to be invoked to restore the reign of the law. The first steamer arrived 22 Oct. 1821; the Montgomery Railroad opened its first 12 miles in 1840. The place received a city charter about 1837; on 22 Jan. 1846 it was made the State capital; the capital was occupied 1847, burned 1849, replaced by the present, in 1851. Montgomery's interests and central location made it the focus of the secession movement; its position as capital drew in some of the ablest leaders and orators of the South, the famous William L. Yancey (q.v.) being one; and it was made the first capital of the Southern Confederacy, whose government was organized there 4 Feb. 1861. The next year the capital was removed to Richmond; the Union army reoccupied Montgomery 12 April 1865. Alabama was among the first of the States to create a Department of History and Archives, which is located here. This department has a complete record of all State documents since territorial days. It maintains a museum and art gallery.

Population.—The population in 1840 was 2,179; 1850, 6,728; 1860, 8,843; 1870, 10,583; 1880, 16,713; 1890, 21,883; 1900, 30,346; 1910, 38,785; 1920, 42,478. Estimated population 1919 (city directory), 59,710. Its suburbs, however, have far overspread the official limits, and the population within a few miles is toward 60,000. The city directory compilation for 1916 fixes the population in the city limits at 55,410.

Bruce Kennedy,
General Secretary, Montgomery Chamber of Commerce.

MONTH, a period of time derived from the motion of the moon. The synodic² month, more commonly called a lunar month³ or "lunation," is the period during which the moon goes through all her phases. It is usually reckoned from new moon to new moon; to complete the lunation the moon must not only pass through the 12 signs of the zodiac, but also come again to occupy her old position relatively to the sun, as in the zodiac, hence the lunar is longer than the sidereal month. The mean value of the lunation is 29.5306 days. The "solar" month is the 12th part of one solar year, or 30.4368 days. The anomalous fourth month is the period in which the moon passes from perigee to perigee in its orbit; it differs from the sidereal month because the perigee varies its position. The line of nodes of the moon's orbit varies its position, and the nodical.month, or the period of her motion from ascending to ascending node, differs from the other months mentioned above. The 12 civil or calendar months of the year have from 28 to 31 days each. The lunar month was used by the Chaldeans and Egyptians, and is still by the Jews, Turks and some uncivilized nations. The calendar or mean month is not equal divisions of the year, some (April, June, September and November) consisting of 30, and the remainder of 31 days, except February, to which a period of only 28 days is assigned (see Leap Year), with the addition every fourth year of one more day. These distinctions often give rise to much confusion as to the time intended to be designated by a month. In popular language it is often understood to be four weeks, as this is very nearly an equal period, expressed in the division by weeks, to the month. This definition was made by Blackstone as the legal definition of the term, so that a lease for 12 months was only for 48 weeks. The expression of a twelfth month, however, has been legally held to mean a solar year. See Calendar; Moon; Zodiac.
requiem mass celebrated on the day of decease or burial except the "Collect," "Secret," and "Post-Communion." In the early English church the prayers were offered daily for a month after the person's death. The anniversary of the death is commemorated similarly by the mass called the Year's Mind. Consult Missal; O'Brien, The Mass; Sullivan, A Guide to the Mass.

MONTI, Vincenzo, vên-chêndzô món'tê. Italian poet: b. Fusignano, near Ravenna, 19 Feb. 1754; d. Milan, 13 Oct. 1828. He was educated in law against his inclination; became secretary to Prince Luigi Braschi; won his literary spur with Saggio di poesie in 1779; gained speedy popularity with various occasional odes; and in 1787 and 1788 brought out his two great tragedies, Aristodemò and Galetotto Manfredo, both in the style of Alferi. His Basvilliana, a Dantesque poetic chronicle of recent happenings, notably the massacre of the French envoy Basville by the Roman populace, showed ability to treat a theme in politics; but from the detestation expressed in that poem for the excesses of the Revolution and his appeal to the Austrians against the French, he soon came to the most ardent praise of Napoleon and fled to France to escape punishment from Austria. His panegyric of the mathematician Mascheroni (1801) is largely an attack by the poet upon his personal enemies. (See MARANGONI.) After Marengo he returned to Italy and became professor of oratory at Pavia, imperial poet-laureate in Milan, and, after the coronation of Napoleon, historiographer of the Italian kingdom. From that time until the restoration of Austrian rule in Italy, Monti was devoted to Napoleon and wrote numerous odes of victory in his honor. In his latter years, a period of study and adversity, he joined his son-in-law, Giulio Perticari, in his fight with the Della Crucians, and published his single great work, a version of the Iliad (1810). His translation of Persius should be mentioned and his most successful drama, Caio Gracco (1802). Monti was an ardent classicist and in his Sermone sopra la mitologia (1825) combated romantic tendencies. Consult the biographies and appreciations by A. Monti (1873), Vicchi (1879-87) and Zumbini (1894); and the Milan (1839), or Florence edition (1817) of his works.

MONTICELLI, món-tê-seIlô, Adolphe, French painter: b. Marseilles, 1824; d. Marseilles, 1886. He made a short stay in Paris and contributed to the Salon; but, not meeting with success, returned to his native town, where he died poor, ignored and insane. Unappreciated, he sold his pictures in cafés for 10 or 20 francs; to-day they bring large sums. Collectors have made fortunes out of the small canvases which have given Monticelli posthumous fame. His 'Court of the Princess' is in the Metropolitan Museum, New York. "Monticelli," writes a French critic, "painted landscapes, fantastic scenes, still life and fêtes galantes in the style of Watteau. One cannot imagine a more inspired sense of color than shown by his works, which seem to be painted with powdered jewels, with powerful harmony, and all else with an unheard of delicacy in the perception of fine shades. There are tones which nobody had ever invented before, and a richness, a profusion, a subtlety which almost vie with the resources of music. The fairyland atmosphere of Monticelli's pictures surrounds a very firm draughtsmanship style; but, to use the words of the artist himself, 'in the canvases the objects are the decoration, the touches are the scales and the light is the tenor.' Monticelli has created for himself an entirely personal technique, which can only be compared with that of Turner. He painted with a brush so full, fat and rich that some of the details are often modeled in relief, in a substance as precious as enamels, jewels, ceramics—a substance which is a delight in itself. Every picture by Monticelli aroused astonishment. Constructed upon one color, as upon a musical theme, a picture by Monticelli rises to an intensity which one would have thought impossible. His pictures are magnificent bouquets, bursts of joy and color, where nothing is ever crude and where everything is ruled by a supreme sense of harmony." Consult biographies by Faure (Paris 1908); Gouraud (Paris 1900).

MONTICELLO, món-tê-seIlô, Ark., town, county-seat of Drew County, on the Saint Louis, Iron Mountain and Southern Railroad, about 81 miles south by east of Little Rock. The industries and trade are connected with the lumber, fruit, cotton and grain of the surrounding region, and stock raising is also carried on. Municipal enterprise has installed waterworks, sewage-disposal system and electric lighting. It is the seat of the Hinemon University school, the Arkansas Orphans' Home (Baptist) and of the State agricultural school. Pop. 2,500.

MONTICELLO, Fla., town, county-seat of Jefferson County, on the Seaboard Air Line and Atlantic Coast Line railroads, about 32 miles east by north of Tallahassee. It is in an agricultural section, where the chief products are cotton and fruit, of which it prepares and ships large quantities for northern markets. Pop. (est.) 2,000.

MONTICELLO, Ill., city, county-seat of Piatt County, on the Illinois Central and the Wabash railroads, about 147 miles south by west of Chicago. It is situated in an agricultural and stock-raising region and has attractive high school, library and college buildings. The chief manufactures are foundry and machine-shop products, dairy products, patent medicines, sirups, tile, brick, wagons and carriages. It is the trade centre for a large part of Piatt and the nearby counties, and ships considerable hay, livestock and vegetables. Pop. (est.) 2,100.

MONTICELLO, Ind., town, county-seat of White County, on the Tippecanoe River and on the Chicago, Indianapolis and Louisville and Pittsburgh, Cincinnati, Chicago and Saint Louis railroads, about 75 miles north by west of Indianapolis. The river furnishes good water power for manufacturing. The chief manufacturing establishments are flour and lumber mills and creameries; farming implements, thread, cement and tiles are also manufactured. The town owns and operates the waterworks. Pop. (est.) 2,500.

MONTICELLO, N. Y., village, county-seat of Sullivan County, the terminus of the Port Jervis, Monticello and New York Rail-
road, about 67 miles northwest of New York city. It is situated in an agricultural region from which large quantities of potatoes, apples and a considerable amount of dairy products are shipped. Southern Mountains Pertie's gloves and leather goods are manufactured. The nearby Mongaup Falls furnish ample water power and the village owns its waterworks. The village is a favorite summer resort on account of its pleasant climate and beautiful scenery. A deduction of 600,000 would cost a property loss of $1,000,000. Pop. 2,200.

MONTICELLO, mō-nē-tě-sē'ålō (It. Little Mountain), Virginia, the estate and residence once owned by Thomas Jefferson (q.v.), third President of the United States. It is in Albemarle County, Va., about two miles from Charlottesvile. The estate was an unbroken forest in the early part of the 18th century, until in 1735 the land came into possession of the father of Thomas. Peter Jefferson, the father, and his brother-in-law decided to "go West" and try a new life, they left the tides-water settlements on the James River and journeyed about 100 miles toward the west, to what is now Albemarle County, and located 20 miles east of the Blue Range and among the foothills of the Southwest Mountains. Peter Jefferson patented a tract of land of about 1,000 acres. In looking over his new possession he found no site for a home, such as pleased him; his neighbor, Randolph, sold him from his tract 40 acres for "Henry Weatherbourne's biggest bed of arrack punch." The place was then called Shadwell, after Shadwell street in London, and the country around Goochland. Thomas Jefferson was born in the old residence at Shadwell, and this house was his home for 27 years. From his boyhood his favorite spot on the estate was Little Mountain. Often he and his most intimate friend, Dabney Carr, after his brother-in-law, ascended the mountain in the twilight, and in the long vacations they studied astronomy and the stars on the mountain. They were buried under this tree, and at an early age Dabney Carr was here laid to rest. Later Jefferson, his wife, two daughters, and others of his descendents were buried in the little cemetery which was formed around this oak.

It was when Jefferson was a member of the house of burgesses of Virginia, to which he was elected in 1769, that he began the erection of his residence on the summit of the world-renowned eminence, Monticello. (Jefferson changed the English name to the Italian, Monticello.) The Shadwell mansion was on a hill on the north bank of the Rivanna River, and Monticello is south, just where the stream cuts through the outlying range of the Alleghanies, the Southwest Mountains. On the northeast Monticello has a steep rocky base, washed by the Rivanna, on the southwest is a dip of about one-third the height of the mountain which connects it with Carter's, a higher peak. Monticello is still covered by a dense growth of timber, mainly hardwood deciduous trees.

Before the residence on Monticello was completed, the Shadwell mansion was burned down, 1727. The first building on Monticello was a brick story-and-a-half structure containing one good-sized room and some smaller rooms; it still stands as the south pavilion. Here Jefferson brought his bride in 1772. He was often absent from this beloved home, but his own manuscripts, especially his garden-book, show his love for a quiet domestic life. This same garden-book shows that in 1769 he planted a variety of fruit trees on the southeast slope of the mountain, many of them still in existence. The house was enlarged to suit the needs of the family, and in accordance with the master's plans. From his European journeys he brought back many new ideas, so that the architecture of the house is somewhat complex. It has the appearance of an Italian villa, with a Greek portico, and considerable of the features of Colonial architecture. The Marquis de Chastellux in a book of travels mentions a visit to Monticello in 1782, and says of Jefferson: "He is the first American who has consulted the fine arts to know how to shelter himself from the weather." Architecture in America has advanced since that time. Some of the plans, drawn by Jefferson himself, are still in existence. The part of the home that was to last was made of good material and possesses a certain elegance, but the furniture was most simple. His last days saw the estate in such a state of deep poverty that it was feared he would have to end his life an exile from his beloved mountain. He sacrificed some of his estate hoping to save the residence and some land for his daughter. His friends assisted him so the estate was not lost to the Jefferson heirs until after his death; it had been his home for 56 years. No debt was allowed to defame the name of Jefferson; Thomas Jefferson Randolph, the grandson, and his daughters paid every dollar of debt that his eminent ancestor owed after Monticello had been sold. The great-granddaughters kept a school to assist their father in paying this debt. Ten years after Jefferson's death, Monticello was purchased by U. P. Levy, U. S. N., who bequeathed it to the nation. His will was contested and Jefferson Levy, New York congressman, bought off the other heirs, and restored the building and estate to their original condition. From 1912 a campaign conducted by Mrs. Martin W. Littleton was carried on to induce the government to turn it over to the national government as of national interest. It was finally bought for $500,000, the owner stipulating that it should be used only by Presidents of the United States as a Virginia home and not converted into a museum. Consult Century Magazine, Vol. XII, p. 643, article by Nicolay, 'Monticello; Home of Jefferson'; Craighill, 'The Virginia Peerage'; Foote, 'Sketches from Old Virginia.'

MONTIGNIES-SUR-SAMBRE, mōn'tē-nē-sôr-săn'br, Belgium, town in the province Hainaut, located on the Sambre 30 miles south of Brussels and on the London to Strasbourg railway. It is the centre of a coal mining industry and has manufactures of ovens, machinery, steel ware, etc. Its population in 1910 was 21,748.

MONT JOIE SAINT DENIS, mōn-zhwa sâⁿ dē-nē, a French war cry dating from the 12th century. The name is derived from the hill near Paris on which Saint Denis suffered martyrdom.
MONTLOUIS, mōn'lō'zyā', François Dominique Reynaud, Count de, French publicist and politician; b. Clermont, Auvergne, 11 Apr. 1747; d. Dec. 6, 1808. He was elected a member of the States-General (1789) and favored protection of royalty and nobility. He fled (1791) to London where he started an anti-revolutionary paper, the Courrier de Londres. In 1800 he was won over by Bonaparte and appointed to important posts in the ministry of foreign affairs. He frequently accompanied Napoleon I as political correspondent during his campaigns, but resigned in 1812. After the first Restoration his De la monarchie française depuis son établissement jusqu'aux nos jours (Paris 1814) was a work in praise of the feudal state. Under the Restoration he took a prominent place fighting the activities of the Jesuits and published his Mémoire à consulter (1826), but in his De la crise présente et de celle qui se prépare (1829) he tried to intervene between the parties, returning to his aristocratic views in his Mémoires sur la Révolution française, le Consulat, l'Empire et la Restauration (1829). He defended the Louis Philippe government and was created a peer.

MONTLUÇON, France, town in the Department of Allier, located on the Cher, starting point of the Berry Canal and junction of the Orleans Railway. It consists of the old town with its 15th century castle, and the modern industrial section which has been built up since the opening up of the coal field of Commeny. It possesses a lyceum, commercial court, chambers of agriculture, and manufactures, a library and theatre. Its industries are important and consist chiefly of iron and steel works, glass and mirror factories, chemical products, machinery and considerable trade. In 1911 it had a population of 35,799.

MONTMAGNY, Charles Jacques Huault de, shārl zhak ô-ült de mōn-mä̃n-yē, French colonial governor; b. France, about 1649. He was Canada's second governor-general, 1630-48, and proved himself a wise and able ruler. The condition of the colony improved under his administration, he defeated the Iroquois and conquered with them the Three Rivers in 1645; and had begun the subjugation of the Hurons when he was recalled in 1647. Under his rule the Jesuits made extensive explorations and settlements, but though deeply religious Montmagny disapproved of the founding of Montreal, considering it a weakening of the missionary forces.

MONTMARTRE, mōn-mar tr', France, a northern district of Paris, a former suburban village, on a conical hill commanding an extensive view of the metropolis. See Paris.

MONTMÉDY, mōn-mä̃d, France, capital of the Arrondissement of the same name in the Department of Meuse, located on the river Chiers and the East Railway. It is a port of the section that consists of the citadel on a rock 960 feet above sea-level with its old or upper town built in 1235 by Arnoux III, Count of Cas and Chiny, and surrounded by its high walls and tower, and the lower town (Bas-Médy). It was several times taken by the French but always recaptured by the Spaniards until, in 1659, it came permanently under French rule. Louis XIV had Vauban greatly strengthen the fortifications. In 1815 the Prussian and North-German allies besieged and then took the lower town by storm when it capitulated. In 1870 it became a useful railroad centre between the Germans. In the World War it was again captured by the Germans. In 1911 it had a population of 2,774.

MONTMORENCY, mōn-mōr-rēn sē, Anne, Duc de, French soldier; b. Chantilly, 15 March 1492; d. Paris, 11 Nov. 1567. He was a distinguished general in the wars of Francis I, and was taken prisoner at Pavia (1525). In 1538 he was made constable of France, but by a rapid change of fortune was banished the court in 1541 under suspicion of conspiracy. He was restored by Henry II (1547), in 1557 was defeated by the Spaniards and taken prisoner at Saint Quentin, and in 1562 was again captured while commanding against the Huguenots at Dreux. In 1563 he drove the English from Havre, and in 1567 received a fatal wound in the battle against Condé at Saint Denis. Consult Life by Decrue (1885-89).

MONTMORENCY, mōn-mō-rēn sē, Henri, Duc de, French soldier; b. Chantilly, 30 April 1595; d. Toulouse, 30 Oct. 1632. In 1612 he purchased the vicereignty of Canada from the Prince of Condé for 11,000 cows, and was wise enough to retain Champlain in command at Quebec. He weared, however, of the post, which gave him constant trouble, and in turn sold it. His services against the Huguenots in the civil wars were distinguished, and included a victory over the Duc de Rohan in 1628; but he took part in the insurrection of Gaston of Orleans in 1629, was made prisoner, condemned for treason, and beheaded.

MONTMORENCY, mōn-mō-rēn'sē, Falls of, Canada, a beautiful cascade near the mouth of the Montmorency River, on the Saint Lawrence River, seven miles below Quebec. The river has an irregular course north and south of about 15 miles, and just above its confluence with the Saint Lawrence falls over a precipice 251 feet high, and 100 feet wide at its crest. The falls are visited by great numbers of tourists, and are utilized to supply the power necessary for the electric and street railway plants of Quebec.

MONTOJO, mōn-sēo, Patricio, Spanish naval officer; b. 1833. He entered the navy when a young man, and at the outbreak of the Spanish-American War was in command of the Spanish fleet in the Pacific. This force was attacked by the American Pacific squadron under Dewey in Manila Bay 1 May 1898. Montojo's flagship, the Reina Christina, was successively engaged by the Olympia, Baltimore, Raleigh and Boston, received 70 shots, which killed 52 men and wounded 150; and finally caught fire. Montojo transferred his flag to a galleon. In September 1899 he was court-martialed in Madrid, and urged in his defense that the fault of the defeat was the Spanish government's, as it had not given him proper equipment. He was retired without right of promotion.

MONTORO, mōn-tōrō, Spain, town in the province of Cordoba; b. 200 B.C.; laid out by the Guadalquivir and on the Madrid-Sevilla Railway. It has a beautiful church and a fine bridge built in the 16th century and remains of
the ancient Moorish fortifications. Its chief industry is olive oil and cultivation of tropical fruits. Its population in 1910 was 15,144.

MONTORSOLI, Fra Giovanni Angelico da, fra jō-văn-ne ąn-du-lé-kō dā mōn-tōr-sō-lē, Florentine sculptor and architect; b. Montorsoli, 1407; d. Florence, 1556. He was a member of the religious order known as Servites; worked at Genoa, after retiring from that order, and by building the Serra and Doria palaces and adding a chantry and Doria tomb to the church of San Matteo, established his reputation as a sculptor and architect (1525). He was soon afterward engaged as assistant by Michelangelo in his work on the chapel of the Medici at Florence; the statue of Saint Cosmas there is by him. Among his other productions are the fountain in the Cathedral square at Messina (1547); he also designed several chapels in the cathedral there and built the light-house.

MONTOUR, mōn-toor', Esther (called 'Queen Esther'?), American half-breed Indian of the 18th century. She had French blood in her veins and was supposed to have been a descendant of Count de Frontenac, governor of New France. She married Eghobund, chief of the village of Sheshquein, and her keen intelligence enabled her to completely dominate the Seneca over whom she reigned as 'Queen Esther.' She was friendly to a Moravian mission which was located near her village for some years, and accompanied the delegates to various congresses of the Six Nations in Philadelphia, where she was well received among the best society owing to her pleasing manners and beautiful person. In the Wyoming massacre in July 1778 the savage in her nature, however, asserted itself and to avenge the death of her son she deliberately tomahawked 14 prisoners. Consult Conolly, General Sullivan's Indian Expedition (1887).

MONTPELLIER, mōn-pēl-ér, Vt., city, capital of the State, county-seat of Washington County, on the Winooski River, and on the Central Vermont, the Montpelier and White River, and the Montpelier and Burlington railroads, about 45 miles southeast of Burlington. It is situated in a beautiful valley surrounded by hills and in an agricultural region. In the vicinity are valuable granite quarries. The chief industrial establishments are flour, feed and lumber mills, machine shops, hardware, patent medicines, granite works, lathes for turning steel clothes pins and creameries. It controls a large portion of the trade of the surrounding country, and ships considerable farm products, especially hay, maple sugar, apples and potatoes, and also dairy products, poultry, granite and lumber. One of the prominent buildings is the State capitol, a fine granite structure built in the form of a cross, the dome, 124 feet high, surmounted by a statue of agriculture. A marble statue of Ethan Allen is at the entrance, under the portico; large State administration building under construction. Another fine building is Montpelier High School built 1915, also the Heaton Hospital, opened in 1909. The city has public and parish schools, the Washington County Grammar and Montpelier Union School Library, and the seminary library. The Y. M. C. A. is in flourishing condition. The government is administered under a charter of 1900 which provides for a mayor, who holds office one year, and a council. The mayor, subject to the approval of the council, the police; and the council elects the health officer, overseers of the poor, superintendents of streets and water and other officers. The waterworks, owned and operated by the city, were opened in 1884, and now (1913) comprise about 40 miles of mains. The water is brought from Mirror Lake, or Berlin Pond, situated about four and one-half miles southeast of the city. The land which is the town site was chartered in 1761, but the first permanent settlement was made in 1787 by people from Massachusetts. The town was organized in 1791, and in 1805 Montpelier was chosen as capital of the State. It was incorporated as a village in 1855. For 40 years it maintained town, village and school district organizations, until 1894, when it was chartered as a city. Among the noted people who have lived in Montpelier are Admiral George Dewey and Rear-Admiral Charles E. Clark, Joseph A. Deboer, an authority on insurance and loans. Pop. 7,856. Consult Hempen, History of Vermont, and 'History of the Town of Montpelier'; Thompson, History of Montpelier.

MONTPELLIER, mōn-pēl-lē-ā, Fr., chief town of the department of Hérault, on the Lez, six miles north of the Mediterranean, and 80 miles northwest of Marseilles. It is one of the handsomest towns of the southern coast of France and with its equable climate a favorite tourist and winter resort for invalids. Among its noteworthy features are the Peyrou, a splendid promenade, on which is the Château d'Eau, at the termination of a lofty double-arched aqueduct; the citadel; the cathedral; the Palais-de-Justice; the university buildings, and Porte de Peyrou, a triumphal arch of the Doric order. Montpellier is well equipped with educational and other institutions, and since the 12th century has been famous for its schools of medicine, said to have been founded by Arab physicians driven out of Spain. It is now merged in the celebrated University of Montpellier, dating from 1289, which has also "faculties" of law, science and literature, and an average annual attendance of 1,500 students; there is a public library of 130,000 volumes. The botanical garden, begun under Henri IV in 1593, is the oldest in France. Montpellier manufactures cottons, candles, soap, verdigris, chemicals, etc. It carries on an active trade, Cete serving as its harbor. Montpellier dates from the 8th century as a village built around a Benedictine abbey. It was a stronghold of the Huguenots, and suffered much in the religious wars. The edict of Montpellier (23 Oct. 1622) granted the free exercise of their religion to Protestants, and confirmed the Edict of Nantes. The philosopher Comte was one of Montpellier's distinguished sons. Pop. about 80,250.

MONTPENSIER, Anne Marie Louise d'Orléans, an mā-ri lōo-ēz dör-lā-ā mōn-pēn-sē-ā, Duchesse de, French princess, better known as Mademoiselle or La Grande Madeleine; b. Paris, 29 May, 1627; d. there, 5 April 1693. Her father was Gaston d'Orléans,
Montpensier — Montreal

Louis XIII’s brother; and her mother was Marie de Bourbon-Montpensier, who died when her daughter was five days old, leaving her the richest princess of Europe. Her wealth, pride and romantic disposition prompted her to a high match. In 1646 she refused the Prince of Wales. The II and her chance to marry Louis XIV was ruined in 1652, when she sided with Condé for whose protection she had the cannon at the Bastille fired on the royal troops. Upon her return to the court in 1657 she fell in love with Lauzun, a young cadet, whom Louis refused to let her marry. Lauzun was imprisoned for 10 years, but Mademoiselle seems to have married him secretly, in spite of the king, only to find him a brutal husband; they were separated and her last years were spent in pious devotion. Her ‘Memoirs’ covering the years 1630–88, are particularly valuable for the light they throw upon the history of the Fronde; they are edited by Chérual (1850). Consult Barine, Sain Neugeu de la Gruines, north of New York, 1627–32. Another by Lauzun (New York 1901); Price, E. C., ‘A Princess of the Old World’ (New York 1907).

Montpensier, Antoine Marie Philippe Louis d’Orleans, an-twân mà-ré fé-lép loo-è dôr-là-àn, Duc de, French prince and claimant to the Spanish throne: b. Neuilly, 31 July 1824; d. San Lucas, near Seville, 4 Feb. 1890. The fifth son of King Louis Philippe, he studied at the Collège Henri IV, entered the army in 1842, served in Algiers, and in 1846 married the Spanish infanta Maria Luisa Fernanda. After the revolution of 1848 he lived in England and Holland; then settled in Spain, where he received the title of Infante and was made captain-general of the Spanish army; was suspected of a plot against the Crown and was exiled from Spain, returning only after the revolution of 1868. In 1870 he quarreled with the Duke of Seville, also a claimant for the throne, and killed him in a duel. During the reign of King Amadeus (1871–73), Montpensier was exiled to the Baleares; upon his recall in 1873 he sided with Alfonso XII, and married to this daughter, Maria de las Mercedes, who died without issue in 1878, the close of Montpensier’s political activity. His eldest daughter married the Comte de Paris, and his only son became the husband of the Infanta Eulalia in 1898.

Montreal, Canada, the largest and most important city of the Dominion, and fourth in population among American cities, is in the province of Quebec. It lies on the left or north bank of the Saint Lawrence, at the head of ocean navigation, 983 miles from the Atlantic, 180 miles southwest of Quebec and 430 miles north of New York.

Topography.—Montreal lies in the middle of that great plain which stretches from the Laurentians to the Adirondack Mountains and extends from the sea into the middle of the Continent. The rivers which traverse this plain, the Saint Lawrence and the Ottawa, fall together at the head of the Island of Montreal, which is 32 miles long and 10 miles wide at the broadest part. The city is built upon the southern side of this island, at a point where the Lachine Rapids are rendered impassable. It owes its importance to this situation. Immediately behind the city Mount Royal rises to a height of 753 feet above the level of the sea. Upon three sides the mountain ends in a sheer cliff, but toward the west it extends in broken ridges for three miles. Mount Royal gives to the city its character. It was converted into a park by Frederick Law Olmstead, who succeeded Loudon, bringing to light its characteristic beauties, by obeying the design which nature had already laid down. By following the terraces a roadway was constructed, devious, but always ascending until after a compass of 26 miles, the whole island was laid out. From the various levels and the different points of outlook a wide and diversified view is obtained. To the south, the White, Green and Adirondack mountains may be described upon the horizon. In the middle-distance a number of rounded eminences arise from the plain, which are, like Mount Royal itself, the roots of old volcanoes. Villages, Longueuil, Saint Lambert and La Prairie, mark the southern bank of the Saint Lawrence, which at this point is two miles wide. A wide valley of the Ottawa opens out, and the river, dividing on the Island of Montreal, sends its waters on either side to mingle their dark colors with the blue of the Saint Lawrence. Further to the west Lake Saint-Louis is read out like a sea. The Lachine Canal threads the plain, and upon occasion one may see the leap and sparkle of the Rapids. To the north the Laurentians extend their dark purple irregular masses. Immediately around the mountain and upon its lower terraces lies the city.

Geology.—Fourteen distinct geological formations or horizons have been described within a radius of a few miles from Montreal. Four of these belong to the quaternary or newest system; one is doubtfully but probably referable to the Devonian, one to the Silurian (Upper Silurian of Murchison), seven to the Ordovician (Lower Silurian and Cambro-Silurian of many authors), and the remainder to the Laurentian or part of the great Orchean Complex.

History.—The site of Montreal was first visited by Jacques Cartier in 1535. He landed upon the island and followed an Indian pathway: “And we, being on the road, found it as beaten as it was possible to see, in the most beautiful soil and the fairest air as there are in any forests of France, under which all the ground was covered with acorns. . . . And about a league thence, we commenced to find the lands tilled, and fair large fields full of the corn of their lands, which is like Brazil rice, as large, or more, than peas, whereof they live as we do on wheat. And in the midst of these fields is situated and fixed the said town of Hochelaga, near and adjoining a mountain which is in the neighborhood, well tilled and exceeding fertile; therefrom one sees very far. We named that mountain Mont Royal.”

The next European to visit the spot was Samuel de Champlain in 1611. He landed at a place which he called Place Royale, a name it still bears. He found “in the middle of the river an island about three quarters of a league in circuit, fit for the building of a good and strong town, and I named it the Isle of Sainte Hélène. The rapids come down into a sort of lake, where there is a great quantity of fish and fine meadow-lands.” By this time all trace of Hochelaga had vanished, leaving only ob-
scure legends of a Huron Helen and of the evil which had been wrought by her.

The founding of the present city dates from 1642 and it was marked by voices and visions and dreams and signs. Its inception is shrouded in mysticism; there was Dauversière who whipped himself with a scourge of small chains; there was Olier who afterward founded the Sulpician Seminary, to whom came a revelation as the choir was chanting Lumen ad revolutionem gentium. These two men were miraculously brought together in the church of Notre Dame de Paris, and to them in an ecstasy the Virgin appeared. All these things are set forth in the Relations des Jesuites.

The proposal was to found at Montreal three communities, one of secular priests, to direct the colonists and convert the Indians; one of nuns to nurse the sick; and one to teach the Faith to children white and red alike. This was at a time when, from the condition of Indian warfare, it was like entering a kennel of wolves. The soldier captain of the expedition of 40 men was Paul de Commedy Sieur de Maisonneuve, a valiant and sober man of grave demeanor and full of courage. Accompanying the expedition was the Adviser to the Mance Arnaud, at Quebec, they encountered only jealousy and distrust. It was then the leader cried: "I have not come to deliberate but to act; it is my duty and my honour to found a colony at Montreal, and I would go if every tree were an Iroquois." Upon the 17th of May 1642 this strange expedition arrived at the foot of Saint Mary's current. Maisonneuve sprang ashore on the spot where the Customs House now stands. In the words of the officiating priest, Père Vimont, "tents were pitched, camps were lighted, evening fell and mass was celebrated. Fire-flies caught and imprisoned in a phial upon the altar served as lights." An altar was raised, and kneeling together the adventuriers heard the voice of the priest: "You are a grain of mustard-seed that shall rise and grow till its branches overshadow the earth. You are few but your work is the work of God. His smile is upon you and your children will fill the land."

To trace the trials and growth of the Colony would be to write the romance of a nation's childhood.

As a result of the victory which Wolfe obtained over Montcalm on the Plains of Abraham, Canada fell to the British, and Montreal formally capitulated to General Amherst on 8 Sept. 1760. When the star of the American Revolution broke out, operations were directed against Canada. Montreal yielded to Brigadier-General Wooster, and General Carleton was obliged to withdraw to Quebec. During the winter of 1775-76 the Commissioners of Congregationalists, Samuel Chase and Charles Carroll, took counsel as to how they might detach Canada from its allegiance to the British Crown, which had lasted only six years. The ecclesiastical authorities, with the astuteness of their race, took the occasion to drive a hard bargain with England, by which their religion and laws were guaranteed to them for ever. To England Canada was, in the mocking words of Voltaire, nothing more than a few acres of snow, and the mother country adopted and they were as a beggar with England, by which their religion and laws were guaranteed to them for ever. To England Canada was, in the mocking words of Voltaire, nothing more than a few acres of snow, and the mother country adopted and treaty was made with England, by which their religion and laws were guaranteed to them for ever.

To England Canada was, in the mocking words of Voltaire, nothing more than a few acres of snow, and the mother country adopted and treaty was made with England, by which their religion and laws were guaranteed to them for ever.

To England Canada was, in the mocking words of Voltaire, nothing more than a few acres of snow, and the mother country adopted and treaty was made with England, by which their religion and laws were guaranteed to them for ever.

Saint Helen's Island, at the foot of the current, is a small island called by the name of Helen, wife of Champlain, the first European woman to visit Canada. The English government acquired it from the Barons of Longueuil for a military depot and station. There is yet upon the island a battery of guns and barracks. The place is pretty wooded and has many secluded spots.

Churches.—The Catholic cathedral of Saint James has an imposing situation upon Dominon Square. It is erroneously called the cathedral of Saint Peter, for the statue of Saint Peter's at Rome, modified to suit the exigencies of the Canadian climate;
for example, the roof is sloping to throw off the snow. This noble edifice was projected by the late Archbishop Bourget in 1852, when his church and palace on Saint Denis street were consumed in the great fire of that year. The work was commenced in 1856 and is now nearly finished. Apart from the plan the exterior is hard and gloomy in appearance. The dome is a noble adornment and a salient feature in the architecture of Montreal. Its height with the cross is 250 feet and its diameter 90 feet. The plan is cruciform and the manner of its prototype, the tribune and ends of the transept being rounded. The total length is 330 feet, the breadth of the transept 225 feet, the height to the roof-tree 80 feet. The interior is upon the model of the Italian churches. At the north entrance is a statue to the founder by Hébert.

The parish church of Notre Dame faces the Place d'Armes. It is a plain stately edifice of late Gothic style, built of graystone in 1824, by James de Lard. The site was occupied by a church built in 1672, a low structure with a pointed roof. Notre Dame is one of the largest churches in America, being 255 feet long and 134 feet wide, and capable of containing 18,000 persons. There are two towers, 227 feet high provided with an elevator, and from the summit a notable view may be obtained. They contain a chime of 10 bells which are rung upon special occasions. There are three others, one "le Gros Bourdon," the largest bell in America, weighing 15 tons. The interior is florid and tasteless in its decorations, but the wood carving is good. The organ was built at Saint Hyacinthe in 1890. Behind the choir is a richly adorned Lady Chapel.

The church is the seminary of Saint Sulpice, erected in 1710 and now used for the offices of the Order. As in the days of Charlevoix, it is a stately great and pleasant house, built of free-stone, after the model of that of Saint Sulpice at Paris; and the altar stands by itself, just like that at Paris.9

Notre-Dame-de-Lourdes, on Saint Catherine street, is the only church in Canada in which all the interior decoration is meant to illustrate one central idea; in this case, the dogma of the Immaculate Conception. M. Bourassa, the artist, is as himself the architect and the decoration in 1854, of Pius IX, that this dogma was of faith. The style of architecture is Byzantine and Renaissance in harmonious proportions. Within and without the effect is one of unity and force.

Notre-Dame-de-Bonsecours dates from 1673, when it was founded by Marguerite Bourgeois. The present edifice dates from 1771, and several times has been in danger of being swept away by the tide of commerce at its base. It has been sorely mishandled by the renovator.

The church of the Gesu on Bleury street, with Saint Mary's College adjoining, is the abode of the Jesuits. They returned to Canada in 1847, and erected the present church in 1864. Members of this Order were the first to establish schools in Canada, and an account of their trials affords the most romantic reading of its history. Individual priests penetrated the wilderness and lived and died often in hideous torment amongst the savages of the Iroquois confederacy. At the time of the conquest they were expelled from Canada, and their estates

confiscated. Up to 1892 their revenues were devoted to educational purposes when, under arrangements, their estates were restored to the Order. The church is 194 feet long, 96 feet wide, the transept 144 feet and the nave 95 feet high. The frescoes are in grisaille, grayish tints imitative of bas-reliefs — a very effective decoration for the interior. The evening music is very fine, and an admirable sermon in English is often preached which attracts many non-adherents of the Roman communion.

Amongst the churches of Montreal the Anglican Christ Church Cathedral holds first place in correctness of style. The style chosen is early English. The architect has insisted very clearly upon its proportion and symmetry, and has succeeded in erecting one of the most important architectural units in America. Its conception is due to Bishop Fulford, the first resident bishop of Montreal, and his memorial on the east side is much admired. It resembles the Martyrs' Memorial at Oxford. The church rises in the site of a Latin chancel, the total length is 212 feet, transept 100 feet, height of spire 224 feet, nave 67 feet. The material of which it is built is Montreal limestone faced with Caen sandstone, which, though soft for the climate, has weathered to a very delicate tone of color. There is a subtle attempt at interior decoration, except in the staining of the glass, which is well done, especially the northern windows and those of the transept. Other features are the seats of the choir, and the capitals of the columns carved to imitate Canadian flowering plants. The chapter-house, an octagonal building with broken outlines, adds to the general effect. In spite of, or perhaps by reason of, the correctness of the design and the adherence to it, the edifice somehow lacks the true cathedral feeling.

Saint George's Church, Anglican, on Dominion Square, is a very dainty piece of building, after the manner of the 13th century Gothic. One notes the following features: the stone porch, the spire 230 feet high, with a fine chime of bells, the wide span of the roof, and the freedom of the nave from pillars. The church was erected in 1870, of limestone and olive sandstone.

The church of Saint James the Apostle, on Saint Catherine Street West, is a pleasing little edifice. It contains a chime of six bells which ring with good effect. One admires the pulpit church was erected in 1870, of limestone and the stalls of carved buttonwood.

The principal Presbyterian churches are Saint Andrews (Church of Scotland) on Beaver Hall Hill; Saint Paul's, Knox, American, and Crescent on Dorchester street; and, most important, Erskine Church, on Sherbrooke street.

Saint James is the chief of the Methodist churches. It is situated on Saint Catherine street; it is elaborate in design and within the arrangement is of a very modern kind.

**Educational Institutions.**—McGill University, non-denominational, was founded in 1821, when James McGill, a native of Glasgow, died in 1744, left an account of his estate which in 1811 bequeathed £30,000 to the Royal Institution for the Advancement of Learning. This corporate body dates from 1801 and it secured a new charter in 1821, but it was not until 1829 that the educational work was undertaken. McGill University contains four faculties, Arts, Law,
Montreal

Medicine and Applied Science, the Royal Victoria College for Women and a Conservatorium of Music. In 1917-18 the enrolment was 1,040; about 2,000 students and graduates were serving in the Great War.

The Saint-Sulpice Seminary, a fine Romanesque building, erected in 1893, contains over 150,000 volumes. It is particularly strong in history. The museum, erected in 1882, is rich in geological collections. The observatory is the centre of much valuable work in astronomy. Connected with the university are the Saint-Louis, Saint-Vincent-de-Paul, Saint-Joseph, Saint-Maxime, and Laval Colleges. The College of the Holy Sacrament is a collegiate school for boys.

Laval University was founded in 1852 by the Quebec Seminary, which itself was founded in 1663 by Bishops Laval and Montmorency, the first bishop of Quebec. Laval operates under a royal charter granted at Westminster 8 Dec. 1852 and under the bull, Inter Vos Suavis Dicta, issued by Pope Pius IX, 15 April 1856. In conformity with the decision of the Propaganda a branch of Laval University was established in Montreal in 1877, enjoying all the privileges of the mother college at Quebec. The buildings which is a modern adaptation of the Renaissance was erected on St. Denis street out of the large funds of the seminary. The first floor is occupied by the law faculty, the second by the faculty of medicine. This faculty was formed by an amalgamation in 1891 with the Montreal School of Medicine and Surgery, which had existed since 1843. It is attended by 300 students.

The Seminary of Saint Sulpice undertakes the theological teaching for the Montreal branch of Laval University, and a portion of the work in arts. Its buildings extend from Sherbrooke street up to the slope of the mountain and include the grand seminary and the Seminary of Philosophy. There are more than 450 students in residence with 28 professors. Two towers, the remains of the fort constructed in 1671, still stand in front of the seminary.

Saint Mary's College is conducted by the Jesuits and adjoins the church of the Gesu on the top of Mount Royal. It is a modern building and receive an excellent training in classics.

The Sisters of the Congregation of Notre Dame was established in 1653. These sisters have 91 educational establishments in Canada and the United States with 1,000 nuns and over 30,000 pupils. The mother house, Villa Maria, was burned in 1895, but it is now being replaced on a new site.

The Sisters of the Holy Names of Jesus and Mary inhabit the Hochelaga Convent for a mother house. They have 36 minor houses in which 10,000 children are taught.

Hospitals.—The Hotel Dieu, 253 beds, founded in 1643, occupies a pile of buildings erected in 1859. During the Iroquois Wars and even since this hospital has done good service. It is attended by surgeons and physicians of Laval. The Montreal General Hospital (484 beds) was founded in 1819, and opened in 1822. The Royal Victoria Hospital (355 beds) was founded, erected and endowed between 1855 and 1865 by Lord Strathcon and Mount Royal and Baron Mount-Stephen. Other hospitals are the Notre Dame, with 148 beds, which is now erecting new buildings with accommodation for contagious cases, the Western General Hospital and the enormous hospital of the Pasteur Groupe for foundlings and the aged infirm. The *Alexandra Hospital for contagious diseases was opened by the Protestant community at a cost of $200,000.

Other public buildings are the city-hall, an imitation of the Hotel de Ville in Paris; the courthouse, in a classical style with a dome; the Art Gallery, with some good pictures but not equaling those held in private collections; the Fraser public and reference library with accommodation for 300,000 volumes, opened by Field Marshal Joffre on 1 September; the Canadian Pacific Railway Station, a fine castellated structure. Many of the private residences are fine, and the general material of construction being gray limestone gives to the city an appearance of dignity.

Navigation and Trade.—The Montreal-Quebec channel, with a minimum depth of 31 feet, accommodates vessels of the largest size, and the port handles one-third of Canada's commerce. Montreal has eight miles of deep water in the harbor, and it is well equipped for the expedient handling of traffic. Fort statistics for 1917 show 6,929 vessels, of which 579 were Atlantic ships, 68 from the Maritime Provinces and 6,274 from inland waters (gross tonnage, 5,217,059 tons). The total value of the imports for the year to 31 December 1916, $129,139,817, and of the exports of Canadian products, $175,436,730. The customs receipts for 1917 were $37,857,723, and the inland revenue receipts, $15,685,451.

Banking and Finance.—Montreal is the banking centre for Canada. There are 20 chartered banks in Canada, many of which have their head offices in Montreal and nearly all have branches. The bank clearings in Montreal for 1917 were $4,188,255,210; the assessment valuation was $824,630,229 (doubled in six years). The municipal budget, $14,230,492 in 1916, is the highest in Canada.

Railways.—Three great railway systems, the Grand Trunk, Canadian Pacific and Grand Trunk Pacific, have their headquarters in Montreal with general offices and large works. Two bridges span the St. Lawrence, the Victoria bridge, one and three-fourths miles long, 12 feet wide, costing $6,300,000, was designed by Robert Stephenson, and the work was inaugurated by the Prince of Wales in 1860. It was long regarded as one of the engineering feats of the world, but in 1896 it was converted into a structure more suitable for modern needs with two tracks, a driveway and foot-path. The Canadian Pacific Railway bridge, light and graceful, crosses the river at Lachine. It is built on the cantilever principle, and has two spans each 408 feet long. In order to obtain terminal facilities for the Canadian Northern Railway, a tunnel has been constructed through Mount Royal.

Population.—The population of Greater Montreal is now (1917) approaching 800,000. In the city 75 per cent of the population are of French-Canadian extraction. Both French and English languages are officially recognized and the majority of the population speak both languages. In 1830 the population of Montreal was 7,000. Montreal has the largest birth rate of any of the world's large cities, being in 1915
36.96, the death rate was 19.60; but infant mortality is heavy, 185 per 1,000.

Schools.—The public schools are controlled by boards of commissioners, one for Catholics and one for Protestants. These are chosen by the legislature and the city council. The schools are in the main effective, though the commissioners are chiefly clergymen, and education is free. The city was placed under government by commission in 1918.

Climate.—The weather in Montreal is cold in winter and pleasantly warm in summer. The greatest cold, however, is rarely below 20° zero, and the greatest heat above 88°. The annual mean temperature is about 42°. There is generally plenty of snowfall in winter and sleighing begins about 1 December. Consult Bosworth 1940; Dawson’s 1940; Hinchcliff, Montreal and Vicinity (1940); Brumath, Histoire populaire de Montreal (1890); and Dallaire de Casson, Histoire du Montreal 1640-1672 (1888).

Andrew Macphail

MONTREAL, Capture of, in American Revolution. See Quebec, Battle of.

Montreuil, mōn'trē'y, France, town in the arrondissement Sceaux and department of Seine, five miles east of Paris and north of Vincennes. It has a church dating from the 12th–14th century. The place is noted for its remarkable butter, especially its chevre chèvre. It has manufactures of chemicals, India-rubber goods, dolls, pianos, porcelain and art furniture. Its population, approximately, 43,217.

Montreux, mōn'trō, Switzerland, invalid resort in the canton of Vaud, located on Lake Geneva and on the Geneva-Saint-Maurice line of the Simplon Railway. It consists of several villages scattered on the cliffs and lake shore, among them Vernex (the capital), Clarens, Territet, Vevey, Glion, etc. In 1910 the communities numbered 18,800 souls. On account of its lovely scenery and mild and healthy climate the town is round it is greatly frequented by invalids and convalescents. The ancient noted castle of Chillon is in the neighborhood. A rack-and-pinion railway takes visitors from Glion up to the Rochers de Naye, 5,800 feet above sea-level. Consult Gribble, F. H., Montreux (New York 1908); Bührer, C., Le climat de Montreux (Montreux 1902).

Montrose, mōn'trōz', James Graham, Marquis of, Scotch Royalist general: b. 1612; d. Edinburgh, 1 May 1650. He was son of the Earl of Montrose, whom he succeeded in that title in 1636. He was educated at Saint Andrew’s; joined the opposition to Charles I’s attempt to introduce episcopacy into Scotland in 1637, becoming one of the leaders of the Covenant. In 1638–39 he three times overran Aberdeen. In the latter year he was an envoy to the king at Berwick; in 1640 he was the first to cross the Tweed in the Scottish invasion of England. In 1641, being found in secret correspondence with the king, he was imprisoned by Argyll for five months. In the following year he was offered the command of the Covenanters by King Charles; and in the following year definitely turned to the Royalist side. In 1644 he left Oxford disguised as a groom and penetrated to Blair Atholl. He then united the western clans, united by their common hatred of Argyll against the Covenanters, and with them he won several victories—at Tippermuir, Aberdeen, Inverlochy, Auldearn, Alford, and Muirhead. He was defeated at Philiphaugh (12 September) by David Leslie. Montrose escaped to Norway. In 1649 he succeeded in urging the younger Charles to send him again to Scotland, raised an army at Gottenburg, landed at Orkney, was defeated at Carbisdale in Southernlandshire and afterward was captured, taken to Edinburgh and there drawn and quartered. His loyalty to the Stuart cause is only less remarkable than his own scheme of Scottish independence of ecclesiastical control, an ideal to which he always remained faithful. Montrose was a political poet, whose verse is vigorous. As a general he ranks first among the Scottish Royalists. Consult Buchan, John, The Marquis of Montrose (London 1913); Gardiner, The Great Civil War (Vol. II, which is particularly able in its criticism of Montrose’s strategy); Mowbray, Morris, Montrose (in the English Men of Action series, London 1892); and Napier, Montrose and the Covenanters (ib. 1838).

Montrose, Colo., town, county-seat of Montrose County, on the Uncompahgre River, and on two branches of the Denver and Rio Grande railroad, about 355 miles southwest of Denver. It is in the Uncompahgre Valley, in which there is a large acreage of fertile soil, which is made productive by irrigation. The chief products are fruits, grains and vegetables. The three local banks have combined resources amounting to $1,586,830. The assessed property valuation is $3,002,320, on a real value estimated at $5,000,000. The town’s principal public buildings are the courthouse, city hall, library, fire house, and pump station. The annual revenues are about $150,000. There are two graded schools and a county high school. Considerable attention is given to stock-raising. The government is on the commission-manager plan. Pop. 4,500.

Montrose, Pa., borough, county-seat of Susquehanna County, on the Montrose, the Lehigh Valley, and the Delaware, Lackawanna and Western railroads; also on the Scranton and Binghamton Electric Railroad, about 12 miles north by west of Scranton. It is about 2,000 feet above the sea, and its cool climate in summer and the beauty of its scenery make it a favorite summer resort. The value of taxable property is about $400,000 on a basis of 33 per cent valuation. The tax rate is about 5 per cent. The manufactories are machine shops, lumber mills, flour mills and creameries. The public buildings include the county courthouse, jail and the public library. The government is of the regular borough pattern common in Pennsylvania. Pop. 1,914.

Montrose, Scotland, a seaport town and royal burgh in Forfarshire, 90 miles northeast of Edinburgh by rail, at the mouth of the South Esk, which widens out into a shallow expanse behind the town, known as Montrose Basin. The river is crossed by a suspension bridge, and by a ferry bridge. Montrose is well built and has the usual public buildings and institutions, including two public libraries and one of
the largest parish churches in Scotland. It has one of the best golf links in Scotland. The principal employment is flax-spinning. Boat building is also carried on. There are extensive saw-mills, and a large aerodrome nearby. The foreign trade is largely in timber, flax, etc. Montrose is also the centre of a fishery-district. It dates from the 10th century. Pop. 12,666. Consult Mitchell, 'History of Montrose' (Montrose 1866).

**MONTOYDITE**. A mineral, oxide of mercury, HgO, in ore mined in the Terlingua district, Texas.

**MONTS, Pierre du Guast, pé-ar dû gjmön**, French colonist in North America: b. Saintonge, France, about 1560; d. Paris, 1611. He was of an Italian family and educated in the Roman Catholic faith, but became a Protestant, fought on the Protestant side in the wars of religion, and was made governor of Pons in Saintonge. He made several voyages to America, and is believed to have accompanied Chauvin's expedition of 1600. In 1603 he was appointed lieutenant-general with vice-regal authority by a company of colonists, to whom Acadia had been granted, a territory which included the present maritime provinces of Canada, and part of the province of Quebec and the greater part of New England. He sailed from Harwich in 1604 with Samuel Champlain and the colonists, and after exploring the Bay of Fundy discovered Annapolis Basin, which they called Port Royal, and then explored and named Saint John River. He established a colony at Saint Croix and at Port Royal and then went to France, but his patent for colonization was canceled in 1607, and afterward renewed for a year. At his own expense he sent relief to his colonists and assisted Champlain and Pontgravé to make a voyage to the Saint Lawrence in 1607; and Quebec was founded by explorers aided by him in 1608. He lost favor at court upon the death of Henry IV. The date of his death is uncertain. Consult Lescarbot, 'History of New France' in the Champlain Society's edition, edited by Grant and Béquet (3 vols., Toronto, 1897-14); Parkman, 'Pioneers of France in the New World' (1865); and 'Tercentenary of De Monts' Settlement at Saint Croix Island' (Maine Historical Society's publications, Portland 1905).

**MONTERRAT, moint-sê-r-par', Spain**, a deeply eroded mountain 4,070 feet high in the province of Catalunya, 30 miles northwest of Barcelona, famous for its ancient Benedictine monastery, composed, in part, of 13 hermitages, accessible only by steps hewn out of the steep rock, and founded by Sifredo de Vellaso, count of Barcelona, on the spot where a miracle-working image of the Virgin Mary was found in the 9th century. It was enlarged and richly endowed by Philip II. Learned Benedictines had established themselves here as early as 976; and successors formed a large library, which was destroyed when the monastery was pillaged by the French and partly destroyed in 1811. After the restoration of Ferdinand VII the rebuilding of the monastery was begun, but was stopped when the monks were expelled by the Carlists in 1827. The monastery has fallen more and more into decay since the abolition of the order to which it belonged. While living in this monastery Ignatius of Loyola (q.v.) conceived the idea of founding the order of Jesuits. According to legend Montserrat was the site of the castle of the Holy Grail.

**MONTERRAT, moint-sê-r-par', West Indies, a British island of the Leeward group, almost at the same distance (about 30 miles) from the islands of Nevis, Antigua and Guadeloupe. It is 32 square miles in extent, nearly two-thirds of which is mountainous and barren. Its culminating point is the Soufrière, a volcano 3,000 feet high. The climate is healthful. The principal exports are sugar, molasses, tamarinds and lime-juice, and the principal imports, cottons and clothing materials, hardware and other manufactures. Revenue (1915-16), £10,722; expenditure, £1,909; imports, £33,686; exports, £43,141. The government of the island is vested in the governor-in-chief of the Leeward Islands, who is represented by a commissioner, assisted by a nominated executive and legislative council. Plymouth, the capital (pop. 1,500), is on the southeast coast of the island. The island was discovered by Columbus and was colonized by the British in 1632. It was twice in the hands of the French, but since 1783 has been uninterrupted possessed by the British. Pop. 12,215, of whom not more than 200 are whites.

**MONTT, moint, Jorge**, Chilian sailor and politician: b. Santiago, Chile, 1846. He was a son of the Chilian statesman Manuel Montt (q.v.) and early entered the navy, where he had gained the rank of captain when in 1890 he led an uprising against President Balmaceda, which threatened to overthrown him. When the revolution broke out in 1891 Montt was given command of the naval and land forces subject to the control of Congress, and after the suicide of President Balmaceda was appointed provisional President and in November 1891 was elected to the office. His moderate and conciliatory administration did much to heal the wounds of war; he reformed the currency, reorganized the navy and army and made the municipalities locally autonomous.

**MONTT, Manuel**, Chilian statesman: b. Petorca, Chile, 5 Sept. 1809; d. Santiago, Chile, 20 Sept. 1880. He was graduated from the National Institute in Santiago and was engaged as instructor there until he entered upon his political career. As assistant secretary of state he sternly suppressed the revolt of 1837, and in 1838 was made a judge of the Supreme Court. His election to the chamber of deputies followed and he was for a time president of that body. He was Minister of Justice 1841-43 and of the Interior 1846-48, was elected President in 1851 and under his firm, conservative policy a succession of revolts were crushed, many industrial improvements were introduced and the laws reorganized and codified. After the expiration of his term of office he resigned his office to his successor and assumed the presidency of the Supreme Court. He was president of the American Congress which met in Lima in 1865.

MONTYON PRIZES — MONUMENTS

MONUMENTA GERMANICA HISTORICA, a great historical work dealing with the monuments and antiquities of Germany, the first volume of which was published in 1828. It was begun in 1819 and later was placed under the direction of the Prussian Academy of Sciences. In 1914 upward of 114 volumes had been issued.

MONUMENTAL INTERIOR DECORATION. See Interior Decoration.

MONUMENTS. The term monument is applied to structures which are characteristic or remarkable on account of their being erected as memorials, and also, though loosely, to those buildings which express some form of worship, or have peculiar prominence on account of their beauty, proportion or grandeur. In modern times, churches are often erected as memorials to individuals, and yet the term monument is not applied to them except in the vague general sense named above. It is evident, therefore, that such buildings may be commemorative monuments as well as architectural. So-called sepulchral monuments are the memorials most commonly erected. In Egypt, pyramids are monumental on account of their size, showing very little of so-called architectural art. There are about 100 of these, each containing a room which was used as a royal sepulchre. The Great Pyramid built by Khufu, called by the Greeks, Cheops, about 250 a.c., measures 764 feet square at its base and is 482 feet high. As Saint Peter's, at Rome, is about 15 feet in height, it could be covered by the shell of this pyramid. In Assyria and Chaldea there are few temples and no tombs remaining of sufficient architectural importance to be classed as monuments. Important buildings in these countries were piled on huge mounds of the material of the surrounding country, but as these structures were mainly of unbaked bricks, they have fallen into shapeless mounds.

The earliest existing Greek monuments are found at Mycenae and Tiryns. The Lion Gate at Mycenae shows two large lions rampant on each side of a column, carved in bas-relief above the lintel; and this sculpture is wholly monumental in character, related both to religious and dynastic associations. The gateway at Mycenae is one of the earliest of porches or towers of entrance which were among the chief monuments of Greek art; these were the Propylaea of which the most important was that of the Acropolis of Athens, with the small Ionic temple of Nike Apteros close by. The choragic monument erected by Lysicrates to commemorate his choral victory may still be seen at Athens. This was built at the time of Alexander's conquest, when Athens was declining and Asia Minor was being filled with magnificent temples of the Corinthian order. Other choragic monuments still exist at Athens in a partly ruined condition. The Tower of Winds, or Clepsydra of Andronicus, was erected at Athens about 100 B.C., but this was rather a utilitarian structure, as it served as a measure of time. Other Greek monuments were the Arch of Hadrian, of the later Roman period; entrances to other temple sites, similar to the Propylaea of the Acropolis, as that of Eleusis; theatres, colonnades, stadia and gymnasia. Greek tombs that remain at the present time are nearly all to be found in Asia Minor, the best known being the Mausoleum at Halicarnassus. The small Greek monuments and tombstones are very simple and refined in detail. Of the same epoch are the rock-cut tombs of Asia Minor. Some of these are of great beauty, the exterior face of the living rock having been smoothed and made vertical, and adorned with magnificent bas-reliefs of very large size.

The principal Roman monuments were on a large scale, the rough work being executed by cheap labor, soldiers, barbarians or slaves. The Roman Forum was crowded with temples, arches and individual memorials. Arches were characteristic products of Roman civilization and were generally erected in honor of some victorious general or in commemoration of some great event. Columns were also frequently erected. The column of Trajan is still standing in Rome. It is 133 feet high and has a spiral line of figures in relief from the foot to the top of the shaft, showing the ten Roman campaigns. There is a staircase within the column leading to the top. The sepulchral monuments of the Romans were generally small. One of the larger ones was the circular tomb of Hadrian, now the castle of San Angelo. Small sepulchral monuments lined the sides of Roman roads for miles outside the city. Many have been found at Pompeii. The tomb of Caecilia Metella, a characteristic example, was built by Crassus, about 60 B.c. It was circular in plan, with a square base.

Early Christian architecture, developing after the fall of Rome, used or copied Roman buildings. At Ravenna interesting monuments of this period were the tomb of Galla Placidia, built in the middle of the 5th century, and the tomb of Theodoric, erected early in the 6th century, a two-story structure, roofed by a single stone 36 feet in diameter. Basilicas commemorating scenes in the life of Christ were erected as early as the 4th century in Syria, at Bethlehem, at the sepulchre near Jerusalem and on the site of the temple.

The principal monumental buildings of the Byzantine period were in Syria, where from the
MONVEL—MOODY

4th to the 8th century what we call Syrian architecture was in full luxuriance. The noble tombs, together with the churches and villas built of the same material, rather Greco-Syrian than strictly Byzantine in construction and design. Romanesque architecture in western Europe has not left us many monuments of great size and importance, but some tombs of great beauty remain in the churches of England, France and Germany.

Prominent monuments of the Gothic period were erected in the cathedrals at Paris, Chartres, Rouen, Amiens, Rheims and in the Sainte Chapelle, Paris. In England, early English Gothic is well shown in the crowd of altar-tombs, some of them with canopies, which are found in the churches, especially in Westminster Abbey. Memorial chapels were also built of great richness and splendor. A good example of the decorative period is to be found in Henry VII’s chapel at Westminster. Italian Gothic monuments include many of the wall-tombs in the cathedrals at Florence, Sienna and Milan.

The Renaissance is represented by the Florintine wall-tombs of Santa Croce and the Venetian ones of the churches of Saints Giovanni e Paolo, the Frari and many others. The principal monument of Saracen architecture in India is the Taj Mahal in India, built in the middle of the 16th century, but the tombs of the caliphs near Cairo are equally fine as architecture, however inferior in cost and splendor.

In the 19th century, a list of monuments should certainly include the triumphal arches of the French empire, the arc of the Carrousel and the Arc de l’Etoile, the Pantheon, the Madeleine, the Colonne Juliet; the Siegesthor in Munich and the Brandenburger Tor in Berlin; in America, the tomb of General Grant in New York, the many Lincoln and Washington monuments in different cities, and a host of statues, some equestrian, for which see SCULPTURE.

Biography.—Bartlett, ‘About Monuments’ (1878); Bartoli, ‘Veteres arcys Avgstorum triumphi insignes ex religiis qvae Romae adhuc supvrscnt’ (1824); Benvenuti, ‘Monumenti sepolcrali della Toscana’ (1819); Boussard, ‘Etudes sur lart funerarie moderne dans ses conceptions les plus praetiques, chapelettes, sarcophages, etc.’ (1870); Brindley, ‘Ancient Sepulchral Monuments to the End of the 18th Century’; Chancellor, ‘Ancient Sepulchral Monuments of Essex’ (1890); Clochar, ‘Monuments et tombeaux mesure et dessins en Italie’; Conze, ‘Die attischen Grabreliefs’ (1890–92); Gardner, ‘Sculptured Tombs of Hellass’ (1896); King, ‘Roman Sculpture’ (1907); Macklin, ‘Monumental Bronzes’ (1890); Tatham, ‘Etchings of Grecian and Roman Architectural Ornament’ (1826); Thompson, S., ‘Sepulchral Monuments of Italy’ (1883); Walters, ‘Art of the Greeks’ (1906); id., ‘Art of the Romans’ (1911); Ware, ‘The Memorial Hall of Harvard University’ (1887); Wasmuth, ‘Monumente und Standbilder’ (1891–1901).

MONVEL, Louis Maurice Boutet de, loo-ë mō-rēz boo-tā dē mōn-vēl, French painter and illustrator: b. Orleans, 1850; d. 16 March 1913. He studied with Rudder, Cabanal and Carolus Duran, with the last, after some work in the Atelier Julien. His first important exhibited in the Salon appeared in 1874. He prefers the decorative to the realistic effect in color and modeling. The illustrations which he made for the ‘Life of Jeanne d’Arc’ (1897) in the Century Magazine are supremely successful both in line and color. In the memorial Church at Domrémy he has painted six panels illustrating the career of La Pucelle. Among his best-known pictures is ‘The Apotheosis’ (1885) and his portraits are famous.

MONYPENNY, William Flavelle, English journalist: b. 1866; d. 23 Nov. 1912. He joined the staff of the London Times in 1893, and in 1899, shortly before the outbreak of the South African War, became editor of the Johannesburg Star. Under his direction the Star had strongly advocated the cause of the Uitlanders against the Kruger regime. The latter ordered his arrest, but Monypenny escaped in female garb and joined the Imperial Light Horse. He went through the siege of Ladysmith and after the war returned to his editorial duties in Johannesburg. He disapproved of the Chinese Labor Ordinance and, returning to England in 1903, he was there appointed to write the authoritative ‘Life’ of Disraeli, but died before the work was completed. It was carried on by Mr. George E. Buckle, retired editor of The Times.

MONZA, mōn’za, Italy; a town of Lombardy, in the province of Milan, 11 miles by rail northeast of Milan, on the Lambro. The town is of great antiquity and has a quiet, venerable air. The most remarkable edifice is the cathedral of Saint John the Baptist, originally founded at the end of the 6th century, by the celebrated Lombard queen, Theodolinda, but subsequently renovated and enlarged. It contains the iron crown of Lombardy, which according to tradition was beaten out of one of the nails used at the Crucifixion and which was restored to the Italians by Austria in October 1866, as well as various other relics and some valuable art treasures. There is also an old imperial palace surrounded by a large and well-laid-out park. It has been a residence and the place of coronation of the kings of Lombardy for 900 years. Here, while on a visit, King Humbert of Italy was assassinated 29 July 1900. It has a technical school, a lyceum and gymnasium and there are manufactures of silk, hats, leather, bricks, tiles and sausages, for which the town has long been famous. Pop. 53,214.

MONZONITE. An igneous rock of granular texture often quartzose and said to contain "calcite" which closely resembles. In mineral composition, however, it is intermediate between syenite and diorite; both alkali feldspars (or orthoclase) and lime-soda feldspar (or plagioclase) being present in approximately equal amounts.

MOODY, Agnes Mary (Clapson), American biologist: b. Bristol, England, 1 Jan. 1870. She graduated (1892) at Bucknell College, Akron, Ohio, then studied at Cornell, taking the degree M.S. in 1894 and obtaining (1896) the degree of Ph.D. at the University of Chicago. She taught two years at Westfield College and two years at Cornell, being the first woman to teach in laboratory and recitation courses required of all students. She assisted her father
at Throop Polytechnic Institute, taking charge of the department on his death (1903). She wrote Embryology of Anurida Maritima, which appeared in the Journal of Morphology (1898).

MOODY, Dwight Lyman, American evangelist: b. Northfield, Mass., 5 Feb. 1837; d. there, 22 Dec. 1899. He worked for a time on a farm, then went to Boston as a salesman in a shoe store, and while there became a member of a Congregational church. He later obtained a position in a shoe store in Chicago and there began his active religious work in the Sunday school by forming a class of poor boys; from this beginning he built up a large Sunday school and after 1880 devoted himself entirely to religious work. During the Civil War he worked among the soldiers in the employ of the Christian Commission and at the close of the war resumed his mission work in Chicago, becoming president of the Young Men's Christian Association in 1865. A large church was built for his work, and he became pastor, though not regularly ordained. In 1870 he was joined by Ira D. Sankey, the singer, and in 1873 the two visited England and Scotland, where, in spite of their American methods, they were the instruments in a great religious awakening that had not been paralleled since the days of Whitefield and Wesley. On their return large meetings were held in New York, Brooklyn and Philadelphia, and subsequently in many cities throughout the United States, at which it is estimated Mr. Moody addressed over 50,000,000 people. Without abandoning entirely his evangelistic tours, he made Northfield his headquarters and established there a girls' academy (1879) and a training school for religious workers, and at Mount Hermon a boys' academy. Later he founded a school for Bible study in Chicago; and inaugurated the custom of holding, at Northfield, summer conferences of college students and missionary volunteers, and the annual meetings of the Young Men's and Young Women's Christian associations. He also established systematic preaching and distribution of religious literature among inmates of the prisons; and built up at Chicago and Northfield establishments for the publishing of inexpensive religious books. His marked executive ability won him the confidence of men of wealth, who gave generously to his enterprises. Though a Bible student, he was not a theologian and did not understand the methods of Higher Criticism; he was primarily a preacher of the Word of God as he believed it. The power of his preaching was due to his strong personality, his simplicity of thought and language, and his thorough sincerity and earnestness. In conjunction with his colleague, Mr. Sankey, he surrendered the great profits on their 'Sacred Songs and Solos' to public purposes. He published 'How to Study the Bible'; 'Men of the Bible'; 'Weighed and Wanting'; 'Arrows and Anecdotes' (1877); 'The Way and the World' (1887); 'The Sundry Cowen' (1890); 'Secret Power' (1881); 'The Way to God' (1884); and 'Bible Characters' (1888). Consult Drummond, Impressions of Dwight L. Moody; Hartzler, 'Moody in Chicago'; Moody, W. L., 'Life of D. L. Moody' (1900); and Moody, P. D. and Fitt, A. P., 'Shorter Life of D. L. Moody.'

MOODY, James, American soldier: b. New Jersey, 1744; d. Sissibou, Nova Scotia, 3 April 1809. He was a New Jersey farmer at the outbreak of the American Revolution, but 73 of his neighbors joined the British forces and was active in attacks upon his former friends. He was daring and unscrupulous in his movements and succeeded, in 1781, in seizing important despatches of Washington's; he was captured and imprisoned in West-Point, but made his escape. Though unsuccessful in many instances, his knowledge of the country enabled him to make his escape after his expeditions as a spy and his name was regarded with fear in the region in which he worked. He went to England after the war, and then to Canada where he was presented with an estate and received half-pay as colonel of the militia during the remainder of his life. His adventures are recorded in his 'Lieutenant James Moody's Narrative of his Exertions and Sufferings in the Cause of Government since the Year 1776' (1783).

MOODY, John, American financial writer: b. Jersey City, N. J., 2 May 1868. He was engaged in newspaper work until 1890, then entered the service of Spencer Trask and Company, bankers, rising from office boy to manager (1890-1900). He founded (1900) Moody's Manual of Railroads and Utilities and was its editor till 1907. In 1905 he founded Moody's Magazine, an investor's monthly, and (1909) Moody's Analysis of Investments, both of which he edited. He also wrote 'The Truth about Real Estate' (1906); 'The Art of Wall Street Investing' (1906); 'The Investor's Primer' (1907); 'Masters of Capital in America' (1911); 'How to Invest Money Wisely' (1912).

MOODY, William Henry, American lawyer and politician: b. Newbury, Mass., 23 Dec. 1853; d. 2 July 1917. He was graduated from Harvard in 1876; studied law and began the practice of his profession in Haverhill, Mass. He quickly attained success as a lawyer, was city solicitor for a time, and from 1890 to 1895 district attorney for the eastern district of Massachusetts. In this position he showed himself an active, tireless prosecuting attorney, and became the only in the case of certain aldermen of the city of Lawrence whom he brought to punishment for receiving bribes; he was also associated with the Massachusetts attorney-general as prosecuting attorney in the trial of Lizzie Borden for the murder of her parents. In 1895 he was unanimously nominated for Congress by the Republicans, to fill a vacancy; he was elected at that time and also to the three succeeding Congresses. Through close study of the rules of the House he became distinguished as a parliamentarian and was suggested as a possible candidate for speaker; he was a most active and efficient member of the committee on appropriations and regularly had charge of the Appropriations Bill, which he examined in detail; he was also appointed to a committee on miscellaneous affairs and through his work on both these committees gained special knowledge of naval matters. In 1902 he was appointed Secretary of the Navy to succeed John D. Long (q.v.), in which capacity he remained until 1906, when Attorney-General and on 17 Dec. 1906 became an

2 General Map of the Full Moon, showing the location of the Craters and of the Maria (as seen by the naked eye)
associate justice of the Supreme Court of the United States, resigning in ill-health in 1910.

**MOODY, William Vaughan**, American poet; b. Spencer, Ind., 3 July 1869; d. 17 Oct. 1910. He was graduated from Harvard in 1893, where he was for a time an instructor in English and afterward an assistant professor in English literature in the University of Chicago. He published *The Masque of Judgment* (1898); *Pins and Needles* (1900); and, with R. R. Lovett, a *History of English Literature* (1902); *The Fire Bringer* (1904); and the dramas, *The Great Divide* and *The Faith Healer* (1899). His verse is well wrought, not infrequently rising to a sustained high level as in his *Ode in Time of Hesitation.* See FAITH HEALER, THE; GREAT DIVIDE, THE.

**MOON, William**, English philanthropist; b. Horsemorden, Kent, 1818; d. England, 1894. He was educated for the Church but was compelled to abandon this career upon becoming totally blind. He devoted his life to establishing schools and educational helps for blind children and invented a new and simple system of embossed letters for the use of the blind. He established libraries of his books in Europe and United States and greatly furthered the cause of home instruction. Concluded Rutherford, *William Moon and His Work for the Blind* (1898).

**MOON, The**, from the earliest times, has been the chief object in the sky to attract the attention of the human race. The continual change in its appearance from day to day, its value as a light giver at night, the apparent irregularity of its motions, the curious markings on its face, its connection with the ebb and flow of the ocean, and many a real or supposed influence in terrestrial affairs, have always caused it to be a subject of speculation and inquiry among philosophers of every age. Yet it is only within the last 300 years that the various theories and superstitions connected with it have been put to the test, and that order has been evolved from the chaos of facts and fancy. Even at the present time many a belief, tested by science and found wanting, finds support in otherwise enlightened communities.

**Size, Weight, etc.**—The moon is a nearly spherical body with a diameter of 2,163 miles, a little more than a quarter of that of the earth, moving at an average distance from the earth of 239,000 miles. Its surface is therefore 1/6 that of the earth. It is, however, less dense in the ratio of 10 to 16, or, on the average, its density is the same as that of the rocks on the earth’s surface, so that it would require the materials contained in 81 moons to form our globe. Its smaller size and mass cause gravity at the surface to be only 1/6 of the terrestrial attraction: the same exertion which would lift a given weight here would raise a weight six times as great there, and a body, instead of falling 16 feet in the first second, would fall only 23/5 feet. It moves so as to always turn the same face to the earth and therefore rotates on its axis at the same time that it takes to go around the earth—27 days. The rotation of the moon about its axis and its motion round the earth is neither quite uniform or circular, as will be seen later; consequently extra portions of the eastern and western faces come successively into view. Further, the moon’s axis is not quite perpendicular to the plane of its orbit, so that the north and south limbs are in turn a little closer to the earth. These motions are called the librations of the moon, and they permit us to see rather more than half (about three-fifths) of the surface.

**Light and Atmosphere.**—Like the earth, the moon possesses no light of its own, but receives all from the sun, and its day—the interval from sunrise to sunrise—is a month. At full moon it sends to us about one 600,000th part of that given by the midday sun. The surface is not nearly so white as its concentrated light would seem to indicate; its brightest portions are nearly of the shade of salt and its darkest that of slate, the average being the color of gray weathered sandstone. The long sunshine for two weeks and the absence of sun for the following two weeks must cause immense variations of temperature. But Professor Langley of Washington estimates that the temperature of the surface, even at the hottest, probably never rises above the freezing point of water; the heat is radiated out nearly as fast as it is received. In summer, the surface temperature must fall to something like 200° below zero. In spite of this small amount of heat, Professor Langley, by inventing a very sensitive instrument called a bolometer which would detect the heat from a candle a mile away, succeeded in detecting heat rays coming from the moon. His results depend partly on the many fruitless attempts which have been made to find evidences of the existence of an atmosphere. If air is present its pressure cannot exceed 1-750 that at the earth’s surface and is probably much less, as no refraction has ever been observed when the moon’s limb passes over a star. A similar argument applies to the existence of water in any quantity, and no clouds have been certainly seen. It is possible that water—probably in the form of ice—may exist at the bottom of some of the deeper craters, but the low temperature would scarcely permit it to be liquefied even when the sun was shining full on it.

**Surface Marks.**—The well-known resemblance of the full moon to a human face disappears almost immediately if a glass—even the smallest opera glass—is trained on to it. When it is looked at through a moderately large telescope, the surface is seen to be broken up into mountain ranges and valleys as well as darker portions, which seem to be comparatively flat. A closer inspection made at more favorable times when the moon is not full so that the shadows cast by the sun can be well discerned puts these features clearly into view. The magnificent telescope in the Lick Observatory in California brings the satellite so near that objects which might be seen with the naked eye if the moon were only 100 miles distant, can be distinguished on the surface under favorable circumstances.

**Craters.**—The most marked feature of the lunar surface is the number of craters which appear in almost every region. These are circular rings with diameters ranging from a mile to 100 miles, and with exterior walls sometimes as high as 20,000 feet—formations comparatively rare on the earth’s surface where they seldom exceed a diameter of a very few miles with much lower walls. In some parts they are scattered in the wildest profusion,
overlapping one another, smaller ones breaking into the walls of the larger and so crowded together that it is difficult to distinguish Fauna from one another. In many cases there is a central cone or a group of peaks which often rise as high as the walls of the ring and on which small craters can sometimes be seen. There are also lofty ranges of mountains, ten to fifteen thousand feet high, some peaks of the Lunar Apennines rising to 20,000 feet.

**Seas.**—The so-called seas of the moon are simply portions of the surface darker in color than the average and very much less broken up by craters. These are mountain ranges. They form the main features of the face seen at full moon. They are crossed by thin lines known as rills or clefts which run in all directions, sometimes straight and unbroken for hundreds of miles, even intersecting ranges of mountains and craters and reappearing on the other side. These rills are generally two and rarely exceed 10 miles in width, their depth varying from 100 yards up. A curious feature of a different kind is an absolutely straight cut made in the great Alpine valley—some 83 miles long. This cuts across a range of mountains and runs under low magnification looks as if some wandering celestial body had grazed the surface.

**White Rays.**—The most puzzling feature of the surface consists in a series of white rays or streaks which radiate from a few of the principal craters in every direction. In their brightness they mask all other shades of tint on the surface and seem to continue their course, sometimes for hundreds of miles, quite independently of the nature of the country they cross. Every one who has studied the systems carefully, considers that their actual length has been much exaggerated and believes that the apparent length is due to lines of small craters from which they emerge. The most remarkable system is that starting from the crater Copernicus, itself a brilliant whiteness, and giving the whole region the appearance of a globe cracked by internal pressure—a suggestion made by Nasmyth who actually cracked a glass globe in this way and obtained a striking resemblance.

**Fossa.**—The origin of these various formations has been the object of much speculation. That the craters and mountain ranges came into existence after the cooling down of the outer crust and were produced by its contraction and by the enormous tidal disturbances caused by the earth seems a sufficiently probable hypothesis. Objection has been raised to this view on account of the fact that terrestrial volcanoes all show the presence of large quantities of water and that the earth has comparatively few of such formations. But the weathering action has undoubtedly had little effect on the moon's surface, while it has been a powerful factor in eliminating such features on the earth. Another theory, that the craters are of the nature of cracked bubbles like those which appear in cooling slag which contains gas, does not require the presence of water, but it has not met with any general acceptance. The rills or clefts are unexplained; some astronomers incline to the idea that they are dried watercourses, others with greater probability that they are fissures produced in cooling. The white streaks or rays are considered by Monsieurs Loewy and Puiseux, whose work on the moon accompanies a big atlas of photographs taken lately at Paris, to be formed of volcanic dust or cinders shot out from the craters and carried for considerable distances by currents of air before being deposited on the ground. Prof. W. H. Pickering inclines to the same theory. The rays were the last evidences of activity before the body of the moon became cold and absorbed the small quantities of air and water which at one time were present outside.

**Surface Changes.**—The evidence as to changes in the moon's surface since the first careful observation of them by Galileo about two centuries ago is doubtful. One crater, Linné, observed by Beer and Mädler, is given as having a diameter of about six miles. At various times it seems to have appeared and disappeared again—possibly owing to the different circumstances under which it was seen; at present it is scarcely visible. In the absence of air and water such changes must be very rare, the weathering action which takes place on the earth having little or no effect; possibly the enormous differences of temperature every two weeks may in time cause a breaking up of the rock.

**Photographs.**—The photography of the moon's surface was started by Draper and Bond in America about the middle of the 19th century. The pictures of the latter were shown at the London Exhibition in 1851 and inspired De la Rue in England and others as to its possibilities for the accurate investigation of the lunar surface. The magnificent photographs of Rutherfurd made in New York and published in 1873 have been surpassed by those taken at the Lick, Yerkes and Paris observatories. It is possible that photographs taken 20 or more years from now may, on comparison with these, enable astronomers to detect changes if such occur. The varying aspects of the moon will make this difficult; but the personal element, always present when drawings have to be made, will at any rate be eliminated. At the same time the eye can detect minute details which are absent from photographs.

**Periods.**—The average time occupied by the moon, including its orbit round the earth, is 27d. 7h. 43m., its sidereal period. The synodic period is the interval between successive new moons and it is a little longer owing to the time, 365 1/4 days, occupied by the earth in moving round the sun. The moon performs 1/27 1/4 of its orbit and the earth 1/365 1/4 each day, and therefore the difference between these 1/27 1/4 - 1/365 1/4 = 1/29 1/4 is the daily fraction of its path which the moon describes with respect to the sun; that is, 29 1/4 days (29d. 12h. 44m.) is the synodic period. If the plane of the moon's orbit coincided with that of the earth's equator, the moon would rise about 50 minutes later each day, but the inclination of these planes to one another varies between 18° and 29°, so that this retardation is quite different at different times. When full moon occurs on or near an equinox, it may, in the latitude of New York, be as small as 23 minutes, while further north it may reduce to nothing, so that for several nights the full moon rises about the same time, soon after sunset. The feature is known as the harvest moon and in countries where the autumn weather is very uncertain, it is a valu-

able help to the farmers, furnishing them with light to get in their crops after the setting of the sun. The Hunter's moon is the next full moon after the harvest moon; the same phenomenon, less marked, occurs. The anomalistic month, a little over 27½ days, is the interval between the times when the moon is in its perigee, that is, when it is nearest the earth. Moon's Path.—The shape of the moon's path is approximately an ellipse whose two axes are nearly of equal length, but an ellipse will only represent its orbit for a very short time. In order to give an idea of its complicated motions, a model, on a scale of 1:125,000,000, can be constructed as follows: The first part, to represent the motion of the earth, consists of a rail on raised supports which (are movable) in the shape of an ellipse whose semiaxes are respectively 390 feet in length, 900 feet 3 inches long and whose plane shall for convenience take to be horizontal. The earth is represented by a carriage moving on this rail and the sun by a ball placed on the longest diameter, distance 6 feet 7 inches from the center of the bar. The carriage may be thought of as attached by a bar and socket joint at a point ¾ inch from the center of the bar. The bar forms the longest diameter of an elastic tube in the shape of an ellipse and the tube is so attached to the bar that it may change its size and shape slightly. The plane of the tube is to be inclined about 5° to the horizontal. A bead sliding freely within the tube represents the moon. Motion.—Now let the carriage run along the rail not quite uniformly but so that its angular velocity about the ball representing the sun varies inversely as the square of its distance from the ball, and it makes it a complete circuit once in 365¼ days. At the same time the plane of the tube attached to the carriage is to turn round slowly in the opposite direction, so that the horizontal line in it (that formed by the intersection of the plane of the tube with the horizontal plane and called the line of nodes) will describe a circuit once in 184½ years; the inclination of the tube to the horizontal, not more than 5° on either side of the mean inclination of 5° 8′ to the horizontal. With these motions, the bar carrying the tube is to slowly turn round in its own plane in a forward direction so as to complete a circuit once in about nine years, and the tube is to slightly change its shape and size to and fro as it moves, finally, the bead representing the moon moves according to the same law and in the same direction as the carriage, that is, not quite uniformly but so that its angular velocity about the joint varies inversely as the square of its distance from the joint; its circuit in the tube is completed once in 27,5546 days — the anomalistic period. These various motions, complicated as they are, only give a general idea of the way in which the moon moves, but the model is sufficient to explain most of the phenomena connected with the moon's motion. All the parts are in a state of oscillation about their average positions, the periods varying from a few days to many thousands. Even the plane, size, shape and position of the rail are not quite constant but vary slowly from year to year. The attempt to disentangle even the principal oscillations had become an almost hopeless task until Isaac Newton in the 17th century was able to reduce them all to manifestations of a single law known as the law of gravitation. This law states that every two particles of matter in the solar system attract one another with a force which is proportional directly to the product of the masses and inversely to the square of the distance between them, that is, if either of the masses be doubled, the force is doubled, but if the distance be halved, the force is increased four-fold. From his time mathematicians have been engaged in working out the consequences of this law. If there are only two particles acting, they describe ellipses about one another, but if more than two act, the motion is so complicated that it taxes the mathematician to the utmost to determine it completely. The moon is attracted mainly by the earth, but it is much disturbed from its elliptic motion round the earth (that in the tube) by the pull of the sun (which mainly causes the motions of the tube), and to a small extent by that of the planets. Up to the last quarter of the 19th century this work was undertaken by European mathematicians, among whom may be mentioned Encke, de Pontecoulant, Hansen, Delaunay and Adams; the tables of Hansen, published in London in 1857, are still used, with a few corrections, for the places of the moon in the nautical almanacs of the present day. The greatest advance made during the last 30 years was started by Dr. George William Hill, who was for many years on the staff of the 'American Nautical Almanac' at Washington. His two papers published in 1877 opened a new era in the mathematics of astronomy and especially in that of the moon, and they have formed the basis of nearly all the progress which has since been made in all departments of celestial mechanics. His name, though fully known to astronomers all over the world, is less familiar to the public, on account of the highly mathematical nature of his work. In a different part of the subject, the work of Professor Newcomb is not less valuable, comprising as it does, difficult and laborious investigations into the sufficiency of Newton's law for the explanation of the detail of the moon's motion, and involving researches into ancient records of eclipses of the sun. A new theory of the moon's motion, leading to the formation of new tables, has now been nearly completed by E. W. Brown on the basis of Dr. Hill's work. Brown has shown that Newton's law of gravitation will account for the motion of the perigee of the moon within 1 part in 1 per cent. Secular Acceleration.—In illustration of the great accuracy with which calculations and observations may be compared at the present time, may be mentioned what is known as the secular acceleration. Observation shows that at the end of each century the average time of revolution of the moon round the earth is 2 seconds less than it was at the beginning. Newton's law shows that a slight change in the shape of the earth's orbit (that is in the shape of the rail above) due to the attractions of the planets will account for ¾ of this amount; the other ⅔ are still unexplained. This means that astronomers are searching for the cause of a monthly change of less than 1/1000 of a second in the length of the month. Phases.—The phases of the moon arise from the combined motion of the earth and moon. To resume our mechanical model, imagine the
tube to be transparent and the ball an electric light. When the bead is furthest from the ball, the side of the bead facing the carriage is illuminated and this corresponds to full moon. As the bead moves round the tube a spectator on the carriage sees less and less of the illuminated half; the bead then passes through its third and last quarters until it is at its nearest to the ball and almost invisible. Still progressing, its illuminated half begins to be visible from the other side (new moon) and passing on to its first and second quarters its illuminated half is again fully visible.

**Eclipses.**—An eclipse of the moon takes place whenever the earth gets between the moon and the sun, cutting off the light of the latter from the moon, an eclipse of the sun when the moon gets between the earth and the sun. (See Eclipse.) It so happens that the apparent size of the moon as seen from the earth is very nearly equal to that of the sun. Owing to the varying distance of the moon and sun from the earth, sometimes the moon, as seen from a certain part of the earth, is between the sun and the earth, sun for a time which may be as long as eight minutes, and we have a total eclipse; at other times it fails to cover it and we get a partial eclipse or, if its centre passes across the sun's center, a ring. A lunar eclipse is seen over only a narrow band of the earth's surface. From our mechanical illustration it is evident that an eclipse of the moon can occur only at full moon, and one of the sun just before new moon. If the plane of the tides were horizontal there would be eclipses of both moon and sun every revolution of the moon, that is, once a month; actually, it is only when the bead is very near the horizontal plane (or near the line of nodes) at the time when it is nearest or furthest from the ball, that the event can take place. A complete cycle of eclipses will evidently occur each time the line of nodes completes a circuit—once in about 18 years. This is known as a lunar cycle and during that period there will be on the average 41 revolutions of the equinox and 20 of the apogee.

**Tides.**—Besides the indirect effect of the moon as a light-giver on the earth the most important influence it exerts is that which causes the tides. (See Tides.) These have in their turn a slight reactionary effect on the motion of the moon as we shall see presently. Some slight traces of lunar effect are also observable in the variations of the earth's magnetism. But the most widespread idea with regard to lunar influence is its supposed connection with the changes in the weather. Many an old saying exists, handed down the ages, giving a rule for prophesying the weather by its condition at certain phases of the moon. Since the time when careful daily records have been kept of the temperature, height of the barometer, rainfall, etc., science has been employed in examining whether any kind of period can be traced in them and especially periods connected with the moon's changes. Little positive success has attended these efforts, but there is plenty of evidence of connection. Every attempt to connect a periodical change in the weather with one in the moon's motion has resulted in failure. Undoubtedly some slight connection of a tidal nature must exist, but it is very small and is entirely masked by variations of the weather due to unknown causes. A reason for the popular error is not far to seek. The weather changes, especially in countries lying within the temperate zone, follow one another at short and seemingly irregular intervals; the changes of the moon's phases occur also at short but regular intervals. Coincidences between the two must frequently occur, but humanity is apt to notice these and to forget the failures of coincidence which are just as numerous if not more so.

**Origin.**—The past and future history of our satellite has been the subject of interesting researches during the last 30 years. The chief influence in its life history is assigned by him to tidal action, an idea first broached in 1754 by the philosopher Emmanuel Kant. Imagining that the earth, unattended by any satellite, was in a molten condition—the most probable supposition in view of its nearly spherical form and the nature of its surface—Professor Darwin inquires under what conditions its rotation should be so rapid that, like a bursting mystically covered with a net, it should be thrown off. He finds that this would happen if the earth were rotating about its axis in something like two hours. He has also shown that pear-shaped and dumb-bell shaped forms will result from a rapid rotation and from the revolution of the sun in producing tides; the moon might have been evolved from such a figure by the thinning and breaking of the handle. The earth would then have a satellite revolving very close to its surface in the same time that the earth took to turn on its axis. Either of these hypotheses seems to be allowable.

**Past History.**—From this point, rigorous argument takes the place of speculation. The period of the satellite's revolution (a "month") begins to be slightly longer than that of the earth's rotation on its axis (a "day"). The moon raises tides on the earth and the friction of these, like a brake on a fly-wheel, gradually lengthens the day; the reactionary effect on the moon is to increase the length of the "month", also, but not to raise it to a "day". This goes on until the number of "days" in a "month" is 29. After this date the month and day still go on getting longer, but at different comparative rates, so that the number of days in a month diminishes until it reaches the present condition. The time in which all these changes have taken place must be reckoned in millions or tens of millions of years and though both bodies have grown cool and solid, the water on the earth's surface has in the later portion maintained the process at a slower rate. All this time the tidal friction has also had the effect of sending the moon further and further away from the earth.

**Future.**—In the future, the same processes will continue. The lengths of the month and that of the day will continue to increase, the latter overtaking the former until they are both over 1,300 hours or about 55 of our present days. Then, not only will the moon turn always the same face to the earth, but exactly as for the earth. Every attempt to connect a periodical change in the weather with one in the moon's motion has resulted in failure. Undoubtedly some slight connection of a tidal nature must exist, but it is very small and is entirely masked by variations of the weather due to unknown causes. A reason for the popular error is not far to seek. The weather changes, especially in countries lying within the temperate zone, follow one another at short and seemingly irregular intervals; the changes of the moon's phases occur also at short but regular intervals. Coincidences between the two must frequently occur, but humanity is apt to notice these and to forget the failures of coincidence which are just as numerous if not more so.
SURFACE OF THE MOON

1 The Crater of Copernicus

2 The Appenine Mountains and Crater of Archimedes
enormous. The friction of these tides passing over the surface of the moon then slowed down the rotation of the moon, until its axis until it was in a position where no more friction could act: that is, high tide on the moon was always at the same place on the moon and just under the earth. The axis of the moon in the direction of the earth must from this cause be a little longer than the earth's axis, though the difference has not been certainly observed.

Bibliography.—Besides the numerous textbooks on general astronomy, all of which contain information, readers may consult Nasmyth, 'The Moon' (2d ed. 1893); Neison, 'The Moon' (1873); Proctor, 'The Moon' (1876); the 'Lunar Theory' (1896) by the writer is a mathematical treatise on its motions. 'The Tides,' by Darwin, contains the latest theories concerning its past and future history. A new photographic atlas and description by Pickering has just appeared. The Lick and Paris observatories are also gathering materials for a complete description and charts of the surface.

Ernest W. Brown, Professor of Mathematics, Yale University.

MOON, Mountains of, the, Africa, a mythical chain of mountains designated by Ptolemy as containing the sources of the Nile and extending across the broadest part of Africa from Cape Guardafui, on the Indian Ocean, to the Bight of Benin, on the Atlantic. Modern exploration has proved that no such range exists, though there are numerous different mountain systems in that extensive region. The only mountains that can be looked upon as representing the ancient Mountains of the Moon lie in eastern Equatorial Africa. The highest of these are Mount Kilimanjaro, 19,200 feet high; Mount Kenya, which has an estimated elevation of 17,191 feet, and Ruwenzori, which is 16,816 feet in height.

MOON GODDESS. See Mythology, Moon and Nature.

MOONEY, James, American ethnologist, b. Richmond, Ind., 10 Feb. 1861. He was educated in the public schools and began his career as a teacher. In 1879 he engaged in journalism and in 1885 began his connection with the Bureau of American Ethnology, Washington, which he has continued ever since. He has conducted extended field investigations among the Indians of the South and West, notably the Cherokee; has prepared government Indian exhibits for Chicago, Nashville, Omaha and Saint Louis expositions and discovered the Cherokee ritual. He is a member of the American Anthropological Association, the Anthropological Society of Washington, the American Association for the Advancement of Science. He has published 'Sacred Formulas of the Cherokees' (Washington 1891); 'Siouan Tribes of the East' (Bull. 22, Bureau American Ethnology, Washington 1895); 'Ghost-dance Religion and the Sioux Outbreak of 1890' (ib. 1896); 'Calendar History of the Kiowa Indians' (ib. 1898); 'Myths of the Cherokee' (ib. 1900); 'Cheyenne Indians' (Lancaster 1907). He contributed Indian articles to various encyclopedias and also to the Therapeutic Gazette and Harper's Monthly.

MOONEYE, a fish of the small family Hypseleotidae, related to the herrings and sometimes called toothed herrings. They inhabit the rivers and lakes of the interior of North America, and are elegant, silvery, large-eyed fish, eight to 12 inches long, extraordinarily well supplied with teeth and voracious. They are eager biters and take indiscriminately the feathered lures, small spoons, grasshoppers, grubs and other natural baits. In Canada they afford much sport in fly-casting and repeatedly leap into the air when hooked, like trout. The principal species called mooneye is Hyodon tergisus; the more northerly one, called toothed herring and la quache (Canada), is H. alosoides. Neither is good for food.

The "Mooneye cisco" is a small whitefish (Argyrosomus hoyi), related to the lake herring. See Whitefishes.

MOONFISH, any of the compressed ovate highly silvery fishes of the family Carangidae, genera Selene and Pomer, including small tropical forms allied to the pompanos. One greenish species (Pomer sethania) is well known in New York Bay and markets as a panfish, sometimes called blunt-nosed shiner. More widely recognized is the look-down or horsehead (Selene vomer), which reaches a length of more than a foot, and is regarded almost as one of the best foodfishes; it also occurs along the western coast of Mexico and Central America, as do certain other species. It has a thoromboidal outline, with a hind-head greatly elevated, the line of the profile almost equal to the length of the body, and the dorsal and ventral fins prolonged into streamers. Consult Jordan and Evermann, 'Food and Game Fishes' (1902).

MOONGA, or MOOGHA. See Silkworks.

MOONLIGHT SONATA, a term used popularly in Germany and England for the Beethoven sonata quasi una fantasia in C minor (1802), dedicated to the "Damigella Contessa Giulietta Guicciardi." The term arose from the critic Reilisib speaking the first movement to a boat gliding by moonlight on Lake Lucerne. Vienna knows it as "Laubensoata."  

MOONSEED. See Sarsaparilla.

MOONSHINNER, a term applied in the United States, and especially in the southern and western States, to makers of illicit whisky and other spirituous liquors. Moonshine stills are frequently raided by the secret service officers. Of late years the business has been largely confined to the Tennessee and Kentucky mountain regions.

MOONSTONE. A translucent or transparent variety of the mineral feldspar (orthoclase, albite or labradorite) which exhibits a delicate pearly opalescent play of colors. Used as a gem.

MOONWORT, a popular name for a fern (Botrychium virginianum) of the natural order Ophioglossaceae, and also for various species of Lunaria of the natural order Crucifera. The former is the most popular of its genus, being readily grown in partial shade and with no special treatment; the latter are also readily cultivated under ordinary garden conditions and are popular because of their showy flowers, but more especially because of their large, flat pods which are used in winter decorations. One of their popular names, honesty, is sug-
suggested by the visibility of the seeds through the pods. *Lumaria annua*, especially its variegated variant *Lumaria annua* var. *variegata*, was an important species in different cultures and is still used today for its decorative value.

**MOORCROFT, William**, English veterinary surgeon and traveler: b. about 1765; d. Andehkhu, Afghanistan, 1825. He studied veterinary science in France, settled in London and made a fortune which he lost in patents, and then became a veterinary surgeon (1808) in the Bengal army. He crossed the Himalayas, explored (1811-12) the sources of the Sutlej and Indus rivers, explored (1819-22) Lahore and Kashmir, visited Bokhara in 1825 and died at Andehkhu, Afghanistan. Prof. H. H. Wilson edited and published his papers under the title 'Travels in the Himalayan Provinces of Hindostan and the Punjab from 1819 to 1825' (1841). He wrote also on veterinary surgery and made a translation of Vallis's 'Experiments in Animal Electricity' (1793).

**MOORE, Addison Webster**, American professor of philosophy: b. Plainfield, Ind., 30 July 1866. He was graduated at De Pauw University (1893-94) and obtained Ph.D. diploma (1896) at Chicago University. He served as instructor in English at Chicago, assistant in philosophy (1895-97), associate (1897-98), instructor (1898-1902), assistant professor (1900-02), associate professor (1900-09) and professor (1909). He was lecturing on philosophy at Harvard in 1918. Among his works are 'Theism and Its Critics' (1910); 'Existance, Meaning and Reality' (1903). He was president of the Western Philosophical Association in 1911 and of the American Philosophical Association in 1917 and associate author of 'Creative Intelligencie' (1916).

**MOORE, alfred, American jurist, son of maurice moore (q.v.): b. Brunswick County, N. C., 21 May 1755; d. 15 Oct. 1810. At 20 he became captain in a regiment of North Carolina troops, but was soon afterward obliged to resign in order to provide for his destitute relatives. When the British seized Wilmington, however, he raised a troop of volunteers, with whom he rendered great service to the American cause. In order to alleviate the distress to which his patriotism had reduced him, the General Assembly in 1782 made him attorney-general; and though he had not yet mastered the first rudiments of law, he soon attained, by hard study, a foremost rank in his profession, was raised to the bench in 1798 and became associate justice of the Supreme Court of the United States in 1799. He resigned in 1805.

**MOORE, Benjamin**, American Protestant Episcopal bishop: b. Newtown, L. I., 5 Nov. 1748; d. New York, 29 Feb. 1816. He was graduated at King's (now Columbia) College in 1768, studied theology and in May 1774 went to England to obtain orders and in June of the same year was ordained deacon and priest. On his return to New York he became an assistant minister of Trinity Church and succeeded to the rectorship in December, 1780. In 1801 he was appointed bishop of New York. He was also rector of Trinity Church and president and professor of logic in Columbia College. In 1811 an attack of paralysis rendered him incapable of further active duty.

**MOORE, Charles Herbert**, American professor of art: b. New York, 10 April 1840. He was educated at Harvard and was professor of art at that university from 1896 to 1909. He has published 'Examples of Elementary Practice in Delineation': 'The Development and Character of Gothic Architecture' (1889; enlarged ed., 1899), and 'Medieval Church Architecture of England' (1912). In the latter work, which has been widely read by students of architecture, he takes the position, earlier adopted by Viollet le Duc, that English Gothic is wholly a development from a French source, and that the progress of the art in England was always some years behind its French original. His warm advocacy of this view has excited some opposition among English critics.

**MOORE, Charles Leonard**, American poet and essayist: b. Philadelphia, Pa., 10 March 1854. He was educated in the public schools of his native city. In 1878-79 he was one of the managers of the Madeira and Mamore Railroad Construction Company and was United States consular agent at San Antonio, Brazil, the headquarters of that operation. He was afterward engaged in railroad construction in Pennsylvania, and for several years was one of the Disston Florida Sand companies for four years. For the last 20 years he has been occupied with literary work. He has been a constant contributor to *The Dial* during that time. He has published 'Atlantis' (1881); 'Poems Antique and Modern' (1883); 'Book of Day Dreams' (1887); 'Banquet of Palaces' (1889); 'Odes' (1896); 'Ghost of Rosaly' (1900); 'Red Branch Crests' (1904); 'Incense and Iconoclasim' (1915).

**MOORE, Clarence Bloomfield**, American archaeologist: b. Philadelphia, 14 Jan. 1852. He was graduated at Harvard (1873), then traveled through most of Europe, Asia and Egypt. He crossed the Andes and traveled down the Amazon (1876) and made a journey around the world (1878-79), to Egypt, the last 20 years has been exploring the Indian mounds of South Carolina, Georgia, Florida, Alabama, Mississippi and Louisiana. His many scientific writings have been mostly published by the Academy of Natural Sciences, of Philadelphia.

**MOORE, Clement Clarke**, American educator and poet: b. New York, 15 July 1779; d. Newport, R. I., 10 July 1863. He was a son of Benjamin Moore (q.v.); was graduated at Columbia College in 1798; in 1821 became professor of biblical learning at the General Theological Seminary, New York, and retired from that position in 1850. He gave to the seminary the ground on which it stands. A collection of 'Poems' which he published in 1844 included 'A Visit from Saint Nicholas', better known under another title—'Twas the Night Before Christmas'—which has long had great popularity with grown people as well as with children. Written in 1822 for his own children, these verses were printed anonymously and without Moore's name, first in the *Sentinel* 23 Dec. 1822. He also compiled a 'Hebrew and English Lexicon' (1809) and wrote 'George Castriot, Surnamed Scanderbeg, King of Albania' (1850). Consult Stedman, 'An American Anthology' (1900).

1866. He was graduated (1889) at Harvard University and received (1897) the Ph.D. diploma (1897) at the University of Munich. He was classical master (1889-1892) at Belmont School, California, professor of Greek (1892-94) at the Athenaeum Academy, Andover, Mass., assistant professor of Latin (1895-98) at the University of Chicago. From 1898 to 1905 he was assistant professor of Greek and Latin at Harvard and professor of Latin since 1905. He was professor of Latin (1905-06) at the American School of Classical Studies, Rome. He has been trustee for Philip's Academy since 1902. He wrote "Religious Thoughts of the Greeks" (1916); and numerous articles on his special subjects and edited Allen's "Medea" (1899) and Horace's "Odys and Epodes" (1902). In 1914 he received the degree of Litt.D. from Colorado College. Contributed to International Encyclopedia.

MOORE, David Hastings, American Methodist Episcopal bishop: b. Athens, Ohio, 4 Sept. 1838; d. Cincinnati, Ohio, 23 Nov. 1915. He was graduated from the Ohio University in 1860 and ordained to the ministry in that year, but entered the Federal army at the outbreak of the Civil War, remaining in it till the close of the war and attaining the rank of lieutenant-colonel. He was president of the Cincinnati Wesleyan College (1875-80) and of the Colorado Seminary, and chancellor of the University of Denver (1880-89). He was elected bishop in 1900 and had his episcopal residence during the three ensuing quadrennial periods in Shanghai, China, Portland, Ore., and Cincinnati, Ohio. He retired in 1912. He was a member of the General Conferences of 1888, 1892, 1896 and 1900, and of the North China Branch of the Royal Asiatic Society.

MOORE, Edward, English fabulist and dramatist: b. Abingdon, Berkshire, 1712; d. 1737. He was, by trade, a linen-draper but failed in business and took up literature. His first work was 'Fables for the Female Sex' (1744) and in 1748 his 'Trial of Selim the Persian' and 'The Foundling' were published. In doubt, some of his success in the literary world to such prominent patrons as George Lyttelton, 1st Baron Lyttelton, and Henry Pelham. His 'Gil Blas' was published in 1751 and 'The Gamester' in 1753, Garrick probably assisting him in the work. From 1753-57 he was editor of 'The World,' a satirical periodical. A collection of his works under title of 'Poems, Fables and Plays' was published in 1756.

MOORE, Edward, English Dante scholar: b. Cardiff, 1835; d. 2 Sept. 1916. He was educated at Pembroke College, Oxford, where he received high honors and became Honorary Fellow, and was principal of Saint Edmund Hall, 1864-1913 and a canon of Canterbury from 1903. His early research was on Aristotelie and his editions of the 'Ethics' and of the 'Poetics' are excepted. But he is much more favorably known for his studies of Dante, and published 'Time References in the Divina Commedia' (1887; revised, in Italian, 1900); 'Textual Criticism of the Divina Commedia' (1889); 'Dante and His Early Biographers' (1890); the 'Complete Dante' (complete in five volumes, 1894); and 'Studies in Dante' (3 series 1896, 1899, 1903).

MOORE, Edward Caldwell, American theologian: b. West Chester, Pa., 1 Sept. 1857. He was graduated (1877) at Marietta College, then at Union Theological Seminary (1894). He studied (1884-86) at the universities of Berlin, Göttingen and Greifswald, and (1891) the degree Ph.D. at Brown University. In 1884 he was ordained to the Presbyterian ministry and served as pastor at Yonkers, N. Y. (1886-89), and Central Congregational Church, Providence, R. I. (1889-90). He then became pastor of the church of the theology and Plummer professor of Christian morals at Harvard University (1901- ), and served as preacher to the university (1905-06). He lectured at Mansfield College, Oxford, England, in 1884 and 1913, at Andover Theological Seminary, 1900; Yale Divinity School, 1906; Lowell Institute, Boston, 1903. In 1909 he received the degree of D.D. from Yale University. He wrote 'The New Testament in the Christian Church' (1904); 'History of Christian Thought since Kant' (1912). He was a member of the American Board of Commissioners of Foreign Missions (1899-1914), its chairman (1905-14) and was elected president in 1914.

MOORE, Edward Mott, American surgeon: b. Rahway, N. J., 15 July 1814; d. Rochester, N. Y., 4 March 1902. He studied medicine in New York and Philadelphia and was graduated (1838) as M.D. at the University of Pennsylvania. He served as resident physician at Bloxley Hospital and Frankford Lunatic Asylum but settled in Rochester in 1840. In 1842 he received a certificate of instruction at the medical school of Woodstock, Vt., where he lectured for 11 years. He served then successively at Berkshire Medical College, Massachusetts (1853-54); Starling Medical College, Columbus, Ohio (1854-55); then went (1855) to Buffalo Medical College, serving in the same capacity till 1883. His greatest work was done in research and experiments on the heart's action. He was president of the New York State Medical Society; a founder of the American Surgical Association, successor of Dr. Gross (1883) as its president; and was president of the American Medical Association (1889-90). For many years he was president of the board of trustees of the University of Rochester, and also of Reynolds Library and Rochester Public Health Association.

MOORE, Eleasim Hastings, American mathematician: b. Marietta, Ohio, 26 Jan. 1862. He was graduated (1883) at Yale, receiving the Ph.D. diploma in 1885. He then studied at Berlin (1885-86) and was appointed tutor in mathematics at Yale (1887-90); becoming assistant professor (1889-91) at Northwestern University and associate professor (1891-92). In 1892 he was made professor of mathematics at the University of Chicago becoming head of the department since 1896. He edited 'Transactions of the American Mathematical Society' (1899-1907) and has been associate editor of the 'Proceedings of the National Academy of Sciences' since 1915. He was vice-president at the International Congress of Mathematicians held at Cambridge, 1912. The mathematical periodicals of Europe and America have published many of his contributions.

MOORE, Frank Frankfort, British novelist and dramatist: b. Limerick, Ireland, 15 May
1855. He was educated at the Royal Academical Institution, Belfast, and has traveled extensively in Africa, India and South America. From 1876 to 1892 he was art editor of the British "Theatre Letter." He has since lived in London. Among his chief works are 'Nell Gwynne' (1900); 'The Capture of Corailie' (1900); 'He Loved but One' (1905); 'Priscilla and Carybdis' (1910); 'The Lady of the Lake' (1915); 'The Romance of a Red Cross Nurse' (1915); 'The Tale of a Millionaire' (1915); 'Popular plays by him include 'Moath and Flame' (1878); 'Broken Fetters' (1881); 'Oliver Goldsmith' (1892); and 'Kitty Clive' (1895), and he is also author of 'The Discoverer' (verse, 1911); 'A Georgian Pageant' (essays, 1910); and a work on antiquities, 'The Commonsense Collector' (1911).

MOORE, Frank Gardner, American educator: b. West Chester, Pa., 25 Sept. 1865. He was graduated (1886) at Yale, receiving the Ph.D. diploma in 1900. He studied (1890-91) at the University of Berlin and became tutor in Latin (1888-93) at Yale. He was made assistant professor in Latin (1893-1900) at Dartmouth College, then associate professor of Latin and Roman archaeology (1900-08). He was made professor of Latin (1908-10) at Trinity College, Hartford, Conn., and professor of classical philology at Columbia University from 1910. He edited Tacitus 'Histories,' (Vols. I and II, 1910); Cicero's 'Cato Major' (1904) and 'Transactions and Proceedings of the American Philological Association,' of which society he was secretary (1904-16), becoming president in 1917.

MOORE, George, English author: b. Ireland, 1853. He studied art in London under Luyten, but completed his education in France and became thoroughly imbued with a Gallic spirit. Apart from a few contributions to periodicals, his first literary work was contained in two volumes of quasi-French verse, 'Flowers of Parnassus' (1877) and 'Pagan Poems' (1881). With his entry into fiction he allied himself immediately with the French realism or nature, and his success, and then swings from his riotous living to remorse and back again, only to commit suicide at the end; or in 'Esther Waters' (1894), a detailed sketch of life among the servant class and in a country inn, the theme being the allurements of gambling, 'Evelyn Innes' (1898) and its sequel, 'Sister Teresa' (1901), are a keen analysis of a musical and sensuous temperament under the successive influence of social temptation and of convent life. What he exemplified in these novels was a growth of his growing conviction that the English stage and English novel were far gone led him to assist in founding the Irish Literary Theatre in Dublin and to take a prominent part in the movement styled the Irish Renaissance, a movement of which his 'Bending of the Bough' (1900) is one of the most promising dramatic productions and ranking above 'The Strike at Arlington' (1893).

His later works include 'The Unfilled Field' (1903); 'The Lake' (1905); 'Memoirs of My Dead Life,' which purports to be autobiographical; the autobiographical 'Hail and Farewell,' (3 vols., New York 1911-14); 'The Brook and the Hermit,' 'A Romance of Palestine in the times of Christ, the publication of which gave rise to a good deal of criticism; 'Lewis Seymour and Some Women' (1916).

MOORE, George Foot, American Orientalist: b. West Chester, Pa., 13 Oct. 1851. He was graduated at Yale in 1872 and at Union Theological Seminary in 1877. Entering the Presbyterian ministry, he was pastor of the Putnam Presbyterian Church, Zanesville, Ohio, 1878-83, and in the latter year became Hitchcock professor of Hebrew and the history of religions at Andover Theological Seminary, and from 1899 to 1901 was president of the faculty there. In 1902 he was appointed professor of theology at Harvard and in 1904 Frothingham professor of the history of religions. For some years he edited the 'Journal of the American Oriental Society,' of which he was president 1911-12. He has written 'A Commentary on Judges' (1895); 'The Book of Judges,' a translation with notes for the Polychoetae Bible (1895); and 'The Book of Judges in Hebrew' (1900); 'The Literature of the Old Testament' (1913); 'History of Religions' (Vol. I, 1913); and 'Metempsychosis' (Ingersoll lecture at Harvard, 1914).

MOORE, George Henry, American historical writer: b. Concord, N. H., 20 April 1823; d. New York, 5 May 1882. In 1839 he removed to New York and was graduated at the University of the City of New York (now New York University) in 1843. As assistant to his father, Jacob Bailey Moore (q.v.), librarian of the New York Historical Society, he had been, as may be seen in 'A Mummer's Wife' (1884), a story of the degeneration of a farmer's wife, her elopement with a strolling player, and the sufficiently squalid sequel; in 'Mike Fletcher' (1891), in which a gay young Irishman wins a fortune by his wits and his social success, and then swings from his riotous living to remorse and back again, only to commit suicide at the end; or in 'Esther Waters' (1894), a detailed sketch of life among the servant class and in a country inn, the theme being the allurements of gambling, 'Evelyn Innes' (1898) and its sequel, 'Sister Teresa' (1901), are a keen analysis of a musical and sensuous temperament under the successive influence of social temptation and of convent life. What he exemplified in these novels was a growth of his growing conviction that the English stage and English novel were far gone led him to assist in founding the Irish Literary Theatre in Dublin and to take a prominent part in the movement styled the Irish Renaissance, a movement of which his 'Bending of the Bough' (1900) is one of the most promising dramatic productions and ranking above 'The Strike at Arlington' (1893).

His later works include 'The Unfilled Field' (1903); 'The Lake' (1905); 'Memoirs of My Dead Life,' which purports to be autobiographical; the autobiographical 'Hail and Farewell,' (3 vols., New York 1911-14); 'The Brook and the Hermit,' 'A Romance of Palestine in the times of Christ, the publication of which gave rise to a good deal of criticism; 'Lewis Seymour and Some Women' (1916).

MOORE, George Thomas, American botanist: b. Indianapolis, 23 Feb. 1871. He was educated at Wabash College and graduated A.B. at Harvard (1895), A.M. 1896 and Ph.D. 1900. He was eagerly engaged in systematic botany at Harvard and teacher at Radcliffe College. From 1899-1901 he had charge of the botany department at Dartmouth College and was (1903-05) physiologist and algologist at the Bureau of Plant Industry, Department of Agriculture. He had charge of botany at the Marine Biological Laboratory at Woods Hole, Mass., and became professor of applied botany and plant physiology at Shaw School
MOORE, Jacob Bailey, American journalist and author: b. Andover, N. H., 31 Oct. 1797; d. Bellows Falls, Vt., 1 Sept. 1853. He learned the printer's trade on the Concord Patriot, became bookseller and publisher, then partner in the above paper, after 1828 he held the New Hampshire Statesman to aid the election of John Quincy Adams as President, and became (1828) member of the State legislature and, in the same year, sheriff of Merrimac County (1828-33). In 1839 he edited the New Hampshire Journal, but soon moved to New York to edit the Daily Whig. He was government clerk in the Washington post office (1841-45), then librarian of the New York Historical Society (1845-49), when he moved to San Francisco as its printermaster (1849-53). He collaborated in compiling a topographical, historical and biographical work on New Hampshire (Concord 1822-24), and he published 'A Gazetteer of the State of New Hampshire' (1823); and histories of Concord and of Andover, N. H., and 'Memoirs of American Governors' (1846).

MOORE, James, American colonial governor: b. probably in Ireland about 1640; d. Charleston, 1706. He is supposed to have been a son of the Irish rebel, Roger Moore, and to have come to this country about 1663. Settling in South Carolina, he became a leader among those who openly resisted the lords proprietors in their oppressive demands. In 1682 he was made a member of the governor's council, and in 1692 was sent to the Assembly. In the latter year the proprietors named him for exclusion from their pardon. Two years later he was again one of the governor's council; that body in 1700 elected him governor; and he filled the executive office until 1703, when Sir Nathaniel Johnson arrived. Appointed by the Assembly to lead an expedition for the capture of Saint Augustine (1702), Moore took the town without difficulty, but failed to reduce the fort. Under Governor Johnson he served as comr. general, and was successful in an expedition (1703) against the Apalachee (q.v.). Consult McCrady, 'History of South Carolina Under the Proprietary Government' (1897).

MOORE, James, American colonial officer: b. Charleston, S. C., 1667; d. 17 Feb. 1723. He was a son of the James Moore preceding, in whose expeditions against the Indians he participated. In 1713 Governor Craven appointed him commander of the forces sent to aid the North Carolina colony against the Tuscarora Indians, and two years later served as lieutenant-general of an expedition sent to subdue the Yamasi. In 1719, when Gov. Robert Johnston was deposed, the Convention having made an end of the proprietary government, Moore became governor. He was succeeded in 1721 by Francis Nicholson, who was commissioned by the English crown, afterward becoming speaker of the assembly.

MOORE, James Hobart, American lawyer and promoter: b. Berkshire, N. Y., 14 June 1852; d. 8 July 1916. He was bank clerk (1871-73) at Binghamton, N. Y., went to Chicago (1873) and was admitted to the bar (1881). In collaboration with his brother, William H. (q.v.), he created the great "Moore group" of four great corporations which
together had a capitalization of $187,000,000,这些 since being incorporated in the United States Corporation. They were also the promoters of the great National Biscuit Company, and other mercantile amalgamations. He was a director of the American Can Company, American Tin Plate Company, and numerous other leading industrial corporations.

**MOORE, John**, Scottish physician and author: b. Stirling, December 1729; d. Richmond, Surrey, 21 Jan 1802. Having obtained a knowledge of medicine and surgery he went to the Netherlands in 1747, and served as a surgeon's mate in the military hospitals. Returning to Scotland he practised till 1772. In that year he became medical attendant to the ninth Duke of Hamilton, whom he accompanied on a five-year tour on the Continent. In 1779 he published 'A View of Society and Manners in France, Switzerland and Germany,' which passed through numerous editions, and has been translated into several foreign languages. In 1781 appeared his 'View of Society and Manners in Italy;' and in 1786 'Medical Sketches' followed by 'Zeluco,' a novel (1786); 'A View of the Causes and Progress of the French Revolution' (1795); and two other novels, which were not so successful as his first.

**MOORE, Sir John**, British soldier, son of the preceding: b. Glasgow, Scotland, 13 Nov. 1761; d. Spain, 16 Jan. 1809. He served in Nova Scotia during the American Revolutionary War; from 1784-90 was member of Parliament for a group of Scottish burghs; served in Cordova, the West Indies (1795), in Ireland during the rebellion of 1798, in Holland in 1799 and in Egypt in 1800-01. He was created Knight of the Bath in 1804 and was in command in the Mediterranean (1806-8). He was appointed commander-in-chief of the British army in Portugal in 1808. His intention was to cut the French communications with Madrid, but struggling against the apathy of the Spaniards and intrigue among his own countrymen, he advanced to Salamanca in spite of the greatest difficulties, but was ultimately forced to make a midwinter march to Coruna, a distance of 250 miles, through a desolate and mountainous country, rendered almost impassable by snow and rain, and constantly harassed by the enemy who outnumbered him by three to one. His troops arrived at Coruna in a distressing condition; Soutl was ready to attack him as soon as he began the work of embarkation, and in the battle that followed Moore fell, mortally wounded, in the hour of victory. Wolfe's celebrated poem, 'The Burial of Sir John Moore,' keeps his memory green. Consult Carrick Moore, 'Life of Sir John Moore' (1835), and his 'Diary' (ed. by Maurice 1904).

**MOORE, John Bassett**, American lawyer, diplomatist and author: b. Smyrna, Del., 3 Dec. 1860. He attended private schools and was graduated at the University of Virginia in 1880. He was Justice of the Peace of Edward G. Bradford, now United States district judge at Wilmington, Del., and was admitted to the bar there in 1883. In 1885 he passed the first civil service examination for admission to the Department of State, at Washington, and was appointed a legation at a department in July of that year. In August 1886 he was appointed Third Assistant Secretary of State. In the summer of 1887, he acted as secretary to the conference between the Secretary of State and the British and German ministers on the affairs of Samoa; and in the winter of 1887-88 he acted as American Secretary in the conference on the North Atlantic Fisheries. He assisted at the organization of the First International Law and Diplomacy at Columbia University, New York, a chair which he has since continued to hold. In April 1898, on the outbreak of the war with Spain, he was without solicitation appointed by President McKinley to the position of Assistant Secretary of State. This position, which he had on three previous occasions declined, he resigned in September of the same year, in order to accompany the American Peace Commission to Paris as Secretary and Counsel, in which capacity he was engaged in the negotiation of the Treaty of Peace with Spain. In 1904 he acted as agent of the United States before the United States and Dominican Arbitration Tribunal. He was a member of the delegation of the United States at the Fourth International American Conference, at Buenos Aires, in 1910, and afterward served as a special plenipotentiary to the Chilean Centenary. In 1912 he was appointed the delegate of the United States on the International Commission of Jurists, which was organized at Rio de Janeiro in that year, under the Pan-American Treaty of 1906, for the codification of International Law. In March 1913 he became by appointment of President Taft a member of the Permanent Court of Arbitration at The Hague. In the following month he was appointed by President Wilson counselor for the Department of State and was invested with authority to sign as acting Secretary of State in the absence of the Secretary, the grade of the position thus being raised. He resigned the position of counselor in March 1914. Mr. Moore is a member of the Institut de Droit International, of the Institut Colonial International, of the American Philosophical Society, of the American Political Science Association, of which he was one of the founders in 1913-14, and of various other learned societies. He is a member and honorary secretary of the Hispanic Society of America; and an honorary member of the College of Lawyers at Costa Rica. He was a member of the Pan-American Financial Congress at Washington in May 1915, acting as chairman of the committee on uniform laws, by which the scheme of work of the Congress was drawn up; and he is vice-chairman of the American section of the International High Commission organized to carry out the plans of the Congress. He was a delegate of Columbia University and of various learned societies in the Second Pan-American Scientific Congress at Washington, December 1915-January 1916. He is vice-president of the Pan-American Society of America. He is an incorporator of the American National Red Cross and a member of its central committee and of the executive committee of the New York chapter. His publications, at large and addresses, include 'Report on Extraterritorial Crime' (Washington 1887); 'Report on Ex-
MOORE, Irish poet: b. Dublin, 28 May 1779; d. Bromham, near Devizes, 25 Feb. 1852. He was educated at Trinity College, Dublin, with a view of becoming a lawyer, and in 1800 entered as a student at Merton College. In 1800 he published a translation of *Anacreon* dedicated to the Prince of Wales (his enemy in after years), and in 1801 *The Poetical Works of the late Thomas Little.* His fine musical talent got him admission to the best society. The office of admiral registrar at Bermuda was bestowed on him in 1803. The post was given to him as a sinecure, and he quit it after appointing a deputy to perform his duties. In November 1804 after a tour through the United States and British America, he was back again in England. In 1806 he published *Odes and Epistles,* which contained some attacks on America, and, castigated by Jeffrey in the *Edinburgh Review,* occasioned the memorable frustrated duel between him and the distinguished critic who had no bullet in his pistol. Moore entered in 1807 into an engagement with Power, the music publisher, to produce a series of adaptations to the national Irish airs, he furnishing the words and Sir John Stevenson the music. This great undertaking, which extended over a number of years, only completed in 1834, is the work on which his reputation will mainly rest. Many of the numbers, such as *The Last Rose of Summer,* and *Those Evening Bells,* are generally familiar. His *National Airs* (1806), *Oft in the Stilly Night* and the *Sacred Songs* (1816); *Sound the Loud Timbrel.* In 1811 he married Bessie Dyke, an actress. *The Twopenny Post Boy,* by Thomas Brown the Younger, a series of satires on the proceedings of the prince-regent and his ministers, appeared in 1812, and by their genuine wit attracted much attention and in this kind of composition he afterward excelled. The same year he removed to Mayfield Cottage, near Ashbourne, Derbyshire, and here his *Lalla Rookh* was elaborated. Its production was the result of an agreement with Messrs. Longman, by which he was to receive 3,000 guineas for a poem to form a quarto volume. It appeared in 1817, and its success fully justified the liberality of Moore's publishers. It was translated into numerous languages, and attained a European fame. Later criticism has deemed it rather a work, as Garnett says, *of prodigious talent,* than of the genius ascribed to it in Moore’s own day. The same year appeared a satirico-burlesque poem, *The Pudge Family in Ireland* (1818) in the form of a series of amusing letters supposed to be written by the different members of an excursion party to the Continent, *Rhymes on the Road* and *Fables of the Holy Alliance* followed in 1819. About this time he became involved in serious embarrassments by the defalcations of his deputy in Bermuda and found himself suddenly called upon to make up a deficiency of $6,000, ultimately reduced to about £1,000. This vast sum he contrived to clear off by his literary labors. In 1822 appeared his *Loves of the Angels,* The *Life of Sheridan* was produced in 1825, and the *Epicurean,* a prose romance of small value, in 1827. Next came the justly praised
MOORE, William Henry, American lawyer and capitalist: b. Utica, N. Y., 25 Oct. 1848; d. 16 May 1916. He was educated at Amherst College and called to the Wisconsin bar 1872. He settled in Chicago making a specialty of corporation law and with his brother R. W. (q.v.), he created the great "Moore Group" of four corporations having a total capitalization of $187,000,000, all of which have since become absorbed in the United States Steel Corporation. Other immense industrial amalgamations brought about by them were the Diamond Biscuit Company, National Biscuit Company, American Tin Plate Company, etc. He was known to the public as "Judge Moore," through his prominent position at European and American horse shows, his own stable, taking frequent prizes for coaching teams. He was director of the Delaware and Lackawanna Railway Company, the Lehigh Valley Railroad Company, American Cotton Oil Company, First National Bank of New York, etc.

MOORE, Willis Luther, American meteorologist: b. Scranton, Pa., 18 Jan. 1836. At eight years of age he joined his father, with Grant's army, at City Point, Va., and sold papers to the troops in the field; was educated in the Binghamton public schools; was student of natural sciences under scientific staff of the Weather Bureau for 15 years and under private tutors six years. He served full apprenticeship as printer and pressman on the Binghamton Republican, and worked as union printer in Chicago, Burlington, Iowa and Washington, D. C.; entered Signal Corps (now Weather Bureau) 1876, and rose through successive grades to local forecast official in Milwaukee, 1891-94; won professorship of meteorology in open competitive examination against 23 contestants, 1894, and was assigned to duty as district forecaster of Chicago; was chief United States Weather Bureau, 1895-1913; professor applied meteorology George Washington University 1914. He was lecturer for the Royal Institution (London) in 1912; and is popular lecturer on the Lyceum and Chautauqua circuits, tel- low of the American Association for the Advancement of Science; and honorary member of the Royal Meteorological Society (London), and of the Austrian Meteorological Society; was president of the National Geographic Society, 1905-10; and vice-president Washington Acad-
MOORES HILL COLLEGE, in Moore's Hill, Ind.; coeducational; opened in 1856 by Methodist Episcopal. In 1917 the college had 14 professors and instructors, 106 students, and about 6,000 bound volumes and 1,000 periodicals in the library. The grounds, buildings and apparatus were valued at $35,000, the productive fund was $30,000, and the annual income about $13,000. The courses of the collegiate department lead to the degrees of A.B., B.S., and Ph.B.

MOORHEAD, mōr'hēd, Minn., city, county seat on the Red River between the Red River of the North, and on the Great Northern and the Northern Pacific Railroad, opposite Fargo, N. Dak. It is in a productive farming region in which wheat is one of the great crops. It has flour mills, grain elevators, foundries, machine shops, brick yards, and stock yards. It is a trade centre for a large part of Clay and Norman counties, and ships large quantities of wheat. It is the seat of Concordia College, the Sharp High School, a State Normal School, and 3 public and parochial schools. The city owns and operates the electric-light plant and the waterworks. Pop. 4,840.

MOORISH ART. See Architecture; Mohammedi Art.

MOORS (Lat. Mauri; Sp. Moros; Dutch, Moors), the people of Morocco. The Arabs who conquered the Roman province of Mauritania in North Africa in the 7th century converted to Mohammedanism the native population, who in Europe were still called Moors, though in their own language they called themselves Berbers, while by the Arabs they were termed Moghrabines, "westerners" or "men of the west." Arabic manners and customs, and in a corrupt form the Arabic language, soon prevailed in the country, the Arab conquerors freely amalgamating with their converts, who far exceeded them in numbers. In 711 an army drawn from this mixed population, under Arab leaders, crossed the strait at Gibraltar, so named from their leader, and began the conquest of the Spanish peninsula. The Spaniards and Portuguese called these invaders Moors because they came from Mauritania, and the term Moors soon became synonymous with Mohammedans or Moslems, as the invaders designated themselves. The Spanish writers subsequently applied the term to all the Mohammedans of northern Africa; and when, at the close of the 15th century, the Portuguese made their way around the Cape of Good Hope and encountered the Arabs on the coasts of East Africa and of Asia, they still called them Moors. See Morocco.

MOOS, mōs, Salomon, German autist; b. Randegg, Baden, 15 July 1831; d. Heidelberg, 15 July 1887. He studied at Heidelberg, Prague and Vienna; in 1859 he became privat-docent at Heidelberg, and in 1866 professor of aural surgery there. His most valuable researches were in relation to the diseases of the labyrinth of the ear, and he was the first to demonstrate that in Clay County, among others within the labyrinth cause derangement of hearing and equilibrium. He wrote 'Klinik der Ohrenkrankheiten' (1866); 'Anatomi und Physiologie der Eustachischen Röhre' (1874); 'Meningitis cerebro-spinalis epidemic' (1881); 'Über Pflanzung des Labyrinths im Gefolge von einfacher Diphtherie' (1887); 'und im Gefolge von Masern' (1888); 'Untersuchungen über Mittelohrrkrankheiten bei den verschiedenen Formen der Diphtherie' (1890). He also founded and edited with Knapp the 'Zeitschrift für Ohrenheilkunde.'

MOOSE. The deer family (Cervidae) embraces not only all the round-horned deer, but also the caribou and moose, whose horns are flattened in a manner known as "palmination." Of this family, the American moose (Alces americana) is the most colossal and also the most picturesque member. In Europe and Asia, there called "elk" (q.v.), is a much smaller animal. Even in comparison with the largest American elk, our moose, is a giant, and it is impossible to appreciate fully the great height and bulk, length of leg and size of antlers of this wonderful creature, without seeing a full-grown bull, either in his native wilds or mounted in a museum.

At nearly every point the species presents a peculiarity. The largest specimens ever shot and measured by naturalists stood from 78 to 84 inches in height at the shoulders. The body is very short in comparison with the great length of the legs, but the depth of the chest is unusually great. The end of the nose is flabby and pendulous, and overhangs the chin by three or four inches. In browsing it is half prehensile, and is of great use in conveying twigs into the mouth. A moose in full winter pelage is covered by a coarse thatch of straw-like hair, from three inches in length on the body to six inches on the neck and shoulders. The color of the hair is purplish-gray, and for an animal which lives so far north, the pelage is exceptionally coarse and open.

The antlers of the moose are strikingly peculiar. The upper two-thirds of the beam is enormously flattened, often to a width of 12 inches or more, and the upper end of this great shovel of solid bone terminates in a row of from 6 to 12 short points. The single brow-tine is also well palmed, and usually terminates in three or four long points of great strength. Occasionally the main shovel throws out sidewise a palamed spur of striving form and size, and such a head when seen from the front presents a chaotic jumble of tines and palimations. The largest antler on record, in the Field Columbian Museum, and have a spread of 78 inches, greatest width of palmation 16 inches, thickness of palmation 2½ inches, and a total of 34 points. The weight of the antlers and skull is 53¼ pounds. At least 25 pairs of antlers are known to exceed 70 inches in spread. The female has no antlers.

The moose is a browsing animal, and its favorite food consists of twigs of the willow, birch, hemlock, spruce, alder, aspen and maple. It also feeds upon moss, and in summer is very fond of wading in ponds and giving to the stems and leaves of water-lilies. Because of their very unusual feeding-habits, moose are very difficult to rear in captivity to adult age. About 90 per cent die of gastro-enteritis before they attain the age of three years. The large aboriginal demand and high market value of a live moose is far below its rarity and general desirability in a collection. Moose calves are born either singly or in pairs, in May or June. At birth an average specimen stands about 32 inches in height, and is a most grotesque-looking creature. Its first coat of hair is sandy-red, like that of a buffalo calf. At 15
months old, a healthy young animal is about five feet high at the shoulders. The weight of a large adult male moose is between 1,100 and 1,200 pounds, but the maximum weight for the species would probably reach 1,500 pounds.

The range of the moose extends from Nova Scotia and New Brunswick to northern Alaska, a total distance along the axis of distribution of about 4,100 miles. This animal does not seem to have arrived in the United States, at least, before the final retreat of the ice of the last glacial age; and a somewhat different deer (see Cervales) probably preceded it.

The valley of the Ottawa River and its tributaries yet affords good hunting for moose, and so does northern Manitoba. The species still exists in small numbers in northern Minnesota, and along the western slope of the Rockies as far south as the head of Green River, Wyoming, (lat. 43°). Northward, moose are found in British Columbia, Alberta, Athabasca, Yukon and in many portions of Alaska. Those found on the Kenai Peninsula and north of Cook Inlet have the most massive and widespread antlers to be found, and have even been described as an independent species, under the name of Alces gigas.

Everywhere throughout its range, the killing of moose is regulated by law. The open seasons are very short, the number that may be killed by each hunter is limited to one or two males, and the killing of females is forbidden. For the protection of the species in Alaska, Congress has enacted in 1902 a stringent law, which will at least serve to prevent much of the reckless slaughter that up to that time had been proceeding. But, despite all laws that can be framed and enforced, the size of the moose, and its desirability, both as a hunter's trophy and for food, render it practically certain that the species will be destroyed far faster than it breeds, and that 25 years hence it will be as nearly extinct in America as the buffalo is today. Consult bibliography under DEER and ELK.

WILLIAM T. HORNADAY
Director New York Zoological Park.

MOOSE-BIRD, one of the names in eastern Canada for the Canadian jay. See JAY.

MOOSE-FLY, a small biting fly (Hematobia alcis), parasites on the moose and very annoying to that deer in the Northwest. It is closely related to the horn-fly (q.v.).

MOOSE JAW, city in Saskatchewan, Canada. It is 398 miles west of Winnipeg and 420 miles east of Calgary, on the Canadian Pacific (divisional point), Canadian Northern and Grand Trunk Pacific railways. It is a well laid out centre in a rich wheat-growing tributary region, situated in a valley at the confluence of the Moose Jaw River and Thunder Creek, and is a thriving agricultural and industrial town. There are government elevators with a total capacity of 4,000,000 bushels; flour mills, brick works, brass and iron works, and coal mines have been opened 40 miles south of the city. The city is well equipped educationally, and has a handsome Collegiate Institute; there is a general hospital and one under construction for the Gray Nuns. The street railway, electric power, light and waterworks are municipally owned. The population (1,558 in 1901) was 13,823 in 1911, and, according to a local estimate, was over 16,000 in 1916.

MOOSE-WOOD, a local name in the Eastern States and Canada for either of two shrubby trees of whose leaves and twigs the moose is fond: (1) the striped maple or whistle-wood (see MAPLE); (2) leatherwood (see Cytisus).

MOOSEHEAD, the largest lake in Maine, lies at an elevation of 1,085 feet on the boundary between Piscataquis and Somerset counties. It is about 35 miles long; its average width is about 7 miles and maximum 12. A number of rivers flow into the lake, and its direct outlet is Kennebec River. Part of its waters enters the Penobscot by way of a short stream, and the lakes which are the source of the Penobscot. Game abounds, fish fill its waters and but few people inhabit the region near the shores. The Canadian Pacific Railroad passes along the southwest shore and connects the villages of Greenville and Moosehead.

MOOSE, Loyal Order of. A secret fraternal society founded in 1888 at Louisville, Ky., by Dr. J. H. Wilson. The first lodge was organized in Cincinnati, Ohio. The Supreme Lodge administers the society which comprises 1,610 subordinate lodges and has nearly 61,000 members. The society is benevolent, furnishing the social advantages of brotherhood, and without obligation to buy life insurance or pledging to any specific cause, paying sick and funeral benefits. A home and vocational school for dependents and orphans of members of the society with suitable buildings are maintained on a farm of 1,000 acres at Mooseheart, near Aurora, Ill.

MOPSUS. (1) A seer, the son of Aymyx by Chloris, and one of the Thessalian Lapithae, who died from the bite of a serpent which sprang from the blood of the Gorgon Medusa. (2) A legendary Greek prophet, son of Apollo and Manto, who vanished Calchas in prophetic skill. Its chief products are brandy and wine, and of the prophet Amphilochos. The name is also commonly used of the shepherd poets of Greek bucolic poetry, and hence of pastoral poetry generally.

MOQUEGUA, mōk’-ē-gwa’. Peru, a province in the southern part of the republic, bounded on the north by the department of Arequipa, on the east by Puno, on the south by Chile and on the west by the Pacific Ocean. Area, 5,549 square miles. The eastern part is crossed by the Andes Mountains. The fertile portions are on the mountain slopes, the region along the coast is a rainless desert. The chief products are brandy and wine, and of the is considerable mineral wealth. Pop. 31,920. (2) Moquegua, the capital, is southeast of the centre of the province, was destroyed by earthquake in 1868. Pop. 6,125.

MOQUELUMNAN, a family of North American Indians, living in California and consisting of the Miwok and other tribes. The Moquelumian family is officially included with the Costanoan in the so-called Musun, named after the language, or more probably the village, at the mission of San Juan Bautista. The Moquelumian family, as at present generally recognized, consists of two detached divisions, the principal one occupying the terri-
MOQUI INDIANS — MORAI

tory in the San Joaquin Valley and on the slope of the Sierra Nevada; the other, a smaller territory on and near the coast north of San Francisco. The smaller division comprises three dialects, which are spoken in two separate areas: one near Clear Lake, the other north of San Francisco Bay. That spoken in the area near San Francisco is again divided into two dialects. The people of the principal division, the Moqueleman family call themselves by some form of the name Miwok. They occupy one of the largest territories held by a single family in California, extending from the Consumnes River on the north to the Sierra Nevada and south to the Sierra Nevada. The three well-marked Miwok dialects: one in the northern plains, the second in the northern and central hills and mountains and the third in the south. These dialects resemble the northern neighbors of the Miwok people — Maidu — and not those of the Yokuts to the south. Consult Barrett, S. A., 'Geography and Dialects of Miwok Indians' (Berkeley, Calif., 1906), and Viro noble, A. L. (in American Anthropologist, Vol. VII, Lancaster, PA., 1876).

MOQUI (mō'kē) INDIANS, a semi-civilized tribe living in northern Arizona. The first accounts of them date from the expedition of Coronado in 1540. Their history is strikingly similar to that of the Indians of New Mexico, except that after a successful revolt against the Spaniards, in 1540, they remained independent. They are kind-hearted and hospitable, cultivate the soil, raising grain and vegetables, possess large flocks of sheep and goats and weave very fine blankets. The houses are built of stone set in mud for security and are perched upon the summits of almost inaccessible mesas. They number about 1,600. See INDIANS.

MORA, mō'rə, Francis Luis, American artist: b. Montevideo, Uruguay, 27 July 1874. He studied art in the School of Drawing and Painting, Museum of Fine Arts, Boston, and the Art Students' League, New York. From 1892 he worked on illustrations for magazines and other periodicals, receiving his first important commission (1900) for a large decorative panel for the Lynn (Mass.) Public Library. In 1914 he did some decorative paintings for the Missouri State building and for the Saint Louis Exposition. He received the Sears prize, Museum of Fine Arts, Boston; Rothschild prize, Arts Students' League; gold medals from the Philadelphia Art Club (1901) and the American Fine Arts Society, Philadelphia (1902); a bronze medal from the Saint Louis Exposition (1904); 1st Hallgarten prize, National Academy of Design (1905); Beal prize, New York Water Color Club (1907); Evans prize and Shaw prize, Salmagundi Club (1908 and 1910); silver medal, International Fine Arts Exposition, Buenos Aires (1910). His works are displayed in the Boston Art Club; Lotos Club, New York; Art Gallery, Oakland, Calif.; Columbia University; State Gallery, Dale, Ind.; National Academy Collection, New York, etc. Some of his greatest works are in most of his creations, which show true coloring and due attention to detail; his figures are full of expression. Of his best works might be named 'The Letter', 'The Mendicants' (1906); 'Spanish Café' (1906); 'After the Bull Fight, Granada' (1910); 'Studio Tea' (1911); 'Evening News' (1914).

MORACEAE, a family of trees and shrubs (rarely herbs), related on the one hand to the elms and on the other to the nettles, whose botanical characteristics are: cotyledons usually with four perigone leaves; stamens straight or inflexed in the bud; ovary dimerous, with one suspended, anotropous ovule; stipules caducous; juice milky. The species are mainly tropical and include the mangos, oranges, yams, etc., bread-fruit, osage-orange, rubber or caoutchouc plants, upas tree (qq.v.) and others.

MORAINE, a deposit of sand, gravel or clay made by a glacier. Moraines may be divided into two classes, those that exist on the ice itself and those that are formed at the edge of or under the ice. Of the first type, the most common are the lateral moraines. These are ridges of debris that accumulate on the ice next to the rock wall on either side. They consist in part of material that the glacier has scraped from the valley sides and in part from avalanche debris. When two glaciers unite into one, two lateral moraines are brought together to form a medial moraine. Glaciers that result from many branches uniting may have several such medial moraines. The lower stagnant ends of many large glaciers are wholly covered with debris that was once frozen into the ice, but which has accumulated as the ice wasted away by melting. Such deposits are known as ablation moraines. Forests grow on the ablation moraine of the famous St. Elias Glacier in Alaska. Such moraines above three types seldom remain as distinct ridges after the glacier has melted away.

Of the second type, the frontal or terminal moraines are of the most importance. These are formed at the ice front, when loss by melting just equals ice advance, and all the debris is accumulated in one ridge. In the case of valley glaciers, these form dams across the valleys, often producing lakes. In the case of continental ice sheets the moraine may stretch for miles across the country as they do across our Northern States, at the southern margin of the glaciated region. Sometimes the ice in its retreat pauses several times, building a moraine at each pause, in which case they are called recessional moraines. The thin sheet of till (q.v.) that a glacier spreads over the country at large and which results chiefly from material that the ice is forced to drop from the bottom, due to overload, is called ground moraine. Drumlins (q.v.) are a special phase of ground moraine. Morainic debris is mostly unstratified and contains many polished and striated boulders. See also GLACIERS and the section on Glaciology in the article on GEOLOGY.

MORAYS, Sabato, American rabbi and educator: b. Leghorn, Italy, 13 April 1823; d. Philadelphia, 11 Nov. 1897. He was carefully trained in Hebrew lore, and taught first in Leghorn and then for a few years in London. In 1851 he came to Philadelphia and until his death was minister of the Mikveh Chayim Synagogue. In 1857 he was appointed professor of biblical exegesis in the short-lived Maimonides College of Philadelphia, and he was one of the founders and the first president of the Jewish Theological Seminary of New York. During nearly five decades of activity he was a representative of
conservative Judaism, unremitting in his efforts in behalf of education and charity and an earnest and scholarly contributor to the Jewish press on historical, literary and theological themes.

MORALE, Luís de, loo'-és dā mō'-rä'-läs, Spanish painter: b. Badajoz, about 1509; d. there, 1586. His early artistic life was spent in Andalusia, but he removed to Madrid in 1564, where he remained for the rest of his life, returning to his native city only to die. He was essentially Spanish in his conception of religious art, from his devotion to which he was called "El Divino." The main theme of his paintings was the Dead Christ and the Mater Dolorosa. There is in them a blending of religious austerity with a sense of beauty, which recalls the early Italian school, but his figures have the distorted and macerated air which later became the accepted type in Spanish religious paintings. His drawing is monotonous and mannered, and his modeling so as to attempt to make his half skeleton proportions the limbs and features, but his coloring is of sweet and melting tenderness. The Madrid Museum has several examples of this master, namely, an 'Ecce Homo,' a 'Mater Dolorosa' and a 'Madonna.' A half-length figure of 'Christ Bearing the Cross' is in the Louvre under his name. An 'Ecce Homo' of his hangs in the Dresden Gallery, and one in that of the New York Historical Society.

MORALITIES, the name given a class of allegorical plays, so termed because they consisted of moral discourses in praise of virtue and condemnation of vice. The dialogues were carried on by such characters as Good Doctrine, Charity, Faith, Prudence, Discretion, Death, etc., whose discourses were of a serious cast and were occasionally exhibited as late as the reign of Henry VIII. The morality play, 'Every Man,' was performed by Ben Greet's company in America and England in 1802 and 1803. Consult Mackenzie, W. R., 'English Morality Plays' (New York 1894); Moore, 'English Miracle Plays and Moralitys' (London 1807), and Pollard, A. W., 'English Miracle Plays, Moralitys and Interludes' (5th ed., Oxford 1899). See DRAMA.

MORALITY. See Ethics.

MORAN, mō-rän', Edward, American painter: b. Bolton, Lancashire, England, 10 Aug. 1829; d. New York, 9 June 1901. He was a pupil of Hamilton and Weber in Philadelphia and in 1862 went to Europe, where he studied in France and England for seven years. He afterward made his permanent home in New York. His best-known pictures are seascapes, such as 'Outward Bound'; 'Launch of the Life-Boat' (1865); 'The Coming Storm in New York Bay,' etc. His historical series, representing epochs in American seafaring from the 'Sounding of Leif Ericson' (1001) to 'Dover's Return' was completed in 1899 and exhibited at the Metropolitan Museum, New York, in 1904. He was a member of the National Academy.

MORAN, Patrick Francis (CARDINAL), Australian Roman Catholic prelate: b. Leighlin Bridge, Carlow, Ireland, 16 Sept. 1830; d. Sydney, Australia, 16 Aug. 1911. He received his education at the Irish College, the Gregorian University and the Propaganda, Rome, and was ordained to the priesthood in 1855. He was successively vice-rector of the Irish College, Rome; professor of Hebrew at the Propaganda; vice-rector of the Scots College, and secretary to Paul, Cardinal Cullen, archbishop of Dublin. In 1872 he was consecrated titular bishop of Oliba and made confessor to the bishop of Ossory. He succeeded to the diocese of Ossory in the same year and remained there until 1884, when he was appointed archbishop of Sydney, Australia. In 1885 he was made cardinal of the Roman Church with the titular church of Saint Susanna. He convened and presided at three plenary synods of the Church of Australia in 1885, 1895 and 1905, and also the Catholic congresses held at Sydney in 1900 and 1910. He was, in addition, author of 'Memorials of the Venerable Oliver Plunkett' (1861); 'Essays on the Early Irish Church' (1862); 'History of the Archbishop of Dublin' (1864); 'History of the Persecutions of the Irish Catholics' (1865); 'An Irish Sandwich' (1876); 'Monastic Life in Ireland' (1873); 'Spicilegium Ossorianum' (1874); 'Irish Saints in Great Britain' (1879); 'Pastoral Letters of Cardinal Cullen' (1882); 'Occasional Papers' (1890); 'Letters on the Anglican Reformation' (1890); 'History of the Catholic Church in Australasia' (1894); 'Reunion of Christendom and Its Critics' (1896); 'The Mission Field in the Nineteenth Century' (1900); 'Three Patrons of Erin' (1905); 'Priests and People of Ireland' (1905). He founded the Irish Ecclesiastical Record, edited it for some time and was a frequent contributor to its pages. He contributed to 'The Catholic Encyclopedia.'

MORAN, Peter, American artist: b. Bolton, Lancashire, England, 4 March 1842; d. Philadelphia, 9 Nov. 1914. He belonged to an artistic family, being brother of Thomas Moran and of Edward Moran, both painters of reputation; he became their pupil at Philadelphia and chose landscape and animal life as his special department. Among his paintings are 'Return of the Herd,' to which a medal was awarded at the Centennial of Pennsylvania; 'Barbara Mission'; 'Pueblo of Zia, New Mexico.' He was also successful as an illustrator and etcher and at the Centennial of 1876 received a medal for his etchings of animals.

MORAN, Thomas, American artist: b. Bolton, Lancashire, England, 12 Jan. 1837. He came to the United States with his parents in 1844, was educated in the schools of Philadelphia and studied painting in that city, first exhibiting in the Pennsylvania Academy of Fine Arts in 1856. In 1862 he visited England and at this time formed his great and lasting admiration for the work of J. M. W. Turner, the English landscape painter. In 1871 he accompanied the F. V. Hayden expedition to the Yellowstone country and on his return painted 'The Grand Canyon of the Yellowstone,' which was purchased by the government for the Senate Hall in the Capitol. He made a trip to Arizona in 1873 and the result was 'The Chasm of the Colorado,' also bought by the government. He made many other expeditions into the western country and Mexico, also to
Europe and painted many canvases of Venice. About 1873 he removed to New York and at this time did an enormous amount of drawings on wood for magazine illustration and for schoolbooks. He was a member of the National Academy of Design, the American Water Color Society and similar societies. Other important works from his hand are 'Mountain of the Holy Cross'; 'Someone Falls', 'The Grand Canal, Venice'; 'The Purple and the Venus'; 'The Dream of the Orient'; 'Solitude', etc.

MORANT, mő-ránt, Sir Robert Laurie, English educator; b. London, 7 April 1863. He was educated at Winchester, and at New College, Oxford; received (1885) the degree B.A. He undertook educational work of several kinds, becoming tutor to the royal family of Siam and organizer of education in that country. He then took up social and educational work in East London, becoming (1895) assistant director of special inquiries and reports in the Educational Department, Whitehall, which included education reports on England, France and Switzerland, etc. He was appointed Permanent Secretary, Board of Education, 1903-11, and has been chairman of the Insurance Commission since 1912. He was created Knight Commander of the Bath in 1902.

MORAT, mő-rå', Switzerland, town in the canton Fribourg, located on Lake Morat and on the Palézieux-Lys and the Ins-Fribourg railways. It has a 13th century castle, but is chiefly noted for the brilliant victory of the Swabians over the Spanish at the Bold, 22 June 1476. Consult Ochsenbein, 'Die Urgenenden der Belagerung und Schlacht von Murten' (Basle 1876).

MORATIN, mő-rå-tén, Leandro Fernandez, Spanish dramatist; b. Madrid, 10 March 1760; d. Paris, 21 June 1828. He was son of Nicolas (q.v.) and was early instructed in poetic art, and (1786) went to Paris as secretary of Count Cabarrus, where he gained the acquaintance of Goldoni who strengthened his purpose of reforming the Spanish stage by introducing into it the manners of the French. After a short stay in Spain he was granted a benefice by Minister Florida-Blanca which permitted him to follow a literary life. His first comedy, 'El viejo y la niña' (1790) was successful and it was followed by the satyric play 'La comedia nueva' (1792) which revenged him for the opposition given him by the old adherents to the national taste. Prince Godoy afforded him the means to visit France, England, Germany, Switzerland and Italy, returning in 1796. Next year appeared his 'Elbaron,' 'La mogigata,' 'El si de las ninas,' the latter proving an immense success and soon being translated into various languages. Under French occupation he accepted (1811) the post of librarian to King Joseph for which he was given a pension and he settled (1822) in Paris. His plays have their characters drawn true to life, the dialogues are lively and these works show originality. Concerning the history of Spanish drama he wrote 'Los caracteres del teatro español,' a worthy work. The Spanish Academy presented his opera entitled (Madrid 1830-31) and the 'Biblioteca de autores españoles' (ib. 1867) published his 'Obras postumas.' Consult also Ford, 'Si de las ninas' (Boston 1899).

MORATIN, Nicolas Fernandez, Spanish poet and dramatist; b. Madrid, 20 July 1737; d. there, 11 May 1780. He studied law at Valladolid, devoting time also to fine arts, and received a position in the Most High Court after finishing his studies. He first turned to the drama, starting with the play 'La petimetría' (1762), attempting to combine his national taste with that of the French. Next came 'El poeta' and the tragedy 'Luchrina' in the French style which he held to in his later 'Homenaje a y Guzman el Bueno.' The small income he derived from his literary work decided him (1772) in taking up the work of attorney-at-law, but he was soon made professor of poetry. His last and superlative work was 'Canto epico de las naves de Cortez destruidas' (1785), one of the finest of the Spanish heroics. His son Leandro edited a collection of some of his works under the title of 'Obras póstumas' (Barcelona 1821), but a more extended collection appeared in 'Biblioteca de autores españoles' (Vol. II, Madrid 1848), printed later in Paris (1881). R. Foulecke-Delbosc published his remaining works under title of 'Poesias ineditas' (Madrid 1892).

MORAVA, mő-rá-wa, Serbia, a river about 250 miles long, formed by the confluence at Stalashd of its head streams, the western Morava rising near the southwest boundary, and the southern Morava, with its source in Kosovo, Turkey. It is the largest river in Serbia and is navigable 50 miles from its mouth in the Danube River, 30 miles east of Belgrade.

MORAVA, a river of Austria-Hungary. See March.

MORAVIA (German, Mährren), Austria-Hungary, a western province and crownland bounded north by Prussia, northeast by Galicia, east and southeast by Hungary, south by Hungary and Austria and west by Bohemia; area, 8,584 square miles. Moravia proper consists of a large basin surrounded by mountains, on the north the Sudetes, on the east the Carpathians and on the west a range of hills which gradually ascends toward the north until it unites with the Sudeten mountains on the south, at a central point, toward which all its slopes converge and all its drainage is carried. Its climate is milder and more genial than that of most European countries under the same latitude, the mean at Brunn being 48° F. Moravia belongs to the basin of the Danube, all the smaller streams falling into the March or Morava, a tributary of the Danube. About 55 per cent of the land is arable and 27 per cent is occupied by forests. The minerals are of considerable importance and include silver lead, copper, iron, coal, graphite, etc. The soil is generally fertile and all the ordinary cereal, leguminous and root crops are raised in abundance. Flax of excellent quality is extensively grown in several districts and fruit is so abundant that many parts of the country have the appearance of one great orchard; but the favorite culture is that of the vine, for which both the soil and exposure of the province are admirably adapted. The pastures, in general excellent, occupy a larger extent than the rearing of cattle, nevertheless, gets comparatively little attention and is not sufficient to meet the home demand. Sheep, on the other hand, are reared in abundance and are of good
MORAVIAN CHURCH

The common name given in England and America to the renewed Unitas Fratrum or Church of the Brethren— for a time styled also in English the Church of the United Brethren—which originally flourished in Bohemia, Moravia and Poland, was disrupted and suppressed in the 17th century, was resuscitated in Saxony in the 18th century and at present exists in its reorganized form in Europe and America with an extensive mission work in many parts of the world. It was a product of the evangelical movement led by the Bohemian reformer, John Hus, who suffered martyrdom at Constance, 6 July 1415. It developed out of an association formed in 1457 in Kutná Hora which was intended to foster pure Christian teaching and life within the National Church. Its attitude toward the abuses of the time and its rapid growth caused it soon to be put under proscription by the authorities. Drastic measures intended to suppress and disintegrate it had the contrary effect. It formed a more compact union, perfected its organization and gradually became a distinct church with its own recognized and established through the good offices of Waldensian bishops who conveyed the historic episcopate to it in 1467. A system was developed which followed primitive Christianity in its elementary principle. With the increase of its own self-sustaining unit, based on Scripture, bound by a Brotherly Agreement and governed by an elected eldership. With the increase of congregation, the Synod was formed, legislating by delegated authority. The Synod committed executive control to the Council which was also elective and representative, for while the episcopacy stood at the head, the presbytery and the laity had a voice in it, with the central principle of confessional government and collegiate administration fixed. This principle, inherent in the episcopate, is cardinal in the modern structure of the Church, adjusting together conceptions of polity commonly regarded as opposites and presenting affinities to widely divergent church types.

Its history during the ancient period is to a great extent one of cruel persecution. Its speedy recuperation after such ordeals and its increase during intervals of peace were phenomenal. When the German Reformation began in 1517, the Bohemian and Moravian Brethren numbered nearly 200,000 with about 400 places of worship. In the baronial castle and in the peasant's cottage loyalty to their Church, which embodied the best ideals of the nation, rendered them amenable to a discipline in which they stood pre-eminent and made them a strong moral power to be coped with by ecclesiastical and political authorities. In their highest ascendency they led the educational and literary activity of the regions in which they were established. Their formulated conceptions of Christian doctrine were a gradual growth. Their last and most mature confession of faith before the overthrow of the Church in its original seats was published in 1573.

The Counter-Reformation inaugurated by Ferdinand II in 1621 brought the organized existence of the Church to an end in Bohemia and Moravia, subjected many of its members to martyrdom and drove thousands into exile. It was excluded from the terms made to other evangelical parties in the Peace of Westphalia which ended the Thirty Years' War in 1648 and the hope of its resuscitation in its home-lands was crushed. The parishes of its Polish province, founded in 1548, maintained an organized existence much longer, but they were gradually absorbed by the Reformed Church of Poland of which ultimately even the clergy in whose persons the episcopate of the Unitas Fratrum was being perpetuated in the hope of its renewal were legally recognized ministers.

The first step in the restoration of the Church occurred in 1722, when a little company of refugees from Moravia were given an asylum by Nicholau Lewis, Count of Zinzendorf. In his estate at Breitenfeld, on the Elbe, here, on 17 June of that year, they began a settlement which was called Herrnhut. Many others from Moravia, Bohemia and different parts of Germany joined them during the next few years.
and a gradual process of organization took place in which the plans of the Moravians were merged with those of Zinzendorf who had in view rather an evangelical association harmonizing different confessional affiliations and Church traditions, with the necessary adaptation of the whole to its situation within the pale of the state church. The doctrinal articles of the Augsburg Confession were adopted and concessions from the Saxon and Prussian governments permitted the establishment of Moravian Church order and constitution modified to suit the new conditions.

The Moravian episcopate was transferred to the new organization on 13 March 1735, when David Nitschmann was consecrated a bishop at Berlin by Bishop Daniel Ernst Jablonsky with the written concurrence of Bishop Christian Sikovius of Liessa, they being the last two surviving bishops of the old line. A notable spiritual experience which marked the year 1727, when the first definite organization took place at Herrnhut, produced an intense zeal for evangelization. The result, during the next few years, was the establishment of other congregations on the continent of Europe, the founding of the Church in England, and派人 missions to the heathen which have chiefly given the Church its reputation. The first such mission was begun in 1732 on the island of Saint Thomas, West Indies.

The first Moravian evangelist came to Pennsylvania in 1734. The first settlement in America and mission to the Indians was founded at Savannah, Ga., in 1735. Untoward political causes caused its abandonment in 1740 and the removal of the colonists to Pennsylvania, where a permanent settlement arose in the present Northampton County, with organized activity in Philadelphia and New York and an extensive itinerary among white settlers and Indians. The Moravian pioneers in the Forks of the Delaware first located on a tract of land which the evangelist George Whitefield had purchased and named Nazareth, where he proposed to found a village and a negro charity school. This property came into possession of the Moravian Church in 1731. The chief settlement of the Monocacy Creek and the Lehigh River its chief settlement was founded in that year and at Christmas 1741, when Count Zinzendorf was at the place, it received the name Bethlehem. In June 1742, a considerable colony from Europe joined the pioneers and the settlement was regularly organized. The population was divided into an itinerant and a local congregation, the former to engage in gospel work among white settlers and Indians, the latter to develop the settlement and provide support for the missionaries. Thus, from the first, Bethlehem was the centre of the Moravian Church in America and of its various activities.

Until 1762 a co-operative union was maintained at Bethlehem and Nazareth which was called the General Economy. All labored for a common cause and received sustenance from a common stock, but there was no surrender of private property and no obligation which prevented the individual from withdrawing when he chose. Of diverse occupations during those years on vessels owned and managed by the Church and under the arrangement which existed results were accomplished which would not otherwise have been possible. The material benefits of the settlement were appreciated by the authorities of Pennsylvania, and the spiritual activities prosecuted by the Moravians, although misunderstood and opposed by some, as was the case also in Europe, were epoch-making in the religious growth of the country.

Two notable lines of effort in colonial times, in addition to the Indian missions, were the propagation of Zinzendorf's idea of evangelical alliance and denominational federation, and religious education of children. Desiring to diminish rather than increase denominational divisions the leaders of the Church generally refrained from organizing distinctly Moravian congregations and in consequence of this policy the Moravian Church remained numerically a small body. The European plan of the Church to concentrate in exclusive settlements to some extent was followed for a full century. Besides Bethlehem and Nazareth, General Snyder's Villages, founded prior to the Revolutionary War, were Lititz in Lancaster County, Pa., Hope in Sussex, now Warren County, N.J., abandoned in 1808—and Salem, now a part of Winston-Salem in Forsyth County, N. C., the central settlement of which landed in the early years. Wachovia and named the earl of Granville and named Wachovia. These places continued long to be conserving centres of all that was distinctive in the religious and social life of the Moravian Church, as fostered under the influence of Zinzendorf's ideas and methods, presenting interesting experiments in municipal government, industrial order and general culture. They are yet the seats of widely known educational institutions, all founded in the 18th century. A few of the town and country congregations organized in colonial times, without the peculiarities of the church settlements, are yet in existence. During the years from 1844 to 1856, the exclusive system was entirely abolished by all of the Moravian villages in America and their unique character rapidly disappeared. At that period active home mission work was revived and since then many congregations have been founded in various parts of the United States. The most fruitful of these efforts have been in several of the Northwestern States.

The Moravian Church has no peculiar doctrines. It is simply and broadly evangelical, in harmony with other Protestant denominations on the cardinal doctrines of Christianity, and bound by no articles on the points of difference. Its only prominent doctrinal feature is the strongly Christ-centred tendency of its teaching which pervades its official statements, its liturgy and its characteristic preaching. The digest ("Results") of the Old and New Testament catechisms and the Easter Morning Litany sufficiently set forth the doctrinal position of the Church. The Church has an established liturgical system, with a litany used regularly on the Lord's Day, and a variety of offices for different Church seasons, in which special prominence is given to singing; the cultivation of church music having always been a conspicuous feature of the Moravian cultus. The general order of the ancient church year is observed in the Church, and by some congregations, the love-feast, introduced in 1727 in imitation of the Agape of the Apostolic Church, is the most conspicuous. Moravian orders of the ministry are bishops,
presbyters and deacons. A diocesan episcopacy does not exist. The bishops are, as such, everywhere on a parity, representing the entire Unita Fratrum. They are ex officio members of the General Synod and of the synods of the several provinces in which they reside. Besides having the exclusive function of ordaining men, they are looked to as pre-eminent the guardians of sound doctrine and established order. In governing boards they are the officers, not by virtue of episcopal authority, but by election, and those who do not occupy executive positions serve, meanwhile, in pastorate. The Moravian Church in America is divided into a Northern and a Southern province, constituting, with the British and German branches of the Church, an organic unity under the General Synod. The legislative authority of each province is the Provincial Synod which elects an executive board known as the Provincial Elders' Conference and composed usually of a bishop and two presbyters. The Northern province is divided into districts, each organized with its synod and its executive board. The communicant membership of the American Church in 1917 was 21,302 and its total 30,441. The church membership in the immediate provinces of the Church was 109,079 and its grand total in all countries was 156,210, besides 70,000 members of the state churches of Europe, ministered to by Moravian home missionaries.

Bishop J. M. Levering.
Revised by J. H. Clewell,
President of the Moravian Seminary and College, Bethlehem, Pa.

MORAVIAN SEMINARY AND COLLEGE FOR WOMEN, at Bethlehem, Pa., founded almost at the beginning of the Moravian settlement of Bethlehem (1741), it is the second oldest girls' boarding school in the United States, the Ursuline Academy, New Orleans (7 Aug. 1727), being the first. 'Colonial Hall,' built in 1748, is the oldest structure in the group of buildings owned by the seminary. From the roof of this building it was customary in pre-Revolution days to play the trumpet on feast days to announce the death of members. Tradition says that on one occasion during the French and Indian War a band of Indians had planned to attack the settlement, and at sunset as they lay waiting on Calypso Island, for the darkness, they heard a strange melody floating down from the sky. They had never heard anything like it before, and thinking it must be the voice of the Great Spirit warning them, they held a hurried council, and silently stole away in the darkness. In 1776-78, 'Colonial Hall' served as a military hospital for the Continental troops. After the battle of Brandywine the place was crowded with wounded. On the slope of the hill, just west of Moravina peak, are the graves of over 500 of unknown dead. Many distinguished women of the nation have graduated at this institution. A preparatory school, music, art and science departments are connected with the seminary, and 10 years ago a fully accredited college course leading to A.B. (and B.S. degrees was added, and is recognized by the College and University Council of Pennsylvania. The average attendance is about 200, the number of teachers 20.

MORAVIANS. See Moravian Church.

MORROWETZ, mör'-wēts, Victor, American corporation lawyer; b. Baltimore, 3 April 1859. He studied at foreign universities, and received the degree LL.B at Harvard (1879), and was a prominent lawyer and judge in the practice of law he has acted chiefly in the capacity of counsel for railway and other corporations. He was general counsel, director and chairman of the board of directors of the Atchison, Topeka and Santa Fé Railway Company, and is now director and member of the executive committee of the Norfolk and Western Railway Company, as well as director in other corporations. He was made LL.D. in 1914 by Williams College. He wrote 'Law of Private Corporations' (1882); 'Banking and Currency Problem in the United States' (1900).

MORAY, mōr'ē, Earl of. See STUART, James, Earl of Murray or Moray.

More correctly STEWART: it was Mary Queen of Scots who adopted the latter spelling STUART.

MORAY FIRTH, Scotland, a large bay on the northeast coast, containing at its widest extent the sea enclosed by a line running from Dunscairn Bay in Caithness-shire to Kinness Head in Aberdeenshire. It thus comprises the Deveron Firth and the inner Moray Firth, to which the name is more strictly applied, the entrance to which lies between Tarbet Ness in Cromarty and Burghhead in Elginshire, and which gives off Cromarty Firth and Beauly Firth and Loch. The opening of the outer firth to the North Sea is 80 miles in width. The rivers which enter the firth include the Deveron, Spey, Findhorn, Ness, Beauly, Oykel.

MORAYS, eel-like fishes of the family Muranidae. There, says Jordan, may be distinguished by the small round gill openings and the absence of a pharyngeal arch. They are small in size and tough, the narrow jaws are armed with knife-like or else molar teeth, and the lower one is moved by muscles of extraordinary size and power. They are carnivorous and pugnacious fishes, and some of them, which reach a length of 10 or 20 feet, may be dangerous to bathers and fishermen. They abound in the tropics, lurking in the crevices of rocks, coral reefs and similar places, and most of them are colored in striking patterns, as fine marblings of black or lustrous green, or varied spotlings.
Several genera and more than 100 species are known, of which a celebrated type is the murana (Murana bellina) of the Mediterranean Sea, which was extensively cultivated by the Romans, in the classic period, for the sake of its flesh. Two or three species are well known as food-fishes on both coasts of tropical America, and one, usually called "conger," is similarly utilized in southern California.

MORAZAN, Francisco, frań-sēsˈkō mō-rä-sän′, Central American soldier and politician: b. Tegucigalpa, Honduras, 1799; d. San José, Costa Rica, 15 Sept. 1842. He early entered political life and in 1824 was secretary-general of Honduras; when Honduras and Salvador revolted against President Arce of Central America, Morazan came rapidly to the front as a military leader, and in 1830, after a series of brilliant military exploits, was elected President of the Central American Confederation. Though a wise ruler, his administration was interrupted by several revolts. At the close of his second term it was found that no provision had been made for electing his successor, and in spite of efforts the union of the states of Central America was dissolved and he himself compelled to find refuge in Peru. In 1842 he landed in Costa Rica, proclaimed the federation of the states, and after defeating Carillo assumed the Presidency at San José. A revolution followed directed against his federal activities and he was captured and shot. Consult Bancroft, "History of Central America" (Vol. III, 1887).

MORDANT, in dyeing, a substance which is capable of penetrating the fibres of the substance that is to be colored, or of forming an insoluble deposit upon them, and which also forms an insoluble compound with the dye that is to be used. Mordants vary greatly in character, according to the nature of the dye and of the fabric. They may be classified, however, as "acid" and "basic," an acid mordant being required to fix a basic dye and a basic mordant to fix an acid dye. Tannic acid is a typical example of an acid mordant. Cotton may be mordanted with this substance by soaking it in a solution of tannic acid and then picking it through a solution of a salt of antimony, tin or some other suitable base, by which the tannic acid is fixed upon the fibre in the form of an insoluble tannate, with which the dye subsequently combines. The acetates and sulphates of aluminum and of iron may be cited as examples of basic mordants. Wool may be mordanted, for example, by boiling it in a dilute solution of such a salt (usually with the addition of certain other substances, such as cream of tartar or oxalic acid), the wool causing the mordant to partially dissociate, so that the head of his class from West Point in 1850, he became 2d lieutenant of engineers, and after work as instructor at West Point and assistant engineer was appointed captain of ordnance corps 30 May 1832. He was assistant to the chief of ordnance at Washington (1838-42) and member of the ordnance board (1839-60). Brevetted major (1848) for meritorious conduct in the Mexican War, he was sent to the Crimea (1855-57), his observations on military organization and ordnance being published by order of Congress in 1860. He resigned from the service in 1861, settling in Philadelphia, where, after acting as assistant engineer of the Mexican and Pacific Railroad (1863-66) and as treasurer (1867-87) of a canal and coal companies controlled by the Pennsylvania Railroad. Among his works are "Digest on Military Laws" (1833); "Reports of Experiments on Gunpowder" (1845-49); "Artillery for the United States Land Service," as devised and arranged by the Ordnance Board with plates (1849); "Ordinance Manual for the Use of Officers of the United States Army" (1841 and 1850).

MORDECAI, Alfred, American engineer, son of the preceding: b. Philadelphia, 30 June 1840. On graduating from West Point (1859) he was brevetted 2d lieutenant of topographical engineers. After service on the field (June-August 1861) he taught at West Point for nearly a year and then was promoted until he became chief of ordnance, Department of the South (1863-64). From May to September 1864 he was chief of ordnance, Army of the James, later holding similar office in the Army of Ohio, Army of the Cumberland, and military division of the Tennessee. Breved lieutenant-colonel for services in the war (13 March 1865), he was instructor of ordnance and gunnery at West Point 1865-70, and again 1874-81. He was commander, with rank of colonel, of the Benicia (Cal.) arsenal, 1899-1902; promoted brigadier-general and retired in January 1904.

MORDENITE, a native hydrous silicate of aluminum, potassium, sodium and calcium, occurring in small monoclinal crystals, or in small hemispherical concretions with a fibrous structure. It is white, or nearly so, with a vitreous lustre. Mordenite occurs at Morden, N. S., and in western Wyoming.

MORDVINS, mōrdˈvins, a race of people scattered over the Volga provinces of European Russia and to the south and east of these, and belonging to the Ural-Altaic family. There are two distinct groups, the Ersh or northern and the Moksha or southern, with differences in feature, and the latter darker hue. They are a well-built, hardy race, and superior to the Russians by whom they are surrounded. Their chief sources of livelihood are cattle-rearing, hunting, fishing and bee-keeping, and they are famous as carpenters and woodworkers. They are nominally Christians; their conversion beginning at the time of the Empress Anna; but their Christian beliefs have been superimposed on remains of the old pagan worship. Pop. about 1,000,000.

MORE, mōr, Hannah, English moralist: b. Stapleton, near Bristol, 2 Feb. 1745; d. Clifton, near Bristol, 7 Sept. 1833. She was educated in the seminary in Bristol kept by her elder sisters, and her talents early made her acquainted with Johnson, Burke, Garrick and other literary men of the period. Her first
success was as a dramatic writer. 'The Inflexible Captive'; 'Percy'; and 'The Fatal Captive' were successfully brought out through the patronage of Garrick and her other friends.

After the production of the last in 1795 she gave up playwriting from religious motives, and devoted herself to writing works of a moral and religious tendency, the diffusion of tracts and other philanthropic labors. In this new course her talents commanded an extraordinary number of subscribers. A series of tracts called 'The Cheap Repository,' commenced at Bath in 1795, is said during the first year to have had a circulation between 1,000,000 and 2,000,000 copies, and led to the foundation of the Religious Tract Society. Her most popular fiction, 'Celebs in Search of a Wife' (1809), ran through eight editions in the course of a year, and passed through 30 editions in America.

Sydney Smith's hostile review of this work in the Edinburgh is highly diverting. Her works include 'Strictures on the Modern System of Female Education' appeared in 1799, followed by 'Hints Towards Forming the Character of a Young Princess' (1805); 'Practical Piety' (1811); 'Christian Morals' (1818) and 'Sketches on the Character and Life of Saint Paul' (1815); 'Morals and Sketches, with Reflections on Prayer,' (1817). Consult Roberts, 'Life of Hannah More' (1838); Thompson, 'Life of Hannah More' (1858); 'Correspondence of Hannah More with Zachary Macaulay' (ed. by Roberts, 1860); Yonge, C. M., 'Hannah More' (1888); Halland, Marion, 'Literary Hearthstones: Hannah More' (1900).

MORE, Louis Trenchard, American educator: b. Saint Louis, 9 April 1870. He studied at Johns Hopkins taking (1895) the degree of D. I. R. and was instructor of physics (1896) at Worcester Polytechnic Institute and was appointed instructor and adjunct professor of physics at the University of Nebraska (1896-1900), becoming professor of physics (1900) and dean (1910-13). He was dean of the Graduate School (1916-17) at the University of Cincinnati. He has written 'The Limitations of Science' and contributed many articles to the technical press on such subjects as light, electricity, magnetism, ionization and sound.

MORE, Nicholas, English colonist: b. England; d. Philadelphia, Pa., 1689. He was a physician and left a promising career in England to come with William Penn to America in 1682. He was from the first prominent in the affairs of the colony, was president of the first assembly in 1682 and in that year presiding judge of the courts of Philadelphia. In 1683 he was clerk of the provincial council and the next year was speaker of the assembly. He was appointed first chief justice of the Supreme Court of the province in 1684, and in this position incurred the disapproval of the colony and was impeached for having wielded an unlimited and arbitrary power. He retained the confidence of Penn, however, who appointed him in 1686 one of the five commissioners in control of the government.

MORE, Paul Elmer, American author: b. Saint Louis, Mo., 12 Dec. 1864. He was graduated Harvard in 1887, studied later at Harvard and was instructor in Sanskrit there for a year and subsequently at Bryn Mawr for two years. He was literary editor of the Independent, 1901-03, and of the New York Evening Post, 1903-14. He also was editor of the Nation from 1909 to 1914. To it he contributed many valuable reviews and essays of scholarly criticism. His fine scholarship and effectiveness of pen had placed him in the front rank of American literary critics. He has published 'The Great Re- fuse'; 'A Century of Indian Epigrams: chiefly from the Sanskrit of Bhartrihari' (1898); 'The Judgment of Solomon', 'Life of Dr. Franklin'; 'Translation of the Prometheus Bound of Aeschylus'; 'The Jessica Letters,' with Corra Harris; 'Shelburne Essays' (9 vols., 1904-13); 'Nietzsche' (1912).

MORE, Sir Thomas, English statesman and author: b. London, 7 Feb. 1478; d. there, 6 July 1535. In 1492-94 he studied at Canterbury Hall, now Christ Church, Oxford, and in 1494 was a student in Lincoln's Inn. At 21 he obtained a seat in Parliament, and distinguished himself with spirit in opposition to a subsidy demanded by Henry VII. After being admitted to the bar he enjoyed great reputation as a pleader. In 1516 he accompanied the commissioners sent to renew the alliance between Henry VIII and Charles, then Archduke of Austria, and showed much ability. In 1516 he published his celebrated political romance 'Utopia,' Cardinal Wolsey gave him a pension, which he refused as inconsistent with his official duties; but he was induced to accept the place of master of requests. He was shortly after knighted, and taken into the Privy Council. In 1521 he was appointed treasurer of the exchequer, and in 1523, at the instance of Wolsey, was elected speaker of the House of Commons. He was joined with Wolsey in a mission to France in 1527 and on his return made Chancellor of the Duchy of Lancaster. In 1529 he succeeded the cardinal as Lord High Chancellor, which office he filled for three years with scrupulous integrity, but he was severe in his punishments for heretical opinions. Unable to acquiesce in the king's wishes respecting his divorce from Catherine of Aragon, he obtained permission to resign the seals. The affront rankled in the mind of Henry, and was further inflamed by his refusal to attend the coronation of Anne Boleyn. An attempt made to implicate him in the practices of Elizabeth Barton altogether failed; and he also perfectly cleared himself of the charge of inducing the king to publish the book against Luther, in which the Pope's authority was upheld—a doctrine now found inconsistent with the intended attack on the Roman See. The king was declared supreme head of the Church in 1534; but More steadily refused to recognize any other head than the Pope, declined to take the oath of supremacy and was consequently committed to the Tower and indicted for treason. After an imprisonment of 12 months he wrote a 'Dialogue of Comfort against Tribulation' and a treatise on Christ's passion. At his execution he comport himself with dignity and with a
MOREA—MOREEN

great degree of good humor. The news of his death startled Catholic Europe, and British ambassadors were instructed to explain that all was done by due legal process. More's letters, including excerpts of, abundant and his elocution ready and agreeable. He wrote elegant Latin prose and verse, and a terse and simple English. His 'Utopia' is a classic of literature, and he, one of the brightest spirits of the Renaissance. The second of the theme of beatification, that of Blessed John has been conferred on More by the Roman Catholic Church. His English works were published collectively, in 1557, and his Latin in 1567. (See UTOPIA.) Consult the 'Life' by Reuter (1820), reprinted 1716, and Stapleton's 'Trés Thomae' (1838), the principal sources; and the biographies or studies by Bremond (Eng. trans. with bibliography, London 1904); Bridgett (ib. 1891); Campbell's 'Lives of the Chancellors' (ib. 1845-48); Sir Sidney Lee's 'Great Englishmen of the 16th Century' (ib. 1904); Manning's 'Household of Sir Thomas More' (ib. 1851) and 'The Book of Sir Thomas More' in 'Malone Society Reprints' (ib. 1911). MOREA. See PELOPONNESUS.

MORÉAS, mòr-à', Jean, French poet and author: b. Athens, 15 April 1856; d. 1910. His real name was Jean Papadimitriopoulos. He was sent to Paris to study law but, from 1882, devoted himself entirely to poetry. His poems, 'Les Syrtes' (1884) and 'Les Cantilenes' (1886), made him one of the most prominent representatives of symbolism. In the novel, 'Le Thé chez Miranda' (1886), so hard to understand, he tries to bring prose under the same new tendency. His poem, 'Le Pélérin passionné' (1891), shows a happy leaning toward Ronsard. The six books of 'Stances' (1905) contain most of his most perfect works. He wrote a version of Euripides' 'Iphigenia in Aulis' (1903) in semi-archaic language, which was produced at the Odéon, Paris, with success. Consult Gourmont, J. de, 'Jean Moréas' (Paris 1905).

MOREAUX, mòr-ro, Gustave, French painter: b. Paris, 1826; d. there, April 1898. He began his career under the influence of Delacroix, but on going to Rome he chose as his special subjects of study the fantastic architectural effects of Mantegna and the dramatic composition and sometimes violent poses of Luca Signorelli. His works show the characteristics of these masters and are eminently original both in design and coloring, though little known until the latter days of his life, as he seldom exhibited until he was past 40, or offered his works for sale. On his death he left upward of 800 canvases to the municipality of Paris to form the Musée Moreau. In 1892 he was awarded a medal at the École des Beaux-Arts and held the position till his death. He was made an officer of the Legion of Honor in 1883. His most notable pictures are 'Death and the Young Man' (1865); 'Orpheus' (1867) in the Luxembourg; 'Prometheus' (1868); 'Hesiod and the Muses' and 'The Apo- partition,' the last two in the Luxembourg also. Consult Dr. Kanen, 'Moreau' (Paris 1900); Flot, 'Le Musée Gustave Moreau' (ib. 1905); Muther, 'History of Modern Painting' (London 1896).

MOREAUX, Hégesippe, French poet: b. Paris, 9 April 1810; d. there, 20 Dec. 1838. Of illegitimate descent, losing both parents early, he died young, in poverty and need, in a hospital. He set up type for a book-shop, first in Provin, then at Paris, but found no favor or success in his writings. Tenderness and nobility of character appear in his earlier poems with excellent effect but his more mature works show the ill of fashion and the world's sorrows. His finest for two years, the elegies, 'La Voulzie,' etc. Among his novels are 'La Fermière,' 'Contes de ma sœur' and the shy prose novelles, 'Le gui de chêne,' etc. His works are published under the title 'Myo- socia' (1838) and his correspondence in 'Œuvres complètes' (1890-91). Consult Moret, J., 'Hégesippe Moreau' (Paris 1871).

MOREAU, Jean Victor, French general: b. Morlaix Finistère, 11 Aug. 1763; d. Laun, Bohemia, 2 Sept. 1813. His father was a lawyer and the son, apparently against his will, studied law and held a post in the judiciary at Rennes. But at the beginning of the revolution he entered politics, formed a company of the National Guard and in 1791 was elected lieutenant-colonel of a volunteer battalion which joined Dumouriez in the field. He rose rapidly, replaced Pichegru in 1795 as commander of the Army of the North, and in 1796 was put at the head of the Army of the Rhine and the Moselle. His retreat before a superior force after Jourdin's defeat at Würzburg, and his swift movement to the attack again before the truce of Leoben proved him a masterly strategist. Momentarily retired for failure to reveal Pichegru's Royalist plot, he was recalled in 1799; served under Schérer in Italy and largely recouped his superior officer's losses; succeeded Joubert after that general's death; was Bonaparte's confidant in the coup d'état of 18th Brumaire; passed the Danube and the Rhine; defeated the Austrians in a series of brilliant engagements culminating in Hohenlinden (1800); and then with the backing of the Royalists attempted to oust Bonaparte. He was found guilty of plotting against Napoleon and was exiled from France where he spent a farm in Pennsylvania. Although Republican in his sympathies, in his last campaign he took arms with the Allies, served against France in 1813 and was killed at the battle of Dresden. Consult Jochmus, 'General Moreau' (Berlin 1814); Ar Renan, 'Moreau' (Paris 1900).

MOREAU RIVER. One of the larger branches of the Missouri River draining a wide area in northeastern South Dakota. Its length is about 180 miles. The name is a French one, signifying a dark horse or nosebags. On some maps the name Owl River is improperly given to this stream.

MORECAMBE, mòr-kum, England, a Lancashire seaside resort on Morecambe Bay, four miles by rail northwest of Lancaster. Its principal features are the promenade pier, three miles long, observation tower, winter garden, etc., and the fine beach of Morecambe Bay, this inlet of the Irish Sea being about 18 miles long and 10 miles broad. Pop. 12,131.

MOREEN. See More.
MOREHEAD, John Henry, American public official: b. Lucas County, Iowa, 3 Dec. 1861. He was educated in the public schools, removed to Nebraska in 1883 and taught school for some time. Later he engaged in mercantile affairs at Barada, Neb., and in 1896-99 served as county treasurer and auditor of Fremont County. In 1900 he was mayor of Falls City and in 1910 was elected member of the Nebraska senate. He was president pro tempore of the senate and lieutenant-governor in 1910-11 and served as governor of Nebraska for the terms 1913-15 and 1915-17.

MOREL. See FUNGI.

MORELAND, William Hall, American Protestant Episcopal bishop: b. Charleston, S. C., 9 April 1861. He was graduated from the University of the South in 1881 and was assistant rector at Christ Church, Hartford, Conn., in 1884-85. In 1885-93 he was rector at the church of the Good Shepherd, Nashua, N. H., and in 1893-99 rector of Saint Luke's, San Francisco. He was consecrated bishop of Sacramento in 1899. He has published 'What is Christianity? (1887); 'The Church or the Churches: Which?' (1894), etc.

MORELIA, Mexico, capital of the state of Michoacan, situated on the line of the National Railway, 234 miles west from the city of Mexico, elevation 6,314 feet above the sea, distant by straight line from the nearest point on the Pacific Ocean about 140 miles. The city was founded in 1541 and known as Valladolid until 1828, when it was given the name of Morelia in honor of Morelos (q.v.), patriot and soldier, who was a native of the city, to whom the most notable monument in the city is dedicated. Morelia is set on a rocky eminence rising from the Guayangareo Valley, which is almost surrounded by mountains, and in climatic conditions favorable to the successful cultivation of nearly all grains, fruits and vegetables. Patzcuaro Lake, the most beautiful body of water in the republic, is only 39 miles to the southwestward. The College of Saint Nicholas was founded in 1533; there was at this time a School of Medicine (in the General Hospital) and the Charity Hospital for Women, are among its institutions. There are several well-equipped libraries, the State Library having a remarkable collection of rare books. The great cathedral, begun in 1640 and completed in 1741, is a very imposing edifice. A stone aqueduct of exceeding beauty supplies water for domestic purposes. Cottons and woolens and sugar are among its industries, and guayabate, a high-grade confection, there are extensive barrancas. The streets are well paved, with electric lighting and a municipal tramway system. Pop. 40,042.

MORELL, George Webb, American soldier: b. Cooperstown, N. Y., 8 Jan. 1815; d. Scarborough, N. Y., 12 Feb. 1883. He was graduated at the West Point Military Academy (1836) and was commissioned as a second lieutenant of cavalry. He worked three years in Michigan and southern coast States on railroad construction, settling (1840) in New York to study law. He was admitted to the bar (1854) and began practice but was made commissioner of the United States Circuit Court for the southern district of New York. When civil war broke out he was inspector-general on the staff of Major-General Sanford, with the first division New York State militia, and accompanied it to Washington. He was colonel on General Patterson's staff during the Shenandoah campaign and was promoted to brigadier-general, then major-general, commanding the 2d brigade, 2d division, 5th Army corps, to be given next command of a division. He was in command of the supports of the celebrated battery of 100 guns at Malvern Hill, and was engaged at Hanover Court House, Mechanicsville and Gaines's Mills. He contracted germs of disease during the Chickahominy campaign that later proved fatal. He lived on his farm at Tarrytown, N. Y., after being mustered out of the service and was senior warden for many years at Trinity Episcopal parish church, Tarrytown.

MORELLI, John Daniel, English philosopher and inspector of schools: b. Little Bad- dow, Essex, 1816; d. 1891. He studied at Glasgow, taking (1841) the degree of M.A., when he went to Bonn to study theology and philosophy. He was made Congregational minister at Gasport (1842-45), becoming inspector of schools (1846-76) through the influence of the Duke of Devonshire. He wrote numerous works dealing with English grammar and spelling, as well as his better known 'Historical and Critical View of the Speculativ Philosophy of Europe in the Nineteenth Century' (1846), and his 'Philosophy of Religion' (1849). Other works are: 'On the Philosophical Tendencies of the Age' (1848); 'Philosophical Fragments' (1878). Consult Theobald, R. M., 'Memorials of J. D. Morell' (London 1891).

MORELLA, mō-rəˈlə, Spain, town in the province Castellon de la Plana in the mountain district Maestrasgo. It has a 14th century Gothic church, and an aqueduct, a powerful castle and is surrounded by walls with towers. Its industries consist of cloth and cotton fabric factories, dyeing establishment, etc. This is the location of the old Roman Castra Aelia, and it played a prominent role during the Cantab wars. In 1382 it was renamed Mollars, the name assumed by Cabrera, who received the title Count of Marella. In 1910 it had a population of 6,722.

MORELLI, mōrɛlˈli, Domenico, Italian historical painter: b. Naples, 1826; d. there, 13 Aug. 1901. His true name was Soliero. He studied at Rome under Camillo Guerra, advancing his talent under the influence of Filippo Palizzis, studying nature. He ripened thus into a historical and genre painter of the most successful form, especially through his attractive religious pictures. His chief early works were 'The Sicilian Vesper,' 'Count Lara,' 'The Refugees from Aquileja,' etc. In 1867 he turned to biblical work with his 'Christ Walking on the Sea,' a grand work; 'The Descent from the Cross,' 'Christ in the Desert,' etc. He painted the 'Ascension of the Virgin' for the royal palace at Naples. He created several 'Temples of San Antonio' of other work, the fruits of his journey in the Orient were 'A Street in Constantinople,' 'The Road to the Bath,' 'The Prayer in the Wilderness' and 'Mohammed before the Battle.' He was made senator of the kingdom of Italy and became director of the Institute of Fine Arts and the Museum of Applied Arts at
MORELLI—MORETO Y CABAÑA

Naples, where he used his best influence to advance the decorative arts at the latter institution's classes. Consult Willard, 'Sketch of the Life and Works of Domenico Morelli' (Boston 1881).

MORELLI, Giovanni, Italian art critic and statesman: b. Verona, 25 Feb. 1816; d. Milan, 28 Feb. 1891. He was educated at Bergamo, then Aarau (Switzerland), but turned his studies to natural science at Munich, becoming interested at the same time in art through Genelli, the painter. After a short stay at Erlangen and a visit to Berlin, where he made the acquaintance of Waagen, the art critic, he joined (1838) Agassiz in investigating the Swiss glaciers. In Paris and Siena and through numerous journeys he gained increasing culture and made acquaintance with Manzoni, Capponi and other prominent Italians. In 1848 he took to politics for a short while, never returning to that field till (1859) he was made commander of the National Guard at Magenta. In 1860-70 he was elected deputy for Bergamo, and in 1873 became senator of the kingdom of Italy. His knowledge in art criticism gained during his travels he published in treatises in Zeitschrift für bildende Kunst (1874-76). His work 'Die Werke italienischer Meister in den galeries von München, Dresden und Berlin' (Leipzig 1880), contains his criticism, empiric principles being their base, and show unexcelled connoisseurship. As sequels to this clever work amplifications are contained in the later published 'Kunstkritischen Studien über italienische Malerei': Vol. I, 'Die Galerien Borghese and Doria Pamphili in Rom' (Leipzig 1880), Vol. II, 'Die Galerien zu München und Dresden' (ib. 1891) and Vol. III, 'Die Galerie zu Berlin' (ib. 1893). Italian translations of these were published (Milan 1897). His 'Kunstkritische Studien' has been translated by Foulkes into English under the title of 'Italian Painters; critical studies of their works' (1892). In 1895 a monument was erected at Milan to the memory of this genius of keen critical art research.

MORELLY, R., French publicist of the 18th century: b. Vitry-le-François. Beyond the plausibility of his birth and the fact that he became an abbé there, nothing whatever is known of his life. His works, however, are known and important; they are philosophical and socialist, and consist chiefly of 'Le prince; les délices du cœur, au traité des qualités d'un grand roi, etc.' (2 vols. Amsterdam 1751), a description of a prince who made his people happy by carrying into action philosophical ideas: 'Naufrage des îles flottantes, ou la Basilide du célèbre Bilpai' (1753), an allegorical communist novel which depicts a people ruled by natural laws instead of political. His third work was 'Code de la Nature' (Amsterdam 1755; Paris 1841), erroneously attributed to Diderot, which sketches a perfect communist organization and is said to have had considerable influence in the formation of the social programs of the French Revolution.

MORELOS Y PAVON, José María, hó-sá-mi-ré-loz e pé-vón, Mexican patriot: b. near Apatzingan, Michoacan, 30 Sept. 1765; d. near City of Mexico, 22 Dec. 1815. He worked for many years as a muleteer; at 32 entered the college of Valladolid; was ordained to the priesthood three years afterward; and from 1801 to 1810 was in charge of the parishes of Caracuaro and Nucupetaro. In 1810 he joined the standard of rebel priest Miguel Hidalgo, who had been rector of the college of Valladolid during Morelos' student days, and after Hidalgo's death kept the cause alive in the north by his own vigorous movements in the south. His few followers soon became an army, and having defeated several Spanish armies he advanced upon the City of Mexico, defeated Portier 22 Jan. 1812, successfully held Cuautla for 62 days against the famous siege by the viceroy, finally making a skilful withdrawal of his forces, and captured Oaxaca (October 1812) and Acapulco (August 1813). He was made captain-general in November 1813 by the Congress convened at Chilpancingo, and the declaration of Mexican independence soon followed. He attempted to capture Valladolid, was defeated by Iturbide, and taken prisoner was shot as a traitor at San Cristobal Ecatepec. His remains lie in the cathedral of Mexico City.

MORELOS, Mexico, an interior state south of the Federal District and the state of Mexico. Capital, Cuernavaca (q.v.). Area, 2,773 square miles; pop. about 183,700. It was named in honor of Gen. José Morelos y Pavón.

MORENO, Alfredo Baquiorizo, ál-frá-dó hā-kwō-re-śō mō-rā-nō, Ecuadorian diplomatist and novelist: b. Guayaquil, Ecuador, 29 Sept. 1859. He was graduated in law from the University of Quito and began the practice of his profession in 1884. From 1897 to 1901 he was a member of the Superior Court of Guayaquil, was Minister of Foreign Relations, 1901-02, was elected Vice-President of Ecuador in 1903, and is now Minister from Ecuador to the United States. He is author of 'Poesías' (1882); and the novels 'Titañia' (1892); 'El Señor Peneo' (1892); 'Un Sueño o Prosa' (1894); 'Evangelina' (1895); 'Luiz' (1901).

MORESNET, mō-rēnēt, a small neutral territory on the Belgo-Prussian border about five miles southwest of Aix-la-Chapelle, traversed by the Belgian Lüttich-Bleiberg on the west and the Prussian Herbsthal-Aachen railways. The only village is Neutral-Moresnet (or Kelmis) with the important calamine (zinc-silicatc) mines and 3,400 inhabitants. The territory was under the protectorate of the signatories of the Vienna Congress (1815) and the citizens had choice of military service with either the Belgian or Prussian army. Many of the inhabitants were French and Dutch, as well as Flemish and German. Under the terms of the Peace Treaty, promulgated 7 May 1919, Belgium was awarded full sovereignty over the contested territory of Moresnet and over part of Prussian Moresnet.

MORETO Y CABAÑA, mō-rē-to i kā-bā'nya, Augustín, Spanish dramatist: b. Madrid, 9 April 1618; d. Toledo, 28 Oct. 1669. Returning home from the University of Alcala, where he had just been graduated in law, he began writing successfully for the stage (1640). In Madrid he soon found a friend and patron in Calderón. He was very prolific, turning out drama after drama until he finally passed the 100 mark before he had reached middle age.
His popularity was immense and he was rated as the equal, if not the superior, of Lope de Vega, by his admirers, among whom were the best critics of the age. Positivity, however, was not a feature of Moreto, and his valuable contributions to the Spanish drama, has not sustained this high verdict of his contemporaries. One reason is that Moreto was not original in the sense that Lope de Vega was. His dramas or "comedias de capa y espada," while clever in themselves and instinct with the dramatic spirit, have more than an echo of Vega and Calderón, from whom he frequently borrowed and sometimes improved upon, as in "El desdén con el desdén," which is generally considered to be his masterpiece. In addition to "dramas of intrigue," he also produced historical dramas and wrote considerable lyrical poetry and autos sacramentales. Moreto's incursion into the field of historical drama was probably occasioned by the decision of the Royal Council and Chamber of Castile which, in 1644, educed the numbers of dramas and comedies licensed and ordered that, in the future, the dramatists should turn their attention to historical drama and plays based on the lives of saints. He found a new field for recasting old plays, comedies and other plays and making them conform to the requirements of the censor, who was, in reality, controlled by the Church authorities who had dictated the new move for restricting the activities of the drama and the stage. Like Shakespeare, Moreto put so much of himself into this work of reconstruction that many of the new-made dramas were more deservedly his than the work of their first creators. He excelled in painting certain human passions and feelings, among them all the shades of love, including undying passion, disdain, the suffering of unrequited love, jealousy, friendship, faithfulness, unfaithfulness, intrigue in love and in the ordinary affairs of life. In this field he surpassed his predecessor and master, Lope de Vega, and led the way for true and delightful character painting in which the Spanish drama and novel have since shown such power and realism combined with idealism. Moreto painted people of more familiar, more earthy life than did Lope de Vega, probably because he was better acquainted with upper class society than was the older dramatist. The complicated complexion of Spanish court life with its intrigues, ambitions, plots and insincerity is well pictured in the dramas of Moreto who swept into his dramatic net every character and condition that he met in his march through life. While he lacks invention and made use, without conscience, of his predecessors and followed the style of drama made popular by Lope de Vega, he gave the Spanish drama characterization and artistic development that it had not previously possessed. He rejuvenated old plays and scenes, breathing into them the breath of life, and he polished his work as no Spanish dramatist had done before his day. He thus pointed the way to the successes that have since his time, been achieved by dramatists and novelists in Spain. Spanish literature, therefore, owes him much. What he lacked in originality he made up in his knowledge of the stage and in his ability to reconstruct the scenes and thoughts of others. His plots move along with rapidity, satisfactory development and wonderful management of dialogue which is ever fluid and graceful. He surpasses his contemporaries in the number and variety of characters which he handles with great skill in his realistic pictures of the extravagances, customs and vices of the life of his day; so that he has made himself the greatest of the Spanish writers of character drama. In this field he shows his deep and wide knowledge of the world and his power to analyze characters and motives, passions and virtues. On the whole, his plays are in better taste and superior in morality to those of any of his contemporaries. Comparatively early Moreto entered a convent, embracing monastic life. From there he sent out numerous plays, became the delight of Maestranza audiences for 10 years or more. Among his notable plays are "De fuera vendrá quien de casa nos echará," "Trampa adelante," "Los Jueces de Castilla," "San Francisco de sena," "La fuerza del natural," "El mandado don Diego," "El parroco," "Santa Rosa de Perú," "El desdén con el desdén," "Rico hombre de Alcalá" and many autos sacramentales.

B., "Spanish Literature" (London 1909); Fernandez-Guerra y Orbe, Luis, "Augustín Moreto y Cabañas" (Biblioteca de autores españoles, Vol. XXXIX); also in Vol. LVIII of the same work for "Autos Sacramentales" of Moreto; Fitzpatrick, "A History of Spanish Literature" (New York 1898); Gias, É., "Studien og Essays" (Copenhagen 1898); Mariscal de Gante, Jaime, "Los autos sacramentales desde sus orígenes hasta mediados del siglo XVIII" (Madrid 1911); Pérez de Alba, Cristóbal, "Bibliography of Spanish Literature" (part 3, Madrid 1907); Ticknor, G., "History of Spanish Literature" (New York 1854).

MORETON (mör'ton) BAY, Australia, on the east coast of Queensland, formed inside the islands of Moreton and Stradbroke, is 40 miles long by 17 broad; its south half is dotted with islands and sandbanks. It contains six considerable rivers, including the Brisbane, with the important city of Brisbane at its outlet. The entrance at the north end is practicable at all times for vessels of the largest size; the entrance between Moreton and Stradbroke islands is narrow and less safe. This Bay was discovered by Captain Cook in 1770, and explored by Flinders in 1799.

MORETO DA BRESCIA, mō-rettō da brachtschē'-ā (his proper name was Alessandro Bonvicino), Italian painter; b. Brescia, 1498; d. there, 1554. He took Titian as his model, imitating also Palma Vecchio and Romanino, whose styles he developed on in part of his own. He was already famous as an artist at 18, and is reckoned a master of pictorial expression, uniting in his coloring tenderness and freshness of flesh tones with a brilliant power of chiaroscuro. His pictures are particularly noted for their bright background, from which his figures stand out with life-like clearness. His frescoes were less successful. His numerous religious paintings are full of devotional feeling. Most of these are at his native town of Bres-
cia. In Saint Clement's Church in that city is a vast altarpiece of his containing a Madonna and Child surrounded by singing angels and the Saints Clement, Dominick, Florian, Catharine and the Magdalen. He painted an 'Assumption' in the church of San Mazzaro. His masterpiece, 'The Virgin Appearing to a Shepherd,' is in the church at Faitone, province of Brescia. There are some fine paintings of his in the galleries at Berlin and Frankfort, and in the Brera at Milan; and examples are to be found also in the public galleries of Vienna, Petrograd, London and Paris. The portraits by this master are equally excellent in conception and power of coloring. Consult the volume in the 'Painters Series' (New York 1910), and 'Masters of Art' (Vol. IX, Boston 1908).

MOREY, mō'ri, Samuel, American inventor: b. Hebron, Conn., 23 Oct. 1762; d. Fairlee, Vt., 17 April 1843. He early evinced a talent for mechanics and engineering, and at the age of 18 he worked on the opening of the Connecticut River to navigation designed and built the locks at Bellows Falls. On his large estates he built chutes with which to bring his pine logs to the mills years before Napoleon's accomplishment of the feat in the Alps. When but 18 he began his experiments with steam, and in 1790 had conceived the idea of propelling boats by means of an improved steam-engine. In 1793 he succeeded in building a boat which attained a speed of four miles an hour, which later he improved and exhibited in New York with a speed of five miles an hour. Morey was often in consultation with Professor Stillman of Yale College as to the value of his inventions; and when Chancellor Robert R. Livingston offered him $7,000 for the patent allowing him to run the boat from North River to Amboy, Morey declined. He continued his experiments, encouraged by an offer of $100,000 for an eight-hour steamboat which Livingston was said to have made, and several patents were issued to Morey which showed that he conceived the object almost within his reach. In 1797 he exhibited a greatly improved boat at Philadelphia and became famous throughout the Middle and New England States. His object seemed practically achieved and arrangements were made for the operation of the steamboats, when misfortune overtook the capitalists who were to promote the enterprise and it failed of operation. Morey is believed by many authorities to have been the real inventor of the steamboat, as Robert Fulton visited him before the exhibition of his own invention.

MORY, William Carey, American professor: b. Attlemore, Mass., 21 March 1843. He left his studies at the University of Rochester to enter the army as volunteer during the Civil War, becoming brevet major and lieutenant-general. Returning to college he graduated (1868) at the University of Rochester and entered (1869) the Rochester Theological School. He was professor of history and English literature at Kalamazoo College (1870-72), becoming professor of Latin and history (1872-83) and of history and political science (1883-93) at the University of Rochester. He had the degree D.C.L. conferred on him by Denison (1903) and Rochester (1908). He wrote 'Outlines of Roman Law' (1884); 'Outlines of Roman History' (1900); 'Government of New York' (1902); 'Outlines of Greek History' (1903); 'The study of Roman Law in Liberal Education' (1911); 'Outlines of Ancient History' (1906).

MORY LETTER, The, in American political history the forgery of a letter during the Garfield-Hancock campaign of 1880. The letter which favored Chinese immigration purported to have been written by General Garfield and to be addressed to H. L. Morey, Lynn, Mass., and was made public in the New York Truth, 20 Oct. 1880, and a facsimile published in the same paper three days later. James A. Garfield, Republican candidate for President, denounced the letter as a forgery, but Democrats made liberal use of the document and many votes, it is said, were lost to the Republicans through the publication of the letter. Consult Davenport, 'History of the Morey Letter' (New York 1884).

MORGAGNI, Giovanni Battista, jō-vän'ni bät-tēs'tā mōr-găn-yē, Italian anatomist: b. Forlì, 25 Feb. 1682; d. Padua, 6 Dec. 1771. After taking his degree of M.D. at Bologna, he went to Venice and ultimately to Padua, where in 1712 he became professor of the theory of physics; and in 1715, as successor of Molinari, was appointed to the principal anatomical chair in the same institution, which he continued to occupy till his death. He was the first to show the importance of anatomy as being the basis of all other medical studies, and is regarded as the founder of pathological anatomy. He established a great reputation, students from all parts of Europe flocking to Padua. His most celebrated works are 'Adversaria Anatomica' (1766-19), afterward enlarged and published under the title of 'Adversaria Omnia' (6 vols., 1741); and particularly his 'De Sediis et Causis Morborum per Anatomam Indagatis' (1761; 6 vols., Leipzig 1827), which has been translated into various European languages.

MORGAN, Charles Hill, American mechanical engineer: b. Rochester, N. Y., 8 Jan. 1831; d. 1911. He was educated at public school and Lancaster Academy, his uncle's machine shop at Clinton, Mass., in his 18th year, studying in spare time mechanics and drawing. From 1855-60 he was draughtsman for Erastus B. Bigelow. He designed and constructed one of the first automatic paper bag machines and associated himself with his brother in paper and paper bag making in Philadelphia. He became superintendent (1864) of Washburn and Moen Wire Works, Worcester, Mass., where he became very prominent as mechanical engineer, bringing about great improvements in the winding, rolling, and drawing processes, etc. In 1887 he became consulting engineer for the American Wire Company, Cleveland, Ohio, and opened up an office in Worcester. In 1891 he established the Morgan Construction Company, of Worcester, Mass., for making rolling mill appliances, etc., and at the same time was president of Worcester Polytechnic Institute. In 1881 the Morgan Spring Company was organized at that city of which he became president. He was president of the American Society of Mechanical Engineers 1899-1900.
MORGAN, Conwy Lloyd, British zoologist: b. London, 6 Feb. 1852. He was educated at the Royal Grammar School, Guildford, and Royal College of Science. From 1878-83 he was lecturer in English and physical science at the Diocesan College, Rondesbosh, Capetown, then (1884) professor of zoology and geology at University College, Bristol, becoming principal (1887-1909). He was appointed vice-chancellor of the University of Bristol, but resigned after three months. He has written 'Animal biology' (1887); 'Animal Life and Intelligence' (1890); 'Animal Sketches' (1891); 'Introduction to Comparative Psychology' (1895); 'Instinct and Experience' (1892); 'Spencer's Philosophy of Science' (1913).

MORGAN, Daniel, American soldier: b. Hunterdon County, N. J., 1736; d. Winchester, Va., 6 July 1802. His early life was passed in obscurity and in 1753 he removed to Virginia where in 1755 he served under Braddock as a teamster. He was afterward engaged in Indian warfare. In 1759 was a member of Pontiac's War and in Lord Dunmore's War. In 1775 he entered the army of the colonists and commanded a company of riflemen under Washington. He accompanied Arnold at Quebec in 1775 and rendered gallant service there but was captured by the British and not exchanged until nearly a year afterward. He was then given command of a Virginia regiment with the rank of colonel, and in the campaign against Burgoyne took a prominent part; but his services not being recognized by Congress, he resigned. In 1780 he returned to the service as brigadier-general under Gates, and under General Greene who succeeded Gates. Morgan won a brilliant victory over Tarleton at Cowpens, which was recognized by a gold medal from Congress. His subsequent movements were of serious annoyance to Cornwallis, but in 1781 he resigned from the army owing to ill health. In 1794 he returned to it as major-general and helped to crush the Whisky Insurrection, and from 1795-99 was a member of Congress. Consultant Graham, 'Life of General Daniel Morgan of the Virginia Line' (1856); McConkey, 'The Hero of Cowpens' (2d ed., 1885).

MORGAN, Edwin Dennison, American politician: b. Washington, Mass., 8 Feb. 1811; d. New York, 14 Feb. 1883. He was educated in the public schools, at 17 entered the store of his uncle in Hartford, Conn., and three years later was made a partner in the business. In 1836 he removed to New York and engaged in the grocery business. During the cholera visitation of 1849 he rendered devoted service. Elected to the State senate in 1850, he continued in that office until 1858, when he was elected governor of the State and served until 1862, his administration during those trying times being marked by great sagacity and patriotism. About 223,000 troops were raised for the Federal; New York's firm attitude during the war being in large measure due to Governor Morgan's influence. In 1862 he was elected to the United States Senate; in 1865 he declined the secretarship of the treasury offered him by President Lincoln, and again refused it under President Grant. He served in the Senate until 1869, and though still taking an active interest in politics held no further political office excepting that of chairman of the Republican committee which conducted the presidential campaign of General Grant in 1872. He was connected with numerous great financial enterprises during the last years of his life and was a generous benefactor to education, notably to the New York Theological Seminary and Williams College.

MORGAN, Edwin Vernon, American diplomatist: b. Aurora, N. Y., 22 Feb. 1865. He graduated (1890) at Harvard University and studied (1891-92, 1894-95) at the Berlin University. He was appointed assistant in history (1892-94) at Harvard and instructor in history (1895-98) at Adelbert College, Cleveland. In 1899 he was appointed secretary to the Samoan Commission, and (1900) secretary of legation at Seoul, Korea. He served as second secretary of the embassy, Saint Petersburg (1901) and as consul at Dalny, Manchuria (1904), Minister Plenipotentiary to Korea (1905), filling the same diplomatic position at Cuba (1905-10), then Uruguay, Paraguay (1910-11), and Portugal (1911-12). He was made Ambassador Extraordinary and Plenipotentiary at Brazil 1912.

MORGAN, George Campbell, British Congregational preacher: b. Tetbury, Gloucestershire, 9 Dec. 1863. He was educated at the Cheltenham Douglas School, became master in the Jewish Collegiate School, Birmingham (1883-86), then mission preacher (1886-88), to be ordained (1889) to the Congregational ministry. He served as pastor at Stone, Staffordshire (1889-91); Rugeley (1891-93); Westminster Road, Birmingham (1893-97); New Court Tollington Park, London (1897-1901). He was extension lecturer (1901-04), then pastor of Westminster Congregational Chapel (1904-17). He wrote 'The Analyzed Bible' (10 vols. 1910); 'Evangelism'; 'The Life of the Christian' (1904); 'God, Humanity and War' (1914). He has been editor of The Westminster Bible Record and The Westminster Pulpit.

MORGAN, Sir George Osborne, English politician: b. Gothenburg, Sweden, 8 May 1836; d. 1897. He was graduated at Oxford in 1848 and was admitted to the bar in 1853. In 1868 he became a member of the House of Commons and was a staunch supporter of various reform movements, particularly those concerning the English land laws, Welsh disestablishment and education. He was appointed judge-advocate-general in Gladstone's ministry in 1880 and carried through legislation abolishing flogging in the army; and in 1886 was Under-Secretary for the Colonies. He was created a baronet in 1892 and was leader of the Welsh party in the House of Commons until his death. He was the author of a work on 'Chancery Acts and Orders' (1858).

MORGAN, George Washbourne, Americanorganist: b. Gloucester, England, 5 April 1822; d. Tacoma, Wash., 10 July 1892. When he was eight he played the entire service at Saint Nicholas' Church in Gloucester, and at 12 became assistant organist at the cathedral there. He removed in 1853 to New York, where he was organist in several leading churches, and gave recitals in different cities of the United States with marked success. He conducted an annual Lenten service in Chicker-
ing Hall, New York, after 1880, and was the author of an Episcopal service, and numerous compositions.

MORGAN, George Washington, American soldier: b. Washington County, Pa., 20 Sept. 1820; d. Old Point Comfort, Va., 26 July 1893. He left college in 1836 to enlist in the Texas army and fought for the independence of that country as lieutenant and then as captain when he resigned and in 1841 entered West Point. In 1852 he left the academy to study law and established a law practice at Mount Vernon, Ohio, in 1845. When the Mexican War broke out he became colonel and served under General Scott with distinction, becoming brevet brigadier-general. He returned to his law practice and in 1856 was sent as United States consul to Marseilles; in 1858 he went from there to Portugal Minister where he remained until 1861. He entered the army immediately upon his return to the United States and as brigadier-general was given a command under General Buell. In 1862 he took command of a division of the Army of Ohio, later was with Sherman at Vicksburg and held the command at the capture of Port Hindman, Ark. He resigned in 1863 on account of failing health. He was a member of Congress from 1869 to 1873.

MORGAN, Sir Henry John, Welsh buccaneer, lieutenant-governor of Jamaica: b. Llanrhynny, Glamorganshire, about 1635; d. Jamaica, 1688. While a boy he was kidnapped at Bristol and sold at Barbados. Just when he joined the Jamaica buccaneers is uncertain, as there were several Morgans in the marine at Jamaica at the time, but he may have commanded his own ship as early as 1663; a Captain Morgan who sailed from Jamaica in that year taking part in the sack of Villefranche, Truxillo and Granada (1665-66). In 1666 Morgan sailed under Mansfield to capture Curaçao, and was chosen admiral after Mansfield's death at the hands of the Spaniards. In 1668 he captured Puerto Principe in order to get information of Spanish plans for an attack on Jamaica; then took Porto Bello, Panama, after a sharp siege during which the buccaneers planted scaling ladders under the cover of captured priests and nuns, sacked the city and tortured and maltreated its inhabitants; and in the end of the summer again ravaged Cuba. The next year, 1669, saw Morgan's attack on Maracaibo, followed by fresh outbreaks. The arrival of three Spanish warships did not check Morgan's success, for he set fire to one ship, captured another and forced the Spaniards to heave and burn the third; he killed almost all his prisoners, recovered 15,000 pieces of eight from the sunken ship, got a ransom for the city from the Spanish forces in the fort and by a clever manoeuvre made his escape. Returning to Jamaica he was first reprieved for exceeding his powers and then made commander-in-chief of the entire naval force of Jamaica, so that in 1671, with a stronger force under him than before, he approached the city of Panama, which he captured after a thrilling battle, in which the Spanish cavalry was broken by riding into a swamp, and further execution was done by a herd of cattle which the Spaniards intended should break the English ranks but which stampeded the Spanish. This attack and the capture of Panama occurred some time later than the signature of peace between England and Spain, and in consequence Morgan was ordered to England for trial in 1672. The whole story of this, however, possibly because Morgan made free use of his wealth in England. In November 1674 he held a commission as lieutenant-governor of Jamaica. He can hardly be called a pirate; his cruel, brutal methods were those of his enemies and England's enemies. The primary source for Morgan's life is Exquemeling, 'Buccaneers of America' (1684), the work of one of Morgan's followers and reprinted in the 'Adventure Series' (London 1891). Professor J. K. Laughton in the 'Dictionary of National Biography' (Vol. XXXIX, 1894), first set straight the chronology of Morgan's life. Popular accounts are Hutchison, 'Sir Henry Morgan' (1890); Pyle, 'Buccaneers of America' (1891); Stockton, 'Buccaneers and Pirates of Our Coast' (1898); and Brady, 'Sir Henry Morgan,' a romance (1902).
adopted, he was elected professor of the theory and practice of medicine, and, three years later, five young men received medical degrees — the first conferred in America. In 1775 he was appointed director-general and physician-in-chief to the general hospital of the American army, and reorganized the hospitals of the army. But lack of supplies for the sick and wounded made his energetic efforts largely ineffective, and complaints to Washington caused Congress (1777) to dismiss him without reason. A committee of that body, however, after an investigation, honorably acquitted him of blame, while Washington wrote him: "No fault could be found with the economy of the hospitals during your directorship." He wrote "A Discourse on the Introduction of Medical Schools in America" (1765), and his dissertation "The Reciprocal Advantages of a Perpetual Union between Great Britain and her American Colonies" (1766) won him a gold medal from England.

MORGAN, John Hartman, British publicist and educator: b. 20 March 1876. He was educated at Caterham School, studied at University College of South Wales, Balliol College, Oxford, and University of Berlin. From 1901–03 he was on the literary staff of the Daily Chronicle, became editorial writer on the Manchester Guardian (1904–05), and London University Extension lecturer as well as the London School of Economics. He became lecturer in constitutional law at London University College (1907) and was Liberal candidate, in 1910, for Edgbaston (Birmingham), and later in the year for West Edinburgh. Since 1916 he has been staff-captain on the adjutant-general's staff. He has written "The House of Lords and the Constitution" (1910); "The New Irish Constitution" (1912); "The German War Book" (1915); "German Atrocities: An Official Investigation" (1916). Many articles from his pen have appeared in the leading periodicals.

MORGAN, John Hunt, Confederate general: b. Huntsville, Ala., 1 June 1836; d. New Greenville, Tenn., 4 Sept. 1864. His boyhood was spent in Lexington, Ky., where he was largely under the influence of his father who served through the Mexican War as lieutenant of cavalry. At the outbreak of the Civil War he, with 200 men of the local militia, made for the Confederate lines, and he was appointed a captain of volunteers. Soon discovering that he could best serve the Confederacy by adopting guerilla methods of warfare he began the series of raids which so annoyed the Union commander. Moving with great celerity, and accompanied by his own telegraph operator, he kept himself acquainted with the plans of the enemy while he misled them regarding his own position. As the result, bridges which they expected to cross were burned, much-needed supply trains were captured and railroad tracks were destroyed. In 1862 he was rewarded by appointment as major-general. In 1863 he proceeded to Kentucky, Tennessee, Ohio and Indiana, but was captured and, with many companions, imprisoned in the Ohio Penitentiary. Escaping, he again attempted a raid but, while sleeping at a farmhouse near Greenville, Tenn., he was surrounded by National troops under Gen. Alvin C. Gillem, and upon attempting to escape was killed. See MORGAN'S RAID INTO INDIANA AND OHIO.

MORGAN, John Livingston Rutgers, American chemist: b. New Brunswick, N. J., 27 June 1872. He was graduated (1892) at Rutgers College, received a Ph.D. degree at the University of Leipzig (1895) and was appointed assistant in chemistry at Stevens Institute (1895–96). He became instructor of quantitative analysis at Brooklyn Polytechnic Institute (1896–97). He served at Columbia University as tutor of chemical physics and chemical philosophy (1897–1901), professor of physical chemistry (1901–05) and as professor since 1905. He has written "The Principles of Mathematical Chemistry" from Helms' German work (1897); "The Theory of Solution and its results" (1897); "Elements of Physical Chemistry" (5th ed., 1914); "Physical Chemistry for Electrical Engineers" (2d ed., 1909), besides contributing to the chemical periodicals.

MORGAN, J(ohn) Pierpont, American financier: b. Hartford, Conn., 17 April 1837; d. Rome, Italy, 31 March 1913. He was the son of J. S. Morgan (c.v.). He was educated at the English High School in Boston and at the University of Göttingen, Germany. He began his business career in the banking house of Duncan, Sherman & Co., New York City; in 1860 he became agent and attorney in the United States for George P. Baring & Co. of London; in 1864 junior member of the banking firm of Dabney, Morgan & Co., and later member of the firm of Drexel, Morgan & Co., of which his father was also a partner. By the death of the older members of the firm he became the head of the latter house and the firm name was changed to J. P. Morgan & Co. He also controlled the firm of J. S. Morgan & Co. of London and had partnership interest in Drexel & Co. of Philadelphia. For many years his chief interest lay in railroad negotiations and combinations, and he gradually gained control of the New York Central system, the New York, New Haven and Hartford, the Reading, the Erie, the Lehigh Valley, the Southern, the Northern Pacific, the Big Four and the Chicago & North Western. Shortly after this great railroad consolidation was completed (1901), he succeeded in organizing the United States Steel Company, uniting the Carnegie Steel Works and other large concerns with a capitalization of $1,000,000,000, and dominating the steel industry of the United States. In the same year he bought up a large English shipping line with the evident design of organizing a trust for the control of transatlantic shipping, but did not succeed in completing the consolidation. He was the head of both the anthracite and the soft coal trusts and was several times prominent in the settlement of miners' strikes. In 1895 he organized the syndicate which floated the United States bond issue of $2,000,000,000, for the increase of the gold reserve; and in 1901 secured American subscriptions of $50,000,000 to the British war loan. In 1912 he testified before the Pujo Banking Committee in Washington, appointed by the House of Representatives to investigate the alleged "Money Trust." Probably no other American capitalist was so well known and so thoroughly
trusted in Europe as Mr. Morgan; particularly was this the case in England, and a large majority of English investments in American securities were made through his house; everywhere he was recognized, not merely as a man of vast wealth, but also as a man of unusual organizing and constructive ability. He gave largely to many charities and institutions, particularly to hospitals, churches and the Trade School in New York, and to Harvard University. He was an enthusiastic yachtsman, was for two years commodore of the New York Yacht Club and built the yacht Columbia, which defeated Sir Thomas Lipton's Shamrock in the international yacht races. Mr. Morgan was the greatest art collector of his time, his collections being among the most varied and important ever owned by an individual. The historic and romantic aspects of art appealed more strongly to him than the purely aesthetic. He built a beautiful library adjoining his home, wherein he housed a collection of important manuscripts and rare and handsomely-bound books. The Metropolitan Museum of Art in 1913 exhibited most of his collections. Thirteen galleries were needed to house the many rare specimens of Byzantine and Gothic enamels and ivories, bronzes and marbles of the Renaissance, metal work, crystals, Flemish tapestries, a great collection of miniatures and paintings by artists of the first rank. His collection of porcelains, French furniture and objects of decorative art and the paintings of the celebrated Fragonard room were sold by his son in 1915. Mr. Morgan published elaborate catalogs of nearly all of his collections. Consult the catalogs published by the New York Museum of Art (1914), and for much valuable material on Mr. Morgan's career as financier, art collector and philanthropist, consult the New York Evening Post of 31 March 1913.

MORGAN, [John] Pierpont, American financier, son of John Pierpont Morgan (1837–1913): b. Irvington, N. Y., Sept. 1867. In 1889 he was graduated at Harvard University and soon afterward entered the London branch of J. P. Morgan & Co., bankers, remaining until 1911. In 1911 he was elected president and upon his father's death in 1913 became his head. He inherited the greater portion of his father's vast wealth including his almost priceless art collections. He also succeeded to the directorate of several corporations in which his firm held large financial interests, including that of the New York, New Haven and Hartford Railroad. He resigned from the latter in 1914 when criticism of the financial management of that road became general. Mr. Morgan is a director of the United States Steel Corporation, of the International Mercantile Marine Company, of the Pullman Company, the Northern Pacific Railway, the First Security Company of the City of New York, the Aetna Insurance Company and the New York and Harlem Railroad Company. When the United States Government purchased the Panama Canal Company for rights in the Panama Zone Mr. Morgan arranged for the payment of $40,000,000 in gold to the French Panama Canal Company. After the outbreak of the European War he made a five million dollar loan to the United States, and in January 1915 the Morgan firm was appointed the commercial agent of the British government in the United States and thereafter conducted the purchase of all munitions and supplies for the Entente in the United States. In the same year the control of the Equitable Life Assurance Society was sold by Mr. Morgan to T. Coleman Du Pont. On 1 July 1915 at Glen Cove, L. I., Mr. Morgan was wickedly shot and severely wounded, but escaped with minor injuries. A loan of $50,000,000 was made to the French government by the Morgan firm in April and a few months later the firm organized a syndicate of about 2,200 banks in the United States and floated a loan of $500,000,000 to the Entente Allies. Mr. Morgan is a member of the advisory council of the Federal Reserve Board, member of the New York Exchange, trustee and treasurer of the Church Pension Fund and governor of the Peabody Donation Fund.

MORGAN, John Tyler, American lawyer and politician: b. Athens, Tenn., 20 June 1824; d. Washington, D. C., 11 June 1907. He went to Alabama when nine years old, received his education there, was admitted to the bar in 1845 and commenced practice. He rapidly gained a high reputation as a speaker; was presidential elector in 1860, voting for Breckenridge, and in 1861 was a delegate to the Alabama convention which declared for secession. He enlisted in the Confederate army as a private in 1861; in 1862 raised a regiment in his State, of which he was made colonel; and in 1863 was commissioned brigadier-general and commanded a division under General Johnston. After the war he resumed the practice of law at Selma, Ala.; was presidential elector on the Democratic ticket in 1876 and sat in the United States Senate from 1877 until his death. He was long recognized as one of the ablest leaders of the Democrats in the Senate, was a member of the Senate Committee on Foreign Relations and for some years its chairman; in his last term he was chairman of the Committee on Interoceanic Canals and, favoring in that capacity the Nicaragua Canal route instead of the Panama, was removed from his post in November 1903. He was an earnest and able advocate of recognition of Cuban independence, and throughout the whole length and breadth of the country by his eloquent speeches in behalf of Cuba. In 1892 he was a member of the board of arbitration on the Bering Sea Fisheries, and in 1898 was one of the commission appointed to prepare a system of laws and organize the government for the Hawaiian Islands.

MORGAN, Junius Spencer, American financier: b. West Springfield (now Holyoke), Mass., 14 April 1813; d. Monte Carlo, Monaco, 8 April 1890. He entered a dry-goods store when a boy and remained there until he came of age, when he was engaged for 18 months in banking in New York. He returned to the dry-goods business in Hartford, Conn., where he was junior partner in a leading firm and rapidly advanced until he formed a partnership under the name of J. M. Beebe, Morgan & Co., which became one of the largest dry-goods establishments in the United States. In 1854 he became a member of the banking house of George Peabody & Co., in London, which subsequently became J. M. Morgan & Co., and was ranked among the world's greatest banking
MORGAN, Sydney Owenson, Lady, Irish novelist: b. Dublin, Ireland, about 1783; d. London, 14 April 1859. Her father was an actor on the Dublin stage, of the name of Mac Owen, afterward changed to Owenson. She was a governess for a time. Her first literary effort was a volume of poems (1801), followed by a collection of Irish songs and two novels, 'O' Saint Clair' and 'The Young Conqueror Dominick' (1804). In 1806 appeared her 'Wild Irish Girl,' a novel which, avowedly nationalist in sympathy and containing good descriptive passages, established her reputation, became immediately popular and secured for her a high position in fashionable and literary life. She had by this time removed from Dublin to London, and in 1812 was married to Sir Charles Morgan, an eminent physician. She also contributed English words to be set to Irish airs. In 1837 she received a civil list pension of £300 a year, the first woman author to be so rewarded. Her style was inflated and gushing; her vanity was inordinate; but she drew many vivid characterizations of Irish character. Among her other works are novels 'O'Donnell'; 'Florence McCarthy and the Gentleman'; 'The Life and Times of Salvador Rosa'; 'Woman and her Master'; and 'Passages from my Autobiography.' Consult Fitzpatrick, W. J., 'Lady Morgan' (London 1860).

MORGAN, Tali Eseen, American choral conductor: b. Llangynwyd, Wales, 28 Oct. 1858. He studied music and came (1876) to Scranton, Pa., and was publisher of the Cambria American, Scranton, in 1879, also editing The People, the State prohibition organ for six years. He was associated (1887) with Walter Damrosch on musical work and later with Anton Seidl; conducting the Ocean Grove (N. J.) Festivals since 1888, becoming manager and conductor of the Ocean Grove Summer Music Festivals from 1898. He was next conductor of the New York Festival Chorus. He is editor and publisher of The American Musical Times and president of the Independence School of Music, Asbury Park, N. J.

MORGAN, Thomas Hunt, American zoologist: b. Lexington, Ky., 25 Sept. 1866. He was graduated (1886) at the State College of Kentucky, took the degree Ph.D. (1890) at Johns Hopkins and became professor of biology at Bryn Mawr (1891–1904). In the latter year he was appointed professor of experimental zoology at Columbia University. He was given the degree LL.D. by Johns Hopkins in 1917. He has written 'The Development of the Frog's Egg' (1897); 'Regeneration' (1901); 'Evolution and Adaptation' (1903); 'Experimental Zoology' (1907); 'Heredity and Sex' (1913); 'Critique of the Theory of Evolution' (1916). Many monographs and papers of his have been published on biology and embryology, etc.

MORGAN, William, American Freemason, whose death was the immediate cause of the formation of the Anti-Masonic party: b. Culpeper County, Va., about 1775; d. possibly near Niagara in 1826. He fought in the defense of New Orleans in 1815; removed to York, Canada, in 1821, where he became a brewer, and whence soon after he moved to Batavia, N. Y.; and in August 1826 disappeared soon after a
MORGAN, Fort—Morgan's Raid into Indiana and Ohio

rumor had been spread that he was to reveal in a book the secrets of the Masonic Order. He was supposed to have been abducted by fellow-Masons and drowned in Lake Ontario, but his death was never proved. A corpse found near the mouth of Niagara River was stated to be his, and as such was claimed by his family, but disbelieved and believed to be some one else. Much political capital was made of the alleged abduction and drowning and it was averred that Thurlow Weed, a leader in the anti-Masonic movement (see Anti-Masonry), cynically said that it was "a good enough Morgan till after election," a remark that has become proverbial for campaign deceit. Morgan's book Illustrations of Freemasonry, by One of the Fraternity Who Has Devoted Thirty Years to the Subject (1826) roused much less excitement than the story of his death. This book, under the title 'Free Masonry Exposed and Explained,' was reprinted in 1912. Consult Greene, 'The Broken Seal' (1870); Morris, 'History of the Morgan Affair' (1852); O'Reilly, 'American Political Anti-Masonry' (1879).

MORGAN, Fort. See Fort Gaines and Fort Morgan.

MORGAN CITY, La., city, port of entry, in Saint Mary's Parish, on the Atchafalaya Bayou and on the Southern Pacific Railroad, about 70 miles west by south of New Orleans, and 20 miles from the Gulf of Mexico. The place was formerly known as Brashear City. The Atchafalaya Bayou is navigable for steamers of light draft, and at it connects Grant Lake and the Gulf. Morgan City has steamer connections inland for some distance and with the principal Gulf ports. Considerable sugar-cane is cultivated in the country around Morgan City. The chief industrial interests are connected with the cultivation of sugarcane, rice and with market gardening, fish and oysters. It has Oneonta Park in which are botanical gardens and a fine zoological collection. Water and sewage works are municipally owned. On 23 June 1863, a Confederate force of 3,000 soldiers under Richard Taylor captured the Federal garrison of about 1,000 soldiers. The Confederates secured property to amount to $2,000,000; but they soon abandoned the city, and the Federals again took possession. Pop. 5,477.

MORGANATICA MARRIAGE, a marriage between a prince or noble and a woman of inferior rank in cases where a perfect marriage is not legal except with a woman of equal rank. The distinctive feature of the morganatic marriage is that the wife does not acquire the rank of the husband and the children, legitimate though they are, do not inherit it: in some states they do not inherit either entails estates or personality. In Great Britain under the Royal Marriages Act (1772) such a marriage is invalid in public law. A morganatic marriage and a regular marriage cannot exist at the same time, so that the Church regards the morganatic marriage as a perfect one. The custom originated in ancient German law, is prevalent among the princes and high nobility of that country and is also in force among the royal families of Europe.

MORGANFIELD, Ky., city, county-seat of Union County, on the Illinois Central Railroad, about 30 miles southwest of Evansville, Ind. It is in an agricultural region, in which tobacco is an important product. The principal industrial establishments are tobacco factories, flour-mills, carriage factories, brick yards and lumber-mills. It is the seat of Saint Vincent's Academy (R. C.). The city owns and operates the waterworks. Pop. 2,000.

MORGAN'S RAID INTO INDIANA AND OHIO. In the middle of June 1863 General Bragg ordered Gen. John H. Morgan, with 2,000 picked mounted infantry and four guns to move from Tennessee into Kentucky, break up the railroad upon which General Rosecrans depended for supplies, capture Louisville, destroy the public works and return to Tennessee as quickly as possible. Morgan determined to exceed his orders and make a raid north of the Ohio. On 2 July, with 2,460 men and four guns, he set out from Burkesville, crossed the Kentucky River in the face of Union troops guarding it, and marched northward, followed by all the Union detachments within immediate call. He passed through Columbia, after a sharp skirmish with about 300 Wolford's Kentucky cavalry, in which he lost about 40 killed and wounded; on the 4th reached Green River at Tebb's Bend, and demanded the surrender of Col. O. H. Moore, who, with about 300 men of the 25th Michigan, was guarding the bridge at that point. Moore replied that the Fourth of July was not a good day to surrender, and was instantly attacked with artillery and musketry. After a hard fight of three hours, in which Moore had six killed and 23 wounded, Morgan was repulsed, with a loss of 36 killed and 46 wounded, and drew off, crossing the river below the bridge. On the 5th he defeated and captured the small garrison of Lebanon and marched by Bardstown to Brandenburg, on the Ohio, where he arrived on the morning of the 8th, and seizing two steamboats began crossing his command. His passage was guarded by a gunboat and by militia with field-pieces on the Indiana shore, but by the morning of the 9th his whole command was in Indiana. Twenty-four hours later General Hobson, with 2,500 cavalry and mounted infantry and four guns, crossed the river in pursuit, and for 17 days hung upon Morgan's heels. Indiana and Ohio were aroused and turned out their militia by thousands. After crossing the Ohio, Morgan rode north through Corydon, where he was resisted by militia, who were soon overpowered. He then pushed on to Salem, where he captured nearly 400 militia, then through Lexington and Paris to Vernon, near which place on the evening of the 11th he encountered a stiff resistance from about 1,200 militia under Colonel Love. Under cover of darkness he withdrew from Love's front, and pressing on through Dupont and Sumansville, crossed the Indiana line on the 13th to Harrison, Ohio, and concentrated his command preparatory to making his way across the Ohio into Kentucky, detaching parties to burn bridges and confuse the pursuit, and impressing fresh horses. Under cover of a fog on Hamilton he marched by night a few miles north of Cincinnati, moving directly east, closely pursued next day by Hobson, who was marching 40 miles a day, and threatened from all directions by the militia. Turning toward Berlin,
where the government had a large number of animals, he was confronted by a small body of militia under Colonel Runkle, lost much precious time in threatening an attack, drew off closely followed by Runkle, and after dark of the 18th reached the banks of the Ohio, a short distance above Pomeroy, near Buffaloing Bar and Blennerhasset's Island, where from the first he had planned to escape. His pursuers were closing in on him from every direction. On the west Hobson was hanging on his rear; General Judah, who had been withdrawn from Kentucky, had landed his division at Portsmouth, and was marching up from the southwest; regiments were coming down the river from Parkersburg; and gunboats patrolled the river and watched the roads. Early in the morning of the 19th Morgan endeavored to cross the river, but was speedily checked. He was attacked in rear by the head of Hobson's column, Judah's cavalry struck him in flank and two gunboats poured upon him from the front. A sea battle engagement cost him about 120 killed and wounded, and more than 700 of his officers and men surrendered. Morgan with the remainder escaped up the river, where he attempted to cross to Belleville by swimming his horses. Three hundred men, under Colonel Johnson, had crossed when a gunboat stopped the remainder of the column, Morgan himself returning to the Ohio shore and with about 800 men retreating inland. He had lost all his artillery and trains. He pressed on northeast through Athens and Washington, marching 35 miles a day, burning bridges behind him, with General Schackelford and 500 men close upon his rear and skirmishing with it. Near Saleville on the 26th Schackelford's advance captured 250 men, and later in the day he was intercepted near New Lisbon and Beaver Creek, and surrendered with 364 officers and men. The Union loss in the campaign July 2-26 was 19 killed, 47 wounded and 8 missing. Consult 'Official Records' (Vol. XXII); Duke, "History of Morgan's Campaigns, etc."; Senour, "Morgan and His Captors"; The Century Company's "Battles and Leaders of the Civil War" (Vols. III and IV).

