POMACE FLY, a small yellowish fly of the genus Drosophila, frequently a nuisance in cider factories and wine houses. The eggs are laid in the pomace in which the large seed and from which the adults fly to the houses. They also visit dwellings in which decaying fruit is exposed. Sometimes they breed in other organic remains. Cleanliness and the prompt removal of fermenting or decaying matter are preventive measures.

POMADE, POMMADRE, or POMATIUM, a term originally applied to a fragrant ointment prepared with lard and apples, but now wholly restricted to perfumed solid greasy substances used in dressing the hair. In the preparation of pomades the first object of consideration is to obtain their fatty oils as pure and fresh a state as possible. Lard, beef and mutton suet, beef marrow, veal fat and bear's grease are the materials commonly employed for this purpose, either singly or in mixtures of two or more of them. The fat, which should be that of a young and healthy animal, is pounded in a marble mortar in the cold, until all the membranes are completely torn asunder; it is then submitted to the heat of a steam-bath until its fatty portion has liquified and the albuminous and aqueous matter and other foreign substances have completely subsided. The liquid fat is then carefully skimmed and passed through a flannel filter. In this state it may be perfumed at will; after which, when it is intended that the pomade should be white, it must be constantly stirred with a glass or wooden spatula until it solidifies; should it be wished transparent or crystalline it is allowed to cool very slowly without being disturbed. To prevent its becoming rancid a little benzoic acid, gum benzoin or nitric ether may be added and this increase the life of a little wax or spermaceti. Pomade may be perfumed by emulsification, maceration or simply by adding the fragrant essences or essential oils in the required quantity. See Perfumes and Perfumery.
POMBAL — POMERANIA

POMBAL, Sebastião José de Carvalho e Mello, sá-bás-ti-ou jé de kar-vál-yoo a má-lo’c, póm-bál’, or póm-bál’, MARQUIS of Portuguese statesman; b. Sória, near Coimbra, 13 May 1699; d. Pombal, 2 May 1782. He successively entered the law and the army, but soon relinquished each because of incompatibility. In 1739 he was appointed Ambassador to London, but was recalled in 1745. He was then sent to Vienna to act as mediator between the Pope and the Empress Maria Theresa. Carvalho here gained general esteem and married the youthful Countess of Daum. In 1750 Carvalho obtained from Joseph I the post of Secretary of State for Foreign Affairs and soon rendered the feeble and sensual king entirely subject to his influence. Joseph I fell in with the most daring projects of his minister; and the latter now proceeded to the accomplishment of his four favorite objects — the expulsion of the Jesuits, the humiliation of the greater nobles, the restoration of the prosperity of Portugal and the establishment of a state in the name of the monarch. After the earthquake of 1 Nov. 1755, which destroyed Lisbon, Carvalho displayed great vigor and resolution. He was now created Count of Oeiras and in 1756 First Minister. He then removed every one who ventured to obstruct his plans. The discontented vinedressers committed excesses in Oporto, but Pombal vigorously suppressed the riots and passed most comprehensive laws against treason. He also expelled the Jesuits from their flourishing missions in Paraguay, and Carvalho finally determined to remove the Jesuits entirely from the persons of the king and they were ordered (16 Sept. 1757) to retire to their colleges. A conspiracy against the life of the king, who was wounded on the night of 3 Sept. 1758, by assassins, he falsely laid to the charge of the Jesuits. Pombal denounced the Jesuits to the Pope as the contrivers of the scheme and caused some of them to be executed in prison. Pombal had already banished the Order from the kingdom by a royal decree of 3 Sept. 1759 and those who did not comply with the mandate were seized and transported to the states of the Church. A protracted dispute with the Pope followed; in 1763 the king took the papal nuncio beyond the frontiers and was on the point of dissolving all connection with Rome when Clement XIII died and Clement XIV, his successor, abolished the order in 1773. Through Pombal the Portuguese army received an entirely new organization and the fortifications on the frontiers were restored. He paid particular attention to the schools; he also rendered the censorship less strict. Joseph I died 24 Feb. 1777 and was succeeded by his daughter, Maria I, who immediately deposed Pombal and deprived him of all his offices. The state-prisoners whom he had incarcerated, 9,800 in number, were released, and all his regulations abolished. All those who had been attainted with treason under Pombal’s charges were rehabilitated and he himself ordered to retire to his estate, where he died. His record is one of the bloodiest in Portuguese history, yet it is said to his credit that he favored the establishment of various manufactures; encouraged the art of printing and again claimed possession of the University Press Co. and the University, and opened a chemical laboratory, a botanical garden and an observatory; and introduced into Brazil the cultivation of coffee, sugar, rice, cocoa and sugar-cane. His Life of Pombal (1819); Opperman, Pombal und die Jesuiten (1845); Wedl, ‘The Suppression of the Society of Jesus in the Portuguese Dominions’ (1877); Feval, ’The Jesuits’ (1878).

POMEGRANATE, a shrub or tree (Punica granatum), native of southern Asia, widely cultivated for its fruit. It is usually of bushy growth, with glossy entire leaves and red flowers. The fruit is globular, sometimes five inches in diameter, the interior filled with numerous seeds covered with a juicy red, pink or white pulp, usually of acid flavor. The cultivation of the pomegranate in the Old World is of great antiquity. The plant is supposed to have been introduced into southern Europe by the Carthaginians, whose Latin name of *Punicus* was applied to it. The fruit is cultivated in the United States along the Gulf Coast and more extensively in tropical America.

POMEGRANATE MELON. See MELONS.

POMELO, or PUMELO. See SHADDOCK.

POMERANIA, póm-e-rá-ni-á (German, Pommern), Prussia, a northern province and duchy, bounded north by the Baltic, west by the duchy of Mecklenburg, south by the province of Brandenburg and east by West Prussia; area, 11,629 square miles. It consists of a long and comparatively narrow tract of country, stretching longitudinally east to west. The coast is generally low and lined by a great number of lagoons, separated from the sea by narrow belts of land or low sandhills. Along the coast are a few islands, but none of them, except Rügen, Usedom and Wollin, are of great extent. The principal rivers are the Oder, Persante and Stolpe. The soil generally is sandy and indifferent; but there are many rich alluvial tracts, particularly along the banks of the rivers and lakes, producing a surplus of grain for export. Flax, hemp and tobacco also are cultivated. The domestic animals, of which sheep and swine are the most important, are numerous, and of tolerably good breeds. The forests are of large extent and well supplied with game. Fish also are abundant. The only minerals are iron, salt and alum. Manufactures early made considerable progress, in consequence of the influx of French refugees on the revocation of the Edict of Nantes, who introduced the manufacture of woollens and other fabrics. Through the Oder the province carries on a considerable trade, both general and transit. The principal exports are corn, cattle, wood, wool, wax, amber and fish; the principal imports are wine, cotton goods, coffee, sugar and other articles of colonial produce. The domestic animals, of which which ranks as one of the most important commercial cities of Prussia. Pomerania was originally inhabited by Goths, Vandals and Slavs. The first mention of it in history is in 1140. It long served as a neutral territory and was of much larger extent than at present. In 1637, on the extinction of the ducal family, the electoral house of Brandenburg claimed possession, but was obliged to give way to Sweden. On the death of Charles XI the electoral house again claimed possession, and by the Treaty of Stettin, formally ceded to it except a part which received
the name of Swedish Pomerania. This part having been ceded to Denmark, was by it given up in exchange for the duchy of Lauenburg, to Prussia, to which the whole of Pomerania now belongs. For administrative purposes it is divided into three governments (Regierungsbezirke), Stettin, Köslin and Stralsund. Pop. 1,716,921.

POMERENE, Atlee, American legislator; b. Berlin, Holmes County, Ohio, 6 Dec. 1863. In 1884 he was graduated at Princeton University, and two years later at the Cincinnati Law School. In 1886 he was admitted to the bar and has since practised at Canton. In 1887-91 Mr. Pomerene was city solicitor; in 1897-1900 prosecuting attorney of Stark County and in 1905 was appointed member of the Tax Commission of Ohio. On 8 Nov. 1910 Pomerene was elected lieutenant-governor of Ohio and on 10 Jan. 1911 was elected United States senator for the term 1911-17 and was re-elected for the term 1917-23 in 1916.

POMEROY, pomp or pőmpê-rol, John Norton, b. Greensville, Va.; d. Rochester, N. Y., 1828; d. 1885. In 1847 he was graduated at Hamilton College and became a practising lawyer in 1851. He practised in Rochester until 1864, when for four years he held the chair of law and political science at the University of New York. He returned to his law practice at Rochester in 1869 and from 1878 to 1885 held the chair of municipal law at the University of California. Pomeroy edited Sedgwick's 'Statutory and Constitutional Law' (1874) and Archbold's 'Criminal Law' (1877). He wrote 'Introduction to Municipal Law' (1865); 'Introduction to the Constitutional Law of the United States' (1868; 9th ed., 1886); 'Remedies and Remedial Rights According to the Reformed American Procedure' (1876); 'Treatise on Foreign Righ (1884); 'Treatise on Equity Jurisprudence' (3d ed., 4 vols., 1905).

POMEROY, Marcus Mills ("Back Pomeroy"), American journalist and humorist; b. Elmira, N. Y., 25 Dec. 1833; d. Brooklyn, N. Y., 30 May 1896. He was apprenticed to the printer's trade when very young, established the City News (N. Y.), Journal and the Atheneum Gazette, and in 1857 removed to Horicon, Wis., where he successfully conducted the Argus. Later he went to Milwaukee where he edited the Daily News and subsequently secured an interest in the La Crosse (Wis.) Union and Democrat. After the Civil War he removed to New York and founded the Daily Democrat, which in 1887 was merged in Pomeroy's Advanced Thought. In the latter part of his life he undertook to tunnel the Rocky Mountains, and had cut nearly a mile on each side when the failure of the national government to aid him caused the abandonment of the project. His chief publications are 'Gold Dust' (1872); 'Brick Dust' (1872); 'Perpetual Money' (1878).

POMEROY, Seth, American Revolutionary soldier; b. Northampton, Mass., 20 May 1706; d. Peekskill, N. Y., 19 Feb. 1777. He was by trade a gunsmith, and early spent much time in the colonial military service, attaining the rank of colonel. In 1774-75 he was delegate in the provincial congress, in October 1774 was made a general officer, and in February 1775 became brigadier-general of militia. After having participated as a private soldier in the battle of Bunker Hill, he was appointed 22 June 1775 senior brigadier-general of the Continental army. His appointment, however, was the occasion of some difficulty in the adjustment of matters of rank, and he resigned from the service, without having acted. When New Jersey was overrun by the enemy in 1776, he headed a volunteer force and marched for the Hudson, but died on the way.

POMEROY, Theodore Medad, American jurist and statesman; b. in Cayuga, N. Y., 31 Dec. 1824; d. Auburn, N. Y., 23 March 1905. He received his early education at Monroe Academy and graduated from Hamilton College, taking his degree in 1842. He was admitted to the bar in 1846, practising until 1870. In 1851 he was elected district attorney of Cayuga County, holding that position until 1856, when he was elected to the assembly. In 1861 he was elected to Congress, remaining there until 1869 and during the 40th Congress acting as speaker of the House of Representatives. In 1870 he was elected mayor of Auburn, serving one year, and was elected to the State senate in 1878-79. After abandoning the practice of law he engaged in banking and at the time of his death was first vice-president of the American Express Company.

POMEROY, Ohio, city, county-seat of Meigs County, on the Ohio River and on the Hocking Valley and the Kanawah and Michigan railroads, 125 miles southeast of Columbus. It was first settled in 1816 and incorporated as a city in 1846. It is built on a strip of land lying between the river on one side and hills on the other. It is in a region rich in bituminous coal and salt, and is the centre of an important mining industry. It also produces calcium and brome, and has numerous manufacturing interests. Its industrial establishments include rolling mills, steel works, machine and foundry works, furniture factories, planing and lumber mills and flour mills. There is a public library. The city is governed by a mayor, who holds office for two years, and a city council. Pop. 4,023.

POMFRET, a name given in Europe to a species of Siromaleus, allied to our butterflyfish (Rhombus trachanthe), found in the Mediterranean and Indian Ocean; and in the Bermudas to a large fish (Brama raii) of the family Bramidae. Both of these belong to the scormeberoid series of percomorphous fishes. The latter is a fish of comparatively deep oceanic waters, and is quite cosmopolitan in its range. Occasionally it has been taken in our waters on both the Atlantic and Pacific sides. As a food fish it is of excellent quality, but is nowhere sufficiently plentiful to be of importance. The family Bramidae is a small one, comprising only three genera and 10 or 12 species, which are remarkable for the changes which they undergo with growth. Brama raii reaches a length of four feet, and has a somewhat compressed form, with the dorsal and anal fins very long. The cycloid scales are peculiar in being provided with a deep perpendicular bony plate, one side of which is embedded in the skin.

POMMADE. See Pomade.
POMO, a linguistic stock of northwest California also known as Kulaicapan. It includes several tribes, once very numerous, but now almost extinct. Consult Barrett, S. A., 'Pomo Indian Basketry' (Berkeley 1908); id., 'Ethnography of Pomo and Neighboring Indians' (ib. 1908); Mason, O. T., 'Aboriginal Indian Basketry' (Washington 1894).

POMOLOGY, the science of fruit-culture, especially apple-culture (Lat. pomum, apple). It is divided into four main divisions: viticulture, or grape-growing; orcharding (itself divided into the cultivation of pomaceous fruits; drupaceous or stone fruits; citrus fruits, as oranges and lemons; nut-fruits; and palmaceous fruits); small-fruit culture; and cranberry culture. (See Fruit-culture; Grape Industry; Horticulture; and special fruits, as apple, pear, orange, etc.). Consult Bailey, L. H., 'Cyclopedia of Horticulture' (4 vols., New York 1912).

POMONA, Cal, city in Los Angeles County, on the Atchison, Topeka and Santa Fé and the Southern Pacific railroads. It was first settled in 1875 and incorporated as a city 12 years later. It is the commercial centre and showplace for an agricultural and fruit-growing region, particularly noted for its oranges; and also manufactures wine, and has a planing mill and a canning factory. It is a well-built, handsome city, with a fine park from which a wide view of the surrounding country may be obtained, and is a health resort. It has a high school and a public library, and Pomona College (q.v.) is located within a few miles at Claremont. The city is governed by a board of trustees; the city officials are mostly elected directly by the people. Pop. 13,150.

POMONA. See Orkney Islands.

POMONA, the Latin goddess of fruit, orchards and gardens. Various legends are associated with her cult. The longest story as also the most famous concerning her is told by Ovid in his 'Metamorphoses' (XIV, 623 et seq.). Consult Wissowa, Georg, 'Religion und Kultur der Römer' (2 ed., Munich 1912).

POMONA COLLEGE, located at Claremont, Cal. It was established by the Congregationalists and was first opened to students in 1888, but it is now non-sectarian in control. Women are admitted to all courses. The college offers three general courses, classical, scientific and literary, for the completion of which the degrees of A.B., B.S. and B.L. are conferred. There is also provision for graduate work, a normal course and a preparatory department. In 1917 the grounds and buildings were valued at $530,880; the amount of productive funds was $1,105,358, and the annual income $304,957. The library (1917) contained 35,510 volumes; the students number 542, and the faculty 46.

POMORYANS, a Russian sect founded in 1695 by Danilo Wiculim. Their teachings are called Danilowitchin, and inculcate the doctrine that since the deposing of the prelate Nikon (1667), Antichrist has reigned in the Orthodox Church, and thus the true priesthood has been destroyed. As there are no longer true priests nor true sacraments, there is no authority to sanction marriage, and, therefore, all should live in celibacy; and those married in the Greek Church should separate. Persons desiring to join the sect are required to be rebaptized by those already members. The sect has monasteries and nunneries, and has amassed much wealth which they have expended in gathering a large and very valuable library treating chiefly on the fine arts—music, painting, poetry, etc.

POMPADOR, Jeanne Antoinette Poisson, zhän ån-twä̃-ät pwä̃-swä̃n pỗ-dỗ-dỗ. MARQUISE DE, mistress of Louis XV; b. 29 Dec. 1721; d. Versailles, 15 April 1764. She was the daughter of François Poisson, equerry to the Duke of Orleans, and not butcher to the Invalides as frequently stated. The paternity of the future favorite was, however, claimed by Lenormand de Tournemire, a rich farmer-general, who spared no pains to give her a brilliant education. On his death left had the half of his immense fortune. In 1741 she was married to her cousin Lenormand d'Etioles. She succeeded in attracting the attention of the king, was formally presented to him and soon entirely engrossed his favor, appearing at court under the title of Madame de Pompadour. Here she enjoyed the highest consideration, but did not at first interfere in political affairs, satisfied with appearing as the patroness of learning and the arts. She collected books, pictures and curiosities, and encouraged the institution of the military school of which Paris du Verney was the founder. But when she could only maintain her influence with the king by furnishing him other objects for favor, she turned her attention to state affairs. She filled the most important offices with her favorites, and contributed to produce those evils which afterward pressed so heavily on France. It is said to have been principally owing to her that France became involved in the war against Frederick II. The Empress Maria Theresa had propitiated her favor by writing to her with her own hand a letter in which she called her "dear cousin." The bur- dens and sufferings which this war brought with it upon France must be laid at her door, since she removed Berns, who was in favor of peace, and supplied his place by Choiseul, effected the recall of Marshal d'Estrees at the moment of triumph, and promoted incapable generals to the command. She died little regretted by the king (see Louis XV), and hated and reviled by the nation. To her credit, however, is awarded praise for her patronage of literary men and artists. Consult Beaupoir, 'Secret Memoirs of La Marquise de Pompadour' (1855); Brassey, 'Madame du Barry' (1887); Pavlovski, 'La Marquise de Pompa- dour' (1888); Fleury, 'Louis XV intime' (1899); De Caraman, 'La Famille de la Mar- quise de Pompadour' (1900).

POMPANO, an important food fish (Trachinotus carolinus) belonging to the teleosteous family Carangidae, and found chiefly in the southern United States, especially in Florida. These fishes are related to the mackerels, but lack the median finlets which are so general in the latter. The pompano reaches a length of about 12 inches, and has a somewhat elevated and compressed body with a covering of very small scales and a strongly convex steep forehead. The anal and soft
dorsal fin from which the membrane disappears with age, and a deeply forked caudal without keels or bony plates on its peduncle. The jaws are at first provided with numerous small teeth which fall out with age, changes in other parts also taking place. The color is a beautiful polished silvery blue with golden reflections in parts and touches of orange on the paired fins. On the Atlantic Coast the pompano ranges from Brazil to Cape Cod; but it is only in the warm waters of the south Atlantic and eastern Gulf coasts that it is plentiful. Although occurring on the Pacific side of the continent it is there nowhere common. Except at the extreme southern end of Florida the pompano is a migratory fish, coming in from the sea and entering the shallow bays in the spring, the migratory wave gradually moving up the coast and reaching the waters of New Jersey and Maryland about when the summer is well advanced. In the fall they leave about a correspondingly early date. They approach the shores in large schools, swimming swiftly at the surface, but some time after entering the shallow bays break up into small parties to spawn and search for the shellfish which are their chief food. The largest runs come in April and May, and, as the dense schools approach very close to the shelving shores, seines may be operated with great effect, and large quantities are thus taken in Florida and South Carolina. Farther north, in Chesapeake Bay and on the coasts of New Jersey and Massachusetts, they are taken in pound nets. The pompano is the favorite fish of the wealthy and commands a high price in Northern markets. The name pompano is also applied to other species of the same and related genera, but the Irish pompano (Gerres) and California pompano (Rhombus) are not closely allied. Con- suit Goode, 'American Fishes' (New York 1886); Jordan and Everman, 'American Food and Game Fishers' (New York 1902).

POMPEII, pōm-pē'yē (Lat. pōm-pē'yē), ancient city of Italy, near the Gulf of Naples, and 12 miles southeast of Naples, lying at the southeast base of Vesuvius, and important as being preserved almost intact to our own time by a shower of ashes and pumice from Vesuvius 24 Aug. 79 A.D., which also covered Herculanenum. The city, according to Strabo, was founded by the Oscans; it must have come under Hellenic influence by the 6th century for a temple unearthed in the city is of the Doric of that century. Held by the Samnites from 426 B.C. to the end of the Samnite War in 290, Pompeii then became dependent on Rome; and two centuries later at the close of the Social War the city which had sided with the Italian allied forces was captured by Sulla, and was forced to cede a third of its territory for a Roman military colony. In the years that immediately followed Pompeii became a favorite resort of rich and fashionable Rome, being near the sea and having the glamor of Greek elegance. An earthquake in 63 A.D. nearly destroyed the city, and when it was rebuilt and resettled, Roman architecture that of the tomb of M.Cicerone and the work of building seems to have been shabby and far from thorough in many in-

stances. But the city had regained much of its old popularity when it was destroyed by the eruption of Vesuvius in the year 79. Few of the inhabitants escaped, but the better class of buildings was scarcely injured by the alternating falls of ashes and pumice, or pumice. These with the additional burden of earth now amount to about 20 feet. The eruption is described by Pliny the Younger in letters written to Tacitus telling of the death of the elder Pliny, who perished in the city. The site, for a time occupied by a little village, was deserted after the eruption of Vesuvius in 472, and no attention was paid to this great storehouse of antique life until the middle of the 18th century. Indeed the precise position of the buried city was problematic, for the volcano had changed the coast line so that it is now some distance from Pompeii. In 1748 valuable finds were made by a peasant digging a well. In 1755, Charles III having become interested in the work, the amphitheatre and other public buildings were discovered. But in 50 years nothing systematic was done: there was still search for rare objects, but when these were found houses and streets were left to decay or were covered up again. No one realized that the prime value of the city archaeologically is that it is the genuine setting of Roman life, a very different thing from remnants, no matter how curious, in a museum. Under Murat (1808–15) houses and streets were again excavated; and since the establishment of the united Italian kingdom work has been carried on systematically by the government, notably under the management of Fornelli, who devised a method of making casts of the human remains by pouring plaster into the hollows occupied by the bones of the victims. The streets are now nearly half exposed; the completion of the work may take 50 years more. The fear has occasionally been expressed that an eruption of Vesuvius might undo all this work, and, if lava were poured down on the city, all the ancient monuments be destroyed. But 63 A.D. Hence generalizations as to Roman manners and customs founded merely on Pompeian remains are liable to error. The city was an irregular oval, the length being east and west, surrounded by a wall with a circuit of a little more than a mile and five-eighths (2,925 yards), which is pierced by eight gates. At each there were sentry boxes in which the Roman legionaries were found, still on duty when the excavations began. The most important gate is that opening toward Herculanenum, on the west end of the ovoid. From this gate leads a road paved with tombs, the Pompeian Via Appia. Parts of this region, the Pagus Augustus Felix, were among the earliest excavated; in 1771-74 the diggers discovered the villa of Diomedes, which got its name from the tomb of M.Cicerone and the work of building seems to have been shabby and far from thorough in many in-
house, 20 of them in the wine cellar. Within the walls the streets are straight but narrow (14 to 24 feet wide), paved with lava blocks, and deeply grooved by the passage of chariot wheels. The streets are deeply worn with ruts. On the walls there are scribbled inscriptions, the famous graffiti, which are full of the gossip, scandal and politics of the city. The forum, a little southwest of the geographical centre of the town, was an open market place surrounded by buildings, the temple of Apollo lying to the west, the temple of Jupiter to the north and that of Mercury to the east. The last temple was flanked by the curia on the left and the house of Eumachia on the right; south of this house, across a street leading to the Sarno gate, was a school. At the intersection of this street with that connecting the Vesuvian and Stabian gates were situated the public baths; and near the latter gate were a second forum, called the "triangular," a temple of Isis north of it, a large and a small theatre to the east, the extensive gladiators' barracks to the southeast, noted for the fine arms, shields, helmets, etc., discovered here, and to the south a temple to Venus. The gladiators' quarters include a large rectangular enclosure, which measures 183 feet long by 148 feet wide. It is surrounded on all four sides by a colonnade whose columns are painted red at the lower part, and alternately red and yellow at the upper. The wall back of the columns is covered with stucco. Other baths are on the street crossing the city from the Nolan gate. The unfinished temple of Venus Pompeiana in the southern corner of the city, near the old Sea gate and the modern hotel, seems to have been the repository of many valuables, probably left by the inhabitants who escaped from the city at the first alarm. Valuable finds of the same sort are to be looked for in villas outside the city; in 1893 in a well at Boscoreale a set of silver utensils, lamps, mirrors and candelabra was discovered. The type of art in these pieces of silver and in the mural paintings is apparently Alexandrian, with a profusion of Grapes. Among the better known private dwellings, apart from the "Villa di Diomedes" already named, are the house of Pansa, one of the largest residences of the city, a pattern of the Roman house which has often been reproduced, notably at Saragossa; the house of the Tuccii, excavated in 1894, the home of a rich fuller, with brilliant, fresh frescoes, and the interior equipment of the house in such good condition that it has been left there instead of being carried to the Museum in Naples. The discoveries produced by the excavation of the ruins of buried Pompeii and Herculanum were of vast interest from the viewpoint of archaeology; but a far greater effect produced was from a popular standpoint, not only in the modern world of art, and the decorative arts especially. The early excavations created a classic influence in the architecture and decoration in France during the reign of Louis XV, which, with the more advanced disclosures, entirely dominated the style Louis XV, to become excuse for the debased copies of these antiquities in the empire style. In England the disinterest of these Glamorous ruins and their bringing into being the Adam Period of architecture and decorative art (1760-94).

POMPEY, pōm'pi (Cneius Pompeius), surnamed the Great (Magnus): b. 30 Sept. 106 b.c.; d. 28 Sept. 48 a. c. In 98-87 B.C. he served in the Social War with great distinction. For some years subsequently the part of Marius was in the ascendant in Italy, and Pompey, who belonged to the aristocratic party, kept in the background. Learning, however, that Sulla was about to return from Greece to Italy, he hastened into Picenum, and raised an army of three legions, with which he successfully defeated three generals of the opposite party, who attempted to prevent his junction with Sulla. That junction was accomplished in 83, and Sulla received the young soldier with the greatest marks of esteem. When the war in Italy ended, Pompey was sent to Sicily to aid the Marian general. He won a complete and speedy victory, and on his return was received by the people with great enthusiasm, and greeted with the surname of Magnus. He was also granted a triumph, a noteworthy distinction for one who had as yet held no public office. Subsequently he induced the Senate to send him to the aid of Metellus Pius, hard pressed by Sertorius in Spain. Pompey remained in Spain (76-71), but neither he nor Metellus could gain any advantage over Sertorius. But when the latter was treacherously murdered by Perperna, his own officer, the war was speedily brought to a close. On his return he defeated the fragments of the army of Spartacus, and claimed the glory of having finished the Servile War. He now became a candidate for the consulship, and although he was not of the legal age, and had not held any of the lower offices of the state, he was elected consul with Crassus at the end of 71. The aristocracy began to look upon Pompey with jealousy, and ceased to regard him as belonging to their
Pompey had established himself in Sardinia, and was preparing to march on Greece. He had sent ambassadors to the Senate at Rome, and offered to assist in the war against Egypt in return for recognition of his conquests. The Senate was divided in its opinion of Pompey's actions. Some senators believed that Pompey was acting in the best interests of Rome, while others considered his actions to be too ambitious and potentially dangerous.

The Senate eventually decided to send a commission to meet Pompey in Sardinia. The commission consisted of Tiberius Gracchus and Quintus Cornutus. They were to negotiate with Pompey and try to persuade him to return to Rome and submit to the authority of the Senate.

Pompey met the commission at Syracuse, and the negotiations began. However, the talks were not successful, and Pompey refused to return to Rome. He remained in Sardinia, and continued to expand his territory. The Senate was plagued by the knowledge that Pompey was acting without their permission, and the situation became more and more tense.

In the end, the Senate had to accept the facts and deal with the consequences of Pompey's actions. The question of how to handle the situation would have to be addressed in the future.
ATRIUM, OR COURT OF A HOUSE, IN POMPEII
Pompey the Younger—Pompey's Pillar

party, as he and his colleague openly courted the people—Crassus, by profuse largesses, and Pompey by the restoration of the tribuneship and other popular institutions. In 67 he was invested with extraordinary powers by sea and land. He was for the purpose of preventing an end to the outrages of the pirates in the Mediterranean, in which he was successful. Meanwhile the war against Mithridates had been carried on with varying fortune, and the Romans were discredit by the slow progres of Lucullus. The tribune, Caius Manlius, proposed that Pompey should have absolute power over the army and fleet in the East, and proconsular authority over all Asia as far as Armenia, a proposal supported by Cicero in the famous oration 'Pro Lege Manilia.' It was opposed by the whole influence of the aristocracy, but carried triumphantly. In 65–62 he conquered Mithridates; Tigranes, king of Armenia; and Antiochus, king of Syria. At the same time he subdued the Jewish nation, taking Jerusalem by storm after a three months' siege. He returned to Italy in 62, and disbanded his army, but did not enter Rome till the following year, when he had the honor of a third triumph. From this date till he was 45, his star began to wane. The aristocracy still distrusted him, yet he was unwilling to throw in his lot entirely with the popular party, which had been steadily rising in power during his absence, and over which Cesar now possessed unlimited control. The Senate refused to sanction his measures in Asia, and to make an assignment of lands which he had promised to his veterans. Pompey, therefore, resolved to ally himself closely with Cesar, who promised to obtain the ratification of his acts provided Pompey would assist him in the attainment of his ends. Through the mediation of Cesar Pompey became reconciled to Crassus, who, in consequence of his enormous wealth, had a wide influence in Rome. Thus was brought about the coalition of these three powerful men, which is known in Roman history as the first triumvirate. In order to tighten the bonds of alliance Cesar bestowed upon Pompey his daughter Julia in marriage. It was soon apparent that this alliance would not last, and as Pompey could brook no rival. The death of Julia in 54 severed one of the ties which bound the two men, soon to become open rivals. In consequence of the serious tumults which broke out in Rome on the death of Cælius in the beginning of 52, the Senate called in the assistance of Pompey, who was appointed sole consul for that year, and who succeeded in restoring order in the city. The most important state offices were now filled with Caesar's enemies, and Pompey the coalition led a Senate to pass a decree by which Caesar was to give up the provinces of which he was governor, and the command of his army. This he refused to do unless Pompey would throw up his offices, which was a step the latter would not take. Caesar was proclaimed an enemy to the state, and his rival was appointed general of the army of the republic. Caesar crossed the Rubicon in 49, and in 60 days was master of Italy without striking a blow. Pompey, to secure his life, he collected a numerous army, and was followed by Caesar in January 48. At first the campaign was in Pompey's favor; Caesar was repulsed before Dyrrhachium with considerable loss, and was compelled to retreat toward Tassaly. In this country, on the plains of Pharsalia, occurred the decisive battle which made Cæsar master of the Roman world. His rival fled to Egypt, where he was murdered in the presence of the king and the queen by an adventurer, M. T. Brutus, at the instigation of Achillas and Herodotus, who feared the anger of Cæsar. His head was struck off, and was shown to Cæsar, who, however, ordered the murderer to be put to death. Cæsar, now supreme, laid the foundations of the Roman Empire. The reign of Augustus was the Roman Empire. The reign of Augustus was the first of the Roman Empire. The reign of Augustus was the first of the Roman Empire.

POMPEY THE YOUNGER (SEXTUS POMPEIUS), Roman warrior, 2d son of Pompey the Great: b. 75 B.C.; d. 35 B.C. He accompanied his father in his flight into Egypt and after his death went to Spain, where he organized a force of fugitives and malcontents and demanded from the Roman Senate restitution of his father's property. The Senate granted him a large sum of money and made him commander of the seas. He marched to Africa, where he crushed all opposition and assumed the powers of a sovereign. Upon the formation of a second triumvirate in 43 B.C. he was proscribed and thereupon turned pirate, waging continued war upon Rome by cutting off her supplies. He made Corsica, Sardinia and Sicily, which islands he had captured, the seat of his power, and from them sent forth his marauders. When Rome reached the point of starvation the populace compelled Antonius and Octavianus to sue for peace and a treaty most advantageous to Sextus was signed, in which he was confirmed in his occupation of Sicily, Corsica, Sardinia and Achaia, and promised the consulship. The war was, however, speedily resumed, and Sextus twice defeated the fleets of Octavianus, but his indecision permitted the Romans to rebuild their fleets and in 36 B.C. he was signally defeated. He fled to Armenia, but being overtaken by his enemies and deserted by his troops, he surrendered, and was put to death at Mileius by the Roman legate, M. Titus, who wished to remove a man who might endanger the cause of a rupture between the triumvirs. He had assumed the name of Pluus, because he endeavored to avenge the death of his father and his brother, and this surname appears on many of his coins.

POMPEY'S PILLAR, the name of a celebrated column, standing on an eminence about 1,800 feet to the south of the walls of Alexandria in Egypt. It consists of a capital, shaft, base and pedestal, which last rests on substructions of smaller blocks once belonging to older monuments. One of these blocks bears the name of a monarch of the 13th Egyptian dynasty, and another that of Psammetichus I. The total height of the column is 98 feet 9 inches; the shaft, a monolith of red granite, is 73 feet long, and 29 feet 8 inches in circumference. The name it is popularly known by was applied to it by ancient travelers for no assignable reason. An inscription on the base shows that it was erected by Publius, the prefect of Egypt, in honor of Diocletian, probably commemorating his capture of Alexandria, and the suppression of the rebellion of Achilles. On the summit there is a circular depression of considerable size, intended to admit the base of a statue.
POMPEY'S THEATRE — PONCA DE LEÓN

POMPEY'S THEATRE, a theatre of ancient Rome, erected by the great Pompey and completed in 52 B.C. It was the first stone theatre of ancient Rome, with a noble interior and was variously stated to have seated 10,000, 17,000 or 40,000 people. After surviving many confiscations it finally collapsed in the 6th century. Some of the ruins are still discernible about the Palazzo Pio. Consult Flattner, S. B., 'The Topography and Monuments of Ancient Rome' (2d ed., 1911).

POMPONIATUS, Petrus, póm-pō-nā-shī-ūs pē-trūs (Latinized name of Pietro Pomponazzi), Italian philosopher: b. Mantua, 1462; d. Bologna, 1525. He was one of the leading Greek revivalists of the Renaissance and taught peripatetic philosophy in Padua and Bologna, endeavoring to purify the current Aristotelianism from the ecclesiastical admixture of scholasticism. In his essay 'De Immortalitate Animae' he taught that the application of Aristotle's method would necessarily result in a profoundly split and morbid mortality and confirmed the Greek criterion of 'virtue for its own sake' as an ethical standard, in 'Premium essentiale virtutis est ipsam virtutem quae hominem feli-cem facit.' His treatise 'De Incantationibus' was directed against the superstitions of his time. His works were published in Venice (1525) and in Basel (1567).

POMPONIUS, Lucas, Latin writer who flourished about 90 B.C. He was a native of Bonia. He was the first author to give form and finish to the Attellam Fabulae, the popular plays which he believed his time were largely improvidences. He introduced a written text in the technical form of the Greek playwrights. The parts of his work which have come down to us show a skilful use of the rustic dialects and not a little obscenity. The fragments are contained in O. Ribbeck's 'Sceincce romanorum poesis fragmenta' (Leipzig 1897-98). Consult Duff, J. W., 'A Literary History of Rome' (London 1909).

POMROY, Rebecca Rosignol, American nurse: b. Boston, Mass., 1817; d. 1884. She was the daughter of Samuel Holliday and in 1830 married William F. Pomroy. Her experience as nurse was gained within her own family circle, and at the beginning of the Civil War she offered her services to the government. During the war she was stationed successively at Georgetown Hospital, West Hospital, Baltimore and Columbia University Hospital, Washington, D. C. On two occasions Mrs. Pomroy attended the family of Abraham Lincoln. About the end of the war she had an attack of typhoid fever which left her an invalid for many years. Upon regaining her strength she was engaged as matron in a girls' reform home at Newton Centre, Mass., and subsequently in the Newton Orphan Home, since named the Rebecca Pomroy Home.

PONAPÉ, pōná-pā, one of the Caroline Islands (q.v.) in Micronesia, in form nearly circular with a diameter of 16 miles and an area of 140 square miles and rimmed by a coral reef three miles distant. The interior is mountainous, the coast fertile. Mangroves flourish and durian and vegetable-ivory nut are exported. Remarkable ruins consisting of great blocks of basalt have been found. The island belongs to the group of Eastern Carolines, of which the town of Ponapé is the seat of government. Pop. (est.) 2,000. Consult Pereira, 'La isla de Ponapé' (1906).

PONCA (pōn'kā) CITY, Okla., city in Kay County, on the Arkansas River, the Atchison, Topeka and Santa Fe and the Hutchinson and Southern railroads, 63 miles north of Guthrie. It contains flour mills, oil refineries, grain elevators, glass works and a tent-making factory and has extensive wheat-grinding and pampas factories. There is a public library and a considerable trade is carried on with the Indians. Pop. 2,521.

PONCA INDIANS, one of the five tribes of the so-called Dhegiha group of the Siouan family, forming with the Omaha, Osage and Kiowa, the upper Dhegiha or Omaha division. The Ponca and Omaha Indians have the same language, differing only in some dialectic forms and approximating the Quapaw rather than the Kansa and Osage languages. They are a partly civilized and peaceable race. They became separated into two bands; one, numbering about 225, remained in the former Indian Territory, while the other, numbering about 225, retained their reservation in Nebraska. In 1906 the bands numbered respectively 570 and 263, total 833.

PONCE, pōn's, Porto Rico, city, capital of the department of Ponce, three miles from the coast. It is the second largest city of Porto Rico and the first in commercial importance. Coffee is the most important export. Other exports are sugar, rum, molasses and tobacco. The main part of the town is connected with the port, Playa, by a good road and electric railway. The harbor is large and accommodates vessels drawing 25 feet; the custom-house is located at Playa. Ponce is connected with Yanco, 20 miles distant, by railroad and with San Juan and Arecibo by highways. The greater part of the inhabitants are engaged in commercial and mercantile pursuits; but there are a few mechanical industries, shoemaking, etc., and the mechanics of Ponce excel in the quality of their workmanship. The city is considered the most progressive on the island; it is well built and its houses are large and commodious. The streets, several plazas or open squares, the largest of which is the Plaza Principal and a number of handsome residences. It has also the best market-house and best market on the island. The water supply is excellent; there are electric lights and electric railways; the chief buildings include the church of Our Lady of Guadalupe (Roman Catholic), a Protestant church, the municipal hall and two theatres. There are also several asylums and hospitals. The city has a public library and a good public school system has been established since the American occupation. In 1918 the city had two earthquake visitations; in the second (15 October) Red Cross workers estimated that 600 families were rendered homeless.

PONCE DE LEÓN, pōn'shā dā là-ó'n, Fray Luis de, Spanish theologian and poet: b. Belmonte, La Mancha, 1527; d. Madrigal, Spain, 23 Aug. 1591. He entered the Augustinian order at 16, was educated at the University of Salamanca, where he later became professor of theology and of Thomistic philosophy. As a linguist and a theologian he became famous,
Helmets, Shields, Gauntlets, etc., found in the "Gladiators' Barracks"
but in 1572 was brought before the Inquisition on a charge of Lutheranism and of having translated into Spanish without authorization the 'Song of Solomon.' He was held in prison until 1575, when he was reinstated in his offices in the university and subsequently became vicar-general and finally provincial of his order. His lyrical poetry is chiefly of a religious character and though small in quantity is of great merit. He translated the 'Eclogues' of Virgil, about 30 odes of Horace, 40 of the Psalms, besides selections from modern Greek and Italian poets. His most popular prose work was 'Perfecta casada' ('The Perfect Wife,' 1583), a treatise in the form of a commentary on portions of Proverbs, a treatise on widely duties. Another notable prose work was a treatise on the 'Names of Christ' (1583). The best edition of his works is that of Merino (6 vols., 1804-16). Counsel of Gonzales de Tejada for the 'de Fra Luís de León' (1863); Ford, J. D. M., 'Luis de León, the Spanish Poet, Humanist and Mystic' (in the 'Publications of the modern Language Association of America,' Vol. XIV, No. 2).

PONCE DE LEÓN, Juan, Spanish discoverer: b. Leon, about 1460; d. Cuba, 1521. He fought in the conquest of Granada and in 1493 shipped with Columbus on the admiral's second voyage. Subsequently he held under Ovando the post of governor of the eastern portion of Españaola, in 1508 undertook the conquest of Porto Rico and in 1510 was made governor of the island. He had already played a brave part in the struggles attending Spanish colonization in the New World, when in 1512 he obtained from King Ferdinand permission to conquer Bimini. The Ledo-shaped island was spoken of a land called Bimini, north of Españaola and in the 1511 edition of the 'Decades' of Peter Martyr is a map on which appears a large island named Beimeni. To this Bimini Ponce de León was going for the 'Fons Jovis ventosae,' or fountain of youth, the belief in such a fountain being a part of the folklore of his day. A spurious letter purporting to be from John Prester (q.v.), circulated through England at this time, of such a fountain. Sir John Mandeville calmed appropriated the story, described the fountain as at a place called Polombe and said that he drank thereof thrice, and 'feel me the better and the haler.' Stories of an island northward of Españaola, where a fountain of youth was, must have been long ago in Spain; for the same 1511 edition of the 'Decades' refers to them. In the patent granted in 1512 to De León, condition was made that the island had not been already discovered. In March 1513 the veteran set sail with three caravels from San German in Porto Rico. On the 27th he came in sight of the mainland on which he landed, 2 April, taking possession in the name of the king and calling the region Florida, since 27 March had been Easter Sunday, styled by the Spaniards Pascua Florida ('flowery Easter'). The spot at which he landed was a little northward of the present site of Saint Augustine. He then coasted about the peninsula to the west side, reaching lat. 27° 30'. The bay at which he arrived was long known as Juan Ponce. He reached Porto Rico on the return voyage 21 September. He had to subdue the Caribs, a long undertaking; and not until 1521 did he attempt a new expedition. Then with a new patent for conquest and settlement, he set out with equipment for starting a colony. The hostility of the Indians, however, rendered the success of the enterprise doubtful. Ponce De León was severely wounded by an arrow and returned with the whole expedition to Cuba, where he died of his wounds. He had not discovered that Florida was not an island, but he opened the path to this knowledge.

PONECELT, pons-la, Albert, Belgium clergyman: b. Liège, 30 Aug., 1861; d. Montpellier, France, 19 Jan., 1912. He was educated at Liège, Tronchiennes and Louvain; entered the Society of Jesus in 1878 and was professor of grammar at Saint Michael's College, Brussels, in 1884-85. In 1888-89 he was assistant editor of 'Acta Sanctorum' and was ordained to the priesthood in 1891. From 1892 to 1912 he was charged with the practical direction of 'Analecta Bollandiana' at Brussels. He compiled one volume of 'Acta sanctorum Belgii' (1911). His works include 'Analecta ex consecutius hagiographicis Johannis Gielmansi' (1885); 'Catalogus Codicum Hagiographicorum Latinorum Bibliothecarum Romanorum praeter quam Vaticanum' (1909); 'Catalogus Codicum Hagiographicorum Latinorum Bibliothecae Vaticanae' (1910); 'Bibliotheca Hagiographica Latina antiquae et medio ætatis' (1911). He edited 'Annales de l'Abbaye de Saint Ghislain par Dom Pierre Bandry et Dom Augustin Durot' (Vols. X, XI, XII, 1897), etc., and contributor to 'The Catholic Encyclopedia,' 'Analecta Bollandiana,' 'Précis historique' (Archivio della R. Societá Romana di Storia Patria,' Deutschc Literaturzeitung, etc.

PONECELT, Jean Victor, French military engineer: b. Metz, 1 July, 1788; d. Paris, 23 Dec., 1867. Between the years 1807 and 1810 he attended the Ecole Polytechnique, where he was a pupil of Monge. In 1812 he received the commission of lieutenant in the engineers, but on Napoleon's retreat from Moscow was taken prisoner and transported to Saratov, on the Volga. On returning to Metz in 1814 he worked out the geometrical problems he had begun to consider during his captivity, and attained little recognition from the French Academy. In 1829 he published his 'Traité des Propriétés Projectives des Figures.' He henceforth gave himself closely to the study of applied mechanics; invented the water wheel which bears his name and published numerous works on mechanics. In 1835 he was appointed member of the National Defences Commission and professor of applied mechanics in the University of Paris. He was promoted general in 1848 and went to the Exhibition of 1851 at London as president to the Commission of Mechanics. In 1857 he published his important account of the progress of mechanical science, 'Collection des Travaux de la Commis' n Française. The work which he published in Saratov — 'Application d'Analyse et de Géometrie' — he published in 1862. He was really the founder of modern geometry and had gained great influence among German mathematicians at a time that his countrymen had accorded him only scant recognition. Among his other works are 'Les Roues Hydrauliques Verticales' (1826); 'Expériences Hydrauliques' (1832); 'Traité de Mécanique Appliqué aux Machines'
PONCHO — POND SNAIL

(1845); 'Applications d'anay. se et de géométrie' (2 vols., 1862-64), etc. Consult Didion, 'Notice sur la Vie et les Ouvrages du Général Poncet' (1869).

PONCHO, a kind of cloak worn by the Indian and Spanish inhabitants of South America. It resembled a narrow blanket with a slit in the middle, through which the head passes, so that it hangs down loosely before and behind, leaving the arms free.

POND, Frederick Eugene ('Will Wildwood'), American author and journalist; b. Fackwaunee, Wis., 8 April 1850. He was educated at Montello, Wis., and early turned to journalism, in which he made sporting matters his specialty and was one of the first to urge the establishment of a National Sportsman's Association. In 1881-86 he was field editor of Turf, Field and Farm, edited Wildwood Magazine in 1888-89, and when it was merged with Turf, Field and Farm, he became corresponding editor. Since 1897 he has edited the Sportsman's Review. From 1893-95 he was secretary of the National Game Protective Association. He has published 'Handbook for Young Sportsmen' (1876); 'Gun Trial and Field Records of America' (1885); 'A Strike' (1897); edited Frank Forrester's works (1879); 'Sports' (1895); Hallock's 'An Angler's Reminiscences' (1913) and has contributed to the 'Cyclopedia of American Biography.'

POND, James Burton, American lumber merchant; b. Cuba, Allegany County, N. Y., 11 June 1838; d. Jersey City, N. J., 21 June 1903. His parents settled in Wisconsin in 1847 and there he learned the printer's trade. He edited the Weekly Journal of Markeesan, Wis., 1860-61, and becoming 2d lieutenant in the 3d Cavalry Volunteers of that State, rose to the rank of major and was among 17 survivors of the general loss of the regiment's massacre of a band of 118 soldiers at Baxter Springs, Kan., in October 1863. Between 1865 and 1874 he engaged in business and was it as the manager of the lecture tour of Mrs. Ann Eliza Young, the Brigham Young, when she denounced Mormonism, that he chanced to take up the business of manager and for the rest of his life he continued to manage platform speakers. He went to New York in 1879. Among famous men whom he managed are Wendell Phillips, William Lloyd Garrison, Robert G. Ingersoll, Henry Ward Beecher, Bill Nye, Max O'Rell and the Dean of Ely, Charles William Stubbbs. He published 'Eccentricities of Genius' (1900); 'A Summer in England with Henry Ward Beecher.'

POND, John, English astronomer; b. London, 1767; d. Blackheath, Kent, 7 Sept. 1836. He was educated at Cambridge, traveled extensively and on his return to England in 1798 settled at Westbury, near Bristol, where he engaged in astronomical observations. He erected their instrumentarium and a house two and a half feet in diameter and by a series of observations proved that the quadrant then in use at Greenwich had changed its form through age, rendering the re-equipment of the Royal Observatory a necessity. He removed to London in 1807, was elected a fellow of the Royal Society and in 1811 was appointed astronomer royal. By means of the six-foot mural circle mounted by the Royal Society in 1812 Pond compiled a catalogue of the north polar distances of 84 stars, which he presented to the society in 1813. In 1821 he substituted the mercury-horizon for the plumb-line and raised the spirit level and in 1825 commodiated the system of making observations alternately by direct and reflected vision, for further experiments in which direction he was subsequently transferred to Queen's College, Belfast. Though his mathematical knowledge was slight and his work wholly technical, he nevertheless performed valuable services to science and succeeded in introducing modern methods and instruments at the national observatory. He first used two instruments for direct and reflected observations of the same star; invented the method of observing in groups; and was the first astronomer who advocated the practice of depending upon masses of observations for all fundamental data. He was pensioned and retired in 1835. He published a catalogue of 1,113 stars (1835), a work of great value and accuracy. His other publications include the volumes of ' Greenwich Observations,' during his astron- omical; various 'Papers' in the 'Transactions' of the Royal and Royal Astronomical Societies; and a translation of the 'Système de Monde' of Laplace.

POND LAW, the, in American politics and legislation an act passed by the Ohio legislature in 1882, for the regulation of the liquor traffic. For eight years the liquor question had agitated Ohio politics and the Republicans finally adopted the Pond Law for the taxation of liquor selling. The law was afterward declared unconstitutional by the Supreme Court of the State.

POND-SKATERS, long, narrow bugs of the hemipterous family Hydrocoraxide which glide swiftly over the surface of ponds and quiet pools in search of prey. The front pair of legs, comparatively short, serve to seize prey or to cling to a support; while the strong middle and hind legs carry the insect rapidly over the surface, the film bending but not breaking under the feet, which are covered with a velvety fur; and when the insect dives it carries down a jacket of air, upon which it sustains breathing for a considerable time. Consult Howard, 'The Insect Book' (New York 1902). See Fresh-Water Insects.

POND SNAIL, a small surf smelt, numerous along the shores of Bering Sea and regarded as excellent food.

POND SMELT, a small fresh-water pulmonate mollusk of the family Limnside. In this family the shell is large and thin, the lip sharp, the muzzle short and broad and the eyes are placed at the base of the tentacles. The genera Limns, Physa, Ancylus and Planorbis are prominent. The first-named genus contains the gracefully spiral water-snails with triangular tentacles, numerous in all parts of the world and mostly less than an inch long; a widespread and familiar species is Limns axialis, which is covered over twice that length and the aperture widely flaring. This form is found in streams and pools and crawls upon the leaves and stems of aquatic plants. The equally common genus Planorbis possesses a flattened disc-shaped shell, the whorls of which are coiled round a central axis and lie in one plane. The shell aperture is crescentic in shape, and the foot is round and
short. The genus *Physa*, represented all over the United States by *P. heterostropha* (see *Spira*). Its spiral whorls of the shell turned to the left hand; the tentacles are long and slender and the edge of the mantle is fringed.

**PONDICHERY,** pōn-di-shër’ (French, *Pondichéry*, pōn-dē-shā-re), India, the capital of the French possessions in India, on the east coast and south coast, 83 miles on the south west of Madras. Its territory, with an area of 107 square miles, is surrounded on the land side by the British district of South Arcot. It stands on a sandy beach, and consists of two divisions separated by a canal. The "White Town," or European quarter, on the east, facing the sea, is regularly laid out, contains a spacious square, in which is the government-house, handsome planted boulevards and a number of well-built houses. The "Black Town," or native quarter, on the west beyond the canal, consists mainly of huts of brick or earth and a few pagodas. Its streets are broad and shaded by palm-trees, but filthy. The fortifications, formerly strong, were destroyed during the war with the British, and the rest of Pondicherry was not to be rebuilt nor is Pondicherry to be garrisoned by a native French force. The province is partly watered by the Gingee River, but is not very fertile: some rice, indigo, tobacco, betel, cotton and coconuts are raised; which, with cotton cloths and oil seeds, form the chief exports. The imports consist chiefly of manufactured goods. There is no harbor, but only a roadstead, where the surf beats almost as strongly as at Madras. There is, however, an iron pier. The town has been provided with a good supply of drinking water. The settlement was purchased by the French from the Bejapoor rajah in 1672. It was several times taken by the British, the last being in 1803, being restored in 1815. The population of the town in 1916 was 47,998; of the province, 168,344.

**PONDOLAND,** province of the Cape of Good Hope, a maritime district; area, 3,906 square miles. Its vegetation is luxuriant, and it is well adapted for the rearing of cattle and sheep. The Saint Johns River flows through its south-stocks, and is an excellent harbor. It was the last part of Kaffraria that remained independent until it became a British protectorate in 1884, and was annexed to the cape in 1894. On 31 May 1910, the colony was merged in the Union of South Africa, thereafter forming an original province of the union. Pop. 234,637.

**PONIATOWSKI,** pō-ni-a-tōv’skē, the name of an illustrious Polish family descended from an Italian stock. Giuseppe Salinguerra (b. 1612), of the Italian family Torelli, having settled in Poland, took the name of Eziolek, and afterward that of Poniatawski, from the estate of Poniataw belonging to his wife. Among important descendants of his may be cited (1) Stanislas, Count Poniatawski (b. 1678; d. 1782), known for his connection with Charles XII, whom after the battle of Pultava he followed to Sweden, and as atraise and ambassador at Constantinople, he had the address to involve the Porte in a war with Russia. He wrote "Remarques d’un Seigneur Polonais sur l’Histoire de Charles XII par Voltaire" (1741). (2) His eldest son, Stanislas Augustus (b. 1732) was elected king of Poland in 1764. (See STANISLAW I), has (3) Joseph Anton, nephew of King Stanislas (b. Warsaw, 7 May 1762; d. Leipzig, 19 Oct. 1812). When the Poles attempted in 1794 to drive the Russians out of their country, he joined the Polish camp as a volunteer. Kosciuszko gave him the command of a division, at the head of which he distinguished himself at the two sieges of Warsaw. On the creation of the duchy of Warsaw, Poniatawski accepted the place of Minister of War in the new state. In 1809 he commanded the Polish army against the superior Austrian force sent to occupy the duchy, and compelled it to retire. In the war of 1812, against Russia, he was again at the head of the Polish forces, and distinguished himself throughout this campaign. After the battle of Leipzig, during which Napoleon created him marshal of France, he was ordered (19 Oct.) to cover the retreat of the French army; with a handful of men he protected the retreat until he was twice wounded. He was sorely pressed by the enemy on the banks of the Elster River, he spurred his horse into the stream and was drowned. His body was afterward removed to Warsaw, and in 1816 was deposited in the cathedral at Cracow. An equestrian statue of Poniatawski was executed for the city of Warsaw by Thorwaldsen.

**PONS ASINORUM,** pōnz äz-nôr’züm (*the bridge of asses*), a Latin expression applied, early in the 16th century to a diagram showing how to find middle terms to arguments. The original allusion seems to have been the difficulty of getting across a bridge. The name is also given to the fifth proposition of the first book of Euclid, which sets forth that, if a triangle has two of its sides equal, the angles opposite to these sides are also equal.

**PONSARD,** François, frâⁿ-so, pōn-sahr, French dramatist: b. Vienne, Dauphiné, 1 June 1814; d. Paris, 13 July 1867. His first venture in literature was made with a translation of Lord Byron’s ‘Manfred’ (1837), and his first success was his ‘Lucrèce,’ produced in 1843, and welcomed as a return from romanticism to classicism. As the mouth of the Seine is an excellent harbor. It was the last part of Kaffraria that remained independent until it became a British protectorate in 1884, and was annexed to the cape in 1894. On 31 May 1910, the colony was merged in the Union of South Africa, thereafter forming an original province of the union. Pop. 234,637.

**PONSON DU TERRAIL,** pōn-sō̃ do tār-ē, Éric Alexis, French romancer: b. Montmaur, Isère, France, 8 July 1829; d. Bordeaux, 31 Jan. 1871. He wrote a large number of novels which were very popular with an un critical public. Among his works are ‘Les Couteuses du Monde’ (1853) which established his fame; ‘Gown and Sword’ (1857); ‘The King of Nandy’s Mistresses’ and ‘Gifts of World’s Great Bohemians’ (1867); ‘Aurora’s Amours’ (1870).

**PONT, Timothy,** Scottish geographer, son of Robert Pont: b. about 1560; d. about 1630. He was graduated from St Andrew's in
1584, was Minister of Dunnet, Caithnessshire in 1601. In 1609 he subscribed for 2,000 acres of forfeited lands in Ulster and soon after conceived the idea of a Soo line in Ulster. An assurance of his plan he visited all portions of Scotland to the most remote and dangerous sections, making his maps on the spot. He died some time between 1625 and 1630 and his maps, which were exceedingly neat and accurate, were ordered by the Abyssinian king to be purchased and published. In the troublesome times following they were forgotten until rescued by Sir John Scott of Scottstarvet, and published in Bleau's 'Atlas' (Vol. V, 1668).

PONT-À-MOUSSON, pōn'tā-moo'sōn, France, town in the Department of Meurthe-et-Moselle, 16 miles northwest of Nancy, on the Moselle, which divides the town. It contains the Gothic Church of Saint Martin, begun in the 13th century, the town hall, an old convent now used as a petit seminaire, a communal college, blast furnaces and several industrial establishments, including potteries, textile mills, sugar factories, paper and card board mills, cable works, etc. The town was founded about the late 9th century and in 1572-1763 was the seat of a university. It suffered greatly in the Great War of 1914-18, being captured by the Germans early in the war and held by them despite several attempts by the French to retake it. In the autumn of 1918 after the Americans wiped out the Saint Mihiel salient the town was again close to the battle lines. Pop. 14,000. See War, European.

PONTA DELGADA, pōn'tā dél-gā'dā, or PONTE DELGADA, Azores, town on the island of Saint Michael, the largest town in the islands. It is defended on the west side by the castle of Saint Braz, and about three miles to the east by the forts of São Pedro and Rosto de Cão. The principal buildings are churches, monasteries, convents, and an English chapel. The town was founded in 1604, but was on the site of an old town since 1584. The harbor accommodations are good. The trade is considerable, and is chiefly with the British, of whom a considerable number are residents. The chief exports are wheat, maize and sugar, and the imports are manufactured and silk goods and hardware. Pop. about 16,179.

PONTANO, pōn-tā'nō, Giovanni Gioviano, or PONTANUS, Jovianus, Italian poet: b. Cerreto, 1426; d. Naples, 1503. He was educated at Perugia and at 22 settled in Naples. There he received a government appointment; became tutor to the sons of Alphonso the Magnanimous; and finally became chancellor. He founded an academy of letters at Naples and was a favorite at court and with the literary men of that capital. For having welcomed Charles VIII of France in 1495 Pontano was in disgrace after the Restoration. He is a figure of political importance in southern Italy but is best known for his poems and dissertations. His Latin is quite pure and his works are of interest in the study of the social life of the period. His chief works are 'Urania,' Latin didactic poem in hexameter; 'De Hortis Hesperidum'; 'De conjugal amore'; 'Eridans'; 'Tumuli'; 'Naeniae'; 'Baiae.' His works were published at Venice (5 vols., 1505-15). Consult Arditò, 'Giovanni Pontano e i suoi tempi' (Naples 1871) and Symonds, 'Renaissance in Italy.'

PONCHARTRAIN, pōn-chär-trān', a lake of Louisiana, about five miles north of New Orleans, 40 miles long from east to west, and nearly 25 wide. The water is generally from 12 to 14 feet deep. It communicates with Lake Borgne on the east and with Lake Maurepas on the west. It is connected with New Orleans by a railroad, by Bayou St. John and a canal, and also by a long embankment. It is surrounded by marshes, which have a dense vegetation of water plants. The residential sections, Madisonville and Mandeville, are on the north shore.

PONTEDERIAE, a family of aquatic plants, the pickerel-weeds, which are perennial water of marsh herbs, with perfect, mostly irregular flowers from a one-leaved spathe; perianth corolla-like, equally six-cleft. One genus is Pontederia, with one American species (P. cordata); another genus is Heteranthera, with three species.

PONTEFRACT, or POMFRET, England market town and parliamentary borough of Yorkshire, 20 miles south-southwest of York, on the Midland, Lancashire and Yorkshire and Northeastern railroads. It has a grammar and other schools and has extensive agricultural interests. Licorice is a specialty for the manufacture of Pontefract lozenges since 1562. The remains of a Roman camp have been discovered nearby and there are ruins—an old castle in which Richard II died. The water-supply system, cemetery, markets and recreation grounds are owned by the town. Pop. 15,989.

PONTEVEDRA, pōn-te'vā'dra, Philippines, (1) pueblo, province of Negros Occidental, on the western coast on Guimaras Strait at the mouth of the Mangla River, 22 miles south of Bacolod, the provincial capital. It is a military station. Pop. 12,000. (2) Town, province of Cápiz, island of Panay, 12 miles southeast of Cápiz, the provincial capital. Pop. 9,500.

PONTIAC, pōnt'ē-āk, Indian chief: b. on Ottawa River, about 1720; d. Cahokia, III, 1829. He became head of the usually friendly tribes of the Ottawas, Ojibways and Pottawatomies, and it is thought that he led the Ottawas at the defeat of General Braddock (q.v.) near Fort Duquesne. After the taking of Quebec, Major Rogers was despatched to take possession of the western forts for Great Britain, under the terms of the treaty of Paris. Pontiac objected to this procedure, which he regarded as an invasion of his domain, and as a result began to plot the complete extermination of the English. In 1762 he sent out messengers who secured the allegiance of all tribes as far as the lower Mississippi in a confederation against the common enemy. The plan, as arranged, was that each tribe was to attack the fort nearest to it and that there should be a combined descent upon the undefended settlements. A great pow-wow or council was held. 27 April 1763 near Detroit; Pontiac made a stirring oration, rehearsing the wrongs inflicted upon the Indians by the English. He then himself to make an attempt to capture Detroit on 7 May, but the design was revealed, and Pontiac could lay siege only to the fort. But a long
investment was a thing foreign to Indian warfare, and the lines were so loosely drawn that provisions were freely smuggled into the fort. Pontiac was supplied by the Canadians, and paid in promissory notes of birch-bark, later, it is said, scrupulously redeemed. Schooners sent through Lake Erie with supplies and reinforcements were captured by the savages, but at last one with ammunition and provisions did succeed in reaching the fort. The besieged thereupon believed themselves strong enough to venture a sally against the Indian encampment, but Pontiac, warned of the project, defeated them in the battle of Bloody Bridge (31 July). The siege was sustained until 12 October, when Pontiac withdrew his forces to the neighborhood of the Maumee. This part of the conspiracy had, it is true, been a failure; but elsewhere the success was remarkable. When the detached and unorganized character of Indian warfare is considered, recognition must be made of the notable diplomatic and military talent of the chief who directed the largest and most powerful coalition in Indian history, and came so near to realizing his grand object. Of 142 fortified points of attack eight were taken, while the garrisons of most were massacred; several English expeditions were annihilated; and the frontiers were desolated and terrified. Hostilities continued in a desultory fashion into 1764, but by 1765 Pontiac formally made peace at Detroit, and in the summer of 1766 concluded a treaty with Sir William Johnson at Oswego, N. Y. In 1769 a Kaskaskia Indian, bribed by an English trader, murdered Pontiac; in vengeance the northern tribes made war on the Illinois group, which was all but exterminated. Consult Parkman, 'The Conspiracy of Pontiac' (1851; new ed. 1898); 'Handbook of American Indians' (Bureau of American Ethnology, Vol. II, 1910).

PONTIAC, Ill., city, county-seat of Livingston County, on the Vermillion River, and on the Illinois Central, the Wabash and the Chicago and Atlantic railroads, about 95 miles north by east of Springfield and 90 miles south by west of Chicago. It was settled about 1825, but was founded permanently in 1829, by colonists from Indiana and Ohio. In 1856 it was incorporated, and received a city charter in 1872. It is in a fertile agricultural region in which stock-raising is given considerable attention. In the vicinity are extensive coal-fields. The chief industrial establishments are candy factories, a hook and eye factory, box factory, and large shoe factories. There is considerable trade in coal, grain, livestock and manufactures. The principal public buildings are the State Reformatory for juvenile offenders, which will accommodate 1,500, the city hall, the public library, and the church and school buildings. Pop. about 6,000.

PONTIAC, Mich., city, county-seat of Oakland County, on the Clinton River, and on the Grand Trunk and the Pontiac, Oxford and Northern, railroads, about 26 miles northwest of Detroit. It was settled in 1818–20, incorporated as a village in 1837, and in 1861 was chartered as a city. It was named after the Indian chief Pontiac. It is in a section of beautiful lakes, in which there is considerable hunting and fishing. It is surrounded by an agricultural region, and has a number of industries connected with farm and forest products. The chief manufacturing establishments are automobiles and accessories works, farm implement works, foundry products, carriage factories, machine shops, flour and lumber mills, knit-goods factory and gas and gasoline engine works. There is considerable trade in farm products, fruit, vegetables, wool and carriages and wagons. It has the State Hospital for the Insane, a library building (ladies' library), a public high school library, public and parish schools and churches. The government of the city is now conducted on the commission plan. The city owns and operates the waterworks. Pop. 17,524.

PONTIANAK, pōn-tē-ā-nāk', West Borneo, town and capital of the Dutch settlements on the west coast of Borneo; on the Kapuas or Pontianak River, at the mouth of the Lapadak, in the administrative division of the outports. It is on the equator and 110° 20' E. longitude. It is in a region in which the chief productions are rice, sago, sugar, birds' nests, pepper and wine. Salt, opium, soap, tobacco, wares and machinery are introduced. Pontianak is the chief port of West Borneo, which has an area of 55,825 square miles and population estimated in 1912 at 467,158. It has a Dutch resident. Pop. 10,000.

PONTIFEX, one of the highest priestly colleges at Rome, to which was entrusted the oversight of all religious observances, public or private. Their institution, like that of all important matters of religion, was ascribed to Numa. The number of pontiffs was originally probably six, all patricians, exclusive of the king, whose place, after the abolition of the monarchy, was taken by the pontifex maximus, or chief priest. The Ogulian Law (300 a.c.) raised this number to eight, or, including the pontifex maximus, to nine, five of whom were to be plebeians and the other four patricians. In the time of Augustus, Tiberius, and Caligula, from 15 and Julius Caesar to 16, including in both these instances the pontifex maximus. The duty of this dignitary was the inauguration of the priests, and in earlier time the care of the public records (annales maximi). He also superintended the sacred rites of Vesta, held his office for life, and could not leave Italy. The emperors afterward assumed this title until the time of Theodosius, and it was subsequently assumed by the Christian bishop of Rome. The pontifices also had the care of the calendar, and decided lawsuits which were connected with religion (hence the jus pontificum). The external badge of the pontifex, at least on solemn occasions and while engaged in the duties of his office, was a dress bordered with purple (toga praetexta), and a tapersing hat made of the skins of sacrificed animals (galerum). Consult Bouché-Leclercq, 'Les Pontifes de l'Ancienne Rome' (1871); Mommsen, 'Römisches Staatsrecht' (1856–88); Winslow, 'Religion und Kultus der Römer' (1902).

PONTIFICAL ORDERS. See Orders, (Royal) and Decorations.

PONTIGNY, pōn-tē-nē, France, a village on the left bank of the Serein, in the depart-
PONTINE MARSHES — PONTUS

ment of Yonne, on the railway between La- roche and Isle-Angely. Its abbey, founded in 1114 by monks from Citeaux, was itself the mother abbey of 43 monasteries. Thomas à Becket, Saint Edmund of Canterbury and Stephen Langdon spent their exile here, and Saint Edmund died and was buried in the monas- tery, which was destroyed in 1569, and destroyed in the Revolution. The abbatical church (mainly 1150-70) is one of the finest examples of Cistercian architecture. The shrine of Saint Edmund (18th century) in this church was visited by a large number of Eng- lish Roman Catholics in 1874. Consult Chaillot des Barres, 'L'Abbaye de Pontigny' (1844).

PONTINE (pön'tèn) MARSHES, Italy, a swampy plain, 18 to 30 miles long and 6 to 10 miles wide, lying 25 miles southeast of Rome, bounded on the south and west by the Tyrren- hian Sea and sand dunes covered with oaks, and on the east by Monti Lepini. Only a small part of this large area is actually marshy, but enough to make the whole region and much of its surroundings very unhealthy, the marsh vapors being carried to Rome itself by the south wind. This was probably the cause of the Ro- man fever. In the early days of the Roman republic the Volscians possessed the Ager Pomatinus, possibly so named from Suessa Po- metia, one of its cities, and by elaborate en- gineering made it habitable and fertile. But the inhabitants, which its 33 cities were conquer- ed and driven out by the Romans in 358 B.C., and the land soon became dangerous; even in 312 B.C. its centre was pierced by the great Appian Way built by Appius Claudius. Cethegus attempted to drain the marsh about 160 B.C. Julius Caesar planned to turn the Tiber into it, but died before the undertaking was commenced. Augustus built several canals, and after him Nerva, Trajan, Theodoric, and 18 popes attempted to better conditions. A law passed in 1899 by the Italian government voted 7,000,000 lire to complete the work, which is estimated to take 24 years. The region has a scanty population of farmers and shepherds, who, however, only spend a part of the year here. Consult Blainville, Ménard de la, 'Le Drainage antique' (1882); Berti, 'Paludi Pontiche' (1884); Donat, 'Die Pontinischen Sumpfe' (1898).

PONTMARTIN, pön'mär-täń, Armand Ferrand, Count de, French author: b. Avignon, 1811; d. 1890. He received his education in Paris; became interested in journalism about 1830 and soon became prominent as a critic. He is the author of many novels written in a brilliant style; his best works are 'Causeries littéraires' (1845-56); 'Causeries du samedi' (1857-61); 'Semaines littéraires' (1861-63); 'Souvenirs d'un vieux critique' (1881-89). Consult his 'Mémoires' (1885-86).

PONTOON, in military engineering a flat- bottomed boat, or any light and buoyant frame- work or floating body, used in the construction of a temporary bridge for the passage of troops over a river or arm of the sea. As pontoons form part of the equipment of any army they must be able to cross rivers quickly, and as is customary with safety. The pontoons used by armies have differed greatly at different times, the two chief types being a kind of undecked boat, and a decked boat or close cylinder. The introduc- tion of pontoons may be considered to date from the 18th century, although long previous to this similar means were used for the passage of streams. Darius passed the Hellespont and Danube by pontoon bridges. In the World War American engineers constructed many pontoons to afford passage across streams where the Germans had wrecked bridges.

PONTORMO, Jacopo Carucci (commonly known as Jacopo da Pontormo), Italian painter: b. Pontormo, near Florence, 1494; d. Florence, 1556. He was a pupil of Andrea del Sarto and painted history and portraits. At 13 he was left an orphan and sent to live at Florence as a pupil of Leonardo da Vinci. He also studied under Pietro di Cosimo and Mariotto Alberti- nelli. His early work won the approval of both Raphael and Michelangelo, who foretold his future greatness. His pictures are often mistaken for those of Andrea, and the best of them are those produced soon after he had been dismissed from the school of del Sarto who, it is said, had grown jealous of him. He, however, altered his style several times, and the look at the pictures probably of the Ro- man fever. In the early days of the Roman republic the Volscians possessed the Ager Pomatinus, possibly so named from Suessa Po- metia, one of its cities, and by elaborate en- gineering made it habitable and fertile. But the inhabitants, which its 33 cities were conquer- ed and driven out by the Romans in 358 B.C., and the land soon became dangerous; even in 312 B.C. its centre was pierced by the great Appian Way built by Appius Claudius. Cethegus attempted to drain the marsh about 160 B.C. Julius Caesar planned to turn the Tiber into it, but died before the undertaking was commenced. Augustus built several canals, and after him Nerva, Trajan, Theodoric, and 18 popes attempted to better conditions. A law passed in 1899 by the Italian government voted 7,000,000 lire to complete the work, which is estimated to take 24 years. The region has a scanty population of farmers and shepherds, who, however, only spend a part of the year here. Consult Blainville, Ménard de la, 'Le Drainage antique' (1882); Berti, 'Paludi Pontiche' (1884); Donat, 'Die Pontinischen Sumpfe' (1898).

PONTUS, in ancient geography, a country of northeastern Asia Minor, originally the part of Cappadocia lying between Armenia and Col- chis and the Halys River; it included Cappado- cia on the Pontus (that is, Euxinus, or Black Sea), and then simply Pontus. The country on the east and south is mountainous, but along the coast there are large and fertile plains. A son of the Persian king Darius, Artaxerxes, received Pontus as a separate satrapy, with the right to transmit it as an inheritance to his posterity. One of his successors, Mithridates (about 400 B.C.), assisted the younger Cyrus, and refused to pay tribute to Artaxerxes. His son, Ariobar- zanes I (363-337), made himself independent during the general insurrection of the governors of Asia Minor against Artaxerxes II. Mithri- dates II (337-302) transferred his kingdom voluntarily to Alexander. Afterward, in the division of his empire in 322, it fell to Ant- itigor's. His successor, Mithridates II (280), enlarged his paternal kingdom by con- quests, and was succeeded by his son Ariobar- zanes III, who reigned from 266 to about 240 B.C., and he again by his son Mithridates IV,
whose reign extended to about 190 B.C. He drove back the Gauls, who at various times in the course of the 3d century B.C. invaded Asia Minor, formed settlements there, and attacked Pontus and Phrygia. He also sent out a session, Pharnaces I, who succeeded Mithridates IV, and reigned till about 156 B.C., took possession of Sinope, and made it his residence. Mithridates the Great in 124 succeeded his father, in whose time Phrygia had become a part of Pontus. He carried on many wars with Rome until his death; at last he submitted to Pompey, and killed himself, 63 B.C., from despair. The western part of Pontus was then annexed to Bithynia, and the remaining parts given away to the chiefs of some of the adjoining states. Pharnaces II, the treacherous son of Mithridates, obtained only Bosphorus, and when he attempted to conquer again his paternal kingdom was vanquished by Cæsar, and put to death by Asander, which had the mark of Bosphorus. Still his son Darius received through Antony a part of Pontus. Polemon, who at the same time possessed the kingdom of Bosphorus, Asia Minor and Colchis, was his successor. After the death of his father, Polembor, he succeeded, as king of Pontus, 39 a.D. Nero took Bosphorus from him, and Pontus, under the name of Pontus Polemoniacus, became, after Polemon’s death, a Roman province. When the Latins in 1294 again conquered Constantineople, Alexius Comnenus founded a new kingdom in Pontus, which remained until Mohammed II united it in 1461 with his great conquests. The most noted town on the coast of Pontus was Trapesus, the modern Trebizond. Consult Clinton, ‘Fasti Hellenici’ (Vol. III, Appendix); Meyer, ‘Geschichte des Königreichs Pontus’ (1879).

PONTUS EUXINUS, ūk-i-nūs, the ancient name for the Black Sea, still called the Euxine. The name, signifying in Greek hospitable, is supposed to have been given as a garuas by a king of this name, in his acut. In the middle of the 19th century it was a gathering-place for the followers of the Neo-Druide cult. Pop. 43,211.

PONY (Lat., pullum, pullos, a young animal), a horse of small breed, usually under 13 hands high, and several breeds scattered throughout the world. The Shetland, Connemara, Galloway, Dartmoor and Canadian types are best known in northern countries. These horses are extremely hardy and are for their size much stronger than the full-sized horse. The Shetland is the smallest of the types named. In Corsica and Sardinia there are breeds of ponies which have long existed there.

PONY EXPRESS, the mail service between Saint Joseph, Mo., and California inaugurated in 1860. It was discontinued in 1861. Consult article in Century Magazine, Vol. XXXIV, New York 1896.

PONZ, pōnz, Antonio, Spanish painter, archæologist and art critic: b. Bexis, Valencia, Spain, 1725; d. Madrid, 4 Dec. 1792. He was educated at the University of Valencia, but, though he made sufficient progress in theology to be able to take the degree of doctor, his tastes diverted him to foreign languages and most strongly to the fine arts; the latter led him to become a pupil of Richart at Valencia. He subsequently lived at Madrid and Rome (1751), but returned to his native land (1760) and received a commission to paint a series of portraits of Spanish authors for the Escorial. Among his published works is ‘Viaje de España’ (18 vols.), in which he relates his experiences as a commissioner appointed to collect paintings and statuary of suppressed monasteries. The book is full of art criticisms and sketches of Spanish social life of the period. He also wrote ‘Viaje fuera de España,’ an account of travels through England and France. PONZA (pōnˈzə) ISLANDS, or PONTINE ISLANDS, two small groups of volcanic islands on the west coast of Italy, 20 miles from the Gulf of Gaeta and not far from the Pontine Marshes. The larger and more westerly group belongs to the department of Gaeta in the province of Caserta, and consists of: Ponza, off the coast of Naples, which attains at Monte Guarda a height of 900 feet, is four miles long and two-thirds of a mile wide, was the place where Tiberius banished Germanicus’ son, where Caligula sent his sisters and Domitian banished Flavia Domitilla; Zanone (Lat. Sinone), further north with a cloister at the summit of its mountain; and Palmarola (Lat. Palmaria), whose rude and wild inhabitants brought upon the island the repute of being the home of the Devil. In the second group are Santo Stefano, the most easterly of the Ponza Islands, and Ventotene (Lat. Pantataria), the place of banishment of Julia, Augustus’ daughter, of Octavia (q.v.), Nero’s wife, and of Agrippina, wife of Germanicus.

POOD, or PUD, a Russian weight of 40 Russian pounds, equivalent to 36 English pounds of avoidupois.

POODLE. See Dog.

POOK, Samuel Hartt, American naval constructor: b. Brooklyn, N. Y., 17 Jan. 1827; d. Washington, D. C., 30 March 1901. He was graduated from the Portsmouth Academy, New Hampshire, in 1843, and became a shipbuilder, afterward settling in Boston, where as a naval architect he was engaged in building several clipper ships. At the outbreak of the Civil War he entered the government service, superintended the construction of the ironclad Galena and assisted in building the Monitor. He was appointed assistant naval constructor in the United States service in 1866, promoted naval constructor in 1871, and served in different navy yards until his retirement in 1899.

POOL, Maria Louise, American novelist: b. Rockland, Me., 20 Aug. 1841; d. there, 19 May 1898. For several years she was a contributor to the New York Evening Post and
was also connected with the New York Tribune. She excelled in descriptions of life in New England and among her works are 'In Buncombe County'; 'A Vacation in a Buggy' (1887); 'Tenting at Stony Beach' (1888); 'Rowena in Boston' (1892); 'Mrs. Keats Bradford' (1892); 'In a Dike Shanty' (1896); 'In the First Person' (1898); 'A Golden Sorrow' (1898); 'The Malvon Farm' (posthumous, 1899).

POOL, or POOLING, in commerce and finance, a combination of persons contributing money to be used for the purpose of increasing or depressing the market price of stocks, with a view to the settlement of differences. In pooling railroad interests the common method of dividing the traffic between competing lines, is to pool the receipts and to redistribute them on percentages based upon experience and decided by an arbitrator.

POOL, a game. See BILLIARDS.

POOLE, John, English dramatist: b. England 1786; d. London, 5 Feb. 1879. His success as a dramatist came early in life, and beside his plays he wrote several satirical and humorous books. His dramas were played by the leading actors of the day and were almost invariably successful. His fame, however, rests principally upon the widely popular comedy, 'Paul Pry' (1825), and his farce, 'Twixt Cup and Lip' (1826). Other plays of his that may be named are 'Hamlet Travestie' (1813); 'Who's Who, or the Double Imposture' (1815); 'Deaf as a Post' (1823); 'The Wife's Stratagem' (1827); 'Lodgings for Single Gentlemen' (1829). He also wrote the satirical sketches: 'Little Peddington and the Peddlingtonians' (1839); 'Comic Miscellany' (1842), etc.

POOLE, Matthew, English compiler: b. York, 1624; d. Amsterdam, 12 October 1679. He studied at Emmanuel College, Cambridge, and took orders, but in 1662 was ejected by the Act of Uniformity from his church of Saint Michael-le-Querne in London, and turned his attention to a boy school by spending 10 years on his 'Synopsis Criticorum Biblicorum,' an attempt to condense into one work the opinions of all the biblical critics of all times and countries previous to his own. The work extended to five large folio volumes, and indicates great labor and research as well as not inconsiderable degree of learning; but it is now of little use, later criticism and research having done much to supersede it. Poole also wrote a defense of the non-conforming clergy (1662); 'The Nullity of the Romish Polly' (1666); ' Annotations upon the Holy Bible' (1683-85), and other works, and took an active part in the leading controversies of his time, especially those with the Socinians and Roman Catholics. The tolerant spirit of the Stuarts compelled him to seek an asylum at Amsterdam.

POOLE, Reginald Lane, English educator and author: b. London, 29 March 1857. He was educated at Oxford and at the University of Leipzig, in 1880-81 was assistant in the department of manuscripts in the British Museum and since 1885 has been editor of the English Historical Review. He has lectured in modern history at Jesus College, Oxford, since 1886 and is also lecturer on diplomacy in the University of Oxford. He has published 'A History of the Huguenots of the Dispersion' (1880); 'Sebastian Bach' (1882); 'Wycliffe and the Movement for Reform' (1889); edited Wycliffe 'De Civili Domino Liber I' (1885) and 'De Domino Divino' (1890); 'Historical Atlas of Modern Europe' (1897-1902); 'John Bale', in the Britonniae Scriptorum' (1902), with Dr. W. Hunt, 'The Political History of England' (12 vols., 1905-10, etc.)

POOLE, William Frederick, American librarian: b. Salem, Mass., 24 Dec. 1821; d. Evanston, Ill., 1 March 1894. Graduated from Yale in 1849, he became assistant librarian of the Boston Athenæum in 1851, and in 1852 librarian of the Boston Mercantile Library. From 1859 to 1869 he was librarian of the Athenæum, in 1869-73 of the Cincinnati Public Library, which he organized, and in 1874-87 of the Chicago Public Library, whose formation he also directed. From 1887 he was in charge of the Newberry Library at Chicago, founded by W. L. Newberry. In 1885-87 he was president of the American Library Association, and in 1877 vice-president of the international conference of librarians at London. He was best known for his 'Index to Periodical Literature,' originally begun in 1848, in the preparation of which he was assisted by W. I. Fletcher and many other librarians. His writings, which were very numerous, include 'The Battle of the Dictionaries' (1856); 'Websterian Orthography' (1857); 'Cotton Mather and Salem Witchcraft' (1869); 'Anti-Slavery before 1800' (1887). He also discovered and printed a manuscript of Gov. Thomas Hutchinson on 'The Witchcraft Delusion of 1692,' and reprinted, with introduction and index, the rare work 'Wonder-working Providence of Sion's Saviour in New England.'

POOLE, England, a seaport of Dorsetshire, on the eastern coast of the county, 15 miles west of Wornemouth. There are extensive municipal and harbor improvements, an esplanade, a free library, etc. Ropes, cables, sailcloth, tiles, etc., are manufactured, and there is a large coasting trade principally in clay and grain. Much of the property is owned by the town. Pop. 38,586.

POONA, or PUNJA, India, (1) the capital of a district of the Deccan division, Bombay, at the confluence of the Mula and Muta, tributaries of the Bima in a plain nearly 2,000 feet above the sea, 119 miles eastward from Bombay by the Great Indian Peninsula Railway. It is well built and has a European aspect. Its main street is wide and lined with buildings ornamented with paintings and carvings; it has numerous pagodas; the Deccan College for classics, mathematics and philosophy; and a college of science, with special training in civil engineering; a training college for teachers of vernacular and Anglo-vernacular schools, a female normal school, a government first-grade high school, besides other schools; legislative council hall, public library, civil hospital, arsenal and barracks. The European cantonments are on the north, where most of the Europeans reside. In the town are the ruins of the palace (burned in 1827) of the Peishwa or head of the Marhatta confederacy, whose capital was Poona. This station is famed for
salubrity, and from July to November is the seat of the Bombay government. It is an important military post, and has some manufactories of cotton and silk, and small manufactures of iron and other small articles of ivory, silk and cotton fabrics and articles of brass, copper, iron, and clay. Important works supply Poona with water from the Mula Valley, 10 miles above Poona. Poona 1855, (2) is a district bounded on the north by the district of Ahmednagar, west by the Ghats, south by Satara and east by the Nizam's dominions. Area, 5,348 square miles. It is an elevated table-land, watered by the Bima and its tributaries, and abounding in isolated heights, formerly crowned with strong fortresses. The villages are mostly open, but sometimes surrounded by hedges of cactus.

POOY-DECK, in shipbuilding, a deck raised over the after-part of a spar-deck, sometimes called the round-house. Ships formerly had several poop's, the one above the other.

POOR, Charles Lane, American astronomer: b. Hackensack, N. J., 18 Jan. 1866. In 1886 he was graduated at the College of the City of New York and in 1882 received the degree of D.Ph. at Johns Hopkins. After 1891 he was successively tutor in mathematics, instructor, associate and associate professor of astronomy at Johns Hopkins. In 1903–10 he was lecturer and professor of astronomy and after 1910 professor of celestial mechanics at Columbia University. In 1901-05 he edited the Annals of the New York Academy of Sciences and is author of 'The Solar System' (1908); 'Nautical Science in its Relation to Practical Navigation, together with a Study of the Tides and Tidal Currents' (1910).

POOR, Enoch, American soldier: b. Andover, Mass. 21 June 1736; d. Hackensack, N. J., 8 Sept. 1780. He engaged as a shipbuilder at Exeter, N. H., until the battle of Lexington, when he raised a regiment of which he was commissioned colonel. He received rank of brigadier-general in 1777, and at Saratoga he performed brilliant service, his brigade leading the advance and bearing a heavy share of the American losses. He joined Washington in Pennsylvania after the surrender of Burgoyne, shared with him the winters at Forts Tioga and in 1778 distinguished himself at the battle of Monmouth. He assisted in the campaign against the Six Nations in 1779 and by his able co-operation with General Sullivan gained advantages which resulted in the victory at Newtown. In 1780 at the request of Lafayette he was transferred to the leadership of a brigade of light infantry under his command. Shortly after he contracted the fever from which he died.

POOR, Henry William, American banker and financial writer: b. Bangor, Me., 16 June 1844; d. 13 April 1915. In 1865 he was graduated at Harvard University and three years later entered the brokerage business with his father under the firm name of H. V. and H. W. Poor. In 1860 Mr. Poor became a member of the New York Stock Exchange and was also a senior member of the banking firm of H. W. Poor of New York and Boston. In 1868 Mr. Poor issued the first number of the annual which has taken such high rank as a guide to investors, 'Poor's Manual of Railroads.'

POOR RICHARD'S ALMANAC, an American almanac published by Benjamin Franklin (q.v.) from 1732 to 1757. It was noted for the maxims it contained.

POOR ROBIN, the name of an English almanac which first appeared in 1663. It was published continuously until 1828. The title page bore the inscription 'Written by Poor Robin Knight of the Burnt Island; well-wishes to the Mathematics.'

POOR-SOLDIER. See Friar-Bird.

POORE, Benjamin Perley, American journalist: b. Newburyport, Mass., 2 Nov. 1820; d. Washington, D. C., 30 May 1887. Placed by his father in a military school to prepare for West Point he ran away and apprenticed himself to a printer. In 1838 he established a weekly, The Southern Whig, which he edited until 1841 when he became an attaché at the United States legation in Belgium. In 1844-48 he was engaged in France in making a collection of historical manuscripts for the State of Massachusetts, and also traveled extensively in Europe, Egypt and Palestine as correspondent for the Boston Atlas in 1843-48. On his return to the United States in 1848 he edited the Boston Bee and Sentinel until 1854, when he became Washington correspondent for the Boston Journal and several other newspapers, a position he occupied for 30 years, with the exception of a brief period as major in the Union army. In 1884 he became clerk of the Senate Committee on Printing Records and edited several publications concerning government affairs. Among his works are 'Campaign Life of Gen. Zachary Taylor' (1848); 'The Rise and Fall of Louis Philippe' (1848); 'Early Life of Napoleon Bonaparte' (1851); 'The Constitution of the United States'; 'Life of President Lincoln' (1855); 'Federal and State Charters' (2 vols., 1877); 'The Political Register and Congressional Directory' (1878); 'Life of Burnside' (1882); 'A Descriptive Catalogue of the Government Publications of the United States, 1774-1881' (1885); 'Reminiscences of Sixty Years in the National Metropolis' (1886), a compilation of treaties between the United States and foreign governments, etc.

POORE, Henry Rankin, American painter and illustrator: b. Newark, N. J., 21 March 1859. He received his training under Peter Moran and the Pennsylvania Academy of Fine Arts at Philadelphia. Later he studied at the National Academy of Design in New York and under Luminas and Bouguereau in Paris. In 1910 he received a gold medal from the Pennsylvania Academy. He has also been the recipient of the following awards: the first prize of the American Art Association; the second Halgarten Prize of the National Academy of Design; the bronze medal of the Pan-American...
Exposition (1901); the silver medal at the Saint Louis Exposition (1904); the gold medal at the Buenos Aires (1910) and the silver medal at the Panama Exposition (1915). Poore excels in his artistic grouping of human figures with animals. He has written several valuable books of criticism including 'Pictorial Composition and the Critical Judgment of Pictures' (1888); 'The Conception of Art'; 'The New Tendancy in Art'. Among his best-known pictures are 'Night of the Nativity' (Fine Arts Academy, Buffalo); 'The Shore' (City Museum, Saint Louis); and 'The Meadow' (Art Association, Indianapolis).

POPE, pā-pā-yān', Columbia, capital city of the department of Cauca, near the left bank of the Rio Cauca, in a plain plentifully watered by that river, 228 miles southwest of Bogota, at the foot of the volcanoes Puracé and Sotara. An Episcopal city, Popayan has a college and a seminary for the training of priests. The products of its woolen mills and of the farms of the surrounding county are the main articles of commerce. The city, the first built by Europeans in this region, was founded in 1536 and was nearly destroyed by an earthquake in 1837. Pop. about 8,500.

POPE, the title of the Bishop of Rome, Supreme Pontiff of the Roman Catholic Church. (See PAPACY; TEMPORAL POWER; CATHOLIC CHURCH, etc.) The following list of Popes has been compiled from the most careful authorities, but the dates up to the 3d century are only approximate, the chronology being very obscure previous to that time:

Peter 1
Linus 2
Clemens I (or Anacletus) 3
Evaristus 4
Alexander I 5
Sextus I (Xystus) 6
Theonas 7
Hyginus 8
Pius I 9
Anicetus 10
Soter 11
Elix II 12
Victor I 13
Zephyrinus 14
Caius 15
Urban I 16

POPE, Albert Augustus, American manufacturer: b. Brookline, Mass., 1843; d. 1909. During the Civil War Mr. Pope served with the 35th Massachusetts Infantry and attained the rank of lieutenant-colonel. After his return to civil life he merchandised shoemaking supplies. He founded the Pope Manufacturing Company, of Cambridge, Mass., in 1877, which secured control of many minor patents; in 1877 also he imported bicycles, but in the next year began to make them. During the
bicycle craze. Pope's company acquired millions. When the automobile had passed the experimental stage Mr. Pope engaged in the manufacture of cars, but was unable to duplicate his success with the bicycle. The company was placed in the hands of a receiver in 1907.

POPE, Alexander, English poet: b. in Lombard street, London, 21 May 1668. He was at Twickenham on the Thames, Middlesex, 30 May 1744. His parents were Roman Catholics. His father, to whom the poet ascribed a not-yet-established connection with the Earls of Downe, was a linen-draper who dealt in Hollands wholesale; his mother, Edith Turner, a second wife, was the daughter of William Turner, of Tottonthorpe, in Yorkshire. About 1700, Pope's father, having prospered in his business, retired to a small property he had purchased at Binfield, in Windsor Forest. Pope was not a strong child. When he was born no one believed he would live; and from his father he inherited a frail constitution, from his mother a life-long tendency to headache. But he had in his boyhood, and retained through life, a voice like a nightingale, and his education was devoted to literary and mostly derived from Romish ecclesiastics. Writing he taught himself by copying type. From his first school at Twyford, near Winchester, he was removed because he had been severely punished for lampooning his master at the tender age of nine. At a subsequent school in London, kept by one Thomas Deane, he learned little; but he gave a taste of his future quality by taking together an acting play from Ogilby's Homer, in which the school gardener personated Ajax. Leaving Deane, he became the director of his own studies at his home in the Forest. Here it is worth while to let him speak for himself: "When I had done with my priests, I took to reading by myself, for which I had a great eagerness and enthusiasm, especially for poetry; and in a few years I had dipped into a great number of the English, French, Italian, Latin and Greek poets. This I did without any design, but that of pleasing myself: and got the languages, by huming after the stories in the second; rather read the books and the books to get the languages. I followed everywhere as my fancy led me, and was like a boy gathering flowers in the fields and woods, just as they fell in his way. These five or six years I still look upon as the happiest part of my life."

Numbers. His first dramatic essay has already been referred to, and is said to have composed another on the Legend of Saint Genevieve. A third effort was an epic on Alexander, Prince of Rhodes, being four books of 1,000 lines each on the Dryden pattern, which opened under Water in the Arch of Chipstead with a description of the Court of Neptune. By his own account this must have been a medley of many notes. "There was Milton's style in one part, and Cowley's in another; here the style of Spenser imitated, and there of Statius; here Homer and Virgil, and there Ovid and Claudian" (lb. pp. 24, 277, 279). "Alexander? he afterward burned; but detached couples found their way into later works. He also translated part of Ovid's 'Metamorphoses,' of Statius, and Cicero de Senectute. His chief adviser was his father, who criticised his "rhymes," and ruthlessly "sent him down" when he did not think them good enough. The Alexander epic occupied him from 13 to 15 (lb. p. 279), when he went to London to learn French and Italian. His education was completed by a brief study of Tully and Lozio; of Rapin and Bossu, and of Dryden's "Prefaces."

Already, while living at Binfield, he had made friends who served to influence his tastes. One was the old scholar and diplomatist, Sir William Trumbull of Easthamstead Park, who advised him to translate Homer; another, the wit and man of fashion, Henry Cromwell; a third, the veteran dramatist Wycherley, who was foolish enough to submit his senile poetical compositions to the criticisms of his sharp-eyed junior, a circumstance which has generally been held to have brought about a cooling of their friendship, although the manipulation of Pope's correspondence has not made it an easy matter to understand the actual attitude of affairs (Courthope's Life, pp. 73, 387-407). By Wycherley Pope was introduced to William Walsh of Abberley, in Worcestershire, the critic and minor poet, who enjoyed his young friend's task of righting his "study and aim" (Spence, p. 280), in other words, "to study not only of expression," but also "propriety of design and justice of thought and taste" (Courthope's Life, p. 25). It has been shrewdly suggested that in all probability Pope's native bias to these things suggested the judicious counsels of the critic whom Pope afterward styles "knowing Walsh." Other literary luminaries with whom he became acquainted at this period were Garth of 'The Dispensary,' Congreve, and Lord Lansdowne.

Pope's first important publication was his 'Pastorals' (1709). After the 18th century fashion, these were much circulated in manuscript, and they were already well known to most of the contemporary literati long before they were printed. They appeared at the beginning of the sixth volume of his 'Poetical Miscellanies' (which also included a modernization by Pope of January and May, Chaucer's 'Merchant's Tale'); and, exhibiting, as Johnson says, "a series of versification which had in English poetry no precedent," met with complete success. Two years later appeared the 'Essay on Criticism,' said to have been written in the year in which the 'Pastorals' were printed. In this poem Pope aimed at occupying much the same place in English as
Horace had occupied in Latin with the 'Ars Poetica,' and Boileau in French with the 'Art Poétique'; and the performance, though, of necessity a cento, was certainly an extraordinary one for a youth of three and twenty. Adity, who noticed it in Spectator, No. 253, certainly did not 'damn it with faint praise' when he called it 'a masterpiece in its kind,' which contained things that 'would have been very much admired in an Ancient Poet,' though he regretted the freedom with which the writer altered the spirit of his prototype. But the commendation shows how closely Pope had followed the injunctions of Walsh; and moreover, fully justified him in offering to Steele's and Addison's paper (No. 378), his next effort, the 'Messiah,' a sacred Eclogue modeled on the 'Pollio' of Virgil. By this time his style was formed, and his metrical skill developed to an extraordinary point of excellence. Nothing was wanting but a theme suited to his peculiar gifts.

This theme he found in a little piece which, as a matter of fact, on its first form, preceded the 'Messiah,' namely, the hero-comic 'Rape of the Lock,' contributed in May 1712, to another 'Poetical Miscellany,' that of Bernard Lintot. It is a flawless piece of executive jewel-work, the fragile theme, which is the theft of a lock of hair by Lord Petre, a Roman Catholic peer, from a noted beauty, Miss Arabella Fermo. Out of this trifling amatory escapade had arisen a family estrangement, which Pope was invited to reconcile by his rhymes. His poem was more successful than its purpose. Upon this he extended his plan, and improved it. Not content with the "let well alone" of Addison, who called it "merum sal,—a delicious little thing," Pope proceeded to weave skillfully into his first sketch a subordinate Rosicrucian mythology of sprites and gnomes, which eventually proved the best part of what Johnson justly describes as "the most airy, the most ingenious, and the most delightful of all his compositions."

He was now launched, and his future popularity was assured. His next works were 'Windsor Forest,' of which he borrowed the design from Denham's 'Cooper Hill;' and the 'Ode for Music on Saint Cecilia's Day,' a competition with Dryden suggested by Steele. Both these came out in 1713. In 1715, following the 'Lock,' in its extended form (1714) and another imitation of Chaucer, 'The Wife of Bath,' came a second modernization from the same source the longer 'Temple of Fame.' But the great event of 1715 was the publication in June of the first four books of the translation of the 'Iliad.' Proposals for this had been issued in 1713, and the generous advocacy of a new friend, Swift, had largely swollen the subscription list. The task progressed until, in 1720, the 'Iliad' was completed in six quarto volumes, dedicated to Congreve. Then came the 'Odyssey,' in which the poet was assisted by two subordinate "hands," William Broome, 1683-1745, and Elijah Fenton (1683-1730). By these two works Pope must have cleared from 56,000 to 78,000 to 85,000. His old friend Congreve was indignant that, thanks to Homer, "he was indebted to no prince or peer alive," it is only just to recall the fact that while he was right in contending that no bounty was involved, his subscription list would have been considerably contracted if his patrician supporters were withdrawn. For this famous paraphrase itself, it must be admitted that its fame has somewhat—perhaps too much—faded at the present time. It may be that, in Gibbon's epigram, 'it is a portrait with very merit but that of faithfulness to the original,'—it may be that, as Bentley said 'it is a pretty poem, which must not be called Homer;' but it is at least a triumph of uniform versification, and a surpassing example of sustained achievement. In that full-wigged Age of Anne, for a few years, it was impressively calculated, it bulked largest of the poetical output; and its influence extended far beyond its period of production. No one has written more indulgently of it than one of Pope's modern rivals, Professor Conington: 'It has been—I hope it is still—the delight of every intelligent schoolboy; they read of kings and heroes and of mighty deeds in language which, in its calm, majestic flow, unhaunting, unresting, carries them on as irresistibly as Homer's own could do, were they born heirs of Greek; and their minds are filled with a conception of the heroic age, not indeed strictly true, but almost as near the truth as that which was entertained by Virgil himself.\'\' (Misc. Writings,' 1872, i. 43.)

A minor incident connected with the 'Iliad' was the misunderstanding between the translator and his first critic, Addison, to which it gave rise. Pope's frailty of constitution led him easily to magnify mole hills, and his literary susceptibilities were painfully morbid. His relations, moreover, with Addison had already become strained. Addison, as we have seen, had deprecated that recasting of 'The Rape of the Lock,' which subsequently proved so fortunate. Pope's suspicious nature resented this advice, especially in view of the result. When again Pope championed Addison against the rancorous old critic, John Dennis, Addison had not approved—he could hardly be expected to approve—the peculiarly Swiftian character of Pope's warfare. Finally, by an unfortunate coincidence, when Pope's 'Iliad' was about to run a rival version was put forward by Addison's bosom friend, Thomas Tickell (1686-1740), which Pope perhaps not unnaturally regarded as prompted, if not edited, by Addison himself. Modern criticism has failed to find any valid ground for this supposition. But the cumulative result of Pope's irritation was the cruelly clever portrait of Addison as 'Atticus' which 18 years after Addison's death, found its final place in the Prologue to the Satires ('Epistle to Arbuthnot'). Upon the faith of Spence's 'Anecdotes,' pp. 148-149, it was long held that Pope, in his first anger, had actually sent the lines to Addison; but this is now held not to be probable (Courthope's 'Life,' 1889, p. 161); and Spence's entire account is conjectured to be a fabrication by Pope arising out of his desire to establish beyond a doubt the fact that the character was not written after the death, but during the life of Addison. In any case, the 'Atticus' is a matchless piece of writing, and (as even Addisonians must allow), in some particulars, presents—to quote Thackeray on Dennis portrait of Steele—a dreadful resemblance to the original.

After the already-mentioned 'Temple of Fame,' Pope's published works were the 'Elegy
the Memory of an Unfortunate Lady," a poem, probably idealized from the story of a Mrs. Weston of Sutton, whose relations with her husband had not been of the happiest (Courthope, 133); the "Epistle of Eloisa to Abelard," which is supposed to owe something of its passionate rhetorical imagery to the feelings of the day by the writer for Lady Mary Wortley Montagu; and, in collaboration with Gay and Arbuthnot, the dramatic skit upon Dennis and others entitled "Three Hours after Marriage" which ignominiously failed at Drury Lane in 1717, to which year the pieces above mentioned also belong. In 1725, appeared an edition of Shakespeare in six quarto volumes which has no more authority than that of Johnson. Then, in May 1728, came the first edition of The Dunciad, Pope's famous onslaught upon those swarming hacks and poetaesters of the day, whom his heated imagination exaggerated into an army of personal enemies. In 1729 followed a more perfect edition with a dedication to Swift. Other imitations came and, in 1742, was added a fourth book directed against dunces theological and scientific. The scheme of the poem describes the elevation, with fitting ceremonial, of Lewis Theobald (who had earned Pope's hatred by certain merited strictures on his Shakespeare) to the throne of Dunlos, then vacant by the death of Dryden's "Mac Flecknoe" Shadwell,—

"without dispute
Through all the realms of Nonsense absolute."

In 1742 Pope gratified a new antipathy by substituting Colley Cibber for Theobald, a change which has been said to have been an improvement. The Epos of the Dunces remains nevertheless a magnificent satire upon a subject which is not worthy of the powers it called forth, though it is perhaps the culminating example of the combative gifts of its author. Ruskin goes even so far as to call it "the most absolutely chiselled and monumental work 'extracted' in our country" (Lectures on Art, 1870, p. 70).

Swift has the credit of eventually prompting the Dunciad form. Pope's next effort, the "Bishop on Man," is inscribed to another "guide, philosopher and friend," Bolingbroke. "One truth is clear, Whatever is, is right"—which is the last line of the first of its four epistles, might be described as the keynote of his attempt "to vindicate the ways of God to Man." The writer's metrical dexterity, his power of crystallizing precept, and his executive skill generally, were never shown to greater advantage than in this work; but the consensus of criticism has come to the conclusion that he was not in complete sympathy with, if indeed he thoroughly comprehended, the philosophical tenets of the meteoric genius whom he terms "the master of the poet and the song." Hence critics like the late Sir Leslie Stephen have come to describe the argument translated on it, as "faint and often childish." Yet, although the poem labors under these disadvantages, and although, moreover, it is only part of an unfinished whole, it had an extraordinary popularity with its first public, and also on the Continent, where, in its translated form, it must, in all probability, have achieved the same success in the original. To Bolingbroke also Pope owed what must ever be regarded as his greatest and most personal performances, his "Moral Essays," and his "Satires and Epistles." The "Moral Essays" appeared from 1720 to 1735; the "Satires and Epistles" from 1733 to 1738. These last are unrivaled in their pungent criticism and portraiture of contemporary character and manners. "It is no paradox," said the late Rector of Lincoln College, Mark Pattison, "to say that these imitations are among the most original of Pope's writings. So entirely do they breathe the spirit of the age and country in which they were written that they can be read without reference to the original model, "Preface to 'Satires and Epistles.'"

The discussion of Pope's untiring literary labors has left his life somewhat in the background. In April 1716, not long after the appearance of the first instalment of his Homer he moved from Binfield to Chiswick, where he lived in what is now known as Mason's Row. In 1717 his works had become numerous enough to fill a handsome folio volume which was issued by Tonson and Lintot, with its author's portrait engraved by George Vertue after Charles Jervas. In October of the same year his father died; and he moved with his mother to a little villa at Twickenham in which he thenceforth resided, "twisting and twirling and rhyming and harmonizing" five acres of garden until it became "two or three sweet little lawns opening into one another and surrounded with impenetrable woods." Here he received his friends, among others the Joseph Spence, to whom we owe the bulk of our Popiana. In 1733 his mother, to whom he had always shown an exquisite filial affection, and whom he tended lovingly to the last, died at an advanced age. Ten years later he himself was passing away, prematurely old, and worn out with asthma and dropsy, though scarcely 55. To the end he continued to "dispense his morality" (in the form of his Ethic epistles), and rearranged and repeated his other poems. Finally he died at Twickenham, 30 May 1744, and was buried in the middle Isle of the parish church, where 17 years later a monument was erected to him by his literary friends. In 1730 Gilliver had published a second volume of his poems, and in 1737-41 had appeared two corresponding volumes of his letters, etc. The story of these last,—of the artifices employed to secure their publication, of their manipulation and readjustment to suit the writer's own views would take too long to tell here. But the subject has been amply discussed in Dike's "Papers of a Critic," 1875, in the "Introduction to Pope's Correspondence" (Vol. VI, 1871) of Elwin and Courthope's "Works," and in Courthope's "Life" (1889).

Pope was never married. At one period of his career he had cherished a passion for the brilliant Lady Mary Wortley Montagu, by whom he was encouraged and scorned, treatment for which he retaliated fiercely in subsequent satires. But his greatest feminine friend was Miss Martha Blount of Maldenham, an old acquaintance of the Binfield days, with whom he renewed his relations at Chiswick and Twickenham, and whose friendship he retained at the close of his life. He had spent three or four hours a day with her for 15 years, he said in 1730; and the companionship,
which was prolonged for nearly 15 years more, seems always to have had a cheering effect upon his drooping and variable disposition. Into the tangle of gossip which has gathered about this connection, memorable among literary alliances, it is profitless to enter. But that Pope was devotedly attached to his blue-eyed goddess there can be no manner of doubt; and he suffered cruelly from any deviation from his régime. He was intensely susceptible to changes of temperature and climate. In his earlier days he was able to take horse exercise; but in his manhood he could not dress himself without becomingTier and stiffen with buckram. That these things reacted upon his views of life can scarcely be contested. He was the most irrigable of the irritable race, says one contemporary; Mens cura et turba cura, says another. He played the politician about cabbages and turnips, says a third. Per contra, it must be remembered that, however sensitive, artificial and vindictive, he was a devoted son and an attached friend. And at least he was a genuine literateur.

As a poet his general position is easy to define. He was not a great lyrist; he was not a profound thinker; but he is supreme artificer. Borrowing the heroic couplet from Dryden, he brought it, as the medium for didactic and satirical verse, to a pitch of perfection which has never been surpassed, though it has sometimes been made monotonous by imitation. He could not, as we have implied, originate; but he could decorate to any extent. Granted the theme, he could decor it as he pleased; he could embellish it supremely; he could lend it every advantage in the way of condensed perspicuous and epigrammatic exposition. The major part of his work is a triumphant exemplification of Addison's dictum that 'Wit and fine Writing doth not consist so much in advancing Things that are new, as in giving Things that are known an agreeable Turn.' This was Pope's chief function. With inspiration, with the unattempted or unimagined in poetry, he had small concern. But he could express, in a geometrical form, and with faultless lucidity and finish, the best floating ideas in circulation at the time of writing. His gifts of wit and irony led him inevitably in the direction of the satire; and his high-water mark is his 'Epistle to Arbuthnot.' These things, except the power of his imagination, were the powers in their fullest diversity.

Bibliography.—There are several early lives of Pope of which that by Johnson ('Poets,' London 1781) is the most important. Of later efforts, the most notable are Carruthers (1853–57); Sir Leslie Stephen (1880); Courthope (1889). Of Pope's 'Works' there are editions by Warburton (1751); Warton (1797); Bowles (1806); and Roscoe (1824); but all these give place to the 10 volume edition by Elwin and Court hope (1871–89). Glossed editions of the poems alone are: 'Cambridge Edition,' edited by H. W. Boynton (Boston 1903); that edited with memoir by J. Dennis (London 1891) and the 'Globe Edition' (New York 1899). Consult Spence's 'Anecdotes,' by Singer (1828); Dike's 'Papers of a Critic' (above mentioned); Mark Pattison, 'Essay on Man' (1869); and 'Satires and Epistles' (1872); Congington (above mentioned); Abbot's 'Concordance' (London 1875), and Montégut in 'Revue des deux Mondes' (March 1888 for Pope's influence abroad. Consult also Dennis, John, 'The Age of Pope, 1700–1744' (London 1894); Chesterton, G. K., 'Varied Types' (New York 1903); Symonds, E. M., 'Mr. Pope. His Life and Times' (ib. 1909).

AUSTIN DORBON, Author of Life of Goldsmith, 'Life of Richardson,' etc.

POPE, Charles A., American surgeon: b. Huntsville, Ala., 1818; d. 1870. He received his education at the Cincinnati Medical College and at the University of Pennsylvania. From 1843 to 1847, Dr. Pope was professor of anatomy and physiology at Saint Louis University; from 1847 to 1853 professor of surgery and from 1848 to 1853 dean at the same institution. From 1853 to 1867 he held the chair of surgery at the Saint Louis Medical College, the medical department of Washington University. He was president of the American Medical Association in 1854 and after 1867 lived in Paris.

POPE, Franklin Leonard, American electrician: b. Great Barrington, Mass., 2 Dec. 1840; d. there, 13 Oct. 1895. He was a telegraph operator in 1857, assistant engineer of the American Telegraph Company in 1862 and in 1864 while holding a similar position in the Russo-American Company made the first survey of the territory between British Columbia and Alaska. Later with Edison he invented the stock exchange ticker in 1872. He invented the rail circuit for automatically controlling electric block signals. He was editor of the Electrical Engineer, 1884–95; and president of the American Institute of Electrical Engineers in 1885. He published 'Modern Practice of the Electric Telegraph' (1871) and 'Life and Work of Joseph Henry' (1879).

POPE, John, American soldier: b. Louisville, Ky., 16 March 1822; d. Sandusky, Ohio, 23 Sept. 1892. He was graduated from the United States Military Academy in 1842, was assigned to the topographical engineers, served in Florida in 1842–44, in 1846 entered the United States Army in Mexico during its advance on Monterey, was brevetted captain, and in 1849 conducted the exploring expedition which opened up Minnesota and demonstrated the navigability of the Red River of the North. In 1853 he was on the New Mexico, employing in surveys for the projected Pacific Railway; and in 1854–59 explored the plains and the Rocky Mountains, being the first to experiment in the irrigation of arid western tracts by means of artesian wells. After his return from these duties, he criticized the political policies of Buchanan in a lecture delivered at Cincinnati in February 1861 and for this action was summoned to a court-martial. The trial was, how-
POPE—POPLAR

ever dropped. Made brigadier of volunteers in May, 1861, he was assigned to command in Missouri, quickly organizing an army of about 12,000, and in March 1862 effected the capture of New Madrid and Island No. 10. He was promoted major-general of volunteers and made brigadier-general in the regular army. He was then placed in command of the Army of Virginia and fought the battles of Cedar Mountain and the second Bull Run. In the latter he was badly wounded by Stonewall Jackson (q.v.) and on his return to Washington requested to be relieved from his command. He was thereupon transferred to the Department of the Northwest, where he directed a campaign against the Sioux; and in 1865 was appointed to the command of the military division of Missouri; subsequently he was in command of various military districts, of the Department of the Lakes and of the Pacific and in March 1866 was retired with rank of major-general. From his defeat in the second battle of Bull Run developed the trial, conviction and subsequent restoration of Gen. Fitz John Porter (q.v.). He published "Explorations from the Red River to the Rio Grande" (in "Pacific Railroad Reports", vol. III); and "The Campaign of Virginia, of July and August 1862" (1865).

POPE, John Henry, Canadian statesman: b. Eastern Township, province of Quebec, 1824; d. 1889. He received his education at the Compton High School; took an active interest in Conservative politics after 1857 and after 1867 represented Compton County in the Canadian Assembly. In 1871-73 Pope became Minister of Agriculture in Sir John A. Macdonald's first Cabinet and held the same office in that premier's second Cabinet from 1878 to 1885. After 1885 Pope was Minister of Railways and Canals. With Tupper and Macdonald he negotiated the contract for the construction of the Canadian Pacific Railroad which was later approved by the Dominion Parliament.

POPE, John Russell, American architect: b. New York, 24 April 1847. He was educated at the New York School of Mines and in 1894 was graduated at the School of Mines of Columbia University. In 1895 he was Fellow of the American Academy in Rome, and in 1896-97 held the Schermerhorn traveling fellowship in architecture. In 1900 Mr. Pope attended the Ecole des Beaux Arts, Paris, since when he has practised in New York. His principal works are the Scottish Rite Temple, Washington; Plattburg (N. Y.) City Hall; McDonough Memorial, Plattsburg; Lincoln Memorial, Hodgenville, Ky.; the Terminal Station, Richmond, Va.; residences of Mrs. W. K. Vanderbilt, Jr., Ogden B. Mills, Mrs. Arthur Scott Burden, Levi P. Morton, John R. McLean, Henry White and Mrs. R. S. Hitt, Washington, etc., and memorial of William B. Leverett, New York. In 1916 Mr. Pope was awarded the Architectural League medal of honor in architecture and in 1919 was elected associate of the National Academy of Design.

POPE, William Burt, Methodist theologian: b. Harrisburg, Pa., 1822; d. 1903. He received his education at Richmond College, London, and from 1841 to 1867 held pastorates in England, after which he held the chair of theology at Didsbury College, Manchester. He published "Discourses on the Kingdom and Reign of Christ" (1869); "The Kingdom of Christ" (1875; 3d ed., 1899); "Christian Theology" (2d ed., 3 vols., 1877-80); "The Prayers of St. Paul" (1876); "Sermons and Addresses" (1878); "A Higher Catechism of Theology" (1878); "Consult Miss. R. W., The Life of W. B. Pope, Theologian and Saint" (London 1912).

POPERINGHE, pôp'œring, Belgium, town in the province of West Flanders, about four miles from the French frontier and five miles west of Ypres, with which it is connected by rail. It is an ancient town and in the 14th century was a rival of Ypres. Nearby were great hop gardens, tanneries and bleaching grounds. Most of the city's ancient landmarks were obliterated during the War of 1914-18 in the exceptionally severe fighting in Ypres and its neighborhood. Laces, linens and woollens were manufactured in considerable quantities previous to the war, when the population totalled 12,205.

POPHAM, pôp'am, George, English colonist: b. Somersetshire, about 1550; d. 1608. Becoming a parson of Georges Bay, he engaged in the colonization of Maine, he collected 120 men and sailed from Plymouth in 1607 with two vessels and arrived in August of that year at the estuary of the Kennebec. There he erected a small fort and storehouse and named the place Fort Saint George. He was chosen president of the colony, the first English settlement in New England, but his death in the following year and the severity of the winters disheartened his followers who soon after his death abandoned the settlement and returned to England by sea.

POPHAM, Sir John, English jurist: b. Wellington, Somerset, 1531; d. 10 June 1607. He was educated at Oxford, studied in the Middle Temple and became sergeant at law in 1571. After having been speaker of the House of Commons in 1581 and Attorney-General in 1585 he was made Lord Chief Justice in 1592 and held this post 15 years. He was a brother of George Popham, and in 1607 was associated with him and Sir Fernando Gorges in establishing the Popham colony in what is now the State of Maine. He held three holdings at one time on an extensive tract of territory in that region.

POPINJAY, a parrot; a figure of a bird formerly put up as a mark for archers to shoot at. The green woodpecker is also so-called in provincial parts of Great Britain.

POPISSH PLOT. See OATES, TITUS.

POPLAR, England, a metropolitan and Parliamentary borough of London, on the Thames between Limehouse Reach and Blackwall Reach. Area, 2,326 acres. The district is poor, overcrowded and depressing, with a high deathrate and containing the largest proportion of paupers in London, the latter being 43, four per 1,000 at Christmas 1913. Blackwall and the Isle of Dogs are the borough, and the docks - East and West India and Millwall - afford employment to the laboring population. Engineering, shipbuilding and chemicals are the chief industries. The metropolitan borough includes the Bow and Bromley and the Poplar divisions of Tower Hamlets, each returning one member. Pop. about 162,442. Consult Copper, "Descriptive Account of Millwall." (1853);
Forrow, 'The Thames and Its Docks' (1877); Simmonds, 'History of Poplar' (1870), and the publications of the committee for the survey of Great Britain, London.

**POPLAR**, a genus (Populus) of trees of the family Salicaceae which includes only one other genus, *Salix*, the willows. The species, which probably do not exceed 25, are widely distributed in the Northern hemisphere from sub-tropical regions to the limits of vegetation both in latitude and altitude. Half of them are American. They are mostly of small or medium size, quick growth and short duration; bear deciduous, broad, heart-shaped or lozenge-shaped leaves on long slender petioles; discosic, naked flowers usually in pendulous catkins which appear before the leaves; and small two-to-four-celled fruits (capsules) filled with cotony seeds. Their wood is generally soft, light and white. It is little used for timber or lumber; but it is an important fuel wood in regions such as the Western States, where fuel is scarce and costly. The trees are often planted for this purpose and for windbreaks, their rapid growth being in their favor. They are also favorites for copsees and for pollarding (q.v.).

The Lombardy poplar is generally that of another tree—the whitewood or tulip tree (q.v.). Poplars are used in enormous quantities for making wood-pulp paper, cardboard, etc., especially in Ontario, Quebec and the New England States, where hundreds of acres of forest are cut for this purpose annually. As ornamental trees they are frequently planted to excess at summer resorts because they quickly make an effect. In such cases they give an air of cheapness to the place not observable where maples, oaks, etc., are prevalent. The latter should always be planted with poplars, in order to replace them.

Poplars are as easily propagated from cuttings as currants or willows; in some cases the switches need only be stuck in moist ground. The choice horticultural varieties, especially the weeping kinds, are grafted. Suckers may be used, but since their removal generally induces the growth of many more suckers, this method must be practised with caution except where the valuable tree is not wanted. The species will succeed in a great variety of soils from sand to clay, and in almost any situation, even in crevices on rocky mountain slopes. Some of them, however, especially the cottonwood, seem to thrive best in low alluvial land upon the margins of streams.

The best-known species are probably the following: The Lombardy poplar (*P. nigra*, var. *italica*, also called *P. pyramidalis*, *P. italic*, *P. fustigiala*, etc.) is probably a native of Asia, whence it has spread to the Mediterranean region and thence to temperate countries throughout the world. It is noted for its erect instead of spreading habit, which makes it a striking specimen in ornamental plantings. It grows very rapidly, attains a height of 100 to 150 feet, but in London is grafted in the coldest States and most of Canada. It is one of the worst species to produce suckers; hence it should not be planted where the soil will be disturbed by cultivation.

The black poplar (*P. nigra*) is a native of northern Asia and Europe, and is occasionally seen as an escape in America east of the Mississippi River. It is of rather pyramidal habit, less erect, however, than its variety the Lombardy, and of darker colored foliage and slower growth than the cottonwood. It seldom exceeds 100 feet in height. The down from its seeds has been used for paper, hat and clothmaking in France, but the industry has been abandoned as unremunerative. The wood, which is not prone to shrink and swell, is used for turning, cabinet-making, toys, flooring, doors, etc.

The Carolina poplar (*P. deltoides*) is an American species well known from New Brunswick to the Rocky Mountains and southward to the Gulf States. It is the largest of the genus, specimens sometimes attaining 150 feet in height and more than six feet in diameter. It is also one of the most valuable, its timber being considered useful for nearly all the purposes mentioned. It is also more highly prized for ornamental planting than any other species, since it not only succeeds well in all soils, but possesses qualities of stability and strength lacking in other species. It has bright, glossy foliage, constantly in motion, adds cheeriness and life to plantations, and its trees can be one of the most popularly planted species in the Western States, not only for shelter and for fuel but for timber and lumber. In Europe it is often called the Canadian or Italian poplar. It has several horticultural varieties, among which a striking form -s the golden-leaved *P. vangeetii*, which is one of the choicest of yellow-leaved trees.

The balsam-poplar or tacamahac (*P. balsamifera*) is indigenous from Newfoundland to British Columbia and extends west to Siberia, its southern limits, except in the mountains, being about Pennsylvania. Its erect growth resembles the Lombardy poplar, but it is slower in growth, more rugged and hardy. The type species and its three well-marked botanical varieties exceed the cottonwood in variability. A closely related species is the balsam of Gilead (*P. candicans*), a well-known tree, frequently planted, with large buds noted for their spring fragrance. It is indigenous from Nova Scotia to New Jersey and westward, and is less pyramidal than the type species, usually making a rather broad top. It seems to be disappearing from the woods, though formerly it was a large tree sought for its timber. For the dark tone of its foliage it is often planted as a background tree, but not in smoky localities.

The white poplar or abele (*P. alba*), a European and Asiatic species, which grows about 75 feet tall, has been introduced into America, where it has become naturalized, from Nova Scotia to New Jersey. In Europe it is used for many of the purposes mentioned above. The European aspen (*P. tremula*), common in both Asia and Europe, is known in America mainly by its weeping variety (*P. tremula*, var. *pendula*). The American aspen (*P. tremuloides*) is one of the first trees to appear in clearings, thus acting as an important agent in reforestation, holding the soil until slower-growing trees can obtain a start. (See Aspen).

About 100 species of insects feed upon the poplars in America. Among these are several species of plant-lice, leaf-miners and leaf-rollers (q.q.v.). Among the caterpillars which
feed upon the foliage, the most common are probably the larvae of the antiopa butterfly, the io moth, tussock moth, and the poplar spanworm; also several general feeders of the families Nocuidae and Geometridae. These creatures may be controlled by spraying, when practical, with arsenites. (See FUNGICIDE.) There are also a large number of borers which live in the trunks or twigs. The poplar and trunk are attacked by *Prionus laticolis*, which also feed upon pine and apple trees and grape vines.

**POPLAR BLUFF**, Mo., city, county-seat of Butler County, on the Big Black River, and on the Saint Louis, Iron Mountain and Southern, the Saint Louis and San Francisco and the Butler County railroads, about 125 miles south of Saint Louis. It is in a section where lumbering and the manufacture of forest products are given much attention. Stock-raising is carried on to a considerable extent. In the vicinity are valuable clay deposits. The chief manufactures are foundry and machine-shop products, canning products, brick and lumber products. The city owns and operates the waterworks. Pop. 6,916.

**POPLAR SPRING CHURCH (PEELES' AND PEGRAM'S FARM, Vaughan Road), Battle of.** In co-operation with the movement against Richmond from the north side of James River, 29 Sept. 1864 (see POWHARRISON, BATTLE OF), General Grant ordered a movement from his left, south of the river, in a northwest direction toward the Boydton road and South Side Railroad, the intention being to extend his intrenched line beyond the Weldon Railroad in the direction of the South Side Railroad. General Warren, with Griffin's and Ayres' divisions of the Fifth corps, was first to secure the junction of the Squirrel Level and Poplar Spring Church roads, coming in from the southwest, at which point the Confederates had intrenchments covering the roads. General Parke, with Wilcox's and Potter's divisions of the Ninth corps, was to follow Warren and form on his left, then both were to advance toward the Boydton road. Gregg's cavalry division was to move on the Vaughan road and other roads on the left and rear to the crossing of Hatcher's Run, where the Confederates had a redoubt at the termination of their intrenchments. At 7.30 A.M., 30 September, Griffin and Ayres moved out of their intrenchments at Globe Tavern, advanced cautiously three miles through a dense growth of woods and encountered a Confederate picket-line behind light works thrown up along the road in front of Poplar Spring Church. This line was driven in, and the advance continued, until it came under a sharp fire from a line of works on Pigeon' farm, held by Dearing's cavalry brigade and some infantry. A short halt was made, the order to assault was given, and the works were carried with small loss. On the left Parke moved through a narrow belt of timber, in a northwest direction toward the Boydton road, and encountered the Confederates on Pergam's farm. The works holding the Petersburg intrenchments were A. P. Hill's corps and B. R. Johnson's division of infantry, with Wade Hampton's two divisions and Dearing's brigade of cavalry, all under command of A. P. Hill. The main Confederate line of intrenchments had been extended in a southwest direction nearly to Hatcher's Run, covering the Boydton road and South Side Railroad. Hill threw out two divisions, which came into collision with Potter's division, flanked it on the right and drove it back in some confusion. A new line was now formed by Parke, with Wilcox's troops, which, with Griffin's line on the right, after a spirited engagement, checked the Confederate advance about dark, after a loss in Parke's command of nearly 500 killed and wounded, and many prisoners. Late in the afternoon next day (1 Oct.) Mott's division of the Second corps came up, and on the 2d Parke advanced, under a heavy fire of artillery and musketry, and established a line of intrenchments about a mile from that of the Confederates, connecting on the right with the line held by the Fifth corps, and on the left reaching the Weldon Railroad and extending to the left and rear. On the left and rear Gregg's cavalry, 30 September, drove back Dearing's cavalry, and the next day was heavily attacked by Hampton's cavalry on the Vaughan road, but he repulsed the attack, inflicting heavy loss. The Union loss, 30 September, 1 and 2 October, was 187 killed, 900 wounded and 1,802 missing. The Confederate loss is not certainly known, but is estimated at less than 1,000. Consult 'Official Records' (Vol. XI); Humphreys' 'The Virginian Campaign of 1864-65'; Powell, 'History of the Fifth Army Corps'; 'Battles and Leaders of the Civil War' (New York 1890).

**POPLIN**, in textile manufacture, a kind of finely woven fabric, made of silk and worsted. In the best poplins the warp is of silk and the weft of worsted, a combination which imparts peculiar softness and elasticity to the material; in the cheaper makes cotton and flax are substituted for silk, which produces a corresponding deterioration in the appearance of the stuff. The manufacture of poplin was introduced into Ireland from France, where it originated, in 1775 by Protestant refugees, and Ireland is still famous for its production. To make a poplin, having a silk warp and worsted weft and in the common grades cotton or flax is mixed with the silk. The term *poplin* is a corruption of the French *papeline*.

**POPOCATEPETL, pō-pō-kátá-pētl**, a volcanic mountain of the province of Pueblo, Mexico, about 40 miles southeast of the city of Mexico, whence it can be seen as if near at hand because of the clear air of the intervening country. "Smoking Mounta" is the meaning of its name, an Aztec compound, and it is constantly sending out smoke and ashes, and occasionally cinders and stones, but has had only two or three small eruptions in the last four centuries, the last recorded being in 1540. Its height is 17,784 feet, considerably more than that of Mont Blanc, and it is the highest mountain in North America. There are oak and pine forests on its sides to a height of 12,540 feet; then a stretch of sand and sulphur before the snowline at 14,900 feet. There are small glaciers on the eastern slope of the mountain. The crater is much smaller than commonly reported, being probably not more than one-fifth of the famed three miles in cir-
cumberence; its depth, reported as 1,000 feet, seems to be actually only 250. Indians gather sulphur from the rim of the crater. Some of Cortes' men explored the mountain in 1519; three years afterward Montano seems to have reached the top and let himself down into the crater; in 1827 Glennie and Taylor made the ascent.

POPOFCHINS. See Religious Sects.

POPOUL VUH, pő-pool' voo, the sacred book of the Quiché (q.v.).

POPEEA SABINA, pő-pē'ə sə-bi'nə, Roman empress, wife of Nero: d. 65 A.D. She was the daughter of Ullius and married Rufius Crispinus, Praetorian prefect, was divorced by him and married to Otho, who in his turn was set aside for the Emperor Nero. She was famous for her beauty, but heartless and immoral. At her desire Nero murdered his mother, Agrippina in 59, divorced and put to death his wife, Octavia in 62, after which they were married. Three years later she was killed by Nero in a fit of rage. The one redeeming incident in her career seems to be the mercy she urged upon Nero in behalf of the Jews.

POPPY, a popular name for several plants of the family Papaveraceae; for instance, California poppy (Eschscholzia californica), horned poppy (Glauceanum), Welsh poppy (Meconopsis cambrica), prickly poppy (Argemone spp.), celandine poppy (Stylorhum diphyllum), tulip poppy (Hunnemannia fumariaefolia) and various species of genus Papaver. Unless modified by some adjective as above the term usually refers to members of the last-named genus.

The 50 species of Papaver are annual and perennial herbs, mostly indigenous to the Mediterranean region. One is South African, one Australian and a few North American. They are smooth or bristly; have a milky juice; usually dissected or lobed leaves on long peduncles; showy flowers of various varied tints and forms, and capsules containing very numerous small seeds. For several centuries some of the species have been leading garden flowers, not only for their beauty of form, but because of their ease of cultivation. The seed should be sown very early in the spring where the plants are to remain. Any good, well-drained garden soil will do, but it should be finely broken up and the seed covered very thinly. The seedlings should not stand closer together than six inches for the weak growing kinds and 12 inches for the strong. The removal of the pods as soon as the flowers fade will prolong the blossoming season. If allowed to ripen the seed will stock the garden as weeds. Such plants blossom about two weeks earlier than spring-sown ones. The perennial species should be replaced by new plants each second year, since in cold parts of the country they are likely to winter-kill when old.

The most cultivated species are the opium poppy (see below) and the corn poppy (P. rhaëas), a European annual with rather small flowers and finely cut foliage.

The Oriental poppy (P. orientale), a native of southwestern Asia, is a perennial with large flowers. The Iceland poppy (P. nudicaule), an Arctic species, is a remarkably beautiful perennial, which is usually grown as an annual; it is perhaps the best species for cutting as a bouquet flower. Other species are popular with fanciers, but have not gained prominent places in general esteem.

As a garden plant the opium poppy (P. somniferum), an annual, is the most famous since it has probably the widest range of color and form. It is, however, noted as the source of opium-seed oil and opium alkaloids. The plants, which contain no opium, are rich in a bland, fixed oil (about 40 per cent), which is expressed for culinary uses, and to a small extent for painting and soap-making. The growing of the plants for this purpose has been an important industry in the Old World for centuries. In mild climates the land is made very fine by plowing and harrowing in the autumn when the seed is sown; in colder regions the seed is either scattered on the snow or sown in early spring, the land being prepared previously. Drilling and broadcasting are both popular. Shelter from wind is advisable to prevent scattering of the seed.

POPULAR SOVEREIGNTY. See Squatter Sovereignty.

POPULAR VOTE. See Aliens; Electoral Qualifications; Woman Suffrage; Elections; Naturalization; Vote.

POPULATION, Growth of World Population from 1800 to 1919. One of the most striking facts which we encounter in searching for the causes of the wonderful growth of world commerce in the past century is the discovery that world population has doubled within that period. In all the untold centuries in which man has existed on the globe, the number of people in the world in 1830 was but 850,000,000; to-day the world total is 1,700,000,000, or double that at the time when the application of steam to transportation enabled population to expand into hitherto unpopulated areas and supplied the means by which the products of those areas could be transferred to the continents where population exceeded the food-producing power.

World Population Doubled in 100 Years.—We may fairly fix the date of the practical application of steam to transportation at the year 1830. Fulton had shown the use of the steam-boat on rivers as early as 1807, and the little American steamer Savannah made the first steam voyage across the Atlantic in 1819, but it was not until 1838 that steam transportation across the ocean was regularly established. Steam engines had moved wagons on lines of rail as early as 1804 but it was not until 1825 that the first railway for the regular transportation of freight, the Stockton and Darlington Railway in England, was put into practical operation. The world's railways in existence in the year 1830 were but 200 miles; the world's steamships but 100,000 tons and none of those crossing the ocean.

So we shall do no violence to history if we fix the year of the practical application of steam to freight movement on land and sea at about the year 1830, in which the world's population was 850,000,000 or just one-half of that to-day. The total world population in 1819 is set down by the best authorities at approximately 1,700,000,000 and most of this totalization is by actual count, for countries representing more than two-thirds of the people of the world now take periodical censuses of
The above estimates of areas of North and South America, Europe and Australasia, and of populations are compiled from the 'Statistical Abstract of the United States' and 'The Statesman's Year-book'; the estimates of areas of Asia and Africa are based on planimetric measurements of shore lines; the estimate of polar areas is necessarily an approximation, founded on known data.

The latest estimate of the earth's fertile region in square miles is 29,000,000; steppe, 14,000,000; desert, 4,861,000; polar, 6,970,000.

The population of the earth according to race is based on an estimate by John Bartholomew, F.R.G.S., Edinburgh, revised to 1910:

Chief Causes of Growth in Last Century.

What are the causes of this wonderful growth in world population in the past century, the addition in less than 100 years of as many as had been accumulated in all the centuries preceding? While there are many causes the most important is that implied by the fact already mentioned that this growth is coincidental with the development of steam power for transportation on land and ocean. Before the advent of steam transportation, man was entirely dependent upon his immediately surrounding area for food, manufacturing materials and manufactures. When the population of a city or community became greater than the food producing power of the surrounding area, the people went hungry, diseases developed and life was shortened. When bad crop years came, there was suffering and starvation, and epidemics swept off population by millions. Life was short, infant mortality high, epidemics frequent, emigration from the congested districts difficult, immigration into the unpopulated areas equally difficult. The walled cities of Europe and Asia with their insanitary conditions and underpopulated were popularly designated 'man destroyers' and yet men still thought it necessary to congregate in walled cities or towns for mutual protection, and even those engaged in agriculture lived in little villages, going out to their fields in the morning and returning to their insanitary homes at night. Of the 850,000,000 people on the globe in 1830, approximately 700,000,000 existed on the single continent of Eurasia (which we now divide into "Europe" and "Asia") while the remainder of the world, Africa, North America, South America, Australia and all the islands of the seas had but about 150,000,000, though it should be added that population figures at that date are necessarily based in a considerable degree on estimates of the best experts upon this subject.

Opening New Areas to World Population.

- But the application of steam power to transportation on land and sea changed all this. Great areas, especially in the interior of the Americas, which had remained unpopulated because there was no way of moving necessary products to the markets of the more densely populated continent, have developed population and production as the railways were projected into the interior and steamships built to carry their products across the oceans. The population of the United States prior to the advent of the railway was chiefly along the ocean frontage or the navigable rivers. Turnpikes were constructed to enable the areas within a dozen or 20 miles of the river to move their products to the water's edge, but the great bulk of the fertile interior was too distant from the rivers or ocean to enable its scattering population to send their crops to world markets to purchase the manufactures of other countries. As a consequence the United States only added 6,000,000 to its population in the first quarter of the 19th century, a period in which it had no railways. In the next 25 years, about 9,000 miles of railway were constructed and the additions to the population were 12,000,000, or twice as great as the preceding quarter century in which there were no railways to stimulate the development of the interior. In the third quarter century the new railway construction was 63,000 miles and the additions to the population 21,000,000, or three and one-half times as much as in the like period before the advent of the railway. In the fourth quarter of the century the railway construction was 115,000 miles and the additions to population 32,000,000, or five times as much as in the quarter century when there was no railroads on the land or steamships on the ocean. In the 19 years of the present century, railway construction has been about 75,000 miles and the additions to the population 28,000,000.

Increase of Population and Commerce Co-incidental with Railway Development.

- The population of the entire United States when railway building began in 1830 averaged only seven persons per square mile; to-day it is 36 per square mile. The cotton lands of the Mississippi Valley when railway building began was but 3,500,000 and to-day is 52,000,000, or 15 times as many as when that valley had no railways to connect it with the oceans and no steamships to carry the products to other parts.
of the world. During this period in which rail-
way construction has developed, 30,000,000 peo-
ple came from other parts of the world to the
United States seeking homes, chiefly in the in-
terior of the country, and with their aid and
that of immigrants, the commerce was built up from a little over $100,000,-
000 in 1830 to $4,250,000,000 in the year preced-
ing the great European War which by its
special demand upon our facilities coupled with
increasing demand from other parts
of the world brought the grand total of
approximately $10,000,000,000 in the fiscal
year 1919. Our international trade in the
year which preceded the European War
was 30 times as much as at the beginning
of railway construction in the United States,
and in the closing year of the war 65 times as
much as in 1830 when the United States had but
23 miles of railway.
In the other parts of the American continent,
the increase in facilities of transportation on land
and sea have been followed by a marked
increase in population and commerce. The com-
bined population of all America which was
but 20,000,000 a century ago is in 1919 fully 200,
000,000, and the international commerce which
was then $200,000,000 is now $15,000,000,000, or
75 times as much as a century ago when there
were no railways to carry the products to the
water's edge or steamships to move them across
the ocean.

Growth of Population in the Various Sections of the World.—Population has shown
dependency upon transportation in all the grand
divisions of the world. Europe, with a short-
age of food and an increasing power to produce
manufactures, has, since the advent of steam
transportation, drawn upon the other parts of the
world for food and raw material, and to pay for
them in the products of her factories, and the
other parts of the world with surplus stocks of
food and a shortage of manufactures have de-
sired to make the exchanges which Europe
wanted, and with these exchanges Europe has
been able to greatly increase her already dense
population, by drawing food from abroad and
paying for it with the products of her work-
shops. While the Americas, Asia, and Australia
have increased their population and natural
products and thus greatly enlarged their com-
merce. The population of Europe a century ago
was but 200,000,000; it is now 465,000,000. Asia
had at that date about 400,000,000; now it is
870,000,000. Africa's population at that time
was possibly 100,000,000; to-day it is 140,000,000,
while that of all America has, as already indi-
cated, grown from 20,000,000 in 1830 to 205,000,-
000 at the present time.

Transportation Facilities, Distribution of
Industries and Specialization of Production.—
Steam transportation has thus enabled the
newer countries to develop population by giving
them access to the vast interior areas having
large producing power, while it has also in-
creased the population of the more densely
populated countries of the globe by giving to
them an opportunity to bring food from other
continents at such small cost of transportation
that they could pay for it with products from
their own soil. Time and again by this means
further increase their dense population, the im-
proved conditions of living and better sanitary
methods giving to their people greater comfort,
other parts of the world, especially the densely populated countries of Europe, which are rapidly increasing the use of vegetable food from the tropics. Sugar, an extremely valuable article of food, has developed with astonishing rapidity as a result of cheap transportation and better process of manufacturing, and the world's production of sugar in the year preceding the war was 40,000,000,000 pounds against 4,000,000,000 pounds a half century earlier. The world's corn crop of which the United States is the world's largest producer is now about five times as much as 50 years ago. Meantime we have brought from other parts of the world many grain and other food products and so adapted them to our own soils and climate as to materially increase our power of sustaining a large population.

Increased Density of Population no Longer Considered Alarming.—Even those sections of the world long looked upon as densely populated go calmly on increasing their populations at a rapid rate and producing the bulk of their own food by the exertions of their own people. In fact, several of the most densely populated countries of the Orient, has doubled its population in less than 50 years, yet it imports comparatively very little foodstuffs, drawing its chief food supply from its rice fields with which the mountain sides are terraced and the surrounding seas whose fisheries supply practically all of the animal food consumed by the people of Japan. These require the time of about 2,000,000 people in accumulating and preparing the nearly $100,000,000 of sea food which that industrious people draw from the surrounding waters. Java, the most densely populated island of the world, has doubled its population in less than a half century, and its people, who now average more than 700 per square mile for the entire island, draw most of their food from the rice fields and the fishing industry, and have rendered the island extremely prosperous with such valuable products as coffee, tea, sugar, spices, cinchona, tin, petroleum and India rubber, which they exchange with other parts of the world for such requirements as they are not able to meet from their own sources of production. Germany, with an area less than our State of Texas, had doubled its population between 1840 and 1914, and with a population much more dense than that of Germany and equally dependent upon other countries for food and manufacturing material, doubled her population in the past 60 years and ranks among the most prosperous of the world's nations, bringing its food and manufacturing materials from long distances and paying for them with the products of her work shops.

Relative Density of Population in Representative Countries.—We of the United States can give another example for the density of population in certain other countries than that of our own. We have in continental United States, exclusive of Alaska, an average of 36 persons per square mile, while Germany has 325 per square mile, Italy 332, Japan 392, Netherlands 499 and England an average of 624 per square mile, or 17 times as much as our own. If all the people of the entire world were set down in continental United States, exclusive of Alaska, our average density of population per square mile would be less than that of England to-day. Yet England is looked upon as one of the most prosperous countries of the world and feeds her dense population in large part with food brought from other countries, often from the opposite side of the globe, and paying for the same with the product of her factories.

The Drift to Industrial Centres.—With this change in the habits of life among the people of the world, the exchange of food of the agricultural areas for the manufactures of other areas, the density of population in the manufacturing areas has gone on increasing without the danger of starvation or food shortage which existed a century ago when cheap transportation of food across the ocean was impossible. In England, for example, the share of the population living in the cities of more than 20,000 in 1800 was 21 per cent and 66 per cent in 1900. The British census of 1851 classed 49 per cent of the population as "rural" and in 1911 only 22 per cent was classed as "rural." The population of the 12 great cities of England was in 1821, 2,000,000 and in 1919 is 9,000,000. In Scotland in 1800 only 17 per cent of the people lived in cities of 10,000 or upward; now it is over 50 per cent. In Prussia in 1800 only 7 per cent of the people lived in cities of 10,000 or more; in 1890 it was 30 per cent and at the beginning of the war approximately 40 per cent. These changes are the result of a transfer of labor in the older countries from agriculture to manufacturing and reliance upon younger countries for food and manufacturing materials.

This habit of accumulation of population in dense masses and of drawing food from other areas better able to produce material of this character is exemplified in a striking degree in the United States which has recently become a great manufacturing nation. In 1820 the population was 5,000,000 but its own population living in cities of more than 10,000 was in 1800 only 4 per cent; in 1890 it was 28 per cent, while the share of the population living in cities of 2,500 or more in 1910 was 46 per cent and at the present time is approximately 50 per cent. Thus it may be said that even in this comparatively new country, with its large agricultural powers, approximately one-half of our population now live in cities or towns and draw their food and manufacturing material from other areas, some of them on the other side of the globe. While the United States is still the world's greatest producer of both food and manufacturing material, it now brings from other countries, mostly across the ocean, about $2,500,000,000 worth of food and manufacturing material annually, and these two groups of material actually form 85 per cent of the merchandise imported into this country, much of it traveling half-way round the world before entering our ports. Great Britain is the largest single producer of this type of material brought into other parts of the world for food, since with a population less than half our own she brings in normal years nearly $3,000,000,000 worth of merchandise, chiefly food and manufacturing.
material from other countries, much of it across the ocean.

Will the Recent Growth of Population Continue?—Now a word as to the future. The population of the world has doubled in the past century. Will it double again in the next 100 years? Probably not. The growth has perceptibly slowed down in the past quarter century and is now at the rate which suggests a net increase of little more than 1,000,000,000 in world population during the next century, giving a grand total of about 3,000,000,000 as the world’s entire population a century hence.

Can the world sustain a population of 3,000,000,000 as against 1,700,000,000 at the present time? Undoubtedly. The developments of science and industry will bring under the control of man vast areas now contributing practically nothing to his support. The great tropical and subtropical belt which stretches round the world between the 30th parallels of north and south latitude has about one-half of the land area of the globe, but now supplies but one-sixth of the human food requirements. The development of long distance commerce, despite the fact that its producing power per acre or square mile is double or treble that of the like area in the temperate zone. With the lessons of the war, man has learned to substitute the internal combustion engine for the horse which could not perform a satisfactory service in the tropics, and with this new instrument of production and transportation he will now, after long years of waiting, be able to conquer the tropics and multiply the production of the food and manufacturing materials which they can so easily turn out and for which the other sections of the world are clamoring. The producing power of the older and longer cultivated lands of the world is largely dependent upon the soil foods supplied, and with the lessons of the war, man has learned to reach out into the air and obtain unlimited quantities of that most important of soil foods, nitrate, utilizing for that work the power of the waterfalls which has been going to waste in the past. The great deserts of the world now producing nothing have shown that they only need the application of water to render them more productive per acre or square mile than those of the areas now under cultivation, and man is gradually learning methods of bringing to them the necessary moisture from beneath the surface or from distant water courses, and at the same time has learned through the application of ‘dry farming’ to obtain enormous quantities of food from areas formerly considered of little value as food producers. The substitution of the internal combustion engine, utilizing gasoline, kerosene, heavy oils or alcohol, will take the place of the horse and thus release enormous areas of land hitherto devoted to producing food for that animal whose services will be no longer required. The scientists of the world are showing us every day the feasibility of utilizing for food purposes untold quantities of natural products which have been permitted to go to waste in the past, while the world has also learned how to conserve the importance of so conserving the products of nature as to render them far more valuable in the future than under the wasteful methods of the past.

Division of Labor and Specialization of Industry.—All of these things, the disposition of the densely populated countries to continue their growth of population by drawing foods from abroad and increasing their output of manufactures to pay therefor, and the disposition of the agricultural countries to continue their growth by increasing their output and accepting manufactures in exchange, means the application to world industries of that great economic law The Division of Labor and Specialization of Industry. Man long ago learned that this system would give better results in the operations of considerable groups of people under a single management. The manager of the successful factory divides the various processes required for producing the completed article among a large number of people or groups, but keeps each man or group of men steadily at the particular part of the work in which he has thus become especially expert. By this process of distributing the various parts of the proposed article to small groups of individuals and charging each group with the entire output employed upon that particular part of the work, he increases the producing power of the factory and cheapens the cost of producing the articles being manufactured.

This system of division of labor and specialization of production, so successful in the operations of comparatively small groups of men, is now being applied, perhaps unconscious, to the production of the world, through the cooperation of cheap and plentiful transportation. Europe, the United States and Japan have become the world’s great manufacturers and the agricultural, forestal and mineral areas in other sections of the globe have become the producers of food and manufacturing materials. As a result of this distribution of labor and specialization of production in the great world industries, the quantity of the respective articles which each group of men can produce has been greatly enlarged and the cost of production, measured by man power, consequently reduced. Specialized transportation developed by another group of specially trained men enables the interchange of these articles at small cost.

As these great principles of division of labor and specialization of industry are applied from day to day to the world production of the staples required by man, they are being, little by little, extended to such new articles or industries as may be developed by the ingenuity of the human mind. The producing powers of the whole world are thus steadily increased, while the amount of man power required for the production and distribution of the respective products is being decreased by the same process of specialization.

As a result of these conditions, the division of labor, the specialization of production and the cheapening of transportation, the world today is able to sustain a population double that of a century ago, with greater comfort, greater prosperity and a higher degree of intelligence than at that time. When we consider what has been done in this line in the last century, we may confidently expect that the world will be able to meet the requirements of such further additions to its population as the future may bring.

Population, Relation to Wealth to.

See Capital.

Populist Party, The. See People's Party, the.

Porbandar, pôr-bûn'dar, India, a seaport town, capital of a native state of the same name, in the political agency of Kathiawar, Bombay. It is built on a creek on the southwestern coast of Gujarat and has an active shipping trade with Bombay and Malabar. Pop., 19,000.

The state has an area of 636 square miles and a population of 85,785.

Porbeagle, a shark of the family Lamnidae, more usually called mackerel sharks (q.v.), on the northeastern American coast. The best-known species is Lamna cornutica, the Beaumouris shark, which occurs in the north Atlantic, attains a length of 10 feet and feeds chiefly on fishes. The porbeagle has two dorsal fins, a wide mouth, lanceolate teeth and very wide gill openings.

Porcelain. An argillaceous substance characterized by its translucency and vitrification; hence the ware made from the same is often so termed. These two qualities are not found combined in other pottery, earthenware being porous and opaque and stoneware being vitreous but not translucent. The derivation of the word is not clear, but some claim it comes from the cowry shell named porcellana (Italian) or porcelana (Spanish), part of the enamel coating of which has the appearance of porcelain.

Technology. — The body or substance of which porcelain is made is termed paste or pâte (French). The Chinese hard-paste porcelain (first to become known to Western civilization) is made up of certain clays of clays known as kaolin and petuntse or cornish stone. Kaolin is frequently called china clay and cornish clay on account of its most prolific source of high quality being Cornwall (also Devon), England. Both kaolin and cornish stone are the natural products of weathered granite (pegmatite). Kaolin is a silicate or alumina and infusible, while cornish stone (petuntse), afeldspar containing silicate of alumina combined with potash, soda and lime or barium, is fusible and acts in the furnace to produce with the kaolin a molten mass of homogenous texture and having conchoidal fracture like glass. Porcelain is generally divided into two main classes known as hard-paste and soft-paste or natural and artificial. The French know them as pâte dure and pâte tendre, terms very frequently used by English-speaking connoisseurs. In general it may be said that the hard-paste is not scratched with a file or steel point while soft-paste is abraded under such a test. Soft-paste is slightly porous. While hard-paste porcelain is, as before stated, produced (body and glaze) from kaolin and china stone, soft-paste was made (the Chinese clays being unknown at first) in imitation of the Eastern wares from substitutes after an enormous amount of research. But the old Sévres soft-paste was an artificial body and glaze of astonishing beauty and perfection, its uncertain, soft tone contrasting much in its favor on comparison with the glaring whiteness of the Chinese natural porcelain body. Bronnigeard, the great ceramist and director at the Sévres works (middle 18th century), gives the following formula all of which are favorite at the present time: molten nitre, 0.220; gray sea salt, 0.072; alum, 0.036; Alicant soda, 0.036; Montmartre gypsum, 0.036; Fontainebleau sand, 0.600; all made into a frit (fused into a vitrified mass, then pulverized). This artificial substance was made of the following ingredients, in the following proportions, to produce the actual pâte: Frit (as above) 0.75; calcareous marl from Argenteuil, washed, 0.068. A glaze formula was: calcined Fontainebleau sand, 0.27; calcined flint, 0.11; litharge, 0.38; carbonate of soda, 0.09; carbonate of potash, 0.15. The physical softness of this pâte and glaze allowed the colors in the decoration to sink into pâte and glaze so as to leave a lovely mellowness like wax. In 1769 Sévres started hard-paste. One considerable advantage of which soft-paste has over hard-paste from the manufacturing point of view is the fact that less heat is required in the baking; but, hard-paste firing at from 2,462° F. to 2,642° F. with safety, while soft-paste permits only a margin of heat of from 2,012° F. to 2,102° F., gives hard-paste a safety margin against crazing of 180° F. against a range of but 90° F. for soft-paste firing. The firing, which is done in specially constructed ovens, takes place after the wares are stacked in safety, protected by fire-clay covers, known as saggars. The incandescent heat of the hard-paste furnace is generally called by experts by the French term grand feu, sometimes hard fire, while the lesser heat required in baking the body of other wares is termed demi grand feu. The preparation of the clays for porcelain is done in blungers, sifting machines, etc.; the forming or shaping of the mass or body on the potters' mold or in the modern turning lathes, "jiggers," "jollies," all of which are classified under this specialized head (see Ceramics; Clay; Pottery, and related references).

Colours. — The only colors that will stand the grand feu heat of hard porcelain are: blue from cobalt, red from copper and céladon green and brown from iron. These, therefore, are used under the glaze. In order to extend the range of colors on hard porcelain ware a separate firing becomes necessary, either in an oven of less intensity or in parts of the incandescent oven which are not reached by the most intense temperature. Of such are turquoise blue from copper; purple from manganese; yellow from iron with a proportion of antimony. Colors which will stand.
in kilns of lesser heat are red, from iron oxide; brown, from iron chromate or manganese; green from copper; yellow from antimony; rose and purple from gold.

History.—No industry furnishes a history so full of romance as that of porcelain. The discovery of the porcelain body was made in China; the first production having the characteristics of translucence with vitrification would appear to have taken place at the end of the 6th century. The cause of its discovery is the great interest which centres in the Celestial jade of translucent jadestone. Carved jade was, par excellence, the most valued of the Chinaman’s possessions, and it was in the attempt to obtain a substance with the qualifications of this hard, semi-translucent, greenish-yellow mineral ( nephrite) that kaolin was used for a body or mass, combined with other silicious material, and céladon was the outcome from which magnificent vases, bowls, etc., were produced. Céladon could not be called translucent. By the 7th century, at least, the porcelain body, or nearly, that of a later Ching-te-chén, true porcelain was in course of manufacture in large quantities having the qualities of being translucent, stone-hard, resonant and of vitreous fracture—the natures call it to distinguish it from the true porcelain of any ware. A description of the different lovely wares of the Chinese dynasties will be found elsewhere (see CHINESE CERAMICS). Already in the 16th century Chinese porcelain ware was becoming known in different parts of Europe as rare and lovely works of art of great value and Florence (under the Medici) attempted to make imitations, at the end of that century, of Chinese specimens in their possession. It was an artificial glassy porcelain made from impure china-clay (Terra-Vicenza), fine white sand and powdered glass. With the growing admiration of Europeans for the Oriental porcelains and the increasing numbers of superb collections among the royalty and nobility grew up an intense desire to produce the ware at home. The Jesuit priest, Père d’Entrecelles, during his prolonged stay in China gathered a mass of information as to the methods of manufacture of the coveted ware and sent detailed accounts home of his discoveries among the porcelains of Ching-te-chén. They did not bring about the discovery of materials for the porcelain body, however, though they assisted greatly in giving invaluable information on the Chinese methods of porcelain manufacture. To meet the popular clamor for pieces of pottery similar to the Oriental porcelains at a cost within the reach of the bourgeoisie of wealth the lovely specimens of blue-and-white underglaze and some polychrome pieces (see CHINESE CERAMICS) were reproduced in earthenware coated with a tin-glaze opaque white slip by the 17th-century Dutch potters at Delft. (See DELFT.) In spite of diligent search, the clays which produce porcelain remain unknown. The Japanese nation claims that its knowledge of art pottery was gained from the Koreans, but Chinese influence introduced porcelain manufacture to the realm of the Mikado. With the Japanese connoisseurs porcelain took a secondary appreciation and was received in their patronage. The peculiar decorative talents of these islanders produced clever porcelain styles that quickly attracted European attention and demand and the trading companies of Holland and England were soon importing great quantities of Japanese alongside the Chinese wares. The porcelains of Japan are described fully elsewhere. See JAPANESE CERAMICS.

European Porcelains.—While both Florence and Venice had produced, in 1760, pieces to start ware of porcelain appearance, these were but of glass body with admixture (perhaps) of ground Chinese porcelain fragments. Of recent years the honor of making porcelain ware in the industry and realizing the Celestial jade stone, where a good quality of ware was produced in an admirable soft porcelain body. In 1673 Edme Poterat (talented faience master) secured a license to manufacture in his earthenware works porcelain as well as faience. It was carried on till 1696 by Louis Poterat, a son, who when he died had never divulged the secret working formula. Several pieces of this rare ware are in Europe and America (Morgan collection). Pierre Chincaneeu’s porcelain factory (Sillé) was founded early as 1670 and the letters of several contemporary notablest testify to the fact that both in painted decoration and beauty of form and finish the ware fully equaled that of the Chinese. It continued in use as late as 1760, each piece of many pieces are found in present-day collections proving the high quality of this ware, which, besides cups and saucers, includes tea-pots, milk jugs, candlesticks, spice-boxes, handles for knives and forks. The delicate relief work is remarkable, but the pieces are rather thick. Johann Friedrich Böttger, a German alchemist, was the first to make hard porcelain in Europe. His claims of power to turn base metal into gold caused Augustus II, Elector of Saxony, to hold him in captivity in preference to turning him over to the king of Prussia, who was anxious for him to carry out his proclaimed powers in Berlin. Böttger, under the protection of the Elector, set up his furnace and laboratory in Dresden. But his failure to bring forth the precious metal caused him to be moved from place to place as a prisoner under associates of the king. After several attempts at escape his life was in danger from anger at his deceptions till he discovered the process of making porcelain in 1708 and 1723. They did not bring about the discovery of materials for the porcelain body, however, though they assisted greatly in giving invaluable information on the Chinese methods of porcelain manufacture. To meet the popular clamor for pieces of pottery similar to the Oriental porcelains at a cost within the reach of the bourgeois of wealth the lovely specimens of blue-and-white underglaze and some polychrome pieces (see CHINESE CERAMICS) were reproduced in earthenware coated with a tin-glaze opaque white slip by the 17th-century Dutch potters at Delft. (See DELFT.) In spite of diligent search, the clays which produce porcelain remain unknown. The Japanese nation claims that its knowledge of art pottery was gained from the Koreans, but Chinese influence introduced porcelain manufacture to the realm of the Mikado. With the Japanese connoisseurs porcelain took a secondary appreciation and was received in their patronage. The peculiar decorative talents of these islanders produced clever porcelain styles that quickly attracted European attention and
Porcelain

Porcelain was developed in delicate beauty and softness anything produced at Meissen and we are indebted to the fact that kaolin had not been discovered in that section that we inherit an artificial porcelain body that is the admiration of the world. The wealth of royalty caused marvelous pieces in the most delicate color decoration to be made for the court and for gifts to foreign rulers, regardless of the great expense in production. A full account of the history and products of this world-renowned porcelain will be found under another title (see Sévres). Already in 1725 Cquaire Grou had established a porcelain factory at Chantilly under the patronage of Louis-Henri de Bourbon, Prince de Condé. Beautiful figures, but mainly table services, artistically decorated, were its chief products. Japanese decoration frequently is found on earliest pieces, for the factory license was granted to produce pieces in imitation of the Japanese porcelains. For Japanese porcelains were becoming popular with their clever kakiemon decorative methods. Chantilly factory remained active till 1800. And from now on members of royalty and nobility aided in the starting of porcelain factories in different parts of France, even when the laws protecting the royal Sévres monopoly forbade the competition. Soft porcelain was made at Mennecy, Villeroy from 1734 till 1773 when the factory was transferred to Bourg-la-Reine, continuing till 1806. Others opened as follows: Lille (1711), Sceaux (1749), Orleans (1753), Crepy-en-Valois (1762), Saint Amand-les-Eaux (1771), etc. But about 1768 kaolin was discovered at Saint Yrieix (Haute-Vienne) and France turned to making hard porcelain at Orleans (from 1768); Brancas-Lauragais (1764), where kaolin and petuntse were also found as early as 1750; Vincennes (from 1765), Niderviller (1765), Vaux (1769), Lunéville (1769), Arras (1770). At Paris alone we find the following hard porcelain factories established: Rue de Bondy, named after the Duc d'Angouleme (1780); Pauvain Saint Antoine (about 1773); factory of the Comte d'Artos (about 1769); Clignancourt (1771); La Courtille or Basse Courtille, in the faubourg du Temple (1771); Prince des Galies factory, rue de Cromer (same date); factory in Orly (about 1784), then transferred to Pont-aux-Choux; rue Popincourt factory (1782); rue de Reuilly (1774); rue de la Roquette (1774); rue Thioux (1775), made Porcelaine à la Reine. Other notable hard porcelain factories were established as follows: Arras (1770), La Seynie (1774), Marseilles (1776), Boissesse (1778), Lille (1784), Valenciennes (1785), Caen (1797). In Belgium a factory was started in 1750 at Tournay which became one of the most flourishing in Europe, lasting to the present day. In Germany very noted factories, besides that of Meissen (Dresden) and turning out the most beautiful art ware (figures, etc.), must be mentioned that of Fürstenberg, established in 1746 by Duke Karl of Johanneburg and Christian Gisbert von Bayreuth as expert. Its activities continue to this day. At Höchst (1746) porcelains were produced that brought the factory to be third in Germany after Meissen and Berlin, but the workshop was closed in 1796. In 1791 Caspar Wegeli established a factory at Berlin, but he closed to take up the wool industry in 1757. The sculptor, Ernest Heinrich Reichard, got possession but turned over the place to J. E. Gotzkowski in 1761. Friedrich Elias Meyer, the modeler, was engaged with Jaques Clauze, the noted enamel painter and other skilful craftsmen. Lacking success Gotzkowski sold the factory (1763) with a rich stock, 133 figure molds and other valuable material for 225,000 thalers and the place received the title "Königliche Porzellann-Manufaktur" as the property of Frederick the Great, who got craftsmen from Meissen and soon established successful operations. The early yellowish-gray paste formerly used was displaced by that made from kaolin obtained in Silesia, making a whiter paste. Rococo style was in highest vogue so the Berlin pieces of the early period are steeped in the extravagances of this style. Grand pieces were constructed for the king's court, candelabra and mirror-frames for Sans-Souci Palace, a great centre table-piece for Catherine II of Russia consisting of allegorical and other figures in which biscuit (unglazed) has been ever since the usual method of production of Berlin figures. Coffee and tea services from this factory show very delicate decoration en camaisons. Berlin's iron-red and rose-crimson are two of her best successes in colors. The factory is still active but has suffered from the same degeneracy in art as other fabriques. The porcelain factories of Frankenthal (1755) and Ludwigsburg (1758) are noted for the lovely art works produced, but lack of space forbids their detail; the same must be said of the factory at Nymphenburg (1758), bare enumeration of their existence being here alone possible together with the statement that their productions when they appear in the auction-room bring extraordinary prices and are considered worthy the cost. Cassel (1762) and Keltersbach (1758) and Fulda (1763), all had porcelain factories, and in the Thuringian forests, where kaolin was discovered and fuel was cheap, Sitzendorf-Volkmest (1762), Gera-Unterhaus (same date), Klister Veitsch (1765), have their works still active. Wallen-dorf (1765), Götha (1767), Limbach (1772), Grossbreitenbach (1780), Rauenstein (1783), Tettau (1794) and Pössneck (1800) are all in more or less vigorous activity. The porcelain factory at Vienna was established in 1718 but failed to make headway, and to 1744 had been a financial failure all the time. Its sale to the state in that year permitted a more substantial condition to prevail and both demand and supply grew till the great trade depression that started in 1779 caused such an unsatisfactory financial condition at the factory that (1784) it was offered for sale without bidders. Rococo, the prevailing style of decoration of that period, remained in the Vienna wares of this second period. In the latter-mentioned year the factory was placed under the control of Baron von Sorgenthal as director; and the fortunes of the fabrique rapidly changed for the better and with an ever-increasing demand demand the firm opened a branch was started in 1799 at Engelhardtzell, near Passau. The rococo style gave way to antique classic under Sorgenthal. In 1805 Vienna entered on her fourth period, when Sorgenthal died and Nibbrig took the direction and continued the financial success in spite of the severe obstacles created by the war, such
as the loss of Passau and the factory at Engelhardzell. By 1816 decline set in and in 1827 Niedermayer retired, the fifth period opening with Benjamin Scholtz directing. He used cheap clay and made poor quality of ware and the factory declined still further till 1833, when Scholtz died and Baumgartner, professor of physics at the university, succeeded. A small profit was now made by producing common porcelain for domestic use. Later more artistic work was undertaken (1856) by Alexander Lowe, but in 1864 the factory was closed to stop the continuous loss. Holland had porce- lain factories at Weesp (about 1763), Oude Loosdrecht (about 1774) and The Hague (1778), but none lasted long. Switzerland, in Zürich (1763) and Noyon (end of the 18th century), had porcelain factories but they soon closed. Kaolin was discovered in Denmark (1756) and a porcelain factory was opened the same year in Copenhagen, which after changing hands was followed by a new factory in 1772, but it was no success till, in 1779, the king took up the work and the factory began producing beautiful art work worth lengthy comment. In Italy, besides Florence and Venice before mentioned early in this article, Doccia (1737) made both soft and hard porcelain; Capo-di-Monte also made soft porcelain of lovely character and refinement from 1742 till 1759, when the king of Naples and Sicily became king of Spain and removed his factory to his palace of Buen-Retro, near Madrid, where work continued till 1808. At Saint Petersburg, Russia, about 1745, Empress Elizabeth started a hard-paste factory which has continued to this day. The chief work strongly imitates Meissen (Dresden) during the Seven Years' War period as the workmen were from Meissen; then followed Sévres style.

English Porcelain.—So far as known the first English soft paste was made at Chelsea (earliest specimen dated 1745). Bow is said to have produced artificial porcelain as early as 1730, but 1740 is generally considered the date of work on a commercial scale. Derby works were started in 1756 and Worcester was established in 1771. Other factories are those of Longton Hall (1752), Davenport (1794), Meissen (1745), Minton (1765/7), Liverpool (Herculaneum 1800), Caulfeild (1772), Coalport (after 1814), Pinxton (about 1795), Church Gresley (1795), Nantgarw (about 1813), Swansea (1814). Kaolin and petuntse for making hard-paste porcelain were first discovered by Stickle (1758) in Cornwall and the first factory to make true porcelain was at Plymouth (1764); he sold out to Champion of the Bristol works (1770). Full description of the history and characteris- tics of the wares of prominent factories will be found under the titles Bow, Bristol, Chelsea, Derby, Lowestoft, Worcester, etc. With the 18th century certain proportions of bone had been used in the ingredients composing the porcelain body by certain factories; with the beginning of the 19th century this bone paste had become standardized in all factories and, as a consequence, the English *standard* or "bone" porcelain swept aside all other kinds and the factories of the Continent found themselves in a condition in which the English porcelain factories filled all the common needs of the European table services with a pure white, inexpensive, hard-porcelain, impossible of competition. The *standard* ware has been universally used for commercial ware ever since.

CLEMENT W. COUMBE.

PORCELAIN CLAY. See KAOLIN.

PORCELAIN TOWER, a tower which was erected in the early part of the 15th century and destroyed by the Taipings in 1853. It was octagonal in construction, had nine stories, faced with variegated porcelain (from which it received its name), and from these lamps and bells were hung. A miniature reproduction of the tower may be seen in the Green Vault in Dresden.

PORCH, a covered place of entrance to a building and differentiated from its principal mass. Its forms are various, sometimes extend- ing above by more than one story, sometimes enclosed save for the doorway, then again open to the outside on three sides, with its outer corners supported by columns or piers. It may be simplified into an overhanging hood or baldachino. In Byzantine and Eastern churches the porch was an enclosed atrium or narthex, a feature that has developed with modifications into the mosque of the Moslems. The enclosed atrium was retained in the early basilican churches and contained a fountain where worshipers might wash their hands,—the origin of the present universal Roman Catholic practice of dipping the fingers in the holy water of the piscina. In this space, probably always called the narthex of the basilica, the penitent or unbaptized persons were compelled to stay. Such a structure may be seen in the church of San Lorenzo, in Rome, and Saint Apollinaire in Clusse at Ravenna. The narthex extended across the front of the church and its inner wall contained three doors through the nave and aisles of the main body. Of Romanesque churches, the porch of the church of
Vézelay is an important example; while the church of Saint Germain l'Auxerrois in Paris shows a Gothic edifice with a porch extending across the front, dating from 1431, its horizontal crown in sharp contrast to the climbing lines of the main edifice.

Porches are characteristic of the Gothic style in Italy, though instead of being placed in front they often occur on one side of the flanks, thus forming side entrances. A remarkable specimen in three stories, the upper and surmounting one of a pagoda-like structure, is attached to the church of Santa Maria Maggiore at Bergamo.

PORCIA. (1) The plebeian gens of Rome, flourishing from the 3d century B.C. and whose most famous family was that of Cato. (2) An ancient lady living in Rome, the daughter of Cato, of Utica. She became the wife of M. Bibulus, who was Cesar's colleague in the consulship, in 59 B.C., by whom she had three children, and after his death married M. Brutus in 45 B.C., who later murdered Caesar. After the death of Brutus she committed suicide.

PORCUPINE, a rodent of the family Hystricidae. Porcupines are distinguished by the peculiar nature of the body-covering, which consists, especially on the back and haunches, of hairs specially modified to form the so-called quills, or dense, solid, spine-like structures. These quills are intermixed with bristles and stiff hairs, and in the American subfamily Syntereinae are almost concealed beneath the hair-fur of the body. The incisor or front teeth number two in each jaw and spring from permanent pulps, so that they continue to grow throughout the lifetime of the animal as in the other members of the order. There are four molar teeth on each side of each jaw, exhibiting complicated foldings of the enamel on both the internal and external sides; and sometimes they, like the incisors, continue to grow throughout life from persistent roots. The skull exhibits an infrarostral foramen of very large size. The muzzle is generally short and broad. The lips are divided at the ears short and rounded. The anterior feet possess four and the hinder feet five toes, all provided with strong, thick nails. The tongue is roughened or, as in the Javan porcupine, may be provided with horny plates or scales.

The family Hystricidae is divided into two groups, Histricinae and Syntereinae, or two subfamilies, Histricinae and Sphyngurinae. The Histricinae or Old World true porcupines are terrestrial, and have imperfect clavicles and open rooted molar teeth. They fall into several genera. Of these the most familiar is Hystrix, represented by the true porcupines. The common or crested porcupine, Hystrix cristata, found in southern Europe and in northern Africa, is the best known. The true porcupines have non-prehensile tails, which may be spiny or covered with scales or bristles. When fully grown the common porcupine measures nearly two feet in length, and some of its spines exceed one foot. The general color is a dark brown. The black part of its head and neck is furnished with long, light-colored hairs, capable of being raised or depressed at pleasure; and most parts of the back and sides are armed with spines, which are longest on the centre of the back. In their usual position they lie nearly flat upon the body, with their points directed backward; but when the animal is excited they are capable of being raised. The quills are loosely inserted in the skin, and may, on being violently shaken, become detached—a circumstance which may probably have given rise to the purely fabulous statement that the animal possessed the power of actually ejecting its quills like arrows or darts at an enemy. These animals generally lead a solitary life, and inhabit burrows during the day, coming forth at night in search of food, which consists of vegetable matter. The common species is quiet and peaceable, but shows no disposition to become familiar or domesticated. An Indian form (H. leucurus) resembles the created porcupine, but is larger.

The genus Atherurus, including three species, possesses a long scaly tail, which is terminated by a tuft of bristles. The species of this genus occur in the Malayan region and West Africa. The Atherurus fasciatus, or brush-tailed porcupine, is a familiar species of the Amazon. The Syntereinae, or American tree-porcupines, are easily distinguished by their well-developed clavicles, molars with closed non-growing roots, usually prehensile tails, the feet with tuberculated soles and the absence of the pollex. The three genera are confined to America.

The Canadian porcupine (Erethizon dorsata) is the best known, and is a robust animal with a short non-prehensile tail. It is about two and a half feet long; of a brownish color, mingled with white; the spines are about four to six inches long, concealed in the fur and attacked in a very slight manner to the skin, and, from being barbed at the tip with numerous small reversed points or prickles, they by degrees penetrate very deeply into the flesh after having once pierced it. Small and insignificant as these defensive weapons may appear, they are capable of severely injuring dogs, wolves or indeed any animal that inadvertently attempts to seize the porcupine. These spines or quills were much dreaded among the Indians to whom different articles of dress; they dyed them various colors, in a very permanent manner. The Canada porcupine is found in the thickly wooded parts of northeastern United States and in Canada, the northernmost limit of its distribution being the shores of the Mackenzie River and the southernmost the high mountains of Pennsylvania. They feed on the barks of various trees, apples, corn, etc. Their flesh is said to be very unpalatable, resembling flabby pork. They pair about the latter end of September and the female brings forth two young in April or May.

The genus Syntereinae of South America to Mexico possesses a distinctive feature in the elongated prehensile tail, adapting it for an arboreal existence. They are the true porcupines. About 10 species of these animals are indigenous to America, the spines, as in the Canadian porcupine, being of much smaller size than in the Old World forms. In length the typical species of this genus averages one and one-half feet, the tail measuring about 10 inches.

PORCUPINE ANT-EATER. See ECHIDNA.

PORCUPINE FISH. See DIODON.

PORCUPINE RIVER, a tributary stream of the Yukon. Fort Yukon is at the confluence of these rivers. The Porcupine is navigable for steam vessels a distance of about 100 miles and for about twice that distance for smaller craft. The lower Mackenzie is most easily reached via the Yukon, not the Porcupine or the Peel River.

PORCUPINE-WOOD, the timber of certain Oriental palms. See PALMS.

PORDONEONE DE SACCIS, pór-dón-nó'né dà săk'kéz (or De Corteccelis) really named Giovanni Antonio da Pordenone, Italian painter; b. Pordenone, 1483; d. Ferrara, January 1539. He painted in his native home and worked without much influence from abroad, until in his 27th year he visited Venice and was captivated by the productions of Giorgione, Palma and Titian. In 1535 he settled at Venice and before the end of the year was knighted by the king of Hungary (taking in addition the name of Vecchialo), and in 1538 was summoned to the court of the Duke of Ferrara, who desired his services to prepare designs for Flemish tapestry, but here he died suddenly the following year. These are the few incidents of his life with which we are acquainted. His works consist of altar-pieces and frescoes, painted in the spirit of the Renaissance. Of these the most important are the New Testament series of frescoes in the church of San Salvador, Cotalto; the paintings on the walls and roof of the cathedral chapels at Treviso; and those in the cathedral of Cremona (1520-22). He also painted the altar-piece of the cathedral at Pordenone—'The Madonna Attended by Saints' (1515). Most of the frescoes he painted in houses and churches at Venice have perished. Several of his paintings are in England, notably his colossal figure of 'An Angel' in the National Gallery, and a large picture of himself and family at Hampton Court.

PORE FUNGI. See FUNGI; POLYPORUS.

PORGEY, or PORGE, name applied in different localities to many or several different fishes. In eastern United States the scup (Stenotomus argyroxyce), and occasionally the menhaden (Brevoortia tyrannus) are so named. The moon-fish or angel-fish (Chatodipterus faber) is rarely so called. The Pagrus pagrus of European waters is called the red porgy. Consult Kingsley, I. S., 'Standard Natural History' (Vol. III, Boston 1885).

PORIFERA, the phylum of animals which includes the sponges, the term referring to the apertures or pores which characterize them. See SPONGE.

PORISM, in geometry, a name given by ancient geometers to a class of mathematical propositions having for their object to show what conditions will render certain problems indeterminate. Playfair defined a porism thus: *A proposition affirming the possibility of finding such solutions as will render a certain problem indeterminate, or capable of innumerable solutions.* Euclid's three books on porisms have been lost, and in consequence there has been much controversy as to what the ancients meant by the term. The porism partakes of the nature both of a problem and of a theorem, without being exactly either.

POUR, the flesh of swine, is one of the most important and widely used species of animal food. Fresh pork, though by some considered a delicacy, especially when killed young, is a much inferior article of diet to beef or mutton, and is much less used. The flesh of pork, particularly the lean, is coarser and ranker than that of the other animals chiefly used for food, but there are certain advantages which give pork a place in the supply of animal food that can be filled by no other article. The appetite of swine being much more catholic than that of their daintier neighbors, the feeding of them answers the purposes of economy, and extends very materially the supply of food. This, it is true, is attended with considerable dangers. If care is not taken that the feeding of swine shall be wholesome and cleanly, their flesh becomes tainted with disease and unfit for food. Unscrupulous breeders sometimes take advantage of their exorbitant and omnivorous appetite to make them consume the most disgusting offal, and even when their feeding is not conducted with this utter recklessness of consequences it is often less careful than is consistent with sound sanitary conditions. There is in fact no animal to the perfection of whose flesh as an article of diet careful attention to feeding is more indispensable. The main recommendation of pork lies in its superiority to other kinds of animal food in undergoing the process of curing. The quality of beef and mutton is seriously deteriorated when long kept, even under the best methods of curing; that of pork is decidedly improved, and when of good quality and well cured it develops a richness and delicacy of flavor in marked contrast with the dryness and insipidity of other salted meat. Another recommendation of pork is the abundance and very digestible quality of its fat, which makes it a very suitable diet for cold climates, but which is, on the contrary, rather a disadvantage in hot ones. For long sea voyages, especially before the introduction of modern methods of keeping fresh meat, pork was by far the most convenient and acceptable form of animal diet, and it is still one of the most valuable items in naval stores. The swine was among the unclean animals forbidden to be eaten by the Mosaic Law. It is still regarded by the Jews as specially typical of the unclean animals. The Egyptians, Arabsians and other Eastern nations had similar opinions as to the use of pork. See HOGS; NUTRITION OF FARM ANIMALS; PACKING INDUSTRY; SWINE.

PORPHYRITE, a porphyritic orthoclase rock free from quartz; so named by some petrologists for whom the name has been applied to various rocks generally of this character. Some of these rocks, however, include varieties in which the orthoclase constituent is more or less replaced by oligoclase. Many porphyritic dolerites have been also included under this name. By the presence of hohlende it often approaches the composition of a syenite, with which it is frequently associated.

PORPHYRY (Porphyrios), Greek philosopher of the Neo-Platonic school, celebrated as an antagonist of Christianity; b. either at Tyre,
whence he is called Tyrus, or at Batanea, the Bashan of Scripture, a town of Syria, whence he is also called Bataneotes, about 233 A.D.; d. Rome, about 304. His original name was Malchus, from the Syrophonecian melech, king. Longinus, whose pupil he became, gave him the title of Porphyrios, that is, purple-clad. He early became the pupil of Origen, and afterward studied under Apollonius and Longinus in Athens. At 30 he came for the second time to Rome to place himself under the teaching of Plotinus. Porphyry at first disputed the doctrine taught him, in a treatise in support of the position "that the things perceived by the mind exist out of the mind," which he submitted to Plotinus. Amelius, his associate and assistant, wrote a treatise in reply; and after some further controversy Porphyry read a recantation in the school. This incident is important, as indicating the teaching of Longinus, and possibly by implication of Ammonius, the instructor of Plotinus. Porphyry finished by entirely adopting the opinions and obtaining the confidence of Amelius, his associate and executor he became, and whom he induced to commit his views to writing. Porphyry was naturally of a hypochondriacal disposition, and the abrupte mysticism of Plotinus incited in him a tendency to cherish thoughts of suicide, which Plotinus perceiving recommended to him a change of situation, and about 268 he went to Sicily. Here he is said to have written his treatise against the Christians in 15 books. It was publicly burned by the Emperor Theodosius, and is known only from fragments in the authors who have refuted him. Porphyry, as well as Plotinus, recognized Christ as an eminent philosopher; but charged the Christians with corrupting his doctrines. The philosophy of Porphyry is completely identified with that of Plotinus (q.v.). Porphyry represented chiefly the religious phase of this philosophy, and we need here only refer to its relation to the popular mythology and theurgy, which has been merely adverted to in the life of Plotinus. The best ancient philosophers found it difficult to reconcile polytheism with the belief in one supreme and omnipotent God. Plotinus and Porphyry joined a belief in good and evil demons and a respect at least for the Greek mythology with their philosophical tenets. These beliefs have been the ground of accusations of inconsistency against Porphyry, who dwells on them occasionally in his writings. He believed, as did Plotinus, in enchantment as a means of acquiring power over demons and the soul of the dead; but always ranked philosophy higher than mythology, and from his letter to the Egyptian prophet Anebo it appears that at a later period of his life doubts of the popular theology, and of the theurgical notions associated with it, had begun to prevail with him. The practical tendencies of his philosophy were ascetic. He held that all matter was polluted, and that no material sacrifice ought to be offered to the supreme God. He abstained from animal food, and would also, had it been possible, have abstained from all liquids. He distinguished four degrees of virtue — political virtue, or that of moderation is the first grade; purifying virtue, which sets the soul free from passion, and by means of which men are made to resemble demons, is the second grade; in the third grade, which corresponds with the absorbing devotion of philosophy, man becomes a god; and in the fourth, answering to the ecstatic state of Plotinus, he becomes the father of the gods. He recognizes a soul in animals, and accords to them a certain amount of intelligence and reason. Porphyry was a voluminous writer, but comparatively few of his works are extant. Besides his editorial work for Plotinus, the most important are his Lives of Plotinus and Pythagoras, the latter supposed to be a fragment of a larger history of philosophers. Among his other works are "Principles Concerning Intelligibles," a summary of the Philosophy of Plotinus; the "Cave of the Nymphs in the Odyssey"; four books, "On Abstinence from Animal Food"; an "Introduction to the Categories of Aristotle"; a "Commentary on the Harmonics of Ptolemy," a 10-volume work in verse, "De Philosophia ex Oraculis Libri," and a contribution to a symbolic interpretation of Homer. Consult Bouillet, "Porphyre, son Role dans l'Ecole Neoplatoniens" (1883).

POPHYRY, any one of various kinds of compound rocks having a basis in which the other contemporaneous constituent parts are imbedded. The base is sometimes claystone, sometimes hornstone, sometimes compact feldspar, jade, pitchstone, pearlstone and obsidian. The imbedded parts are commonly orthoclase feldspar and quartz; the former in more or less distinct crystals. There are porphyries of different ages. One variety is found graduating into granite and gneiss, but this does not possess the characteristics of the rock in the highest perfection; another is found in overlying strata, and unconfomeable to other rocks, which is the true porphyry. Its color is often red or green, and when polished it is valuable for ornamental work, being superior to marble on account of its great hardness.

PORPOISE. Any small or moderate-sized cetacean is usually called a porpoise, but the name is applied chiefly to members of the subfamily Delphinidae belonging to the suborder Odontoceti, or the toothed whales. Its principal characters are as follows: The anterior pairs of ribs are joined to the vertebrae by both a tubercle and a head. The sternal ribs are completely ossified. The cervical vertebrae are more or less united. In the skull the pterygoid bones are inflated. The symphysis of the mandible is short. The teeth are always present, but vary greatly in number in different genera; they usually occur in both jaws and are simple and conical. The genus Grampus is without teeth in the upper jaw, and the genus Monodon without teeth in the lower jaw. The blowhole is single and crescentic in form. Between 60 and 70 species of porpoises are known, representing 19 genera. They are greatly diversified in form and color. Some have a large, falcate dorsal fin, while in others the fin is reduced in size, or is represented only by a low ridge, or is entirely absent. The pectoral fins are usually far behind the foreparts, being short and broad in some forms and very long and narrow in others. The beak may be long or short, compressed or depressed, and is sometimes replaced by a narrow rim, or is absent altogether. The representatives of
several genera of porpoises have received special names, such as killers (genus *Orcinus*), grampus (genus *Grampus*), blackfish (genus *Globicephalus*), beluga or white whale (genus *Delphinapterus*), narwhal (genus *Monodon*), etc.

The *Delphinidae* are chiefly marine, but some species of the genus *Sotalia* live in the Amazon River, and in the rivers of China, and one species of the genus *Orcas* in the Irawadi River, Burma. The harbor porpoise (*Phocoena phocoena*) and the bottle-nosed porpoise (*Tursiops truncatus*) frequently ascend the Potomac, Hudson and other rivers of the eastern coast of the United States, and the beluga ascends the Saint Lawrence regularly every spring in large numbers.

The geographical range of the porpoises as a group extends over all seas from the Arctic to the Antarctic, but while some species, such as the common dolphin (*Delphinus delphis*) have a very wide distribution, that of others is more circumscribed. Thus, the narwhal is confined to the Arctic Ocean, and rarely leaves the ice. The beluga is also an Arctic species, though it ranges southward regularly in spring to the St. Lawrence, and as already stated, and occasionally individuals stray as far south as Cape Cod and the New Jersey Coast. The white-headed porpoise (*Lagenorhynchus albirostris*) is common about the British Isles, but is not found on the coast of the United States. The species of blackfish (*Globicephalus melas*) found on our east coast north of New Jersey is different from that occurring further south. Our commonest east coast porpoise (*Tursiops truncatus*) is not found in Greenland waters, while the harbor porpoise (*Phocoena phocoena*), which is abundant in the gulf of Maine and northward, does not range south of New Jersey. Many species occurring in the tropics and the south seas are never seen in North American waters.

The majority of porpoises feed upon fish, but the various species of blackfish, the narwhal and the white whale subsist chiefly or exclusively upon cuttlefish, while the killers devour the young or other cetaceans and of various amphibiaous mammals, such as seals, sea-lions, etc. The stomach of the porpoise (*Sotalia leucist*) recently discovered on the west coast of Africa was found to contain leaves of the mangrove tree and other vegetable matter. Porpoises are gregarious animals, congregating in large herds or "schools," which sometimes comprise an enormous number of individuals. Schools of blackfish numbering hundreds of individuals occasionally approach the land at the Faroe Islands, the Orkney Islands, Cape Cod, and other points, where they strand, or are driven shore by the fishermen. They are the source of a considerable profit, on account of their oil, which is of a superior quality. The skins of the blackfish and of the white whale are valuable for leather, but the dermis of the majority of porpoises is too thin, or too irregular in texture, to form good leather.

Besides the porpoises of the family *Delphinidae*, there are a few species generally called river dolphins representing three genera, which belong to a separate family, the *Platanistidae*. The best known are the susu of the Ganges River, genus *Platanista*, a blind form which subsists chiefly upon fresh-water crustaceans; the *Inia*, genus *Inia*, of the Amazon River; and the *Pontoporia*, found about the mouth of the La Plata River. These porpoises are remarkable for their long beaks, their broad pectoral fins, their free cervical vertebrae, and their rugose or otherwise peculiar teeth. They are highly specialized forms of ancient origin. Numerous fossil species of *Delphinus* and *Platanista* occurs in the Tertiary and latter geological formations, beginning with the Miocene. Consult: *Birdard, P. F. A Book of Whales* (London 1900); *Goode, G. G., 'Fishery Industries* (Washington 1884); *True, F. W., 'Bulletin of the United States National Museum, No. 36* (Washington 1889).

PORPORA, pór'pó-rá, Nicolo, Italian composer: b. Naples, 19 Aug. 1685; d. there, February 1766. He studied under Scarlatti and his first opera, 'Arianna e Teseo,' was brought out at Vienna, 1717. In 1725 Porpora went to Vienna with his celebrated pupil, Farinelli, and in 1728 accepted a pressing invitation from the court at Dresden. He had already given 50 operas, and was regarded as without a rival. In 1729 a faction in London, discontented with Handel, opened another opera house, and called Porpora to take the direction of it. Porpora, supported by Farinelli and other distinguished singers whom he had trained, triumphed, and Handel accordingly gave up the theatre, and devoted himself to oratorio. Porpora now gave up his engagements in Dresden, and established himself in London. Here his reputation, especially as a singing-master, continued to be great; but after a few years he went to Venice and later was established in Vienna where in 1754, Haydn, for the sake of obtaining his instructions, became his valet. In 1760 he presided at the production in Naples of his last and feeblest opera, 'Il Trionfo di Camillo.' Only a few of his operas are now known, and none of them have retained popularity; but he is regarded as the most accomplished singing-master who has ever existed. His religious compositions and especially his cantatas, are his chief works in which he appears to most advantage. Besides the 50 operas, he composed six oratorios, many masses and other church music, and numerous cantatas, and published six "Sinfonie da camera." Consult: *Marchese Villarosa* (in 'Memorie dei compositori,' 1890, and Clement (in 'Musicisti célébres').

PORRAS, pór'rá, Belisario, Panaman statesman: b. Panama, 1860. He received his education at Bogotá and Brussels; was counsel for the French Canal Commission, and professor of international law at the Universities of San Salvador and Managua. He subsequently became judge of the Supreme Court of Colombia and served his country as consul-general in Belgium. He was Panaman delegate to the Hague Peace Conference in 1907 and in 1910-11 was the Panaman Minister in Washington, D. C. In 1912 Mr. Porras was chosen president of Panama.

PORRO, pór'ró, Count, Italian general: b. Bologna, 1854. He passed through the Turin Military Academy and received his commission as sub-lieutenant of artillery at the age of 22. On reaching the rank of major he was appointed to the General Staff and later acted as director of the War School and under-secretary
of war in the Second Fortis cabinet (1905-06). Promoted lieutenant-general in 1911, he commanded divisions at Verona and Milan, and was offered the portfolio of War in the Salandra cabinet. In 1915 he became under-Const Staff. General Cadorna (q.v.) he was relieved of his command after the Italian defeat on the Isonzo in October 1917, and in July 1918 both officers were placed on the retired list with loss of rank and pay. General Capello suffered the same fate.

PORSENA, pör'se-nə, or PORSENNA, a Larus (or "mighty lord"), king of the Etruscan city of Clusium. According to the legend narrated by Livy, he received the Tarquins on their expulsion from Rome (A.C.) 508, and after enfeebling them in vain to effect their restoration by negotiation, advanced with an army to Rome. He would have entered the city with the flying Romans had not Horatius Cocles disputed the passage until the bridge was broken down. Porsea then besieged Rome, and a famine was produced in the city, when another Roman youth, Mucius Scaevola, gave striking proof of his patriotism. (See SCÆVOLA.) A truce was now agreed upon, and the Romans sent 10 young men, and as many girls, as hostages to the Etrurian camp. The latter escaped to Rome by swimming across the Tiber, but the consul Publicola conveyed them back again to Porsea, and was on this occasion treated with the greatest indignity by the Tarquins. Indignant at the perfidy of the Tarquins, and respecting the magnanimity of the Romans, Porsea separated himself from the former, and concluded peace with the latter without taking away their hostages. To relieve the wants of the Romans without offending their pride by a formal present, he left behind at his departure his camp with all its stores, and in remembrance of his magnanimity the senate erected to him a monument, and presented him with an ivory chair and sceptre, a golden crown and a royal robe. Thenceforward Porsea lived in undisturbed friendship with the Romans. The accounts of Dionysius (v. 33), Plutarch ("Pup. 19) and Livy ("Hist. Nat. 1.xxxxiv, 13) will be found to be inconsistent with one another. Modern critics have held that Rome was completely conquered by Porsea, and that the gifts they represent as offering from gratitude were really a tribute indicating subjection. Aruns, the son of Porsea, was defeated by a league of the Latin cities, after which the Romans are believed to have recovered their independence. According to Pliny, Porsea forbade the Romans the use of iron, except for agricultural purposes.

PORSON, Richard, English Greek scholar: b. East Ruston, Norfolk, 25 Dec. 1759; d. London, 25 Sept. 1808. He was educated at Eton and Cambridge, took the degree of M.A. in 1785, and not choosing to take holy orders, on applying for admission to the diplomatic service, signing the 39 articles was obliged to relinquish the fellowship he had held from 1781. In 1792 he was appointed Greek professor, and in 1794 began the publication of the Tragedies of Euripides, with annotations, but continued his labors only till the end of the year, 1796. "Orpheus," "Phænissæa," and "Medea," he assisted in editing the Grenville Homer (1800), and corrected the texts of the tragedies of Æschylus for an edition which issued from the Foullis Press at Glasgow. He had the reputation of being one of the best Greek scholars and critics of the age, notwithstanding which he experienced little patronage, a circumstance partly attributable to his inimperate habits. He was the author of "Letters to Archdeacon Travis, in Answer to his Defense of the Three Heavenly Witnesses" (1790, 8vo.), in which he is allowed to have proved that the received text of 1 John v. 7, 8 is spurious. After his death were published his "Adversaria, or Notes and Emendations of the Greek Poets;" and his "Tracts and Miscellanies" (1815). In Porson acute discernment and solid judgment were united to intense application and a stupendous memory. Consult Watson, "Life of Richard Porson" (1861).

PORT. See HARBOURS, DOCKS AND BREAKWATERS; SHIPBUILDING; ETC.

PORT ADELAIDE, Australia. See ADELAIDE.

PORT ARTHUR, Canada, city and port of entry in Thunder Bay District, province of Ontario; on Lake Superior; the lake terminals of the Canadian Northern, also of the Canadian Pacific, and of the Grand Trunk Pacific railways. About 200 miles northeast of Duluth, Minn., and about 500 miles from Manitoba. It is the principal commercial point on the northwest shore of Lake Superior. It is in a lumbering region and valued, especially for its iron and ore adjacent. Large shipments of merchandise, coal, wheat, etc., are made to eastern ports. Iron is smelted here. The city is the iron centre of the north shore and district, and there are also foundries, blast furnaces, brick yards and other manufactories, railway coal and ore docks, lumber yards, refrigeration plants, etc. Port Arthur has several churches, a high school, public schools and a Separate school, public library, armory, sailors' institute, Y. M. C. A. buildings, and district courthouse. The city was first settled in 1870, became a borough in 1884, and a city in 1907. The government is vested in a mayor and council of 10 members. The city is the county-seat for judicial purposes. Pop. 18,500.

PORT ARTHUR, or LU-SHUN-KOU, Manchuria, a strongly fortified seaport town at the southern extremity of the Liao-tung peninsula, dominating the Liao-tie-shan channel entrance to the Gulf of Pe-chi-li from the Yellow Sea and Korea Bay. Prior to its capture by the Japanese in the War of 1894 it was a Chinese fortress and naval arsenal. Its occupation by the Japanese was prevented by the Russian, German and French coalition, but on 27 March 1898, the Chinese government leased it to Russia with adjacent territory for 25 years. Under the Russians it became the terminus of a railway line connecting with the Trans-Siberian Railway, the Chinese railway systems, and with modern Dalny, the important commercial seaport city, 14 miles to the northeast. It is fortified, its harbor and dock accommodations extended, and it was considered one of the strongest fortresses and navel stations in Chinese waters. At the outbreak of the Russo-Japanese War in 1904, it was the scene of a series of disasters inflicted upon the Russians by the torpedo boats of the enemy, but also by their own submarine mines and forts. It was surrendered to the Japanese, 3 Jan. 1905, after
PORT ARTHUR SHIP CANAL—PORT GIBSON, BATTLE OF

a remarkable siege, for the term of the Russian lease (25 years from 1898). The lease was extended in 1915, due to pressure being put on China by Japan. The lease was to expire in 1917, 100,000. See CHINA; DALNY; JAPAN; MANCHURIA.

PORT ARTHUR SHIP CANAL, Texas, an artificial waterway, named after the town of Port Arthur, Tex., which is situated on Sabine Lake, a body of water three miles long and 10 miles wide, which marks the boundary of Texas and Louisiana. Seven and one-half miles from Port Arthur, Sabine Lake empties into a long channel called Sabine Pass. This channel is from 26 to 40 feet deep and extends for seven miles to the mouth, terminating in the Gulf of Mexico. At the outer end of the pass is a bar which has been pierced by a channel formed by extending for a mile or more from shore two jetties of piled stone built by the United States government. The jetties narrow the entrance to the pass from the Gulf, and the wash of the incoming tide, in turn, forms and maintains the ebb and flow of the tide, scoured a channel over the bar of 16 to 25 feet deep. The opening of this canal signalized the creation of a new seaport on the Gulf for the largest ocean vessels, the connection of a land-locked fresh-water harbor with the term of the overland telegraph, 1,973 miles from Adelaide, and of the cable to Java. Since 1891 it is also the starting point of a railway to the gold fields of the interior, 150 miles distant.

PORT BLAIR, the principal port of the Andaman Islands (q.v.) on South Andaman. It is connected with Calcutta, Rangoon and Madras by a mail steamer line; has a fine harbor with safe anchorage, and is an important penal settlement.

PORT BRETON, a name given to the southeast part of New Mecklenburg (formerly and as far back as New Bern), Archipelago off Kaiser Wilhelm Land, New Guinea, the scene in 1879 of a disastrous colonizing experiment by a company of French Legitimists. In 1883, the Marquis Du Rays, who floated the company, and his associates were condemned to various terms of imprisonment for fraud and raising money by false pretenses. German New Guinea was occupied by an Australian force 12 Sept. 1914, and came under British military occupation.

PORT CARBON, Pa., a borough in Schuylkill County, on the Schuylkill River, and on the Philadelphia and Reading Railroad, about two miles northeast of Pottsville. There are ironworks within the boroughs, but the mining of coal is the chief industry. Pop. 2,678.

PORT CHESTER, N. Y., village, Westchester County, on Long Island Sound, and on the New York, New Haven and Hartford Railroad, 26 miles northeast of New York City. It was settled in the middle of the 18th century, and was at first called Saw Pit; the name was changed in 1837, and the village incorporated in 1868. It contains four mills, screw and belt factories, carriage works, shirt factories and a woolen mill. It is also a summer resort. It contains a public hospital, also a public library and high school which has its own school library. The village is governed by a president and a board of trustees, all holding office for two years. Pop. 15,000.

PORT CLARENCE, Alaska. See CLARENCE HARBOR.

PORT CLINTON, Ohio, village, county-seat of Ottawa County, on Lake Erie at the mouth of the Portage River, and on the Lake Shore and Michigan Southern Railroads, 64 miles west of Cleveland. It has a good harbor and carries on a considerable lake trade, being the commercial centre of a region where the chief industry is grape and peach culture; lime and building stone are also obtained in the vicinity, and gypsum is mined. Fruit baskets are manufactured, and the fisheries are also of commercial importance. The village contains a public high school. Pop. 3,007.

PORT DARWIN, Australia, one of the finest harbors of the Commonwealth, on the north coast of the state of South Australia. Its entrance is two miles wide, and vessels of any tonnage can float in it with safety. Palmerston, the chief town on its shores, is the land terminus of the overland telegraph, 1,973 miles from Adelaide, and of the cable to Java. Since 1891 it is also the starting point of a railway to the gold fields of the interior, 150 miles distant.

PORT ELIZABETH, South Africa, a seaport city of Cape Colony, on the west side of Algoa Bay, about 420 miles east of Cape Town. It has many fine buildings, including a handsome town hall, custom-house, hospital, college, public library, museum, Grey Institute, and several churches. It is the great centre of trade for the eastern portion of the colony as well as for a large part of the interior, being the terminus of railways that connect it with Kimberley and other important inland towns. The exports and imports together amount to over $30,000,000. There is a seaway and two iron jetties, but the shipping is much expanded to eastern ports and extensive harbor works are being built. Pop. 18,190.

PORT ESSINGTON, Australia, an inlet in the Coburg Peninsula of the northern territory of South Australia, on the Araflura Sea, forming a fine harbor. The British Government had a penal settlement on its shores from 1831 to 1850.

PORT FAMINE, Chile, a deep bay on the east coast of the Straits of Magellan, so named in 1857 by Cavendish. It was a Chilean penal colony in 1843-53.

PORT GIBSON, Battle of. After much unsuccessful effort to reach Vicksburg from the north, General Grant, late in January 1863, directed his attention to opening a canal which had been begun the year before across the peninsula on the west bank of the Mississippi. The canal proving impracticable and other plans failing, and of trustees to open up the Yazoo River, Grant determined to move his army by land down the west bank of the river some 70 miles and across the Mississippi below Vicksburg, while transports for crossing should fill past the Mississippi. Farragut had already run two of his vessels past the
Confederate batteries at Port Hudson and Grand Gulf, and cleared the river of the enemy's boats below Vicksburg. On the night of 16 April, Admiral D. D. Porter ran the Vicksburg batteries with a fleet of six vessels and three transports carrying stores, one of the transports being armed. Six dozen batteries in transports, towing 12 barges, ran the batteries safely, a sixth being sunk and half the barges disabled. Meanwhile, Grant had marched McClernand's and McPherson's corps from Milliken's Bend for New Carthage, but was detained at that place and finding a limited number of transports the troops were marched to Hard Times, where a number of boats were collected from the different bayous in the vicinity, and 29 April, having 10,000 troops on barges and transports, Grant was opposite Grand Gulf, prepared to land and carry the place by storm the moment the batteries beating on the river had been silenced by the navy. Admiral Porter, with seven ironclads, opened the attack at 8 A.M., and engaged at close quarters until 3 P.M., the batteries of the Confederates batteries on the high ground preventing him from silencing them with his guns, and therefore withdrew, when Grant immediately decided to land his men on the Louisiana shore and then move across the point to below Grand Gulf, the gunboats and transports to run the batteries. At dusk the gunboats engaged the batteries, and all the transports ran by, the gunboats following. Grant had heard of a good landing on the east bank of the river, and at daybreak of the 30th transports and gunboats began the ferrying of the troops across to Bruinsburg, 10 miles below Grand Gulf and 32 in a straight line below Vicksburg. At noon McClernand's corps, four divisions, 18,000 men, had been landed, and at 4 P.M. McClernand pushed out into the country, and at 1 A.M. of 1 May met the Confederates 12 miles from Bruinsburg and four from Port Gibson, and after slight skirmish the advance division, under General Carr, lay on its arms until daybreak. The Confederate force met was General Green's brigade, which had marched from Grand Gulf on the afternoon of the 30th. During the night it was joined by General Tracy's brigade from Vicksburg, and limited the ferrying across three miles west of Port Gibson, across two roads converging on the town and uniting just outside of it. Green was across the southern road, and Tracy across the northern one, the roads running on two ridges, separated by a deep ravine, filled by a dense growth of cane and underbrush. At 5 A.M. of 1 May the battle was opened by the advance of Osterhaus' division on the left, which was checked and repulsed by Tracy's brigade with much loss, and made no further progress until late in the afternoon. Carr's division, supported by Hovey's, advanced on the right and assaulted the ridge held by Green's brigade, and after a hard fight carried it, capturing two guns and over 300 prisoners, Green falling back toward Port Gibson. Gen. J. S. Bowen, commanding the Confederate forces at Grand Gulf, arrived on the field with General Baldwin's brigade, about 9 A.M., and formed line in Green's rear, Carr and Hovey continued to press Green, who was soon withdrawn and some to assist Tracy, leaving Bowen in the rear. Early in the afternoon Baldwin was attacked, and a severe contest ensued, lasting nearly two hours, during which Bowen, with two regiments of Col. F. M. Cockrell's brigade, which had arrived about noon, made a very determined effort to turn McClernand's right, but the attempt was defeated, and Cockrell's men joined Baldwin. Meanwhile, Logan's division of McPherson's corps had come up, and part of it joining Osterhaus, both advanced on Tracy's and Green's brigades and slowly forced them back. McClernand's troops on the right again attacked Baldwin, and just as sunset the entire Confederate force, Baldwin covering the rear, fell back through Port Gibson and destroyed the bridge over the south fork of Bayou Pierre, two miles beyond Port Gibson. Grant entered the place next morning. The Union forces engaged were four divisions of McClernand's corps and part of Logan's division of McPherson's, in all about 23,000 men, and their losses were 131 killed, 719 wounded and 25 missing. The Confederate forces, under Bowen, were four brigades of 6,000 men and 13 guns. They lost five guns and reported 68 killed, 380 wounded and 264 missing. Col. 'Official Records' (Vol. XXIV); Greene, 'The Mississippi'; Grant, Ulysses S., 'Personal Memoirs' (Vol. II); 'Battles and Leaders of the Civil War' (New York). E. A. CARMAN.

PORT-GLASGOW, Scotland, a seaport town of Renfrewshire, on the estuary of the Clyde, 20 miles west-northwest of Glasgow and about two and a half miles above Greenock. In 1662 the magistrates of Glasgow purchased here 13 acres of land on which they built harbors and the first drydock in Scotland. The town was intended to be the seaport of Glasgow and long did a large shipping trade; but when the Clyde was deepened so as to enable large vessels to sail up to Glasgow the trade rapidly diminished. The staple industries are shipbuilding and marine engineering, and there are manufactures of sail-cloth, ropes, etc., iron and brass foundries, bolt and rivet works. Pop. about 18,000.

PORT HAMILTON, Chosen, formerly Korea, a spacious, well-sheltered harbor, formed by three islands of the Nanhou group in the Chosen or Korean archipelago; 30 miles south of Chosen Bay, Korea and 45 miles northeast of Quelpart Island. It was explored and named by Belcher in 1845. In 1885 it was annexed by Great Britain as a prospective coaling station, but was abandoned the following year.

PORT HOPE, Canada, town, port of entry in Durham County, in the province of Ontario, on Lake Ontario, and on the Grand Trunk Railroad, about 60 miles east by north of Toronto. There are steamer connections with the principal lake ports and there is here a good harbor. The chief industries of the place are fishing (it has a large fishing fleet), and manufacturing of leather machinery, steam engines, iron castings, buttons, woolen goods and woodenware. There is a large trade in its own manufactures, grain and lumber. Pop. 5,902.

PORT HUDSON, Siege of. Port Hudson, a small village of East Baton Rouge Parish, La., on the east bank of the Mississippi, 135 miles above New Orleans, was occupied by the Confederates, under General Breckinridge, after their defeat at Baton Rouge, 5 Aug. 1862. The place was in a sharp bend of the river, on bold
bluffs rising 75 to 90 feet above it, which for three miles along the river were strongly fortified and armed with heavy guns. In November 1862 General Banks was ordered to relieve Port Hudson, La., under instructions from Halleck requiring Banks to clear the Mississippi River, also to occupy the Red River country as a protection for Louisiana and Arkansas and as a basis for future operations against Texas. He was authorized to assume control of the military forces on the upper Mississippi which might come within his command, and to exercise superior authority as far as he might ascend the river. When these instructions were issued General McClernand had been given authority to organize an expedition on the upper Mississippi to reduce Vicksburg, and the intention was that Banks should ascend the river from New Orleans, join forces with McClernand at Vicksburg, and assume command for operations against that place. When Halleck gave the instructions he did not suppose that there were any barriers on the river that would seriously interfere with Banks' movement to Vicksburg. Banks arrived at New Orleans with about 20,000 men 14 December, and on 21 December Halleck informed him that he learned that the Confederates held Port Hudson, with 21 heavy guns on the bluffs and a garrison reported as numbering from 12,000 to 16,000 men. Nothing was heard from McClernand or Grant. On the 18th General Grover, with a division of 18,000 men and some artillery, was sent to occupy Baton Rouge, 25 miles south of Port Hudson, which was accomplished without opposition and was the first step in the reduction of Port Hudson.

After providing for the security of New Orleans, Banks organized his available forces into a corps of four divisions, under command of Generals Augur, Thomas W. Sherman, Emory and Grover. Exaggerated reports of the strength of the Confederates at Port Hudson forbade a direct attack upon it, and Banks endeavored to turn it on the west and reach Vicksburg by means of the Atchafalaya, the mouth of Red River and the various bayous connecting the Atchafalaya with the Mississippi. He also directed General Grover to turn his attention to a movement from Berwick Bay by the Atchafalaya, when news came that two of Colonel Ellet's rams, after running the batteries of Vicksburg, had been captured. Admiral Farragut, who was co-operating with Banks, now proposed to run his fleet past the batteries of Port Hudson, recapture or destroy the rams and thus control the river as far up as Vicksburg, and cut off supplies from the Red River country. Banks promptly assented and moved from Baton Rouge, with 17,000 men, to the rear of Port Hudson, on 14 March 1863, to cooperate with the fleet. That night Farragut started to run the batteries with nine vessels, carrying 116 guns. Most of the fleet, under the heavy fire brought to bear upon them, failed to get through, and put back; the Mississippi passed the lower batteries, then ran aground and, being under fire of three heavy batteries, was burned by her commander, the crew taking to the boats and going back; the little frigate Albatross made the passage and communicated with Porter's fleet above Vicksburg. Farragut's loss was 113 killed and wounded; one vessel had been destroyed and four disabled. The navy now had control of the mouth of Red River, and Banks, reverting to the execution of his turning movement by the Atchafalaya, re-crossed the Mississippi, drove back the Confederate forces and occupied Opelousas 20 April, from which place he marched to Alexandria, on Red River, reaching there 7 May. Taylor retiring before him to Shreveport and Tyler of Texas. He had captured a large number of prisoners and 22 guns, and Farragut had destroyed three gunboats, including those that had been taken from Ellet. Meanwhile he had received word from Farragut that Grant, 23 March, had written him that should river transportation be secured he would send 20,000 men through the Tensas, Black and Red Rivers to join in reducing Port Hudson, and at the same time a letter from Grant that he could not advance against that place. When Halleck gave the instructions he did not suppose that there were any barriers on the river that would seriously interfere with Banks' movement to Vicksburg. Banks arrived at New Orleans with about 20,000 men 14 December, and on 21 December Halleck informed him that he learned that the Confederates held Port Hudson, with 21 heavy guns on the bluffs and a garrison reported as numbering from 12,000 to 16,000 men. Nothing was heard from McClernand or Grant. On the 18th General Grover, with a division of 18,000 men and some artillery, was sent to occupy Baton Rouge, 25 miles south of Port Hudson, which was accomplished without opposition and was the first step in the reduction of Port Hudson.

After providing for the security of New Orleans, Banks organized his available forces into a corps of four divisions, under command of Generals Augur, Thomas W. Sherman, Emory and Grover. Exaggerated reports of the strength of the Confederates at Port Hudson forbade a direct attack upon it, and Banks endeavored to turn it on the west and reach Vicksburg by means of the Atchafalaya, the mouth of Red River and the various bayous connecting the Atchafalaya with the Mississippi. He also directed General Grover to turn his attention to a movement from Berwick Bay by the Atchafalaya, when news came that two of Colonel Ellet's rams, after running the batteries of Vicksburg, had been captured. Admiral Farragut, who was co-operating with Banks, now proposed to run his fleet past the batteries of Port Hudson, recapture or destroy the rams and thus control the river as far up as Vicksburg, and cut off supplies from the Red River country. Banks promptly assented and moved from Baton Rouge, with 17,000 men, to the rear of Port Hudson, on 14 March 1863, to cooperate with the fleet. That night Farragut started to run the batteries with nine vessels, carrying 116 guns. Most of the fleet, under the heavy fire brought to bear upon them, failed to get through, and put back; the Mississippi passed the lower batteries, then ran aground and, being under fire of three heavy batteries, was burned by her commander, the crew taking to the boats and going back; the little frigate Albatross made the passage and communicated with Porter's fleet above Vicksburg. Farragut's loss was 113 killed and wounded; one vessel had been destroyed and four disabled. The
thought to secure that object by authorizing you to assume the entire command as soon as you and Gen. Grant could unite. When these letters were received both Grant and Banks had fully committed themselves to the independent sieges of Vicksburg and Port Hudson.

The failure of Grant to co-operate with him was a keen disappointment to Banks. He could not join Grant for want of water transportation; he could not leave Port Hudson, with its large garrison in its rear, with endangering New Orleans and all the Red River region and, therefore, he concluded to concentrate his command and move immediately against Port Hudson. On 14 May he marched from Alexandria for Bayou Sara, crossed the Mississippi on the night of the 23d, and on the night of the 24th was in rear of Port Hudson, where he was joined next day by General Augur, who had come up from Baton Rouge, defeating the Confederates at Plains' Store, on the 21st, with a loss of 86 killed and reached the Confederate loss being about the same. The investment was completed on the 26th with about 14,000 men, Gen. Frank Gardner, commanding at Port Hudson, having about 7,000 men. Gardner had been ordered by Gen. J. E. Johnston, 19 May, to evacuate his garrison forthwith and move to Jackson, but the order came too late. Under the impression that Gardner's force was much less than it was in reality, as it was reported much reduced by troops sent to oppose Grant in rear of Vicksburg, Banks ordered a general assault to be made on the morning of the 27th. The Confederate fortifications on the land side of Port Hudson consisted of a series of strong works connected by rifle-pits, with their flanks resting on the river above and below the place. Their length was nearly four miles, and upon them were about 30 field-guns. The approach to them was difficult, being cut by ravines and for the most part covered by dense groves of magnolia and other trees. The investing line was seven miles in length. The brigades of General Weitzel and the divisions of Generals Dwight and Grover were on the right, Augur's division in the centre, and a part of Thomas W. Sherman's on the left. The assault, which was only along the entire line, was preceded by a heavy fire of artillery, and at 10 A.M. Weitzel, on the right, commanding his own troops and Dwight's, moved forward fighting severely until late in the afternoon, and gaining some ground; Grover, on his left, gained and held commanding positions within 200 yards of the Confederate works. In the centre and on the left Augur and Sherman did not advance until 2 P.M., when they made a most determined effort, under a severe fire of canister and musketry, and reached the crest of the works, but could not cross the parapet, and were withdrawn at night. The only advantages gained were the advanced positions held by Weitzel and Grover. The Union loss in the assault, in which 13,000 men participated, was 293 killed, 1,545 wounded, and 157 missing. The Confederate loss was about 235 killed and wounded. Regular siege operations began next day, siege-guns were planted, and constant skirmishing was kept up, during which, while the Union line made some advances, it made also persistent efforts. On 10 June a heavy artillery-fire was kept up and at 3 o'clock on the morning of the 11th an attempt was made to get within assaulting distance of the works. A portion of the troops worked their way through the abatis, but were repulsed with loss and some captured. Meanwhile Banks had reorganized his command. Sherman, who had been severely wounded on the 27th of May, was succeeded by General Dwight, and General Grover was assigned to the command of the right wing, consisting of his own and Paine's division and Weitzel's brigade. The line was formed in this order from right to left: Weitzel, Grover, Paine, Augur and Dwight. On 14 June, the line of investment being well advanced, Banks made a second general assault at daylight from his left and right. Dwight, on the left, endeavored to gain entrance to the works by passing a ravine, while the main attack was made on the right by Grover and Weitzel. The assault ended in a bloody repulse, the Union loss being 203 killed, 1,401 wounded, and 188 missing. The Confederates had 22 killed and 25 wounded. The only advantage gained was a few yards nearer approach to the works on the right, and on the left an eminence commanding a strong part of them, and which later enabled Banks to get possession of the bluff within 1,000 yards of the enemy's lines. Siege operations were continued and on the right saps were run to the very line of the Confederate works. On the left a mine had been prepared for a charge of 30 barrels of powder, and a storming column of 1,000 volunteers organized, when, during the night of 6 July, news was received that Vicksburg had surrendered. Gardner soon heard the news, and asked Banks to give him an official assurance of its truth, adding that if true, he requested a cessation of hostilities with a view to consider terms for a surrender. Banks furnished him a copy of Grant's despatch, terms were agreed upon, and on the 8th Gardner surrendered 6,340 officers and men, 51 guns, about 7,500 muskets, large quantities of ammunition, and two river steamers. In an address commending the gallantry of his men, Gardner stated that his surrender was not on account of the fall of Vicksburg, nor for want of ammunition or provisions, but was due to the exhaustion of his men, who had been without rest for more than six weeks, and who could not resist another assault. The operations against Port Hudson the fleet under Farragut had co-operated and assisted. The Union loss during the siege was 708 killed, 3,336 wounded and 319 missing, an aggregate of 4,363. Incomplete Confederate returns show a loss of 176 killed and 447 wounded. Consult 'Official Records' (Vol. XXIV, XXVII); Greene, 'The Mississippi'; Grant, 'Personal Memoirs,' (Vol. 1); The Century, 'Battles and Leaders of the Civil War' (Vol. 111).
Clair River extends from Port Huron to Sarnia, Ontario. This tunnel is over a mile long directly across, but including the approaches it is nearly two miles long. It cost about $2,700,000, and was opened in 1891. The climate, scenery, mineral springs and opportunities for fishing have combined to make Port Huron a favorite summer resort. It has considerable manufacturing interests; the chief industrial establishments are shipbuilding works, knitting mills, overall factory, paper mill, wire fence factory, two large foundries, engine and thresher works, Grand Trunk car and locomotive shops, foundry works. Port Huron has an extensive commerce, especially with Canada. The exports in a recent year were valued at $37,000,000, and the imports at $8,100,000. The principal public buildings are the custom-house and post office, courthouse, auditorium, hospital and home, the Carnegie Library, and two Maccabbee Temples. The educational institutions are several public schools, including two high schools. The city has just voted to build another $100,000 high school building. The commission form of government is in operation. In 1866 the French under Duluth built a fort here but it was maintained for two years only. The United States built Fort Gratiot on the site in 1814 and maintained it until 1839. The village of Port Huron was organized in 1849 and became a city under a charter of 1857. Pop. 18,863.

PORT ISABELA, é-sâ-bâ'la, Philippines, harbor in channel between Malamalau Island and the northwest coast of the island of Basilan. It has a naval hospital, a small arsenal and equipment for the repair of small vessels. The town Isabela de Basilan is the capital of the island. Pop. about 1,331.

PORT JACKSON, Australia, the beautiful and extensive inlet on the east coast in New South Wales, forming the well-sheltered harbor on the south shore of which Sydney stands. See SYDNEY.

PORT JACKSON SHARK. See CESTRA-CION.

PORT JERVIS, N. Y., city in Orange County, on the Delaware and Neversink rivers, where the States of New York, New Jersey and Pennsylvania meet, and on the New York, Oneida and Lewis Railroad. 88 miles northwest of New York City. It was settled in the last of the 18th century, and laid out as a village in 1826. The first permanent settlers were descendants of the French Huguenots and the Dutch, who settled the town of Deerpark. It is a popular summer resort on account of the many waterfalls nearby and the beauty of the scenery in general. Its water-power and transportation facilities have contributed toward making the village of commercial and industrial importance. The chief manufacturing establishments are railroad shops, glove factories, silk mills, silver plating works, necktie factory, overall factory, saw factory, shirt factory, and other industrial works are flour and planing mills, sash factory, printing works and a number of smaller establishments which supply local needs. The principal public buildings are the Carnegie Free Library, cost $30,000; Port Jervis chamber of commerce, two hospitals, the Y. M. C. A. building, Methodist Church, Asylum, asylum, churchs of several denominations, Elks Home, Federal building, and a new $35,000 parochial school. The educational institutions are public and parochial schools, a new high school, two private schools, a conservatory of music and the public library. In recent years the city has paved several streets with brick, erected an electric-light plant, and installed a new electric-lighting system. The Erie Railroad whose interests are closely identified with those of the city has erected a monument to the founders of the city. The demand for extra housing facilities has resulted in increasing activity in building operations. Pop. 9,504.

PORT LOUIS, loo'is or loo'f, Mauritius, capital of the British colony of Mauritius; on the northwest coast, on a cove formed by a series of basaltic hills, portions of which are covered with forest. The streets are narrow, laid out at right angles with basaltic curbstones, and shaded by large acacias. A mountain stream traverses the town. The town and harbor are protected by Forts Adelaide and George. The principal buildings and institutions are the Roman Catholic and Protestant cathedrals, the barracks, theatre, hospital, botanical gardens, an observatory and library. It is the chief commercial port of the island and a coaling station for the British navy. Great damage and loss of life were caused by a hurricane in April 1892. Pop. (with suburbs) 50,060. Consult Flemmyng, "Mauritius, or the Isle of France"; Decottet, "Géographie de Maurice et de ses Dépendances."

PORT MAHON. See MAHON.

PORT-MOODY, Canada, a harbor at the head of Burrard Inlet, British Columbia, a little to the north of New Westminster. It was at one time intended for the terminus of the Canadian Pacific Railroad, but was abandoned for Vancouver, at the entrance to Burrard Inlet.

PORT NATAI, nî-tî', South Africa. See DURBAN.

PORT ORCHARD (formerly Sidney), Wash., a United States naval station in Kitsap County, on Port Orchard Bay, an inlet of Puget Sound, about 20 miles west of Seattle. The station was established in 1891, when the government purchased here 200 acres of land, built a dry dock 600 feet long and 75 feet wide, and capable of holding vessels with a 30-foot draft. The original cost of the improvements, not including purchase price of land, was $700,000.

PORT DE PAIX, pôr dé-pâ', Haiti, town on the Tortuga Channel, and on the right bank of Tris Rivieres, about 95 miles north of Port-au-Prince. The place was visited by Columbus in 1492, and by him was named Valparaiso. It is in an agricultural region, in which coffee is the principal production. There is a large trade in coffee and fruit. Pop. estimated at about 10,000.

PORT PHILLIP, Australia. See MELBOURNE.

PORT-AU-PRINCE, pôr-tô-prîns' (Fr. pôr-tô-prâns'), or PORT RÉPUBLICAIN, pôr-râ-pwâlik, Haiti, city, capital of the Republic of Haiti; on the Bay of Haiti. It is the principal seaport, and although it has an excellent harbor, the low marsh land surrounding it renders it undesirable as a place of residence.
The buildings are mostly of wood. There is considerable trade in fruits, the cocaanuts, and cabinet woods. It has municipal buildings, a mint, college and lyceum. The city was founded in 1745, and was completely destroyed by an earthquake in 1770. It has also been ravaged by fires in 1791, 1843 and 1867. In recent local disturbances, it was occupied by American marines. Pop. about 100,000.

PORT REPUBLIC, Battle of. Gen. "Stonewall" Jackson defeated General Banks at Winchester, 25 May 1862, drove him across the Potomac, and then retreated up the Shenandoah Valley, slipping between the converging forces of General Frémont and McDowell near Strasburg on the 31st. Frémont pursued by the Valley road, and General Shields, commanding a division of McDowell's corps, endeavored to fall upon his flank and intercept him by moving up the Luray Valley. On the evening of the 1st, Shields moved out of Front Royal. Col. S. S. Carroll leading, with some cavalry, infantry and four guns, to destroy the bridges over which Jackson might retreat to Stanardsville. But Jackson himself had destroyed the bridges by which his flank could be reached, and Shields halted his advance brigades at Conrad's Store and Columbia Bridge. On hearing that Jackson had passed through Harrisonburg in the direction of Port Republic, and that Frémont had reached Harrisonburg in close pursuit, Shields ordered Carroll's and Tyler's brigades forward to head off Jackson while Frémont pressed his rear. The orders to the two brigade commanders were to guard the river at Port Republic and cut the railroad at Waynesboro. Shields, with two brigades, remained at Luray to watch Longstreet, who was incorrectly reported moving into Luray Valley, by the gaps of the Blue Ridge, with 10,000 men. Carroll, with less than 1,000 infantry, 150 cavalry and Clark's regular battery of six guns, marched from Conrad's Store on the afternoon of 7 June, and halted in the night six miles from Port Republic, where his scouts brought information that Jackson's train was parked near the place, guarded by about 300 cavalry. Carroll, with his 150 cavalry and four guns, learning of the intention to follow, started very early in the morning of the 8th, drove in the Confederate outposts and put two guns in position commanding both ends of the bridge over the South Fork of the Shenandoah River, and ordered the cavalry to charge and seize the bridge. The charge was made and the bridge seized, Jackson, whose headquarters were in the village, narrowly escaping across it, while some of his staff were captured. Carroll, with two guns, followed his cavalry to the bridge; some of the cavalry entered the village and attacked the wagon-train. By some misunderstanding the bridge was not burned as Shields says it was intended to be, and Jackson, the moment he crossed it, ordered batteries in position which opened on Carroll, and a regiment of infantry rushed down and over the bridge, driving him away and capturing one of his guns. Carroll retreated two miles down the river, with a loss of 39 men killed and wounded, the greater part of which was in the 7th Indiana, which came under artillery fire as it was moving to the support of the cavalry. Jackson moved Taliaferro's brigade into the village to hold the fords of South River, a branch of the South Fork of the Shenandoah, and placed Winder's brigade on the north side of the latter to observe Carroll and by artillery check any renewed advance. While all this was transpiring the battle of Cross Keys (q.v.) was going on, and Jackson, hearing the sounds of the engagement, rode to the field. At 2 P.M. Tyler came up with his brigade and joined Carroll, and as senior officer assumed command. He had about 3,000 men and 16 guns, and took position with his right on the South Fork of the Shenandoah and his left on commanding ground, on which was disposed the greater part of the artillery. Jackson, who had repulsed Frémont at Cross Keys, on the 8th, returned to Port Republic during the night, leaving Ewell, with a small force, to confront Frémont, and early in the morning of the 9th led Winder's brigade across the bridge and attacked Tyler's right, with the intention of turning it, but was repulsed. Winder, rallying a part of his brigade and reinforced by a regiment of Taylor's Louisiana brigade, made another effort, which was again repulsed with the loss of one of his guns and many men. Meanwhile some of Ewell's troops from Cross Keys came on the field and Taylor's Louisiana brigade was ordered to turn Tyler's left and take his guns. Tyler moved unfordable cover of dense woods to a position on the flank of Clark's battery of six guns, from which support had been withdrawn, and charged it; but Clark, turning his guns upon him, repulsed him with shell and canister. The attempt was renewed on that flank, but Tyler's infantry was now supporting the guns, and the contest around and among them, at close quarters, was severe, but the Confederates were held in check. The fight had now raged more than four hours, Jackson had withdrawn all his forces from Frémont's front, crossed the bridge and destroyed it, and concentrated against Tyler, who saw that the time had come to retreat, and gave the order, Carroll having charge of the movement. The artillery and infantry on the right were withdrawn in good order, but on the left so many horses had been killed or disabled that but one gun was saved, the Confederates advancing and seizing five, as Tyler's men began the retreat, and turning them upon the retiring troops, throwing the rear of the column into some disorder. The Confederate infantry cover of dense miles, the cavalry until Shields came up with the rest of his division, when pursuit was checked and Shields continued the retreat to Conrad's Store. After the retreat Frémont appeared on the opposite side of the river, which he could not cross, and opened upon Jackson with his artillery. During the morning Jackson had put his trains in motion for Brown's Gap of the Blue Ridge, and after the battle he followed them. The Union loss was 67 killed, 393 wounded, and 558 missing; total loss, 816 killed, wounded and missing. Consult 'Official Records' (Vol. XII); Allan, 'Jackson's Valley Campaign'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. II).

E. A. CARMAN.

PORT-ROYAL, pōrt-rō'jal, a Cistercian convent in France, which played an important part in the Jansenist controversy (see Jansenism). It was founded in 1204 by Mahaut de
PORT ROYAL

Garlande, wife of Matthieu de Montmorency, was situated near Chevreuse in the Yvette Valley, at what is now called Les Hameaux, about 13 miles southwest of Paris, and was under the rule of Saint Bernard. The original name of the site was Porrais or Porrois; this was transformed first into Port-du-roi, then into Port-Royal. Port-Royal had declined from its original importance in 1643. In 1673, Marie-Angélique-Arnauld undertook its reform. The number of the nuns increased under her rule, and in 1625 amounted to 80. The building had become insufficient, and the situation was unhealthy. The mother of the abbess therefore presented to the nuns the house of Cluny, situated at the end of the Faubourg Saint Jacques in Paris. The old site was subsequently improved by drainage, and a new house built on higher ground. The two sections of the convents now distinguished as Port-Royal des Champs and Port-Royal de Paris. About 1636 a group of eminent literary men of religious tendencies, mostly the relatives of the abbess, took up their residence at a house called Les Granges, near Port-Royal des Champs, where they pursued their intellectual exercises, manual and literary work, the education of youth, and the compilation of educational works. These were regarded as forming a joint community with the nuns of Port-Royal, among whom most of them had relatives, and who in most matters followed their counsels. Among them were Antoine Arnauld, Arnauld D'Andilly, le Maître de Sacy and his two brothers, the first two being brothers, the last three nephews of the abbess; Nicole, and subsequently Pascal, whose sister Jacqueline was a nun of Port-Royal. These men founded here an educational institution, which flourished till 1660, and became a rival to the institutions of the Jesuits, and as they adopted the views of Jansenius, subsequently condemned by the pope, a quarrel ensued between the two parties, and with their male friends, became subject to the opposition of the Jesuits, which culminated in the ruin of their institution. Port-Royal de Paris had, in the meantime, been growing rapidly in wealth and influence. It was protected by persons of rank at the court, some of whom made it their last retreat and bequeathed their fortunes to it. It was under the direction of the Abbé de Saint Cyran (Duvergier de Haurame), whose virulent Jansenism led, during the last days of Richelieu, to his imprisonment in Fort Saint Vincennes. During the wars of the Fronde the house in the country exercised a liberal hospitality. The history of the struggle in which the two convents of Port-Royal successively succumbed to their foes is too long to be dealt with here. It has been related in detail by Racine, the most distinguished pupil of the Port-Royalist seminary, in his *Histoire de Port-Royal*. The most remarkable incident in it was the miracle alleged to have been wrought upon the person of the niece of Pascal, and was believed in by two such men as Pascal and Racine. The object of this miracle, wrought by means of a thorn from the crown of our Saviour, was to demonstrate the innocence of the nuns of Port-Royal, accused by their opponents of contempt of the holy sacrament. But this vindication was unavailing. In 1664 Port-Royal de Paris was occupied by the police. The nuns, save few who acceded to the terms of the court, and were forthwith declared enemies of their former regime, were imprisoned for some months and then sent to Port-Royal des Champs, which was put under military surveillance till 1669. In 1669 the two houses were permanently separated by royal authority. Port-Royal des Champs was sold by the Jesuits, and two-thirds of the joint property, Port-Royal de Paris 10 nuns and one-third of the joint property, and was placed perpetually under the nomination of the king. The nuns of Port-Royal des Champs still persisted in refusing to sign the papal edict condemning the doctrines of Jansenius, and on 29 Oct. 1790 the convent was finally suppressed by order of Cardinal Neâîles, in execution of a bull of Pope Clement XI. The nuns were dispersed in different convents, and their property given to Port-Royal de Paris. This convent continued in existence till the Revolution, when its house was converted into a prison, and subsequently (1814) became the Maternity Hospital. In 1825 some Jansenist descendants bought the site at Les Hameaux, on which they have placed some Jansenist relics. The grounds have been restored as far as possible to their original appearances. (See Arnauld; Jansenism; Pascal, Blaise.)

PORT ROYAL, Jamaica, the principal naval station owned by the British in the Caribbean Sea. Port Royal, the city, which was destroyed by an earthquake in 1692, was near the site of the present naval station. The present Port Royal is at the entrance to Kingston Harbor.

PORT ROYAL, S. C., village in Beaufort County, at the southern end of Port Royal Island, on the Port Royal and Augusta Railroad, 53 miles southwest of Charleston. Near here, a French Huguenot colony was established in 1654 by Ribault, which was taken by the Spaniards in 1665, and all the garrison killed. On 3 Feb. 1779, during the southern campaign of the Revolution, Major Gardiner, with 200 British soldiers, attempted to seize Port Royal Island, but was attacked and defeated by General Moultrie, with about 600 men, the British loss being serious, that of the Americans slight. In the Civil War the harbor
of Port Royal was defended by two forts, Fort Walker and Fort Beauregard, built by the Confederates and garrisoned by a Confederate force under Drayton and Ripley. On 7 Nov. 1861 an attack was made on these forts by the Federals with a force of two frigates, three sloops and seven gunboats, commanded by S. F. Dupont (q.v.). This fleet opened fire on both forts at once, on entering the harbor, but later concentrated the attack on Fort Walker till that fort surrendered; Fort Beauregard was surrendered shortly afterward. Port Royal has an excellent harbor, and a large drydock, and has been the rendezvous of the North Atlantic Squadron. Pop. about 700. Consult Parkman, 'Pioneers of France in the New World' for an account of the Huguenot colony.

PORT ROYAL BAY, Battle of. As early as June 1861 the United States authorities, in order more effectually to maintain the blockade and to secure a military and naval base of operations on the southern Atlantic Coast, determined to seize a good port south of Cape Hatteras; and in August a naval and land expedition was prepared for the purpose. Capt. S. F. Dupont was ordered to organize the naval expedition, and Gen. Thomas W. Sherman to organize a force of 12,000 men to accompany it. It was agreed between Dupont and Sherman to seize Port Royal Bay, one of the finest harbors on the coast, 36 miles south of Charleston and 25 north of Savannah. The destination was kept a profound secret. The fleet of 16 war vessels and nearly 40 transports, carrying Sherman's 12,000 men with supplies, sailed from Hampton Roads on the morning of 29 October, and on the night of 1 November was struck by a furious storm off Hatteras and scattered. Four vessels and a few lives were lost, one war vessel was disabled and, with two transports, returned to Hampton Roads; but by the 6th the fleet had assembled off the entrance to Port Royal Bay, the gunboats, preceding, having driven into the harbor three Confederate vessels that had run out and opened fire upon them, and coming under a long cross-fire from two works commanding the entrance. It had been the intention to silence and take these works on the afternoon of the 6th but necessary arrangements were not perfected until too late in the day. The bay was defended by two earthworks and some shore batteries, one earthwork on each side of the entrance, Fort Walker, on Hilton Head, the south side, and Fort Beauregard, on Bay Point, Saint Phillips Island, on the north. These were strong and well-constructed works, mounting 42 heavy guns, 22 of which were in Fort Walker, and garrisoned by nearly 3,000 men under Gen. T. F. Drayton. The distance between the two works was two and one-half miles. In addition to the landworks, there were three small Confederate gunboats of two guns each in the bay, under command of Com. Josiah Tatnall. The Wabash, the flagship of the fleet, carrying 46 guns, was to lead in the attack, followed by nine other vessels, a ship's length apart, and a flanking column of five gunboats was to move on the right. The fleet was to pass up the roads on the Bay Port, giving broadsides on Fort Walker until each vessel had reached a point two miles above the fort, when they were to turn and come down and again deliver their broadsides at Fort Walker and enfilade its two water-faces. Having completed the circuit, the line was to return to the transport forts. All surrendered. At the same time the five flanking gunboats were to pass and attack Fort Beauregard and, on reaching the turning-point two miles above it, remain there and hold Tatnall's fleet in check, with special orders to see that it did not make for the transports. At 9 A.M. 7 November the fleet crossed the bar and advanced in a long well-ordered column to the attack, while the transports lay at anchor outside ready to land troops. Captain Dupont led the Wabash up the middle of the bay, receiving the first fire from both forts at 9:26 A.M. and replying to both, until two miles beyond them; then he turned to the left in a wide circle and led back past Fort Walker at 800 yards distance, opening upon it broadside after broadside. The rest of the column followed, each vessel in succession opening its guns, keeping range and maintaining a rapid fire as it slowly drew past. The gun-fire from the fleet was a terrific continuous roar and was replied to by a well-maintained fire, notwithstanding the fact that hundreds of shells were dropping into the fort and almost burying its defenders, under the dirt thrown up. At the same time the flanking column of five gunboats steamed up the bay, nearer to Bay Point, and poured broadsides into Fort Beauregard and then, steering to the other side, advanced against Tatnall's fleet, driving it into Scull Creek and, taking position near the shore and flanking Fort Walker, opened upon it a destructive fire, to which it could not respond, as the one gun on that flank of the fort had been shattered by a round shot. After the main column had passed down the bay about two miles, it turned, at 11 A.M., and again passed in front of Fort Walker, at 300 yards closer range than before, and with a more terrific fire, part of which was against Fort Beauregard. As the manoeuvre was repeated for the third time it was discovered that the Confederates were abandoning Fort Walker; its garrison fired a few shots fired, to which there was no response; a small party was sent ashore, the Confederate flag hauled down, and the Union flag ran up at 2:20 P.M. Before the close of the action the Powhatans, Commander Percival Drayton, which had been delayed by injuries received in the storm, entered the bay and opened fire on the fort. Commander Drayton was a brother of the commanding officer of the Confederate forces. The Confederates had left in haste, leaving tents standing, and escaped across Scull Creek, being assisted by the boats of Tatnall's fleet. By nightfall the transports had come into the bay and landed Gen. H. G. Wright's brigade at Hilton Head. Fort Beauregard was abandoned about 5 P.M., after its commanding officer had spiked the guns and destroyed the greater part of the powder. It was occupied next morning by General Stevens's brigade. The battle was of great value to the Federal government in its moral and political effect, in addition to the fact that it gave the Union army one of the finest harbors on the Atlantic Coast, and providing for the prosecution of war for both the army and navy. The Union loss
PORT ROYAL-DES-CHAMPS — PORT TONNAGE

was 8 killed and 23 wounded; the Confederate loss, 11 killed, 48 wounded and 7 missing. Consult ‘War Records’ (Vol. VI); ‘Naval War Records’ (Vol. XII); Ammen, ‘The Atlantic Coast’; and Amy, ‘The History of the United States Navy’ (Vol. II); ‘Battles and Leaders of the Civil War’ (Vol. I).

PORT ROYAL-DES-CHAMPS, pör rwa-jäl d-dā śa-n. See Port Royal.