E. A. CARMAN

MORGANTE MAGGIORE. The 'Morgante Maggiore' of Luigi Pulci (1432-84), begun in 1460 and completed in 1483, is the first of the great Italian humoristic poems dealing with the material of the Old French epic, with the adventures and adventurers of the court of Charlemagne, with chivalry and deeds of valor, with Saracens, witches and magic, with all that distinguishes men from animals. The spirit of the treacherous and in a world of strong arms and generous appetites, good humor and simple passions. It is a reworking of an earlier popular poem called the 'Orlando,' with a few elements borrowed from another poem of the same cycle called the 'Spagna.' Pulci thus obtained the traditional schematic plot of the Italian chivalric tale: the struggle between the house of Clermont and the treacherous descendants of Ganelon, resulting in the slaughter of Orlando, his flight to the Orient, his adventurous battles with the Saracens, his return to Paris to raise the inevitable siege by the Saracens, his reconciliation with Charlemagne and ultimate vengeance on his enemies at court. Pulci is more faithful to the spirit and the substance of the Carolingian tale than either of his great successors, Boiardo or Ariosto, who utilized the more fantastic and sentimental legends of the Round Table to such an extent as to obliterate the character of chivalric romance. The famous and popular legend passed over directly into the 'Morgante,' to constitute the solid base for its pervasive humorism, on which the author then erects an original comic structure of his own, with sententious and satiric elements. Neither Petrarchism nor classical models were strong enough in their influence on Pulci to alter or to vitiate this humorous attitude toward his subject. The reader willingly remembers three salient figures from the 'Morgante Maggiore': that of the giant Morgante himself, whose size and corresponding appetite for food have a jolly time getting along in this world made for smaller people; that of the half-giant Margutte, liar, thief, glutton, blasphemer, and all-around rascal of perennial good-nature, the most popular figure in the rambling story; and finally that of the devil Astaroth, who treats learnedly on orthodox theology, and among whose many feats of magic the most famous and startling remains his discovery of a new Western world some years before the voyage of Columbus. Save in its best episodes, the 'Morgante' is no longer much read. Popular in its own day, it helped to fix the direction of the efforts of Boiardo and especially of Ariosto, who used the chivalric legends as vehicles for an art more personal and powerful than that of Pulci. There is an English translation by Roscoe.

ARTHUR LIVINGSTON

MORGANTOWN, N. C., town, county-seat of Burke County, on the Southern Railroad, about 80 miles west of Salisbury. In the vicinity are gold and silver deposits. It has lumber and cotton-mills, flour-mills, machine-shops and tanneries. It is located on the North Carolina School for the Deaf and Dumb and of the State Hospital for the Insane. It is a favorite health resort for people threatened with pulmonary diseases. Pop. 3,000.

MORGANTOWN, W. Va., city, county-seat of Monongalia County, near the northern boundary of the State, on the Monongahela River which is navigable throughout the year, and on the Baltimore and Ohio, the Monongahela River Railroad and the Morgantown and Kingwood Railroad, 100 miles south of Pittsburgh. Electric trolley lines with a city loop system reach all suburbs, in a region noted for extensive coal and oil fields, glass-sand deposits and limestone quarries, with abundant water power used for electrical manufacturing purposes. Chief of the manufacturing industries is the Sabaton plant of the American Sheet and Tin Plate Company, founded in 1898, employing 900 people with a payroll of over $1,000,000 a year; 12 glassworks employ 2,500 hands with an annual payroll of $2,040,000; and there are important brickworks, while coal is obtained from 40 mines; all producing a large trade with the local trade. Besides the flourishing building and loan associations, Morgantown has six banks with an aggregate capital and surplus beyond $1,350,000 and de-
posits of upward of $4,500,000. The city has
gas and electric-light and power plants. Morgantown's greatest industry is the West Vir-
ingia State University founded in 1868; its staff
is about 200 people, its annual enrolment of
regular students reaches 1,200, and of summer
students in the agricultural schools 1,400. The
library contains over 44,000 volumes. The
university, in addition to the Morrell and Hatch
funds appropriated by Congress, received from
the State for 1919-20 appropriations of $1,250,-
000. Six commodious elementary schools and a
great high school furnish a perfect educational
system. The leading religious denominations are
represented by fine churches,
including three for the colored population.
Cheret River nearby is a summer resort of much
scenic beauty and residential suburbs include
Westover, Sabronton, Star City, Riverside and
Granville. The first settlement was made in
1756 by Nicholas Decker, soon followed by the
Morgan family, from whom it takes its name. Morgan
county was incorporated in 1838 and recog-
nized as a city charter in 1901. Pop. (1918 est.)
16,000; with suburbs 22,000.

MORGARTEN, mör-gär-tén, Switzerland,
a hill two miles west of Rothenhurst, on the
margin of the lake of Egeri, on the confines of
the canton of Zug, memorable as the scene of
the battle of 15 Nov. 1315, in which a small
body of Swiss mountaineers from Schwyz, Uri
and Unterwalden, ill armed and undis-
ciplined, totally vanquished an Austrian army of
20,000 under the Archduke Leopold, sent by
Frederick the Fair to avenge the seizure of the
abbey of Einsiedeln the previous year. This
was the first victory achieved by the Swiss in
their struggle for freedom.

MORGENSTERN, mör-gén-stérn, Lina
(Bauer), German writer and reformer; b. Bres-
lau, 25 Nov. 1830; d. 1909. She did much social
work in Berlin after her marriage (1854) to
Dr. Theodor Morgenstern. She was leader of
the women's Verein (1860-86) in their further-
ing the cause of the Froebel Kindergärten, and
(1866) she founded the Verein Berliner Volks-
küchen (public kitchens). In 1868 she started
the Kinderschützverein, for the protection of
children; in 1869 she founded an institute for
the training of young women in the useful arts;
in 1873 the Berlin Hausfrauenverein (house-
wives' league) for protection against extor-
tionate prices and adulteration; it existed till
1883. In 1880 she established a woman's soci-
ety for the rescue of orphaned girls, placing
them in schools to teach housework and farm-
ing. She wrote 'Das Paradies der Kindheit'
(1865; 6th ed., Regensburg 1904); 'Die Volksküchen'
(4th ed., Berlin 1882); 'Der Beruf des Weibes'
(1869); 'Die Frauen des 19. Jahrhunderts'
(1886-91); 'Hilfsbuch zur Gründung, Leitung und Kontrolle von Volks-
küchen' (3rd ed., 1900), besides several works
on the systems of economical cooking. Since
1874 she published 'Deutsche Hausfrauen
Zeitung' and from 1886-94 a monthly publica-
tion named 'Für junge Mädchen.'

MORGENTHAU, mör-gén-thou, Henry
American lawyer, merchant and ambassador; b.
Mannheim, Germany, 26 April 1856. He came
(1865) to the United States and was educated
at the New York public schools, studied at the
College of the City of New York and was
graduated at Columbia Law School, receiving
the degree of LL.B. He became partner in
the law firm of Lachman, Morgenthau and
Goldsmith, New York (1879-99), was president
of the Central Realty Bond and Trust Company
(1899-1905), and of Henry Morgenthau Com-
pany (1905-13), dealers in realty. He was a
director in the Underwood Typewriter Com-
pany, American Metal Company, and Equitable
Life Assurance Society, and president of the
Herald Square Realty Company. As a Demo-
crat he has taken a very active place in his
party and was chairman of finance committee
of the Democratic National Committee 1912,
1916-20. He was Ambassador to Turkey
(1913-16) and at the outbreak of war took
charge of the interests in Turkey of Great
Britain, France, Italy, Russia, Belgium, Monte-
 Negro, Serbia, etc., rendering invaluable as-
sistance to these nations. He is president of
the Free Synagogue, Bronx House (Settle-
ment), and director of Mount Sinai Hospital.

MORGENHEU, Rafaelo, mör-fa-łü' lô mör-
gén, Italian engraver; b. Ferrara, 6 June
1758; d. there, 8 April 1833. He received his
early instruction in his art from his father, Filippo, and his uncle, Giovanni Elia, and was
afterward placed as a pupil under the cele-
brated Volpato, whom he assisted in engraving
the pictures of Raphael in the Vatican. The
print which represents the miracle of Bolsena
is inscribed with his name. He settled in Flo-
rence about 1793 as professor of copper-plate
engraving in the Academy of Art. Here the
grand-duke employed him to engrave Leonardo
da Vinci's 'Last Supper,' which is painted on
the wall of the refectory in the Dominican con-
vent at Milan. This picture is faded and ef-
faced, and the drawing which was made from
it for Morghen was by no means worthy of
the original; so that, though the engraver has
given to the world an admirable print, he has
failed in giving a correct idea of the work of
Leonardo. In 1803 he was chosen an associate
of the French Institute; and in 1812 was in-
vited to Paris by Napoleon, who treated him
with flattering kindness. Among the most
remarkable of the other numerous works of
Morgenheu may be noticed the 'Transfiguration'
from Raphael; a 'Magdalene' from Murillo; a
'Head of the Savior' from Da Vinci; the 'Car
of Aurora' from Guido; the 'Hours' from
Poussin; the 'Prize of Diana' from Domen-
icino; the 'Monument of Clement XII' from
Canova; 'Theseus vanquishing the Minotaur';
portraits of Dante, Petrarch, Ariosto, Tasso,
etc.

MORGIANA, mör-gi-a'na, a female slave
figuring in 'Ali Baba and the Forty Thieves,' a
story in the 'Arabian Nights Entertainment' (q.v.).

MORUE, mör (Old French, to look at
solemnly), a place or building in large cities
where the bodies of unknown persons who have
perished by accident, murder or suicide are
exposed, that they may be recognized by their
friends. If not claimed within a certain period
they are either buried or given over to medical
institutions for dissection purposes. The name
arose from the building in Paris, dating from
the 5th century, devoted to this purpose.
MORI, Arinori, mōrī å-rē-nōrē, Japanese statesman: b. Satsuma, 1848; d. 11 Feb. 1889. He was educated in England; as chargé-d'affaires in Washington arranged the postal convention between Japan and the United States; served as plenipotentiary in Peking and in London; and was chairman of the Education from 1885 to his death. He was an extremely cultured man, with progressive educational ideas. On the day of the proclamation of the Japanese Constitution he was assassinated by a Shinto fanatic for violating a shrine at Ise by lifting the car and with his walking stick.

MORIAH, mō-ri-ä, Palestine, the hill on which the temple of Jerusalem was built (2 Chron. iii, 1), and by many authorities believed to be the mount on which Abraham was commanded to sacrifice his son Isaac (Gen. xxii, 2).

MORICE, Adrian Gabriel, Canadian clergyman, ethnologist and author: b. Saint Mars-sur-Colmont, Mayenne, France, 27 Aug. 1859. He was educated at Oisseau, Sion and Autun, France; entered the Oblate Order in 1877 and three years later was sent to British Columbia. In 1882 he was ordained to the priesthood, and for the following three years labored as missionary to the Chilcotin Indians at William's Lake. From 1882 to 1906 he was stationed at Saint Boniface, the Oblate College in Winnipeg, and then transferred successively to Kamloops 1906, Saint Boniface 1908, Winnipeg 1909, Duck Lake, Sask., 1910, and Winnipeg 1911. Since 1911 he has been lecturer in anthropology at the University of Saskatchewan. During his missionary career he worked up a number of Indian languages and compiled dictionaries and grammars of Chilcotin, Sekanais and Nahanais. He invented the Déén syllabary and printed books in that language. He made maps during his wanderings up and down British Columbia. For one of these the Geographical Society of Paris awarded him a silver medal and another map was published by the provincial government. He is a member of the American Anthropological Association, the Historical Society of Saint Boniface, the Colonial Commission of the British Association for the Advancement of Science, corresponding member of the Canadian Institute, the Geographical Society of Quebec and of many others in Canada and abroad. He is the author of 'Au pays de lours noir' (1897); 'History of the Northern Interior of British Columbia' (1904 et seq.); 'Aux sources de l'histoire manitobaine' (1907); 'Dictionnaire historique des Canadiens et des Métis francois de l'Ouest' (1908); 'History of the Catholic Church in Western Canada' (2 vols., 1910). He collaborated in 'Encyclopedia of Religion and Ethics' and in 'The Catholic Encyclopedia.'

MORICHI, a palm. See MURICHI.

MORIER, mō-rē-är, James Justinian, English diplomatist, traveler and novelist: b. Smyrna, about 1780; d. Brighton, March 1849. He was educated at Harrow, England, and entered (1807) the Persian diplomatic service and returned (1809) to England via Turkey, making a journey that became celebrated and a description of which he published under the title of 'A Journey through Persia, Armenia and Asia Minor to Constantinople in the years 1808 and 1809' (1812). Returning (1810) to Teheran as secretary of legation he made his journey (1815) back to Europe through Asia Minor and published another book entitled 'A Second Journey through Persia' (1818). After a trip to Mexico he settled in England and devoted himself to a literary life. Among his works are the Oriental novels 'Hajji Baba of Ispahan' (1824; new ed., 1914), perhaps his best work; 'The Mirza' (1842); 'Zohrab the Hostage' (1832); 'Ayesha, the Maid of Kars' (1834).

MORIER, Sir Robert Burnett David, English diplomatist: b. Paris, 1836; d. Montreux, 16 Nov. 1893. He was graduated (1849) at Balliol College, Oxford, entered (1851) the diplomatic service and served as attaché at the embassies of Vienna and Berlin. In 1865 he was appointed secretary of the embassy at Athens, then at Frankfort, becoming chargé-d'affaires at Stuttgart, and (1872) at Munich. In 1876 he was made English Minister at Lisbon, and at Madrid 1881-84, was appointed Ambassador at Saint Petersburg, 1884-93. In 1888 he was in a bitter conflict with Count Herbert Bismarck, who accused him of furnishing Marshal Bazaine with information as to the German advance over the Moselle at the outbreak of the Franco-Prussian War. Later it was proven that spies of the French government had obtained the information from other sources and that Bismarck's disliking was really caused through his knowledge of the diplomat's brilliant work. He was created K.C.B. (1882), privy councillor (1885), G.C.B. (1887), D.C.L. of Oxford (1889).

MÖRIKE, mōrē-kē, Eduard, German lyric poet and short-story writer: b. Ludwigsburg, Württemberg, 8 Sept. 1804; d. Stuttgart, 4 June 1875. His father was Kreis Medical Councillor Karl Friedrich Mörike, d. 1817; his mother Charlotte, née Bayer. He attended the Latin school at Ludwigsburg, the seminary at Urach (1818), where he made the acquaintance of Wilhelm Hartlaub and Wilhelm Wackernagel; and the pedagogical school at Tübingen where he came into contact with Ludwig Bauer, David Friedrich Strauss and F. T. Vischer. After completing his studies at these theological institutions, he spent the greater part of his life as a country pastor in various parts of Württemberg. Mörike's incumbency was at Cleversulzbach (1834-43), where he associated with Justinus Kerner, Hermann Kurz, Uhland and Karl Mayer. From 1851 to 1866 he taught literature at the Stuttgart Katharinensift, receiving the title of professor in 1856. His first literary work was the short novel of artist life, 'Maler Nolten,' which passed through many revisions and was printed in its final form after his death (1877). His shorter stories are more finished artistically, especially 'Mozart auf der Reise nach Wien' (Stuttgart 1856). As a lyricist, no other Slavian poet attains his simple yet perfect form. His observations of life and of nature are realistic, and his depth of feeling sometimes approaches Goethe's. Some of his poems have even become favorites among the people, especially the ballad 'Schö'n Rotbraut,' opening with the line: 'Wie heisst König Rangings Töchterlein?'

JACOB WITTMER HARTMANN.
MORILLO, mō-rēl'yō, Pablo, Spanish general: b. Fuente de Malva, Spain, 1777; d. Madrid, Spain, 27 July 1838. He enlisted in the navy in 1797 and was engaged at Trafalgar in 1805; but when the French invaded Spain he left the navy to enter the army and rose to the rank of major-general in 1814. In 1815 he was sent to South America to subdue the revolution in Venezuela and Colombia, and after varying fortunes, during which he made for himself a name as a cruel and tyrannous general, perceiving defeat to be inevitable, he asked to be relieved but was compelled to sign a truce with the victorious Bolivar before sailing for Spain. He was appointed to command the garrison at Madrid, and in 1822 became captain-general of Galicia, which he surrendered to the French. He retired in disgrace to Rochefort, France, but returned to Spain in 1832 and led an army against the Carlists. During his exile in France he published his Mémories (1826).

MORIN, mō-rōⁿ, Arthur Jules, French mathematician and engineer: b. Paris, 19 Oct. 1795; d. there, 7 Dec. 1880. He was educated at the École Polytechnique in Paris and at the École d'Application at Metz, and was for a time professor of mechanics in the latter institution. In 1819 he became lieutenant in a battalion of engineers and later accepted a professorship at the Conservatoire des Arts et Métiers in Paris of which he became director in 1847. He held the rank of general in the army and was a member of various military boards, and his inventions were of great scientific value. He published Aide-mémoire de mécanique pratique (1833); Salubrité des habitations (1868), etc.

MORIOKA, mō-rē'-ō-kā, Japan, a town on the island of Honjo, 40 miles from the coast, and 339 miles by rail with Tokio. It is the capital of the prefecture of Iwate, in the north-eastern province of Rikuchu, has manufactures of silk, copper and other ware, and is celebrated for its fine fruits and vegetables (many of these of American origin) and preserves. Mount Iwate (6,800 feet) is in the vicinity. Pop. 36,012.

MORISCOS, mō-rē-skōs, Spanish term applied to those Moors who accepted Christianity. After the fall of Granada (1492) many of the Moors returned to Africa. But most remained in Spain, permitted under pretense of conversion to Christianity and lived, under the name of Moriscos, as industrious, peaceful inhabitants, till they were driven to revolt by the cruel persecutions under Philip II (1568–70) and over 100,000 of them were exiled; the few remaining being now found in the mountains of Granada after Philip III (1609) deported another 500,000. Consult Rochau, Die Moriscos in Spanien (1853); Borissy y Barrachina, Los moriscos españoles y su expulsión (Valencia 1901); Lea, The Moriscos of Spain (Philadelphia 1901).

MORISON, George Shattuck, American civil engineer: b. Bedford, Mass., 19 Dec. 1842; d. New York, 1 July 1903. He was graduated from Harvard in 1863, and was a private in the 6th regiment of the New York in 1865. In 1867-73 he was engaged in engineering in Kansas, Michigan and Indiana, and then returned to New York, which he thereafter made his headquarters. He was an expert on railroad conditions and became famous as a bridge builder; constructing five bridges across the Missouri and 10 over the Mississippi, the greatest of these being the bridge at Memphis, Tenn., which has a single truss span of 790 feet. He was a member of the Istamus Canal Commission (1898).

MORISON, James Augustus Cotter, English biographer and essayist: b. London, 1832; d. 26 Feb. 1888. He was educated at Oxford in 1859, was a Positivist in philosophy, was one of the most brilliant contributors to the Saturday Review and one of the founders of the Fortnightly Review. He wrote Life and Times of Saint Bernard, 3d ed., 1877; brief biographies of Gibbon, Macaulay and Madame de Maintenon; The Service of Man: An Essay toward the Religion of the Future, 2d ed., 1887), which he regarded as his best work. His knowledge of French literature and history was profound.

MORISON, Robert, Scottish botanist: b. Aberdeen, Scotland, 1620; d. London, 10 Nov. 1663. He was graduated from the University of Aberdeen in 1638 but having borne arms as a Royalist in the Civil War, was obliged to take refuge in France when the cause of Parliament triumphed, and took the degree of doctor at Angers in 1648. From 1650 to 1660 he was superintendent of the garden formed at Blois by Gaston, Duke of Orleans. After the Restoration he was appointed by Charles II one of his physicians and botanist royal, and in 1669 became professor of botany at Oxford. His strong point as a botanist was in classification. His chief work is Oxford University History of Plants (1680). Consult Pulteney, Sketches of the Progress of Botany (1790); Sachs, History of Botany (1906); Tournefort, Éléments de Botanique (1797).

MORISONIANS. See Evangelical Union.

MORISOT, mōrē-zō, Berthe (MADAME EUGÈNE MANET), French painter: b. 1840; d. 1895. As great-granddaughter of Fragonard she inherited from this great French painter his gracefulness, his spirit, and many fascinating qualities. Her natural talents she placed under the influence of Corot, Renoir, Degas and Manet. Having married Eugène Manet, brother of the great painter, she exhibited with the Impressionists, but always signed her pictures Berthe Morisot, delicately respecting Manet's great name. She acquired her own reputation by distinguished and beautiful coloring and dash. She was as much admired for her beauty as for her talent. A French critic sums up her qualities as follows: "All her work is bathed in brightness, in azure, in sunlight; it is a woman's work, but it has a strength, a freedom of touch and an originality, which one would hardly have expected. Her water-colors, particularly, belong to superior art: some notes of color suffice to indicate sky, sea or a forest background and everything shows a sure and masterly fancy, for which our time can furnish no analogy. A series of Berthe Morisot's pictures looks like a veritable boudoir in brilliant light due to the color-schemes which are comparatively soft (gray and blue) than to the absolute correctness of the values. A hundred canvases
and perhaps 300 water-colors attest this talent of high mark. Normandy coasts, scenes with pearly skies and turquoise horizons, radiant gardens of Nice, fruit-laden orchards, girls in white dresses, with big hats wreathed in flowers, young women in ball-dresses and flowers are the favorite themes of this artist."

MORITZ, mōr'īts, Karl Philipp, German author: b. Hameln, 15 Sept. 1756; d. Berlin, 26 July 1793. He was born of poor parents and became one of the most extraordinary figures in the Sturm und Drang (Storm and Stress) period. After distressful attempts to gain a living he caught the attention of a patron in Hanover and entered the gymnasium to reach quick promotion, but soon accepted an engagement as actor under Eckhof at Gotha, failing in which he returned to study (1786) at Erfurt; but tired again he joined the Herrnhuter (Moravians) at Barby, and studied theology at Wittenberg (1777); then taught philanthropy at the Potsdam military orphanage, soon again to take to wandering. Teaching in Berlin, he made a reputation as writer, preacher and poet, and went to England; then became professor at the Kölönisches Gymnasium; next tried editing the Vorsuche Zeitung to make it proletarian, but failed. Later, he traveled to Italy (1786) where he met Goethe, who made a favorable influence on his mind, and on his return to Germany he took up residence as Goethe's guest at Weimar. Duke Karl August aided him to a membership in the Berlin Academy of Sciences and he became (1789) professor of antiquities at the Berlin Academy of Art. He wrote much of his life's vicissitudes into his works, notably, 'Anton Reiser' (Berlin 1785-90), an autobiographical novel; 'Andreas Hartkopf' (ib. 1786), also contains other elements from his life. Other important works are: 'Versuch einer deutschen Prosodie' (Berlin 1786; later ed., 1815); 'Über die bildende Nachahmung des Schönen' (Brunswick 1788; Heilbronn 1888); 'Götterlehrte' (Berlin 1791 10th ed., 1851); 'Reisen eines Deutschen in England' (ib. 1783); 'Reisen eines Deutschen in Italien' (ib. 1792-93). Consult Dessoir, 'Karl Philipp Moritz als Aesthetiker' (Berlin 1889); Eibisch, Hugo, 'Anton Reisers kritische Autobiographie' (Leipzig 1909).

MORLAIX, mōr-lä', France, capital of an arrondissement in the department of Finis-tère, picturesquely situated on two hills on the river Dossen, rendered navigable to the town. It is the junction of the West Railway and has two churches dating from the 15th and the 16th centuries, besides ancient wooden houses, a commercial court of justice, chambers of commerce and of agriculture, a college, theatre, museum, hydrographic school, etc. Its industries consist of a tobacco factory, hardware, leather and candle factories, besides import trade in coffee, lumber, stearic acid, fertilizers, wine, brandy, petroleum. It has also an export trade in wheat, fish, grain, cattle, eggs, vegetables, fish, etc. In 1911 its population was 15,262. It is the birthplace of the generals Moreau and Souvestres.

MORLAND, mōr'land, George, English painter: b. London, 26 June 1763; d. there, 29 Oct. 1804. His father, himself a painter, gave the boy a severe early training in art, and his proficiency was such that his productions found ready purchasers, while at 10 he exhibited in the Royal Academy and became famous as a copyist of Dutch interiors. Soon after he rebelled against the strict discipline of his father's house, and entered upon a career of dissipation, in the company of stable-boys, money lenders, pimps and pugilists, supporting himself, meanwhile, by the pictures which he painted with amazing facility. So great was his productivity, that he was able to paint one or two pictures daily, and on one occasion completed a large landscape containing six figures, in six hours. The demand for his work was so great that dealers would take them before the oils had dried. In 1786 he took up his residence at Kensal Green, where he changed his mode of life and married the sister of James Ward, the animal painter, and William Ward, the engraver. Here he worked hard, and the mere subjects, after the manner of Hogarth, which he favored at this period, were engraved and became very popular. Soon again, however, he drifted back into his old habits, and, as his pictures were eagerly sought by the dealers, he was able for some time to follow a reckless career. He had to make many changes of residence to avoid his creditors; and at length, in 1799, he was arrested for debt, but "obtained the rules of the Bench," took a house within the bounds and continued to practise his art up to his release in 1802. In his later days he suffered from a palsied hand. Under arrest for debt, he died in a sponging-house. His epitaph for himself was, "Here lies a drunken dog." The art of Morland is characterized by a picturesque representation of rural life in its homelier aspects, his rustic story being always happily conceived and skilfully told. He is one of the first genre and animal painters of the English school, and his reputation has increased of recent years. He painted about 4,000 pictures, 192 of which were engraved during his lifetime. Six of his best paintings are in the Kensington Museum, and the 'Farmhouse Stable' in the National Gallery is sometimes considered his masterpiece. The New York Historical Society possesses his 'Old English Sportsman' and 'Dogs Fighting'; the Metropolitan Museum the 'Midday Meal' and 'Weary Wayfarers' and the Corcoran Gallery, Washington, 'The Farmhouse.' Consult Collins, W., 'Memoirs for Picture' (1803); and memoirs or biographies by Dawe (1807); Gilbert and Cuming (1807); Richardson, Ralph (1895); Williamson, G. C. (1904) and Wilson, D. H. (1907).

MORLAND, Sir Samuel, English inventor and diplomat: b. Sulhampstead-Bannister, Berks, 1625; d. Hammersmith, 30 Dec. 1695. He studied at Winchester School and at Magdalen College, Cambridge; was a tutor at Cambridge in Pepys' day; and about 1650 devoted himself to diplomacy. Cromwell sent him to Sweden in 1653; and in 1655 to the Duke of Savoy, to protest against the persecution of the Waldensians, in whose history he became deeply interested. He was too intelligently interested in the 'History of the Evangelical Churches of the Valley of Piedmont' (1658), relying as it did to some extent on documents that were forgeries, being absolutely misinformed and unreliable. He was
close in the secrets of Cromwell, and upon learning of Sir Richard Will's plot against
Charles revealed it to that prince. He then
became privy to Charles's schemes, and was re-
warded after the Restoration with a baronetcy.
He then withdrew from public life, devoted
himself to mechanical experiments, was one of
the first to demonstrate the utility of steam
power for propulsive purposes, improved the
fire-pump or fire-engine, the forerunner of the
steam-engine, and invented a speaking
trumpet. He wrote on cryptography, mathe-
matics and mechanics.

MORLEY, Edward Williams, American chemist: b. Newark, N. J., 1838. He
was graduated from Williams College, Wil-
liamstown, Mass., in 1869. He was elected to
the chair of chemistry in Western Reserve Col-
lege, Hudson, Ohio (later Adelbert College,
Cleveland), in 1869, and became professor emeritus in 1906. He was also professor
of chemistry at Cleveland Medical College in
1873–88 and he has been connected with various
scientific societies. He retired in 1906 and re-
moved to work on his laboratory, the Anorge,
inventor of an 'improved apparatus for gas
analysis and has published 'Atomic Weight of
Oxygen' (1895). Some of his scientific papers
relate to atomic weight of oxygen; densities of oxygen and of hydrogen; variations in the
amount of oxygen in the air; vapor density of
mercury from 0° to 100°; analyses of igneous
rocks.

MORLEY, Frank, American mathematic-
studied at Kings College, Cambridge, obtaining
(1898) the degree of Sc.D. He was master of
Bath College, England (1884–87), becoming
(1887–88) instructor, then (1888–1900) pro-
fessor of pure mathematics at Haverford Col-
lege, Pennsylvania. He has been, since 1900,
professor of mathematics at Johns Hopkins.
He was editor of the American Journal of
Mathematics, and wrote 'Introduction to the
Theory of Analytic Functions' (1898). In
collaboration with Prof. James Harkness, he
wrote 'Elementary Treatise on the Theory of
Functions' (1893).

MORLEY, Henry, English author: b. Hat-
ton Garden, London, 15 Sept. 1822; d. Caris-
brooke, Isle of Wight, 14 May 1894. Educated
at King's College (London), he practised med-
icine in Somerset and Shropshire; taught at
Manchester and Liverpool; was editorially con-
ected with Dickens' periodicals, Household
Words and All the Year Round; was for a
time editor-in-chief of the Examiner; and in
1865 was appointed professor of English litera-
ture in University College, London. In 1878
he received a similar chair at Queen's College,
London; and in 1882–90 was principal of Uni-
versity Hall, London. As a popular lecturer on
literature he was much in demand. He edited
'Morley's Universal Library' (1883–89); 'Caris-
brooke's National Library' (1886–90); and the
'Carisbrooke Library' (1889–91); published
biographies of Palissy (1852), Jerome Cardan
(1854) and 'Cornelius Agrrippa' (1856); and
wrote 'English Writers' (1887 et seq.); a
smaller work on the same subject, 'First Sketch
of English Literature' (1873), a much-used
manual and 'Early Papers and Some Memoirs'
(1891). He was an enthusiast in the popu-
larising of good literature. Consult the 'Life'
by Solly (1898).

MORLEY OF BLACKBURN, Viscount
(John Morley), English author and statesman:
b. Blackburn, Lancashire, 24 Dec. 1838. His
father, a surgeon of good professional repu-
tation, was a Yorkshireman, and his mother a
Kentishwoman. He was strictly reared; 'the rigors
of Sabbatical observance forced on us a literary
diet that neither enlightened the head nor
melted heart and temper.' His early education
was obtained at an Independent school in his
native town, from which he was ejected from
Blackburn College School, London, where Joseph Cham-
berlain had preceded him, and then to Chelten-
ham College; there he won a scholarship at
Lincoln College, Oxford, where he lodged in
the rooms at one time occupied by John Wesley,
the founder of Methodism. It had been inten-
tended that in due course he should take orders
in the Church of England; but his life at
Oxford had shaken his foundations. Although
never formally a Positivist, he was profoundly
influenced by the teachings of Comte; and in
political economy he became a disciple of John
Stuart Mill, and imbibed the 'pure milk of the
Millite'ward® from the master himself. After
graduation (1869) he embarked on a journalis-
ic career, and in 1873 he was called to the bar
of Lincoln's Inn, of which he was elected a
bencher in 1891. He was on the staff of the
Saturday Review and afterwards edited the
Literary Review (later the Pantheon). He suc-
ceded George Henry Lewes as editor of the
Fortnightly Review in 1867, and during his reign,
which terminated in 1882, the magazine became
noted, not only for its high literary standards,
but for the diffusion of radical ideals in things
temporal, and in things spiritual for its pro-
ouncedly aggressive agnosticism. His contribu-
tors included the most illustrious names in
the letters and controversies of the time. Mor-
ley also became reader for the publishing house
of MacMillan, and edited the 'English Man of
Letters' series. In 1880 he became editor of the
Pall Mall Gazette; and in that capacity be-
gan his long association with the Irish Home
Rule cause, which throughout has been his chief
political preoccupation; and he opposed the
policy of coercion in Ireland which at this
period found favor with the Liberal leaders.
Morley had before this made two unsuccessful
attempts to enter Parliament: in 1869 for Black-
burn; and in 1880 for Westminster; and in
1873 had begun the friendship with Joseph
Chamberlain which was to endure through life
and the political identification with him which
was finally to break in 1886. In 1883 he was
returned for Newcastle-on-Tyne at a by-elec-
tion, and his connection with journalism ter-
minalated. After the conversion of the Liber-
arty to Home Rule he accepted the post of
Chief Secretary for Ireland on the formation
of the brief Gladstone Ministry of 1886—an ap-
pointment that was acceptable to the Irish Na-
tionalists, because, unlike his leader and the ma-
Jority of his colleagues, he had no political
past to wipe out; and he became the trusted
mediary in the difficult and delicate negoti-
ations between the Irish members and the Cab-
inet leading up to the introduction of the first
and second Home Rule Bills. After the defeat
of the measure of 1886 he, with the exception of Gladstone, came to occupy the chief place in the task of converting the English people to瓦 allow-an honorary degree. He again occupied the post of Chief Secretary in the Gladstone and Rosebery cabinets (1893-95); and on him fell to a large extent the task of adjusting and of piloting the Home Rule Bill of 1892 through the House of Commons. At the general election of 1895 he was defeated in the contest at Newcastle-on-Tyne — largely because of his refusal to vote for a statutory eight-hour day for miners; and in the following year he was elected for the Montrose Burghs—a seat he held until his elevation to the peerage in 1908. Between 1899 and 1903 he was half withdrawn from politics while engaged in the colossal task of writing the 'Life' of Gladstone; but he condemned the diplomacy that had led up to the South African War and was pro-Boer in his sympathies. In 1903 to 1910 he was Chief Secretary for India in the Campbell-Bannerman and Asquith cabinets, his tenure being noteworthy for reforms in administration and the introduction of Indians into the Councils of State; and throughout his term his relations with the governor-general, Lord Minto, were markedly cordial. After his resignation in 1910, he accepted the lighter post of Lord President of the Council, which he continued to hold until his retirement from public life on the outbreak of the Great War in August 1914, with the participation in which by Great Britain he was out of sympathy. Morley held for 30 years a conspicuous place in British public life; but, as was to be expected from his training and earlier work, he never became a great Parliamentary debater, but the transparent honesty of conviction which had earned for him the sobriquet of 'Honest John,' the absence of overstatement and of superlatives, the profound thought and fine literary texture which marked his speeches, ensured for his utterances full reports, and they had considerable educative effect on the country. His tenure of the crucial Irish office—the most wearing and thankless of all posts and the grave of many reputations—was rendered only less difficult because he was in Irish aspirations; and he was an undoubted success at the India office, where failure might have been anticipated. But his place in public life is secondary to his rank as an author. His writings include essays, studies of the French encyclopedists and political biography, and they bear the stamp of a rich, full, matured and balanced mind, which illuminates everything it touches. His works include 'Edmund Burke' (1867); 'Critical Miscellanies' (1871, 1872, 1877); 'Voltaire' (1871); 'The Struggle for National Education' (1873); 'Rousseau' (1874); 'On Compromise' (1874); 'Diderot and the Encyclopedists' (1878); 'Burke' (1879); 'Studies in Literature' (1891); 'Oliver Cromwell' (1890); and the standard and definitive 'Lives' of Golden (1881), and of Gladstone (1903); the last named one of the greatest biographies in the English language. His latest work, 'Recollections' (2 vols., 1917), covers his entire life. While not abating one jot from his characteristic view of life, and in a large and gracious spirit, and contain many intimate and delightful sketches of the most distinguished figures in letters and public life of his time.

Many nobors have come to him. He has been a trustee of the British Museum since 1894; was elected (in succession to Lord Acton) an honorary Fellow of All Souls, Oxford, in 1902; was one of the first recipients of the Order of Merit founded by King Edward VII in 1902; has been the chancellor of Manchester University since 1908; and holds numerous honorary degrees. He visited the United States in 1886 and 1904, on the last occasion as the guest of Mr. Andrew Carnegie; on the death of Lord Acton, Mr. Carnegie bought and presented his valuable library to Mr. Morley (1902), who in turn gifted it to Cambridge University; and in 1909 Mr. Carnegie gave Manchester University $50,000 to establish a chemical laboratory to be named after his friend. Consult Cecil, 'Six Oxford Thinkers' (London 1909).

MORLEY, Margaret Warner, American educator and author: b. Montrose, Iowa, 17 Feb. 1858. She was graduated from the Normal College of New York in 1878 and has since taught in the Oswego Normal School and in the normal school at Milwaukee. She was for a time engaged in Armour Institute as teacher of biology. She has published 'A Song of Life' (1891); 'The Bee People' (1899); 'Wasps and Their Ways' (1901); 'The Insect Talk' (1903); 'Butterflies and Bees' (1905); 'Grasshopper Land' (1905); 'Donkey, John of the Toy Vault' (1909); 'The Agile Sprite' (1915); and other works intended to familiarize young people with science.

MORLEY, Samuel, English philanthropist: b. Homerton, England, 15 Oct. 1809; d. near Tunbridge, Kent, England, 5 Sept. 1886. He engaged in hosiery manufacture in Nottingham and amassed a large fortune, which he used in philanthropic enterprises. He represented Bristol in Parliament in 1868—85 and upon his retirement was offered a peerage which he declined. In Parliament he supported various religious and social reforms and was opposed to capital punishment. He was one of the chief proprietors of the London 'Daily News,' and was instrumental in reducing its price to one penny.

MORLEY, Thomas, English composer: b. 1557; d. London, about 1664. He may have been trained as a choir boy in Saint Paul's; was a pupil of Byrd; studied music at Oxford; from 1591 to 1592 was organist of Saint Paul's; in 1592 was appointed gentleman of the Chapel Royal and in 1586 he was given the exclusive right of printing books of music and selling ruled paper. He is best known by his 'Booke of Aires' (1600), which contains the page's song in Shakespeare's 'As You Like It' ('It was a Lover and his Last'), with the original music. Morley's 'Plaine and Easie Introduction to Practicall Musick' (1597), in dialogue form, is the earliest regular treatise on music published in England.

MORLEY, England, municipal borough in West Riding, Yorkshire, between Leeds and Dewsbury. It has two Gothic Anglican churches as well as others of different denominations, and a very modern town the volume and business of which industries are woolen goods, textile machinery, coal mining, stone quarrying, etc. Domesday Book mentions Morley. The borough was incorporated in 1885. The population in 1911
was 24,828. Consult Smith, 'Morely, Ancient and Modern' (London 1880).

MORMON CRICKETS. Western names for various species of long-horned, wingless, migratory (Anabrus simplex, and A. purpurascens), which are especially destructive at times in Montana and Idaho. See Grasshoppers.

MORMONS, a popular pseudonym for the Church of Jesus Christ of Latter-Day Saints, a religious body founded by Joseph Smith (see Smith, Joseph) at Fayette, N. Y., 6 April 1830. Only six persons took part in the formal organization of the Church as a body corporate, such being the minimum requisite under the laws of the State, but the entire number of adherents at the beginning comprised only a few more. The founder averred that in 1823 he was visited by an angel, who revealed to him the repository of certain records, engraved on plates of gold, buried on the side of a hill near Palmyra, N. Y., and said by the angel to contain the history of the aboriginal peoples of the Western Continent. In 1827 these plates were delivered by the angel into the custody of Joseph Smith, with the assurance that through divine assistance he would be enabled to translate the records, which he was specially appointed. With the plates were two stones set in bows of silver, and these, according to the angel's statement, were the Urim and Thummim, the power to use which constituted the special attribute of the seers of ancient days. Smith avowed that by the aid of these instruments under the inspiration of God he was able to read the ancient inscriptions, which consisted of characters said in the body of the record to be Reformed Egyptian and to dictate an exact rendering thereof in the modern tongue. In 1830 he published an English translation of the plates under the title 'The Book of Mormon,' and the work has been distributed by millions of copies through later editions in English and in numerous foreign languages. In every copy appear as separate appendices the 'Testimony of Three Witnesses' and the 'Testimony of Eight Witnesses,' in which the signers solemnly affirm their personal knowledge as to the plates, the engravings thereon and the genuineness of the transaction; and it is said a remarkable fact that although most of these witnesses apostatized from the Church, or were excommunicated, and though they developed bitter animosity against Joseph Smith, everyone of them stoutly maintained, even unto death, the truth of his testimony concerning the 'Book of Mormon.' The book sets forth that in the first year of the reign of Zedekiah, king of Judah, 600 B.C., an Israelitish prophet named Lehi, together with his family and parts of other families, migrated from Palestine to America under divine direction. In the New World the colony multiplied rapidly; but in course of time the people were rent by dissension and formed two opposing nations, known in the record as the Nephites and Lamanites. The former, named after their chief, Nephi, a younger son of Lehi, cultivated the arts of civilization, built cities in South, Central and North America, and through succession of duly appointed recorders kept a history of their doings. This historical record as later received by Joseph Smith, one of their prophets, is the original of the 'Book of Mormon.' The Lamanites, named after Lehi's eldest and rebellious son, Laman, led a nomadic life, neglected agriculture and productive industry and relied for subsistence upon war and the chase. They came under the predicted curse of darkness, specifically marked by a ruddy skin, and their degenerate posterity are the American Indians. The enmity of the Lamanites toward the Nephites culminated in the utter extermination of the latter at about the close of the 4th century, the final struggle being waged in the region now known as northern New York and near the Hill Cumorah, in which the Nephite records were in modern time disclosed to Joseph Smith. The Book of Mormon story, therefore, is seen to cover a period of approximately a thousand years. The Nephites were observers of the Law of Moses, a copy of which together with other Old Testament Scriptures had been brought by Lehi and his colony from Jerusalem. The birth, earthly ministry, death and resurrection of Jesus Christ were predicted by Nephite prophets; and the 'Book of Mormon' contains the record of the personal visitation of the resurrected Christ to these Hebrew children of the Jewish fold, soon after the Lord's ascension from Olivet. Among them the Christ established His Church, prescribing the same ordinances, such as baptism by water and of the Spirit, the sacrament of bread and wine, etc., as were instituted among the Jews, and ordaining a body of 12 disciples to whom He gave commission to preach the Gospel and administer the ordinances thereof. Mormon's son, Moroni, finished the record of his people about 420 A.D.; and the angel who deposited the plates to Joseph Smith announced himself as that same Moroni, the last prophet and historian of the ancient nation. Years after the first publication of the 'Book of Mormon,' a story purporting to explain the modern origin of the book, as a plagiarized and altered version of a work of fiction, attracted some attention; but the theory has been abandoned as utterly untenable. See Book of Mormon.

From the day of its organization in 1830 the Church grew with surprising rapidity; and from that time to the present every year has witnessed an increase in membership and an expansion of propaganda. A temporary gathering centre was established at Kirtland, Ohio, where the first temple was reared. This building, an imposing structure as judged by the standard of the time, was dedicated in 1836. As early as 1831, however, the Mormons had begun to establish themselves in Jackson County, Mo., which region they still regard as the central place of the land of Zion. Persecution was waged against the Church from its beginning. Both in Ohio and Missouri the people met violent opposition. In 1833 they were driven from Jackson County, under cover of a charge that they were abolitionists. They sought refuge in Clay County, but their sojourn there was brief. In 1838 Gov. Lilburn W. Boggs of Missouri issued an exterminating order against all Latter-day Saints, and they were forcibly expelled from the State. In sorry plight the people turned again eastward and settled in Illinois, making the village of Commerce in Hancock County their headquarters. There they founded the city of Nauvoo,
the phenomenal growth of which attested at once the industry and skill of the people and the vitality of their organization. Nauvoo was chartered by the State with liberal provisions for local government. A university and a military organization were provided for, and both institutions were successfully established. The city flourished and in time numbered 20,000 inhabitants. A temple was reared, in proportions and beauty of architecture far surpassing the earlier structure in Kirtland. In 1844 a few apostates from the Church started a newspaper at Nauvoo with the avowed purpose of assailing the prophet and exposing alleged misdeeds. Only one issue of the paper was published. The city council of Nauvoo promptly declared the printing establishment a nuisance and ordered its immediate abatement. In the seizure by officers of the law the printing plant was wrecked. Smith was blamed for this by his enemies and then secured the issuance of a warrant for his arrest. As he was the officially recognized commander of the Nauvoo Legion, a duly constituted unit of the militia, the imminence of a military clash was exploited and public opinion in the State became intensely antagonistic. The governor of Illinois armed Smith to surrender himself under assurance of safeguard against mobocratic violence. The prophet was imprisoned at Carthage, where on 27 June 1844 a mob broke into the jail and shot to death Joseph Smith and his brother Hyrum, and wounded John Taylor, one of the prophet's party.

Even this outrage failed to bring about the end of Mormonism. Joseph Smith was succeeded in the leadership of the Church by Brigham Young (see Young, Brigham), who, easy in mind, was impelled through the violence of persistent persecution to leave Nauvoo with his people. They set out for the West. A party numbering 143, led by Young, started in the spring of 1847, and on 24 July arrived in the valley of the Great Salt Lake, which region the leader declared to be the land of promise to the Saints. To ordinary view the promise was most uninviting. The pioneer band placed a dam across the little stream later known as City Creek and flooded a small area of the hard-baked plain, irrigating the land was again watered. Thus was inaugurated the system of modern irrigation in America. The first crop raised by the colonists was small and the next was partly destroyed by an invasion of crickets; but the people pushed out into the remoter parts of the valley beyond; and within a few years the wilderness—a part of the Great American Desert—was blossoming as a flower garden. The site of the present Salt Lake City was surveyed, streets laid out, the Temple block was marked by boundaries and other reservations for community use were made. Brigham Young returned to Council Bluffs, Iowa, where the main body of his people had established temporary headquarters. The migrating hosts followed the route of the pioneer band, traveling in the smiling vales of Utah and contiguous States relate their experiences of having crossed the plains afoot, guiding ox teams or pushing handcarts by dint of strenuous effort. Great Salt Lake City, as the new settlement was first called, became at once important on account of its position on the route of wagon trains between the Missouri River and the Salt Lake.
his brother Joseph. After an administration covering 17 years and marked by unprecedented expansion in all phases of Church activity, Joseph F. Smith died on 19 Nov. 1918, a few days after his 80th birthday. On 23 Nov. 1918 Heber J. Grant, the senior member of the apostolic body, was made president of the Church on the second day of his 63rd year.

From the seemingly insignificant beginning of six the membership of the Church has now risen above half a million. In Utah and adjoining States, as also in Canada and Mexico, the people are organized according to residence into stakes, each of which comprises several wards; and outside the area so included, that is, in all the rest of the country, as also many foreign lands, are covered by missions. The theology of Mormonism is epitomized in the following exposition:

The Articles of Faith of the Church of Jesus Christ of Latter-Day Saints.

1. We believe in God, the Eternal Father, and in His Son, Jesus Christ, and in the Holy Ghost.

2. We believe that men will be punished for their own sins and not for Adam's transgression.

3. We believe that through the atonement of Christ, all men may be saved, by obedience to the laws and ordinances of the Gospel.

4. We believe that the first principles and ordinances of the Kingdom of God are: (1) Faith in the Lord Jesus Christ; (2) Repentance; (3) Baptism by immersion for the remission of sins; and (4) laying on of hands for the gift of the Holy Ghost.

5. We believe that a man must be called of God, by prophecy, and by the laying on of hands, by those who are in the ministry, to teach the Gospel and administer in the ordinances thereof.

6. We believe in the same organization that existed in the Primitive Church, viz.: apostles, prophets, pastors, teachers, evangelists, etc.

7. We believe in the gift of tongues, prophecy, revelation, visions, healing, interpretation of tongues, etc.

8. We believe the Bible to be the word of God, as far as it is translated correctly; we also believe the Book of Mormon to be the word of God.

9. We believe that all that God has revealed, all that He does now reveal, and we believe that He will yet reveal many great and important things pertaining to the Kingdom of God.

10. We believe in the literal gathering of Israel and in the restoration of the Ten Tribes; that Zion will be built upon this (the American) continent; that Christ will reign personally upon the earth; and that the earth will be renewed and transformed in its parabolical story.

11. We claim the privilege of worshipping Almighty God according to the dictates of our own conscience, and allow all men the same privilege; let them worship how, where, or what they may.

12. We believe in being subject to kings, presidents, rulers, and magistrates, in obeying, honoring, and sustaining the law.

13. We believe in being honest, true, chaste, benevolent, virtuous, and in doing good to all men; indeed, we may say that we follow the admonition of Paul, We believe all things, we hope all things, we have endured many things, and hope to be able to endure all things. If there is anything virtuous, lovely, or of good report or praiseworthy, we seek after these things.—Joseph Smith.

The presiding council of the Church is the first presidency, consisting of the president and his two councillors, each of the three being an ordained high priest. The president is officially styled "prophet, seer, and revelator" to the Church. Next in authority is the council of 12 apostles, and in addition there are patriarchs, high priests, seventies, elders, bishops, priests, teachers and deacons, the organization operating as a theocratic system. Authority and all the organizations are maintained as helps in government; these comprise relief societies, Sunday schools, young men's and young ladies' mutual improvement associations, primary associations for the children and religion classes for supplying religious and ethical instruction as a supplement to the secular teachings of the public schools. A system of church schools is operated for those who prefer denominational training, and these institutions range from the kindergarten to the normal school and college. The practice of plural marriage was a feature of the Church from the time of Joseph Smith's presidency to that of Wilford Woodruff. In 1852 the Federal government legislated against the system, but the constitutionality of the law was contested by the Mormons on the ground that it was in effect an infringement on religious freedom. More stringent laws followed, and numerous prosecutions resulted. Many members of the Church suffered fine and imprisonment rather than renounce plural marriage with whom they had covenanted under Church sanction. In 1887 the Mormon Church was disincorporated by Congress and the greater part of its property was confiscated by the government. In recognition of the final decision of the Supreme Court that the laws forbidding a plurality of wives were constitutionally valid, the Church in general conference assembled adopted as a binding rule the Wooruff manifesto; and except for sporadic cases of violation of this rule of 1852, plural marriage has ceased to be an issue in Mormon affairs. In 1898 Brigham H. Roberts was elected to Congress on the Democratic ticket, but a protest followed on the charge that he was living in polygamous relations, and on the recommendation of an investigating committee of the House of Representatives he was denied a seat in Congress. In 1904 an effort was made to unseat United States Senator Reed Smoot, on the charge that he, being a member and an official of the Mormon Church, did in effect and encourage the practice of plural marriage, and that he was disloyal to the Federal government. Both charges failed and the senator was confirmed in his place in the upper house of Congress.

Salt Lake City, which is still the headquarters of the Mormon Church, and both capital and metropolis of the State of Utah, is famed for its beauty of situation, its wide and excellent streets and its many imposing structures. The great tabernacle, a building begun in 1864 and completed in 1867, is of stone 16 long, 150 feet in greatest width and over 70 feet high from floor to ceiling at the centre. The roof is a great dome of lattice-work construction and is self-supporting, the vast span being without a single pillar. As first constructed the enormous beams and trusses, entirely of wood, were held together by wooden pegs and rawhide thongs, for in that day iron spikes were unobtainable. The seating capacity of the building is over 9,000; but, with aisles and other standing space occupied, assemblies of nearly 11,000 are not uncommon. The great organ in the tabernacle is of world-wide fame, and the choral service is scarcely less renowned. The temple is built of solid granite, with walls eight feet thick in the first story and six feet above. This building was begun in 1852 and was dedicated in 1893, the time occupied in its construction being 40 years to the day. It is of composite architecture, with dimensions of 186 feet length, 118 feet width and 210 feet from ground to highest pinnacle. There are three other temples in Utah, one in Canada and one in Hawaii. The temples are used in ordi-
MORMYRIDÆ — MOROCCO

nance work and not for worshiping assemblies in general. A characteristic of Mormon practice is the rendering of vicarious service in baptism and other ordinances for the dead; and this labor is performed only within temples erected and dedicated for the purpose. Ordinarily, it is for the dead likewise administered in these structures; and the distinctive ceremony of "celestial marriage" is confined to the temple administration. This order of marriage involves a covenant between the parties for time and all eternity, and not only until death shall them part. No marriages are solemnized in the temples or elsewhere among the Mormons except such as are authorized by the license of the State. See SALT LAKE CITY; UTAH.

MORMYRIDÆ, mör-mir'î-di, from the Greek mormyros, sea-fish. They are known as the African-beaked fish of the pike family, but, by Professor Cope, applied to the Sphyrophori. They have the narrow parietal bones of the skull distinct both from one another and from the supraoccipital and they have the special distinction of having the pterocasts (on each side of the parietals) large, funnel-shaped and enclosing a cavity expanding externally and covered by a lid-like plate of bone. The anterior vertebrae are simple and unmodified and the gill cover has a sub-opercular bone. Scales cover both body and tail, but the head is naked and barbels are absent on muzzle. The central portion of the upper jaw is formed by the united premaxillae and the sides by the maxillae. A small slit represents the gill opening and there are no false gills. The air bladder is simple. The beaked fishes are divided into two groups, the Nile having 11 species.

MORMYRUS, a fish of the Nile (Mormyrus petroli), regarded as excellent for the table, and caught with line and hook. Its lower jaw is extended into a fleshy appendage and its characteristic form is depicted on ancient wall-paintings and carvings. It represents a group of maleopertoral nocturnal African river-fishes allied to the pikes.

MORNAV, Philippe de, fé-lép dé mör-nä, SEIGNEUR DU PLESSIS-MARLY, French statesman; b. Buhy, Normandy, 5 Nov. 1549; d. La Forêt-sur-Sèvre, 11 Nov. 1623. He was brought up a Huguenot; entered Coligny's service; escaped to England at the time of the Massacre of Saint Bartholomew; returned to France in 1573, and took up arms for the Huguenots; was captured at the siege of Dornans and afterward ransomed, and joined the army of Henry of Navarre, who used not only his sword but his pen and his diplomatic gifts, made him a member of his council and appointed him governor of Saumur. After Henry became Henry IV of France and a Catholic, Mornav was the sole Huguenot leader and was even styled the "Huguenot pope" by his enemies. He retired to Saumur (where he founded a Protestant university) soon after the Edict of Nantes, in the negotiations leading up to which he had definite importance. He wrote, among other controversial works aimed now at pagans or atheists, now at the Roman Catholic Church, 'De l'Eucharistie,' urging the Calvinistic view of the Lord's Supper as opposed to transubstantiation (1598). His 'Mémoires pour servir à l'Histoire de la Réformation en France,' re-edited in 1824, is a valuable source for the history of the period. His wife's memoirs (1824) detail his life down to 1600. Corr. AMB. Students: There, Mornav (Paris 1847), and Baird, 'The Huguenots and Henry of Navarre' (New York 1886).

MORNING-GLORY, an annual twining or trailing vine (Ipomoea purpurea) or some related species (a native of South America), popular as a garden ornament all over the world and often found escaped to the fields and road sides. There, it is sometimes. It is erect, tall, with large roundish heart-shaped leaves and large delicate ephemeral flowers of very various forms and colors. The seed may be sown in any garden soil well exposed to the sun, where the plants may be expected to grow the following year. They self-sow readily. If the soil is very rich they increase so fast as to make an excellent screen for a low porch by midsummer. See CONVOLVULACEÆ; IPOMEA.

MORNINGSIDE COLLEGE, in Sioux City, Iowa; coeducational; founded in 1894, under the auspices of the Methodist Episcopal Church. In 1916 the school had 35 professors and instructors and about 770 students. There were 28,000 volumes in the library; the grounds, building and apparatus were valued at $157,000; the income was $33,000, not including benefactions. The collegiate course leads to the degrees of A.B., B.S. and Ph.B.

MORNY, mör-né, Charles Auguste Louis Joseph, Duc de, French politician; b. Paris, 23 Oct. 1811; d. there, 10 March 1883. He was a half-brother of Louis Napoleon (afterward Napoleon III), a natural son of Queen Hortense and Count Flahaut. He was for a time in the army, then tried commercial speculation and finally politics. He became a deputy in 1842, took a prominent part on the side of Napoleon III in the coup d'état of 1851, and was a conspicuous figure under the Second Empire, during which he was Minister of the Interior (1851–55), president of the Corps Législatif (1854–65), and was sent on a special embassy to Saint Petersburg (1856–57) and was created duke in 1862. Possessed of a certain sort of ability, he employed it with perfect unscrupulousness for the advancement of his personal interest. Alphonse Daudet (who for a time served as one of his secretaries) has portrayed him as the Duc la Mora in 'Le nabab.' Consult the biographies by Castille (Paris 1859) and Lolié (English trans., New York 1910).

MOROCCO, mő-rökō, or MAROCCO, a sultanate or empire and French protectorate of northwest Africa, known to its inhabitants only by its Arabic name Moghreb-el-Aksa, "The Extreme West." It is bounded on the west by the Atlantic Ocean, north by the Mediterranean Sea, northeast by Algeria and east and south by the Sahara, the boundary in the southwest being formed by the Wady Draa, while elsewhere there is no definite line of demarcation between the French Sahara and Morocco; area, about 219,000 square miles. The rulers of Morocco exercised sovereignty at one time over Twal,
of 700 miles. The lower portion of its bed, however, is periodically quite dry. Lake Ed-Debayaa, formed by the floods of the Draa, is reported to be very large; but it disappears annually, and gives way to rich cultivated fields. The fresh-water lake of Gebel el Akhdar (Green Mount) lies about 30 miles north of Morocco. The coast offers few good harbors; of these Tangier and Mogador, or Sveira, are the best; the rest are but open roadsteads at the mouths of rivers.

Natural Resources, etc.—The extent of the mineral wealth possessed by Morocco is not known with any accuracy. Copper, iron, and lead are obtained in larger or smaller quantities. The flora of Morocco includes the esculent oak and cork oak; in the higher regions of the Atlas the cedar and Aleppo pine, with many varieties of oxycedrus and juniper yielding fragrant gums; also the date-palm and the dwarf-palm east and south of the Atlas; and near the coast the Eau, which yields an excellent oil. Among the wild animals are lions, panthers, ousses, wild boars, gazelles and several species of large antelope, especially the bubalus. The locust makes its appearance in May, when it lays its young brood come forth a month later in countless multitudes, and in another month they take wing, consuming all vegetation in their progress and spreading desolation over the fields. They are gathered and eaten in large quantities. The ostrich is found on the south frontiers of Morocco.

Climate.—The climate west of Atlas is much more temperate than might be expected under such low latitudes. This is due to the circumstance that a lofty chain of mountains, covered in some parts with perpetual snow, intercepts the hot winds from the deserts of the interior, so that the equable and refreshing sea-breezes prevail throughout the year. Hence the extremes of temperature lie within moderate limits; the thermometer rarely falling below 40° F. in the winter, while it does not rise above 95° in summer. In the region east of the mountains intense cold is felt in winter, while in summer the heat of the plains is insufferable.

Agriculture.—The agriculture of Morocco was in the lowest possible condition and the annual production calculated barely to supply the wants of the country; though with proper cultivation and under an enlightened government Morocco will become one of the most productive countries in the world. Unfortunately, until the French protectorate was established, owing to oppression and extortion, there was nothing but discouragement for anyone attempting to reap advantage from these resources. The cereal crops are wheat barley and maize; but durrah or millet (Sorghum vulgare) constitutes the chief support of the population, though beans, the esculent arum, and even canary seed are much eaten by the poorer classes. Cotton growing was introduced in 1911. The vine was cultivated only near towns for the sake of the fresh grapes and for the raisins; but now the outlook for this product is promising. All the fruits of the south of Europe are cultivated to some extent. Large numbers of the inhabitants lead a pastoral life, subsisting wholly on the produce of their herds and flocks, or else on game and the wild fruits of the forests. The chief wealth of the tribes
scattered over. Morocco consists in their herds
and flocks. The spirited small horses, for
which the country was famous in ancient times,
are still numerous, particularly in the southern
provinces. Horned cattle are numerous, particu-
larly in the northern districts. The bulls are
generally tractable and are employed in the labors of the field — bullocks being little known.
The sheep are supposed to number at least
45,000,000; while the goats are estimated at
10,000,000 or 12,000,000, and goat-skins constitute
half of the principal of export.

Manufactures and Commerce.—In general
among the rural population, each family sup-
plies all its own wants. In the towns, however,
some manufactures are carried on. Fez makes
and exports great quantities of the cloth caps
which bear the name of that city. The tanners
of Mequinez and other places have a great reputa-
tion, and Moroccan carpets are much esteemed
in Europe. The commerce is partly carried on
with the adjacent countries, partly with Euro-
pean states. From the Sudan are obtained
ivory, gold-dust, ostrich feathers, asafoetida,
gums, Guinea pepper and slaves. Of the whole
of the commerce with Christian states nearly
half is carried on with Great Britain. The ex-
ports consist of beans, dates, 64,000 bushels of
grains, eggs, wheat, wool, wax, etc.; the imports,
of cottons, sugar, wine and flour. The French
have constructed 1,500 kilometers of roads. A
railway has been completed to Fez and another
connecting Casablanca to Marakesh is under
way, while a line to link up with the Algerian
railways has been completed as far as Taza.
Postal services have been introduced, there are
several wireless stations, and in 1916 there were
4,185 miles of telegraph, exclusive of military
lines. Imports (1915), about $54,000,000; ex-
ports, $12,834,000. The number of vessels en-
tered at Moroccan ports in 1915 was 4,319, of
a total tonnage of 1,963,240 tons.

Money, Weights and Measures.—Spanish
dollars and pesetas, as well as Moorish, coins
minted for the Government in France are cur-
rent, but of fluctuating value. The common
currency consists of coins (two two-third cents)
the blanken or muzoon of six dimes equaling
approximately 16 cents; the okia or ounce of
tiny sheets, about 126 pieces, and the Arabe,
of 10 ounces equaling 76 cents. The kintar of
100 rotals for native produce is equal to about
168 pounds; the kintar for imported articles
about 112 pounds. The drak of eight tomens is
equal to about 22 inches. They could dry meas-
ure by which grain is sold equals 1 1/266
bushels; the kula of 28 rotals, by which oil is
sold wholesale, equals 47 pounds in weight, or
53 pints by measure.

Government.—The sovereign or Sultan of
Morocco is styled by Europeans; emperor, bears
the title of Emir el Mumenin, or Lord of the
True Believers. He is ordinarily called by his
subjects simply Seid-na — Our Lord. He is
absolute in the strictest sense; the lives and
properties of his subjects are at his disposal; the
laws, which he makes and unmakes at his pleasure. The
imperial revenues are derived from imports on
property, from duties on imports and exports,
from monopolies and from fines or confiscations.
Liquorism is very prevalent, the persons who
were directly or indirectly purchased, small sal-
aries or none were paid, the holders recouping
themselves by plunder and oppression, tem-
pered by the fact that at any moment they may
be forced to disgorge to the Sultan, or in de-
fault be left to rot in the loathsome Moroc-
don dungeons, or be beaten or tortured to death.
All justice was bought and sold. Yet going
to the religious fanaticism of the people, and
the mutual jealousies of the European powers,
especially France, Great Britain, Germany, Italy
and Spain, these unsatisfactory conditions were
until recently preserved. See post, under Gover-
ment articles of export.

Population.—For an estimate of the popula-
tion of Morocco there are no certain data.
One of the most recent calculations estimates
it at 5,000,000. An important element of weak-
ness in the social and political constitution is
found in the several distinct races which,
so far from uniting, repel one another. The
Berbers are the oldest inhabitants of the coun-
try, and they devote themselves to agriculture
rather than to pastoral pursuits. Their chief
physical characteristic is their corpulence and they are
more indolent and much less sociable than the
Arabs. A considerable number of Jews is to
be found in all the commercial towns of Mor-
occo, where, in spite of the oppressions to
which they are subjected, they often accumu-
late wealth, being the sole dealers in bullion
and holders of capital. To these various in-
redients of a checkered population must be
added the negroes and their posterity of every
shade, who are particularly numerous in the
southern provinces. The civilization of Mor-
occo had sunk to a low condition. The educa-
tion given at the schools in the chief towns, and
completed at the University of Fez, does not go
beyond the theology of the Koran; but un-
der French rule progress has been made. The
public libraries, once famous, are now dis-
persed; true science is unknown, and whatever
monuments of art are to be found in the king-
dom point to the time when literature and
draftsmen flourished, and the literary activities in
Spain. Music is the only art for which the
Moors are said to manifest a decided taste,
but they have not as yet arrived at any profi-
ciency in it.

History.—In the Mauri of ancient writers it is
easy to recognize the Moors of modern times.
These people were supposed to have come from
Asia, and particularly from Palestine, but their
origin is doubtful. The Berbers are believed to
be the representatives of the races that ex-
isted in the country in the earliest historical times.
After being for more than four centuries a part
of the Roman empire, and in the later period of its sway venerated with a corrupt
Christianity, "Mauritanian Tingitanum," fell (A.D.
429 A.D.) into the hands of the Vandals, who in-
truded the piratical habits which afterward
became so characteristic of the coasts of Bar-
hary and Morocco. They held it till 553, when
Belisarius having defeated them, it became sub-
ject once more to the Eastern empire. But in
the latter part of the 7th century the Arabs
spread over North Africa, and having taken
possession of Mauritanian, penetrated to the
borders of the desert. About this time the Jews were expelled from Spain by decree of the Council of Toledo (694 A.D.), and sought refuge in great numbers on the shores of Africa. Near the close of the 8th century a Sherif or descendant of Mohammed named Edris obtained such an ascendency over the Berber tribes that they made him their sovereign, with the title of Imám. His son and successor founded in 807 the city of Fez. In 1035 the warlike sect of the Morabites rose into existence, and in 1055 their chief was proclaimed sovereign of Moghreb-el-aksa. His grandson and successor crossed the mountains and in 1072 laid the foundations of the city of Morocco, which thus arose with the remarkable dynasty of the Morabites. The expulsion of the Moors and Jews from Spain (1440-1501 A.D.) added 800,000 souls, it is said, to the population of Moghreb-el-aksa. In the middle of the 16th century a new dynasty commenced with the descendants of Sidi El Haddad, the property of Fath-al-Mansur (1579-1603), made himself master of the whole of Moghreb-el-aksa, and pushed his conquests through the desert as far as Timbuktu and khartoum. His reign is regarded as the golden age in the history of Morocco. The ninth and last Moroccan dynasty was that founded in 1648, by Sulaiman el-Fihili, or King of Tafilect. In 1814 the slavery of Christians was abolished and piracy was prohibited in 1817.

Several complications arose with France, caused by the plundering of French vessels by pirates, but in each instance the emperor gave compensation. In 1859-60 there was a war with Spain, owing to attacks made by some of the wild tribes upon the Spanish territory; it resulted in a cession of land and an indemnity of $20,000,000 to Spain.

The Sultan Abdul Aziz IV succeeded his father El Hasan III, in 1894, when he was 14 years of age, and he had a difficult task with his turbulent people. On 18 May 1904, Rais-Ullah, a prominent chieftain, captured and held for ransom, the Hon. Ion Perdicaris, an American subject, and his stepson Mr. Varley, an English subject. The ultimatum of the United States was ignored, and the French Minister of Foreign Affairs, without receiving any plausible explanation, fired upon the palace of the Sultan.

The Sultan's wealth became more and more apparent to the insurgent tribes of northern and central Morocco, and contempt for the rights of foreigners, with utter lawlessness prevailed throughout the kingdom. At the ports, especially Tangier, the property of Europeans, and even their lives, were in jeopardy. To safeguard the loan of $10,000,000 which had been advanced to the Sultan, the French government arranged for the appointment of a French financial adviser, with agents to undertake the control of the Customs; it was also arranged to police Tangier with French-Algerians, and a French military mission proceeded to Fez. By the Anglo-French Agreement of 8 April 1904, France was the nation whose dominions bordered on Morocco, was to be unchallenged by Great Britain in guarding the tranquility of that kingdom, in return for allowing Great Britain freedom of action in Egypt; moreover, freedom of trade was guaranteed for 30 years in Egypt and Morocco. In October 1904 a Franco-Spanish Agreement was also arranged, which recognized the terms of the Anglo-French Agreement, the maintenance of the territorial integrity of Morocco, the neutralization of the coast between Melilla and the Sebu River, the preponderating right of France to give the Sultan military, economic and financial assistance, and modified the limits of the Spanish sphere of influence. In January reforms submitted by the French government were received with marked disfavor by the Sultan and by his Council of Notables. This was thought later to have been due to German diplomacy, which under the terms of the Madrid Convention of 1880, refused to recognize the agreements made by France with Great Britain and Spain concerning Morocco.

In 1880 the Madrid Convention with Morocco, bearing the signatures of Austria, Belgium, Denmark, Germany, France, Great Britain, Italy, Morocco, the Netherlands, Portugal, Spain, Sweden and Norway, and the United States, had established the right of protection in Morocco, and the 17th article of the treaty reads: "The right to protection in Morocco, and the most favored nation is recognized by Morocco, as belonging to all the Powers represented at the Madrid Conference."

The German opposition was further emphasized by the visit of the German Emperor, William II to Tangier, 31 March 1905, when he assured the Sultan of his intention to uphold the integrity of the Moroccan kingdom and the equality of Germany's commercial and economic interests in the country. A special German mission was sent to Fez, and British and Spanish missions also proceeded to the Moorish capital, ostensibly to support the French policy. The Sultan and his advisers, 26 May 1905, refused to entertain the proposed reforms and advised an international conference of the Powers to deliberate on the Moroccan situation. After protracted negotiations between France and Germany, which were shadowed by rumors of probable war between the countries, and in which the resignation of M. Delcassé, the French Minister of Foreign Affairs, was the downfall of the Rouvier Ministry were incidents, a program was arranged to place before the International Conference. Algeciras in Spain, opposite Gibraltar, was chosen as the meeting place.

Various reasons were assigned for the unexpected raising of the Moroccan question by Germany; among these were — alarm at the apparent isolation of Germany in European politics, at the increase of French influence in North Africa, and at the consummation of an agreement which implied a further territorial division of Africa by private arrangement between two powers, regardless of German and other economic rights.

The various countries signatory to the Madrid Convention of 1880 sent delegates to Algeciras, and the conference was opened 16 Jan. 1906. The presence of the United States representatives was explained as safeguarding the nation's commercial interests in Morocco; with the political aspects of the conference arising solely from the strained relations between Germany and France, wherein a casus belli might
be found, the United States agents were specifically instructed not to participate. The meetings of the conference lasted until 31 March 1906, when after strenuous opposition and counter-proposals on the part of Germany, supported only by Austria, against the French program; supported by Great Britain, Russia, Italy, Spain, Portugal, the United States, Belgium and Holland, an agreement on all points was reached. The French program maintained that the police, under the Sultan's orders, should be commanded by French and Spanish officers and sub-officers nominated to the Sultan and appointed by him, and that the Inspector-General of the Police should report to the Sultan. Germany made a series of propositions in opposition to this general plan, seeking to bring the whole Moroccan business practically under the control of the European concert, requiring those Powers directly acting in Morocco to take a European mandate, and to be subject to the interposition of the other Powers. Germany would be an important one. Matters had almost reached a deadlock when a proposition relative to a mixed police force for the ports in dispute was brought forward by Ambassador White, under instructions from President Roosevelt, and introduced by the Russians, provided a solution for the existing difficulties. The division and the policing of the ports of Morocco was arranged as follows: Spain to police Tetuan and Larache; a Franco-Spanish mixed police to be established at Casablanca and Tangier, and a French police force alone to have charge of Mogador, Safi, Mazagan and Rabat. The result of the conference was virtually a victory for France, which retained the preponderance of influence in the financial affairs of the kingdom, and lost little of what was demanded with regard to the policing of the country.

In 1907 Dr. Marchand was killed by natives at Marrakesh, and this was followed by French occupation of Ujda, on the Algerian border. In 1908 Mulai Hafid succeeded to the throne. In 1909—and again in 1911—the Rifians made attacks on the Spaniards in the neighborhood of Melilla, which were ultimately defeated. In July 1911 the German government distanced the French Panther to Agadir in southern Morocco, where German financiers had acquired considerable concessions. The local chiefs were entertained on board the vessel and promised German support in any resistance they might make against French paramountcy in the country. The result was a threatened European conflagration: Great Britain assured France of her support, and for a time the situation was tense. Negotiations were entered into between France and Germany, which lasted for three months, and the result of which was the drawing up of two agreements (4 Nov. 1911), the one practically recognizing a French protectorate in the country but obtaining for German interests absolute equality in economic and commercial matters, with a treaty of a two-year duration covering 40,000 square kilometres in the northern French Congo. In April 1912 the Sultan recognized the French protectorate, which has also been recognized by Great Britain, Germany and other great powers. General Lyautey was appointed resident-general, with both civil and military powers. In that year Mulai Hafid abdicated in favor of Mulai Yusuf, the present Sultan. Spanish rights in the Spanish Northern Zone have been conceded, and it is administered by a Khalifa chosen by the Sultan. A zone in the district of Tangiers 140 square miles in extent, has been granted to France. After the outbreak of the Great War in August 1914 the French army of occupation, amounting to 85,000 men, was required elsewhere; it was decided to withdraw troops from the interior and to hold only the towns on the coast, as a mobile corps was organized to keep order. Disturbances were created at the outset, inspired by German agents in the Spanish zone. About 30,000 Moors have fought in Europe, and thousands have filled places in munitions and other industries in France.

MOROCCO, or MARRAKESH, the second capital of the sultanate of Morocco (q.v.) on the north side of an extensive and fertile plain, 1,500 feet above sea-level, about 96 miles from Mogador, its port on the Atlantic, and 230 miles southwest of Fez, the chief capital of the empire. It has an excellent situation in sight of the Atlas Mountains, from which cool streams are always flowing and is noted for its genial and healthful climate. It commands the trade routes across the mountains, but the city has long been hastening to decay, chiefly the result of war, plague and wretched government. It is incircled by a lime and earth wall nearly six miles in circuit, between 20 and 30 feet high, with square towers every 50 paces, and pierced by nine gates, but all in a run-down condition. A large portion of the immense space within the walls is occupied by ill-kept gardens, open areas, and 'sols,' or market-places; the eight large cemeteries are outside the walls. In the bazaar and merchants' quarter a considerable local trade is carried on with the country people, the mountaineers from the neighboring Atlas, and with Sus, Taflet, Marzag, Safi and Mogador. Morocco possesses many mosques, one of which, the Kutubia, has a tower, and after the model of the Hassan in Rabat and the Giraldas in Seville, 320 feet high. On the south of the city stands the palace, now seldom occupied by the sultan, comprising a space of about 1,500 yards long by 600 yards wide, and near it is the palace of El-Millah, a walled enclosure of about one and one-half miles in circuit, one-half of it nearly
ruins, thronged to suffocation and excessively filthy. There are several tanning and leather-

dyeing establishments of considerable extent, though of late years European goods have been

gradually displacing native manufactures. The

population varies according to the presence or

absence of the sultan, his court and army. Mo-

rocco was founded in 1072 by the Emir Yusuf

ben Tachefyn, and reached the summit of its

prosperity in the 13th century and was famous

as a seat of learning. In those days it is af-

firmed to have contained more than 700,000 in-

habitants. During several centuries it suffered

from civil wars, and was sacked by the reli-

gious Berbers more than once. Pop. estimated

at from 50,000 to 80,000; Jews, according to one

computation, totaling 17,000.

MOROCCO, or MAROQUIN, a fine kind of

leather, prepared from the skin of the goat, o-

originally brought from the Levant and the

Barbary States, but now manufactured in most

other countries. The colors most commonly

communicated to it are red (by cochineal)

and yellow (by the Avignon or yellow berries).

Kano, in British Nigeria, is an important centre

of production. Split calf and sheepskins are

used in the production of good imitation

(French morocco) for binding; the peculiar

graining of the genuine article being imitated

by machinery. See also LEATHER.

MORÓN, mórón, or MORÓN DE FRON-

tERA, Spain, town in the province of Seville,

situated at the foot of the Sierra de Morón

on the Guadira and on the Ulterra-Morón

Railway. It contains the ruins of an ancient

Morish castle of great strength; the French

destroyed it on their evacuation in 1811. The

industrial resources are limited chiefly to the

production of olive oil and its red hematite

mines and marble quarries. Pop. 17,059.

MORONG, Thomas, American botanist: b.

Cahaba, Ala., 1827; d. 1894. He went in boy-

hood to Munich, and was graduated at An-

berst College in 1848. After studying law

he pursued a course in theology at Andover,

leaving the seminary in 1853. He had early

developed taste for botany, and in 1888 he

began a voyage which led to valuable botanical

collections. His explorations made a prominent

American, Peruvian, and Paraguayan.

Returning in 1890, he became curator of the

Columbia College herbarium. With N. L.

Britton he published ‘An Enumeration of the

Plants Collected by Dr. Thomas Morong in

Paraguay, 1888-90.’

MÓRONG, móróng, Philippines, capital of

the province of Rizal, Luzon, situated on the

bay Lagoon (Laguna de Bay), 19 miles south-

east of Manila Point.

MORONI, Giovanni Battista, jô-vâ-nî

bâ-tê-sâ môrô-né, Italian painter: b. Bondia,

near Albino, 1525; d. Bergamo, 5 Feb. 1578. He

painted many altarpieces and historical com-

positions, some of which are to be found in the

Bruno in late years in the Brera. Musées of

the province of Bergamo. He was, however,

most especially celebrated for his portraits which

are lifelike and arrest the attention by their

startling projection and lucid color tone. Many

of them are to be met with in Italy. There

are three examples in the British Museum, and

five in the London National Gallery, amongst

which is ‘The Tailor,’ a masterpiece. There

are also portraits in Boston, Philadelphia, Bal-

timore and the Metropolitan Museum, New

York.

MOROS, môrôz, Mohammedan Malays in-

habiting the southwestern part of the Philip-

pines, chiefly the Sulu Archipelago and the

islands of Palawan and Mindanao; various sub-

divisions include the Ilianos, Samales, Joloanos,

Maguendanaos, etc. Mohammedanism was

propagated among the Moros in the 14th cen-

tury by Malays from the island of Borneo, and

is the prevailing religion. The Moro alphabet,

which is still retained in writing, shows distinct

traces of Arabic origin introduced by Arabic

teachers of the doctrines of Islam. The Moros

are governed by their local chiefs, datus or

sultans under a form of primitive feudalism.

They have no system of laws as such. The

penal passages of the Koran, taken in connec-

tion with local customs, are referred to as the

Tilah; the local customs being mainly interpre-

tations or even evasions of the Koran. Land is

held in common, the dattos claiming sections as

their own; in some localities, a ‘Master of the

Field’ allots plots of ground to individuals for

permanent or temporary occupation. Such an

estate may not be alienated without permission

having first been obtained from the authority

granting residence thereon. Slavery and po-

lygamy prevail among them; and they have

for many years engaged in piracy and predatory

expeditions against the neighboring Filipinos.

They remained unconquered by the Spaniards

until the era of modern firearms, and were

still an inexhaustible source of trouble when

the sovereignty of Spain terminated. Their

religion and peculiar customs, as well as their

spirit of independence, have made the govern-

ment of their country one of the greatest prob-

lems of the United States occupation of the

Philippines. The Sulu Archipelago in 1901 was

placed under military supervision and govern-

ment in accordance with a treaty made by the

United States representative and the sultan of

Sulu, who has relinquished his authority (see

SULU). In 1903 a law was passed by the Philip-

pine Commission providing government for the

Moro country of Mindanao and the neighboring

islands. This act provides that the civil
governor of the Philippine Islands shall appoint

for the Moro Province a governor and other

officials who were to form the legislative coun-

cil, which was empowered to organize educa-

tion, create a form of local government, establish

courts and enact laws providing for the aboli-

tion of slavery and the suppression of all

slave hunting and slave trade. The Moros

were informed in 1900 that slaves who sought

the protection of the United States garrison

would be considered free and their freedom

enforced. The datto at Zamboanga in 1901

abolished slavery among his followers. In 1903

the legislative council of the Moro Province

passed a law prohibiting slave hunting in all

the province, which was strongly demurred

by the Philippine Commission. The order for

disarmament of the Moros, made in

September 1911, is being systematically carried

out, but led in 1913 to a rebellion which was

not quelled till they had been pursued and

conquered in the mountain fastnesses of Baysak

in Northern Jolo. In 1914 the department of
MOROSAURUS, a genus of sauropodous dinosaurs (q.v.), with an extremely long and flexible neck and small body; found fossil in the Upper Jura beds of Wyoming and Colorado. It was related to Brontosaurus.

MOROSINI, Andrea, än-drä’a mör-rō-sé’-né, Venetian historian: b. Venice, 13 Feb. 1558; d. there, 29 June 1618. He was educated in belles-lettres at Padua, and from 1583 was in the service of the state. In 1600 he entered the senate, later was three times elected to the Council of Ten and in 1598 was made official historiographer of the republic to continue the work of Paolo Paruta. He was given access to the state papers as far as 1594. His "History of Venice from 1521 to 1615," appeared in 1623 (2d ed., 1719), and has been esteemed for its accuracy and elegant Latinity.

MOROSINI, Francesco (called the PALPONNESIAC), Venetian soldier: b. Venice, 1618; d. Napoli di Romagna, 6 Jan. 1694. He was a leading military commander of his day, and four times made generalissimo of Venetian forces. His career was almost a continuous struggle with the Turks. In 1656 he became governor of Candia, but in 1669 was compelled to surrender the island to Mehemet Kopril. His sobriquet was gained by later victories in the Morea. From 1668 he was doge of Venice. ("Histoire de la République de Venise," 4th ed., 1819; 4th ed., 1853) calls him "the last of the Venetians."

MORPETH, England, market town in the municipal borough of the same name in Northumberland County and located on the Wansbeck. It has two Anglican and one Catholic church, a town-hall (dedicated 1869), a large prison, ruins of a castle, etc. It has an iron foundry, brewery, tanneries, etc., and does considerable trade in grain. Nearby are the ruins of the Newminster Abbey, dating from 1138. The neighboring village of Mitford also has interesting remains of a 12th century castle and Bothal Castle dating from the 14th century is on the northern bank of the Wansbeck. North of Morpeth is a 15th century "pee[p] tower. Its population in 1911 was 7,433.

MORPHEUS, mör-fë’s, in classical mythology a minister of the god Somnus, sometimes called the god of sleep. He is generally represented as a slumbering child, of great corpulence, weathing with a wand holding a vase in one hand, and in the other some poppies.

MORPHINE, an alkaloid occurring in opium, and constituting from 3 to 20 per cent of the crude drug depending upon where it originated. It has the chemical formula C_{17}H_{21}NO_{3} + H_{2}O. In the crude opium morphine and codeine are in the form of two salts — the meconate and sulphate of morphia; and as both of these salts are soluble in water their recovery from the opium is of the simplest. In the preparation of morphine the opium is digested with water at 100° F., common chalk is added, and the solution is evaporated to a small bulk. Calcium carbonate is then added to precipitate the meconic acid that the extract contains, and after filtration the solution is evaporated. Calcium meconate separates out first, after which crystals of the hydrochlorides of morphine and codeine are deposited. The latter crystals are re-dissolved in water and decomposed with ammonia, the morphine with a little codeine being thereby precipitated while most of the codeine remains in solution. The codeine is separated from the morphine by dissolving it with ether. Morphine dissolves in 10,000 parts of cold water, and in 500 parts of boiling water. It is also readily soluble in hot alcohol, but is insoluble in ether, benzene and chloroform. It is bitter and very poisonous, and crystallizes in small rhombic prisms, or needle-like crystals. Morphine acts as a base toward acids, and numerous salts of the alkaloid are known. In medicine, morphine is usually administered in the form of the sulphate or some other salt. When morphine is heated with hydrochloric acid in a closed tube, for two or three hours at a temperature of about 290° F. it loses a molecule of water and it becomes converted into another alkaloid which has the formula C_{17}H_{21}NO_{3} + HCl and is called "apomorphine." Apomorphine is also poisonous. Its salts, when administered in small doses, however, do not act as a narcotic, but as a powerful emetic. Special attention has been paid, by chemists, to the positive identification of morphine, owing to the frequent importance of such identification in medical jurisprudence. The subject is full of technical difficulties, especially when (as is commonly the case) morphine, if present, is mingled with large quantities of animal tissue, and in this case it must be separated before the tests are applied. Many such tests are known, of which the following are the most familiar: (1) A neutral solution of a ferric salt, when added to a neutral solution of a morphine salt, gives a blue color which is destroyed by heat, by alcohol and by acids. (2) If iodic acid and starch are added to a weak solution of a morphine salt, and a weak solution of ammonia is floated upon the mixture, a brown ring below a blue ring will be formed at the bounding surface that separates the liquids from each other. Consult AuTenriech, W. (Warren's translation), "Laboratory Manual for the Detection of Poisons and Powerful Drugs" (Philadelphia 1915).

MORPHOLOGY, the division of biological science which deals with the form of parts and organs of animals and plants, from Gr. morphē, form, and logos, doctrine, the term being equivalent to "science of form." The investigation of the structure of living organisms is the only true method by which we may become acquainted with their relations to each other, singly or in groups. Morphology thus lies at the foundation of physiology, and all true systems of classification and explanations of serial development. Goethe was the inventor of the term and the first to state the intention to relations in structure presented by living beings. See PLANTS; ANATOMY OF; PLANTS; MORPHOLOGICAL EVOLUTION OF.

MORPHY, mör’fi, Paul Charles, American chess-player; b. New Orleans, La., 22 June 1837; d. there, 10 July 1884. He showed his fondest exaltation is the art of playing chess at an early age, and at 12 had defeated many of the local amateurs. At the College of South Carolina he studied
law for several years, occasionally playing a game. In 1857 at the first American chess con-
gress in New York, he defeated his strongest opponents. During the next year, in England, he successfully met such players as Bird, Boden and Löwenthal, and astonished the world of chess by playing as many as eight games simultaneously and without loss. He was一致性 of strength and skill, and his blindness did not prevent him from winning games. He was a pupil of Adolf Schack and of the famous German chess player, Anderssen. In 1858 he won five games out of eight against Harrwitz, and exhibited his blindfold skill, which was equally surprising. In 1859 he returned to the United States and here met the famous German player Morphy, who was at that time the world's champion. Morphy's skill at chess appeared to take part of the quality of genius. His brilliant achievements were not the result of long or deep deliberation, yet displayed all the elements usually connected with mental strength and quickness, and are sustained by profound study. Consult Löwenthal, 'Morphy's Games of Chess' (1860).

MORRELL, Imogene Robinson, American artist: b. Attleboro, Mass.; d. Philadelphia, 22 Nov. 1906. She was married to Abram Morrell in 1869. She studied art in the United States and Europe, and was a pupil of Adolf Schack at Düsseldorf and of Couture at Paris (1864). In 1874 she returned to America, opened a studio at Washington as a portrait and historical painter, and there established and became president of the Washington National Academy of Fine Arts (1879). Some of the more notable paintings are 'The First Battle of the Puritans'; 'Washington Welcoming the Puritan Trains at Newburgh, N. Y.'; 'Portrait of General John A. Dix.'

MORRIL, Anson Peaslee, American politician: b. Belgrade, Maine, 10 June 1803; d. Augusta, Maine, 4 July 1887. He was first engaged in business in his native town, then in 1833 was sent to the State legislature; was sheriff of Somerset County 1839-40, and in 1853 postmaster and agent. In 1853 he was an unsuccessful candidate for governor on the Free-Soil ticket, but the following year he was elected as the first Republican governor of Maine, and later was a delegate to the convention which nominated Frémont. In 1860 he was elected to Congress, but declined a re-election.

MORRILL, Justin Smith, American senator: b. Strafford, Vt., 14 April 1810; d. Washington, D. C., 28 Dec. 1898. He received a good primary and secondary education, was a merchant and then a farmer; was first elected to the House of Representatives in 1854. In 1867 he was transferred to the Senate, in which he was long chairman of the committee of finance. With his 12 years in the lower house and 31 in the upper, he was more closely connected with Congress than any other man of his time, and was styled 'The Father of the Senate.' His college bill of 1858, for the creation of seats of learning in newly-settled States, has, with supplemental legislation, resulted in the erection of some 70 colleges. He introduced the war revenue tariff of 1861, commonly called the Morrill tariff, and during his later years consistently opposed the recruitment of volunteers, while advocating 'The Self-Consciousness of Noted Persons' (1886). Consult G. W. Atherton, 'The Legislative Career of Justin S. Morrill' (Washington 1901).

MORRILL, Lot Myrick, American politician: b. Belgrade, Maine, 10 Jan. 1813; d. Augusta, Maine, 10 Jan. 1883. He was educated at Waterville College (now Colby University), studied law and was admitted to the bar in 1839, when he went to Augusta and established a law practice. He took an active part in politics, in 1853 was elected to the legislature, and in 1856 was chosen president of the Senate. He was governor of his State 1858-60, and in the latter year was elected to the United States Senate, where he proved himself an indefatigable worker. He favored the resumption of specie payment and was an authority on financial, naval and Indian affairs. In 1876 he retired from the Senate to become Secretary of the Treasury under President Grant, and during his administration of that office constantly urged the return to specie payment. He declined an appointment to a foreign mission under President Hayes, and in 1887 became collector of customs at Portland, Maine, in which office he died.

MORRILLTON, Ark., capital town of the county of Conway, 50 miles by rail from Little Rock. It has manufactures of cottonseed oil, furniture, woolens, lumber, etc., and has a general trade in cotton and cattle. The town owns its electric light and waterworks, and in 1910 had a population of 2,424.

MORRIS, Benjamin Wistar, American Protestant Episcopal bishop: b. Wellsborough, Pa., 30 May 1819; d. Portland, Ore., 8 April 1906. He was graduated from the General Theological Seminary in 1840 and held successive rectories in Sunbury, Manayunk and Germantown, Pa. He was consecrated missionary bishop of Oregon and Washington in December 1864, and on the division of the diocese in 1880, became bishop of Oregon until 1882. His 'Presbyterian, Baptist and Methodist Testimony to Confirmation' (1890).

MORRIS, Charles, English song writer: b. 1745; d. near Dorking, Surrey, 11 July 1838. In 1764 he entered the 17th foot, with which he served in America, later exchanged into the Irish Dragoons and then into the 2d life-guards, in 1785 was made hard of the Beefsteak Society, and before its gatherings sang many of his wittiest efforts. He was a boon companion and associate of Fox and the Prince Regent. His humor and vivacity led Curran to say, 'Die when you will, Charles, you will die in your youth.' He wrote hundreds of songs, many being political ditties for the Whigs; and a posthumous volume, 'Lyra Urbana' (1840) collected them. His 'A Reason Fair to Fill my Glasses' was praised by Moore and set to music by Charles Dibdin.

MORRIS, Charles, American naval officer: b. Woodstock, Conn., 26 July 1784; d. 27 Jan. 1856. Entering the navy in 1799, he participated in the war with Tripoli, was an actor in the recapture of the Philadelphia, in the harbor of Tripoli (1804), being the first to gain her
deck when she was boarded. At the outbreak of the War of 1812 he was serving as executive officer of the sloop Pelew; he was wounded in the engagement of Old Ironsides with the Guerrière (August 1812); and afterward successfully commanded the John Adams until, being blockaded by a British squadron in Penobscot River, he was compelled to destroy his ship to save her from being taken by the enemy. In the war with Algiers (1815) he commanded the Congress, and it was he who, in the Brandony, carried Lafayette home to France (1825). After serving for some years as naval commissioner and as supervisor of the United States Naval Academy he became chief of the bureau of ordnance and hydrography, which position he held till the time of his death. Consult his "Autobiography" (1880).

MORRIS, Clara, American actress: b. Toronto, Ont., 1849. After early study in Cleveland, she became leading lady in Wood's Theatre, Cincinnati, Ohio, and in the winter of 1869-70 joined Augustus Daly's Fifth Avenue Company, New York. She at once achieved success in emotional roles and afterward made many tours throughout the United States. Her leading roles include "Camille," "Alix in the Countess de Sommereville," "Mercy Merrick," "Miss Multon," "Lady Macbeth," "Leah the Forsaken," and "Cora in L'Artiste." After her retirement from the stage she wrote much for periodicals and published in book form "A Silent Singer" (1899); "My Little Jim Crow" (1900); "A Pasteboard Crown," fiction (1902); "Stage Confidences" (1902); "The Trouble Woman" (1904); "The Life of a Star" (1906); "Lien in Charge" (1907); "New East Lynne" (1908); "Dressing Room Receptions" (1911). She was married to F. C. Harriot in 1874. In her later years she was afflicted with blindness.

MORRIS, Sir Daniel, British colonial expert: b. Loughor, Glamorgan, 26 May 1844. He was educated at Cheltenham, at the South Ken-
of his life. He wrote *Briarcliff*, a popular drama (1825) and edited *American Melodies* and (with Willis) *The Prose and Poetry of America* (1845). His *Poems* (final collection, 1860) included *Woodman, Spare that Tree*; *A Long Time Ago*; *My Mother's Bible*, and other well-known pieces.

**MORRIS, George Upham**, American naval officer: b. Massach. 3 June 1830; d. Jordan Alum Springs, Va., 15 Aug. 1875. He was appointed midshipman in the navy in 1846 and received steady promotion. In 1862 he was made lieutenant-commander and assigned to the *Cumberland*, and was in temporary command of her when she was attacked by the *Merrimac* in Hampton Roads. The gallant seamanship displayed by Morris on this occasion evoked the admiration of the country. He refused to leave the ship and stood at his post as she went down, but was rescued by some of his men. He afterward had command of the gunboat *Port Royal* and was engaged on the James River, at Fort-Darling, and later at Fort Powell and at Grant's Pass. He was promoted commander in 1866 and retired in ill-health in 1874.

**MORRIS, Gouverneur**, American statesman: b. Morrisania, N. Y., 31 Jan. 1752; d. there, 6 Nov. 1816. He was graduated in 1768 from King's College (now Columbia University); after study of the law was licensed in 1771 to practise as an attorney; did excellently well at the bar; and during the earlier difficulties between Great Britain and the American colonies maintained a conservative attitude and was eager to effect a compromise. Finally, however, he concluded this in with the patriot cause and was elected from Westchester County to the provincial congress of New York (1775). In this assembly he became the leader of the patriotic party and made an able speech favoring the adoption of the recommendation of the Continental Congress that the colonists establish new governments. A delegate to the constitutional convention of New York, he was chosen to the committees for drafting a plan for the constitution — in which Livingston and Jay were other prominent men — and played an important part in the establishment of a State fund. In 1777–83 he was a member of the Continental Congress, and almost immediately upon taking his seat was appointed one of a committee of five to visit Valley Forge and examine the condition of the troops. Early in 1779 he was made chairman of the important committee for receiving communications from our ministers abroad, and from the envoy of France. In this capacity he drew up the draft of instructions to the ministers which was adopted by Congress and formed the basis of the Treaty of Peace with Great Britain. In February 1780 he began the publication in the *Pennsylvania Packet* of a series of essays on American finances, in which he endeavored to show the wisdom of the colonists submitting to a reasonable taxation and outlined a scheme for such assessment. These essays influenced his appointment in 1781 as assistant financier to Robert Morris, a post he successfully filled until 1785. He was really the founder of the national currency, though his plan was later modified by Jefferson and Hamilton; he introduced the decimal notation and devised the word "cent" to indicate one of the lesser coins. In 1787 he was a delegate to the constitutional convention, and there he advocated a strongly centralized government, and finally revised the draft of the instrument. He was in France in 1788–91 for the transaction of private business, witnessing the stirring events of the French Revolution, and of which he kept a diary, and in 1791 was appointed by Washington a confidential agent to treat with Great Britain regarding certain unfulfilled articles of the treaty of peace. In 1792–94 he was minister to France, and in 1800–03 was United States Senator, filling a vacancy. He supported the Louisiana Purchase, but opposed the abolition of direct taxes and of the judiciary system. In 1810–13 he was chairman of the Erie canal commission; in the entire plan for this waterway, which he wished to make large enough for ships, he was a leader. He was keen in intellect, an excellent orator and rendered notable services to America. During the War of 1812 his ultra-Federalist views led him into positions that were extravagant and unwise. He pronounced funeral orations on Washington, Hamilton and Clinton; published pamphlets and addresses; and latterly contributed to newspapers political satires in both prose and verse. Consult Sparks, *Life* (1832); Roosevelt, *Life* (1888); *American Statesmen* series); Morris, A. C. *Diary and Letters of Gouverneur Morris* (1888).

**MORRIS, Gouverneur**, American novelist, great-grandson of the preceding: b. New York, 7 Feb. 1876. He was graduated from Yale in 1898 and has published *A Bunch of Grapes* (1897); *Tom Beauling* (1901); *Aladdin O'Brien* (1902); *The Footprint and Other Stories* (1904); *The Footprint and Other Stories* (1908); *Putting on the Screws* (1909); *Spread Eagle, and Other Stories* (1910); *The Voice in the Rice* (1910); *It and Other Stories* (1912); *If, You, Too*, Then *Tis Vanish* (1913); *The Incandescent Lily and Other Stories* (1914); *Seven Darlings* (1914); *When My Ship Comes In* (1915); *We Three* (1916).

**MORRIS, Harrison Smith**, American author: b. Philadelphia, 4 Oct. 1856. He was educated in the public schools of that city and early began to do literary work. From January 1899 to 1905 he was editor of *Lippincott's Magazine*. He is versed in the history of art, and was managing director of the Pennsylvania Academy of Fine Arts, in Philadelphia, from 1893 to 1905. He has written *A Duet in Lyrics*, poems, with J. A. Henry (1883); *Tales from Ten Poets* (1893); *Madonna and Other Poems* (1894); a continuation of Lamb's *Tales from Shakespeare* (1893); *Lyrics and Landscapes* (1908); *Life of William C. Richards* (1912) and has edited *In the Yule Log Glow* (1892) and *Where Meadows Meet the Sea* (1892). He was president of Wharton Steel Company (1909–17), and has been chairman of the committee on arts and means of the National Academy of Design, New York; was commissioner general of the United States of America to Roman Exposition of 1911 and decorated with Grand Cordon of Crown of Italy. He is a member and former vice-president of the National Institute of Arts and Letters; member of the American Philosophical Society and in 1915 became president Contem- porary Club, Philadelphia.
MORRIS, Sir Henry, English physician: b. Petworth, Sussex, 7 Jan. 1844. He was educated at Epsom College and University College and studied medicine and surgery at Guy's Hospital, London. Established in practice, he delivered the Cavendish lecture (1896), was Shaw lecturer at the Royal College of Surgeons (1903), since which he has distinguished himself frequently on the lecture platform. He was former surgeon and lecturer in anatomy and surgery at Middlesex Hospital Medical College, examiner in surgery at University of London and in anatomy at University of Durham. He was for six years chairman of the Court of Examiners of Royal College of Surgeons, president of the Royal Society of Medicine (1910-12) and Royal College of Surgeons (1906-09). He was created baronet 1909. Among his literary works are 'Anatomy of the Joints of Man' (1879); 'Surgical Diseases of the Kidney and Ureter' (1885); 'Gynaecology and Diseases of the Genital and Urinary Organs' (1895); 'Treatise on Human Anatomy' (1898; 4th ed., 1907). His 'Treatment of Inoperable Cancer' (1902) and 'Suggestion in Relation to the Treatment of Disease' (1910); 'Looking Back; Christian Science Refused' (1947), all contributed to his reputation.

MORRIS, Henry W., American naval officer: b. New York, 1806; d. there, 14 Aug. 1863. He entered the navy in 1819 and in 1828 was made lieutenant. He was on duty in New York waters and on the Potomac until 1835, when he was fleet-captain in the Mediterranean under Commodore Stringham. In 1861 he superintended the completion of the Pensacola, and in 1862 took command of her, successfully passed the Confederate fortifications on the Potomac and took a distinguished part in the battles at Fort Jackson, Fort Saint Philip and Chalmette. He guarded New Orleans after its capture, but failing health necessitated his return to the North, where he soon after died. He was buried at Commodore in 1862.

MORRIS, John, English Jesuit: b. Ootacamund, India, 1826; d. 1893. He studied (1845) at Trinity College, Cambridge, became (1846) a Roman Catholic, was ordained (1849) to the English mission, and became vice-rector of the English College, Rome (1852-55). Returning to England he was appointed secretary to Cardinal Wiseman and to his successor Cardinal Manning. He entered the Society of Jesus in 1867, was rector of Saint Ignatius College, Malta (1877-78), was made professor of canon law and church history at Saint Bruno's College, Saint Asaph (1879) and was rector at Rochester 1880-86. He wrote 'Condition of Catholics under James' (1871); 'The Troubles of our Catholic Forefathers' (1875); 'Cardinal Wiseman's Last Illness' (1871); 'Life and Letters of Saint Thomas Becket' (2nd ed. 1885). Consult Pallen, J. H., 'Life and Letters of Father John Morris' (London 1896).

MORRIS, John Gottlieb, American Lutheran clergyman: b. New York, 14 Nov. 1803; d. Lutherville, Md., 10 Oct. 1895. He was graduated from Drexel College in 1823 and studied theology at the Princeton and Gettysburg seminaries, receiving his license to preach in 1826. He founded the first English Lutheran church of Baltimore and was in charge of it from 1827-60, after which he held various important charges. He was chiefly instrumental in the founding of the College for Women in Lutherville and of the town. From 1834 until his death he was lecturer at Pennsylvania College, and he also lectured at Union Seminary at Washington. He was prominently connected with scientific and religious societies, and founded the Lutheran Observer in 1831 which he edited until 1833. He was librarian of the Peabody Institute at Baltimore, 1860-64. Among his many publications are 'Catechumen's and Communicant's Companion' (1831); 'Life of John Arndt' (1853); 'Fifty Years in the Lutheran Ministry' (1878); 'Memoirs of the Stork Family' (1880), etc.

MORRIS, Lewis, American statesman, b. New York, 1671; d. Kingsbury, N. Y., 21 May 1746. He practised law in New York, was judge of the Superior Court of New York and New Jersey in 1692, became one of the governor's council and a member of the assembly, and drew up and presented to Queen Anne the complaint against Governor Cornbury formulated by the assembly. From 1710-38 he was chief-justice of New York and New Jersey, in 1731 was acting governor of New Jersey, in 1738 was prominent in effecting the separation of New Jersey from New York and from 1738 until his death was governor of New Jersey.

MORRIS, Lewis, American patriot, one of the signers of the Declaration of Independence: b. Morrisania, Westchester County, N. Y., 1726; d. there, 22 Jan. 1798. After being graduated at Yale College in 1746 he engaged in farming on a very extensive scale on his paternal estate at Morrisania. He took strong ground against the act of Parliament compelling the inhabitants of the province of New York to furnish with supplies the foreign troops quartered upon them. He was elected to the Congress of 1773, was a member of the committee to devise means for supplying the colonies with munitions of war, and after the close of the session was sent west to detach the Indians from the British. In 1776 he resumed his seat, and signed the Declaration of Independence, although his estate was at that time in the hands of the enemy. As a consequence his manor was laid waste and his family expelled. In 1777 he was succeeded in Congress by Governor Morris, his half brother, but afterward served in the State legislature. The latter part of his life was spent at Morrisania. He was one of the boldest and most zealous promoters of the Revolution.

MORRIS, Sir Lewis, Welsh poet: b. Carmarthen, Wales, 23 Jan. 1813; d. London, England, 12 Nov. 1907. He was graduated from Jesus College at Oxford, studied law and was admitted to the bar of Lincoln's Inn in 1861, practising until 1881. Was deputy chancellor of University of Wales and prominently associated with the cause of education. Other volumes of his verse are 'Songs of Two Worlds' (1871-75); 'Gwen: a Drama in Monologue' (1879); 'The Ode of Life' (1880); 'Songs Unsung' (1883);
MORRIS 477

A Vision of Saints (1890); 'Harvest Tide' (1901); 'The Life and Death of Leo the Armenian' (1904); 'The New Rambler: From Desk to Platform' (1905), etc.

MORRIS, Mary Philes, American Tory: b. Philadelphia, 8 May 1806. She came to the colonies about 1747 and entered at Philadelphia the counting-room of Charles Willing, merchant; in 1754 formed a partnership with Thomas Willing maintained until 1793; acquired a very considerable fortune for the America of that time; and despite his strong loyalty to England, opposed the Stamp Act and signed the non-importation agreement of 1765. In October 1775 he was elected to the provincial assembly, and in 1776-78 was a member of the Continental Congress. On 2 July 1776 he voted against the Declaration of Independence and on 4 July abstained himself; but on 2 August he was one of the signers. When hostilities began his services became of increasing value. When Congress moved from Philadelphia to Baltimore on 12 Dec. 1776, Morris was left in charge of its affairs, and when it reassembled at Baltimore on 20 December was made with George Clymer of Pennsylvania and George Walton of Georgia a committee for the execution of Continental business. Morris did all that was done. Most of the business of the colonies during December and January was transacted by him; he prepared American ships for sea, assumed charge of incoming freights and supplied Washington with money. On 20 Feb. 1781 he was elected superintendent of finance. He found the treasury in a disordered state through a vastly depreciated paper currency, and at the lowest point in the fortunes of the Continental army borrowed money on his own credit and was the instrument in the difficult task of financing the war. He presented to Congress a plan for the organization of the Bank of North America, accepted 28 May; and himself subscribing $39,200 worth of shares. The bank was incorporated 31 Dec. 1781 and began operation 7 Jan. 1782. Morris resigned January 1783, but on request did not retire until 1 Nov. 1784. He was a member of the Pennsylvania assembly in 1776-78, 1778-79, 1780-81. In 1789 he was a member of the convention that framed the United States Constitution. He declined the Secretaryship of the Treasury, and was United States Senator from Pennsylvania in 1789-95. With James Greenleaf and against Washington's advice, he entered land speculation, but especially in the western half of New York State in anticipation of immigration after the war, and purchased in the new city of Washington 6,000 lots at $80 each, and agreeing to build yearly 20 brick houses. Largely through the defaulting of his partners he was compelled to make an assignment, and was imprisoned for debt at Philadelphia from 19 Feb. 1798 to 26 Aug. 1801. The influence of his credit, his ability in raising loans and his financial skill distinguished him as an opponent of staggering cause of the Revolution; and it is generally admitted that he was a momentous force in Washington's administration and fully earned the title of the 'Financier of the Revolution.' Consult Sparks, 'Alphabetical Correspondence of the Revolution' (1829-30); the 'Life' by Sumner (1892) in the 'Makers of America' series; Rolles, 'Financial Administration of Robert Morris' (1878), and Oberholzer, 'Robert Morris: Patriot and Financier' (1903).

MORRIS, Thomas, American statesman: b. Augusta County, Va., 3 Jan. 1776; d. Bethel, Ohio, 7 Dec. 1844. He removed in 1795 to Columbia, Ohio, and was employed by the Rev. John Smith, the first senator from Ohio. He fixed his residence in 1800 in Clermont County, studied law, was admitted to the bar, was a member of the State legislature from 1806 to 1830, was a judge of the State Supreme Court (1815-21), and in 1832 was elected to the United States Senate as a Democrat, where he distinguished himself as an opponent of the corrupt Democratic party, by which he had been elected, and he permanently retired in March 1839. In 1844 he was nominated for Vice-President by the Buffalo convention of the Liberty party, on the ticket with J. G. Birney (q.v.) for President. Consult the 'Life' by F. B. Morris (1856).

MORRIS, William, English poet and artist: b. Walthamstow, Essex, 24 March 1834; d. Hammersmith, London, 3 Oct. 1896. He was educated at Marlborough College and Exeter College, Oxford, where he began a lifelong friendship with Edward Burine-Jones. Both were attracted by the Anglo-Catholic revival, and intended to enter the Anglican priesthood, but early abandoned that resolve, and was for some nine months a pupil in the office of the noted architect, George Edmund Street. In 1856 he founded The Oxford and Cambridge Magazine, to which he contributed often, and which he published at his own expense for the year it was issued. Two years later (1858) appeared The Defense of Canterbury, a poem in the pages of which the temper of the Middle Ages may be said to find its most accurate modern interpretation. In 1867 he published the Life and Death of Jason, an epic of 17 cantos in heroic couplets, which showed him to be a teller of stories par excellence. By this time he had definitely entered upon his career
of weaver anew of old tales from classic or mediaeval sources, and the next year (1868) appeared the first volume of 'The Earthly Paradise,' a series of stories retold from classical and mediaeval originals, but with a mediaeval setting. A second and third volume followed in 1869 and 1870, the entire work comprising 24 tales with the addition of interludes and preludes and 12 lyrics of the months. In 'The Earthly Paradise,' as in the 'Jason,' Morris took the poet's inspiration from his hero in the structure of his verse as in what may be termed the processional nature of his descriptive passages. Three verse forms are employed by him, the seven-lined decasyllabic stanza known as the Chaucerian hexastich, the four-foot couplet and the heroic couplet. 'The Earthly Paradise' includes some 40,000 lines, but when once the reader has fallen under the poet's sway his leisurely manner will not be found wearisome. In 'The Lovers of Gudrun,' one of the tales of 'The Earthly Paradise,' Morris had wearily turned to Iceland for a theme and in 'The Story of Sigurd the Volsung and the Fall of the Niblungs' (1876) he returned to Icelandic myth for his subject. The poet regarded this poem as his masterpiece and in the opinion of many his most powerful. It ranks as almost the greatest, if not the greatest epic of the 19th century. In his hands the ancient myth becomes alive and throbs with all the intensity of primeval passion. Besides these works Morris published also in verse 'Love is Enough,' or the Freeing of Pharamond' (1872); 'The Æneids of Virgil done into English verse' (1875), in which the metre adopted is that of Chapman's Homer; 'The Odyssey of Homer done into English verse' (1877); 'The Dream of John Ball' (1888), and 'Poems of the Way' (1892).

In 1859 Morris married Miss Jane Burden. In 1861 he founded the firm of Morris, Marshall, Faulkner and Company and began the manufacture of wall-paper, stained glass and artistic furniture, and to his labors in this particular is ascribable much of the reform which English and American trade has experienced in household art during the last generation. In 1890 he established the Kelmscott Press at Hammersmith, and there published exquisitely printed editions of Chaucer, Beowulf and other works, as well as of his own writings. Still another side of his nature was shown in the trend of his human sympathies. He had long been known as poet and craftsman, but from 1885 he was active as a social reformer, lecturing frequently to workingmen in halls in the open air, and helping to support the Commonwealth, a Socialist journal. It is not wholly easy to understand this side of his nature, for intensely democratic as he became, in theory at least, he was an equally intense lover of that very beauty which a social upheaval would destroy. The ugliness of much of modern life led him to Socialism, but he was thoroughly sincere in his attitude, illogical as it may seem to many. However difficult it may be to adjust satisfactorily to our minds the attitude of the poet who is a craftsman, it is a fact that his work as a craftsman, which was offered to the world at prices practically prohibitory for the majority of persons, it is an unquestionable fact that the world is a pleasanter, wholesomer world for his having lived in it. He helped his generation to perceive that there is no necessary alliance between utility and ugliness; he raised the standard of household taste, and as a poet he was one of the most melodious of his time. In the later year of the last century a new form of composition in rhymed prose and verse greatly enjoyed by many, though perhaps not wholly to the taste of those who liked him best as the author of 'The Earthly Paradise' and 'Sigurd,'—a series of romances beginning with 'The Tale of His Mother,' in the structure of his verse as in what may be termed the processional nature of his descriptive passages. Three verse forms are employed by him, the seven-lined decasyllabic stanza known as the Chaucerian hexastich, the four-foot couplet and the heroic couplet. 'The Earthly Paradise' includes some 40,000 lines, but when once the reader has fallen under the poet's sway his leisurely manner will not be found wearisome. In 'The Lovers of Gudrun,' one of the tales of 'The Earthly Paradise,' Morris had wearily turned to Iceland for a theme and in 'The Story of Sigurd the Volsung and the Fall of the Niblungs' (1876) he returned to Icelandic myth for his subject. The poet regarded this poem as his masterpiece and in the opinion of many his most powerful. It ranks as almost the greatest, if not the greatest epic of the 19th century. In his hands the ancient myth becomes alive and throbs with all the intensity of primeval passion. Besides these works Morris published also in verse 'Love is Enough,' or the Freeing of Pharamond' (1872); 'The Æneids of Virgil done into English verse' (1875), in which the metre adopted is that of Chapman's Homer; 'The Odyssey of Homer done into English verse' (1877); 'The Dream of John Ball' (1888), and 'Poems of the Way' (1892).

In 1859 Morris married Miss Jane Burden. In 1861 he founded the firm of Morris, Marshall, Faulkner and Company and began the manufacture of wall-paper, stained glass and artistic furniture, and to his labors in this particular is ascribable much of the reform which English and American trade has experienced in household art during the last generation. In 1890 he established the Kelmscott Press at Hammersmith, and there published exquisitely printed editions of Chaucer, Beowulf and other works, as well as of his own writings. Still another side of his nature was shown in the trend of his human sympathies. He had long been known as poet and craftsman, but from 1885 he was active as a social reformer, lecturing frequently to workingmen in halls in the open air, and helping to support the Commonwealth, a Socialist journal. It is not wholly easy to understand this side of his nature, for intensely democratic as he became, in theory at least, he was an equally intense lover of that very beauty which a social upheaval would destroy. The ugliness of much of modern life led him to Socialism, but he was thoroughly sincere in his attitude, illogical as it may seem to many. However difficult it may be to adjust satisfactorily to our minds the attitude of the poet who is a craftsman, it is a fact that his work as a craftsman, which was offered to the world at prices practically prohibitory for the majority of persons, it is an unquestionable fact that the world is a pleasanter, wholesomer world for his having lived in it. He helped
were strengthened and called Battery Gregg. Attempts were made, in 1863, by the Union forces under Admiral David D. Porter, the General Hunter, to secure possession of the island, and later by Admiral Dahlgren and General Gilmore. A landing was made on 10 July and on the 11th and 18th an encounter took place, and a regular siege began. See FORT SUMTER.

MORRIS, III., city and county-seat of Grundy County, 59 miles southwest of Chicago, on the Illinois River, the Illinois and Michigan Canal, the proposed Lakes to Gulf Deep Waterway, the Chicago, Rock Island and Pacific Railroad; the Chicago, Ottawa and Peoria and the Fox and Illinois Union electric interurbans. The first settlement was made in 1834, and in 1857 the town was incorporated. The surrounding country is a fertile agricultural region in which there are large bituminous coal fields and beds of clay used for brick and tile. Industries include a paper mill with box-board factory, oatmeal mill, large tannery, cut glass, heavy hardware, novelties, factories and a brewery. Three national banks containing highest per capita deposits of any in State in towns of 5,000 class. Morris is the seat of the largest sheep feeding and shearing yards between Chicago and western ranges. The town is the seat of Saint Angela's Academy. It has a new, all modern high school building and four new modern ward schools. Also has large parochial school. Pop. 4,563.

MORRIS, Minn., village, county-seat of Stevens County, on the Great Northern and Northern Pacific railroads, about 160 miles west by north of Saint Paul. Good water power is obtained from the Pomme de Terre River which is near. The chief product of the surrounding agricultural region is wheat. The principal manufactures of the village are flour and dairy products. The three local banks have combined resources of $1,200,000. There are several grain elevators, flour mills, cement works, fanning mill, planing mill, oatmeal mill, large tannery, cut glass, hard ware, novelties, factories and a brewery. The town has two good schools, a high school, general hospital, parochial school, seven churches, two theaters, an armory, fire hall and a public library. It is also the seat of the West Central School of Agriculture and of Assumption College (R.C.). The value of all taxable property is $650,000. The government is vested in a commission of three with city manager. The municipal receipts average about $35,000. Pop. 2,500.

MORRIS DANCE, or MOORISH DANCE, supposed to have been derived from the Morris dances in Spain, was formerly danced as puppet-shows, etc. It was introduced into England in the reign of Edward III., when John of Gaunt returned from Spain. In the May-games morris-dancers formed an important part with Robin Hood, Friar Tuck, Little John and the Hobby Horse were introduced as characters in the dance. In the reign of Henry VIII. the morris-dancers were dressed in gilt leather and silver paper, and sometimes in coats of white and spangled fustian. Suppressed by the Puritans it survives in the country dance so named in the north of England.

MORRIS PARK. See HORSE-RACING.

MORRIS PLAN, The. The Morris Plan of industrial loans and investments takes its name from a Southern lawyer, Arthur J. Morris, formerly of Norfolk, Va., but now of New York. Over 100 companies were organized to operate this plan within the nine years ended 23 March 1919; the capital invested was about $12,000,000, and the amount of money lent to about 660,000 borrowers was near $100,000,000. Loans are now running at the rate of $36,000-00 a year. The urgent though unvoiced demand for a special banking institution for the benefit of the industrial classes—which had existed on the continent of Europe for over half a century—was first met in this country by the Fidelity Savings and Trust Company, of Norfolk, modestly capitalized at $20,000, which began the operation of the Morris Plan on 23 March 1910. The Plan itself may be briefly described as follows:

A man needs a small sum of money to tide him over some urgent financial difficulty. Being unknown at the commercial banks and having no securities he can borrow on, he has to rely on the generosity of a friend, to turn to the tender mercies of a loan shark, or seek relief at the counter of a Morris Plan company. Here, if his application is granted, for each $50 borrowed he pays $1 toward the cost of investigation, and gives a promissory note signed by himself and two friends who, as co-makers, guarantee his honesty and earning capacity. This note is discounted at the legal rate of interest, and for each $50 of his indebtedness the borrower agrees to pay $1 a week toward the purchase of a certificate of investment equaling the amount of his loan. At the end of 50 weeks he has paid for this certificate in full, and two weeks later he may cash it at the company's office and pay off his note, which is then due. He has not had to pawn his watch or mortgage his furniture, and instead of paying a ruinous rate of interest to a disreputable money-lender he has dealt with honest people who have treated him fairly and squarely. When his debt is paid he may, if he wishes, subscribe for a share in the company's certificates of investment, bearing interest at 5 per cent from date of payment, and pay for the same with cash down or on the installment plan; and these certificates will be available as security for future loans, in which case no endorsements will be necessary. Many a man who begins as a borrower ends by becoming an investor in interest-bearing Morris Plan certificates; but one does not have to be a borrower in order to buy them.

Most Morris Plan loans are made to wage-earners or small-salaried workers, but many are made to individuals, firms or small corporations to extend their business.

The first Morris Plan companies were organized in the South, but to-day there are more of them in Massachusetts than in any other State, North Carolina coming second. They extend in the Atlantic States from Manchester, N. H., to Atlanta, Ga., and westward to New Orleans, Detroit, Chicago, Minneapolis, Denver, and the Pacific Coast. The Morris Company, first capitalized at $100,000 and now at $1,000,000, began business on the last day of 1914; Cleveland's $500,000 company on 8 March 1916; the Boston company, similarly capitalized, three months later; Chicago's $1,000,000 bank
began on 27 July 1917, and the half-million dollars Detroit and Los Angeles companies date from the closing months of 1917. The officers and directors of these companies are chosen from among the most representative bankers and other business men in each community, and local interests own a large majority of the stock in every case. A minority interest — varying in amount, but usually substantial — is held by the Industrial Finance Corporation, a national institution with headquarters in New York, capitalized at $3,700,000, and having as its president Gen. Coleman du Pont and as its vice-president and general counsel Arthur J. Morrison from whom the Plan takes its name.

The purpose of this corporation is to organize Morrison Plan companies in response to the demand from all parts of the United States, and to standardize and facilitate their operations. Early in 1919, the local companies began operating the Morrison Plan of Retail Trade Acceptances, by which retail dealers in articles of general utility are relieved of the burden of acting as bankers for customers requiring time for the liquidation of their accounts. This natural development of the original loan-and-insurance idea will vastly increase the business done by the Morrison Plan banks.

A recent development is the formation of The Morrison Plan Insurance Society to insure borrowers for the amount of their loans throughout the period of their indebtedness. From November 1917, when it began operating, to 31 March 1919 this Society issued over 28,000 policies for more than $4,000,000 of insurance.

JOSEPH B. GILDER,
Secretary of the Industrial Finance Corporation.

MORRISON, Arthur, English author; b. 1863. He was for a number of years secretary to a charity-trust in London's East End, and there made the studies utilized in his 'Tales of Mean Streets' (1895), and 'The Child of Jago' (1896). He wrote also 'Martin Hewitt, Investigator' (1894), detective stories; 'The Dead Boy's Dated-Box' (1897); 'To London Town' (1899); 'The Hole in the Wall' (1902); 'The Red Triangle' (1903); 'Divers Vanities' (1905); 'Green Ginger' (1909); 'The Painters of Japan' (1911), and he has collaborated in the production of three plays.

MORRISON, George Ernest, British traveler and Sino-expert; b. Geelong, Victoria, Australia, 4 Feb. 1862. He was educated at the Melbourne and Edinburgh universities, receiving (1887) degrees M.D. and C.M., crossed Australia on foot (1882-83) and crossed from Shanghai to Rangoon by land (1894); as special correspondent for The Times (London) he traveled from Bangkok to Siam, to Yunnan City, China, and round Tonquin (1896), and in the same capacity, crossed Manchuria from Stretensk, Siberia, to Vladivostock (1897). He was in Pekin during the Boxer siege (1900) and was present at the Japanese triumphal entry into Port Arthur (1905). In 1907 he crossed China from Pekin to the French border of Tonquin and has since done much travel and exploration in China and Russian Turkestan. On account of his great store of knowledge of Chinese geography and politics he has been political adviser to the President of the Chinese Republic since 1912. He wrote

An Australian in China: being the Narrative of a Quiet Journey Across China to Burma' (1895).

MORRISON, Henry Clay, American Methodist (South) bishop: b. Montgomery County, Tenn., 30 May 1842. He was educated in the public schools and after teaching for several years entered the ministry in 1865. He has held important charges in Louisville, Ky., and Atlanta, and was missionary secretary in 1890-98 when he raised $140,000 for the Board of Missions. He was appointed bishop in 1898, and has been five times elected to the General Conference.

MORRISON, James Dow, American Protestant Bishop: b. Waddington, N. Y., 1844. He was graduated from McGill University, Montreal, in 1865, took orders in the Episcopal ministry and after holding rectories at Herkimer and Ogdenburg, N. Y., was consecrated first missionary bishop of the diocese of Duluth in 1897. In 1907 he organized the diocese of Duluth of which he became first diocesan bishop. He has published 'Fundamental Church Principles' (1899); 'Suffragan Bishops' (1910), and also sermons and addresses.

MORRISON, John Frank, American army officer: b. Charlottesville, N. Y., 20 Dec. 1857. He was graduated from the United States Military Academy and commissioned 2d lieutenant, 20th Infantry in 1881. During his service as a subaltern and captain he was noted as a student of tactics and an authority on general military science. He served in the Santiago campaign later in the Philippines with distinction. In the Russo-Japanese War he was selected for service as an observer and accompanied General Kurski through the campaign from the Yalu to Liao Yang and Mukden. On his return home in 1905 he was detailed as a student to the nascent Army War College and in the following year went to Leavenworth service schools as instructor. In 1907 he became chief of the department of military art in that institution. The drastic reforms which he there carried out led to a high degree of efficiency under his administration. During 1912 and 1913 he was sent to Hawaii and the Panama Canal Zone to plan the defenses of those places. He served on the Mexican border in 1914 as colonel and in 1915 was sent on a mission to China. At the end of 1915 he was promoted to brigadier-general, and to major-general in 1917. In January 1918, shortly after his return from a tour of observation and inspection in France, he was appointed to the newly-created office of Director of Training. His teaching has revolutionized American Infantry drill regulations; a number of his lectures have been collected and published, among them being 'Seventy Problems, Infantry Tactics, Battalion, Brigade, and Division in War' (1914); 'A Study in Troop Leading,' etc. (in collaboration with E. L. Munson: 1911 and 1918); 'Training Infantry' (1914).

MORRISON, John Tracy, American lawyer and politician: b. Jefferson County, Pa., 25 Dec. 1860. He was graduated from the University of Western Reserve, in 1887, and from the law department of Cornell University in 1890. In the latter year he moved to Caldwell, Idaho,
where he established his law practice. In the campaign of 1896 he was secretary of the Republican State Committee, and in 1896 and 1902 was Republican candidate for Congress, but was not elected. From 1897 to 1900 he was chairman of the State committee, and governor of Idaho 1903-5.

MORRISON, Robert, English missionary and Orientalist, the founder of Protestant missions in China: b. Morpeth, Northumberland, 5 Jan., 1782; d. Canton, China, 1 Aug., 1854. He learned the trade of boot-tree maker. After studying at Hoxton Academy and the Missionary Academy, Gosport, he was ordained in 1807 and as an agent of the London Missionary Society he embarked for Canton. In 1808 he was appointed translator to the East India Company's factory at Canton, and in 1810 began to print the New Testament in Chinese from a text which he had carefully revised. In 1811 he completed a 'Chinese Grammar,' published by the American Board of Commissioners for Foreign Missions, and with the assistance of Dr. Milne, who had joined him in 1813, the translation of the Old Testament which was completed in 1818 and published in 1823. In 1815 he founded a 'Chinese newspaper' (1815-23), at the expense of the East India Company. Dr. Morrison and his colleagues superintended very extensive printing operations for the diffusion of tracts and Scripture portions among the Chinese, and he founded in 1818 the Anglo-Chinese Missionary College at Malacca. Besides the works mentioned he wrote 'Horse Sineces, or Translations from the Popular Literature of the Chinese' (1812); 'Dialogues translated from Chinese into English' (1816); 'A View of China for Philological Purposes,' (1817), and several educational works in English and Chinese. Consult his 'Memoir' (1839); Townsend, 'Robert Morrison' (1888).

MORRISON, Theodore Nevin, American Protestant Episcopal bishop: b. Ottawa, Ill., 18 Feb., 1850. He was graduated from Illinois College, Jacksonville, Ill., in 1870, studied for the ministry at the General Theological Seminary, and took priest's orders in the Episcopal Church in 1874. After being rector of Saint Paul's Church, Pekin, Ill., 1873-76; and of the Church of the Epiphany in Chicago, 1876-99, he was consecrated bishop of Iowa in February 1899.

MORRISON, William Ralls, American lawyer: b. Monroe County, Ill., 14 Sept. 1824; d. 30 Sept. 1909. He was educated at McKendree College, Lebanon, Ill., and served in the Mexican War. In 1852-54 he was clerk of the circuit courts of Monroe County, and in 1854 was elected to the State legislature; was admitted to the bar in 1855 and he continued in the legislature until 1859, holding the speakership in the latter year. He served in the Civil War 1861-65, receiving the rank of colonel, and being present at the battle of Port Donelson. He was a member of Congress from 1863-65 and 1873-87. He introduced the Morrison tariff measure providing for drastic tariff reductions, but it was defeated by a small majority. He was a delegate to the Republican National Conventions in 1884 and 1888. He served as member of the Interstate Commerce Commission, of which he was chairman after 1891.

MORRISON, Ill., city, county-seat of Will County, on the Chicago and Northwestern Railroad, about 120 miles west of Chicago and 12 miles east of the Mississippi River. It is situated in an agricultural and stock-raising region. The industrial establishments are furniture and carriage factories, school furniture and refrigerator works, furnace factories, flour mills and creameries. It has considerable trade in dairy products, live-stock and manufactures. There are three banks with combined resources of $2,015,217. The value of all taxable property is placed at $3,000,000. The city has a public library, a museum, courthouse, county offices, city hall, two common schools, a high school and a gaol. Pop. 3,000.

MORRISTOWN, N. J., city, county-seat of Morris County, on the Delaware, Lackawanna and Western, the Morris and Essex, and the Pennsylvania railroads; also Morris County Tract Company line from Elizabeth to Lake Hopatcong 40 miles; about 20 miles west of Newark. It is situated in an agricultural region in which market gardening and fruit growing receive considerable attention. It was settled in 1709-10 and was called West Hanover. In 1740 the name was changed to Morristown in honor of Lewis Morris (q.v.) then colonial governor of New Jersey. It was incorporated in 1865. It is about 700 feet above sea-level and overlooks a beautiful section of country. The place figured prominently in the Revolution; in 1777, from January to May, and from December 1779 to June 1780, Morristown was Washington's headquarters. The old Ford mansion, which he occupied, is now owned by the "Washington Association" who preserve here numerous mementoes of Revolutionary and pre-Revolutionary times. It was here that Samuel F. B. Morse (q.v.) and his associate, Alfred Vail, worked on the electric telegraph experiments about 1837. The shaft of the Savannah, the first steamboat to cross the Atlantic, was cast at the old Speedwell Iron Works. Morristown is largely a residential city; its climate, scenery and easy access to the cities of New York, Jersey City and Newark make it a most desirable location for the homes of city business men. It has considerable trade and ships considerable quantities of flowers, fruit and vegetables. Some of the prominent buildings are the Young Men's Christian Association and the Young Men's Catholic Association buildings, and All Souls' and the Memorial hospitals, post office, Vail Museum, a new high school, new public library and lyceum. There is a beautiful park, in which a soldiers' monument has been erected. A monument marks the site of Fort Nonsense, erected by Washington. The city has public and parish schools. At Morris Plains, about four miles northeast of the city, is a State hospital for the insane, which has accommodation for about 1,500 patients, and which cost about $3,000,000. Government is vested in a mayor and council. Pop. 13,500. Consult Tuttle, 'History of Morristown'; Colles, 'Authors and Writers Associated with Morristown' (1893); Sherman, 'Historic Morristown' (Morristown 1906).
MORRISTOWN, Tenn., city and county-seat of Hamblen County, 42 miles northeast of Knoxville. It is also a large freight and stock market, and Bristol railroads. It has manufactories of flour, wagons, agricultural implements, furniture, mantels, hosiers, brooms, concrete blocks, leather, medicines, hardwood tops and panels, canvas gloves, harness, monuments, lumber, etc. It is also a large shipping point for the South. It is the seat of the Morristown Normal and Industrial College for negroes. During the Civil War Morristown was the scene of two engagements. On 10 Dec. 1863 Colonel Garrard's Union cavalry brigade attacked Gen. W. E. Jones cavalry brigade in works here, and drove it out of them and from the town. Four days later Col. W. J. Palmer, commanding the Anderson (Pa.) cavalry, had a skirmish near the town with a part of General Martin's cavalry brigade of five regiments, and withdrew leaving Martin in possession of the place. On 28 Oct. 1864 the town was held by Gen. John C. Vaughn's brigade of Confederate cavalry. Vaughn was attacked that day by Gen. A. C. Gillem, with a brigade of Union Tennessee cavalry. Vaughn was falling back to a more favorable position, when Gillem charged his right and centre and stamped the entire brigade, which fell back in disorder to Russellville. Gillem took 224 prisoners, including 19 officers, four guns and caissons, part of the ammunition train, and about 300 stand of small arms. The Union loss was eight killed and 18 wounded. Pop. 7,000.

MORRO (mór’rō) CASTLE, a former Spanish fort at the entrance to the harbor of Havana, Cuba; also the name of an imposing fortification on the cliffs overlooking Santiago Bay. It was in sight of this fort and under fire of its guns that Lieutenant Hobson and seven men of the United States navy, on 3 June 1898, sank the Merrimac at the entrance to the harbor to prevent the Spanish fleet from escaping. See CUBA; HAVANA; UNITED STATES—SPANISH-AMERICAN WAR.

MORROW, Thomas Vaughan, American eclectc physician: b. Fairview, Ky., 14 April 1804; d. Cincinnati, Ohio, 16 July 1850. Educated at Transylvania University of Lexington, Ky., and graduated in medicine from the Reformed Medical College of the City of New York. He was a pioneer promoter and organizer of medical eclecticism in the West. He established the Reformed Medical College of Ohio at Worthington, Ohio, 1830; the Reformed Medical School of Cincinnati in 1842; the Eclectic Medical Institute at Cincinnati, Ohio, in 1845; and was editor of the first eclectic medical journal, and author (with Dr. I. G. Jones) of Jones and Morrow's «Practice of Medicine» (eclectic). Dr. Morrow was the first president of the National Eclectic Medical Association.

MORROW, William W., American jurist: b. near Milton, Ind., 15 July 1843. He was educated in the public schools of Indiana and California, and was admitted (1869) to the bar and became assistant United States attorney for California (1870-74). He was (1879-82) chairman of the Republican State Central Committee, and (1882-85) attorney of the State Board of Harbor Commissioners. From 1881-83 he was counsel for the United States before French and American Claims Commissions, and (1882-85) before the Alabama Claims Commission. He was chairman of the California Delegation at the Republican National Convention, 1884, and member of the 49th and 51st Congresses (1885-91). From 1891-97 he was United States district judge of the Northern District of California, and judge of the United States Circuit Court and United States Circuit Court of Appeals, 9th Judicial Circuit, since 1897. In 1905 he was the incorporator of the American National Red Cross Society.

MORS, or MORSEO, Denmark, the principal island of the Limfjord in the northwest of Jutland, 23 miles long, 11 miles broad and with an area of 140 square miles. Capital, Nykøbing (pop. 6,918), on the east coast. It reaches a maximum altitude of 250 feet and its shores are marked by precipitous cliffs. Pop. 24,270.

MORSE, mörse, Edward Sylvester, American naturalist and Orientalist: b. Portland, Me., 18 June 1838. He was educated at the Lawrence Scientific School, Harvard University; taught zoology and comparative anatomy at Bowdoin College 1871-74, and at the Imperial University of Tokio, Japan, 1877-80; and in this way added to his reputation as a zoologist a remarkable intimacy with Chinese and Japanese art, especially ceramics, and with the folklore and early archeology of the two countries. His collection of Japanese pottery is now in the Boston Museum of Fine Arts; it keeps his name and he is its curator. In 1881 Morse became director of the Peabody Academy of Sciences, of which he was one of the founders. He is now president of the Boston Society of Natural History. He wrote 'Early Stages of Terebratulina' (1870); 'Embryology of Terebratulina' (1872), and other studies showing the non-molluscous character of the brachiopods; 'First Book in Zoology' (1875), and in German and Japanese versions); 'Early Races of Man in Japan' (1879); 'Japanese Homes and Their Surroundings' (1886); 'Glimpse of China and Chinese Homes' (1902); 'Mars and its Mystery' (1906), and many papers on zoology, ethnology and archeology.

MORSE, Harmon Northrop, American chemist: b. Cambridge, Vt., 15 Oct. 1848. He was graduated (1873) at Amherst College and took the degree of Ph.D. (1875) at the University of Göttingen. He became assistant in chemistry (1875-76) at Amherst College, then (1876-91) associate professor at Johns Hopkins, and professor of analytical chemistry and adjunct director of the chemical laboratory (1891), and is now professor of inorganic and analytical chemistry and director of the chemical laboratory. He was given the degree LL.D. by Amherst in 1912. His name has been done by him in investigating osmotic pressure. He wrote 'Exercises in Quantitative Chemistry' (1905).

MORSE, Harry Wheeler, American physicist: b. San Diego, Cal., 25 Feb. 1873. He was
graduated (1897) at Leland Stanford Jr. University, and took the degree of Ph.D. (1901) at the University of Leipzig. He was instruc-
tor of physics (1902-10) assistant professor (1910-12) at Harvard and professor of chem-
istry at the University of California (1912-13) and from 1913 has had charge of scientific work
for the Western Precipitation Company, Los
Angeles. He translated Ostwald's 'Elementary
Painting on the Theory and Practice of Painting
(1906) and is joint author of 'Ostwald's and
Morse's Elementary Chemistry' (1907), and
author of 'Chemistry and Physics of the Lead
Accumulator' (1912). Numerous monographs on
spectroscopy, fluorescence, diffusion, electro-
chemistry, etc., are from his pen.

MORSE, Hosea Ballou, American author-
ity on Chinese affairs: b. Brookfield, N. S., 18
July 1855. He was graduated (1874) at Har-
vard University and was appointed in the same
year assistant in the Imperial Chinese Customs
service, being promoted (1887) to deputy com-
misssioner and (1896) commissioner. From
1903-07 he was statistical secretary (commissi-
oner of customs) to the inspector-general of
customs, retiring 1909. By Imperial decree
(1904) he was made a member of the French
Commission connected with the terminating of the Franco-Chi-
inese War, and fulfilled special duties (1885-
87) connected with the reorganization of the
subsidized China Merchants' Steam Navigation Company. He was appointed special com-
misssioner to arrange for opening Hunan
Province to foreign trade. For his numerous
services he has received (by Imperial rescript)
The Decoration of the Double Dragon, III
division, 2d class (1885); Double Dragon 1st
class (1903); Order of Chia Ho, 3d class, Re-
public of China (1916). He has written 'The
Currency of China' (1906); 'Trade and Ad-
ministration of the Chinese Empire' (1908,
new ed. 1913); 'Guilts of China' (1909); 'In-
ternational Relations of the Chinese Empire
(1910-18).

MORSE, Jedidiah, American Congregation-
alyst clergyman and geographer: b. Woodstock,
Conn., 23 Aug. 1761; d. New Haven, 9 June
1836. He was graduated from Yale in 1783; studied theology under Jonathan Edwards; was
pastor at Charlestown, Mass., from 1789 to
1820; and spent his last years in New Haven.
He was intensely orthodox; established in 1805
the Panoplist, a religious journal combating
Universalist views; and was an able and suc-
cessful teacher. He wrote 'A Compendious
History of New England,' with Elijah Harris
(1804); 'Annals of the American Revolution'
(1824), and a series of excellent biographies.

MORSE, John Torrey, American historian:
b. Boston, 9 Jan. 1840. He was graduated at
Harvard in 1860, and was lecturer on history
there from 1876 to 1879. For two years he was
associated with Henry Cabot Lodge in the edi-
torship of the International Review. Served
on board of overseers of Harvard University
for 11 years and was member of the Massa-
chusetts legislature in 1875. He was in and
outside of Congress from 1876 to 1880 and
practiced law in Boston a time and wrote
'Finance and Banking' which has now reached
seventh edition; also 'Law of Arbitration and
Award.' His literary work has been chiefly in historical biography, and he has
edited the 'American Statesmen' series, which is ranked among the best biographical
works for the interpretation of American history.
For this series he has written Abraham
Lincoln' (1893); 'Benjamin Franklin' (1899);
'John Adams' (1884); 'John Quincy Adams'
(1883); and 'Thomas Jefferson' (1883); his
other works include 'Life of Alexander Hamil-
ton' (1876) and 'Life and Letters of Oliver
Wendell Holmes' (1896); also 'Life and Let-
ters of Colonel Henry Lee' (1905).

MORSE, Richard Cary, American clergy-
man: b. Hudson, N. Y., 19 Sept. 1841. He was
graduated (1862) at Yale and took (1864) the
degree of A.M. when he studied theology at
Princeton and Union Theological seminaries
(1867). From 1867-9 he was assistant editor of
the New York Observer and was ordained (1869)
to the Presbyterian ministry. He was general secretary of the international commit-
tee Y. M. C. A. (1869-1915), continuing as con-
sulting general secretary. His work has been
connected with the supervision and extension of
the Y. M. C. A., especially in North America;
but his labors have taken him on tours to India,
Australia, China, Korea, Japan, the Philippines
and Russia. He has written 'Robert R.
McBurney, a Memorial of a Prominent Divine'
and 'Observations of Young Men's Christian Associations' (1904); 'Fifty Years of Federation of the Y. M. C. A.'
(1905); 'History of the North American
Y. M. C. A.' (1913).

MORSE, Samuel Finley Breese, American
inventor and artist: b. Charlestown, Mass., 27
April 1791; d. 2 April 1872. He was the eldest
son of the Rev. Jedidiah Morse (q.v.). After
graduating at Yale in 1810, he visited England
with Washington Allston (q.v.) to study paint-
ing. In 1813 his first attempt at sculpture, a
dying Hercules, won for him the gold medal
of the Adelphi Society, and he received the
same from the hands of the Duke of York.
He returned to New York in 1815, and in 1824-
25 organized an association which became the
present National Academy of Design. He was
its first president and continued in office for 16
years. He again spent years in Europe, and then returned to New York to take
the professorship in the University of the City
of New York.

Morse had always been fond of the study of
chemistry and natural philosophy, and it became
at last a dominant pursuit with him. In con-
sequence of his intimacy with Prof. J. Freeman
Dana, who was lecturing in the same institution
on the electro-magnet, Morse became interested
in electrical matters, and in 1832, while returning
home from Havre on the packet ship Swify,
he first conceived the idea of the telegraph.
But though thus early devised, yet circum-
stances prevented the complete construction of
the first recording apparatus in New York until
1835, when he exhibited it at the University
building. In 1837 he made another and
more perfect exhibition, and filed his
caveat at Washington. He now considered his
apparatus sufficiently perfected for commercial
introduction, and in 1838 he asked Congress to
construct an experimental line from Washing-
ton to Baltimore to show its practicability.
From the skepticism of many and the ridicule
of others, Morse's request was not acted upon
by Congress, and, disappointed and almost dis-
heartened, he repaired to England in hopes of
getting some foreign government to aid him. The result of this visit was a refusal to grant him letters patent in England, and the obtaining of a useless brevet d'invention in France. For four years he struggled and put up with many privations, and, as it were, were designed to try him up to the last moment, no recognition of the matter was taken till the last night of the Congressional session. He retired to bed disheartened and discouraged before the session was closed. But in the morning—the morning of 4 March 1843—he was startled with the announcement that the desired aid of Congress had been obtained in the midnight hour of the expiring session, and $30,000 placed at his disposal for his experiment between Washington and Baltimore. In 1844 the work was completed, and demonstrated to the world the practicability and the utility of the Morse system of the electro-magnetic telegraph. The first message, "What hath God wrought?" was sent from the United States Supreme Court room in the Capitol at Washington to Baltimore, 24 May 1844. From that day the telegraph was a success.

Honors were showered upon him by European sovereigns and governments. Probably no American has ever received so many marks of distinction. In 1848 Yale College conferred on him the complimentary degree of LL.D., and in the same year he received the decoration of the Nishan Itchwar in diamonds from the sultan of Turkey. Gold medals of scientific merit were awarded him by the king of Prussia (set in a massive gold snuff box), the king of Württemberg, and the emperor of Austria. From the French he received in 1856 the cross of chevalier of the Legion of Honor; in 1857 from the king of Denmark the cross of knight of the Dannebrog; and in 1858 from the queen of Spain the cross of knight commander of the Order of Isabella the Catholic. The sum of 200,000 francs was presented to him jointly by the principal governments of Europe. It has been said that much of this money was spent in the ceaseless litigation and lawsuits in which he was involved in the defense of his patent rights.

Professor Morse also had the distinction of laying the first submarine telegraph line, which was done in New York harbor in 1842. He likewise set up the first daguerreotype apparatus and was associated with John W. Draper in taking the first daguerreotypes in America. A letter from Professor Morse to the Secretary of the Treasury in 1843 seems to contain the earliest suggestion of the possibilities of an Atlantic cable. His last public act was the unveiling of the statue of Benjamin Franklin in Printing House Square, New York. Consult Prime, 'Life of S. F. B. Morse' (New York 1875) and Morse, E. L. (son), 'Samuel Finley Breece Morse, his Letters and Journals' (2 vols., Boston 1914).

MORSE, Sidney Edwards, American journalist and inventor, son of Jedediah Morse (q.v.), was born 20 Oct., 1800, in Charlestown, Mass., 7 Feb. 1794; d. New York, 24 Dec. 1871. He was graduated at Yale in 1811; studied law; established the Boston Recorder in 1815 and the New York Observer in 1823, the pioneers of American religious journalism; invented a flexible piston-pump in 1817 and the cerographic method of printing maps in 1859; improved a bathymeter for deepsea soundings; and, like his father, was a life and successful geographer. His 'New System of Modern Geography' ran to half a million copies.

MORSE, Sidney H., American sculptor and editor: b. Rochester, N. Y., 17 Oct. 1832; d. San Mateo, Fla., 18 Feb. 1903. In youth he worked at marble-cutting and as a lecturer for sculpture. Later he studied at Antioch College and afterward began to preach in Unitarian pulpits in the West; still later made further preparation for the ministry at Harvard, and for some time was settled in Haverhill, Mass. From 1865 to 1872 he was editor of the Radical, a worthy successor of the famous Dial. Morse counted among his friends and contributors Emerson, A. B. Alcott, Samuel Johnson, Samuel Longfellow and many others prominent in literature and reform. When he discontinued the Radical he turned with enthusiasm to sculpture and produced many notable works. He made a bust of Emerson, which is in the Second Church, Boston, the present edifice of the society to which Emerson ministered (1829-32), and another of the same subject, regarded by Emerson's friends as the best extant. His other subjects include Channing, Parker, James Martineau, Walt Whitman, Carlyle, Thomas Paine, Lincoln, Holmes and President Cleveland. Morse wrote much for periodicals and attained fame as a lecturer and as one of his poems, 'Sundered,' is to be found in Emerson's 'Parnassus'.

MORSHANSK, mōr-shansk', Russia, capital of the government Tomboy, on the navigable river Tsna and on the Syrain-Vyasa Railway. It has a gymnasium for girls, a city bank and factories producing tobacco, soap, tallow, spirits, etc., besides doing a lively trade in grain. Its population in 1911 was 31,802.

MORSÖE, mōrs'-ē. See Moss.

MORTALITY, a term applied to that branch of investigation which determines the proportion of the number of persons who die in any assigned period of life or interval of age, out of a given number who enter upon the same interval, and consequently the proportion of those who survive. Tables showing how many out of a certain number of infants, or persons of a given age, will die successively in each year till the whole become extinct, are generally called tables of mortality. There is no fixed number of lives upon which such tables are based, but the observation of a large number is indispensable to accuracy, and the larger the number that can be duly observed the greater will be the degree of accuracy attained. It must always be borne in mind, however, that direct observation of a moderate number will yield truer results than a looser induction from a larger number. The basis of such calculations must be an accurate register of the number of births and deaths, and in the case of the latter, at what ages, in a given district or extent of country.

In Great Britain the bills of mortality, or abstracts from parish registers, were long the only means of arriving at these results; but being found very imperfect and unreliable, they were supplanted in 1836 by a general regis-
tration. The results furnished by such tables are very various and of great interest. The registers, if kept with sufficient accuracy and minuteness, enable us to determine the proportion of deaths, not only at different ages and in different regions, but at different seasons, in persons of different occupations and habits, in towns or the country; and thus afford valuable materials for the science of political economy. Although much more attention has been paid to this subject in recent times, yet the observations are not extensive nor so accurate as is desirable.

Although the collection of regular statistics of mortality is of recent origin, the subject has always excited much interest, and many general facts have been collected regarding it. The tendency of mortality to diminish with the progress of civilization has been satisfactorily established by statistics. The average rate of mortality is affected by regular or constant causes, such as race, climate, age, sex, profession or occupation, density of population, political institutions, habits, etc., and by such irregular or occasional causes as war, famine, pestilence, etc., but notwithstanding the interruption of these occasional causes a constant tendency to a decrease has been found to exist in any given state of society. The fact that the tendency of population to increase or diminish is quite independent of the rate of mortality was first established by Malthus, who showed that the increase of population depended on the facility of procuring the means of subsistence and not on the duration of life. The mortality in the United States, for example, is greater than in England, yet the population of the United States doubles itself in 25 years and that of England in 43 years, while in various European countries which have a lower mortality than the United States, the population will not double in a century.

Some statisticians have attached considerable importance to the effects of race on population. It is extremely difficult, however, to establish anything in regard to race independently of circumstances and social habits. It has been shown, for example, that the average mortality among the Jews in Prussia is less than among the average mortality among the races that inhabit the Austrian Empire, being least among the Germans, and that a similar difference prevails in the departments peopled by various races in France, but all such evidence is open to the most obvious exceptions. The influence of climate on mortality is inseparably associated with that of migration. It cannot be established that any climate, except perhaps the extremes of heat or cold, moisture or dryness, is in itself exceptionally favorable or unfavorable to human life, but change of climate is frequently adverse to it.

The most remarkable fact in respect to age is the great mortality which commonly takes place among children under five years of age. This is especially remarkable in large towns, because not so many are there. Although the diseases to which infancy is liable are naturally accounted for in this excessive mortality, the greater part of it must be attributed to ignorance and want of due care in the nursing of children, probably arising from the unfavorable circumstances in which, through the too rapid increase of population, they are brought into the world. This is both directly and indirectly a considerable cause of the extra mortality of large towns and other dense centres of population. The question whether city or country life is most conducive to a low rate of mortality is still undetermined. Direct statistics prove nothing, as the death rate of towns is raised by immigration from the country and other causes. In regard to sex it is established that women live longer than men, and that among men the married live longer than the single. The condition of life in respect of poverty or wealth is known to have a considerable influence on mortality. Dividing France into two classes, rich and poor, the annual mortality was found to be 1 in 46 in the former and 1 in 33 in the latter. This gave to the rich an average duration of life of 37 and to the poor one of 37 years. See Longevity; Vital Statistics.

**MORTAR**, a calcareous cement used in building. It differs in its characteristics according to the nature, proportions or treatment of its constituents. The proportions vary from one and one-half to four or five of sand to one of lime. Hydraulic mortar is made from certain limestones which include in their composition so large a proportion of iron and clay as to enable them to form cements which have the property of hardening under water and are called hydraulic limestones. The proportions of clay vary in different quarries, and often the same from 8 to 25 per cent. See Cement; Lime.

**MORTAR**, or MORTER, a vessel of iron, porcelain or stone used by pharmacists and others in preparing powders and other medicines. Also a piece of ordnance. See ORDNANCE.

**MORTAR**, utensil employed by the Indians of America and other semi-civilized races for the grinding or mashing of grains and other substances used as food or for other ends. The Indian mortar naturally had a different name in each tribe, and some of these names were familiar to the whites. A survival of these Indian mortar names is the metate of Mexico (q.v.) derived from the Spanish metate and metal. The mortar has many forms ranging from a flat stone to a deep receptacle of stone, bone or wood in which the grain or other substance is reduced by pounding or grinding to a floury or plastic state. Throughout the area occupied by the Pueblo Indians in the United States, and in Mexico, Central America and the greater part of South America, and especially in Colombia, Venezuela and the Pacific Coast countries the grinding of grain, seeds, nuts, roots and other substances is done on a flat stone, generally rectangular in form. For the most part the grinding is performed by means of a stone muller more or less cylindrical in shape, which is rarely used as a roller, the substances being crushed between the metate and the muller by pressing and rubbing. Although the process used throughout the great corn belt stretch from Arizona to southern Chile at the time of the discovery of America; and throughout this vast region it is the process most generally in use among the Indians and mestizos for reducing corn and other substances to a condition for cooking.
Forms of Mortars.—Throughout other parts of North America there were many forms of mortars distinctly different from those in use in the region already indicated, but closely related to one another in shape. Among the Iroquois and other northern and eastern tribes of the United States and parts of Canada the natives made use of wooden mortars hollowed into the top of a block cut from the trunk of a tree. These mortars were of considerable size and depth, the corn or other substance was put in a dry or wet condition, and pounded into a more or less fine powder or into a soft, semi-liquid mass, by means of a long wooden pestle, with a pounding surface at both ends. The remains of very primitive mortars in many parts of the American continents show the various processes through which the modern mortars have passed to reach their present perfection. Originally a rough unworked flat stone was used as a grinding surface and an unshaped rounded stone served to do the pounding. From this primitive utensil to the carefully shaped metate of the Mexican or the handsomely carved and hollowed mortar of the Alaskan and British Columbian tribes is a long step which bridges a lengthy period of cultural development. In the granite rock of California mortars in the shape of excavations are frequently found on the sites of old Indian villages. Some of these are very primitive in form, while others, evidently of a much later development, are carefully shaped and seem to follow a regular plan of structure. It is probable that the flat stone metate form and the hollow mortar form both originated in pounding grain on a flat surface, the two natural methods of preventing the loss of the pulverized grain being to reduce the grain to a mush by rubbing or rolling, and to pound the grain, in a deepish hole, as was done in the California granite rock. The tribes of the great forest area of the North, having no hollow rock beds or stones easily worked, hollowed out the ends sections of tree trunks or set up in any manner of fire which also hardened the inner surface of the mortars, dried the wood and made them very durable. In regions where stone and wood were not available, bone, rawhide and other materials were converted into mortars for the grinding of food materials. In the whale country some of the races addicted to whale hunting used the vertebra of that animal for mortars. Some of these are still employed. In the Eastern States of the United States primitive mortars made of hollowed but otherwise unshaped boulders are frequently encountered; and similar mortars are formed in California, side by side with other globular mortars, which are evidently but a more artistic development of the boulder form. A further evolution of the artistic form was reached when stones were quarried from the rocky bed, shaped to exact pre-determined form and proportions and frequently decorated with conventional forms, mystic signs or figures of household gods.

The pestle took upon itself as many shapes and designs as the mortar, and like relation of the latter to the metate, it was first cousin to the muller, both of which had their origin in the rough, unworked stone used by primitive man to pound or crush his food, and other objects. Some pestles were heavy and several feet long; others were short instruments which could be used with one hand. Metates and mortars were of many shapes, sizes and designs, and their uses were almost as varied as their forms.

Uses of Mortars.—Indians, throughout the buffalo country, put the buffalo meat into a rawhide bag which they placed in a hole in the earth with the open mouth upward. While here they pounded it with metates for pemmican. Some Indians placed their shallow mortars in closely-woven baskets considerably larger than the mortars so that the grain that fell from the latter, in the process of grinding or pulverizing, might be saved. Others of the Pueblo Indians placed a basket-shaped hopper in the mouth of the mortar to prevent the pounded grain from hopping out. It is probable that very large "mortar holes" found in rock were also used as boiling pots, in which the heated water was obtained by dropping superheated stones into the hole. The large wooden portable mortars of the forest-region Indians were generally set on the ground so as to make them firm and steady. The ordinary metate of Mexico and Central America has generally four feet upon which it rests; the upper foot may be made to give it an artistic appearance. Most of these metates are made of lava rock, especially in the districts where lava is plentiful. Metates are made of rocks of different grades of coarseness. Thus it is possible, by passing ground grain from one metate to another, to finally obtain a flour as fine as the finest turned out by the modern mill machinery. Fine metates and mortars are also made from granite, limestone, sandstone and other rocky material. Perhaps the most artistic development of the mortar is to be found among the Haida Indians of Alaska, who probably learned their art from Asiatic tribes. Not only are mortars of a great variety of forms and designs but they are also of many sizes, ranging from tiny little vessels to huge excavations. The reason is that they were put to a variety of uses. The smaller mortars were employed as receptacles in which to grind paints, medicines, shells, tobacco and other substances used in medicine, personal decoration, ceremonies and dances. All the grinding of corn and other food products was almost universally done among the American Indians by women; but in the case of the ceremonial substances, especially those considered of a sacred nature, where the efficacy of the charm, ceremonial use or medicine depended upon the manner in which the grinding was done, this work was generally left to the medicine men, who were learned in all the ceremonial forms and traditions of the tribe.

MORTARA, mór-tā'rā, Edgar, Jewish boy whose forcible removal from his parents by the orders of the archbishop of Bologna in 1858 aroused great excitement in Europe and led to protests from several powers, but the Pope
declined to interfere. The plea made in justification of the act was that Mertara had been early baptized into Christianity by a Roman Catholic mailot. No evidence has been found that any chivalrous authorities, however, declined to return him; and despite the many protests in the matter, he remained, of his own choice in 1570, with the Church and entered the Augustinian order. Consulted 'The True Story of the Jewish Boy, Edgar Mortara' (1860), and Vollet, 'Edgar Mortara' (1881).

MOTORA, mōr-tār'ēa, Italy, capital of the province of Pavia, on theARBogna, also chief town of theLomellina, and junction of theNovara-Mortara-Alessandria, the Mortara-Milano and theVercelli-Mortara-Pavia and the Mortara-Casale railways. It has a Gothic church (San Lorenzo) and the Santa Croce convent church, also a theatre, gymnasium and technical school. It has manufactures of machinery and hats and does considerable trade in its rice and cheese products. The Austrians under Duke Albrecht won a battle here against the Piedmontese in 1849. It had a population of 10,468 in 1911 for the entire commune.

MORTE D'ARTHUR. This great English collection of Arthurian romances, written before 1470 by Sir Thomas Malory, as one of the cardinal books whose influence has reached beyond any mere personal fame. Personally, indeed, Malory has remained almost unknown. Even the probability that this 15th century gentleman made not the work; from Richard the second to the Earl of Warwick, pattern of chivalry, was recovered only 25 years ago; but 400 years have proved the vitality of his book. After inspiring the conduct of noble English youth for generations, it was reinterpreted in Tennyson's most popular poem, 'TheIdyll of the King'; and, surviving so unusual a competition, it is still reprinted, read and loved. Yet as a translation, in great part from known French sources, it is not in our modern sense original. Therefore the reasons for its fame are the more significant as going to the roots of permanent literary interest. The first reason, of course, is style. Writing in the early days of English prose, Malory has the dignity and ease of such early historians as Froissart; but his even and leisurely style is not so often unconquerable. This rare combination of dignity with simplicity has been sufficient to preserve his work without any great strength of structure, any compelling movement of the whole. The 'Morte d'Arthur' is not composed as a whole, not planned to lead us on stage by stage to a culmination. True, the closing books are felt as the tragic conclusion of Arthur's chivalry in a world of violence; but with many of the preceding stories it has no specific connection. Rather Malory worked as the medieval romancier did, taking and adapting what he found before him. Collecting all the well-known stories — and a few less well known — that had come to be associated with the great name of Arthur, he used them much as he found them; and he told each for itself. Though he sometimes suggests a compulsion of plot here and there, he never worked for these in the ways of the modern novelist. The Renaissance had touched England; and its literary ideas, even if they had been prevalent, would hardly have moved so thorough a mediævalist as Malory. He turned away from the actual wars of the Roses to the legendary wars of Arthur's knights because of his intense sympathy with the ideals of a passing chivalry. His style is more mediæval than Chaucer. Though in style he has his own distinction, in composition he is the typical mediæval transmitter.

Every one of the stories that he thus brought together has a long history. Many of them reach far back into folk-music, but were not before they came to him had been told over and over again. The successive versions, their relations, their combination, the transference of a tale from Gawain to Percival and then to Galahad, the building up of the Grail stories and the attaching of this to the Arthurian cycle — all these have claimed much scholarly investigation and still offer problems as difficult as they are significant. But of this Malory was no more aware than the thousands of readers who have gone before him, not for history or mediævallore, nor for psychology or drama, but for the solace and inspiration of high adventure.

Beginning with the perennial story of the prince wondrously born and sent in the nick of time to claim the crown, Arthur, king of the Britons, establishes a kingdom of justice, courtesy and honor, he ends with the traditional hope that the same king, though in his stricken age borne away to the isle of Avalon, may yet return to reign. Only to the latter books belongs properly the title 'Morte d'Arthur,' which is borne also by several mediæval poems. Between the young prince smiting the stone with his miraculous sword and the old king fighting his last battle against treason in the dim West, what a store of quests and deliverances, what a goodly array. Baling and of a long and primitive wilderness in spite of the faint hint of the coming Grail; and the fairies, though crowded to the back of the stage by the stir of chivalry, still peep from their Celtic twilight. Morgan le Fay is dangerous in revenge. The Lady of the Lake gives the magic sword, and to her at the last it returns. Merlin the wizard, after all his triumphs of wisdom and skill, "was assottled and doted on one of the ladies of the lake." But these are only old echoes. The stories are of chivalry; of Beaumains, youth and love; of Tristram and Isolt, the immortal lovers, and Guenever, the queen mistress who drew the peerless Lancelot across steel and fire and even across loyalty; of Gawain, his earlier fame tarnished, but still the courteous; of a hundred good knights who sought wild paths and frightful risks and stiff battles because they must make life an adventure.

Following these old adventures with adventurous hearts, readers have always been glad that they are numerous, and have not missed in the thronging of Malory's stories that unity which he did not seek. From the conquest of Rome to the earliest adventures of Lancelot, from Beaumains to Tristram, Malory goes leisurely, but always with zest; and by the way he pauses for yet other stories. The 'Morte d'Arthur' shows the writer's delight in mediaeval life and in the lore and folklore of romance. And above all the other quests, above the errant fighting throng, shines the supreme quest of the Holy Grail, the great romance of the Mass. Malory's aim, then, was not that modern literary distinction which comes from
originality of composition; it was to make men love the high things that he loved. His work was to him the handing on of the great traditions of chivalry. Caxton, who printed it in 1485, well calls it a "noble and joyous book."

CHARLES SEARS BALDWIN.

MORTEN-MÜLLER, mör-tén-mül·ler, Norwegian painter: b. Holmestrand, Christianiafjord, 29 Feb. 1826; d. 1911. He began to study art in Düsseldorf (1847) first under Tidemand and Budd, and later as a pupil in the academy under J. W. Schirmer. He removed to Stockholm in 1850, but in 1856 opened an art school in Christiania under government patronage. He returned to Düsseldorf in 1871 and devoted himself to setting forth the wild scenery of his native country in a series of vast canvases. Fiord, valley and mountain height are represented with fine imaginative yet truthful line and color. The most noteworthy of his landscapes are 'Norwegian Landscape' and 'Entrance to Hardangerfjord' (both in the National Gallery of Christiansia); 'A Fir Forest' (in the Gallery at Hamburg); 'Romsdal-fjord,' with historical figures put in by Tidemand (1876); 'Start of the Fishing-boats, Night'; 'Fishing Fleet and Pine Forest;' (1879); 'Fisherman's Cot in Christianiafjord;' (1880); 'Woodland Lake by Moonlight;' (1892). His works combine romantic picturesque ness with color power of startling realism. In 1874 he was appointed court painter and member of the Stockholm Academy.

MORTGAGE, mör'gáj ("dead pledge"), in law, the conveyance of property, movable or immovable, as security for the payment of a debt on the condition that if the debt be duly paid the conveyance shall be void. The term is applied: (1) To the act of making such a conveyance; (2) to the deed by which such conveyance is made; (3) to the rights thereby conferred on the mortgagee. He who makes the mortgage is the mortgagor; he for whose benefit it is made is the mortgagee. Whatever may be said may be mortgaged. Mortgages may therefore cover chattels or real estate. Mortgages must be in writing, either in one single instrument containing the whole case or in two, one containing the conveyance, the other the instrument of the conveyance, this last document being the "defeasance." A deposit of tilled deeds, with a verbal agreement, creates an equitable mortgage in some States which recognize this proceeding as a mode of securing a debt. The different States regulate the time in which mortgages are to be recorded, in order to protect innocent purchasers, but an unrecorded mortgage is good as against the mortgagor or any purchaser knowing of its existence at the time of his purchase. The tendency of courts now is to regard a mortgage as a lien rather than a conveyance of the land, and it is now generally regarded as a mere security for the payment of a debt. In those States which recognize chattel mortgages (or mortgages of personal property), a record of the same within a specified time is required to render them valid as against other claimants. See also FORECLOSURE.

MORTGAGE BANKS. See BANKS AND BANKING—WORLD'S SYSTEM.

MORTIER, mör-tý'ë, Edouard Adolphe Casimir Joseph, Duke of Treviso, French

marshal: b. Cateau-Cambrésis, 13 Feb. 1768; d. Paris, 28 July 1835. He entered the army in 1791, fought in the campaign of 1792 to 1795, was in the field of Germany and Switzerland, and besieged (1803) Hanover, being raised (1805) to rank of marshal. In the war with Prussia he commanded the army against the Swedes and was victorious at Anklam (1807), whereupon he agreed to an armistice at Schlachtow (18 April). He commanded the left wing of the army in the battle of Friedland and was created Duke of Treviso (1808), to be given in that year command in Spain, where he won the battle of Ocaña (1809). He commanded the young Guards in the Russian campaign and also in 1813. In 1814 he, together with Marshal Marmont, defended Paris, but submitted to Louis XVIII and was made a peer of France. By March 1815 he had again joined the forces of Napoleon, thereby losing his title of peer, on the latter's defeat and the second Restoration. He was elected (1816) member of the Chamber of Deputies and retained the place till the end of 1818. In 1819 the dignity of the peerage restored to him, being made hereditary in 1824. He was made chief chancellor of the Legion of Honor (1834) and became Minister of War and president of the council in the same year. He was killed (1835) by the infernal machine of Fieschi at the king's side as he was passing along the Boulevard du Temple, Paris. Monuments have been erected in his memory in his native city and also Lille.

MORTIFICATION. See Gangrene.

MORTIMER, mör'ti·mér, John Hamilton, English artist: b. Eastbourne, Sussex, 1741; d. 1779. After studying under Sir Joshua Reynolds, he carried off the first prize of the Society of Arts, London (1763). He was elected R.A. in 1779. A bold and vigorous draughtsman and a good colorist, he was fond of dramatic scenes in which there was an element of the terrible. His style and manner are well exemplified in the pictures 'Battle of Agincourt'; 'Voltigern and Rowena'; 'Hercules Slaying the Hydra'; now in the South Kensington Museum. He was very successful as an etcher, and designed stained glass for Salisbury Cathedral and other churches. See also MORTIMER, Roger, 8th Baron of Wigmore and 1st Earl of March, English noble: b. about 1287; d. Smithfield, 29 Nov. 1330. He had been convicted of treason in the reign of Edward II and pardoned; but notwithstanding the king's clemency took part in the rebellion of the Earl of Lancaster, and was made prisoner in 1322. Having escaped from the Tower, where he was confined, he went to France and at Paris in 1325 met Queen Isabella, who had been sent thither by Edward to negotiate a treaty. Fascinated by his person and beauty, the queen was soon known to be living in guilty intimacy with the exile, and, having secured the person of her young son, began to make plans with Mortimer and the other leaders of the barons for getting possession of the kingdom. Mortimer went with her to London when the king was deposed and his son Edward III proclaimed in his stead, and for some years Isabella and her paramour governed the realm in the name of the young prince. Mortimer is popularly regarded as responsible for the
MORTMAIN—MORTON

death of the dethroned monarch in his prison (1327). The failure of the Scottish expedition in 1327, and the "shameful peace" with Scotland in the following year, had wounded the pride of the English people, and both wearied of his arrogance and Edward resolved to take the sceptre into his own hands. While the queen and Mortimer were in Nottingham castle during the session of Parliament at that town, the king and Lord Montacute with attendants were offered by a man in a rags, a subject for the royal passage and carried off the earl. The king summoned a new Parliament to meet him at Westminster, and on 26 November Mortimer was condemned by this Parliament and executed three days later.

MORTMAIN, mort'mán, in English law, lands held by a corporation were said to be held in mortmain (mortua manu, by dead hand), because they were then not alienable. The expression has particular reference to estates held by religious and ecclesiastical corporations in England. At one time half the land in England was vested in religious houses. As early as 1279 the English Parliament began to deal with the evils arising from the transfer of lands to religious corporations; the lords of the soil were deprived of escheats or oblations feudal profits: "a dead hand yieldeth no service." In 1376 by the Mortein Act the power of devising land by will to charitable purposes was destroyed. The law on this subject was consolidated by the Mortmain and Charitable Uses Act (1888), under which no bequest for a charitable purpose was to involve the acquisition of land. The Act of 1891 enacted that land may be devoted to any charitable use, but it must be sold within a year from the testator's death, unless the time be extended by certain authorities. It also permits the acquisition of land directly to be acquired for a charity if the court or the charity commissioners consent. A large number of acts from 1841 onward have exempted from mortmain restrictions land bequeathed for school sites, burial places, places of worship, literary and scientific institutions, public parks, but maximum limits are imposed in several cases.

The old English statutes of mortmain have not been regarded as in force in the United States except in Pennsylvania, where the dedication of property to superstitious uses, and grants to a corporation without statutory license, are forbidden. In some States the right of religious corporations to hold land, and the power to make, devise or bequeath land to religious societies or charitable purposes, is restricted.

MORTON, Charles, English-American Puritan divine: b. Pendavy, Cornwall, 1627; d. 1698. He studied at Wadham College, Oxford, 1643-48, and at Queen's College, Cambridge, 1648-51, but his puritanic tendencies caused his ejection in 1662. He was made master of the dissenters' school at Stoke Newington, London (1658), where Daniel Defoe was numbered among his pupils. The accusations of ecclesiastical courts caused him to migrate (1662) to New England and he became minister of the first church at Charlestown, Mass. He was prosecuted for a seditious sermon (1667) but acquitted. He got into close connection with Harvard and was given (1692) the management of the inward affairs of the college with the title of vice-president. His succession to the college's president, Increase Mather, seemed likely but for his death. He approved the prosecutions for witchcraft at Salem. Consult Quincy, Josiah, 'History of Harvard University' (Cambridge, Mass., 1840).

MORTON, or MOURT, George, Puritan colonist: b. York, England, about 1585; d. 1628 (?). He affiliated himself with the Puritans in 1600 and settled in Holland, a subject for reasons of persecution, and then came to America in 1620 London agent for the Puritans. Authorities disagree as to his career, some placing his emigration to America in 1620 while others fix it at 1623, and the same uncertainty prevails as to his death, the dates varying from 1624 to 1628; there is no conclusive evidence as to whether it occurred in England or America. For many years he was credited with the authorship of Mourt's 'Relation or Journal of the beginning and proceedings of the English Plantation at Plimoth,' published in London in 1622. Careful investigation, however, seems to prove conclusively that the authorship must be credited to Winslow and Bradford, and that at most only a small portion of it can be claimed by Morton. The work, which is regarded as the most authentic history of the times in existence, has been several times reprinted. Consult 'Mourt's Relation,' with introduction and notes by Henry Martyn Dexter.

MORTON, Henry, American scientist: b. New York, 11 Dec. 1832; d. 19 May 1902. He was graduated from the University of Pennsylvania in 1857 and became professor of physics and chemistry at the Episcopal Academy of Philadelphia in 1860. His lectures in 1863 at the Franklin Institute in Philadelphia attracted attention throughout the United States and Europe by reason of his brilliant and unique experiments. He was one of the founders of the Philadelphia Dental College in 1863 and its first professor of chemistry, and in 1864-70 was resident secretary at Franklin Institute, where he continued his work. In 1867 he was appointed professor of chemistry at the University of Pennsylvania, and in the same year became editor of the Franklin Institute Journal. He conducted the photographic branch of the United States eclipse expedition to Iowa in 1869, and in addition to securing several excellent photographs of the eclipse, proved that the bright line of the sun's disc adjacent to the moon is due to a chemical action in the process of developing the plate and not to diffraction as had hitherto been held by the best scientists. In 1870 he was chosen president of the newly-founded Stevens Institute of Technology, and under his direction the faculty was selected and the course of instruction formed. His management of the institute made it one of the leading technological schools of the country; he gave it the benefit not only of his great learning but also several munificent gifts in the establishment and endowment of various necessary departments. His reputation as a scientist became world-wide and his services as a chemical expert were eagerly sought in litigation. From 1878-85 he was a member of the United States Lighthouse Board and in 1876-81 he was president of the American Chemical Society. Besides writing numerous
papers on electricity and fluorescence, he assisted in the preparation of 'The Student's Practical Chemistry' (1868).

**MORTON, James Douglas**, 4th earl of, regent of Scotland; b. Dalkeith, Scotland, about 1530; d. Edinburgh, 3 June 1581. He married a daughter of the third earl and succeeded to the earldom on the death of his father-in-law, in 1553. He became Lord High-Chancellor of Scotland 10 years later, but fled to England in 1556 on account of his share in the murder of Rizzio. He was soon pardoned and on Bothwell's abduction of Queen Mary joined the confederated lords against him. He stood sponsor for James VI at his coronation, and led the van at the battle of Langside (1568). He again became one of the leading opponents of Bothwell; was chancellor, and in 1572 regent of the kingdom. Having made himself many enemies by maladministration, he resigned, but recovered authority not long after. His enemies, however, at length proving too strong for him, he was charged as accessory to the murder of Darnley. This was headed by the decapitating instrument he himself had introduced into Scotland.

**MORTON, James St. Clair**, American soldier; b. Philadelphia, Pa., 24 Sept. 1829; d. Petersburg, Va., 17 June 1864. He was graduated from West Point in 1851, was appointed to the engineering corps and in 1855–57 was assistant professor of engineering there. He was in charge of the Chiriqui expedition in Central America in 1860, and later superintended the work on the Washington aqueduct. In 1861 he was in command of the fortification at Tortugas, and in May 1862 was appointed chief engineer of the Army of the Ohio. In October 1862 he was promoted brigadier-general and was transferred to the Army of the Cumberland as chief engineer in command of the bridge-brigade. He built the entrenchments around Murfreesboro, Tenn., and was engaged in the battles at Chattanooga and Chickamauga. He was chief engineer of the Ninth army corps in the Richmond campaign of 1864, and was killed in the battle of Peters- burg. He wrote 'An Essay on Instruction in Engineering' (1856); 'Memoir on Fortification' (1858); 'Life of Maj. John Saunders, of the Engineers' (1860), etc.

**MORTON, John**, English prelate; b. Milborne, Saint Andrew, Dorsetshire, England, about 1420; d. Knoll, Kent, 15 Sept. 1500. He studied at Balliol College, Oxford, and subsequently became principal of what is now Christ Church College. He adhered with great fidelity to Henry VI and the house of Lancaster, but nevertheless Edward IV made him master of the rolls and bishop of Ely (1478). Richard III imprisoned him, but he escaped to Flanders and under Henry VII became archbishop of Canterbury and chancellor (1486). It was he who suggested the union of the house of Lancaster and York by the marriage of Henry with Elizabeth of York, daughter of Edward IV. In 1493 he became a cardinal.

**MORTON, John**, one of the signers of the Declaration of Independence; b. Ridley, Delaware County, Pa., 1724; d. April 1777. After working for several years as a surveyor he began the practice of law. In 1764 he was elected to the general assembly of Pennsylvania, of which he became a conspicuous member, serving for a number of years and being speaker from 1772 to 1775. In 1765 he was a member of the Stamp Act congress; in 1766 became sheriff in his country, and a few days afterward appointed one of the judges of the Supreme Court of Pennsylvania. He was always an earnest advocate of the rights of the colonies and warmly supported the Revolutionary War. In 1774 he was elected a delegate to the 1st Continental Congress, and was a member of that body till his death, taking active part in its debates and in the framing of the Articles of Confederation. He gave the casting vote of Pennsylvania in favor of the Declaration of Independence, the four other delegates present from that State being equally divided as to the measure, and affixed his signature to the Declaration.

**MORTON, John Maddison**, English dramatist; b. Pangbourne, 1811; d. 1891. He was educated in France, then held a clerkship in Chelsea, then managed 'Arabella' (1848–49). In 1881 he became a Charterhouse brother when in sore need of a pension. He wrote farces, showing exceptional facility in the adaptation of French dialogues to suit English taste. While he was a prolific writer of plays little survives for recent presentation except his ever-popular 'Box and Cox' (1847). Consult 'Dictionary of National Biography,' Vol. XXXIX (London 1894).

**MORTON, Julius Sterling**, American agriculturist and statesman; b. Adams, N. Y., 22 April 1832; d. Lake Forest, Ill., 27 April 1902. He was graduated from Union College in 1854 and removed to Nebraska City in 1855, where he was editor of the Nebraska City News. In 1856–57 he was a member of the Territorial legislature, and in 1858 secretary of the Territory. Upon the resignation of Governor Richardson in 1858 he acted as governor, and in 1893–97 was Secretary of Agriculture under President Cleveland. He was the originator of Arbor Day and an active member of various agricultural and horticultural societies.

**MORTON, Levi Parsons**, American banker and politician; b. Shoreham, Vt., 16 May 1824. He received an academic education, and in 1843 established a mercantile business at Hanover, N. H.; in 1850 entered the banking business in Boston; and later removed to New York, where in 1863 he founded the large banking firm of Levi P. Morton & Company (later Morton, Bliss & Company), which assisted in floating the government war loan during the Civil War. He also established a branch of his firm in London, and the Morton Trust Company of New York, and gained a reputation as an able financier. He was elected to Congress on the Republican ticket in 1876 and served one term (till 1881); he was then appointed United States Minister to France, where he remained till 1883; in this capacity he secured legal status in France for American corporations. In 1888 he was elected Vice-President of the United States, and made an especially able presiding officer in the Senate. In 1894 he was elected governor of New York State, serving for one term; in the last year of administration he urged in a special message the abolition of the
WARD-TRUSTEE SYSTEM OF SCHOOL GOVERNMENT IN NEW YORK CITY PUBLIC SCHOOLS, AND SIGNED THE BILL WHICH ENFORCED THIS REFORM. IN 1896 HE WAS NEW YORK CITY'S CANDIDATE FOR THE PRESIDENCY AT THE NATIONAL REPUBLICAN CONVENTION. AFTER RETIRING FROM PUBLIC LIFE HE RESUMED HIS BANKING OPERATIONS AND BECAME A DIRECTOR IN SEVERAL INSURANCE COMPANIES.

MORTON, Nathaniel, American historian: b. Leyden, Holland, about 1613; d. Plymouth, Mass., 29 June 1685. He was of English descent, came with his father to Plymouth in 1623, became an inmate of Governor Bradford's family and his public assistant, and from 1645 until his death was secretary of the colony. In compliance with the request of the commissioners of the New England colonies, he compiled (1669) and published his principal work, 'New England's Memorial, or a Brief Relation of the Most Remarkable and Memorable Passages of the Providence of God Manifested to the Planters of New England.' For nearly two centuries, or until Bradford's 'History of Plymouth' was discovered in 1855, Morton's work was the principal authority on the matters it dealt with. He compiled it largely from Bradford's manuscript and Edward Winslow's journals. 'New England's Memorial' was several times reprinted in the American colonies, and was also reprinted in England. Besides various other works, Morton was also the author of 'A Synopsis of the Church History of Plymouth.'

MORTON, Oliver Perry, American statesman: b. Salisbury, Wayne County, Ind., 4 Aug. 1823; d. Indianapolis, Ind., 1 Nov. 1877. He studied law, was admitted to the bar in 1846, began the practice of his profession in Centreville, Ind., and became a circuit judge in 1852. He was an anti-slavery Democrat, but, after being read out of the party for his refusal to support the Kansas-Nebraska bill, became one of the leaders of the new Republican party, and was defeated as its candidate for governor in 1856. For a time he was in the United States Senate, and, when, in January 1861, Governor Lane was elected to the national Senate, Morton became governor. His active loyalty to the government did much to sustain the administration during the trying times of the Civil War. At its outbreak he at once sent troops to the field, but in the next year was greatly hindered in his efforts by a hostile legislature and subsequently by the efforts of a secret, disloyal society known as the Knights of the Golden Circle. Several plots at his assassination were hatched. Nevertheless he surmounted all obstacles, and his services to the nation were thankfully recognized by its chiefs. He was elected a United States senator from Indiana as a Republican in 1867, serving until 1877, and in the latter year was a member of the Electoral Commission. Consult 'Life,' by Foulke (1899).

MORTON, Paul, American financier and politician: b. Detroit, 22 May 1857; d. New York, 1911. He attended the Nebraska public schools, and at the age of 16 started his commercial career as office boy in the land office of the Burlington and Missouri River Railroad, at Burlington, Iowa; after several promotions he entered the employ of the Chicago, Burlington and Quincy Railroad, rising from clerk to chief clerk, then successively assistant general agent, general passenger agent, and general freight agent. In 1890 he became vice-president of the Colorado Fuel & Iron Co., for six years, when he accepted the vice-presidency of the Atchison, Topeka & Santa Fe Railroad, greatly distinguishing himself in railroad and public affairs. He influenced great advances in the railroad system, and was a true friend and advocate of the rights of the employees in large corporations; also favored publicity as assisting in the work of the investing public and productive of honesty in management. Until 1896 he had been very staunchly Democratic but the question won him over to the Republican party. In 1904 he was appointed by President Roosevelt to be rear-admiral of the Navy, but he retired (1905) to become president of the Equitable Life Assurance Society of New York. He thoroughly reorganized the corporation's system and advanced to fruition many measures that brought about uniformity in tariffs and stability in executive departments of insurance. His death occurred suddenly and unexpectedly as he was, unaccompanied, passing between the different public offices in the course of business.

MORTON, Samuel George, American anatomist: b. Philadelphia, Pa., 20 Jan. 1799; d. there, 15 May 1851. He studied medicine at the University of Pennsylvania and in Edinburgh; began to practice in Philadelphia in 1824; was immediately prominent in the Academy of Natural Sciences being its secretary 1825 and its president 1830; became professor of anatomy in Pennsylvania College in 1839; and made special studies of ethnology, craniology and plant physiology. His valuable collection of skulls, numbering 1,500 specimens (900 human), led him to urge the diverse origin of the human race. He contributed to publication and published 'Crania Americana' (1839), 'Crania Egyptica' (1844), and 'Illustrated System of Human Anatomy' (1849). Consult 'Life' by Meigs (1851).

MORTON, Thomas, English prelate: b. York, 1604; d. 1659. He studied at Saint John's College, Cambridge, receiving the degrees M.A. (1590), and D.D. (1606), becoming a Fellow and university lecturer in logic. He became one of the chaplains of James I and (1606) dean of Gloucester, was transferred (1609) to deanery of Winchester, and (1610) of York and was made bishop of Chester in 1616. He was translated to Litchfield and Coventry (1618), in which fields he devoted his endeavors to win over the Nonconformists and recusants. In 1632 he was appointed to the see of Durham, holding the position canonically till his death, though Parliament decreed his deprivation in 1647. He had been impeached (1641) on the fall of Charles I, but was released after four months' imprisonment without trial, and was again imprisoned in 1645
because he refused to surrender the seal of Durham. After being driven (1648) from Durham House, London, he ultimately resided at Easton-Mauduit with Sir Christopher Yelverton. The latter disapproved of his written works and was against exposing of Romish fallacies. His three most noted works are 'Apologia Catholica' (1605); 'Catholic Appeal' (1609); 'Causa Regia' (1620).

MORTON, Thomas, English colonist in America, b. in England about 1575; d. Agamenticus (or Agamentius), Me., 1646. He was an attorney of Clifford's Inn, London, of a somewhat doubtful reputation, and seems to have practised mainly in western England. In 1622 he landed in New England, where he remained three months; and in 1623 returned with Wollaston's Company. Wollaston soon after left for Virginia, and in the summer of 1626 Morton assumed control over those of Wollaston's following that remained. The settlement, Mount Wollaston (now Braintree, Mass.), near the coast, he called Mount Mount (Merry Mount); and in the spring of 1627 he erected a Maypole, and with the "salvages" proceeded to hold May-day to the scandalizing of their Puritan neighbors of Plymouth. Contrary to law, he supplied the Indians with firearms and instructed them in their use; and he was a rival of the Plymouth settlers in the fur-trade. He was accordingly arrested by Capt. Miles Standish and sent back to England (1628). But in August 1629 he was again in New England. In August or September 1630 he was a second time arrested and banished. He published, in 1637, 'New English Canaan,' which Nathaniel Morton ("New England's Memorial") denounces as "full of lies and slanders, and full fraught with profane calumnies," but which as a satire is sometimes not unamusing, and contains information of interest regarding local features and the Indians. When he ventured back to New England (1643) he was imprisoned for about a year while evidence for a conviction was collected, and was finally let go on payment of a fine of $500. Nathaniel Hawthorne's 'The Maypole of Merry Mount' (in 'Twice-Told Tales,' 1837) and J. L. Mottley's 'Merry Mount' (1849) are based on Morton's career.

MORTON, William James, American physician: b. Boston, 3 July 1845. He is a son of W. T. G. Morton (q.v.), whose name is connected with the first anaesthetic use of ether. He was educated at the Boston Latin School, Harvard University, and Vienna. On his graduation there, in 1872, his thesis on "Anaesthetics," gained him the Boylston prize. He practised medicine at Bar Harbor, Me., and in Boston; went to Kimberley, South Africa, where, besides practising his profession, he engaged in diamond mining; was a retired professor of nervous diseases and electrotherapeutics at the New York Post-Graduate School. He then taught at the New York Infirmary and Atascot, 1877-90; and was afterward professor of nervous diseases and electrotherapeutics at the New York Post-Graduate School. As an authority in electrotherapeutics he has won wide recognition, and by his mechanical device for establishing the "static induced current" of electricity - the "Morton current" of the scientific world - has supplied a means for producing the X-ray, and rendered a service of great practical value to medicine and surgery. Indicted in January, 1912, in association with Julian Hawthorne and others, on a charge of fraudulent use of the mails in the promotion of bogus mining companies, conviction followed nearly a year after; he was sentenced to 12 months' imprisonment, but was released in October 1913, pardoned by the President and reinstated in his profession.

MORTON, William Thomas Green, American dental surgeon: b. Charlton, Mass., 19 Aug. 1819; d. New York, 15 July 1888. He established himself in the practice of dentistry in Boston, and there in March 1844 became a student of medicine in the office of Dr. C. T. Jackson (q.v.), the scientist. In November 1846 he obtained a patent for the process of anaesthesia by what he called "letheon," now known as ether. Jackson claimed the discovery of etherization previous to the winter of 1841-42, and Morton's patent was contested by both Jackson and Horace Wells, another of Jackson's pupils. Morton communicated his knowledge of the process to Dr. J. C. Warren, and anaesthesia by ether was made public through an operation performed by Warren at the Massachusetts General Hospital 16 Oct. 1846. The French Academy of Sciences investigated the matter and decreed a Montyon prize of 2,500 francs to Jackson for the discovery, and another of like amount to Morton for the application of the discovery to surgical operations. In 1852 a bill appropriating $100,000 as a national testimonial to Morton was introduced in Congress, but failed, as it did also in 1853 and 1854. Testimonials accrediting to him the application of ether as an anaesthetic were signed by the medical profession in Boston (1856), New York (1858) and Philadelphia (1860). Consult Weyman, 'Trials of a Public Benefactor' (1859).

MORTUARY CUSTOMS. See BURIAL; DEAD, DISPOSAL OF.

MORWITZ, mör'vits, Edward, German-American journalist: b. Dantzig, Prussia, 12 June 1815; d. Philadelphia, 13 Dec. 1893. After thorough training in the sciences and medicine at various German universities, he was graduated in 1840 from Berlin University, where he became an assistant physician and wrote 'The History of Medicine' (1848-49). In 1843 he practised his profession at Comitz, Prussia, but after the Revolution of 1848 settled in the United States. In 1853 he bought the German Democrat of Philadelphia and in 1855 issued a German political weekly, The United States Journal, followed in the same year by a German Sunday paper, The New World. He gave great assistance in raising funds during the Civil War, and assisted in the raising of troops and the placing of government loans. In 1862 he took a leading part in establishing the German Press Association of Pennsylvania, and in 1870 organized the movement to raise funds for aiding German soldiers in the German War, about $600,000 being received for that purpose. He at one time owned or controlled about 300 newspapers, both German and English, and was a powerful factor in welding together the German population of the State.
He invented a breech-loading gun before leaving Germany.

**MOSAIC**—**MOSAYLIMA**

MOSAIC, an imitation or reproduction of a painting or ornamental design, formed generally by small pieces of different colors, also by colored stones (especially marbles and precious stones) placed side by side, and attached by being bedded in cement. The art originated in the East, but received its perfection from the Greeks, and was thus conveyed to the Romans. In Italy many floors ornamented with mosaic work have been found among ancient ruins. Afterward, when the art was revived in Italy, the Venetian school becoming very celebrated, Clement VIII, in the 17th century, had the interior of the dome of Saint Peter's decorated with this kind of work. The art was largely employed for copying paintings by famous artists, and thus rendering permanent their original freshness and unity. The Venetian school of mosaics is still the most famous, though excellent works have been produced in recent times by Venetian and also by Russian artists. There is a studio for the production of mosaics in the Vatican at Rome. The most important works executed here are a series of portraits of the popes. In the most costly mosaics precious stones have been cut to furnish materials; but in common works of this art enamels of different colors, manufactured for the purpose, are the material employed. Roman enamels are made of small rods of opaque colored glass. In the first place cakes of glass are made of every variety of color and shade likely to be required. As many as 10,000 shades are said to be in use. These cakes are drawn out into rods thicker or thinner, according as they are to be used for finer or for coarser work, a great number being mere threads. They are kept in bundles, and arranged in sets corresponding to their colors. For a work of moderate size a piece of dark slate or marble is prepared by being hollowed out like a box and filled with plaster of Paris; upon this plaster the artist draws the design or pattern, and the workman proceeds with his work by removing successive portions of the plaster, and filling in these with pieces cut from the glass rods, the pieces being fixed in their places by a cement. Gradually, in this manner, all the plaster is removed, and a picture is formed by the ends of the pieces of colored glass. It will easily be understood that this is a very slow process, and there are large pictures that have taken as many as from 12 to 20 years to produce. When mosaic pictures are to be viewed near at hand they are polished perfectly smooth with a flat stone, and present a glossy surface similar to that of paintings in oil. When they are to be viewed at a distance the surface is left rough, when they present an appearance similar to pictures in fresco. Inlaid works, of agate and other costly stones, are executed on the same principle as mosaic, except that the stones are larger, and cut to the shape of different parts of the object to be represented. Works of this class are known as Florentine mosaics. Flowers and ornamental designs are the objects on which this mode has been invented of sawing the plate with the mosaic pictures into two or three sheets, and thus increasing the number of works produced at one time. Consult Barwell and Drutt, 'Mosaics and Stained Glass' (New York 1909); Furnival, W. J., 'Leadless Decorative Tiles' (Stone, Staffordshire, 1904).

**MOSANDRIUM** or **MOSANDRUM** (from K. G. Mosander, a Swedish chemist) was supposedly a new rare earth metal, whose oxide was thought to have been discovered in 1878 by Lawrence Smith, in specimens of the mineral samarskite obtained from North Carolina. It was afterward shown to be a complex substance containing terbium, samarium, dysprosium, traces of praseodymium and neodymium and probably gadolinium.

**MOSASAURIA**, an order of marine reptiles of the Upper Cretaceous Period, typical of the reptilian subclass **Pythomorpha**. They were of world-wide distribution and their remains occur so plentifully in the western United States as well as in the Old World that their structure is thoroughly known. They were large predaeous marine lizards, resembling the modern monitors in many features, but reaching in many species the size of crocodiles—larger in some cases, but no skeletons are known indicating a greater length than 45 feet. They had four limbs with all the bones well developed but enclosed in a mitten of flesh and skin, forming paddles, which, with their great tails, must have made them powerful and agile swimmers. Their cup-and-ball vertebrae indicate great flexibility of the body, their sharp teeth denote ability to capture slippery prey, and the structure of the lower jaw shows that they probably ate in a hurry and swallowed their food entire. In the mosasaurs, as in the cormorants, among birds, there is a sort of joint in each half of the lower jaw, which permits it to bow outward when open; if the reader will extend his arms at full length, the palms touching, and then bend his elbows outward, he will get a very good idea of the action of a mosasaur's jaw.—Lucas. The mosasaurs were of three types, namely, **Tylosaurinae**, resembling gavials, with a long slender beak or extension of the snout beyond the teeth, and long paddle-like feet with numerous phalanges; **Platynotinae**, short-headed, very long-tailed reptiles, including **Platecarpus**, **Propygnathosaurus**, **Brachysaurus** and some other genera; and **Mosasaurinae**. The last were the typical mosasaurs, apparently the most completely marine and powerful and perfectly of the race. The two genera are **Mosasaurus** and **Codiades**. None survived the close of the Cretaceous. Consult Zittel-Eastman, 'Text-book of Paleontology' (1902), in which will be found detailed and illustrated descriptions of various forms, and many references to the literature of the subject.

**MOSAYLIMA**, mō-sā-lē'mā, or **MOSEILIMA**, Arab prophet and rival of Mohammed (q.v.) b. early in the latter half of the 6th century; d. 633. He seems to have been born and lived in the tribe of Bani Hanifah, in Najd, before Mohammed arose; and his name Rahimân, "the merciful," one of Mohammed's favorite titles for Allah, may be held proof that he claimed to be the Messiah. Tradition says that Mohammed scornfully refused Mosaylima's suggestion that they should share the spiritual leadership of the earth; but modern criticism makes it more probable that the Prophet compromised with him considerably, and it is even suggested
that Mohammed wished to make him his successor by testament, but was prevented by his attendants as he was dying. A break between Abu Bekr, the caliph, and Mosaylima came speedily; perhaps Mosaylima even openly opposed Islam. At any rate in the 11th year of the Hegira, his forces though far superior in numbers were met and defeated by Khaled, the Sword of God.

**MOSELY, mōz'bi,** John Singleton, American lawyer and soldier: b. Edgemont, Powhatan County, Va., 6 Dec. 1833; d. Washington, 30 May 1916. He was graduated at the University of Virginia (1852), admitted to the bar (1855) and was practising law at Bristol, Va., when the Civil War broke out. He enlisted as private in the Confederate army and was later promoted adjutant of the 1st Virginia Cavalry. In two months' time, however, he was reduced to the ranks. Mosely, undaunted, then offered his services as scout to Gen. James E. B. Stuart, and in that capacity guided Stuart's cavalry in a desperate raid on McClellan's army on the Chickahominy in June 1862. In 1863, after ended as short captives, he was demobilized and recruited an independent body of fighters which soon became famous under the name of Mosely's Partisan Rangers. This small cavalry command, of which he was colonel, became a terror to the Union troops and did much damage in cutting off means of communication and destroying supply trains, capturing outposts, etc. They adopted a guerrilla style of warfare and operated through Virginia and Maryland. Subsequently his force was pressed into the regular Confederate army as the 43d battalion of Virginia cavalry and served till the cessation of hostilities. His men were dispersed and concealed when not engaged in raiding, and he had in force a perfect system of reassembling them at the shortest notice. At Chantilly (16 March 1863) he defeated a much larger force than his own. Probably his most brilliant exploit was the capture of Brigadier-General Stoughton, United States army, at Fairfax Court house, in the same month. To accomplish this he made a raid inside the Federal lines. At Danesville (1 April 1863) he successfully defended himself against a force sent especially to capture him. He harassed the rear of Grant's army, in its advance on Fredericksburg, to such an extent that Grant was forced to send a special detail to protect his communications and supplies. One of Mosely's most important raids resulted in the capture of Sheridan's entire supply train, which he surprised near Berryville.

Mosley was commissioned captain in March 1863, major two weeks later and colonel some time after that. His regiment was disbanded 21 April 1865, and he again took up the practice of law, settling at Warrenton, Va.

Mosley became a Republican after the War and supported General Grant for the presidency, it is said he originated the phrase "the solid South," used in the railroads by Mosley in 1878-85, afterward practised law in San Francisco, Cal., and was assistant in the Department of Justice at Washington 1904-10. He delivered a lecture in Boston, on Stuart's Cavalry, 1 December 1886, which was afterward published in a book entitled "War Reminiscences" (1887). He also wrote "The Dawn of the Real South" (1901). Consult Crawford, 'Mosby and His Men' (1867); Scott, J., 'Partisan Life with Mosby' (1867); Williamson, 'Mosby's Rangers' (1896).

**MOSCHELES, Felix,** British portrait painter: b. London, 8 Feb. 1833; d. Tunbridge Wells, January 1918. He was the son of Ignaz Moscheles, the distinguished pianist and composer, and the lifelong friend of the great Mendelssohn. Felix was educated at King's College, London, and was then sent to Hamburg and Karlsruhe. His childhood was spent amid a circle of literary and artistic celebrities, including Mendelssohn, Joachim, Malibran, Lablache and Dante Gabriel Rossetti. In later years the list was extended by many of the most famous characters of the age, In 1846 his father migrated to Leipzig to take over the direction of the Conservatoire. Here Felix was taught drawing and architecture. In 1850 he went to Paris to pursue his art studies, arriving in the days of the Republic which followed the flight of Louis Philippe, and he witnessed the coup d'état which placed Napoleon III on the throne. A lucky arrest brought Moscheles into touch with Théophile Gautier, whose husband was then at the head of affairs, and who was a friend of the Moscheles family. The young artist was introduced into the best circles of Parisian society. At the Atelier Gleyre, where he studied, he made the acquaintance of Du Maurier, afterward the famous Punch artist. Moscheles pursued his later studies in Antwerp, where Alma-Tadema, Maris, Neuhuys and Heyermans were his fellow-students. He afterward opened a studio and settled in London, where he and Du Maurier formed a merry circle with Poynter, Whistler, Stacy Marks and Charles Keene. In 1862 he painted a portrait of Mazzini, which after the latter's death he offered to the Italian nation, but the offer was refused. Moscheles had long been interested in the question of universal peace and international arbitration. He discussed this subject with President Cleveland during a visit to America in the '80's, when he crossed the Atlantic with Henry Irving, carrying an introduction to Robert Browning. He painted Cleveland's portrait and later one of Browning, which is now in the Armour Institute, Chicago. Among his works are studies of Gounod, Rubinstein and Sir H. M. Stanley. He exhibited in Antwerp, Paris, and London, and published two volumes of autobiography, 'In Bohemia with Du Maurier' and 'Fragments of an Autobiography,' besides editing Mendelssohn's letters to his parents. He was president of the International Arbitration and Peace Association and of the London Esperanto Club.

**MOSCHELES, Ignaz,** German pianist and composer: b. Prague, 30 May 1794; d. Leipzig, 10 March 1870. Of Jewish parentage, studied under J. D. Weber, director of the Prague Conservatory of Music, and afterward under that of Albrechtsbursl. In 1814 he went to London, where, on the completion of his studies he made a successful professional tour in Germany, and in 1820 arrived at Paris, where he met with an exceptionally enthusiastic reception and afterward made tours of other continental capitals. In 1825 he settled in London, where he was professor of music at the Royal Academy for 21 years. Here he had Thalberg for a pupil, as
he had formerly, in Berlin, had Mendelssohn. At the latter's request he went from London to Leipzig where he was professor of music in the conservatory there from 1846 till his death. Among his finest compositions may be mentioned his Concertos Nos. 3, 4 and 5, the Concertos Fantastique and Pathétique; his great Sextet and Trio; his Sonatas Caractéristique and Mélancolique; and his studies. Consult 'Leben' (1872); 'Briefwechsel mit Mendelssohn-Bartholdy' (1888).

MOSCHEROSCH, mösh're-osh', Johann Michael, German satirist; b. Willsädte, near Strassburg, 5 March 1601; d. 4 April 1669. He was a descendant of an Aragon (Spanish) family and studied at Strassburg, after a short stay in France was appointed (1626) master of the court for the Duke von Leiningen-Dagsburg, then acted as district magistrate (1630) for Count von Criechingen and (1635) for the young Protestant Duke Bogislav von Croÿ at Finstingen-on-Saar. Between war, looting, famine and pestilence life was a series of disasters. In 1643 he was transferred to Benfelden, then a Swedish fortification, as member of the council of war, to become secretary of state at Strassburg. In 1656 he was appointed deacon of war and of the Church for the Duchy Hanau, next entering the service of the Elector of Mayence and, from 1664, under the Landgravine of Hesse. He was admitted to the Fruchtbringende Gesellschaft, in 1643, with the surname 'Der Traumende' (the Dreaming One), his principal work 'Wunderlichen und wahrhaftigen Geschicht (Visionen) Philanders von Sittewalt' having been published in 1640 (revised editions, Strassburg 1642-43). It is clearly a keen satire of his times laid down on the lines of Quevado's 'Sueños.' Consult Nickel's 'Moschrosch als Pädagog' (Leipzig 1883); Parisier, 'Beiträge zu einer Biographie von Moscherosch' (in Münchens Dissertation 1891); Martin, 'Johann Michael Moscherosch' (in Jahrbucher der Gesellschaft für lothringische Geschichte und Altertumskunde, Vol. III, Metz 1891).

MOSCHUS, mós'kùs, Greek buccolic poet of Syracuse in Sicily, flourished about 150 B.C. Four idyls form the whole of the remains of Moschus, which exhibit great elegance of style and delicacy of conception. The 'Errhegios Blauec' ('Lament for Bion') was imitated by Shelley in 'Adonais.' A translation by J. M. Edmonds was published in 1812. The works of Moschus have commonly been edited with those of Bion (q.v.) and Theocritus (q.v.), and the three have been well translated by Andrew Lang (1889). See Theocritus, Bion and Moschus, Idyls of.

MOSCOSO DE ALVARADO, Luis de, loo'-és mós-kô'sô dâ' ál-vâ'-râ'dô, Spanish adventurer: b. Badajoz, Spain, about 1505; d. Peru, about 1560. He served under his kinsman, Nuño Álvarez de Pineda, in Guatemala in 1529 and in 1534 accompanied him to Peru where he was for two years a follower of Pizarro, and then returned to Spain to live in luxury for several years on the proceeds of his services. In 1538 he attached himself to De Soto's expedition in Florida and upon the latter's death in 1542 took command and after many hardships succeeded in returning to Mexico. He was honored by the viceroy, Mendoza, and in 1551 accompanied him to Peru where he was entrusted with important commands until his death.

MOSCOW, Idaho, town, county-seat of Latah County, on the Northern Pacific, Oregon and Navigation Company's railways, about 65 miles south by east of Spokane, Wash. The chief industries of the country around Moscow are lumbering, farming, stock-raising, mining and fruit-growing. Considerable grain and vegetables are raised. The chief manufactures of the town are lumber, flour and mercantile goods. The University of Idaho and the State Agricultural College are located in Moscow. Pop. 3,670.

MOSCOW, Russia, the second capital of the empire, and until Peter the Great selected Saint Petersburg as a northern capital, the sole capital and imperial residence, situated in a highly cultivated district on the Moskva, 400 miles direct by rail southeast of Saint Petersburg. It is the capital of a government of the same name (area, 12,847 acres; pop. 5,662,900), and is especially esteemed by the Russians as the place of the coronation of the tsars, the favorite residence of many of the nobility, the commercial emporium of central Russia and western Asia, and a principal seat of Russian manufactures. It is the holy or white mother city in the creed of the people, and no tsar would omit visiting it at least twice a year, or presenting in the city his eldest son after he has reached his majority.

As a general rule the temperature ranges from a winter mean of 14° F. to a summer mean of 66°, the annual mean being 40°. Sections of the city are walled. A considerable portion of the enclosed space is unoccupied by buildings, has an undulating surface and is traversed by the navigable Moskva, which is crossed by five bridges, and entering at the middle of the west wall makes a series of serpentine windings, in the course of which it receives the Iauosa and the Negliana, and leaves the city at the southeast corner. The river is frozen for five months of the year. The general view of the town, as seen from Tarrrow Hill, an eminence on the southeast, is peculiarly striking and picturesque. Its hundreds of churches and convents, surmounted by gilt and variously colored domes and spires, its imperial and other palaces, its boulevards, gardens, ponds and, above all, the high walls and numerous stately towers of the Kremlin or citadel, produce an effect unequaled by any other European city. It formerly comprised five principal divisions: the Kremlin, Kitalgorod, Byelorogorod, Semlyanigorod and the Sloboden or suburbs.

Public Buildings, etc.—The Kremlin, situated on the north bank of the river, forms the centre of the town, and in it are found the principal civil and ecclesiastical buildings. The Kremlin has always been held in almost superstitious veneration by all Russians. "Above Moscow there is nothing but the Kremlin; above the Kremlin, nothing but the sky." Here in the first place is to be seen the Great Palace, a lofty building in a mixed style of architecture, erected in 1598. In 1693, having the Treasury, forming a sort of wing, on the right, while also connected with it is the Terem or old palace of the tsars, belonging to the 16th and 17th centuries. The Cathedral Square, on
the summit of the Kremlin, contains the Us-
penskiy Cathedral (cathedral of the Assump-
tion), in which the emperors being crowned,
built in 1475-79, a clumsy building with heavy
pillars, which support five cupolas, these, like
the walls, glittering with grotesque frescoes of
sacred subjects, painted on a golden ground;
another cathedral here is the Archangelskiy
Cathedral (cathedral of Michael), founded
in 1333 and rebuilt in 1505-09, containing
the tombs of many tsars down to Peter the Great;
a third is the Blagoveschenskiy Cathedral (of
the Annunciation), founded in 1597. The arse-
nal is an immense building lining one side of
the northern angle of the Kremlin, the opposite
side being occupied by the senate. The chief
attraction is the upper story of the treasury,
containing the crowns of the early tsars, several
thrones, warlike trophies and miscellaneous
curiosities; the arsenal contains an immense
quantity of weapons and arms, the cannon
taken from the French during their retreat
and numerous other military trophies. Near
the centre of the buildings of the Kremlin is
the palace of Ivan the Terrible, which stands on
the height of 322 feet, contains numerous bells
and is surmounted by a gilded dome, on which
the cross is displayed above the crescent. The
great Tsar Kolokol, or king of bells, the largest
in the world, stands at the bottom of the tower
on a granite pedestal, to which it was raised
in 1832, after having remained for more than
a century buried on the spot where it had
fallen, while an attempt was being made to
hoist it. The Kremlin also contains a bronze
table of Alexander II (1888). Outside of it, the
chief buildings are the cathedral of Saint
Vassili (Saint Basil), one of the strangest
specimens of architecture anywhere to be met
with, having no less than 20 gilded and painted
domes and towers, all of different shapes and
sizes; and the temple of the Saviour, built
(completed 1883) to commemorate the French
retreat, at a cost of $10,000,000, and which is
regarded as the most beautiful church in Rus-
sia. Other buildings worthy of notice are the
great riding school, the Gostinci Dvor or
principal bazaar in the Kitai gorod, a colossal
building of three stories, where the leading
wholesale merchants carry on their business;
the Kiadi, in the same quarter, occupied by
handsome shops. Among the principal educa-
tional establishments is the university, the
largest in the country, founded in 1755 by the
Empress Elisabeth; it consists of four faculties,
attended by nearly 10,000 students and has
a library of about 400,000 volumes, an observa-
tory and botanical garden. A popular univer-
sity bearing the name of its founder, Gen.
Alphonse Shaviavsky, was opened in 1908.
The gallery of art contains 2,000 pictures,
mainly Russian, bequeathed by the brothers
Tretiaka. There are several good museums,
the largest and most important being the Ru-
miantzof, in a fine building, with library and
reading-room. The foundling hospital, in which
children are received without questions being
asked, supports annually 5,000 children, 1,500
boys, and 3,500 girls; the number of the open
and planted spaces throughout the city is great, but otherwise the streets
are narrow, uneven and crooked, lined by
mean-looking brick and wood houses. Beside
the imperial palaces in the Kremlin are the
Petrovskoi Palace and gardens outside of the
Saint Petersburg gate, the principal fashionable
resort during the winter season, and the palace
of the Empress Elisabeth; and among the
favorite pleasure grounds are the beautiful gar-
dens of the Kremlin and the Galitzin garden
on Sparrow Hill. Moscow is the residence of
two archbishops and of the governor-general
of the province.

Manufactures, Commerce, Communica-
tions.— Moscow is the second manufacturing
city in the empire, and of late years its indus-
trial and commercial activity has greatly in-
creased. The manufacturing establishments
give employment to more than 125,000 workmen
and annually turn out goods to the value of
about $150,000,000. The principal establish-
ments are for textile fabrics, chiefly cotton,
woolen and silk, besides manufactures of met-
als, railway trucks, looms, machines, paper,
leather and other articles. The enamelware in-
dustry owes its beginning to an American,
Henry Hille. The machinery employed in the
factories is generally of the most improved
description, and partly made in the city. It
largely comes from Britain and elsewhere.
From its central position Moscow is the great
entrepot for the internal commerce of the em-
pire and toward which six railway lines con-
verge. Great facilities for this commerce are
given by water communication, which extends
on one side to the Baltic, on another to the
Caspian and on a third to the Black Sea; and
by the railways to Saint Petersburg, Yaroslav,
Nijinovgorod, Siberia, etc. In winter the
traffic over the snow in sledges is enormous.
Tea, silk, indigo and cotton are important ar-
ticles of trade.

Administration, etc.— Moscow is under
the immediate charge of a general governor and
a military governor. It is the seat of important
civil and criminal courts, and of various super-
intending boards of police, manufactures, trade,
etc., and has a number of literary, scientific
and other societies of different kinds. Pop.
(1891) 822,397; (1897) 977,269, with suburbs
1,035,664 (1889, 1,117,106). Nearly all Great
Russians of the Orthodox Greek Church, males
greatly preponderating.

History.— Moscow is said to have been
founded in 1147 by George Dolgoruki, Prince
of Kiev. Its nucleus was at first was nearly surrounded by a palisade,
and formed an important military station.
For a long time it continued to be a dependency of the principality of Vladimir;
and in 1238, when Batou-Khan devastated Russia, it was sacked and burnt.
In 1293 it was again sacked, and the inhabitants were dragged away into slavery
by Khan Nogai. Ivan Danilovitch of Vladimir
took the title of grand prince of Moscow
in the early part of the 14th century and from
that time it remained the seat of government
until the beginning of the 18th, when the admin-
istration was transferred by Peter the Great
to Saint Petersburg. Moscow was plundered by
the Lithuanians and the Tartars of Tamerlan
in the latter part of the 14th century, and was
nearly conquered by fire in 1536, in 1542, and
again in 1571, when the Tartars set fire to the
suburbs, a large part of the population perish-
ing on that occasion. During the insurrections
caused by the pseudo-Demetrius (1605-12),
when the Poles and Cossacks took the city, it
was again partly destroyed. In 1812 it was entered by the French under Murat on 14 September, and on the 15th by Napoleon, who took up his residence in the Terem Palace in the Kremlin. The city, deserted by its inhabitants, was set on fire by order of the governor, Count Koutoupin, compelling Napoleon to leave on 19 October and to take his final departure on the 23rd, and resulting in the disastrous retreat of the French army. The greater part of the city was then destroyed, notwithstanding the efforts of the French to stay the progress of the flames. It was rebuilt within a few years. The railway to Saint Petersburg was opened in 1851. The chief of modern events are the coronations in 1856 of Alexander II and in 1866 of the late Nicholas II, at the latter ceremony 2,000 people being crushed to death, and hundreds injured, during the distribution of gifts. On 17 Feb. 1905 the Grand Duke Sergius was assassinated in the Kremlin, and there were revolutionary disturbances in that and the following years. On 14 March 1918 the People's Commissioners (the new Russian Soviet Government) left Petrograd for Moscow, which thus became the centre and capital of the new Russia. Consult Wirt Garee, 'The Story of Moscow' (London 1900); Grove, H. M., 'Moscow' (New York 1912).

MОСЕЛИМА. See MOSAYLIMA.

MOSLEY, mōz'li, Edward Augustus, American lawyer. b. Newburyport, Mass., 23 March 1846; d. Washington, D. C., 18 April 1911. He engaged for several years in both the East and West Indian trade. He then studied law, was admitted to the Massachusetts bar and was also a member of the State legislature for several terms. His chief interest was in the lessening of danger in railroad travel, and he became the leading authority in the United States on all measures or appliances for procuring the safety of railroad employees and travelers. Largely for this reason he was appointed secretary of the Interstate Commerce Commission at the time of its formation. His efforts in obtaining and enforcing the Safety-Appliance Law gained him testimonials from all the railroad men's organizations in the United States, and the formal thanks of the Commonwealth of Massachusetts. He published 'Arbitration as applied to Railways and their Employees'; 'Safety Appliances on Railroads'; 'One Hundred Years of Interstate Commerce Law' (1900); 'The Transportation Question as Affected by the Civil War Bill' (1900); 'Federal Supremacy' (1907).

MOSLEY, Henry, English mathematician. b. Newcastle-under-Lyme, 1801; d. Bristol, 1872. He was graduated at Saint John's College, Cambridge, and after studying theology was ordained a priest of the Church of England. From 1831-44 he was professor of natural and experimental philosophy and astronomy at King's College, London, and was one of the first inspectors of schools to be appointed (1844). He was appointed canon of Bristol in 1853, next becoming chaplain to the queen. He was given the degree L. D. by the university of Cambridge, 1870. Among his best-known works are 'A Treatise on Mechanics, Applied to the Arts' (1834); 'Astro-Theology' (1838; 3d ed., 1860); 'Lectures on Astronomy' (1839; 4th ed., 1854); 'The Mechanical Principles of Engineering and Architecture' (1843), much in use to this day as a textbook and frequently re-edited and revised.

MOSELLE, mō-zēl (German, Mozelt), a European river which rises in France at a point over 2,400 feet high on the western side of the Vosges and quite close to the German boundary. After flowing northward, through the department of Meurthe-et-Moselle, it proceeds north-east through German Lorraine into Rhenish Prussia. After passing Tréves in a remarkably winding course, it falls into the Rhine at Coblenz; total course, about 314 miles. It is navigable from its junction with the Meurthe. Its principal affluents are, in France, the Valogne, Meurthe, Seille, Madon, Math and Orne, and beyond France, the Sarre, which joins it above Tréves; and the Sure, Kill and Elz. Of these affluents the Meurthe, Sure and Sarre are navigable. The fortress of Metz protects the valley of the Moselle, which forms the natural line of communication between France and Germany. The valley is famous for its fertility; the lower part for its vineyards. In the early days of the Great War in the fall of 1914, the German army of the Moselle took part in the attempted march on Paris.

MOSELY COMMISSIONS, two delegations known as the INDUSTRIAL and the EDUCATIONAL, which visited the United States in 1902 and 1903 to study conditions and methods in their respective branches, for comparison with those of Great Britain.

The Mosely Industrial Commission made a tour of the United States from November 1902 to January 1903, to investigate manufacturing, industrial and commercial lines, which in international competition had seriously affected the commerce and free trade policy of Great Britain. It was financed by Mr. Alfred Mosely (b. Bristol, England, 1855), a diamond merchant whose relations with American mining and other engineers in South Africa had developed the desire to discover the sources of their success, the comparative causes of Great Britain's commercial decline, and to evolve a plan whereby American methods could be introduced into the United Kingdom for the rehabilitation of its economic and industrial status. A suggestion to invite British trade-unions to select a representative from each to form a commission to study American industries and the condition of the workmen was actuated upon, most of the unions electing as representative their general secretary. Twenty-three formed the commission and were given a free trip to the States, with expenses paid for nearly three months. Each man was pledged to study conditions carefully and to answer fully on his return a series of tabulated questions.

Mr. Mosely and the delegates made a circular tour in which they were afforded every opportunity to inspect some of the largest factories in the United States. They visited Niagara, Buffalo, Cleveland, Chicago, Dayton, Pittsburgh, Philadelphia and New York, as one party, while individual members took trips to other points. The chief results of their observations were published in the 'Reports of the Mosely Industrial Commission' (London, April 1903).
Some of the conclusions arrived at were: The American workman for two and one-half days' work receives remuneration equal to that of the British for a week; the American is more temperate than the British; he lives longer; is more thrifty, and after a few years frequently retires with his savings to an easier occupation, usually farming or market-gardening. Labor-saving machines were more in evidence in America than in the United Kingdom, but, there was a considerable difference of opinion among the various delegates as to what could be learned from America in their respective trades, for instance, the shipbuilding and bricklaying in England were considered superior to those of America. To the question "Are there greater opportunities for the workingman to rise in America than in England?" "Yes," came as a unanimous answer. The average workman was considered as good in one country as the other, the difference was to be found in conditions. In Great Britain generations of workers toil in a confined area, and have become hideous by inherited labor traditions; increased production to them does not mean increased wages—hence a lack of incentive. In the United States, the stimulating climate and abundance of undeveloped resources tend to a constant striving for direct results through the simplest means, whence the wonderful development of machinery, manufacturing equipment, output, increased wages, general prosperity and well-being of the American workmen, together with a unity of feeling between employers and employees along the lines of increased production, which is not to be found in England. The organization of capital and labor in the United States produced a great impression on the delegates, and the advantages of the Civic Federation to bring together these two great and active factors in production on all disputed questions, and at the initial stages to avert strikes by arbitration, were fully recognized as those of a model organization worthy of immediate adoption. The freedom accorded to religious belief and the excellent public school education of the States elicited the warmest praise from the commission, the advantage given to all the American youth being fully apparent.

The success of the Industrial Commission led to the organization of the Mosely Educational Commission to the United States, October-December 1903, in which 26 prominent British educators took part at the invitation of Mr. Mosely to investigate:

1. The development of individuality in the primary schools.
2. The social and intellectual effects of the wide distribution of secondary education.
3. The effect of specific instruction given (a) in business methods; (b) in applied science.
4. The present state of opinion as to the value of professional and technical instruction of university rank, designed with special reference to the tasks of business life.

As in the work of the Industrial Commission, the positive deductions drawn were wholly in favor of the system of education in the United States which was described as practical, enlarged, enlightened, up-to-date and scientific. Consult Mosely, Reports of the Mosely Educational Commission to the United States of America, October-November 1903 (London 1904).

C. LEONARD-STUART, Editorial Staff Of The American.

MOSEN, mōzên, Julius, German poet; b. Marieneey, in Vogtland, Saxony, 8 July 1803; d. Oldenburg, 10 Oct. 1867. He was educated in the Plauen Gymnasium, studied law (1822) at Jena, travelled through Italy and then worked for some time under an attorney at Markneukirchen. In 1834 he settled at Dresden, taking up the practice of law, and soon becoming noted as an author. He became (1844) dramaturgist at the Oldenburg Hoftheater, but incurable sickness greatly deterred his activities after 1848 and he was pensioned in 1850. He first came into prominence through his epic poem 'Das Lied vom Ritter Wahn' (Leipzig 1831), a very ancient Italian legend redressed in a liberal form. His 'Ahasver' (Dresden 1838) contains more of philosophy than poetry; but in his 'Gedichten' (Leipzig 1836; 2d ed., 1843) he showed national radiance in a string of ballads as 'Die letzten zehn vom vierten Regiment,' 'Andreas Hofer,' 'Der Trompeter an der Katsbach,' etc. In narrative form we have the novel 'Georg Benlot' (Leipzig 1831), 'Bilder im Moose' (ib. 1840). His great ambition was centred in dramatic writing, but these works are too saturated in abstract rhetoric. Of his best might be mentioned 'Cola Rienzi,' 'Die Braute von Florenz,' 'Wendelin und Helene,' 'Kaiser Otto III.,' all of which are to be found in Theater (Stuttgart 1842), the latter being the most imitating. His talented work, 'Die Dresdener Gemaldegalerie' (Dresden 1844), should also be quoted. His works in eight volumes has been published under the title 'Sammliche Werke' (Oldenburg 1863) and a fuller edition, including biography, was published in six volumes by his son (Leipzig 1880). Consult his 'Erriterungen,' extended by Zschommler (Plauen 1893); 'Julius Mosen, eine biographische Skizze' (Oldenburg 1970) is anonymous.

MOSENTHAL, mōséntál, Joseph, German-American musician; b. Dusseldorf, Germany, 38 Nov. 1834; d. New York, 6 Jan. 1896. He studied music in Germany and in 1853 removed to the United States where he was organist and choir director of Calvary Church, New York, 1860-87. He conducted the famous Mendelssohn Glee Club in New York in 1867-96 and played the violin in several leading orchestras. He composed both church and secular music, among which are the psalm 'The Earth is the Lord's' and part songs for Thatanopsis,' 'Music of the Sea,' 'Blest Pair of Sirens,' etc.

MOSENTHAL, Salomon Hermann von, German dramatist; b. Cassel, 14 Jan. 1821; d. Vienna, 18 Feb. 1877. He studied at the University of Marburg and in 1851 obtained a position under the Austrian government. His best-known dramas are 'Deborah' (1836); the original of 'Leah der Forsaken' and 'Engel von wendhof' (1856), which were translated into English, Danish, Hungarian and Italian. He wrote also 'The German Actors' (1863); 'The Mayor of Altenburen' (1868); 'Maryna' (1871); the tragedies 'Diweke' (1880); 'Pietra' (1885), etc.
MOSER, mo-rèr, Gustav von, German dramatist: b. Spandau, Prussia, 11 May 1825; d. 1903. He obtained a military education and after serving in the Prussian army resigned in 1856 to devote himself to literature. He produced more than eighty successful comedies and farcical comedies, sometimes in collaboration; several of his works have been well received in English translations. Among his plays may be named 'Das Stiftungsfest' (1873); 'Ultima' (1874); 'Der Bibliothekar' (The Private Secretary) (1878); 'Der Vater' (The Father) (1876); 'Krieg im Frieden' (1880). A uniform edition of his plays was published 1873-94 in 22 volumes. Consult the biography by Hans von Moser (Weimar 1908).

MOSER, Johann Jakob, German jurist and publicist: b. Stuttgart, 18 Jan. 1701; d. there, 30 Sept. 1785. He received his education at the University of Tübingen; in 1720 became teacher of law there, and in 1729 was appointed to the full professorship. In 1736 he became a director of the university at Frankfort-on-the-Oder, but in 1739, having fallen into disfavor with Frederick William I, was compelled to resign. He then founded the academy at Hanau for the education of the young nobility in political science; and he suffered imprisonment for five years at the instance of the Duke of Württemberg, his patron. He is credited with being the first to publish a systematic account of European international law. He was a prolific writer, his books numbering over 50. The most important of which are 'Deutsches Staatsrecht' (3 vols., 1737-54, with additions of 2 vols. 1766-75, and 3 vols. 1781-82); 'Lebensgeschichte' (1783). Consult the biography by Wächter (Stuttgart 1885).

MOSER, Justus, German historian and humorist: b. Osnabrück, 14 Dec. 1720; d. there, 8 Jan. 1794. He studied jurisprudence at Jena and Göttingen; in 1747 became attorney for the government, and for 25 years during the minority of Duke Frederick of York acted as his legal adviser, and was afterward appointed a judge. His most important work is 'Osnabrücksche Geschichte' (2 vols. 1768-70; ed. 1820; Vol. III, edited by Herbert von Bar, 1824). Of his humorous writings perhaps the most striking is 'Harlekin,' in which he attacks hypocrites and pedants of all kinds. He also published some valuable essays on local topics entitled 'Patriottische Phantasien' (4 vols., 1774-86). An edition of his complete works was published by Abeken in 10 volumes (Berlin 1842-43).

MOSES, Hebrew leader and legislator, the story of whose life and work is given with such singular clearness and strength in the Pentateuch, is one of those rare names that have stamped themselves permanently on the world's history, so that we turn again and again to the simple record of his career and advancement with an interest that never lags. With all his Oriental background and the fact that his concern was primarily with his own race to lead them from bondage to freedom, there is so much breadth and suggestiveness in the laws that bear his name, his moral statutes being at the basis of modern civilization, although promulgated 3,600 years ago, that he continues a familiar and fascinating figure to all eyes.

Tradition. Data.—The Biblical account, with its rapid, stirring recital, which attains at times a kind of dramatic effectiveness, tells of his birth, how his mother, in dread of Pharaoh's mandate which consigned all Hebrew children to be thrown into the Nile, concealed him for three months, then set him adrift on the river, and how he was washed up on the river's banks, where Pharaoh's daughter discovered him and had him reared as her son (Ex. xi, 1-10). His days of ease were not to last. Not all of Egypt's luxurious wealth and his own hopes of future power were possible occupant of the throne could dull his innate racial sense of duty. Seeing an Egyptian attacking a Hebrew, he interferes and slays the aggressor, hiding the body in the sand. Then the next day he sees two Hebrews quarreling, and when he tries to separate them, one taunts him with slaying the Egyptian. In fear of further discovery and of death by Pharaoh, he escapes to the peninsula of Sinai, dwelling with the priest of Midian, whose daughter he marries. Then at 40 he is called as a shepherd, when occurred the episode of the burning bush on Mount Horeb. Now began his mission—it was his task, divinely appointed, to return to Egypt and redeem his brethren from slavery (Ex. iv. 1-9). His first encounter with Pharaoh he met and aided by his brother Aaron, how he gained a hearing with his brethren, how Pharaoh's heart was hardened against the departure of the Hebrews, until, after a series of successive plagues, the Egyptians in their terror bade the Israelites make every haste to leave, are steps in a thrilling drama that has served as material for preacher, poet and playwright, with its incidents to-day as fresh as when first read or narrated. Now began the long 40 years' march, but the Israelites had not advanced very far, they moved slowly, being accompanied by their wives and children, and their flocks and herds, when Pharaoh and his army started in pursuit (Ex. xiv, 8-9). How the panic and despair of the people are changed to exultation as the waters recede and Pharaoh's hosts are drowned in the Red Sea, while the wanderers are saved, is another of those thrilling episodes immortalized in Miriam's Song of Triumph, that belongs to the highest strata of Hebrew poetry. These are led by Moses through the wilderness to Sinai or Horeb, where he received the Ten Commandments and the Law and God enters into a covenant with Israel (Ex. xix et seq.). After this culminating incident, so vividly related, Moses continues his leadership and amplifies his message from Sinai with many details as to the tabernacle, the priests, the encampments. Caustically now he marches forward to Kadesh, from which place the spies or scouts were sent to Canaan, the ultimate thule of the people's journeyings. How characteristic—they refuse to advance in their alarm at the report of the spies, and were condemned to remain in the desert until that generation had passed away (Num. xiii-xiv). Nothing is extenuated in the flaming record—every act of weakness, of rebellion, of disobedience with its invariable penalty, all are frankly and unflatteringly told. Moses resumes the march eastward, making death threats to foes on the journey, but receives warning that he will not be allowed to lead the people across the Jordan as he would die on the eastern side.
MOSES

(Num. xii). He gathers the tribes in consequence and gives them a farewell address, which is embodied in the book of Deuteronomy. He repeats the Law, adds his wise counsel, warns of the consequences of disloyalty and adjoins the people to be faithful with an eloquence and sympathy that give his words perennial force. Then after a final blessing of the multitude, he ascends Mount Nebo to the summit of Pisgah, and dies in his 120th year. The place of his sepulchre is unknown (Deut. xxxiv. 6), but for good reasons as one familiar with the history of similar founders of religions can readily understand.

Character of the Laws.—The open pages of the Pentateuch relate the character of the laws of Moses with a minuteness of detail that leaves little, if anything, untold. The code, embracing 613 statutes, covers the entire requirements of priesthood, community and individual. While his training and early life in Egypt influenced in many ways his legislation, the distinctive features are vital, with their emphasis on a purer and more rational divinity, belief and their elements of a democracy after which later nations in certain respects have modeled their systems. Despite the elaborate forms of priesthood and sacrifices, concessions to a people not ready for a loftier attitude, from our 20th century point of view, although our later day civilization still needs balance wheels, and holds fast to signs, symbols, forms, ceremonies of its own, the essential truths of the Mosaic laws, its insistence on personal equality and personal morality, cannot be outgrown. Its spirit of broad humanity, its consideration for the old and the young, the slave and the enemy, the fruit tree and the animal creation, its health and food regulations full of suggestions to the modern physician and dietician, all these show a wisdom in their author that accounts for his fame and the fact that so many of the Mosaic laws are still observed by the great majority of the people to whose ancestors the code was given.

Moses in the Legends.—It was to be expected that in course of time legends should arise as to the character of Moses and the various episodes in his career. In rabbinical literature, these have assumed a variety, a grandeur and a poetical beauty that account for their hold on the imagination for centuries to our day. To the average English reader Rev. S. Baring Gould’s ‘Legends of the Patriarchs and Prophets’ will be found stimulating. Dr. Ginzberg’s ‘Legends of the Jews,’ with its exhaustive chapters, will satisfy the more critical reader, although there is no attempt to elaborate the stories which are narrated with sober exactness. If it was denied the people to know his sepulchre and render him worthy post mortem honors, they had full license to draw upon their imagination and adorn the memory of so great a prophet, leader and law-giver by spinning the web of fairy tales in apt Oriental fashion so dear to the Semitic mind and in which the Occidental no less delights even if he assumes a more worldly-wise air. These legends stretch over his entire history from birth to death and set off in their own imaginative way, which is often far from being forced or unnatural, the scenes and incidents that he encounters, which so readily adapt themselves to the story-teller’s mood as well as to the teacher’s vision. It is not necessary in the limited space at command to dwell at any length on the mass of legends so quotable and stimulating. The Hellenistic stories of Moses, if more limited, have a quaint interest of their own. The Mohammedan are obviously distortions or exaggerations of the rabbinical, although occasionally the treatment is original. Moses plays a part, too, in apocalyptic literature.

Modern Critical View.—Since Astuze in 1753 produced his few of the compositional character of the book of Genesis, due, as he stated, to the use by Moses of certain documents in its elaboration, the critics have waged a long continued battle as to the question of authorship, which has its piquant features and is still being contested almost as hotly as a century ago. The fact, too, that a parallel to the story of the birth of Moses and his experience in the bulrushes of the Nile is found in the cuneiform library of Assurbanipal and told of Sargon, a Babylonian king who ruled, it is said, about 3500 B.C., is not without more rational discussion. Although the name Moses, too, has given rise to much speculation, although the Biblical account has still its doughty defenders. However, whatever the criticisms as to name, authorship, date, whatever the differences in details, the prevalent opinion as to the man himself is one and the same, as a great historical figure, who added unity and strength to a nation, after setting it free, and under Providence, shaped its destiny and gave it the essentials of a religious and civil code of laws, which later ages developed. The verdict of the great majority of scholars from Wellhausen to Kittel, from Budde to McCurdy, from Cornill to Barton and Patton, is conclusive. Just as the story of the Exodus has been confirmed by modern investigation step by step on the long journey across the Desert, so the historical character of Moses stands out in clear relief after the fullest and most exacting analysis and research by the modern scholar and critic.

AARON I. ISAACS.

MOSES, Bernard, American historian and political economist; b. Burlington, Conn., 27 Aug. 1846. After graduating from the University of Michigan in 1870, he went to Europe for further study, receiving his Ph.D. from Heidelberg in 1873. In 1875 he became professor of history at Albion College, but since 1876 has been professor of history and political economy at the University of California. His more important works are: ‘Politics’ (D. W. Crane); ‘Federal Government in Switzerland’; ‘Democracy and Social Growth in America’; ‘Establishment of Spanish Rule in America’ (1898); ‘The Spanish Dependencies in South America’ (1914); ‘The Government of the United States’ (1900). The ‘Government of South America on the Eve of Emancipation’ (1908) was later rewritten and embodied in the larger work on the Spanish dependencies. In March
1900 he was appointed a member of the United States Philippine Commission, and served in this capacity three years in the Philippine Islands. In 1908 he was a delegate from the United States government to the Pan-American Scientific Congress held in Santiago de Chile; in 1910 he was delegate to the International Mercantile Mission held at Buenos Aires; and in the same year he was Envoy Extraordinary and Minister Plenipotentiary on special mission to Chile in connection with the centenary celebration of that country.

MOSES, George Higgins, American diplomat and public official: b. Lubec, Me., 9 Feb. 1869. He was graduated at Dartmouth College in 1890 and since 1898 has been president of the Monitor and Statesman Company of Concord, N. H. In 1890-91 he was secretary to the governor of New Hampshire, and from 1893 to 1906 was secretary of the State Forestry Commission. Mr. Moses was a member of the Concord board of education in 1902-03, 1906-09 and after 1913. He was delegate-at-large to the Republican National Convention of 1908 and 1912. From April 1909 to November 1912 he was Envoy Extraordinary and Minister Plenipotentiary of the United States to Greece and Montenegro. In November 1918 Mr. Moses was elected United States senator to fill the unexpired term of two years, occasioned by the death of Senator J. H. Gallinger, defeating John B. Jamison, Democrat, by a majority of 998.

MOSHEIM, Johann Lorenz von, yō'hân lō'rënts fon mô's him, German Protestant theologian: b. Lubeck, 9 Oct. 1694; d. Gottingen, 9 Sept. 1755. He studied and taught at Kiel; became professor of theology at Helmstedt in 1723, abbot of Marienthal in 1726 and professor in 1747 and university chancellor (1755) at Gottingen; was a notable preacher and an erudite theologian and church historian of liberal leanings; and wrote 'Institutiones Historicæ Ecclesiast.' (1620); 'Institutiones Historiae Christianæ' (1763); 'Attempt at an Impartial and Thorough History of Heresies' (1748-50); 'Moralis of the Holy Writ' (1770-78); etc.