PORT ROYAL FERRY, Engagement at. After the naval battle of Port Royal Bay (q.v.), 7 Nov. 1861, the navy explored the various sounds and creeks in the vicinity, capturing some abandoned guns. While the navy was thus employed the army had completed a very large and strongly intrenched camp on Hilton Head, surrounding Port Walker, and on 11 December occupied Beaufort, some Confederate cavalry falling back across Coosaw River, taking to the farther side the ferry-boat and ropes and all other boats and covering the crossing by a blockhouse, which was soon destroyed by two advancing gunboats who swept the river. By the end of December the Confederates had erected a strong field-work on the mainland opposite and commanding Port Royal Ferry, on the Coosaw, and they repulsed the efforts of the gunboats to dislodge them. The position was held by the 14th South Carolina regiment, four companies of the 12th South Carolina, about 45 cavalry and a section of Leake’s battery, all under command of Col. James Jones. Obstructions had been placed in the Coosaw above and below the ferry to prevent the ascent of the gunboats, and a battery put in position opposite Seabrook’s Point. A combined land and naval expedition was set on foot to take the position and clear the river. Gen. I. I. Stevens’s brigade, reinforced by two regiments, in all 3,000 men, was to cross the Coosaw several miles below Port Royal Ferry, advance up the left bank of the river and take the work in rear, while two gunboats, an armed tug and four boats armed with howitzers, all under Commander C. R. P. Rodgers, were to enter the Coosaw by Beaufort River. A naval co-operating force was to move up Broad River and thence to the Coosaw to attack the battery opposite Seabrook’s Point. On the night of 30 December a battery of 6 howitzers was elected and sent up Beaufort River, and at 1 A.M. 1 Jan. 1862 the embarkation began and, passing up the Coosaw, the troops were landed during the morning. At 1.30 p.m. they moved for Port Royal Ferry, marching parallel with and close to the river, the gunboats and launching shells the woods in advance of the skirmish-line. A mile had been marched when a concealed battery opened its fire on Stevens’s column, but Stevens soon drove it and its infantry support from the field and, closely following, reached the fort which had been abandoned, upon the appearance of the gunboats, the enemy leaving one gun. Meanwhile the gunboats moving by way of Broad River had cleared the Coosaw, beyond the ferry. During the night the ferry was completely restored, the captured fort leveled to the ground, and next morning the troops crossed the ferry and marched back to Beaufort with the captured gun and a few prisoners. The result of the attack was the capture of any future attempt to plant batteries on the Coosaw or the adjacent network of waters; and, being almost the first Union success since the defeat at Bull Run, it was considered of so much importance that the thanks of the government were given in general orders to General Stevens and his command for their services at the battle of Port Royal Ferry. The Union loss was 3 killed and 14 wounded; the Confederate loss, 8 killed and 23 wounded. Consult ‘Official Records’ (Vol. VI); Ammen, ‘The Atlantic Coast’; Stevens, ‘Life of Gen. I. I. Stevens’ (Vol. II); ‘Battles and Leaders of the Civil War’.

PORT SAID, sā-ā-dī, Egypt, seaport at the northeastern end of the Suez Canal, and capital city of the Egyptian department of the Isthmus. It lies in the easternmost part of an island between the Mediterranean and Lake Menzaleh, about 110 miles north-northeast of Cairo, in lat. 31° 16’ N. and long. 32° 19’ E. Its whole being is dependent on the canal and it was not founded until the canal was partly built. Hence its architecture is European, and many of the houses are wooden with sloped roofs. North of the city on the coast of the canal and of the Mediterranean is an electric light about 175 feet high and visible 20 miles out. Two great concrete moles 5,300 and 7,400 feet long reach out into the sea. The trade of the city is almost entirely transit. The city was named for Said Pasha, viceroy of Egypt 1854–63. A fountain and statue of Queen Victoria was built in 1898, and a colossal statue of De Lesseps, by Frémiet, has stood since 1900 at the entrance of the canal. Attempts by the Turks in the World War to capture the city and wreck the Suez Canal proved signal failures. The population of Port Said and Ismailia, including more than 10,000 Europeans, mostly French and Greek, numbered about 90,000 in 1917.

PORT OF SPAIN, Trinidad, city, capital of Trinidad (q.v.), one of the West Indies group, belonging to Great Britain. The city is a large salt harbor; steamers and other vessels are loaded and unloaded from the principal ports of the Caribbean Sea and Gulf of Mexico, and with many South American ports; and railroad connection with San Fernando, to the south, and with several other places on the island. The most of the products of the Orinoco region are shipped from Port of Spain. The city is well built and has many fine residences. It has the government buildings, botanical gardens and the Immaculate Conception College. It is a Roman Catholic archiepiscopal see. Pop. 60,000.

PORT TAMPA CITY, Fla., town, Hillsborough County, on Tampa Bay, and on the Atlantic Coast Railroad, eight miles south of Tampa. It was founded in 1889 and incorporated as a town in 1891. In the Spanish-American War, the United States troops were mobilized here for embarkation to Cuba. It is the port of Tampa (q.v.), has a large and excellent harbor and is connected with the West Indies, Mobile and other ports by steamer. It is in a fruit-growing and agricultural region for the products of which it is the shipping point. Pop. 1,343.

PORT TONNAGE. Some interesting facts are shown in the relative rank in tonnage movement of the principal ports of the world, in a table prepared by the Bureau of Sta-

Hongkong would show a much higher figure, but for the fact that Chinese junks engaged in the foreign trade are excluded from the estimate, the tonnage of these vessels entered in 1901 having been 1,126,931, and of those which cleared, 1,130,279. Singapore excludes native craft and vessels under 50 tons, excepting vessels engaged in trade between the Straits Settlements.

In this connection it is interesting to note that during the fiscal year 1 July 1917-30 June 1918, the net tonnage of vessels that entered the various ports of continental United States aggregated 45,455,937 tons, of which 19,283,530 tons represented American vessels; and the net tonnage of vessels that cleared the ports aggregated 46,659,482, of which 19,261,715 were American. It should also be noted that during this period the imports of merchandise into the United States aggregated in value $2,946,059,403, and the similar exports from the United States, $5,928,285,461—the largest totals on record. And this is when the world was aflame from the Teutonic torch.

In the previous fiscal year the tonnage entrances and clearances at United States customs districts aggregated 50,472,766 and 52,077,070 tons, respectively, as follows: Atlantic Coast, 24,010,685 and 25,047,868; Gulf Coast, 6,991,335 and 7,570,242; Mexican border, 65,670 and 64,396; Pacific Coast, 5,453,278 and 5,411,299; and Northern border, 13,951,208 and 13,983,265.

PORT TOWNSEND, Wash., city, county-seat of Jefferson County, on Port Townsend Bay, at the entrance to Puget Sound (q.v.), and on the Northern Pacific and the Port Townsend Southern railroads, about 70 miles north of Olympia. It has steamers connection with San Francisco, Alaska and many of the principal ports on the eastern coast of Asia. The harbor ranks with the largest in the world. The place was settled in 1851 and in 1860 was incorporated as a city. Port Townsend is on the west side of the bay, five miles by land and two and one-half miles by water from the city, and other government fortifications are located on Admiralty Head, Point Hudson, Point Partidge and Marrowstone Point. The government has established a marine hospital and a quarantine station. The city is included in the Jefferson-Southwest customs district, through which about $140,000,000 is declared passively annually.

The city is in an agricultural and lumbering region. In the vicinity are deposits of oil and valuable minerals. The chief industrial establishments are lumber and planing mills, a shipyard, machine shops, steam-boiler works, bottling works, herring pickling and curing works, salmon and sardine canneries, grain elevators and flour mills. The chief exports are grain, lumber, fish, oil, livestock, farm and dairy products and iron. The pig iron is from the Irondale furnaces. The principal public buildings are the government house, city hall, county courthouse, United States Marine Hospital, the quarantine station, a sanatorium and Saint John's Hospital. The educational institutions are a high school, public elementary schools, private business schools and a public library. The scenery around Port Townsend is beautiful, surrounded as it is by water and mountains. The government is administered under a charter of 1890, which provides for a mayor, who holds office one year, and a council. The administrative officials are appointed by the mayor or elected by the council. Pop. 4,161.

PORT WASHINGTON, Wis., city and county-seat of Ozaukee County, on Lake Michigan and on the Chicago and Northwestern Railroad, 25 miles north of Milwaukee. Its industries include the manufacture of woodenware, foundry products, internal-combustion engines, etc. Pop. 3,792.

PORT WINES. The name of port wines, or Oporto wines, is given, in commerce, to the produce of the vineyards of Portugal, the district in which they are produced being a rugged and mountainous tract that begins about 60 miles above Oporto, and extends for 30 or 40 miles with an extreme breadth of about 12 miles. Port is naturally a very rich and delicate wine, varying in color from a pale rose to a deep red. It owes its special character partly to the soil of the district where it is grown, partly to the climate, which is cold in winter and very hot in summer. The harvest lasts from the beginning of September to the middle of October. The wines for export are very much mixed and are strongly fortified with brandy, partly to make them sooner ready for export and partly to suit the taste of the foreign markets. The mixing of the various wines considerably reduces the variety of qualities of port exported, compared with those which are naturally produced. The English market has always been the principal market for port wine. English connoisseurs have tended more than anything else to spread its fame in other countries. The taste for this wine was introduced into England in the 17th century and English establishments were formed in Oporto to direct the purchase and shipping of the wines. These companies eventually united into a sort of corporation called the English Factory, which became completely master of the market. In the following century (1756) the Marquis of Pombal organized an association of producers to oppose this monopoly of buyers and the company then established imposed restrictions on the trade which were not finally abolished till 1853, a new company having latterly taken the place of the old. In recent times the wines have suffered rather severely both from the oidium and from the more serious plague of the phylloxera. See WIne and Wine Making.
PORTAELS, Jean François, zōhí frán-swá pórz-táls, Belgian painter: b. Vlvoorde, near Brussels, 1 May 1818; d. Brussels, 8 Feb. 1895. He owed his early art training to Navez of Brussels. He afterward proceeded to Paris where he became the pupil of Paul Delaroche, gaining the "Grand Prix" in 1842. After traveling in Syria, Egypt, Palestine, Greece and Turkey, he was appointed director of the academy in Ghent, an office he retained for three years. He then resumed his travels which included the whole of Europe in their range. He ended his days as director of the Brussels Academy. His works are faulty in composition and deficient in living characterization, but in spite of occasional insipidity they are pleasing and full of expression. Among them the most important are "The Journey of the Magi"; "Funeral Procession in the Desert of Suez"; "Teptha's Daughter"; "The Daughter of Zion"; "The Flight into Egypt"; "Leah and Rachel"; "The Young Witch"; "The Simon."…

PORTAGE, N. Y., town in Livingston County, on the Erie and Pennsylvania Railroads, 60 miles southeast of Buffalo. It is the distribution and marketing centre for a prosperous agricultural district and here also is Letchworth Park of 1,000 acres crossed by the Genesee River, which is crossed by a fine bridge. The falls of the river and the cañon at this point are very picturesque. The town contains a museum. The park is the gift of the State of William Pryor Letchworth. Pop. 1,273.

PORTAGE, Pa., borough of Cambria County, on the Pennsylvania Railroad, six miles southeast of Ebensburg. There are several coal mines nearby and coal-mining is the principal industry. Pop. 2,954.

PORTAGE, Wis., city, county-seat of Columbia County, on the government ship- canal between the Fox and Wisconsin rivers, and on the Chicago, Milwaukee and Saint Paul and the Minneapolis, Saint Paul and Sault Sainte Marie railroads, about 92 miles west by north of Milwaukee and 35 miles north of Madison, the State capital. It was settled in 1835, incorporated in 1837 and in 1854 was chartered as a city. It is in a prodigious industrial district and is the commercial and industrial centre for quite a large portion of Columbia County. The chief manufactures are flour, brick, hosiery, knitgoods and farm implements. The educational institutions are a high school, public and parish elementary schools and a public library. In the vicinity are the ruins of Fort Winnebago (1828). The government is according to the commission plan since 1912. The city owns the waterworks. Pop. 5,440.

PORTAGE GROUP, in geology, a portion of the Devonian series, so-called by the geologists of Yost and Lyell. The Survey because largely developed near the town of Portage, N. Y. The rocks of this period are chiefly sandstone and shale.

PORTAGE LA PRAIRIE, pórz-tá li prárrí, Canada, a town in Manitoba, on the Canadian Pacific, Grand Trunk Pacific, Canadian Northern and Great Northern Railways. It is 56 miles west of Winnipeg and 15 miles south of Lake Manitoba. It is an important railway centre and the receiving and distributing point for the fertile "Portage Plains," one of the finest wheat-growing sections in the world. It has railway machine shops, a large flouring mill, grain elevators, a paper mill, brickworks, and is the seat of an Indian industrial school and the provincial home for incurables. Pop. 5,892.

PORTE, The, or OTTOMAN PORTE. See SUBLIME PORTE.

PORTE CRAYON. See STROTHER, DAVID HUNTER.

PORTEOUS RIOT, so called from the lynching of Capt. John Porteous, commander of the city guard of Edinburgh, 7 Sept. 1736, was occasioned by various incidents connected with the trial and execution of Andrew Wilson, a smuggler, who with two companions had robbed the Kirkcaldy excise officer. The mob after the execution became disorderly and commenced throwing stones, whereupon Porteous ordered his command to fire into the crowd, with the result that seven people were killed and 20 wounded. Porteous, after trial, was condemned to death, but being reprieved, a mob broke into the jail and released him. He was fined $4,500 for the benefit of the widow and the provost was imprisoned for a year and disqualified from holding any further official position. The Porteous Riot is one of the main features of Sir Walter Scott's 'Heart of Midlothian.'

PORTER, Alexander, American jurist: b. Armagh, County Tyrone, Ireland, 1780; d. Atakapas, La., 3 Jan. 1844. He came to the United States in 1801, settled in Nashville, Tenn., studied law and was admitted to the bar in 1807. He established a law practice in Saint Martinville, La., in 1810; was a member of the convention which framed the State constitution in 1811; in 1821 was appointed a judge of the Supreme Court of Louisiana. During his 12 years' occupation of that office he established a fixed system of jurisprudence to supersede the chaotic mixture of Spanish, French and civil law in use. Elected United States senator in 1833 he voted to censure President Jackson for removing the deposits from the United States Bank, opposed the abolition of slavery in the District of Columbia and the bill to compel specie payment for public lands, advocated the division of surplus revenue among the States and also the recognition of Texas' independence. He was re-elected to the Senate in 1843.

PORTER, Anna Maria, English novelist, sister of Jane Porter (q.v.): b. 1780; d. near Bristol, Gloucestershire, 21 Sept. 1832. Before she was 15 she published two volumes entitled 'Artless Tales.' The greater part of her life was spent with her mother and sister Jane in the neighborhood of London. She produced considerable works in their day. Among them are 'Walsh Colville' (1797); 'The Lake of Kilcarney' (1804); 'The Hungarian Brothers' (1807); 'The Recluse of Norway' (1814); 'The Knight of Saint John' (1817); 'Rocque Blanche' (1812); 'Honour O'Hara' (1826); 'The Barony' (1830). She also published 'Tales of Pity' and 'Ballads, Romances and Other Poems.' Nearly all her books were translated into French and several were republished in this country.
PORTER, Benjamin Curtis, American portrait painter: b. Melrose, Mass., 27 Aug. 1843; d. New York City, 2 April 1908. He early became a pupil of Dr. Remmier and A. H. Bicknell in Boston, studied art in Paris and Vienna in 1872–78 and first devoted himself to figure painting, but later made portraits his specialty. In 1880 he became a member of the National Academy. His work showed harmonious coloring, and his portraiture was accurate and striking. Among his works are 'Henry V and the Princess Kate' (1888); 'Cupid with the Butterflies' (1874); 'Portrait of Boy with Dog' (1884), etc.

PORTER, Charles Talbot, American mechanical engineer: b. Auburn, N. Y., 1826; d. 1910. In 1845 he was graduated at Hamilton College; was admitted to the bar and practised law for many years before he adopted the career. In 1860 he became partner of John F. Allen and with him controlled the manufacture of the Porter-Allen engine. He was the first engineer to complete the resistances of the reciprocating type of engine and to evolve the steam-screw stationary engine. He invented two successful steam-governors. His published works include 'Mechanics and Faith, Spiritual Truths in Nature' (1885) and 'Engineering Reminiscences' (1908).

PORTER, Charlotte, American author: b. Towanda, Pa., about 1853. In 1875 she was graduated at Wells College. In 1886–88 she edited 'Shakespearean Drama' and the 'Ethical Record' from April to December 1888. With Helen A. Clarke she founded 'Poet-Lore,' of which she is still editor; and with her also edited 'Poems of Robert Browning' (2 vols., 1896); 'The Ring and the Book' (1897); 'Clever Tales' (1897); 'Robert Browning's Complete Poetical Works' (12 vols., 1898); 'Mrs. Browning's Complete Works' (6 vols., 1900); 'Pembroke Edition of Shakespeare' (12 vols., 1903); 'Poets' Parleys' (1902). She is sole author of 'Dramatic Motive in Browning's 'Strataford' (1897); 'Browning Study Programmes' (1900); 'Stage Version Browning's Return of the Druses' (1903); 'Maeterlinck's Monna Vanna' (1904); 'Shakespeare Studies—Macbeth' (1902); 'The Tragedy of Life' (1896); 'The Countess' (1902); 'The Histories' (1913); 'Poetic Translation of D'Anunzio's Daughter of Jorjo' (1907); 'Lips of Music,' poems (1910); 'Revels of Father Christmas and the Bishop' (1917), etc., and contributions to periodicals.

PORTER, David, American naval officer: b. Boston, 1 Feb. 1780; d. Pera, near Constantinople, 3 March 1869. He made voyages in the West Indian merchant service, was twice impressed by the British, but escaped, and in 1798 entered the United States navy as a midshipman. He was on board the Constitution in the fight with l'Hermione in 1799, and served as a lieutenant in the war with Tripoli. Captured with the Philadelphia, he remained in imprisonment until the peace. In the War of 1812, he fought with distinction, capturing many English merchant vessels and seriously crippling Great Britain's whale-ships engaged in the Pacific. His vessel, the Essex, was blockaded in 1813 in Valparaiso Harbor by two English vessels, which he offered to fight either singly or together. This offer having been refused, he attempted to make a dash for the open sea, but his ship was severely damaged by a squall, and he put back, anchoring a half mile off the shore, and three miles from the town. There the English, regardless of neutrality laws, attacked him, and after a struggle of two and a half hours, one of the fiercest ever, compelled him to surrender. He described the situation in a communication to the Secretary of the Navy by saying, 'We have been unfortunate, but not disgraced,' and upon his return he was voted the thanks of Congress and other legislatures, and received with much distinction. He was sent in 1824, being then a commodore, to operate against pirates in the West Indies. An officer sent by him to make an investigation at Fajardo, Porto Rico, was seized and imprisoned. Porter compelled the Spanish authorities to apologize for the act; was deemed to have exceeded his authority; and was suspended for six months by court-martial. On 18 Aug. 1826 he resigned his commission, and became rear-admiral in the Mexican service. From this time, too, he resigned in 1829; and later was consul-general to the Barbary states and chargé d'affaires at Constantinople. Among his writings are 'Journal of a Cruise Made to the Pacific Ocean' (1815), and 'Narrative of the United States Ship Niagara and its Environs' (1835). Consult 'Trial of Commodore David Porter before a Court-Martial' (1825); Porter, D. D., 'Life of Commodore David Porter' (1875).

PORTER, David Dixon, American naval officer: b. Chester, Pa., 8 June 1813; d. Washington, D. C., 13 Feb. 1891. He was son of David Porter (n.v.). In 1826 he entered the service of the Mexican navy as midshipman, and while serving on board a vessel employed in damaging Spanish commerce was captured and for a time held prisoner in the Spanish guardship at Havana. Not long after his release, he was made midshipman in the United States navy, and until 1835 was on duty on the European station. In the Mexican War he distinguished himself as a lieutenant, and later as commander of the Spitfire. After the war he commanded a passenger steamer on the extended furlough. At the beginning of the Civil War he was made commander of the Powhatan for the relief of Fort Pickens. On 22 April 1861 he was made commander, soon afterward was placed in charge of the mortar fleet, in March 1862 joined Farragut, and on 18–24 April exploded 20,000 bombs in the Confederate forts Jackson and Saint Philip, below New Orleans. Farragut's fleet was thereby enabled to pass them and capture New Orleans; and the forts finally surrendered on 26 April. At Vicksburg, also, Porter by his remarkably effective bombardment of the forts enabled the fleet to pass safely. He was ordered in September 1862 to command the Mississippi squadron as acting rear-admiral. With an improvised navy-yard at Mound City, he quickly increased to 125 vessels, and in January 1863 aided Sherman in the capture of Arkansas Post. Not long afterward he ran the Vicksburg batteries, captured the enemy's fortifications at Grand Gulf, commanded with Grant, and then cooperated with that general in the well-known siege of Vicksburg. On 4 July 1863 the city fell. Porter's commission as rear-admiral bore that date; he also received the thanks of Con-
gressive. He then aided Banks (1864) in the Red River expedition, and only with difficulty rescued his vessels. He was placed in command of the North Atlantic blockading squadron in 1864; and with Gen. A. H. Terry co-operated in the capture of Port Fisher 15 Jan. 1865. After the war he was superintendent of the United States Naval Academy in 1865–69, and did much to improve it. He was promoted vice-general in 1866 and admiral in 1870. He wrote a 'Life of Commodore David Porter' (1864); 'Allan Dare and Robert Le Diable' (1885); 'Incidents and Anecdotes of the Civil War' (1885); 'Harry Marline' (1886); 'History of the Navy in the War of the Rebellion' (1887), and other works. Consult 'Chesney, 'Essays in Military Biography' (1874); Soley, 'Admiral Porter' (1903).

PORTER, Fitz-John, American soldier, cousin of David Dixon Porter; b. Portsmouth, N. H., 13 June 1822; d. Morristown, N. J., 21 May 1901. He was graduated from the United States Military Academy in 1845, was assigned to the 4th artillery, served in the war with Mexico, and after being brevetted second lieutenant for services at Molino del Rey and major for similar services at Chapultepec. After the war he was on garrison duty until 1849, and then was made assistant instructor of artillery at West Point, where in 1854–55 he was instructor of artillery and cavalry. Appointed assistant adjutant-general in 1856, he served under Gen. A. S. Johnston (q.v.) in the Utah expedition of 1857–60. In 1860 he was made assistant inspector-general, with headquarters at New York; and in this post, during the Baltimore riots, he superintended the defense of the railway between Harrisburg and Baltimore. He became colonel of the 15th infantry, a newly-organized regiment, on 14 May 1861, and on 17 May brigadier-general of volunteers. After having been for a time on duty in Washington, he participated in the Peninsular Campaign (1862) in Virginia, and after the capture of Yorktown, in the siege of which he had fought (5 April–5 May), was for a brief while its garrison commander. Appointed major-general of the Fifth corps, which he led at Mechanicsville (26 June 1862) and Gaines' Mills (27 June). He was in command of the left flank, the centre of the conflict, at Malvern Hill (1 July 1862); and for his conduct at the battle of Chickahominy was brevetted brigadier-general, United States army. On 4 July 1862 he was made major-general of volunteers. While he was temporarily attached to Pope's Army of Virginia, the battle of Manassas or the second Bull Run occurred (29–30 Aug. 1862). On the first day his corps was ordered to advance, but found itself unable to do so; on the afternoon of the second day, however, it was in action, and by its stubborn bravery saved the defeat from being a complete rout. Pope was greatly dejected by the reverse, which he attributed largely to Porter's failure to execute orders. He made a complaint in his report but preferred no charges. Porter was in the defenses of Washington 2–13 September, then commanded the Fifth corps, Army of the Potomac, September–November, fought at Antietam (17 September), and afterward in the skirmish at Shepardstown (19 September). On 27 Nov. 1862 he was arraigned before a court-martial at Washington, charged with disobeying orders at the second Bull Run. On 21 Jan. 1863 he was cashiered, and, for violation of the 9th and 25th articles of war, was 'forever disqualified from holding any office of trust or profit under the government of the United States. This sentence for years remained unaltered. Its justice was much debated. Numerous appeals were made for a reopening of the case, and Porter himself several times petitioned for a reversal of the judgment. Grant, while President, declined to reopen the case; but after his second term, upon an examination of all the testimony, published in an article entitled 'An Undeserved Stigma' (December 1882) his conclusions to the effect that Porter was by the evidence vindicated of the charges against him. Under President Hayes a military board acquitted Porter of all faults attributed to him or at the instance of his superior. On 4 May 1882 President Arthur remitted the sentence so far as disability to hold office under government was concerned but a bill for Porter's relief failed to pass. A subsequent bill was passed 4 Apr. 1884, and then the matter was vetoed by Arthur on a technicality. A third bill, however, was passed, and was signed by President Cleveland; and by the act of Congress of 1 July 1886 Porter was made colonel of infantry 5 Aug. 1886 to rank from 14 May 1861. On 7 Aug. 1866 he was placed on the retired list. Subsequent to 1863, Porter was superintendent of certain mining operations in Colorado in 1864–65; a merchant in New York 1865–71; superintendent of the erection of the New Jersey State asylum for the insane at Morristown; commissioner of public works, N. Y. 1875–76; assistant receiver of the Central Railroad of New Jersey, 1877–82; police commissioner, New York, 1884–88; fire commissioner, 1888–89; and cashier of the post-office, 1893–97. An offer, received in 1889, from the Khedive, to command the Egyptian forces with major-general's rank, was declined by Porter. Among the best statements of the case for and against Porter may be respectively mentioned, besides the article by Grant above cited (Vol. 135, North American Almanac for 1884), 'The Supreme Court of the United States, on the Case of the' (1883), and Cox, 'The 2d Battle of Bull Run as Connected with the Fitz-John Porter Case' (1882). See also Pope, John.

PORTER, Gene Stratton, American author, ornithologist and illustrator; b. Wabash County, Ind., 1868. She received a private education and in 1886 was married to Charles Darwin Porter. For two years she was editor of the camera department of Recreation and two years on the natural history staff of Outing. Subsequently she was for four years specialist in natural history photography on the Photographic Times Annual Almanac. Mrs. Porter is the author of many entertaining and deservedly popular works including 'The Song of the Cardinal' (1902); 'Freckles' (1904); 'What I Have Done with Birds' (1907); 'At the Foot of the Rainbow' (1908); 'A Girl of the Limberlost' (1909); 'Birds of the Bible' (1909); 'Moonlight on the Wild' (1910); 'The Harvester' (1911); 'Moths of the Limberlost' (1912); 'Laddie' (1913); 'Michael O'Halloran' (1915); 'Morning Face' (1916); 'Friends in Feathers' (1917).
PORTER, Horace, American diplomat: b. Huntington, Pa., 15 April 1837. He studied at Harvard and was graduated from West Point in 1860; served for a short time as instructor there and at the outbreak of the Civil War was assigned to duty in the Department of the East. He commanded the siege batteries at Fort Pulaski and was brevetted captain for his gallantry. After the battle of Antietam he was transferred to the Army of the Ohio and later to that of the Cumberland. He was engaged at Chattanooga, Chickamauga, the battle of the Wilderness and New Market Heights, and as aide-de-camp of General Grant witnessed the surrender at Appomattox. In 1865 he was brevetted brigadier-general for his services throughout the war. He was assistant to Grant when that general was Secretary of War for a few months in 1867 and upon Grant's election to the Presidency Porter became his private secretary. In 1873 he resigned from the army. After the close of Grant's second term as President, Porter entered upon a business career in which he was eminently successful, became noted as an author and lecturer, and the management of his estate and the writing of books completed. In 1897 he was appointed by President McKinley, United States Ambassador to France, which position he filled with tact and ability till 1905. He succeeded in finding the burial place of John Paul Jones, the American naval hero, and recovered the body, later sending it to the United States for burial in Annapolis. He was awarded the thanks of Congress and the privilege of the floor of each House for life, and was a delegate to The Hague Peace Conference of 1899. He wrote 'West Point Life' (1866); 'Campaigning with Grant' (1897).

PORTER, James, American Methodist Episcopal clergyman: b. Middleboro, Mass., 1806; d. 1888. In 1830 he became a member of the New England Conference and in 1856 became an agent of the Methodist Book Concern, and was reappointed in 1860 and 1864. From 1866 to 1882 Mr. Porter was secretary of the National Temperance Society; in 1852-55 was an overseer of Harvard University and in 1855-71 was trustee of Wesleyan University. He was the author of several works on religious topics.

PORTER, James Davis, American politician: b. Paris, Tenn., 7 Dec. 1828; d. Paris, Tenn., 18 May 1912. He was graduated from the University of Nashville in 1846; admitted to the bar in 1850; and sat in the Tennessee legislature, 1859-61. He served in the Confederate army during the Civil War, and was adjutant-general of the staff of Major-General Cheatham. In 1870-74 he served as judge of the 12th judicial circuit and in 1874-78 was governor of Tennessee. He was United States Assistant Secretary of State in 1885-89 and Minister to Chile in 1893-97. He wrote 'The Confederate Military History of Tennessee.'

PORTER, Jane, English novelist: b. Durham, England, 1776; d. Bristol, Gloucestershire, 24 May 1850. She was a sister of Anna M. and Sir Robert Ker Porter (qq.v.) and was brought up at Edinburgh and in London. She became immediately famous in 1805 with her historical romance, 'Thaddeus of Warsaw,' and 'The Scottish Chiefs' (1810) was even more successful despite its high-flown sentiment and stilted characterization. Among her other works were 'The Pastor's Fireside' (1815); 'Duke Christian of Luneburg' (1824); 'Tales Round a Winter's Hearth' with Anna M. Porter (qq.v.) (1824); 'The Field of Forty Footsteps' (1828), and 'Sir Edward Seaward's Narrative of his Shipwreck and Adventure in the vicinity of Certain Islands in the Caribbean Sea' (1831), a praiseworthy fiction, edited.

PORTER, Jermain Gilderleeve, astronomer: b. Buffalo, N. Y., 8 Jan. 1852. He was graduated from Hamilton College, Clinton, N. Y., in 1873 and studied at the University of Berlin. He was appointed to the United States Coast and Geodetic Survey in 1878 and since 1884 has been director of the Cincinnati Observatory and professor of astronomy at the University of Cincinnati. In 1894 he received the Astronomical Journal Comet Prize. His principal investigations have been on the motions of the stars and the variation of latitude. He published 'Our Celestial Home' (1888); 'The Stars in Song and Legend' (1901); also many catalogues of stars, nebulae, and memoirs on various astronomical subjects.

PORTER, Noah, American educator: b. Farmington, Conn., 14 Dec. 1811; d. New Haven, Conn., 4 March 1892. Graduated from Yale in 1831, he was a tutor and student of theology there in 1833-35, was pastor of Congregational churches at New Milford, Conn., 1836-43, and Springfield, Mass., 1843-46. In 1846 he was made professor of moral philosophy and metaphysics at Yale, and from 1871 until his resignation in 1886 was president of that institution. His administration was a distinguished one. During it the curriculum was broadened by the introduction of new elective subjects, although Porter never favored the development of the elective system attempted at Harvard and supported the classic for the leading place in a scheme of liberal education. Material progress was also of note, large additions being made to the buildings and funds. Porter was also known as the editor of revised editions of Webster's 'Unabridged Dictionary.' He ranked among the foremost American metaphysicians of his time. Among his works are: 'Historical Discourse on Farmington' (1841); 'The Educational Systems of the Puritans and Jesuits Compared' (1851); 'The Human Intellect' (1866); and many subsequent eds.; 'Books and Reading' (1870); 'American Colleges and the American Public' (1871); 'Science of Nature vs. the Science of Man' (1871), a review of the philosophy of Spencer; 'Elements of Intellectual Science' (1871); 'Evangeline; the Place, the Story and the Poem' (1882); 'Science and Sentiment' (1882); 'The Elements of Moral Science' (1882); 'Life of Bishop Berkeley' (1885) and 'Kant's Ethics; A Critical Exposition' (1886).

PORTER, Peter Buel, American soldier: b. Salisbury, Conn., 14 Aug. 1773; d. Niagara Falls, N. Y., 20 March 1844. He graduated at Yale College in 1791, studied at the Litchfield Law School, and in 1795 began practice at Canterbury, N. Y. In 1808 he was chosen a representative in Congress, where as chairman of the Committee of Foreign Relations he prepared and introduced the celebrated report of Decem-
ber 1811, recommending war against Great Britain. As soon as hostilities had been declared he resigned his seat in Congress, was appointed quartermaster-general of New York and commonly passed as a sort of representative of Pennsylvania and New York volunteers and Indians of the Six Nations. Black Rock, where General Porter resided, having fallen into the hands of the British in June 1813, and his own house, from which he was taken prisoner, was burnt. Being there his headquarters, he rallied a force by which they were expelled and their commander mortally wounded. In July 1814 he joined Brown's invading army with a brigade of 3,500 volunteers and Indians and distinguished himself at Chippewa and Lundy's Lane, and the siege of Fort Erie. He declined President Madison's appointment as commander-in-chief of the army in 1815, and served again in Congress for a few months. Porter was one of the earliest projectors of the Erie Canal, and was named, with Morris and Clinton, on the first board of commissioners to explore a route for it. In 1816 he was appointed commissioner under the Treaty of Ghent for determining the northwestern boundary. In May 1828 he was appointed Secretary of War by President Adams.

**PORTER, Pleasant, Creek Indian leader:** b. near Clarksville, in the Creek Nation, 26 Sept. 1840; d. Vinita, 3 Sept. 1907. His paternal grandfather, a native of Pennsylvania, was a captain in the United States army at the time of the Creek War and showed such consideration for the defeated Muskees that they formally adopted him as a member of the tribe. Years later, Pleasant Porter's father, Benjamin E. Porter, settled in the Indian Territory, where he married the daughter of a prominent chief, Tusk-tee Tust-e-nuk-kee, and became a planter. Pleasant Porter's early life was simple and uneventful. He was educated at the Presbyterian mission school at Talahassees. At the outbreak of the Civil War he entered the Confederate service as a private soldier in one of the Creek Indian regiments. He saw much active service and was promoted through the non-commissioned grades to the rank of a first lieutenant. The end of the war found him, like most of his fellow-tribesmen, as poor as the beggar of a farmer. His first official position in civil life was that of superintendent of schools in the Creek Nation, in which capacity he reorganized the tribal public school system, which had ceased to exist during the war. His ability becoming recognized, his services were soon in demand as a representative of his people in Washington. As the commander of the Creek National forces during the intratribal insurrection known as the Spiechee War, in 1882, he displayed not only courage but sagacity, and a tact that served him well. During his later years he occupied the position of principal chief of the Creek Nation. In 1905 he was chosen as president of the Sequoyah Constitutional Convention, which gathered at Muskogee to frame the organic law for a commonwealth to be composed of the tribal domains of the five civilized tribes.

**PORTER, Sir Robert Ker, English artist, brother of Jane and Anna Maria Porter (qq.v.):** b. Durham, 1775; d. Saint Petersburg, Russia, 4 May 1842. He studied at the Royal Academy in London, and became famous for his battle pieces. In 1804 he was appointed historical painter to the czar of Russia. In 1808 he served under Sir John Moore in Spain, and in 1811 returned to Russia, where he married the Princess Sherbatoff. He was knighted in 1817, and from then until 1820 was engaged in antiquarian studies in Asia. In 1826-41 he was British consul at Venezuela. Of his paintings the most notable were 'The Storming of Seringapatam' (1803); 'The taking of Acre' (1811); 'Agincourt' (1813); 'Peter the Great Planning the Port of Cronstadt and Saint Petersburg' (1813); 'Christ at the Last Supper Blessing the Cup' (1817). He wrote 'Travelling Sketches in Russia and Sweden' (1816); 'Letters from Portugal and Spain' (1809); 'Narrative of the Late Campaign in Russia' (1813); 'Travels in Georgia, Persia, Armenia and Ancient Babylonia' (1821-22), etc.

**PORTER, Robert Percival, American journalist:** b. Norwich, England, 30 June 1852; d. 26 Feb. 1917. A leading light in 1882 in the staff of the Chicago Inter-Ocean. He specialized in economics and statistics; prepared census reports of the 10th census, and was appointed member of the Tariff Commission in 1892. On half of the Tribune of New York and the Press of Philadelphia he studied industrial and housing conditions in Europe. With Frank Hatton he founded the New York Press in 1887 and in 1890-94 was superintendent of the 11th census. He became a member of the staff of the London Times in 1904, and subsequently investigated social and industrial conditions in Cuba, Porto Rico and Japan. His published works are 'The West in 1889' (1882); 'Bulldozerers About Trade Folly' (1886); 'Commerce and Industry of Japan' (1896); 'Life of William McKinley' (1896); 'Industrial Cuba' (1899); 'Lectures and Addresses on Municipal Ownership' (1905); 'Dangers of Municipal Ownership' (1907); 'The Full Recognition of Japan' (1911).

**PORTER, Thomas Conrad, American botanist:** b. Alexandria, Pa., 1822; d. 1901. In 1840 he was graduated at Lafayette College and three years later at the Princeton Theological Seminary. He became professor of natural science in Marshall College (later Franklin and Marshall). He removed to Lafayette College in 1866 as professor of botany. In 1897 he resigned his professorial duties and became curator of the botanical collection of the college and dean of the Fardeel school. His published works are 'Sketch of the Flora of Pennsylvania' (1872); 'Sketch of the Botany of the United States' (1873); 'Synoptical Flora of Colorado' with J. M. Coville (1881); 'The Carices of Pennsylvania' (1887); 'The Grasses of Pennsylvania' (1893).

**PORTER, William David, American naval officer:** b. New Orleans, La., 1809; d. 1864. In 1823 he entered the United States navy as midshipman; gazetted lieutenant in 1830, and transferred to the coast survey in 1833. In 1855, but restored to active service in 1859 with rank of commander. He was actively engaged during the war with Mexico in the '40's and organized the Lighthouse Service. When the Civil War broke out Porter was in command of the ironclad Essex, in the Missis-
PORTER—PORTLAND

sippi, took part in the taking of forts Donelson and Henry and effected the passage of the river from Cairo to New Orleans through the fire of severalConfederate gunboats, his next engagement with the ram Arkansas of the Confederate navy on 6 Aug. 1862, he sank her and sometime afterward bombarded the batteries at Natchez, Port Hudson and Vicksburg. On 16 July 1862 he was made commodore.

PORTER, William Sydney, American short-story writer, well known under the nom-de-plume of Henry', b. Greensboro, N. C., 1862; d. 5 June 1910. He received an academic education in Texas, in which State he spent some time on a cattle ranch before beginning his journalistic career as reporter on the Houston Post. Shortly afterward he purchased Brand's Iconoclast, which he converted into a 10-page fiction weekly, and for which he furnished himself most of the copy. He renamed it the Rolling Stone, but soon abandoned the venture and undertook a journey to Central America. The trip was two years long and he used as a base San Francisco, from which he traveled to draw some of his best tales. He set about raising bananas on a large scale and the venture proving unsuccessful he returned to Texas and sought employment as a druggist's clerk. Soon afterward he moved to New Orleans and there his literary work began in earnest. His stories were sent all over the country, but he remained in comparative obscurity until his removal to New York in 1901. Within a few years he became one of the most popular short-story writers in America. His 'Heart of the West' (1907) and 'Roads of Destiny' deal with Western life as he knew it, and his 'Cabbages and Kings' deals with life and incidents in Central America. His fame, however, rests on his stories of New York life in its many phases, from the palatial mansion of the millionaire to the homeless wayfarer and tram of the slums. His stories are marked by a freshness of style and by keen penetration and characterization, albeit deficient in psychological insight and abundant in slang. The short stories have appeared in the following collections: 'Cabbages and Kings' (1905); 'The Four Million' (1906); 'The Trimmed Lamp' (1907); 'The Gentle Grafter' (1908); 'The Voice of the City' (1908); 'Opium' (1909); 'Whirligigs' (1910); 'The Two Women' (1910); 'Strictly Business' (1910); 'Sixes and Sevens' (1911); 'Rolling Stones' (1912). A complete edition of his works was published at Garden City (1912).

PORTERANTHUS, an erect, perennial, medicinal plant of the rose family, growing in woodlands from two to four feet in height and bearing five-petalled white or pinkish flowers in May to July. Two varieties are known: P. trifoliatus, found in the area from New York and Lower Canada southward as far as Georgia and westward as far as Missouri; and P. stipulatus, found from western New York southward to Louisiana and westward as far as Oklahoma. The latter variety is smaller than the former and has five-parted leaves instead of three-parted leaves as in the former. The plant is popularly known by several names: False Ipecac, American Ipecac, Bowman's Root and Indian Physic.

PORTERSVILLE, Cal., city in Tulare County, on the Southern Pacific Railroad, 30 miles south of Visalia. The city is situated in the citrus-fruit region, which produces great quantities of olives, deciduous fruits, berries, etc. Cattle-raising is also an important industry. The warehousing and shipping of these gives employment to a great number of Portersville citizens. In addition, there are marble and granite works, canneries, cement works and lumber yards, a public library, high school, recreation parks, etc. The water-supply system is the property of the municipality. Pop. 2,696.

PORTLAND, Conn., town of Middlesex County, situated on the Connecticut River, directly opposite Middletown, on the New York, New Haven and Hartford Railroad. It has manufactory of engine parts and there are brownstone quarries. Pop. 3,425.

PORTLAND, Ind., city, county-seat of Jay County, on the Salamonie River, Grand Rapids and Indiana, Lake Erie and Western and Chicago, Bluffton and Portland Trunk line, about 45 miles east of Fort Wayne. It is in the midst of a productive agricultural region. The chief manufacturing establishments are wood-working plants, automobile parts, flour mills, clay and tile works, machine shops, cooperage and creameries. The manufacturing investment aggregates $850,000 and value of products $1,400,000. The educational institutions are five public schools and a free public library. There is a public hospital. The city owns and operates an electric-light plant and waterworks. There is a supply of natural gas. The five banks have annual clearings over $16,000,000. The city is especially noted for large mercantile trade. There are six miles of brick streets. Pop. 6,300.

PORTLAND, Me., the largest city in the State, an important seaport and county-seat of Cumberland County, is situated on Casco Bay, 106 miles northeast of Boston, with which it is connected by the Boston and Maine Railroad. The Maine Central and Grand Trunk railways connect it with the eastern provinces of Canada and the British provinces. It has direct steamship connections with Boston, New York and other Atlantic Coast ports, and steamship lines to Europe. The government defense works here, recently enlarged, include Fort Preble, Fort Williams on Portland Head, Fort Levett on Cushing's Island and Fort McKinley on Great Diamond Island. Forts Scammell and Gorges, formerly strongly equipped, command the entrance to the harbor.

Topography.—The city proper has an area of 17 1/2 square miles and is well laid out, with beautiful shade trees lining its streets and avenues. The site is one of great natural beauty, rising on a peninsula extending into Casco Bay, in view of many small islands, which have become popular summer resorts for Portland residents. In the vicinity are many other resorts and watering places, popular with people from all parts of the Union and an increasing number of tourists from foreign countries. The drives around the two hills at the extremities of the peninsula are not surpassed in beauty by any in the United States. The city slopes
from the water front to two heights, forming a natural amphitheatre, giving the city a picturesque appearance from the sea. The harbor is protected by a massive breakwater.

**Park System.**—The extensive public park system of Portland includes over 115 acres and embraces the Eastern and Western Promenades, on the latter of which is a fine statue of Thomas B. Reed, Lincoln Park, Fort Summer and Fort Allen parks, Deering's Oaks and Monument square, in the latter of which stands an elaborately memorial, the work of Franklin Simmons, a son of Maine, to the Maine soldiers who were killed in the Civil War. These parks will soon be connected by a boulevard extending around Back Bay, forming a driveway of about three miles and affording extensive views of sea and mountains.

**Public Buildings.**—Among the prominent buildings are the United States Courthouse, the City Hall, the Custom House, Post Office, Mechanics' Hall, United States Marine Hospital, the Public Library, containing over 80,000 volumes; the library of the Maine Historical Society of 14,000 volumes; the Portland Society of Natural History; the Maine Eye and Ear Infirmary, the New City Building, the Portland Society of Art, the Cumberland Club, the Trelawny building, the Fidelity building, Portland School for the Deaf Old Men's Home, Home for Aged Women, Saint Elizabeth's Academy, Female Orphan Asylum, Episcopal and Roman Catholic cathedrals and several noted colonial mansions, including the Longfellow House and Deering Mansion.

**Government.**—The city is governed under a charter granted in 1863, subsequently amended, and later acts, by a mayor elected annually, a bicameral council, consisting of 36 members, three councilmen and one alderman from each ward, and city officials, most of them elected by the people. The city marshal, commissioner of public works and members of the board of health are appointed by the mayor. The members of the board of education are elected by popular vote. The city has watersworks, electric light and gas systems, and a connecting railroad tracks.

**Schools.**—The graded school system of Portland is excellent and managed by a school board of 12 members, including three women, who are elected as members at large. The mayor is chairman of the board. There are two high schools, 19 grammar, 31 primary, nine kindergarten, besides a manual training school. The cost for maintaining the schools for 1915 $303,822.35. The Roman Catholics maintain four parochial schools.

**Fire Department.**—There is an efficient fire department, under the charge of a chief and four assistants. The department is managed by a committee of the city government; the cost for the year 1915 was $157,037.93.

**Churches.**—Portland has 52 churches, among which are three Baptist; three Roman Catholic, 14 Congregational, four Episcopal, three Lutheran, 15 Methodist, one Presbyterian, two Second Advent, two Unitarian and five Universalist churches. No city of its size has more benevolent societies.

**Courts and Police Department.**—There are United States courts, circuit and district; supreme-judicial; superior; probate and municipal courts. The police department is under the charge of a chief and two deputies. The mayor is at the head of the department. The cost of maintenance for 1915, including pensions ($5,007.93), was $129,760.14.

**Manufactures.**—Portland has 271 manufacturing establishments, of which by last public report the output was valued at $11,950,000. The industries include boat and shoemakers, rolling-mills, foundries, machine shops, locomotive works, engine and boiler works, petroleum refineries, match factory, chemical works, carriage and sleigh factories, manufactories of stonework, jewelry, edge tools, varnish, soap, meat-packing establishments, cooperage shops, lumber mills, etc. The capital invested in these industries, according to last census, was $9,597,000. Shipbuilding is still carried on, though of less importance, relatively, than in former years. Fishing and the shellfish industry are extensively pursued. The assessed property valuation (1915) was $71,843,235. Net public debt, $408,957.71. Tax rate (per $100), $2.28.

**Trade and Commerce.**—In the earlier days Portland had an extensive and valuable trade with the West Indies, a portion of which it still enjoys. It has large commercial interests and is noted for its exports of grain, fruit and live stock. Exports in 1916 from Grand Trunk piers and elevators 1,092,622 tons; package freight, 122,593 tons; horses, 22,593; mules, 6,194; also 39,083 pieces of cooperage stock. Imports (trans-Atlantic), 16,260 tons; sulphur, 102,344 tons; pulp wood, 20,205 tons; china clay 383,56 tons; fire clay, 13,315 tons; lumber, 1,575 tons; ore, 6,644 tons. The fish receipts were approximately 13,990 tons. Miscellaneous: Mexican crude petroleum oil, 21,769,104 gallons; coal, 1,511,168 tons; salt, 3,184 tons; through this port by water, 75,614 tons. The harbor is of easy access, capacious, safe, deep enough for the largest vessels and rarely obstructed by ice; hence it is an important seat of winter traffic between Great Britain and Canada. There are docks and other facilities for the repair of vessels. The greater part of the city is connected by street railway track with ships in foreign parts is in British ships. The coasting trade is extensive. England, France, Portugal, Uruguay, Haiti, Argentine Republic, Norway and Sweden maintain consular service here.

**Newspaper.**—Portland has 14 newspapers; six political, two religious; one agricultural, one Masonic, four miscellaneous.

**Banks.**—There are five national banks, with a capital of $2,000,000; five trust companies, with a capital of $1,000,000; two savings banks (resources), $34,186,217.25.

**Insurance Companies.**—Two, with assets of $18,537,161.04.

**History.**—In 1623 Christopher Levett of York, England, visited the Maine coast and under a patent embracing the present site of Portland, 1630, he landed in the harbor a fort, in which he placed 10 men and sailed for England, intending to return and plant a colony. To the site of his proposed plantation he gave the name York, from his native city. The project failed, owing to war between England and France, and the area remained uninhabited by Europeans until 1632, when George Cleeve and Richard Tucker of England made a settlement on the eastern ex-

tremity of the peninsula within the limits of the present city of Portland. The Indian name of the place was Macchegonne and was entitled in the patent to Cleeve and Tucker Stogomor, from Stogumber, the birthplace of Tucker. This was shortened to Casco Neck. In 1658 the name was changed to Falmouth. The Indians made an attack on the town in 1676, burning houses, killing some of the inhabitants and making many captives. It was completely destroyed by the French and Indians in 1690. The Government court and its residents was resettled in 1714, and in 1716 it was resettled by Col. Samuel Moody, who soon gathered about him about 50 families. On 10 March 1719 the first town meeting was held. The town suffered severely during the Revolutionary War from a bombardment by a British fleet in 1775. It was again rebuilt, and in 1836 received its first city charter. On 4 July 1866 a fire destroyed 1,500 buildings, involving a loss of $10,000,000. Longfellow, N. F. Willis, William Pitt Fessenden, Neal Dow and Thomas B. Reed were natives of Portland. Pop. at present time estimated at 65,000.

Bibliography.—Neal, 'Portland' (1874); Willis, 'History of Portland' (1865); Elwell, 'History of Portland' (1869); 'The attractive Cleeve City; and His Times' (1885); 'Portland in the Past' (1886); 'Christopher Levett' (1893); Powell, 'Historic Towns of New England' (1898).

JAMES PHINNEY BAXTER.

PORTLAND, Ore., chief city of the State and county-seat of Multnomah County, situated just above the confluence of the Willamette and Columbia rivers, a position made doubly important through the continuous improvement of these great commercial waterways by the United States government and the port of Portland. The city is 771 miles north of San Francisco, 115 miles from the ocean and covers an area of 66.36 square miles. The population of the city is steadily increasing at a rate approximating 10 per cent annually. It is called "The Rose City" in appreciation of the fact that its people pay special attention to the beautification of their homes and especially to the planting of rose gardens and hedges. Portland is unique in its efforts to develop the country throughout the State and this policy has reacted very advantageously indeed on the trade of the city. Geographical contours give a water-level route from far in the interior. Railway lines operating on this grade pour their traffic into the city most economically as a consequence. The splendid fresh-water harbor is the best one on our Pacific Coast and there is better than a 30-foot channel to the sea at low tide with 35 feet assured in the near future.

Columbia River Entrance.—The entrance to the Columbia River is deeper than any other Pacific Coast port, the most recent government figures showing a depth of water in excess of 42 feet for a width of over half-a-mile and a depth of 35 feet for an additional half-mile of width. The United States government has spent $16,000,000 to remove what was once considered a hazardous bar at the mouth of the Columbia. This obstruction has been entirely removed by the construction of two long jetties, one on either side of the river entrance. The waters of the Columbia constantly are scouring the channel and the depth of water is increasing year by year. Portland is the chief lumber manufacturing city in the world. The by-product of lumber is the manufacturing of furniture, the city having some of the largest furniture manufacturing plants in the United States. Portland is also the chief wharf on the long coast of the Pacific Coast and in normal times the second largest wheat shipping port in the United States, handling the bulk of the great crop produced in the Inland Empire (eastern Oregon, eastern Washington and Idaho), and in 1915 the wheat receipts of the city multiplied from 200,000 in 1913 to 18,718,755 bushels. Portland has 772.39 miles of improved streets; of this, 384 miles are hard surfaced, 116.30 miles macadam and gravel, and 269.66 miles graded. Completed sewers show a total of 574 miles. The assessed valuation of taxable property in Portland at the end of 1918 was $305,200,640. The tax rate is $1.20 per hundred dollars and the net bonded indebtedness of the city is $11,859,011.38.

Streets and Parks.—Portland is continuously improving its streets and in this respect stands among the most modern cities of the country. Blocks are 200 × 200 feet, with no alleys, giving the city a fine appearance. The city is a huge park, in that great Douglas fir trees, oaks and cedars and other large growths grow on the hills and close down to the border of the city limits. The streets are lined with shade trees and practically every home has its lawn and rose hedges. Boulevards run along each side of the river, both above and below the business district. Council Crest drive is one of the city's show places, because of the vast panorama of mountain, hill, valley and city that unfolds to the view of the spectator. Terwilliger boulevard, following the contour of the hills on the west side of the river, is a connecting link of an extensive chain of scenic roads that lead from the city into beautiful verdure-barred valleys dotted with orchards and farm homes.

Columbia River Highway.—The Columbia River highway, along the east bank of the Columbia River, is said to be the most beautiful highway in the world. It traverses the gorge of the Columbia River for 50 miles east of Portland. This portion of the highway is hard surfaced. By the fall of 1920 the Columbia River highway will be completely hard surfaced from Pendleton in eastern Oregon to Astoria, at the mouth of the Columbia River, a distance of 370 miles. The Pacific highway, from Portland south to the California line, is also a wonderful roadway. Hard surfacing will also be completed by the fall of 1920, the distance being about 360 miles. Oregon is spending $33,000,000 on her highways in the next three years. Portland's park area compares favorably with other cities of its size. Washington Park is situated on the edge of the western hills, a most sightly location, where some of the most magnificent views of the city and mountain peaks are to be obtained from an eminence in this park. Another one of the interesting parks of the city is Peninsula Park, where are to be found beautiful sunken gardens, said to be the largest rose park in the United States and accessible by street car from the center of the city. Macleay Park is situated in the Willamette Heights district and was donated by an early pioneer with the request that its natural ruggedness be maintained in its present state.
There are 21 parks and playgrounds in and about the city, many of which are highly improved. In addition to public parks, Portland has 12 branch libraries, one of which is controlled by the municipality, also a number of fine privately controlled amusement parks.

Libraries.—Portland is the seat of the magnificent new Multnomah County Library. This, with five tastefully designed and substantial branch buildings and 12 sub-branches and 22 deposit stations, gives easy access to its privileges from every portion of the city; its circulating rural libraries throughout the entire county and affiliations with suburban communities make this institution unique among American libraries. A feature of the new building is a series of commodious halls, available without charge for meetings of a civic or development nature. More than 50 organizations regularly avail themselves of this opportunity. The circulation is about 1,385,964 volumes annually. Portland, according to the latest available government statistics, is the most highly cultured city in the United States; the percentage of illiteracy is but 1.2 per cent.

Fine and Educational.—Portland has an excellent public school system. There are 71 school buildings in the city under the control of the school board. There are 1,202 teachers and supervisors employed, and 44,996 pupils enrolled, segregated as follows: Elementary schools, 35,636 pupils; high schools, 4,672 pupils; trade schools, 1,623 pupils; night schools, 3,065 pupils. There are four special schools and many private schools of high class and efficiency, as well as numerous trade and technical institutions. The University of Oregon maintains its medical department in this city. The largest dental college on the Pacific Coast, teaching dentistry and pharmacy, is located in Portland, besides private medical institutions and law schools. A public art institution fosters the fine arts. The Reed College is an institution offering courses of the highest order in the arts and sciences. It has a large endowment fund and is fast forging to the front as a school of national prestige. Music conservatories of many schools rank among the highest in the country.

Newspapers.—Five daily newspapers are published in Portland, the Oregonian, Oregon Journal, Evening Telegram, Portland News and the Nachrichten (German), with an additional 80 semi-weekly, weekly and monthly publications.

Climate.—Portland has an equable climate. The summers are cool and comfortable, the winters mild and rainy. For a period covering the last 30 years the United States Weather Bureau gives the average annual rainfall as 45 inches; the average yearly temperature was 52.4°. There are no destructive storms, wind or electric disturbances.

Churches.—Portland has 213 churches, with rich buildings valued at approximately $3,150,000. The Y.M.C.A and Y.W.C.A have large memberships and splendid buildings of their own. The B'hai B'rith have also a building of their own.

State Exhibit.—The State of Oregon maintains an exhibit of Oregon products, agricultural, mineral and manufactured, on the ground floor of the Oregon building, in which building also is located the Chamber of Commerce with an information bureau for home-seekers. The Portland Chamber of Commerce maintains several bureaus where the home-seeker, investor or tourist may secure information pertaining to any particular subject in which he may be interested. The Oregon development bureau of the Chamber of Commerce is of special interest to the home-seeker. Information as to lands and agriculture and advice is furnished free of charge.

Clubs and Commercial Organizations.—Club life is well developed here. In addition to various social organizations there are strong commercial bodies. The Portland Chamber of Commerce is one of the largest in the world. The East Side Business Men's Club, Press Club, the Portland Ad Club, Civic League, Progressive Business Men, Realty Board, Rose Festival Association, Rose Society, Royal Rosarians, the Kiwanis and Rotary Club deal with public questions and do valuable publicity work. All have large memberships, made up of the most substantial business interests in the city. There are many social, educational, literary and musical clubs. The city is specially known for its symphony orchestra. Notable among the clubs owning their own homes are the Arlington Club, University Club, Elks Club, Multnomah Club, Oregon Yacht Club, the Hat Club, Rex City Park Club, the Laurelhurst Club, Portland Heights Club, Concordia Club, Waverly Golf Club, Tualatin Country Club, Portland Rowing Club. The holdings of these clubs would aggregate more than $3,000,000.

Lumber.—There is tributary to Portland 564,000,000,000 feet of merchantable timber, consisting of yellow and red Douglas fir, yellow, white and sugar pine, spruce, cedar, hemlock, larch and other commercial woods. During the great European War, Portland, which is the largest lumber-manufacturing city in the world, was governmental headquarters for spruce production for aeroplanes.

Manufactures, Commerce, etc.—The city is rapidly forging to the front as a manufacturing centre and is one of the chief shipping cities in the Pacific Northwest and is the centre of the jobbing trade. There are 950 manufacturing establishments here, representing an investment of $75,000,000. There are 40,000 factory employees, officials and office men, whose wages amount to $65,000,000 per annum. The value of the product in 1918, not considering shipbuilding, was $200,000,000. The principal lines of manufacturing are lumber and its by-products, flour, furniture, woolens, harness and saddlery, machinery, fruit-canning and meat-packing and railroad cars and equipment. Portland's shipbuilding contracts for the period of the war approximated $230,000,000. Oregon and the Portland district were the largest producers of commercial ships, steel and wood, in the United States during the war. Portland has been the business centre of the Oregon country since the earliest days, when the State name included the whole Pacific Northwest. This city has been the banking centre for this corner of the United States and her banks are the largest and most substantial in the territory. They have a wide reputation for strength and conservative methods. Portland
1 View of Portland, showing Mount Hood

2 View of Portland Harbor
Scene in Portland harbor
Portland has 23 banks, eight of which are national institutions. In 1918 the bank clearings amounted to $1,323,082,798.21 and the deposits for the year ending 31 Dec. 1918 aggregated $140,290,153. Postal receipts for 1918 were $1,630,000; postal savings for 1918 were $1,800,000.

Livestock Markets.—The rapid and substantial growth of the Portland Union stockyards since their opening in 1909 has conclusively shown the position of the Pacific Coast as the great livestock centre on the Pacific Coast. In fact, it is the only competitive market west of Denver, and is growing in importance each year. Portland's livestock industry in 1918, including packing-house products, involved $75,000,000.

Railroads.—Portland's growth as a railroad centre within the past few years has been almost phenomenal. The fall of 1906, when the Spokane, Portland and Seattle (the North Bank Road, affiliated with the Hill system) was built down the north bank of the Willamette River at a cost of $53,000,000, marked the opening of a new era in railroad development for Portland, since which time millions of dollars have been expended annually within the State in railway improvement and extension. The completion of this line opened up a vast new territory to Portland. Then came the extension of the Oregon-Washington Railroad and Navigation Company (Harrison system) and the building of the Oregon Trunk (Hill system). The city is also reached from the south by the Southern Pacific. Building of feeder lines, double-tracking and electrifying of present systems, is going on continuously in the territory contiguous to Portland and numerous electric interurban lines stretch out in all directions from the city throughout the Willamette Valley. Most notable among these latter are the Oregon Electric (Hill system) with a total mileage of 154 miles; the United Railways operate in connection with the Oregon Electric, which operates from Portland to Wilsonville, Willamina, in Washington County, a distance of 28 miles, and the Portland, Eugene and Eastern branch of the Southern Pacific, which has a network of electric lines throughout the Willamette Valley. Twelve main depots give excellent passenger accommodations and freight terminals and warehouse facilities here are constantly being enlarged to meet requirements of ever-increasing traffic. The great transcontinental railway systems operating into Portland at present include the Northern Pacific, Great Northern, Burlington, Union Pacific, Southern Pacific and Canadian Pacific.

Water Transportation.—Portland's commerce reaches every prominent port. Steamship lines ply to the Orient, to Pacific Coast ports and to the Atlantic Coast via the Panama Canal. The Panama Canal affords much closer connection with Atlantic ports and is having important bearing on Portland's progress. Tramp steamers and sailing vessels carry lumber and wheat from Portland and the great foreign shipping-houses have branches here. The harbor is in the heart of the city and vessels dock close to wholesale and warehouses.

City and Interurban Transportation.—Excellent street car service is afforded by the Portland Railway, Light and Power Company. The street car mileage of this company totals 215.49 miles within the single-fare zone. Only cars of the most modern type are used, embodying the latest improvements for safety and comfort of the passengers. Frequent interurban electric trains connect Portland and the surrounding district for a radius of from 25 to 125 miles.

Water, Electricity and Gas.—Portland's pioneers were far-sighted and made reservations of Bull Run River, a splendid mountain stream, for the perpetual domestic water supply of the city. A municipal gravity system has been built that brings the water from its source, the Bull Run River, which is fed by melting mountain snows, through conduits for a distance of 24 miles. There is ample supply for all purposes and the water is remarkably soft and pure. Over 67,000,000 gallons of water are carried through two huge pipe lines to the city every 24 hours. The city in 1918 possessed 738 miles of water mains. The chief supply and distribution of electricity for light and power purposes is made by the Portland Rail- way, Light and Power Company, which operates five water-power plants and four coal plants with a total capacity of 109,340 horse power. The power furnished by this company is all generated within 40 miles of Portland, the hydraulic plants being located on the Willamette River, Clackamas River and Willamette Valley. This arrangement, in connection with the five steam plants, ensured reliable service to all parts of the company's system. Some parts of the city are also supplied by the North- western Electric Company, with a hydraulic generating plant at White Salmon, Wash., and two steam plants in the city with a present capacity of 34,500 horse power. These two systems combined have a generating capacity in excess of the present demand of approximately 65,000 horse power, ensuring an ample power supply for Portland to meet future demands. There are 50,000 customers in the city and the territory served by these light and power companies. Gas for lighting, heating and power purposes is adequately supplied to all parts of the city by the Portland Gas and Coke Company.

History.—When William Overton in November 1843 landed his Indian canoe on the river's western bank and examined the townsite of Portland, now spreading for miles along both shores, his imagination probably did not suggest to him its present magnitude. A solid mass of forest and underbrush, skirted on the one side by the Willamette River and on the other by massive hills, was all that met his view. With William Overton was A. L. Lovejoy, having come from the Hudson Bay Company's resort at Vancouver, B. C., and the townsite was the best location for a town site. Mr. Overton disposed of his property to F. W. Pettigrove and the latter and Mr. Lovejoy had the site surveyed and the boundaries established during the summer of 1844. They recognized the advantages of the location and reasoned that some day it must not only become a metropolis of a vast region but also one of the chief seaports of the Pacific Coast. The first house, made of logs, was built in the winter of 1844. F. W. Pettigrove was a native.
of Maine and A. L. Lovejoy of Massachusetts. The former wanted to name the new town Portland and the latter favored Boston. It was decided by the toss of a coin—Heads it is Portland, Tails it is Boston—and Portland grove winning twice out of three. Portland was incorporated in 1851. The first city election held 7 April 1851 showed a total vote cast of 140. In 1860 the population was 2,674. The population has more than doubled each decade. If the founders of Portland could now return for one brief moment, the scene which would meet their eyes would without doubt surpass their most sanguine anticipations. They might easily recognize the beautiful snow-capped mountains and nature's many artistic environments of their pioneer home, but this is all that would appear familiar to them. They would find a cosmopolitan city, large blocks of commercial buildings, massive and at the same time models of architectural beauty, while the residences, churches and schoolhouses are not surpassed by those of equally large cities of the East. Pop. 330,000. Consult Gaston, Joseph, "Portland, Ore.: Its History and Builders" (3 vols., Chicago, 1911).

Sydney B. VINCENT, Portland Chamber of Commerce.

PORTLAND, Isle of, a peninsula of the coast of Dorsetshire, England, about four miles long and of an extreme width of one and three-fourths miles. Only on the south is it accessible from the sea, its shores being wild and precipitous. Once an island the waves have built up a narrow ridge of shingle, Chesil Bank, which connects it with the mainland. Great quantities of building stone have been taken from its beds of Oolitic limestone, including material for Saint Paul's, London. Portland Castle was built by Henry VIII in 1520. Pop. 17,011.

PORTLAND CANAL, a narrow body of water separating Alaska from British Columbia, and extending for over 80 miles in a north-eastern direction. Its shores are precipitous cliffs of from 3,000 to 6,000 feet in elevation.

PORTLAND CEMENT. Portland cement is the product obtained by finely pulverizing cinder produced by calcining to incipient fusion an intimate and properly proportioned mixture of argillaceous and calcareous materials with no additions subsequent to calcination excepting water and calcined or uncalcined gypsum.

The old Roman cements were natural cements or were a mixture of slaked lime and volcanic dust which was found in large quantities in Italy. Indications are that concrete was prepared much as it is to-day and even this combination which is crude in comparison with the modern Portland cement concrete produced an asphalt which stood the test of time. There is a gap of about five centuries between the Roman times until the next record of the use of cement. In 1756 John Smeaton, an engineer who constructed the Eddystone lighthouse in the English Channel, while searching for a suitable mortar discovered that an impure limestone containing a certain amount of clayey matter possessed decided hydraulic properties when calcined or roasted.

These early natural cements were very different from modern cements, however. It was necessary to use rocks with the proper proportion of material in their makeup and any variation in the composition could not be regulated since the nature of the material was not understood. Portland cement originated with Joseph Aspdin, a bricklayer of Leeds, England, who in 1824 took out a patent for a cement to which he gave the name of "Portland" on account of its resemblance when hardened to the famous stone used extensively for fine building and found on the Isle of Portland on the northern coast of England. It is interesting to note that about a quarter of a century later came one of the earliest recorded uses of the modern reinforced concrete construction in the building of a reinforced concrete rowboat by M. Lambot, near Carcass, France, which is the forerunner of the modern concrete ship.

In his patent, Aspdin signified that definite amounts of clay and limestone be used and described a process of putting these two materials together, then calcining them in the manufacture of his "Portland" cement. This is the distinction between natural and Portland cements. The material upon which cement is a gift of Nature depending as it does upon Nature for the proper materials correctly proportioned for the manufacture of cement. A Portland cement is a manufactured product, its composition being generally influenced at all times by the proper selection of raw materials of which it is made, and any variation in the composition of these raw materials is easily detected and it is, therefore, a highly dependable product.

The history of the commercializing of Portland cement is a history of inventions and improvements in its manufacture. In this, American engineers and inventors have had remarkable success, for although this country was one of the last to begin the production of Portland cement the output to-day has far outstripped that of Europe.

Aspdin's Portland cement was found greatly superior to the Roman cement, Puzzolana cement and hydraulic lime Portland used, and its manufacture extended rapidly, especially in England and Germany. In this country it was first successfully made atCoplay, Pa., in 1878 but until 1890 practically all the Portland cement used in this country was imported from Europe. After that date the industry increased with great rapidity until the United States ranks as the chief cement producing country of the world. From a production of 42,000 barrels of Portland cement in 1899, the annual output in the United States rose to nearly 93,000,000 barrels in 1917.

Modern Portland cement is manufactured from a mixture of two materials, limestone rock or similar material like chalk or marl which is produced in the natural state and of moderate heat and kiln cement, supplying the other ingredients needed which is usually shale or clay although blast furnace slag is also used in conjunction with limestone. The one supplies the calcareous materials and the other the argillaceous or clayey materials. It is essential that the material be of a nutritive nature and certain exact percentages of these ingredients; this proportion differs slightly with different materials but ranges generally 75-80 percent of carbonate of lime to 25-20 percent of anhydrous clay.
Portland Cement

Material for portland cement must be comparatively free from magnesia since the specifications limit the magnesia content to 5 per cent. The clay or shale must be siliceous, preferably containing two and one-half to three times as much silica as alumina plus iron oxide. In preparing the mixture the proportions must be correct and uniform. It is found that the best results are obtained with mixtures in which the percentage of lime is \(2.8 \text{ silica} + 1.1 \text{ alumina}.\)

In the manufacture of portland cement, the first essential is to mix the raw materials in the correct proportions and grind the mixture to a high degree of fineness. Failure to produce cement of good quality results more often from neglect of the latter precaution than from all other causes combined. In England, the mixture of chalk and clay was generally made by the wet process, in which the materials were stirred with water in wash-mills and the "slurry" allowed to settle in large reservoirs until firm enough to be cut into blocks and dried by the waste heat of the burning kilns. The dry process is generally used in the case of limestone and cement rock, both in Europe and America, with a number of plants using limestone and clay operating on a semi-wet process. In the dry process, the materials are crushed, dried and finally ground together in tube mills which consist of revolving cylinders partly filled with rounded pebbles. Marl and clay are usually treated by a wet process, in which the materials are mixed as taken from the beds and ground in tube mills with sufficient water to make a thick slurry.

The burning of portland cement was formerly done in simple, intermittent vertical kilns similar to lime kilns or in ring kilns consisting of a number of chambers connected to a central stack into which the fuel was introduced through openings in the roof. Later, continuous kilns were adopted in which the bricks of dry slurry and the fuel were fed in at the top and the clinker periodically withdrawn at the bottom. These three classes of kilns required the materials to be molded into bricks and dried, an operation involving much labor.

In 1855 Ransome patented in England a process of burning cement material in the form of powder in revolving kilns heated by a flame of gas. The invention was a failure in Europe but was developed by American engineers and found to be especially adapted to conditions in this country. Petroleum was first used as fuel and later this gave place to powdered coal blown in by a blast of air. The rotary process was found to yield cement superior in several respects to the product of the older types of kiln and to be adapted to the burning of cement mixture in the form of dry powder or wet slurry without previous molding into bricks. With the advantage of the rotary kiln, portland cement manufacture in this country began, about 1890, a career of wonderful expansion and development which is still in active progress. At the present time there are more than 600 kilns of this type in operation in the United States and cement plants have been built after American designs in the leading factories of Europe.

There are three distinct and separate operations from the preparation of the raw material to the finished product. The first is mechanical and includes the assembling, preparing, grinding and amalgamating of the raw materials; the second is chemical, during which the material prepared by the first process is calcined or roasted at a high temperature, bringing about chemical composition of the various ingredients. The third and final process is partly physical and partly chemical, in which the clinker resulting from the calcination together with a small percentage of retarder is reduced to a fine powder.

In the dry process the raw materials are quarried, crushed, dried, pulverized, and mixed in the proper proportions. The powdering or pulverizing of the raw materials is one of the most important steps in cement manufacture and decided advances have been made in the last few years in grinding and pulverizing machines. Grinding machines nearly all work on the principle of striking or pouding the material between a hammer in some form and a solid metal mass.

After the raw material has been prepared for mixing this operation is accomplished by means of automatic weighing machines which weigh out just the right quantity of each of the two materials. These machines are always under the direct control of the chemist in charge of the operation day and night. There is then a perfect grinding of the raw materials to fine powder called the "raw mix." In the wet process used by some plants, a slurry is made containing the proper amount of each raw material which is then put in storage tanks and from there pumped into the rotary kilns.

The modern rotary kiln consists of a steel cylinder lined with fire brick, generally 60 to 220 feet in length and from 6 to 12 feet in diameter, set in a slightly inclined position upon rollers so that the raw material when fed into the upper end gradually moves toward the lower or discharge end as the kiln slowly rotates about its own axis. The output of the rotary kiln is from 150 to 2,000 barrels per day. In these kilns the raw mix is burned or "calcined" in a temperature of powdered coal blown in at the lower end through a hood with 50 to 100 per cent excess air over the amount theoretically required for combustion of the coal.

The cement mixture in powder or as wet slurry is continually fed in at the upper end and as it travels downward becomes dried (if wet) and is gradually brought to the white heat of the hottest zone, issuing finally in the form of black, rounded nodules of clinker varying in size from birdshot to perhaps two inches. The clinker is cooled and then ground and pulverized to fine powder usually in mills of the pendulum type or in tube mills. About 2½ per cent of gypsum is ground with the clinker to regulate the time of set of the cement. The fineness of grinding is such that at least 78 per cent of the product will pass a sieve of 200 meshes to the linear inch. After the cement has been ground it is usually deposited in bulk bins holding several thousand barrels each. Samples of the cement and complete tests made for fineness, setting, soundness, strength, chemical analysis, etc.

Portland cement is a gray powder weighing from 80 to 110 pounds per cubic foot, depending upon its fineness and how much it has been compacted; in actual practice a sack of...
cement is ordinarily considered as containing one cubic foot and weighing 94 pounds net. Mixed with water to a paste it sets or hardens slowly, resisting pressure of the finger nail after several hours. After setting it gains rapidly in hardness during the first 30 days, the increase coming on much more slowly, through a long period of years. In testing portland cement, the most important qualities to be observed are fineness, time of setting, tensile and compressive strength, and soundness. Fineness is determined by sifting through standard sieves of the correct number of meshes and gauge of wire. The time of setting is determined by preparing a test piece of suitable form from neat cement and noting the time at which needles of certain definite size and having certain definite weights cease to make appreciable indentations on the test piece. A needle exerting a certain unit pressure on the test piece is used for determining the initial set from that used for determining the final test. For tensile strength, briquettes one square inch in section, smallest section are made by filling standard molds with a plastic paste of cement and sand. These are kept 24 hours in moist air, then immersed in water and broken in a testing machine at the age of 7 and 28 days and if desired at longer periods. Soundness or constancy of volume is tested by making pats of cement with thin edges on plates of glass, keeping them in moist air 24 hours and then exposing in a loosely covered vessel to an atmosphere of steam above boiling water for five hours. These pats should remain firm and hard and show no signs of distortion, cracking, checking or disintegration. The use of concrete is continually extending and being applied to many new enterprises in the structural and commercial fields. The construction of concrete roads and streets is perhaps the most prominent development of the past decade and has reached such proportions that there are at the present time practically 150,000,000 square yards of such pavement in the United States, an amount sufficient to make nearly 15,000 miles of 18-foot highway. The recent war brought the practical development of the ocean-going concrete ship of large tonnage and the concrete barge for harbor and inland waterway transportation, also the underground concrete tank of large capacity for the storage of crude oil, fuel oil, etc. New uses for the material are discovered almost daily so that the present century may well be called the Cement Age.

PORTLAND STONE, (1) In England, a limestone of the Upper Oolite, located between the Purbeck Beds, the highest of the Jurassic Epoch, and the Kimmeridge Clay. It is so named from the Isle of Portland. It was used in the construction of Saint Paul's Cathedral, Somerset House and other notable buildings. (2) In the United States, the name is applied to the brownstone, much used as a building stone in New York, quarried at Portland, Conn. This belongs to the New Red Sandstone of the Triassic Epoch.

PORTLAND VASE, a cinerary urn or vase and a beautiful specimen of Greek art found in the marble sarcophagus of the Emperor Alexander Severus at Monte del Grano, near Rome, during the pontificate of Urban VIII (1622-44). It is formed of glass of a dark-blue color, and is ornamented with relieved figures in white enamel, representing the marriage of Peleus and Thetis. It is 10 inches high, seven in diameter at the broadest part, and is furnished with a handle on each side. It was placed in the Barberini Palace, where it remained till 1770, when it was purchased by Sir William Hamilton, from whose possession it passed into that of the Duchess of Portland. In 1810 the Duke of Portland gave the vase to the British Museum, of which he was a trustee. In 1845 a stupidly malicious fellow, or more probably a lunatic, who had been admitted to the museum as a visitor, deliberately smashed it with a stone. It was skilfully repaired, however, and is exhibited to visitors.

PORTO ALEGRE, pôr'tôo ă-l'grê, Brazil, capital city of the state of Rio Grande do Sul, about 710 miles from Rio Janeiro, on the left bank and near the mouth of the Jacuhy River, and northwest of the Lagoa dos Patos, on railroad connections with other cities. The streets are broad and clean with handsome squares. The charm of the city and its surroundings gave it the Portuguese name of Smiling Harbor (Porto Alegre). A hospital, theatre and cathedral are in the main public buildings. There are good schools, and a large colony of Germans, who, prior to the World War, handled most of the city's commerce. This consists chiefly of the produce of the rich agricultural and grazing lands. It has several steamboat lines to Janeiro, and extends on loan to the former German colony of Sao Leopoldo, etc. The imports are mostly English and German wares. Porto Alegre was founded in 1742 by colonists from the Azores. Pop. 100,000.

PORTO CABELLO. See PUERTO CABELLO.

PORTO MAURIZIO, Italy, the capital and chief town of the province of Porto Maurizio. It is situated on a promontory projecting into the Ligurian Sea, 14 miles from San Remo, 58 miles by rail southwest of Genoa and 41 miles by rail east by north of Nice. The harbor is formed by two mole walls and is entered from the south-southwest. Olivella are produced in considerable quantities, and there is an extensive shipping trade in fish, agricultural produce and olive oil. The town consists of an old section on a hill and a new section near the sea, the latter containing a fine church, a theatre, a technical school, a school of navigation and a library. Pop. 11,603. Pop. of province, 141,778.

PORTO RICO, pôr'tô ré'kô, or PUERTO RICO, an island of the West Indies and a possession of the United States; the easternmost and smallest of the group of Greater Antilles, about 1,400 miles from New York, 1,000 miles from Havana and less than 1,000 miles from Colon, Republic of Panama; lying between lat. 17° 50' and 18° 30' N. and long. 65° 30' and 69° 15' W. The estimate of its area commonly accepted is 3,660 square miles, or, without Vieques, 3,550. Adjacent to the same jurisdiction are the small islands Vieques and Culebra, in the passage between Porto Rico and the Virgin group; Mona, between Porto Rico and Santo Domingo, and a few other islets.

Topography, Climate and Hydrography.—A chain of mountains, the summits of which

### Additional Notes
- The population figures are rounded to the nearest whole number.
- The list includes major cities and towns in the Porto Rico region.
- The data is presented in a tabular format for easy readability.
are ranged in two nearly parallel lines with intervening tablelands and high valleys, crosses the island from west to east, culminating in the peak called El Yunque (3,700 feet) in the northeast. Lower transverse ridges, running northward and southward from the principal chain, sink into the wide plains which border the coasts, forming a large number of pretty scenes and valleys. The eastern and northern slopes, valleys and plains receive an abundant rainfall through all the year, while the regions on the other side of the mountains are often parched by drought. The mean temperature at San Juan ranges in different years from 78° to 82° F., the maximum on record being 99° and the minimum 57° F. The climate of the highlands, where the mean annual temperature is 72° F. or less, is very agreeable all the year, although it contains an excess of moisture at some points. (See also paragraph History for statement in regard to hurricanes.) This island is well watered. Streams are uncommonly numerous, and some of them are navigable for small craft near their mouths. On the north coast 17 rivers flow into the sea; on the east coast, 9; west of Cape Mala Pascua on the south coast, 16; on the west coast three, beside the outlets of several freshwater lakes. There are several falls of considerable size, the largest being Comerio and Rio Blanco falls. Harbors are those of San Juan, Culebra, in the island of Culebra (at both of which United States naval stations are established), Guanica, Hobos or Jovos, Guayanilla and Ensenada Honda.

Mineral Resources.—It is certain that large quantities of gold were found in the alluvium deposits during the early years of Spanish occupation; it seems probable, therefore, that lodes of gold-bearing quartz or conglomerate will be discovered in the central range from which the streams issue. A systematic geological and mineralogical survey is required. Casual explorations have shown the presence, in several places, of magnetic and specular iron in large quantity, especially in the eastern part of the island; copper, gold and silver, garnet, malachite, manganite, etc. Here, as throughout the Antillean regions (see CUBA and CENTRAL AMERICA), the older metamorphic rock and conglomerates, even on the summits of the mountains, are covered with limestone formations.

Flora and Fauna.—The island was once covered with a beautiful virgin forest, but unfortunately Forestry regulations, according to Robert T. Hill, have not been more wisely observed in Porto Rico than elsewhere in the West Indies; however, in the highlands the conditions, both in soils and climate, are favorable to vegetation. The trees, which are noteworthy on account of their size or beauty, are the several species of palms and tree-ferns, timber of Ceiba, several species of Alba, dobela, etc. Useful woods are the asuabo, cedar, aceitillo, mahogany, laurel, West Indian sandalwood, ebony and wily and a large variety of dyeing wood. Trees producing edible fruits and plants valuable medicinally are especially numerous. A species of Coffee, Macaúba, and Acalypha, are indigenous. There are no beasts of prey or wild animals of any kind, and unlike the Caribbees, or the tropical continent, Porto Rico is not infested by poisonous snakes and other noxious reptiles, though centipedes and the tarantula are not unknown. There is a large variety of bees. Birds are multitudinous and are noted both for their fine singing and beauty of their plumage; they include the canary-bird, humming-bird, mynah-bird, parakeet and quail. The lizards of the island are said to be closely allied to those of the Galápagos Islands (q.v.). Some of the rivers are well stocked with fish, and the fisheries, on the north coast especially, are valuable.

Agriculture, the Fruit Industry, etc.—Compared with that of the other West Indian islands, Porto Rico's agriculture is remarkably diversified, the chief products being sugar, tobacco, coffee, pineapples, grape fruit, oranges and other tropical fruits, sea island cotton, textile fibres, bat guano, phosphate and vegetables. The sugar crop for three years was as follows: 1915, 488,943 tons; 1916, 483,589 tons; 1917, 502,390 tons. Sugar exported in 1917 amounted to 488,943 tons, valued at $54,015,593, being over 40 per cent of all exports of the island. When the Americans occupied the island there were 250 sugar mills and about 20 centrals. The latter have been increased in number as well as in capacity, due to the protection enjoyed by Porto Rican sugar in the United States market, while the old-fashioned mills are gradually disappearing by their constant conversion into modern centrals. Next to sugar the tobacco industry takes the lead. But although the number of acres of land dedicated to tobacco has increased by tenfold during the last 20 years, and the quality has been much improved, it may be safely stated that the industry has not yet attained its full development. The cocoanut industry is also very promising; the farmers dedicate more land to it steadily, and better attention is paid to the selection of seed. At present hundreds of acres are dedicated to cotton, and much effort is being made by merchants of San Juan to encourage farmers to increase the acreage as well as improve the quality. There is a ginner from San Juan. Before the American occupation the oranges and pineapples of Porto Rico were famous for their flavor and sweetness, but they grew wild and in such small quantity that seldom were they exported. Since then, however, the fruit industry has undergone such a favorable change, that while the number of acres dedicated to oranges or pineapples has not been exactly estimated, yet the former are now shipped to the United States in large quantity and in 1917 more than $900,000 worth of pineapples were exported. It may be safely asserted that the fruit industry will be the future industry of this island, as roads are built and better transportation facilities are offered to shippers. Rice, corn, bananas and beans are also raised, but not in sufficient quantity for export trade. Cattle-raising is an important industry in the sugar plantations lying on the northern and eastern slopes.

Commerce.—The exports of sugar are given above under Agriculture. In 1917 210,390-365 cigars and 9,571,250 cigarettes were exported. Over 9,000,000 pounds of leaf and scrap tobacco, valued at $4,500,000, were exported in 1917. The coffee crop, which in 1916 amounted to 32,144,223 pounds valued at $5,049,283, reached 39,615,146 pounds in 1917 with a
value of $5,892,081. In the same year oranges to the value of $1,009,737 were exported; fresh pineapples to the value of $916,415; canned pineapples to the value of $139,765; grapefruit to the value of $393,677; and cocomanuts to the value of $438,504. The total imports of 1917 aggregated $3,545,224; domestic exports to foreign countries amounted to $7,855,693. United States goods to the value of $49,539,249 were shipped to Porto Rico in the same year and foreign merchandise to the value of $4,005,975. Porto Rican shipments to the United States in the same year were valued at $73,-
115,224.

Manufactures.—The chief industries of the island are manufactures of cigars, cigarettes, hats, embroiders, drawn-work, rum, etc. According to the last census there were on the island 939 industrial establishments, employing 18,112 persons, of whom 15,582 were wage-earners, having a total capital of $25,544,385, with an output valued at $3,749,742; of these there were 108 establishments connected with the sugar and molasses industry, employing 5,062 wage-earners and having an annual product valued at $20,559,000; there were 282 tobacco establishments employing 7,025 wage-earners, with annual products valued at $6,060,000. Other classes in order of their importance were bakeries and bakery products, boots and shoe factories, printing and publishing, lumber and timber products, etc.

Railways and Roads.—The undertaking to encircle the island with a railway dates from 1888. By 1892 there had actually been built 119 miles. There are now over 1,100 miles of road in the island and about 300 miles of railway. The railway system connects towns on the west coast and now almost encircles the island and penetrates the interior. A line is operated from Rio Piedras to Caguas inland. Extensions of existing lines are being undertaken and a route from Juan Ramón to Guajataca is projected. There are 80 post offices and 73 telegraph stations, 1,544 miles of postal telephone and telegraph wire. Passenger and freight lines connect Porto Rico with the United States, Cuba, Panama, France, Spain and other countries.

Finance.—The annual budget of the island has varied from three to four millions of pesos, aside from city budgets. This budget included from 1,250,000 pesos to 1,500,000 pesos which the Island contributed to the national expenses, under the subheads of Ministries of Colonies, War and Navy. In 1909 no appropriation bill was passed and Congress continued the appropriation of 1908.

The budget for 1898-99 (the first year under the home rule system) showed expenditures of 4,446,952 pesos and income of 4,792,500 pesos. The first budget under the civil government established by the Foraker Act was about $2,000,000 (expenditure); that of the year 1906 about $2,500,000 (expenditure). The main sources of revenue were customs and excise, general property tax, collateral inheritance tax, taxes on insurance companies and from various licenses and fees. The treasury statement of 1 July 1917 is as follows:

The bonded indebtedness amounts to $9,280,000. Porto Rico has had several currencies. The macuquina, which was introduced in the island as early as 1800 from Venezuela, was the legal tender up to 1857. This currency was very imperfect; it consisted of pieces of solid silver and copper, irregularly cut, bearing a poor imitation of the Spanish coat of arms and had a discount of 12½ per cent on the Spanish national currency. To withdraw the macuquina money the Spanish government sent to the island 1,350,000 Spanish pesetas, the island losing 215,400 pesos, which was necessary to cover the difference in value. In 1867 the island of Santo Domingo having gained its independence, its money, known as Calderilla, was brought to Porto Rico. The same year a royal decree allowed the free circulation of foreign money in the island, fixing a relative value on the basis of the Spanish legal tender. This measure brought abundance of money into the island. In 1879 a royal order made the Mexican peso the official currency, giving it a value of 95 cents American money; and another royal order in 1881 authorized its free circulation. In 1895 the government ordered the exchange of the Mexican money for what was called the "special currency"; 6,426,393 pesos were thus exchanged, at a cost to the island of $1,210,000 for receiving, transportation expense, etc. This special provincial money was finally exchanged for the American legal standard at a discount of 65½ per cent.

Banks.—These institutions were unknown in Porto Rico up to 1888, in which year the Spanish Bank (known now as the Porto Rico Bank) was organized, but not opening its doors until February 1890; capital 1,500,000 pesos, 750,000 paid up; in 1898 it had issued notes to the extent of $2,581,445; head office in San Juan. The Banco Territorial-Agrícola (Agricultural Bank) was established in July 1894; capital 2,400,000 pesos; head office in San Juan. The Banco Popular was also organized in 1894 with a capital stock of $384,000; head office in San Juan. The Crédito y Ahorro Ponceño (a savings bank) was organized in November 1894, with a capital stock of $200,000; head office in Ponce. American Colonial Bank was established in 1899 with a capital stock of $400,000; head office in San Juan, Puerto Rico, opened in 1902 with a capital stock of $100,000. Union Bank of Halifax, in San Juan, with a capital stock of $1,500,000, was established in August 1905. There are now 15 banks with a capital aggregating $2,250,000, deposits over $12,000,000.

Population.—On 14 Dec. 1910 the number
1 Porto Rican Tobacco Fields

2 Harbor of San Juan
of inhabitants was 1,118,012 (consisting principally of whites, mulattoes, negroes and Chinese). It is to be observed that while the census taken in 1887 shows a black population of 76,985, and that taken in 1897 reduces the figure to 75,894, the census of 1899 further reduces the figure to 59,990. If this decrease should continue for a number of years, the black race would eventually disappear from Porto Rico, unless there is an immigration of that race from the other West Indian islands in the future. This is the only island in all the West Indies where the white population is so overwhelmingly in the majority. At the last census there were 50,245 negroes and 335,192 mulattoes, 732,555 whites and 20 Chinese. In 1910 the colored population was 35 per cent of the whole. The estimated population in 1914 was 1,184,489. Of the working population 63 per cent are engaged in agriculture, fisheries and mining; 21 per cent in domestic and personal service; 8 per cent in manufacturing industries and 8 per cent in trade and transportation. The percentage of illiteracy which was over 83 per cent in 1899 has been reduced to 66.5 per cent. The white population was divided into three classes: (1) The aristocracy of the country, not seldom colonial branches of exiled families who owned estates in the villages or the countryside; (2) a peasantry plagued with anemia, the so-called jíbaro, of whom Mr. van Middeldyk says: "Intellectually the jíbaro is as poor as he is physically. His illiteracy is complete." But the jíbaro, it must be admitted, has had his day. The Spaniards who took advantage of their ignorance, reducing them to a sort of serfdom worse than slavery, have made them what they are to-day, a physically degenerated class with no ambition whatsover. They are, however, naturally genial and generous and once they have gained their confidence, dispelled their mistrust, they are most hospitable and loyal. Above all they love peace and fear the law. Education, which they never had a chance of getting, and the development of the inferior, will improve their way of living, awake their dormant intellect and redeem them from their present debased condition.

The members of the first class who were rich and could receive a liberal education went to Europe or the United States, where they would become lawyers, physicians, engineers, etc., and return to their country to practise their profession. Those who were poor were compelled to remain home, contented with what knowledge could be acquired in a very reduced number of public schools, a normal school and a high school in San Juan (where the degree of bachelor of arts could be obtained); the second and third classes did not receive any education at all, except in rare cases, no efforts being made by the government to raise the standard of education either by making it compulsory or by furnishing sufficient public schools, the number never exceeding 124 and the system being extremely antiquated.

Education.—In 1899 only 16 or 17 out of 100 Porto Ricans could read and write. Under the new government the number of schools was increased to 1,104; local authorities were required to provide suitable school buildings; primary instruction was made compulsory; and existing institutions of higher education were supplemented by normal, trade and high schools. In 1917 there were 1,666 school buildings, with 115,000 pupils enrolled; and a well-distributed system of night schools and kindergartens. There are also a number of private schools. The University of Porto Rico, established in Rio Piedras, near San Juan, is co-educational. There are 41 school districts on the island, each under a supervising principal, who is appointed by and represents the Commissioner of Education. There are local school boards of three elected for terms of four years by popular vote.

History and Government.—On 19 Nov. 1493 Columbus landed on the western coast, and named the island San Juan Bautista. On 14 Aug. 1509, Juan Ponce de Leon, who had discovered gold on the island, was appointed governor by King Ferdinand. The natives, who called their island Borinquen, and had chiefs of their own, were enslaved and forced to work for the placer deposits on the south shore. The Indians in the towns; (3) a peasantry plagued with anemia, the so-called jíbaro, of whom Mr. van Middeldyk says: "Intellectually the jíbaro is as poor as he is physically. His illiteracy is complete." But the jíbaro, it must be admitted, has had his day. The Spaniards who took advantage of their ignorance, reducing them to a sort of serfdom worse than slavery, have made them what they are to-day, a physically degenerated class with no ambition whatsover. They are, however, naturally genial and generous and once you have gained their confidence, dispelled their mistrust, they are most hospitable and loyal. Above all they love peace and fear the law. The members of the first class who were rich and could receive a liberal education went to Europe or the United States, where they would become lawyers, physicians, engineers, etc., and return to their country to practise their profession. Those who were poor were compelled to remain home, contented with what knowledge could be acquired in a very reduced number of public schools, a normal school and a high school in San Juan (where the degree of bachelor of arts could be obtained); the second and third classes did not receive any education at all, except in rare cases, no efforts being made by the government to raise the standard of education either by making it compulsory or by furnishing sufficient public schools, the number never exceeding 124 and the system being extremely antiquated.
Sept. to 2 Nov. 1625 San Juan was besieged by a Dutch fleet; landing was effectuated, but the besiegers were compelled to withdraw with heavy losses. The city was under the command of Don Juan de Haro. From 1640 to 1780 expeditions were equipped in Porto Rico for the long struggle with the buccaneers. In 1702 some English troops landed at Arecibo, but were driven from the island by Captain Correa. On 17 April 1797 an English fleet, 15 ships and several transports, under Admiral Harvey, with troops commanded by Sir Ralph Abercromby, numbering over 6,000 strong, appeared before San Juan; the city was under the command of Don Ramon de Castro, who gathered with him among regulars, militia and volunteers, about 4,000 men. The forts were manned by Frenchmen, then the allies of the Spaniards. The invading force landed back of the city by the place known as Caigo, and marched on to the city, but before they came to the San Antonio bridge, they met such strong resistance, both from the infantry and artillery on the forts, that they were compelled to reembark, apprehending an attack from the rear, which had been laid to both in vain; the last men. The ineffectual siege was maintained only 15 days. This attack and that made by the Dutch in 1625 are perhaps the most important events in the history of the island since the conquest from a military standpoint. To the city, as a reward for gallant resistance at this time, was granted the privilege of adding the words "very noble and very loyal" to its coat-of-arms. Loyalty was strikingly evinced early in the following century. On 20 Dec. 1819, in February 1825 and November 1829 expeditions from Colombia landed in Porto Rico, to encourage the inhabitants to rebel against Spain; they were not welcomed. Nevertheless, in 1837, Porto Rico was deprived of the right of representation in the Spanish Cortes, which she had since 1808, as a result of the advent of Ferdinand VII to the throne. During half a century the captains-general as a rule favored a systematic demoralization of the common people. "While they dance and gamble, they will not conspire," said a soldier. As a means to this end, the government encouraged the demoralization by promoting and giving good offices to those of the natives who would be traitors to their country by denouncing imaginary conspiracies and revolutions. But one fact about this little people is that, while they feel proud of their Spanish ancestry, yet neither money nor threats could ever win an intellectual Porto Rican to serve the cause of tyranny. On 20 Sept. 1858 the "insurrection of Lares" broke out—an insignificant rising, quickly suppressed. The plan was to follow Cuba, which island was then struggling to throw off the Spanish yoke. Dr. Beances, the leader of this movement, escaped to the neighboring island, and then went to live in exile in Paris where he died some 30 years later, never forgetting his little island, and never forgotten by those whom he once dreamed he could free. As one result of the revolution of that year in Spain and the subsequent establishment of the republic, Porto Rico was again placed under military government and representatives to the Cortes. On 22 March 1873 the slaves in Porto Rico were manumitted, 31,000 receiving freedom in a single day. The slaveholders were paid in government bonds, which a foreign syndicate bought up at 15 per cent. Then followed a wave of political unrest with the restoration of the monarchy, marked by abuses of all kinds committed by the officials sent by Spain. By this time, 1873-74, political parties were organized following the line of the Cuban reform party and later (1886) the Home Rule party. This movement on the part of the Porto Rican patriots brought about in 1887, under General Palacios, what is called the "Compontera," when the people were tortured by the mounted police (Guardia Civil), and the most honorable citizens were thrown into the dungeons of "El Morro" and barely escaping being shot. This is perhaps one of the darkest periods of the colonial history of the island. By the end of 1896 the Porto Ricans again began to feel the influence of the Cuban ideas, and the western part of the island showed a disposition to revolt, and might have done so if some one of the Porto Ricans who had gained honor and renown in the Cuban War had landed to lead them. But as a rule the Porto Ricans are a peace-loving people; and the Porto Ricans were not to gain what liberties they could bargain from Spain by means of the press and other means of propaganda, rather than resort to arms. It was about this time that some prominent citizens of Porto Rico, Camuy were imprisoned and tortured, and everything indicated that the horrible scenes under General Palacios were to be once more repeated under General Sabas Martin. It was now, however, too late for this, for although the Spaniards never doubted that they would ultimately come out victoriously from a conflict with the United States, nevertheless a little apprehension as to the future made them more humane and cautious in their treatment of defenseless Porto Ricans. On 25 Nov. 1897 the royal decrees conceding autonomy to Porto Rico was signed.

After 400 years of a military government of a most absolute character, Porto Rico finally secured what is called an Autonomic Constitution, which gave the island a Parliament consisting of a governor, 45 legislators, 45 whom were elected by the people and seven appointed by the Crown; and a lower house, consisting of one representative for every 25,000 inhabitants. The system also provided for a body of five ministers,—Minister of Justice and State (Gracia, Justicia y Gobernanza), of Finance, of Education, Public Works and Roads, and of Agriculture, Industry and Commerce,—appointed by the governor, thus practically providing for the separation of the three powers. The power of veto was retained by the government at Madrid. It has been asserted by the natives that this measure of home rule fully satisfied their ambition. Notwithstanding it has often been set up against this law that it was not in good faith, and was not to stay, being only a measure of war and a trick of Spain to induce the Cubans to lay down their arms. It is probable that the law was so intended; those, however, who so speculate seem to forget that colonizing nations never granted any degree of liberty to their colonies, except they were compelled to by the force of circumstances; but no one will question the fact that once Spain had granted to her colonies in America a liberal
form of government, she could never have been able to restore on this side of the ocean her 16th century régime. This self-government, however, was of short duration, for a few months after the elections, 21 April 1898, Gover-
ner-General Macias suspended the constitu-
tional guarantees and declared the island in a
state of war. On that day war began between the
United States and Spain, though not for-
mally declared until the 20th. On 12 May
1898, the capital was bombarded by Admiral
Sampson, only a few buildings being damaged
and probably a dozen casualties. On 25 July
1898 American forces occupied Guanica; three
days later Ponce; on 10 August skirmishes took
place at Hormigueros and Guamaní, on the west
and southeast parts of the island, and on 12
August at Las Marias, on the west, and near the
Asomante, on the Ponce road. On 12 Aug.
1898 the protocol was signed providing for the
cessation of Porto Rican life and judicial branches,
the United States; 18 Oct. 1898 the last of the Spanish
troops to sail embarked for the peninsula; the
forces of the United States occupied San Juan,
Mag.-Gen. John R. Brooke taking up the duties
of military governor. His successors in that
office were Maj.-Gen. W. F. Henry, and 18 May
1899, Brig.-Gen. George W. Davis. This government is noted in the his-
tory of Porto Rico for its mildness and wis-
dom. On 8 Aug. 1899 a hurricane, accompanied by
eccentric rainfall, devastated the island, 3,360
persons being killed outright, while thousands
died from starvation. The army distributed
32,000,000 rations to the sufferers. Disasters of
this nature have befallen Porto Rico, although
probably never so severe, more than 20 times
since the year 1515, occurring most commonly
in July, August and September. On 12 April
1900 an act of Congress required that there
should be established for Porto Rico a modified
territorial form of government, consisting of
executive, legislative and judicial branches, with
the benefit of such government a tariff of 15
per cent was imposed on imports from the
United States into Porto Rico, and vice-versa.
On 1 May 1900 civil government was inaugu-
rated, having the following features: Gover-
nors appointed by the President of the
United States; legislative assembly, consist-
ing of an executive council or senate appointed
by the President (six Americans and five Porto
Ricans), and a house of delegates (35 mem-
bers elected by the people); judiciary, includ-
ing Supreme and United States District Courts.
The first governor was Hon. Charles H. Allen.
His successor, 15 Sept. 1901, Hon.
William H. Hunt; 25 July 1901 the President pro-
claimed the collection of tariff duties begin-
1901 the Supreme Court of the United States decided
that Porto Ricans were not ipso-facto citizens of the
United States. In December 1902 the in-
sular treasury had on hand a considerable
balance from revenues produced by the system
of local taxation enacted by the legislative
assembly. On 4 July 1904 Beckman Winthrop
took the oath of office as governor; followed by
George R. Colton. Mr. Colton was suc-
ceded by A. Yerger in 1913. The present
constitution is determined by the "Organic Act" of
1916, the main features of which are the
granting of American citizenship to the people of
Porto Rico, the separation of the legislative
and executive departments, extension of the ap-
pellate judiciary system and an elective senate.
The franchise is restricted to citizens of the
United States 21 years of age or over, residence
of one year and such additional qualifications
as may be prescribed by the legislature, but no
property qualification may be imposed.
The governor is appointed by the President of
the United States. The senate is composed of 19
members and the house of representatives of
39 members. The island is represented in the
United States Congress by a resident commis-
sioner elected for four years. Six heads of
departments form a council to the governor.

There are two political parties in Porto Rico,
both working to change the status of the island;
one, which is called the Republican party, with
a marked tendency for Americanization, wants
the island to become a State of the Union, and
the other, the Unionist party, with a platform
advocating either home rule under a colored
government, statehood or independence.
In one point both parties agree, and that is that
the upper house, which is now appointive,
should be elective, at least a majority of it.

Literature. History, Arts. Porto Rico has a
considerable literary history. It is hard to define
intense or varied, but it has originality. Poets:
The natural beauty of the country, its exuber-
ance, and the despotism to which it has been
subjected, have fostered poetic production, the
genre of literature more successfully cultivated.
Among the poets who flourished between the
years 1860 and 1880 are José Gauthier Benitez,
of exquisite sensibility, a Lamartinean melanch-
oly and a rare sense of beauty; and José G.
Padilla, better known as the "Caribe," a brave
heart, who gave vent to his patriotic indignation
in vigorous and well-rhymed stanzas. Deca-
dence set in after the death of these two poets.
There are, however, some younger poets of
considerable talents, among who may be men-
tioned J. de Diez, Lola Tio, R. del Valle, J.
Gordil, Negro Sanjurjo, F. Cestero, E. del
Toro, Negron Flores, and F. G. Marin who
was killed in Cuba fighting for the cause of
liberty. Historians (local): By the middle of
the 19th century Alejandro Tapia published his
"Biblioteca Historica de Porto Rico," and J.
Julian Acosta published a revised and com-
mended edition of the "History of Porto Rico"
by Fray Ignacio Abbad; and among the contem-
porary authors we have Salvador Brau and
Drs. Stahl and Coll. Orators: Manuel Cor-
chado, who died while still young (1840-84),
has been perhaps the most eloquent orator pro-
duced by Porto Rico. His brilliant speeches in
behalf of the liberties of his country are still
remembered. He was also a poet and writer.
Among the orators of the day are J. Hernandez
Lopez and R. Matienzo Girtron, both powerful
and brilliant, good specimens of the best parlia-
mentary speakers, and Alvarez Neva, a power-
ful forensic orator. Journalism. This was the
means chosen by the Porto Ricans to contest
the Spanish oppression from the middle of the
19th century. This journalism, however, is not
as it is understood in the United States; it is
more of doctrinal and polemic character; but
reporting is gradually creeping in, and we may
say that the influence of modern Porto
Rico is nowhere better manifested than in
the field of journalism. Among the ablest news-
paper men of the day are L. Muñoz Rivera, Dr.
Zeno G. Gandoa, Manual Rossy and Matos Bernier. Music: The higher order of music is not cultivated in the island, so far as production is concerned; the composers of “danza,” a dancing piece, a sort of a rondó andante which, being exceedingly graceful and melodious, evinces better than anything Porto Rican the nature and sensibility of this people. Painters: Campeche and P. Oller.

PORTO RICO, University of, an institution for the promotion of higher education, created by an act of the insular legislature which was approved 12 March 1903. The president of its board of trustees writes that one of the first acts of the army officers during the occupation of the island by military forces of the United States at the close of the Spanish-American War was the establishment of a normal school. (For the need of instruction, and of teachers to give it, see Porto Rico: Population and Education.) That school was located at Fajardo on a site of 80 acres given for the purpose by the citizens of that town. It is evident, however, that a more central location was required, and, therefore, in 1901 the school was transferred to Rio Piedras. When the university was founded (1903) the normal school with its land, etc., passed under the control of the university board of trustees and became the first department of that institution to be put into full operation. In its building and equipment the normal department has enjoyed the liberality and interest of the people of Porto Rico. Its growth has been steady. At the April 1913 meeting of the board of trustees of the university resolutions were passed providing a college of pharmacy, university high school and extending the course of the college of liberal arts to four years, giving authority for the granting of the degree of bachelor of science or bachelor of arts upon the satisfactory completion of this course. The college of liberal arts had, indeed, been legally constituted since 1911, but no particular effort had been made to attract students. The president of the University of Porto Rico states that the act of 12 March 1903 vested authority in a board of trustees composed of 11 members; that the bond of connection between this new university and the Department of Education was preserved through the appointment of the commissioner of education as president of the board of trustees and chancellor of the university; and that “except for this connection, the university is an independent and separate department of the insular government.” The same act gave the board of trustees power to establish new departments and the right to confer degrees. Subsequently the number of members of the board of trustees was reduced from 11 to 7, the governor appointing four while the remaining three, namely, the commissioner of education, the treasurer of Porto Rico and the speaker of the house of delegates, are ex officio members. The work of that department known as the college of agriculture and mechanic arts, at Mayaguez, was begun in 1912. Consult Annual Reports of the Governor of Porto Rico (in Annual Reports, War Department, Washington).

PORTO RICO EXPEDITION, Military and Naval Society of the, an association projected at Caguas, Porto Rico, 11 Oct. 1898, and formed at Columbus, Ohio, 5 June 1900, to bring into permanent relationship the men connected with the military and naval forces during the Spanish-American War which led to the acquisition of Porto Rico by the United States. There are three classes of members, active, associate and honorary. The active members comprise those officers and enlisted men in any branch of the United States service who accompanied the Porto Rico expedition and were on the island on or before 18 Oct. 1900, the day when the American flag was raised over the Capitol at San Juan. The associate members are those soldiers or sailors of good reputation who were attached to organizations or vessels which composed the expedition but who, through sickness, disability or by assignment to other duties, were detained in the United States and failed to actively participate in the expedition. Members of the Red Cross, Red Men, nurses and others who served with the army in Porto Rico may also become associate members.

PORTO SANTO, pôr‘too sân' too, one of the Madeira Islands, 26 miles northeast of Madeira (q.v.). Its area is about 20 square miles. It is six to eight miles in length, two to
three in breadth and not more than 500 feet above sea-level, though the surface is rugged and hilly. It is of volcanic origin, and almost destitute of trees. The soil is poor; the only productions are limestone, maize, barley, vegetables, a few fruits and a poor kind of wine. Its capital, La Vilha do Porto Santo, on a handsome bay with a good harbor, protected by a battery, is frequented by vessels going to and from the Cape of Good Hope. Pop. of island about 1,600.

PORTOBELLO, pôr-tô-bêl’ô, Scotland, a suburban watering-place of Edinburgh, three miles to the east, on the Firth of Forth. Its first house was built in 1742 by one of Admiral Vernon’s officers, in the expedition against Puerto Bello, whence its name, but its progress dates like that of its east extension, Joppa, from 1804. It has some manufactures of glass, pottery, bricks, etc., and is fully equipped with the usual accompaniments of a popular summer sea-bathing resort.

PORTOVIEJO, pôr-tô-vé-â-hô, Ecuador, the administrative seat of Manabi Province, 100 miles north of Guayaquil. It was founded in 1534, and was frequently captured and destroyed by buccaneers. It has manufactures of straw hats.

PORTRAIR. See Painting; Photography.

PORTSMOUTH, pôr’tsmôth, England, the principal naval station of Great Britain, a seaport and municipal and parliamentary borough, in Hampshire, on the southwest extremity of Portsea, 68 miles southwest of London by rail. The island of Portsea is bounded on the east by Langston Harbor, on the west by Portsmouth Harbor, and on the south by the roadstead or channel of Spithead, across which is the Isle of Wight; it is separated from the mainland by a narrow creek called Porthbridge Canal. It consists of the four districts. Portsmouth proper, Portsea, Landport and Southsea, these being now more extensive than the towns to which they belong. The towns, united so as to form a fortress, are protected by some of the most extensive modern systems of fortifications, which have replaced the former moats, walls, and ramparts, entered by four gates, one of them designed by Inigo Jones. Landport and Kingston are adjacent to Portsea on the north, and Southsea, on the east side of the town of Portsmouth. The two first-named districts are for the most part occupied by artisans connected with the royal naval dockyard in Portsea. A fine park, the Victoria, is in a conveniently central situation. Southsea is one of the favorite English seaside resorts. Its situation commands fine views of the anchorage at Spithead, and of the Isle of Wight. Southsea common, which extends down to the beach, forms a fine public recreation ground, and on it troops from the depot of Portsmouth are often assembled for field days and reviews. Southsea Castle with its adjacent earthworks, the batteries of the Gosport side, and the circular forts in the roadstead, command the entrance to Portsmouth Harbor. The town of Gosport on the opposite side of the harbor entrance is connected with Portsmouth by a floating bridge ferry.

The best street in Portsmouth is the High street, which divides the town into two nearly equal parts and contains the principal shops, hotels and places of business. The prominent public buildings include Government House, the splendid new town hall opened in 1890, the post office, the grammar school, Athenaeum, Theatre, hospital, Sailors' Home, Central Railway station, the parish church (Saint Thomas à Becket's), built about 1170, the Roman Catholic cathedral with schools adjacent, the Presbyterian Church, the Independent Chapel in King street, and numerous other places of worship.

The royal dockyard, which has been extended by the addition of new docks and basins, covers an area of about 500 acres. It is enclosed by a wall 14 feet high, and entered by a lofty gateway. It includes vast storehouses, machine shops, extensive slips and docks, ranges of handsome residences for the port-admiral and other officials, etc. Outside the dockyard an area of 14 acres contains the gunwharf, where vast numbers of guns and other ordnance are kept. Another is an armory with 25,000 stand of small arms.

Portsmouth has no important manufactures except those connected with its naval establishments, and a few large breweries. Its trade, both coasting and foreign, is of considerable extent; the former consisting chiefly of coals from the Welsh and Newcastle coal fields, cattle and sheep from the Isle of Wight and the west of England, and large quantities of corn and provisions from Ireland; and the latter of wine from different parts of the Continent, eggs from France, and timber from the Baltic.

Portsmouth is mentioned in the Saxon Chronicle as existing in 501. It appears to have taken the place of Porchester, which as Portus Magnus had been selected by the Romans for a naval station, but became unfit for its purpose in consequence of the siltting of the harbor. During the reign of Alfred a fleet of nine ships fitted at the port defeated the Danes, who had long infested the coast; and immediately before the Conquest a large fleet was sent out to intercept the Norman armament. About 1256 Henry III assembled an army here for the invasion of France. In 1377 Portsmouth was attacked by the French, who succeeded in burning a part of the town. This disaster appears to have shown the necessity of fortifying the place, and the works, commenced by Edward IV, were much improved and extended during succeeding reigns. The town was taken by the Parliamentarians in 1642. The Royal George battleship in one piece over and sank in Portsmouth Harbor, drowning nearly 1,000 persons. Pop. about 231,141.

PORTSMOUTH, N. H., city, one of the county-seats of Rockingham County, on the Piscataqua River near its mouth, and on the Boston and Maine Railroad, 57 miles north of Boston. It was first settled in 1623 by a company under the name of Orendo Gorges, and was under the jurisdiction of Massachusetts until 1679, when New Hampshire became a separate colony. It was incorporated as a town in 1653, when it received the name of Portsmouth, and became a city in 1849. It was the capital of the State for some time, and is now
alternately with Concord the seat of the sessions of the United States District Court of New Hampshire. It is built on a peninsula and has an excellent harbor, deep, well sheltered and always free from ice; it is the only seaport in the State, yet has practically no foreign commerce, but a considerable coasting trade, particularly in coal. Over 1,000,000 tons of coal are shipped annually to Dover, Concord, Manchester and other inland cities. The harbor is protected by earthworks at Jaffrey's Point and Gerrish's Island. The manufacturing establishments are important; they include boot and shoe factories, cotton mills and marble works, button works, tanneries, foundries, oil refineries, lumber yards. Shipbuilding was formerly an important industry, and small vessels are still built. The industrial output of the city is valued at $3,000,000 yearly. It has railroad and trolley connection with York Beach, Hampton Beach, and other popular summer resorts; and, in the summer, daily steamboat connection with the Isles of Shoals. It is a quiet city and old-fashioned in appearance, containing many colonial houses of historic interest, chief among them is the Wash- worth house, the Warner house, the Moffatt house, the Pierce mansion and the Langdon house. Other buildings of note are the Saint John's Church, the North Congregational Church, the Federal Custom House, the Athenæum, the Rockingham County courthouse, the Portsmouth Hospital, the three national banks, two savings banks and the trust company. The latter has a library of over 25,000 volumes, and there is also a public library of 20,000 volumes. The city contains a Home for Indigent Women, a Home for Children and other charitable institutions. The navy yard, which is officially known as the Portsmouth navy yard, is situated on an island of the Piscataqua (formerly known as Pemiquid's Island), within the limits of the town of Kittery, Me. It has large dry docks and in the days of wooden ships many were built here including the Ranger and the Kearny. For many years the historic frigate Constitution was kept at this navy yard, until taken to Charlestown. In the late 18th century prisoners from Cervera's fleet were brought here and given comfortable quarters on a small island connected with the navy yard island. The treaty ending the Russo-Japanese War was negotiated at Portsmouth in the Peace Building, on Leavitt's Island. There are three public parks, Langdon, Haven and Goodwin. There is a statue of General Porter in Haven Park and a Soldiers and Sailors' Monument in Goodwin Park. There is also a large public playground. The city government is vested in a mayor, who holds office for a year, and a legislative council. The police commissioners are appointed by the State. The waterworks are under municipal management. Pop. 11,602. The city claims among her illustrious sons Gov. John Wentworth, Gov. John Langdon, Tobias Lear, the private secretary of George Washington, Benjamin P. Shillaber, James T. Fields, Thomas Bailey Aldrich and Gen. Fitz John Porter.

PORTSMOUTH, Ohio, city and county-seat of Scioto County, at the confluence of the Scioto and Ohio rivers, at the southern terminus of the Ohio Canal, and on the Chesapeake and Ohio, the Baltimore and Ohio, the Norfolk and Western, the Chesapeake and Ohio Northern and the Ohio Valley Traction Line railroads, about 80 miles north of Columbus, and 107 miles east by south of Cincinnati. It has steamboat connection with all the Ohio River ports. It was settled in 1803 and in 1814 was incorporated. It is in an agricultural region, and the chief products are consisting of fire-clay. It is the commercial centre of an extensive mining and manufacturing section. The chief manufactures of the city are steel mill products, foundry and machine-shop products, paving and building brick, fire-brick, cars, lumber products, stove ranges, beer, rectified spirits, paper boxes, wagons, carriages, furniture, veneer factory products and boots and shoes. The invested capital in manufacturing plants is $7,500,000; and the value of the products aggregates $10,000,000 yearly. The principal public buildings are the government building, county courthouse, municipal buildings, some of the business blocks, the church and educational buildings. It has a city hospital, homes for old ladies and orphans. The educational facilities are the West- worth house, the Warner house, the Pierce mansion and the Langdon house. Other buildings of note are the Saint John's Church, the North Congregational Church, the Federal Custom House, the Athenæum, the Rockingham County courthouse, the Portsmouth Hospital, the three national banks, two savings banks and the trust company. The latter has a library of over 25,000 volumes, and there is also a public library of 20,000 volumes. The city contains a Home for Indigent Women, a Home for Children and other charitable institutions. There is a statue of General Porter in Haven Park and a Soldiers and Sailors' Monument in Goodwin Park. There is also a large public playground. The city government is vested in a mayor, who holds office for a year, and a legislative council. The police commissioners are appointed by the State. The waterworks are under municipal management. Pop. 11,602. The city claims among her illustrious sons Gov. John Wentworth, Gov. John Langdon, Tobias Lear, the private secretary of George Washington, Benjamin P. Shillaber, James T. Fields, Thomas Bailey Aldrich and Gen. Fitz John Porter.
PORTSMOUTH, Treaty of — PORTUGAL

PORTUGAL, pórtu-gal (Port. pór-too-gal’), the southwestern-most republic of Europe, on the Iberian or Pyrenean Peninsula, between Spain and the Atlantic Ocean. The Portuguese title is República Portuguesa. No natural boundaries separate Portugal from Spain, except on a small part of the frontier, the Minho River forming part of the northern boundary, and the Guadiana River part of the southeastern. The shape of Portugal is nearly that of a parallelogram. Its greatest length north to south, is 335 miles, greatest breadth 138 miles, extending respectively between latitudes 36° 55′ to 42° 7′ N., longitudes 6° 15′ to 9° 30′ W. The territory is divided into the three provinces of Minho, 2,793 square miles; Trás-os-Montes, 4,163 square miles; Beira, 9,208 square miles; Estremadura, 6,937 square miles; Alemtejo, 9,219 square miles; Algarve (Faro), 1,937 square miles; and, with the insular provinces, comprizing the Azores, 922 square miles; and Madeira, 314 square miles, gives a total area of 35,490 square miles for the republic; but this does not include the colonies noted below. The only large cities are Lisbon (q.v.), the capital, and Oporto (q.v.), the chief port. Setúbal, Funchal (Madeira), Braga and Coimbra have each over 20,000 population.

Colonies.—Besides the Azores and Madeira islands, mentioned above, the Portuguese African colonies are 823,334 square miles in area, with an estimated population of over 8,000,000. The largest of these is Portuguese East Africa, formerly called Angola; nearly as large is Portuguese East Africa (q.v.), formerly called Mozambique. There are also the Cape Verde Islands (q.v.), Portuguese Guinea (q.v.), Princeps (or Prince’s) and Saint Thomas islands. Their Asiatic colonies of 8,933 square miles have an estimated population of 950,000. Goa, Damio and Timor in India, and Macao Island and some small islands in the Indian Archipelago complete the other dependencies.