MOSHER, mo'zher, Eliza Maria, American physician: b. Cayuga County, N. Y., 1846. She was graduated from the University of Michigan in 1875, and studied at the School of Medicine in Paris from 1879-80. She was resident physician at the Massachusetts Reformatory for Women in 1880-81 and director of the institution in 1881-83. In 1883 she went to Vassar College as professor of physiology and resident physician; from 1886-96, she was engaged in general medical practice in Brooklyn, N. Y., and then became professor of hygiene in the department of literature, science and arts, and women's dean at the University of Michigan, holding this position till 1902 when she returned to her practice in Brooklyn. She has been lecturer at the Chautauqua Summer School of Physical Education since 1888. She is the author of 'Health and Happiness' (1911).

MOSKVA, mōsk-vā, Russia, an affluent of the Oka, a tributary of the Volga, which rises in a marsh in the east of Smolensk, flows east to the city of Moscow and thence 112 miles southeast to the Oka, which it joins near Kolomna after a total course of 305 miles. It is connected with the Volga by the Moskva Canal. It is navigable from its mouth to Moscow except between November and April when it is frozen. The battle of Borodino or Moskva, between the French under Napoleon and the Russians under Kutuzoff, was fought on its banks (7 Sept. 1812).

MOSLEM, or MUSLIM. See Mohamnedanism.

MOSLER, mōz'ler, Henry, American artist: b. New York, 6 June 1841. A diligent student of wood-engraving, he was draughtsman on a Cincinnati comic weekly (1855), studied with James H. Beard (1859-61), and was art correspondent for Harper's Weekly with the Army of the West 1862-63. Realizing the need of study he followed art at Dusseldorf and Paris (1863-66), returning to Europe in 1874. He resided for many years in France, was appointed a Chevalier of the Legion of Honor in 1892 and has been a successful exhibitor and prize winner at many exhibitions at home and abroad. His specialties are portraits, figure paintings and groups of figures.

MOSQUE, mōsk (Arabic mesjid, Italian moschea), a Mohammedan house of prayer. The form of the oldest mosque was that of the Christian basilica, which however became modified in the progress of Mohammedan architecture. Mohammedans borrowed or adapted their ideas of architecture from the nations on whom they imposed their faith; the famous mosques of Turkey resemble the Byzantine architecture of Constantinople, and certain of those in India the temples of the Jains. Domes and minarets in course of time became characteristic of the mosque and ornate examples of Moresque or Saracen art; but these are non-essentials, for in poor communities a bare whitewashed room may suffice for the public worship of the faithful. The mosques of the Arabs often include, in a quadrangular area by means of columns ranged in files, the multiplicity and extent of which impress the mind of the beholder with surprise and admiration. These columns are, in numerous instances, the rich spoils of ancient monuments. Mosque architecture, with no fixed rules, deeming lightness and elegance alone to be the fundamental laws of architecture. In these Mohammedan churches we find neither altars, nor paintings, nor images, but a great quantity of lamps of various kinds, which form the principal interior ornament, and some sentences from the Koran written on the white walls. The buildings are often quadrangular in plan, and have an open interior court, where are fountains for ablutions. In the southeast of the building there is a pulpit for the imām; in the direction in which Mecca lies (the Kiblā) there is a niche toward which the faithful look when they engage in prayer. Opposite the pulpit there is a platform surrounded by a parapet, with a desk on which is placed the Koran for the purpose of reading to the congregation. On Fridays the five daily prayers, obligatory on the faithful every day, are recited in the mosque by the whole congregation, together with additional prayers. It is not customary for women to enter the mosque, and when they do they are placed...
separately from the males. The chief officer of the mosque is the nadir, under whom are two imãms, muezzins who call the people to prayer, etc. These in addition to their religious vocation generally pursue secular callings. It is usual to cover the floor of the mosque with mats. On entering the mosque, the faithful remove their shoes. The building is never closed; and while nothing could exceed the devotion of the congregation gathered together in worship, at other times the mosques serve as convenient meeting-places, and in which wayfarers may accommodate themselves. They also serve as schools and seats of learning. Thousands of students are regularly in attendance at the most famous of these, the Azhar Mosque in Cairo. The mosques are maintained for the most part by endowments in land. The finest of the mosques of Constantinople and of the world is that of Saint Sophia, at one time a Christian church. In addition to schools, the imperial mosques have frequently hospitals and kitchens for the poor and poor travelers.

MOSQUERA Y ARBOLEDA, mós-kâ-râ č är-bô-lâ-dâ, Tomás Cipriano de, Colombian politician and President: b. Popayan, 20 Sept. 1798; d. Cooconeó, 7 Oct. 1878. After three years of service in the patriot army he was captured by the Spaniards, when he was only 18, but he escaped at Jamaica, returned to the army and in 1829 was made general by Bolivar, who made him also envoy to Peru. After Bolivar's death Mosquera traveled in North America and Europe. He became a senator in 1831; was president of New Granada 1845-49; in 1859 led the federalist revolt against Osipina, adopted a federal constitution by which the name of the country was changed from New Granada to the United States of Colombia, and became dictator of the new federation. His power was checked by a revolt led by Canal, with whom Mosquera in 1862 came to terms. Under the constitution then adopted Mosquera was elected President in 1863 and in 1866; the latter term was cut short by a successful revolution due to the President's arbitrary use of power. He was banished to Lima for four years, but upon his return again entered politics, was governor of Cauca and became a member of Congress. He was strongly anti-clerical; and wrote on the geography of New Granada, and a valuable life of Bolivar (1853).

MOSQUITIA, mós-kë-të-a. See MOSQUITO COAST.

MOSQUITO (diminutive of the Spanish mosca, a fly), a name applied to insects of the dipterous family Culicidae. Mosquitoes are cosmopolitan, only a few oceanic islands, desert and midcontinental areas from them. Frequently they occur in vast swarms, and they abound equally in arcetic regions, as Alaska and Greenland, and in the tropical swamps of Africa and South America, while at many intermediate points they are intolerable pests. Vertically they range from the equator to altitudes of at least 13,000 feet. While many species are local, others are very widely distributed. Typical mosquitoes have the following characteristics: The mouth is provided with a prolonged, subtorial, piercing proboscis; the greater part of the body and head and portions of the wings and legs are covered with scales which determine the color pattern; the complicated venation of the wings is also highly characteristic. These features distinguish mosquitoes from the related midges (Chironomidae and Cecidomyiidae) and the black flies (Simuliidae); and from the crane-flies (Tipulidae) which inspire most of the stories of gigantic mosquitoes. Not less than 22 genera and 350 species are now known. The species are based largely upon differences in the form and arrangement of the scales and the resulting coloration, the form of the foot-claws, etc.

Development.—The typical life-history of a mosquito is as follows: The eggs are deposited at night in or (rarely) near shallow water, usually fresh but in the case of a few species brackish or salt. After one or a few days they hatch into legless, aquatic larvae, popularly known from their activity as "wrigglers." These have the mouth provided with small jaws for browsing at the bottom, and with brushes of hairs whose movements induce currents in the water and bring to the mouth floating particles or minute food forms on which they feed. The thorax is more or less swollen, and the abdomen slender and nine-jointed, with the last, or anal, segment bearing two pairs of leaf-like appendages and a more or less conspicuous band of thin thread-like filaments, which serve as food. The thorax is more or less swollen, and the abdomen slender and nine-jointed, with the last, or anal, segment bearing two pairs of leaf-like appendages and a more or less conspicuous band of thin thread-like filaments, which serve as food. The thorax is more or less swollen, and the abdomen slender and nine-jointed, with the last, or anal, segment bearing two pairs of leaf-like appendages and a more or less conspicuous band of thin thread-like filaments, which serve as food.

On the dorsum of the eighth segment is a pair of spiracles, or breathing-pores, usually borne at the end of an elongated tube or siphon. By their active wriggling the larvae come frequently to the surface and breathe, and then sink by gravity lazily to the bottom. After one or more weeks the larvae molt finally and transform into pupae, which have the head and thorax closely united, and the latter greatly enlarged, with the form of the future legs and wings apparent. At the tail end is a pair of fin-like expansions; while the respiratory organs, instead of being near the end of the abdomen, have the form of a pair of large mouthed tubes or funnels on the dorsum of the thorax. Like the larva the pupa is active wiggler, but, unlike them, they are buoyant and naturally float at the surface with the respiratory funnels uppermost and exposed. When alarmed they display much activity and wiggie violently toward the bottom. The imagos escape from the pupal investments at the surface, and winds or waves can often throw them up at the water's edge. The males, which transform first, hover in little clouds and are sought by the females. In the males the antennae are broad and feather-like, in the females slender and simply hairy. The duration of the period of aquatic life varies with the species and temperature; in our common Culex jungens it may be only 10 days, so that many generations may be produced during a favorable season. The winter may be passed in any stage from egg to adult, all of which are extremely resistant to cold, and the aquatic stages capable of withstanding repeated freezing and thawing. The hibernating imagos, which are found in houses and other sheltered places, may number one or two thousand eggs and in the case of Anopheles, at least, are chiefly fertilized females. Mosquitoes have many natural enemies. The aquatic stages are preyed upon by carnivorous fishes, water-nests larva of dragon-flies and aquatic beetles, and leeches. Vast and pestilential flying insects are destroyed by night-hawks and bats, and during
INDIA

the day they are pounced upon by dragon-flies, hornets and other carnivorous insects, and snapped up by swallows and swifts as they skim the grassy meadows. Of their parasites the recently discovered worm, *Agammomermis culicis*, is considered to exert an important checking influence in some years.

Mosquitoes are weak fliers and usually seek shelter when the wind blows, so that railroad trains, ships and wagons are far more effective than their own wings in accomplishing their dissemination.

Notwithstanding that the chief human interest in mosquitoes arises from their blood-sucking habits, yet the taste for blood is certainly an acquired one and a relatively unimportant factor in the lives of the majority of mosquitoes. The normal food of both sexes of many species, and the only food of the males of nearly all, consists of the juices of flowers, fruits and other plant parts. In a few species a meal of blood by the female seems requisite to the maturation of the eggs, but this is decidedly exceptional. Most of the species are active chiefly at night, but a few, like *Stegomyia fasciata*, in which also both sexes bite, are most vicious during the early afternoon. The bites of all species are not equally irritating, probably the result of dissimilar qualities of the salivary secretion which is poured into the wound to facilitate the blood flow. Ammonia and glycerine allay the irritation. Besides the warm-blooded birds and mammals, mosquitoes attack fishes, frogs, turtles and even other insects.

Until within a few years mosquitoes were regarded merely as intensely annoying pests, but since the definite discovery of their relation to disease-transmission their momentous importance has been recognized. Besides several diseases of the lower animals three serious human maladies — malaria, yellow fever and elephantiasis — have been definitely traced to their agency, and they are suspected of others.

**Kinds and Characteristics.** Within the limits of North America nine genera and upward of 30 species are known to occur. Illustrations are here given of the three varieties which assume importance through their relations to the human race: the *Culex*, or gut-ter mosquito, the *Anopheles*, or swamp mosquito, and the *Stegomyia*, or cistern mosquito. *Culex puniens* prefers the gutter and may be likened to the sparrow among birds; it is noisy and numerous, and always hungry.

The male insect (Fig. 1) presents a rather bushy head-dress, by which it may be easily distinguished from the plainer but more dangerous female. Male mosquitoes are not blood-suckers, but vegetarians; for the reason that the male insect cannot pierce the skin and must, therefore, subsist on food more easily obtained.

The feeding organ of the mosquito, called the proboscis, is composed of seven parts (Fig. 2), which together form the organ by means of which the blood is reached and through which it is obtained.

In the male insect the stylet, or piercing instrument, is adherent to the neighboring parts and cannot move sufficiently to puncture the skin.

The female insect (Fig. 3) is plain as compared with the male. The palpi, those projections on either side of the central proboscis, are much shorter in the female; and the organs to the outer side, the antennae, are not as beautifully plumed. The female of the *Culex* is very annoying, but is not known to transmit disease in this country, though it is suspected of conveying dengue fever. In eastern tropical countries a species of the *Culex* is connected with the disease known as elephantiasis.

The *Anopheles* is the spotted-winged swamp mosquito, responsible for malaria in the human. A peculiarity of this mosquito is its long, thin legs, and the dark spots on the wings are characteristic. The same general difference in the head-dress of the sexes obtains, save that the palpi are about equally long in both, as may be seen by comparing the pictures (Figs. 4 and 5).
The *Stegomyia* is for the South by far the most important mosquito; not because it is most numerous, but because it is the natural conveyer of yellow fever. It has been called the tiger mosquito because of its striped appearance. It is a most beautifully marked mosquito and very dainty. It is essentially a domestic insect and is found only in inhabited localities. It is a day mosquito, and, resting on a dark background, such as a black coat or dress, presents a particularly striking appearance, the white bands on the legs and the peculiar marking of the back easily distinguishing it from any other (Figs. 6 and 6a).

The antennæ of all male mosquitoes are more hairy than those of the female. Some of these hairs respond to sound by a vibratory motion; they are, therefore, auditory. These are the ears of the insect and it is believed that the male flies to the female guided by her song, adjusting the direction of his flight by turning his head until both antennæ are equally af-

fected, when the object of his search is directly in front. The song of the insect is not produced solely by the buzzing of its wings, but also by the vibration of a peculiarly constructed chitinous process situated near the breathing apertures along the sides of the insect and set in motion by respiration. This is the famous yellow fever mosquito, which has been the greatest and most persistent enemy the South has ever had, costing many thousands of lives and many millions of dollars, but which is at last, happily, conquered, if we but use the weapons that have been put in our hands by the patient searchers for truth in the field of science.

Mosquitoes cling to surfaces as a cat clings to the bark of a tree. A mosquito cannot rest on a perfectly smooth perpendicular surface; a
fly can. A fly’s foot is a sucker; a mosquito’s foot is a claw (Fig. 7). Mosquitoes resting upon window panes would seem to deny this, but a window pane, very shortly after a thorough cleaning, may collect enough moisture and dust to form a film over the glass sufficient, though invisible, to afford a firm hold for the insect.

The resting position of *Anopheles* is peculiar in that the head, body and tail present a straight line, at an angle with the resting surface, while in the *Culex* and *Stegomyia* the body is bent as you observe in Fig. 8.

The eggs of *C. pungens* (Fig. 9), the gutter mosquito, are cone-shaped and float on end, being glued together in large masses to maintain this position in the water. The number deposited by a single mosquito varies from 50 to 400, and they hatch in from one to three days, varying according to temperature and environment. When a sufficient time has elapsed to complete the hatching process, the larva (Fig. 10) or wiggle tail issues from the shell and begins to feed on the vegetable and animal matter contained in the water.

In its growth the larva sheds its skin several times before the pupal stage is reached—in from 7 to 10 days. Mosquito wigglers get along apparently without air, when the surface of the water is covered with ice, and it is possible that they get air then, in the same way that fish do. This would account for their not being destroyed by surface freezing of the water. Entomologists must decide whether or not the larva have gills or some organ analogous to the gills of the fish. The wigglers of some mosquitoes may be frozen in ice and hibernate until liberated by warmer weather.

The pupal stage in mosquito life corresponds to that of the chrysalis in the transition of a caterpillar into a butterfly (Fig. 11). The pupa does not feed. In about two days it becomes an imago, which is the technical name for the completed insect whose life begins with the ovum or egg.

The shell of the pupa breaks at its highest point and the completed mosquito issues, being supported by the floating shell until its wings spread for flight (Fig. 12). The kind of mosquito that issues from the shell of the pupa depends of course on the kind of egg which has been deposited and hatched in the water.

The life cycle of *Culex*, the gutter mosquito, is from 10 to 15 days. Do not mistake the life cycle for the length of life; mosquitoes may live as adult insects for many months, and some females must hibernate through the winter to furnish eggs for the next summer’s supply.

Eggs of *Anopheles* (Fig. 13), the swamp mosquito, are boat-shaped and float singly on the surface of stagnant pools. They are deposited in numbers between 40 and 100. The bottom of the floating egg is marked somewhat like mosquito netting, the pattern being raised.

From the top of the egg is smooth, black in color and partly covered by a transparent membrane which stands out from the surface of the top and sides, permitting intervening spaces of air, which float the egg like a lifeboat. The egg hatches in from three to four days.

The larva of *Anopheles* (Fig. 14) may be readily distinguished by its position at the surface of the water, as well as by its general appearance, differing from that of either *Culex* or *Stegomyia*. You will observe that the neck of the *Anopheles* larva is very slender, and that the head is turned upon the body. This is because the *Anopheles* larva finds its food on the surface and gathers it by the constant motion of little broom-like processes projecting from the sides of the mouth, and furnished for this purpose.
The breathing tube, you will observe, projects from the back or upper surface of the larva, near the tail end. To get its mouth to the surface while maintaining its position for breathing, requires that the head should be turned half round on the body, an impossible position to any but the thin-necked *Anopheles* larva.

The larva becomes a pupa (Fig. 15) in about 12 days. In about five more days the pupa is a full-grown mosquito.

Eggs of *Stegomyia* (Fig. 16), the yellow fever mosquito, float singly upon the surface of the water and are deposited in numbers varying from 5 to 75. They hatch in from 10 hours to 3 days, according to climate and other conditions. The shell is marked like mosquito netting, the white pattern being raised and somewhat similar to that of the *Anopheles* egg, and on the sides are air-chambers which float it. The larva (Fig. 17) is very similar in appearance to that of the *Culex*, and its position in the water is also similar to *Culex* and unlike *Anopheles*.

In about six days the pupa (Fig. 18) develops and in a day or two the mosquito begins its flight.

The larvae of all mosquitoes have a breathing-tube near the end of the tail and the pupae have a pair of breathing-tubes projecting from the body near the head.

The insect, both in the larval and the pupal stage, requires air, to obtain which the breathing-tubes at frequent intervals protrude from the water surface into the air above.

The life cycle of the different mosquitoes varies, as to duration of the formative periods, according to conditions favoring rapid development; and no hard and fast rules can be laid down as absolute in this regard. It may be said, however, that the common mosquito breeds, approximately, in one week, the gasterotrophic mosquito in two weeks and the swamp mosquito in three weeks.

Observe how both the larvae and the pupae rise to the surface to breathe. This necessity suggested that they could be destroyed by pouring oil on the water surfaces so as to cut off the air. It is estimated that about two tablespoonsful of ordinary kerosene will spread and film the water surface of an average cistern, and the oil will positively not affect the taste or healthfulness of drinking water. The placing of oil upon drinking-water for the destruction of mosquitoes is not a new idea, for it was suggested as early as 1812 and has been practised for many years.

**How Mosquitoes Transmit Disease.**

*Mosquitoes and Malaria.*—Malaria is one of the greatest scourges to which man is subject. Its cause is fully established to be a minute unicellular animal parasite or haemosporidium of the class *Sporozoa* (q.v.), living within the red blood-corpuscles and introduced by the bite of a mosquito. Each well-marked variety of malaria has its especial causal parasite, which passes through a complicated life-cycle. (See *Malaria*.) The parasites enter the blood of the mosquito as minute slender sporozoites. When mature the sporozoites are freed into the body-cavity by the rupture of the wall of the sporocyst, when they migrate to the salivary glands, penetrate their walls and reach the proboscis through the salivary duct. When a mosquito harboring the parasites in this stage bites a susceptible human being, some of the spores pass into the blood with the saliva and induce an attack of malaria, mild or severe according to their number and other conditions. The malarial organism once introduced into the human system may continue to multiply indefinitely by the asexual method unless destroyed by drugs or some reaction of the organism, but that it can be transferred naturally to another person only through the intermediary of a mosquito and the intervention of the sexual generation. Properly speaking, man is the intermediate, the mosquito the final or definitive host, though the latter appears to suffer no ill consequences from the presence of the parasite. In pernicious tropical malaria, or seasonal-autumnal fever, the period for the complete development of the characteristic sporozoites (*Laverania malariae*) in the mosquito is seven or eight days, but owing to the vast number of parasites of different broods present in the blood and their overlapping stages of development the exact time of schizogony is doubtful. Tertian and quartan fevers, the two best differentiated types of mild or benign malarial fevers, are caused by related parasites, known respectively as *Plasmodium vivax* and *P. malariae*, which differ from *Laverania* chiefly in the replacement of the crescent stage by an immediately spherical gametocyte. Asexual sporulation recurs in the first form at intervals of 48 hours, and in the latter of 72 hours, corresponding with the rhythm of the fever's paroxysms. Daily or other intermediate recurrences are due to double or triple infections, in which the different broods sporulate on alternate days or in other combinations.

It was not until 1880 that Laveran, a surgeon in the French army, discovered the amœbula in the blood of malarial patients in Algiers; the development of the sexual generation in the mosquito and its relation to Laveran's parasite were traced by Ross in 1897-98, while in the Italian zoologist Rosati is due the first clear demonstration of the effectiveness of preventive measures directed at the mosquito.
Our scientific knowledge of the subject was almost entirely created within the five years subsequent to 1898, and workers in many countries have added details. That several species of Anopheles, and especially A. maculipennis, are the chief, and so far as known the sole disseminators of all types of malarial fever, is absolutely and thoroughly demonstrated and every stand point.

Mosquitoes and Yellow Fever.— In the case of yellow fever our knowledge is in a very different and less satisfactory state. The relation of mosquitoes to this disease was suspected by Dr. Finley as early as 1881, but his theory excited little interest until, upon the occupation of Cuba by the American navy, a Yellow Fever Commission of inquiry, headed by Major Reed, was appointed. By a series of very careful experiments it has been established that mosquitoes are agents in the dispersal of this disease, and at the same time the old view of infection by contact and the old practice of isolation and fumigation for prevention have been nearly repudiated. The particular species of mosquito which transmits yellow fever is St. gemini, an especially active biter in the early afternoon, which is found in the tropical parts of both hemispheres, and in America as far north as Virginia.

The germs of the disease may be taken by the mosquito only during the first three or four days of the fever; after that time the blood of the patient cannot infect the mosquito. The germs require about 12 days to migrate from the stomach of the insect to the salivary glands, from which they may be injected through the mosquito’s biting organ into the human blood stream. Mosquitoes, after becoming infectious, are capable of inoculating the disease into the human at intervals of three days (period of feeding) for practically an indefinite time.

The adaptation of protective measures to this important discovery renders the prevention or suppression of an epidemic very simple, theoretically. Screening the patient from mosquitoes during the first four days of fever (before the diagnosis), or killing all mosquitoes in the room in beta, an especially active biter in the early afternoon, which is found in the tropical parts of both hemispheres, and in America as far north as Virginia.

Mosquitoes and Yellow Fever.—In the case of yellow fever our knowledge is in a very different and less satisfactory state. The relation of mosquitoes to this disease was suspected by Dr. Finley as early as 1881, but his theory excited little interest until, upon the occupation of Cuba by the American navy, a Yellow Fever Commission of inquiry, headed by Major Reed, was appointed. By a series of very careful experiments it has been established that mosquitoes are agents in the dispersal of this disease, and at the same time the old view of infection by contact and the old practice of isolation and fumigation for prevention have been nearly repudiated. The particular species of mosquito which transmits yellow fever is St. gemini, an especially active biter in the early afternoon, which is found in the tropical parts of both hemispheres, and in America as far north as Virginia.

The germs of the disease may be taken by the mosquito only during the first three or four days of the fever; after that time the blood of the patient cannot infect the mosquito. The germs require about 12 days to migrate from the stomach of the insect to the salivary glands, from which they may be injected through the mosquito’s biting organ into the human blood stream. Mosquitoes, after becoming infectious, are capable of inoculating the disease into the human at intervals of three days (period of feeding) for practically an indefinite time.

The adaptation of protective measures to this important discovery renders the prevention or suppression of an epidemic very simple, theoretically. Screening the patient from mosquitoes during the first four days of fever (before the diagnosis), or killing all mosquitoes in the room in beta, an especially active biter in the early afternoon, which is found in the tropical parts of both hemispheres, and in America as far north as Virginia.

Agency in Other Diseases.—Elephantiasis or filariasis, like malaria, results from the presence in the blood of an animal parasite, but one of a very different nature. The adult males and females of the Filaria, which is a slender nematode worm, live together in the subcutaneous lymph vessels and produce enormous numbers of living, minute embryos which swim in the blood, usually passing into the superficial capillaries at night and retreating to the deeper vessels by day. This peculiarity first led Manson to suspect the mosquito as a means of distribution and as a result of his studies and those of Bancroft and others on the Filaria of man and the dog, it is now known that when infected blood is swallowed by Culex fatigans and other mosquitoes the embryos pass through certain stages of development within the intestine and malpighian tubules and then migrate through the body-cavity and windpipe of the host, from which human infection occurs. About three weeks are required to complete the development within the mosquito, and a year before the worms become sexually mature in the final host. Elephantiasis is a dreadful and prevalent disease in tropical countries, and is frequent in the Southern States, but rare in temperate latitudes.

The mosquito is suspected of being instrumental in the spread of leprosy and other diseases, and undoubtedly many important discoveries await the investigator in this field.

Restraining Local Pests of Mosquitoes.—The possibility of the control or complete extermination of mosquitoes has received serious attention from zoologists, physicians and sanitary engineers, and is encouraged by local and national governmental grants. Wherever the problems have been carefully considered, as in New Jersey, Long Island, the Connecticut coast and Winchester, Va., in this country, much has been already accomplished toward the mitigation of the pest. As to measures, the complete destruction of all breeding-places by the draining of swamps, pools and ditches is the most effective and permanent. This must be supplemented by emptying or suitably protecting by screening against the access of gravid mosquitoes all artificial vessels, such as pails, rain barrels, cisterns, troughs, and ditches, that contain standing water in which mosquitoes may breed. A most effective and simple measure for local application is to pour a small quantity of kerosene upon the surface of the water of possible breeding-places. This spreads as a delicate film which deters the larve and pupae from coming to the surface to breathe, so that they quickly suffocate, and at the same time kills or drives off females which come to lay their eggs. The application should be repeated at intervals of two or three weeks. Small fishes and the other natural enemies named above may be introduced into breeding-places to good purpose. The usual methods of ridding houses of mosquitoes by fumigation with sulphur dioxide gas; of preventing their entrance by thorough screening; and of protecting the person by the application to the skin of oil of citronella and other substances have a certain protective value. The most approved application is a mixture of one ounce of each of oil of citronella, camphor and oil of cedver. This effect will last longer if incorporated with vaseline. It has been shown by the experiments of Grassi and others that this method alone is sufficient to grant immunity from malaria to inhabitants even of such fever-scorched districts as the Campagna of Rome. For the medical treatment of malaria we have a powerful specific in quinine, which is most effective at the time of the paroxysms, when the sporules are free in the blood-plasma and most susceptible to the action of the drug. See MALARIA.

MOSQUITO BEE—MOSSES

Calif. Agricultural Experiment Station Bulletin 178 (Sacramento, 1906); Connecticut Agricultural Experiment Station Bulletin 173 (New Haven, 1917); New Jersey Agricultural Experiment Station Bulletin 276 (New Brunswick, N. J., 1915).

MOSQUITO BEE, one of the small, gregarious, stingless honey-bees of the genera _Aryglossa_ and _Melipona_, which make very large combs of bitterish honey in the tropical forests. Their stings are blunted and are never used as a weapon. Ordinarily they place these deposits in hollow trees, but sometimes suspend them from branches, protected from enemies in various ways.

MOSQUITO BLIGHT, a disease of Oriental tea-plants resulting from the attacks of great numbers of plant-bugs of the family _Capsida_. They breed upon the plant and young and old suck its juices.

MOSQUITO COAST, or MOSQUITIA, Central America, an extensive region on the Caribbean Sea, still unexplored, forming the eastern seaboard of Nicaragua; area, 26,000 square miles. It is inhabited by Mosquito Indians. For a considerable period it was governed, under British protection, by a native chief, until in 1856 it was made over to Nicaragua (See CLAYTON-BULWER TREATY). In 1894 it was incorporated with Nicaragua and is now known as the department of Zelaya. Capital, Bluefields.

MOSQUITO FLEET, in the navy, a term given to what is known as "the second line of defense," which is used in protecting the fortifications and harbors along the coast line, and, like the insect for which it is named, annoys the enemy in every way, at the same time preventing the possibility of a blockade. A fleet of this kind was organized during the Spanish-American War in 1898, and was composed of all kinds and kinds of ships to the number of about 130.

MOSQUITO LAGOON, Fla., a salt water lagoon on the east coast 30 miles long by one mile wide, separated by a sandy strip of land, half a mile to five miles wide, from the ocean, and connecting with the latter by Mosquito Inlet and half a mile navigable for boats of very shallow draught. It connects also on the north with Halifax River and on the south with Indian River. Fish and oysters are plentiful in its shallow waters, but mangrove swamps, sand and coral banks obstruct navigation even by the smallest boats.

Moss, Frank, American lawyer; b. Cold Spring, N. Y., 16 March 1860. He was educated in the public schools and in the College of the City of New York. In 1897 he was president of the board of police in New York and was counsel to the "Lewey Investigating Committee." In 1899 he was leading counsel for the "Mazet Investigating Committee," has since been connected with the Society for the Prevention of Crime and is professor of medical jurisprudence in the New York College and Free School for Women. As assistant district attorney of New York he was associated with the prosecution of Lieut. Charles Becker for the murder of Herman Rosenthal. He is the author of "The American Metropolis" (3 vols., 1897).

Moss, Lemuel, American Baptist clergyman; b. Owen County, Ky., 27 Dec. 1829; d. New York, 12 July 1904. He was graduated from the University of Rochester in 1858 and became pastor of the First Baptist Church of Worcester, Mass., in 1860, and thereafter held professional and editorial posts. He was president of the University of Chicago in 1873 and of the University of Indiana in 1875-84. He was president of the American Baptist Historical Society in 1895-1900. He published "Annals of United States Christian Commission" (1866); "A Day with Paul," etc.

MOSS-ANIMALS, or BRYOZOA. See POLYZOA.

MOSS-BUNKER, a common name about New York for the menhaden (q.v.). It is one of many forms of the Dutch name "marsbanker" for the scad, ignorantly applied by the early Hollanders, and has been misspelled and mispronounced in a great variety of ways. A detailed account of this matter will be found in Goede's "Fishery Industries of the United States" (Sec. 1, 1884) as a part of the history of the menhaden.

MOSS-PINK. See PINKS.

MOSS SIDE, England, town in Lancashire, near Manchester, of which it really forms a part. It has a great cotton-goods industry. Among its public works are the Saint Edmund's Gothic Church (1882), a free library, slaughterhouses, etc., and the tramways are owned by the city, while gas, electric light and waterworks are the property of a Manchester corporation. In 1911 there was a population of 33,100.

MOSS TROOPERS, in English history, bands of marauders infesting the districts which divided the English and Scottish territories before the union in 1707. They were rarely heard of after that year. The name was derived from the character of the country over which they conducted their nefarious operations.

MOSSAMEDES, mós-sá́má-dész, Africa, capital of the most southerly district of Portuguese West Africa, situated on a small bay, in a rainless, sandy, desolate neighborhood, but with healthy climate and palm-lined streets. It has a government building and does an increasing trade with Portugal, having connection by a steamship line with Oporto. It has a population of less than 5,000, nearly half white men.

MOSSES (Musci), a class of cryptogamous plants, forming with the liverworts (Hepaticae) the group Musci or Bryophyta. The only plants likely to be wrongly called mosses are the foliose liverworts, and these are readily distinguished by their two-ranked nerveless leaves, their four-valved capsule and certain other characters. A germinating moss spore gives rise to a filamentous body called a protonema, from which buds arise and develop into the leafy shoots which constitute the true moss-plants. After a time the reproductive bodies are formed at the tips of certain shoots. The anthidia, or male reproductive organs, are club-shaped and contain cells which afterward develop into the antherozoids. These antherozoids, when liberated from the antheridium, move about until they come in contact
with an archegonium, or female reproductive body. The fertilized archegonium is then carried upward on a slender filament or seta, and now forms the fruit or capsule, usually closed by a lid or operculum, and often covered by a hood called a calyptra. When the capsule opens and liberates the spores, which by germination begin the life-history again. Mosses may also reproduce themselves asexually by the formation of buds or gemmae. There are no true roots in mosses and the leaves are of sterile origin, and not true leaves; new shoots are continually springing from old shoots, so that in bogs the top remains growing while the underlayers die and the deeper ones slowly change into peat. Some 5,000 species of mosses are known, of which about nine-tenths belong to the order Bryaceae. This order comprises the two suborders, Cleistocarpaceae, with an indehiscent capsule, including the genera Phascum, Ephe- merum, etc., and Stegocarpaceae, in which the capsule opens by a lid. The stegocarpous mosses, again, may have the capsule either terminal (Acrocarpa) or lateral (Pleurocarpa), the former group including, among others, the genera Grimmia, Fissidens, Polytichium, Orthotrichum, Dicranum, Mnium, Bryum and Fun- naria, Hyanium, Lebkea and Climacium. There are three other orders of mosses, namely, Sphagnacea, or Bog-mosses, with only one genus, Sphagnum; Andreaeaceae, with the single genus Andreaea, and Archididesae, with the genus Archidium. Mosses are of little or no economic value, but they form an important part of the natural covering of rocks and serve to prepare the way for higher forms of plants. Consult Campbell, 'Mosses and Ferns' (New York 1895); Grout, A. J., 'Mosses with a Hand-Lens' (2d ed., New York 1905); Hale, E. H., 'Flowerless Plants' (New York 1909); Strasburger, 'Textbook of Botany' (1903).

MOSES FROM AN OLD MANSE, title of Nathaniel Hawthorne's second collection of tales (1846). The Old Manse, Hawthorne's Concord home, is described in the opening chapter of the book. The remaining contents include many of Hawthorne's most famous short sketches, such as 'The Birth-Mark,' 'Roger Malvin's Burial,' and 'The Artist of the Beautiful.' These bear witness to his love of the mysterious and the unusual; and their action passes in a world of unreality, which the genius of the author makes more visible than the world of sense.

MOSSLEY, England, town in Lancashire, located on the Tame and the Huddersfield Canal. It contains great woolen factories and foundries and has among its public buildings a modern Gothic church, handsome town-hall in a park, besides markets, gasworks, etc. Its population in 1911 was 13,205.

MOST, mōst, Johann Joseph, German-American anarchist; b. Augsburg, Bavaria, 9 Feb. 1846; d. Cincinnati, Ohio, 17 March 1906. He learned bookbinding and traveled on the Continent in the pursuit of his trade. Later he was editor of the Freie Presse at Berlin and in 1874-78 member for Chemnitz in the Reichstag. His success was immediate and striking and he made frequent concert tours. He has resided chiefly in Berlin and Paris. He is a talented composer; his opera 'Boabdil' was produced at Berlin in 1871. He was arrested and sentenced to 18 months' imprisonment for printing an article approving of the assassination of the Emperor Alexander II, and upon his release came to the United States. He continued Die Freiheit in New York. In 1901 he was arrested for a seditious editorial and his journal after the assassination of President McKinley was sentenced to a year's imprisonment, commencing June 1902. He published several anarchistical writings, such as 'Why I Am a Communist' (1890) and "Down With the Anarchists" (1901).

MOSTAGANEM, mōst'ā-gə-nəm', Algeria, capital of the arrondissement in the province of Oran, located on the Bay of Arzew. It has a branch of the Oran-Algiers Railway and is connected also with the military station Tiaret. It is situated on a steep cliff 280 feet above the Mediterranean Sea and has a deep-water harbor into which steamers enter. The Ain Sabra River feeds water power here to flour mills, and it does considerable export to Europe in olive, wine, wool, cattle, grain, figs, etc. It is situated on the ruins of an important city of the old Roman period and was flourishing in the 16th century under the Berbers, but lost its prestige till the French in 1833 captured the site and built up its industries. In 1911 it had 21,619 inhabitants in the commune.

MOSTAR, mōst'ār, Bosnia, former capital of Herzegovina, now belonging to the circuit of Mostar. It is a station on the Bosnian Sarajevo-Mostar-Metaković State Railway and is picturesquely situated along the cliffs from Podvelez and Ham in the narrow valley of the Narenta. The latter is spanned by an imposing, single-arched, stone bridge. The town is built of stone and was formerly strongly fortified with its star-batteries and walls. It has 25 mosques, two Oriental-Greek and one Roman Catholic church, besides a convent of the Sisters of Mercy. Its industries consist of arms, leather and tobacco factories and wine culture. There are several Catholic and orthodox schools, a trade school, high gymnasium, fruit and wine-culture schools, etc. It is the see of a Catholic and a Greek bishop. Its population in 1910 was 16,369.

MOSUL, mō'sool, Asiatic Turkey, capital of a vilayet and sanjak of the same name, on the right bank of the Tigris, 220 miles northwest of Bagdad. A stone bridge continued by a bridge of boats crosses the river to the site of ancient Nineveh. The town is surrounded by decayed walls, and has houses of stone and brick, mosques, shrines, Christian churches, convents, etc. Formerly a place of much commercial importance, it has greatly declined, mainly owing to diversion of traffic due to the opening of the Suez Canal, but it still carries on some trade, especially in gill-nuts. Muslim is named from this town. Population about 80,000, mostly Mohammedans, but including about 7,000 Christians and 1,500 Jews. The vilayet has a population of 351,200.

MOSZKOWSKI, mōsh-kōf'skē, Moritz, Polish composer and pianist; b. Breslau, 23 Aug. 1834. At 19 he began to appear in public after studying at Dresden and Berlin. His first success was immediate and striking and he made frequent concert tours. He has resided chiefly in Berlin and Paris. He is a talented composer; his opera 'Boabdil' was presented at Berlin in
MOTA-PADILLA — MOTH

1892; his other works include a ballet, 'Laurin'; a symphonic poem, 'Jeanne d'Arc'; some 'Danses espagnoles' for the piano or violin; and the two orchestral series called 'Les Nations.'

MOTA-PADILLA, mō'tā pá-de'lyā, Matías de la, Mexican historian: b. Guadalajara, Mexico, 1668; d. 1766. He was a lawyer, and dying the latter part of his life a priest. He wrote, among other works, 'History of the Conquest of New Galicia' (1870-71).

MOTET, or MOTETT, a vocal composition in harmony, set to words generally selected from sacred writings. Like the madrigal, the motet was at first set to words of a profane character, and there are ecclesiastical decrees extant forbidding its use in church.

MOTH, any insect of the order Lepidoptera not included among the butterflies (q.v.). Moths have antennae of many forms, and on account of this variability are often grouped in a section Heterocera, but their antennae are rarely swollen at the tips or 'clubbed' and never in the North American forms. They are farther distinguished from butterflies by their wings being horizontal when at rest, and by their being seldom seen on the wing except in the evening or at night, although certain species of moth fly in the brightest sunshine, and some butterflies appear at twilight. In most cases there is a peculiar arrangement of interlocking spines (frenulum and retinaculum) by which the hind wings are kept in contact with the front wings during flight. The pupae are never angular; they are mostly smooth and dark-colored; and are often enclosed in a cocoon, which the larva spins before it passes into the pupal stage. Moths are in general larger than butterflies and more hairy or downy in character. A Brazilian giant measures nearly a foot from tip to tip, and there is a gilded species smaller than a pin's head. Similarly they present as great a variety of outlines and as much beauty (with less gaudiness) as do the butterflies; and they interest the philosophical naturalist by the extraordinary adaptations to conditions which have come about in the development of the race. Some of the most extraordinary examples of sexual of protective coloration (q.v.) and resemblance, of mimicry (q.v.) and of curious armaments, are to be found among these creatures, whose small size, weakness and edibility, especially when in the larval condition, render essential means of concealment and of passive defense. Nevertheless caterpillars of moths, as well as of butterflies, furnish a large part of the food of birds and of various other insect-eating animals; and in the adult state they are seized by night-flying birds, by lizards, monkeys, turtles, and by some predatory insects and spiders. The eggs of moths are laid upon the proper foodplant of the species, and are various in form, ranging from that of a sphere or a cylinder to the discus, often with the surface beautifully sculptured or ornamented. Each has a micro-pyle or lidded opening from which the larva escapes. They are laid by most species of temperate regions in the early summer, and the life-cycle of the insect is completed before the end of the season; but some moths oviposit in the autumn, when their eggs remain quiescent through the winter, or, in some cases, hatch in time for the larva to partly grow, then hibernate and complete their development the following spring.

The larve or caterpillars of moths, like those of butterflies, hatch as very minute objects, but rapidly grow, shedding their skins (see MOTET) at intervals to permit of enlargement, until some attain a length of six or seven inches. Most moth-larve molt five times, but some oftener and a few less times.

The larval condition is the insect's period of feeding and growth, some species taking no food whatever in adult life. The vast majority feed upon green vegetable food, leaves most of all; and among the worst foes of our parks, orchards and gardens, attacking cultivated plants in a great variety of ways. "A few larve," remarks Holland; "feed upon woody tissues, and bore long galleries under the bark or in the wood of trees." (See MOTH, LEOPARD; MOTH, BROWN-TAIL; MOTH, GYPSY.) Others feed upon the pith of herbaceous plants. A number of species feed upon the inside of growing furs. Only a very few are known to be carnivorous. The household moths (Tineola) are well known on account of the injury they work among clothes, carpets, furs, etc. Other species attack grain, meal, flour, hay, herbs, drugs, and a variety of stored products; other bored into timber, or damage human property in some other way. Some recompense is obtained, however, from the silkworms (q.v.), the moths whose cocoons furnish silk.

There is a considerable variety in the form of the caterpillars of moths, but most are worm-like, and the structure and appendages resemble those of butterfly caterpillars (q.v.). The great majority possess besides the six-minute thoracic legs the usual four pairs of "prolegs" or false feet, in the middle of the body, and a fifth pair on the hindmost (13th) segment (somite) of the body, which in reality are clasping organs needed for clinging to twigs in the process of molting. In some (numerous species) of these prolegs are reduced in number, and in the geometrids they are placed in only two pairs on the 9th and 13th segments, and these larve can progress only by looping the body upward (see MEASURING-WORMS). Other variations of this feature exist, as the sucker-like pads of the Megalopygidae and Callidiidae.

"The bodies of the larve of moths," to quote Holland, "are covered with tubercles, the location and arrangement of which have in recent years received considerable attention from students, and are thought to furnish a clue to the lines of descent of certain families. These tubercles sometimes carry only a single hair, in other cases they carry large tufts of hairs; they may be small and inconspicuous, or they may be developed until they assume the form of great spines, horns, or bulbous masses."

"Some moth caterpillars exhibit bright and beautiful colors, and move about fearlessly, protected by thorny projections, or nauseous exudations, or by hairs which possess severe stinging properties. Others present striking examples of protective resemblance and mimicry, in color or form or attitudes, or all three respects. While many are solitary in their habits
1 Pepper Moth, with larva and pupa
2 Red Underwing, with caterpillar
3 Pine Moths, with caterpillar
4 Group of Geometrid Moths
5 Currant-worm Moth (Abrasa)
6 Gipsy-moth, illustrating development
7 Black Arches Moth, in various stages
others are gregarious, forming "armies" and "processions" during their feeding life which disperse when the time for pupation arrives.

Many moth-larvae enter the ground and surround themselves with an earthen cell in which to pupate; they are simply stumps soon very under use. Others spin cocoons in great variety, usually formed more or less of silk, and well protected against both the weather and enemies. Some are hidden away under leaves, beneath loose bark, in the crevices of rocks or old stumps or fastened to the branches of trees. As a rule the cocoons are whitish or brown in color, never ornamented with the bright silvery or golden spots characteristic of the chrysalids of many butterflies. Escape from the tough silken kind of branch is aided by copious saliva which dissolves or cuts the silk, so that the newly-born insect may wriggle out.

The anatomy of the moths is substantially the same as that of butterflies, but in these heterocercous families the head is not so prominent; the proboscis is often large and better, as would be expected of insects mainly crepuscular in their habits; and some have the suctorial apparatus in high perfection, so that many of the hawk-moths and noctuids can poise upon whirring wings, and inserting the long proboscis soon very under use. "They are simply animals with elongated reserves of reproductive energy, and, when the sexual functions have been completed, they die."

The antennae of moths assume a great variety of forms. They may be simple or thread-like, funiform, spicate or like broad feathers; and those of the males frequently differ from those of the females. In an attempt at classification various subdivisions have been proposed, but lepidopterists no longer make artificial groupings of the families, whose inner relations seem very under use. Most of the families, of which about 50 are recognized by modern systematists, are represented in America, but several families are confined to the Oriental regions, and a few are exclusively African. The criteria principally used in separating families are found in the characters and arrangement of tubercles, and in the structure of the wings. The lowest are the very small moths called Micropterygidae, with bronzey golden wings, whose larvae show striking affinities with the caddis flies, and feed in damp moss. The large yellowish-brown "swift" moths (Hepialidae) come next, whose larvae and incomplete pupae live underground and feed on roots; followed by the Zygaenidae or burnet moths, which are small day-flying insects accommodating bright orange or red larvae feed open on various plants, and spin elongated cocoons. The tropical Chalcisidae and Limacodidae are allied to them; also the large, day-flying, brilliant tropical cattanids, which have clubbed antennae like butterflies. The small family Megalopygidae of hairy caterpillars live in portable cases made of sticks, grass, etc., and are called "basket worms" (q.v.). The Cosidae are large moths, unable to feed, most numerous in the tropics and exemplified in Europe by the well-known gnat and leek moth (q.v.). The two species are North American; and the Sesidae are the clearwings (q.v.), resembling wasps. In the Tortricidae is found a very large assemblage of small species known as leaf-rollers (q.v.), plentiful in the United States and embracing many pests, as the codling moth, etc. Another immense family of evil repute is the Tineidae, represented by the clothes-moth, flour-moths (q.v.) and the like, which damage woolen goods, furs and stored products of every kind, as well as feed upon plants, some of them performing an essential work in cross-fertilization, conspicuously the yucca-moths (q.v.); there are thousands of species. The plumemoths (q.v.) come next, followed by a series of families having obtuse pupae, which never emerge from the cocoon until the final moth. Among these are the Pyralidae, a huge and varied family, having nearly 800 beautifully marked species in the United States alone, and largely destructive to cultivated plants. Representatives are the grape-leaf-folder, print-moth, sugar-beet moth, clover wither, grass-moths, corn-stalk borer, bee-moth, leaf-crumplers, dried-currant moth and others, many of which are elsewhere described in this work. The egger-moths, tussock-moths (q.v.) and some minor families are nearly related to the pyralids. The gaily colored tiger-moths (q.v.) carry the list to the owlet-moths (q.v.), which belong to the cosmopolitan nocturnal group Notodontidae, and these are followed by several families, chiefly belonging to the Old World. Then come the Sphinxidae (see Death's Head and Hawk-moth), familiar all over the world; and the great assemblage of small, plainly but exquisitely colored geometrids (see Measuring-worm). Closely related are the tropical Uranidae, which contain large and magnificent green and gold tropical moths, common to the forests of Brazil and the East Indies. Many of these, as of the Oriental family Epicopidae, are "tailed" and simulate the papilionid butterflies in many ways. Next to these are placed the silk-worm moths (Bombycidae), several families of large tropical moths, leading up to the great Saturnians (Saturniidae), scattered over most of the warmer parts of the world; among them is the great Attacus atlas of India, the largest of all Lepidoptera, and many of the largest and most notable American cocoon-making species, such as the Allanthus silk-moth, the Cecropia, Polyphemus, Luna and several others well known and elsewhere described.

Bibliography.—The literature relating to moths is very extensive. The most complete and scientific account of the subject, though not sufficiently full accounts of structure; and Carpenter's 'Insects and their Structure' (1899), and Sharp's 'Insects' (Vols. I and II, of Cambridge Natural History) (1895-99), contains a résumé...
of general information and of modern views as to relationships, phylogeny, etc. A good reference book for the British species is Newman, L. W., and Leeds, H. F., 'Text-Book of British Butterflies and Moths' (Saint Albans 1913). The best general illustrated descriptive work on North American species is W. J. Holland's 'The Moth Book' (New York 1903), which contains an extensive classified list of books relating to the whole subject, including the splendid monograph of American families by Packard, Grote, Smith, Beutenmueller, Hulst, Dyar and others. Among the more or less popular works treating of the moths are Dickerson, Mary C., 'Moths and Butterflies' (Boston 1901); Robertson-Miller, Eith, 'Butterfly and Moth Book' (New York 1912); Stratton-Porter, C., 'Moths of the Limberlost' (New York 1912).

**MOTH, Brown-tailed, a moth (Euproctis chrysorrhoea) of the family Lepidoptera, accidentally imported from Europe in 1890 or 1891, and nearly related to the gypsy and tussock moths. Its color is white, with the hinder end of the abdomen brown. The caterpillars defoliate trees and have done much damage throughout the greater part of New England, as well as become an annoyance by their flying hairs which irritate the skin; but the insect is not so much feared as is the gypsy moth. This moth lays in midsummer about 250 eggs underneath a leaf of a leaf, and covers them with its hairs. The larvae appear in early autumn and begin to eat the green substance of leaves, skeletonizing them; they also feed on apples and pears. In mid-autumn they form cases of bits of leaves, attach them to twigs by silken strands, pass the winter in them, complete their growth the following spring, feeding on foliage, flowers and fruit, and then pupate in June and emerge in midsummer. The larvae may be killed by arsenical sprays. Another mode of control is the destruction of their cocoons in the winter. They are easily transported with twigs or Christmas trees or nursery stock and these should always be inspected. See *Gyps Moth.* Consult any work on agricultural entomology.

**MOTH, Gypsy, or Gipsy. See *Gipsy-Moth.*

**MOTH, Leopard. See *Leopard Moth.*

**MOTHER ANN. See *Lee, Ann*; *Shakers.*

**MOTHER CAREY'S CHICKEN, any of several small oceanic petrels (q.v.); specifically, in the Mediterranean and Atlantic, the storm-petrel (Procellaria pelagica) often seen about ships, especially in wild weather, and looked upon with superstitious dread by sailors. Its manner of paddling along the surface of the waves suggested the name petrel, namely, little Peter (the Apostle), afterward transferred to the whole group; and the 'Mather Carey' is supposed to be a queer Anglicization of the Latin *Mater Cara* ('Dear Mother,' an appellation of the Virgin). These little petrels are about six inches long, sooty black, with white rump and a little white on the wings. They breed numerously on all northern coasts, as about Newfoundland, Labrador, North Greenland and the British Isles, wherever suitable places can be found, occupying holes in the face of earth banks, like bank-swallows, and rarely approaching or leaving their nests, each with a single white egg, except at night.

**MOTHER OF CITIES,** the euphemistic local title for Balkh (q.v.), central Asia.

**MOTHER GOOSE'S MELODIES,** the well-known collection of nursery rhymes. In 1860 a story was started to the effect that *Mother Goose* was a Boston woman; and she was identified as Elizabeth Goose, widow of Isaac Vosegrove, or Goose, and mother-in-law of Thomas Fleet, a Boston printer, who issued a collection of the *Melodies* in 1719. It is now conceded that *Mother Goose* belongs to French folklore and not to English tradition. Charles Perrault (q.v.), b. Paris, 1628, was the first person to collect, reduce to writing and publish the *Cortes de Ma Ster l'Oye,* or *Tales of Mother Goose,* though he did not originate the name; and there is no reason to think that *Mother Goose* was a term ever used in English literature until it was translated from the French equivalent, *Mère l'Oye.*

**MOTHER-OF-PEARL.** See *Pearl.*

**MOTHER OF PRESIDENTS,** in American history, a name given to Virginia because that State has given eight chief executives to the Union, namely: Washington, Jefferson, Madison, Monroe, Harrison, Taylor, Tyler and Wilson.

**MOTHER OF STATES,** in American history, a name given to Virginia, from the fact that out of the original colony of Virginia were formed the States of Kentucky, Ohio, Indiana, Illinois and West Virginia.

**MOTHERS' CLUBS,** organizations of women in various American cities designed to better the condition of the home and aiming to formulate improved methods for the moral training and education of children. They are active in promoting playgrounds, children's clubs, etc. An organization of these societies is the New York Mothers' Club. There is a New York State Federation of these societies which holds annual meetings.

**MOTHER'S DAY.** The honor of the originator of Mother's Day belongs to Miss Anna Jarvis of Philadelphia. Her mother died in 1906. On Sunday, 9 May 1907, she told a friend whom she had invited to remember with her the anniversary of the death of her mother of her desire to dedicate a day to all mothers. Before the next anniversary came she had interested many individuals and organizations in the observance of the second Sunday in May as Mother's Day. As a result of her efforts, Philadelphia observed the day, 10 May 1908. Miss Jarvis then became the missionary of the idea. She wrote thousands of letters to influential men in all walks of life. She interviewed many public men and pleaded for the observance of the day. Since 1912 the governor of Texas has observed the day by imposing a sentence of prisoners on that day. State after State has adopted its observance. In May 1913 Pennsylvania made it a State holiday. On 10 May 1913 a resolution passed the Senate and the House of Representatives to make the second Sunday in May a national holiday, "dedicated to the memory of the best mother in the world, your mother."
A. C. Parker & Company

MOTHER OF PRESIDENTS. in America, the State of Virginia is the mother of Presidents. It has produced nine Presidents of the United States: Washington, Jefferson, Madison, Monroe, Jackson, Van Buren, Fillmore, Pierce, and Buchanan.

MOTHER OF STATES, in America, the State of Virginia is also known as the mother of States. It was a leader in the formation of the United States and helped to shape the Constitution. It has produced ten Governors of the State of Virginia.

MOTHER OF MOTHERS, in America, the State of Virginia is also known as the mother of Mothers. It was a leader in the formation of Mothers' Clubs and helped to shape the lives of many women.

MOTHER OF THE West, in America, the State of Virginia is also known as the mother of the West. It was a leader in the development of the West and helped to shape the lives of many people.

MOTHER OF THE Nation, in America, the State of Virginia is also known as the mother of the Nation. It was a leader in the formation of the United States and helped to shape the Constitution.

MOTHER OF THE World, in America, the State of Virginia is also known as the mother of the World. It was a leader in the development of the West and helped to shape the lives of many people.

MOTHER OF THE Future, in America, the State of Virginia is also known as the mother of the Future. It was a leader in the formation of the United States and helped to shape the Constitution.

MOTHER OF THE Past, in America, the State of Virginia is also known as the mother of the Past. It was a leader in the development of the West and helped to shape the lives of many people.

MOTHER OF THE Present, in America, the State of Virginia is also known as the mother of the Present. It was a leader in the formation of the United States and helped to shape the Constitution.

MOTHER OF THE Future, in America, the State of Virginia is also known as the mother of the Future. It was a leader in the development of the West and helped to shape the lives of many people.
1. Gypsy Moth (Porthetria dispar), female: a, male; b, feeding caterpillar; c, pupa. 2. European Processionary Moth; a, feeding caterpillar. 3. Lackey Moth. 4. Tiger Moth and its “woolly bear” caterpillar. 5. Tussock Moth (Pseudisana monacha), female: a, male; b, eggs, young caterpillars and pupa. 6. Tussock Moth, on the under side of a piece of bark: c, feeding caterpillar. 7. Pine Moth (Gastropacha), female: a, feeding caterpillar and cocoon; b, eggs.
MOTION (from the Latin mo-TOtio and the verb move, to move). In legal practice it means an application made by one party in a cause, or his counsel, seeking a rule he considers necessary in the case or to obtain relief in summary manner from an injustice. This may be made in a written application or orally. In cases where the object of the motion may be granted on reques: and a hearing it is a motion of course, such as an ex parte application; if notice is required for other party it is a motion on notice. A motion made on matter of fact has to be supported by an affidavit that such facts are true. There are also motions for decree and for judgment, etc. See DECREE; JUDGMENT.

MOTION, in music, is a term used to express a change of pitch in successive sounds, when they are allotted to a single part or voice, or to groups of parts or voices which sound simultaneously. In a single part the motions are classified according to whether the successive steps do or do not exceed the limits of a degree of the scale at a time; in the former case it is called disjunct and in the latter conjunct motion. When more than one part is sounding together independent it constitutes counterpoint, in which cases, according to their relations, we get contrary, similar and oblique motions. Contrary motions have their parts converge or diverge, one rising as the other falls. Similar motions either rise or fall together; while the oblique defines one part only moving up or down, the other standing still.

MOTLEY, mōt'lē, John Lothrop, American historian: b. Dorchester, Mass., 15 April 1814; d. near Dorchester, England, 29 May 1877. His education was obtained at Harvard, from which he was graduated in 1831, and at the universities of Berlin and Göttingen, between which he divided two years (1832-33). His first published writings were contributions to Willis's American Monthly Magazine and "verses in the corner of a paper called the Anti-Masonic Mirror." His first book, the two-volume, semi-autobiographical "Mortimer's Hope" (1839), met with a generally unsatisfactory reception; and, according to Holmes, the North American Review "dropped a small-print extinguisher upon it." He went to Saint Petersburg in the autumn of 1841 as secretary to the American legation, but after a brief residence returned (1842). His first important attempt in history was a 50-page article, nominally a review but really a narrative, on Peter the Great, in the North American for October 1845. In book-form in the "Hast-Hour Library." His further literary work during this period includes notable essays on Balzac (July 1847) and the "Policy of the Puritans" (October 1849) in the North American; and a second effort of fiction, "Merry Mount" (1849), certainly an advance on the first, and rewarded by a meeting of notice in the North American, but clearly not a success. But so early as 1846 he had been gathering material for a history of Holland.

Having learned that Prescott, then at the height of his reputation, was busy upon the "History
MOTMOT—MOTOR AREAS

of Philip II, Motley had a conference with Prescott, who urged him to continue, even though the two works would unavoidably cover the same ground. For the year 1849 he was a member of the Massachusetts house of representatives; and he often humorously referred to his experience when an extensive and, as he fancied, incomparable event proved to him as chairman of the committee on education was triumphantly demolished by George S. Boutwell (q.v.), then a young representative from Groton. From 1851 until 1856, the year of the appearance of the 'Rise of the Dutch Republic,' he was in Europe, continuing his investigations at Berlin, Dresden, The Hague and Brussels. When, after 10 years' labor, the great work was at last ready for the press, it had to be published at the author's expense. It was received with almost universal praise by public and critics—Froude writing, "one of the earliest as well as one of the most important recognitions"—and definitely established Motley's fame. It was widely translated, Guizot superimposed upon it a German version and writing and introduction. Motley was in America in 1856–58, but then returned to Europe. In 1861 he wrote two letters, then of great timeliness and importance, to the London Times, setting forth to the English nation the structure of the United States government, the causes of the Civil War and the results involved. From 1861 until his resignation in 1867 he was United States Minister to Austria, and his official dispatches in this post were highly praised by the New York Times, his successor. He returned to the United States in 1868, in 1869 was appointed Minister to England by Grant, but in 1870 was suddenly recalled. This action by the government was never explained with any degree of satisfaction. The correspondence between Motley and Fish, Secretary of State, is to be found in a publication of the State Department (1871). It would appear that Holmes' verdict that Motley was greatly wronged is the correct one. Summer said: "How little Mr. Motley merited anything but respect from the secretary is attested by all who know his eminent position in London and the service he rendered to his country." Motley continued writing until 1873, and in 1875 paid a visit to the United States. His other famous works are the 'History of the United Netherlands, from the Death of William the Silent to the Twelve Years' Truce, 1609' (1860) and 'The Life and Death of John of Barneveld, Advocate of Holland: with a View of the Dutch Causes of the Thirty Years' War' (1874). They confirmed his rank as a great historian; some of the best Dutch critics thought the 'Barneveld' his chief publication. His style is precise and brilliant; his narratives are full of movement, his portraits vivid. Consult Holmes, O. W., 'John Lothrop Motley: A Memoir' (Boston 1898); Bassett, J. S., 'The Middle Group of American Historians' (New York 1916); Curtis, G. W. (ed.), 'Correspondence of John Lothrop Motley' (New York 1889); Mrs. S. St. J. Mildmay (Motley's daughter), 'John Lothrop Motley and his Family: Further Letters and Records' (New York 1910).

MOTMOT, a bird of the tropical American family Momotidae, allied to the kingfishers and todies, of which about 20 species are known, all in the genus Momotus. They inhabit the forests, as a rule, and are usually solitary in the daytime, nesting with the head drawn between the shoulders, solemn and still except for an occasional melancholy creak from the repetition of which they derive their name, originally French and pronounced mo-mo. They are most lively at early morning and in the dusk of evening, pursuing insects in short flights; they also eat fruits, lizards and snakes, which are tossed into the air from the point of the bill and swallowed; they sometimes devour the eggs of other birds. The nest is made in holes of trees or banks of earth. The motmots are birds of brilliant plumage, with one striking peculiarity. The two middle feathers of the long-tail are much prolonged and are always more or less denuded of vanes on both sides of the shaft except near the tip, giving a rafterlike shape to the feathers. This seems to be the result of a habit in the bird of gnawing its feathers, which begins as soon as their growth outgrows the other rectrices. The best-known species is the Brazilian motmot ('Momotus brasiliensis'), about the size of a blackbird, with wide, deep rich green color, with bluish forehead, violet back of head and black crown. One of the Mexican species ('Momotus cariniceps') occasionally crosses the line into the United States. Consult Belt, 'Naturalist in Brazil' (London 1888) and Zoologica (Vol. I, No. 5, New York 1910).

MOTOR, a machine for utilizing some power, as gas expansion or an electric current, to do useful work. The meaning of the word "motor" is similar to the commonest meaning of "engine," but the application of the words is different. We have become habituated to reserve the word engine for a steam-engine or large stationary gas-engine. The word motor came into common use with the commercial development of electricity. The makers of the first electric machine that was marketed for delivering power chose to call it an electric motor, and since then a reversed dynamo has always been a motor. Then came Daimler's perfecting of the "petrol" engine, for use on bicycles, which is now technically called an internal combustion engine, and a motor. The developments of this are the automobile motor, the aviation motor, Liberty motor, etc. Motor is now being used as a verb, as "to motor into town." It has become fixed in the language.

MOTOR AREAS, those portions of the brain in which are located the cells that govern the voluntary muscles of the body. The motor areas are confined more distinctly to the cortex or outer surface of the brain on either side of the fissure of Rolando, making up the areas known as the anterior central and posterior central convolutions. In these areas are numerous motor cells, the stimulating of which results in bodily motion. From these motor cells the impulse passes inward through the substance of the brain. The motor cells may be isolated from an adjoining surface area by excision, with no effect on the control of the specific motion. When these surface areas are removed or injured there follows an impaired function of the muscle corresponding to the cells or the fibres interfered with. The motor area in the right side of the brain controls the
MOTOR BOATS

voluntary muscles of the left side of the body and the right hand and leg are controlled by the left side of the brain. The tracts of fibres that come from one side pass the middle line at the lower level of the medulla, the decussation of the pyramids. The motor area itself is subdivided into irregular areas or centres as they are loosely called—an arm-centre, a leg-centre, etc. In these more or less clearly delimited areas the cells governing the voluntary muscles of a leg or an arm are grouped. In much the same manner the nerves of the muscles of the face and of the eyes, tongue, etc., have their locations of origin in certain portions of this general motor area. There is, however, no evident relation between the size of a cortical area and the size of the mass of muscle which is controlled thereby. Thus the cortical area for the face and head is much larger than for the leg area which controls the many times greater bulk of the leg muscles. Irritation of the motor area usually causes excessive muscular movements or convulsions and destruction results in loss of motor power or paralysis. The experiments from which these facts are drawn were performed upon rabbits, dogs and monkeys. Some few of them have been confirmed in the course of surgical practice upon human patients. (See Brain: Convulsions, Paralysis, Consult Howell, W. H., Text-Book of Physiology) (Philadelphia 1903).

MOTOR BOATS, power boats equipped with internal-combustion engines, as distinguished from boats propelled by steam power. They divide into several groups or types: (1) or sets of engines varying from 50 to 300 or more horse power.

The hulls are built in several styles—round-bottom, flat-bottom, V-bottom, tunnel-bottom, etc., and with widely varying types of bow and stern. Of the former, the prevailing types are the straight, round, dory, spoon and clipper bows; of the latter, the square, round, transom, fantail and torpedo sterns. A straight bow has the most elegant appearance, but a round bow rides better and is preferable. A transom or V-shaped stern makes the fastest and driest boat. Open boats of the launch class have a few feet of deck forward and aft, with a narrow strip along the gunwales, and a five or six-inch coaming around the cockpit. They are often fitted with a spray shield of canvas or a "buzzy-top" sun and rain shield. Larger boats are protected by an awning top carried on a frame overhead, or by a fixed "standing-roof" which is commonly fitted with side curtains of canvas, making a weather-tight enclosure, but dangerous in a high wind. Boats 25 to 30 (or more) feet in length usually have a cabin of some sort. This may be of the "raised deck" or "hunting cabin" type, inclosing the bow for several feet back, or a "glass cabin" inclosure toward the middle of the hull. The last is liable to make the boat top-heavy unless it has considerable width of beam.

At the Paris Exposition of 1889 there was exhibited a boat with a Daimler motor, this being among the first of the motor boats. As this form of motor was developed and improved for automobiles and aeroplanes, manuf...
and no change-gear for various speeds nor differentials are needed. The engine may be direct-connected to the propeller-shaft. Motors of two to six cylinders are in common use. In small boats the gasoline or fuel tank is placed forward to get it high enough to feed the carburettor by gravity. The exhaust is carried to a water-cooled muffler and thence outboard. The crank-shaft is run fore and aft and is coupled to the propeller shaft. The latter has thrust-bearings with steel balls to relieve the friction. The propellers are made with two or three blades and special forms of spiral blades are made for shallow and weedy water. Some 20-foot motor boats are made to run in one foot of water, the propeller being placed in a tunnel in the hull. Some propellers have adjustable blades, which can be positioned so as to rotate either right-hand or left-hand, though the driving is in one direction. This adjustment therefore enables one to reverse and backward motion. The more common method, however, is to have the propeller-shaft geared to the engine by a lever-operated reversing gear.

The familiar type of six-cylinder internal-combustion engine for motor boats is shown, in the diagram. The cylinders are cast in pairs and placed upright, as in an automobile, with the inlet pipes on one side and the exhaust on the other. The crank-shaft is casued in below. At one end is the fly-wheel, the reversing lever at the other. A 12-horse-power engine in a 30-foot boat may drive it 10 miles an hour or more; with 20-horse-power motors make 30 to 35 miles an hour, meaning in each case statute miles. Over considerable distances the speed shown is much less. For instance, in the Philadelphia-Havana 1,200-mile ocean race in 1910 the winner averaged less than eight miles an hour.

The small open boats employ mostly engines with one or two, and occasionally three cylinders. In these small engines the bore and stroke are about the same. In the larger engines, the stroke usually exceeds the bore by 20 to 30 per cent. The displacement speed boats commonly employ four-cylinder to eight-cylinder engines, while hydroplanes are built with four- to six-cylinder engines, up to 65 horse power or more. The large cruisers commonly install several motors tandem to get the desired horse power. In small boats the usual motor is of the two-cycle type; in the larger boats the four-cycle type is common, but by no means universal. The four-cycle motor is more economical of gasoline, and from a mechanical point of view is superior as a machine, but it is much more complex than the two-cycle motor, and is nearly twice the weight—

Diagram Illustrating the Principle of a Hydroplane Boat.

the two-cylinder two-cycle motor having the same effective power as the four-cylinder four-cycle motor. For the ordinary motor boat no engine is better than the three-cylinder two-cycle motor. It runs with a minimum of vibration, and is of less dead weight for the power developed than any other. The ignition system is another fundamental feature upon which the motor boat operators and builders divide in opinion. The two systems in use are the make-and-break, and the jump-spark systems. Few who have had a serious amount of experience with both will hesitate to choose the make-and-break as the easiest to get along with in all circumstances. Most motor builders recognize this condition, and nearly every make of motor may be had with either system. Cabin motor boats, as a rule, are equipped with a storage battery, and a generator attached to the propeller shaft to keep it charged, thus providing the boat with whiter forward and backward current for a searchlight to aid the pilot in making landings after dark.

Rowboats, canoes, dories and other small craft may be turned temporarily into motor boats by attaching to them a portable detachable motor made for such purpose. These little engines range from one horse power upward, and are provided with one or two cylinders, the latter type being more dependable. The motor is self-contained, and is simply clamped upon the stern board of the boat. It will drive an ordinary round-bottom rowboat six to seven miles an hour.

The hydroplane boat is of a distinct type, having a flat bottom or hull in the first instance, then a step being introduced in the hull, this being called a biplane hydroplane. This step construction involved a division in the bottom or hull, so that the forward half was a "step" lower than the aft half, this step being perhaps two inches high. This worked well, and the multiplane or multistep type was introduced and generally followed, as securing the best results. In its natural position the first plane of the hull is on the water level, and as the boat gathers speed the bow rises, and the entire boat is more or less lifted out of the water, tending to skim on top instead of to drag through the water, like other boats. But in order to rise upon the surface the speed must be very great; a slow boat will not "plane." The highest authentic record up to 1 Jan., 1918, is that of the Whip-Pow-Will which averaged 69.39 miles per hour for six one-mile spurs on Lake George, 6 Nov., 1917; and made its fastest mile in 51.55 seconds—a rate of 70.15 miles per hour. Other fast records for 1917 were by Miss Detroit II, 61.72 miles per hour; and Miss Minneapolis, 49.27 miles per hour.

Motor boat races are held regularly at

MOTOR CAR—MOTOR TRUCK

MOTOR CAR. See Automobile.

MOTOR FUELS. See Chemistry, Progress of.

MOTOR TRUCK, a heavy type of automobile developed for carrying truck or freight. At first they were called auto-trucks, and were simply stout automobiles, with wagon bodies, suiting them to carry goods. Because of the great weight on the rear tires these were doubled literally, two tires being placed on each rear wheel. For a few years truck-builders gave their attention mainly to bodies, building them to suit all sorts of trades, but employing a cheap heavy automobile chassis and motor. As the automobile proper was improved for speed, it became less suited to use for a truck, where slow speed and large carrying capacity were demanded. Heavy, slow-running motors were then designed, but the old chain-drive for the rear wheels was adhered to. Though this chain was called "silent" it was a noisy affair, and the entire motor truck of that date (about 1910) looks very crude now. In 1914 and 1915 the war demand for motor trucks aroused American builders to construct more efficient models, and the result is that in 1918 there are on the American market well over 100 makes of motor trucks, that wholly outclass the older types. The great majority run from one to six tons. A light delivery wagon sells for $885; stout 1½-ton trucks from $1,400 up; 2- to 3-ton trucks from $1,775 to $3,250; 5- to 6-ton trucks from $3,500 to $5,300. The last are taken from the listings at the automobile show in New York city in 1918. A few 7- to 10-ton trucks are being built. For motors the four-cylinder is most common, though many six-cylinders are employed. There is no demand for a large number of cylinders, as in automobile and aviation motors. The typical motor-truck motor is often called an "engine" by the trade, because its design resembles small stationary and marine engines. Practice as to clutches varies, but the disc type predominates, this being well adapted to the slow speeds and heavy power transmission of the truck, though poorly adapted to a racing automobile. Rollerbearings are universal, Tinkum and Hyatt being the familiar types. The chain drive has almost wholly given way to the improved worm drive, described and illustrated under automobile (q.v.). The four-wheel drive is increasing in popularity and numbers. Wheel bases tend to grow greater. The shortest seen on any 1918 truck was a 6-foot truck and 135 on a 6-ton truck, while the larger trucks of the best makes run up to 163 to 180 inches wheel base.

The number of motor trucks in use in the United States in January 1918 was estimated by the editor of Motor to be 435,000. The number of commercial cars built in 1917 was 181,348, but these are not all properly designated as motor trucks, for many of them are light wagons for city express work. The light traffic is being taken care of in large measure by an attachment to the Ford car. A truck frame and rear wheels are arranged to be hitched on to the fore-wheels and motor of a Ford car; any sort of a wagon body can be placed on top. This combination has a carrying capacity of 1½ tons, utilizes heavy artillery wheels, 34 x 3½, including solid tires. The wheel base is 128, the loading space over nine feet long, and it sells for only $390 ready to attach to any Ford. This cheap truck is rapidly driving out the horse, and the estimate is that 2,000,000 horses have at this date (1918) been released from servitude in the United States by the near half-million of motor trucks in use.

The wonderful tests to which motor trucks were subjected in the Great World War have been a prominent factor in the development of superior machines. Manufacturers have met the strain and built better than they ever built before, producing machines that stood amazing rough usage, on broken ground, in the rear of the Allied armies. The demands of the British and American governments for certain types developed the artillery type of truck, adapted to army conditions. Thousands of these machines were built in the West, and made their way to the Atlantic seaboard for shipment under their own power. On several occasions the great Lincoln highway witnessed processions of them miles in length, all going over to help win the war.

The motor truck having proved that it can compete advantageously with the railroad for short hauls is already in business. One concern in New York city does a truck and freight business to any point within 400 miles. It operates great trucks regularly to Boston, Baltimore and cities in central New York and Pennsylvania. The running time between New York and Philadelphia (116 miles by road) is 12 hours; and to Baltimore, 188 miles, 22 hours. The operating cost is said to be 18 cents per ton mile, as against 24 cents for same work by horses and wagons. While this is far higher than railroad cost, yet it saves handling, and as goods mostly have to be trucked at both ends of a railroad route, this item is a clear saving. It is thought that the system must prove permanent for haulage around large cities up to 150 miles.

A considerable number of electric motor trucks have been built, and they operate very satisfactorily. Their traveling range is limited to about 50 miles, after which the batteries have to be recharged. The electric light and power companies, which charge the batteries, have not generally cared to cater to this business, so the electric trucks are not common, though they have been adopted by some large concerns.

A large heavy road motor truck is a good deal like a locomotive to care for. Before starting on a tour the driver must look it all
over to make sure that everything is in working order. In making down grades he must remember that he has a great weight behind him and cannot lock the brakes and expect to stop. He must slow down his engine and use it as a resistance, and apply his brakes gradually. The use of heavy motor trucks involves trailers, which may be likened to small open freight cars designed to be drawn by the big truck, serving as a road locomotive. This combination gives us the long-sought independent train that can run on any fairly good road. It is beginning to be used, and will before many years be common on certain American highways given up mainly to trucking, for this heavy traffic surely means that the highways of the future must be separated, that fast driving automobiles and slow-moving heavy trucks with trains of trailers may not have to occupy the same route and interfere with each other.

MOTORS IN WARFARE. The various motors employed in military aeronautics, culminating in the "Liberty motor," and the various motor trucks produced under specifications approved by the War Department Motor Transport Board are so constructed that the various units entering into the construction, including the engine, transmission, axes, springs, universal joints, frame, radiator and fan, are interchangeable as far as possible. This interchangeability of parts led quickly to the standardization requirements of the government which put an end to the complicated engineering, purchasing, and manufacturing problems, to say nothing of the enormous cost of the finished product, due to lack of uniform manufacturing limits and patterns.

The Liberty airplane engine and the war trucks are not examples of standardization in the commercial sense, but of military designs dictated by war needs. The standardization by the government of the necessary designs of all kinds of self-propelled vehicles operable on land, sea, and in the air, is one of the chief factors in determining the outcome of war. Likewise the submarine problem may possibly be solved by the adoption of one of the designs of large seaplanes recently perfected. The seaplane is not the only type of craft for marine use in attacking the submarine. The so-called submarine chaser is another recent war product. The designs and construction of motors used in many of these submarine chasers constitute some of the most important problems of automotive engineers. The production of the boats by standardized processes has been a great achievement. The development of small stationary or semi-portable units for the operation of the wireless set, the searchlight, pumps, isolated electric lighting plants and machine tools in portable repair shops, is another of the matters handled by automotive engineers. These machines perform highly important functions in the great military organizations of modern times and those responsible for their design and operation deserve equal credit with those who have contributed to the more spectacular forms of modern warfare. The United States standard army truck is not a commercial 3-ton truck, but an excellent 5-tonner and its engine axles and transmission is commonly used for 5-ton assembled trucks. Its outstanding characteristics are exceptional power; good springing, making the riding almost as good as that on a passenger car; reasonable economy of fuel; ability to handle cold air and poor fuel without the least difficulty in starting and ease of steering and control. The complete truck with body, top, and equipment weighs a triffe over 10,000 pounds, and the chassis with driver's seat and in running condition scales 8,600 pounds. The engines have detachable heads and complete pressure lubrication is used. The following is a summary of principal points: (1) the engine has four 4¾ by 6 cylinders, cast in pairs, with detachable heads; (2) much attention has been paid to the cooling and water systems; (3) force-feed lubrication is used throughout and the oil is doubly strained; (4) two entirely separate ignition systems, one battery, the other magneto, are used; (5) the crankcase, including the bell housing and the oil pan, is aluminum, three-point support being used; (6) the crankshaft is very rugged, and is notable for its large intermediate bearing, as long as the rear one; (7) the governor is the steel-ball type, and so enclosed and sealed that it cannot be tampered with; (8) there is a four-speed horizontally arranged change gear, a work drive, a full floating rear axle and Hotchkiss drive.

There are two methods of transporting heavy artillery; one to pull the piece; the other, to carry it in one or two loads. Both have their advantages and disadvantages. It is naturally easier to pull the gun than to load it on the truck, but the pulling of the gun on the road behind a truck results in considerable wear and tear on the pieces. To reduce the latter, truck-pulling pieces do not go faster than from seven to eight kilometers per hour, and a great deal of care is taken to prevent injury to the recoil apparatus of the gun by collision, etc. Carrying the gun has the great advantage of permitting the truck to make from 10 to 15 kilometers per hour. It is necessary to differentiate between these methods of movement and the movement of heavy tractor artillery. This latter artillery is actually formed in requirements and groups and includes all the necessary power trucks for its complete unit and for the first supply of ammunition. The tractor of the group are all of the 4-wheel driven type instead of the 2-rear wheel driven, as is the case with all other tractors.

Edward S. Farlow,
Consulting Military and Civil Engineer.

MOTRIL, mō-tēr'il, Spain, town in the province of Granada, somewhat over a mile from the Mediterranean Sea. It is in itself a port but the anchorage harbor, Calahonda, to the southeast, is more important. The climate is very mild and its industries consist of sugar plantations, wine-culture, sugar mills; cotton also is grown to some extent. There are also iron foundries, soap works, etc. Pop, 18,444.

MOTT, Alexander Brown, American surgeon: b. New York, 31 March 1826; d. Yonkers, N. Y., 12th July. 1890. He was educated by Professor Darling of the University Medical College and at Columbia College Grammar School, then (1836) went to Europe for five years continuing his education. Although a Quaker he entered West Point, resigning at his father's demand. He served in the Pacific as commodore Morris in United States naval quarters on
the Mediterranean. He next took up commercial life (1845) visiting Turkey, Greece, Italy and Austria for a Marseilles firm. Continuing the study of medicine at Haarlem he returned to New York and was graduated (1849) at New York Medical College, at the University of Pennsylvania (1850) and Castleton Medical College. In 1853 he became visiting surgeon at Saint Vincent's Hospital and was attending surgeon (1855–63) to the Jewish Hospital. He was one of the founders of Bellevue Medical College. During the Civil War he was medical director (1862–64) at New York and (1864–65) inspector of the department of Virginia and was mustered out of the service in 1866 with rank of brevet-colonel. From 1872 he was professor of clinical and operative surgery till his death at Bellevue Medical College. He wrote ‘Surgical Operations' (1856–57); ‘Advantages of Clinical Teaching' (1866), and other works.

MOTT, James, American abolitionist: b. Cowaneck, L. I., 29 June 1788; d. Brooklyn, N. Y., 26 Jan. 1868. He was a teacher in a Friends' boarding school in Dutchess County, N. Y., at 19, where he later married Lucretia Coffin. In 1810 he went to Philadelphia, Pa., and engaged in mercantile business. He was a staunch friend of William Lloyd Garrison (q.v.), assisted in the organization of the Philadelphia Anti-Slavery Society in 1833 and attended as a delegate the World's Anti-Slavery convention in London in 1840. He was a determined supporter of the cause of woman's rights and in 1848 presided over the first woman's rights convention at Seneca Falls, N. Y. From 1865 till his death he became interested in the foundation of Swarthmore College.

MOTT, John Raleigh, American Y. M. C. A. leader: b. Livingston Manor, N. Y., 25 May 1865. He was graduated (1888) at Cornell University when he was made chairman of the executive committee of the Student Volunteer Movement. Since 1895 he has also been general secretary of the World's Student Christian Federation and is now chief executive of the National War Council of the Y. M. C. A. associations. On the retirement of Woodrow Wilson from the presidency of Princeton College he was offered the position but did not accept it. In 1916 he was appointed by President Wilson member of the joint commission for settlement of differences between Mexico and the United States and he was a member of the mission to Russia, headed by Elihu Root, in 1917. He has written ‘Strategic Points in the World's Conquest' (1897); ‘Evangelization of the World in this Generation' (1900); ‘Christians of Reality' (1902); ‘The Pastor and Modern Missions' (1904); ‘The Future Leadership of the Church' (1906); ‘The Decisive Hour of Christian Missions' (1910); ‘The Present World Situation' (1914). In 1910 he had conferred on him the degree LL.D. by the University of Edinburgh and in 1911 the same degree by Princeton University.

MOTT, Lewis Freeman, American educator: b. New York, 29 Sept. 1863. He was educated in his native city and was graduated (1883) at the College of the City of New York, where he became tutor (1884–94) of English and (1894–97) instructor, then assistant professor and professor. He was elected (1911) president of the Modern Language Association. His profound studies of English and Romance literature and folklore assisted him to the material of many lectures and he has written ‘The System of Courtly Lore' (1896) and ‘Provençal Lyrics' (1901). He has been editor of the City College Quarterly since 1906.

MOTT, Lucretia Coffin, American abolitionist and woman's rights advocate: b. Nantucket, 3 Jan. 1793; d. New York, 17 Nov. 1880. With her parents, Thomas and Anna Coffin, she removed to Boston in 1804, and two years later became a pupil in a Quaker boarding school at Nine Partners, N. Y., where James Mott (q.v.), whom she subsequently married was a teacher. In 1817 she opened a small school, but soon gave it up and became recognized as ‘an acknowledged minister.' She joined the Hicksite branch of the Quakers upon the schism of 1827. In 1833 she joined in the formation of the American Anti-Slavery Society, as whose delegate she went to the London World Convention in 1840, from which all women were excluded. The result was the women's rights movement, in which Mrs. Mott became a leader, taking a prominent part in establishing the Charities and Foreaying Society of Seneca Falls in 1848. Consult Hallowell, A. D., and ‘Letters of Lucretia and James Mott' (1894).

MOTT, Valentine, American surgeon: b. Glen Cove, L. I., 20 Aug. 1785; d. New York, 20 April 1865. He was graduated (1809) at Columbia College when he went to England to continue his studies in medicine at the postgraduate courses of London and Edinburgh. In 1809 he returned to New York and was given the chair of surgery at Columbia College, continuing to hold the position at the newly formed college when Columbia College was merged with the College of Physicians and Surgeons. In 1826 he with the entire body of his colleagues resigned on account of offensive actions of the trustees and they founded Rutgers College. The latter institution, in 1836, had to close from defects in its charter and he returned to the College of Physicians and Surgeons as professor of operative surgery and surgical and pathological anatomy. Ill health caused him (1835) to resign to visit Europe twice, finally returning in 1841. He gained high honors for work done in the old country. He was elected president of the medical faculty of the University of the City of New York while still practising as surgeon in New York Hospital, till 1850 when he spent a year in Europe. In 1851 he was appointed professor of operative surgery and surgical anatomy again at the College of Physicians and Surgeons for a year when he resigned and was made emeritus professor for the rest of his life. On his death his fine library went to the Academy of Medicine. He gave but little time to literary composition, one of his most extensive works being his ‘Travels in Europe and the East' (1842). He supervised a translation of Velpeau's ‘Operative Surgery,' writing its preface. In ‘Transactions' of the New York Academy of Medicine were published numerous addresses and lectures. He also wrote a ‘Sketch of the Life of Dr. Wright Post' and a ‘Eulogy on his friend Dr. John Wakefield Francis' (1861). ‘Mott's Cliniques' (1860) is an abstract of his later clinical lectures.
Consult Gross, S. D., 'Memoir of Valentine Mott' (Philadelphia 1868).

MOTTIER, mot'yer, David Myers, American botanist: b. Patriot, Ind., 4 Sept. 1864. He was graduated (1891) at Indiana University, then took the Ph.D. degree at the University of Bonn in 1897 and at Leipzig in 1898. He was (1891–93) instructor of botany at Indiana University and associate professor (1893–98), then professor from 1898. He was elected president of the Indiana Academy of Science in 1907. He has written 'The Practical Laboratory Guide for First Year in Botany' (1902); 'Fecundation in Plants' (1904), as well as a number of technical papers on botany.

MOTTLED OWL, a small horned owl (Megascops, formerly Scops, asio), which, in one or another geographical variety, occurs numerously all over the continent, except in the colder parts of Canada. Very similar species are known in Central America and in Japan. It is only 9 or 10 inches long, with large facial discs, two small erectile horns and a short rounded tail. Its plumage is a mottling of gray and rust-red. These little owls are not very bold and are almost blinded by daylight glare. They come out in the dusk of evening, and from sunset to darkness, or all night when the moon is shining, is heard their low, musical, trilling cry—one of the pleasantest of bird voices; yet in some evil way the name screech-owl was long ago fastened upon this bird. Its eggs are five to seven, pure white. The food of the mottled owl is chiefly small rodents and insects, and occasionally, in spring, small birds; they destroy a vast number of insects and mice, hurtful to the farmer and gardener. Books upon American birds abound in facts as to their habits.

MOUCHEZ, moo-shá, Amédée Ernest Barthélémy, French astronomer: b. Madrid, Spain, 24 Aug. 1821; d. Wissous, France, 25 June 1892. He was educated in the French Naval Academy and remained in the navy until 1878 when he was appointed chief of the National Observatory. He had previously shown himself a brilliant scientist and particularly distinguished himself in coast surveys of Algeria and Egypt as well as in the observations of the transit of Venus in 1874. He bent all his energies to the improvement of the observatory, introduced several innovations of value, and was the originator of the international photographic chart of the heavens. In 1880 he was appointed rear-admiral. He wrote 'Côtes du Brésil' (1869–76); 'La Photographie astronomique et la carte du ciel' (1877); 'Rio de la Plata' (1873; 3d ed., 1891).

MOULON, mool'lon, or MUSIMON, a wild sheep (Ovis musimon) of Corsica and Sardinia, where it wanders about the summits of the mountain ranges in small flocks, and offers excellent sport. It is a question whether this species ever existed on the mainland, one opinion being that it arose in the isolation of the islands; but most naturalists believe that it formerly existed in Spain. The rams are about two and one-quarter feet tall at the withers, and have very large coiled horns, but the females are hornless. The long mane-like hair that covers the neck and chest of the rams is gray, but the remainder of the coat is mainly rust-red above and white on the ventral surfaces. A similar *mouflon* inhabits Cyprus; and the Barbary aoudad (q.v.) is often called *ruffed mouflon.* Consult Afhol 'Sport in Europe' (London 1901).

MOULE, mool, Handley Carr Glynn, English Anglican bishop: b. Dorchester, Dorsetshire, 1841. He was educated at Cambridge University, took orders in the Anglican Church, and was an assistant master at Marlborough College 1865–67. From 1873 to 1876 he was dean of Trinity College, Cambridge, and he was first principal of Ridley Hall, Cambridge, 1881–99. He was nine times select preacher at Cambridge and once at Oxford, was Norrissian professor of divinity at Cambridge 1899–1901 and in the last-named year was consecrated bishop of Durham, succeeding Bishop B. F. Westcott (q.v.). He has published many devotional and expository works, among which are a series of commentaries on the Epistles; 'Thoughts on Christian Sanctity'; 'Ephesians Studies' (1900); 'The Secret of the Presence' (1906); 'Thoughts for the Sundays of the Year' (1901); 'The School of Suffering' (1905); 'Christus Consolator' (1915); 'The Call of Lent' (1916).

MOULIN, an opening from top to bottom of a glacier, by means of which a stream flowing on the surface of the ice plunges to the bottom and flows on as a subglacial stream.

MOULIN ROUGE, moo'lan rozh, Paris, the "Red Mill," noted dance-hall on the right bank of the Seine, the "students' quarter" (Quartier Latin). Since the notorious Jardin Mabile, in this section, went out of existence the Moulin Rouge has since been the favorite resort for can-can and other gay dances of the Parisians.

MOULINS, moo'lan, France, capital city of the department of Allier, on the right bank of a river of the same name, which is spanned here by a beautiful bridge, built in 1763. It is the junction of the Lyons and Orleans railroads, the road to Paris, the observation of the transit of Venus in 1874. He bent all his energies to the improvement of the observatory, introduced several innovations of value, and was the originator of the international photographic chart of the heavens. In 1880 he was appointed rear-admiral. He wrote 'Côtes du Brésil' (1869–76); 'La Photographie astronomique et la carte du ciel' (1877); 'Rio de la Plata' (1873; 3d ed., 1891).

MOULTON, moul'ton, Boho, Louise Chandler, Author: b. Pomfret, Conn., 10 April 1835; d. 10 Aug. 1908. She was married to William U. Moulton, a Boston publisher, in 1855 (d. 1898). She had a wide literary acquaintance both in this country and in Eng-
land where she spent a part of every year for many seasons. Her weekly receptions both in Boston and London were the resort of many literary and artistic persons. She published such books for children as 'Bedtime Stories' (1873-80), while her other writings include 'Some Women's Hearts' (1874); 'Miss Eyre from Boston' (1889); 'In the Garden of Dreams'; 'Lyrics and Sonnets' (1890); 'Lazy Toms in Spain and Elsewhere'; 'At the Wind's Will,' verse (1899), etc. Her lyrics are extremely musical and as a sonneteer she ranks high.

MOULTON, Forest Ray, American astronomer: b. Le-Ray, Mich., 29 April 1872. He was graduated (1894) at Albion College and took (1899) the degree Ph.D. at the University of Chicago. He was appointed (1900) assistant professor, associate professor of astronomy (1908) and professor (1912). He has been associate editor of 'Transactions of the American Mathematical Society' since 1907 and research associate at Carnegie Institute since 1908. He has written 'Celestial Mechanics' (1902); 'Introduction to Astronomy' (1905); 'Descriptive Astronomy' (1911); 'Periodic Orbits' (1913), besides contributing numerous articles to the mathematical and astronomical periodicals.

MOULTON, Richard Green, Anglo-American educator: b. Preston, England, 5 May 1849. He was graduated from the University of London in 1869 and at Cambridge University in 1874, since when he has been associated with the university extension movement of various American and English universities. He has been connected with the University of Chicago since its foundation in 1892, and since 1901 has been professor of literary theory and interpretation and head of the department of general literature. He is author of the following works: 'Shakespeare as a Dramatic Artist' (1885); 'Shakespeare as a Dramatic Thinker' (1907); 'The Ancient Classical Drama' (1890); 'The Literary Study of the Bible' (1896); 'A Study of Old Testament Literature and the Bible' (1901); 'The Modern Reader's Bible' (1895-1907); 'World Literature' (1911); 'The Modern Study of Literature, an Introduction to Literary Theory and Interpretation' (1915).

MOULTRIE, mól'tri, John, English poet and clergyman: b. London, 1799; d. 1874. He was educated at Eton and was graduated (1822) at Trinity College, Cambridge. He abandoned his law studies to be ordained (1825) in the church and went to Rugby (1828) as rector, while Thomas Arnold was head master of the school and with whom a close friendship grew up, as his poems testify. He wrote 'My Brother's Grave' (1820); 'Godiva' (1820), which is considered his best work. His collective works were published in 1876.

MOULTRIE, William, American soldier: b. South Carolina, 1731; d. Charleston, S. C., 27 Sept. 1805. He early allied himself with the American Minute Men of the colonies and in the war with the Cherokees in 1761 the confidence of his fellow citizens in his ability was shown by his selection as captain of the body of troops raised to defend the frontier against the Indians. At the outbreak of the American Revolution in 1775 he was appointed colonel of the 2d colonial regiment and he also served as member of the South Carolina provincial congress in that year. He was engaged in the seizure of the public arsenals and the construction of fortifications around Charleston, and in March 1776 was ordered to construct a fort on Sullivan's Island. This he made of the only material at hand, palmetto logs, and when General Lee made an inspection he expressed his disapproval of the work, considering it totally unfit for the purpose of defense and advised its abandonment. Moultrie, however, continued the work and when an attack was made by the British fleet under Sir Peter Parker the rude fort successfully withstood all assaults and was subsequently named for its brave commander.

He was promoted to the rank of brigadier-general in recognition of his services and given command of the forces in South Carolina and Georgia. So complete had been the defeat of Parker, however, that Charleston was not again attacked until 1779 when the British availed themselves of the absence of a large share of the Continental force and attacked the town. The return of General Lincoln saved the town, but in the spring of 1780 a third attack by land and sea compelled capitulation. Moultrie was held a prisoner for two years and though offered rank and money to enter the British army remained loyal to the cause of the colonies. Release came in 1782, when he was exchanged for Burgoyne, and though promoted to the rank of major-general it was too late for him again to engage in active service. He was elected governor of South Carolina in 1785 and in 1794, and published in 1802 'Memoirs of the Revolution.'

MOULTRIE, Fort. See Fort MOULTRIE.

MOUND BIRDS, a group of Australasian gallinaceous birds remarkable for the large mounds which they build as incubators for the eggs. See MEGAFODES.

MOUND BUILDERS AND MOUNDS. Two terms that have been inseparably connected by investigators into the history of these early earthen pyramids, mounds, and earthen artificial structures of the North American Indians. In the broader sense, mounds, especially in their connection with mound builders, include not only pyramidal structures and mounds proper, but also walls, forts, embankments and life artificial structures especially those built of earth. Archaeological investigators also include among the mounds the accumulations of débris which grew up near ancient centres of population through the gradual increase of dump heaps or other long continued deposits.

The ancient American mounds seem to have been destined for a variety of uses; some of them were burial places, others foundations for edifices, still others served as fortresses, while the most pretentious were used for sacrificial and other religious purposes. From the Canadian border to southern Peru stretch pyramids (generally truncated), terraces and tumuli of various forms, sizes and modes of structure. That the builders of the various sections of this vast chain of artificial structures were related ethnologically, racially or by political contact has never been clearly proved and may never be. At one time it was popular to main-
tain that the builders of the great American mounds were a people distinct from the Indians inhabiting the United States territory at the time of the first contact of the Europeans and the aboriginal Americans. Bryant sang of the mysterious lost race, and romances and sober scientific works were written about them. Now scientific criticism has swung to the opposite direction and not only is the existence of such a race denied, but it is claimed that ancestors of the modern American Indian were the mysterious mound builders. But the last word has by no means been said upon the subject. The fact that Indian chiefs were found with their dwellings erected upon the summits of mounds is no proof that they built the mounds. Even if they did build small mounds as bases for their dwellings or as burial places for their dead, this again is no proof that their ancestors built vast structures like Cahokia. These were the very existence of a politically organized society and the command of vast supplies of labor for long periods of time. As the Indian races of the North American continent seem to have been, for ages, given to migrations, the contrast is rather against than for the modern theory that the ancestors of the modern United States Indians built the older and more monumental of the great mound structures, which must have served a race much more advanced in political and social organization than those to whom their construction has been attributed by those who hold the modern origin theory.

Shapes and Sizes.—The mounds are generally conical, hill-like structures, though some of them approach more or less closely to the true truncated pyramidal form and these vary, in the United States, from a few feet in height to over 100; and southward, throughout Mexico, Central and South America, very formally constructed pyramidal mounds exist that are over 100 feet in height and of vast proportions. The mounds of the United States which stretch from Canada to the Gulf of Mexico, down the Mississippi Valley and far across the plains on either side present a wide variety of forms. Conical, square-based, and rectangular shapes add variety to the construction of the mounds proper; and forms of serpents and other reptiles, mammals and birds of gigantic size add to the impress of the civic culture of the races who conceived and constructed them. There can be little doubt that the more spectacular of these vast earthen structures were intimately connected with the religious beliefs of their builders. Eagles, panthers, serpents and other animal forms from 500 to 1,000 feet in length are among these mound structures, which include representations of many animals later known to have been totem signs among the American Indians over a very wide extent of territory. For this reason the theory has been advanced that these animal mounds were representations of tribal totems; and as such, probably served as emblems worshiped as protecting tribal deities.

Great Serpent Mound.—Of these animal form structures one of the largest and most notable is the Great Serpent Mound in Adams County, Ohio, which contains 1,350 feet of wall and is so constructed that it might, at one time, have formed a defensive work. The central folds of the serpent make two fort-like enclosures open only at the back; while the coil of the tail, which is whirl-shape, is especially well arranged for defensive purposes, the swollen end of the head, which is varied and the body of the snake, which is formed of earthen walls, constitute a very extensive fort-like structure, divided in two parts by a wall similar to that of the rest of the structure. Within the larger of these two divisions is an oval enclosure of considerable extent for cremated bodies similar to those of the rest of the edifice. In the outer wall of the head section is an opening leading into the larger subdivision; but the other sections and the oval enclosure are without openings of any kind. The whole structure is admirably laid out for defensive purposes. It may, and probably did have a three-fold purpose, defense, totemic representation and religious significance. The wall is now only five feet high, but it may have been originally somewhat higher.

Situation of Chief Mounds. In the United States there are still a vast number of mounds; and in the State of Ohio there were, at one time, thousands. The smallest of these, however, have disappeared or are rapidly being leveled to the earth. There are two broad groups of mounds, like those that formed the basis for a part of the city of Saint Louis, Mo., have been leveled and built up over. In Wisconsin are large numbers of mounds representing the forms of animals, while in Tennessee are smaller mounds which were used for burial purposes, as is clearly proved by the stone graves they contain. Some of these seem to have been either community, tribal or family burial places, as considerable numbers of graves have been found in a single mound. Burial tumuli were also erected in Illinois, Minnesota, Mississippi, Indiana, Florida, Wisconsin, Virginia, Kentucky and Missouri. The mound ranges seem to have set a limit to the mound builder activity which did not extend to the east of the Alleghenies, North Tennessee and North Carolina. Some of the mounds of the mound-building regions were old when they first became known to the white explorers, but now old is not known. Indian races in various parts of the continent have continued to build mounds for a century after the discovery of America and some of them were constructing them both for burial purposes and as foundations for buildings; but it seems to be uncertain whether any of these later constructions were used for religious purposes. Some tribes are also known to have built, in historical times, miniature mounds in their great council houses, apparently as a part of a religious ceremony. This calls to mind the fact that the Mixtecs and Zapotecs represented the sacred mound as the symbolical presentation of the “heart of heaven.”

Among other tribes the custom obtained of collecting the bones of the dead, cleaning them carefully and burying them in a common grave over which a mound was erected. It is evident from the great variety of mound structures that they could not have all been constructed by the same tribe or race and that the erection covered a very considerable period of time. This was also the case in the later Stone Age of which some of the mounds show some beautiful workmanship; but nothing in metal except that introduced into them later of European make, and a few things
probably obtained by barter from southern races.

Cahokia Mound is the largest prehistoric artificial earthwork in the United States. It is in Madison County, not far from Saint Louis; it lies in the American bottoms and is surrounded by a number of smaller mounds which Brackenridge, who visited Cahokia and the complete mound neighborhood in 1811, asserts then numbered 45, exclusive of a great many smaller elevations. These probably did not include the mounds that existed at one time on the site of Saint Louis, Mo., and which gave that city the title of the "Mound City." The Cahokia truncated pyramids had, if it was real, is, measures about 1,000 feet from north to south, 725 from east to west, and 100 feet high at its greatest elevation. But the level top of the mound is not all at the same elevation. In fact one section of it is only 30 feet high, another is over 60 feet, while a third and fourth are slightly lower than the summit. The total Cahokia terrace measures about 200 feet by 500 feet. It thus affords considerable space, nearly two and one-half acres, which was probably used as a foundation for Edifices. The base of Cahokia covers 17 acres, or over 40 per cent more than Cheops, the greatest of the Egyptian pyramids. Situated in the midst of a very populous district, and commanding the great bottoms from, which rose scores of mounds of all sizes, Cahokia must have presented an inspiring sight in the days of its prosperity and might. The great pyramid was constructed of earth, which was taken from the country surrounding it, as is evident from the depressions in the soil. Cahokia is sometimes called "round mound," because it was occupied for a considerable time, from the beginning of the 19th century on, by Trappist monks, who had a vegetable garden on the top of the mound. Next to Cholula (q.v.), Cahokia is the largest based artificial pyramid in North America.

Elephant Mound, a large prehistoric mound three miles southeast of Cartersville, in Bartow County, Ga. Like the Cahokia mound it is situated on a river bottom and is surrounded by several smaller mounds of which it seems to have been the center of community or civic life. Etowah is a quadrilateral, truncated pyramid much like Cahokia in form. It is over 60 feet high with a base length on one side of 380 feet. On the south side of the mound broad inclined roadway leads up to within 18 feet of the summit. This incline once was provided with wooden steps. The truncated top of the mound measures 170 by 176 feet. On the east side there is also a narrow slide reaching from the top to the bottom. The base of the pyramid covers nearly three acres. In excavations made in some of the surrounding mounds, stone images and copper plates have been encountered. Earthware, copper, celts, pipes and stone objects suggestive of a fair degree of culture were also unearthed.

Elephant Mound, a well-known mound of massive form originally believed to represent some prehistoric animal probably an elephant. It is situated about four miles south of Wyalusing, Wis., on low ground a few feet above the level of the high-water mark of the Mississippi. The dimensions of this mound, which is badly disfigured through cultivation, is given as follows by the Bureau of American Ethnology; length 140 feet, height about four feet, width across the body to the lower end of the hind leg 72 feet. The bureau, upon careful examination, decided the mound was intended to represent a bear.

Fort Ancient, a prehistoric American mound fortification in Warren County, Ohio, and on a headland nearly 300 feet high overlooking the Miami River. The fortress itself is divided into two unequal portions known as the "Old Fort" and the "New Fort" and altogether it encloses a space of about 100 acres. The wall, for the most part, is constructed of clay but it is underlaid, in many places, with stone. This great wall is nearly 19,000 feet or more than three and one-half miles long and from 6 to 10 feet high and contains as much earth as the great pyramid of Eotowah. Not far to the east of the "New Fort" are two mounds, and within the fort itself were other small mounds which evidently served as burial places. Most of the property covered by Fort Ancient has been secured by the State of Ohio and some has been made a park and reservation placed in the care of the Ohio Archaeological and Historical Society.

Grave Creek Mound, near Moundsville, W. Va., at the junction of Grave Creek and the Ohio River, is one of the best known of prehistoric Indian mounds. It is conical in shape with a base diameter of 320 feet, and a dish-shaped depression at the top. During excavations made in 1838 two burial vaults were uncovered, one at the base and the other 30 feet above. The lower contained two skeletons and the upper, one. Buried with the skeletons were several thousand shell beads, mica ornaments, stone objects and several copper bracelets.

Newark Works, near Newark, Ohio, an extensive group of prehistoric Indian constructions of a complicated nature. They are situated on an elevated plain from 30 to 50 feet above the river bottom and are composed of walls, circles, squares, an octagonal enclosure, ditches, mounds and avenues covering about four square miles. Two groups two miles apart are connected by avenues bordered by walls. The western group contains a large walled octagon and a square connected by a walled passage way; and the eastern group contains another large circle connected with it by a wide walled avenue. While the square enclosures have, each, several entrances, the circles have only one each and that leading into the square. The larger circle has a diameter of over 1,000 feet, and embraces within its circuit the fair grounds of the Licking County Agricultural Society.

MOUND CITY—MOUNT CARMEL

MOunt CITY, Ill., city, county-seat of Pulaski County, on the Ohio River, and on the Illinois Central and the Cleveland, Cincinnati, Chicago and Saint Louis railroads, about 200 miles south of Springfield and eight miles northeast of Cairo. It is in an agricultural section, but the principal industries are connected with manufacturing and trade. The chief manufactures are furniture, pumps, stoves, headings and other hardware products, boxes, trunks, foundry and machine-shop products. It has considerable trade in its own manufactures and in farm products, and has one of the largest preserving and canning factories in the United States. A National Cemetery, located here, contains 5,310 graves, of which 2,732 are unknown dead. Pop. 2,837.

MOund CITY, Mo., city in Holt County, on the Chicago, Burlington and Quincy Railroad, about 40 miles north by west of Saint Joseph. It is situated in a fertile agricultural region in which farming and stock raising are the chief occupations. Its principal manufactures are milling, canned fruits and vegetables and dairy products. Its trade is in farm products and live-stock. In the vicinity are numerous mounds belonging to the age of the Mound Builders (p.v.). Pop. 2,000.

MOundsville, W. Va., city and county-seat of Marshall County, and the seat of the State Penitentiary, on the Ohio River and on the Baltimore and Ohio and Ohio River railroads, about 12 miles south of Wheeling. It is situated on a point of land, about three miles wide, at the confluence of the Big and the Little Grave creeks. It was once called Grave Creek Flats, and at first there were two small villages called Elizabeth town and Lampadysville. The present name is on account of the Mammoth Mound in the centre thereof, one of the largest ancient mounds in the United States. In the vicinity are other mounds classified as the Grave Creek group of mounds. The Mammoth Mound is connected with a series of earthworks of ancient construction and is 820 feet in circumference at the base, 63 feet in diameter at the summit and about 70 feet in height. It is now owned by the State and beautifully cared for. In the chambres have been found a stone tablet, the hieroglyphics thereon are yet undeciphered; the stone was sent to Europe for the purpose of determining the meaning of the marks and returned and is now in Smithsonian Institution, Washington, D. C. Shell beads, ornaments made of mica, others carved in stone, copper bracelets and other ancient articles have also been found. Moundsville is in an agricultural and coal region and the industries are connected with farming and coal mining. It manufactures also glass, enameled ware, bricks, lamps, ceilings, boxes, whips, cigars, clothing, flour, feed, leather, etc. Pop. 12,000.

MOUNeT, moo'na', (Jean) Paul, French actor, brother of Jean Mounet-Sully: b. Bergerac, Dordogne, 1847. He studied medicine and received the degree of doctor of medicine; first appeared in 'Horace' at the Odéon in 1880. Later he appeared in 'Roi, 'Le ROI, 'L'Enigme,' 'Le Dédaie, and 'Edipe Roi.'

MOUNet-SULLY, moo'ná sú-lá, Jean (Jean Sully MouNet), French tragedian; b. Bergereac, 1841; d. Paris, 2 March 1916. His precocious talents and success were due to the encouragement of his family and it was not until he became of age that he entered the Conservatoire, where he won the first prize for tragedy, and made a successful first appearance at the Odéon in 1868. During the Franco-Prussian War he was an officer in the Garde-Mouvements. In 1874 he became a member of the Théâtre Français and remained in the company until he became its dean. Nature had endowed him with a most expressive face, a voice which had a convincing tone and a gift of gesture. He was made a chevalier of the Legion of Honor in 1889, and was decorated with the "Palmes Académiques." His chief successes, although he essayed 'Hamlet,' were in the tragic roles of French classic drama. His production of 'Edipe Roi' at the old Roman theatre of Orange was a notable achievement. It was repeated in Paris in 1888 and in New York some years later. With Barbie, he wrote 'La Vieillesse de Don Juan' (1906) in which he played the title rôle. Consult Brander Matthews 'The Theatres of Paris' (New York 1889).

MOunt, William Sidney, American painter: b. Setauket, Long Island, 26 Nov. 1807; d. there, 19 Nov. 1868. He studied at the National Academy, N. Y., and became a member in 1832. His power as a genre painter was first proved by 'Cork Husking' although he had aroused interest by his 'Raising of the Daughter of Jairus' (1828) and a number of striking portraits, including a full-length of Bishop Onderdonk. He may be looked upon as the founder of the American school of genre, and is particularly happy in his treatment of negro characteristics. He has a genuine sense of humor and his 'Bargaining for a Horse' (New York Historical Society); 'Raffing a Goose' (Metropolitan Museum); 'A Long Story' (Corcoran Gallery, Washington); 'Coming to the Point' (New York Public Library) are real pictures of American life.

MOunt AUBURN, a celebrated burial-place in Watertown, Mass., covering over 100 acres. Here are the graves of Longfellow, Lowell, Sumner, Phillips Brooks and other well-known men.

MOUNT CARMEL, Ill., city, county-seat of Wabash County, on the Wabash River, and on the Cleveland, Cincinnati, Chicago and Saint Louis and the Southern railroads, about 35 miles northwest of Evansville, Ind. The place was settled in 1818 and was incorporated in 1868 and chartered. It is in an agricultural section; but the good water-power has contributed toward making it a manufacturing city. The chief public buildings are the courthouse, public library and High School building. The chief manufactures are furniture, lumber products, strawboard, machinery supplies, shafting, pulleys and dairy products. It has the railroad shops of the "Big Four" railroad. There is considerable trade in manu-
factured articles, farm products and livestock. Pop. 6,934.

MOUNT CARMEL, Pa., borough in Northumberland County, on the Pennsylvania, the Philadelphia and Reading, and the Lehigh Valley railroads, about 45 miles north by east from Harrisburg. It is in a mountainous region, in the midst of valuable coal fields, and nearby are a number of large anthracite mines. The manufactures are mining implements, miners' lamps, hats, caps, cement blocks, men's clothing, flour, and also a planing mill, silk and knitting mills, foundries, meat packing plant and wagon works. The borough has an extensive trade in lumber and coal. Pop. 19,000.

MOUNT CARROLL, Ill., city, county-seat of Carroll County, on the Chicago, Milwaukee and Saint Paul Railroad, about 22 miles southwest of Freeport and 10 miles east of the Mississippi River. It is in a situation in an agricultural and stock-raising region, and in the vicinity are deposits of iron ore. It is the seat of a normal and high school and Carnegie library, Caroline Mark Home for Aged Ladies. The water-supply system is the property of the municipality. Pop. 1,759.

MOUNT CLEMENS, Mich., city, county-seat of Macomb County, on the Clinton River, and on the Grand Trunk Railroad, about 22 miles northeast of Detroit. Electric railroad lines connect the city with Detroit and the towns along the coast. The first settlement was made in 1802; and the original plan of the village was made in 1818 by Christian Clemens. This first plat consisted of 60 lots now in the business centre of the city. The cooperative business was most important in the early days; the staves and heads for oil casks and barrels being made in Mount Clemens and shipped to large oil plants in New Bedford, Mass. Then Mount Clemens was considered the most important place in Michigan; but with the decay of whaling and whale-oil industries, the cooperative business declined and the town was at a standstill. After 1850 the town was prospering for oil sank a well at Mount Clemens. After going to a depth of about 1,300 feet they abandoned all hope of oil, but found salt instead. Soon a new company was formed for the purpose of manufacturing salt, but the enterprise did not prove a success because of the quality of the salt. In 1868, apparently by accident, the discovery was made that the water from the salt wells possessed remarkable medicinal properties and since then the place has had a steady growth which is increasing each year. Large sanatoriums, hotels and bathing places have been built to accommodate the thousands of people who annually visit the place seeking health. The mineral waters, classed as sulpho-iodo-chromo-salines, as they come from the wells are about 50° F. and very rich in mineral salts, chiefly chloride of sodium and chloride of magnesium. About 30 different chemical ingredients constitute their make up. The beautiful residences, broad, well-kept streets and grounds, the long lines of shade trees, the parks, the drives, all make the place most attractive. Gratiot avenue is virtually a continuation of the avenue of the same name in Detroit. Both avenues are parts of what was once the government road made in 1840 and extending from the fort in Detroit to the fort at Port Huron. The churches and schools compare favorably with others in the State. Mount Clemens has manufacturing and commercial interests. Some of the manufacturing establishments of the city are a carriage and wagon factory, agricultural implement works, beet-sugar factory, machine-shops, a large pottery, an automobile spring factory, a bath tub factory and a cooperage works. The government of the city is administered under the law of the State for the cities of the fourth class. The water-supply system is the property of, and is operated by the municipality. Pop. 7,707.

MOUNT COKK, or AORANGI, New Zealand. See COOK, MOUNT.

MOUNT DESERT, dé-zért, or déz-ért, an island off the coast of Maine, the largest belonging to the State, part of Hancock County. It is separated from the mainland by Western Bay, Mount Desert Narrows and Frenchman's Bay. It is about 15 miles long and 12 miles wide; area, about 100 square miles. The coastline is very irregular; the chief indentations are on the north, Eastern Bay; on the south, Somes Sound, a fiord which extends into the centre of the island, and Southwest Harbor. On the west are Seal Cove and Western Bay. Barlett's Narrows on the west separates Bartlett and Mount Desert Islands. On the south Cranberry Passage separates Great Cranberry Island from Mount Desert. The irregularity and nature of the coast-line, and the separation of the island from the mainland is due to submergence of the land and weathering. The surface is mountainous, along the northern coast is a line of rugged cliffs, and Green Mount, in the interior, is over 1,000 feet in height. Several fresh-water lakes beautify the island and add to its attractiveness. Long Pond, Eagle Lake, Jordan's Pond, Echo Lake and Seal Cove Pond are the principal bodies of water lying wholly within the interior.

The principal harbors are Bar Harbor, Southwest and Northport. Bar Harbor in Eden township is a popular summer resort and connected by a ferry to the Maine Central Railroad and by steamboat lines with Rockland, Portland, Boston and other Atlantic ports. There is a naval coaling station on the north shore of Eastern Bay. In Frenchman's Bay are five rocky islands called the Porcupines, and about 20 miles south, in the open ocean, is Mount Desert rock, on which is built a lighthouse.

The first authentic account of this island was given by Champlain (q.v.), who gave it the present name. In 1608 M. De la Saussaye and the Jesuit Fathers Lallemant, Masse, Quentin and Biard, together with 25 colonists from France, established on Somes Sound a colony which they called Saint Sauveur. Eighty years later the colony was destroyed by a party of Englishmen from Virginia. The first permanent settlement was made by Abraham Somes, who, in 1761, built a house at the head of the sound which still bears his name. The town of Mount Desert was incorporated in 1789: Eden, in 1796; Cranberry Isles, in 1830, and Tremont, in 1848. The population of the several towns is about as follows: Mount Desert, 1,659;
Eden, 4,441; Cranberry Isles, 399; Tremont, 1,116. Consult Fairfax, 'At Mount Desert'; Street, 'Mount Desert, a History' (Boston 1903).

MOUNT ETNA. See ETNA, or Ætna.

MOUNT EVEREST. See EVEREST, MOUNT.

MOUNT FOREST, Canada, a town in Wellington County, Ontario, on the south branch of the Saugeen River, on the Canadian Pacific and Grand Trunk railways, 40 miles northwest of Guelph. Its industrial establishments include flour, grist, saw and woolen mills, and it has manufactures of iron, agricultural implements, carriages, leather, pottery and bricks. Pop. 1,839.

MOUNT GILEAD, Ohio, village, county-seat of Morrow County, on the Whetstone River, and on the Cleveland, Cincinnati, Chicago and Saint Louis and the Toledo and Ohio Central railways, about 40 miles north by east of Columbus. It has considerable trade in farm and dairy products, and it is a distributing centre for quite a section of the country. The industries comprise hydraulic machine works and a concrete sewer-pipe plant. The three local banks had combined resources amounting to $1,310,000. The value of taxable property is $2,500,000. The chief buildings are the opera house, fire house, mayor's office and the high and grammar schools. The government's receipts and expenses amount to $20,000.

There are an electric-lighting plant, water-supply system, sewer system and disposal plant. Pop. 1,700.

MOUNT HOLLY, N. J., town, county-seat of Burlington County, on Rancocas Creek, and on the Pennsylvania Railroad, seven miles south of Burlington City and 18 miles east of Philadelphia. It is in an agricultural section but its industries are chiefly manufacturing. The industrial establishments are foundries, large shoe factories, shirt-waist factories, a brewery, machining shops, hosiery factories, tapestry mills, leather goods works and canneries. There are two banks and two trust companies. The value of the town's taxable property is $2,300,000. The government's receipts and expenses amount to $26,000 approximately, annually balancing the account, excepting bond issues. The town has improved and well-lighted streets and sidewalks. It has the Children's Home, the Burlington County Hospital and the Burlington County Lyceum of History and Natural Science, founded in 1870. The library connected with the lyceum contains about 7,000 volumes. Some of the other prominent buildings are the churches, schools and county buildings. Pop. 5,500.

MOUNT HOLYOKE (hol'yök) COLLEGE, a college for women at South Hadley, Mass., founded by Mary Lyon (q.v.), chartered in 1836 and opened in 1837 under the name of Mount Holyoke Female Seminary. From the first it has had a reputation for thorough scholarship; the curriculum was gradually enlarged and the entrance requirements raised until a full college course was given and the old seminary course entirely superseded. In 1888 the name was changed to Mount Holyoke Seminary and College, and in 1893 to Mount Holyoke College. Formerly three degrees were given, A.B., B.S. and B.L.; but A.B. is now the only degree conferred. The course is arranged in two years of required and two years of elective work; the curriculum in addition to other subjects may include courses in education, biblical history and literature, music and art; a limited amount of technical work in the two latter courses may count toward the degree. Provision is also made for graduate work leading to the degree of M.A., and for special work for teachers. Graduates are entitled to fellowships in the American School of Classical Studies at Athens, and in the similar school at Rome; also to the advantages of the Zoological Station at Naples and the Marine Biological Station at Wood's Hole, Mass. Entrance to the college is by examination, or by certificate from approved schools. The campus now includes over 150 acres; the principal buildings are Mary Lyon Hall, which occupies the site of the original building destroyed by fire in 1880, the Dwight Memorial Art building, Lydia Shattuck Hall for the physics and chemistry departments, the Lyman Winston Hall for the other sciences, the Skinner Recitation Hall, the observatory, the gymnasium and the Student-Alumnae Hall which contains a large auditorium and offices for the college organizations and publications and for the alumnae secretary, seven large and four small residence halls, and the library which contained in 1915, 58,200 volumes; there are also plant houses and botanical gardens. Full attention is given to physical training; regular gymnastic work is required for the first three years of the course, and there is provision for basket ball and tennis. In 1915 the productive funds of the college amounted to $1,390,219.15, the income for the year was $372,939.39; the students numbered 791, the faculty 93 with a staff of 27 assistants, and the total number of graduates, 4,870.

MOUNT OF OLIVES. See OLIVES, MOUNT OF.

MOUNT PLEASANT, Iowa, city, county-seat of Henry County, on the Chicago, Burlington and Quincy Railroad, about 120 miles east by south of Des Moines and about 28 miles west of the Mississippi River. It is in an agricultural region in which considerable attention is given to raising horses and livestock. Largé limestone quarries are in the vicinity. It was settled in 1834 by Pressley Saunders; incorporated in 1838, and chartered in 1851. The chief industrial establishments are flour and lumber mills, planing mills, brick and tile yards, potteries, wagon and carriage factories, grain elevators, repair shops and machine shops. It has considerable trade in grain, limestone, horses and livestock. It is the seat of the Iowa Wesleyan University (M.E.), founded in 1844, and until 1911 of the German Theological College (M.E.), now known as the Sioux City Theological School, which has 13 churches, a conservatory of music, a high school, public and parish schools, and a Carnegie free public library. The State Hospital for the Insane is located here. The government is vested in a mayor and council of eight members, all elected for two years. The city owns and operates the electricity plant and the waterworks. Pop. 4,078.

MOUNT PLEASANT, Mich., city, county-seat of Isabella County, on the Chippewa
River, and on the Pere Marquette and the Ann Arbor railroads, about 70 miles north by west of Lansing. It is in an agricultural and lumbering region, and the city has considerable manufacturing. The principal industrial establishments are brick and tile works, condensed milk factory, chemical works, lumber and flour mills, foundry, machine shops, woolen goods factory and furniture works. A Government Indian School and the Central State Normal School are in this city. Pop. 5,500.

MOUNT RAINIER NATIONAL PARK.
See Rainier, Mount.

MOUNT SAINT ELIAS. See Saint Elia, Mount.

MOUNT SAINT MARY'S COLLEGE, a Roman Catholic school, founded Emmitsburg, Md., in 1808. It was chartered by the legislature of Maryland, and the charter was amended in 1815, to enable the college to carry on its work more efficiently. There are 360 students in the scientific and classical courses. The faculty consists of 37 professors and instructors. The institution is under the direction of the secular canons, who also have charge of a theological seminary, in which 75 seminarians, belonging to various dioceses, are prepared for the priesthood. The library has 30,000 volumes. The property is valued at $400,000, approximately.

MOUNT-STEPHEN, George Stephen, Baron, Canadian financier: b. Dufftown, Banffshire, Scotland, 5 June 1829. He removed to Canada in 1850 where he engaged in mercantile business and became wealthy. He was afterward president of the Bank of Montreal and was conspicuous in promoting the completion of the Canadian Pacific Railway for which service he was knighted by the queen in 1888. He returned in 1888 to Great Britain and in 1891 was created Baron Mount-Stephen after a mountain in Caithness, where he was born. In 1897 he gave $500,000 for the founding of the Royal Victoria Hospital of Montreal; Sir Donald Smith (later Lord Strathcona) contributing an equal sum.

MOUNT STERLING, Ill., a town, county-seat of Montgomery County, on the Chesapeake and Ohio Railroad, about 70 miles west by north from Springfield. A fertile agricultural region surrounds the town, and coal and clay deposits are in the vicinity. The chief manufactures are tile, brick, flour, wagons and dairy products. The town owns and operates the waterworks. Pop. 1,986.

MOUNT STERLING, Ky., city, county-seat of Montgomery County, on the Chesapeake and Ohio Railroad, about 31 miles east of Lexington. It is in an agricultural region, and has considerable manufacturing. Its chief industrial establishments are flour and planing mills, a distillery, machine shops, a glove factory and furniture works. It has several private schools, good public schools and a public library. Pop. 3,932.

MOUNT UNION COLLEGE, in Alliance, Ohio, coeducational, founded in 1846 under the auspices of the Methodist Episcopal Church as Mount Union Seminary, and chartered as Mount Union College in 1858. It was the first consistently coeducational college in the United States. In 1911 Scio College, of Scio, Ohio, was amalgamated with it. Its courses lead to the degrees of A.B., B.S., Ph.B. and B.L. In 1919 there were connected with the school 20 professors and instructors and 316 students. Summer courses are provided for the long vacation.

MOUNT VERNON, the estate of George Washington, in Fairfax County, Va., on the right bank of the Potomac, 15 miles below Washington, D.C. The original name of the estate was Hunting Creek, and it contained about 800 acres. When it came into possession of Lawrence Washington, the brother of George, he changed the name to Mount Vernon, in honor of Admiral Vernon of the British navy. The house is of wood, erected on a bluff 200 feet above the river. It is a two-story house, 96 feet long and 30 feet deep. The main part was built by Lawrence Washington in 1743 and the wings were added by George Washington; the estate came into possession of George Washington in 1773 at the death of his brother. In 1855 the house and 200 acres of land around it was bought by the Mount Vernon Ladies' Association; the purchase money was $200,000, raised in great part by Edward Everett. Since then the Association has restored the house as nearly as possible to what it was in the lifetime of George Washington. A high piazza extends along the front of the house, and the six rooms on the ground floor contain many objects of historical interest connected with the life and times of Washington. The key of the French Bastille, the furniture used by the family, in the piazza the tiles which were brought from the Isle of Wight, and many other relics are objects of attraction to visitors. In the garden are a number of trees planted by Washington, and in the coach-house is his carriage. The room at the south end of the first floor is the one in which Washington died. In 1831 the body of Washington was removed from the old family vault to a tomb, a plain brick structure, which is near a wooded ravine, a short distance from the house. Behind an iron grating may be seen the two sarcophagi which contain the remains of George Washington and his wife, Martha.

The estate was willed by George Washington to Bushrod Washington, and at the death of the latter it came into possession of John A. Washington, from whom the Ladies' Association purchased the house and adjacent grounds, Consult Lossing, "The Home of Washington" (New York 1865); Page, T. N., "Mount Vernon and its Preservation" (New York 1910); Wilsits, P., "Mount Vernon, Washington's Home and the Nation's Shrine" (New York 1916); Wineberger, "Home of Washington at Mount Vernon" (Washington 1866).

MOUNT VERNON, Ill., city, county-seat of Jefferson County, on the Southern, the Wabash, Chester and Western, Chicago and Eastern Illinois, and the Louisville and Nashville railways, about 115 miles south by east from Springfield, 76 miles east of Saint Louis. The site for a city was first marked in 1819, and city lots laid out in 1840, and the city was incorporated in 1872. It lies in the north edge of the great Southern Illinois coal field, having one mine and is surrounded by splendid agricultural country, producing corn, oats, wheat, hay, fruit and vegetables. It has a plant for producing 22 wooden and 18 steel freight cars per day.
MOUNT VERNON — MOUNTAIN ASH

its chief manufacturing, constantly operating to near full capacity. Its other manufactures are cut-glass, cotton bales, ice-cream, railroad cross-ties, preserving, concrete, brick, flour, bread and pastry, mattresses. Dairying is fast becoming the chief industry on the farm.

Its chief public buildings are the county courthouse, State appellate courthouse, Federal post office, six grammar schools employing 32 teachers and a high school employing nine teachers. The city spends on school maintenance annually $48,000. There are 12 principal churches, some of them very excellent edifices. The government is under a charter under the general statute of the State, mayor and 12 councilmen who hold office for two years. Pop. 10,124.

MOUNT VERNON, Ind., city and county-seat of Posey County, on the Ohio River near the mouth of the Wabash, and on the Chicago and Eastern Illinois and the Louisville and Nashville railroads. It is in a rich agricultural region in which principal crops are corn, wheat and hay. Coal is plentiful in the near vicinity and the city is underlaid with two good veins of bituminous coal. It lies on a large flat top basin, over four miles in extent, one of the very few places on the Ohio River never endangered by high waters. The principal industries are flour mills, hominy mill, straw board plant, foundry and machine shop and products, lumber and lumber products. It has seven churches, seven public schools, including an accredited high school, and one parochial school, a modern courthouse and a Carnegie-Alexandrian free public library. The three banks have a combined capital of $200,000 and annual business of $10,000,000 and annual clearings are $1,000,000.

The government is vested in a mayor and a council of six members, each of whom holds office four years. Pop. 5,563.

MOUNT VERNON, N. Y., city in Westchester County, on the Bronx River and Hutchinson river, an arm of Pelham Bay, and on the New York, New Haven and Hartford, and the New York Central and Hudson River and New York, Westchester and Boston railroads, adjoining New York city on the north, and about 13 miles from the Grand Central station in New York. Electric lines connect Mount Vernon with New Rochelle, Yonkers and a number of the villages and cities in the vicinity. Rapid transit lines from New York city extend almost to Mount Vernon (1903) and the present plans provide for the extension of the lines into the heart of the city. Mount Vernon is really a residential suburb of New York; a large part of the city is restricted for residential purposes. It was founded in 1832 and in 1892 was chartered. It has several industrial establishments and considerable trade, chiefly in the products of market-gardens and as a distributing centre for the nearby sections of county.

The Westchester Lighting Company is located here. It has about 1,000 employees, and furnishes for many places in Westchester County, lighting that is superior to the best for public and private uses. The streets and avenues are well-paved and well-kept. The handsome lawns and gardens and the great number of shade trees make the city most attractive. Some of the prominent buildings are the Mount Vernon Hospi-

MOUNT VERNON, Ohio, city, county-sea of Knox County, on the Kokosing River, and on the Cleveland, Akron and Cincinnati and the Baltimore and Ohio railroads, about 40 miles northeast of Columbus and 85 miles southwest of Cleveland. It is in an agricultural region and near the natural gas belt. The chief industrial establishments are a foundry, the Corliss engine-works, flour and lumber mills, forge, a glass works, a gas works, and the Ohio Valley Railroad repair shops and bridge works. It has considerable trade in manufactured articles and in farm and dairy products. The Hiawatha Park, the courthouse, the library and fine church and school buildings; all contribute to the attractive features of the place. The city owns and operates the watersheds. Pop. 12,000.

MOUNT WASHINGTON. See WASHINGTON, MOUNT.

MOUNTAIN ASH, Wales, a coal and iron-mining town of Glamorganshire, five miles south of Merthyr-Tydfil. The principal buildings comprise the parish church of St. Margaret, the Workman's Hall, a library and reading-room, etc. Pop. 42,246.

MOUNTAIN ASH, QUICKEN TRE or ROWAN TREE, popular names for a small European tree (Sorbus aucuparia) of the order Rosacea, and, by extension, for two American species. The European species is an erect, graceful tree about 30 feet high with odd-pinnate leaves; corymb of small yellowish-white flowers followed by globular orange colored acid fruits. It is frequently planted for ornament and seems to thrive upon any soil except that which is very heavy or very light, or poorly drained. It does well in the cold north beyond the range of most fruit trees, and there the fruits are often made into preserves. The hard, compact wood is used for turning, cabinet work, etc. In Europe its twigs are highly prized by the superstitious as charms and as guardians against evil spirits.

The American species (S. americana), which resembles the preceding, ranges from Labrador to the mountains of North Carolina and from there irregularly northwestward to Manitoba. With the exception of its leaves, which is lower and inferior, it is used like the first species. The elder-leaved species (S. scopulina) ranges from Pennsylvania and Michigan to Labrador and an allied species extends in eastern Asia as far south as Japan. Its flowers and fruits are larger than those of the previous species.
MOUNTAIN BEAVER — MOUNTAIN CLIMBING

and its leaves are more like those of the elder. In the southern part of its range it is only occasional; in the northern, common. Both American and European species are edible. The latter is regarded as extremely perilous, mountain climbing or mountaineering now claims hundreds of thousands among its devotees. The effort, endurance and skill required by the sport are in themselves physical virtues which carry their own rewards. Far beyond this is the profound mental invigoration from association with nature in her most majestic phases and awe-inspiring moods. Mountain climbing may be properly viewed as of two distinct classes, according to the goal to be attained; the easy and the difficult. The ascent of the lower mountains like the White Mountains, the Adirondacks, or the Carolina mountains is a very common amusement for summer visitors in such regions, and demands no special adaptability. The slight rarefaction of the air at the elevation to which these summits reach do not seriously affect the untrained climber. But for elevations higher than 10,000 feet above the sea-level a special type of physical development is required, and as a rule a long and persistent cultivation becomes necessary. There are a few individuals who are naturally fit, possessing the requisite qualifications without preliminary training. They are of the class who have at sea-level a pulse beat below the normal — about 60 beats to the minute. This slow pulse will have risen to not more than 70 or 75 beats per minute at 10,000 feet elevation, while a normal pulse beat of 70 at sea-level will rise to 90 or 95 at 10,000 feet, with the consequent distress, requiring frequent and prolonged rests. But aside from this peculiar physical disposition other qualifications are needed to make a successful and exultant mountaineer — a delicate sense of balance, cool-headedness, fearlessness, imperturbability, bold and persistent spirit. The latter, once the course of training to which an ambitious member of the British Alpine Club submits himself begins with rock and crag climbing among his home mountains; and then follow progressively the Swiss mountains, the Caucasus, the Southern Alps of New Zealand, the Siberian Atlas or the mountains of Chinese Turkestan, and last, the Himalayas. It is a fact, however, that several of the high Himalayas do not demand as much real climbing as mountains much lower, for in not a few cases more may be taken in the Himalayas to heights of 18,000 to 20,000 feet, leaving comparatively little toil to the mountaineer. On the more rugged mountains the ascent of 3,000 feet elevation is regarded as a full day's work, while on several rumored ascents of mountains which have gained through repetition a certain historical position, it is generally accepted that the pioneer of mountaineering as it is understood to-day was Jacques Balmat, who, with Michel Paccard, at the instigation of the scientist de Saussure, made the ascent of Mont Blanc in 1786. The following season Balmat piloted Professor de Saussure and a party safely to the summit of Mont Blanc, no other Alpine peaks were soon recorded, but they were almost exclusively by explorers for scientific information. Amateurs began to become interested in the sport soon after 1850, and a party of English tourists succeeded in ascending Mont Blanc without a native guide in 1856. But the systematic and scientific climbing of mountains had its growth from the formation in 1857 of the first Alpine Club in London, which was organized to enlarge "the community of feeling among those who in the life of the High Alps have shared the same enjoyments, the same labors and the same dangers." Alpine Clubs.—Alpine clubs and mountain-climbing societies have since been organized in nearly all continental countries. The European clubs and societies have an aggregate membership of over 120,000; the consolidated German and Austrian clubs having 75,000; Italian, 14,000; French, 6,000; and Swiss, 12,000.

Climbing Records.—The records of mountain climbers cover all nationalities and various years from Balmat (1787) to Dr. Stuck (1912). The highest point thus far climbed in foreign lands was 24,583 feet by the Duc d'Abruzzi in 1909 in his climb of Mount Bride in the Himalayas. He did not reach the summit, some 600 feet higher. Previous to this feat the record had been held by W. W. Graham, who in 1883 reached a height of 24,015 feet. In North America, the Duke of Abruzzi, and his party reached a height of 18,024 feet on Mount Blackburn in 1897. In South America, S. Vines climbed 22,860 feet to the summit of Aconcagua in the Andes in the same year. In 1903 Mrs. Workman accompanied her husband, Dr. W. H. Workman, to the summit of Lulungma in the Himalayas, a height of 22,865 feet. In the United States the more recent notable ascents have been that of the South Peak of Mount McKinley on 7 June 1912 by Dr. Hudson Stuck and H. P. Karstens — a height of 20,300 feet; and that of Mount Blackburn (16,140 feet) by Miss Dora Keen on 19 May 1912.

The Bureau of Associated Mountaineering Clubs of North America was organized in May 1916 by nine clubs and societies. Seven more clubs joined the association. The number of clubs and societies affiliated in 1917 the combined membership was about 12,000. The societies included in the association were:

The American Alpine Club, of Philadelphia and New York; the American Civic Association, of Washington, D. C.; Appalachian Mountain Club, of Boston and New York; British Columbia Mountaineering Club, of Vancouver; Colorado Mountain Club, of Denver; Explorers' Club, of New York; Fresh Air Club, of New York; Geographic Society, of Chicago; Geographical Society, of Philadelphia; Green Mountain Club, Inc., of Rutland, Vt.; Hawaiian Trail and Mountain Club, of Honolulu; The Mazamas, of Portland, Ore.; The Mountaineers, of Seattle; Prairie Club, of Chicago; Sierra Club, of San Francisco; and the United States National Parks Service Club, of Washington, D. C. The Alpine Club, of Canada, while not a member, is affiliated with the association.

The object of the association is declared to
be to unify effort in the preservation of natural scenery, including also bird and animal life, trees and flowers; the creation and development of national parks and reservations; and the opening of mountainous regions with trails and shelters.

Accidents.—In the Alpine countries, thousands of Swiss, Italians and Tyrolean have become professional guides, and their skill exceeds that of the most scientific of learned Alpine club members. Hundreds of lives amount; both visitors and guides have been lost in the Alps, but this fact does not appear to deter thousands of others from making ascents each year. Accidents in mountain climbing rarely occur when guides are employed and reasonable precautions are taken. Occasionally a foothold seemingly secure gives way; but more frequently the fall occurs because the climber is overreached or has started too quickly, without the necessary training. Over-exertion of either body or mind is always to be avoided. The use of the alpenstock and the ice-axe in mountain climbing, as well as general directions for making an ascent and descent, are fully set forth in a manual prepared under the auspices of the London Alpine Club, entitled 'Dent's Mountaineering.'

The bibliography of mountain climbing is very voluminous, and is eagerly sought after by a large number of persons detached by physical inability from engaging in the rigorous exercise, but who are none the less ardent mountaineers at heart. The following named volumes are only the more prominent of those published in recent years. The extensive library of the American Alpine Club was recently placed in the custody of the New York Public Library, which compiled and printed a complete list of the books and pamphlets, to be had upon application.

Bibliography.—Abraham, G. D., 'Complete Mountaineer' (London 1907); 'On Alpine Heights and British Crags' (Boston 1916); and 'Swiss Mountain Climbs' (London 1912); American Alpine Club, 'Alpina Americana' (Philadelphia 1907-14); Appalachian Mountain Club, 'Guide to Paths in the White Mountains and Adjacent Regions' (Boston 1916); Bell, J. M., 'The Wilds of Moiriland' (London 1914); Belloc, H., 'The Pyrenees' (London 1909); Bent, A. H., 'Equipment for Mountain Climbing' (Boston 1916); Bowman, L., 'The Andes of Southern Peru' (New York 1916); Browne, B., 'The Conquest of Mount McKinley' (New York 1913); Burlingham, F., 'How to Become an Alpinist' (London 1914); Burpee, L. J., 'Among the Canadian Alps' (New York 1914); Coleman, A. P., 'The Canadian Rockies: New and Old Trails' (Toronto 1913); Conway, Sir W. M., 'The Alps from End to End' (London 1905); Cook, F. A., 'To the Top of the Continent' (New York 1908); Du Faur, F., 'The Conquest of Mount Cook' (London 1915); Farrer, R. and Compton, E. H., 'The Dolomites' (London 1913); Filippi, F. de, 'Karakoram and the West Himalayas' (London 1912) and 'Rwenzori' (London 1909); Freshfield, D. W., 'Exploration of the Canadian Rockies' (London 1912), and 'Rwenzori' (London 1909); Gribble, F., 'The Early Mountaineers' (London 1899); Hamer S. H., 'The Dolomites' (London 1910); Holtz, M. E., and Bemis, K. I., 'Glacier National Park: Its Trails and Its Treasures' (New York 1917); Kilbourne, F. W., 'Chronicles of the White Mountains' (Boston 1916); King, C., 'Mountaineering in the Sierra Nevada' (New York 1907); Lewis, T. H., and Munson, S. C., 'The Upper Engadine' (London 1907); Mills, E. A., 'The Rocky Mountain Wonderland' (Boston 1915), and 'Your National Parks' (Boston 1917); Morley, M. W., 'The Carolina Mountains' (Boston 1913); Muir, John, 'Our National Parks' (Boston 1909), and 'The Mountains of California' (New York 1911); Mummm, A. L., 'Five Months in the Himalayas' (London 1909); Neve E. F., 'Beyond the Pir Panjal' (London 1912); Peck, A. S., 'A Search for the Apex of America' (New York 1911); Ross, M., 'A Climber in New Zealand' (London 1914); Turner, S., 'My Climbing Adventures in Four Continents' (London 1911); Workman, F. B., and W. H., 'Peaks and Glaciers of Nun Kun' (London 1910), 'The Call of the Snowy Himalayas' (New York, 1911), and 'Two Summers in the Ice Wilds of Eastern Karakoram' (London 1917).

MOUNTAIN ERYNGIUM. See BAUHINIA.

MOUNTAIN-FEVER, or MOUNTAIN-SICKNESS. The term mountain-fever was applied formerly to a fever accompanied by delirium, diarrhea, etc., which occurred quite frequently among mountaineers in the Alps, especially those in the western part of the United States. It is now generally conceded that this form of fever is essentially typhoid, modified by the effects of extreme altitude. The term mountain-sickness (sometimes used synonymously with mountain-fever) means a condition produced by the action of rarefied air upon organic functions, especially in persons who exercise considerably. The fact that the same symptoms are caused in persons who climb mountains to the height of several thousand feet and in those who ascend in balloons to twice as great a height is accounted for by the exhaustion caused by the climbing. The intake of oxygen is diminished in high altitudes; the pulse is quickened, and the body-temperature is raised to 100°-101° F. Difficulty in breathing, headache, vertigo, nausea and vomiting are likely to occur. Hemoptysis is rare, although it is found in tuberculous patients who have sought health in the mountains. Rest and acclimatization are the remedies and oxygen has been given to offset the diminution of it in the air. It is also administered through the stomach in the shape of chlorate of potash, the aim being to keep up the normal constitution of the blood which at high altitudes is not always freed from carbonic acid, an account of the inadequacy of the lungs to exchange it.

MOUNTAIN GOAT. See ROCKY MOUNTAIN GOAT.

MOUNTAIN LAUREL, or AMERICAN LAUREL, a shrub of the genus Kalmia of the order Ericaceae. The few species which are native to North America and Cuba are mostly shrubs and hybrids, and of ornamental, especially when in flower, the blossoms being usually in terminals corymbs or axillary umbels, individually of medium size, white, pink or purple. On account of their beauty and
hardiness most of the species are very popular for planting in parks and private grounds even in the northern States and southern Canada. They do well in ordinary garden soil if not too clayey, but thrive better in peaty loam, particularly if partially shaded. They require plenty of moisture and will do well even in marshy soil. The best known species is probably *K. latifolia*, most frequently known by the above names and also as calico-bush and rhododendron. It ranges from New Brunswick to Ohio and southward to Florida. Sheep-laurel (*K. angustifolia*), also known as wicky and lambkill, extends from Labrador southward to Georgia. These two species are the most conspicuous flowers in the Alleghany Mountains during the early summer. *K. polifolia*, also found in the East, is common in the Rocky Mountain region from Alaska to California. The deciduous species *K. hirta* and *numeata*, range southward from North Carolina. They are less planted in the north than the first two species.

**MOUNTAIN LIMESTONE**, a term commonly used in England of the stratum in southern England and Wales at the base of the carboniferous deposits. The phrase was also used for a time of the subcarboniferous limestones of American plains, but has now been dropped. It contains many fossils, especially crinoids and some important fossil fish. Its commercial value, apart from its being a bearer of lead and zinc ores, lies in its use as building stone, since it is capable of a high polish, and for the preparation of lime.

**MOUNTAIN LION.** See COUGAR.

**MOUNTAIN MAHOGANY,** the sweet or black birch. See BIRCH.

**MOUNTAIN MEADOWS MASSACRE,** in American history, a massacre of Western emigrants, near Mountain Meadows, Utah, in September 1857. The emigrants numbering 140 souls were on their way from Arkansas and Missouri to Southern California. While in camp in the valley of Mountain Meadows, in Washington County, they were attacked by Indians and it is alleged by Mormons disguised as Indians. They were surrounded for three days, when under promise of protection by John D. Lee, a Mormon and Indian agent, they left their barricade of wagons; where- upon the attack was renewed and every person of the 140, slaughtered excepting 17 young children. These were distributed among Mormon families but were afterward restored to their relatives by the United States government. The Mormons have always been blamed for the massacre. Lee was executed for the crime in 1887, but a number of his codefendants were acquitted. Lee in his confession asserted that the massacre was ordered by Brigham Young and other Mormons high in authority, but the facts are not certain. Consult "Confessions of John D. Lee" (Saint Louis 1891); Bancroft, H. H., "History of Utah" (San Francisco 1889); Linn, "Story of the Mormons" (New York 1902).

**MOUNTAIN TEA.** See GAULTHERIA.

**MOUNTAINS.** A high elevation of land is called a mountain; a low elevation, a hill. The application of the term "mountain" varies in different localities. In the low lands, where the elevations are not numerous, and do not reach a great height, a rise of ground of about 100 or 200 feet is called a mountain; while in a mountainous country an elevation of 1,000 feet, or less than 2,000 feet, is often called a hill. Prominent parts of mountains or isolated mountains are called peaks. Some of the common names applied to the parts of a peak, or mountain, are summit, base, slope, crest, pinnacle, needle, knob. A series of connected mountains form a ridge, range or chain; if the mountains extend a considerable length, the whole is called a range or chain; if short, a ridge. A group of parallel ridges or ranges, or of ridges or ranges near together, usually resulting from similar causes, is called a mountain system; and several systems combined form a cordillera. An elevation with a level-topped area of considerable extent is called a plateau and is usually associated with mountains. Many of the highest mountains of the world rise thousands of feet above the basal platform of the plateau. The mesa is a large level-topped section of the plateau; the butte is a small section. Valleys, lower land than plateaus, exist between the ridges, ranges or systems. A wide valley is called a basin. The interior basin area of Australia is over 51 per cent of the whole area; of Africa, 31 per cent; of North America, 32 per cent, and of Eurasia, 28 per cent. (See Great Basin; Valleys). Low, narrow places in mountain ridges and chains are called passes. The depressions among the mountains contribute in a great measure to a solution of the causes which have determined the kind and location of the vast elevated land masses of the earth.

Mountains have been variously classified, but the following outline embraces most of the important classes which have been described.

1. **Folded Mountains.**—These make up the great mountain systems of the world, and usually consist of very thick sedimentary rocks which by lateral compression have been thrown into more or less closely compressed series of folds or flexures. When first folded, the uparches or anticlines constitute mountains, the troughs or synclines form valleys. Such a situation is found in the Jura Mountains, in Switzerland. In other cases the folds may have been completely worn away to a plain and uplifted. Erosion has then etched out the softer rocks, leaving the edges of the harder rock layers projecting. In such cases the ridges may be the syncline, the flanks of the fold, or the anticline, wherever the hard layer of rock may happen to be. This latter is the history of the Appalachian Mountains. Mountains are frequently regions of intense igneous activity, and the cores of ranges are often occupied by enormous bodies of granitic rock which have melted their way into the sediments, as in the case of the large batholith core of the Sierra Nevada Mountains, in California. The cause of the compression which produces such folds is by no means clear. By some it is attributed to the fact that the supposed molten interior of the earth cools and contracts and that as a result the crust, in accommodating itself to the smaller nucleus is forced to crumple. Others believe that great wedge shaped blocks of the earth's crust settle toward the centre, and so crowd one another that crumbling is produced.
at the borders of the blocks. Whatever may be the cause, the fact remains that some enormous force causes lateral thrust, throwing the rocks into great folds and producing thus all the great mountain systems of the world. See Folds.

2. Fault Mountains.—Sometimes great breadths occur in the earth's crust, one side of the fracture dropping hundreds of feet, and leaving the elevated block as a mountain. Many of the ranges of western Utah and Nevada are of this origin. See FAULTS.

3. Volcanic Mountains.—Mountain ranges are rarely formed by volcanic action alone, but isolated peaks are often of this origin. Volcanic cones, great piles of lava and ash, form one type, of which Mount Shasta is one of our best-known examples. Recently formed cones are often beautifully symmetrical, as are those of Hood and Shasta. But as soon as activity ceases, denudation sets in, the cone becomes gashed with valleys, and in course of time only the harder central plug is left as a volcanic neck. Such plugs are common in the Puy region of central France, and in the region of New Mexico. Sometimes masses of igneous rock are intruded under sedimentary beds in the form of laccoliths (q.v.), arching up the beds to form elevations such as the Henry Mountains in Utah. Many ranges of folded earth are the result of folding, as in the case of Mount Hood and other cones on the folded Cascade Range. See BATHOLITHS; CONE; LACCOLITH; VOLCANO.

4. Residual Mountains.—When great areas are uplifted bodily without folding, they form plateaus. When such a plateau is greatly dissected, it becomes mountainous in topography, merely because some parts are not worn away as fast as others. These are residual mountains, or mountains of circumdenudation. The Alluvial Plains are a region of this type. Whatever may be the cause which makes the uplift on the earth's surface, denudation begins as soon as the peak appears, and formation and destruction are conjoint agents in making the mountains what they are on the surface of the earth. Before the work was completed the elements have begun their work of shaping and sculpturing, but the destructive agents at first work more slowly than the constructive. The chief agents of changes after formation are frost, wind, and water. The position of a mountain gives some idea of its rock structure, and its rock structure and form tell something of its age. The presence of hard rock in a mountain is often shown by the upright peak whose faces may be comparatively bare, but which points up, resisting wind and water. Pike's Peak is granite rock. The White Mountains, N. H., have many hard rocky peaks; the Matterhorn, in the Alps, is a hard crystalline rock, and some of the Alaska peaks are examples of almost unyielding formations that appear to defy the agents. Remarkable examples of the sculpturing of the mountains by water are shown in the gorges in the Rocky Mountains, the removal of soft layers leaving the hard rocks standing like gigantic castellated ruins. The high, sharp pointed peaks and the irregular rugged surfaces indicate that the mountains are of comparatively recent date of the earth. The Adirondacks, with their low, rounded tops, their comparatively uniform slopes, show that long periods have passed since their formation; erosion and weathering have removed much of the ruggedness and sharp angularities that once existed. Along the Atlantic Coast east of the Appalachian Mountains the low round hills are remnants of mountains that were once high mountains. If given sufficient time, erosion will reduce the highest mountains to low featureless plains.

The mountains of the world are distributed with remarkable uniformity. The longest and highest ranges of North and South America face the Pacific Ocean, and extend almost due north and south. The longest and highest ranges of Eurasia extend nearly east and west. Starting from the highest plateau in the world, Pamir, in Asia, there are extending west, mountain ranges which are continuous through Europe to the Atlantic, and, also, with low depressions, along the eastern coast of Africa to Cape of Good Hope. Passing east from the plateau of Pamir are lofty mountain ranges extending to the northeastern part of Asia, which is the Mount Tai, the highest range which skirts the western coast of the Americas. The highest mountains in the world are the Himalayas; the highest peak, Mount Everest, is fully 29,000 feet high. High mountains exist on the bed of the ocean. A number belonging to the submerged Atlantic continent have been located, and their elevation determined. Some of the most prominent are Mount Chaucer, located in 1859, in lat. 42° 50', long. 28° 50', crest 284 feet from the surface; Mount Saimshion, in lat. 45° 50', long. 42° 20', discovered in 1832, height about 11,000 feet. Another important submarine mountain is the Laura Ethel, discovered in 1878, its crest about 216 feet below the surface. A group of submarine mountains, in lat. 43°, long. 22° 30', has been named Edward the Seventh Range. Other Atlantic peaks are Tillston, Bright, Placentia and some in lat. 45° and long. 48°. Mount Placentia is only about 30 feet below the surface.

The mountains of the world are the great depositories for the world's mineral wealth. The large proportion of the valuable metals in general use in the world have been obtained from the mountains. This is probably due to the close relation between mountains and igneous activity. (See Ore Deposits). Mountains affect the climate by protecting from cold winds or by preventing the ocean breezes from cooling the interior of countries in tropical regions, and by controlling in a great measure the rainfall. (See CONDENSATION). The flora and the fauna, so dependent upon climate, are modified greatly by the mountains. The elevations are the great water-reservoirs of the world; they store almost the whole supply of water which falls on the earth's solid surface and distribute it in channels throughout the land. Lakes and springs are common in mountains. These elevated bodies of water have been most important in determining the history of the world. They are natural boundaries, they have protected the weak from the strong, the civilized from the savage, and many sturdy, powerful races of to-day owe their early elevation to the mighty natural barriers which stood between
them and a stronger and more ferocious race. The mountains of the world have affected the literature and art of the world, and these influences are still felt wherever a mountain uplifts its crest.

MOUNTAINS OF THE MOON. See MOON, MOUNTAINS OF THE.

MOUNTED POLICE. See POLICE.

MOURNING. In most nations from the earliest ages it has been the custom of bereaved persons to testify their grief for the loss of friends or relatives by some external change of dress and deportment. The eastern nations and the Greeks cut off their hair, the Romans allowed the beard and hair to grow, in mourning. Different colors have been adopted as badges of grief; the ancient Egyptians wore yellow; the Etruscans, gray; the Roman and Spartan women, white, which is still the color of grief in China, Japan and Siam; in Turkey, blue and violet; and in the other European countries, black is used for this purpose. Some have attempted to trace the associations by which the colors acquired their character to natural causes; but it must be allowed, with little success. The Jews, in sign of grief at the loss of their relatives, rent their garments, tore their hair and wore coarse garments of a dark color; they went barefoot, neglected their persons and performed other acts of penance. The term of mourning with them was from 7 to 30 days. Among the Greeks and Romans it was the custom to lay aside all ornaments of dress, to abstain from the bath and all indulgences. The kings of France mourned in violet. Among the ancients, as among the moderns, public mournings were common on the death of the sovereign or of a distinguished public benefactor. The period of mourning differs in different countries, but in all is generally regulated by the nearness of relationship between the survivors and the deceased. In Scotch law a widow has a claim to mournings for her husband where his estate or rank requires mourning in point of decency. Mournings for such of the deceased's children as are to be present at the funeral also form a privileged debt. In the United States the customary period of mourning for widows is one year.

MOURNING-CLOAK. A butterfly. See CAMBERWELL BEAUTY.

MOURNING-DOVE. See DOVE.

MOUSCRON, moos'kron, Belgium, town in the province of West Flanders on the French border and located on the Ghent and the Oudenaarde-Mouscron railways, 32 miles distant from Ghent. It has a customs station, episcopal college, cotton and woolen goods factories, a brewery, etc. In 1910 it had 22,122 inhabitants.

MOUSE, a small rodent mammal of the family Muridae, the larger members of which are called rats, hamsters, lemmings, voles (q.q.v.), etc.; specifically, the house-mouse (Mus musculus), originally Asiatic, is now widely domesticated. The family is an extremely large one, embracing some 300 well-established species, and is distributed over the whole world except the islands of the Pacific. A mouse is the only native mammal of Australia besides the dingo (q.v.) not a marsupial. The character and width of the incisor teeth of this family vary in size from some smaller than a house-mouse to the bigness of the American muskrat (q.v.), and exhibit much diversity in form, especially in respect to the limbs, which in woodland and aquatic species are usually of nearly equal size, but in those that dwell on prairies and deserts are far from it, the hind-legs there becoming immensely enlarged and serving as almost the only means of safety (by leaps), while the fore-legs are of little use except as hands in holding the food. It is a characteristic of mice, as of squirrels, to lift the food to the mouth and gnaw it while the animal sits up on its haunches. The pollex (thumb) on the fore feet is a mere wart-like rudiment; but the hind feet have five full toes, and in some aquatic species these are connected by webs forming swimming feet. The skull is shapely, the nose is long, pointed, hairy, keenly sensitive to odors, and protected by remarkably long tactile hairs (whiskers); the eyes and ears are usually large, for these animals are mainly nocturnal in habits; and the teeth are peculiar in that the lower incisors are compressed and pointed, and the molars (usually three on each side) are rootless. The tail in nearly all rats and mice is long, always thinly haired, often naked or scaly, and in aquatic species as the muskrat is compressed into a powerful sculling oar. Most species burrow or make their homes in holes; a few are arboreal. The nearest relatives of the group are the dormice, mole-rats, jerboas and pouched rats or gophers, a list which shows that the word 'mouse' or "rat" is popularly applied to many small rodents outside the Muridae. This family is divisible into 10 sections—Murina, or typical Old-World mice; Hydromysina; Phyncomysina; Gerbillina; Otowymysina; Dendromysina; Lophiomysina; Microtina, or voles; Sigmodontina, or hamsters; and Neotomina.

The first sub-family contains the various rats (q.v.), the house-mouse, the delicate harvest-mouse and more than 100 other species of Europe and Asia, which agree in having wide upper molars marked by three series of tubercles and in other distinctive peculiarities. The house-mouse has been a denizen of men's habitations probably ever since housekeeping began, finding there safety from many natural enemies, opportunities and materials for making a plentiful daily food. It accompanies mankind wherever he goes, and soon replaces in frontier houses the local wild mice which for a time attempt to imitate its domestic habits. These mice are about three inches long, the tail measuring one and one-half inches more. The general color is bluish or dusky brown, but is subject to variation and influenced by climate, food and other external conditions. Albino or "white" mice, with pink eyes, are kept as pets, also black and piebald ones; and these breeds
are easily maintained by selective breeding. Such pets are readily tamed and taught simple tricks. Certain individuals, known as "singing mice," make, especially at night, a pleasing whistling noise, like feeble chirpings of a canary, and in the same sort of a tune. It has been heard from the wild-mice, and is believed to result from an asthmatic condition rather than to be a normal musical utterance. The fecundity of mice is excessive. From six to ten young are produced in a litter, and this species brings forth several times in the year. In about a fortnight the young are able to shift for themselves, although born in a helpless condition. This illustrates how sometimes, under especially favorable conditions, mice may multiply far beyond normal numbers and overrun the country as a devastating plague, instances of which are mentioned under Field Mouse. The two most common European types, the long-tailed brown field-mouse (M. sylvaticus) and the diminutive harvest-mouse (M. minutissimus), are farmers' pests, destroying large quantities of grain. The harvest-mouse is one of the smallest of mammals and constructs a beautiful and elegant little nest of the blades of grass or corn, entwined round and supported by the stalks of the corn or wheat. A similar smaller species in South Africa weighs only a quarter of an ounce. These out-door specimens hibernate during winter and lay up an autumnal store of grain in their nests and burrows—a matter in which great diversity of habit exists elsewhere in the family.

American native mice are all of one or the other of the remaining sub-families, or else do not belong to the Muridae at all. The short-tailed meadow-mice (see Field-Mouse), the neotomas (see Wood-Rat), lemmings (q.v.), and their allies are elsewhere described. The most of our smaller mice belong to the sub-family Sigmodontinae, characterized prominently by having cheek-pouches, and represented in the Old World by the hamsters. Five genera and about 75 so-called species have been catalogued, but probably further study will greatly reduce the number. Onychomyss is a rather short-tailed fossorial genus living in the plains region and northern Mexico. Sigmodon is another genus of Florida and the Southwest, taking its name from the sigmoid form of the cusps of the molars; Reithrodontomys embraces several very small burrowing brown mice of the same region; and Otomys includes the large, handsome "rice-field mouse" of the Southern States (O. palustris). The fifth genus, Peromyscus, contains the most numerous and familiar of the long-tailed field-mice. These are the "wood-mice," "deer-mice" and "cotton-mice," more familiar under the old name Hesperomys, and commonly represented by the white-footed mouse (P. americanus, or H. leucopus), which occurs all over the more temperate parts of the continent. This species is somewhat larger than the house-mouse, and is yellowish brown above, darker on the back, the lower parts of the body and tail and the upper surface of the feet white; the young are dark slaty; the eyes and ears are large, and the fur long and soft. It is nocturnal in its habits, as active as a squirrel, and is found in fields and woods, and in dwellings of all sorts of people, and in newly settled districts comes into dwellings and granaries and is as mischievous as the house-mouse. Species with similar habits are a beautiful golden-haired southern one (P. auriculus); the large, dark-brown, gray-bellied cotton-mouse (P. gassyprius), only numerous in the South Atlantic States; the "red-backed" or Michigan mouse (P. michiganensis) of the North Central States, and several others.

Bibliography.—Couses and Allen, 'Monograph of the Rodentia' (Washington 1877); Merriam (and others) 'North American Fauna' (Washington 1899 and subsequently); Stone and Gram, 'American Animals' (New York 1902); Ingersoll, 'Wild Life of Orchard and Field' (New York 1902); and the books of Audubon, Godman, Kennicott, Merriam, DeKay, Baird, Couses, Herrick and other naturalists.

Ernest Ingersoll.

MOUSE-BIRDS, a group of peculiar birds of central Africa, constituting the family Coliidae and the suborder Colli, and also known as colies. They are of small size, grayish colors, marked with darker tints and in some species with touches of brighter colors; have finchlike beaks, crests, short, weak wings, very long tails and remarkably strong feet. They are active, but fly little, spending their lives mostly in creeping about the branches of trees in a way that with their dun colors strongly suggests the behavior of mice. They are fond of hanging head downward, and at night gather in bands that roost together in hanging postures as closely as they can crowd. Their food consists mainly of fruit; and they place their cup-shaped nests in low trees and bushes.

MOUSE-DEER. See Chevrotain.

MOUSE-EAR, the name of various small plants, suggested by the shape and appearance of the leaves: (1) a borage of the genus Myosotis, more generally known in the United States as "forget-me-not" or sometimes "scorpion-grass," small furry herbs, growing in damp and shady places through the temperate regions and bearing blue or yellow flowers; (2) the marsh cweedweed (Myosotis palustris). (See Cudweed). (3) One of the wound-worts (Stachys germanica). (4) Any of several chickweeds (q.v.), especially the widely scattered Cerastium vulgare. (5) The cats-foot, or plain-leaved everlasting (Antennaria plantaginifolia). (6) A European hawkweed (Hieracium pilosella). (7) The cruciferous plant Sisymbrium Thaliana.

MOUSE-LEMURS. See Chiromale; Lemur.

MOUSTERIAN STAGE, a period in the history of Paleolithic man in southwestern Europe when men had made considerable advancement in the arts of working in flint and other stones, and in the graphic arts. See Stone Age.

MOUTH (oral or buccal cavity), primarily the nearly oval cavity at the commencement of the alimentary canal or digestive tract, into which food is taken, and from which the voice issues. In birds, in bats and in many houses, and making a dwelling resembling a covered bird's nest; it feeds principally on grain, seeds, nuts and insects; and in newly

of taking into the mouth, or chewing anything not food is to be regarded as a survival into later days of a characteristically infantile trait. A possible exception to this is kissing which is customarily retained in most civilized races as an expression of affection.

MOUTH — MOVING PICTURES

MOUTH, Diseases of the. The principal diseases of the mouth may be classified as follows: Inflammation of the mucous membrane and its results; epulis, gumboil, ranula, salivary calculus and salivary fistula.

Inflammation of the Mouth (Stomatitis). — This disorder is usually caused by local irritants, such as scalding drinks, corrosive substances, jagged teeth or tartar. Suitable remedies are: Cooling and demulcent washes, soft food, building up of the strength and removal of tartar or other sources of irritation. Inflammation invading the mucous follicles, usually in debilitated children or from the irritation of teeth or as the result of an eruption (herpes) is follicular stomatitis. It is attended with thin spots of white exudation, but there is no breach in the surface of the mucous membrane. The patient is troubled with difficulty; the mouth is hot and tender; the submaxillary glands may be swollen. The remedies are as above given, with the addition of a disinfectant to the mouthwashes. The terms aphthæ and thrush (q.v.) are given to a stomatitis, usually follicular, attending by curd-like exudations with ulceration beneath the exudates (ulcerative stomatitis). The disease may be conveyed to the nipples of the nursing woman. In true aphthæ the exudations are due to a microscopic fungus, the Oidium albicans. In treatment the child is to be carefully fed, its mouth kept clean and disinfecting, and the bowels regulated. Borax or tincture of myrrh, well diluted, is a good mouth-wash. Do not use honey. Canker refers to isolated superficial ulcerations of the mucous membrane, usually the result of debility and dyspepsia. Remedy these two conditions and touch the spots occasionally with nitrate of silver. Gangrenous stomatitis (noma) or cancrum oris means a more or less shallow gangrenous defect of the cheeks. The breath is fetid; there is great swelling with soreness, high fever, marked debility, etc. It may follow measles or some other debilitating blood-disease. The treatment requires a physician.

Epulis. — This is a smooth round or lobular tumor springing from some portion of the alveolar processes and the periosteum covering them, usually from the lower jaw. It is more frequent in women, and may be caused by irritation from decayed teeth.

Gumboil. — The gum-disease so named is a circumscribed inflammation of the mucous membrane or of the periosteum covering a portion of an alveolar process, caused usually by a decayed tooth. Wash the mouth frequently with water. Do not let it become lacerated or cause it to discharge by applications of hot figs (boiled in milk) and have sources of irritation removed.

Ranula. — This term denotes a cystic formation in the mucous membrane beneath the tongue, sometimes originating in the duct of a sub-lingual or submaxillary gland. It is either congenital or acquired. Treatment consists in the excision of the cyst, generally through the mouth and rarely through an incision under the jaw.

Salivary Calculus. — Such is the name given to a concretion, mainly of phosphate of lime, formed in the duct of one of the salivary glands, but rarely in the glands themselves. Sometimes it forms around a foreign body, such as a seed or a bit of food or tartar, and sometimes produces a ranula.

Salivary Fistula. — A fistula of this character is an abnormal canal opening upon the cheek, and arising from the duct of the parotid gland as the result of ulceration.

MOUTON, moo-tôn', Alexander, American politician: b. Bayou Carenco, La., 19 Nov. 1804; d. near Lafayette, La., 12 Feb. 1885. He was graduated from Georgetown College, District of Columbia, and in 1825 was admitted to the bar. He was elected to the State legislature in 1826 and in 1831-32 he was speaker. He was presidential elector in 1828, 1832 and 1836, and was elected to the United States Senate in 1837. He was governor of Louisiana in 1843-46, and later presided over various conventions, but retired to plantation life at the outbreak of the Rebellion in 1861, upon failing to be elected to the Confederate Senate.

MOVABLE BRIDGES. See BRIDGE CONSTRUCTION, MODERN METHODS OF.

MOVEMENT-CURE. See SWEDISH MOVEMENT CURE.

MOVILLE, Ireland, town and seaport in the county of Donegal, at the mouth of Loch Foyle. It is a port of call for the Glasgow-New York steamers of the Anchor and Allan lines, as well as a favorite bathing resort. Pop. 1,016.

MOVING PICTURES are produced by lantern projection on a screen, of a series of pictures in such rapid succession that the eye sees them as one continuous representation. The possibility of such pictures depends upon what might be considered a defect of the human eye, known as the persistence of vision— the technical name for the lingering on the retina of an impression received, after the excitement which produced the impression has passed. This lingering of the impression is sufficiently long to tide over the gap of one-sixtieth to one-eighthieth of a second during which there is no picture on the screen. So that if the mechanism of human vision was perfect the illusion of the moving picture would be impossible.

It has been determined by experiment that the duration of the persistence of vision averages one-fiftieth of a second and it was calculated that 14 pictures per second would be needed to produce a continuous impression upon the eye—assuming each picture to occupy the screen for three-fourths of its allotted share of the second, the other fourth being the gap of darkness while the film was moving forward to the next picture. With the improvement of the exhibiting mechanism, however, the number of pictures per second was increased to 16, the length of time each is on the screen being one-twentieth of a second, and the dark gap between being reduced to one-eighthieth of a second. In this way the presentation has been made much smoother and the former unpleasant flickering eliminated.
The fact that moving pictures are projected on a screen by means of an optical lantern (q.v.) has already been referred to. This lantern with the film moving mechanism is called the kinetoscope or kinetograph (and numerously other names). The lantern part is essentially the same general type as the magic lantern, being equipped with a brilliant light (usually the electric arc) and a projection lens by which the image is enlarged upon a screen. The moving-picture lantern, however, is a very highly complicated apparatus as compared with the magic lantern, for, instead of the simple lantern-slide pushed into place in the field of the lens of the latter and left there as long as desired, the kinetograph mechanism must bring its long series of thousands of pictures one by one into place with the most exquisite accuracy, opening the shutter when the picture is ready and closing it while another is being moved into place, and all at a speed so rapid that the human eye is unable to follow the motion.

One of the requirements arising from this great rapidity of movement is that the individual pictures must be very small—a large picture could not be moved fast enough without the destruction of the film on which the pictures are carried. These physical conditions have resulted in fixing the workable size of the kinematograph pictures at one inch in length by three-quarters of an inch in height. The magnification of this little picture on the screen is therefore about 10,000 times its original area—which suggests the extreme perfection in the picture itself as well as in the projection apparatus. These little pictures are arranged continuously one above another on a strip of perfectly transparent horny material resembling celluloid. The strip is one and three-sixteenths of an inch in width and may be any length desired—generally ranging from 120 feet to 1,000 feet. The pictures occupy the centre of the strip and in the margins on both sides are square-cut perforations by which the movement of the strip in the lantern is accomplished through sprocket wheels and hooks.

The pictures themselves are produced by photography, on a coating of sensitized gelatine spread upon the strip of film, and the pictures are photographic positives printed from negatives on a similar strip made in a special moving-picture camera which will be briefly described farther on in this article. For exhibition with the lantern the film is rolled on a spool or reel and fed in a loose loop by a series of sprocket wheels and idlers to the "gate," as it is called, through which the light passes to the screen. The gate carries a mask which cuts down the size of the picture actually illuminated and projected to fifteen-sixteenths of an inch in length and eleven-sixteenths of an inch in width. The film is pressed against this mask firmly but gently by delicately acting springs. The movement of the film is downward through the gate and is accomplished by a pair of hooks just below the gate, framed together so that they will accurately engage the perforations in the margin of the film, one hook of the pair on each edge of the film. These hooks are operated by a revolving cam which causes them to move forward into the perforations; then to move downward, pulling the film with them just the height of one picture; then to move backward out of the perforations, and then upward to their first position. The cam is so fixed that the pull downward on the film occupies about one-fifth of the complete cycle of the movement of the hooks. During that period of one-fifth of the time allotted to one picture—one-sixteenth of a second—the shutter which revolves in front of the projection lens shuts off the light from the screen for the eightieth of a second; when, the next picture being in position, the shutter allows the light to pass to the screen for four-eighteenths of a second—the entire operation being repeated for the next picture. And thus the operation goes on, 16 times per second until the film has all been run. As the pictures run 16 to the foot of film, a short film of 120 feet, containing 1,920 individual pictures, will be run off in two minutes. A 1,000-foot film, with 16,000 individual pictures, will occupy nearly 17 minutes. As the film which has been shown passes over the hooks it is gathered by sprocket wheels and passed to a receiving reel on which it is wound for storage and from which it must be rewound before it is in proper order for another exhibition. The entire mechanism of the lantern is operated by the handle turned by the operator. In some instances electricity has been used in place of hand power, but the latter is relied on in the great majority of cases. Fig. 1 shows the relative arrangement of the carbons, the condensing system of lenses, the gate with the film passing downward through it from the full reel box to the empty one, propelled by the sprocket wheels. The projecting lens is shown between the reels. The drawing is skeletonized in order to show simply the essentials of the moving picture lantern.

![Diagram of the Film Moving Mechanism and the Lens Systems of the Moving Picture Lantern.]

A comparatively recent contribution to the steadiness of the picture on the screen is the narrow, transparent violet vane placed on the shutter frame opposite the opaque sector. In spite of the brevity of the dark gap there was a certain letting down of brilliancy, noticeable to the eye toward the close of the dark gap which was emphasized when the light came on again in full force, and these closely following contrasts proved very tiring to the sight. The violet vane, by cutting into the high brilliancy,
POWER'S CAMERAGRAPh, WITH MOTOR DRIVE
MOVING PICTURES

reduces the representation to a slightly lower but more uniform illumination. Other important accessories of the lantern are the heat screens, which stop a large proportion of the intense heat rays inherent in the condensed light from reaching the film and injuring the pictures. One ingenious device provides for the complete intercepting of the light and its contained heat unless the film is passing through the gate at a speed sufficient to protect it. Another closes this "fire shutter," as it is called, instantly in case the film breaks.

When all is said, however, the exhibition of moving pictures is simplicity itself as compared with the intricacies of making them in the first place. The processes of photography in any case require for success an extreme nicety of adjustment of many factors. It is a praiseworthy feat to secure a single excellent "snapshot." The task of the moving-picture photographer is to take thousands of pictures of such uniformity as to appear one continuous view, and of such excellence in definition and depth of focus as to be capable of magnification 10,000 times and still be satisfactorily sharp and clear. And all this is to be done often where the lighting is beyond control, where the only available position for the camera is one that no photographer would willingly choose, and where swarming crowds of bystanders seem to vie one with another to thwart the design of the camera man.

The camera which has been designed to overcome all these external difficulties and many others peculiar to moving-picture work is a marvel of ingenious adaptation and mechanical skill.

Of supreme importance in the kinetograph camera is the lens, which is so designed as to admit the largest amount of light consistent with sharpness of definition and with the shortest practicable focus. The factors of the lenses usually employed in taking moving pictures are for the focal length, 2 to 3 inches and for the working aperture f/3.8 to f/3.1. One prominent lens house has produced a lens of 3½-inch focus and a working aperture of f/1.9, with which have been made some very successful films under the most adverse conditions of lighting. It is not to be understood that the lens is habitually used at its full aperture. This is the rule only in extreme cases of under-lighting. The usual aperture employed in good light is f/16. Next in importance to the lens is the shutter which must be capable of adjustment with the utmost nicety to control the length of time the light transmitted by the lens is to act on the sensitive film. The shutter makes one revolution for each picture taken, that is, ordinarily, one-sixteenth of a second.
The larger part of the disc of the shutter is opaque, one section being cut away to admit the light to the film as it passes the gate. This cut-away sector is adjustable in size of opening, so that for quickly-moving subjects the actual time of exposure may be reduced to a very small fraction of a second. With moving pictures, however, extreme sharpness of the subjects in motion is not a necessity, a slight blurring being rather an aid to the general optical illusion.

The construction of the camera otherwise resembles in fittings the exhibition lantern, except that everything about it is in light-tight compartments. A large reel carries the sensitive film before it is exposed and another takes it up afterward. The hook contrivance for moving the film at the gate and the arrangement of sprocket wheels and idlers to keep it in motion are practically the same, and the entire mechanism is worked by the crank turned by the camera man. Fig. 2 shows the arrangement used. After the film is loaded, it is placed in the camera without the gear-wheels which connect it with the driving crank. F, F, represent the film, cases, the upper one full of new film. The sprocket wheels, S, S, turn so as to keep the film wound up. The sprocket hole in the hook of 
L is the lens with the pivoted shutter behind it and T is the focusing tube. Other devices, however, are attached to the head of the heavy tripod which carries the camera while it is being operated. There is a gearing which swings the camera around slowly on a horizontal plane, and so enables the camera man to make a panoramic view or to follow a moving subject with his lens. A finder at the side of the camera gives him continually the exact view which is being impressed upon his moving film. For a view which lies above or below the plane on which the camera is standing there is a tilting device by which the horizon of the picture is kept in a level position. Both of these movements are made by cranks at the left of the operator and turned with his left hand.

In making usual exposures the exposing crank is turned steadily and with skilled uniformity 120 times a minute, each turn of the crank making eight exposures on the film. The exposed film is removed from the camera in the dark room and wound upon a "pin frame." This is a square frame, generally of brass, with diagonal and semi-diagonal spokes radiating from the centre, each studded with pins slightly longer than the width of the film. Starting at the centre of the frame the film is wound around and around in an ever-widening spiral which offers free play between the coils for the developer. Before compounding the developer a test is made upon a few inches of film clipped from one end, and according to this test the developer is prepared with such developing agents as promise the best results. The developing agents usually employed are metol and hydroquinone in combination. Glycerin and eikonogen are also used. The pin frames with their coils of film are put into an upright bath. The development aimed at is one that will give the widest contrast of highest light and deepest shadow, with a full range of intermediate values in soft gradations. Hydroquinone is depended on to give the first quality and metol the second. When thoroughly fixed and washed the negative is wound upon a large revolving drum to dry.

The positive film used in the exhibiting lantern is made from the negative by a photographic printing process. This positive film is perforated exactly like the negative film, but it is coated with a much slower emulsion and contains a larger proportion of silver chloride salts, so that the development of the positive produces blacks of greater opacity, yielding pictures of more contrast and brilliancy. The negative and the unexposed positive are placed face to face, the perforations matching, in the printing camera and are pulled downward together by the hook mechanism through a gate, in front of which is an artificial light, commonly an incandescent electric lamp. A revolving shutter at the gate cuts out the light while the film is being moved and makes the exposure while it is stationary, at the rate of from five to eight exposures per second; and this is kept up until the negative film has all been passed through. When the whole is then attached to another printing made and so on for as many positives of that subject as are required. It is to be noted in passing that no two negatives can be relied on to register in the same amount of light in printing. Skilled judgment must determine the speed and opening of the shutter which will produce the best results.

The development of the positive film is conducted in exactly the same fashion as with the negative film, but the light used is much stronger. An orange light is perfectly safe with a positive film. The progress of the development is closely watched by examination before the light, and the process is stopped when the necessary density is obtained—a matter to be determined by the trained judgment of the operator. The film is then rinsed, fixed and hardened and washed absolutely free of hypo before drying. There may be, if desired, further treatment by tinting or toning to produce certain scenic effects. In tinting the whole film is passed bodily through a bath of some dye which imparts its color to the gelatine pellicle, but does not alter the black of the silver deposit. For example, a blue hue is given for a moonlight scene, a yellowish brown for lamplight; red for firelight, etc. In tinting the silver deposit itself is chemically changed in color, the clear part of the film remaining unchanged. Some beautiful effects in sepia, green, indigo, etc., are thus produced.

The greater part of the films produced and exhibited at the present time are those which Along with a large number of comic and delineate what might be called picture-stories. Farcical subjects there are pretentious panto- mimic plays—of the type known as "photo-
plays" (q.v.). Some of these have engaged the talents of actors and actresses in the front rank of their profession. In addition to these presentations of theatrical proportions, vast imaginations and historical pageanties have been stage entrances. Hopes were placed on perform- ers and a wealth of artificial scenic accessories running in value to many thousands of dollars—all to produce the one master negative. In not a few cases whole companies of performers have been transported to some distant locality in order to secure the appro-
priate "local color" for the film-play. The moving-picture mechanism lends itself readily to an endless variety of trick pictures, through the facility with which a film may be cut and joined to another set of pictures, showing no break on the screen. For example, a magician may be seen to touch the "villain" with his wand, and instantly he becomes a mammoth wriggling caterpillar — through the simple joining of the two distinct films. As films may be run repeatedly as fast as desired, remarkable extravaganzas may be produced. A wall may be seen to build itself from a pile of bricks — the picture actually taken having been the demolition of the wall. A picture of a man climbing down a fire-escape rope may be shown on the screen as one climbing up the rope.

While the majority of films are made for purposes of entertainment, the moving picture has an extensive use in the commercial world by salesmen of machinery and mechanical appliances, thus enabled to show their products at work in any part of the country where they may fill a need. Much educational work has been done with the aid of the films; manufacturers have used them to display fashions in dresses; social organizations for the spread of their peculiar propagandas; and charitable institutions to arouse interest in their work. In scientific research it has also played a large part. The combination of the microscope and the moving picture camera has revealed an entirely new field of interest in the invisible world. The growth of plants has been studied by a series of exposures lasting over several weeks in the opening of a flower, and covering months in the growth of a stalk of corn. In securing these films the exposures are not made continuously as in ordinary camera work. In the case of the corn, which may take 90 days to mature, the separate exposures are made at such intervals as to give a film of perhaps 2,800 pictures in all, which will occupy the screen for just three minutes in its exhibition. The telephoto lens has also been combined with the moving picture apparatus, permitting pictures to be taken at a distance from the subject. Thus the actions of wild birds and animals have been recorded. Some of the most interesting films have shown the emerging of the butterfly from its chrysalis; the silkworm spinning its cocoon; a snake shedding its skin; a war of enemy tribes of ants; and many such incidents.

A very important application of the moving picture idea is the study of the movements of highly skilled mechanics at their work, particularly in factories. A tiny electric light is attached to the hand, or other moving part, and its trace on the moving picture film affords a diagram from which wire forms or guides are constructed. Unskilled workmen are taught by these forms to learn the motion which gives greatest efficiency in production. The introduction of a clock into the picture permits the measurement of the actual time consumed in making each movement or part of a movement, with the accuracy of one-millionth part of an hour. The moving picture camera has also been used to study the movements of expert typewriter and piano players. In surgery it is used to observe defective or abnormal motions after operations; and the makers of artificial limbs use it to secure the nearest possible counterpart of the normal movements of sound members.

The moving picture business has settled into a triplex organization: (1) the producers of the picture films; (2) the exchanges, or distributing middlemen; (3) the exhibitors. In the United States in 1915 there were 248 firms and studios registered as film producers; 1,364 exchanges; and 15,046 exhibiting houses of all types. The recent trend has been toward the combination of the larger producing companies, and the establishment of the new combines of branch houses throughout the country, acting as distribution centres. And many of the former middlemen have become producers on a small scale.

Figures as to the attendance at the moving picture theatres cannot be given with any degree of accuracy. The number of the smaller houses, those seating about 300, is constantly diminishing, but the continued building of larger houses keeps the seating capacity about the same as in the days of the multitudinous nickelodeon. It is officially reported (for purposes of taxation) that the gross annual income of the moving picture theatres aggregates $275,000,000.

A considerable factor in the business of producing films is the large export trade. In spite of the many difficulties in such traffic on account of the war, the high-water mark in film exportation was reached in 1916, when 136,141,137 feet of film pictures, valued at $6,051,031, were sent abroad.

RICHARD FERRIS,
Editorial Staff of The Americana.

MOVING PICTURES, Censorship of. Since the beginning of the 20th century, the development of the film-drama, or moving picture, has revolutionized amusements in America. With low prices, the attendance has become enormous, and the influence upon society is more portentous than either that of the church or the spoken drama. For millions of people the moving-picture supplies the place of sermons, books, pictures and travel. In the early years of its development the selection of subjects for presentation was made by the proprietors, who were not averse to presenting horrible crimes and indecent scenes.

The early film dramas were very simple and very crude from a dramatic viewpoint. They were followed by plays of some depth dealing with the questions of the day. The early plays followed in turn by plays showing the features and ramifications of the white-slave traffic, drug addicts, robberies, etc. Many of these failed utterly to teach the moral lesson which could be the only excuse offered for their presenta-
tion; on the contrary, competent authorities pointed out the grave dangers inherent in such crude, bold presentations of depravity and crime. The evil became so great that a private society in New York looked into the matter and after consultation with the producers of films persuaded them that the approval of a board of censors would enhance the demand for a film.

In 1909, therefore, was organized the National Board of Censorship (now the National Board of Review) in New York and demand of many exhibitors of films. This board was a voluntary group from the People's Institute. No member had any financial or other connection with the moving-pictures business, being drawn instead from professional and business men and women, social workers and others interested in civic and social betterment. The members serve without compensation; there is, however, a paid secretary and clerical staff. Over 100 members serve on the censoring committee and average each year 25 films, averaging 5,000 feet, each day, and requiring, if exhibited successively on one machine, 41 hours and 40 minutes for presentation. The film is viewed by one or more members of the censoring committee in the office of the board in the producer's studio, after which the film is approved in toto or recommendations are made in regard to certain scenes, which are thereafter eliminated altogether or revised so as to remove the objectionable features pointed out by the reviewers. At the end of every film so reviewed there is attached the legend "Passed by the National Board of Review." Its work in the years following its organization proved so successful that exhibitors throughout the country highly appreciated it and the board increased its scope, becoming national in extent, increasing its control over the film output in all parts of the United States and co-operating with small local boards in various cities. Its work at present is so organized that it passes upon over 95 per cent of all films produced, and of this amount about 90 per cent receive the board's immediate approval. The board is unofficial and merely recommends changes or alteration and does not desire in any way to control or to possess any legal power to enforce its recommendations. The necessity for a board with broader powers has influenced several States to pass legislation to this end, but in every case the constitutionality of such legislation has been questioned, its proponents maintaining that censorship is un-American, and the aims of such legislation are secured by the ordinary police power governing public morals, etc.

The work of the national board, however, has given fairly satisfactory results, its uniform system of passing upon photo-dramas giving it a decided advantage over local boards or State commissions, the latter seldom working in harmony. The need for a Federal board with broad powers has been emphasized in recent years, and certain parties have carried on an agitation with a view of securing Federal legislation for its creation. An attempt of this kind in 1915 met with signal failure. Producers and exhibitors have maintained a firm front of opposition against censorship of any kind, on the ground, as stated above for the local bodies, that the police and municipal authorities are already possessed of adequate powers to deal with questionable or immoral plays. Among the churches, the Roman Catholic has instituted a board which publishes regularly a list of approved photo-plays, condemning the baser kind by silence. In many cities of the United States the license of moving-picture houses and empowering the police or municipal authorities to close such houses as continue to exhibit pictures which have been condemned by the board of censors. On 31 July 1912 an act of Congress was passed, vesting the Interstate Commerce Commission with the power to require the license of moving-picture houses and empowering the police or municipal authorities to close such houses as continue to exhibit pictures which have been condemned by the board of censors. The act also provides for regulating the importation of films representing prize fights. The license plan has so far proved inadequate to protect public morals and many cities are following the example of Chicago, where the chief of police appoints a committee which passes on all films shown in that city.

MOVING PLANT, an East Indian leguminous plant (Desmodium gyrans), remarkable for the motions of its pinnate leaves. The large terminal leaflet becomes more or less horizontal under the influence of light and heat, and is depressed during darkness of night. The movement of rising and falling, it has also a lateral oscillatory motion with a period of two to four minutes, so as to occupy an oblique position relative to the leaf-stalk. The smaller lateral leaflets, of which there are one or two pairs, also exhibit jerking movements, approaching and retiring from each other, and these motions proceed to a limited extent during darkness. Gray describes 20 species of Desmodium in the flora of the United States, without mentioning that any of them exhibit such movements.

MOWAT, Sir Oliver, Canadian statesman: b. Kingston, Ontario, 22 July 1820; d. Toronto, 19 April 1903. He was educated in Kingston and Toronto, studied law in Kingston and began practice in that city, afterward moving to Toronto. He took high rank in his profession, especially as an equity lawyer. In 1856 he was appointed Queen's Counsel, and from that date until 1859 he served as a member of a commission appointed to revise and consolidate the statutes of Canada and Upper Canada. From 1857 to 1864 he was in the legislative assembly of Upper Canada, and in 1858 was provincial secretary. In 1863–64 he was postmaster-general, and in the latter year he served in the Quebec Conference, as one of the Fathers of Confederation from Upper Canada. From 1864 to 1872 he was vice-chancellor of Upper Canada, in the latter year, on the urgent solicitation of the Liberal leaders in the province, retiring from the bench to re-enter political life. From that date until 1896 he was premier of Ontario, holding office with conspicuous ability for 24 consecutive years. In his first session (1873) he passed the Municipal Loan Fund Act, which put an end to the financial muddle caused by frenzied municipal aids to railway construction at an earlier period. To him is largely due the credit of the revision and codification of the provincial laws, embodied in 'The Revised Statutes of Ontario, 1877.' He was brought into conflict with Sir John A. Macdonald on the question of provincial autonomy, Mowat regarding the provincial legislature as sovereign within its own sphere, and his reading of the British North America Act was in this connection borne out on repeated occasions by the
MOYATT — MOXOM

Imperial Privy Council, notably in the Ontario boundary dispute. In 1896 he entered the Laurier ministry as Minister of Justice, and was president of the senate. In 1897 he was appointed lieutenant-governor of Ontario. Altogether, Mowat gave 45 years to the public service. He was created K.C.M.G. in 1892. Compiled Biggest’s ‘Life of Sir Oliver Mowat’ (2 vols., Toronto 1903).

MOWATT, Anna Cora. See Ritchie, Anna Cora Ogden Mowatt.

MOWBRAY, mō'brā, George W., American inventor: b. Lewes, England, 1815; d. North Adams, Mass., 21 June 1891. He studied chemistry in England, came to America in 1853, worked in the California gold-mines until 1858, in the Pennsylvania oil-country until 1868, and then at North Adams, where he perfected the commercial use of nitroglycerin, and invented a smokeless powder. He was consulting chemist to the Maxim and Nordenfelt Arms Company.

MOWBRAY, Henry Siddons, American artist: b. Alexandria, Egypt, 1858. He was brought to the United States in early childhood and educated in North Adams, Mass. He studied one year at West Point. In 1878 he entered the studio of Bouman, Paris, and subsequently settled in New York as a figure painter and decorator. He is a member of the Society of American Artists, was the first director of the American Academy at Rome, and was elected a Member of the Academy in 1891. He is especially noted for his mural decorations in the library of the University Club, New York, and elsewhere. He was awarded the Clark prize by the National Academy in 1888.

MOWBRAY, J. P., a pseudonym of Andrew Carpenter Wheeler. See Wheeler, A. C.

MOWER, Charles Drown, naval architect: b. Lynn, Mass., 5 Oct. 1875; educated in the Lynn public schools. After serving for four years in the offices of Arthur Bundy and R. B. Crowinshield, naval architects, at Boston, he went to New York to take the position of designing editor of The Rudder, the yachting magazine. During the seasons of 1903-04 he was official measurer of the New York Yacht Club, measuring the yachts Shamrock III and Reliance for the American cup races of 1903. Is a member of the Society of Naval Architects and Marine Engineers, and of many yachting clubs. Among his works are: ‘How to Build a Motor Launch’ (1900); ‘How to Build a Knockabout’ (1901); ‘How to Build a Racing Sloop’ (1901); ‘How to Build a Cruiser’ (1903).

MOWER, mō'or, Joseph Anthony, American soldier: b. Woodstock, Vt., 22 Aug. 1827; d. New Orleans, 6 Jan. 1870. He was educated in the common schools and Norwich University, enlisted as a private in the Mexican War and in 1855 was commissioned 2d lieutenant. He was promoted captain in 1861 and for bravery in action was made major in 1862. He served, passed through all the ranks up to that of brigadier-general, and in 1863 commanded a brigade at Vicksburg. In 1864 he was in charge of a division under General Banks in Louisiana and he accompanied General Sherman in his Georgia and Carolina campaigns and received promotion to the rank of major-general. He remained in the army after the war with the permanent rank of colonel, and was in command of the department of Louisiana at his death.

MOWRER, Frank Roger, ex-consul-general; b. Xenia, Ohio, 7 July 1870. He received the title of LL.B. at Cornell in 1894 and was admitted to the bar the following year. In 1897 he decided to enter the consular service, in which he continued for 12 years, holding many important posts in that period of time. The record of his service is as follows: Marshal of the consular court at Yokohama 1897-99, from which he retired by operation of the treaty; marshal at Canton, 1899-1900; consul at Antigua, from January to October 1901; at Ghent, Belgium, 1901-06; consul-general at Abyssinia, 1906-07; consul at Leghorn, Italy, from April to June 1907; consul-general at Copenhagen, Denmark, 1907-09, from which he resigned in the latter year and returned to the United States.

MOWRY, mō'rē, William Augustus, American educator and author: b. Ukridge, Mass., 13 Aug. 1829; d. 22 May 1917. He was educated at Brown University and in 1862-63 was a captain in the Federal army. He was principal of the English and Classical school in Providence in 1864-65 and in 1884-85 edited the Journal of Education. In 1886-91 he was editor of Education, and from 1887 to 1905 was president of the Martha’s Vineyard Summer Institute. Among his writings may be mentioned ‘Nathaniel Mowry and His Descendants’ (1879); ‘Richard Mowry and His Ancestors and Descendants’ (1878); ‘Studies in Civil Government’ (1887); ‘Elements of Civil Government’ (1890); ‘Talks with My Boys’ (1892); ‘A History of the United States’ (1896); ‘The Ukridge Academy: A Brief History’ (1897); ‘First Steps in the History of Our Country’ (1898); ‘American Inventions and Inventors’ (1900); ‘Marcus Whitman and Early Oregon’ (1901); ‘The Territorial Growth of the United States’ (1902); ‘American Heroes’ (1903); ‘American Pioneers’ (1905); ‘Essentials of United States History’ (1906); ‘Recollections of a New England Educator’ (1908); ‘Descendants of John Mowry of Rhode Island’ (1909); ‘Camp Life’ (1914), also many papers, addresses, magazine, book and encyclopedia articles.

MOXOM, Philip Stafford, American Congregationalist clergyman: b. Markham, Canada, 10 Aug. 1848. During the Civil War he served as "captain's boy" (1862), then enlisted in the Illinois cavalry in 1863, and served till 1865. At the close of the war he entered upon a course of study at Kalamazoo College, Mich., and later studied at Shurtleff College, Ill. (1868-70). Being ordained to the Baptist ministry in 1871, he studied at Rochester Theological Seminary from 1875 to 1878, and was graduated from Rochester University in 1879, with the degree of A.B. He was admitted to the Baptist Church of Cleveland, Ohio; and from 1885 to 1893 at First Baptist Church of Boston, where he gained a reputation as a preacher of marked power. In 1894 he joined the Congregationalists and became pastor of the South Congregational Church at Springfield, Mass. In November 1915 he
resigned and became pastor emeritus. From 1894 to 1897 he was university preacher at Harvard, and has preached frequently at other universities and colleges. He delivered the centennial address on the 100th anniversary of the birth of Browning, in the Brooklyn Institute, 7 May 1912. He was at the World's Parliament of Religions, and presented a paper on 'Immortality'; he was also at the World's Peace Congress, and has been delegate to several international peace congresses. He attended the first Ecumenical Council in the interest of international unity at Constance, Baden, in August 1914, which was broken up by the war, but reassembled in London. He has written 'The Aim of Life' (1894); 'From Jerusalem to Nicea, the Church in the First Three Centuries' (1895); 'The Religion of Hope' (1896).

**MOXON**, mô'sôn, Edward, English publisher and verse-writer: b. Wakefield, 1801; d. 3 June 1858. Going to London (1817) he entered (1821) the service of the Longmans, publishers. A volume of his verses appeared in 1820, and he started as a publisher in 1830, bringing out Lamb's 'Alphabet Verse's' as his first book. He became publisher to Barry Cornwall, Southey, Wordsworth, Tennyson, Monckton, Milnes, Landor, Browning, etc. His second volume of poems appeared in 1837 and both were published together in 1843 and 1871.

**MOYOBAMBA**, mô-yô-bäm'bä, or MOYAMBA, Peru, capital of the department of Loreto on the Mayo River, 50 miles north-east of Chachapoyas. It is noted for its manufactures of Panama hats. It occupies an isolated position on a gravelly plateau intersected by deep ravines. Its chief communication is by river with Brazil, the Mayo as an affluent of the Huallaga connecting with the Amazon. Pop. 2,000.

**MOZAMBIQUE**, mô-zâm-bêk', South Africa, formerly the entire colony of Portuguese East Africa (q.v.); now one of its provinces and its capital town. The town of Mozambique is situated on the coast near the island. It contains the governor's palace, a cathedral, a hospital, a prison, warehouses, etc. The harbor is secure. Pop. 8,000. The population of the province in 1910 was about 362,000.

**MOZAMBIQUE CHANNEL**, the passage between the east coast of Africa and the island of Madagascar, about 1,050 miles long from northeast to southwest, 530 miles wide at its southern entrance, about 250 miles wide in the centre and nearly 600 miles wide at the northern entrance, where lie the Comoro Islands. The harbors of Mozambique and Beira are on its west shore.

**MOZARABIC LITURGY**, the liturgy used by the Mozarabs, or 'spurious Arabs', that is, Chosen Jews who submitted to the Moorish government in Spain, while retaining their own religion. This office is sometimes styled 'Officium Gothicum' or 'Isidori Missale,' because it was in vogue during the Gothic domination and was first revised by the great abbot Isidore of Seville in the 6th century. In Toledo after the gradual adoption of the Roman missal throughout Spain during the 11th and 12th centuries, Ximenes, cardinal archbishop of the see, revised in the 16th century the ancient office and built the beautiful chapel at the west end of the cathedral where the old Gothic ritual is still observed. It is supposed from the Greek affinities of its form, that the original liturgy was brought from Asia Minor by the Goths who dwelt south of the Bosphorus in the 5th century. Consult editions by Lesley (Rome 1755); Lorenzana (Rome 1804); Migne, 'Patrologia Latina' (Vol. LXXXV and Vol. LXXXVI); also a new edition (Toledo 1875) by Father C. E., 'Ancient Liturgies' (Oxford 1879) and Neale, J. M., 'Essays in Liturgiology and Church History' (London 1863).

**MOZART, mô'zart** (Ger. mô'tsârt), Johannes Chrysostomus Wolfgangus Theophilus, Austrian composer: b. Salzburg, Austria, 27 Jan. 1756; d. Vienna, 5 Dec. 1791. With this somewhat harsh combination of names Mozart was baptized on the day following his birth. His parents were Johannes Georg Leopold Mozer, and his wife, Anna Maria.

Until 24 years of age Mozart led a wandering life, being taken on several tours by his father, who, while himself fully appreciating the child's genius, chafed under the continuous disappointments resulting from the fact that it was not productive either of the appreciation or financial returns which it richly deserved. But later the musical world recognized his powers, nor has there since his death been any stint of praise for his marvelous achievements. Mozart's genius was not merely the brilliant flash of a meteor, dazzling the world for a brief moment and then gradually flickering out. He did not earn his title of "musician of musicians" through one sublime effort in early life. Of him, perhaps more than of any of the other great composers, it may be truly said that his powers steadily increased as he grew older, a statement borne out by the fact that three of his greatest works were composed during the last year of his life.

Nor is this high estimate of his worth confined to those of the laity who since his time have been added to the race. All men, including his fellow artists, paid sincere homage to him as supreme in several of the departments of the musical art. Thus Rossini, on being asked who was the greatest musician, first replied "Beethoven"; but when the question was put "What of Mozart?" he answered "Mozart is not the greatest, he is the only musician in the world." Again, Gounod in an address before the Académie des Beaux Arts in 1882 expressed his deep admiration for Mozart in the following words: "Oh, divine Mozart, bounteous nature had given thee every gift; grace and strength, fulness and sobriety, bright spontaneity and burning tenderness, all in that perfect balance which makes up the irresistible power of thy charm, and which makes of thee the musician of musicians, greater than the greatest, the only one of all."

This sounds like high praise, and that was what Gounod meant it to be. And so throughout the ages it has been. A genuine fire of genius which animated his compositions and which found its expression not only in his inimitable perception of the relation between the human feelings and the realm of
tones, or in his inexhaustible power of interpreting widely different types of character, but above all in the superb beauty of proportion and balance which pervades his creations. Mozart was not only a brilliant composer, but also a remarkable performer on the piano, organ and violin. Haydn said that he could never forget Mozart's playing, for "it went to the heart." The number of separate published works ascribed to Mozart is 560, while he is also said to have written 294 compositions which were unfinished or unpublished. When only three years old Mozart showed evidences of his musical genius, perceiving which his father taught him minuets on the harpsichord and at four years he commenced composing. His first appearance in public was in September 1761, as a chorister in some theatricals held at the University of Salzburg. In his 6th year he composed his first published work—a 'sonata pour clavecin.' When seven years old the Mozart family visited Paris, Wolfgang playing the violin and organ at several churches en route. Here he composed a Kyrie, his first sacred piece. Later in the year they went to London, where the boy's playing, and especially his power of improvising, excited the greatest admiration. In 1764, while in London, he produced 10 sonatas for the clavier and violin, six of which, dedicated to the queen, were brought out early in the following year. In January 1766, Wolfgang gave two concerts in Amsterdam, at which all the instrumental work was of his own composition. Later, on the occasion of the installation of the Prince of Orange as stadtholder, he composed a concerto named 'Galimatius musicum.' After several months of travel the family returned to Salzburg in November. Here they remained till September 1767, Wolfgang devoting himself to study and composition. He composed a part of a sacred cantata for the archbishop of Salzburg, a Passion-cantata, his first concertos for the piano, and a Latin comedy, 'Apollo et Hyacinthus.' In September he was again in Vienna, his father being attracted there by the approaching betrothal of the Archduchess Josepha to King Ferdinand of Naples. Here much jealousy and intrigue were displayed, and although Mozart composed an opera, 'La Finta Simplice,' at the request of the emperor, it was not given a performance. Mozart, however, had the satisfaction of producing privately his operetta entitled 'Pastor Fido and Bastione.' He also composed an offertory and a trumpet concerto to be used at the consecration of a new church at the Waisenhaus.

After the return of the family to Salzburg Mozart was in 1768 appointed concertmeister, and a performance of 'La Finta Scapinella' was then arranged. He next composed two masses, and the Johannes Offertorium for a priest in the monastery at Secon. Preparations were now made for a tour of Italy, the family arriving at Milan at the end of January 1770. While in Rome he visited the Sistine Chapel to hear Allegri's 'Miserere.' On his return he wrote down the entire work from memory, a feat which did much to spread his fame abroad. They next visited Naples where his concerts were brilliantly attended. In Bologna in 1772, he was also rewarded for his labours by election to the 'Accademia dei Filarmonici,' his test piece being an antiphon for four voices, which he composed in about half an hour.

His first opera 'Mitridate Rê di Ponto' was composed and produced in Milan, where it was performed 20 times. In Padua on his way home, Mozart was commissioned to compose an oratorio, perhaps 'Betulia Liberata,' which was first performed in Lent, 1772. His stay at home was brief, for his friend Count Firmian, who had met him when in Milan, commissioned him to write a dramatic serum to celebrate the nuptials of Archduke Ferdinand with Princess Maria of Modena. On 17 Oct. 1771, the performance of 'Ascanio in Alba' was given with very gratifying results. The next month saw Mozart in Milan again and hard at work on his opera 'Lucio Silla,' which was at length produced at the Milan opera house with great success. On reaching home Mozart composed four symphonies, three divertimenti for a wind orchestra, a grand concerto for two violins and a mass, and in the following year two masses, a grand litany, two vespers psalms, an offertorium, a bassoon-concerto, four symphonies, two serenatas, etc. The next visit was to Munich where young Mozart was engaged to compose a new opera for the carnival, and on 13 January 'La Finta Giardiniera' was produced. From that time to September 1777 Mozart, now a young man of 21, devoted himself to composing and the list of his pieces is very extensive. Later in the year he visited Mannheim with his mother, and while there he had his first love affair, the young lady being Aloysia, second daughter of Fridolin Weber, a prompter and copyist. His father, on hearing of it, ordered them away to Paris, where they arrived in March 1778. Here he composed several pieces, including a gavotte, a quintette for flute and strings, and some parts of a 'Miserere,' which were produced without even the mention of his name. On 3 July of this year his mother died. Again we find him in Salzburg in mid-June 1779, during which year he wrote the music to Goethe's drama 'König Thamos,' the operetta 'Zaidé,' several sonatas dedicated to the Electress of Bavaria, an arià for Aloysia Weber, whose love for Mozart had, however, grown cold, and a number of minor pieces, for which he had received commissions. His first great opportunity came in 1780 when he received orders to furnish an opera for the Munich carnival. It was entitled 'Idomeneo, Rê di Creta,' and had its first performance on 29 Jan. 1781. Mozart now received a summons to Vienna from the archbishop, who, however, seems to have treated him as a menial. Finally severing his official relations, he took lodgings with the Webers. During the summer he wrote an opera for the National Singgesellschaft (German), founded by the emperor in 1778, and in spite of many obstacles 'Entführung aus dem Serail' was produced by the emperor's express order on 16 July 1782. A month later he made Constance Weber his wife.

Mozart's marriage seems to have brought with it a succession of difficulties. Constance was a poor manager and Mozart was as yet without any fixed appointment. He gave a series of subscription concerts which were well attended, and during six weeks played at 17 concerts besides five of his own. On 6 July 1783 he took his wife to Salzburg to present her to his father, and in August produced
a mass in the Peters Kirche, which he had composed in honor of his wife, who sang the soprano part on that occasion. During the latter part of 1785 Mozart was engaged on one of his masterpieces, an opera based on Beaumarchais’ comedy entitled ‘Le Mariage de Figaro.’ The first public performance of the opera (‘Le Nozze de Figaro’) took place on 1 May 1786, and the triumph of the composer was complete. In 1787 Mozart wrote his Davide Penitente for the Society of Musicians and some music for the vaudeville piece ‘Der Schauspiel-Direktor’ was also produced. In 1787 Mozart and his wife visited Prague in response to an invitation from Count Thun. Here it was decided that he should compose another opera, which he did for the small sum of 100 ducats. ‘Don Giovanni’ was the result and its first performance was given on 29 Oct. 1787. Returning to Vienna in November, he was appointed Kammerkomponist with a salary of 800 gulden.

The year 1788 was a very busy one for Mozart. In six weeks he wrote his three last and finest symphonies (in C, E flat and G minor), as well as several pieces for the piano, arranged five fugues from Bach’s ‘Wohl-teurer Gönner Mann,’ for string quintet, and added a number of parts to Handel’s ‘Acis and Galatea,’ ‘Messiah,’ ‘Ode to St. Cecilia’s Day’ and ‘Alexander’s Feast.’ In 1789 Mozart was offered the post of kapellmeister at the Prussian court. The salary was 3,000 thalers, but in spite of the comforts which this comparatively large income would have insured, Mozart declined rather than forsake his ‘good Kaiser.’ Arriving in Vienna on 4 June, and being in much trouble, partly on account of his wife’s constant illness, he informed the emperor of the offer of the King of Prussia, and tendered his resignation. The emperor exclaimed: ‘What, Mozart, are you going to leave me?’ Mozart replied, ‘Majesty, I throw myself upon your kindness—I remain.’ The emperor then ordered him to compose a new opera, which under the title ‘Così fan tutte,’ was produced on 26 Jan. 1790.

During the last year of Mozart’s life, as already stated, he composed three of his greatest works, all of which must be always reckoned among the highest of musical creations, namely, the opera ‘Die Zauberflöte’ and the ‘Requiem,’ which latter he was commissioned to compose under very mysterious circumstances. Mozart’s health had now become much impaired and he was greatly depressed. He believed that he was writing this ‘Requiem’ for himself. The third notable composition of this year was the opera ‘La Clemenza di Tito,’ composed for the coronation of Leopold II at Prague, which took place 6 September, the opera being performed on the same evening. His recent exertions and excitement proved too much, however, for his remaining strength, and on 5 Dec. 1791, he died of malignant typhus fever. He was buried in a pauper’s grave in the churchyard of Saint Marx.

R. I. GAIK.

National Museum, Washington, D. C.

MOZART, möt'tär or möz'art, Leopold, German composer: b. Augsburg, Bavaria, 14 Nov. 1719; d. Salzburg, 28 May 1772. He became kapellmeister to the archbishop of Salzburg. He wrote voluminous amounts of music, and published a justly famous ‘Violin School’ (1756), the first theoretical and practical guide to that instrument and long the only one. It passed into numerous editions. He was the father of Wolfgang Amadeus Mozart (q.v.).

MOZDOK, möz'dök’, Russia, town in the province of Terek in the government of the Caucasus, located on the left bank of the river Terek. Its manufactures are candles, soap leather, tiles, brandy, etc., and it has a good trade in coarse woolen and cotton goods, sheep, horses, silks, etc. In the neighborhood are vineyards, silk-growers, vegetable gardens, etc. It holds agricultural markets twice yearly, with a considerable cattle exchange. In 1911 it had a population of 17,068, made up of Kazars, Tchechens, Georgians, Armenians, etc., besides Russians.

MOZIR, mözh'ér, Joseph, American sculptor: b. Burlington, Vt., 1812; d. Faid’s, Switzerland, 1870. He was a merchant in New York from 1831 till 1845, when he retired and went to Rome to open a studio to practice as a sculptor. He added a number of figures, the best known being ‘Pocahontas,’ ‘The Wept of Wish-ton Wish,’ ‘Rizpah,’ in
MOZLEY — MUCH ADO ABOUT NOTHING

Metropolitan Museum; 'Rebecca at the Well,' 'Jephtha's Daughter,' 'Undine,' 'Queen Esther,' 'The Prodigal Son,' etc. The latter, his most ambitious work, is in the Pennsylvania Academy of Fine Arts, and his 'Il Penseroso' is in Horticultural Hall, Fairmount Park, Philadelphia.

MOZLEY, James Bowling, English clergyman: b. Gainsborough, Lincolnshire, 15 Sept. 1813; d. 1878. He was educated at Grantham and was graduated K.C. (1838) at Oriel College, where he became a close acquaintance of Newman, Pusey, Froude, etc. He participated in the 'Oxford Movement,' but could not accept the Roman communion and some other features. He was elected (1840) a Fellow of Magdalen and became joint editor of the Christian Remembrancer, resigning in disagreement with the Gorham decision. He was one of the Guardian's first adherents and became vicar of Shoreham in 1856. In 1869 he was made canon of Worcester and was created regius professor of divinity at Oxford in 1871. He wrote 'A Treatise on the Augustinian Doctrine of Predestination' (1855); 'The Primitive Doctrine of Baptismal Regeneration' (1856); 'A Review of the Baptismal Controversy' (1862); 'Lectures on Miracles' (1865), the Bampton Lectures. His 'Essays, Historical and Theological' (1878), were published in two volumes, and his sister's biographical comment in the preface.

MOZOOMDAR, mō-zoom'där, Pratap Chandra, Hindu reformer: b. Calcutta, India, about 1840; d. 1905. He joined the association of the Brahma-Somaj (q.v.) organized for the purification of Brahmanism, and edited at Calcutta the Theistic Quarterly Review and The Interpreter, published by that organization. In 1874 he visited England and in 1883 the United States, being received with honor by leading men of both nations. In 1893 he made a second visit to the United States to attend the World's Parliament of Religions, before which he read a paper on the Brahma-Somaj. He wrote The Faith and Progress of man (1882); The Oriental Christ (1883); Life and Teachings of Keshub Chunder Sen (1887), and articles for English and American periodicals. His influence in India was never great despite his great acclaim outside his native land.

MOZyr, mō-zēr, Russia, a town in the government of Minsk, on the Pripet River and on the Brjansk-Brest Railway. It has three orthodox and one Roman Catholic Church, also a synagogue. It has suffered much from depredations of the Tartars and was consumed by fire in 1869 and 1864. It has manufactures of hardware and leather and considerable trade in lumber and cattle. Pop. 10,729.

MR. MIDSHIPMAN EASY, published in 1836, is probably the best known of the many sea novels by Capt. Frederick Marryat. This spirited and entertaining story deals with the life of John, otherwise known as Jack Easy, from the time of his birth to his settlement in life by marriage and inheritance of an important estate. A youth of fine qualities, he is spoiled at home by his mother and educated in ideas of equality by his father. Much against their will he is sent to sea as midshipman at an early age and at the end of four years returns quite cured of odd ideas and with a fine record for bravery. There are exciting and humorous adventures in the service of the royal navy make up the bulk of the book, which gives a lively picture of sea actions and a sailor's life on shore and on board ship. The galaxy of characters, part serious, part comic, Captain Wilson, Sawbridge, Misty, Boney, Oxley, and many others — is an especially good one. The deeper purpose of the novel is to show the more humane and chivalrous side of naval warfare and to set forth the finer traditions of the service.

WILLIAM T. BREWER.

MUCH ADO ABOUT NOTHING. 'Much Ado about Nothing' is first mentioned in August 1600 and was printed in the same year. It is not referred to in Meres's famous list of Shakespeare's plays in 1598, unless indeed it is to be identified with the mysterious comedy, 'Love's Labour's Won,' which bears the imprints among Shakespeare's works. That 'Much Ado,' in some less finished form than we now have, had been staged as early as 1598 under the title of 'Love's Labour's Won,' is a bare possibility which hardly warrants speculation, but there is this to be said in its favor: it occupies among the comedies of Shakespeare's full maturity a position very analogous to that which Love's Labour's Lost, has among the early comedies. Each of these plays, when compared with others of the same period (with The Two Gentlemen of Verona and A Midsummer Night's Dream) or with As You Like It; Twelfth Night; and All's Well that Ends Well) impresses the reader as a drama of the intellect rather than of the heart. Intrigue and wit overbalance romance in both, and personal planning largely takes the place of delectable chance. Benedick and Beatrice are finished studies which seem to have developed out of the sketches of Biron and Rosaline in Love's Labour's Lost. It goes with what has been said that this is a play of somber import of epigram rather than sentiment. Only a quarter of the lines are in verse, and this verse is seldom notable. The unfailing charm of the comedy lies in the infinitely brilliant superficiality of Beatrice and Benedick, the two arch-enemies of romance — in the occasional cut and thrust of their badinage; and, next, in the ludicrous realism of the constables, Dogberry and Verges. All testimonies agree that this comedy is one of Shakespeare's most complete successes. It is also a remarkable evidence of the author's versatility, for it proves that he could execute with unsurpassed spirit and skill a type of play for which his other greater works would indicate that he had little natural inclination. 'Much Ado about Nothing' is the only one of Shakespeare's dramas which one can imagine that Congreve or Sheridan might have written. On the stage it has always been triumphant. When compared with its special forerunners among Shakespeare's comedies — the more romantic As You Like It and Twelfth Night — it impresses one as suited rather more to the theatre and rather less to the study. About a quarter-century after the poet's death, it was selected by
Leonard Diggles among the special examples of Shakespeare's drawing power:

"Let but Beatrice
And Benedick be seen, lo, in a trice
The Cockpit, Galleries, boxes, all are full." (1640)

David Garrick was a famous Benedick, and nearly all the greatest actresses have found opportunities for added laurels in Beatrice. The source of this play is relatively unimportant, for the greatest parts of it—the clownery of the constables and the figures of Beatrice and Benedick—seem to have sprung spontaneously from Shakespeare's brain. That part of the plot, however, which concerns Hero, Claudio and Don John is paralleled in several earlier works, in Spenser's 'Faerie Queene' (Bk. IV, ii), in Ariosto's 'Orlando Furioso' (Bk. V), and particularly in the 20th tale of Bandello's Italian novelle (printed 1554). It appears to have been from the last (possibly in the French or in some now unknown English version) that Shakespeare drew his hints; but the dramatist, besides altering the material in details, so subordinated it to the newer themes that it is likely to impress modern taste as either repellent or uninteresting.

TUCKER BROOKE.

MUCIC ACID, $CHO\textsubscript{3}$O\textsubscript{3}, an organic acid formed by oxidizing milk sugar, or galactose, gum arabic and certain other substances, by the action of dilute nitric acid. It crystallizes in colorless tablets which are insoluble in alcohol, slightly soluble in cold water, and rather freely soluble in boiling water; though when boiled with water it becomes converted into an isomeric substance known as "paramucic acid." Mucic acid melts at about 410° F., does not reduce Fehling's solution, and combines with ammonia and with metallic and organic bases to form an extensive series of salts.

MUCILAGE, a solution of gum in water. In chemistry, the gum of seeds and roots. The name is also given to commercial adhesive gum made from gum arabic or dextrin. Mucilages in pharmacy, are water preparations of substances dissolved in water, used to suspend insoluble ingredients or to bind them together in a mass.

MUCIN, an ameboid mucous substance, which is an important constituent of the connective tissue of the animal body, and which gives to the mucous membranes their characteristic sliminess. It may be isolated by extraction with lime water (or with pure water), and subsequent precipitation with acetic acid, in excess of which mucin is insoluble. Mucin is not precipitated by heat nor by tannic acid. It is, however, precipitated by alcohol, or by saturating its solution with common salt, or with magnesium sulphate. When boiled with strong sulphuric acid, mucin yields leucine and tyrosine.

MUCIUS SCÆVOLA. See SCÆVOLA.

MUCKER, nickname of certain mystic fanatics who were thus popularly derided as "cancelling hypocrites." The adjective is of ancient origin and did not connote a specific sect until it was applied to the followers of Johann Heinrich Schönherr and later Johann Wilhelm Ebel in Königsberg. Schönherr, who was the son of a Prussian non-commissioned officer, and was educated under the theological faculty of the University of Königsberg, combined odd ends of the Kantian philosophy with gleanings from the Bible into a dualistic neo-Gnosticism. Ebel, a Lutheran pastor, was a convert of his, and in 1826 was joined by Johann Diestel, another pastor. The doctrine, which involved peculiar views as to the sexual relations, spread among fashionable circles in Königsberg. In 1835 Count Pinckenstein, a former convert, accused Ebel and Diestel of immorality. They were unfrocked, but were not convicted of actual immorality. Consult Schönherr, I. "Faith Victorious" (New York 1882); Dixon, W. H., 'Spiritual Wives' (London 1868). See SCÆVOLANS.

MUCORACEÆ, the molds. See FUNGI.

MUCOUS MEMBRANE. The mucous membranes line passages and cavities which communicate with the exterior of the body, where they become continuous with the skin. They constitute the lining of the canal or tract, which begins at the mouth and ends at the anus, a distance of about 27 feet, and is the passage through which the food for nutrition of the body is introduced, digested and taken up for the preservation and growth of the body. They also form the lining of the nose, the throat, the middle ear, the various sinuses communicating with these cavities, the eyes, and of the respiratory apparatus, which comprises the lungs, the windpipe or trachea, and the larynx. The kidneys, the ureter, the bladder, the testes and the urethra in the male, and the Fallopian tubes, womb, vagina and vulva of the female are all lined with mucous membrane, together with the membrane of the ducts of glands which open upon it. In the female it becomes continuous with the peritoneum at the fimbræ of the Fallopian tubes. The surface of the mucous membranes of the body is subjected to the contact of various matters, such as the food, the air, and the different glandular secretions and excretions. They are protected from undue irritation by a viscid liquid called mucus (q.v.), which constantly bathes their surface, and are also well supplied with blood-vessels and nerves. The mucous membranes are not of a single origin, but may be derived from ectoderm, as is the case with the lining of the mouth, entoderm, as with the greater part of the digestive tract, or mesothelium, as in the urogenital ducts. A mucous membrane consists of an epithelium, or layer of lining cells; a connective-tissue basement-membrane, which may be hyaline and apparently homogeneous; and a further connective-tissue support or tunica propria. It usually is invaginated into glands, and may be evaginated into villi along the alimentary canal, as in the stomach and intestine. For the diseases of the mucous membrane, see the respective organs or systems concerned.

MUCUS, a semi-fluid substance, of a viscid, tenacious character, produced by the various mucous membranes of animals, and found covering the exposed surface of such membranes. Thus it is found in the mucous membrane lining the nose, the mouth and throat, the gullet, stomach, large and small bowel, the air-tubes of the lungs, the kidneys, ureter, and bladder, the gall-bladder, the ducts of glands, the bile-duets, etc. In all these situations it serves to lubricate
the membrane over the surface of which it is spread, and to protect the delicate surface from the action of irritating agents. Its viscid character prevents it being readily removed, and thus enables it more effectually to discharge its protective function. It is to be noticed that many of the mucous membranes have special glandular structures embedded in them, which produce special secretions, not mucus, such as the mucous membrane of the stomach and bowels, whose secretions have special properties connected with the digestion of the food. The saliva from the mouth is a mixture of mucus and the special secretion from the salivary glands, which acts on the starchy elements of food. Other mucous membranes have no such special structures, and only mucus is secreted by them, such as the mucous membrane of the nasal passages. Mucus is secreted by glands situated deep in the mucous membrane, and such glands are found in the mucous membrane of the nose; similar glands of very minute scattered thickly in the mucous membrane of the mouth, and are found of considerable size in the back part of the tongue, in the gullet, and other situations. But mucus is also produced by single epithelial cells, lining the membrane. The former of epithelial cells called the "goblet cell" is believed to be a mucous-secreting cell, and it is found in large numbers lining the mucous membrane of the air-passages, the stomach and bowels. So that by their agency the special digestive secretions of stomach and intestines contain a large admixture of mucous material. Pure mucus is transparent, but it is usually turbid from the presence of forlorn materials, and epithelial cells from the secreting membrane. Its chief ingredient is mucin, a derivative from albuminous bodies, consisting of carbon, hydrogen, oxygen and nitrogen, but, unlike albumin, containing no sulphur. It is held in suspension by water, forming an opaque liquid, but is not dissolved by it. Besides mucin, mucus contains small quantities of protein substances and salts, chiefly common salt. Water constitutes nearly 94 per cent of its bulk. From fluids containing it in suspension, such as bile, it may be precipitated in a flocculent stringy mass by alcohol. Heat does not coagulate it; and it is dissolved by weak solutions of alkalies and alkaline earths.

MUD (or PEAT) BATH, in which the body is immersed in mud or peat. At Eger, Boehemia, black mud is heated to a temperature of 100°. It contains sulphate of soda, iron, lime, alumina and ulmic acid. The body is immersed for 15 minutes, after which the patient goes into water to remove the mud. Such a bath may be of use in chronic skin diseases, rheumatism, gout, etc.

MUD-BUFFALO, a name in the leather trade, for the Indian buffalo (Bubalus bubalis) as found in a wild or semi-wild condition in the Malay Peninsula, where they frequently swamps and are shot for the sake of their hides. These hides are not tanned, but are sent green to India, Europe and America to be used in the manufacture of leather shoes and other tools used in cotton-milling. They become harder than wood, and are tougher and more elastic.

MUD-CAT. See CATFISH.

MUD CRACKS, cracks formed in mud surfaces by shrinkage due to drying. The surface of the mud flat is usually broken up into polygonal blocks, by cracks varying from a few inches to several feet in depth. These are also known as sun cracks, and are commonly formed in the muds of flood plains and deltas, and on playas (q.v.) surfaces. They are often filled with drifting sand and preserved in the sediment as the rock solidifies. For a discussion of their geological significance, see the section on Structure, in the article on Geology.

MUD-EEL, the amphibian Siren lacertina, which has persistent gills but no hind legs. It resembles the Proteida (q.v.) in many ways. See SIRENIDAE.

MUD-FISH, the name of various fishes found in muddy water, or fond of burrowing in the ooze of swamps. The Nile bichir and its relatives, the reed-fishes of the sluggish African rivers, are so-called; also the lepidosiren and other dipnoans, which grovel on muddy bottoms. In the United States, the name belongs to some small mud-minnows (q.v.), and to a curious fish (Amia calva) of the Mississippi Valley, known as dogfish, bowfin and by various other names. This, like the bichir and the reed-fish, is a ganoid (q.v.). It is a rather shapeless, dark-colored, exceedingly hardy fish, reaching a length of two feet and a dozen pounds in weight. It is carnivorous, feeding voraciously upon crayfish, small mollusks and anything it is able to seize and swallow; and it greedily seizes a baited hook and then fights gamely for its life, so that it is a favorite with anglers, though hardly fit to eat.

MUD-HEN, or MARSH-HEN, a sportsman's name for any of several rails, gallinules, coots and similar birds which make their home in marshes; it is most often given in the North to the Gallinule (Gallinula galeata), a bird of the rail family, much like the British water-hen (G. chloropus), and common in the marshes about the Great Lakes and Mississippi Valley, where its clucking resounds in summer from every reedy marsh. It is about a foot in length, olive-brown on the back, dull black on the under parts and with a red bill. In the prairie states of the Southern States have a smaller and more handsome mud-hen in the resident purple gallinule (Itonornis martinica).

MUD-MINNOW, or DOGFISH, one of the smaller fresh-water carnivorous fishes of the pike family, the Esocidae and the genus Umbra related to the Alaskan blackfish (Dallia). It lives in muddy bayous, and among weeds at the bottom of clear but sluggish streams, often burrowing in loose mud. There are two North American species: Umbra limi of the interior, and U. psyma of the eastern coast; and one in Austria. Such a distribution increases the probability that this is of an archaic type, characteristic of some earlier fish-fauna. The mud-minnows reach a length of about four inches and are valued as live bait, since they will long endure with vigor impalement on the hook.

MUD-PUPPY, or WATER-DOG, a member of the Proteida (q.v.). In this country usually Necturus maculatus, a large newt common in the eastern Mississippi Basin. For its
development and metamorphoses, see Embryology.

MUD-SHAD (Dorosoma cepedianum), the hickory or gizzard shad. This fish grows to a length of about 15 inches, is silvery blue in color, and occurs throughout the Mississippi Valley and in great abundance from Cape Cod to Mexico.

MUD-SKIPPER, a minute tropical fish of the goby family and genus Persophthalmus, which is accustomed to go ashore and skip about the space between tide-marks, exploring the rocks, roots of trees, etc., for food, and skip up spouting fountains as if they were steam-shoppers. Some curious qualities distinguish these little creatures, which are found from West Africa to Japan, and make them highly interesting to naturalists. Consult Day's 'Fishes of India' (1878) and other works on the natural history of the Eastern seas.

MUD-TURTLE, or MUD-TORTOISE, any fresh-water turtle usually found in muddy places. In the United States, the ordinary mud-turtle is Cisternon pennsylvanicum, which has a grayish-brown smooth shell, and a dark-colored head, with light dots. See Box-turtle.

MUD-WASP, one of the many kinds of solitary wasps which fabricate out of wet clay cell-like receptacles, variously shaped and placed, in which to store their eggs and the provision for the larve. See Wasp.

Muddock, Joyce Emmerson, English journalist and author; b. Southampton, England, 28 May 1843. He has been connected with several London journals and besides publishing some verse under the nom de guerre of "Dick Donovan" is the author of many other works, among which are: 'Basile the Jester'; 'The White Hand'; 'Fair Rosalind,' and 'Pages from an Adventurous Life.'

Mudge, Enoch, American Methodist clergyman; b. Lynn, Mass., 28 June 1776; d. 2 April 1830; the first Methodist clergyman reared in New England. He became an itinerant clergyman of the Methodist Church in 1793, and in 1793-99 traveled on his duties about Maine until hardships affected his health, and he was settled at Orrington (1799–1816). During this period he was twice elected to the legislature, where he obtained the repeal of a law imposing a tax on other denominations for the benefit of the Congregationalists. Having resumed itineracy in 1816, he was stationed at Boston, Lynn, Portsmouth, Newport and other places. From 1832 until his retirement from active life in 1844, he was pastor of the Seamen's Chapel at New Bedford. He was a member of the Massachusetts Constitutional Convention in 1819. He contributed much to the press, and published in bookform 'Camp-Meeting Hymn Book' (1818); 'Notes on the Parables' (1828); 'Lynn,' in verse (1830), and 'Lectures to Seamen' (1836).

Mudir, moo-dër, the title of a Turkish or Egyptian official; the governor of a province.

Muezzin, mū-iz'īn, in Mohammedan countries the bell-ringer of the mosque, whose duty it is to summon the faithful to prayer at the assigned periods by public proclamation from the minaret (q.v.). His call is the azan, and is sounded five times each day. The call is "God is most great [four times]! I bear witness that there is no god but one God [twice]! I bear witness Mohammed is the apostle of God [twice]! Come to prayer [twice]! Come to salvation [twice]! God is most great [twice]! There is no god but God [twice]!" In the morning call the words "Come to salvation" and "Prayer is better than sleep" are repeated twice.

Mutti, the title of a high Turkish official: who assists the judge or caliph by interpreting the law of the Koran, of Moslem tradition and of other legal sources. The Grand Mufti or Sheikh-ul-Islam (see Sheikh) is one of the interpreters of the Koran, by whose decisions the caliphs have to judge. The phrase, in multi meaning, "not in uniform; in civilian dress," is an Anglo-Indian expression, referring to the loose robes of the Moslem mufti.

Mugger. See Marsh-Crocodile.

Muggletonians, a religious sect founded (1660) by Lodowick Muggleton in London. He claimed that he and his cousin John Reeve, a tailor like himself, were the two witnesses who should prophesy a thousand two hundred and three score days, clothed in sackcloth (Rev. xi, 3). He was 40 years old when he received this commission through visions and mysterious voices. 'The Divine Looking Glass' (1650) contains an exposition of the teachings of the Muggletonians who deny the doctrine of the Trinity and believe in a material God, who suffered on the cross. Penn's 'The New Witnesses proved old Heretics' (1672) was a reply to the attacks of Muggleton. This Muggletonian bible was republished 1846 by a few remaining adherents of the sect. Consult Jessopp, A., 'The Coming of the Friars' (1888).

Mugwort, an ornamental and culinary herb. See Artemisia.

Mugwump, in American politics, a term originating during the Presidential campaign of 1844 between Grover Cleveland and James G. Blaine. It was applied by a New York newspaper to such members of the Republican party as refused to support their party nominee, James G. Blaine, and advocated the election of Grover Cleveland in the interest, they claimed, of civil service reform. The word belongs to the Algonquin dialect of the Indian language and is used by John Eliot in his translation of the Bible to translate the Hebrew word Alaph, a 'leader.' Eliot used it in the sense of 'big chief,' a term more comprehensible to the Indian mind than that which appears in the King James' version—"duke." The word was spelled 'Mugwump' in the singular, and "Mugwumpog" in the plural. It appears in many places throughout the Algonquin translation of the Old Testament.

Muharram, (Ar. mu-har-ram), sacred, from korama, to forbid) moom-haram, the first month in the Mohammedan calendar. The tenth day is known as the day of Ashura, and was originally made by Mohammed the great fast of the year, in imitation of the Jewish Day of Atonement, which is celebrated on the tenth day after New Year's Day. Later on came to be replaced by the last month of Ramadan. Nowadays among the Sunnites the day of Ashura is only a voluntary
fast. The Shutes mourn on this day in memory of the martyrdom of Husein (q.v.) at Kerbela. **Mühlbach,** mülbahrk, Luise. See Mündt, Klara.

**Mühlberg,** mülbérk, Prussia, town in the government of Cursitz, Merseburg, and the district Liebenwerda. It is located on the Elbe, has two Evangelical churches, court of justice, inland-revenue office, etc. Its industries consist of a sugar factory, saw-mills, brick kilns, besides commerce in lumber and grain and shipping. It is noted in history through the victory of Emperor Charles V over John Frederick, Elector of Saxony, in 1547. Pop. 3,345.

**Muhlenberg, **müll’man, Maurice Louis, American author: b. near Alton, Ill., 27 Nov. 1852; d. 12 June 1913. He was graduated from the law school of Columbia University in 1879 and was appointed to the United States treasury service in 1872. In 1888-1901 he was deputy assistant treasurer of the United States. He has published *The Money of the United States* (1894); *Monetary Systems of the World* (1900); *A History of the United States* (1907); *Banking Systems of the World* (1908); *A Plan for a Central Bank* (1910) *Governmental Supervision of Banks* (1911).

**Muhlenberg, **müll’lén-berg, Frederick Augustus Conrad, American Lutheran clergyman and politican: son of Heinrich Melchior Muhlenberg (q.v.): b. Trappe, Pa., 1 Jan. 1750; d. Lancaster, Pa., 4 June 1801. He was educated in Halle, Germany, and returning in 1770 was ordained to the Lutheran ministry. In 1773-76 he had charge of a Lutheran church in New York and then removed to Pennsylvania where he held several pastoral charges. He was a hearty sympathizer with the cause of the colonies and though not participating in the war aided his countrymen politically and ultimately abandoned his pastoral or political life. He served in the Continental Congress and was speaker of the first House of Representatives under Washington, and in 1795 his was the deciding vote which rescued the Jay treaty from defeat.

**Muhlenberg, **Gottthilf Henry Ernst, American Lutheran clergyman and botanist: b. Trappe, Pa., 17 Nov. 1753; d. Lancaster, Pa., 23 May 1815. He was a brother of F. A. C. Muhlenberg and son of Heinrich Melchior Muhlenberg (q.v.), and was educated with him in Halle, Germany. He returned to America in 1770, was ordained to the ministry and became an assistant to his father who was in charge of a Lutheran church in Philadelphia. He served in various charges until 1779 when he accepted a call to Lancaster where he remained until his death. In addition to his pastoral duties he distinguished himself as a scientist and took first rank as a botanist. He published *Catalogus Plantarum Americarum Septentrionalium* (1813); *Descripicio Inferior Gnomionum* (1817), etc.

**Muhlenberg, **Heinrich Melchior, German-American clergyman, organizer of the Evangelical Lutheran Church in America: b. Embeck, Hanover, 6 Sept. 1711; d. New Providence (now Trappe), Montgomery County, Pa., 7 Oct. 1787. He was educated at the University of Gottingen (1735-37), studied theology there (1737-38) and at Halle (1738-39), was ordained in 1739, and from 1739 to 1741 was deacon of the church at Goess, Upper Lusatia. On 6 Sept. 1741 he was called as missionary to the Lutheran congregations of Pennsylvania, located at Philadelphia, New Providence (now Trappe), and New Hanover. At that time there was a large number of Lutherans in America; but they were unorganized and without pastors, and such religious meetings as they had were conducted by laymen. Muhlenberg, who arrived at Charleston, S. C., 22 Sept. 1742 and at Philadelphia, 25 November, was well qualified for the work of effecting union and order. He at once entered on the duties of his charge, and preached his first sermon in Pennsylvania in an unfinished log-building at New Hanover, 28 November. Though Muhlenberg's local pastorate was largely restricted to the three congregations which had summoned him, his activities were really those of a bishop. He traveled over a wide extent of territory, preached at Lancaster, York and other places in Pennsylvania, in New York, and also in the regions of New Jersey, Maryland and among the Salzburger Lutherans of Georgia. "There was probably," thinks Stoever, "not a Lutheran church in his day, in this country in which he had not officiated." He was at first looked upon as an intruder by Zinzendorf and other Moravians, with whom he was for a time involved in conflict. But so successful was he in his labors that by 1745 there was real need for the reinforcement from Halle, consisting of the Rev. Peter Brunnholz and the catechists Kurtz and Schaum. The first church edifice at Philadelphia, Saint Michael's, was completed in 1743, and on 25 June 1769 Zion's Church, then considered the largest and finest in the United States, was dedicated there. On 14 Aug. 1748 the first Lutheran synod in America was organized under the direction of Muhlenberg, who became its president. In 1754 Muhlenberg prepared the 'Kirchen Agende,' a directory for public worship, and in 1762 reorganized the Philadelphia congregation under a constitution which became the basis of that of most congregations later established. He identified himself with the American cause in the Revolution, and was in consequence subject to a large number of annoyances, particularly when Pennsylvania was the scene of war (1777-78). He was a linguist of high rank, versed in Hebrew, Greek and Latin (in which he made an address at the synod of 1750), and proficient in English, Dutch, French, Bohemian and Swedish. His large foreign correspondence appeared at Halle in 1787. Consult 'Die erlaubte Klage über den Abschied treuer Knechte Gottes' (1788), a memorial sermon by J. H. C. Helmuth (with biographical sketch); Stoever, 'Memoir of the Life and Times of Muhlenberg' (1856); Mann, 'Life and Times' (1887), considered the best.