Topography and Physical Features.—The coast-line, of great length in proportion to the extent of the whole surface, lies mainly north and south on the Atlantic, but extends some 50 miles westward to Cabo da Roca, the most westerly point of the peninsula and of continental Europe. Here it becomes somewhat irregular, forms two bays—that of Lisbon and that of Setúbal—by the interjection of the remarkable promontory which terminates in Cape Espichel, and again curves round in a south-southwesterly direction till it reaches Cape Saint Vincent, where it suddenly turns east. This direction it retains to its termination at the mouth of the Guadiana. It is occasionally bold and rises to a great height, particularly at Cabo da Roca, where it presents a range of precipitous cliffs; but for the greater part is low and marshy, and not unfrequently covered with small streams and reefs, which make navigation dangerous. It is indented by some 21 harbors; the only ones of importance, either from their excellence or the trade carried on at them, are those of Lisbon, Oporto, Setúbal, Faro, Figueira, Aveiro and Vila Nova. The interior is generally mountainous, a number of ranges stretching across the country, either in west, southwest or south-southwest directions, forming a succession of independent river basins, while their ramifications, penetrating in all directions, form

PORTSMOUTH, Treaty of. The treaty of peace signed 5 Sept. 1905 at the navy yard, Portsmouth, N. H., which ended the Russo-Japanese War 1904-05. At the close of 16 months of war between Russia and Japan over the former nation’s occupation policy in Manchuria (q.v.), President Roosevelt in the early part of May 1905 made known his sincere belief that the time had come for the two belligerents to end the war and conclude peace. In accordance with these proposals Russia and Japan named their plenipotentiaries, who were sent to the Portsmouth, N. H., navy yard, which had been selected as the place of conference, and on 10 August the negotiations were begun. On 29 August an accord was brought about, the treaty signed by the plenipotentiaries on 5 September, and approved by the emperor of Japan and the tsar of Russia on 14 October to take effect on the 16th. Japan consented to yield some of the Manchurian territory won and Russia consented to Japanese supremacy in Korea. Incidentally, owing to racial sympathies and because of the prestige gained, Japan attained supremacy in Chinese affairs. See CHINA; Japan — Russo-Japanese War; Russia — History.
the watersheds of numerous subsidiary streams and enclose many wild and beautiful valleys. The loftiest range is the Serra da Estrela, which may be considered as a continuation of the mountains along the coast from Old and New Castle, and between Leon and Estremadura. Near the town of Guarda it forms a sort of fork, one limb of which proceeds north and another southeast, while the main chain, running southwest, attains its terminal point of 6,337 feet about five miles west of the town of Covilhão, and ultimately terminates in the lofty cliffs of Cabo da Roca. Nearly parallel to this chain, and at no great distance from it, are on the north the Serra de Alerce, and on the south the Serra Moradal. In the north branches or continuations of the Spanish mountains enter Portugal, and attain heights of 4,740 feet in Peneda, and of 5,180 in Larouco. At the opposite extremity the Serra Monchique, stretching across the country at a short distance behind the south shore, attains at its western extremity in Mount Poia, the height of nearly 3,000 feet. The rugged nature of the surface makes the plains both few in number and of limited extent, but many valleys equally remarkable for beauty and fertility occur. The chief plains are those of Almeda and the Terra de Bragança, the former in the province of Beira and the latter in that of Tras-os-Montes; the chief valleys, those of Chaves, Villarica and Besteiros.

Hydrography.—No rivers of importance take their rise in Portugal, and yet few countries in proportion to their extent are better supplied with large and navigable streams. The Minho in the north, forming the boundary between Spain and Portugal in the lower part of its course; the Douro, first skirting the east frontier and then pursuing its course west to its mouth at Oporto; and the Tagus, all flow east to west; the Guadiana is the only large river of Portugal which deviates from the general west-east direction, and flows mainly south, forming part of the boundary line with Spain. In addition to these rivers, for which Portugal is indebted to Spain, the purely local rivers are the Vouga, Mondego and Sado. Numerous small lakes are scattered over the plains and among the mountains, both in the valleys, especially those of sardine and tunny, and of considerable commercial importance, giving employment to about 45,000 people. The yearly catch is worth $3,000,000.

Geology and Mineral Resources.—The nucleus of the mountains is usually granite, overlain in the north by micaceous schist and other metamorphic rocks. Crystalline rocks and Palaeozoic formations (especially Silurian) occupy about two-thirds of the surface, but the Jurassic, the Cretaceous and various Tertiary formations are also represented in the more southerly parts of the country. Volcanic formations are very apparent in the Serra de Caldeirão, forming a continuation of that of Monchique. The mineralogical treasures seem moderate, but the gold found in the socalled peasan proprietors is of the highest value, though some are, and many more it is supposed might be, worked to advantage. They include argentiferous lead, copper, iron, cobalt, bismuth, antimony, fine marble, slate, salt peter, lithographic stones, mill-stones and porcelain earth. Some gold also is washed from the sands of the Douro, Mondego and other streams, and in several serras, particularly those of Estrela and Gerez-Larouco; and many valuable pebbles and rock-crystals are found in a great number of places. Large quantities of salt are formed in bays along the coast by natural evaporation; there are numerous salt marshes; and over 200 mineral springs, mostly impregnated with sulphur.

Climate.—The climate is greatly modified by the proximity of the sea and the height of the mountains, the former tempering the excessive heat of summer by refreshing breezes and the latter making the winter more rigorous than usual in countries under the same latitude. In general, however, winter is both short and mild, and in some places never completely interrupts the course of vegetation. In consequence of this many parts of Portugal enjoy the benefit of a double spring. Early in February vegetation is in full vigor; the plants shoot forth rapidly, attain maturity and either wither away or if of economical value are gathered and harvested. During the month of July the heat is often extreme, and, rain seldom falling, the whole country, particularly at its lower levels and along the coast, assumes a very parched appearance. The drought generally continues through-out August and far into September; but at last the sky, which had previously been serene, becomes overcast and copious showers descend. The second spring now begins, and the fields again become covered with flowers and verdure. Winter begins at the end of November. In the mountainous districts the loftier summits obtain a covering of snow and retain it for a greater or less period according to their altitude; but in all the country south of the Douro, and at a moderate elevation, snow generally soon melts away. The mean annual temperature in the north of Portugal is about 50° F., and of the south 65°. Deluges of rain, however, continue to fall, with occasional violent hurricanes and thunderstorms. Shocks of earthquake are sometimes felt, particularly in the vicinity of the metropolis, where those of 1755 were overwhelmingly disastrous.

Forestry, Flora and Fauna.—Many of the mountains are clothed with fine forests, chiedy pines and cedars, in both the fisheries, especially those of sardine and tunny, and of considerable commercial importance, giving employment to about 43,000 people. The yearly catch is worth $5,000,000.

Landscape, Agriculture, and Stock-Raising.—The country north of the Douro and the Beira lowlands is of low fertility, and is correspondingly poor in stock. To the south, however, the land is more fertile, and the people are farmers, and a considerable part of the country west of the Tagus is also primarily agricultural. The chief product is corn, the chief cereal, and a great deal of small cattle is raised, together with pigs, sheep and goats. The country is rich in minerals, and the most important are iron, copper, lead, antimony, zinc, silver, gold, and precious stones. The country is also rich in timber, and the forests are well stocked with oak, chestnut, and beech. The climate is mild, and the soil is well adapted to agriculture. The chief crops are wheat, barley, and rice. The country is also rich in minerals, and the most important are iron, copper, lead, antimony, zinc, silver, gold, and precious stones. The country is also rich in timber, and the forests are well stocked with oak, chestnut, and beech. The climate is mild, and the soil is well adapted to agriculture. area being in cereals or grass and 7 per cent in vineyards and fruit orchards, 17 per cent under forest and 43 per cent is waste land. Barley and rye are important crops in the north, elsewhere wheat and maize are of more importance. In swampy localities some rice is grown great. The production in 1916 was: wheat, 7,115,790 bushels; rye, 2,676,107 bushels; oats, 3,189,078 bushels; barley, 1,158,461 bushels; beans, 1,102,401 bushels; potatoes, 1,709,527 hundredweight. In non-edible chief products are maize and oxen, in the central region, wheat and maize and in the south, wheat and swine. Wine is produced in large quantities. In 1917 the vintage amounted to 109,908,265 gallons. Olive oil was produced the same year to the extent of 362,094,064 gallons. Figs and tomatoes are also important crops.

Fruits of excellent quality are common in every quarter, though it is only in the warmer and better-sheltered districts that the orange, lemon, and olive are divided with success on an extensive scale. The mulberry is admirably adapted to the climate, and by means of it a good deal of excellent silk is obtained; and a large extent of country is devoted to vine culture, mainly cultivated by the demand for Portuguese wines in Britain. Among domestic animals the first place is due to the mule, of which very superior breeds have long been possessed and are carefully preserved. Sheep, goats and hogs are numerous, but little attention is paid to their improvement. Cattle are of comparatively less importance.

Manufactures and Commerce.—Manufactures are still limited, although they have been rapidly increasing of late years, and cotton goods are now exported. Among the articles made to some extent on a wholesale or commercial footing are textiles at Lisbon; woolen cloth and other woolen stuffs at Portalegre, Covilhão, etc.; porcelain at Vista Alegre; delft and ordinary earthenware at Lisbon, Porto, Coimbra, Beja, Estremoz, etc.; cottons at Oporto; prints and lace at Lisbon and Oporto; cotton-twist at Thomar; silks at Braganza, Chacim, Porto, etc.; copper and tinware at Lisbon and other places; corks, ribbons, emboidery, hats, paper, apparel, fine soap, leather and curly gums, glass, paper, wickerwork and tobacco. Shipbuilding is carried on to some extent, vessels being constructed at Lisbon, Figueira, Oporto and elsewhere. The principal exports are wine, cork, oil, cotton, olive-oil, sardines and tunny fish, fruits, iron and copper pyrites, tin and horses; the principal imports are cereals, colonial produce, woolen, cotton, linen and silk textiles, iron, steel and various other metals, machinery, cured fish, coal, petroleum, timber, dyestuffs and drugs, etc. In 1913 (the last normal year before the war) the value of the exports was over $40,000,000 (more than half foods), imports over $78,000,000. The bulk of the trade is with Great Britain and France, and the chief export to the former is wine. The value of the wine sent to Great Britain annually is nearly $5,000,000. Coal and cotton goods have the highest value among the exports from Great Britain to Portugal, with considerable amount in iron (wrought and unwrought) and machinery.

Shipping and Navigation.—The mercantile shipping of the republic in 1911 comprised 66 steamers and 259 sailing vessels, with an aggregate of 114,000 tons. In 1914, 9,017 vessels of 20,505,334 tons entered, and about the same total cleared the ports of Portugal.

Communications.—The length of sea-coast, with the harbors found upon it, and the number of rivers, furnish great facilities for trade, but all the other means of internal communication are defective. There are over 9,000 miles of public roads; in 1914, 1,849 miles of railway were open for traffic, of which 711 miles were owned by the state, the remainder belonging to companies with a total of 5,945 miles of telegraphic line in operation. There are 4,300 post offices, handling annually 55,000,000 letters, 24,000,000 cards, and 50,000,000 pieces of printed matter.

Money, Weights and Measures.—The republic of Portugal established a new monetary system, the main unit being the escudo, worth a little more than one dollar, or 100 cents; four and one-half escudos are legal tender for an English sovereign. Paper and silver are the chief media of circulation. The French metric system of weights and measures was introduced into Portugal between 1860 and 1863. The Portuguese libra was 1.012 pound avoirdupois, the arroba was 32 libras, the quintal four arrobas. The chief linear measures were the lego, or league of 18 to the lego, or common geographical mile: the braza, or fathom—7.4 feet; the vara, or yard, one-half of the former; and pe, or foot—about 13 inches. For dry measure the moço—22 bushels; and for liquids the almudo—from 3.7 to 5.6 gallons, were used.

Government.—The last king of Portugal was Manoel II, who came to the throne 1 Feb. 1908, on the assassination of his father and elder brother, Luiz Philip. In 1910 there was a short revolution, that culminated 5 October in the proclaming of La Republica Portuguesa. A provisional government held authority until a constitution had been formed and a regular election took place, in August 1911, when Manoel de Arriaga was chosen the first constitutional President (24 Aug. 1911–27 May 1915). He did not serve out his term, but was succeeded by Theophilo Braga as provisional President from 29 May to 5 Oct. 1915. The new constitution was patterned in some respects after that of the United States, though with several marked differences. There are two Chambers, the National Council, having 164 members, directly elected every three years, and the Second or Upper Chamber, of 71 members, elected by all the municipal councils, half of them elected every three years. The Chambers elect the President for a single term of four years. The President appoints the Cabinet or Ministry, but they are responsible to the Parliament, consisting of the two Chambers. The constitution may be revised once in 10 years. Bernardino Machado was elected the second constitutional President of the republic and took office 5 Oct. 1915. On 25 April 1917, he formed a new Cabinet, Affonso Costa being Premier and Minister of Finance, Lieut.-Col. Norton de Mattos, Minister of War, and Augusto Souza, Minister of Foreign Affairs. Machado held office until 8 Dec. 1917, when he was swept out of office by a revolution. A revolutionary Junta succeeded; it was led by Dionisio Paes, who, on 12 Dec. 1917, became Premier and on the 28th of the same month was
made acting President, pending the regular election of a President by Congress. On 28 April 1918 Paes was elected President. The new government assumed the old public debt, which was about $800,000,000, and which has grown steadily, being at the billion mark in 1918. The revenue for the three years previous to the war was about $46,000,000 annually, with slightly greater expenditures. In 1917 the revenue fell off and the expenses were scaled to meet the funds. The war expenses were separate. (See Army and Navy.) In addition the colonies of Portugal have an annual revenue of about $18,000,000, balanced by equal expenditures.

Banking.—The Government financial institution is the Bank of Portugal, which has branches in 22 cities. Taking the last normal year (1914) as the fairest statement the annual transactions are about 1,205,000,000 escudos ($1,301,000,000), and the cash on hand — gold, 8,505,000; silver, 3,563,000; nickel, 104,000; copper, 13,517 escudos. Bills discounted, 820,000; loans, 2,327,000,000 escudos. There are 18 other banks, with 47,000,000 escudos capital, and deposits of 30,000,000 escudos.

Army and Navy.—The army consists of about 30,000 men on the peace footing and 175,000 on a war footing. Compulsory service was introduced in 1895, and all above 21, with certain exceptions, are liable to serve three years with the flag, five in the first reserve, and seven in the second. The reserve army, which was mustered during the World War, consisted of 35 regiments of infantry, eight squadrons of cavalry and 24 field batteries. The military budget for 1915–16 was over $100,000,000, to which was added $42,000,000 for extraordinary expenses. The navy consists of five protected cruisers, some old gunboats, five destroyers, four torpedo boats, three submarines, etc., with a program for constructing three more cruisers, three dreadnoughts, 12 destroyers and six submarines.

Ethnology.—The Portuguese are a mixed race—originally Iberian or Basque, with later Celtic admixture. Gallician blood, (derived from the ancient Galli, presumably Gallic invaders) predominates in the north, Jewish and Arabic blood are strongly present in the centre, and African in the south. The Portuguese differ essentially from their Spanish brethren, whom they regard with invertebrate hatred and jealousy, mainly on account of their past attempts to subvert the independence of Portugal. They are short of stature, have a long cranial index, dark hair and olive skin. The opinions of observers differ as to the national traits of the people. They are, however, generally sober, good-natured, obliging and patriotic, but shiftless and not over-clean.

Population.—At the last census there were 2,828,691 males and 3,131,365 females. The urban population was 32.4 per cent and the rural 67.6 per cent of the total. The foreign population in 1911 numbered 41,197, comprising 20,517 Spaniards, 12,143 Brazilians, 2,576 Englishmen, 1,645 Armenians. The rate of illegitimate births is 12.5 per cent of the total births. In 1914 there were 193,942 births, 117,967 deaths and 41,724 marriages. In the same year 25,722 persons emigrated chiefly to Brazil and the United States.

The following table gives the population at the census of 1900 and 1911. The Azores and Madeira are regarded as an integral part of the republic:

Religion, Education.—The state religion was that of the Catholic Church, which largely prevails, though toleration is extended to all other creeds. There are three ecclesiastical provinces presided over by the cardinal patriarch of Lisbon, the archbishop of Braga, who is primate of the kingdom, and the archbishop of Evora; these dignitaries rule over 14 bishops. The monasteries were dissolved in 1834, their properties, yielding about 1,000,000 sterling annually, being appropriated by the state. Their books were collected, and form a library of 30,000 volumes at Lisbon. There are only about 5,000 Protestants, mostly foreigners, and 500 Jews. Education is superintended by a council, at the head of which is the Minister of the Interior, and is entirely free from the supervision and control of the Church. Compulsory education was enacted in 1844, but was far from being fully enforced, until the republic took it up actively in 1911. In 1913 there were 5,563 public elementary schools and 31 secondary schools, the teachers being trained in the universities (three in number), of Lisbon, Coimbra

and Oporto. The secondary schools had 11,000 students in 1916 and the universities over 3,000. There are also numerous private schools; polytechnic academies at Lisbon and Oporto; and clerical, medical, agricultural, naval and military training-schools. The university at Coimbra (established 1290), one of the oldest in Europe, has five faculties, 75 professors and about 900 students.

**History.**—Portugal forms the greater part of ancient Lusitania. It was subdued by the Romans in the time of Augustus and was constituted into a province. In the 5th century, on the overthrow of the Roman supremacy, Portugal was invaded by the Alans and Visigoths, and suffered with Spain, of which it was then a part, all the troubles and vicissitudes endured by the inhabitants of the peninsula till the 8th century, at which time the Arabs, called indifferently Saracens or Moors, possessed themselves of the whole of Portugal, and kept absolute dominion for nearly five centuries. When the gallant Spaniards of the Christian kingdoms of Castile and Leon finally wrested the country between the Minho and the Douro from Moorish hands, they placed counts or governors over this region. Henry the Younger of Burgundy, whose grandfather Robert I, Duke of Burgundy, was grandson of the French king Hugh Capet, came into Spain about 1090, to seek his fortune in the wars against the Moors. Afonso VI, King of Castile and Leon, gave him the hand of his daughter, and appointed him (1095) count and governor of the conquered districts, which comprised the provinces Entre Minho e Douro, Tras os Montes, and a part of Beira, and the harbors of Oporto (Portus Calle), from which Portugal is said to have derived its name. In the land居住ed in Guimarães, owed feudal service to the Castilian kings, but was permitted to hold in his own right whatever conquests he should make from the Moors beyond the Tagus (1112). Under his widow, Theresa (1114–28) the country acquired a sense of national unity and a certain measure of independence. Their son, Afonso I, made Portugal an independent kingdom (1143)—through the victory of a picked body of Portuguese knights over a picked body of Castilian knights in the tourname—but gained signal advantages over the Arabs, whom he fought for 25 years, his greatest exploits being the victory in the plain of Ourique, in Alemtejo, in 1139, when he was saluted king of Portugal on the battle-field, the capture (with the help of English crusaders) of Lisbon in 1147, and of Alcácer do Sal in 1158. The Burgundian House, which continued in possession of the throne for 440 years, gave to Portugal some of its best kings. The immediate successors of Afonso I were engaged in incessant wars against the Moslems and in severe struggles with the clergy and nobles, who were always ready to combine against the sovereign; but, although often baffled in their attempts to uphold the independence of the crown, the dignity of the kingdom was, on the whole, well maintained by the representatives of this family, who were, moreover, distinguished as the promoters and champions of the maritime glory of Portugal. Prominent among these were Diniz or Denis (1279–1325), son of Afonso III. He encouraged agriculture, manufactures, navigation and commerce. He admitted the representatives of towns to the Cortes. He liberally patronized learning, and founded a university at Lisbon, which in 1308 he transferred to Coimbra. By these and other acts of a wise and beneficent administration he earned the title of Father of his Country. Among his other cognomens the most frequently applied is the "Farmer." He was succeeded by Afonso IV. In conjunction with Afonso II of Castile he defeated the Moors at Alcalada in 1343; he murdered Inez de Castro, the wife of his son Pedro, in 1335. (See CASTRO, INEZ DE). He was succeeded by his son Pedro I, who exhumed the body of Inez, and caused her to be crowned along with him (1361). He died in 1387, and was succeeded by his son Afonso V, who, reneging the male line of the Burgundian princes became extinct. In 1385 the king of Castile laid claim to the crown, but was opposed by Don John, the illegitimate brother of Ferdinand, who ascended the vacant throne and ruled his subjects with justice and prudence. Under this wise and enlightened sovereign the Portuguese first directed their attention to those maritime adventures which subsequently placed Portugal at the head of all European nations. Under John I the Portuguese first projected those Atlantic discoveries on the African Coast, and began the conquest of such territorial and commercial advantages to the nation; and, under John II and Emanuel, between 1481 and 1521, Vasco da Gama explored the Indian Ocean, the riches of the East began to pour into the kingdom, Goa became a great and opulent possession, and Brazil was added to the possessions of the crown of Portugal. The latter monarch, Emanuel, has been regarded as the greatest and best man who e'er sat on a throne. Under his wise, just and benevolent reign distinction was banished from his court, his subjects and his subjects rendered rich and happy. Sebastian III, fired with a holy zeal to exterminate the infidels from his country, commenced a sanguinary crusade against the Moors, which he carried on through such repeated defeats that he eventually lost both his crown and life in the struggle. With Henry the Cardinal, his uncle, an old man of 70 who died after a reign of two years, the male line terminated, after enduring for 400 years. Spain once more laid claim to the vacant throne, and Portugal, which again became a dependency of the Spanish crown, the nation suffering all the injustice, exactions and tyranny usually inflicted on a conquered country by its haughty masters. After enduring 60 years of incredible hardships and exactions, a Portuguese nobleman named John, Duke of Braganza, plying his unfortunate countrymen, excited a revolution, which again broke the Spanish fetters, while the people hailed their deliverer as their king, who, being crowned as John IV, commenced the dynasty of the House of Braganza, a family whose descendants still
saw the destinies of Portugal. During the 18th century, as an ally of Great Britain, Portugal became rather a commercial dependent, especially after the Methuen Treaty (q.v.) of 1703.

When Napoleon, in 1807, entered the country, and declared the family of Braganza had ceased to reign, the royal family of Portugal, consisting of Prince, the old king and his imbecile wife, Maria Frances Isabella, queen-regent, the prince-regent and all the court set sail from the Tagus to Brazil, transferring the capital to Rio de Janeiro. On the death of the queen-regent, John VI ascended the throne of Portugal and Brazil. After the downfall of Napoleon, the history of Portugal is composed of a long succession of political disturbances. The Inquisition introduced in 1536 was abolished in the Portuguese dominions in 1815, and the Jesuits, established in 1540 and banished in 1759, were refused admission. The Jews, at the request of the pope in 1817, were allowed the same privileges which they enjoyed in the Roman states. The absence of the court was viewed with delight by the nation; the military were dissatisfied with the British occupation of Marshal Beresford and the general feeling required some fundamental changes in the administration and constitution of government. A revolution in favor of constitutional government was effected without bloodshed (1820), and the king invited to return home. Before landing in Portugal he swore to observe the constitution which had been adopted. A counter-revolution of the nobles and clergy was vigorously repressed by the Cortes (February 1822); but the queen, a Spanish infanta, who exercised great influence over her son, Dom Miguel, gained the colonels of several regiments; a new reactionary movement was organized; and the Cortes, being overpowered, dissolved itself after a solemn protest on 2 June 1823. In 1822 Brazil threw off the yoke of Portugal, and proclaimed Dom Pedro, son of John VI, emperor. Her independence was recognized in 1825. John VI died 10 March 1826, having named the Infanta Isabella Maria regent. She governed in the name of the Emperor of Brazil, Dom Pedro IV of Portugal, who granted a constitution with two chambers, modeled on the French, 23 April 1826. In May he abdicated in favor of his daughter Maria da Gloria. He imposed on her the condition of marrying her uncle Dom Miguel, who was entrusted with the government as regent; but the absolute party in Portugal set up the claim of Dom Miguel to an unlimited sovereignty and a revolution in his favor, notwithstanding the intervention of England placed him on the throne in 1828. In 1831 Dom Pedro resigned the Brazilian crown and returning to Europe, with the aid of English partisans succeeded in overthrowing Dom Miguel and restoring the crown to Maria in 1833. In 1836 a successful revolution took place in favor of the restoration of the constitution of 1820 and in 1842 another in favor of 1842. Maria died in 1853. Her husband, Ferdinand of Saxe-Coburg, brother of Prince Albert of Britain, became regent for her son Pedro V. He placed the government on a purely constitutional basis, which was maintained by his son Pedro, who died in 1861 and by Louis I, who succeeded him and who died in 1889. The abolition of monopolies, the improvement of finances, the formation of railways and the cadastral survey of the country, are among the measures which distinguished his reign. Slavery was abolished in 1868 in the Portuguese dependencies. Carlos I ascended the throne in 1889. His reign was marked by serious colonial, financial, social and political troubles. Slain in 1908, his son and heir apparent were assassinated and his second son driven from the throne. A national assembly was formed and on 19 Aug. 1911 it completed and signed the constitution of the Republic of Portugal and elected a President as stated under Government. Portugal came into the World War on the side of the Entente Allies in 1916.

PORTUGUESE EAST INDIA COMPANY. See EAST INDIA COMPANIES.

PORTUGUESE GUINEA, a northwest African colony on the Atlantic Coast, extending from the Cape Verde Islands southward to Kaffrwater, and eastward to long. 13° W., its boundaries on all its land sides, fixed by the convention of 12 May 1886, being the French Senegambian possessions. The climate is very hot and unhealthy for Europeans. The coast borders with other islands off the coast belong to the colony, which has a total area of 14,440 square miles. The capital and chief port is Bula in Bulama Island; other trading ports are Biosso, Bubah, Geba and Cacheo. The coast is indented by the estuary of the Rio Grande River with its numerous deltaic islands; the colony from the eastern mountains westward lies on both sides of the river and is mainly an alluvial plain covered with tropical forests and vegetation. Rice and millet are cultivated. The chief commercial products, largely controlled by the French, are rubber, ivory, hides, oil-seed and wax; the annual exports amount to over $6,000,000; the imports to $1,500,000. There is a small coastal trade, 150 vessels with an aggregate tonnage of 37,000, trading for hides, ivory and timber in one year. There is fine hunting, elephants and hippopotami being still common. The colony is administered by a Portuguese governor and council. The military force numbers about 250. The colony is non-supporting, the revenue being less than the expenditure. The United States in 1870 as an umpire settled the long-standing disputes between Great Britain and Portugal over this territory in favor of the latter. The population, almost wholly native blacks, is estimated at about 1,000,000. Consult Machat, J., 'Rivieres du Sud' (Paris 1906).

PORTUGUESE LANGUAGE, LITERATURE, AND ART. — The Portuguese is one of the Romance family of languages, formed by the union of the Latin-speaking Celts with the Teutonic races. Words of Greek, Phoenician, Iberian, Celtic and Carthaginian origin are found in Portuguese; in Spain, indicating the relations into which commerce or conquest had brought the early inhabitants of the country. The Moorish occupation has further infused into it a Semitic element. Under the early kings of Portugal all documents were written in Latin; judicial sentences were written in Latin till a comparatively recent time; it is still used in seals, coins and memorial inscriptions. It was only under Alfonso III and Diniz that Portuguese began to be generally used in documents. The differences between Portuguese and Spanish are comparatively of modern origin, the two languages being very nearly alike in the time of Alfonso I (1143). These differences are due partly to the different spheres of activity of the two peoples. The relations of Spain were with France, Italy, Austria, and the Low Countries; those of the Portuguese were almost exclusively with the Spaniards themselves, or with peoples removed from European civilization. The dialect of Spanish spoken in Portugal at the beginning of the monarchy, moreover, was the Galician, which was also that of the court of Leon; but that court subsequently adopted the Castilian, which became the dominant language of Spain. The decline of the Galician dialect in Spain and the formation of the Portuguese language through the influences peculiar to the people
finally determined the separation of Spanish and Portuguese, and from cognate dialects made them distinct languages. Early French introduced by King John of Castile and his suite also constituted an element in the formation of the Portuguese language, and old French words which have fallen into desuetude are still to be found in Portuguese. The heraldic devices of the oldest Portuguese families are in French, and the Portuguese have shown a strong tendency to imitate the French in everything, and the language has been considerably modified by the introduction of French expressions and grammatical forms.

The 16th century is the classical age of Portuguese literature, and the Royal Academy of Sciences began a dictionary in which all doubtful points in regard to the language are referred to quotations from the writers of that age. There is no determined orthography except that which the rules of grammar have made prevalent in printed books. Royal edicts and other public documents were formerly cited as models of language, but in later times they were far from being distinguished by accuracy.

The Portuguese language, by means of colonization, has spread widely. It is spoken in Portugal, the Azores, Brazil, the Portuguese colonies in Asia, Africa, and in the United States, and among the Portuguese Jews scattered over Europe, particularly in Hamburg and Amsterdam. The Portuguese possesses the richness and conciseness of the dialects founded on the Latin tongue. It appears to have derived from French the j sound and the nasal syllables, and it lacks the strong aspirations and guttural sounds of the Spanish. It has less dignity than the Spanish, but is superior in flexibility. In popular songs it displays a delicacy and variety of expression which have made the Spaniards call it the language of flowers. It makes free use of augmentives and diminutives. It is soft and sonorous in sound, but the too frequent occurrence of the nasal ò is somewhat mars its harmony. The words are systematically grouped, every noun having in general an adjective, a verb and an adverb corresponding to it. Latin terms are preserved in Portuguese where they have not been in the other Romance languages. These, as well as other Latin elements, are more radically changed than elsewhere, so that it is often extremely difficult to trace the derivation of Portuguese words. Medial consonants, such as l and n, are frequently suppressed, dolor becomes dór; pôr, povo; pôr, por (Italian porre). The dialects of Portuguese differ only slightly from each other. Those of Minho, Algarve, the Azores in Europe, and of Goa, Macao, East Africa and Brazil are farthest from the written. The lingua geral spoken on the eastern and western coasts of Africa, as well as in some parts of India and Ceylon, which bears an analogy to the lingua franca of the Mediterranean, may be regarded as a dialect founded on Portuguese, and as containing reminiscences of the ancient maritime power of the people.

Literature.—The earliest productions of Portuguese literature do not go back farther than 1125, from which date the poetical compositions of Egaz Moniz Coelho and of Gonzales Hermigues. These are written in the Galician dialect. This closely resembled the Provençal and the Provençal bards who were received at the court of the kings of Portugal and made friends with the Portuguese, as well as other languages of southern Europe to their own. The Provençal literature for some time absorbed all the efforts directed toward the cultivation of the higher arts of writing, and in Portugal, as elsewhere, it was almost the exclusive Portuguese literature. During the 12th and 13th centuries the Portuguese native literature could boast of nothing more than a collection of popular songs (chacarás), remarkable for freshness and vigor. The first Portuguese collection of poetry (cancioneiro) was made by King Diniz. It consisted of a selection of the court lays composed about this time by the Portuguese, Provençal and Galician bards. The manuscript of this collection, discovered in the Vatican by Ferdinand Wolf, has been officially published in Paris and Lisbon (1847) under the title of 'Cancioneiro do Rei Dom Diniz.' To Dom Pedro, Count of Barcellos, son of Diniz, is attributed a 'Cancioneiro do Real Collegio dos Nobres.' His half-brothers, Alfonso IV and Afonso Sanchez, were likewise poets. Poets of this time wrote in Castilian, and are reckoned among Spanish writers. Some poems on the death of his wife, one of which is in Castilian, are attributed to Pedro I, husband of Inez de Castro. There is also a prose chronicle of Pedro's reign by Fernão Lopez, from which are derived the chief particulars of his vengeance on the abettors of the murder. In the 15th century the court was still the centre and source of the national literature. The sons and grandsons of John I were poets and patrons of the troubadours. Galician, Castilian and Provençal were still cultivated as well as the native language. Garcia de Resende, a poet of some merit, who lived under Emanuel, has collected in a Cancioneiro (Lisbon 1516) the principal poetical works of this age. Bernado de Ribeiro wrote pastoral poems and romances in imitation of the Italians and Spanish. Sá da Miranda, who succeeded him in the same line, marks the transition from the 15th to the 16th century and the separation of the Portuguese from the other Romance languages. The Dante of the language of the troubadours. This progress is also observable in the prose chronicles which record the current history of the day. The reign of King John, the discovery and conquest of Guinea, the career of Prince Henry and the first voyage of Columbus are among the subjects dealt with by the chroniclers. Literature still continued to be patronized by the royal family. King Edward (Duarte) wrote a book of morals for the use of his sons, and two works. 'The Art of the Cavalier' and 'The Loyal Councillor,' which have been republished in France. There is also a treatise on military art by Alfonso V. The 16th century is the classic era of Portuguese literature. Pastoral poetry, the epic and the chivalric romance flourished in an especial manner. The chief names are Sá da Miranda, Antonio Pereira, Camoens, Diego, Bernardes, Andrade, Caminha and Alvares do Oriente. Their compositions are distinguished by elegance and variety, but like other modern pastorals, exhibit rather a tedious affectation of rusticity than a life-like
representation of rural life. Sá da Miranda has also written epistles, sonnets, hymns and other compositions. In his hymns he has employed for the first time the hendecasyllabic verse, which has become the chief instrument of Portuguese poetry. The numerous hymns, odes, elegies and sonnets of Camoens are equally distinguished for elegance, but are marred by numerous conceits according to the taste of the period. The principal epic and the greatest poem in the Portuguese literature, almost the only one which has acquired a European renown, is 'Os Lusíadas' ('The Portuguese') of Camoens, which has placed its writer in the rank of the few great poets of the highest class whose genius is universally recognized by the whole world. (See CAMOENS.) After Camoens as an epic writer comes Cortereal, who has celebrated the siege of Diu and the shipwreck of Sepulveda.

The Portuguese romance writers claim to be the originators of the character of Amadis, but the question remains undecided between them and the Spaniards Vasco de Lobo, Francisco Nunez and Bernardim Ribeiro, among the leading romance writers. Lopez de Castanheda has written a Libro de Caballería. The drama also began to be cultivated in the 16th century. The first autos and rustic dialogues were probably composed for the festivities of Christmas; a few rude comedies also preceded the classic period. Sá da Miranda studied and imitated Plautus. Ferreira, who followed his example, composed the first regular tragedy, Ines de Castro, only a few years after Solomina was produced at Rome by Trissino. Camoens wrote several theatrical pieces, among which are 'Amphityron' and 'Seleucus.' Autos, farsas and comedias magicas were far more numerous than simple dramas.

The chronicles in the same age expanded into history. The events of their own day, in which their country played so large a part, afforded ample matter of inspiration for historians as well as poets. Barros is esteemed the Livy of Portugal though he is also a writer of fiction. It is to note the 'History of the Conquest of India' in an elegant, pure and energetic style. The 'Commentaries of Alphonso d'Albuquerque,' by a nephew of the conqueror; the 'Chronicle of King Manuel and of Prince John,' by Damian de Goes, a Portuguese ambassador; the 'History of the Discovery and Conquest of the Indies,' by Lopes de Castanheda; the 'Chronicle of King Sebastian,' by Diego Bernardo Cruz, are all works of great merit. Narrations of voyages are fewer than might have been expected, but there are a few of great interest—'A Letter to the King of Portugal on the Discovery of Brazil,' by Vas de Caminha, companion of Cabral; the 'Voyages of Magellan,' narrated by some of his comrades; and the 'Voyages of Pinto,' who visited China, Tartary, Arabia and other countries. This work is one of the classics of the 16th century.

The opening of the 17th century is distinguished by the crowd of imitative epics which naturally followed the success of Quevedo de Castro. Mascarenhas and Brandam are among the principal authors of these works, the most noticeable feature of which is the national patriotism they continue to display after the loss of the political independence of Portugal. This century is also distinguished by great historical compilations. It was the period of repose after an epoch of great activity and the absorption of the Portuguese nationality in the more powerful monarchy of Spain naturally turned all eyes to the recent period of its glory. The 'Monarchia Lusitana' (1597-1690); Bernardo Brito's 'Eulogy of the Kings of Portugal'; Faria de Souza's 'Europa Portugueza' (1607); 'Asia Portugueza' (1606-75), 'Africa Portugueza' (1680); 'America Portugueza' (left in manuscript), the historical works of Nunez de Laio, Manoel de Mello and others belong to this epoch. Antonio Vieira, a Jesuit preacher, is one of the most vigorous prose writers of this century. The letters of Alcofarrara are also among its notable procreative. But the most prolific writer of all was the padre Macedo, who composed a number of epic poems, besides 110 odes and numerous dissertations. He wrote chiefly in Latin, Spanish and Italian.

The Portuguese drama was nearly extinguished during this century by the predominance of the Spanish, to which even Portuguese writers contributed. Cocho Rebello has collected a number of the minor indigenous productions of this period. 'A Morte de Manuel da Vaz de Morais' (1606) and several others.

In the 18th century the influence of the French writers of the age of Louis XIV so completely dominated Portuguese literature that it became almost entirely imitative. Translations from and imitations of the French formed the staple of its products in every department, and the nation that gave birth to the Lusiad condescended to copy the Henriade and the Lutrin. Scholarship in this age made greater progress than literature. The academy called the Arcadia was founded in 1772 by António Diniz da Cruz Silva, the Portuguese Boileau, and other promoters of the revival of learning. It became extinct in 1776 and was replaced in 1779 by the Royal Academy of Sciences of Lisbon. Toward the close of this century the first great Portuguese writers appeared who have formed schools, Francisco Manoel do Nascimento (1734-1829), an elegant lyricist, and Barbosa du Bocage, who introduced an affected and hyperbolical style of writing, which has been called, from the pen-name Elmano, which he adopted, Elmanismo.

In the 19th century the classic school was represented by the followers of Manoel do Nascimento, Domingo Maximiano Torres and Rebeiro dos Santos. Among poets of the century possessing some claim to originality are Roque, Carvalho Moreira, Mouinho de Albuquerque, Feliciano de Castilho, Herculano de Carvalho, Almeida Garret, João de Lemos, Antonio de Serpa and Palmeirim. Through the efforts of these and other Portuguese literature has again begun to assume a national character. The drama has also been revived by J. B. Gomez, Pomenta de Aguilar, Mendes Leal and A. Herculano. Alexandre Herculano and Rebelo da Silva are also writers of history and historic romance. Castello Branco is a novelist. To the Coimbra School, which found inspiration in the leading writers of modern France and Germany, belong the lyric poet João de Deus, the historian Theophilo Braga, the philologist Coelho and other less-known writers. Science,
law and political economy are likewise well represented.

Portuguese literature is also cultivated with considerable independence and success in Brazil. For an extended discussion of Portuguese-Brazilian literature see the article WEST INDIAN, CENTRAL AMERICA AND BRAZILIAN LITERATURE.

Art.—The principal architectural monuments which Portugal possesses are due to the Goths and Moors. There are also numerous aristocratic families, such as the ruins of an amphitheatre at Lisbon, those of a Corinthian temple dedicated to Diana at Evora and a round tower named after Sertorius. The cathedrals of Coimbra and Braga and the church of Céu do Outeiro are due to the Goths. The châteaux of Fombal, Feira, Alcobaca, etc., were palaces inhabited by the Saracen princes. There are no native works of any importance. Although the art has been well patronized Portuguese painters are few and derive a recognized school; the same may be said of native sculpture.

Portuguese MAN-OF-WAR, a pneumatophore or air-sac, often seen floating on the ocean, supporting or carrying suspended below a colony of Physalia. They are usually found floating in tropical seas, but in the latter part of summer often seen off the southern coast of N. England. They have a small, conical, crested bladder, flattened on the lower side, from which are pendent the various individuals of the colony. The gaseous contents of the air-sac or bladder appear to be under the control of the individual, so that it can sail awash or submerge like a submarine. The long fila-
PORTUGUESE WEST AFRICA—POSEIDON

ments, sometimes trailing out to a distance of fully 20 feet, have batteries of nettle-cells numerous and powerful enough to paralyze fishes, and cause much discomfort to human beings, even when the organisms in question are dead on the beach. See Sparusworopha.

PORTUGUESE WEST AFRICA. See AFRICA.

PORTULACA, a genus of annual and perennial herbs of the family Portulacaceae. The species of which about 20 have been described, are natives of warm and temperate climates and are mostly American. They are often trailing, have fleshy stems, usually thick leaves and generally terminal flowers followed by small conical capsules containing numerous tiny seeds. The flowers open in sunshine but close in shade. The two best known species are P. grandiflora and P. oleracea. The former is widely cultivated in gardens for its very showy but ephemeral flowers which have a wide range of color. The hottest, sunniest places and lightest, poorest soils suit the plant well. It is a native of Brazil. The other species is said to be a native of Persia, where it was used as a potherb more than 2,000 years ago. It is also said to be indigenous in the southwestern United States. Popularly, as a potherb and sedative, it is one of the commonest weeds in warm and temperate climates upon light loamy and sandy soils, but rarely upon heavy. It has several improved varieties which are cultivated, especially by the French, for greens.

PORTUNUS, pör-tün′ís, or PORTUM- NUS, Roman god of harbors. He corresponds to the Melicerta or Palemon of the Greeks and was originally the god of doors, symbolized and represented with a key in his hand. He had a temple on the Tiber where his festival, the Portunalia, was annually celebrated on 17 August.

PORUS, king of India: d. 317 B.C. He was of ancient and noble lineage, and his kingdom occupied the north of India between the Hydaspes and Acesines. When Alexander invaded India in 326 B.C. he found the army of Porus barring his further passage at the Hydaspes. After considerable delay Alexander succeeded in fording the river higher up in its course, but was met by Porus and a terrific battle ensued, in which the Indian king was wounded and taken prisoner. Brought before Alexander his noble bearing aroused the admiration of the conqueror and they became friends and allies. Alexander extended the kingdom of Porus to the Hyphasis and when he retired from India he left him as ruler of the enlarged kingdom. Porus seems to have extended his domain still further after the death of Alexander, but in 317 B.C. was assassinated by the satrap Eudemos. There appear to have been two other Indian rulers of the same name. One of these was a nephew and an enemy of the great king, and the other a king of Madura, on friendly terms with the Emperor Augustus. Consult M'Crindle, 'Invasion of India by Alexander the Great' (1886); Macdonell, 'History of Sanscriot Literature' (London 1913).

PORE, pör′i, John, English colonist: b. England about 1570; d. there, before October 1635. He was graduated from Gonville and Caius College, Oxford, in 1592, studied under Hakluyt and in 1619–21 was secretary to Sir George Yeardley in Virginia. His accounts of his excursions among the Indians are published in Smith's 'General Historie.' He returned to England in 1621, but in 1623 was appointed commissioner of the privy council, resided in Virginia for another year, and the remainder of his life appears to have been spent in England. His letters and other British investigators have been translated 'Geographical Historie of Africa,' written in Arabic and Italian by John Leo, a More.

POSADAS, a name given in Mexico to the nine consecutive days' celebration immediately preceding Christmas day. From their nature the posadas would seem to have originated in a miracle play employed to teach the Indians the story of the birth of Christ. The Aztecs were accustomed to hold a year-end celebration of five days (an aboriginal week), beginning on or about 16 December. The Spaniards held another from 22 to 24 December. As it was impossible to suppress the Indian celebration, the Catholic Church extended the Christian festival to cover the nine days of the posadas.

POSEIDON, pō′sē-dōn, in Greek mythology the lord of the sea, identified by the Romans with the Italian deity Neptune. He was a son of Cronus and Rhea, and hence a brother of Zeus, Hades, Hera, Hebe and Selene. His usual residence was in the depths of the sea near Egae, in Euboea, where he had a palace, and kept his horses, with brazen hoofs and golden manes. He is called the earth-holder or earth encompasser, as the sea surrounds the earth, and the earth-shaker, as the earth is shaken by the waves of the sea beating on the shore. He is the ruler of all other marine deities and of all animals that live in the sea. He gathers clouds and raises storms and slays them. In several myths he is represented as contending with some land divinity for the possession of particular spots of earth. The horse, and more particularly the war-horse, was sacred to Poseidon, and one of the symbols of his power. Poseidon's other well-known symbol of his power is the trident, or three-pronged sceptre. During the Trojan War Poseidon was the constant enemy of Troy. The cause of this enmity was the ingratitude shown him by Laomedon, the second king of Troy, and the builder of the walls of the city. Poseidon had numerous offspring by mothers divine and human. The worship of Poseidon was common throughout Greece and the Greek colonies, but especially prevailed, as is natural, in the maritime towns. The animals sacrificed to him were horses and bulls, sometimes he also wild boars and rams. The Isthmian games, and the Panonia or festival of all the Ionians, celebrated near Mycale, were held in his honor. In works of art Poseidon is represented with features resembling those of Zeus, but he has not the calm majesty of the supreme god, although he is more powerfully built. When represented standing, he always bears the trident in his right hand and a dolphin in his left. (See NEPTUNE). Consult Farnell, L. R., 'Cults of the Greek States' (Vol. IV, 1907).
POSEN—POSEY

POSEN, pō'zēn, Germany, (1) a fortified town in Prussia, capital of the province and government of the same name, on the river Warthe, 149 miles east of Berlin and 103 north of Breslau. Fort Winnyary, adjoining the town, serves as the citadel. It is a railway centre, enjoying an active trade to and from by rail. Of its public edifices the chief are the Roman Catholic cathedral and the parish church, the former having the splendid "golden chapel" attached; the archiepiscopal palace; the town-hall, a Renaissance building mostly of the 16th century; the Raczyński Library; the Mielszynski Museum, the archeological museum and library, the real-gymnasium and two other gymnasiae (one Protestant and one Roman Catholic), an academy, normal and other schools, hospital, a theatre and some elegant private mansions. The manufactures consist chiefly of agriculture and other machines, carriages, artificial manures, etc. There are also large breweries and distilleries. Posen is the see of an archbishop, the residence of a provincial governor and the seat of important courts and numerous civic offices. It was one of the oldest and most important towns of Poland, and its inhabitants still largely consist of Poles. It was at one time allied with the Hanseatic League. It is one of 10 fortified cities of the first class in Germany and has underground and wire connections with the nearby fort of Geogau. It was a Russian objective in their advance in 1914-15. Pop. about 156,691. (2) An eastern grand duchy and province of Prussia, bounded north by West Prussia, east by Posen and Pomerania, south by Silesia and west by Brandenburg; area, 11,186 square miles. The surface is generally flat and extensively occupied by lakes and marshes. A small portion belongs to the basin of the Vistula, which touches it on the northeast; the rest belongs to the basin of the Oder, which receives its drainage through the Warthe in the south and centre and the Netze in the north. The soil is for the most part light and sandy, and considerable tracts are covered with heath; many parts are covered with a rich alluvium or vegetable mold, yielding potatoes, corn and grain, and yielding grass, flax, hemp, tobacco and hops. The pastures are extensive and feed numerous herds of cattle, horses and swine; considerable attention is paid to the rearing of poultry, particularly geese, and also to the rearing of bees. The minerals, comparatively unimportant, include bog iron-ore, saltpetre, limestone and building-stone. The manufactures consist chiefly of spirited liquors, woolen stuffs, linen and leather. The trade in these articles and in horses and swine is considerable; other exports are corn, cattle, tallow, leather, honey, wax, goose-feathers and hog's-lard. There are 1,200 miles of railway in the province. The inhabitants include a considerable mixture of Germans and Jews, but the great majority are Poles. The acquisition of which Prussia made by the dismemberment of Poland. It is divided into the two governments of Posen and Bromberg and has been subjected to a representative rule to overcome disaffection. It is represented in the Imperial Reichstag by 15 members and in the Prussian Landtag by 29 delegates in the lower and 19 in the upper chamber. As part of Poland, Posen was divided into the palatinates of Pozmania, Gnesen and Inowraclaw. At the first partition of Poland in 1772 the district of the Netze fell to Prussia, and the remainder in the second partition of 1793. Between 1807 and 1815 Posen formed part of the grand duchy of Warsaw, but in the latter year reverted to Prussia. Pop. 2,009,831.

POSEY, pō'zē, Alexander Lawrence, Creek Indian educator, journalist. While at work to near Eufaula, Okla., 3 Aug., 1873; d. 27 May, 1908. His father was a white man of Scotch-Irish descent, born about 1842 in the Indian Territory, the child of white intruders in the Cherokee Nation. His mother was a Muskogee Indian of unmixed blood. Until he was 12 years old, Alexander Posey spoke only the language of his mother's people. Then his father, who was in independent circumstances, employed a private teacher and compelled the son to learn to read and write. A year or two later he was sent to the public (tribal) school at Eufaula. When he was 17 he entered Bacone Indian University at Muskogee, where he acted as librarian, learning to set type on The Instructor, a small paper published by the faculty, and discovered his vocation for literary work. In October 1892 he published 'The Comet's Tale,' a lengthy poem relating to the Indian tradition of the coming of the first ships of the white men to discover America. Immediately after his graduation, in 1895, he entered public life, being elected a member of the Creek House of Warriors, the popular branch of the tribal legislative council. In 1896 he was appointed superintendent of the Creek Orphan Asylum at Okmulgee. A year later he became tribal superintendent of schools, but held it only a short time, resigning to settle on his farm near Stidham. There he continued to write as inspiration prompted. He was pre-eminent a poet of nature and loved the solitude of which he wrote. Then he was called back to educational work as superintendent of the Creek National High School at Eufaula, with a brief term of service at a similar institution at Wetumka, but soon relinquished that work to take charge of a newspaper. He was the author of Joural at Eufaula. There he found his literary opportunity, developing marked ability as a satirist. His inimitable "Fus Fixico" letters, in which he humorously discussed the white man's politics through the medium of dialogues between fictitious characters who were typical of the older and more conservative Creek full-blood element—Wolf Warrior, Hot Gun and others—who talked in the broken Creek-English dialect, were widely copied in States far from Oklahoma, where they especially could not be appreciated because its object was unknown. Because of his sympathetic understanding of the uneducated people of his tribe, whose interests were jeopardized in the readjustment incident to the allotment of lands in severality, he gave up newspaper work and became a field agent of the allotting commission, in which position he rendered valuable service. In 1905 he was chosen a delegate to the Sequoyah Constitutional Convention, which met at Muskogee, and was made secretary. The simple, terse, clear English of the instrument framed by that convention was said to have been largely due to his writing and revising. He met death by drowning in the
North Canadian River. A volume of his poems was published after his death.

POSEY, Thomas, American soldier: b. eastern Virginia, 9 July 1750; d. Shawnetown, Ill., 19 March 1818. He was quartermaster in Lord Dunmore's expedition against the Ohio Indians and was engaged in the battle at Mount Pisgah. In 1775 he was a member of the Virginia committee of correspondence and raised a company of which he became captain for the 7th Virginia Continental Regiment. He assisted in defeating Lord Dunmore at Gwynn's Island in 1776; in 1777 joined the Continental army at Middlebrook, N. J., and with his company was transferred to Morgan's renowned riefe-corsps, where he played a conspicuous part in the engagement at Piscataway, N. J. He served with great gallantry under Gates at the battles of Bemis Heights and Stillwater, and in 1778 was promoted major and had charge of the expedition against the Indians of Wyoming Valley in that year. In 1779 he commanded a battery under General Wayne at Stony Point and was one of the leaders in the assault which carried the enemy's works. He was present at the surrender of Yorktown, organized a regiment of which he was given command with the rank of lieutenant-colonel, and served under General Wayne in Georgia until the surrender of Savannah, where he routed the Indians under Gueristeggro. After the war he lived in Spottsylvania County, Va., until 1793, when he was appointed brigadier-general and served under General Wayne in his campaign against the Indians in the Northwest. He resigned in 1794, settled in Kentucky, entered the State senate, and was ex officio lieutenant-governor. He raised a company of which he was for a time captain in the War of 1812, and in 1812-13 he served as United States senator from Louisiana. He was governor of Indian Territory from 1813 until her admission into the Union as a State and from 1816 until his death was Indian agent.

POSIDONIUS, pó-si-dó-ni-ús, Greek Stoic philosopher: b. Apamea, Syria, about 135 n.c.; d. after 51 n.c. He studied at Athens under Panetius of Rhodes, after whose death in 112 he succeeded him as teacher and Rhodian, whence he is called the Rhodian. He taught the Stoic philosophy with great applause, was at the same time a statesman and one of the Frytanes, and went at 50 as an ambassador to Rome. The most distinguished Romans were his scholars, and Cicero was initiated by him into the Stoic philosophy. He wrote many works on history, astronomy and geography, now lost. In his physical investigations he was more nearly a follower of Aristotle than of the Stoic school, and the members of which he greatly excelled in this department of knowledge. Fragments of his writings were edited by Bake (1814), and by C. Müller in ' Fragmenta Historicarum Graecorum' (1849). Consult Ritter-Prelter, ' Historia Philosophiae Graeca' (1913).

POSILLOPO, pó-sé-lé-pô, or PAUSILIPPO, po-zi-li-po (Latin, Posilippo), a hill and grotto to the southwest of Naples, the grotto furnishing a passage from that city to Pozzuoli. This grotto, or tunnel, leads directly to the village of Fuorigrotta; its height is about 70 feet, and the breadth 21 feet. It was long supposed that it was earlier than the time of the Romans, but it is now supposed to date from the time of Augustus or Tiberius. It was widened in 1442 by Alphonso I, plastered by Pietro of Toledo, and again repaired in 1574 by Charles II. Since 1885 there has been a second "grotto," about 150 feet longer, which is more commonly used, as is also a road over the mountain built in 1822. On the hill above the grotto is the famous Tomb of Virgil. To the south is Cape Posilippo. The town of Posilippo on the hill has about 4,500 inhabitants.

POSITIVE, that which is active, affirmative, known, virile, definite, strenuous; opposed to negative, which is quiescent, receptive, unresponsible, indefinite. The word has many specific senses: (1) In electricity, the active pole, from which a current is regarded as flowing. (2) In photography, a picture so taken that the lights and shades appear naturally, which is opposite to a negative, in which they are reversed. (3) In optics, a lens that shows a view naturally instead of upside-down. (4) In general, that one of two opposite things which is regarded as primary or active. (5) The thing that is known, can be seen clearly or sensed readily. (6) An adjective, characterizing a dogmatic person, who "always knows he is right." It is also applicable to the many natures, as opposed to the womanly, feminine or negative, nature.

POSITIVISM, póz'-ti-iv-izm, originally denotes any theory that takes the affirmative side and states its tenets in positive terms. In this sense one speaks of positive Christianity or positive theology, as synonymous with dogmatism, indicating thereby that liberal religion which rejects belief in miracles, or a special revelation, or the traditional Church doctrines, is negative.

The term was appropriated by August Comte to denote a philosophy that would limit itself to the positive sciences and exclude all metaphysical speculation. Comte propounded positivism as the ultimate aim of the evolution of knowledge, which (as Turgot had indicated) necessarily passed through three stages: the theological, the metaphysical and the positive. In the theological stage, the classified phenomena of nature are personified as gods—a view based upon a mythological interpretation of nature which reaches its climax in minoanism and leads to the metaphysical stage in which the laws of nature are conceived as impersonal essences or powers. The highest and last stage is attained when the scientist is satisfied simply to describe the facts and leave out all metaphysical speculation.

Comte felt that there was something wrong with metaphysics, and he eliminated it from the domain of his philosophy, but instead of solving the problem, he ignored it on the plea that it was insolvable. His great work 'Philosophie Positive' (consisting of six volumes) contains simply a recapitulation of the whole range of human knowledge, the systematic arrangement of which he called the hierarchy of the sciences. Comte does not deny the existence of something metaphysical, but only maintains that research in this domain is fruitless.

Eugen Dühring, a German philosopher of great acumen, rightly criticizes Comte's positivism in saying that "its main contents,
strangely enough, consist in negativism, and a hierarchy of the sciences offering a digest of knowledge cannot pretend to be philosophy. (F. B. p. 489)

In a more advanced stage of his life, Comte felt the need of going beyond the standpoint of the positive sciences. In response to this need of his nature he invented a religion of mankind, which should be based on science, replacing the idea of God by the conception of an ideal mankind. Comte's conception of a scientific religion is worthy of a great genius, but the rituals which he prescribes are too artificial, and proved acceptable only to a very limited circle of admirers.

Littre, the well-known author of a French dictionary, disavowed Comte's religion as fantastic, but he accepted his philosophy which he formulated as follows: "The domain that lies beyond refers to the things that cannot be known. A positive science is limited and does not deny nor to affirm them. In a word, it does not know the Unknowable, but it recognizes its existence. This is the highest philosophy. To go beyond is chimerical, to go not so far is to miss the mark."

The prominent English representative of Comtean positivism, George Henry Lewes, sums up the tenets of positivism in this sentence: "Our province is to study her (nature's) laws, to trace her processes, and, thankful that we can so far penetrate the divine significance of the universe, be content — as Locke wisely and modestly says — to sit down in quiet ignorance of all transcendent subjects."

The modern representative of Comte's positivism in England, averring both his philosophy and his religion, is Frederick Harrison, president of the English Positivist Committee, and author of 'Positive Evolution of Religion' (New York 1913).

In spite of the shortcomings of Comte's philosophy, the conception of positivism is a great moral achievement, but positivism in order to fulfil its purpose should be truly positive. Genuine positivism would be a philosophy based upon the facts of experience. Whether or not metaphysics is wrong depends entirely upon the definition of the word. It is the metaphysical a mysterious essence or power behind nature, the scientist should not merely ignore it but deny its existence; but if, after the precedence of Aristotle, we understand by metaphysics the science of first principles, we must grant that its study, far from being fruitless, is indispensable for every scientist.

The aim of a positive philosophy should be to understand the methods and general spirit of science, to systematize the results of the totality of human knowledge and to apply them to practical life. Accordingly, philosophy will serve three purposes: it will be (1) the propedeutics (preliminaries) of science, (2) a synopsis of all knowledge and (3) ethics or the science of moral conduct. The first branch of philosophy includes logic, epistemology and methodology, that is, the sciences which are equally needed as intellectual tools in all the several branches of inquiry. The second part, a systematic knowledge, cannot be a mere compendium or a hierarchy of the sciences, but must be worked out into a systematic world-

conception, not a mere sum of the sciences but their product, which might be called "ontology," that is, the science of existence or "cosmonomy," the science of the world conceived in the old sense is an a priori construction of a system of abstract thought; in the new sense it would be a methodical arrangement of the facts of experience, a monistic or consistent system of human thought. Cosmonomy explains the prevalence of uniformities and their formulation as general rules, called laws of nature, etc. It points out the permanent background of existence, the eternal conditions of becoming from which world-systems originate and, above all, defines man's position toward the whole of existence, toward his fellows and especially toward those factors that determine his destiny — in religious nomenclature called God." The third part of philosophy would be a practical application of the second, resulting in what has been called philosophy proper, world-wisdom or, broadly speaking, ethics. Consult Huxley, Thomas, 'Scientific Aspects of Positivism' (in 'Lectures and Lay Sermons,' Everyman's Library, 1910).

Paul Carus,
Editor of 'The Monist.'

POSSE COMITATUM, pōs'ē kōm-ī-tā'tās, in law, the force of able-bodied male citizens whom the sheriff by the common law is authorized to call to his assistance in case of invasion, rebellion, riot, breach of the peace, forcible resistance to process, etc., in the county or district of whose office he holds his office. All persons included in the posse comitatus are bound, under penalty of indictment, to assist the sheriff when lawfully called upon and are justified in killing a person in case of resistance. Unnecessary violence on their part, however, is punishable.

POSSESSION, a legal term, which has come to have a larger meaning than in common usage of the word or the primary sense, from Latin possideo — to sit upon. It has grown to mean something distinct from mere custody. It is defined as the detention and enjoyment of a thing which one holds and exercises by oneself or through others. It is the condition by which a person may exercise power over a thing at his pleasure and to the exclusion of all others. There are two requisites to complete possession: first, occupancy, and second, the taking with intent to possess — hence persons who are without legal wills — as children, idiots, etc., cannot acquire possession; however, a child of sufficient understanding may legally acquire possession of a thing.

One is said to be in actual possession when the thing is in immediate occupancy and constructive possession when one claims to hold by virtue of a title without actual occupancy; possession may be enjoyed by the proprietor of the thing — thus the proprietor of a house possessing it by his tenant. A thief may have a thing he has stolen, but he does not rightfully possess it. One who borrows his friend's horse has it in his custody, but is not a legitimate possessor.

To acquire possession of a property it is requisite that there be intention of possessing as owner and also the possession of the thing.
Possession is lost when one transfers a property to another with the intention of divesting himself of the title or when he does some act which manifests his intention of abandoning possession. Though, of course, no proof of ownership or title to property or a thing, the possession is a fact in evidence of it and it is sufficient evidence against anyone who cannot show a better claim. Continuous possession of land for a time, which varies in the statutes of various jurisdictions, usually 20 years, will give the occupant title by adverse possession. With chattels a replevin suit is often instituted to regain custody, when the goods are illegally withheld from the rightful owner. See BAILMENT; TITLE; REPLEVIN.

POST, Alfred Charles, American surgeon: b. New York, 13 Jan. 1806; d. there, 7 Feb. 1886. He was a student in the College of Physicians and Surgeons in 1822 and from the College of Physicians and Surgeons in 1827. After two years' further study in Paris, Vienna, Berlin and London he established a practice in New York, in 1831–35 was demonstrator of anatomy in the College of Physicians and Surgeons, in 1836 became an attending surgeon at the New York Hospital and throughout his life continued his connection there, occupying at his death the office of consulting surgeon. He was an appointed professor of ophthalmic surgery at Castleton Medical College, Va., in 1843, and of surgery in the following year. In 1851–75 he was professor of surgery in the University of the City of New York, vice-president of the New York Academy of Medicine in 1861–66 and its president in 1867–68, president of the Pathological Society, and for many years was connected with Saint Luke's, the Presbyterian and the Women's hospitals. He conducted a weekly clinic at the University Medical College in New York, for many years, was the first surgeon in the United States to perform an operation for the cure of stammering and was the inventor of several valuable surgical instruments and appliances. Besides numerous medical papers contributed to scientific journals, he published 'Strabismus and Stammering' (1840) and 'Observations on the Cure of Stammering' (1841).

POST, George Edward, American missionary: b. New York, 1838; d. 1905. In 1860 he was graduated in medicine at the University of the City of New York and in the following year at Union Theological Seminary. He was appointed to the chair of surgery at the Syrian Protestant College of Beirut, where he remained until his death. He was an accomplished linguist and wrote several Arabic works, including 'Flora of Syria, Palestine and Egypt'; 'Textbook of Botany'; 'Textbook of Mammals'; 'Textbook of Birds'; translation of Butler's 'Physiology'; 'Concordance to the Bible'; 'Textbook of Surgery'; 'Textbook of Materia Medica'; 'Dictionary of the Bible.'

POST, Melville Davison, American lawyer and novelist: b. Harrison County, W. Va., 19 April 1871. He was graduated from the University of West Virginia and has since practiced law in Grafton, W. Va. In 1896 he was chairman of the Democratic Congressional Committee of West Virginia. He has published 'The Strange Schemes of Randolph Mason' (1896); 'The Man of Last Resort' (1897); 'Dwellers in the Hills' (1901); 'The Gilded Chair' (1910); 'The Nameless Thing' (1912).

POST, Wright, American surgeon: b. North Hempstead, N. Y., 19 Feb. 1877. He was graduated at Throstle Neck, N. Y., 14 June 1898. He received his medical education in New York and London and in 1896 established a practice in New York. In 1972 he was appointed professor of surgery at Columbia, where he later occupied the chair of anatomy and physiology, afterward holding the same chair in the Medical School of New York. For 35 years he was consulting surgeon in the New York Hospital, president of the College of Physicians and Surgeons in 1821–26, and was prominently connected with numerous medical societies. He made himself famous by his surgical achievements, many of which were departures from the old school.

POST-Nuptial Contract. See Law of husband and wife.

POST-Obit Bond, a mode of contracting loans sometimes resorted to by heirs and others who expect a legacy on the death of the intestate party. The condition in the bond is that the sum borrowed shall not be exigible till that party's death; and hence, not only in consequence of the uncertainty of the event, but also sometimes in consequence of the uncertainty of the succession itself, which may be contingent, and perhaps never be realized, the creditor usually makes very exorbitant terms.

POST-OFFICE. See Post-office Department.

POST-OFFICE Clerks, United National Association of, an association formed in 1890, for the purpose of securing, through legislation and other means, the classification of post-office clerks with a view toward securing more equitable salary rates, regulation of hours of labor and other similar objects. The organization also issues death benefit insurance policies.

POST-OFFICE DEPARTMENT. The official title of one of the executive departments of the government; established in 1794. It is under the management of the Postmaster-General, who since the time of Andrew Jackson has been a member of the President's Cabinet.
He is appointed by the President and confirmed by the Senate. The department is divided into four great bureaus each under the immediate charge of an assistant postmaster-general. The first assistant's bureau is in charge of the larger clerical and carrier forces and all the matters of actual management. It supervises an annual expenditure close to $100,000,000. The bureau of the second assistant has the immense task of providing for the transportation of the mails at a yearly cost of about $80,000,000. That of the third assistant looks after the financial side, furnishes the stamps and keeps the accounts. The fourth assistant has charge of the appointment of 55,000 postmasters and directs the force of inspectors.

The Railway Post Office.—The idea of a railway post office was first brought officially to the notice of the department of First Assistant Postmaster-General Hobbie, who, in 1847, had been in Europe, and in his report gave his impressions of the traveling post office in England. Under Postmaster-General Holt, in July 1862, the first railway post office was introduced in this country. In 1864 the leading railroads were induced to alter the cars for the purpose of the railway post office, and from that time this department has grown into one of the most important institutions of its kind. In 1916 there were 3,479 railway routes, 8,027 mail messenger routes, 571 electric car routes, 264 wagon routes, 260 steamboat routes, 21 star routes (in Alaska), and six pneumatic tube routes. The cost of the railway mail has charge of $28,516,000, and railway mail pay $61,692,000.

Money-Order System.—The money-order system was established in 1864, under the administration of Postmaster-General Blair. In order to accommodate soldiers and others wishing to transmit small sums of money, he advised the incorporation of this idea in our postal system. At its beginning only 138 offices were allowed to issue orders. The number increased to 34,547, which during 1903 issued 45,941,291 domestic orders, 133,392,000 domestic orders, and 1,973,714 foreign orders, this latter a decrease due to the war. See Postal Money Order Service.

Rural Free Delivery.—The rural free delivery service was established under President McKinley, in 1893. That year 44 routes were put in operation. The service has grown steadily. By 1901 the mileage had grown to over 100,000, the cost was $1,750,321, and over 15,000 carriers were employed. In 1905 the mileage was 721,237, cost $20,064,000, with 32,055 carriers. In 1910 the mileage was 993,068, cost $36,915,000, with 40,997 carriers. In 1917 the mileage was 1,112,556, cost $52,420,000, with 43,338 carriers.

The net advantage of the Rural Free Delivery system include (1) postal receipts increased; (2) sale of farm lands enhanced; (3) farmers brought into touch with markets; (4) social and educational benefits derived in country and town by being kept in touch through the daily receipt of papers and correspondence; (5) benefits to small towns. In three, at least, of these advantages the benefit of the postal service to commerce is distinctly notable. See Parcel Post.

Dead Letter Office.—The dead letter office dates back to 1825. An act of Congress made it the duty of postmasters to publish quarterly, or oftener, whenever the Postmaster-General might direct, a list of letters remaining in their offices, and once every quarter to forward those that could not be delivered to the department at Washington. Here they are examined and disposed of within about 15,000,000 pieces of mail matter.

The Postal Union.—Under the terms of a treaty concluded at Berne, 9 Oct. 1874, the object of which was to secure uniformity in the treatment of correspondence, and the simplification of accounts, as well as postal rates within certain limits, and whose provisions were carried into operation generally 1 July 1875, the whole of Europe, the United States, Egypt, British India and all the colonies of France were at the outset, or shortly thereafter, included in the union, and many other countries and colonies have since joined it. The international accounts in respect of postages are based on a month's return of correspondence taken every third year.

Postal Savings Banks were established by the Postal Savings Act of 25 June 1910. See Banks and Banking; Postal Savings Banks and Postal Savings System.

Increase of Rates.—In November 1917 the law for increased postage for war revenue went into effect, and first-class mail, drop letters and post cards were raised one cent each. The rate on magazines containing over 5 per cent advertising was also increased, according to zones of delivery. Former rates restored 1919.

Post-Office Statistics.—In the United States in 1879 there were only 75 post offices established, the length of the post routes being 2,275 miles and the gross revenue of the department being only $7,510. The expenditures for the same year were $7,560 and of this only $1,657 were paid in salaries to postmasters. In 1875 there were 278,000 miles of postage routes, a revenue of $27,000,000, with expenses of nearly $34,000,000. In 1900 there were 428,000 miles of post routes, a revenue of $110,000,000, and expenses of $120,000,000. The total number of post-offices was reduced from 74,169 in 1903 to 55,413 in 1917, rural free delivery causing the dropping of small offices. There were in 1910, 59,580 post offices in operation, 447,998 miles of post routes, 353,312,998 miles of mail service, 192,000 miles of government road mileage. The gross revenue for the year was $224,128,657.63, the expenditures $229,977,224.50, and $27,521,013.29 were paid as compensation to postmasters. In 1917 these figures had grown to 55,413 offices, 479,487 miles of post routes, $329,726,116 revenue, and $319,838,718 expenditure. In 1911, 1913, 1914, 1916 and 1917 the post office showed a profit, and it is the policy of the department to continue making a slight profit. From June 1847 to June 1851, 4,603,200 postage stamps were issued, while in the single year 1910, 11,360,353,679 stamps were used by the people of the United States. In 1853, the year in which stamped envelopes were first issued, 5,000,000 were used, while in 1910 the total was 1,506,861,393. The first year's issue of postal cards—1873—numbered 31,000,000, while in 1910 726,441,000 were issued. The registration system was started in 1854, and in that year the registered pieces numbered 629,322. In 1910 they numbered 42,053,574. In 1865 money-orders to the amount of $1,360,122 were issued, while in 1910 the total amounted to $647,736,327, and in 1917 it was
The number of pieces of matter of all kinds mailed increased from 500,000 in 1790 to about 20,000,000,000 in 1919. For further information see Philately; Post and Postal Service; Stamps, Postage; and related references.

POST-PLIOCENE, that division of geologic time and the strata laid down in it which follows immediately after the Pliocene. The term has been used as designating all that period from the end of the Pliocene till now, in which sense it is equivalent to Quaternary (q.v.) or, by some geologists, as applied only to the earlier portion of this period, in this sense being equivalent to Pleistocene (q.v.).

POST AND POSTAL SERVICE. The word post is derived from the Latin postus, meaning “placed,” because horses were put or placed at certain distances to transport letters or travelers. From this ancient beginning, the post has developed into one of the most effective instruments of civilization. In the Old Testament are frequent references to the posts. In 2 Chron. one will find: “So the posts went with the letters,” and “So the posts passed from city to city.” In Esther, also, and in Job and Jeremiah one will find other allusions to the posts. But they were never for the use of the common people. The first recorded postal system was in the Persian Empire. According to Xenophon, Cyrus the Elder caused couriers, with saddled horses, to stand ready at different stations throughout the empire, situated one day’s journey from each other, in order to receive reports from the provinces without delay. In the time of Julius Caesar the service of couriers in the parts of the Roman dominions under his government was so well organized that of two letters which he wrote from Britain to Cicero at Rome, the one reached its destination in 26 and the other in 28 days. Such services, however, were only established by governments or persons in authority for their own use. Private persons, in their intercourse with one another, had to employ slaves to convey their letters to destination, or to trust to the chance of finding some person who was going to the place to which the letter was addressed, and was willing to undertake the delivery of it.

The Emperor Diocletian, at the end of the 3d century, appears to have been the first to establish a postal system for the benefit of private persons. At later dates Theodoric the Great, Charlemagne and others had well-organized services for communication with all parts of their empire.

Early History of the Public Post.—The earliest postal system was established in France by the University of Paris. From the end of the 13th century this institution maintained couriers, who at certain times took charge of letters and money for the students collected in that city, from almost all parts of Europe. Louis XI established for his own use mounted messengers, and by an edict of 19 June 1464 instituted post stations on the chief roads of France. This system was continued under the following reign, and ultimately private persons began to make use of the royal couriers for the transmission of their own correspondence. During the reign of Louis XIII the French system of posts received a more regular form from the establishment of a comptroller-general of posts.

In Germany the first post was established in Tyrol in the latter half of the 15th century, by Roger I, count of Thurn, Taxis, and Valsassina. His son established another from Brussels to Vienna in 1516, by the wish of the Emperor Maximilian I. In 1522 a post was established between Vienna and Nuremberg, and Charles V, anxious to have news as quickly as possible, on account of the vastness of his states, caused Leonard of Thurn and Taxis to establish a permanent riding-post from the Netherlands through Liège, Trèves, Spire, and Rheinhausen, through Würtemberg, Augsberg and Tyrol to Italy.

The postal system of Italy began in Piedmont. Until 1561 the transmission of letters was in the hands of the communities or private persons, who were authorized by the state to charge for the service a sum which varied according to circumstances. In the year mentioned the posts were farmed out by Emmanuel
POST AND POSTAL SERVICE

Philibert, Duke of Savoy, to a postmaster-general. This arrangement continued until 1697, when Duke Victor Amadeus II added the post of postmaster-general of the state, an indemnity being paid to the postmaster, who had the contract for them. From 1710 downward the post office was administered directly by the state.

The British Post.—There were private posts in England from the time of Edward III. In 1635 a public post was established between London and Edinburgh. In 1644 Edmund Prideaux, then a member of the House of Commons, was appointed master of the posts, and first established a weekly conveyance of letters into all parts of the nation. In 1663 a penny post was set up in the metropolis. During the government of William III acts of Parliament were passed which regulated the internal postal system of Scotland; and, by the ninth act of Queen Anne, the postal system of England was arranged on an improved footing. A general post office was instituted at London for the British dominions with chief offices at Edinburgh, Dublin and other places, while the whole system was placed under the control of a postmaster-general, and the postmaster in each city or town was made responsible for the chief offices. At this time the letter rate of postage was eight cents for 10 miles or under, with a rising scale to 25 cents for 300 miles. In 1837 Sir Rowland Hill inaugurated a movement for reform in the postal service. Penny postage resulted in 1839, and on 6 May 1840 the first postage stamp, designed by W. Mulready, was first brought into use. In the same year the money-order system was adopted and in 1848 the book post was established. In 1853 pillar letter-boxes were introduced, and London was divided into 10 districts, for greater facility in the distribution of city letters. The British post-office system developed rapidly after 1800, and has long included a parcels post and banking and telegraph systems. The service is under the immediate control of the Postmaster-General, assisted by the chief secretary of the post office in London. There are also chief officers in Edinburgh and Dublin. The Postmaster-General is a member of the Privy Council, and sometimes a Cabinet minister. In 1915 there were 242 post offices in the United Kingdom, 50,285 road and pillar letter-boxes. The total number of letters delivered during the year was 3,409,000,000.

The Colonial Post in America.—In the American colonies the post office made its first appearance in Massachusetts in 1639, when the General Court of that colony issued the following: “It is ordered that notice be given that Richard Fairbanks, his house in Boston, is the place appointed for all letters, which are brought from beyond the seas, or are sent thither, to be left with him, and he is to take care that they are to be delivered or sent according to direction: and he is allowed for every letter a penny, and he must answer all messages through his neglect of this kind.” In 1657 a postal service was established in Virginia. The colonial law required every planter to provide a messenger to convey the dispatches, as they arrived, to the next plantation, and so on, on pain of forfeiting a hoghead of tobacco for default. In 1672 the government of New York established a mail to go monthly between New York and Boston. In 1674 the General Court at Hartford enacted laws to regulate the postal services in the colony. In July 1683 William Penn established a post office in Philadelphia, with weekly mails to various places near the city, and about the same time opened mail routes between Philadelphia and the larger towns of Pennsylvania and Maryland. These represent the several colonial enactments in relation to postal communication existing from the time of Edward III.

Neale’s American Post.—The beginning of the American post proper dates with the signing of a patent 17 Feb. 1691 vesting in Thomas Neale the American post. On 4 April following, Neale and the Royal Postmaster-General appointed Andrew Hamilton postmaster-general of America. Hamilton undertook the arduous duty of establishing an intercolonial post. He visited all the colonies, was trusted implicitly and satisfied each colony of his ability and resources in the new venture. The co-operation of all the colonies except Virginia having been secured, services began on 1 May 1693, and consisted of a weekly post from Portsmouth, N. H., to Boston, Saybrook, New York, Philadelphia, Maryland and Virginia. Five riders were engaged to complete the circuit in five days and five days a week. In winter, service was performed fortnightly. Hamilton died in 1703, and his son, John Hamilton, succeeded him. In 1707 the Crown purchased the good will of the American post office and continued John Hamilton as postmaster-general. From 1747 to the year before the Revolution the General Post Office in London controlled the service in America. In 1711 there was a weekly mail operation between Boston and Main, and fortnightly exchange between Boston and New York. In 1717 the mail ran weekly between New York and Williamsburg, Va., and 10 years later there was a fortnightly mail between Philadelphia and Annapolis, Md. The period of activity in the establishment of postal facilities began when Benjamin Franklin was appointed postmaster at Philadelphia in 1737. At the request of the deputy postmaster-general for the colonies, he assisted him in the regulation and management of the various post offices then established, and when that official died, in 1753, Franklin, in company with William Short, a United King, form 50,285 road and pillar letter-boxes. The total number of letters delivered during the year was 3,409,000,000.

The United States Post.—The Continental Congress met at its second session, in Philadelphia on 26 July 1775, and its members resolved to have a post-office system of their own, and Franklin was elected to carry on the work. A salary of $1,000 a year was voted him. However, Franklin’s great diplomatic talents secured him soon afterward a transfer to France, and in 1776 his son-in-law, Richard Bache, was appointed to succeed him. Mr. Bache was succeeded in 1782 by Ebenezer Hazard, who had, in 1775, been the “constitutional postmaster” of New York, so termed to distinguish him from the British postmaster at that place. The Colonial Congress in 1782 passed an act authorizing the postmaster-general to establish a line of posts between New Hampshire and Georgia, and to such other places as Congress might direct and to appoint the necessary deputies, for whose faithfulness and honesty he was to be held ac-
countable. On 8 May 1794 the Congress passed the first law for the proper management of the postal service. In 1799 the postal laws were revised, and flogging substituted for the death penalty for robbing the mails. This law, however, was repealed by a subsequent enactment, and imprisonment for a term of years made the penalty. The office of Second Assistant Postmaster-General was created in Madison's administration, and the scale of postage changed. Single letters—that is, containing no remittances from various religious bodies, and the strife was kept up in Congress and occupied the attention of the Department for 20 years. In 1813 the mails were first conveyed in steamboats from one post town to another. The postal laws of 1816 made a change in the postage, which lasted until 1845. The reduced rate was charged for letters consisting of one piece of paper, not going over 30 miles; six cents; not over 80 miles, 10 cents; not over 150 miles, 12½ cents; and not over 400 miles, 183¼ cents; and for greater distances, 25 cents. The success of the postage stamp in Great Britain led local postmasters in a number of large cities, notably New York, Baltimore, Saint Louis, Providence and New Haven—to issue stamps. They proved popular, and in 1847 the United States introduced stamps and the 5 and 10-cent denominations, with the faces of Franklin and Washington respectively. Previously the postage was collected entirely in money, its prepayment being in all cases optional. On 1 July 1851 a new series of stamps was adopted, consisting at first of denominations of one and three cents, but afterward of larger amounts. Stamped envelopes were first used in 1853. The registration system was instituted in 1854, during the administration of President Pierce. The first fee was five cents; the price was raised in 1863 to 20 cents. It is now ten cents. In the administration of President Lincoln the free delivery service was established. As early as 1823 provision was made by Congress for the delivery of letters by carriers at a cost of two cents each to the persons named in the letters. In 1836 this was further amended by allowing newspapers and pamphlets to be delivered at half a cent each. In 1863 Postmaster-General Blair introduced the free delivery system, beginning the practice in cities of 30,000 population. Receiving boxes were also put up and deliveries provided for as often as the public convenience demanded. For the postal card was introduced in 1873. For the further development of postal service see POST-OFFICE DEPARTMENT and related references.

POST-RENAISSANCE PAINTING, painting as practised in Europe after the middle of the 15th century.

Seventeenth Century. The great color school of monumental and decorative painting which was the glory of Venice was one of the last to disappear (see RENAISSANCE PAINTING). Paris Bordone, of Venice, and Titian, did little to maintain it, but a much more vigorous and original talent was that of Jacopo Robusti (1518-94), called Il Tintoretto from his father’s occupation as a dyer, and also surnamed Il Furioso from his manner of working. The number of his paintings was very great, and their merit very unequal. From the school of Verona, which had been for some time rising in importance, and even in the 15th century had produced some painters of note, came another illustrious artist, Paolo Cagliari (q.v.), called Paolo Veronese (1532-88), one of the most brilliant of all decorative painters. The school of Bologna was founded by Lodovico Carracci, aided by his two cousins, Agostino and Annibale, in 1589, at the period of the rise of the Electric Church, combating against the Mannerists, and of the naturalists, rejecting all tradition and professing to study nature directly. In Naples appeared an Hispano-Neapolitan school of which the chief was Josepe Ribera, called Lo Spagnoletto. Spain produced a number of native painters in the 15th and at the beginning of the 16th century; and the influence of Italian art became more predominant toward the middle and at the close of the latter. But the authority of the Inquisition was strongly restrictive. Francisco de Zurbarán (q.v.) (1598-1662) was preeminently a painter of monks. The three great names in Spanish art are Alonso Cano (q.v.) (1601-67), a pupil of Francisco Pacheco, the master and also the father-in-law of Velasquez; Diego Rodriguez de Silva y Velasquez (q.v.) (1599-1660); and Bartolome Estéban Murillo (q.v.) (1618-82). The name of Velasquez has been raised by modern criticism to the summit of the art of painting. In Germany, no painter attained the eminence of Düer and Holbein for more than two centuries; after them, a baleful imitation of the mannerisms of the Italians suppressed any assertion of national individuality, and the so-called inspiration from Michelangelo affected even foreign painters visiting in Germany—as the Hollander Goltzius, Hubert and Hendrick. The works of Adam Elsheimer (1578-1620), though he visited Italy and died in Rome, displayed a curious and original talent, both in figures and landscape, unusual at this period.

But it was to the Netherlands that the chief seat of the art of painting was transferred in the 17th century, made illustrious by the great development of all resources of the art; the influence of Peter Paul Rubens (q.v.) (1577-1640) not only revolutionized the entire painting of his era but is still felt in those of our day. One of the most celebrated of his pupils was Anton Vandyck (q.v.) (1599-1641), whose portraits constitute his chief title to eminence; another was Dierik Teniers, the elder (q.v.) (1632-1649), instructor of his still more famous son of the same name. In the works of the latter, and of a number of the painters of Holland, Adrian Brouwer (q.v.), Adrian Van Ostade (q.v.), Jan Steen (q.v.), Gérard Terburg (q.v.), and Giel Metzu (q.v.), Gerard Dow (q.v.), is carried to the highest point the genre painting of contemporary life, the extérieurité, which so strongly differentiates this Northern art from that of Italy. In the painting of landscapes, animals, marines and even still-life, this example was maintained, reaching its supreme development in the genius of Rembrandt (q.v.) (1607-69), the greatest master of light and darkness of any school of painters. Under François 1, a number of Italian painters were induced to visit France, many of them being employed in the decora-
opening of royal galleries and the dissemination of engraving. Three female painters appear, whose graceful talents entitle them to recognition,—in Venice, Rosalba Carriera (q.v. 1656-1757); in Germany, Angelica Kauffmann (q.v.) (1741-1807); and in France, Mme. Vigée-Lebrun (q.v.) (1755-1842). In Italy, the last glories of the Venetian school flamed up in the daring and truly decorative work of Giambattista Tiepolo (q.v.) (1696-1770).

Nineteenth Century.—During the 19th century the supremacy in painting and sculpture was transferred to France; Paris, with its annual official Salons, became the recognized capital of the fine arts for Europe and America. French art in this century has been considered to have passed through three great periods, corresponding closely with changes in the national government,—Classicism, Romanticism and the third period, dating from 1848, the schools of the Second Empire and the Third Republic. All these have naturally had many subdivisions. The classicism of Louis David (q.v.), with its sacrifice of everything in painting to the outline and to what was considered to be an imitation of the ancients, was obliged to give way to the Napoleonic art, representations of battles and of state ceremonies, and to genre painting,—the last not being officially recognized till 1816. Classical painting, which dominated in Europe for 50 years, with almost exclusively figure painting; its rigid formalism gave way to a greater sympathy with nature even in the works of David's immediate pupils and followers, Regnault (q.v.), Picot (q.v.), Baron Gérard (q.v.), Gros (q.v.) and Ingres (q.v.). And much more living and sympathetic classic taste than David's was that of Prud'hon (q.v.). Romanticism found its first expression in painting in the works of Géricault (q.v.), though Delacroix (q.v.), more emotional and more of a colorist, is considered to have been the leader. The essential narrowness of this form of art was also gradually tempered by naturalism, so that its range became wider,—as in the very different art of Decamps (q.v.), first of the Orientalists, and of Ary Scheffer (q.v.) and Paul Delaroche (q.v.). In Rome, 1741. The future leaders in the second phase of this movement, Cornelius, Overbeck, Veit, Schadow, etc., were all born in the very last years of the century. Great Britain and France on the contrary, developed, in a number of distinct schools, each a fresh evidence of a national and original art, in practically all the branches of painting. In portraiture, the British record the names of Reynolds, Gainsborough, Romney and Raeburn; in genre, not always satiric, Hogarth,—one of the most pre-eminently national of all artists, and, Wilde; in landscape, Gainsborough, Old Crome, Constable and Turner. In academical and historic art, the Americans, Copley and West, rose to international eminence. In France, the last days of the reign were made illustrious by the delicate and graceful courtly art of Watteau (q.v.), Pater, Lancret and Fragonard, the frail idylism of Greuze (q.v.) and the admirable naturalism of Chardin (q.v.)—to be succeeded in their turn by the pedantic classicism of David. In the Empire art is distinguished also by the growing recognition of the popular interest in art, encouraged by the
Académie and the Institut, included such celebrated names as those of Gérôme (q.v.), Jules Joseph Lefebre (q.v.), Cabat (q.v.), Baudry (q.v.), Bouguereau (q.v.) and Henner. In Genre, characterized usually by excessive delicacy and accuracy of finish, the highest place was held by Meissonier (q.v.) and the little inferior was the work of Louis Leloir and Vibert (q.v.). Something of the haunting antique influence appears in the work of Gleyre, Couture (q.v.) and Flandrin (q.v.), protesting against the rising flood of "realism"; something also in that of the so-called Neo-Grecs, of which the two most sincere and persistent were Hamon (q.v.) and Aubert. The most graceful of the Orientalists was Fromentin (q.v.), and the painters of Eastern subjects, in very varying methods, include many of the most celebrated names of this epoch, Gérôme, Henri Regnault (q.v.), Benjamin-Constant (q.v.), Belly, Boulanger and others. Of the Mystical school, influenced by any conventions or traditions, the most striking example is that of Gustave Moreau (q.v.); and one of the most distinguished artists of the men in Hébert (q.v.), whose delicate, melancholy art has not varied since 1850. Nearly all the French figure painters are portraitists. Military subjects have been rendered with a realistic accuracy and a dramatic force never before attained, by Yvon (q.v.), Detaille (q.v.), De Neuville, Aimé Morot, Roll and others; mural painting received a new inspiration from Puvis de Chavannes (q.v.); a warmer splendor of color than that of the Venetians was revived by Monticelli (q.v.); and the still-life of the early Dutch painters equaled that of Doggoffe and Volland (q.v.) One of the most important manifestations of this contemporary school was that of the Impressionists (q.v.), with their new theories of presenting absolute realities, and of which the most uncompromising advocates among the leaders were Manet (q.v.), Monet (q.v.), Sisley, Pissarro, Cabillebotte, and others. While the influence of this innovation still lingers, the contemporary art of the Salons shows but very little change. It is almost to be noticed that the great decline in all artistic value of these annual Salon exhibitions, and of the national art generally, within the last 10 years, has been admitted by the French themselves.

In Great Britain, the influence of the Pre-Raphaelite movement of 1851 is considered to be still very strong, especially among the younger painters, but it is certain that that of the Newlyn school, much later, and even of the Glasgow school in landscape painting, has had very much more to do with the introduction of more purely artistic conceptions and a much sounder technique. A few of these younger colorists, as La Thangue and Clausen, have been officially recognized by the Royal Academy (q.v.), and the works of a number of the others, as Edward Stott, Alfred East, Alfred Parsons and J. M. Swan, the animal painter, appear at its annual exhibitions. Unlike the French, the British guard the distinctly moral purpose of art — rejecting all but the sincerity and truth-seeking methods of Raphael's predecessors, and unlike the conventional characteristic art of the day with its insistence upon details and a subject, these modern innovators paint the simplest themes with breadth and with skilful rendering of atmosphere and color. At the head of the academic school stands the Cabinet of Charles Fortuny (q.v.), afterward Lord Leighton (q.v.); his immediate successors in the office of president, Sir John Everett Millais (q.v.) and Sir Edward John Poynter (q.v.), sustain intelligently the traditions of an art whose greatest defect is generally in the brushwork. All forms of painting are represented in this school, historical, decorative, portrait, genre, landscape and marine. The British water color school has long been considered to be one of the most important branches of the national art; it likewise includes all subjects in its province and treats them with much the same seriousness of detail as the oil-painting. The most important of the official bodies after the Royal Academy are the Royal Scottish and the Royal Hibernian academies, and there are many minor societies representing various tendencies of the art.

Unlike England or France, northern Germany has never possessed one recognized centre of the arts — the conflicting claims of Berlin and Munich became identified. Austria, the capital, Vienna, has long enjoyed this distinction — in the 18th century and in the 19th more particularly since the aggrandizement of the city following the razing of the outer walls in 1858. This period gave rise to a species of eclecticism in all the arts, in which a great variety of styles and influences prevailed. In Prussia and Bavaria, the second period of the great revival, led by Cornelius and Overbeck, began about 1830; and the third — the natural reaction against the mysticisms and devours of these "Nazarites" (q.v.), and hence considered to be naturalistic — about 1830. Still another regeneration is placed immediately after the close of the war of 1809-71. The development of this latter, however, was slow; the real leader in the modern movement is considered to be Franz Stuck (q.v.), who first became widely known at the exhibition in Munich in 1889. This movement was particularly directed against the academic formulas of the historic painters of the school of Piloty (q.v.) and the rural genre of Defregger (q.v.) and Vautier (q.v.). Much of the influence of the older men, however, still survives and among those who escaped this general denunciation was the veteran, Menzel (q.v.). The three great "Secession" movements were those of Munich, Düsseldorf and Berlin, but the art of the latter capital is still largely official. The secession in Austria and the division of the painters into "the old and the new" dates from only about 1897. In Hungary, the national art, rising from the exhaustion and devastation of the numerous wars and revolutions, is considered to have taken form after the Revolution of 1848.

Contemporary continental painting may be said to have been so greatly influenced by the art of France as to have fallen into a routine in which mere technical skill very frequently takes the place of any strong national or individual assertion. This is particularly true of Italy, Spain and Holland. Among the Neapolitan painters, the chief of whom are Palizzi, Morelli and his pupil, Michetti, are the most interesting and the best known abroad; about 1867 a society of Roman painters was formed to combat the commercial art of the day, for which Fortuny (q.v.) was con-
sidered to be largely responsible. Among the few painters with international reputations, two of the most prominent are Segantini and Madame Romani-Carlesimo. In Spain also, but few traces are left of the brilliant Roman-Spanish school (q.v.) of Fortuny, even in the genre. In much broader methods all the brilliancy of the contemporary cosmopolitan technique is to be seen in luminous canvases of Sorolla y Bastida (q.v.), and what are considered to be the qualities of Goya in the somewhat brutal scenes of daily life by Zuloaga. Dignified historical art is worthily represented by Pradillos (q.v.); and the small Venetian scenes painted by Rico are widely known. Portuguese art has suffered from many national ills; the list of contemporary painters is headed by the king, Dom Carlos I.

Painting in the Netherlands has not followed common lines of development in Holland and Belgium—in the latter, it has been susceptible to every new wind of doctrine from abroad, while the Dutch artists have remained faithful to what may be defined as the national principles for the last 30 years. This close adoption of native traditions in the essential and intimate quality of things, differs from the famous national art of the 17th century, both in conception and in technical processes, but it seems to be rather an evolution than a revolution. The leaders in the movement against the indiscriminate assimilation of all other European methods, which prevailed in 1830, were Josef Israels (q.v.) and Jacobus Maris (q.v.); the renown of the latter is shared by his two brothers, Matthys and Willem. The great work is that of Carel van Mander, Willy Sluiter, Blommers and Anton Mauve, the marines of Mesdag, the domestic genre of Albert Neuhuys, the church interiors of Bosboom, have given this art an international renown. Among the younger painters, a not very important independent movement was set on foot within the last few years—that of the "New Impressionists," seeking the expression of greater vehemence, of more passion, in their works. The leaders in this were Isaac Israels, the son of Josef, and Georges Hendrik Breit-ner, whose independent movement was set on foot within the last few years—of the "New Impressionists," seeking the expression of greater vehemence, of more passion, in their works. The leaders in this were Isaac Israels, the son of Josef, and Georges Hendrik Breit-ner, whose independent movement was set on foot within the last few years—of the "New Impressionists," seeking the expression of greater vehemence, of more passion, in their works.

Scandinavian art, also, shows divergencies according to the many characteristics—that of Norway being under, somewhat more distinct; that of Sweden following more faithfully the varying currents of foreign art, as does the scantly art of Finland; that of Denmark, seemingly more senile, with comparatively little variety. The emancipation from foreign domination, mostly German and latterly French, is recent and is not yet complete, dating in Denmark from the commencement of the 19th century, under Thorwaldsen (q.v.) the sculptor and Eckersberg (q.v.) the painter; in Norway from 1870 only about 1890. The sound technical training that permits of the rendering of even the distinctively northern themes, the clear, cold, impressive aspects of nature, the sincere and intimate domestic genre, has in nearly all cases been acquired in foreign schools—Norway and Finland having none of their own; and of the most brilliantly equipped of these painters, as the Swede, Zorn (q.v.), and the Norwegian, Thaulow, it is to be said that their art, like their country, is cosmopolitan. Many of the artists trained in Paris have identified themselves with the contemporary French school—the Norwegians generally excepted. Among the few painters who have remained distinctly national, one of the most original and most decorative in his work is the portrait painter, Thorvald Munthe of Norway, a good landscape painter, owes his international reputation to his very curious and novel renderings of ancient legends.

The art of Switzerland, like the best of all that of the minor countries, even the South American and the Danubian, reflects strongly the influence of the Parisian schools. In Basel, however, in 1897, was celebrated a double festival in honor of Holbein and Böcklin (q.v.), the latter a painter whose art was singularly free from all traditions whatever.

The art of western Europe was first introduced into Russia by Peter the Great; before him it was barbaric, or semi-Byzantine, like the civilization. The Saint Petersburg Academy of the Arts was founded by the Empress Elizabeth in 1757. In its curriculum, the influence of the various European schools of painting were taken up in turn, or simultaneously, from Carracci and Guido Reni to the classicism of David and Mengs. The reaction against these has naturally developed a number of painters who strive to negative everything native, and of the various European schools of painting were taken up in turn, or simultaneously, from Carracci and Guido Reni to the classicism of David and Mengs. The reaction against these has naturally developed a number of painters who strive to negative everything native, and of the various European schools of painting were taken up in turn, or simultaneously, from Carracci and Guido Reni to the classicism of David and Mengs. The reaction against these has naturally developed a number of painters who strive to negative everything native, and of the various European schools of painting were taken up in turn, or simultaneously, from Carracci and Guido Reni to the classicism of David and Mengs.

In the United States, painting has developed along the lines of technical excellence, rather than in any striking or inspiring development of a great distinct national art. Even in the
matter of technique, some of the early portrait
painters, as Gilbert Stuart (q.v.) and the wood-
cutter, A. B. Durand (q.v.), remain unsur-
passed. Trumbull (q.v.) and Washington All-
ston (q.v.) were not only portraitists but also
painters of historical and imaginative composi-
tions, the former excelling in the small heads
in his large historical canvases, and the latter
displaying more of a painter's feeling for tone
and color. The art of Benjamin West and
C. R. Leslie belongs rather to England and is
to-day quite alien. The modern landscape may
be said to commence with the pictures of the
visionary Thomas Cole (q.v.), and is rapidly de-
developed in the work of the painters of the
'Hudson River School,' the most important of
which are J. F. Kensett (q.v.), Sandfor R.
Gifford (q.v.), W. Whittridge (q.v.) (d. 1910),
T. A. Richards (d. 1900) and Jervis Mc
Entee (q.v.). The great panoramic canvases of
Albert Bierstadt (q.v.) and the far more dis-
tinguished landscape compositions of Fred S.
Church (q.v.) have no reflection in the work of
to-day. The landscape art has culminated,
apparently in the renderings of tone and atmos-
phere, and the sentiment of nature in her
quieter moods, in the works of such artists as
George Inness (q.v.), Homer Martin (q.v.) and
A. H. Wyant (q.v.) (d. 1892), and, of the
stronger moods, Winslow Homer (q.v.), a painter of the clearest insight and most truth-
ful rendering. William Page (q.v.) (d. 1885)
and Daniel Huntington (q.v.) (d. 1906), each
in his turn president of the National Academy
of Design, were considered reputa-
tions as portrait painters, the former devoting
himself to an effort to discover the secret of
the color of the Venetians. At the present day,
Blakelock, Ryder, Horatio Walker, Murphy,
Dewey and Dearth represent the imaginative
school of landscape; with them may be placed
the more literal canvases of Tryon, R. Swain
Gifford (d. 1905), Chase, Pickenall, Bolton
Jones and Theodore Robinson (d. 1896)—to
mention only a few of a very long list. The
portrait painters are also numerous; John S.
Sargent (q.v.) and A. T. Richardson (q.v.),
among the best known, have been most
frequent in the one of the greatest of any school;
Whistler (q.v.) (d. 1904; who resided in
England), Eastman Johnson (d. 1906), Brush, Chase,
Alexander (d. 1881), Vinton, Collins (d. 1903),
George Healy, Wyatt Eaton (d. 1896), Beck-
with, Tarbell, Benson, Vonnah, Metcalf,
Wiles and Fowler (d. 1910), at home, are among the
most distinguished, as is Miss Cecilia Beaux.

Most of these also paint genre, or semi-decora-
tive figure pieces; some of them having com-
minated as illustrators, or still practicing that
art. Among the latter are Howard Pyle (d.
1911), A. B. Frost, W. T. Smedley and Hop-
kinson Smith (d. 1915). E. A. Abbey (q.v.)
(d. 1911), originally an illustrator, had trans-
ferred his residence to England and painted
both in historical and in large mural composi-
tions.

John La Farge (q.v.) is in a way a link be-
tween the old and the new, having been a pupil
of Couture, and the first, practically, to seek
color for its own sake in oil paint; his very numer-
ous water-colors and in his later monumental
work both on walls and in stained glass. An-
other of the older men, Robert Weir (d. 1889),
was noted for his important figure compositions,
apparently influenced by the European schools;
Mr. Golden Weir renders much similar scenes in
methods somewhat more affected by wholly
modern processes; Thomas Moran, mountain
landscapes and Venetian scenes inspired by
the English painters of the early part of the
century. A number of the figure and landscape
painters have established themselves in Paris,
MacEwen, Melchers, Julius Stewart, Edwin
Lord Weeks (d. 1903), Johnston and others;
Hitchcock in Holland, Ulrich in Germany, etc.
The list of marine painters is also long; among
the most talented are Arthur Beasis (q.v.)
(d. 1886), Henry Snell, T. W. Richards, C. T.
Chapman and some others, and, among the older
men, James Hamilton (d. 1878).

In figure painting there has seemed to be a
lack of popular appreciation for anything more
ambitious than small examples of genre, usu-
ally familiar and domestic themes, rather than
for the historic or the more purely imaginative
or mystical—the most important exceptions of
late years being the dignified, almost monu-
mental canvases of Charles Deas, and the
Oriental interiors of Siddons Mowbray. The
increasing use of large mural paintings in pub-
lic and private buildings has, however, devel-
oped a school of truly decorative artists, of
which the first in point of time was Wm. Mor-
ris Hunt, Frank H. Hodges, (q.v.); the first
painters are Mowbray, Dewing, Simmons,
Blashfield, Vedder, C. Y. Turner, Robert Reid
and a few others.

Universelle,' Paris.

POST-TERTIARY PERIODS, the last
major division of the Geological Record, and
which includes all the formations accumulated
from the close of the Tertiary Periods down to
the present day. No sharp line can be drawn
at the top of the Tertiary groups of strata. On
the contrary, it is often difficult, or indeed im-
possible, satisfactorily to decide whether a par-
ticular deposit should be classed as a part of
the younger Tertiary or among the Post-Tertiary
groups. In the latter the mollusks are believed
to belong to still living species, and the
mammals, although mostly of existing
species, include some which have become extinct. These extinct forms are numerous in post-antiquity, and the deposits in which they have been preserved. Accordingly a classification of the Post-Tertiary strata has been adopted, in which the older portions, containing a good many extinct mammals, have been formed into what is termed the Pleistocene, or Glacial, group, while the younger deposits, containing few or no extinct mammals, are termed Recent. The Post-Tertiary periods are now generally termed Pleistocene and designate the units of geological time from the end of the Tertiary to the beginning of the Historic. This term was introduced by Sir Charles Lyell.

The gradual refrigeration of climate was prolonged and intensified in Post-Tertiary time. Ultimately the northern portion of the Northern Hemisphere was covered with snow and ice, which extended into the heart of Europe, and descended far southward in North America. The previous denizens of land and sea were in large measure driven out, or even in many cases wholly extinguished by the cold, while many advanced southward to take their places. The reindeer, for instance, roamed in great numbers across southern France, and Arctic vegetation spread all over northern and central Europe, and what is now the temperate zone of America. After the cold had reached its climax, the ice-fields began to retreat, and the northern flora and fauna to retire before the advance of the plants and animals which had been banished by the increasingly severe temperature.

The insensible gradation of what is termed the Pleistocene into the Recent series of deposits affords a good illustration of the true relations of the successive geological formations to each other. We can trace the gradual passage because it is so recent that there has not yet been time for those geological revolutions which in the past have so often removed or concealed the evidence that would otherwise have been available to show that one period or group of formations merged insensibly into that with which it follows it. The Recent formations are those which have been accumulating since the present general arrangement of land and sea, and the present floras and faunas of the globe were established. They are particularly distinguished by traces of the existence of man. Hence the geological age to which these belong has been spoken of as the Human Period. But there is good evidence that man had already appeared on earth during Pleistocene time, so that the discovery of human relics does not afford certain evidence that the deposit containing them belongs to the Recent series. Nevertheless it is in this series of the Post-Tertiary deposits that vestiges of man become abundant, and that proofs of his advancing civilization are contained.

During the Recent period the same agencies have been and are at work as those which have been in progress during the vast succession of previous periods. No trace can anywhere be detected of a break in the continuity of the evolution through which our globe has passed. See Geology (Ages of Geologic Time) and consult the bibliography under that article. Consult also Fairchild, H. L., "Pleistocene Geology of New York State" (in Bull. Geol. Soc. America, Vol. XXIV, Washington 1913).
issued on the application of the War Department for the payment of claims for bounty and back pay due by the United States to colored soldiers. The generalization of the money-order service rendering valuable assistance in insuring the proper payment of the claims.

One of the means provided by the act approved 13 June 1898 to meet the expenditure caused by the Spanish War was the collection of a tax of two cents on each domestic order issued. The collections began 1 July 1898 and ceased 30 June 1901, by repeal of the law. During this period the system collected for and paid to the Internal Revenue Service $9,531,481.94, without any expense whatever to the Treasury Department and with practically none to the Post Office Department.

Aside from the ordinary service which it renders the citizen by affording him the practical result of a checking account in making purchases and settling financial obligations by mail, the money-order service of the United States is now used by the foreign-born population to send money to relatives and to the postal-savings banks in their own countries. Many persons in the past have found the money-order system a convenience for the temporary deposit of funds for safekeeping by having the order drawn on the office of issue and in their own names. The establishment of a postal-savings system in this country, however, served to reduce the amount of money sent to postal-savings banks abroad and to curtail the use of the money-order service for savings purposes.

The act of Congress establishing the money-order system limited the amount for which a single order could be issued to a maximum of $30 and a minimum of $1. It was stated by Postmaster-General William Dennison on 2 Nov. 1864, the day following the opening of the service, that the limit of $30 is believed to be sufficiently large to include all that class of remittances now sent in money through the mails, but in exceptional cases more than one order can be procured. As a basis for this statement it was shown that the average amount collected in the dead letter office during the fiscal years 1862, 1863 and 1864 was $4.53, $4.20 and $5.18, respectively. However, before the service had completed its first year of operation, experience showed that so many applicants desired to send larger amounts through the mail that the labor imposed by the necessity of writing several orders to cover the remittances handicapped the economical operation of the system. This condition resulted in a recommendation to Congress by Postmaster-General Dennison on 15 Nov. 1865 for the increase of the maximum amount of orders to $50, which was accepted in the act approved 12 June 1866. The present restriction on the amount for which an order may be issued is $100. The reasons which led to this amount being fixed as the maximum were substantially the same as those already recited for increasing it from $30 to $50. The desirability of the present maximum was suggested as early as 1886, but it was not until 3 March 1883 that Congress authorized it.

The growth of the system and the continuous simplification of business methods are reflected in the reductions that have been made from time to time in the money-order fees, the principal source of revenue from the business. It is a noteworthy fact that with few exceptions the gross receipts of the organization since 1873 have permitted successive decreases in the charges to the public. These reductions were uniformly recommended to Congress whenever the receipts derived from the operation of the system were substantially greater than the expenses. The present low schedule is the result of the extensive patronage of the system by the public and the progress that has been made in handling the business economically.

It was proposed by Postmaster-General Dennison on 2 Nov. 1894 that—

"The establishment of the (money-order) system in this country will no doubt lead to arrangements for the interchange of international money orders with the several foreign countries with which we have direct postal arrangements."

This prediction was fulfilled on 27 July 1868 when the President signed an act authorizing the Postmaster-General to make conventions for exchange of orders with countries with which the Department had negotiated postal conventions. It was not until over a year later, however, that the first convention was concluded.

The service was initiated with Switzerland, pursuant to the terms of a convention signed at Washington on 2 July 1869 by the Postmaster-General, under the authority given by the act of 27 July 1868 and at Berne on 26 July 1869 by the chief of the Federal Post Department of Switzerland. The new service commenced on 1 Sept. 1869, 150 post offices in this country being authorized to issue and pay the international orders.

Service was next established with Great Britain on 2 Oct. 1871. Germany and Canada were the next countries with which conventions were concluded. The service has gradually been extended to other countries under the present time conventions for the exchange of money orders exist with more than 50 foreign postal administrations.

The year 1880 saw important modifications in the terms of the original conventions with the United Kingdom and Ireland, the German empire and the Dominion of Canada. At the time the original conventions with these countries were concluded the value of United States currency was below par of gold and was continually fluctuating, which made it impossible for the issuing postmaster to draw the order for a fixed sum in the money of the country of payment and confined the actual exchange of orders between the respective countries to certain international exchange offices. The postmaster at the ordinary international money-order office would draw on the exchange office and the latter would make the conversion from the money of one country to that of the other at the market rate of gold prevailing in New York. When the currency of this country became stable, therefore, a simplification of the mode of procedure in the exchange of orders was made possible. Under the new method the postmaster at the inland international money-order office was able to issue the orders for a determinate amount by the use of conversion tables supplied him. The rate of commission to be paid by each postal administration was
lowered and the cost of the interchange of orders between the contracting countries was further reduced by the diminution of the number and cost of the blanks and the amount of clerical labor required. These economies per-

1 Domestic money orders first issued, 1 Nov. 1864, under act of Congress approved 17 May 1864.
2 International money orders first issued, 1 Sept. 1869, under act of Congress of 27 July 1866.
3 Postal notes first issued, 3 Sept. 1883, under act of Congress approved 3 March 1883.

International money-orders are of two kinds—those issued on what is known as the "domestic basis" and the "international basis." In the former class the orders are drawn on the ordinary domestic form and settlement is made between the two countries involved on the exchange of paid orders. In the latter class the orders issued in each country are recorded on descriptive lists at an exchange office designated for the purpose, and accounts are settled on the basis of such lists, care being taken to give due credit to the country of origin for the amounts of

$50 to $100 instead of two orders as theretofore. Following is a table showing the growth of the service from the time of its inauguration in 1864 to the close of the fiscal year which ended 30 June 1918.
POSTAL MONEY-ORDER SERVICE

orders not presented for payment within one year from the time of issue.

Countries having postal money-order systems arrange themselves into two general groups:

1. The United States, Great Britain, her colonies, protectorates and dependencies, comprising Canada, the Commonwealth of Aus-
POSTAL SAVINGS BANKS — POSTER ART

Austria, Belgium, Denmark, Germany, Greece, Hungary, Italy, Luxemburg, Netherlands, Norway, Russia, Sweden and Switzerland.

The general distinction between the two groups is that the countries named in the first (excepting the United States) are upon an advice to facilitate and safeguard payment; those in the second use a card order sent in open mail by the issuing to the paying postmaster. In the first case, the intending remitter must file with the proper amount for order and fee a written application containing the full particulars of the remittance — amount, name and address of sender and of payee, from which the postmaster prepares the order, which is then handed to the applicant to be mailed at his own expense to the payee.

Card orders are printed on thin boards and supplied to applicants free or at a merely nominal charge. The remitter fills in the required spaces on the card and hands it to the needed stamp for $1.25. The present amount of the fee is affixed to the card, which is then numbered, signed, stamped and mailed by the postmaster. No written application is required from the remitter who receives, however, for his protection, a coupon receipt corresponding to the order. (The foregoing statements refer particularly to Germany, but are believed to apply equally to the other countries named in the same class). When it reaches the office of delivery, the order is given to a letter carrier, who calls at the designated address, pays the amount to the payee and obtains the latter's signature to a form of receipt on the back of the card, which is then returned to the postmaster at the office of payment.

France uses both forms of money-order and is in a class by herself.

As a separate feature or adjunct of the money-order systems, many countries issue postal orders or notes for small sums, limiting the amount to the equivalent of $5 or $10. The notes of Great Britain and Canada are printed in fixed denominations from 6 pence to 21 shillings in the one case and from 20 cents to $10 in the other. Twenty-two separate pieces are needed to complete a set of British notes and 18 of the Canadian. Intermediate amounts may be represented by canceled postage stamps affixed to the notes.

In the French service, it is understood, fractions being canceled, the amounts are expressed in writing, from one franc to 20 francs.

In effect, card orders and postal notes are money-orders without advice, issued by the postmaster with the minimum expenditure of time and labor consistent with a reasonable degree of safety. As already explained, postal notes are for small amounts only and, as might be expected, greatly outnumber the issues of money-orders.

ALEXANDER M. DODDERY.
Third Assistant Postmaster-General.

POSTAL SAVINGS BANKS. See Banks and Banking — Postal Savings Banks.

POSTAL SAVINGS SYSTEM. The Postmaster-General’s Annual Report for the fiscal year ending 30 June 1918 registered an increase during the 12 months of $16,516,803, at 6,678 depositories; the depositors numbering 612,198 and the total deposits increasing to $148,471,499, an average of $242.53 per depositor. Congress further amended the Postal Savings Act by increasing the amount that a depositor may have to his credit from $1,000 to $2,500 which largely accounted for the increase. The amendment also eliminated the 10-cent savings card, provided for in the original Postal Savings Act as one of the means of evidencing small deposits and stipulated that hereafter a card with 10 (instead of 9) savings stamps affixed shall be accepted as a deposit of $1, either in opening an account or in adding to an existing account or may be redeemed in cash, the card provided for by the new legislation being furnished free of charge.

By eliminating the savings card as a means of evidencing deposits, the accounting made necessary by the maintenance of both the card and the stamp was reduced by one-half.

The system is self-supporting. The profit in 1918 amounted to $1,135,288.61. At the close of the year, 4,622,701 Liberty Loan bonds were invested in the postal savings bonds authorized by the Postal-Savings Act. The board also purchased for investment $14,000,000 third Liberty Loan bonds.

POSTAL UNION, The. See Post and Postage.

POSTER ART. Posters are a modern field for the artist, having been developed within the last 50 years, along with advertising art. They are usually conventional in form and any degree of exaggeration is permissible, if it attracts attention. The earliest example of the poster dates back to the days of Pompeian splendor. During the Middle Ages managers of theatres and officers recruiting for the army used pictorial advertisements. From these pictures, Jules Chéret of Paris (b. 1836), called the father of the modern poster, is said to have received his first suggestion of the possibility of adopting art to latter-day advertising. One of his first efforts was an announcement of a fairy play, La Biche au Bois, in which Sarah Bernhardt was acting in 1863. Chéret's principles were conventionality, elimination of detail, arrangement and pure color. For a long time he was almost alone in his efforts and did not attain to the pre-eminence that has come in more recent years.

In order to produce a good advertising placard it must command the attention of the public. It should be attractive to the man in the street without being vulgar; sufficiently startling, but not aggressively so. Jules Chéret understood the requisites and limitations of this kind of art better than any other of his time and his work gained for him a world-wide reputation. He can justly lay claim to founding a new school. He has defined his idea of a perfect poster as follows: "It should be as simple as possible and I consider the introduction of one figure — and need I hardly say that of a lady for choice — is indispensable; whenever it is possible this figure should be life-size. My own posters are never smaller than 60 centimeters (two feet) by 80 (nearly three feet) and my favorite size is 250 by 90; the figure should, of course, be elegantly and brightly dressed in some striking costume.
not likely to go out of fashion so long as the railway is in use. I always make a point of designing the lettering of the actual advertisements. I do not believe in black and white letters, but have no objection to their being very dark blue, red or violet; this produces the effect of lack without giving a jarring note.

Close rivals to Chéret are Grasset and Steinlen, and by some critics the two are considered to be in many respects superior to the master. Eugene Grasset, a native of Switzerland, is a decorator and architect by profession. His work is characterized by a vital principle of design, effective yet subdued. His Napoleon and Jeanne d'Arc (Bernhardt) posters are superb creations. Grasset's work is always refined and harmonious, yet less bright and striking than Chéret's. There is more repose and it appeals more to the artist than to the public. The poster of the Salon des Cent in its tenderness, its exquisite lines and its spirituality, is worthy of Rossetti. French artists De Feure, Guillaume, Ibels, Lautrec, Boudet de Monvel, Steinlen, Willette and Jossot are perhaps the most accomplished. Bossot is a great artist, essentially a caricaturist, who works with vagabond and artistic lines and in a morbid color-scheme—rusty greens and pale yellows. Steinlen is every way a charming artist. His "Lait Pur Sterili," a child in a red dress drinking from a bottle, envied by three eager tabby cats, is perhaps one of the most attractive posters ever made. Lautrec has not the refinement of Grasset, nor the sprightliness of Chéret, yet he possesses an individuality which makes his work peculiarly interesting. His posters are generally simple in composition and depend to a great extent for their effectiveness on the skilful arrangement of masses. Ibels is remarkably clever in drawings that are inimitably and effectively grotesque. Aristide Bruant has done some things that are strikingly forcible in their broad masses of color. In Great Britain, Audrey Beardsley and Walter Crane were early experts in the new art. They have been gloriously followed by Gordon Craig, Will Owen, Hardy Simpson, Bell and others.

In the United States the modern poster artists include Louis J. Rhead, Will H. Bradley, Kenyon Cox, W. H. Carqueville, Edward Penfield, Ethel Reed, A. Friedler, Walter Fawcett, Max Parrish, Hy Mayer, Hamilton King, Clarence Tilt, E. Haskell, etc. The war brought forth a great demand for inspiring patriotic posters and many a new man entered the ranks. By long odds the most successful of these war posters was a picture of a Red Cross nurse with a miniature wounded soldier in her arms and the inscription "The Greatest Mother in the World," this being by A. E. Foringer.

POSTING, in Europe, traveling by means of horses hired at different stations on the line of the railway. Such post offices as have been established by private enterprise on some of the main routes in England, at least as early as the reign of Edward II. It was afterward made a government monopoly. As letters were originally carried on foot, a standardized manner, the name of post office has come to be applied to the institution charging itself with conveyance and delivering of letters. The custom still obtains in certain parts of the world where the railway has not penetrated.

POSTMAN POET, The. See Capern, Edward.

POSTMASTERS, National Association of, an organization formed in Detroit, Mich., in 1898, taking in first and second-class postmasters and higher postal officials. They aim to improve the postal service by an exchange of information. In 1917 the president was D. T. Gerow of Jacksonville, Fla., and the secretary, W. C. Markham of Baldwin City, Kan.

POSTULANT, the canonical term for one who desires to take holy orders in the Protestant Episcopal Church of America and whose name has been entered by the bishop upon a list of postulants, as required by Canon 2, Title I of the Digest. A postulant may in due course be recommended, by the Standing Committee of the diocese, to the bishop for admission as a candidate for holy orders. The term is applied in the Roman Catholic Church to those on probation before entering a religious order. It is a preliminary stage for the novitiate and existed in the early days of monasticism. With modern decrees the postulant has to wait from three months to two years or more, usually in the novitiate's house.

POSTULATES, or axioms, are sets of propositions belonging to mathematical disciplines from which the remaining propositions can be deduced. Thus the axioms of Euclid constitute a tentative set of postulates for ordinary geometry. The old-fashioned view was that these axioms constitute a set of self-evident truths, referring only to one system, that of the space in which we live. The work of Bolzai, Lobachevsky and Riemann, however (see Geometry, Non-Euclidean), cast grave doubts on the self-evidence of these propositions, and led to the more modern attitude according to which the axioms are merely hypotheses concerning space. As far as the mathematician makes use of the axioms it is a matter of entire indifference whether they concern space or not; in other words, strictly speaking, postulates are not propositions concerning a definite subject matter at all, but are merely forms of such propositions. Once this view is accepted it becomes easy to see that sets of postulates can be formulated for systems as unlike ordinary geometry or any ordinary mathematical system as you please, and that these sets will have just as much intrinsic, underived right to exist as that of Euclid. This has led to a large number of sets of postulates for various mathematical systems, such as non-Euclidean geometry, line geometry, analysis situs, algebra, the theory of functions of a real variable, quaternions, symbolic logic, etc. (q.v.).

Furthermore, various sets of postulates can be formed for the same system. Thus, one can describe all the possible homometrics of points and their distance-relations, or in terms of spheres and their relations of inclusion. Accordingly there are at least two possible sets of propositions characterizing the properties of geometrical entities, or, in other words, two sets of postulates for geometry. Furthermore, it is possible to define all geometrical properties in terms of the same entities
by different sets of postulates. As a consequence of these facts it becomes a desideratum to determine those sets of postulates which are in some sense the most practical or simple. The criteria of simplicity usually employed are (a) the independence of the postulates—no set of the postulates must imply another; (b) their finiteness in number. Independence of the postulates is demonstrated by the exhibition of systems which fail to satisfy but one of the postulates, this postulate being each in turn. E. K. Moore of Chicago discusses a strengthened form of independence, in which not only are the postulates independent of one another, but no postulate or its denial is dependent on any combination of the other postulates or their denials. Many mathematicians, however, consider this a rather unnecessary refinement. As to the fineness of the postulates, for some purposes of analysis the opposite extreme seems desirable as indicating a greater degree of analysis. However, no really unequivocal definition of the number of distinct postulates in a set has yet been given.

Besides these properties of postulates that are more or less independent of the systems they define, there are others which are bound up with the latter. In the first place, though a set of postulates always defines a class of mathematical systems, this may be the null class (see Logic, Symbolic). In that case the postulates are called inconsistent, otherwise they are consistent. The consistency of a set of postulates is demonstrated by the exhibition of a system which satisfies them. For all ordinary purposes the exhibition of a system formed from the natural numbers is regarded as sufficient. The policy of producing such a system in the case of all mathematical systems is called the arithmetization of mathematics.

Another desideratum of a set of postulates is that the systems they define be one from the mathematical standpoint—that is, that the set be categorical. A categorical set has the property that a one-one correspondence can be set up between the two systems which it defines and that this correspondence will leave their structure invariant.

There is one set of postulates whose position in the theory is unique. This is the set of postulates for symbolic logic (q.v.). Symbolic mathematical logic consists in the criteria and methods of logical and mathematical reasoning in all fields. It is consequently in essence an individual system, not a type of systems. Consequently, if it can be treated by the postulate method at all, its postulates are genuine individual propositions, and not propositional forms. It is by no means obvious that any finite set of postulates will suffice for symbolic logic, and the attempt of Whitehead and Russell to find such a set breaks down in certain details, yet is sufficiently close to complete success to give promise of even better results in the future.

In the course of any attempt to formulate postulates for logic, two propositions appear which postulates appear which have been discussed for the development of the simpler and many of the more complicated propositions in logic and mathematics, but are continually involved in many processes of reasoning that were formerly accepted without question. There are the proposition that there are an infinite number of things in the world, and the proposition that given an aggregate A of aggregates B, some aggregate C exists containing one member of each of the B's, and only one. This latter is essentially due to Zermelo. See ASSEMBLAGES, General Theory of.

There is no book devoted to postulates theory at large, although almost any of the mathematical works of the writers already named or of Huntington, Veblen, Sheffer, Peano, Valenti or of many other writers of the last quarter century approach mathematical problems with this attitude in mind. By far the largest part of the literature is contained in the American Journal of Mathematics, the Transactions of the American Mathematical Society and the Annals of Mathematics for the past 15 years. For the postulates of logic consult A. N. Whitehead and B. Russell, 'Principia Mathematica' (1910—).

Consult the various articles on mathematical disciplines for their peculiar postulates, and see especially Logic, Symbolic; Assemblies, General Theory of.

ROBERT Wiener.

POSTULATION, in canon law, an appeal to a competent authority to remove a disability by which one who has been appointed to a benefice is prevented from entering upon it. The term was also applied to the method by which a bishop was translated. The canon law declared that a person once elected to one see could not be elected to another; and when an electoral college desired the bishop of another see to occupy their own, they petitioned the bishop to make the change. No postulation could be made unless the electoral college were unanimous, while in the case of an election a majority was sufficient.

POT-HOLES. Cylindrical holes in rock ledges usually in or near beds of streams. They are caused by the wearing action of sand and pebbles whirled by the water. They have been called giant kettles, giant caldrons, Indian kettles, wells and the Spanish name, re- moliens. Their size and character vary greatly, many of the larger ones being 10 feet in diameter and 25 feet deep. One in Saint Croix, Dallas, Wis., is 27 feet in diameter, another with diameter of 15 feet is 65 feet deep, and another in diameter is 160 feet deep. The pot-holes of the "Glacial Gardens" of Lucerne in Switzerland are famous. In some cases, notably on Kicking Horse River, near Field, British Columbia, a small natural bridge has resulted from the coalescence of the lower parts of two or more pot-holes. The canyon at Watkins Glen, N. Y., consists partly of coalescing pot-holes. Pot-holes develop only in streams that are eroding in fairly well consolidated rock. They evolve from small hollows due to solution, removal of a lense or pebble or a joint-crack. Such hollows are necessary to hold the first few pebbles which begin the grinding. Too much sediment stops the process, but otherwise flood stages of the stream greatly facilitate the erosion. The rate of the development and declivity and volume of the stream are important factors. Many holes, "moulins," are of glacial origin, not caused by the ice, however, but by water falling over the edge of the ice or into holes extending to the rock floor. Ir-
regular pot-holes or basins also occur along the coast, scoured out by tidal or other currents. Plunge pools are frequent at the foot of water falls and a notable one on the Canadian side of Niagara Falls according to J. W. Spencer is 72 feet deep. Small pools due to swirling of hard parts of sea urchins have been observed on sea coast in New Brunswick and at Bia-

NELSON H. DARTON.

POTAMIAN, pō'tā-myan, Brother (Mi-
chell Francis O'Reilly), American physi-
cist: b. County Cavan, Ireland, 29 Sept. 1847; d. New
York, 20 Jan. 1917. He was educated in the public and Christian Brothers schools, New York City, London University, and the Chris-
tian Brothers Scholasticate, Montreal, Canada. In 1871 he was one of the founders of the Christian Brothers; taught successively at Quebec and Saint Louis, Mo., professor at Saint Joseph's College, London, from 1870 to 1893, and pro-

fessor of mathematics and experimental phys-
ic at De La Salle Normal College, Waterford, Ireland, in 1893-96, and from 1896 to 1917 pro-

fessor of physics at Manhattan College, New York City. In 1893 he was appointed by the British government a member of the jury of awards at the World's Columbian Exposition, Chicago. His writings include 'Gleamings in Electrical History'; 'Franklin and De Romas, or the Lightning Kite'; 'Gilbert of Colchester'; 'The Rotation of the Earth.' He was joint author of 'Electric Illumination' (2 vols.); 'Letter of Peregrinus on the Magnet'; 'The Makers of Electricity'; 'The Makers of As-

tronomy'; and 'Catalogue of the Wheeler Gift' or a brief illustrated account of works on electric-
y and magnetism from the earliest times to
the middle of the 19th century.

POTAMOGALE, the generic name of a
stramineous 'African otter' (P. anguina), which
might be called the insectivorous otter. It is a
turetive, representing the family Potamogalidae, is somewhat larger than a stoat, perhaps two feet long being an average, and the appearance and habits are like those of an
ter, save that it is not certain that it subsists

on fish. A related smaller potamogale (Geo-
gale aurita) inhabits the valleys of Madagascar.

POTASH, originally a vegetable alkali (so-
called), obtained by leaching wood-ashes, evap-
orating and calcining, commonly called car-
bonate of potash or pearl-ash, K₂CO₃. Soda and potash were not distinguished by old-time
chemists, but in 1807 Davy separated them. Various plants take up potash salts, and the
use of beet-roots has been utilized as a
source of potash. After the electrolytic pro-
duction by Leclanché and others, it came to be understood that a metallic element was being
dealt with and potassium (q.v.) was developed.

Commercial Potash.—Previous to the
outbreak of the World War nearly the whole
potash supply of the United States market was
imported from Germany. A glance at the
portations of 1913 shows the various forms in
which the potash came in and the amounts
consumed normally by the industries of the
country. The figures are as follows: Kainit, 521,176 tons; manure salts, 250,529 tons; muri-
ate of potash, 237,630 tons; sulphate of potash, 44,349 tons; argol or bitartrate of potash (mainly from France and Italy), 14,499 tons; carbonate of potash, 11,003 tons; nitrate of potash, 4,826 tons; ferrocyanide of potash, 1,706 tons; and much smaller quantities of other potash salts—cyanide, chlorate, permanganate, etc., a grand total of 1,052,588 short tons, having a con-
tent of actual potash amounting to 270,720 tons and valued at $18,073,865. Beside these, the
figures of the imports of potash for 1917 indi-
icate the remarkable change of conditions and values—8,100 tons, valued at $7,788,406.

Although the world's supply of commercial potash had come almost wholly from mines in Germany and Austria, it was a matter of com-
mon knowledge to geologists everywhere that
potash occurs very extensively in nature, being a component of granites and most other igneous
rocks, and occurring in smaller amounts in the various sedimentary strata and soils. It is es-
estimated to form 3 per cent of the earth's crust. In the dry saline matter from evaporated river waters there is generally about 0.2 per cent of K₂O (potassium oxide) and in the ocean from
1 to 2 per cent. Where these waters evaporate
and the other saline components crystalize out, the potash accumulates in the remaining so-
lution so that on the evaporation of the final
pane the percentage of K₂O may be high.
There are deposits of this kind in various lake
basins, both recent and of various older geo-
logic periods. Alunite, a hydrous potassium-
 aluminum sulphate (K₂O • 3Al₂O₃ • 4SO₃ • 3H₂O),
contains when pure 11.4 per cent of K₂O which is made soluble by roasting.

The orthoclase feldspars which are of wide-
spread occurrence in granite and gneiss contain from 16.8 per cent of K₂O in combination with
silicic acid and some processes for separating
this ingredient appear to be commercially prac-
ticable, especially when the residue can be util-
ized for making brick. Some of the younger
igneous rocks contain much potash notably the rhyolites, trachytes and phonolites, some of
which carry 8 per cent. The mineral leucite KAl(SiO₄) contains a large amount of K₂O, the
rock in Leucite Hills, Sweetwater County, Wyo., carrying from 9 to 11 per cent of potash. Sericite or altered mica schist in the southern
Appalachians carries 10 per cent or more.
Glaucnite or greensand, which occurs in beds
notably in southern New Jersey, Maryland and
Virginia, Kentucky, Tennessee and Georgia,
contains up to 9 per cent, and in some cases 11
per cent of K₂O in form of silicate. These
deposits are from five to 20 feet thick and
easily worked. These various silicates are ex-
ceedingly difficult to resolve, but heat and ad-
mixture with lime and other agents liberates
most of the potash.

The largest known potash deposits exist in
the Permian in central Germany, the Oligocene in
Alsace, the lower Miocene in Spain, in the
early Tertiary near Sauria in northeastern Spain
and in beds of unknown age in India. They are
associated with the great deposits of common
salt, dolomite and gypsum such as occur in the
Permian beds in the central United States, and
it is hoped that domestic supplies may be de-
rived from these beds. The potash deposits in central Germany have been very extensively developed by numerous mines, some of great depth. Annual production under ordinary conditions is about 7,000,000 metric tons valued at more than $30,000,000 and sold at a profit of about $4,000,000. The potash occurs in various compounds, the principal one being Kainite, MgSO₄·KCl·3H₂O, which is in the midst of a 3,350 feet salt bed and anhydrite, the products of long-continued desiccation of a water body. The potash salt was deposited at or near the end of one stage of desiccation, but there was a later incursion of waters from which finally there were deposited anhydrite and common salt. Fortunately a thin overlying sheet of clay was deposited which protected the potash from solution by the water which brought the anhydrite and salt now covering the potash.

The larger percentage of potash consumed by the world is used in commercial fertilizers, although considerable is made into chemicals for the arts and medicine and for explosives. In the latter case, however, it is not as important as it was formerly, as the high explosives do not contain it. Potash is essential to plant growth and in agriculture is rapidly depleted from the soil, and must be returned in fertilizers. It also has an important stimulating effect on soils naturally deficient in this component. The production of potash-bearing material in the United States in 1917 was 126,961 short tons, containing an average of 26.4 per cent of K₂O, an equivalent of 32,573 short tons of potash; that is, 13.6 per cent of the normal consumption of the United States. This production was three times the amount produced in 1916 and 30 times the amount in 1915. During the war the price rose from the normal rate of 50 to 75 cents a unit to about eight times as much. The average for 1917 was $4.26 per unit or a total of $13,791,922. The unit is 1 per cent K₂O per ton. The production in 1917 is shown in table below.

About 63 per cent of the total output was produced from brines in lakes, mainly from those in the Sand Hill district of western Nebraska and from lakes in California. From the Nebraska lakes a total of 61,053 tons of crude potash material was marketed in 1917; equivalent to 14,588 tons of pure potash. The residue resulting from the burning of kelp, the great sea weeds on the Pacific Coast, is a potential source, but as the raw material contains 90 per cent of water the expense of handling and drying it is great. The char or clinker carries from 20 to 30 per cent of K₂O and valuable by-products, including iodine, help defray the otherwise prohibitive cost of treatment. Charred molasses residue at alcohol distilleries yields considerable potash, while waste liquor from one of the beet sugar processes is a minor source. Potash is extracted from the mineral alunite mined near Marysville, Utah, the potassium sulphate being made soluble by calcining. Plume dust from cement mills is an important source, with constantly increasing product as mills utilize more material rich in potash and make provision to catch flue dust. The dust is leached and a high grade potassium sulphate is obtained by evaporation. In 1917 eight mills produced a total of 1,621 tons of actual potash. A very large amount of potash is given off as vapor in furnaces from blast furnaces, but no provision is made to collect this material. The present small output (1917) reported from three steel companies was recovered from the dust which collected in flues and stoves. The loss of potash in the furnace gases is not less than 22 pounds for each ton of iron produced. It is believed that if the large furnaces installed suitable flues the supply would be sufficient for all domestic purposes and at very low cost. A constantly increasing supply is derived from the old-fashioned source of leaching wood ashes. Considerable potash is extracted from the crude Chillian nitrate of soda. See Potassium.

In 1918 production increased to 192,587 tons of products, containing 52,135 short tons of K₂O. The producing capacity of American potash plants at end of 1918, classified according to sources of raw materials, is estimated roughly as follows:

**Capacity of American Potash Plants.**

United States Geological Survey.

POTASH FERTILIZERS. See FERTILIZERS.

POTASSIUM PRODUCTION IN THE
UNITED STATES. See FERTILIZERS; POTASH.

POTASSIUM (from "pot-ashes," wood ashes being one of the best known sources of the carbonate of potassium) is one of the most important elements of nature, many of whose compounds have been known from antiquity, but which was first prepared in the metallic form by Davy, in 1807, by the electrolysis of fused potassium hydrate — a substance which had previously been supposed to be itself elementary. In 1806 Gay-Lussac and Thénard showed that the hydrate can be reduced by heating it with finely divided iron and in the same year Curaudan showed that the reduction can also be effected by carbon. Several methods of preparing metallic potassium are now known. The best known of these and the only one that was in practical service for many years consists in the direct reduction of the carbonate of potassium by carbon, the reaction being carried out in an iron retort heated to redness. The chief products of the distillation are carbon monoxide gas and metallic potassium, the latter being volatile at a red heat. The production of potassium by this method is attended by more or less danger, not only because the vapor of potassium takes fire spontaneously upon contact with air or with water, but also because under certain conditions potassium and carbon monoxide combine to form a black explosive compound, whose production has caused a number of fatal accidents. The potassium vapor should be permitted to condense before it issues from the neck of the retort, a cooling device being provided for effecting its liquefaction, and the molten metal should then be allowed to drip into a receiver containing petroleum oil or some other similar fluid that is free from oxygen. In G. A. Gauthier's process, the carbonate or (hydrate) of potassium is mixed with carbon and finely divided iron, or with carbon and a metallic carbide and the reduction is effected by the agency of heat, as before. A considerable part of the commercial supply of metallic potassium is now produced, however, by the electrolysis of the melted hydrate or chloride of potassium.

Potassium is a lustrous, silvery-white metal, brittle at 32° F., but soft and wax-like at ordinary temperatures, so that it can be easily cut with a knife. It melts at about 144° F., and boils at about 1,250° F. (when heated in an atmosphere of hydrogen), its vapor being green. It has a specific gravity of about 0.87 and, with the exception of lithium, is the lightest metal known. Its specific heat is 0.166, its coefficient of linear expansion (Fahrenheit scale) is about 0.0000467. It conducts electricity much better than mercury does and it is soluble in anhydrous liquid ammonia (NH₃), forming a blue solution. It is also deposited on the vessel again deposited upon the evaporation of the ammonia.

Chemically, potassium has the symbol K (from kalium, Latin for potash), and the atomic weight 39.15. It oxidizes in the air with great readiness, a freshly cut surface becoming almost instantly covered with a film of oxide. It also decomposes water vigorously, uniting with it to form potassium hydrate, KOH, in accordance with the equation

\[ K + H₂O \rightarrow KOH + H₂ \]

hydrogen gas being liberated at the same time. When potassium is thrown upon the surface of water it floats and the heat generated by the chemical action is sufficient to set fire to the liberated hydrogen and to part of the potassium. This experiment is a favorite one in the lecture room, since it is beautiful as well as instructive, the flame having the purple color that is used in the laboratory as a test for the presence of volatile potassium salts. (See BLOWPIPE ANALYSIS.) Potassium never occurs in nature in the free state, but it forms an essential constituent of many minerals, among the most important of which are feldspar, niter and carnallite. Chloride and sulphate of potassium are found in sea water and various binging. It also occurs in its animal body and in plants and in remote country districts its carbonate is still prepared (chiefly for the manufacture of soap) by leaching wood ashes. (See POTASH.) Wool yields an organic potassium salt, which may be washed out from the natural grease with water.

Trost and Heutsefusse's experiments show that when potassium is heated to over 200° C. it ocludes hydrogen gas. In a vacuum, when diluted with hydrogen, the compound will lose hydrogen above 200° C., down to a certain point.

The potassium compounds are exceedingly numerous and many of them are of great importance both in the laboratory and in the arts. Two oxides of the metal are certainly known and others probably exist also. Potassium monoxide, K₂O, which is the oxide that is understood when "potassium oxide" is mentioned without qualification, is formed when thin slices of the metal are allowed to oxidize in cool, dry air. It may be prepared more readily on the large scale by heating potassium chloride in its melting point and then heating it over a stream of air that has been dried and freed from carbon dioxide. The monoxide is a gray, brittle substance, which has a specific gravity of 2.66 and melts at a strong red heat. It has a powerful affinity for water, with which it combines with the evolution of much heat, to form potassium hydrate, KOH. Potassium tetroxide (or peroxide) is formed when potassium is burned in a stream of pure, dry oxygen. It has the formula K₂O₃, and is a yellowish substance at ordinary temperatures, melting, at a red heat, to a black liquid, which crystallizes upon cooling. The tetroxide combines with water to form potassium hydrate and peroxide of hydrogen, oxygen being also set free at the same time. When heated to a white heat, the tetroxide gives off oxygen and becomes reduced to the monoxide.

Potassium chloride, KCl, occurs native in large quantities at Stassfurt, Germany, chiefly in combination with magnesium chloride, with which it forms nothing else than KCl·MgCl₂·6H₂O. Most of the commercial supply of potassium chloride is now prepared from this mineral by crystalizing its solution. In order to obtain a satisfactory product, however, many practical details must be carefully
attended to, for which reference must be made to advanced works on inorganic chemistry and to treatises on alkali manufacture. Potassium chloride is very similar in its general properties to sodium chloride (common salt). It has a saline taste, is white in color and crystallizes in cubes. Its specific gravity is 1.94 and it melts at about 1,350° F. Potassium chloride is now extensively used as a source of potassium in the preparation of other salts of that metal. Potassium nitrate or "nitre" (Q.v.), KNO₃, occurs native, but the greater part of the commercial supply is now manufactured by acting upon the cheaper nitrate of soda (NaNO₃) by means of potassium chloride; the reaction being as indicated by the equation

$$\text{NaNO}_3 \text{+ KCl} \rightarrow \text{KNO}_3 \text{+ NaCl}.$$  

Potassium forms two carbonates, known respectively as the "normal" carbonate and the "acid" carbonate. Normal potassium carbonate, K₂CO₃, may be obtained in an impure state by leaching wood ashes and evaporating the resulting solution to dryness. The residue is then strongly heated to destroy any organic matter that it may contain and is subsequently redissolved and redeposited by evaporation. The crude product as obtained from wood ashes is known as "kakelhout" or "kakelhout". Pure normal potassium carbonate is best prepared by heating ordinary monomoritate of potassium (see below), which is thereby resolved into a mixture of free carbon and potassium carbonate, from which the latter salt may be obtained by solution, filtration and subsequent evaporation. Acid potassium carbonate has the formula HKCO₃ and may be prepared by passing carbon dioxide over the normal carbonate or through its concentrated solution in water; the reaction being as indicated by the equation

$$\text{K}_2\text{CO}_3 \text{+ CO}_2 \text{+ H}_2\text{O} \rightarrow 2\text{HKCO}_3.$$  

The greater part of the commercial supply of normal potassium carbonate is now prepared by a method similar to the Leblanc process for the preparation of carbonate of soda. (See Sodium). Normal carbonate of potassium is quite alkaline in reaction, deliquescent and very readily soluble in water. It is used in the manufacture of soap and as a raw material in the manufacture of various compounds of potassium. The acid carbonate is much less soluble than the normal salt and its solution is nearly neutral to litmus paper. Potassium hydrate, potassium hydroxide or "caustic potash," KOH, is formed when metallic potassium is dissolved in water; but the commercial supply is obtained either by the electrolysis of a solution of potassium salt, or by acting upon a solution of normal potassium carbonate by means of slaked lime, Ca(OH)₂; the reaction, in the latter case, being as represented by the equation

$$\text{K}_2\text{CO}_3 \text{+ Ca(OH)}_2 \rightarrow 2\text{KOH} \text{+ CaCO}_3.$$  

The calcium carbonate (CaCO₃) that is formed at the same time is practically insoluble and may be removed by filtration. The solution is then evaporated to dryness and the resulting hydrate of potassium is finally melted and cast into sticks in metallic molds. Potassium hydrate is a white substance, absorbing moisture from the air with great readiness and also taking up carbon dioxide gas from the air, being thereby converted into the acid carbonate. The hydrate dissolves in half its own weight of water, the solution being intensely alkaline. The solid hydrate has powerful caustic-hydrate properties (whence the name "caustic potash") and destroys the skin when brought in contact with it. It is used in the arts and in the laboratory for a great variety of purposes. The bromide of potassium (KBr) and the iodide (KI) are soluble, crystallizable salts, which are largely used in medicine and in photography. The bromide may be prepared by adding bromide to a solution of potassium hydrate, the reaction being

$$6\text{KOH} \text{+ Br}_2 \rightarrow 5\text{KBr} \text{+ KBrO}_3 \text{+ 3H}_2\text{O}.$$  

To remove the potassium bromate (KBrO₃) that is formed, the solution is evaporated to dryness after the addition of a small quantity of powdered charcoal and the dry residue is well pulverized and finally raised to a dull red heat. The carbon that is present then reduces the bromate to potassium bromide and free carbon dioxide gas. When this mixture of carbon and bromine vapor is collected and the gas is passed into water, in which the pure bromide of potassium is prepared by evaporation and crystallization. Iodide of potassium may be obtained in a similar manner. Potassium chloride, KClO₃, which is used in the laboratory for effecting oxidations and also as a source of free oxygen and which is likewise employed in medicine, may be prepared by passing chlorine gas through a warm, concentrated solution of potassium hydrate; the chlorom of potassium being formed at the same time, as is indicated by the equation

$$6\text{KOH} \text{+ Cl}_2 \rightarrow 5\text{KCl} \text{+ KClO}_3 \text{+ 3H}_2\text{O},$$  

the reaction being entirely analogous to that given above for the formation of potassium bromide. As will be seen from the last equation, only one-sixth of the potassium of the original hydrate is converted, by this method, into the form of chlorate; the remaining five-sixths being converted into the chloride. The process as given is, therefore, wasteful; for, although the potassium chloride may be easily recovered, it is not available for the manufacture of further quantities of the chlorate until it has been reconverted into the hydrate. In practice it is, therefore, customary to prepare calcium chloride, Ca(ClO₃)₂, as the first step in the process; potassium chloride being then obtained by treating the calcium chloride with potassium chloride, according to the equation

$$\text{Ca(ClO}_3)_2 \text{+ 2KCl} \rightarrow 2\text{KClO}_3 \text{+ CaCl}_2.$$  

Several sulphates of potassium are known, the most important of these being the normal sulphate, K₂SO₄, and the acid sulphate, HKSO₄. These may be prepared by the action of sulphuric acid upon potassium chloride; but the commercial supply is obtained in large measure from the mineral "kainite," which occurs in great quantities at Stassfurt and which consists of normal potassium sulphate in combination with the sulphate and chloride of magnesia. It is also obtained as a by-product in the working up of beet root, vinasse and kelp, and in other chemical industries. Normal potassium sulphate forms, with aluminum sulphate, a compound familiarly known as "alum" (q.v.) or "pottash alum," which crystallizes in octahedral having the composition

$$\text{Al}_2\text{(SO}_4)_3 \text{+ K}_2\text{SO}_4 \text{+ 2H}_2\text{O}.$$  

\[ \text{Al}_2\text{(SO}_4)_3 \text{+ K}_2\text{SO}_4 \text{+ 2H}_2\text{O} \]
POTASSIUM

Three important salts of potassium, known respectively as the cyanide, ferrocyanide and ferricyanide, are described under HYDROCYANIC ACID, and the permanganate of potassium is described under MANGANESE. Several sulphides of potassium may be prepared, the best known being those having the formulae K₂S, K₂S₂, K₃S₄, and K₃S₅. These are all soluble and evolve sulphuretted hydrogen when heated with an acid. Common "liver of sulphur" is a brown, ill-smelling substance, prepared by heating normal potassium carbonate, potassium and potassium hydroxide, with charcoal. When this substance is heated with alcohol, it contains various sulphides of potassium, together with more or less of the normal sulphate and carbonate of potassium. When potash and pul- verized quartz are melted together, a compound of potassium, oxygen and silicon is obtained, which is usually described as a silicate of potassium. This compound is soluble in water and is known in the arts as "potash water glass," the corresponding compound of sodium being known as "soda water glass." The residue left when a solution of water glass is evaporated has a glassy appearance, from which fact the popular name is derived.

With tartaric acid, H₂C₂O₄, potassium forms two compounds (the acid being dibasic), Monopotassium tartrate, K₂C₂O₄, tartar, and Dihydrogen potassium tartrate, KH₂C₂O₄, is formed in the course of the fermentation of wine, and, as deposited by the wine in a crude state, is known as "tartar," or "argol." When purified, it constitutes the substance familiarly known as "cream of tartar," which is used in the manufacture of various baking powders. The normal tartrate of potassium, KH₂C₂O₄, is not used in the arts to any great extent.

With the fatty acids (for example, stearic, palmitic, etc.), potassium combines to form salts that are familiarly known as "soaps." The bases are usually obtained by boiling potassium hydrate or carbonate with fat. The fats are composed of glycerine in combination with various fatty acids; and the potassium, being more soluble in water than glycerine, remains in the compound, the result being the formation of a soap, and the simultaneous liberation of free glycerine. See SOAP.

Sources of Potassium.—Since the largest deposit of potassium salts are in Prussia, the United States experienced a scarcity as the war progressed; in fact there had been a shortage of supply in America and friction over the importation as early as 1909. The year before the war our importation of potassium salts from Germany was about 25,000 tons. When this was cut off we had to get along with less than a tenth of the usual supply, and potash as a fertilizer had to be foregone, as the price was prohibitive. These conditions caused active search for new sources of supply. Wood ashes were carefully saved for leaching. The Bureau of Soils, Department of Agriculture, obtained an appropriation for experiments as to the best methods of securing potassium in commercial quantities, and the United States Geological Survey spent considerably time and money in searching for deposits. Small quantities were found in Arizona, Colorado and Nevada, but it was not until a large deposit was uncovered in Utah in 1915 that the source of supply assumed importance. In 1916, the Survey classified 24,650 acres of diantian lands as potash land and prospecting commenced. One of the most promising finds was the Searles Lake, California, a dried-up salt lake with an area of 7,500 acres and a crust 50 to 100 feet deep, saturated with a brine rich in ash and borax. The salt lakes of Nevada were able to yield a supply. Potash fields and silicate of potash have been located at a number of places, and only await practicable methods of extraction to become available: while a considerable group of inventors are striving to improve and cheapen methods of extraction of the dust and waste of the blast furnaces has disclosed a source that should be conserved. The dust that gathers around the bases of hot-blast stoves in such quantities is now carefully saved and utilized. Cement mills also yield a dust rich in potash, which is being gathered more or less, and the distillery wastes have contributed a little more. The 1915 production of potash salts in the United States was 9,720 tons; for 1917 about 32,000 tons and for 1918 the estimate is 40,000 tons, which is only one-eighth of the normal consumption.

The prospective supply of potash within the United States is summarized by the Geological Survey as follows: The 7,000 to 8,000 acres of Searles Lake, California, are estimated to contain about 20,000,000 tons of actual potash, enough to supply the present demands of the country for 80 years. About 100,000 tons annually may be recovered from the dust of cement mills. Approximately 300,000 tons of potash are annually volatilized in the blast furnaces of the United States, and much of this could be recovered by installing proper apparatus, not unduly expensive. The numberless salt lakes of Nebraska, chiefly in the Sand Hill region, range from an acre to a square mile in area, with a crust varying from a few inches to three feet in thickness. It has been discovered that below the hard pan bottom of these lakes is a layer of sand saturated with a strong potash brine, resting on a second bottom of hard pan. The possibilities of this source have not been estimated, but they are large. At the Salduro salt marsh, in Utah, wells have been sunk, and the brine pumped from them is found to be closely similar to the artificial brines of the German potash works. The dumps of old copper and gold mines now being regrown for treatment by the flotation process are found to contain considerable amounts of potash easily recoverable. The present possibilities of the molasses distilleries is estimated at 30,600 tons per annum; and from the beet sugar works it is expected to get 16,000 tons of pure potash a year. The supply from kelp is not regarded as especially promising. The difficulty of drying the raw material before it can be calcined, and the tendency of the great kelp plantations to become diseased and disappear entirely from a given locality renders the kelp-potash industry hazardous. The green sands of New Jersey are estimated to contain not less than 2,000,000,000 tons of actual potash.

The costs of getting potash from these various sources is estimated as follows: From the brines of the Nebraska lakes, $120 per ton; from roasting alumine (as at Marysville, Utah), $40 per ton; from cement mill dust (as at Hagerstown, Md.), $50 per ton; from the German mines at Bassfurt, $40 per ton.
man product was sold in the American market at (about) $80 per ton and the investment in the German mines is about $150 per ton of annual product. This is not much less than the investment at the Hagerstown cement mills, where the net cost per ton is $10 less than at the German mines. The market price of actual potash in the United States in 1917 averaged about $423.50 per ton. See also Potash, Commercial.

Potassium in Medicine.—Caustic potash is a useful irritant and caustic and may be used to kill off warts and other morbid growths. Permanganate of potash is valued as an antiseptic and disinfectant. Where an old sore tends to gangrene it may be applied wet to oxidize the products of decomposition. A 1 per cent solution has been recommended for external use on snake-bites. Any potassium salts taken internally serve as cardiac depressants, and also reduce the nervous action. Very small quantities of potassium are administered by the medical profession, in a variety of forms, internally, for several ailments; but it should always be taken under a physician's advice. For it is improperly classed as a poison. An overdose causes abdominal pain, burning, diarrhea, and vomiting and should be treated with emetics, followed by lemon juice, then vegetable oil and white of egg. Washing out the stomach is of course advisable. In one paper, made with potassium nitrate, is burned by asthmatic patients, that they may inhale the fumes and relieve the paroxysms. Acetate and citrate of potassium are sometimes employed to increase the flow of urine. Potassium salts will neutralize the gastric acid, and small doses may thus relieve an acid condition of the digestive tract, but the tendency to induce inflammation and gastritis should not be overlooked.

Consult Bulletins of the United States Geological Survey; also Bulletins, United States Department of Agriculture, and Cushman and Coggeshall (in Eighth Inter-Congress of Applied Chemistry, Vol. V, 1912).

POTASSIUM PERCHLORATE. See Perchloric Acid.

SALT. A perennial herb (Solanum tuberosum of the family Solanaceae). It is a native of the Chilean and Peruvian Andes. Its tuberous roots send up weak stems which bear pinnate leaves and white or lilac flowers which in cultivation are rarely followed by fruits. When fruits are produced they are globular, yellow or purple, and about the size of a gooseberry. The plant is extensively cultivated in temperate climates for its tubers, which are used as a staple food for man, and to a less extent for animals. It was in cultivation before the discovery of America, and was taken to Europe (probably to Spain from Peru) in the early part of the 16th century. It seems that Sir Francis Drake introduced it into England in 1586, though Sir Walter Raleigh is said to have brought it to him the year previous. Gerarde mentions it in his Herball in 1597 under the name Batatas Virginiana, but it seems to have been regarded somewhat as a curiosity until the latter part of the 18th century, although the Royal Society of London had recommended it as a means for checking famine among the Irish peasantry. Owing to the failure of grain crops in 1772 the potato soon commenced to grow in popularity as a food-plant, but even as late as 1771 only two varieties, one white and one red, were listed. In 1900 it was the most commonly cultivated vegetable in the United States and Europe to test more than 150 varieties at one time. The crop is one of the most important in Germany, France, Ireland and the United States. In the last-named country the yield per acre averages less than 100 bushels (1917), but with proper attention to cultivation, etc., yields of 200 to 400 bushels are not unusual, and even 1,000 bushels have been obtained under the best conditions. By artificial methods 2,558 pounds of tubers have been grown from one pound of seed in one season; but this was in a competition for prizes. The crop in the United States for 1917 was 442,536,000 bushels. Besides being an important article of food the potato is largely used in the manufacture of starch, and in some countries for making alcohol, etc. For such purposes special varieties are generally grown; these are usually coarse and are little used for human food.

The culinary varieties have been found to contain about 78 per cent water, 18 per cent starch, 2.2 per cent protein, 1 per cent ash and 0.1 per cent fat. During storage these proportions change, since the tubers shrink nearly two per cent a month as an average for seven months. Since the potato is rich in starch and poor in protein it is valued chiefly as a carbohydrate food, the deficiency of protein being made up by eggs, meat, fish, beans, peas, etc., and that of fat being supplied by butter, fat, oat-meal, etc. During the process of cooking the cells are ruptured, the starch expanded and made "mushy," and great changes in flavor and palatability are produced, either by the dissipation of raw flavors, the development of new ones, or both. In the cooked state more than 90 per cent of the nutritive substances are considered assimilable. Large quantities of potatoes are annually evaporated to supply the demand for provisioning expeditions, camps, cruises, etc. "Saratoga chips" are thin slices of potato which have been fried in fats or oils and sprinkled with salt. The potato is cooked in many various ways, not any vegetable, but fundamentally the various processes are baking, boiling and frying, the first being the most economical when properly performed.

Methods of Propagation.—The potato is propagated almost wholly by means of its tubers, which are cut in many ways intended to increase the amount of "seed." Some growers plant the whole tuber, others half-tubers, and others "single-eye pieces." Probably there is no one method which is best under all conditions of soil, cultivation, etc., but it seems as if the half-tuber of medium-sized, well-formed specimens is in most general favor. Extra large and little potatoes are not favored. In the propagation of new varieties seed-balls are used, and after they have germinated it may be increased rapidly by means of cuttings made from the sprouts. These are rooted under glass in the same way as geranium cuttings, etc., and the rooted plants set in good soil when the weather becomes settled. The growers expose their "seed potatoes" to the sun for about 10 days before planting in order to hasten the growth. During this period of ex-
POTAWATAMI — POTEMKIN

Potawatami—Potemkin

Potawatami and Potemkin are two different names for the same people, a Native American tribe that lived in what is now the Midwestern United States. They were known for their agricultural practices and their trade relationships with European settlers. The Potawatami tribe is one of the Ojibwa or Chippewa nation, and their lands were highly valued in the fur trade.

Insects—Among the insects which feed upon the potato are tortoise blisters and flea beetles. The three-lined potato beetle (Lema trilineata) and the tomato worm (Sphinx quinquemaculata) are also frequently seriously troublesome. The most widely destructive enemy, however, is probably the potato-hoe or properly the Colorado potato beetle (Dorysthenes decemlineata). Unlike most insect pests this beetle became troublesome first in the West and migrated eastward. When the potato was first cultivated in the West, this insect left its original food plant the sand-bur (Solanum rostratum), and traveled from field to field, living upon potato vines. In 1860 it had become troublesome in Nebraska; in 1870 it was busy in Ohio and Ontario; and in 1875 it was well known in the Atlantic States as far south as Virginia. Its spread in the South has been less rapid probably because the potato is there less extensively grown than in the North. The hibernating adults appear in the spring and lay yellow eggs in clusters upon the remains of the old vines before it appears above the surface. In about a week the red larvae appear, eat ravenously for about three weeks, pupate for about 10 days and emerge for feeding and egg-laying. From two to five broods appear in a season. This insect has a number of enemies, but farmers prefer to depend upon Paris green or other arsenites which are sometimes applied as a dust while the dew is on the plants, but usually as a spray. This is also more or less effective for the other species mentioned above.

Two stalk-borers are often troublesome; one, the larva of an owllet moth (Gortyna nitula), the other of a beetle (Trichobas trinitatus). Wilting of the vines is generally the first indication of their presence and the only remedy recommended is the burning of the vines as soon as observed to be wilting.

Two so-called plant diseases are reported troublesome in the North; early blight (Alternaria solani) and late blight or rot (Phytophthora infestans). In the South Bacillus solanacearum is believed to be the cause of the brown rot. These three maladies are characterized by the destruction of the plants and are thought to be spread by insects which feed upon the foliage. Here the remedies to be recommended are the control of the insects and the use of Bordeaux mixture, Paris green, and Pyrox. Care in selecting “seed” potatoes from non-infected districts and rotation of crops, the potatoes being moved to fresh soil each year, are also recommended. The scabiness of potatoes is thought to be prevented by soaking the “seed” in a solution of formalin or of corrosive sublimate, and by rotation of crops.

Consult Gilbert, A. W., The Potato (New York 1915); Grubb, E. H., and Guilford, W. S., 'The Potato' (ib. 1912); Riley, C. V., 'Potato Pests' (ib. 1876); Smith, J. B., 'Economic entomology' (Philadelphia 1886); also bulletins of the United States Department of Agriculture and of the State Agricultural College.

POTAWATAMI. See POTAWATOMI.

POTEMKIN, pō-tem'kin (Russ. potyem'kin), Gregory Alexandrovich, prince of Taurida, Russian field-marshal: b. Smolensk, Russia, 1739; d. Bessarabia, Russia, 16 Oct. 1791.
He came of a noble Polish family, entered the Russian army, was distinguished for bravery in the war against the Turks in 1771–72 and was promoted lieutenant general. He soon supplanted the brothers Orloff in the favor of the empress Catharine and for years was her acknowledged lover. When she found another more to her taste, choosing Zavadovsky as prime favorite, Potemkin was clever enough to retain his political supremacy with her, and she continued to rely on his advice, which permitted him to wield great power. He enlarged the Russian army, built a fleet on the Baltic Sea, annexed the Crimea, founded the cities Kherson, Kerch, Nikolaiev, Sebastopol, etc., was honored by Frederick the Great, Maria Theresa, Joseph II and other monarchs, and became recognized as an important factor in the politics of Europe. He was waging a successful war against Turkey at the time of his death. In his private life he was mean and avaricious, though loaded with wealth by the empress, and his public life, though eminently successful, shows little indication of high ability as a statesman. Consult Cérenville, 'Vie de Prince Potemkin' (1807).

**Potential.** In the third volume of the 'Mécanique Céleste,' Laplace, in 1784, determined the attraction exerted by a spheroid on a particle outside the mass, in the course of which he discovered the so-called potential function as the limit of the sum obtained by dividing every element of the mass of the attracting body by its distance from the point upon which the force is exerted. That is, in the case of gravitation, if \( \Delta m \) denotes the element of mass, \( r \) the distance from the particle at \( P \) and \( V \) the potential function, then

\[
V = \lim_{\Delta m \to 0} \sum \frac{\Delta m}{r}
\]

where the numerator includes all the elements that compose the mass \( M \). Laplace then proceeded to show that if the potential function of a mass was known at any external point, the attraction exerted in any direction by the mass upon that point could be found at once by performing a differentiation of the potential function in the required direction and, finally, that such a potential function would always be a solution of the differential equation

\[
\psi V = \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = 0
\]

when \( \psi \) is a symbol generally employed to denote the operator

\[
\psi = \frac{\partial}{\partial x} + \frac{\partial}{\partial y} + \frac{\partial}{\partial z}
\]

This is called Laplace's equation and \( V \) is a potential function.

Poisson (1813), a student of Laplace, gave the form of the equation which \( V \) must satisfy for all points, situated either within or without the attracting mass,

\[
\psi V = -4 \pi \rho
\]

This equation must be satisfied by the potential function for every conceivable distribution of attracting matter at any point \( P \), where \( \rho \) is the density of the attracting matter at \( P \). Since \( \rho = 0 \) for points outside, Poisson's equation reduces to that of Laplace in such a case.

In 1827, George Green, a self-educated mathematician, before he took his degree at Cambridge in 1837, noted the peculiar property of \( V \); namely, that it is a function of the initial and the final position only, thereby recognizing its universal application in dynamics in the treatment of a conservative system of forces, that is, a system that is independent of all intermediate conditions. For example, the work done in moving a mass against the force of gravity from \( P \) to \( Q \) is the same whether it is lifted directly up from \( P \) to \( Q \) or moved along any other path, as an inclined plane, provided always there is no friction. That is the earth, and every mass connected therewith constitutes a conservative system with respect to gravity. The work done is independent of the path. But if, as in practice, friction is involved, some energy is dissipated in overcoming this force and the system is no longer conservative. Green recognized, therefore, that, so far as natural phenomena are concerned, forces that are functions of distances only constitute a conservative system to which the theory of the potential is applicable, and, in particular, that in addition to gravitation, forces exerted by electrified and magnetized bodies upon each other are of this nature. Green was the first to call \( V \) the potential function. Its peculiar property may be said to be this: that it measures the work done in moving a unit of mass, electricity or magnetism from one position to another by virtue of the forces in action.

**Attraction.**—Newton's law states that every particle of a body attracts every particle of another body with a force that varies directly as the product of the masses of the attracting particles and inversely as the square of the distance between them. Let \( P \) be any particle, or point, \( M \) any mass, \( \rho \) the average density of an element of mass, \( d\mathbf{v} \), \( Q \) a point of the element whose co-ordinates are \( x', y', z' \) and take \( x, y, z \) as the co-ordinates of \( P \). By definition the attraction at \( P \) in the direction \( PQ \) will be

\[
\rho \mathbf{a} = \frac{\rho d\mathbf{v}}{dP}
\]

and its components in the direction of the axes become

\[
\rho \mathbf{a} \cos \alpha = \frac{\rho d\mathbf{v}}{dP} \cos \alpha, \quad \rho \mathbf{a} \cos \beta = \frac{\rho d\mathbf{v}}{dP} \cos \beta, \quad \rho \mathbf{a} \cos \gamma = \frac{\rho d\mathbf{v}}{dP} \cos \gamma
\]

whence

\[
\cos a = \frac{x' - x}{r}, \quad \cos \beta = \frac{y' - y}{r}, \quad \cos \gamma = \frac{z' - z}{r}
\]

Denoting the components of the total attraction by \( X, Y, Z \), we have, by Newton's law:

\[
X = \iiint \frac{\rho (x' - x) d\mathbf{v}}{r^4},
\quad Y = \iiint \frac{\rho (y' - y) d\mathbf{v}}{r^4},
\quad Z = \iiint \frac{\rho (z' - z) d\mathbf{v}}{r^4}
\]

when the integration is taken over the mass \( M \). It follows that the resultant attraction at \( P \) due to \( M \) will be \( R = \sqrt{X^2 + Y^2 + Z^2} \). But by definition, the potential function of \( P \) due to \( M \) assumes the element of mass
\[ dm = \rho ds' dy' dz' \] will be
\[ V = \int \int \int \frac{\rho dx' dy' dz'}{r^4} = f(x, y, z), \text{ and } \frac{dv}{dx} = \int \int \int \frac{\rho dx' dy' dz'}{r^4} \]
differentiation under the sign of integration being possible when P is outside the mass M, since \( r \), the radical in the denominator, can in that case never become infinite. By comparison observe that the last expression is the attraction. X. That is
\[
\frac{dv}{dx} = Y, \frac{dv}{dy} = X, \frac{dv}{dz} = Z; \text{ whence}
\]
\[ R = \sqrt{X^2 + Y^2 + Z^2} = \left( \frac{dv}{dx} \right)^2 + \left( \frac{dv}{dy} \right)^2 + \left( \frac{dv}{dz} \right)^2
\]
That is, to find the component of the attraction in any direction for a point P, find the potential function at P and differentiate this function partially in the required direction.

**Potential Function as Measure of Work.**—
By definition, the work done in moving a unit of mass along a path S against a force F is equal to the product \( F \times S \). Let the attraction at any point of the path and oppose the force \( F \) be \( -\frac{dv}{dx} \), negative since in the opposite direction from the motion, and let \( ds \) be an element of the path. Then, if the unit mass moves from \( P_i \) to \( P_f \), the work done is given by
\[
W = \text{limit } P_i P_f ds = -\int P_i \frac{dv}{dx} ds = V_i - V_f,
\]
when \( V_i \) and \( V_f \) are the values of the potential function of \( P_i \) and \( P_f \) respectively. That is, the difference or loss in potential measures the work done.

Since the difference of potential is the measure, we observe that the farther \( P_f \) is from the attracting mass the less \( V_f \) becomes. For, in general,
\[
V = \text{limit } \sum m_i \frac{1}{r_i} = \sum m_i \frac{1}{r_i},
\]
and if \( r_i \) denotes the distance of the nearest point in the attracting mass from \( P \), then
\[
V < \frac{1}{r_i} \sum m_i, \text{ or } V < \frac{M}{r_i}.
\]
That is, when \( P \) is at infinity \( r = \infty \), and the potential is zero.

It follows that when \( P \) is at infinity, \( W = V_i - V_f = V_i \).

That is, the potential function or the potential at any point \( P \), due to an attracting system, is equal to the work done in moving a unit mass considered as concentrated at \( P \), from \( P \) to infinity along any path. In most modern works on mathematical physics the word "potential" does not denote the value of the potential function at a point but measures the work done in moving a mass from a given position to infinite in the presence of the system considered. \( W \) is used by some authors as "the potential of the mass \( M \) with reference to the mass \( M \)". Others use the negative of \( W \) as the equivalent of "the mutual potential energy of \( M \) and \( M \)".
scribed under that name; it has about 500,000 inhabitants. (3) The city, capital of the province, lies on the left bank of the Basento and of the river main: it was founded by Charles V., Emperor of the Holy Roman Empire, on the site of a bishop and of several important courts, has a cathedral church, a liceo, a technical school and a great prison. It is near an older city of the same name, the old Roman colony of Potentia in Lucania, which was mentioned by Pliny the Elder, and at the beginning of the 15th century it was destroyed by Charles of Anjou. An earthquake in December 1857 nearly destroyed the modern city. Pop. about 17,938.

POTIDEA, pöt-i-de'a, in ancient history, a city of the peninsula of Pallene in Chalcidice, founded as a Corinthian colony in the beginning of the 6th century B.C. It was successfully defended against the Persians under Artabazus in 479; in 432 revolted from the Athenian League, thus precipitating the Peloponnesian War, in which it was captured by the Athenians in 429 and occupied by Athenian colonists; was destroyed in 356 by Philip II of Macedon; and was restored to its former state in 316 by Cassander, which prospered until its destruction by the Huns.

POTIPHAR PAPERS, The, a series of sharply satirical papers on New York society by George William Curtis, first published in Putnam's Magazine in 1853. The papers are somewhat in the manner of Addison's satires on the pretensions and insincerities of society; but at times the bitterness becomes more scathing, and reminds one of Thackeray in his merciless analysis of folly and ignorance. One of the enduring characters is the Rev. Cream Cheese, who sympathetically advises Mrs. Potiphar as to the color of the cover of her prayer-book.

POTLATCH, among American Indians of the Pacific Coast, a feast often lasting several days, given to a tribe by one of its members who aspires to the position of chief. The word is from the Nootka, meaning a gift, and at the potlatch feast numerous and valuable gifts are distributed among the members of the tribe. The token given at a potlatch is a piece of engraved copper, whose value is usually estimated in blankets. At these feasts the guests are expected to accept whatever is offered, but there is a "string" tied to every gift in that it must be later returned with excess. The wealthy chief who gives a potlatch will sometimes show his distinguished disregard of material values by burning a few hundred blankets, also a few canoes or other property he may have; the more he destroys the bigger chief he is. They have even been known to break up and give away the fragments of a potlatch copper representing a value of many thousand blankets.

Consult Barbeau, C. M., 'Du Potlatch en Colombie Britannique' (in Bull. Soc. de Geographic de Quebec, Quebec 1911-12).

POTOCKI, pö-tot'kë Ignacy, Court, Polish patriot and statesman; b. 1727; d. Warsaw, 1792. He adhered pertinaciously to the old constitution of Poland, and exerted his influence against the constitution of 3 May 1791. (See Poland.) Potocki so far forgot his duty to his country as to form connections with Russia, and on 14 May 1792 joined with Rzewuski and Branicki in the declaration at Targovice against the constitution. He then united himself with the Russian army, and was one of the leaders of the Diet of Grodno, which abolished the constitution, and subscribed the act for the partition of the country. He was thought to aspire to the crown, and received important appointments from Catharine II.

POTOCKI, Stanislas Kostka, Polish patriot and statesman, brother of I. Potocki (q.v.); b. 1752; d. 14 Sept. 1821. He distinguished himself greatly by his eloquence in the various diets which were held between 1788 and 1792. When the king acceded to the Confederation of Targovice, and by that false step consummated the ruin of Poland, Potocki retired to Austria; but was arrested there and imprisoned in a fortress. On his release he continued to live in retirement till the creation of the grand duchy of Warsaw in 1807, when he returned to his native country, and as President of the Council of Education applied himself to the promotion of intellectual culture among his fellow-countrymen. When Napoleon gave out that he mediated the restoration of the ancient kingdom of Poland, Potocki's talent and influence were called into action. In 1815 he was appointed Minister for Ecclesiastical Affairs and Public Instruction. He wrote a work on eloquence (1815) and an unfinished work on Polish translation of Winckelmann's work on ancient art.

POTOMAC, pö-töm'äk, a river in the eastern part of the United States, formed by the junction of two rivers on the boundary between Maryland and West Virginia. The river called North Branch rises in the western Alleghenies and the South Branch in the central Alleghenies, and flowing northeast they unite about 15 miles southeast of Cumberland. The North Branch
POTOMAC, ARMY OF THE — POTSDAM

flows southeast from Cumberland for over 100 miles. From the junction of the two head- streams, the river flows generally east-southeast, forming the irregular boundary between Maryland and West Virginia and between Maryland and Virginia, and after entering Chesapeake Bay about 73 miles from the Atlantic Ocean. The chief branches are the Shenandoah from Virginia, and the Monocacy from Maryland. At Harper's Ferry the river breaks through the Blue Ridge, forming a picturesque gorge. There are a number of falls, especially in that part of the course through the mountains. About 15 miles above Washington begins a rapid descent which in two miles is 80 feet and which ends with the Great Falls, a cataract 35 feet high. At Washing- ton the river meets the tide, 125 miles from its mouth; and about 25 miles below it becomes an estuary from two to eight miles wide. It is navigateable for large vessels to Washington. The Chesapeake and Ohio Canal is parallel to and near the river the whole length from Georgetown to Cumberland. The Potomac is the most important river in this section of the United States. It was the route whereby explorers journeyed to the interior in the early days, and it has been closely associated with many of the important events in the history of the country. The nation's capital is on its bank, the home of the first President, and his grave, is a few miles below, and Arlington (q.v.), with its white tombs, may be seen from the Capitol. The drainage area is about 15,000 miles. See BOUNDARIES OF THE UNITED STATES.

POTOMAC, Army of the, a national organization which grew out of the Civil War. It was founded in New York City 5 July 1869, since when it has held annual reunions. All officers and soldiers who served in the Army of the Potomac and in the 10th and 18th army corps, Army of the James, are eligible to membership.

POTOMAC COMPANY, The, in American colonial history, a land company charted in 1784, with General Washington as president. It was organized for the purpose of connecting the Potomac Valley with the West by means of a canal, and for general land improvement. The Chesapeake and Ohio Canal Company succeeded it in 1828.

POTOMAC FORMATION, the lowest deposits of the Cretaceous period in America, so-called from the location of some of its typical beds. It is represented by a narrow belt in Maryland, running southward, east of Washing- ton to North Carolina, by strips in New Jersey and in Alabama, Arkansas and Texas. The series has been found to be from 5 to 500 feet thick. It is made up of various sandstone, gravel, sand and clays. Portions of the formation have supplied glass sand, clay (at Amboy, N. J.) and iron ore for manufacturing pur- poses. Consult United States Geological Sur- vey Bulletins.

POTOSI, pó-tó-sé, Bolivia, (1) city, capi- tal of the department of Potosí, on the side of the Cerro do Potosí, at an elevation of over 13,000 feet; about 80 miles southwest of Sucre, and 300 miles from the Pacific. It is one of the highest inhabited places in the world. The city owes its origin to the silver discovered in the mountains and at the site of the present city about 1540. The first mine was opened in 1545; the city was founded in 1547; a royal mint was established in 1562 at a cost of over $1,000,000. From the time of the first discovery to 1864 these mines supplied silver to the value of often over $50,000,000 a year; nearly 2,000 shafts were sunk. If the smuggled silver could have been taken into account no doubt the amount would be much greater. The number of mines worked was formerly 300. They are now exhausted. The city is still one of the most important in Bolivia. It has a mint, a cathedral, numerous churches, convents and various public buildings, but the general appearance is dilapidated and unattractive. In the 17th and 18th centuries the population was over 160,000. There are two banks besides the National Bank of Bolivia. Pop. about 24,795.

(2) A department of Bolivia, in the south- west, bordering on Chile and Argentina. Area, 45,031 square miles. It is crossed by long mountain ranges; but in the northwest is a low, saline marsh, called "Grandes Salinas." Many of the inhabitants are Indians. Since the silver mines ran out, there is little industry. Pop. 530,748.

POTOTAN, pó-tó-tán, Philippines, pueblo, province of Iloilo, island of Panay, on the Jalaur River, 17 miles north of Iloilo. It is well built and maintains a large church and a convent. Pop. 14,500.

POTPOURRI, pó-tō-poo-ri, (1) Foods of various kinds, of meat and vegetables, cooked together. (2) A mixture of rose leaves and various spices, kept in jars or other vessels as a scent. (3) A vase or bouquet of flowers used to perfume a room. (4) In music, a medley; a collection of various tunes linked to- gether; a capriccio or fantasia on popular melo- dies. (5) A literary composition made up of several parts put together without any unity of plot or plan.

POTS DAM, póts'dám, Germany, a district and a city of the province of Brandenburg in Prussia. (1) The administrative center of Potsdam lies between Mecklenburg-Schwerin and Anhalt in the western part of the province of Brandenburg, and is well watered by lakes, and the rivers Oder, Havel, Spree and Ucker, with several connecting canals, and is marked by fine strips of forest and stretches of moor, land, and has a flourishing commerce, good fisheries, agriculture and grazing. There are 18 administrative divisions in the district, and

vol. 22 — 29
10 electoral districts for the choice of deputies to the Reichstag. Area, about 8,100 square miles; pop. about 2,000,000, of whom 1,800,000 are Evangelical Protestants, 114,000 Roman Catholics, 35,000 Jews, and 20,780 Jews. (2) The capital city of the province is situated in its most pleasant and beautiful part, on an island where the Nuthé and several canals and lakes join the Havel, 17 miles southwest of Berlin. Most of the city is well built, with broad straight streets, fine houses, and trees planted in the squares and streets; and the five different parts, the old city or Potsdam proper, and the Berlin, Nauen, Brandenburg and Teltow quarters are connected by bridges, steamers and tramways.

Among the city’s beautiful squares are the Wilhelmplatz, with a bronze statue of Frederick William III, by Kiss; the Bassinplatz with Dutch architectural treatment; the Lustgarten with its parade-ground and park and a bronze statue of Frederick William I, by Hilgers, busts of the heroes of the War of Liberation and statues of the generals of the armies of Brandenburg and Prussia and cannons captured between 1680 and 1815; the Old Market with a red and white marble obelisk 75 feet high; and in the narrowest part of the river on the Freundschënsel a place with a bronze equestrian statue of the Emperor William I, by Herter, erected in 1900. The churches of the city, five Protestant and one Catholic, include the Garrison Church planned by Gerlach in 1730 (and rebuilt in 1898), with a tower 295 feet high and the graves of Frederick William I and Frederick II; the Nicholas Church, begun in 1830 and finished in 1850, with a beautiful dome 240 feet high and four bell-towers; the French church, after the Pantheon; the church of the Holy Spirit, with a steeple as tall as the Garrison Church; and the fine Friedenskirche. Among the profane edifices the chief are the Brandenburg Arch, on the lines of the Roman triumphal arch built in 1750, and leading up to Frederick the Great’s palace and French gardens of Sans Souci; the palace of Sans Souci is a low building on fine terraces, its historical associations quite out of all proportion to its poor appearance; the New Palace built at the close of the Seven Years’ War; the Marble Palace, the former residence of the Kaiser, situated in a northeastern suburb; northwest of this palace the Pfindstberg, an ornate building with two towers and a fine view. In the extreme northeastern part of the city in front of the broad expanses of the river lies the large Pauweninsel (or Peacocks’ Island) with a park and a hunting lodge. Woods, hills and the stretches of water everywhere make the city an ideal one.

The city is situated on the Berlin-Magdeburg branch of the Prussian governmental railroad system, and has other rail connections with Berlin. The commerce is comparatively unimportant; there are sugar factories, several breweries, etc. It is an important garrison post, and among the educational institutions of the city are a military school, a war-school for the training of officers and a military orphanage, in which there are 800 pupils. There are also excellent schools for girls, a normal school for women, training schools for gardeners, etc. Pop. 62,243, of whom 5,000 are Catholics and 500 Jews.

Potsdam was a Wendish fishing village founded about 1300, and attained no importance until 1660 when it was selected as a site for a palace by the Great Elector. In 1685 (8 November) by the treaty for the Peace of Nijmegen, he opened the city to the French refugees and made the city his residence. He not only built the palaces mentioned above as his, but erected many private houses to keep up the tone of architecture. Frederick William IV did hardly less for the highway and the street system of the city. The Peace of Potsdam was signed here 3 Nov. 1805, ratifying an alliance between Russia and Prussia against France.

Consult the works cited under the article Berlin; also ‘Geschichte der Königlichen Residenzstadt Potsdam’ (1883) and ‘Potsdam ein deutscher Fürstensitz’ (illuminated, 1893).

POTSDAM, N. Y., village in Saint Lawrence County, on the Raquette River, and on the New York Central and Hudson River Railroad, about 20 miles from the Saint Lawrence River and 30 miles west of Malone. In 1791 the State of New York created a land commission to further the settlement of the unexplored northern part of the State. Ten towns were established, one of which was Potsdam. Later General Van Horne and David M. Clarkson purchased the town of Potsdam. In June 1803 their agent, Benjamin Raymond, arrived at the place to sell the property. A number of persons from Vermont soon purchased land and settled here. The village of Potsdam was incorporated in 1831. It is in a productive agricultural region, which has had extensive lumbering interests from its foundation. The first industrial establishment built by Benjamin Raymond was a saw mill, and saw mills have been there for over 100 years. In a recent year, one Potsdam company alone had 1,000 men employed in lumber camps in the Adirondacks, and in spring floated down the Raquette River, to the Potsdam mills, 30,000,000 feet of log stock. The village has flour and lumber mills, paper mills, creameries and machine shops. An extension of the water power is being developed in the vicinity. It has an extensive trade in lumber, paper, farm and dairy products, and men’s clothing. The celebrated Potsdam sandstone (q.v.) is quarried in the vicinity, and is used in nearly all the large public buildings of the town. It has the Potsdam State Normal and Training School, which has a library of 8,000 volumes, the Clarkson School of Technology, founded in 1895, the Crane Institute of Music, a high school and public elementary schools. There are seven churches. The two banks have a combined capital of $200,000. The government is administered by a village president and a board of five trustees elected annually. The village owns and operates the waterworks. Pop. 4,036.

POTSDAM SANDSTONE, an American geological formation of the Cambrian Period of which a yellowish brown sandstone found at Potsdam, N. Y., is typical. The formation was long supposed to be the oldest of Paleozoic time in America, but is now placed at the top of the Cambrian group. It is found across the north of the Adirondacks in New York and in Canada, and in Michigan, Wisconsin and Virginia.
POTT, pót, August Friedrich, German philologist: b. Netterlohe, Hanover, 14 Nov. 1802; d. Halle, 5 July 1887. He studied at Göttingen, where he entered a theological course in 1821, and in 1833 professor of the science of language at Halle. His reputation as a comparative philologist was established by his 'Eymologische Forschungen auf dem Gebiet der Indogermanischen Sprachen' (1833-36; 2d ed., 1859-76), and he soon took place with Grimm, Bopp and W. von Humboldt among the students of the newly developed science. His researches were peculiarly thorough; and this fact makes them yet of value despite the advances made in his subject in later times. His books, which have been compared, for their want of order, to the plain of Shimar upon the confusion of tongues, include further: 'Die Zigeuner in Europa und Asien' (1845); 'Die qui-näre und vigesimale Zählmethoden' (1847); 'Die Personennamen und ihre Entstehungsorten' (1853); 'Anti-Kaulen' (1863); 'Die Sprachverschiedenheit in Europa, an den Zahlwörtern Nachgewiesen' (1868); and 'Wilhelm von Humboldt und die Sprachwissenschaft' (1872).

POTT, Percival, English surgeon; b. London, 1713; d. 22 Dec. 1788. He was assistant surgeon in Saint Bartholomew's Hospital, 1745-49, and a chief surgeon there from 1749 to 1787. In spinal diseases he was a specialist, who won distinction by his investigation of angular curvature of the spine. He had in New York, in 1740, discovered a disease of the bones of the spinal column, called after him Pott's disease (q.v.). He wrote a number of works, including 'A Treatise on Ruptures' (1756); 'Fistula Lacer-rima in the Spine' (1757); 'Reflections on Hydrocele' (1762); 'Some Few General Remarks on Fractures and Dislocations' (1769); and 'Remarks on That Kind of Palsy of the Lower Limbs Found to Accompany a Curvature of the Spine' (1779).

POTT'S DISEASE, an affection of the spinal vertebrae characterized by tuberculous inflammation of their bodies; spinal carries. The nature and cause of the disease were first correctly described by the English surgeon Percival Pott (q.v.), after whom it was named. The inflammation is sometimes followed by total paralysis of the lower limbs. On the diseased parts tubercles form, resulting in disintegration of the vertebrae. A curvature or hump is formed by the visible projection of spinal processes beyond their normal situation. The treatment of the disease must always be hygienic and constitutional, and for surgical treatment special methods are now in general use whereby excellent results are often obtained.

POTTAWATTOMI (pót-a-wót'ə-mi) INDIANS, an American tribe of the Algonquian family, early occupied what is now lower Michigan and upper Illinois and Indiana. Joining Pontiac, they surprised Fort Saint Joseph in 1763. During the Revolution they were hostile to the Americans, but joined in the treaty of 1795. The tribe was then composed of settled bands and the wandering prairie tribes. In 1812 they aided England. A few descendants are now living in Kansas and Iowa.

POTTER, Alonzo, American Protestant Episcopal bishop: b. Beekman, Dutchess County, N. Y., 6 July 1800; d. San Francisco, Cal., 4 July 1865. He was graduated from Union College in 1818 and became a tutor there in the following year. In 1822 he was made professor of mathematics and natural philosophy. Of Quaker parentage, he nevertheless studied for the Episcopal ministry and was ordained to the priesthood in 1824. He was rector of Saint Paul's Church, Boston, 1826-31, and then returned to Union College as professor of moral philosophy and political economy, which position he retained until his elevation to the episcopacy. He was consecrated bishop of Pennsylvania 23 Sept. 1845, and became known as one of the most sagacious and original prelates of his day, as well as a man of marked intellectual force and spiritual fervor. His plans of church extension and benevolence were large and costly but he found means to carry them into effect, and not a few flourishing institutions, including the Episcopal Hospital and the Philadelphia Divinity School, owe their origin chiefly to him. Among his published works are several educational treatises and 'Religious Philosophy' (1870), besides sermons and addresses, and the Lowell Institute lectures on 'History, Science and Christian evidences, delivered in Boston 1845-49. Consult memoir by Bishop Howe (1870).

POTTER, Cora Urquhart (Mrs. James Brown Potter), American actress; b. New Orleans, about 1872. She first appeared on the amateur stage in New York, where she was a society favorite; her professional debut was made at the Haymarket, London, as Anne Syl-vester, in 'Man and Wife,' in 1887. Later in the same year she played in New York. She made several tours in the United States and obtained funds for the comfort and nursing of British troops in the Boer War. In recent years she has played mostly in and near London. She has written 'My Recollections.'

POTTER, Edward Clark, American sculptor: b. New London, Conn., 26 Nov. 1857. He was educated at Amherst College; studied sculpture under Mercei and Fremo, Paris, 1888-89. He collaborated with D. C. French in sculptures for the Chicago Exposition of 1892-93; executed equestrian statues of Grant at Philadelphia in 1894; Washington at Paris in 1895; Hooker at Boston in 1904; and Derens at Worcester in 1905. The statue of General Slocum at Gettysburg and De Soto at the Saint Louis Exposition of 1904 are also by Potter. He is also represented in the Fulton Library, Washington, the Appelate Court, New York, and the Michigan State House. He executed four groups for the Buffalo Exposition of 1901, two animal groups for the library of J. P. Morgan, New York. Potter is a member of the National Institute of Arts and Letters and was elected a National Academician in 1906.

POTTER, Edward Tuckerman, architect, son of Alonzo Potter (q.v.); b. Schenectady, N. Y., 25 Sept. 1831; d. New York City, 21 Dec. 1904. He was graduated from Union College in 1853 and studied and practised architecture in New York City, giving his attention principally to collegiate and ecclesiastical architecture. He designed and superintended the building of the church of the Heavenly Rest, in Fifth avenue, New York City, the Colt Memorial
CHURCH at Hartford, Conn., the church of the Good Shepherd and the Memorial Hall at Schenectady.

POTTER, Eliphalet Nott, American educator and Bishop of Alono Potter (q.v.): b. Schenectady, N. Y., 20 Sept. 1836; d. City of Mexico, 6 Feb. 1901. He was graduated from Union College in 1861 and from Berkeley Divinity School in 1862, in which year he entered the Episcopal ministry. He was rector of Christ Church, Greenbush, Pa. (1862-69), and professor of ethics at Lehigh University in 1866-71. He then accepted the presidency of Union College and when the college was made a university in 1873 he was elected chancellor. In 1884-97 he was president of Hobart College and in the latter year became president of the Cosmopolitan University, a correspondence school. He wrote 'Parochial Sermons'; 'Washington a Model in His Library and Life' (1895), etc.

POTTER, Henry Codman, American Protestant Episcopal bishop of Schenectady, N. Y., 25 May 1835; d. 21 July 1908. He was the son of Bishop Alono Potter (q.v.), and was educated at the Episcopal Academy, Philadelphia, Union College, and at the Theological Seminary of Virginia. In 1857 he was ordained deacon and in 1858 priest. He was rector of Christ Church, Greensburg, Pa. (1857-58); and at Saint John's Church of Troy, N. Y. (1859-66); then became assistant at Trinity Church, Boston, and in 1866 rector of Grace Church, New York City. In 1883 he was consecrated assistant bishop of New York, and on the death of his uncle, Horatio Potter, in 1887 became bishop. Under his energetic and successful administration, the site for Saint John's Cathedral on Morningside Heights was purchased and funds raised for building. In his decisions on theological questions and controversies he proved himself sagacious and tolerant. He took a deep interest in political life of the city and nation, and wrote and spoke forcefully on a wide variety of educational and political subjects. He lent his influence to promoting friendly relations between labor and capital, and to assisting the reform movement in New York City. His views were extremely liberal. He held that the beer saloon as a poor man's club was a necessity in a great city like New York, and that the church should try to elevate it, and not work — ineffectively — to smother it. In 1904 he established a tavern which was designed to be run as an ethical saloon. It was not well patronized and the newspapers ridiculed it, so it had to be abandoned. He had a great big heart, and did able work among the poor. He published 'Our Threefold Victory'; 'Young Men's Christian Associations and Their Work'; 'The Church and the Borderlands and Deaconesses' (1873); 'The Religion for To-day' (1877); 'The Gates of the East' (1877); 'The Scholar and the State' (1897); 'The East of To-day and To-morrow' (1902); 'Law and Loyalty' (1903); 'The Drink Problem' (1905). Consult Keyser, H. A., 'Bishop Potter, the People's Friend' (1910); Hodges, George, 'Henry Codman Potter' (1915).

POTTER, Horatio, American Protestant Episcopal bishop, brother of Alono Potter (q.v.): b. Beekman, Dutchess County, N. Y., 9 Feb. 1802; d. New York, 2 Jan. 1887. He was graduated at Union College in 1826, like his brother student, for the ministry, and was ordained deacon in 1827 and priest in 1828. In the latter year after having held one pastoral charge in Maine, he was elected professor of mathematics and natural philosophy in Washington (now Trinity) College, Hartford, Conn. He was rector of Saint Peter's Church, N. Y., 1833-54, and was then (1854) elected provisional bishop of New York. His predecessor, Bishop Benjamin T. Onderdonk, after trial before a court of bishops, had been suspended from his episcopal functions in 1854 on a charge of impiety, the truth of which, however, he never acknowledged. Thus the diocese remained for some time in an anomalous position, until finally a canon was passed authorizing the election of a provisional bishop. On the death of Bishop Onderdonk, in 1861, Bishop Potter assumed entire charge of the diocese, and ruled it prudently until his own death. The care of such a large and important diocese, especially in the trying times of the Civil War and the ritual controversy, required an unusual amount of wisdom and impartiality. These qualities Bishop Potter exhibited in such a degree as to bring a large measure of unity and peace to New York diocese. His published writings are principally sermons, addresses and pastoral letters dealing with religious and occasionally with civic questions.

POTTER, John, English Anglican archbishop: b. Wakefield, Yorkshire, 1674; d. London, 10 Oct. 1747. He was educated at Oxford, and in 1694 became Fellow of Lincoln College, Oxford. In 1697 he printed a work, 'Lycephon.' In 1697-99 appeared his 'Archeologia Graeca,' or the 'Antiquities of Greece,' which has gone through many editions, and was long indispensable to the classical student. In 1706 he was appointed regius professor of divinity at Oxford, and in 1719 was appointed archbishop of Canterbury. His 'Theological Works' in three volumes appeared in 1753.

POTTER, Louis, American sculptor: b. Troy, N. Y., 1873; d. 1912. His art instruction was obtained under Charles and Montague Flagg. Potter went to Paris in 1896 and studied painting under Merson and Dampf. He executed a number of statuettes, including such excellent pieces as 'The Snake Charmer'; 'Young Bedouin'; 'Tunisian Jewess,' etc. About 1900 he returned to the United States and specialized in American Indian subjects. Of these the best known are 'The Tuku Wind'; 'Spirit of the Night'; and 'The Clam Diggers.' Other works are the heroic groups 'Earth Bound'; 'Earth Unfoldment'; and the 'Earth Man'; busts of Mark Twain and de Monvel, and the Horace Wells Memorial, Hartford, Conn.

POTTER, Paul, Dutch artist: b. Enkhuizen, November 1625; d. Amsterdam, January 1654. He came with his father to Amsterdam in 1631, and in 1646 joined the Painters' Guild of Delft and three years later that of The Hague. In 1653 he settled in Amsterdam. Of exceedingly precocious genius he early won a reputation as a painter and etcher, and although he died early takes the first place in the
Dutch school of painting as an animal painter. His life-size pictures such as 'The Young Bull' in the museum of The Hague, and the 'Bear Hunt' in the museum at Amsterdam, have contributed less to his reputation than the smaller canvases, in which are represented cattle, sheep, horses and hounds, grazing or a pasture. His clear and true color and the fidelity of his drawing and modeling are remarkable. His chief works are 'The Cow'; 'The Sentence of the Beasts upon the Hunters' at the Hermitage, Petrograd'; 'Horse Standing before a Cottage'; 'The Meadow (Louvre); 'The Shepherd's Cottage'; 'Orpheus and the Beasts'; 'Shepherds with their Flocks' (Amsterdam Museum). The Dresden Gallery possesses two landscapes with cattle, of his, in which the flat fields, peculiar sky and pollard trees of the local scenery are depicted with singular felicity. Most of his pictures are in English galleries. He is also to be considered one of the best etchers of his day. Consult Westheimen: Paulus Potter, sa Vie et ses Oeuvres' (1867).

POTTER, Paul Meredith, American dramatist: b. Brighton, England, 3 June 1853. He entered journalism, was foreign editor of the New York Herald 1876-83, and its London correspondent 1883-84. He was on the editorial staff of the Chicago Tribune in 1888, and in 1889 composed his first play, 'The City Directory.' Among his many later plays may be cited 'Our Country Cousin' (1893); a dramatization of 'Trilby' (1895); 'Under Two Flags' (1901); 'Notre Dame' (1903); 'Nancy Stair' (1905); 'Scape of the Moune Rouge' (1898); 'The Girl from Rector's' (1909); 'Arsene Lupin' (1909).

POTTER, Robert B., American lawyer and soldier, son of Alonzo Potter (q.v.): b. Schenectady, N. Y., 16 July 1859; d. Newport, R. I., 19 Feb. 1887. He studied at Union College; began the practice of law in New York, became colonel of the 51st regiment of New York volunteers upon the organization of that regiment, and served with distinction at Newbern, where he stormed the intrenchments on the Confederate left, and at Antietam, where he became brevetted major and colonel the day he fought also at Fredericksburg, was made a brigadier 13 March 1863, commanded the second division of the Ninth corps at Vicksburg, and the corps at the siege of Knöxville. Under Grant he commanded his division from the Wilderness to the final attack on Petersburg. He was brevetted major-general in 1864. Retiring from the army in 1866, he was chosen receiver of the Atlantic and Great Western Railway.

POTTER, William Parker, American rear-admiral: b. Whitehall, N. Y., 10 May 1850. Graduating from the Naval Academy in 1869, he rose steadily in the service, serving several years as flag secretary, both of the North Atlantic fleet and of the European squadron. He took part in the destruction of Cervera's fleet at Santiago, 3 July 1898, and was advanced five numbers for 'eminent and conspicuous conduct.' Thereafter he served as commander and captain at several stations, being raised to the rear-admiralty in 1908, and placed in charge of the fourth division of the Atlantic fleet. Later he was chief of the Bureau of Navigation, and in 1912 he retired.

POTTER'S CLAY. See Clay.

POTTER'S FIELD, the name commonly given a piece of ground usually adjoining a cemetery, and reserved as a burial place for strangers and the friendless poor. The name is derived from its use in the following passage from the Bible: 'And they took counsel and bought with the money (30 pieces of silver) the potter's field, to bury strangers in.' Matt. xxvii, 7.

POTTER'S WHEEL. The wheel as used by the potter ranks among the earliest mechanical contrivances. The Egyptians classed it among the inventions of the gods and claimed that Nun, the creator, fashioned man upon it. As a broad principle the wheel consists of a flat disc, on an upright axle, rotating in a horizontal plane. The primitive form was simply a turn-table. The edge of the disc was made of heavy substance to secure firmament and steady motion. It was rotated by the hand. The Chinese improved upon this by driving it by a cord running in a groove. In Europe the favorite device was a lengthening of the axle of the wheel, enabling a heavy disc some three feet in diameter to be placed at the bottom. The potter seated himself at the wheel and propelled it with his foot, working on the lower disc. This was the first form of the kicke wheel. The next improvement was the application of a crank and handle which was kept in constant motion by one foot. The introduction of power gave rise to two forms of wheel. The special requirement is that the speed of the wheel shall be variable at the will of the workman. This is accomplished either by cones in contact or by a traveling disc, or some similar device. In the former case a cone with a slightly curved face is fitted to the axle, so that it forms the base of the machine. In contact with this is an inverted cone faced with paper or leather and so arranged that the potter can, by pressure of his foot, bring the large end of one cone into contact with the small end of the other or vice-versa. Thus the speed of rotation is completely under control. In the second form, the power is applied to a large steel disc revolving in a vertical plane. Upon the shaft of the wheel is a small disc faced with leather and free to move up and down the shaft, but rotating with it. A treadle enables the workman to place this either at the center or the edge of the large steel disc, thus securing any desired speed. The potter's wheel is fast disappearing. It is now used mainly for shaping blanks, which are afterward pressed into molds, or is employed by the makers of artistic pottery for the sake of the individuality of the work. Stoneware makers also use it for the production of large jars. See Pottery, Manufacture of.

PO ETTER (from the Latin potum, a pot); any article made with clay and fired. The origin of the formation of vessels from clay is lost in antiquity. The process is not peculiar to any nation or people, but resulted from the necessity which arose for articles of domestic use when humankind emerged from savagery to barbarism and communal life was instituted. It required the aid of no metal tool; the fingers
of the primitive potter were sufficient to fashion it. Its history cannot be related chronologically and the stages that mark its progress are few. First came the knowledge that clay could be formed by the hand, and that it hardened by exposure, that this hardeness could be materially increased by fire and then some genius discovered the potter's wheel. How long ago is unknown. The Chinese and Egyptians claim its invention, and to the latter at least it was legendarily ascribed to the god Ptah as creating the egg of the world upon it. There is a long hiatus before another stage is reached, the production of porcelain by the Chinese early in the Ming dynasty (1368-1644). Followed the use of flint by Astbury (1720) and printing from copperplates (1752).

Ceramic authorities differ considerably in their classification of pottery but it may broadly be divided into three groups: (1) Porcelain—(a) hard or natural; (b) soft or artificial. Vitreous and colourless, or with a glaze not easily scratched with a knife. Examples: Chinese, Japanese and European porcelains; European potters, unaware of the composition of Chinese porcelain, tried by the mixing of various materials to imitate it, the Medici porcelain (1574) being the first of which we have specimens. The only artificial porcelain to survive is the English bone china. The glaze, fired at a less heat than the body, is softer and more velvet than that of hard porcelain, the colors applied to it sink in the glaze and have not the applied look of those on hard porcelain. Examples: Early Sèvres, Capo di Monté, English bone china. (2) Bodies made wholly or partially from clay, opaque with a non-vitrified break. This includes (a) wares made entirely from clays in their natural state which are found sufficiently pure to use without levigation, which, owing to the presence of iron, manganese or other impurities, cannot be used for white wares and which are termed unwashed clays. Examples: Terra cotta, yellow ware and some ornamental wares where the color of the body is concealed by a glaze or engobe; (b) Faience; the body covered with an opaque (tin) enamel, decorated on either the raw or the baked state. Examples: Medici porcelain, marbled faience. (c) Mezza-majolica and majolica. The former had an engobe of white clay on its surface, and tints corresponded to faience except that it was enriched with metallic lustres. It is so termed because of the supposition that it was made on the island of Majorca, but this is disproved by M. Van de Put, who claims that the trade between Spain and Italy was conducted by Majorca vessels and traders, the ware taking its name from this fact. Examples: Hispano-Moresque, Italian 15th and 16th centuries. The term is now erroneously applied to wares covered with one or more colored glazes which might be properly called such; (d) white and decorated household wares masquerading as Queenware, white granite, semi-porcelain, ironstone, etc. 3. Stoneware: Opaque with a vitrified break. Examples: Gres des Flandres, Höhr and Grenchusen wares. Doulton's Lambeth ware. Before quitting the subject it is proper to decide what part clay forms in these divisions. The lowest content is that in English bone china which rarely exceeds 30 per cent; hard porcelain about 40; earthenware from 50 to 60 and stoneware from 70 to 80.

Buried in the dust of untold ages, specimens of the potter's art have and continue to be unearthed, telling us of civilizations before dreamed of. Assyria and Babylon, in the immense library of Nippon, formed of clay cones and tablets, reveal the history and most intimate details of their existence 7000 a.c. The bricks of Babylon were coated with a stanniferous enamel, the secret of which was lost for ages, to reappear in the 15th century when the Moors drove the Arabs out of Spain and established the kingdom of Granada. Egyptian tombs, walls and papyri, depict the whole process of the art, including the use of the potter's wheel, which even then as already said must have been of great antiquity for they represent their god Ptah as fashioning the egg of the world on it. Glazes were early known to them, no less than seven colors being in use about 1500 a.c. The Greeks had obtained a certain technical excellence 2500 a.c. and later proved themselves magnificent potters. There is nothing finer in ficelle art than their vases with friezes of figures, each one telling some story of mythology or of their warlike prowess, whilst the exquisite little Tanagra figures are distinguished by an inimitable grace. The art was at its best from 700 to 200 a.c. Much of this pottery which was unknown to Europe until the 18th century was found in Etruria and was for some time regarded as the product of that country, but Etruscan antedated the Greek period, dating from 1000 to 300 a.c. and though toward the close it was imitative of Greece it never equaled it. Etruscan civilization was merged in that of Rome, the natural successors of Greece, and the art was carried on by the Romans until the 1st century of our era. By them it came into use in Gaul and England and though never equalling that of Greece is distinguished by a black ware obtained by manipulation of the heat during firing and which when made by them in England later became known as Upschurch ware from the site of its manufacture; and by the beautiful Arretine, or Samian ware as it is erroneously called, a red body, the composition of which has never been determined. Mesopotamia, Crete, Syria possessed a knowledge of lustres, a Rakka bowl bearing a date equivalent to about 700 a.c. though probably later. Persian pottery exerted a far-reaching influence. Their Arab conquerors were not in themselves an artistic race but fascinated by the beauty of the Persian style they largely adopted it and with the modifications demanded by their religion it is known as Saracenic art, the Arabs being known as Saracens during the Crusades. Probably much of the work ascribed to the Arabs was executed for them by Persian workmen. To Persia we are properly called such;
Rome of which no positive trace remains. These beautiful lustres made their reappearance during the Renaissance, the secret of manufacture again disappearing until rediscovered in the 19th century.

Before telling how the art was carried into Europe by the Moors another civilization, that of the Orient, demands notice. The Chinese, those indefatigable workers, the acknowledged past masters of the ceramic art, claim an antiquity equal to that of Egypt which until very recent years has been largely accepted by actual specimens, but examples are now appearing lending color to their claims. Examples differ little from those of other countries. The Han dynasty, 206 B.C.—220 A.D., furnishes examples of glazed pottery and from that time progress must have been rapid. Unlike European, Chinese civilization had not halted and the T'ang period, 618—906 A.D., was remarkable for the development of the ceramic and kindred arts. Even life-size figures in pottery were made of the period and were the forerunners of the thousands of years later considered a great achievement. The pottery of the Sung dynasty, 960—1280 A.D., had disappeared and became legendary in the 16th century, the Ch'ing and Ju wares made famous by Chinese writers. The period marked the introduction of kaolin in the body, not as yet a true porcelain but perhaps best described as a porcelainous stoneware. It was then that pieces of alternate colors of clay were made, the prototype of the agate ware of Whieldon, Wedgwood and other English potters of the 18th century. We are but just beginning to emulate their elusive flambé glazes, the cracked ware and the wonderful colors such as sang de boeuf produced by a reducing fire. With their characteristic reverence for age the Chinese have always delighted in reproducing their own past triumphs and so skilfully has this been done that there are but few who may reasonably be classed as experts who can distinguish the difference. The beautiful celadons are also of the period and were the forerunners of true porcelain which was probably produced early in the Ming dynasty, 1368—1644. (See Porcelain.) While the wares we have but hinted at continued to be produced, they were largely confined to China. The great centre of production has since the 7th century been the town of Ching-té-Chen and in spite of its having been several times destroyed, has always phoenix-like risen from its ashes. The Japanese learned much from the Chinese, as also they did from the Koreans who were responsible for the establishment of the industry at Karatsu (Hizen) end of the 7th century; Satsuma 1457—86; the Rakut factories at Kioto 1550; Seto 1590, and later at Haji. It is difficult to understand the Japanese preference for these Korean wares, which should not have been equal to their own productions except for some supposed superiority for use at their tea ceremonies. What merits Satsuma wares possess is due not to Korean but to Japanese influence, the art instinct being the head instead of the Chinese, whom they soon began to rival. Practically no good pottery was made in Japan until Kato Shirozayemon, called Toshio, finished his five years' studies in China and came to Seto in 1200. Porcelain was not made until about 1513. Having obtained mastery of the art it spread all over the kingdom and was patronized and encouraged by emperors, princes and potentates. Two distinct styles are apparent, that made for use at home and that intended for export. The so-called old Japan, imitated and copied by nearly every manufacturer in Europe, is an example of the latter. Japanese pottery is largely the work of an individual or at least of a family, while Chinese is the result of combined workmanship. This individual work of recent years has been largely the work of factories which to the great debarment of the national art have been induced to copy European designs with a result, with the single exception of price, disappointing and regrettable. There remains, however, a number of artist potters who refuse to prostitute their talents, such as Miyagawa, Kozen, Seifer, Sobei, Watano and others. Even this glimpse of Japanese ceramics would be incomplete without reference to the great Imari artist Kakiyemon whose isolated designs on a white ground inspired the beautiful productions of a thousand Copenhagen porcelain and to whom many of the early European factories were largely indebted. African pottery was made at Bagdad in the 9th century and at Cairo in the 11th, the Moors having obtained their knowledge from the Arabs, largely adopting the style of the Saracen potters. In the 8th century the Arabs conquered Spain but no ceramic specimens definitely assigned to them at this period are known. Five hundred years later, 1235 A.D., the Arabs were driven out of Spain by the Moors and their wares as known as Hispano-Moresque began to appear, the most notable example being the Alhambra vase made about 1230. The production continued until the 15th century, though its Moorish characteristics were gradually disappearing through coming into contact with Christian art, the late examples consisting of decorations of mock Arabic characters, with borders and diaper of leaves, principally of the vine and bough. The Moors had found in Spain a plentiful supply of tin and abandoned the calcareous covering they had hitherto employed in favor of a tin enamel and which they enriched with brilliant lustres. As the wares lost their Moorish character, so the application of the lustre became bolder. The ware was converted into a ruddy copper. Much of this pottery found its way into Italy and it is probable that a Moorish potter gave assistance to Luca della Robbia who in 1440 produced the first white enamel made in Italy. This led the way to those later triumphs in Italian ceramics which culminated in the period 1470 to 1530, a period remarkable for its awakening from the oblivion of centuries and one of the most splendid epochs of the ceramic art. The painter had recognized in della Robbia's invention a material on which his paint could be preserved all time and loyally backed by the reigning houses, the princes of Urbino, of Pesaro and Florence, the Sforza, the Montefeltros, the Medici and the Fontanas, he found the opportunity to express himself in his art, and the heroes of the moment; they were created maestros, entitling them to rank with princes. Never was an art so honored, so worthily expressed, and from the great centres at Castel-Durante, Urbino, Faenza, Gubbio and many other places there was a constant producing stream.
Italian majolica was practically an art expression confined to plaques, vases, etc., and was not applied to utilitarian articles if we except the pottery of the period of the Renaissance when Italian workmen carried the art to France and in 1578 when the Nevers works were started. Except for the use of the tin enamel it had nothing in common with Italian majolica and in the early part of the 18th century had so degenerated as to become grotesque. Nevers pottery is important only on account of its extent. Toward the middle of the 17th century Rouen came into prominence and in the early part of the 18th century potteries had become very numerous. Several distinct styles of decoration were introduced, owing nothing to foreign influence, and the industry received an impetus which extended all over France, some of the principal places being Moustiers, Marseilles, Lille, Strasbourg and Bordeaux, and literally hundreds of other places had their small potteries. The most original of those mentioned was Moustiers; for the rest they relied for inspiration on the parent factories—Rouen stands pre-eminent, the faience produced there being so much inferior to that of the other centers that the name of Bougival is combined with perfect workmanship. Another important pottery centre owing its influence to the Normandy potteries was at Alcora in Spain, which was of great extent, but which seems to have been somewhat neglected by ceramic writers. Delft in Holland came suddenly into life at the commencement of the 17th century and a tremendous trade was built up. Some English potters are known to have worked there, but the inspiration was no doubt Italian, for as early as 1500 Peccol Passo of Urbino had established at Antwerp a pottery for making Italian majolica so that the use of the tin enamel would be known to the Low Country potters. The manufacture of white ware in England, its superiority for use and durability and in the case of France the lowering of the duties on its importation, brought the manufacture of faience to a close. Recent years have seen the reproduction of much of the faience of the 17th and 18th centuries, their incontestable artistic merit being highly valued by refined connoisseurs.

After the collapse of the faience industry the manufacture of earthenware on the English plan was introduced. Many English potters assisting in perfecting it. The principal factories were Choisy-le-Roi, Creil, Montereau, Chantilly and Sarreguemines. Ware of good quality was made for a time but gradually deteriorated and the industry faced extinction, but was rescued by a scientist, M. St. Amand, who with the assistance of Brongniart succeeded in again placing it on a sound basis. About the middle of the 19th century there was a remarkable art revival as applied to ceramics which has practically revolutionized the pottery of France. The tinware of Claude Louis Ziegler (1840-54), so pure in form and decoration, was perhaps the first evidence, followed by the remarkable reproductions of Parisian ware by Charles Avissieu of Tours (1842), his examination of which is given in "The Art of Potteries, Pull (1855)," both of Paris. From 1854 to 1871 Sévres took the lead and a great impetus was given to the movement. In 1859 Theodore Deck, the greatest of French ceramists, demonstrated that the secrets of the Orient were secrets no longer and he appeared to be able to duplicate at will the lustres of the Persians, the celadons of the Chinese, the intricacy of Hispano-Moresque, and the brilliant colors and designs of the Orient. Still more recently an apparently army of artist potters have given expression to their ideals in the Renaissance, the royal factory assisting in the movement and restoring France to the position she seemed in danger of losing. No account of French pottery would be complete without reference to the work of Bernard Palissy and the faience of Oiron, though neither appears to have exerted any influence on French ceramics—Faience d'Oiron was made under the direction of Hélène de Hangest by her librarian, Jehan Bernart, and François Charpentier and consisted mostly of small pieces, the decoration formed by inlaying different colored clays. The work was executed in a marvelous manner, so well, indeed, that for centuries it was impossible to reproduce it; and owing to many of the late pieces bearing the monogram of the Dauphin (Henry III) it was long known as Henry ware. Its manufacture extended from 1524 to the middle of the century but the late period is much inferior to the earlier. Of the 60 specimens known, each worth more than its weight in gold. Bernard Palissy, a land surveyor, a glassmaker, a portrait painter, but poor withal, became obsessed with the idea of discovering the art of making enamel. Against difficulties and privations, disappointments without number, he struggled against a fate which threatened to overwhelm him, continuing his experiments for over 16 years, until at last success rewarded him and the secret of the enamel was discovered. The time of his triumph was also one of the greatest despair, for reduced to absolute penury, his credit exhausted, reviled by his neighbors as a madman, he could not procure fuel to finish the firing of his kiln and in a frenzy tore down the doors of his house, broke up and fed to the flames what little furniture was left him in the house, his mad act rewarded at last by success. He died in 1589.

In England tin enamel never seems to have obtained much popularity. No pottery worthy of record with the exception of the Encaustic tiles made by religious orders in the 14th and 15th centuries occurs until the awakening of the Staffordshire potters in the 18th century. We are not forgetting the quaint slip-painted wares of Wrotham and Staffordshire which were but the expression of the rude art of the old English potter who had no materials beyond his clay to work with, but rude as that art was it is the prototype of the most difficult and most beautiful ware of the end of last century, pâte-sur-pâte.

The advent of Elers who came to England in the train of William of Orange and had a small pottery at Bradwell Wood prior to 1608 is generally spoken of as the beginning of Staffordshire pottery, but as before his arrival there John Philip Elers is known to have been in litigation with some of these Staffordshire potters for infringing his rights there appeared at least in 1630 and was better than the rude better pots of their forefathers. Certainly Elers by his refined processes stimulated competition; and when his carefully guarded secrets had been mastered by Astbury and Twyford and by them freely communicated
to their brother potters, the establishment of an important industry was laid. Whether the Elers introduced salt glazing in England is a moot point, but the process became prevalent in France and Belgium in the early 18th century. In the United States, the process was not widely used until the 19th century. The use of salt glaze in pottery production in England and France had a significant impact on the development of the industry.

The production of pottery in Staffordshire, England, was revolutionized in the 18th century with the introduction of new glazing techniques and the use of local clays. The Staffordshire potters were known for their high-quality tableware, which was exported to the rest of Europe and the Americas. The introduction of new glazes and techniques allowed for a greater variety of colors and designs, which helped to distinguish English pottery from that of other European countries.

In the United States, the production of pottery was initially focused on utilitarian items such as stoneware jars and water jugs. However, in the 19th century, the demand for porcelain increased, and American potters began to experiment with new glazing techniques and porcelain formulas. The development of the porcelain industry in the United States was partly due to the influence of European potters and the availability of high-quality clay deposits.

The production of pottery in America was also influenced by the introduction of new technologies and techniques from Europe. The use of porcelain and other fine ceramics became more widespread in the United States in the 19th century, and American potters began to produce works that were comparable to those produced in Europe. The production of fine ceramics in America was partly due to the influence of European potters and the availability of high-quality clay deposits.

In the late 19th century, the production of pottery in America was also influenced by the introduction of new technologies and techniques from Europe. The use of porcelain and other fine ceramics became more widespread in the United States in the 19th century, and American potters began to produce works that were comparable to those produced in Europe. The production of fine ceramics in America was partly due to the influence of European potters and the availability of high-quality clay deposits.
and only a few works can be indicated which will serve as an introduction to more intensive reading. WILLIAM P. JERVEY,
Author of "The Pottery Marks of the World,
etc.

POTTERY, Manufacture of. Clay in itself is not sufficient to make good pottery. The materials used for mixing with it are flint, Cornish stone and feldspar. The first process is to reduce all these materials to a common fineness by means of grinding and levigation. These in their proper proportions are mixed with water, the resultant liquid mass being known as slip. If plastic clay is required the slip is pumped into a clay press. The press consists of a number of what are termed chambers lined with very heavy cloth into which the slip is forced, pressure is brought to bear on them and the water expelled, leaving the clay mass inside the cloth "in the bags." The presses are then opened, the clay taken from the bags, but as it may not all be of exactly the same consistency a further process is necessary. This was formerly done by cutting off pieces with a wheel and dashing it down into another piece until the whole was of the same density and moisture, and was known as wedging. This is now done by the pug mill, a cylinder down which runs an axle to which are attached blades of iron set at such an angle that they not only cut the clay but force it forward at the same time until it comes out at the bottom in a solid block about 6 × 4 inches. It is now in a plastic state ready for either the thrower or the presser. Throwing is perhaps the most fascinating operation in all the industrial arts. Taking a ball of clay the thrower throws it on a revolving horizontal wheel and grasps it on the side with hands held rigid, which forces the clay to the exact centre. He then with an upward pressure raises it into a cone and when this has been repeated once or twice inserts his thumb in the top to make the aperture, and according to the shape required so guides and gently forces the clay to the proper contour entirely by the use of his fingers. Watching a skilled workman, the clay appears as if imbued with life, obedient to his slightest wish or thought. There is, however, a good deal of nonsense talked about the expression of the thrower's individuality, and whilst this may be true of the few craftsmen who have mastered the art, it is ridiculous as applied to commercial wares, for when the individual work of the thrower is finished it is passed on to the turner, who places it on a horizontal lathe and turns out all the marks of the potter's thumb and fingers until it assumes the exact size and shape required, no better and none worse than if it had been cut from the mold. The process is very little employed to-day. For the presser much preliminary work must be done. An artist must design a shape, a model of it must be made and from this model must be the molds, so constructed that the different parts of them lift cleanly away from the clay inside. Taking these molds, the parts held firmly together with a strap, the presser lines them with bats of clay, which he presses firmly down and then sponges the inside to make it smooth. Evaporation causes the clay to harden and the particles to shrink more closely together, and the piece can then be removed from the mold. If it requires a handle it is passed to the handler who presses the handles into the molds and then with a little water or slip adjusts them to their proper place. Plates, saucers, etc., are made by machinery, but the principal is the same, the molds being fixed on a revolving disc, which greatly facilitates the work. The ware is now in the green state and when it is ready for the first firing, after undergoing which it is called biscuit ware, the first form of pottery. If instead of the plastic clay slip is used it is poured into a plaster mold, which being made somewhat softer absorbs some of the water, the clay particles floating to the side. The mold is kept full of slip until the requisite thickness is attained, the surplus slip is emptied out and the mold put away until the piece dries itself by shrinkage. All mold-made pieces require retorting, that is, the mold marks are removed with a knife or sponge. Biscuit ware can be decorated either by painting with a brush or by printing. The former enables the artist to express himself just as on canvass, except that his colors will be absolutely permanent. For printing, the design is engraved on a copper plate; an impression on thin paper is obtained from this and transferred to the ware, the paper being afterward washed off. In both cases the colors are mixed with oil and to make sure this the ware is put into the "hardening on" kiln before the glaze is applied. Biscuit ware may also be dipped in a plain or colored glaze, which simply requires the "ghost" fire to complete. The glazing is done by immersion in a trough of glaze, the finger holding the piece with the least possible contact with his finger and quickly and dexterously plunges it in the glaze, which covers it all over with a thin film. It is now ready for its final firing. In the biscuit kiln it is immaterial whether one piece touches another, but this would be fatal to glazed pieces, which are separated by means of separators called stilts, spurs, pins, etc., according to how they are used and which are easily removed when the firing is finished. A biscuit kiln will hold from 1,500 to 2,000 dozens and is likely to take from 45 to 50 hours to cool. A ghost kiln does not take so long, the clay ware requiring a greater heat than the glaze. If the biscuit ware has been glazed and fired it can be decorated in a number of ways, either by painting with the brush, by applying decalcomanies or by printing. The colors used in this case are heavily fluxed
and only require a fire of about 8 to 10 hours. The average Centigrade heat for biscuit ware is 1,270°, and for porcelain on the glaze 840°. The heat conditions in the kiln were formerly determined by the color and the withdrawal of certain trials, but small triangular cones made to melt from the lowest to the highest heat are placed in the kiln within various intervals; the cone at which a certain temperature is reached they bend and melt, showing that the firing is finished.

William P. Jarvis, Author of "The Pottery Marks of the World, etc.

POTTSTOWN, Pa., borough, Montgomery County, on the Schuylkill River, and on the Pennsylvania and Philadelphia and Reading railroads, 40 miles northwest of Philadelphia. It was laid out as a town in 1752 and was at first named Pottsgrove, after its founder, John Potts; in 1813 it was incorporated as a borough and renamed Pottstown; the boundaries of the borough were increased in 1888. It is the trade centre of a fertile agricultural region. The immediate vicinity possesses considerable mineral wealth, and a result Pottstown is grown to be of importance as an industrial centre. Though at the time of the last United States census Pottstown was only 39th in size amongst the cities of Pennsylvania, it was 18th in volume of products manufactured in its 76 industrial establishments. The total value of these products in 1909 amounted to $12,205,000, an increase of 68 per cent since 1899. The capital invested in these industrial establishments was almost $10,000,000, and the number of persons engaged in industrial pursuits was 4,128, more than 25 per cent of its total population. The borough is especially noted for its manufactures of iron and steel; it contains rolling mills, blast furnaces, steel mills, bridge works, boiler works, nail factories and manufactories of agricultural implements; also cigar factories, carriage works, planing mills and creameries. It has a public high school and library as well as a number of private educational institutions, the best known of which is High School, a non-sectarian secondar school for boys. Pop. 12,298.

POTTSVILLE, Pa., borough, county-seat of Schuylkill County, on the Schuylkill River, near its source, and on the Pennsylvania, the Lehigh Valley, the Philadelphia and Reading and the Central of New Jersey railroads, 95 miles northwest of Philadelphia. It was first settled in 1800, incorporated in 1828 and made the county-seat in 1851. It is situated among the Schuylkill anthracite coal fields and is one of the most important mining centres and shipping points of the region. Its manufacturing interests are also of considerable importance. The total value of products manufactured in 1909 in its 91 industrial establishments amounted to $9,138,000, an increase of 99 per cent since 1899. The capital invested was $13,982,000, and the number of persons employed 3,533, and 10 per cent of the total population. Its industrial establishments include steel mills, blast furnaces, rolling mills, foundries, planing mills, cotton-velvet and silk mills. It was in Pottsville that anthracite coal was first successfully used in smelting iron and for more important buildings are the county courthouse and jail, a public hospital and the Pottsville Athenaeum.

The latter contains a library and the borough also has a public library as well as the county law library. The city has a public high school, public and parish graded schools and some private educational institutions. The chief executive officer of the borough is a burgess, elected for three years; the legislative body is a borough council, possessing the power of appointing many of the city officers; the city auditor, city treasurer and the school directors, however, are elected by the people. Pop. 20,236.

POTTSTOWN CONGLOMERATE, the name by which the Millstone-Grit at the base of the Pennsylvania series (coal measures) is generally known in Pennsylvania, because it has its greatest development at Pottsville, near the eastern edge of the anthracite fields. It is there more than a thousand feet thick, but toward the west and north grows thinner. The rock is composed of sand and pebbles, chiefly of quartz, giving it considerable hardness.

POTVIN, Poy-zo, Charles, Belgian Author: b. Mons, Belgium, 2 Dec. 1818; d. Ixelles, 1 March 1902. He was educated at the Catholic University at Louvain, became professor of national literature at Brussels, in 1833 conservator of the Wiertz Museum there, and in 1881 a member of the Belgian Academy. He was editor of La Nation in 1850-53, and in 1862 became editor of the Revue de Belgique. For many years he was the recognized leader of the Liberal party in Brussels. His writings comprise volumes of verse, history, political philosophy and criticism, including: "L'Eglise et la morale" (1858, under the pseudonym Dom Jacobus); "Le Roman de Renard" (1860); Marbres antiques et crayons modernes" (1862); "Jacques d'Artevile" (1861); "L'Histoire des lettres en Belgique" (1882); and "L'Art Grec" (1895).

POUCHEE, Dog. See DASYURE.

POUCHEESEE, po-kep'si, N. Y., city and county-seat of Dutchess County, on the eastern bank of the Hudson River, 72 miles north of New York, midway between the Highlands and the Catskills, and on the New York Central and Hudson River and the Central New England railroads. A ferry is maintained across the West Shore Railroad. A cantilever bridge carries the Central New England lines across to the west bank of the river. Poukeessie has an elevation of 200 feet and a mean annual temperature of 50°. The city is the seat of Vassar College (q.v.), of Glen Eden Seminary, Putnam Hall, Eastman Business College, Adirondack Memorial Library, containing over 40,000 volumes, the Hudson River State Hospital for the Insane, Vassar Brothers' Institute, Vassar Brothers' and Saint Francis hospitals, Pringle Home, Columbus Institute and Riverview Military Academy. College Hill Park has an area of 100 acres and is finely situated, commanding a magnificent view of the Hudson. The Intercollegiate regatta is an annual event in June. There are four national banks, one trust company and one savings bank, with total resources of $30,000,000. There is also an active Chamber of Commerce of 822 members and having an annual income of over $22,000. The assessed value of property in all tax districts follows: Real property, $24,844,845; personal property, $956,650; special franchise, $1,387,680;
shares of bank stock, $1,573,047. The city's funded debt is $2,135,000. The total tax rate is $263.20 per $1,000 valuation. There are 55 lines of manufacture in the city, with products having an estimated total value of $15,000,000 and employing over 5,000 people. There are, all told, 176 establishments, employing 5,380 persons; of the latter 147 are proprietors and heads of families, 704 are salaried employees and 4,729 are wage-earners. The capital invested aggregates $13,935,000; wages, $2,284,000; salaries, $1,039,000. The cost of materials used aggregates $6,115,000, and the value added by manufacture, $6,676,000. The chief manufactures are mill supplies, underwear, trousers, cigars, candied fruits and preserves, cream separators, foundries, knitgoods, celluloid articles, skirts, infants' garments, ball bearings, auto specialties, children's dresses, machine shop products, linen and cotton mesh, shoes, ivory buttons, piano and organ players, dyes, etc.

In September 1917 the average wage of 44 concerns employing men in Poughkeepsie was $16.01, and the 25 concerns employing women $8.90 per week. There are 11 grade schools with 5,500 pupils, five parochial schools, a $230,000 high school with 1,100 students. About $150,000 represents the municipal annual outlay on education. Poughkeepsie has steamer connection with Albany, New York and other Hudson River points. It is also a terminal point on the State canal system. What is now termed the city of Poughkeepsie dates far back of definite records. Its name is found in an Indian deed of date 5 May 1683, granting to Pieter Lam-singh and Jan Smedees each a farm, and to the latter a tract of land "far the eastern bank of the Hudson, to build a mill thereon. The waterfall is called Poughkeepsingh ("the place where the water breaks through"). A Dutch settlement sprang up about 1688, and during the Revolutionary War the place was a base for the Continental armies. In 1778 it became the State capital and in 1788 the Federal Constitution was ratified at a State convention held here. In 1799 it was incorporated and in 1834 was chartered as a city. The present charter was adopted in 1874. Under it the people elect a mayor, a common council of 14 members and an alderman-at-large, who is president of the council. Pop. 32,000. Consult Platt, E., 'Eagle's History of Poughkeepsie' (Poughkeepsie 1905).

POULSON, pōl'sōn, Niels, Danish-American architect, ironmaster and philanthropist: b. Horsens, Denmark, 1843; d. 3 May 1911. He studied architecture and building at Copenhagen and came to the United States in 1864. He was for two years employed in the United States government supervising architects' office at Washington and afterward was in charge of the architectural and engineering departments of the New York Architectural Iron Works. He engaged in business in partnership with C. M. Eger in 1876, the firm being incorporated as New York Iron Works, New York, in 1879. Poulson was an active promoter of the welfare of his employees, a free technical school was established by the company and many of the men were enabled to establish themselves in business. He was also desirous of a closer understanding between the United States and Scandinavian countries and in 1910 gave $100,-

00 to be expended in an exchange of lecturers and students. His fortune, amounting to about $500,000, was left to the same cause and resulted in the establishment of the American-Scandinavian Foundation and the American-Scandinavian Society. Scholarships for Scandinavian students were established at Harvard, Yale, Columbia and the Massachusetts Institute of Technology; while those for American students were established in Christiania, Copenhagen and Upsala.

POULTNEY, pōl'tnē, Vt., town, Rutland County, on the Poulney River and Lake Saint Catherine and on the Delaware and Hudson Railroad, 18 miles southwest of Rutland. It is in an agricultural region; slate is quarried in the town and vicinity and there are slate manufactures, a foundry and machine shops. It is situated in a picturesque country in the Green Mountains and the lake affords facilities for boating and fishing; consequently the town has become popular as a summer resort and contains several hotels. It has a public high school and is also the seat of the Troy Conference (Methodist) Academy. Pop. 3,644.

POULTON, Edward Bagnall, English scientist: b. Reading, Berkshire, 27 Jan. 1856. He was educated at Oxford and was demonstrator in the anatomical department of the University Museum 1877-79, and lecturer in natural science at Kibble College 1880-89, as well as at Jesus College 1880-89. In 1889 he became a Fellow of the Royal Society and since 1893 has been Hope professor of zoology at Oxford. He was vice-president of the Royal Society 1909-10, president of the Linnean Society of London 1912-16 and is a member or correspondent of many scientific societies. He delivered a course of lectures before the Lowell Institute, Boston, Mass., in 1894 on 'The Meaning and Use of Colors in Animals.' He is the author of 'The Colors of Animals' (1890); 'Charles Darwin on the Theory of Natural Selection' (1896); 'Essays on Evolution' (1908); 'Charles Darwin and the Origin of Species' (1909); 'Virgilius Jones and other Oxford Memories' (1911); 'Hope Reports' (Vols. I-IX, 1897-1913).

POULTRY. A term designating collectively all birds which have been domesticated for their flesh, eggs or feathers, for fighting or for pets, including fowls, ducks, geese, swans, turkeys, guineas, peacocks and pigeons. The word "fowl" once included wild game birds but now applies only to the domesticated fowl (gallus domesticus) and does not properly include turkeys, guineas or pheasants which belong to a similar genus (Phasianus) which are now kept in semi-captivity and are only partially domesticated.

Origin. The common fowl which makes up the largest class of domestic poultry is supposed to have originated in southwestern Asia. Darwin believed all domestic fowl to have sprung from a single species, the wild jungle fowl (gallus indicus) which is still to be found in the jungles of India in the wild state. His belief was founded upon the fact that gallus bankiva closely resembled the common Black Breasted Red Game of to-day, one of the oldest varieties of domestic fowl, and readily bred with the common hen, producing fertile offspring; that it resembles the domestic fowl
in voice and action; that it is readily domesticated and that according to his observations it produced sterile offspring when crossed with other species of wild fowl and that sterile offspring resulted when other wild species were crossed with domestic fowl. On the latter two points it is believed that Darwin was in error and that many varieties of common fowl have descended from several wild species and their crosses. In support of the belief it is known that several domestic varieties bear a much closer resemblance to other wild species than do *gallus bankiva*. The Oriental games, for example, resemble *gallus giganteus* much more closely than they do *gallus bankiva*; indeed, the *gallus giganteus* kept in domestication by the natives of the Malay Peninsula at the present time are so like the Malay breed of our domestic fowl that they might be considered the same. Among the wild fowl now in existence which may have contributed largely or in slight degree to the foundation of the common fowl encyclopedia compiled from ancient documents from southern India only; *gallus sonnerati*, found in Hindustan; *gallus fercatus* from Java; *gallus stanley* from Ceylon; *gallus giganteus*, the Kulm fowl of the Malay peninsula, and others not so well known.

The principal characteristics of the domestic fowl are as follows: Beak, heavy; gullet enlarged to form a crop; small stomach; gizzard strong to crush hard seed; two long scats; body temperature 105 to 106, varying slightly according to temperature of the environment; feet adapted to scratching, running and perching; wings not suited to long flight; gregarious; polygamous; domestic in the extreme; prolific; period of incubation 21 days; young covered with down and able to run about as soon as hatched; brave in defense; flesh and eggs prized as human food.

History.—Fowls are the oldest of our domesticated animals so far as history records. The earliest record is to be found in a Chinese encyclopedia compiled from ancient documents, where it says "fowls are creatures of the west." First, the ancients were introduced into China 1,400 years B.C. and the Chinese considered the Indian region as their source. They were also mentioned in the works of the Greek and Roman authors Theopomus, Aristotle, Dikeorus, Aschylus, Plutarch, Plato and Pliny, and are supposed to have been taken into the British Isles by the Romans, who regarded them as sacred to Mars. The cock has in all ages occupied an exalted position as an emblem, symbolizing courage among the ancient Gauls and afterward among the French, who used it on their ensign after the Revolution. It figures also, in the Bible and has been used in Christian art to symbolize the Resurrection. At the present day it is regarded by political parties as a herald of victory.

Extent and Importance of the Poultry Industry.—Poultry husbandry is an old art and a comparatively new science for it is only within the present century that special attention has been given to raising poultry as a commercial enterprise, and only within the past generation has any real effort been made to classify the information on the subject into anything like a science. The explanation of this recent advance may be found, first, in the fact that this class of domestic animals supplies human food that is second only in importance and value to dairy products. The egg offers the most digestible form of food known and one which can be cooked in the greatest number of attractive ways, and the flesh forms an article of diet universally prized for its attractive flavor, which is distinctly different with each kind of the fowls and in addition to and perhaps of greater importance than the nutritive value of eggs is the nutritive value which eggs possess in large degree and which are essential to growth. The fact that eggs contain all of the nutritive qualities and also the life-giving vitamin principle complete and in proper proportions to sustain the developing embryo chick makes the egg superior even to milk in sustaining human life.

The second reason is found in the fact that poultry, particularly fowls and turkeys, are variable and plastic in the hands of the breeder and can be rapidly and skillfully made to acquire new forms and colors. In no branch of animal husbandry have so striking results been accomplished as in poultry breeding. Observe the number of varieties at the present time and note the contrast between the mammoth Brahma, weighing 12 pounds, and the diminutive bantam of the same name weighing 20 ounces; the brilliantly spangled Hamburg and the sombre Orpington; the long tail of the Yokohama and the inconspicuous, cushion tail of the Cochin; the clean, close feathering of the Indian game and the abundant, fluffy feathering of the Asiatics; the smooth shanks of the Plymouth Rock and the feathered shanks of the Langshan; the great prolificacy of the sprightly Leghorn and the large, solid muscle of the unproductive, clumsy Indian Game. Also note the great variety of plumage, both in color, color pattern and form of feather in the different breeds and varieties of the domestic fowl. For example, the spangled, laced, penciled, striped barred pattern and the solid-colored feather, including red, buff, black, white and blue; and in feather forms—ragged in the Frizzle, smooth in the Pekin; Silky; varieties of fowls with eyes varying in color from black to pearl, bay or gray; fowls with rose combs, leaf combs, single or pea combs, spike combs; fowls with or without beards and crests and showing in their plumage every color of the spectrum.

Equal in variability to the domestic fowl is the pigeon with its vastly different types of colors, sizes, shapes and physical characteristics. Then realize that all of these have been produced within the history of man; in the case of the fowl from a single or, at most, a few wild species of jungle fowl, and in the case of pigeons, from the single rock pigeon; moreover, domestic fowls, including several hundred varieties, breed reasonably true.

Poultry Statistics, 1910 and 1900 in the United States.—The tables on following page give the number of the various kinds of poultry reported in 1910 and 1900, together with their value, and the number of farms reporting each kind in 1910; the number and value of poultry by States, value of products, etc.

3 Less than one-tenth of 1 per cent.

The summary on poultry shows that the total number of farms reporting the different kinds in 1910 was 5,585,012, the total number of fowls being 295,876,176, and the total value $153,394,000. Of the total number of farms reporting, nearly all, or 5,577,218, reported chickens, numbering 280,340,643, valued at $140,193,000. The number of farms in the United States reporting poultry increased 489,732, or 9.6 per cent, during the decade. The total number of fowls increased 18.1 per cent, while the relative increase in their value was considerably over four times as great, amounting to 78.9 per cent. The average number of fowls per farm reporting increased from 49 to 53.

### 1. History and Origin

The oldest varieties in the American class are about to 35 to 60 years old. Youngest only 10 to a dozen years and new ones developing. All are of mixed origin. Composite breeds all originating in America.

### 2. Distinguishing Class Characteristics

- (a) Purpose. General purpose, meat and eggs, and exhibition.
- (b) Size and weight. Medium to large.
- (c) Type compact, blocky, meaty, symmetrical, graceful.
- (e) Skin. Yellow medium to coarse.
- (f) Attractiveness. Attractive on account of type, carriage and color variations. "Style Plus?"
- (g) Rate of development. Moderately rapid, maturing three to four weeks later than Leghorns under normal conditions, and three to four weeks earlier than Asiatics.
- (h) Habit. Non-flying, active, low to medium fences will retain them. Very best of foragers.
(f) Temperament. Active, but not sprightly, slow but not sluggish.

(g) Hardiness. Very hardy, small to medium comb and wattles. Well-protected bodies.

(h) Maternal qualities. The very best. Courageous and strong. Brooding instinct largely developed, intelligent, kind disposition, medium size, not clumsy. Occasionally bred small for hatching and brooding wild game birds. Smooth shanks are an advantage in brooding.

(i) Disposition. Kind, somewhat combative, but not vicious.

(j) Prolificacy. Except in some instances. The very best of winter layers. Good all-year-round producers. Superior to Asiatics, but inferior to Mediterraneans.

(k) Eggs. Slightly tinted to very dark brown, mostly lighter tints. Size medium to large. Thick, uniform shells.

(l) Meat production. Excellent. Medium as to quantity and also quality and rapidity of growth. Rocks for large roasters, Wyandottes for broilers or medium to light roasters, and Rhode Island Reds for small to medium roasters.

(m) Breeding efficiency. Most of the breeds are reliable in transmitting their characters, but are not as prepotent as Asiatic or Mediterraneans because a composite group and of more recent origin.