**Muhlenberg, **John Peter Gabriel, American patriot: b. Trappe (then New Providence), Montgomery County, Pa., 1 Oct. 1746; d. near Philadelphia, 1 Oct. 1797. He was the son of H. M. Muhlenberg (q.v.), the founder of the German Lutheran Church in America. He was educated for the ministry, was for a time pastor of German Lutheran churches at New Germantown, N. J., and Bedminster, N. J. In 1772 he went to Woodstock, Va., and
finding that in order to enforce the payment of taxes he must be ordained in the Episcopal Church, he was ordained priest in England. He was chairman of the Shenandoah County committee of safety, and 1774 a member of the Virginia house of burgesses. At Washington’s request he became a colonel in the Continental army. His name is upon the seals of the men who wrote our country; and saying, “There is a time for all things—a time to preach and a time to fight—and now is the time to fight,” he stripped off his gown after the service, appeared in full uniform, called for recruits and enlisted about 300 of the parishioners. He participated in several battles, was made brigadier-general in 1777, and major-general at the close of the Revolution. After the war he removed to Pennsylvania, where he was elected a member of the supreme executive council, and in 1785 became its vice-president. He served as representative in Congress from 1789 to 1795, and from 1799 to 1801. In 1801 he was elected United States senator, but soon resigned and was appointed supervisor of the revenue for the district of Pennsylvania. From 1803 till his death he held the office of collector of the port of Philadelphia. Consult Muhlenberg (H. A.), ‘Life’ (1849).

MÜHLHÄUSEN, William Augustus, American clergyman: b. Philadelphia, 16 Sept. 1796; d. New York, 8 April 1877. He was graduated (1814) at the University of Pennsylvania and was ordained deacon (1817) of the Episcopal church and priest three years later, becoming assistant to the rector, Bishop White, of Saint Peters and Saint James parishes. In 1821 he moved to Lancaster, Pa., becoming rector of Saint James Church and established there the first public school in the State outside of Philadelphia. He went to Flushing, L. I. (1828), and founded a Christian high school (later called Flushing College), he remaining principal till 1846, when he was appointed rector of the church of the Holy Communion, New York City, erected by his sister. He started collecting a fund for the erection of a church hospital and was appointed chief of the Saint Luke’s Hospital was built (1858) on 54th street between Fifth and Sixth avenues and he became its first pastor and superintendent, which positions he held till his death. His last very useful work was in founding Saint Johnland Christian industrial community on the north shore of Long Island. In 1843 he organized the first Protestant sisterhood in the United States. He wrote several well-known hymns including ‘I Would Not Live Alway’, ‘Like Noah’s Weary Dove’, ‘Shout the Glad Tidings’. His chief works published are ‘Evangelical Catholic Papers’ (1875-77, 2 vols.); ‘Christian Education’ (1831). Consult Ayres, Sister Anne, ‘Life and Work of William Augustus Muhlenberg’ (1889).

MÜHLHÄUSEN COLLEGE, in Allentown, Pa.; founded in 1867 under the auspices of the Lutheran Church. In 1915 there were connected with the college 16 professors and instructors, and about 354 pupils. There were in the library 20,741 volumes. The courses of study lead to the degrees of A.B., B.S. and Ph.B.

MÜHLHAUSEN, mülˈhau̯-zen, Germany, a town of Alsace-Lorraine. See MÜHLHAUSEN.

MÜHLHAUSEN, Prussia, town of Saxony, in a fertile district on the Unstrut, 25 miles northeast of Erfurt. It is surrounded by old churches, an old town-house, a gymnasium, various technical, commercial and other schools, hospitals, an orphanage, etc. It manufactures woolen and cotton or mixed goods, hosiery, cigars, leather, cycles, sewing-machines, wooden wares, furniture; and carries on tanning, dyeing, maling, brewing, etc. The Anabaptist Münzer, a leader in the Peasants’ War, had his headquarters here, and was executed near by in 1525. The town became part of the Kingdom of Prussia in 1815.

MÜHLEHEIM, mülˈheim. See MÜHLEHEIM.

MUIR, mür, John, Scottish Sanskrit scholar: b. Glasgow, 5 Feb. 1810; d. Edinburgh, 7 March 1882. He was educated at Glasgow University and at Haileybury College, whence he passed into the Bengal Civil Service in 1828. He remained in India 25 years, filling various offices in the revenue, educational and judicial departments. His fame will rest on his ‘Original Sanskrit Texts on the Origin and History of the People of India, their Religion and Institutions,’ illustrated (1858-70). The first volume discusses the legendary accounts of the origin of caste; the second, the primitive homes of the Hindu; the third, the opinions of Hindu writers on the Vedas; the fourth, the contrast between Vedic and later Hindu theology; and the last the cosmological and mythological conceptions of the Indians in the Vedas. In 1862 he founded a chair of Sanskrit and comparative philology in the University of Edinburgh, following out the plans of the Association for the Better Endowment of Edinburgh University, of which he was the main originator.

MUIR, John, American naturalist and explorer: b. Dunbar, Scotland, 21 April 1838; d. Los Angeles, 24 December 1914. He came to America in 1849 with his father, who settled near Fox River, Wis.; entered the University of Wisconsin when 22; and after a special course of four years completed his journeys through Canada, Eastern and Western United States, the West, and the South, that made him a botanist and a geologist. In 1868 after visiting the Yosemite Valley, he made it his main central camp for 10 years while studying the forests, glaciers, etc., of the Sierra Nevada. He discovered in the High Sierra 65 residual glaciers. He made his first trip to Alaska in 1879, discovered Glacier Bay, and Muir Glacier, named after him, and explored some of the upper courses of the Yukon and Mackenzie rivers; in 1880 accompanied the Delong search expedition to the Arctic, and in 1903-04 traveled in the Caucasus, Siberia, Manchuria, Japan, India, Egypt, Australia and New Zealand. He has written much newspaper and periodical work, urging the formation of national parks — both the Sequoia and Yosemite are in great part due to his efforts — and has published ‘The Mountains of California’ (1894), and ‘Our National Parks’ (1901). He was a member of the American Academy of Arts and Letters, and received honorary degrees at Yale and the universities of Wisconsin and California. Among his works are ‘Stickeen’ (1909); ‘My First Summer in the Sierra’ (1911); ‘The Yosemite’ (1912); ‘Story of My Boyhood and Youth’ (1913); and the
posthumous 'Letters to a Friend' and 'Unpublished Prose and Letters' (1915).

MUIR, Sir William, Scottish administrator and Arabic scholar: b. Glasgow, 1819; d. 11 March 1876. He lectured at the universities of Edinburgh and Glasgow and at 18 entered the Bengal civil service, where he attained distinction. He became secretary of the government of the Northwest provinces and member of the commission Board, and during the mutiny was in charge of the Intelligence Department at Agra. He was lieutenant-governor of the Northwest provinces 1868-74, and financial minister to the government of India 1874-76. Returning to England he sat on the Council of India, 1876-85, was elected principal of the University of Edinburgh, 1885-1900. He has published 'Life of Mahomet' (1858-61; abridged ed. 1877); 'Annals of the Early Caliphate' (1883); 'The Koran, its Composition and Teachings, and the Testimony it Bears to the Holy Scriptures' (1877); 'Extracts from the Koran' (1880); 'The Early Caliphate and Rise of Islam' (1881); 'The Mohammedan Controversy' (1897).

MUKDEN, mook'dén, MOUKDEN, or FUNG-TIEN-FU, capital of Manchuria and of the province of Shinking, situated on the Hu, a tributary of the Liau River, about 500 miles northeast of Peking. Its port is Newchwang, about 120 miles distant, near the Gulf of Liao-Tong. It is the cradle of the Manchu race, and until recently was known by its old Chinese name of Sin-Yang, its Manchu name of Mukden —or 'Flourishing Capital'—given to it by its conqueror nearly 200 years ago, being used only in official documents. It is a station on the Russo-Chinese Railroad, and is surrounded by walls laid out in regular parallelograms between one and two miles each way, and built of squared stone or brick, thick and massive at the base and tapering gradually to the top. These walls are 40 feet in height, 21 feet in width, and are protected at the top by an eight-foot crenelated parapet. Outside these walls there is a wide moat, and then come the suburbs, which extend for a mile or more on all sides. These again are enclosed by walls, which are constructed of mud. In the heart of the town is an inner wall, three miles in circuit, enclosing the emperor's residence, the government offices, courts and other buildings connected with them, which are arranged on a plan similar to those of Peking. In 1631 the Manchu monarchs made Mukden the seat of government, and succeeding emperors have done much to enlarge and beautify it. At Mukden are the tombs of the Manchu emperors, and the royal burying ground is ornamented with stone images of elephants as ponderous as some of the great statues of the graves of Egyptian kings. Other interesting relics of the past in the environs of the city are the Temple of Heaven and the Temple of Earth, both of which were built by Tai Tsung, and the remains of which are still to be seen.

Like all the cities of Manchuria, Mukden is laid out on a regular plan not unlike American towns. The main street runs due north and south, and the second best crosses it at right angles, while parallel to these run a series of alleys teeming with an industrious population. The city suffered greatly during the uprising of the Boxers in 1900, and was used by the Russian army under Kuropatkin as a base of supplies during the Russo-Japanese War. It was captured (March 1905) by the Japanese army in one of the greatest and most remarkable battles of modern history. Pop. about 250,000. See MANCHURO.

MUKHTAR PASHA, mookh-tahr pash'â (GHAZEE AHMED), Turkish general: b. Brussa, Turkey, 1832. He was educated in the military schools in Brussa and in Constantinople and entered upon a military career. He served in the Crimean War, taught at the military school, became the military instructor of Prince Yusuf Iseddin, the favorite son of Sultan Abd-ul-Aziz, and was second in command of the expedition to Yemen in 1870, receiving the full command and the rank of field-marshall in 1871. In the campaign of 1880 in Montenegro he played a conspicuous part and thereafter received steady and rapid promotion. He became a full general in 1870 and in 1873 was appointed minister of public works. In the wars of Bosnia, Herzegovina and Montenegro in which he was commander he displayed great generalship, gaining 20 victories and never suffering defeat. The campaign of Kars-Erzerum in 1877 went against him and he was defeated by the Russian general Melikoff after a brilliant engagement for which he received the highest Turkish military title, "Ghaeez." In 1878 he was made grand master of the Turkish artillery, in which capacity he subdued the Cretan insurrection in that year, and in 1885 was designated to the post of Turkish High Commissioner in principally because he had remained there about 10 years, and then returned to Constantinople. He was one of the commissioners in 1912 to arrange for a peace with Italy and to pacify Albania. In July 1912 he became Grand vizier, but resigned in October.

MULA, moo'la, Spain, town in the province of Murcia, on a branch of the Segura, has ancient castle ruins, but is chiefly known on account of its iron and sulphur natural hot baths. Pop. about 11,922.

MULBERRY, a genus (Morus) of trees of the order Moraceae (q.v.), of which 100 species have been described, but only five are recognized. The mulberries are characterized by the possession of leaves variable in form even upon the same twig; monocious flowers which became fleshy as they swell. They are natives of the mild parts of Asia, Europe and America, whence they have been taken by man to similar regions throughout the world. In the Old World various species are of economic importance, principally because their foliage supplies the food of the silkworm, and their fruit a dessert and a wine. The wood of most species is of inferior quality, but that of one species, the red mulberry (M. rubra), is fine-grained, strong and useful for ship-building. The trees are propagated by means of seeds, layers, cuttings or by graftage. They thrive upon almost any soil; even on rocky hillsides and gravelly lands, and succeed best upon arable soil in which they may be planted from 20 to 40 feet apart, and are v egeted like other orchard fruits until they have full possession of the ground. The fruits,
which are borne in great profusion, are too soft for market purposes, and usually too sweet for preserving alone. They are generally shaken from the trees upon sheets. Pigs are very fond of them.

The following are the most important species. The white mulberry (M. alba) is the silkworm mulberry, and has produced most of the best known American varieties valued for the fruit, but not those esteemed in Europe. The black mulberry (M. nigra) is the European "dessert" species, and is little used for the feeding of silkworms. The red mulberry (M. rubra) is a native American tree to be found from Massachusetts to Nebraska and southward to the Gulf States. It has produced several good dessert varieties, the fruits, of which are characterized by greater acidity than those of the Old World sorts. It seems to be ill adapted to the feeding of silkworms. The so-called Russian mulberry is a variety of the white. It produces inferior fruits but is valued in the Plains States for wind-breaks, for which purpose its ability to resist extremes of drouth, cold and neglect specially fit it. All the above species have produced horticultural varieties, some variegated, others weeping, which are planted more for ornamental purposes than for fruit.

Another important species is the Indian (M. indica) which is used in silk culture and for its fruit, which is of fine flavor. It is cultivated in India, China and other countries of the East. The allied paper-mulberry (Broussonetia papyrifera) is a native of Eastern Asia. This tree is of a moderate size, bearing leaves which are either simple or divided into lobes, more or less above and hairy beneath. It was originally from India and Japan, but is now very commonly cultivated in Europe, and succeeds even in the more northern parts. The islanders of the Pacific make a kind of clothing from the bark of this tree in the following manner: When they about an inch in diameter are cut and deprived of their bark, which is divided into strips, and left to macerate for some time in running water. After the epidermis has been scraped off, and while yet moist, the strips are laid out upon a plank in such a manner that they touch at the edges, and two or three layers of the same are then placed upon them, taking care to preserve an equal thickness throughout. At the end of 24 hours the whole mass is adherent, when it is removed to a large, flat and perfectly smooth table, and is beaten with little wooden clubs till it has attained the requisite thinness. This kind of cloth is easily torn, and requires to be washed and beaten many times before it acquires its full suppleness and whiteness. The natives dye it red and yellow, and also make a similar cloth from the bread-fruit tree, an allied plant; but that from the mulberry is preferred. The paper which is used in Japan and many other countries in the East Indies is made from this plant. For this purpose the annual shoots are cut after the fall of the leaves, tied in bundles, and boiled in water mixed with ashes; after which the bark is stripped off by longitudinal incisions, and deprived of the brown epidermis. The mark of the more tender shoots is separated from the rest, as it furnishes a white paper for writing, while that produced by the remainder is coarse and gray, and serves for wrapping or similar purposes.

MULCH, any material kept in a loose condition at the surface of the soil for the purpose of checking evaporation, conserving moisture, protecting plant-roots or low-growing plants from frost or heat, preventing puddling and washing of the soil, retarding growth in spring, keeping the surface soil open, supplying plant-food, protecting fruit or flowers from dirt, and keeping down weeds. The materials most frequently applied are straw, marsh-hay, leaves, litter and brush; but the most widely important mulch is the surface soil itself, kept powdery by frequent tillage, given especially after rains when it is desirable to break the crust formed upon the surface. Since mulches keep the soil beneath them moist by breaking the capillary, they are of particular advantage in dry climates; but since the vegetable mulches, such as straw and leaves, cannot be used in summer where the land must be kept dry, they supply hiding places for insects, they can rarely be used advantageously in fruit plantations, in which they are often also a positive detriment because they encourage the growth of roots near the surface. In climates liable to extremes of temperature, the feeding roots is often disastrous to the crop if not to the plants themselves. Except, therefore, for winter protection, when such seems to be necessary, the soil itself is generally best. But the depth of the powdery layer will depend largely upon the climate, character of the soil, and kind of crop; in arid regions, with light soils, and with deep-rooted plants, the soil mulches are usually deeper than with the reverse conditions.

MULDER, mool'dër, Gerardus Johannes, Dutch chemist and physician: b. Utrecht, Holland, 27 Dec. 1802; d. there, April 1880. He was educated at the University of Utrecht and became professor of botany and chemistry there (1840-68), but first practised medicine in Amsterdam for some years. He was also for a short time professor of chemistry at Rotterdam. He became known chiefly through his researches on the proteins, and advanced the belief in a hypothetical substance which he called protein. This he believed to be the essential nitrogenous constituent of food, existing in animals, and derived ready-formed from plants and vegetables. The publication of this theory involved Mulder in a controversy with Liebig, who from the first doubted the existence of protein as an independent chemical compound. The whole theory has been abandoned, and the word protein is now used to indicate the first element in compounds. His principal work 'Chemistry of Vegetable and Animal Physiology' has been translated into English by Fromberg, and his 'Chemistry of Wine,' by Bence Jones. He also wrote 'Chemical Researches'; 'De voeding in Nederland'; 'De Voeding van den Neger in Suriname;' and his posthumous autobiography 'Levensschets' (1881; 2d ed. 1883).

MULE, in zoology, a term loosely used as synonymous with hybrid, more usually applied to the produce of a male ass with a mare, the mule proper, and to the hinny, the offspring of a stallion and a she-ass. The mule does not
attain maturity as soon as the horse, but is useful a much longer period. As a beast of burden it is in some respects preferable to the horse, being less subject to the ills of climate and not requiring to be bridled and reins kept at a short rate. Like the ass, it enjoys comparative immunity from disease, and it is as surefooted as a goat.

Mules have been known from the earliest ages; their history is to be found in Scripture and in Greek and Latin literature. Kentucky, Missouri and Kansas take the lead in mule-raising in the United States, and the small Mexican mule is a very useful animal. France is the most important mule-raising country in Europe; then come Italy, Spain and Portugal, where they are used for pack and draft. They are largely employed as draft animals in warfare. Fecundation of the hybrid-female by the male ass or the stallion is not very rare, though the rarely throws a viable offspring. See Blacktail.

HORSES, Asses and Zebras (London, 1855), and publications of the United States Department of Agriculture. (See Hybridity, 1910). In 1910 there were 4,480,140 mules in the United States.

The value per head was $126.00. For further statistics see Livestock, American.

MULE DEER, or BLACKTAIL, a deer of the western United States (Odocoileus hemionus), remarkable for its disproportionately large ears. Its common name "blacktail" among the hunters is due to the black color of the terminal part of the tail, distinguishing it from the "whitetail" or eastern deer (q.v.), but is better reserved for the Pacific Coast species. (See Blacktail). This deer is rather larger than the eastern and is a deer of the rocky plains, and especially of the mountains, which is a characteristic of the rockies and the Vail, and it is often to be seen on the summits of cliffs and ledges where it has a wide outlook. Its gait is very distinctive, also, consisting of a series of jerking bounds very effective on declivities, but looking strange on a level plain. The character of the sport afforded by this deer depends much upon the kind of country in which it is hunted, the method of pursuit being very different in the central and southern California from that followed among the broken plains of Montana. When hiding in summer it will often wait until almost touched before starting off. In winter it gathers into herds and wanders among sheltering hills and vales. It is therefore the characteristic deer of the Rocky Mountain region and was formerly exceedingly numerous and one of the principal sources of food and clothing for the Indians. Originally the species occurred commonly as far east as the plains and prairies extended; but was early exterminated in the central Mississippi Valley and from about 1875 to 1895 was the object of persistent slaughter by hide hunters. At the beginning of the present century, therefore, it had nearly disappeared from the plains south of the upper Missouri, was scarce in the central Rocky Mountains and was exterminated in the adjoining provinces of Canada. Its hide makes the best tanned deer-leather (buckskin) and its flesh is excellent. The mule deer is much taller than the Virginian deer, standing about three feet four inches high at the shoulder, but is heavier and of coarser build. The ears are very large and thickly haired, the tail rounded and white with broad black tip. The coat is still yellowish in summer, palest in the southern desert varieties, but becomes bluish gray with the autumnal molt; face between the eyes dusky, elsewhere white; throat, abdomen and inside of the legs white; antlers forked equally and each prong against one another. See Baille-Grohman, 'Fifteen Years' Sport and Life in the Hunting Grounds of Western America' (1900); Caton, 'Antelope and Deer of America' (1877); Lydekker, 'Deer of all Lands' (1898); Roosevelt (and others), 'The Deer Family' (1902).

MULE-KILLER. See Mantis.

MULE MACHINE, a spinning-machine in which the rovings are delivered from a series of sets of drawing roller to spindles placed on a carriage, which travels away from the rollers while the thread is being twisted and returns toward the rollers while the thread is being wound. It was invented by Samuel Crompton of Bolton, England, in 1779. The combination which gave rise to the term mule was the junction of the drawing rovings of Arkwright with the spinning jenny of Hargreaves. The object of the machine is to deliver the roving with the required degree of attenuation and twist it as delivered. For this purpose the spindles, instead of being stationary, are placed on a movable carriage which is wheeled out to twist the threads and wheeled in again to wind on the spindles.

MULE AS A WORK ANIMAL, THE. The use of mules for doing the work of the world is almost as old as history. The historical records that have come down to us recounting the exploits and industrial achievements of the more civilized peoples of the earth have all mentioned the mule. The impression which one gathers from reading the opinions of the earlier peoples is that the mule was highly regarded, particularly as a burden bearer.

So far as the writer has been able to determine, there are no unfavorable reports of the work of mules. On the other hand the unanimous opinion of those who have had most to do with the utilization of mules is that they are in many respects the most efficient and satisfactory work animals employed by mankind.

In more modern history the evidence of the value of mules is still more thoroughly recognized. The number of mules in the United States has increased rapidly. One hundred years ago the mule was not generally used as a draft animal except in a few Southern States. At the present time the mule is used to a greater or less extent in every State of the Union. He is particularly valued in the South, in the Middle West and the West. In these great agricultural regions the mule has won a place in competition with horses and he will not be replaced unless we should ultimately come to a type of farm practice which will make it possible to employ mechanical motors exclusively for agricultural production.

The favorable opinion of mules as work animals is not due to any accident nor indeed to any peculiar psychology of those who have used the mule largely in their industrial occu-
pations. There are certain outstanding qualities characteristic of the mule which single him out from among other types of draft animals and horses. He is today, with little doubt, one of the most popular and economical of draft animals.

The mule is recognized as possessing unusual endurance, exceptional courage, sure-footedness, steadiness and is exceptionally free from endemic and harmful nervousness. The mule is also given credit for the possession of an unusual amount of instinctive wisdom which protects him against many of the dangers and accidents to which horses are subject.

No draft animal so far developed has the endurance of the mule under all kinds of hard working conditions. In the excessive hot climate of the tropics mules will work steadily day after day without injury to themselves and accomplish an astonishingly large amount of productive labor. Under similar conditions horses are far less efficient and indeed it is plain that under many such conditions horses are entirely unable to accomplish the work. On the arid plains and in the desert regions of the world the mule is of value in quality and endurance. The mule has been recognized and particularly where the trails are rocky the mule outlasts any other draft animal.

A part of the endurance of the mule is due to his temperament, a part to his sound, thoroughly good feet and a part to his instinctive food habits. The mule is not so well adapted to the sandy stretches of the arid regions because his small, somewhat pointed foot causes him to sink more deeply into the sand than flat-footed horses. The mule is sure-footed. Over the dangerous trails of the mountains the mule rarely meets with an accident. He is wise in selecting his foothold and will carry the rider or pack safely along precipitous trails where under similar conditions horses would be unsatisfactory.

On the farms, particularly of the Middle West and the South, the mule is more economical. The statement is frequently made that the mule requires less food for the performance of a given amount of work than the horse. This is the general opinion among farmers who have experimented in the use of mules. Investigations on this point are not numerous and are not thoroughly convincing, but in the main the conclusion that mules will consume less food than horses is probably true. It is certainly true that mules will thrive on a coarser character of fodder. They will thrive under conditions which would be impossible for horses.

The mule will rarely if ever injure himself by over-heating, over-eating or drinking when he is too hot. Under similar conditions horses are frequently injured and their usefulness greatly diminished.

This interesting hybrid, descended from the ancient wild ass of the deserts, has inherited a certain type of wisdom which protects him from the dangers incident to civilization. The mule has made himself at home in the farms of Missouri where mules attain their highest development the risk from rearing young mules, so far as acquiring blemishes is concerned, is much smaller than the risks from similar accidents among young horses. This is an economic factor which is clearly recognized and one which constitutes an argument for the increased profit in the raising of mules. In the earlier use of mules in this country the small, active, hardy mule of good quality was universally favored. In more recent years, however, with the increase of heavy farm machinery, larger mules have been in demand. At the present time (1919) the large draft mule of good quality sells for the highest price on the market. The draft mules are not only used in the cities for heavy hauling but farmers also demand the heavy mule than in former years. The smaller mules, known on the market as "cotton" mules, are more generally sold in the South. The draft mules are sold in the mining regions, for city drayage and on larger farms of the Middle West. The "sugar" mule is a larger mule than the "cotton" mule and is demanded in the cane-growing regions of the South. The demand for large draft mules has caused the breeders of mules to produce a larger jack of good quality. This animal mated to the mares belonging to the principal draft breeds of the United States is the source of the draft mules of America. These draft mules may perhaps lack somewhat in quality but in the main have a better active mules of earlier history but they do possess a power and efficiency in the hauling of heavy loads which is comparable to the similar power of great draft horses so long used on the city streets.

This brief article on the value of the mule as a work animal would not be complete without recognizing the great value of the mule in war. During the great European War the Allies made large use of the mule in transporting artillery and supplies, particularly in carrying supplies to the front. Through much of his courage and steady, reliable subservience was dependable under fire and could be used where horses could not be employed.

The rearing of mules has come to be as much an art based upon scientific principles of breeding as has the production of the class of domestic animals. While it is true that the mule is a hybrid and always sterile, the principles of breeding which may be applied in his production are more complicated and involve the successful breeding of two distinct species, it is nevertheless true that the value of the mule for industrial purposes is to-day as largely dependent upon the skill of the breeder as is the breeding of cattle, horses, sheep or swine.

FREDERICK B. MUNFORD, Dean and Director of the College of Agriculture, University of Missouri.

MULFORD, EliasA. American Episcopal clergyman and philosophical writer. b. Montrose, Pa., 10 Nov. 1833; d. Cambridge, Mass., 9 Dec. 1885. He was graduated from Yale in 1855 and subsequently studied theology, law and philosophy. He entered the Episcopal ministry and held several rectories, but from 1881 lived in Cambridge, Mass. He wrote "The Nation" (1870), a treatise on the philosophy of the State, and "The Republic of God" (1881), relating to the philosophy of religion. From 1881 till his death he taught at the Episcopal Theological School at Cambridge, Mass.

MULHALL, Michael George, Irish statistician: b. Dublin, Ireland, 1836; d. Killiney, Ireland, 12 Dec. 1900. He was educated in the
Irish College at Rome, and in 1861 went to
Buenos Aires, where he founded the Standard,
the first English daily paper in South America.
He gained a wide reputation as a statistician,
and in 1880 made a calculation of the census of
the United States for 1900 which came within
95,000 of the number given by the census report
in that year. He was a frequent contributor to
the Contemporary Review, and published 'Rio
Grande do Sul and Its German Colonies
(1873); 'A Dictionary of Statistics' (1883); '
Fifty Years of National Progress, 1837-87
(1887); 'Industries and Wealth of Nations'
(1896), etc. His wife, Mrs. Marion Mullhau,
 wrote 'Between the Amazon and the Andes'
(1883); 'Celtic Sources of Dante's Divine
Comedy.'

MUL HAUSEN, mül'hauz-en, or MUHL
HAUSEN (French, MULHOUSE), Germany,
a town of Alsace-Lorraine, on the Unstrut River
and the Southern Canal, 66 miles by rail south
west of Strasbourg, on the Rhine, and 25 miles
northwest of Basel, Switzerland. It is an important commer-
cial and manufacturing centre, the principal seat of cotton spinning in western Germany, and carries on calico printing, dyeing, the spinning and worsted yarn, the manufacture of machinery, railway material and numerous other industries. Its industrial im-
portance dates from 1746, when a cotton-factory was established. It is noted for its model dwell-
ings for the working classes in the "cité ouvrière," workingmen's colony, on the northwest, founded by Mayor Dollfus in 1853. A migration to the suburbs, however, left the artisan colony in the occupation of small trades-
men. Mulhausen is first mentioned in 717; it became an imperial free city in 1273, and in the 15th century entered into an alliance with the Swiss, which lasted till 1798, when it became French. It was included in the cession of Alsace to Germany in 1871. In the great European War (q.v.) it was the scene of con-
siderable military activity. Pop. about 95,000.

MÜLHEIM, mül'him, or MÜHLHEIM,
Prussia, known as the Rhine province: (1) Mulheim-on-the-Rhine, with a bridge spanning the river, is almost opposite Cologne. The town has manufactures of machinery, cables, wire ropes, wagons, velvet, silk, chemicals, etc. From 1914, the town with Cologne suffered from the operations of Allied aviators during the great European War. Pop. 53,500. (2) Mühl-
heim-on-the-Ruhr, 14 miles north of Düsseldorf, has coal and iron mines, iron foundries, manufactures of iron-ware, machinery, glass, woolen and cotton goods, and a considerable trade in sandstone, building materials and coal. The Ruhr is crossed here by a chain bridge and a railway bridge. Pop. about 112,500.

MULHOLLAND, mül'hóland, William,
American hydraulic engineer: b. Belfast, Ire-
lund, 11 Sept. 1855. He was educated at the Christian Brothers' School, Dublin. Coming to the United States, he became superintendent and chief engineer of the waterworks of Los Angeles, Cal., from 1886. He devised the plans and estimates, then superintended the con-
struction of the Los Angeles aqueduct to bring to the city water from the Sierra Nevada Mountains, a distance of about 250 miles, at a cost of $24,500,000. He has been consulting
engineer on many projected water supply and irrigation plants.

MULITA, a small armadillo, with head and
ears like those of a mule, native to southern
South America.

MULL, Scotland, an island of Argyllshire,
the largest of the Inner Hebrides next to Skye.
Its length is 35 miles; greatest breadth, 30; su-
perficial area, 347 square miles. It is irregular in shape, and the large bay on the west side
contains a number of islands, including Ulva
and Staffa. Iona lies off its southwest extremi-
ty. The island is rugged and mountainous; Benmore, the highest mountain, is over 3,000
feet above the level of the sea. The principal
village is Tobermory; pop. about 1,000. Be-
tween the island and the mainland, on the north-
est, is the Sound of Mull, from one to three
miles wide.

MULLANY, mül'la'ni, James Robert
Madison, American naval officer: b. New York,
He was appointed to the navy as midshipman in
1832 and received steady promotion, becoming
lieutenant in 1844. He served with distinction in the Mexican War, and at the out-
break of the Civil War in 1861 was promoted commander. He commanded the Omeida in the
battle of Mobile Bay and performed valiant
service with her on that occasion, losing his left
arm. He was commissioned commodore in 1870
and rear-admiral in 1874, and until 1876 was in
command of the North Atlantic squadron
and in conjunction with General Emory and
General Sheridan at New Orleans protected
American interests on the Isthmus of Panama.
From 1876 until 1879, when he was retired from
active service, he was governor of the naval
station at Philadelphia.

MULLANY, Patrick Francis. See Aza-
rias, Brother.

MULLEIN, a genus of biennial and peren-
nial herbs (Verbasum) of the natural order
Scrophulariaceae. The species, of which more
than 100 have been described and more than 30
are cultivated, have tap roots, woolly foliage
and rosettes during the first season, and spikes or racemes of small, usually yellow,
flowers which appear from midsummer until late autumn. Some species were formerly re-
puted medicinal. In America they are usually
considered as weeds, but in Europe they are
valued as ornamental plants, particularly for
mixing with shrubbery and planting in the rear
of flower borders. Though natives of the Meditterranean region, some species are known
in England as American flannel or velvet plant.
The best-known species in the United States are
probably the moth mullein (V. blattaria), the
common mullein (V. thapsus), the white mul-
lein (V. lycnatis), and V. phlomoides, which
are all common in pastures and uncultivated
fields.

MÜLLER, mül'ær, Adam Heinrich, Ger-
man economist: b. Berlin, 1779; d. 1829. In
his 19th year he went to the University of
Göttingen, where he at first occupied himself
with theology and then became a student of jurisprudence, in which he was a pupil of Hugo. He afterward sought to complete his education by the private study of the natural
sciences, which he had previously neglected.
MÜLLER

He early formed a close intimacy with Friedrich Gentz, his elder by 15 years; and this connection exercised an important influence both on his material circumstances and his mental development in after life. The two men differed widely in character and in their fundamental principles, but agreed, at least in their later period, in their practical political aims, and the friendship was only terminated by death. Müller's relations with the Junker party and his co-operation with them in opposition to Hardenberg's reforms made any public employment in Prussia impossible for him. In 1805 he was in Vienna, where he became a convert to Roman Catholicism, and thenceforth only as a poet, for at a time when German poetry had degenerated, Müller helped to give a new impulse to German literature. His best works, 'Nibel', 'Faust', and 'Geneviève', are characterized by richness, warmth and elevated delineation of character, though sometimes wild and disconnected.

MÜLLER, Friedrich Max (known as Max Müller), English philologist: b. Dessau, Germany, 6 Dec. 1823; d. Oxford, 28 Oct. 1900. His father was Wilhelm Müller (q.v.), a famous German lyricist, and his maternal great-grandfather, Basdow, the educator. His bringing up was in his mother's hands, as his father died when the boy was four. He studied in Leipzig, at the Nicolaischule; had some thoughts of becoming a musician, but entered the University of Leipzig in 1841, and there, under the leadership of Hermann Brochhaus, devoted himself to Sanskrit, publishing a German version of the 'Hitopadēśa' in 1844; worked under Bopp in philology and Schelling in philosophy at Berlin for a year; in 1845 went to Paris, where Burnouf suggested to him an edition of the 'Rig Veda'; and in 1846 went to England and interested the East India Company in this work, which he undertook at the expense of the company. He was in Paris in 1848, and brought to Palmerston, in London, the first news of Louis Philippe's flight from Paris. In the same year he settled in Oxford, where the 'Rig Veda' appeared, with Sāyana's commentary, 1849-74. He became deputy Taylорian professor in 1850, and Fellow of All Souls' in 1858; but in 1860 was defeated in his candidacy for the chair of Sanskrit by Monier Williams, after a fierce fight on the part of his opponents, who objected partly to his foreign birth and partly to his very free and unorthodox religious views. The result for linguistic science was unimportant, as it turned Max Müller from the narrow field of Sanskrit, in which he easily outranked his contemporaries, to comparative philology and the science of religion, in which his achievements were less exact and scholarly, to say the least. In 1868 he became professor of comparative philology at Oxford. He was made a privy councillor in 1896. His greatest single work was as editor of the 'Sacred Books of the East,' a series of English versions of Oriental scriptures, to which he contributed three vols., and which was begun in 1879 and is not yet complete. He is possibly even better known as a popularizer of the first principles of linguistic science, so that he became in the lay mind the main exponent of this science, and of which one of his chief charges was inadequate, and many of the etymologies he advanced showed that he was not conversant with the strict rules of phonetics. But the charm of his style, his general grasp of so large a subject, and his admitted pre-eminence in San-
skrit, make interesting and valuable, if not absolutely authoritative, reading of 'The Science of Language' (1861–63); 'Essays on Language and Literature,' and 'Biographies of Words' (1888), all of which have passed through new editions. Max Müller's works on mythology and religion also have a higher repute among general readers than with the specialist, but it cannot be denied that they did much good in stimulating research, as the 'Sacred Books' did in their author's field. Although this class of writings mention should be made of the 'Essay on Comparative Mythology' (1856); 'Introduction to the Science of Religion' (1873); 'The Origin and Growth of Religion' (1876); 'Natural Religion' (1889); 'Physical Religion' (1891); 'Anthropological Religion' (1892); 'Theosophy, or Psychological Religion' (1893); the 'Essays on Mythology and Folklore' in the 4th volume of 'Chips from a German Workshop'; and 'Contributions to the Science of Mythology' (1897). His versions from the Sanskrit and the Pali have been alluded to; 'A History of Ancient Sanskrit Literature' (1859), and a 'Sanskrit Grammar' also should be mentioned, and it should be borne in mind that it is in this field that the scholar spoke with authority. From his youth Max Müller was interested in philosophy; he wrote an excellent version of Kant's 'Critique of Pure Reason' (1881), and also 'The Science of Thought' (1889), urging that thought was inconceivable without language, and the Oriental studies, 'Three Lectures on the Vedânta Philosophy' (1894), and 'The Six Systems of Indian Philosophy' (1899). An entirely different side of the man is disclosed by 'My Indian Friends' (1899), which shows much of his broad and charming personality, or by 'Deutsche Liebe' (1857), a romantic and popular story translated into French, Italian and Russian, and appearing in English in two versions, one American, unauthorized and very successful, and a later one (1873) by Mrs. Max Müller. He also edited his father's poems (1868), and Scherer's 'History of German Literature.' His collected works, including the four volumes of 'Chips from a German Workshop' (1867–75), appeared 1896 and 1897. Containing his 'Mythology' (1898), and 'My Autobiography' (1901); his wife's 'Life and Letters of Max Müller' (1902); and Whitney, W. D., 'Max Müller and the Science of Language' (New York 1892).

MÜLLER, Johann Friedrich Theodor, yō hân fřēdˈfrɪt tāˈo-dōr (better known as Fritz Müller, and also known as MÜLLER-DESTERRO), German naturalist: b. near Erfurt, 31 March 1821; d. 1897. After studying at the universities of Greifswald and Berlin, he went to South America in 1848, and settled on the island of Santa Catharina, Brazil, living there the ordinary pioneer's life until appointed (1856) to teach natural history and mathematics in the Desterro gymnasium. From 1874 he was engaged for a time as collector in the museum at Rio de Janeiro. His published papers on crustaceans, insects, worms, jellyfishes, etc., were many, most of them appearing in the 'Annals' of the Rio de Janeiro Museum, Wiegmann's 'Archiv für Naturgeschichte,' and similar publications. In his 'Facts for Darwin' (1864), a book written under the stimulus of Darwin's 'Origin of Species,' he made valuable applications of Darwinianism in new fields, and won reputation among men of science for the originality and fertility of his observations and deductions. Among the more important pieces of work which he did were researches on mimicry (q.v.) and the first clear statement of the theory of recapitulation (q.v.).

MÜLLER, Johann Gotthard von, German engraver: b. Bernhausen, near Stuttgart, 4 May 1747; d. Stuttgart, 14 March 1830. After studying under Guibal, the painter, he turned to engraving, and in 1770 went to Paris, where, under Willi, he studied for six years, and after winning several prizes was elected to membership in the French Academy. Returning in 1776 to Stuttgart, he taught there the engraving art. While there he was called to Paris to engrave a portrait of Louis XVI. This is regarded as his most important work, next to which may be ranked his 'Battle of Bunker Hill,' after Trumbull; 'Madonna della Seggiola,' after Raphael, etc. He was knighted in 1818.

MÜLLER, Johannes, German physiologist: b. Coblenz, Prussia, 14 July 1801; d. Berlin, 28 April 1833. He studied, from 1819, at Bonn and Berlin, started service (1824) as private assistant of physiology and comparative anatomy at Bonn, and became assistant professor (1830), then (1833) professor of anatomy and physiology at Berlin. His first important works, 'Zur vergleichenden Physiologie des Gesichtssinn's' (Leipzig 1826) and 'Über die phantastischen Gesichtserscheinungen' (Coblenz 1826), are of a subjective philosophical cast concerning the most important facts as to human and animal sight; the second sound depths of difficult psychological problems. He soon became the leader in the science of the morphological treatment of zoology as well as
of experimental physiology. To his active researches (1830) are due the foundation of the Bell law concerning the work of the roots of the nerves of the spinal marrow, the settlement of the theory of reflex action, the more exact knowledge of the blood's constitution, lymphs, chyle, etc. He even investigated the vocal organs and sound expression, producing fundamental work on the sense of hearing. He finished his great work 'Handbuch der Physiologie des Menschen' (Coblentz 1833-40; 4th ed., 1841-44) in Berlin. It has been translated into English under the title 'Elements of Physiology' (1837-43). The work discloses an entire knowledge of physiology, including comparative organology and medical histology from their microscopic and chemical viewpoints. The work was epoch-making. From 1833 he issued numerous treatises on comparative and pathological anatomy and systematic zoology. Of such should be cited 'Der vergleichende Anatomie der Myxozoen' (Berlin 1835-37), 'Bemerkungen der Plagiostomen' (ib. 1836-41), in collaboration with Jacob Henle; 'Über den Bau und die Grenzen der Ganzioide und das natürliche System der Fische' (ib. 1844); 'Über die Larven und die Metamorphose der Echinodermen' (ib. 1849). His 'Über den feinarchiefären Geschwiß' (ib. 1838), which was never finished, was a pioneer for microscopic research in pathological anatomy. From then on he worked almost exclusively in the realm of comparative anatomy and brought forth numerous researches concerning the lower animals. He took 19 trips to the Baltic and North Sea, the Adriatic and the Mediterranean to investigate salt-water life. It is declared of him that he was the most versatile, fruitful, genial and lucky investigator of modern days, and he maintained his vitality till the end. He never questioned the rights of philosophy or even faith nor positive religion, but no single being has done more toward placing physics and chemistry in their correct place in physiology and medicine. The true method in contrast with the errors of natural philosophy, spiritualism and orthodoxy, for all time. From 1834 he published Archiv für Anatomie, Physiologie und wissenschaftliche Medizin. In 1899 a bronze statue was erected in his memory at Coblentz. Consult his biographies by Virchow (Berlin 1858) and De Bois-Reymond (ib. 1860).

Müller, Johann von. German-Swiss historian; b. Schaffhausen, 3 Jan. 1752; d. Cassel, 29 May 1809. He studied at Göttingen, and in 1772 became professor of Greek at the gymnasium at Schaffhausen, and published 'Bellum Cimbicum,' his first work. He lived and taught in Geneva 1774-80, where he began his 'Allgemeine Geschichte' (3 vols., 1810), and published the first volume of his 'Geschichte der Schweizer.' He returned to Göttingen in 1781, and there he taught history and statistics at the Collegium Carolinum at Cassel. In 1786 he became librarian and councillor of state to the Elector of Mainz. Here he wrote his 'Geschichte der schweizerischen Eidgenossenschaft' and several other works. In 1795, going over to the French, he went to Vienna, where the Emperor Leopold nominated him a member of the Privy Council. In 1804 he left Vienna for Berlin, where he was appointed historiographer of the Hohenzollern family. He also published 'Über die Geschichte Friedrich I.;' 'Über den Untergang der Freiheit der Alten Völker;' 'Versuch über die Zeitrechnungen der Vorwelt.' After the battle of Jena, he was appointed by Napoleon (1807) Secretary of State in the new kingdom of Westphalia. His 'Sammliche Werke' appeared in 27 volumes (1800-17); (new ed., 40 vols., 1831-35). Consult lives by Heeren (1820); Döring (1835); Monnard, in French (1851); and Thielsch (1861).

Müller, Julius, German theologian; b. Bries, Prussia, 10 April 1801; d. Halle, Germany, 27 Sept. 1878. He was educated at Breslau and Göttingen, and abandoned the study of law for theology. He was opposed to the Rationalists, and in 1825-31 was in charge of several small parishes. In 1831 he was preacher at Göttingen University, and in 1834 was elected professor of theology there. From 1835-39 he was professor in Marburg, and for the remainder of his life filled the chair of theology at Halle. His greatest work is 'Die christliche Lehre von der Sünde' (1835-38; 2nd ed., 1868), and among his other books are 'The Evangelical Union' (1854); 'Dogmatische Abhandlungen' (1870), etc.

Müller, Karl Otfried, German archeologist and philologist; b. Bries, Silesia, 1797; d. Athens, 1 Aug. 1840. The son of a field preacher, his education began at the gymnasia of his native town. He was then sent to Breslau, and afterward went to Berlin, where, as a pupil of Böckh, he devoted himself to the study of the life and art of the ancients. After publishing the 'Egypitocorum Liber' (1817) he was appointed instructor in the Magdalum at Breslau. Here he made an elaborate analysis of Greek mythology, separating allegorical inventions from true history. In 1819 he was made professor of philology and in 1823 became professor ordinarius, Göttingen. He was a great traveler, and his writings embrace the whole circle of antiquity. His intention was undoubtedly to concentrate the results of his whole life of scholarly activity in his great work, 'Geschichte hellenischer Stämme und Städte.' He only completed the first volume, however: Vol. I, 'Orchomenos und die Minyer' (1820), and Vol. II, 'Die Dorier' (1824). One of his best-known works, 'A History of the Literature of Ancient Greece,' a translation by Lewis and Donaldson from the author's manuscript, was published in London in 1840, and the continuation, Donaldson, published another edition in 1858. His 'Kunstarchäologische Werke,' in five volumes (1872-73), is a valuable work. Müller's 'Eschylus's Eumenides' (Göttingen 1833) was the object of profound controversy in which Gottfried Hermann and his followers attacked him with great bitterness. Karl Müller was also prominent as an editor. Consult the biography by F. Ranke (1870).

Müller, Morten. See Morten-Müller.

Müller, Victor. German historical painter; b. Frankfort, 2, March 1829; d. Munich, 21 December 1874. Beginning his artistic career at the Frankfort art school, he continued it at Antwerp and ultimately went to Paris (1849), where he stayed for 11 years, dili-
ently studying the methods and manner of Couture, Delacroix and Courbet. He settled in Munich in 1865, and for the castle of Kronberg in the Taunus painted a series of scenes from the history of Baron von Kronberg. He also produced his famous ‘Hero and Leander.’ Following these works came ‘Hamlet with Horatio in the Churchyard;’ ‘Ophelia;’ ‘Romeo and Juliet;’ and his last and unfinished work, ‘Faust, or a Stroll.’ Among his other works are ‘Wood Nymph;’ ‘Tannhäuser in Venusberg;’ ‘A Scene from Les Misérables.’ His last finished picture was a ‘Flower Girl.’ All of his works are distinguished by a certain literary or poetic character which appeals to the fancy like a strain of lyric music, although the coloring sometimes runs in its vividness to the verge of extravagance.

MÜLLER, Wilhelm, German poet: b. Dessau, 7 Oct. 1794; d. there, 30 Sept. 1827. He studied at Berlin, but the war of 1813 called him from his studies, and he was sent as a volunteer in the Prussian army at the battles of Lützen, Bautzen, Hanau and Kulm. In 1814 he returned to his studies at Berlin. His journey to Italy (1819) produced his ingenious work ‘Rom, Römer und Römerinnen’ (1820), and on his return to Germany he became teacher of Latin and Greek in the newly-established school at Dessau, where he was also appointed ducal librarian. In 1824 appeared his ‘Gedichte aus den hinterlassenen Papieren eines reisenden Waldbornisten.’ His ‘Lieder der Griechen’ (1821-24) celebrate the awakening of an oppressed nation, its struggle and its victory. His ‘Lyrische Spaziergänge’ (Leipzig 1827) displays the same truth to nature, freshness and fire and the same harmony of language which characterizes his other poems. Many of his poems imitate with utmost perfection the true German Volkslied. Several of the ‘Müllerlieder’ are familiar through Franz Schubert’s remarkable musical settings. His ‘Bibliothek deutscher Dichter des 17. Jahrhunderts’ (1822-27) is a collection of the best lyric poems of that period. His works were collected in five volumes (1830). He was the father of Prof. Max Müller, the well-known philologist. A critical edition of his works appeared at Berlin in 1905. Consult Hako, B., W. Müller, Leben und Dichten’ (Berlin 1908).

MÜLLER, Wilhelm Max, American Orientalist: b. Gleisengem, Germany, 15 May 1862. He studied at the universities of Erlangen, Leipzig, Berlin and Munich, obtaining the degree Ph.D. at Leipzig. Since 1888 he has been a resident of the United States, but has undertaken researches repeatedly in Egypt (1904, 1906 and 1910) under the auspices of the Carnegie Institution. He has been professor in the Reformed Episcopal Seminary at Philadelphia since 1890 and assistant professor of Egyptology at the University of Pennsylvania. He has written ‘Asia and Europe after the Egyptian Monuments’ (1893); ‘The Love Poetry of the Ancient Egyptians’ (1899), both of which are in German, ‘Egyptological Researches’ (1902), which is in English, and ‘The Ancient Egyptians’ (in ‘Mythology of all Races,’ 1918). He is also a contributor to the ‘Encyclopaedia Biblica,’ ‘Jewish Encyclopaedia’ and joint editor of ‘Gesenius Hebrew Dictionary’ (1905).

MÜLLER, Müller, William James, English painter: b. Bristol, 28 June 1812; d. there, 8 Sept. 1845. He studied painting under J. B. Pyne, and first exhibited in the Royal Academy in 1833, his picture being entitled ‘The Destruction of Old London Bridge—Morning.’ In 1833-34 he visited Germany, Switzerland and Italy, and in 1838 Greece and Egypt; while in 1843 he accompanied the Lycian expedition under Sir Charles Fellowes, bringing back many sketches and pictures of Oriental life and scenery. He lived for some time in London, but returned to Bristol in later life. His pictures, though not numerous, are of exceptional power and merit, among the more notable being the ‘Baggage Wagon;’ ‘Dredging on the Medway;’ ‘The Slave Market;’ and the ‘Salmon weir.’ He painted both in water-color and in oils, and was remarkable as a colorist. Consult the ‘Memoir’ by Solly (London 1875).

MÜLLER-URY, Adolfo, Swiss-American portrait painter: b. Airolo, Switzerland, 28 March 1854. He was educated at the public schools and at Sarnen and became a pupil of Deschwanden at Stans, Switzerland, after which he entered the Munich Academy and then went to Paris to study under (1881-83) Cabanel. From 1883-85 he worked at Rome and came to the United States in 1886. He has done numerous canvases on religious subjects but his paintings are mostly portraits, among which figure Pope Pius X, several cardinals, Bishop Kennedy (1907), some English nobility and other European personages. In this country he has painted among other portraits those of President McKinley, General Grant, Senator and Mrs. Depew, Senator Hanna, J. Pierpont Morgan, J. J. Hill, Mrs. Woodrow Wilson (1916), President Wilson (1917), etc.

MÜLLER, the name of several distinct kinds of fishes having external similarities. (1) The red mullets or surmullets are a group of elongate marine fishes of moderate size, renowned for the delicacy of their flesh, and the esteem in which they were held by the ancients. They with the goat fishes (Upernaeus) and others form a family Mullidae, with five genera and about 40 species, found in all tropical seas, and some species straying northward. Jordan, who classifies them in the suborder Berycoidr, remarks: “The family is a very natural one and not closely related to any other.” It resembles the barracudas (Polymixis) in having two long unbranched erectile barbels at the tip, which are of service in exploring the muddy bottom along which these fishes creep and search for animal food, mainly small crustaceans. The best-known species is that of the Mediterranean (Mullus barbatus), which is a small fish, rarely exceeding six inches in length, and is carmine red on the upper parts and silver white on the lower surface. This is the fish held in so high esteem by Roman epicures, and reared in ponds where they were attended and caressed by their owners, and taught to come to be fed at the sound of the voice or bell of the keeper. Specimens were sometimes sold for their weight in silver. Pliny instances a case in which the sum of about 600 sterling was
paid for a single fish; and an extraordinary expenditure of time was lavished and wasted upon these slow-learning pets. Juvenile and other satirists descanted upon the height to which the pursuit of this luxury was carried as a type of foolish extravagance. Hortensius, the rival of Cicero, we are told, had a canal of water constructed below the festive table, in which the mullets were kept, and from which they might be carried to table, and thence to the fire to be cooked and dressed. Apicius invented a mode of drowning or suffocating these fishes in a certain sauce or pickle, which process was said to add highly to their flavor. A similar fashion prevailed of old in England with regard to lampreys, which were drowned in wine previously to being cooked and eaten. This mullet is still esteemed as an article of food, the flesh being white, fat and nutritious. They are caught mainly in nets and are hawked about the streets of Italian cities, not under the old Latin name "mugil," but by one from the Greek, "trigla." The roes are preserved as condiment called botargo and resembling caviare.

A closely related fish, the striped red mullet or surmullet (M. cephalius), is caught abundantly about the British Islands and along the continental coast, and is seen sparingly in the local markets. By some naturalists these mullets are thought to be only the females of the Mediterranean species. A smaller form of the same species is frequently taken on the eastern coast of the United States. Another genus (Mullolides) is represented in the Gulf of California by a single species.

(2) The gray mullets are a group of spiny-rayed marine fish forming a family (Mugilidae) of the suborder Percopsocoidei, allied to the silversides and barracudas. They are oblong fishes of moderate size, without a lateral line, very numerous in species common in all warm parts of the world, and often appearing in vast schools so that they may be captured by wholesale in large nets. Though the flesh is not so good as that of the red mullets it is nutritious, and many species are economically important. These mullets are short-finned, small-mouthed, bottom-feeding fishes, subsisting chiefly upon the invertebrates of organic matter found in the sand and mud; and they have a special straining apparatus in the pharynx for the purpose of preventing objects of too large size from entering the stomach, or foreign substances getting into the gill-chamber; after grinding a mouthful between the pharyngeal bones (for teeth are absent or feebly) the mineral matter is rejected. Another peculiarity of the mullets is to be found in the structure of the oesophagus and stomach, the former being lined with long thread-like papillae, while the latter has its second portion furnished with muscular walls like the gizzard of a bird, but not divided. The common species is the striped or liza (Mugil cephalus) which seems to be almost cosmopolitan, as it is known only on both Atlantic and Pacific shores but abundantly from California to Chile. It is one to two feet long, dark bluish above, sides silvery, with conspicuous dark stripes along each row of scales. A smaller, more thoroughly marine species, dark olive and without streaks, is the white mullet or liza blanca (M. Careno), numerous on both American coasts. Several other species are taken in the Gulf of Mexico and southward, one of which (M. gyroso) has the curious habit of swimming about and resting on the surface in schools, and is called whirling mullet.

(3) In the Mississippi Valley, several suckers (q.v.) of the family Catostomidae are called mullets in reference to their mullet-like appearance and were allowed to swim, and from which they might be carried to table, and thence to the fire to be cooked and dressed. Apicius invented a mode of drowning or suffocating these fishes in a certain sauce or pickle, which process was said to add highly to their flavor. A similar fashion prevailed of old in England with regard to lampreys, which were drowned in wine previously to being cooked and eaten. This mullet is still esteemed as an article of food, the flesh being white, fat and nutritious. They are caught mainly in nets and are hawked about the streets of Italian cities, not under the old Latin name "mugil," but by one from the Greek, "trigla." The roes are preserved as condiment called botargo and resembling caviare.

A closely related fish, the striped red mullet or surmullet (M. cephalius), is caught abundantly about the British Islands and along the continental coast, and is seen sparingly in the local markets. By some naturalists these mullets are thought to be only the females of the Mediterranean species. A smaller form of the same species is frequently taken on the eastern coast of the United States. Another genus (Mullolides) is represented in the Gulf of California by a single species.

MULLINGER, müll'ing-ger, James Bass, English historian; b. Bishop Stortford, England, 1834. He was graduated from Saint John's College, Cambridge, in 1866 and in 1881-83 was lecturer at Bedford College, London. In 1885-95 he was lecturer on history of education to the Teachers' Training Syndicate at Cambridge and in 1890-94 lecturer on ecclesiastical history at Trinity College, Cambridge, since when he has been librarian and lecturer in history in Saint John's College. He has published, among other works, 'Cambridge Characters in the 17th Century' (1887); 'The Schools of Charles the Great' (1890); 'The Age of Milton' (1897); 'History of Saint John's College, Cambridge' (1901); and wrote the article 'Pope's Donn' for the ninth edition of the 'Encyclopædia Britannica.'

MULLION, in architecture, a vertical division between the lights of windows, screens, etc. The term is also applied to the division between the panels in wainscoting.

MULOCK, mō'lok, Dinah Maria. See CRAIK, Dinah Maria.

MULOCK, mō'lok, Sir William, Canadian educator and politician; b. Bond Head, Ontario, 19 Jan. 1844. He was graduated from the University of Toronto in 1863 and 1868 was admitted to the bar. He was first elected to the Parliament of Canada in 1882 and was vice-chancellor of the University of Toronto from 1881 until 1900 when he was retired. He was Postmaster-General of Canada from 1896 to 1905 and was instrumental in establishing the penny postal rate with other parts of the empire. He was Minister of Labor 1900-05. Besides his public duties he is connected with many large financial interests.
MULREADY, mül’réd-l, William, Irish genre painter: b. Ennis, County Clare, 1 April 1786; d. London, 7 July 1835. He went to London while yet a child, and there his talent for art came under the notice of Banks, the sculptor, who assisted him in his education, and in 1800 he became a student of the Royal Academy, where he first exhibited in 1804. In 1806 he appeared his 'Hampstead Heath,' and in 1809 'Rumours from the House of the Carpenter's Shop.' He was elected an associate of the Royal Academy in 1815, and to full membership in the following year, an honor won by 'The Fight Interrupted.' Although purely English in his education, subjects and general treatment, Mulready's pictures, in color and characteristic care of detail, have often suggested comparisons of him with the Dutch painters. While popular in character, his work never descends to the merely vulgar or sensational, his representations of common life being properly dignified by the fidelity and thoroughness of his art. Besides those already mentioned, his best known works include 'Giving a Bite' (1836); 'Snow Scene' (1842); 'Choosing the Wedding Gown' (1846); 'The Bather' (1850); and 'The Wolf.' His illustrations to 'The Vicar of Wakefield' were very successful. Mulready became most widely known through the ornamental design which he furnished in 1840 for the postal envelope designed by Rowland Hill (q.v.). Nearly all of Mulready's best pictures are now the property of the English nation. Consult Stephens, 'Memorials of Mulready' (London 1867).

MULTAN, mool’tan’, or MOOLTAN, India, an ancient city of the Panjab, capital of a district, 190 miles southwest of Lahore, and four miles from the present left bank of the Chenab. It is surrounded by a dilapidated wall, upward of three miles in circumference. It is an important railway centre. The principal manufactures are silks and fine cotton fabrics, while coarse cotton cloth is also produced for home consumption. Multan has an extensive foreign trade with the countries west of the Indus, and a large banking business is carried on by its merchants. The fortress built in 1640 stands to the north on a mound of earth on the site of the old city. The vicinity is covered with a vast quantity of the ruins of tombs, mosques and shrines. Many of these have been substantial edifices. The tombs of Bhawal Hak, Shams i Tabriz and Rukn ul Alam and the Hindu temple of the Narasing Avatar of Vishnu are the most important. There is an important cantonment one and one-half miles east of the city. Multan is one of the most ancient cities in India. It was taken by Mahmud of Ghazna in 1005; by Pir Mohammed for Tamerlane in 1398. After many vicissitudes it fell into the hands of the Sikhs, from whom it was taken by the British in 1849. Pop. 99,243.

MULTIPLICATION. See Algebra, Definitions and Fundamental Concepts; Arithmetic; Mathematics.

MULTITUBERCULATA, a group of fossil mammals of small size, first appearing early in the Mesozoic and disappearing with the Paleocene. They were so called from the many tuberculated surfaces developed upon the molar teeth. They were reptilian and are considered the earliest of the mammals, and were probably egg layers. Little is known of the structure of these animals except as to the lower jaws and teeth. The character of these last had suggested that these forms belong near the Monotremata (q.v.) in the sub-class Prototheria (q.v.). The propriety of placing the term and the characteristics of the group are discussed by Beddard, in 'Mammalia' (1902).

MUMBO JUMBO, an African (Mandingo) superstition; a bogie, hideous and malignant, who is the terror of negro women and children.

MUMFORD, James Gregory, American physician: b. Rochester, N. Y., 2 Dec. 1863; d. 1914. He was educated at Saint Paul's School, Concord, N. H., and was graduated (1885) at Harvard and received the M.D. diploma (1890) from the Harvard Medical School. He started medicine and surgery practice at Boston in 1890, was appointed (1892) surgeon to Carney Hospital and (1894) to the Massachusetts General Hospital. He served successively as assistant in surgery (1895) and instructor in surgery (1902) at Harvard Medical School, and became (1905) visiting surgeon of the Massachusetts General Hospital. He wrote 'Narrative of Medicine in America' (1903); 'Clinical Talks on Minor Surgery' (1903); 'Surgical Aspects of Digestive Disorders' (1905), besides contributing numerous articles to the surgical and medical periodicals. He wrote the introductory article on 'History of Surgery' for Dr. W. W. Keen's 'System of Surgery.'

MUMMICHOG. See Killifish.

MUMMIUS, möm’i-əs, Lucius, Roman consul: flourished about 185-130 B.C. He served as praetor in Spain in 146 B.C., conquered Greece, where he burned and pillaged her finest cities, sending the art treasures of Corinth to Rome. According to Cicero, he did not retain any of the plunder. He was made governor of Achaia with the surname Achaicus, and a triumph was held in his honor. In 141 he was re-elected consul. He later became a censor, but of his last years and death little is clearly known.

MUMMY (Arab. mumām), specifically a dead body preserved from putrefaction by embalming with bitumen or other asphaltic substances. The wider use of the term includes bodies preserved in a dry state by any process. The custom of thus preserving the bodies of the dead has prevailed in several countries. Hum-boldt found mummies in Mexico, and in Peru the bodies of the Incas were rudely embalmed and dried. The Guanches, or aboriginal inhabitants of the Canaries, removed the entrails of the dead, dried the corpse in the air, covered it with aromatic varnish and, wrapping it in goat skins, kept it in a wooden box. These mummies, of which thousands have been found, are light in weight, of a yellow color and have a strong aromatic odor. But it was among the ancient Egyptians that the art and practice of embalming the dead was developed to the greatest extent and highest perfection. From Egypt the practice spread southward along both coasts of Africa and to India, Malaysia, Polynesia, Australia and Arabia. On the Western Con-
MUMMY WHEAT — MUNCH

tinent it reached Peru, Colombia and Mexico and also Alaska. In the last-named country it may have been sporadic for it was first in vogue there about 1720. All the dead of Egypt, including many animals, were embalmed in some manner, partly, it is supposed, from religious motives and partly for sanitary reasons. The notion formerly prevalent that the Egyptians preserved the body in order to keep it in a fit state to receive the soul when it should have passed through its allotted transmigration is inconsistent with the facts that tombs were sometimes sold to later occupants. The origin of embalming among the Egyptians has been attributed to their first merely burying in the sand, impregnated with natron and other salts, which dried and preserved the body, which natural process they afterward imitated, drugs and bitumen being later improvements. Comparatively few mummies of children have been discovered in Egypt, though even those just born were embalmed. Embalming was practised by the Hebrews to some extent. Joseph commanded the physicians to embalm his father and in the time of Christ it was "the manner of the Jews" to bury the body "wound in linen clothes withenoamphor." The practice continued in Egypt from 4500 B.C. till the 7th century, and was common among the Greeks there, and even among the early Christians. It seems to have fallen gradually into disuse. See also EMBALMING; MUMMIES; MUMMY, E. S., 'Alaskan Mummies' (Seattle 1900); Pettigrew, J. J., 'A History of Egyptian Mummies' (London 1834); Smith, G. E., 'The Migration of Early Culture' (Manchester, England, 1915).

MUMMY WHEAT, a variety of wheat said to have been produced from grains found in an Egyptian mummy, but there is no good reason to believe the legend. It has long been in general cultivation in Egypt and neighboring countries in Africa. The spike is compound following a local injury, diseases of the mouth, diphtheria, occlusion of the salivary duct by a foreign body, etc. There is a secondary symptomatic or metastatic form of mumps which sometimes follows dysentery, enteritis, malarial fever, small-pox, measles, etc. The parotid gland in this form of mumps tends to suppurate. The best treatment for mumps consists in rest, preferably in bed, the giving of saline laxatives and soft diet, keeping the fever, and securing sleep by mild remedies and keeping the face warm with flannel or some other agreeable application. In cases of slow convalescence tonics should be given.

MUN, mén, Albert, Count de, French politician: b. Lumigny, Seine et Marne, 23 Feb. 1841; d. 1914. He was graduated (1862) at Saint Cyr, and entered the army and fought in the Franco-Prussian War (1870-71), to become a captain and ordinance officer of the governor of Paris. He devoted himself to the Ultramontane party and founded the Catholic Labor Circles. Owing to the complicity of the Liberals concerning such activities on the part of an officer he resigned (1875) his commission and, with the aid of the Clerical party, was elected (1876) as deputy. He took his place among the extreme right in the Liberal Chamber, between both Church and monarchy. He led mass-meetings to agitate for the union of Church and State and social reform in the Catholic sense. In 1897 he was made member of the Academy. In 1913 he advocated the abolition of the Three-Year Military Law, but when the war broke out next year his eloquent oratory was exerted exhorting his fellow-citizens to show courage and persistence. His speeches were issued in collective form (Paris 1888-1904) in seven volumes. He wrote 'Les congrégations religieuses devant la Chambre' (1903); 'Contre la séparation' (1905); 'L'heure décisive' (1913).

MUN, Thomas, English merchant and political economist: b. London, England, June 1571; d. there, July 1641. He engaged in mercantile business when very young, and retired to the Mediterranean trade and in 1615 was a director of the East India Company. As a writer on economics he presents really the first clear and systematic treatment on the subject and his is admitted to have been of great influence. He published 'A Discourse of Trade, from England into the East Indies' in 1621, and his greatest work, 'England's Treasure by Foreign Trade,' was published posthumously in 1664.

MUNBY, Arthur Joseph, English poet: b. Bulmer, Yorkshire, England, 22 Aug. 1828; d. Ripley, Surrey, 29 Jan. 1910. He was graduated at Trinity College, Cambridge, in 1851, and was admitted to the bar of Lincoln's Inn in 1855. He was the author of 'Verses Old and New,' which contains the much admired poem 'Doris' (1865); 'Dorothy' (1880), which has been widely circulated in the poet's own country and in America; 'Vestigia Retrosum' ('Steps Backward,' 1891); 'Vulgar Verses, by Jones Brown,' (1891), mostly in dialect; 'Susan' (1893); 'Ann Morgan's Lament' (1898); 'Poems, chiefly Lyric and Elegiac' (1901); 'Relecta' (1909).

MUNCH, moonh., Peter Andreas, Scandinavian historian: b. Christiania, Norway, 15
CASE AND MUMMY IN ITS CEREMENTS
MUNCH—MÜNCHHAUSEN

Dec. 1810; d. Rome, 25 May 1863. He was educated at the University of Christiania and studied law and archeology and antiquities. In 1841 he was appointed professor of history at the University of Christiania. He was accorded the unusual privilege of access to the papal archives in Rome, where he spent much time in study. His principal work is 'History of the Norwegian People' (1852–63). Munch published several works of a linguistic character, and, repudiating the term "Icelandic," maintained that the so-called Icelandic literature was really Old Norse. He also translated several of the Old Norse sagas. A collection of his essays was edited by Gustav Storm (1873–76).

MUNCH, Peter Andreas, Norwegian poet: b. Christiania, 19 Oct. 1811; d. near Copenhagen, 27 June 1884. He was originally a student of law, but became an editor (1841–46) and professor in the university (1866) at Christiania. Among his writings are "Sorg og Trost" ("Grief and Consolation"); of which seven editions have been printed; "Ephemera" (1836); "King Sverre's Youth" (1837), a drama; "The Singer" (1838); "Poems Old and New" (1842); "Fragments from North and South" (1848), in prose; "New Poems" (1850); "Lord William Russell" (3d ed., 1858), a tragedy; and "An Evening at Giske" (1855), a historical drama. Munch translated into Norwegian many works from such authors as Tennyson and Walter Scott, and wrote some popular Norwegian songs.

MÜNCH-BELLINGHAUSEN, münk-bel'ing-hou'zen, Eligius Franz Joseph, FRIEDRICH von, also known under the pseudonym FRIEDRICH HALM, Austrian dramatist and short-story writer: b. Krakau (Cracow), 2 April 1806; d. Vienna, 22 May 1871. He came to Vienna in 1811 and began studying law there in 1822, making the acquaintance while a young student of such prominent literary men as Bauernfeld, Lenau, Seidel, etc. In 1826 he entered the employ of the Austrian government as a lower official and remained in the body of that ministry until his death, his chief positions being custodian (later director) of the court library and general superintendent of the Vienna Hofburgtheater. As a dramatist, Halm's position in German literature is that of a constructor of correct dramatic outlines, often banal in their conventionalism, which are always surrounded with resounding rhetoric and a peculiar union of romanticism and pessimism, together with occasional real feeling. His first play, "Griseldis" (1835) had a great stage success and passed over most of the stage of Germany. There followed a number of less successful productions: "Camoes" (1837); "Adapt," tragedy (1838); "Imelda Lamber, tragedy (1842). His greatest success and his best-known play is "Der Sohn der Wildnis" (1842; known on the English stage as "Ingomar"), although "Der Fechter von Ravenna" (1857) also was very popular. Of his short stories the best are "Die Marzipanfee" and "Das Haus an der Veronabrücke." His works have been published: "Werke" (8 vols., Vienna 1856–64; 4 additional vols., 1872); "Ausgewählte Werke" (4 vols., Leipzig 1904, another ed. by Bong, Berlin 1910). Consult Schneider, "Friedrich Halm und das spanische Drama" (Berlin 1909); Schachinger, R., "Briefwechsel zwischen M. Euk und Halm" (Wien 1890); Pachler, F., "Die Jugendjahre Halm's" (Wien 1877).

MÜNCHEN (mun'-ken) GLADBACH. A town in the Prussian Rhine province.

MÜNCHHAUSEN, mun'how-zên, Hieronymus Karl Friedrich, BARON: b. Bodenwerder, Hanover, 1720; d. there, 1797. He was a German soldier and served in his youth as a cavalry officer in the Russian army. He was possessed of an adventurous and dare-devil spirit and an imagination that knew no bounds. He told the most wonderful stories of his adventures in the Turkish campaign of 1739–39, and soon became famous as the most unique exaggerator that ever lived. The tradition of the baron's story-telling is supported by the evidence of a clergyman, who says that in his old days the officer used to relate his most surprising adventures in a cavalier manner, with a military emphasis, but without any passion and with the easy humor of a man of the world, as things which required no explanation or proof. His tales are thought to have been first compiled by Rudolf Erich Raspe, a man of letters, who, being compelled to flee from his position as curator of the museum at Cassel to England on account of a charge of embezzlement, was engaged in London in literary pursuits, and is generally believed to have published anonymously an English edition of the stories under the title of "Baron Münchhausen's Narrative of his Marvelous Travels and Campaigns in Russia" (1785). A second edition, enlarged and ornamented, was published at Oxford in 1786 under the title of "The Singular Travels, Campaigns, Voyages and Sporting Adventures of Baron Münchhausen, commonly pronounced Munchhausen; as he relates them over a bottle when surrounded by his friends." A third edition, published by Kearsley in London the same year, bore the title of "Gulliver Revived." The story passed through many editions by different hands, gaining more and more accretions each time, whether in form of borrowings from Lucian or of topical "hits" on Baron de Tolt, Montgolfier, the first balloonist, or Bruce, the explorer of the Nile. One of the best editions is that by Shore (1872), illustrated by Dore, with additions by Theodore Gautier. It is said a large proportion of the hunting tales are derived from Henry Bebel's "Facetiae" (1508), while other incidents are borrowed from Castiglione's "Cortegiano" and Bildermann's "Utopia," which are included in Lange's "Delicia Academica" (1765). Consult Müller-Fraureuth, "Die deutschen Lügengeschichten auf Münchhausen" (1881). See ADVENTURES OF BARON MÜNCHHAUSEN, THE.

MÜNCHHAUSEN: A Story in Arabesques: a satirical romance by Karl L. Immermann (q.v.) originally published in four volumes in Düsseldorf during 1838–39. The eponymous hero is presented as the nephew of the famous prevaricator of the same name. The hero also has been interpreted as the reincarnation of "Don Quixote" in attaching to the hero a droll serviteur who closely resembles the materialistic Sancho Panza. Other influences are traceable in the work, notably of Rücker's translation of Harri's "Makamen," Swift's "Gulliver's
MUNCIE — MUNDT

Travels and 'Gil Blas.' The story may be described as a formless mass of episodes played in Westphalian villages. The New Münchhausen, he is a traveller like Humboldt; like Gulliver, he sojourns among and converses with animals; like Gil Blas he serves as kitchen boy; like Cagliostro he lives indefinitely on rejuvenating medicine. He appears in different roles, and in each character successfully exploits the credulity of his audience. As a disinterested financier and company promoter he is eminently and humorously successful.

MUNCIE, mûn'sî, Ind., city, county-seat of Delaware County, on the White River, and on the Central Indiana, the Lake Erie and Western, the Cleveland, Cincinnati, Chicago and Saint Louis, the Chesapeake and Ohio of Indiana, Fort Wayne, Cincinnati and Louisville and other railroads, about 56 miles northeast of Indianapolis. There are six interurban lines. A belt railway encircles the city and furnishes intercommunication among the lines which enter the city. Muncie is situated in an agricultural region, in a naturally-gas belt. The chief manufacturing industries are iron and steel works, glass works, machine shops, canneries, pulp and paper mills, manufactories for silver and silver-plated goods, wagon and carriage works and flour mills, automobiles and automobiles parts, motors, pianos, toys and gloves. Other articles manufactured are gas-engines and gas fixtures, knit underwear, glass-jars, lawn mowers, silverware, wheels, boilers, iron bedsteads, caskets and undertakers' supplies. There is a large trade in the manufactures of the city, and in coal, farm products and livestock. The city is the seat of the Eastern branch Indiana State Normal Institute. The city has good public and parish schools, good modern high school, a public library which has over 35,000 volumes, a city hospital, courthouse and a number of fine churches. The government building cost over $90,000 and the public library building $50,000. The present form of city government is on the Federal plan, consisting of a Mayor and aldermen elected under the ward system and, with the usual executive boards. Pop. 35,000.

MUNDE, mûn'dé, Paul Fortunatus, American gynecologist: b. Dresden, Saxony, 7 Sept. 1846; d. New York, 7 Feb. 1902. After coming to the United States in 1849 he attended the Boston Latin School and then studied medicine at Yale. He left before completing his course, entering the Union army as medical cadet in 1864. He was afterward graduated from the Harvard Medical School in 1866 and went to Germany, where he enlisted in the Bavarian army. He was decorated by the emperor with the Iron Cross for heroism in saving the lives of patients from a burning hospital near Paris. After devoting himself to study and practice in hospitals in Berlin, Heidelberg, Paris, London and Edinburgh he took up his residence in New York in 1873, and practised obstetrics and gynecology. He was appointed professor at Dartmouth Medical College and in the New York Polyclinic in 1882. He edited (1874—92) the American Journal of Obstetrics, and was president of the American Gynecological Society in 1897—98. Among his works are 'Minor Surgical Gynecology' (1880); 'Appendix to the Midwifery of Cazeaux and Tamier' (1884); 'Pregnancy and the Puerperal State' (1887), and 'Diseases of Women' (1891).

MUNDELEIN, George William, American Roman Catholic archbishop: b. New York, 2 July 1872. He studied first at the Holy Cross Institute and later at Manhattan College, after which he began his theological course at Saint Vincent's Seminary, Beauty, Pa., completing it at the Urban College of the Propaganda in Rome. Ordained to the priesthood in Rome 8 June 1893, he became assistant to Bishop McDonnell of Brooklyn, N. Y., being appointed diocesan chancellor in 1897, which office he held for 12 years. In 1903 Father Mundelein was named censor of the Liturgical Academy; in 1906 was elevated to the rank of domestic prelate and in 1908 received from the Propaganda the degrees of licentiate of sacred theology and doctor of divinity. Monsignor Mundelein was consecrated titular bishop of Loryma and auxiliary bishop of Brooklyn 21 Sept. 1909 and on 15 Dec. 1913 was appointed to the archiepiscopal see of Chicago, receiving the pallium at the hands of Archbishop John Bonzano, Apostolic Delegate to the United States, 9 Feb. 1916. Archbishop Mundelein is a distinguished liturgist and a linguist of marked ability and as metropolitan of the ecclesiastical province of Chicago is shepherd of over 1,150,000 souls.

MÜNDELN, mûn'dên, Prussia, town in the government district Hildesheim, located on the confluence of the Werra and Fulda with the Weser. It is the junction of the Hanover-Eisleben-Cassel and the Nordhausen-Mündeln state railways. The neighborhood has romantic forests and contains two Lutheran churches, the Blasikirche dating from 1263 has a monument to Erich II of Brunswick, besides a Catholic, a Reformed church and a synagogue. There are also an ancient castle with a museum, an imperial academy of forestry, a gymnasium, a realprogymnasium, etc. Its industries include rubber works, wooden and lead ware, leather, tobacco and cigar factories, all factories producing cellulose, artificial manures, glass-papers, a sugar refinery, boiler factory, etc. Considerable commerce is carried on in lumber and shipping. In 1910 it had 10,991 inhabitants.

MUNDT, moon't, Klara Müller (*MUHLBACH, LUISE*), German novelist: b. Neubrandenburg, January 1814; d. Berlin, 26 Sept. 1873. She was married to Theodor Mundt, (q.v.) in 1839. She was an extremely prolific writer of popular historical novels, which though quite without merit in point of style are by no means wanting in descriptive excellence. They were all published under the pen name of 'Luisa Mühlbach' and have had as many eager readers in this country and England as in the writer's own land. Among them are 'Queen Hortense' (5th ed., 1861); 'Emperor Joseph II and his Court' (9th ed., 1866); 'Marie Antoinette and her Son' (1867); 'Emperor Alexander and his Court' (1868); 'Mohammed Ali and his House' (1871); 'Frederick the Great and his Court' (8th ed., 1882).

MUNDT, Theodor, German author: b. Potsdam, Prussia, 19 Sept. 1808; d. Berlin, 30 Nov. 1861. He was the husband of Luise Mühlbach. He studied at the University of
MUNGER — MUNICH

Berlin, and in 1842 became privat docent there. In 1848 he was appointed professor of literature and history at the University of Breslau, and in 1850 was recalled to Berlin as university librarian and professor. He belonged to the "Young German" school, was a Radical in politics and favored the emancipation of women. His writings include 'Madonna, Unterhaltung mit einer Heiligen' (1840), a memoir of Charlotte Stieglitz; the novels, 'Thomas Münzer,' 'Carmela' (1844); 'Mendoza, der Vater der Schelme' (1847); 'Die Matadore' (1850); the critical and historical works, 'Kunst der Deutschen Prosä' (1837); 'Geschichte der Gesellschaft'; 'Geschichte der Weltliteratur'; 'Geschichte der Literatur der Gegenwart' (1852); and political sketches included in 'Patriar Kaisersuzen' (1856); 'Paris und Louis der Napoleon' (1858); 'Italienische Zustände' (1859-60). He also published Luther's 'Politische Schriften,' and with Varnhazen von Ense edited Nebel's letters and posthumous works.

MUNGER, Theodore Thornton, American Congregational clergyman: b. Bainbridge, N. Y., Aug. 7, 1829; d. 12 Jan. 1910. He was graduated at Yale in 1851, and at Yale Theological School in 1855. He held pastorates at Rochester, Mass., 1856-60; Haverhill, Mass., 1862-70; Lawrence, Mass., 1871-75; San José, Cal., 1875-76. He was for several years pastor at North Adams, Mass, resigning in 1885 to become pastor of the United Church, New Haven, Conn. He was prominent in his denomination as well as an active supporter of municipal reform. He published 'On the Threshold' (1880); 'The Freedom of Faith' (1883); 'Lamps and Paths' (1883); 'The Appeal to Life' (1887); 'Horace Bushnell' (1889); 'Character Through Inspiration,' etc. Consult Bacon, B. W., 'Theodore Thornton Munger, New England Minister' (New Haven 1913).

MUNGO, Saint, or KENTIGERN, the patron saint of Glasgow: b. Culross, about 518; d. Glasgow, 13 Jan. 603. He was haptized and brought up by Saint Serf, the head of a monastery at Culross. His name, Kentigern or Cyndegynn (from kem and tigarno), means head lord, and it is said that it was exchanged by the bishopric of Mungo and the beloved, on account of the affection they bore him. On leaving Culross Kentigern took up his abode as a missionary priest near the site of the present Glasgow. Here he was chosen bishop, but having troubles with the king of the Strathclyde Britons afterward took refuge at Saint David's in Wales, and while in that region founded a religious establishment under a follower named Asaph, which afterward became the seat of the bishopric of Saint Asaph. Red- derych, king of the Strathclyde Britons, recalled him to Glasgow, where he acquired a character of great sanctity. The city arms of Glasgow are associated with various legends concerning Saint Mungo, and the cathedral is supposed to be built over his tomb. The parish of Saint Enoch, in Glasgow, is so called from a corruption of his mother's name (The- neu). A life, written by Jocelyn of Furness about 1180, was published in Pinkerton's 'Vite Antiquae Sanctorum Scottiae.' Consult Rhyi, J., 'Celtic Britain' (London 1904); Skene, 'Celtic Scotland' (Edinburgh 1877).

MUNGOOS, or MONGOOSE, an ichneumon (Herpestes griseus), common in many parts of India, and closely akin to the Egyptian species ichneumon (q.v.). The mungoo is a burrowing, nocturnal, weasel-like animal, tawny yellowish-gray, 16 or 17 inches long, and with a long thick terete tail. It kills other small animals, however, commonly domesticated as a mouser in the Orient, and has been colonized in various parts of the world to destroy vermin, usually with sad results; hence the bringing of a living one into the United States has been forbidden by law since 1902. This animal was introduced into Jamaica and some other islands of the West Indies about 1872, and later in Hawaii, in the expectation that it would overcome the plague of rats in the sugar plantations. It did so, but it multiplied excessively, preying on poultry and insect-eating birds, reptiles and marmals, which were useful. Many of these animals changed their habits somewhat to accommodate themselves to the novel enemy, and the mungoo does not now multiply so rapidly as at first, and does less damage. The same experience was had elsewhere, and has warned other countries to avoid a repetition of it. Consult Blanford, 'Fauna of British India; Marmals' (1889); Morris, 'The Mungoos on Sugar Estates in the West Indies' (London 1884); and The Field (London 1892), deker, Richard, 'Royal Natural History' (London 1886); 'Cambridge Natural History' (New York 1904 et seq.).

MÜNCHEN, mû'nik, or MÜNCHEN, mûn'-hen, Germany, the capital of Bavaria, one of the most beautiful cities in Europe, lies on an extensive but uninteresting plateau, about 1,700 feet above sea-level, on the left bank of the Isar, with suburbs on the right, the river being crossed by nine bridges. The original nucleus of the town was at one time surrounded by walls and ditches, and entered by lofty turreted gates. The ditches have been filled up and the walls removed, but three of these towers, their loopholed and embattled flanking towers, still remain. In the older part of the town there are many old houses, irregular both in size and form, and of quaint but not unpicturesque architecture. This quarter, though it contains the government offices and many public edifices, is surpassed, both in extent and magnificence, by the new town, which has risen chiefly to the north and west, with almost unexampled rapidity and splendor, due to the art-loving proclivities of King Ludwig I and his successors, who spent over 7,000,000 thalers in beautifying the city, and adorning it with buildings of almost every style of architecture, wide and handsome streets, and squares and gardens decorated with statues and other monuments. Near the centre of the city, between the Max-Joseph-Platz and the palace gardens, is the royal palace, consisting of an old central building of vast extent and two modern wings. From this great pile run at right angles to each other the two finest streets in Munich — the Maximilian-strasse and the Ludwigrstrasse. The chief pubi.
lic buildings are the old town-house and the new, the latter in the Gothic style, considerably enlarged in 1899; the old palace and the Herzog Max Burg, now used as public offices; the post office; the central station (1880); the chief customs house (1876–79); and the new palace of justice (1897). Buildings connected with art embrace the gallery of sculpture, or Glyptothek, an edifice of the Ionic order, containing a series of the finest ancient and modern sculptures; the Old Pinakothek or picture-gallery (1826–36) another beautiful edifice, containing one of the richest collections of pictures in the world; the New Pinakothek, adorned externally with frescoes and containing only paintings by recent masters; the academy of arts, an imposing building in the Renaissance style; the academy of the plastic arts (1885); the Schack Gallery of paintings (1894), named from its donor; the Schwabtaler and Kaulbach museums, etc. The Crystal Palace (1854) is used for the annual art exhibitions. Other collections are the Hof-und-Staats-Bibliothek, with 1,100,000 volumes and over 2,000,000 MSS.; the Bavarian national museum, now used for art collections; the new Bavarian national museum (1889), etc. The German Museum is in all probability the finest museum of technology and the physical sciences in the world. The chief theatre is the Royal and National Theatre, with a lofty Corinthian portico. Munich is rich in monuments, as its squares, gardens and public promenades. Among the chief are the monument of Maximilian II, with its statue 26 feet high, and the colossal bronze statue of "Bavaria," 65 feet high. It is a hollow female figure, designed by Schwanthaler and cast from foreign cannon. From the head a fine view of the city and the Alps is obtained. It stands on a low eminence in front of the "Hall of Fame," a Doric building of horse-shoe shape, containing busts of notable Bavarians. The "Gate of Victory," in imitation of the arch of Constantine at Rome, and the Propylea, in imitation of that at Athens, should also be mentioned. There is a fine statue of Maximilian I by Thorwaldsen, and statues of Schiller, Gluck, Schelling, Fraunhofer and Gartner, a bronze monument to the Bavarian soldiers who died in the war with Russia and a monument to the chemist F. K. Hofmann. Das Englische Garten is a garden near the palace, finely planted, and surrounded by an open and richly ornamented arcade; the so-called English Garden is an extensive and beautiful park. The cemeteries of Munich are noteworthy for their artistic tombs, probably the most beautiful in Europe. The ecclesiastical buildings, include the cathedral or Frauenkirche, founded in 1488, a vast pile, entirely of brick, with two lofty towers, terminating in domes 333 feet high; Saint Michael's or the Jesuits' Church (1538), a handsome Italian structure; the church of the Theatines, another Italian structure, beneath which are the burial vaults of the royal family; the church of Saint Louis, a modern building of brick, faced with white marble, decorated externally with statues by Curt Schwitter, and a large fresco of Cornelius; the church of All Saints; the basilica or church of Saint Boniface; the Marienlch church on the right side of the river; the three Protestant churches; and the Jewish synagogue. At the head of the educational institutions is the university. (See Munich, University of). Closely associated with it are the university library with 600,000 volumes and 2,500 manuscripts, together with 3,000 incunabula; the Collegium Georgianum (1494), a priests' seminary; the Maximilianeum (1852), etc. There is also a high school of technology and numerous higher schools, besides the many institutions for educational purposes. The industrial development of Munich lags behind its aesthetic development. Its stained-glass works, iron, brass and bell foundries, lithographing and engraving works and manufactories of optical and mathematical instruments and various artistic articles are, however, deservedly noted. Still more famous are the enormous breweries of Bavarian beer, which annually produce about 49,000,000 gallons, of which 7,000,000 are consumed in the city itself. The brew-house and beer-garden are world famous. Munich carries on a large trade in grain and in objects of art.

In 1158 Henry the Lion raised the Villa Munich from its previous obscurity by establishing a mint and a salt-emporium within its precincts, the name "München" being derived from the monks who owned the site. In the 13th century the dukes of the Wittelsbach dynasty selected Munich for their residence and fortified the town. In 1327 the old town was nearly destroyed by fire, and was rebuilt by the Emperor Louis the Bavarian; it was not until the fortifications were razed at the close of the 18th century that the limits of the town were enlarged to any extent. The true history of modern Munich is the account of its artistic development in the 19th century, closely identified with which are Klenze and Gärtners the architects, Schwantaler the sculptor, Cornelius and Kaulbach, the painters, and Wagner the composer. The modern Munich school of painting, headed by K. von Piloty, W. Diez and Gritschnitzer, is characterized by marked realism in color and detail, in contrast to the romanticism of the older masters. The elevated site of the city and the neighborhood of the Alps render it liable to sudden changes of temperature, sometimes ranging over 20° in 24 hours. The population in 1801 was only 48,885; in 1915 it was 630,000; from 30.4 per thousand in 1871 the death-rate fell to 20.5 in 1904.

The university, the Academy of Fine Arts, and the Conservatory of Music, under the leadership of men of world-wide reputation and the splendid facilities of the city in its theatres, museums and galleries, its handsome buildings and healthful location, attract thousands of visitors to Munich every year.

The municipal budget of Munich is about $4,500,000. The debt is not far from $40,000,000, but the city has almost twice the sum invested in public property. The city is governed by 2 burgomasters, 40 magistrates and about 70 councliers.

MUNICH, University of, German university, located in Munich, Bavaria. It had its beginning in the Studium Generale of Ingolstadt, founded by the Emperor Ludwig with a special bull of approval by the Pope, Pius II, in 1459. The University of Ingolstadt opened its doors in 1472; and after more than three centuries of continuous struggle and growth, and during its educational vicissitudes, the university has achieved a position of great importance, not only in Bavaria, but also throughout Germany and Central Europe. The university is now one of the most important and progressive institutions of higher learning in the world. It offers a wide range of academic programs, including degrees in law, medicine, philosophy, mathematics, science, engineering, and the arts. The university is located in the heart of Munich, a city with a rich cultural history and a vibrant academic community.

The university is home to numerous research centers and institutes, attracting scholars from around the world. It has strong partnerships with other academic institutions and is known for its contributions in fields such as medicine, engineering, and the social sciences. The university's campus is situated on a hill overlooking the Isar River, providing a picturesque setting for its extensive facilities and state-of-the-art research laboratories. The university continues to foster innovation and excellence in teaching, research, and community engagement, making it a leading institution in the global academic landscape.
MUNICIPAL ACCOUNTING IN THE UNITED STATES

It was removed by Ludwig Maximilian in 1800 to Landshut. In 1826 it was reorganized and transferred to Munich, where with increased facilities it has grown steadily in attendance and influence. The university has faculties of theology, law, medicine, philosophy, political science, and numerous seminars and clinics, a botanical garden, museums, laboratories and an observatory; and has access to the libraries, museums and art treasures of the city. The university library contains 600,000 odd volumes, besides many manuscripts, pamphlets and rare books. The number of students is now more than 200 and more than 7,500 students are in attendance. The annual income averages $250,000, in large part contributed by the government. Affiliated with the university are the Collegium Georgianum, for the education of Roman Catholic priests, founded in 1494, and the Maximilianum, a secondary school, founded in 1852.

MUNICIPAL ACCOUNTING IN THE UNITED STATES. Definitions.—The term "municipality," when used herein, is a generic designation of all public corporations formed by or for a community with powers of local government, by whatever name or designation known in the several States of the Union. Chief Justice Marshall defined a municipal corporation as "such only as is founded by the government for public purposes where the whole interests belong to the government." Municipal accounting is the adaptation or application of generally recognized principles and methods of accounting to the conditions, business and requirements of municipalities—the art or science of analyzing, classifying, recording, summarizing and elucidating facts relative to financial transactions.

Objects of Municipal Accounting.—Its function or purpose is to make possible the production, from the accounts of a municipality, of complete, accurate and prompt information and statements of the financial results of its operations for any given period and of its financial condition at any given time, and to supply the public with such other information which accounts can supply for the orderly and prosperous administration of municipal affairs.

Like accounts of private affairs, a municipality's accounts should provide the data for thinking about the business at hand, the development of plans, the determination of policies and the judgment of results. If a municipality's accounts comply with these requirements, two aims will be satisfied: (a) administrative officers will be aided in performing their duties and in executing the trust imposed upon them, and (b) the public can pass intelligent judgment as to the fidelity, efficiency and economy of their chosen officials.

Similarity between Private and Municipal Accounts.—The thought is not infrequently expressed that municipal accounting differs widely from private accounting; that each in itself constitutes a separate science bearing little or no relation to the other. That thought is a fallacy, and is materially incorrect. In purpose, method or principle between private and public accounting. The distinguishing features of each, which are sometimes thought to be fundamental differences, relate only to the subjects concerning which information is needed. For instance, municipalities seldom, if ever, engage in business for profit. They exist to render service at cost. Hence profit and loss accounts are uncommon. On the other hand, individuals, partnerships and private corporations are not subject to the special limitations placed upon the administrative action of municipal officers by the terms of appropriation acts and legislation generally, and, hence, they seldom maintain appropriation accounts. But these variations should not conceal or obscure the fact that the principles and rules of municipal and private accounting are identical. Furthermore, since municipal business may be conducted economically or improvidently, or efficiently or inefficiently, and thereby affect the interests of its proprietors directly by limiting the service rendered or increasing service cost, there is as much necessity of applying accounting principles to municipal business transactions as to private affairs of the same nature.

History.—It is not known just when and where municipal accounting originated. Reliable authorities disclose that the Athenians maintained a rather well-known system. Rome's plan was based upon and adhered closely to the system employed in private business of the time. Great Britain, from which municipal accounting methods in this country were very largely borrowed, copied or adapted, is said to have had a system as early as the 12th century.

Prior to the 16th century, little if any thought or attention was given to the permanency of accounting records. That true of private as well as of public accounts. When a transaction was concluded and the account closed, the record was thought of no value and was destroyed. The history of municipal accounting in the United States may, for the purpose of discussion, be divided in three eras. Naturally, no sharp line of demarcation separates them; nevertheless, they stand out with sufficient clarity and are as follows:

1. The period from the settlement of the country to and including the decade immediately following the Civil War.

Within that epoch, accounts of municipalities were maintained, with few, if any, exceptions, merely to show the flow of cash into and out of the municipal treasury. It may with propriety be characterized as the age of "receipt and disbursement" accounting.

2. The last quarter of the 18th century.

Within that series of years public thought in relation to better processes of accounting for municipalities quickened. Serious consideration was by no means universal. The efforts were sporadic rather than general, but at the close of the century sentiments had, to a considerable degree, crystallized and in a general way the movement assumed measurable success and tangible form. It is, for the lack of a better term, characterized as the period of "awakening." (3) The third epoch comprises the first 18 years of the 20th century. Within those years rapid and substantial progress was made in securing, in a great number of municipalities, decision and materially improved methods of accounting developed along comprehensive, logical lines. The period of "accomplishment" is a suitable designation for that time.

Development.—In England, no impetus characterized the action toward municipal accounting reform until at or near the middle of
the 19th century, and it was some years later before energetic thought and attention was addressed to the subject by or on behalf of American municipalities. And then the movement was tardy, inactive, sluggish. The principal result, with which the country was confronted, was a lack of interest and retardation of the development of the work in this country as are follows:

(a) The country was relatively new, the population very largely rural, the form of organization comparatively simple, the scope of municipal activities confined, the tax rates insignificant when compared with present-day standards and accounts matters of indifference.

(b) Absolute necessity — the mother of invention and progress — did not call for attention to the desirability of better methods. Improvement in private accounting methods did not develop of its own volition nor was it prompted by the unstimulated energy of those engaged in keeping private business accounts. It was forced upon them. Competition and strife in every line of business endeavor made it imperative that the head of a business enterprise should have available every essential financial fact concerning the business. To fail to have it resulted in the loss of funds or, frequently, the bankruptcy of the concern. The competition need which business experienced did not affect municipalities in the same way. They could not become insolvent. If their officers were wasteful, extravagant or inefficient and the treasury was emptied, the matter could be remedied by raising more taxes. If the same governmental service cost twice as much in one place as in another, that fact was not known, and, if known, it would have mattered little because actual competition was nonexistent.

The prevailing form of government usually provided for the election of the chief fiscal and accounting offices by popular vote, and, as was to be expected, they were more frequently selected by reason of their popularity and vote-getting ability than for their talents and knowledge of municipal finance and accounting. More often than otherwise, those officials entertained something akin to contempt for new, advanced or improved accounting ideas. Where such feelings were absent, they displayed a complaisant attitude toward established methods, due, no doubt, to the thoughts that tenure of office was insecure; that the holding of public office was a reward for political service; that to attempt to revise the accounts would entail a tremendous amount of hard work; that no money compensation or reward in the form of thanks or praise would be forthcoming; and, in short, that the easiest course was to let matters drift as they had in the past, take the compensation and honor incident of the position and at the end of the term deliver the office to the successor in much the same condition as it was received.

(d) And finally, the taxpayers — the stockholders in the corporation — demanded no better methods, no more accurate, detailed and scientific statement of financial facts showing sources of revenue, objects of expenditure and the financial condition of the business. The business man of capacity and affairs had been too busy with his personal matters to devote time and thought to the concerns and activities of government. That was left to the officers selected by the political organizations and their recognized heads.

Viewed in the perspective, it seems that in this era accounts were kept with one principal or primary end in view: the test of whether or not the fiscal officer had stolen money. In form, they indicated the liability of that officer to the municipality and appear to have been predicated on the assumption that the municipality would keep its own accounts. They utterly failed to display essential financial facts relative to revenues and expenses, what was owned, due or owed, or to tell any of the material stories concerning fiscal transactions which accounts should relate.

During the second period, very material changes are observed. The country grew in population and wealth. The population commenced to drift from rural to urban. Tax rates mounted higher and higher. The activities of municipalities were increased in variety and achieved in a bewildering, perplexing number of financial transactions assuming proportions and importance which necessarily called for careful and accurate accounting. It was realized that to the old use of accounts as a means of testing the honesty of fiscal officers must be added the efficiency of their concern. The means of testing, and measuring the efficiency of the work of all officers. There developed a general demand for municipal reform. Business men were chosen to fill important posts in municipal governments and, as was to be expected, they sought more comprehensive financial statements which would disclose more clearly the financial condition of their respective municipalities. Furthermore, civic organizations, of which the National Municipal League was one of the pioneers, sprang into existence, and they in conjunction with accountants employed in municipal work consistently and persistently advocated better accounting methods.

However, little was actually accomplished by way of changes within the period, but much was achieved in awakening public feeling and thought. While the need was real, the response was not immediate, for, as has been seen, the municipal corporation, unlike a private business concern, could not enter the bankruptcy courts even though it possessed all the elements of insolvency. As in the means of testing and municipal accounts were little more than cashbook entries and treasury statements. But the foundation upon which to build more substantial and appropriate systems was laid and the way paved for the rapid development in the period which followed.

It remained for the years intervening since the commencement of the 20th century to witness actual changes in accounting procedure. The demand for better accounting and the necessity of providing systems which would furnish exact knowledge of details and summaries of results in aid of better administrative direction and control induced some of the larger cities (Chicago, New York, Boston, Philadelphia and others), and a number of the smaller and other municipal corporations, to employ their common business accountants to install improved accounting systems and to audit their accounts periodically. The accountants aimed, and to a measurable extent succeeded, to make
the accounts disclose (a) the current cost of government, (b) the revenue provisions to meet that cost, (c) the property (other than cash) owned and (d) a complete statement of debt obligations. The plans worked out in each municipality were studied by officers and accountants having to do with the affairs of others. The movement was contagious. At the beginning of the year 1919 there was scarcely a city having a population of more than 30,000, in which some improvement in accounting procedure had not been made.

In a very considerable number of municipalities, centralized financial control and accounting are facts. Unit cost records, monthly departmental reports, uniform classification of receipts and expenditures, established fund accounts and subsidiary records and ledgers are actually being maintained or produced.

However, great as the improvement has been, there are relatively few municipalities in this country which are able to compile a complete financial statement, including a balance sheet, revenue and expense statement, records of city property and equipment, accurate and scientific sinking-fund records and other data, comparable to those obtained by up-to-date private business. (Consult National Municipal Review, Vol. VI, p. 715.)

Some indication of the backwardness of cities is gleaned from the 1913 report of the auditor of the city of Cleveland. He said: "I have the honor to present for the first time in the city's history, a general and detailed balance sheet from our general ledger." Cleveland was at that time, in population, the sixth city of the United States. What was true of Cleveland prior to 1913 is equally true of many sizable American municipalities at this writing.

Uniform Accounting.—Coincident with the actual betterments made in the methods of keeping municipal accounts, there developed the movement for securing reasonable uniformity. The origin or development of the movement may be attributed to no one person, group of persons or association but interest in the whole subject was intensified as well as extended through the discussions and recommendations of numerous associations, national, State and local, of which some of the more important are: National Municipal League, League of American Municipalities, American Society of Municipal Improvement, United States Census Bureau, Bureau of Municipal Research, various State bureaus organized expressly for the purpose and an army of city clubs, business organizations, citizens’ and taxpayers’ associations, civic organizations and public-spirited individuals.

In this relation it is worthy of mention that the uniform accounting idea was not of American origin. In 1871, by act of the English Parliament, a "local government board" was created for the express purpose of establishing in counties, municipal corporations and towns, uniform systems of accounts, of complete audits of accounts and of uniform reports to the government of the financial operations and condition of local governmental units. The larger German cities, although not compelled by any statute, had for years maintained substantial uniformity of accounting methods which afforded excellent facilities for comparing costs of administration, maintenance, etc.

State Supervision.—The first step in this country toward State supervision of municipal accounts and accounting appears to have been taken by Minnesota in 1878, when an act was passed creating the office of public examiner, with power to audit the accounts of State and county officers and to enforce a correct and uniform system of bookkeeping in counties.

Minnesota’s action was followed by Massachusetts in 1879, when it placed the accounts of certain county officers under the supervision of the savings bank commissioner. Later in 1887, there was established the office of comptroller of county accounts. Without following the various amendments to the Massachusetts statute, it may be said that it does not confer power on State authorities to force or compel the establishment of uniform accounting methods. It does require the State to install such systems when invited or requested by municipal authorities to do so. Substantial progress and valuable and constructive work has been done in that State without finding it necessary to enact mandatory legislation. The power of suggestion and moral suasion has met with remarkable success.

The Wyoming constitution of 1892 made the office of State examiner of county accounts constitutional. That official has the general supervision over such accounts and a well-organized bureau has been in existence since Wyoming first became a State.

Other States which have enacted similar legislation are North Dakota, South Dakota, Ohio, New York, Iowa, Washington, West Virginia, Wisconsin, Rhode Island, Idaho, North Carolina, Nebraska, New Hampshire and New Jersey. In but few of the States has State supervision been completely inaugurated and established. In some of them the authority is to examine accounts; in others, to establish uniform accounting practices and, in some few, the measure of supervision is limited to certain classes of accounts, as is the case in New Jersey where the commissioner of accounts exercises jurisdiction in respect to sinking fund accounts only. Perhaps the most comprehensive statutes are those enacted in Ohio and New York.

The Ohio law was passed in 1902. It confers upon the auditor of the State supervision to establish a uniform system of accounting, auditing and reporting for all counties, cities and towns in the State.

The New York act confers upon the comptroller of the State, except in respect of first-class cities and counties wholly contained within such a city, authority (a) to cause the accounts of each county, city, town and village to be inspected and examined periodically, as he may deem necessary; (b) to formulate, prescribe and install uniform systems of accounting in several groups of municipalities; (c) to require of fiscal officers of municipal corporations annual reports upon blanks prepared and furnished by him; and (d) to tabulate the substance of such reports in comparative statistical form so arranged as to reflect the financial condition of each corporation, its sources of revenue and the purposes and objects for which its funds have been expended.

Although these States have assumed supervision over municipal accounting, it does not follow that each municipality is keeping its
accounts according to a uniform plan. Perhaps the situation in New York is typical of that existing in other States. No municipality of any considerable size in New York remains uninfluenced by the work undertaken by the State comptroller. Nevertheless, of 1,500 municipalities in the State, uniform systems are being successfully operated in no more than 300 of them. The work moves slowly because of the limited number of men employed and for the further reason that in smaller municipalities the officers are reluctant to have their accounting methods revised.

Who Should Keep Accounts.—Generally speaking, every office and department of a municipal corporation which collects or receives money or which is authorized to expend or authorize the expenditure of public funds should keep accounts thereof. In every municipality there is a chief fiscal officer. He or she be called comptroller, auditor, accountant, treasurer, chamberlain, commissioner of finance, commissioner of accounts or any one of a number of names. Just what official is the chief fiscal officer depends entirely upon the provisions of the governing laws and in that respect it is to be deplored that such laws do not always outline with clarity who the principal fiscal functionary is. But that official, by whatever designation known, keeps or should keep complete records of all fiscal transactions of the corporation. It is frequently found that the elements of authority or duty necessary to vest in a single office power adequate to constitute the incumbent thereof the chief fiscal officer of the governmental unit are distributed between two or more officers.

Municipal governing laws are by no means perfect, particularly the older ones. They are especially deficient along accounting lines and in relation to the formulation of financial plans (budgets). It is not so many years since laws were prepared by members of the legal profession, who, as a rule, had little knowledge of and less patience with accounting requirements and orderly financial planning.

It is at this point that the fiscal officer encounters the first serious obstacle if he is determined to make changes in methods or even to reorganize the accounts completely. The situation is different in a municipality. It has no sovereign power. What authority it possesses is derived from enactments of the State legislature. Frequently it is found that the law requires certain specific procedure which is not the best course or method to follow, or that well-nigh insurmountable legal provisions prevent doing in a direct, orderly, business-like manner that which accounting principles require. In fact, in very many cases the obstacles encountered have the effect of discouraging officials, impairing their enthusiasm and retarding the development of better accounting systems.

The first step in reorganizing the accounts of a municipality is to study its laws and ordinances, and sometimes that discloses the impracticability of undertaking the task until changes are made in the applicable laws and ordinances. It is evident that from time to time municipal laws must be changed by amend-
(b) departmental officers may not be in sympathy or harmony with the plan and execute it with indifference. In such cases a campaign of education may be necessary in order to procure a change of condition.

Annual Budget: The arrangement of current accounts by the fiscal officer necessarily follows the budget classification. A properly constructed annual budget usually reflects more of the business side of a municipal government than any other single document. It should be the financial program of the annual budget as expenditures are in the nature of allowances or drawing accounts. Expenditure appropriations should be correlated with the revenues intended to meet expenditures. From an accounting point of view, the annual budget affords the most satisfactory method yet found for gaining centralized control over municipal expenditures. Generally speaking, a proper system of municipal accounting can be obtained only when a well-arranged and properly constructed financial plan is adopted.

The reorganization of a city's accounts should be undertaken at the time of the preparation of the annual budget.

Revenue and Expenditure Accruals.—True stories concerning the operations of a municipality cannot be told near the effect of its fiscal activities accurately reflected unless the accounts show accruals of revenues and of expenditures as well as encumbrances of appropriations. The money actually received during a given period does not accurately measure revenue and the cash disbursed does not correctly state the cost of conducting the business of the corporation. The system should afford means of showing the financial condition of the municipality at all times. To accomplish this, there must be records which disclose not merely undisbursed balances of appropriations but, as well, the obligations incurred upon contracts and open market orders. In short, it should show what is owing the municipality as well as what it owes.

Grouping of Accounts.—To secure correct information relating to the financial condition of a municipality, it is essential that the accounts, reports and balance sheets provide for a proper presentation of the facts by grouping the accounts; this for the reason that it is necessary to guard against the use of particular funds for purposes other than those intended. Otherwise, there is danger of having applied capital, trust or sinking funds to the payment of expenses incurred for current administration, operation or maintenance.

The grouping of accounts is not an arbitrary classification of them. All obligations entered into by a municipal corporation and all transactions recorded in its accounts pertain to some particular fund. Therefore, to assemble accounts in independent balancing groups is in formal recognition of the fact that every account naturally falls within one of several groups.

In fact, just what groups the accounts of a given municipality should be divided depends entirely upon the character of its business and the nature of the funds held. The comptroller of the State of New York, in a uniform system formulated for cities of the third class (those having a population of 50,000 or less), allocates the accounts to the following groups: (1) current accounts; (2) assessment accounts; (3) capital and sinking fund accounts; (4) trust accounts.

The current group includes those in which are recorded transactions relating to budget expenditure appropriations and revenues applicable to meet them, together with the financing done respecting those transactions. It is intended primarily to keep the record of current operations separate and apart from all other transactions. The distinction between current operations and all others is regarded as important and one which should be maintained in order that the results of current activities may be reflected simply and intelligently.

The accounts forming this group are closed at the end of the year into a current surplus or deficit account, thereby indicating how the financial plan actually worked out. If there is an excess of revenue over expenditure, it will be shown by a credit balance in the current surplus account. If the expenditures on an accrual basis exceed revenue accruals, then a debit balance will result, reflecting what is in fact a current deficit.

The assessment group includes all accounts relating to assessment work, the levy and collection of assessments, the financing of cost and assessments remaining uncollected.

The capital group embraces the accounts pertaining to bond issues for construction purposes (excluding assessable work) and the expenditure of the proceeds of such issues. There is also included accounts showing the value, appraised or assessed, of the municipality's property.

While the accounts for sinking fund transactions are included in this group, that is because in cities of the third class sinking fund transactions are not numerous. If in any municipality those transactions are of volume, a separate group of accounts should be established.

The trust group contains the accounts of all funds or properties held in trust, including pension funds.

Classification of Accounts.—Having assembled the accounts of a municipality into logical groups, it then becomes necessary to further classify them to show the channels or purposes from which money is received and the purposes and objects for which it is expended. In this, as in other matters, uniformity should prevail and uniform terminology be employed.

With reference to receipts, a classification is not difficult. The groups older than the current accounts group will be arranged according to the nature of the transactions occurring. In the current accounts division, receipts will be divided into two general classes: (a) revenue and (b) non-revenue.

The revenue receipts may then logically be classified as (1) General property taxes; (2) special property taxes; (3) interest and penalties on taxes; (4) licenses and permits; (5) fines and forfeits; (6) interest and rents; (7) gifts and donations; (8) sale of property; (9) departmental earnings, etc.

In the non-revenue class will be found current loans, transfers, refunds, advances and other such classes as may occur in the municipality.

Respecting expenditures in the current accounts group, the situation is more difficult. In
MUNICIPAL ACCOUNTING IN THE UNITED STATES

is very aptly stated in the January 1917 issue of the Municipal Research Bureau, that expenditures should be classified in as many different ways as there are stories to be told concerning costs. The following four methods are the most indicated:

41. Total cost incurred by organization units—to mark the lines of official responsibility and the jurisdiction of each spending officer.

42. Total cost incurred, classified by functions—for determining questions of policy having to do with service rendered as well as to be rendered, and laying a foundation for appraisal of results.

43. Cost of things classified by objects expended or used in carrying on the work; such as 'personal service,' 'supplies,' 'materials,' 'equipment,' etc.—to lay the foundation for considering the amounts to be appropriated to buy things needed.

44. Total cost classified by character, that is with a view to determining what part is for current expenses, what part for capital outlays, etc.—to lay the foundation for considering financial policy.

It is not probable that any municipal corporation is grouping its expenditures in the four ways indicated. In many of them, a twofold classification is followed—that is, by governmental function and by purpose or object of expenditure.

In the New York State comptroller's system for third-class cities, arrangement by governmental function is as follows: (1) General government; (2) police service; (3) public service; (4) education; (5) highways; (6) charities and corrections; (7) recreation; (8) public utilities—non-commercial; (9) miscellaneous; (10) municipal improvements; (11) construction and permanent improvements (financed from tax moneys or current revenues); (12) public utilities—commercial.

His classification by purpose or object of expenditure is as follows: (a) Salaries and wages; (b) salaries and wages; (c) taxes; (d) printing and advertising; (e) purchase of equipment; (f) maintenance of equipment; (g) materials and supplies—(g-1) specify; (g-2) specify; (g-3) specify; (h) repairs by contract or open market order; (i) light, heat and power; (j) rent; (k) insurance; (l) pension fund contribution; (m) other expenses—(m-1) specify; (m-2) specify.

The foregoing are based upon the classification worked out by the National Municipal League (Proceedings of 1899, pp. 116-123), as modified and adopted by the Census Bureau in many municipalities.

Stores' Accounts.—In order to ascertain the precise cost of administration for a given period, it is necessary to take into account, as an offset to charges against appropriations, the cost of materials and supplies not used. The best method is that of keeping a running inventory account of materials and supplies. To do that necessitates keeping stores accounts, in which case requisitions are issued when stock is called for by a department, and then the expense may be charged and the appropriate stores account credited with the supplies so furnished.

If accounting requirements only were to be considered, it would be advisable for each municipality to adopt this plan. However, the size and the experience of the personnel of accounting offices in average municipalities has thus far rendered it impracticable to adopt such a system.

Substantially the same result may be attained by taking an inventory of materials and supplies on hand at the end of a fiscal year and by placing their cost on the records. Of course, the fiscal officer should audit the inventory, and open an account for materials and supplies by debiting "materials and supplies" and crediting "inventory surplus." The materials and supplies account will be temporary, to be opened at the end of the year and closed at the beginning of the next following year or as soon thereafter as the budget shall have been adopted, by reversing the entry or by charging against appropriations provided for the purchase of the particular class of materials and supplies shown by the inventories to be on hand. In the latter case, the charges against appropriations, less the inventory value of materials and supplies not consumed, will accurately reflect the total of actual expenses for the year. This plan corresponds with the practice prevailing in business concerns that do not keep running inventory accounts.

Unit Costs.—A noted railroad man, now deceased, will long be remembered for his advocacy of the principle of "per mile cost." The application of that idea may well be extended to municipal enterprises. Municipal enterprises may be of great interest and value if officials and taxpayers might know the cost per unit of street paving, sewer construction, street lighting, water pumping and filtration, etc., and the per-capita cost of public education and of maintaining patients in public institutions per day, week or month. Unit costs are the most significant bases for comparison and of great administrative value.

Commercial Public Utilities.—Municipalities are more and more engaged in commercial enterprises; (a) police services; (b) police service; (c) taxes; (d) printing and advertising; (e) purchase of equipment; (f) maintenance of equipment; (g) materials and supplies—(g-1) specify; (g-2) specify; (g-3) specify; (h) repairs by contract or open market order; (i) light, heat and power; (j) rent; (k) insurance; (l) pension fund contribution; (m) other expenses—(m-1) specify; (m-2) specify.

The foregoing are based upon the classification worked out by the National Municipal League (Proceedings of 1899, pp. 116-123), as modified and adopted by the Census Bureau in many municipalities.

Stores' Accounts.—In order to ascertain the precise cost of administration for a given period, it is necessary to take into account, as an offset to charges against appropriations, the cost of materials and supplies not used. The best method is that of keeping a running inventory account of materials and supplies. To do that necessitates keeping stores accounts, in which case requisitions are issued when stock is called for by a department, and then the expense may be charged and the appropriate stores account credited with the supplies so furnished.
MUNICIPAL APPROPRIATIONS — MUNICIPAL DEBTS

Mark Graves, Director, Bureau of Municipal Accounts, State Comptroller’s Office, Albany, N. Y.

MUNICIPAL APPROPRIATIONS. See appropriations, American system of; budgets, American.

MUNICIPAL ART SOCIETIES, organizations in the various large cities of the United States, devoted to the promotion of municipal art, and the making of the city beautiful. The ends of these associations are pursued by planting trees, restricting billboard advertising, establishing small parks and playgrounds in the congested districts, improving as far as possible the architecture of public buildings and in general making the city artistic a unit as possible without hampering the commercial or utilitarian activities of the city. Among these organizations are the Municipal Art Societies of New York, Chicago, Cincinnati and Baltimore; the American Park and Out-Door Association; the Fairmount Park Association, etc. In several of the larger cities, as New York and Chicago, there are now official municipal art commissioners having supervision over public buildings, monuments, etc. (See Art, American; City Planning; Parks, Public. Consult Mason, T. H., ‘Civic Art’ (London 1911); Robinson, C. M., ‘Modern Civic Art’ (New York 1903); id., ‘The Improvement of Towns and Cities’ (5th ed., ib. 1915); Municipal Affairs (Vol. II and III, ib. 1898-99).

MUNICIPAL COLLEGES AND UNIVERSITIES. The United States.— The passion for free public education in the United States has carried well beyond the original intention. At first only the elementary school was free; tuition was free, and the schools were maintained by public taxation. Secondary education was then conducted by private academies and higher education by privately endowed colleges and universities. But before the free elementary school had become universal, free high schools were opened and maintained in the more progressive communities and by the close of the 19th century the free public high school was practically the uniform policy of public education in every State of the Union. Opposition to such free secondary education in tax-supported schools has almost entirely disappeared. The newer States have gone beyond this and have established universities, supported entirely by taxation and offering free tuition to residents of the State. This has strengthened the theory that all education in a free State should be at public expense, college, university and professional education.

The municipal college and university has grown out of the city high school in response to the public demand for higher education. High school work in modern languages, in mathematics and some of the sciences, overlap the college program in the freshman year. It is an easy step, therefore, to add college work to the high school program. Baltimore, Philadelphia, Charleston, Los Angeles, Cincinnati, Toledo, New York City, are cities where municipal colleges are now in operation. Cincinnati has developed a municipal university with the usual departments of medicine, law, dentistry, education and engineering. The new College of Arts and Sciences, Toledo is developing a university along similar lines. New York City, on the other hand, has confined its efforts to the development of the college as distinct from the university idea. This is the municipal college in its perfect form since it is entirely supported by public taxation and admits as students only residents of the city of New York. Its equipment, costing upwards of $5,000,000, was likewise provided out of municipal funds. Other municipal colleges and universities have received private endowments in addition to municipal appropriations. The University of Cincinnati received a large private gift and is less typical of public higher education for that reason. The public high schools, sometimes called the ‘People’s Universities,’ are fitted to develop into municipal colleges at the demand of the people. In the United States, colleges and universities frequently reflect local characteristics; for example, the University of Chicago, the University of Denver, University of Buffalo, University of Rochester; but they must be carefully distinguished from municipal universities since they are not maintained by the cities where they happen to be located, nor is the student body wholly or even largely drawn from such city.

England.— England has developed a type of municipal college but they are not tax supported and therefore are not municipal institutions in the strict sense. Nevertheless, although on private foundations and maintenance, many of these English colleges are of local character, reflecting the local industries, local ideals, local pride. Thus the Sheffield College reflects the cutlery interests by its excellent School of Metallurgy, the College of Leeds reflects the textile industries by its School of Textiles. Birmingham, Liverpool and Manchester have local universities. The University of London has a long and honorable record.

A. R. Brubacher.

MUNICIPAL CONTRACTS. See municipalities.

MUNICIPAL DEBTS. One of the most striking facts in modern American city development is the appalling increase in municipal
indebtedness. Startling figures upon this subject have been compiled by the United States Census Bureau. Municipal and country debts increased 76 per cent from 1890 to 1902. From 1902 to 1913 they had increased 113.2 per cent and had reached the enormous net total of $3,475,954,533, or more than twice the combined indebtedness of the Federal and State governments. As of the year 1915 the fiscal year, 1915 there were 146 of the cities in the United States which had a population of more than 30,000, whose total indebtedness exceeded that of the national government by $1,155,739,406 or 106 per cent. In these cities the per capita debt had increased from $44.71 in 1903 to $77.86 in 1915. That this increase in indebtedness has not been uniformly rapid, however, is shown by the fact that in Rhode Island the debts of cities, towns and villages increased less than 1 per cent between 1902 and 1913, while in California there was an increase of 986.1 per cent during the same period.

An accurate statement of the causes of this increase in municipal indebtedness does not reflect credit upon the soundness of our municipal finance. After the Civil War American cities generally embarked upon programs of reckless expenditures for various municipal services and utilities. These were paid for by the issuance of bonds. These bonds were too frequently issued for terms much longer than the life of the improvements or property for which they were to pay. Cities also entered upon the unwise policy of borrowing to meet the current expenses of the city. Inefficient methods of municipal accounting contributed to the general financial chaos. State supervision was too often inadequate to the task of preventing the floating of ill-advised municipal loans. To all these factors should be added the general recklessness and optimism of municipal administrators who were never depressed by the consciousness that money once borrowed must ultimately be repaid.

The conviction that municipalities cannot be trusted to borrow money without restraint while new has in recent years grown stronger. This is clearly evidenced by the increasing number of restrictions placed upon the borrowing power of the American city which may be thus summarized:

Restrictions upon Municipal Indebtedness.

(1) A city must not incur debts beyond its delegated powers. The power to borrow must either be given in express words in the city charter or it must be implied from some power which is specifically granted. Without such positive authority debts incurred by the city are absolutely void.

(2) Municipal debts may be contracted only for public purposes and not for the benefit of private individuals. This restriction is the logical result of the well-established rule of constitutional law that taxes may be levied only for purposes which are public, inasmuch as the city's debts must ultimately be paid by taxation.

(3) Limits upon the amount of municipal indebtedness which may be incurred are found in the statutes or constitutions of most States. These restrictions specify that city debts must not exceed a certain per cent of the value of all the taxable property, all the real property or must not exceed the annual income of the city. These percentages vary greatly, running up to 10 per cent in the constitution of Virginia. The establishment of a debt limit is a very important business. By State constitution does not confer upon cities any power to create an indebtedness up to that limit and the State legislature may, by statute, impose additional restrictions in its discretion. Any of the fiscal year the limits so set are void and persons who loan money to municipalities must learn at their peril whether the city, in issuing the bonds they buy, has exceeded its debt limit. Both constitutions and statutes sometimes provide that in determining whether the total indebtedness of a city exceeds the limits set, debts incurred for certain special purposes shall not be included. The debts so excluded are those contracted for the purchase or construction of public utilities such as waterworks or lighting plants from which the city expects to derive revenue. There is a difference of opinion as to the wisdom of this policy. It has been urged that bonds issued for these revenue-bearing projects should be counted in computing the city's debt unless such funds are realized merely by liens or mortgages on the properties in which the money was invested and do not constitute general liabilities upon the credit of the city. In short if the bonds will be paid ultimately out of revenue derived from taxation they should be viewed in the same light as debts incurred for any other purpose.

(4) Statutory or constitutional provisions frequently require that bonded debts shall be contracted only after a vote of the people registered in a special election upon the question. Such a referendum may be required for the creation of any debt, or of such debts as would be in excess of a specified amount, or of debts which are to run for more than a certain length of time. In some cases two-thirds or more of the voters must approve the proposed debt; in other instances only taxpayers or property owners are allowed to vote.

(5) Maximum period of years to constitute the life of the debt is often stipulated. These limits are frequently placed at from 20 to 30 years but in some cases the term will vary with the purpose for which the debt is incurred. By vote of the people, above mentioned, the length of the debt term may be extended in a few instances.

(6) One of the most common restrictions upon municipal indebtedness is that which compels the city when incurring a debt to levy a direct tax annually during the life of the debt for the purpose of paying the interest and of accumulating a fund out of which to pay the principal at maturity. Such a fund is known as a sinking fund. This fund must not lie idle but must be profitably invested by the city.

These restrictions upon the power of American cities to borrow money have been of some use in preventing financial recklessness on the part of cities, but in general the policy of setting up hard and fast restrictions of general application to all cities is unsatisfactory. There is an unfortunate lack of elasticity. Some cities cannot borrow as much as they need; others borrow more than they need. A debt limit based upon assessed property values is an incentive to raise the assessments unduly. There are
MUNICIPAL GOVERNMENT

no general legislative or constitutional restrictions upon the power of English, French or German cities to borrow. Instead municipal debts in those countries are supervised as to purpose, amount, interest-rate and methods of repayment by administrative authorities of the central government. This administrative control is exercised in England by the local government board of the prefectures in Prussia by the provincial authorities. By this method the city's debts are adequately regulated but by a means elastic enough to meet the needs of the individual city.

Kinds of Municipal Debts.—Municipal debts may be classified in several ways. A debt may be funded, in which case it is represented by interest-bearing bonds issued for a definite period, and with some definite provision for repayment at maturity, or it may be a floating debt, not secured by bonds, usually small in amount, and with no special scheme provided for its repayment. The latter comprises usually the short-time obligations which the city incurs in special emergencies in connection with the current needs of administration. The floating debt has been the result of the small amount. The bonds representing the funded debt of the city are usually negotiable and are sold in the financial market like the securities of private corporations. They usually bear recitals stating the authority under which they were issued and other facts tending to show their legality. If these recitals are false for the purpose of floating an illegal bond issue, the courts will refuse to allow the city to escape paying its just debts by setting up the falsity of its own statements. This is known as the doctrine of estoppel by recitals. The gross debt of the city is the sum total of all its funded and floating debts. The net debt is the amount of the gross less the amount of such sinking funds as have been accumulated for the ultimate repayment of the funded debt.

Methods of Borrowing.—A city may follow one of two policies in borrowing money. First, it may issue sinking-fund bonds, all of which mature at the same time, and which are to be paid out of a fund gradually created for that purpose. This plan has thus far been most often used. It has, however, several disadvantages. It requires the setting aside of a certain part of the city's income each year and the investment of that money. Sometimes through miscalculations, carelessness or dishonesty the funds are not properly invested. Sometimes the annual stipend is not paid into the sinking fund as it should be. The second method of borrowing is by issuing serial bonds. These bonds mature at different times in such a way that a fixed proportion of the debt will fall due each year and must be retired. The advantage of this plan is that there is no necessity for a sinking fund with the problems it creates and there is no way for the city to escape its annual payment short of absolute default of the bonds which annually mature. The weight of opinion now favors this plan.

ROBERT EUGENE CUSHMAN,
Associate in Political Science, University of Illinois.

MUNICIPAL GOVERNMENT. In March 1897, as a tribute to the growing public interest in the city problems, 'Bibliography of Municipal Administration and Cities' was published as the first number of the quarterly magazine, Municipal Affairs. Even at that time the list of books and articles dealing with the various aspects of city government drew its lengthening trail through no less than 224 octavo pages. It is well nigh beyond the power of the imagination to see to what length a similar bibliography of municipal administration prepared in 1916 would run. The extraordinary interest in municipal government exhibited during the past 20 years in this country stems from the recognition of the obligations imposed upon a municipal corporation by the very nature of urban life, or of its inherent privileges, have during this period made a virtue of necessity in beginning to think for the civic problems of the present and the future.

1. Origin of Municipal Corporations.—It is not possible to draw an exact line between rural and urban conditions, and it is a fact that municipal government in its more complex and commanding forms is the result of a gradual development from the simple groupings of the army post or the simple rural government of the agricultural town. When a community has reached the stage where it is willing to organize a municipal government it is ready to take a long step away from the Anglo-Saxon individualism so well expressed by the old saying that "the Englishman's house is his castle." It is, of course, true that political government in any of its forms means a curtailment of individualism. But the phenomena of city government marks a distinct advanced stage in this process. Let the man who believes that he has an inalienable right to do that which seemeth good in his own eyes and to do as he please with his own, beware of the city! The utmost development of social control to be found in the latest city planning scheme is inherent in the first formal recognition of the fact that the conditions of urban life make necessary a special form of government. People cannot live close together without submitting their individual fancies to community control. In this fact the city has its origin.
2. Relation of Municipal Corporations to State and National Government.—It is the theory of American law that sovereignty, as manifested through the colonial and subsequent governmental action of the States, presides both in time and authority the powers which are manifested in the operation of municipalities. In other words, the city, although it is a normal development of the economic and social needs of the people, acquires no authority or power in the absence of express delegation by the state legislature. Municipalities within their borders are theoretically complete, even to the point that municipal government might be abolished altogether and their functions discontinued or transferred to central authorities of the State. This theoretically helpless position of the cities has subjected them to many abuses, particularly at the hands of the State legislatures, with the result that one of the most potent reform movements connected with city government has been the movement for municipal home rule. The purpose of the home rule movement is not to create imperia in imperis or to remove the cities from the jurisdiction of the State in its sovereign capacity. It is rather to give the cities in each Commonwealth a constitutional status and to this extent to curtail the general governmental powers conferred upon the legislature. Municipal home rule in various forms has already been embodied in the constitutions of the following States: Missouri, 1875; California, 1879; Washington, 1889; New York, 1894; Minnesota, 1896; Colorado, 1902; Oregon, 1906; Oklahoma, 1907; Michigan, 1908; Arizona, 1912; Ohio, 1912; Nebraska, 1912; Texas, 1912. The chief purposes of municipal home rule are to enable cities (1) to frame their own charters and thus choose their own forms of government; (2) to prevent legislative interference with municipal affairs by means of local and special legislation; (3) to exercise police control over their inhabitants in accordance with the dictates of local public sentiment; and (4) to determine what co-operative functions shall be undertaken by the community. It is noteworthy that of the large cities of the country, Saint Louis, Cleveland, San Francisco, Kansas City (Mo.), Seattle, Portland (Ore.), Denver, Saint Paul and Toledo, are living under charters framed and adopted by their own people, subject in some cases to subsequent ratification by the legislature. Detroit, Cincinnati and Minneapolis are only deterred from having home rule charters by their inability thus far to devise any that are satisfactory to themselves. Many of the States not enumerated above have provisions in their constitutions for holding the legislature to pass local or special acts amending city charters or interfering in the internal affairs of cities.

In theory the national government has no control whatever over the forms or functions of local government. In practice, however, the Federal government exercises considerable indirect control over cities through its control of interstate commerce and the use of the post roads, as well as through its control over navigable waters and the development of natural resources such as water powers. Still more important in practical effect is the judicial control exercised by the Federal courts over the actions of municipal governments affecting contracts and property rights. The Federal government of course, by the establishment of a uniform system of accounting and the publication of uniform statistics and in the establishment of uniform standards for the testing and control of the gas supply. These activities, however, are purely advisory.

In the extra-legal aspects of the relations between municipal government and the State and national governments, the political issues which have their origin in municipal problems are becoming very important. In the early stages of the municipal reform movement in this country, it was thought necessary to separate municipal elections from State elections so that the voters would not be confused by political issues and by the exigencies of party strife in the selection of their local officials. Prof. Frank J. Goodnow, the eminent authority on administrative law, was a pioneer in trying to work out a proper delimitation of the spheres of local and State government in order to find a basis for an intelligent home rule program. This task, however, proved to be one of very great difficulty and in spite of the continued efforts of scholars, reformers in the National Municipal League and other organizations, and public officials in various associations for the promotion of home rule, no exact definition of the proper scope of municipal government has yet met with general acceptance. In the States, the sentiment for municipal home rule has been slowly finding expression in constitutional and statutory provisions, conditions have been growing up which make cities necessarily more and more municipal in actual fact, while the sentiment for municipal home rule has thus lost much of its force. With the election of United States senators by direct vote of the people the chief link that formerly tied the State government to national politics has been broken so that at the present time the more logical line of separation of political issues is between municipal and State government on the one hand and national on the other, but even here a solidarity of interests is arising, notably in connection with the development of water power and the conservation of natural resources, which tends to make undesirable any
MUNICIPAL GOVERNMENT

hard and fast separation of political organizations and issues among local, State and national.

3. Relation of Cities to County and Township Government—Counties are in the main divisions of territory, and the source of revenue in the administration of State laws through the agency of locally elected officials. The functions of the county usually include the prosecution of criminals, the keeping of records relating to the title of property, the administration of the Inheritance Law, the care of the poor, the supervision of public education and the planning and execution of certain major improvements such as important highways, bridges and drainage schemes. The primary functions performed by counties are universal ones, and the absence of any strict administrative control by the State government over county affairs, together with the original prevalence of the free system through which many of the county officers have received their compensation, has made county government all but universally the football of politics, and county officials everywhere the main cogs in the machine of one or the other of the two principal parties, according to whether the one or the other is in control in particular counties. These conditions tend to establish a situation very embarrassing to municipal government in those counties where, through urban development, the vast majority of the electorate are also electors of one city. Side by side with the increase in the complexity of the activities of the city, the expensiveness and political importance of county government grow. The result is a duplicate system of local government, with extravagant expenses and no end of political interference. Under these circumstances, movements have taken place in many of the States for the consolidation of city and county governments wherever large cities have sprung up. Wherever this consolidation has been established the county functions have been taken over by the city government and thus the city, in a sense, has been taken out of the regular administrative organization applying to other portions of the State. The most notable instances in which this consolidation of city and county functions has been completely established are New York City (which includes five counties whose affairs are partly under the jurisdiction of the central board of estimate and apportionment and partly still conducted by county administrative officials), Philadelphia, Saint Louis, Baltimore, San Francisco and Denver. In Virginia all the cities, large and small, are separate from and independent of the counties within which they are located.

So far as township government is concerned, cities often remain subject to it until they become large enough to absorb all of one or more townships, when the functions of the several town governments included within the city limits are usually taken over by the city and the separate township organizations abolished. The infinite confusion and difficulty that results from the persistence of a multitude of different local governmental bodies occupying in whole or in part the same territory is sufficiently illustrated by the experience of Chicago, where until comparatively recent years even the assessments of property forming the basis for municipal taxation were made by independent assessors elected by the different towns surviving within the city limits, with the result that all the assessors competed against each other to keep down the assessments of their constituents. The result was that Chicago struggled along for many years trying to operate its municipal government under a constitutional limitation of its debt based upon a low percentage of its assessed valuation, although that valuation was in fact only 8 or 10 per cent of full value. The experience of cities points to the conclusion that in the interest of efficiency and economical government all local functions and all administrative functions performed by locally elected officials within the limits of the city should be consolidated with the city government.

4. Relation of Cities to Each Other.—Theoretically all cities, even those of the same State, are independent political units, having formal relations with each other, and responsible either to their own people or to the people of the State as represented in the central government. However, with the enormous increase in urban population, particularly in the Eastern States, cities have been brought in contact with one another. Sometimes two or more communities which started out as independent urban units have actually grown together as far as their industrial and social life is concerned without as yet being consolidated politically. In other cases, the extra-territorial needs of a great urban community for water supply, drainage, transportation and harbor facilities or electric power have brought cities into contact with the interests of other cities whose locations may be quite remote. For example, around the city of Boston has grown up a group of cities which, while politically independent of each other and of the metropolis, are all actually inter-dependent, so far as water supply, drainage and park development is concerned. The result in this case has been the establishment by State authority of metropolitan districts under the control of State commissions whose duties are to co-ordinate and promote the interests of all the cities in the matters subject to their jurisdiction. This form of co-operation is in effect partial consolidation through State initiative. As another illustration we may take the city of Newark, N. J., which is closely surrounded by a group of overflow cities, all combined together so far as public utilities are concerned, by one semi-private agency, the Public Service Corporation of New Jersey, which operates the street railways, the gas plants and the electric light and power works in that area. In case the control over these utilities which the individual cities have necessarily in large measure lost is exercised not through a metropolitan district nor through a federation of the cities concerned, but through a State board of public utilities having jurisdiction throughout the limits of New Jersey. In Ohio a few years ago a group of cities centring around Akron and Canton, all served by the transit system of the Northern Ohio Traction and Light Company entered into what was called the "Inter-City Traction League" for the purpose of assembling their complaints against the traction company, co-ordinating their remedies and
MUNICIPAL GOVERNMENT

uniting to present their demands to the public service commission of Ohio. In California a few years ago an act was passed by the legislature enabling cities to federate and establish districts coterminous with the areas served by particularly utilities for the purpose of acquiring and operating such utilities. Cities throughout the country have found it their interest to combine informally in organizations for the study of municipal problems and the interchange of experience. Notable among these are the League of American Municipalities and the Utilities Bureau. In many States also leagues of municipalities have been formed which often have their nucleus in the municipal reference departments of the State universities and thus give to their constituent members the benefit of the research and constructive suggestions of modern applied scholarship.

5. Influence of Increase of Population upon the Development of Municipal Problems.—While cities remain small and are surrounded by wide stretches of agricultural territory, it is only the simplest communal needs, such as water supply and fire protection, that go to make up the necessary functions of city government as distinguished from rural local government. As cities grow larger, however, and as more cities spring up primarily dependent upon the same outside areas for water and food supplies, the original city problems became more complex and their solution more difficult. Furthermore, cities as they grow not only spread over larger areas but become more congested at their centres. Wherever cities become so large or so crowded that any one of them ceases to be a certain size and finds that it must try to remove these neglected disadvantages at whatever cost, it begins to feel the pinch of civic poverty and is never able fully to catch up with its work. The unpaid judgments of civilization that have been piling up against it can no longer be escaped, and this fact combines with many others to make municipal functions in large cities extremely complex and extremely expensive. The law diminishing returns as applied to agriculture may be considered to apply also to the economic basis of the city government. Beyond a certain point, which is determined primarily by the size of the city, the community gets a diminishing return for every dollar spent, but since the necessity is increasing the number of dollars to be spent increases by a geometrical progression.

6. The City Plan.—The first conscious constructive act of a community organizing itself into a city logically should be the development and adoption of a city plan, to utilize to the greatest advantage the site occupied by the city and to adapt and make the most of its resources. It would be an error to say that this fundamental duty has been universally and completely neglected by the cities of America; for in a number of cases, of which Washington and Detroit are notable examples, city plans have been laid down at the beginning and more or less closely adhered to in their larger outlines. Moreover, the laying out of a single street, the construction of a harbor, the development of a sewerage system or of a municipal water supply, is in itself an act of city planning. Where most cities have lamentably failed is in the fact that they did not at the beginning exercise wise prevision and lay out a comprehensive plan of development when it was possible to do so. The purpose of the city plan is to help to define what the city is and what it is to become. Every city has certain advantages of site which account for its existence. Through its location it establishes its relations with the outside world, upon which it is absolutely dependent not only for its growth and riches, but for its very life. The size of cities is of infinite variety and as the city plan must be made in...
MUNICIPAL GOVERNMENT

every case with regard to the particular site, it is futile to attempt to work out a uniform civic plan through which for all sites, every plan must utilize the site by developing all its inherent physical advantages as a terminal for transportation and traffic, by removing as far as possible, even at great expense if need be, its inherent disadvantages and by opening convenient thoroughfares for all kinds of traffic. The importance of providing great radial highways reaching out into the surrounding country can scarcely be overestimated in the case of cities largely dependent upon direct communication with their agricultural environs. Where a city is situated upon navigable waters the development of the harbor and of the water front terminals in convenient relation to the distributing land arteries within the city or reaching out from it is one of the greatest factors in a good city plan. In this connection it may be noted that of the 28 largest cities in the United States, all but four or five have the advantage of navigable water ways and owe their greatness in considerable measure to the upper modern conditions, while the railroads have become the great land highways of the civilized world, the provision of adequate rights of way and terminal facilities for them is perhaps the most important single factor in the city plan, at least so far as it relates to the industrial and commercial growth of the city. But the city plan has other functions besides establishing convenient means of communication with the outside world. It is also to provide for the internal convenience of city life. Upon it depends whether the streets will be wide or narrow, straight or crooked; whether street railway lines shall be conveniently laid out for rapid and comfortable transit; whether swamps shall remain undrained and hills undeveloped; whether there shall be playgrounds for the children and parks for all; whether available lakes and beaches shall be developed to their maximum usefulness; whether there shall be civic centres adorned with beautiful and convenient structures, or whether public buildings shall be dropped hit and miss about the city without reference to dignity of approach or convenience of use; whether skyscrapers and hovels shall nestle against each other or through proper zoning and restriction of the heights of buildings, each section of the city shall be utilized to the maximum without the egregious inconsistencies so often characteristic of unregulated development; whether the homes of the people shall be constructed with reference merely to the rents that can be extracted from the unfortunate or with reference to comfort, sanitation and the provision of adequate sunshine and fresh air. City planning in its broadest meaning comprehends all the fundamental and permanent civic improvements which are ordinarily paid for out of bond issues or special assessments, as distinguished from the current operations of the city government, the expenses of which are paid out of taxes and other annual revenues. One of the most important and most difficult problems of the city plan is the adoption of adequate measures to control the development of suburban communities at the time outside of the city limits but which sooner or later will inevitably be brought in. This is an extra-territorial problem and the city cannot solve it in any reasonable measure unless it receives from the State drastic extra-territorial powers, as the adoption of such powers through a permanent agency brings all suburban land subdivisions and other basic improvements under strict control and into harmony with a plan which the city itself has worked out for the development of the larger community of which it is a part.

7. The Disposal of Wastes.—The primitive method for the disposal of sewage and liquid wastes is based upon the fact that water runs down hill. Most cities, up to comparatively recent times, have drained off their surface waters and their sewage as best they could into the nearest available stream or body of water that would carry it away or absorb it, but the obviously disastrous results that come to a city from pouring its sewage into its own water supply early led to the taking of some precautions against this particular civic blunder. For a long time, however, every city was careless of the welfare of communities further down the stream which often were dependent upon the same river for their drinking water. At one time it was the theory that sewage ideaer would purify itself by running a few miles, so that the down-stream communities need not be afraid, but the immense increase in urban population and the consequent increase in the volume of sewage has compelled cities willingly or unwillingly to spend enormous sums of money to carry their sewage for away or to establish purification plants for treating it before the innocuous effluent is permitted to run into rivers or other bodies of water. The disposal of wastes, however, includes much more than sewage. It includes the collection and final disposition of garbage, ashes and household wastes, the removal of dead animals and the provision of cemeteries or crematories for the disposal of the human dead. These problems are far from simple and their complexity multiplies as cities become large. Ashes and cinders, if not mixed with garbage or other household wastes, may be profitably used for filling in and even as material for the construction of certain improvements, such as roads. Garbage is one of the most persistent nuisances of the city. The efficient handling of the garbage problem requires the close cooperation of the individual householder with the civic authorities. The health of the community, especially during the warm months, requires that the garbage should be kept isolated from the time of its production to the time of its final disposition. This means tight cans, covered wagons and prompt cremation or reduction. But the very process of cremating it or of reducing it is so offensive that cities often find difficulty in securing proper and convenient locations for the garbage works. Cemeteries and crematories are very often established and maintained by private organizations but in every case the city must see to it that the cemetery is not located so as to endanger the public water supply or otherwise affect the community's health.

8. The Public Water Supply.—It is the custom in the country and in very small villages for each householder to develop his own domestic water supply by means of a well. But in some locations individual wells are extremely expensive and in any case villages do not be-
MUNICIPAL GOVERNMENT

come very populous before the danger from the general use of well water is recognized on account of its contamination by sewage. No general sewerage system is possible until a public water supply under pressure has been developed and so the very inability of the young communities to dispose of their sewage increases the danger of their primitive water supply and brings the time when a public supply must be developed. As cities grow larger and the volume of water required for domestic, industrial and public purposes becomes greater than any suitable supply available in the immediate vicinity, it becomes necessary to build aqueducts and pipe lines to come within waters of distant watersheds and to spend enormous sums of money to protect the purity of the supply, to bring it to the city and to distribute it to the people for its various uses. If mountain water is available, it can generally be delivered by gravity and need no special treatment for purification. If water has to be taken from rivers or lakes it requires expensive pumping machinery to lift it from its natural level and force it into the distributing mains under pressure. If the public water supply has to be brought from the ground it requires the construction of infiltration galleries or series of wells, often very deep and expensive, with elaborate collection works and often double sets of pumping machinery to make it available for use. If the only available water supply is in its natural state impure or otherwise unsuitable for domestic or industrial uses, it has to be treated by filtration or by the use of chemicals to render it safe and suitable for use. It is noteworthy that all public utilities the water supply is the only one (if we except electricity) which has come to be generally recognized in the United States as appropriate for municipal ownership and operation. Many cities, especially the small ones, are still served by private water companies; nevertheless, the public investment in water supply far outweighs the private investment in it. It is sometimes suggested that water, which, like air and sunshine, is provided by nature for the necessities of all living creatures, including man, should be as free as air and sunshine to the denizens of cities. While there is something to be said in this respect the practical problems that arise make it difficult to believe that water differs from air and sunshine in that it has to be collected, stored and distributed and in some cases really manufactured by the purifying process in order that it may become available for use. It is, therefore, the general policy of those cities which furnish the water supply to sell it as a commodity to consumers, thus paying the expenses of the installation and operation of the waterworks. This practice involves the city in the difficult problem of rate-making and the establishment of rules and regulations for the curtailment of use and waste. Even if water were to be furnished free to the consumers it is obvious that they could not be permitted to use it extravagantly or to waste it without limitation. Such a policy might bankrupt in a little while the city in the world. As a means of distributing the costs of the water supply justly among the various consumers and as a means of curtailing waste, the metre system has been adopted in many cities. The administration of the metre system involves large expense for frequent inspection, reading and testing of metres and for repairs and renewals. The city is thus confronted with all of the difficult problems involved in the construction and operation of a public utility and the maintenance of amicable commercial relations with all its citizens. The water supply is vital, not only for the health and convenience of domestic and business consumers, but also for public purposes, particularly for use in the extinguishment of fires, for the flushing of sewers and the sprinkling of streets. Without an adequate water supply, fire protection is impossible. The double purpose for which water is provided involves the city in the question of the prices from the carelessness of the householder or his family. But when great numbers of houses are crowded together in a city, every man’s home is endangered by the carelessness or misfortune of every other man. Nothing can be more terrible than a great conflagration such as the fire which swept Chicago, Boston, Baltimore and San Francisco. It is probably true that not a large city in the United States would escape such a conflagration for a month, certainly not for a year, if it were unprotected by elaborate fire-fighting apparatus. The fire-fighting force is itself a part of the force of fire-fighters. The fire department is the most picturesque of all municipal departments. It appeals most to the imagination of the entire community, because city dwellers are more or less conscious all the time that it stands between them and disasters which are ready to spring upon them in any unguarded moment. Fire protection is primarily designed for the protection of property values, the accumulations of invested wealth making up the homes, the offices, the factories and other equipment, which together constitute the tools of city life. In order that fire protection may be adequate, the organization of the fire-fighting men and machinery has to be correlated with the right kind of a water supply. Not only must the supply of water for the city be sufficient to meet all emergencies, but the distributing mains must be of such a size and be so correlated and fire hydrants must be so placed that the volume of water potentially necessary for the extinguishment of a large fire shall be available upon the instant at any point where
perishable buildings stand. In the smaller towns which cannot afford powerful fire engines, it is important that the water pressure in the mains should be sufficient to raise streams to the tops of the highest buildings in the place. In places where powerful fire engines are provided, the most important thing is to have a sufficient supply of water available at every hydrant outlet. The engines will do the rest. In the very greatest cities it is sometimes deemed necessary to install a separate water system, the mains designed exclusively for high-pressure fire service. However, the effectiveness of fire protection does not depend altogether upon the supply of water available for extinguishing fires after they get started. It is most necessary in cities that measures be taken to prevent fires. One of the first of these measures is the establishment of a central zone called the “fire limits,” within which property owners are not permitted to erect buildings which are easily combustible. This control of structures becomes very drastic in some of the great cities and extends far beyond the mere question of the materials to be used in construction. It includes provisions for the supervision of electrical wiring and for the proper installation for the interior construction of buildings. Fire prevention also requires the prohibition of the storage of combustibles except in approved places and according to approved methods. The fire department, in order to be efficient, must be ready to give almost instantaneous service. For this purpose it is necessary to establish a complete system of fire signals with fire-alarm boxes scattered throughout the city. For the protection of life in connection with possible fires the city has to see that fire escapes are placed upon all non-fireproof buildings above a certain height in which people live or are employed. It also has to establish rules in regard to the location and opening of exits in public buildings, in regard to the operation of motion-picture shows and in regard to many other things which, if left to themselves, are likely to increase the fire hazard.

While the dangers of fire are constant, many cities are so situated with reference to the natural flow of waters that they are in periodic danger of inundation or submersion. The maximum flood may not come oftener than once in 50 years, but if it comes and no provision has been made to safeguard the city against it, its ravages may be so great as to more than justify the expenditure of the enormous sums necessary to protect the city against its recurrence. The flood danger does not generally affect cities situated on the seacoasts or on the shore of a large lake. It is in interior cities, wholly or partly built in river valleys, that the ultimate consequence is the most disastrous. Kansas City and New Orleans, that are most likely to be overwhelmed by uncontrolled floods. To guard against flood dangers levees may have to be built, river channels blasted out and straightened, lowlands filled in or natural waters impounded in storage reservoirs. In fact, a city may find itself so situated that by its own unaided effort and expenditures it is wholly impossible to protect itself against flood dangers. It may be most economical and in some cases a solution necessary, if a city can be protected at all, for it to secure and exercise extra-territorial powers, perhaps for the building of dams scores of miles away in the hills.

10. Protection Against Crime and Vice.—The crowding of a great many people together into a single urban community multiplies almost infinitely the number of points of social contact, every one of which is potentially a temptation to vice or crime. Both personal interests and property interests are constantly clashing in the swirl of city life. All the weak spots in human nature are tried out. Out of these conditions grows the necessity for the police department, the magistrates’ courts, the juvenile courts and the city prisons.

11. Protection Against Pestilence.—City dwellers are not only subject to cumulative dangers from the uncontrolled outbreaks of the visible forces of nature, but through their close contacts become an easy prey to the ravages of contagious and infectious diseases, ranging from chicken-pox, measles and mumps through scarlet fever, typhoid fever and diphtheria to the most terrible diseases, such as smallpox, tuberculosis, syphilis, cholera, yellow fever, bubonic plague and infantile paralysis. Without the control established by the boards of health, the sanitariums, the hospital facilities and medical attendance furnished by the city, and without the universal vigilance of an efficient health department in educating the people in hygienic methods of living and in protecting them from the nuisances created by the carelessness of others, a great city would become a mere charnel house. It is indeed the glory of efficient modern city government that in many instances it has transformed cities from the deadliest to the safest places of abode for human beings. In certain matters relating to physical health, city governments have overcome the natural disadvantages of city life and have turned them into positive advantages.

12. Protection Against Poverty and Misfortune.—City life raises the standard of living and also increases the cost of living. Rents for even modest homes mount high. Milk and meat, fruits and vegetables have to be brought from far and pay tribute to a complex distributing organization, which means high prices to ultimate consumers. The real producers received little for their products. The stress of city life tends to multiply misfortunes. Those who lose out in the game lose more heavily and become more helpless than they do in rural communities. The result is that one of the great functions of municipal government is to provide means for succoring the poor, shielding the unfortunate, caring for the aged and giving homeless children a start in life. The performance of this function requires the maintenance of the multiplicity of public institutions, including hospitals, lodging houses, children’s homes, employment agencies, almshouses, etc. Even the employees of the municipality itself have to be protected from helpless poverty in old age by means of municipal pension systems.

13. Control of Housing.—At the beginning of this article it was pointed out that the very recognition of the necessity for the incorporation of a city is pregnant with the idea that unrestricted individual liberty in an area of social control invading what many regard as
the sacred domains of personal liberty and individual property rights. Perhaps there is no branch of municipal activity that illustrates this tendency so well as the control which comes to be more and more necessary as cities grow, and the character of the houses built for the people to live in. This control is embodied first in the building code; then in the tenement house law; then in the adoption of districting plans and limitations upon the height of buildings. The exercise of this control brings the city government, representing the public interest, into direct conflict with the most powerful individual motives. The passionate greed that seems to be developed most readily in the soul of the landlord class where the growth of a community is pouring riches into its lap, opposes with almost fanatical persistence the restrictions upon housing which are absolutely necessary to provide for every living apartment enough sunshine and fresh air, with safety from fire and disease and sufficient space for the children to play in.

14. Education.—Under whatever conditions people may live, their children in a democratic country have to be educated. The little red schoolhouse is one of the traditional symbols of the freedom and intelligence of America when it was a predominantly rural nation. Nevertheless, the characteristics of urban life are such as to place upon the public school system an infinitely greater burden than it has to bear in the country. With the curtailment of the opportunities for both work and play in and about the home, the functions of the public school system multiply. It is no longer sufficient for the school to teach the three R's, leaving the children to get all of their education other than book learning from other sources, but in addition to a much more complicated book learning than that deemed necessary in the little red schoolhouse of the past, the modern city school has to take care of the health of the children, to give them physical training, to direct and direct their play and to teach them how to work. The school even has to assume the burden of teaching the girls how to sew and to cook and the boys how to drive nails and saw wood. Under the conditions of city life, new opportunities are thrust upon the public schools by reason of the presence in the community of large numbers of foreign-born adults who need to be taught the English language. This involves the establishment of evening schools. Moreover, the absence of opportunity for the wholesome employment of children during the vacation periods leads to the establishment of school gardens and summer schools. Cities also have to provide great libraries with local branches and elaborate organization for the stimulation and direction of the reading tastes of the children and the young people. This multiplicity of activities comprised under the general term education places upon municipal government one of its heaviest financial burdens. The schools are always calling for more money and the importance of education, which may be termed the process of reproducing citizenship, assumes constantly a greater and greater place in the public mind. In fact, the school system in a great city becomes so overwhelmingly important through the accumulation of the subtle influences which the conditions of city life bring to bear upon children that it is hard to give adequate expression to the significance of this function.

15. Recreation.—For children recreation is a necessary part of education and the playgrounds that become necessary under city conditions are often connected with the public schools. But the alchemy of congestion has such a strange and far-reaching effect upon human beings that recreation takes on a new meaning in the community as a whole to provide and regulate in large measure even the amusements of the adult population. All cities provide public parks; many provide open air concerts; many maintain public baths and bathing beaches; some maintain athletic fields and recreation centres, provide public auditoriums and operate municipal theatres. Museums, zoological and botanical gardens, aquariums and art galleries are frequently maintained at the expense of the municipality. City life is characteristically gay. The hours of labor are relatively short and the amount of available leisure relatively great. It is a common adage that "the Devil finds mischief for idle hands to do," and every urban community organized as a municipal corporation finds that it cannot afford to ignore the Devil's activities. Thus more and more the problem of the control of leisure presses upon the great city for solution. The recent stupendous development of the "movies" as a means of recreation in cities and the obvious need for some community control over the character of the films exhibited, have led some advanced thinkers to propose the municipalization of recreation as the next most important step in the development of municipal functions. The advocates of this program maintain that recreation is a necessity of life for urban populations and that it should be provided as a community function and thus be removed from the realm of private greed and exploitation. Foremost among the specific measures proposed by this group of reformers is the intensive use of the public schoolhouses as meeting places and community centres.

16. Franchises and Control of Public Utilities.—Perhaps there is nothing more characteristic of the urban life than the process by which the public utilities commonly called public utilities, such as water supply, gas and electric light, heat and power, street railways and telephones. The modern city as a great co-operative unit could not exist as it is without these utilities and these utilities themselves could not exist except through the use of the public streets, which are rightly regarded as the common property of all the people, the very symbols of democracy and civic freedom. In America the habit of individualism has been so strong and community life in cities has been so poorly organized and so devoid of initiative that the actual construction and operation of most of these great utilities has been left in private hands. Waterworks are an exception. Also, a few cities have gas and electric plants. The many of the smaller cities maintain municipal electric plants. New York and Boston have built rapid transit subways at public expense, but they are equipped and operated by private companies under long-term leases. San Francisco and Seattle have within the last few
years constructed certain street railway lines which are now being operated in partial competition with the privately owned street railway systems in these cities. Baltimore, Erie and other large cities operate under public systems of electrical conduits which are rented out to the public service corporations having wires in the streets. In so far as public utilities have been recognized as a direct municipal function, they involve the expenditure of enormous sums of money in the acquisition or construction of plants, the maintenance of great operating departments with multitudes of employees and the collection of vast revenues. By way of illustration, the department of water supply, gas and electricity of the city of New York operates a water plant representing a total investment of about $350,000,000, employs over 2,000 persons in the operation of this plant and levies and for the most part collects over $12,000,000 per annum of water rates. So far as they are regarded in the character of a private function, their presence imposes upon the city government the heavy responsibility of granting franchises and of attempting to regulate on behalf of the general public the rates at which service is rendered and the character and extent of this service. It is in connection with these matters that many of the most important civic struggles take place, and more and more the issues involved in the ownership and regulation of public utilities tend to affect and even dominate the policies of municipal government.

17. Municipal Revenues and Taxation.—The multiplication of the functions of government necessarily results in a tremendous increase in the cost of government. The city of New York makes annual appropriations of about $200,000,000, or nearly four times the amount appropriated each year by the state of New York. Municipal revenues are derived from many sources, but the one most important source is the taxation of land. Indeed, it is the great increase in the value of land arising as a city grows that enables it to meet the expenses incident to growth. It is the general practice in American cities to levy taxes on property. Municipal property but is practically for the most part upon real estate. Land cannot run away at all and buildings cannot do so without extreme difficulty. In most American cities personal property is subject to taxation but on account of the difficulty of detecting and appraising it the great bulk of personal property values escapes direct taxation. Another means of securing revenues for public improvements is the so-called special assessment or what in England is referred to as the 'betterment tax.' It is the theory of special assessments that the particular improvements for which they are levied have a direct effect in increasing the land values in the vicinity and that therefore the owners of the land should pay for the improvements. Special assessments are most frequently levied for the opening, grading, paving and widening of streets and for the construction of sewers. Sometimes also they are levied to pay the cost of parks and water main extensions. Another source of revenue is the general business license tax, a form of tax quite prevalent among the cities of the South. Every city, however, collects some revenue from various kinds of license fees. In some of the States, cities get subventions from the State government, usually for the benefit of the schools. From waterworks or other utilities operated by the city, large revenues are obtained and in some instances a city gets a great deal of money from the public service corporations through the form of franchise taxes.

18. Municipal Debt and Debt Limits.—A city's wants are never satisfied. Its needs out-run its income. Expensive improvements have to be constructed which are destined to last and be of service for many years. The citizens of a growing city hard bestead to get rich and at the same time pay the increasing cost of the government, generally feel that a portion of the burden of paying for such improvements should be passed on to the next generation, which, it is expected, will continue to have the benefit of their use. Therefore, it has been customary for cities to borrow the money required to make the so-called permanent improvements, and in times of rapid growth when the demand for additional investment is great and the expectation of future profit keen, a strong temptation arises to pile up municipal debts needlessly and to provide for the payment of expenses which in fact ought to be paid out of current revenues. The danger of municipal bankruptcy is regarded as so serious that the State seldom, even in the adoption of home rule amendments to the constitution, gives the city authorities power to incur debt without limitation. In fact, it is a well established, though not universal policy of the States, to limit municipal indebtedness by direct constitutional provisions, and where this is not the case the legislature is often given specific authority by the constitution to pass general laws limiting municipal indebtedness and sometimes limiting the tax rate. Frequently the issuance of municipal bonds is made subject to approval by a majority of the people at an election. The establishment of debt limits of course can be embarrassing to cities. The exigencies of municipal development have seemed to require in many cases the borrowing of all the money that can be borrowed up to the debt limit. The real purpose of a debt limit is to keep within reasonable limits the taxation upon property, for obviously the borrowing of money is merely the postponement of taxation. Bonds that are issued fall due after a while and have to be paid, and in the meantime interest charges add to the annual burden of the taxpayers. The fundamental purpose of debt limitation is served when bonds issued for self-sustaining activities of the city government, such as waterworks, docks, rapid transit subways, electric-light plants, etc., are exempted from the debt limit, for a city's financial strength and civic prosperity is not measured by the smallness of its debt, but by the excess of its assets over its indebtedness and of its revenues over its current obligations. A debt limit that is inflexible and gives no leeway to a city to embark upon public utility enterprises is one of the most effective means of tying the city's hands and hindering the full development of its functions. In fact, municipal ownership and operation of public utilities as an ultimate policy is quite generally recognized, but cannot be prevented from entering upon the realization of this policy, or even preparing for it, by
MUNICIPAL HOME RULE

stringent financial limitations often placed upon them. In a few States, of which Michigan and Ohio are examples, cities are authorized to acquire public utilities and to issue bonds therefor, against the general credit of the city, if this is possible and if this is not possible then against the utility property itself. The State of Washington has gone even further and permitted the issuance of public utility certificates under ordinances pledging the utility revenues, not the utility plant, to the bonds and thereby to make a lien upon the gross earnings, so that if earnings are insufficient for all purposes the city will have to come to the rescue, not through the payment of interest on bonds, but through the payment of operating expenses of the utilities. The very great additional sums paid in the form of interest where long-term bonds are issued has led to the advocacy in some quarters of the "pay-as-you-go" policy, under which non-revenue producing public improvements, if not paid for directly out of annual revenues. It is urged that by the adoption of a proper program of improvements so that the expense will be spread along quite evenly by year the city will save a great deal of money by this policy. It has been generally customary for cities to establish sinking funds when bonds are issued for the purpose of accumulating a sufficient amount of money to pay these bonds when they fall due. The difficulties and dangers involved in the management of great trust funds like these have led to the adoption in some instances of the serial bond plan in accordance with which an issue of bonds to provide funds for a specific purpose will be divided into as many parts as the number of years which are reckoned to be the life of the improvement, and equal numbers of them are made to fall due each year up to the limit of such estimated life. In connection with special assessments it is customary, in order to make the payment of the assessments levied against benefited property easy, to allow the property owner a certain period of years for completing the payment of his assessment. Under this plan he is expected to pay an equal amount each year until the whole is paid, and in the meantime the city issues more commercial bonds to pay the remaining part of the improvement, these bonds to be payable out of the assessments as they are paid.

19. Participation of Citizens in Municipal Government.—As cities grow and their functions become complex and technical it is more and more necessary that there should be permanency in the municipal service. At the same time the city government requires more and more the co-operation of all the citizens. To secure efficiency in municipal administration and to encourage intelligent young men and women to enter the public service, the merit system has been devised by which the appointments to subordinate positions are made as a result of competitive examinations and city employees are protected from arbitrary removal for political or personal causes. Furthermore, if the merit system is in vogue a special commission is established to administer the civil service laws and regulations. This is one of the most difficult tasks of municipal administration and its difficulty increases as the functions of city government increase and the number of city employees multiplies. The administrative and civic importance of the merit system becomes evident the moment we think of the vast number of men and women engaged in the city service as policemen, firemen, school teachers, clerks, janitors, etc. The municipal government depends upon the loyal interest and support of the community at large. Without civic intelligence and civic spirit a great city with a democratic political organization cannot maintain efficient government. Often citizens feel that the city government is a distant, unresponsive power over which they have no control. It is for the purpose of developing and maintaining active interest among the citizens themselves and of giving them the complete control of all important matters of government which democracy demands, that such devices as the direct primary, the preferential ballot, nomination by petition, the recall, the referendum and the initiative have been made use of in many American cities. The problem of how to facilitate the intelligent participation of all the citizens in municipal government remains the crucial problem of American democracy. See City Manager Plan of Government; Executive.

DELOS F. WILcox.
Franchise Expert, Author of 'The Government of Great American Cities,' etc.

MUNICIPAL HOME RULE.—Municipal home rule is the term applied to the power possessed by many American cities to frame and adopt their own charters. It is a power which must be conferred upon municipalities by a provision of the State constitution since the courts have held with practical unanimity that a grant of home rule by the State legislature would be an unconstitutional delegation of legislative power.

The constantly increasing demand for home rule which cities in the United States are making is due to the numerous and serious evils that seem to be the inevitable result of the present system of local government over municipal affairs which the legislatures enjoy in three-fourths of our States. In the absence of restrictions in the Federal or State constitution the power of the legislature over the city is absolute. Legislatures have not hesitated to exercise this power. They have withheld from cities powers necessary to their development. They have interfered directly and unjustifiably in municipal matters. They have too often treated the revenues, contracts and offices of cities as the legitimate spoils of partisan politics. The problems of municipal government and administration have been left for solution to men competent neither in experience nor training to solve them. Furthermore, the necessity under which cities have labored of seeking continuously for extensions of power or other modifications of their charters has resulted in swamping the legislative calendars with an enormous mass of business, local in significance, to the exclusion of more important matters of State-wide concern.

It is these evils which municipal home rule
aims to abolish by allowing cities to deal without interference with their own affairs. It is also urged that a valuable political education is received by the citizens who assume the responsibilities of home rule, while at the same time the system tends to divorce State and local policy from a tendency to be entirely federal. Municipal home rule does not, however, set the city free from all State control. A municipality is not only an agency of local self-government, but it is also a part of the administrative machinery of the State government. Complete freedom of action for the city is as undesirable in this latter capacity as it is desirable in the former. The city must serve as the unit through which must be secured the enforcement of State laws relating to health, safety and the suppression of crime, the efficient conduct of elections, the promotion of education and philanthropy, and in all these matters it must be subject to State control. The necessity for the steady flow of State revenue renders desirable restrictions upon municipal expenditure. What is not required or even being borrowed. Municipal home rule, therefore, means merely the right of the city to control its own destinies in matters municipal or local in significance and not the right to interfere with those problems which must concern the welfare of the State at large. To define accurately which functions of the city are municipal in character and which have this State-wide significance has been found to be a practical problem of great difficulty.

The home rule provisions of State constitutions vary in character. Sometimes home rule is given to all cities, sometimes only to those of a certain population. These provisions have usually been self-executing, but in a few cases the legislature has acted for the purpose of making the grant of home rule effective. Usually the home rule charter is framed by a popularly elected charter commission and becomes effective upon the approval of a majority of those voting upon it. There are, however, cases in which an extraordinary majority of the voters or even the subsequent approval of the governor or legislature. These special restrictions are exceptional. Home rule charters commonly provide for their own amendment by means of initiative petition. They are not subject to change at the hands of the State legislature.

In 1918, 12 States in the United States had constitutional provisions giving some or all of their cities municipal home rule. These States and the dates of the home rule grant in each are as follows: Missouri (1875); California (1879); Washington (1889); Minnesota (1895); Colorado (1902); Oregon (1906); Oklahoma (1908); Michigan (1908); Arizona (1912); Ohio (1912); Nebraska (1912); Texas (1912); Consult Arndt, 'The Emancipation of the American City' (1917); Beard, 'The American City' (1912); Fitzpatrick, E. A., 'Law of Municipal Life' (1916); Goodnow, 'Municipal Home Rule' (1895); McBain, 'The Law and Practice of Municipal Home Rule' (1916); Munro, 'The Government of American Cities' (revised, 1916).

ROBERT EUGENE CUSHMAN, Associate in Political Science, University of Illinois.
MUNICIPAL LEAGUE — MUNICIPAL OWNERSHIP

MUNICIPAL LEAGUE, National, an interstate organization, made up of individual members and affiliated with State and local associations for the purpose of promoting better government in cities. It was founded in New York in 1884; the league is non-partisan in politics, but seeks to promote its ends by the enactment of sound municipal laws, charters, etc., by the election of able and efficient men to public office, by correcting abuses in the existing administration of city departments, as police, vice control, etc. Its annual conferences are of great value in that it promotes the exchange of views between municipal workers and experts. At the 1915 meeting a model charter was issued, which has since been adopted by several municipalities. At present there are committees on franchises, State municipal leagues, city management, municipal information and county government. Consult Proceedings of the National Municipal Leagues: Philadelphia, annually, 1894-1910 and the National Municipal Review (Baltimore, bimonthly).

MUNICIPAL OWNERSHIP is a term broad enough to include the ownership by a municipality of any form of property. Usage has limited its meaning, however, to the ownership by cities of certain well recognized types of public utilities or services such as water, gas, electricity and street railway transportation. Municipal ownership is usually thought of as including the municipal operation of the utilities owned, the ownership and operation being popularly regarded as inseparable. It is, however, not common for municipally owned utilities to be leased and operated by private corporations. In the following paragraphs municipal ownership and operation will be discussed as a single policy and system.

In recent years the number and variety of enterprises to which municipal ownership has been extended throughout the world have greatly increased. This extension has been more striking in Europe than in the United States. A survey made in 1906 showed that in the towns and cities of Prussia 33 different kinds of undertakings were in public hands. Needless to say most of these were enterprises which are almost universally regarded in this country as improper fields for municipal activity. The following may be mentioned as examples: harbours and stockyards, warehouses, breweries, hotels, canning factories, mines, bakeries, mills, fisheries and livery stables. In the United States municipal ownership has usually been confined to undertakings which have some or all of the following characteristics: (1) those which are natural monopolies, in which competition is either impossible, impracticable, or highly inconvenient, such as supplies of water, gas or electricity; (2) those which are dependent upon securing special privileges and rights from the public, such as the right of eminent domain and the right to occupy the streets with tracks, pipes, poles, etc.; (3) those which produce commodities or services of which the city itself must necessarily be a heavy consumer, such as water for various municipal purposes and electricity or gas used for public lighting; (4) those which directly concern the health of the city or its general safety, as water, the purity of which directly affects the public health and which is also necessary for fire protection and street flushing; (5) those which subserve the public welfare directly but which private capital cannot always be relied upon to provide at sufficiently low cost, such as public recreational facilities of various kinds or commercially unprofitable transportation facilities such as some of the municipal ferries in New York. There is a marked tendency in this country to emulate the cities of Europe and enlarge the scope of the arguments. Recent years have witnessed experiments in the direction of the municipalization of ice plants, fuel yards, theatres and opera houses, although in none of these cases has the city made any effort to monopolize the field. It seems clear that we may expect a considerable expansion in the field of municipal ownership. At present, however, municipal ownership in the United States is confined in the main to the systems for supplying water, light, power and transportation.

Cities which have embarked upon municipal ownership ventures have almost always been led to do so by force of certain concrete facts existing in individual cases rather than by any dispassionate and logical analysis of conflicting arguments. It has required no argument to convince indignant citizens that under private ownership of the city's vital utilities rates were high, service was poor, equipment was out of date, stock was watered and that public utility corporations were an influence for evil in local government and politics. Efforts to correct these abuses by legislation or by administrative control have usually proved ineffective and municipal ownership has been resorted to, frequently without much examination of the arguments for or against it, on the assumption that it would succeed where all else had failed. And it may be said, whatever criticisms may be raised by persons looking on from the outside, that the cases in which municipal ownership has proved unsatisfactory to the cities which have adopted it are few indeed. It should not be inferred from the foregoing that there has been any dearth of arguments on either side of the question of municipal ownership. In spite of the extension of municipalization already alluded to it remains one of the most debatable and hotly contested issues in the whole field of municipal policy. In favor of municipal ownership may be summarized as follows: (1) A broadening of the scope of municipal activity will stimulate interest on the part of the citizens in civic affairs by giving them a direct and immediate concern in what the city is doing. Civic personal interest will produce civic efficiency. At the
MUNICIPAL OWNERSHIP

The same time a higher grade of public officer will be attracted into the service of the city by the necessary creation under municipal ownership of places of dignity and importance. (2) The city will enjoy better service from publicly owned and operated utilities than from those privately owned. The primary motive of the public utility corporation is to make a large profit, frequently on watered capitalization. Expenditures made to improve the service rendered mean a reduction in these profits and are, therefore, not made when they can be passed on to the consumers. Under municipal ownership the ambition to make profits is absent. The city could afford to invest the profits of the business in necessary improvements of service. It could make needed extensions of service into undeveloped parts of the city at a temporary loss which could be met from the proceeds from the rest of the system. It is untrue that the city would display less initiative than would private capital in the management of these enterprises. In fact the reverse would be true. The history has shown that the desire to remain in the undisturbed possession of generous revenues has completely killed the business initiative of many public utility companies, which, secure in their monopolistic franchise rights, have shown little or no interest in improvement. (3) Municipal ownership has been shown by experience to be financially successful. It gives the city a substantial surplus or enables it materially to reduce rates and in many instances it has done both. The case of Glasgow, Scotland, is frequently cited. There the horse car lines in 1894. The lines have been electrified and extended from 64 miles to 197 in 1913. The number of passengers has increased from 57,104,647 to 311,480,086 during the same period. The fares have been reduced. Under a system of zoning the average rate per mile is .44d under municipal management as against .89d under private control. The hours of labor of employees have been reduced and their wages raised. At the same time the enterprise has proved a source of income to the city, and in 1913 after deductions for operating expenses, depreciation, interest on capital, sinking fund charges, etc., there was a balance of £33,000 to be turned over to the Common Council. (4) Municipal ownership has been shown by example to overburden the municipality with duties that not only would the operation of the public utilities be less satisfactory than under private control but also the efficient conduct of the other affairs of the city would suffer by being over-shadowed and crowded out. (3) Serious difficulties would arise from the creation of a large body of municipal employees who would enjoy an enormous potential political influence. In European countries this problem has sometimes been met by the disfranchisement of the employees of the city and it will not be seriously argued that such a solution would be open to the American city. (6) Experience in many instances has shown that municipal ownership is a failure in operation. In this connection the experience of Philadelphia in the public ownership and operation of her gas plant is usually referred to. The city took over this utility in 1914 and retained it until 1897 when it leased the plant to a private cor
MUNICIPAL OWNERSHIP

poration. The history of the public ownership and control of this enterprise is a story of almost incredible corruption and mismanage- ment. Other less conspicuous instances are cited of cases in which, due to mismanagement or financial failure, municipally owned plants have been turned back again if not to private ownership at least to private operation. It is pointed out furthermore that not only has the success which has attended municipally owned enterprises in Europe been greatly over-rated but that even if admitted, it does not serve as an argument for municipal ownership in this country since the determining conditions surrounding such enterprises are strikingly different here from what they are abroad. It must not be assumed that the argument for or against mu- nicipal ownership is equally strong in the case of every type of public utility. There are special considerations in connection with certain enterprises which have a bearing upon the de- sirability of municipal ownership which may be briefly commented upon. The argument in favor of the municipalization of the city's water supply is stronger than for the municipal ownership of any other service or utility. Many cities who oppose the system generally favor its application to waterworks. There are several reasons why this is true. First, the health of the city is dependent upon an adequate sup- ply of pure water. The city should control the conditions which relate so directly to its disease and death rate. Second, the city itself is the largest consumer of water, taking usually about 10 per cent of the entire supply. The city must have water for fire protection, sewers, street sprinkling and cleaning, public buildings, parks and fountains. Third, many social, industrial and business enterprises and interests depend upon the adequacy and cheapness of the water supply. The prosperity of the city may be deeply involved in the policy which controls the supply and price. As a result of these considerations a large majority of the waterworks plants here and abroad are under public management. In 1915, 156 of the 204 cities of the United States having a population of 30,000 or more had municipally owned water plants. Only seven of the 62 cities of 100,000 popula- tion and not a single city of 300,000 or over still allowed their waterworks to re- main in private hands. The two most interesting cases of publicly managed water systems are, perhaps, those of New York City and Los Angeles. The new Ashokan reservoir and aqueduct opened in 1917, brings water for a distance of more than 100 miles to the city of New York and when entirely completed will have a capacity of 500,000,000 gallons per day. The Los Angeles system will bring water from the mountains 260 miles away. The adminis- tration of municipally owned waterworks seems to have been satisfactory. It should be remem- bered, however, that apart from the gigantic engineering projects just mentioned there are no serious technical problems connected with the systems to test severely the administrative capacity of the city.

The increase in the number of municipally owned lighting and power plants in the United States is much less marked than in the case of waterworks. There probably is no rule and not the exception. Twenty-one of the 204 cities having a population of 30,000 or more in 1915 had municipally owned ownership of commercial light and power. Some others sup- plied merely their own needs for public light- ing. It has been estimated that of all the towns and cities of this country over 1,500 have elec- tric lighting plants under municipal ownership and management but that more than twice that number still retained private ownership and control. It is usually in the smaller municipali- ties that public ownership is found. The most important exceptions are the cities of Chicago and Detroit. It will be noted that, with the exception of public street lighting, the sup- plying of electricity and power bears no inti- mate relation to public health or safety while at the same time the business itself is highly technical in character. These facts doubtless have some bearing upon the limited extent to which electric lighting has been municipalized. Municipal ownership is still less common in the United States in the field of municipal gas supply than in that of electric light and power. Wheeling, W. Va., seems to have had the first municipally owned gas plant, the policy of mu- nicipal ownership being instituted in 1851. At the present time the total number of such plants under municipal management is less than 40. Only four of the 204 cities having a popula- tion of 30,000 or more in 1915 have municipally owned gas plants. Of these Richmond, Va., is the largest. It is probable that municipal- ization in this field has been thus limited in extent because of the costly equipment neces- sary to the business as well as the difficult scientific problems incident to its conduct. In the field of municipal ownership of transportation facilities there have been no important ventures in this country. It has been noted above that San Francisco has recently undertaken the municipal ownership and operation of one of its street car lines. New York and Boston own their subways but they are operated by private corporations. There are provisions in many modern franchises which will make the acquisi- tion of the street car lines by the city possible at some future time. It is highly probable that the next few decades will see considerable ex- pansion of municipal ownership and operation in this field. Thus far American cities have been deterred from embarking on this field not only by the difficulties and complexities of administration but also by the financial obsta- clces such as municipal debt limits which have made it impossible for municipalities to acquire a reservoir of such costly properties.

The foregoing paragraphs point to the con- clusion that the practicability and desirability of municipal ownership vary with the kind of public utility to which it is applied and that the relation of such utilities to the public health and safety, the inherent difficulty and complex- ity of their management, and the amount of capital investment needed for the enterprise are all factors which have a direct influence upon cities in determining the advisability of venturing into the field of municipal ownership. It has not yet become profitable nor illuminating to multiply statistics regarding municipal own- ership in American cities for two reasons. The first is that the facts regarding private owner- ship which should be available for purposes of comparison are too confused by private corporations which do not encourage such in- trusion into their private affairs. The second
reason is that municipal accounting in this country is almost always inaccurate, confused and non-uniform as to render almost meaningless the comparative financial statements which have thus far been issued. There are few fields of inquiry in which less reliance may safely be placed upon published statistics. This situation will doubtless be remedied in time and even now some reliable facts regarding municipal ownership are being collected and published from time to time by the United States Census Bureau.

In Great Britain municipal ownership has become much more extensive than in the United States. The public ownership of waterworks is practically universal, and, although profits are not primarily aimed at, these plants seem to be making a fair net return to the public treasury. There are a large number of municipally owned gas plants, between 200 and 300, including those in about half of the largest cities. The municipalization of electricity and power is even more common. These ventures have proved of some profit to the city and in many cases have made possible reductions in the rates of service. The most striking facts regarding municipal ownership in Great Britain, however, are those regarding the tramways. In 1914, 171 of the 286 tramways in British cities were municipally owned and 115 remained in private hands. The public management was proving profitable in practically every case. The reason why municipal ownership should be so prevalent in the local transportation systems of Great Britain is found in the extreme rigor of governmental control exercised over the public utility corporations as well as the subsidies these private companies were obliged to pay into the public treasury. The result was so marked a reduction of monopoly profits that private corporations in many cases were not unwilling to dispose of their businesses at a fair figure.

Several striking facts may be noted regarding the municipal ownership of public utilities in Germany. First, the process of municipalization has gone further in that country than in any other in the world. This is true both as to the kinds of projects publicly owned and as to the extent of the public ownership of any one utility or service. In 1911 the statistical report upon the public utilities of 89 towns having a population of over 50,000, 77 owned their waterworks, 72 gasworks, 67 electrical works and 47 tramways. There are upwards of 40 kinds of services which are in the hands of the municipalities in some or all of the German cities. In the second place, the German cities systematically aim at profits in the management of publicly owned enterprises. Practically all German cities use their public utilities as a means of reducing taxes. In 1912 the gas plant in Berlin gave a surplus of over $2,000,000 to be applied in this way. In the third place, there are some German towns in which the profits from publicly owned utilities and services are so large that they defy all the costs of government and pay yearly dividends in excess of 5%. These are the small towns of Klingenberg, Seeburg and Enkirch.

It may be said in conclusion that while municipal ownership will remain a debatable policy there seems to be an irresistible movement throughout the progressive countries of the world in the direction of its adoption. While this movement may be less rapid in the United States than elsewhere it is worthy of note that in many instances the threat of municipal ownership has had the salutary effect of producing better conditions in the administration of privately owned public utilities.

ROBERT EUGENE CUSHMAN, Associate in Political Science, University of Illinois.

**MUNICIPAL REFORM ACTS, English.** The body of the laws passed by the English Parliament since 1832 dealing with municipal franchises, suffrage charters, etc. In the 14th and 15th centuries the municipal suffrage fell gradually more and more into the hands of restricted bodies of men. Notorious abuses crept into the system and the Parliamentary Reform Act of 1832 left the municipalities well advised as regarded charters, suffrage, etc. In 1833 a royal commission made an extended report on existing abuses, showing that most municipalities were ruled by venal cliques, funds were wasted or worse, public service was neglected, municipal courts were corrupt, etc. New legislation based on the commission's report was enacted in 1835 known as the Municipal Corporation Act, under which 178 boroughs were reformed and about 125 others created. The more flagrant abuses were corrected and means were provided by which other abuses might be eliminated. The franchise was extended to all property owners and occupiers of property of £10 ($50) valuation or over and a uniform system of administration was provided under which an elected council of a size proportionate to the population of the borough was made into a bicameral body, the upper chamber to be composed of aldermen elected by the council. The mayor was to be chosen from among the councilors or aldermen by vote of both these bodies. In great part these features still constitute the municipal constitution of England, although various modifications have been made by subsequent act of Parliament. The Consolidated Municipal Code was passed in 1882 and six years later cities and towns with 50,000 or
over population were constituted distinct counties, with municipal councils discharging the functions ordinarily exercised by county councils. (C. B. Read, 'Local Government in Great Britain')

MUNICIPAL WATER SUPPLY. See HYDRAULIC ENGINEERING; MUNICIPAL GOVERNMENT; WATER SUPPLY.

MUNICIPALITIES. Municipalities are as old as civilization itself. The story of the nations of antiquity that flourished in the valleys of the Nile, Tigris and Euphrates is in large part the narrative of what went on in the imposing cities of Thebes, Memphis, Babylon, Nineveh, and the like. These great cities give us ideal and accurate knowledge of these populous centres of the ancient world and the student of municipal government gains little from a scrutiny of the autocratic systems by which they were ruled.

Greece.—Real city life may be said to have been born in Greece. Under the necessity of having a little accurate and topographical conditions which made community isolation inevitable, ancient Greece never became a unified nation. It was merely a geographical term applied to a group of independent, usually self-governing cities with the areas of land adjacent to them. The Greek city-state was the sole unit of government. The city was the state and the state was the city. A man was a foreigner in any city but his own. There were no distinctions between the duties and functions which in modern times we call national or state and those which were municipal. It is therefore perfectly proper that we should derive our words "politics," "political," and the similar terms by which we describe our public policies, institutions and concerns from polis, the Greek word for city. The Greek cities differed widely in government. In Sparta the governing power remained consist- ently autocratic or oligarchical, while in other Greek cities, notably Athens, the form of government fluctuated between autocracy and democracy.

Rome.—Early Italian history, like that of Greece, is the record of the development and struggles of a large number of city-states. The history of Rome as a nation is the history of the conquest or establishment of numerous cities bound together into one gigantic, unified system by the dominating power of Rome. As in Greece, city life and national life tended to merge. The government of the city of Rome itself, beginning with monarchy, progressed through various stages of democracy and representative government which were never completely lost even under the autocratic forms of the empire. There was little in the government of the cities outside of Rome, however, which could be called truly popular, and such democratic features as existed in the earlier period tended to diminish or disappear as the empire became more and more a Roman Empire. The civil rights conferred by Rome upon these tributary cities were usually made the basis for the imposition of heavy taxation. It is from the word municipium applied by the Romans to these dependent and partially self-governing cities that we derive our word municipality. In complexity of organization and in diversity of function the Roman provincial government and life at Rome at the height of its development rivaled that of the modern metropolis.

Medieval Cities.—During the "dark ages" municipalities seem to drop out of sight for a time being. The remnant of the same feudal prerogatives as over the individuals on his land. In spite of feudal oppression the medieval cities prospered as centers of trade and commerce. With prosperity came wealth and with wealth came the power to bargain or to fight with the feudal barons. Due to the legal and topographical conditions which made community isolation inevitable, ancient Greece never became a unified nation. It was merely a geographical term applied to a group of independent, usually self-governing cities with the areas of land adjacent to them. The Greek city-state was the sole unit of government. The city was the state and the state was the city. A man was a foreigner in any city but his own. There were no distinctions between the duties and functions which in modern times we call national or state and those which were municipal. It is therefore perfectly proper that we should derive our words "politics," "political," and the similar terms by which we describe our public policies, institutions and concerns from polis, the Greek word for city. The Greek cities differed widely in government. In Sparta the governing power remained consistently autocratic or oligarchical, while in other Greek cities, notably Athens, the form of government fluctuated between autocracy and democracy.

England.—English municipalities were subjected to the same feudal oppression which the more prosperous towns on the Continent suffered. They were not at first incorporated and had few political or civil rights and little if any self-government. They were small in area and population. London was not a metropolis then as now had about 40,000 inhabitants at the beginning of the 15th century. As feudalism lost its grip these towns or boroughs became incorporated, and gained in power and independence usually because the extension of privileges made easier the collection of taxes by the feudal lord. It was for this mercenary reason that Edward I gave the English boroughs representation in the historic national parliament called in 1295. The political power which the cities thus acquired was of great potential value to the Crown, and in the struggle it was then waging with the nobles. The establishment of the rule that no corpora- tion was lawful without royal sanction gave the Crown the chance it desired to dominate municipal affairs and control the selection of the borough representatives in Parliament. Finding that the political and economic uncertainties of basis of control, the Crown finally built up a sufficiently servient municipal organization by creating a mayor and council selected in the first instance by the king and endowed
with the power of self-perpetuation. It was not until the passage of the Municipal Corporations Reform Act of 1835, made necessary by the inefficiency and corruption in municipal life, that the English city government was forced to be other than garrisonal and took on the general form it now bears—that of a representative governing body holding office for short terms and elected by popular vote.

United States.—American municipal history is marked by the national and state corporations established in the English colonies in the 17th and 18th centuries. The oldest of these charters seems to have been the one given to New York in 1666. The charters were granted by the provincial governors and in the main the government consisted of a popularly elected board of councilmen and aldermen and a mayor appointed by the governor. Although not originally subject to the control of the colonial legislatures these municipalities finally became so and found itself under the necessity of applying to the legislature for additional grants of power, especially in the matter of taxation. After the American Revolution the state legislatures assumed that position of complete supremacy over American cities.

Relation Between the City and the Central Government—England.—While cities are the organs for local self-government their functions do not end there, and the modern municipality finds itself bound to the state or nation within which it lies by a complex web of political, legal and governmental ties. The place of the city in the English administrative system may be sketched as follows: The city is a corporation created by Parliament. The municipality which desires a charter petitions for it, and the petition is granted or rejected in accordance with a procedure which assures a fair consideration of the merits of the case. Needed amendments to the charter must be secured in the same way. The charters thus granted are of great variety and widely in the details of municipal organization and power. Powers are usually conferred upon English cities which are broad in scope and which create a system of local legislative autonomy. While Parliament remains the ultimate source of all English municipal authority there has never been a disposition on its part wantonly to interfere in the affairs of single cities after the fashion of American legislatures. This is due partly to the control over and responsibility for legislation in Parliament which is centred in the cabinet, making "log-rolling" and "pork-barrel" legislation impossible; it is also due to the essential nature of English municipal organization, politics and traditions which have prevented the English city from becoming the prey of partisan exploitation. Not only does the English national government exercise legislative power over the English city in the manner described but it also exerts an administrative supervision over it. The most important agency for this central administrative control is the Local Government Board. In a wide range of matters connected with municipal debts, municipal ownership, poor relief, and health, it is necessary for the city to secure the approval of this board for its projects. Administrative supervision of English cities is not centralized in one department however, but the Board of Education, the Board of Agriculture, the Board of Trade and the Home Office have varying degrees of authority over the municipal activities falling within their respective jurisdictions. The result of this central administrative control has been wholesome. There has been no serious infringement of municipal autonomy but a valuable check on municipal extravagance and inefficiency. The administrative agencies mentioned have been generous in their grants and have been able to settle many of the questions of municipal administration and power which in the United States have been fertile sources of ill-advised interference by the legislature in municipal affairs. In short, the English system may be said to be one of legislative decentralization, in view of the whole legislative power given to English cities, and administrative centralization.

United States.—In this country the opposite principle prevails, that of legislative centralization and administrative decentralization. Many of the most serious abuses in American municipal life have been due to the practically unrestrained and frequently abused power of the State legislatures over cities. Only too frequently has the American city been a victim of legislative exploitation and corruption. State legislatures have interfered in all kinds of municipal affairs. They have destroyed, enlarged or abridged municipal charters; extended or narrowed boundary lines; abolished municipal offices in order that those created to replace them might be available as party spoils; imposed upon cities burdensome debts against their will; bartered away municipal franchise privileges; and in countless ways contributed to the depravity and inefficiency which have too frequently been the shame of American cities. Among the efforts which have been made from time to time to prevent the abuses of special legislation affecting our cities the following may be mentioned: First, a general prohibition against the granting of charters to cities. Practically every State now forbids the incorporation of cities except by general law. The criticism urged against forbidding all special legislation is that the prohibition, if broad enough to cover adequately the abuse of special legislation, does not leave power to deal with the peculiar problems of individual cities. Second, the classification of cities with the requirement that laws must apply to all the cities of the same class. It has been found easy to create classifications in which each important city was in a group by itself. Third, general municipal codes, like that of Ohio in 1902, under which all cities are governed in accordance with a general and uniform scheme. This plan has not been found elastic enough to meet the needs of cities of varying size. Fourth, the municipal veto, by which a city is given the right to ward off legislative interference. This veto may be absolute, as in the case of Chicago, or it may be merely suspensive, as in the case of the cities in the State of New York. Fifth, the optional charter plan. This creates a series of model charters providing different forms of city government suitable to varying municipal conditions. A city may select whichever form it chooses and be governed under it. Sixth, municipal home rule (q.v.), which is now com-
monly regarded as the only adequate remedy for the evils of State interference in municipal affairs. There is in the United States practically no State administrative control over cities. There are no State administrative agencies which supervise municipal activities and there seems to be little disposition to create them. In a few instances there has been some degree of administrative supervision in the matters of education, health, civil service, elections, public utilities, and liquor sales, but these cases are very rare. There have been instances in which the State has taken direct charge of various municipal functions, such as police protection, and operated them by State appointed officers, but this is very different from central administrative supervision over municipal activities. It is possible that some scheme comparable to the one in England already described would aid us in the solution of some of our problems of municipal administration.

Municipal Charters.—Allusion has already been made to the charter of the municipality which constitutes the constitution of the city. It is the document which the city receives from the State legislature setting forth the form of municipal organization, the measure and limits of the city’s power. It is granted by the legislature either by special act or in accordance with general laws; or, in the case of cities enjoying home rule, it is framed by the city itself. There are at least two respects in which the charter of a municipality differs from that of a private corporation. A private corporation becomes such by its own volition and no group of citizens can be compelled to incorporate against its will. The State, however, has power to organize a community into a municipal corporation against the protest of every inhabitant of the district involved. In the second place, a charter given by the State to a private corporation is a solemn and binding contract which without mutual consent cannot subsequently be revoked or altered by the State, the obligation of which cannot be impaired without violating the provisions of the Federal constitution. The charter given by a municipality is not a contract taking effect in law, unless restrained by special provisions of the State constitution, may amend it or abolish it at its discretion. It stands on the same footing as any other piece of legislation.

Municipal Powers.—Character and Construction.—No rule of law is more firmly established in this country than that the powers of a municipality are not residuary but are delegated and limited. These powers may be found in the charter of the city, in the general laws of the State, or in the self-executing clauses of the constitution; but they must be found positively set forth somewhere. Not only are municipal powers delegated but they are also curtailed with utmost strictness. No clearer or more adequate statement of the character and extent of the powers of the American city can be found than the classic words of Judge Dilllon: “It is a general and undisputed proposition of law that a municipal corporation possesses and can exercise the following powers and no others: First, the power to levy and to collect taxes; second, those necessary or fairly implied in or incident to the powers expressly granted; third, those essential to the accomplishment of the declared objects and purposes of the corporation—not simply convenient, but indispensable. Any fair, reasonable, substantial doubt concerning the existence of power is resolved by the courts against the corporation, and the power is denied.”

Ordinance Power.—One of the powers which is invariably granted to a municipal charter is the power to pass ordinances which shall have the effect of law. The legislature may not, under our State constitutions, delegate its legislative power; but since a city is regarded as an administrative subdivision of the State the courts have uniformly held it to be proper to endow it with a share of the State’s legislative power. The power to pass ordinances is hedged about by many limitations express or implied, which may be summarized as follows: First, where the procedure to be followed in passing an ordinance is set forth in the charter it must be rigidly adhered to or the ordinance will be held void. Second, ordinances must not be passed in excess of the power delegated to the city. Third, there must be no violation of the provisions of the State constitution or statutes. Fourth, since every power is granted to a municipality under the implied condition that it will be reasonably exercised, any ordinance will be held void which is regarded as unreasonable by reason of its being oppressive, discriminatory, unduly restrictive of trade, or in contravention of common right or public policy. The invalidity of part of an ordinance does not vitiate the entire ordinance if the valid and invalid portions are separable.

Power of Taxation.—The power of the American city to tax must be given either by express or implied grant. It is usually specifically conferred in the charter, but if not it will be implied from the grant of other powers for the exercise of which revenues are necessary. When not limited by the provisions of the State constitution the State legislature has complete control over the city’s power of taxation. It may in its discretion extend, curtail or revoke it in general or with reference to special taxes. It is subject in the exercise of this power to one restriction: not a contract tax. The legislature, unless restrained by special provisions of the State constitution, may amend it or abolish it at its discretion. It stands on the same footing as any other piece of legislation.

Municipal Powers.—Character and Construction.—No rule of law is more firmly established in this country than that the powers of a municipality are not residuary but are delegated and limited. These powers may be found in the charter of the city, in the general laws of the State, or in the self-executing clauses of the constitution; but they must be found positively set forth somewhere. Not only are municipal powers delegated but they are also curtailed with utmost strictness. No clearer or more adequate statement of the character and extent of the powers of the American city can be found than the classic words of Judge Dilllon: “It is a general and undisputed proposition of law that a municipal corporation possesses and can exercise the following powers and no others: First, the power to levy and to collect taxes; second, those necessary or fairly implied in or incident to the powers expressly granted; third, those essential to the accomplishment of the declared objects and purposes of the corporation—not simply convenient, but indispensable. Any fair, reasonable, substantial doubt concerning the existence of power is resolved by the courts against the corporation, and the power is denied.”

Police Power.—The power to pass ordinances for the protection of the public health, safety, morals and general welfare of the municipality is commonly conferred upon cities by express grant. It may be implied, however, from a general grant of power to pass ordinances. It is under this authority that municipi-
MUNJISTIN

palities make enactments relative to the preservation of peace and order, sanitation, fire protection, regulation of amusements and occupations, and the control of vice. When exercised by the city the police power is subject to all the usual constitutional restraints against arbitrary and discriminatory enactments, and in addition police ordinances are held void if they are unreasonable even though they violate no constitutional provision. The police power is not parting with its police power by the making of any grant, concession, exemption or contract. Its police ordinances may deal with subjects already covered by State law provided the ordinance does not conflict with the statute. The power to pass police ordinances carried with it by implication the authority to establish and enforce reasonable penalties. Such ordinances may be enforced either by penalties inflicted upon individuals or by summary destruction of private property which is held to be a public nuisance.

Municipal Contracts.—The power to make contracts is given to all municipalities by express grant or by implication. Such contracts have been held to be valid between municipalities and between individuals but the city must be exceedingly cautious not to exceed its power. If the procedural requirements in the city charter are not complied with the contract is void. Where cities enter into contracts for the securing of services or goods it is commonly required that the city must call for sealed bids based upon plans and specifications and that the contract must be let to the lowest responsible bidder. If it can be clearly shown that a city did not have the requisite authority to make a given contract such a contract is completely void. Cities are, however, bound by the principles of common honesty and in cases where its contracts are illegal because of hidden defects of procedure or non-compliance with other formal requirements the city may still be bound. It may elect to ratify such contracts and ignore the irregularities, or, under what is known as the doctrine of estoppel, it may be prevented from contesting them by declaring acts of the city to have been illegal. The courts have based upon its own acts for the purpose of freeing itself from its just obligations. The contracts of a municipality are enforceable in court like other contracts and neither the city nor the State legislature may by ordinance or statute impair their obligation.

Miscellaneous Powers.—The American municipality enjoys several powers which do not call for elaborate discussion. It may appropriate and spend money for purposes within its authority and in accordance with the procedure outlined in its charter. It may, within these same limits, acquire, manage and dispose of property. It may construct public improvements and in so doing may use the power of eminent domain and levy special assessments. Its power to incur debts, own and operate public utilities and services and grant franchises are treated in separate articles. See Municipal Debts; Franchises; Public Utilities; Assessments.

Liability of Municipalities.—Since a municipality is a government possessing sovereign powers it is not, like the State, immune from suit without its consent. On the other hand, since in the performance of many functions it is an agent of the State its legal liability is not as wide as that of a private corporation. The rules governing the civil liability of the city are, accordingly, complex. In the first place, its liability upon all contracts which it hasike and is paid for may be enforced in the usual ways. Secondly, the city is not liable in damages for the torts or legal wrongs resulting from the performance of its governmental powers and functions. This immunity rests partly on the theory that the city performs these functions as an agent of the State which is immune from suit, and partly on the theory that it is contrary to public policy to expose the fortunes of the city to the heavy drainage which an unrestricted liability would entail. This immunity extends to the injuries resulting from the negligence or misconduct of the city's officers and agents, or from the fault construction, repair or maintenance of its property when used for governmental purposes. By governmental functions or powers are meant those pertaining to the protection of public peace, health, safety, education, charity, etc., in contrast to the commercial or quasi-private enterprises on which modern cities may depend. The immunity is never, furthermore, for the tortious acts of its officers when they have exceeded their legal authority. In such a case the injured person may sue the officer individually and recover damages. The State legislature may create by statute municipal liability which would not otherwise exist. In the third place, the municipality is liable in tort for the injuries resulting from the performance of non-governmental or commercial functions, i.e., the operation of revenue-earning utilities, as well as from the use of property not used for governmental purposes. Furthermore, a legal obligation rests on the city to exercise reasonable care in keeping its streets, highways, bridges, viaducts, etc., safe for ordinary use and it is accordingly liable for the injuries resulting from a breach or neglect of this duty. On the whole the modern tendency seems to be to broaden rather than to curtail the civil liability of the municipality.

ROBERT EUGENE CUSHMAN,
Associate in Political Science, University of Illinois.

MUNJISTIN (purpuraxanthin carboxylic acid), an orange-coloring matter closely allied to purpurin and to alizarin, which occurs in munjeet (East Indian madder), and has the formula C₉H₇(OH)₃.O.CO.OH. It may be changed into purpuraxanthin by boiling with alkalis; also by heating it above 448° F., its melting point. It dissolves in boiling alcohol, separating again, upon cooling, in the form of brilliant golden flakes. Munjistin gives an orange-yellow color when mixed with aluminum mordants, which, however, is not fast either as to light or soap. With iron mordants it gives a brownish purple, which is fairly permanent. Munjistin is one of the compo-
nents of commercial "purpurine," also known as "Kopp's purpurine."

MUNKÁCS, münk'äch, Hungary, town in the county of Bereg, located on the Latorczza River and on the Bátuy-Munkács-Lavoczne-Stryj state railway. Its industries consist of vineyards, coarse cloth weaving, spirit distilleries, petroleum refining, lumber, cattle and grain trade. In the vicinity the noted "Hungarian diamonds" (rock crystal) are mined. Close by are productive alum and iron mines. Built on a plain is the historic fortress usually utilized as a state prison, that was first built in 1359. It was surrendered (1688) to the Austrians after withstanding a siege of three years under the brave leadership of Helen Zriny, wife of the patriot Emmerich Thököly. Franz Rákóczi II (1703) was defeated here by the Austrians under Nigrelli and the place was surrendered (1708) to the latter. Alexander Ypsilanti was imprisoned here from 1821-23, and the famous painter Munkácsy was born here. Pop. about 17,240.

MUNKÁCSY, münk'äch, Michael, Hungarian painter; b. Munkács, Bereg County, Hungary, 10 Oct. 1846; d. Endenich, near Bonn, 1 May 1900. His real name was Lieb, but he is known only under the assumed name derived from that of his birthplace. Beginning life as a carpenter, he met the strolling portrait painter G. Szamosy, in Gyula, who was so much struck by the artisan's interest in art that he gave him painting lessons. Munkácsy proceeded to paint portraits and genre pictures, taking his subjects from common country life. One of these early canvases, 'A Country Idyll,' was purchased by the Art Union of Pesth. He eventually put himself under the instruction of the battle-painter, Franz Adam, at Munich. He made rapid progress and the Hungarian government awarded him the first prize for genre paintings thrice in succession and he was thus enabled to take up his residence at Düsseldorf and to study under Knaus and Vautier. The first great picture he painted was 'The Last Day of a Condemned Man,' (in the collection of Mrs. P. W. Voorhees, Philadelphia) exhibited in the Paris Salon in 1870. This was followed in 1871 by 'Wartime' (an episode in the Hungarian war. The succeeding year he made Paris his home and his pictures began to attract growing attention. He painted many small genres of singular power and character, such as 'Going to School'; 'The Kitchen Politician'; 'The Butter Woman'; 'The Pawn Shop' (1874) (Metropolitan Museum, New York); 'The Workshop' (1875): but as his strength and mastery of his art grew he rose to loftier subjects, religious and historical. In 1877 he painted 'Milton in his Blindness Dictating Paradise Lost,' to which was awarded the gold medal at the Paris Exposition. It is now in the Public Library, New York. Great was the sensibility created by this picture, a historic genre of remarkable coloring in gray and black and of profound insight and power of characterization, an even deeper impression was produced by his 'Christ Before Pilate' (1882), which some critics consider the religious masterpiece of the century. This vast canvas is startling in its freshness of conception, its living action, the mingled grandeur and pathos which the artist has infused into his treatment of the central figure, as well as its mastery of composition and technique. It has been exhibited in all quarters of the civilized world and was bought by John Wanamaker of Philadelphia for $120,000. It was executed by his dramatic 'Christ on Calvary,' the religious intensity of which is heightened by the accurate fidelity to differing national types with which the spectators of the Crucifixion are portrayed; a piece of realism whose suggestiveness is obvious. In 1880, he produced 'The Last Moments of Mozart,' now in the collection of Gen. Russell Alger, Detroit, Mich. The present owner paid $50,000 for this pathetic picture, in which the composer is listening to his still uncompleted requiem, sung at his bedside by his favorite singers, the night before his death. The last three years of his life this painter suffered from mental alienation and closed his days in a sanitarium. In addition to the works already mentioned, 'The Music Room' and 'The Two Families' are in the Metropolitan Museum in New York; 'The Prowlers of the Night' is in the Pennsylvania Academy, Philadelphia, and 'The Story of the Battle' is in the Walters Gallery, Baltimore. Consult Tait, T. R., 'Michael Munkácsy' (in American Art Review, Vol. II, Boston 1881).

MUNKAR. See MOHAMMEDANISM.

MUNN, Charles Clark, American novelist; b. Southington, Conn., 1848; d. 8 July 1917. Bred on a farm which he left at 17, for 30 years he was engaged as a commercial traveler. From 1910 he was editor of the Commercial Travelers' Magazine. He was the author of several popular novels, including 'Peckett Island' (1900); 'Uncle Terry; A Story of the Maine Coast' (1900); 'Rockhaven' (1902); 'The Hermit' (1904); 'The Girl from Tim's Place' (1906); 'Boyhood Days on the Farm' (1907); 'Myrtle Baldwin' (1908); 'The Castle Builders' (1910); 'The Spice of Life' (1911); 'The Heart of Uncle Terry' (1915); 'Camp Castaway' (1916).

MUNN, George Frederic, American artist; b. Utica, N. Y., 1852. He began his early studies in art under Charles Calverly, the sculptor and also in the National Academy of Design, New York. After high school he went to art schools at South Kensington, England, and there won a gold medal, the first award of the kind to an American. His clay model of the Farnese Hercules won the award. He also was the winner of a silver medal at the Royal Academy for life drawing, and in 1876 entered the studio of George F. Watts. He traveled in Britain, where he painted and sketched and was a frequent exhibitor at the Dudley Gallery, London, and elsewhere. Among his best-known works are 'Wild Flowers'; 'The Rose'; 'Meadow Sweet' and 'A Sunny Day in Britain.' Consult Munn, Margaret Crosby and Cabot, Mary R., 'The Art of George Frederic Munn,' with an introduction by Sir Johnstone Forbes-Robertson (New York 1916).

MUNN, Orson Desaux, American publisher; b. Monson, Hampden County, Mass., 11 June 1824; d. in the yrok, 28 June 1889. Educated at the academy in Monson, he was a clerk and country storekeeper there until 1846, and then bought the Scientific American, which he made one of the leading scientific papers of the
country. Other periodicals owned by him were the Scientific American Supplement (1876–), and Architects' and Builders' Edition (1888–), now American Homes and Gardens. He was also head of Munn and Company, patent solicitors.

MUÑOZ, mu-ñóth, Juan Bautista, Spanish historian: b. Forcachon, Spain, 1745; d. Madrid, Spain, 1799. He was graduated from the University of Valencia in philosophy, being influenced more by the views of the enlightenment than by the official scholasticism and was appointed in 1779 historiographer of the Indies and was instructed by the king to write a history of America. This work was published under the title 'Historia del Nuevo Mundo' in 1793, and though completed only to 1500 is highly valued. Its publication was forbidden by the Council of the Indies, but permitted by Charles IV, notwithstanding its exposition of the barbarity of the Spaniards to the natives. Of his manuscripts many are now in the Academy of History at Madrid, but unfortunately many others are scattered.

MUNRO, mún'ró, Neil, Scottish novelist: b. Stewarstoun, Scotland, 3 June 1854. He has published 'The Lost Plibroch: Celtic Tales and Sketches' (1886); 'John Splendid,' a Highland romance (1898); 'Gillian the Dreamer' (1899); 'Doom Castle' (1901); 'The Shoes of Fortune' (1901); 'Children of the Tempess' (1903); 'The Clyde' (1907); 'Fancy Farm' (1910); 'Ayrshire Idylls' (1913); 'The New Road' (1914).

MUNRO, Robert, Scottish archaeologist: b. Ross-shire, 21 July 1835. He was educated at the University of Edinburgh and was a physician at Kilmarnock till 1886 when he turned his whole attention to archaeological researches. He is a member of many learned societies at home and abroad, and has published 'Ancient Scottish Lake Dwellings' (1882); 'The Lake Dwellings of Europe' (1890); 'Ramblas and Studies in Bosnia, Herzegovina and Dalmatia' (1895); 'Prehistoric Problems' (1897); 'Prehistoric Scotland and its Place in European Civilization' (1899); 'Man as Artist and Sportsman in the Palaeolithic Period' (1904); 'Archaeology and False Antiquities' (1905); 'Palaeolithic Man and Terremare' (Munro Lectures, 1912); 'Prehistoric Britain' (1914); and with others, 'The Glastonbury Lake Village.'

MUNRO, Wilfred Harold, American historian: b. Bristol, R. I., 20 Aug. 1849. He was graduated (1870) at Brown University, receiving (1873) the A.M. degree. He served (1870–71) as master at De Veaux College, Niagara Falls, as associate principal of Saint Mark's School, Salt Lake City (1871), and spent 1873 in South and Central America. From 1875–79 he was principal at Le Roy (N.Y.) Academy and was president of De Veaux College from 1881–89. He was a corresponding member at the universities of Freiburg and Heidelberg (1890–91), when (1891–99) he became associate professor of history and director of university extension at Brown University, to he made professor of European history (1899–1911), then emeritus professor. He has written 'The Story of Mount Hope Lands, A History of Bristol, R. I.' (1880); 'The Most Successful American Privateer' (1913); 'Legends of Mount Hope' (1915); 'Tales of an Old Seaport' (1917). He was editor of the 'Works of W. H. Prescott' (22 vols., 1905–06), and of the 'Record Book of the Rhode Island Society of Mayflower Descendants.'

MUNRO, William Bennett, American political economist: b. Almonte, Ontario, Canada, 5 Jan. 1875. He was graduated (1895) at Queen's University, Canada, receiving the degree M. A. (1896) there, L.L.D. at Edinburgh (1898), Ph.D. at Harvard (1900). He studied (1900–01) at the University of Berlin and was (1901–04) instructor of history and political science at Williams College, then, successively, instructor in government (1904–06), assistant professor (1906) and since has served as professor of municipal government at Harvard University. He has been president of the Harvard Co-operative Society, university editor of Harvard Graduates' Magazine, and director of the Cambridge Trust Company. He has written 'Canada and British North America' (1904); 'The Seignorial System in Canada' (1907); 'Documents Relating to the Seignorial Tenure' (1907); 'The Government of European Cities' (1909); 'Initiative, Referendum and Recall' (1911); 'Government of American Cities' (1912); 'Bibliography of Municipal Government' (1914); 'Principles and Methods of Municipal Administration' (1916).

MUNROE, mún'ró, Charles Edward, American chemist and expert on explosives: b. Cambridge, Mass., 24 May 1849. He was graduated at Harvard (1871); was assist. in chemistry there for three years; and was chemistry United States Naval Academy (1874–86); chemist to United States Naval Torpedo Station (1886–92); and since the last date professor of chemistry and dean of faculty of graduate studies of George Washington (formerly Carleton) University, Washington, D. C. He was expert special agent on chemical industries for the United States Census of 1900, 1905 and 1910; consulting explosives expert United States Bureau of Mines since 1907; president American Chemical Society (1898); president Cosmos Club (1913 and 1914); received the decoration of the Order of the Medjilde from the Sultan of Turkey (1901); has invented a smokeless powder; and is the author of various monographs on chemistry, notably of explosives.

MUNROE, Henry Smith, American mining engineer: b. Brooklyn, N. Y., 25 March 1850. He was graduated (1869) at Columbia and received (1877) the degree Ph.D. He was (1870–71) assistant geologist of the Ohio State Geological Survey; assistant chemist, United States Department of Agriculture (1870–72); assistant geologist and mining engineer of the Geological Survey of Yesso, Japan (1872–75). In 1875–76 he was professor of mining and geology at the University of Tokyo; then successively adjunct professor and professor of practical mining (1877–91); professor of mining (1891–1915), and emeritus professor in 1915 at Columbia University. He was also dean of the faculty of applied sciences (1893–99) and member of the university council (1895–1915). He was manager (1881–84), then vice-president (1890–92) of the American Institute of Mining Engineers, and was (1908–09) president of the Mining and Metallurgical Society of America...
and (1909) president of the Society for the Promotion of Engineering Education.

MUNROE, Kirk, American writer of juvenile stories: b. Prairie du Chien, Wis., 15 Sept. 1850. He was educated at the public schools, then studied at Cambridge, Mass., and Harvard. He became the first editor of Harper's Round Table (1879-82) and is editor of "Emancipating Men of Our Time." Of the large number of juvenile works from his pen might be selected: 'The Flamingo Feather'; Derrick Sterling'; 'The Golden Days of '49'; 'Dorymates'; 'With Crockett and Bowie'; 'Cab and Caboose'; 'Big Cypress'; 'The Fur Seal's Tooth'; 'Campanetes'; 'Canoeomates'; 'Raftermates'; 'At War with Pontiac'; 'Under the Great Bear'; 'Forward March'; 'The Belt of Seven Totems'; 'The Outcast Warrior'; 'The Mikado.'

MUNSEE INDIANS, an American tribe of the Delaware family, originally one of the three great divisions of that race. They were sometimes called the Wolf tribe of the Delawares. They resided along the Delaware River, and in New York, Pennsylvania and New Jersey. During the Revolution many of the Munsee removal to Canada, where at Thames, Ontario, there are some survivors. At Green Bay, Wis., is another tribal remnant and a third remnant is found in Kansas; in all, less than 100 in the United States. See DELAWARE INDIANS.

MUNSELL, Joel, American printer: b. Northfield, Mass, 14 April 1808; d. Albany, N. Y., 15 Jan. 1880. He established himself in Albany in 1827, and was publisher and editor of the New York State Mechanic from 1841 to 1843. At various times he was the publisher of the Unionist, the Albany Daily State Register, Morning Express and Slaterman, and other journals. Munsell made a close study of the art of printing, in its history and application, and his collection of works on the subject, the largest in America, was in part purchased for the New York State Library. He contributed papers to the Transactions of the Albany Institute, of which he was a founder, and published 'Outlines of the History of Printing' (1839); 'Annals of Albany' (1849-59); 'Every-Day Book of History and Chronology' (1856); 'Chronology of Paper and Paper-Making' (1857; enlarged 1870); and 'Manual of the First Lutheran Church of Albany, 1670-1870' (1871).

MUNSEY, mun-si, Frank Andrew, American publisher: b. Mercer, Me., 21 Aug. 1854. After receiving a common school education he became manager of a telegraph office in Augusta, Me. In 1880 he moved to New York in 1880 to become editor and publisher of The Golden Argosy, a juvenile weekly, which he afterward changed into a monthly for adults under the style of The Argosy. Munsey's Weekly appeared in 1889 and after issuing this for one year he transformed it also into a monthly, calling it Munsey's Magazine. He now owns The Argosy, The Railroad Man's Magazine, and the All-Story Weekly and the daily newspapers New York Sun and Baltimore News. He has also conducted the publications of the cheap illustrated magazines, Munsey's being the first magazine to be sold at ten cents a copy. He is a member of many clubs in New York City and elsewhere and is the author of several books: 'Afloat in a Great City' (1887); 'The Boy Broker' (1888); 'A Tragedy of Errors' (1889); 'Under Fire' (1890); and 'Derrington' (1894).

MUNSON, James Eugene, American inventor: b. Paris, N. Y., 12 May 1825; d. 1906. He was educated at Amherst College and in 1857 removed to New York, where he was court stenographer for 30 years. He invented the Munson System of shorthand, a machine for operating the typewriter by telegraph and a type-setting machine. He published 'The Complete Phonographer' (1866); 'Dictionary of Practical Phonography' (1874; 2d ed. 1906); 'The Phrase-Book of Practical Phonography' (1889); 'A Shorter Course in Munson Phonography' (1901; 2d ed. 1912); 'Phonographic Diction Book' (1904), etc.

MUNSON, Thomas Volney, American horticulturist and plant breeder: b. on New York near Astoria, Ill., 26 Sept. 1843; d. Denison, Tex., 21 Jan. 1913. His early education was obtained in the rural district schools, followed by a course in an academy at Lewiston. He subsequently took a course in a commercial college after which he entered the University of Kentucky, whence he was graduated in 1870. Shortly after completing his education he married and removed to the vicinity of Lincoln, Neb. In 1873 he became interested in the improvement of the various species of the native American grapes and planned to do systematic work in the way of developing new varieties by cross-pollination and hybridization. The experiments thus undertaken were doomed to failure because of climatic rigors and a visitation of the Rocky Mountain locusts. Undismayed, he sought a new location, settling at Denison, Tex., in 1876. There climatic conditions were much more favorable to the prosecution of such experiments and, moreover, wild grapes were much more abundant and more profuse in variety than in Nebraska. He engaged in the nursery business, selecting new varieties of grapes and also growing them upon a commercial scale. During the ensuing 25-year period, he produced and experimentally fruit No less than 150,000 new varieties of grapes, many of which were far superior to those hitherto in common cultivation. Only the very best of these were selected for propagation and dissemination and so rigid and exacting was the process of elimination that but 50 varieties were retained for introduction and cultivation as a permanent addition to American viticulture. He became recognized as a botanist as well as a viticulturist, a volume entitled 'Native Trees of the Southwest' having been prepared under the direction of the United States Department of Agriculture and a similar thesis being submitted in 1883 for the master's degree at the Kentucky Agricultural College. But his specialty was the grape and he became the recognized authority on the native wild grapes of North America. His horticultural and scientific work in hybridizing and perfecting the American grapes won recognition and appreciation of his service in producing and introducing resistant stocks with which to re-
store the phylloxera infested vineyards of France, the French government conferred upon him the diploma and decoration of the Legion of Honor, with the title of "Chevalier du Merit Agricole," in 1888. He wrote "Classification and Generic Synthesis of the Wild Grapes of North America" (issued as Bulletin No. 3 of the Division of Pomology, United States Department of Agriculture, Washington, 1890). The most complete botanical display of the whole grape genus ever made was prepared by Mr. Munson and exhibited at the World's Columbian Exhibition at Chicago in 1893 and has since been preserved by the United States Department of Agriculture at Washington. He was the founder and for many years the president of the Texas Horticultural Society and was a member of a number of learned societies, including the American Agricultural Society, the National Agricultural Association of France, the American Pomological Society, the American Breeders' Association and the American Association for the Advancement of Science. His volume "Foundations of American Grape Culture" (1909), embodied the practical results of more than 30 years of patient, painstaking investigation, experimentation and observation and must long remain the leading treatise on its class. His work, which may be justly said to have been monumental in its significance and beneficence, was continued until his death.

MÜNSTER, Ireland, the southwest largest of the four provinces of that country, bounded on the north by Connaught, on the east by Leinster, and on the west and south by the Atlantic Ocean. It has an area of 9,532 square miles and is divided into the counties of Clare, Cork, Kerry, Limerick, Tipperary and Waterford. Pop. 1,035,495, 94 per cent Roman Catholics.

MÜNSTER, min'ster, Prussia, the capital of Westphalia, a city and episcopal see, in a plain on the Rhine, at the junction of several railways and on the Dortmund-Ems canal, 78 miles northeast of Cologne. The site of its mediæval ramparts has been converted into promenades. The principal edifices are the 13th century cathedral, the church of Saint Lambertus and the church of St. John, the castle, the Pauline Library, several educational, benevolent and charitable institutions, etc. The manufactures include woolen, linen and cotton goods, leather, sugar, starch, beer, etc. Münster originated in a monastery and walled settlement arose in the 12th century; it was long governed by martial bishops. The most notable event in its long history occurred in 1532-35 when the city fell into the hands of the Anabaptists (q.v.). Pop. about 90,000.

MÜNSTERBERG, min'ster-berg, Hugo, German-American psychologist; b. Danzig, Germany, 1 June 1863; d. Cambridge, Mass., 16 Dec. 1916. He was graduated at the Danzig Gymnasium in 1882, and pursued post-graduate studies in physiology, philosophy, natural sciences and medicine until 1887. He received the degree of Ph. D. at Leipzig in 1885 and that of M.D. at Heidelberg in 1887. After this he was instructor and assistant professor of psychology in the University of Freiburg at Baden, Germany. In 1892 he came to America at the invitation of Harvard University, Cambridge, Mass. He was professor of experimental psychology and director of the Psychological Laboratory in Harvard from that time until his death. His scholarly work was partly psychological, partly philosophical. After 1900 he gave special attention to the new field of applied psychology, in particular to the application of psychology to education, medicine, law, commerce and industry. He was a member of the Psychological Association (president 1898), of the Philosophical Association (president 1905) and of the Washington Academy, of the American Academy of Arts and Sciences, etc. He was organizer and vice-president of the International Congress of Arts and Sciences at the Saint Louis World's Fair 1904, vice-president of the International Psychological Congress in Paris 1900, vice-president of the International Philosophical Congress at Heidelberg 1907, etc. In 1910-11 he was Harvard exchange professor at the University of Berlin and during that year founded the American Psychological Association. During the whole period of his American stay he worked for the improvement of the relations between the United States and Germany, writing in America for a better understanding of Germany and in Germany for a higher appreciation of America. The outspoken views of Professor Münsterberg on the issue of the War of 1914 raised storms of controversy about his head. He appeared as probably the most eminent supporter of German policies in America, and as such was most bitterly condemned by the Entente Allies and their friends, while the pro-Germans Le appeared almost an idol. While supporting German policies, Professor Münsterberg denounced many of the activities of the Teutonic hyphenates in this country. He condemned the forming of an alien party within the United States as "a crime against the spirit of true Americanism," and said that its results would reach far beyond the time of the war. Professor Münsterberg's early writings in Germany were exclusively devoted to experimental psychology. During his sojourn in America he published the following works, some of which have been translated into many languages: "Psychology and Life" (1899); "Grundzüge der Psychologie" (1900); "American Traits" (1903); "The American Genius" (1904); revised (1912); "Principles of Art Education" (1905); "The Eternal Life" (1905); "Science and Idealism" (1906); "Philosophic der Werte" (1907); "On the Witness Stand" (1908); "Aus Deutsch-Amerika" (1909); "Das Entstehen der Werte in der Kunst" (1909); "Psychotherapy" (1909); "Psychology and the Teacher" (1910); "American Problems" (1910); "Psychologie und Wirtschaftsleben" (1912); "Vocation and Learning" (1912); "Psychology and Industrial Efficiency" (1913); "American Patriotism" (1913); "Grundzüge der Psychotechnik" (1914); "Psychology and Social Sanity" (1914); "Psychology, General and Applied" (1914); "The War and America" (1914); "The Peace and America" (1915); "The Photo- play, A Psychological Study" (1916). He was also a large contributor of psychological and philosophical articles in the scientific magazines and of social, political and practical psychological articles in the popular periodicals.

MUNTJAC, a small East Indian deer representing the genus Cerculus, which resembles
the musk-deer in many points, especially in having, in the male, long sharp upper canine teeth, or tusks, which are effective weapons. The little deer, only 20 to 22 inches in height inhabit hilly jungles, and have lyrate, single-pronged antlers, mounted upon remarkably tall pedicels. The females have no antlers. Several species are found in China and in the Malay archipelago, and fossil related genera existed in Europe in Tertiary times. Consult Kinloch, *Large Game Shooting* (1885).

**MÜNTZ**, munts, Eugène, French art critic: b. Sulz, Alsace, 1845; d. Paris, 30 Oct. 1889. He studied at the Lycées Bonaparte, Paris, and then went (1873–76) to the French School at Rome, where he was appointed librarian at the École des Beaux Arts, Paris, to become (1880) curator of the library, archives and of the Museum. He made a number of trips to Greece, Egypt, and Italy for research. Among the most important of his many works are *Les arts à la cour des Papes pendant le XV et le XVI siècle* (1878–79, 4 vols., awarded prize of the Academy of Fine Arts); *Raphaël, sa vie, son œuvre et son temps* (1881, 3d ed. 1899), also a *La Vie et lŒuvre de Raphaël* (1901); *La tapisserie* (1882; 5th ed., 1903); *La Renaissance en Italie et en France à l’époque de Charles VIII* (1885); *Tapisserie, broderies et dentelles* (1890); *La mosaique classique et médiévale* (1893); *Florencet las Toscane* (1897; new ed. 1901); *Leonard de Vinci* (1898). Under the title *Bibliothèque internationale de l’art* undertaken in collaboration with foreign critics and published since 1881, he brought out a number of monographs which he called *Les précurseurs de la Renaissance*, which were followed by *Les collections des Medicis* (1887) and later *Les historiens et les critiques de Raphael* (1884) and *Études sur l’histoire de la peinture en France* (2d ed. 1885). He also collaborated with Guiffrey in *Histoire générale de la tapisserie*. He was made a member of the Institut de France. Consult Girodi, *Eugène Müntz* (Strassburg 1902).

**MUNZER**, minišer, Thomas, German religious fanatic: b. Stolberg, about 1490; d. Frankenhäuser, 15 May 1525. He claimed that he was in direct communion with the Holy Spirit, and advocated communism, denouncing all existing governments. His violence brought him into conflict with Luther as well as with the Catholics. He preached at Zwicken in 1520, and at Prague in 1521, promulgated his doctrines at Allstedt in Thuringia in 1523, and excited the people to revolt against the authorities. In Mühlhausen (1524) he gained the unqualified support of the populace, deposed the city council, appointed a new one, suffered the monasteries and houses of the wealthy to be sacked, and proclaimed a community of goods. He was now joined by another fanatic named Pfeffer, with his troop of rapacious followers, and in this circumstance with the news that 40,000 peasants had assembled in Franconia and plundered and burned 150 castles of the nobles and 23 monasteries, inflamed his zeal, and he joined in what was termed the *Peasants’ War*, intending to exterminate the goddess priest and priests. Leaving Pfeffer governor in Mühlhausen, he proceeded to Frankenhäuser, and rekindled the ardor of the townpeople. The dukes of Saxony, Philip and Brunswick, and other rulers sent a force against the insurgents; Müntzer was totally defeated after an obstinate struggle, was taken and executed. (See PEASANTS’ WAR.) Consult Merx, *Thomas Münzer und Heinrich Pfeiffer* (Gottingen 1859); Seidemann, *Thomas Münzer* (Leipzig 1842); Strobel, G. T., *Leben, Schriften und Lehren Thomä Müntzers* (Nürnberg 1795); Wolfram, G., *Thomas Münzer in Allstedt* (Jena 1852).

**MUNZINGER**, moon’sing-ër, Werner, Swiss explorer: b. Olten, Switzerland, 4 April 1832; d. Africa, 14 Nov. 1875. He was educated at Bern, Munich and Zurich. He became in mercantile life at Alexandria, Egypt, in 1852–53. He participated in several expeditions into Abyssinia, and later became British and then French consul, and finally in 1874 was made the Khedive at Massowah in Egyptian Abyssinia. In 1870 he started an expedition into southern Arabia. In 1872 he became Pasha and governor-general of the eastern Sudan. He was killed in 1875 while leading an expedition against Abyssinia. Among his works are *Ostafrikanische Studien* (1864); *Vocabulaire de la Langue Tigré* (1865).

**MURADABAD**, moo-rá-dá-bád’, India, city and capital of the district of Muradabad in the United Provinces, on the Ramganga River, situated 50 miles north by west of Bareilly. The city has an extensive commerce in rice, sugar, wheat and other products of the surrounding district and has cotton factories, printing establishments and manufacturies of engraved brass ware. Its most notable architectural feature is the great mosque erected in 1631. There are also Saint Paul’s Church (Church of England), and the American Christian Church founded in 1874. Rustam Khan founded Muradabad in 1625; the ruins of his early fortifications are still visible. The city is governed by a council of 23 members, of whom five are appointive and the remainder elected. A cantonment is located in the skirts of the city to the northwest. Pop. 81,168.

**MURAENA**, a very large marine eel or moray of the family *Muraenidae*. (See MORAYS.) There can be little doubt that the *muraena* of the Roman feasts often translated "lamprey," was one of the true eels. It was held in the highest esteem. Pliny mentions sums of money and the great care which were spent on the cultivation of the muraena. The artificial fish-pond of Lucullus was said to have been sold for about $200,000; and one Hirrius is said to have furnished Caesar with 6,000 muraenas alone for a regal entertainment given to the people. These fishes were kept as pets by the Roman nobility. See Muller.

**MURAL CIRCLE**, in astronomy, an instrument consisting of a circle carrying a telescope and mounted against a wall; whence its name. The telescope revolved in the plane of the meridian. It was formerly employed at observatories to measure the zenith distances of stars,
and thus their declination. The mural circle is now superseded by the Meridian Circle.

MURAL PAINTING, that branch of interior decoration which has for its object the adornment of the walls of buildings by painting, as distinguished from mosaic, wainscoting, sculpture, bas-relief and all other kinds and means of adornment. By extension the term includes also the painting of vaults and ceilings. It is not commonly used of mere painting with uniform flat color, but only of such painting as involves systematic decorative design, whether pictorial or by means of conventional patterns and ornament. In its highest development it is the most exalted, spiritual and imaginative form of decorative art, and indeed of painting in general, and has enlisted the genius of the most gifted painters of all time.

General Purpose and Principles.—Mural painting is not an independent art, like the painting of easel pictures, but an art intimately allied with architecture. Its function being to contribute to the beauty of the building to which it is applied, the decorator must subordinate his invention to the architectural conditions and character of the building and of the spaces he is to adorn. He must consider the size, shape, and proportions of the rooms; its architectural style, features and divisions; its conditions as to lighting; the distance from the spectator's eye of the various surfaces he is to paint; and thus to make his paintings contribute to the dignity and effectiveness of the completed structure. This requires a knowledge of architecture and a sympathetic attitude toward the architect's purpose, and the best results are secured when the architect and painter have collaborated from the beginning. Usually, however, the building is "turned over" to the decorator only when completed, and the artist must do his best with the conditions thus created for him in advance. He is least hampered when the interior surfaces assigned him (for nearly all mural painting is of interiors) are broad and sure, as in the Arena Chapel at Padua by Giotto and the Sistine Chapel at Rome by Michelangelo and others; but the truly great artist can triumph over such architectural complexities as the great central and lateral naves of the Duomo at Florence, and create an illusion of actuality and space; to "break through the wall" as the painters say. But even in such paintings a certain formality of composition and an evident recognition of the shape of the space occupied may serve to distinguish them as real mural decorations rather than easel pictures framed and hoisted into their places on wall or ceiling.

Methods and Technique.—Four processes or methods of producing mural paintings have predominated in the history of the art: Fresco, Tempera (or painting in distemper), Encaustic and Oil painting.

Fresco was the process most generally employed in the Early Renaissance, in the Middle Ages and to some extent in antiquity. In fresco painting the pigment is applied to a specially prepared surface of wet plaster, which it penetrates so that when the plaster sets the picture is incorporated in its substance and to some extent encased in a thin coating of carbonate of lime. Only so much of the picture can be painted at a time as will cover the plaster before it hardens, after which the unpainted remainder of the
plaster must be cut away. Thus each day's work must be complete in itself, there can be no retouching or correction on that portion except in distemper, which is less permanent. "Buon fresco" is pure fresco, untouched with tempera, and such are the greatest works of the later masters in fresco. The medieval and early Renaissance painters (and probably also the Greco-Romans) used tempera retouching quite freely. But even with tempera retouching fresco-painting is a difficult process; and the work must be done in place, not in the studio, and to paint a dado or ceiling while hanging on one's back is no easy task. Oil painting has almost completely driven out this most permanent and monumental style of painting, in which most of the greatest works of the Italian Renaissance were executed. See Painting.

Tempera, or painting in distemper, is a process of painting on dry plaster with pigments carried by some slightly glutinous medium, like white of egg or honey, or gum, mixed with water. The work must be done in place, like fresco, but is easier of execution and permits of retouching and correction ad addition. It is far less permanent than fresco, being likely to scale, peel or powder off. It was, however, much used in antiquity, and the so-called "frescoing" or painted decoration on walls and ceilings of ordinary modern houses and apartments is done in distemper.

Encaustic is painting on a surface prepared with wax, and employs either distemper pigments which after painting are covered with a coat of melted wax, or pigments mixed with melted wax on a wooden palette. It is a difficult and meticulous process, which was used by the Romans for certain details of their mural a coat of melted wax, or pigments mixed with occasionally by modern artists, F. C. Crowning, and others among them, but has no decided advantages. Oils sufficient to counterbalance its difficulties.

Oil painting, which employs linseed oil as the carrying medium of the pigment and turpentine as a dryer, appears to have been first developed in Flanders in the 15th century and thence to have been carried to Italy, where it finally supplanted all other processes, first for easel pictures and altar-pieces, and later, in the hands of the great Venetian painters, for mural decorations of the greatest magnificence. Oil painting has many advantages; it can be executed in the studio, upon wood, copper or canvas, the latter being usually employed; it is the most brilliant of all kinds of painting and lends itself to the greatest variety of technic, and can be indefinitely corrected and retouched. For these reasons it is the preferred process of nearly all modern muralists. Its disadvantages are that it cannot be executed directly on plaster, even specially prepared for it, with any prospect of permanence; and execution in the studio often leads to disappointing results when the work is in place; moreover it is liable to darken with age and to suffer from deterioration on walls. Yet many of the great Venetian masterpieces are as brilliant to-day — or nearly so — as when painted over 300 years ago. Sometimes the painted canvas, instead of being mounted on a stretcher, is "clued" to the wall by the application of a mixture of white lead and oil. This method is called "marouillage" by the French. It can only be used up walls absolutely protected from dampness.

Two other processes deserve mention, having been used with some success in Germany and England respectively: water-glass and spirit fresco. The first requires special preparation of the wall-plastering, which is then primed with a thin coat of a special preparation made in Germany, and when dry is successively treated with ferrosilicic acid and two coats of water-glass (potassium silicate). The colors, specially made for this process, are laid on with water, and the finished painting, when dry, is sprayed with a fixative. It is said to be ill adapted to very damp climates, but has been successfully used, even for out-door wall-paintings, in Paris as well as in Germany. The "spirit fresco" process invented by Gambier Parry and employed by him in the House of Parliament, makes use of wax and certain gums, melted and dissolved in turpentine, as a medium both for sizing the plaster and for carrying the pigment. The wall, thus sized, is primed with white lead and gilder's size, and then dry can be painted upon with colors mixed with the medium, as if with oils. The painting can thus be corrected and touched up without danger, and the result appears to be satisfactory as to permanence.

Exterior Mural Painting.—The Egyptians, Greeks and Pompeians, all executed painted decorations on walls exposed to the weather. In dry climates like those of Egypt, Greece and southern Italy, tempera painting upon carefully prepared stucco is fairly durable. Modern efforts to produce durable wall-paintings on stuccoed walls have rarely been successful. Hittorf's decorative paintings on the façade of Saint Vincent de Paul in Paris (1846), quickly faded and peeled, although sheltered by a portico. Kallianiotis' great exterior "frescos" on the New Pindanotch at Munich have fared better; they were presumably executed in water-glass. The danger to such paintings lies not merely in alternations of dry and damp, heat and frost, but also in the acid fumes from factories, coal-smoke and gas-works in modern cities, so that the exteriors of buildings and mosaic are now generally preferred as the means for color and pictorial effects on the exteriors of buildings. The Germans, it is true, frequently paint ornamental designs on their stuccoed façades, but these decorations have to be periodically renewed. No really successful process has ever been devised for painting directly on stone or marble, exposed to the weather. The ancients always covered even marble surfaces with a thin coating of very fine lime stucco, sometimes called "mastic," before applying their polychromatic decorations.