(n) Variable physical characters are: (1) Shanks smooth, yellow except Javas, and responsive; (2) Skin yellow (except Javas); (3) Comb and wattles medium to large; (4) Earlobes red; (5) Molting normal.

II. ASIATIC.

This class includes three breeds and eight varieties as follows:

Brahmas ........................................ Dark. Light.
  Black. White.

Cocks ...........................................

Langshans ...................................... Dark. Light.
  Black. White.

For breeds and varieties consult the 'American Standard.'

1. History and Origin.—These are among the oldest known breeds. None are older except, perhaps, the games. They are of Chinese origin with a parentage too remote to be known.

The size of fowl appeared to be a religious requirement in the country of origin. Have exerted the greatest influence of any class of fowl in the formation of new breeds in this country.

2. Distinguishing Class Characteristics.—

(a) Purpose. Meat and winter egg production and for exhibition. Poor laying qualities. Among the best for heavy roasters and capons, particularly the Brahmans. Especially desirable for capons, especially for crossing for meat purposes. Rather coarse flesh. For village and general farm rather than large poultry plants, except on roaster farms. (b) Size and weight. The largest and heaviest class, weighing from 11 to 12 pounds for the cock; 7½ to 9½ for the hens.

(c) Type. Rangy, large bone, open organiza-

(d) Plumage. Exceedingly heavy. The breeds are parti-colored and solid buff, black and white. The breed of feathers. Withstand cold weather.

(e) Skin. Yellow and coarse.

(f) Attractive because stately and large.

(g) Rate of development slow, late matur-
ing both in growth and in egg production. Have a pronounced tank and bony state in development.

(h) Habits. Non-flyers. Do not scratch. Feet on ground all time. Low fences and small yards are sufficient. Naturally good foragers because not timid.

(i) Temperament. Phlegmatic and inactive. Not easily frightened.

(j) Hardiness. Very hardy naturally except when bred in too close confinement for the fancy. Resistant to unfavorable conditions. Not responsive to distinct climate changes.

(k) Maternal qualities. Brooding instinct largely developed. Persistent sitters. Kind, but clumsy mothers. Because of their large size and abundance of feathers, they can cover many eggs and chickens.

(m) Prolificacy. Poor producers. A large proportion of eggs in late winter.

(n) Eggs. Medium to large in size, but small in proportion to the size of fowls. Fairly uniform in shape and size. Color, light to very dark brown and fairly uniform.

(o) Breeding efficiency. Prepotent because characters long established and proven. Mating efficiency low—Brahmas, 1 male to 8-10 females. Langshans, 1 male to 12-15 females. Cochins, 1 male to 6-8 females.

(p) Meat quality. Considered coarse in texture but large in quantity for Brahmas and Langshans but to a less extent of which Cochins are not meaty. Brahmas and Langshans are among the best for meat production of any of the larger breeds. Not equal to Orpington or Dorking, Laflche or Paverolles, Sussex, but as satisfactory as the American class, as Rocks or Wyandottes and better than the Mediterraneans, such as Leghorns, Anconas, etc., especially satisfactory for "roasters," but not as broilers.

(q) Variable physical characters, as indicating laying condition and productive capacity. Less responsive to feed, fright and temperature: (1) Shanks yellow. Feathered; (2) Skin yellow; (3) Comb, pea comb and single comb, small. Wattles medium in size; (4) Earlobes red; (5) Molting habits similar to other breeds.

III. MEDITERRANEAN.

In this class are five breeds and 17 varieties as follows.

Leghorns

- Single Comb Brown.
- Rose Comb Brown.
- Single Comb White.
- Rose Comb White.
- Single Comb Black.
- Rose Comb Buff.
- Single Comb Silver.
- Red Pyle.
III. MEDITERRANEAN — Continued.

Minorcas

Single Comb Black.
Rose Comb Black.
Single Comb White.
Rose Comb White.
Single Comb Buff.

Spanish

White Faced Black.

Blue Andalusians.

Anconas

1. Origin and History.—Next to the Americans they are the most popular breeds. All from Italy and Spain or in the neighborhood of the Mediterranean.

2. Distinguishing Characteristics.—Active, non-broody, prolific.

(a) Purpose. Special egg breeds.
(b) Size and weight. Generally light to medium except Minorcas, which are heavy.
(c) Type. Well-balanced proportions. Small boned, compact.
(d) Plumage. Light and close feathered, in many colors, white, buff, brown, red, pyle and black, in the native country; black predominating, mostly solid colors, motled, penciled, striped.
(e) Skin. Fine in texture. Yellow except Minorcas and Spanish.
(f) Attractiveness. Graceful, sprightly, head points and plumage especially artistic.
(g) Rate of development. Rapid in both growth and reproduction, except Minorcas, which are like the breeds of the American class.
(h) Habits. Flyers. Only fair foragers because timid. Especially active and industrious in scratching and foraging. Exceedingly active in hunting for food but timid in foraging long distances.
(i) Temperament. Alert, nervous, flighty, quick acting; that is, easily frightened.
(j) Hardiness. Very adaptable to wide extremes but more suited to mild climates. Suffer from frozen head appendages, comb and wattles. Very responsive and sensitive to changes in climatic conditions, hence variable in production and physical characters due to environment.
(k) Maternal qualities. Unreliable, largely non-broody, except occasional individuals. Occasional individuals fairly satisfactory for brooding pheasants. Only about 5 to 10 per cent broodiness per year. Require artificial incubation and brooding. Kind but fickle and fussy as mothers.
(l) Intelligence. Especially intelligent, in learning to eat and return to hover when young.
(m) Disposition. Courageous, strong in defense but not quarrelsome.
(n) Prolificacy. The very highest in fecundity. Exceedingly precocious. The first eggs laid when four and one-half to five and one-half or six months.
(o) Economical production. Economical production is their strongest point as layers. Cost of production among the least per dozen, or per pound of eggs, due to small size of body.
(p) Feeding advantages. Easy to feed; not as likely to get too fat as heavier, less active breeds. (Except Minorcas).
(q) Egg quality. Eggs are medium to large. All white with but slight tendency to tintedness. Uniform in shape.

(1) Meat qualities. Generally too small. Lack economical dressing quality. Unsatisfactory except for squab broilers at three-fourths of a pound to one and one-fourths pounds. Flesh fine graded. Large proportion of breast meat. The muscles used in flight.

(s) Breeding efficiency. Prepotent. A dominant race well established. Run out other less prepotent races. Mating qualities one to 25 or 40 hens. Mate most freely of any class. Highest fertility and hatching power.

Variable physical characters. Most variable and hence most expressive of laying performance.

(1) Shanks smooth, non-feathered and yellow (except Minorcas and the Mottled Anconas), and of great value in judging birds for quality of egg production; (2) Skin yellow, soft and fine; (3) Comb and wattles medium to large; (4) Earlobes white and very responsive to change in color pigmentation; (5) Molting quick and regular.

IV. ENGLISH CLASS.

This class includes: (1) White, Silver and Gray and Golden Duckwing; (2) Redcaps; (3) Orpingtons, Single Comb Buff, Black, White and Blue; (4) Cornish, Dark, White and White Laced Red; (5) Sussex, Speckled and Red.

The English class are, for the most part, developed along meat-producing lines, although the general purpose idea of combining egg production has been attempted. The Orpingtons, the Cornish and the Sussex have been developed particularly for meat type which has materially decreased egg production qualities. They form the basis, however, of some of the most desirable of our varieties for the production of high quality meat.

V. POLISH CLASS.

This family consists of one breed having eight varieties; namely, White-Crested Black, Golden, Silver, White, Bearded Golden, Bearded Silver, Bearded White and Buff Laced. They are medium in size, good layers of white eggs and non-sitters. All have large, showy crests owing to which they fall easy victims to hawks and enemies. They have, in some cases, beards; small V-shaped combs and slate and willow shanks. As they are chiefly ornamental they are not popular in the United States.

VI. HAMBURGS.

This is a Dutch family consisting of one breed and six varieties. Golden Spangled, Silver Spangled, Golden, Silver and White Penciled Silver. They are unsatisfactory for meat and generally considered too small for popular use for egg production.

VII. FRENCH.

This class consists of four breeds and five varieties. (1) Houdans, White and Mottled; (2) Creveceurs, Black; (3) La Fleche, White; (4) Faverolles, Salmon. All of these varieties are distinctly of the meat-producing type, although bred as general purpose fowls having fairly satisfactory egg-producing qualities.

VIII. CONTINENTALS.

This class consists of Silver and Golden Campines. They are Belgian in origin and are of small size, distinctly of the egg-laying type, very prolific and extremely hardy.
A POOR LAYER — (a) Yellow color of head, shanks and plumage. (b) New plumage. (c) Small, hard, dried, scale-covered comb. (d) Wrinkled ear lobes. (e) Tucked up abdomen. (f) Full face

A GOOD LAYER — (a) Pale color of beak, eye-ring, ear lobes, face, shanks. (b) Old, unmoistened, ragged plumage. (c) Full, bright, waxy comb. (d) Full ear lobes. (e) Deep abdomen. (f) Intelligent head

HEAD PARTS — 3 (a) Wrinkled ear lobe. (b) Full face. (c) Face, eye-ring and beak yellow.

5 and 6 EGG PRODUCTION INDICATED BY THE LENGTH OF TIME OF MOLTING AS DETERMINED BY THE SHEDDING OF THE PRIMARY FEATHERS — It takes about six weeks to completely renew the primary feather (P) next to the axial feather (A) and an additional two weeks for each subsequent primary feather (P'). (Photographs taken on 4 December). 5 AN EIGHT-WEEK MOLT (Two feathers completely renewed) — Estimated date stopped laying 9 October. Second year record 144 eggs. 6 A SIX-WEEK MOLT (Primary feather next to axial feather renewed) — Estimated date stopped laying 23 October. Second year record 186 eggs.

7 A TWENTY-FOUR WEEK MOLT (Ten feathers completely renewed) — Estimated date stopped laying 21 June. Second year record 75 eggs.

8 A TEN-WEEK MOLT (Three feathers completely renewed) — Estimated date stopped laying 25 September. Second year record 121 eggs.

9 and 10 HEAD PARTS — 9 LOW PRODUCER (not laying) — (a) Small, hard, dried, scale-covered comb and wattles. (b) Fat face. (c) Yellow color of beak, eye-ring, ear lobes, face. (d) Wrinkled, shrunken ear lobe. (e) Dull, smoky eye. 10 HIGH PRODUCER (full laying) — (a) Full, bright, stuff, waxy comb and wattles. (b) Thin face. (c) Pale color of beak, eye-ring, ear lobes, face. (d) Full ear lobe. (e) Bright, round eye

11 and 12 HEAD PARTS — Same as above

13 POOR LAYERS (In non-laying condition) — (a) Vent yellow, small, hard and puckered. (b) Distance between blunt pelvic bones short. (c) Body full, hard and plump. 14 GOOD LAYERS (In laying condition) — (a) Vent pale, large, full and moist. (b) Pelvic bones wide-spread. (c) Skin soft and flabby

15 and 16 SHANKS — 15. (a) Shanks yellow. (b) Shanks full, hard, round in the back. 16. (a) Shanks pale. (b) Shanks thin, and soft in the back
IX. GAMES AND GAME BANTAMS.

This class consists of 16 varieties, eight of which are Black Breasted, Red, Brow-Red, Golden Duckwing, Silver Duckwing, Birchen, Red Pyle, White and Black, and eight varieties of bantams, minatures of the above. Their purpose is primarily for exhibition and fighting.

X. ORIENTALS.

The Orientals are Sumatras, Black Malay, Black-Breasted Red Malay Bantams, Black-Breasted Red. The class is primarily kept for exhibition purposes.

XI. ORNAMENTAL BANTAMS.

The Ornamental bantam class consists of (1) Golden and Silver Sebright; (2) White and Black Rose Comb; White Booted; Light and Dark Brahmas; Buff Partridge, White and Black Cochins; Black Tailed, White, Black and Gray, Japanese Bearded, White, Buff Laced, Non-Bearded Polish and Millefeur (booted).

XII. MISCELLANEOUS.

The miscellaneous class consists of the Silkys, Sultans and Frizzles which are produced as oddities and primarily for ornamental purposes and for exhibition.

Education and Research in Poultry Husbandry. — Among the 62 State agricultural colleges and experiment stations in the United States, only 10 offered courses of instruction in poultry husbandry in any form in 1904, whereas now nearly every State in the Union offers instruction in some form in poultry husbandry. To Cornell University is due the credit of having given the first regular course of instruction in poultry husbandry in the United States, which occurred in the winter of 1891 at Ithaca, N. Y. The first specialized short course where the students devote all of their time to poultry instruction occurred at Kingston, R. I., in 1898, at which time a six-weeks' poultry course was given. The first poultry investigational work in the United States devoted to poultry was at the Maine Experiment Station, Orono, Me., in 1885. In New York State, at the New York State agricultural experiment stations at Geneva, N. Y., and at Cornell University, experimental work with poultry was conducted in 1889 and 1890, respectively. At the present time practically every State in the Union provides facilities for experimental work in this subject and many States have made as large or larger provision for research work in poultry husbandry as for any branch of agriculture.

More than 75 poultry and pigeon papers are published in the United States alone, several of which report circulations of 30,000 to 40,000 copies to each issue. In addition to this nearly all agricultural and livestock papers conduct poultry departments. In order to catch the billions of chickens, produced each year more than 50 kinds of incubators are manufactured in the United States, which leads all nations in this field of inventive skill. In 1890 a 500-hen poultry farm was an object of wonder, but now there are thousands of poultry plants having 2,000 hens and many which have from 5,000 to 10,000 or more, besides broiler and roaster farms, squab duck and squab pigeon establishments, some of which turn out more than 100,000 birds per year.

Evolution of Commercial Poultry Husbandry. — Among the more important discoveries which have had a profound influence on the poultry industry may be mentioned: (1) The development of efficient hatching devices. Incubators and the increase in our knowledge of successful hatching have almost completely eliminated the natural methods of hatching by hens on the large commercial farms and has made possible a rapid and extensive expansion of the size of poultry enterprises; (2) The improvement of large flock-brooding systems which enables poultrymen to brood several hundred chickens in single flocks in portable buildings, which is a material saving in labor and provides for rearing under free range conditions; (3) Standardized methods of feeding for special purposes which results in larger and more economical production of healthier stock; (4) Large flock laying houses which reduce cost of construction per bird, economize labor and provide greater comfort, reduce mortality and increase production; (5) Improvement in the breeds as a result of discovery of methods of judging fowls for production by means of external characters and the development of methods of marking poultry for future identification, the use of trap nests and pedigree hatching trays which enables the breeder to connect up the performance of the progeny with that of the parents, has resulted in greater progress being made in efficient production in the past generation than in the preceding century; (6) The use of artificial light in the control of egg production is one of the most important discoveries in the efficient management of poultry. By our knowledge of this factor in the economical production of eggs it is now possible to materially increase the proportion of eggs that are normally laid in periods of scarcity and high prices in the fall and winter months in the north temperate climate and to do so without proportionately decreasing the normal production during the remainder of the year. The influence is far reaching in its effect upon the poultry industry due to the fact that by the control of production by means of artificial light, the poultryman increases the production of eggs laid during periods of high prices and reduces the cost of production without injury to the fowls.

Some of the more important variable physical characters used in determining the laying quality of fowls are shown in accompanying plate and explained in the descriptive statement of method of judging fowls for egg production, prepared at the Judging School, State College of Agriculture, Cornell University, and approved by the American Association of Instructors and Investigators in Poultry Husbandry.

Method of Judging Fowls for Egg Production. — In order to lay well a bird must have a sound body. As a first consideration a bird must be vigorous and healthy if it is to be able to lay well. Vigor and health are shown by a bright, clear eye, a well-set body, a conparatively active disposition and a good circulation. Further, the bird must be free from physical
defects such as crooked beak, excessively long toes, nails, eyelids that over-hang so that the bird cannot see well, scaly leg or anything else that would keep the bird from seeing or getting an abundance of food.

Loss of Fat Due to Laying.—Color or pigmentation changes. (These should be observed by daylight). A laying fowl uses up the surplus fat in the body, especially it removes the fat from the skin. In yellow-skinned breeds this loss of fat can readily be seen by the loss of the yellow color. The different parts of the body tend to become white according to the amount of fat stored in the body and the amount of circulation of blood through that part. The changes occur in the following order: The vent changes very quickly with egg production so that a white or pink vent on a yellow-skinned bird generally means that the bird is laying, while a yellow vent means a bird is not laying. It should be recognized that all yellow color changes are dependent on the feed, coarseness of skin and size of bird. A heavy bird fed on an abundance of green feed or other material that will color the fat deep yellow will not bleach out nearly as quickly as a smaller or paler colored bird. The eyering, that is, the inner edges of the eyelids, bleach out a trifle slower than the vent. The earlobes on Leghorns and Anconas bleach out a little slower than the eyering so that a bleached earlobe means a little longer or greater production than bleached vent or eyelid. The color

goes out of the beak beginning at the base and gradually disappears until it finally leaves the front part of the upper beak. The lower beak bleaches faster than the upper, but may be used where the upper is obscured by horn or black. On the average colored, yellow-skinned bird a bleached beak means heavy production for at least the past four to six weeks. The shanks are the slowest to bleach out and hence indicate a much longer period of production than the other parts. The yellow goes out from the scales on the front of the shanks first and finally from the scales on the rear. The scales on the heel of the shank are the last to bleach out and may generally be used as an index as to the natural depth of yellow color of the bird. A bleached-out shank usually indicates fairly heavy production for at least 15 to 20 weeks.

The yellow color comes back into the vent, eyering, earlobes, beak and shanks in the same order that it went out, only the color returns much more quickly than it goes out. A vacation or rest period can sometimes be determined by the outer end of the beak being bleached and the base being yellow.

Body Changes Due to Laying.—A laying hen has a large, moist vent showing a dilated condition and looseness as compared with the hard, puckered vent of a non-laying hen. The whole abdomen is dilated as well as the vent so that the pelvic arches are widespread and the keel is forced down, away from the pelvic arches so as to give large capacity. The more eggs a bird is laying the larger the abdomen and the larger the keel. The relative size of the abdomen will be the size of the abdomen. The actual size of the abdomen is, of course, influenced by the size of eggs laid and by the size of the bird. Heavy production is shown by the quality of the skin and the thickness and
stiffness of the pelvic arches. Fat goes out from the skin and body with production so that the heavy producers have a soft velvety skin that is not underlaid by layers of hard fat. The abdomen in particular is soft and pliable. The _ternal processes_ are very prominent and are generally bent outward. The thicker and blunter the pelvic arches and the greater the amount of hard fat in the abdomen the less the production or the longer the time since production. One of the finer indicators, but yet one of the most valuable in picking the high layer, is the fineness of the head and the closeness and dryness of _feathering_. The head of a high layer is fine. The wattles and earlobes sit close to the beak and are not loose and flabby. The face is clean-cut. The eye is full, round and prominent, especially when seen from the front. The high layer is trimmer, that is, the feathers lie closer to the body and after heavy production the oil does not keep the plumage so sleek and glossy, but the plumage becomes worn and threadbare.

**Changes in Secondary Sexual Characters.**

---

**The Comb.** Wattles and earlobes enlarge or contract, depending on the ovary. If the comb, wattles and earlobes are large, full and smooth or hard and waxy, the bird is heavy; if the comb is limp the bird is only laying slightly, but is not laying at all when the comb is dried down, especially at molting time. If the comb is warm it is an indication that the bird is coming back into production.

**Moltning.**--When a bird stops laying in the summer she usually starts molting. The later a hen lays in the summer or the longer the period over which she lays the greater will be her production, so that the high producer is the late layer and hence the late molter. The length of time that a hen has been molting or has stopped laying can be determined by the molting of the primary feathers. It takes about six weeks to completely renew the primary feathers next to the axil feathers and an additional two weeks for each subsequent primary to be renewed.

**Temperament and Activity.**--A good layer is more active and nervous and yet more easily handled than a poor layer. A high layer shows most production while the axil feathers and yet clumsy less than the poor layer. A low producer is shy and stays on the edge of the flock and will squawk when caught. While the characters discussed have dealt specifically with the current year's production, it should be borne in mind that a high producer one year is, generally speaking, a high producer in all other years.

**James E. Rice,**

Professor of Poultry Husbandry, Cornell Uni-

**Poultry as an Industry.** The information of the present article will be given under the following divisions: (1) The demand; (2) conditions of success; (3) details to be observed; (4) the necessary equipment; (5) the profit of the industry.

**The Demand.**

There is a steady and constantly increasing demand for first-class poultry products, both in the form of eggs and poultry for the table and when the production of either of these commodities is combined with bure-bred poultry first producer has a doubly assured and considerably increased income.

There is certainly no danger of over-stock- ing the market, provided the quality be first-class. Statistics prove that the city of Greater New York consumes more eggs each year than the entire Empire State produces. The two States of New York and Pennsylvania consume five times as many eggs as they produce. The importation of poultry into these two States is even proportionately larger than that of eggs. The people who produce the choicest poultry for the tables of the more fastidious residents of our great Eastern cities realize prices more than double the average price of the average poultry products marketed in those same cities.

The retail price of strictly first-class eggs during the fall and winter months is more than three times the average summer price of average eggs in those same markets. There is a constant demand at these high prices for a product that can be guaranteed strictly first class, while it is only the second-class or third-class products that are at any time a drug on the market. The people are being educated to the fact that there is a vast difference between fowls of the same age for table and the demands of that even fowls of the same variety and age vary largely in quality according to the methods by which they have been fatted and dressed.

**Conditions of Success.**

There are a few general principles, there- fore, that he who hopes to succeed in the pou- ltry business should become familiar with be- fore embarking largely in this enterprise. 1. He must ever bear in mind that to acquire the greatest profit he must produce the finest qual- ity. The market is generally glutted with the lower grades of poultry and eggs. These are supplied at an actual loss. 2. He must decide upon some one branch of the business which he will make his specialty, and, having made his decision, he must push that line to the limit, cultivating only a small section of the branches of the industry. In making this de- cision he must give careful attention to his own adaptability to his chosen branch of the work, considering well his location and surroundings, his proxi- mity to markets and the demands of that market. 3. He must be prepared to apply the business principles of the business man to
the poultry industry. He must apply the principles of industry, thrift and economy in poultry production with the same energy and persistence as they are practised in our great manufactures. In fact, he becomes a manufacturer, converting the raw materials of the farm crops into those finely finished products, eggs and poultry.

Details to be Observed.

Having decided, for example, that egg production for the city markets shall be his chief aim, he must proceed in building up his business with that particular object constantly in view. In this work the following hints will be useful:

1. Selection of His Variety.—He must keep but one variety, so that his eggs may be as nearly uniform in color and size as possible. Boston calls for a brown egg; New York prefers a white egg. Each city will pay a few cents per dozen more for eggs of its favorite color. The Asiatics—Brahmas and Cochins—and the Americans—Plymouth Rocks and Wyandottes—produce the brown eggs. The Mediterranean varieties—Leghorns, Minorcas and Anconas—are the largest producers of the white eggs. He must, however, in selecting his variety, remember that the Brahmas and Cochins will produce but few eggs until eight months old, while the Plymouth Rocks will lay at six months, and the Wyandottes and Leghorns at five months.

If he intends to grow his own young stock he must provide incubators and brooders for the non-sitting Mediterranean varieties, while the Asiatic and American varieties will hatch and rear their own young. He must also calculate on building warmer and more comfortable houses for the Mediterraneans than will be necessary for the close-fitting rose-combs of the Wyandottes or the small pea-combs of most of the other Asiatics. All the Mediterranean varieties have large combs and pendulous wattles, very susceptible to frost. The Plymouth Rocks, with their medium-sized combs, come between the extremes described, in this respect.

The time of year when he stocks his plant will decide whether he shall start by purchasing eggs for hatching or shall purchase fowls for his foundation. If he begins in the spring, and is equipped with incubators for hatching—and few now depend exclusively on the hens for hatching and rearing—then he will start more cheaply by purchasing eggs from some reliable breeder of his chosen variety. In the fall of the year it is best to start by buying pullets then four to six months old and ready to begin producing eggs.

2. Care of the Stock.—No hen can be a profitable egg producer unless she is kept comfortable and happy. More poultry plants have been wrecked and abandoned because of neglect in caring for the fowls than by any other cause. The questions of food and shelter will be considered under those headings, so we shall content ourselves here with merely mentioning two items:

(a) Cleanliness.—The hen is not an exacting tenant but she is naturally rather fastidious about some things, and she has a right to be. She must have her bath, and that bath is not a water bath, but a dust bath in which she can wallow occasionally and sift her feathers full of fine dust. This looks to be dirty, but it is not; since the dust is much finer, fur, feathers, and all else, must be frequently cleansed. All droppings should be removed from the dropping-board at least once each week, and a little sweetening of the surroundings by a liquid disinfectant and insecticide is most advisable. Fresh straw as a litter for the floor of the house should be provided occasionally, and the nests—the receptacles for those fresh eggs so susceptible to any taint—should be renewed with fresh material frequently.

(b) Water.—Since an egg is two-thirds water, it seems useless to argue for a constant supply of pure, fresh water. If this is provided, a hen will drink 20 times a day. If it is not supplied, her natural thirst will compel her to drink the filthy pools where the hens will find them, even from the cow tracks in the mud of the barnyard. Is it strange that fastidious people are becoming so particular as to specify how the hens that produce their eggs shall be supplied with food and water?

3. The Separation of the Sexes.—This subject is attracting much attention of late, and properly. So soon as the cockerels can be determined from the pullets they should be separated. Both sexes develop much more satisfactorily when kept by themselves. The cocks should be removed from the yards at the close of the breeding season, say in June, not to return until January or February. This much for the best interests of the fowls themselves.

But it is for a better and more certain quality of the eggs that we urge a separation of the sexes. When a hen that has been mated produces an egg, that egg has been fertilized at a certain point in its passage down the oviduct. From the moment of said fertilization until it is deposited in the nest—under normal conditions about 12 hours—the heat of the hen's body has caused the process of incubation to progress. If some great excitement prevents the hen from depositing the egg until the next day, the egg shows bloody spots on known eggs to be thus retained by the hen for 60 hours, so that at the time the egg was laid the heart beats of the embryo chick could be seen with the naked eye.

While the process of incubation practically ceases as soon as the freshly-laid egg reaches a temperature as low as 80°, yet succeeding hens coming on the nest, perhaps several of them the same day, each warm that fertile egg up above 90° and the process of incubation is resumed. Where eggs are gathered at irregular periods—too often only "every few days"—it can readily be seen that only absolutely infertile eggs, those laid by unmated hens, are safely fresh, and many institutions, and even private families, are now making their contracts for "virgin eggs."

On the other hand, eggs that are absolutely infertile may be kept in almost any temperature without spoiling. We have placed such eggs in an incubator and kept them there for three weeks at a temperature above 100° all the time, and at the end of that period amateurs could not distinguish them from fresh eggs. Only the infertile egg will bear transportation in warm
weather, and only those who will take care to have such can hope to realize the highest prices. But as soon as a flock of this sort is now very properly attracting much attention in our agricultural colleges. All desire to be excused from eating the eggs of a diseased hen. One's comfort comes, however, in the fact that dis-
ed hens do not lay many eggs. There is a further satisfaction in the knowledge that the much-talked-of fowl cholera is a rare disease. Only a very few well-authenticated outbreaks of this disease have occurred in this country. There are a few other diseases with somewhat similar symptoms that are frequently mistaken for cholera.

(a) Diarrhoea and Dysentery.—These diseases are both usually brought on by neglect in the matter of food and drink. Pure water is one of the first essentials, and the fowls usually having an unnatural thirst, the pure water is an easy medium for administering some of the simple remedies, such as the Doughlass mixture or a little carbolic acid in the water. With brooder chicks many of these irregularities of the fowls are brought about directly, either from the heat and cold. Chicks under three weeks old will scarcely endure day and night extremes of more than 15 or 20 degrees without manifesting bowel trouble, however carefully they may be fed. With mature fowls in confinement, a failure on the part of the attendant to provide them with grit, gravel, oyster-shell and broken bone is a fruitful cause of these two diseases. Sour and rancid food will also cause diarrhoea, while fowls nearby fed on sound grains will be free from it.

(b) Roup.—This is by far the most com-
mom disease to which our domestic fowls are subject. It is generally considered contagious, but the most careful experimenters have failed to identify the germ or to inoculate a well fowl from a diseased one. Still we advise caution, and recommend that affected birds be isolated. Roup being simply an aggravated cold which rapidly takes on the catarhial form, prevention is most advisable. Under buildings we shall urge freedom from draughts and dampness, which are the most prolific causes. The bird taken in the early stages, kept warm and dry, fed liberally, and the throat and nasal passages sprayed with a weak solution of carbolic acid or an emulsion of unrefined petroleum, will generally recover. If he gets seriously ill, kill and bury him.

5. The Kinds of Food.—This is a subject on which volumes could be written. In brief, since analyses show that, the egg and the body of the young bird are almost identical, we may conclude that the food that is best for egg pro-
duction is almost the best also for the growing fowl. When the fowl is grown and is about red, to be fattened for market, then a different ration is best, as will be shown.

For either the growing chick or the egg-
producing hen, in addition to the grits, bone and shell already referred to, the best results are obtained by a liberal supply, in large variety of feeds of the three following classifications of food:

(a) The Grains.—These are the natural food of our domestic fowls. They grow in such a variety in this country that there is no excuse for limiting our fowls to a scanty vari-
ety. Many erroneously suppose that what a hen picks up first is best for her. Throw down a few handfuls of corn, wheat, oats and millet to a bunch of the birds, and let the others in the order named. Notice that this is in the order of the size, instinct teaching them to take first that of which they can get the most in the shortest time. Now the corn is the grain that ordinarily should be fed the most sparingly. It is so rich in the carbon-
aeous, or fat-making, elements that it is nei-
ther a good egg-maker or a good flesh-pro-
der. To feed to fowls thin in flesh or to feed on a very cold evening, to enable the fowls to keep up their temperature through a long night, corn is best.

Of all our grains we esteem oats the best. Fowls do not take so kindly to oats as to wheat which we rank as second. Use these two grains alternately. Do not mix your grains. Give them something different each time if possible. Kaffir corn is one of our very best poultry foods. Sorghum seed and broom-corn seed are very similar. Buckwheat and sun-
flower seed in moderate quantities are excellent. Never feed more than one-fourth of the grain in a few minutes, unless you bury it among the litter so that they must scratch and work for it. Better that your fowls be kept slightly hungry and in working condition than too fat.

There is not so much necessity for soft foods as most people imagine. With plenty of grit to do the grinding, fowls will do well a longer time on the grains fed whole than on any other rations. There are, however, two forms of the grains that are urged to be used freely, namely, common or coarse bran constantly in boxes, dry, where the fowls, young and old, can get all they will eat of it, and ground oats. This last should be fed mixed with bran for the middle-of-the-day feed — the only time that it is advisable to feed soft, wet food.

(b) The Greens.—The hen at liberty, or in a state of nature, in summer consumes a large quantity of green, succulent food — clover, white clover, alfalfa, lawn-grass, plantain and a score of other forms of greenness will be found in her full crop as she comes up to the perch at night. On such a ration, together with the grains she picks up, she does her best at the egg-basket, or puts on good flesh the most rap-
"dly. This should teach us, therefore, what to supply her in the cold weather if we wish her to do then the work of summer. We must supply these green things to her. Cabbages and mangel wurzels, one each hung in her pen, are good. Clover and alfalfa, harvested before the stalks have become woody, cut into short lengths, steamed or wet with hot water, and then dried out in part with the bran or chopped oats — this is the most dependable of all green foods in winter.

(c) The Meat.—As full as an egg is of meat is an old-time proverb. The white of an egg is largely albumen, and this is best supplied to the laying hen in some form of meat. The hen at liberty gets many a bug and worm. The hen in confinement must have these supplied. The eggs laid by hens reared on a growing and fattening fowl also meet the meat in some form.

Avoid as far as possible the meat-meals of the trade, of uncertain origin and quite likely to be adulterated. Use the coarse granulated meat-scaps whose contents can generally be dis-
covered. These, having been prepared by steam cooking, keep well in any climate. Add to these an abundant supply of clean-cut bone and the combination is cheaper, richer and better than even the ground bone obtained by grinding fresh bones secured from the butcher.

(d) Fattening Fowls.—Where it is desired to quickly finish either young or old birds for the market, the crate-fattening process has no equal. Two birds are confined to a slatted coop two feet square, and, for convenience in handling the droppings, the bottoms are slatted also. The most successful food is some skim milk or buttermilk, thickened to the consistency of batter with finely ground and sifted oats. Feed in a small trough in front of the coop all the birds will consume in 20 minutes, then remove the trough, returning it clean for the next feeding. Some give an occasional feed of grit and cut bone with advantage. Three weeks is as long as birds can be fed by this method; in that time, one will gain 80 to 100 per cent, some 50 per cent. The improvement in the quality of the flesh is as noticeable as is the increase in quantity. To advance a cockerel weighing three and one-half pounds and worth 10 cents per pound, to one weighing five pounds, worth 15 cents per pound, in three weeks, at a food cost of eight cents, is to almost double one's investment, and many are doing this very thing. The yellow-skinned bird takes on a quality of flesh well distributed and having the white skin and white flesh so much desired by epicures.

RATION FOR FATTENING POULTRY.

The following fattening rations are recommended by the Cornell Department of Poultry Husbandry:

Ration with Mill.—50 pounds corn meal; 20 pounds white wheat middlings; 10 pounds ground heavy oats. Mixed to a batter fresh at each feeding with buttermilk or skim milk. Will require approximately 1 quart (3 pounds) milk to 1 quart (1 pound) feed.

Ration with Meat Scrap.—50 pounds corn meal; 20 pounds white wheat middlings; 10 pounds ground heavy oats; 20 pounds meat scrap. Mixed to a batter fresh at each feeding with warm water. Will require approximately 11 quarts (3 pounds) water to 2 quarts (2 pounds) feed.

Methods and Practice.—The Stock: Rations recommended for both young and old stock. Birds off condition or of low vitality cannot be profitably fattened. Before putting in crates grease for lice below vent and under wings with equal parts of vaseline and 'one-third strength blue ointment.' The quarters must be clean. Mite-free quarters are necessary to ensure keen appetites — the keynote of successful fattening.

Crate Fattening.—Construct the crates 36 inches by 20 inches high of slats, using false bottoms and wire netting and suspend trough outside. The capacity of this crate is 6 to 8 fowls or 10 to 12 broilers, determined by the number that can eat from trough at once. Locate crates in comfortable temperature — outside in shade or open shed for summer use and in reasonably warm house for fall and winter.

Pen Fattening.—For best results limit flock to 20 or 30 birds, allowing two square feet of floor space per bird. To prevent dirt and waste feed in troughs, so built that the bottom may be easily cleaned. The milk ration is to be preferred where milk is available or can be bought at a price not to exceed 45 cents per 40-quart can (55 cents per hundred weight). Feed all they will clean up readily twice daily for about two weeks, which is usually as long as fowls will "stand up" under such heavy feeding. Feeders may be held longer, especially in the case of pen-fattening, if the birds should be fed grain in the litter at noon. Birds should not be fed for the first 24 hours so they will eat the new ration greedily. Omit one feeding if at any time birds go "off feed"; clean pans and troughs will help to avoid this. Grit, shell, green feed and water are unnecessary except in hot weather when milk or water may be given at noon.

(e) The Secret of Successful Feeding.—To put it in a word, it is variety. Whether feeding for eggs or for growth, your aim must be to have the fowl consume and assimilate the largest possible quantity of food and then convert and manufacture this into eggs or flesh. With the hen as with the dairy cow, the individual with the best digestive apparatus gains most. One can feed modestly, and you must constantly cater to her appetite; when she gets tired of one thing, have something else more appetizing to tempt her to eat more of it.

THE NECESSARY EQUIPMENT.

(a) Houses.—We have already intimated that the houses must be clean and comfortable. In order to be comfortable they need not be made warm with artificial heat. Hens will endure intense cold if it is dry cold. Their bodies generate enough heat, if properly conserved, to keep them comfortable through the danger period — the night time. In the day they should have an opportunity to exercise and make their blood circulate in scratching in the litter on the floor for their grain rations.

The simplest and best houses are usually about 12 feet wide and of any length desired so as to be divided into compartments each 12 feet square. The rear posts are four and one-half feet high, the front posts five and one-half feet high, the rear rafter nine feet long, and the front rafters five feet long. This makes a house low at the back and only seven feet high at the apex of the rafters, which is about two-thirds of the distance from the rear to the front.

When the rafters are set, sheeting boards are put on the back and roof lengthwise. Over these the best quality of three-ply tarred paper is placed, running from the ground at the rear to the front eaves. This, if treated to a coat of hot gas tar, twice the first year and once each year thereafter, will last for a dozen years or more, and it will be a house "air-tight at the back." The front and ends may be covered with finished weatherboarding, when these, but if so the ends should be lined with the tarred paper.

Be sure that the house is only four and one-half feet high at the back. Build the dropping-boards three and one-half feet wide, exactly half way between the floor and ceiling. Use 2 X 4-inch scantling, flat side up, and running lengthwise of the house, for perches. These, if placed six inches above the dropping-boards, will place your fowls at night 10 feet distance from the front or cold portion of the house. The hens will give the very least amount of space overhead, so the warmth of their bodies will not be scattered but will be retained where it will keep
most combs from freezing in the coldest weather.

Put one window in the front of each compartment. Do not be too lavish of glass. It radiates the heat and makes the house cold at night. A window 2 feet by 4 inches is too small in the cold weather. If hung on hinges, it serves as a door through which one can step out from each compartment into its corresponding yard in front. A small exit hole, 8 x 14 inches, in the front for the use of a small screen to provide ventilation in winter. In April the glass hinged windows may be removed and replaced until November or later with wire-screening doors.

All nest boxes, feed boxes, etc., should be attached to the front and sides of each compartment, one and one-half feet above the floor, so as to leave the entire floor area for scratching room for the fowls.

Each compartment being 12 x 12 feet, and each hen requiring a floor area of six square feet in order that she may have sufficient room for healthful exercise, it will be readily seen that 24 hens is the proper number of occupants for each compartment. A house of this kind, 120 feet long, divided into 10 compartments, holding 240 hens, should not cost more than $40 or $2 per hen. Do not be deluded into the idea of making the walls double and stuffing the space between with straw or sawdust. The thin walls, if made air-tight as directed, are better in every respect and the house will be drier and more wholesome.

(b) Incubators and Brooders.—Better buy these from those who have learned how to make them. There are a dozen good incubators on the market. Purchase the one that seems to you simplest and best. After some experience you may learn to make large box brooders out of discarded piano boxes that will save you some money, and give greater area for the chicks than the brooders you buy. Those of the writer are 3½ x 5½ feet, two feet high at the back, three and one-half feet high at the front, with a 2 x 3 feet window in the front. They are built on 12-inch plank set edgewise for a foundation, thus allowing room for the lamp-box underneath the back. When chicks no longer need the heat of the apparatus may be removed and this brooder used as a colony house for the youngsters until cold weather.

The Profit of the Industry.

This must depend largely upon the intelligence, skill, energy and location of the operator. On farms the cost of food seldom exceeds $1.25 per hen per year. Where everything is bought in most localities it need not exceed $2.25 per hen. It is a poor class of hens that cannot be made to average 120 eggs each, and it is a poor manager, anywhere east of the Missouri River, who cannot realize three cents each for those eggs. Deducting food cost of $1.25 the returns for labor and investment are $2.35 per hen. Many are averaging 180 eggs per hen and receiving four or more cents each for the eggs, which come on the egg business up to approximately $5 per hen.

The best poulterers are combining the branches of the industry by raising pure-bred birds of some variety popular and saleable. They sell most of their surplus eggs for hatching during February, March, April and May, the price they realize varying with their reputations, from five cents to $1.00 per egg.

Their next sales are from the culm male birds of their early hatching. These go for broilers, at from 75 cents to $1.50 each, from April to July. The early hatched chicks at one pound each bring more than those three times as large but later, in the Eastern cities.

The early hatched pullets become egg-producers by August and September must time to replace the hens that have quit laying on account of the molting. The choicest of both sexes are reserved for breeding, show or sale purposes and bring fancy prices. It is no unusual return for such a fancier to have an income of from $5 to $10 for every hen that he starts the year with, before that year closes.

For bibliography see article Poultry; also consult Valentine, C. S., 'The Beginner in Poultry' 1912; id., 'How to Keep Hens for Profit' (1910).

POUNCE (a corruption of pumice), cuttlefish bone or gum sandarach. The resin of the sandarach tree, ground very fine, was used formerly to prevent the spreading of ink on the surface of vellum, parchment or paper where it had been roughly erased. In general the term pounce was also used, previous to the invention of blotting paper, for the finely ground black sand which was generally used for the purpose of drying ink. The container in which this sand was kept and which was to be found on every writing desk was known under the name "pounce box" or "pounce box." Finely powdered gum of the juniper tree or pipe clay, darkened by an admixture of charcoal, is also known as pounce when used for the purpose of transferring designs from the original to some other material. This is accomplished by punching small holes along the outline of the original design and shaking through these openings the darkened pounce which will fall thereby on the material onto which the design is to be transferred in such a manner that the original design can easily be traced in its complete form by means of a pencil, brush or similar instrument.

POUND, Ezra Loomis, American poet: b. Hailey, Idaho, 30 Oct. 1885. He was educated at Hamilton College and at the University of Pennsylvania. He later traveled in Spain, Italy and Provence, engaged in literary studies. He became known for his verse and has also produced several translations and some prose work. He was literary executor for Ernest Fenollosa's work on Japanese classical drama and on Japanese and Chinese poetry. He has contributed to the Fortnightly Review, the Quarterly Review, Blast and other publications, and makes his home in London, England. Author of, verse, 'The First Winter' (1909); 'Excursions' (1909); 'Ripostes' (1912); 'Cathay' (1915); 'Lustra' (1916), etc.; prose, 'The Spirit of Romance' (1910); 'Gaudier Brzeska' (1916). His translations include 'The Sonnets and Ballads of Guido da Cancia' (1913); 'Cicero and Boys' (1913); 'Certain Noble Plays of Japan' (1916). He edited 'The Catholic Anthology' (1915).

POUND, Roscoe, American college professor: b. Lincoln, Neb., 27 Oct. 1870. He was graduated at the University of Nebraska in 1888 and later studied at the Harvard Law
POUND—POUND-NET FISHING

School. He was admitted to the bar in 1890 and engaged in practice at Lincoln, Neb. He was assistant professor of law at the University of Nebraska in 1899-1903, and dean of the law faculty there in 1903-07. He was professor at the Northern University in 1907-09 and at the University of Chicago in 1909-10. He was Story professor of law at Harvard in 1910-13, and has since been Carter professor of jurisprudence there. He was commissioner of appeals of the Supreme Court of Nebraska in 1905-06, and member of the commission from Nebraska on uniform State laws in 1904-07. He was president of the Association of American Law Schools in 1911. Author of 'Readings on the History and System of the Common Law' (1904); 'Readings on Roman Law' (1906); 'Lectures on the Philosophy of Freemasonry' (1915), etc.

POUND, (1) an English weight of two different denominations, avoirdupois and troy. Since 1856 the legal original standard weight in Great Britain and her colonies has been the imperial pound avoirdupois, a cylindrical mass of pure platinum of the weight of 16 ounces, marked "P. S. 1844 1 lb." the two letters P. S. signifying "Parliamentary Standard." The pound troy in Great Britain is defined as 5,760 grains and is divided into 12 ounces, being used almost entirely for weighing gold, silver and precious stones; the pound avoirdupois contains 7,000 grains, divided into 16 ounces, and is used for all ordinary commodities. The imperial standard troy pound constructed in 1758 was the only legal original standard weight between the years 1824 and 1856, previous to these years certain weights, both troy and avoirdupois, had been the standards. These standards were not very accurately constructed, and through constant use became worn, but the pound avoirdupois probably contained as much as 7,002 of our present grains, while the pound troy weighed 5,759 grains. In the United States the British imperial pound avoirdupois has been copied to a great extent, but in theory the pound avoirdupois of Elizabeth is legal in this country. Edward III from evidence in the official records, made the pound avoirdupois the standard, and Elizabeth probably copied her standard from this 56-pound weight, although standards had existed since 1497. The troy pound derives its name from the city of Troyes, where it was used as the standard of weight in the fairs held in that city. In 1497 it was made the legal weight for gold and silver and some authorities claim it was also used for bread, being known as the old commercial weight of England, and containing 7,600 grains. This troy pound displaced the monetary pound which had been in use from the times of the Saxons, and which contained 5,400 or 5,420 grains and was divided into 12 ounces or 20 shillings. At about the same time the pound containing 6,775 grains, divided into 15 ounces, came into considerable use. The apothecaries' pound is now obsolete. (2) Pound is also the highest monetary denomination used in British accounts as well as in U.S. currency, comprising £240 pence, and originally to a pound weight of silver (or of the alloy used). The pound (£) weighs 123.274 grains and contains 113.001 grains of fine gold. In the use of pound as designating money, the epithet sterling is generally affixed to discriminate from the pound weight. (See Weights and Measures.) (3) In law, an enclosed space for keeping cattle which have strayed on another man's ground, until they are reprieved or redeemed. When cattle are put into pound it fails to the person impounding them to feed, but he is entitled to charge the owner of the cattle the cost of keeping them in settling with him for the amount of damages to be paid. In England, an attempt to release from a pound cattle lawfully impounded is liable by a fine. In cases of the seizing of stray cattle and keeping them till damages are paid is called poinding of cattle.

POUND-NET FISHING, any fishing which is conducted by means of fixed enclosures of considerable size into which the fish are led by suitable guides, and within which they are confined by appropriate devices. Under this head will be included the pound-nets proper and trap-nets, as well as the simpler forms of weirs, which together constitute a class of automatic fishing gear quite distinct from the various forms of seines, gill-nets, etc., on the one hand, and from treading the beds and eel-pots on the other. Devices of this sort are employed in the prosecution of the fisheries in many parts of the world, but the method, although not originating in the United States, has here been more highly elaborated and is more characteristic of our fisheries than elsewhere. The precise form and construction of pound-nets varies greatly in different localities, owing to the necessity of adapting it to local conditions of bottom, tides, currents, the kind and number of the fish sought, the available capital, resourcefulness of the fishermen, etc. The terms weir and pound in connection with the fisheries are to a great extent used interchangeably, according to local custom. The chief distinction between a weir and a pound-net seems to lie in the character of the enclosure within which the fish are confined. In the former this is more fixed and has no bottom which can be lifted; in the latter the pound is a netting bag which can be raised to the surface.

The most primitive apparatus of this sort in use in the United States is represented by the brush weirs employed in the herring fisheries of Maine and Canada. These consist of brush walls constructed of stout stakes driven into the bottom to a distance of about six feet and three feet apart. Between these brush, preferably of cedar or spruce for the bottom course, is woven in and out and held firmly in place by smaller stakes placed on the outside and bound to the large body-stakes. Toward the top a looser construction is adopted and the brush is placed vertically, as being less liable to be carried away by the current. Sometimes the brush is constructed in sections afloat and subsequently attached to stakes driven in the proper positions. This has the advantage that the brush sections can be removed and saved at the close of the fishing season, whereas the ordinary weirs, with the exception of such brush as can be removed from the bottom, remain to 20 feet beneath the surface by the winter's storms. When weirs are located on a bottom of solid rock into which no stakes can be driven, recourse is had to the construction of a platform of solid plank, which serves as a bottom to which the poles are fastened.
The whole is heavily weighted and held in place by loading it with stones. A pound-net in the more restricted sense of the term is constructed entirely of cordage netting, supported and held in place by stakes, and consists of three essential parts; the pound or body, the wings and the leader. The pound is located off-shore, usually in from two to four fathoms of water and consists of a bag of very stout netting of about one inch mesh, the margin of which is supported above the level of the water by stout upright stakes driven into the bottom at suitable intervals which vary with the character of the ground and the force of the waves and currents. Where the bottom is rocky further security is found by the attachment of anchored guys ropes to some of the stakes. The only opening in the pound is the slit-like entrance, usually about six feet across, on the inshore side. At this point the walls of the net are carried inward, in order to render the opening less conspicuous from the inside, and are so arranged that by means of suitable ropes they may be brought together even when the net is drawn. The bottom of the pound is spread and secured by means of ropes which pass through loops or pulleys near the bottom of the stakes.

The wings are vertical fences of netting, diverging from the entrance to the pound and having a length of 100 feet or more. The ends directed toward the shore are carried toward one another in the form of a semi-circle, but leaving a wide opening between the two wings. The netting of which the wings are constructed is lighter than that forming the pound, and of about one and one-half inches mesh. It is supported by stakes and reaches from the bottom to the surface, the lower border being weighted with a heavy chain.

Any form of enclosure employed in the capture of fish may be called a trap, and trap-net is frequently used as an equivalent of pound-net. The best usage of the term, however, is to include those forms of pound-nets which are especially adapted to deep water, or to contain a considerable tidal rise and fall by the attachment to the upper margin of the nets of floats which keep it always level with the surface. When surface-swimming fish only are sought, the parts of the net which correspond to the leaders and wings of pound-nets frequently hang suspended above the bottom. The whole is of coarse held in position by a suitable system of ropes, anchors and moorings. This type of apparatus is an approach to the floating gill-net, the sets of which are often arranged in the form of leaders and enclosures. Much information relating to all phases of the use of pound-nets in the American fisheries will be found scattered through the 'Annual Reports' of the United States Bureau of Fisheries and of the commissions of the various States in which these fisheries are located, and especially in the 'Fisheries Industries of the United States' (Washington 1884-87).

'POUNDAL. See Force; Mechanics.'

POURBUS, poor'tud-lés', COUNT (Graf) Friedrich von, German diplomat: b. 24 Oct. 1853. He is descended from a noble French Huguenot family domiciled in Switzerland since the revocation of the Edict of Nantes. Three brothers were made Prussian counts in 1815, and members of the family has long served Germany in bureaucratic, military and diplomatic capacities. The subject of this sketch served as lieutenant of Hussars in the German army and was attached to the Foreign Office in 1880. After serving in secretarial positions in Vienna, at The Hague and Saint Petersburg (Petrograd), he became Ambassador to Holland in 1899, to Munich in 1902, and to Russia in 1907. In the last-mentioned post he handled the negotiations preceding the European War. He did not figure prominently in the diplomatic

POURBUS, Frans (The Younger), Flemish painter: b. Antwerp, 1569; d. Paris, 1622. He was a pupil of his father Frans Pourbus, the Elder, and doubtless studied with others, for his father died when he was 12. He was a free master of the Guild of Saint Luke in 1591. After 1600 he resided at Brussels, then in Italy at the court of the Duke of Mantua, and after 1610 was court painter to Henry IV of France. Of the latter monarch he painted several portraits; he painted also Marie de Medicis, the Louvre portrait of whom has accounted his greatest work. Works by him are to be found in museums at Hampton Court, Madrid, Munich, Paris, The Hague and Vienna. His portraits are inferior to those of his father in warmth of color.

POURBUS, Pieter, THE ELDER, Flemish painter: b. probably Gouda, 1463. He is supposed to be the father of Pieter the Younger and grandfather of Frans the Elder. A portrait of a goldsmith, now at Vienna, is assigned to him.

POURBUS, Pieter (The Younger), Flemish painter: b. probably Gouda, 1510 or 1513; d. Bruges, 1584. He was a pupil of his father and probably of Lancelot Blondeel whose daughter he married. In 1540 he entered the Serment des Arbaletteris de S. George and in 1543 became a free master of the Guild of Saint Luke, of which he was 'doyen' in 1569 and 1589. As he did not buy his citizenship at Bruges it is argued that his father may have moved thither from Gouda before his birth. He worked as decorator and surveyor, having remarkable gifts as a geometrician; but he is known chiefly as a portrait painter. His portrait of Dr. Ambroise Paré is owned by the New York Historical Society. Other works by him are in churches of Antwerp and Bruges and in museums of Brussels, Paris, Rotterdam and Vienna.

POURTALÉS, poor'tud-lés', COUNT (Graf)
history of that war, though the British Ambassador in Petrograd telegraphed to Sir Edward Grey on 29 July 1914: "I fear that the German Ambassador will not help to smooth things over, if he uses to his own government the same language as he did to me to-day."

POULTALÉS, Louis François de, Swiss-American naturalist: b. Neuchâtel, Switzerland, 4 March 1824; d. Beverly Farms, Mass., 17 July 1880. He studied engineering but turned to natural science; was a pupil of Louis Agassiz (q.v.), whom he assisted in 1840 in an exploration of Alpine glaciers; and in 1847 came with him to America, where the next year he entered the United States coast-survey. He was the first in this country to attempt deep-sea dredging. Among his important researches in this field were those conducted during the Hassler expedition from Massachusetts Bay to California by way of the Straits of Magellan. From 1854 until his resignation from the survey in 1873, he was in charge of the office and field work. His chief work was accomplished in marine zoology, and the large collections accumulated by him in connection with that subject were deposited in the Harvard museum of comparative zoology in which he was for a number of years an assistant, and as keeper of which he succeeded Agassiz in 1873. The genus Poultalesia of searchers was named after him. His writings include, besides articles in scientific journals and contributions to the survey reports, the following works among several published by the Cambridge museum: 'Contributions to the Fauna of the Gulf Stream at Great Depths' (1863-69); 'List of the Crinoids Obtained on the Coasts of Florida and Cuba in 1867-69' (1869); 'Deep-Sea Corals' (1871); 'The Zoological Results of the Hassler Expedition' (with A. Agassiz, 1874); 'Corals and Crinoids' (1878); a report on 'Corals and Antipatharia' (1880).

POUSHKIN. See Pushkin.

POUSSIN, poo-sahn, Gaspar, Italian painter: b. Rome, 1613; d. there, 15 May 1665. He was the son of a Frenchman named Duchet, who had settled at Rome but in signing his etchings his name was always Poussin. He was married to a daughter of Duchet's. When his sister married Nicolas Poussin he took the name of his brother-in-law, whose studio he entered as pupil. The standard landscape of his day was that of Claude Lorraine, but Poussin was not so conventionally classical but more true to the animalism of nature than his great rival, the transparent lucidity of whose aerial perspective he never attained to. As he painted on a red background his pictures have so darkened by age that it is hard to imagine their effect when first produced. It can, however, be seen that he discerned the true lines of a landscape; that he composed with natural grace his groups of forest trees and antique ruins; and that his land storms, in which the trees seem to over and here, are genuine transcripts from tempest-harried plains and mountain. He was imitated by many painters of his day. The best of his pictures are at Rome. They are painted in tempera or oil, and examples of both styles may be seen in the Fabriano Doria, Colonese Barberini, Dugesse and Corsini and in the gallery of the Accademia di San Luca. At Rome he executed the frescoes 'History of Eleiah and Elisha' in the church of San Martino a' Monti. There are pictures of his to be found in the galleries of Paris, Petrograd, Florence, Madrid, Stockholm, Vienna, London, Dresden and Dresden and a great number are scattered through the private galleries of England and through the public galleries of many small European cities. He was one of the most prolific and finished painters of his time, but his that to-day most of his pictures are to be found in various European galleries and collections. Two of his landscapes are in the New York Metropolitan Museum of Art.

POUSSIN, Nicolas, French painter: b. Les Andelys, Normandy, 15 June 1593; d. Rome, 19 Nov. 1665. He studied first in his native place, and then at Paris. He had already acquired considerable reputation when, in 1624, he went to Italy, where at Rome, Marini, the poet, inspired him with a taste for the Italian poets, in whose works he first found the chief source of his art. After the death of Marini (1625), though left without patronage, he continued the study of geometry, perspective, architecture, anatomy, as well as the practice of his art. His conversation, his walks, his readings were also almost always connected with studies of antique and classical antiquities, modeled statues and reliefs, diligently painted from nature; and all his works show the results of this study. At last he was attacked by an illness brought on by his labors. He was, however, taken care of by a Frenchman, Jacques Dughet, the father of Gaspar Poussin (q.v.). In 1630 Poussin married the daughter of his benefactor. About this time his affairs began to improve. He found patrons in Cardinal Barberini and the Cavaliere Cassiano del Pozzo, for whom he painted the celebrated 'Seven Sacraments.' These works likewise gained him celebrity in France; and Cardinal Richelieu invited him to Paris to paint the great gallery of the Louvre. Louis XIII appointed him president of the Academy, and gave him a pension of 3,000 livres. Poussin arrived in Paris in 1640, and executed numerous works, particularly historical pieces from the Old Testament, but was much harassed by his enemies. The painter Jacques Fouquet had just paid the rent of the studio to decorate the gallery and the architect Mercier had overloaded it with ornament. Poussin found himself under the necessity of removing their labors. He also had to contend with the whole school of Simon Vouet. Harassed on every side he determined to leave Paris. In September 1642 while employed on cartoons of the 'Labors of Hercules' for the gallery of the Louvre, he returned to Rome (ostensibly for the purpose of bringing his wife to France) and never again quitted that city. The second period of his life in Rome was even more productive than the first. Many of his works were the result of orders that came to him from admirers in Paris, especially from de Chantelou, an influential courtier, for whom he painted, between 1644 and 1646, a second series of 'The Seven Sacraments.' As a painter his drawing is remarkably correct; his composition dignified and noble; his invention rich; his style grand and heroic. His expression approaches that of Raphael, and it is the direct heir of the whole line of France. He has been censured for a too
studied arrangement and a too great propensity to episodes; too much uniformity in the attitudes, air and expression of his figures; an excessive fullness in the drapery and too small proportions in his figures—faults which may have been owed to a certain lack of imitation of the ancients. But notwithstanding these faults Poussin may be compared with the greatest Italian masters. Among his most celebrated works are 'Seven Sacraments'; 'Deluge'; 'Death of Germanicus'; 'Capture of Jerusalem'; 'Plague of the Philistines'; 'Rebecca'; 'The Adulteress'; 'The Infant Moses'; 'Moses bringing Water from the Rock'; 'The Worship of the Golden Calf'; 'John Baptistizing in the Wilderness,' etc., and many fine landscapes. The largest collection of Poussin's works is to be found in Paris, the Louvre alone containing 39. London, too, holds many of his paintings, and practically every one of the more important European galleries owns specimens of his work. Only comparatively few, however, have remained in Rome. Three of his pictures may be seen in the New York Metropolitan Museum of Art.

POUT, or HORNED POUT. See BULLHEADS.

POUTER, a variety of fancy pigeon, the chief character of which is its projecting highly inflaible breast. See PIGEON.

POUTRINCOURT, Jean de Biencourt. See BIENCOURT DE POUTRINCOURT, JEAN.

POW, WOW, an American Indian term meaning (1) a ceremony, with conjurations, held for the curing of diseases; (2) a consultation of chiefs or leaders; a deliberation over important tribal matters. In colloquial use powwow is used in American politics as applied to any non-party meeting or gathering.

POWDER, a general name applied to explosive as gunpowder, giant powder, etc. See EXPLOSIVES.

POWDER-DOWN FEATHERS. See PLUMAGE.

POWDERLY, Terence Vincent, American labor leader and lawyer: b. Carbondale, Pa., 22 November 1862. His early education was obtained in the public schools and he then (1862) became a railroad switch tender. At 17 he became a machinist's apprentice, settled in Scranton, Pa., in 1866, and there worked as a machinist until 1877. He was elected mayor of that city on the labor ticket in 1877 and re-elected in 1880 and 1882. He was General Master-Workman of the Knights of Labor in 1879–93, but resigning in the last-named year took up the study of law and was admitted to the bar of Lackawanna County in 1894, and in 1901 to that of the Supreme Court of the United States. He was United States commissioner-general of immigration 1897–1902, special representative of the Bureau of Immigration and Labor to study causes of emigration from Europe 1906 and since 1907 has been Chief of Division of Information in Bureau of Immigration to distribute immigrants throughout the United States. He has lectured frequently, made many Republican campaign speeches in 1896 and 1900 and published 'Thirty Years of Labor 1858–89' (1899–1900); 'History of Labor Day'; and articles on economics in numerous magazines. In collaboration with S. C. T. Dodd he published 'Trusts' (1892) and also contributed with others to 'The Labor Movement' (1887).

POWELL, Baden, English Anglican clergyman and mathematician: b. Stamford Hill, London, 22 Aug. 1796; d. London, 11 June 1860. He was graduated from Oxford in 1817, took orders in the English Church and became vicar of Plumstead, Kent, in 1821. He was elected a Fellow of the Royal Society in 1824, and in 1827 was appointed Savilian professor of geometry at Oxford, on which occasion he resigned his living of Plumstead. He was the father of the famous English general, Sir Robert S. S. Baden-Powell (q.v.). He contributed many papers on optics, radiant heat and other physical subjects to the 'Philosophical Transactions,' and published a 'History of Natural Philosophy' (1834); but he is better known by his essay 'On the Study of the Evidence of Christianity' (in Essays and Reviews, 1860). Earlier theological works of a similarly liberal character are 'The Connection of Natural and Divine Truth' (1838) and 'Tract Unveiled' (1839); 'The Unity of Worlds' (1855); 'The Study of Natural Theology' (1856); 'Christianity without Judaism' (1857); and 'The Order of Nature' (1859).

POWELL, Edward Payson, American Unitarian clergyman and author: b. Clinton, N. Y., 9 May 1833; d. Sorento, Fla., 14 May 1915. He was graduated from Hamilton College in his native town and from Union Theological Seminary, New York, in 1858. Entering the Congregational ministry he was pastor at Adrian, Mich. 1861–71, and of the Mayflower Congregational Church, Saint Louis, 1871–74. From 1874 to 1877 he held a Unitarian pastorate in Chicago and has since been editorially connected with secular and religious journals to which he has contributed articles on outdoor life and kindred subjects. He has published 'Our Heredity from God' (1886); 'Liberty and Life' (1890); 'Nullification and Secession in the United States' (1896); 'Hurd-breaks, Hedges and Gates' (1901); 'The Country Home' (1904); 'In the Orchard and Fruit Garden' (1905); 'How to Live in the Country' (1910).

POWELL, Frederick York, English historian: b. London, 14 Jan. 1850; d. Oxford, 8 May 1904. He was educated at Rugby and
POWELL, John Wesley, American geologist: b. Mount Morris, N. Y., 24 March 1834; d. Haven, Maine, 23 Sept. 1902. He was educated at Illinois and Wheaton colleges, studied also at Oberlin and made researches in natural history and geology. At the outbreak of the Civil War he enlisted as a private in the 20th Illinois volunteers. As a result of a severe wound, suffered in the battle of Shiloh, he lost his right arm. At the expiration of his term of service in the spring of 1865 he returned to civil life, after having been promoted to the rank of major. In 1865 he was appointed professor of geology and curator of the museum at Illinois Wesleyan University at Bloomington, and in 1867 lecturer and curator at the State Normal University. He conducted in 1868 a perilous exploration of the grand canyon of the Colorado, and in 1870 took charge of the newly established geological and topographical survey of the Colorado River of the West. By this survey nearly 100,000 miles of the Colorado Valley were carefully explored. The work was subsequently transferred to the Interior Department. By 1874 there were four surveys in the field, and this led in 1879 to the establishment of the organization known as the United States Geological Survey, in the formation of which Powell was largely instrumental. From 1881 to 1894 he was director of the survey. He also made a particular study of American ethnology and organized the Bureau of Ethnology, of which he was the director until his death and which he trained to a high plane of scientific efficiency. His studies of the Indians are deemed of great value. As administrator of the survey, which included also economic geology, geography and paleontology, he was very successful. Later in his life he devoted considerable attention to philosophy and psychology. He secured valuable legislation in connection with the land laws affecting the development of the arid West. In May 1910 a memorial in form of a stone altar supporting a bronze tablet engraved with a brief account of Powell's expedition to the Grand Canyon of Colorado was erected on the brink of the Grand Canyon in commemoration of the explorations accomplished by the expedition. Among his writings are 'Exploration of the Colorado River' (1875); 'Report on the Geology of the Uinta Mountains' (1876); 'Introduction to the Study of Indian Languages' (1877); 'Studies in Sociology' (1887); 'Indian Linguistic Families of America, North of Mexico' (1891); 'Canyons of the Colorado' (1895); 'Truth and Error; or, the Science of Intellec-
tion' (1896); and 'First Through the Grand Canyon' (1915).

POWELL, Lyman Pierson, American college president: b. Farmington, Del., 21 Sept. 1866. He was educated at Johns Hopkins University and the University of Wisconsin and in 1893-95 he was a Fellow of the University of Pennsylvania. He was ordained deacon in the Protestant Episcopal Church in 1897 and priest in 1898; was rector at Landsdowne, Pa., in 1898-1903, and at Northampton, Mass., in 1901-12. In 1912 he became professor of business ethics at New York University and in 1922 he has been president of Hobart College and William Smith College. He edited 'American Historical Towns' (4 vols., 1898-1902); 'Current Religious Literature' (1902); 'Devotional Series' (2 vols., 1905-07); 'Hymns in Our Colleges and Universities' (1912); and is author of 'The History of Education in Delaware' (1893); 'Family Prayers' (1905); 'Christian Science—the Faith and its Founder' (1907); 'Heavenly Heretics' (1910).

POWELL, Maud (Mrs. H. Conway Turner), American violinist: b. Peru, Ill., 22 Aug. 1868. She received her musical education at Chicago, Leipzig, Paris and Berlin, studying under William Lewis, Henri Schradiech, Dancla and Joachim and made her début at Berlin in 1885. She was married to H. Godfrey Turner of London in 1904. She has been soloist with many great orchestras, including those of Thomas, Siedl, Gericie, Nikisch and Damarisch. She toured Germany and Austria with the New York Arion Society in 1899, the British Island and Egyptian Gulf in 1899-1901, and in 1903-05; and also toured South Africa in 1905. Since 1903 she has appeared in America every musical season. She attained a high reputation and holds a large and appreciative following. She is noted for her interest in new compositions and in arousing her audiences to appreciation of them, and she is likewise keenly on the alert for excellence in the work of American composers.

POWELL, William Byrd, American physician and cerebral physiologist: b. Bourbon County, Ky., 8 Jan. 1899; d. Henderson, Ky., 3 July 1887. He became noted by reason of his work, 'The Natural History of the Human Temperament' (1836), announcing the theory known as Powell's life-line, and his novel views concerning the results of marriage within near or prohibited degrees of consanguinity. He was graduated from Transylvania University, at Lexington, Ky., in 1820, and from the Transylvania Medical School in 1823. In 1835 he was appointed professor of chemistry in the Medical College of Louisiana, holding that posi-
tion for several years. In 1843 he began a so-
journing among the American Indians, adopting
their dress and manners in order to study their
habits, dispositions, longevity, etc., and secured
the esteem of many warriors and chiefs. In
1849 he organized at Memphis, Tenn., the Mem-
phis Medical Institute, heading its department
of cerebral physiology. He held a similar posi-
tion in the Cincinnati Eclectic Medical Insti-
tute and was a professor of cerebral physiolo-
gy in the New York Eclectic Medical Institute.
He bequeathed his head to his literary executor
to be preserved with his collection of crania con-
taining some 500 specimens. He was a mem-
ber of many scientific and medical journals. Beside
' The Natural History of the Human Temperament' (1856), he published
' Eclectic Treatise on the Diseases of Chil-
dren' (1857); ' The Eclectic Practice of Medi-
cine' (1857).

POWELSON, Wilfred Van Nest, American
naval officer: b. Middletown, N. Y., 15
Sept. 1872. He was graduated from the United
States Naval Academy in 1893 and was then
sent by the government to study naval archi-
tecture at the University of Glasgow. While
serving at the Firth of Forth in 1893 he was
ordered to consider the destruction of the Maine
in the harbor of Havana and published reports stating that the Maine
was sunk by an exploded mine was much dis-
cussed by scientific periodicals. He was pro-
moted lieutenant in March 1901 and retired in
1902. After becoming general manager of the
Union Electric Light and Power Company of
St. Louis, Mo., in 1904; and president and
treasurer in 1906, he has been, since 1908, a
member of a New York firm of consulting engi-
neers and managers of public utilities corpora-
tions.

POWERS, Frederick Belding, American
chemist: b. Hudson, N. Y., 4 March 1853. He
was graduated at the Philadelphia College of
Pharmacy in 1874 and at the University of
Strassburg in 1880. He was professor of ana-
lytical chemistry at the Philadelphia College of
Pharmacy from 1883; professor of pharmacy
and materia medica at the University of Wis-
consin in 1883-92; director of the laboratories of
Fritzsche Brothers in 1892-96; and in 1896-
1914 was director at the Wellcome Chemical Research Laboratories, London, England. He
was awarded the Ebert Prize of the American
Pharmaceutical Association in 1887, 1912 and
1906; and received gold medals at the Saint
Louis Exposition, 1904, at Milan in 1906, at the
Franco-British Exposition in 1908; grand prize
at Brussels in 1910; the gold medal at Turin
in 1911, and the Hamburg gold medal in 1913.
He was a member of the Committee of Revision
of the United States Pharmacopeia in 1890;
and United States delegate to the International Congress for the Uniformity of the Formulas
of Potent Medicaments at Brussels in 1902.
With Dr. Fred Hoffmann he edited 'Manual of
Chemical Analysis' (1883).

POWER (William Grattan), Tyrone,
Irish actor: b. near Kilmacthomas, County
Waterford, 1795; lost at sea, 1841. He made
his début as Orlando in 'As You Like It' in
1811 at Monmouth, Wales. In 1822 he appeared
in London, where he made a hit as Larry
Hooligan O'Halloran in 1824, and henceforth
devoted himself to impersonations of Irish char-
acters in which he was inimitable. He visited
the United States in 1833, 1836 and in 1840,
and in 1841 embarked for Europe on the Presi-
dent, which was never heard of. He published
two novels, 'The King's Secret' and 'The
Lost Heir'; a number of plays; and 'Impres-
sions of America' (1836). Consult Winter,

POWER, in arithmetic, and in the algebra
of real numbers, the product obtained by multi-
plying a given number by itself a specified
number of times. If x is the given number,
and s is the number of times that x is taken
as a factor in forming the product, then the
product that is finally obtained is

\[ x \times x \times x \cdots \times x \times x \times x \]

\( (n \text{ factors altogether}) \)

This is called the \( n \text{th power} \) of the number x, and is represented by the symbol \( x^n \). Assum-
ing for the moment that \( n \) (which is called the \( n \text{th exponent} \) of the power) is an inte-
gral (since this is the only case in which the
foregoing definition is applicable), we easily
obtain the following general laws which the
powers of numbers must fulfil.

\[ x^m \times x^n = x^{m+n} \]
\[ (x^m)^n = x^{mn} \]

To extend the conception of a power so as to permit the use of fractional and negative
exponents, we may assume that the foregoing laws hold true of all real exponents, and from them
we may seek the interpretations that must be
given to an expression of the form \( x^n \), when \( n \)
is fractional or negative. First, if we make
\( m = 0 \) in the equation \( x^m \cdot x^n = x^{m+n} \) we have
\( x^0 \cdot x^n = x^n \); and hence we conclude that the
symbol \( x^0 \) must be interpreted as representing
unity in all cases. Again, if we make \( m = -n \),
we have, from the first of the general relations
given above, \( x^m \cdot x^{-m} = x^n \cdot x^{-n} = x^0 = 1 \)
and hence we must interpret the expression
\( x^{-n} \) as signifying the reciprocal of \( x^n \). We
may ascertain the significance of a fractional ex-
ponent by means of the second relation of the
laws above. Thus in the identity \( x^{m+n} = x^m \cdot x^n \), let
us put \( m = 1 \). Then we have \( \left( \frac{1}{x^n} \right)^m = \frac{1}{x^{mn}} \)
\( x^m = x \). Hence \( \frac{1}{x^n} \) must be interpreted as rep-
resenting one of those quantities which, when
raised to the \( n \text{th power} \), will yield \( x \) itself.

That is, we must interpret \( \left( \frac{1}{x^n} \right)^m \) as equivalent to

\( \frac{1}{x^n} \). In general, this will be a many valued func-
tion. If \( x \) is real, \( \sqrt[n]{x} \) is often interpreted as the
positive real number which when raised to the
\( n \text{th power} \) gives \( x \). This is only one of the
values of \( \frac{1}{x^n} \). In a similar manner it is easily
shown that the symbol \( n \) must be interpreted

\( \frac{1}{x^n} \) as equivalent to \( \sqrt[n]{x} \).

The significance of a power, when the ex-
POWER — POWER, UTILIZATION OF

ponent is irrational or imaginary, is considered in the theory of functions, but these generalizations are too difficult for sound treatment in the present article. For this aspect of the subject, and for the discussion of the development of a series while in the terms are powers of that variable, consult Harkness and Morley, 'Introduction to the Theory of Analytic Functions' (London 1898).

POWER, in mechanics and physics, the rate at which work is performed; or (what is the same thing), the quantity of work that is performed per unit of time. In ordinary engineering practice in the United States and England, the unit of work is the "foot-pound;" a foot-pound being defined as the quantity of work that is performed when a force equals the weight of one pound of matter is exerted through a distance of one foot. (See MECHANICS). Nothing is here specified, it will be observed, as to the time in which this work is done. A small motor, for example, might require 10 seconds to accomplish it, while a more powerful one might perform it in a very small fraction of one second. The work that is performed by a given motor or engine in one second, or in one minute, is therefore the true measure of the power that is being developed. James Watt adopted the horse power as the unit of power for steam engines and other large motors, and this has been universally adopted, since his time, in all English-speaking countries. He estimated that a strong horse is capable of performing 33,000 foot-pounds of work per minute; and although it is known that the horse cannot work continuously at this rate, his definition has never been modified, and in steam and hydraulic engineering a horse power is still understood to signify the performance of 33,000 foot-pounds of work per minute, or (what is the same thing) 550 foot-pounds per second. The horse power of an engine or a water-wheel is therefore determined by observing how many foot-pounds of work it is performing per minute, and dividing this number by 33,000. In the centimeter-kilogram-second system of units, which is in extensive and increasing use in modern physics, the unit of work is the erg, and the unit of power is the watt; a watt being defined as the power that is developed by 10,000,000 ergs of work performed per second. The watt is employed in practical electrical engineering, as well as in experimental physics; it being then defined as the rate at which work is being done in a circuit in which the current is one ampere, and the electromotive force is one volt. This change in definition is merely a matter of convenience, since it may be shown that the two definitions amount to precisely the same thing. A horse power is approximately equal to 746 watts. Consult Everett, 'Units and Physical Constants.' See also the article UNITS OF MEASUREMENT.

POWER, Utilization of. The economical production of manufactures and the convenient adaptations of time- and labor-saving devices in all the various lines of constructional work have every year during the last 100 years been increased so that their use is now almost universal in American industries. Among other significant features the present tendency is marked by the adaptation of compressed air and the application of electric power to machine driving. In the use of compressed air, the facility of adaptation to various requirements which are in many cases additional to the supply of motive power, is a valuable feature peculiar to this system and one which is susceptible of extension along many lines. The labor cost in machine shops and other works is so much greater than the cost of power that any expedient by which the labor cost may be appreciably reduced is justified, even though the efficiency of the agent itself be low. Whenever new methods or agencies cause an increased production with a given outlay for labor, these methods will supersede the old, even though the cost of the power required be greater than before. The saving of power is a consideration secondary to the advantages and economical output obtained by its use. While economy in the use of power should therefore be secondary to increased output, yet careful attention to details will often greatly reduce the useless waste of power. Engineers have recognized that there is a very great percentage of loss due to shaft friction, which, in railroad and other shops where the buildings are more or less scattered, may be as great as 75 or even 80 per cent of the total power used. In the ordinary machine shop this loss will probably average from 30 to 50 per cent. No matter how well a long line of shifting may have been erected, it soon loses its alignment and the power necessary to rotate it is increased.

Manufacturers are realizing the loss of power which ensues from the present system of mechanical transmission, and there is an increasing tendency to introduce different methods by which a part of this loss will be obviated. Among these are the adoption of hollow and lighter shafting, higher speeds and lighter pulleys, roller and ball bearings in shaft hangers, and the total or partial elimination of the shafting.

Subdivided Power.—Independent motors are often employed to drive sections of shafting and isolated machines, and among these are found steam and gas-engines, electric motors, compressed air and hydraulic motors, although the latter have not been used for the special purpose to any appreciable extent. In the choice of motors, until quite recently the steam engine has generally been used, especially where the units are relatively large, but the advantages possessed by electric driving has caused the electric motors to replace the steam engine in many cases. An interesting example of this is noted in the Franklin Sugar Refining Company of Philadelphia, in which there were formerly some 90 Westinghouse engines about the works, many of them being of 75 and 100 horse power each; others of 5 and 10 horse power only. At the present time these have all been replaced with electric motors. A similar subdivided-power plant involving nearly 50 steam engines was erected some years ago at the Dunnell Print Works of the United States Finishing Company at Pawtucket, R. I. More recently many of the steam engines have been replaced by electric motors, but there are still 27 engines in use in this plant. It was not too many years ago that several large economic Corliss engines were replaced at the Baldwin Locomotive Works by a greater number of small, simple-expansion engines, which actually required about 15 per cent more steam
per horse-power hour than the Corliss engines. This loss, however, was only apparent, for by increasing the number of units and locating them at convenient centres of distribution much of the danger of the armatures of the motor. Under these conditions it is necessary to use a motor of much larger capacity than the average load would indicate. Ordinarily in machine driving the motor is shunt-wound, and the current through the field coils is constant under all conditions of load; but to obtain the best results with that class of machinery in which the load is intermittent and subject to sudden variations, the motor should be compound-wound so as to increase the torque without an excessive increase of current in the armature. In many cases with individual motors, owing to wide variations in power required, the average efficiency of the motor may be very low; for this reason a careful consideration of the total mass from power in the case indicates that for ordinary machine-driving, especially with small machines, short lengths of shafting may be frequently employed to good advantage, and the various machines, arranged in groups, may be driven from one motor. This method of operation is required, and each may be so proportioned to the average load that it may run most of the time at its maximum efficiency. When short lengths of shafting are employed the alignment of any section is very little affected by local settlement of beams or columns, and since a relatively small amount of power is transmitted by each section, the shaft may be reduced in size, thus decreasing the friction loss. Moreover, with this arrangement, as also with the independent motor, the machinery may often be placed to better advantage in order to suit a given process of manufacture; shafts may be placed at any angle without the usual complicated and often unsatisfactory devices, and setting-up room may be provided in any suitable location as required, without carrying long lines of shafting through space. This is an important consideration, for not only is the running expense reduced and the lighting increased thereby, but the clear space required is thus increased, and the loss from shafting, belts, ropes, pulleys and other power-transmitting devices can be more easily utilized for hoists and cranes, which have so largely come to be recognized as essential to economical manufacture.

Distribution.—In arranging such a system of power distribution the average power required to drive is of such importance as the maximum, for in a properly arranged group system the motor capacity need not be the equivalent of the total maximum power required to operate the several machines in the group, but may be taken at some value less than the total, depending upon the number of the machines and the average period of operation. On the other hand, as already shown, the motor capacity of independently driven machines must not only equal the maximum power required to drive the machine at full load, but it must be capable of exerting a greatly increased momentary torque. In any case large units should be avoided, for the first principle of these motors driven from one motor entails additional shafting, counter-shafts and belting which may readily cause the transmission losses to be greater than those obtained with engines and shafting.
POWER, UTILIZATION OF

alone, besides frustrating some of the principal objects of this method of transmission.

As far as the efficiency of transmission is concerned, it is doubtful whether, in a large number of cases, the motor system is any more efficient than well-arranged engines and shafting. The principal thing to be kept in mind is a desired increase in efficiency of the shop plant in turning out product, with a reduction in the time and labor items, without especial regard to the fuel items involved in the power production. On account of the subdivision of power which results from the use of many motors, there is less liability of interruption to manufacture, and in case of overtime it is not necessary to operate the whole works, with its usual heavy load of transmitting machinery. Another advantage is the adaptability to changes and extensions; new motors may always be added without affecting any already in operation, and the ease with which this system lends itself to varying the speed of different unit groups is a very potent factor in its favor. When power is delivered to the machine by direct connected motors, a serious difficulty is often experienced in obtaining speed variation, which is so necessary with a large proportion of the machines in use; when used in conjunction with the field, a certain amount of variation can be obtained by rheostatic control — a wasteful method; or by using a single voltage system with shunt field regulation, but the variation in either case is very limited. This, however, may be increased by using double commutation if space will permit. The three-wire, 110-220-volt system, offers many advantages for both power and lighting systems, and is very frequently employed. Variations of speed may be obtained with this system by using a combination of field regulation with either voltage, and, in rarer cases, by the use of a double commutator motor. A method which has been used with considerable satisfaction involves the use of a three-wire generator, with collector rings connected to a generator or motor to a bank of a two-phase rotary converter. Balancing coils are used, and the middle points of these are connected to the third wire, which is thus maintained at a voltage half way between the outer wires. This system is simple and economical, and possesses all the advantages of the ordinary three-wire method; it permits similar variations in speed by field regulation with either voltage; and if still wider ranges are desired a double commutator motor may also be used.

In other installations the four-wire multiple voltage system is used, which permits of very wide variations of speed in the operation of the tool. This system gives excellent results and removes one of the objections urged against direct-connected motor-driven tools, namely, that such machines are not sufficiently flexible in regard to speed control, and that such variation can only be obtained by throwing in resistances which cut down the efficiency of the motor or by varying the strength of field which reduces the torque. The multiple voltage system, however, has some serious disadvantages. It may be operated from an outside source of power without rotary transformers; the generating sets and switchboard are complicated, and the total cost of installation is expensive; yet with these drawbacks the system is growing in favor, as it has manifest advantages which outweigh the objections. Storage battery power has been used to some extent to obtain multiple control and is suggestive of interest; but for general use it is not altogether desirable for this purpose. In many of the larger sizes of certain metal-cutting machines marked changes in design have taken place, and these machines are now built with direct-connected motors incorporated in them, possessing wide variations of speed and power.

Improvements in the manufacture of tool steel have shown indisputably that the older designs of machine tools are not sufficiently heavy to stand up to the work in order to obtain the economy of operation which results from the use of such steels. Higher speeds, heavier cuts and greater feeds may be obtained if the machines will stand the strain, but in most cases the capacity of the machine is not commensurate with the capability of the tool to remove metal. With cutting speeds of 100 to 200 feet per minute, it is evident that the power requirements will be much greater than for those machines which use ordinary carbon steel with cutting speeds of from 10 to 30 feet per minute. Here the direct-connected motor with ample power and speed variation for any work which it may be called upon to perform.

Compressed Air.—Reference has been made to the use of compressed air power, and its facility of adaptation to various requirements, but it is evident from an inspection of some of the devices in use that enthusiasm for new methods, rather than good judgment, has controlled in many of its applications. For some years compressed air was introduced into manufacturing lines, and to-day its use in railroad and other machine shops, boiler shops, foundries and bridge works is being widely extended. In the field of railroad shops at Topeka there are over five miles of pipe in which compressed air is carried to the different machines and labor-saving appliances throughout the works. In such shops air is used to operate riveting machines, punch presses, stay-bolt breakers, shank-bolt cutters, rotary field and drilling machines, flue rollers, rotary grinders, rotary saw for sawing car roofs, pneumatic hammers, chisels and caulking tools, flue welders, boring and valve-facing machines, rail saws, machine for revolving driving-wheels for setting valves, pneumatic painting and whitewashing machines, dusters for car seats and the operation of switching engines about the yard. It is also used in the foundry for pressing and ramming molds, and for cleaning castings by the sand blast; but its greatest usefulness lies in its application to hoisting and lifting operations in and about the works. More recently its use has been extended to include the sand blasting of steel passenger coaches. In mines, where exhaust steam or gas engine exhaust would interfere with proper ventilation, compressed-air engines and motors, which discharge pure air directly into the workings, are used for a variety of purposes, such as locomotive haulage, hoisting, pumping, cutting and drilling. Probably nothing has called wider
attention to the possibilities of the use of compressed air than the recent installation of a system of compressed air deep-mine hoists in the Butte, Mont., mines. This is especially remarkable in view of the fact that the compressors are operated electrically from transmitted water power; it was found to be better to use electricity to operate compressors discharging into storage reservoirs from which the air passed through heaters on the way to hoisting engines than to operate the motors electrically. One factor in this conclusion is the special construction of the engine, which as the cage descends operates as a compressor, storing air by the energy of the falling hoist, and acts as a brake at the same time.

New applications of compressed air are constantly being made, and each new use suggests another. This has a tendency to increase the number of appliances which are intended to be labor-saving devices, but in many cases the work can not be done just as well and much more cheaply by hand. The success and economy which has attended the use of compressed air in so many lines of work has led to its adoption in fields which are much better covered by electrically operated machines. While compressed air has been used under certain conditions very satisfactorily to operate pumps and engines, printing-presses, individual motors for lathes, planers, slotters, dynamos and other work, it does not follow that it is always an economical agent under these various uses or that other methods could not be used even more satisfactorily. It has been proposed to use individual air motors in machine shops and do away with all line shafting, except possibly for some of the heavier machinery. This use of compressed air seems entirely outside the pale of its legitimate field; the general experience thus far indicates that rotary motors are not at all economical and generally are not as satisfactory as electric motors. Exceptions are to be found in the small portable motors for drilling and similar operations to which electricity is not so well adapted and where compressed air has been found to give excellent results. Although these tools are very successful, they are still rotary motors, not excepted from the objectionable features which seem to be inseparable from them. It is not surprising, therefore, to find a tendency to employ reciprocating pistons and cranks in these portable machines, and such tools are now in use weighing only 40 pounds capable of drilling up to two and a half inches diameter. In most cases no attempt has been made to use compressed air power efficiently; its great convenience and the economy produced by its dispersion have, until recently, been accepted as sufficient, and greater economies have not been sought.

In the matter of compression, very inefficient pumps are still in use, but manufacturers generally have found that it pays to use high-grade economical compressors. The greatest loss is that in the air motor itself. In a large number of cases it is impracticable or, at most, inconvenient to employ reheaters, and the air is used very generally at normal temperature for the various purposes to which it is applied. To obtain the most satisfactory results, the air must be used expansively, but usually where the demand for power is intermittent no attempt has been made to reheat the air, and as a result the combined efficiency of compressor and motor is quite low, varying in general from 20 to 50 per cent. When low-wattage motors more efficient than high, the use of such pressures would demand larger and heavier motors and other apparatus which is undesirable.

The advantages of higher pressures in reducing cost of transmission are also well recognized, and the present tendency is to use pressures at 100 to 150 pounds instead of the 60 or 70 pounds formerly used. By reheating the air to a temperature of about 300° F., which may often be accomplished at small expense, the efficiency is greatly increased; in some cases this has been shown to be as high as 80 per cent.

A remarkable development of compressed air power, in which very high compression is used, has recently been accomplished in the Porter compound compressed-air locomotive for use in mines, lumbering operations, powder works or other places where fire is much feared; also in hauling cars about the yards of large manufacturing plants, where cleanliness as well as avoidance of fire risk is important. In this case the air is stored in the locomotive tanks under a pressure of 800 pounds per square inch; this air thoroughly dried by the high compression then passes through a reducing valve, where it produces kinetic energy due to expansion, which it immediately loses by impact, thus avoiding temperature drop when falling from 800 to 250 pounds per square inch. At this pressure and practically atmospheric temperature the air is admitted to and expanded in the high-pressure cylinder of the locomotive, exhausting into the receiver at as low a temperature below atmosphere as practicable. Atmospheric air is blown through a series of tubes in the receiver, so that the working air takes up heat from the atmosphere and, subsequently, expanding in the low-pressure cylinder, converts some of the atmospheric heat into work. This process is peculiarly interesting, in that it provides a means of reheating the working air directly from the atmosphere. This necessitates the defy an increase of 30 per cent in the economy.

While the lower pressures are in general more efficient, the loss due to higher compression is not serious. If the compressed air be used without expansion, it will be seen that there is a material loss in efficiency; but, on the other hand, if it be used expansively without reheating, trouble may be experienced, due to the drop in temperature below the freezing point. When moisture is present, this will cause the formation of ice, which may clog the passages if proper precaution is not taken to prevent it. The low temperature will not in itself cause trouble; if, therefore, the moisture which the compressed air holds in suspension be allowed to settle in a receiving tank, placed near the motor or other air apparatus and frequently drained, less trouble will be experienced from this cause. The greater adaptability of compressed air to various purposes causes its use to increase along with that of the electrical motor, for it has a different field of usefulness, independent of power transmission; at the same time, when the requirements are prop-
erly observed in its production and use, its
economy as a motive power in special cases
compares favorably with other systems. But
compressed air possesses so many advantages
that it may be regarded as the most efficient
motive power, its application to shop processes
will be continually extended as its usefulness becomes
better known. See PNEUMATIC TOOLS.
Hydraulic Power.— Mention has been made
of the use of hydraulic motors as a factor in
the subdivision of power but these are being
used to such a limited extent for this purpose
that they will not be considered here. There is,
however, a growing field of usefulness for hy-
draulic power in manufacturing operations
which is peculiar to this agent alone, namely, its
use in forging and similar work. Where hy-
draulic power exists for this purpose it is also
generally used for a variety of work which
could be accomplished just as well, and often
economically, by steam with compressed air;
but in forging operations where heavy
pressures are required hydraulic power is in-
finitely better than either. The compressibility
of air is an objection in many lines of work,
and it is not to be recognized that the effect of a
hammer blow is oftentimes merely local. As
H. F. J. Porter has so ably shown, the pressure
applied in forging a body of iron or steel should be
sufficient in amount and of such a character
as to penetrate to the centre and cause flowing
throughout the mass; as this flowing of the
metal requires a certain amount of time, the
pressure should be maintained for a correspond-
ing period. Hydraulic pressure, instead of a
hammer, should, therefore, be used to work the
metal into shape. Under its influence the forg-
ing is slowly acted upon and the pressure is
distributed evenly throughout the mass, where-
as under the high velocity of impact of the
hammer the metal does not have time to flow,
and thus internal strains are set up in the mass,
which may cause serious results, especially with
certain steels which have not the property of
welding. Moreover the quality of the steel is
very much improved by the processes of hy-
draulic forging. There exists at present a
marked tendency to substitute in a wide variety of work in which presses are
employed varying in capacity from 20 tons to
14,000 tons.

It is an interesting fact that the magnificent
hammer, designed and built by the Bethlehem
Steel Company, of a nominal capacity of 128
tons and an actual of 145 tons falling weight
has been superseded by hydraulic presses for
forging purposes. This hammer is no more in
existence. The largest hammer at the Bethe-
hem plant to-day is a 10-ton hammer. Among
the numerous hydraulic presses at Bethlehem
under which forgings are made they have one of
14,000-ton capacity, operated by the world’s
largest land engine of 16,000 horse power.

The different hydraulic systems are as fol-
lows: (1) A pump or continuous intensifier
using pressure corresponding to the resistance
of the press. This pressure runs up to 7,000
pounds per square inch; (2) single stroke
steam or air intensifiers where the hydraulic
cylinder is filled with water, under a pressure
of 2 to 50 pounds per square inch and then the
pressure increased by means of the intensifier
from 3,000 to 9,000 pounds per square inch.

The latest development at Bethlehem has
been in high speed processes where the water is
pumped, electrically, to an accumulator and from
there used as the pressure. In such processes
of this nature, the cylin-
der is filled from a tank through a valve of
very large dimensions (to date up to 16-inch in
diameter) withstanding a pressure of 10,000
pounds per square inch. A water intensifier is
then used; this may be one, two or three-pres-
sure intensifier. The nominal pressure used in
the lines for operating auxiliary parts of the
press, together with the intensifier, is 2,500
pounds per square inch line pressure. A line
pressure lower than this makes the machinery
bulky and cumbersome and does not take advan-
tage of modern steel construction, nor does it
give high speed.

Any one of these presses will run up to 100
or more strokes per minute when needed. A
press at Bethlehem has been taken up to 60
strokes of three feet length per minute. Most
die forging presses are made of this last type.
The speed of these presses may be understood
when it is stated that as many as 10 projectiles
are turned out per minute.

Presses are now built at the Bethlehem plant
of 10,000 and more tons capacity for the manu-
facture of die forgings, such as car wheels,
which may be produced at the rate of one a
minute.

The high efficiency of the presses has chiefly
been accomplished by means of the large valves
and the high initial pressure in the lines, the
cushioned accumulator, and the shifting tables
(both in top and bottom platen). These have
all been developed by the Bethlehem Company,
which, at the present time, stands practically
alone in the building of these enormous ma-
chines, a single one of which will weigh as
much as 1,000 tons. All handling of pieces
under these presses is done mechanically by
hydraulic or electric power. The success which
has attended the use of hydraulic power in
forging is causing it to be applied to other and
similar work to an increasing extent. In boiler
works, railroad and locomotive shops, bridge
works and many similar places compressed air,
where heavy pressures are desired hydraulic power is greatly to be pre-
ferred; hence we find it operating machines for
punching and shearing heavy plates and sec-
tional beams, riveting machines, stationary and
portable, flanging and bending machines, tube
upsetting machines, wheel and crank-pin
presses, lifting jacks and hoists of all kinds.
For heavy boiler work hydraulic riveting seems
especially well adapted, since an intensity of
pressure can be brought to bear upon the plates
which is obtained by no other method.

Transmission.— In the transmission of
power by compressed air, within reasonable
limits, the loss in transmission if the pipes be
tight need not be considered, for although there
is a slight loss in pressure due to the frictional
resistances of the pipes, yet there is a corre-
sponding increase in volume due to drop in
pressure, so that the loss is practically inap-
plicable. It has already been stated that com-
pressed air as now used without reheating is
not at all efficient as a source of motive power,
since the combined efficiency of compressor and
motor, even under favorable conditions, is not
more than 50 per cent of the available energy put into the compressor. In other cases the efficiency is as low as 20 per cent. There should be no comparison between the cost of power by compressed air and its brilliance, and electricity, since each has its own field of usefulness. With a three-wire 220-volt-system, which is very suitable for ordinary shop transmission when both light and power are to be taken off the same circuit, the combined efficiency of generators and motors working intermittently with fluctuating loads will be about 60 per cent of the power delivered to the engine. For greater distances than those which obtain in plants of this character, the loss in transmission will be greater, and higher voltage must be employed in order to keep down the line loss.

While it is possible to put in conductors sufficiently large to carry the current with any assumed loss, yet the cost of the line may become prohibitive with low voltage. Where cheap fuel is available it is found in many cases that electric power can be generated at the works more cheaply than it can be purchased from a central station; especially is this the case if the exhaust steam be used for heating purposes. In isolated plants the cost of transmission is very small, as compared 150,000 the total cost of generation; whereas in the average central station the cost of transmission, which includes interest and depreciation on pole line, may constitute a large percentage of the operating cost.

As already stated the last census shows that 63 per cent of the electric power used in the industries is generated by the user. In those localities where the cost of fuel is high, electric power can often be purchased more cheaply from a central station which possibly obtains its current from a water-power development many miles distant and transmits it electrically to a convenient distributing centre, where it is used for power and light. The recent advances in electrical transmission are very marked, and one constantly hears of some new achievement more wonderful than anything previously accomplished. Distances have been gradually increased until it is now not uncommon to transmit electrical energy economically over lines up to 150 and even 200 miles; in one recent case the transmission extends from the Sierras to Los Angeles, Cal., a distance of 240 miles.

If the available power cannot be utilized near at hand, by converting the industries near the source, there is no reasonable limit to the distance to which it can be transmitted if occasion should require. The problem resolves itself largely into a question of voltage, which has steadily increased from the 4,000 to 6,000 volts in use not so many years ago to 40,000 and 60,000 volts which are now quite commonly employed; but it appears that even 60,000 volts which was regarded as a high value a few years since has been far exceeded in the most recent developments. The Los Angeles transmission line for industrial use uses this high-voltage-electric development at Victoria Falls, in South Africa, contemplates a line pressure of 200,000 volts through a distance of 700 miles.

The possibility of electrical transmission thus permits the utilization of available sources of power at great distances from the centre of distribution; but while it is interesting to know that a certain amount of power may be transmitted over a distance with a high degree of efficiency, it is more important to know whether the same amount of power could be obtained at the objective point more economically by other means.

**Petroleum Fuel.**—It has been suggested that the future of long-distance transmission depends largely upon the development of oil as a fuel; but at the present time the outlook for oil fuel in general competition with coal or long-distance transmission is not encouraging. While the development of the Texas and Southern California oil fields has increased the visible supply and brought about increased activity in the use of liquid fuel, yet it is doubtful whether the advantages would be sufficient to cause it to come into general use as a fuel, since with a limited production and an increased demand for this and other purposes the cost would be correspondingly increased.

A number of railroads contiguous to the oil-producing centres have equipped their locomotives to burn this fuel, and it is used to an increasing extent for marine and naval boilers, with great satisfaction, since its displacement for a given heating value is only about one-half that of coal and the labor cost is materially reduced. It is also used quite extensively in certain sections of the country as a steam producer in power plants, but it is hardly possible that liquid fuel will be a serious competitor of coal for steam generation. At present, as far as power for manufacturing plants is concerned, it is largely a question of transportation, whether oil can be laid down and handled at a given point more cheaply than coal. It is probable, however, that oil fuel will supply a local demand in certain sections where transportation charges, and possibly insurance, will permit its use at a low cost, and it is in this connection that it may become a competitor of electrical transmission.

**Internal Combustion Engines.**—One interesting phase of the power problem which forcibly presents itself at the present time is the vast possibilities possessed by the modern combustion engine, which includes the various types of gas and oil engines. As a motor in industrial establishments has been somewhat limited, yet there is a marked tendency to employ the gas engine in manufacturing works, and consideration of its advantages and cost of operation, together with its high thermal efficiency and possibility of still further improvement, indicates that, for a great many purposes, both steam engines and electric motors may be ultimately replaced by some form of internal combustion engine. That the gas engine in both large and small sizes has reached a point in its development where it can fairly rival the steam-engine in reliability and satisfactory running qualities there can be no question. In point of fuel economy, a gas engine of moderate size is on a parity with the largest triple-expansion steam and will give it horse power on less than one pound of fuel. The high price of gas in this country has contributed largely to those causes which have prevented a more common use of the gas engine as a motor. For this reason the gas engine has generally been used, not so much because of its
high efficiency as a thermo-dynamic machine, but rather on account of its convenience and saving in labor. It is true that natural gas is cheap, but it is equally true that natural gas is not uniformly available. In many localities the manufacture of producer gas has reached a high state of development, and there are now in successful use several processes by which producer gas can be made from cheap bituminous coals as well as anthracite and coke. The keenness of such gases renders them less effective per cubic foot of gas, as compared with the richer coal gas or even water gas; but this difference is more than compensated for by the low cost of production.

A prominent factor in gas engine practice which has attained a high degree of development in European practice is the small gas producer. These generators are very simple in operation, and furnish a convenient and economical means of obtaining power at a much lower rate than with the ordinary city lighting gas. The economy of these small producers is shown by tests which give one horse power on a 16 horse-power engine with a consumption of only 1.1 pounds of fuel. For engines above 40 horse power one horse power can be obtained on seven-eighths pound of fuel. The successful employment of large combustion engines with blast furnace gases as the explosive medium utilizes vast sources of power which a few years ago were allowed to go to waste or, at most, were used very inefficiently. The high thermal efficiency of the gas engine has long been recognized and the possibility of further development is a promising factor in this field. The accomplished efficiency of 38 per cent reported by Professor Meyer, of Göttingen, greatly exceeds the maximum theoretical efficiency of the steam engine. With higher compression even greater efficiencies may be expected. But with high compression there is danger of premature explosion, due to the generation of heat in compressing the gas in the presence of oxygen; for this reason Herr Diesel compresses the air separately. Under a pressure of 500 pounds or more, which is used in the Diesel motors, the air becomes very hot and ready for a charged form of combustion to be injected into the compression chamber. There is no explosion; combustion occurs while expansion goes on, and the heat generated disappears in the form of work. The United States census report for 1900 shows that about 135,000 horse power derived from gas or internal combustion engines were used in the industries, whereas, according to the latest (1910) report 750,000 horse power from gas and internal combustion engines were so used. That is, an increase of more than 500 per cent had taken place during the decade. The present development is toward the improvement of the internal combustion engine similar to the Diesel type, and this is accompanied by a marked tendency to use this type in marine engines; essentially this is noticeable in European practice, where it is employed in sizes up to 2,500 horse power per cylinder. In the larger sizes these engines are of vertical construction double acting two-cycle, and usually with six cylinders; but for fuel, a compression of 0.7:1 is small for this type than in the four-cycle. The experience already obtained with Diesel engines in scores of vessels indicates that they may be made as reliable and that they are as suitable for ship propulsion as steam engines, which in a number of cases they have displaced. In many locations coal is available and cheap, and since its value in heat units per pound is from one-third to one-half greater than that of steam coal, the space occupied by the fuel in the vessel is greatly reduced; moreover remarkably high thermal efficiencies are obtained in this type of engine and even greater may be expected in the future since tests with various oil fuels have shown that thermal efficiencies of 45 to 48 per cent are possible. At the present time one ton of oil will accomplish approximately as much work in a Diesel engine as four tons of coal converted into steam power. In addition to the greater economies due to the fuel there is a marked saving in space and weight in the power plant, since the internal combustion engines weigh only about half as much and occupy only two-thirds of the space of the steam engines and boilers, which saving may be profitably used for cargo. These advantages and others indicate that internal combustion engines using crude oil, especially those of the Diesel or semi-Diesel type, must inevitably be used to an increasing extent both for land and marine engines.

Although this country has lagged somewhat behind Europe in adopting large gas engines, there is evidence that this state of affairs will not exist very long, for a number of firms are now in the field building gas engines from 1,000 to 6,000 horse-power capacity. The uses to which these large engines are put are about equally divided between the operation of blowing engines for blast furnaces and the driving of dynamos for general power distribution. While the gas engine in the larger sizes is thus used extensively for the generation of electric light and power, a growing tendency is observed to use the gas engines direct as motors. A number of railroad and other machine shops have been equipped with moderate sized gas engines suitably located about the works, and in addition, thousands of horse power are used in the smaller sizes for a wide variety of purposes, including rolling mill drives and in gas stations and manufacturing plants of all kinds.

The gas engine, usually adapted to consume gasoline or other oil fuel, has invaded the agricultural field and is being used to an increasing extent for a variety of purposes and in many forms, not the least important of which is the gas tractor, which is especially adapted to agricultural service in that it is conveniently mobile in the field and on the road, nor is it burdened with steam pipes nor gas producers.

In the field of transportation in addition to its use in the familiar automobile and motor truck, the oil engine constitutes the power plant in motor cars, in submarine vessels, in aeroplane service and also to a limited though increasing extent in railway motor cars.

Gas Engine Central Power Stations.— With the possibilities of high thermal efficiencies still higher development of cheap fuel gas processes may be expected that will bring the gas engine into close competition with the electric motor for some purposes. For it is doubtless be found that gas transmitted from a central gas-making plant at a manufacturing
works into engines located nearby, combined with the recovery of by-products from the fuel, will produce a very cheap form of power. Where large amounts of power are involved, as in the various coal-chemical Industries, it is quite feasible to locate such works near a cheap fuel supply; in which case the recovery of ammonia and liquid hydrocarbons from the solid fuel, and the use of the residual gas in internal combustion engines combined with the generation of electric current, should effect a material saving in the utilization of power over any existing method. It is not to be presumed that the gas engine will displace either the electric motor or the steam engine; each has its own sphere of usefulness, and each will be more highly developed as the result of direct competition. Yet the economies already obtained indicate that the field of the gas engine will be gradually extended into that of the steam engine and the electric motor.

Steam Turbines.—Many of the questions involved in this consideration are at the present time in a transitional stage. The reciprocating steam engine has reached a high state of development, but it is not probable that it has attained its highest degree of perfection. While the economics of less than eight and one-half pounds of steam per horse-power hour has been obtained, even better results may be anticipated; the use of high pressure super-heated steam in compound, jacketed engines involves more perfect lubrication, and this may demand modification in existing valve types; however this may be, the outlook is promising for still higher efficiency.

Experiment demonstrates that both piston engines and steam turbines gain more in efficiency with a reduction in back pressure that they do with a corresponding increase in initial pressures; and further that steam turbines gain more than reciprocating engines. Superheat is another important element in steam engine and turbine economy. A gain in thermal efficiency very nearly proportional to the superheat is to be expected, but since maintenance costs increase rapidly beyond a moderate degree of superheat practice has confined itself to values of about 100°; occasionally going as high as 200° or 250° as the economic limit for reciprocating engines. These amounts depend upon the boiler pressure so that the initial temperature of the steam usually runs from 450° to 550° F. In steam turbines, owing to the absence of rubbing surfaces in contact with the steam, the superheat may be higher and temperatures of 650° F. are not uncommon. With back pressures reduced to less than one-half pound per square inch absolute which are now in use, it is reasonable to assume that any increased gain in efficiency in the future must result from the use of higher initial temperatures and pressures. In this respect it is significant to note that steam boilers have recently been constructed for initial pressures of 400 pounds per square inch, and even 600 pounds pressure is being considered. At the same time high degrees of superheat have recently been adopted in special cases in which final pressures of 800° F. and 1,000° F. have been attained. Whether this will mean cheaper power than can be obtained in other ways will depend upon many conditions. In any case, and especially with intermittent or variable loads, it is not so much a question of maximum efficiency as it is economy of operation.

From this point of view the present activity in the construction and development of the steam-turbine is of interest to engineers and power users. The steam consumption of a modern steam-turbine of moderate size compares very favorably with that of the better class of large reciprocating engines, but what is of greater importance is the gross superior steam economy under variable loads. The steam consumption per horse-power hour varies little from one-third to full load; at over-loads the economy, as shown by numerous tests, may be even better. This feature predetermines the steam-turbine to the special field of electric lighting and power generation, where it must inevitably become a formidable rival of the larger-sized, slow-speed reciprocating steam-engine.

The turbine is not only able to utilize a fairly large fraction of the possible gain due to reduction of back pressure, but is generally much cheaper to build than piston engines, especially for very low back pressures which require in piston engines abnormally large low-pressure cylinders. The establishment thereby established of using turbines for the low ranges of pressure in preference to piston engines, and of combining reciprocating engines and turbines to work together—the turbine taking the exhaust steam from the engine at whatever release pressure it is discharged, usually from atmospheric to 25 pounds absolute. This practice has been found especially valuable in adding capacity to existing overloaded reciprocating engines. In some cases the power has been doubled by this arrangement.

The high rotational speed of the steam-turbine is a prominent factor in favor of its adoption in connection with electrical generators, since the cost of the generator end of the equipment ought eventually to be very materially reduced; but for many purposes of work the high rotational speed of the present types of steam-turbine is prohibitive, nor can it be adapted successfully to belt-driving, except by the use of gearing.

The economies already obtained with both the steam-turbine and the gas-engine have brought each into a prominent position, and at least suggestive of the important developments that are taking place in methods of obtaining and using power.

J. J. Flather, Professor of Mechanical Engineering, University of Minnesota.

POWER OF ATTORNEY. See ATTORNEY.

POWER OF DARKNESS, The (Vlast' t'my). Leo Tolstoy had made in his youth several abortive attempts at writing dramas, but he scored a remarkable success when, in the eighties, under the influence of his moral regeneration, he published his first drama, 'The Power of Darkness.' His intention was to strike terror into the hearers, not through the action of inexorable fate, but through the possibility of being engulfed by the Power of Darkness; hence figures of the tiger, etc., if its claw is caught. This is illustrated in the case of the hero, Nikita, who pays no attention to the advice of his simple-minded father, the cesspool-cleaner Akin, but allows his wily
POWER HOUSES

Leo Wiener.

POWER HOUSES. With the growth of electrical distribution, the generating station has become a highly specialized structure which demands consideration both from the electrical and mechanical viewpoints. In the first instance it presents peculiar requirements as to location, differing widely according to its purpose. Broadly, one may divide power houses into two general classes, those designed for the utilization of water power and those using heat engines as prime movers. The former are nearly always power transmission stations connected by high tension lines with the centre of distribution and not themselves burdened with direct distribution of energy to consumers. The latter are generally within the area of distribution and the centre of distribution itself. In the cases where power is transmitted considerable distances from stations of the second class they are still generally to be regarded as distributing stations as regards the requirements of location.

Location.—The location of hydro-electric power houses is usually determined by purely hydraulic considerations. The area within which they may be economically placed is limited by the topography, and the chief requirements are as follows: First, the location must be such as to keep the power house free of floods under all conditions of stream flow. Second, within this limitation the location must be such as to utilize the maximum possible proportion of the available head. Third, in the interest of regulation the station must be placed so that it may be subject to the minimum variation of head. In plants working under high hydraulic heads, high enough to utilize impulse wheels conveniently, these conditions are easily met. At low heads there is often difficulty in placing the power house clear of floods and above any possible backing up of the tail water.

The location of a station driven by heat engines of one sort or another is usually kept as nearly as may be at the centre of the electrical distribution. Since for the delivery of any given amount of power a given weight of conductor required varies directly with the square of the distance from the load, the reason for a central location is obvious. Assuming, for example, an electrical load uniformly distributed over a circular area, the most economical location of the power station so far as the conductors are concerned, is at the centre. Transference of the station to a point at the edge of the area approximately doubles the cost of the distributing system. The causes which may justly remove from the central position are local conditions as to cost of real estate, of fuel and of water. The first item is part of the capital charge which may be taken as an offset to change in the cost of distribution; the last two affect the operating expense, and the change in these with change of location must be capitalized for comparison with the concurrent change in the cost of distribution.

Fuel.—Fuel is by far the largest single item of expense in ordinary electrical power production, and a power house must be so located, on a railway spur or waterway, that it can receive its supply and secure proper storage space without incurring serious charges for cartage or other handling of fuel. This necessity usually compels a location somewhat out of the centre of distribution. Water supply is more easily secured, but occasionally it becomes an important factor in location. In cases where the principal office of the power station itself is to furnish energy at high voltage for a distribution from substations, the cost of conductors is relatively a smaller consideration and commonly a location meeting the requirements just laid down can be secured without serious increase in the cost of the conducting system.

Equipment.—The electrical equipment of a modern power station usually consists of a small number of electric generators directly coupled to their prime movers, whether hydraulic, steam or gas operated. Except in small plants generators driven through intermediate belts, ropes or gears are rare, since these introduce added complications, cause some loss of energy, cannot well be used for large power, and serve no useful purpose of themselves, save to allow and then give to the generators some specially valuable advantage in speed. In such case they should be used without hesitation if the conditions permit. The day of stations equipped with numerous small dynamos has passed, and for good cause, since the small machines are more costly and less efficient for a given total output, and they require also more space and more care.

Hence the number of generating units should generally be reduced to the minimum that will satisfy the following condition, viz.: that the total number should be such that one unit can go out of service without seriously overloading the others, dividing its load among them. Good modern generators usually are able to carry 25 or 30 per cent over their normal rated loads for some hours without serious increase in temperature, ordinarily four or five generators suffice. If the load upon the plant is normally moderate, two or three generators may serve admirably until such time as the normal full load nears the rated capacity of the machines.
In the case of a transmission or distributing network fed from several stations the total output rather than the individual output of the separate plants should be considered in determining the size of units to be used. for as regards reserve capacity it makes little difference whether it is in one location or another. Thus in some of the large hydro-electric networks 6 or 10 plant units and the size of the units in each is determined not by the possession of a theoretical reserve capacity in a particular station, but by considerations of convenience, though some of the stations may have only one or two generators where such an arrangement suits the hydraulic conditions, and any station is called into or out of action by the load dispatcher just as if all the generators were concentrated under a single roof.

In steam-driven stations past practice has tended toward great aggregation of capacity, but more recently, since widespread distributing networks have become fairly common, the advantage from the standpoint of distribution of several generating plants has gradually been recognized and the saving in the total capacity on the system which counts. The vital point is to avoid on the one hand putting too large a proportion of the possible output into a single unit, and on the other splitting the output into a number of units too small for the most economical operation. Stations with more than five or six generators are now generally relics of an early stage of design, except in certain cases of hydro-electric plants where the hydraulic conditions are such as to introduce the dilemma of choosing between relatively small units of normal design, or large units of special and sometimes disadvantageous design. Such cases arise in working at low heads where the available power from a single wheel or pair of wheels is comparatively limited. Cases may also arise in which generators for different purposes, as for general transmission, railway and electro-chemical service, may have to be installed in the same plant. In this case the number of machines for each use would be determined as if the other machines were located somewhere else. In plants including raising transformers the capacity of these is determined on the principles already laid down for the generators. Recent practice tends toward the use of a single or two phase transformer or bank of three single-phase transformers for each generator without further subdivision. As between the two, practice is drifting toward the latter on account of the more convenient size of the separate units in large output and from the fact that in case of need two of them can be operated on open delta connection, thus giving an additional element of reserve capacity. Broadly, large stations should differ from small ones only in the capacity of individual units, so that if a 2,000 kilowatt plant is equipped with four 500 kilowatt units a 20,000 kilowatt plant would be equipped with four 5,000 kilowatt units and so on.

In either case the same allowance for reserve capacity would naturally be made, but evidently the larger plant would have the advantage not only of greater economy in the larger units but of reduced attendance cost per unit of output, and would also cost less per unit of output.

Large power plants then evidently can produce electrical energy at a lower cost than small ones. As the size is increased, however, the relative gain is diminished so that a size will finally be reached at which further increase in capacity ceases to be beneficial. Indeed since a very large station usually implies a large area served, the average distribution losses will be reduced by serving it from several interconnected power houses, so that the maximum economical capacity of a single power house is less than would be determined by considering only the effect of size on fuel and labor.

For example, if a certain considerable district requires 200,000 kilowatts, it is altogether probable that two 100,000 kilowatt plants will serve it more economically than a single gigantic power house and unless the district is of moderate area, four 50,000 kilowatt stations would probably do even better, provided they could all be well located. In other words a power plant of 50,000 kilowatts and thereabouts comes so near to giving maximum economy of operation that the difference is easily offset by lessened losses in distribution. The only cases in which size may be economically increased without limit are those in which the plants must for one reason or another lie far without the area served, as in great hydro-electric plants like those at Niagara, or in plants using coal at the mines for transmission of power on a colossal scale.

In any power house adequate provision for reserve capacity evidently can be most easily made if the equipment throughout is of a single kind so that everything may be as far as possible interchangeable. Similar units of uniform size are, therefore, advisable throughout the entire plant unless there is some good reason to the contrary.

The equipment of a power house may be divided into four parts: the prime movers, the electric generators, the accessory apparatus, and the switchboard, from which the output is regulated and distributed. The power-house structure must be planned for advantageous location of all of these and in addition, if steam is the motive power, there must be ample provision for the storage of fuel.

Design and Arrangement.—In point of design hydro-electric power houses present by far the simplest problem of all. The prime movers are the water wheels, which are relatively simple and compact, the generators are directly coupled to the shafts of these, and the output is delivered to a small number of lines so that the switchboard is relatively simple. As most such plants are for high voltage, the power house must often provide place for the transformers which raise the voltage from that of the generators to that of the line. Less frequently such transformers are found in steam-driven plants.

Structurally the ordinary power house consists of two parallel halls with a common dividing wall, one containing the generating units, the other the water wheels or boilers as the case may be. The generator room contains or has annexed to it space for the switchboard connections and for the transformers, if any, while the boiler or wheel room has annexed to it space on the one hand for fuel, on the other for the hydraulic connections. Usually the plant comprises only a single story, although more
rarely ground space is gained by superimposing some of the parts.
One may now pass to consideration of the concrete arrangements usually adopted, the hydro-electric case being taken up first, as the simpler in design.

Fig. 1 shows the small plan of a typical hydro-electric power station using as prime movers water wheels under high head. Here A is the receiver terminating the supply pipe and provided with branches to the several wheels. At very high heads these branches are sometimes made farther back, spreading finger-wise from a terminal chamber to secure a straighter run to the wheels. B, B, B are the water wheels, directly coupled to and on the same level with the generators C, C, C. The pipes from the water supply enter the lower part of this case the inner tail-race wall would usually carry a partition wall separating the wheel room from the dynamo room proper and provided with water-tight fittings for the turbine shafts to pass through.

In case raising transformers were to be used in such a plant the generators would be for perhaps 2,300 volts, the switchboard would preferably be turned around, facing the exciters, and the station would be extended far enough to the left of the cut to accommodate the transformers and the necessary accessories; or, if more convenient from the nature of the ground, space could be gained by widening the power house enough to accommodate the row of transformers. The size of the power house of Fig. 1 is about 40 feet by 85 feet and slight modifications of this simple design serve the wheel cases and discharge into the tail race below the power-house floor. The wheel gates are controlled by the governors D, D, D. The generators are revolving-field, 400-kilowatt, three-phase machines, giving 13,000 volts at the terminals at 500 revolutions per minute. Their fields are excited by two 25-kilowatt direct-driven exciters, E, E, each of which is regulated by a separate hydraulic governor. The switchboard is located on the floor level at F, and the line wires leaves the power house just above and behind the switchboard. Room is provided for a fourth generator and a traveling crane running lengthwise the power house is available for handling the machinery if necessary. The material of this power house is brick, on concrete foundations, with a steel truss roof covered with reinforced concrete slabs and then with roofing felt and asphalt, as the location is in a cold climate.

The design here followed is thoroughly simple and normal. At high hydraulic head the somewhat unusual turbines here used would be replaced by impulse wheels in the same situation; at lower head by considerably bulkier turbines, which would require a wider tail race and power house for their accommodation. In well up to very much larger capacities. In case the necessary width becomes too great to be conveniently covered by a single roof, separate roofs are placed over the wheel rooms and generator rooms and in mild climates the wheel cases and tail race may sometimes be left uncovered.