Historical Summary.—The articles INTERIOR DECORATION and PAINTING summarize briefly from different points of view the general history of the mural painting of Rome. From these the reader may gather some idea of its progress from the prehistoric cave paintings through the Egyptian and Greek civilizations, the brilliant and fantastic Pompeian and Roman developments, and the solemn religious representations of the Christian and Byzantine churches, to its partial
eclipse, outside of Italy, in the Gothic period. It was largely displaced in Byzantine art by the more brilliant art of mosaic, and in the Gothic period by that of stained glass, although the painting of conventional patterns on walls, columns and vaults never entirely ceased. It was in Italy, pre-eminently the land of color-decoration, that mural painting was revived in the 13th century by Cimabue, and carried to a marvelous perfection in the 14th century by Giotto and his followers, in the church of Saint Francis at Assisi, the Arena Chapel at Padua and the National Cathedral at Ravenna. The human body was studied; artists painted from models; an increasing mastery of light-and-shade and of perspective made possible a corresponding increase in realism. The earlier pictures symbolized or suggested facts and events; the latter ones show the artists' effort to picture a scene as he imagined it would have appeared to an actual spectator. This completely changed the character of all mural painting; the flat wall or ceiling or curved vault was more and more ignored, and the distinction between mural decoration, in its strictest sense, and easel pictures painted merely to fit a given space, was less and less insisted on. Distance, perspective, relief and living action were more and more perfectly represented. But the decorative sense was never lost and the grandeur of the composition, its harmony of line and of color, and the absolute beauty of the result, are in many cases so admirable that one cares not at all to think about the wall or the vault. The highest development of this art in fresco was reached in Rome in the first half of the 16th century, especially in the Vatican. For majesty and solemn significance the paintings in the Sistine Chapel are unapproached; for richness and splendor those of Raphael in the Stanze, especially the Camera della Segnatura, are unsurpassed. For decorations of a lighter sort, Raphael in the Vatican Loggie, and with his pupils in the Farnesina Palace and the Villa Madama and Giulio Romano at Mantua, revived the old Roman practice of combining mural painting with delicate stucco-relief. In Venice the art of painting in oils received its most brilliant development as applied to the decoration of walls and ceilings at the hands of Titian, Paolo Veronese, and Tintoretto in the Ducal Palace. Churches throughout Italy were made splendid with frescoed vaults and painted ceilings. The art declined after 1600, but many brilliant works in both mediums were still executed, and Tiepolo in Venice, Wtitzburg and Madrid, temporarily revived the art with paintings of a marvelous bravura of conception and execution.

In modern times the French have led in mural painting; no considerable public building is erected without providing for interior mural paintings by the greatest artists (Opéra House by Baudry; Hôtel de Ville by various artists; Sorbonne and Panthéon by Puvis de Chavannes and others). In England there has also been a notable revival in the last 50 years; men like Gambia Parry, Coke, Dice, Lord Leighton, Sir E. J. Poynter, and of late especially Frank Brangwyn, have executed notable decorations in fresco, spirit fresco and oils in both public and private buildings.

In the United States previous to 1876 there was no mural painting worthy of the name, though in the National Capitol a group of second-rate Italian painters had for years been employed in decorating the dome. In 1876 Mr. John LaFarge was commissioned to decorate the interior of Trinity Church, Boston, and gathered about him a group of young artists to assist him, many of whom later reached distinction. This was the first work of American artists in this field, and for many years thereafter it remained almost alone. But in 1891-93 for the Columbian Exhibition at Chicago a number of artists, even not very well known, were employed to paint decorative compositions in the various buildings, and a few years later, in the Boston Public Library and the Congressional Library at Washington, more inspiring opportunities were given to artists like E. A. Abbey, J. S. Sargent, E. H. Blashfield, Kenyon Cox, Elihu Vedder, Gari Melchers, W. del. Dodge, W. H. Low, H. Walker, E. Simmons and others, for permanent and monumentally important works. Since then such opportunities have been multiplied tenfold in State capitols, courthouses, libraries, theatres, hotels and private houses, and the number and the skill of American mural painters have both increased greatly. See articles INTERIOR DECORATION and PAINTING, also those on particular phases or styles of art and on particular artists, e.g., Giotto, Michelangelo, Perugino, Raphael, Tiepolo, Titian, etc.

ALFRED D. F. HAMLIN, Professor History of Architecture, Columbia University.

MURANO, moo-ra’no, Italy, town in the province Venice and situated on an island in its
lagoons, one and a half miles north of Venice. It contains the very ancient basilica, San Donato Cathedral, which was repaired as early as the 12th century; a 16th century Renaissance church (San Pietro Martire) with its altar painting by Bellini. The town has for centuries been world-renowned for its glass industry (see Glass), the wonderfully artistic delicate blown-glass ware being highly valued in the collections of connoisseurs. It also has a glass-industries museum. The noted Venetian pearls also are manufactured here. Consult Molmenti, "Le isole della Laguna Veneta" (Venice 1885).

MURAT, mü-ra, Joachim, French marshal and some-time king of Naples: b. Bastide, Lot, France, 25 March 1771; d. Pizzo, Calabria, Italy, 13 Oct. 1815. He was the son of a prosperous innkeeper of La-Bastide-Fortunière, near Cahors, France, and had a remarkable career. While studying for the priesthood at Toulouse he enlisted in a cavalry regiment but was soon dismissed for insubordination. He served in the constitutional guard of Louis XVI; then entered the 12th regiment of mounted chasseurs and, by his zealous Jacobinism to the rank of lieutenant-colonel. He attached himself to Napoleon in 1795, and followed him to Italy and to Egypt. In these campaigns he frequently distinguished himself, and in 1799 Napoleon appointed him general of division. He clung close to the great leader and returned to France with him from the disastrous Egyptian campaign. At a time when everything depended on prompt action he rendered Napoleon most valuable service by dispersing the Council of Five Hundred at Saint Cloud, on the memorable 18th Brumaire. In gratitude and as a reward Napoleon entrusted him with the command of the Consular Guard, and shortly after (20 Jan. 1800) gave him his youngest sister, Caroline, in marriage.

Murat had command of the cavalry at the battle of Marengo and expelled the Neapolitans from the Papal States. In 1803 he was made a member of the Corps Legislatif, and in 1804 was the governor of Paris. On the establishment of the Empire Murat became one of the popular idols, and was showered with honors. He was made marshal of the empire, grand-admiral, and prince of the imperial house. His services in the campaign of 1805 against Austria, in which he entered Vienna at the head of the army, were rewarded in 1806 with the grand-duchy of Cleves and Berg. He participated in the battles of Austerlitz, Jena, Eylau and Friedland. In the war of 1806 with Prussia, and of 1807 with Russia, he commanded the cavalry, and in 1808 he commanded the French army which occupied Madrid, and quelled the insurrection there in May. He expected to receive the crown of Spain, as Charles IV had invested him with royal authority; but Napoleon, who destined Spain for his brother Joseph, placed him on the throne of Naples, 15 July 1808. He then took the title of Joachim I. Ferdinand V (1808-8). Murat proved a beneficient king and instituted some reforms, but he was, after all, but the tool of Napoleon. He shared the hardships and reverses in the disastrous Russian campaign of 1812, and returned to Naples discouraged and discontented. In 1813 he again fought for Napoleon, whose cause he deserted after the battle of Leipzig. He entered into a treaty with England and Austria in 1814 which guaranteed him his throne on condition that he would join the coalition against Napoleon. He pretended to keep this treaty by attacking Eugene Beauharnais in Italy, but defeated him at the arm of the Seine again in 1815 for Napoleon; but being defeated by Generals Neipperg and Bianchi he was forced to leave Italy, and took refuge in Toulon. His offers of aid were spurned by Napoleon. After the overthrow of Napoleon he escaped to Corsica, declining the offer of an asylum in Austria which was made to him by Metternich, and set sail for the Neapolitan territory with a view to the recovery of his kingdom. He foolidly landed at Pizzo on 8 October, but was immediately captured, tried by court-martial, condemned and shot. Murat was vain, unstable and full of ambition. As a cavalry leader his dash and bravery inspired his men with almost superhuman courage. As king, he proved himself sincerely eager to initiate genuine reforms, and did much to abolish laundry. New York 1904); Lumbroso, A., "Correspondance de Joachim Murat" (Milan 1899); Murat, Count, "Murat, lieutenant de l'empereur en Espagne" (Paris 1897); Rouget, E. "Lettres de Joachim Murat" (Pavia 1890); Sorel, A., "L'Europe et la révolution française" (8 vols., Paris 1885-92).

MURAT, Napoleon Achille, French American author: b. Paris, 21 Jan. 1801; d. Wasceissa, Leon County, Fla., 15 April 1872. He was the son of Joachim Murat, king of Naples, and before his father's overthrow bore the title of Prince of the Two Sicilies. When his father lost the throne he sought refuge in Austria, where he received his education. In 1821 he came to the United States, and after an extended tour through the country bought a large estate and settled near Tallahassee, Fla., where he devoted himself to farming and literary work; he also gave largely to and was active in philanthropic enterprises. He became a United States citizen, and in 1824 was made alderman of the city of Tallahassee, in 1825 mayor and in 1826 postmaster. He accompanied Lafayette during most of his visit to the United States, and at that time was introduced to Catharina Dudley, a granddaughter of Washington, whom he afterward married. He refused many offers of political advancement, and lived quietly on his estate. In 1828 he published in the Paris Revue Trimestrielle a series of letters on political parties in the United States, which were later published as "Lettres d'un Citoyen des Etats-Unis ante aux Amis d'Europe"; in 1838 he published "Essais morales et politiques sur les Etats Unis d'Amérique"; and "Exposition des Principes du Gouvernement républicain tel qu'il a été perfectionné en Amérique" (Exposition of the Principles of Republican Government as Perfection in America). This latter work was very popular
among those of republican sympathies in Europe, was translated into several different languages and passed through over 50 editions. Consult MacConnell, 'The Prince and Princess Achille Murat in Florida' (Century Magazine, New York 1893).

MURAT, Napoléon Lucien Charles, Prince of Pont-à-Mousson, French politician, second son of Joachim Murat; b. Milan, 16 May 1803; d. Paris, 10 April 1878. He left Italy for Austria with his mother in 1815; started for the United States in 1824 to join his uncle Joseph, but was shipwrecked on the Spanish coast, and held prisoner for a time; arrived in Boston in 1825; and in 1827 married an heiress of Bordentown, N. J., Georgaina Fraser, who was soon afterward reduced to school teaching for her living. Murat returned to Paris in 1848, sat in the Constitutional Assembly and the Legislative Assembly (1849), was Minister to Turin (1849–50), had his debts paid and received a pension of $30,000 a year under Napoleon III, and in 1859–60 made a feeble claim to the crown of Naples, but received no recognition from France. His vote in the Senate, where he sat from 1852 to 1870, for the temporal power of the Pope, alienated from him the French Freemasons, whose grandmaster he had formerly been. He retired to private life after the revolution of 4 Sept. 1870.

MURATORIANS AND FRAGMENT, or Canon of Muratori, a fragment from an ancient Bible treatise discovered in the Ambrosian Library at Milan by Lodovico A. Muratori and published (1740) in his Antiquitates italicæ. It contains an imperfect list of the books in the New Testament, and is considered highly important as testimony of at least a list of some of the works considered canonical at the time of writing, which is supposed to be late in the 2d century. The much-damaged documentary fragment is in barbaric Latin, probably translated from the Greek. The books are named in their order and start with mention of the Gospel of St. Mark on its first line which is broken and probably contained mention of Matthew as St. Luke's Gospel is mentioned as third. Saint John, the Acts, 13 epistles of St. Paul are cited (omitting Epistle to the Hebrews), the Revelation of John, Jude, two epistles of John (James is omitted, also Peter), but the Apocalypse part of John and that of Peter are accepted, as is also Wisdom of Solomon as being written by his friends. A translation is to be found in H. W. Gwatkins, 'Selections from Early Christian Writers' (New York 1893) and Lietzmann's 'Kleine Texte für theologische Vorlesungen, No. 1' (Bonn 1902). Consult Kuhn, 'Das muratorische Fragment' (Zürich 1892); Tregelles, 'Canon Muratorianus' (Oxford 1867)

MURAVIEFF, mûrâ-vîîf', Russian noble family, originally settled in the grand-duchy of Moscow, but in 1488 receiving from Ivan Vasilievitch holdings in Novgorod. Its chieftain Mikhail Nikolayevitch, who wrote 'Das muratorische Fragment' (Zürich 1892), was the founder of the family of Muravieff. Mikhail Nikolaevitch, b. Montpellier 1770, governor of Livonia and author of the first Russian algebra, Mikhail Nikolayevitch, b. Smolensk, 25 Oct. 1757; d. Saint Petersburg, 29 July 1807; was chosen tutor to the grand-dukes Alexander and Konstantin in 1785, rector of the University of Moscow (1796), and Secretary of State to the Ministry of Public Instruction (1801); and wrote a manual of ethics, which is classic in Russia (1810, 1815). Nikolai Nikolayevitch, son of the governor of Livonia: b. Riga, 1768; d. Moscow, 1 Sept. 1840; was educated at Strassburg, entered the navy 1788; was captured in 1790; was transferred to the army in 1796; and from 1797 to 1823, with the exception of service against Napoleon in 1812–14, he was at the head of a private military school near Moscow, which was bought by the government in 1816. His son, Alexander Nikolayevitch, b. 1792; d. Moscow, 1864; was sent to Siberia for his part in the conspiracy of 1825; was pardoned; served in the Crimean War and became major-general; and as governor of Nijni-Novgorod did much for the Poles the name of serfdom. Another son, Nikolai Nikolayevitch, b. Saint Petersburg, 1793; d. there, 4 Nov. 1866; entered the army at 17; served in the Caucasus; was sent to Khiva 1819; distinguished himself in the war with Turkey, 1828–29, and in the Polish campaign, 1831; in 1832 treated with Mehemet Ali; was disgraced and retired in 1838, but reinstated in 1848; and in 1855 commanded the army in the Caucasus, taking Kars. He wrote a valuable book about his travels in Khiva (1822) and the campaign in the Caucasus in 1855 (1876). His brother, Mikhail Nikolayevitch, b. 1795; d. Syriez, near Luga, 10 Sept. 1866; fought against France (1812–13); took part in Decembrist uprising and was jailed for five months; became major-general in 1830; was military governor of Grodno; was a member of the Council of State, 1850–62; opposed the emancipation of the serfs; used such cruelty in putting down a student rising in 1861 that he was forced to resign; but in 1863 was sent to Wilna as governor-general, and won from the Poles the name of the Hanger or Executioner by his pitiless severity; and in 1866 was president of the commission which examined Karakasoff, who attempted to assassinate Alexander II. His memoirs were published by his grandson, Mikhail Nikolayevitch, b. 7 April 1843; d. Paris 1900; Ambassador to Berlin (1885), to Copenhagen (1893); and from 1897 to his death Foreign Minister. He did much to solve the Crimean question, published the invitation to The Hague Peace Conference (1899), and forwarded Russia's interests in China. Another Mikhail Nikolayevitch, Count Muravieff Amursky, b. Saint Petersburg, 1809; d. Paris, 19 Nov. 1881; fought in the war with Turkey, 1828–29; became governor-general of eastern Siberia in 1847; in 1858 concluded the Treaty of Aigun with China, by which Amur was ceded to Russia, and thus won the title Amursky; and in 1859 arranged a treaty with Japan at Yedo. The last 20 years of his life were spent in Paris. The Muravieff-Apostol branch of the family, so called because of its intermarriage with that of Apostol, a Cossack hetman, is most prominently represented by Ivan (1769–1851), who translated Aristophanes, Horace, Sheridan, etc., into Russian; and by his son Sergei (1796–1826), who took part in the conspiracy of 1825 and was executed in Saint Petersburg.

MURCHISON, mûr-chî-sûn, Sir Roderick Impey, Scottish geologist: b. Tarradale, Ross,
MURDOCH, Mér'dôk, James Edward, American actor: b. Philadelphia, Pa., 25 June 1811; d. Cincinnati, Ohio, 19 May 1893. He made his début as an actor in Philadelphia in 1829, playing Frederick in 'The Lover's Vow,' and in 1833 acted with Fanny Kemble during her American tour. In 1836 he appeared in New York as Benedick in 'Much Ado About Nothing.' He played Pythias to Edwin Forrest's Dannon and in 1842 retired from the stage to study. He reappeared in New York, 1845 as Hamlet for 15 years and played with considerable success in the United States and England. During the Civil War he devoted himself to caring for the wounded soldiers and in giving entertainments for their benefit. Later he became professor of elocution at the Cincinnati College of Music. His best roles were Hamlet, Mercutio, Benedick and Claude Melnotte, in which he had few equals. He published with William Russell 'Orthophony' (1845) and 'The Stage' (1855).

MURDOCK, Joseph Ballard, American rear-admiral: b. Hartford, Conn., 13 Feb. 1851. He was graduated (1870) at the United States Naval Academy, then served (1870–74) on the North and South Atlantic stations and was carrying out coast surveys from 1875–79. From 1880–1903 he was instructor of physics at the naval academy. During the Spanish-American War he was executive officer of the Panther and became a commander in 1901, captain in 1906, rear-admiral 1909. He commanded the Rhode Island in the cruise of the fleet (1900–09) around the world and was received as commandant at the navy yard, New York, from 1909–10, having command of the second division Atlantic fleet (1910–11), and was commander-in-chief, United States Asiatic fleet (1911–12), retiring 1913. He wrote 'Notes on Electricity and Magnetism' (1878), and contributed articles on the same subject to Proceedings of the United States Naval Institute and for Van Nostrand's Magazine, etc.

MURDOCK, Victor, American legislator: b. Burlingame, Kan., 18 March 1871. He was educated at the common schools and at Lewis Academy, Wichita, and became managing editor of the Wichita Daily Eagle. He was elected a Republican to the 58th Congress in 1903, re-elected for 59th to 63d Congresses (1905–15) for the 8th Kansas district and has been a member of the Federal Trade Commission since 1917. In 1918 he was appointed member of the Meat Commission of the United States government. He became an insurgent in his party and joined the Progressives and was chairman of the Progressive National Committee from 1914–16.

1839. He went in 1777 to Birmingham, where he obtained employment in the famous engineering establishment of Boulton and Watt, at Soho, near Birmingham. Watt's piston engines came from the Cornish mines and Murdoch was soon sent thither to superintend the erection and fitting of these engines. In 1800 he was made manager of the works of Boulton and Watt, being afterward admitted as a partner. He retired in 1830. His invention of coal-gas lighting remains his most conspicuous achievement. He began in 1792 his experiments regarding the illuminating properties of gases produced by distilling wood, peat and coal. In 1800 he had an experimental gas apparatus in operation at Soho and in 1802 gas was employed when Soho, London, was illuminated upon the news of the Peace of Amiens. In 1803 the Boulton and Watt foundry was regularly lighted by that means. In February 1808 Murdoch read before the Royal Society a paper detailing his investigations. Gas-lighting fell into the hands of others and in 1809 Murdoch was compelled to publish a vindication of his claims in 'Letter to a Member of Parliament.' It has been asserted that he invented the steam locomotive but the three engines he made came to nothing.

MUREX, a genus of gasteropod mollusks typical of the family Muricidae, resembling the whelk; shell spiral, rough, with three or more ranges of spines simple or branched. Murices are remarkable for the beauty and variety of their spines. They were in high esteem from the earliest ages on account of the purple dye that some of them yielded. M. pomum, which is not so spiny as some of its congeners, is found on our coasts from Cape Hatteras to Texas. It is two to three inches long. The oyster-drill (Urosalpinx cinerea), which uses its buccal ribbon to bore into oyster shells, is closely allied to Murex. See PURPLE SHELL.

MUREXIDE, in chemistry, the hydrogen-ammonium salt of a hypothetical acid called "pulvis," that is, an acid itself not being known to exist in the free state. Murexide has the chemical formula C₆H₅N₅O₂(NH)₄, H₂O, and about 1855 it was largely used as a dye. The colors that it gives are fast so far as light is concerned, and are quite brilliant; but they tarnish quickly when exposed to sulphur dioxide gas, and hence are more or less fugitive in houses where coal gas is burned. As a dye, murexide has now been replaced by coal-tar colors (q.v.). It may be prepared by oxidizing a mixture of uric acid with nitric acid, evaporating to dryness and moistening the reddish residue with ammonia or ammonium carbonate. The beautiful purple red of murexide is at once developed. (This reaction is used in urine analysis as a test for uric acid). Murexide crystallizes in short four-sided prisms, brownish red in color with green and yellow iridescence, dissolves in water to a beautiful purple solution, the color changing to blue upon the addition of potash. The commercial supply of murexide, when it was used as a dye, was prepared from the uric acid of guano. A dye similar to murexide, and perhaps identical, was obtained by the ancients from a gland of the murex, *purplefish,* whence the name "murexide."

MURFREE, mërf'ri, Mary Noailles ("CHARLES EGERT CRADDOCK"), American novelist; b. Murfreesboro, Tenn., 28 Jan. 1850. Her early years were spent in Murfreesboro to which after some years in Saint Louis she returned in 1890 and her careful studies of life in the mountains of Tennessee, where her summers have usually been passed, are reflected in nearly all of her books. Her earliest short story appeared in the "Atlantic Monthly" in 1878 and was followed by others over the signature "Charles Egbert Craddock." Until her identity was revealed in 1885 they were supposed to be the work of a masculine writer. She has published 'In the Tennessee Mountains' (1884); 'The Prophet of the Great Smoky Mountains' (1885); 'Down the Raving' (1885); 'The Story of Keedon Bluffs' (1887); 'His Vanished Star' (1894); 'The Phantoms of the Footbridge' (1895); 'The Mystery of Witch-Mountain' (1895); 'The Witches of Mountains' (1897); 'The Story of Old Fort Loudon' (1899); 'A Sceptre of Power' (1903); 'Storm Centre' (1905); 'The Windfall' (1907); 'The Fair Mississippian' (1908); 'The Story of Dusiehurst' (1914). See IN THE TENNESSEE MOUNTAINS.

MURFREESBORO, mërf'ri-zôrô, Tenn., city, county-seat of Rutherford County, on the Nashville, Cincinnati and Saint Louis Railroad, about 33 miles southeast of Nashville. The first settlement was made in 1811 and in 1817 it was incorporated. It was the capital of the State from 1819 to 1826. It has had a coalition government since 1915. In Murfreesboro are the Middle Tennessee State Normal School and the Tennessee College for Young Ladies (Baptist), founded in 1906. It is in an agricultural section in which cotton is one of the principal products. The city has a number of manufacturing establishments, chief of which are flour and lumber mills, tanneries cotton gins, cotton compresses, machine-shops, red cedar ware factories and carriage factories. On the site of the Stone River battlefield, near the city, is a national cemetery which contains the graves of 6,150 soldiers, 2,333 of unknown dead. (See STONE RIVER, BATTLE OF). It is the birthplace of the author, Mary Noailles Murfree (q.v.). Pop. about 4,679.

MURGER, Henri, ön-rè nûr-zhâr, French poet and novelist; b. Paris, 24 March 1822; d. there, 28 Jan. 1861. He entered a lawyer's office, but left it and was for a time secretary to the Russian Count Tolstoi. Of his career in 1838-48 almost nothing is known. He was a member of an informal club or clique of unconventional and impervious young artists and writers, which was named *Bohemia* and the associates *Bohemians*—a name famous in general literary history. He contributed a great mass of *copy* to numerous periodicals, and at last made a reputation by his 'Scènes de la vie de bohème,' in which he appears as Rodolphe (1848). This was dramatized in 1849, in collaboration with Théodore Barrière, and served as the basis of Puccini's opera, 'La Bohème' (1898). He then found sufficient to do, wrote dramas for the Luxembourg Theatre and articles for the Revue des Deux Mondes. Other works are 'Scènes de la vie de jeunesse' (1851); 'Le Pays Latin' (1852); 'Le dernier
rendezvous' (1852); and 'Les buveurs d’eau' (1854). Many of his lyrics are very beautiful and have been translated by Andrew Lang in 'Ballads and Lyrics of Old France' (London 1872), and his prose works, especially his masterpiece, are characterized by rare humor and pathos. His general influence, however, was unhealthy, and he personally sank into the depths of dissipation and died in a charity hospital. When a monument was later erected to his memory there was a considerable amount of criticism. Consult the appreciation in Saintsbury's 'Essays on French Novelist' (1891) and that by his fellow Bohemians in 'Les nuits d’hiver' (Paris 1862). See BOHEM, LA.

MURGHAB, moo-gab', a river of central Asia, which rises on the northern frontier of Afghanistan, in the Paropamisus Mountains, and after a northwestward course of nearly 400 miles loses itself in the desert sands surrounding the oasis of Merv.

MURIACITE. Same as ANHYDRITE (q.v.).

MURIATIC ACID. See HYDROCHLORIC ACID.

MURICHI, or MORICHI, a South American palm of the genus Mauritia (M. flexuosa), also known as ita-palm; it is nearly related to the bunia (q.v.) or wine-palm. These palms reach a height of 100 to 150 feet and grow along the Orinoco River, forming great forests near its mouth. It furnishes to the Indians of that region almost everything; and during much of the year, when the lowlands adjacent to the river are flooded, they dwell among its branches, like monkeys, for want of dry land upon which to rest or travel. At the time of the inundations, says Humboldt, 'the tufts of the fan-leaved murichi present the appearance of a forest issuing from the bosom of the waters. The navigator, traversing at night the branches of the Orinoco delta, sees with surprise the crowns of these palms lighted up by large fires. These are the habitations of the Guaranes suspended from the trunks of the trees. These people stretch mats in the air, fill them with earth and on this bed of wet clay light fires they require for household purposes. For ages they have owed their liberty and political independence to the treacherous and miry nature of their soil, which they traverse in seasons of drought and over which they alone know how to pass in safety; to their isolation in the delta of the Orinoco, and to their living in the trees.' Consult von Humboldt, 'Voyage aux Regions Equinoxiales,' Vol. VIII (1807–27).

MURIDAE, the family of mice and rats (q.v.).

MURILLO, mú-ri’l’ō (Sp. moo-ri’l-yo’), Bartolomé Esteban, bár-tōl’ō-mā as-tā-bān, Spanish painter: b. Seville, 31 Dec. 1617; d. there, 3 April 1682. He began his art education under Juan del Castillo, and in 1642 sought wider experience in Madrid, where his townsman Velasquez was enjoying a brilliant career. By the latter he was dissuaded from a contemplated visit to Rome and secured facilities for studying in the Royal Galleries and in the Escorial, mainly and chiefly after the years under the inspiration of Ribera, Titian, Rubens, Vanderlyck and Velasquez himself. In 1645 he returned to Seville where he undertook to paint 11 separate pictures for the cloister of Saint Francis in illustration of Franciscan history. These works proved the foundation of his renown. The principal pieces of this series are 'Saint James Distributing Alms' (now in the Academy, Madrid); the so-called 'Angel Piece', and 'Saint Clara' (in the Dresden Gallery). These strike the note of the early Seville school, being warm in tone, and exhibit Murillo as drawing his types of beauty from the lower orders of the Spanish people. Of even more transplant coloring are his 'Saint Leander and Isidore' in the sacristy of the cathedral at Madrid; 'The Birth of Mary' (in the Louvre); and the 'Vision of Saint Anthony' (in Seville Cathedral, 1656); both of these latter belong to the middle period of his artistic development. In 1665 he began his four pictures for the church of Santa Maria la Blanca, among them being his 'Church Triumphant'; 'The Immaculate Conception' (in the Louvre); and 'The Foundation of the Church of Santa Maria Maggiore at Rome' (in the Musée du Louvre). In 1668 he painted his 'Madonna Hovering in the Clouds Surrounded by Eight Saints of Seville' (in the chapter-house of Seville Cathedral); and about 1670 his 'Holy Family with Elizabeth and The Infant Baptist' (in the Louvre). His most brilliant period was between 1670 and 1680; and in 1674 he had completed the eight vast pictures illustrating the 'Corporal Works of Mercy.' These were intended for the church of the Caridad Hospital, and are remarkable for splendor of coloring and strength of design; the interest in expression and the composition and perspective faultless. His 'Saint Elizabeth of Hungary Nursing the Sick' (in the Madrid Museum) belongs to this period. In 1676 he executed 20 pictures for the Capuchin monastery at Seville, 17 of which are now in the local museum. It was at this time that he painted the famous 'Immaculate Conception', which Maréchal Soulis took to France and sold to the nation for 615,000 francs. It is now in the Louvre, and is the work he is most popularly known. While Murillo was engaged at Cadiz in painting 'The Betrothal of Saint Catherine' for the high altar of the Capuchin Church, he fell from the scaffolding and died as the result of his injuries. The work was completed by his pupil Osorio with no particular success.

Murillo left about 400 pictures, including his devotional paintings and the many representations of the 'Immaculate Conception,' one of his favorite and characteristic subjects. His most important works in the United States are the altar-piece in the cathedral of Saint Peter's at Cincinnati and 'Gallegas at the Window' in the Widener collection, Philadelphia. He was the greatest of Spanish religious painters because his imagination was raised to the sublime and only raised by the magic of his brush into sainthood or apotheosis. But he was a great genre painter also. He knew the gypsies and beggars of Spain as well as he knew the saints. He could paint landscape and portrait, flowers and fruit, maidens and children of that Seville which he loved so well and never left for France or Italy. Unswayed by the influence of the dazzling schools of Tuscany or Flanders
he has confined himself to Spanish faces, to Spanish atmosphere and scenery, and has realized a manner and color of his own. If he sacrificed in this way anything of vigor or variety he gained far more in originality, sincerity, and individuality which is truly national.

Consult Calvert, A. F., 'Murillo, a biography and appreciation' (New York 1907); Hurll, E. M., 'Murillo' (Boston 1901); Tubino, F. M., 'Murillo y su época; vida, sus cuadros' (Seville 1864); Leftor, P., 'Murillo et ses élèves' (Paris 1892).

MURLIN, Lemuel Herbert, American clergyman: b. Mercer County, Ohio, 16 Nov. 1861. He was graduated (1891) at De Pauw University and studied (1896) at the University of Pennsylvania and (1897) at Clark University, then in Europe (1898). He received the degree B.D. at Garrett Biblical Institute (1899). He was teacher at the public schools and in Fort Wayne College (1897—86), pastor of churches in Fort Wayne, Knightstown and Vincennes (1898—94). From 1894—97 he was president of Baker University, Baldwin, Kan., and president of Boston, Mass., University from 1911. During 1909 and 1911 he was acting pastor of the American Church at Berlin. He has been a member of the General Conferences of the Methodist Episcopal Church in 1900, 1904 and 1916 and of the Ecumenical Conferences at London (1901) and Toronto (1911).

MURMANSK, a new town in the extreme northwestern Russia, on the Kola Peninsula and the northern terminus of the Kola-Petropavlovsk Railroad. Situated on a sheltered, ice-free harbor on the Murman Coast, the town has sprung into existence and importance during the European War. In appearance it resembles a Kondé or mining camp; its position, 150 miles north of the Arctic Circle, gives it a severe winter temperature of 30° below zero. The population, stated to be about 7,000 (1918), live in roughly-built frame shacks and are largely composed of refugees from Finland as well as Russia. With the detection of Russia as an active participant in the war, the Allies ceased using Archangel as a port for unloading provisions and war materials and as the only line of communication with the former Russian government. To this circumstance is due the rise of Murmansk. With the spreading anarchy promoted by the Bolsheviks and the German encroachments on Russian territory during 1917 and 1918, the town grew in importance and value as a strategical point to the Allies. In the absence of an effective government in Russia, the isolated position of Murmansk and its long distance from the centres of turmoil enabled the Allies to keep in unofficial communication with the country. According to an American correspondent, the Murmansk Bolsheviks, with their excellent terms with the Allied naval and military men, owing to the fact that they derived nearly all their supplies from British and American vessels. Money was stated to be of little value; food, shoes, clothing and tobacco could purchase any local product, such as furs and live reindeer. See RUSSIA; WAR; EUROPEAN.

MURNER, moor'nér, Thomas, German satirist and opponent of the Reformation: b. Strassburg, 24 Dec. 1475; d. about 1536. He studied at the principal universities of Europe, devoting himself particularly to theology and philosophy, and early gained a reputation for ability, marred however by a quarrelsome disposition. He led an unsteady life, chiefly for some time at Frankfort-on-the-Main and other places, but incurring generally the displeasure of his congregations by the coarse personalities of his sermons, and was successively expelled from Freiburg, Tübingen, Würzburg and Heidelberg, and became one of the most virulent opponents of the Reformation. Some of his writings against the Reformation were burned by order of the Diet of Worms; and he was compelled to flee to Switzerland, whence he was in time likewise expelled. The latter part of his history is not known. In 1506 he had been crowned as poet laureate by the Emperor Maximilian; and his 'Narrenbeschworung' (1512), of which his 'Der Schelmzenzunft' (1516) may be regarded as a continuation, is one of the most remarkable imitations of Sebastian Brant's celebrated satirical poem entitled 'Narrenschiff.' He wrote 'Chortulidium logice,' etc. (1507), and other Latin works; prepared a German version of Virgil and other translations; and was also regarded as a translator of 'Eulenspiegel.' But he is chiefly remembered by his writings against Luther and the Reformation. His most celebrated satirical work is entitled 'Von dem grossen Lutherischen Narren' (1522; new ed., 1848); Consult Goedeke, 'Murners Narreneschwörung' (1879); Kellwald, 'Murner und die Kirche des Mittelalters' (1890); Lappenberg, 'Murners Eulenspiegel' (1854); Ries, W., 'Quellenstudien zu Murners satirisch-didaktischen Dichtungen' (Berlin 1890); Schatz, H., 'Stimmungen und Effekte in Murners Dichtungen' (Kiel 1909).

MUROM, moo'röm, Russia, town in the government of Vladimir, located on the Oka and Kovrov-Murom Railway. It has a cathedral, theatre, city bank, high school, etc. Among its industries are large linen weaving factories and trade in grain. This was a very important trading town in the 10th century. Its population is about 18,016.

MURPHEY, Archibald De Bow, American jurist: b. Caswell County, N. C., 1777; d. Hillsboro, N. C., 3 Feb. 1832. He was graduated from the University of North Carolina in 1799 and was for the three succeeding years professor of ancient languages there. He studied law and was admitted to the bar in 1802 and established a large practice. He was a member of the State senate in 1812—18 and proved himself an able legislator, advocating internal improvements and working earnestly to enlarge and improve the educational system of the State. In 1818 he was a judge of the Superior Court and in 1819—20 was a justice of the Supreme Court of North Carolina. He published 'Memoir of Improvements Contemplated and the Resources and Finances of the State' (1819); 'Reports of Cases in the Supreme Court of North Carolina in 1804—13 and 1818—19' (1821—26), etc.

MURPHY, Arthur, British dramatist: b. Cloonquin, near Elphin, County Roscommon, Ireland, 27 Dec. 1727; d. 18 June 1805. He was educated at the Roman Catholic College of
Saint Omer, France, and was subsequently employed in a London banking house. His first daughter, born in 1738, was entitled 'The Apprentice.' In 1758 appeared 'The Upholsterer,' a farce directed against politicians, which proved 'very successful, followed by 'The Orphan of China'; 'The Way to Keep Him'; 'A Man in the Wrong'; 'The Citizen'; 'The Old Maid'; 'Three Weeks after Marriage'; 'Zenobia'; 'The Grecian Daughter,' etc. At various times in his life he engaged in political controversies, and edited journals opposing Mr. Fox, the first Lord Holland and Whigs' North Briton. He also edited Dr. Thomas's Fielding, wrote an essay on Dr. Johnson, translated Tacitus, and wrote a 'Life' of Garrick. His plays are his best performances, and some of them, including 'The Way to Keep Him' and 'Three Weeks after Marriage,' long kept the stage.

MURPHY, Charles Francis, American politician: b. New York, 20 June 1858. He received a public school education, and early in life began to take an interest in politics. As organizer and member of the Sylvian Club and through his fame as an athlete he gained a wide personal acquaintance. He opened a series of saloons which he held to be practically poor men's clubs. He showed decided talents as a political organizer and in 1891 became the Tammany leader of his assembly district. In 1897-1900 he was a commissioner of docks and ferries in New York, served for a time as chairman of Tammany Hall and on the retirement of Richard Croker in 1902 succeeded him as chief. In 1903 and 1905 he led his party to victory in the primary campaigns, which elected George B. McClellan as mayor. In 1904 Murphy opposed the nomination of Alton B. Parker for the Presidency and in 1906 supported William R. Hearst for governor, the latter's defeat being regarded as a severe defeat for Murphy. In 1909 the Tammany Hall nominee for mayor, W. J. Gaynor, was the only successful candidate on the Democratic ticket, the Fusionists having captured the remaining offices. Many thought that this reverse would complete Murphy's retirement, but to the despair of the political prophets he continued as chief. In 1910 the election of John A. Dix to the governorship was supposed to be due to Murphy's influence with the up-State Democrats and that as a result his power had become paramount in the Democratic party throughout the State. The succeeding years brought sharp criticism to Tammany and its leader because of several scandals regarding highway and canal contracts. Boss rule now became a State issue and his opponents held up Murphy as an example of everything vicious in the boss system. This, however, came with a bad grace from Republicans, themselves the most notorious upholders of the system. In 1912 Murphy supported Wilcox after the nomination of the latter although he favored Harmon and Clark in the early stages of the convention. He was a presidential elector the same year. In State politics it appears that Murphy took little part in the annexation of the territories after election and Tammany was by many believed to have been the real factor in the imprisonment and removal of Sulzer in 1913. The mayorality campaign of 1913, in which Edward E. McCall was the Tammany nominee, was exceedingly bitter, and Murphy was violently assailed by the Fusionists. He remained unimpeached in 1917. The Tammany candidate for mayor, Judge Hyland, was elected by a great majority and Murphy's leadership continued unimpaired. Mr. Murphy's financial connections are large, but he refuses to have his charitable activities advertised, and this side of his character is known to comparatively few persons.

MURPHY, Francis, American temperance evangelist: b. Wexford, Ireland, 24 April 1836; d. Los Angeles, 30 June 1907. During the Civil War he served in the Union army in 1870. In Portland, Me., he began the organization of temperance reform clubs, which were established in all parts of the State, and of which he was the first president. He made his headquarters in Pittsburgh, Pa., where, after his first address, in 1876, the pledge was signed by 45,000 people; and before long the signatures secured throughout the United States in response to his endeavors numbered as many as 10,000,000. His labors were also carried into England with noteworthy results. During the Spanish-American War he served as chaplain in the United States army.

MURPHY, Franklin, American manufacturer and politician: b. Jersey City, N. J., 3 Jan. 1846. In 1856 the family removed to Newark where his father was born and which had been the home of his ancestors from its original settlement in 1650. He enlisted in the Federal army in 1862 at the age of 16 as a member of Company A, 13th New Jersey Volunteers. This regiment was assigned to the 12th, afterward the 20th, corps, which constituted a part of the Army of the Potomac and which was afterward transferred to the west, becoming part of Sherman's army in his march to Atlanta and the sea. At the close of the war he established at Newark a varnish business which has since become well known. He began his political career in the early '80's, occupying various minor city and State offices until 1901, when he was elected governor of New Jersey for three years. His term as governor was noted for the passage of the first State primary law (not the open primary as invented later), improvement in the child labor laws and general improvement in labor legislation, a tenement-house law and a law requiring banks to pay interest on deposits of State moneys. He was chairman of the Republican State Committee for 20 years, beginning with 1892, has been a delegate to many Republican national conventions, has been member of the National Committee since 1900. He was commissioner to Paris Exposition of 1900. Mr. Murphy is a member of the Society of the Cincinnati, of the Colonial Wars and the Sons of the American Revolution, of which latter he was president-general. He was a member of the board of managers of the National Soldiers' Home, and at one time president of the New York Firemen's Relief. In 1906 he received 158 votes for Vice-President. He has been a member of the Essex County, N. J., Park Commission for 20 years, and continues actively interested in the affairs of his home city of Newark and its State.
MURPHY, Henry Cruae, American politician and historian: b. Brooklyn, N. Y., 5 July 1810; d. there, 1 Dec. 1882. He was graduated at Columbia in 1830, studied law, was admitted to the bar in Brooklyn, became city attorney there and in 1842 was elected mayor. In 1843 he was elected to Congress; was a delegate to the New York Constitutional Convention in 1846, and re-entered Congress. In 1850 he was a candidate for the Democratic nomination for President. From 1857 to 1861 he served as United States Minister to Holland. He became well known as a journalist, being for some time editor of the Brooklyn Eagle; and through the publication of his studies in the colonial history of New York valuable documents were brought to light. He translated from the Dutch De Vries' 'Voyages from Holland to America, 1632 to 1644' (1853), and his other publications include 'Henry Hudson in Holland: Origin and Objects of the Voyage which Led to the Discovery of the Hudson River' (1859); 'Jacob Steendam, Noch Vasater' (1861); 'The Anthology of the New Netherland' (1865), and 'The Voyage of Vertrazano' (1875).

MURPHY, John Benjamin, American surgeon: b. Appleton, Wis., 21 Dec. 1857; d. 11 Aug. 1916. He graduated (1879) at Rush Medical College, Chicago, and practised medicine (1879-82) at Chicago, then studied (1882-84) in Germany, to resume his practice in Chicago. He was head of the department of surgery and clinical surgery at Northwestern University Medical College and chief surgeon to Mercy Hospital, but (1908) joined the United States medical corps as 1st lieutenant. He invented a Whitman button, which simplifies the technique in abdominal operations and reduces the fatalities. He has written 'Gunshot Wounds of the Abdomen'; 'Actinomycosis Hominis,' he was the first in America to recognize the disease; 'Experimonal and Clinical Research,' which illustrates the use of his anastomosis button; 'Surgery of the Stomach.' For his great services he was decorated with many honors, such as the D.M. from the Catholic University of America, Washington; M.Sc., University of Sheffield, England (1908), etc. He edited 'General Surgery' for the 'Practical Medicine Series' from 1901.

MURPHY, John Francis, American painter: b. Oswego, N. Y., 11 Dec. 1853. He came to New York in 1825 and educated himself in art, giving especial attention to landscape painting. His first picture to appear in the National Academy of Design was exhibited in 1876, and since 1887 he has been a National Academician. His painting 'Tints of a Vanished Past' gained the Haligaran prize (1885). In 1887 he was awarded the Webb prize by the Society of American Artists, of which he is a member. He also received a gold medal at Charleston (1902), and in 1910 the Inness medal.

MURPHYSBORO, Ill., city, county-seat of Jackson County, on the Mobile and Ohio and the Illinois Central railroads, about 140 miles south of Springfield. It is situated in an agricultural section, and nearby are coal-hills and building stone. The chief industrial establishments are foundries, machine-shops, flour and lumber mills and brick and tile yards. There is a large trade in farm and dairy products, coal and lumber. Murphysboro has a commission form of government. Pop. 8,000.

MURRAI, loosely, any widely prevailing and contagious disease among domestic animals. The term is applied to various specific disorders in different localities, but more particularly to the epizootic diseases, especially those of cattle. Still more strictly it is limited to the plague commonly known as the foot-and-mouth disease (aphthous fever), which attacks cattle and other animals, causing loss of appetite, febrile disturbance, lameness, vesicular eruptions on the feet and in the mouth, etc., with frequent complications. See Anthrax; Cattle-Plague; Rinderpest.

MURAL, one of the snake-headed, or walking, fishes of India (Ophiocelphalus marulius), regarded as one of the best fresh-water table-fishes of the East. It abounds in rivers and inland waters, especially the "tanks" so numerous in Madras, and sometimes attains a weight of 20 pounds, although usually far smaller than that. It is caught with live bait, not rising readily to a fly, and affords excellent sport to skilled anglers.

MURRAY, mər'ə, Alexander, American naval officer: b. Chestertown, Md., 1765; d. Philadelphia, 6 Oct. 1821. In 1776 he received a commission in the then half-organized navy, and while waiting for sea duty entered the army, serving (1776-77) as lieutenant and captain in the 1st Maryland regiment, and participating in the actions and operations near New York. Toward the end of 1777 he was given command of the Revenge, with letters of marque; was captured by the British, exchanged, served with distinction on the Trumbull; was again captured and exchanged; then took command of a privateer, and served later on the Alliance. In 1798, on the reorganization of the navy, he was appointed captain and during the difficulties with France commanded the Monticuma. Transferred to the Constellation, he served in the Mediterranean War, and was in Tripoli, in which he initiated actual hostilities by attacking a flotilla of the enemy. After that war he was mainly engaged in shore duty at Philadelphia until his death.

MURRAY, George Gilbert Aimé, British classical scholar: b. Sydney, New South Wales, 2 Jan. 1866. He was taken to England in 1877 and educated at Merchant Taylors' School, London, then studied at Saint John's College, Oxford. He was made (1888) a Fellow of New College, Oxford, and was professor of Greek at Glasgow University 1899-1905. Since 1905 he has been regius professor of Greek at Oxford University. Numerous degrees have been conferred on him, as LL.D., Glasgow, D. Litt., Birmingham, D. Litt., Oxford, F.R.S., etc. In 1914 he was appointed trustee of the British Museum. He has written 'History of Ancient Greek Literature' (1897); 'The Foreign Policy of Sir Edward Grey' (1915); 'Rise of the Greek Epic' (1907-11); 'Four Stages of Greek Religion' (1913); 'The Rhesus of Euripides' (1913); 'The Alcestis of Euripides' (1914). He was also author of 'Liberalism and the Empire' (1900). His plays 'Carlyon
Sahib (1899) and Andromache (1900) have been successfully performed on the stage. Of his verse translations for which he is noted are 'Hippolytus,' 'Barabbas,' 'Trojan Women,' 'Electra,' 'Medea.' For 'Iphigenia in Tauris,' which appeared at the Court Theatre, London, the highest comment of the critics was worthily gained. 'Trojan Women' and 'Iphigenia' have been played on the boards of American colleges and also at fresco.

MURRAY, George Henry, Canadian politician: b. Grand Narrows, Nova Scotia, 7 June 1861. He was educated in Grand Narrows and in Boston University and was admitted to the bar in 1883. He was appointed to the legislature of Nova Scotia in 1889, but resigned in 1891, and in the same year became a member of the provincial cabinet without portfolio, under the Hon. W. S. Fielding, and in 1896 became premier and provincial secretary of Nova Scotia under a Liberal administration.

MURRAY, Grenville, ("Eustace Clare") English journalist: b. 1824; d. Passy, France, 20 Dec. 1881. He was a natural son of Richard Grenville, second Duke of Buckingham. He was in the diplomatic service from 1851 to 1868, but was guilty of irregular practices, and was generally in discord with his superiors or with British residents. From 1869 he lived in France, where he was Paris correspondent of the Pall Mall Gazette and the Daily News, and an early contributor to the Cornhill. He was one of the ablest journalists of his time and the initiator of "yellow" methods in English newspapers, being horsewhipped by Lord Carrington in 1869 for a libel that appeared in The Queen's Messenger, a paper he conducted. He lived in Paris as the Comte de Retel d'Aragon, using the title of his wife, a Spanish woman. A voluminous writer, among his works were 'The Roving Englishman,' chapters of travel (1854); 'Embassies and Foreign Consulates'; 'The Member for Paris' (1871); 'Young Brown' (1874); 'Turkey' (1877); 'The Russians of To-Day' (1878); 'Under the Lens: Social Photographs' (1885).

MURRAY, James, Scottish soldier: b. about 1725; d. 1794. He was a son of the fourth Lord Elgin, and about 1740 entered the army; came with his regiment to America in 1757, at the siege of Louisburg (1758) commanded a brigade; and in the battle on the Heights of Abraham (13 Sept. 1759) led the left wing of the army under Wolfe. In 1760 he held Quebec against superior numbers of the French, in the same year served with Amherst in the reduction of Montreal and was made governor of Quebec. From 1763 to 1766 he was governor of Canada; in 1774 became governor of Minorca; was compelled to surrender Fort Saint Philip to the French, in 1782, after a heavy siege, and upon returning to England was court-martialed and acquitted. In 1783 he was made a full general in the British army. Consult Parkman, 'Montcalm and Wolfe' (1884, 1898).

MURRAY, James Augustus Henry, Scottish philologist and lexicographer: b. Denholm, near Hawick, Roxburghshire, 1837; d. 26 July 1915. He was graduated B.A. of London University, from 1855 till 1858 was an assistant master in Hawick Grammar School, becoming in the latter year master of Hawick Academy, for a few years was foreign correspondent to the Oriental Bank in London, and from 1870 till his removal to Oxford in 1885 a master at Mill Hill School. Meantime he had become well known as a philologist. He was president of the Philological Society in 1878-80 and 1882-84. On the death of Dr. Furnivall, Dr. Murray became in 1879 general editor of the 'New English Dictionary on Historical Principles,' the great work issued under the auspices of the Philological Society from the Clarendon Press, Oxford. He was assisted by a staff of from 20 to 30 editors, and thousands of volunteer assistants, who read every book published before 1500 A.D. and the principal books since that date, thus obtaining many millions of illustrative references for use in the work. He had almost completed the tenth and last volume, T to Z, when he died. His aims in connection with this vast undertaking are embodied in an address to the Philological Society in 1879. Other works by him are 'A Week among the Antiquities of Orkney' (1861); 'Dialects of the Southern Counties of Scotland' (1875); 'Synopsis of Paley's Horae Paulinae' (1872); 'The Romance and Prophecies of Thomas of Ercildoune' (1873); the article 'English Language' in the 'Encyclopaedia Britannica' (9th ed.), and many papers on the archæology, history, geology and language of the border counties of Scotland. In 1884 he was awarded a civil list pension of £270 per annum. In 1900 he was appointed Romanes lecturer at Oxford and he was knighted in 1908.

MURRAY, or MORAY, James Stuart, Earl of. See STUART, JAMES.

MURRAY, Sir James Wolfe, British lieutenant-general: b. 13 March 1753. He was educated at Harrow, then entered military service at Woolwich and joined (1782) the Royal Artillery. He became colonel in 1789, served (1805) in the Ashanti campaign and in Natal (1809-1900), to become 1903-04 quartermaster-general in India. He was made general of the Ordnance from 1904-07, commanded the 9th division in India from 1907-11, then commanded in South Africa in 1914. He was created K.C.B. in 1900. From 1914-15 he was 1st Military Member of the Army Council.

MURRAY, John, American clergyman, founder of American Universalism: b. Alton, Hampshire, England, 10 Dec. 1741; d. Boston, Mass., 3 Sept. 1815. He was brought up in Ireland, where he joined the Methodist congregation and did some preaching, but in 1760 went to England, came under the influence of James Relig and was excommunicated by Whitefield. He came to America in 1770; preached in Newport, Boston and Portsmouth his peculiar doctrines, which agree with modern Universalism only in the belief of universal salvation, but otherwise held to the dogma of the Trinity, of personal devil and of the incarnation; and at the outbreak of the Revolution was chaplain of a Rhode Island brigade for a short time, during which his resignation was demanded by the orthodox chaplains in the army. He formed a Universalist church in Gloucester, and in 1783 recovered property be-
MURRAY

loving to his parishioners which had been seized by the parish authorities, who acted on the ground that the Universalists had no corporate existence; the success of this suit was a distinct advance in congregational freedom in New England. At his death he was in charge of the Unitarian Society of Boston. He wrote ‘Letters and Sketches’ (1812) and an ‘Autobiography,’ continued and edited by his wife (1816).

MURRAY, John, English publisher: b. London, 27 Nov. 1778; d. there, 27 June 1843. John Murray, the second was the son of John MacMurray (1745-93), a descendant of the Murays of Atholl, who commenced business as a publisher in London in 1768, dropping the prexif to his name. He began business in 1799, early attained success and became the friend of, as well as publisher for, some of the chief writers of the day, including Byron, Moore, Rogers, Campbell, Crabbe, Washington Irving, George Borrow and Benjamin Disraeli. He started the Quarterly Review in February 1809 in opposition to the Whig Edinburgh Review, of which Coleridge and Lockhart were editors, and Scott and Southey contributors. By 1817 the Quarterly was a great success. In 1824 Murray was involved in the controversy with Moore regarding the destruction of Byron’s ‘Don Juan’; and in 1826 undertook the publication of the Representative, a daily newspaper, which, after running six months was discontinued at a loss of $130,000. Consult Moore, ‘Life of Byron’ (1830), and Smiles, ‘A Publisher and his Friends’ (1891). The third John Murray (1808-92) was the project of the famous series of guidebooks that bears the firm’s name. He was present at the Theatrical Fund banquet at Edinburgh in 1827 when Scott avowed himself the author of Waverley. The fourth John Murray (b. 1851) is the present head of the firm.

MURRAY, Sir John, Canadian scientist: b. Coburg, Ontario, 3 March 1841; d. Kirkliston, near Edinburgh, 31 March 1914. He was educated at Edinburgh University. In 1867 he accompanied for biological purposes an expedition to Spitsbergen and Greenland, and from 1871 to 1876 he served under Sir Wyville Thomson as one of the scientific staff of the Challenger expedition. From 1876 till 1882 he was chief assistant editor of the scientific reports published in connection with that voyage, and in the latter year became editor-in-chief, liberally supporting the work out of his own means. He defrayed the expenses and accompanied the Michael Sars expedition to the north Atlantic (1910), the literary fruits of which were ‘The Depths of the Ocean’ (1912) and ‘The Ocean: a General Account of the Science of the Sea’ (1913). He was killed in an automobile accident. He was knighted in 1898. Besides editing the Challenger reports he wrote a number of books on geographical, oceanographical and biological subjects, and at his own expense established oceanographical laboratories in Scotland.

MURRAY, John Clark, Canadian educator: b. Paisley, Scotland, 19 March 1836. He was educated in the universities of Edinburgh and Glasgow. He accepted the chair of moral philosophy in Queen’s University, Kingston, Canada. Since 1872 he has been professor of moral philosophy in McGill University, Montreal. He has published ‘Outlines of Sir W. Hamilton’s Philosophy’ (1870); ‘The Ballads and Songs of Scotland’ (1874); ‘A Handbook of Psychology’ (1885); ‘An Introduction to Ethics’ (1901), etc.

MURRAY, John O’Kane, American historian: b. Glenriff, Ireland, 1847; d. Chicago, Ill., 30 July 1885. He removed to the United States where he became a physician and author of some repute. His most important work was a ‘Popular History of the Catholic Church in America’ (1876), and among his other books are ‘The Catholic Heroes and Heroines of America’ (1878); ‘Lessons in English Literature’ (1883), etc.

MURRAY, Lindley, American grammarian, son of M. L. Murray (q.v.): b. Swatara, Lancaster County, Pa., 22 April 1745; d. Holgate, near York, England, 16 Feb. 1826. He studied law (1761-65) and practised as a barrister; but after the Revolution quitted the bar for a commercial speculations, and having realized a fortune went, in 1784, to England for reasons of health and settled at Holgate, near York. ‘His English Grammar’ (1795) met with a truly enormous success, being almost universally introduced as a textbook in England and the United States, and for years was regarded as the standard authority. It passed through nearly 50 editions in its original form. A corrected edition by the author was published in 1816, and his abridgment (1818) of this went through 150 editions, each of 10,000 copies. His work was far from accurate, however, and was soon superseded; but it freed a difficult subject from chaos. He wrote ‘English Exercises,’ the ‘Key’ and ‘English Reader’ (1799), and a ‘Spelling Book’ (1804) which went through 50 editions. He was also a botanist and his gardens were renowned. In 1787 he published ‘Power of Religion on the Mind.’ Consult Egle, ‘Life’ (New York 1885), and an autobiography edited and continued by Frank (1826).

MURRAY, Mary Lindley, American heroine: b. Pennsylvania; d. New York, 25 Dec. 1782 (O. S.). She is known through an incident of the Revolution. On 15 Sept. 1776 the British line of march passed her residence, ‘The Grange,’ a small country-seat at Murray Hill, New York. Putnam, having evacuated New York, was at the same time marching along the Bloomingdale road near the North River, intending to join Washington at Harlem Heights. Howe thought by marching across the island to cut off the American retreat. He was, however, invited, with his officers, to luncheon at ‘The Grange’ by Mrs. Murray, accepted and remained more than two hours, during which time Putnam entered a butter tablet in commemoration was placed in the park enclosure on Park avenue below 37th street on Evacuation day (25 Nov.) 1903.

MURRAY, William, Earl of Mansfield. See Mansfield, William Murray, Earl of.

MURRAY, William Vans, American diplomat: b. Maryland, about 1762; d. Cambridge, Md., 11 Dec. 1803. He received a classical education and after peace was declared in 1783 he went to London and studied law. He returned to the United States in 1785 and estab-
lished a law practice in Maryland. In 1791–97 he served in Congress where he gained a reputation as a learned and skillful legislator, and in 1797 was appointed by Washington Minister to the Netherlands. He was envoy to France in 1800 and was chiefly instrumental in concluding the treaty between the United States and that country. He then returned to the Ministry at The Hague and remained there until 1801, when he retired from public life. He published 'The Constitutions and Laws of the United States.'

MURRAY, the largest river of Australia, rising in the Australian Alps, its sources being partly in New South Wales, partly in Victoria. It flows for a long distance westward, forming the boundary between these two colonies, then passes into South Australia, where it takes a southern direction and falls into the Indian Ocean at Encounter Bay, 39 miles southeast of Adelaide, after passing through a large shallow sheet of water called Lake Alexandrina. Its total length is about 1,300 miles. Its chief affluents are the Murrumbidgee and Darling. It is navigable by light draft steamers in the wet season for the greater part of its course to Albany, 190 miles northeast of Melbourne.

MURRAY BAY, or MALBAIE, Canada, the county town of Charlevoix County, Quebec, on a bay of the Murray estuary, near the north bank of the Saint Lawrence River, 90 miles east of Quebec. It has lumber industries and its dependent suburbs, Pointe à Pic and Cap à l'Aigle, at each end of the bay, are popular summer resorts, the surrounding country being very attractive and affording angling, rowing, bathing and other facilities. Steamboats connect with Quebec. During the Revolutionary War Murray Bay was a station for United States prisoners of war. Pop. about 1,500.

MURRAY'S TRANSLATIONS OF EURIPIDES. George Gilbert Murray, since 1899 regius professor of Greek at Oxford University, was born in Sydney, N. S. W., in 1866, went to England in 1877 and became professor of Greek at Glasgow in 1889. Besides his work as a translator, he has edited a critical edition of Euripides, and is the author of 'A History of Greek Literature,' 'Four Stages of Greek Religion,' 'Euripides and His Age' and many essays on ancient and modern subjects. His translations of Euripides include the 'Hippolytus,' the 'Bacchae,' the 'Trojan Women,' the 'Elektra,' the 'Medea,' the 'Iphigenia in Tauris,' the 'Rhesus' and the 'Alcestis.' Like Browning's version of the 'Alcestis' in Balaustion's Adventure (1871), Way's translation of Euripides entire (1894–98), revised and republished in the 'Loeb Classical Library' (1912), and Verrall's editions and essays in the 'rehabilitation' of Euripides, begun in 1881 and continued for 30 years, Murray's work in Euripides is at the same time a manifestation of revived interest in the ancient dramatist and a means of his reinstatement as a great artist. His translations are distinguished (1) by the rendering of the iambic trimeter of the episodes into English rhymed heroics instead of the traditional blank verse; (2) by variety and grace of metre in the choral parts; (3) by the use of two directions which contribute remarkably to the reader's imagination; (4) by a poetic fancy which so suffuses the whole with color and spirit as to give it a creative quality rare in translation, and (5) by flowing and harmonious language of great charm. The employment of rhymed heroics instead of blank verse, which is the natural vehicle of drama in English as the iambic trimeter is of drama in Greek, has been accused as interfering with spontaneity and accuracy, and it may be said also that the use of rhyme in both episode and chorus lessens the distinctness of separation between the two in the original; but the loss in these respects is not great, and is more than compensated by the richness of fancy resulting from the translator's ingenious conquests of the difficulties presented by rhyme. Murray is at once poet, scholar and dramatist, and his translation is in marked contrast with that of uninspired scholarship alone.

GRANT SHOREMAN.

MURRE, mér, or MURRELET, an auk (q.v.) of the genera Uria sephus, and related groups; a guillemot. They are small, black-and-white, web-footed, diving, fish-eating birds, which abound on all rocky northern coasts, breeding on sea-fronting ledges. Each pair produces a single, large, pyriform, variously colored egg, which is not placed in a nest but incubated in turn by the parents, who lift it from the ground upon their webbed toes and warm it between their downy legs. Several diminutive and handsome ornamented species of the coasts of the north Pacific are called murrelets. Consult Baird, Brewer and Ridgway, 'North American Water-Birds' (1884); and the writings on Arctic ornithology of Fiedler, Nelson, Turner, Murdock, etc.

MURRUMBIDGEE, mūr-ūm-bi:dʒi, Austral, a large river of New South Wales, rising in the Gourouck Range above Numeralla, about 40 miles from the Pacific Ocean. It flows at first northward, but the greater part of its course is westerly; and after receiving the Lachlan from the north, near Nap Nap, it turns toward the south to join the Murray below Balranald. It is navigable only in the wet season for 500 miles by light-draft steamers. Length about 1,300 miles.

MURSHIDABAD, moor-shē-dā-bād', India, the administrative town of a district of Bengal, 116 miles north of Calcutta, on the Bhagirathi, a branch of the Ganges. It is a straggling collection chiefly of mud houses occupying an extensive area, but has several substantial brick buildings, chief of which are the beautiful Nawab's palace dating from 1837, the imambagh and a Moslem mosque. Two miles south of the city is Motijheel or Pearl Lake and the site of the historic palace of Suraj-ud-Dowlah. On the opposite bank of the river connected by a ferry is Azimagan containing the old cemetery of the Nawabs, a mausoleum, mosque, etc. The city is noted for its ivory carving, its embroidery in gold and silver lace, silk weaving, and
the manufacture of hookah pipes and musical instruments. It is still a busy centre of trade but less so than during the 18th century when it was the capital of Bengal and a very populous city, the rise of Calcutta causing its decline. Pop. about 16,000; with Azimganj 30,000.

**MUSA, Ibn Nusair, moo'sa 'ib'n noo-sir',** Arabian general: b. 640 A.D.; d. 716 or 717. He became (704) governor of North Africa which he held with integrity as far as the ocean between 706-709. He sent (711) Tarik to Spain but the expedition was so successful he became jealous of his assistant officers and hindered the expedition while he started himself (712) with an army which carried everything before it. He was recalled and had a most brilliant triumphal procession through Africa to Damascus, where the caliph, Suleiman, accused him of great embezzlement, deprived him of command, and he was either condemned to pay a heavy money indemnity, or, as other writers say, was put to death. Consult Burke, 'History of Spain' (Vol. I, 1895); 'Cambridge Medieval History' (Vol. II, New York 1913).

**MUSACEAE, the banana family, a group in the Order Scitamineae, comprising the largest of herbaceous plants, generally destitute of or modified, dilated, or reduced to mere stems, yet resembling trees in appearance, and sometimes rivaling palms in stateliness, the long sheathing bases of the leafstalks combining to form a false stem. The blade of the leaf has many fine parallel veins proceeding from the mid-rib to the margin. The flowers are congregated on spadices, which are protected by spathes. The fruit is either a three-valved capsule or fleshy. The species are not numerous; they are natives of warm climates, in which they are widely distributed, and of great value to the inhabitants of tropical countries; the fruit of some, particularly of the genus *Musa*, being much used for food, while the fibres of the leaves are employed for cordage and for textile purposes. See BANANA; FIBRE.

**MUSÉUS, mū'sē'os, in Greek mythology, a poet, seer and priest, said to have been the son of Eumolpus and Selene, or, according to others, the son and pupil of Orpheus. He was the reputed author of a number of poems, oracles, purificatory verses, hymns, etc., of which we possess but a few fragments, and those of doubtful authenticity. A later Muséus, who flourished about the end of the 5th century A.D., was the author of a beautiful little poem in Greek, entitled 'Hero and Leander.' See HERO; HERO AND LEANDER.

**MUSCARDINE. The common European dogfish, *C. (C.) canis*.

**MUSCARINE, a coal tar color introduced by Durand and Husenin, and having the empirical formula CnH4nNO6Cl. It is a brownish violet powder, slightly soluble in cold water, but dissolving readily in hot water with the formation of a violet-blue solution. Powdered zinc decolorizes its aqeous solution, but the color returns on exposure to air. Muscarine produces a blue color upon cotton that has been mordanted with tannin and tartar emetic.

**MUSCARINE, an alkaloid having the chemical formula C14H24NO5, and occurring in certain mushrooms, notably in the 'fly agaric' (*Agricultus muscarum*). It is also formed in the putrefactive decay of flesh. It may be obtained in the form of deliquescent crystals, which are without taste, and insoluble in ether, though readily soluble in water and in alcohol. Solutions of the alkaloid are strongly alkaline, and precipitate ferric and cupric salts in the form of hydrates. Muscarine is exceedingly poisonous. It contracts the pupil of the eye, slows the pulse by prolonging the diastolic state of the heart, and induces salivation, vomiting, intestinal spasms and general muscular weakness, followed by death. Atropine acts as an antidote to muscarine by producing antagonistic physiological processes. The 'fly agaric' takes its name from the fact that flies that alight upon it are killed, either by the muscarine or by another alkaloid, neurine, which the fungus also contains.

**MUSCAT, mūs-kāt', MUSKAT, or MAS-KAT, Arabia, the capital of Oman, on the Gulf of Oman, commanding the entrance to the Persian Gulf. It is a fortified seaport of considerable commercial and strategical importance; the seat of the Imam or Sultan of Muscat; by arrangement it has a British political resident and since 1898 is used as a coaling station by France. Its appearance, by means which corresponds with its wealth and importance. Large buildings are few, and the sultan's palace (a plain edifice), the governor's house, and a few minarets, alone rise above the mass of flat-roofed huts or houses. The streets are extremely narrow and its situation at the foot of high cliffs, and nearly surrounded by bare rocks, renders it one of the hottest places in the world. A sufficient supply of water is obtained from wells about 40 feet deep. About three miles distant is the town of Matrah with docks for building and repairing shipping. As it stands in an open plain, exposed to the sea-breeze, it is cooler than Muscat, so that many of the wealthier merchants of the latter place have their dwellings at Matrah, and spend only the hours of business in the city. The combined population of Muscat, Matrah and intervening villages has been variously estimated at 25,000 and at 60,000.

Muscat was occupied by the Portuguese under Albuquerque in 1507. In 1651 it fell again under a Mohammedan ruler, and in the middle of the 18th century it attained, under a ruler who bore the religious title of Imam, considerable importance as a seaport. In 1808 Seid Said succeeded to the sovereignty, having assassinated his cousin, Bedr. His sovereignty embraced also a stretch on the east coast of Africa, extending from the neighborhood of Cape Delgado northward as far as the equator. In like manner a large portion of the coast of the Persian Gulf acknowledged his sway, so that, including Oman and the African islands Zanzibar, Monba or Mafia, and Pemba, the coast ruled by him, for the most part only commercially, could not have had an extent of less than 3,000 miles. In 1840 Seid Said removed the court and seat of government from Muscat to Zanzibar, and in 1856 died on the return voyage from the former place. His son Mejid succeeded him as Sultan of Zanzibar and ruler of the African territory, and another son acquired Muscat. Seivdji Turki became ruler of Muscat in 1871, and on his death in 1888 a son succeeded him.
MUSCATEL, a name given to certain sweet and strong French and Italian wines, white or red. The white Riverits and red Bagnoy wines from Roussillon, the Carigiano and Lacryma Christi of Naples, and the Lunel from the Pyrenees are among the most famous.

MUSCATINE, mūs-kɑː-tɛn, Iowa, city, county-seat of Muscatine County, on the Mississippi River, and on the Iowa Central, the Chicago, Rock Island and Pacific and the Chicago, Milwaukee and Saint Paul railroads, about 30 miles below Davenport and 140 miles east by south of Des Moines. It is at a bend in the river where the waters change from a westward to a southward current. As usual along the west bank of the Mississippi, the city is on high bluffs which command an extended view of the river. It was first settled in 1833, and in 1839 was incorporated. It is situated in a fertile agricultural region in which there is considerable wood land. Muscatine Island, just below the city, is noted for its watermelons. The chief industries of the city are connected with the manufacturing of foundry and machine-shop products, oatmeal, flour, pickles, brick, tile, boxes, canneries, buttons, sheetrock, engines, packing cases, wagons, carriages, pottery, rolling-mill products, canned goods, lead works and lumber. It has considerable trade in its manufactured articles, farm and dairy products, hogs, lumber and fruit. Muscantine has good public and parish schools and several private schools. It has the public Musser Library. It has also several charitable institutions. The government is vested in a mayor, who holds office two years, and a council. The school board, police judge, treasurer, assessor and warden are chosen at a popular election by the people. The waterworks are owned and operated by the city. Pop. about 17,074. Consult Richman, I. B., (ed.), ʻHistory of Muscatine Countyʻ (2 vols., Chicago 1911).

MUSCHELKALK, mush'el-kalk, a German name, signifying shell limestone, applied to geological beds of Middle and Lower Sandstone period, occurring in the Alps, in northwestern Germany, Alsace and Lorraine, Swabia, Franconia, Hesse, Thuringia and upper Silesia. The name is due to the many fossil remains of Cephalopods, Encrinutes and Molusca in general found in the limestone mass of these beds. The Muschelkalk is divided into lower, middle and upper. The beds contain valuable minerals such as salt, marl and gypsum.

MUSCIDÆ, mūs'-cidé, family of flies from the Latin musca, a fly. The most familiar examples are the house-fly and the blow-fly. They belong to the order Diptera and their wings face of thorax has a transverse suture and the feet have a pair of adhesive pads. Their presence is almost universal, as they thrive in the cold northern latitudes as well as in tropical climates. The eggs are laid and hatched in filth. The species reaches a large and varied assortment.

MUSCLE-READING, a form of observation whereby one who is specially trained may, by careful inspection of muscular movements, interpret many wishes that are present in others. This is possible because all wishes, to be expressed, primarily involve muscular or glandular activity. Even though the wish, when conscious, is repressed, muscular reactions registering such repressions are often observable and can be detected by a keen and practised observer. Thus a person who is told to think steadily, hearing in mind a certain number, unconsciously says that number over and over to himself, making thereby visible muscular formations of the lips and muscles of the face. These can be seen and read by a skilled person, and thus is explained the common trick of many so-called clairvoyants. This tendency of motor expression of mental images is very pronounced in some people. They involuntarily go toward or away from a hidden object, and a blindfolded person can often find these objects by carefully noting the degree of muscular resistance or acquiescence in their search for such objects. This parlor trick takes much practice, a quick sense and much concentration, but does not involve any "thought-transference," or "mind-reading." Some people become very skillful in this type of observation, and all may acquire a certain amount of skill by careful watching. Much of the so-called intuition of women is in reality muscle-reading. They are on the lookout for certain forms of muscular reaction, and can thus guess at what is going on in the minds of others. Their constant contact with small children, who characteristically show what they are thinking about, through their muscles of expression, is a school of experience for them. Man oozes his secrets at his finger tips. The popular song which says ʻEvery little feeling has a movement of its own‖ contains more truth than fiction. (See EMOTION.) Consult Jastrow, American Journal of Psychology (Vol. IV, p. 308); Preyer, ʻDie Erklärung des Gedankenlebensʻ (1886); and ʻFact and Fancy in Psychologyʻ (1900); Kempf, ʻTriennire or New Functions of the Personalityʻ (1919); Freud, ʻPsychopathology of Everyday Life.‖

MUSCLE-SENSATION, a loose and vague phrase, otherwise muscle-sense, to express the sum of sensations that come from the joints, skin, muscles and tendons in the act of making muscular movements. It is also applied to a generalized dull sensation which results from the stimulation of a muscle, either from electrical discharge or from fatigue following the long-continued stimulation of either a voluntary or involuntary muscle. The perceptions of muscular sense are usually grouped under (1) those of posture, the sensations occurring while standing, sitting or maintaining some unusual position being characteristic and recognizably different for each relative position of limbs; (2) those of the passive movement, in which a limb is moved by another limb; (3) those of the active movement; (4) those of resistance to movement. The case of passive muscular sense is not to be confused with that of the so-called static sense, which is a sensation of change of direction, which one gets while being transported through space, or turned or inverted, and is mediated through the
MUSCLES

The muscle-sense is of much importance in imparting information concerning the relative position of the different members of the body, and its loss in this particular (astereognostia) constitutes a valuable symptom in the diagnosis of certain nerve disorders. The muscle-sense is all-important in maintaining bodily equilibrium. Each joint in the body possesses a varying degree of muscletonic function and equilibrium. Thus the shoulder-joint is considered to be 40 times as delicate in this respect as the joints of the fingers. Angle of bending and speed of movement are both important in the interpretation of these joint-sensations. Muscle-sense in all its bearings has close relations to accuracy and skill in all limb-movements, as seen in musical performances, marksmanship, ball-playing, billiards, golf, etc., in all sports and games requiring delicate muscular adaptations. The muscle-sensations may become a seat of a great deal of autoerotic pleasure, even exclusive of merely genital masturbation, as may be seen in certain forms of dancing. In persons who take an undue interest in athletics there is frequently in addition to the exhibitionistic motive a large factor of gratification of the lector-muscular (q.v.) through merely muscular contractions, the development of muscular strength feeding the unconscious desire for power and superiority in a sphere which frequently excludes real social aims. Consult Henri, "Année Psychologique" (Vol. V, with full bibliography); Baldwin, "Dictionary of Philosophy and Psychology"; Schäfer, "Physiology" (1900); Kempf, "The Autonomic System and the Personality" (New York 1919).

MUSCLES. The organs called muscles are made up of a collection of muscle-cells, which have for their function the accomplishment of bodily movements. These movements may be gross, as in walking, or very minute, such as take place in the contracting movements of the arteries or veins; they may be voluntary brought into action by wishes and called "motor impulses" made possible by the brain structure, or they may be involuntary and brought about by acting through the vegetative nervous system (q.v.). The muscular movements necessary in writing are illustrative of the voluntary type; the heart-beat, of the involuntary variety. In point of evolutionary development the involuntary movements may be said to have preceded the voluntary, and hence in regard to complexity of structure the involuntary muscle-cells are simpler than the muscles that perform voluntary movements, and to these two types of cells students of muscle anatomy have given the names of unstripped or involuntary muscle, and striped or voluntary muscle. The muscular tissue of the heart is of intermediary character. It is a stripped involuntary muscle. Muscle-tissue, like protoplasm, is strongly contractile, but unlike ordinary protoplasm, which can contract in all directions, muscle-substance can contract in only one direction. The simplest type of muscle-substance is seen in many lower animals. In these the muscle-cells are elongate, having pointed ends and with a single elliptical to rod-shaped nucleus, situated about the middle of the fibre. They show a faint longitudinal striation, vary in length from 40 to 500 microns (1-600, 1-50 of an inch) in length, and 3 to 8 microns (1-8000, 1-3000 inch) in diameter. These muscle-cells in man correspond to the unstripped muscle-cells, are bound together in bundles or flattened plates by an inter-cellular substance and are found more particularly in the walls of the intestine, the trachea, bronchi, blood-vessels, bladder, ureter, uterus, in many of the organs of the body, and in glandular structures. They have a rich blood-supply and a nervous network of sensory terminal filaments, as well as fibres from the vegetative (old term was sympathetic) nervous system. The pains of an intestinal colic, of a gall-stone, of childbirth, are all due to forcible contractions of these involuntary muscle-cells in the respective organs. The more prominent muscles of the body, such as those that move the various bones, the muscles proper and such as are eaten as roast beef are of the striped variety. These are a modification of the simple muscle-cells. Many of them originate in the mesoderm, muscle-substance commences to form in the interior of some of the cells; these elongate, many nuclei are formed and the final result is a bundle of much elongated cylindrical cells 12 centimetres (1-5 inches) long and from 10 to 40 microns (1-2500 to 1-250 inch) broad. Each cell is covered by a special sheath, the sarcolemma, and within is made up of very intricate and minutely structured protoplasm, the most striking feature of which is its banded or striated appearance; hence the name striated. Just within the sarcolemma a number of flattened elliptical muscle-nuclei are found. In insects striped muscle-tissue can be studied to best advantage. Occasionally branched forms of striated muscle are found. Blood-vessels are numerous in striped muscle and lymphatics and nerves are also abundant. Special types of nerve-endings and muscle-plates, are characteristic of voluntary muscle. Striped muscle is probably a combination of types of muscle. The sarcoplasmic substance is thought of as of unstripped muscular origin, and it is probably innervated by the vegetative nervous system. This type of innervation is that which keeps its metabolism in order, and also contributes to what is known as the mutability, the emotions act through this part of the muscle probably. The other part of the muscle, called the anisotropic disc, is probably innervated by the sensori-motor system and is that part of the muscle which carries out willed or wished actions.

Heart-muscle differs from ordinary striped muscle by having shorter oblong cells, which are branched. There is no sarcolemma and the cells contain but one or two nuclei, which are situated in the centre of the muscle-substance. Blood-vessels, lymphatics and nerves are plentiful in the heart-muscle.

Groups of these muscle-cells, with connective tissues, tendons and fat, make up the gross muscles of the human body. The voluntary muscles are all attached to bony structures; the involuntary muscles are found in the softer parts. Contraction and expansion are the expressions of their functions, each set of muscles being provided with antagonists, and it is characteristic that in response to pleasure-grinding stimuli movements of expansion result, whereas under painful stimuli contraction is marked. Modern psychological theories have been
founded on this fundamental principle, emotional states being interpreted as being founded on visceral muscular activities. The forms of external stimuli that can cause muscular action are commonly classified as mechanical, chemical, thermal and electrical. Excess of stimulus brings about a condition of fatigue in muscle. This is accompanied by diminished muscular power, by pain or discomfort, by diminished reflex excitability and by vague symptoms in the body indicative of some perversion of metabolism.

Muscles are classified in various ways, according to structure or according to their function, or by their positions and situations in the body. For example, some muscles are attached to bones, which they move after the fashion of levers. Such muscles are said to arise or take origin from definite points of bones and are generally inserted into bones by tendinous prolongation of the muscular substance. The insertion is the most fixed point, and the origin the fixed point of the muscle. The tendons of muscles vary in length and breadth. They represent indistinct bands of fibrous tissue, the fibres of which insensibly merge into and become continuous with their attachments. When the tendinous fibres of muscles become greatly broadened out, so as to form fibrous webs or membranes, which separate or enclose muscles, or which afford extensive surfaces for their attachments, the term aponeuroses is then applied to them. Such aponeurotic expansions are seen in the terminations of the muscles of the abdominal wall, in the scalp and in other situations. The limit or extent of the action of a muscle is determined by the length of its fibres, whilst its degree of force or strength depends on the number of the fibres. Other muscles are not attached to bones as levers, but on the contrary surround and enclose cavities, which they limit or expand as required. Such hollow muscles are exemplified in the heart and uterus, in the muscular fibres of blood-vessels, in the muscles of the digestive tract, in the iris of the eye, etc.

The nature, mode and effects of muscular action may be briefly considered in connection with the present subject. The muscles which have the most active functions are those most abundantly nourished. Every action on the part of a living being results in the production of a certain amount of waste material, evidenced by perceptible differences in the chemical composition of the tissue. And when it is remembered that the nervous and vascular supply of muscle is also concerned in muscular work and waste, the entire question is seen to assume aspects of a very intricate and complicated nature. Increased exercise of muscles—as seen in gymnastic exercises, or in the exercise of certain trades (for example, the arms of the blacksmith and the lower limbs of the ballet-dancer)—demanding increased nutrition, results in the increased growth of the muscle and in the formation of new tissue. This result, it is evident, can take place only when the nutrition of the tissue keeps pace with or slightly outstrips its waste and wear.

The property of contractility distinctive of muscular tissue, and through which its functions are manifested, is generally, though not always or invariably, brought into action through the stimulus of the nervous system, or more widely speaking, through stimuli conveyed to the muscular fibres through the nerves. The subject of the various kinds of muscular actions involves both physiological and mechanical considerations. The voluntary muscles thus constitute moving powers for the bones as levers; and in the living body examples of the three kinds of levers which mechanical science distinguishes are found. In the familiar action of the biceps muscle, which flexes or bends the fore upon the upper arm, is seen an instance of a lever of the third kind, in which the power (represented by the insertion of the muscle on the radius or bone of the fore-arm) is placed between the fulcrum (at the elbow-joint) and the weight (in the hand). The lever of the second order may be illustrated by the raising of the body upon the toes, as in the act of making a step forward in walking. Here the weight (represented by the body pressing on the ankle) is placed between the fulcrum (formed by the fixed toes) and the power represented by the muscles of the calf. The head moving on the spine illustrates a lever of the first order; the fulcrum being represented by the atlas vertebrae, the power by the muscles of the neck, and the muscular action of the skull situated in front of the spine. See Anatomy.

MUSCLES, Diseases of. Very little is known of the diseases of muscles themselves. Muscle-tissue, in common with other types of tissue, undergoes certain forms of degeneration, fatty, mucoid, gelatinous, calcareous, etc., but of the diseases of the muscular tissues themselves there are few well-defined types. The reason for this lack of definite information bearing on diseases of the muscles is largely due to the close relationship that the nervous system bears to the muscular system. This renders it almost impossible to distinguish between a disease of the muscle and a disease of the nerve structures which are distributed to that muscle. Thus, at the present time, it is held that many of the forms of muscular atrophy and some of the forms of muscular dystrophy are forms of the diseases of the nervous mechanism of the muscle rather than disease of the muscle itself. In former times these were classed as diseases of muscle.

Myositis, simple inflammation of the voluntary muscles, is a form of acute or subacute inflammation in the muscle, due probably to some infectious organism. It is characterized by stiffness of the muscles and with swelling in the muscle-substance. It is usually progressive, the muscles of the body becoming stiff, hard and fragile, and undergoing fatty degeneration. Myositis is probably a very rare affection, and it is not yet known whether it is a primary or a secondary condition. Myositis muscular spasms or muscular cramps are in reality localized neuralgias in the muscle, and should be considered as of nervous rather than muscular origin. Lamphago is one of the conspicuous phenomena distinctive of a nervous affection. It is probably located in the sarcoplasm of the muscle, and results from disturbance of the vegetative nervous system control of the muscle. It may be a result of emotional upsets,
MUSCOGEE—MUSCULAR SYSTEM

or follow undue exercise. Myoclonia or Friedrich's disease, and myotonia, or Thomsen's disease, are two forms of disease affecting the muscular system that have certain superficial resemblances to hysterical affections, and although regarded by many as of purely muscular origin, there are many reasons for believing that all these cases are due to a disturbance of certain muscular types. In myotonia the disease usually comes on in childhood; the muscles become stiff, and the children are noted for being clumsy in their movements. The contractions, as in the hand, for instance, commence very slowly and are performed almost automatically, and when the patient desires to loosen his grasp of an object the muscular response is slow, the contraction often persists or the patient may be scarcely able to open his hand. In much the same manner walking is affected; the patient starts with difficulty; one leg seems to be stiff and halts; but after a few moments of limbering up, as it were, the patient may be able to walk more or less briskly. The disease is chronic, and is probably related to a defect in the vegetative reflex arcs, which are mechanisms acting chiefly through the sarcoplasmic elements. It may be emotional but is probably related to faulty muscle metabolism of endocrine bases.

Myoclonia occurs chiefly in patients of bad nervous condition, and consists in tonic contractions of the muscles of the extremities. These contractions somewhat resemble chorea. Associated muscle-groups seem to be involved in myoclonia, whereas in chorea the contractions are extremely irregular. The disease is probably most closely associated with the excretory system of the body and is probably due to some affection of the motor cortex. Treatment is difficult but the psychogenic element may be reached by psychoanalysis.

Myositis ossificans is a very rare chronic affection of muscles, during which the muscles become harder and harder, and finally develop bone-like transformations, so that the patient becomes like the ossified man of the circus. As a matter of fact most of these cases drift into idiocy. Very little is known as to the cause of the disease, and treatment is unavailing. Consult Jelliffe and White, 'Diseases of the Nervous System' (3d ed., 1919).

MUSCOGEE, Okla. See MUSKOGEE.

MUSCOVITE, or COMMON MICA, a native silicate of aluminum, potassium and hydrochloric acid, occurring in crystals that belong to the monoclinic system, though usually hexagonal or trigonal in general form, and distinguished by the facility with which it may be split into thin laminae. Muscovite also occurs in massive forms and in scaly aggregates. It occurs in various colors, and has a lustre that is vitreous or pearly. It is transparent or translucent, with a hardness of from 2 to 2.5, and a specific gravity of from 2.8 to 3. It is a very common mineral and is an essential constituent of granite, gneiss and numerous other rocks. The transparent varieties, when obtainable in considerable size, are used for the manufacture of gas-burners, chimneys, for covering the windows of stoves and the "peep-holes" of furnaces, and for other purposes where transparency must be combined with insusceptibility to external injury and a general power of resisting the prolonged action of heat. Considerable quantities of it are mined in Bengal and in Switzerland, and fine deposits occur in many parts of the United States. Perfectly transparent plates a yard in diameter are sometimes found at Grafton, N. H., and similar specimens also occur in the western part of North Carolina. Pulverized muscovite is employed in the preparation of certain kinds of paint and in the manufacture of insulating material for use about electric machinery. Muscovite is not affected by acids, but decomposes upon being fused with the alkaline carbonates. The name "muscovite" is derived from the older popular name "muscovy-glass," which is supposed to refer to the fact that the Russians used it for window-panes. See MICA.

MUSCOVY DUCK, or MUSK-DUCK.

See DUCK.

MUSCULAR SYSTEM, Development of.

Two main forms of muscle-tissue (see MUSCLES) exist in the human body, the striated muscle-tissue, which makes up the muscles of the bony framework of the body, and which responds to willed or wished impulses passing through the brain structures, and also to vegetative stimuli of the unstriated muscle-tissue, which chiefly responds to automatic stimuli of unconscious nature by means of the autonomic or sympathetic nervous system. Some control of vegetative functions may be exercised by conscious processes. (See NERVOUS SYSTEM.) The heart-muscle is regarded as an intermediate form, resembling striated muscle-tissue, but in its development more nearly allied to the more primitive unstriated muscle-tissue. Non-striated muscle-tissue is formed by a direct transition of certain cells in the middle germinal layers (see EMBRYOLOGY) or mesenchyme. At first these muscle-fibres are irregularly distributed, but later they are collected into small bundles or into layers, and become associated with the individual organs with which they functionate. Striped muscular tissue develops from the same layer, but the details of development, as is the case in the heart, are extremely complicated. The cells at first develop a mesh-like structure or reticulum. This reticulum develops small discs, which later become small columns of muscular tissue. The columns lie at the periphery of the cell, and gradually fill in around the nucleus, which in the heart-muscle lies in the centre of the cell, whereas in the muscles of the skeleton the nucleus is pushed to one side, or disappears, new nuclei appearing just beneath the sarcolemma-sheath. The skeletal muscles develop in regular order from the different segments (somites) of the mesoderm. In the early stages the distribution is very symmetrical, but later it becomes extremely uniform by reason of the irregular welding of different segments of the bony skeleton. There remains, however, a regular association of the muscular myotomes and their embryonic nerve supply, and the homologies of structure may be traced by the nerve-supply. Although the muscles therefore receive shifted from their original position. This is a question of highly technical nature, but has many practical bearings in modern medicine. Thus the great broad muscle of the back, the latissimus dorsi, which arises from the seventh and eighth cervical segments, but later migrates...
and is fastened all the way down the spine as far as the crest of the hip-bone, is supplied by a nerve which also develops from the seventh and eighth cervical nerves. The developmental history of each skeletal muscle can thus be traced by means of its nerve-supply. The whole process is one of extreme intricacy and should be studied in special monographs.

Evolution of Muscular Tissue.—As in the development of the nervous system in man, there has been a gradual evolution of the plan of muscular arrangement, so in the animal series there has been a gradual development of a muscular system from the very simplest types of contractile protoplasm. Even in plants definite movements may occur which may be very slow or very rapid. Yet no muscular tissue proper has ever been found in plants. Many of the lowest plants, the Algae, are motile and are provided with vacuolated cilia, but these minute hairs, although capable of rapid motion, cannot be regarded as muscular organs. In the contracting protoplasm of the lowest animals, the rhizopods, although movements take place, there is no muscle-tissue. Nor is muscle-tissue found in the next higher group, the Infusoria, although very actively moving forms are known, for example the familiar microscopic animal Paramecium. The bell-animalcules, Vorticella, Stentor, etc., have stalks that coil and uncoil with great rapidity, but they contain no muscle-tissue proper. They do, however, contain what are termed myonemes, and spermocytes, which are longitudinal filaments and have as many functionate as muscular organs. In another genus of infusorians (Bursaria) there is a contractile band about the body of the animal. It has been regarded as a true sphincter muscle. It has not the structure of the developed unstriped muscle-cell. In the closely allied sponges (Porifera) certain elongated cells with rod-shaped nuclei are found, and may be considered the ancestral forms of the unstriped muscle-cell, although it is not until the group of the Ctenelerates is reached that true unstriped muscular tissue is present in its more advanced forms. In many of the hydroids a form of external neuromuscular cell is found. This is a type of cell half nerve, half muscle, but not resembling true muscular tissue. In the jelly-fishes of this order both neuromuscular tissue and true unstriped muscle-fibres are found. In the sea-anemones unstriped muscle is abundant. It is mostly developed, however, from the external layers of the body, and thus embryologically is not comparable to the muscle-tissue that in practically all the animals higher than the Ctenelerates is formed in the middle germinal layers of the developing animal. In one of the higher Ctenelerates, the common water-hydra, some muscle-cells are found imbedded in the proper tissues of the body, thus forming the higher type of muscular tissue. In the next great family of animals, the Echinodermata, to which the sea-urchins, starfishes, and sea-cucumbers belong, unstriped muscular tissue is common, but no evidence of striated or striped muscle is yet present. In the worms the muscular tissue is unstriped and abundant. In the mollusks, the foot of the soft clam, the muscle of the oyster, are made up of unstriped muscle fibres. A higher order, the Arthropods or Crustaceans, including the crabs, lobsters, etc., contains a well-developed muscular system, which is made up of striated muscle, practically the first appearance of this type of muscle in the animal kingdom. In these animals, moreover, there is a type of development of the muscles that anticipates the regular segmented type, metameres or myomeres, of higher animals.

From the crustaceans onward both types of muscle-tissue are found. In the low vertebrates, selachians and fishes, typical heart-muscle cells, striated and with central-lying nuclei, are found. Consult McMurrich, 'Development of the Human Body,' with full bibliography (1902); Pasker, 'The Elementary Nervous System' (1919); Bayliss, 'General Physiology.' See Anatomy.

Smith Ely Jelliffe, M.D., Editor Journal of Nervous and Medical Disease.

MUSCULUS, Wolfgang, German scholar and Protestant theologian; b. Dieuze, Lorraine, 1497; d. Bern, 30 Aug., 1563. He entered the Benedictine Abbey of Lutzeltstein and was ordained priest. He was converted to the Protestant faith by Luther's writings, withdrew from his order in 1527 and in 1531 became pastor of a church in Hilkingen. In 1538 he was appointed at the Wittenberg assembly, and in 1540 was appointed by the Augsburg senatus a delegate to the ecclesiastical conferences at Worms and Ratisbon. He subsequently became professor of theology at Bern. Among his works are 'Comenium' (1537); 'Genesis' (1537); and an edition of Polybius.

MUSES, goddesses of the liberal arts and sciences; originally nymphs of inspiring fountains. Different accounts are given of their origin. There is also a great difference in their names and attributes. The most celebrated are the daughters of Zeus and Mnemosyne. According to Homer they lived upon Olympus. At first three Muses only were known: Meletè (meditation), Mnémè (memory, for the immortalizing of great deeds), and Aoidè (song, for the accomplishment of art). Four Muses are sometimes mentioned as the daughters of Zeus and Plutia, namely, Meletè, Aoidè, Archè and Thelxinoë. At other times they are said to have been seven, at others eight in number. Nine Muses are also enumerated as the daughters of Pierus, king of Emathia; but these are usually held to be different from the nine Muses who ultimately came to be generally recognized in Greece; and although the genuine Muses are sometimes called Pieride, they are said to have derived the epithet not from Pierus but from the district of Pieria. The names finally recognized as those of the Muses were Clio, Euterpe, Thalia, Melpomene, Terpsichore, Erato, Polyhymnia, Urania and Calliope. Among the adventures of the Muses their three companionship with the Sirens, with the daughters of Pierus and with the bard Thamyris, in all of which they were victorious, are particularly famous. The customary occupation of the Muses was singing and dancings, and their attributes were naiad, a comparatively late period assigned to the individual Muses. Calliope became the Muse of epic poetry. She was the most distinguished among the Muses, the protectress of kings, whom she endowed with eloquence and song.
MUSEUM OF ART—MUSEUMS

Clo became the Muse of history; Euterpe of lyric poetry and music, particularly of wind-instruments; Thalia of comedy; Melpomene of tragedy; Urania of astronomy; Erato of lyric and erotic poetry; Polyhymnia of the sublime hymn; and Terpsichore of the dance. They are commonly represented as beautiful virgins, adorned with wreaths of palm leaves, laurel, roses or the feathers of the Sirens. They dance in a circle, together with Apollo, who in later times was styled Musagètes, or leader of the Muses. Their worship extended from Greece to Italy. In Rome they had a separate temple, and a grove was sacred to them. The swan, the nightingale and the grasshopper were also sacred to them.

MUSEUM OF ART, Metropolitan. See ART, METROPOLITAN MUSEUM OF.

MUSEUMS are institutions for the preservation, study and display of natural objects, or of those made by man, while as a sequence of study come the publication of the information thus derived. The word museum originally signified merely a grove or other locality sacred to the Muses, but with the development of the museum the word has undergone a parallel course of evolution until it has come to have its present meaning. The next use of the term was for an institution devoted to the study of philosophy, literature and art, but not including the preservation and display of objects; in this sense it was applied to the famous Museum of Ptolemaic Soter at Alexandria. While this was in the nature of a university, there is some reason to believe that collections of plants and animals were attached to the institution so that it may be regarded as the prototype of the modern natural history and zoological garden. In modern sense public museums are of comparatively recent establishment, and as educational factors, of later date than art galleries and libraries, although like these having their beginnings in the gratification of the desires of individuals. The origin of the museum is to be found in the collections of statuary, paintings and other works of art, made by kings, nobles and men of wealth; the herms of the modern museum of natural history were the cabinets of miscellaneous curiosities brought together by students, merchants, or men of leisure. Many of these collections subsequently developed into important public museums, the most striking example, and the one most frequently cited, being the British Museum (q.v.), which was the final outgrowth of the cabinet and library of Sir Hans Sloane. In the United States the Museum of Comparative Zoology, at Cambridge, Mass., has grown from the collection made by Louis Agassiz (q.v.) in the winter of 1842, and is one of the most important museums in this country. Even the United States National Museum, if not the direct outgrowth of a private collection, was indirectly due to the labors of individuals, for its nucleus is to be found in the specimens gathered by the National Institution (q.v.), a body organized with the avowed purpose of directing the bequest of James Smithson (q.v.) and engaging in pursuits in accordance with its terms. The cabinets of private collectors were the museums of scientific societies where specimens were gathered for purposes of study and display, and while these still exist they have largely given place to museums supported by the State or municipality. Private collections are more numerous than ever, but these are rarely formed with any intention of displaying their contents to the public, although there are some notable exceptions, as in the museum of the Hon. Walter Rothschild at Tring. Ultimately, however, a large proportion of these private collections find their way to public museums through the liberality of their owners, or by bequest.

Another step toward the establishment of public museums was the formation of collections of objects of more or less popular interest and their exhibition to the public on the payment of a fee. Notable examples of these abroad were those of Sir Ashton Lever and Charles Bullock, which flourished in London during the latter portion of the 18th century and first part of the 19th. It is interesting to note that one of the earliest cabinets formed in the United States, that of Mr. Arnold, of Norwalk, Conn., was sold to Sir Ashton Lever, while later on the "Leverian Museum" was sold and its specimens scattered among the great museums of Europe.

Early American Museums.—In this country the principal recent museums of this character were the Boston Museum and Barnum's Museum in New York, in both of which the idea of amusement predominated, the first named being a rather incongruous introduction to a theatre. Both, however, contained some really valuable specimens of natural history and Barnum was among the first to exhibit living fishes. Of a very much earlier date in their aims were the museums conducted by Charles Willson Peale and his son, Rembrandt Peale, in Philadelphia, established in 1765 as the Philadelphia Museum, and from 1822 to 1828 installed in Independence Hall. This museum is of particular interest from the fact that many of Peale's ideas as to the arrangement and educational value of museum collections were in advance of his time. In his use of painted backgrounds and the addition of nests and eggs to the display of mounted birds we have the germ of the elaborate habitat groups shown in modern museums.

The modern "dime museum" with its exhibit of "freaks" is a survival of this phase of museum development, and the catalogues of some celebrated old collections will show that they comprised many very similar objects, as well as those of real value from a naturalist's standpoint.

Government Museums.—The final step in the establishment of public museums, the transfer of collections from private to governmental ownership, may be said to date from the founding of the British Museum in 1753. At first admission was by ticket and limited to 30 persons per day; in 1810 the museum was made accessible to the public for three days a week, and not until in 1852, the museum daily. The United States National Museum was only formally created in 1876, although so early as 1846 the government possessed collections which were in the custody of the Smithsonian Institution. Exploration has developed so much for museums that it may almost be included among the causes that have led to their
formation. The colonization of America brought to Europe many examples of new plants and animals, while the Dutch East India voyages did the same for southern Asia, and it is surprising to see how large a number of species from these regions was described by Linnaeus and others so early as 1760.

In more recent times, the Wilkes Exploring Expedition of 1838-42 and the government surveys for a route for the Pacific Railroad had a very decided influence on the origin and growth of the United States National Museum, and there is scarcely an institution that has not been benefited in a similar way. It is but a step from expeditions in which scientific results were subordinate to practical ends to those undertaken solely for scientific purposes, and the systematic exploration of our Western Territories for fossils by such institutions as the American Museum of Natural History and the Carnegie Museum, and by Yale, Princeton and other universities, has become a matter of almost daily news. Another most important factor in the development of museums has been or is the national exhibition. These have had a direct effect in bringing together collections illustrative of natural or industrial resources, and a more indirect influence in stimulating methods of arranging and displaying such material. The London Exhibition for establishment of the South Kensington (now Victoria and Albert) Museum, and the ethnological museum of the Tricolor in 1851 was one of the outcomes of the Paris Exposition of 1851. Our own Centennial Exhibition was the direct cause of the erection of a building of the United States National Museum and of the founding of the Pennsylvania Museum of Art, while from the Chicago Exposition came the Field Columbian Museum, the Chicago Art Institute and the Philadelphia Commercial Museum. Other causes play minor parts in influencing the growth of museums both small and great. Thus the extensive colonial possessions of Great Britain have been largely instrumental in making the vertebrate collections of the British Museum, the greatest in the world, while the museum at Leyden is not far behind owing to the former extensive commerce of Holland. In the United States the large deposits of fossil vertebrates in the West, their general accessibility, the imposing appearance of many of the specimens and the important results to be derived from their study have given a great impetus to the formation of paleontological collections, while special attention has been given to the preparation and exhibition of this class of material.

The display of fossil vertebrates in the American Museum of Natural History is unrivaled, and other notable exhibits are to be found in the Museum of Yale University, and in the Carnegie, Field and United States National museums. The National Gallery of Art and the Freer Institute, in a building of their own, both forming parts of the United States National Museum, were respectively the gifts of William T. Evans and Charles L. Freer.

Popular Display of Specimens.—What may be termed the popularizing of museums has been a very noteworthy development. The development of objects has always been regarded as one of the functions of museums, it is a branch which has received particular attention only during the past 30 years. Originally the larger part of the specimens of birds and mammals were placed on exhibition, but it became evident that this meant the injury or even loss of many, and that the public cared little for large monotonous series of stuffed animals. At present the number of objects in exhibition is relatively small compared with those in the reserve or study series, and there is a very general effort to display at least a part of the specimens amid their natural surroundings. The influence of the private collector has probably had much to do in bringing about this change, and the British Museum, under the administration of Dr. Günther, was the first of the great museums to introduce groups of birds, with their natural surroundings, as a part of its exhibition series. These were largely added to under the directorship of Sir William Flower, who took great interest in the problem of rendering museums attractive and instructive, while, following this example, the American Museum of Natural History took the lead in this direction within the United States. To the museum of Leyden, Holland, however, belongs the credit of having before this departed from the tradition that mammals must be stuffed in stiff and formal attitudes and caused some to be mounted in some more lifelike manner of life. Change in the character of the exhibits has been accompanied by equal changes in the matter of labeling and so some extent in the publications issued by museums, so that from being merely storehouses of material for the benefit of a few they have become great schools of instruction for the many.

School Work of Museums.—In direct line with what may be termed passive educational work by means of carefully arranged and well-labeled exhibits is the active participation of museums in the work of public schools. All grades by means of circulating loan collections, the giving of lectures at museums or sending lecturers to the schools, and the loaning of series of lantern slides to illustrate such subjects as natural history, geography, history or technology, have been found most helpful.

The initiative in this line seems to have been taken by the Buffalo Academy of Sciences in 1872 and the Davenport Academy of Sciences in 1878, in both cases by means of lectures given at the museum. The Public Museum of Milwaukee appears to have been the first to loan definitely selected material; the American Museum of Natural History, under the administration of Professor Bickmore, the first to give systematic courses of lectures more or less correlated with school work. This latter institution was also the first to establish a department of public education (instruction) for the sole object of co-operating with the public schools.

Following in the lead of these institutions, or acting independently, many other museums have actively engaged in school work, notably the Commercial Museum of Philadelphia, Chicago Academy of Sciences and the Educational Museum of the Saint Louis public schools. This last name in the list, the development of objects has always been regarded as one of the functions of museums, it is a branch which
tion of that year, is a museum of distribution rather than of exhibition, its work being the loaning of specimens, charts, models and similar objects to the public schools.

Classification. Museums may be grouped or classified by their contents, or according to the purposes for which they were established. Following the first method Dr. Goode has divided them into museums of art, history, anthropology, natural history, technology and commerce. A museum may be established for any of these great subjects as a whole or for one of the many branches in to which they may be subdivided. Thus a museum of natural history may comprehend both animals and plants, or one of the other of these primary divisions; it may include the animals of a single continent, a single geographical region or be restricted to those of one locality; it may be devoted to some large group, as mammals, birds or insects, to some minor division, as birds of prey, butterflies, etc., and may or may not include fossil species. Technology may be greatly subdivided, and while the favorite and more striking subjects are shipbuilding and railroads, there are also museums of hygiene and textile fabrics, while the United States National Museum contains collections illustrating the development of electrical apparatus. And technology may trespass on art in the matter of ornament, or, like art, be included in a historical collection illustrating the progress of mankind or of one nation.

According to the purposes for which they are founded Dr. Goode distinguishes national museums; local, provincial or city museums; college and school museums; professional or class museums; and museums or cabinets for special research owned by societies or individuals. This scheme of classification is open to the objection that it confines purpose with ownership or administration, since, for example, national and municipal museums are not merely for the display of objects found within their boundaries, but for those belonging to the nation or city.

College and school museums have for their immediate purpose the formation of collections that shall aid students in understanding various phases of life connected with science, technology and art, but they are usually extended beyond this and become more or less general in their character. This has been the case with the museums of Harvard and Yale universities and is notably true of many foreign museums, such as that of the Royal University of Prussia, which is the national museum. The professional museum is for the illustration of some special occupation or line of research such as mining, medicine or even psychology, which has a museum attached to it, and is directed by a medical professor. The largest institution of this kind is the Museum of the Royal College of Surgeons, London, which has developed from the private collection of John Hunter.

The Army Medical Museum, Washington, had its inception during the Civil War as a museum of pathology and military surgery, but its scope has been so extended that it offers a fairly comprehensive history of the progress of medicine and surgery. The library established in connection with this museum has grown to be the first medical library in the world.

Modern European Museums.—Europe naturally has the greatest number of governmental museums, the capital of almost every state claiming at least one museum of natural history and an art gallery, and often anthropological and technological collections as well. Paris, with some 30 museums, probably leads in the matter of national collections, while Berlin and Vienna have respectively about 20 and 15 museums. Turkey forms a notable exception to the above statement, for Friedjander's Directory contains no mention of a Turkish museum, although a commercial museum has been established at Constantinople. Great Britain has the largest number of local museums, those devoted to the preservation and display of objects illustrating the natural history and archaeology of the immediate vicinity, and, as a whole, these are better administered than those of other countries, great care being devoted to labeling, arranging and otherwise making the collections interesting and instructive to the public.

Europe in general and Germany in particular possess many technological museums devoted to the illustration of subjects as mining, pottery making, weaving, shipbuilding, machine construction and operation and similar topics. Perhaps the most important of these is the Deutsche Museum of Munich, which among other exhibits has a considerable number of working models of such machines as locomotives, so constructed that a large number of the parts is visible, and may be set in motion by the visitor.

Modern American Museums.—There are now nearly 600 museums in the United States, about three-fourths of them attached to colleges or under the supervision of societies, but comparatively few of these are active or important. Nearly half of the whole number are entirely or chiefly devoted to natural history and about 10 per cent to art; though this proportion seems on the increase and the past decade has witnessed the establishment of several important museums of art. A considerable number of museums are general in their character, including both art and natural history.

About 25 per cent of our museums include or are devoted to history, but here again few are active, though there are noteworthy exceptions, such as the Essex Institute of Salem, Mass., and the Historical museums of Chicago and Buffalo, the latter of which makes a specialty of publication.

The United States is strangely poor in technological museums or even in extensive technological collections, though these are steadily on the increase. There is, for example, no museum of naval architecture in this country, the nearest approach to it being the collection of the United States National Museum, in which certain phases of the subject are well represented.

Our oldest existing museum, as well as the first public museum in America, is the Charleston (S. C.) Museum, founded by the Charleston Town Library Society in 1773, later incorporated in the College of Charleston and recently passing to municipal control, thereby taking on a new lease of life. Next to this is the Peabody Museum of Salem, the successor of the East India Marine Society, founded in 1799; it also includes the natural history collections of the Essex Institute.
The Museum of Comparative Zoology, Harvard University, holds the first place among college museums. It is not confined to zoology, as its name might imply, but covers the entire field of natural history. The mineralogical collection dates back to 1793 and is probably the oldest of its kind in America, while the botanical section includes the Gray Herbarium. The nucleus of the Museum of Comparative Zoology was the private cabinet of Louis Agassiz, which was purchased by subscription for $12,000 in 1852. In 1858 an allowance was made for the maintenance of the museum and in 1859 the State of Massachusetts assumed an interest in the institution, at the same time appropriating $100,000 for its increase; $71,000 was also raised by private subscription. In 1876 the State assigned its rights to Harvard College and since that time the museum has been maintained by the university, although the great increase in its collection was principally due to the liberality of Alexander Agassiz, who expended over $1,000,000 for that purpose. An important museum of anatomy is attached to the Harvard Medical School. The Museum of Yale University contains the Marsh collection of fossil vertebrates, comprising many types, as well as the largest collection extant of fossil footprints, while brachiopods and sponges are well represented. In other departments are a fine series of modern corals and many rare archeological specimens. The Museum of Yale University is temporarily in storage and there is no immediate prospect of a new building — nevertheless the collections exist. The Museum of Princeton University possesses large and important collections of fossil mammals from Patagonia and our Western States, a good collection of North American birds and many examples of ancient and modern art. The Museum of Archæology, University of Pennsylvania, has the best collection of Egyptian antiquities in America and is also particularly strong in America archæology; also attached to the university is the Wistar Institute of Anatomy. To Amherst College belongs the Appleton Cabinet of fossil footprints, containing the specimens described by Prof. E. Hitchcock, and the University of Kansas is rich in Cretaceous vertebrates and large North American mammals. On the Pacific Coast Stanford University and the University of California both have museums; at present these are largely working collections, but both have art collections apart from these.

The most important as well as oldest museums under the control of scientific societies are those of the Academy of Natural Sciences, Philadelphia, and the Boston Society of Natural History; the first dating from 1812, the latter from 1831, although it was the successor of the Linnaean Society, founded in 1814. Each contains large collections of birds comprising many types of species described by our earlier ornithologists, such as Wilson, Bonaparte, Cassin and Lawrence. The academy has the largest collection of mollusks in America, and one of the largest in the world, including many types of Tryon, Say and Pilshy. These two institutions may be looked upon as the predecessors of public, scientifically arranged museums in the United States, the majority of our museums being of very recent origin.

There are few museums in the United States directly owned or administered exclusively by municipalities, as are public libraries, almost the only one being the Public Museum of the city of Milwaukee, but there are many to which the city has contributed or does contribute, either by grants of land, erection of buildings or annual appropriations for financial support, and there is a growing tendency toward this cooperation between city and citizens as the educational value and practical importance of museums are recognized. About 15 per cent of our museums belong in this class, including many of the largest and most active, the chief among them being the American Museum of Natural History.

There is, however, a large and constantly growing number of State museums, that of New York standing first, while those of Ohio, Illinois and Pennsylvania are most important. The scope of these State institutions is somewhat general, comprising natural history and history, this latter being usually treated in a somewhat desultory way.

In the category of museums supported by endowment, the Museum of Fine Arts in Boston, the Peabody Museum of Salem and the Egyptian Museum in Boston are the best known. These institutions have collections of great value, but they are not available to the public, the Peabody Museum, for example, being essentially a scientific institution.

Bibliography — For detailed information as to museums and their administration, cases, labels and the arrangement of exhibits, consult 'Museums Association, Report of Proceedings, etc.' (London 1890 to 1900); since that date 'Journal of the Museums Association and Proceedings of the American Association of Museums' from 1907; the museums of the United States are listed in 'A Directory of American Museums,' published by the Buffalo Society of Natural History, 1910; those of Great Britain and her colonies in 'Directory of Museums in Great Britain and Ireland.' (London 1911). For the history of the Smithsonian Institution, United States National Museum, classification and administration of museums, consult 'A Memorial of George Brown Goode' (Report of the United States National Museum for 1897, Part 2, Washington, D.C.).

A work in three volumes on 'Museums, their History and their Use, with a Bibliography and List of Museums in the United Kingdom,' by Dr. D. Murray, has been published by James Maclehose & Sons, Glasgow.

The volume of museum literature in the shape of reports, bulletins, general guides and special leaflets is to-day very considerable and many museums issue regular periodicals for the information of their sustaining members and the public. FREDERIC A. LUCAS, Director, American Museum of Natural History.
MUSGRAVE, William Everett, American physician; b. Farmington, Tenn., 12 Sept. 1869. He was graduated (1901) at George Washington University and became (1902-09) pathologist of the Bureau of Science at Manila, P. I., then chief of clinics and later director of the Philippine General Hospital and dean of the College of Surgery, University of the Philippines. He was (1903-04) president of the Manila Medical Society and (1905-06) president of the Philippine Islands Medical Association. He is editor of the Bulletin of the Manila Medical Society.

MUSH, mooch, Asiatic Turkey, the chief town of the Mush sanjak, vilayet of Bitlis, 79 miles south of Erzerum, near the Kara-su, the eastern affluent of the Euphrates. It is built on a plateau 4,800 feet above sea-level, rising on the south side of a mountain-girt and fertile plain. It is an ill-built, unclean town, peopled by Turks and Armenian Christians. It has Gregorian and Roman Catholic bishops and an American Protestant mission and schools. A thriving trade is carried on in the tobacco, grape vine, wheat and other agricultural products of the adjacent plain. Mush is mentioned by Xenophon and Moses of Khorene, and came into prominence in 1844, owing to the massacre of Armenian villagers at Sasun, in the neighborhood. Pop. about 20,000.

MUSHROOM, a popular term loosely applied to many species of higher fungi, especially such as have a cap (pileus) upon an erect stalk. Primarily, the mushroom is Agaricus campestris (see Fungi), the only species cultivated upon a commercial scale. Though more than 700 species of mushrooms have been proved edible within the last half century, and though many others will doubtless be proved harmless, the novice should be cautious in trying new species. Each unfamiliar variety should be subjected to rigid examination first by smell, and malodorous ones discarded; then by taste, a small piece being nibbled but not swallowed. If no ill results follow in the course of several hours, a small piece may be swallowed. If no evil effects follow, but the flavor remains unpleasant, cooked morsels may be cautiously tried, and results noted. Each individual must decide what species agree with him, because some systems will not endure kinds innocuous to others. Nervous fear of fancied bad symptoms must be controlled, or real illness may be induced by the imagination.

Several species are popularly reputed virulent which do not produce any marked effect upon the health for several hours, and which are widely feared as deadly. Since the two commonest of these (Amanita muscaria and A. phalloides) are often mistaken for the common mushroom, the novice should never gather any toadstools in the woods under the impression that they are the proper mushroom, which grows upon the lawns and cultivated places. Further, all species with yellow or white gills should be avoided until known to be edible. The common mushroom has pink gills when young, and purplish-brown or black gills when mature.

Several of the thousand species of the genus Agaricus are valued for food, but the common mushroom (A. campestris) is the most important. It is occasionally found in open and grassy glades; never in the deep forest, but most frequently in old pastures and lawns, especially in autumn, but often when conditions are favorable during the summer. It grows about three inches tall, measures nearly as much across the cap, has an irregular top-shaped yellow or orange cap and has much-branchied gills. It grows upon the ground in woods. Moras-
MUSHROOM GNATS—MUSIC

*mus ordeces*, the fairy ring or champignon, is a small cream-colored or reddish species, which tends to grow in circles upon lawns and pastures. It is rather tough and solid, but is valued for its nutty flavor and its drying qualities. Its gills are alternate and long and short. *Lactarius deliciosus* has an orange cap, an orange milky juice and with age shows greenish tints where bruised. *Boletus edulis*, the edible pore-mushroom, has a yellowish or brownish cap, with convex tubes which change with age from buff white to greenish yellow. It is common in chestnut, pine and oak woods during autumn. *Fistulina hepatica*, the liver-fungus, grows upon decaying wood, is stemless and of irregular form, red, succulent and fibrous. It is often called beefsteak-fungus on account of its edible qualities. *Morchella excelsa* and seven related species, popularly known as morels, are of various colors, but usually grayish or yellowish. The top somewhat resembles honeycomb, which makes them easily recognized. They delight in potash and are common where the land has been plowed over or wood ashes have been thrown; also in orchards and woods. *Lycoperdon giganteum* and other species of puff-balls, which are common in pastures, are considered among the best edible fungi if used while still white. They are more or less globular in form. The species mentioned sometimes attains a diameter of several feet.

Mushrooms are often said to be equal to meat in nutritive qualities, but these statements are not warranted by analysis, which show that fresh mushrooms contain about 88 per cent of water, 35 per cent of protein, 60 per cent of nitrogen-free extract, and generally less than one per cent each of fat, fiber and ash. The protein content is therefore less than one-fifth that of porterhouse steak, less than one-third that of dressed codfish and but little more than one-fourth that of hens' eggs. Indeed, according to analysis, they seem to be inferior to most vegetables. Their chief value is therefore in their flavors, which vary with individual species as much as among higher plants. They are easily prepared (see Fungus-Eaters).

MUSHROOM GNATS. See Fungus-Eaters.

MUSIC is the science of combining tones in melodic, rhythmic and harmonic order, so as to excite the emotions or appeal to the intellect. Its value varies as is true of all the arts. With its development as a science, in the Middle Ages, it appealed almost entirely to the intellect, this species of music culminating shortly before 1600. At the present time that music is considered best which appeals both to the intellect and to the emotions. It is this equipoise of these two factors which causes Beethoven to be considered one of the chief masters, and the music of Wagner, with all its intensity of passion, to appeal also to the mental processes by its peculiar treatment of Leitmotive.

Spencer and Huxley suggested imitations of nature (bird-songs, etc.) as a possible commencement of emotional music. Paleolithic man had his music, even instrumental music, as may be deduced from a primitive flute of reindeer's horn, found in a cave which was inhabited during the Stone Age. Many prehistoric tunes have been unearthed among the relics of the Bronze Age.

From two or three notes the scale grew into various intricate and widely differing forms. The five-toned (pentatonic) scale is the most primitive now in use among civilized nations. It was chiefly employed by the Chinese, even 4000 years ago, but is also used in some hymns ('There is a Happy Land') and in many Scotch songs, such as 'Ye Banks and Braes,' or 'Auld Lang Syne.'

About 600 B.C. Pythagoras (see PYTHAGORAS) discovered the proportions of the intervals, and Music, always an artificial and a human product, was given a natural foundation. (See MODE; INTERVAL.) It may be doubted whether harmony existed at all in the ancient world. It is absolutely certain that the Chinese, who were well advanced in the art in ancient days, and who formulated many acoustical principles before the time of Pythagoras, used melody without supporting harmonies. It is possible that the Greeks had a crude accomplishment of drone bass to some of their songs. The Scriptural music, loud ecstatic, and of an improvisational character, is a blind alley and does not lead to modern development of any kind. The music of both the old and new Testaments was orally transmitted and is not to be traced. Ancient Rome adopted the Greek music but without fully understanding it. Rome conquered Greece but could not assimilate its culture, and in the first centuries of our era the musical art was retrogressing. The influence of the Christian Church stayed the decadence and gave a new direction to the art. Ambrose (about 340–398) and Gregory (540–604), stemmed the tide of decay and rescued some part of the ancient systems or modes. The power of music in the early Christian ritual is not only shown by the praises of the Fathers of the Church, but by the fact that the Emperor Julian in 361 endeavored to found a musical conservatory in Alexandria to educate boys to sing in the pagan rites as his adversaries were singing in the Christian churches. The Roman influence now extended the Gregorian chants all over the civilized world. Boethius (475–524) had written a treatise on the Roman system which became the misty textbook of the earliest days (see BOR Cons). In 790 Pope Adrian sent singing teachers into France with missals illustrating the Gregorian modes. A purely emotional music was left at Saint Galen which still exists and proves the earnestness of the musical mission. The music of this early period, however, is still very vague to us, since no practical notation existed. The musicians of this epoch sometimes employed alphabetical notation and it was (deciphered) but more frequently a system of lines, curves, dots and dashes, called the
Neumes, which were only to aid the memory of one who had learned the song orally, but meant nothing definite to anyone who had not thus studied it.

A step forward was made by a monk named Huçbald, in Saint Amands, who improved the notation somewhat by using a staff (it is very doubtful if he invented it) and by writing certain rules regarding the union of different parts in music simultaneously. The reform seems, at first, to be a very great one, meaning nothing less than the birth of part-music, the evolution of a new science; but, when one knows that these parts were simply consecutive fifths or fourths, or other equally harsh progressions, one can only marvel that the men of the Middle Ages bore it so patiently. The new system was called the Organum, since it was often played upon the great wind instrument which had disappeared when Rome went down, and reappeared in Europe in the reigns of King Pepin and the Emperor Charlemagne.

A much greater reformer than Huçbald came upon the scene about 1000 A.D. Guido, an excellent monk of Arezzo, founded the system of sight-singing, by establishing a vocal scale on the syllables still in use. He noticed that the hymn to Saint John (patron saint of singers) rose step by step from C to the following words:

Causing his choir-boys to memorize the syllables from the melody of their chief hymn, he soon taught them intervals by this simple means, and his treatise "De ignoto canti" was the first practical mode of singing "an unknown song" (that is, a song unknown before to the singer), in short, the birth of sight-singing. It must be confessed, however, that Guido's claims to this tremendous discovery have been contested, and that every point connected with the rise of the science of music is more or less wrapped in vagueness and doubt.

We come to somewhat firmer ground a little later when notes of definite length are introduced. Franco of Cologne may be credited with the first clear treatise upon such a system (he calls it "Ars Cantus Mensurabilis") in the first half of the 13th century.

And now there came a recession from the evil-sounding fourths and fifths that had existed in the 10th century, and from some equally harsh progressions that were countenanced long after this. The troubadours in France and the minnesingers in Germany had brought forth secular music that broke many of the old rules yet sounded infinitely better than the more "regular" music. The musical canons of the ecclesiastics began to broaden. Marchetius of Padua and his followers in the middle of the 14th century, began to urge new progressions and the consecutive fifths were tabooed, only to reappear copiously in the most modern works of the 20th century.

It will be impossible in an outline sketch to give all that was that were made in evolving the new science, from the 11th to the 14th centuries. Suffice it to say that out of these efforts there grew the first real school of composition, and instead of its having birth in Rome, it was born in the Netherlands and in Flanders. Yet the Flemish school at once gave its services to the Church, and many of its greatest representatives in its earliest stages went to Rome as servants of the Catholic church. The Flemish school may be called the true beginning of the science of music, since now, for the first time, a race of composers existed who worked according to definite rules in the production of intricate counterpoint, and were able to impart their knowledge to their pupils. William Dufay was the first of this line of composers. His epoch is mistakenly given in many histories as falling in the 14th century, but the researches of F. X. Haberl have proved that he was born shortly after 1400. He died 27 Nov., 1474. The chief of his contemporaries were Hobrecht, Eloy, Brasaert and Binchois, who have, however, left little more than their names, and even of Dufay very little music is extant.

The first great teacher of the school was John Ockeghem or Ockenheim (about 1430-1513), and among his pupils was the first great contrapuntist of that time, practically the first great composer that the world had ever possessed,—Josquin Des Pres,—whose music Martin Luther delighted in. Des Pres was born about 1440 and died either in 1515 or 1521. Other pupils of Ockeghem were De la Rue, Brumel and Agricola. All the music of the foregoing composers was purely intellectual, but with Des Pres we find the first glimmerings of emotion mingled with the musical mathematics, and he taught that dissonances could be used to express passionate feeling.

The greatest figure in the Flemish school, however, is Orlando Di Lasso (1520-94), who composed works which are beautiful even to modern ears. The Flemish school ended with this culmination. It had existed about two centuries and in that time it had brought forth the science of composition and some 300 composers.

There was, however, another country which helped greatly in this result. The first musical dictionary ever written, by John Tinctor (1476), gives the credit of the invention of counterpoint to the English, and a manuscript of a canon for six voices, in the British Museum, would seem to show that there were very skilful composers in England as early as in the 13th century. This canon "Sumer is icumen in" ascribed by some to John of Reading, in 1250, by others to a much earlier date, is a surprisingly advanced work for its epoch. A mysterious figure looms up as an English contemporary of Dufay, in John Dunstable, but of the music of this Englishman (who died about 1458) very little is known, only a few fragments remaining.

Contemporary with the later Flemish writers one finds a few Italian composers forming a school of their own. Among the Italian school was Costanza Festa, a Florentine, who died in 1545. But the one great master in this field was Palestrina (born probably in 1524—there is much doubt about the date of birth,—and died 1594), who was without doubt the greatest composer up to that time. He combined the Flemish ingenuity with a lofty dig-
nity and sometimes (as in his 'Improperia') with emotional power.

The year 1594 was an epoch year in music. The event that occurred that year, with Di Lasso’s death; the Italian school lost its chief master in Palestrina; a revulsion against the intellectualism of music took place,—and the first opera was written.

We pause here, therefore, to sum up a few other events in musical evolution that had preceded this important date.

Although the chief scientific music of the world had been ecclesiastical up to this point, the troubadours in France, and the minnesingers in Germany, had turned the attention of cultured minds to the beauties of secular singing. Instrumental music was as yet a Cinderella among the arts. The strolling jongleurs and wandering minstrels amused the people, and sometimes the nobility, with displays of skill upon various instruments, combined with juggling tricks. They were generally under the ban of the law and led a very precarious existence. Troubadours and minnesingers wrote melody only, without harmony.

One of the trouvères of France,—Adam de la Halle (1180—1250),—written half of the 13th century, had written a musical play, entitled ‘Robin et Marion,’ which was the precursor of light opera. It is the earliest popular work of which we have any record, but it was written by ear, and not by any teachable rules. Venice, partly through the efforts of Flemings, partly through Italian influence, had become a centre of organ-playing. Adrian Willaert (1480—1562), a Fleming, had become organist of St. Mark’s in Venice and drew many pupils thither, among them Di Rore, Zarlino and Andrea Gabrieli. The last named taught his nephew, Giovanni Gabrieli, who became one of the noblest composers of the Venetian school. He was born in 1557 and died in 1613. Zarlino taught many German pupils, and through the Venetian school of organ-playing Germany for the first time came in close musical touch with Italy. Zarlino taught Scheidt, Praetorius and Scheidemann, while the elder Gabrieli had Hans Leo Hassler as a pupil. Zarlino and Willaert were the first to agitate for the tempering of the musical scale (Fundamentum); his friend Palestrina came much later through the wisdom of Bach.

Claudio Merulo (1533—1604) established the organ toccata, probably the earliest form of technical instrumental display in the modern sense. One other form of scientific secular music had arisen, thanks to the Netherlands; the madrigal, an unaccompanied vocal composition displaying the most intricate counterpoint had come into vogue, and Willaert and Di Lasso had achieved triumphs in this school. Luca Marenzio (1556—99) had also done good work in this field. But the most charming madrigal composers were to be found in England, where this style of singing met with special favor. It is customary to vaunt the glory of the Elizabethan poets, but if the tremendous name of Shakespeare be eliminated, the excellence of the contrapuntists at this time rivals that of their literary brethren. Tallis, Weelkes, Wilbye, Morley, Farrant, Byrd, Bull, Ford, etc., may well be cited as balancing Beaumont, Fletcher, Massinger, Marlowe, Jonson, etc.

Music-printing (see PRINTING) had also been established, in 1502, by Petrucci of Fossombrone, and caused the compositions of all these men to spread from country to country with great rapidity.

The change from the old school of pure counterpoint to a more emotional style, from intricate choral works to solos both vocal and instrumental, had its first practical demonstration in 1594 (some place the date two years later), by the composition and performance of the first opera, entitled 'Daphne.' The work was the outcome of the efforts of a coterie of cultivated amateurs who began their meetings in Florence, and endeavored to bring into music something of what they supposed it to have possessed in ancient Greece. The men who were active in this movement, which caused the renascence of music, were Giovanni Bardi (Count Vernio), Vincenzo Galilei, Strozzi, Mei, Rinuccini, Caccini and Peri. Their first operæ met with great success, but their second,—'Euridice'—was an epoch-making work, since it contained in embryo an entirely new mode of musical treatment. Counterpoint was replaced by monody, solo singing began, and recitative allowed musical declamation to take the place of intricate tonal construction. The libretto was the work of Rinuccini, while the music was written by Peri and Caccini in two versions, that of the former being the better.

The new school spread quickly to all countries, only in France its progress was checked by the power of Lulli, who devoted himself chiefly to ballet-music. The latter was largely introduced into Molière's plays and obtained the favor of Louis XIV, who sometimes appeared himself in the dactyls.

The opera was not the only form of the period of phenomenal musical activity which marked the closing of the 16th century and the beginning of the 17th. The oratorio also had its beginning in this wonderful era. Filippo Neri (1515—95), a Jesuit who had once been canonized by the church, was an enthusiast in the matters of good church music and at his church in Rome he frequently had religious meetings apart from the regular services, in which he portrayed Scriptural subjects in the shape of musical plays. His establishment at Palestrina in this pious work, and may have had a hand in the development of the great sacred form. As these entertainments did not take place in the body of the church, but in the Oratory (Oratorio), the origin of the name of this form will readily be seen.

But the real establishment of the form came with Emilio del Cavaliere (1550—98), who wrote a large work in the new style, entitled 'L'Anima e Corpo.' This was first performed in 1600, to much direction were left regarding the mode of presenting the work that one may presume that the interpretation thereafter were thoroughly carried out. This first oratorio was so entirely in the new school of monody and declamation that one may doubt as to whether the establishment of opera is not in a large degree to be credited to Del Cavaliere.

Besides the opera and oratorio, instrumental
forms were established at this time as well. Dancing is the mother of instrumental form. The dances of Spain had gradually made their way into France and exerted a strong influence upon classical music. In an effort to obtain contrasts several of these were joined together in one large composition, which was at first called a partita, but afterward became a suite.

Free instrumental music from the organ toccatas already alluded to. Frescobaldi (1588-1653) was to Rome what Willaert had been to Venice half a century before. Frescobaldi has been called the father of true organ-playing. He improved the toccata and called it sonata (a sonorous piece—that is, an instrumental piece), to distinguish it from the cantata, — the singing piece. Corelli (1653-1713) gave to the old sonata a form, which, although much less important than the later, classical shape, had yet within itself the elements of the noble form. Its first movement was a large three-division shape, exposition, development and recapitulation; and this led to the Sonata-Allegro, the first movement-form of the classical symphonies and sonatas, the form of many noble operatic overtures.

Amid all these remarkable advances the fugue remained rigid and lifeless, a survival of the old intellectual problem-music. As yet the fugue was little more than a canon, a continuous imitation of a given melody. It waited its liberator — Bach.

During the century which followed we find Italy combining contrapuntal skill with the less educated enthusiasm which marked the early operas, and such men as Monteverde (1566-1633) and eventually Alessandro Scarlatti (1659-1725) enlarged the new school of sonatas so far better than its founders had dreamed of. Stradella, Carissimi, Lotti and Rossi added to the advance of the great new school which was to cause Italy to be justly called the *Mother of Music*. The school was established in England too by Henry Purcell (1658-95), who even introduced the Italian musical signs and expression-markers into his native country. Purcell, who was the greatest musical genius that England ever produced, founded his own English operas upon the Italian models, but his works had characteristics entirely their own and extend all the way from the melody of ‘Lilli-burlero’ (the revolutionary song of 1688) to the loftiest anthems and brightest operas.

In France the great Lulli (1633-87) was bringing forth the most dainty and graceful ballets. In Germany Reinhard Keiser (1673-1739) began the 18th century by endeavoring to form a German school of opera, but the Italian operas soon resumed their sway.

In Germany, also, the effect of the numerous students who had gone down to Venice in the 16th century and the beginning of the 17th, was beginning to make itself felt. Luther’s influence had established the chorale as a sturdy root whence much sacred music was to grow. Perhaps the three men who most helped the growth of Germany’s sacred music in its earliest post-Lutheran stage were *Buxtehude*, *Seb. Bach*, (1685-1723), Scheidt (1587-1654) and Schein (1586-1630), who not only helped Italian music in the Fatherland, but elevated the style of organ-playing far above anything that Italy had done. Musical settings of the Passion began to appear in Germany, and the oratorio took a nobler path than in Italy, even before the appearance of Bach and Handel. To Germany also was due the new and independent genre of music, which took the melody out of the tenor voice, where it had always been in the Flemish and old Italian music, and placed it in the soprano, a change due to the choral-singing of the 16th and 17th centuries.

Out of the great musical epoch at the beginning of the 17th century there came also a radical change of notation. The notation of Franco of Cologne had been improved by the invention of many additional rhythms and the employment of smaller notes. In the music of Palestrina and of Orlando di Lasso, that is to say up to 1594, one finds some half-dozen tonalities (keys) employed, and notes and rests down to 6ths. But one does not yet discover a rational division of music into measures. This great advance came shortly after 1600, with the new monody, the declamatory music of the early operas, and with this came also, for the first time, the use of terms of tempo and of expression. Even the general line of notes was invented in the latter part of the 17th century, so that this epoch saw the establishment of the greater part of our present notation system. Music of the better class, printed after 1700, is without any very important difference from that printed to-day.

And now the procession of the tone-masters who are prized by the modern world begins. Bach (1685-1750) and Handel (1685-1759) were so exactly contemporaneous that many speak of them as if they had been the Siamese twins of music. Yet their influence was very divergent. Bach leaned toward the old school of pure counterpoint; Handel was impelled toward modern dramatic effects. They faced different ways. Handel led toward orchestral experiments and was more directly melodic than Bach. We owe to him the noblest form of oratorio, which, by the way, he did not attempt seriously until after his 50th year.

To Bach we owe debts far more varied and even greater. He reconciled the old diatonic style of composition with the newer more modulatory school; by his great organ works and his clavichord fugues he founded modern technique; he was the father of the best school of organ-playing; he composed the greatest mass (that in B minor) which the world possesses, and also the noblest Passion music, and he was absolutely the inventor of freedom of modulation. Before his time, by what is called *mean temperament*, it was possible to modulate into some three or four major and minor keys. Bach in 1722 gave to the world the first book of his *Well-tempered Clavier*, the composer’s declaration of independence — “We hold that all keys are created free and equal” (See TEMPERAMENT). In 1740 he wrote the second book, riveting the great reform.

Opera in the meantime had lost its opening splendor. Intoxicated by the success of the new style of music the composers began to believe that poetry was a secondary matter in the wedding of the arts, and all allowing the music to pursue an independent path all dramatic purport was soon lost. A reformer was needed and he soon came. Gluck (1714-87) began a crusade against the meaningless character of many of the beautiful melodies of the
Italian opera. In 1776 his opera of 'Orpheus' (which still holds the stage) began the dramatic school of operatic music. Mozart followed in this path, and Mozart managed to reconcile melodic grace and dramatic content.

In carrying this sketch to its conclusion we must now trace three intertwining paths—piano music, orchestral music and operatic and other vocal music. Naturally we shall be able to allude only to epoch-making composers.

In 1709 Cristofori, an Italian, invented the pianoforte. The instrument was at first neglected. Bach thought it fit only for rondos. Mozart used the spinet, as did Haydn. It was Haydn who first turned the tide toward the new instrument. Instrumental technique grew up in the train of the new invention. Domenico Scarlatti (1683-1757) led toward a piano style while writing for the spinet. In 1752 Philipp Em. Bach published the first valuable book of technique, which could be applied to the piano, to the clavichord, or the spinet.

The classical piano sonata grew gradually from the opus 23 by Beethoven, composed in 1801. But Beethoven was not the first to attempt the large form. Haydn first established it, Mozart improved it and Beethoven brought it to its culmination. The symphony was but a larger form of sonata, for orchestra, and the same process of evolution took place. Seldom has a form reached its zenith more quickly; from the first symphony, composed by Haydn (in three movements and for eight instruments only) in 1792, to the tremendous ninth symphony of Beethoven, composed in 1824, is but 65 years, yet these years contain all that is pertinent to the birth, growth and climax of every form of sonata,—in which we include classical chamber music, string quartetts, quintettes, etc., and orchestral works such as symphonies and concertos.

Just as there was a most significant musical epoch from about 1590 to 1620, so we find the classical period, from about 1775 to 1825 to present not only a marvelous amount of creative energy, but a change in the musical taste of the world, a transformation of the scope and style of music. Only the opera went on its uninterrupted path. Yet here, too, there were some changes. Beethoven (1770-1827) was an instrumental, an orchestral composer, par excellence. His one opera, 'Fidelio,' great art-work though it was, exerted no special influence upon any school of composition. Mozart (1756-91) improved the style of the Italians in opera, but did not actually strike out a new path. Mozart's 'Don Giovanni,' for a long time the masterpiece of the world in the operatic form, was but a culmination of what Italy had already attempted. Rossini (1792-1868) with a pernicious habit of creating the most beautiful melodies whether they fitted the text or not, set back the hands of the clock of musical progress, as far as opera was concerned, for a good half-century.

The first ringing note of the newer and truer epoch in the drama was struck by Weber (1786-1826) in 1820. He completed his 'Freischiitz,' an opera built upon the sure foundation of the folk-song, a dramatic work, thoroughly wedded its poetry and music. The sacred forms, during the classical epoch, did not change materially. Beethoven wrote a most intricate mass, but it was only an echo of Bach with his great polyphonic B minor mass. Mozarte Beethoven, although noble requiem, but it was only an addition of operatic flavor to the requiems that had preceded. Cherubini (1760-1842) wrote a couple of requiems that were as great as any of the school—but were not in any sense innovations. Piano and orchestral works advanced the most in the classical half-century. The latest piano-work existing to-day is probably Beethoven's B flat sonata, Op. 106.

The orchestra, in the modern sense, had its birth in the classical half-century. Bach and Handel made only outline sketches of their orchestral works, leaving much for modern commentators to fill in. But when Haydn came to England, in 1791, he directed a complete orchestra and he published complete orchestral scores, an epoch in the history of orchestral development. Mozart had, however, before this time, written a large number of symphonies in complete score, many of which were published at a later date. The last of the full score had their origin in this remarkable epoch, the art of conducting came later. Mendelssohn and Berlioz may be named as the first really great conductors in the modern definition of the word. The use of the baton in conducting only became established after 1800.

One other important evolution must be added to the work of the 50 years which form the golden epoch of musical creation. The songs of Europe, such as had any real worth, were almost altogether folk-songs, melodies which grew up as the briar rose by the wayside of art, not the careful product of great composers, but the spontaneous voice of the people. The songs of the composers were generally dull and artificial things, made so, perhaps, by the fact that the poets were not concerning themselves with short and lyrical forms. But when Goethe and Heine, in Germany, began writing beautiful lyrical poems, the song-composer was sure to follow soon. Franz Schubert (1797-1828) was the genius who evolved the 'Lied,' the artistic song which, however short, was yet a complete and perfect whole; as a tiny Meissonier painting is as perfect in its way as the large canvas, so Schubert added glorious works to the symphonic repertoire, his piano-works practically founded the 'Minuet-form,' yet he thought vocally, and his most spontaneous and most important works we consider to be his 'Lieder,' which songs began a new school.

We may now follow the three distinct musical paths,—vocal forms (including opera), piano music and orchestral music,—each by itself, to the present time. Continuing the song development, we find Schumann (1810-56), and Robert Franz (1815-92) following in the footsteps of Schubert and bringing the miniature vocal form to perfection. The operatic form took a wide deviation.

The work of Rossini was baleful only in the fact that it was heard before the wedding of words and music in dramatic unity. In light operas Rossini was a model, and his 'Barber of Seville' is a masterpiece. Once, and once only, he proved that he could write a truly dramatic opera, and produced 'William Tell.' Donizetti (1797-1848), Bellini (1802-35), and others, fol-
lowed his lead and wrote charmingly, but untruthfully. France compromised and united prettiness and some degree of dramatic feeling in the works of Gounod (1818-93) and of Ambroise Thomas (1811-96). The final reform in harmonic writing of opera and music was made by Richard Wagner (1813-83).

Wagner's combat and triumph have been too recent to require detail here. We need only state that his theories of opera, or "music-drama," as he preferred to call it, were:

1. The abolition of a set form (that is, ending as one began), and the use of any shape that the poet suggested.
2. Absolute unity of the entire work. No division into songs, duets, choruses, with applause between and sometimes even encore. Continuity from beginning to end.
3. The music is always to interpret the poetry. Its entire character is to be dictated by the words: "Music is Truth." In the wedding of the arts Poetry is the man, Music the woman; "Poetry must lead. Music must follow;" "Music is the handmaid of Poetry;" are a few of Wagner's aphorisms.
4. Abolition of mere tune and the substitution of a melodic line, called the "Motif."
5. Absolute freedom of modulation. Not necessarily a fixed tonality to any work or part of it. "Swimming in a sea of tone."
6. Excellence of libretto. No book is fit to be used for the text of an opera unless it would make a successful drama by itself.
7. A constant use of the Leit-motiv (a musical figure expressing a definite meaning) by which the orchestra speaks a language that can be comprehended, somewhat like the chorus used to do in the old Greek tragedies. (See Leit-Motiv.)

These are not all of the theories that Wagner evolved, but they are the most important. They did not spring into being at once. One sees a few of them in 'Tannhäuser,' more in 'Lohengrin,' but the fulness of his reforms is first revealed in 'Tristan und Isolde.'

Wagner's work has influenced all the modern opera composers. Verdi (1813-1901) had begun his career in Italy almost upon the lines of his predecessors. Thanks to his genius he soon began to carve out a better vein for himself. In his 'Aida' he began to lead Italy to a much finer and truer school of opera than it had ever possessed. In 'Otello' and 'Faust' while carefully discarding the 'Leit-motiv' he seems to arrive at almost all the other Wagnerian conclusions, although his Italian personality prevents any great resemblance in results. In France, Bizet (1838-75), the best of French operatic composers, was starting upon a similar path with 'Carmen' when death interrupted his career. America has begun to add to the repertoire. Paine and Chadwick began the modern work, but important operas have since been composed by Horatio Parker, Nevin, Cadman, Gilbert, Herbert, Converse, Damrosch and others.

Tracing the piano path from the time of Beethoven we find three great "Cs" in technical writing — Czerny (1791-1857), Clementi (1752-1832) and Chopin (1809-49). These led to a modern technique and this bore fruit in two different directions. Liszt (1811-86) became the king of the piano and brought its technical power to a point that had never been suspected before his time. Chopin (1809-49) chose as the poet of the piano and gave to the instrument its most beautiful phases of expression. A host of piano composers have sprung up in every civilized country. Russia furnishing a great number.

In connection with the rise of technique we may speak of the advance in other branches of music. Italy had great singing schools in the 18th century, and some of the most famous vocal teachers. Nicoletta Porpora (1683-1762) was the most eminent of these, and had as pupils some of the most renowned singers of his day, among them Farinelli (Carlo Broschi) who was reputed to be unrivaled in flexibility and in power. Pistocchi was another of the famous teachers of this epoch, and his most famous pupil, — Senesino, — disputed the palm even with Farinelli, in England in Handel's time. Vocal technique could scarcely go further than it advanced in the 18th century, although the 19th furnished such singers as Caltabiano, Malibran, Mario, Rubini, Lablache, Jenny Lind, and later such artists as Jean De Reszke, Adelina Patti, and, in the dramatic school, Materna, Tietjens, etc.

In violin technique the chief advance was begun in the 17th century, when Corelli (1653-1713) was the most prominent teacher of Italy. At about this time, too, the golden period of violin making began and the Amatis, Stradivarius and the Guarneri made the name of Cremona (the city in which Cremona is famous all over the world. The king of all violinists, speaking entirely from the standpoint of virtuosity, was Paganini (1784-1840) who advanced technique so far that even to-day the greatest living violinists are unable to conquer all of the difficulties which he left as a legacy to the world. Since his time the sceptre has passed to Joachim (1831-1907), who held it for many years, but in his old age, saw it contended for by a host of advanced players. Paganini influenced violin music toward mere virtuosity, while such players as Joachim, Wilhelmi or Wieniawski combined musical feeling with technique in their work. In recent days Ysaye and Kreisler take the lead in this field.

Orchestral advance has been absolutely phenomenal since Beethoven made his developments in tone-coloring. Berlioz (1803-69) was the first to improve upon the great pioneer's work and achieved remarkable results by his various experiments with new combinations. Wagner carried the art of orchestration still higher in his operas, and since his death a whole host of great tone-colorists have arisen. Russia has contributed very much to this advance, and it is not an absurd prophecy to predict that the Slav may attain the orchestral supremacy of the world in the near future. Tschaikowsky (1840-93) appears to be the greatest genius in this field that Russia has yet produced.

In Russia, however, there was, at the end of the 19th century, a decided movement toward a national school, headed by the so-called "Big Five" — Rimski-Korsakov, Borodin, Cui, Mousorgsky and Balakireff, and such composers as Rachmaninoff, Glazounoff, Tanaiieff, Scriabine and Stravinsky have helped the orchestral advance, the two latter being especially radical and ultra-modern in style.

France has also advanced greatly in the orchestral field thanks chiefly to the naturalized Belgian, César Franck (1822-90), who taught many of its chief composers. In 1863 he himself wrote many noble works. Massenet, Saint Saens, D'Indy, Charpentier, Pierre, Chabrier and many others have advanced the orchestral standard or have written what may be called symphonic operas. There is much free-
dom of form in the neo-Gallic school. Debussy (1862-1918) and Ravel have established a new school of orchestral treatment, the former being renowned for his delicate and subtle coloring as well as for the frequent employment of a scale consisting entirely of whole tones.

Germany has developed chiefly along the Wagnerian lines, not an unmixed blessing when applied to purely orchestral music. After Beethoven came a period of dulness in the symphonic field. Mendelssohn (1809-47) wrote much symmetrical orchestral music, but in spite of his melodic grace and symmetrical style he was not of the stuff of which epochmen are made. It was Schumann (1810-56) who led the campaign against following too slavishly the classical paths and through this the romantic school and the freer sonata forms came into modern music. Brahms (1833-97) by his great symphonies and other sonata forms has proved, however, that the classical school does not merely belong to a by-gone epoch. Richard Strauss (1849—) has followed the Wagnerian system in all of the theories given above. He has exhibited overwhelming skill in both operatic and orchestral works, and Occasionally his title, but "Richter," the term, is firmly established. Whether this is but a passing phase only time can show. Conservative musicians are aghast at the many bold experiments which are being attempted. We believe, however, that when the experimental stage is passed the tremendous orchestral skill that has been won will be retained, but that it will be again combined with the melodic grace and beauty of the older masters, and that Beethoven's aposthegm will be re-established—Music, even when picturing something ugly, must itself remain beautiful.

England too has heard the modern voice and her precise and correct contrapuntal school as represented by Mackenzie, Stainer and others, has given way to a much freer and bolder expression as shown in the works of Elgar, Delius, Bantock, Holbrooke, etc.

Even Italy is influenced by the orchestral tendencies of the present and the operas of Puccini, Wolf-Ferrari, Mascagni and Leoncavallo, and the cantatas of Bosia, no longer give the voice great preponderance over the orchestra and no longer treat the latter as a mere accompaniment. One Italian, Ferruccio Busoni, has plunged headlong into the German school of advanced orchestral works of freest form.

Scandinavia deserves great credit for the nationalism of her best music. As in Russia, her chief composers endeavor to reflect the spirit of their native folk-music in their classical works. Grieg (1843-1907) was the chief founder of this style, but Sinding and Sibelius have given important works in the same vein and the last-named has recently attempted the most free and radical modes of modern expression.

America has been especially fertile in the orchestral field. The real classical beginnings were made by John K. Paine, and a little later by George W. Chadwick, but at present Foote, Converse, Gottschalk, Hadley, Schelling, Gilbert, Cadman and many others are writing in the largest forms. MacDowell's (1861-1908) orchestral works, as well as his piano compositions, have a place in the standard repertoire of all nations, and Horatio Parker has composed the first great American oratorio—"Hora Novissima."

Women composers are more numerous now than at any previous epoch in the world's history. Ethel Mary Smyth, in England; Mrs. H. H. A. Beach, in America; Augusta Holmes (1847-1903), in Paris, and many others have composed good works in the largest musical forms.

It is difficult to prophesy what the future may bring in musical development. Music is the most changeable of arts. Like language it is an invention of man, and even if founded upon natural laws it is still an artificial and, therefore, a changeable product. There is at present a decided tendency toward great complexity and cryptic expression; heavy scores and epic, the extreme and understatement. Whether this is but a passing phase only time can show. Conservative musicians are aghast at the many bold experiments which are being attempted. We believe, however, that when the experimental stage is passed the tremendous orchestral skill that has been won will be retained, but that it will be again combined with the melodic grace and beauty of the older masters, and that Beethoven's aposthegm will be re-established—Music, even when picturing something ugly, must itself remain beautiful.

LOUIS C. ELSON,
Instructor at New England Conservatory of Music, Lecturer and Author.

MUSIC, Children's, a somewhat ambiguous phrase which may be applied to music written specially for children or music produced by them. As used in this article, the term covers the broad, educational phase of the subject as to what may and should be done to make the noblest of the arts an important factor in the child's spiritual development. The purpose of this article is, therefore, to point out the necessity for intelligent treatment of children's music and to outline some ways and means by which the musical side of a child's nature may be developed fully and naturally. The need of such an encyclopedic article is obvious. There is hardly a subject that is so shamefully overlooked and so little understood by parents and others as the educational and cultural significance of music. Even in our schools, where better consideration and fuller comprehension might be expected, music teaching falls far short of its cultural possibilities. In our homes, naturally, the state of music and musical instruction is generally worse, due largely to the mediocrity of the average music teacher.

"It is doubtful," says one of our foremost musical educators, "whether there is any subject of instruction which is taught so carelessly, so ignorantly, or so improperly, and by so many people who are by nature and training unfit to teach as music.

But methods of teaching, save in their general educational aspect, do not come within the scope of the present article. These and the various other technical phases of music and music-teaching are adequately treated under their respective heads.

The Educational Value of Music.—Quite apart from such general considerations as have long been adduced in support of music's claims as the purest, the noblest and the most universal of the arts—which, of course, cannot be enumerated here—there are several very weighty reasons why music is peculiarly fitted to serve as the first art in the education of the young. One of these is for the fact that music, although the most abstract (subjective) of all the arts, is the only art that can be apprehended in early childhood. The normal human infant sings and is susceptible to song long before he can talk or walk—certainly very long before he is sufficiently sensitive to color vibrations and other complex sensory impressions. Thus, at an age when children can neither draw nor mold nor read nor write, they can enter the kingdom of beauty through music. "By singing, and by singing only," says Mr. T. W. Surrent, "a little child of five may come in contact with a pure and perfect form of beauty." Just because music is an abstract art, an art which has no necessary objective reference (like painting and sculpture, for instance), it lends itself so admirably to the expression of that idealism with which every normal child is endowed by nature.

Another important educational advantage possessed by music is its great stimulating energy. For very young children music means, or should mean, primarily singing; and singing for them should imply, principally, group-singing. Now, such singing, being the spontaneous duets of the nursery or the more conscious choruses of school and other assemblies, is a decidedly social activity requiring a degree of co-operation and self-abnegation not called forth by any other abstract. When children sing in unison—and adults, too, for that matter—their natures tend to lose much of their angular, anti-social individuality. Incidentally, such exercises afford invaluable practice in concentration and co-ordination—concentration of attention and co-ordination of eye, ear and mind—which promote a degree of mental alertness and precision hardly result from participation in any other cultural art.

A third reason for the educational pre-eminence of music—and many others could be given, did space permit—is found in the fact that, being the purest of the arts, music is, in the words of Montesquieu, "the only one of the arts which cannot corrupt the mind." That this is another very important educational advantage goes without saying. For, however young or immature a child may be, its mind cannot be debased by bad music in the manner of "spicy" stories or obscene pictures. Music as such is neither moral nor immoral, as has been repeatedly pointed out; it is immoral. It is not before music is wedded to some other means of expression (language, acting, etc.) that it assumes any definite meaning. If the result of such union proves to be ethically undesirable, the objectionable element is not the music, which is not definitive like sculpture or painting, but the concrete medium with which it happens to be united. Even in the sad case of "bagpipe music," the "dime-novel of music," as it has been aptly called, the harm lies more in the vulgar and highly suggestive words than in the meretricious melody. Thus, while cheap and noisome music, if long persisted in, may corrupt a child's musical taste, it cannot undermine its morals. The loss in the former case is negative; in the latter, positive. The first belongs to the sphere of aesthetics; the second, to that of ethics. It is this negative quality of music,
the ideal of all art, that makes it so well suited to serve as the first and foremost cultural art in the spiritual education of the young — an art which, properly presented, enlarges the child’s sympathies, broadens its emotional experience, gives greater play to its innate idealism and increases its capacity for joy in num-
berless ways.

The Need for Early Music-Training.— In view of the great educational, social and cultural importance of music, its neglect in our homes is as inexcusable as it is unaccountable. Yet, so general is this neglect that most children grow up to manhood and womanhood without ever becoming really musical. Even of the thousands of people who consider themselves musical, say two prominent American writers on music, "it is surprising how few have any real appreciation of it." But if American adults are, as a class, unmusical, while American children are for the most part musical — and both are facts generally admitted by musical educators — the fault can lie only in the wasted musical opportunities of childhood. "If the natural taste of our children for music were properly developed," says a distinguished musical authority, "they would continue to practice it and to find pleasure in doing so." This neglect is chargeable partly to our homes, whose prevailing music is still of a cheap and vulgar character and where music-making is rarely pursued as a family function, and partly to our schools, where musical education is still not to be considered as an extra subject for the talented few rather than as the rightful heritage of the many. That the other fine arts fare no better in this respect does not, of course, improve the musical situation in the least.

Just because music is, as already stated, the only art-form accessible to very young children, neglect to cultivate it properly in the home is far more irredeemable than is the case with any other art. Yet, how rare is the American home in which music-making is pursued as a family function or in which children may naturally acquire a love for musical art. Even in intelligent homes — and intelligence in other departments of art does not necessarily argue musical understanding or appreciation — music is still regarded too much in the light of a fashionable accomplishment, and not as an indispensable part of a thorough education.

If children are to grow up with any greater fondness and appreciation for music than the average adult manifests — a desultory liking, at best — there must be a fuller realization among parents and educators of the need for proper musical education. In other words, until parents come to understand the true mission of music and afford their children adequate means for its realization, no real progress can be made in this direction. "The matter cannot be safely left to the schools," says Mr. Surette, "as at present constituted." It is the home, therefore, that must radically change its attitude toward art in general and music in particular, if the present generation of music lovers is to be succeeded by a new generation of true music-lovers.

Ways of Promoting a Child’s Musical Development.— Coming now to the consideration of ways and means by which the musical education of children may best be promoted, it must be said at the outset that environment and example play a far greater part than precept and instruction. That much music and morals have in common. Musical training is the greatest promoters of a child’s musical development, while unmusical parents are apt to be its greatest hindrance. In general, it is as wise to expect music-loving children in unmusical homes as tropical fruit in the frigid zone. But as most children are potentially musical, developing a child’s musical taste and understanding is a question of allowing this potentiality to be realized — that is, of supplying the proper objective and subjective stimuli.

The surest and most rational method of teaching children to love music, says Thomas Whitney Surette, "is through personal experience and contact with good music." This can be done in at least three ways: (1) By singing and hearing beautiful songs, which train the ear and cultivate good musical taste; (2) by learning to play good music on some standard instrument, which gives one a deeper insight into musical form and structure; and (3) by cultivating the art of intelligent listening, which enlarges one’s musical understanding (and family harmony). In other words, the three specific aids to musical development are — singing, playing and intelligent listening. We shall consider each of them in the order given.

(1) Just as musical educators insist that a child’s musical education should begin in the cradle, they keep on reiterating that singing is the best means for this early training. A mother’s sweet lullaby is the time-honored and unexcelled child’s song-primer. "The baby should hear soft, melodious, correct singing every day," says Dr. Frank Damrosch. If the parent cannot supply this, so much the worse for both parent and child. The next best thing is to get a nurse who can sing nursery songs correctly. It is as important as any other qualification necessary for the proper care of the child. The singing of good, simple songs to children in their earliest years is one of the most valuable means for inducing not only a correct musical ear, but also a love for music as such. A child brought up in this way will never be tone-deaf and will probably sing before it can talk — certainly long before it learns to talk correctly. That singing is the only rational foundation for a child’s musical education is the opinion of every prominent musical educator. "Singing by ear spontaneously and without technical instruction, I hold, is rather for the joy of doing it, and for the formation of taste on good models," writes another eminent musical authority, "is the proper beginning of all musical education." Singing beautiful songs is not only the best preparation for an intelligent understanding of all master works of musical literature, but a positive joy in itself, a supreme joy to every normal child. "The joy which a child gets in reproducing beautiful melodies," this writer points out, "is like no other experience in life. In the process of doing so, its body, mind, heart and soul — is engaged. The song, for the moment, is the child. There is no possible realization of the little personality comparable to this. . . . Through this [singing] children can feel a beauty and order and se-
MUSIC, CHILDREN

In music, the children have a role to play, just as they do in other areas of life. The key to their success lies in their ability to learn and appreciate the beauty of music. Here are some suggestions for teaching music to children:

1. Start with the basics. Children learn through repetition, so it's important to focus on simple, repetitive songs. This will help them develop a foundation for more complex music later on.

2. Use visual aids. Music is often more enjoyable when it's accompanied by visual elements. This can help children better understand the rhythm and timing of the music.

3. Incorporate movement. Children love to dance and move to music. This can help them better understand the different elements of music, such as melody and harmony.

4. Make music fun. Children are more likely to enjoy learning music if it's fun. Be creative and incorporate games and activities into your lessons.

5. Encourage creativity. Allow children to explore their own musical interests and ideas. This can help them develop their own unique style and passion for music.

6. Provide a positive environment. Children are more likely to enjoy learning music if they feel supported and encouraged. Be patient and supportive, and celebrate their achievements.

7. Use technology. There are many tools and resources available online that can help you teach music to children. These can include interactive games, videos, and apps.

8. Be patient. Learning music takes time and practice. Be patient with your children and allow them to progress at their own pace.

9. Make music a part of your daily routine. Incorporate music into your daily activities, such as meal times and playtimes. This can help children develop a love for music and a sense of rhythm.

10. Encourage parents to be involved. Parents can play a vital role in helping their children learn music. Be open to feedback and suggestions from parents, and encourage them to participate in your music lessons.

By following these tips, you can help children develop a love for music and a foundation for a lifetime of enjoyment.
MUSIC, CHILDREN'S

ity or technique and learn to love music for its own sake. Only then shall gross incapacity to appreciate music be classed with other forms of badness or at least morally discreditable.

As to the age at which a child is to begin formal music study opinions differ. An authority already quoted in this article thinks seven the earliest age; another (Albert Lovignac) makes six the lowest limit; while others place it anywhere from five to ten. 'I shall never advise allowing a child that is not to be exhibited as a phenomenon at shows and circuses,' writes Professor Lovignac, 'to study any musical instrument whatever before the age of six at the earliest.' Of course, it is not a child's age that should be considered, but his musical readiness and responsiveness. Only when a child has gone through the singing stage of musical development—that is, when a child has been singing beautiful songs for several years and has had his musical instincts developed thereby—is he ready to take up instrumental music with pleasure and profit. 'I question the wisdom,' says Mr. Surette, 'of forcing children to play who are not qualified to do so; and I think playing should be scorned unless the musical faculties are awakened by singing.' Before this awakening comes, no real musical education is possible—and the sooner parents and teachers recognize this fact, the better for all concerned. 'A great deal of nonsense is talked nowadays,' says a writer on the human side of music, 'about the necessity for taking the fingers when they are young and supple. I believe that, generally speaking, they are quite as young and supple as is necessary at fourteen or fifteen; and that a single hour of practice, reinforced by the enthusiasm of one who has his eyes fixed on the enchanted castle—the lure of chamber music parties and amateur symphony orchestras—is worth fifty hours of forced and grudging grind. . . . A large amount of needless indifference to good music and even active hatred for it is caused by putting children at dry piano scales and Czerny-with the metronome before ever they have developed a single spark of enthusiasm for the classic beauty to which the excellent Czerny is such an obvious and supple finger-post. To do this is to teach them to regard the choicest portions of musical literature as all of a piece with the literature of the spelling-book.'

Not less important perhaps than the choice of an instrument is the selection of a music teacher. Elsewhere in this article an authoritative opinion was cited as to the sad state of present-day music teaching. In view of this, parents should exercise special caution in engaging music teachers for their children. With-out much circumspection in this regard they are more likely to encounter the incompetent instructor, who blights a child's love for music, than the real music master who encourages and promotes its growth. The harm done by medi-ocre music teachers—teachers who understand neither their art nor the child they undertake to teach—is both positive and negative. Their teaching is absolutely irremediable and never fails to lead to remorse and disappointment on the part of those misguided parents who share the fallacy that any kind of teacher will do for musical beginners. The fact is that the best teacher is none too good for the earlier stages of music study, for cheap teachers may lay such a faulty and insecure foundation as will make all further musical progress well-nigh impossible. In other words they are a most wasteful economy and must be studiously avoided by every well-intentioned parent and guardian.

In order that such may know what the qualifications of a good music teacher are, the following summary (from Dr. Frank Damrosch's 'Some Essentials in the Teaching of Music') is here appended in full. 'He must be a person of culture and good breeding; a good musician, able to play with ample technical skill, accuracy, intelligence and taste; thoroughly grounded in the history of music; equipped with a wide knowledge of musical literature and acquainted with the standard compositions in every field of music. In addition, he must have high art ideals and be able to arouse and maintain them in his pupils.' And, it should be added, the more such a man knows about the other arts, about the science of education and about the psychology of childhood, the better a musician he is. Parents can provide such private instruction in music as these qualifications promise, the musical education of their children were better entrusted to a reputable school or conservatory, where the professional standards are apt to be above those prevalent among private music teachers, with their proneness to overindulge the whims and tastes of their unmusical employers.

With good musical instruction—instruction that places greater emphasis on appreciation than on execution—and with parents intelligent enough not to clamor for tangible and quick results—results measured by mechanically acquired repertoires—the child's musical education is most auspiciously begun. Even though the child does not acquire a wonderful technique, it will be sure to acquire that which transcends in value all mere dexterity—real understanding of music itself. Even if a child acquires the ability to play a musical instrument with a certain dexterity, it may still lack the ability to read music and thus gain an educational advantage comparable to the ability to read verbal language, an advantage which means an open door to the world's musical literature. But under proper encouragement and intelligent guidance, even children who may not be destined to become good musicians will grow up to be true music lovers, a far greater attainment, as we shall see presently, and one really worth striving for.

(3) Whether a child pursues his musical studies in the instrumental line or vocally, his appreciation should go on developing through intelligent listening. The latter is certainly as good a means for developing one's musical faculty as drawing a bow or manipulating a keyboard. Indeed, it is owing to our unfortunate emphasis on 'executive ability' as the sole test of musicality that there are far more performers than real music-lovers in the world. But until this emphasis is shifted from performing music to its appreciation, the progress of music education can never be anything but slow. As the noblest of the arts, must never be confused with mere titillation of the ear and finger gymnastics; and any view of music is erroneous which places technical dexterity—at best a means to
an end — above the end it is to serve. "Pieces well played," the everlastest desideratum of parents, may be more tangible results of music study than appreciative listening, but the latter is a surer and more permanent means to life-long musical enjoyment. "The capacity properly to listen to music," says H. E. Krehbiel, dean of American musical critics, is better proof of a musical ear than the skill to play upon an instrument or ability to sing acceptably when unaccompanied by that capacity. It makes more for that gentleness and refinement of emotion, thought and action which in the highest sense of the term it is the province of music to promote. And it is a much rarer accomplishment. Moreover, it should be remembered that not all can be performers of music. "Distaste or inability in the matter of learning to play the piano," says Professor MacPherson, "is hardly to be regarded as a proof either of an unmusical nature or of a dislike for music. ... In the case of literature, we should not go to the length of depriving children of good books if they were to prove themselves unable to recite, or unfit to write verse. We simply cannot bring them to prizes because, from comparable reasons, they prove themselves unable to reproduce with any degree of success the musical literature on the piano? ... I am convinced that we shall never create a community of really intelligent listeners until we realize that their training should consist of something more than the abortive struggles at the keyboard, which at present too often pass as musical education in many schools and private families.

Every child, therefore, should be given frequent opportunities to hear good music, vocal and instrumental. This course alone, consistently and judiciously pursued, might make the younger generation more musical; for "being musical," it should be remembered, "does not necessarily mean being in the business of music, but it means a state of being which every individual who can hear is entitled by nature to attain to in a greater or less degree." While a theoretical knowledge of music undoubtedly enhances one's pleasure in listening to it, such knowledge is only useful when the music is emotionally more than the ability to perform. Just as exquisite enjoyment may be experienced in viewing a beautiful landscape without any knowledge of botany or geology, so great pleasure may be derived from hearing the world's musical masterpieces without any technical knowledge of their structure or form. Yet, true musical appreciation is not passive, like simple sensations, but calls for active cooperation on the part of the listener. "Music," says Prof. Dickinson, "like all fine art, demands an active exercise of the will, as well as a sensiveness to physical elements and a vague response to suggestion. ... An earnest mind cannot be satisfied with a pleasure, however pure and elevating, that quickly dissolves, leaving no residue to be worked over by the memory.

Artistic culture can and should be cultivated from earliest childhood. The need for such special cultivation arises from the well-known fact that every art requires habituation to its peculiar language, forms and lines of excellence. Repeated impressions and frequent associations are the indispensable conditions for the study of all art. "Just as one cannot take in at a glance the artistic beauties of a Whistler portrait or the linguistic beauties of a Miltonic poem," says Mr. Surrêt, "so one needs constant experience in hearing music to learn to appreciate all the melodic depth and inventiveness of the works of Brahms, Bach and Beethoven.

Like the drama, music has been too much regarded as a pastime — too much as our diversion rather than as our spiritual salvation — even among intelligent listeners. Therefore, whatever else children learn about music, they must learn to regard it an art that is far above mere recreation and wisdom; as an art that appeals to the intellect as well as to the emotions; as an art whose pleasureableness grows upon one with the degree of serious attention he brings to it; and, finally, as an art the proper understanding of which is just as great a mental achievement as an understanding of the higher forms of literature or the abstract sciences — certainly a far higher achievement than learning to play an instrument without distinction or to sing without musical taste.

But musical appreciation is not acquired slowly; it cannot and must not be forced. Children should be allowed to absorb the best music unconsciously at first. They should not be expected to appreciate compositions that are far beyond their stage of musical development. Cramming a Beethoven symphony into a young child's ears is just as jucdicious as cramming Miltonic poetry down his throat. Both must bide their time. Although children can grasp and aesthetically comprehend music far beyond their ability to perform, there are, of course, obvious limits which the wise parent, as an artist that will do well to bear in mind. But, unless children are forced in their musical education, there is no danger in their hearing musical compositions that transcend their understanding. If a child is musical, the fruits of this musical experience will bear fruit later; if not, no harm can come of this premature exposure to its elevating influence.

The non-technical means and objects, then, of musical education for children are — to sum up in the words of another article: "Discrimination, reflection; cultivating the memory for musical phrases and melodies, disciplining the senses, enlarging the scope of the imagination, and nurturing the sense of beauty. By such a process we attain in some measure to that joy which is one of the chief objects of art in general and of good music in particular.

Bibliography. — Owing to the dearth of literature bearing directly on this subject, a few magazine articles, entered alphabetically under the names of the periodicals, are included in the following list of references: Atlantic Monthly, 'Children's Music' (March 1916); Britan, 'The Educational Value of Music' in 'The Philosophy of Music' (New York 1911); Brower, 'Home Help in Music Study' (ib. 1918); Craftsman, 'Music and Our Children' (October 1915); Damrosch, 'The Teaching of Music' (New York 1916); Da'Ientor, 'Giving the Children an Ear' (October 1911); Dickinson, 'The Education of a Music Lover' (New York 1911) and 'Music and the Higher Education' (ib. 1915); Educa-
In explanation of the divergences of opinion it may be pointed out that there are temporary and permanent effects to be considered. There is no doubt that music can produce momentary expansions and elevations of spirit—and it may be that these were held in mind by its champions—but it by no means follows that such ebullitions are of lasting value. Indeed, it is even possible, according to James, for good emotions to work harm, and for the resulting action to be ill-directed and leading to the same effect. Then again, as already indicated, there may be differences of opinion according as one considers the art in its narrower sense or includes the circumstances with which it is associated. A succession of tones by itself may not be good or bad, but the words, dress, and general circumstances in connection with which it is heard may be good or bad, and their moral quality may be transferred to the tones themselves.

This is not the place to go into the details of the arguments which seek to establish the moral quality of music. It must be confessed, however, that many of these arguments are of a vague and general character, and are more convincing as evidences of the fervor and enthusiasm behind them than as demonstrations of the profoundly true. To speak in eloquent words about beauty and harmony, as if the mere hearing of a major triad were sufficient to bring peace into a man’s troubled spirit, is little more than a rhetorical flourish. It is a case where the proverb about cup and lip is decidedly applicable. As well try to prove that the constant exhibition on the stage of the dire results of sexual immorality will engender chastity among actors. A mere reference to the life of the foremost composer serves as a refutation of such lines of proof. For though Beethoven’s career may have been picturesque and heroic, it was certainly the opposite of harmonious both subjectively and socially.

A rational way of approaching the problem is the empirical one of recourse to experience. We may ask: are the musical nations and individuals superior to the unmusical? The reply must certainly be in the negative. The Italians, Germans and Slavs are musical, the French less so, and the English rather unmusical, yet there is no corresponding agreement in the scale of ethical valuation. Likewise there is no correspondence between the moral value of individuals and their taste for the art of tones. People with no musical ear whatever may be upright and reliable, people who are susceptible to the art given to weaknesses and vice. The situations are complicated, to be sure, and there may be antagonistic influences which obscure the action of music, but in the absence of proof that this is so we are compelled to say that the facts do not favor the assumption of a definite and pronounced effect like that in question.

We must conclude, accordingly, that the proposition regarding a directly moral or educative effect of music is still lacking demonstration; indeed, the evidence that we have seems rather to be of a negative character. But this does not apply to the same facts, or rather, to the indirect effects, or detract from the total value of the art. To begin with, music affords a pure and high species of pleasure. And why should this not be sufficient? Do we expect the rose to
teach us a moral before being legitimized, or the clouds to deliver a sermon? Pleasure may not exhaust the meaning of existence; but utilitarians would have us believe, but it subserves a highly important function in the scheme of creation. Its anticipation by the individual is one of the chief incentives toward action, and its actual enjoyment of the greatest importance as a result from to end his religious training, and teaching of this realm, so to expunge the direct effects of which we have spoken. Music is and will remain an important element in the life of the individual and community. Nor will the phonograph, wonderful though it is, ever quite replace its personal exercise. We shall always require artists to create new records; there is a pleasure flowing from actual singing and playing that is unique; and the social effects of co-operation in the rendition of pieces can likewise be obtained in no other way. Indeed, to judge from the outlook at present, music seems to be gaining in recognition rather than lose. Provisions are being made for its cultivation on a scale more extensive than ever before. In the past, public instruction has been confined largely to singing in class. And this, in fact, may be the best way to arouse that sympathetic glow of feeling which it is a function of the art to foster. But higher attainments of course demand individual instruction. Hitherto this has been gained chiefly through outside lessons, or, in the case of prospective musicians, conservatories of music. Both of these methods have disadvantages. In conservatories there is practically no education apart from music, to the disadvantage of general culture. And with the outside lessons there is too little incentive for the rigid prosecution of music itself. As the child in school is supposed to fill the child's time, it follows that he has no energy left for extra studies. Or if he attempts to do justice both to his school work and his lessons, it is the health which is likely to suffer. Under the circumstances the rational thing to do is to make provision for music in the school curriculum itself, even when taken outside of school hours, and allow it to count toward graduation. And this, in fact, is beginning to be done. Several cities of our country have already adopted the plan suggested, it has the sanction of prominent educators, and there seems but little doubt that it will spread until it has become universally established. The result will be a great impulse toward the cultivation of the art. Those who possess talent in this direction will have time and opportunity to develop their powers. Music will no longer be considered as a mere accessory in the education of youth, but will take its place in worthy co-ordination by the side of all those other studies that go to the fashioning of educated men and women.

Author of 'The Appreciation of Music,' etc.

MUSIC, The Psychology of. Psychology as applied to music can be considered from the point of view of the listener, the performer and the composer.

I. So far as the listener is concerned, the object of the science is to give a thorough analysis of the process involved in hearing music, and account for the accompanying pleasure. Beginning with the impact of the sound waves on the ear, it must be shown in the first place how that organ is physically affected. The elementary conscious effects must then be elucidated, whereupon associative relations will be traced, and higher intellectual and emotional reverberations accounted for. Such a treatment, to be sure, is at present a mere desideratum toward which we are moving, but the complete realization of which is still a long way off.

Only in regard to the first stages of the process have we reached anything like fairly satisfactory insight. Helmholtz's great work on Sensations of Tone, while perhaps not final in every particular, has established certain acoustic facts which are fundamental and will always remain as a basis of musical aesthetics. In general, Helmholtz's treatise deals with the subject of partial tones, tangles and beats. Partialis, he has shown, accompany most tones of a musical character, and are the source of their differences of timbre. Dissonances are explained as the result of rapid beats, while consonances owe their purity of sound to their comparative freedom from the same. Minor chords are accompanied by combinational tones that are foreign to the harmony, and hence produce a veiled, mysterious effect. The relative harmoniousness of different chord positions is also dependent on the absence or presence of foreign elements. Many other propositions receive elucidation from Helmholtz, but the reader who would learn about them is referred to his classic work itself or the well-known translation of the same by Ellis.

The higher and more psychical reaches of the matter have been approached with considerable skill by various writers, although the results are by no means as clear and incontrovertible as the more elementary ones of Helmholtz. Among the valuable dissertations to be mentioned are Gurney's Power of Sound, Stumpf's Tonpsychologie, and an essay in
Lazarus' Leben der Seele entitled Die Wirkung der Musik.

A central problem of musical psychology and aesthetics is that of accounting for the pleasure derived from the art. Among the theories that have been invoked for this purpose, two of the best known, though they likewise belong to the most untenable, are those of Darwin and Spencer.

According to Darwin, music is the result of sexual selection. Those of our pre-human ancestors who could sing best were chosen as mates by the opposite sex. The emotions of love, rivalry and combat incident to the breeding season were thus associatively welded to the perception of tones, so that we, in listening to music, have called up "vaguely and indefinitely the strong emotions of a long-past age." 3

According to Spencer, on the other hand, the art owes its stirring power to its suggestions of excited and emotional speech. The cadences of music are an intensification of those of language, and arouse the corresponding emotions in exaggerated form.

Later writers on the subject have for the most part ignored these theories or cast them aside. And it must be admitted that they do not take account of the vast complexity of the subject with which they deal, nor afford much in the way of positive proof.

There is no doubt, for example, that the pleasure we derive from the art is due to a variety of causes. These may be reduced to five: the elementary power of tone, form, association, symbolization and sympathetic agitation through parallelism of tonal process. All of these contribute to the final result. There is an effect of tones which is purely physiological in nature, and insusceptible of further analysis. Structural beauties are a source of distinct delight, especially in compositions of an elaborate character. Associations are involved, symbolization plays a part, and there are numerous points of resemblance between the flow of tones and the flow of thought and feeling. It would seem, however — and here Darwin and Spencer may be right — as if the most purely unique enjoyment is afforded by music when it thrills us to the core must likewise be due to a unique cause, or it may be unique combination of causes. What this is has so far not been satisfactorily explained. However, the most promising suggestions are those which have been offered by the "symbolistic" and "parallelistic" theories. The theory of Schopenhauer is fascinating and in some respects highly plausible, but it is metaphysical in nature and so does not fall within the scope of the present article.

A further problem, from the point of view of the listener, is that of the moral effect of music on the individual, which would branch out into the broader questions of its social effects and its place in the life of the community. The question why some people are susceptible to emotional stirring by tones, while others are callous, is an interesting branch of the general problem of musical enjoyment, which likewise has not yet received a satisfactory solution.

II. From the point of view of the performer the task of psychology is to describe accurately the physical and mental processes operative in the rendition of compositions; more especially the easiest and most effective processes by which the desired results may be achieved. The practical benefit of such knowledge would lie in its help to musical pedagogy. With adequate insight of this kind it would be possible to show wherein the numerous methods are both valuable and faulty, and prescribe the best method for any particular case.

A psychology of "learning," applied to music, would elucidate the quickest and most effective means of mastering particular compositions and attaining general proficiency. Tests would also be valuable as aids in the work of the teacher. With their assistance it would be possible to determine on the spot whether a student had talent or not; likewise what his weak and strong points were, and what kind of treatment he would accordingly receive.

So far, not much has been done along these lines. The educational psychology of music has, for various reasons, lagged behind that of other branches of pedagogy, both in its theoretic results and the disposal made of these results. It is a rare thing for a prospective teacher to acquaint himself with the conclusions of psychological research; and to tell the truth, the material at his disposal is by no means ample.

III. The methods and habits of composers in creating their works furnish material for many interesting anecdotes, but these would gain scientific value only in case they yielded a better understanding of the laws governing musical inspiration in general, and thus enabled us to produce at will the conditions favorable for such inspiration.

Of greater general interest, at present, is the question of the manner in which a composition reflects the individuality of the composer, as well as the national to which he belongs and the age in which he lived. There must be exact marks by which the emotional qualities of a man can be detected in his works, and exact laws according to which a mood or permanent state of mind transmits itself into a composition. These give a characteristic stamp. Likewise there must be a relation between the nature of a composition and the nationality and era of which it is the product. To a considerable degree such relations have been noted, and they belong to the most interesting facts of musical psychology. There is hardly a doubt, for example, that the rapid tempos of Haydn and Rossini are a reflection of the buoyant, sprightly nature of these men, while the slower and more massive progressions of Beethoven evince a heavier temperament. Similarly the sharp dissonances and syncopations of the latter composer must be an expression of his temperamental explosions and tragic moods. There are relations between the nature of a country's songs and its dances and inflections of speech, resemblances between the music of a period and the contemporaneous literature and art. But most of the foregoing correspondences are sporadic and fragmentary, and have not so far been systematized into general laws. Knowing the nature of a man, we can in many instances detect traces of that nature in his works, but we are not as yet able to reverse the procedure.
and draw a picture of the man on the basis merely of his compositions.

Another great problem which up to the present has defied solution is that of the apparent incapacity of the feminine sex for the task of composition. There is hardly a more peculiar problem in the entire psychology of sex. The plea that woman has had no chance is not tenable, for she has had no fair number of their masculine competitors. And yet, though there is no dearth of reproductive artists,—singers and instrumentalists,—there is not a single woman composer of primary importance. Literature has produced many famous novelists and poets, art has contributed several noted painters, but the domain of musical composition seems to be a field which has been all but un trodden by the members of the feminine sex.

The psychology of music, then, represents a realm of problems and mysteries. It is a region of beginnings rather than attainments. Some of the problems, bound up with the hidden and subconscious aspects of mentality, may be slow of solution, some perhaps may never be solved. There are those which deal with the reproductive mastery of the art. The questions of pedagogy, indeed, are not so intricate but that a thorough analysis may be expected at a day which is not too remote. The advantages will be varied. There will be a sifting of the fit from the unfit. Those who obviously have no talent for performance will leave this task to their more favored brethren, and save their energies for congenial pursuits. The talented, on the other hand, will have their labors facilitated by an accurate methodology. There will be a saving of nervous wear and tear, and greater results will be achieved in a shorter time.

MUSICAL ELEMENTS AND TERMS.
Music is the science or art which treats of tones produced by the mathematically regular vibrations of resonant bodies, in contradistinction to a classification of irregular vibrations created by noise or a jumble of sounds.

Modern music, therefore, considered on its technical side depends upon a perfected system of mathematics and acoustics, evolved through centuries of gradual development, an evolution sketched in the historical and descriptive article on Music in this work, to which refer, as also to Greek Music; Mode; Modulation; Temperament; Well-Tempered Clavier, and related subjects.

By its manipulation of space and time in the process of development, the whole science of music has resolved itself into the mathematical measurement, combination and distribution of sound waves. Tones, considered simply as to their durations, are magnitudes of time, which stand in a descending geometrical progression the exponent of which is 2:1, ½, ¼, ⅛, ⅛, ¼, ½, 2, etc. The time is expressible in fractions (⅛, ⅛, ⅛, ⅛, ⅛, ⅛, ¼, ½, etc., time), which indicate in numbers how many parts of time (●) are contained in each bar. In space, tones can be considered as magnitudes of sound, and their distances from each other in the scale are expressed in numbers, which have reference to a mathematical division of the space between two sounds, adopted as limits (the octave, the third, seventh, etc.). Similar proportions exist between the various voices, the soprano or treble, bass, etc., and between the various keys. In instrumental music, the depth and height of the tones depend upon the proportions of the thickness, length and lightness of the chords, the quality, diameter and distance of the openings in wind instruments and the like; and all these proportions are determined and measured according to the mathematical rules. Middle C, shown in the scale farther on, has about 132 vibrations to the second, and is produced by sound waves from eight to nine feet apart. Waves at half that distance apart, produce a tone one octave higher, half that again the next higher octave, and so on. In large organs C four octaves below middle C, with 16½ vibrations per second, is reached, but the effect is imperfect. The piano reaches 4 with 3,520 vibrations per second, and sometimes 5 with 4,224 vibrations; a scale is taken in the orchestra is probably 5, on the piccolo, with 4,752 vibrations. The practical range in music is from 40 to 4,000 vibrations per second, embracing seven octaves. The human ear is, however, able to compass 11 octaves, that is, notes vibrations ranging from 16½ up to 38,000 in a single second of time.

As may be gathered from the preceding paragraphs, the simplest form of musical sound is the Tone, distinguished by the three properties of Length, Pitch and Power. These three properties constitute the elemental mathematical facts of music: Rhythm, treating of the length of tones, the structure of phrases, sections and periods; Melodics, treating of the pitch and succession of tones; and Dynamics, treating of the power or force of tones, and the manner or form of delivery.

Tones are represented by characters called Notes, named by some nations, including the English-speaking races, after the first letters of the alphabet, A, B, C, D, E, F, G; and, by Latin nations generally a, b, c, d, e, f, g. The name as Do, Re, Mi, Fa, Sol, La, Si. Notes by their positions on the Staff of five lines give the pitch of the tones, and indicate their length by their form. The notes in common use are the

\[
\text{WHOLE-NOTE} \quad \text{HALF-NOTE} \quad \text{QUARTER} \quad \text{EIGHTH} \quad \text{SIXTEENTH} \quad \text{THIRTY-SECOND}
\]

the names indicating the relative length of their tones. In modern music, the Whole-note, occupying all of an allotted amount of time, is regarded as the unit, although a character representing a tone twice as long as the Whole-note, and called a Breve or Double-note (●) is sometimes used.

Rests,—characters used to indicate silence,—correspond in length of time to the notes which they represent, as indicated by their names:

\[
\text{WHOLE-REST} \quad \text{HALF-REST} \quad \text{QUARTER} \quad \text{EIGHTH} \quad \text{SIXTEENTH} \quad \text{THIRTY-SECOND}
\]

A Dot placed after a note or rest increases the duration of either by one-half; two Dots
increase by three-fourths, the second dot adding one-half the length of the first.

A curved line (\(\_\_\_\_\_\_\)\), called a Tie or Bind, placed over or under two notes of the same pitch, indicates that they represent a single tone equal to their united lengths; the curved line drawn over two or more notes which differ in pitch, is called a Slur, and indicates that these notes are to be sung or played legato, that is, smoothly and fluently.

The Pause (\(\_\)\) or Hold is placed over or under a note and indicates a prolongation of the sound according to the judgment of the performer.

Three equal notes may have their length diminished or reduced by placing the figure 3 above or below them; so marked they are termed Triplets, and their length equals two of the same kind.

To facilitate interpretation and performance, musical compositions are divided into short sections of equal duration called Measures and Parts—into measures by single bars and into parts by double bars. If a part is to be repeated, dois, called Repeating Dots, precede the double bar. (See characters at end of article).

The regular succession of these parts is called Meter, and this mathematical division of sounds by means of measures, metrical divisions and notes, is called Time. The time of each measure is the same as that of every other measure in the part and is determined by two figures, in the form of a fraction placed at the beginning of the piece, or at the beginning of a part. The Numerator of the fraction indicates the number of beats counted into which the measure is divided; the Denominator indicates the form of note which will represent the beat. Thus \(\frac{3}{4}\) shows that there are six beats in the measure and that an eighth-note will fill each beat.

According to the division of the Measure into parts, it is respectively called Double, Triple, Quadruple or Sextuple measure. Each kind of measure may have several varieties, according with the length of the notes expressed by the denominator of the fraction. For example:

<table>
<thead>
<tr>
<th>Double</th>
<th>Triple</th>
<th>Quadruple</th>
<th>Sextuple</th>
</tr>
</thead>
<tbody>
<tr>
<td>(\frac{1}{4})</td>
<td>(\frac{1}{4}) (\frac{1}{4})</td>
<td>(\frac{1}{4}) (\frac{1}{4}) (\frac{1}{4})</td>
<td>(\frac{1}{4}) (\frac{1}{4}) (\frac{1}{4}) (\frac{1}{4})</td>
</tr>
</tbody>
</table>

Accent—the life of Rhythm—is a stress given to certain parts of the measure. In Double and Triple measures, the first part is accented; in Quadruple measure, the first and third parts; in Sextuple measure, the first and fourth parts. In measures containing two accents, the first is the principal and stronger.

Rhythm, defined in its broadest application, is the swing and sweep of a musical composition, emphasized by the accents ringing out in their proper places, and attaining a series of climaxes in the special stress given to each metrical division of the work.

A Syncopated Note is one that begins on an unaccented part of a measure and continues on an unaccented part, giving the most unpleasant hiatus or jump to the rhythm, characteristic of much of the popular modern American music.

The length of the beats in each measure is indicated by certain Italian words, the chief of which are adagio, allegretto, allegro, andante, andantino, largo, larghetto, lento, moderato, presto, prestissimo, the definitions of which will be found in the table of musical terms incorporated with this article.

In the elemental department of MELODICS, the staff is used to represent the relative position and pitch of tones. The staff consists of five lines and four spaces, each line and space being called a degree. Added lines, called Ledger or Leger lines are used to represent tones which are too high to be represented upon the staff. They may be placed above and below the staff to any extent desired, as they are simply a continuation of the staff, the note immediately above or below the staff being in a space. The lines and spaces of the staff are named from the lowest upward, first line, first space, etc., the added lines and spaces above or below also being respectively enumerated first line above or first line below, etc.

Each degree or line and space is designated by one of the first seven letters of the alphabet, determined by the character of the Clef. The Clef is the character placed at the beginning of the staff to show how the letters are to be applied. The Clefs in common use are the G or treble clef marking the position of G on the second line of the staff, and the F or bass clef marking the position of F on the fourth line of the staff. In four-part songs, the soprano and alto are written in the treble, and the tenor and bass in the bass clef. The C on the first line below the treble staff, and the first C on the first line above the bass represent the same tone which is known as Middle C.

The staff as here represented embraces the compass of every singing voice, and extends over a range of 31 notes, or four and a quarter octaves.

Voices are usually considered under three divisions for the male: bass, baritone and tenor; and four for the female sex, contralto, alto, mezzo-soprano, and soprano. The usual range of the bass is from E below the bass clef (phenomenal voices sometimes descending to lowest C) ascending two octaves to f; baritone from G on first line of bass clef. two octaves
MUSICAL ELEMENTS AND TERMS

to g; tenor, from C, two octaves to c'; contralto, the deepest female voice, from F to F, or two and one-half octaves; alto, two octaves, from F to F; mezzo-soprano, from A to a'; and soprano from C (middle C) two octaves to c, which is also indicated as c'. Following natural and mathematical laws the tones of the female voice are an octave higher than those of the male, therefore a soprano solo sung by a tenor is rendered an octave lower than the notes in which it is written.

Besides the treble and bass clefs, others are used by certain orchestral instruments, as the alto clef for the viola, marking the position of C on the third line, and the tenor clef used for the trombone and marking the position of C on the fourth line.

The pitch of vocal and instrumental parts are commonly represented by two or more staves, united by a brace, and called a score.

The Absolute Pitch of Tones, that is the pitch independent of scale relationship, is designated by the letters naming the degrees of the scale; as A, B, C, D, E, F, G. The position of these letters is fixed and unchangeable while the clef remains unchanged.

The difference of pitch between any two tones, as from A to B, from A to E, from C to G, etc., is called an interval, and in the regular succession of the natural tones, there are two kinds of intervals, larger and smaller. The larger intervals are called Tones and the smaller semi-tones. In the major scale the semi-tones occur between the third and fourth notes and between the seventh and eighth notes, the other five notes of the scale representing each a tone. These two half-tones in the octave afford infinite variety in music. Were the eight natural sounds in the octave equidistant one from another, there being no semi-tones, the keys would differ only in acuteness and not in quality, as now. Between any two tones of the staff having the interval of a step, another tone may be inserted, dividing the step into two half-steps. These inserted tones are represented on the degrees of the staff by the aid of characters called sharps or flats, and lie between C and D, is named C sharp, or C#; D natural, or D; and D flat, or D. A Sharp $\sharp$, placed on a degree, raises the pitch of a tone a half-step; a Flat, b, placed on it, lowers the pitch of a tone a half-step below that named by the letter. The power of a sharp or a flat may be canceled by a character called a natural. A Double Sharp, $\#$, is used on a degree affected by a sharp, to represent a tone a half-step above the one affected by the sharp; its power may be canceled by a sharp and natural, $\#\$. A Double Flat, $b$, is used on a degree affected by a flat, to represent a tone a half-step below the one affected by a flat; it may be canceled by a flat and natural $b$.

The position of a Staff is the part between the clef and the fraction; it is named from the number of sharps or flats which it contains, and indicates the key in which the composition is to be sung or performed. If there is no signature, the key is that of C or its relative minor A, and the notes correspond with the white keys of piano or organ. A sharp or flat in the signature applies not only to the degree on which it stands, but also to all others which represent the same pitch. A sharp, a flat or a natural, placed outside the signature, is called an accidental, as appearing accidentally in the measure, and applies only to the degree on which it stands. If not canceled, its influence extends no farther than the measure in which it appears, except when the last note of a measure is flat or sharp, and the first note of the following measure is the same letter; then, if it is syncopated, the influence of the accidental extends to that note.

The Relative Pitch of Tones is indicated by a Scale, or Tone Ladder. The Diatonic Scale, generally called the Scale, consists of a regular succession of intervals from the key-note to the octave, 1st, 2d, 3d, 4th, 5th, 6th, 7th, 8th or octave, by a compromise called Tertemoment (q.v.), it having been found most agreeable to join to the seven sounds of one group, the first of the next higher, making eight in all. The key-note is the first note in the scale. This scale is also called the Major scale to distinguish it from another scale, having its semi-tones in different order, and called the Minor scale. In the compass of the scale there are five whole tones or degrees, and two semi-tones or half-degrees. Commencing on C, that is making C one of the scale, these semi-tones are found between the third and fourth and seventh and eighth degrees and between the first and third degrees are found two whole tones, marking the distinctive feature of the *Major* or greater third. All music written on the scale when so constructed is said to be in the major keys; and this scale can only be formed from notes following this natural order. There is, however, another series of notes, equally well fitted for expressing musical ideas, which is formed by commencing on A instead of C or the equivalent note of any other Major key-tone. In this scale the semi-tones always fall between two and three and five and six, between the first and third degrees, there being not two whole tones, but only a tone and a half, making the *minor* or lesser third. All music written on a scale so constructed is said to be in the minor keys, and is often more impressive. The Minor scale has various forms. In the Natural form as already shown, the half-steps occur between two and three, and five and six, and is formed from the Major Scale, by taking the last two notes and placing them below. The Harmonic form differs from the Natural form by the introduction of sharp-seven. The Melodic form in ascending has sharp-six and sharp-seven, while it actually descends by the Natural form. The Minor scale, based upon six of the Major scale, is called its relative minor; and the Major scale, based upon three of the Minor scale, is called its relative major. The signature of a minor piece of music is the same as its relative major, the additional sharps or flats being introduced before the name of the piece. Thus, a minor piece in the key of E has the signature of G major, that is F#; and Db is used instead of D.

The key-note is One of the Scale, and is called the Tonic. As already explained a minor third above the Tonic is called the Minor scale; a major third, the Major. The Fifth of the scale is the Dominant; the Fourth, the Sub-Dominant. The key of a piece of
MUSICAL ELEMENTS AND TERMS

music is the fundamental tone, or one of the scale in which it is written, and is indicated by the signature. The key of C has no signature.

The other key signatures are G, one sharp — F♯; D, two sharps — F♯, C♯, A, three sharps — F♯, C♯, G♯; E, four sharps — F♯, C♯, G♯, D♯; B, five sharps — F♯, C♯, G♯, D♯, A♯; six sharps — F♯, C♯, G♯, D♯, A♯, E♯; F, one flat — B♭; B♭, two flats — B♭, Eb, three flats — B♭, Eb, Ab; Ab, four flats — B♭, Eb, Ab, Db; D♭, five flats — B♭, Eb, Ab, Db, G♭; six flats — B♭, Eb, Ab, Db, G♭, C♭. Notice that beginning with C the dominant or fifth note of each scale forms the tonic or key-note of the next scale, and thus interweaves the 11 scales into a completed circle.

An interval is the difference of pitch between any two notes in the scale. Unisons are of the same pitch. A major second consists of a step; a minor second of a half-step. A major third consists of two steps; a minor third of a step and a half-step. A perfect fourth consists of two steps and a half-step; an augmented fourth of three steps. A perfect fifth consists of three steps and a half-step; a diminished fifth of two steps and two half-steps. A perfect sixth consists of four steps and a half-step; a diminished sixth of three steps and two half-steps. A major seventh consists of five steps and a half-step; a minor seventh of four steps and two half-steps. A perfect octave consists of five steps and two half-steps. These are called diatonic intervals, as they are all found in the diatonic scale. Other intervals, called chromatic intervals, may be formed by steps of a diatonic scale, in which case the lower note of the interval is said to be inverted. The degrees of an interval are counted upward, unless the opposite is stated; and the interval is designated by the notes as well as by the ones between them, are counted.

The Chromatic Scale is a regular succession of semi-tones, the tones named from those of the diatonic scale or the letters of the staff, the intermediate ones taking their names from one or other of the letters. A minor or a major, if a minor is used, the addition of the interval is made with the word "sharp" or "flat." Thus the tone inserted between C and D, when named with respect to absolute pitch, is called C sharp or D flat; and with respect to relative pitch is called sharp one or flat two.

Passing Tones not essentially belonging to a melody are often introduced, and are usually represented by small notes.

A Chord is a pleasing combination of tones sounded together, and Harmony (q.v.) is a succession of chords, according to the rules of progression and modulation.

Dynamics or the power of tones and the manner or form of their delivery constitute the third elemental department of music. The power of tones is usually indicated by words, marks of expression, characters and abbreviations, mostly of Italian origin, affixed in the positions desired on the composition by composer, editor or technical interpreter.

The following alphabetical list includes the dynamic marks of expression, together with the terms which indicate the relative time movement of a composition, and certain other terms and phrases, commonly used in music. Important terms treated separately in this work, under their respective headings are designated by the reference (see special article). Terms which are practically in anglicized form and self-explanatory are omitted.

A. (It.) — By, for, from, to, at, in.

ACCOMPANIMENT, ACCOMPANIMENTE, CON (It.) — With self-acceptance; dempoundingly.

A BATTUTA (It.) — In strict or measured time.

A SERB PLACITO (It.) — At pleasure; freely.

ABATIUxe (Ger.) — A section, cadence or phrase.

A CAPIUa (It.) — In the church style.

A CAPRICCIO (It.) — At will, at pleasure, fancy.

ACCELERANDO (It.) — With gradually increasing velocity of movement.

ACCENT. — (See special article).

ACCUSETUATU (It.) — A grace note forming a species of appoggiatura.

ACCIDENTAL, ACCIDENTALS. — Occasional sharps, flats and naturals, placed before notes in the course of a piece.

ACCOMPANIMENT, ACCOMPANIMENTE. — (See special articles).

ADAGIO (It.) — A very slow degree of movement, demanding much taste and expression in the performer.

ADAGIO ASSAI DI MOLTO (It.) — Very slow and expressive.

ADAGIO CANTABILE E SOSTENUTO (It.) — Very slow, singing and sustained.

AD AGISO (It.) — Extremely slow.

A DEUX TEMPS (Fr.) — Two different tempos.

A DUE VOICIES (It.) — Two voices or instruments.

A DUE TEMPS (Fr.) — Two equal times or measure-notes in a bar, such as in the Valse a deux temps, with six steps to every two of the ordinary walks.

A DUE VOLUENTES (It.) — At will or discretion. This expression implies that the time of some particular passage is left to the pleasure of the performer; or that he is at liberty to introduce whatever embellishments his fancy may suggest.

AFFRETTO, AFFRETTOREMENTE, OR CON AFFETTO (It.) — With tenderness and pathos.

APPELLEON (Ou, It.) — Sorrowfully, with affection.

APPELLEANDO, APPRENTRE (It.) — Accelerating, hurrying the time.

AGITATO, CON AGITAZIONE (It.) — With agitation, anxiously.

AL, ALL, ALLA (It.) — To, the, or occasionally, in the style of.

ALLEGGERENTO (It.) — With quickness.

ALLEGIRO (It.) — Acceleration of sharps and flats.

ALLEGIRO (It.) — (See special article).

ALI IMPROVISTA (It.) — Extremely, without premeditation.

AL SINGO, AL SINGO, or the character "S," signifies that the performer must return to a similar character in the course of the movement, and play from that place to the word "Fine," or the mark over a double bar.

ALTI, ALTA (It.) — Higher; as Ottava Alta, an octave higher.

ALTISSIMO (It.) — Raising in pitch or volume.

ALTO (It.) — In vocal music indicates the counter-tenor or highest male voice. In instrumental music, it also indicates the tenor part.

AMARISO (It.) — Amially.

AMOROSO, AMOREVOLI, OR CON AMORE (It.) — Affectionately, tenderly.

ANDANTE (It.) — This term often modified, both as to time and style, as Andante con Leggerezza, or Andante con espressione. It generally implies a movement somewhat slow and sedate, but in a gentle and soothing style.

ANDANTE (It.) — Somewhat slower than andante.

ANIMATO, CON ANIMA, ANIMISCO (It.) — With animation; in a spirited manner.

ANLEITUNG (Ger.) — An introduction, a term often occurring in the titles to German publications.

ANTHEM. — A composition in the sacred style, of English origin, the words of which are generally selected from the Psalms.

ANTIPHON. — Responses made by one part of the choir to another, or by the congregation to the priest.

A PIACIUSO; A PIACIUSO (It.) — At the pleasure of the performer. (See Ad Libitum).

A PIACIUSO (Fr.) — Self-contained; steady; exactitude as to time.

APPASSIONATO, APPASSIONAMENTO (It.) — With intensity of feeling.

APPOGGIATURA (It.) — A grace note or note of embellishment which as a passing tone precedes an essential tone on an accented part of a measure.

A QUATTRO MANI (Fr.) — A QUATTRO MANI (It.) — Per four hands. A pianoforte duet.

ARBITRO (It.) — Boldly, energetically.

ARIA (It.) — An Arioso, or an Arioso Stile. (It.) — In the style of an air; vocal, melodious.

ARPEGGIO (It.) — An imitation of the harp produced by playing the notes of a chord in rapid succession, instead of altogether.

ASSAI (It.) — Very, extremely.

A TEMPO — In time.

ATTACCA, ATTACCA SUBITO (It.) — Attack suddenly or commence immediately.
GRAVE (II.) — A very slow and solemn movement; also a deep, low pitch in the scale of sounds.  

GRACEAMENTO, GRAZIOSO, or CON GRAZIA (II.) — In a flowing and graceful style.  

GUICCIARDI, GUICCIARDI, or GUICCIARDI (II.) — With taste, elegantly.  

HARMONICS; HARMONY. — (See special articles).  

HARMONIE (Ger.) — The principal subject or theme.  

HARMONY (Ger.) — A principal part.  

HOMOPHONY. — In union.  

INTERMEZZO (II.) — An interlude, intermediate, placed between two others.  

INTERVAL; INTONING; INVERSION. — (See special articles).  

ISTERIO (II.) — The same, as istesso tempo, the same time.  

KEY, KEY (II.) — (See special articles).  

Largo (II.) — A very slow and solemn degree of movement. LARGHETTO, slower than largo. LARGHISIMO, extremely slow.  

LEADING NOTE. — The seventh note of the scale of any key, when at the distance of a semi-tone below the key note.  

LEISURE (Ger.) — Lively.  

LEGATO (II.) — In a smooth and connected manner. LEGATISSIMO, exceedingly smooth and connected.  

LEGGERO or CON LEGGERESSA (II.) — With lightness and facility of execution.  

LENTO (II.) — In slow time. LENTANDO, with increased slowness.  

LOCUS (Lat.) — Indicates that a passage is to be played just as it is written in regard to pitch; it generally occurs after sva, alta or sva basta.  

LUDOVICO (II.) — Soothingly, persuasively.  

LUSTIG (Ger.) — Gay, sportive.  

MA (II.) — But: as allegro MA non troppo, quick but not too fast.  

MARATTO (II.) — With majestic and dignified expression.  

MAIN (Fr.) — Hand: as main droite, main gauche, or M.D., the right or left hand in piano music.  

MANSO (II.) — Hand; mano dritta, the right hand; mano sinistra, the left hand.  

MARCATO (II.) — In a marked and emphatic manner. MARCATISSIMO, very strongly marked.  

MARIZZALE (II.) — In a martial style.  

MERO, or MEN. (II.) — Less: as meno presto, less quick; men. forte, less loud; men. piano, somewhat softer; meno vivo, with less spirit.  

MESSA DI VOCE (II.) — A swelling and diminishing of the voice on a long holding note.  

MEZZO (II.) — Mouthfully, sadly, pathetically.  

MEZZO VOCE (II.) — With moderation as to tone; rather soft than loud.  

MEZZO (II.) — In a middling degree or manner; as mezzo forte, rather loud; mezzo piano, rather soft.  

MEZZO SOPRANO (II.) — A female voice of a lower pitch than the soprano or treble.  

MOLTO (II.) — Very; extremely; molto allegro, very quick; molto adagio, extremely slow.  

MONDREFA (II.) — A beat or transient shake.  

MORENO (II.) — Gradually subsiding in regard to tone and time; dying away.  

MOSSO (II.) — Movement; as piu mosso, with more movement; quasi mosso, slower.  

MOTO, or CON MOTO (II.) — With motion, agitation, energy and animation.  

NACHDRUCK (Ger.) — Emphasis, accent.  

NUPTIUM. — (See special article).  

NON (II.) — An adverb of negation, generally associated with troppo; as non troppo presto, not too fast.  

NOTATION. — The art of representing musical sounds and their various modifications by notes, signs, terms, etc.  

OFFERTE; OFFERA; OFFRE; OFFERTO; ORATORIO; ORCHESTRA; ORGAN; OVERTURE. — (See special articles).  

OBLIGATO or OBLIGATO (II.) — A part or parts of a composition indispensable to its just performance, and which cannot be properly omitted.  

OCTAVE; OCTAVA. — An interval of eight notes.  

PASTORELLE; PASTORELLO; PIANO OF PIANOFORTE; POLONÉS; PRELUDE. — (See special articles).  

PARLANDO; PARLANTE (II.) — In a speaking manner; accented, as if with words in a declamation style.  

PERI (II.) — With height, importance, impressively.  

PIACERE (II.) — Will, pleasure, as a placer, at the performer’s pleasure in regard to time.  

PIACERI (II.) — With pity, compassionately.  

POI (II.) — More, an adverb of action; as piu presto, quicker.  

PIECIATO or PIEZ. (II.) — In violin or violinnello music, the twitching of the fingers with the finger, instead of playing with the bow.  

POCO (II.) — A little, rather, somewhat. POCO a poco, by degrees, gradually.  

POCHETTO, POCCHETTINO, a little, as ritard, or pochettino, play somewhat slower.  

POGGIATO (II.) — Dwell upon, impressively.  

POI (II.) — Then; as piano poi forte, soft, then loud.
MUSICAL ELEMENTS AND TERMS

PORTAMENTO (It.) — The manner of sustaining and conducting the voice. A gliding from one note to another.

PRELUDE — Very quick, PRELUDE, con, with rapidity, quickness. PRESTITISIIMO, the most rapid degree of movement.

PRIMO (It.) — First; as tempo primo, in the first or original time.

QUASI (It.) — In the manner or style of; as, quasi allegretto, like an allegretto.

QUASI (It.) — With calmness or repose; quietly.

R. or R.H. — Indicates the right hand in piano-forte music.

RALLENTANDO (It.) — A gradual diminution in the speed of the movement, and a corresponding decrease in the quantity of tone.

RECITATIVO (Fr.) — (See special articles).

RAGGIO — The beam which necessarily follows a preceding discord.

RITARDANDO — A gradual retardation and decrease in the speed of the movement.

RITORNO — Theory of musical cadence, as applied to melody, more broadly defined in the first part of this article, to which refer.

RICERCARI (It. plur.) — Difficult exercises, usually fugal, for the voice or for some instrument.

RISONANCE — With a rich sound or echo.

RONDÀ or RONDO; ROUND. — (See special articles).

RUBATO or ROBATO (It.) — Robbed, borrowed. Tempo rubato is applied to a style in which the interpreter, to express some emotional mood, holds some notes longer than their legitimate time, curtailing others of their proportionate duration. In other words, the aggregate value of the bar may not be disturbed.

SACERDOTE; SACERDOTE; SACERDOTI; SCOLASTICO; SCOLASTICO; SCONATA; SOPRANO; STABAT MATER; SYMPHONY; SYMPHONIA. — (See special articles).

SCERENDO, SCERENDO, SCHERZO, SCHERZO, SCHERZO, or SCHERZETTO (It.) — In a light, playful and sportive manner. SCHERZANDO, in an exceedingly playful style.

SCIOLTÓ (It.) — With freedom and boldness.

SUDICCIOLATO (It.) — Sliding or gliding the finger along the keys or strings of an instrument.

SUGG. or SUG. (It.) — A sign; as al sugo, return to the sign.

SUGESTA (It.) — Now follows, or as follows; segue il coro, the chorus follows; segue la finale, the finale now follows.

SUGGESTO (It.) — A gradual diminution as to tone.

SOLOMUTO or SOLOMUTO (It.) — Despondingly, with apprehension.

SOSTENUTO or SOSTENUTO (It.) — Sustained, continuous in regard to tone.

SOTTO (It.) — Below, under; as sotto voce, in an undertone.

STACCATO (It.) — Implies that the notes so marked are to be played distinct, short and detached from one another.

STACCATISMO, very detached.

STRETTI, STRETTI, STRETTI, STRETTI (It.) — In a noisy, boisterous manner, for some particular effect.

STRETTO (It.) — The knot. That part of a fugue in which the subject and answer succeed one another at a very short interval of time. In modern music it is sometimes used to imply an acceleration of the time near the close of the piece.

STAGIONE (It.) — Accelerating the degree of movement.

TARIETTA; TEMPO RESTANTE; TEMPO TRESSE; TONE; TREBLE; TRIO; TRIPLET. — (See special articles).

TANZO (It.) — Not so much; not too much.

TENEBROSO, TENERO, or CON TENEREZZA (It.) — Tenderly.

TENUTA, or TEN. (It.) — Implies that a note or notes must be held on, sustained or kept down the full time.

THROUGH BASS or FIGURED BASS. — A bass part with figures placed over the notes which indicate the harmony to be played to each note, and serve as a guide to the accompanist.

TOCCATA (It.) — A composition of indefinite form and rapid movement somewhat in the style of the fantasia (q.v.).

TRANPOSITION — Changing from one key to another for performance or transcription.

TUTTO (Ge). — All.

TENUTO (It. plur.) — A term used to point out those passages where all the voices, or instruments, or both, are to be introduced.

VA (It.) — Go on; as va crescendo, continue to increase in loudness.

VARIATION (It.) — In a varied and free style of execution.

VOLTA or CON VOLTA (It.) — In rapid time. VELOCITÀ, with extreme rapidity.

VIBRATO, VIBRANTE, VIBRATO (It.) — With a strong vibrato quality of tone.

VIBRATISSIMO (It.), VITE, VIBRATUM (Fr.) — With quickness.

VIVACE, VIVEMENTE, or CON VIVACITÀ (It.) — With briskness and animation.

VIVACO, CON VIVACITÀ (It.) — Lively, vivaciously.

VOCALIZATION. — To practice; singing on the vowels.

VOLANTE (It.) — In a light and rapid manner.

VOLANTE (Fr.) — Will, pleasure, as a volonté, at will.

VOLA (It.) — Time of play or a movement; as prima volta, the first time of playing.

VOLTI SUMMÔ or V. S. (It.) — Turn over the page quickly.

VOLUNTARY.— An organ piece, generally consisting of two or three movements calculated to display the capabilities of the instrument and the skill of the player, and used before or after service, or during the offertory.

ZOPPO (It.) — In a halting or limping manner. A style of melody in which a long note is always placed between two short notes.

Characters indicating the various degrees of loud and soft:

Characters used to separate a movement into its component parts or strains, marks of repetition, etc.:
MUSICAL Festivals—Musical Instruments

Bar lines, dividing a movement into small equal portions of duration.

Double bar, indicating the limit of a measure.

Double bar, with a repetition of the preceding strain.

Double bar, with a repetition of the following strain.

Double bar, with a repetition of the strain on each side.

The close, or character indicating the end of a piece of music.

MUSICAL Festivals, series of performances with large choral and orchestral auxiliaries usually held in large cities yearly or bi-yearly. While musical festivals were of periodical occurrence among the ancient Greeks at Delphi during the Olympic celebrations (see GREEK MUSIC), their first mention in modern history is at Bologna, Italy, in 1315, when at an interview between Francis I, king of France, and Pope Leo X, the musicians of both courts united for a performance. Musical festivals were also known in Rome, France, Bohemia, Austria, etc., but in the modern acceptance of the term the great musical festivals date from the Handel Commemoration in London (1784-87). Festival performances of Handel's oratorios were subsequently given in Berlin and other Continental cities. In the United States the better-known entertainments of this kind are the Cincinnati, Ohio, the Worcester, Mass., and the Bethlehem, Pa., musical festivals. See Oratorio.

MUSICAL instruments, mechanical devices from which musical sounds are produced by the vibration of strings, the movement of air-columns in tubes and the vibration of solid and hollow bodies of resonant materials. Of very ancient origin, their earliest forms were probably derived from suggestions offered by inanimate nature. The earliest authentic record of a musical instrument giving a complete diatonic scale is that of a flute of Egyptian origin; but it is more than probable that the first instruments were those of percussion, such as drums, cymbals and gongs, which were suggested by the clapping of the hands, the stamping of the feet and the resonance of hollow trees under the impact of blows. These were followed by the wind instruments, such as whistles and flutes, suggested by the sighing of the wind through standing reeds and bamboo grooves. They were first used, probably, for hunting purposes; subsequently, to express human emotions and for purposes of amusement.

When the human ear learned to recognize variations of pitch and to distinguish tune from time, the twangling of bowstrings probably suggested the stringed instruments, such as the harp, lute and lyre.

These three stages of the development of musical instruments are very clearly established by existing examples of gongs of stone and flutes of bone, found among the flint implements of the ancient cave-dwellers and in the tracings of the later forms—stringed instruments, in the sculpture of ancient Babylonia, Egypt and Greece. It is impossible, however, to determine the exact origin of any one of the higher classes, such as those of the third stage; since even that of the lyre is ascribed by Egyptian and Greek mythology to the god Toth (Hermes), thus throwing the entire question of origin beyond the pale of written history.

Prehistoric forms of musical instruments have their counterparts among the many savage tribes and nations of civilized mankind who inhabit the various parts of the world at the present time. African Kaffirs, the Caribes, Peruvians and Indian races of the American continents and the wild inhabitants of Australia, New Zealand and the other Polynesia Islands, use various forms of gongs, flutes and harps. The war trumpets of the Maoris are of remarkable power, the sounds of which are capable of being heard at a distance of several miles. Among the more highly civilized nations, the Chinese possessed a system of music and its instruments centuries before the birth of the Greek and Roman empires. The invention of these is ascribed to a traditional emperor, Kai-tien-chai, who ruled about 2500 B.C. The eight instruments he made are supposed to reproduce the sounds of eight substances—tanned skin, stone, metal, clay, strings of silk, wood, bamboo and calabash or gourd. They consisted of drums, musical gongs, bells, harps, whistles or flutes, called "hiuens," the "kin," a form of lyre with seven strings, the "che," of 25 strings, and the "siao," a pan-pipe of 16 bamboo pipes bound together. All of them are used at the present time, together with the "cheng," an elementary reed organ equipped with a calabash, which supplies the necessary resonance. Trumpets and banjos are also used, and a stringed instrument on a frame resembling a mallet, the sounds of which are of the most execrable character. Its value in an orchestra appears to be quite beyond the appreciation of any but a Chinese ear. They have two scales corresponding to the white and black keys of the modern piano, and, although by employing both of these scales they could reproduce modern Occidental music, they appear to be satisfied to confine themselves to the five-note scale, and produce a slow music overlaid with a great amount of noise and clatter, through which it is impossible to distinguish the underlying truly musical notes of great rhythmical beauty.

Almost all of the Chinese instruments, slightly modified, are used by the Japanese. The "kin" and "che" are represented by the "koto," of 6 to 13 strings. They have also the

MUSICAL INSTRUMENTS

1. Wurzel fagott
2. Bassoon (nineteenth century)
3. Oboe (France. Camus, eighteenth century)
4. Transverse flute
5 and 6. Double flutes
7. Flageolet (French, nineteenth century)
8. Double flute
9 and 10. Flutes à bec
11. Clarinet (Italy, early nineteenth century)
12. Clarinet (France)
13, 14, 15, 16, and 17. Transverse flutes with keys
18. Flute polyphonique (Italy, seventeenth century)
19. Serpent
20, 21, and 22. Trombones
23. Serpent (made in England, 1820)
1 Alto viol, with six strings and pegs (made in France, eighteenth century)
2 Bayrton (Viola di Bordone, 1779)
3 Pochette D'Amour (France, eighteenth century)
4 Mandora (made in Italy, eighteenth century)
5 Lyre guitar (eighteenth century)
6 and 7 Guitars
8 and 9 Lutes
10 Theorbo (made in Italy, eighteenth century)
11 Harp Lute (1800. Light London)
MUSICAL INSTRUMENTS

bones and various forms of monochords, their
development keeping pace with the evolution of
music up to its higher forms; but it was not
until about the end of the 16th century that any
attempt was made to combine them into a
definite orchestra, the development of which is
coincident with that of the opera.
The first approximation to an orchestra was
the group of instruments employed in connec-
tion with the production of Cavalieri’s oratorio,
Lesue dell’Anima & del Corpo, at Rome in 1600;
but the first definite orchestra was the one that accompanied the first opera
ever performed in public—Peri’s ‘Euridice’—
at Florence, in the latter part of the same year.
It was composed of a harpsichord, a guitar, a
viola da gamba, a theorbo or large lute and
three flutes. In both cases the combination of
the instruments was designed to afford the
simplest possible accompaniment to the dramatic
recitative; but a few years later Monteverde
noth the individual peculiarities of the several
instruments, and introduced a new system of
orchestration by which the number of pieces
was greatly increased and the instruments given
a score practically free from the limitation of
the vocal parts. In his opera, ‘Orfeo,’ produced
at Fasani in 1608, was accompanied by 36
pieces, 22 of which were stringed instruments,
mostly viols, thus making them the foundation
of the orchestra. With the evolution of the
dramatic work to higher forms, better accom-
paniments were required, and the preponderat-
ing viols were superseded by violins, during the
earlier part of the 18th century, while later on,
during Handel’s time, Lully introduced flutes
into the French orchestra to double in unison
the parts of the stringed instruments. The
strengthening of the violins is shown to a
marked degree by the orchestras of Scarlotti
and Lyrenzi, as many as 20 violins entering
into their composition. Up to this time, how-
ever, the real art of writing for the strings
was unknown. The works of the elder Bach,
probable the greatest master of part writing,
and those of Handel, subsequently reorches-
trated by Mozart, show a great lack of appreci-
ation of tonal coloring, and it remained for
Haydn to lay the true foundations of the mod-
er science of instrumentation. He dispensed
with the obsolete instruments employed by his
predecessors and arranged five combinations by
the skilful use of which are produced the great
orchestral effects of the present time. They
are (1) the complete string band, composed of
two violins, violas, violoncellos and contra-
basses; (2) the string band supported by wind
instruments playing in unison with the string
parts; (3) the string band supported by the
wind instruments in the free parts; (4) the
string band with wind instruments playing in
the separate passages; and (5) the string band
supported by and contrasted with a complete
wind band.
The instruments entering into these com-
binations in a modern orchestra may be con-
veniently arranged into four general groups,
according to the means employed to produce
their sounds, and in the order of their respec-
tive importance, as follows: (1) stringed in-
struments; (2) wind instruments; (3) instru-
ments of percussion; (4) instruments operated
by keys arranged in a keyboard.
The stringed instruments may be subdivided
into two classes: (1) bowed instruments, or
those in which the sound is produced by draw-
ing a horse-hair bow across the strings; and
(2) those in which the sound is produced by
twanging the strings with the fingers, or with
a plectrum of bone or ivory. To class 1 be-
long the violins, violas, violoncellos and the
double bass. Plate 1 shows typical forms of
some of the 16th century makers.
The violin is the most important instrument
in an orchestra and the first violinist ranks
next to the conductor himself, and sought to
be a performer of the greatest ability and fully
capable of playing the obligato passages that
occur frequently in modern scores. It is the
most personal of all instruments, because of the
wide range of vibrations which may be utilized,
rendering it capable of expressing every human
emotion from sadness to merriment and from
the deepest love to the holiest hate. Its use in
the orchestra is varied, continuous and
extensive. In the violin quartet the next im-
portant instrument is the second violin, which,
being played in a lower part of the accordace,
gives the difference of sound heard by both itself and the first violin. The viola or tenor
takes the third place and is a fifth lower in
the accordance, the open notes being C and G
below, and D and A above, middle C. It is
played exactly like the violin, and its part in
the score is notated in the alto clef. It has a
wonderfully beautiful and peculiarly plaintive
and melancholy tone quality. The fourth place
is filled by the violoncello or bass violin. Its
strings are tuned in fifths, one octave lower in
pitch than those of the viola, the accordance
being C below and C, D and A in the bass clef.
It has a compass of three and a half octaves,
and its tone color, like that of the violin, is
capable of expressing with surpassing faith-
lessness all the human emotions. Its harmonies
are rich and full; the "pizzicato," especially
telling in effect, while the tone of the A string
is the most suitable of all instrumental music
for passionate expression. The contrabass or
the double bass is used to double the part of
the violoncello or contrary notes. While the
violoncello is the bass of the stringed instru-
ments, the contrabass is the bass of the whole
orchestra. They are of two types, those with
three strings tuned in A, D, below G in the
first space in the bass clef, and those with four
strings tuned in E, A, D and G, in ascending
order, an accordance rendered necessary by
the works of modern composers. Its tone is
gruff and ponderous, unfitting it for use as a
solo instrument, but it is used with great effect
to give an ominous significance and in imitating
effects as the rumbles of a thunder storm, frequently employed by
many of the great composers.
To class 2 belong the mandolin, guitar and
banjo, instruments of a few strings, and the
harp and zither, instruments of many strings.
Of these the harp is the most important. Of
very ancient origin, probably Assyrian, it has
been used by the musicians of almost all of
the ancient and modern nations. The "minnie-
singers" employed it in connection with the
guitar to accompany the songs of the troubad-
dours. In 1720 Handel introduced harp parts
in one of the choruses of the oratorio of
‘Esther.’ Gluck employed it to play the part
of the lyre in the hands of Orpheus. Mozart wrote a concerto for it in combination with the flute, and Wagner introduced eight of them in the closing scene of 'Das Rheingold,' their shrill music giving an indescribable splendor to the entrance of the gods into Valhalla. The great musical value of the harp is its sympathetic tone quality and the power of its full-sounding arpeggios or sweeping chord effects. Almost all of the music written for the pianoforte can be reproduced effectively on the harp, but it is almost incapable of rendering the chromatic passages. It is the only instrument of this class that forms a part of a regular orchestra, the mandolins and zithers being used only in the orchestration of large compositions. The tones of the guitar are especially suitable as an accompaniment for the human voice and are notably used for this purpose by Rossini in Almaviva's air in the ' Barber of Seville.'

As previously stated, wind instruments were introduced into the orchestra by Lully merely to double in unison the parts of the stringed instruments; but since then various changes and improvements have been made by eminent flutists and skilful flute-makers, especially those of the 19th century, until their importance is hardly exceeded by that of the stringed instrument. They may be divided into two classes, according to the materials of which they are made: (1) wood-wind, and (2) brass instruments. Many of both classes are of the transposing type—instruments in which the sounds actually produced are a key either above or below that in which the composition is written. To the wood-wind band belong the flute, piccolo, flute à bec, horn or cor anglais, bassoon, double or contra-bassoon, flageolet and the clarinet. They are usually made of wood, and sometimes of ivory and silver; but their particular tone qualities do not depend so much upon the material of which they are made as upon their form and the elasticity of the sides of the tubes. The flute, which is the most facile of them all, has a full chromatic compass from middle C to G, two octaves above the treble clef C, a range of three octaves. This compass is partly obtained by altering the pressure of the blowing, all of the notes below D in the treble being produced by the normal pressure, while the harmonics D in the treble clef and A and B above it are attained successively by over-blowing. In the orchestra the flute goes with the violins, its part in the score being written at the top in G clef. It is also used to sustain the long notes of the other wood-wind instruments, and, being the closest approximation of artificial sounds to the human voice, is used effectively in the conversational passages, and enhances the characteristic charm of orchestral music. In the form of the piccolo, an octave flute, it is more frequently employed to double the melody in the highest octaves and to accentuate brilliant points of effect in the score. It is exactly an octave higher than the flute proper, and is very shrill in the over-blow notes, so that, unless very carefully played, tends to vulgarize the music. Other forms are the D-flat or minor ninth transposing piccolo; the flute d'amour, a minor third below the ordinary flute; the E-flat or 'fieze,' and the fife. The last named, in its old cylindrical form, gave low, piercing notes, and was extensively used in military music, but it has been entirely superseded for that purpose at the present time; the modern flute, still called a fife, which forms a component part of a modern fife and drum corps.

Next in importance to the flutes is the family of oboes, represented during the 16th and 17th centuries by the little schalmei, the disant schalmei, the alto, the tenor and the pommers. The modern oboe was evolved from the disant schalmei, and is a double-tongued reed instrument. Its fundamental sounds are reproduced an octave higher by over-blowing, its scale being thus stabilized. It has a compass of three octaves, which are made completely chromatic by the use of keys which permit the lengthening of the air column in the lower tones, and the introduction of other partial tones than the first harmonics in the higher notes. Like the flute, it has only the soprano register—B-flat below middle C to F above the treble clef, about two octaves and a fifth. The basis of the scale is D major, and its place in the orchestra is between the flute and the clarinet. A modern orchestra employs two oboes—the non-transposing treble oboe, for which the scale is written in G clef, and the 'cor anglais,' a transposing instrument, the mournful sounds of which are especially suitable to accentuate the depressing effect of the sad or serious dramatic passages.

The bassoon is the bass of the oboe and fulfills that function to the entire wood-wind band. It was evolved from the pommers, bombardis, tenors and basses of the 16th century, and possesses advantageous tonal characteristics and adaptability. It has a compass of three octaves—from B-flat, an octave below that in the bass clef, to B-flat in the treble clef and is usually played with the violoncello, the united tones of the two instruments being very effective. The contra-bassoon is an octave below the violoncello and is the deepest instrument of the orchestra. Its compass extends as far as B-flat, next to the lowest note of the pianoforte. It is but rarely used, although its grand sounds, like those of a great organ pipe, may be used effectively, as in the overture of Beethoven's 'Fidelio,' and in Handel's anthems, written for the coronation of George II in 1727. Although a wood-wind instrument, it is now also made in brass with a reed mouth-piece. The sarrusophones, invented by Sarrus of France, comprise a complete family of this type. They are larger than the corresponding wooden oboes and are therefore louder in tone and are extensively used in military bands. Other forms of double-reed instruments are the 'cornmone,' made of wood and cylindrical in shape, with the lower end turned up like a shepherd's crook. The name is derived from the German Krummhorn, and the French call it the tourneboute. It has a bleating tone. The familiar Highland bagpipe, and various forms of oboe instruments equipped with reservoir of air and furnished with drones enclosing single reeds, such as the 'cornemuses,' and the 'musettes,' complete the series.

Of the single-reed instruments, the 'clari-net' is the most important. It was invented by Christopher Denner of Nuremberg, in 1690, and embodies the very ancient principle, that of the
squeaker* reed, which is commonly made by children even at the present time.

Of the several forms of clarinets those in A- and B-flat are used by the modern orchestra, while the B-flat and E-flat instruments are used in military bands, in which their functions correspond to that of the violins in the orchestra. The C clarinet with its shrill tone is seldom used. Their color varies according to the register. The ordinary notes are eloquent, heroic and tender; in the lower register they become spectral, and impressively sombre in the bass. Although the last instrument introduced into the orchestra, all the great composers wrote for it, and considered it favorably. With Mozart it was one of the leading instruments of the orchestra, and in his beautiful E-flat symphony, written in 1788, clarinets are employed even in the place of the oboes.

As in the case of the double-reed woodwind instruments, in which the mouthpiece is used with a metal tube and gives the sarrusophone, the adaptation of the clarinet-reed to a brass tube gives the family of "saxophones," invented by Adolph Sax in 1846. They resemble the clarinets very closely in shape; have a rich pointing tone-color, and are extensively used by the military bands of France and Belgium, and have also been used with great advantage in the French orchestras.

Of the *brass instruments,* the most important are the horns, cornets, trumpets, trombones and tubas. Two other forms, the ophicleide and the serpent, though frequently employed in the older orchestral scores, are now obsolete, having been entirely superseded by the tuba.

There are two important differences between the woodwind and the brass instruments. In the former, tones are produced almost entirely by vibrating the air-columns, or by vibrating single or double reeds, and alterations of pitch are accomplished by shortening the air-columns, while in the latter the vibrations are those of the player's lips, which are pressed against a round cup-like mouthpiece, and the air-column is lengthened to alter the pitch. The brass instruments are capable of giving a much larger number of partial tones naturally than the flutes, oboes and clarinets, which use only a few notes of the harmonic series, and derive such partial tones from the fundamental tones, or from the overtones. Horns and cornets furnish romantic tone-coloring, and are effectively used in connection with forest and hunting scenes, while the trumpets are employed to express brilliant martial passages depicting heroic deeds. Trombones and tubas are grand, sonorous tubes which afford a solemn and menacing tone-color to the splendor of a full orchestra, and are also advantageously used to depict coarse and brutal scenes. All of them are valuable components of modern military bands. Plate II illustrates various types of wind instruments, developed from their original forms into perfect instruments during the latter part of the 18th and the earlier part of the 19th centuries.

The instruments of percussion are those which are incapable of giving many tones, or playing definite melodies, like the stringed and wind instruments already described. They are of two classes — those that give an actual tone, such as the wood drums, glockenspiel and xylophone; and those without any definite pitch, such as the bass and small drums, tambourines, cymbals, castanets and triangles. Of these, the kettledrums are the most important, and, together with the cymbals, are extensively used to emphasize military effects; while the others serve to express those that are purely rhythmic.

For detailed descriptions of all of the instruments mentioned, see special articles under their respective titles; also ORCHESTRA, INSTRUMENTS OF THE. For descriptions of keyed instruments, see articles on the ORGAN and the PIANOFORTE.

Bibliography.—For further detailed information consult Elson, 'Orchestral Instruments and their Use' (Boston 1903); Hawkins, 'General History of the Science and Practice of Music' (London 1875); Hofmann, 'Katechismus der Musikinstrumente' (Leipzig 1890); Vidal, 'Les Instruments a Archet' (Paris 1878); and Schletterer, 'Die Ahnen modernen Musikinstrumente' (Leipzig 1882).

**MUSICAL INSTRUMENTS, Mechanical.**

The record of inventions and devices in this field shows a great variety of shapes, sounds and methods of operation. One of the most famous in this class of music-makers was Barnum's steam calliope, used for many years in circus processions. Organs of all sizes and shapes, set in motion by the occasional turning of a crank or pressing a button, are widely used for purposes of public entertainment. Swiss music boxes with cylinders and American music boxes with discs are embraced in the same class. There are also mechanical banjos, violins, zithers, mandolins and trombones.

**Progress of the Piano-Player.**—Since the advent of the first piano-player, a few years ago, rapid strides have been made in the creation and production, by purely mechanical methods, of classical and popular music. The perforated paper roll, passing over a perforated wooden cylinder, so that a current of air may pass at stated times, still forms a leading feature of the automatic idea in many pianos. See PIANO.

The earliest efforts of those who undertook to create and introduce mechanical harmony effects yielded crude, unsatisfactory and unimproving results. Progress was blocked at every turn by practical difficulties not contemplated in theoretical calculations and experiments.

**First Products.**—Among the first products of the mechanical piano-playing movement was an odd-appearing, seemingly over-extravagant accumulation of rubber-tubes, strikers, bellows and pedals, nearly all of these contrivances and accessories being fixed to a wooden frame and inserted in the back part of the piano, between the frame-posts. It was found impracticable to include all necessary material without increasing the size of the piano proper. This was accomplished by adding several inches to the piano's depth.

**Portable Players.**—Notable among the next succeeding stages of piano-player development was the invention and perfecting of a movable and easily-portable player, having cylinder, perforated rolls and pedal action. About half the regular piano width and only a trifle higher than the keyboard, this "supplement" can be moved at will to the center of the room. Operation of the pedals results in the bringing of any one or more of a series of
hammers or strikers in direct contact with the
key surfaces, speed and force being regulated
by several thumb-pieces projecting from the
player top or sides. Players of this description,
with some variations, are still in use but have
been partially superseded by more elaborate
corrivitations.

Interior Players.—After many costly ex-
periments, covering several years, an interior
player, which has been very successful thus far
and promises to revolutionize the whole industry
of piano-making, was perfected. It was found
possible to minimize the parts in such a way
that practically the entire player apparatus, ex-
cepting, of course, the pedals, could be placed
above the keyboard in front of the action and
behind the fallboard, the latter hiding it com-
pletely from view. Thousands of these pianos
containing mechanical players have been made
and sold. Makers of pianos of all grades have
accepted the interior player with modifications
as permanent, and it is becoming a standard
feature in regular piano styles.

Electricity Introduced.—In the interval
between the perfection of the movable and the
interior players, an enterprising practioner,
New York electrician and piano-action maker
secured certain important player rights and
privileges and set to work on the problem of
electrical operation. Experiments, extending
d over several years, were finally successful.
Electrical attachments were devised and intro-
duced in such a manner as to make it possible
for any person or firm, in any part of the
world, having a simple electrical connection,
to start and stop the player at will. The advance
in usefulness of the mechanical piano-player
thereby reached a stage where it only needed
the occasional insertion of a perforated roll to
produce, without any further physical effort
whatever, perfect musical effects, including cor-
rect tempo and proper expression.

Continuous Rolls.—Since that time, con-
tinuous rolls have been devised to admit of
several tunes being played successively without
any interference on the part of the person who
applies the electrical connection and turns on
the player. The attachment device
just referred to, with numerous variations, is
now largely in use throughout the United
States, Canada and other countries for the en-
tertainment of guests, travelers and others in
restaurants, hotels, saloons, railroad stations
and similar public resorts. Some are operated
by use of an electric button conveniently placed
at tables, hotel desks and in private apartments.
Others start by the insertion of a coin in a
metal slot at the side of the instrument.

The manufacturer of pianos in the United
States gives employment to 24,000 persons, and
piano materials 10,500 more. Organs and organ
materials employ 3,500; other musical instru-
ments and materials 2,000. These figures do
not include phonographic machines for repro-
ducing music. The musical instrument industry
centres mainly in Indiana, Illinois, Massachu-
setts, New Jersey, New York and Michigan.

MUSICAL SAND, beaches which emit
musical tone or other sound when the sands
are pressed under foot or struck together in a bag.
They occur throughout the world, notably in the
peninsula of Sinai, on the great musical moun-
tain of Jebel Nagous; near Colberg in Po-
merania; on the east Russian coast; in the
United States, where there are such sonorous
beaches on the Atlantic, on the Wisconsin
River (near Kilbourn City, Wis.), on the
Mississippi (opposite Carondelet) and on the
Pacific Coast near Hialeah. Thereby the
Barking Sands on the southwest coast of
Kauai; in Africa (Liberia and West Griqua-
land); in Botany Bay, New South Wales; and
in Brown's River Bay, Tasmania. The sound
is a mere squeak unless the sand is very dry;
then it is musical. Hence the common ex-
planation that the sound is due to the "rubbing
together of millions of clean sand-grains very
uniform in size" is less likely than the hy-
thesis that it is caused by the oscillation of the
particles which are prevented by elastic
air-cushions from actual contact.

MUSK, or MUSCOVY, DUCK. See
Duck.

MUSK-DEER, a small deer-like animal
(Moschus moschiferus) of the sub-family
Moschinae differing from typical deer in the
absence of antlers in either sex, in having only
one lachrymal orifice, in the nose, a
bladder, and, in the male, of the musk-bearing
glands to which the animal owes its name.
Other peculiarities are the smooth brain, long
tusks (canines) of the upper jaw of the male
and the character of the feet, where the "false
hoofs" come to the ground and the characters
led Flower to declare it "an undeveloped deer"—a representative of an an-
cient type.

The musk-deer is of small size, about 20
inches tall, grayish, marked with obscure stripes
on the fore quarters and neck, thick-legged and
ungraceful in form, but agile in movement.
The species is confined to the highlands of
Tibet and northward, where they frequent the
pine woods, going to the heights above them
in summer. They dwell alone or in family
parties, are timid and secretive, feeding rarely
except at night, and then subsisting partly on
roots dug with their great teeth.

The males alone yield the musk secretion,
which is furnished by a glandular sac or pouch
situated on the abdomen, averaging the size of a
hen's egg. The secretion is resinous and unctuous,
and becomes granular and of a
dark color when dried. About 190 grains is
stated to be the average quantity obtained from
a single animal. When the musk-sac is first
opened the odor is said by Tawerer to be so
difficult that it causes the mucous membrane
of the nose to bleed. The bag or "pod" is
cut out by the hunters and its orifices are tied,
nevertheless the contents are often found much
adulterated. In the substance also reaches the
market in a granular form, having been scraped
off rocks where it has been deposited by the
animal. The best comes by way of India and
China, and is known as Tongking musk; a
poorer quality comes from Siberia. Formerly
musk had some value in medicine but now is
used almost wholly by perfumers; and the de-
mand is so great that the animals are now com-
paratively rare, and the price of musk-pod has
greatly advanced over former rates.

A somewhat similar secretion is possessed
by many other mammals and reptiles, and in
some cases, as of the muskrats (q.v.), is very
strong, especially in the mating season. The
biological significance of it, no doubt, is sexual
1 Musk Deer

2 Musk Ox
attraction. A similar odor belongs to certain plants. Consult Flower and Lydekker, "Mammals" (London 1902).

MUSK-OX, a singular ruminant (Ovibos moschatus), now confined to the Arctic regions of North America, but once circumglobal, it is in Pleistocene times an inhabitant of all Europe and in America as far south as Kentucky. In general appearance it much resembles a large hairy sheep. Its body is clothed in long, brownish hair, with a warm undercoat of wool, very thick and taut on the neck and shoulders, and elsewhere long and flowing, so that it hangs down almost to the feet. A lighter saddle-shaped patch marks the middle of the back. The tail is short and invisible. The legs are short and strong, and the hoofs of unequal size and shape, the outer being much broader than the inner one. The horns are broad at the base, covering the forehead and crown, much as do those of the Cape buffalo, then curve downward between the eye and the ear and then upward and backward. The average size of the male is that of a small domestic ox. This animal seems intermediate in structure between oxen and sheep, having part of its characteristics bovine and the other part caprine. A thorough exposition of its anatomy by Dr. Lümburg may be found in the "Proceedings of the Zoological Society of London for 1900. The musky odor which belongs to them is not emitted by any special gland, but seems a general emanation, and is not very strong.

In habits these animals are gregarious, each herd consisting from 20 to 30 members. They migrate in winter from the most northern and exposed places to those farther south, or where food is more accessible, and are constantly hunted by the Eskimos as an important source of food. To this is added much destruction by 'fish-traders' whales and explorers, and their numbers are much diminished. Their present winter range is rarely south of the Barren Grounds (q.v.), between Hudson Bay and Great Slave Lake. Their food consists of moss, lichens, herbage and twigs of the dwarf willows and birches which grow in parts of their country. They are extremely wary, and their hunting requires great skill and endurance. Their flesh is good, their hide very useful, and from their wool might be woven an admirable cloth could it be obtained in sufficient quantity. Consult books by Arctic explorers and Allen, J. A., "Ostogenetic and Other Variations in Muskoxen (American Museum of Natural History, Memoir, Vol. I, N. S., New York 1913); Grimell, Wister and Whitmey, "Bison, Musk-Ox and Sheep" (New York 1904).

MUSK PLANT, a popular name for several unrelated plants. The one most cultivated in the United States is Mimulus moschatus, of the family Scrophulariaceae, a native of the Western States. It is very popular in cool greenhouses and window gardens and, being hardy, in damp, shady places out of doors. In Europe the name is most applied to Eurodium moschatum of the family order Geraniaceae, a native of the Mediterranean region, growing in gardens from annually sown seeds. The name is applied in the West Indies to Guamia grandifolia, which is also known as musk wood, and to Trichiia moschata, also called musk tree. This last popular name is also applied to a Tasmanian tree (Olearia argophylla). An East Indian plant (Euryangium moschatum) is probably the best known in the markets as musk root. Its starchy roots are used as a substitute for musk in perfumery.

MUSK-SHREW. See Muskrat, Indian.

MUSK-TURTLE, or STINKPOT. See Mud-turtle.

MUSK-KEGON, mus'kè'gon, Mich., county-seat of Muskegon County, at the mouth of the Muskegon River, on Muskegon Lake, and on the Grand Rapids and Indiana, the Grand Trunk, the Pere Marquette, and the Grand Rapids, Grand Haven and Muskegon Electric Railroads, about 95 miles northwest of Grand Rapids and 38 miles northwest of Grand Rapids. Lake Muskegon, upon which the city is situated, is connected with Lake Michigan by a channel 300 feet wide and of sufficient depth for large vessels. This gives the city an excellent harbor for lake steamers, which connect it directly with all the important lake ports. The harbor is clear of ice all the year. Muskegon was first settled in 1834, although a temporary trading post was established here in 1812. It was incorporated as a village in 1870, and as a city in 1869. The chief manufactures are furniture, curtain rollers, refrigerators, flour, beer, knit-goods, paper, pianos, iron products, automobile engines (Continental) and auto parts, many large foundries in malleable steel and gray iron products, electric cranes, leather and cutlery. It has a large trade in lumber, the manufactures of the city, fruit, celery, vegetables and farm products. The city has been greatly favored by the numerous donations of one of its own citizens. He has presented a public library, a gymnastic and manual training school, an endowed hospital and a square upon which has been erected a soldiers' monument, and several bronze statues. The government is vested in a mayor, who holds office one year, and a council. The waterworks are owned and operated by the city. Pop. 35,765.

MUSKET, a small hand-gun with which infantry soldiers were formerly armed. When first introduced, early in the 16th century, it was discharged by means of a lighted match, and was so heavy that it had to be laid on the ground and a staff to be fixed. To make use of it the soldier required to carry aslow-burning match with him which was apt to be extinguished in wet weather. The wheel-lock followed, the chief feature of which was a wheel made to revolve by means of a spring, and to cause sparks by friction against a flint. The next improvement was the flint-lock proper (about 1625), in which sparks were produced by one impact of a piece of flint on the steel above the priming powder. Musketeers were soon intro-
duced into all armies, and in the beginning of the 17th century infantry consisted of pikemen and musketeers, and all changes in regard to the relative proportion of the two arms were always in favor of the latter. The flint-lock musket was introduced into the British army toward the end of the 17th century, and was the British musket of the days of the Peninsular war and Waterloo, known familiarly as Brown Bess. It was superseded by the percussion musket in 1842, this musket being in turn superseded by the rifle. See Arms and Armor; Fire Arms; Rifle.

MUSKETRY, the science and art of shooting small arms (q.v.), particularly the musket or rifle (q.v.).

MUSKHOGEAN (músk-hó-ge'án) STOCK. See Creeks.

MUSKEGUNGE, MASKINONGE, etc., the great pike (Lucius nobilis) of the lakes of the interior of North America. See Pike.

MUSKINGUM, músk-ing'gúm, a river of eastern Ohio with a course of about 120 miles wholly within the State. It is formed by the junction of the Ohio and the Wabash, at Coshocton in the county of the same name, and it flows in a general southeast direction through a fertile valley to Marietta, where it joins the Ohio. The chief towns on its banks are Zanesville, McConnelsville and Marietta. It is navigable for 90 miles to Dresden. The Ohio and Erie Canal follows its course as far as Zanesville.

MUSKINGUM COLLEGE, in New Concord, Ohio, founded, under the auspices of the United Presbyterian Church, in 1837. In 1917 there were connected with the institution 30 professors and instructors, and about 760 pupils. There were about 7,500 volumes in the library. The courses lead to the degrees of A.B. and B.S.

MUSKIMELON. See Melons.

MUSKOGEE, músk-o'gé, or MUSCOCHEE, Okla., city and county-seat of Muskogee County, on the Missouri, Kansas and Texas, the Missouri and Gulf, the Midland Valley and the Saint Louis and San Francisco railways. It is situated 45 miles from the eastern border of Oklahoma and about 130 miles from Oklahoma city, in a fertile agricultural region well adapted to the cultivation of wheat and other cereals and to cattle-raising. There are also abundant supplies of oil and natural gas. Industrial activity is manifested in the oil refineries; in the manufacture of oil-well supplies, of hardware, mattresses, cotton goods and agricultural implements; in the corrugated iron and steel works and the railway shops. Noteworthy are the educational establishments: the high school, Saint Joseph's College, Bacon University, etc. Other features are the new post-office building, waterworks, the property of the city and valued at $1,000,000; public parks (100 acres) and fair grounds; Carnegie library and the Town and County and Traveling Men's clubs. Muskogee is the head-quarters of the government Indian agent. The commission form of government was adopted for the city in 1910. Pop. 45,000.

MUSKOGI INDIANS. See Creeks.

MUSKOKA, músk-kó'ká, Can., a county of Ontario, bordering on Georgian Bay, the name also being borne by a beautiful lake and river, and comprehensively applied to the extensive region, 4,000 square miles in extent, lying between Georgian Bay on the west, Lake Nipissing on the north, Ottawa River on the east and Lake Simcoe on the south. The capital of the county is Bracebridge, on the Grand Trunk Railroad. The county is bounded on the north by Ottawa and 1,000 lakes and smaller bodies of water, chief of which are Muskoka, Rosseau and Joseph lakes, all abounding in fish and studded with beautiful islands; several rivers and picturesque waterfalls, notably High Falls and South Falls on the Muskoka River and Bridal Veil Falls on the Shadow River, and extensive forests filled with game, is a paradise for sportsmen. It is one of the most popular summer resorts in Canada, and is visited annually by 30,000 people. During the summer steamboats ply on the principal lakes connecting with the Grand Trunk, Canadian Northern and Canadian Pacific railroads.

MUSKAT, or MUSQUASH, an aquatic rodent (Fiber subtilis) numerous throughout North America, and yielding a valuable fur. It is a member of the rat family (Muridae, q.v.), and is, in effect, a gigantic water mouse, with a tail flattened sideways into a powerful swimming instrument, and fringed with stiff hairs; the hind feet are set obliquely to the leg; the ears are very small and buried in fur, the muzzle is blunt and furry; the palms and soles are naked and fringed with hairs. The average total length is about 21 inches, of which the tail is more than a third, measuring as long as the body without the head. The color varies above from almost black to pale brown; sides of head and body chestnut-brown; under-fur bluish gray; feet dark brown; tail black. Those of the Rocky Mountain region are smaller and paler than Eastern ones. The musky odor of these animals is due to a thick fluid secreted in two small glands near the generative organs, which imparts a taint to the flesh that makes it unpalatable to most persons. These animals reside along small streams, and in swampy places generally, being most abundant around Chesapeake Bay and in the marshy lakes of the upper Mississippian region and northward to Hudson Bay. Where the banks have some elevation they form extensive burrows, which have entrances below the surface of the water, and gradually ascend till they terminate in a chamber above the level of high water. These burrows are most frequently made under the roots of trees, or in other situations of difficult access. The excavations are of great injury to artificial embankments along canals and rivers, by permitting the water to undermine and to make large breaches in them, and in some parts of the country they do serious damage to canal embankments and river dikes. When, however, these animals inhabit low and marshy situations, they construct conical houses usually surrounded by a ditch. Unlike those of the beaver, these smaller, composed of reeds, etc., mixed with clay. These houses have subterranean passages leading to them, and are inhabited by many individuals during the winter; but in the warm weather they desert them entirely, and dwell in pairs in
a bank-burrow while they rear their young. The houses contain a large, smooth-walled chamber, above the water-line; and when frozen are sufficiently solid to form a protection against all but the largest carnivora; but they are usually destroyed and swept away in the spring floods, so that a new house is erected every season.

The muskrat feeds mainly upon aquatic vegetation, especially the buttresses and basal parts of stems, and is especially fond of the pond-lily. This it brings to the shore to eat, almost always during the night, for it is essentially nocturnal, although often seen abroad in the daytime. It is very fond of mussels, and brings great quantities of these ashore, always, when possible, at the same place, so that piles of their shells accumulate to indicate favorite feeding-spots. In summer the muskrats feed on shore-herbage somewhat, and frequented by America, the Russians and Germans being especially large consumers. It is employed in making gloves, collars, caps, caps, muff's, trimmings, linings, etc., and is made up either natural, plucked, plucked and pointed or plucked and dyed black or various shades of brown. Large quantities are used as linings for overcoats and long wraps, from 40 to 60 being necessary for each garment. Sometimes the under parts are used separately for this purpose, the natural white color being quite effective. The skins of young animals are especially suited for linings. The unplucked skins are frequently dyed to imitate mink, and sold as 'Alaska mink,' 'water mink' or 'black mink.' Muskrats are taken by shooting, spearing in winter (through their houses, or through the ice), or, most numerous, by trapping. Ordinary steel traps are used, placed under the water inside a broken house, or in a runway or landing place, baited with an apple, bit of parsnip, and often scented with musk or an aromatic oil, and fastened by a heavy chain so arranged, if possible, as to lead the animal to drown itself in its struggles. In certain districts, as along Chesapeake Bay, men make a regular business of trapping muskrats in winter; and even own, or rent, large spaces of marshland for that purpose. See MUSK.
MUSSELS — MUSSET

market gardens. There is a large fishing population located in Fisherville. The battle of Pinkie, in 1547, was fought in the vicinity. Pop. (1911) 15,938.

MUSSELS, Fresh-water. See Fresh-water Mussels.

MUSSELS, Marine. The marine mussels belong to a family (Mytilidae) of bivalve mollusks which have the anterior retractor muscles very small, the posterior large and the two valves of the shell equal and covered by a thick horny layer. Numerous species occur in all seas, and, because of the comparative delicacy of their flesh, and their habit of forming immense beds, many are of commercial importance.

Foremost in this respect is the edible mussel (Mytilus edulis) which has a smooth, dark-colored, wedge-shaped shell with the umbos or beaks exactly at the hinge end. This species is circumpolar in its distribution, and on our Atlantic coast extends southward to North Carolina. Wherever rocky reefs, piles or other suitable objects for attachment occur at low water, combined with currents for bringing food, this mollusk multiplies into extensive colonies. In Europe it is valued much more highly than in this country, where it is chiefly used for bait, although considerable quantities are canned in New York. Under certain conditions mussels seem to be poisonous. Besides the fisheries on natural beds this mussel is regularly cultivated in France by methods akin to those used in European oyster culture. The genus Modiola, containing the so-called horse-mussels, is distinguished by the more oblong shell inflated toward the hinge end, from which the umbos, though close, are quite distinct. The best-known one (M. modiolus) is a large species distinguished by the nearly unribbed surface and the coarse hairy epidermis. It has nearly the distribution of the Mytilus, and abounds in the north on rocky shores at low water and below to a considerable depth. Modiola plicatula is distinctly ribbed and has a thinner epidermis. This is an American species which ranges from Nova Scotia to Georgia and is extremely abundant at low water on the mudflats of the New Jersey coast, where it is doubtless the principal upbuilding of sedimentary areas. These two species are less valued for food than the Mytilus, but are largely utilized in certain localities as fertilizers. Consult Goode, 'Fishery Industries of the United States,' Sec. 1 (1864); Cooke, 'Mollusca' (London 1895); or any other work on mollusks.

MUSSET, mii-sä, Louis Charles Alfred de, French author: b. Paris, 11 Dec. 1810; d. there, 2 May 1857. His father was a man of letters who held several important ministerial posts. Alfred's home environment did much to engender a literary spirit. He was educated at the Collège Henri Quatre, where he won a prize for his essay on the 'Origin of our Feelings.' After this, he tried to study law and medicine, but became dissatisfied and gave himself up entirely to literature. At Paris he met the famous young men of the day, among them Hugo, Mérimée and Sainte-Beuve, who inspired him to write verse and plays. He began composing rhymes and in 1830 appeared his first volume of poems, 'Contes d'Espagne et d'Italie,' a parody on the latest works of the romantists which gained him a great reputation. In 1830 his play 'La Nuit Venitienne' proved a failure. This discouraged de Musset so much that he refused to write plays for production until the public should demand them. In 1831, however, he followed a new collection in 1831 entitled 'Poesies Diverses,' and in 1833, a third, bearing the general title 'Un Spectacle dans un Fauteuil' in which the chief pieces are a comedy of light and delicate grace called 'A quoi revient les jeunes filles,' and a tragedy, 'Namouna' written after the manner of Lord Byron. The success of this volume led to his connection with the Revue des Deux Mondes in which he published 'André del Sarto' (1833) and 'Caprices de M. Cam (the same year). In this play, which for many years enjoyed a distinguished place in the repertory of the Théâtre Français, he combines the best features of the romantic and classic schools of drama. It combines swift action with high sensitivity of theme and thought; blends comedy and tragedy with Shakespearean excellence. 'Rolla' was the next piece to appear in the Revue. In the same year, 1833, de Musset conceived a violent passion for George Sand, and accompanied her to Italy, which was only the attraction of genius for genius lasted but two years. The story is told in his volume 'Lui et elle,' by de Musset and 'Elle et lui,' by George Sand. But the affair affected de Musset profoundly. It emphasized a deep melancholy strain in his nature and a morbid sensitivity which appears in his later writings. In Italy he wrote 'Où ne bat l'amour.' In 1835 there appeared 'Lucie;' 'La Nuit de Mai;' 'Le Chandelier;' 'Une Lettre à Lamartine;' 'L'Esprit de Dieu' and other poems. His 'Confession d'un enfant du siècle' (1836) is an autobiographical novel, containing the analysis of his state of mind; his moody introspection, his revolt from all the unpleasant necessities and labor of life. It contains also an interesting account of his reactions to Bonaparism, and his unfortunate liaison. Among his other works are 'Stances a Madame Malibran,' a volume 'Comédies et poèmes' reprinted from the Revue des Deux Mondes (1840); 'Nouvelles,' a play 'Un Caprice' performed at the Théâtre Français in 1847, which succeeded by the truth of the characters and the charm of the dialogue, rather than by its regard for stage customs. In 1848 'Il ne fait jourde rien' was successfully played at the Théâtre Français. His last plays 'Bettine' and 'Carmosine' were written between 1848 and 1851. De Musset was made librarian of the Department of the Interior in 1836, of which post he was afterward deprived, and of the Department of Public Instruction in 1855. In 1852 he was admitted to the French Academy. He has been called after Hugo as the third French poet of the 19th century. His wit, his fine satiric power, his many and diverse moods mark him a man of genius. A monument was erected to him on the Place du Théâtre Français in 1906. Consular biographies of Paul de Musset (1877; Eng. trans. by H. W. Preston, 1887); Barine, Arvède, in 'Grand écrivains français.' His correspondence with George Sand was published in 1904. See NIGHT OF MAY, A; ONE MUST NOT TRIPLE WITH LOVE.
MUSSEY, Renben Dimond, American surgeon: b. Pelham, N. H., 23 June 1780; d. Boston, 21 June 1866. He was graduated at Dartmouth in 1803; studied medicine at the University of Boston. He practiced in Salem, Mass.; taught in the Dartmouth Medical School 1814-20 and 1822-38, at Bowdoin 1833-35, at Ohio Medical College 1837-50, and at Miami Medical College, which he founded, 1851-58; and spent the last eight years of his life in practice in Salem. He was a famous operator, the first to remove the shoulder blade, or to tie both carotid arteries, and successful in his operations for stone, for removing ovarian tumor, for strangulated hernia, and in subcutaneous deglition in varicocle. Mussey wrote 'Health: Its Friends and Its Foes' (1862).

MUST, the juice of the grape, which by fermentation is converted into wine. In the wine countries this underfermented sweet must is distinguished from the sour must or unripe wine of a year old.

MUSTANG. See BRONCO.

MUSTARD, a genus of annual, biennial and perennial herbs (Brassica) of the family Brassicaceae. The species, of which about 100 have been described, are characterized by yellow four-petaled flowers and linear or oblong pods containing one row of seeds. All are noted for their more or less biting flavor for which some are valued as22. Strictly speaking, cabbage, kale, cauliflower, turnip and other similar vegetables are mastered in a species of mustard. The name of the following is restricted to a few species: Black mustard (B. nigra) so called from its dark brown seeds, white mustard (B. alba), the seeds of which are yellowish, Indian mustard (B. ramosa), and charlock (B. arvensis). These are all cultivated for their seeds which when ground constitute the popular condiment, mustard. Sometimes flour and turmeric are added to the mustard to dilute and color it. This mixture of green peas are often eaten like spinach or as a salad. They may be easily obtained from seed sown in any garden soil.

MUSTARD GAS, a persistent though not deadly poisonous gas, first used by the Germans, at Ypres in 1917, as a very powerful weapon of war, and is officially known as yellow cross gas. Its chief effects are on the eyes and lungs. The eyes inflame and become very sore, the lids swell and blister, but no permanent injury to the eyes takes place, although the victim may be temporarily blinded. The effects developed in the lungs are equally painful and consist of severe inflammation and bronchitis, which may develop into pneumonia. 'Duds' collected during the European War show that the mustard gas liquid is a chemical called dichlroethyl sulphide, a liquid that gives off its vapor slowly. Respirators and the helmet protection of dogmen keep out the gas, but if a gas cloud gets a direct hit with a mustard gas shell, it must be left empty for some days, as the liquid cannot be removed by ventilation with either fires or fans. In battery positions the most annoying feature of the mustard gas is the length of time it persists. In the shell holes it is partly de-stroyed by sprinkling with chloride of lime. The British invented a method for firing a large number of drums of gas simultaneously. These drums are used chiefly against the frontline troops and are generally filled with pure phosgene. See MEDICAL SCIENCE AND THE WAR; MEDICINE, RECENT PROGRESS IN; POISON GAS.

MUSTARD OIL, a volatile, pungent, colorless, irritating oil formed in mustard seed when crushed and wet. See OIL OF MUSTARD.

MUSTELIDAE, a family of small carnivorous mammals classified between the dogs and the bears, and traceable in geological history back to early Eocene time. The special characteristic of the family is the reduction of the molar teeth in the upper jaw to a single one. The dentition in general resembles that of the cats. The family is divisible into five subfamilies: Weasels (Mustelinae), otters (Lutrinae), badgers (Melininae), skunks (Mephitinae) and sea otters (Enhyridinae) and thus include the ermine, mink, fisher, sable, marten, polecat, and wolverine. The Harvard is worldwide outside of Australasia and Madagascar, but it is in the subarctic and temperate regions of the Northern Hemisphere that the Mustelidae are most numerous and produce the most valuable pelts. The sea otter and the skunks are exclusively American. All are small animals, the largest (the sea otter and the wolverine) being about three feet long. They are characterized by strength, nimbleness and especially bloodthirstiness, and in general have slender bodies, rather short legs, round heads, powerful jaws and strong teeth. They possess anal glands which in some genera, as the skunks, are highly developed, enabling them to discharge at will, as a means of defense, an acrid, malodororous fluid. Some of the Mustelidae are arboreal, but most are terrestrial, living in burrows. Their food consists of small mammals, birds, birds' eggs, crustaceans, fish and insects. Their lust for killing seems to bear no relation to their food requirements; for example, a mink, gaining access to a chicken house, is likely to kill as many fowls as it can seize. The trapping and hunting of the Mustelidae has long been an important industry in both Europe and North America. Consult Coues, E., 'Purifying our Animals' (Washington 1877); Ingersoll, E., 'Life of Mammals' (New York 1909).

MUT, moot, in Egyptian mythology, a goddess of heaven and queen of earth, the wife of Ammon and the mother of Chons. Her name signifies 'mother.'

MUTA NZIE, moo'ta nz'ëg, Africa, the local name for a lake discovered by Stanley in 1876, explored by him in 1889, and renamed the Albert Edward Nyanza (q.v.).

MUTANABBI, moo-ta-nahb''bë, Arabic Abu 't Tayih, Arabian poet: b. Kufa, 915 A.D.; d. Sept. 965. He studied in Syria and, for a period, proclaimed himself a prophet, whence the title 'el Mutanabbi' (the man who is fallen from his prophetic state). From 948 he resided at Aleppo under the patronage of the Prince Saif ed Daula and from 957 he lived in Egypt, Bagdad and Persia. He was killed by Bedouin robbers near the Tigris. His greatly admired 'Diwan' consists of a collection of 289 poems and shows
great talent and national spirit besides richness of language, but there are defects of exaggeration in poor taste and certain frilliness that is lowering to the general dignity of the versification. Dieterici edited the work, together with the 'Commentary' of Wahidi, who died 1075, under the title 'Mutanaabii carmina' (Berlin 1861); and that of 'Ukhari, who died 1219, was published at Calcutta, Cairo and Bulak with other 'Commentaries.' Hammer-Purgstall translated (poorly) the 'Diwan' (Vienna 1824). Consult Bohlen, 'De Motenabio' (Bonn 1824); Dieterici, 'Mutanabbi und Seifuddaula' (Leipzig 1847).

**MUTATION THEORY**, a hypothesis of organic evolution which accounts for development by sudden changes or 'leaps' rather than by slow and successive degrees; sometimes styled saltatorial evolution. It is illustrated by sports (q.v.), sudden aberrations from the normal, more familiar in botany than in zoology, but often occurring there. This mode of mutation has always been regarded as effective to some degree, but its general application was urged by Prof. Hugo De Vries, of Amsterdam, in his work 'Die Mutationstheorie,' published in 1901. Professor De Vries showed that the objections urged against the Darwinian theory on the ground of the prodigious length of time needed for the development of species could be explained away by a due regard to the phenomena of mutation. He showed that new species are produced in this way not only on a single occasion, or with single individuals, but repeated continually and in large numbers. In the field of botany to which Professor De Vries' investigations were confined, he established the fact that mutations take place in the seed, independently of the vicissitudes of growth in the field, and in accordance with certain apparent laws. The new species which results from mutation remains constant but exhibits a tendency to throw off an ever increasing series of variations. Consult De Vries, H. 'Species und Varietaten' (Chicago 1906); Lock, R. H., 'Recent Progress in the Study of Variation.'

**MUTHER**, moo'tér, Richard, German art historian: b. Ohrdrufl, Germany, 23 Feb. 1860; d. 1909. He was educated in the University of Heidelberg and the conservatory of Munich and devoted his attention to the history of art in which subject he was professor at the University of Breslaun since 1895. He has published 'Anton Graff' (1881); 'Meisterholzschnitte aus den Jahrhunderten' (1887); Geschichte der Malerei des 19ten Jahrhunderts' (1893; Eng. trans., 'History of Modern Painting,' 4 vols., 1907); 'Geschichte der Malerei' (5 vols., 1899-1902; Eng. trans. by George Kriehn, 2 vols., 1907).

**MUTINY** (Fr. mutin, refractory, stubborn; mutiner, to rise in arms). Two hundred years ago the word mutiny was often used in describing insurrection or sedition in civil society; but it is now applied to certain offenses by sailors and soldiers. Properly it is the act of numbers in resistance of authority; but by statutes, certain acts of individuals are declared to be mutiny. The act of Congress of 3 March 1835 defines mutiny or revolt in the following language:

If any one or more of the crew of any American ship or vessel on the high seas, or on any other ship or vessel from the master or other lawful commanding officer thereof; or deprive him of his authority or control thereof; or resist or prevent him in the free and lawful exercise thereof; or transfer such authority and command to any other person not lawfully entitled thereto; or, in such case, every such person so offending, his aids and abettors, shall be deemed guilty of a revolt or mutiny and felony.

The same statute provides for conspiracies and conspiracies to excite mutiny. In consequence of the act it has been held that mere disobedience of orders by one or two of the seamen, without any attempt to excite a general resistance or disobedience, and insolent conduct or language toward the master or violence to his person, if unaccompanied by other acts showing an intention to subvert his authority as master, are not sufficient to constitute the offense of endeavoring to excite mutiny. An indictment for this crime, it is said, must set forth a confederacy of at least two of the men to refuse to do full duty, and to resist the lawful commands of the officers. The offense of making a revolt was by the act of April, 1790, punishable by death. By the act of 1835, it is punished by fine not exceeding $2,000, and by imprisonment not exceeding five years, or by both. Mutinous conduct in the army and navy is provided for by the acts of 10 April 1806 and of 23 April 1800. By the former, any officer or soldier who shall begin, excite, cause or join in any mutiny or sedition, in any troop or company in the service of the United States, or in any party, post, detachment, or guard, shall suffer death, or such other punishment as by a court martial shall be inflicted. Under the latter, "if any person in the navy shall make, or attempt to make any mutinous assembly, he shall, on conviction thereof, be cashiered, and all the other laws are embodied in the present articles of war and articles for the government of the navy, except that death is not now mandatory in the navy. The law of mutiny in Great Britain is in general similar to the United States statute, except that the penalty of death is not imposed.

**MUTOSCOPE**, a mechanical apparatus for exhibiting instantaneous pictures of moving objects taken by the kinetograph or similar instrument. Photographic prints from the series of pictures thus obtained are mounted in consecutive order around a cylinder standing out like the leaves of a book. When the cylinder is slowly revolved, the picture cards being held back by a stop, and allowed to snap past the eye one by one, as one thumbs the leaves of a book, an apparently moving picture is the result. See CINEMATOGRAPH; MOVING PICTURES.

**MUTSU**, mit'su or mit's, Munimitsu, Count, Yamato no hamato no, b. Komada, 1842; d. Tokio, 24 Aug. 1897. After six years' foreign service and as governor of the province Kanagawa he was appointed (1874) secretary of the senate. He suffered a long imprisonment, from 1878, for participation in the Saigo Rebellion, but was pardoned in 1882 and
MUTSUHITO—MUZIANO

was again employed in foreign affairs by the state. From 1888-90 he was Ambassador to the United States, then becoming Minister of Agriculture in the Japanese Cabinet. During the Ministry of Marquis Ito (1892-96) he was Minister of Forestry Affairs being a member of the peace plenipotentiary party that arranged the treaty with Li Hung Chang at Shimonaskei, for which he was rewarded (1895) with the title of count. In 1894 he negotiated a treaty with Great Britain in which the latter renounced extra-territorial jurisdiction from July 1899. Lung troubles enforced his retirement from political activity in 1896.

MUTSUHITO, moo-tsue-hee-to, the 121st in the line of mikados or emperors of Japan and, according to the impersonality ruling in all Japanese history, posthumously called after the year period, the Mei-Ji Tenno: b. Kyoto, 3 Nov., 1852, 2d son of the Emperor Kojong (1831-67), declared heir-apparent 10 July 1860; succeeded to the throne January 1867; inaugurated as sovereign, with the three imperial symbols, mirror, jewel, and sword, 31 Oct., 1868; married 28 Dec., 1868 to Haruko, then 19, and the 3d daughter of the noble of the 1st rank Ishijo. No children were born of this union, but of the issue from imperial concubines, four sons and four daughters survive in 1918. From the first, brought up amid sounds of battle and in sight of the war fires of contendence clansmen in Kyoto, as the old and new forces struggled for mastery, and, happily, early surrounded by men of vision and liberal minds, some of whom had been in Occidental countries, Mutsuhito was from the first in hearty and active sympathy with modern progress and civilization. One of his first public acts was to take the famous charter oath of five principles. In one of these he promised a national deliberative assembly, and in the other to seek for talent throughout the world, for assistance in relaying the foundations of his empire. He became a shrewd judge of men and motives and a lover of peace. He signed in autograph the treaties, entered warmly into measures of reform and in erecting memorials to the martyrs and those who had advocated mikadoism and unity of government, traveled all over the empire to see his people, paid unique honors to his wife in public and private, and was a laborious servant of the nation. By personal tastes and habits thoroughly Japanese to the end of his days, he was a cosmopolitan in mind and sympathies, and his character as well as his office turned the scale in great crises, when grave debate was held by rival statesmen in his presence. Every word of the text of the constitution of 1889 was, during the two years of deliberation, discussed before him. Most notable and fiercely debated was the guarantee of religious liberty. His reign was marked by many wonderful events and a most extraordinary outburst of intellectual, industrial and military energy. On the 25th anniversary of his marriage, memorial postage stamps were issued and the empress was notably honored, marking a new era in the history of Japanese womanhood. The days of his last illness saw a prayer-meeting that was national and without regard to creed or class, all gods being petitioned, and the general sorrow was sincere and profound. His mausoleum in Kyoto cost over $1,000,000. His con-

sort, a true helpmeet and of finest character, followed him in death 8 April 1914. Both sovereigns were notable poets. From about 1870 the Japanese ceased to use the ancient poetical term mikado and adopted the native term Tenno, or tenno (son of heaven, or heavenly king), or emperor, as best according with the new status of Japan as a world-power. Consult Griffin, 'The Mikado's Empire' (1909), and 'The Mikado: Institution and Person' (1915); and Mrs. Fraser's 'Letters from Japan' (1899).

MUTTON-BIRD, a sailor's name for the shearwater (q. v.).

MUTTRA, is the northwestern district of the Agra Division, United Provinces, lying between lat 27° 14' and 27° 58' N., and long 77° 17' and 78° 13' E., with an area of 1,445 square miles. It lies on both sides of the Jumna and in the centre of the western border; the Arvallis Mountains extend in the form of a low range of hills. There are no rivers besides the Jumna, but there are canals, wells and marshes. The climate is hot and dry, with extremes of temperature. There is very slight rainfall. Muttra contains 14 towns and 837 villages. The population has been frequently devastated by famine, but better road facilities and irrigation have lessened these difficulties. About 90 per cent of the people are Hindus and less than 10 per cent are Mussulmans. The principal crops are millets, pulse, cotton, wheat, barley and sugar cane. The administration is under a member of the Indian Civil Service and three deputy collectors. According to Ptolemy, Muttra was the capital of the ancient kingdom of Surasena and was an important religious centre, as the many antiquities discovered here testify. It was sacked by the Mahmud of Ghazni in 1019, but played only a slight political part. It was revived during the Buddhist period as a centre of faith. Its history was merged into that of the Jats of Bharatpur, and after changing hands several times came under British dominion in 1803. In 1857 it mutinied but was put down in the same year and has since remained friendly. Consult 'Gazetteer of India' (Vol. XVIII, Oxford 1908).

MUTUAL BANKS AND CO-OPERATIVE SOCIETIES. See Banks and Banking—World's Systems.

MUYSCAS, mú-ché-ská. See CHIBCHAS.

MUZAFFAR-ED-DIN, moo-zä-fär'ed-din'; Shah of Persia: b. Teheran, 25 March 1853; d. there, 9 Jan. 1907. He was governor of Azerbaijan; succeeded his father, Nasr-Ed-Din (q. v.), 1 May 1896. Influenced by European civilization, he showed great tolerance toward the Christians, and did much to reform the internal administration of Persia by lightening taxes and by establishing a parliamentary government. He visited Europe several times.

MUZIANO, moo-té-zé-nö, Girolamo, commonly known as BRESSANO, Italian painter: b. Aquafredda, near Brescia, 1528; d. at Venice, 27 April 1592. He was a pupil of Romanino (see Romanino Girolamo) and of Titian at Venice, and subsequently imitated Michelangelo. He was a skilled mannerist who could paint in
any style while possessing none of his own. The Academy of Saint Luke was founded at his instigation. Among his most successful pictures are 'The Taking Down from the Cross,' in the Borghese Gallery, Rome; 'The Gift of the Apostolic Keys,' in the Vatican. There are also frescoes of his still to be seen in the Vatican.

MY PRISONS ('LE MIE PRIGIONI'), one of Italy's most noted books, was written by Silvio Pellico (1789-1854) and published in Turin in 1832. The work is autobiographical, relating the 10 years' experience of the author, charged with conspiracy and condemned by the Austrian government, first to death and subsequently to 15 years of imprisonment in the prisons of Venice and Spielberg, near Brunn in Austria. The work itself is of the simplest character, written, as he says in his preface, to comfort unfortunates like himself by showing that under the most unfavorable conditions humanity is not as black as it is painted. Had Pellico aimed directly to expose the inhumanity and cruelty of the Austrian government, as might have been expected he would have done, his effort would likely have fallen far short of what he actually accomplished in doing just that in this pathetic tale of his sufferings borne with the utmost Christian resignation. No hatred nor vindictiveness toward his arrogant persecutors escapes the unfortunate victim. In fact it is just here that the recital is most open to criticism. The patient sufferer is too submissive, too long-suffering and saintly as he is, that virility, which, because founded on righteousness, must ever command respect, is conspicuously lacking in him. His sad story awakened throughout Italy the most profound sympathy. Its moral effect may be compared to Chateaubriand's 'Genie du christianisme,' which was worth an army to Napoleon. Pellico's 'Le mie prigioni' was, as Caesare Balbo, who counseled the author to write the story, has said, worse for Austria than losing a battle. It is not primarily as an author that Pellico's place is secure in the hearts of his countrymen, for his literary work as a whole is rather commonplace, but as a Christian martyr upon whom an odious enemy has placed a crown of thorns. From the time of the appearance of this story, the hateful domination of Austria was judged and condemned by the fair-minded not only of Italy but of Europe. Nothing has ever been written better adapted to cause and to perpetuate feelings of hatred toward a despicable tyrant. And even to-day the influence of 'Le mie prigioni' on Italian sentiment toward Austria is abiding. Many translations of 'Le mie prigioni' have appeared in many languages and English versions are easily procurable in the large libraries.

JAMES GEDDES, JR.

MYCALE, mik's-lë, Asia Minor, the classical name of the modern Samos, a mountain of south Ionia, with the promontory of Cape Santa Maria opposite the island of Samos as its seaward termination.

MYCNÆ, mi-se'në, Greece, an ancient city of Argolis in the Peloponnesus, six miles north-northwest of Argos, and dominating the passes to Corinth. Its ruins since Schliemann's excavations in 1876 have yielded an abundance of archaeological treasure of the greatest value and interest, illustrating the distinctive Mycenaean period of civilization, which preceded the culminating era of Hellenic culture. Mycenae is said to have been founded by Perseus, and before the commencement of the Trojan War was the residence of Agamemnon, in whose reign it was regarded as the leading city in Greece; it was also the scene of the domestic tragedies of the house of Atreus (q.v.). It declined in importance after the invasion of the Dorians, but its cyclopean walls, citadel and other features, chief of which are the Lion's Gate, and the vaulted building of megalithic architecture called the Treasury of Atreus (q.v.), stood through succeeding centuries, and still stand, as monuments of its ancient grandeur and importance. Consult Schuchhardt-Sellers, 'Schliemann's Excavations' (1891); Hall, 'The Oldest Civilization of Greece' (1901); Tsountas and Manatt, 'The Mycenaean Age' (1897).

MYCORRIZA is a general name for a group of subterranean fungi that spread their growing, feeding part (mycelium) through the loose damp soil (humus) of forest or wood-lot. They are symbiotic with a great variety and number of green-leaved plants, including forest trees of several families. The first root of one of these affected plants, just born from the seed, remains free, but as fast as the lateral roots push out they are enveloped in the mycelium of the fungus, and their ramifications become entangled in it as they spread, and this connection continues throughout life. Wherever a root or rootlet extends underground the fungus accompanies it. The mycelial filaments may form a dark-brown, felt-like coating over the whole surface of the root, or, in other cases, depending on the species, may make a net-work of spider-web-like mesh. At various points the spore-producing hyphe proceeds outward through the soil from the mycelium; they look like rootlets and seem to perform a similar service. This mycelium (called spawn by mushroom growers) represents an unknown number and variety of species of fungus, and it absorbs the humus of forests and uncultivated heaths where the top-soil is the result of vegetable decay. The coating of roots by this mycelium is to be seen wherever plants grow, but it does not affect every kind of plant. It is restricted to the flowering plants, among them all the Pyrolaceae, Vaccinæ (whorlberries), and Arbutæ, and most if not all the heath family (Ericaceae), rhododendrons, daphnoids, a great number of conifers and all the Cupuliferae—a group that includes the oak, beech, alder, chestnut, and many other trees; also many isolated trees, as willows and poplars, and the genista and several other familiar garden herbs.

This association of the mycorrhiza with the flowering plants is in each a partnership of mutual benefit. Covering the root with a mantle it prevents, it is true, the absorbing pores from performing their function of withdrawing from the soil the dissolved elements that constitute the food of the plant, but in compensation it is performing its own function, absorbing the required nutriment and delivering it to the plant. It is enabled to do
this because the mycelium has the power of secreting "those special enzymes, or fermenters which, while they are not capable of assimilating the food materials which they touch. In return for this service it receives from the plant-root nourishment for itself, which has been elaborated in the leaves and distributed to every part of the plant, including its utermost rootlet. This, indeed, is only one side of the story. The organic indigens, having no chlorophyll with which to derive nourishment from the air through chemical dissolution and recombination, must get it from vegetable sources. This association of the mycorrhiza with plant-roots is therefore parasitical, yet it seems not only harmless but decidedly beneficial—in fact, those plants participating in this association will not do well, and perhaps will fail to grow at all, in a soil wholly free from suitable mycorrhiza. Hence the special value of the addition of wood-mulch to garden or window-plot soil is that it brings with it this advantageous, and sometimes indispensable, mycorrhiza mycelium.

ERNEST INGERSOLL.

MYDDELTON, or MIDDLETON, Sir Hugh, British conductor: b. Gaith Hill, Denbigh, Wales, about 1560; d. 10 Dec. 1631. He was by trade a goldsmith, banker and clothmaker of London, but became (1597) an alderman of Denbigh, then was elected member of Parliament for that town in the years 1603, 1614, 1620, 1623, 1625 and 1628. The lack of water supply for the rapidly growing city of London induced the Parliament to pass a bill for the construction of the "New River" to tap the springs in Hertfordshire, and he contracted to carry out the undertaking. Fearing opposition from the landed proprietors forced him to call in the king's aid and James I paid half the cost in return for half the profits. The canal, begun 1609, was completed in 1613 and was then 38 miles long, 20 feet wide, with a depth of but four feet and half a mile after land. The death project was unprofitable and he lost considerably though the New River Company later became, after his death, one of the most profitable undertakings of centuries, its shares (known as "King's" and "Adventurers") being broken up in 36-second parts, bring immense dividends to this day. In 1617 he made considerable profit in the exploitation of lead and silver mines in Cardiganshire. He was created a baronet in 1622.

MYELITIS (from Greek μυελός: marrow), an inflammation, attended with more or less softening, of the substance of the spinal cord. It may be acute or chronic and is a rare disease. Some of the maladies formerly ascribed to chronic myelitis are now known to be due to chronic induration and thickening (sclerosis). The most common causes of myelitis are: irritation of the cord by fractured, dislocated or diseased vertebrae, by the pressure of a tumor, or by hemorrhage into its substance. The disease is aggravated by intense pain, pressure of the affected vertebrae, and other uncomfortable sensations in the spine or extremities, and fatigue, followed by an uncertain gait, paralysis and very frequently death. There are four different forms of the disease according to the position of the inflammation, which may be in the midbrain region, the most common form, or in the lumbar or lumbo-sacral region, in the cervical region or it may, instead of affecting only a certain definite locality such as those already mentioned, involve a number of small areas in the whole length of the cord and brain. This form is called disseminated myelitis. If the inflammation involves the upper part of the cord above the origin of the respiratory nerves, respiration is interfered with and death results from asphyxia. This is, however, exceedingly rare. If the inflammation exists lower down, in addition to the loss of motor power in the extremities the bladder and rectum may be paralyzed, the evacuations are discharged involuntarily and death occurs from exhaustion. The tendency of the inflammation is to spread. Treatment consists of salvarsan and mercury for the cases of syphilitic origin. Absolute rest in bed must be required, an air or water bed being preferable as bed sores are very likely to occur.

MYERS, Abraham C., American Confederate soldier: b. in South Carolina, 1811; d. Washington, D. C., 20 June 1889. When a boy he removed to Louisiana, was appointed to West Point, and in 1853 was graduated and entered the army. He served several years on the frontiers, in the War with Mexico, and entered the quartermaster's department as lieutenant-colonel. When Louisiana seceded, Myers resigned and was soon appointed Confederate quartermaster-general with the rank of colonel. Myers rendered great service to the Confederacy in organizing its transportation and supply departments. On 10 Aug. 1863 he resigned. His life after the war was uneventful.

MYERS, Henry L., American legislator: b. Cooper County, Mo., 9 Oct. 1862. He was educated at private schools and practised law (1885-93) at Boonville and West Plains, Mo., then at Hamilton, Mont., from 1893. From 1895-99 he was prosecuting attorney for Ravalli County, Mont., becoming Democratic member of the Montana senate 1899-1903. He was (1907-11) district judge of the 4th Judicial District of Montana, becoming (1911-17) United States Senator for Montana, to which position he was re-elected for the present term (1917-23).

MYERS, Jerome, American artist: b. Petersburg, Va., 20 March 1867. He received his first art education in Cooper Union, New York, and also at the Art Students' League. In 1903 he won a Saint Louis Exposition bronze medal. His "Night Mission" is in the New York Metropolitan Museum of Art and other works are in leading galleries of private collections. His favorite subjects are taken from local sources, New York's "East Side" especially.

MYGALE, the technical and book-name of the Theraphosidae a species of trap-door spider (Mygale auricularia) which has been known to catch small birds and kill them. It is a native of India, Australia, Africa, and South America. It is the largest of all the spiders, being very stout, dark brown or black in color, and its thick legs covered with hairs mingled with longer bristles. It builds its nest in trees. Similar species are brought into our ports in bunches of bananas. These spiders are nocturnal in their habits and feed usually on-
sects, but they do not hesitate to attack any living creature which seems unable to resist them. The fact that the head-spider will actually kill birds and suck their blood was asserted by Madam Meriam in 1705. Her statements were received with doubt, but long after were verified by Bates. The specimen he observed on the Amazon River was nearly two inches in length, the legs extending seven inches. He saw the monster on a tree-trunk beneath a deep crevice in the tree, across which was stretched a dense white web. The lower part of the web was broken, and two small finches were entangled in the pieces; one was quite dead; the other was still living and was smeared with the filthy liquor or saliva exuded by the monster. The natives call them arawhas caranguejeiras, or "crab-spiders." The hairs on the body and legs come off when touched, and "are at least maddening irritation." This, Bates thinks, is not due to any poisonous quality residing in the hairs, but to their being short and hard, and thus getting into the fine creases of the skin.

**MYIASIS**, a diseased condition in humans caused by the larvae of flies. House-flies may attack the skin of man by depositing eggs in wounds and on ulcerations, or may invade the external cavities of the body. The eggs hatch, and the maggots cause much local irritation and symptomatic fever; or in case of the botfly (q.v.), penetrate the skin deeply and produce large abscesses. The maggots, as a rule, do not penetrate other tissues. The principal flies that infect wounds, etc., are the flesh-fly (blue-bottle), blow-fly, screw-worm fly, which deposits its eggs in the noses of persons who sleep unprotected during the day, and houbyd (qq.v.). Internal myiasis may result from swallowing the eggs of flies in raw vegetables containing them, and sometimes eaten in salads, when the resulting larvae are got rid of by vomiting or purgation. Consult Howard, 'The Insect Book' (1901).

**MYLITTA**, mi-lit'ta, an Assyrian goddess identified by the Greeks with Aphrodite. She was, as goddess of the moon, the female principle of generation.

**MYLODON**, the "ground sloth," a genus of extinct edentate mammals, of sloth-like structure and large proportions, the remains of which occur along with those of the Megatherium and Megalonyx, in the recent or post-Tertiary deposits of South America and also scattered widely over the United States from Pennsylvania on the east to Oregon on the west. It was peculiar and almost the most familiar species — attained a length, in some instances, of 11 feet. A large piece of the very thick hide of one of these mylodons, found in a cave in Patagonia, shows that they were covered with a dense coat of yellow-brown furry hair, similar to that of the brown bear of the Rocky Mountains. See SLOTH; ME-GEATHERIUM.

**MYNA.** See MINA-BIRD.

**MYOPIA**, mi-ó'pi-a, nearsightedness. See ASTIGMATISM; COLOR BLINDNESS; EYE; EYE STRAIN; VISION; DEFECTS OF.

**MYOSIN**, or **MYOSIN-FIBRIN**, a simple protein substance, usually classed as a globulin (see GLOBULINS), which separates from muscle plasma after death, in the form of a clot, which is analogous to the clot of fibrin. It is also analogous to fibrinogen in blood. Its average composition is carbon, 52.28 per cent; hydrogen, 7.11 per cent; nitrogen, 16.77 per cent; sulphur, 1.27 per cent, and oxygen, 22.03 per cent. It does not exist in the living muscle, being there represented by two other proteids called myosinaogen and paramyosinogen, respectively. The stiffening of the muscles after death (technically known as the "rigor mortis") is due to the formation of the myosin-fibrin and myogen-fibrin clots in the cells of the muscles. Myosin is insoluble in water, but dissolves in dilute saline solutions. It is soluble also in dilute acids and alkalies, which convert it promptly into albuminates. Consult Hammarsten, O. (Mandel's translation), "A Textbook of Physiological Chemistry" (New York 1908).

**MYOSOTIS.** See MOUSE-EAR.

**MYRES**, mîrs, John Linton, English classical scholar: b. Preston, Lancashire, 3 July 1869. He was educated at Winchester and studied at New College, Oxford. From 1895-1907 he was tutor at Christ Church and lecturer in classical archaeology at Oxford University, junior proctor (1906-1908), secretary to the committee for anthropology (1905-07) and examiner in final classical school (1906-08). From 1907-10 he was Gladstone professor of Greek and lecturer in ancient geography at the University of L. as a special lecturer in archaeology, pro- fessor of ancient history at Oxford. He traveled through Greece and Asia Minor, conducted excavations in Cyprus (1894 and 1913), and reorganized the Government Museum (1894). He has written 'A Catalogue of the Cyprus Museum' (1899), in collaboration with Dr. Ohnefalsch-Richter; 'A History of Rome' (1902); 'The Dawn of History' (1911); 'Handbook of Cesnola Collection of Antiquities' (in Metropolitan Museum of Art, 1914). He also wrote many papers on anthropology, geography and archaeology for the scientific periodicals.

**MYRIAPODA**, a group formerly classified among the arthropodan animals, but now better known. It includes the groups of Chilo- poda, or centipedes, and the Diplopoda, mile- peds or galley-worms. The centipedes to all are the elongate worm-like body consisting of a head and behind this the trunk of numerous similar leg-bearing segments, not di- vided into thorax and abdomen. They are all habitants of dark and obscure places,—under logs and stones and the bark of trees. All but two species are terrestrial; those two are semi- aquatic, living between the high and low-water levels on the sea-coast. Closer analysis shows that the chilopods are related to the crustacea while the diplopods are unrelated. In the chilopods the head bears a pair of groups of simple eyes, a pair of antennae and three pairs of jaws (mandibles, maxille, labium), while the first pair of trunk appendages be- comes connected with the head and forms poison-jaws. The trunk-segments are all similar, and each bears one pair of legs, the number of segments ranging from 15 to 170 or more. The body-segments are flattened and the reproductive openings are at the hinder end of the body. Most of the chilopoda are carnivoro
ous and ferocious and are very quick in movement. The most noticeable members of the group are the centipedes (Scolopendra) of the tropics, some of which are nearly a foot in length and have considerable poison powers. See CENTIPEDE.

In the diplopoda the head bears but two pairs of jaws (mandibles and lower lip or gnathochilium), while the trunk-segments are usually circular in section, and each, except a few near the head, bears two pairs of legs, an exception to the otherwise universal mode of walking among arthropoda of a pair of legs to a somite. The range of segments is even greater than in the chilopods, there being nine in Pauropoda and 200 in some Polyzoa. The reproductive organs lie ventral to the intestine, and the external openings are a little behind the head. The Diplopoda live mostly upon decaying vegetation and are extremely slow in movement. For protection they rely upon the very thick and hard walls of the bodies, and in some species upon peculiar sinistral glands which open on the sides of the body. See MILLEDIP.

Fossil Myriapods appear in the Devonian rocks and they are found in all parts of the world to-day. Most of the American species are described in Willard's 'Myriapods of America' (United States National Museum, 1893).

MYRICIN, a substance formed by the combination of palmitic acid with an organic radical known as "myricyl." It has the chemical formula C_{15}H_{28}O_2, and occurs in beeswax, forming the chief portion of that part of the wax which is insoluble in alcohol. Myricin melts at 162° F., is readily saponified by alcoholic potash, and may be obtained in the form of feathery crystals by deposition from its solution in alcohol.

MYRISTIC ACID, an organic acid occurring in the form of a glyceryl ether in nutmeg butter, from which it may be prepared by saponification and subsequent distillation at a pressure materially below that of the atmosphere. It is a component also of butter, wood fat, cocoanut oil and oil of quince seed. It has the chemical formula C_{15}H_{28}O_2, and is insoluble in water. It is very soluble in hot alcohol, however, from which it separates, upon cooling, in the form of lustrous lamellae, melting at 120° F., and boiling at 250° F. It may be prepared by melting stearic acid with potash. A number of compounds of myristic acid with the metals are known, as well as several others and other organic compounds. Myristic acid gives their characteristic name to the myristica farts of which it forms the pre-dominating part as trimyristin glyceride.

MYRMECOPHILY, in its broadest sense, signifies a condition of friendship with ants, and includes the subject of the various insect and other guests kept or entertained in their nests by ants. The side of it to be considered now, however, is the relation of certain plants to ants, when this relation is, or is supposed to be, of mutual advantage. Such plants are termed myrmecophilous and are of great variety, especially in the tropics. That ants inhabit all sorts of cavities in trees and large vascular plants, such as cacti, is well known, and often they dig out the pithy interior or otherwise modify these cavities into homes fully adapted to their requirements. "The rigid vegetable tissues are an excellent protection against enemies," as Wheeler points out, "and the cavities are moist, dark and free from molds, so that they make perfect nurseries for the larve and pupae." It is a matter of common knowledge also that in most cases the plants thus utilized furnish a good deal of food material for the ants. The great mass of observations bearing on this matter have been interpreted by many naturalists to support the view that many plants have developed as an adaptation through natural selection elaborate structures to be used as ant-lodgings or even to furnish these insects with food-substances in order to attract certain pugnacious ants whose stings are formidable, because they will protect the plants from leaf-cutting ants or other leaf-destroying enemies. In this alleged symbiotic arrangement the insects profit by the supply of special food-material growing on the plant and return the service by warding off harm; and it is said that such have occurred between the chosen kind of plant and the species of ant that inhabits its appointed cavities. The great body of facts collected by Fritz Müller, Schimper, Belt, Semper, Beccari and others are accepted, and some of their interpretations are admitted, but recent students of the matter regard the theory as far overstrained and doubt that true symbiosis can be shown to exist in any case. The latest and fullest treatment of the matter will be found in William M. Wheeler's "Ants" (New York 1910).

MYRMIDONS, mér'mi-dónz, a former people on the southern borders of Thessaly, who accompanied Achilles to the Trojan War. They were said to have received their name from Myrmidon, a son of Zeus and Eurymedusa, the daughter of Cleitus, whom Zeus deceived in the disguise of an ant. He was married to Peisidice by whom he became the father of Aníphus and Actor. For Æacus, a descendant of this branch, Zeus changed the ants of the island of Ægina to men. This legend was the origin of the belief that the Myrmidons emigrated to Thessaly under the leadership of Peleus.

MYROBOLANS, the dried fruits of various species of East Indian trees, all having more or less astringent properties. They are used for dyeing and tanning, especially the latter. The trees are of the genus Terminalia, family Combretaceae, the chief being the belleric myrobalan (T. bellerica), and the chebulic (T. chebulaica).

MYRON, Greek sculptor. h. Eleutherus, a seaport of Boeotia, about 450 B.C. He was, along with Phidias and Polycletus, a pupil of Ageladas, the founder of the Peloponnesian school of sculpture, and made his renown at Athens as a versatile and masterly worker in bronze, silver and every other art material. He executed statues of gods, heroes and especially of athletes, many of which were set up in the temples at Delphi and Olympia. The most celebrated among them was that of swift runner Ladas, and the Doryphorus or hurler of the discus, a work of art highly admired by the Romans, as is proved by the many Italian copies of it made in marble, the finest of which is that now in the Lancellotti Palace, Rome. On
medals, basins and reliefs there are still extant copies of his Athenian work, 'Athena Throwing Away the Flute,' etc. A marble copy of his 'Marsyas' is in the Lateran Museum at Rome, and one in bronze is to be seen in the British Museum. He was equally successful in the representation of animals. His 'Cows' in the market at Athens was the subject of many a laudatory epigram and was brought to Rome in the time of Cicero. Myron gave a somewhat exaggerated slenderness to the human form, which he modeled with exquisite beauty and anatomical accuracy, but was not a master of facial expression.

MYRRH, a popular name for a gum resin produced by Commiphora myrrha of the family Burseraceae; also for a garden plant Myrrhis odorata of the family Apiceae. The resin is obtained from Arabia and adjacent Africa from a small, prickly, stunted, gray-barked tree which bears few small denticulate leaves and smooth, brown, egg-shaped drupes as large as currants. The drops, granules or tears which in commerce are brown, red or yellow are at first rather oily, yellowish and soft, becoming brittle with age. They have a pleasing balsamic odor and lasting, bitter, aromatic taste. From earliest times they have been used for making incense and other perfumery and have been reputed useful in medicine, especially for cleansing, the mouth and sweetening the breath. Myrrh, the garden plant, also known as sweet cistus, has been cultivated for ages as a sweet herb for flavoring salads and culinary preparations. It is little grown in the United States except by people of rather recent European ancestry.

MYRTACEAE, a family of trees and shrubs, the myrtle family, comprising about 70 genera and more than 2,000 species widely distributed in warm climates, but sparingly in temperate. It is one of the most important families of economic plants. Some of the species, such as pomegranate (Punica granatum), guava (Psidium spp.), luma and ugni (Myrtus), yield important fruits; some such as cloves (Eugenia spp.), allspice (Pimenta), furnish highly valued spices; and still others, especially species of Eucalyptus, are leading timber trees of the world. The species are characterized by simple, entire leaves generally dotted with glands; perfect flowers in racemes or sometimes cymes, and various kinds of fruits. See MYRTLE.

MYRTLE, a popular name for several unrelated plants of which the following are probably the best known: Crape myrtle (Lagerstroemia indica) of the family Lythraceae; running myrtle (Vinca spp.) of the family Apocynaceae; sand myrtle (Leiophyllum spp.) of the Ericaceae. When unqualified the name generally refers to various species of Myrtus of the family Myrtaceae. The common myrtle (M. communis) is an evergreen shrub native of the Mediterranean region and western Asia, whence it has been introduced into gardens throughout the warmer temperate climates of the world for its foliage and flowers. It was used in Greek festivals as sacred to Venus and as the symbol of beauty and youth. Its aromatic leaves and berries were formerly used in medicine and its bark in tanning, uses still made of them to some extent in southern Europe. The small leaved myrtle (M. microphylla), the luma (M. luma) and the Chilean guava (M. ugni) yield edible fruits, for which they are planted in South America and to some extent in California.

MYRTLE TREE. See Beech.

MYSIA, mish'-tə, Asia Minor, a name anciently applied to a district which varied greatly in extent at different periods. The name first occurs in the legend of Telephus, who became king of Mysia. Under the Persian Empire Mysia was the name of the section between Lydia on the south and the range of Ida on the north. It was united with the region on the north and with Lydia in satrapy. After the overthrow of the Persian Empire by Alexander the Great, Mysia fell to Lysimachus (311 b.c.). Subsequently it formed part of the Greco-Syrian kingdom, then of the kingdom of Pergamus, and finally, in 133 b.c., was bequeathed with the rest of the kingdom of Pergamus, by Attalus III to the Romans. By whom it was made a part of the province of Mysia. When the divisions of Asia Minor were settled under Augustus, the name was given to the whole of the northwestern district, bounded on the north by the Propontis (Sea of Marmora), east by Bithynia and Phrygia, south by Lydia and west by the Ægean Sea. Under the later empire Mysia was erected into a separate proconsular province and received the name of Hellespontus. The inhabitants were thought by some ancient writers to be of Thracian or Lydian descent.

MYSORE, mī-sōr', or MAISUR, mī-soor', India, the dynastic capital of the native state of the same name, 250 miles west by south of Madras, in a valley 2,450 feet above sea-level, dominated on the southeast by Chamundi Hill, 1,040 feet higher, with a temple on its summit. It is on the Mysore State Railway. Modern enterprise on European methods has greatly improved the town. The streets are broad and regular, the houses intermingled with trees and temples, and there are several fine modern public buildings, including the British residency. The fort built in European style, and separated from the town by a promenade, encloses the maharaja's palace, and the dwellings of his officials.

MYSORE STATE, or MAISUR, a native state in Southern India, lying between lat. 11° 36' and 15° 2' N. and 74° 38' and 78° 36' E. Its area is 29,433 square miles; the greatest length north and south being about 230 miles; east and west about 290 miles. It is bounded by Madras districts on all sides except on the northwest where it is bordered by two Bombay districts and toward the southwest where Coorg intervenes. It consists of an undulating table land, much broken up by chains of rocky hills and scored by deep ravines. Its form is that of a triangle with the apex to the south at the point where the western and eastern ghats ranges converge in the group of the Nilgiris. The general elevation rises from about 2,000 feet along the north and south to about 5,000 feet at the apex. The chief river is the Kistna which rises in the north of the Kistna to the north from that of the Cauvery to the south. Isolated rocky peaks called "droogs" appear on all sides at an elevation from 4,000 to 5,000 feet. The drainage
of the country finds its way east to the Bay of Bengal and there are three great river systems; the Kestna on the north, the Cauvery on the south and the Penner, Ponnaiya and Palar on the east. None of these is navigable, but they are sometimes used for floating lumber. They support an extensive system of irrigation by means of channels formed by immense dams. Tracing a course of more than 1,200 miles. There are no natural lakes in Mysore, but by embanking streams, tanks or reservoirs of all sizes are formed numbering some 30,000. Mysore is divided naturally into two regions—the hills of the east—picturesque mountain land, with fine forests—and the open country on the east comprising the greater part of the state, known as Middan or Bayalishine, where the towns are located. The products of the country vary with the water supply and nature of the locality. The level plains of black soil in the north grow cotton or millets; the tracts in the south and west are covered with plantations of sugar-cane and rice; the lands irrigated from tanks yield coco-nut and areca palms; the red soil in the south produces ragi and dry crops; the central parts covered with areas of coarse grass relieved by shady groves, are good for grazing. The principal mountain ranges besides the Ghats are the interior range, from 10 to 20 miles wide running between 77° and 77° 30' E. to the frontier; and a corresponding range in the west. The highest point is Mulainagiri, at an elevation of 6,317 feet. Granites and granite gneisses of the Achean occupy the greater portion of the state and traversing these are numerous streams of Pre-Pleistocene Age. There are other more recent deposits. Granite exists in large intrusive masses. Wild animals and reptiles are abundant in the forests and streams of the forest. Large fish are found in the west.

There are three seasons, rainy, cold and hot. The country is visited by two monsoons, the southwest, from June to November, followed by the cold season. The temperature ranges from 64° to 84° in the rainy season; and from 51° to 80° during the cold season. In the hottest season it ranges from 66° to 91°, rarely reaching 96°. The rainfall varies from 19 inches in the north centre to 360 inches on the crest of the Western Ghats.

Mysore yields 95 per cent of the gold of India. Iron is found in small quantities and asbestos is an undeveloped industry. The manufactures consist of fabrics, silk and carpets, gold ornaments, copper vessels. Sandal wood carving is extensively carried on. Coffee, cotton-ginning, bricks, tiles, etc., are also among the manufactures. A system of railways radiates from Bangalore; the length of the railway open to traffic in Mysore is about 500 miles. For postal services, Mysore is now part of the Madras circle. There are Mysore state savings banks and life insurance companies. Farming has been a lack of rainfall or crop failure carried off many of the people, but measures have been taken to alleviate this condition, such as the extension of railways, irrigation and plans for relief work.

Government is vested in His Highness the Maharajah, a chief justice and a court of three judges. The capital is at Mysore City, but the administrative headquarters are at Bangalore. The administrative districts of the state are Bangalore, Kolá, Tumkúr, Mysore, Hassan, Spimoga and Chitaldroog. The officer in charge of a district is called the deputy commissioner who has a staff of assistants. The villages have local government under a pátí, a hereditary office. A representative assembly meets once a year, when the annual statement of finances is made. The government of India is represented by a resident. There are military systems, lesser courts, systems of land tenure and revenue, police departments, etc. Education was at first introduced by European missionaries and has been developed into a fine public system. There are now about 3,800 schools of all grades with some 125,000 male and 25,000 female students. Hospitals and asylums are also provided in the larger cities. The population of the entire district according to the most recent census is 2,871,572. Hindu castes predominate. The Lingayats forming the strongest sect. There are about 50,000 Christians, about 8,000 of whom are white. The principal towns are Bangalore, Mysore, Kolá, Tumkúr, Channapatna, Davangere and Tarikere.

The authentic history of Mysore as gathered from inscriptions, begins after the invasion of Alexander the Great in 327 B.C. After his departure the north of Mysore came under the rule of the Andhra of Sàtavāhan dynasty, extending down to the 2d century B.C. The various parts were under petty local princes who were frequently at war with each other, until in the 14th century the territory became a part of the Ballala Kingdom of Delhi, after the invasion of the Mohammedans. After their downfall a new Hindu sovereignty arose at Vijayanagar on the Tungabhadrā. In 1565, this dynasty was defeated at the battle of Talikota and petty chieftains again divided up the state. The most important of these, the wodeyar of Mysore, seized the fort of Seringapatam in 1610 and founded the present state. Under Deva Raja it became a powerful kingdom. In the 18th century this dynasty was overthrown by the Mohammedan Hyder Ali, who, after a brief but brilliant reign, was defeated at Seringapatam in 1799, and the government was left to an infant descendant and an unscrupulous regent, Furrnay. The British government took over the administration in 1831. In 1867, it was determined to permit the native rule, under British surveillance. In 1881, Maharaja Chamarajendra took the rule of the state, maintaining the standard of administration. In 1902 the ruler was vested with full powers. Consult 'Imperial Gazetteer of India' (Vol. XVIII, Oxford 1908).

**Mysteries** (Latin *mysterium*, from Greek *mytēs*, initiate)—in ancient history, were among the Greeks, and afterward also among the Romans, secret religious assemblies, in which no uninitiated person was permitted to take part. They originated at a very early period. They seem to have had a double object—first, that of handing down the traditions relating to the divinities in whose honor they were celebrated; and secondly, that of teaching and practising religious rites. The value of the mysteries did not lie in dogmatic teaching, but in the moral improvement apparent in
the votaries, in the comfort the rites gave in their life, and the hopes they inspired for the world to come. The most important Greek mysteries were (1) the Eleusinian; (2) the Samothracian, which were celebrated in honor of the Cabeiri in all the places where these divinities were worshiped. (3) The Dionysia, at Athens called Bacchantia, which were celebrated in honor of Dionysus or Bacchus. These latter mysteries were of so licentious a character that they were first forbidden in Thebes, and afterward in all Greece, as prejudicial to the public peace and morals. This was likewise the case in the Roman senate in 186 B.C. (See BACCHUS). (4) The Orphic, consecrated to Dionysus Zagreus, the son of Zeus and Persephone. (See ORPHEUS). See also MIRACLE PLAYS.

Eleusinian Mysteries were generally held by the Greeks to be the most sacred of all the mysteries; and their great secrecy, intricate ritual and dramatic features were undoubtedly strongly influential in shaping the form of the ritual for many succeeding secret orders. They were connected with the worship of Demeter and Cora at Eleusis in Attica; and they appear to have had their origin in the ceremonies connected with the birth and death of the grain spirits. Demeter, in the ceremonies of initiation through which the candidate had to pass in order to become a member of the mysteries society, finally bestows agriculture upon man. The mysteries seem to have had degrees suggestive of the degrees in modern secret societies. All candidates had to become members of the society of the Lesser Mysteries at Agrae (as in the Eleusis); before they entered that of the Greater Mysteries at Eleusis; and six months had to elapse between the two initiations. At both initiations the candidate made his own personal offerings or sacrifices to the gods, accompanied by fasting and other ceremonial practices in the nature of purifications; after which he wandered, or was led, through dark and intricate passages until finally he emerged into the presence of the deity upon whom streamed the rays of light. As the Lesser Mysteries were celebrated in the early spring and the Greater Mysteries in the fall, the first probably represented the coming of life to dead nature and the latter the death of vegetation. A sacred peace declared some days previous to the opening of the ceremonies and continuing several days after their close permitted the pilgrims to the shrines and the candidates to come and go in peace, without any fear of molestation. The public ceremonies of the Greater Mysteries began with the bringing from Eleusis to Athens of certain sacred relics to be placed in the Eleusinia; the following day the celebrants put in an appearance and on the third day all the initiates (Mystae) marched in procession to the Phalerum beach where they performed the necessary ceremonial bathing which was symbolic of purification. This was followed by sacred offerings presented at various shrines throughout Athens. Early on the morning of the next day the relics were returned to Eleusis, escorted by a great religious procession, in the midst of which was the image of Bacchus. This occupied all day. The following four days and nights were given up to the secret ceremonies of the mysteries, under the direction of the Hierophant, the Dodouchos (torchbearer), the Hierokryseus (herald) and the officiating priest. Eleusinian mysteries were also celebrated in various other places in Greece proper and outside of it, among these being Megalopolis, Phlius and Andania (in Messenia). The mysteries undoubtedly date back to a period far earlier than antiquity, far as the earliest notice we have of them they are possessed of an organized priesthood and the custom of choosing the Hierophant from one family (the Eumolpides of Eleusis), and the Dodouchos from another (the Kerykes). It is probably true that the 8 families which derived their family names from their offices, as the Jewish priests did.

Samothracian Mysteries. These which were originally two, were known as those of the Cabeiri. In the course of time they became the Mysteries of Dionysus, Attis, Osiris, Antheros, Aterkera, Atroperos and Kassilos, in popular phraseology; though the grammarians identified them, respectively, with Demeter, Persephone, Hades and Hermes. It seems probable that they were the survival of tribal deities belonging to the same great family religion.

Gradually as time went on these mysteries, which had much of the spectacular and the mystical which always appeal to humanity, spread throughout Greece, in their own form and under their own name or in the shape of evident imitations or of other closely related tribal mysteries. The worship of the Egyptian moon and mother goddess, Isis, which had early been introduced into Greece, spread rapidly throughout all the land round the Mediterranean and later to the parts of western Asia. With this worship came foreign mysteries, which seem to have originated in the same form of nature worship as the native Greek mysteries. Other foreign mysteries, apparently also of similar origin, were introduced into Greece and appear to have taken root there. The Greeks seem to have been very fond of these semi-religious, semi-social mysteries and most of the prominent citizens appear to have belonged to one or more of them, much as people to-day belong to secret societies. These mysteries, however, had a deep meaning for the Greek, which the modern secret society does not have for its members.

MYSTERIES OF UDOLPHO, published in 1794, is the best known of the several novels of Mrs. Ann Radcliffe (1764-1822). The book was exceedingly popular at the time, the author receiving the unusual sum of £500 for it, and it was translated into French. Though the story of Udolpho is usually cited as an example of the florid, romantic style of the later 18th century, it is as a matter of fact an interesting and in many respects a powerful novel. It tells the romantic history of a young French lady, Emily d'Aubert, a heroine of much sensibility, but of considerable character, who has shown trying and mysterious adventures in France and in Italy, and her marriage to the hero, Valancourt. The plot is an intricate and eventful one and the story deals with kind parents, unkind relatives, fine feelings, rude behavior, ruf-fies, and with the mysteries, both of character and of circumstance, which are ultimately explained as natural. Perhaps the most distinguished parts of the book are the fine and often beautifully poetical descriptions of nature. The character and atmosphere are less interesting in that nearly all seem to the modern reader to be unreal and melodramatic. The novel contains many good poems by Mrs. Radcliffe in the 18th century style. The tale is high in its class, but was, of course, overshadowed by the greater power and popularity of the Waverley novels, which owe something to it.

WILLIAM T. BREWSTER.

MYSTERY OF EDWIN DROOD, novel by Charles Dickens. It was the last work by this noted author and was never finished. Only eight numbers appeared in which the author died in 1870, the year of the author's death. Numerous conjectures as to the outcome of the plot started or have been published from time to time, but his notes for the continuation of the work leave little toward unraveling his intent.

MYSTIC SHRINE, Ancient Arabic Order of Knights Templar and 32d degree of the Ancient and Accepted Scottish Rite, Masonic Order. The governing body is the imperial council with 101 subordinate branches called temples. The membership in America amounts to 200, 500. See Masonic Fraternity.

MYSTICISM, mis'ti-siz'm, a term derived from the Latin mysticus, Greek mystikos, mystical, secret, from mys 'a mystic, a mystic, one initiated into mysteries, and from mys, to close the lips or eyes. Mysticism has for many minds a repel-lent sense, owing, as a recent writer has acutely observed, to its association with the delusions of visionaries and the extravagance not only of gnostics and Neoplatonists, but of many so-called Christian mystics, who, misled by a resemblance in terminology and statement, as well as in practice and discipline between the false and the true, have failed to observe a difference of infinite movement in principle and substance, and have striven to mingle into one system the less essential elements. Against extravagances such as these common sense has justly rebelled, while pantheism has found in them a pretext for making a clean sweep of everything that would seem to raise religion above the plain man's apprehension and criticism.

For many, mysticism means simply an abandonment of all attempt to reconcile the "religious sentiment" with intelligent thought, a deliberate yielding of one's self to any unchecked and unverifiable fancy or speculation which seems to interpret the vague yearning of the soul after a transcendent being. Or it suggests a morbid quietism effected by a complete deadening of the affections and stupification of the mind, an Oriental contempt not only for everything material and natural, but even for all desire and existence; thus giving a Buddhist interpretation to the Christian discipline of self. Or at best the term stands for the exalted state of a few saint-like beings who have attained to a preternatural state of communion with the Deity, a state that has no practical interest to the ordinary mortal. But merely to tabulate the countless divergent senses associated with the term, not only in common usage, but by authors of high repute, would exhaust the limits of this essay.

The reader interested in the matter can consult some such work as that of Mr. Inge, mentioned below. One reason for the great discrepancy of usage has been already suggested. The confusion results mainly from failure to view mysticism objectively in its ultimate meaning and relations, its origin and finality; an omission on which has followed a confusion of a primary and an essential property of human nature with one or other of its merely contingent modifications or partial fail-urues; and thus abnormal and insane phe-nomena have come to be associated with a term which radically expresses the deepest movement and loftiest aspiration of man's being.

Like all other words of similar structure, the term mysticism connotes both a tendency or a realized experience, and a theory conversant therewith. For the sake of brevity the former acceptance may be here subsumed under the latter. The finality inherent in mysticism is a tendency so eminent in nature that the effort to explain it away by reducing it to merely mechanical motion is impugned by the very ideas and terminology in which the attempt is conceived and expressed—reaches its highest expression in man's nature. Whether it be viewed as a process of natural selection, an adaptation to environment, a part of the struggle for existence, or under any other biological metaphor, this tendency to a purpose is as essen-tially—nay, surpassingly more so—a property of man as it is of any of the lower forms of life, vegetable or animal. If it be asked what is this purpose, this goal to which man ever presses, the answer may be given in terms of universal significance, that ultimately it is the realization of the plan of the universe. To this end, however, man strivs unconsciously, and in a certain sense mechanically and involun-tarily. Proximately, on the other hand, man is forever seeking self-realization, the development of his total self. This self, however, is perfected only in and by the exercise of his highest activity, and that activity can reach its complete perfection only when directed to and exercised on his highest object. Now man's
highest activity to which all other forms of energy within him are subordinate is mental, intellectual and volitional, and the highest object answering thereto is the True and the Good. The true as well as the peremptive of the intellectual side of human nature is identified with the Good as it satiates the appetitive or comative side, and both are concretely realized only in the Supreme Being, the Infinite, the Absolute. Only one who, whether implicitly or explicitly, recognizes this essential relation of his nature to God and strives to adjust his life accordingly. It may of course be said that this is a conception of mysticism in the abstract, as seen from some transcendent viewpoint of man's personality, but not of mysticism in the concrete, as it occurs in actual life and history. In some measure this may be admitted. On the other hand it is the conception realized in those who have lived it out in the sanest form and the most perfect degree, and is inapplicable only in the case of those who directing their energies to some one or other partial object; to an object answering to only individual tendencies of their nature, to the neglect of the demands of their complete self; have thrown their lives into disorder and confusion and have brought mysticism into obloquy and derision.

It is almost impossible to make any classification of mysticism that shall be adequately comprehensive. For the purposes of this article it will suffice to consider it as a rationalistic, natural or purely philosophical, and as a Christian-theological or primarily religious experience and theory; though these distinctive qualifications are far from being mutually exclusive; on the contrary they overlap at more than one point. Christian mysticism as rationalistic, philosophical and of course rational; but it introduces a supra (not contra) rational element. On the other hand what is here called rationalistic-philosophical mysticism may and does work with many of its disciples include Christian doctrine and practice, and in so far may claim the latter title. For the rest the distinction will become plainer from what follows.

I. Rationalistic Mysticism.—As a philosophical theory this attributes to the human mind the natural ability to contemplate the Absolute, that is, God, and therein and thereby to an intuition of all truth. This immediate vision whilst reflective and contemplative is not attained so long as the mind remains on the lower level of ordinary discursive reasoning. Such thought being, it is claimed, confined to the sensible, to empirical phenomena, cannot attain to higher ideal truth. To contemplate the Absolute, man must withdraw his mind from the world of sensuous phenomena, inhibit all discursive activity, and concentrate his mental energy. As the mind escapes from the mists of earth the rising light of a higher vision is felt. In that vision the lower cognitive powers become inactive, the very consciousness of self is obliterated and the mind is absorbed in ecstasy. The ecstatic state is a condition pre-required for the contemplation of the Absolute. This state, however, is attained only through ascetic practices and he alone who reaches its heights is enabled to contemplate pure ideal truth and manifest it to others as he has perceived it. In ecstasy, moreover, the mind becomes interpenetrated, even identified with God. Nay more, ecstatic vision is one and the same with the act in which the Deity contemplates His own self: "the eye with which He sees the world is the eye of Brahma, and which God sees Himself." Philosophical mysticism thus terminates in pantheism.

II. History.—The birthplace of this form of Mysticism is the Orient. Brahmanism (q.v.) is a finished mysticism. For it Brahma is the sole existent. What is this Brahma, and what is not Brahma is nothing. Things mundane are distinct neither from Brahma nor from one another. They are simply modifications of Brahma. So long as the mind conceives of them as distinct it is in a state of delusion. From this delusion it must free itself by penetrating into the vision of the unity of all things in Brahma. To this end man must perform works of penance and sacrifice, cut himself loose from the sensible and sensual world, and by concentration of his entire physical energy absorb himself in the All; that is, lay aside all self-activity and allow the One alone to work within him. Then will the light of vision rise on his mind and in everything he shall see Brahma, the eternal self-existent One, the All. Oriental mysticism was transplanted to the West by the Neoplatonists in the form of emanational pantheism. God is here the primal One and the primal Good; from Him emanates directly the pure (Nours) as a rationalistic-natural or purely philosophical, and as a Christian. The latter remains in essential union with the primal One. The Nours is the soul enabled to rise to an immediate vision of the primal unity. Sense cognition is simply a dream of the soul from which it should withdraw and sink itself in its centre, the Nours; and as the latter is essentially the universal Nours revealing itself in the human soul and absorbed in the contemplation of the primal One, therefore is the human soul likewise through the indwelling Nours able to reach this same contemplation of the original unity; and when it rises to an immediate intuition of the Absolute, that is, God, and therein and thereby to an intuition of all truth. This immediate vision whilst reflective and contemplative is not attained so long as the mind remains on the lower level of ordinary discursive reasoning. Such thought being, it is claimed, confined to the sensible, to empirical phenomena, cannot attain to higher ideal truth. To contemplate the Absolute, man must withdraw his mind from the world of sensuous phenomena, inhibit all discursive activity, and concentrate his mental energy. As the mind escapes from the mists of earth the rising light of a higher vision is felt. In that vision the lower cognitive powers become inactive, the very consciousness of self is obliterated and the mind is absorbed in ecstasy. The ecstatic state is a condition pre-required for the contemplation of the Absolute. This state, however, is attained only through ascetic practices and he alone who reaches its heights is enabled to contemplate pure ideal truth and manifest it to others as he has perceived it. In ecstasy, moreover, the mind becomes interpenetrated, even identified with God. Nay more, ecstatic vision is one and the same with the act in which the Deity contemplates His own self: "the eye with which He sees the world is the eye of Brahma, and which God sees Himself." Philosophical mysticism thus terminates in pantheism.

III. History.—The birthplace of this form of Mysticism is the Orient. Brahmanism (q.v.) is a finished mysticism. For it Brahma is the sole existent. What is this Brahma, and what is not Brahma is nothing. Things mundane are distinct neither from Brahma nor from one another. They are simply modifications of Brahma. So long as the mind conceives of them as distinct it is in a state of delusion. From this delusion it must free itself by penetrating into the vision of the unity of all things in Brahma. To this end man must perform works of penance and sacrifice, cut himself loose from the sensible and sensual world, and by concentration of his entire physical energy absorb himself in the All; that is, lay aside all self-activity and allow the One alone to work within him. Then will the light of vision rise on his mind and in everything he shall see Brahma, the eternal self-existent One, the All. Oriental mysticism was transplanted to the West by the Neoplatonists in the form of emanational pantheism. God is here the primal One and the primal Good; from Him emanates directly the pure (Nours) as a rationalistic-natural or purely philosophical, and as a Christian. The latter remains in essential union with the primal One. The Nours is the soul enabled to rise to an immediate vision of the primal unity. Sense cognition is simply a dream of the soul from which it should withdraw and sink itself in its centre, the Nours; and as the latter is essentially the universal Nours revealing itself in the human soul and absorbed in the contemplation of the primal One, therefore is the human soul likewise through the indwelling Nours able to reach this same contemplation of the original unity; and when it rises to an immediate intuition of the Absolute, that is, God, and therein and thereby to an intuition of all truth. This immediate vision whilst reflective and contemplative is not attained so long as the mind remains on the lower level of ordinary discursive reasoning. Such thought being, it is claimed, confined to the sensible, to empirical phenomena, cannot attain to higher ideal truth. To contemplate the Absolute, man must withdraw his mind from the world of sensuous phenomena, inhibit all discursive activity, and concentrate his mental energy. As the mind escapes from the mists of earth the rising light of a higher vision is felt. In that vision the lower cognitive powers become inactive, the very consciousness of self is obliterated and the mind is absorbed in ecstasy. The ecstatic state is a condition pre-required for the contemplation of the Absolute. This state, however, is attained only through ascetic practices and he alone who reaches its heights is enabled to contemplate pure ideal truth and manifest it to others as he has perceived it. In ecstasy, moreover, the mind becomes interpenetrated, even identified with God. Nay more, ecstatic vision is one and the same with the act in which the Deity contemplates His own self: "the eye with which He sees the world is the eye of Brahma, and which God sees Himself." Philosophical mysticism thus terminates in pantheism.
and not simply united to Him. It is uncreated. This something is the "spirit" the ground or basis of the soul. Here the "ground of God is my ground and my ground is God's ground." Now this divine spark in the soul he continues, is the organ of mystical contemplation. The "ground" and "spirit" of the soul penetrates into that "ground" in God, in which the latter is pure simple unity neither Father nor Son nor Holy Ghost. There, in this its "ground," the spirit seeks God, there to know and love Him without medium or veil. There is "my eye and God's one eye, one vision, one knowling, one love. The eye whereby I see God, is the same eye wherein God sees me. In order, however, to reach this vision of God in His "essence" (ground) man must first of all forsake all the soul's "power" and concentrate himself entirely within the essence of his soul; and having reached this state he must "leave" himself entirely to God, hold himself passive and allow God alone to work within him. (Gottlessheit.) Then will there arise in the essence of his soul (ground) a heavenly light. In this light God reveals to man the entire "ground" of the Deity; the whole essence of God becomes revealed to man. The soul flows into God; its essence and life passes over into the essence and life of God; man is deified, is born a son of God; just as is the Eternal Word.

Subsequently the mystical Theosophists Valentine Weigel and Jacob Böhme built on the teaching of Luther who was in close sympathy with the "German Mystics," a form of mysticism which in many respects surpassed what most men will call the extravagance of Neoplatonism. A few souls not of necessity withdraw from all outward things, from himself and his "powers" and concentrate himself entirely within the essence of his soul; and having reached this state he must "leave" himself to God, hold himself passive and allow God alone to work within him. (Gottlessheit.) Then will there arise in the essence of his soul (ground) a heavenly light. In this light God reveals to man the entire "ground" of the Deity; the whole essence of God becomes revealed to man. The soul flows into God; its essence and life passes over into the essence and life of God; man is deified, is born a son of God; just as is the Eternal Word.

The soul is enabled to enter into the very heart of the Deity and to see therein without any intermediation the primal generation of God in the three principles of being, and the process of becoming of all things. As I then, he says, earnestly uplifted myself to God, the spirit of God broke through me and my spirit brokethrough unto the immost generation of the Deity and in this light did my spirit see all things. The influence of Böhme is seen later in the philosophy of Schelling (q.v.).

Neoplatonic mysticism modified by Protestant doctrine reappears in the 17th century in the mystical speculations and practices of the Cambridge Platonists Cudworth, Henry More and John Smith. Other noteworthy mystical writers in England during the same century were George Herbert, Francis Quarles, Henry Vaughan, and in the following century William Law.

III. Christian Mysticism.—A recent writer has greatly simplified this subject by defining mysticism as "the love of God," and he quotes in confirmation an author whose genius and amiable personality have endeared him hardly less to those who differ from him in religious belief than to those who venerate him as Saint Francis de Sales. Speculative theology, he says, tends to the knowledge of God. Mystical theology to the love and prayer of God. Contemplative and mystical theology are one and the same thing. They are neither more nor less than the loving intercourse which the soul holds with God. In this sense every Christian whose practice accords with his profession is more or less of a mystic and differs from the highest mystic, the saint, not in his mysticism but in the degree of his mysticism. The term, however, is usually restricted to the higher degree of unitive insight. This simplification of the subject will doubtless be mistrusted mostly by those who insist on associating all mysticism with mystery and in placing both if not against at least above reason. They should, however, remember that all even human love in a measure transcends reason. Feeling, instinct, sympathy, second sight, telepathy, hope, expectation, hope and fear, all these may elude psychological dissection! It may well be that in the intimate communion of God with the soul which He permeates there are psychical acts and states of which reason and common sense can give no distinct account, "uprising strains that from the memory slip and fall away," as was the case in Dante's experience. But while mystical phenomena have in common with many ordinary psychical, especially emotional, experiences that they escape rigorous analysis, they lend themselves equally with their familiar analogues to a philosophy and even a certain though higher psychology. This statement will of course be a commonplace to those who are familiar with the great masters of mystical theory, such as Saints Dionysius, the so-called Areopagite, Augustine ('Confessions,' Engl. trans.), Bernard (Engl. trans.), John of the Cross (Engl. trans.), Thomas à Kempis, or the more modern authors mentioned below. For the benefit of those who are not so informed a very brief summary of the principles of Christian mysticism is here subjoined.

1. As in the macrocosm, the world of living organisms, the law is universal that all life emanates from life, omne vivum ex uno, and as in the scale of their various kingdoms the higher raises up and assimilates the lower the latter receiving an essentially new and greater perfection from the former, so in the microcosm, the minor world of the human individual. Here, too, life is from life and life is from above; and the perfection of the lower consists in assimilation to the higher.

2. Beyond the natural life in man, the soul or mind, Christian Mysticism discerns a supernatural life consisting radically in a principle of activity higher than that of man's purely mental and volitional operations and consequently energizing in higher forms of thought, belief, hope, aspiration, love, etc.

3. The existence and supernatural character of this life and its activity are accepted in the first instance on faith, the data of this belief being found in the Bible, especially the New Testament. The foundations of this faith it is claimed are rational and the workings of the
higher life are confirmed by experience and attested by manifest effects. 4. Essentially and objectively this higher life consists in the vivifying operation of the Divine Spirit within the human soul; accidentally and subjectively it consists in the responsive co-operation of man's mental activities with the Divine influences. 5. The reception of this higher life is normally conditioned by certain spiritual dispositions and lines of conduct — notably of faith, love, prayer, repentance and self-discipline. The soul is thus prepared by antagonism, from carnal and inordinate propensities and rendered more sensitive to higher stimuli. 6. According to the degree of the soul's co-operation with the indwelling Spirit of God the former becomes proportionately assimilated to the latter. The soul thus passes from what is known as the purgative to the illuminative stage of mystical life. 7. This assimilation culminates in the act of contemplation which is distinguished from meditation in that it is not a mental strain and does not apprehend its object, the divine presence or cognate truths, by inference; but in consequence of the immanent light simply gazes intuitively thereon; contemplatio perisset ad simplicem intuitum veritatis, as all the mystics teach. The clarity of the act or state of vision begets sentiments of admiration, contemplatio est perspicue veritatis jucunda admiratio, as Saint Augustine says, and fills the consciousness with joy and rapture. The faculties are herein not merely passive, for contemplation is a vital activity, though the divine influence is the primary source of its elevation and application to the corresponding truths. The Church censured the teaching of the Spanish mystical writer Molinos on the question of the soul's passivity in contemplation, — a theory which was taken up by Madame Guion in France, and eliciting Penelou's (q.v.) sympathy, entailed the well-known controversy with his great contemporary Bossuet (q.v.). 8. The unitive or contemplative state in so far as susceptible of psychological analysis is essentially intellectual, the mind being absorbed in intuition; it is, however, no less essentially volitional and in the sanest sense emotional, the whole adhesive power of the soul being drawn out in love of the object contemplated. Obviously, however, the two forms of energy — intellectual and emotional — act and react upon one another and in the intensified states of mental absorption entirely interfuse, all psychical differentiation being obliterated and the entire field of consciousness bathed so to say in light and love of the object contemplated. With the intellectual activity is generally though not always associated representations of the imagination wherein the object contemplated is symbolized. The object-matter of contemplation is immediately God or something Godlike. Secondly it may be any divine manifestation in the created, animate or animate order, above all in this respect the humanity of Christ. With many of the mystics the suggestion of the divine image in the object is enough to lift them at once to a condition of transport contemplation. 9. The strictly contemplative condition varies in duration from moments to several hours, dependently on preternatural and natural conditions. In the highest stage it may become practically habitual and yet leave a normal residue of attentional energy amply sufficient for all the demands of every-day life. Often times it is associated with extraordinary psychical phenomena such as ecstasies, seances, revelations, visual or auditory — states wherein the mind sometimes though not always loses consciousness of self and of all else save the object contemplated. These are not, however, as many suppose, essential properties of mystical experience, but rather effects resulting from the absorption of the psychical energy. An asserted similarity of these states to the well-known phenomena transpiring under the various forms of somnambulism, obsession, divided personality and the like, has led many psychologists to confound all mystical states with abnormal psychoses. The subject here opened out is a large one. The reader will find it fairly discussed in 'The Psychology of the Saints.' Suffice it to note with M. Joly that the true mystical states of which experience is not a 'disintegration' of the powers of the mind; it is an aggregation of the closest possible kind, which derives its strength from a higher principle under the control of which it forms and sustains itself. It is not a narrowing of the field of conscious sentment, rather the opening out of a wider field, at the cost, if we may use the expression, of a narrowing of the field of passing sensations and empty illusions. Neither is it a 'division of the personality' although it certainly evokes what may be called a 'new personality' and that at the cost of great sacrifice and much suffering. This 'new personality' is not a medley of divided and disordered parts. It exhibits a cohesion, a strength and a unity above anything else which psychology can show us. This 'new personality' also retains whatever was best of the original personality and these surviving elements combine peacefully with the new. 10. None the less the Saints, the typical mystics, were fully alive to the fictitious semblance of purely natural, both normal and abnormal, subjective states to genuine mystical experience and writers on the subject have laid down certain signs for discerning the true from the false. Usually they point to the 'fruits of the Spirit' as enumerated by Saint Paul (Gal. 5, 22); charity, joy, peace, patience, benignity, goodness, longanimity, mildness, faith, modesty, continency, chastity. The essence of all these fruits of true mysticism is self-denial, love of self-sacrifice and humility; only where such dispositions are habits the subject he said 'to walk by the Spirit.' This mental attitude the mystics observe shows itself in subjection of the will to God and to lawful authority, a care to avoid self-obtrusiveness, a tenderness of conscience, a 'frail and tenacious' exultation, a peace even in the midst of misunderstandings and persecutions. On the contrary, they say, where the opposite signs prevail, self-conceit, obstinacy, an appetite for singularity, moroseness, refusal of humiliation, sentimental self-devotional observances, unrest and suchlike — all being indications of pride, vanity or some form of sensuality — there the subject, though seemingly wrapped up to the third heaven, will be...
found to be the victim of an active or a passive delusion.

11. From the foregoing principles it should be inferred that Christian differs essentially from purely rational mysticism in the primacy it gives to divine influence in mystical experience. The uplifting and sustaining of the individual intellect and will in communion with God are due not in the first instance to purely innate endowments but to a transcendent light and energy. Christian mysticism as a theory ignores or preempts none of the ascertained facts and legitimate inferences of the intellect and philosophy, but it claims to supplement this knowledge with principles and deductions of a religious and theological character. The higher influences thus postulated though distinct from are nevertheless continuous with the normal psychical life of the mind, just as the higher mental powers are themselves distinct yet not severed from the sentient and organic activities. Thus genuine mysticism by its sharp distinction between the mental activities and the immaterial extends the terms “deification,” identification with God and the like in which mystical writers speak of the contemplative state are meant to express the close union of the soul with God but not a unity or substantial identity.

Christian Mysticism.—Mysticism as an experience is as old as humanity. The patriarchs Abraham, Isaac, Jacob, Moses, are described in the Bible as men who while not exempt from human failings, lived more or less habitually in converse with God, while the prophets from Samuel to the Babylonian passed much of their lives in the abiding realization of the divine presence. The unitive or highest form of mystical life culminates in Christ, who though of necessity perpetually conscious of His Divine Personality nevertheless frequently retired from human association to commune with His Father in the solitude of the mountain or desert. Christ became for all future time the pattern of the mystical life while His Personality, deeds and words have formed and determined the subject-matter wherein the genuine mystical mind has been nourished. As his example and teachings spread abroad and the realization of their power deepened in the Christian consciousness the tendency to devote more and more of life to mystical contemplation increased. Spontaneously and gradually at first and accelerated afterward by the pagan persecutions which drove numbers of the early Christians into the desert the eremitical and subsequently the monastic state grew up and developed, at first in the East and in Egypt and later on throughout western Europe. Monasticism (q.v.) was and is essentially an institution established as a means to facilitate and conserve the contemplative life. Some of the religious orders were founded by women and these the majority, aimed at combining the contemplative with the active life, a so-called mixed status wherein the cultivation of an abiding consciousness of the Divine Presence, and the engagement in labor for human welfare. How successfully this aim was accomplished is told in the history of monasticism and the biographies of such men as the Gregories, Basil, Benedict, Bernard, the Franciscans, Dominic, Borromeo, Loyola; and of such women as Hildegard, the Elizabeths, the Catharines, Teresa and other well-known heroes and heroines of human as well as of divine charity; all of whom drew inspiration and energy for lives of continued self-sacrifice from an almost uninterrupted communion with the Unseen.

Though monastic retirement and discipline facilitate and foster the genesis of mystical habits, they are by no means essential thereto, as is patent from the case of numberless men and women and even ages that have attained a high degree of contemplation with every variety of secular occupation. Here again the lives of the true mystics, the Saints, show that the cultivation of an abiding converse with God culminating frequently even in deep mystical union is compatible with all the duties and reasonable demands of social life.

V. Mystical Theology.—It is with mysticism as with every other human experience, Muslim follows on life. Speech precedes grammar, thought logic, thinking. ETIMs est vivere deinde philosophari. As mystical tendencies and habits spread and strengthened, there gradually grew up a mass of facts and inferences which constituted in time the body of a mystical theory, or what is known as mystical theology, and which took its place in the evolution of Christian doctrine as a sequent of moral theology. Mystical experiences were analyzed and systematized, principles induced therefrom and clarified in the light of Biblical and Patristic teaching, and practical rules for discernment and guidance in the mystical life were formulated; the whole developing by degrees into an organized science or discipline. The writers eminent in the formative stage of mystical theory were Saints Basil, Gregory of Nyssa, Gregory of Nazianzus, Chrysostom, John Climacus, Cassian, Gregory the Great, Ambrose and Augustine. The first systematic work on the subject was that of Dionysius, the so-called Areopagite. In the intense intellectual ferment that followed the triumph of Christianity the Neoplatonists endeavored to set up against Christianity a world-religion whose controlling tenet it was that the universe is simply a phenomenon of the divine life, the human individual a manifestation of the divine essence, God coming to consciousness in man. Dionysius opposed this teaching, vindicating the Christian doctrine that in the union of the human soul with the Deity it retains its distinct entity. During the Middle Ages the works of Dionysius became for the mystical writers what the ‘Sentences’ of Peter the Lombard was to the Scholastics, a text for the numerous commentaries of eminent writers such as Hugh and Richard of Saint Victor, William of Paris, Bonaventure, Dionysius the Carthusian, Gerson and others. The Scholastics, likewise, especially Aquinian, based their system of mystical phenomena on the Areopagite. The influence of Neoplatonism (q.v.) lingered, however, in the writings of Erigena, even though he translated the works of Dionysius.

A tinge of Neoplatonism more or less clings to the 14th and 15th century writers. Tauler, Suso and Ruysbroek, who theorized more in the interests of an intellectual union with God, while the most eminent teacher of practical
MYSTROPETALON — MYTHOLOGY

mysticism — union of will — was at this time Thomas of Kempen. In the subsequent centuries practical mysticism is systematically represented by Saints Teresa, John of the Cross, Francis de Sales and Ignatius of Loyola. The works of these writers have for the most part been translated into English. Among the later mystical authorities may be mentioned Louis of Blos, John of Avila, Louis of Granada, Louis da Ponte, James Alvarez, Alphonsus Rodriguez, Nieremberg, Lacunis, Susin, Godin, Serramelli, Benedict Kuhn and Silvain.

MYSTROPETALON, a genus of leafless root-parasites constituting the tribe Mystropetalaceae of the order Belamoporales. It contains two South African species. It is known by the two or three free stamens, cubical pollen-grains, and the two-lipped staminate and bell-shaped pistillate flowers. The stem is sheathing covered by imbricated scales; the flowers in dense heads of spikes. They are monoeious, the male flower being on the upper and the female on the lower part of the spike. The fruit is a rounded achene.

MYTENS, mi'tènz, Daniel, Dutch painter; b. The Hague, about 1590; d. Holland, 1642. He went to London, England, and was welcomed at the court of James I; he was appointed royal painter, a position much favored by the king and aristocracy. Many of his portraits, which are bold and spirited in conception, broad in treatment and of admirable color, are in Hampton Court. When Van Dyck came to England he gradually eclipsed in royal favor the glory of his predecessor, who returned to Holland.

MYTH, a general name for certain kinds of folk-lore stories, historic tales setting forth the processes of nature, or beliefs about religion, custom, tradition, etc., and differing from fable (q.v.) and from legend (q.v.). See MYTHOLOGY.

MYTHICAL ISLANDS, imaginary islands described in poems of romance, and songs supposed to have existed in all ages in the several oceans of the world. The Islands of the Blessed were creations of the Greeks, who there placed the homes of all who had been first mentioned by Plato, and situated in the realm of eternal bliss. The lost Atlantis was first mentioned by Plato, and situated in the same part of the world. The fairy isle of Avalon is a feature of Celtic mythology, presenting an exact counterpart to the Greek Island of the Blessed. The mythical land of Saint Brendan is also of Celtic origin and was thought to lie off the west coast of Africa, where, even as late as the 18th century, frequent expeditions searched for it. The Island of Seven Cities was also long sought for. The Celtic hare is ascribed in legends to the Christian refugees from the Iberian Peninsula, who had been driven out by the Mohammedans. Marco Polo's 'Cipango' was probably Japan. Probably the best known mythical lands or islands during the Age of Discovery were the island of Bimini, in the Bahamas, and the island of Brazil.

MYTHO, MITHO, or MITO, French Indo-China, a town of Cochinchina, on the northermost branch of the Mekong delta, about 50 miles by rail southwest of Saigon. Mytho is an important trading centre for the produce of Cambodia and Annam, and the railway from Saigon was the first built in the country. It has a college and a hospital. Pop. 30,000.

MYTHOLOGY. (Latin mythologia; Greek μύθος, a myth, and κύος, an account), includes the whole body of myths of a nation. The explanation, comparative study and interpretation of these myths. In the popular acceptance of the term, mythology, however, is used to signify the religious conceptions of races expressed in the form of tales and other accounts of their deities. This is a very restricted part of the broad field of mythological activity; for mythology covers the whole sphere of activity of races before the knowledge of the laws of nature came to replace the exercise of the imagination in the explanation of natural phenomena. It includes physical, historical, philosophical and religious myths, generally so intermingled and interdependent that it is often difficult or impossible to separate the one from the others, since the imagination was the greatest source from which they all sprang either as a whole or in part. Owing to this constant play of the imagina-tion, such history as primitive races possessed rapidly became myth, and the myths as- sumed the form, appearance and intent of his-tory. During the pre-scientific ages of all races were credited with the scientific, philosophical and religious beliefs of the mass of one's fellows. Thus creed became a synonym for religion, or the true religion. To-day the Pueblo Indian speaks of one who holds to the faith of his ancestors, as "the true believer." How Primitive Man Thought.— Man has apparently, since ever he began to reason, tried to explain the natural phenomena which most impressed him; and his success has always been in proportion to his scientific knowledge. At the beginning of his investigation of the phenomena of nature he was handicapped by an absolute ignorance of all natural law, and he was forced to reason from his experiences, much as the higher forms of animals do to-day. To him all life meant activity of some kind, generally translated into motion, and conversely, all activity meant life and volition. Thus when the sun, the moon and the other planets appeared and disappeared or changed form or position in the sky or appeared to change so by their own volition. Behind the rushing of the wind, the fierce heat of the sun, the blighting cold of the north, the thunder of the clouds,
the destructive fury of the hail and the lightning, the insatiable greed of the fire, the reviving force of water and of the midnight mists and summer showers were so many powerful intelligences, human in every respect except in their magic power, working in concert with his primitive virtues, which he used to surround the physical world about him with a multitude of beings essentially like himself in their ambitions, desires, motives, loves and passions. These he classified unconsciously according to their apparent swiftness, strength, cunning and constancy, the primitive virtues by which he set great store, and the impenetrable mystery by which they were surrounded. These were the supernatural people in contradistinction to the human race, which belonged to the natural people. But it is necessary to understand in what sense the word supernatural is here used. It never implies beings in any sense different from man himself except in the power of their magic. Even the form in which a supernatural being appeared was not a moment, since he generally had the power to exchange his shape for another at will. The Sun-father, the Moon-mother, the Thunder-man, Morning-star, the great hunter, the Spirit of the Northland, the Summer-queen, the four great Wind Spirits, the Ghost Spirit that rode upon the tempests, the dark beings from the under-world, the bright beings who peopled the Cloud-land, the Sky-land and the Sun-land were essentially human; and each lived in strict conformity with his surroundings and attributes. The Sun-father and the Moon-mother inhabited a shining wigwam in the Sky-land, the Frost-spirit a yellow ice tepee in the far North, on the outer border of the world. The Great Spirit sat far up upon the mountain and smoked his pipe; the four winds blustered and quarreled and had ambitions and loves, hatreds and jealousies essentially human. The waters moved, rippled and roared; the trees swayed and whispered; the leaves rustled; the clouds raced across the sky or lazily disported themselves in the sun. All the scientific fact found in this which made them feel like actors on the stage of human activity. Into this curious world so unlike our own scientific age, the study of mythology introduces us. Here all nature is not only alive but instinct with the motives that move the man to action; and no explanation or interpretation of mythology which fails to keep constant in mind primitive man's ignorance of the laws of natural phenomena, and its effects upon his religious, scientific and philosophical views can be effective.

The Spirit of the Myth.—To understand the spirit of the myth one must learn to live over again the age which produced it. Without this, the practice of minute analysis of myth forms and derivation of myth names, the division of myths and storms, which make them the low-actors with man on the stage of human activity, into this curious world so unlike our own scientific age, the study of mythology introduces us. Here all nature is not only alive but instinct with the motives that move the man to action; and no explanation or interpretation of mythology which fails to keep constant in mind primitive man's ignorance of the laws of natural phenomena, and its effects upon his religious, scientific and philosophical views can be effective.

The Spirit of the Myth.—To understand the spirit of the myth one must learn to live over again the age which produced it. imagination he built up a mass of traditionary lore which was carefully handed down from father to son. In this lore he grouped and classified these supernatural beings; and to each he attached myths to explain their attributes, powers, functions and affections. Quite philosophical were these myths from the point of view of their creators. The earth received the seed and the sky sent the water that made it grow. The union of the two gave birth to the plant. The earth, the mother and the sky became wife and husband. The sun was the greater light that ruled the day, the moon the lesser light that ruled the night, so in many theologies the former was the husband and the latter the wife, while the morning star, which appears with the sun, was their offspring. However, frequently in northern mythologies, where the light of the sun loses its great power for a part of the year, the latter frequently becomes the wife and the moon the husband. The moon governed the night, the season when the mind most freely delves upon the deep. So she becomes the goddess of fertility and as such is closely connected with all the water and vegetation deities. In Egypt Egyptian women prayed to Isis, the moon goddess, that she may make them fertile and bless them and make them fruitful. Roman women about to be married invoked Juno, the queen of heaven, that she might make them bear children; and Greek women made the same prayer to Hera, the mother of the stars, the queen of heaven, the moon goddess, the great deity of growth and fertility. Among the Aztecs and other cultures of America, Indian women prayed the moon to make them fruitful; and offerings are still presented to the moon throughout India America with the same end in view. The strong is the belief that the Indians of Latin America frequently associates the name of the ancient moon goddess with that of the Virgin; and so powerful has the influence of the Virgin become that not only Indian but also educated white women go to certain shrines of the Virgin to pray that they may be blessed with children. Indian women still hold up their new-born children to the moon-mother that she may bless them and make them, in turn, fruitful. Being the patroness of growth, birth and fertility the moon became the deity of doctors and of medicine, and among Egyptians, Indo-Europeans, Aztecs, Mayas, Zapotecas and Mixtecans alike she took a kindly interest in people of feeble mind or those afflicted with skin or other scrofulous diseases. She was also the protector of young children and animals both in Europe and America. She was the goddess of hunters and is frequently represented as armed for the chase. A close examination of all these functions and attributes of the moon goddess will show that they are closely related, interdependent, and that the one naturally grew out of the others. The moon, in most of the Indian mythologies of America, was also the mother or the grandmother of the winds or some of them, who are themselves the bringers of the fruitful rains and mists. Here again the mythology is consistent.

Growth of Myths.—Examples might be given ad infinitum, but the foregoing are sufficient to show that the mythologies of most ancient races represented systems of thought, of philosophy and religion which followed what were then rational lines of reasoning to those holding them and passing them on to succeeding generations. These ancient myths were at once religious, philosophical and scientific in that they contained within themselves the religious, philosophical and scientific knowledge of the race or what passed for such. Behind all mythologies are broad, general principles which lead, everywhere, to similar results. This is true of the unsolved and unrelated myths in widely different parts of the earth, a similarity more marked in the nature myths. The comparative study of myths is of as much importance in the development of the science of mythology as is the comparative study of languages in the development of the science of philology; since the general laws that govern the making of myths seem to produce as closely related results as those that govern the formation of languages. Fairy tales, folk-tales, historical, philosophical, religious and scientific myths are connected with one another. Often one short tale contains all these elements. Hence the field of study is not only very extensive, but the lines of thought are continually crossing and recrossing one another. Confusing maze have confused many theories, explanations as of mythologies, most of them defective in that they have failed to survey the whole field and to take into account its broad general significance. Mythologies are like rolling stones, they take new forms as the current flows; and when they come to rest they gather extraneous mosses, which disfigure them often to such an extent as to hide their original forms. These changes are due to both external and internal influences, to action and reaction. Dissimilar myths are often found side by side apparently unconnected by one another; others are blended, while still others are so confused from long contact with one another that their original functions and attributes are not clearly discernible. Tribal influences, captives, slaves, foreign teachers and philosophers, servants, broken-down mythologies and the myths of subject people all have had their part in the shaping of the myths of nations. The constant rising and dying of religious, scientific and philosophical ideas, throughout the long unwritten history of man's progress toward civilization molded and shaped his myths; so that it is safe to say that however primitive myths may seem to us, there are probably no primitive myths in existence, since man even in his lowest stage of development to-day, has passed far beyond the condition of his ancestors when they first began to formulate their philosophy of the world about them in the stories that we have named mythology. In the days when the Romans had conquered the civilized nations surrounding them, Rome had already become the meeting-place of creeds or mythologies as had Athens in the days of Paul. And often there, the same deity was worshiped in separate temples and under separate guise. There were temples to Juno and Luna, both moon deities, the ancient Greek goddess of the moon and Isis the Egyptian moon divinity. Each was the sovereign lady of the sky. And when Christianity stepped in and drove out the heathen deities, her triumph was only partial, for the converted heathen could
not so easily forget his past. To his new Christian saints he attributed the powers and virtues of his ancient gods. Upon the Virgin, as the lady of heaven, he lavished all the adoration given to the dead past; for the dead past he longed to depict as standing upon the crescent (the symbol of the moon). Thus the mythologies of the past have followed us into the present. In art, architecture, literature, philosophy, science, their names and influence greet us in turn; for the dead past has not buried its dead. To-day the Christianized Indian throughout Latin America, in his Christian devotions, thinks as frequently in terms of his ancient gods as of his new faith. To the Virgin he attributes the power to send the rain, to fertilize the earth, man and beast; and he still puts food on the graves of the departed that they may have provision for their journey to the future world. Once a year, on the 9 day de los muertos (day of the dead), when the dead are popularly believed to revisit the earth, he decorates their resting-places in like manner. Thus the present teaches that the mythologies of the past were constantly being modified and changed while they were exerting their influence upon dying or supposedly defunct mythological systems. This is the same principle that was at work when Greece, Rome, Egypt, Assyria, Arabia, Persia, India and the broken-down mythologies of the races who preceded them, acted and reacted upon one another. To these must be added the modifying influences of the Celt and the Arab, the German and the Mongol, who, each, in his own way, left his mark upon the mythologies of northern Africa and southern Europe and Asia.

Classes of Myths.—Myths fall into several more or less well-defined classes: myths of origin, myths of the stars and the sky-land, folk-tales, myths of the future world and of ancestors, and myths relating to or explaining the elements. Origin myths account for the creation of the universe, of man, the other animals and plants; for the customs and habits of animals, trees and plants and for their peculiar markings and characteristics; for the origin of tribes and races and for their racial names, tokens and customs. Under this head come the culture gods, the inventors and bestowers upon humanity of the arts, trades and sciences, of which they naturally became the patron divinities. The myths of the sky-land and the stars, as the name indicates, deal with the solar, stellar and lunar stories and their relationship to one another and to the other dwellers in the sky-land. They are, in many mythologies, closely related with the creation and the culture myths. The moon-mother as the fruitcarrier and the goddess of medicine is in the category of the culture heroes, of whom she is the mother of man, the near ancestor. The sun, as the vivifier, the sender of life and death, has a close relationship with the deities of vegetation. The myths of the future world deal with the mystery of death to the moon divinities, and he longed to depict as standing upon the crescent (the symbol of the moon). Thus the mythologies of the past have followed us into the present. In art, architecture, literature, philosophy, science, their names and influence greet us in turn; for the dead past has not buried its dead. To-day the Christianized Indian throughout Latin America, in his Christian devotions, thinks as frequently in terms of his ancient gods as of his new faith. MYTHOLOGY

folk-tales of northern Europe and northwestern Asia.

Transformation.— The pre-scientific world firmly believed in transformations. This was the natural outcome of the superstitious fear of all nature. The wind was a person, yet he became invisible; the sun, also a person, hid himself, as did the moon and the morning star, behind a mask. The spirits of the forest whispered or roared, or danced, but they could not be seen by human eyes, either because they were hidden within the trees or because they had actually changed themselves into trees. The rivers, the mountains, the clouds were persons; but because of this power of self-transformation they could not be seen by earth-beings. If spirits could hide in trees and other moving things they could just as easily hide in sticks and stones. So inanimate objects, the residence of such spirits, becamefetches and wonder-working charms. Thus all nature, animate and inanimate, to the ancient myth was the abode of life, active, free and powerful as human life itself. All these different possessors of life might, on occasions, have the power of self-transformation, so that appearing in some other than the natural human form was sufficient proof of their power of self-transformation. There were also, according to the belief of the mythological ages, other powers or beings who, in addition to possessing the ability to transform themselves, could bestow upon another the power of transforming himself. This was generally accomplished through the presentation of some wonder-workingfetch which enabled the owners to effect self-transformation. Thus the hunter, in the Algonquin tale of the 'Wolf-Man,' takes from the breast of the wolf-man himself a powerful amulet, which enables him to transform himself into any form he desires. Though the wolf-man pursues him and overtake him at sun-down each day for six days in succession, he outwits him each time by his transformations and succeeds finally in drowning him by the same means on the seventh. In the tales of 'The Witch and the Wind-Man' the Moleman shoots his magic arrow into the cloud on which his brother, the wind-man, is riding and drives it backward with terrific force. This he does several times until finally he wins the race against him. In the same tale the Old Witch changes herself into a monster white rabbit and thus lures the nine brothers to her den; but the wind-man rides the wind into the cave of the supernatural people and rescues the brothers before the witch has had time to get them fattened enough to eat. Many similar Indian tales are built about the supernatural power of self-transformation. Nanabozho, the great culture hero of the Algonquian races, under his many tribal names, is an adept at transformation; and in nearly all his adventures in which he takes the leading part he makes use of it. The heroes of the Plains Indians are constantly subjecting themselves to self-transformation. Everywhere throughout Indian America the belief in transformation is strongly held, whether in tales or folk-tales. Witches, wizards and other evil-disposed beings had the power of self-transformation, and unnumbered are the myths, legends and folk-tales in which they figure. In the rivers and lakes and pools were other evil-disposed spirits who delighted in luring people to death. These characters are well known in Latin and Greek mythology; but just as picturesque tales are told of them in the stories of other races. Under the name of the Malinche, the water siren shows herself as a beautiful woman on the tops of certain mountains in Latin America and lures men to her only to tear them in pieces. As the Llorona or 'Crying Lady' she inhabits pools, lakes and rivers where she cries like a lost child all night and draws her victim on to his death; for when he falls into the water she drags him down; so that there is no chance of escape for him. Or she may change herself into a 'fool's-light' and lead some unfortunate into a bottomless swamp where death is equally certain. In all these stories self-transformation is the chief motive.

Ritual, supplying as it does the means whereby the correct relation to the various superhuman powers may be properly maintained, forms a very considerable part of mythology. Since the beings to be worshiped or propitiated are varied in attributes and powers the form in which they are dedicated to must be varied also. In an age when the virtues of magic, charm, song, incarnation, ceremonial dancing and instrumental music were firmly believed to be effective means of protection against adverse powers or of attracting the favorable attention of divine beings, extraordinary importance was placed upon the literal rendering of ritual and all other ceremonial forms. This belief helped to preserve ritual myths in a substantially unchanged form for generations; and many partially broken down myths repeated by primitive and other races are the survivals of the stories that once formed part of or went with rituals to explain them or to account for them.

These characters are well known in Latin and Greek mythology; but just as picturesque tales are told of them in the stories of other races. Under the name of the Malinche, the water siren shows herself as a beautiful woman on the tops of certain mountains in Latin America and lures men to her only to tear them in pieces. As the Llorona or 'Crying Lady' she inhabits pools, lakes and rivers where she cries like a lost child all night and draws her victim on to his death; for when he falls into the water she drags him down; so that there is no chance of escape for him. Or she may change herself into a 'fool's-light' and lead some unfortunate into a bottomless swamp where death is equally certain. In all these stories self-transformation is the chief motive.

Ritual, supplying as it does the means whereby the correct relation to the various superhuman powers may be properly maintained, forms a very considerable part of mythology. Since the beings to be worshiped or propitiated are varied in attributes and powers the form in which they are dedicated to must be varied also. In an age when the virtues of magic, charm, song, incarnation, ceremonial dancing and instrumental music were firmly believed to be effective means of protection against adverse powers or of attracting the favorable attention of divine beings, extraordinary importance was placed upon the literal rendering of ritual and all other ceremonial forms. This belief helped to preserve ritual myths in a substantially unchanged form for generations; and many partially broken down myths repeated by primitive and other races are the survivals of the stories that once formed part of or went with rituals to explain them or to account for them.

MYTHOLOGY, American. See American Mythology.

MYTHS. See Mythology.

MYXILENE. See Mytilene.

MYXEDEMA, a peculiar state of the nerve tissues of the body causing many nutritive changes in the body. Its cause is a loss of function of the thyroid gland (q.v.) and a resulting diminution in the supply of its secretion to the blood. It is strictly a fibrosis of the thyroid. The disease was first described by Sir William Gull of London in 1873. A similar condition results from removal of the gland by operation. Women are the principal sufferers, furnishing 80 per cent of the cases. Myxedema is found in cold climates, and probably most frequently in Europe; in certain districts for instance in Switzerland, France and Italy, it appears to be endemic. It is believed that certain mineral constituents in the water in these regions is the cause of the endemic cretinoid degeneration, as the water was brought from a distance to a certain goiterous region in Kupperwill and the disease disappeared. The onset of the disease is gradual, and the symptoms are loss of activity, sensiveness to cold, falling of the hair, decay of teeth and nails, rough, dry skin, spongy gums, diminution of perspiration, yellow tint and swelling of the face, paleness of the mucus membrane, subnormol temperature, constipation, albuminuria, impairment of sight and hearing, headache, slow intellecton, hallucinations and, in some cases, a hypothyroid psychosis. A most striking symptom is the edema, which develops principally in the loose subcutaneous tissues, appearing like a considerable swelling. The face, the back of the hands and the upper limbs first present enlargement; but in time it involves the whole body. The thickening and enlargement of the face renders the patient unrecognizable.

What has been called infantile myxedema by some writers is characterized by a failure of the child to develop bone in the normal manner, the result being a fat dwarfish individual. The dentition is imperfect and the anterior fontanelle does not close for many years.

Treatment consists in the administration of thyroid gland and of tonics. Grafting of a partial or entire thyroid gland taken from an animal into the subcutaneous tissue has not been very successful. Internally a glycerine extract of sheep's thyroid is given, or a dry extract, or an emulsion may be made and used hypodermically. This treatment was first suggested by Murray, of Newcastle-upon-Tyne, in 1891. The remedy must be used cautiously, especially if cardiac or vascular disease exists. Thyroid may cause vomiting, diarrhea, fever, profuse perspiration, headache, glandular swellings and prostration. The dose should be graduated so as to avoid these symptoms of poisoning. After many months of treatment the disease disappears. The dose should then be diminished, but the patient must continue to take thyroid all her life, lest the myxedema return. (See CRETINISM; THYROID GLAND.) Consult Gull, 'On a Cretinoid State Supervening in Adult Life in Women' (in Clinical Society's 'Transactions,' London 1874); Gimlette, 'Myxedema and the Thyroid Glands' (London 1895); Jelfiffe and White, 'Diseases of the Nervous System' (3d ed., 1919, 'Endocrinepathies').

MYXOSPORIDIA, or fish psorosperms, are Protozoa belonging to the class Sporozoa. They are characteristic fish parasites, occurring on the gills, in the skin and muscles, and free in swimming bladder, gall bladder and urinary bladder. Serious epidemics and common diseases among fishes are due to their excessive multiplication under favorable circumstances. The spores which are produced in large numbers in the protoplasm of their bodies contain 1, 2 or 4 polar capsules with a coiled thread like the nematocysts of the hydra.
N

the 14th letter of the English and sev-
eral other alphabets is classed as a
dental-nasal consonant; it is pro-
nounced when a voiced sound is
emitted through the nose while the tip of
the tongue is in contact either with the front upper
teeth or with the front of the palate; the posi-
tion of the tongue, whether touching the teeth
or the palate, distinguishes the n of one lan-
guage from that of another; the n of English
speech is produced by placing the point of the
tongue against the palate just behind the gums.
When n is followed by a guttural either the m
and the guttural form one nasal sound, as in
ring, or the n becomes distinctly gutteral and the
guttural retains its own sound-value, as in rank;
but when the n and the gutteral belong to dif-
ferent syllables, as in the words engage, include,
conceive, unkind, the n usually retains its pure
sound; yet the rule has many exceptions recog-
nized by orthoepists, who while they regard the
m of syncarp, syncretic, as pure, mark the n
of syncope and many other words as nasal,
equal to ng. In words ending with n preceded
immediately by l or m, the n is silent: kiln,
hymn; in the beginning of a word a consonant
preceding n is silent: know, gneiss, mnemonic,
pneumatic. In many words is seen an intrusive
n, as in passenger, messenger, though the
words from which these are formed, passage,
message, have no n. The initial n of newt,
nickname, and a few other words the n of the
indefinite article which became inseparably
attached to ewt, ekename, etc.; conversely, by
dropping the initial n in the forms adder,
nauger, napron became adder, auger, apron.
The alphabetical character n has remained al-
mast unaltered in shape from Phoenician to
English. See ALPHABET; PHONETICS.

N-RAYS, a supposed form of new radiation
discovered by M. Blondlot, while experimenting
upon the polarization of the X-rays. The rays
were said to be invisible, but could be de-
fected, and by means of appropriate screens
could be seen, and were marked out in great
detail by Blondlot and his followers. These
rays were declared to be susceptible to the
attraction of gravitation; and were decided to
lie in wave-length between the shortest electro-
magnetic rays and the longest of Rubens rays.
Many interesting discoveries were supposed to
be made concerning the N-rays; they were de-
tected as issuing from various objects in a
state of tension or torsion, such as a cane
forcibly bent; a stick of crystallized sulphur;
compressed rubber; ice at zero; or a piece of
tempered steel; the rays disappeared when the
temper was drawn. An eminent French physi-
ologist asserted that he had seen these rays is-
suing from muscles, when active, and from
nerves after death. One curious thing about
the supposed rays was that, while some of the
observers could see them clearly, others were
quite unable to see them, nor could their in-
struments detect their operation. Blondlot and
his disciples asserted that this was due to the
fact that those who were unable to see the
rays possessed defective vision, and that, while
the rays really existed, only those peculiarly
endowed could perceive them. Two other
forms of these rays were announced, the N-
rays and the N-rays. These rays were be-
lieved in for several months by an increasing
number of eminent scientists, though doubt as
to their existence had begun to be aroused,
when experimenter after experimenter failed
to detect them. Finally, after a prolonged
series of experiments the conclusion was
reached that these rays were subjective in
character and had no real existence. A sum-
mary of the very voluminous literature pub-
lished on the subject may be found in the
Journal of the Franklin Institute (Vol. CLXV,
Philadelphia 1907).

NABAL, in Biblical history (1 Samuel xxv),
the name of an Israelite of the tribe of Judah.
David, having afforded protection to Nabal
and saved his flocks and herds, his property and
even his life when in danger, some time after
sent to him to supply his troops with provi-
sions. This Nabal refused; on which David,
stung with the ingratitude of the man, vowed
to take summary justice on the ungrateful Jew
and exterminate his family; and taking with
him 400 men set out for the residence of the
mercenary Hebrew. Abigail, Nabal's wife,
hearing of her husband's conduct and David's
resolve, collected such provisions as the army
required, and, attended by a train of servants,
set out to meet the approaching king. Her
beautiful person, combined with the excuses
she made for her husband's conduct, so softened
the heart of David that he accepted her gifts,
averted his wrath, and Nabal having been
"smitten by the Lord" a few days after, David
married his widow.

NABATEANS, a Semitic race of people
whose kingdom extended from Damascus on
the north to Al-Hajr (Hegra) on the south.
They were in possession of the country as
early as 312 B.C. for Antigonus and after-
his son Demetrius tried in vain to conquer
them. Judas and Jonathan had relations with
them at the time of the Maccabean struggles
(1 Macc. v, 25; ix. 35). The Edomites were
forced up into southern Judah by them. They
are chiefly known by inscriptions, written in
Aramaic, which seems to establish the fact that
they were either of Aramaic origin directly, or
of Arabic extraction later influenced by the
Aramaic. These inscriptions give information
concerning the rulers, but since they are mostly

[676]
funerary, they furnish no other historical data. Their commerce was very important, as their capital Petra (q.v.) was on the route from Egypt to central Arabia. A temple to their native deity was found at Puteoli, an Italian port, which indicates the presence of a Nabataean colony there and points to the extent of their vast trade. A coinage of the country dating from the 2d century B.C. bears the names of the rulers. These, with their approximate dates, are Malchus I (145 B.C.); Obodas I (85-82 B.C.); Obodas II; Aretas IV (2-50 A.D.); Malchus II (50-70 A.D.); Rabel (70-95 A.D.). There are also coins of Alexander Jannaeus, Hasmonean king of Judea, who captured some of the trans-Jordanic cities and struck coins in them. The Nabataeans were very powerful in the 1st century B.C., but lost Hauran and Perea to Herod, retaining fortresses on the edge of the desert. Under Augustus the country became a Roman dependency and lost its warlike nomadic character. Some later inscriptions have been found which are in Arabic, but the word Nabataean is generally used as synonymous with Aramaean. (For their alphabet see plate under Alphabet). Their national temple was at Al-Hijr, and the chief gods seem to have been Dusares, Manat, Kais, Allat and Hobal. Consult Cooke, G. A., 'North Semitic Inscriptions' (pp. 214-262, 1903); Head, 'Historia Numorum' (pp. 685-686, 1887); Vincent, F. G., 'Les Nabataéens' (in Revue Biblique, pp. 563-588, 1889); Momm- sen, 'Provinces of the Roman Empire' (pp. 160-171, 1887); Schürer, 'History of the Jewish People' (Vol. I, Eng. trans., New York 1896).

NABOB, or NABAB, the title applied to the administrator of a province ruled by the viceroy. The name was also given to unofficial wealthy natives as a term of derision.

NABOB, THE, a novel by Alphonse Daudet, published in 1877. This is one of the most highly finished of the author's works. It is a romance of manners and observation.

NABONASSAR, nāb-ō-nāsār, Era of. See Bablyonia; NEBUCHADNEZZAR.

NABONIDUS, nāb-ō-nī’dūs, or NABO-NADIUS (Babyl. Neb’inad’), last king of Babylon (555-538 B.C.). He was elevated to the throne by his fellow-conspirators in the murder of Prince Labosborsacus (or Laborosoachard). Soon after his accession he concluded with Lydia and Egypt an offensive and defensive alliance against the Persians under Cyrus. He then greatly strengthened the defenses of his capital. It was not, however, until 539 B.C. that Cyrus, who had already defeated the impetuous Croesus, marched upon Babylon. Nabonidus followed the traditional Oriental strategy in opposing his foe. He fought a battle within sight of the city, which he had fortified, and then, while most of his army found safety within the great walls, he himself with a small force entered Borsippa, an important town southwest of Babylon; possibly hoping by this movement to force Cyrus to divide the Persian host. His stepson, Belshazzar (Bel-sha’-zur), familiar through the scriptural narrative in Daniel, and apparently cosovereign, conducted the defense of Babylon. After the fall of the capital, Nabonidus surrendered, was kindly treated by Cyrus, and even made governor of the province of Carmania. Some of his inscriptions show that he was a personage of historical interest. See Belshazzar; Cyrus.

NABOPOLASSAR, nāb’ō-pō-lās’ār, Babylonian king, founder of the New Babylonian Empire. He was a Chaldean, not of the kingly line, and erected an indestructible empire in Chaldea in the second quarter of the 7th century B.C., thence extending his power to Babylon about 620. With his ally, Cyaxares of Media, he conquered Nineveh about 660, which brought about the destruction of the Assyrian Empire. The Chaldean Empire became under him the greatest power in the Euphrates Valley. He died about 605 B.C., leaving the empire to Nebuchadnezzar, his son. Nabo polassar improved the irrigation of the country round Babylon and did much to develop it. Consult Rogers, 'History of Babylon and Assyria' (1900); and likewise the histories of Hommel, F. (Berlin 1885); Winckler, H. (Leipzig 1892); Sayce, A. H. (London 1900); Johns, C. H. (ib. 1911).

NABOTH, an Israelite, owner of a plot of ground in Jezerel, during the reign of Ahab, king of Israel, about 897 B.C. This plot lay on the eastern slope of the hill of Gilboa and in addition to this he owned a vineyard. The palace of Ahab immediately adjoined this vineyard, which became an object of the king's desire and he offered to purchase it or give another in exchange for it. When Naboth refused to part with the 'inheritance of his fathers,' Ahab was bitterly disappointed, but his wife sent a warrant in Ahab's name, sealed it with his signet and caused Naboth to be apprehended, brought to Samaria, tried for blasphemy and treason on the testimony of two suborned witnesses and stoned to death with his sons. Their mangled remains were devoured by the dogs and swine and the blood from their wounds ran down into the large tank or reservoir which still is seen on the slope of Samaria. This crime brought down the curse of Elijah upon the guilty couple (2 Kings ix, 2-26), which was fulfilled soon after in the fate of both. See Ahab, Jezerel.

NABU. See NEMO.

NABUA, nā’bwā, Philippines, a pueblo of the province of Ambos Camarines, island of Luzon, situated in the southern part of the province, on the Buhi River, 20 miles southeast of Nueva Caceres. It is in a marshy region where rice is grown, and is connected with the neighboring towns by a good road. It is a military and telegraph station. Pop. about 19,000.

NABULUS, nā’boo-loos’, or NABULUS, nāb-loos’, Palestine, the ancient Shechem, and one of the chief cities of Samaria, 30 miles north of Jerusalem, on the highest part of the fertile and fruitful pass between Mounts Ebal and Gerizim, leading from the Mediterranean to the Jordan. It is a busy trading and industrial centre, the seat of a governor, the see of a Greek bishop, and is visited by great numbers of pilgrims attracted by the tombs of Joshua and Joseph, Jacob's Well and the Tree of the Sanctuary, three miles south on the road to Jerusalem. As a Canaanite city it was destroyed by Abimelech, a son of Gideon the
NACHTIGAL, nächt-i-gäl, Gustav, German explorer in Africa; b. Stendal, 23 Feb. 1834; d. at sea near Cape Palmas, 19 April 1885. He studied medicine; became a military surgeon; in 1861 went to Algiers; in 1863 became surgeon to the army of the Bey of Tunis; and in 1868 was sent with others to the king of Persia to Sultan Omar of Bornu in recognition of kindness shown to German explorers. His journey through Tibbu and Tibesti was over country hitherto untraversed by a European. He arrived at Kuka in 1870, then explored Borku, Kamem and the country south of Bornu and on his way back to Cairo passed through Wadai. The years from 1875 to 1882 he spent in Germany arousing national interest in German colonization. He entered the consular service in 1882, became consul to Tunis, and in 1884 was German commissioner for the annexation of Togolod, Kamerun and Lüderitzland. He died on his way back to Europe. Nachtigal's work marked a distinct era in the exploration of northern Africa and even more notably in German colonial policy. He wrote 'Sahara und Sudan' (1879-80). His letters are collected in Berlin, 'Erinnerungen an Gustav Nachtigal' (1887). Consult also the life by Ruhle (1892).

NACIMIENTO MOUNTAINS. A prominent ridge in Sandoval County, N. Mex., lying between the Pecos and Jemez rivers. The length is about 40 miles and highest portions have an altitude of about 9,500 feet. To the north they merge into San Pedro Mountain. The rocks are uplifted granite with limestones, sandstones and volcanic tufts on the flanks. Copper is mined on west slope at San Miguel and Senorito.

NACOGDOCHES, nák-ō-dō-chéz, Tex., city, county-seat of Nacogdoches County, on the Texas and New Orleans, the Houston and the East and West Texas railroads, about 120 miles north by west of Beaumont and 130 miles north by east of Houston. It is in a rich agricultural region, in which the chief products are cotton and tobacco. A government experiment station for testing the tobacco is located here. The industrial interests of the city, beside the government station, are connected chiefly with the preparation of cotton and tobacco and lumber for market. Nacogdoches was first settled by Spaniards in the early part of the 18th century; it was first a mission, the headquarters for the converted Indians of the surrounding region. It figured in the United States quarrel with Spain over the Spanish possessions in the Southwest. Magee and Gutierrez captured it in 1812 when it came into the possession of the United States. Pop. 3,309.

NACRE. See Mother of Pearl.

NACRITE, a class of white unctuous minerals possessing a nearly shining lustre. They are usually found with mosaic slate and also occur native in granite and gneiss, crystallizing in four-sided prisms. The constituents are usually aluminia 28.844, silica 64.440, with varying por-

NADAL, Ehrman Syme, American author: b. Lewishburg, W. Va., 13 Feb. 1843. He was graduated from Yale in 1864 and was a secretary of the United States legation at London, 1870-71 and 1877-78. He has published 'Impressions of London Social Life' (1875); 'Essays at Home and Elsewhere' (1882); 'Zwei- bach or Notes of a Professional Exile' (1893).

NADGES INDIANS. See Creeks.

NADEN, Constance Caroline Woodhill, English poet: b. Edgwortham, Birmingham, 24 Jan. 1858; d. London, 22 Oct. 1889. She studied at the Mason College, Birmingham, in 1881-87; became interested in sociological problems and lectured with effect. She was an investigator of Spencer's system of philosophy and became the advocate of a doctrine, taught also by Dr. R. Lewins, called "Hylo-Idealism," an attempt to furnish a metaphysical system reconciled with the science of the time. She is best remembered for her volumes of 'Songs and Sonnets of Springtime' (1881) and 'A Modern Apostle and Other Poems' (1887). The poems were commended for their promise by Gladstone in a review in the 'Speaker.'

NADIA, ná-dé-a, or NUDDEA, India, town and district of Bengal: (1) the town, capital of the district, on the Bhagirathi River, 54 miles north of Calcutta, is a place of sanctity, the seat of native Sanskrit schools and was the residence of the last independent Hindu king of Bengal in 1203. Pop. 14,105; (2) the district has an area of 2,892 square miles. The Ganges here known as the Padma skirts its northwestern boundary and from it branch the three "Nadia rivers," the Bhagirathi, Jalangi and Matabanga, which irrigate the district and are valuable thoroughfares for communication and trade. Its capital is Krishnagur.

NADIR, in astronomy, that point of the heavens which is diametrically opposite to the zenith or point directly over our heads. The zenith and nadir are the two poles of the horizon; the zenith, nadir and centre of the earth are in one straight line.

NADIR SHAH, ná-dér shá, or TAMASP KULI KHAN, king of Persia: b. Khorasan, 1688; d. Fethabad, 19 June 1747. He was of Turkish blood and poor family; early showed his cunning by his attempts, while in the service of different governors of Khorasan, to get this province for himself, but was unsuccessful. Putting himself at the head of a band of robbers he got possession of several strongholds in Khorasan; and in 1726 entered the service of Tamasp II, for whom he checked the Afghans and defeated the Turks and from whom he received four provinces. When Tamasp was defeated at Hamadan by the Pasha of Bagdad and was forced to cede the provinces on the Araxis to the Turks and to make a disgraceful peace, Nadir dethroned him, put his son Abbós III in his place and took the regency upon himself. The lost provinces were won back from the Turks and in 1736 upon the death of Abbós Nadir came to the throne, invaded Afghanistan and conquered it, took most of India from
the grand mogul, Mohammed XIV, pillaged Delhi and was everywhere so successful that his empire reached from the Indus to the Euphrates and Caspian. He made peace with the Turks in 1746, but was assassinated by the officers of his guard, who were weary of his brutal cruelty. Consult Maynard, 'Nadir Shah' (1885).

NAEGELE, nā'gē-lē, Charles Frederick, American painter; b. Knoxville, Tenn., 8 May 1857; d. about 1912. He studied figure and portrait painting under C. Myles Collier, William Sartain and William M. Chase in New York. He has received many awards in competitive exhibitions and has painted portraits of Peter Cooper, Charles L. Tiffany, ex-Governor Roswell P. Flower, Gen. Joseph D. Bryant, Gen. Edwin A. McAlpin, John W. Gates and others. For his oil painting 'Divinity of Motherhood,' he won a gold medal at Boston.

NÆNIA, or NENIA (Latin), a funeral song among the ancients, sung generally by women. Nænia was also the goddess of lamentation.

NÆVUS, nē'vūs, Gneius, early Roman poet; b. probably in Campania between 274 and 264 B.C.; d. Utica, Africa, 204 B.C. or 202 B.C. He wrote in the old Saturnian verse an epic on the First Punic War; but was better known as a dramatic writer, particularly for his comedies. Most of his plays, of which the earliest was produced in 235 B.C., were translations or adaptations from the Greek. His attacks on the Metelli, of the Roman nobility, provoked their anger and he was banished from the city and retired to Utica. Fragments only of his works have come down to us. These have been edited by Klussmann, Wahlen and most recently by Ribbeck ('Fragmenta Scenicorum Romana- rum').

NÆVUS, a birth-mark, port-wine mark or mother's mark. This disfigurement, which occurs most frequently on the head and trunk, but may also appear on the extremities, is essentially an enlargement of the minute veins or venous capillaries, which are dilated and anastomosed or fuse into a long shining vascular patch generally of a deep-red color. The lesion is confined to the upper layer of the true skin. No pulsations are observable in the nævus, but if the circulation in the neighborhood is obstructed in any way, turbescence is seen and the color deepens. The familiar name of "mother's mark" or "longing mark," is applied to nævus from a former belief that the lesion was the result of fear, fright, unnatural longing or some such irritation acting upon the mother's constitution and communicating its effects to the unborn child, in the shape of this mark. Nævus, apart from questions as to its exact cause, appears to be invariably congenital in its nature. After birth it usually enlarges and after attaining a certain size may remain to constitute a permanent lesion or it may be absorbed with or without inflammatory action. The name birth-mark is in some cases a misnomer because the nævus may appear at different periods of life. Nævus has been treated in various ways, by excision with the knife, ligature, caustics, etc. The ligature has until recently been most commonly employed for its removal, threads being passed under the base of the nævus and tied so as to produce strangulation of the vessels. Electropuncture and electrolysis have also been employed, but none of all discovered means is the use of carbon dioxide snow, a cone of which is made and pressed upon the nævus for a quarter or half a minute. This causes a blister, which dries and come off, leaving no scar. In cases where a nævus is of limited extent and does not produce disfigurement or where from its situation it may not be seen at all in ordinary circumstances, the surgeon's advice generally is to let it alone. In subcutaneous nævus the lesion is more deeply seated. Subcutaneous nævus generally accompanies the more superficial form, but may bleed spontaneously and weaken the patient unless removed.

NAFA, nā'fā, NABA, or NAVA, Japan, the principal seaport town of the Liu-Kiu Islands, on Okinawa. It is on the west coast of the island, and carries on a considerable export trade in silk, cotton and sugar. Pop. about 50,000.

NÄFELS, nā'fĕls, Switzerland, parochial village in the Canton Glarus, junction of the Zürich-Glarus-Linthal and the Nafels-Weesen railways. Its industries are chiefly cotton spinning, printing and structural iron material, besides agriculture. It was here that, on the 9 April 1388, 400 Glarus natives defeated 6,000 Austrians, a feat still commemorated yearly. In 1799 Suwarov was defeated by the French under Moltor here in the Russian attempt to force a way into France. Its inhabitants numbered 2,818 in 1910. Consult Heer, G., 'Zur 500 jährigen gedächtnissfeier der Schlacht by Näfels' (Glarus 1888).

NAFTIA, nā'ftē-ä, LAGO, or LAGO DEI PALICI, Sicily, a historic lakelet of volcanic origin, in an ancient crater over 900 feet in circumference, near Palagonia, in Catania. Its nauseating naphtha-like emanations are fatal to birds and small animals; its waters thick and greenish, and in a frequent state of ebullition from the under-pressure of escaping carbonic acid gas. The lake was regarded with superition by the ancients, and here the Siculi, the earliest known inhabitants, had their chthonic gods, the Palici of the Romans, which was the seat of the conspiracy and revolt against Rome 104 B.C. Consult Freeman, E. A., 'History of Sicily' (Vol. I, Oxford 1891).

NAGA, nā'gā, Philippines, (1) a pueblo of the province of Cebú, situated on the east coast, 12 miles southwest of the town of Cebú. It is a port of call for steamers and coasting craft going to Cebú by the southern passage, and is on the east coast road. Pop. 16,884. (2) The former name of Nueva Caceres (q.v.).

NAGA, in Hindu mythology, the name given various defied serpents, which are represented as the sons of the Muni Kasyapa and his wife, Kadiri. Their king is Sesa, the sacred serpent of Vishnu.

NAGA, INAYA or BÍCOL RIVER, a river of southern Luzon, Philippines, rising in the mountains of the province of Albay, within four miles of the Pacific Coast and flowing northeast to Bató Lake, one of the lakes between Albay and Ambos Camarines. Passing through the lake, it continues its northwest
course across Ambos Camarines, and empties into San Miguel Bay. It is navigable to Nueva Cáceres for vessels of 150 to 200 tons.

NAGANO, nagā-nō, Japan, a city of Honshū, 90 miles northwest of Tokio. It has an active trade in silks, woolens and other textiles, and is a noted Buddhist pilgrim resort, visited for its celebrated Zenkoji Temple, dating from the 7th century.

NAGASAKI, nagā-sākē, Japan, capital city of the province Hizen and one of her principal and deepest seaports on the west coast of the island Kiushiu, located at the end of a long narrow bay and beautifully surrounded by high hills on three sides, and protected on the west side by the island Taka-boko, from whose steep heights many hundreds of Christians were once thrown to death. The town has narrow streets and a Chinese quarter in its rear; the foreign quarter is roomy and clean. It contains a hospital, school of medicine, lunatic asylum, arsenal, prison, botanical garden and a model waterworks. Its considerable imports consist of cotton, wheat, flour, whale-meat, sugar, beer, machines and railway equipment, petroleum, cement, coal, bone for fertilizer, etc. Of exports the chief commodities are raw silk, tea, sea-products (except fish), furs, salt, vegetable wax, paper, etc. It has steamboat connections with Korea, China, Hongkong, Vladivostok and North America. The harbor was first opened to the Portuguese (1639) and up to 1859 was opened to the Dutch and Chinese only but the treaty of 1858 rendered it accessible to all foreign commerce. Pop. 161,000.

NAGCARLÁN, nag-kār-lān', Philippines, a pueblo of the province of Laguna, Luzon, situated in the centre of the province between the headwaters of the Santa Cruz and the San Diego rivers, 92 miles south of Santa Cruz. It is on the road between Majayjay and San Pablo. Pop. 13,000.

NAGEL, nagēl, Albrecht Eduard, German ophthalmologist: b. Danzig, 14 June 1833; d. Tübingen, 24 July 1895. He studied medicine at Königsberg and Berlin and established a private clinic in Danzig in 1863. He was privat-docent at Tübingen and 1874 he became professor of ophthalmology there. He developed the theory of the identity of the retina. He edited the 'Mittheilungen aus der ophthalmitischen Klinik in Tübingen' after 1880, and published 'Das Sehen mit zwei Augen' (1881); 'Die Anomalien der Refraction und Accommodation des Auges' (1880); 'Die Vordigung zum medicinischen Studium' (1890).

NAGEL, nagēl, Charles, American lawyer and cabinet officer: b. Colorado County, Tex., 9 Aug. 1849. He was educated at Saint Louis and studied Roman law and political economy (1873) at the University of Berlin, when he was admitted to the bar and practised at Saint Louis. He was (1903-05) member of the firm Finkelburg, Nagel and Kirby, and (1903-05) of Nagel, 96 miles north of Santa Cruz. He was (1905-06) partner in the firm of Finkelburg,. He was lecturer at Saint Louis Law School and was member of the Missouri house of representatives from 1881-83. He was (1893-97) president of Saint Louis city council and (1908-12) member of the Republican National Committee. President Taft made him (1909) Secretary of Commerce and Labor, which position he retained during the life of that administration. In 1872 he was given the degree of LL.B. by Saint Louis Law School and was made LL.D. (1911) by Brown University, Villanova University, Pennsylvania, and Washington University, Saint Louis.

NÄGELI, nā-gē-li, Karl Wilhelm, Swiss botanist: b. Kilchberg, near Zürich, 27 March 1817; d. Munich, 10 May 1891. He studied in Zürich, Geneva and Berlin, where he acquired practical experience in the teaching of botany in Zürich; became extraordinary professor at the university there in 1848, full professor in 1852 at Freiburg, and at Zürich three years later. Afterward he held the professorship of botany at Munich. His most important work for science was in the physiology and morphology of plants. His writings deal chiefly with morphological and cytological subjects, and the transformation of species is fully treated in his 'Mechanisch-physiologische Theorie der Abstammungslehre' (1883). Most of his publications appeared first in scientific journals, those contributed to the Royal Bavarian Academy of Sciences being published as three volumes of 'Botanische Mitteilungen' (1861-81).

NAGLEE, nā-gē-li, Henry Morris, American soldier: b. Philadelphia, 15 Jan. 1815; d. San Francisco, 5 March 1886. Entering the Union army early in the Civil War, he participated in the Peninsula campaign of 1862, and in the following year was appointed to the command of the 7th Army Corps and of the District of Virginia. He retired from the army in 1864, and later went to California, where he cultivated a vineyard at San José, and gave his name to a well-known brandy.

NAGoya, nā-gō'yā, Japan, the chief town of Owari province, in the island of Hondo, near the head of Owari Bay, 92 miles by rail east of Kioto. It was formerly a city of great importance, being for a time the capital of the empire. It is still the fourth city in Japan in respect of population and an important centre for the production of pottery and fancy ware, silk and cotton goods, and other manufactures. The chief rivers are the Shimanto and Owari with its valuable art collection, and the Higashi Hongwanji Buddhist temple. Pop. 389,272.

NAGPUR, nag'- or nūg-pōor', or NAGPORE, India, a city, district and division of the Central Provinces (1) The city, capital of the district and division, and also of the Central Provinces, 520 miles by rail east of Bombay, although at an elevation of 1,100 feet above sea-level, occupies an unhealthy situation on the banks of the Nag. The municipal limits include, besides the town proper, the native suburb of Sitabardi, the European station of Sitabardi, the small suburb of Takli, and a considerable area of land under cultivation. In the centre rises Sitabardi Hill, crowned with the fort, which is garrisoned by a small detachment from the British garrison at Kanpur, nine miles distant. There are some Hindu temples and mausolea built in the best style of Mahatta architecture, and several schools. The chief manufactures are cotton and woolen cloths. There is a trade in wheat and other grain, hides, country cloth, European piece and miscellaneous...
outs goods, silk etc., and coal is obtained from a bed one-deph of 200 feet, which is estimated to contain 17,000,000 tons. Here, in 1817, a British force of 1,350 men defeated a Maharatta army of 18,000 men. Nagpur was formerly the seat of a line of rajahs, which became extinct in 1853, when their territory was annexed to the British dominions. Pop. 101,415. (2) The district of Nagpur has an area of 3,483 square miles; pop. about 800,000; (3) the division of Nagpur, divided into five districts, has an area of 23,521 square miles. Fruits, vegetables, cotton, rice, maize, oilseed and oranges are cultivated. The locality is also rich in minerals, coal, anthimony, ochre, gold being extensively mined. The territory was annexed by the British in 1853, previous to which it had been part of the Maharatta kingdom under the rule of the rajahs of Berar. Pop. 3,109,838.

NAGUILIAN, nà-gé-le'-án, Philippines, a pueblo of the province of Union, Luzon, situated on the Bauang (or Baoang) River, four miles from the mouth and 10 miles southeast of San Fernando. Pop. 11,885. A small town (pop. 2,200) in the province of Isabela, Luzon, has the same name.

NAGYAGITE, a sulpho-telluride of lead and gold with about 7 per cent of antimony, with the formula AuPbSbTe3S5. Besides these elements it often contains traces of copper and silver. It is found native in foliated masses and is hence sometimes called "foliated tellurium," also granular. It crystallizes, but rarely, in tabular diametrical forms and its specific gravity is 6.85 to 7.2. It melts easily under the blow-pipe and burns with a blue flame. In color it is blackish lead gray, and exhibits a brilliant metallic lustre. It is found in Colorado and Virginia, but derives its name from Nagyag, Transylvania, where it was first found.

NAGYBANYA, nôj'-bân'-ya, Hungary, a royal free town formerly known as Frauenstadt (Magyar Asszonypataka), located in the county Sztamnai on the Szatmari and the Nagybanya-Zsibó railways. It was at one time fortified, is handsomely built, and contains beautiful squares and a Minorite monastery. Its industries consist of mining and fruit culture, the manufacture of linens and cotton fabrics, and the distillation of alcohol, besides having considerable trading. The mines produce gold, silver, lead and copper. Pop. about 30,000.

NAGYKÁROLY, nôj'-kâ'-rôl'-y, Hungary, in the county Szatmar, on the Debreczin-Szatmar, the Magyarkároly-Zilah and the Nagykároly-Csap railways. It has a handsome church, a Piarist monastery, the Károly Palace and park. Its industries consist chiefly of the manufacture of coarse peasant linen and woolen cloths, leather, art furniture, decorative locks, bricks, besides its electricity, wine and tobacco works. Its population in 1910 was 43,692 for the commune. This has been the seat of the Károlyi family since the 14th century.

NAGYKIKINDA, nôj'-kê'-kên-da, or GROSS-KIKINDA, Hungary, city in the county Torontal, junction of the Szegedin-Temesvár and the Gross-Kikinda-Gross-Besterek railways. It has a modern town-hall, Obergymnasium, court of justice, etc. Its chief trade is that of a railway station, and the town was at one time the principal location of a privileged Serbian district. Its inhabitants in 1910 amounted to 32,987, consisting of Serbians, Germans, Magyars, etc.

NAHANT, nà-hàнт', Mass., town, in Essex County, on Massachusetts Bay. It is on a peninsula, which extends into the bay about four miles. The surface is uneven, the east coast rugged, in some places bold cliffs are along the shore; the west coast is low and muddy. There are two small villages in the town, one Nahant, the other Little Nahant. The whole peninsula is a residential section; many of the handsome dwellings are the summer homes of Boston men. Nahant is four miles from Lynn, the nearest railroad station, and about 10 miles northeast of Boston. Formerly it was part of Lynn, but in 1853 it was made a separate town. Pop. 1,184. Consult Hur, 'History of Essex County, Mass.' (Philadelphia 1888).

NAH-EL-ASI, nàr'-el'-â'sé. See ORONTES.

NAHUA (nà-wà) INDIANS, a Central American collective name given to the Indian tribes which were the most powerful in Mexico at the time of the Spanish Conquest. See AZTEC CONFEDERACY.

NAHUA MYTHOLOGY. See MEXICAN MYTHOLOGY; YUCATAN; PALENQUE; QUETZAL-COATL; MAYA; CHOLULA.

NAHUEL-HUAPI, nà-wél'-wà'-pe', or TIGER LAKE, Argentina, a lake on the boundary between the territories of Neuquen and Rio Negro, on the east slope of the Andes. It is 75 miles long, 10 miles broad and has an area of 300 square miles, dotted with several islands. It is fed by numerous mountain torrents and is drained by the Limay affluent of the Rio Negro. In 1690 the lake was discovered by Jesuit missionaries.

NAHUM, nà-hùm (Hebrew for "rich in God's comfort"), one of the 12 minor Hebrew prophets of the Old Testament, whose only record is the book, attributed to 607-606 b.c., that bears his name, a reference in Nehemiah vii. 7, as "Rehum" being a copyist's error. Nahum is described as "The Elkoshite," either the son of a man named Elkosh, or native of a village of that name in Galilee, the location of which is uncertain. Saint Jerome states that the village in Galilee which bore the name of Elkesi in the 4th century A.D. was the prophet's birthplace, and the Galilean village Capeenau, signifying the "village of Nahum," has also been vaguely speculated upon. The tomb of the prophet is pointed out at Alkush near Mosul — ancient Nineveh — and his life has been associated with the great city, the destruction of which he prophesied. His book entitled 'The Burden of Nineveh. The Book of the Vision of Nahum the Elkoshite,' should be compared with that of Jonah which illustrates the remission of God's judgments, while Nahum describes their execution, in a style full of animation, fantasy and originality, and at the same time clear and rounded. His language throughout is classical and in the purest Hebrew, before the second half of Hezekiah's reign, or to the time immediately following the defeat of Sennacherib before Jerusalem. Nineveh was at that time the capital of the great and flourishing Assyrian Empire. It was a city of vast extent and population; the centre of the principal commerce of the world. Its wealth, however, was not
altogether derived from trade. It was a "bloody city, full of lies and robbery," chap. ii. It plundered the neighboring nations; and is compared by the prophet to a family of lions, which "fill their holes with prey, and their dens with ravin," chap. ii, 11, 12. At the same time it was strongly fortified, its colossal walls, 100 feet high, with their 1,500 towers, bidding defiance to all enemies. Yet so totally was it destroyed that, in the 2d century after Christ, not a vestige remained of it; and its site was for centuries a matter of doubt and uncertainty. The book is surpassed by none in sublimity of description. It consists of a single poem which opens with a superb vision of God's coming to judge the nations, vs. 2-8. Then follows vs. 8-14, an address to the Assyrians describing their confusion and overthrow; vs. 12-13 parenthetically consoling the Israelites with promises of future rest and relief from oppression. Chapter ii depicts in vivid colors the siege and capture of Nineveh by its foes, the Medes and Chaldeans, and the consternation of the inhabitants. Chapter iii describes the utter ruin of the great city and the various contributing causes. The fall of No-Ammon, Thebes in Egypt in 668 B.C., about half a century before, under the judgment of God, is cited, vs. 8-10, to illustrate the punishment coming on the Assyrian Empire and the deliverance and restoration of Israel. With a wide view of the working of Providence, an avoidance of all moral or homiletic utterances, this powerful prophecy advances with majestic unity from its noble premiss to its close. Consult Davidson; B. *Nahum, Habakkuk, and Zephaniah* in 'Cambridge Bible' (1896); Driver, S. R., *Nahum* in 'Century Bible' (1906); Smith, G. A., *The Book of the Twelve Prophets' (2 vols., 1876-77); Halle, *Nahum* in 'Die Religion in Geschichte und Gegenwart' (1913); also the numerous commentaries, notably by Fickell, Billerbeck and Jeremias, Gunkel, Marti, Norvack, Wellhausen, etc.

**NAIADACEÆ** a small family comprising one genus, Naias, of submerged fresh-water plants, differing from the Potamogetonaceæ (q.v.) in having the flowery declivous, with stipules and one ovario. There are about 12 species and varieties found generally over the world. In the United States some members of the family are found in the fresh-water lakes and ponds from New York to Florida, others in the Mississippi Valley and others still in California.

**NAIL**, an elastic horny plate on the upper or dorsal surface of the end of a finger or toe, as in man and monkeys. Hoofs, claws, talons, sheath-horns and the bills of birds are analogous. Nails and claws of all kinds are modifications of the epidermis, identical in formation and mode of growth. The root of the nail rests in a matrix which is a fold of the dermis, particularly rich in vascular papillæ from which the nail-cells are produced. The pink color of a healthy nail is due to the blood beneath the little white area of the root of a nail, called lunula from its crescentic shape, has less blood under it. When nails are destroyed new ones will be formed if the matrix is uninjured. Nails are a support and a defense to the ends of the fingers and toes, assist in picking up small objects, and if healthy and in good condition add comeliness to the parts to which they are attached. To most animals possessing such organs of support of great importance, giving a needed rigidity to fingers and toes, and adapting them to a great variety of necessary utilities, as firmly seizing and holding prey (perfected in the retractile apparatus of feline claws), scratching, digging, searching crevices for food, and as terrestrial animals, in horses, cattle and other ungulated animals, they enclose some or all the digits and are called hoofs (q.v.). In the sloths the nails assume a relative size and are used as a chief means in arboreal progression. In the Amphibia—as in some toads, efts, etc.—the nails are represented in their simplest form and appear as mere thickenings of the skin at the extremities of the digits. In man the nails appear about the third month of fetal or embryonic life. After birth the nails of the hand grow at the rate of about one millimeter per week, those of the foot about one millimeter per month.

The health of the nails is affected, as is that of the skin, by many local diseases. They may become thickened (hypertrophy) as the result of inflammation or a degeneration of nerves; diminished in size (atrophy) from traumatic influences; malformed as the result of disturbed function of the matrix; degenerated from faulty nutrition and discolored in various diseases, the discoloration probably being in the tissues beneath. Nail-biting is a bad habit not only leading to a morbid condition of the nails themselves but also sometimes being an indication of some types of nervous disease. The nails are also subject to parasitic diseases. A hang-nail is a sliver of skin attached at one end; it should be cut off close to the point of attachment. The familiar white areas on the nails are considered to be injury received by the nails in being manipulated. The painful affection called ingrowing nail usually occurs in the great toe, not through alteration in the nail itself, but from constant pressure of the adjacent soft parts against its edge by a tight shoe. The irritation often results in the formation of an ulcer, extremely subject to continual aggravation from the embedded nail, and in some cases necessitates a slight operation to excise a portion of the nail and the nail fold.

**NAILS**, headed spicules of metal, varying in size from those a little larger than ordinary pins to those several inches in length and from 1/40 to 1/4 of an inch in thickness. Up to the beginning of the 19th century they were made by hand as a household industry in various countries. In England, Birmingham was the centre of the industry, at one time giving employment to over 60,000 persons, and requiring a weekly supply of 200 tons of nail-rod from the iron-works of that district. In the United States, New England held a corresponding position and is even to-day the centre of the industry in America, with Taunton, Mass., as the great centre toward the west. It is certain that all of the nail output of England was consumed at home and similar conditions obtained in the United States, France and Germany. Hand-made nails were known as wrought or forged nails and were made from metal plates rolled to the required thickness and then
sinks under their heads, and chisel points: extensively used by wheelwrights and smiths. (6) "Fine-dog" and "strong-dog," with solid, slightly countersunk heads, round shanks and pointed spears: used for nailing down stout iron-work, in which the heads are not required to lie flush with the face of the metal. (7) "Kent-buried" and "Gate" nails, with broad thin rose heads, flat shanks and good spear-points: used for nailing together and clenching the oaken bars of hurdles, fences and gates. (8) "Rose-clench" nails, with points cut square: used in nailing wood-shewing and the manufacture of packing cases and boxes, in which the soft wood is liable to split unless bored before being nailed. The square heads of the nails punch out their own holes by driving a portion of the wood before them. The term "clench" was derived from the mode of their employment in boat-building, where they were clenched by hammering down or by riveting the end over a "rove" (a diamond-shaped metal plate), thus drawing the planks together firmly. (9) "Horseshoe" nails, with square or countersunk heads: made of the best refined iron and capable of being drawn out fine without breaking in the hoof. (10) "Brads and tacks": a class of small very useful nails, employed for a variety of purposes too numerous to mention. The latter were sometimes made so small that 1,000 did not exceed 20 grains in weight. In the United States nails are designated as to kind as wrought, cut and wire nails; as to type by the purpose for which they are to be used, as lath nails, shingle nails, etc.; and as to surface, as smooth, barbed, etc. In sizes they range from the two-penny (6d) to the sixty-penny (60d) nails. Above these sizes they are called spikes; below them, brads. The smooth wire two-penny nails run almost exactly 1,000 to the pound; of larger sizes the count runs about as follows: three-penny, 600; four-penny, 300 to 450, according to gauge of wire; five-penny, 275 to 400; six-penny, 175 to 300; eight-penny, 100 to 150; 10-penny, 70 to 90; 12-penny, 65; 16-penny, 50; 20-penny, 30; 40-penny, 18; 60-penny, 11. Six-inch spikes run about nine to the pound and 12-inch spikes three to the pound. For many years nails have been marketed by the box, containing 100 pounds. Through the use of a recently developed packing machine, which, through the action of magnetism, arranges the nails in parallel, nails are in the market in cardboard cartons from 10 pounds upward and in large quantities in wooden boxes which occupy only half the space required by the "leg" with its shelter-skelter contents. The small nails or brads are usually packed in telescope containers, holding from one-quarter pound up to one pound.

The credit of inventing nail-making machinery appears to belong to the United States, a patent having been granted in 1786 to Ezekiel Reed, of Bridgewater, Mass., for a "cut-nail" machine. About the beginning of the 19th century nailing machines were first introduced in England, but the first English patent was granted to John Clifford in 1790. In making cut nails strips of metal of a breadth and thickness corresponding to the length and thickness of the required nail and about a foot in length are heated to a bright red and then fed into the machine end first. A slider cuts off the
nail-blank, which in falling is clutched at the neck and held until a moving die strikes its upper end and forms the head; it is then liberated and passes out into the trough. In small nails the taper of the shanks and points is obtained by cutting the nail-blanks alternately, the metal strip (of uniform thickness) being turned over after each stroke so that the points and heads are taken from the opposite sides of the blank; while in the larger nails the metal strip is rolled so that its cross-section corresponds to the required taper. These machines turn out nails at a rate of 10,000 to 1,000 per minute, according to the size of the nails. Cast nails are produced by the ordinary process of molding in sand. They are relatively brittle, but are cheap, and are used for rough purposes, such as lathing and in the manufacture of stout boots and shoes. Wire nails were first made in France, hence sometimes called 'French nails.' They were used in the woodworking trades and up to 1850 were made by hand. The wire was cut into the required lengths; a wire-blank was pierced with a small portion projecting, which was flattened into a head by a few blows of the hammer. Subsequently machines were invented into which the wire was fed and the cutting, heading and pointing were performed automatically.

In the United States William Hersel, of New York, produced the first hand-made wire nails in 1850. Shortly afterward French machines were imported, but they were soon superseded by those of American make, which were awarded medals over those of French and German manufacturers at the Centennial Exhibition in 1876. The new industry, however, was of slow growth. Up to 1885 there were about 25 firms engaged in it, but since then these nails have been widely adopted in the manufacturing trades. The United States Census of Manufacturers for 1914 reported 64 establishments devoted exclusively to the manufacture of nails, tacks and spikes. The factories employed a total of 2,644 wage-earners to whom was paid annually in wages the sum of $1,507,689. The aggregate capital invested was $7,883,371. The value of the year's production was $7,198,600, of which $3,604,281 had been added by manufacture. In addition to this product, however, the steel mills of the country made nails at the value of $1,469,780 and railroad spikes to the value of $4,201,388; brass and bronze factories made brass nails to the value of $40,252, the wire mills made wire nails to the value of $23,561; 63; and other metal-working establishments made a value of $321,256. The aggregate output of these concerns not classed as nail-makers is thus shown to be $29,401,319 — more than four times the output of the recognized nail industry. With the exception of horseshoe nails, which to a considerable extent continue to be made by hand, from fine grades of wrought iron, all nails are now made of mild steel by machines. In the United States the production is in excess of the consumption and American wire nails, especially, have been exported to European and other countries in increasing quantities for several years. The money value of the export of 1881 was but $420,697, while that of recent years has exceeded $5,000,000 annually. Concerning Smith, B. 'Wire: Its Manufacture and Uses' (New York 1891); Swank, J. M., 'History of the Manufacture of Iron in All Ages' (Philadelphia 1892).

NAIN SING, Hindu explorer: b. Numaon; d. Morabad, 1 Feb. 1882. He received from a military officer, Colonel Montgomery, instruction and stimulus for the work of exploration, which he afterward carried on in central Asia, first in Cashmere and Ladak (1893-5), and later in Tibet, making a journey (1895-6) to Lhasa (q.v.), which won him recognition from the Royal Geographical Society. This was followed by other important journeys, chief of which was that across the Tibetan Plateau (1874-5), of which he was the first explorer. The Geographical Magazine (London 1876) published an account of this journey, with a map.

NAINI TAL, India, a town of the United Provinces in the district of Kumaon. It has a beautiful situation beside a lake, 6,409 feet above sea-level, between spurs of the Himalayas, 70 miles north of Bareilly. It is a popular health resort, the summer headquarters of the provincial government, and has a military convalescent hospital. A disastrous landslide here in 1880 destroyed 150 lives. Pop. about 14,000.

NAIPALI (ni-pal'e) LANGUAGE, a dialect spoken in Nepal, India. It resembles the Hindi. The literature of the language is very scanty. Consult Turnbull, A. 'A Nepali Grammar and English-Nepali and Nepali-English Vocabulary' (Darjeeling 1887).

NAIRNE, när'n, Carolina Oliphant, Baroness, Scottish poetess: b. Gask, Perthshire, 16 Aug. 1766; d. there, 26 Oct. 1843. Her father was a staunch Jacobite, and named her after the young Pretender. In 1806 she was married to her cousin, William Murray Nairne, who in 1824 became Baron Nairne. Her poems were issued in 1840 as 'Lays from Strathearn,' and in 1869 Charles Rogers edited a volume entitled 'The Life and Songs of the Baroness Nairne,' of which a revised edition appeared in 1886. Among her poems are several of the most popular Scottish songs, such as 'The Land o' the Leal'; 'The Laird o' Cockpen'; 'Callin' Herrin'; 'The Auld House'; 'Charley my Darling'; Consult Oliphant, K. 'Jacobite Lairds' (Grampian Club 1870).

NAIROBI, ni-rō'bi, British East Africa, capital city of the province Ukamba, a station of the Uganda Railway, and 327 miles by rail northwest of Mombasa. It is located on the Athi plains at the foot of the Kikuyu hills. It has a town-hall, Protestant, Catholic, Mohammedan and Hindu places of worship, schools, hospital, waterworks, etc. Its bazaar is the centre of a thronging populace of traders. The European inhabitants find their dwellings in the higher lands. Pop. about 30,000.

NAIRS, nā'rēz, a Mohammedan caste in Malabar, who have peculiar marriage customs, polygamy and polyandry thriving side by side.

NAKED BAT, strangest of all chiroptera is the chiropterus torquatus or collared bat of the Malayean region. It measures five and one-quarter inches in length exclusive of the tail and has 26 teeth. Except the collar of thin-spread hairs surrounding the eyes the puckered skin is practically naked. Its muzzle is long and pig-like but the most curious characteristic
of this repulsive creature is the deep pouch on the underside of the body below the arm-pits existing in both sexes and holding the young while suckling. These strange creatures are found on the islands of Java, Sumatra and Borneo in dense forests where they repose till the sun reaches the horizon.

NAKONG, na-kong, one of the four species of harnessed African antelopes. It inhabits the swamps of Central and South Africa and East Africa and is known also as the sitingga (Tragelaphus spekei). This species has the distinctions of having a perfectly uniform grayish brown color, while the young are faintly striped and spotted, the hair being more silky and longer than the others; the horns, forming nearly two complete turns, are smooth, slender and strongly ridged. The male stands about three foot seven inches. They go in pairs never in herds. They are highly prized by the natives as game.

NAKSHATRA (Sanskrit, "Celestial lumnary" or "star"), in the Vedas simply means a star, but later was used of what in the mythological astronomy of India are called mansions of the moon, in which that planet periodically rests in its course through the heavens; these were small clusters of stars or asterisms, 27 or 28 in number. They were mythologically personified as the daughters of Daksha, wives of the moon. Their introduction into the Hindu system has been variously accounted for. Consult Thibaut, G., "Astronomie, Astrologie und Mathematik"; "Grundriss der Indo-Arischen Philologie und Altertumskunde" (Strassburg 1899).

NAKSKOV, nask-skov, Denmark, seaport town on the west coast of the island of Lolland, on Nakslov Fjord and on the Nykjöbing-Nakslov Railway. Its chief industries are the manufacture of sugar and machines, a trade in grain, besides its ship-building and shipping. It was once fortified and was captured by the Swedes in 1658. Its inhabitants in 1911 numbered 9,400.

NALA, nāla, in Hindu mythology, a legendary star, the residence of the god of love for Damayanti, the daughter of Bhima, king of Vardhna, and the adventures arisit therefrom, forms a celebrated episode of the "Mahabhārata" (q.v.), as also of a separate poem, the "Nalodaya," attributed to Kalidasa. Consult Macdonell, A. A., "A History of Sanskrit Literature" (London 1900).

NALUNTUNNE (näl-tú-näl-tú-ná') INDIANS, an American tribe of the Athapascan family, formerly residing on the Pacific Coast south of Rogue River, in southwest Oregon, between the Tututini on the north and the Chetco on the south. They had no separate villages, and spoke a dialectic variation of the Tututini language. Their tribal name signifies "people among the mushrooms." A few descendants of the race now live on the Siletz reservation, Oregon.

NAMALAND. See South West Africa.

NAMANGAN, nā-mān-gān, Russian Turkistan, a town of Ferghana, on the Sir-Daria, near lake Chandak, 50 miles northeast of Khokand. It is in a rich oasis, and is the trading centre for the surrounding nomadic tribes. Near it naphtha and coal are found. The principal industries are soap and leather manufactures. Pop. 78,942.

Namaqualand. See South West Africa.

NAMAS. See Hottentots.

NAMAYCUSH, the great lake-trout (q.v.).

NAMES of persons in the very earliest ages no doubt had some significance and meaning, but no record is handed down to us. The Old Testament names are almost all original, that is, given in the first instance to the individual bearing them, and either originated in some circumstance of birth as an expression of some religious sentiment, thus—Jacob (supplanter), Isaac (laughter), Isaiah (salvation of Jehovah), etc. The names of women had equal significance: Rachel (ewe), Hannah (favor), Deborah (bee), etc. In Old Testament times the name was often changed on the occasion of an important event in one's life, Abram becoming Abraham, Jacob becoming Israel, and so on. Neither the Hebrews, Egyptians, Assyrians, Babylonians, Persians, or Greeks gave their names; and in the earliest period of their history the same may be said of the Romans. In course of time, however, every Roman citizen had three, the praenomen or personal name, which was placed first, and commonly written with one or two letters, for example C. for Gaius, Cn. for Gneius, M. for Marcus, Q. for Quintus, and so on. Then followed the nomen, the name of the gens or clan, as Cornelius, Julius, Fabius, from the Cornelian, Julian and Fabian gentes. Lastly came the cognomen, family name, as Cicero, Caesar, Scipio, etc. Conquerors were occasionally complimented by the addition of a fourth name or agnomen, commemorative of their conquests, as Coriolanus, Africanus, Germanicus, etc. While the earliest Greek names were expressive of some quality in high estimation, as Callimachus (excellent fighter), Apollodorus (gift of Apollo), the Roman names were less dignified and ambitious in their origin; thus Porcius (swineherd), Cicero (vetch grower); some from personal peculiarities, as Naso (long-nosed), Paulus (little), Crassus (fat), Cocles (one-eyed). Celtic and Teutonic names had often equal significance, as Gottfried (God's peace), Conrad (bold in counsel), Bertha (brightness), Ethel (noble), etc. Times of great public excitement have had a very considerable influence in modifying the fasion in names. Thus the English Puritans preferred Old Testament names and such as directly expressed religious sentiment. Among the Scottish Covenanters Old Testament names were also prevalent. At the French Revolution the names of the most famous Greek and Roman republican heroes were in general favor. Among primitive races, names of familiar objects were first given to clans, local groups, and finally very loosely to individuals. The principal of the modern system of personal nomenclature now adopted in most countries in Europe is to have one name for the individual (Christian or baptismal name) joined to a second name which is common to the family to which he belongs (surname); it is impossible to state with any degree of certainty when this system became general. No instance is known, we believe, of any Anglo-Saxon family bearing a surname from generation to gen-
eration. They were introduced by the Norman adventurers, but were for centuries confined to the upper classes. Surnames became general in Scotland about the 12th century. In some of the wilder districts of Wales they can hardly be said to have been adopted even yet. The principal sources from which surnames are derived are personal characteristics, rank, or profession, localities, animals, or natural objects, and patronymics. Thus from the first source, personal characteristics, we have Black, Brown, Grey, Green, Whyte; Little; Long, Short, Broadhead, Lightfoot, Cruckshank. From rank or profession, we have Lord, Pope, Bishop, Abbot, Prior, Steward or Stuart, Smith, Wright, Carpenter, Taylor, Baker or Baxter, Weaver or Webster, Falconer, Fletcher (arrow-maker), Glover, Bowman, Chapman or Marchant, Miller, Brewer or Brewer; Shepherd. From localities, animals or natural objects, come Hill, Dale, Wood, Forest, Brookes or Burns, Grove, Shaw; Bird, Lyon, Hogg, Crabbe, Fox, Roe buck, Bull; Stone, Tree, Flint, Steele. From patronymics are derived Andrews, Anderson, Alexander, Sanderson, Sandison; James, Jamieson, Jamieson; Jones, Johnson, Jonson, Jackson; Williams, Williamson, Wills, Wilson; Thomson, Roberts, Robertson, Robinson. Surnames in many other languages are derived from different sources; thus Black, Whyte, Brown, are with the Germans Schwartz, Weiss, Braun; with the French, Lenoir, Leblanc, Lebrun; the Gaelic prefix Mac, the Irish O', the Norman-French Fitz, the German affix -son or -son, the Scandinavian -sen, the Russian -vitch, are all equivalents of the English affix -son. The Hebrew, as already stated, had no surname, proper, nor had the Arabsians; but to distinguish two men of the same name the former used the form Solomon ben David (Solomon son of David), and the latter Abraham ibn Ezra. The Welsh used the word ap in the same way; Evan ap Richard (John son of Richard). In most nations the wife changes her surname on marriage to that of her husband; in Spain, however, she retains it, while the son may adopt either the paternal or the maternal surname. In Great Britain a man cannot now change his Christian name and surname without an act of Parliament, royal license or even public advertisement; but there is no law to compel third parties to use the new name. In the United States names can only be changed by special act of State legislatures.

Nicknames of persons are most difficult to classify owing to the great variety of origins. Physical peculiarities, complimentary (as Strongsharm), derogatory, as Spindleshanks, Shropshanks, Crookshanks, Heaviesides, etc.; mental attributes, as Grave, Stern, Wise, Saucy, Moody, Proud, Courteous (Curteis), on one hand, and on the other Blythe, Gay, Foolhardy, Jolly, Meek, etc.; nicknames from complexion and color of the hair, as Black, White, Brown and upper class names, as Micklejohn, Littlejohn, Brownjohn; if he was a comely, well-made fellow, he was Properjohn.

These names appear again in Norman guise, as Grosjean, Petjean, Buryan, from which comes Bunyan — so that when we speak of good John Bunyan we are (perhaps unconsciously) only translating the name of "the inspired tinker." See National Nicknames. Consult Barber, British Family Names" (1894); Bardsley, "Dictionary of English and Welsh Surnames" (1901); Innes, 'Concerning Some Scotch Surnames' (1860); Yonge, 'History of Christian Names' (1863).

NAMOUNA, ná-moó-ná", in Persian mythology, an ever young and beautiful enchantress, born long before any other created thing, yet still retaining all her youthful attractiveness. The idea probably originated in the observation of the changes of nature, the drying of vegetation and its renewal. The same conception has been held concerning the moon for the same reason. Among various American Indian tribes a very similar myth prevailed. The Navajos personified nature in their goddess Esatsánatlehi, "the woman who rejuvenates herself." When she grows to be an old woman she becomes a young girl again. She is always changing but she never dies, for she is the mother of the twin war gods by the sun. These sons destroyed the alien gods and bad spirits and aided the sick suffering from witchcraft. The power of her two sons over witchcraft would seem to reflect Esatsánatlehi with the moon and also with the sun of whom the moon is generally the wife.

NAMUR, ná-moor (Fr. ná-múr’). Belgium; (1) a city, capital of the province of the same name, at the confluence of the Sambre and Meuse, 35 miles southeast of Brussels. The old fortifications have been raised since 1866 with the exception of the picturesque citadel dating from 1784, built upon steep rock, high above the confluence of the rivers. A cordon of five large and four small modern forts now defend the town. The town is beautifully situated and well built, with spacious streets and several handsome squares. Frequent sieges and bombardments destroyed almost all its ancient buildings. Among those of more recent times are the cathedral dedicated to Saint Aubin, one of the most handsome modern churches of Belgium; the church of Saint Louis, the church of Notre Dame, the Hôtel de Ville and the belfry tower. Namur is the seat of a bishop; it possesses a chamber of commerce, a royal atheneum, a public library, a museum, an agricultural society, normal and various other schools and numerous benevolent institutions. Namur is famous for its cutlery, its leather-works and its iron and brass foundries. The trade is greatly favored by the two navigable rivers. Steamers ply on the Meuse and railways communicate with Brussels, Mons and the French frontier. Namur dates from the 7th century, under the names of Namuceum, Navinicum Castrum and Namon. It was taken by Louis XIV in 1662, and retaken by William III of England in 1695. Pop. before the World War, about 33,000. The Germans occupied Namur on 23 Aug. 1914. (2) The province is bounded on the north by Brabant, northeast by Liège, east by Luxembourg, south by France and west by Hainaut; greatest length, north to south 57 miles; greatest breadth, 37 miles; area, 1,413 square miles. The surface
is greatly diversified, well watered by the Meuse, with its tributaries, the Lesse and the Sambre. About one-half of the whole surface is cultivated. The chief vegetable productions are the ordinary cereals, oil-seeds, chicory, fruit and medicinal and dye plants. In some places the vine is cultivated. The extensive forests furnish good timber and the prevailing carboniferous strata yield coal, iron, limestone, etc. The industry of the province, both manufacturing and commercial, is largely developed. Namur was an independent country as early as the 10th century. At the close of the 12th century it came into the possession of the counts of Hainaut, and early in the 13th century fell to Peter of Courtenay, emperor of Constantinople. It was sold by his son Baldwin to Guy of Dampierre, Count of Flanders, with whose descendants it remained till 1420, when it was purchased by Philip the Good. Duke of Burgundy, for 132,000 gold ducats, and afterward shared the fate of the other Burgundian states. Pop. before the war, about 365,000, nearly all of whom speak Walloon. See WAR, EUROPEAN.

NAN-CHAN-GFU — NANCY

China, the chief town of the province of Kiangsi, 176 miles southeast of Hankow, on the Kan-Kiang, near its entrance into the Poyang. It is noted for its porcelain industries. Pop. 150,000.

NANA, a novel by Emile Zola, one of the Rougon-Macquart series, which appeared in 1880.

NANA SAHIB, nà'nah sā'hīb, Mahratta leader of the Sepoy Rebellion: b. near Cawnpore, 1825; d. Nepal, about 1859. His real name was Dhanu Panth, and he was the adopted son of the last Mahratna peshwa of Poona, whose great wealth he inherited, but whose annual pension of about $400,000 was not continued to him by the British government. He lived as a native prince, moving in European society, and when the Sepoy mutiny broke out he secretly encouraged it, but openly offered aid to the English. He marched on Delhi at the head of native troops; promised the English a safe conduct from Cawnpore, but shot or drowned all of them but four; and before leaving the city killed all Europeans, women and children included, that he found in the city and threw their bodies into the famous well of Cawnpore. He fled to Nepal, was repeatedly defeated by the English, who ultimately drove him out of the English province, and was not heard of after 1859. Consult Landon, P., 'Under the Sun, Impressions of Indian Cities with a Chapter Dealing with the Later Life of Nana Sahib' (London 1906); Burgess, J., 'The Chronology of Modern India, 1494–1894' (Edinburgh 1913).

NANAIMO, na'nî'mô, Canada, a city of British Columbia, on Departure Bay, on the east coast of Vancouver Island, opposite Vancouver on the mainland, with which it has daily steamer service. Its harbor is deep and safe, though often closed by ice in winter. It is connected with Victoria, 73 miles from Victoria by the Esquimalt and Nanaimo Railway. The coal mines at Nanaimo and in the vicinity produce a ton more than 1,000,000 tons a year. It exports large quantities of coal, lumber and herring. It also has extensive freestone quarries, large saw-mills and is the centre of a great fruit-growing district. It is the seat of a United States consular agent. Pop. 8,300.

NÁNAK, nà'nák, NÁNEK, or NÁNUK, Hindu religious leader, founder of the sect of the Sikhs: b. Talwandy (now Nankana), in Lahore, 1496; d. Kirtipur, 1538. A member of the warrior caste, he early associated with Kahir, leader of a monothene sect, under other mystical influences. He traveled to all the holy places of India, made the pilgrimage to Mecca and Medina, and as a result of his studies of Brahmanism and Islam wrote the 'Adi-Granth,' which requires the veneration of Ka-bir, and in general is a mixture of the Vedas and the Koran. This gospel he preached through India; it became the national religion of the Sikhs and was proclaimed by Nának's successors from Labhna down to Gobind Singh, who died in 1708. The 'Adi-Granth' preaches the worship of one god, the equality of man, the duty of loving all men and the need for frequent ablation. See SIKH.

NANCÉDÉ, C(harles) B(eylard) Guer-ard de, American surgeon: b. Philadelphia, Pa., 30 Dec. 1847. He was educated at the University of Pennsylvania and at Jefferson Medical College; began practice in Philadelphia; and after 1889 was professor of surgery and clinical surgery and surgeon of the university hospital at the University of Michigan, retiring in 1913. In the Spanish-American War he served as surgeon at the front and in 1908–09 was president of the American Surgical Association. He is the author of 'Principles of Surgery' (1899; 1905); 'Essentials of Anatomy' and a contribution to 'A textbook of the Medical Sciences' (1887); 'The International Encyclopedia of Surgery' (1881–95); 'Cyclopedia of the Diseases of Children' (1890); 'Cyclopedia of Diseases of Nose and Throat' (1893); 'Dennis' 'System of Surgery' (1895) and 'American Practice of Surgery' (1898), etc.

NANCY (Fr. nôn-sê), France, the capital of ancient Lorraine, of the former department of Meurthe and since 1872 of the department of Meurthe-et-Moselle, situated in a fertile plain, near the left bank of the Moselle, about 10 miles east of Paris, on the railway to Strassburg. It is divided into the old and the new town, has extensive suburbs and is strongly defended by isolated 'forts d'arrêt.' The old town is irregularly built, with streets narrow and winding; but has several fine public buildings. The new town has straight and spacious streets, intersecting each other at right angles, and traversed by tramways; the houses, almost without exception, are handsome. The Place Stanislas, surrounded by several fine public buildings and communicating, by a triumphal arch, with the Place Carrière, has a fine statue of Stanislas Leszczynski, king of Poland, who passed the latter years of his life here as Duke of Lorraine and beside it one of the finest of its modern embellishments. There are statues also to General Drouot, Thiers and other notabilities. The Cours Léopold, occupying the highest part of the town, and finely planted, is the principal promenade; another is the Pépinière, a large public park. Of the chief edifices are the cathedral, a modern structure in the Italian style; the church of Saint Esprit, with a lofty tower and a fine
NANDUS — NANNING

NANNING, nän’king/ (offically Kiang-
ning, that is, Southern Capital), China, capital
of the province of Kiangsu, and vice-regal
headquarters for the three provinces of Kiang-
su, Kiangsi and Ngan-hui, near the south
bank of the Yang-Kiang, 560 miles south
by east of Peking. It is 18 miles in circum-
ference and is surrounded by a wall 40 feet
high. The principal streets are of moderate
width, clean, well paved and lined with hand-
some trees. The houses are, in general,
mean, and only one story high. The city
occupied by the Manchus is separated
by a wall from the Chinese town. There
are extensive manufactures of fine satin
and crimp, and the cotton cloth which foreigner
flannel derives its name from this city; paper
and ink of fine quality, and beautiful artificial
flowers of pith paper, are produced here.
Nanking is celebrated also for its scholars
and literary atmosphere, having many large
libraries. Nanking was the capital of the Chinese
Empire from 1368 to 1403, but when the seat
of government was transferred to Peking it lost
its importance and a great part of its popula-
tion, while about a third of its area is now un-
occupied. The only remarkable remains of
royalty are the sepulchral Ming statues situated
near the walls. The famous porcelain tower
of nine stories and 260 feet in height, completed
in 1432, was destroyed during the Taiping
Rebellion. The city was held from the spring
of 1853 to July 1864 by the Taipings, who made
it their capital. At its capture by the rebels
and recapture by the Imperialists it suffered
severely. By the French treaty of 1858 Nanking
was made a treaty port, but never attained
any importance as such, owing to the vicinity
of Chinkiang-fu. Pop. estimated at
300,000.

NANNA, nän’nä, in Scandinavian mythol-
ogy, the wife of Balder and the goddess
of immaculate purity. Her name means "Blos-
som" and she was the daughter of Nip, which
means "Bud," and a goddess. In the myth of
the 'Death of Baldur' in Norse mythology, Nanna,
falls dead by the side of the corpse of
her husband and is placed upon the bier with
him that she may accompany her beloved even
dead. When Hermod visited the land of the
dead to gain the freedom of his brother, he
found Nanna ministering to him as he lay
sick and pale on a couch. Balder wished her-
mod to take Nanna back with him; but she
refused to leave her husband. Balder is the
personification of life-giving light and his wife,
Nanna, is the personification of vegetation
which dies when the great light giver, the Sun,
goes on his winter journey to the south. Bal-
der is generally called the "radiant god of
sunshine"; and his wife, like the classical Pro-
sperine, goes down into the underworld.

NANACUS, or NANNAKOS, according
to a Greek legend, the king who predicted
Deucalion's flood.

NANNING, China, city in the province
of Kwangsi on the Ya-Kiang River, the chief
southern outlet of the Si-Kiang. It is sur-
rounded by a strong wall and lies in a plain
enclosed by hills. Before the Taiping revolution
the place was of much greater importance but
still has a considerable trade in opium and met-

als carried on with Canton, Yünnan, etc. It has a population estimated at about 40,000.

NANSEN, Fridtjof, frét'jóf nán'sén, Norwegian Arctic explorer: b. Great Frøen, near Christiania, 10 Oct. 1861. He studied at Christiania University and in 1882 made an Arctic voyage in a sealing vessel in order to have opportunities of studying animal life in the higher latitudes. On his return he was appointed curator of the Bergen Natural History Museum. In 1888 he crossed Greenland from sea to sea a little north of latitude 64°, an account of this journey being published in England in 1890, under the title 'Across Greenland.' He returned in 1889 and was appointed curator of the Museum of Comparative Anatomy in Christiania University. In 1893 he sailed on board a specially built steamer (the Fram), in the expectation that, entering the Polar ice in the neighborhood of the New Siberian Islands, he would be drifted by a current over the Pole and would come out on the east side of Greenland. This expectation was based on the fact that articles belonging to the Jeannette, an Arctic expedition vessel lost in 1851, had drifted in about three years, and had reached the Polar Regions to Greenland. After being carried to lat. 83° 59', he left the Fram and crew, and with a single companion, Lieutenant Johansen, and with sledges, dogs and kayaks, took the ice. In this way he reached a higher latitude than any previously attained, 86° 14' (8 April 1895), and then turned southwestward to Franz Josef Land. There he spent the winter of 1895-96, and on 17 June 1896 fell in with members of the Jackson-Harmsworth expedition, with which he returned to Vardø. The Fram, under Captain Sverdrup, had reached lat. 85° 57', and had been for four months fast in the ice. Nansen was received everywhere with the greatest enthusiasm and medals and other honors were conferred upon him, including a professorship of zoology in Christiania University. In 1897 he published an account of his voyage, which appeared in English as 'Farthest North,' the most interesting of all narratives of Arctic travel. A translation of a part by Dr. Bluckman was published in 1893. His further works include 'Northern Mists' (1911) and 'Through Siberia' (1914). He was strongly favorable to the separation of Norway from Sweden (on which he wrote a volume) and was Minister for Norway at London (1906-08). In 1906 he was elected Grand Cross of the Victorian Order was conferred on him. On his return to Norway he became professor of oceanography at Christiania University. Consult Dolman, F., 'Dr. Nansen: the Man and His Work' (1905); Haggard, W. E., and Rolfseth, N., 'Fridtjof Nansen' (London 1861-92; trans. by Archer, ib. 1906).

NANSEN, Hans, Danish statesman: b. Flensburg, 28 Nov. 1598; d. Copenhagen, 12 Nov. 1667. He entered (1621) the service of the Danish Icelandic Company and made many travels and voyages in the North. In 1660 he was made burgomaster of Copenhagen, and from 1658-60, during the storm and stress period, his city's trust in his abilities enabled him to obtain from Frederick III the anti-aristocratic reform of 1660. The resulting absolute monarchy is said to have been contrary to his wishes, but he retained his honors, going largely into commercial life and omitting poli-

NANTS, nán'ts Fr. nánt, France, capital of the department of Loire-Inférieure, and an important commercial port, on the right bank of the Loire, where it receives both the Erdre and the Sèvre, 245 miles by rail west-southwest of Paris. The Loire here forms a number of islands, two of which are among the finest quarters of the town, and are connected by several bridges. The situation, on an important navigable river, within 40 miles of the ocean, is advantageous for commerce, and has been enhanced since 1891 by the construction of a ship-canal to Saint Nazaire, at the mouth of the Loire, and by considerable expenditure in harbor improvements since 1914. Nantes is so well placed on the Loire that, in some parts so splendidly built, that it justly ranks as one of the finest towns in France. It has a number of elegant squares; and its quays, which line the banks of the rivers, extend nearly five miles. The notable public edifices are the cathedral, in the flamboyant style, dating from the 15th century; the handsome modern church of Saint Nicholas in the Gothic style of the 13th century, with a tower 278 feet high; the celebrated ducal castle, an edifice of the 14th century, partly modernized in the 16th, flanked with massive round towers; the palaces of justice or law courts, a large and handsome building; the Hôtel de Ville; the exchange, restored and enlarged in 1891; the museum of natural history; and the new museum (1897); the large picture gallery; public library of 102,000 volumes; chapter-house, and Hôtel Dieu or infirmary. Nantes is the see of a bishop; it has courts of first resort and commerce, a chamber of commerce and exchange, a college, diocesan seminary and secondary ecclesiastical school; a secondary school of military and a hydrographical school of the first class. The manufactures consist of blankets, serge, flannel, printed stuffs, canvas, ships' boilers and machinery, cordage, chemical products, glue, ship biscuits, etc.; there are also cotton mills, paper refineries, iron works, glass works, bleaching fields. Sardines and preserved meats are important articles among its industrial products. The ship-building docks are of great extent. Nantes carries on a large foreign trade, vessels of 1,700 tons being able to reach the town. The trade includes a variety of articles both for the home, the colonial and the foreign markets. Before the conquest of Gaul by the Romans, Nantes was the capital of the Nantenes. In 1445 it valiantly withstood the siege of 60 days by the Huns. During the 9th century it was thrice taken by the Normans and almost entirely ruined. In 1118, when it had again become prosperous, an accidental fire reduced the greater part of it to ashes. During the English wars in France it frequently fell into the hands of opposite parties. For a long time it formed one of the most valuable
NANTES — NANTYGLO AND BLAINA

possessions of the dukes of Brittany, but in 1549 the heiress of the dukedom, Anne of Brittany, who was the chief actress of Louis XII, it passed with the rest of her possessions to the Crown of France. The most memorable event connected with the history of Nantes is the famous edict (see Edict of Nantes) issued by Henry IV, 30 April 1598, securing the Protestant interest in France freedom of their religion, and making them eligible to all civil and military employments. This edict was revoked by Louis XIV in 1685. The noyade or drowning of the monster Carrier during the Revolution were perpetrated here. (See Carrier.) Pop. about 171,000.

NANTES, Edict of. See Edict of Nantes.

NANTEUIL, Robert, nandif, French copperplate engraver: b. Rheims, 1630; d. Paris, 1678. His father-in-law, Nicolas Regniesse, was his first instructor and in 1647 he went to Paris and worked under the eye of Philippe de Champagne (q.v.). Louis XIV appointed him designer and engraver to the king. He employed in his work a simple line which grew gradually thicker at the shade point and died away toward the high light in faint and fainter stipple points; in this way he produced the fine color values which characterize his engravings. In the portraits of which about 200 exist, he exhibits powerful modeling and life-like drawing. They include portraits of Louis XIV, Anne of Austria, Madame de Sévigné and other renowned persons. Some of these latter works are after the paintings of Lebrun, Du Chastel and others. He also executed some excellent pastels. Consult Loriquet, 'Robert Nanteuil' (1886); Metcalfe, 'Prints and Their Makers' (New York 1912).

NANTICOKE, nand't-i-kok (Nantigio, tide-water people), a former American Indian tribe of the Algonquian family residing, when first discovered by the whites, on the east shore of the Nanticoke River, where according to Smith their principal village, also called Nanticoke, was situated in 1608. Their language was very closely related to that of the Delaware. They were great fishers, trappers and hunters and had been in their native land in a period of their history, gone southward in search of game, when their old hunting grounds had become too densely populated for a nomadic race. Tradition also says that a league existed between the Nanticoke and other tribes covering a large extent of territory, for many generations. Already in 1642 the Nanticoke had been declared enemies of the Maryland colony; but in 1678 a treaty was made with them; and 20 years later reservations were set apart for them. About 1725 they began to move northward gradually, going up the Susquehanna and finally settling at Oswego, Chenango and Chugnut in the State of New York. A part of the tribe, however, under the name of Wiwash, remained behind in Maryland. Some of those in New York State amalgamated with the Iroquois; but most of them, feeling the pressure of the white intruder, crossed into Ohio and Indiana and there joined the Delawares about 1784.

Among all the neighboring tribes the Nanticoke Indians had the reputation of being great magicians; and they were greatly feared on this account. A head chief ruled over all the villages, thus binding together the interests of the tribe or tribes composing the Nanticoke people. Apparently this chief was married to a woman of the Provençal family. They fortified their towns against the enemy. In the Nanticoke Confederacy were included the Nanticoke proper, Arseek, Cuscaraoco, Nause and Sarapinagh and perhaps Oznies and other sub-tribes. In southern Delaware there are still the descendants of the Nanticoke.

NANTICOKE, Pa., borough in Luzerne County, on the Susquehanna River and on the Delaware, Lackawanna and Western, the Central of New Jersey and the Pennsylvania railroads, about 80 miles north by east of Harrisburg. The town of Nanticoke was surveyed, platted and streets laid out in 1793. It is situated in an anthracite coal region in Hanover and Newport township, and has extensive water power which is utilized in manufacturing. The industry contributing most to the wealth of the town is coal mining. This is the greatest coal deposit and the richest mining district in the world. The chief manufacturing establishments of the city are rolling mills, implement works, large hosiery mills, knitting factories, canning factory, flour and grist mills, lumber mills, silk mills and cigar factories. It has considerable trade in coal and its own manufactures. There is an excellent school system with 12 modern school buildings. The government is administered under the original charter which provides for a burgess, who holds office three years, and a council. Pop. 23,000.

NANTUCKET, Mass., town, county-seat of Nantucket County, embracing the islands of Nantucket, Tuckermuck and Muskeget. It is about 25 miles from the mainland of the State and 100 miles southeast of Boston. On the north is Nantucket Sound, on the east and south the Atlantic Ocean and on the west Muskeget Channel, which separates it from Martha's Vineyard. The main island, Nantucket, is about 15 miles long, and averages about two miles in width. The area of the whole town is about 60 square miles. The most populous part of the town is along the north shore of the largest island. There are several villages in the town; the largest, Nantucket, on Nantucket harbor, was founded in 1673. The first settlement was made in 1659 by a colony in charge of Thomas Macy, at the place called Madeget. Nantucket is a famous summer resort; the island is dotted with handsome summer villas. The residents claim that the climate is antagonistic to asthma, hay fever and malaria. At one time Nantucket was the headquarters of a great whaling industry, but the chief industries of the present are agriculture and fishing. A flourishing coastwise trade is carried on by a number of the islanders. Muskeget Park is one of the attractions. The town has a school system (four schools), an Athenaeum, and the Coffin High School. At the "town meeting" the administrative officials are annually elected. Pop. 2,962. Consult Hinchman, 'Early Settlers of Nantucket'; Worth, H. B., 'Nantucket Lands and Landowners' (Nantucket 1902); Duglas-Lighthow, 'Nantucket' (New York 1914).

NANTYGLO (nand'-'gil) and BLAINA, blan'-'e, England, town in Monmouthshire near
NAON—NAPHTHA

Abergavenny. Its importance lies in its large coal-mining and iron industry. Pop. 15,395.

NAON, nā'-ôn', Rómulo S., Argentine diplomat: b. Buenos Aires, 17 Feb. 1875. He studied at the University of Buenos Aires and later became professor of philosophy at the Colegio Nacional de Buenos Aires, then professor of constitutional law and member of the directive council faculty of law and social sciences (1902) as representative of the National Congress and was re-elected (1906), becoming Minister of Justice and Public Instruction (1908). He was (1911–14) Envoy Extraordinary and Minister Plenipotentiary to the United States and in the latter year became the first Ambassador of Argentina to the United States. He was re-elected (1912) to the National Congress but resigned to remain with the United States. In 1917 he resigned his office because his country's government refused to declare war against Germany. He served as general secretary of the Argentine delegation to the second Hague Peace Conference, was a member of the A. B. C. (Argentina-Brazil-Chile) Peace Conference in 1919, and in (1945) was a delegate between the United States and Mexico, a delegate at the Pan-American Conference (1915). For his valuable services he has received numerous decorations. He has written several works on political science and constitutional law, and has received, among other diplomas, that of LL.D. from the universities of Pittsburgh, Yale, Harvard and Brown.

NAOROJI, nō-rō-ji, Dadabhaí, first Indian member of the British Parliament: b. Bombay, 4 Sept. 1825; d. 2 July 1917. The son of a Parsi priest, he was educated in the Bombay school, later the Elphinstone School and College, where he was the first native professor of mathematics and natural philosophy (1854). In 1855 he went to England, where he afterwards, for the most part, resided. In 1857 he assisted in founding the East India Association; through his efforts in 1867 the civil service was opened to native Indians; and he accomplished much for the improvement of Indian finance and industries. He became Prime Minister to the Prince of Baroda in 1874; from 1875 to 1876 he held important municipal and legislative positions; and in 1886 and 1893 was president of the Indian National Congress. For many years he was president of the London Indian Society. From 1892 to 1895, as a Liberal, he represented Central Finsbury in the House of Commons, and in the latter year was made a member of the royal commission formed to inquire into Indian expenditure, etc. He published 'England's Duties to India' (1867); 'The Wants and Means of India' (1870); articles collected in 'Poverty and the British Rule in India' (1901), and 'The Rights of Labour' (1906).

NAPA, nā-pā, Cal., city, county-seat of Napa County, on the Napa River and on the Southern Pacific Railroad. It is in an agricultural region in which large quantities of fruit are raised, and in the vicinity is an extensive deposit of gold. It was first settled in 1847 and in 1863 was incorporated. The city has excellent transportation facilities as the Napa River is navigable, thus making direct water communication with San Francisco and other cities. The chief manufactures are gloves, leather and shoes. There is a large trade in fruit, Portland cement (made at Napa Junction), and the manufactures of the city. The scenery around Napa is beautiful; some of the attractions are the petrified forest, the mineral springs and the Napa Redwoods. It has the State Hospital for the Insane. Pop. 7,000.

NAPANEE, Canada, a port of entry and the county-seat of the united counties of Lennox, Addington and Ontario, 24 miles west of Kingston, on the Bay of Quinte, about seven miles from the mouth of the Napanee River. It is the terminus of the Quinte and Napanee Railroad and is on the Grand Trunk and Canadian Northern railroads. It has flour-mills, factories, brick and tile works, motor boat and carriage works, and is the centre of a rich agricultural district. Pop. 2,807.

NAPERVILLE, nā'pèr-vill, Ill., city in Du Page County, on the Du Page River and on the Chicago, Burlington and Quincy Railroad, about 28 miles west of Chicago. It was settled in 1830 and in 1857 was incorporated. It is an agricultural and industrial city, the seat of the Northwestern College, established in 1861 under the auspices of the Evangelical Association. It has good public and parochial schools, the Nichols Library, a theological seminary, V. M. C. A. building, the Edward Tubercular Sanatorium, Saint Procopius Bohemian College, a convent and orphanage. The city's manufactures include couches and davenport, fly-netting, gloves, ice, butter, ice-cream, etc. There are two large nurseries also in the city, which is under the commission form of government. Pop. 3,449.

NAPHTALI, nā'pta-li (Hebrew, "wrestler"), the seventh son of Jacob by Bilhah, Rachel's maid, one of the 12 patriarchs and eponymous founder of one of the 12 tribes of Israel. The territory of Naphtali lay to the northwest of the Sea of Galilee; of this tribe was Barak, the hero and deliverer of Israel in the days when Deborah, the wife of Lapidoth, judged Israel. This frontier tribe was opposed to the incursions of the adjoining heathen and is specially mentioned in the Song of Deborah as among those who "jeopardized their lives under the death" in the battle against Jabin the Canaanite king. "Japheth's sons when they overran the north of Palestine carried off the whole population to Assyria, after which Naphtali disappears from history. The district became famous under the name of Galilee as the home of Jesus Christ and most of his apostles. Capernaum, Tiberias, Magdala and Chorazin lay within the ancient boundaries of the tribe of Naphtali.

NAPHTHA, in the commercial sense a product of the fractionation of crude petroleum, obtained by the distillation of benzine, being the heavier constituent after the benzolene has distilled over. It is also called "mineral naphtha." Another commercial article is "solvent naphtha," a somewhat similar liquid obtained in the fractionation of coal-tar, distilling over between the temperatures of 250° and 330° F. Its chemistry of the ancient term included all inflammable liquids, especially the more fluid sorts of asphalt or bitumen; the word which is of Persian origin and signifies "moist" being
NAPHTHA-POISONING — NAPHTHOL.

first used of the Persian product and then applied more generally. In modern usage and among chemists the term is applied to any volatile inflammable liquid product of organic decomposition, as the distillation products from peat, wood, India-rubber, bones, etc. These vary in density from 0.67 to 0.72, and in gravity from 90° to 60° Beaumé. American petroleum naphtha constitutes from 6 to 20 per cent of the crude petroleum. Russian petroleum is only 5 or 6 per cent naphtha. Scotland produces a naphtha called shale-spirit, being 4 or 5 per cent of the crude shale oil, and rather heavier than most other naphthas, but not so heavy as the coal-tar naphthas, which vary in specific gravity between 850 and 950. Caoutchouc is another name for India-rubber naphtha. The uses of naphtha are various, the lighter grades being utilized as detergents in the cleansing processes preparatory to dyeing, and in the dry cleaning of clothes and gloves. The coal-tar naphthas are largely employed as solvents in making India-rubber goods. The Scotch shale-spirit is the liquid component of a wood preservative. Naphtha is also used very largely as a solvent in the extraction of oils from oil seeds, and of essential oils in the manufacture of perfumes and essences.

NAPHTHA-POISONING. While the vapors, and even the ingestion of naphtha in small quantities, have not been found poisonous to human beings, the fumes resulting from the burning of naphtha are deadly if in admixture with the air in a confined place. This poisoning effect is due to the large proportion of carbon monoxide—about 7 per cent—contained in the residual gases. A proportion of one-tenth of 1 per cent in the air renders it dangerous to the majority of persons. A considerable number of fatal accidents have been caused by breathing these gases from a gasoline-burning automobile in the restricted space of a small garage. See Petroleum Poisoning.

NAPHTHALENE, or NAPTHALIN, a coal-tar product consisting of carbon and hydrogen, with the chemical composition C10H8, and a certain chemical similarity to benzene.

Its peculiar chemical composition may be represented by the graphic formula known as the condensed benzene rings, as below. These are generally written without the letter symbols, as at b.

Naphthalene is prepared from the middle or carbolic oil obtained in the distillation of coal-

tar between the boiling point temperatures of 410° and 460° F. The naphthaline crystallizes out on cooling, is then centrifugized, pressed, warmed, stirred with caustic soda and, after the addition of sulphuric acid and several washings with hot water, is either sublimated or distilled. Physically, naphthaline is a white solid, with brilliant, leafy crystals, melting at 175° F. to a colorless liquid, which boils at 425° F. It burns with a sooty flame and pitchy odor. It is insoluble in cold water, slightly soluble in water at a higher temperature and easily soluble in the essences, in boiling alcohol or in ether. Naphthalene forms a multitude of various compounds, mostly by simple addition; the most important are the various sulphonic acids, such as C10H8SOH + H2O, used in the manufacture of dyes. The nitro-derivatives of naphthalene are also extensively used as intermediates in dye-making. Under the popular name of "moth balls" or "coal-tar camphor," naphthalene is used to keep moths and other insects from clothes. It vaporizes slowly with no residue, and is useful to some extent as a disinfectant and deodorizer. Consult Tinker, C. K., and Challenger, F., "The Chemistry of Petroleum and Its Substitutes," (New York 1915).

NAPHTHOL, in chemistry, a substance derived from naphthalene in the same way that phenol is derived from benzene.—that is, by replacing one of the hydrogen atoms of the hydrocarbon by a molecule of hydroxyl, OH. Its chemical name is hydroxynaphthalene. The empirical formula for naphthaline being C10H8, the corresponding formula for naphthol therefore is C10H7OH. In benzene the substitution can be made in only one way, because the molecule of that substance is chemically symmetrical, its hydrogen atoms being all similarly related to one another, and to the carbon atoms. In naphthalene, however, there are essentially different kinds of substitution possible, according to the position of the hydrogen atom that is replaced. This will be understood by reference to the structural formula of naphthalene, as presented herewith. The hydrogen atoms in the positions marked "a" are more directly associated with the central pair of carbon atoms than are those in the positions marked "b," and we must therefore admit that two chemically different naphthols are possible, according as the hydrogen that is replaced by hydroxyl is an "a" atom or a "b" atom. These two naphthols are in fact known, and to distinguish them from each other the prefixes
NAPHTHYL — NAPIER

*alpha* and *beta* are attached to the name. Thus *alpha-naphthol* is the compound obtained by replacing one of the *a* hydrogen atoms by OH, and *beta-naphthol* is the compound obtained by a similar replacement of a *b* atom. Both of the naphthols resemble ordinary phenol (or carboxic acid), and both are used as antiseptics and also in the preparation of certain of the coal-tar colors. The naphthols exist in coal-tar in very small quantities in the fractions made at a high boiling point and may also be prepared by the action of fuming sulphuric acid upon naphthalene, followed by treatment with sodium hydroxide. In the making of a naphthol the sulphuric acid treatment is conducted at a temperature ranging from 175° to 190° F. For B-naphthol the temperature is kept at 390° F. Alpha-naphthol crystallizes in short lustrous monoclinic needles, which melt at 201° F. and boil at 543° F. Beta-naphthol crystallizes in flat plates or tablets, melts at 253° F. and boils at 547° F. Both are slightly soluble in hot water, and both dissolve freely in alcohol, ether and benzene. The solution of A-naphthol in water has a violet color; that of B-naphthol a yellow color. The naphthol derivatives of most value in the arts are their sulphonated derivatives, and the tri-sulphonic acid of A-naphthol, and chromo trope acid or chromogen; all used in the production of coal-tar dyes.

NAPHTHYL, a hydrocarbon radical C₈H₇, occurring in the compounds and derivatives of naphthalene. It is a merely hypothetical group as it appears only in compounds. If its existence be assumed, naphthalene (C₁₀H₈), or C₁₀H₇H, is merely its hydride; naphthol or naphthyl alcohol in the same way might be considered a hydrate of naphthyl, since its formula may be written C₁₀H₈OH. Dinaphthyl (C₂₀H₁₆) is a carbide formed by the action of heat upon naphthalene; it is a solid and is fusible at 154° C.

NAPIER, Nápí-ér, Sir Charles, British naval commander, cousin of Sir Charles James and Sir William Napier (g.v.): b. Merchiston Hall, Stirlingshire, 6 March 1786; d. Merchiston Hall, Hampshire, 6 Nov. 1860. At 13 he entered the Navy and in 1802 was promoted lieutenant. In 1807 he became commander, and from the gallantry he displayed in the pursuit of three French line-of-battle ships in 1809 was shortly after made post-captain. He was then put on half-pay and joined the British army in Portugal where he took part in the battle of Busaco. In 1814 he was dispatched to the United States, and led an expedition against Baltimore. In 1827 he received the command of the Galatea, in which he was employed on the coast of Portugal and the Azores. Becoming acquainted with the Duke of Terceira and other Constitutionalists, he accepted the command of their fleet, and by his defeat of the Mignettes in a naval engagement effected the relief of Oporto and the establishment of Domna Maria on the throne. For his services the Portuguese government created him Count Cape Saint Vincent and nominated him admiral-in-chief. He soon returned to England and in 1839 was ordered to the Mediterranean, where, upon the outbreak of the war between Mehemet Ali and the Porte, and the co-operation of Britain with Russia and Austria on behalf of the latter power, he performed some of his most gallant exploits, including the storming of Sidon and the capture of Acre. Having blockaded Alexandria, he concluded on his own responsibility a convention with Mehemet Ali, by which the latter and his family were guaranteed in the hereditary sovereignty of Egypt on resigning all claim to Syria. In 1841 he was elected member of Parliament for Marylebone, and mounted himself a warm advocate of liberal measures and naval reform. In 1847, while in command of the Channel fleet, he compelled the emperor of Morocco to grant compensation for the injuries inflicted by him on British commerce. On the commencement of the Crimean War he was nominated to the command of the Baltic fleet, but in this capacity had few opportunities for striking a decisive blow, which at the time somewhat disappointed his country. Sir Charles Napier was an author as well as a commander and published 'The War in Portugal' (1836); 'The War in Syria' (1842); 'The Navy, its Past and Present State' (1851). Consult Elers Napier, 'Life and Correspondence of Admiral Sir Charles Napier' (1862); Williams, H. N., 'The Life and Letters of Admiral Sir Charles Napier, K.C.B.' (London 1918).

NAPIER, Sir Charles James, English soldier and administrator: b. London, 10 Aug. 1782; d. Oaklands, near Portsmouth, Hampshire, 29 Aug. 1853. He entered the army as ensign in his 12th year and within four months was gazetted lieutenant. Having become captain in 1803, he accompanied his regiment to the Peninsula and distinguished himself at Coruña, where he had the rank of major, and where, after receiving five wounds, he was taken prisoner. In 1810 he returned to the Peninsula and fought at Busaco. After obtaining the rank of colonel and taking part in most of the leading events of the Peninsular campaigns, he returned to England on the conclusion of peace. He was in the United States during the War of 1812, and after his return took part in the storming of Cambrai in 1815. From 1822 to 1830 he was governor of the island of Cephalonia, where he pleased the inhabitants better than the authorities at home. In 1841 he sailed for the East to assume the chief military command within the presidency of Bombay. He was shortly afterward called to Sind in consequence of the determination of Lord Ellenborough, then governor-general, to punish the amirs for alleged misconduct during the Afghan war. This policy was ably carried out by Napier, first by the splendid victories of Meanea (17 Feb. 1843) and Hyderabad (24 March) and afterward by the administration of Sind as lieutenant-governor of which Lord Ellenborough made him governor. He retired in 1841, but during the Sikh war of 1848-49 he sailed once more for the East as commander-in-chief of all the forces in India. Having taken a step which subjected him to an unmeritorious rebufke from the Marquis of Dalhousie, the governor-general, he resigned and returned to England the next year. Consult Bruce. 'Life of General Sir Charles Napier' (1885); Butler, 'Sir Charles Napier' (1890).
NAPIER, John, Scottish mathematician: b. Merchiston, near Edinburgh, 1550; d. there, 4 April 1617. He was educated at Saint Andrews, traveled in Europe, returned to a life of proprietorship and leisurely study, and published in 1593 his 'Plaine Discovery of the Whole Revelation of Saint John,' which was an original work, without a predecessor in its line. For a time he busied himself with devising instruments of war, such as burning-glasses for firing hostile vessels; a piece of artillery for destroying everything round the arc of a circle; and a round metal chariot, from which shot might be fired through small openings while the enemy became 'abased and altogether uncertain.' Sir Thomas Urquhart ('The Jewel,' 1652) says that the artillery was tried on a Scottish plain with the slaughter of many sheep and cattle. His great work, 'Mirifici Logarithmorum Canonis Descriptio,' appeared in 1614. This explained the nature of logarithms (q.v.), then styled 'artificial numbers,' and supplied the table for their application. It astounded Europe and deeply interested Kepler, who helped to extend the use of them. With Henry Briggs, Napi er devised the new canon in which 10,000,000,000 of the entire sine. His 'Mirifici Logarithmorum Canonis Constructio' (1619) explained the method of constructing the table; and the 'Rabologia' (1617) was a description of enumeration by bone or ivory rods, which, known as 'Napier's rods,' were widely employed in Europe for assistance in multiplication, division and the extraction of the square and cube roots. Consult Napier, Mark, 'Memoirs' (1834).

NAPIER, Robert Cornelis, Lord Napier of Magdala, English soldier: b. Ceylon, 6 Dec. 1810; d. London, 14 Jan. 1890. Educated at the Military College, Addiscombe, he entered the Bengal Engineers, and during the second Sikh war (1848) was present as chief engineer at the siege of Multan, and after its fall took part in the battle of Gujarath. When the Mutiny broke out in 1857 he was appointed chief of the staff to Sir James Outram, and in the second retreat of Lucknow he constructed the engineering works which enabled Sir Colin Campbell to capture the city. In the Chinese campaign of 1860 he was second in command, and in 1865 became commander-in-chief of the Bombay army. He commanded in 1868 the expeditionary force against King Theodore of Abyssinia, defeated the king's forces, released the English prisoners and stormed the mountain fortress of Magdala (April 1868). For his services in this short but brilliant campaign he was rewarded with a peerage and a pension. Subsequently he was appointed commander-in-chief in India (1870), governor of Gibraltar (1876) and constable of the Tower (1887). At his death he was buried in Saint Paul's with military honors. Consult Markham, 'History of the Abyssinian Expedition' (1869), and Scott, 'Pillars of the Empire' (1879).

NAPIER, Sir William Francis Patrick, British soldier and author, brother of Sir Charles James Napier (q.v.): b. Kildare, Ireland, 17 Dec. 1878; d. Scinde House, Clapham, Surrey, 12 Feb. 1900. At 14 he entered the army with his brothers Charles and George, took a distinguished part in the Peninsular campaigns, receiving seven decorations for the share borne by him in as many particular actions, including Busaco, Talavera, the Nivele and Orthez. Some years later he began his celebrated 'History of the Peninsular War' (6 vols., 1828-40). It furnishes the best and most interesting record existing of the momentous transactions which chronicles, though from its opposition to the prevailing politics of the day its merits were at first insufficinetly appreciated. In 1841 he was advanced to the rank of major-general, was appointed lieutenant-governor of Guernsey the following year and in 1848 created a K.C.B. Criticisms on his brother's proceedings in India called him forth as his champion, and produced successively the 'Conquest of Scinde' (1845); 'History of Sir Charles Napier's Administration of Scinde' (1851); and 'Life and Opinions of the Late Sir Charles Napier' (1857). He also wrote 'English Battles and Sieges in the Peninsula,' Consult 'Life' by Lord Aberdare (1864).

NAPIER OF MAGDALA. See Napier, Robert Cornelis.

NAPIER. The chief town and port of the district of Hawke's Hill, east coast of North Island, New Zealand. It is the centre of a large district of squatters and is rated for its size. Being a peninsula, it has excellent harbors. Its bay ranks with that of Naples for picturesque ness. The exports are wool and frozen meats. The town has freezing plants and a number of other prosperous industries. Its exports were recently valued at £532,422; the imports at £467,837. Napier is a famous winter resort.

NAPIER'S RODS, in mathematics, a set of rods contrived by John Napier in 1617 for the purpose of facilitating the numerical operations of multiplication and division.

NAPLES, nap'les, Italy, the capital of the province of Naples, and previously of the former kingdom of the Two Sicilies (q.v.), the largest city and most important seaport of the kingdom, situated on the celebrated Bay of Naples, 150 miles by rail southeast of Rome. Its site is of singular beauty, occupying an area about five miles long and the bay, the north side of the nearly semi-circular bay, partly along the shore and partly climbing the adjacent slopes. It is bounded on the one side by the picturesque heights of Posilipo and on the other by the lofty, volcanic mass of Vesuvius (q.v.). The environs are densely populated, among neighboring towns and villages being Portici, Resina, Castellamare, Casoria, Pozzuoli, etc., and the classic sites of Herculanenum and Pompeii (qq.v.), all connected by rail. The bay, 20 miles wide, and extending inward 10 miles, with a coast line of about 35 miles, has Cape Miseno as its northwest extremity, off which lie the islets of Procida and Ischia; Campanella Point forms the southeast extremity, with the beautiful isle of Capri lying beyond. The city is divided into two unequal parts by a steep ridge projecting from the height on which stands the castle of Saint Elmo, and terminated by a rocky islet surmounted by the Castello dell'Ovo. The largest and most ancient part of Naples lies to the east of this heights. This now forms the business quarter
and is intersected from north to south by the main street, the Via di Roma. The western and more modern part of the city, the fashionable quarter, has a superior situation, and commands magnificent views; the chief street in this quarter is the Corso Vittorio Emanuele, nearly three miles long. The streets are mostly well paved with lava or volcanic basalt, and the houses are large, lofty and solidly built, and have flat roofs. Since the cholera epidemic of 1884 a plan of municipal improvement on an extensive scale has been carried out, including a new water supply, a modern sewerage system, the destruction of the narrow streets, alleys and lanes, the former abodes of filth, misery, vice and crime, and the building of new quarters, with wide thoroughfares and modern houses.

There are few remains of ancient times, but there are five castles, dell'Ovo, Nuovo del Carmine, Capuano, Saint Elmo, the gates Porta del Capo and Porta Capuano; the chief edifice of medieval construction, and Virgil's tomb.

Among the chief public edifices is the cathedral, dating from 1272, a large Gothic building erected on the site of two temples dedicated to Neapolis, Myrsini and Neptunus. It was consecrated in consequence of possessing the relics of Saint Januarius or Gennaro, including the phial of his blood which liquefies periodically in a miraculous manner. Other edifices are the church De' Santi Apostoli, said to have been originally founded by Constantine the Great on the site of a temple of Mercury; the church of Saint Paul, built in 1817-31 in imitation of the Pantheon at Rome; the Palazzo Reale (Royal Palace), a building of great size in the lower part of the town; the palace of Capo di Monte, situated on a height in the outskirts; the old palace, where the courts of justice now hold their sittings; the Galleria Umberto I; the Palazzo dei Pubblici Studi, formerly occupied by the university, but now converted into the Museo Nazionale, a museum containing not only a valuable library of over 600,000 volumes and pamphlets and many rare manuscripts, but also the older and more recent collections belonging to the Crown, the Farnese collection of paintings and sculpture from Rome and Parma, and an unequaled collection of gems, bronzes, vases, etc., chiefly obtained from the excavations of Pompeii and Herculanum. Naples has a university, dating from 1224, and attended by over 5,000 students; many other educational institutions, including the celebrated zoological station with marine aquarium and laboratory, and numerous hospitals and charitable foundations. It is the see of an archbishop and an important naval and military station, with an arsenal and gun works. The manufactures include steel and engine works, woolens and cottons, silk known as gros de Naples, glass, china, soap, chemicals and macaroni, their products being largely exported, other exports being gloves, perfumery, artificial flowers, paper, olive oil, wines and fruits. The imports include manufactured goods, Colonial produce, iron, coal and cotton yarn. The harbor affords magnificent anchorage, the depth at the end of the mole being 65 feet; its length is 55 feet. In 1915, 8,913 ships entered; total tonnage, 7,603,106 tons. Naples is an important point for transatlantic emigrants.

Naples is one of the most densely populated cities of Europe, and one of the features of the city is its unique population, which swarms incessantly in the thoroughfares, where throngs of sellers, buyers and idlers intermingle with asses, mules, hand carts and vehicles, dazzling the eye with their brilliancy of costume, and the expressiveness of their frantic gestures and attitudes, while the ear is stunned by the shrill cries of the itinerant dealers, the songs of the improvisatore and the high-pitched patios of the Marinella, an open beach fronting the east part of the city, was formerly the abode of the lazaroni, a class which has now lost its distinctive features, the term being now generally applied to the fishermen.

Naples was founded by a Greek colony from the town of Cumae some centuries before Christ. It took the name of Neapolis ("New City") to distinguish it from a still older Greek city adjoining called Parthenope. It passed to the Romans in 290 B.C. In 530 A.D. it was taken by Belisarius, and was pillaged by Totila in 542. In 1130 the Norman Robert Guiscard united the south of Italy and the adjacent island of Sicily into one political unity, Naples being recognized as the metropolis. It was tentatively placed under the sway of the emperors of Germany and the kings of France and Spain. Under the latter it became the capital of an independent kingdom, but having been brought within the vortex of the French Revolution, was handed over by Napoleon, first to his brother Joseph, and then to his brother-in-law Murat. The Congress of Vienna having restored the legitimate sovereignty, Naples received back its former masters. After a long period of misrule they were ejected by Garibaldi in 1860, and Naples was then incorporated into the kingdom of Italy. Pop. 697,917.

The province of Naples covers an area of 351 square miles; pop. 1,360,324.

NAPELS YELLOW, or NEAPOLITAN YELLOW, a permanent orange-yellow pigment much used in oil painting, in glass and porcelain painting. It is essentially an antimonate of lead with an excess of lead oxide. It is prepared by fusing at a moderate heat, for two hours, a mixture of chemically pure tartar emetic, lead nitrate and sodium chloride. When cooled the common salt dissolves, leaving a fine yellow powder.

NAPO, nápō, Ecuador, an affluent of the Amazon, which rises on the north side of Cotopaxi, and after a southeasterly course of about 800 miles, forming for a considerable distance the boundary between Colombia and Ecuador, joins the Amazon just beyond the eastern boundary, at Corocho, Peru. It is navigable nearly 500 miles for steamers; it flows through a region rich in mineral and vegetable wealth, but comparatively destitute of inhabitants.

NAPOLEON I, emperor of the French: b. Ajaccio, Corsica, 15 Aug. 1769; d. Longwood, Saint Helena, 5 May 1821. He was descended from the Italian family of Bonaparte (q.v.), of which the Corsican branch through him became the historic representative. Napoleon Bonaparte was the son of Charles Bonaparte, an advocate of some repute, and of Letitia Ramolino, whose family were Florentines. Of 13 children born to them, he was the fourth, and was the second son. At 10 he was sent to the military school of Brienne, where he remained till 1784,
NAPOLEON I

His school companions regarded him as taciturn and morose; but as he was a Corsican, speaking very little French, and poor as well as proud, his conduct is doubtless to be ascribed much to his circumstances as to his temperament. Toward those who, like Bouverrienne, showed him sympathy, he was susceptible of strong and lasting attachments. From the annual report of the school it appears that he distinguished himself in mathematics, was tolerably versed in history and geography, was well in Latin, general literature, and other accomplishments; of regular habits, well behaved and studious, and enjoying excellent health. His favorite author was Plutarch. In October 1784 he repaired to the military school at Paris to complete his studies for the army; and in September 1785 received his commission as second lieutenant in the artillery regiment of La Fère. Soon afterward he was promoted to be first lieutenant in the regiment of Grenoble, then stationed at Colmar, and was assured some attention to literature, gaining a prize offered by the Lyons Academy. He had the intention of describing an excursion he made to Mont Cenis in the style of Sterne's 'Sentimental Journey,' then much in favor. The Camp Minet, but much too monotonous a task, was a 'History of Corsica,' which he began and communicated to Paoli, then living in exile in London.

Meantime the Revolution was rapidly developing. Many of Napoleon's fellow-officers at Valence openly took part with the Royalists, but he kept the popular side, though in a quiet and undemonstrative way as he had little liking for the turbulence of mobs. On 6 Feb. 1792 he became captain of artillery by seniority, and, being in Paris the same year, he witnessed the insurrections of 20 June and 10 August. He was accompanied by his friend and biographer, Bouverrienne (q.v.), who relates that on one of these occasions, when Napoleon saw the mob break into the Tuileries and force the king to don the red cap, he exclaimed, 'It is all over with that poor man! A few discharges of grape would have sent all those despicable wretches fleeing.' Soon after he left for Corsica, where Paoli then held the chief command, the excesses of September, the Terrorists, however, induced Paoli to break with the Convention and seek the assistance of England. This brought him into conflict with Napoleon, who adhered to the Convention, which so exasperated the Corsicans against him that after a few skirmishes he was driven from the island along with his whole family. He made a short stay at Marseilles, where he published a small pamphlet, 'Le Souper de Beaucaire,' Republican in sentiment, but not Jacobin, as has been asserted. He then set out for Paris, where he spent a part of the summer of 1793; and in September of that year was sent, with the commission of lieutenant-colonel of artillery, to assist in the reduction of Toulon, then in the hands of the English. The place was captured 19 December entirely through his strategic genius; and in the following February he was made a brigadier-general of artillery. Later in the year he was sent to Genoa to examine the state of the defenses of that city, and to ascertain the political disposition of its inhabitants.

In the beginning of 1795 he was again in Paris in search of employment, but in spite of his known abilities was not at first successful. In his letters to his brother Joseph, written about this time, he complains of poverty and ennui, and seems to have thought of offering his services to the sultan of Egypt. On the 13th Vendémiaire IV (5 Oct. 1795), four sections of Paris had risen against the Convention, Napoleon, named by Barras (q.v.), was commander of the 5,000 troops provided for its defense. Although he had had but a night's sleep, and which to an Englishman was the dispersion of the populace, when the National Guards, as the defenders of the sections were called, advanced to the number of 30,000 along the quays of the Seine, the Rue Saint Honoré and the other approaches to the Tuileries, they found every point securely guarded. To their feeble musketry fire Napoleon replied by murderous discharges of grape. In less than an hour of actual fighting victory was secured for the Convention, which recognized the value of the young valorous officer and appointed him to the command of the Army of the Interior.

About this time he made the acquaintance of Josephine Beauharnais, to whom he proposed marriage and was accepted. The ceremony took place on 1 Aug. 1796, but a week afterward he had to depart to assume the command of the Army of Italy, which for three or four years had been carrying on a desultory warfare against the Sardinians and the Austrians amid the defiles of the Alps and the Ligurian Apennines. His army consisted of only 40,000 men, and even those were badly fed and clothed, while the Allies could oppose him with a much larger force. In the end of March he set out from Nice and came up with the Allies at Montenotte, and inflicted on them a disastrous defeat (11 April). This victory separated the Sardinian from the Austrian army, and Napoleon, determined to crush them in detail, pursued the former and beat them at Millesimo (13th and 14th), and then fell on the latter at Diego (14th and 15th).

This opened up for him both the route to Turin and to Milan. Napoleon lost no time; the Sardinians who were retiring upon Turin, were overtaken and beaten at Mondovi (22d), and again at San Martino, and com September's and the Austrians, who were falling back on Milan, were signally defeated at the battle of Lodi (10 May). On the 15th he entered Milan, where heavy contributions were levied on the state, and the principal works of art were seized and sent to Paris. Naples, Modena and Parma hastened to conclude a peace; the Pope was compelled to sign an armistice; and the whole of northern Italy was in the hands of the French. Mantua was the next object of attack. Wurmer, at the head of large Austrian reinforcements, advanced through the Tyrol to its defense; he was defeated at Castiglione 5 August and again at Bassano 8 September, which compelled him to take refuge behind the walls of Mantua. Not yet disheartened, Austria sent a third army in two divisions under Marshal Alvinczy and General Davodovich. This for a while held the French in check, but on 15 November a battle was begun at Arcole, which, after three days of hard fighting, gave the victory again to the French, and marked the close of the campaign. In January 1797, Alvinczy opened a fresh campaign by advancing at the head of 50,000 troops from Roveredo to the
NAPOLEON BONAPARTE

After a Painting by Paul Delaroche
NAPOLEON I

relief of Mantua, but was completely routed by Napoleon on the 14th at Rivoli; and on 2 February Wurmser was compelled by famine to surrender at Mantua. On the same day Napoleon put an end to the armistice with the Pope and proclaimed the annexation of the Duchies of the Este, which he beat the papal troops on the Senio, and took in quick succession the towns of Faenza, Ancona, Loreto and Tolentino. On the 19th the Pope was compelled to conclude a peace by which he surrendered Avignon, Bologna, Ferrara and the Romagna to France. Napoleon next entered the Tyrol, driving before him the Archduke Charles, who had undertaken another invasion of Italy. An armistice was agreed upon, 7 April, and Austria gave territory and indemnity to France, receiving Venice in return. This closed the great Italian campaigns, in which Napoleon, by ingenuity of plan, celerity of movement and audacity in assault, far outgenerated all his antagonists.

In December 1797 Napoleon returned to Paris; the enthusiasm of the Parisians was immense, and the festivals in his honor innumerable. About this time the Directory seems to have had the intention of invading England, and brought an army together for that purpose. The command was conferred on Napoleon, who at first professed to favor the design, but who well knew its impracticability. It has been thought by many that this proposal was merely the real design of the Directory, namely, the invasion of Egypt, as a preliminary step to the conquest of British India. By 10 May 1798 an army of 36,000 men was collected and embarked at Toulon in a fleet commanded by Brueis (q.v.). A body of scientific and artistic explorers accompanied it. On 9 June the French landed at Malta, and the next day took possession of the island, in which they left a garrison. Ten days after the fleet resumed its voyage, reaching Alexandria on 1 July, and that city being taken, Napoleon and the army advanced on Cairo. Here they encountered a large body of Mamelukes, which, after a long and bloody struggle, known as the battle of the Pyramids, they repulsed. Many of the tribes thereupon submitted to the French, who thus for a while held a seeming possession of the whole of Egypt. Thinking himself secure in his conquest Napoleon immediately set about reorganizing the civil and military government of the country; but fortune was preparing for him a terrible reverse. The English admiral Nelson, who had long been in pursuit of his fleet, found it moored in the Bay of Abukir, and, with the exception of four vessels which contrived to escape, utterly destroyed it.