In case of hydraulic plants operating at rather low heads one is often driven to the use of vertical shaft turbines, which results in a somewhat different arrangement of power house from that shown in Fig. 1. In such cases the forebay usually comes fairly up to the power-house wall instead of the water being received from a reservoir at the end of a pipe line. The generators like the water wheels are vertical shaft machines, the weight of the revolving fields being carried by a combination of water pressure and step bearing. Fig. 2 shows a cross-section through one of the four 6,000 horse-power units in a recent hydro-electric plant operating under a head of 49 feet. The design is an interesting one from the fact that the wheels have but a single runner which operates at 116 revolutions per minute, while the spiral wheel case and its entrance and the discharge draft tube are smoothly molded in
the concrete foundation of the power house, which is really built as a sort of annex to the massive forebay wall, and in the monolithic foundations, of which the wheel cases and the water channels are a part. The bus bar and switchboard galleries occupy in this structure their woned position, but the power-house interior is otherwise very simple, containing around, instead of containing, the hydraulic units.

It is necessary even in hydraulic plants to make the power station as nearly fireproof as possible and hence brick, steel and concrete are the most suitable materials of construction. Wood, even if treated by some fireproofing process, should be sparingly employed. For

merely the four great vertical-shaft units rising above the floor over the wheels, the water-wheel governors and a few other auxiliaries. This power-house design is the latest type of those designed for the utilization of large powers at fairly low head. The hydraulic construction has the advantage of combining very high efficiency with compactness and extreme simplicity. It is really a power house built floors, concrete, reinforced when necessary, is probably the best material. The transformers and switchboard are the danger points, from the standpoint of fire risks. The former should be placed so that even if they burn out no exterior damage will result. If, as is usual in high voltage plants, they are oil-insulated, provision should be made for disposing of the oil harmlessly in the rare case

**Fig. 2.—Section through power house No. 2, Appalachian Power Company, showing 6,000 horse-power hydraulic turbines and generators in place.**
where it ignites from an extreme short-circuit. Transformer oil is very difficultly inflammable, but it can be fired, and oil transformers should be guarded by pits with drains, so that the oil may not run about if it escapes from the cases. Generally the transformer cases are provided with drainage holes from which the oil can be quickly run off outside the station.

The connections between generators and switchboard are generally made by cables laid under the floor in tile ducts, so as to keep the overhead space free for the crane. The higher voltage wires from the transformers should be taken out of the building by a very short route overhead or through very capacious ducts. In any case great care should be taken to locate all cables carrying heavy currents where a burn-out of one will not involve others.

In very large stations, both hydro-electric and steam-driven, the switchboard is frequently placed in a gallery overlooking the generator room. This position is in itself undesirable as adding enormously to the complexity of the wiring, but it is often become advisable. In such case the larger switches are not manually operated, but are worked by electric or pneumatic power controlled from the switchboard. The switches themselves are then located under or behind the gallery and the control room become less exposed and enclosed in masonry or concrete cells. With three or four generators and one or two main lines to be fed the switchboard is sufficiently complex, but when in addition numerous feeding lines must be controlled the complication becomes something frightful and a large amount of space is required for the switching apparatus, so large and so subdivided for safety that manual control is practically out of the question. In large high voltage power stations the transformers are commonly in a building entirely separated from the main station and provided with an independent high voltage switching equipment, a procedure which probably adds nearly as many risks as it avoids. On the whole a plant with few units and relatively simple equipment is likely to give the most reliable service at the lowest cost.

Automatic Stations.—The possibilities of the remote control switching system just referred to have borne fruit in hydraulic generating stations partly or wholly automatic in their performance. If the switching of a generator can conveniently be accomplished, as is the case, from a distant part of the power house without seeing the apparatus controlled, the working of which is signaled back by electrical telegraph, then it is evidently possible to work a wheel gate or a main switch or any other apparatus in precisely similar fashion from a distance of rods or miles. There have, therefore, been introduced auxiliary generating stations started and stopped from the main switchboard by the occasional visit of an inspector. The generators used in such case are commonly of the induction type, which do not require separate excitation by direct current and are consequently simpler to operate without attendance. When desired to start the station the motor-driven wheel-gate is opened by remote control of the circuit and the subsequent necessary operations of switching the generator fully into circuit are performed either by other remote control apparatus or by a drum switch thrown into operation when the generator is at speed and performing the necessary switching operations in their proper sequence. In stopping the plant the same operations are gone through with in reverse order. Most stations of this type are of relatively small power and contain but a single generator, but the system is important in that it enables small hydraulic privileges to be effectively utilized without undue cost of attention. As the great majority of available water powers are of modest capacity economic utilization depends upon lowering the labor factor in the cost, which the generating station with remote control effectively does. It is likely to play a considerable part in the establishment of power networks utilizing, wherever available within the territory served, water powers of small capacity.

Steam-driven power stations are proportioned very differently from hydraulic stations owing to the large space needed for the boilers and their apparatus, and the greatly increased capacity. However, is quite similar, the common arrangement being in two long parallel rooms separated by a party wall, one containing the boilers and boiler equipment, the other the generators and prime movers. It is a curious fact that whereas the prime movers and generators have increased enormously in available capacity in recent years the advance in the size of boilers has been relatively very slow. It is only recently that large boiler units have come into service, despite the fact that tests upon them show very material gains in efficiency.

Boilers are rated conventionally on a basis which the uninstructed no notion whatever as to their real steaming capacity. The canonical boiler horse power has long been based on the evaporation of 34.5 pounds per hour of water from and at 212°. This nominal rating requires, when a boiler is to be applied to a prime mover, wholesale modification, on the one hand by reason of the actual steam consumption per horse power of the prime mover, and on the other hand only to give is likely to give is likely to give is likely to give. Steam is generally at high pressure and superheated. In point of fact the steam capacity of a boiler in a modern steam plant may be counted as two to three times the conventional rating so far as the actual operation of the prime mover is concerned.

But, even so, the boiler capacities have grown much more slowly than the capacities of the steam engines or turbines, the latter being almost invariably used in plants of any size. It is, however, a fact that boilers of large capacity may be counted on for considerably higher efficiency than those of small capacity, as in many other cases, so that larger and larger units are quite certain to come into use. At present boilers of more than 1,000 horse power are required without other apparent reason, although units of more than double that size have been successfully used for some years past. The chief difficulty in employing very large boiler units in is adapting the setting to withstand the extremely high furnace temperatures which result in added efficiency. It is usual, therefore, to find each large prime mover in a modern station supplied with steam by a group of four or more boilers, a number
which a few years back would have been doubled.

There is a collateral advantage in thus subdividing the boiler units, inasmuch as the boiler is the part of a steam plant which requires, probably, the most frequent repairs, and there is some advantage in having enough units for each prime mover group so that one can be cut out without seriously lowering the capacity, inasmuch as a boiler can at a pinch, particularly by help of forced draft, be driven temporarily 30 to 50 per cent above its working rate. A single boiler group of three or four units can readily be made an independent source of steam supply for its prime mover under ordinary circumstances. Generally, however, the steam piping in a modern plant is so arranged that in case of withdrawing a single boiler from service its place can be filled from steam from the general supply without exceptional forcing at any point.

The power plants here shown are almost universal, as is the use of mechanical stokers for feeding the boilers, which are almost invariably of the water-tube type. This particular boiler plant delivers steam at 200 pounds pressure and 160° F. super-heat, which is a fair example of present practice. There is a strong tendency, however, toward the use of higher pressures and super-heat in the interest of economy.

The generators in this instance are for 6,600 volts, a figure convenient where there is to be local distribution beside possible feeding of transmission lines and which is besides a convenient voltage in the design of large generators. Smaller machines are often wound for 2,300 volts and 6,600 is rarely exceeded. The reciprocating engine has practically passed out of existence in large electric generating plants owing to the lower cost, greater compactness and higher efficiency of the turbines, particularly at loads below the normal. The

Fig. 3 shows in elevation the layout of a typical modern steam plant of fair size designed for feeding high-tension lines. It includes a boiler room with typical provision for receiving and distributing the fuel, a turbine room parallel thereto containing the generators, with adjacent provision for switchboard transformers and auxiliary apparatus, while next to the boiler room is a coal shed for the reception of fuel. This particular plant is planned for an ultimate capacity of 75,000 kva. in six 12,500 kva. generators. The location of the equipment is clearly shown in the cut. In larger plants the turbo-generators often run to 20,000 or 30,000 kilowatt units and occasionally higher. At the present time as here shown these turbo-generators are built with horizontal axis, the vertical type of a decade since being now obsolete. Very commonly the coal shed with its track for the reception of coal cars is replaced by a storage yard equipped with automatic conveyors for the maintenance of a large fuel supply, and crushing apparatus for dealing with run-of-the-mine coal is a not uncommon accompaniment. In small plants the transformers and circuit breakers would often be installed under the switchboard gallery instead of, as here, in an adjacent building.

The capacious coal bunkers above the boiler room with distributing apparatus similar to that boiler units here employed are of 1,050-rated horse power each and can readily be forced to three times their nominal rating which is, as in the case of all boilers based on a conventional steaming capacity, long obsolete.

Each turbo-generator has its own bank of boilers, but the piping is so arranged that one set of spare boilers is sufficient for the entire plant. At Q will be noted an equipment for purifying and cooling an airblast for the artificial cooling of the turbo-generators. As the size of such generating units has increased artificial cooling has been very generally adopted, the air being forced through the ventilating slots in the machines. The capacity of the individual boilers here noted is now a common one in plants of fair size, such boiler units having replaced very extensively those of a few years in the horse power generally in use until very recent years. In larger plants boiler units up to and exceeding 2,000 nominal horse power have been introduced to material advantage in economy. In many plants the familiar tall stacks are replaced by rather short ones supplemented by forced draft. This arrangement is not particularly advantageous in plants working at moderate and fairly steady load, but gives great capacity for forcing the output when abnormally heavy peak loads have to be dealt with.
As steam turbines for efficient operation demand a rather high vacuum, 28 inches to 29 inches, they are usually fitted with highly-developed surface condensers and the power required for delivering water to these and for other auxiliary purposes is considerable. One of the most points in station design is the source of this auxiliary power, whether it should be derived from steam turbines or from electric motors operated from the generating system. Practice is about equally divided in this matter with a frequent tendency to adopt a combination of the two systems. It will be noted that the switching apparatus in this typical plant is somewhat intricate and occupies considerable space.

This arises from two causes, first, the absolutely large amount of switching apparatus required, and second, from the fact that it is desirable and usual to install high-power switches and circuit breakers in independent concrete cubicles, from which a burn-out will not extend. As plants have increased in size the switching problem has become a very serious one. It is usual and sometimes necessary to operate all the generating units in parallel. In this case any unit which is the victim of a short-circuit may receive the aggregate output of all, so that each main protective switch has practically to be able to handle successfully the whole output of the station. In long-distance transmission plants this difficulty is often minimized by putting the high-tension transformers in parallel only at the far end of the line, but within the station and in ordinary distribution plants the difficulty remains. Hence the switchboard equipment increases in relative apparatus that nothing need be done by manual labor which can better be done by mechanism, and that no heat shall be lost which can be made to serve a useful purpose. In the station of Fig. 3, for example, the fuel is dealt with mechanically from the time it drops by gravity from the cars to the moment when it drops as ashes into the ash cars beneath the grates, save for such attendance as is necessary to see that the mechanical stokers are functioning properly and to lend what little aid may be needed. The steam piping is relatively short, simple and well jacketed, the surface condensers are immediately beneath the turbines and the waste exhaust from the auxiliary turbines goes to heat the feed water.

Sub-Station.—An account of power houses would be incomplete did it not take notice of sub-stations. The modern power house is almost always fitted with alternating current generators which transmit current either for gen-
eral distribution or for conversion into direct current for supplying electric railways or the old direct current lighting systems. Such conversion must probably be regarded as a makeshift, but at present a necessary one. The high voltage current from the power house is transmitted through cables or over aerial lines to the sub-stations, and there the voltage is lowered by reducing transformers to the amount appropriate for the synchronous converters. The sub-station must, therefore, accommodate the reducing transformers, the converters, regulating apparatus, switchboards for both alternating and direct currents, and sometimes a storage battery and its accessories. The structure, therefore, becomes practically a power house for general service, less only the prime movers. Fig. 4 shows in elevation a sub-station for city lighting and power service which is a masterpiece of compactness. It is a modern steel building two stories above grade and with a basement for the cable entrances and exits. The main floor contains, as Fig. 4 shows, arranged in order, the high-tension bus and main switches, the three-phase transformers, the regulators, and the rotary converters, of which there are four, each of 1,000 kilowatt capacity. The same room contains the booster set for charging the batteries at a variable voltage somewhat higher than that of the rotaries, and the switchboard, also a blower set for ventilation. Large apertures are left under the rotary converters and transformers so that a liberal air supply may be drawn in from below and exhausted by the blower. The second floor contains the storage batteries and their special switching arrangements. On account of possible leakage of acid from the batteries the floor construction is peculiar. The basis is tile arch over steel beams. Then comes a layer of concrete coated with asphalt, then a floor of hard-baked brick, glazed all over, laid with narrow interstices which are finally filled with hot asphalt.

Sub-stations for railway service do not so commonly have the storage battery, and are generally less compactly arranged, but after about the same general plan. The sub-station shown here covers only 3,150 square feet for its 4,000 kilowatts capacity. Ordinarily the switching arrangements in a sub-station are so intricate as to require a rather liberal allowance of space.

The same principles of location and subdivision of units hold for sub-stations as for power houses in general, with the advantage that the location is not dependent on water and fuel supply. Sub-stations for the receiving ends of power transmissions for general service differ from those just described in the lessened importance of synchronous converters. The ordinary distribution from a high voltage transmission service is very largely by alternating currents, and is accomplished by substations designed accordingly. The high voltage current is received in large reducing transformers which in number, size and location are to be treated as so many alternating current generators fortunately exempt from the necessity of rotation. Regulating apparatus is an important feature of stations of this class, and being inductive can be applied with very small loss of energy to the exact regulation of voltage on individual feeders.

For arc light service constant current transformers are very widely used, taking energy from the lower voltage side of the reducing transformers. This service requires a special switchboard, and is generally set apart in the sub-station. Owing to the absence of rotating machinery in any considerable amount the sub-station for general service is compact and requires less in the way of foundations and special construction than the sub-station of Fig. 4. Otherwise the principles of location and design are unchanged.

**Out Door Sub-stations.**—The needs of high voltage transmission have evolved in recent years an interesting and important form of sub-station which is coming into very wide use. One of the main difficulties of high tension practice is the large space required for switching apparatus and the great difficulty of getting high voltage wires into and out of buildings while retaining adequate insulation. The result is that a sub-station building and equipment rises to very burdensome cost in case the output required is not large. There has, therefore, been evolved the outdoor sub-station derived by natural process of growth from the transformer mounted on a pole, and supplied with the necessary auxiliaries for protection and switching. To meet these requirements weatherproof apparatus has been designed which can be safely left in the open under all climatic conditions.
POWER SIGNALS — POWER TRANSMISSION

conditions. The common form taken by the outdoor sub-station is a concrete platform to bear the weight of the transformers and above it a quadrilateral of steel or wooden poles braced together and carrying switches, cut-outs and other auxiliary apparatus, as well as serving to support the incoming and outgoing circuits. In stations of the larger capacities electrolytic cell or similar lightning arresters, and oil switches form part of the platform equipment. The air-break switches with very long swing and protected by horn-gaps, and horn-gap lightning arresters often take the place of the more expensive apparatus. Fig. 5 shows in section and plan a typical station of this kind and of medium capacity. Here the transformers are of the usual oil-filled type, cooled by natural draft, and the lightning arresters are of the electrolytic form installed on a platform by themselves. The switching equipment is of oil switches carried on a platform like that which supports the transformers. Above these concrete bases for the heavy apparatus rises a latticed steel structure well braced together and supporting the busses, transformer connections and going and outgoing lines. These last as well as the busses are borne by disc insulators carried in tension between the supporting members. In larger installations it is not uncommon to find the high-tension equipment in the open and the low-tension switches and apparatus in a suitable adjacent shelter. The purpose of the outdoor sub-station in every case is to cut down the heavy expense of housing high-tension circuits and apparatus, and so successful has the expedient proved that a large proportion of all service sub-stations on the great transmission systems are now of this form. It is needless to say that they are protected against interlopers by thorough fencing in, and are otherwise treated with the respect due to their voltage.

POWER SIGNALS. See Block Signal System.

POWER TRANSMISSION. It is rarely convenient to develop power at exactly the point where it is to be utilized, and hence the necessity of devices and systems for conveying it from place to place without loss, or with the minimum of loss. These systems of power transmission separate naturally into two groups: one in which the motion produced by a power is transmitted mechanically; the other where the power generated by one engine is used to operate another engine, the motion developed by the second engine being employed in work. To the first group belong the mechanical devices known as shafting, belts, chains, rope and cable drives, friction gearing, toothed gearing, link work and the like. To the second group belong the transmissions of power by compressed air, steam, hydraulic pressure and electricity.

Shafting.—Between the different parts of a given machine, or of a given mill, the transmission is often effected by means of a rotating shaft, which is subjected to a torsional moment. In mill work the shaft is rigid, and is made of solid steel, or of steel tubing; while in small machines (as in dental drills and the like) the shaft is often flexible, so that the point of application of the power can be varied at will, without disturbing the source from which the power is drawn. In mill practice it is essential that the alignment of the shafting shall be as good as possible,—that is, that the centre line of each shaft shall be as nearly straight as it can be made. It is also essential that the journals, or bearings which support the shaft, shall be properly designed and well lubricated. If care is not paid to these points, transmission by shafting may be quite efficient; but if the alignment is poor, or the journals are poorly designed, or the lubrication is inadequate, a great deal of energy may be absorbed by the shaft, and dissipated in the form of frictional heat. In transmission by shafting, the speed remains invariable, that is, that of the engine as controlled by its governor, and if (as is usually the case) a change of speed is desired, it must be effected by the use of gearing or belting, or some similar device. The more common practice, however, is to transmit the engine power to one or more jack-shafts where it may be divided as desired, and distributed to the several machines where it is utilized.

Belts are employed more commonly than gearing for transmitting power from one shaft to another. They are generally of leather, but rubber belts are in considerable use and belts of canvas are common for small farm machines. Leather belts are single- ply or double-ply. The latter cost about twice as much as the former, but are more economical in the long run as they deliver four times the power during life. The double-ply belt, however, is much less pliable, and cannot be used on small pulleys. Rubber belts are made of alternate layers of rubber and cotton duck compressed into a solid band. They are more resistant than leather to heat, cold and moisture but are easily ruined by lubricating oils and greases. If kept strictly clean they will wear outlast leather, and are considered to give a better grip on the pulleys. Canvas belts are cheap, and are readily affected by the weather. They are much improved by waterproofing paints and dressings. Steel belts have been used with success. They are simply flat bands of tempered steel. For an equal power they are about one fifth the width of a leather belt, and show only one-tenth the slip. They are run at speeds up to 10,000 feet per minute. The resistance of a belt to slipping is independent of the width of the belt, so long as the total stress upon the belt is constant. It depends chiefly, in this case, upon the arc of contact between the belt and the pulley; and a belt will slip just as readily upon a pulley four feet in diameter as upon one that is two feet in diameter, if the arc of contact (measured in degrees) is the same in both cases, and the surfaces of the two pulleys are in the same condition. The laying out of a successful system of belting, for use in mill work, calls for practical experience with belts, since it must be admitted that the formulae that have been given do not correspond with experience. The performances of belts have made all the carefully devised rules seem ridiculous. There are too many variables in the problem. In most cases it is customary to make a computation according to Webber's rule for ordinary leather belting of single thickness: A belt one inch wide
will safely transmit one horse power, when run at a speed of 600 feet per minute; and the power transmitted will be proportional to the width of the belt, and to the speed at which it is run. This rule gives no information with regard to the proper tension, but it implies that the tension may be safely increased until the belt actually does transmit the computed horse power. For efficient operation, that is, the economical transmission of the power, the driver and driven pulleys should not be too close together. A large percentage of wear may be transmitted if a distinct sag in the driving side of the belt is arranged for. For narrow belts the pulleys should be at least 10 to 15 feet apart and the sag about 2 inches; and for wide belts from 20 feet upward and the sag up to 5 inches. Where the distances between shafts are necessarily less than these either rope or chain drives may be more effectively employed. The angle at which belting is placed with reference to the horizontal should never exceed 45°. A very stiff belt, or a very light belting is practicable if necessary. In placing belt pulleys on the jack shaft they should be so arranged that the pull alternates in different directions. Unless absolutely impossible, the motion should be from the top of the driver to the top of the driven pulley: in this case the sag increases the arc of contact. The pulleys should be as large as practicable to lessen the abruptness of bending in the belt but the speed (except for steel belts) should not exceed 4,000 feet per minute. If the pulleys are faced with leather, the tension of the belt may be reduced, with a larger transmision of power and an increased durability of the belt.

The greatest efficiency in belt transmission of power is secured with narrow belts on large pulleys, run with low tension at high speed (4,000 feet per minute).

**Rope and Cable Drive.**—Rope drives are used where the shaft centres are too close together or too far apart for the economical use of the same, and where very large power is to be transmitted. The faces of the pulleys are scored with deep grooves narrow at the bottom, so that the rope will be gripped by the wedging of the sides of the groove. The width of the rope should be from one to three times the thickness of the rope to be conveyed, ranks of 30 ropes being not uncommon for large powers. There are two methods of fitting out such a drive: the English and the American. By the former method each complete wind of the rope is individual, and is spiked in its place. In the American system the entire drive consists of one continuous rope, with one splice. The slack of so long a rope is large, but is taken up by a tension carriage around which the rope makes a single turn. After a new drive has run a few minutes all the slack has been gathered upon this carriage, and the tension of all the coils of the drive is uniform, and is kept so by the tension regulator. In the English drives, on the contrary, it is rarely that any two coils are taken together into one tension carriage, and better results. The speeds at which rope drives are run vary from 2,000 to 4,000 feet per minute. They are most effective when run under full load. The rope used in such drives is preferably a four-strand rope of song-hire Zebu made a twist upon a core. This rope is not only soft and pliable, but very durable. Cotton ropes have made remarkable records in some cases. In a certain Scottish cotton mill a rope drive of 24 cotton ropes one and three-fourths inches in diameter ran continuously at a speed of 4,400 feet per minute for 26 years without repair. This drive transmitted 826 horse power from a driving pulley 28 feet in diameter.

Wire ropes or cables are useful in very long horizontal transmission. They work acceptably up to 6,000 feet, if relay pulleys are provided at least every 500 feet, transmitting 75 per cent of the power. They are generally woven of six strands upon a cotton core, each strand being a cable of from 7 to 19 wires of charcoal iron or low steel: the 7-wire cables make a stronger rope, but less pliable. On account of its great liability to rust a wire cable used in power transmission is usually treated with boiled linseed oil, which has also the effect of improving its grip on the pulleys. The pulleys for wire cables should have a leather bed in the bottom of the groove to save wear of the cable.

**Chain Drive.**—For speeds of less than 1,000 feet per minute the chain and sprocket drive is highly efficient. The disadvantage with it is that the teeth of the sprocket wheel become worn so that the pull is not evenly distributed upon the wheel. In extreme cases the entire pull may fall upon a single tooth. The sprocket wheel should never have less than 12 teeth. The usual top limit is 60 teeth. This form of drive is particularly adapted to situations where the driving shaft and the driven shaft are necessarily close together. For very heavy powers the gear-chain is effective. It is so constructed that the ends of the links form a series of cogs on the inner side of the chain-belt, to engage with the cogs of a broad spur-gear wheel. Because of their noiseless running these chains are sometimes called "silent chains."

**Friction Gearing.**—In some circumstances friction gearing is desirable, but as it depends for its efficiency upon strong pressure, with the excessive strains which accompany it, this form of power transmission is generally avoided. Where used the driving wheel is usually of iron, the power being on leather, or faced with leather. It has been found, however, that the friction of aluminum on leather is 40 per cent greater than that of iron on leather.

**Wheel gearing** is discussed at length in a special article under that title, to which the reader is referred. This form of power transmission is effective in overcoming resistances in which belts, ropes and chains would be insufficient. The efficiency of toothed gears ranges up to 98 per cent when the teeth are comparatively small and the speed low, up to 75 per cent, medium speeds showing a lower efficiency. The breaking pressure on the teeth of toothed gears increases up to a certain speed, and above that speed decreases.

Link work includes the mechanical devices known as cams, eccentrics, cranks, connecting-rods, levers and the like. They serve to transmit motion from one part of a machine to some other part.

The second group of power transmissions depends upon the elasticity of fluids. Air,
steam or water are put under pressure, and this pressure is available for work at the farther end of the pipe-line which confines and conveys the fluid. In the case of electricity the condition is somewhat different, but is comparable to a hydraulic current flowing in a pipe.

Compressed air (gases) is employed in the transmission of power in many cases, especially in the operation of rock drills, and in mining generally, the air serving, in such cases, not only to operate the machinery, but also to aid in the ventilation of the mine. While the efficiency of the mains is 98 per cent that of the motors varies from 40 to 67 per cent. The compressed air may be delivered to the point at which the power is wanted by means of pipes directly from the compressors, or it may be stored at high pressure in tanks, from which it is drawn as needed. For example, in mining locomotives are used which derive their power from large tanks of compressed air that take the place of the ordinary steam boilers of other locomotives; these tanks being charged at the point of delivery and sufficient air is allowed to escape to maintain the pressure. Steam is used in the same way but with much less efficiency as enormous amounts of heat are lost from the steam pipes and they are very rarely insulated. Power is also transmitted hydraulically, when, as in cranes, presses and elevators, it is desired to exert great force in some slow-moving piece of machinery. In London and other European cities there is a regular public service of water under high pressure for use in small shops as a cheap source of power.

A great deal of attention has been given, in recent years, to the economical transmission of power by electricity, and the various problems that are involved have been solved so satisfactorily that enormous quantities of power are now transmitted electrically, in some instances to a distance of upwards of 200 miles. The mechanical energy that is to be transmitted is first converted into electricity by means of a dynamo; and the electricity thus generated is led along the wire to the various machines that are to be operated, each machine being provided with its own separate motor. Installations of this kind are especially successful when the work is of such a nature that the machines are idle for a considerable part of the time, because there is no loss, in electrical transmission systems, when the circuit is interrupted and no current is flowing; whereas in a mill that is fitted up with shafting and belts the shafting runs all the time, and the losses due to its friction go on all the time, whether the machines are running or not. The use of individual motors, as described, is also advisable in plants where the machines are run at high speeds, since the desired speeds can be attained electrically, without the losses incident to the use of belts, fly wheels, or trains of gearing, or any other method of direct mechanical multiplication.

In the transmission of power by electricity to considerable distances, the chief losses are those due to direct leakage of electricity along the line, and to the dissipation of energy in the form of heat in the conductor. The losses due to the former cause can be kept down to a reasonable limit by paying proper attention to insulation, though the problems that are here involved are very serious, when the potential of the conductor is maintained at 60,000 volts or over. The loss due to the development of heat on account of the resistance of the conductor can theoretically be diminished as much as we please, by merely increasing the size of the conductors, but conductors sufficient in size to render the heat loss negligible are too expensive to be commercially practicable. Lord Kelvin, in an attempt to determine the most economical size of conductor for electrical transmission, came to the conclusion that the maximum economy is attained when the conductor is of such a size that "the annual interest on the capital outlay is equal to the annual cost of energy wasted." Under ordinary conditions, this is found to lead to the conclusion that the most economical current-density in the conductor is 2.5 amperes per square inch sectional area of the conductor. For the case in which a given horse power is to be delivered at a given distance, the condition is somewhat different, and not so simple. Professors Ayton and Rea, who have investigated this case, have given somewhat complicated formulae for determining the most economical cross-section of the conductor. (Consult Kent, 'Engineer's Pocket Book,' and the references there given.) In long distance transmission it is customary to adopt, for the transmission line, a far higher potential than is desired for the operation of the machinery at the delivery end, since this artifice makes it possible to transmit a given quantity of electrical energy over a given conductor with a smaller heat loss than would be involved if the transmission were effected at a lower potential. When the transmitting current is alternating, the reduction of potential at the delivery end may be effected by means of a transformer; but when the transmitting current is direct, it is customary to use "motor-generator" which consists of a motor, actuated by the transmission current, coupled on the same shaft with a dynamo, which gives out a current adapted to the work to be done. The motor-generator is also used to change the direct current into an alternating current, when the alternating current is desired for delivery purposes. Some of the problems of electrical transmission have been solved on a very large scale at Niagara Falls, where the water power is partially utilized for mechanical purposes. A portion of the power that is developed in the turbine houses is transmitted electrically to Buffalo, for the operation of electric railways and for other purposes, and the remainder is utilized, also in the electrical form, in factories in the more immediate neighborhood of the falls. The modern electric transmission line for high voltages is of aluminum cable on a steel core — to give it strength and lessen the sag between towers — or of copper-clad steel, known to the trade as "Alcoons" or "Alcons," or of some ingeniously devised steel core which is first alloyed with copper on its surface, and then covered with a heavy coating of pure copper. The aluminum cable has to be 6.6 per cent larger in volume than a copper cable to obtain
an equally low resistance. As the weight of aluminum is 30.2 per cent that of an equal volume of copper, the weight of aluminum required for a stated conductivity is 48.8 per cent of the weight of copper having the same conductivity. An aluminum line is, therefore, much cheaper than a copper line. For voltages up to 66,000 volts, the "petticoat" type of insulation, set upon iron pins, are commonly used. The "petticoats" or porcelain "bells" are nested one within another until the insulation is sufficient to prevent the current from the cable from leaping to the supporting pin. The protective power ranges about 15,000 volts to each bell; that is, for a current of 44,000 volts, three bells are required; for 66,000 volts, at least four bells in the nest. The great weight of these porcelain masses limits their use to the smaller voltages, so that above 66,000 volts the suspension type of insulation is used. This consists of a series of porcelain discs hanging in horizontal position one below another and suspended through their centres. As many discs may be added to the "ranges" as is necessary to insure the particular current. On 110,000-volt lines five or six discs are used. On 140,000 volt lines the number of discs is increased to 10 and the space between the horizontal cables is not less than 12 ft. On lines of low voltage wooden poles of white cedar (arbor vitae) or chestnut are generally used. They have a "life" of from 10 to 12 years. Concrete poles are practically indestructible, but very expensive to set, on account of their great weight. For high voltage transmission lines the steel tower of lattice construction is favored. These are set from 400 to 1,000 feet apart. The longest known span is one reaching across the Saint Lawrence River at Three Rivers (Canada) which is a clear span of 4,800 feet from towers 315 feet high; the cable carrying 140,000 volts. Underground conduits are common for electric transmission in cities. They are variously constructed: of artificial stone—made by mixing limestone and Portland cement; of fiber paper made of wood pulp saturated with a bituminous compound. The cables used in underground transmission are usually three-phase, three-conductor cables of the so-called "copper-leaf" pattern, the conductors being insulated by manila-ropes paper of various thicknesses, with pitch or pitch and resin oil. This type of insulation is as durable as the lead sheath in which the cable is encased; which is all that can be desired. The voltage which such an underground cable can carry without loss, or perforation of the insulation, ranges up to a maximum of 300,000 volts.

POWERS, Hiram, American sculptor: b. Woodstock, Vt., 29 July 1825; d. Florence, Italy, 27 June 1873. He received his education at the district school, and on the removal of the family to Ohio in 1819 was employed as assistant to a clock-maker. At the same time he learned the art of modeling in clay from a German sculptor. He was subsequently appointed director of the waxwork department of the Western Museum of Cincinnati, an employment he pursued for seven years. In 1835 he went to Washington, and was for some time employed in modeling busts of distinguished men. With the proceeds derived from these efforts, and the aid of Gen. John Preston, he was enabled to visit Italy. In 1837 he established himself at Florence, where he resided until his death. His statue of 'Eve Tempted,' which excited the approval of Thorwaldsen, was produced in 1838; in 1843 was modeled the still more popular 'Greek Slave,' of which six copies in marble and innumerable casts and reduced copies are in existence. Among his other statues the most notable are 'The Fisher Boy' (1846); another of 'Eve Tempted' (1850); 'America' (1854), destroyed by fire in 1866; 'I'Penseroso' (1856); 'California' (1858); and 'The Indian Girl' (1872); and statues of Washington for the State of Louisiana, of John C. Calhoun for South Carolina, of Daniel Webster for Boston, and of Franklin and Jefferson. He also executed several ideal busts, such as 'Ginevra' (1840-65); 'Proserpine' (1845); 'Psyche' (1849); 'Diana' (1852); 'Christ' (1866); 'Faith' (1867); 'Clytie' (1868); 'Hope' (1869); and 'Charity' (1871); besides busts of Jackson, John Quincy Adams, Edward Everett, Van Buren, Longfellow, John Marshall, Philip Sheridan and others.

POWERS, Le Grand, American statistician: b. Preston, N. Y., 1847. He was graduated at Iowa State University in 1872 and was engaged in active ministerial work 1874-90. He was commissioner of labor in Minnesota 1891-99, and has since been chief statistician of the United States census, in charge of agriculture. He has published 'Minnesota Bureau of Labor Biennial Reports' (1890-99); 'Farmer Hayseed' (a reply to 'Coin's Financial School') (1895) Twelfth Census of the United States (Vols. V-VI); Census Report on wealth, debt, taxation and other statistics of cities. He is also a frequent contributor to newspapers, American and English reviews and financial and statistical journals.

POWERS OF CORPORATIONS. See Corporations, Legal.

POWHATAN, pow-ha-tan', Indian sachem: b. about 1550; d. 1618. This was the name of his tribe; his own was Wahunsonacock. Originally he was at the head of eight tribes, but being a man of great natural abilities he raised himself from the rank of a chieftain to the command of 30 tribes, numbering about 8,000. (See Powhatan Indians). His dominions included the country between the James and Patuxent, and extended into the interior as far as the falls of the Potomac. One of his abodes was a village of a few wigwams near the present site of Richmond. A large guard of warriors
usually attended him, and his dwelling was watched at night by sentinels. After the extension of the country northward, he dwelt mainly at Werowocomoco, on York River, in the present county of Gloucester, a few miles from Jamestown. He was disposed to look with dislike upon the coming of the whites. Capt. John Smith, in 1607, dined sometimes for some time by Powhatan, a prince, and according to the tradition, when Smith had been condemned to death, the sachem yielded to the entreaties of his daughter Pocahontas (q.v.) and spared his life. Two years later Powhatan was crowned Emperor of the Indies by Smith's and Capt. Christopher Newport, during a visit which they paid him in quest of supplies. Smith afterward made an unsuccessful attempt to capture Powhatan in order to obtain a supply of corn, and in revenge for this Powhatan prepared to exterminate the English, but was foiled by the watchfulness of Pocahontas. The quarrels between Powhatan and the English did not cease until the marriage of his daughter to John Rolfe (q.v.), after which he was their firm friend. Smith's description of the nation represents him as a "tall, well-proportioned man, with a sour look, his head somewhat gray, his beard so thin that it seemed none at all, his age near sixty, of a very able and hardy body to endure any labor." Powhatan died in 1618 and was succeeded by his brother Opitchapam, who was soon supplanted by a younger brother, Opechancano (q.v.) already a very noted warrior.

POWHATAN, Indian *pawatan* falls in a current of water, a confederacy of southern Algonquian tribes resident at one time within the territory now occupied by the State of Virginia and a part of Maryland. They were surrounded by the Monacan, Manahoac, Chowanoc, Nottoway and Meherrin. When the Powhatan first came into contact with the whites they were one of the most numerous and powerful tribes in America east of the Mississippi. On his map of their territory Capt. John Smith gives 160 of their villages, which were only a part of the territory under the control of their high chief. The Powhatan were among the first tribes on the continent and north of Mexico visited by the English. As early as 1570 the Jesuits established a mission among them; and a few years later reports of them reached the English who finally came into contact with them on the foundation of the Jamestown settlement in 1607. The Indians were alternately friendly and hostile until finally a unity of interest was created between the whites and the natives through the marriage of Pocahontas (q.v.), the daughter of the high chief, to John Rolfe, an Englishman of middle-class family. On the death of Powhatan, father of Pocahontas, in 1618, he was succeeded by his brother Opechancano who had always been an enemy of the white settlers. On 22 March 1622 he attacked, at the same time, all the settlements in Virginia, killing 347 English, destroying all their plantations. The settlers declared war to the death against the Powhatan and made arrangements to render them helpless by sending against them three yearly expeditions with a view to molesting them in every way and especially of destroying their plantations. For 14 years the war continued during which both sides suffered severely. In 1625 General Wyatt defeated a force of 1,000 Powhatan at the battle of Paumunkey and destroyed their villages and crops. They were killed or captured, or driven away, or killed in retaliation, but at a great disadvantage owing to the better arrangement of the whites. A peace made in 1636 lasted seven years, when the aged Opechancanough headed another massacre in which over 60 whites were killed in one day. The settlers retaliated and finally captured and shot Opechancanough and broke up the confederacy (1642), after which each tribe made its peace as best it could with the whites. Again the Indians rose in revolt, but their strength, near Richmond, was stormed and men, women and children were put to the sword (1676). Some 46 years later a treaty was signed in Albany between the whites, the Powhatan and the Iroquois in which they mutually agreed to keep the peace. From this time on they gave no further trouble. They gradually mixed with the negroes and whites, and from time to time individuals, or even whole decimated tribes, joined other tribes not of their own tongue until finally they disappeared as a tribal organization. They numbered 3,000 or 3,500 and were numbered at one time at least 8,000. They lived in community houses which were well built and varying in length from about 35 to over 100 feet. Most of their villages were fortified with post-palisades about twice the height of a man. There were from one to three of these walls, one within the other. They had gone a considerable way along the road to the sedentary life that leads to civilization. They had extensive plantations of corn, beans, pumpkins, melons, squashes, vegetables, tobacco and fruits; and they kept account of time and their business transactions on knotted strings much as the ancient Peruvians did. They are represented by a considerable number of Mesizos, most of whom are either farmers or fishermen; and they are as expert to-day as in olden times in the making and management of canoes and fishing nets. See POCAHONTAS; OPECHANCANO; VIRGINIA; Consult Eggleston, E. A. Pocahontas (New York 1899); Hamor, R. A., 'True Discourse of the Present Estate of Virginia' (London 1915); Hodge, W. H., 'Handbook of the American Indians' (Washington 1910); Price, W. T., 'Historical Sketches of Pocahontas County, West Virginia' (Martinville 1916), Waston, V. C., The Princess Pocahontas (Philadelphia 1916).

POWNULL, Thomas, English statesman, colonial governor and author: b. near Lincoln, 1722; d. Bath, 25 Feb. 1805. He was graduated at Cambridge in 1743. In 1753 he went to America as private secretary to Sir Daniel Gooch, governor of New York, and in 1757 was made governor of the colony of Massachusetts Bay. He showed considerable disinclination to carry out the policies of his superiors in London and as a result he was transferred to South Carolina in 1760 as governor of the settlements. With the flight of South Carolina he returned to England in June 1760 and soon after his arrival resigned the governorship. In 1762-63 he was comptroller-general of the expenditures of the army in Germany, and in 1768 was elected to Parliament. He earnestly opposed the measures of the government against the colonies. After being three times returned to Parliament, he retired in 1780.
and passed the remainder of his life in antiquarian studies. In the sphere of scholarship he achieved a greater reputation than that which he won in the field of politics. His writings have a wide range of subjects, and among his principal works are: 'Admission of the Colonies' (1764); 'A Memorial to the Sovereigns of America' (1773); 'A Topographical Description of the Middle Colonies' (1776); 'A Memorial to the Sovereigns of Europe on the Sublime Heroic Art of Painting' (1777); 'Rhode Island, and the New World' (1767); 'Notice and Descriptions of the Antiquities of the Provincia Romana of Gaul' (1788); 'Intellectual Physics' (1795); 'A Treatise on Old Age' (1801); 'A Memorial to the Sovereigns of Europe and the Atlantic' (1803), and numerous monographs on antiquarian subjects. Consult Pownall, Chas. A. W., 'Thomas Pownall' (London 1908).

POYNINGS, poinţing, Sn Edward, English statesman; b. 1459; d. 1521. As a result of his activity in the Kentish revolt against Richard III he had to flee to the Continent. In 1485, however, he returned to England in the train of the Earl of Richmond, afterward Henry VII. During the life of this monarch he was one of the most favored and trusted members of his entourage, a position which he also occupied under his successor, Henry VIII. In 1493 he was made governor of Calais. He went as lord deputy to Ireland in 1494 and there defeated Perkin Warbeck at Waterford. During his administration of Ireland he summoned a Parliament at Drogheda, which, and his instigation, gave to the English Crown and the king's Privy Council direct control of Irish administrative affairs. The act by which this was accomplished became known as the Poynings' Law (q.v.; also see IRELAND, HISTORY). After his recall in 1496 he was made warden of the Cinque Ports. Henry VIII, immediately upon his succession to the throne after the death of Henry VII in 1509, made him a member of the King's Council. During the following years he was frequently entrusted with important diplomatic missions and military commands, and in 1520 he was especially active in arranging and preparing for the Field of the Cloth of Gold (q.v.), the famous meeting between Francis I and Henry VIII.

POYNINGS' LAW, or STATUTE OF DROGHEDA, an act of the Irish Parliament, passed in 1495, whereby it was provided that no Irish Parliament should be summoned and no act passed without the previous approval of the English king and his Privy Council under the great seal of England. At the same time all laws that had so far been enacted and were in force then in England were declared of force in Ireland. It was so named from Sir Edward Poynings (q.v.). It was repealed in 1782. Consult 'The Policy of Poynings' Law' (Dublin 1770).

POYNTING, point'ţár, Sir Edward John, English painter; b. Paris, 20 March 1836; d. London, 26 July 1919. He received his early education in Westminster School and in 1856 entered the studio of Gleyre in Paris from 1856 to 1859. In 1860 he returned to London and was elected Royal Academician in 1876. From 1894 to 1905 he was director of the National Gallery. On the death of Sir John Millais in 1896 he was elected president of the Royal Academy and the same year was knighted. He was created a baronet in 1902. His paintings in oil and water colors are distinguished by originality of conception, faultless drawing and strong color qualities, and the most remarkable of them are 'Israel in Egypt' (1867); 'The Catapult, an incident in the siege of Carthage' (1868); 'Faithful unto Death'; 'Proserpine'; 'Perseo and Andromeda' (1872); 'The Fortune Teller' (1877); 'Rhode Island, and the New World' (1878); 'The Meeting of Solomon and the Queen of Sheba' (1891); 'Horne Serenae'; 'Ile de Pears' (1894); 'The Ionian Dance' (1899); 'The Cave of the Storm-Nymphs' (1893); 'The Nymphs' Bathing Place' (1904); 'The Cup of Tantalus' (1905); 'Lesbia and Her Sparrow' (1907); 'Bathing a Storm' (1908); 'A Naval Disaster' (1912); 'At Low Tide' (1913); 'The Sea Bath' (1914); and portraits of King Edward VII and of numerous persons of prominence as well as many water colors, figures and landscapes. Also two sets of designs for the new coignage of 1894 and cartoons for mosaics of Saint George and Saint David in Westminster Palace. During the years 1872-73 he was employed in frescoing the walls of Saint Stephen's Church, Dulwich. He also furnished designs for the decoration of the interior of the dome of Saint Paul's Cathedral with subjects from the Apocalypse, as well as for the mosaics in Westminster Palace. He also published 'Ten Lectures on Art' (1879); 'Classic and Italian Painting' (with P. R. Head, 1880); 'German, Flemish and Dutch Painting' (with H. J. Wilmot Buxton, 1881). He acted as editor of 'The National Gallery' (1899), containing reproductions of all pictures in the National Gallery acquired up to the end of 1899. Du Maurier in 'Trilby' draws a delightful sketch of Poynter in their old student Paris days and of his passionate study and admiration for all the great masters.

POYNTING, point'ţár, John Henry, English scientist; b. Monton, Lancashire, 9 Sept. 1852; d. Birmingham, 30 March 1914. He was educated at Owens College, Manchester, and Trinity College, Oxford, was assistant to Prof. Joule in the laboratory at Owens in 1876-79, and in 1880 was appointed to the chair of physics at Mason College (now Birmingham University). In 1905 the royal medal of the Royal Society was conferred upon him. He has contributed papers on electrical theory, gravitation, radiation and the mean density of the earth to the 'Philosophical Transactions' and the 'Proceedings' of the Royal Society; published his Adams prize essay on 'The Mean Density of the Earth' (1891); and 'A Text-book of Physics' (with Sir J. J. Thomson, 1902-14).

POZZO DI BORGO, pōt'sō dé bōr'gō, Carlo Andrea, Count, Russian diplomat; b. Alfreda, Corsica, 8 March 1764; d. Paris, 15 Feb. 1842. He was educated at Pisa and became an advocate. In 1791 he was elected to the National Assembly of France and became friendly with Napoleon Bonaparte and his family, but later joined Paoli in his opposition to Napoleon and became the bitter enemy of the latter. As a result he had to flee from France. In 1794, when the English instituted a protec-
torate over Corsica, he became president of the council, holding this position until the withdrawal of the English forces in 1796. At that time he was specifically excluded by Napoleon from the amnesty which he extended to his other Corsican opponents and he, therefore, went for his safety to England where he resided for a number of years, working to the fullest extent of his power against Napoleon.

In 1804 he entered the Russian diplomatic service and was employed in various missions of importance, continuing at all times his activities against Napoleon. As a result of this attitude he resigned from the Russian diplomatic service in 1807 after Emperor Alexander I had concluded a treaty with Napoleon. Again he retired to England where he resided until 1812 when he was recalled by Emperor Alexander.

He now devoted himself more than ever to the prosecution of the war against Napoleon. He succeeded in persuading Bernadotte and Sweden to turn against Napoleon and was most active in forming the coalition against the French emperor. He played an important part at the Congress of Vienna. Throughout his whole diplomatic career he openly and constantly displayed his friendship for France, which country honored him in 1818 by making him a count and peer of France. From 1830–35 he was Russian Ambassador at Paris and from 1835–39 at London. Consult Uvarov, S., ‘Stein et Pozzo’ (1840); Maggioni, A., ‘Casa, France et Pouzo, Pozzo di Borgo et du Comte de Nesselrode’ (Paris 1890–97).

POZZOLO, pôt-soo’ô-lê, Italy, a city on the bay of the same name, six miles west of Naples, at the western foot of the Solfatara and in a volcanic country known to the Romans as the Phlegræan Fields. Near by is the Avvernian Lake famed as the entrance to hell both in Virgil’s sixth Æneid and in early Christian legend, which pointed out here the place where Christ descended into hell. Remains of a theater near the town, which is particularly famed for its amphitheater, where 30,000 spectators could sit and in which there were naval battles as well as the ordinary gladiatorial contests. The so-called Serapeum is an archaeological puzzle and may have been a town-hall; traces of the action of sea water on several pillars not now touched by high water seem to prove that the coast, possibly from volcanic disturbances, has undergone marked and recurrent changes.

The only other ruin of importance is that of the temple of Augustus, the site of which is occupied by the cathedral, which preserves six of the original Corinthian columns. Pozzolu is a good fishing-port; exports the volcanic sands called pozzolana, which are used in making concrete; has important mineral baths in the vicinity, and is the site of an ordnance factory, a branch house of Armstrong and Company, which makes armor plate and cannon for the Italian government.

Pozzolana was founded by Greek exiles from Samos in the 6th century B.C., as Dicæarchia, but the Italians called it Puteoli, “the wells,” because of the sulphurous cavities in the earth, and the city continued to be known under this name after it was made a Roman colony in 194 B.C.

The city became the greatest port of Italy and on entrepôt for Oriental commerce; goods were sent overland hence to Rome and the dangerous navigation of the coast of Latium avoided. Even after Ostium was built the port retained its importance, and its beautiful coast and curative springs and baths made it a favorite station. During the Middle Ages it suffered a great deal from frequent convulsions caused by nearby volcanos. Pop. (1910 census) 28,167. Consult Loffredì, E., ‘Antiquus Puteolorum’ (in ‘Thes. Antiq. Francesco, frán-thês’kô pré-dê-yâ, Spanish painter: b. Villanueva de Gallego, in the province of Saragossa, 24 July 1848. His parents were very poor, and the young Pradilla, who early in his youth showed a re-
markable gift for drawing, had to undergo a hard struggle before he could find the ways and means to develop himself to the development of this gift. In 1836 he came to Madrid where he devoted himself zealously to the study of the old masters and became a pupil of Serrit. Before long he was sent to the Spanish Academy of Fine Arts in Rome, in which he was one of the first pupils. His first signal achievement was 'The Rape of the Sabines'; this was followed in 1878 by 'Joanna the Mad, following the Coffin of Philip the Fair, her Husband'. The latter was exhibited at the World's Exposition at Paris in the same year, where it created quite a sensation and was awarded a medal. It is now in the Prado at Madrid. His next important work was 'The Surrender of Granada to Ferdinand and Isabella,' a picture remarkable for spirited delineation of character, lifelike action and grandeur of style. It was awarded a first medal at the exposition in Munich (1883) and may now be seen in the Senate Hall in Madrid.

Still another picture of the same type is 'The Last Sign of the Moor.' In addition to these large canvases he has produced many small genre pictures. Most of these illustrate modern life, especially amongst the peasants, and show keen observation, subtle power of individualization and a remarkable genius for realism. These small canvases are masterpieces of their kind and have won for him an international reputation. The best known amongst them are 'High Mass in the Pilgrims' Chapel at Guia' (1891), 'Mark's Day in Vigo' (1892), and 'Pilgrimage to the Shrine of Our Lady of Good Counsel' (1895). He has also painted some mural decorations of great beauty in the Murgo Palace in Madrid. In 1892 he was made a member of the Berlin Academy and in 1896 he became director of the Royal Museum in Madrid.

PRADO, prá'thò, Mariano Ignacio, Peruvian politician: b. Huanaco, 1826; d. Paris, 1902. He engaged actively in a revolution which in 1854 overthrew General Echenique and led the opposition to President Pezet in 1855 which resulted in his resignation and his designation as supreme chief. He then formed an offensive and defensive alliance with Chile, and declared war against Spain. A Spanish attack upon Callao was repulsed 2 May 1866, but his own position having been declared unconstitutional, he was obliged to leave Peru in January 1868 and went to Chile. Returning several years later he was elected President in 1876 and in 1879 declared war against Chile. Prado went to Europe in the same year, for the purpose, as was then stated, of obtaining a loan and ironclads, and in his absence the Presidency was seized by Pierola. He returned to Lima in 1886, but ceased to be active in politics. Consult Markham, C. R., 'A History of Peru' (Chicago 1892).

PRADO, prá'd, Mrs. Campbell Mackworth. See FRAED, ROSA CAROLINE MURRAY-PRIOR.

PRADO, Rosa Caroline Murray-Prior, Australian novelist: b. Proston, Queensland, 27 March 1852; d. London, 1872. She was married to Campbell Mackworth Praed (d. 1901) and in 1876 went to London where her Australian stories soon made her well known. She has been a prolific writer of popular fiction and many of her books have reached large editions. Amongst the more important of them are 'An Australian Heroine' (1880); 'Policy and Passion' (1881); 'Nádine' (1882); 'Moloch' (1883); 'Zero' (1884); 'The Head Station'; 'Affinities'; 'The Brother of the Shadow' (1885); 'The Bond of Wedlock'; 'Miss Jacobson's Chance' (1887); 'The Romance of a Station' (1889); 'The Romance of a Chalet'; 'The Soul of Countess Adrian' (1891); 'December Roses' (1892); 'Outlaw and Law Maker' (1893); 'Christina Chacon' (1894); 'Mrs. Tregaskiss' (1896); 'The Scourge Stick' (1898); 'Madame Izaan' (1899); 'As a Watch in the Night' (1900); 'The Insane Root'; 'Dwellers by the River' (1902); 'Fugitive Anne' (1904); 'Nydia' (1904); 'A Mail of the River' (1905); 'The Lost Earl of Elan' (1906); 'The Luck of the Leura' (1907); 'By Their Fruits' (1908); 'Opal Fire'; 'The Romance of Mademoiselle Aissé' (1910); 'Body of His Desire' (1912); 'Lady Bridget of the Never-Never Land' (1913). She also published 'My Australian Girlhood' (1902), an autobiography; with Justin McCarthy (q.v.), 'The Right Honorable' (1886); and with Justin McCarthy and M. Menpes, 'The Grey River' (1889). She consulted, 'Our Book of Memories; Letters of Justin McCorthy to Mrs. Campbell Praed' (London 1912).

PRAED, Winthrop Mackworth, English poet: b. London, 26 July 1802; d. there, 15 July 1839. He was educated at Eaton and Trinity College, Cambridge, was elected to a fellowship in 1827, and in 1829 was admitted to the bar. In Parliament he sat for Saint Germains in 1830–32, for Great Yarmouth in 1834–37 and for Aylesbury from 1837. Praed made some successful speeches in the House and was requested by Wellington to write for the Morning Post a defense against certain attacks on the Duke in the Times. He showed a remarkable gift for versification comparatively early in life, writing considerable poetry of the lighter sort even during his public career. He was a liberal Whig, but his political writing was too restrained to reach its mark; but his verse is marked by a lightness of touch and a metrical ease and finish which in more recent times finds its closest resemblance in the work of Austin Dobson. He excelled in vers de société, though he displayed, as in the 'Red Fisherman,' an imaginative force which suggests broader fields. Of his writings the following have been published in book form: 'Charades' (New York 1832); 'Essays' (London and New York 1887); 'Poems' (London 1865). Consult Kraupa, Matilde, 'Winthrop Mackworth Praed' (in Wiener Beiträge Zur Englischen Philologie, Wien and Leipzig 1910).

PRAEFECT, the title of various civil and military officials of ancient Rome. Of these the most important was the prefectus urbis, or warden of the city, originally called custos urbis. The name prefectus urbis does not seem to have been used till after the time of the emperors. During the kingly period and the early years of the republic the custos urbis exercised within the city all the powers of the chief of the state in his absence; he convoked the senate, held the comitia, and on any emer-
gency might take such measures as he thought proper. When the office of praetor urbain (see Praetor) was instituted the wardenship of the city was merged in it; but the conservative spirit of the Romans still induced them to appoint annually a praefectus urbi for the time during which the consuls were absent from the city to celebrate the Feriae Latinae, a festival held on the Alban Mount. Under Augustus, however, the office ceased to be a sinecure. The praefectus urbi was a permanent magistrate whom the emperor invested with all the powers necessary to maintain peace and order in the city. He had under him a sort of police called milites stationarii; and the powers of the office were gradually so far extended that at last there was no appeal from his sentence except to the emperor. The praefectus praetorio was the officer who commanded the troops who guarded the emperor's person. (See Praetorian Guards.) The office was first instituted by Augustus, and was at first only military and had comparatively little influence attached to it; but under Tiberius it became second only to that of the emperors. From the time of Severus to that of Diocletian the praefects had the superintendence of all the departments of the state—the palace, the army, the finances and the law; they also had a court in which they decided cases. In addition to these functions there were the praefectus aquis, charged with the regulation of the water supply of the city; the praefectus aravori, who had charge of the public treasury; the praefectus vigilum, who commanded the night-watch; with others of less importance.

Praemunire, pré-mù-nîrè, the opening words of the writ issued preparatory to the prosecution of certain offenses supposed to imply legal contempt toward the sovereign or the government. Praemunire or praemunire facias A. B. (Cause A. B. to be forewarned that he appear before us, etc.). Gradually the word acquired a wider meaning, being used to denote both the offense and the penalties incurred. The first statute of praemunire was passed during the reign of Edward I (1272-1306) and was intended to repress the papal encroachments on the rights of the Crown, and several subsequent statutes before the Reformation greatly extended the number of penal acts under this title. By still later statutes acts of a very miscellaneous nature were rendered liable to the penalties of praemunire, as knowingly and wilfully solemnizing, assisting or being present at any marriage forbidden by the Royal Marriage Act; asserting by preaching, teaching or advice speaking that any person other than according to the acts of settlement and union has any right to the throne, or that the sovereign and Parliament cannot make laws to limit the descent of the Crown; to assert that both or either of the Houses of Parliament have or has a legislative authority without the sovereign; and so on. Cathedral chapters in England which refused to elect the bishop nominated by the Crown were liable to be prosecuted on praemunire. The punishment was forfeiture and imprisonment during the sovereign's pleasure. Prosecution by writ of praemunire has been obsolete, however, for a long time. Consult 'Statutes of the Realm'; Reeves, John, 'History of the English Law' (London 1869); Stubbs, William, 'Constitutional History of England' (Oxford 1875-78); Holdsworth, W. S., 'A History of English Law' (London 1903-09); Jenks, Edward, 'A Short History of English Law' (Boston 1912).

Praeneste, pré-nèsêtè. See Palestina.

Praetor, originally the official title of the consuls at Rome. When the patricians were compelled to acquiesce in the consuls being chosen open to the plebeians, they stipulated that a new curule magistrate should be appointed from the patricians exclusively, to act as supreme judge in the civil courts. On this magistrate the title of praetor was bestowed. In 337 B.C. the office was thrown open to the plebeians. About 240 B.C., the number of aliens residing in Rome had increased to such an extent that it was found necessary to appoint a second praetor, who should decide suits between aliens or between aliens and citizens. This praetor was known as the praetor peregrinus, the other praetor, praetor urbain, having cognizance of suits between citizens only. In 227 B.C., the number was increased to four, the two additional praetors to act as governors of provinces. By Sulla the number was augmented to eight, by Julius Caesar to 10, 12 and eventually to 16. The praetors held their offices for one year and were afterward sent out by lot as governors of provinces.

Praetorian Guards, a body of permanent troops, established by Augustus as Imperial Life Guards, in imitation of the cohors praetoria, or bodyguard attached to the person of the commander-in-chief of a Roman army. The Praetorian guards were kept up by successive emperors and, being under special organization and enjoying several privileges, became in time so powerful that they were able to raise and depose emperors at their will. They were reorganized by Septimius Severus and were finally suppressed by Constantine the Great.

Praetorium, (1) the official residence of a praetor or governor of a Roman province: hence, a hall of justice; a judgment-hall; a palace. (2) That part of a Roman camp in which the general's quarters were.

Praga, prâgâ, Russian Poland. See Warsaw.

Pragmatic Sanction (Sanctio Pragmatica), a public edict relating to important state business, pronounced by the head of a state and differing from the simple rescript, in that the latter was a declaration of law in answer to a question propounded on behalf of an individual. The pragmatic sanction was considered irreversible and formed part of the fundamental law of the country. In European history the following are the most important pragmatic sanctions: (1) The ordinance of Charles VII of France, drawn up at Bourges in 1438, conformably to the decrees of the Council of Basel and on which rest the claims of the Gallican liberties. It was repealed by Francis I. (2) The instrument published in 1713 by which the German emperor, Charles VI, being without male issue, invested his great niece, Maria Theresa, with his female descendants. It was in accordance with this instrument that he settled his dominions on his daughter Maria Theresa. He induced most of the European sovereigns to
PRAGMATISM—PRAGUE

Pragmatism. The term pragmatism, as employed in philosophy at the present time, denotes the general tendency to subordinate logical thinking to the ends of practical life and to define the doctrine in terms of the practical consequences. There are thus two somewhat distinct sides to the doctrine, which we find differently emphasized by different writers. On the one hand, this view points out that thought owes its origin to the demands of the practical life. Thought is thus a tool or instrument that is always invoked to meet a particular crisis or problem resulting from a concrete situation. Thought, therefore, does not aim at truth in general. Its business is to discover, in concrete circumstances, the best means to the realization of some practical end that life demands.

This side of the doctrine has been chiefly elaborated by Prof. John Dewey and those associated with him at the University of Chicago as colleagues or students. These writers have connected their theory with the doctrine of evolution and support it mainly by arguments and analogies drawn from this source. On the other hand, to decide regarding the truth or falsity of any theory or concept, we must also appeal to the practical consequences that result from it. A theory is demonstrated in the only possible way when it is shown that it will “work”; that is, that the results that we wish to obtain in a given situation follow from it. It is only in the light of these results that a conception has meaning. Apart from its practical consequences, a conception is an abstraction without meaning or significance and consequently without truth or falsehood.

This practical test of the truth of a theory through an appeal to its consequences is the element in pragmatism that has been mainly emphasized by C. S. Peirce and Prof. William James. Peirce first employed the term and outlined its definition in the Popular Science Monthly (January 1878), though he put it forward merely as a practical method of avoiding abstractions by making clear to oneself the consequences in terms of action of general logical conceptions. The present currency of the position in America and England is, however, largely due to Professor James, who has elaborated and enforced it in his psychology and in a number of popular works and articles. The teachings of Peirce and James are so closely connected with pragmatism that we quote here the formal definitions of the term which they have written for Baldwin’s Dictionary of Philosophy. Peirce describes the doctrine as follows: "The opinion that metaphysics is to be largely cleared up by the application of the following maxim for attaining a clear comprehension: 'Consider what effects that might conceivably have practical bearings, we conceive the object of our conception to have. Then our conception of these effects is the whole of our conception of the object.' 8 James defines pragmatism: 'The doctrine that the whole 'meaning' of a conception expresses itself in practical consequences, consequences either in the shape of conduct to be recommended, or in that of experience to be expected, if the conception be true; which consequences would be different if it were untrue, and must be different from the consequences by which the meaning of other conceptions is expressed.' If a second conception should now appear to have other consequences, then it must really be only the first conception under a different name. In methodology it is certain that to trace and compare their respective consequences is an admirable way of establishing the differing meanings of different conceptions."

JAMES E. CREIGHTON,
Professor of Logic and Metaphysics, Cornell University.

PRAGUE, prá̆g (German Prag; Bohemian Praha), Austria-Hungary, the capital of Bohemia and the third largest city of the empire, 217 miles by rail northwest of Vienna and 118 miles southeast of Dresden. Its site is a regular basin, traversed by the river Moldau, from the banks of which the city's buildings rise in terraces, till they are terminated and enclosed by hills of considerable height. Of nine bridges including two railway viaducts the most striking is the Karlbrücke, dating from 1359-1503 and reconstructed after damage by a flood in 1892; it is 543 yards long with tower gateways at each end and buttresses adorned with statues of Saint John Nepomuk, the patron saint of Bohemia, and other saints. The medieval fortifications and ramparts have been demolished since 1866 and their sites occupied by pleasure grounds, boulevards, dwellings, etc. The city is divided into eight districts, the Altstadt, Josefstadt, Neustadt, Vysehrad and Lieben on the right, and Holesovitz, Bubeneč and Holeschwitz-Bubena on the left bank. Outside the line of the old walls lie the suburbs Karolinenthal, Smíchow, Weinberge, Zirkov and others. The Altstadt and Josefstadt, the
latter formerly the Jewish Ghetto, lie along the right bank toward the north. The streets of the Altstadt are narrow; it is the principal seat of trade and business and contains some of the best stores, besides numerous churches, ecclesiastical and educational establishments. The Neustadt encloses the Altstadt on the northeast, east and southeast. Though newer than the other, it is still very ancient, having been built by the Emperor Charles IV in 1348. On the opposite side the Kleinseite forms the aristocratic quarter of the chosen abode of the Bohemian nobles and the site of several remarkable palaces. The Hradcchin, to the west of the Kleinseite, occupies the site of a steep hill, is of less extent and contains fewer houses than the other quarters, but the chief public edifices. Among these are the royal palace, formerly palace of the Bohemian kings, situated in the Hradcchin, parts of which date back to the 14th century; the Gothic cathedral, begun in 1344 and still uncompleted, also in the Hradcchin; the Clementinum, the seat of the university since 1383 and still devoted to the faculties of law and medicine; the Teynkirche, a Gothic church, begun in 1370, historically interesting as the place where the Bohemian estates made George Podiebrad their king, and containing the grave of the celebrated Danish astronomer, Tycho Brahe, who spent his last years at Prague; the palace of Wallenstein, originally a structure of great magnificence, but now much dilapidated; the Alte Rathaus (old town hall), an irregular Gothic edifice, partly of the 15th century and partly of the early 19th century, with a fine old clock dating back to 1490, the chief synagogue of the Jews, rebuilt in 1538 after the burning of the Jewish quarter; the military hospital, a large and magnificent edifice, originally erected by the Jesuits as a college; German and Bohemian theatres, the opera house, the national museum, museum of natural history, picture gallery, the German and Bohemian Physical collegicum, Landesbank (1896), municipal savings bank (1894), central market hall (1896), the new Ritterakademie (1896), the Municipal Museum, the Museum of Industrial Art (1899), etc. Besides the cathedral there are a number of other smaller churches of considerable interest and antiquity, such as the Karlov church (1351–77), church of Saint Mary the Virgin (1348–72), church of Our Lady of the Snows (about 1347), Saint Thomas' Church (14th century), Saint George's Church (1142–50), etc. The university, founded in 1384, had 10,000 students at the beginning of the 15th century; but subsequently as a result of the Hussite disturbances it had a long period of inactivity. It received a new constitution in 1880, having now two co-ordinate sides or sections, one German and one Czech, with respectively 184 and 249 teachers, and 2,067 and 4,713 students (1914). It possesses a library of 370,000 volumes and 3,920 manuscripts, a fine observatory, museums of zoology and anatomy, a botanical garden, etc. The manufactures consist of gold and silver embroidery, silk, woolen, cotton and linen goods, buttons, hats, leather, paper, soap, refined sugar, vinegar, liqueurs, refined salt, gloves, sugar of lead, steakine and tallow candles, machines, musical and mathematical instruments, firearms, porcelain, jewelry, etc. The trade is of great importance; Prague, owing to its central position, and to its facilities of transport by river, roads and railway, being the great entrepôt for all the traffic of the kingdom. There are seven railroad stations and two river steamship lines. It has also several important fairs, particularly one for wool, which lasts seven days, and during which a great amount of business is done; that of Saint Wenceslas, the old patron saint of Bohemia, and that of Saint Nicholas, though these two are rather religious festivals than fairs, and are more crowded with devotees than dealers.

Prague is supposed to have been founded in 722 by the Duches Libussa. In 1348 Charles IV founded the university, the first which Germany possessed, and it soon acquired such celebrity through the teachings of such zealous rectors as Huss and Jerome that it was resorted to from all quarters of Europe. In 1424 Prague was taken by the Hussites and almost destroyed, but after their submission to the emperor in 1433 the town was rebuilt. It reached its greatest prosperity and importance during the times of George Podiebead and his successors. It suffered severely in the Thirty Years' War, which, indeed, started in Prague, and in 1620 a battle was fought at the White Mountain in the neighborhood, in which the Elector-palatine Frederick V was defeated by the Emperor Ferdinand II and compelled to renounce his crown. In 1631 the city was captured by the Saxons, who were driven out a few months later by Wallenstein. In 1741 it was taken by the French and Bavarians, and three years later capitulated to Frederick the Great. After the Seven Years' War the city made rapid strides and enjoyed peace and prosperity until 1848, when the Austrian government caused it to be bombarded for two days, owing to the marked democratic demonstrations excited by the meetings of the Slavonic Congress within its walls. During the Austro-Prussian War in 1866 the city was occupied by the Prussians and here the treaty of peace was signed on the 23d of August.

Prague is the seat of the Imperial government and a Roman Catholic prince-archbishop. The city is governed according to a charter dating back to 1850. At the head of its government is a burgomaster. The citizens elect a board of aldermen of 90 members from whom a second body of 24 members, the Stadtrat, are chosen. The city owns three of its own gas works, several waterworks, the electrical power works and street railways and the slaughterhouse.

Besides the two universities and technical colleges there are numerous public, normal, high, manual training, trade and grammar schools, both for German and Bohemian children, as well as a number of private educational institutions. There are also nine public hospitals, a state insane asylum, orphan asylums and a large number of other charitable institutions. The manufactures are enormous and are sold daily in both German and Bohemian. Of the total population 90 per cent were Bohemians and 8 per cent Germans. Almost 90 per cent were members of the Roman Catholic Church and about 8 per cent Hebrews. Prague has
shown the least increase in population of all Austrian cities during the decade 1900-1910; namely, less than one-half of one per cent. (1910 census) 223,741. Consult 'Privilegia Civitatum Pragentum' (Prague 1886); Tomek, W. W., 'History of the City of Prague' (in Bohemian, Vols. 1-12, Prague 1855-1901); Oesterreich- issued and German, published in 1899, to date); Neuworth, J., 'Prag' (Leipzig 1901); Luetzow, F. H. von, 'Story of Prague' (New York 1902); Symons, Arthur, 'Cities' (London 1903).

PRAHRAN, pré-rán', Australia, a town in the state of Victoria, four miles southeast of and suburban to Melbourne (q.v.). It is a separate municipality and in 1899 was made a city. Pop. (1911 census) 45,367.

PRAIA, prä-yä, or La Praia, Cape Verde Islands (q.v.), since 1770 capital of this group of 14 Portuguese islands; on the southeast coast of the island of São Tiago, the largest and most important of the 14. It has a good harbor and commercial relations with all the cities of the islands. It is the seat of the governor-general, whose palace is located there; has a meteorological observatory; and is an important cable station between South America, Europe, and West Africa. Pop. 21,000.

PRAIRIE, a treeless region in the Mississippi Valley, adjacent to the forested area, so called since the time of the early French explorers. The eastern border of the prairie region is an irregular line crossing Minnesota and Wisconsin in a southeasterly direction and extending into western Indiana, thence crossing Illinois and Missouri southwestward to the borders of Oklahoma and eastern Texas. From this forest line the prairies extend westward from 200 to 600 miles to the Great Plains, into which they merge quite imperceptibly. In general we may say that the characteristics of the prairies are intermediate between those of the adjacent forests on the east and the plains on the west. The soil, climate, rainfall, etc., of the prairies are much like those of the forest in the season; on the other hand, the rainfall less, the conditions which prevail on the plains.

The soil of the prairies is usually dark in color and rich in organic matter. It is composed of very fine particles, and when dried after wetting becomes very hard. It contains much finely divided sand, and is generally somewhat deficient in clay. While very rich and often of great depth, it is by no means inexhaustible, and the better classes of farmers have found it profitable to add fertilizers from time to time.

The climate of the prairies is somewhat more severe than that of the adjacent forest areas, on account of the free sweep of the winds which intensify the cold of winter as well as the heat of summer. The annual rainfall is about 30 inches, diminishing somewhat as we go westward, and this is so distributed that by far the greatest portion falls in the spring and summer.

Although the prairies are usually spoken of as treeless, this is not strictly true, since the streams are always fringed with trees, the treeless areas extending over the higher lands from stream to stream, in the manner of treeless heaths. But these fringes are often confined to the deep narrow valleys in which the streams flow, they are often scarcely noticeable as one looks over the landscape. The vegetation of the prairies naturally divides itself into that of the open country and that of the woods. In the open country the grasses constitute the dominant vegetation, since they are mostly perennial, and very tenacious of life. The species which are most common are grama (Bouteloua aestivalis), buffaloberry (B. curtipendula), har- suta), buffalo grass (Bulbisus dactyloides), dropseed grass (Sporobolus, of several species), wild June grass (Koeleria cristata), blue-stem (Andropogon, of several species), switch grass (Panicum virgatum), beard-grass (Aristida, of several species), Muhlenbergia grass (Muhlen- bergia, of several species), sand-grass (Calamo- grostis), pericarp-grass (Stipa spartea), Eaton grass (Eatonia), spear-grasses (Poa), fescue grasses (Festuca, bromegrasses (Bromus), wheat-grasses (Aegilops), and wild-rye (Elymus), each of many species. Altogether about 150 native species of grasses grow upon the prairies, affording fine pasturage and hay for stock. In those portions of the prairies where the rainfall is abundant, sod and humus constitute a continuous sod which completely covers the surface, but where there is less rain they are in isolated clumps or bunches, and are then called "bunch grasses." In all prairies there are other plants which grow intermingled with the grasses, the most conspicuous of which are the golden-rods (Solidago rigid, S. serotina, S. canadensis, and other species), asters (Aster, A. sericus, A. multiflorus, and other species), sunflowers (Helianthus annuus, and other smaller species). A few shrubs are found scattered over the prairies, adding to the variety of the vegetation, most noticeable the wild roses, redroot (Ceanothus), and shoe-string (Amor- phia canescens), the last so-called on account of its long tough roots which trouble the plowman.

The woodlands are usually found bordering the water courses. In some cases they constitute broad areas extending for many miles on each side of the streams, while in others they are narrow belts but a few rods in width and often mere fringes along the stream-banks. The trees of the prairies are all of species which have wandered away from the eastern forests, and pushed up the streams to a greater or less distance. There are more species along the eastern side of the prairies, and their number decreases as we go westward. The common species are oaks, hickories, walnuts, willows, cottonwood, elms, maples and ashes. As a rule these trees are not as tall as those which occur in the heavy forests eastward, and they generally grow with more spreading tops. Occasionally, however, trees of gigantic dimensions are found in sheltered situations. Careful observation of the trees on the prairies shows that where they are protected from fires, stock and other adverse influences, they generally reproduce so rapidly as gradually to extend the forest areas. In many places the forest belts along the streams are widening, and also pushing up the valleys. Since the prairies fires this natural spreading of the forests has gone on rapidly, so that there is to-day more forest-covered land in some parts of the prairie country than when it was first visited by white men. The prairie lands are from 30 to 1,400 feet above sea-level, and are bounded by small channels which have been cut in places to depths of over 100 feet.
PRAIRIE CHICKEN, or PINNATED GROUSE, a familiar western gamebird (Tympanuchus americanus). The genus Tympanuchus (or Cupido) is particularly well characterized by a large patch of naked yellow skin on each side of the neck, ordinarily concealed by a tuft of narrow-pointed feathers attached to the skin at its anterior border. Beneath this patch is an air-sac connected with the respiratory system and which can be inflated until the skin is distended to the size and form of half an orange. The head-crest is small, the tail is rather short, rounded and formed of 18 rather stiff quills, and the tarsi are incompletely and lightly feathered to the toes, which are naked and conspicuously webbed at the base. The plumage is plain, the colors being various brown and yellow with white and black, finely mottled above and more boldly barred transversely below. The neck-tufts of the male are two and one-half to three and one-half inches long, those of the female being considerably shorter. A full-grown male prairie-chicken is fully 18 inches long, but the females are smaller.

The changes in the centre of population of the prairie chicken as related to human settlement of the country are interesting and still in progress; formerly it ranged throughout all open country between the Appalachian and the Rocky Mountain systems, and from Manitoba to the Gulf Coast. As the country has become more thickly populated it has disappeared from many regions and the eastern limit of its range has receded more and more westward. At the same time the clearing of the forests has provided much new open country which it has been prompt to occupy, replacing other species of grouse less adapted to life on bare prairies, and becoming abundant in many places where, as in parts of Minnesota, the land is cultivated in large tracts. In this way its range has extended westward and northward as it has been curtained eastward. Like most of the grouse the prairie chicken is gregarious, living in flocks which become very large in the winter, when the birds are more and more disposed to wander about the outskirts of towns and cities. It is to be observed that in most of its still wide range this species is not in any true sense migratory; but a definite northward and southward movement takes place in the upper part of the central Mississippi Valley, although according to some experienced gunners and ornithologists, this is limited to the females, the males being quite stationary. In the spring parties of the males congregate at dawn on knolls, perform various antics, and from time to time inflate and empty the air-sacs, thus producing a loud booming noise which is said to be audible, in the stillness of the time and place, for a mile. In a few days the females gather, when the cocks engage in fierce battles for the possession of mates, before whom they strut and swell, with drooping wings and greatly expanded air-sacs, in an effort to make the female choose them, but with the approach of cooler weather the birds become more alert, harder and swifter of wing, the long quick shots which are now necessary testing the skill of even the most experienced gunner. Still later nothing but the rifle and much hard tramping is likely to yield any returns. As in the case of all similar gallinaceous birds, a strong shooting gun and good dogs are required. Whether the latter be setter or pointer is generally immaterial, as both may be equal in speed, ruse and training.

For this work on the wide, little watered prairies, endurance is a prime qualification and many hunters use their dogs in relays. The best time for the sport is in the early morning and late afternoon, not only because tramping under the noonday sun is very wearying to hunters and dogs, but also because the birds cease feeding at that time and retire to sheltered gulleys and ravines. The species is easily domesticated.

It is very commonly stated that the prairie chicken was a more buff colored than the New England and Middle States a century ago; but ornithologists are now practically agreed that the eastern heath hen is a distinct species, properly called T. cupido. At one time it was common, but became practically extinct 75 years ago. At
the present time the only colony known to be in existence is one which inhabits the wooded hills and scrubby plains of the island of Martha's Vineyard, where the birds are seldom seen in the thick coverts which this region affords. In general habits the heath hen differs little from its western relative. This remnant of its race is absolutely protected by the Massachusetts game law and a generally sympathetic local sentiment. A third species (*T. pallicinctus*) is found in the region from Kansas to Texas, and along the Gulf Coast the common prairie chicken develops a distinct local race in Texas and Louisiana. In parts of the northwest the sharp-tailed grouse (*Pedioecetes rhamnus*) is called prairie-chicken. See *Grouse*.

Consult Baird, Brewer and Ridgway, "Birds of North America" (Boston 1887); Sandys and Van Dyke, "Upland Game Birds" (New York 1902); Coves, "Birds of the Northwest" (Washington 1874); Leffingwell and others; "Shooting on Upland, Marsh and Stream" (Chicago 1890); Elliot, "Gallinaceous Game Birds of North America" (New York 1877); Elliot, "Monograph of the Tetraonidae" (New York 1872); and Palmer and Olds, "Digest of Game Laws," Bulletin No. 16, Div. Biological Survey, United States Department of Agriculture, Washington 1902.

**PRAIRIE DOG**, a name given to either of the two species of marmot-like rodents of the western plains of the genus *Cynomys*, but especially to *C. ludovicianus*. It is about a foot long, reddish-brown above, lighter beneath. Its habits are eminently social. It forms large communities on the higher and drier parts of the plains, each burrow having a little hillock at its entrance, forming a firm curb about the shaft, which leads steeply down to a series of chambers a dozen feet or more underground, where the animals spend the winter in comfort, sustained by a store of the stems and seed-heads of sunflowers and similar plants.

These colonies were naturally several acres in extent. The "towns" of crowded burrows and were frequented by weasels, wolves, badgers, snakes and birds of prey, which preyed upon the rodents and their young, and kept down their numbers. Since the general settlement of the borders and river-valleys of the plains region, the prairie dogs have been so favored by the decrease of their natural enemies and by the spread of irrigated cultivated lands, supplying them with both water and food in vast abundance, that they have increased enormously, so that at the opening of the present century areas of thousands of square miles in northern Texas, and in the region between the upper Arkansas and Platte rivers, were so infested with the animals as to be practically useless to man. The question of practical relief found a Coalition of farmers and landowners, which was placed upon balls of absorbent material and rolled down their burrows. Consult publications of the United States Department of Agriculture since 1891.

**PRAIRIE DU CHIEN**, Wis., city, county-seat of Crawford County, on the Mississippi River and on the Chicago, Missouri and Saint Paul and the Chicago, Burlington and Quincy railroads, about 90 miles in direct line west of Madison. In the vicinity of the city of mineral springs. Previous to its settlement the ground on which the city stands now was open prairie land. It is said that it was then the seat of an Indian chief named "The Dog," from which the French gave it its present name. Prairie du Chien was settled in 1823, but a French fort was built here in 1681 and abandoned a few years later. Another fort was built in 1755. In 1786 the British surrendered this place to the United States, but captured it again in 1814 and retained possession for two years. In 1822 it was incorporated. Prairie du Chien is the trade centre of a fertile agricultural section. The chief manufactures are pearl buttons, barrels, veneer, egg cases, woolen goods, pickles, dairy products. The trade is chiefly in eggs, poultry, farm and dairy products, buttons and twine. The principal public buildings are the churches and schools; the ruins of Fort Crawford (1830) still remain. The educational institutions are College of the Sacred Heart, for boys and young men; Saint Mary's Institute, for girls; a high school, public and parish schools and a public library. The population in 1910 was 3,149. Consult "State Historical Society of Wisconsin Collections" (Madison 1855-1916).

**PRAIRIE FOX**, the swift or kit fox (*Vulpes velox*) of the western American plains. See *Fox*.

**PRAIRIE GROVE**, Battle of, an engagement between the Confederates under General Hindman and the Federals under Generals F. J. Herron and J. G. Blunt, at Prairie Grove, Ark., 7 Dec. 1862. Blunt had been stationed for some time at Cane Hill, when he received information that Hindman, with a force of about 25,000, was advancing northward to enter Missouri. He immediately summoned Herron and his two divisions, then near Springfield, Mo., to his aid. Herron reached Fayetteville, about 12 miles from Blunt's position, in the evening of 1 Dec. and, on 2 Dec., the Confederates at that time lay between the two Union camps. Early that morning Hindman, with 11,000 men, moved against Herron; the Confederate cavalry at first had the advantage, but were in turn driven back by Herron, whose entire force came up; Hindman then took up a strong position and awaited attack. Meantime Blunt hastened to Herron's aid, and Hindman thus faced a force superior to his own in both numbers and equipment. The battle lasted the greater part of the day, and the Confederates were finally forced to retreat. The Confederate loss in killed, wounded and missing was 1,317; the Federal loss, 1,251. The battle was of importance as checking the further advance of the Confederates into Missouri. Consult "The War of the Rebellion" (Series I, Vol. XXII, Part 1, pp. 67-158, Washington 1888).

**PRAIRIE HEN**. See *Prairie Chicken*.

**PRAIRIE PIGEON**, name given in the prairie region of the western United States to both the golden plover and the upland plover. See *Plover*; *Sandpiper*.
PRAIRIE RATTLESNAKE, a name applied to one of several rattlesnakes to be found on the prairies of North America, the massasauga (Smirurus catenatus). See Rattlesnake.

PRAIRIE Schooner, a type of covered wagon, used by the pioneers in transporting their chattels across the western prairies. As the type has by vanished, but the covering of the modern army motor truck is arranged in many respects similarly to that of the early prairie-schooner — more or less of a horseshoe shape with openings in front and back.

PRAIRIE Squirrel, or Gopher, a name for several animals of the genus Spermophilus, found in the American prairies in great numbers. See Gopher.

PRAIRIE STATE, a name applied to Illinois from the fact that the face of the State is mostly a level table-land, elevated from 300 to 800 feet above the sea.

PRAIRIE Wolf, the coyote (q.v.).

PRAISE OF FOLLY, The ("Morie Encomium"), the wittiest of all Erasmus's writings, was written, as at Sir Thomas More's house in Bucklersbury immediately after Erasmus's return from Italy in 1509, but was not published until two years later when Erasmus went to Paris to see it through the press. At least 12 editions followed within the next 10 years, and several English translations quickly appeared, so that Milton in 1628 speaks of it as being "in everyone's hands" at Cambridge. In a dedicatory letter to More, Erasmus tells us that the first hint (of the work) was your own surname of More, which comes as near the literal sound of the word (Moria) as yourself are distant from the significations of it, and that in all men's judgments is vastly wide.

From a subsequent letter to John Boteheirn (1523) it appears that Erasmus had intended at the same time to write three essays in praise of Folly, Nature and Grace, respectively, but that the carping disposition of certain persons made him change his mind. 'The Praise of Folly,' which is very entertainingly written, is filled with all the classical allusions and quotations of the poets, scourgis the abuses and follies of the various classes of contemporary society, although not by lashing particular persons by name. If I did not, Erasmus tells us, "so far imitate Juvenal as to take into the sink of vices to procure a laughter rather than create a hearty abhorrence." The entire work is put into the mouth of Folly herself, who, after describing her descent, education and attendants, proceeds to show that the class of human beings is free from her influence. In this process, it is shown to what extent grammarians and poets, philosophers and theologians, religious and monks, princes and courtiers, popes, cardinals and bishops and all other classes of men are under Folly's sway. The work is comparatively free from the coarseness of speech prevalent at the time, and men like More said that it needed no defense. It has been charged, however, that it was a deliberate attempt to discredit the Church and its dogmas and teaching, unless by the words "the Church" one means "the wicked and unfaithful ministers of the Church." Among these indeed it produced consternation, although its author did not incur the disfavor of secular princes, many fellow-clerics and even Pope Leo X. Hard as he struck at the existing evils he had said nothing for which the Church courts could openly punish him. When it is remembered that 'The Praise of Folly' appeared after the pontificates of such Popes as Alexander VI and Julius II, at a time when simony and similar abuses had made such an inroad into the Church that plans were laid for convening the great reformatory Council of Trent, it is not difficult to imagine that such outspoken works as the one under discussion were needed to speed the day.

HERBERT F. WRIGHT.

PRAISES OF THE CREATURES, The. See CANTICLE OF THE SUN.

PRAJĀPAṬI, Hindu divinity, having the character of a creator; at various periods this name was given to different Hindu deities, such as Indra, Brahma, etc. Thus there were many Prajāpatis, and the Puranas contain many legends concerning them. Consult them, e.g., William's "The Religions of India" (Boston 1882); Hoppings, W. W., "The Religions of India" (Boston 1895); Macnider, N., "Indian Theism." (London 1915).

PRAJĀNA PARAMITĀ, the principal Sutra (body of rules or precepts) of the Mahayana School of Buddhists. The words mean in Sanskrit 'absolute or transcendental wisdom.' Consult Walleser, M. G. L., "Prajñā Paramitā; Die Voll-Korurneueit der Erkenntnis" (In Quellen zur Religions-Geschichte, Vol. VI, Göttingen and Leipzig 1914).

PRAKRIT LANGUAGES AND LITERATURE. The term Prakrit is applied to the vernacular languages of India, in distinction from the literary idiom, the Sanskrit (Samskrta), purified, refined; prakrit, natural, common), and it is a sign of the venerable age of Prakrit that we find traces of it even in some very early Vedic hymns. Prakrit again is subdivided into primary, secondary and tertiary, according to the period when each of these forms of the vernacular was in general use. There are two main groups of primary Prakrit, namely, the Aryanvarta or that spoken in the central part of India, the Madhya-desa, and that current in the zone beyond, the so-called "Outer Band." That of the Midland developed in its turn into literary Sanskrit about A.C. 300. Irrespective of that process, however, the primary Prakrits arose and grew in accordance with the usual courses of phonetics, with a general tendency to simplify the different forms of the diphthongs and diphthongs and also complicated grammar forms. Side by side, however, with the literary Sanskrit there developed in the central region of India a vernacular, though this was somewhat hampered in its growth by the literary tongue. One of the secondary Prakrits at least, the Pali, grew into the literary vehicle of Buddhism and became a highly articulated tongue. Besides, other Prakrits in a measure went through the same process and blossomed out into literary languages, both for profane and sacred uses. Thus, Jainism (or the Jaina religion, a regenerated Brahmanism) was propagated by three distinct Prakrits, and in the Indian drama and in other branches of lit-
erary production some of the common dialects were likewise employed. Singularly enough, in such dramas the Brahmans, heroes and persons of high degree in the male personages, the celestial nymphs, courtesans, and even in the Sātras, were, generally in Sanskrit to the audiences, all the others in the various forms of Prakrit. In fact, our knowledge of the older Prakrits has been greatly enhanced by this Indian stage convention, because the vernaculars thus employed in plays by acting persons varied greatly, partaking as they did of the provincial character assumed by each. Often as many as 10 different forms of Prakrit are thus introduced in a single play, the wise, the cowardly, and sometimes one of the less prominent Prakrits, notably of those possessing no literature of their own, we should not have a single trace without the aid thus given our understanding. Distinguished again from Prakrit proper, or perhaps rather as its lowest expression, was Mahārāmā ("corrupt" language, or "patois"), a name given to the wholly unliterary form of Prakrit, the one quite devoid of grammatical niceties and ingenious refinements of speech. However, it might happen that the Apabhramsa itself grew into a sort of vehicle and receptacle of a grammatical construction, while a coarser form of the vernacular remained as the speech of the totally uncultured masses. The secondary Prakrits again attained a double growth, that of the Māhābārata, or Eastern region of India, which was named Sārasaṇi, and that of the surrounding country district. Sauraseni extended as far as Lahore, overrunning Rajputāna and Gujerat. Its vocabulary was nearly identical with the primary Prakrit, but physically less refined and more importunate. The Prakrits of the Outer Band comprised the Magadhi, Ardhamāgadhī and Mahārāstrī. Pāli grew out of Magadhi. Ardhamāgadhī (half Magadhi) developed itself by itself. Mahārāstrī was spoken and cultivated in the large kingdom of that name, reaching from the Nεķεντια to the Kistna and including parts of Bombay and Hyderabad, all of it south of the Sauraseni territory. At one time the prevalence of Prakrit of the Outer Band extended up to and including the majority of the regions of India. It is to be noticed that there was an Apabhramsa (corruption) to each proper form of Prakrit. But uniform with them all, Prakrit and Apabhramsa both had the inclination to do away with certain harsh consonantal sounds which existed in literary Sanskrit itself, and with as much grammatical restriction as possible. Thus, for example, the Sanskrit brataḥ (brother) develops into vaśam in Pāli and into vaśam in Mahārāstrī. A number of the Prakrits, too, cast out the Sanskrit r. Of all these Prakrits it is Mahārāstrī which deserves most mention. In the Indian texts it usually stands for Prakrit per se. It obtained literary prominence quite early, epical, lyrical and dramatical literature being alike cultivated. Ardhamāgadhī also produced literature, although not the same inferior. However, the early Jaini books were composed in it. Sauraseni is, on the other hand, the usual prose dialect of the plays and is also used exclusively by one of the Jaini sects in their writings. There is, then, a plenitude of material from which to study the earlier as well as the later Prakrits, and there are grammars, too, to help. Throughout one notices a steadily proceeding decay of grammatical rules and forms in all the Prakrits, until, as in the Hindustani of to-day, a purely analytical vernacular is the result. In their general phonetic effect there was a flattening of the vowels and a pruning away of superabundant consonants. To be more explicit as to the poetical and literary uses made of the Prakrits, the holy writings of the Jainism, religion, the Śāstras, etc., were in Ardhamāgadhī; the non-canonical books of the Śvetāmbara sect were in Mahārāstrī, and the canon of the Digāmbaras was in Sauraseni. In lyrics, which all are of a highly the Prakrit reigns supreme. Most admired by Indians is Hāla's Sattasāl, a collection of lyrics compiled some time before the 7th century A.D. There is much grace and playful fancy displayed in this collection, though in range of subjects and thought typically narrow. Many imitations inspired by this volume have appeared in India, the best being probably the Satsāl of Bihārī Lāl (17th century). The sources whence Hāla drew are, unfortunately, lost. It has been concluded that this Hāla also owed much to Prakrit, and that it had first been written as a folk-epic in the early vernacular before being done over into Sanskrit proper. Mahārāstrī was employed for lyrics, even in Sanskrit dramas, as Sauraseni was for the most interspersed dialogues. In Prakrit epic poetry the Rāvṇava[a] (Death of Rāvana), based on the Rāmāyan[ā] of Pravaraṇa (about A.D. 700) occupies first place. Since then the Gāudāvaha[ya] by Viśakapi (about 750 A.D.), telling of the taking of Bengal by Śāhāman, and the Kumbhā[pan]c (A.D. 1150) are the most pretentious. Of Prakrit dramatic literature may be mentioned the Kaur_dpā-mañjarī, a lively comedy of intrigue (A.D. 900) by Rājaśekhara; in fiction the Kalhāsaritśāgara, a tale of adventures by Somadra, and the Citagōvinda by Jayadeva, a fanciful narrative may be cited.

WOLF VON SCHIEBER, Author of 'America, Asia and the Pacific'; 'Germany: the Welding of a World Power'; etc.
PRAM. präm, Christen Henriksen, Danish poet, critic and economist: b. Gudbrandsdal, Norway, 4 Sept. 1756; d. island of Saint Thomas, West Indies, 23 Nov. 1821. He studied at Copenhagen and in 1781, as a member of the agricultural and commercial college of Copenhagen, he undertook several tours, the results of which were published in the Commercial Journal of 1782. In 1815 he was discharged from his office with a small pension, and in 1819 became collector of customs on the island of Saint Thomas. His numerous writings embrace a great variety of subjects, both in political and natural science. Among his poetical productions are 'Heroic Tales of Erich'; and 'Starckoder' (Copenhagen 1785), a heroic poem, in 15 cantos. He also edited J. H. Wessel's 'Collected Writings' (1787). Besides the Commercial Journal he founded another, the Minerva, a critical monthly which rendered essential service in the formation of literary taste in the Scandinavian kingdoms. As editor of the latter he was succeeded by K. L. Rahbek, who edited and published his Works (six vols., 1824-29). Consult Host, J., 'Über Christen Henriksen Pram's Amindelse' (Copenhagen 1820).

PRANG, prang, Louis, German-American engraver and publisher: b. Breslau, Germany, 12 March 1824; d. Los Angeles, Calif., 15 June 1909. His part in the revolutionary movement of 1848 compelled him to leave Germany and he came to this country in 1850. He established himself as a wood engraver in Boston, later becoming a lithographer, and in 1861 engaged in publishing, making a specialty of color printing. He was especially known for his well-executed reproductions of famous paintings. He invented the Prang method of art instruction and published the drawing books and materials used in that course. He was president of the Prang Educational Company of Boston and of the T. Prang Art Company of Springfield, Mass. He published 'The Prang Standard of Color' (1898); and with John S. Clark and Mary D. Hicks, 'Suggestions for Color Instruction' (1893).

PRASE. See Quartz.

PRATER, prä'ter, the most famous promenade of Vienna. See Vienna.

PRATI, Giovanni, jô-vân'né prâ'tî, Italian poet: b. Dasiido, near Trent, 27 Jan. 1814; d. Rome, Italy, 9 May 1894. He studied law at the University of Padua, from which he was graduated in 1834, but soon turned to literature. Strongly anti-Austrian and deeply in sympathy with the movement for national independence and unity under the rule of the royal house of Savoy, he was frequently in political difficulties during the period of Italy's unification. He lived successively in Milan, Turin, Florence and Rome. His first major work, 'Edmenegarda' (1841), a narrative poem of the Romantic school, was received with extraordinary favor. Several volumes of lyric poetry still further increased the poet's reputation, but during the last years of his life he wrote but little. In 1862 he was elected to the Italian Parliament and in 1876 became senator. He was an adherent of rather uneven merit. Endowed with rich imagination and facility of style and expression, he was lacking in originality and depth. Some of his lyric poems are amongst the best of his time, but much of his work is mediocre. His works include: 'Canti Lirici, Canti per Il P. Ricci e Il P. Battista' (2 vols., Milan 1843); 'Lettere a Maria' (Turin 1843); 'Memorie e Lacrime'; 'Nuovi Canti' (Turin 1844); 'Poesie' (Palermo 1844); 'Nuovi Verdi' (Venice 1845); 'Poesie Politiche' (Italia 1850); 'Rodolfo' (Turin 1853); 'Satana e le Grazie' (Pinerolo 1855); 'Arberio' (Turin 1860); 'Armando' (Florence 1868); 'Psiche' (Padua 1876); and 'Iside' (Rome 1878). A collection of his works was published as 'Opere Varie' (5 vols., Milan 1875). Consult Zanichelli, D., 'La Rivoluzione de l'84 e le Poesie Politiche di G. Prati' (Bologna 1895); Cavalluzzi, C., 'La Poesia del Prati' (Citta di Castello 1898); Emmer, Bruno, 'Saggio Bibliografico; Giovanni Prati' (in 'Atti della R. Accademia di Scienze Lettere ed Arti degli Agiati in Rovereto,' serie III, Vol. 17, pp. 173 and 285, Vol. 18, p. 89, Rovereto 1911).

PRATINAS, Greek poet: flourished about 500 a.c. He was a native of Philus in the Peloponnesus and became famous as a lyrical and dramatic poet. He is credited with originating the paeonic lyric drama which was the standard of tragedy at Athens. Fragments of his lyric poetry have been collected and published by T. Bergk in 'Poeete Lyrici Greci' (Leipzig 1843); Nauck, A., 'Tragicorum Graecorum Fragmenta' (Leipzig 1856).

PRATINCOLE, a genus Glareola of wading birds of the family Glareolidae; allied to the plovers, inhabiting the temperate and warmer regions of the Old World. About half a dozen species are described in Europe, Asia, Africa and Australia, frequenting the borders of rivers, lakes and marshes in low and high regions; the food consists of worms and insects, which they pick from the ground or aquatic plants or take on the wing like swallows; they fly and run very swiftly; the nest is a slight structure on the ground, among the thick herbage of the marshes, and the eggs three or four in number. All scream noisily. The collared pratincole (G. pratincola, Pall.), plentiful in southern Europe, is about the size of a blackbird, nine inches long; it is brown above, white on the rump and below; the throat surrounded by a black circle; the base of the bill and the feet reddish.

PRATIQUE, prat'ik, a term used to signify the permission given to a vessel to hold communication with the land after the port authorities have been satisfied that the ship is free from infectious diseases. See Quarantine.

PRATO, prâ'tô, Italy, city in the province of Florence, on the Bisenio, 11 miles north-west of Florence, with which it is connected by a railroad and a street railway. It is surrounded by ancient walls and is a well-built, cheerful-looking place. The cathedral, begun in the 12th and finished in the 15th century, with a very beautiful open air pulpit by Donatello and Michelozzo, contains also some very fine frescoes by Fra Filippo Lippi (q.v.). Among the other memorable buildings is a court of justice, several other churches, monasteries, convents, an old castle, an ancient preторио (Palazzo Pretorio), a college, called
after its founder Cicognini, a public library, a theatre and several hospitals. Its extensive manufactures of woolen, silk, straw hats, paper, candles, olive oil, and furniture, together with its iron and copper works have made Prato a prosperous, up-to-date city. It is the seat of a bishop. Pop. (1910) 20,360 (city proper); 56,715 (commune).

PRÄTORIUS, prä-toh-REE-uss, Michael, German-painter; b. Kreuznach, Thuringia, 15 Feb. 1571; d. Wolfenbüttel, Brunswick, 15 Feb. 1621. Details concerning his life are very meagre. He began his career as kapell-meister at Wolfenbüttel, was secretary to the Duke of Brunswick, and later was appointed prior of the monastery of Ringelheim, near Gotha, with the privilege of making his residence where he chose. He was one of the most prominent composers of his time and also an able writer on musical topics. His most noted literary work is 'Symptoma Musicum' (Wolfenbüttel 1614-20), and his compositions include 'Musae Sioniae' (published in 16 volumes, containing 1,244 vocal numbers, Wolfenbüttel 1605-10); 'Musae Aonia' (9 vols.), etc. His works are now exceedingly rare. A detailed description of his life and work is to be found in 'Grove's Dictionary of Music and Musicians' (Vol. III, p. 806, New York 1911).

PRATT, Ambrose, Australian journalist and author: b, Forbes, New South Wales, 31 Aug. 1874. He was graduated in law from Sydney University, but he soon left his profession to join the editorial staff of the Melbourne Age (1905). His published works include the following: 'King of the Rocks' (1900); 'The Loot of the Tien-ti-Hway' (1900); 'Franks, Duelist' (1901); 'The Great Push in the Koreas' (1902); 'Vigil of the Billionaire' (London 1903; New York 1904); 'Three Years with Thunderbolt' (1905); 'The Countershake' (1906); 'The Remittance Man' (1907); 'The Emperor and his Double' (1908); 'First Class' (1909); 'The Veiled Man' (1909), and many short stories.

PRATT, Anne, English botanist: b. Strood, England, 5 Dec. 1806; d. London, England, 27 July 1893. She made a life-study of the nature of plants and her writings reveal a wide knowledge as well as a deep love of nature. Her books are illustrated with her own excellent sketches and achieved great popularity. She had the happy faculty of combining a popular style with a considerable amount of scientific accuracy, so that her books served not only the purpose of increasing popular interest in botany, but also added considerably to the sum total of knowledge regarding English plants, grasses, etc. The most important of her books, all of which were published in London, are 'The Field, the Garden and the Woodland' (published under the pseudonym 'A. Lyny', 1838); 'Flowers and their Associations' (1840); 'Dawnings of Genius, or the Early Lives of Some Eminent Persons of the Last Century' (1841); 'The Pictorial Catechism of Botany' (1843); 'Our Native Scenery' (1846); 'The Green Fields and their Grasses' (2 vols., 1852); 'Flowering Plants, Grasses and Ferns of Great Britain' (5 vols., 1854); 'The Ferns of Great Britain, etc.' (1855); 'The Poisonous, Noxious and Suspected Plants of our Fields and Woods, etc.' (1857); 'The British Grasses and Sedges, etc.' (1859); 'Hauts of the Wild Flowers' (1866). She also translated 'Oden's Feldblumen' (1837) under the title 'Tageslicht' and published it in 1865 under the title 'By Daylight.'

PRATT, Bela Lyon, American sculptor: b. Norwich, Conn., 11 Dec. 1867; d. Boston, 19 May 1917. He studied at the Yale School of Fine Arts under Niemeyer and Wier, and at the Art Students League in New York; with Augustus St. Gaudens, F. Edwin Elwell, William Chase and Kenyon Cox, working under St. Gaudens in his studio. Later he studied in Paris under Chapu and Falguière and at the Ecole des Beaux Arts. He received two medals and two prizes while in Paris and in 1892 he returned to the United States. He has been instructor of modeling at the Boston Museum of Fine Arts since 1893. He has produced many works in sculpture, including statues, memorials, portrait busts, tablets, medallions and other works. He is a member of the National Institute of Arts and Letters, the American Academy of Arts and Sciences and of the National Sculptors Society. He was awarded a Gold Medal and a position in 1915. Among his works may be mentioned two colossal groups on the Water Gate of the Peristyle at the Chicago Exposition: the Eliot medal for Harvard University and the Yale Bi-centennial medal; six seven-foot spandrel figures for the main entrance of the Library of Congress, as well as a 12-foot figure of 'Philosophy' and a series of four medallions, 'The Seasons' there; recumbent figure of Dr. Coot, Saint Paul's Church, Concord, N. H., which received honorable mention at the Paris Salon in 1897; 'Study of a Young Girl,' second medal at the Buffalo Exposition in 1901; statues of Bishop Brooks, Gov. John Winthrop, Jr., General Stevenson and others; portrait busts of Gen. C. J. Paine, Bishop Huntington, Dr. Homans, Dr. Richard Hodgson; the Harvard Spanish War Memorial; statue of Nathan Hale, Yale Campus, etc.

PRATT, Charles, American philanthropist: b. Watertown, Mass., 2 Oct. 1830; d. New York, 4 May 1891. He obtained a portion of his education at Wesleyan Academy, Wilbraham, Mass., after having saved the money needed by working as a machinist, and in 1851 removed to New York where he engaged in a paint and oil firm, of which he became a member in 1854. When the firm dissolved in 1867 he retained the oil interests and under the firm name Charles Pratt and Company organized a most successful business. He grasped the possibilities of the petroleum trade when the oil fields of Philadelphia were being developed in 1860 and devoted himself to producing the best petroleum possible for the market on the market, Pratt's asphalt oil becoming world-famous. He acquired an enormous fortune and in 1874 his business was merged in the Standard Oil Company, with which concern he was, therefore, from its beginning and in the prosperity of which he shared to a very considerable extent. He afterward devoted himself to philanthropic enterprises and contributed generously to various religious, charitable and educational causes. His greatest philanthropic work was the founding
of the famous Pratt Institute (q.v.) in 1886, in which he embodied his ideas of a thorough and practical education. It was opened in 1887 with 12 students, a number which at the time of his death had increased to over 3,000. The entire cost of the buildings, equipment, grounds and ample endowment was borne by Mr. Pratt and at his death he left a further endowment of $2,000,000. He was public-spirited in every way but firmly declined public office.

PRATT, Daniel, the "Great American Traveler," American eccentric: b. Prattville, Chelsea, Mass., about 1809; d. Boston, Mass., 21 June 1887. He was a carpenter by trade, but became mentally unbalanced and wandered about, a pensioner on general charity. Contributions of his, including certain "proclama-
tions," appeared from time to time in print; and for several years he made annually a grand tour of New England colleges, delivering in each grandiloquent orations. He believed himself unjustly deprived of the Presidency, asser-
ting that he had been duly elected.

PRATT, Ella Farman, American writer for young people: b. New York; d. Warner, N. H., 22 May 1907. With C. S. Pratt, for a series of seven she edited the juvenile periodical Wide Awake and later Little Folks. Among her books, many of which were published under her maiden name, are Good-for-Nothing Polly; How Two Girls Tried Farming; A Girl's Money; The Cooking Club of Tu-
Whit Hollow; A Little Woman; Grandma Crosby's Household; Mrs. Hurst's Niece; Anna May; American Whim-Hand; Sugar Plums; Happy Children; The Play Lady and The Little Cave-Dwellers.

PRATT, Enoch, American philanthropist: b. North Middleborough, Mass., 10 Sept. 1808; d. near Baltimore, Md., 17 Sept. 1896. He was educated at the Bridgewater (Mass.) Academy, entered a commercial house in Boston and in 1831 removed to Baltimore where he became a wholesale iron merchant and engaged in various financial enterprises which gained for him great wealth. He presented to the city of Baltimore in 1882 the Enoch Pratt Free Library, endowing it to the extent of $1,145,000. He was one of the first amongst American million-
ares to devote part of his wealth to the found-
ing of public libraries. He also gave generously to different churches, libraries and schools, especially to the House of Reformation and Instruction for Colored Children at Cheltenham, Md., and the Maryland School for the Deaf and Dumb at Frederick. The residue of his large estate was left to the trustees of the Sheppard Asylum, a hospital for mental dis-
cases near Baltimore, which is now known as the Sheppard and Enoch Pratt Hospital.

PRATT, George Du Pont, American con-
servation commissioner: b. Brooklyn, 16 Aug. 1869. He was graduated at Amherst College in 1893 and entered the employ of the Long Island Railroad, eventually becoming assistant to the president of that company. In 1915 he became conservation commissioner for the State of New York and rendered important service in prevention of forest fires and by an education campaign in the field of hunting and forest laws has made great progress in his conserva-
tion of the natural resources of the State. Mr. Pratt is also well-known for his philanthropic interests.

PRATT, John Francis, American scientist: b. Pomfret, Vt., 18 June 1848. He was gradu-
at Dartmouth College in 1871; studied civil engineering and in 1871 became connected with the United States Coast and Geodetic Survey, being made an assistant in 1884. He led the expedition to Chilcoot, Chilkat, Skagway and Dyea to determine the southeast boundary of Alaska; conducted an expedition to the east side of Bering Sea and the lower portion of the Yukon River in 1898. Has commanded several different vessels of the United States Coast and Geodetic Survey in conducting various expeditions to Alaska, Bering Sea, Hawaiian Islands, central portion of the Paci-
cific Ocean and the Philippine Islands. He has recently been appointed on inspection duty in Oregon, Washington and Alaska.

PRATT, Orson, American Mormon ap-
poste: b. Hartford, N. Y., 19 Sept. 1811; d. Salt Lake City, Utah, 3 Oct. 1881. After a common-school education, he followed the lead of his brother, Parley P. Pratt (q.v.), and joined the Mormons in 1830, accompanying them on their westward migration and in 1835 became one of the original 12 apostles. With Erastus Snow he was the first to enter the valley of the Great Salt Lake. From 1840-78 he accomplished eight missions to Great Britain and in 1846-45 one to Austria. During his visits to England he edited at various times The Millennial Star, the circulation of which he increased greatly. He began in Washington in 1852 the publication of The Seer, a monthly, of which 18 num-
bbers appeared. From 1874 until his death he was historian and general church recorder. He was also for many sessions a member of the Utah Territorial legislature and seven times its speaker. In spite of the lack of educa-
tional opportunities which he had experienced in his early life, he became a well-versed scholar of higher mathematics, astronomy and Hebrew. In 1854 he announced his "law of planetary rotation" to the effect that the cubic roots of the densities of the planets are as the square roots of their masses. Among his works are New and Easy Method of Solution of the Cubic and Biquadratic Equations (Lon-
don 1866); Key to the Universe (1879), and a large number of tracts and pamphlets dealing with the Mormon doctrine. He also edited and published in Salt Lake City The Doctrine and Covenants of the Church of Jesus Christ of Latter-Day Saints, Containing the Revelations Given to Joseph Smith, Jr., the Prophet.

PRATT, Parley Parker, American Mon-
mon apostle: b. Burlington, N. Y., 12 April 1807; d. near Van Buren, Ark., 13 May 1857. He advocated the Mormon faith in 1830 and in 1835 was elected a member of the first quorum of the 12 apostles. He traveled in this country, Canada, South America and in England, en-
gaged in missionary work and in 1840 estab-
lished a Manchester, England, the Millennial Star. At various times he was conductor of the Mormon churches and missions in Great Britain, New England and the Middle States. He was one of the party which explored the valley of the Great Salt Lake in 1847 and 1849 and Parley's Peak and Parley's Cañon were
named in his honor. He assisted in forming a constitution for the Provisional Government of Deseret, the name then applied to the present State of Utah, served as a member of its senate later, when Deseret became the United States Territory of Utah, as a member of its legislative council. Throughout the early days of Mormonism he suffered all the hardships and persecutions which were then inflicted upon members of his sect, which he many narrow escapes from injury and death. At last, while engaged in one of his frequent missionary tours, he was murdered by three men near Van Buren, Ark. He wrote 'A Voice of Warning' (1837); 'History of the Persecutions in Missouri' (1839); 'Key to the Science of Theology' (1854), etc. His 'Autobiography' edited by his son, Parley P. Pratt, was published in 1874.

PRATT, Samuel Jackson ('Courtney Melmoth'), English author: b. Saint Ives, Huntingdonshire, 25 Dec. 1749; d. Birmingham, 4 March 1819. He was ordained in the Church, but later went on the stage where his career was not notable and then turned his attention to literature. He was a very prolific writer and his works cover a wide range of subjects. Though undoubtedly possessing considerable literary talent, force of circumstances prevented him from giving sufficient time and effort to his work so that very little of it proved of lasting value. He is by some authorities credited with a translation of Goethe's 'Sorrows of Werther;' which, in 1839, was published by a Dr. Pratt. Of his works, many of which were published anonymously, the most important are 'Tears of Genius' (1774); 'Liberal Opinions Upon Animals, Man and Providence' (6 vols., 1775-77); 'Theology of David Hume' (1777); 'Tutor of Truth' (3 vols., 1779); 'Emma Corbett, or the Miseries of Civil War. Founded on some events in America' (1780); 'The Fair Circassian, a tragedy (1781); 'Sympathy,' a poem (1788); 'The Gleanings through Wales, Holland and Westphalia' (1795); 'John and Dame, or the Loyal Cottagers,' a poem (1803); 'Harvest Home: Consisting of Supplementary Gleanings, etc.' (3 vols., 1805). In 1788 he edited and published 'A Collection of Poetry,' consisting of selections from the poets (Milton to Beattie) with short biographical notices (6 vols.). He also edited 'Specimens of the Poetry of Joseph Blacket' (1809) and 'The Remains of Joseph Blacket' (2 vols., 1811), and with Dr. Mavor 'A Collection of Classical English Poetry' (1813). The epitaph on Garrick's monument in Westminster Abbey is likewise from his pen and perhaps has been criticised and condemned to a greater extent than any of his other writings, as the selections from his works were published as follows: 'Pity's Gift' (London 1801) and 'The Paternal Present' (London 1810). Consult Blackwood's Magazine (January 1895, pp. 121-125); Gentleman's Magazine (1814, pt. II, pp. 390-393).

PRATT, Silas Gamaliel, American pianist and composer: b. Addison, Vt., Aug. 1846; d. Pittsburgh, Pa., 31 Oct. 1916. He studied in Berlin in 1868-71 with Kullak, Bendel and Kiel and with Liszt and Heinrich Dorn in 1875-76. His first symphony was performed in Berlin in 1871 and in the following year he organized the Apollo Club of Chicago. His opera 'Zenobia' was well received on its presentation in 1882; in 1884 he was director-general of the Chicago Grand Opera Festival. In 1885, Pratt accepted an appointment as professor of piano at the New York Metropolitan Conservatory. In 1906 he became president of the Pratt Institute of Music and Art, Pittsburgh, Pa., and in the same year he also organized there the Pittsburgh centre of the American Music Society. He has published numerous songs, part-songs, symphonies, etc., the operas 'The Triumph of Columbus,' 'Lucille,' 'Ollanta' and the symphonic poems 'America' and 'A Tragedy of the Deep.' He has also written 'Lincoln in Story' (1901) and 'Pianist's Mental Velocity' (1903).

PRATT, Kan., city and county-seat of Pratt County, 80 miles west of Wichita, on the Atchison, Topeka and Santa Fe and on the Chicago, Rock Island and Pacific railroads. The city is situated in a rich agricultural and stock-raising district and a State fish-hatchery is located here. The population is increasing. Pop. 3,302.

PRATT INSTITUTE, a polytechnic school in Brooklyn, N. Y., established in 1887 by Charles Pratt (q.v.). Its aim is to promote manual and industrial education and cultivation in literature, science and art. Its organization includes the following departments: (1) School of Fine and Applied Arts; (2) School of Science and Technology; (3) School of Household Science and Arts; (4) School of Library Science; (5) Department of Education; (6) Department of Physical Education. The regular courses of the institute vary in length; mostly they cover two or three years; the general course in domestic science is only one year, and the general art course four years. Normal courses are given in the schools of Fine and Applied Arts and of Household Science and Arts, evening classes in these two schools as well as in the School of Science and Technology. The library has a free use of the public, has a large children's room, and in equipment and management is considered a model library. It contained 114,775 volumes in 1918. The library school offers a one-year general course and provides practice work for students in the library (See Library Schools). The institute confers degrees, but grants diplomas for the completion of any of the normal courses, and gives certificates attesting the completion of the full-time day courses. It occupies 12 large buildings, the main building, the science and technology building, the electrical building, the chemistry building, the machinery building, the household arts building, the practice house, the men's club house, the women's club house, the rest home, the library and the gymnasium. The endowment is large and the tuition fees are small. The productive funds consist of the original endowment made by the founder, to which large sums have been added at various times by members of the Pratt family. The students in 1918 numbered 3,700, including all those in the special and evening, as well as the regular courses. The faculty consisted of 195 members.

about 1690; d. 1775. Entering the French army and serving in Germany for a time he was subsequently a member of the French Compagnie d'Occident which acquired a grant of territory near New Orleans. In 1720 he led an expedition there in 1718 and made unsuccessful attempts to found a colony. In 1720 he went up the Mississippi and settled among the Natchez Indians. Later he explored the region bordering the Mississippi and Arkansas and was for some years treasurer for the land company at New Orleans. He returned to France in 1734. He wrote a valuable and detailed account of his life in Louisiana which was published under the title 'Histoire de la Louisiana' (3 vols., Paris 1758). It was translated into English as 'History of Louisiana' (2 vols., London 1763).

**PRAWN**, a small decapod crustacean of the family *Palamonides*, allied to the shrimps, in which the beak or 'rostrum,' which projects in front of the carapace, is large, toothed and of compressed shape. The common British prawn ('Palaemon elegans') grows to five inches long, shrimp-like in form, half-transparent and often beautifully tinted, and is taken for market in great quantities by means of nets operated on sandy shores. When boiled, prawns become of a pale pink color, and are highly esteemed as table delicacies in this and in other shapes. Several species occur on the eastern coast of the United States, but are little used.

**PRAXEAS**, a teacher of the errors of the Antitrinitarians or Monarchians. Data concerning his existence are meagre and uncertain. It is claimed that toward the end of the 2nd century, after suffering persecution in the reign of Marcus Aurelius for his open confession of the Christian faith, he came to Rome from his native Phrygia to acquaint Pope Victor with the erroneous teachings and vicious practices of the Montanists, and prevailed upon Victor to recall the letters of communion which he had given to those sectaries. But while at Rome and afterward at Carthage he became an apostate. The doctrine of the Monarchians teaching that in the Godhead is but one Person, who proceeding forth of his own divine essence and called Son, entered the Virgin's womb, was born of her and suffered on the cross; hence the distinctive name of the sectaries who followed Praxeas—Patricians. See **ANTITRINITARIANS**; **MONARCHIANS**; **SAEBELIUS**; **UNITARIANS**.

**PRAXITELES**, práks-i-té-léz, Greek sculptor; b. probably, about 400 B.C. He was an Athenian by birth, the contemporary of Scopas (q.v.), and one of the greatest sculptors of ancient times. The date of his death is unknown; but his life must have been long, since nearly three score works are mentioned as executed by him. He lived in the age of greatest opulence in Greek art, an age succeeding that of the Lycurgian, which had outgrown the austere vigor displayed in the works of the earlier master. During the time of Praxiteles the life of the individual was less merged in that of the body politic, and became more highly developed. This fact consequent upon the growth of wealth in private possession made the work of the sculptor in demand for the adornment of private houses instead of temples of worship. Praxiteles worked for private buyers, and many of his statues went to Asia Minor as well as Greece. Antiquity placed the highest estimate upon his statue of Aphrodite, and people traveled in large numbers to Cyprus to see it. Lucian records seeing it there about 150 A.D. The statue has disappeared, but an idea of its form may be derived from a Cnidian coin, bearing its effigy, struck in honor of Plautilla. The greatest of his extant works is the statue of the youthful Hermes bearing on his arm the infant Dionysus. This statue, described by Pausanius, was discovered in 1877 by German excavators, at Olympia, where it now remains. The face, which is perfectly preserved, gives to posterity a revelation of the exquisite beauty of the Greek face. The mutilated statue of Demeter from Cnidus, now preserved in the British Museum, is probably by Praxiteles; but the Hermes is the only unquestionable one. Pausanias records that Praxiteles regarded his statue of Eros and one of a satyr as his greatest works. The Eros was presented to Phryne, the courtesan, who posed for the Cnidian Venus, and was afterward placed in the temple at Thespiae. There was another Eros at Parium on the Hellespont. The Satyr, represented leaning gracefully with his arm on a support, is preserved in reproduction in the Capitoline Museum at Rome, and furnished Hawthorne with his inspiration for his romance, 'The Marble Faun.' The 'Apollo Sauroktonos' (Lizard-Killer), a motive original with Praxiteles, is also known to posterity in reproductions in the Louvre and elsewhere. Reproductions of other works of Praxiteles, the authenticity of which, however, is frequently very doubtful, may be found in many museums and private collections, especially in Athens, Berlin, Dresden, Florence, London, Naples, Paris and Rome. Good casts of his most important works are to be seen in practically every art museum in this country, especially in the New York Metropolitan Museum of Art and in the Boston Museum of Fine Arts. Praxiteles was the forerunner of all modern portrait busts and genre-scenes, the latter being in the form of sculptured reliefs. His work, which exercised a great influence upon the further development of Greek art, charms by its perfection of form and grace and its natural expression of human emotions. Consult Kekulé, R. von S., 'Der Kopf des Praxitelischen Herms' (Stuttgart 1881); Amelung, W., 'Die Basis des Praxiteles aus Mantinea' (München 1895); Förste-Angel, A., 'Masterpieces of Greek Sculpture' (ed. by E. Sellers, London 1895); Klein, W., 'Praxiteles' (Leipzig 1898); 'Praxiteles' (in 'Masters in Art', Vol. III, Boston 1902); Gardner, E. A., 'Six Greek Sculptors' (London 1906).