All means of return to Europe for the French were thus cut off, and to add to their misfortunes the sultan declared war against them, and a short time after serious disturbances broke out at home. A rising of the Levant, suppressed by terrible massacres. Napoleon resolved to meet the Turkish forces assembling in Syria. In February 1799 he crossed the desert with about 13,000 men; took El-Arish and Gaza, and stormed Jaffa, where a great number of Turkish prisoners were deliberately massacred. On the 17th he reached Acre, which was defended by a Turkish garrison under Djezzar Pasha, assisted by Sir Sydney Smith and a small body of English sailors and marines. After 60 days he gave up the siege and returned to Egypt, leaving the whole country on fire behind him. He re-entered Cairo 14 June, having lost 4,000 men in the Syrian expedition. About the middle of July the sultan landed a force of 18,000 in Abydos, which Napo-

A revolution in the government 18 June had not made new directors more competent than their predecessors. Another change became necessary. Napoleon secured the resignation of Moreau and the other generals then in the capital, and abolished the Directory on the 18th and 19th Brumaire (9-10 November). A new constitution was then drawn up, chiefly by the Abbé Siéyès, under which Napoleon was made first consul. As, however, he had resolved not appointing to all public offices, of proposing all public measures in peace and in war, and the entire command of all administrative affairs, both civil and military, he was virtually ruler of France. From this time Napoleon's policy developed itself more distinctly; its objects were to estab-

lish order at home and to humiliate the enemies of the nation; but personal aggrandizement was an end scarcely less conspicuous. With sagacity, activity and boldness he undertook to re-

form civil affairs. He recruited the national treasury by various expedients, repealed the more violent laws passed during the Revolution, such as punishment for matters of opinion, reopened the churches and suppressed the Venetian insurrection by a series of conciliatory measures. But he was well aware that his genius was essentially military, and that his most striking triumphs were those won on the battlefield. He offered Austria, England and Turkey, in theatrical phrases, terms of peace, which were rejected. He determined to strike a blow first at Austria by a renewal of the glories of his former Italian campaign. An army of 36,000 men was concentrated with unparalleled rapidity and secrecy on the shores of the Lake of Geneva. On 13 May 1800 he began his daring march across the Great Saint Bernard, and almost before the Austrian general Melas was aware, had entered Milan (2 June). After several unimportant skirmishes he encountered the Austrians at Marengo (14 June), where he achieved the most brilliant victory, which put all the Piedmontese fortresses, for the second time, in possession of the French. Having established provisional government at Milan, Turin and Genoa, he returned to Paris 3 July. As his general, Moreau, had de-

feated the Archduke John in the decisive battle of Hohenlinden (3 December), Austria was re-

duced to sue for peace, and on 9 Feb. 1801 signed the Treaty of Lunéville, which was
mainly based on that of Campo Formio. Treaties were subsequently concluded with Spain, Naples, the Pope, Bavaria, Portugal, Russia, Turkey, and finally 27 March 1802, the Peace of Amiens. Thus it seemed as if a universal establishment of the French arms should mark the history of Europe, and allow Napoleon the opportunity to crush the insurrection of the blacks in San Domingo. An army was sent out under Leclerc; some 20,000 of which were swept away by disease or the sword; the blacks were provoked by brutal cruelties to still more fearful massacres, in which about 60,000 whites perished. Toussaint l’Ouverture, an able and courageous negro who had made himself the leader of his unfortunate countrymen, was seized during a truce and carried to France, where he died in prison.

But the great occupation of Napoleon was the improvement of the interior affairs of the nation. A general amnesty allowed all the émigrés to return home; the Legion of Honor, a new order of knighthood, was established. Considerable attention was paid to such departments of education as tended to promote efficiency in the public service. Mathematics and physical science were encouraged at the expense of philosophy, ethics and social and political science. All the mayors of cities were appointed by Napoleon, so that not a vestige of provincial or municipal freedom remained. On 2 Aug. 1802, Napoleon was proclaimed by a decree of the Senate consul for life, a step confirmed by a plebiscite of 3,300,000. A Nepos consuli issued some days after, reconstraining the electoral bodies and reducing the tribunate to 50 members, showed, however, that Napoleon was not yet satisfied with the authority he was clothed with, and many persons saw in the movement a step toward still more absolute power. It is to this period that the greatest of his services to France belongs. He assembled the first lawyers in the nation, under the presidency of Cambacérès, to draw up a code of civil law. Code Napoléon.

Meanwhile the state of Europe was beginning to look serious. Disturbances in Switzerland in the early part of 1802 induced Napoleon to resort to an armed mediation in its affairs; in August of the same year Elba was incorporated with France, Piedmont 11 September and Parma in October. England regarded these proceedings as an infringement of the Treaty of Amiens, and as remonstrances were ineffec- tual, there was in a short time a resumption of hostilities. On 18 May 1803, England declared war against France, having laid an embargo on all French ships in British ports. France retaliated by a decree that all Englishmen found on her territory should be detained as prisoners of war; and General Mortier was sent to occupy Hanover, as belonging to the British crown. While these events were taking place a conspiracy for the overthrow of the first consul and the re-establishment of the Bourbons was discovered and thwarted. Napoleon pretended to see an accomplice of the conspirators in the Duc d’Enghien, but caused him to be arrested in neutral territory, brought to Vincennes and, after a mock trial, shot. Napoleon now seems to have thought it necessary that he should assume the imperial dignity. An appeal was made to the nation, and upward of 3,000,000 votes were given in favor of conferring on him the title and prerogatives of emperor, while less than 3,000 were against it. On 18 May 1804 Napoleon assumed the imperial title; and in order that there should be nothing tending to prevent the performance of the ceremony of his coronation. The Pope assembled and went to Paris 2 December. He was only allowed to perform part of the ceremony, however, as Napoleon snatched the crown from the pontiff’s hands and placed it on his own head, performing a like office for his consort, Josephine. On 26 May 1805 he was also crowned king of Italy in the cathedral of Milan; and Eugène Beauharnais, his stepson, was appointed vice-regent. He created a nobility with sounding titles; surrounded himself by a brilliant court; established all the etiquette of royalty; and introduced many practices marked by ostentation and parade.

Meanwhile the Northern powers were listened to the solid warnings of England, and last united in a coalition against the new emperor. Russia, Austria and Sweden all joined in the charges of aggrandizement laid against Napoleon by the English government; but Prussia, tempted by him with the promise of Hanover, could not be brought to depart from its departments. Austria abandoned his design of making a descent on England, broke up the camp at Boulogne, and concentrating his widely scattered forces at Mainz, September 1805, he marched at once across Bavaria at the head of 180,000 men, and compelled the Prussians to retreat. Entering the Austrian capital, he made rapid preparations to meet the combined armies of Russia and Austria, then concentrating on the plains of Olmütz. On 2 December the three armies, each commanded by an emperor, met at Austerlitz. The struggle was desperate and long, but at last victory was won by Napoleon. The rout of the Allies was complete. The Austrian emperor instantly sued for peace, giving up to France all his Italian and Adriatic territories. The Russian emperor retired behind his own frontiers, and Hanover was handed over to him. The emperor of Napoléon had received English and Russian troops into his dominions, Napoleon constructed this act into one of direct hostility. In February 1806 a French army occupied the Continental part of the Neapolitan States, of which Joseph Bonaparte was declared king on the deposition of their former sovereign. The Bavarian republic was transformed into a kingdom dependent on France and given to another brother of the emperor, Louis, who took the title of king of Holland. Various districts in Germany were ceded to Italy; and the conqueror into dukedoms and bestowed on his most successful generals.

But the most important change of all was the formation of the Confederation of the Rhine on 12 July, which the dissolution of the old German Empire. On the death of the English Minister, Pitt, and the accession of Fox, negotiations were entered into for the cessation of hostilities between France and England, and as
propositions were entertained toward the restoration of Hanover, the eyes of the Prussians were at once opened and war, however hazardous, was determined on and was declared on 8 October, the emperor being already at Bamberg directing the movements of his troops, which had remained in Germany. On the 14th Napoleon met the enemy at Jena, and inflicted on them a severe defeat; while his general, Davout, added on the same day to the French triumph by the brilliant victory of Auerstädt. On the 27th Napoleon entered the Prussian capital. After garrisoning all the important fortresses and reducing such towns as made a show of resistance, he issued the celebrated Berlin decree (see Continental System), directed against English commerce. This policy nearly ruined the commerce of France and the other European nations, while it increased the prosperity of England. Her fleets and cruisers swept the seas; nothing could be obtained from the colonies save through her, and the Continental merchants engaged in an extensive smuggling to the British, which it was impossible to prevent.

After the capture of Berlin Napoleon marched north against the Russians, who were advancing to assist the Prussians. He called on the Poles to rise, but was answered with little enthusiasm. At Pultusk, 28 Dec. 1806, and at Eylau, 8 Feb. 1807, he met with severe checks, and retired on the line of the Vistula; in the course of a few months, however, having received heavy reinforcements, he once more took the offensive. On 14 June was fought the battle of Friedland, which was so disastrous to the Russian arms that Alexander was compelled to sue for an armistice. The Peace of Tilsit was concluded 7-9 July, and by it the king of Prussia received back half of his dominions, and Russia undertook to close her ports against British vessels. The duchy of Warsaw was erected into a kingdom and given to the king of Saxony; out of the Prussian territories west of the Elbe the kingdom of Westphalia was formed and bestowed on Jerome, Napoleon's youngest brother; and Russia obtained a part of Prussian Poland, and by secret articles was allowed to take Finland from Sweden. Soon after the Peace of Tilsit was signed, Napoleon and Joseph, his brother, entered Portugal, as that nation had refused to respect the Berlin decree, and Junot was sent to occupy Lisbon (30 Nov. 1807). The Pope refusing to carry out the Continental blockade and to recognize Joseph Bonaparte as king of Naples, Rome was occupied 2 Feb. 1808. The administrative affairs of Spain having fallen into inextricable confusion, Napoleon sent into that kingdom an army under Murat, who with difficulty took possession of the capital and by the Treaty of Bayonne Charles IV resigned the Spanish crown, which was given to Joseph Bonaparte, Murat (q.v.) receiving the vacant sovereignty of Naples.

The great body of the Spanish people rose against this summary disposal of the national crown, and England was empowered with immense supplies. Thus began the Peninsula War (q.v.), which lasted seven years. The Spaniards were at first successful; a French squadron was captured by the English at Cadiz, 14 June; General Dupont surrendered at Bay-

len, 22 July, with 18,000 men; Junot was defeated 21 August by Sir Arthur Wellesley at Vimeira. But Napoleon rushed to the scene of action in October at the head of 180,000 men, and entered Madrid in spite of all resistance by the Spaniards, 2 December. The British troops which had advanced to the aid of the Spaniards were driven back on Coruña, where they made a successful stand, but lost their general, Sir John Moore, 16 Jan. 1809. In the meantime Austria, alarmed at the aggressive policy of Napoleon, who had seized Tuscany and the states of the Church, and determined to profit by his absence in Spain, again declared war, and got together an effective army under the Archduke Charles. Napoleon hurried into Bavaria, encountered the archduke at Eckmühl (22 April), and completely defeated him; on 13 May he again entered Vienna. Reorganizing his shattered army, Charles likewise advanced toward Vienna on the opposite bank of the Danube. The French seized the island of Lobau, threw a bridge across the river and attacked the enemy at Aspern. On 21st and 22d, but were repulsed and thrown back on the island, which they proceeded to fortify, waiting the arrival of Eugène with the Army of Italy. On 5 July they debouched on the left bank of the Danube, and on the 6th the Austrians were crushed at Wagram. This enabled Napoleon to dictate his own terms of peace, which were agreed to on 14 October at Schönbrunn. On the preceding day an unsuccessful attempt was made to assassinate him by a young German enthusiast named Stieglmeier. Whether the subsequent marriage with the daughter of the Austrian emperor was in course of negotiation at Schönbrunn is doubtful, but soon after his return to Paris Napoleon formed Josephine of his determination to divorce her. He seems to have arrived at the conclusion that he could only put an end to the machinations of the old legitimate dynasties by intermarriage. Josephine, too, had borne him no children, and he was ambitious of perpetuating his power in his family. On 16 December an act of divorce was passed by the commissioners of the Senate, and by proxy 11 March (formally 2 April) 1810 he was married to the Archduchess Maria Louisa. The fruit of this union was a son, Napoleon Joseph, born 20 March 1811, and proclaimed in his cradle king of Rome. See REICHSTAAT, DUKE OF.

The years 1810-11 were the period of Napoleon's greatest power. On the north he had annexed Holland, Prieslau, Oldenburg, Breemen and all the coast-line as far as Hamburg, and on the south Rome and the southern papal provinces. His empire thus extended from the frontiers of Denmark to those of Naples, with Paris, Rome and Amsterdam as its first, second and third capitals, and it was divided into 130 provinces, having a total population of 42,000,000. He may also be said to have exercised almost unlimited control in Spain, the Italian kingdoms, Switzerland and the Confederation of the Rhine (q.v.), but now the tide began to turn. Russia found it impossible to carry out the Continental blockade without permanent injury to her great landowners: Sweden, which had accepted Berneadotte, one of Napoleon's generals, as king, was in a like
NAPOLEON I

predicament. The Berlin decree was frequently evaded, which involved Russia particularly in fresh complications, and in view of the war now inevitable that nation formed an alliance with Sweden. In May 1812 Napoleon declared war against Russia, and determined in spite of the dissuasion of his most prudent generals to invade the country. On 16 May Napoleon was in Dresden making arrangements for the great Russian campaign. The army he organized for it has been estimated at from 60,000 to 65,000, inclusive of Prussian, Austrian, German, Polish and Swiss auxiliaries. An army of 300,000 Russians, under Barclay de Tolly and Bagration, assembled on the banks of the Niemen to oppose him. On 24 June he crossed that river at Koen, and the Russians retired step by step before him, deliberately wasting the country, carrying off all supplies and avoiding as far as possible general engagements. The French, however, pushed rapidly forward, overtook and routed the rear guard of Bagration, 25 July, and on 28th occupied Vitebsk. On 16 August the Russians made a stand at Smolensk against an advanced division of the French army, and when the latter entered the city on the 18th it was in ruins.

Both the opposing armies now took up their march toward Moscow. Kutusoff, who had succeeded Barclay, resolved to dispute the passage of the Borodino. An obstinate battle ensued 7 September, which cost the French nearly 30,000 men, and their opponents about double that number. On the 15th Napoleon entered Moscow, which had been deserted by its inhabitants, and which was nearly destroyed by a fire that began on the same night and lasted five days. The baffled French were compelled to seek shelter in the desolate surrounding country. Napoleon vainly attempted to negotiate with Alexander; it was impossible to pursue the Russians farther; nothing remained but retreat. The French army was now reduced below 120,000 men, and the weather was favorable, but the winter set in earlier than usual, and with extraordinary severity.

The line of retreat, too, led through the very districts which had been wasted on the advance. Swarms of mounted Cossacks incessantly harassed the French, now sad demoralized by cold, famine, disease and fatigue. When the invaders left Smolensk (14 November) they numbered only 40,000 fighting men, and when they had fought their way over the Berezina (27th) there remained but 25,000. At Smolensk Napoleon quitted the army (5 December), leaving Murat in command.

Napoleon reached his capital on the 18th and immediately ordered a fresh conscription, still determined on prosecuting the war. But the spirit of Europe was now fairly roused; kings, ecclesiastics and people rose unanimously against the devastator of the Continent, the terror of whose name had been destroyed by his disastrous reverse. A sixth coalition, consisting of Prussia, Russia, England, Sweden and Spain was formed, which early in 1813 sent its forces toward the Elbe. Napoleon had still an army of 350,000 in Germany. For some months he was everywhere victorious. On 2 May he defeated the Allies at Litzen, and on the 21st at Bautzen. He reached Breslau 1 June, and on the 4th concluded a six weeks' armistice, which gave the Allies time to reorganize and concentrate their forces and, what was of equal consequence, to gain over Austria. The campaign was reopened 16 August. The Allies advanced on Dresden, where Napoleon had his headquarters. The battle which ensued (see Dresden, Battle of) 26-27 August was another dearly bought victory for the French, who were now so outnumbered that their chief was compelled to fall back on Leipzig. There he was completely surrounded. At the Battle of the Nations (Völkerschlacht), as this battle of Leipzig is called, fought 19-19 October, he was completely defeated. The retreat across the Rhine was almost as disastrous as that from Moscow.

On Napoleon's arrival at Paris, 9 November, he succeeded in obtaining from the Senate, in spite of the opposition in the legislative body and the prevalent discontent of the people, a decree for a conscription of 300,000 men. With a fertile imagination almost miraculous, he was able to enter on another campaign, which was this time to be conducted in France. From January to March he confronted the combined hosts of the Allies, inflicting defeat after defeat on them. But numbers were again against him; a new and formidable enemy, Wellington, was rapidly advancing on the capital from the south. On 30 March the Allies, after a severe engagement, captured the fortifications of Paris, and on the 31st Alexander and Wellington entered the city amid the acclamations of the people.

On 6 April Napoleon abdicated at Fontainebleau in favor of his son. He was allowed the sovereignty of the island of Elba, with the title of emperor, and a revenue of 6,000,000 francs. After bidding his army adieu he departed for his new abode, landing from the British frigate Undaunted at Ferriago 4 May, and Louis XVIII was restored. After a residence of 10 months, most of which was spent in intriguing with the Republicans and his own adherents, he made his escape from the island, and landed at Fréjus 1 March 1815, with an escort of 1,000 of his old guard. As soon as his arrival was known Ney and a large part of the army joined him, and he made a triumphal march on Paris, which he reached on the 20th. Louis was driven from his throne without a shot having been fired. The Allies were startled at the astounding event. Their armies once more marched toward the French frontier. Napoleon, hastily reorganizing the government on a rather more liberal basis than that of the empire, and having made vain attempts to open negotiations for peace, advanced to meet them. On 15 June he crossed the Sambre at the head of 130,000 men to attack the English and Prussians again. Wellington and Blücher. On the 16th he defeated Blücher at Ligny, while at Quatre-Bras the English were held in check by Ney. The Prussians made an orderly and leisurely retreat, pursued by a division of the French army under Grouchy.

In order to preserve his army with the Prussians, Wellington fell back upon Waterloo, where he was attacked by Napoleon on the 18th. The British held their ground obstinately during the greater part of the day, and in the evening, when Blücher, who had outmaneuvered Grouchy, came up, the French were completely
NAPOLEON II — NAPOLEON III

crushed, and Napoleon's power forever broken. The retreat was a disorderly flight. The Allies marched without opposition on Paris. On the 22d Napoleon again abdicated in favor of his son; but being threatened by Fouché, who had assumed the direction of the government, and seeing no hope of escape from France, he surrendered at Rochefort to Captain Maitland of the British warship Bellerophon, claiming the hospitality and protection of the British government. Captain Maitland was instructed to detain him as a prisoner, and then transfer him to the Northumberland, which was to convey him to the island of Saint Helena, where he was to be confined for the rest of his life, according to a convention signed at Paris, 20 August, between Great Britain, Austria, Russia and Prussia. He landed there 16 October. In July 1816 Sir Hudson Lowe was sent out as governor of the island. From the very first Napoleon seems to have quarreled with that officer, and he appealed to the sympathy of the world through reports of the ill treatment he was subjected to. The governor Maitland refused to release him, and on 30 Oct. 1836, was declared emperor. He was arrested and sent without trial to the United States, returned to Switzerland in 1837, lived in London in 1838-40, and on 6 Aug. 1840 landed at Boulogne for a fresh attempt against Louis Philippe. This time he was imprisoned in the fortress of Ham, under a life sentence; but he contrived his escape 25 May 1846. During this time he had leisure for the exercise of his literary abilities, and the result was the works 'Aux manes de l'Empereur'; 'Fragmentes Historiques'; 'Analyse de la Révèries politiques'; 'Réponse à M. de Lamartine'; 'Extinction du Paupérisme'; besides contributions to the 'Dictionnaire de la Conversation,' and several articles to democratic newspapers. On the outbreak of the 1848 revolution in Paris he hastened from England to Paris, and in a letter to the provisional government declared that he came to serve under the republican flag (28 Feb. 1848). On the day following he issued another letter announcing that as the government deemed his presence in Paris dangerous he would immediately quit the country. He accordingly returned to London, where he served as a special constable on the occasion of the great Chartist demonstration of April (1848). In the election of September he was put forward by Paris and three other departments. He returned to Paris and on 26 September took his seat.

He at once commenced through his zealous associates his candidacy for the Presidency. On the day of the election, 10 December, it was found that out of 7,500,000 votes Louis Napoleon had obtained 5,434,226. On the 20th the prince-president, as he was now called, took the oath of allegiance to the republic. For a time the greatest harmony seemed to be re-established; the President selected his ministers from the ranks of the various political parties, and strove to gain a majority in the assembly by the adoption of a strictly conservative policy. On 2 Dec. 1849 was formed a new ministry, the members of which were merely tools of the President. It was evident that a crisis was approaching. At last on 2 Dec. 1851 the coup d'état came. Paris was overawed by the army; there was needless butchery in the streets; reports of approval by Paris of this course were sent to the provinces. The empire was re-established in Louis Napoleon by a vote of 8,000,000 to 640,000. On 29 Jan. 1853 the new sovereign married Eugénie Marie de Montijo, Countess de Teba. In 1854 Napoleon, in conjunction with England, entered the Crimean War in the interest of Turkey against Russia—a war which was carried on by all the parties with great vigor, until a peace was concluded, 30 March 1856, the terms of which were the neutralization of the Black Sea, the abandonment by Russia of her protectorate of the Danubian principalities and a rearrangement of frontier territory between Russia and Turkey, to the advantage of the latter power. (See CRIMEA, History). About the beginning

For the relations of the United States with the United States, Adams, 'History of the United States, 1801-17' (1889-91) should be consulted. The 'Correspondance de l'Empereur Napoleon I' (1858-70) is a main source of original documentary history. Of works of a more personal character, dealing with the life of Napoleon from various points of view, among the more important are those of Boutrit, Talleyrand, Metternich, Rémusat, Marbot, Montholon, Pasquier, Séguir, Las Casas, O'Meara, Sachet, Fresnay, Marmont and Roe-derer. As recent writings of another sort bearing on Napoleon's personal history, those of Levy and Mason deserve particular notice. The work of Rose, 'Life of Napoleon I' (1901), is the latest complete biography in English. Channing's essay on Napoleon, and Emerson's chapter in 'Representative Men,' as well as Carlyle's pictures in 'Heroes,' are still worthy of attention.

NAPOLEON II, son of Napoleon I. See REICHSTADT, DUKE OF.

NAPOLEON III (Charles Louis Napoleon Bonaparte), emperor of the French: b. Paris, 20 April 1808; d. Chislehurst, England,
of the year 1859 it was evident that another European war was imminent. Northern Italy was groaning under the Austrian yoke; Sardinia demanded a separate government for Lombardy and Venetia, which Austria refused to grant. War was declared between that country and Sardinia about the end of April, and Napoleon took up arms in favor of his Italian ally, Victor Emmanuel. The two allied sovereigns took the field in person. Montebello, Magenta, Marignano and Solferino were brilliant victories for the Allied Armies. By the terms of the Peace of Villafranca, Austria ceded Lombardy to Italy, and the provinces of Savoy and Nice were given to France.

A second distant expedition was undertaken, but had not a like success. Toward the end of 1861, France, England and Spain agreed to dispatch a joint expedition to Mexico for the purpose of exacting redress of injuries of long continuance inflicted on the subjects of the respective allies, and the enforcement of pecuniary claims, which were obstinately contested by the Mexican government. Demands of M. de Solfigny induced the English and Spaniards to believe that Napoleon had some ulterior object in view, and they withdrew from further intervention (April 1862). The French army continued the quarrel alone. On 10 June General Bazaine led his troops into the Mexican capital amid many demonstrations of enthusiasm. An imperial form of government was initiated, and Maximilian (q.v.), Archduke of Austria, was placed at its head with the title of emperor. The United States considered this a piece of treachery, and after the Civil War dispatched Sheridan with troops who speedily put an end to French aggression and Mexican instability. Maximilian's death caused Napoleon's policy to be viewed with suspicion in France. The emperor opened the Suez Canal, entertained Europe at the World's Exposition, rebuilt and greatly beautified Paris. But France lost slowly in prestige, and there was a decline of administrative integrity.

On the conclusion of the Austro-Prussian War of 1866, Napoleon, jealous of the growing power of Prussia, demanded a reconstruction of frontier, claiming, by way of compensation for his non-intervention in the quarrel, Prussian territory on the Saar, a claim peremptorily refused. The ill-feeling between the two nations was increased in 1867, when the king of Holland signified his intention to cede Luxembourg to France. The cession was strongly resisted by Prussia, and at the London conference (7–11 May) the neutralization of the duchy was agreed to by treaty under the guarantee of the Great Powers. It could no longer be concealed, however, that a rupture between France and Prussia was imminent, and in 1870, on the Spanish crown being offered to Leopold of Hohenzollern, Napoleon demanded that the king of Prussia should compel that prince to refuse it. Notwithstanding the subsequent renunciation of the crown by Leopold, war was declared by France (19 July). (See French–German War). On the 28th Napoleon set out to take the chief command. After Sedan, he had a personal interview with King William, who assigned him the province of Hesse-Wilhelmshöhe, near Cassel, as a place of residence during his captivity. One of the immediate consequences of this disaster was a revolution in Paris. Gambetta, Jules Favre and several other members of the Corps Législatif proclaimed a republic and the dethronement of the emperor (4 September). The empress and her son secretly quitted Paris and repaired to England, where they took up their residence at Camden House, Chislehurst. Here they were rejoined by the emperor, when he regained his freedom in March 1871, and here he remained till his death.

Napoleon III was rather a student and literateur than a statesman. He was not an efficient administrator and was most unfortunate in his advisers and subordinates. At the time of the Franco-Prussian War he appears to have been quite deceived as to the military strength of France and its readiness for the conflict. Besides the literary works already mentioned, Napoleon III is the author of an uncompleted 'History of Julius Caesar' (1865–66), and various productions collected and published in 1854–69 and 1873. (See France; History Since 1815; Consult Gottschalk (1871); von Sydow 'Monarchie et Etat'; for biography; also Hugo, 'Histoire d'un Crime' (1877) and various standard histories of modern Europe; also De la Gorce, 'Histoire du second empire' (4 vols., Paris, 1885–98); Simson, 'Über die Beziehungen Napoleons III zu Preußen und Deutschland' (Freiburg 1882); Ebeling, 'Napoleon III und sein Hof' (Collogne 1891–94); Imbert, A. L., 'The Court of the Second Empire' (Eng. trans., 1898); Hugo, 'Napoleon the Little' (Eng. trans., 1909).

NAPOLeON. Eugène Louis Jean Joseph, Prince Imperial of France, only son of Napoleon III. b. in the Tuileries, Paris, 16 March 1856; d. South Africa, 1 June 1879. He fought for the Imperial arms in the Franco-German War of 1870–71, but when disaster seemed imminent was sent to join his mother in England, whither she had fled. He was proclaimed Napoleon IV by his adherents in 1874. In 1879 he joined a British expedition against the Zulus in South Africa and was killed in ambush. He was buried beside his father at Farnborough, England. Consult Barlee, Ellen, 'Life of Napoleon, Prince Imperial of France' (London 1889); Martinet, A. L., 'Prince Imperial' (ib. 1895); Barthel, E., 'Empress Eugenie and her Circle' (New York 1913).

NAPOLEON, Joseph Charles Paul, Prince, a son of Jerome Bonaparte. See BONAPARTE, JEROME.

NAPOLEON, Ohio, village, county-seat of Henry County, on the Maumee River and the Miami and Erie Canal, and on the Lima Northern and the Wabash and Detroit railroads, about 38 miles southwest of Toledo. Its chief manufactures are flour and dairy products as well as windmills, tanks, threshing machinery, separators, flour, etc. It has considerable trade in farm and dairy products and livestock. The village owns and operates the electric-light plant and the waterworks. Pop. 4,007.

NAPOLEON, a piece of French money valued at $4 or 20 francs. See LOUIS D'OR.

NAPOLEON GUN. See ARTILLERY.

NAPOLEON LE PETIT, le pé-té ("Napoleon the Little"), the title of Victor Hugo's
NAPOLEON'S TOMB — NARCISSISM

NAPOLEON'S TOMB, the burial-place of Napoleon Bonaparte under the dome of the Invalides in Paris. It has the form of a circular crypt 20 feet deep and 36 in diameter, open at the top. The tomb was designed by Viollet-le-Duc; the walls are 10 marble statues of the chiefs by Simon. The sarcophagus is 13 feet long, 65½ wide, 14½ high, cut from a single block of red porphyry, 67 tons in weight, surrounded by 12 victories by Pradier. The inscription above the entrance to the crypt is taken from Napoleon's will: "I desire that my ashes shall rest on the banks of the Seine, in the midst of the French people that I have loved so well." Two adjoining tombs are those of the emperor's friend, Duroc, and his companion, Bertrand. Napoleon's remains were brought here in 1840 from Saint Helena.

NAPRAPHY, nā-prā’pē, the science of drugless healing, revolutionizing the treatment of disease into simple exercises or methods. It is founded upon the researches of Dr. Oakley Smith, who discovered that human ailments are traceable to spained or diseased ligaments connected with the spinal column, thorax and pelvis. By overcoming these, with scientific manipulation, which relieves the pressure upon the nerves and the arterial system, most of the diseases of the human body cannot only be overcome but a permanent cure affected. Diseased conditions which are regarded as incurable by older methods are found to yield readily at the hands of the skilled napraphath.

NAKATEZ (nā’kwa-tes) INDIANS. See CREEKS.

NAQUET, nā-skā’, Alfred Joseph, French chemist and social reformer: b. Carpentras, 6 Oct. 1834; d. Paris, 10 Nov. 1916. In 1867 he came into prominence, losing his professorship in the faculty of medicine in Paris and being condemned to 15 months' imprisonment for his share in the activities of a secret society. In 1869 he fled to Spain after the publication of his book, and returned September 1870 and in the Revolution became Secretary of National Defense. Soon after he was elected to the Chamber of Deputies and began agitation against the French marriage laws. His agitation for the re-establishment of divorce resulted in the law of 1884, and in 1886, through his continued efforts, divorce became legal after three years of definite separation, on the demand of one of the parties concerned. Besides a professional work, "Principes de chimie fondés sur les théories modernes" (1865; 5th ed., 1890; Eng. trans. 1881), he wrote numerous works on social questions, including "Le divorce" (1877; 2d ed., 1881); "La loi du divorce" (1903); "L'Humanité et la Patrie" (1901); "L'Anarchie et la collectivism" (1904); "Désarmement ou alliance anglaise" (1908).

NARAKA, or NURUK, in Hindu mythology, a term equivalent to the English word heel. In Narakas there are 8 divisions, in which sinners of as many different classes are confined and subjected to torments corresponding to the gravity of their offenses.

NARBADA, nār-bā’dā. See NERBUDDA.

NARBONNE, nār-bōn, France, the chief town of an arrondissement in the department of Aude, in a beautiful hill-girt plain, eight miles from the Mediterranean and 36 miles by rail east of Carcassonne, and commanding the entrance into Spain by the southwest. Boulevards occupy the site of the old city walls removed since 1865. The town, traversed by the Robine Canal, has dark and winding streets lined with ill-built houses and is generally unattractive. It is, however, of historical interest as the Roman Narbo Martius, the earliest colony (118 B.C.) beyond the Alps. It flourished under Tiberius, its schools for a long time rivaling those of Rome. About 309 A.D. it became the capital of Gallia Narbonensis, and had its capitol, forum, theatre, aqueducts, triumphal arches, etc., of which there are few remains owing to the vandalism of Francis I in using them as building materials. In 412 it was taken by the Visigoths, in 719 by the Saracens, from whom it was recovered by Pepin in 759, to form a part of the Frankish Northmen. During the 11th and 12 centuries it was a prosperous manufacturing city, but subsequently deteriorated owing to the silting of its harbor. Its port, La Nouvelle, is 13 miles distant by canal. The principal edifices are the Romanesque church of Saint Paul Serge (1229); the quondam cathedral of Saint Just (1272-1332), only the fine Gothic choir of which, 131 feet high, has been completed; and the former archbishop's palace, now the city hall, in which are a good museum, a library and a picture gallery. A seminar and hydrographical school are among its educational institutions. The white heather honey of Narbonne maintains its ancient celebrity; the wine is chiefly used for blending purposes, its production being now carefully supervised by the enological station founded in 1894. The manufacture of bricks and tiles, sulphur refining, cooperage and the distillation of brandy are among its industries. Pop. 28,173.

NARCISSISM, nār-sl’sis’m. In the newer analytic psychology Narcissism is the stage in the development of the self, in which the ego derives the gratifications of its libido (q.v.) from the projections of its own mental states. In the development of the child the autoerotic pleasures derived from merely masturbatory sources in different parts of the body give way, in the average individual near or after the time of puberty, to a need for gaining satisfactions from activities exercised upon the world of external reality and not upon self. In the love life of the individual this change from autoeroticism to the final selection of the love object of the opposite sex passes through a stage called Narcissism. Thus the child takes pleasure in or pain from the treatment it gets from other people in contradistinction to the adult satisfaction of giving pleasure or inflicting pain on other people. That is the chief ceiving as it does the pleasure at first solely from its own states and activities, learns eventually through experience to appreciate pleasurable and painful sensations with certain external happenings; and in time of itself it associates pain with the sight of a stove or a match, and from having gotten pleasure from eating jam, it associates the pleasure
NARCISSUS

with the jam. Or, if it eats too much, and is of the proper grade of intelligence, it may associate unpleasant feelings with jam. At any rate there is here a projection (see MECHANISMS, MENTAL) of the really subjective pleasure or pain feeling, which is thereby attributed to the jam as a quality which jam uniformly has. This process, which is psychological, but not illogical, is the same as that carried out when the child forms a concept of another person. Therefore the concept of this other person than itself is made up of feelings which really belong to the child but which it irrationally attributes to other persons.

The intermediate transitional stage in the development is where the individual not merely regards his own body as a source of gratification (pure erotism) but with absolute naiveté looks upon his own personality or some other which he identifies with himself in the same light, as he will later regard the true object of love. That is, the autoerotic satisfaction comes from an exercise of the child's own body on itself or, as is seen in day-dreaming, or romancing of almost any kind, from an exercise of its own mind with its own mental material not correlated with the external reality. In the Narcissistic stage of the development of the human psyche the young person shifts from a crassly subjective form of gratification of the libido to a more objective form, without, however, realizing the actual differences between the projections of his own mind and the concrete facts of the characters of other people. The narcissistic youth finds some other person to love, but naively endows that other with his own qualities, not making, or perhaps not being able to make, necessary discriminations between what he thinks the other is and what the other really is. Thus a young person will find some other personality attractive and suppose that because some elements of the other are agreeable, the rest of the elements are so, and he is very much disturbed, if not disordered, at the occasional outcroppings of ungenial traits. Just as in the legend of Narcissus, who is fabled to have fallen in love with his own reflection which he perchance saw in a pool, and later to have punished his unavailing desire for the being he saw but could never touch, so the ordinary person of to-day may, through constitution or lack of proper training, become a modern Narcissus, who desires merely the gratification of his projected unconscious wishes. He thinks his own thoughts will be given external reality simply by wishing for it, either unable or unwilling to see the discrepancy between his essentially autoerotic desires and the actual nature of external reality. The average child is taught by experience to derive satisfaction from exerting the limit of his ability upon external reality in order to make it conform to his wishes, and to take so much pleasure from the exertion that there will be no pain from the necessary disappointment of his wishes. This the fabled Narcissus never did, but tried again and again to embrace the beautiful being in the pool, where the average youth would have seen the impracticability of such action.

The subject of Narcissism is extremely important in the modern analytical explanation of the mental disease paranoia. In this disease, which is characterized by a systematized suspicion and delusion of persecution, the subject takes unconsciously and crystallizes the attitude expressed by Narcissism. The process of mental development which shows how vitally important in the usual development of the psyche is the next and last step to adulthood, may be outlined somewhat as follows: The various phases of the situation have been illustrated by the development of the implications of the simple statement "I love him," supposing, for the sake of illustration, that the subject is a male. If the idea represented by the sentence is followed out in real life, there results a more or less veiled homosexuality and the lack of adaptation of the individual to external reality is not so great as if the idea "I love him" is completely repressed into the unconscious. The idea "I love him" in the ego of a male, however, particularly if thus repressed, is always inevitably transformed, by virtue of the principle of ambivalence into "I hate him," and the inference from that is readily made to "He hates me," which is the basis on which this type of paranoid trend is built. Men who have this buried homosexuality in their unconscious, external reality, because they do not know of the existence of it and can never find it themselves. Therefore persons who are unduly suspicious of those around them have frequently the germ of a very serious mental disease, the cure of which requires a very special technique and the prevention of which would be of the utmost importance. Narcissism is thus seen to be an unconscious subjective homosexuality, differing from other forms of autoerotism in being applicable only to the whole individuality instead of to parts of it, and by reason of its total applicability being the cause of the tendencies which, when allowed to become extreme, lead to paranoia or paranoid states, as well as to alcoholism and various drug addictions. Consult Jellicoe, D.S., 'Diseases of the Human System' (1917).

NARCISSUS, nár-sis'ús, in Greek mythology, the son of the river god Cephissus. Narcissus was of surpassing beauty, but excessively vain and inaccessible to the feeling of love. Echo pined away to a mere voice because her love for him found no return. Nemesis determined to punish him for his coarseness of heart, and caused him to drink at a certain fountain, wherein he saw his own image, and was seized with a passion for himself of which he pined away. The gods transformed him into the flower which still bears his name. See ECHO; MYTHOLOGY.

NARCISSUS, a genus of plants of the order Amaryllidaceae (q.v.). The species, numbering from 16 to about 50, according to different authors, have bulbous roots, narrow grass-like leaves, and generally white or yellow flowers borne singly or in small clusters and protruding from a dry spathe at the summit of a leafless scape. Their hardness, ease of cultivation, habit of blooming in early spring, beauty and fragrance, many of the species and their numerous hybrids and varieties have been general garden favorites for centuries. A few produce their blossoms in the autumn (for example, N. serotinus, N. ele-
NARCOSIS — NARES

Narcotics, or narcotism (Greek, "stupor"), insensitivity more or less profound, the result of absorption by the blood, and subsequent action on the brain, of certain drugs in poisonous amount, or of certain excretry elements, as in uraemia.

Narcotics (from Greek vapovo, to be numb), substances which have the property of stupefying. In small (medicinal) doses they either quiet undue irritability of the nervous system, producing sleep and relieving pain or spasm, or they excite or stimulate the normal irritability of the brain and alcohol, for example, are sometimes used as "bracers." Narcotics are too frequently used for slight ailments or fancied ones because the repeated or habitual use of small doses is dangerous, as it is apt to excite a craving for and the use of larger or poisonous doses. (See Poisons). Poisonous doses produce stupor, coma and sometimes convulsions and death. Though the effects of most of the narcotics resemble more or less those of opium each narcotic affects the system in a peculiar way. Opium dries the throat, dims the vision, dilates the pupils of the eyes (opium contracts them), and produces delirium. Some narcotics produce constipation, others do not. Some act principally upon the brain, others upon the alimentary canal or bronchial tubes. The principal narcotics are opium (with its alkaloids, such as morphia, codeine and thebaia, and preparations of it — paregoric, laudanum, etc.), belladonna, camphor, bysoceamus or henbane, caffeine, chloral hydrate, alcohol, Indian hemp, hops, bromide of potassium and stramonium. There is also a group of chemical organic compounds which are narcotics, such as paraldehyde, sulphonal and trional. Narcotics should be used with extreme caution, as the susceptibility to their poisonous effects varies in different persons. Of late years the market has been flooded with so-called paincures, carminatives, cordials, soothing-syrups, etc., warranted to be beneficial to the patient. They are in fact narcotics, in mixtures more or less agreeable to the taste, but none the less liable to do harm. Children are more susceptible to the influence of narcotics than adults, hence the risk of giving them to children should be greater. See Analgesics; Coal Tar; Hypnotics; Tobacco.

Narcotine, an alkaloid which forms from 5 to 6 per cent of the opium from Asia Minor and a larger proportion of the opium from India and Persia. It has the chemical formula C21H21NO6, and acts as a narcotic poison. It may be prepared as follows: The morphine content of the opium is first dissolved out with water — in which narcotine is almost entirely insoluble. The residue is then exhausted with dilute hydrochloric acid, forming narcotine hydrochloride. The alkaloidal bases that the extract contains are precipitated by the addition of caustic potash. The precipitated bases are then redissolved, and the precipitate is treated with alcohol. A simpler method, but more expensive, is to boil the opium with ether in which the narcotine dissolves. Narcotine was the first alkaloid obtained from opium, of which it constitutes from 1 to 8 per cent by weight. It is almost insoluble in cold water, moderately soluble in alcohol and completely soluble in chloroform. It crystallizes in trimeric prisms, or in radiating needle-like forms, which melt at 345° F. Aqueous solutions of the alkaloid are neutral, and solutions in other menstrua are but feebly alkaline. Morphia (unlike the other alkaloids that opium contains) appears to exist in opium in the free state, and not in the form of a salt. Its salts do not crystallize readily, their aqueous solutions are acid, and are decomposed when evaporated, with separation of free narcotine. A large dose of narcotine is required to produce the same effect as a given quantity of morphia or codeine.

NARD, a plant, spikenard. See Aralia.

NARES, nárz, Six George Strong, English vice-admiral and Arctic explorer; b. Aberdeen, 1831; d. 15 Jan. 1915. The son of a naval officer, he was educated at the Royal Naval College and entered the navy in 1845. After serving on the Australian station he was appointed mate on the Resolute in the Arctic expedition of 1852-54, taking part in some long sledge journeys, covering 665 miles in 69 days and later 866 miles in 36 days. He next served in the Crimean War; on the Mediterranean station; and lieutenant in charge of cadets, for whose instruction he wrote "The Naval Cadet's Guide" (1860), afterward published under the title of "Seamanship." In 1865-67 he surveyed the coasts of Australia; in 1869 the Gulf of Suez, and from 1872 to 1874 commanded the Challenger on a deep-sea exploration round the world. In 1875 he was placed at the head of the North Polar Expedition, consisting of H. M. S. Alert and Discovery, with the object of reaching the Pole via Smith's Sound. Leaving the Discovery in Lady Franklin Bay, Nares proceeded in the Alert along the western shore of Robeson Channel, reaching the then highest latitude (82° 27') and long. 61° 22'. The sun disappeared for 142 days in December 1875; on the return of daylight, a sledge expedition of 53 men attempted a "dash" to the Pole, returning after 72 days, suffering intensely from the cold and scurry. They had planted the British flag in lat. 86° 28' W. Returning home in Oct. 1876, Nares was employed in various duties till 1878, when he was
sent in the Alert to survey Magellan Strait. South America. He was created K.C.B. in 1876. For 18 years he was next engaged at the Board of Trade as professional officer of the harbor department; then he became Acting Conservator of the River Mersey, retiring in 1886. He published a number of reports on his voyages.

NAREW, nàrɛf, Russia, river in Poland rising in the government of Grodno out of the swamps of Byelovyzh and becoming navigable near Tikozy, it flows past Lomza and Pultusk entering the Bug below the latter town. It has a length of 271 miles. The Niemen is connected with this river by the Augustowo Canal.

NARIKAI, Daimyo, of Mito, a member of the Gonsanké, or three princely Tokugawa families of Kiushiu, Owari and Mito, who ranked first among the territorial nobility of Japan. He flourished in the middle of the 19th century, and was noted as the leader of the seclusion policy of Japan. While working hard to improve the military and educational systems and to stir up her warlike spirit much the long years of peace had greatly diminished, he, not realizing that his country must soon be called upon to take her place among the nations of the world, yet he deliberately proclaimed the doctrine of the seclusion of Japan, in the meantime working strenuously to transform Japan along the lines of the very civilization and culture he pretended to be fighting. Nariaki's personality was the strongest and his intelligence the keenest, in his day, in Japan, and he soon was able to make his cry of the "expulsion of the barbarians" that of the whole country. His history shows that he was, by far, the best informed man in his day, in Japan, on "foreign ways." He fully appreciated the importance of providing Japan with the armaments and sciences of the western nations; and as early as 1849 he had begun spending comparatively large sums of money in the manufacture of arms along the latest European models. Against all opposition he prepared Japan for her wonderful leap into the arena of western culture, while all the time he was not understood at home and abroad. Consult Okuma, Count Shigemou, 'Fifty Years of Japan' (English trans. by Marcus B. Huish, London 1909).

NARINO, nàrɛn, Antonio, Colombian politician: b. Bogota, Colombia, 1765: d. Leiva, Colombia, 13 Dec. 1823. He was educated in the college of San Bartolome in Bogota and entered the magistracy. His writings of a revolutionary character brought him into trouble and in 1795 after a tedious trial he was transported to Spain under sentence of 18 years' penal servitude. Coming in 1797 he returned to his own country but was again imprisoned and not released until the Revolution of 1810, when he joined the patriot army. He was elected President in 1811 and later dictator. On the outbreak of war Narino defeated the Federalists, and then resigning his dictatorship marched against the Royalist forces in the south. His success was followed by defeat at Pasto in 1814 when he was captured and sent a prisoner to Mexico, where he was held a prisoner until 1820 when he returned to his own country. In 1821 he was elected senator, but declined the vice-presidency in 1822, and ill-health compelled him to retire after his appointment as commander-in-chief in 1823.

NARNI, nàrni, Italy, town known to the ancients as Nequinum and later as Narnia. It is located in the province Perugia on a cliff beneath which, in a deep ravine, flows the Nera (the ancient Nar). It is on the Rome-Foligno Railway, is seat of a bishopric and has a cathedral dating from the 11th to 15th centuries, besides other churches erected from the 9th to the 15th century. Here are also ancient dwellings and castle, a town-hall dating from the 13th to 16th century, strong remains of a Roman bridge (of Augustus), an ancient aqueduct, etc. Its industries number leather and rubber-ware factories and oil presses. This is the birthplace of the Emperor Nerva and of Pope John XIII. Pop. 12,943.

NARO, nàr, Italy, town in the province of Reggimento, Sicily, on the coastal river Naro, 12 miles from Siracusa. It dates from the Middle Ages and Early Christian catacombs. In the vicinity are large sulphur pits. The population in 1911 was 13,802.

NARRAGANSETT (nàr-æ-GAE'nt) BAY, an inlet of the Atlantic Ocean, extending into the State of Rhode Island about 28 miles. At its entrance, from Sakonnet River and the chief arms of the bay are on the east, Mount Hope Bay, on the west, Greenwich Bay. The principal rivers which enter the bay are, at its head, Providence River, from the east Taunton, from the west Pawtuxet. The largest island in the bay is Rhode Island, and others are Conanicut, Prudence and Hog. Several places of importance are on the shores of the bay, chief of which are Providence at the mouth of the Providence River, Newport on Rhode Island and Fall River, at the mouth of the Taunton. Narragansett Bay is of great importance to the State, as it gives opportunities for commerce and transportation. The first explorers of the north coast of the United States mention this bay. Consult Bacon, E. M., 'Narragansett Bay' (New York 1904).

NARRAGANSETT INDIANS, an American tribe formerly occupying the territory now comprised in the State of Rhode Island and the eastern part of Long Island. Shortly after the arrival of the pilgrims they manifested symptoms of hostility; and as an expression of sentiment Canonicus, their chief, sent to Plymouth a bundle of arrows wrapped in the skin of a rattlesnake; to which Bradford, the governor, replied with the same skin filled with powder and shot. This significant reto secured, if not the good-will, at least the peaceableness of the sagacious chief. In the Pequot War they aided the colonists, but not unanimously. In the winter of 1675, during King Philip's War, that chief having taken refuge with the tribe, the colonists, apprehending that they would join his cause, made a secret attack upon their principal fort, killing about 1,000 warriors, destroying all their provisions, and exposing those who escaped to cold and famine, of which was held a protracted and from this time waged incessant war with the whites. They have now entirely disappeared as
a race, although some of their descendants of mixed blood are to be found in one or two localities in Rhode Island.

NARRAGANSETT PIER, R. I., a famous summer resort, in Washington County, on Narragansett Bay, is on the Narragansett Pier Railroad, a connecting line with the New York, New Haven and Hartford Railroad, about 10 miles from Newport and 28 miles from Providence. The railroad was built in 1876 and extends from Kingston Station to "The Pier," a distance of about 12 miles. A steamer plies daily during the season between Newport and "The Pier." The chief attractions are the climate and the scenery. Narragansett Heights, about three miles distant, are about 400 feet above sea-level and the colored rocks, nearby and the long beach are attractive. There are a number of fine hotels, handsome cottages and excellent bathing houses and pavilions. The place was settled in 1675, and the same year an engagement took place nearby between the colonists and the Narragansett Indians. General Winslow, who commanded the colonists, about 1,000 in all, captured 600 Indians and killed 300. The loss of the whites was about 150 wounded and 85 killed. The pier, from which the place takes its name, was built in 1878. Pop. 1,250.

NARRATIVE POETRY. The telling of a story in verse is in modern times rather exceptional than normal, owing to the extraordinary rise in importance of prose fiction. But in early periods narrative poetry was the most abundant and important kind, owing to the primitive tendency to devote poetry largely to objective purposes, in contrast with the subjective tendency of modern poetry. For the various types, see under LITERARY FORMS.

The Ballad.—In general this is the most primitive type of narrative poetry, and is assumed to have existed among practically all peoples, though in many instances no early examples have survived. This proportionately large disappearance of early ballads is due to their belonging to the period of oral composition and transmission, as distinguished from that of written literature; and this oral element is the fundamental characteristic of the type. It is connected, too, with the element of song; for the primitive ballad may always be assumed to have been sung. A surviving evidence of this is the frequent appearance of a refrain, perhaps originally joined in by the whole company of persons present at the ballad-singing. Closely connected with these characteristics is the communal spirit of the old ballad: the form arises from a state of society when the individual poet is of relatively slight importance and when the content of poetry is not the experiences and feelings of the individual singer but those of the group. Hence in the ballads we do not look for individuality of style; of this their universal anonymity is a sign. Their language is simple, unsophisticated, but conventional, marked by abundant repetition yet by rapidity of action and a predominance of action; that is, as Ten Brink put it, whose poetry is oscillating perpetually between reminiscence and improvisation. Very many of the ballads, if not all, had their origin in the versifying of a real fact, gathering up mythical elements in the manner of popular tradition. Often there are many different versions of the same story, some differing only in details, others in essential elements, such as changes from supernaturalism in the direction of realism, or variants characteristic of particular localities or social groups.

Of ancient ballads of Greece and Rome no remains survive, though evidence of their nature is thought to be traceable to the folk poetry of the ancient epics. Macaulay, in his "Lays of Ancient Rome," made a brilliant but rather sophisticated attempt to conceive the matter and spirit of ballads of the early Roman people. Of the Latin races the Spanish branch has preserved the greatest number of ballads, some of those still extant dating from the early 11th century; most famous are those concerned with the story of "the Cid," in the 12th century. Of French balladry the remains are more fragmentary. The early Germans are known to have made abundant use of ballads, and a collection of them was made under the direction of the Emperor Charlemagne; a surviving fragment of a "Hildebrand song" is supposed to date from the 8th century. Later, in the 15th and 16th centuries, a new era of German balladry developed; and toward the end of the 18th century modern scholars, led by Herder, began the systematic collection of the ballads of the race. There are also rich remains of the ballads of the Scandinavian peoples, dating from the 11th, 12th and 13th centuries; a collection was made in Denmark as early as 1591, while one of the greatest of modern ballad collections is that of the Danish scholar Grundtvig. The Slavic peoples have preserved an abundant ballad tradition, and some of them, notably the Serbians, are to this day in the ballad-making and ballad-singing period. Of the early English ballads no remains are preserved; but there are numerous survivals of the mediaeval and modern periods of ballad-making, both in Scotland and England, beginning perhaps in the 13th century and extending as late as the 17th. The Robin Hood group includes the most famous of these, —a cycle thought to have originated in the 13th century. A monumental collection of the English and Scottish ballads was made by the American scholar F. J. Child.

The revived interest in balladry characteristic of the romantic movement in the late 18th century led to the writing of various modern adaptations and imitations, of which one of the most famous is the German poet Bürger's ballad of "Lenore," which was translated by Walter Scott. Wordsworth and Coleridge also adapted the ballad form to two different types of narrative verse found in their volume of "Lyrical Ballads" (1798).—types represented respectively by Coleridge's "Ancient Mariner" and Wordsworth's "The Lark". A composition was must note the distinction between these ballads which in one way or another hark back to the old folk poetry and the so-called ballad which is characteristic of the age of printing, and was abundantly produced, in doggerel verse, in the 16th and 17th centuries, and, what is usually or at least part of the common form of their printing.

The Epic.—This type may be viewed as an elaboration of the ballad, developing similar
material more formally and at greater length, and representing a state of society more highly organized, socially and politically. Frequently a definite racial or national spirit underlies the epic, its subject, as Hegel expressed it, being some action which "includes the whole life of a nation and the history of an epoch." Like the primitive ballad, the primitive epic belongs to the period of oral transmission, but is associated with religious rather than song, and with the art of professional entertainers, such as the German stock and the French jongleur. In some of the more elaborate ballads, notably the expanded ballad called "A Gest of Robin Hood," one may see something of the transition to epic elaboration and individual art-composition; and certainly when we reach the full epic form, though it is still representative of communal material and interests, we recognize the skill of highly developed individual workmanship, giving unity and form to great masses of material. It is customary to distinguish between the folk-epic, based originally on ballad tradition, and showing comparatively little of the spirit of the individual artist, and the art epic, consciously and imaginatively developed by a poet of genius. Of the former the conventional example is the Greek Iliad of Homer, dealing with the hero Achilles and the Trojan War; of the latter, the Roman Aeneid of Virgil. But the distinction cannot be maintained with accuracy, since there is indefinite gradation from the communal to the individual method. Thus the Greek Odyssey, on the wanderings of Ulysses, which is traditionally attributed to the same poet as the Iliad, shows far less of the national and communal, and more of the individual, spirit. Other epics of the more or less primitive type are the Mahabharata of India, based on the mythologic legends of the Hindu people; the German stories of the Nibelungen and Gudrun, dating from the 13th century; the French chansons de geste, or heroic songs, abundant in the 11th and 12th centuries, of which the chief is the Song of Roland; the Spanish Poem of the Cid, of the 12th century; and the old English Beowulf, in its present form dating from the beginning of the 8th century, but representing an earlier period and Scandinavian rather than English matter. The old Norse lays of the Elder Edda approximate epic form, but in unity and elaboration the prose Saga of the Volsungs is nearest, for the Scandinavians, to the true epic. Epics half way, in a sense, between the primitive and the sophisticated type, are the Indian Ramayana, the Persian Shah-NAMEH (made by the court poet Firdausi from primitive epic material), and the Finnish Kalevala (compiled by the modern philologist Lomroa). To the same hybrid class belong the partly compiled, partly composed Celtic "epics" of James Macpherson, Fingal" and "Temora" (1762-63), based on more or less genuine materials from the Scottish Highlands, attributed to a traditional bard named Ossian.

The imitative or art epic has been well represented in every literature which came under the influence of the classical tradition. For Greece itself there was a considerable number of these poems, commonly called the "epic cycle," whose authors undertook to complete the epic treatment of national material left untouched by Homer; and, in the Alexandrian age, the "Argonautica" of Apollonius of Rhodes. For Rome, as we have seen, the great example is the Aeneid, which contains the most successful representation by art of the spirit of the folk epic; for Virgil celebrated a theme of national significance at the moment when the national life of the Romans was at its height. Later Roman epics were the "Pharsalia" of Lucan and the "Thebais" of Statius. In the medieval period the epic form, like all literary forms, was turned to the service of the Church, and there was a considerable production of Christian epics, beginning with the Historia Evangelica of Juvenecus, in the 4th century. Highly characteristic, too, of this era are narrative poems of allegorical or symbolic type, having something of the dignity and elaboration of the epic but without its usual themes or methods; one may note examples as different as the great Spanish romance of Dante and the English poem of "Piers Plowman." The Renaissance was followed by various experiments in formal epic, such as the "Lusiad" of Camoens in Spain (1572) and Tasso's Gerusalemme liberata in Italy. In the 18th century Voltaire attempted to revive the glory of the form in his Henriade (1723). In Germany the most notable modern epic is Klopstock's biblical "Messias" (1773); there is also a 19th century version of the Nibelungen epic by Wilhelm Jordan. In England the Renaissance poets were rather less interested in the epic than those of the Continent, though Spenser doubtless regarded the allegorical narrative of his "Faery Queene" (1590-96) as in the epic tradition; and the same thing is true of historical poems like Warner's "Albion's England" (1586), Daniel's "History of the Civil Wars" (1595), and Drayton's "Mortimeriados" or "Barons' Wars" (1596, 1598). It was reserved for Milton to make the only really vital application to English poetry of the old epic method, in his "Paradise Lost" (1667), a work dealing with the supreme conflict of the whole human race instead of a special branch of it. Cowley had already produced a biblical epic in the "Davidis" (1656), and Davenant an historic epic in the "Gondibert" (1651)—both highly praised in their time, but now considered unreadable. Equally lacking in vitality were the English epics of the 18th century, such as Blackmore's "Alfred" (1723); Glover's "Leonidas" (1737), and Wilkie's "Epigoniad" (1757); on the other hand the taste of this age for the epic form found expression in Pope's famous translation of Homer. In the early 19th century the epic method was revived by Southey in a series designed to represent the great religions of the world: "Thalaba," "Madoc," "The Curse of Kehama," and "Roderick" (1801-14). The taste of the modern period, however, turned very definitely either to romance or realism, both of which found expression in Byron's great satiric-romantic-realistic epic of "Don Juan" (1819-24). Something of the old epic method was again revived by Tennyson for his rather mysteriously termed "Idylls of the King" (1859-85), and—recently and without the old epic tradition—by William Morris in "Sigurd the Volsung" (1876). But the finest example in modern poetry of classical epic style is found in the episodic "Sohrab and Rustum" of Matthew Arnold (1853).—a version of a brief
portion of the Persian 'Shah-Nameh.' Once more, at the opening of the 20th century, a vigorous effort has been made to revive the national epic, in the 'Battle of Alfriston' of Alfred Noyes.

Finally, we may note that in every period there have been burlesque or satiric epics, taking their point from the very dignity of the traditional form in contrast with the triviality or meanness of its new application; such are the ancient Greek 'Battle of the Frogs and Mice,' Butler's 'Hudibras' (1662); Boileau's 'Lutrin' (1674), and Pope's 'Rape of the Lock' and 'Dunciad' (1712 and 1728).

The Metrical Romance.—This type of narrative poem is especially characteristic of the medieval period, or, more generally, of the age of chivalry as distinguished from that of primitive heroic life and literature. Between many of these poems, however, and the epic, the line is a very doubtful one. The greatest representative, possibly, of the metrical and chivalric poetry of the Middle Ages is the 'Troyes, a trowére de France in the late 12th century, and two German poets of the early 13th century, Gottfried of Strassburg and Wolfram of Eschenbach, of whom the former wrote the 'Parzival' and the latter the story of Parsifal. But besides these, in every country of western Europe, there were uncounted nameless authors both of individual poems and of those which go to make up the great cycles like those of Arthur, Tristan, Gawain and other popular heroes. It is common to divide these romances according to the geographic source of their material, which is thus classified as 'Matter of France,' 'Matter of Britain' (that is, the primitive Celtic region, whether continental or insular), 'Matter of the Orient,' etc. But in the actual authorship and distribution of the romances, linguistic, racial and geographic lines play comparatively little part, a good portion of them having become the property of all the European peoples of their age. Like the epic, these romances represent the age of recited poetry and of professional entertainers; Scott's 'Lay of the Last Minstrel' at once describes the type and exemplifies the way in which he came to pass from the study of history to the modern method. In England the finest of the romances are as late as of the 14th century; notably, for the more popular sort, the 'Sir Gawain and the Green Knight' of a genius whose name has been lost, and for the more literary, the 'Troylus and Criseyde' of Chaucer, in which a familiar episode of the old Trojan war story is treated with an interest in characterization and in realistic humor which make it anticipatory of the modern novel. On the border between the medieval and the modern spirit was the popular Italian romance of the Renaissance, Ariosto's 'Orlando Furioso' (1515). In the neo-classical period, especially the 18th century, this loose and unauthenticated type of poetry was naturally regarded with little favor, and for equally obvious reasons it was enthusiastically revived by the representatives of the romantic revival. In England the metrical romances of Scott, already referred to, were the most important results of the movement; the 'Lady of the Lake' (1808 and 1810). In the introduction to 'The Bridal of Triermain,' Scott distinguished the form from epic poetry as being free from all rules save 'those which good sense, good taste and good morals apply to every species of poetry.' In the later 19th century it was again revived by William Morris in various imitations of French and Spanish medieval romancers; while in Germany a notably successful specimen was Scheffel's 'Trompet von Säckingen' (1853).

The Tale, etc.—In all periods, and especially in modern times, narrative poetry tends to overrun the bounds of fixed types, and to appear in forms which may be vaguely called metrical tales or otherwise. In classical literature the most influential example of this form is the 'Metamorphoses' of Ovid, whose material sifted down into a great part of medieval and Renaissance poetry. In the medieval period the supreme example is the 'Canterbury Tales' of Chaucer, which drew upon every type of story material, combining sentiment and humor, realism and romance. In the Renaissance the Ovidian type of narrative poem is represented by Marlowe's 'Hero and Leander' and Shakespeare's 'Venus and Adonis' and 'Locrine.' Dryden's 'Fables' (1700) are a landmark in another period, but are largely versions of tales by each and the other. In the romantic tale, the poetic tale was abundantly revived in the period of the romantic revival, sometimes with a view to the attainment of realistic simplicity, as in Wordsworth's 'Michael' or (in Germany) Goethe's 'Hermann and Dorothea,' sometimes with a preference for highly romantic elaboration, like 'The Eve of Saint Agnes' of Keats. Byron's 'tales,' nine in number, published between 1813 and 1823, went far to supplant the popularity of Scott's metrical romances, and in some cases might very well be called by that name themselves. Space does not permit the tracing of the varied development of the less defined types of narrative poetry through the 19th century. Perhaps the most remarkable experiment made in that period was Browning's 'The Ring and the Book' (1868), in which a single story is told 10 times over, in a series of monologues supposed to be uttered by various persons concerned. Tennyson, on the other hand, told the story of 'Maud' (1855) in modern dialogue and lyrics supposed to be uttered by a single person, forming a 'monodrama.' Both these works are characteristic of the trend of narrative poetry in modern times, toward subjective and spiritual qualities, as opposed to the objectivity of the increasingly rare epic method. On the other hand, the early 20th century has seen some return to the more objective tale in the Elizabethan narratives of Alfred Noyes's 'Tales of the Mermaid Tavern' and the realistic contemporary narratives of John Masefield, notably 'Dauber.'

Bibliography.—For the nature and development of the more primitive types of narrative poetry, consult Gummers's 'The Beginnings of Poetry' (New York 1901) and 'The Popular Ballad' (Boston 1907); Knight's 'Matter of Romance' (London 1897); Hart's 'Ballad and Epic' (Harvard Studies and Notes, Boston 1907); Saintsbury's 'The Flourishing of Romance and the Rise of Allegory' (London 1897); Billings's 'Glyd 'That' or Metrical Romances' (New York 1901); Schofield's 'English Literature from the Norman Conquest to Chaucer' (New York 1906); the introductions to the translations of 'Beowulf'
and the 'Song of Roland' in the 'Riverside Literature Series' (Boston); and the volume of 'Arthurian Chronicles' in 'Everyman's Library'. "One of the Greek epic, "Homer and the Epic"; on epic poetry in general, Dryden's Preface to his translation of Virgil and Clark's 'History of Epic Poetry' (Edinburgh 1900); on English narrative poetry, Dixon's "English Epic and Heroic Poetry" (London 1912).

RAYMOND M. ALDEN, Professor of English, Leland Stanford Junior University.

NARENSCHIFF, nár‘en-shiff, Das ('The Ship of Fools'). Sebastian Brant's celebrated work (1494). See BRANT, SEBASTIAN.

NARROWS. See TWELLED DRAINAGE AND STREAM PIRACY.

NARROWS, The, a narrow part of New York Harbor, contains the Government submarine base, and connects Upper New York Bay with Lower New York Bay, and separates Long Island and Staten Island. At the south entrance of The Narrows are two forts, Fort Hamilton on Long Island and Fort Wadsworth on Staten Island. See map of Greater New York and vicinity under New York.

NARSES, nár’séz, Byzantine general: b. Armenia, 472; d. Rome, 568. He was a eunuch when he entered the imperial household in Constantinople, of which he soon became chamberlain. His ability soon advanced him to the office of treasurer to Justinian, who sent him to Italy in 538 to keep an eye on Belisarius. Narces was recalled in 539 and in 551 succeeded Belisarius as commander-in-chief in Italy and speedily drove thence the Franks and Goths, and re-established Byzantine control. He took possession of Rome and was appointed prefect of Italy in 554. In spite of his able administration he was removed by Justinian's successor, Justin II, on the ground of his avarice which caused him to levy severe taxes on the people. Legend says that he was Insulted by the Empress Sophia upon his dismissal, and that he thereupon went over to the Lombards. He was equally famous as general and statesman. Consult Hodgkin, 'Italy and Her Invaders' (1885-95, Vols. IV and V); Bayley, 'Later Roman Empire' (Vol. I. 1889); Gibbon, E., 'Decline and Fall of the Roman Empire' (London 1898); 'Cambridge Medieval History' (Vol. II, New York 1913).

NARTHEX (Greek, a reed, hence any oblong figure), the term used in ecclesiastical architecture to designate the westernmost division of a church, running like a cloister from the north to the south wall. It was a vestibule, separated from the nave proper by a screen or railing, beyond which catechumens and those under Church censure or penance were not permitted to advance. It had three door-ways, one on the west as well as one in the northern and southern walls. The western was the principal entrance and was known as the "beautiful" or "royal gate." The doors leading through the screen into the nave were named according to the classes who used them, "the priest's gate," "the man's gate," etc. The narthex was also used for funerals and public meetings; baptism was celebrated there and the font, which had formerly been in a building adjoining the church, was also placed in the narthex. There was sometimes an inner and an outer narthex. Consult Busch, "Chrestliche Alterthümer"; Walcott, 'Sacred Archaeology.'

NARUSZEWICZ, ná-roo-shá-vich, Adam Stanislaw, Polish historian and poet: b. Pinsk, Lithuania, 20 Oct. 1733; d. Janow, Galicia, 8 July, 1796. He became a Jesuit in 1748; taught in the Jesuit schools in Vila, Warsaw, and after the suppression of the Order became bishop of Smolensk, and later of Lutsk. His poetry, consisting of translations, odes, fables, epigrams, satires and idylls, was first published in 1778. In prose, he translated "Cicero's Letters to Atticus" and a biography of Chodkiewicz (1781), composed a history of Crimea (1787), and on the suggestion of his patron, King Stanislaus Augustus Poniatowski, wrote his greatest work, a history of Poland. The Great, from 1386 (1789-86, new ed. 1859-60), which, because of its style and its protest against the abuses of a monarchy or an aristocracy, won him the name of the Polish Tacitus.

NARVA, nár'vä, Russia, town in the government of Petrograd, on the river Narva, 100 miles southwest of Petrograd. It contains several Greek and Lutheran churches, has a fine town-hall, a castle, two gymnasiums, a theatre and technical schools in connection with the cotton and woolen mills nearby. Cotton and lumber are the principal items of trade. The town was founded by the Swedes in the 13th century, and after being held briefly by the Russians passed to the Swedes in 1581. Peter the Great took it in 1704. Here, on 30 Nov. 1700, was fought a battle between 8,000 Swedes under Charles XII and 80,000 Russians under General Dolgorouki. The Russians were besieging Narva, and after driving in 10 large bodies who occupied advanced positions, Charles boldly attacked their entrenched camp. After a brief cannonade the Russians retired, and although the Russian artillery stood to their guns, the defenders were driven out in disorder after three hours of hard fighting. The Russians lost 18,000 men in the trenches and many more in the open field; the Swedes lost 13,000. Pop. 21,475, Germans, Esths and Russians.

NARVACAN, nár-vä-kän', a pueblo of the province of Ilocos Sur, Luzon, situated 13 miles southeast of Vigan, the provincial capital. It is on the main road and one of the most important towns of the province, being next the capital in population. Pop. 10,500.

NARVAEZ, nár-vä-étz', Pánfilo de, Spanish soldier in America: b. Valladolid, about 1470; d. near mouth of Mississippi River, November 1528. He came to America about 1498, settled first in Santo Domingo and then in Cuba, where from 1512 until his death he was under Velasquez in the command of an auxiliary force in the conquest of the island. The disobedience of Cortes in Mexico, whither he had been sent by Velasquez, led the latter to send Narvaez in 1520 to supersede and punish Cortes. This expedition was unsuccessful. Narvaez landed at Vera Cruz in April; was defeated in May at Temapala by the army of Cortes; lost one eye in the battle, and was deserted by the remnant of his army, which
joined Cortés. He was captured, but soon released; returned to Spain, where he was appointed governor of Florida in 1526, and sailing from Cuba in March of 1528, landed at Apalachee Bay, lost half his men on the march inland, retreated to the shore, where he found that his ships had been destroyed, and having built boats, sailed westward along the coast, only to be defeated by his men. Consult Bourne, E. G., *Spain in America* (New York 1907); Alvar Núñez Cabeza de Vaca, *Relación* (in J. F. Jameson's, ed., *Original Narratives of Early American History* (Vol. II, ib. 1907).

**NARVÁEZ, Ramón María, Duke of Valenciad.** Spanish general, and statesman: b. Loja, Andalusia, 4 Aug. 1800; d. Madrid, 23 April 1868. He entered the army in 1815; fought against the French and in 1822 assisted in putting down the uprising in the Royal Guards; lived in retirement at Loja from 1830 until the death of Ferdinand VII in 1833; in 1836 defeated the Carlist leader, Gómez; and in 1838, after clearing La Mancha of brigands, was made captain-general of Old Castile. He led an insurrection against Espartero, in 1840, his forces were beaten and Redutada, where he joined the party of Maria Christina. He returned to Madrid in July 1843; Espartero left the country; and from May 1844 to February 1846, and from October 1846 to January 1847 Narváez was President in recognition of his services to Maria Christina. In 1845 he was made grandee of Spain of the first class and Duke of Valencia. He began by changing his policies to the more conservative form, revising the Liberal constitution of 1837. He held the same post in 1856–57 and 1864–65, being Minister to Paris and Vienna in the intervals. During the military rising of 22 June 1866 Narváez commanded the loyal soldiery, and in July succeeded the defeated O'Donnell as Ministry President and Minister of War. A Liberal in early life he became more and more conservative and spent his last years in attempting to keep Isabella on the throne. Consult Mazzari, *Les révolutions d'Espagne* (Paris 1899); Pirala, A., *Historia contemporánea* (Madrid 1871–79).

**NARVIK, nárˈvik,** Norway, small town on the Ofoten Fjord, with beautiful mountainous surroundings. It is also known as Victoriahavn, and is the terminus of the Ofoten Railway which transports an enormous tonnage of Swedish iron ore. It is used by the tourists visiting the lovely Lofoten Islands. It is a station for coastwise trading steamers. Pop. about 4,643.

**NARWAL, a large porpoise which inhabits the Arctic Ocean. It belongs to the family Delphinidae and was named Monodon monoceros by Linnaeus in 1758. Its most striking characteristic is the possession by the male of a very long, straight, spirally-grooved tusk, which projects forward from the left side of the upper jaw in line with the axis of the body. When mouth-grooved, the tusk is a length of about 16 feet. The head is rounded, the back has a very low ridge instead of a fin and the pectoral fins are short and broad. The color of the body is gray above and white below, everywhere mottled and spotted with gray and black. The young are darker colored, while old individuals are often nearly white throughout. The vertebral formula is as follows: Cervicals, 7; dorsals, 11; lumbars, 6; caudals, 26; total, 50. The cervical vertebrae, unlike those of other true porpoises, except the heluga or white whale, are all free. The skull is depressed, with a broad rostrum.

The massive tusk or maxillary tooth of the narwhal is developed only in the male, and with rare exceptions, only on the left side of the jaw. Normally the corresponding tusk or tooth of the right side remains concealed in the maxillary bone during life. In females neither tusk is visible. All of its teeth are wanting in adults of both sexes. Occasionally, both tusks are developed in males and in females as well. About 16 such heads have been preserved, including one from Prince Regent Inlet, in the National Museum, Washington. The largest narwhal tusks are about eight feet long, with a girth of about nine inches at the base. They are hollow for a considerable proportion of their length.

The tusk is a secondary sexual character like the antlers of the stag, the spurs and comb of the cock, etc. It has been suggested that the narwhal makes use of the tusk to break the ice, to transfix its prey, or in combat, but these ideas lack confirmation.

When first introduced into Europe, the true origin of the tusks not being known, they were supposed to be the horns of the mythical unicorn. For a considerable time they were highly prized on account of their reputed medicinal properties, and are still made use of in China as a drug.

Narwhals occur in large herds or schools among the ice of the Arctic Ocean, northward of lat. 65° N. They migrate to higher latitudes as the ice recedes and return in the fall. Very rarely individuals stray southward along the coast of Europe as far as Scotland.

The narwhal resembles the balea or white whale in many important characters, not shared by other porpoises, and forms with it a separate sub-family, the Delphinapterina.

**NASBY, názˈbi, Petroleum V. See Locke, David Ross.**

**NASCENT STATE, in chemistry, the state or the peculiar reactionary power possessed by an element at the instant of liberation from a compound or combination in which it has previously existed. At the moment an element is liberated from a compound of which it has been a constituent it acquires a higher power of chemical reaction than it displays some time after its liberation. One theory of the nascent state of an element is that the molecules at the instant of liberation are separate and independent; and that an appreciable length of time is required for their final arrangement; and that while they are in this free state they possess an extraordinary power of reaction, which power is otherwise exerted and expended in the act of molecular arrangement. For instance, it has been advanced by some chemists and physicists that hydrogen in a nascent state is made up of single atoms, while hydrogen in a gaseous state is composed of molecules, each molecule containing two atoms. Another theory is that nascent hydrogen is simply hydrogen under great pressure, for a mere increase in pressure will make ordinary hydrogen act
like nascent hydrogen. Thus many substances, such as aldehyde, will combine with nascent hydrogen which utterly refuses gaseous hydrogen.

NASCOPI (nā-skō'pē) or NASCAPEE. INDIANS, a Labrador tribe, the most northeasterly known branch of the Algonquian family. They formerly occupied the interior table-land extending from Lake Mistassini to the Atlantic Ocean.

NASEBERRY, the fruit of Sapota achras, one of the finest West India fruits. The bark of the tree has astringent and febrifugal properties. See SAPOTACEAE.

NASEBY, nás'bi, England, a village of Northamptonshire, 12 miles northwest of Northampton (pop. 450), on the north side of which, on 14 June 1645, Fairfax and Cromwell, commanding the Parliamentary troops, defeated Charles I and his army, taking 5,000 prisoners and capturing the royal cannon and baggage. An obelisk marks the site. Pop. about 700.

NASH, Abner, American politician: b. Prince Edward County, Va., 8 Aug. 1716; d. Philadelphia, Pa., 2 Dec. 1786. He studied law at the age of 21 and moved to New Bern, N. C., where he practised successfully and in 1774 he was a member of the first provincial congress of North Carolina. He served as member of the council which framed the State constitution in 1776 and was speaker of the senate in 1778. He was governor of the State from 1779-81 and in 1782-86 sat in the Continental Congress.

NASH, Francis, American soldier: b. Prince Edward County, Va., 10 May 1720; d. Germantown, Pa., 7 Oct. 1777. He was a brother of Abner Nash (q.v.), and early removed to North Carolina, where he was clerk of the Superior Court of Orange County. He was a member of the assembly in 1771, 1773-75. He served under the Crown with a captain's commission, but resigned and was a member of the provincial congress which met in 1775 when he was appointed lieutenant-colonel in the Continental army. In 1777 he was commissioned brigadier-general by the Continental Congress and at once joined Washington, under whom he commanded a brigade and was mortally wounded at the battle of Germantown.

NASH, George Kilburn, American politician: b. York Township, Medina County, Ohio, 14 Aug. 1842; d. 28 Oct. 1904. A descendant of Thomas Nash, he was educated at Reserve University and at Oberlin College (1862-64), studied law and was admitted to the bar in 1867. He was editor of the Ohio State Journal, and in 1879-82 was prosecuting attorney of Franklin County, Ohio. He established a law practice in Columbus in 1883-85. In 1880-83 he was attorney-general of Ohio and in 1883-85 served as member of the State Senate and of the Land Commission. In 1888-81 and 1897 he was chairman of the Republican executive committee. In 1899 he was nominated for governor, was elected in November of that year and re-elected in 1901, his second term expiring in January 1904.

NASH, Sir John, English architect: b. London, 1752; d. East Cowes Castle, Isle of Wight, 13 May 1835. He studied and practised architecture under Sir Robert Taylor; then retired from business until 1793; and upon his re-entry into the profession gained much royal and noble patronage. He laid out Regent's Park and the street leading up to the park, now called Regent street; remodelled Buckingham Palace and altered the Brighton Pavilion. He was particularly fond of single façades, of projecting colonnades and of a plentiful use of plaster and stucco. The use of casement girders was principally introduced by Nash, who patented several varieties. Personally he was an estimable man, but unpopular because of George IV's display of favoritism toward him.

NASH, Richard, called Beau Nash, English leader of fashion: b. Swansea, Wales, 18 Oct. 1674; d. 3 Feb. 1762. He studied at Jesus College, Oxford, for was a time in the army, but finding military discipline not to his liking, entered at the Inner Temple. In 1705 his skill in gaming took him to Bath, which in 1703 had become a much frequented watering-place. He determined to improve the provincial character of the spa, and soon became a self-appointed but arbitrary master of ceremonies. He was known as the 'King of Bath' and his rule was celebrated. In 1716 he included the prohibition of swords within his realm, a restriction which tended toward that consideration for the public peace which was then prevailing in England. His vanity grew with his power; he appeared in a monstrous cream-colored beaver and invariably journeyed by post-chariot with three span of greyhounds, footmen and outriders. Gambling was prohibited by law in 1740, and Nash, by 1745, had lost his trade. The town granted him an annuity of 410 month. Goldsmith wrote his life (1762). Consult also Jerrold, C., 'Beaux and the Dandies' (New York 1910).

NASH, or NASHE, Thomas, English satirist and dramatist: b. Lowestoft, Suffolk, 1567; d. 1601. He studied at Cambridge in 1586, spent some time on the Continent, and returned to England in 1592. In 1590 he published his 'Anatomy of Absurdity.' In the literary warfare carried on between the Puritans and bishops Nash took an active part in behalf of the latter. Under the pseudonym 'Pasquil' he published the tracts 'A Counter-cuffe Given to Martin Junior' (1589) and 'Pasquil's Apologie' (1590). In 1592 he issued his powerful satire on contemporary society, 'Pierce Penniless his Subplication to the Divell,' His 'Christes Teares over Jerusalem' (1593) followed in repentant mood, and he affected to dismiss satire, in which, he said, he had "prodigiously conspired against good hours." His notable work of picaracte fiction, 'The Unfortunate Traveller, or the Life of Jack Wilton' (1594) to a certain extent anticipated Defoe. Involved in a paper war with Gabriel Harvey, who had boasted of having put him to silence, he thereupon published 'Have with you to Safron-Walden, or Gabriel Harvey's Hunt is Up!' (1596), brimming with scorn. Nash also wrote plays, in whole or in part. He completed, unsatisfactorily (1594), Marlowe's 'Dido.' His 'Summers Last Will and Testament' (1593), comedy, was first published in 1600. A play, 'The Isle of Imprisonment' for attacks contained in it. He died having, as one epitaph put it, "never in
NASHUA — NASHVILLE

his life paid shoemaker or tailor.” Nash’s personality was somewhat unique in Elizabethan literature, as he was one of the most successful and versatile of those poets. His works were edited by Grosart (1883-85).

**NASHUA**, NASH’ou-uh, N. H., city, one of the county-seats of Hillsboro County, on the Nashua River and on several branches of the Boston and Maine Railroad, about 38 miles south of Concord and 38 miles north west of Boston. The first settlement was made in 1655 and in 1673 it was incorporated by Massachusetts as Dunstable township. In 1746 it was reincorporated by Massachusetts, and in 1836 it adopted the name Nashua. It received its city charter in 1853. It is an important manufacturing city; the water power is obtained from the Nashua River by means of a canal three miles long, 60 feet wide and eight feet deep. The chief manufactures are cotton goods, paper, wire and iron and steel products, edge tools, hardware, saddlery, refrigerators, registers, sash, doors and blinds, ice-cream freezers, stationary engines, caskets and furniture. It has a United States fish hatchery, city and county buildings and several fine church buildings; Saint Francis Xavier (R. C.) is the largest. There are excellent public and parish schools and two academies. A new charter which provides for a mayor and 15 aldermen has been in force since 1913 and is working well. City elections are held entirely separate from State and national elections. The school board is chosen by popular vote. Pop. 26,000.

**NASHVILLE**, Ill., city, county-seat of Washington County, on the Illinois Southern and the Louisville and Nashville railroads, about 110 miles south by east of Springfield. It is in an agricultural region, in which there are large coal fields. The chief manufactures are flour, dairy products and agricultural and mining implements. Coal mining and cattle raising contribute to the industrial wealth of the city. Pop. 2,135.

**NASHVILLE**, Tenn., capital of Tennessee, the largest city in the State, and county seat of Davidson County, 186 miles southwest of Louisville, Ky., and 234 miles northeast of Memphis. Nashville is on the Cumberland River and the Nashville, Chattanooga and Saint Louis, Louisville and Nashville and Tennessee Central railroads.

**Topography.**—The city has an area of 18.2 square miles and is regularly laid out on gradually rising ground, sloping back from the river to an elevation of 654 feet above the sea. The streets are wide and well paved, about 242 miles of thoroughfare being covered with macadam and about 39 miles paved with granite, brick and bitulithic pavement. Around the city in every direction are the green hills of Middle Tennessee, where there is much commercial timber and mineral wealth. The soil in the vicinity produces every fruit and vegetable not absolutely confined to the tropics. The average rainfall for 31 years has been 48.82 inches; the average winter temperature 39° and summer temperature 79°; mean temperature for the year 59.8°.

**Government.**—Nashville has a commission form of government, of five commissioners, of whom the mayor, commissioner of police and public welfare is chairman. The other commissioners are commissioner of finance and street lighting; commissioner of streets, paving and sewers; commissioner of waterworks, street sprinkling and alleys; commissioner of fire and buildings. The various other officers are elected by the city commissioners, who also serve as a board of civil service; the vacancies on the park commission, however, are filled by the surviving members of that commission which is self-perpetuating. The city expends annually $2,000,000 for maintenance; the principal items being $49,000 for schools; $2,000 for interest on debt; $213,000 for police department and $230,000 for waterworks. The waterworks are owned by the city; the system which comprises 200 miles of mains cost over $2,000,000. The electric lighting plant is also owned by the municipality. Pian $1,000,000 has been expended in recent years on a new and improved sewer system. The street railways operate over 95 miles of track, all converging at a central transfer station.

**Buildings.**—Prominent among the noticeable structures are the State capitol, $1,500,000; United States Government building; Davidson County court house; the city hall: Tennessee School for the Blind; Tennessee Industrial School; the State penitentiary; the Parthenon, city hospital; Confederate Soldiers Home; Vendome Theatre; the Union depot; Hermitage hotel; Stahlman building; Independent Life building and the various churches and educational institutions.

**Education.**—There is no city in the South as prominent in educational interests as Nash-ville. Here is the seat of the Vanderbilt University; the University of Nashville; George Peabody College for Teachers; Ward-Belmont College; Boscobel College; Watkins Institute; Buford College; Nashville Bible School and many others; Saint Cecilia Academy; Fisk University; Roger Williams University; Walden University. The State Library contains 40,000 volumes. The Carnegie Library cost $100,000 and has a fine rapidly increasing number of volumes. The Tennessee State Library has a large and valuable library of many rare manuscripts, portraits, etc. The public schools are of the highest rank; and embrace, in addition to the ordinary studies ranging into the high school education, departments of industrial education, typewriting, bookkeeping.

**Parks and Cemeteries.**—Nashville have 480 acres in parks. In the park surrounding the State capitol building is the tomb of James K. Polk (q.v.) and an equestrian statue of Andrew Jackson. The Hermitage, the former home of Jackson, is 10 miles east of the city. To the north is the National Cemetery where are buried 16,643 soldiers who fell in the Civil War. A Centennial Park has been made on the grounds of the Tennessee Centennial Exposition of 1897, and the former history building is now a museum and art gallery. In the park is a fine monument honoring James Robertson, the founder of Nashville. Watkins Park is to the west. Shelby Park, to the east of the city, is a natural shade haven with river frontage. Glendale Park, to the south, is a place of unrivaled beauty. There is also here
Mount Olivet Cemetery, with the beautiful Confederate soldiers' monument, and the Cumberland Driving Park.

The industries of Nashville, which are more extensive than any other city in the State, had in 1919 aggregate capital of $115,000,000, and manufactured products valued at $150,000,000. The manufactures include flour, grist-mill products, lumber and timber products, fertilizers, cotton goods, clothing, harness, saddlery, soap, stoves, ranges, hollow ware, coffins, shoes, candles, tobacco, wagons, carriages, confectionery, printing, clothing and cars. There is a large export trade and extensive wholesale traffic in dry-goods, boots and shoes, groceries, drugs, hats, millinery, paper and hardware. The wholesale trade is estimated at over $250,000,000 annually. Almost at the doors of Nashville, and tapped by every line of railroad entering the city, are apparently inexhaustible fields of coal of the highest grade. The bountifulness of the supply is attested by the fact that during the prolonged anthracite coal strike, when coal was selling at almost prohibitive prices in every other section of the country, there was no advance in the price of coal in Nashville.

History.—The city was settled in 1780 by a band of pioneers under the leadership of James Robertson. It was named in honor of Gen. Franklin Varnum, a distinguished officer in the Revolutionary War, and was called Nashborough until 1784. During the early years of its existence Nashville was repeatedly attacked by the Cherokee and other Indian tribes. It was chartered as a city in 1806; was the seat of the State legislature in 1812-15, and became the permanent State capital in 1843. The Federal army occupied the city in 1862 and around the city in 1864 was fought one of the greatest battles of the Civil War. (See NASHVILLE, BATTLE OF.) In 1896 the State celebrated the centennial of Tennessee's admission into the Union, and a great industrial exposition was held here the following year.

Population.—Nashville in 1830 had a population of 1,856; (1860) 16,986; (1870) 25,865; (1880) 43,350; (1890) 76,168; (1900) 80,865; (1910) 110,364; the 1910 total included 2,993 persons of foreign birth and 36,523 of negro descent (1919) 145,000.

NASHVILLE, the name of a Confederate privateer that left Charleston in 1861 on a cruise to England and captured booty to the amount of $3,000,000. In March 1863 she was sunk by a Federal ironclad in the Savannah River.

WILL R. MANIER,
Secretary, Commercial Club of Nashville.

NASHVILLE, Campaign and Battle of. When General Sherman's picked army of 62,000 left Atlanta 15 Nov. 1864 for the March to the Sea, the Confederate army under Hood, strengthened by Forrest's cavalry, was on the Tennessee River in the vicinity of Tuscumbia and Decatur, with S. D. Lee's corps across the river and in advance. Forrest's forces were making for a move on Nashville with the Ohio as a possible objective. General Thomas had been sent to Nashville six weeks before to organize a force to resist Hood. Toward the last of October the Twenty-third corps, Schofield's, and the Fourth, H. S. Stanley's, were ordered to Thomas, who sent them under General Schofield to Pulaski, with orders to delay Hood as long as possible to allow of the needed concentration and organization at Nashville. The infantry force at Pulaski aggregated 18,000 effective, one division of the Twenty-third corps being detached, and was further strengthened by four brigades of cavalry under Gen. James H. Wilson. Forrest's force of Confederate cavalry was four times Wilson's. General Sherman thus describes the force with General Thomas at Nashville at the time of Hood's advance on Pulaski: "General Thomas was at Nashville with Wilson's dismounted cavalry, and a mass of new troops and quartermaster's employees amply sufficient to defend the place." Of the sound men sent back to Thomas by General Sherman when he was fitting out a perfect army for the March to the Sea, he lost 15,000 from expiration of service, or from furloughs previously granted, within a week after Hood's advance from Florence. In place of these 15,000 Thomas received 12,000 newly enlisted recruits. To secure Chattanooga Sherman telegraphed General Steedman, who held the place with a small force: "You are to organize the hospitals and men sent back to Chattanooga" and to a suggestion that he might make use of some of the convalescents he was receiving from Atlanta he replied: "So far, all such detachments reported from the front are with furloughs and are awaiting transportation home.

Under such conditions General Thomas was working most energetically at Nashville to organize an army to meet Hood, while General Schofield, with his inferior force, was holding against him with the utmost stubbornness to gain time for Thomas.

Hood was baffled in his attempt to intercept General Schofield at Pulaski and Columbia, Schofield reaching the latter place, forming solidly before Hood, who arrived 27 November, and holding him there to the limits of possibility. Again, by skilful work, Schofield reached Franklin in advance of Hood, marching his troops at night within rifle-shot of the enemy's lines at Spring Hill. Here Hood's army en masse upon Schofield, who had taken position around the town. The attack was delivered at 4 P.M., and lasted into the night. It was one of the most desperate assaults of the Confederates on any field, and most depressing for them in its results, five general officers being killed, six wounded and one captured. (See FRANKLIN, BATTLE OF.) The night of the 30th Schofield withdrew to Nashville, and the morning of 1 December Thomas' army was united.

A part of A. J. Smith's veteran division arrived at Nashville during the battle of Franklin, but not in time to be sent to General Schofield. The rest of his division, and General Steedman's division from Chattanooga also arrived 1 December.

Hood returned the next day after the battle of Franklin and established his lines in front of Nashville 2 December. Not until Hood appeared before Columbia with the entire army that had confronted the three armies under Sherman, re-enforced with Forrest's 10,000 cavalry, and the fact appeared that Schofield was fighting a gallant, almost desperate game to
NASHVILLE, TENN.

hold him back while Thomas was working energetically to organize his forces, did the authorities at Washington and City Point realize that Thomas had been left with wholly inadequate means to repel the attack made by General Grant in which he was directed not to ‘let Forrest get off without punishment,’ General Thomas, 24 November, thus stated his real condition.

Your despatch of 4 p.m., yesterday just received. Hood's entire force is now concentrated at Memphis, and a small portion of his force is at the Memphis and Charleston Railroad. The raw troops from the south are fast arriving. I have asked for more troops and have been told that I will get them. My cavalry is just arriving. The situation is critical.

This created a feeling at Washington and City Point approaching a panic. It was feared that Hood might avoid Thomas, cross the Cumberland and carry out President Davis' plan to have him push on to Chattanooga. This fear was redoubled when the necessity appeared for Schofield to retire from Franklin. It was not so clearly seen that his stubborn holding against Hood had saved the situation which Sherman created.

Hood had never lost a movement or a battle, to deal with Hood as his full knowledge of the situation might suggest, it was insisted that he should be removed from his command. The Straits of the situation were recognized at City Point, and the order of Schofield to retreat, telegraphed: "Arm and put in your trenches your quartermaster's employees, citizens, etc., etc." The fourth day Thomas was peremptorily ordered to attack. He camely went on with his energetic preparations to deal a final blow to Hood. His despatches and orders to the field grew his force and his active work were ridiculed by Stanton and Halleck, and Grant repeated his orders to attack, and next directed Halleck to relieve him, first with Schofield, and next with Logan, and Grant himself started to take general direction, although Thomas had explained that while he had the troops ready to attack, a sleet-storm had covered the country with a sheet of ice upon which neither men nor horses could move, but that the moment it melted he would attack. When Logan reached Louisville he was met with the news of an overwhelming victory.

The two-days' battle, 15 and 16 December, was remarkable for its perfection of plan, and for the fact that in its progress to the end this plan was closely followed by the execution.

The Confederate main and advanced lines were intrenched on bold hills about two miles from the city. Their advanced salient was established within three-eighths of a mile of the Union centre. The Union lines extended from the river below the city to the river below it. The Confederate lines were compact between the Murfreesboro Railroad at their right and the Hillsborough Turnpike, which ran south from the centre of the city, across the Union centre. Thus the Confederate lines covered less than half of the ground that Lee's corps was on the right, Lee's corps formed the centre, and Stewart's corps the left.

More than half the inner line was held by quartermasters' employees under Quartermaster-General Donaldson, and the rest of that line by new troops under Captain J. Smith's corps held the right of the advanced Union line, Gen. T. J. Wood's line the centre and General Schofield the left. General Steedman's division was in echelon to the front on the left. The night before the battle General Schofield's corps was moved to the left and front of Wood's line, and prepared to take prominent part in turning the Confederate left.

The morning of the 15th fog veiled the rapid formation of Union forces in front of their works. The battle began at 8 o'clock by a successful attack by General Steedman's division upon the earthworks commanding the extreme left. This attracted the enemy's attention to that quarter. About 10 o'clock Smith's corps moved against Hood's left, and Wilson's cavalry corps of 9,000 horsemen and 3,500 mounted men swung off in its wide circuit against the right and rear of the Confederate works, one division extending to the river below the city, and forcing back Hood's cavalry reserve under General Chalmers. Forrest's main body was sent to attack Murfreesboro. Smith's corps moved obliquely against the Confederate left flank and took it in reverse. Schofield by a wide detour, penetrated still further to the rear. At the same time Wood assaulted in front. Wilson's troopers carried earthworks, captured 27 guns and swept squarely into the rear of the Confederate left. These movements compelled its withdrawal for two miles. The next afternoon five of the four attacking were continued by Smith, Schofield and Wilson, while Wood, with the Union centre, and Steedman on the left, pushed forward to Hood's new line. This had been reformed with Cheatham on the left, Stewart in the centre and Lee on the right. The Union lines began the attack when Hood's position at 3 o'clock with an unsuccessful assault by two brigades from Wood and one from Steedman upon the Confederate right. Soon after 4 o'clock Smith and Wood's corps on the front, with Schofield operating on their right and against the Confederate left flank, attacked in force, soon carrying the entire line. This attack and its results General Hood thus described in his official report: "The position gained by the enemy being such as to enflute our line caused in a few moments our entire line to give way, and our troops to retreat down the pike in the direction of Franklin, most of them, I regret to say, in great confusion, all efforts to reform them being fruitless." Here 54 guns in position were captured. There was immediate debate as to the cause of the losses, led by Wilson's cavalry, when the remnant of Hood's forces crossed the Tennessee, having suffered a loss during his campaign of over 13,500 prisoners and 78 guns, and here the Union pursuit ended. Over 2,000 deserters came into the Union lines.
The result vindicated Thomas’ insisting upon waiting for the remounting of his cavalry, since Wilson with his troopers formed an essential and controlling element in the battle and in the pursuit which were designed to disintegrate an army.

The records do not show the number of men with which Hood reached Tupelo. He claims that there were 16,500 left there after 3,600 had been lost. He further says that 14,000 that left Tupelo to join Gen. J. E. Johnston in North Carolina, 9,000 deserted. General Johnston's reports show that when Hood's forces reached him they numbered 3,953 officers and men. Thus, after Nashville, Hood's splendid force of Confederate fighters did not again appear as an army on the theatre of war.

Even this complete victory, defeating the contemplated advance of the Confederate army to the Ohio, did not fully allay the panic at Washington lest Sherman's movement to the sea should prove to have left the Central West without sufficient protection, and while every possible effort in pursuit was being put forth in horrible weather, General Halleck thus telegraphed General Thomas:

"Permit me, General, to urge the vast importance of a hot pursuit of Hood's army. Every possible sacrifice should be made, and your men for a few days will submit to any hardships to accomplish the great result. If you can capture or destroy Hood's army General Sherman can extirpate and root out the rebel military force in all the Southern States. He begins a new campaign about the first of January, which will have the most important results if Hood's army can now be used. A most vigorous pursuit on your part is, therefore, of vital importance to General Sherman's plans. No sacrifice must be spared to obtain so important a result."

General Thomas, nagged beyond endurance, put an end to this style of despatches by the following reply:

"Your despatch of 12 M., this day, is received. General Hood's army is being pursued as rapidly and as vigorously as it is possible for one army to pursue another. We cannot control the elements, and you must remember that, to resist Hood's advance into Tennessee, I had to reorganize and rearm the men and equip the force now under my command. I fought the battle of the 13th and 16th instants with the troops but partially equipped; and, notwithstanding the inclemency of the weather and the partial equipment, have been enabled to drive the enemy beyond Duck River, crossing two streams with my troops, and driving the enemy from position to position without the aid of pontoons and little transportation to bring up supplies of provisions and ammunition. I am doing all in my power to crush Hood's army, and, if it be possible, will destroy it. But pursuing an enemy through an exhausted country, over mud roads completely sogged with heavy rains, is no child's play, and can not be accomplished as quickly as I thought of. I hope, in urging me to push the enemy, the department remembers that General Sherman took with him the complete organization of the Military Division of the Mississippi, well equipped in every respect, as regards ammunition, supplies, and transportation, leaving me only two corps, partially stripped of their transportation to accommodate the force taken with him, to oppose the advance into Tennessee of the army which had resisted the advance of the army of the Military Division of the Mississippi on Atlanta, from the commencement of the campaign till its close, and which has been pursued by Forrest's cavalry. Although my progress may appear slow, I feel assured that Hood's army can be driven from Tennessee, and eventually driven to the wall by the force under my command. But too much must not be expected of troops which have been recently recruited, particularly when they have the task of destroying a force, in a winter's campaign, which was able to make an obstinate resistance to twice its numbers in spring and summer. In sum, I cannot submit to any sacrifice to crush Hood's army, or to strike any other blow which may contribute to the destruction of the rebellion."

This changed the tone of despatches from Washington and City Point. Grant and Stanton sent congratulations, and Grant, in his official report, after setting forth his impatience and apprehensions that Hood would go north, said of Thomas: "But his final defeat of Hood was complete, and he was regarded as a vindication of that distinguished officer's judgment." — H. V. Boynton.

NASHVILLE, CHATTANOOGA AND SAINT LOUIS RAILWAY. The first advocate of the building of the Nashville and Chattanooga Railroad, the first railroad completed in the State of Tennessee, Dr. James Overton, a man of far-reaching sagacity, dauntless courage and great faith in his well-matured convictions. In 1843, he offered himself a candidate for the legislature, basing his canvass on the promise that he would do all in his power to secure the construction of a railroad from Nashville to Chattanooga, to connect with the proposed Western and Atlantic Railroad, chartered to be built from Atlanta to Chattanooga, thus creating a large link in a great trunk line to extend from the Atlantic Coast to the Mississippi River. At that period, Chattanooga, or Ross Landing as it was then called, was but a small trading point in a wild, mountainous region, lately vacated by the Indians. Dr. Overton, with a keen foresight, however, recognized that this was the focus to which the lines of traffic from the Southern States must converge, and he believed that if connections should be opened between that point and Nashville the latter place would be able to control the large cotton trade of Georgia and Alabama. These arguments made little impression on the minds of the people, however, and Dr. Overton was not only defeated but the title "Old Chattanooga" was applied to him by those who derided his scheme as the impracticable dream of a visionary. Two years after the defeat of Dr. Overton the necessity for other outlets from Nashville besides the Cumberland River brought the subject of railroads under agitation again, and, through the pressure of many influential citizens of the State, the legislature passed an act on 11 Dec. 1845 incorporating a railroad from Nashville to Chattanooga. In 1847 this act was amended to permit the town of Nashville to subscribe the sum of $500,000 for the benefit of the road, and to raise money on loans by pledging the road for collection; by pledging a portion of its taxes; by mortgage or otherwise to an amount not exceeding what might be demanded for the calls on the stock. The town of Murfreesboro, Tenn., subscribed $30,000; the city of Charleston, S. C., $500,000; and the Georgia Railroad and Banking Company of Augusta, Ga., $250,000. The balance of an approximate capital stock of $2,000,000 was subscribed by individuals in Nashville and along the line of the proposed road. Shares of stock had then a par value of $25 each and in many instances the subscriber paid for his stock by actual work on the line or in materials furnished. The State also gave material assistance by lending its endorsement to the bonds of the company issued from time to time on completed miles of road.

The first general meeting of the stockholders was held in the City Hall at Nashville on 24 Jan. 1848. V. K. Stevenson, who had so earnestly labored in the interest of the road, was elected the first president. Other presidents of the
road to date are as follows: Michael Burns, 17 Feb. 1862; J. C. Allen, Aug. 1866; E. W. Cole, 15 Aug. 1866 to 15 Sept. 1880; J. D. Potter from the latter date to 10 Sept. 1884; J. W. Thomas, Sr., from then to 12 Feb. 1906; J. W. Thomas, Jr., 28 Feb. 1906 to 17 Dec. 1913; Maj. E. C. Lewis, 19 Dec. 1913 to 1 April 1914; and John H. White from 1 April 1914 to the present time. The first contract for any of the actual construction was let in August 1848 for cutting the tunnel under the Cumberland Mountain. Construction on other parts of the line began the latter part of that year. The first train, Anson, N. Hickman to Anson, in 13 April 1851, and when, on 4 July of the same year, a train arrived at Murfreesboro the event was made the occasion of a great celebration, people from all the country round being on hand to greet this sign of progress. By April 1852 the road had reached Bridgeport, Ala., on the Tennessee River, from which communication was immediately established with Chattanooga with the aid of steamboats; but the entire line, 151 miles in length, was not completed until February and March 1853. The road consisted of 17 engines, bearing names instead of numbers, among which were the Tennessee, Nashville, Chattanooga, Governor Savage and Governor Blount; 11 passenger cars and 164 freight cars. The iron rail used in track was purchased in England and delivered at Nashville for about $45 per ton. In November 1871 the company acquired by purchase from the State of Tennessee the railroad properties of the Nashville and Northwestern Railroad Company, a line extending from Nashville, Tenn., to Hickman, Ky.; in 1873 the name of the corporation was changed from that granted in the original charter, "The Nashville and Chattanooga Railroad Company," to the Nashville, Chattanooga and Saint Louis Railway. The Western and Atlantic Railroad, extending from Chattanooga, Tenn., to Atlanta, Ga., is leased for 29 years from 27 Dec. 1890. The Paducah and Memphis division, extending from Paducah, Ky., to Memphis, Tenn., with a branch from Lexington, Ky., is leased from the Louisville and Nashville Railroad Company for 99 years from 14 Dec. 1895. The several branches of the present system were built under separate charters, some of them by independent corporations. The parent company, therefore, operates its present mileage under the charters granted originally to the various corporations which have been merged from time to time into its line.

The total number of miles of line operated at present are approximately: main track, 1,230.76; second track, 54.10; spur track and sidings, 482.53. Its main line extends from Hickman, Ky., through Nashville and Chattanooga, Tenn., to Atlanta, Ga., and from Memphis through Jackson, Tenn., to Paducah, Ky. At the latter point physical connection has been made with the line of the Chicago, Burlington and Quincy Railroad by means of about 12 miles of line of the Paducah and Illinois Railroad Company and a double track bridge across the Ohio River opposite Metropolis, Ill. It also reaches the great coal manufacturing city of Birmingham, Ala., and the ramifying branches extend to various mining centres, agricultural districts and timber regions. To-day the road has few superiors, whether we consider the excellence of its roadbed; its admirable equipment; the beauty and historical interest of its scenery, or the fertility of the country through which it passes, while its strategic position in relation to the commerce of the land is not surpassed by that of any other railroad system in the South. At many of the termini of its divisions it connects with a cluster of railroad systems that run to every point of the compass. It is also brought in closest touch with the great river trade of the Mississippi and its tributaries at several points, reaching the Mississippi River at Memphis and Hickman, Ky.; the Ohio River at Paducah, Ky., and the Tennessee River at Johnsonville, Tenn.; Bridgeport, Ala.; Hobbs Island, Ala.; Guntersville, Ala., and at Chattanooga, Tenn. It strikes the Cumberland River at Nashville and crosses the Chattahoochie River near Atlanta, Ga. The company in a recent statement reported its capital stock was $16,000,000; funded debt, $10,122,000; investment in road, equipment, etc., $34,120,000. The average yearly gross revenue is more than $12,000,000. Since beginning operations it has paid cash dividends of 185 per cent on its capital stock and in 1873 it gave the stockholders a stock dividend of 200 per cent. A majority of its capital stock has been held since about 1880 by the Louisville and Nashville Railroad Company, but its stockholders number above 600, located in 20 different States and three foreign countries. About 260 of its stockholders are women. According to the same statement its equipment consisted of 273 engines, 10,919 passenger, freight and work cars, two steamers and three transfer barges. Its roadbed for the main line is of full rock ballast and the weight of steel rails thereon is from 80 to 90 pounds to the yard.

During the Civil War the line of railroad was in charge of the Federal military authorities from 7 March 1862 to 15 Sept. 1865. Most of its equipment, however, was moved South at an early period in the war, and it served on the rails of other lines in the interest of the Confederacy. Many important battles of the Civil War were fought along the line of its road and the territory contiguous thereto and its scenery is rich in historical interest. The corporation has maintained in an unusual degree the good will of the communities which it serves and is endeavoring to the utmost to advance the development of the country along its lines.

NASHVILLE, University of, in Nashville, Tenn., a coeducational institution founded in 1785 by the State of North Carolina as Davidson Academy. In 1806 after Tennessee had been founded, the name was changed to Cumberland College, and in 1826 to the University of Nashville. The school was closed during the Civil War. The trustees of the university and of the Peabody Education Fund united in 1875 in establishing a normal school for teachers, which has since become, through co-operation of the university, a separate corporation — George Peabody College for Teachers (q.v.). Montgomery Bell Academy, the preparatory department, has six instructors and about 200 pupils. The other collegiate depart-
mements, both literary and medical, have been discontinued. The library contains over 2,000 volumes, and the grounds, buildings and furnishings are valued at $150,000; the productive fund is about $106,500; and the annual income about $10,000.

NASHVILLE CONVENTION, in American history, a convention of delegates from the Southern States held at Nashville, Tenn., 10 June 1859, called to consider the slavery question and the encroachments of Northern abolitionists. The Wilmot Proviso and the Missouri Compromise were disapproved, but resolutions of open resistance advanced by Texas, South Carolina and Mississippi were voted down. The convention, which was never generally popular, met again in November and again moderate resolutions were adopted. For text of the resolutions adopted at both meetings consult Harper's 'Encyclopedia of United States History' (Vol. VIII, New York 1915).

NASIK, nā-sîk, or NAASICK, India: (1) the capital of Nasik, 31 miles from its source, and 100 miles northeast of Bombay. It is the headquarter of Brahmanism in the Deccan and one of the most sacred of Hindu pilgrimage resorts; the banks of the river here are crowded with temples and shrines. Nasik is the Nasica of Ptolemy and was anciently a Mahrratta capital. It has noted manufactures of brass and copper work, paper and cotton. Interesting relics of the religion were found in the Lena caves excavated in the 2d or 3d century A.D. Pop. about 35,000. (2) The district has an area of 5,940 square miles; pop. about 825,000.

NASMYTH, nā-smîth, Alexander, Scottish painter: b. Edinburgh, 9 Sept. 1758; d. there, 10 April 1840. He chose portrait painting as his specialty; became Allan Ramsay's pupil and subsequent assistant and accompanied that artist to London. He returned to Edinburgh (1779); and traveled in Italy (1782), where he devoted himself to landscape and historical painting. Among his works is the famous portrait of Burns in the London National Gallery; the large 'River Scene' owned by the Society of Arts; 'The Fort of Leith' (1824); and 'The Lawn Market' (1829). In 1822 he published 16 scenes described by Sir Walter Scott. His landscapes are finely composed and very impressive, though he is inferior as a painter to his son Patrick (q.v.). His style is simple, rarely striving for grand effects. His scenes are naturally picturesque and well chosen. His coloring is somewhat weak and his execution of a neat and detailed rather than a vigorous character. The Nasmys were an artistic race and between 1829 and 1866 no less than six woman painters of the family exhibited in London.

NASMYTH, James, Scottish engineer: b. Edinburgh, 19 Aug. 1808; d. South Kensington, 7 May 1890. He was the son of Alexander Nasmyth (q.v.). After study at Edinburgh University, he went to London in 1829, offered his services to Maudsley, founder of a well-known engineering firm, and was appointed assistant in his private workshop. There he remained till 1831, when he returned to Edinburgh and constructed a set of engineering tools with which he began business in 1834 at Manchester. Here he was so successful that he had soon to erect a large new workshop at Patricroft near Manchester, where he became famous as a machine constructor and inventor. Chief among his inventions was the steam-hammer, designed in 1839 and in 1842 patented in an improved form. The first hammer was constructed from a view of the violent actions of a metalworker named Schneider at Creusot, in France, about 1841; but the first British one was erected by Nasmyth at Patricroft in 1843. Among Nasmyth's further inventions are a nut-shaping machine, a hydraulic punching-machine and a flexible shaft for driving small drills. In 1856 he retired from the firm of Nasmyth, Gaskell and Company, which which he had founded, and devoted himself to the study of astronomy. He was the first to observe the mottled appearance of the sun's surface known as "willow-leaves" or "rice grains" (1860). He is author of 'Remarks on Tools and Machinery' in Baker's 'Elements of Mechanism' (1858); 'The Moon Considered as a Planet, a World and Satellite' (1874), with James Nasmyth, and 'The Life and Works of Dr. Bunsen' edited by Dr. S. Smiles (1883, latest ed. 1895).

NASMYTH, Patrick Milner, Scottish painter: b. Edinburgh, 7 Jan. 1787; d. Lambeth, London, 17 Aug. 1831. He studied under his father and developed a great talent for landscape, though he labored under the difficulties of ill health and a crippled right hand which necessitated the use of the left in painting. He came to London in his 20th year and made his reputation by his first picture exhibited at the Royal Academy, 'A View of Loch Katrine' (1809). He invariably painted en plein air. and in his last sickness was raised on his bed that he might watch through the window the violent thunder-storm that was raging outside and in the progress of which he expired. His pictures are highly valued and his 'View in Surrey' sold in 1892 for $11,125.

NASO, nā'sō. See OVID.

NASR-ED-DEEN, nās'-r̩-ē'-d̩en', Shah of Persia: b. 24 April 1831; d. 1 May 1896. He was not the eldest son but the ability and influence of his mother induced his father, Mohammed Mirza, to proclaim him and he succeeded to the throne in 1848. His accession was disputed by the reformer, El Bab, but the new Shah crushed the opposition mercilessly and became the ablest ruler that Persia had had in many years. He studied European methods of warfare and proved himself a master of finance. He crushed the insurrections which broke out in various provinces and by his occupation of Herat in 1856 provoked a war with Great Britain which was concluded in 1857. In 1873-74 and in 1889 he visited western Europe and endeavored to establish more friendly relations with England, soon, however, returning to his friendship with Russia. He favored progress and Western civilization in so far as it did not conflict with his despotic rule and under his reign the telegraph through Persia connecting Europe and India was built. He was assassinated in 1896. Consult Morgan and Burger, 'Nasr-ed-Din, Schah und das moderne Persia' (Dresden 1889); Greenfeld, 'Die Verfassungspolitik des persischen Taus' (3d ed. 1891); Jackson, A. V. W., 'Persia Past and Present' (New York 1906).
NASSAU, nā's-sow, Joan Mauritz van, Count of Nassau-Siegen, Dutch general and statesman: b. Delft, Holland, 17 June 1604; d. Cleves, Prussia, 20 Dec. 1679. He was gov-
ernor-general of the Dutch possessions in Brazil in 1637-44 and had a brilliant and prosperous administration. He defeated the Spanish and Portuguese and upon his return to Holland was made lieutenant-general of cavalry; in 1647 he was governor of Cleves and in 1665 commanded the army of the Netherlands. In 1671 he was made field-marshal and led the forces against Louis XIV in the Spanish Netherlands. He became governor of Utrecht in 1674. Consult Driesen, 'Leben des Fürsten J. Moritz von Nassau-Siegen' (Berlin 1849).

NASSAU, nā's-a, the capital of the Bahamas Islands (q.v.), situated on the north coast of New Providence, the largest island of the group. The town is built on a steep hill, is well laid out and has fine government and other public buildings and handsome residences. The climate is mild and healthful and Nassau is a popular winter health resort for Americans and West Indians. There is a good harbor and an active general trade is carried on. The United States is represented by a consul agent. It was founded by the English in the 17th century, destroyed by the French and Spaniards in 1703 and rebuilt in 1718. It was fortified 20 years later and opened to free trade. Pop. 10,000, chiefly colored.

NASSAU, Germany, a former independent duchy, now as Wiesbaden, forming a district of the Prussian province of Hesse-Nassau (q.v.). The chief town is Wiesbaden (q.v.). The family of Nassau, the elder branch of which reigned till 1866, dates from the 10th century. The younger branch inherited in 1544 the principality of Orange, and as the princes of Orange took an important place in European history. The reigning Duke of Nassau sided against Prussia in 1866 and his duchy was incor-
porated with Prussia. (See PRUSSIA; GER-
MANY). On the extinction of the male line of the Orange branch by the death of William III of Holland, in 1890, the Duke of Nassau became duke of Luxembourg.

NASSE, nā's-ē, Erwin, German political economi-
crist: b. Bonn, 2 Dec. 1829; d. there, 4 Jan. 1890. He was educated in Bonn and became prominent as an economist. In 1869-79 he served in the Prussian Lower House and in 1889 became a member of the House of Peers. He founded and was president of the Verein für Socialpolitik. He published 'Über das preußische Steuersystem' (1861); 'Über die mittelalterliche Feldgemeinschaft in England' (1869); 'Agrarische Zustände in England' (1884).

NABSICK. See NASIK.

NAST, Thomas, American caricaturist: b. Landau, Bavaria, 27 Sept. 1840; d. Guayaquil, Ecuador, 7 Dec. 1922. His mother brought him to the United States in 1846. He was employed as a doorkeeper in Bryant's Art Gallery, Broadway and 13th street, New York, where he spent his spare time copying the paintings. For six months he studied in a drawing class, then be-
came a draughtsman for Frank Leslie's. In 1860 he went to England to draw for the Illustrated News the Heenan-Sayers prize fight.

In 1861 drew sketches of the Italian campaign; in 1862 joined the Harper's Weekly staff and by his clever cartoons soon became famous. But with his purely political and personal caricatures dating from 1871-73, when he attacked the Tweed Ring in New York City, drew the money-bag head of Tweed and the first Tam-
many tiger and largely contributed to the de-
feat of the Ring, he came to new fame and power. He bitterly opposed Greeley in 1872, Tilden in 1876 and Hancock in 1880, urging against each of these nominees his inevitable connection with Tammany Hall. In 1884 he attacked the Republican candidate for the only time, but with unusual bitterness. He left Har-
per's Weekly in 1887 and in 1894 became a member of the staff of the Pall Mall Gazette. In May 1902 he was appointed United States consul at Guayaquil, where he died of yellow fever. For several years he published 'Nast's Almanac,' with his own illustrations to text by various authors and illustrated 'Pickwick Papers' and 'Pictures from Italy.' Nast did some oil-painting, especially of scenes of the Civil War. He was a great caricaturist, as realistic as the French masters in his groups and as dignified as Tenniel in his single figure cartoons. Consult Paine, A. B., 'Thomas Nast: His Period and His Pictures' (New York 1904) and 'Life and Letters of Thomas Nat's' (ib. 1910).

NAST, William, American clergyman and editor: b. Stuttgart, Germany, 15 June 1807; d. Cincinnati, Ohio, 16 May 1899. He was educated at Blaubeuren and studied theology at the University of Tübingen, but became a rationalist and took up literary work till 1828. He then came to America and was tutor at Duncan's Island, Pa., becoming (1830) librarian and instructor of German at West Point Mili-
tary Academy. Resigning (1832), he became instructor of German, Greek and Hebrew at Kenyon College, Gambier, Ohio. He next (1835) joined the Methodist Episcopal Church and was appointed missionary evangelist for Cincinnati. Continuous persecution made his labor hopeless during his travels in the State and he returned (1838) to Cincinnati and founded the first German Methodist society in the United States, thus becoming the originator of German Methodism which now is in every State and extends to Germany and Switzerland. In 1839 he founded Der christliche Apologist at Cincinnati, a German organ of the Methodist Episcopal Church, being its editor for 53 years. Many German publications of the Church were edited by him. He wrote 'Wesley's Sermons,' 'Das Christenthum und seine gegensätzte' (1863); 'A Commentary on the New Testament — Matthew, Mark and Luke' (1864); 'The Smaller and Larger Catechism' (1868).

NASTURT U M I T I O N, the Indian cress (Trop-
acaolum majus), a climbing annual plant, native of South America, with pungent fruits and showy orange flowers. T. minus, a smaller species. See TROPACOLUM.

NASUA. See CAWII.

NAT TURNER'S REBELLION, in American history, a term applied to a negro insur-
rection at Southampton, Va., in 1831. The rebellion was led by Nat Turner, a negro slave who believed himself chosen by God to free the
NATA—NATAL

colored race. At an appointed time he set out with several hundred followers, going from house to house with the intention of killing all white persons. Before the authorities dispersed the rebels 55 persons were killed. The faithfulness of many of the slaves saved the lives of many whites. Many States enacted more stringent laws governing slaves, free negroes lost their privileges, suspects were killed or maltreated and the manumission movement received a staggering blow. See TURNER, Nat, and consult Drewry, W. S., 'The Southampton Insurrection' (Washington 1900), and Weeks, 'The Slave Insurrection in Virginia' (in Magazine of American History—New York, June 1891).

NATA, nà'tá, in Mexican mythology, the name of a former legendary prophet, who in the "Age of Water" (Atonatiuh) escaped with his wife, Nena or Xochiquetzal, from the general destruction of mankind by the deluge, in a boat made from the trunk of an ahuehuan or Mexican cypress tree, or according to another version, either in the hollow of the tree or on the trunk of the tree itself. The proper name of this legendary Nahua or Noah is "Coxcox," the "Nata" being apparently correlative with "Tata," the "old father," or uncle or simply the "old one." The legend of Coxcox was common not only to all the Nahua tribes, but it was recounted by the Zapotecas the Mixtecas and other cultured races of Mexico. According to this flood legend, Coxcox and his wife landed at Mount Colhuacan (Place of the Colhuas); and their children increased very rapidly; but they were all born dumb. Finally a dove took pity on them and gave them the power of speech. But they all spoke different languages. Of the descendants of Coxcox or Nata, 15 chiefs spoke the same tongue or nearly so; and from these were descended the different tribes of the Nahua race. According to a Michoacán version of the same myth, their deluge hero who was called Texpi escaped in a large boat with his wife, his children and numerous animals and various kinds of grain for seed. According to still another version of this story, the people drowned in the deluge or were turned into fishes; and the earth-ocean and the sky-ocean drew near to one another and they were overwhelmed in the down-pour of the sky-waters into the earth-waters, which swallowed up even the highest mountains for an Aztec century (52 year.).

NATAL, nà'tál, Africa, an original province of the Union of South Africa, formerly a separate colony on the southeast coast, bordering on the Indian Ocean and bounded by Portuguese East Africa, the Transvaal and Orange River colonies, Basutoland and Cape Colony. Including Zululand, annexed in 1897, it has an estimated area of 35,019 square miles. In January 1903 the former Transvaal districts of Vryheid, Utrecht and part of Wakkerstroom were transferred to Natal.

Topography.—The chief natural boundary on the land side is formed by the Drakensberg Mountains, which separate the Orange River Colony and Basutoland. The Tugela River separates Natal proper from the Zulu country; on the southwest the Umzimkulu and Umtamvuna partly separate it from Cape Colony. Thus contains the mouths of numerous streams, but is destitute of creeks and bays, having only one sheltered anchorage at Port Natal (on which stands the seaport Durban), a fine circular bay completely landlocked, capacious enough to contain whole fleets and deep enough to float the largest vessels. The surface is finely diversified, rising by successive terraces from the shore toward the lofty mountains on its western frontiers. The chief summits are Champagne Castle, 10,357 feet; Mont aux Sources, about 10,000 feet, and Giant's Castle, 9,657 feet. From the main chain numerous transverse branches proceed nearly at right angles and form a series of minor water-sheds, separating the different streams. The mountains descend very gradually on the west and may be regarded as the abutments of a very elevated table-land, but they present precipitous fronts to the east and are so broken by chasms and ravines that they were at one time regarded as impassable.

Hydrography.—Natal has a great advantage over most of the districts of South Africa in its abundance of perennial streams, though these are all too shallow to be navigable. The many flow through precipitous ravines and rocky gorges. The most important rivers are the Tugela, which has a course of about 150 miles, its tributary, the Buffalo or Umsinyati, being also a considerable stream; the Umzimkulu; and Umkomanzi, farther to the south and the Umzikmku, which partly separates Natal from Cape Colony.

Geology and Mineral Resources.—The prevailing stratified rocks are sandstone and slate, often thrown into confusion and pierced by igneous rocks, particularly basalt, greenstone and porphyry, which assume the form both of continuous ridges and isolated hills and often cover extensive areas. The mineral productions are principally coal, iron-stone, limestone and marble. Coal is worked and is used on the railways and the iron-stone is also being utilized. About 3,000,000 tons is the normal annual output of coal and of gold about 2,000 ounces. There are rich gold-fields in Zululand.

Climate.—The climate of the province is extremely salubrious. On the coast the range of temperature is from 47° to 88°, giving an average in summer of 76° and in winter of about 55°; in the interior, at the town of Pietermaritzburg, the mean temperature of the coldest month, is 55°; of February, the hottest, 80½°; and of the whole year, 67°. During the rainy season (October to March) thunder showers are of almost daily occurrence. Long droughts are almost unknown.

Vegetation.—Under such a climate, and with a soil of considerable fertility, vegetation is obviously vigorous. Timber-trees everywhere exist in sufficient numbers for the wants of the colony and on the western frontiers as well as elsewhere form considerable forests, for the most part unencumbered by the underwood which prevails in Cape Colony.

Fauna.—The wild animals include the leopard, hyena, tiger-cat, antelopes, jackal, antbear and porcupine. The hippopotamus has still his haunt, in the great Natal River, and numbers of small crocodiles; while snakes, some of them venomous, are also plentiful. The birds comprise the vulture, several varieties of eagle and the secretary-bird, etc.

Agriculture.—The level districts of the interior, wheat, barley, oats, beans and vege-
tables of almost every description have been largely and successfully grown; but the chief crop everywhere is maize, of which even two good crops can be raised in the year. About 2,000,000 muids (200 lbs.) is the average annual output. In many parts the vine thrives well, and vanneries for the manufacture of wine are being established in unlimited quantities. In the coast districts, where the climate is tropical, the sugar-cane is cultivated with success. In similar localities tobacco, arrowroot, ginger, bananas, pine-apples, etc., also grow well. Tea has begun to be cultivated with good prospects and coffee is also grown to a small extent.

Commerce, etc.—The total value of exports amount to about $25,000,000, wool being by far the largest, others being gold, sugar, coal; the imports are valued at about $60,000,000, mostly manufactured goods. The railways, which belong to the government, have a length of 1,053 miles and extend into the Orange River Colony and Transvaal. Separate trade returns are not available since the establishment of that union.

Constitution and Government.—Natal, which had been annexed to Cape Colony in 1844, was placed under separate government in 1845 and under charter of 15 July 1856 it was erected into a separate colony. By this charter partially representative institutions were established and, under a Natal Act of 1893, the colony obtained responsible government. The province of Zulu-land was annexed to Natal in 1897. The districts of Vryheid, Utrecht and part of Wakkerstroom, formerly belonging to the Transvaal, were added to Natal in 1893. In 1910 the colony was merged in the Union of South Africa. The seat of the provincial government is Pietermaritzburg. There are an administrator appointed by the governor-general for five years and a provincial council of 25 members elected for three years, each council having an executive committee of four, the administrator presiding at its meetings. In the Union Assembly at Cape Town Natal has 17 members.

Education.—With the exception of higher education, which is under the control of the Union, education comes under the provincial administration. There are three government high schools, two preparatory schools, 73 government primary schools, two government art schools, one agricultural and trades school, five government Indian schools, two government schools for colored children, besides 107 government-aided schools and 163 government-aided farm-schools for European children. Also there are two technical institutes, 34 Indian schools, 302 native schools and 77 colored schools, all of which receive government aid, and a considerable number of private schools in the province. Three of the aided schools are secondary schools for girls. The aggregate number of European pupils in regular government-aided schools was 19,892 in 1916; the average daily attendance 86 per cent of the number on the registers. At the government high and preparatory schools there is an average daily attendance of 1,294 pupils. About 1,500 children attending private unaided schools and it is estimated that only a very small percentage of white children are receiving no education. The direct government expenditure on schools for 1916 was $628,300 (excluding expenditures for furniture, buildings, but including maintenance). Fees paid by pupils in government schools in the same year amounted to $114,445. The number of European children receiving gratuitous education was 3,695. The 302 schools for natives had a total enrolment of 24,700 and received in 1916 grants in aid aggregating $107,935 and the 34 Indian schools had a total enrolment of 4,438, for which a grant of $28,295 was expended.

History.—Natal owes its name to having been discovered on Christmas Day, 1497, by Vasco da Gama. In 1823 a small English settlement was formed on Port Natal. Subsequently large numbers of discontented Boers from the Cape Colony entered the country as settlers. A treacherous massacre of part of the Boers by Dingaan, chief of the Zulus, in 1838, led to hostilities, in which Dingaan was ultimately driven beyond the frontiers. In 1839 the Boers proclaimed themselves an independent republic, also declaring their determination to establish diplomatic relations with the British powers. The establishment of a hostile settlement at the only port between Algoa and Delagoa bays, and at a valuable entrance from the coast to the interior of South Africa, was so obviously incompatible with British interests that a force was dispatched from the Cape and after some fighting the Boers submitted, except a discontented section, who retired beyond the Drakensberg range. The territory was proclaimed British in 1843. It formed an integral part of the Cape Colony until 1856, when it was erected into a separate colony. Its prosperity has been affected by the Kaffir troubles, as well as by the British complications with the Transvaal Boers; and in 1899-1900 it suffered severely in the South African War (q.v.). There was a Zulu insurrection in the Tsongas region in 1906, thousands of the natives losing their lives in the subsequent fighting. By referendum in 1908 Natal determined to join the Transvaal, but in the following year was admitted as an original province of the Union of South Africa, having 1,108,754, including 1,011,645 native or colored and 97,109 Europeans.

J. B. McDONnell.

NATAL, Brazil, the principal seaport and capital of the state of Rio Grande do Sul, lying on the right shore of the Potonay River near the Atlantic, 150 miles north of Pernambuco. Notwithstanding the sand-bars at the entrance to the harbor, considerable export trade is carried on chiefly of cotton, sugar, rubber, hides, hemp, number, etc., about $1,000,000 annually. The United States is represented by a consul agent. Natal was originally called Cidade dos Reis. Pop. 15,000.
NATALIE, nát'a-lé, a queen of Serbia; b. 14 May 1859. She is a daughter of Pierre Ivanovitch Keschkko, a Russian officer, and married Prince Milan, afterward king of Serbia, in 1875. The marriage turned out unhappily and the union was broken in 1886, when Milan obtained a divorce. The king abdicated in the following year, and Natalie, retiring to Belgrade, the Serbian capital, resided there for a time with her son, King Alexander, enjoying the favor of the people; but in 1891, at the request of the National Assembly, left the country on account of political interests. Becoming reconciled to Milan in 1893, she resumed her former relations with the royal family; and returning to Belgrade in 1895 she was greeted by the people with every token of popularity. Her residence has since been chiefly in Biarritz, France; and after the assassination of King Alexander (1903) the political authorities at Belgrade decreed that she should not again enter the Serbian kingdom. She became a Roman Catholic in 1905.

NATATORIB, an obsolete group of birds, the swimmers, artificially allied by illiger on their likeness in pursuing an aquatic life, but structurally having relationships with several natural orders. Similar illogical groupings in the same by-gone but once popular classification were Camartorio, the screamers; Scolarios, the climmers; Corsauros, the runners, etc.

NATCHEZ, ná-cház, Miss., city, county-seat of Adams County, on the Mississippi River, and on the Yazoo and Mississippi Valley, the Mississippi Central, the Natchez and Southern and the Saint Louis, Iron Mountain and Southern and Louisiana and Arkansas railroads. 297 miles by rail and 470 miles by river from Memphis, and 214 miles by rail and 265 miles by river from New Orleans. It has steamner connection with all the Mississippi River ports. The country surrounding Natchez is chiefly devoted to livestock and agriculture; cotton is the principal product. The principal industries of the city are packing plants, box factory, cotton mills, broom factories, oil mills and candy factories. It has ice faciies, planing mills, foundries, machine shops and furniture factories. Natchez has a large trade in cotton, shipping each year thousands of bales. Considerable rice and sugar-cane are shipped from this port. The city has a Confederate Memorial Park, Baker Grand Theatre, Duncan Memorial Park, and public buildings, Institute Hall, several excellent hotels and a large number of handsome residences. It is the seat of Jefferson Military College; Natchez Institute; and Natchez College (colored); has good public and parish schools, the First Library and the Carpenter public library. Natchez has one Associated Press paper. There are four orphanages, a charitable hospital, three sanatoriums and a number of private schools. The government, in accordance with the charter of 1877, is vested in a mayor, who holds office two years, and a council. The school board are elected by the council. The waterworks are municipal property. The city is built on a bluff about 200 feet above the river. On the left of the city's settlement, by Bienville, who built here Fort Rosalie in 1716. The place was destroyed and many of the inhabitants murdered, in 1729, by the Natchez Indians. The fort came into possession of the English in 1763, when the name was changed to Fort Panmure. In 1779 the Spaniards took possession, and in 1793 the United States became undisputed owner of lands east of the Mississippi, which included Natchez and much of the adjacent territory. From 1798 to 1820 Natchez was the capital of Mississippi; in 1803 it was incorporated as a city. During the Civil War the city suffered considerable loss of property, and damage. In 1862 Commodore Porter shelled the city, and in 1863 Federal troops took possession and retained control until peace was declared. On a bluff just outside the city limits is a national cemetery and an observatory affording extensive views. Pop. 15,000.

NATCHES, nák-cház, La., town, parish-seat of Natchitoches Parish, on a short stream which flows into the Red River, and on the Texas and Pacific Railroad, about 150 miles in direct line northwest of Baton Rouge. The town is on the site of what was once a French trading post established in 1714. It is situated in an agricultural region in which the chief products are sugar-cane and cotton. Considerable attention is given to stock-raising. The principal industries of the town are connected with the shipment of the agricultural products and livestock. It is the see of a Roman Catholic bishop, and there is a Normal School and Saint Mary's Academy (R. C.); it has a high school, public and parish elementary schools. Pop. 2,600.

NATHAN, Hebrew prophet in the time of David and Solomon. He was in his day the latest direct descendant and representative of the school of the prophets under Samuel. Saint Jerome mentions a Jewish tradition which identifies him with the eighth son of Jesse, but there is no ground for this supposition. His earliest appearance in the history of David is as the king's counselor, advising the building of the temple and then after a vision announcing that the time had not yet come (about 1010 b.c.). His power, eloquence, and tact as a prophet are shown by his exquisite apologue of the ewe and the vine, which in the Gospel of John is said to be a symbol of his guilt in the case of Bathsheba (1000 b.c.). On the birth of Solomon the prophet named the child Jedidiah, "friend of the Lord," and was entrusted with his education. When the elder David had lost the fil's. settlement, by Bienville, who built here Fort Rosalie in 1716. The place was destroyed and many of the inhabitants murdered, in 1729, by the
and assistance at the inauguration of his successor (977 B.C.). Nathan's sons occupied high posts in the new court. Nabud being the king's friend and favorite, took the name of Azariah and was over the twelve officers which provided victuals for the king and his household. It was in accordance with the counsel and suggestions of this prophet that David, the year after his son's accession, crowned the work of his life, as poet, musician and promoter of a rich temple ritual, by introducing into public worship an orchestra of Levites. Eccles. ix, 14-16, a passage attributed to Solomon, is evidently an imitation of 2 Sam. xii, 1-2, which shows how the influence of Nathan was perpetuated in the literature of succeeding ages. In I Chron. xxxix, 29, and II Chron. ix, 29, he is mentioned as historian of the reigns of David and Jonathan. He died about 935 B.C., and his grave is still pointed out at Halhul, five miles north of the ancient Hebron. An echo of his parable of the rich man with many flocks is found in the Koran, Sura xxxviii, 20-25.

NATHAN, MAUd, American reformer: b. New York, 1862. She was educated at private schools and Cooper Union. In 1883 she married Frederick Nathan; was speaker before the International Congress of Women, in London (1889), at Berlin (1904) and International Peace Congress, New York (1907), and International Conference of Consumers' Leagues, Geneva (1908). In 1908 she was also a delegate at the International Congress for Labor Legislation, Lucerne (1908), since which she has preached and lectured in the principal cities of the country. She was a delegate to the International Woman Suffrage Convention at Stockholm (1911) and at Budapest (1913) and numerous other conferences abroad. She has been president of the Consumers' League of New York (1897-1917) and vice-president of the National Consumers' League. Numerous periodicals have published contributions from her pen, and she has taken an active part in three municipal campaigns in New York.

NATHAN THE WISE. Lessing's immediate occasion for writing 'Nathan der Weise' ('Nathan the Wise') (1779) was the necessity of finding a form, to which the censor could take no exception, for final utterance of some sentiments on the subject of personal religion which he had very much at heart. During a controversy with the Pastor Goetz in Hamburg he had had abundant experience of the pharisaical intolerance of the Lutheran orthodoxy of his day; and, on the other hand, his dear friend Moses Mendelssohn gave him an example of one of the gentlest, most enlightened of spirits in a member of a despised and persecuted sect. The idea of a dramatic poem on the subject of 'Nathan' goes back, however, some 25 years before this time.

The central motif Lessing adapted to his purposes from one of the stories of Boccaccio ('Decameron,' first day, third novel): Saladin, desiring to extort money from the Jew Mehlizedek, invites him to declare which is the true religion. The Jew seeks to tell a story: a father, possessed of a precious ring and having three sons equally dear to him, causes two rings to be made so nearly like the true one that he himself can hardly tell which is which, gives each son one ring, and nobody can decide who is heir of the original. So it is with the three principal religious faiths. Lessing's version attributes to the true ring the special virtue of man, which, when seen in the sight of God and man, provided he wears it confident of its effect. Proof, then, for each son that his ring is genuine will appear in the use that he makes of it. The moral is obvious: faith is the working of salvation; the possession of the truth. And from this follows a sufficient principle of conduct: act so as to deserve, and the right that you earn is right indeed, so far at least as any human being can judge.

As a dramatic poem this noble plea for humanitarianism certainly leaves much to be desired. The dialogue is too rationalistic and the versification too mechanical. These very defects, however, being in the direction of realism, secured for the German drama after Lessing's version the opportunity for a new development in verse, of which the artificial Alexandrines of the school of Gottsched contained no promise. And on the stage the great scene (III, vii) between Nathan and Saladin is so charged in effect as it is sublime in idea. Conflicting interests on the part of the other characters are also resolved in dramatic manner by a change of heart; but the discovery of blood relationship between some of the more important, while it enhances the potential tragedy in the previous state of misunderstanding, takes from the dramatic impressiveness of the dénouement somewhat to add to the impressiveness of that doctrine of human brotherhood which the whole piece inculcates. Accordingly, 'Nathan der Weise' has been theatrically most successful in times when its doctrine was particularly at issue. But never has it lost its claim to respectful attention as one of the classic plays to be regularly presented as a matter of course.

NATHANIEL, one of the earliest believers in and follower of Christ. He was a native of Cana in Galilee and attached himself to Jesus on becoming convinced of the messiahship of the son of Mary by his miraculous insight and power of reading the heart (John i, 46-49). On the hypothesis that he was one of the 12 he has been identified with Bartholomew, but on insufficient grounds. There is a tradition that Nathanael was the bridegroom at the marriage at Cana, and Ephraimus implies that he was one of the two disciples whom Jesus overtook on the way to Emmaus.

NATHORST, ná'hörst, Alfred Gabriel, Swedish scientist: b. Wäderbrunn, near Nyköping, 7 Nov. 1850. He studied at Lund and Upsala, served (1874) as privat docent in geology at Lund and (1873-84) as geologist on the royal Swedish geological research, becoming (1885) intendant of the palaeontological plant collection of the Stockholm Riks Museum. In 1870 and 1882 he was exploring in Spitzbergen and (1873-84) in South and central Sweden. In 1883 he accompanied the Nordenskiöld expedition to Greenland and (1898) led an Antarctic
NATICA.—NATIONAL ASSOC. OF CORPORATION SCHOOLS

expedition. His researches in the field of glacial flora and fossils were very fruitful. In 1880 he published 'Verzoehnte Geologie' (Stockholm 1888–94) ; 'Sveriges Geologi' (ib. 1892–94) ; 'Zur fossilen Flora der Polarländer' (ib. 1894—) ; 'Två somrar, i Norra Ishalvet' (ib. 1901) ; 'Polarforsknngen' (ib. 1902). He also edited (1895–98) the periodical 'Ymer.'

NATICA, a genus of sea-snails, forming the type of the family Naticidae. The shell is globose in form, the spiral portion being minute and indistinctly marked, smooth and porcelain-like and its aperture of large size and semicircular form. The animal appears large in proportion to the shell, the foot especially being extensive. The mantle-lobes partly conceal the shell, and an operculum is always present. Most of the genera of this family are marine, and the white, chalky N. heros is a familiar species all along the eastern coast of the United States, and lays its eggs in a collar-shaped mass of glutinous material mixed with sand which often excites the curiosity of the stroller by the seaside. This shell is the one most frequently chosen by our hermit-crabs. It may attain a diameter of three and a half inches and a length of five inches. South of Cape Cod naticum duplicata is common. Consult Arnold, 'The Sea-Beach at Ebb Tide' (1901).

NATICK, nà’tlk, Mass., town in Middlesex County, on the Charles River and on the Boston and Albany Railroad. The head of Cochituate Lake, one of the sources of the water supply of Boston, is in the northwest part of the town. The place was founded by John Eliot (q.v.), and from 1651 to the time of the founder's death it was used chiefly as a home for converted Indians. In 1781 it was incorporated as a town. The chief manufactures are shirts, men's clothing, boots, shoes, edge tools, boxes, baseballs and supplies for athletic games. A monument in honor of John Eliot is in one of the public parks and a soldiers' monument in another park. Some of the educational institutions are the Morse Institute, the Wheaton College for young women and the Bacon Public Library. Pop. 10,026. Consult Hurd, 'History of Middlesex County, Mass.'; Bacon, 'History of Natick.'

NATION. See NATIONALITY; NATIONALISM.

NATIONAL ACADEMY OF DESIGN. An American association devoted to the fine arts, membership in which is limited to 125 painters, 25 sculptors and 25 architects and engravers. In 1906, joined by the Society of American Artists (q.v.), the National Academy became affiliated with Columbia University and the Metropolitan Museum of Art. The school of design conducted since 1825 in connection with the academy is located at Amsterdam avenue and 109th street and is open for instruction from October to May; the main exhibition building of the society is at 215 West 57th street. The instructors in the school are selected from the governing council of the academy, which consists of its officers and six members. The average annual attendance of students is between 200 and 300. The annual exhibitions of the National Academy are features of the art life of the metropolis, interest being focussed on the awards of the Inness gold medal for the best landscape, the Halgarten prizes respectively of $300, $200 and $100, and the Clarke prize of $300. First known as The New York Drawing Association, a secession in 1825 of young artists from the first academy of arts in New York founded in 1802, the present name was adopted in 1825 when the society composed of 30 members with Prof. S. R. Morse (q.v.) as president, was incorporated. Consult Cummings, T. S., 'Historic Annals of the National Academy of Design' (Philadelphia 1865); Catalogues of the Annual Exhibitions (New York 1826, to date).

NATIONAL ACADEMY OF SCIENCES, The, an American institution, founded in 1863, consisting of 100 members, elected from among the most distinguished scientific men of the United States; analogous to the Royal Society of London.

NATIONAL APPROPRIATIONS. See APPROPRIATIONS, AMERICAN SYSTEM OF; BUDGET, AMERICAN.

NATIONAL ASSOCIATION OF CORPORATION SCHOOLS, The. In 1911 The New York Port Harbor Commission commercial school to correct faulty fundamentals of employees of that company; to train employees in the duties they were then performing, and for more advanced work. As the movement progressed there was publicity in the New York press which resulted in a large number of inquiries from members of industrial institutions throughout the United States as to: (1) Why the school was established. (2) What was taught in the school. (3) What results had been attained.

The volume of such requests led to the conclusion that there was need for a clearing-house to which those interested might contribute and from which they might secure information. This plan was discussed by the organizer and a few acquaintances who were interested in the subject of better education and better training for the workers of the United States.

After several months of preliminary effort an organizing convention was held at New York University on 24 Jan. 1913. At this meeting several institutions sent delegates. A provisional organization was perfected and officers chosen.

On 4 April following the executive committee met, declared the charter closed and The National Association of Corporation Schools was a reality. In the fall of 1913 the first annual convention was held in the Hall of Education of the National Cash Register Company at Dayton, Ohio, and in 1914 the annual convention was held in the auditorium of the Curtis Publishing Company in Philadelphia. The 1915 meeting was held at the Hotel Bankcroft in Worcester and in 1916 convention at the Carnegie Institute of Technology in Pittsburgh. In 1917 the association met as the guests of the Larkin Company at Buffalo. The 1918 convention was scheduled to be held in Chicago, but upon the entrance of the United States into the World War the association pledged its members and its resources to the government. Because of the peculiar fitness of membership nearly all of the active workers were taken into government service in some
NATIONAL ASSO. OF MANUFACTURERS — NATIONAL BANKS

capacity, which prevented the meeting at Chicago.

The commercial school established by The New York Edison Company was not the first corporation school in the United States. There are different claims as to where the first school of this character was held. The Pennsylvania Railroad Company, prior to the Civil War, held conferences at its Altoona shops, and the Werenb Book Publishing Company of Akron, Ohio, early in the eighties, held meetings for the purpose of discussing... Other industrial institutions have come forward with claims of having established schools, but the most authentic information regarding educational activities on behalf of employees of an industrial institution indicates that the first school to be called a school, inaugurated by an industrial institution was held by the National Cash Register Company in April 1896. This school has been convened more or less consecutively from that time on down to the present date.

The growth of the Association has been steady, and now embraces in membership a total of 117 industrial institutions, including over 70 different branches of the industries of the United States.

NATIONAL ASSOCIATION OF MANUFACTURERS, Ths. A convention, consisting of several hundred representative American manufacturers, met in Cincinnati, Ohio, 22 Jan. 1895, and provided for the organization of a national association of manufacturers. At the first annual convention of the Association held in Chicago 21 Jan. 1896, the name "The National Association of Manufacturers of the United States of America" was adopted, a preamble setting forth the objects of the Association was published, and a constitution was adopted. The constitution has been revised, elaborated and amended several times to cover the constantly expanding activities of the Association, and in 1908 a new constitution was adopted.

The general objects for which the Association works are: (1) the promotion of the industrial interests of the United States; (2) the fostering of domestic and foreign commerce; (3) the betterment of the relations between employers and their employees; (4) the education of the public in the principles of Individual liberty and the ownership of property; and (5) the support of legislation advancing development along the lines above defined, and opposition to legislation retarding it.

To the individual manufacturer the Association offers its trained and practical assistance in supplying accurate and reliable information on pertinent subjects, and organized protection against abuses and unlawful and unjust exactions, unbiased mediation in cases of dispute, and the furtherance of cordial relations between the several members.

The foreign trade department has been highly organized in three divisions devoted to (1) Latin-American trade; (2) Russian trade and trade with Spain, for which six bureaus is devoted to general information; foreign buyers; credits; translations; trademarks and publicity. These are in charge of a staff of experts in the several lines, and are in constant communication with a corps of over 2,000 correspondents located in every city and town of commercial importance in all foreign lands.

To the individual member of the Association the foreign trade department offers quotations and suggestions from foreign markets; confidential reports on foreign trade opportunities; advice as to advertising, financing foreign accounts, foreign collections, etc.; reports on the financial standing of foreign firms; translations of foreign letters; information as to the customs duties of all countries and shipment thereto; registration of trademarks, etc.

The law department is devoted strictly to matters which pertain to the pursuits of the Association, and aims to keep its members fully abreast of all decisions and interpretations of the law which can in any way affect their business interests.

In the home department the Association has a number of committees specializing on health and safety; industrial betterment; industrial publicity; industrial education; immigration; banking and currency; trade practices; uniform State laws and foreign trade.

Though its business corporation, "The National Manufacturers' Company," the Association publishes a monthly magazine under the title American Industries, and issues periodically The American Trade Index containing alphabetically paragraphs concerning the business and products of its several members. These are indexed in several foreign languages and are sent to prominent merchants and buyers in foreign countries. Nearly 44,000 copies of this index have been thus distributed.

The membership consists of individuals, firms and corporations actually engaged in manufacturing. The executive officers, the president and the treasurer are elected annually by ballot and the secretary is appointed annually by the executive committee. The executive committee consists of the president, the treasurer, secretary, a vice-president from each of the 12 States having the largest recorded membership in the Association upon election day of its annual convention, and any members at large elected by the executive committee as thus constituted. The members paying the same annual dues, $50, are exactly similar in voting power in the annual conventions, and the democracy of management is further secured by the choice of vice-presidents by the different State delegations attending the annual convention. The entire income of the Association is expended in the interest of its members; the president, vice-presidents and the directors serve without compensation. The Association maintains an extensive reference library at its general offices in New York City.

NATIONAL ASSOCIATION FOR THE STUDY AND PREVENTION OF TUBERCULOSIS. The, an organization composed of prominent Americans who are especially interested in preventing the further spread of consumption. The headquarters are at 105 East 22d street, New York.

NATIONAL BANKS. See Banks and Banking—National Banking System.
NATIONAL BOARD OF HEALTH. The, a Federal body, instituted by Act of Congress, 3 March 1879, to consist of 11 members—
one army surgeon, one navy surgeon, one medical officer of the marine hospital service, one officer of the Department of Justice and seven physicians from civil life appointed by the President. Industrial development had rendered all sections of the country interdependent in matters of health, and isolation was no longer possible. At the period of the passage of the Act of Congress there were only State and local systems of quarantine in existence in the United States, and Congress did not regard them as adequate to meet all the emergencies that had arisen or that might arise in the prevention of the introduction of contagious and infectious diseases from foreign countries. The Act was designed to establish a complete and effective system of quarantine to the Unit States. National authority was required to have (1) international sanitary co-operation; (2) the collection and distribution of sanitary information; (3) the preparation of maritime sanitary regulations; (4) the enforcement of maritime sanitary inspections in foreign ports; (5) the erection and maintenance of refuge stations; (6) the aid of State authorities; (7) the organization of quarantine where none exists; (8) the power to add necessary rules to any deficient quarantine. A further act (2 June 1879) defined the powers and duties of the Board and transferred to it the quarantine work formerly conducted by the Marine Hospital Service. This Act limited the duration of the Board to four years so that it expired by limitation 2 June 1883. Its work was carried on during 1884 and 1885, when, the appropriation being exhausted, its activities ceased.

The work is now performed by the Bureau of the Public Health Service under the direction of the surgeon-general, and as a part of the Treasury Department. Consult Allen, 'Rise of the National Board of Health' (1899).

NATIONAL BOUNDARIES. See Boundaries of the United States.

NATIONAL BOUNDARY CHANGES. For the decisions and awards of the Peace Conference relating to the various nations, see War, European.

NATIONAL BUDGETS. See Budgets, American; Appropriations, American System of.

NATIONAL CEMETERIES are burial grounds, instituted by Act of Congress, for the interment of United States soldiers and sailors who have fallen in battle or all men and women who have died in the regular or volunteer military or naval service of the United States after having been mustered out or honorably discharged. The presentation of the commission warrant, letter of appointment, or discharge, and the certificate, provided there be no dishonorable charges connected therewith, are sufficient evidence for interment. Wives of officers and enlisted men may be interred in national cemeteries, according to certain regulations. Na-

NATIONAL CITY BANK OF NEW YORK, The, chartered 16 June 1812, under 'An Act to incorporate the stockholders of the City Bank of New York,' was directly related to the dissolution of the first Bank of the United States, the charter of which, dated 1791, had expired in 1811, and was extended, owing to political opposition to the Bank of the United States. The closing of the bank creating a need for a new strong banking institution in the metropolis, the directors of the City Bank of New York arranged that the holders of stock in the Bank of the United States might exchange that stock, upon equitable terms, for stock in the City Bank, and this offer was avail of to the extent of 10,000,000 shares, or $500,000 par value, of City Bank stock. As this comprised more than a majority of the original capital, the City Bank may be fairly said to have been a direct offspring of Alexander Hamilton's Bank of the United States. It opened for business in the banking-room that had been occupied by the New York or pension branch of the United States, at 52 Wall street, and remained in that location until it moved in 1908 into its present home, a handsome modern structure with a perfect equipment at 55 Wall street. The authorized capital of the bank was $2,000,000.
in shares of $50 each, but it commenced business with $800,000 of capital paid up at one of the most critical periods of the country's history. The records of the institution afford complete evidence of the political and commercial activities and condition of the nation from 1812 onward. Upon the establishment of the national banking system, the bank surrendered its State charter and entered the new system as The National City Bank of New York. The efforts of successive management have always been energetically directed toward broadening and perfecting the scope of the institution for the accommodation of the rapidly expanding business interests of the United States, and the volume of business handled by the bank has increased until all banking records for an institution without branches in its own country have been surpassed. The bank has been foremost in its efforts to develop international trade, it has established branch banks in South America, the West Indies and in Carribbean countries. It has also acquired the International Banking Corporation, which has branches in many parts of the world; a large number of these are located in the Orient and Far East. For over 16 years The International Banking Corporation has been serving the commercial interests with banking facilities. At the present time the bank has 31 branches doing a general banking business and aiding in the development of international commerce. The latest statement, 4 March 1919, shows the capital at $25,000,000, surplus and undivided profits $54,495,013, loans, discounts, and investments, $364,153,179, deposits $770,263,453, total resources $894,270,410. Night and day forces are continuously at work. The bank's staff consists of 1,700 employees and connected with the clerical force is the City Bank Club organized in 1904, and now numbering practically all employees as members. Educational work with recreation is systematically carried on; notable among the activities are the advanced courses of instruction, largely attended, in economic banking, foreign exchange, law and kindred subjects.

NATIONAL CIVIC FEDERATION, an American organization, founded 16 Dec. 1903 by a number of local ministerial conventions representing capital and labor. Its purpose is to seek, by an organization of the best thought in the country, a solution of industrial problems; to assist in the enlightenment of public opinion through study and discussion of national questions; and to promote progressive social and industrial legislation when it seems desirable. It is entirely non-partisan in principle, considering such topics as imperialism, trusts, tariff, taxation, etc., with a view of obtaining the clearest understanding of them. The Federation is controlled by a national executive committee of three factors: the public, represented by the church, the bar, the press, statesmen and men of affairs; employers, represented by large manufacturers, corporation heads and officials of employers' organizations; and labor, represented by official members of labor organizations. This committee, numbering 54, meets annually, or at such other times and in such localities as may be deemed advisable. Its membership consists of men from all parts and of all occupations of the country, including a large number prominent in the various pursuits of life.

In the natural expansion of its activities the work of the Federation has been very highly organized under nine general departments, as follows: (1) Trade Agreement Department, devoted to the advancement of industrial peace; (2) Industrial Conciliation Department, dealing particularly with actual or threatened strikes or lockouts, the adjustment of labor disputes by arbitration and the creation of definite contractual relations between employers and employees; (3) Industrial Economics Department, devoted to the study and discussion of the practical phases of economics as applied to industrial problems; (4) Industrial Welfare Department, with the duty of promoting sanitary working conditions, technical training, housing of employees, the conduct of insurance and pension systems and savings and loan operations, etc.; (5) Public Employees Welfare Department, devoted particularly to the economic benefit of that much neglected class of workers; (6) Public Utilities Commission, assigned to the study of the results of public ownership of public utilities in all countries; (7) Immigration Department, concerned with the questions arising from immigration, governmental regulations and safeguards of the country at large, and individual localities in particular; (8) Political Reform Department, devoted to the teaching of practical non-partisan politics, the enlightenment of voters and the promotion of active participation in civic and national politics; (9) Women's Department, in which nearly all the members are women who are actively interested in industrial enterprises as stockholders, and in active welfare work, such as prison reform, rural betterment, community nursing and the like.

Under the general departments there are committees almost without number assigned to carefully delimited lines of investigation and operation, their members selected especially for notable aptitude in their specific subjects. With the entrance of the United States into the war, the Federation has found an entirely new series of problems presenting, and its membership has furnished well-equipped minds to attack them intelligently and effectively.

Within recent years the work of the Federation has been intensively developed by the organizations of State councils all over the country, to aid in unifying laws on intrastate matters and to further co-ordination of State and Federal legislation on subjects of public welfare.

At the present moment the industrial economics department has under way a comprehensive survey of social and industrial conditions under 26 separate committees, each composed of members specializing in the particular phase of the investigation to which they are assigned.

The chief mission of the National Civic Federation being educational, one of its most important functions is to give publicity to its labors. This duty is assigned to a bureau of publicity, which besides issuing large numbers of pamphlets and leaflets for general distribution conducts a monthly magazine, The National Civic Federation Review, in which is preserved the records of results achieved by the several committees.
NATIONAL CONFERENCE OF CHARITIES AND CORRECTION, an American association composed of State boards of public charities and various charity organizations. The national conference is held each year in some city determined upon at a preceding meeting. At these conferences papers are read and general subjects embraced under charity and correction are discussed. The Conference publishes its Proceedings and a National Bulletin monthly, and maintains a bureau of information on all subjects concerning charities and corrections.

NATIONAL COVENANT, a league formed by Scotch Presbyterians in 1638. See COVENANT.

NATIONAL CONVENTION, in France, a legislative body constituted in the hall of the Tuileries 17 September and formally opened 21 Sept. 1792. The third assembly of the deputies elected by the French people after 1789 decreed the suspension of all trials and the suppression of the Jacobins. Its first act was to make France a republic by abolishing the throne, and this was followed by the trial and sentence to death of the king. Interests and ambitions arose between the Jacobin or Montagnard party and the Girondists, resulting in the overthrow of the latter. The convention sent thousands of its political opponents to the guillotine, and the Reign of Terror under the dictatorship of Robespierre was followed by his downfall and the suppression of the Jacobins.

The convention then existed till a new constitution was organized, and the executive directory was installed at the Little Luxembourg, 1 Nov. 1795. The Chartists in England formed a national convention in 1839. In the United States a national convention is the meeting once in four years of a political party assembled to select a Presidential ticket. See ELECTION.

NATIONAL CONVENTIONS. See CONVENTION, POLITICAL.

NATIONAL DEBTS OF THE WORLD. Debt incurred by the nations has developed with startling rapidity in recent years. National debts in the year 1790 were, as nearly as can be determined, about $1,000,000,000, and in 1800 approximately $5,000,000,000. By 1900 they had grown to $31,000,000,000. At the beginning of the great European War in 1914 they were about $45,000,000,000, and in 1919 aggregated $225,000,000,000.

The first great increase in national indebtedness of the modern period was that caused by the Napoleonic Wars, which in 15 years increased the national debts of the world from $2,500,000,000 to over $7,000,000,000. From 1814 down to the middle of the century, a period of comparative peace, the growth of the national debts was slow, the total of all the debts of the countries for which statistics are available having been in 1850 approximately $12,000,000,000. In 1880 it was 31 billions, and at the beginning of 1914 45 billions. Then with the demands of the European War upon the nations participat-
Borrowing became comparatively easy. It is quite impossible, of course, to accurately measure the wealth of the entire world, especially at the earlier dates under consideration, for even at the present time we can only estimate the wealth of a score of the principal nations, but an examination of the wealth figures of a few countries for which data for earlier years can be had shows an extremely rapid growth in the last 40 years, and suggests that the available wealth of the world upon which the nations requiring loans were able to draw had very greatly increased during that period in which they developed great debts for other than war purposes. The wealth of the United Kingdom, for example, is estimated as having been about 30 billion dollars in 1865 against 90 billion in 1914; that of France is estimated at 25 billion in 1865 and 65 billion in 1914. Thus the wealth of these two fairly representative countries of Europe, speaking in broad terms, trebled in the half century immediately preceding World War I. On the other hand, the United States, a newer country, and having special facilities for the increase of its wealth through the development of its producing powers, the rate of growth has been much greater, increasing from 16 billion dollars in 1860 to approximately 200 billion in 1914, our own wealth having been in 1914 fully 12 times as much as in 1860, a rate which could not of course be applied to the world as a whole. In certain other countries, Canada, Australia, South Africa and parts of South America, the gain was also rapid, but the rate of growth of the world’s wealth is fairly exemplified by that of France and Great Britain, and it seems probable that the world’s available wealth practically trebled in that 40-year period, in which the nations of the world were doubling their national indebtedness in times of comparative peace.

The purposes to which the increase in debts was devoted are not difficult to trace. A half century ago the world was calling for railroads, steamships, inter-oceanic canals, better harbors, waterways on land, telegraphs and ocean cables to further facilitate communications and the interchange of commerce and its equivalents. With a third of the railways of the world now governmentally owned, and have been largely paid for by borrowed money. Of the 220,000 miles of railway in Europe about 120,000 are government owned; of the 70,000 in A. I. A., 45,000 belong to the governments of the countries in which they exist; of the 28,000 miles in Africa about 17,000 are owned by the governments of the respective colonies into which that continent has been divided or by the governments of the countries controlling those colonies; of the 23,000 miles in Australia over 20,000 were constructed by the government, while of the 360,000 miles in America only about 10 per cent are government owned. A large part of the railways of Russia, Germany, Austria-Hungary, Italy, France, England, the United States, and Portugal are government owned. The more or less government-owned railways comprise approximately one fifth of the total length of railways in the world.

transportation, inter-oceanic canals, harbors, inland canals and the deepening of rivers it will be apparent that the mere matter of transportation has absorbed a very considerable part of the indebtedness accumulated in the half century prior to 1914.

While much of the growth of national debts between the great war periods was for legitimate improvements in transportation and world progress, it must be admitted that the preparations for possible wars had much to do with the large national expenditures. At the same time, the debentures were encouraged the debt habit. During the 40-year period of debt making without war the countries of Europe built up and maintained as a permanent part of their establishments enormous standing armies, which not only withdrew large numbers of persons from the productive industries, but required large sums of money for their equipment and maintenance, and at the same time they greatly enlarged their navies, and this was undoubtedly one of the important causes of the very large increase in the world’s accumulation of indebtedness during the period 1874-1914, in which world debts doubled in a time of comparative peace. The 1913 debts of the European countries were about $1,400,000,000; the United States $2,300,000,000, South America $2,300,000,000, North America $2,100,000,000, Africa $1,500,000,000 and Oceania $2,000,000,000. Of the world’s national debts in 1874, which aggregated at that time about $22 billion dollars, about 13 billion were owned by European countries, and the remainder distributed among the other grand divisions, that of North America alone being approximately 3 billion dollars.

Of the 45 billion dollars of national debts in existence at the beginning of the year 1914 about 34 billion dollars were owed by the countries which entered the war. France stood at the head of the list with an indebtedness of $6,346,000,000; Germany (including the German states), $5,027,000,000; Russia, $4,336,000,000; Austria-Hungary, $3,869,000,000; United Kingdom, $3,486,000,000; Italy, $2,921,000,000; Australia, $1,433,000,000; Japan, $1,241,000,000; United States, $1,028,000,000; Portugal, $943,000,000; Belgium, $626,000,000; Turkey, $624,000,000; Canada, $426,000,000; Brazil, $438,000,000; Rumania, $316,000,000; Bulgaria, $135,000,000. This list of countries whose total debts at the beginning of the war were $33,657,000,000 includes only those which actively participated in the fighting, and in the war period they practically sextupled their indebtedness as shown by the tabular statement which follows this discussion.

The relation of national debts to national wealth is of course of great importance, but can only be discussed in very general terms, owing to the fact already mentioned, that no country other than the United States takes a wealth census, and figures on the wealth of other countries are at the best only estimates; while figures as to income of a country are therefore estimates based on estimates, the estimates which have been made of the wealth of the principal countries in 1919 it would appear that the ratio of debt to wealth in 1919 would be in case of the United States about 8 per cent, Great Britain, about 10 per cent. The per capita indebtedness of the principal countries in 1919 is: United States, $223;
Great Britain, $700; France, $800; Germany, $675; Italy, $350.

Practically all of the loans made by the great nations of Europe have been issued by the governments at less than their face or par value. The first of the British war loans in the great European War (that which bore an interest rate of 3$% per cent was issued by the government at 95 per cent, or at 5 per cent below par; a part of the third was issued at par and a part at 95 per cent. The German loans were issued at slightly below par, 97$% per cent in some cases, 98 per cent in others and 99 per cent in one instance; those of Italy at from 90 to 97 per cent of their face value, while in the case of France the first National Defense Loan bore an interest rate of 5$% per cent and was sold by the government at 88 per cent of its face value, and in the second loan, which bore an interest rate of 5 per cent, the issue was made at 88 per cent while a still later loan was issued at about 70 per cent of its face value, the Austria-Hungary loans which bore interest at the rate of 3$% per cent in most cases were issued at from 93 to 97 per cent of their face value. As a result of this the amount of money which European governments have actually received upon their loans issued since the beginning of the war is nearly 3 billion dollars below the par value of the securities issued, upon which par value the present generation must pay full interest while the later generations who meet the principal of the bonds will have to pay approximately 3 billion dollars more than was received by the government which issued them. The United States is in fact the only one of the great nations making popular loans in behalf of the war which actually sold its bonds at their full face value. And many of the securities of the European countries sold at less than par have also been paid for in a paper currency more, or less depreciated.

A very large proportion of the national loans issued by governments other than the United States in former years were also sold by the issuing governments at less than their face value, in most cases at from 2 to 5 per cent below par.

Loans made by the United States government have usually been issued at their full face value. In the very early days there were a few exceptions to this general rule. A 22-year bond issued in 1796 was sold at 87$% per cent of its face value; a 16-million dollar issue in 1813 was sold at 88 per cent; another in August of that year at 11$% per cent discount, and in 1814 sundry issues at a discount of 20 per cent. Again in 1842 there was one small issue at 97$% per cent, and in 1861 two larger issues at 99 per cent of their face values. During the Civil War apparently all of the numerous bond issues made by the government were sold at par, and in a few cases above par, but were paid for in the depreciated currency of that period—greenbacks—which were accepted at their face value.

Of the world's national debts which existed at the beginning of 1914 a large part were held in Europe, and practically all of those issued after 1914, aside from those of the United States, were taken in Europe. Of the total of the world's national debts at the beginning of 1914, 43 billion dollars, about 32 billion dollars were the obligations of European governments, approximately 4 billion dollars of Asiatic governments, 2$½ billions South American, 2 billions Oceania and 1$½ billions Africa. Practically all of the European government issues, amounting to 32 billion dollars in Europe, most of them in the countries by which they were issued, except in the case of Russia, Italy, Spain, Portugal and certain of the Balkan States. A very considerable proportion of the Russian securities aggregating about 4$½ billion dollars at the beginning of the war were held in France, Germany and Great Britain, and this was true to a considerable extent of those of Italy, Spain, Portugal and the Balkan States. Of the South American securities, a large proportion were held in Great Britain and France. Those of North America were chiefly held at home; those of Asia in part in Great Britain, France and Germany, but a considerable share was held in Asia, while those of the British colonies in Africa and Oceania were largely held in Great Britain. Practically all of the great loans made by the European countries since 1914 (with the exception of the $500,000,000 marketed by the British and French in the United States) were placed among the people of the country issuing them, in the form of popular loans, though some parts of the early Russian loans were probably taken in Great Britain and France. This fact, that most of the obligations of the nations are held by their own people, is the one mitigating feature of the enormous increase in national indebtedness of today. The payment of the debts will not send out of the country the money so paid, while the greatly increased interest payments are also distributed among home population.

* Includes debts of Austrian Empire and Hungarian Kingdom.
† Includes debts of German states chiefly created prior to the formation of empire.
‡ Does not include debts created by Bolshevik government.
†† Includes debts of the six colonies of Australia, created prior to their incorporation as the Commonwealth of Australia in 1901.

O. P. Austin, Statistician, National City Bank, New York

NATIONAL EDUCATION ASSOCIATION,
since 1870 the name adopted for the
National Teachers' Association founded at
Philadelphia, Pa., in 1857, an organization com-
posed of teachers and other persons interested
in education. Its purpose is the discussion of
topics relating to the education of the whole
people, to the end that the profession of teach-
ing may be elevated in its character, that its
interests may be advanced and that the cause
that it represents may be promoted in the
United States. The Association exists as a body
corporate of the District of Columbia, under
the name of the National Education Association
of the United States, by virtue of an act of incorporation
passed by Congress and approved
by the President 30 June 1906.

Section 2 of the act provides that "This cor-
poration shall include the National Council of
Education and the following departments, and
such others as shall be created by organization
or consolidation, to wit: the departments (1)
of superintending libraries; (2) of normal schools; (3)
of elementary education; (4) of higher educa-
tion; (5) of manual training; (6) of art edu-
cation; (7) of kinder education; (8) of music educa-
tion; (9) of secondary education; (10)
of business education; (11) of child study;
(12) of physical education; (13) of natural
science instruction; (14) of school administra-
tion; (15) the library department; (16) of
special education, and (17) of Indian educa-
tion, the powers and duties and the number and
names of these departments and of the National
Council of Education may be changed or abol-
ished at the pleasure of the corporation, as pro-
vided in its by-laws."

The membership consists of three classes:
active, corresponding and associate members.
Any eligible person may become an active mem-
ber upon application endorsed by two active
members by paying an enrollment fee of $2
and the annual dues of $2 for the current year.
Teachers and all who are actively associated
with the management of educational institu-
tions, or who are educational publica-
tions, are eligible for active membership.
Only active members have the right to vote
and to hold office. All active members are en-
titled to a volume of the Proceedings.
Corresponding members, whose number shall not
exceed 50 at one time, shall be eminent edu-
cators not residing in America. They shall
be elected by the board of directors and shall
receive the volume of Proceedings without the
payment of any fee. Associate members pay
an annual fee of $2 and may receive the volume
of Proceedings by formal application. The
board of trustees consists of four members,
elected by the board of directors for a term of
four years and the president of the Association,
who is ex officio a member during his term of
office, shall be one of them. The board of trustees
may be found in full in the Proceedings (1906 et seq.).
The several departments engage in the special
work of education which their names indicate.
The National Council of Educa-
tion is a deliberative body, whose functions
need brief elaboration. One of them is the
proposal to the board of directors of suitable
subjects of investigation and research and the
recommendation of the amount of money that
should be appropriated for that purpose. When
the board of directors authorizes special studies
and investigations the council selects the mem-
bership of the committees to make them. Sev-
eral important reports have issued from such
committees and may be obtained by correspondence
with the secretary of the Association.
The council consists of 60 members, selected from
the membership of the Association. The board
of directors annually elects five members and
the council the same number, each to serve for
six years and until the expiration of the terms for
which they are elected. All members become honorary members on the
expiration of the terms for which they are elected. They are privileged to attend the ses-
sions of the council and participate in its discus-
sions. No State is entitled to more than
eight members.

History.—The Association was organized in
1857 as the National Teachers' Association. It
was an extension of the State association ideas
to the country at large. To T. W. Valentine,
vice-president of the State Teachers' Association
of New York, belongs the credit of initiating
the movement. In conference with D. B. Hagar,
of the Massachusetts Association, a call for a
convention was agreed upon and prepared by
the latter in 1856, in pursuance of which a small
number of men gathered in Philadelphia,
1857. At this meeting the National Teachers' Association
was founded with Zalmon Richards
of Washington, D. C., as president. There
were 43 members enrolled but 12 States and
the District of Columbia were represented.
At the Indianapolis meeting of 1869 the word
"person" was substituted for "gentleman," in
the section defining eligibility for membership.
Women were thus admitted to full membership.
Meetings were held annually in the different
States and before 1870 all discussions were held
before the whole Association as a body. In that
year the department feature of the Association
was introduced and the name changed to the
National Education Association. Some of the
departments had existed previously as independ-
et associations. This was the treatment of normal schools, formerly the American
Normal School Association, and organized at
Norwich, Conn., in August 1858 and of the
department of superintendence, which was
previously the National Association of School
Superintendents, organized at Harrisburg, Pa.,
in August 1865. Although the Association drew
its membership from all parts of the country
the attendance at its meetings was small, never
reaching the 400 mark in the first quarter cen-
tury of its existence. The 1884 meeting was the
turning point in the fortunes of the organiz-
ation. The financial difficulties had been ex-
remely embarrassing. It had been impossible
to print the addresses without contributions from
liberally disposed members. The presi-
dent for that year, Thomas W. Bickell,
conceived a plan of ensuring the interest of the
railway people and the days of poverty were
a matter of history. The enrolment reached
2,729. The Association was freed from debt
and a permanent fund started. While the num-
ber varied widely in succeeding years, it has
steadily increased, the most notable record being
that at the Boston meeting of 1903, at
which 34,983 members were enrolled.

The movement to secure a permanent mem-
bership was inaugurated at the Denver meet-
NATIONAL EXPANSION — NATIONAL HYMNS

ing in 1895. The old scheme by which one could purchase a life membership for $20 and a life directorship for $100 was abolished. In its stead, the present plan of the payment of annual dues, whether in attendance at the meeting or not, was introduced. In consequence the society now has a permanent membership of about 10,000 active, and a far greater number of associate members. Since 1898 a permanent secretary is employed by the board of trustees. He is chosen for a term of four years. Reference has been made to the special studies that have been conducted in an exhaustive way by committees composed of experts in the subjects under consideration. They are among the most notable publications of the Association. The following reports, among others, have been widely circulated and have had no little influence in determining policies in the fields which they cover: of the Committee of Fifteen on 'Elementary Education'; of the Committee of Ten on 'Secondary Studies'; of the Committee of the Ten on 'Higher Studies'; of the Committee on 'Salaries, Tenure of Office and Pension of Teachers,' on 'Taxation as Related to Public Education.' The permanent invested fund of the Association amounts at present to $188,750, yielding a net revenue of $7,176. The annual receipts in a recent year amounted to $42,329; the expenses, $37,158. Consult 'History of the National Education Association of the United States' (Washington, D.C., 1892); the 'Annual Report,' 'Proceedings,' etc., of the Association; the most important publications on pedagogy now in the United States; the 'Reports' of committees referred to above.

NATIONAL FARMERS' ALLIANCE. See Farmers' Alliance.

NATIONAL FORESTS. See Forestry in the United States.

NATIONAL GALLERY. The British National art gallery; a collection of paintings, in Trafalgar Square, London. It originated in a collection formed by Mr. Angerstein, consisting of 38 pictures, 29 by old masters and 9 by British painters, and purchased with public funds in 1824 for $280,000 as the nucleus of a national gallery. Since that time the collection has been greatly enlarged by purchases out of funds provided by Parliament, as well as by bequests and gifts. Of the latter the most munificent has been that of Mr. Vernon in 1847, a collection of 157 works of English painters. Another highly valuable section is that of the pictures and drawings by Turner bequeathed to the nation at his death in 1856. In 1871 a valuable prize was secured by the purchase for $375,000 of Sir Robert Peel's collection, consisting of 77 paintings and 18 drawings. In 1885 Parliament voted $500,000 for the purchase of a single picture, the 'Asnidei Raphael,' together with $57,500 for another, Van Dyck's 'Charles I on Horseback.' The National Gallery now comprises over 1,200 pictures and though specially strong in examples of the British school of picturing foreign scenes are fully represented. The various early and late Italian schools are extensively illustrated; there are good examples of the chief representatives of Italian art, as Raphael, Correggio, Paul Veronese. There are also good examples of Murillo and Velasquez and the Spanish school, and the great Dutch and Flemish painters, Rembrandt, Rubens, Van Dyck, etc., are well represented. The original building of the National Gallery dates from 1838 but has since had additions to accommodate the increasing collection.

NATIONAL GUARD. See Militia.

NATIONAL HYMNS. A national hymn as usually understood is the official song rendered on ceremonial occasions, fêtes and other public gatherings. It is sometimes an air (without words) that is recognized by the government, a march, or a battle song, which is sometimes called to stimulate patriotism and loyalty to the ruler. While the oldest of national hymns now extant date back less than five centuries, lines breathing the spirit of patriotism were written by Horace and other poets of ancient times. The national song is intimately related with and probably grew out of the folksongs. Words and music should convey something of the national temper, should voice the aspiration of a people and express to some extent the ideas that a nation stands for. Love of fatherland and pride in one's country are the keynotes of many national anthems. In some of them religious feeling is blended with patriotic sentiment. The tune as well as the lyric should be by a native composer. In Europe the writers of national hymns have usually been enlisted in the service of institutionalism. Their productions have been often inspired by devotion to church and state, also by love of home. Considering the lack of poetical merit in most national songs, their influence has been very great. Wars and revolutions have sometimes called them into being and in these especially the note of freedom is emphasized.

Argentina.—'Oid, mortales, el grito sagrado' (1810) ('Hear, O mortals, The Sacred Call.') Music is by D. V. Lopez.

Austria.—The Austrian national hymn in the days of the empire, 'Gott erhalte unsern Kaiser,' or, according to the monarch's name, 'Gott erhalte Franz den Kaiser,' was written in 1797 by Laurence L. Haschka (1749-1827); music by Joseph Haydn (1732-1809). A stanza is quoted:

God preserve our Franz in glory. Franz our Emperor good and great!

High in wisdom, famed in story, we his praises celebrate;

Love of subjects young and bowing his crown of regal state.

God preserve our Franz in glory, Franz our Emperor good and great.

Belgium.—The Belgian national hymn is 'La Brabançonne' (the Song of the Brabantines); music by François van Campenhout (1780-1848). The words were written by Jeneval, a French comedian, who was playing in a theatre in Brussels when the rising took place which resulted in Belgium's independence from Dutch rule in 1830. The refrain plays on the word "orange," referring to the reigning house
of Orange in the Netherlands. The first stanza is appended:

Who would have thought the arbitrary
And scheming despot would bring force?
Asqueus comes compaigny
Princeling, with shrapnel in his course.
Tis done, o’er Belgians come a change.
No more with Nassau shameful pact shall be.
The grape-shot’s shattered the orange
Upon the tree of liberty.

Three other versions of ‘La Brabançonne’ were written—that by Lonlai in 1846, another by Cambpbeit and one by Hyman in 1852—related to the political situation in those years.

Bohemia.—Bohemia has two well-known national songs, the ‘War-song of the Hussites’ (dating back to about 1460) and ‘My Fatherland’, composed centuries ago. The names of author and composer are forgotten. The first stanza of this favorite national ditty is:

Where is my house? Where is my home?
Streams among the meadows creeping,
Brooks join together,
Everywhere bloom spring and flowers,
Within this paradise of ours;
There, ‘tis there, the beauteous land!
Bohemia, my fatherland!

Bolivia.—Words by J. I. de Sanjines and music by B. Vincenzi.

Brazil.—Words by Medeiros Albuquerque and music by L. Miguez.

Burma.—‘Kayah Than’ (Sound the Trumpet).

Canada.—‘The Maple Leaf Forever’, words and music by Alexander Muir.

Chile.—‘Dulce Patria’ by Cardenas.

Costa Rica.—‘De la Patria’ by M. M. Gutierrez.

Denmark.—The Danish national hymn, ‘Kong Christian stod ved højsten mast’ (King Christian stood beside the mast), was written by Johannes Evald (1743-81); music adapted from an old air by John Hartmann (d. 1793), a German who settled in Copenhagen in 1768. Longfellow’s version of this spirited poem is well known.

Ecuador.—‘Salve, O Patria.’

Egypt.—‘Salaam Effendi’ (March of the Khedive).

Finland.—‘Vart Land’ (Our Land). Words by J. L. Runeberg; music by F. Pacius.

France.—The history of ‘La Marseillaise,’ the most famous of all national songs, is dealt with elsewhere. See MARSEILLAISE.

The national hymn of the Second Empire (1852-70) was ‘Partant pour la Syrie’; words by A. de Laborde and music by Queen Hortense.

Germany.—Germany’s national hymn, ‘Die Wacht am Rhein’ (The Watch on the Rhine), is treated under that head (q.v.). A national song very popular among Germans is ‘Deutschland über Alles,’ written in 1841 by August H. Hoffmann (1798-1874), generally known as Hoffmann von Fallersleben. It is sung to the music of the Austrian national hymn. The first stanza of ‘Das Lied der Deutschen’ is thus translated:

German Empire over all things, over all things in the world.
When for safety and defence its proud banner is unfurled
From the Rhine unto the Meuse, from the Elbe to sea
Waves curled—German Empire over all things, over all things in the world!

The Prussian national hymn is ‘Heil dir im Siegekrantz’ (Hail to thee laurel-crowned), written in 1790 by Heinrich Harries (1762-1802). It is sung to the tune of ‘God Save the King.’ A general favorite is ‘Preussenlied’ (Song of the Prussians), written in 1830 by Bernhard Thiersch (1794-1855); melody composed in 1839 by H. A. Neithardt (1793-1861). The Bavarian hymn is ‘Heil unserm König, Heil’ (Hail to our monarch, hail).

Great Britain.—The British national hymn, ‘God Save the King,’ was composed in 1739 by Henry Carey (1692-1743), who was partly indebted to others for the words. He borrowed and rewrote the air from the French. The music has been adapted for the national hymns of the United States, Switzerland, Prussia and other German states. Welsh.—‘Hen Wlad Fy Nhadau’ (Land of my Fathers), was written by Evan James; melody by James James. The first stanza, as translated by Eben Vard, is as follows:

The land of my fathers, the land of my choice,
The land in which poets and minstrels rejoice;
The land whose stern warriors were true to the core,
While bleeding for freedom of yore.

Among the patriotic songs of various parts of the British Empire are ‘The Song of Australia’ (words by Mrs. C. J. Carleton and music by Carl Linger) and Canada’s ‘Maple-leaf Forever’ (music by A. Muir).

Greece.—The Greek national hymn is the war song, ‘Sons of Greece, come, arise,’ which dates back to the days of the Greek struggle for independence (1821-29). Byron translated it.

Guatemala.—Words by F. Molina and air by R. Alvarez.

Hebrew.—The songs of the Hebrew nationalists is ‘Hatikva.’

Honduras.—Music by L. Campos.

Hungary.—Among the patriotic songs of Hungary the one most frequently heard is ‘Isten alld meg a Magyart’ (Lord, bless the Hungarian) by F. Koseley, which is wed to a striking melody. The renowned ‘Rákosczy March,’ by an unknown composer, has even greater power over Hungarians.

Ireland.—The patriotic songs of the Irish have for their themes episodes in the glorious but tragic history of the race. A song still popular is ‘The Wearing of the Green,’ dealing with the rebellion of 1798. In the latter half of the 19th century it was supplanted somewhat in popular favor by T. D. Sullivan’s ‘God Save Ireland’ (1867). The new century and the new nationalism have produced the stirring call to freedom in the native tongue, ‘Sinn Fein Linn Fein mar Iadain,’ now only rivaled by the popular ballad, ‘Who Fears to Speak of Easter Week,’ dealing with the rising of Easter Week (24 April 1 May 1916).

Italy.—The only national air of Italy is Gabetti’s ‘Marcia Reale Italiana’ (Royal Italian March), played on all official occasions. The famed Garibaldi’s ‘Hymn’ (q.v.) is a martial strain, and the other patriotic songs are sectional.

Japan.—The Oriental national airs are very simple. That of Japan ‘Kimi Ga Yo Wa,’ by Hayashi Hiromori, contains four lines:

Let Mikado’s empire stand
Till a thousand years, till ten thousand years shall roll.
Till the sand in the brooklets grow to stone.
And the moss these pebbles emeralds make.

The Japanese have borrowed G. F. Root’s
‘Battle Cry of Freedom.’
México.—The Mexican national hymn, 'Mexicanos, al grito de guerra' (Mexicans, at the cry of war), was written by F. G. Bocanegra; air composed in 1853 by James Munó.

Mohammedan.—Some Mohammedan countries of Africa have sultans' hymns. The national air of Liberia is by Olmstead Luca.

Montenegro.—'Onward! Onward!'

Netherlands.—Holland has two national songs that are often sung on public occasions—'Wilhelmina van Nassouwe' (dating back to almost 1700) and 'Dit Nederlandse Bloed.' The latter hymn, by H. C. Tollens (1778-1856), begins:

Let him in whom old Dutch blood flows,
Untaunted, free and strong;
Whose heart for Prince and country glows,
Now join us in our song;
Let him with us lift up his voice,
And sing in patriot band.
The song at which all hearts rejoice,
To Prince and Fatherland!

The Boer national hymn is by Catherine F. Van Rees, who wrote both words and music.

There are three stanzas, of which the first runs as follows:

Knowest thou a race, of freemen bred,
That seek the tyrant's might;
Who burn their bonds and fought and bled
For freedom and for right?
Come,burghers! Raise the flag on high
That led to victory;
The hour of bondage has gone by —
Free men, free men we are!

There are two stanzas in the national hymn of the Orange Free State; words by H. A. L. Hammersberg and music by W. F. G. Nicolai.

Nicaragua.—Music by Bias Villatias.

Norway.—The Norwegian national hymn is 'Sang for Norge' (Song for Norway), written in 1859 by Bjørnsterne Bjørnson. Three stanzas of this admirable lyric have been translated by Rasmus B. Anderson. The first is:

Yes, we love with fond devotion
Norway's mountain domes,
Rising storm-lashed, o'er the ocean,
With their thousand homes;
Love our country, while we're bending
Thoughts to fathers grand,
And to saga-night that's sending
Dreams upon our land.

Another patriotic song is 'Sønnen af Norge' (Sons of Norway), by H. A. Bjerregaard (1792-1842); music by C. Blom (1782-1801).

Persia.—'Salmati Shah.' Music by A. Leicher.

Perú.—'Somos libres, seámoslo siempre' (We Are Free, Let Us Be So Forever).

Poland.—Besides the Polish song referred to under Russia (below) the Poles have a national song entitled 'God for Poland.'

Portugal.—Portugal's national hymn is the 'Hymn Constitucional,' written about 1861 by Dom Pedro I, emperor of Brazil. Upon the accession of Don Carlos I (21 Dec. 1889), a new national air was composed by H. M. Juriót.

Rumania.—In 1861 the Rumanian government offered a prize for the best national hymn, which was won by V. Alexandri's stanzas, 'Traeasca Regale' (Long live the king); music by E. A. Hübisch.

Russia.—The former Russian national hymn, 'Ozhe Zaria Chro'ny' (God preserve the Tsar), written by Yukovsky, is a prayer. The air by Alexis Lvooff dates from 1830, when Nicholas I ordered it sung as the national anthem. The revolt of 1830 produced the stirring battle song by Wybitaki, 'Poland's not yet dead in slavery,' which has been called the Polish national hymn.

Salvador.—'Saludos de la Patria' (Let Us Hail Our Country). Words by J. J. Canas; music by J. Abarie.

Serbia.—Serbia has two: 'Rise, Oh Serbians!' and 'God in His Goodness,' set to music by D. Jenko.

Spain.—The Spanish national air is the fine 'Hymno de Riego,' by Huerta (1803-80).

Sweden.—The Swedish national hymn is 'Ur Svenska Hjertans' (From the depths of Swedish Hearts); words by Strandberg; music by Lindblad. Equally popular is 'Fosterjorden' (Land of my Birth), by Richard Dybeck (1811-77); melody from Jemtland (a province in western Sweden) arranged by J. N. Abström. C. T. Hanson's translation is:

Oh, ancient beloved Northland of my birth,
The happiest of nations though lowly,
I greet thee, most beautiful land on earth,
Thy green hills, thy sun, thy heaven blue and holy.
The thought of thee brings back the days that are gone,
The same in thy royal beauty ever,
O'er all lands and seas thy sweet name is borne.
Oh, I would live among thy hills forever!

Switzerland.—The Swiss national hymn, 'Dem Vaterland' (To the Fatherland), by J. R. Wyss (1781-1830), is sung to the tune of 'America.' The first stanza of this inspiring lyric is:

Callst thou, my Fatherland?
See us with heart and hand
Vowed to thee, all!
Helvetia, hail to thee!
True still thy sons shall be,
Like them Saint James did see
Leap at war's call!

Turkey.—Turkey has no national hymn. Each sultan has an imperial air composed in his honor. There are several Ottoman war songs full of national feeling.

United States.—The national anthem of the United States is the 'Star Spangled Banner' (q.v.) written in 1814 by Francis S. Key. The melody is that of an old drinking song. Other patriotic songs that divide honors with it are: 'Hail, Columbia!' (1798), by Joseph Hopkinton (1770-1842), sung to music composed by Fyles in 1788; and S. F. Smith's 'America,' written in 1832 to fit the air of 'God Save the King.' It is now generally conceded that 'Yankee Doodle' is the true national American air. Its origin is obscure. The most probable account ascribes to the tune an English origin and the words of Dr. Shuckburgh, an army surgeon, about 1755, soon after which, during the American Revolution, it came extensively into vogue. Other popular American national songs are 'John Brown's Body' and 'Dixie.'

Uruguay.—'Himno Nacional de la República Oriental del Uruguay.'

Venezuela.—'Gloria al bravo pueblo' (1811) (Honor to a Brave Nation). Words by V. Silvas, music by J. Sandhu.

NATIONAL IDEALS IN THE WAR.

In the strain of the great war the national ideals of all the peoples were severely tested. Articles of political faith previously accepted without much question were challenged to defend themselves in the face of a new criticism and of directly antagonistic ideals. And this warfare of ideals was no mere "battle of the books"; it was fought with machine guns and heavy artillery, with dreadnaughts and submarines, with battle-planes and poison gases. One was forced to ask himself what were the essential principles for which they were ready to make the supreme sacrifice? Thus the war made necessary a thorough reconsideration of national ideals.

President Wilson's war message was read to Congress almost exactly 52 years after the surrender of Lee's army at Appomattox. More than half a century, therefore, had passed since the last conflict which seriously tested the morale of the American people. With few exceptions the founders of the republic kept for the first time the real meaning of that struggle — what it involved for the civilian as well as the soldier — had passed away. Among those in youth and middle life, there was little appreciation of the responsibilities and the sacrifices by which the national fabric had been established and maintained. Furthermore, the issues of the great war were such as to demand of the citizen a quite unusual capacity to see the interest of his country in matters lying beyond his ordinary horizon, an ability to take long views which has rarely, if ever, been demanded of any democratic community. The rights of the United States had indeed been seriously invaded, but the enemy seemed very far off. It was not enough to depend upon the primitive instinct which calls men to the defense of their own home against a pressing danger. The patriotism of Americans was not stirred, like that of France, by hostile armies upon the actual soil of their country. There was, rather, a quite unusual degree, to permanent, as distinguished from immediate, interests, to ideal, rather than purely material, gains.

National Ideals on the Eve of the War. — The foundation of American political thought is to be found in the doctrine of popular sovereignty, now interpreted to mean literally that governmental authority of every kind must proceed directly or indirectly from the qualified voters. In the century that followed, the application of this principle was carried much farther than was expected or desired by the founders of the republic. Notwithstanding important variations in practice, the orthodox American doctrine came to be that of individual manhood suffrage. Restrictions based on color disappeared in theory, if not in practice. A large number of women had already secured the suffrage by State action before 1914 and the movement for equal suffrage by an amendment to the Federal constitution was gaining headway.

But in respect to the 20th century American democracy is far more radical than that of the fathers. The framers of the early State governments and of the Federal Constitution were much occupied with the dangers, as well as the advantages, of popular government. Their remedy for ultra-radicalism was the system of checks and balances and the frequent use of indirect elections, notably in the Federal Constitution. The President was to be chosen by electors exercising a real discretion; senators were elected by the State legislators, who also had in many instances the choice of governors and other State officers; even State constitutions were put into effect without ratification by the voters. Gradually there was a growth of direct action by the voters. Gradually the scope of direct action by the voters was extended. Presidential elections became merely counters; governors were everywhere chosen by popular vote; and even that safeguard of conservatism, the Senate of the United States, was brought within the scope of the same principle. From elections the principle was extended to nominations through the system of direct primaries for the choice of party candidates and committees. The voters also sought to exercise a closer control upon the process of legislation by initiative and referendum; and there have been numerous protests against judicial action declaring unconstitutional measures approved by public opinion. In short, American democracy of the 20th century is far more absolute in its scope, more impatient of restrictions upon the immediate execution of the popular will than that of 1776 or 1789.

With this advance in political democracy there has developed a different way of thinking about the sphere of government in general. In the radical democrats of the 18th century were chiefly anxious to free individual energy from the restraints imposed by the old arbitrary governments. America seemed a land of boundless resources; on the frontier, especially, equality of opportunity seemed to ensure the maintenance of a democratic society as well as a democratic government. By the end of the 19th century this optimistic faith in laisser-faire was much shaken. The free play of individual energy brought unexpected results, antagonistic to democracy rather than favorable to it. Resources, apparently inexhaustible and open to every one, were seen to be limited after all, and more and more coming to be concentrated in the hands of a community of domestic and foreign monopolies and corporations. To conserve these resources and ensure their use in the public interest, democratic control must be extended more largely, in the economic, as well as the political, sphere. Many men who might otherwise have clung to the old laisser-faire type of democracy were reconciled to the new policies by realizing that in the long run democracy in government rests upon some approximation to equality and democracy in the social order. Undue concentration of economic power must in the end produce an undesirable distribution of political influence. This new type of democracy found expression in statutes regulating commerce, industry, transportation and labor conditions; also in many new administrative divisions, charged with the oversight and control of individual and corporate business.

Not only was the new democracy more ready to use governmental agencies for the reorganization of economic affairs but it was also adjusting itself to greater centralization. The State sovereignty idea, already weakened by the Civil War, was even more seriously
undermined by the industrial development of the next half century. The great corporations which controlled transportation, commerce, manufactures and finance could not be dealt with on a purely state basis without endless confusion. As interstate organizations of capital were confronted by the irrational organization of labor, it became increasingly evident that labor problems must receive national rather than merely local or state solution. Thus American democracy was becoming more and more national.

The transformation which modern science and its application to industry had brought about in the nation was also powerfully affecting the international position of the United States. Though independence had been achieved through a foreign alliance and largely because of certain conditions in European politics, the founders of the republic were soon convinced that the safety of their political experiment could best be secured by political isolation. In the year of intervention in American affairs by the reactionary governments of Continental Europe produced the Monroe Doctrine, setting forth the republican ideals of America, disclaiming interference with monarchial Europe, but insisting that the European system should not be further extended to any part of the American hemisphere.

This tradition of isolation was still the orthodox American theory on the outbreak of the European War; but it was maintained with increasing difficulty and with some inconsistences as the 20th century opened. Steam navigation, the ocean cable and wireless telegraphy increased the number of international problems for which the United States was forced to assume some responsibility. The Spanish War and the acquisition of island possessions in the Pacific brought new relations with the European powers which had similar interests there and in eastern Asia. We were presently taking a large part in international councils of the protection of China. While still expressly reserving the principle of the Monroe Doctrine, the United States took an active part in the Hague Conferences and even in the fateful conference of Algeciras on African interests. American public opinion followed with deep interest and sympathy the proposals for a new international organization to establish the reign of law for nations as well as for individuals.

America and the World War.—So matters stood at the outbreak of the European War. The President's proclamations of neutrality were quite in accord with traditional policy. Even when the invasion of Belgium showed Germany's cynical disregard of international law, American interest and responsibility in the matter were apparently very remote. The assumption of such responsibility by the government would have been possible only if the nation as a whole had clearly understood the issues of the European war. This was not the case in 1914. The strongest body of American opinion favored the cause of the Allies, but the pro-German element was aggregated around a highly organized group of all, especially west of the Alleghenies, was composed of those who could hardly realize what was happening in Europe and thought chiefly of America's protection from the horrors of European warfare. Under these circumstances, many even of those who sympathized with the cause of the Allies were convinced for the time being that the government must remain neutral. But there was also among the more idealistic elements a strong desire that America, by holding somewhat aloof, should leave itself free to exercise a mediatory influence in the interest of a lasting peace.

The abandonment of the neutrality policy came by a very gradual process, which is partly reflected in the speeches of President Wilson, especially during the year 1916. The development of the President's policy was undoubtedly much too slow for those who had felt from the beginning that France and England were guarding democracy and international justice against the militaristic traditions of the Central Empires. On the other hand, his gradual assumption of American responsibility in the international situation and the political ideals toward which he was working, that it was willing to accept his leadership.

The direct menace to the United States of German methods and German aims was brought home more and more by the recklessness of the submarine warfare; by the intrigues of German agents in the United States and the acts of violence instigated by them; by their persistent appeals to the separate consciousness of the German-born element; and lastly by their efforts to disturb the friendly relations of the United States with Latin-America. From a strictly nationalistic point of view, these things fully justified the President in asking and Congress in voting the declaration of war in April 1917.

There was, nevertheless, an important group which was not satisfied by any purely nationalistic conception of the issue. These men were patriotic, but American loyalty meant to them not only the defense of immediate national interests but the maintenance of the Union and the Civil War Lincoln had summoned to the preservation of the Union not merely the sentiment of American patriotism but the devotion of those who valued America as the chief representative in the world of democratic ideals—of government by the people. On that ground also he asked the moral support of European liberals, especially the British working-classes. More and more the great European War seemed to involve equally momentous consequences for civil liberty. The victory of a highly organized military monarchy like Prussia over the democracies of western Europe was likely to discredit democracy as the less efficient form of government and thus exert a reactionary influence on political thinking everywhere. This issue was not far, thus creating a unified public opinion. This was obviously not the case in 1914. The strongest body of American opinion favored the cause of the Allies, but the pro-German element was aggregated around a highly organized group of all, especially west of the Alleghenies, was composed of those who could hardly realize
interest of the United States in the preservation of the Latin-American republics, so Wilson, dealing with a world far more closely knit together, made his plea, that the "world" should be made safe for democracy.  

In his presentation of war aims, the President also appealed to the growing sentiment among thoughtful men everywhere, nowhere stronger than in the United States, for some escape from national egoism and international anarchy. Such men followed Wilson's example, and the President's stubborn refusal to be drawn into an imperialistic policy toward Mexico; they defended his extraordinary patience in the face of German aggression; and they hoped to the last that the United States, without actually entering the war, might contribute something to the establishment of a just and lasting peace. The clearest expression of this idea that America must accept a more definite responsibility for the establishment of a new international order is to be found in the President's speech to the Senate of 22 Jan. 1917. The time had come, he said, "to lay afresh, and upon a new plan, the foundations of peace among the nations." It is inconceivable," he continued, "that the people of the United States should not make an important part in that great enterprise. To take part in such service will be the opportunity for which they have sought to prepare themselves by the very principles and purposes of their policy and the approved practices of their government ever since they set up a new nation in the high and honorable hope that it might in all that it was and did show mankind the way to liberty. It must be said, however, that this emphasis on the larger responsibility of the United States aroused the antagonism of certain senators who urged the danger of abandoning the traditional policy of isolation.

A few days later the German government by its announcement of practically unrestricted submarine warfare not only declared war against the United States but proclaimed its entire lack of sympathy with the international ideals of which the American President had become the chief exponent.

Phases of Public Opinion. — When Congress met pursuant to the recommendations of the President declared war on the German Empire, there was still opposition in Congress and in the country at large, an opposition more serious indeed than is indicated by the overwhelming majorities in both houses (72 to 6 in the Senate and 373 to 50 in the House). This is shown by a study of the Congressional debates and by reports from various sections in the press and elsewhere. In this as in many other cases it was inevitable that every measure should be subjected upon the guidance of its chosen representatives and especially of the executive. It is equally evident, however, that the decision once made soon received a more general and effective support from public opinion than any similar decision in the history of the country. There was not at any time after the outbreak of the war an opposition comparable in relative strength to that of the Tories in the War of Independence, of the Federalists in 1812 or the "Copperheads" in the Civil War. Those who supported the war did so on various grounds — some undoubtedly as a simple matter of acquiescence in a decision already made. A more definite analysis of opinion brings out certain other facts of interest.

The war and the nature of the ideals for which the United States was fighting were not a distinctly party issue. The pro-German element had some influence in both the leading parties before the war but became almost negligible after its outbreak. Much the same thing may be said of the pacifist element, which, sympathizing with Wilson's international peace program, had accepted his conclusion that the first step toward such a goal must be the military defeat of the Prussian oligarchy.

To the Socialists the war brought a more difficult problem. They had always emphasized the solidarity of the working class interests as more important than strictly nationalistic aims. Nevertheless, after the outbreak of the European War, the majority of the Socialists in Europe supported their respective governments. In the United States, however, the majority wing of the Socialist organization persisted in its opposition to the war as a measure conceived in the interest of the capitalist classes. This majority, made up of various elements, included genuinely idealistic pacifists, advocates of revolutionary socialism who were ready to fish in troubled waters and a distinctly pro-German group, which was possibly the leading factor in determining the position of the party. On the other hand a considerable group of Socialist intellectuals dissented from the party decision and left the party. It is impossible to analyze accurately the Socialist vote in recent elections so as to determine the strength of pro-Germanism and pacifism as distinguished from economic discontent.

Before the outbreak of the war the sentiment in favor of American participation was most evident in the Northeastern States among the educated classes of that section who were most closely connected with the allied nations of Europe by various ties, economic, social, intellectual. This was in part, at least, the obvious effect of geographic proximity. On the other hand, the large cities of the East furnished considerable centres of pacifist and Socialist opposition, especially among their imperfectly Americanized immigrant population.

In the Middle West the unification of public opinion on war issues was delayed by the presence of a strong German element, by a somewhat antiquated type of anti-British feeling and a certain lack of interest in international relations. The last consideration naturally operated with still greater force in the rural areas of the South and in the States of the Far West. When, however, the war had actually begun the hearty acceptance of it as a great national enterprise was nowhere more striking than in many of the areas where the opposition had at first seemed most serious.

The attitude of labor was seen from the first to be one of crucial importance. How far would it accept the Socialist view that this was a "Wall Street War" in which the working class had no real interest? Fortunately for the country, the leaders of organized labor as a whole accepted the President's definition of the conflict as a war for democracy and depended upon his influence to safeguard their interests. There was some opposition to the policy within the ranks of organized labor, but the policy of the
leaders was in general carried out. With the extreme radical wing of the labor movement, represented conspicuously by the I. W. W., the situation was quite different. Recruited outside the ranks of union labor from comparatively ignorant unskilled workers, and to a large extent from recent immigrants, it was easy for the leaders to draw their followers into unpatriotic and anti-social forms of opposition. Probably this opposition would have been much less formidable if the employing classes had laid more emphasis on constructive measures and less on mere repression.

In short, the war has revealed to an even greater extent than could have been expected the national unity of the American people. Most striking of all has been the loyalty of the great majority of the foreign-born population, including even those of German ancestry, not only to the national government, but to the ideals for which America stands among the nations.

National Ideals in the Conduct of the War.—The national temper was revealed not only in the decision which brought America into the war, but no less clearly in the measures adopted to secure its effective prosecution, especially when these measures involved a radical departure from normal American practice. It was seen from the outset that American participation in the war must involve co-operation with the allied governments, to an extent beyond precedent since the days of the American Revolution. To make such co-operation cordial and effective, it was necessary to use every possible means to remove antiquated prejudices and promote a better mutual understanding between the United States and its European associates. This new spirit of international co-operation was promoted by the exchange of special missions between the United States and the allied governments,—notably the French Mission of Marshal Joffre and M. Viviani and the British Mission headed by Mr. Balfour, the British Foreign Secretary. The first thought of many Americans was that the part of this country would be chiefly financial and naval. Such co-operation was indeed given at once and on a large scale. It soon became evident, however, that the raising of a great American army for service abroad was also an urgent necessity. How was such an army to be raised? Notwithstanding the previous national tradition in favor of the volunteer system, public opinion rapidly took shape in support of the selective draft as the most democratic method of enlisting the citizenship of the country for the national defense. Far more important were the steps taken to secure the necessary economic support for the armies in the field. Funds for the use of the United States and the Allies had to be secured through national loans, unprecedented in amount and requiring the co-operation of millions of people who had never before invested in government bonds. The success of the Liberty Loans was a striking example of what may be accomplished through the cooperation of volunteer service with governmental agencies. The effect on the national morale was far less important than the financial returns. Never before had so large a number of citizens become conscious partners in a great national enterprise.

In earlier wars, notably in the Revolution, the War of 1812 and the Civil War, the government, fearing the effect of heavy taxes on public opinion, had depended too largely on loans and paper money for the necessary revenue and depreciating the currency. As to the precise proportion of war costs in the Great War, to be raised respectively by taxes and loans, there were sharp differences of opinion; but there can be no doubt in any case that the Americans of 1917—set a new national record of willingness to carry the necessary burden of war taxes.

The successful prosecution of the war required not only the financial co-operation of governments, but acceptance by the American people of a new responsibility for the food supply of the allied nations which the submarine warfare had brought dangerously low. To secure this result it was found necessary to organize through the Food Administration a governmental control of commerce in food products, as for instance by fixing the price of wheat, which went squarely against traditional American ideas. On the other hand, the government depended largely upon appeals to the patriotism of producers, middlemen and consumers to stimulate production and lessen unnecessary consumption. The result was seen not only in increased exports of foodstuffs to the Allies, but again, as in the case of the Liberty Loans, in the awakening of a new sense of civic responsibility.

The spirit of civic co-operation was shown also in the support of various auxiliary agencies, such as the Red Cross, the Y. M. C. A., the Knights of Columbus and various other organizations, religious and philanthropic. All of these agencies required and secured for their operations voluntary gifts on a scale which before the war would have been thought impracticable. It is in these various forms of voluntary co-operation even more than in any formal votes that the future historian will find the best evidence of national solidarity in support of the war aims of the United States.

No less important than the national ideals can leave out of the record the darker shades of the picture. War unquestionably develops the spirit of self-sacrifice, but it also gives new opportunities to those who are willing to profiteer by the necessities of the nation. The problem of the profiteer is as old as the world and is writ large in the record of earlier wars. In the present war this danger to the national morale was perhaps more clearly foreseen than ever before and appropriate safeguards were carefully considered; it was hardly reasonable to expect that it would be avoided altogether.

It soon became apparent that the necessities of war reconciled public opinion to extraordinary extensions of governmental authority. Step by step Congress authorized the taking over by the Federal government of business—the railroads, the telegraph and telephone service, and to a large extent the shipping business. Through the War Industries Board and the Food and Fuel Administrations the government controlled to a large extent the production and distribution of products, directly or indirectly related to the efficient prosecution of the war. In the exercise of all these functions, the government did not escape sharp criticism, some just and some unjust; but public opinion
accepted these radical changes with surprising composure. This comparative unanimity was partly due to the conviction that the measures in question were intended to meet a temporary emergency. None the less, they were in line with certain tendencies existing before the war began, and may have a permanent influence on the political future of the nation.

As the period of the Civil War, the stress of a great national crisis had not only developed the authority of the national government as a whole; it had also immensely expanded the authority of the President as the chief agent of the public will. The people and their representatives in Congress had in large measure accepted his judgment on the main issues of national policy, and American confidence in this leadership was strengthened by the President's new position as the most generally approved spokesman of the Allied nations. In the carrying out of national policies also an extraordinary concentration of authority in the President was necessary in order to secure unified and efficient action. Not only was he the commander-in-chief, but he directed through officials responsible to him the immense powers of the Food, Fuel, Railroad and Wire Administrations and the War Industries Board. To the statesmen of 1789 the concentration of such power in an American President would have been unthinkable; yet it is, in the main, only the application to new conditions of the war powers, whose latent possibilities were revealed in Lincoln's administration during the Civil War. Then as now they were accepted, not as desirable in themselves, but because concentration for executive purposes is in time of war one of the necessary measures by which the National Democracy is to achieve its ends. It must not be forgotten, however, that while the sentiment of nationality has been greatly strengthened, it is a nationalism incrusted with notions of international responsibilities, and ready to sacrifice not only material resources, but even those points of prestige which often prevent effective co-operation among allies. Striking examples of this spirit of co-operation are the decisions to allow American troops to be brigaded with those of the Allies, and the active part taken by the United States in securing the final acceptance of a united military command. These were decisions of the President as commander-in-chief but they were cordially supported by public opinion.

Finally in the background of American thought during the war were the great problems of reconstruction, the growing recognition among thoughtful men of new problems, political, industrial, educational and ethical, which cannot be met by routine methods and purely emotional modes of thought—which demand on the contrary the effective use of all our intellectual and spiritual resources.

Bibliographical Note.—President Wilson's "State of the Union Address" (December 8, 1918) also in various other forms; publications of the Committee on Public Information, the Congressional Record, especially January-May, 1917. NATIONAL LEGISLATIVE ASSEMBLY—NATIONAL LIBRARY OF FRANCE

See Constituent Assembly.

NATIONAL LIBRARY (BIBLIOTHEQUE NATIONALE) OF FRANCE, one of the world's most famous libraries. Some of its historians find its origin in the books of Charlemagne and Charles the Bald but this is not the point of view in which the library has for the most part have formed a collection in the 13th century, but whether his books are among those of the Bibliothèque Nationale is not known. At any rate, the real founder of the Royal Library was King John, who bequeathed his collection of manuscripts to his successor Charles V, who transferred it from the Palais de la Cité to the Louvre. The first librarian of record was Claude Mallet, the king's valet de chambre, who made a sort of catalogue 'Inventaire des Livres du Roy nostre Seigneur estans au Chastel du Louvre.' Jean de Bègue made another list in 1380 and Jean de Bègue one in 1411 and another in 1424. Charles V was a patron of learning and encouraged the making and collection of books. It is known that he employed Nicholas Oresme, Raoul de Presle and others to transcribe ancient texts. This first collection of the King's Library was sold by Charles VI to the English regent of France, the Duke of Bedford, who transferred it to England in 1424. It was apparently dispersed at his death in 1435.

Charles VII and Louis XI did little to repair the loss of these books, and the interest of printing resulted in the starting of another collection in the Louvre. Louis XI added to this characteristic by confiscating libraries that struck his fancy, as also did Charles VIII, who seized the collections of the kings of Aragon. Louis XII, who had inherited the library at Blois, incorporated the latter into the Bibliothèque du Roi and further enriched it with the splendid Gruthusye collection and with plunder from Pavia. Francis I transferred the collection in 1534 to Fontainebleau and merged it with his private library. During his reign, fine bindings became the craze and many of the books added by him and Henry II are masterpieces of the binder's art. Under librarianship of Amyot, the collection was transferred to Paris during which process many treasures were lost. Henry IV again moved it to the Collège de Clermont and in 1604 it was housed in the Rue de la Harpe. The appointment of J. A. de Thou, the famous historian and bibliophile, initiated a period of development that made it the finest and richest collection of books in the world. He was succeeded by his son who was replaced,
when executed for treason, by Jerome Bignon, the first of a line of distinguished librarians of the same name. Under de Thou, the library was enriched by the collections of Queen Catherine de Medici. The library grew rapidly during the reigns of Louis XIII and Louis XIV, due in great part to the interest of the Minister of Finance, Colbert, one of the most indefatigable collectors of books. The quarters in the Rue de la Harpe becoming inadequate, the library was again moved, in 1666, to a more spacious house in Rue Vivienne. The Minister Louvois took quite as much interest in the library as Colbert and during his administration a magnificent building to be erected in the Place Vendôme was planned. The death of Louvois, however, prevented the realization of this plan. Louvois employed Mabillon, Thevenot and others to procure books from every source. In 1688 a catalogue in eight volumes was compiled, and under the administration of Abbé Louvois, the Minister's son, the library was opened to all scholars. Abbé Louvois was succeeded by his brother, Abbé Bignon, or Bignon IV as he was termed, who instituted a complete reform of the library's system. Catalogues were made which appeared from 1739-53 in 11 volumes. The collections increased steadily by purchase and gift to the outbreak of the Revolution, at which time it was in grave danger of partial or total destruction, but owing to the activities of Renouard and Van Praet it suffered no injury. The Revolution appears to have benefited the library for many of the books of the emperors and the suppressed religious institutions found their way to the shelves of the Bibliothèque Nationale, as it was now called. Furthermore an administrative organization was established that is the basis of its present system. Napoleon took great interest in the library and among other things issued an order that all books in provincial libraries not possessed by the Bibliothèque Nationale should be forwarded to it, subject to replacement by exchanges of equal value from the duplicate collections, more or less possible, as Napoleon said, to find a copy of any book in France in the National Library. Napoleon furthermore increased the collections by spoil from his conquests, a good share of which, however, was returned to his downfall. During the periods from 1800 to 1836, the library was virtually under the control of Joseph Van Praet, to the development of which he consecrated the whole of his energies. At his death it contained more than 650,000 printed books and some 80,000 manuscripts, many of them of exceeding rarity. His work has been carried on by Taschereau, Delisle and Marcel Homolle under whom the collections have grown to their present size of 4,050,000 volumes, 11,000 manuscripts.

NATIONAL PARKS AND MONUMENTS. The former are large tracts of public lands in the central and western parts of the United States retained and protected by the Federal government for public purposes as are mentioned in the National Parks Service Bill, creating in the Department of the Interior a service to be called the National Park Service, which shall be under the charge of a director who shall be appointed by the Secretary. That service shall promote and regulate the use of the Federal areas known as national parks, monuments and reservations, the object being to conserve the scenery and the natural and historic objects and the wild life therein and to afford the enjoyment of the same in such a manner and by such means as will leave them unimpaired for the enjoyment of future generations. National monuments, on the other hand, are defined in an act approved 8 June 1896, entitled "An act for the preservation of American antiquities as historic landmarks, historic and prehistoric structures and other objects of historic or scientific interest that are situated upon lands owned or controlled by the government of the United States."

There are at present 16 national parks. The oldest, Hot Springs, was created in 1832; the most recently created, the Hawaiian and the Lassen, date from 1 Aug. 1916 and 9 Aug. 1916, respectively. The following list gives, besides the name of each, its location, date of creation, area in square miles and distinctive characteristics:

- Hot Springs, 1832, middle Arkansas, 1¼ square miles. There are 46 hot springs possessing curative properties; many hotels and boarding-houses; 20 bathhouses under public control.
- Yellowstone, 1872, northwestern Wyoming, 3,348 square miles. A greater number of geys-
1 "The Court Group," Colorado National Monument, near Grand Junction, on the Denver and Rio Grande Railroad. (An idea of the immense size may be obtained by noting the minute figure of a man near center of picture, half-way between camera and rock)
2 "Independence Rock" (side view), Colorado National Monument, on the Denver and Rio Grande Railroad. Height from bottom of canon to top of rock, 800 feet
NATIONAL PARKS AND MONUMENTS

sers than in all the rest of the world; also boiling springs, mud volcanoes, petrified forests; grand canyon of the Yellowstone, remarkable for its coloring; large lakes, streams and waterfalls; wilderness inhabited by deer, elk, bison, moose, antelope, bear, mountain sheep, beaver, etc.—the greatest wild animal and bird preserve in the world; altitude, 6,000 to 11,000 feet.

Yosemite, 1890, middle-eastern California, 1,125 square miles. It is famous for its beauty; there are high cliffs, waterfalls, three groves of big trees, high sierra, large areas of snowy peaks, the "waterwheel" falls; and here, as in several other national parks, good trout fishing.

Sequoia, 1890, middle-eastern California, 237 square miles. The big tree national park, containing 12,000 sequoia trees over 10 feet in diameter; mountains and precipices.

General Grant, 1890, middle eastern California, 4 square miles. This was created to preserve the "General Grant tree," 35 feet in diameter; it is six miles from Sequoia National Park and under the same management.

Casa Grande Ruin, 1892, Arizona, 34 square miles. Ruin built in form of Indian pueblo.

Mount Rainier, 1899, west-central Washington, 324 square miles. The largest accessible single-peak glacier system, containing 28 glaciers, some of large size, 50 to 500 feet thick; also sub-Alpine wild-flower fields.

Crater Lake, 1902, southwestern Oregon, 249 square miles; the lake, extraordinarily blue, lying in the crater of an extinct volcano. The sides are 1,000 feet high; the lava formations are interesting.

Wind Cave, 1903, South Dakota, 16½ square miles, a natural cavern with passages or galleries 90 miles in aggregate length.

Sully's Hill, 1904, North Dakota, 6½ square miles, a wooded hilly tract on Devil's Lake.

Mesa Verde, 1906, southwestern Colorado, 77 square miles; most notable and best preserved prehistoric cliff dwellings in the United States.

Platt, 1906, southern Oklahoma, 1½ square miles; sulphur and other springs possessing curative properties.

Glacier, 1910, northwestern Montana, 1,534 square miles. This is a rugged mountain region of Alpine character. In it are found 250 glacier-fed lakes of romantic beauty; 60 small glaciers; peaks of unusual shapes and precipices of great height.

Rocky Mountain, 1915, north-middle Colorado, 358 square miles; embracing a snowy range with peaks from 11,000 to 14,500 feet in altitude in the heart of the Rockies. Here are seen remarkable records of the Glacial Period.

Hawaiian, Hawaiian Islands, 56 square miles; including three volcanoes and a lake of blazing lava.

Lassen, 1916, California, 106 square miles. This includes a volcano—the only one in the United States that is still potentially active.

PURPOSES SERVED BY NATIONAL PARKS.—The Secretary of the Interior writes that there is no reason why the United States should not make itself the health and scenic domain as available to all its citizens as Switzerland and Italy make theirs. The aim is to open the national parks thoroughly by road and trail and give access and accommodation to every de-

gree of income; accordingly renewed efforts are promised, to outfit the parks with new hotels which should make the visitor desire to linger rather than hasten on his journey. The Secretary's comment on the Yellowstone Park concludes: "Its great size, its altitude, its vast wildernesses, its plentiful waters, its favorable conformation of rugged mountain and sheltered valley and the nearly perfect protection afforded by the policy and the scientific care of the government, have resulted in the fact that since its inauguration in 1872, the natural and inevitable centre of game conservation for this nation. There is something of significance in this. It is the destiny of the national parks, if wisely controlled, to become the public laboratories of nature-study for the nation. From them specimens may be distributed to the city and State preserves, as is now being done with the elk and may be done later with the antelope. The report of the general superintendent and landscape engineer of national parks for 1915 contains the observation that the first step in the consideration of a general policy for the administration of the national parks is the determination of just what functions they perform. The general superintendent holds the opinion that "the fostering of recreation purely as such is more properly the function of the city, county and State parks." We must note the clear distinction between the character of such local parks and those which are national. The latter form a class that should be of national interest; and in the category of national parks no reservation should be found that is of local interest only. The national parks should serve three functions: The stimulating of national enthusiasm or patriotism, the furthering of knowledge and health and the diverting of tourist travel to the scenic areas of the United States. The claims of the national parks upon the attention of tourists and others are thus summarized: "In Yellowstone are the geysers, in Yosemite the highest of waterfalls, in Sequoia the largest and oldest trees on earth, trees that were 3,000 years old when Christ was born. In Wind Cave National Park is a cave that comprises over 200 miles of sparkling passages. Hot Springs and Platt National Park are medicinal waters that have dispelled the pain of legions of sufferers. In Mesa Verde National Park are the crumbling dwellings of a forgotten race."

The National Monuments.—There were 30 "national monuments" (as above defined) at the close of 1917, two which formerly existed having been eliminated by the creation of Lassen National Park. Their names, State and areas (in acres) are given in the following list: Devil's Tower, Wyoming, 1,152; Montezuma Castle, Arizona, 160; El Morro, New Mexico, 160; Chaco Canyon, New Mexico, 20,629; Muir Woods, California, 293; Fincales, California, 2,000; Tumacacori, Arizona, 10; Mukunkutuape, Utah, 15,840; Shoshone Cavern, Wyoming, 210; Natural Bridges, Utah, 2,740; Gran Quivira, New Mexico, 160; Sitka, Alaska, 57; Rainbow Bridge, Utah, 160; Lewis and Clark Cavern, Montana, 160; Colorado, Colorado, 13,883; Petrified Forest, Arizona, 25,625; Navajo, Arizona, 360; Papago Saguaro, Arizona, 2,050; Dinosaur, Utah, 80; Sieur de Monts, Maine, 3,000; Gila Cliff Dwellings, New
NATIONAL PORTRAIT GALLERY — NATIONAL SOCIETY

Mexico, 160; Tonto, Arizona, 640; Grand Canyon, Arizona, 806,400; Jewel Caves, South Dakota, 1,280; Wheeler, Colorado, 300; Oregon Caves, Oregon, 480; Devil Postpile, California, 600; the 300-acre reservoir at Washington, D.C., Big Hole Battlefield, Montana, 5; Cabrillo, California, 1. Of these 30, the first 20 are administered by the Interior Department, the next eight by the Agricultural Department and the last two by the War Department.

An article entitled 'Our National Parks' in the Scientific American, 11 Nov. 1916, includes an observation on the commercial value of tourist traffic: "It is estimated that in time of peace the annual revenue from tourists is $150,000,000, that of France $600,000,000. It is claimed that Americans have spent $500,000,000 a year in travel abroad. The pine woods of Maine are estimated to bring a revenue of $40,000,000 each year on account of the tourists they attract. Every dollar, therefore, which is spent by the nation on national parks may be considered an investment on capital account which is likely to bring in a very satisfactory return upon the money invested. (See also separate articles Casa Grande Ruin; Crater Lake; General Grant; Hot Springs National Park; Yellowstone National Park, etc.). Consult Yard, R. S., 'The Book of the National Parks' (New York 1919).

NATIONAL PORTRAIT GALLERY, British, an institution that owes its origin to the zealous and enlightened efforts of Earl Stanhope. A board of trustees was appointed late in 1856, and by the end of the following year 23 portraits had been secured — some of them purchases and others gifts. The difficulty of the trustees was to guard against improper admissions in the way of donation, and therefore no donation can be accepted unless approved of by at least three-fourths of the trustees present at a meeting. At present the National Portrait Gallery contains over 2,000 portraits, under the varieties of paintings, busts, medallions, etc. Its treasures were for a time accommodated in the Bethnal Green Museum, but a new building, erected for it mainly by public subscription (funds being provided by W. H. Alexander), beside the National Gallery, was opened in 1896. The arrangement of the portrait is chronological, beginning with Richard II (1366-40). The large picture of the Reform Parliament hangs in the lower exhibition hall, while the portraits exhibited include representative works of Van Dyck, Gainsborough, Reynolds, Raeburn, Lawrence, Watts and other great masters.

NATIONAL REPUBLICAN PARTY, In American history, the name taken by those who deserted the old Democratic-Republican party after the defeat of Adams by Jackson in 1828. Clay was defeated. In 1835 the party, reinforced by other elements, took the name of Whig. See WHIGS.

NATIONAL ROADS. See Roads and Highways.

NATIONAL SOCIETY OF THE SONS AND DAUGHTERS OF THE PILGRIMS, The. Organized at Providence, R. I., Monday, 21 Dec. 1908, by 10 gentlemen, most of whom were of Mayflower ancestry. The plan and purposes of the Society originated with Thomas W. Bicknell of Rhode Island, who had, for a year, consulted with men and women of Pilgrim ancestry in several States as to the needs and work of such a society. The term "Pilgrim" was used in the broad sense to include all those who settled the English Colonies, between 1607 and 1700. This period the English historian Green calls the "Pilgrim Century" in the great western trans-Atlantic settlement. During that century, many thousands of the yeoman class, with a sprinkling of nobility, crossed the ocean and made permanent homes on the eastern coast of America, between the Saint Lawrence and the Gulf of Mexico, and their descendants, numbering many millions, are located in all the States of the Union.

The objects of the Society are to perpetuate the memory and to foster and promote the principles and virtues of the Pilgrims; to publicly commemorate, at stated times, principal events in the history of the Pilgrims, and to erect durable memorials of historic men and events; to encourage the study and research of Pilgrim history, especially as related to the foundation of civil government on the principles of soul liberty; to foster and to establish such departments of study and of promotion as seem best to promote social rights, civic virtue, industrial freedom, political equality, the supremacy of just laws, the value and sacredness of the ballot, the purity of the home, temperate and godly living, and the dependence of individuals, communities, states and nations on the guidance of Almighty God, as taught by the Pilgrims. Any person of good moral character, in lineal descent from Pilgrim ancestry in any colony prior to 1700, is eligible to membership. The officers are a governor-general, a deputy governor-general for each State, seven assistants, a secretary-general, a treasurer-general, a captain, an elder, an historian and a board of commissioners of seven members, of which the governor-general and the secretary-general are members, ex officiis. These offices constitute the General Court of the Society. They are elected annually in the month of December of each year, hold office for one year or until their successors are elected. The secretary-general, who is the executive of the General Court, is elected by that body.

Local chapters and State societies are formed under the direction of the secretary-general. The headquarters of the National Society are in Providence, R. I. — Thomas W. Bicknell, the founder of the Society, is the secretary-general.

NATIONAL SOCIETY FOR VOCATIONAL EDUCATION, New York City, an association to aid in the evolution of sound aims, methods and practices and to promote the further development of practical vocational education for agricultural, commercial, homemaking and industrial occupations. It was the first national organization to promote interest in publicly supported vocational education, and until 1918 its title was the National Society for the Promotion of Industrial Education. Through its earlier conventions and publications it crystallized the public opinion that led to the enactment of legislation in the States which pioneered the development of public vocational schools. Its organization is democratic. Its membership includes industrial managers, educators, labor leaders, social workers,
manufacturers and other public-spirited men and women. See Vocational Education.

NATIONAL SONGS. See National Hymns.

NATIONAL OR STATE GUARD. See Militia.

NATIONAL TRANSCONTINENTAL RAILWAY (Canadian Government Railways). This railway is the eastern section, extending from Moncton to Winnipeg, of a railway spanning the continent, the western section of which, from Winnipeg to Prince Rupert, is called the Grand Trunk Pacific Railway. The entire system was the joint enterprise of the Canadian government and the Grand Trunk Railway. Owing to the inability of the Grand Trunk Pacific Company to operate the eastern section it was taken over by the government as part of the government railways in 1915. The great bridge across the Saint Lawrence River above Quebec, completed in 1917, is on this line. In the year ending 30 March 1917 receipts from passengers were $5,916,550; operating expenses $7,883,177; cost of line $152,802,746. The length of lines operated is 2,009 miles. For an account of the enterprise see Grand Trunk Pacific Railway.

NATIONAL UNION, an American fraternal and beneficial organization, incorporated in 1881 under the laws of Ohio. In 1917 there were 702 councils and 57,817 members in the order. Over $150,000,000 in insurance is carried by the members and $44,476,008 has been paid out in death benefits since its organization. The headquarters of the Order are located at Toledo, Ohio.

NATIONAL UNIVERSITY. History.—The proposition to establish a national university was first made by George Washington. He discussed such a university in his first Presidential message to Congress and from his private fortune bequeathed $25,000 to the nation as a basal sum around which a national university might be built. President Madison likewise urged upon the Congress the wisdom of establishing such an institution. Three of his Presidential messages deal with the matter. John Quincy Adams returned to the subject in a message to Congress, urging upon that body the consummation of Washington's plans. Congress was hostile to the plan. Jefferson opposed it. In 1811 a Congressional committee reported against a national university, pronouncing the scheme unconstitutional. Since then the proposal has been revived by several Presidents and by many statesmen but without favorable results, in spite of the George Washington endowment fund and a popular subscription fund of $30,000, which was paid in in 1793.

In 1869 the National Education Association espoused the cause of a national university by appointing a permanent committee of the association to promote the plan. Through this committee the subject was kept alive for more than 30 years. In 1899 a majority of the committee was composed of university presidents and rendered a report calling for Federal aid, but vigorously opposing Federal control of national education and declaring against a university maintained by the Federal government at the national capital. In 1907 the National Association of State Universities pronounced in favor of organized facilities for research in the scientific departments of the Federal government, but opposed a national university as a degree-confering institution.

Educational and Research Facilities in Washington.—The various bureaus, departments, libraries, literary and scientific collections, museums, etc., maintained by the Federal government in Washington, and the facilities of which constitute valuable facilities for university research. They are equipment for university work. While these facilities are not organized in institutional form, they are open to investigators by resolutions passed by Congress in 1892 and again in 1901. The Act of Congress, 3 March 1901, provides:

"That facilities for study and research in the government departments, the Library of Congress, the National Museum, the Zoological Park, the Bureau of Ethnology, the Fish Commission, the Botanic Gardens, and similar institutions hereafter established shall be afforded to duly qualified individual students and graduates of institutions of learning in the several states and territories, as well as in the District of Columbia, under such rules and restrictions as the heads of the departments and bureaus mentioned may prescribe."

The resources for study at the national capital are very great. The Library of Congress ranks high among the libraries of the world. The Smithsonian Institution has great value to the scientific student. In addition to departmental records and collections in various fields, there is the Corcoran Art Gallery, the Patent Office, the Geological Survey, the Medical Museum, the National Museum and various scientific bureaus, which together constitute an educational equipment far greater in value than that of any one organized educational institution anywhere in the world. Its value has been roughly estimated at $75,000,000. In a real sense this vast equipment is part of the equipment of every university in the United States in so far as such university makes use of it. In its best sense this is a national university where research is carried on under most favorable circumstances; its equipment is maintained by the national treasury; but the seal of approval for scientific achievement is granted in the form of degrees conferred by the universities located in the various States.

NATIONALISM, the Historical Development of.

I. Introductory Definitions.

No concepts in history, politics or sociology are to-day more important or evident, and, yet, at the same time, more difficult to define than the terms nationality and nation. To the writer it seems that a nation is a culturally homogeneous social group, which is at once conscious and tenacious of its unity of psychic life and expression. Some writers, especially Ernest Renan, have emphasized the desire to live together as the essence of a nation, but as more profound students, particularly the sociologists, have made clear, this will
to live in, and to preserve the unity of, the group exists only where there is a very high degree of cultural and psychic likeness and unity. The most fundamental basis and characteristic of a nation, then, is cultural homogeneity, from which the will to exist in contiguity naturally proceeds. If such a group is at the same time politically organized within a given territory it may then be designated a national state. The term nationality is frequently used to describe a culturally homogeneous group which has not yet attained complete national and political unity, but it seems that this view only brings a confusion of terms. Rather, the term nationality should be used as a general descriptive and collective expression somewhat analogous to the broader meaning of the term politics in relation to a study of the state.

It is a generic and comprehensive concept which refers to and describes that variable ensemble of physical and psychic elements which generate the cultural homogeneity and group self-awareness and resistance and cohesion of a nation. The dynamic expression of the cultural and political activities and ambitions of a nation or national state is most usually and logically known as nationalism. It is not the same as national consciousness, which is a purely subjective expression of political or cultural aggressiveness, such an implication is not essentially involved in the definition, even if it is normally to be observed in the practical operation of nationalism. In the static or analytical sense, nationalism is conventionally used to designate the modern political system or order, based as it is upon the unit of the national state. The history of nationalism then is essentially the tracing of the rise and development of the nation and the national state.

The history of the development of nations and national states is a most complicated problem. So difficult is it to determine just when tribal or pre-political society ends and political society begins and so many and deep-seated are the aspects of psychic life and cultural characteristics which are carried over from the tribal period into the political, that it is well-nigh impossible to say that one can fix any definite period as marking the origin of nations. One can, however, with fairly good reason agree with the generally accepted idea that the socially organized Jews of ancient Palestine constituted a national state in the sense in which that term would be used to describe the German of Bismarck and Treitschke and Revett, or the Italy of Crispi and Cardocci and Sarnino, and, yet, it is not easy to deny the force of his criticism of those writers who find nations to be wholly a phenomenon of very recent origin. Rather, it is best to agree that modern nations have their constituent psychic elements deeply rooted in the tribal past and that the history of nationalism and of nation-building is essentially the tracing of the expansion of cultural entities and of the sociological centres of emotional fixation; in other words, the record of the expansion and rationalization of "herd-institution.

The society has undergone tremendous transformations in the period from the gradual breakdown of tribal society to the 20th century, there are differences of corresponding scope and significance between the nature and mode of expression of group psychology and culture in tribal society and in the national states of to-day. The most profound and far-reaching of these contrasts are connected with the conversion of the basis of group solidarity, from the standpoint of social control, from blood-kinship, real or assumed, to a definite territorial habitat, and with the development of what is conventionally known as "political society." The connections will appear clearly only upon the careful historical analysis of the development of the constituent principles of the nations of to-day. It is this fact that renders such a survey of vital importance, entirely aside from the specific content of the historical facts enumerated.

II. A Brief Historical Sketch of the Stages in the Origins of Nationality and Nations Previous to the Rise of the Modern National States.

1. Tribal Society.—It is now generally agreed among students of cultural anthropology that the earliest well-defined units of social organization were either the village and local group, or the forming of the origins of a nation. The dynamic expression of the cultural and political activities and ambitions of a nation or national state is most usually and logically known as nationalism. It is not the same as national consciousness, which is a purely subjective expression of political or cultural aggressiveness, such an implication is not essentially involved in the definition, even if it is normally to be observed in the practical operation of nationalism. In the static or analytical sense, nationalism is conventionally used to designate the modern political system or order, based as it is upon the unit of the national state. The history of nationalism then is essentially the tracing of the rise and development of the nation and the national state.

The history of the development of nations and national states is a most complicated problem. So difficult is it to determine just when tribal or pre-political society ends and political society begins and so many and deep-seated are the aspects of psychic life and cultural characteristics which are carried over from the tribal period into the political, that it is well-nigh impossible to say that one can fix any definite period as marking the origin of nations. One can, however, with fairly good reason agree with the generally accepted idea that the socially organized Jews of ancient Palestine constituted a national state in the sense in which that term would be used to describe the German of Bismarck and Treitschke and Revett, or the Italy of Crispi and Cardocci and Sarnino, and, yet, it is not easy to deny the force of his criticism of those writers who find nations to be wholly a phenomenon of very recent origin. Rather, it is best to agree that modern nations have their constituent psychic elements deeply rooted in the tribal past and that the history of nationalism and of nation-building is essentially the tracing of the expansion of cultural entities and of the sociological centres of emotional fixation; in other words, the record of the expansion and rationalization of "herd-institution.

The society has undergone tremendous transformations in the period from the gradual breakdown of tribal society to the 20th century, there are differences of corresponding scope and significance between the nature and mode of expression of group psychology and culture in tribal society and in the national states of to-day. The most profound and far-reaching of these contrasts are connected with the conversion of the basis of group solidarity, from the standpoint of social control, from blood-kinship, real or assumed, to a definite territorial habitat, and with the development of what is conventionally known as "political society." The connections will appear clearly only upon the careful historical analysis of the development of the constituent principles of the nations of to-day. It is this fact that renders such a survey of vital importance, entirely aside from the specific content of the historical facts enumerated.
largely on the perfection of his gregarious instinct, there has been achieved in man a keen sensitivity to the call of the group. This herd instinct, as Trotter calls it, is, therefore, the very basis of human society and the most primitive stage in the evolution of the social nation. It is for the group what the instinct of self-preservation is for the individual. It is aroused only in times of stress and danger; group fear in some form is essential to its development; when awakened it not only grips every tribeman in an atmospheric of electrified suggestibility, but stirs within his bodily mechanism the internal secretory apparatus whose products are essential to deeds of valor. It is in its strength and vigor an assertion of the group will to live, and is therefore as deep and mysterious and indeed as permanent as the eternal nius of nature, the insistent push of everything that throbs with life and energy. Further, tribal groups were relatively small, as compared to modern political aggregates, and were little attached to any particular territory. While such group organization had with great tenacity to particular areas on account of special economic advantages, such as better fishing or hunting grounds, it was the economic phases of the attachment rather than the purely territorial which played the predominating part. The superior force and aggressiveness of one of these cities which compelled the submission and enforced the subjection of others. The ancient Egyptian Empire was a product of the forcible subjugation of the numerous city-states of the Nile Valley; the Babylonian, Assyrian and Persian empires were in large part the result of a particular locality to follow migrations of fish or game. This matter has been well summed up by Professor Robinson: "Patriotism, the love of one's terra patria, or natal land, is a recent thing. During far the greater part of his existence man has wandered ever in search of better or new pastures as a hunter and can hardly have had any sweet and permanent associations with the tree or rock under which he was born. But the fore-runners of territorial emotion were the group loyalties of the tribe, clan, family and totemistic group, in whatever order and with whatever peculiarities these may have originated and come to exist side by side."

2. Early City-States.—The transition from tribal groupings and modes of life to the city-state, the earliest type of political organization, was gradual and slow. The chief contrast between tribal society and that of the protohistoric city-states was that in the latter the basis of group and individual relations was gradually coming to be political and territorial, rather than purely personal and consanguineous. For many and diverse reasons, groups tended to consolidate about certain vantage points determined by considerations of fortification and protection, religious significance, economic superiority and better potentialities for robbery and brigandage. Stability replaced the earlier nomadic life, and the habitat became more or less permanent. The early city-states did not, however, at all resemble the modern urban centres of life and industry. For the subjection of the "citizenship" was little more than a citadel surrounded by the homes of the peasants who would retire within the walls in time of danger. As trade developed and the division of labor between city and country was established, the early city-states assumed more of a commercial character and the coming of foreign merchants produced those problems of assimilation and the extension of citizenship which were the chief force in breaking down the remaining vestiges of tribal society and in creating the origins of the modern political order. A few historical or semi-historical instances of this specific and all-important change from tribal to civil society have been preserved in historical records. Such were the occupation of ancient Palestine by the Jews and their subsequent choice of a king; the constitutional reforms of Cleisthenes in Attica at the close of the 6th century B.C.; the alleged reforms of Servius Tullius in early Rome and the subsequent constitutional struggle between the patricians and plebeians; and the breakdown of Teutonic tribal society and the establishment of political relations in the interval between Arminius and Alaric—the transition which Paul Vinogradoff has called "one of the most momentous turning-points in the history of the race."

Important as were the city-states of antiquity as a stage in political and social evolution, they were soon submerged in the great patriarchal empires which arose in the "state-making age" through the superior force and aggressiveness of one of these cities which compelled the submission and enforced the subjection of others. The ancient Egyptian Empire was a product of the forcible subjugation of the numerous city-states of the Nile Valley; the Babylonian, Assyrian and Persian empires were in large part the result of the same process. The extensive amalgamation of the city-states of the valleys of the Tigris and Euphrates and the coast of Asia Minor. Only the cities of ancient Hellas retained their independence long enough during the historical period to give adequate conception of the type of cultural solidarity and political reactions which characterized the antique city-state. Here personal and kinship relations had been replaced by the institution of citizenship, based upon residence and naturalization instead of blood-relationship or elaborate initiation ceremonies designed to confer the sanction of artificial relationship. Groups were generally more populous and civilization more advanced than in tribal society. Most of the psychic characteristics of tribal life, however, were, if in a modified form, still retained in the civilization of Athens, which may be taken as the most advanced product of the ancient city-state civilization. Group solidarity was still intense. The elements of common culture were prized even to the extent of being venerated with a sacred significance. Ceremonies, costumes, legal and political forms and practices, moral codes, religious festivities, and even amusements were tinged with the divinity of their alleged origin. The gods were limited to the group and were regarded as wholly solicitous for the welfare of the particular political and social entity. The attitude toward foreigners was well exemplified by the well-known contrast between "Greek and Barbarian," in which Aristotle was able to find a justification for the phases of group solidarity and symbolic unity, which had their roots in tribal psychic life, a new attachment to territorial possessions arose when fixity of habitat had become the rule. Not only were particular sacred places, such as
NATIONALISM

Olympus and Delphi, prized and venerated, but the whole habitat of the group was valued as a special gift from the gods. Aristotle found that the fortunate situation of the Greeks in their geographical habitat served sufficiently to explain the superiority of the Greek genius. The ancient city-states seemed well on the way toward transforming group life from the tribal to the modern national basis and had made notable advances in that direction. Had their progress not been arrested by the development of the tribal empires, mentioned above, the national state in its completeness might have been a product of antiquity. For better or worse, however, this was not to be, and even Athens itself was swallowed up in the imperial domains of the Macedonian conqueror after its African and Asiatic prototypes had long before bowed to the might of Thebes, Memphis, Babylon, Nineveh, Ecbatana, Sardis and Susa. James Bryce has admirably described the general absence of anything approaching a national cultural or political union before the conquests of Rome: "Men with little knowledge of each other, with no experience of wide political union, held differences of race to be natural and irremovable barriers. Similarly, religion appeared to them a matter purely local; and as there were gods of the hills and gods of the valleys, of the land and of the sea, each tribe rejoiced in its peculiar deities, looking on the natives of other countries who worshipped other gods as Gentiles, natural foes, unclean beings. Such feelings, if keenest in the East, frequently show themselves in the early records of Greece and Italy; in Homer the hero who wanders over the unfruitful sea glories in sacking the cities of the stranger; the primitive Latins have the same word for a foreigner and an enemy; the exclusive systems of Egypt, Hindostan, China are only the more vehement expressions of the belief which made Athenian philosophers look upon a state of war between Greeks and barbarians as natural, and defend slavery on the same ground. Also, the original diversity of the races that rule and the races that serve."

3. The Patriarchal Empires of Antiquity.

— The formation of the extensive and autocratic patriarchal empires in whatBagh et has somewhat loosely called "the nation-making age" was one of the most important and sweeping transformations in the political and social evolution of humanity. Paradoxical as it may seem, they both stifled and promoted the growth of nations and nationalism. Their development was invariably brought about by the cumulative extension of the power and prestige of some more powerful and aggressive city-state at the expense of its neighbors. This very process naturally produced an enormous inflation of group pride and egoism on the part of the conqueror; Alcman of Miletus urged that the severely treated and their national culture sternly repressed, nothing makes a group so proud and tenacious of its cultural characteristics and possessions as persecution, and the conquerors unwittingly only intensified the particularism and local pride of such subject communities as maintained and preserved their corporate existence. The history of the ancient empires is little more than a record of constant warfare produced by the attempt of the ruling city and dynasty to repel and suppress the revolts of subject cultural groups. This process of ancient empire-building culminated in the expansion of imperial Rome, in its task of absorbing most of the then-known world and of bringing into existence the ideal "reign of universal peace" and uniform law. It is probable that the process of Roman expansion marked the nearest approach to the spirit and methods of aggressive nationalism that was witnessed before the dynamic wars surrounding and accompanying the development of the modern national states. The crude and almost tribal expression of collective egoism in international policy; the public theory that all her wars were "defensive" and that Rome was always threatened by aggressive states; the alleged conviction that the gods were always favorable to these defensive wars; the control of diplomatic and military policy by the landed Junker aristocracy—the Senate: the ambition for private or family glory in war, as manifested by Flaminius in the first Macedonian War; the surplus population argument for expansion; the scrap of paper attitude toward treaties as evidenced in the second Samnite War; the harsh and brutal treatment of conquered populations extending to the levitation of fields, the burning of cities and the enslaving of populations; the insatiable greed for further expansion; the disregard of the "rights of small nationalities"—all of these aspects of Roman expansion, which are familiar to students, sound exceedingly modern and seem quite capable, with some few changes of names, of furnishing the proper categories for the analysis of the development of the German Empire from the acquisition of Brandenburg in 1415 to the present momentous collapse of 1870. While this process of the formation of empires was most influential in creating the tradition of the glory of territorial expansion which was to serve as an important impulse to the aggressive ness of the modern national and territorial state, it should not be forgotten that the political and social basis of such a political entity as the Roman Empire and the German Empire of the present day. Though there was a uniform and universal political system, there was no cultural homogeneity or common sentiment of loyalty, which are the indispensable foundations of the national state. Only the citizens of Italian Rome felt any emotional thrill of patriotic reaction at the triumphal processions of the conquering emperors or generals and at the recitation of the Virgilian epic of the growth of the Pax Romana. Though the subject peoples might formally acquiesce in the apotheosis of the Roman emperor and render a lip reverence and allegiance they preserved openly or secretly their admiration for their chief heroes and leaders and retained their deeper loyalty and allegiance to their own pantheon. A common spontaneous patriotism and a general loyalty to the sovereign imperial state was quite unknown in the ancient empires, and the cultural homogeneity which was the political expression of national life was as remote from realization. Even the prevailing political philosophy—Stoicism—decried the sentiment of nationalism and patriotism, and lauded the notion of the
NATIONALISM

brotherhood of man and the cosmopolitanism of world-citizenship. Mr. Bryce thus depicts the nature and operation of the Roman imperial system, so different from the modern political order based on the national state: "No quarrels of race or religion disturbed that calm, for all national distinctions were becoming merged in the idea of a common Empire. The gradual extension of Roman citizenship through the colonies, the working of the equalized and equalizing forces of the government on all subjects, the movement of population caused by commerce and the slave traffic, were steadily assimilating the various peoples.

From Rome came the laws and language that had overspread the world; at her feet the nations laid the offerings of their labor; she was the head of the Empire and of civilization, and in riches, fame and splendor far outshone, as well the cities of that time as the fabled glories of Babylon or Persepolis. Had Rome continued to exist with an improved method of imperial administration and economics for 2,000 years after her fall, it might have been possible for her to have welded her diverse subject populations into a single loyal and unified national unit, but the experiment was made in 313 A.D. by the Teutonic barbarians from the North, who had been gradually filtering into the empire for three centuries, broke their leashes and started on their migrations, which submerged the ancient world in the return of pre-classical barbarism and produced a Clovis, a Charlemagne and a Gortias to the Great to repeat the tasks of an Agamemnon, an Alexander and an Augustus. The ancient world, then, passed without producing the complete parallel of the modern national state, but it laid the psychological and political basis upon which the states could develop, though it must not be forgotten that the growth of the modern national state has been to a large degree a progress sui generis, primarily independent of ancient impulses, even if influenced by ancient models. The psychology and condition of the modern nationalism and the continuity of Roman egotism and jingoism with modern militarism and patriotism have been eloquently stated by Professor Muzzev in the following citation: "The Roman spirit was bequeathed to Europe. Beneath all the art and letters, all the industry and commerce, all the advance in humanity throughout European history, that Roman idea remains. When the old nations speak of patriotism they mean the memory of their glorious wars. War has been their constant occupation and preoccupation. Not a generation that has passed since Virgil, but has paid its terrible toll on the field of carnage to the ideal of pacifying the world by arms. It is not alone Germany, with the celebration of its men of blood and iron from the Great to Otto von Bismarck. The French too rejoice in the Napoleonic legend. They have their glorious wars of the Grand Monarque. They bow before the white plume of Henry of Navarre, and thrill to the echo of Roland's horn at Roncesvalles. The English have their proud memories of Agincourt and BLENHEIM and CreCY and WALLACE and celebrate their Napiers and Nelsons and little 'Bobs.' All these nations of old Europe have their glorious traditions of war, and each one can find enough victories in the uninterrupted course of slaughter through the Christian Ages to justify its belief in its own invincible prowess—nay, even in its divine mission to rule the rest. The Roman ideal still lives in them all. Great Caesar's ghost still walks as at Puteoli. He stalks, gaunt and terrifying, before the chancelleries at London and Berlin, at Vienna, Paris and Rome."

4. The Middle Ages.—The political, social, economic and cultural conditions of the Middle Ages were no better adapted to the production of the national state than was imperial antiquity. The unit of political organization and administration was the domain of the feudal lord, which varied greatly in extent, but never in any way approximated identity with any cultural or national entity. Usually the domain was but a small isolated element in the feudal hierarchy, and it made for political decentralization and local immunity rather than for national unity. The centre of social life was the infinite number of isolated and minute mediæval manors and the many small and scattered mediæval towns. The units of agrarian and urban industry, the manors and the towns, respectively, were isolated, self-sufficient and narrowly selfish. The states were wholly unadapted to providing any firm economic foundations for national unity. The pivotall points in mediæval cultural activity were the towns, but they were too few, too poorly connected with others by the way of communication and too much governed by the spirit of localism and jealous isolation to be able to bring into being any degree of that general cultural homogeneity, so all-essential to the existence of any degree of national unity.

Not only were these local units of the mediæval period ill-adapted to the creation of nations and national states, but there operated from the other extreme powerful forces and institutions making for a continuance of that universalism which had characterized the Roman Empire. "Rome held that universalism and cosmopolitanism were the dominant ideals of the Middle Ages—a sentiment best summed up in Dante's 'De Monarchia,' with its vision of a church and empire universal. Set off against the actual political diversity and location of the feudal system was the political symbol of unity and cosmopolitanism—the Holy Roman Empire. Whatever its actual weaknesses, its symbol power over the mind of Europeans was sufficient to cause so ardent a nationalist and so blasé an advocate of Realpolitik as Frederick the Great to bow before it, even in the days of its declining strength. A universal moral and religious control over mediæval life was provided by the Roman Catholic Church, whose growth has been described as an instance of "the rise of the new Rome." With its control over the religious, and to a large extent the mental, life of the mediæval period through its elaborate hierarchies for administration and for the control of the sacraments, the mediæval church, with the aid of the inquisition against heresy, brought about a degree of psychic unity throughout Europe never before equalled. Under its greatest popes, such as Innocent III, the Church also exercised a degree of control over European politics never
NATIONALISM

matched by any emperor of the period. The three leading crowned heads of Europe were in turn disciplined by Innocent. The learning of Europe was no less markedly universal. The Church prescribed a single theology for all western Europe, which was embroiled in the 'Book of Sentences' of Peter Lombard and the 'Summa Theologica' of Thomas Aquinas. As theology was regarded throughout the mediæval period as the 'queen of the sciences,' and education was chiefly in the hands of the churchmen, learning was no less unified than that of the spiritual world. Again, there was a striking unity of language and literature during the period. Whilst the vernacular languages and literatures began to appear in the 11th and 12th centuries, Latin was, during the greater part of the Mediæval Age, the language of politics, business and learning throughout western Europe. The literature read by the vast majority of those who were able to read was not less uniform than the language; the Bible of the 12th century, few theological manuals extracted from them, and the crude Latin encyclopedic compilations by Isidore and Rhabanus Maurus and their like, were almost the only books read until the prose and verse of the vernacular languages began to appear at the height of the mediæval period. Mr. Bryce in the following brilliant passage characterizes the remarkable unity which was at least symbolically brought to the mediæval period by the church and empire universal:

'It is on the religious life that nations repose. Because divinity was divided, humanity had been divided likewise; the doctrine of the unity of God now enforced the unity of man, who had been created in his image. The first lesson of Christianity was love, a love that was to join in one body those whom suspicion and prejudice and pride of race had hitherto kept apart. There was thus formed by the new religion a community of the faithful, a Holy Empire, designed to gather all men into its bosom, and standing opposed to the manifold polytheisms of the older world, exactly as the universal sway of the Caesars was contrasted with the innumerable kingdoms and republics that had gone before it. The analogy of the two made them appear parts of one great world-movement toward unity; the coincidence of their boundaries, which had begun before Constantine, lasted long enough for him to associate them indissolubly together, and make the names of Roman and Christian convertible. Ecumenical councils, where the whole spiritual body gathered itself from every part of the temporal realm under the presidency of the temporal head, presented the most visible and impressive examples of their connection. The language of civil government was, throughout the West, that of the sacred writings and of worship; the greatest mind of his generation consired the faithful for the fall of their earthly commonwealth, Rome, by describing to them its successor and representative, the 'City which had no foundations, whose builder and maker is God.'"

In spite of this unique prevalence of the universal and the uniform in fact and symbol during the mediæval period, however, forces were working beneath the surface that were to rend asunder this artificial unity for centuries.

As early as the Strassburg Oaths of 842 there could be detected the first beginnings in the differentiation of those vernacular languages which were to lay the literary basis for national diversity and rivalry. Moreover, it should not be forgotten that in a cursory and indirect and obscure, but nevertheless real, manner the mediæval period furnished a psychological impulse to the growth of nationalism by its influence on the 'Romanticists' many centuries later. It was in the imperfect understanding of the Mediæval Age that this school obtained its sentimental impulse, which operated powerfully in the creation of the new nationalism during the French Revolution, and its notion of the unique and indigenous nature of national character, which formed the basis of much of 19th century nationalistic philosophy and historical literature. The revival of Roman law in western Europe in the 12th and following centuries became a powerful instrument making for royal supremacy and the rise of the dynastic state. The new commerce with the East, which had been built up by the Italian cities in the period of the Crusades, was to produce the Italian city-states, which first successfully defied the principle of imperial unity and were the repetition of that process on a vastly greater scale in northern Europe, when the opening of the new trade routes with the East and West should usher in the 'Commercial Revolution' and with it the dawn of the Modern Age.

III. THE COMMERCIAL REVOLUTION AND THE RISE AND DEVELOPMENT OF THE MODERN DYNASTIC NATIONAL STATES.—In October 1492 Columbus landed on San Salvador in the Bahamas and in May six years later Vasco de Gama reached Calicut on the coast of India, and the two most significant steps had been taken in bringing about that great revolution in commerce, thought and politics, which, in the totality of its dynamic reactions on European civilization, was to produce the modern world and to initiate that process of national development, differentiation and expansion which has since persisted without abatement and is not likely to be suspended until a supernational organization shall have been erected with power to curb aggressive nationalism and vested with a function for mutual service which will attract the loyalty of the several component parts of the general world organization.

The older generation of historians, under the spell of the exaggerations and incomplete knowledge of Burckhardt and Symonds, were wont to regard the origin of the modern state system as the product of the so-called 'Renaissance,' or, guided by the enthusiasm of Ranke and Schaaff for the Lutheranism, conventionalize dated the emergence of nationality from the Protestant revolt and its resulting political adjustments in the Peace of Augsburg and the Treaty of Westphalia. A more profound study of modern history by such writers as Brandt, Cunningham, Shepherd Cheynell, Robinson, Abbott, Beard and Hayis has revealed the fact that both Renaissance and 'Reformation,' in their broadest aspects, were but phases or results of that great transformation which marks the origin of the modern world and the national-state system—the 'Commercial Revolution.' By this is meant
not only the discoveries, the revival of trade and the "intervention of capital," but also the results of these innovations upon the whole basis of European civilization. The permanent intellectual progress which followed the so-called "revival" of the 15th century was not so much the result of the resurrection of an antique culture as it was the product of the new psychic reactions which came from the contact of cultures and the intellectual curiosity stimulated by the discoveries. The modern intellectual world grew out of the work of Galileo, Kepler, Newton, Boyle and Lavoisier, and not out of that of Petrarch, Bruni, Poggio and Boccaccio. Not less disruptive of older doctrines has been the result of more critical research upon the deeper significance of the "Reformation." After three centuries of befogging the real issues at stake under the mask of theological controversy, scholars have at last come generally to accept the doctrines of Seli dan, the greatest of contemporary authorities, that the Protestant revolt was primarily the result of the political and nationalistic ambitions of the North German princes, Luther's "theological rebellion" a timely "moral and religious issue" under which to hide their secular ambition to secure political independence from the Holy Roman Empire. The successful impulse to the religious wars that won the day for Protestantism came not from the zeal of the German princes for the triumph of "justification by faith," but from their eagerness to attain unto the "cuius regio eius religio" clause of the Peace of Augsburg (1555) and the recognition of their full political sovereignty by the Treaty of Westphalia (1648).

The chief impulse that the Commercial Revolution brought to the growth of national states came from the rise of the middle class and their alliance with the monarchs in the attempt to destroy the anarchy and decentralization of the feudal system. Hitherto the kings had been compelled to depend upon the feudal lords for the administration of law, the provisions of royal funds and the military protection of the realm. It can scarcely be supposed that the feudal lords would render effective aid to any policy designed to limit their powers or terminate the political order to which they owed their existence. There was, therefore, the possibility of bringing about that allessential step in political progress, the destruction of medieval feudalism, until a new class had arisen with sufficient strength to furnish the kings with the loyal aid necessary to cope with the rival claimants of the old order, and until a source of royal income had been provided which would enable the kings to hire loyal officials and armies without relying for their financial support upon feudal taxes. Both of these all-important prerequisites for the growth of administrative centralization political concentration and the rise of the dynastic national state were supplied by the Commercial Revolution. A loyal officialdom, opposed to the feudal aristocracy, appeared in the new "proletariat of the rich" — the middle class merchants and lawyers that filled the royal offices, and, through the "intervention of capital," coming into the royal treasuries from the national share in the profits of the new commercial and industrial enterprises, the kings were provided with the essential financial power to hire their own officials and to support a national army independent of the feudal lords. Then followed that relentless surge of the national monarchs against their old feudal rivals which extended from the accession of Henry VII of England in 1485 to the close of the last century. While this process involved a great development of royal absolutism and army, as an inevitable accompaniment of the growth of national and dynastic centralization, the movement as a whole was one of the most important in the history of the political development of humanity. All the horrors of the domestic tyranny and foreign wars which have accompanied the rise of national states since 1500 have been the price which mankind has paid through the wasteful economy of nature in attaining to that stage of national independence and self-government which had to precede the ultimate goal of internal democracy and international concert, alliance or federation. Expensive as the process has been, students of the history of civilization unconsciously recognize that the evolution of the nation state and the political aggregates had to be brought about before the basis could be provided for an intelligent, amicable, just and practicable arrangement between the states of the world. An international order arising directly out of the feudal system is inconceivable.

The emergence of the national dynastic state in modern times was first manifested in the case of England, due to the appearance in 1485 of a shrewd and vigorous monarch in the person of Henry VII, and to the fact that in England alone had the feudal nobility been gracious and self-effacing enough to prepare their destruction by a war of selfextermination — the War of the Roses (1455-85). Henry VII filled the royal coffers by taxing the feudal nobles through the use of "Morton's Fork" and other ingenious devices, herded recalcitrant and rebellious feudal lords before the Court of the Star Chamber, and encouraged the new commerce by treaties such as the "Intercurius Magnus" and by subsidizing such explorers as the Cabots. His son, Henry VIII, broke with Rome and gave a religious basis to the growing English nationalism. Elizabeth profited by the labors of her father and grandfather, and her reign witnessed the first pronouncements of English nationalism, as well as the emergence of England as a leading naval and colonizing nation. By the close of the Tudor period (1603) England had become a highly centralized dynastic national state. Pedeslumism in its political aspects had passed, and the middle class had so developed its political strength that a half-century later it was able to demonstrate its superiority over the Crown. After brief but brilliant development of Portuguese nationalism (1498-1580), Spain was next in the order of national development. Charles V had been an imperialist rather than a nationalist and had hoped to revive the Medieval Empire, but his son and heir in Spain, Philip II (1555-98), was a true Spanish nationalist, and proceeded to attempt to bring unity not only to Spain but to the Spanish possessions in the Netherlands. His over-ardent nationalism, however, brought disruption rather than centralization, and in 1567 the Dutch, led by William the Silent, broke into active revolt. The
new Dutch national state declared its independence in 1581 and secured the European confirmation of its action at Westphalia in 1648. A century after England had emerged from civil war with a strong monarch at the head of the state, Henry IV, the founder of the French Bourbon dynasty, came forth victorious over his opponents in the civil wars and was crowned king in 1589. Capturing not only Paris, but France by a "masse," he began with his great minister, Sully, the building of the dynastic national state in France. His work was cut short by his untimely death at the hand of the assassin, Ravaillac, but his work and plan was carried on with vigor and determination by the great ecclesiastics and statesmen, Richelieu and Mazarin, until, by the time of the suppression of the Fronde in 1651, the feudal system as a dominating political power in France had passed away. The fruit of these states during Richelieu, and Mazarin was appropriated by Louis XIV, in whose reign France reached not only the height of her dynastic centralization, but attained to the cultural primacy of Europe.

The Thirty Years' War (1618-48) brought with it a manifestation of national state, and demonstrated the fundamental political nature of the Protestant revolt. The stirrings of national ambitions in Bohemia (1618-20) and in Denmark (1625-29) were speedily repressed, but Sweden forged to the front as a great national state (1630-32) and maintained her position until it was lost through the insane ambitions of her warrior king, Charles XII (1697-1718). The Treaty of Westphalia first gave general European recognition to the growing national state system and to the existence of independent national sovereignty. It brought diversity rather than unity, however, to Germany and necessitated the postponement of German unification until the latter part of the 19th century, when this anachronistic and belated process was to disturb the peace of the world. But if a unified national German state was not the product of this general period of the development of dynastic national states, there appeared the dynastic system which were ultimately to bring centralization and unity to Germany-Prussia under the Hohenzollerns. After having developed from robber barons into wealthy city magnates of Nuremberg in southern Germany, the Hohenzollerns appeared upon the north European stage through the purchase of the mark of Brandenburg by Frederick Hohenzollern from the bankrupt Emperor Sigismund in 1415. Through fortunate marriage arrangements they secured the possession of Brandenburg in 1487. The basis of the Prussian bureaucracy and military system was laid by Frederick William the Great Elector (1640-88) and the process was carried to completion by Frederick William I (1713-40). Starting with these contributions of his ancestors, Frederick the Great (1740-85) was able by diplomatic duplicity and military genius to raise Prussia to the rank of a first-rate European power and to create that German political dualism which erected a final barrier to Central Europe was none other than political power and a half of dismemberment and servitude. Even semi-Asiatic Russia did not remain immune in this general European process of national differentiation and centralization.

Under her barbarous and brutal, but able, Tsar, Peter the Great (1696-1725), when Russia was centralized, a national royal army was established, European manners and customs introduced and Russian foreign policy was given a westward orientation. By 1721 the Baltic provinces had been taken from Sweden and the all-important "window to the west" secured. While neither Prussia nor Russia were seriously affected directly by the Commercial Revolution, the growth of nationalism in these states during the 18th centuries was indirectly almost wholly a result of the political reactions of this great economic movement.

In both states the nationalistic policies were adopted as a direct and obvious imitation of the administrative and military methods of the Prussian monarchy of the 18th century and as a result of the new industry and commerce, while from Louis XIV he obtained his pattern for political centralization and military reorganization. By the middle of the 18th century, then, national states had been created in most of Europe. Only in Germany, Italy and the Balkans was this process postponed until the next century, with results so disastrous to humanity at large.

The growth of nationalism during the period of the Commercial Revolution was forwarded by other forces than political centralization. The narrow and selfish nationalistic commercial policy, known as "Mercantilism," which developed more or less universally after 1500 as the general body of economic and commercial doctrines, and the state of industry until the middle of the 19th century, operated strongly in the way of increasing national consciousness, self-interest and jealousy, and was a potent stimulant to international friction. Commerce during this period became little better than a collective or national monopoly, in which the national states were ignored or denied. In addition to this powerful economic impulse to nationalistic and militaristic policies, a strong intellectual influence arose in the 16th and 17th centuries after the spell of the classical revival, known as "Humanism," had passed. Italy produced Machiavelli, Guicciardini, Ariosto and Tasso; France, Rabelais, Montaigne, Corneille, Molière and Racine; Spain, Cervantes, Lope de Vega and Calderon; Portugal, Camoëns, Miranda and Ferreira; England, More, Spenser, Shakespeare, Jonson, Marlowe, Bacon and Milton; Germany, Sachs, Ayer, Opitz and Fleming; Even Holy Scripture was not spared the drying-up influence of the vernacular literature, but in the translation of Luther and the King James Version became a powerful vehicle in the development, popularization and improvement of the vernacular language and a
NATIONALISM

subtle and effective force making for nationalistic divisions. The vernacular literature not only gave literary expression to the growing differentiation of national cultures, but constituted a national possession of first-rate importance, which served as a patriotic inspiration for the generations to come. When the religious divisions created by the Reformation coincided with national boundaries they constituted a formidable psychic force making for national cohesion and self-satisfaction. Before the end of the 18th century, then, Europe ceased to be either feudal or imperial and had come to be primarily national in political organization, economic policy and intellectual tastes and expression. What was further needed to perfect the nationalistic system was the psychological thrill furnished by the French Revolution and its results, and the provision of a real nervous system for the new nationalism in the improved or revolutionized methods of communication and transportation which came as a part of the Industrial Revolution.

IV. THE FRENCH REVOLUTION, THE NAPOLEONIC PERIOD AND THE POPULARIZATION OF NATIONAL SENTIMENT IN EUROPE.

The Commercial Revolution was not only the most potent force leading to the creation of the dynastic national state, but, curiously enough, it also contributed more than anything else before the Industrial Revolution to its ultimate downfall as a middle class, which it created and advanced in power and prestige, in time turned against the kings in the more progressive countries of western Europe, destroyed the dynastic state and brought into being that control by the middle class which was to prepare the way for the growth of 19th century democracy. The nature and significance of this all-important revolt of the middle class against the dynastic state is effectively set forth by Professor Hayes in the following illuminating citation: *Driven on by an insatiable ambition, not content to be lords of the world of business, with ships and warehouses for castles and with clerks for retainers, the bourgeoisie placed their lawyers in the royal service as a revolt of a sect of the many economists at the king's elbow, and with restless energy pushed on to shape state and society to their own ends. In England by the close of the 17th century they had helped to dethrone kings and had secured some hold on Parliament, but on the Continent their power and place was less advanced. For the 18th century was still the grand age of monarchs, who took Louis XIV as the pattern of princely power and pomp. Benevolent despots they were, these monarchs meaning well to govern their people with fatherly kindness. But their plans went wrong and their reforms fell flat, while the bourgeoisie became self-conscious and self-reliant, and rose up against the throne of the 18th Louis XIV. In France it was the bourgeoisie that started the revolutionary cry of 'Liberty, Equality, Fraternity,' and it was this cry in the throats of the masses which sent terror to the hearts of nobles and kings. Despised by the old order—the old régime—defended itself. First France, then Europe, was affected. Revolutionary wars convulsed the Continent. Never had the world witnessed wars so disastrous, so bloody.*

Along with the destruction of the dynastic aspect of the early national state, there came an intensification and popularization of national sentiment quite unknown in the earlier autocratic form of political organization.

As in England there was witnessed the first emergence of the dynastic national state, there also the middle class first came into power, due primarily to the more complete influence of the Commercial Revolution there than elsewhere. In 1649 the English middle class had headed a would-be autocratic king; 40 years later they completed the process of putting the middle class in political control by driving his son into exile when he attempted to ignore the constitutional barriers to the exercise of unlimited royal power. In France the bourgeoisie did not triumph until a century later. In 1614 they had been too weak to defy the monarch and the feudal nobility, but in 1799 and the following years they gave objective evidence of their increasement of power. Their boleth of fraternit, arose as a 'nation in arms' to defend their freshly won liberty against the champions of the old régime. A vast change took place in the nature of national sentiment as a result of this popularizing force of fraternity. At the close of the 17th century Louis XIV had held that the state and the monarch were one and the same; at the close of the 18th bourgeois officials were declaring that the nation had a glorious existence quite independent of the king. Professor Hayes has well expressed the importance of this new Revolutionary watchword of 'Fraternity' in the process of popularizing the sentiment of nationalism. "Of all the political and spiritual elements in the 'old régime' of the 19th century, one of the most stubborn and impressive was the growth of nationalism. Taking definite form in the days of the French Revolution under the fair name of fraternity, it appeared again in the revolutionary period and again in the 20th century of their individual liberty and equality against the tyranny or inefficiency of contemporaneous divine-right institutions. By the French idea of fraternity every European country was soon affected, so that formerly latent sympathies were galvanized into a most lively sentiment, and theorists from the domains of history or philosophy or even of economics could find popular approval for their solemn pronouncements that people speaking the same language and sharing the same customs should be politically united as nations. As a result of the 23 years of general European war following 1792, the national sentiment of well-nigh every European country was transformed from the autocratic and dynastic type to a popular form, generally diffused through the whole body politic. This came about either directly, where Napoleon conquered and carried the French reforms, or indirectly, as a defense reaction against the great military genius of the time by the other littoral states necessary to arouse a similar patriotism in their citizens in order to cope with Napoleon. The French Revolutionary patriotism was carried..."
directly from France into the Rhine provinces, Italy and Poland and appeared as a defense reaction in the Germanies, particularly Prussia, in Spain and her colonies and, to a lesser degree, even in England and Russia. No state in Europe wholly escaped this wave of patriotic enthusiasm that swept over Europe from 1792 to 1815. The remarkable contribution of Napoleon to the growth of nationalism in modern European history, through giving a widespread dissemination to the forces and tendencies of his time, is thus stated by Professor Robinson: "So long as states were composed of subjects rather than of citizens, the modern emotions of nationality could scarcely develop. Nationality, in our meaning of the term, is a concomitant of another mystical entity, democracy. The French Revolution began, it is true, in a period of philosophic cosmopolitanism, since that was the tradition of the philosophes, but it was immediately followed by Napoleon's project to liberate other peoples from their tyrants in the name of the rights of man, not of nations. But Napoleon, in a somewhat incidental and left-handed fashion, did so much to promote the progress of both democratic institutions and of nationalism in western Europe that he may, in a sense, be regarded as the putative father of them both. His plebeians were empty things in practice, but they loudly acknowledged the rights of peoples to decide on vital matters. He was a friend of constituventions—so long as he himself made them. Then his attempt to seat brother Joseph on the Spanish throne produced a really national revolt, and led to the Spanish constitution of 1812 and all its later revivals and imitations. In Italy he stirred a desire for national unity and the expulsion of the foreigner which had been dormant since the days of Machiavelli's hopeless appeal. He is the founder of modern Germany. He succeeded in a task which had baffled German emperors from the days of Otto the Great; for in 1803 he so far consolidated her disrupted territories that the remaining states, enlarged and strengthened, could in time form a strong union and become a great international power. His successors are building the Prussian army after his victory at Jena suggested to Scharnhorst, Gneisenau and Boyne a subterfuge which made Prussia the military schoolmaster of Europe, and cost the millions of lives since offered up in the cause of nationality. To these European effects of the influence of the Napoleonic period upon the growth of nationalism should be added the contagion of this process which extended to America. The rise of national independence in Latin America was immediately related to the influence of Napoleon upon Spain. As Mr. Fisher has said: "If the South American democracies value their independence, statues of Napoleon might with propriety be raised in the squares of Valparaiso and Buenos Ayres." The naval and commercial aspects of the struggle between England and France greatly stimulated that development of national unity in the United States which was involved in the preparation to meet the insult to this country and all commercial interests in its trade. Finally, the purchase of Louisiana, made possible by Napoleon, was the greatest nationalistic event in the first half century of our history as an independent state. So great was the momentum which the popularized sentiment of nationality gained that not even Metternich, the most astute statesman of the first half of the 19th century, could check it. In spite of his temporarily successful efforts to leave it behind, which he made "geographical expressions" in 1815, the arrangement he produced was cast to the winds by those great nationalistic statesmen Cavour and Bismark in the unification of Italy and Germany, while the national sentiment surged violently, if with us in political expression, in Greece, the Balkans, Bohemia, Poland and Hungary. But the French Revolution, as the final political and nationalistic expression of the Commercial Revolution, only gave the initial impulse to this new democratic phase in the development of nationality. A much more profound revolution was already in process of development in the factories and mines of England, and the greatest transformation in the history of the race was there being prepared, which could not fail to have a far-reaching reaction upon the growth of national sentiment and the activities and attitudes of the national states.

V. THE INDUSTRIAL REVOLUTION, NATIONAL IMPERIALISM AND THE LATEST STAGE IN THE EVOLUTION OF NATIONALISM.

The term "Industrial Revolution" was given by W. S. Jevons and Arnold Toynbee to the great series of mechanical inventions that followed the introduction of John Kay's "flying shuttle" in 1738 and have completely transformed the economic, political and social as well as most of the intellectual, foundations of civilization. The general significance of the Industrial Revolution has been eloquently set forth by Professor Shotwell in the following quotation: "It has brought into existence a vast working population, embodied in iron and steel, drawn from mines and forests, from steam, gas and electricity by the mysterious genius of the human brain. It has transformed the face of nature and the life of the whole world. These are not mere economic facts. They form the largest and most wonderful chapter in the history of mankind. What is the Renaissance or Reformation, the empire of Charles Magne or of Caesar, compared with this empire of mind and industry, which has penetrated the whole world, planting its cities, as it goes, binding the whole together by railroad and telegraph, until the thing we call civilization has drawn the isolated communities of the old régime into a great world organism, with its affluent and effervescent nerves of news and capital reaching to its finger tips in the markets of the frontier. A nickel spent for thread in Uganda sets the spindles going in Manchester. Fellaheen by the Nile may be starving because the cigarette factories are building marble palaces for their owners on the banks of the Hudson." Following as a result of the industrial conditions necessitated by the mechanical inventions came the "factory system" and the growth of the modern industrial cities, with all of their attendant social and economic problems. This meant not only a concentration of the industrial population in the newly-created manufacturing cities, but also the completion of the process of separating capital from labor and the creation of the interrelation
between them that has colored the social and economic history of the last century. Socially and politically the most important results of the sweeping wave of progress were an increase in the number and strength of the middle or capitalist class and the creation of the industrial proletariat. The struggle between these classes and of both of them against the landed aristocracy has been the centre of the political history of the last hundred years and the chief dynamic force in the growth of political democracy. The development of means of the communication of intelligence, through the railroad, telegraph, telephone and cheap newspapers, made possible a real psychological unity within each nation, broke up local isolation and completed the process of popularizing national sentiment and perfecting national self-consciousness. It made the various national manifestations of "herd-innate" more communicable, more responsive and more liable to sudden and hysterical explosions. So fundamentally primitive was the general level of thought and interests on the eve of the Industrial Revolution that the sudden development of communication, newspapers, the telegraph, and the modern national state tended to give to national thought and emotion the same narrowness and self-satisfied provincialism that had earlier prevailed on a smaller scale. Therefore, it is not surprising that Professor Rohnson finds that "Our ancient tribal instinct evidently retains its blind and unreasoning characteristics despite the fact that we are able nowadays, by means of newspapers, periodicals, railroads and telegraphs, to spread it over vast areas, such as are comprised in modern states like Germany, France, Russia and the United States." The world-wide extension of the new mechanism of communication also rendered jingoistic expressions in foreign countries better known and more likely to arouse national antagonisms. Finally, as will be evident from the following discussion, the Industrial Revolution was the most influential force impelling the great modern national states to undertake the building up of new colonial empires in the course of our century.

The European Revolutions of 1848 seemed to bring to a focus the two great principles of the first half of the 19th century—nationality and democracy—which had been produced by the combined action of the French and Industrial Revolutions, and for the moment gave promise of making possible the dream of the European liberals that a political order might be created which would give full recognition to both of these aspirations. The enthusiasm thus engendered among the nationalists and democrats in Europe during these momentous years has been eloquently set forth by Mr. Bryce: "So the sympathy, both of America and of Britain, or at least of British Liberals (among whom was then to be found a great majority of the men of light and leading), went out when, in 1848, the crash of the Orleans Monarchy in France had shaken most European thrones, to the Italian revolutionaries, to the Polish revolutionaries, to the Czechs in Bohemia, to the Magyars in Hungary, who, under the illustrious Kossuth, were fighting in 1849 for their national rights against Hapsburg tyranny, to the German patriots who were trying to liberalize Prussia and the smaller king-
principle of change, no phase of political specula-
tion conceivable which is more comprehensive, 
more subversive, more arbitrary than nation-
ality. In short, national sentiment will seek
as well as moral ruin, in order that a new
invention may prevail over the works of God
and the interests of mankind. The 19th century
witnessed the belated com-
pletion of national unification in two major
European states—Germany and Italy—through
the efforts of Bismarck and Cavour in the
decade and a half following 1855. These states-
men, in deep sympathy with the national aspi-
ration of their countrymen, gathered together
under their leadership the various forces work-
ing in this direction and succeeded in giving
concrete and effective expression to the gen-
erally diffused impulse to political unification.
In a very real sense they may be regarded as
having carried to completion the forces and
tendencies first aroused in their respective
states by the reactions to the French Revolu-
tion and the Napoleonic conquests and states-
manship. Not only were the patriotic tenden-
cies, at the head of which they put themselves,
originally set in action by the Revolution of
Napoleon, but also the main obstacle to na-
tional unification which had to be overcome
in both states was the antagonism of that invet-
erate and implacable enemy of Napoleon and
the "French Ideas"—the anachronistic empire
of the Hapsburgs and Metternich. The work
of Cavour and Bismarck marked a significant
stage in that incessant warfare against the
medieval imperial concepts and practices which
had begun at Westphalia in 1648, was carried
on at Utrecht and in the creation of the Con-
federation of the Rhine, and finally ended in
the utter collapse of that obsolete and oppress-
ive political structure in the autumn of 1918,
as a result of the growth of national senti-
ment among its subject peoples and the blow
to its military prestige by the collapse which
marked the close of the "War of the Nations." 
Force, chicanery, duplicity and intrigue were
employed about equally by both Cavour and
Bismarck in achieving their justifiable ambi-
thions, but the methods and political systems
involved were widely different. "Blood and iron
and Realpolitik' were used by Cavour merely
as a means to the end of creating a liberal
and pacific state and a parliamentary govern-
ment, while with Bismarck they became ends
in themselves and were used to repel the very
liberalism and democracy which Cavour had
established. The temporary vindication of
brute force and autocracy in Germany, as a
result of the success of Bismarck from 1862
1871, gave them tremendous prestige in the
newly-formed empire and served to give color
to the subsequent history of Germany and the
world.

In addition to these larger national states
which have appeared upon the European
map since 1815, a number of smaller nations
have attained in part, at least, to statehood.
Greece attained independence in 1829; Belgium
1830; and its neutralization in 1839; Luxemburg became an inde-
pendent state in 1867; Serbia, Rumania and Montenegro were recognized
as states in 1878; Norway separated from Sweden in
5 1905; Bulgaria took advantage of the Euro-
pean confusion and tension of 1908 to declare
her complete freedom from Turkey; and in
1913 Austria perversely created the independent
Albanian state to block Serbia from an outlet
to the sea. But in spite of this considerable
addition to the "family of nations" in Europe,
national aspirations were by no means satisfied
by 1914. Not only did the political map fail
1908 to coincide with the national boundaries in the cas-
ese. In the case of this considerable
addition to the "family of nations" in Europe,
national aspirations were by no means satisfied
by 1914. Not only did the political map fail
to coincide with the national boundaries in the case
of the new states created during the 19th century, but
there were great historic nations like the Poles,
the Irish, the Czechs of Bohemia and the Finns
which were denied any independent political
existence. Had the psychology of peoples been
the same in 1914 that it was a century and a
half before, this condition of incomplete na-
tional independence would have produced no
very great problem, for potential nations as
distinct in race, language and historical tradi-
tions as they were at the beginning of the 20th
century had long lived without complaint when
subjected to the oppression of alien peoples.
But the perfection of the dynastic national state,
the psychological contagion generated by the
French Revolution, the defense-reactions pro-
duced by it, and the reversion to the concept of
the democracy brought into being by the
Industrial Revolution, and their net result in
arousing the quiescent "herd-instinct" and in
giving it a nation-wide field of operation made
any attempt to deny national aspirations an
impossible dream. A boisterous and intolerant
chauvinism had developed in the greater states
of Europe which inevitably reacted upon the
"repressed nations" and aroused similar simi-
larities and ambitions there. This tendency was
powerfully forwarded by the attempt of the
great national states to crush out by persecu-
tion the national aspirations of the subject
nations within their boundaries. Germany op-
pressed the Poles; Russia the Finns, Letts,
Lithuanians, Poles and Ruthenians; Austria the
Czechs, Slovaks, Poles and Ruthenians; France the
Rumanians, the Ruthenians and the Croats;
and Turkey portions of most Balkan nations
and the embryonic nations of Asia Minor.
Further, these lesser or "oppressed" nations fol-
lowed the example of the greater states in
arousing an interest in nationalistic literature and
by thereby stimulated their hopes for
independence by centering attention upon
the past glory of their peoples, be it as remote
as classical times or the early Middle Ages.
Nothing could thwart this force—not even
the oldest monarchy in Europe nor the mightiest
military state which the world has yet seen.
The general nature of the friction and dis-
satisfaction felt in the Europe of 1914 over
the failure of the political divisions to coincide
with the national groupings has been admirably
summarized by Professor Hazen in the fol-
lowing synoptic outline:

1. Dissatisfaction in Germany on the part of
   a. The people of Alsace-Lorraine;
   b. The Poles of Eastern Prussia;
   c. The Danes of Northern Schleswig.
2. Dissatisfaction in Denmark over
   a. The loss of the Danes in North-
      ern Schleswig.
3. Dissatisfaction in Austria-Hungary on the
   part of
   a. The Czecho-Slovaks;
   b. The Rumanians of Eastern Hungary;
3. Dissatisfaction in Austria-Hungary on the port of — Continued
   c. The South- or Jugo-Slavs;
   d. The Italians of the Trentino, Istria, and Trieste.

4. Dissatisfaction in France over
   a. Alsace-Lorraine.
   b. The occupation of millions of Germans
      in Austria-Hungary.
   c. Lack of outlet to the sea.

5. Dissatisfaction in Italy over
   a. Italian Irredenta — Trentino, Istria, Fiume.

6. Dissatisfaction in Serbia over
   a. The oppression of millions of Serbs
      by Austria-Hungary.
   b. Lack of outlet to the sea.

7. Dissatisfaction in Rumania over
   a. The oppression by Hungary of millions
      of Rumanians.

8. Dissatisfaction in Bulgaria over
   a. The boundaries laid down by the
      Treaty of Bucharest, 10 Aug. 1913.

9. Dissatisfaction in Greece over
   a. Turkish rule of millions of Greeks.

10. Dissatisfaction of the Poles over the fact
    a. That Poland does not appear upon the
        map of Europe, but has been divided
        among and incorporated with the three
        partitioning powers of the 18th century,
        Russia, Prussia, and Austria.

11. Dissatisfaction in Russia on the part
    a. Of the Poles.
    b. Of the people of Finland, etc.

To these, obviously, should be added the dissatisfaction felt by the Irish nationalists, who in spite of the eloquent appeals of O'Connell and Redmond and the sympathy they aroused in Gladstone and the English Liberals, were denied their aspiration for a home rule.

To joined to these sources of friction and unrest produced by the imperfect realization of patriotic aspirations among oppressed national groups, there were deep-seated and ominous rivalries among the great national states of Europe over purely European national problems. From 1870 to 1914 France was mourning over her lost provinces, dragging the Strasbourg Cabell and perpetuating the ceremonials of revanche, while Bismarck alleged that Germany was maintaining and increasing her great armament solely as a protection against the contemplated French war of revanche, so fiercely urged by Dëroux and his fellow patriots. In spite of a formal alliance, Austria and Italy were fundamentally at odds over the solution of the problem of Italia Irredenta. The Mittel-Europa plan of Germany and Austria was diametrically opposed to the Pan-Slavic scheme of Russia as well as to the national aspirations of the Balkan states. Finally, England's jealousy over Russian longing for Constantinople, which had led her to intervene when the effects of the Crimean war in 1854-55, was never removed until the mutual loot and partition of Persia was consummated in 1907.

But ominous and troublesome as were the rivalries of national states in Europe over continental problems, these were as nothing compared with those which arose from the struggle over the opening up of backward countries for investment and the planting of colonies in lands beyond the sea. From the period of the close of the Napoleonic wars to 1870 there had been a decided decline in imperialistic enterprises. Under the reign of economic liberalism European countries even went so far as to discuss the very desirability of colonies, and Richard Cobden and his followers believed that the British Empire was quite as much an English liability as an asset. But the results of the Industrial Revolution put an end to this amiable cosmopolitan dream of the Cobdenites and produced the revival of the Malthusian policy in the shape of a new scramble for the remaining unappropriated parts of the earth, which could be utilized as colonies and markets for the greatly increased volume of manufactured products. The relation between the great increase of production, caused by the various phases of the Industrial Revolution, and the new national imperialism has been admirably stated by Professor Schapiro in the following passage:

Towards the end of the 19th century there took place a new Industrial Revolution, the results of which were almost as startling as those of its predecessor a century before. The application of science to industry through the extraordinary development of the chemical and physical sciences, the better organization of business enterprise through combination, the larger use of capital and the opening up of new sources of raw material in Asia and Africa increased many fold the production of goods. Gigantic plants, equipped with scientific laboratories, worked by armies of laborers, and capitalized by millions of dollars, brought together in syndicates and trusts, displaced the small factories, or mills, as they were still called. It is estimated that the average increase in the commerce of all the countries of Europe during the 19th century was over 1{\textperthousand} per cent. . . . The Industrial Revolution at the beginning of the 19th century transformed the economic life of Western Europe only; the new Industrial Revolution at the end of the century caused Europe to burst her industrial bonds and to encroach on the entire world in its influences. The new industrialism multiplied production so enormously that markets had to be sought outside the limits of the home country. As competition for the home market within the leading industrial countries became very keen, the eyes of the captains of industry were naturally turned to the many regions that were at the same time densely populated and industrially undeveloped. The vast populations of Asia and Africa were so many potential customers for the business men of Europe. What fabulous profits awaited those who got the opportunity of clothing and shoeing the teeming millions of Chinese and Hindus! This process of national expansion overseas, in its second or recent phase, set in about 1870, when the effects of the Industrial Revolution had been felt in England and France and were beginning to be experienced to an ever greater degree by Germany. France turned to Africa and Asia, and in Tunis, north central Africa, Morocco and Indo-China sought compensation for the territorial losses of Alsace-Lorraine and investment opportunities for her growing body of capitalists. To obtain a more complete control over the routes leading to India, Disraeli bought the large block of Suez Canal stock in 1875 and started Great Britain on her second
experiment in empire building, which added to her already extensive territorial possessions, Egypt, the Sudan, South Africa, Nigeria, southern Fennoscandia, Tibet, Russia extended her sphere of political and economic control in the Far East in the region of Manchuria, and also in the district about the Caspian Sea, including the northern half of Persia. Germany sought her place in the imperialistic sun by colonization in Africa and in the island realms of the Indian, the Atlantic, and the Pacific, and by an attempt at the economic control of Asia Minor and Mesopotamia through her Berlin-Bagdad railroad project. Italy, after an unsuccessful attempt to get control of Abyssinia, was compelled to remain content with Somaliland and Eritrea until she was able, 15 years later, to wrest Tripoli and Cyrenaica from Turkey. Finally, nearly all of the above-mentioned states participated in the economic, if not the political, partition of China. The conflict of ambitions in this process of European expansion created many centres of international friction. Germany and England clashed over the distribution of territory in South Africa and over the control of the Persian Gulf. France and Germany precipitated their respective disputes concerning Morocco. France and England nearly went to war over the territory surrounding the source of the Nile. Russia went to war with Japan over Manchuria and Port Arthur, and came to an agreement with England concerning Persia only by a mutual division of spoil in the agreement of 1907. In addition, this new imperialism served to stimulate national pride and aggressiveness on the part of the great national states of Europe through the development of the "mappita" psychosis, namely, the emphasis on design and felt by the citizens over the success or failure of their respective states in covering the map of the world with the brilliant colors designating their colonial possessions. Finally, the struggle for markets and the desire to have control of the economic interests led to the practical institution of a neo-Mercantilistic era of protective tariffs. Beginning with the Bismarckian tariff bill of 1879 there ensued a general European movement toward nationalistic protective tariffs so high that they would have caused even Freidrick List to gasp with astonishment if not with dismay. Only England escaped from this tendency to introduce what practically meant an economic war between the various continental European states. In this manner were economic and political events in and out of Europe contributing to the stimulation of jingoism and international distrust and suspicion in the generation preceding the coming of the calamity of 1914. The writings or speeches of Peters, Reventlow, Rohrbach, Tannenberg, Delcassé, and the Rhineland statesmen presented the world evidence of the various grandiose programs of national expansion and served to stir up mutual suspicion and antagonism. That this dangerous state of mind in Europe was most marked in Germany was probably due more than anything else to the delayed nature and the forcible methods of her national unification, to her rapid and unprecedented economic development since 1870 and its resulting impulse toward imperialistic expansion, and to the fact that the "stigmatic" discrepancy between relative European prestige and relative extent of colonial possessions was most marked in the case of Germany. The diplomacy of the latter part of the 19th century and the beginning of the 20th was very poorly adapted to meeting this difficult task of reaching a peaceful adjustment of conflicting international claims. While there there were instances of diplomatic honor and practice made great strides in advance during the last century, it is equally certain that it was still essentially Machiavellian, and, as Mr. Weyl has well expressed it, was still controlled by "the approved diplomatic type, the aged, bemuddled, chilly, narrow, and conservative, Excellency, very gentlemanly, very astute, fundamentally stupid."

The prospect of a peaceful settlement of the disputes between the European states over European and imperialistic problems was greatly diminished by the vast armaments which were created and increased, ostensibly in the interest of preserving peace, but actually, as subsequent events have proved, to encourage an aggressive nationalistic policy of expansion and annexation. In its effort to settle disputes concerning Morocco, France and England nearly went to war over the territory surrounding the source of the Nile. Russia went to war with Japan over Manchuria and Port Arthur, and came to an agreement with England concerning Persia only by a mutual division of spoil in the agreement of 1907. In addition, this new imperialism served to stimulate national pride and aggressiveness on the part of the great national states of Europe through the development of the "mappita" psychosis, namely, the emphasis on design felt by the citizens over the success or failure of their respective states in covering the map of the world with the brilliant colors designating their colonial possessions. Finally, the struggle for markets and the desire to have control of the economic interests led to the practical institution of a neo-Mercantilistic era of protective tariffs. Beginning with the Bismarckian tariff bill of 1879 there ensued a general European movement toward nationalistic protective tariffs so high that they would have caused even Freidrick List to gasp with astonishment if not with dismay. Only England escaped from this tendency to introduce what practically meant an economic war between the various continental European states. In this manner were economic and political events in and out of Europe contributing to the stimulation of jingoism and international distrust and suspicion in the generation preceding the coming of the calamity of 1914. The writings or speeches of Peters, Reventlow, Rohrbach, Tannenberg, Delcassé, and the Rhineland statesmen presented the world evidence of the various grandiose programs of national expansion and served to stir up mutual suspicion and antagonism. That this dangerous state of mind in Europe was most marked in Germany was probably due more than anything else to the delayed nature and the forcible methods of her national unification, to her rapid and unprecedented economic development since 1870 and its resulting impulse toward imperialistic expansion, and to the fact that the "stigmatic" discrepancy between relative European prestige and relative extent of colonial possessions was most marked in the case of Germany. The diplomacy of the latter part of the 19th century and the beginning of the 20th was very poorly adapted to meeting this difficult task of reaching a peaceful adjustment of conflicting international claims. While there were instances of diplomatic honor and practice made great strides in advance during the last century, it is equally certain that it was still essentially Machiavellian, and, as Mr. Weyl has well expressed it, was still controlled by "the approved diplomatic type, the aged, bemuddled, chilly, narrow, and conservative, Excellency, very gentlemanly, very astute, fundamentally stupid."
system in 1872, and most of the other Great Powers, as well as the lesser Balkan states, did in the same decade of the "seventies. 6 Even Turkey, in 1883, invited Von der Goltz to reorganize the army of the Sultan on the German plan. Nor was the increase in armament limited to land forces; the great extension of the new colonial enterprise and the development of a larger merchant marine seemed to demand new and larger navies. In view of Great Britain's greater colonial possessions and trade it was but natural that she should begin the movement. From 1894, Great Britain passed an act providing for a vast increase in her fleet and initiated that policy of keeping her naval strength far in advance of any rival state. Not until 1898 did Germany's interest in "Weltpolitik" lead her to attempt to rival Britain on the seas, but in that year there was passed the first great German naval act, which was supplemented by other more pretentious increases in acts of 1900, 1906 and 1912, which served to arouse British alarm and ensure a "race" in which the result was extremely improbable. Nor were England and Germany alone in this process. All the leading powers, but especially France and Russia, followed their lead. With these great wars making headway, the German public was little inclined to submit their conflicts and disputes to what were regarded by the jingoistic patriots and imperialists as the pusillanimous and ignoble methods of diplomacy and arbitration.

Accompanying these political and economic forces making for a greater prevalence of jingoism in the last generation of European history, there were psychological causes operating which were not less effective in promoting national aggressiveness and mutual hatred, suspicion and contempt. Anthropological fallacies, growing out of racial historical "Theorie" of the "Inequality of the Human Races" (1854) and Max Müller's hasty generalizations in his "Lectures on the Science of Language" (1861) led to an inflation of racial egotism, the intensity of which was increased over the necessity of reclaiming Italy as a German student. Literary attacks on the original "Aryan" bearer of civilization among the nations of Europe. That writers more patriotic than scientific could find certain and irresistible evidence for the original habitat of the primordial "Aryan" in France, Germany, Italy and Russia is sufficient evidence not only of the hopeless scientific confusion, but also of the disastrous patriotic ardor that invited the search. Pseudo-Darwinian sociology represented war as the supreme principle making for social progress, as the struggle for existence had advanced biological evolution. This distortion of half-truth by Gumpowicz and his school was eagerly seized upon by the military and ultra-patriotic writers, such as Moltke, Bernhardi and Von der Goltz in Germany, Dreyfus and Barrés in France, Lord Roberts, Weyg, Cramp and Maude in England, and Lea Maxim, Mahan and Gardner in America, to give a semi-scientific cloak for their class and clique interests. Super-patriotic history, literature and philosophy magnified the past glory and the future heritage of each nation and proportionately disparaged the past and future of their rivals. The emotional impulse from "Romanticism" led to a greatly increased interest in the study of national history. This was augmented by the patriotic enthusiasm accompanying the growth of nationalism following the French Revolution and the Napoleonic Era. Every country began the compilation of gigantic collections of the sources of national history, of which the "Monuments Germaniques Historiques," the "Documents inédits" and the "Rolls Series" were only the most notable among many similar enterprises.

National narrative histories breasting forth a fiery and defiant patriotic ardor were produced by Giesebrecht, Droysen, Treitschke and Sybel; Mignet, Michaud, Raynoud, Guizot, Thiers, Michelet and Martin; and Freeman, Stubbs, Froude, Carlyle, Macaulay and Napier. Literature became even more chauvinistic. Houston Stuart Chamberlain, building on the risky foundations of the anthropological fallacies of Gobineau, Pöschle and Penka, was able to discover that almost without exception every important figure in history since the beginning of the Christian era had been a German. Even Saint Paul, Dante, Giottio, Michael Angelo and Raphael were included by this unadulterated exponent of "Kultur" under the caption of "We Teutons!" Nisard detected the very essence of Reason, herself, in the spirit of French literature. Maurice Barrés found that French culture was a precious and indigenous product of Celtic blood, to which neither Roman nor Teuton had contributed in the slightest degree, and he advocated its preservation by making it the centre of a near Japanese cult of ancestor-worship. Léon Daudet found that nations other than the French exhibited undoubted stigma of mental and moral decline or deficiency. Rudyard Kipling, the poet of "Saxondom" and British imperialism, indulged in frenzied injunctions to his countrymen urging a greater assumption of the "white man's burden" throughout the non-European world. Carducci made the heroes of Italian unification the theme of the greatest of modern Italian poetry, while d'Annunzio wrought himself up into a neoplatonic ecstasy over the necessity of reclaiming Italy as a German student. Patriotic state education taught unquestioning loyalty to state or dynasty as the first principle of moral conduct, carefully obscured anyquestionable occurrences or policies in the national past and frowned on criticism and progressive reform proposals. Slowly, but surely and wilfully, Europe was preparing for the cataclysm of August 1914. As Professor Sunner long before predicted, the vast armaments that had been prepared with the avowed purpose of defense were invested in the transformation of nationalistic and military philosophy from the advocacy of a purely defensive war into an exposition of the virtues and necessity of a "preventive war." That this process of the cumulative growth of national egotism and aggressive militarism was undoubtedly most marked in Germany has not obscured the fact that she was separated from the other European national states in this respect by a difference in degree rather than in kind, and that she was able to bow the necks of her cousins under the burden of the military monopoly primarly because of the welcome evidence that her neighbors gave to the German military class that they were not unwilling to submit the "rectitude" of their cause to the "test of arms." Nationalistic and ultra-patriotic intoxication.
rather than unique Teutonic perversity "applied the match to the European powder-house" in 1914, and if Germany was the only nation which had produced analogous deviant self-control, none of her opponents could present an unchallenged record of total abstinence.

While the rise of modern nationalism has been most conspicuous in Europe, this should not obscure the fact that similar forces have produced analogous developments elsewhere, most notably in America and Japan. To an astonishing degree the growth of national unity and of national sentiment in both of these more recent cases of the rise of nationalism has been the product of the same general circumstances and conditions which promoted the development of nationalism in Europe, though in most respects these influences did not have a wholly indigenous origin and expansion, as in Europe, but were introduced from abroad.

The causes of the rise and growth of nationalism that of the United States has, of course, been the most significant. As Professor Cheyney has so convincingly pointed out, the settlement of the United States was quick and spontaneous, and much connected with the economic impulses arising from the Commercial Revolution in Europe as it was with the religious revolt from Catholicism and the Established Church of England. Even more consequential were these new commercial forces in promoting unity among the colonists. A century of mutual ignoring of British commercial restrictions had given the 13 colonies a strong common motive for unified action in opposing the proposed enforcement of these long dormant Mercantile restrictions—a motive which Professor Schlesinger has recently shown to have been far more powerful than any theoretical or legal abstractions involved in the colonial movement of resistance to British imperial power. In addition to these economic foundations of the shaping of American national sentiment there was a fundamental sociological process in operation which has been aptly termed by Professor Becker "the beginnings of the American people." A widely diversified, geographical, social, and economic environment acting upon a population originally psychologically variant from the great mass of Englishmen, tended inevitably to create in the colonies a people who became, generation after generation, more and more divergent from their kinmen across the Atlantic. Not only were these environmental influences working to produce an essential dissimilarity between Englishmen and Americans, but through the fundamental uniformity of the American social and economic environment there was being created a homogeneous and unified American people and the beginnings of a national self-consciousness. The American Revolution, initiated by the enterprising and recalcitrant merchants and debtors and carried to success by their courage and audacity and by the not disinterested aid of the French, furnished a unifying force of very great potency for a temporary period, but the reaction in the period of the Confederate for the time being threatened a large interruption and dismemberment. Thanks, however, to their desire for financial stability and security, the vigorous capitalistic class, led by that great constructive statesman of early nationalism, Alexander Hamilton, turned the tide of political opinion and practice from separatism and provincialism to nationalism and unity. Their work was carried on by the strongly moral, and of her opponents could present an unchallenged record of total abstinence.

While the rise of modern nationalism has been most conspicuous in Europe, this should not obscure the fact that similar forces have produced analogous developments elsewhere, most notably in America and Japan. To an astonishing degree the growth of national unity and of national sentiment in both of these more recent cases of the rise of nationalism has been the product of the same general circumstances and conditions which promoted the development of nationalism in Europe, though in most respects these influences did not have a wholly indigenous origin and expansion, as in Europe, but were introduced from abroad.

The causes of the rise and growth of nationalism that of the United States has, of course, been the most significant. As Professor Cheyney has so convincingly pointed out, the settlement of the United States was quick and spontaneous, and much connected with the economic impulses arising from the Commercial Revolution in Europe as it was with the religious revolt from Catholicism and the Established Church of England. Even more consequential were these new commercial forces in promoting unity among the colonists. A century of mutual ignoring of British commercial restrictions had given the 13 colonies a strong common motive for unified action in opposing the proposed enforcement of these long dormant Mercantile restrictions—a motive which Professor Schlesinger has recently shown to have been far more powerful than any theoretical or legal abstractions involved in the colonial movement of resistance to British imperial power. In addition to these economic foundations of the shaping of American national sentiment there was a fundamental sociological process in operation which has been aptly termed by Professor Becker "the beginnings of the American people." A widely diversified, geographical, social, and economic environment acting upon a population originally psychologically variant from the great mass of Englishmen, tended inevitably to create in the colonies a people who became, generation after generation, more and more divergent from their kinmen across the Atlantic. Not only were these environmental influences working to produce an essential dissimilarity between Englishmen and Americans, but through the fundamental uniformity of the American social and economic environment there was being created a homogeneous and unified American people and the beginnings of a national self-consciousness. The American Revolution, initiated by the enterprising and recalcitrant merchants and debtors and carried to success by their courage and audacity and by the not disinterested aid of the French, furnished a unifying force of very great potency for a temporary period, but the reaction in the period of the Confederate for the time being threatened a large interruption and dismemberment. Thanks, however, to their desire for financial stability and security, the vigorous capitalistic class, led by that great constructive statesman of early nationalism, Alexander Hamilton, turned the tide of political opinion and practice from separatism and provincialism to nationalism and unity. Their work was carried on by the strongly moral, and of her opponents could present an unchallenged record of total abstinence.

While the rise of modern nationalism has been most conspicuous in Europe, this should not obscure the fact that similar forces have produced analogous developments elsewhere, most notably in America and Japan. To an astonishing degree the growth of national unity and of national sentiment in both of these more recent cases of the rise of nationalism has been the product of the same general circumstances and conditions which promoted the development of nationalism in Europe, though in most respects these influences did not have a wholly indigenous origin and expansion, as in Europe, but were introduced from abroad.

The causes of the rise and growth of nationalism that of the United States has, of course, been the most significant. As Professor Cheyney has so convincingly pointed out, the settlement of the United States was quick and spontaneous, and much connected with the economic impulses arising from the Commercial Revolution in Europe as it was with the religious revolt from Catholicism and the Established Church of England. Even more consequential were these new commercial forces in promoting unity among the colonists. A century of mutual ignoring of British commercial restrictions had given the 13 colonies a strong common motive for unified action in opposing the proposed enforcement of these long dormant Mercantile restrictions—a motive which Professor Schlesinger has recently shown to have been far more powerful than any theoretical or legal abstractions involved in the colonial movement of resistance to British imperial power. In addition to these economic foundations of the shaping of American national sentiment there was a fundamental sociological process in operation which has been aptly termed by Professor Becker "the beginnings of the American people." A widely diversified, geographical, social, and economic environment acting upon a population originally psychologically variant from the great mass of Englishmen, tended inevitably to create in the colonies a people who became, generation after generation, more and more divergent from their kinmen across the Atlantic. Not only were these environmental influences working to produce an essential dissimilarity between Englishmen and Americans, but through the fundamental uniformity of the American social and economic environment there was being created a homogeneous and unified American people and the beginnings of a national self-consciousness. The American Revolution, initiated by the enterprising and recalcitrant merchants and debtors and carried to success by their courage and audacity and by the not disinterested aid of the French, furnished a unifying force of very great potency for a temporary period, but the reaction in the period of the Confederate for the time being threatened a large interruption and dismemberment. Thanks, however, to their desire for financial stability and security, the vigorous capitalistic class, led by that great constructive statesman of early nationalism, Alexander Hamilton, turned the tide of political opinion and practice from separatism and provincialism to nationalism and unity. Their work was carried on by the strongly moral, and of her opponents could present an unchallenged record of total abstinence.

While the rise of modern nationalism has been most conspicuous in Europe, this should not obscure the fact that similar forces have produced analogous developments elsewhere, most notably in America and Japan. To an astonishing degree the growth of national unity and of national sentiment in both of these more recent cases of the rise of nationalism has been the product of the same general circumstances and conditions which promoted the development of nationalism in Europe, though in most respects these influences did not have a wholly indigenous origin and expansion, as in Europe, but were introduced from abroad.
NATIONALISM

furnish a successive series of impulses to unity. Many pessimistic publicists believed that the great influx of foreigners in the last 50 years threatened national disruption as seriously as the political division. Nationalism has not been the experience of the United States in the Great War has definitely disproved their forebodings and demonstrated that whatever the general results of immigration, they have not brought national disintegration. The United States in the late “War of the Nations” produced a welling-up of exuberant national sentiment and intolerant patriotism which caused even the older allied and enemy European nations to gasp with astonishment. But while national development in the United States has been the most notable exemplification of this process in the western hemisphere, it has not been the only one. Canada, in spite of a titular connection with Great Britain, has developed a very much more intense national consciousness as a result of a century of independent political existence. America’s national sentiment and unity have been created in the various states of Central and South America. Nationalism, then, seems as much a part of modern Europe.

There can be no doubt that the most spectacular rise of nationalism in a 19th century state was witnessed in the case of Japan. After having welcomed European adventurers and missionaries in the middle of the 19th century, Japan suddenly turned against the newcomers, murdered or drove them from her shores and returned to immobility and isolation for three centuries. This artificial aloofness was broken down following 1853 by commercial concessions obtained first by the United States and then by European states. At first, the feudal princes opposed the entry of foreigners and their civilization, but the more far-sighted among them recognized that Japan could hope to compete with the states of Europe and America only by adopting at least the more mechanical features of their advanced civilization. By the Revolution of 1867-68 and its immediate results, this reforming element abolished the Shogunate, brought the Mikado out of seclusion, ordered the Daimyo to reorganize the army along European lines, and accepted the industrial methods and processes which had been produced by a century of economic development in Europe and America. Within a period of less than 40 years Japan passed from a mediæval feudal state to a modern industrial nation, though, as in the case of Germany, this change was limited to the mechanics rather than the philosophy of modern civilization. In no modern state is there such an intense devotion to national ideals as is to be found in Japan. The veneration for the past practically reaches a condition of ancestor worship, while patriotism is in a very real sense the official religion of Japan. When to these conditions there is added the abnormally rapid economic evolution of Japan, it is not difficult to recognize why she has been regarded as the “Germany of the Far East.” By successful wars against China (1894-95) and Russia (1904-05) Japan has become the great world power of the Pacific, and has acquired important territory on the mainland of Asia and has endeavored to erect and maintain a Japanese “Monroe Doctrine” in China and the Far East. The present-day exponents of internationalism seem likely to find Japan the most tenacious adherent to the old order of aggressive nationalism and imperialism, but it must be frankly admitted that Japan’s contact with the diplomacy of the western world could scarcely have taught her that the day of candor, honesty and generosity has yet arrived in the field of international relations. The rise of the new Japan stimulated the great inert mass of China. Stung by the defeat of their country by the microscopic Island Kingdom, the progressive Chinese patriots attempted to guard against another humiliation at the hands of the Japanese by imitating the Japanese adoption of western civilization. While this movement was temporarily obstructed by the reactionary element in the country led by the Dowager Empress, the liberals overthrew the obstructionists by the Revolution of 1911-12, established a Chinese republic, welcomed western influence and culture. While this remarkable transformation was too rapidly consummated to remain secure and unchallenged, it has persisted to a remarkable degree in spite of temporary set-backs, and China seems well on her way toward development. A more moderate nationalism. In conclusion, it should be noted that no observations on the rise of nationalism in the Far East can ignore the remarkable evidences of national self-consciousness in Australia and New Zealand which were brought out by the recent World War.

The disastrous “War of the Nations,” which has just ceased, was not only a product of obsessed nationalism, but also brought with it an unprecedented inflation of national egoism and intolerant patriotism. Never before had a general war occurred when the mechanism for disseminating both information and propaganda was so highly developed or so ruthlessly utilized. The slavish eulogy of national culture and history and the obscuring of national faults and blunders, which had already become half century before the war, were as nothing compared with the tyrannical censorship and unabashed organized propaganda of every state immediately engaged in the conflict. The German censorship, and the more sinister and extensive nature of German propaganda were, no doubt, indicative of the deeper conviction of ultimate guilt on the part of the Teutonic military autocrats, but no warring state escaped from these activities with an enviable record. Each of the opposing groups of powers represented the gigantic conflict as a sort of Persian eschatology—a struggle between the forces of light and darkness, a clash of the powers of righteousness and iniquity. Within each state an attempt was made to sustain morale by a cursory and slight criticism of the “war aims” of the government or its allies and by a carefully planned presentation and reiteration of the past and present criminal record of the opposing states. So powerful and all-embracing was this tidal wave of patriotic defense-reactions that it engulfed not only those on the street, but even the most eminent states and publicists, some of whom in the past had seen great virtue in the cultural complex of the enemy. This disheartening spectacle developed to its climax in the “manifesto” of the German professors, but even in no state were the intellectual classes im-
nure from the contagion of fervid patriotism, while those who maintained their poise were commonly regarded with sincere and genuine horror by their over-excited colleagues and critics. The astonishing effect of the wartime patriotism upon the public mind and its stimulating influence in creating a super-nationalism has been brilliantly and accurately set forth by Professor Hanks in the following citation: "Patriotism, like nationality, is not readily definable. It signifies loyalty to one's nation and implies the obligation to serve and defend it. It is thus a passion which all normal men feel, and which in time of our country's peril commands our instant loyalty. Of all the emotions that move men to action it is the most capacious. When it is aroused there is no other social force comparable to it in the completeness with which it dominates all other springs of action in all sorts and conditions of men. It lifts the average man up out of the concerns of a work-a-day world into the noblest spirit of devotion; it quickens the pulse of the sluggish, reforms the wayward, forges generosity from the ignoble, arouses the vanquished and heroic deeds, gives courage to the cowardly, and makes the hearts of the shrewd and crafty wolves of society swell with an ostensible love of country. In its face local feuds are forgotten, the bitter struggles of parties and classes are submerged; differences of creed, of social status, and even of race are obliterated. Under these circumstances only the group leaders may speak. The citizen must offer himself in silence as a willing sacrifice on the altar of his country in whatever manner those in authority may dictate. Even honest criticism is anathema; the conscientious objector, who in times of peace is praised as a courageous man who dares to stand against the world for what he believes right, is denounced as a sneaking coward and herded into prison. The individual rights of free speech, press, and assembly so essential to democratic government, so zealously guarded during peace, and so boastfully displayed to an admiring world on the national holidays, not only no longer to exist but are even denounced and proscribed as inimical to the public safety. The noble sentiments of toleration are fiercely denounced, as is also individual variation from type which is vigorously defended during peace under the ideals of individual liberty and initiative. Every social institution is brought into line; all organs of public opinion send forth a constant stream of uniform suggestions; the appeal is made through church and lodge and every customary association, until the members of the social group coalesce into a solid society that surpasses the fondest imaginings of the utopian Socialist. It is not unnatural that such a titanic social force should stir men's emotional nature to its depths; and especially during war, for war is self-sacrifice, it costs lives to dilute the honesty of their thoughts; sacrifices of all but the most sturdiest souls by forcing them to substitute the worse for the better reason and the lower ideal for one they feel to be higher. Under its guise every sort of sinister human purpose thrives, for anything which can be made to appear patriotic is instantly and deeply approved. Any counsel of moderation is pounced upon as enemy propaganda, while the advocates of internationalism are accused of silly sentimentalism and treason. To encounter a suspicion of lack of patriotism creates a greater defilement than the violation of an ancient taboo. As in the days of witchcraft, suspects are whipped, tarred and feathered or hanged, or like the distinguished list in Who's Who in Pacifism and Radicalism are immolated on the altar of militarism amid the shouts of the mob and the secret glees of the patriots who find the established social system the best of all possible systems. In other words, patriotism gives full sway to fear, unbridles the lusts and brutalities of savage man, intensifies our innate suggestibility, and subordinates the mind to every sort of delusion and deceit. Unfortunately there is no printed guide for the proper conduct of human affairs, and so deep is the mystery of social processes that only through the ignorant and dreams of heroic deeds, gives courage to the cowardly, and makes the hearts of the shrewd and crafty wolves of society swell with an ostensible love of country. In its face local feuds are forgotten, the bitter struggles of parties and classes are submerged; differences of creed, of social status, and even of race are obliterated. Under these circumstances only the group leaders may speak. Unfortunately there is no printed guide for the proper conduct of human affairs, and so deep is the mystery of social processes that only through the ignorant and dreams of
The reaction against the Seven Years' War, as exemplified in the cosmopolitanism and rationalism of the latter 18th century, brought forth the discussions by Voltaire, Rousseau and Bentham. The French Revolution by way of stimulating the proposal for a federation of republics, and the Napoleonic baptism of blood led to Alexander's theological proposition for the assurance of international peace and to Castlereagh's more practicable, if less noble, scheme for periodic European conferences made between nations arising which threatened the peace of Europe. The "concert of powers," which thus originated, proved unequal to coping with the aggressive nationalism of the last 40 years, the promising beginnings in international organizations provided at the Hague Conferences proved ineffective, and it has required the most expensive and deadly war in human history to drive statesmen into even a half-hearted determination to take effective steps to prevent the recurrence of such events. An adequate and workable international organization arises designed to curb aggressive and unscrupulous nationalism and to diminish the opportunities for future wars, the most complex and involved problem in the history of political organization will have been solved and the authors of the enterprise will take their place on the level of the greatest statesmen of all time.

The history of modem Europe, however, from the passage of the "Statutes of Laborers" in the later 14th century to the present day is strewn with the wreckage of political attempts to resist, restrain or control great economic, social or psychological tendencies, forces and movements. A permanent and enduring partnership of nations must anticipate and forward economic fair dealing, social democracy and cultural assimilation. An abiding and effective international organization has to-day a much better prospect of success than ever before in human history, not only because it has as a psychological stimulus the fresh memory of the horrors of the most frightful military cataclysm in the record of human development, but also because there now exists for the first time in such a crisis a real physical, economic and intellectual internationalism which can serve as the foundation for an international political organization. Paradoxical as it may seem, that same Industrial Revolution which, in its immediate effects, greatly forwarded national development at home and imperialism abroad, also laid the basis for a practical internationalism. The growth of world trade and financial and commercial interdependence have furnished a set of economic motives for pacific adjustments, while the improvement of means of transportation and the communication of intelligence, and the internationalization of science and culture have prepared the way for that growth of intellectual unity and harmony and that development of likemindedness and sympathy which Professor Tenney rightly regards as the essential antecedents of any enduring and effective world organization. But it would, nevertheless, be futile to hope that mankind is far enough advanced in its development to trust merely to the natural course of political evolution for the speedy attainment of world order and permanent peace. Only by the exercise of the utmost thoughtfulness, candor, tolerance and conciliation will it be possible to bring into existence an international spirit and political organization which will possess any assurance of terminating physical conflict among nations. Exuberant nationalism, political and economic, will have to be curbed before international order can exist. Mr. Morrow has well presented the political adjustment which must be made between nationalism and internationalism, "We must not, however, deceive ourselves. It is most important clearly to recognize that we are trying to get two things. If we want world peace at whatever price, we can take our eyes away from liberty and think only of order; and the principle of nationality will go by the board. If we want unrestricted liberty at whatever cost, we can think only of the separate national states and the price will be the abandonment of a League of Nations. The reconciliation of these two great principles must be the test of political organization. Can the development of the world, we must sacrifice some world order for the sake of the development of national characteristics; that if world order is so vitally essential that we must have it, then we must sacrifice some of the power and rights of national states in order to insure a greater measure of world order. This is the reconciliation which the Peace Conference must try to make." Political relations have, however, tended normally to be but the reflection of the deeper economic conditions and forces, and, just as economic unity has always proved the most effective impulse towards political harmony, so economic separatism and suspicion will threaten the dissolution of any political entity. Therefore, it seems clear that any permanent and effective international political or juridical organization must rest upon a basis of economic trust and fair dealing. This phase of the problem has been forcibly set forth by Professor Hanks: "The great stumbling block to internationalism is today the outrageous doctrine of Mercantilism. This familiar doctrine holds that the nation is the trading unit, that consequently it profits most when it sells much and buys little, and that consequently each nation ought to shut itself up behind trade barriers and, like a hermit empire, prevent the intrusion of the cheap goods of other nations. With the overthrow of the dynastic state nothing now seems to have so firm a hold in popular tradition and hence so close a connection to the galvanic batteries of patriotism as this hoary tradition. ... If we are to have a lasting peace, then this illusion must also pass into the limbo of outworn creeds; and the peoples of the earth, freed from local fears under the protecting security of a superstate, can become rivals in exploiting the earth rather than each other and mutually enrich each other by a free exchange of their products. Far more certain than the proposed super-alliance of nations as a guarantee of future peace as well as prosperity among men would be a Zollverein of all industrial nations. Likewise
the most prolific source of international jealousy and suspicion in the future seems likely to be trade discriminations, differential tariffs, unfair control and distribution of raw materials and shipping facilities, and other efforts to maintain the economically self-sufficient national state. The immediate problem is the formation of a League of Nations as the means of allaying fear. The problem of the future is the removal of trade barriers and the establishment of an international economic organization of the world. Only thus will the superrational sanctions of nationalistic patriotism be transmuted into a supreme loyalty to humanity. When these necessary cultural, political and economic prerequisites of a permanent peace have been secured, and then only, can one hope for a just and effective world order, for, as Professor Giddings has well said: "A league to enforce peace must be composed of nations that will both keep faith with one another and practically act in cooperation with one another against the law-breaker. Practically these requirements can only be met, and will be met, only if the component nations of the league share a common civilization and hold a common attitude towards questions of right, liberty, law and property."

III. THE COMMERCIAL REVOLUTION AND THE RISE OF THE MODERN DYNASTIC NATIONAL STATE

IV. THE FRENCH REVOLUTION, THE NAPOLEONIC PERIOD, AND THE POPULARIZATION OF NATIONAL SENTIMENT IN EUROPE

HARRY ELMER BARNES, Associate Professor of History, Clark University.

NATIONALIST, in British politics, a term applied to the Irish political party whose programme includes the establishment of a kingdom from Great Britain. The party was organized by Isaac Butt, and after his death was ably led by Charles Stuart Parnell. After the death of the latter it was split into factions but was re-united in 1889 under the leadership of John E. Redmond. Its principal service to the Irish nation has been the settlement of the land troubles and the establishment of institutions for the higher education of Catholics. The party, however, failed to keep in touch with the younger generation in Ireland; more and more it came to resemble the great parties of England; only men who pledged fidelity to its leaders received its support at elections. The cleavage between people and party became apparent soon after the outbreak of the war in 1914, and after the Russian revolution the support of the masses was withdrawn altogether. At the various by-elections since held throughout the country the party's candidates have been defeated by the Sinn Fein candidates. Its power is gone, and a general election would see it disappear forever. The reasons are not far to seek; as a party it has outlived its usefulness; it is no longer truly representative of the people; new men and new principles clamor for recognition and will not be denied.

NATIONALITY. Nationality is both an ethnic and a legal term. An ethnological concept it has reference to the racial status of an individual or group. Thus we speak of an individual possessing German, Polish, Italian or Greek nationality, without regard to his citizenship, for the terms citizenship and nationality are synonymous. In general, people who have a common ethnic origin, who speak the same language and who have a common literature belong to the same nationality although they may be citizens or subjects of different states. Thus we find large numbers of people that case the indivisibility of Austria, Russia and other states; Germans in large numbers are found not only in Germany, but in Austria, Switzerland and other countries; persons of Jewish nationality are widely scattered over the world and are citizens or subjects of many states. States and nations are, therefore, by no means identical; some states, like Austria, Hungary, Russia and Switzerland, embrace within their borders more than one nationality. On the other hand a nation may extend beyond the limits of a single state. Thus the French nation embraces practically the whole of the French Republic and the larger part of Belgium. The Germanic nation extends beyond the limits of the German and Austria and Switzerland. The tendency of modern times is in the direction of identification of states and nations, that is, toward the organization of states with boundary lines which coincide with those of nations, this on the principle that the bringing of peoples having a common ethnic origin and language under the same state organization conduces to national unity and stability. The organization of the German and Italian states along national lines during the last century was in accord with this tendency. Disregard of this principle, as for example, by the Vienna Congress in 1815 which undertook to reorganize the states of Europe without regard to considerations of nationality, has led to unfortunate results. Experience teaches that either the result in 1815 was re-united in 1889 under the leadership of John E. Redmond. Its principal service to the Irish nation has been the settlement of the land troubles and the establishment of institutions for the higher education of Catholics. The party, however, failed to keep in touch with the younger generation in Ireland; more and more it came to resemble the great parties of England; only men who pledged fidelity to its leaders received its support at elections. NATIONS, BATTLE OF THE—NATIVISM

ence of two conflicting systems for determining nationality. These two systems are known as the *jus soli* and the *jus sanguinis*. According to the former rule nationality is primarily determined by the place of birth, however, by the nationality of the parents. The *jus soli* rule grew up in Europe during the feudal period and in time it became the general law on the subject on the continent of Europe. In the latter case, however, it was largely superseded by the *jus sanguinis* rule which originated in the Roman law. According to the strict principle of the *jus soli* all persons born within the jurisdiction of a particular state, regardless of whether the parents be citizens or aliens, are deemed to be citizens of that state. Likewise all children born abroad, even though their parents be citizens, are regarded as aliens. On the other hand, according to the strict principle of the *jus sanguinis* all persons born within the jurisdiction of a particular state, of parents who are aliens, are also aliens, while those born abroad of citizen parents take the nationality of their parents (or rather that of the father, in case of legitimate children, and that of the mother, in case of illegitimate children).

The *jus soli* principle is the basis of the law of Great Britain and the United States; the *jus sanguinis* rule prevails in Germany, Austria, France, Hungary, Switzerland and other states. Few states, however, apply either principle exclusively. Thus according to American law children born abroad of fathers who are citizens of the United States and who have themselves resided here are deemed to be citizens of the United States. Likewise, according to British law, children born abroad of British subjects are treated as natural-born British subjects. Thus both countries, although following in general the doctrine of the *jus soli*, have adopted the *jus sanguinis* principle for determining the status of children born abroad of citizen parents. In many other states a mixed system prevails. Thus according to French law, while all children born of French parents anywhere in the world are deemed to be French citizens, those born in France of alien parents and not domiciled in France at the age of their majority are regarded as foreigners. A child, therefore, born in the United States of French parents would be a citizen of the United States *jure soli*, but a citizen of France *jure sanguinis*. We have here a case of double nationality, due to the existence of conflicting rules by which citizenship is determined. In practice the consequences of such conflicts are usually avoided by the policy of states in refraining from asserting their claims in such cases so long as the person whose nationality is in dispute remains outside their jurisdiction. To avoid cases of double nationality it would be necessary to assimilate all the various systems for determining national character, an ideal which, however desirable, is not likely to be realized.

In time of war the national character of an individual may not be the same as that of his political character. It may be that of his domicile or place of birth. Thus if he is domiciled in an enemy country or has a house of trade therein he may for certain purposes be an alien enemy to his own country.

Concerning the test for determining the nationality of ships in time of war there has been much diversity of opinion. The continental European view has generally been that national character in such cases should be determined by the nationality of the owner; English and American opinion, however, has regarded the flag which the ship is entitled to fly as the proper test. The question was considered at the London Naval Conference of 1906-09, and a compromise was reached. The adoption of the rule that the nationality of a vessel should be determined by the flag which it is entitled to fly (article 57) and that the enemy or neutral character of goods found on board an enemy vessel should be determined by the neutral or enemy character of the owner (article 38). During the recent World War, however, the British government rejected the former rule and put into effect the rule that the neutral or enemy character of a vessel should be determined by the nationality of the ship. The adoption of this rule is also ALLEGIANCE AND CITIZENSHIP IN THE UNITED STATES. For bibliography see article CITIZENSHIP IN THE UNITED STATES.

JAMES W. GARNER,
Professor of Political Science, University of Illinois.

NATIONS, Battle of the ("Völker- schlacht"), in the Napoleonic wars, the battle fought at Leipzig, 16-19 Oct. 1813, in which Napoleon, with about 190,000 men, was defeated by the Allies numbering from 200,000 to over 300,000 at different stages of the conflict. The French loss is estimated at 40,000 killed and wounded, and 30,000 prisoners; that of the Allies at 45,000 killed and wounded. The liberation of Germany is practically dated from this event. See NAPOLEON I.

NATIONS, Law of. See INTERNATIONAL LAW.

NATIONS, League of. See WAR, EUROPEAN.

NATIVE BEAR, the Australian koala (q.v.).

NATIVE COMPANION, an Australian name for a large local crane (Grus avusraliana) peculiar to that island.

NATIVISM, that theory which bases some tangible part or phase of our knowledge on the inborn nature of mind and not on sense-experience alone. It is opposed to empiricism (q.v.), which finds in sense-experience the origin of all knowledge. While the distinction between truths of reason and truths of sense dates from Heraclitus, or even earlier, Plato was the first to make nativism a leading tenet of his philosophy. Over against the knowledge of sense, he maintained the existence of the knowledge of ideas due to a recollection, stimulated indeed by sensory experience, but reaching back beyond birth. Aristotle's views as to the origin of knowledge, though not greatly emphasized, seem to be essentially of the same nature as those of Plato. The Stoics were the first to use the word *innatus* or truths, applying it primarily to the moral law. The realists of the Middle Ages, holding as they did that universals have a separate existence, were practically driven to nativism. Unlike the nominalists, who maintained that nothing is in the intellect which was not previously in sense. In modern times nativism and rationalism have gone hand in hand, and Descartes, Spinoza and especially...
Leibniz believed in the existence of innate ideas, such as those of God and of the self. Locke opposed this opinion, and pointed out that the new-born child does not possess a ready-made stock of ideas. Kant maintained a theory of knowledge essentially nativistic, but departed from his predecessors in not making knowledge consist in the possession of representative ideas and in holding that the phase of knowledge independent of sense data — innate knowledge which the classical nativism maintains is the same in nature for all minds.

It is not essential for nativism to maintain that the new-born babe actually has certain conceptions perfectly formed, or that he will form them without any sensory stimulus. An item of knowledge may be innate even if it requires experience to evoke it. For this reason Locke's refutation of Leibniz will not hold water. On the other hand, to be an antithesis to empiricism, the nativist must maintain, not merely that the general nature of man is a condition of all sensory experience, for the empiricist would agree with him in this, but that some phase of knowledge, such as that of necessary truths, is peculiarly dependent on the nature of thinking minds themselves. Consult Aristotle, De Anima; Locke, Essay on the Human Understanding; Kant, Kritik der reinen Vernunft; Leibniz, New Essays; Locke, Essays on the Human Understanding; Mill, J. S., A System of Logic, 1st ed., 1859; and on Nativism and Empiricism in Baldwin's Dictionary of Philosophy and Psychology (new ed., New York 1911); Plato, Memo; Phaedo; Theaetetus; Zeller, Stoics, Epicureans and Sceptics (tr. London 1892).

NATIVITY, in astrology, the theme or figure of the heavens, and particularly of the 12 houses, at the moment when a person is born, supposed to indicate his future destinies, and synonymous with horoscope. See Horoscope; Astrology.

NATOPP, Paul Gerard, German scholar: b. Düsseldorf, Germany, 24 Jan. 1854. He was educated in Berlin, Bonn and Strasbourg and accepted a professorship in Marburg in 1885. He wrote 'Descartes' Erkenntnistheorie' (1882); 'Platos Staats' (1895); 'Platos Ideale Bildung' (1901); 'Sozialpädagogik' (3d ed. 1909); J. H. Pestalozzi (2d ed. 1910); 'Die logischen Grundlagen der exakten Wissenschaften' (1910); 'Philosophie: ihr Problem und ihre Probleme' (1911); 'Hoffnungen und Gefahren unserer Jugendbewegung' (1914).

NATROLITE (from 'natron,' native carbonate of sodium), a native hydrous silicate of sodium and aluminum, having the chemical formula Na₂Al₅Si₃O₁₀·2H₂O, and crystallizing in slender prismatic forms belonging to the orthorhombic system. It is in most cases colorless or nearly so, with a vitreous lustre, a hardness of from 5 to 5.5, and a specific gravity of from 2.20 to 2.25. It occurs in cavities in basaltic rocks, and in seams in granite, gneiss and syenite. It occurs in many parts of Europe, and fine crystals are found in southern Norway. In the United States the mineral occurs in Connecticut, New Jersey and Arkansas, and also in the Lake Superior region. It is likewise found in Nova Scotia. Natrolite takes a good polish, and has been used as a gem stone.

NATRON, a carbonate of soda or mineral alkali, Na₂CO₃·10H₂O. It is produced from the ashes of several species of marine plants and is also obtained by evaporating the waters from some mineral springs. It is also found as an efflorescence in the ground. It occurs in nature, but only in solution, and in generally found in an impure state, being mixed with other sodium salts, such as the sulphate and chloride. The soda lakes of Egypt have supplied great quantities of this substance for many centuries; it was used by the ancient Egyptians as an important ingredient in their embalming fluids. A similar but impure hydrogen sodium carbonate is found deposited by evaporation on the shores of the Caspian and Black seas, also on the banks of alkali lakes and springs in California, particularly in the neighborhood of San Bernardino.

NATTER, Heinrich, Austrian sculptor: b. Graun, Tyrol, 16 March 1846; d. Vienna, 13 April 1892. He was five years apprentice to a sculptor in Meran and subsequently was taught drawing at Augsburg by Johann Geyer, a famous painter of humorous genre. Subsequently he studied with great profit under Max Widtmann (q.v.), the sculptor, in the Munich Academy. Weak health compelled him to travel and he visited Riva on Lago de Garda and Venice, until the war of 1866 called him to active military service. He afterward took up his residence at Munich, where his reputation by his portrait busts, sepulchral statues, a colossal statue of the god 'Odin' (1873) and the head of a 'Sleeping Satyr.' A career of wider activity opened for him after his settlement in Vienna, where, besides numerous bust portraits and monuments, he executed the statue of Zwingeri for Zürich; the statue of Haydn for Vienna; the portrait statue of Laube and Dingelstede for the municipal theatre of that city; and the statue of Walter von der Vogelweide for Bolzano (1889). His statue of Andreas Hofer, which is his masterpiece, was unveiled after the sculptor's death on a height near Innsbruck. A poetic delicacy of conception and a certain life-like expression, often found in painting than in sculpture, are the characteristic features of his work. His literary remains were published by L. Speidel, under the title 'Kleine Schriften' (1893).

NATTERJACK, an Old World toad (Bufo calamita), light-brown in color, spotted with patches of a darker hue. It does not leap or crawl like the common toad, but rather runs, whence it has the name of walking or running toad. It has a deep and hollow voice,
AUDIBLE at a great distance, and is often found in dry situations.

NATTIER, nà-tè-à, Jean Marc, French painter: b. Paris, 1655; d. 1736. He was the pupil of Jean Jouvenet, won the Academy prize in 1700 and became professor of the Academy in 1752. His fame as a portrait painter was increased by the visit he paid to Antwerp in 1715 to paint likenesses of Peter the Great and his wife Katharine I; he also painted the portraits of many of their suite. So great was his skill in portraying the fine ladies of his day that he has done as much to immortalize such faces as those of Marie Leszczynska, Henriette de France, Madame Adélaïde, Madame de Chateauroux, Madame de Flavacourt and many others of the court of Louis XV, as Rigaud (see Rigaud, Hycainthe) had done for Bosquet, for Louis XIV, his courtiers and other leading men of the period. His subjects are usually treated as mythological themes. Specimens are to be found in the Louvre, Dresden, Stockholm and the various museums of Paris and London. The Princess de Condé as "Diana" is in the Metropolitan Museum in New York. Consult 'Masters in Art' (Vol. III, Boston 1902) and Pierre de Nolhac, 'Nattier, peintre de la cour de Louis XV' (Paris 1910).

Natty Bumppo, the central figure in Cooper's (see Cooper, J.F.) stories: 'The Pioneers' (1823), in which he appears as 'Leather-stocking,' a name lent to the series as the 'Leatherstocking Tales'; 'The Last of the Mohicans' (1826), in which he is known as 'Hawkeye' and 'Le Longue Carabine' ('The Long Rifle'); and 'The Pathfinder' (1840) and 'The Deerslayer' (1841), in which his respective sobriquets furnish the titles of the volumes. Lounsbury ('Life' of Cooper, 1884) has called him 'one of the few original characters, perhaps the only great original character, that American fiction has added to the literature of the world.'

Natuna (nà-too-nà) Islands, East Indies, a chain of islands in the South China Sea, extending northwest from Cape Apo, belonging to the Dutch. The principal islands are Great and South Natuna islands and Stokong. The aggregate area is estimated at over 800 square miles. The islands are mountainous and densely forested; the chief products are coconuts, fish, rice and maize. Pop. 9,000, mostly Malay fishermen.

Natural Bridge and Natural Arch. A natural bridge has been defined as a natural stone arch that spans a valley of erosion. A natural arch is a similar structure which does not span a [true] erosion valley. These forms are produced in numerous ways. Most of our larger natural bridges are the result of the cutting through of the necks of deeply-entrenched meanders (q.v.), so that the river cuts off an oxbow, just as on a typical modern flood plain, except that the meander is in a gorge or valley and cuts through the narrow neck of rock underneath the surface. (See Meanders.) This is the origin of the famous Pont d'Arc in France. The group of natural bridges in Southern Utah are also of this type. The most noted of these are the Arches, Arches, Arches and Rainbow bridges. The Augusta Bridge has a height of 265 feet, a span of 320 feet, a thickness of arch of 83 feet and a width of roadway of 35 feet.

In limestone regions, solution along joints may form long tunnels, or, if only part of the tunnel roof remains, natural bridges. Sometimes in case of waterfalls, part of the water, before reaching the brink of the fall, may work down through a joint in the bed and come out below the fall. If this passageway enlarges sufficiently to accommodate all the water of the stream, the former fall may be abandoned, leaving its old crest line as a natural bridge. The famous natural bridge of Virginia is perhaps of this or similar origin. It is 236 feet high, has a span of about 50 feet and a thickness of arch of about 40 feet. Other natural bridges are formed by various other means, as by wind erosion undercutting ridges in deserts, wave erosion along shore lines, the falling in of parts of roofs of caves, leaving part of the roof as a bridge and many other minor causes. Consult Cleland, 'North American Natural Bridges' (in Bulletin of the Geological Society of America, Vol. XXI, 1910, pp. 313-338).

Natural Gas. See Gas, Natural; Mineral Production of the United States.

Natural History, in its widest sense, that department of knowledge which comprehends the sciences of zoology and botany, chemistry, natural philosophy or physics, geology, paleontology and mineralogy. It is now, however, commonly used to denote collectively the sciences of botany and zoology, or these together with geology, mineralogy and paleontology, exclusive of physics and chemistry, and it is sometimes restricted to denote the science of zoology alone.

Natural History of Selborne, The, a celebrated work by Gilbert White (q.v.), published in 1789. Its material consists of White's letters to Daines Barrington and Thomas Pennant (q.v.), in which the writer describes outdoor life in the little Hampshire village which his works made famous and interesting alike to students of nature and to lovers of good books, among which the 'Natural History' ranks as a unique classic of science and of letters.

Natural Law. See Law, Natural.

Natural levees, embankments built by a river on either side of its channel. When a river is in flood and overtops its flood plain, there is a constant checking of velocity where the moving water of the channel comes into contact with the stagnant water of the adjacent plain. At this point on either side, the greater part of the river's load of mud and sand is dropped, until a ridge is built up on each side, known as a natural levee. By this process the Mississippi has raised its course many feet above the general level of its flood plain.

NATURAL SELECTION, the doctrine advanced by Charles Darwin and almost coincidently by Alfred Russel Wallace (q.v.), to account for the divergence of animal forms and their gradual separation into distinct species and groups by a process akin to the selective mating practised by men in rearing and perpetuating breeds of domestic animals. It forms the basis of Darwin's hypothesis of organic development by descent, and depends upon the fact that variations are constantly apt to appear in animals, and may in some degree be perpetuated. These variations may be minute fluctuations on either side of a mean, a little more of one character and a little less of another; or they may be sudden steps of considerable magnitude; in other words, they may be continuous or discontinuous. They may visibly affect only one character at a time, or they may affect many parts of the organism at once, as if there were a general movement to a new position of organic equilibrium.

(2) Living creatures are involved in a manifold and intricate struggle for existence, varying greatly in its form and in its intensity, and due to a variety of causes. It is necessitated essentially by the fact that the offspring of the parents usually produce many more than a pair of offspring, and that the population tends to overrun the means of subsistence; and, secondly, that organisms are at the best only relatively well adapted to the external conditions of their life, which moreover are variable. The "struggle" may be for food or foothold, for mates or property, for self-preservation or for the welfare of the young, including much more than an inter-necine scramble among the platter which contains the necessities of life; the phrase is applicable as regards relative length of life, vigor or constitution, success in having offspring, and so on.

(3) In this struggle for existence the relatively less fit organisms are weeded out or eliminated, and sometimes only a small proportion of those born survive to become adults or reproductive. But it must be clearly understood that elimination does not necessarily involve sudden death or no offspring; it may simply involve failure in the first instance, a slightly shorter, less successful life, or a smaller, less vigorous family. Yet whether the eliminative process be gentle or severe, the result is the same—that the relatively more fit variants tend to survive; and since many variations are demonstrably transmissible from generation to generation, and may, through the pairing of similar or suitable mates, or in other ways, gradually increase in amount, the eliminative or selective process works toward the establishment of new adaptations and new species.

The three steps in the argument are thus: (1) The occurrence of transmissible germinal variations is a fact of life; (2) the struggle for existence is a fact of life; and (3) the elimination of the relatively less fit is a fact of life. The result has been, and is, the rise and progress of new adaptations, new varieties, new species, new types.

A formidable objection to the selection theory advanced by Prof. Fleeming Jenkin, is that variations of small amount and sparse occurrence would tend to be swamped out by intercrossing. In human or "artificial" selection, the breeder takes measures to prevent this by pairing similar or suitable forms, but what in nature corresponds to this action of the breeder? Various suggestions have been made in answer to this objection. Thus Weismann says: "The necessary variations from which transformations arise must in all cases be exhibited, over and over again, by many individuals," and in his ingenious theory of Germinal Selection he has suggested the internal mechanism by which this result may come about.

But the answer at present most relied on is that worked out by Romanes, Gulick and others—the theory of isolation (q.v.). The theory of isolation emphasizes the great variety of ways in which, in the ordinary course of nature, the range of intercrossing may be restricted, for example, by geographical barriers, by differences in habit, by psychical likes and dislikes, and by those remarkable reproductive variations which cause mutual sterility between two sections of a species living on a common area.

Another point that has been brought out by De Vries (q.v.) is that variations are not necessarily minute at the start, and that new species may spring into existence at once by what he calls a mutation. Of course, the later history of such a species is conditioned by natural selection.

We have given a statement of the theory of natural selection very much as it might have been given in 1859, when Charles Darwin and Alfred Russel Wallace enriched biology by their independent exposition of the selection idea; but since then our knowledge of the nature and origin of variations has greatly increased, the analysis of the various modes of inheritance has become much more precise, the difficulty of proving any instance of the transmission of an acquired character or direct somatic modification is generally acknowledged, and we have recognized the value of a second directive factor in evolution, namely, isolation. It may be said that the theory of natural selection is now being subjected to more severe and more dispassionate criticism than it had to encounter in the early Darwinian days, when the validity of the general evolution idea was the central subject of discussion.

Thus there is a demand for some serious attempt to measure the intensity of the struggle for existence in typical cases, and for evidence that the absence of a particular variation in certain members of a stock does really determine their elimination. In other words, evolutionists have awakened to the necessity of testing natural selection in relation to actual cases.

Lastly it should be noted that the doctrines of Lamarck, which were that use-and-disuse, inheritance of acquired characters, and other factors were more potent than natural selection, have been revived and strengthened by a school of naturalists who insist that they must at least be held to have had an important share in the phenomena of biology.

Natural Theology, or NATURAL RELIGION, is the knowledge of God's existence and nature which mankind learn from observation of the world of nature. Biblical theology, or, as it is more commonly called, revealed religion, is the knowledge of God's nature and operations derived from revelation; and revelation is impossible unless we first postulate a personal God. Thus natural theology is the foundation of any system which professes to give an account of the Supreme Being as well as of man's origin and destiny.

Method of Natural Theology.—The first proposition postulated in this department of speculation is that every effect requires a cause (q.v.). One of the self-contradictions of Lucretius is contained in his axiom ex nihilo nihil fit, that nothing can come from nothing after pronouncing which he proceeds in his attempt to prove that the order and uniformity of nature proceeds from nothing, that is, random disorder, the fortuitous concourse of atoms. Unless it is admitted that certain events and phenomena are invariably connected as cause and effect, there can be no science of natural theology, which is based upon the assumption that causation is a fact, the truth of which is accepted among the intuitive beliefs of the human mind.

How far a Science.—As Natural Theology claims for its domain the physical, intellectual, and moral nature of man as well as the world of nature in the midst of which he is set, it starts out by saying with Natural Science that the present constitution of things had a beginning. Plants and animals did not always exist on this planet. The question arises, Whence did they come? How came man here? The theory that individual species as at present existing was the original form of organic life on the earth has now been abandoned; and two other theories have replaced it: (1) That animals and plants have been produced by forces eternally and necessarily inherent in matter (see Natural Selection); (2) that nature is the product of a personal being, acting with deliberate design. In the history of recent speculation we come upon a suspenseful judgment in this question; on the other hand Positivists (see Positivism, law of) have ruled it out from the field of human speculation. Suspensive reasoners do not profess to know because they declare the matter unknowable. This is agnosticism (q.v.) and its adherents style themselves agnostics. On the other hand, observers of nature have remarked in the works of nature an analogy with and a resemblance to the works, contrivances and methods of human artificers. They have accordingly reached a belief in a transcendently great and powerful order who has originated all things. The existence of man as an individual person has been taken as testimony to the existence of an infinite and eternal being as the one supreme God. It has also been averred that anti-intuitionists destroy the historical and religious sense of the physicist who denies causation sweeps away the foundation on which his system is reared.

Main Arguments.—(1) It is claimed that the idea of God's existence is innate in every human being and is as necessary a fact of consciousness as his own personal identity. In the most rudimentary and debased tribes is found this sense of a Supernatural Power. Lubbock and others deny to some degraded races this innate idea; it is sometimes added that deaf-mutes are in the same mental condition. It does not, however, follow because an idea has not been expressed in language that it is, therefore, not present in the mind may not have been explored by the subject; the readiness with which belief in the supernatural is accepted by savages and children is one reason for the belief that the response they make to communications on this subject springs from previous divinations of the consciousness in realizing itself. If this idea is not innate it is certain that the faculties of the human mind are such that the study of nature, man, and the obligations of life bring each individual face to face with the reality of a higher power. Descartes, Leibnitz and others aver that the capacity of the human mind to entertain the conception of a being perfect and omnipotent, proves the existence of a reality which corresponds to such a conception; but these arguments have not satisfied metaphysicians such as Reid and Stewart and, through the metaphysical subtleties involved in it, must be laid aside as a popular argument. (2) The study of nature and of history, that is, of man as a physical, intellectual and moral being, furnishes material for arguments from design, teleological arguments as they are sometimes called (see Teleology). This is the simplest and most obvious form of argument to be put forth in Natural Theology and has been put forth in all ages. Socrates constantly stated it: Cicero enforced it among his Roman followers. Although on the first publication of Darwin's and Wallace's theory of evolution it lost its place of importance in Apologetics, it was soon perceived that the theory of Natural Selection in fact multiplied many fold the evidences of design and ordination, and raised the level of intelligence to a higher plane. In consequence Natural Theology has recently been revived and has renewed force. The laws of Natural Selection and Survival of the Fittest must have had a law-giver, and the discovery of additional links in the chain of causation does not necessarily destroy its continuity. The argument now includes the whole of the world as a finished product, but is even now in process of evolution. The Hebrew writers constantly refer to the power and goodness of Jehovah as evidenced both in the works of nature, the events of history and the faculties of mankind. Saint Paul began his Epistle to the Romans with this argument against the degraded paganism of Rome; the Fathers have enforced it over and over again. Paley's 'Natural Theology' has been a most important statement of the argument from design which has been enlarged in its application by Chalmers, Tulloch, M'Cosh and Agassiz. The argument from design can of course only prove the existence of a Creator of the world. Man alone is conscious of a Creator, who, however, need not be the self-existent God, but once grants that man has a maker, and it would at once follow that a supreme self-existent God exists who is the
NATURAL TONES — NATURALIZATION

First Cause. Consult Xenophon, (Memosbillia); Plato, (Laws X); Cicero, (De Natura Deorum); Descartes, (Principia Philosophiae); Leibnitz, (Theodice); Paley, (Natural Theology); Chalmers, (Natural Theology); McCosh, J., (Christianity and Positivism) (New York 1876); Sceezel, J. R., (Natural Religion) (Boston 1882); Robinson E. K., (The Religion of Nature) (New York 1906); Shearman, J. H., (The Natural Theology of Evolution) (New York 1916); Thackray, E., (The Revelation of God in Nature and Man) (London 1916).

NATURAL TONES are tones produced by the natural alteration of nodal points in wind instruments by pressure only. See HARMONICS.

NATURALISM, a term which, in the history of philosophical thought, has received a variety of meanings. In general it refers to that which is in accordance with nature. But the sense in which the term nature may be used is not by any means a constant but a variable, and as this sense varies we will find a set of corresponding meanings for naturalism itself. It may be considered as that which is the opposite of the artificial, the conventional or the traditional. Regarding nature from this point of view, the term naturalism will be employed in much the same sense as that in which Rousseau used it in his plea for a return to nature in matters philosophical, religious and political. Or nature may be regarded as the external reality which furnishes the material of all our sensations; naturalism will then signify in the Lockean sense that which is original and fundamental in knowledge as opposed to that which is the result of the operations of the human understanding. Again, nature may signify the basis of natural affections and dispositions as opposed to the fundamental principles of conduct which are revealed in the "dry light of reason." In this sense Shaftesbury uses nature and naturalism in contrast to the rationalistic ethic of his day. Naturalism also has been used as a term to characterize such a philosophical system as that of Giordano Bruno, which identifies God with nature, and does not distinguish between the Creator and his works. In the midst of this confusion of meanings, however, the present day discussions in philosophy have established a determinate usage which for the most part is uniformly recognized, and consistently employed. This usage is quite different from any of the phases which have been mentioned, and may be defined somewhat as follows: Naturalism signifies a method of interpreting the subject matter of philosophy, which insists that all phenomena whatsoever are to be explained according to the laws of nature, that efficient causes only are to be regarded, while all considerations of final causes are to be rigorously excluded, as well as those alleged ideal implications of reason which postulate some metaphysical necessity as a mode of interpreting physical phenomena.

In this sense naturalism, as regards psychology, grasps all psychological phenomena upon a purely sensationalistic basis; there is no self in the sense of an organizing power and unitary centre in the midst of the various states of consciousness; the spiritual elements of consciousness are regarded as incidental, and determined at the last analysis by the external stimuli. As a theory of knowledge, there is no place for an idealistic construction of the data of experience. In ethics, naturalism is a science of what is and not of what ought to be. It allows a science of ethics but not of metaphysics. It cosmology essays an explanation of the universe in terms of the laws of nature, which inductive research may have discovered, but it has no concern or interest as to the question whether "through the ages one increasing purpose runs."

A system of naturalism, however, is not necessarily a philosophy of materialism any more than it is necessarily pantheistic, although it must be acknowledged that naturalism and materialism are often used as synonymous terms. It is not used in the present day as a term opposed to supernaturalism, as it is essentially a philosophical term and not used in a theological sense. It does not deny a supernatural reality in the theological sense; it is merely not interested in the questions which turn upon a beyond and above as regards human thought and human activity.

The antithesis which the term naturalism suggests does not lie in this direction. To understand the significance of naturalism, it must be understood in order to appreciate in any adequate measure the philosophical problems of the day, the exact antithesis which it implies must be clearly apprehended. The antithesis is between an explanation of the phenomena of existence which can be expressed solely in terms of the laws of nature, and all explanations on the other hand which involve fundamental thought necessities as essential factors. The antithesis is between the natural and the rational, between the natural and the spiritual. This usage of the term we find in such a book as that of Balfour's 'Grounds of Belief,' or in Ward's 'Naturalism and Agnosticism,' or in Sorley's 'Ethics of Naturalism.' When Mr. Balfour's book was first published he was severely criticized in some quarters for his use of the term naturalism. This evoked much discussion, which has served to establish a definite and determinate sense in which the term may be used. A most able and satisfactory defense of Mr. Balfour's usage of the term is to be found in the work of Prof. Andrew Seth, entitled 'Man's Place in the Cosmos.' One of the chief themes in the Term Naturalism, and it is one of the best discussions to which any student of the subject can be referred. Without doubt, the element of variability which has attended the history of this term has been to a large extent, if not altogether, removed, and a constant significance has resulted which conforms to the general usage of the present time; and the significance is the one which it has been the endeavor of this article to present.

JOHN GRIER HIBBEN,
President, Princeton University.

NATURALISTS, American Society of, an association numbering 230 active members, organized in 1883, for the purpose of bringing together persons interested in topics of natural history.

NATURALIZATION, the act of renouncing allegiance to one government and acquiring the rights of citizenship under another. In its broadest sense it signifies the act of adopting a foreigner into the body politic and of clothing
him with the privileges of citizenship. This may result from the annexation of territory, the marriage of an alien woman to a citizen, the naturalization of the parents of children by the applicant of certain prescribed conditions. With a few exceptions the rights of the naturalized person are equal in all respects to those of the native-born citizen; thus in the United States, while the civil rights are the same, the Constitution excludes the naturalized citizen from the offices of President and Vice-President. In Great Britain a naturalized subject enjoys all the political and civil rights of a native-born subject except that when he is in the territory of his original state he is not entitled to protection unless the consent of his original government to be naturalized abroad was obtained. The British naturalization commission of 1901, however, recommended that this exception be abolished. The government of the United States makes no such exception in the case of naturalized citizens, they are protected equally with naturalized citizens in their country of origin whether the consent of their governments to emigrate was obtained or not. The act of becoming naturalized, however, does not abrogate the claims of the government under which the person concerned had previously lived and which were operative at the time such person changed his allegiance, especially in the case of attempts to avoid compulsory service in the army of the native country, and the laws of the United States do not afford protection for aliens who simply become citizens of this country for the purpose of escaping such service. But a distinction is made between the obligations of military service that have accrued at the time of emigration and those which have not. In the latter case the government insists that the citizen cannot be held by his original state to a performance of the obligation.

The majority of treaties with other countries call for a continuous residence of five years before admission, the notable exception being Great Britain, with whom the treaty allows of interchange of citizenship with no stated period of residence. Treaties of this nature were negotiated with the North German Confederation, and also with Bavaria, in 1862, but the Bavarian treaty will not allow of natives who have emigrated to other countries before serving the required time in the army, again becoming permanent residents until they are 32 years of age; but if a certificate of immigration be granted by the terms of this treaty, naturalization does away with the military obligation. Similar treaties were concluded with Sweden, Belgium, Bavaria, Hesse, Mexico, the North German Confederation, and Wurttemburg; in 1869 with Sweden and Norway; in 1870 with Austria and Great Britain; and in 1872 with Denmark. At present all states except Russia and Turkey allow their subjects to expatriate themselves voluntarily and to adopt a new allegiance. The two latter states, however, refuse to recognize the legality of naturalization certificates granted to subjects by foreign governments without their consent previously obtained. Other states attach certain conditions to the exercise of the right of expatriation. The laws of the United States, however, declare it to be an inalienable right of all peoples and the consent of the government is not required.

In the United States, Congress by the Constitution has exclusive power over the naturalization of citizens, and the power cannot be exercised by the individual States, but this does not prohibit the State from granting the rights and privileges of State citizenship, such as voting at State elections, holding offices, etc. See NATURALIZATION LAWS; CITIZENSHIP IN THE UNITED STATES; ALIENS; ALLEGIANCE; NATIONALITY.

NATURALIZATION LAWS, acts placing foreign-born persons in the same legal position as natural-born citizens. The conditions under and the manner in which an alien may be admitted to become a citizen of the United States are prescribed by the United States Revised Statutes.

Declaration of Intentions.—The alien must declare upon oath before a Circuit Court or a District Court of the United States or a District or Supreme Court of the Territories, or a court of record of any of the States having common-law jurisdiction and a seal and clerk, two years at least prior to his admission, that it is, bona fide, his intention to become a citizen of the United States, and to renounce forever all allegiance and fidelity to any foreign prince or state, and particularly to the one of which he may be at the time a citizen or subject.

Oath on Application for Admission.—He must at the time of his application to be admitted declare on oath, before some one of the courts above specified, "that he will support the Constitution of the United States, and that he absolutely and entirely renounces and abjures all allegiance and fidelity to every foreign prince, potentate, state or sovereignty, and particularly, by name, to the prince, potentate, state or sovereignty of which he was before a citizen or subject, which proceedings must be recorded by the clerk of the court.

Conditions for Citizenship.—If it shall appear to the satisfaction of the court to which the alien has applied that he has made a declaration to become a citizen two years before applying for final papers, and has resided continuously within the United States for at least five years, and within the State or Territory where such court is at the time held one year at least; and that during that time he has behaved as a man of good moral character, attached to the principles of the Constitution of the United States, and well disposed to the good order and happiness of the same, he will be admitted to citizenship.

Titulars of Nobility.—If the applicant has borne any hereditary title or order of nobility he must make an express renunciation of the same at the time of his application.

Soldiers.—Any alien of the age of 21 years and upward who has been in the armies of the United States, and has been honorably discharged therefrom, may become a citizen on his petition, without any previous declaration of intention, provided that he has resided in the United States at least one year previous to his application, and is of good moral character.
(It is judicially decided that residence of one year in a particular State is not requisite).

Minors.—Any alien under the age of 21 years who has resided in the United States three years next preceding his arriving at that age, and who has continued to reside therein to the time he may make application to be admitted a citizen thereof, may after he arrives at the age of 21 years, and after he has resided five years within the United States, including the three years of his minority, be admitted a citizen; but he must make a declaration on oath and prove to the satisfaction of the court that for two years next preceding it has been his bona fide intention to become a citizen.

Children of Naturalized Citizens.—The children of persons who have been duly naturalized, being under the age of 21 years at the time of the naturalization of their parents, shall, if dwelling in the United States, be considered as citizens thereof.

The naturalization of Chinamen is expressly prohibited by the Laws of 1882. Under the naturalization laws now in force, only "white" persons and persons of "African nativity and of African descent" are eligible to naturalization. Japanese, Burmese and Ha-

waianaliens have generally been held by the courts not to be included within either category and therefore not eligible. Indians are excluded under the general laws but they may and often have been naturalized by special acts or by treaty. They may also acquire citizenship by taking up public land and separating themselves from their tribes. Polygamists and anarchists are debarred from naturalization by recent acts of Congress.

Protection Abroad to Naturalized Citizens. — The Revised Statutes of the United States declare that "all naturalized citizens of the United States while in foreign countries are entitled to and shall receive from this Government the same protection of persons and property which is accorded to native-born citizens." The Right of Suffrage.—The right to vote comes from the State, and is a State gift. Naturalization is a Federal right and is a gift of the Union, not of any one State. In nine States (California, Kansas, Nebraska, South Dakota, Texas, Oregon and Wisconsin) aliens who have declared their intention to become citizens are allowed to vote equally with naturalized or native-born citizens. By an act of Congress passed in 1900, 90 days must elapse before naturalization and the exercise of the right to vote. This law was designed to prevent the wholesale naturalization of foreigners in the large cities for the purpose of making voters of them for the forthcoming election. The Federal naturalization laws apply to the whole Union alike, and provide that no alien may be naturalized until after five years' residence except in the case of aliens who have served in the army and been honorably discharged, in which case one year's residence suffices. Even after five years' residence and due naturalization he is not entitled to vote unless the laws of the State confer the privilege upon him, and he may vote in several States even after landing, if he has declared his intention, under United States law, to become a citizen.

In Other Countries.—In France a foreigner who has obtained permission to become domiciled in France is entitled to letters of declaration of naturalization after three years' residence. Also, by the French Naturalization Act, 1889, a foreigner who has resided in France for 10 years may at once be naturalized without preliminary ceremony. In Germany naturalization can be conferred only by the higher administrative authorities; the applicant must show that he is at liberty, under the laws of his native country, to change his nationality; or, if he is a minor, that his father or guardian has given him the requisite permission, that he is leading a respectable life, that he is domiciled in Germany, and that he has the means of livelihood. In all countries a married woman is held to be a citizen of the state of which her husband is for the time being a subject, and the naturalization of a father carries with it that of his children in minority. In countries where military service is compulsory naturalization in fraud of this either is prohibited or renders the offender liable to imprisonment, if he returns, and forfeiture of all property subsequently acquired in his native country. In Great Britain five years' residence is necessary, except where the applicant is in the service of the Crown the certificate is granted by one of the secretaries of state. But the British government, unlike that of the United States, will not protect a naturalized subject within his state of origin unless he has ceased to be a citizen or subject thereof in pursuance of its laws or of a treaty stipulation. Thus a Russian or Turkish subject naturalized in Great Britain will not be accorded the protection of the British government upon return to his native state if the consent of his government to naturalization in a foreign country was not obtained. Certain privileges of British nationality may be acquired by the issue to an alien of letters of denization granted by the Crown; and for this no previous residence is required.

Naturalization by Incorporation.—Citizenship has often been conferred on large bodies of inhabitants by the annexation of territory as a result of cession or conquest. It was in this way that the inhabitants of Louisiana, Florida, Texas, Alabama, and the citizens of the United States. For other modes of acquiring citizenship, also modes by which citizenship may be lost. See Citizenship in the United States. See also Allegiance; Aliens; Nationality.

Bibliography.—See the authorities cited in the article on Citizenship in the United States.

NATURE GODS. See Nature Worship; Mythology; American Mythology.

NATURE PRINTING, a modern process for obtaining impressions directly from objects themselves and printing therefrom. In one method the object which must have a tolerably flat surface such as a fern frond, is placed between a steel plate and one of heated lead and subjected to a strong pressure, forming an exact intaglio copy in the lead from which impressions are taken. The plate is too soft for practical purposes, but it is converted by electrolytting on a copper plate if it is to be used many times. The process was invented in 1849 by Alois Auer, director of the state
printing establishment of the Austrian Empire. In 1854 he published a detailed account of this method of printing.

**NATURE STUDY**, an educational means of training the mind of the pupil, by direct observation, to a knowledge and love of the common things about him. Nature study attempts to aid, in the most effective way, through the natural and inherent instincts of all children, the perfect development of the child nature, in accordance with the natural laws of that development. It aims at taking into account the various activities, interests, likes and dislikes of children, their love of activity, their desire to hear, to see and to handle things; to investigate all that they come into contact with and to ask questions about everything that interests them. Nature study accepts the fact that this almost constant activity is the one great law of the child's development, physically and mentally; and it acts upon it. It attempts to direct this activity into the most useful and interesting channels so as to secure for the child the greatest pleasure in doing, with the greatest benefit from the deed accomplished. It seeks to give him direct contact with things rather than to know them by descriptions of them. It makes prominent use of the fact that the human being is essentially an imitator and that the child, especially, is possessed of an irresistible desire or impulse to do what he sees his elders or his companions doing. All these are classed as nature motives; and nature study makes use of them to the exclusion of motives that are merely artificial. In other words, it works on those things that every normal child is born with an instinctive desire to investigate things and sensations, and through this investigation and the experience gained thereby, to get a knowledge of his environment.

A second quality as strongly a part of the child's nature is his irresistible impulse to investigate is his strong social instinct. This enables him to identify himself with those about him and with all their various interests and to realize his relationship to them; and it creates in him a desire to conform to the social judgment of his associates, that is to public opinion. Nature study attempts to develop the life of the child along the lines of its proper relationship to nature; that is, to mankind and the world about him. Another prominently developed instinct of children is the desire to be useful and helpful. Nature study attempts also to make use of this and all other instincts and tendencies of the child so as thus to be able to lead him along the path of development that nature has destined for him and, in this way, infuse a real interest into his work through the inspiration of a desirable object to be attained. Nature study may, therefore, be said to be an element of practically every subject of study in which the child succeeds in becoming interested.

The sawing of a board or piece of wood interests the young child, apart from the actual act of sawing. The nature of the wood; the motions of the person sawing; the teeth of the saw; the saw-dust; the severed pieces of wood; the picking up and carrying of the wood from one place to another; all these actions are naturally related to the child's life; and they are, hence, proper subjects of nature study, just as much as animals, trees and flowers and their actions, colors, forms, sizes and relationships are.

Nature study recognizes the fact that child life and school life, to a very considerable degree, reflect the life of the community and exhibit the child growing more and more rapidly into the more extensive life of that community. It attempts to so direct these natural child interests as to enlarge the childish vision and to prepare the child for the coming greater activities of adult life, through proper perception and correct thinking and reasoning. Its sphere is, therefore, the whole field of animate and inanimate life, in which the child gains his early self-education, largely by observation; for with him literally "seeing is believing" and to this may be added tasting, touching and handling, which nature study helps him to do effectively, intelligently and with added pleasure.

History.—Nature study, as a name, is quite recent, but as an actual fact it is old in a part of its development at least. However, it maintained for recent advocates of nature study to give it a permanent place upon the curriculum of the public schools, and later, the high schools and colleges. Socrates and Aristotle advocated and employed methods in teaching very much like those insisted upon by the modern teacher of nature study. But probably their methods were but echoes of a very general and widely extended custom of nature study. The American Indians, over practically the whole extent of the two continents, had systems of instruction fitted, in short, to their tribe or nation, to its own peculiar condition and racial requirements. But in every case this instruction was carried on very largely along the lines laid down by the modern advocate of nature study. In the case of the North American Indians, the young brave had practically all his instruction in the haunts of nature where he learned to know all about the wild animals of the forest, the birds, the fishes, the trees, the winds, the weather, the seasons and the manifestations of the earth in the sur

At the beginning of the Christian era the philosophers of the Roman Empire were in the habit of teaching their pupils in the open; and traveling teachers frequented the land, from place to place, at times accompanied by pupils who formed a following; and thus accompanied, they taught on the open market places, in front of the temple and other public places where the masses were accustomed to congregate. All these actions were survivals of a very much earlier and more general custom in which nature teaching must have played a prominent part, if we are to judge from
survivals of this very ancient open air teaching in many southern countries to-day and of real nature study and teaching among such semi-barbaric and semi-civilized races as have developed systems of instruction fitted to their several needs.

The Renaissance brought forth teachers who strenuously advocated more natural methods in teaching, not only languages but all other subjects. Of these men the most prominent, the greatest and most far-seeing was Rousseau, some of whose more advanced ideas are yet beginning to make their way into the schools. Pestalozzi, Froebel and their followers and the modern kindergarten teachers have all been working closer and closer to the goal of nature study whose principles they have been following, consciously or unconsciously. The revolution in teaching was bound to come with the Renaissance; but it came very slowly. Men were too busy with the new learning to bother themselves about the methods of acquiring it. The thing itself was to them all important. But as the movement grew and teachers began to talk about ways of teaching, hundreds of methods were put upon the market, all echoes and re-echoes of one another, with here and there a glimmer of new light. But the light, though not very bright, was really there, though hidden by many clouds of prejudice, custom, habit, misunderstanding and ignorance. The cry of men like Agassiz, Rousseau, Ollendorf, Pestalozzi, Froebel, Berlitz and the whole school of natural method teachers was to get nearer to nature, to have teaching of languages conform to the natural methods by which a child acquires his mother tongue. While these men were builders, they were necessarily anarchistic, to a very considerable degree. They were bent upon sweeping out of existence the old methods which had failed to accomplish what they were intended to accomplish. They were largely anarchistic in their methods also. Let us teach as the child teaches himself, they said. Let us gather facts and impressions from nature just as we come into contact with the old ways. we provide what we aim at. The result was that practically all these natural methods were anything but natural. They followed no line of development or plan; because nature's methods presented themselves to these natural method teachers as evolutionary. Just when these unscientific methods of teaching had begun to bring discredit upon their authors and more scientific teachers had begun to protest and to replace the somewhat discredited 'natural method' designation with that of direct method, teachers of natural sciences in the public schools discovered that the term was still a good one for their purposes. Let us get nearer to nature in our teaching,8 said the cry, and the schools looked enthusiastically as though it had not been already worn threadbare. Science had just been introduced into the public schools and colleges of the country. The science teachers of the last ten or twenty years have been the champions of the language teachers in getting nearer to nature. The early teachers, in their protest against the too exact and dry methods of the regular science teachers, protested against any method whatever. If teachers would only get nearer to nature 'everything would be all right, they preached, for nature, in her kindness, would take care of them. These educational anarchists were soon, however, replaced by men of larger vision, who saw the possibilities of nature teaching if it were only organized and made to follow scientific principles and taught according to properly worked out plans by means of contact with nature supplemented by well organized laboratories of natural objects. This, however, was not done without protests from the ultra wing of the nature study teachers, who talked about the restraints of the unnatural technical science in physical education, for what they denounced the natural, untrammeled development of the child's faculties from the child's point of view. In this there was a small amount of truth and a large amount of misconception of the true functions of teaching. Their cry was a protest against the dry, formal teaching of the school room; and it served its purpose. It quickened the science teacher into action; and nature study methods entered many a science room, many a laboratory, greatly to the improvement of teaching, and in fact, of teaching in almost every department of school and college life. Nature study was applied to literature, and literature to nature study. The pupil was taught to see the beauty in the larger structure of nature work in the truest of nature poems, and these poems were read, by nature teachers, as supplementary to their regular studies. This evolution shows two distinct phases, which have been indifferently indicated,—the tearing away from the old methods of teaching; and later on the building of the new nature study structure scientifically upon the bases of the old.

Modern Development.—Nature study made its appearance as such in the latter quarter of the 19th century; and it was due, as has already been said, to the introduction of the teaching of science and vocational studies into the public schools. The common school teacher, finding it difficult to teach pupils science in the orthodox college manner, had recourse to the practice of using concrete examples and of making use of nature herself for the explanation of her moods and phases. This practice gradually grew until, in 1889, considerable attention became fixed upon it owing to the fight made by numerous teachers of elementary science in behalf of more interesting methods of presenting it to younger pupils. In this latter year W. S. Jackman planned a general course in nature study for the ward schools of Pittsburgh, which he was destined to carry out in Cook County Normal School, to which he went in the fall of the same year. Two years later his notes were published for the use of teachers and schools under the name of 'Nature Studies for Common Schools.' They were much along the lines laid down several years before by Sheldon, the State Normal at Oswego, N. Y. This movement in 1889 was noticeable in various educational centres in the Eastern States, notably in Massachusetts. In the latter State A. C. Boyden took the lead and for 10 years lectured extensively in various educational institutions all over the State on nature study. He succeeded in creating a great deal of interest in the subject and in establishing centres of nature study with committees or societies, which met frequently. His methods of using printed outlines and illustrating les-
sons was pretty generally followed; and it was not long before it was improved upon. A special committee on nature study, meeting monthly in Boston, helped to direct the work by arranging courses of study and doing other important work, pieces for the cause. These prepared courses were distributed all over the State, and they helped to greatly increase the interest in nature study and to extend its field of influence.

Materials of Study and Organization.—In the early stages of nature study there was little attempt at the scientific organization of the materials used in teaching. As we have seen, outlines of study were formed for the guidance of teachers in their work; but they were largely suggestive and had little of the scientific about them. But gradually, as the practice of nature spread, extending to the high schools and colleges, trained teachers of science applied their methods of organization to it; and nature study gradually took form and shape. A sound study in which the proximity of the pupil, the teacher and the materials and objects used in teaching were specified and defined. This called into being and well-appointed nature study laboratories and took possession of vacant or available pieces of land for experimental purposes in the growing and observation of plants of many kinds by the pupils under the direction of teachers. It made use of excursions into the woods, fishing, hunting and boating trips and camping out parties. Soon a corps of trained nature study teachers sprang into being, and these, in their turn, as a result of experience gained in their work, proceeded to further organize the subjects, activities and province of nature study. The laboratory teacher, from his inside experiments, helped the work of the nature study teacher doing his work on the outside. Now there is scarcely a summer camping school that does not have its nature study director. The pupils are encouraged to form laboratories or museums of their own made during their nature studies. The school laboratories for nature study contain mounted insects, birds, animals, preserved plants, parts of trees, shrubs, plants, in fact samples of everything pertaining to nature in which the child may be made to take a natural interest. These are supplemented by geological and other specimens, models of a large number of objects of different kinds, drawings, photos, pictures, paintings, plans, designs and castings. These are again supplemented, in the larger towns and cities, by visits to art and other museums, great libraries, factories and other industrial plants, zoological gardens, parks, agricultural farms, truck gardens, hot houses, and in fact any and all places of human activities in which the pupils might be interested.

These and numerous other means of direct contact with nature and human activities and their results in manufactured forms are correlated with art study. The pupils are taught to draw, paint or color, photograph, model and represent in various ways the objects with which they come into contact during their nature study classes. Many schools make a permanent exhibit of their art work; and some of these exhibits show very encouraging results, with some really beautiful and talented work. This correlated art work can, and often is made very extensive, including, for instance, the artistic arrangement of flowers, flower beds, borders, etc., the selecting of flowers and their arrangement in gardens so as to secure the blending of colors, observing the habits of wild and domestic animals and the study of the lives of reptiles, fishes, and, in fact of all kinds of animal life. In other words, nature study is made to lead up directly to the scientific studies of the classroom. See kindergarten; frebel; Rousseau; Pestalozzi.

JOHN HUBERT CORNYN,
Birmingham Southern College.

NATURE WORSHIP. The worship of the heavens, the planets, the elements, the manifestation of all forms of life, vegetable and animal, including the personified life attributed to inanimate objects. Nature worship, though probably everywhere occasioned by the natural impulse of man to fear the terrific manifestations of nature and to show great respect for the powerful and the mysterious, has taken many different by-paths in the development of the various human races and families. The early investigators into the phenomena of natural religions failed to recognize this diversity of development, and they proceeded to build universal theories on divergent growths. Hence all of their theories have either partially or completely fallen by the wayside, or have survived the test of time only as a diminutive part of the original whole. Yet the work of the early investigator has not been done in vain; for, inasmuch as he has thought deeply he has set others thinking. Concerning no part of the extensive field of mythology have more divergent theories been advanced than nature worship. By various writers the origin of worship has been traced to ancestor deification, to the fructification engendered by earth and sky, to the fear inspired in primitive man by the lightning, storms and winds, to the fearful ravages of mysterious all-powerful beings who brought diseases and death. Others have traced the worship of man to the serpent. Still other writers have maintained that man's first gods were his own ancestors; while others see in him worshiping the glory and majesty of the sun and the mystic beauty and mysterious healing powers of arts.
the mountains amid the sources of the streams or in the clouds, the home of the rains.

To these early mythological investigators it never seemed to occur that man's early conceptions of this nature were not at all religious in the modern sense of that term, but that the people grew out of fear and mysterious dread. This primitive religious conception continued one of the strong features of man's worship far down into the monotheistic age of religion. Metaphorically the Jehovah of the Hebrews was a god who rode upon the winds and planted his footsteps upon the storm. At the sound of the horns of the priests of Israel walled cities fell down, just as the forests of old fell before the whistles of the wind gods. The fervid poetry of the greatest of the Hebrew poets is fairly alive with images borrowed from the polytheistic nature worshippers who surrounded them or with whom the race came into contact during its periods of exile. In this Hebrew poetry every phase of nature seems alive, as it is in the Greek and Roman, Egyptian, Babylonian and Indian poetry. In primitive Hindu literature and in the poetical imagery of China and Japan nature appears as one great whole defined in different yet, in many respects, suggestively similar ways. Among the American Indians the deification of the more striking forms of nature is everywhere evident. These primitive ideas became conventionalized, elaborated, amalgamated with other ideas and they long continued to act upon and to be reacted upon by society. A primitive belief was that people were drowned because spirits lived in the depths and dragged them down. The wind was supposed to cry like a lost child. The combination of the two made the Llorona of Spanish lands in Europe and America, who, crying like a lost child, leads the unwary, after nightfall, into a pool or bog where she or her attendants catch him by the legs and drags him down to death. Many primitive nature myths and unions of myths have become much more complicated than the Llorona. In fact little in nature worshiping today remains of the most primitive forms; what is existing is to be found in anything like its original form. Hence the analysis of nature myths is a very complex and difficult matter. Yet the general conception of how primitive man thought is not difficult to understand.

Society and Nature Worship.—Although apparently simple, all modern manifestations of worship, however primitive, are in reality very complex; for society and its beliefs have, for long ages, been continually acting and reacting upon one another. In the more primitive society existing to-day, the medicine-men, are universally believed to possess spiritual or magical powers. They are generally the medium between the people and the powers of the material universe and of the future world. They thus become a sort of divinity which belongs to them through the natural logic of their official position. Here we see, in the early stage of its development, one of the powerful factors in the organization of primitive beliefs of the nature worshippers into organized and complicated mythology. The governing class, consisting of priests or medicine-men, chiefs and leading warriors, early learned to claim descent from their nature gods, about whom they began to invent and relate the stories which we now call myths. The sun became the great ancestor of the Peruvian priests and nobility, of the Mixteca warrior class, as of the ruling body of other great races, the most noted of which was the Egyptian. Once this relationship had been attained the glorification of the sun became the glorification of the ruling powers and the consequent subjugation of the masses to them. Ritual, ceremony, a highly organized and disciplined priesthood and religious society followed; and of this the governing class soon became the head. Among the Toltecs in Mexico, Quetzalcoatl the wind god became the ruling deity and his superior priests, who were always chosen from the nobility, were believed to be his representatives upon earth and his lineal, blood descendants. The royal family and the nobles also represented themselves as god-born. Very frequently the king was also high priest of the nation and as such he was known as the Quetzalcoatl, or the chief of the gods. The principal races of Chiapas and Yucatan also believed themselves to be descended from the wind god, while the Mixtecas and several tribes of Guatemala called themselves ‘Children of the Sun.’ The latter wore upon their breasts and backs the yellow symbol of the sun. In Persia and Egypt the complicated court life centred on the belief in the power of the emperors as the divinities of the earth. Out of this condition grew the acknowledged relationship of the hierarchy of the gods. This was the birth of the great religious systems of Persia, Babylonia and Egypt, which continued to grow more complex until their ultimate decline and disappearance. Thus, too, in their present form the paths followed by the great religions of antiquity, all of which bear plainly the marks of primitive nature worship. The development of a religious theocracy gave very specific functions to the most prominent of races now existing is to be found in anything like its original form. Hence the analysis of nature myths is a very complex and difficult matter. Yet the general conception of how primitive man thought is not difficult to understand.

Animism.—Primitive man undoubtedly held beliefs that we can scarcely comprehend to-day. One of these has been termed animism, a designation that appears to mean different things to different investigators and writers using it. It has been variously defined as belief in souls, spirits and magic power.

All recent investigation tends to show that primitive man made practically no distinction as to animation of life, but regarded the active elements of nature around him. The sun, moon, stars, winds, clouds, thunder and lightning were beings like himself who had at
their command very superior magic power. The stories of all Indo-Europeans and the American Indians are filled with myths depicting the contests in magic that took place between their deities and nature heroes. The Indian stories especially present characters essentially human, so human indeed that they are wretchedly deceived and duped not only by man himself but also by the lower animals and even at times by inanimate things. These hero characters are neither divinities, nor souls, nor spirits in the modern acceptance of the terms. They are simply the wielders of magic power. Therefore, when certain writers on mythology talk gibbly about the religious emotion in the presence of nature giving birth to animism, they are speaking about the past in terms of to-day, forgetful of two facts. The first of these is that even races as far advanced in civilization as the Indians of southeastern Canada and the United States seem to exhibit no appreciation of the beauties of nature, as nature itself. The second is, that religion is not in the remotest degree the offspring of organized religion, exercised consciously or unconsciously to stir up such feelings. Fear and terror of any object inspired respect in all ages of the past as they do to-day. Out of these primal elemental feelings combined with that of admiration, ancient religious beliefs and systems were built up slowly from primitive nature beliefs. The belief in souls and spirits, as things apart from the existence of humanity, came very much later in the religious development of humanity.

Transmigration.—Intimately connected with animation is the belief in transmigration. In fact the one presupposes the other; and both seem to belong to certain stages in the social development of all society. The wind was a most powerful agent of destruction, the mysterious beings hidden in the clouds shouted with their thunderous voices and shot forth their darts of fire. Other beings sent forth the rain from the heavens and the mountains. Yet they all remained invisible as did the spirits that lived in the trees and the water; therefore, they must possess the power of rendering themselves invisible, reasoned the nature worshipper. The same mode of reasoning accounted for spirits in the sky; gods; and the personified elements, planets and phases of nature with the magical power of taking upon themselves other bodily forms at will. Out of this idea of transmigration grew the Hindu belief in reincarnation, which, in the case of Vishnu (q.v.), was carried to an almost unlimited number of bodily changes, each one bringing with it a new existence upon earth. Among many fairly civilized races there still exist in the masses at least a belief in spirits that inhabit trees, rocks, lakes, rivers, mountains, hills, clouds, caves and winds; and this belief teaches us how nature worship grew up and long continued to claim the unquestioned faith of humanity. The belief that human souls may be transmigrated into the bodies of animals, and vice versa, is still held by many races and peoples, and the ghost or disembodied spirit has but recently retreated from the stronghold of science; and so recent is its departure that a goodly body of so-called scientists are gravely experimenting with and seeming to justify to its followers.

Another development of animism and transmigration was the belief in guardian spirits which seems to have been almost universal. Very early in his social development man is found attempting to subject to his will and his uses, by his magic, the various mysterious powers of nature. Dances, charms, incantations, amulets, magic potions and other primitive means were wretchedly deceived and duped not only by man himself but also by the lower animals and even at times by inanimate things. These hero characters are neither divinities, nor souls, nor spirits in the modern acceptance of the terms. They are simply the wielders of magic power. Therefore, when certain writers on mythology talk gibbly about the religious emotion in the presence of nature giving birth to animism, they are speaking about the past in terms of to-day, forgetful of two facts. The first of these is that even races as far advanced in civilization as the Indians of southeastern Canada and the United States seem to exhibit no appreciation of the beauties of nature, as nature itself. The second is, that religion is not in the remotest degree the offspring of organized religion, exercised consciously or unconsciously to stir up such feelings. Fear and terror of any object inspired respect in all ages of the past as they do to-day. Out of these primal elemental feelings combined with that of admiration, ancient religious beliefs and systems were built up slowly from primitive nature beliefs. The belief in souls and spirits, as things apart from the existence of humanity, came very much later in the religious development of humanity.

NATURE WORSHIP

radiant face of the deity; while all the furnishing of the moon goddess were required to be of silver. This latter example well illustrates the extreme growth of naturalistic ideas from the divine, nature associations, a taboo of the most rigid sacred character. About these nature taboos grew up many legends to account for them or to explain them. The Peruvians asserted that gold was formed from the tears of the sun god, the Mixtecas declared that it was the same excrement from the bodily food. The Colombian Indians in the neighborhood of Bogotá inaugurated their new emperor into office by painting his naked body completely with gold dust, thus symbolizing that he was the direct representative of the sun, the great racial father upon earth. Such complicated ceremonies with their rigid, uncompromising taboos, imply a long-developed civilization or culture built upon nature worship.

The Nature Gods.—Nature worship, which, as has already been said, had its origin in the fear of the destructive forces of nature and a desire to placate them, or in respect for virile qualities in the same, grew in time, as man became more civil in his habits, to be a very complicated institution. Under the Aztecs, Mayas, Quiches, Zapotecas, Mixtecas, Pueblo Indians and Peruvians in America and among the great civilized nations of Europe, northern Africa and southern and western Asia, in the pre-Christian era, nature worship had become organized, in each case, into a most complicated religious system, which defined the attributes and sphere of action of each of the deities and explained his relationship to the gods as a whole, to the state, to the priesthood, to the nobility and to the masses. This called for an extensive domestication and cataloguing of the nature deities. This had already taken place in the religious systems of all the great civilized nations in pre-Christian days. Naturally, under such a system, where almost every phase of animate nature was represented by its special deity, the list of the gods became very great. Yet they all came under a few primary divisions.

The upper regions were occupied by the sun, moon and other planets, by the dawn and the darkness, the clouds, the thunder and the lightning, the winds of the four quarters of the heavens and their accompanying night spirits or wind spirits. In most nature religions these regions were divided into the upper heavens, inhabited by the sun, moon, planets and gods of dawn and darkness; and the lower heavens, the home of the clouds, winds, rain gods and other deities of the elements. The earth was the habitation of the deities of growth and fertility and the general habitat of the household penates and guardian spirits; while the regions within the earth or beyond the borders of the natural world, that is out on the great elemental ocean which, in most mythologies, surrounded the earth, were the regions of death and decay. Within the earth, too, quite frequently were the regions of birth. These ideas and divisions sprang naturally out of nature worship. At death all things go back into the earth; at birth all things are reborn from the earth. This was one of the patent facts that first appealed to the imagination of myth-making primitive man. There was a tendency to divide the deities of these divine regions into beneficent and malevolent beings. Thus arose the idea of the warring of the nature gods.

The Functions of the Gods.—Nature worship, originating independently, as it undoubtedly did, in different quarters of the world, naturally developed along different lines among people racially and linguistically different. But as the origin of the pantheistic conceptions that distinguished it were essentially the same, there is a striking similarity in the attributes of the nature gods everywhere. The earth, which gives birth to all things, is the universal mother; the sky, which sends the fructifying rains, is the husband of the earth and the great nature father. The sun, with his vivifying rays is the father of growth. The winds, with their ceaseless movements and their great speed, become the messengers of the gods, the bringers of culture and the purifiers or healers. But there are beneficent winds and harmful winds, gentle winds and destructive winds. Those working in the interest of man are represented as in a constant struggle with those seeking to harm him. This feature of nature worship is strongly evident in many myths. In the Mexican mythology Quetzalcoatl, the beneficent east wind is represented as the culture hero struggling with Tezcatlipoca, the black spirit of the night, or the night wind. Hiawatha fought and defeated the Great Pearl Feather, the wind that broods over the pestilential marshes; and he fought his own father Mudjikierwis, the west wind and the father of all the winds of heaven, who finally shares his kingdom with him, making him the Keewatin, the northwest wind, the home wind.

The Serpent in Nature Worship.—Everywhere the serpent drags its tortuous length through the habitat of the nature gods. Many explanations of its presence there have been presented by students of mythology, but most of these explanations have been unfortunately fanciful or manufactured to fit preconceived theories. The serpent is inseparably associated with the wind gods. Sometimes, he is a kindly deity; at others he is the spirit of malevolence. This is a natural development of nature and in no way demands a supernatural explanation since it fits in with the nature of the winds. Quetzalcoatl (q.v.), the great culture hero of Mexico, Yucatan and Guatemala, was represented as a plumed serpent, and the serpent formed the most conspicuous decoration of his temples. Yet others of the Mexican wind gods also bore the sign of the serpent. The robe of the mother of the gods was represented as consisting of interwoven serpents. The serpent was frequently intimately connected with the deities of fruition and birth, probably because the wind gods were also thus connected. But the destroying force was also represented as a winged serpent in many parts of the world. This is but another form of the evil wind. This latter conception gave birth to the dragons of destruction bearing with them fire or lightning as their destroying agents. From this conception to that of the evil one, the old serpent, the personified force of evil as found in the Persian and other related religions, is but another form of the evil wind. Christianity and the Hebrew faith borrowing the imagery of the nature religions have made it vividly familiar to us.
In Roman and Greek mythologies, the gods of healing are associated with the serpent and not the least of these is Apollo. This association of the serpent with the gods of birth and healing explains their relationship to public worship. The serpent represented kindly forces; as the rain preventer his tendencies were evil.

The Cross in Mythology.—Throughout all primitive America and in many of the mythologies of the eastern hemisphere the world was divided into four quarters over which ruled one of the winds, all of which were frequently represented as so many serpents or dragons. Quetzalcoatl the Toltec culture god, sailed away on the wing of a dragon or in a boat moved by supernatural serpents, which were at once symbolic of his origin as a wind god and his office as the greatest culture hero of the American races and the symbol of divine wisdom and earthly progress. Being the symbol of fertility, the universal benefactor, activity of the winds as the bearers of fertility throughout Mexico, most of Central America and the Pueblo and some other Indians of the United States. In the form of the swastika (the four-footed cross with the ends bent, generally at right angles), the cross became the symbol of good fortune and (among the American Indians) of generation. The Cretan mother goddess, the great deity of fertility, is represented, in her surviving statues, with snakes coiled about her waist and arms, and the wasp, worshipped in the temple of the sacred cross. Throughout Crete, where her worship seems to have had a very important place, the cross was looked upon as a sacred symbol. Like the rain gods of Mexico and Central America, the mother god of Crete was worshipped at the tops of the hills and the high places from whence descended the fructifying waters. Like the tallow and other gods of the rain cross she was connected with death and life, more especially the latter. In the course of the time the cross, especially in America, came to form a very important part of the decoration of temples and sacred places in pre-Columbian days. The trail of the cross, like the trail of the serpent, runs across Mexico and Central America and a very considerable part of the United States.

Fire, along with sunshine, rain, air in motion and regeneration, fire early became for man one of the sacred elements. To him it symbolized (among many races) the sun, the great generator and the source of all heat. By the use of fire it was possible for him to greatly enlarge his range of diet, to fell the huge forest trees. In the shape thence from it he enabled him to smelt metals and to attach them to his car of progress. As it was hurled from the clouds it became symbolic of the power that hurled it. As it was vomited forth from the volcanoes, it came to signify the titanic force inseparably connected with punishment for offenses connected with the infernal regions, in various mythologies. From these primitive beliefs later religious systems borrowed much of their systematized ideas of the nature of future punishment.

The Future Life.—As the beneficent beings who brought their favors to the earth occupied the upper air; and as there, too, is the home of the sun, the moon and the planets which were supposed to strongly influence human life for good or evil, very many races looked upon these regions as the home of their future life. Some believed that the souls of the dead went to the sun, others to the moon, still others to the great cloud land, a mid-region between the earth and the home of the superior deities. Some races placed the future world in the far north or northwest, in the region of the northern lights, whose brilliancy probably suggested the idea. Among many Indian tribes the rainbow was believed to be the bridge that spanned the great sea of fertility naturally became that of the so-called pallic worship which was also symbolized by the cross, as the representative of the four quarters of the earth in which lived the winds and the wind gods. In pre-Columbian times the cross was the symbolical representation of the motion of the winds as the bearers of fertility throughout Mexico, most of Central America and the Pueblo and some other Indians of the United States. In the form of the swastika (the four-footed cross with the ends bent, generally at right angles), the cross became the symbol of good fortune and (among the American Indians) of generation. The Cretan mother goddess, the great deity of fertility, is represented, in her surviving statues, with snakes coiled about her waist and arms, and she was worshipped in the temple of the sacred cross. Throughout Crete, where her worship seems to have had a very important place, the cross was looked upon as a sacred symbol. Like the rain gods of Mexico and Central America, the mother god of Crete was worshipped at the tops of the hills and the high places from whence descended the fructifying waters. Like the tallow and other gods of the rain cross she was connected with death and life, more especially the latter. In the course of the time the cross, especially in America, came to form a very important part of the decoration of temples and sacred places in pre-Columbian days. The trail of the cross, like the trail of the serpent, runs across Mexico and Central America and a very considerable part of the United States.

Fire, along with sunshine, rain, air in motion and regeneration, fire early became for man one of the sacred elements. To him it symbolized (among many races) the sun, the great generator and the source of all heat. By the use of fire it was possible for him to greatly enlarge his range of diet, to fell the huge forest trees. In the shape thence from it he enabled him to smelt metals and to attach them to his car of progress. As it was hurled from the clouds it became symbolic of the power that hurled it. As it was vomited forth from the volcanoes, it came to signify the titanic force inseparably connected with punishment for offenses connected with the infernal regions, in various mythologies. From these primitive beliefs later religious systems borrowed much of their systematized ideas of the nature of future punishment.

Theories of Nature Worship.—At the head of the early naturalistic school is Max Müller. He maintains, with the disciples of his school, that the worship of nature was the primary religious efforts of man; and he attempts to prove his position by means of comparative mythology. His theory, which applied only to the Indo-European races, was carried to an absurd limit by many of his school. E. B. Tylor looks upon the worship of the dead as the earliest of human cults and Herbert Spencer takes the same ground. The latter derives from this source all other forms of worship. Tylor traces the history of the so-called animistic faith, while Spencer displays its evolution. Wundt maintains that religion finds its origin in the primitive belief in human souls and in an early animism out of which a belief in magic and fetishism grew. Dunkheim believes that the totemic principle, or belief in mysterious power (the mana or magic power) is the source of all religion. All of these investigators have hit upon certain important points, but no one has been able to grasp the significance of the wide field of mythology, for they all have made cate-

NAUCRATIS, ná-krá-tis, Egypt, an ancient Greek colony, the remains of which are near Nebiréh, 50 miles by rail southeast of Alexandria. It existed as early as the beginning of the 7th century B.C., and was approached by a navigable canal in the western part of the Delta, near the Canopic branch of the Nile. Its chief period of splendor was during the reign of Amasis II, 570-520 B.C., under whom it was recognized as the official capital of the Greeks in Egypt. Its site was rediscovered in 1884 by Prof. Flinders Petrie. Subsequent excavations have uncovered the remains of buildings described by Herodotus, the Hellenium, temples to Apollo, Aphrodite, the Dioscuri, etc., and there have been valuable finds of early Greek pottery and other archeological treasures. Con- sul F. F. 'Naukratis' (1880); Gardiner, E. A., 'Naukratis II' (in Egyptian Exploration Fund, Publications, Vols. III, VI, London 1886-88); Hogarth, in British School at Athens, Annual (ib. 1898-99); id., 'Naukratis, 1903' (in Journal of Hellenic Studies, Vol. XXV, ib. 1905).

NAUCYDES, ná-sí'déz, Greek sculptor. He flourished in the first quarter of the 4th century B.C. His birthplace was Argos and he was the pupil of the Elder Polycletus of the Peloponnesian school of sculpture. He carved a chrys- elephantine statue of Hebe for the temple of Hecate at Argos; a bronze statue of Hebe; a Hermes; several statues of Victory; a portrait of the poetess Erinnia; 'Phryxus Sacrificing the Ram' (for the acropolis at Athens), and a Discobolus. The younger Polycletus was his pupil.

NAUGATUCK, Conn., town and borough in New Haven County, on the Naugatuck River, and on a division of the New York, New Haven and Hartford Railroad, about 40 miles south by west of Hartford and 25 miles north-west of New Haven. In 1844 it was incorpo- rated as a town and as a borough in 1893. The chief manufactures are rubber goods, paper boxes, knit goods and machine-shop products. It has considerable trade in farm products. It has the largest plant for reclaiming old rubber in the world, also a very large factory for the production of heavy acids used in the brass and rubber industries, and a large chemical plant for the production of chemicals formerly imported. It is well supplied with schools; it has besides the public and parish elementary schools, the Whittemore High School, the Salem School, Saint Francis Academy (R. C.) and the Whittemore Memorial Library. The government is vested in a board of wardens and burgesses, who hold office one year, and who appoint all the administrative officials except the board of education, the members of which are chosen by popular vote. Pop. 15,000.

NAUGATUCK, ná'ga-tük, a river in Connecticut, has its rise in the northern part of Litchfield County and flows south, about 60 miles, and enters Housatonic River at Derby. It flows through a mountainous part of the State and supplies water power to many mills and factories. Waterbury is the chief city on its banks.

NAUHEIM, no'n-heim, Germany, town near Frankfort-on-the-Main, in province of Oberhessen, on the Usa, at the northeast foot of the Taunus, and on the Cassel-Frankfort State Railway. It is world renowned for its saline baths, where the visitors are afforded a magnificent Kurhaus, Inhalatorium, extensive park elaborately laid out, etc. Here are three Evangelical, a Catholic and an Anglican church, synagogues, a high school, etc. The medicinal waters are rich in iron, table-salt and carbonic acid, and are, therefore, available for drinking as well as bathing, and for export, and are used in cases of rheumatism, disease of the spinal marrow, gout, obesity and feminine troubles, and especially for diseases of the heart. Before the World War this was one of the most popular bath resorts in Europe, attracting as many as 34,000 patients per annum. Pop. 5,694.

NAULETTE, nö-lē't, a large cavern in Belgium, near Dinant on the Lesse in the commune of Furfoox. Here, in 1866, was found the lower jaw of a human, together with the bones of the elephant and rhinoceros. The human remains were assigned to the Mousterian epoch.

NAUMACHIA, ná-mák'k-á, or NAU- MACHY (from the Greek naus, a ship, and maché, a fight), among the Romans a public spectacle, representing a naval action. Caesar was the first who exhibited a spectacle of this sort, which soon became the favorite amusement of the Roman people. Buildings were erected by the emperors, specially adapted for the purpose. They resembled the amphitheatres, and like them were at first built of wood. Domitian erected one of stone. A naumachia, built by Augustus, was 1,800 feet long and 200 wide, and was capable of containing 50 ships with three banks of oars, besides many small vessels. They were suddenly laid under water by means of subterranean canals, so that the ships were raised at once from the dry floor before the eyes of the spectators. These sea-
NAUMANN — NAUTICAL TRAINING SCHOOLS

fights were exhibited with the same splendor and reckless disregard of human life which characterized the gladiatorial combats. Titus exhibited a sea-fight in which 3,000 men were engaged and ships almost equal in number to two real fleets were shown by Domitian. The crews generally consisted of gladiators, prisoners or condemned criminals.

NAUMANN, now'man, Johann Friedrich, German ornithologist: b. Ziebiigk, Germany, 14 Feb. 1780; d. there, 15 Aug. 1857. He studied with his father, who was an ornithologist, and became professor and inspector at the Ornithological Museum of the Duke of Annalt-Kothen. His most valuable contribution to the science of ornithology is the 'Naturgeschichte der Vogel Deutschlands' ('Natural History of the Birds of Germany'), published in 1822-24; he prepared the illustrations for this work, making the plates for more than 500 copper engravings. He also wrote 'Taxidermie' (1815); 'Uber den Haushalt der nordlichen Seevoelke Europas' (1824); and, with Buhl, 'Die Eier der Vogel Deutschlands und der benachbarten Lander' (1819-29). A statue of him was erected at Kothen in 1880, and the German Ornithological Society named its official organ in his honor, Nauumannia.

NAUMANN, Johann Gottlieb, German composer: b. Blasewitz, near Dresden, 17 April 1741; d. Dresden, 23 Oct. 1801. Thanks to the interest of a rich Swedish amateur, Weesstrom, he was taken to Italy when 16, and there studied under Tartini. He became court composer at Dresden in 1765, and kapellmeister in 1774, a post to which he returned in 1786, after six years in Stockholm, where he organized the royal orchestra. His music, including operas, oratorios and symphonies, was essentially Italian in style and is no longer popular. Consult the biography by Nestler (1901).

NAUMANN, Karl Friedrich, son of J. G. Naumann (q.v.), German mineralogist: b. Dresden, 30 May 1797; d. there, 26 Nov. 1873. He was educated at Freiburg, Jena and Leipzig, and in 1822 made a scientific tour in Norway. He was an instructor in the University of Jena in 1823 and professor at Leipzig in 1826. From 1826 to 1842 he was professor of crystallography at Freiburg, and from 1842 till shortly before his death held a professorship at Leipzig. Among his works are 'Anfanges-grunde der Krystallographie' (2d ed., 1854); 'Elemente der Mineralogie' (12th ed., 1885).

NAUMANNITE, in mineralogy, is the name given to a native selenide of silver and lead found in the Harz Mountains and so called from K. F. Naumann (q.v.). This mineral contains about 26 per cent of selenium, 65 per cent of silver and 6 per cent of lead; in some samples a great part of the silver is replaced by lead. Specific gravity about 8.0. Color and streak iron-black.

NAUMBURG, now'mubor, or NAUMBURG-ON-THE-SAALE, za'te, Germany, a town of the Prussian province of Saxony, on the Saale, near the junction of the Unstrut, 25 miles southwest of Halle. Its chief edifice is the restored cathedral, which has four lofty towers, one the gift of William II, erected in 1894. The town has some manufactures and a considerable wine trade. Glass and porcelain painting is also an extensive industry. It became an episcopal see in 1029. In the 15th and 16th centuries several treaties were concluded at Naumburg, and the town was of great strategic importance during the Thirty Years' War and the wars of 1806 and 1813. Pop. 26,962.

NAUPLIA, na'plía, a, Greece, a fortified sea-port town, capital of the monarchy of Argolis, at the north extremity of the Gulf of Argos, 25 miles by rail south of Corinth. It was occupied by the Venetians in the 13th century and was taken by the Turks in 1347. From 1821 to 1835 it was the capital of Greece, but declined in importance after the removal of the court to Athens. It is of some importance commercially because of its fine harbors. Pop. about 15,000.

NAUPLIUS, na'plús, in Greek mythology, the son of Neptune and father of Palamedes. He is said to have revenged the death of his son by deceiving the Greeks by false beacons, as they returned from Troy, and causing their vessels to be wrecked.

NAUPLIUS. See LARY.

NAUSEA (Latin from Greek ναύσεις, seasickness), a sensation of sickness and distress, of which the leading characteristic is squamishness of the stomach. The disturbance, however, extends to the entire system. In severe cases languor affects every part; the pulse is small; the skin moist and pale; the flow of saliva increases, and if vomiting does not immediately accompany the sensation the apprehension of it is painfully present. The causes of nausea are many: blows upon the head, mental shocks, hysteria, pregnancy, irritation or tumors of the abdominal or the pelvic viscera may produce it as may also the early stage of syphilitic disease or epilepsy, diseases of the brain, etc. See VOMITING.

NAUSHON, na-sho'n, the largest of the Elizabeth Islands (q.v.), off the southeast coast of Massachusetts.

NAUCH, nach, in India, a dance performed by the dancing girls attached to the temples, called Naucht girls or Nauchtchee, who are brought up and trained to all the arts and allurement of their profession. It is probably a survival of the ancient custom of sacred prostitution. They move with slow, undulatory movements of the body, while the feet are but little used. They correspond to the bayaderes (q.v.) of the south of India.

NAUTICAL SURVEYING. See HYDROGRAPHY; SURVEYING.

NAUTICAL TRAINING SCHOOLS. Schools for training young men in the science of navigation, in the study of marine engineering in all its various branches, in practical seaman ship—in all the necessary matters pertaining to the operation of vessels at sea, have long been established both in the United States and in foreign countries. These nautical schools have for their definite object the training of young men who desire to follow the sea as a profession, to enable them to become officers in the Merchant Service and to provide highly trained, efficient officers for the auxiliaries and reserve of the naval forces. Euro-
NAUTILUS

Lois Weickum,
Secretary, New York State Nautical School.

NAUTILUS, a marine cephalopod of the genus Nautilus and family Nautilidae, a few living species of which are the only survivors of the order or superorder Tetrabranchiata, which including both the nautiloid forms and the ammonites (q.v.) is divided into no less than 22 extinct families, of which they in past ages. The nautiloids began in the Cambrian, became greatly differentiated and abundant in the Silurian and Carboniferous, and by the close of the Paleozoic Age had become almost entirely extinct. The more complex ammonites, on the other hand, reached their full development only during the Mesozoic Age. The shell of the pearly or chambered nautilus, described below, is typical of the armature of the group. It is at first simple, but as the animal grows becomes coiled in a spiral and divided by internal transverse septa into a succession of chambers, the last one of which is occupied by the animal. This process is continued until about 36 chambers have been formed, and are filled with gas which gives a certain buoyancy, but does not enable the animal to come to the surface. Externally the shell is porous; internally is a layer of mother-of-pearl. The septa are perforated by an opening through which a membranous tube or siphuncle passes from the posterior end of the animal to the apical or first chamber of the spire. Among other anatomical peculiarities the animal has four gills and four kidneys, calcareous instead of horny beaks, a funnel composed of two lobes instead of one tube, small stalked imperfect eyes and no ink bag. Quite unique are the tentacles, which number about 90. On each side of the head are a hood tentacle, two ocellar tentacles and 17 branchial tentacles spread around the mouth four groups of 12 or 13 labial tentacles.

The best-known species is Nautilus pompilius, which, with two others, inhabits the Indian Ocean and tropical parts of the Atlantic. They live exclusively on or near the bottom in relatively deep waters, are gregarious, more or less migratory and nocturnal. Although fond of any animal matter, they feed chiefly on prawns. In swimming they dart quickly backward for short distances, with the tentacles either radiating or held together and stiffly projecting from the mouth of the shell; but they are inactive and rest most of the time on the bottom. Little is known of their breeding, which is supposed to take place in deep holes. The eggs are very large; including the capsule they measure nearly one and a half by three-fourth inches. They are attached singly by the base, and the capsule is irregularly folded and fenestrated longitudinally in a most peculiar manner. This species is very abundant in about 60 fathoms of water in the Philippines, and large numbers are captured by the fishermen in bamboo fish traps or baskets constructed on the principle of the lobster pot, and are used on the Bay of England coast and baited with any kind of animal offal. The shells are somewhat used in the arts, but the flesh is little esteemed for food, as is that of the native species by the

pean countries, especially England, France and Belgium, have for many years conducted success fully such institutions. In the last few years Japan, Brazil and the Argentine republic have also developed institutions for this purpose.

In the United States, although there have been but three practical nautical schools for this purpose viz., the New York State Nautical School, the Massachusetts Nautical School and the Pennsylvania Nautical School, they were all of very high order. The schools were maintained on sea-going vessels, usually all sail-rigged with auxiliary power. The course embraced two years and included cruising to foreign waters. During the winter time, when the school-ships were moored at the wharves, theoretical instructions were given and the routine was somewhat similar to a school ashore, but during the summer months practical training under actual conditions prevailed at sea. As given and every operation of the ship was combined with intensive study for the purpose of enabling the cadets to obtain proficiency.

Upon graduation from either the New York State Nautical School or the Massachusetts Nautical School (the Pennsylvania Nautical School having been discontinued some years back) the cadet is entitled to apply for a third officer's or third assistant engineer's certificate. After three months' service at sea he can obtain a second officer's license; after another year's service as second officer on deck he can get his license as first officer, and a year thereafter he can qualify for his master's license.

The coming development of the American Merchant Marine will necessitate an expansion of the nautical school idea in order to enable it to meet the demand for trained personnel. During the war emergency dire necessity caused the Shipping Board to inaugurate emergency schools for the hasty training of officers and engineers, which at the time served to meet the paralyzing deficiency then existent. The Shipping Board schools provided for three months' study, and could in no way be compared in the thoroughness of the education provided by such institutions as, for instance, the New York State Nautical School, which latter has been in existence since 1876.

The success of the New York State Nautical School, as well as the Massachusetts Nautical School, as reflected by services rendered by their graduates in all branches of the Merchant and Naval Service during the World War has impelled, among others, the States of Oregon, California and Maine to establish similar schools to be conducted under the supervision of the State Board of Education.
Fiji Islanders. Consult Willey, 'Zoological Results' (Part VI, Cambridge 1902), and Lacaze-Duthier, 'Arch. Zoologique Experimentale' (1892).

The *paper nautilus* is a very different animal, for which see ARCOAULT.

NAUTILUS, in hydraulic engineering, a device (U. S. v.), requiring no suspension. Water admitted through the cock into pipes flows into the exterior chambers, causing the apparatus to sink. The workmen enter through an aperture at the top, closed by an air-tight cover, and can in any required direction by stepping on the ground and pushing. Air is condensed in a reservoir at the surface to a degree somewhat greater than the condensation due to the depth, and passes through a pipe into the chambers several times, so as to make the machine specifically lighter than water and enabling it to lift stones or other objects below. A gauge indicates the amount of lifting power attained as the air is admitted.

NAUVOO, na-voov, Ill., city in Hancock County, on the Mississippi River, about 50 miles N.W. of Carthage, Iowa. It is situated in an agricultural and fruit-growing region in which grapes and berries are the chief products. The principal industries are connected with the manufacturing of wine and the shipping of wine and fruits. It is the seat of Saint Mary's Academy (R. C.). Nauvoo was founded by the Mormons (q.v.) in 1840, and in 1846 it had a population of 15,000. It had mills, factories, stores, schools, etc. Its most conspicuous building was a temple built of white limestone, 150 feet long and 90 feet wide. The temple was not completed when the Mormons were expelled in 1846; in 1848 it was partially destroyed by fire, and in 1850 it was further ruined by a tornado. A company of French Socialists, called Icarions, took possession of Nauvoo in 1850 and remained until 1857. The *Nauvoo Legion*, a Mormon military organization, which embraced all the boys and men between the ages of 16 and 50, was founded here in 1840, and in 1857 was reorganized in Utah. At the last muster, in 1879, it had a membership of 13,000. Pop. 1,020.

NAVA, nā'nā', a seaport of Japan. See NAPA.

NAVAJO (nā'vā-hō') CHURCH. This name is given to a remarkable spire of white sandstone rising from the top of the red cliffs just west of the continental divide a short distance east of Gallup, N. Mex. It is visible for several miles from Santa Fé Railroad near Wingate station.

NAVAJO INDIANS. An important tribe of the Athapascan stock of Indians, now on a reservation of about 9,503,763 acres in northeastern Arizona, northwestern New Mexico, and southeastern Utah, at an average elevation of 4,000 feet above sea-level. According to Fray Alonso Benavides (1630), the word *Navajo* means *sementeras grandes,* "great planted fields,* and the name was never applied to the Navajo by themselves, their own tribal designation being *Dine.* There is no evidence that the Navajos were ever seen by the Spanish explorers of the Southwest in the 16th century, although the latter passed through their present territory in 1540, 1583 and 1598; it is therefore believed that at this early period they were an insignificant agricultural tribe, but gradually increased in population largely through the adoption of natives of both allied and other stocks during succeeding years. Their territory is entirely within the arid region and their lands are chiefly desert; but in the canyons and about the bases of the mesas that abound in their territory, horticulture is practised through deep planting in the sandy soil, while in the valley of the Río San Juan, which is the largest stream in their country, farming is carried on to a greater extent. Agriculture, however, forms but a meagre part of the Navajo's subsistence, his livelihood being gained principally from the flocks and herds, of which, in 1902, there were 380,000 sheep and 67,000 goats, the formers of which, besides furnishing the chief food supply, netted $150,000 in wool and blankets. These blankets, which have become celebrated, are woven by the women on simple looms and in pleasing and sometimes intricate designs of various colors. Food for the dyes of rare delicacy of tone were employed, but in recent years these have given way to glairing aniline colors, and the decorative patterns have also been largely modified to meet the demands of the white man, so that as specimens of aboriginal handwork many Navajo blankets now woven are comparable with those formerly made. The Navajos also weave belts, garters and saddle-girths, and make a few excellent baskets, mostly for ceremonial use. Some of the men are expert silversmiths. Although more closely related in language to the Apaches than to any other tribe, the Navajos are greatly mixed, embodying elements of Pueblo, Shoshonean, Yuman and even of Spanish blood; hence there is perhaps a greater variety in their physical features than among most Indian tribes.

The typical Navajo dwelling is a conical framework of logs or sticks covered with brush, bark or grass, and earth, with a smoke-hole at the apex and a doorway in one side. Rude shelters with open fronts are used in summer. If a person dies in a house the latter is believed to become haunted and is henceforth tabooed.

Dr. Washington Matthews, United States army, who has studied the inner life of the tribe, discovered the existence of 51 clans grouped into about a dozen phratries, which latter, however, are probably not homogeneous organizations as among some Indians. A Navajo belongs to the clan of his mother, and a man may not marry a woman belonging to his own clan; or, as a rule, one of his own phratrie. The religion of the Navajo is elaborate and complicated. They have a great many ceremonies, most of which are performed for healing the sick, but others are conducted to ensure success in planting, harvesting, building, war, nubility, marriage, travel and for bringing rain. Sacrifice, elaborate dry paintings with sand and pigments, masquerade, dancing, prayer and song are the elements of the ceremonies, the gods being personated by the masked performers.

Almost from the beginning of the 17th century the Navajos were enemies of the sedentary tribes and of the Spanish colonists, and although they were never so predatory and warlike as their Apache cousins, the Spanish villages and
Pueblo settlements suffered almost continuously from their raids up to the time of the conquest of New Mexico by American forces in 1846, followed by the establishment of military posts throughout the Southwest. Treaties were made with them, but in 1848, a number of them were no avail in keeping in check their depredations, which continued at intervals until 1888, expeditions meanwhile being led against them. In the year last named the Navajos killed a negro servant at Fort Defiance, as they did in 1877, but it became necessary to wage warfare against the Indians from August until December, during which 50 Navajos were killed and a large number of sheep and other stock lost. Another treaty was signed, but during 1880 the depredations continued, and another expedition was led against them, but without success. In April the natives boldly attacked Fort Defiance, but were repulsed. In the winter of 1860-61 an active campaign was made against them, and although practically their only loss was in sheep, they later were compelled to sue for peace in February 1861, when an armistice of a year was agreed to, during which the troops were withdrawn. In a dispute over a horserace at Fort Fauntleroy (near the present Fort Wingate, New Mexico), a dozen Navajos were brutally killed. Emboldened by the withdrawal of the troops on account of the Civil War, the Indians resumed their raids, which they continued almost uninterrupted until 1871, when Col. Christopher ('Kit') Carson began operations against them and a plan was formulated to transfer the Navajos from their old haunts to Fort Sumner, at the Bosque Redondo, on the Pecos River, in eastern New Mexico. It was determined that all who refused to go after 20 July would be regarded as hostile and be treated accordingly. By the close of the year 200 prisoners were at Fort Sumner or on the way thither. Early in 1874 Carson made a campaign to the Cañon de Chelly, in the heart of the Navajo country in northeastern Arizona, where he killed 29 and captured over 200 of the Indians. In 1880, 47,000 acres under cultivation, which yielded 1,200 bushels of wheat, 700 bushels of oats, etc., and 3,000 bushels of corn. They earned in addition a quarter of a million dollars by the product of their labor, and besides the sheep and goats above mentioned owned 47,200 horses, mules and burros, and 8,000 cattle. There are also four sectarian missions and two mission schools on or near the reservation. In 1890 a partial census showed 17,204 Navajos; that of 1900, over 20,000; and a rough estimate of the Indian office in 1906, over 28,500. Since then the tribe is believed to have increased.

NAVAJO MOUNTAIN.—A prominent peak rising high above the Arizona Plateau in the extreme southern part of San Juan County, Utah. Its altitude is 10,416 feet. It has rarely been ascended by white men. It is a short distance south of the rim of Glen Canyon of the Colorado River and from its summit a great view is obtained of the upper Grand Canyon region, the Henry Mountains, the Vermilion Cliffs and other features of the high plateaus. It is forest clad, several springs issue from its sides and in its north slope are the great Rainbow and Owl natural bridges. The mountain is due to a dome-shaped upfold of the sedimentary rocks and the top is capped by Dakota sandstone. Consult Gregory, H. E. (in United States Geological Survey, Water Supply Paper 380, and professional paper 93).

NAVAL ACADEMY, United States, the most important naval school in America, established at Annapolis, Md., in 1845, by a special act of the Congress. The origin of this technical educational institution was due primarily to the efforts of George Bancroft, Secretary of the Navy. The academy was opened 10 Oct. 1845, with Commander Franklin Buchanan as superintendent. Prior to time during the Civil War the school was removed from Annapolis to Newport, R. I. The Bureau of Navigation of the Navy Department has direct supervision of the academy.

Admission of Students.—There are received at the academy three midshipmen for each senator, member or delegate of the United States House of Representatives, two for the District of Columbia and 15 at large. The appointment of midshipmen at large and for the District of Columbia is made by the President. In addition to the above the law authorizes the appointment of 25 enlisted men each year to be selected as a result of a competitive examination of enlisted men of the navy and marine corps who have been in the service at least one year and who are under 20 years of age by 15 August of the year in which he desires to enter. The mental and physical requirements for these candidates are the same as for other candidates for midshipmen. One midshipman is also allowed from Porto Rico, who must be
a native of that island. The appointment is made by the President on the recommendation of the governor of Porto Rico. The Secretary of the navy, as soon after 1 June in each year as possible, must notify in writing each senator, representative, and delegate in Congress of any vacancy that may exist in his district. The nomination of a candidate to fill the vacancy is made on the recommendation of the member or delegate by the secretary. Candidates must be actual residents of the districts from which they are nominated. They enter the academy immediately after passing the prescribed examinations and are required to sign articles binding themselves to serve in the United States navy eight years (including the time of probation at the Naval Academy), unless sooner discharged. All candidates are required to be citizens of the United States and must at the time of their examination for admission between the ages of 16 and 20 years. A candidate is eligible for examination on the day he becomes 16 and is ineligible on the day he becomes 21 years of age. The pay of a midshipman is $600 a year, beginning at the date of admission. The course for midshipmen is four years. Examinations on the ground covered are held at the end of each academic term. During the second and third classes go to sea for about three months. Midshipmen after graduation are commissioned as ensigns in the navy and occasionally to fill vacancies in the marine corps and in certain of the staff corps of the navy.

The Course of Study.—When a midshipman graduates he must be a seaman, an engineer, a true marine engineer, well acquainted with steam, electricity and ordnance, and a navigator and surveyor and he must have a fair knowledge of his own language with some acquaintance with French and Spanish. To achieve this in four years he must be well grounded in the rudiments; he must have good health and he must work hard. The course must be progressive and the instructors competent and in sufficient numbers to be able to instruct—not merely to examine and hear lessons. Even then the work of studying would be too hard for the average youth were it not for the fact that much of the practical work is good out-of-door exercise and the hard brain work is well-balanced with plenty of physical exercise and healthy amusement. The instruction for the fourth class, that is for the first year, completes the study of algebra and includes trigonometry and descriptive geometry. In English it includes rhetoric and something of the art of writing English and also public speaking. French and Spanish and mechanical drawing are begun. It is a necessity for a naval officer to be able to read a drawing and to make a good working sketch. The naval architect, the marine engineer and the ordnance engineer has each his special methods in drawing with which the midshipman must become familiar. Accordingly he starts drawing with the beginning of his course. All his professional work during this year is practical and is given him during the drill period. The academic year begins on 1 October and closes about 1 June; then comes the practice cruise, which is devoted almost entirely to practice professional work with some little study of the theory of professional subjects. The cruise ends about 1 September when the midshipmen have a month's leave to visit their homes. Academic life begins again on 1 October. During the third-class year the midshipmen complete their study of geometry and algebra and with the exception of mechanics, a branch of applied mathematics, which is studied during the first term of the succeeding year. They have trigonometry, analytic geometry, conic sections, differential and integral calculus. In English they study naval history and constitutional law. They continue the study of French and Spanish and mechanical drawing and take up the study of elementary physics and chemistry. Their practical work is continued during the drill period and on the practice cruise at the end of the academic year.

Second Class Men.—After the month's leave they take up their life at the academy as second-class men and begin to take up the study of professional subjects. In the department of mathematics they study algebra, geometry, and hydromechanics. They continue the study of English, French and Spanish and begin the study of ordnance, navigation and electricity and magnetism and lay the foundation for engineering in studying the principles of mechanism with marine engines and boilers. The practical work continues during the drill period and has advanced progressively so that the midshipmen are well prepared for the professional subjects of this and the following year. This is their last practice cruise and by far the most important one, as they are now carefully instructed in their duties as officers. They are required to perform the work of officers at sea in handling the ship and managing the motive power, both steam and sail. They must work hard at practical navigation with instruments and charts. In their last year as first-class men they continue the study of French and Spanish, while the periods assigned to English are devoted to public speaking and during the first term they have a course in physiology and hygiene. All other studies are professional. They have seamanship and naval tactics, ordnance and gunnery, navigation, compass deviations and surveying, engineering materials, designing and naval construction and electrical engineering. The practical work goes hand in hand with the theoretical during the drill period. The first class are the officers of the regiment of midshipmen and under supervision perform much of the work of officers.

Athletics.—To discuss the training of midshipmen at the Naval Academy without mentioning athletics would be to leave out a most important factor in their character training. Boating, football, baseball, fencing, track athletics and gymnasium work are all encouraged. The various competitive games are a source of amusement to all and of healthy exercise to many. Courage and skill are gained and self-denial must be practised by those who train for the various sports and athletics furnishes one of the most important aids in training a youth to become an officer.

Academy Buildings.—In 1895 was commenced a new and improved plan of construction and reorganization of the school buildings
Apparatus for Indoor Training in Handling a Full-rigged Ship
Apparatus for Indoor Training in Handling a Full-rigged Ship
at Annapolis. The new buildings are largely
due to the efforts of two men — the super-
tendent at that time, Capt. Philip H. Cooper,
now rear-admiral, and Col. R. M. Thompson,
who graduated in 1866 and was in 1895 a mem-
ber of the board of visitors. The board rec-
commended the rebuilding of the Naval Acad-
emy and the energy of these two men pressed
the scheme upon the government. The depart-
ment was induced to order a board to consider
and report upon the matter. The necessary build-
ing and Colonel Thompson persuaded the New York architect, Ernest
Flagg, to consult with the board and with Cap-
tain Cooper. A set of artistic plans resulted,
recommended by the board and approved by
the department. But the Spanish War inter-
f ered and it was not till 1898 that an approp-
riation became available and the cornerstone
of the new armory was laid by Rear-Adm.
F. V. McNair, who had succeeded Captain
Cooper as superintendent. The plan as viewed
from the sea front shows the midshipmen's
quarters extending 729 feet, flanked on one
side by the armory and on the other by the
gymnasium. These buildings are at right angles
to the direction of the midshipmen's quarters,
are 429 feet long and similar in appearance.
They are connected by colonnades with the
quarters. This gives from the sea a harmonious
group of buildings extending in a northeast
and southwest direction for 1,278 feet with the
high roof of the main building of the midship-
men's quarters as a centre. Thirteen hundred
feet in a northwest direction, with the main
line of buildings parallel to and facing the first
group, is the academic building with the chem-
istry and marine engineering buildings on either
flank and with the high roof of the academic
building in the centre and balancing the group
to the southeast. Between these two groups,
facing the Severn River and forming the west
side of the rectangle, is the chapel with the
superintendent's house and the administration
building on either side. The fourth side of the
rectangle is formed by the basin. From the
steps of this basin and facing the chapel is the
best view. On either hand is a handsome group
of buildings with the dome of the chapel as the
core. The new buildings involved an out-
lay of approximately $10,000,000.

NAVAL AERONAUTICS. The impor-
tance of the aeroplane in naval warfare is great
and varied. It is most useful in scouting, in
locating and bombing enemy ships and sub-
maries and in spotting gunfire (observation
of the fall of the shots). A squadron of battle
cruisers with guns of large calibre, whose fire
is controlled by aeroplanes, can defeat an equal
or greater number of dreadnoughts that are
without this means of fire control. While the
military aeroplane made great advancement in
efficiency during the European War of 1914-18,
comparatively little progress was made in the
design of naval aeroplanes and in the develop-
ment of their tactics. This was evidently due
to the fact that nearly all the air operations
took place over land and when over sea in loc-
talities where rain came from smooth
water. Real naval aeroplanes must be of the
types that can operate from floating bases far
from smooth water. The first problem in naval
aviation is, obviously, getting into the air and
the hydro-aeroplane, or aeroplane that starts
and finishes its flight on water, cannot get into
the air unless the water is considerably
smoother than in average conditions on the
open sea. Hydro-aeroplanes must attain an air
speed on the surface of the sea which is equal to
the flying speed limit before they can have suffi-
cient lift to get into the air under control, this
speed for the various types ranging from 40 to
60 miles per hour. With satisfactory means of
getting into the air, the next problem is to get
assured in nearly all kinds of weather; but, if
flights must originate from the surface of water
then the naval aeroplane becomes a fair
weather apparatus having but little naval value
except in operations near the coast. In naval
aviation the problem of finishing the flight is not
as difficult as that of getting into the air and
is of much less importance.

For work with a fleet three types of aero-
planes are usually required — the high speed
fighting aeroplane, the medium speed torpedo-
carrying aeroplane and the slow-speed spotting
aeroplane. The high-speed fighting aeroplane
is a machine with a maximum speed of about
100 miles per hour, carrying one or more guns
for attack on other aeroplanes and bombs for
attack on dirigibles; it is a fast climber and is
designed with little stability so as to be sensitive
in its control and thus have good maneuvring
qualities. The principal duties of this machine
are to protect the torpedo carriers and spotting
aeroplanes, to attack enemy torpedo carriers
and spotting machines and to destroy or drive
in the enemy's air scouts and dirigibles. On
account of its high speed this machine has only
a small radius of action when carrying the pilot
and observer. On special occasions it can be
used as a one-seat machine either to increase
climbing ability or to increase its radius of
action. The medium-speed torpedo-carrying
aeroplane is a machine with a maximum speed
of about 80 miles per hour, designed primarily
to carry a torpedo or an equivalent weight
(abou t 1,800 pounds) of high explosive bombs.
It has only a small radius of action, either
spotting its torpedo or when loaded with bombs,
but without these weights it can take on an equiva-
 lent weight of fuel and thus add five or six
hours to its cruising radius. The principal duty
of this type is torpedo attack on the enemy's
battle fleet or troop ships, a function of the
naval aeroplane that deserves a most important
consideration in naval battle tactics. Aerop-
planes of this type must have proper escorts of
fighting machines to counteract the enemy's
best means of defense or attack by his aircraft.
This type when carrying extra fuel instead of
its torpedo or bombs can be used for scouting
and in this condition must be armed for pro-
tection in case of a possible contact with the
fighting types of the enemy. The slow-speed
spotting machine is a machine with a maximum
speed of about 60 miles per hour. Its chief
duty is spotting for control of gunfire and for
this reason provides for long endurance and
consequent slow speed. This type of aeroplane
is most important in naval operations because
local long-range firing is absolutely necessary
to control fire by spotting. The

na naval range is inaccurate at long ranges and
even when the exact distance of the target is
known there are disagreements in the sight

bar ranges and actual ranges that must be corrected by spotting observations, these disagreements increasing with the range. When ships are matched in speed and gun-power, those having aeroplane fire control have a positive advantage over those firing from the tops. This type of aeroplane, and especially the medium-speed torpedo-carrying type, perform the important duty of patrolling the fleet when cruising in war time. On this duty some of the machines carry bombs and guns for attack on submarines.

During the European War airships were used most effectively by the navies in scouting work, locating mine fields, discovering submarines and communicating information to their own vessels either by signal or by radio. Airships are remarkable scouts and under ordinary conditions, in a few hours, can explore an immense horizon and inform surface warships by radio as to conditions for miles around. A fleet covered by a sufficiently large fleet of such scouts is practically certain of avoiding surprise from a hostile or superior force. As to effectiveness the airship has a great advantage over the aeroplane in long-sustained flights, especially over sea. The aeroplane must land immediately in case of a mishap such as a stalled engine, a fractured propeller blade, etc., while an airship, on the contrary, can remain afloat and make repairs. Every well-balanced fleet should include a fleet of airships. In the European War when it became necessary to build up a system of protection against submarines, the warning nations pressed into service thousands of small vessels, destroyers, trawlers and submarine chasers; and as fast as they could obtain them they put into service seaplanes and dirigibles to co-operate with the ships in locating and capturing and destroying submarines and in convoying ships, protecting them from submarine attacks. The usual evidence of the submarine's presence is the wake of the periscope. This wake cannot easily be seen from ships, but can always be clearly seen from airplanes. For one thing the wake is not the reflection of the image on the ends of the rays of light which interfere with the vision of the person on a ship. The aviator, flying at a height of from 1,000 to 5,000 feet, has a range of vision of many miles and the whitish wake of the periscope is clearly visible against the dark surface of the waters even in cases where the sea is fairly rough and white caps are showing. Whatever the future development may be, the basis of any air service is its use as an eyeservice, both visual by day and by night and photographic infantry liaison and artillery adjustment. A squadron of airplanes of this type must be provided for every divisional corps staff and army staff. The plans announced call for coast defense squadrons and observation and bombing squadrons. In as much as the coast defense squadrons under army control are not expected to operate far beyond the range of the coast defense guns, all work further at sea is the duty of the navy. It is impossible to develop a comprehensive and effective system of submarine warfare unless there are material and personnel sufficient to permit working with the fleet in large groups. These and many other problems must be worked out in peace time and the personnel carefully drilled, especially in the co-ordinating features of their work. Because of the high speeds and the great number of units dealt with in naval aeronautics, there is no branch or department of service work where thorough co-ordination is more vital to success. The art of flying is a comparatively insignificant part of a naval aviator's attainments. When in command of an aeroplane he must not only be an expert flyer but he must also be well versed in the whole subject of naval aviation tactics as well as being an expert seaman and navigator. See *Aeronautics, History of; Aeroplane; Military Aeronautics*.

Edward S. Farrow,
Consulting Military and Civil Engineer.

**NAVAL ARCHITECTS AND MARINE ENGINEERS**, Society of. The Society of Naval Architects and Marine Engineers was organized under the laws of the State of New York 10 May 1893, its object being the promotion of the art of shipbuilding, commercial and naval. In furtherance of this object special meetings are held for the reading and discussion of appropriate papers and interchange of professional ideas, thus making it possible to combine the results of experience and research on the part of shipbuilders, marine engineers, naval officers, yachtsmen and those skilled in producing the material from which ships are built and equipped. Annual meetings have been held each year since the organization of the Society, the 25th annual meeting being held this year 15 and 16 November. Members of membership consist of members, associates, juniors, honorary members and honorary associates and benefactors and permanent members. Its membership comprises all the leading naval architects and marine engineers in the United States as well as the other leading countries of the world. The papers and discussion are combined in volumes which are forwarded to the members as part of their membership as soon as they are compiled and edited. These volumes comprise valuable books of reference and are also on the shelves of all the leading libraries in this country.

**NAVAL ARCHITECTURE** deals with the designing and development of the nautical qualities of ships as distinguished from their construction, which belongs to shipbuilding. The existence of naval architecture as an art probably dates back to the first development of man, but its elevation into a science can scarcely be recognized until the 19th century, as a part of the advance in all mechanical sciences during that period. During the 19th century, and even earlier, some Continental mathematicians had devoted attention to the subject and developed various theorems concerning floating bodies which were likewise applicable to ships. Throughout this period the French were the acknowledged leaders in the development of knowledge relating to such matters. So much was this the case that it seems to have been not unusual for other countries to reproduce the models of French men-of-war, thereby admiring the excellence of the French type and paying deserved tribute to the labors of the naval architects of that country.

Perhaps the most notable attempt, however, to place naval architecture upon a logical and
scientific basis, prior to 1800, was that of the famed seventeenth-century naval architect Chapman (1721–1808) who, during his long career, achieved special eminence in his profession and wrote a number of treatises relating to various features of naval architecture. One hundred years ago each nation, and, indeed, each master builder, carried on his own experiments in the methods and theories pertaining to the science of naval architecture, which had been deduced from experience or which had been handed down by those who had conducted previous investigations. This state of affairs, in which confusion prevailed throughout the world, was changed by the establishment in the 19th century, of the rapid development of iron shipbuilding, which started about the middle of that century, came a rapid advance in naval architecture and the dissemination of knowledge upon the subject, until, to-day, in the leading shipbuilding countries of the world, the principles of naval architecture are taught in schools devoted to this subject: and the products of the naval architect's skill differ only in comparatively minor respects, whether turned out from British, European, American or Japanese yards.

The primary object of the vast majority of all ships is to-day, as throughout the past, transportation, and the problem is only affected in its details in order to conform to the requirements of the articles carried, be they men, merchandise, or in the case of men-of-war, armament and other appliances for rendering the vessel efficient as a fighting machine. The foregoing statement is quite as true of the humble 10-knot collier, which will carry in coal twice the weight of her hull, machinery and outfit, as of the transatlantic passenger liner, which carries a comparatively small amount of cargo but a large quantity of bunker coal to enable it to make a high speed, and provides luxurious accommodations for numerous passengers. It is true also of the man-of-war which carries a proportionately large crew and a fair amount of cargo in the shape of consumable stores, coal and ammunition, besides a considerable weight of armor, heavy armament, and the necessary military adjuncts required by the duty to which the ship is devoted. Considering, then, all ships as bearers of burdens, there are two essential characteristics which they must show: They must be able to go from point to point at an appropriate speed and with all reasonable safety for ship, cargo and crew. Ability to keep the sea under all the usual conditions of its intended service is indispensable for every ship, and we will now consider briefly the detailed factors entering into the problem.

Buoyancy.—When a ship is entirely waterborne, the weight of water which it displaces is exactly equal to the weight of the ship itself and everything contained in it. To float at all, the volume of the enveloping surface of the ship must be greater than the volume of water which equals in weight the displacement of the ship. The buoyancy, then, be that margin, or reserve of buoyancy, in the ship over and above the buoyancy equal to its weight. The percentage of reserve buoyancy varies widely according to the type of vessel, passing from approximately zero in the case of diving, or submarine boats (where the condition to stability is so great as to allow only small movements under the consequent distribution of buoyant forces of passenger vessels with large deck areas and high sides. In certain types of men-of-war, notably the large cruiser class, the percentage of reserve buoyancy is also very high. In the case of men-of-war, the reserve buoyancy is practically fixed by the design; but, in the case of merchant vessels, and particularly cargo carriers, which are not so severely restricted as to admit the maximum amount of reserve buoyancy, the reserve buoyancy is now practically determined by the marine insurance companies. The business of insuring ships and their cargoes is a large and important one, but is carried on by a comparatively small number of very powerful companies or associations, and these companies, for their own protection, have a well-equipped scientific and technical staff and have prescribed conditions affecting the safety, or seaworthiness, of ships, which must be complied with in order to obtain insurance at a reasonable rate. In England, the Board of Trade, which is the department of the government charged with authority over matters relating to shipping, has acted in conjunction with the large insurance companies in laying down requirements for reserve buoyancy, these authorities being further assisted by representatives of the national associations of naval architects. The actual amount of reserve buoyancy required varies somewhat with the size and type of vessel, and likewise with the character of the service, the maximum amount being required for vessels engaged in winter service in the north Atlantic Ocean. Speaking broadly, the objects aimed at in the load-line requirements are to obtain the greatest possible carrying capacity, compatible with safety of the vessel under all conditions of weather, after making provision for minor casualties which might still further reduce the reserve of buoyancy.

Structural Strength.—Buoyancy, however, is not the only requirement for seaworthiness of a ship. It is essential that the ship should be strong enough to withstand the stresses due to the action of the waves. In this direction, also, the insurance companies have taken a prominent position, and laid down minimum requirements acceptable for merchant vessels. Strength is obtained not only by the use of materials but by the disposition of the material used in such manner as to best accomplish the desired results. The methods used in determining the strength of ships are very similar to those used in determining the strength of other structures, such as bridges, but there is an essential difference due to the fact that it is practically impossible to determine the maximum load to which a ship may be subjected. It is comparatively easy to calculate the strength of the hull structure, knowing the disposition of the weights and buoyancy of the vessel. The stresses upon each part of the vessel's structure, when floating in still water, may be determined with accuracy; but the maximum stress will occur, not in still water, but among waves, and while we know that, whatever the motion of the sea, the buoyancy of a ship must equal the total weight of the vessel and its contents (subject to minor corrections due to the dynamic effect of the motions of the ship itself), it is obviously impossible to foresee the possible combinations and contours of waves to whose action a vessel is subjected, and the consequent distribution of buoyant forces
and structural stresses. Hence, the naval architect, in determining the structural requirements of a ship so far as they affect its strength, must be guided largely by experience. If he provides strength equal or superior to that of ships of the same type and not very dissimilar in size, which have shown good results in service, he has reasonable assurance that he is safe. But, when dealing with vessels of a novel type or size beyond precedent, the skill and judgment of the designer are taxed to the utmost to accurately estimate in advance and provide against the maximum stresses that may occur in service. In this respect also, the accumulated experience of the marine insurance societies has been of great value in determining adequate strength associated with weight of structure which is not excessive, and which will permit a maximum development of carrying and other desirable qualities. The natural tendency of such societies, however, is to make sure of adequate strength, necessarily giving to weight and cost merely secondary consideration; so that whenever a novel type is put forth, it is apt to be the subject of discussion and unsettlement. The builders and owners naturally desire to provide only the minimum strength necessary, in their judgment, for complete seaworthiness, while from the point of view of the insurer, if any error is made it should be in favor of the ship of excessive strength. As the results of experience accumulate, these questions adjust themselves, but with the rapid development in the size of ships, and the variations in types which have been witnessed since the last quarter of the 19th century, shipbuilders and the insurance societies have not been entirely in accord on such questions.

Stability.—In addition to the elements of adequate buoyancy and strength, there must be considered an equally important factor in the seaworthiness of the vessel,—namely, stability. This quality is all-important in rendering the vessel safe and enabling it to resist the capsizing effect of wind and waves. The stability problems which must be solved by the naval architect are practically peculiar to his profession. Safeguarding against the effort required to heel the ship, and hence the range of stability may be made less with safety. In practice, with any type of ship the range of stability can seldom be safely made less than 50 degrees, and, in the majority of cases, should be much more. It is frequently over 100 degrees for vessels of high freeboard. For safety alone, it is not always necessary that, initially, when in the upright position, the metacentre should be above the centre of gravity. If the metacentre is slightly below the centre of gravity, the vessel will heel over a few degrees to one side or the other until it reaches an inclination at which the metacentre rises above the centre of gravity and the vessel becomes stable again; if the freeboard of the vessel is high and the range of stability is great, such a vessel may be perfectly safe. Several of the large trans-Atlantic liners are purposely designed with comparatively small initial metacentric height, as such a condition permits the vessel to respond less quickly to wave action and causes easy and slow rolling.

Rolling.—Closely associated with the question of stability is the question of rolling or pitching of a seaway. When a vessel is floating in disturbed water the effect is to change the relative loca-
NAVAL ARCHITECTURE

synchronism between the period of the roll and that of the wave. The naval architect, however, in the original designs of the vessel calculates the resistance of the water and provides "bilge" or "rolling keels," which aid materially in preventing heavy rolling. Bilge keels are projections at the bilge of the ship, approximately from one to three feet in depth, and extending usually for about half the length of the vessel and so situated when practicable as to offer maximum resistance to rolling. When properly fitted, bilge keels will often reduce the maximum angle of rolling, under adverse conditions, to less than half what it would be without them.

Speed and Resistance of Ships.—It has already been pointed out that an essential characteristic of all ships is mobility. The speed of a ship is a simple, concrete fact, readily appreciated by anyone and comparable with the speed of other ships; therefore, in many cases, it is considered the most conspicuous and important quality of a ship, whether man-of-war or passenger steamer. The keen interest taken by the general public in the speed records of passenger steamers engaged in trans-oceanic service fully illustrates this fact. The present accepted methods of determining the power necessary to drive a given ship at a given speed, and, conversely, the form of ship best adapted to be driven by a given power, are of comparatively recent development and largely due to the late William Froude, who, through an elaborate series of experiments, established the truth of the fundamental laws upon which are based the present theories of the resistance of ships. The resistance of a given ship, moving at a given speed, is made up of three main factors: first, the skin friction of the water on the surface of the ship. This is dependent only upon the surface exposed and the speed of the ship. It varies slightly with variation of form, due to this variation affecting the velocity of the water over the hull, but this variation is too slight to be taken account of in practice. The second element of resistance is what is called "wave-making resistance," due to the fact that a ship in moving through water produces waves and the force required to produce these waves proportionately reduces the power available for propulsion and thus, in effect, increases the resistance to the motion of the ship. The third element is what is called "eddy making," due to eddies of the water behind square corners of the hull and attachments, such as stern-post, propeller struts, etc. The eddy-making resistance is, however, comparatively small. The skin frictional resistance of a ship can be readily calculated with sufficient accuracy from the results of experiments upon the friction of plane surfaces drawn through water at known speeds. Mr. Froude demonstrated that the remaining resistances (wave and eddy making) of a full-sized ship could be estimated with great accuracy from a careful determination of similar resistances experienced by a small model of a ship when towed at a speed corresponding to the desired speed of the ship, the corresponding speeds of model and ship being in the ratio of the square roots of their linear dimensions. For a ship 500 feet in length, and a small model 20 feet long, the ratio of linear dimensions is 25:1, so that the actual speed of the model corresponding to 20
NAVAL ARCHITECTURE

knots for the ship, would be $20 + \sqrt{25}$, or four knots. By model experiments, also, it is com-
prehensive the general effect of changes in shape and dimensions of vessels without having recourse to experiments with full-sized ships. The principles applied in passing from models to full-sized ships were also applied by Mr. Froude in passing from one full-sized ship to another,—being quite applicable if the two ships are similar, and applicable with fair approximation if the two ships are reasonably similar in proportions and shape.

Model Basins.—Experimental model basins are now found in nearly all shipbuilding coun-
tries. That of the United States is located at Washington. It is about 500 feet long, and, at its maximum section, the water is about 42 feet wide and 14 feet deep. Wooden models 20 feet long, made by special machinery, are used in this experimental work, the model being towed back and forth through the water by an elec-
trically-actuated carriage which spans the basin. When erected in 1893, this was the largest ex-
perimental basin in the United States. Later experimental basins built in Germany, however, are somewhat longer but not so deep or wide. From data obtained with models towed in the experimental basin, the effective horse power, as it is called, necessary to tow the full-sized ship without engines, is determined with great accuracy. It is therefore necessary to establish, from actual trials, the relationship between this effective horse power and the indicated horse power which the ship's engines must exert. This ratio depends upon the friction of machinery, efficiency of propellers and to some extent upon the shape of the stern of the ship and other minor factors; it is found, in practice, that it ranges from .50 to .60, although there is seldom reason why it should not be made as great as .55, a lower value being usually due to mistakes in design of hull, unsuitable propellers or some such cause. The tabulated data obtained from ex-
periments with models in the experimental basin, supplemented by progressive trial data taken under actual seagoing conditions, from the full-sized ships, have in recent years greatly aided the naval architect and the engineer in their design work.

Materials Used in Shipbuilding.—As the development of naval architecture has been largely influenced by the materials used in ship construction, brief allusion to these materials seems appropriate. The material used in the construction of ships underwent, broadly speaking, two changes during the 19th century: a change from wood to iron, which dates approximately from about the middle of the century, and a change from iron to mild steel, which dates from about 1880. Wood is still used as material for shipbuilding, many coasting ves-
sels, for instance, in the United States and else-
where being still built of wood; but the number and importance of wooden ships as compared with those of iron and steel is diminishing yearly, and, at the present date, it may be said that the only structural material of importance for the construction of ocean-going ships is steel. Open-hearth steel, suitable for ship-
building purposes, with an ultimate tensile strength of about 60,000 pounds to the square inch and an elongation of an 8-inch specimen of from 20 to 25 per cent before rupture, was introduced between 1870 and 1880. It was practically the general effect of this change that led the United States Navy to adopt steel in 1880. The contractor for the first steel vessels of the new navy, which were contracted for in 1883, had to make special arrangements for the domestic manufacture of the steel needed in his work, and had to pay for it at that time about seven and one-half cents per pound. The growth of the manufacture of this material in the United States since that date, however, has been astonishing, mild steel of nearly the same characteristics as that used for ships being used in large quantities for bridges, houses and other structures, so that, about 1900, its price had fallen as low as one and one-half cents per pound, as compared with seven and one-half cents per pound some 15 years earlier. The qualities of the steel used in shipbuilding vary little in the different ship-
buiding countries, being prescribed, as a rule, for merchant ships, by the marine insurance societies. For men-of-war, a somewhat higher grade of material is prescribed, and the inspec-
tion is rather elaborate. In experimental steel, too expensive for commercial vessels, but very superior for armor plates and guns, gives an added strength of 30 per cent over open hearth steel. It retains its fibrous structure under strains and shocks where carbon steel crystallizes and crumbles. Coincident with the development of iron and steel as materials for shipbuilding, there began to develop an increase in the size of ships, due to the greater strength of the material of construction, and probably also to the fact that the use of steam instead of sails for propulsion made it possible to increase the propulsive steam power of the large ships when it would not have been possible to add correspondingly to their sail area. The tendency toward an increase in size has been very marked since 1885, until now ships have reached sizes and dimensions limited only by the draft of water and the docking and wharf facilities available in the ports to which they trade.

The urgent necessity of quickly replacing the shipping destroyed by the German sub-
marines, while it did not and could not alter the basic principles of naval architecture, called for adaptations which departed widely from the practices of the period preceding the Great War. The lack of shipyard facilities and of highly trained shipbuilders led the men in charge of the government program to enlist the structural iron workers of the country in the great problem of producing ships. The "fabricated ship" thus came into being, designed in such fashion that its parts could be con-
structed by the makers of steel bridges, tanks and frames for skyscrapers. Wherever angles could take the place of familiar bends and curved surfaces the change was made, and quantity tonnage was thus expedited, although the new models were less speedy than the more scientific hulls of former years. The structural shops were able to do much for shearing and bending of the plates, and only the assembling and rivetting and the expert fashioning of bow and stern was done in the shipyards. Another effect of the emergency was the standardization of types of vessels to be built. When the Shipping Board began its work there were many different types of
vessels under construction in the shipyards of the country. The government representatives speedily recognized that much labor was lost in this diffusion of effort and a few types were selected and all agencies concentrated on the utmost possible production of these typical ships. The standard cargo vessel was a single-screw steamer of 9,600 tons deadweight, 395 feet in length, 55 feet molded beam and 34 feet molded depth; the engines, geared turbines of 2,500 horse power, and the fuel, oil. Another type was the combined passenger and cargo vessel, arranged for use as a troopship, carrying 2,700 troops and 7,000 tons of supplies. This type with a displacement of 20,900 tons was 522 feet in length, 62 feet beam and was equipped with twin screws driven by two sets of four-cylinder triple-expansion reciprocating engines. Its speed was 14 knots which could be increased to 15 knots in emergencies. Another selected type was the 10,000-ton oil tanker, 435 feet long and 56 feet beam, equipped with a single screw, triple-expansion engines and oil-burning boilers. A review of wooden ships resulted in the production of 3,600-ton vessels, 286 feet in length and 46 feet beam. A particular type of architectural design gave them the title of Ferris ships, after their designer. While not wholly a development from war conditions the production of the Diesel ships was stimulated by the demand for ocean tonnage, and these, too, were standardized in the interest of rapid multiplication, the selected type being of 9,600 deadweight tons with turbine engines driving twin screws. The compactness of the Diesel engines gave these vessels the advantage of 13 to 14 per cent larger carrying capacity for an equal displacement, and operated with a smaller crew and at a higher comparative speed.

Another architectural development was the reinforced concrete ship, successfully built up to 3,500 tons, and with designs approved up to 7,500 tons. The fact that only $60,000 worth of steel was needed in a 5,000-ton concrete ship as compared with $300,000 worth in an all-steel ship led to earnest effort in the field of reinforced concrete. A special form of concrete lighter than wood and impervious to water was developed by the architects in charge, and the completed ships were found to be unusually free from the vibration commonly associated with wood. Composite ships of wood and steel were also planned and built to meet the emergency caused by the war.

The present state of development of naval architecture is probably best illustrated by examining the characteristics of some of the most recent products of shipbuilding skill in this country as exemplified in the principal characteristics of the United States battleship Idaho, commissioned in March 1919, and the new troopships mentioned above, which are representative of our latest American designs. Commercially, it is now possible to carry cargo and passengers in a single vessel of small displacement. See Warships.

W. L. CAPP, Chief Constructor, U. S. Navy.

NAVAL AUXILIARY VESSELS. When the United States became an active participant in the European War it became at once necessary to provide for meeting the demands for vessels for various naval auxiliary uses. Congress, in anticipation of the situation which did arise when the United States became a belligerent, included in the Naval Appropriation Act approved 4 March, 1917, under the naval emergency fund provisions which were construed as giving the department the right to commandeervessels needed for naval use in war. To safeguard the interests of the government and avoid as far as possible the payment of unreasonable prices for the vessels so acquired the department arranged for and organized a Board of Appraisal for Merchant and Private Vessels, three members of whom were at the time of their appointment civilians especially qualified by education, previous occupation and experience, and possessing a reputation for knowledge of values of vessel property and for disinterestedness which the department felt would be recognized by owners of vessels sincerely desirous of cooperating with the department without taking advantage of the exigencies of the situation. These men were commissioned as lieutenant-commanders in the Naval Reserve Force. The three other members designated by the department for this board were from the list of regular officers of the navy, one an officer of the Constructive Corps of the navy and one a line officer with special engineering experience and knowledge. The board was directed by the department to appraise and fix the fair value of each piece of vessel property which the department considered acquiring, either by purchase or by charter, and the values so fixed were used by the department in its negotiations with the owners of the property. In no case was any vessel property acquired by the navy if the demands of the owner were materially at variance with the findings of this board as to the fair value of the property. The department found a general wish to cooperate on the part of owners and acquired a number of vessels in this way. This spirit of cooperation was especially noticeable among the owners of yachts and other pleasure vessels, a large number of which were required almost immediately after the entry of the United States as a belligerent. It has since been charged that some young owners of such craft were in this way enabled to escape induction into the armed forces.

It became apparent, however, that the powers granted under the naval emergency fund provision of the Naval Appropriation Act were
not sufficient to fully meet the situation, and Congress included in an act making provision to supply urgent deficiencies in appropriations for the military and naval establishments, etc., approved 15 June 1917, provisions granting broader powers under which possession of property needed by the Navy for prosecution of the war might be taken possession of by the department subject to the payment of just compensation to the owners, which compensation the act in question provided should be fixed by the President.

Information as to the property taken, its age, the character of the maintenance thereof, the betterments made thereto, the date on which the property was taken by the Navy Department and the condition of the property at the time it was taken, was supplied to the board, in most cases fully, by the Navy Department. At the hearings granted interested parties, they were permitted to present evidence or information regarding the property which had been taken, supplementing or modifying the information supplied by the Navy Department. In special cases the board made investigation of these matters directly or through agents where this course seemed necessary to the proper performance of the duties of the board. In preparation for the deliberations by which the board arrived at the prices or just compensation, the board procured all possible information from every available source regarding: (a) The opinions of experts regarded by the board as disinterested as to the value of the property under consideration; (b) the testimony of experts produced by the interested parties, as to the value of the property under consideration; (c) the prices at which similar property of like character to that under consideration was sold at or about the time the property under consideration was taken by the Navy Department and the conditions surrounding these transactions; (d) the availability of the property for commercial use; (e) the demand for property of like character for commercial purposes; (f) the original cost of the property; (g) the value of the property under normal conditions; (h) the cost of the property to the owner up to the time the property was taken; (i) the time when the property was acquired by the owner, the use to which the property had been put by the owner and the gross and net earnings of the property in the hands of the owner for a period of from three to five years before possession was taken by the navy; (j) the cost to reproduce the property taken and the time required for such reproduction.

In time of war or during the existence of a national emergency, members of the Naval Reserve Force of sea-going profession who have been employed in American vessels of merchant marine of suitable type for use as naval auxiliaries are required to serve only in vessels of the merchant ship type, except in cases of emergency, to be determined by the senior officer present, when said officer may in his discretion detail them for temporary duty elsewhere as exigencies of service may require. Officers in the Naval Auxiliary Reserve exercise military command only on board ships to which they are attached and in the naval auxiliary service. The annual retention pay of members in this class after confirmation in rank or rating is for officers one month's base pay of the corresponding rank in the navy, and for men, two months' base pay of the corresponding rating in the navy. All naval auxiliary vessels are grouped in districts and each group is placed under a commandant of the district, who is a naval officer of rank and experience. In this way the department is able through the various commandants of districts to carry out problems involving patrol and defenses of the coast, mine sweeping, communications, information, industrial developments, housing facilities, commandeering vessels, etc., in a very efficient manner.

EDWARD S. FARROW,
Consulting Military and Civil Engineer.

**NAVAL CONSTRUCTION.** See Naval Architecture.

**NAVAL CONSTRUCTORS.** Officers of the United States navy, detailed to look after the designing, building and repairing of warships. New types of ships are adopted after recommendations of the General Navy Board and chief of operations. The chief constructor and assistants in the Bureau of Construction and Repair of the Navy Department work out the design and details in consultation with the chiefs of Bureau of Steam Engineering and Ordnance. At every navy yard there is generally a naval constructor on duty. These officers are chosen from Naval Academy graduates and are prepared for their work by special education at technical schools. Latest statistics enumerate 51 naval constructors, five captains, five commanders, 23 lieutenant-commanders and 18 lieutenants; assistant constructors number 24, including 14 lieutenants and 10 junior lieutenants.

**NAVAL EDUCATION.** Thorough educative and systematic study constitute the base rock foundation in the grasping of the principles of the art of war, naval or military. No navy nor army can hold its own that fails to keep abreast of the rapid changes in the fulfillment of the ever-increasing demands of naval or military needs. The educational policy of the most modern navies is based on the fact that the scammanship of the future is dependent on the increasing utilization of the data of science, whether in mechanics, chemistry, physics, electricity, marine engineering or naval construction. Constant experimentation and adaptation, discovery and invention, readiness to abandon the outworn and willingness to try the untried, must go hand in hand with a growing navy, especially with a navy that is itself a vast educational and training school. The new demands, however, do not imply multiplication of studies so much as greater thoroughness in fundamentals. Science is one, though its branches are numerous and ramifications are numerous. The new demands, however, do not imply multiplication of studies so much as greater thoroughness in fundamentals. Science is one, though its branches are numerous and ramifications are numerous.

**United States.** Recent acts of Congress and laws increasing the number of midshipmen have largely increased the attendance at the Naval Academy and other naval institutions. The number of midshipmen coming from the enlisted personnel is increasing, and it is to be hoped that the day will soon come when most, if not all, appointments to the Naval Academy will come from the ranks. When a preeq-
quisite to appointment as midshipmen at the Naval Academy is actual practical sea service in the enlisted ranks, the navy will more and more attract the youths who love the sea and have the taste and the qualifications for the naval service. The Naval Academy was established by an act of Congress in 1845. Administration. His state papers were models, and the Secretary of the Navy is remembered as scholar and writer as well as a secretary with a vision. Bancroft felt the need, as did John Paul Jones and Matthew Fontaine Maury, and other naval leaders, of an institution to educate young men for the navy, but it remained for Bancroft to translate their dream into the Naval Academy. The efficiency of the navy of to-day is largely, if not chiefly, due to the character of the instruction and the high standards that prevail at the Naval Academy.

The United States Naval War College was formally established at Coaster's Harbor Island in Newport Harbor, Rhode Island, in 1884. Recently an apologetic system of study, similar to that in use at the Army War College and at the service schools, was introduced at this college and endeavors are now being made to cultivate in the minds of the officers of the navy the power of reasoning in approaching tactical or strategic problems, such as is given by an "estimate of the situation." An effort is also being made to develop a form of "campaign orders" modifying the field order form to suit all needs and varying conditions. Co-operation in time of war is greatly aided if each service has some personal acquaintance with the other. This acquaintance can be best brought about by the exchange of visits and hospitalities among officers ashore and afloat, and by the exchange of officers in attendance at the service schools and war colleges. The last is deemed of the greatest importance, as thereby selected officers who in time of war may exercise high command or staff duty are thus brought in touch, in a professional way, with the sister service. They find out what may be most probably expected from the other service in time of war; they learn something of the methods and professional opinions of the officers of the other service; and if at the war colleges, they assist in the preparation of the war plans. This interchange of officers is most fruitful of good results. Army officers are detailed to attend the summer conferences at the Naval War College and navy and marine officers are designated to attend the Army War College and marine officers attend the army service schools at Fort Leavenworth. Along the same line is the detailing of officers of the Coast Artillery corps to attend fleet target practices.

Beyond the training of seamen and firemen, which is the principal general purpose of the stations above mentioned, is the matter of training mechanics, radio operators and many other specialists who must be skilled craftsmen as well as good sailors. There are schools for cooks, also, for well-qualified lieutenants, regarded as important enough to justify training in cookery. These men, whatever their origin or previous experience, must be further trained in the navy, first in discipline and second in their trade, as electricians, engineers, carpenters, etc. In the navy, much has to be learned before one can efficiently ply his trade on board a naval vessel. Prior to the European War, artisan recruits were trained in the naval trade schools maintained for this purpose. These schools were at once expanded as far as conditions permitted, but with the enormously increased demand the schools could not be made large enough to supply the requirements if the entire course of training were conducted in such schools. In conjunction with the establishment of the Students' Army Training corps by the War Department, the Navy Department established naval units in over 90 educational institutions of collegiate grade. The object of these naval units is to extend to ambitious students the opportunity to continue their education along the usual channels, at the same time electing special naval subjects. In addition, the student is under constant supervision and receives military drills and instruction.

At the naval training station, Great Lakes, III., is maintained one regiment of about 4,000 men, known as the public works regiment. The officers and petty officers are men of exceptional engineering knowledge or practical ability, and the regiment is so organized that a complete force of carpenters and mechanics, electricians, plumbers, and similar skilled tradesmen is available. Drafts from this regiment are replaced by recruits who are kept in training, both practical and bookwork, to increase their knowledge of their trade. At New London is a ship salvage organization officered by professionals in this line of work, at which men are trained and organized into salvage crews. This is in itself a training school for a wide variety of trades, including diving and the handling of high explosives. For the benefit of men who enter the navy with some knowledge of or experience in a trade, or special vocation, the navy maintains trade-schools as follows: The Navy Electrical School for the instruction of electricians, both general and radio; the Machinist Training School for firemen, wrights, shipfitters, carpenters, blacksmiths, painters, etc.; the Yeoman School for stenographers, typewriters and bookkeepers; the Commissary School for cooks, bakers and commissary-stewards; the Hospital-Corps Training Schools for the instruction of men in nursing, first-aid, drugs, etc.; the Coppersmith School; the Machinist School; the Aeronautic School; the Musician School; the School for Diving; the Torpedo School and the class for instruction in gasoline engines. Not all of these trade schools are open to men on their first enlistment. Some, such as the machinist school and the torpedo school, are open only to men of good record upon re-enlistment. All the schools are conducted, however, for the benefit of enlisted men of the navy, who train themselves for more responsible duty and better pay. In most instances, the training obtained in these schools will stand the men in good stead in civil life should they decide, after a few enlistments, to leave the navy. Former bluejackets, who owe their success to the training they received while in the navy,
NAVAL EDUCATION

may be found in nearly every large industry holding enviable positions.

In addition to the practical instruction imparted at the training stations and in the navy trade schools, a course of academic instruction is conducted throughout the naval service. Every recruit is examined as to his educational needs, and if he is deficient in any commendable school studies, he is assigned to such classes as will supply the education he lacks. The academic instruction does not stop at the training stations, but continues on board ship; and if a young man shows himself to advantage himself, he is given every encouragement and is afforded an opportunity to demonstrate his ability.

England.—Made up of diverse elements, the English system of naval education has a certain unity throughout, which is due solely to the fact that the whole is practically under one head. Except for the gunnery training and the seamanship, which is instilled by some process on board ship, the whole training of officers goes under the direction of the director of studies at Greenwich. His control does not go so far as the devising of a general plan; that is a matter for the Admiralty. From the time the young man of 12 or 13 passes his examination for a cadetship down to his last volunteer course as a captain, through the Britannia, the course afloat, the sublieutenants' collegiate course and the subsequent voluntary studies, his education is under the Admiralty rules, and it is managed with all the wisdom and judgment that the rules will permit. The importance of this single head for the whole system cannot be overestimated. The expedients adopted with reference to the higher education of voluntary students and the admirable courses of instruction for officers who have taken up one branch of the service, do much to remedy the inherent defects of the system; and the promotion in two grades by selection excludes the most incompetent officers from positions of great responsibility.

The following establishments are included in the general system of education of officers of the French navy: The Polytechnic School, Medical Schools, Torpedo School, Machinists' School, Gunnery School and Artillery School. The Polytechnic was established in 1799, is the preparatory school for the scientific branches of the public service and is under the control of the Minister of War. Its organization is military, with a general officer of the army at its head. The pupils of this school are carefully selected at the start and the examination for admission ensures a high standard of preliminary attainment. The success of this school is so remarkable its influence on the public service of France has become a matter of history and it has taken a place among the very first of schools of its class in the world. In the Naval School of Brest, the methods of instruction adopted are similar, in a general way, to those of other French schools and colleges and resemble nothing in America. Recitation is the chief method and the textbooks are almost unknown. A few books of reference are used, including the nautical almanac and the admirable series of manuals published under the authority of the Ministry of Marine. The main feature of the system of instruction is the course, or lecture. The Engr...

structions; a careful examination of all conditions bearing on the situation; a determination of intention; the communication of this intention to subordinates. The best training, as now admitted by all nations, large and small, having navies, is in war. If it were not for the stimulus of necessity, all effort in the world would come to an end. The Naval War College created an artificial war, at first called the war game and later known as chart manœuvre.

This naval problem is a happy example to accentuate the fact that the strategist's real field of operations is the chart and is in keeping with Jomini's definition of strategy—"War on the map." A further consideration will show that ordinary navigation is merely "sailing on the chart." The war game or map manœuvre was a notable factor in the wonderful successes achieved by German arms against Austria in 1866 and France in 1870. The map manœuvre is truly the subcalibre method of training naval strategists. See NAVAL WAR COLLEGE.

NAVAL INSTITUTE, United States, an organization founded in 1873 at Annapolis, Md., by the officers of the Naval Academy. It issues bi-monthly Proceedings on naval affairs. It is regarded as one of the most important publications on naval affairs, because of the broad knowledge of its contributors. Each year the institute offers a life membership, a gold medal and a prize of $200 for the best essay or paper of interest to the naval service. The present membership includes a large portion of the officers of the navy.

NAVAL INTELLIGENCE. The Office of Naval Intelligence is charged with the collection and dissemination of such technical information at home and abroad as will be useful to the various bureaus of the Navy Department in the formulation of plans for peace and war and in the development of personnel and material. The exigencies of war impose new and important duties upon naval intelligence. In peace the function of this agency is to keep in touch with all naval attaches in the leading countries and from other sources furnish the General Board, the Chief of Operations and the bureaux data which give them the benefit of what has been learned or put into practice in other countries. During war their duties increase many fold—in touch with the naval districts and branch offices—it does a most important work in protecting naval and other plants making war material, preventing sabotage and in keeping an eye on alien enemies or others with a destructive propensity. A staff of vigilant and discreet confidential officers and civilians are on the alert to ferret out spies and other dangerous characters and secure their arrest. Close co-operation is had with the Department of State, War, Navy, Labor, and, in addition, with the War Trade Board, the United States Shipping Board and the Alien Property Custodian. The interchange of information and the results of investigations with these departments of the government are most effective and valuable to the prosecution of war.

A detailed account of the work of this office should not be stated as it is of a highly confidential character, but, generally speaking, the scope of its activities include observation, investigation and report of all subjects affecting the navy and the prosecution of war from a naval point of view. It includes naval operations at sea and on land, the status, changes and progress of the material and personnel of foreign navies and a close counter espionage watch at home. This latter includes the investigation of unauthorized radio stations of alien enemies and suspects, matters connected with the cable and mail censorship which affect the navy, the protection of water fronts and vessels, and of plants having contracts with the Navy Department, with a view of safeguarding those plants against sabotage. It includes naval ships while in port and the guarding against the danger from enemy agents among the passengers and crews are largely performed by the Office of Naval Intelligence. See NAVAL COMMUNICATION SERVICE.

NAVAL MILITIA. The first naval militia organization in the United States was established in the State of Massachusetts as a part of the organized militia on 29 March 1890. Other seacoast and lake States soon followed. In 1891 there was included in the Naval Militia Act, as passed by Congress, an appropriation of $25,000 for "Arming and Equipping Naval Militia." This constituted the first Federal appropriation available for the purchase of arms, equipment, etc. Appropriations have been included annually in the Naval Act since that time. Ships were loaned to the organization and material and equipment issued by the various bureaus of the Navy Department for training purposes, the details being carried on by the "Office of Naval Militia." The States themselves purchased and maintained all equipment loaned by the War Department. Annual practice cruises were made and the training of the naval militia gradually progressed. In February 1912, "An Act to Promote the Efficiency of the Naval Militia and for other Purposes," commonly known as the "Naval Militia Act," became a law, and is the act under which the naval militia has since operated. In accordance with this act, the Division of Naval Militia Affairs was established in April 1914, by taking over all work formerly performed by the "Office of Naval Militia." A National Naval Militia Board, composed of naval militia officers, representing the north Atlantic, south Atlantic, Pacific and Great Lakes regions, convenes in Washington as often as necessary and is freely consulted in all important naval matters. Inspections of all naval militia organizations and divisions are made annually by officers of the navy, to determine whether or not the divisions are sufficiently armed and equipped to participate in the allotment of Federal funds for the ensuing year. The first of these inspections was made in the spring of 1914, and
as a result several divisions were disbanded. A board of naval officers formulated examinations for officers and enlisted men and standardized, in accordance with the National Militia Act, the qualifications of the naval militia personnel. This board met in Washington and, assisted by the National Naval Militia Board, formulated a report published in the form of a general order, which established the units of organization, distribution of personnel and other matters which in accordance with the laws of the United States were authorized to prescribe—the unit of organization being the division (battalion). Aeronautical divisions and marine sections were established, while brigade and battalion organizations were maintained for administrative and other purposes.

By the Act of 3 March 1915 a naval reserve force was authorized consisting of six classes: (1) The Fleet Naval Reserve, (2) the Naval Reserve, (3) Naval Auxiliary Reserve, (4) Naval Coast Defense Reserve, (5) the Volunteer Naval Reserve, (6) the Naval Reserve Flying Corps. The Fleet Naval Reserve is composed exclusively of ex-officers and ex-enlisted men of the navy who have left the service under honorable conditions and who are citizens of the United States. Men who have served one enlistment creditably and receive an honorable discharge may enroll in the fleet naval reserve with pay at the rate of $50 per annum. Those with eight years and less than 12 years naval service may enroll with pay at $72 per annum. Those with 12 years or more naval service enroll with pay at $100 per annum. Men who have served in the navy for 16 years or more may transfer to the naval reserve at one-third of their base pay plus all permanent additions thereto. In addition to these rates of pay men who enroll in the reserve receive an increase of 25 per cent for each re-enlistment. It is required of them, however, that they shall serve at least three months on active duty during each four-year period and re-enroll within four months. Men who transfer with 16 or 20 years' service are allowed a further increase of 10 per cent for each re-enlistment. Men with 20 years' active service are given a further credit of 10 per cent, provided their average marks in conduct for 20 years or more shall be not less than 95 per cent of the maximum. Men transferring to the fleet naval reserve, upon completing 30 years' service, including active and reserve, be retired with the pay they are then receiving plus the retired allowances. Men who enroll in the reserve may be retired after completing 20 years' service in the reserve and receive in lieu of their pay a cash gratuity equal to the total amount of their pay during the last term of their enrollment. Members of the fleet naval reserve may be examined for warrants and commissions in the reserve. Men who complete 10 years in the reserve and 12 years' active service are given a clothing allowance, each enrollment amounting to $30, which amount is increased to $60 in time of war or national emergency. As with all organized militia, the naval militia, even with the laws of 1914 and 1915, could not, under the Constitution, be called into service as such except for limited duties, such as to repel invasion. It could not be used outside the territorial limits of the United States. It is evident that, with such restrictions, militia could hardly meet the requirements of the navy in a foreign war, and to overcome this difficulty the Naval Volunteers were created in the act approved 29 Aug. 1916. Under this act members of naval militia organizations were authorized to volunteer for "any emergency," of which emergency the President became the sole judge. Men joining the navy as organizations that in being called as naval militia, militiamen can be used for any naval duty, free from the restrictions imposed on the naval militia as such. The value of this law became apparent as soon as the United States entered the European War. Practically every one in the naval militia at once volunteered and was sent to duty, thus giving the country the services of the trained men who otherwise could not have been used until the country was to be invaded. In the same bill that created the national naval volunteers, other laws were enacted that are of vital importance to the navy and country. That bill carried nearly all of the legislation that was needed to give the navy the personnel required for war on the line of the United States. Men were enrolled in peace and at minimum cost prepared personnel for war, and the form of the laws was such that the personnel could be expanded to meet almost any emergency. Among the other important measures, the bill (1) provided for the United States naval reserve force; (2) increased the enlisted personnel of the regular navy to 68,700 and provided for further increase by the President to 87,000; (3) provided for the automatic increase of officer personnel in each corps to correspond with increases in enlisted men; (4) provided for naval flying corps, for special engineering officers, for taking over the lighthouse service by the navy in time of war, etc. The creation of the United States naval reserve force was a wise provision. The only training in peace times of reserve man power for the navy was in the naval militia, and even under the acts federalizing it the national militia met only to a minor extent the deficiencies in personnel for commissions of the Reserve Fleet and the requirements for personnel for auxiliaries, aviation, technical duties, etc. A much broader plan was necessary if the navy was to have sufficient man power and of the proper qualifications for war service. The naval reserve force legislation gave the navy the broad organization by which a reserve could be formed. The purpose of the reserve force is to enroll and train in peace time all kinds of personnel which in time of war or when the President declares a national emergency to exist can be called to the colors and thereafter be used in any capacity in the navy. This act became a law only a few months before war came and when only the very first steps to create the reserve had been taken. Nevertheless the law was so wisely drawn that the force could be rapidly built up even in war time. While it provided for the naval reserve force that has stood the country so well in war, the act further provided for war by increasing the permanent enlisted strength to 68,700 and permitting its further increase to 87,500, in the discretion of the President. As the permanent
NAVAL MINES

navy is the foundation of the naval structure, these increases, made when they were, put the navy in a position to expand on a sound basis, and especially so as in the same bill provision was made to automatically increase officer personnel when the enlisted personnel strength was increased. Up to the passage of this act the number of officers allowed for the navy was numerically fixed by law. Even though enlisted strength increased, officer strength could not be increased except by special legislation to that sole end. It is apparent that such a plan of increases was cumbersome and difficult, and upon the recommendation of the department a law was enacted in this bill that automatically changed the number of officers whenever the enlisted strength was changed. All corps and all grades in each corps were provided for in this legislation, so that now, when increases in ships of the navy occur, it is only necessary to authorize the enlisted personnel to meet those increases and the officers' personnel is automatically provided for. Had this provision not been in force when war was declared the navy could not have carried on its part in the war so quickly and so successfully. See United States Naval Reserve Force.

NAVAL MINES. Naval mining is logically divided as follows: (1) Coastal mining, which denies to an enemy suitable ports, undefended or nearly so; (2) advance base mining; (3) off-shore or strategic mining; (4) battle or tactical mining, during an engagement between fleets. Coastal mining, outside of areas which are defended by coast fortification guns, does not require large or speedy vessels. Tugs, trawlers and light draught vessels, with naval reserve crews may be advantageously employed for this purpose. These vessels are provided with searchlights and suitable guns in order that they may properly guard their own mine fields. Advance base mining is the logical or legitimate duty of the active naval force. For this purpose an organized unit is supplied, consisting generally of several mine ships, tugs or more seagoing tugs, and two net layers. The mining ships are armed with a sufficient number of guns of proper caliber to defeat any attempt of raiding cruisers from interfering with the work establishing the advance base ashore and the laying of mines for the protection of the harbor. These ships are provided with all facilities to lay and pick up mine fields. The tugs are employed for sweeping areas which are to be used for fleet manoeuvres or to sweep a channel to insure that hostile mines have not been planted. The sweeps, made of wire hawser and chain, are hung between two tugs so that the bight of the sweep is dragged across the area to be swept. When the sweep fouls a mine it drags it from its moorings and explodes it. The net layers are used for laying submarine entangling nets across the entrance of a harbor or about a fleet when at anchor in an open roadstead. In mining the channels of an advanced base, mines are laid in the principal channels and as a rule are distantly controlled or exploded by observers ashore, when an enemy ship is sufficiently near them. Off-shore or strategic mining is done for the purpose of refusing or denying certain waters to the enemy. A sufficient number of mines are laid to make a venture by an enemy fleet extremely hazardous. For this purpose mine-laying vessels of considerable size and good speed are required, being accompanied by a mine depot ship and tugs. When occasion demands very high speed, scout cruisers or even destroyers should be used. High speed can be given mining vessels only by such as are specially designed for the purpose. In strategic mining a supporting force should always accompany the mine force to protect it from interference by enemy fast cruisers which might arrive before the mining has been completed. All hostile obstructions should be guarded against by scout cruisers. Battle or tactical mining, during an engagement between fleets, is accomplished by vessels of very high speed with characteristics on the order of scout cruisers, but with decks arranged to carry several hundred mines. The mines are laid in such localities during the progress of the battle that may be in the line of advance or retreat of the enemy. When an area is properly mined, one of the principal aims of the fleet is to force the enemy over the mine field. Battle mines may be either fixed or floating but when off soundings, floating mines only can be used.

The United States has two mining branches. One branch is under the coast artillery and is employed as an element in the fixed defenses of the coast and the mine fields are covered by guns in fixed positions. The other branch is the active fleet. The control of the fixed mine defense belongs with the control of the fortifications and the control of the fixed land defenses and mine fields belong to the navy in order to insure complete co-operation between the mobile and fixed defenses of the coast. The fleet for its own safety should dictate the location of mine fields. As a rule the navies of Europe control the coast fortifications and the fixed mine fields.

Generally speaking, there are two types of mines—fixed and floating. The fixed or stationary submarine mine is fired by contact, electricity, timing device or fuse. Such mines are rugged in design and may contain large charges of explosives. They are prefabricated or built up by submarines and other especially equipped mine-laying vessels. Such mines are provided with anchoring devices and are deposited, if possible, in harbors and channels of the enemy or in the paths of ocean travel. Floating mines differ from fixed mines in that they are unanchored, and unless guard boats are at hand to warn friendly vessels of their proximity, may be as dangerous to friend as to foe. Such mines must be, according to laws of war, designed to become inoperative within a few hours or days—after being set adrift. They are often cast adrift in pairs, connected by a line about 100 feet long. If a ship runs between the two mines they are drawn alongside the ship, and exploded. See SUBMARINE MINES.