**PRAY**, Isaac Clark, American journalist, dramatist and theatrical manager: b. Boston, Mass., May 18, 1813; d. New York, June 17, 1869. He was educated at Harvard and at Amherst and entered journalism in Boston, where he was at various times editor of the **Pearl**, the **Daily Herald**, the **Sunday Morning News**, the **Dramatic Guardian** and the **Ladies Companion**. He early engaged in play production but became manager of the National Theatre where he produced some of his own plays. In 1846–47 he played the leading parts in 'Hamlet,' 'Othello,' and other productions in London,
PRAY—PRAYER FOR THE DEAD

Liverpool and Cork. He went to New York in 1850 as an editorial writer on the Herald, and he was afterward a theatrical manager. He wrote about 30 plays and was also author of "Poems" (1837); 'Book of the Drama' (1851); "Memoirs of James Gordon Bennett" (1855), etc.

PRAY, James Sturgis, American landscape architect: b. Boston, Mass., 26 Feb. 1871. He was educated at Harvard and in 1903 engaged in independent practice. Since 1906 he has been a member of the firm of Pry, Hubbard and White. He was assistant professor of landscape architecture at Harvard in 1905-14, was appointed chairman of the School of Landscape Architecture there in 1908, and since 1914 he has been Charles Eliot professor. He is author of various articles in the periodicals devoted to his profession and of "City Planning" (1913).

PRAYER, a religious act taking the form of an entreaty for the grant of favor or the forgiveness of trespasses, and directed toward an object of worship in whose power the author of this entreaty is supposed to reside. Since prayer is an act almost universal among the religions of the world, it is but natural that it should exhibit a vast range of variation in its form and its spiritual level. The savage may beseech his fetish like a human king, or he may bribe it by offers and promises, or he may bully it into granting the favors desired. In any case, he is likely to adopt toward it an attitude no more spiritual than that which he adopts toward his fellow savages. This prayer is used for the same purposes as magic, and indeed only differs from magic in that the desired very immediate and very material benefit is accomplished through the mediation of a supernatural person, and not by virtue of the mere wish for the benefit itself. It is rain, or the death of an enemy, or the fertility of his crops, for which he prays, and all notion of the purification from sin is likely to be absent. This awaits the coming of a morality less hand-to-mouth, and the formation of a more or less unified ideal of conduct. While the germs of this inhere in the religion of many races of a low civilization, it is only in such faiths as Buddhism, Judaism and Christianity, which combine a background of vigorous intellectual activity with a fervent exaltation of goodness, that religion habitually expresses itself in "praca." 8

Religion, however, does not run a continu- ally ascending course. The transition from a religion of morality to fetishism, demonology, and magic, easily takes place through the formalism of religious senescence. The faith that has lent dignity to its prayer through a set formula of noble words, or the sonorous cadences of an ancient language, ultimately finds that the formula, the cadences are retained long after all memory of their significance is dead. A condition supervenes—as in many Christian denominations—where the objects of religious worship are held firmly enough in mind, but the prayer, understood but in part by the priesthood and by the laity not at all, has come to be but an induction of the worshipper into a state of devotion. This does not mark the end of the process, which culminates in the mechanical prayer-wheels of the Buddhists of Tibet, who have all but lost their Buddhism in a degraded devil-worship. Here the idea of the object of the prayer has practically vanished, so that religion is about to be resorbed into the magic from which it has emerged with such difficulty.

Even in Christianity, and in cases where the prayer has undergone no significant degree of formalization, the nature of prayer varies between wide limits. It may be like that of the savage, object in trend, and direction primarily toward an allmighty Deity with the purpose of receiving definite physical benefits. On the other hand, as has been seen among those of a more sensitive religious constitution, prayer is rather an entreaty that the merciful God shall aid a sinner in his avoidance of temptation. This entreaty passes over into a state where full reliance is placed in the goodness and wisdom of God; and entreaty gives way to an inner confession. In these instances the emphasis is not so much on the Deity and the answer expected of him as in the purging of the moral consciousness encompassed by the act of prayer itself. It is this awareness of previous sin and rejection of it, this turning over a new leaf, that lends to prayer its chief value. As William James says, the object of prayer is by far the least important feature of it. The prayer becomes a resolution of good works, accompanied by a faith that this resolution can be realized. The Deity who receives this prayer enters into the prayer merely as a symbol and tangible object serving to fix this faith. (See FAITH). Consult Frazer, J. G., 'The Golden Bough' (London 111-15); James, W., 'Varieties of Religious Experience' (New York 1902).

PRAYER, Week of, a special period of devotion set apart as a result of a resolution adopted at Manchester, England, in 1846 at a conference of the Evangelical Alliance (q.v.) which urged "members and friends of the Alliance throughout the world to observe the week beginning with the first Lord's day of July, and in each year as a season for concert in prayer on behalf of the objects contemplated by the Alliance." An appeal from missionaries in India some years later resulted in broadening this scope. The week of prayer has become a settled institution among Evangelical Christians of different churches and countries and has been successful to a considerable extent in promoting Christian union.

PRAYER BEADS, the polished seeds of a West Indian leguminous plant (Abrus precatorius) called wild licorice. These seeds were formerly much used for stringing into rosaries, necklaces, etc.

PRAYER BOOK. See Book of Common Prayer.

PRAYER FOR THE DEAD. The practice of prayer for the dead prevails in the Roman Catholic, Greek and other Eastern churches. Its purpose is the remission of punishment for sin. The custom seems to have existed in most of the ancient religions, especially in those of India, China and Egypt. The doctrine and practice came to the Christian Church through the Jews (2 Maccabees xii, 44, 45). The first of
the Christian fathers who mentions prayer for the dead is Tertullian; but he speaks of the use as well known and time established in the Church; such prayers are frequently alluded to by Saint John Chrysostom, Cyril of Jerusalem and Saint Augustine. The Roman Catholic practice of prayer for the dead stands of course in a close relation with the doctrine of purgatory; and was discarded with the latter by Protestantism. In the burial service of the first Book of Common Prayer of the English Church some prayers for the dead appeared, but they were deleted from the second book, and are not found in the subsequent revisions. Nevertheless, many Anglican clergyman of all periods have approved of such prayers. Consult Bogis, R. J. E., ‘Praying for the Dead’ (New York 1913); Luccock, H. M., ‘Eucharistic Sacrifice and Intercession for Departed’ (ib. 1907).

PRAYER RUGS, the Mohammedan rug used for prostration during prayer. In considering anything to do with the Moslem we have to remember that of the many Oriental tribes most of them are nomadic or were so. Hence their customs. Their tent is their home, their furniture consists of rugs. Before the warmth of the fire they sit on the odjaklik; their floor is carpeted with the sedjadeh; they separate the tent into individual spaces with hangings (berdeh). But each devout Moslem (practically the entire population) must have his prayer rug (namazlik). Being the chief piece of religious furniture his prayer rug is as valuable as his financial condition affords, and on it he prostrates himself five times each day at the prescribed hour. First he spreads his rug in correct orientation, assisted by his compass, seeing that the niche (mihrab) points due toward Mecca, the grave place of Mohammed. Next he removes all valuable belongings, such as jewelry, money, etc., from his person to symbolize his abject humility before Allah; he combs his beard as symbol of cleansing, then he brings forth his rosary of 99 beads and a piece of earth or stone taken from Mecca, placing them below the niche. Now he bows his head to the earth, stretches out his arms and in this pose carries out his devotions. The mihrab or niche is a point, or projection, extending from the central field of the rug, and represents the niche in which the Koran is preserved in the temple at Mecca. Prayer rugs vary in size from two and one-half to four feet in width by four and one-half to six feet in length. Some are made specially for the owner and have his name in wool on it; these are, of course, of the finest weave. Now and again we come across prayer rugs with a design of three or more niches for combined family or children's worship; mostly they are Caucasian. Some have three small medallions in place of the prayer niche; these spaces are for the knees and forehead of the devout. Technique.—As each tribe follows closely the traditional designs (tereh), handed down through the centuries, more especially in its prayer rugs, they are the more easily assigned to the different localities of origin. The field of the prayer rug is divided into sections as follows: then a single panel (square) only appears it is always above the prayer space; Kulahs have generally but one, also Anatolians; but Bergamos generally have two panels, Ghiordes (see Rugs, ORIENTAL) nearly always, Kulahs seldom. When two panels are in the design one each is placed at the upper and the lower end. We find on some rugs emblems of the equipment crudely defined: a compass, a comb, sometimes the 99 beads of a rosary. A small rhomboidal motif is found on some prayer rugs of Asia Minor designating the place for the devotee to put the earth or stone. Odd motifs figure at the sides of some niches showing where to place the hands in worship. A characteristic of the Ghiordes prayer rug is the shoulder on either side of the base of the niche (see illustration). Pilasters used to support these in the old specimens; some had scroll or floral decoration, but they gradually lost resemblance to pilasters evolving into floral motifs, disappearing altogether in some. Suspended from the niche was a lamp motif or a floral piece, also later disappearing often. Some plant life is usually depicted inside the niche and on the inner side of the border. In the upper panel may be a floral decoration, a scroll or a verse from the Koran. The reclining S (~) or pothook also occurs in panels. A large palmette or rosette partly enclosed by foliage, somewhat like the Herati motif (see Rugs, ORIENTAL) is common in the central border stripe, or square flowers and fruit. The wide stripe is at times represented by several narrow ones decorated with small floral figures. Tekke rugs differ so much from the carpets (sedjadeh) they would not be known as of the same tribal make. The glaring golds are the place (on antiques), but are replaced by sober, soft tones of wonderful richness; mahogany color with deep copper bronze tones as relief are usual. The

motif in the border is a "multiplied tree pattern" by thin lines of pure white as high lights. The design of the field corresponds with the borders in its tree form motifs. A horizontal band runs midway across the field and a perpendicular traversing it divides the field into four parts, a tree in each. So much does the Tekke dük üüb mytik differ from others that some of the experts have put them under a different heading, terming them Hardi ji or Princess Bokhara, and the term of the Armenians is Khatichi Bokhara or Cross Bokhara, because of the cross dividing the field. Tekke dük üüb are wider compared with their length, other prayer rugs with the exception of Kand Bergamos. Prayer rugs owned by collectors are rarely Persian as Persian medallions cannot bear the thought of christians trampling on the sacred field aslik, but other Moslems are less strict. Prayer rugs* in America were made to Western markets.

Pre-Emption Law, United States. The first pre-emption act was passed 3 March 1801; it was a special act affecting the Symmes colonization scheme on the Miami River. Between that time and 1841 about 16 pre-emption acts were passed, all of a more or less special nature. The first general law was passed in 1830. That of 1841 granted, upon considerations of residence and improvement, freedom of entry upon 160 acres of public lands to any person over 21 years of age, provided he was a citizen or had declared his intention to become one. By act of Congress of 3 March 1891 the various pre-emption laws then in existence were repealed. All bona-fide claims or rights under them, however, were saved. There are now pre-emption laws at the present statutes of the United States. Consult Mallory, John A., comp., 'Compiled Statutes of the United States, Vol. II, pp. 1854-56 (St. Paul 1914).

Pre-Existence, the doctrine that the soul of an individual had an existence previous to that of the body in which it appears. This opinion was very prevalent in the East, and was held by the Greek philosophers, Pythagoras, Empedocles and Plato himself. A similar doctrine has found some countenance in Christian times among those who were anxious to explain how the soul existed in the body, but could not divine any more plausible hypothesis than that all souls were created before the world, and that each has its proper body allotted to it at the time of birth. In opposition to the doctrine of pre-existentism is that of traducianism, which teaches that the soul, like the body, is propagated; and creationism, in accordance with which a new soul is immediately created out of nothing by God for each newly propagated body. Consult Miller, Julius, 'The Christian Doctrine of Sin' (Edinburgh 1852-53); Howison, G. H., 'Limits of Evolution' (New York 1901).

Pre-Raphaelites, members of the Pre-Raphaelite Brotherhood* and their followers. The original brotherhood was founded by the association of three - Gabriel Rossetti, William Holman Hunt and John Everett Millais. The inspiration, however, which gave life to the Pre-Raphaelites was derived from an artist who never joined the brotherhood, Ford Maddox Brown. In 1848 Rossetti became, those of the Pre-Raphaelite Brotherhood* and their followers. PREACHERS, ORDERS OF — PRÉAULT

was quite neglected at a period when Victorian art in England had sunk to its lowest condition of commonplace prettiness, conventionality and utter want of mysticism or spirituality. Ford Maddox Brown, the practical originator of the new school of English painting, and the bringer-in of a new English Renaissance, had attracted the notice of Rossetti by his powerful picture, 'Parisina's Sleep,' which was exhibited at the British Institution 1845 and was conspicuous for its buoyant atmosphere, finish and fidelity of expression. Rossetti became the devoted disciple of this master. Rossetti was a poet, full of dreams and desires, and passionately striving after the true and the beautiful. At the academy schools he met William Holman Hunt, a man of profound religious feeling, yet reserved, hard working and bound on notable and original achievement in art. With them was eventually associated John Everett Millais, already a brilliant and successful artist, and far in advance of his countrymen as equal age in all the skill that comes from knowledge and practice. These men, strangely different in artistic temperament, formed a powerful trio devoted to making a fearless protest against the shallow and banalities of the day. They called themselves Pre-Raphaelites; but, as W. Holman Hunt has said, 'Neither then nor afterward did they affirm there was not much healthy and good art after the time of Raphael; but it appeared to them that afterward art was so frequently tainted with the canker of corruption that it was only in the earlier work they could find with certainty absolute health. Up to a certain point the tree was healthy: above it, disease began; side by side with life, there was death.' Their artistic doctrines were indeed to be summed up in the one word sincerity; the bond of union between them, as enunciated by one of their number, was (1) to have clear ideas to express; (2) to study Nature attentively, so as to know how to express them; (3) to sympathize with what is direct and serious and heartfelt in previous art, to the exclusion of what is conventional and self-parading and learned by rote; and (4) most indispensable of all, to produce thoroughly good pictures and sculptures.

The three founders of the association which Ford Maddox Brown had inspired were subsequently joined by Thomas Woolner, sculptor; James Collinson, painter, who eventually left the brotherhood; Walter Howell Devereux, painter; Frederick George Stephens, painter and art critic; and William Michael Rossetti, younger brother of Dante Rossetti, and like the latter, a poet. Ford Maddox Brown declined to join simply because the group disliked coterie; and it certainly was not he who gave the doctrine its name of Pre-Raphaelitism. But, as his own work was an embodiment of this artistic creed, so his association with the members of it was always close and his sympathy with their work enthusiastic. Millais remained in the brotherhood 10 years (1849-59); he then dropped out, became a fashionable portrait painter and famous for his power in painting children, and such textures as satin and velvet. W. Holman Hunt, always on an uncompromising adherent to the principles of the brotherhood. But before the work the Pre-Raphaelites had to do was accomplished, they were compelled to run the gauntlet of criticism and ridicule from those whose system and method of painting they were attacking. In the Times of 5 May 1854 a letter appeared signed by John Ruskin, boldly praising and defending the new school. It is doubtful, however, whether Ruskin understood the principle of Pre-Raphaelitism, and it is a mistake to think that his writings gave the first suggestion for the formation of such a league.

Pre-Raphaelitism has become a permanent influence in English art, and a generation of English artists which succeeded in which Ford Maddox Brown lived has followed the guidance of the Pre-Raphaelites, either as to romantic motif, mystic religiousness or drawing and technique; sometimes in all of these. In certain quarters, however, there appeared a tendency in a somewhat perverted manner to carry out the traditions of the brotherhood, by an exaggerated mediævalism, a deliberate crudeness or grotesqueness of design and an insistence on minute detail. The most important English artists who were influenced by Pre-Raphaelitism were: William Morris, W. S. Burton, M. J. Lawless, Robert Martineau, Walter Crane, Sir Edward Burne-Jones and E. De M. Modern Art.

PRÉAULT, prä-ô, Antoine-Auguste, French sculptor; b. Paris, 8 Oct. 1809; d. there, 11 Jan. 1879. He began his art studies with a decided tendency toward romanticism and entered the studio of David d'Angers, but soon left it and afterward aimed at a naturalistic treatment of art themes. This was proved by the first works he exhibited at the Salon (1833)—'Misery,' a group representing a girl dying in the arms of her mother; and two reliefs, the 'Tragedy of the Palm' and the 'Tragedy of the Grape.' In the following years he exhibited numerous works, among them the statue 'Undine'; and the relief 'River Amazon'; 'Queen of Sheba'; a sitting figure of Hecuba; a colossal statue of the statue 'Carthage.' None of these works were admitted to the Salon, but in 1849 the opinion of his merits had changed and the doors of the exhibition in the Champs Elysées were opened to him. After this he was
represented there by his 'Christ on the Cross' (now in the church of Saint Gervais); the relief 'Opheïlia'; the statue of 'General Marceau' at Chartres; the statuette 'French Comedy'; and many other works, amongst which there were many sepulchral monuments. The most famous of these, perhaps, is 'Silence'; now in the Père-Lachaise cemetery. As a sculptor his workmanship was fine, but he sometimes failed to control his fancy and strong feeling for realistic form within that restraint which is the essence of strictly plastic art. He was a tireless worker and one of the most ardent and powerful representatives of the new realistic school of sculpture. Consult Chesneau, E. 'Auguste Préault' in 'L'Art', Vol. XVII, p. 3, Paris 1879; Chesneau, E. 'Pédagogie et statuettes romantiques' (Paris 1880).

**PREBEND**, a stipend paid to an ecclesiastic from the foundation funds of a cathedral or collegiate church. Prebendary is the person who holds a prebend. A simple prebend has no temporal estate, with or without its support; but if the prebend has a jurisdiction annexed, the prebendary is styled a dignitary. Prebendaries, as such, have no cure of souls; but a prebendary may, and frequently does, hold a parochial benefice as well. The prebendal stall is the seat of the prebendary in the church, into which he is inducted by the dean and chapter.

**PREBLE, prébl', Edward, American naval officer**: b. Portland, Maine, 15 Aug. 1761; d. there, 25 Aug. 1807. When about 16 he ran away from home and joined a merchantman, on which he went to Europe; on his return in 1779 he entered with his father's approval the Massachusetts State marine as midshipman on the Protector and participated in the attack on the British ship Admiral Duff which was destroyed. In 1780 he was captured on board the Protector and imprisoned on the prison-ship Jersey in New York Harbor. Upon his release he served on the Winthrop, another Massachusetts State ship, and with 14 men boarded an armed brig and took her out of Penobscot Harbor in the face of the enemy's battery. At the conclusion of peace the Massachusetts navy was disbanded in 1782. For the next 16 years he devoted himself to commercial pursuits and made a number of journeys to various parts of the world. On the organization of the United States navy in 1798 he was one of the first five to be commissioned lieutenant, and in 1799 was promoted captain in command of the Essex with which he convoyed a fleet of 14 valiantly laden merchantmen from China. In 1803 he was assigned to the Constitution and given command of the squadron against the Barbary powers. He arrived at Tangiers in October 1803 and speedily forced from the Sultan of Morocco a renewal of the treaty of 1786. The Philadelphia of his squadron was captured while pursuing Tripolitan gunboats and Preble blockaded Tripoli for several months endeavoring to regain or destroy the squadron. In 1804 he bombarded Tripoli and subsequently conducted six vigorous attacks in which he captured three gunboats and sunk three others. In September the relief squadron under Preble's senior officer, Captain Barron, arrived and Preble returned to the United States early in 1805. The treaty was signed in 1803 without further fighting and Preble received a gold medal and the thanks of Congress. After his return his health showed signs of serious impairment. And, without again assuming active duty, he died after much suffering in his home in Silence; in 1815; Consult Naval Operations against Tripoli (in 'American State Papers,' Class VI, Naval Affairs, Vol. I. 1794–1825, p. 133, Washington 1834); Waldo, S. F., 'Biographical Sketches of American Naval Officers Under the War of Revolution' (Hartford 1823); Sparks, Jared, ed., 'The Library of American Biography' (Series II, Vol. XII, Boston 1847); Preble, Q. H., 'First Three Generations of Prebles in America' (Boston 1868).

**PREBLE, George Henry**, American naval officer: nephew of Edward Preble (q.v.), b. Portland, Maine, 25 Feb. 1816; d. Brookline, Mass., 1 March 1885. He entered the navy as midshipman in 1835, served in the Mediterranean on the frigate United States in 1836–38, on various boats and in the Union and in the Mexican War in 1847; was in command of the sloop Nauvoo in 1849–50, was engaged in the war against the Seminoles in 1841–42, and in 1843–45 circumnavigated the world on the Saint Louis, attaining the distinction of landing the first American force in China. In the Mexican War he participated in the battles of Alvarado, Vera Cruz, Laguna, Tampico, Panuco and San Juan de Ulloa; in 1848 he was commissioned a lieutenant; from 1853–56 he was in Japan and China with the Perry expedition and in 1854–55 he was engaged in several actions with Chinese pirates. In 1862 he commanded the steam-gunned Kedah in under Farragut at the capture of New Orleans, was commissioned a commander in that year and for failure to capture the Confederate cruiser Oreo was dismissed from the navy. Investigation proved him blameless, however, and in 1863 he was restored to his rank, placed in command of the Saint Louis with which he engaged in pursuing Confederate vessels in foreign waters. In the latter part of 1864 he blockaded the North Edisto River, and a little later was placed in command of the fleet brigade organized by Admiral Dahlgren at Port Royal for the purpose of co-operating with General Sherman. Under his command the brigade engaged on 30 Nov. 1864, in the successful battle of Honey Hill. In April 1865 he was put in command of the steamer State of Georgia. From October 1865 to July 1867 he was inspector general of supplies at the Charleston navy yard. From August to December 1867 he acted as chief of staff of the North Pacific squadron. Commanding the flagship Pensacola and in March 1867 was commissioned a captain. He was commissioned commodore in 1871, and in 1873–75 had charge of the navy yard at Philadelphia. In 1876 he received rank as rear-admiral, was in command of the South Pacific station in 1877–78 and in 1878 was retired. He wrote 'Chase of the Rebel Steamer of War Oreo' (Cambridge, Mass., 1882); 'Genalogical Sketch of the First Three Generations of Prebles in America' (Boston 1868); 'Our Flag, Origin and Progress of the Flag of the United States of America, etc.' (Albany 1872); 'History of the Flag of the United States of America, and of the Naval
PRECESSION — PRECEPTORS, COLLEGE OF

and Yacht-Club Signals, Seals and Arms, etc.' (1880); 'A Chronological History of the Origin and Development of Steam Navigation' (Philadelphia 1883).

PRECESSION, in official life, the order in which men and women follow each other according to rank and dignity in a State procession or on other public occasions. In England the order of precedence depends partly on statutes and partly on ancient usage and established custom. Questions arising on matters of precedence depending on usage are hardly considered as definitely settled and are in a great measure left to the discretion of the officers of arms. The sovereign, of course, is always first in order of precedence, after whom in descending order follow the Prince of Wales, younger sons of the sovereign, grandsons of the sovereign, brothers of the sovereign, uncles of the sovereign, nephews of the sovereign, ambassadors, the Archbishop of Canterbury, the Lord High Chancellor, the Archbishops of York, the Prime Minister, and so on through the high state dignitaries, the various ranks of the peerage, etc.

The order of precedence among women follows the same rules as that among men, except that wives and daughters of men possessing official precedence do not participate therein and are ranked entirely by whatever personal standing they may possess by virtue of inherited titles or dignities. By the acts of Union of Scotland and Ireland the precedence in any given degree of the peerage has been established as follows: (1) Peers of England; (2) Peers of Scotland; (3) Peers of Great Britain; (4) Peers of Ireland; (5) Peers of the United Kingdom and Peers of Ireland created subsequent to the Union. The question of precedence in recent times has lost much of its former importance as a result of the spread of democratic institutions. England is, perhaps, still more interested to-day than any other country and has more extensive and detailed regulations concerning it, though, of course, rules governing precedence are in existence in practically every civilized country in the world.

In the United States the most generally accepted order in Washington official life is as follows:

The President,
The Vice-President,
President of the Senate,
Foreign Ambassadors,
Chief Justice of the Supreme Court,
United States Senators,
Speaker of the House,
Representatives in Congress,
Associate Justices of the Supreme Court,
Secretary of State,
Diplomatic Corps (other than ambassadors),
Secretary of the Treasury,
Secretary of War,
The Attorney-General,
The Postmaster-General,
Secretary of the Navy,
Secretary of the Interior,
Secretary of Agriculture,
Secretary of Commerce and Labor,
General Staff of the Army,
Admirals of the Navy,
Governors of States.

Then follow the judiciary, diplomatic representatives of the United States, army and navy officers, chiefs of departments, foreign consuls, secretaries of legations, etc.

Questions of international precedence arising as a result of international commissions or of the signing of treaties by several countries, are solved usually by arranging the names of the counties in alphabetical order. The precedence of diplomatic representatives is determined by the date of the presentation of their credentials, except that ambassadors outrank envoys and ministers plenipotentiary. Consult Burke, 'Peerage'; MacKenzie, Sir George, 'Observation Upon the Laws and Customs of Nations as to Precedency' (Edinburgh 1680); Hellbach, J. C. von, 'Handbuch des Raungrechts' (Ansbach 1804).

PRECEPTOR (Latin, pra, before; canere, to sing), a leader of singing. In cathedrals of ancient foundation of the Established Church of England the preceptor is a member of the chapter and in dignity ranks next after the dean; in cathedrals of the new foundation, that is, those of sees created by Henry VIII or formed in later times, the preceptor is only a minor canon and is removable at the pleasure of the dean and chapter. During solemn functions the preceptor's place is on the north side of the choir and it is a rule that both of the duets is on the south side. In the Presbyterian churches of Scotland it was formerly the custom that half an hour before the arrival of the minister, the preceptor would read to the congregation lessons from the Scripture; when the minister entered, the preceptor would give out a psalm and lead the singing; hence his desk, below the pulpit, is still called lectern, or in Scotch dialect letrin, that is, reading-desk. In the rural districts of Scotland it is still customary for the preceptor to read each verse of a psalm before it is sung.

PRECEPTORS, College of, London, England, a training school for teachers founded in 1846 and granted a Royal Charter in 1849 "for the purpose of promoting sound learning and of advancing the interests of education, especially among the middle classes, by affording facilities to the teacher for acquiring a knowledge of his profession." The college established examinations for teachers and for students in the secondary schools, issuing diplomas and certificates; and performed pioneer work in the training of teachers for the secondary schools. The school examinations, established in 1853, served as standards by which teachers could guide their work. The first examination in the theory and practice of education was held in 1867 and in 1873 the first professorship in education in England was established by the college. There are practical examinations for certificates of ability to teach as well as the written theoretical examinations; and there are, as well, winter meetings and short courses for teachers. The examinations conducted for pupils in secondary schools have proved of value as the marks obtained are recognized by the board of education and by many professional associations. The college has power to inspect schools and decide upon their suitable housing and equipment, as well as upon the adequacy of the teaching staff and the general organization. Membership in the college is open to persons over 18 years of age who have passed the examination prescribed by the council and been thereafter elected. The college is located in Bloomsbury Square and has a library of 10,000 volumes. The organ of the college is the Educational Times, published monthly and one of the oldest educational journals in

PRÉCIEUSES RIDICULES, Les, là prâ-se-t ré-dé-kul, a comedy by Molière (q.v.), produced for the first time 18 Nov. 1659. No one of Molière's plays is better known than this famous satire on the "Précieuses," which can almost be entitled a farce, being an exaggeration of an exaggeration. It is in one act and is a satire on a style of speech and an affected taste in art and literature, prevalent among a certain class at that time. When writing it Molière had in mind the literary lights who assembled at the Hôtel de Rambouillet, the residence of the Marquise de Rambouillet (q.v.). Consult Lang. Andrew, ed., 'Les Précieuses Ridicules' (Keepford, 1960); Davis, W. M., ed., 'Les Précieuses Ridicules' (Boston 1895).

PRECIOUS METALS. Gold and silver are commonly included under this term, though platinum and quicksilver have sometimes been added. However, on the basis of their having sufficient value and being abundant enough for coinage, gold and silver are more accurately described as precious metals. America has contributed largely to the total amount of the precious metals in circulation in the world. The United States, Mexico and Australasia are the three countries which rank highest in annual total production of these metals according to their monetary value.

Fine ounce of gold, $20.67/1834 +; fine ounce of silver, $1.29/29 +, coining rate in United States silver dollars.

The United States, therefore, while greatly surpassed in the amount of gold produced by Africa, and in silver by Mexico, far surpasses every other country in the total value of precious metals produced. It is estimated that the total production of gold in all countries since the discovery of America amounted to 82,000,000,000 fine ounces. In 1919, while the total production of silver in the same period was 12,000,000,000 fine ounces. See Commerce, History of; Gold; Mineral Production in the United States; Platinum; Silver; and consult Smith, E. A., 'Sampling and Assay of the Precious Metals' (Philadelphia 1914).

PRECIOUS STAR, Order of. See Orders, Royal.

PRECIOUS STONES. A substance to be precious must possess variety, beauty, durability and portability. Precious stones, phenomenon stones and semi-precious stones are such as may be used for ornamental jewelry. Strictly speaking the term precious stone is reserved to designate gemstones such as the ruby, the sapphire and the emerald, the others being called "phenomenal" and "semi-precious," but the designation "precious" has been loosely used to indicate all stones used for the jewelry of choice objects of adornment. The following are those which challenge this description.

Diamond.—See the special article describing this gem.

Spodumene has a hardness of 6.5—7, and a specific gravity of 3.13—3.19. The rich green variety, hiddenite, named after the late William Earle Hidden, was found at Stony Point (now named Hiddenite), Alexander County, N. C., in crystals furnishing gems weighing up to five carats each. A yellow variety which occurs in Brazil is called triphane. Kunzite (q.v.) is a rich, lilac-hued variety of spodumene, of which fine examples come from Pala, San Diego County, Cal. It also occurs in crystals weighing up to 100 carats in Madagascar. Spodumene was an earlier time called "triphane," a name given it by the great crystallographer Haüy.

Titanite (or sphehne) is a calcium silicate titinate, having a hardness of 5.5 and a specific gravity of 3.5. It furnishes the most brilliant yellow and brown gem except the diamond. Fine examples have been found in Bridgewater, Bucks County, Pa., from which gems weighing from 10 to 20 carats could be cut. Other sources are the Tilly Foster Mine, New York, and the Pittsfield and Zilo, Conn. Tiffanyite. A name given to a hydrocarbon assumed to be present in certain diamonds, namely those which on that account exhibit fluorescence and phosphorescence. The substance apparently has a bluish-white color. The blue white diamonds of Brazil are called Tiffanyite diamonds.

Moissanite.—A natural carbonarundum, a carbon silicide, of which the French chemist, Henri Moissan, found, in 1905, small blue or bluish-green crystals in the meteorite of Caffon Diablo, Arizona, in association with microscopic diamonds. It belongs to the rhombohedral division of the hexagonal system. The cleavage is poor; the fracture conchoidal; the hardness is next to that of the diamond. The refractive indices are higher than 1.75. As many as 44 varieties of the crystal forms have been observed. The name was given in honor of the discoverer.

Rubes and Sapphires.—The ruby and the sapphire are transparent varieties of corundum (q.v.), the first being carmine-red, and the second bright blue and velvet blue. Both colors also occur, as yellow, green and purple, called, respectively, Oriental topaz, Oriental emerald and Oriental amethyst. Corundum crystallizes in the hexagonal system, and consists of alumina nearly pure. In hardness it ranks next below the diamond, being rated as nine on the scale. The finest rubies are found in Burma, in the Mogok Valley, northeast of Mandalay. They are also mined in Siam, where they are of a darker shade, and in Ceylon, where they are of lighter hue and often of great brilliancy. The finest Burmese rubies have a peculiar tint, called "pigeon's blood." Rubies of large size are extremely rare, and when they weigh four carats or more they are worth from two to five, and formerly 10 times the price of diamonds of the same size. Sapphires, principally from Ceylon, Cashmere and Siam, the finest tints being known as the "cornflower" and the "velvet blue." In Australia, especially at Anakie in Queensland, many dark-blue sapphires are found, too deep in hue to be of...
value if cut into large gems, so they are generally cut as calibre or small stones. Queensland has furnished some wonderful golden-yellow corundums, these being the centres of blue crystals. Sapphires are also found in Montana at several points, generally under two carats each; the choicest are mined at Yogo Gulch, in Fergus County. These are of a rich blue color. Other mines are at Rock Creek, Granite County, where there is a great variety of shades; examples also occur at Chico Creek near the banks of the Missouri River, not far from Helena, Mont. Fancy colors are of little value compared to the blue.

Beryl, Emerald and Aquamarine are the same mineral, a silicate of aluminium and glucinum. The hardness is eight and the crystals belong to the hexagonal system. Beryl varies from blue through light green to yellow, when it is called "golden beryl," and forms a gem resembling topaz. If colored a rich green by a bit of olive, it becomes the emerald, a stone which is rarely flawless, but ranks in value with the diamond. The chief source of fine emeralds has long been the mines at Muzo, about 70 miles on a direct line from Bogotá, Colombia, where they occur in a black, and along the banks of the stream. The mine has been worked by Europeans for three centuries, and was previously exploited by the native peoples of the region. The emeralds known to the ancients came principally from Upper Egypt, near the Red Sea. These mines were long abandoned and left unworked, but are now being operated on a small scale. Light sky-blue, rich ocean-blue, sea green or greenish beryls are known as aquamarines; the finest examples have come from Brazil and Madagascar. A Brazilian crystal weighed 246 pounds. They also occur in the Urals and Siberia, as well as in Maine, North Carolina and Colorado. Golden beryls are found in Maine, Connecticut and Pennsylvania. A variety of golden beryl found at Boston in the former German South-West Africa has been given the trade name "heliodor."

Phenomenal Gems.—The name applied to precious stones which change in color or else have light of several other colors. These gem exhibit some phenoma other than the color itself. Notable among these are the sapphire asteria and ruby asteria; the ruby asteria or star ruby is found in Ceylon and in the ruby mines of Burma, and is a phenomenal gem in high favor. Then come the alexandrite, a variety of chrysoberyl changing from a dark green by daylight to a cumboline red by artificial light; the chrysoberyl cat's-eye, changing from pale honey yellow to dark brown, and, occasionally, the alexandrite cat's-eye; it is green by day and red by artificial light; moonstone, a white feldspar exhibiting the phenomena of lustre, and a white or bluish play of light; sunstone, in which there are brilliant reflections from the interior of the feldspar or quartz; labrador spar, labradorite feldspar, which has a rich play of blue, blue-green and yellow, resembling a peacock feather. All of these are surmised to bring good fortune to the wearer.

Chrysoberyl, which has a hardness of 8.5, is a rare mineral, of various shades of yellow, brown, light green and dark green. One variety contains minute impurities distributed between the layers of the crystal, and these layers are so arranged, by what is termed the "twinning" of the crystal, that when the stone is cut across them light is reflected or condensed into a transverse bright line; such a gem is called a chrysoberyl cat's-eye.

Alexandrite is a variety of chrysoberyl, colored by chromium. This name was given by Nordenskjöld because the gem had been found on the day the Czarévitch, later Alexander II, came of age, in 1833. It was first discovered in the Ural Mountains at Takowaya, but now occurs in larger gems, up to 70 carats each, in the gem-gravels of Ceylon. It possesses the property of changing from a dark green to a cumboline red when exposed to artificial light, thus displaying in turn what were the Russian national colors at the time it was first discovered.

Morganite is a rose red silicate of beryllium containing manganese, found in Madagascar, being the most massive was found in St. Pierre, the emerald, differing only in color. It possesses the property of becoming phosphorescent as does kunzite, a mineral with which it is associated. It appears in beautiful gems up to 200 carats each. It occurs, also, at Pala, in San Diego County, in the mine, yellow and brown, being one of the few gems of some size, and example, small and not of good color, are met with at Haddam, Conn., but not in gem form. The name was given in honor of the late J. Pierpoint Morgan.

Zircon, or Hyacinth (Jacinth), sometimes called jargon, is a gem of 7.5 in hardness and having a specific gravity of 4.1 to 4.7, occurring brown, yellow, blue, green and white; it is a zirconium silicate. Frequently the white gem is the result of the decolorization of a darker stone. These were frequently rose-cut in the East, and in the 18th century were called "Matura Diamonds." The color sometimes reverts after decolorization. The chief source of supply has been Ceylon, although many fine gems have been found in Australia and Tasmania.

Topaz is a rather complex silicate of alumina, occurring in rhombic prisms and possessing a hardness of eight. It is generally yellow, but other examples are: the因为, pale green, pale brown, white and coral. The favorite tint is a peculiar yellow known as sherry color. The finest come from Brazil or from the Ural Mountains, but some very handsome ones have been found in Colorado and Utah. The sherry-colored variety, if heated in vacuo, changes to a rich, almost magenta pink, then to a light pink and finally becomes colorless. White topaz is often found in large masses in Ceylon, and in Brazil, where a 23-pound mass was found. A cinnamon-colored crystall and cinnamon colored crystals occur in the Urals, in Siberia, Japan, Mongolia and in Colorado, Texas and Maine; the cinnamon-colored variety changes, upon exposure to daylight, to colorless topaz. (See also Quartz; nearly all the so-called topazes are really citrines — decolorized smoky quartz.)

Toumaline is a complex silicate of alumina, occurring in prisms of six, nine or 12 sides. It is usually black, but also of transparent, transparently mingled with a rare mineral, of various shades of yellow, brown, light green and dark green. One variety contains minute impurities distributed between the layers of the crystal, and these layers are so arranged, by what is termed the "twinning" of the crystal, that when the stone is cut across them light is reflected or condensed into a transverse bright line; such a gem is called a chrysoberyl cat's-eye.
Auburn, Me. Haddam Neck, Conn., and especially in San Diego County, Cal. Mineralogically it occurs in a great variety of colors and forms; the red is known as rubellite, the blue as indicolite, the white as achatroite and the green is called "Brazilian emerald" in Brazil and "rubellite" in Europe. Rubellite are found in the Ural Mountains, Russia, and red and other colors in Madagascar. At times the crystal is green on the exterior with a white zone and a red interior, the iron which causes the green hue being neutralized by the manganese in the red color; this strange combination forms the so-called "watermelon crystal." Tourmaline is probably the most varied interesting mineral, with the exception of quartz, occurring in magnificent gems of green, blue, red, yellow, brown, white and frequently three or more colors are present in distinct zones in various parts of the crystal. Its electric properties, discovered in the 18th century, was discussed in most of the European societies at that time. The name "Aschentrekker" ("Ash-attractor") being given to the mineral in Amsterdam.

Garnet is the name of a group of minerals closely related in form and properties, but presenting a number of varieties. They are all very complex aluminum silicates, in which various metallic oxides enter as components. The principal gem varieties are almandine, or precious garnet, the carbuncle of the ancients, containing considerable oxide of iron; its color is a deep, rather purplish or brownish red; pyrope, or Bobemian garnet, containing much magnesia, of a fine dark crimson, almost a ruby color. These two are the red garnets of jewelry; when cut en cabochon, that is, not facettcd, but dome-shaped, they are called carbuncles. Manganese garnet, or spessarite, is sometimes of a very beautiful orange-brown color; elegant gems of this kind have been found at Amelia Court House, Va. Uvoroite, or chrome garnet, is a rare variety of a brilliant dark green color, but the crystals are very small. Another green garnet of somewhat different composition, and with very brilliant lustre, from the Ural Mountains, is called demantoid, or Uralian emerald. Much fine garnet is found in the United States. North Carolina yields a beautiful variety that has been called rhodolite,—a brilliant light red garnet, between almandite and pyrope in composition; these are largely mined in the Cowee Valley, in Macon County. New Mexico and Arizona produce fine pyropes, often misnamed "Arizona rubies," and equalling those of any other known locality. They are found where ants and centipedes have carried them out in making the galleries of their hills. In South Africa similar pyrope garnets found with the diamonds are termed "Cape rubies." Quartz is pure silica, the crystalline, rock crystal type occurring as six-sided crystals. It embraces a great number of the common gems, specific gravity about 2.6. These fall into three distinct groups,—The transparent colorless variety, rock crystal, then the purple amethyst which is colored by manganese, and finally the smoky topaz or smoky crystal, the ordinary black variety, and the intensely black "motion." When the black variety can be decolorized by heat, it changes first to a deep brown and then to a transparent yellow, sometimes becoming almost colorless. The original smoky quartz, deep brown in color, is called "cairngorm;" it is mostly used in Scotland and is the Scotch national stone. The lighter colors produced by decolorization by heat are known as Spanish topaz and citrine. Nearly all the so-called topaz of commerce is a quartz variety, not true topaz.

The cryptocrystalline variety, agate, is usually banded, and is generally the result of deposition of silica in the amygdules of a volcanic rock. The structure is in thin layers, even though they may not be visible to the eye. The principal varieties are chalcedony, gray and blue-gray, the apparently unbanded variety; when banded it is called "banded agate." When this banded material has been broken and recemented, it bears the name of "ruin agate;" if the bands are irregular in outline it is denominated "fortification agate." Chalcedony, when treated with iron salts and then highly heated, becomes red and is known as "carnelian;" if there be one or more layers, one of which is composed of impure quartz, the variety is "onyx" (from Greek word signifying "nail"). Should any one of two layers be pink, reddish or brown, it is termed "sardonyx." The latter name has been applied to an artificially colored variety, from pale brown and pale red to brown; when brown with a thin color, it is called "nicol." The name onyx is also applied to chalcedony saturated with boiling honey or blood, and then treated with sulphuric acid, the blood or honey becoming carbonized and making the entire stone a deep black. When chalcedony is stained a translucent red or brown it is also called sardonyx, although it is really not an onyx, as it has only one layer.

The uncrystalline, or slightly crystalline, varieties are notably red Jasper and green Jasper. When Jasper is green with red spots due to the oxidation of the iron in the stone, it is called "bloodstone." When the stone is yellow, brown or black, the term Jasper is also used.

Opal is silica containing from 5 percent to 10 percent of water. When it contains more than 5 per cent of water, the opal is liable to fracture; with 5 percent or less, it is a stone of considerable durability. Magnificent specimens of the white variety have been found in the mines of Hungary and in New South Wales, the white opals in New South Wales occurring in sandstone in which they occasionally replace wood, shells and the bones of reptiles. The black variety offers a velvet black field broken with the most intense red, green, yellow, blue and other colors. This is greatly prized and highly valued; it is found in the Lightning Ridge region in New South Wales. Many thousand fine gems have been brought from this locality, single stones selling for $5,000. The fire opals are a rich, red, honey or honey-red variety, containing a high percentage of water. The fire opal, or flame opal, found in Queretaro and other parts of Mexico is a rich honey-red—a brilliant variety with predominantly large flames of light color, due to inclusion of rutile (oxide of titanium). A colorless variety is also found, in which the play of color is in small flecks. This is known as the harlequin opal. Interesting opals re-
PRECIOUS STONES

placing wood have been found in Humboldt County, Nev., brown, black and colorless.

Peridot, Chrysolite, or Olivine, deriving its name from its olive-green color, is a silicate of magnesia, found in magnificent examples in Egypt. Many magnificent specimens brought from the east are found in the church treasuries, dating from the time of the Crusades, notably at Cologne. They were then called emeralds. After a close study of the peridots here and in other ecclesiastical jewels, the opinion is expressed that almost if not quite all the fine examples in modern jewelry had been derived from this source. In 1900, gem chrysolites were found on the small volcanic island Seberget (also called Zebirget or Saint John) near the Egyptian coast of the Red Sea, an interesting discovery as it serves to confirm the ancient tale in early Greek and Latin authors that their chrysolite (which they called topaz) came from a mysterious *Serpent Isle* in the Red Sea. They are also found in the Nevada desert in Mexico, in small gems of considerable beauty; in Hawaii, as honey yellow and small gems; and at La Hache, British Columbia.

**Jade.**—This name is commonly used to designate (a silicate of magnesia and calcium), and jadjite, named by Damour in 1863 (a silicate of aluminum and sodium). Nephrite has a hardness of 6.5, its specific gravity being 2.8, while jadeite's hardness is 7 and its specific gravity 3.3. The Chinese name for jade is yu or yu-zhi; the most prized variety of jadeite is termed fei-tsu, *kingfisher-plumes,* jewel jade or imperial jade. The jade brought by the Spaniards from the New World was named by them *piedra de yuad,* "stone of the flank," whence our "jade"; it was asserted (and believed) to be a highly efficient remedy for diseases of the kidneys. This belief was reflected in the later name *lapis nephriticus* (kidney-stone) from the Greek nephros, kidney. The origin of our nephrite group is *chloromelanite,* discovered by Damour in 1865. This mineral, with a hardness of over 6.5 to 7 and a specific gravity of 3.4, is of a darker green than jadeite (with which it is very closely related) because it occurs in the position from *Diopside* to *Alumina* in the latter. A number of prehistoric ornamental objects of *chloromelanite* have been found in France, and a few in the lake-dwellings of Switzerland, as well as in Mexico, Guatemala and Colombia. The chief source of supply for nephrite has been in modern times the Kuei-lun Mountain in eastern Turkestan, while the jadeite now mined comes from the Kachin Hills, about 120 miles from Mogauing, Upper Burma. The nephrite of New Zealand, called by the natives *puamau,* or "green-stone,* is also well known. Numerous jade artefacts made in prehistoric times have come to light in almost all parts of the world, although the source whence the stone was obtained has not often been determined. For a time it was rather generally believed that none of it could be found in situ in Europe, and that the material for the European artefacts and for those discovered in the Americas as well was of Asiatic origin. This erroneous idea has been entirely dissipated by several discoveries of nephrite in its original place at various European localities. The largest mass ever extracted was found by the present writer in 1899 at Jordansmüh, Silesia; it weighed 4,718 pounds (2,140 kilograms). This is in the Heber R. Bishop Collection in the American Museum of Natural History, New York City.

The fondness of the Chinese for jade is proverbial, and the finest ornamental objects (both of nephrite and of jadeite) have been produced by Chinese lapidaries, although to Hindu and other Asiatic artists also may be credited most if not quite all the finest. As well as the native nephrite has been quite skillfully carved, as in the case of the curious *hej-tikhs*, grotesque ancestral heirlooms with which some superstitious fancies are associated. In use, jade runs through the gamut of the different shades of green, from the darkest to the lightest; some specimens are quite white. Jadeite is occasionally almost transparent, of a rich emerald green Jewel jade or Imperial jade, when containing a greater quantity of iron or of chromate, with a specific gravity up to 3.6 is called choloromelanite.

The color, translucency, hardness, toughness and fine structure are the properties that have rendered jade a very attractive material for the most artistic work, and of China, ancient Mexico, France, Russia and other countries. The Chinese have been the most pre-eminent in carving jade as is testified by the wonderful, beautiful and interesting carved objects in the Heber R. Bishop Collection in the Metropolitan Museum of Art, New York, and in the collections of the museums of Boston, Chicago, Paris, Berlin and Petrograd. The Russian objects are usually of stupendous size; the Chinese objects scarcely ever a foot high; some of the Russian works are from two to six feet long. Notable are the sarcophagus of Tsar Alexander II, and other work in the Imperial collections or among the Imperial gifts of the Russian tzars.

Nephrite is much tougher than jadeite, and as an illustration of its extraordinary toughness Dr. Heinrich Fischer relates* that he placed a large block of jade under a steam hammer, and that as a result of the blow the anvil on which the stone rested was broken, while the stone itself remained intact. This shows the great difference between hardness and toughness, for although the diamond has a hardness of 10 against 6.5 of nephrite, the former would have been broken to splinters by such a test.

Owing to the chief demand for the European lapidary works due to the World War, the eastern Chinese lapidaries were called upon to supply the deficiency. The chromium-colored jadeite, because of its great beauty, has come into high favor, especially the rich translucent emerald green and yellowish green jewel-jade for bead necklaces, some of which have been sold for $20,000. Carved ornaments of jadeite have sold for from $500 to $2,000. Jade thumb-rings were formerly bought by wealthy Chinese for from a few dollars to $15,000 each. The exports of Burmese jadeite in worked form from China during the five-year period 1914–18 have been valued at about $2,000,000.

Turquoise is a phosphate of lime colored with copper, found for many centuries in the

* Tschermak's "Mittheilungen" (1872, 2, Heft, p. 135); consult Fischer's *Nephrit und Jadeit,* (Stuttgart, 1880, pp. 294, 299).
Nishapur district, near Meshed, Persia, where it is highly valued and is sold in great quantities at the end of each month. It is cut to minute, round discs not more than one or two millimeters in diameter. It is found also in the Sinai Peninsula, where the mines were worked by the Egyptians almost as far back as 4000 B.C. The color is a more intense blue than that of any other stone. In China, where it is worked into Oriental objects, it is found in great masses, weighing many pounds each, but impure. Gem turquoise occurs also in New Mexico, Arizona, Nevada and California as well as in Mexico, and it was used by the pre-Columbians for ornament as well as in mosaics in combination with various colored shells or obsidian and for the decoration of human skulls, daggers, clam shells and other objects. Many of these are of great beauty. As a ring stone the beautiful color of the best turquoise makes it a great favorite. In order to preserve the color, it is desirable to exercise care in subjecting turquoise to contact with liquids. In the Middle Ages, and later, the superstition prevailed that the wearer of a turquoise bill would be protected from injury by falls. In the 16th century this was called the Turkey stone, as it came to Europe from Persia via Turkey; the name was then converted to turquoise.

Benitoite, a titanio-silicate closely related to titanite, a deep blue gem from California, is so named from its occurrence on the Mount Diablo Range in San Benito County. When cut, its beautiful blue color resembles that of the sapphire, which it excels in brilliancy because of its higher refractive power.

Lapis-lazuli was valued as gem-material at a very early date and is mentioned as an article of tribute on Assyrian tablets of the second millennium before Christ. The stone is of a rich blue color and is a complex mixture of minerals, the most important constituent being lazurite. It was originally used to produce the pigment ultramarine. Its average hardness is only about 3.5. Many of the old Egyptian sarcophagi and amulets are made of it and a proof that its beauty was greatly prized by the Assyrians is given in a hymn addressed to the moon-god Sin, where he is said to be "bright as lapis-lazuli" (šúnu). Some of the earliest Buddhist statues were of this blue, and down to the present time it has been highly valued for its rich and beautiful color. One of the chief sources has been the mines of Badakshan, in the northwest part of Afghanistan, near the upper reaches of the Oxus. Still more ancient mines have been discovered in the valley of the Kokcha, a tributary of the Oxus. These mines have been worked for about 6,000 years and are evidently the oldest mines in the world. Near Lake Baikal in Siberia, especially along the river Malaya Bistraya, there are also productive mines and material of a somewhat inferior quality has been found in the Chilean Andes of Ovalle near the watershed between Chile and Argentina. At this locality masses of several hundreds of pounds each have been brought to the surface, and it is thought that the lapis-lazuli is preserved for us the exact appearance of in-sects that died thousands of years ago. Cloudy amber can be clarified by heating it in oil, the latter being absorbed through the pores of the amber and rendering it more highly refractive. Another method of clarifying is by burying the amber in sand and subjecting it to a heat of over 100° C. for a long period.

Phenomenal Feldspars. Aventurine. There are three phenomenal feldspars: Sunstone (Aventurine), Moonstone and Labrador Spar or Labradorite. Of these the sunstone owes its peculiar beauty to the presence of spangles of either hematite, goethite or mica. The name has also been applied to a compact quartzite, usually red, brownish or white, with spangles of mica. This aventurine quartzite is found in several parts of Siberia, sometimes in masses weighing more than a ton and is called by the Russians "orolet." Numerous vases, cups and ornaments are made of this material by the Russians and two great vases formed of it
were presented, one to Sir Roderick Murchison and one to Baron Von Humboldt, when they visited Russia in 1850. A greenish or white quartzite, having spangles of mica, or a greenish chlorite, or both, is said to come from India and is occasionally sold as jade.

Carnilite is a compact variety of vesuvianite, named by George F. Kunz and is found in Siskiyou County, Cal. A somewhat similar variety was discovered in 1889, on the Pir Loughin, Canton, Switzerland.

When cut en cabochon, its bright green hue acquires great brilliancy and resembles that of the nephrite variety of jade, for which it is occasionally mistaken.

Among the finest gem collections in the United States are the Tiffany-Morgan collection and the Bement-Morgan collections at the American Museum of Natural History, New York; the Isaac Lea collection at the United States National Museum, Washington, D. C.; the Tiffany collection of the Field Museum of Natural History, Chicago; the Tiffany collection of the Golden Gate Museum, San Francisco, and the Kunz collection at the New York State Museum, Albany, N. Y. The foreign collections contain many gems and are at the collections of the British Museum; the Musée d'Histoire Naturelle, Paris; the National Mineralogical Collection at Vienna, Austria; the Mining Institute, Petrograd, Russia.

GEORGE F. KUNZ.

PRECIPICE, The, by Iván Aleksándrovitch Goncharóf, had for its chief purpose, even more distinctly than 'Obłomóf' (q.v.), to present the eternal struggle between the East and the West—the contrast between the lethargy or indolence of the Russian and the enterprising spirit of European energy. The protagonist of the story suffers not so much from constitutional laziness as from vacillation, from lack of resolution. Raisky had a good education and served for a time as a civil chinovnik at Saint Petersburg; but left his position as casually as he had accepted it. He had great ability as an artist but he never had the patience to finish the innumerable sketches that he began. He might have been a talented musician but his masters could not induce him to practise. He had no ambition and if he found nothing to interest him in reading he would lie all day in bed as if exhausted by hard labor. He owns a pretty estate on the banks of the mighty Volga and thither he goes to visit his Aunt Tatiana, who has managed to pull him with very much difficulty. There the action of the story unfolds, especially connecting itself with a high bluff (Obruiť) overlooking the wide stream, gliding peacefully between its overgrown banks, with here and there a bush-covered island.

The bluff, or precipice, was once the scene of a murder and was believed to be haunted by a ghost. It occurs to Raisky to make the place the scene of a novel and he writes at it in his usual desultory way, not realizing that the passion and the dramatic color in which he seeks to impart to his imaginary characters are all about him. He finds himself interested in Viera, the elder of the two young girls reputed to be his aunt's grandnieces, but in reality her grandmother's grandchildren and going to an illegitimate child. Viera is under the almost hypnotic influence of Mark Volokóf, a political suspect, interned in the village and enjoying an evil repute as a thief and monster of iniquity. Volokóf can hardly be regarded as a type of revolutionist like Turgenief's Bazárov. He is an exceptional character, somewhat overdrawn in his moral obliquity, but not impossible. In spite of Viera's appeal to Raisky to save her from this human wolf, Volokóf succeeds in his dastardly purpose; but the girl finds an unexpected sympathy in Aunt Tatiana, whose own tragic story is revealed, bringing redemption to both of them. Raisky, finding his love for Viera hopeless through his own fault, throws aside his novels and goes to Paris to take up sculpture as a consolation. The minor characters are admirably drawn and the subordinate strands of the romance are woven in with skill against a charming background of the Volga. Obruiť was published in the Vyestnik Yeovpoli (The European Messenger) in 1859-69, just 20 years after 'Oblomóf.' An English translation by M. Bryant was published in London in 1916.

NATHAN HASKELL DOLE.

PRECIPITATE, in chemistry a solid body produced by the mutual action of two or more liquids. Thus if sulphuric acid is added to an aqueous solution of barium chloride, barium sulphate is produced, and being insoluble in the menstrua present it precipitates or sinks as a solid to the bottom of the liquid in the vessel. So again, if a solution of potassium iodide is added to a solution of lead chloride, a reaction takes place resulting in the formation of lead iodide and potassium chloride, and inasmuch as the former of these bodies is, under the circumstances, a solid, it is precipitated. As a general rule it may be laid down that if it is possible to produce an insoluble solid substance by the action of two liquids on one another, that solid will be produced when these liquids are mixed, and that therefore a precipitate will be formed.

PRECIOSITY, prē-kōs'-ti, an early mental development, surpassing the normal. Generally speaking the precocious child differs from the prodigy in that his attainments constitute an actual achievement rather than an intuitive possession of knowledge; and the precocious child presents a general development of the mental faculties ahead of a superordinate development in a special line, as music, mathematics or other arts and sciences. Precocity may be the result of either training or natural endowment and the course of the educator toward it is usually that of fostering a general development, at the same time exercising care in avoidance of physical overstrain. Precocity has sometimes been held an indication of general physical weakness or inherent physical infirmity and likewise as having a deleterious influence upon
PREDESTINARIANS—PREDESTINATION

adult attainments. As a rule, however, such unfortunate results may be ascribed to undue forcing, although the precocious child is no more immune to physical ills than any other. When due discretion is observed in its training, the trait may generally be welcomed. It is by no means presages genius, but on the other hand a preponderance of geniuses have possessed it. The need for modifying educational methods to meet the requirements of the supernormal individual so as to ensure natural development and at the same time avoid overstimulation is one that has for some time engaged the attention of educators and physicians. Consult Donaldson, H. H., 'Growth of the Brain' (London 1895); Sully, J., 'Genius and Precocity' (1886); Galton, F., 'Hereditary Genius' (London 1892); Constable, F. C., 'Poverty and Hereditary Genius' (London 1905).

PREDESTINARIANS. See Religious Sects.

PREDESTINATION is the doctrine of God's will and counsel as revealed in the decreed redemption of mankind. It includes in its scope two significant facts, namely, his beneficent and allwise purpose and plan in reference to those who are fore-known and forechosen to the enjoyment of eternal salvation; and his fixed, determinate attitude toward those who are permitted to perish in their sins. This doctrine, as thus defined, has been the subject of intense theological controversy, because of the many essential and apparently contradictory personal features involved in it. And yet its history, as it appears in the rise and development of Calvinism over against Pelagianism, gives evidence of the logical connection which it has with biblical and metaphysical truth.

The sources of this tenet are set forth in the Old and New Testament Scriptures. From the earliest times of the human race, the God who "upholds, directs, disposes, and governs all creatures, actions, and things, from the greatest even to the least," is manifestly a potent personal factor in the world. His wisdom and might, his love and grace, are wondrously and sublimely illustrated in the lives and movements of men and nations; in the story, in the genesis and growth of their civil and religious institutions, to the closing tragedy of the life of Jesus Christ, furnishes a series of pictures of the divine method of government, as they are painted by his artist hand. Indeed, so evident is his own mind and purpose throughout the execution of his salvatory plan, that his nature, life and love at once and forever become inseparable elements within the domain of the human universe. And this is fully indicated (1) by the perfection of his nature; (2) in the manner of his life—infant wisdom, poverty, meekness, etc.; (3) in the operations of his will, thought and counsel; (4) in prophetic utterances and their fulfillment; (5) in the coming of Jesus Christ, the true representative of God; (6) in the unchangeable provisions of the redemption wrought out through him; (7) in the actual salvation of men from their sins; (8) in the establishment, upon a sure foundation, of the Fact of eternal life!

The historic birth of this doctrine can be traced to the fertile brain of Origen, who possibly was its first supporter, although he did not fully accept the second portion of it, which consigns the unsaved to conditions of everlasting reprobation. From his time to the Augustinian Age there was no strong and vigorously taught sovereignty of God in its relation to man's freedom and salvation. But during Augustine's sway, in the Western Church, the doctrine of man's inability to save himself and his absolute dependence upon God's eternal decree to be saved, was so strongly and vigorously taught that Pelagius, who represented opposite theological tendencies, declared that the true fundamental conception of sin involved man's capacity of choice to be good or evil, apart from God's plan and grace. This controversy was waged with great earnestness—especially in the Greek Church—for half a century, till it was modified under the form of Semipelagianism.

Later theologians divided themselves into two groups, the infralapsarians and the Supralapsarians. The former taught that the decree of predestination had no effectiveness until after man's fall, while the latter class held that the ultimate end which God had in mind was his own glorification in the salvation of some and in the reprobation of others.

During the Reformation the strongest exponents of the true predestination idea were the Calvinistic thinkers under the leadership of John Calvin (1509), though the Lutherans and Arminians also accepted the doctrine in a modified form. Calvin's doctrinal ideas were incorporated in his greatest masterpiece, 'Institutes of the Christian Religion' (1535). The main features of this scholarly production, aside from the dissertations upon church, state and religion, are embodied in the doctrines of plenary inspiration of the Bible, free-will and predestination. Here God is the centre and man the object of his voluntary interest and love. But in this relation he is confessedly to be dealt with according to his Creator's established order. Everything in and about him which is out of harmony with that order must be adjusted or rejected. In this process of correction or of salvation God acts alone. Man is a passive agent without the power of free-will. His predestination—salvation or reprobation—depends upon the unlimited might and wisdom of God. Hence predestination is a divine necessity.

This view of predestination was presented more philosophically and clearly by Calvin in his catechism published at Geneva (1545). And it was this treatise, without a doubt, that, a century later, furnished the Westminster divines the foundation outlines for the Standards which they drew up in England's great Abbey of Westminster during the years 1643-48. The three products of that representative body called by the English Parliament and made up of the most eloquent, pious and scholarly divines, Lords, Commoners and commissioners from every county of England and the universities of Oxford and Cambridge, are the Westminster Shorter and Longer Catechisms and the Westminster Confession of Faith.

In each one of these the doctrine of predestination is set forth, but more especially so in the 3d and 10th chapters of the Confession of Faith, which respectively treat 'Of God's Eternal Decree' and 'Of Effectual Calling.' The
paragraphs in these chapters that most pointedly outline the doctrine read as follows:

I. The blessedness of the Deity, for the manifestation of his glory, some men and angels are destined unto everlasting life and others foreordained to everlasting death.

IV. Those angels and men, thus predestined and fore-ordained, are particularly and unchangeably designed; and their number is certain and definite that it cannot be either increased or diminished.

As early as in the year 1831 the general assembly of the Presbyterian Church was confronted with the demand for more liberty in the interpretation of the Creed of the Fathers. The marshaling of the forces which stood for a change in the form of statement, involving the doctrines of election and predestination, continued, as shown by the famous heresy trials of Drs. Barnes, Swing, Smith and Briggs. After their deposition from the Presbyterian fold, the consideration of a revision of its standards became a matter of serious importance. In view of this the general assembly of 1889 resolved to transmit an invitation to the presbyteries, asking them to consider the propriety of a revision of the Confession of Faith. The result of this action brought about the sentiment in favor of a revision. The assembly of 1891 now asked the presbyteries for more suggestions. Again the answer came by a large majority of Presbyteral votes for a revision.

In 1893 the assembly was importuned once more for a new and shorter creed, but it voted to lay the matter aside. The battle of the theological giants did not cease at this. Again they pressed to the front. In consequence, the general assembly of 1900 appointed a large committee to reconsider the matter of revision. After seven months they reported that "the returns indicated plainly that no change is desired which would in any way impair the integrity of the system of doctrine contained in the Confession of Faith." In spite of this negating motion, the general assembly of 1902-03 added the Declaration of Purpose to chapters III and X, which reads as follows:

"With reference to chapter III of the Confession of Faith: that concerning those who are saved in Christ, the doctrine of God's eternal decree is held in harmony with the doctrine of his love to all mankind, his gift of his Son to be the propitiation for the sins of the whole world, and his readiness to bestow his saving grace on all who seek it. That concerning those who perish, the doctrine of God's eternal decree is held in harmony with the doctrine that God desires not the death of any sinner, but has provided in Christ a salvation sufficient for all, adapted to all, and freely offered in the Gospel to all; that men are fully responsible for their treatment of God's gracious offer; that his decree hinders no man from accepting that offer; and that no man is condemned except on the ground of his sin."

PREDICABLES, term of the Aristotelian system of logic, denoting a class of concepts which may be predicated affirmatively or negatively of some subject; it is now obsolete. The predicables are five in number, namely, genus, species, differentia, praeprem and accidents, and were used in classifying objects on a systematic plan. Every object was conceived of as belonging to some species and the same species, praeprum, objects in the same genus—a dog and a wolf, for example, would belong to different species because of the differentia between their characters—the specific differentia; a property (praeprem) would form a ground of difference between members of the same species, praeprem.

LOGIC.

PRE-ESTABLISHED HARMONY, The Doctrine of, the philosophical theory of Leibnitz as presented in his doctrine of the monads, which has as its purpose the explanation of the universe as composed of various orders of self-active beings. His belief is that the forces of nature are not externally controlled and that the action of no single monad is influenced by another but is destined by God from the beginning to work out its individual process unaffected by any other and toward an end of perfect harmony which is preestablished. The monads include the physical elements with their chemical affinities and their sentiment life, up to the class of humas with souls and power of thought. The soul becomes the dominating monad in human existence, while God is the monad monadum. The theory involves a progressive independent development of the monads toward an ultimate end of order and regard evil as an evanescent quality in no way conflicting with sure progression of God's original plan. The theory obviates any necessity for interference by the Deity. While of necessity conjectural in its conclusions it is regarded as one of the most profound treatises of philosophical theology in existence. Leibnitz left no elaborate exposition of his theory, its most complete summary being that he prepared for Prince Eugen of Savoy in 1714. See Leibniz, Gottfried Wilhelm.

PREFECT, or PREFET, the title of a high civil official in France, created by a law of the 28th Pluviôse in the year V11 (17 Feb. 1800). It was derived from the old Roman title Praefect (q.v.). There were 86 prefects in modern France, each at the head of the civil administration of a département. The prefect is an official of considerable power, although his prerogatives have been curtailed at various times since they were first established. He is appointed by the President of the French Republic. There are three classes of prefects, according to the size and importance of their département, with salaries ranging from 18,000 to 35,000 francs. The prefect is the chief representative of the government, whose decisions are final and regulatory to some degree. Though directly responsible to the Minister of the Interior, he supervises all governmental institutions and services in his département. He exercises considerable control over the Conseil général, mayors and municipalities, and possesses great power in respect to the administration of the police and of public institutions, both charitable and other-
wise. Formerly he enjoyed almost unlimited powers in regard to the management of his department's local interests. These, however, have now been transferred to a great extent to the conseil général and to a départemental committee, elected by the former for the interval between its sessions. Under the prefects serve sous-préfets of which there are 362, each at the head of an arrondissement, a subdivision of the département. Various attempts to discontinue these officials, made on the part of the Chamber of Deputies by refusing to vote the amounts required for their salaries, have failed. Consult Haas, C. P. M., 'Administration de la France' (Vol. II, Paris 1861); Larroque, P., 'De l'Organisation du Gouvernement Républicain' (Paris 1870); Monnet, Emile, 'Histoire de l'Administration en France' (Paris 1885); Dethan, Georges, 'De l'Organisation des Conseils Généraux' (Paris 1889); Lowell, A. PREFORMATION, a theoretical view of embryological development widely held in the 18th century and especially advocated by Haller. It asserted that the germ held in infinitesimal proportions all the parts and organs of the being, which were simply unfolded by growth. Hence this theory came to be known in England as the "evolution" theory and in French literature as the "embûtement" theory. One class of thinkers regarded the egg as containing the whole of the embryonic material; another class thought it all contained in the spermatozoon. This whole baseless fabric of philosophy was overthrown by the microscopical researches of Wolf and the other founders of the science of embryology (q.v.).

PREGNANCY. See Abortion; Menstruation; Obstetrics.

PREHISTORIC MAN. See Man, Prehistoric Races of.

PREHinite, or EDELITE, a mineral, allied to zeolites and usually found with them, which is characterized by its vitreous luster crystallizing in the orthorhombic system. It is a hydrous silicate of aluminum and calcium, having the formula \( \text{H}_2\text{CaAl}_2\text{Si}_4\text{O}_{10} \). It is most frequently found in rocks of the basaltic type and is obtained from a wide area, being found in the copper region of Lake Superior, at Paterson and Bergen Hill, N. J., in Scotland, France, China and South Africa. It was first found by Colonel Freh in the 18th century at the Cape of Good Hope. It is cut into gems and slabs, resembling chrysoprase in appearance. Its hardness is 6-7, its specific gravity 2.8-3.

PRELATE, a term used generally of bishops and archbishops of the Anglican communion, but bearing a more precise and specific meaning in the Roman Catholic Church, where it is applied to secular or regular clergy, who have a jurisdiction inherent in their office, and not merely delegated by a superior. The title is especially used of the prelates of the pope's court and of the Curia, who hold higher rank than other prelates, have the title "Monsignore" and may wear apparel of violet color.

PRELL, prél, Hermann, German painter and sculptor; b. Leipzig, 29 April 1854. He studied at Dresden and Berlin under Grosse and Gustow respectively, supplementing his studies by a course of study in fresco painting in Italy. He soon became one of the foremost German fresco painters of historical subjects. Returning home he was commissioned to paint the frescoes in the banquet hall of the House of Architects, in Berlin, and for this hall he executed in 1881-82 a series of 11 paintings on the "Main Epochs of the History of Architecture." His other mural paintings are to be found in the City Hall of Worms ("Justice," "Valor" and "Henry IV Granting Privileges to Worms in 1074," painted in 1884); the City Hall of Hildesheim (1887-81); City Hall of Dantzig (1892); the Breslau Museum (1893-94); Palazzo Caffarelli in Rome (1895-98); the Albertinum, Dresden (1901-05); the City Hall of Dresden (1908-12); sculptures by him are in the new Dresden City Hall and in the Albertinum, Dresden. He has also done some mosaics in the Cotton Exchange and in the North German Lloyd Building in Bremen (1911), and in the Staendehaus in Dresden (1907). The Dresden Gallery and the Breslau Museum contain specimens of his easel pictures. He has taught in the academies of Berlin and Dresden. In 1895 he received the Gold Medal at the Berlin Exhibition. He has published 'Die Fresken im Rathause zu Hildesheim' (Hildesheim 1894). Consult Iantisch, 'Die Fresken im Treppenhaus des Schlesischen Museums der Bildenden Kuenste' (Berlin 1895); Meissner, F. H., 'Hermann Prell' (Wien 1897); Rosenberg, A., 'Hermann Prell' (in 'Kuenstler Monographien,' Vol. LIII, Leipzig 1901).

PRELLER, prél'lér, Friedrich German painter, son of the following: b. Weimar, 1 Sept. 1838; d. Dresden, 21 Feb. 1913. After studying under his father and later in Rome, he traveled much in Switzerland, France and Italy and painted landscapes. His wall-paintings in the new theatre at Dresden (especially "Prometheus" and "Iphigenia") and in the Albertinum at Dresden ("Olympia"); "Pergamum"); "The Acropolis at Athens," and "Egina") have been much admired. He also produced a series of landscapes, scenes from Italy and Greece, in oil. His "View of the
Monastery of Santa Scholastica, and some other landscapes are in the Dresden Gallery, his 'Sappho' in the museum at Leipzig. In 1867 he became professor in the Art Academy at Dresden.

PRELLER, Friedrich Johann Christian Ernet, German painter; b. Eisenach, 25 April 1804; d. Weimar, 23 April 1878. In the same year in which he was born, his parents moved to Weimar where he became acquainted with Goethe in his youth, and received encouragement and finally a pension from the Grand Duke Karl August of Weimar which enabled him to travel and study from 1826-31 first in Holland and later in Italy where he imbibed more from the classic than the Renaissance art and formulated a pictorial philosophy in which he saw man as the culmination of all earthly beauties. His important works, especially the series suggested by Homer's Odyssey, now in the Museum of Weimar, are bold and vigorous landscapes forming a setting for nude figures of heroic mold. To paint such subjects was the direction of his bias from his roots; he frequently turned to other fields, partly for financial reasons, partly because of his deep interest in and love of all phases of nature. In 1840 he, he made a sketching trip to Norway, and frankly adopting the naturalism of Ruisdael, of whom he had been an ardent admirer since his early youth and one of whose pictures he copied when he first began seriously the study of painting, he painted landscapes for sale. Even these were vigorous and meritorious in execution, if not fully representing his genius. He had drawn sketches from nature and left behind him a long series of remarkable drawings. In later years he made other journeys to Italy, though most of his time was spent in Weimar where he taught at the Art Academy. Besides the Odyssey landscapes he also painted frescoes in the Wieland room of the Weimar palace showing scenes from Oberon. Paintings from his brush are to be seen in the National Gallery at Berlin and in museums at Weimar, Dresden, Leipzig, Stuttgart and Munich. He was also interested in etching and etched many of his own paintings. Consult Gentzel, J., 'Friedrich Preller d.A.' in 'Künstler Monographien,' Vol. LXXIX, Leipzig, 1890; Rouet, 'Friedrich Preller' (Frankfurt a.M. 1883).

PRELUDE, in music, a short introductory strain preceding the principal movement, performed on the same key as it, and intended to prepare the ear for the piece that is to follow. It may consist of a series of unconnected chords when the intention is simply to attract the attention of an audience, or to fill a singer's ear with the key in which the piece is written, in which case it is generally improvised. It is, however, usually composed of part of the leading or closing phrase or phrases near the close, and is not left to the invention of individual performance. Among classic models are the preludes to Bach's fugues and the preludes written by Chopin and Mendelssohn. See Music.

PRELUDE, The. 'The Prelude or Growth of a Poet's Mind,' a blank verse poem in 14 books, was written by Wordsworth between the years 1799 and 1805, and was published posthumously in 1850. The work was intended to be introductory to a long philosophical poem, 'The Recluse,' of which the second part alone, viz., 'The Excursion,' was completed. In 'The Prelude,' Wordsworth, addressing his friend, Samuel Taylor Coleridge, passes in review his own development as a poet, taking account of the circumstances which influenced him and analyzing the spiritual changes through which he passed. From the point of view of content the work may be classed with such autobiographies as Goethe's 'Dichtung und Wahrheit' and Coleridge's own 'Biographia Literaria.' Throughout the work Wordsworth is chiefly occupied with defining the influence of nature as a determining factor in his spiritual life. As in 'Tintern Abbey,' he distinguishes several stages in his relation to nature. In his early youth he is a thoughtless boy, using nature as the companion of his sports. There is no conscious nature love, but at intervals amid his sports there come to him moments of vision, "gleams like the flashing of a shield," and nature seems to him a "living creed;" at this time, when nature, hitherto secondary in his thoughts, is sought for her own sake, with conscious love; his imagination now leads him to see in nature the reflection of his own soul and to feel the "sentiment of self" and "joy and sympathy," and all that seemed still. His residence in Cambridge comes as a partial interruption of his communion with the divinity in nature, but on his return to the scenes of his childhood during a summer vacation he experiences a renewal of old affection and reverence, and now, too, he begins to interest himself in the human life about him. The incorporation into his thought of the sense of humanity marks a third step in his spiritual evolution. He becomes conscious also at this time of his mission as a poet. During the years which followed, Wordsworth passes through the great crisis of his life. He is caught up by the revolutionary enthusiasm while in France, and for the time being entirely loses sight of the earlier vision in his devotion to the new movement for the regeneration of society. But as the revolution progresses, Wordsworth, like other idealists of his time, begins to lose faith in it. He turns to abstract reason for comfort, becomes hopelessly entangled in the maze of fruitless speculation, and ends in intellectual despair. But this condition he is rescued by renewed contact with the soothing influences of nature and by his sister, who leads him gently back to the life of feeling and restores in him the spirit of joy and love. The emotions are now more precious to him than the intellect, and he regains possession of the creative vision of his youth. But henceforth humanity occupies a position in his heart higher even than that of nature.

'The Prelude' is very important for the understanding not only of Wordsworth himself but of the spiritual history of his generation. It is, moreover, a poem of great beauty, abound-
PREMONSTRATENSANS, or NORBERTINES, a religious order, founded by Norbert, canon of Xanten in Cleves, who on account of his zeal as archbishop of Magdeburg in 1127 was canonized. In the forest of Saint Gobain, in a meadow pointed out to him, as he is said by Heinricus Placitus, prior monasterii, whence the name of the order, he collected his first disciples (1120). The original establishment was built by the bishop of Laon. It contained 40 members who wore the white habit and followed the rule of canons regular, and lived according to the rule of Saint Augustine, a strict conventual life. In 1125 they were formally approved by Pope Honorius II. The order is composed of three classes: (1) priests and clerics under an abbot or provost; (2) nuns who embrace the rule of Saint Norbert; (3) lay members. Their order increased rapidly; several nunneries were established with the same rigid rules. The abbots of the original monastery Prémontré, near Coucy, was general, and with three other abbots formed the great council of the fathers of the order. The order was introduced into England in 1143 at Newhouse in Lincolnshire and its members were there regularly known as the White Canons. Some time before, in 1125, King David of Scotland had brought a colony to his kingdom. Before the Reformation they are said to have had 1,300 monasteries, among which were 500 nunneries, mostly in Germany, the Netherlands, France, England and the north of Europe; but the Reformation diminished this number by more than one-half in the 16th century. In the 18th century the order lost many of its houses as a result of the French Revolution and at the end of the century there were only 27 houses in England. Consult also houses in Holland and Belgium, seven in Austria, two in Hungary, three in England, one in the United States and one in Canada. There are also eleven nunneries in Holland, Belgium, Spain, Austria and Russian Poland, Switzerland and Bohemia. Some of these nunneries have founded priories in Brazil to which colleges are attached, others are doing missionary work in the Belgian Congo and in Madagascar. The entire order is divided into five circaria. At its head is a superior, the most recent one being Norbert Schachinger, abbot of Schläge, one of the Austrian monasteries of the order. In 1913 the membership of the order was made up of one bishop, 17 vicars, one apostolic prefect, 789 priests, 129 scholastics, 51 novices, 91 lay brothers and three lay novices. In modern times the order has become very active in teaching boys in high schools and academies. It possesses a college for its own members at Budapest and one at Rome, the head of the latter being the procurator of the order. The provincial house of the Premonstratensians in the United States was founded at West De Pere, Wis., by fathers from the abbey of Heeswijk, Holland. The very Rev. B. H. Penninger, O.S.B., is the present prior. The fathers conduct missions in the archdiocese of Chicago and the dioceses of Green Bay, Grand Rapids, Marquette and Helsinki, as well as a flourishing classical and commercial college. The membership in 1918 consisted of 28 clerics, six scholastics, four novices and four lay brothers. Consult Statuta Sacri et Canonici Præmonstratensis Ordinis, Renovata Jussu Regis Christianissimi, et Auctoritate Capituli Nationalis, Anno 1770 (Paris 1773); Currier, 'History of Religious Orders' (New York 1894); Gasquet, Rev. J., 'History of Saint Norbert (Saint Louis 1916); Winter, F., 'Die Premonstratensers des 12 Jahrhunderts und ihre Bedeutung für das Nordöstliche Deutschland' (Berlin 1865).

PRENCE, prêns, or PRINCE, Thomas, American colonist; b. Lechdale, Gloucestershire, about 1600; d. Plymouth, Mass., 29 March 1673. He was one of the Leyden band of Pilgrims which arrived at Plymouth on the ship Fortune 9 Nov. 1621, and his wealth soon gained for him considerable influence. In 1634 and in 1638 he was elected governor and was one of the assistants in 1635–37 and in 1639–50. He assisted in the settlement of Nantucket or Eastham and from 1657 until his death he was governor of Plymouth, the law requiring the residence of the governor in Plymouth being waived in his favor. He was also one of the commissioners from Plymouth at various times after the confederation of the four colonies of Plymouth, Massachusetts, Connecticut and New Haven had been formed in 1643. He was zealous in the religious affairs of the colony, an active promoter of educational matters, and was the real founder of the public schools in New England. Consult also 'A Memorial of the Colony of New Plymouth' (Boston 1866); Morton, N., 'New England's Memorial' (Cambridge, Mass., 1669); 'Mour't
PRENDERGAST — PRENTISS

Relation or Journal of the Plantation at Plymouth" (London 1622).

PRENDERGAST, Edmond Francis, American Catholic priest; b. Clonmel, Ireland, 3 May 1843; d. Philadelphia, Feb. 1918. He came to the United States in 1859; was educated at the ecclesiastical seminary of Saint Charles Borromeo, Philadelphia, and was ordained to the priesthood in 1865. He was successively assistant at Saint John Nepomucene Depot and rector of Saint Mark's, Bristol, Pa., for four years. Until 1874 he was rector at Allentown, Pa., and from 1874 to 1897 was rector of Saint Malachy's, Philadelphia. In February 1897 he was consecrated auxiliary bishop of Philadelphia and in May 1911 became archbishop in succession to Dr. Ryan.

PRENDERGAST, Maurice Brazil, American artist; b. Boston, Mass., October 1861. He studied at Julien and Colorossi academies and at the Ecole des Beaux Arts, Paris, under Joseph Blanc, Courtois, Jean Paul Laurens and Jerome. He returned to the United States and settled in Boston, removing to New York in 1914. He works both in oil and in water color, and his favorite subject is a grouping of figures against a landscape background. He is noted for his vivid coloring, his joyous vision of nature and his unconventional but truthful presentation. His strength in design and individuality in execution are remarkable. Among his works may be mentioned 'Crepuscule,' 'Chrysanthemum Madonna,' 'On the Cliffs,' 'The Merry Maidens,' 'Seashore,' etc.

PRETICE, prén'tis, George Dennison, American journalist; b. Preston, Conn., 18 Dec. 1802; d. Louisville, Ky., 22 Jan. 1870. He was graduated from Brown University in 1823; studied law, but did not practise, and was editor of the New England Weekly Review at Hartford, a literary journal, 1828-30. He then removed to Louisville, Ky., where in November 1830 he founded the Louisville Journal and became its first editor, in which position he was noted for his political ability and wit and satire. For many years the Journal was a leading advocate in the West of the policy of the Whig party, and at the outbreak of the Civil War maintained with zeal the cause of the Union. A collection of his poems appeared in 1876 and a selection from his newspaper paragraphs under the title of 'Preticeana' in 1860.

PRENTISS, Benjamin Mayberry, American military officer; b. Belleville, Va. (now W. Va.), 23 Nov. 1819; d. Bethany, Mo., 8 Feb. 1891. He removed with his parents to Missouri in 1835, and in 1841 settled in Quincy, Ill., where he entered the commission business. He served in the Mexican War with rank of captain, and received honorable mention for services at Buena Vista. At the outbreak of the Civil War he reorganized his old company, was appointed colonel of the Seventh Illinois regiment and in May 1861 was made brigadier-general of volunteers. He routed a band of Confederates at Mount Zion, southern Missouri, 28 Dec. 1861, joined General Grant a few days before the battle of Shiloh and was taken prisoner in that battle on 6 April 1862, together with most of his command, while stubbornly holding the position to which he had been assigned. He was released in October 1862, promoted major-general of volunteers in November 1862, and served as a military commandant and martial which tried Gen. Fitzjohn Porter, and in July 1863 defeated the Confederate forces under Holmes and Price at Helena, Ark. He resigned his commission in October 1863 and settled in Bethany, Mo., where he practised law.

PRENTISS, Elizabeth Payson, American author; b. Portland, Maine, 30 Sept. 1815; d. Dorset, Vt., 13 Aug. 1878. She was married to George Lewis Prentiss (q.v.) in 1845 and after the death of two children turned her attention to literary work. Her most popular work, 'Stepping Heavenward' (1869), reached a sale of over 150,000 in this country besides being translated into French, German, Norwegian and Italian, where it met with great success. Many of her other books, too, achieved great success and were translated into foreign languages. Among her other works are 'The Sussy Books' (1853-56); 'The Flower of the Family' (1856); 'Little Threads' (1868); 'Fred, Maria and Me' (1868); 'Nidworth and His Three Magic Wands' (1869); 'The Percy's' (1870); 'Six Little Princesses and What They Turned Into' (1871); 'Saint James's Hero' (1871); 'Golden Hours' (1873); 'Urbane and His Friends' (1874); 'The Home at Greylock' (1876); 'Pemaquid' (1877); 'Gentleman Jim' (1878); 'Avis Benson' (1879). Consult Prentiss, G. L., 'Life and Letters of Elizabeth Prentiss' (1882).

PRENTISS, George Lewis, American Presbyterian clergyman; b. Gorham, Maine, 12 May 1816; d. New York, 18 March 1903. He was graduated from Bowdoin College, Brunswick, Maine, in 1835, which gave him the degree of D.D. in 1854, studied theology in the universities of Halle and Berlin in 1839-41, and was ordained to the ministry in 1843. He was pastor of the South Trinitarian Church, Boston, 1845-50, of the Mercer Street Presbyterian Church, New York, 1851-58, when ill health compelled his resignation. In 1862 he established in New York the Church of the Covenant, and was its pastor until 1873, when he accepted the chair of pastoral theology, church polity and mission work at Union Theological Seminary. He published 'A Memoir of S. S. Prentiss' (2 vols., New York 1855); 'A Discourse in Memory of Thomas Harvey Skinner' (New York 1871); 'Life and Letters of Elizabeth Prentiss' (New York 1882); 'The Union Theological Seminary in New York, Historical and Biographical Sketches of Its First Fifty Years' (New York 1889); 'The Agreement between Union Seminary and the General Assembly' (New York 1891); 'The Union Theological Seminary in New York; its Design and Another Decade of Its History' (Ashbury Park 1899). He also edited 'Faith and Philosophy: Discourses and Essays by H. B. Smith' (New York 1877).

PRENTISS, Sergeant Smith, American orator, brother of G. L. Prentiss (q.v.); b. Portland, Maine, 30 Sept. 1808; d. Natchez, Miss., 1 July 1850. He was graduated from Bowdoin College, Brunswick, Maine, in 1828, removed to Connecticut and in 1829 was admitted to the bar, after which he established a law practice, first in Natchez and later in Vicksburg, Miss., and rapidly
gained high rank in his profession. In 1835 he was elected to the Mississippi legislature, where he won a reputation as an orator, and in 1837 he was elected to Congress, but upon arriving at Washington to take his seat found it occupied by the Democratic candidate, Colonel Claiborne. In a speech of great brilliancy and power, which continued for three days, he argued his case before the House, attracting the attention of the whole nation. In the Election Case, the controlling vote was cast by the speaker, James K. Polk, and Prentiss was defeated, but at the polls in the election following was triumphantly elected. His speech against the sub-treasury bill sustained his reputation as an orator, but at the close of his term he declined re-election. In the campaign of 1840 he actively supported General Harrison, and in 1845 he strenuously opposed revaluation. In the same year, after suffering serious financial reverses, he removed to New Orleans, La., where he spent the balance of his life in the practice of law. Consult Prentiss, G. L., "Memoir of S. S. Prentiss" (New York 1855).

PRENZLAU, Prén'ts-low, or PRENZLOW, Germany, town in the province of Brandenburg, in the district of Oder in Lauchitz. 76 miles north by east of Berlin. It is divided by the river into an old and a new town, is well built and has among its buildings a handsome Gothic church (erected 1325-40), monuments of Emperor William I, Moltke, Bismarck and Grünau, some old city gates and a gymnasium. Of interest is also the Uckermark Kőisch Museum. It has a number of manufacturing establishments, machine shops, woolen mills, tanneries, sugar works, etc. In 1806 a Russian corps under Prince Hohenlohe surrendered here after the battle of Jena to Murat. Pop. 21,431.

PREPOSITION. See Grammar.

PREROGATIVE, in British law a term used to denote an exclusive privilege of the Crown, the expression the prerogative being employed for the whole or any part of such exclusive privilege. The prerogative may be confined or limited by the supreme legislative authority and has in fact been much restricted, notably by Magna Charta (1215), the Habeas Corpus Act (1679), and the Bill of Rights (1689). In a wider sense the term is used to denote a right attached to a rank or office to exercise certain powers or privileges to the exclusion of others. Consult Allan, John, "Inquiry into the Rise and Growth of the Royal Prerogative in England" (2d ed., London 1849); Blackstone, Sir William, "Commentaries" (4th ed., Chicago 1899); Chitty, Jos., the Y, "A Treatise on the Law of the Prerogative of the Crown, etc." (London 1820); Holdsworth, W., "A History of English Law" (3 vols., London 1870-79); Stubbs, W., "The Constitutional History of England" (3 vols., Oxford 1875-78).

PREBENDARY. See Bishop; PREBENDARY; etc.

PREBENDARY CHURCH IN THE UNITED STATES OF AMERICA. The history of Presbyterianism in the United States is closely interwoven with that of the country at large. The early colonists were, for the most part, those who had crossed the ocean to find a home in the New World, in order to enjoy religious freedom. They came for conscience's sake, rather than for the advancement of their fortunes. They claimed the right to worship God according to the dictates of their own consciences and to govern themselves in the administration of church order and discipline. They were bitterly opposed to the claims of prelacy. Alike among the Congregationalists of New England, the Dutch of New York, the Scotch-Irish of Pennsylvania and the Huguenots of the Carolinas, the Calvinistic or Reformed system of doctrine was the prevailing belief. The Shorter Catechism of the Westminster Assembly, embodied in the New England Primer, had a more profound influence in the training of successive generations than any other book of that period, except the Bible. It was the working creed of the men who laid the foundations of free institutions in America. The organization of the church among the colonists was determined largely by their previous associations in the Old World. The New England colonists were mostly of English-Puritan extraction and favored the Congregational polity. There were, however, some who leaned toward the Presbyterian polity. The former belonged to the school called Brownists, the latter to Barrowism. A strictly Presbyterian colony was established in Salem, Massachusetts Bay, under Roger Conant in 1625. Among those who held to Presbyterian views was Rev. Richard Denison, who came from England in 1630, and settled in Watertown, Mass. During the next generation of his views, he removed in 1644, with some of his congregation, to Hempstead, Long Island, where a church was organized in accordance with the Presbyterian form. The earliest organization of Presbyterianism in the New World was made in the Dutch settlement of New Amsterdam, in New York, in 1628. It was a Reformed Dutch church and the first Protestant church in America. Other churches of this denomination were organized at an early date among the Dutch settlements. (See REFORMED DUTCH). While the Presbyterian element was found in all of the colonies from New England to Georgia, circumstances prevented its separate organization. In New England the prevailing form of government was Independency or Congregational; in New York Presbyterianism was of the Dutch type and only Episcopacy was allowed among the English. In Virginia, Episcopacy was established by law and was intolerant toward all forms of dissent. Conditions were more favorable to Presbyterianism in the provinces of Pennsylvania, New Jersey, Delaware and Maryland. To these colonies came a large number of emigrants from the North of Ireland and from Scotland. The religious intolerance prevailing under the reign of Charles II led them to seek refuge from it in the New World. It was among these emigrants that Presbyterianism took its organized form. In answer to a request from one of the scattered groups of Presbyterians in the Presbyterian Church of Lagann, Ireland, sent as its missionary, Rev. Francis Makemie, in 1683. He journeyed in his missionary work as far south as the Georgias, and as far north as New York. He finally settled in Rehoboth, in eastern Maryland, where he organized the churches of Reho-
both and Snow Hill. In 1704 he returned to London, seeking aid for his work, returning in 1705, and bringing with him two additional ministers.

There was also, before the opening of the 18th century, a Presbyterian church in Philadelphia. Rev. Jedediah Andrews was its pastor, in 1701. In 1705 seven ministers, Maka- mue, Davis, Wilson, Andrews, Taylor, Mac- mish and Hampton, met by appointment in the city of Philadelphia and organized a Presbytery. It was the first Presbytery in America and the beginning of the American Presbyterian Church in its organized form. The original minutes of this Presbytery are in the archives of the Pres- byterian Historical Society in Philadelphia. This Presbytery was subsequently divided into three, which were included in a Synod. The Synod held its first meeting 17 Sept. 1717, in Philadelphia. In 1741 a division occurred in the Synod, resulting, not from doctrinal differ- ences, but from those ecclesiastical passions and unregulated zeal which have so often disturbed the church. One party under the leadership of the Tennents, father and son, and greatly helped by the minister of the renowned evangelist, Whitefield, met in another place in the church, charging it with formalism and world conformity. The other party, the con- servative, resisted the charge, and sought to re- strain by ecclesiastical action what they consid- ered the overmoderate zeal of the revivalists. The parties were known respectively as the New Side and the Old Side. The result of these controversies was the establishment of two independent synods, the Synod of New York, composed mainly of those favoring the New Side, and the Synod of Philadelphia, favoring the Old Side. Both synods unanimously af- firmed their adherence to the Westminster Standards. This division lasted 17 years and was healed by the reunion of the two synods in 1758, under the name of the Synod of New York and Philadelphia. With the reunion came renewed effort and enlarged prosperity. Churches were organized in the Carolinas, Georgia, Kentucky, Tennessee, Virginia and Western Pennsylvania. This enlargement of the church had an important bearing on the subsequent efforts of the colonists to secure their independence. The Presbyterians everywhere were foremost in resisting civil and religious oppression and when the period of the Revolution came, were unanimously in favor of independence and the establishment of a government on republican principles. Thirteen months before the signing of the Declaration of Independence, in Philadelphia, the Presby- terians of Mecklenburg County, North Caro- lina, had drawn up and signed a Declaration of Independence from England and also framed a system of local government. The Scotch-Irish Presbyterians in Western Pennsylvania declared for independence in May 1776. The Presby- terian element was everywhere a determining factor in the Revolution, and ultimately succeeded in the Church. In England, the rebellion was attributed especially to the Presbyterians. Walpole said in the English Parliament, "Cousin America has run off with a Presbyterian parson." At the close of the Revolutionary War, the Synod of New York and Philadelphia met, May 1788, and revised the Confession of Faith and the Form of Government in some minor matters, which were required by the change of allegiance in civil affairs. At the same meeting it was re- solved to create a General Assembly, in which all the presbyteries should be represented by their own commissioners. This General Assembly held its first meeting in the Second Presbyterian Church of Philadelphia, Thursday, 22 May 1789. At this time the church had 16 presbyteries, four synods, 177 ministers and 431 churches. Among the first acts of the General Assembly was one directing that efforts should be made to send missionaries to the frontier. Before the close of the century, numerous churches had been established in the West and South. To prevent collision with the missionaries who went out from the Congregationalists in New England, the General Assembly, in 1802, en- tered into the Plan of Union with the associated churches of Connecticut, providing for the orderly organization of churches in mission fields. The withdrawal of the Cumberland Presbytery, until 1836, when it was abrogated by the General Assembly. It provided, in brief, that Congregational churches might settle Presbyterian ministers and the reverse; and that if a congregation was composed partly of Congrega- tionalists and partly of Presbyterians, the party should be no obstacle to their uniting in one church and settling a minister; and that such a church, though not presbyterially organized, should have a representative in Presbytery. Its operation led to most favorable results in the extension of the church. The opening of the 19th century was a time of widespread religious revivals. "The Great Awakening" began in Kentucky and it was attended there with some manifestations which met the disapproval of the more conservative element in the Church. In view of the great demand for ministers, some were authorized to preach who had not received a regular classical and theological education. There were also a few who held that the Con- fection of Faith taught fatalism. This led to the withdrawal of the Cumberland Presbyterian church from which has sprung a large and influential body of Presbyterian known as the Cumberland Presbyterian Church. This separation took place 1810. (See PRESBYTERIANISM.) The period was one of rapid growth for the Church. The tide of emigration poured westward, and new settle- ments and towns were founded. In all these, the missionaries of the Church found a hopeful and fruitful field for their labors. During this period, the Board of Home Missions was organized (1816). Theological Seminaries for the education of ministers were also established; Princeton (1812); Auburn (1820); Western Theological Seminary, Allegheny, Pa. (1826); Union Seminary, Virginia (1828); Colum- bia, South Carolina (1828); Lane (1834); Hanover, subsequently removed to New Albany, thence to Chicago and now known as McCormick Theological Seminary (1829). In 1825 appeared the beginnings of a controversy which culminated in the secession of the Church. Various causes led to the formation of two parties, known subsequently as the Old School and the New School. Chief among these causes was the spread of New Haven Theology, or Hopkinessianism, which was opposed to the doctrine of the Confession of Faith. It was also charged that through the Plan of Union, Presbyterian order had been
subverted and that innovations in worship were permitted in certain parts of the Church. In 1836 Dr. Albert Barnes, who sympathized with the new theology, was tried for heresy before the General Assembly and acquitted. The previous year, Dr. Lyman Beecher, professor in Lane Theological Seminary, had been tried for heresy by the Presbytery of Cincinnati and ultimately acquitted. All these things produced intense excitement in the Church and widened the breach between those who espoused the liberal and the literalist. The Assembly of 1837, which met in Philadelphia, in response to a memorial signed by a large number of ministers and elders representing the Old School party, dissolved the Plan of Union with the Congregational Church, and excommunicated the synods of Western Reserve, Utica, Geneva and Genesee.

At the meeting of the Assembly in Philadelphia, 1838, the commissioners from the excised synods presented themselves and asked to be enrolled; this being denied them, they with their friends proceeded to organize the Assembly and withdraw to hold its sessions in the First Presbyterian Church of Philadelphia.

With the Old School party remained 140 commissioners, while 136 gave their adhesion to the newly organized Assembly. Thus began the unhappy division which lasted 32 years. Both Assemblies had the same name and claimed to be the General Assembly of the Presbyterian Church in the United States of America; both held to the same confession and form of government. Both Assemblies engaged zealously in the work of home and foreign missions and in the establishment of institutions of learning. Both, also, were troubled by questions concerning slavery. As early as 1877, the Presbyterian Church had declared itself in favor of the abolition of the slave and for the adoption of such prudent methods as would procure eventually the final abolition of slavery.

In 1815 the General Assembly adopted a strong anti-slavery document, in which it repudiated the existence of slavery in the United States, urged the duty of educating slaves and expressed the hope for their speedy emancipation. It further declared the buying and selling of slaves to be "inconsistent with the spirit of the Gospel." The Old School Synod, on the contrary, positively avowed in the New School General Assembly than in the Old School General Assembly. In 1838, in consequence of some decided action taken with reference to slavery and emancipation, six Southern synods withdrew from the New School Assembly and constituted themselves the "United Synod of the Presbyterian Church." In 1854 this Synod united with the General Assembly of the Presbyterian Church in the Confederate States. The passage of the "Swinging Resolutions" by the General Assembly (Old School) in 1851 led to the withdrawal from that Assembly of a number of synods, all of which were within the bounds of the Southern Confederacy. This resolution was directed against the rebellion in the South and called upon all of the members of the Church to support the government in defense of the integrity of the Union. It was bitterly opposed by the commissioners from the synods in the South and by a small number from the Northern States. This controversy was the occasion in which the Assembly transcended its prerogatives. The objectors urged that the Assembly had no right to define civil duties. The vote on the resolution stood 156 in the affirmative and 66 in the negative. The action resulted in the withdrawal of the synods in the seceding States and the subsequent formation of the Presbyterian Church in the Confederate States of America. In 1866 the General Assembly Old School and the General Assembly New School met at the same time in Saint Louis, when steps were taken with reference to the reunion of the two bodies, by the appointment of committees to consider a plan of union. These negotiations terminated favorably and the basis of reunion, which was the Confession of Faith, after being approved by the presbyteries, was ratified by the Assembly in 1869. In May 1870, the first General Assembly of the reunited Church met in Philadelphia. In 1837, the year preceding the disruption, the ministers numbered 2,140, the churches 2,865 and the membership 220,537. At the time of the reunion, there were 4,236 ministers, 4,526 churches and 446,561 members. Since the reunion, the progress of the Church has been marked and steadfast. Two notable trials threatened for a time to disturb its peace. The first was that of Rev. David Swing, 1874, for alleged heresy with reference to the second coming of Christ. This case was settled by the withdrawal of Dr. Swing from the Church. The second was the trial of Professor Briggs of Union Theological Seminary, for his advocacy of the higher criticism which it was claimed affected the fundamental doctrines of the Christian faith. This trial resulted in the condemnation of his views, his suspension from the ministry and his subsequent withdrawal from the Church.

Since these ecclesiastical trials the Church remains conservative, but with an increasing tendency toward liberal interpretation of standards. Though the General Assembly has repeatedly stressed the inerrancy of Scripture and has made belief in such inerrancy requisite of teachers in seminaries and candidates for the ministry, in 1902 the Assembly adopted a brief statement of the Reformed faith, not as a legal standard but as an interpretation of the Confession. It repudiated the doctrine of infant damnation, insisting on the free will destination, of God's universal love, and incorporated new chapters on the Holy Spirit, the love of God and missions.

During a number of past years repeated advances have been made looking toward a union with the Southern Presbyterian Church, but so far without success. The Southern Church, while expressing the most cordial relations toward the Church of the North, has felt that the interests of Presbyterianism may be better preserved by their holding for the present to their ecclesiastical organization.

The last few decades have been remarkable in the extension of the missionary work of the Church. Up to the time of the separation between the Old and New School, the foreign mission work was carried on by the American Board of Commissioners of Foreign Missions. After the division, the Old School was established as the Board of Foreign Missions—the New School continuing as the American Board. After the reunification in 1851, the separate Board was continued, embracing all the foreign mission work of the Church. The extent of the
foreign mission activities in 1918 is indicated by the fact that the total contributions amounted to $2,131,387. The foreign missionary work is carried on in all parts of the world.

The home missionary work was carried on in early times by a committee of the General Assembly, but in 1810 the present Board of Home Missions was organized. The total home mission contributions for 1918 was $2,088,925. Its home mission work extends from Alaska to Porto Rico. The woman's home mission work was conducted as a branch of the Board of Home Missions until 1915, when it became incorporated as a separate Board. The Minutes of the General Assembly for 1918 show a roll of 9,902 ordained ministers and 9,928 churches, with a Sabbath-school membership of 1,296,929, the number of communicants being 1,031,748. Its contributions for all purposes in 1918 were $331,484,07.

Other Boards caring for its other branches of Christian service are Education, Publication and Sabbath-school Work, Church Extension, Of Ministerial Relief, Freedmen and Temperance.

The development of the modern American life has given it within the last 15 years new fields of service in immigration, social work, citizenship and country church work. It has also in connection with its numerous schools, colleges, universities and theological seminaries. The national churches of Mexico and Brazil, both Presbyterian, have been established largely through its instrumentality. It has synods in India and China, and its mission operations are carried on in all parts of the world.

The Cumberland Presbyterian Church.—The origin of this branch of the Presbyterian Church is to be found in the great religious revival which swept over Kentucky and Tennessee at the beginning of the 19th century. The demand at that time for an additional number of ministers in that region led the Presbytery of Cumberland, in connection with the General Assembly, to ordain a number of young men of the Presbyterian Church, who had not received the required classical and theological training, for the gospel ministry. This proceeding was contrary to the rules and traditions of the Church, and was strenuously opposed by those who stood for the old ecclesiastical order. The Synod of Kentucky refused to sanction the acts of the Presbytery, and this decision was finally confirmed in part by the General Assembly. There were also among those engaged in this controversy some divergencies in doctrinal belief, especially with reference to what were claimed to be the fatalistic teachings of the Confession of Faith. The result was the withdrawal of those who were dissatisfied, and the formation of an independent presbytery, called the Presbytery of Cumberland. Those who organized it recognized as their standard of doctrine the Confession of Faith of the Presbyterian Church, but made provision for those who objected that fatalism was taught in it. The growth of this Presbytery was rapid. In three years it grew into a synod, composed of three presbyteries, and numbering 60 churches.

Its first meeting was held 5 Oct. 1813, when it was organized and a summary of its doctrines. A year later it revised the Confession of Faith to meet its views regarding the articles to which exception had been taken. These were, specially, the third chapter with reference to the decrees of God, and the article with reference to the salvation of infants. The new Church, filled with the revival zeal of its origin, made rapid advances. In 1827 it established at Princeton, Ky., an institutions of learning, and the next year to securing educated men for the ministry. In 1829 the General Assembly of the Cumberland Church was organized, consisting of five synods. At that time the field occupied by the Church embraced eight States, in which there were 18 presbyteries.

In 1906 it was adjudged that the doctrinal differences which had separated the Cumberland Church from the Presbyterian Church in the United States of America had been largely composed. A union of the two Churches was affected. At the time of the union the Cumberland Church had a roll of 1,514 ordained ministers serving 2,889 churches, with a total membership of 185,212 and annual contributions aggregating $933,920. A union of the Cumberland Church, however, refused to enter into the reunion and has continued the organization of the Cumberland Presbyterian Church. The principal reason given for refusing to enter the union was that the revision of the Westminster Confession had not been made in the Churches sufficiently into doctrinal accord to justify the cessation of the separate existence of the Cumberland Presbyterian Church. The question of property and institutions was carried into the courts; but in almost all cases it was decided in the court of final appeal in favor of the body which had gone into the union. The number of ministers in the continued organization is 996 and the total number of Church membership, resident and non-resident, is 63,735. They carry on their benevolent work through Boards of Missions, Education, Publication and Ministerial Relief. They have a theological seminary — the Cumberland Presbyterian Theological Seminary — at McRae, Ga., and Cumberland College located at Leonard, Tex. During its history, various attempts have been made to restore its union with the Presbyterian Church in the United States of America, but they failed on account of the differences which were evident in 1906 when, in convention assembled, the former at Decatur, Ill., the latter at Des Moines, Iowa, the reunion was accomplished.

The Colored Cumberland Presbyterian Church.—Prior to the Civil War the number of colored people in connection with the Cumberland Church amounted to 20,000. In times of slavery, they worshipped in the same buildings with their masters, a particular portion of the church being assigned to them; but they were not allowed to participate in the government of the church. After the Civil War, it was deemed expedient that these members should be associated in a separate organization. Accordingly, presbyteries and synods were formed, which met in a General Assembly 1 May 1874. This organization, whose statistics are rather indefinite, now reports a membership of 25,000. It has one educational institution, but the poverty of the people has prevented them from obtaining a thoroughly educated ministry.

The Presbyterian Church in the United States (Southern).—This Church had its origin
at the beginning of the Civil War, and from causes connected with it. The action of the General Assembly, Old School, in 1861 was one of the leading causes. By the passage of the "Spring Resolutions" concerning the Civil War, it had determined for all under its jurisdiction that there was no right to maintain national government. A minority held that this action, whether true or false, was beyond the jurisdiction of the General Assembly, and that in making it the Church was transcending its sphere, and encroaching upon the province, which alone had the power to define civil duties. A protest was presented against this action, in which it was urged that the Assembly in thus deciding a political question, and in making that decision binding upon those under its care, practically made a condition of church membership which violated the constitution of the Church, and usurped the prerogative of its divine Head. Presbyteries in the seceding States generally coincided with this view, and concluded that the General Assembly was demanded for the defense of a great truth, and for the protection of the liberty with which Christ had made them free. The organization of the Confederate States furnished an opportunity for the changed condition of civil affairs made it expedient and necessary that the presbyteries within the bounds of the Confederacy should be organized as a separate and independent body. Accordingly 93 ministers and elders, representatives from presbyteries, met in Augusta, Ga., 4 Dec. 1861, and constituted a General Assembly, under the name of the General Assembly of the Confederate States of America. They adopted at the same time, as their standards of doctrine, the Westminster Confession of Faith, and the Form of Government as held in the old Church. At the close of the war, the name of the Church was changed to the Presbyterian Church in the United States. In 1864 the United Synod of the South, composed of the presbyteries and churches which had seceded from the General Assembly (New School), on account of its action concerning slavery, was admitted into the General Assembly of the Confederate States. It consisted of 120 ministers, 190 churches and 12,000 communicants. In 1869 that portion of the Synod of Kentucky which had separated from the General Assembly (Old School) in 1867 was received into connection with the Southern General Assembly, bringing with it 13,540 communicants. In 1874 the independent Synod of Missouri, which had separated itself from the Northern Assembly on account of its action concerning civil affairs, united with the Southern Assembly. The churches in connection with this Assembly are almost exclusively in what is called the South, and for that reason it is commonly called "the Southern General Assembly" in distinction from the Assembly, North. Its missionary and benevolent operations are not conducted by organized bodies, but through committees elected annually by the General Assembly, directly responsible to it, and acting under its instruction. It carries on mission work in China, Africa, South America, Greece, Italy and Mexico. Its home mission work is conducted with vigor and efficiency, and includes work among Indians and negroes, as well as the white population. It has under its care Union Theological Seminary at Richmond, Va.; the Theological Seminary at Columbia, S. C., and the Theological Seminary at Louisville, Ky. The last-named institution, having been joined with Danville Seminary, is now under the joint control of both synods of Kentucky, one in connection with the Northern and the other with the Southern Assembly.

In addition to these, the Southwestern Presbyterian University at Clarksville, Tenn., has a theological department, and there is also a theological seminary at Austin, Tex. For the education of the colored ministry there is the Stillman Institute at Tuscaloosa, Ala., making a total of six theological seminars. This branch of the Church, while holding in common with other Presbyterian churches the Westminster Confession and Catechisms, Larger and Shorter, lays special emphasis upon the spirituality of the Church in its functions. It insists that all church orders be regulated by the articles of the Confession, which says, "synods and councils are to handle or conclude nothing but that which is ecclesiastical." The latest statistics for this Church are as follows: Number of ministers, 1,861; number of communicants, 348,223; number of Sunday school pupils, 328,252; and total contributions, $4,967,852.

The United Presbyterian Church of North America.—This organization is the result of a union between the Synod of the Associate Reformed Church and the Associate Synod, commonly known as the Seceders. This union took place in Pittsburgh, 26 May 1838. The basis of it was the Westminster Confession of Faith, with a modification of the chapter on the power of the civil magistrate, the Catechisms, Larger and Shorter, and a Judicial Testimony. Most of the articles in this testimony are held in common by all Evangelical churches, but there are five which are special to this denomination. The first declares that slave holding is a violation of the law of God and contrary both to the letter and spirit of Christianity. The second declares that all secret and oath-bound societies are inconsistent with the genius and spirit of Christianity, and that church members ought not to have fellowship with such associations. The third is a declaration in favor of close communion; none are to be admitted to the seating ordinances of the Church except such as give their assent to its doctrines. The fourth declares the duty of public social covenanting at special times. The fifth affirms that it is the will of God that the songs contained in the Book of Psalms should be used exclusively in public worship, and that hymns, the composition of uninspired men, should not be employed in such service. In all other respects, the laws, government and discipline of this Church are the same as those of other branches of the Presbyterian Church. It has been distinguished for the careful training of its ministry. It has in its connection two theological schools, and six colleges. For the execution of its work the United Presbyterian Church has seven boards, namely: Home, Foreign, Freedmen's Mission, Church Erection, Publication, Education and Ministerial Relief.

Its foreign mission work is now carried on
688 PRESBYTERIAN CHURCH IN THE UNITED STATES OF AMERICA

in India, Egypt and the Soudan. In home missions it has been progressive in work in the mountains of the South, among the foreigners and the freedmen in the South. It also has departments of work in Bible schools, evangelism, social service and industrial conditions. The latest statistics give 1,143 ordained ministers and 1,130 congregations. The communicants in America are 156,954. The total membership, including the foreign field, is 200,879. Its contributions in 1916 were $3,006,508.

The Reformed Church in the United States (German Reformed).—Previous to the Revolutionary War a considerable number of emigrants from the Palatinate, a district of Germany, emigrated to America and settled in Pennsylvania. They were members of the Reformed Church in Germany and were men of sterling character and devoted piety. They became important factors in the settlement of middle and western Pennsylvania, and also took part in the Revolutionary War. The first German Reformed minister settled among these emigrants was Philip Boehm, who came to Allentown in 1720. In 1747 there were five ordained ministers and 46 organized churches. In 1793, at which time the Synod was divided into classes, there were 22 ordained ministers and about 150 churches. Subsequently affiliated synods were organized in Ohio and in the neighboring States; but it was not until the year 1863 that organic union was established between them. The General Synod was organized 18 Nov. 1863 in Pittsburgh, Pa. It holds its sessions triennially. It is a delegated body composed of an equal number of ministers and elders, elected by the several classes, constituting eight synods. The General Synod has under its control the various boards to which are entrusted the work of home and foreign missions, and also that of the Sunday school. The membership of the Church is located in the northern belt of the country extending from the New England States to the Pacific slope and southward as far as North Carolina.

The last statistics give the number of ministers and of congregations 1,773, with a communicant list of 326,112 members. Their gifts for benevolence during 1916 were $687,446. Its principal foreign mission work is in China and Japan, where evangelistic, educational and hospital work is conducted. Its mission work is growing home work mission at an expense last year of $162,349.

The Reformed Presbyterian Church in North America.—This organization traces its ancestry to the Covenants and claims to be a lineal descendant of the Kirk of Scotland. Its name has a twofold significance and is a résumé of its history. It is called Reformed, to indicate that it was founded on the principles of the Reformation, and Presbyterian because of its adoption of and long struggle to maintain the form of government. The first presbytery of the Reformed Presbyterian Church in America was organized in 1774. In 1782 the majority of this presbytery united with the Associate presbyteries and formed the Associate Reformed Church. It refused to accept the union and maintained their organization in what was called "praying circles." Ministers having been obtained from Scotland, in 1798 the presbytery was again constituted. In 1809 the Synod of the Reformed Church was organized with three presbyteries, in Philadelphia; the three presbyteries a General Synod was in time organized. But in 1833 a division occurred by which it was separated into two branches, known respectively as the Synod of the Reformed Church and the General Synod of the Reformed Church. The distinctive features of the Reformed Church are, first, the kingly office of Christ in the sense that nations as well as individuals are his subjects and should acknowledge his authority. Hence Reformed Presbyterians, in their capacity as a church, refuse to hold office or to exercise the right of suffrage in any government that does not clearly own Christ as king and his law as supreme. Second, the exclusive use of the Psalms in praise. Third, opposition to secret and oath-bound societies. Fourth, communion restricted to church membership. The cause of the division of the Synod into two branches was a difference of opinion concerning the application of these distinctive principles, one party demanding a rigid and the other a liberal interpretation.

The Synod maintained that voting under the Constitution of the United States involves immorality. The General Synod maintained that voting does not involve morality, a position that makes it so near like several other American denominations as to dim its individuality. The General Synod has 20 ministers, 17 congregations and about 3,000 communicants. The Synod of the Reformed Church, representing the "Old Side," is the stronger of the two branches. It now has 8,481 communicants.

The Christian Reformed Church.—The organization of this Church took place in 1857. It is lineally descended from the Reformed Church of Holland. About the year 1847 a large number of Hollanders, connected with the Christian Reformed Church of the Netherlands, emigrated to America and settled in Michigan. For a short time they became associated with the Dutch Reformed Church, now the Reformed Church of America; but after a time withdrew on account of what they deemed a tendency toward the trine and discipline, and formed an organization of their own. Its membership is to be found mainly in the States of Michigan, Illinois, Iowa and New Jersey, with a few scattered congregations in New York, Ohio, Indiana, Wisconsin and Minnesota. It is rigidly Calvinistic in its doctrines, accepting as its standard the articles of the Synod of Dort, and the Heidelberg Catechism. It is opposed to secret oath-bound societies and uses almost exclusively the Psalms and the service of praise. It uses also a liturgy in the administration of the sacraments and in the ordination of ministers and elders. Its theological school is in Grand Rapids, Mich. It numbers about 160 churches and 36,296 communicants. Its General Synod meets biennially at Grand Rapids, Mich. Its ministers officiate in the English, German, French, Bohemian and Hungarian languages.

The Welsh Calvinistic Methodist.—This branch of the Presbyterian body is derived from the Calvinistic Methodist Church of Wales. The first church of this denomination in the United States was organized in Remsen, N. Y., and three years later the first presbytery was
constituted. On 22 Sept. 1869 the General Assembly was organized and held its sessions in Columbus, Ohio; and it has met triennially ever since. Its standards of doctrine are the same as those of the Reformed Church in Wales. Its system of government is presbyterian. The Church exists among the Welsh in 13 States of the republic, and in 1916 had 14,326 members.

The Associate Reformed Synod of the South.—The origin of this synod dates back to 1801. It was the result of a secession from the Associate Reformed Church on account of differences concerning psalmody and communion questions. Its membership is confined principally to the Southern States and numbers about 15,112. Its doctrinal symbols are the same as those of other Reformed churches.

There are also in the United States several organizations of Presbyterians known respectively as The Associate Church of North America, The Reformed (Convenanted) and The Reformed in the United States and Canada. The number of their adherents is small, not exceeding 2,000.

Presbyterian Churches in Canada.—Presbyterianism in Canada is of Scottish origin, and in it are to be found representatives of every shade of Presbyterianism that has appeared in the British islands. Its early history is marked by divisions, which in course of time have been overcome. In 1831 the Synod of the Presbyterian Church of Canada, in connection with the Church of Scotland, was organized. Meanwhile other Presbyterian ministers, chiefly of the Associate Church of Scotland, organized themselves as the Synod of Upper Canada. These two bodies were united in 1840. Previous to this union another church had been formed under the name of the United Presbyterian Church of Canada. On 10 July 1844, 25 ministers, in connection with the Church of Scotland, who were in sympathy with the Free Church movement in Scotland, withdrew from the United Presbyterian Church and organized themselves under the name of the Presbyterian Church of Canada. For 17 years these three bodies maintained a separate existence; but in 1861 a union was effected between the United Presbyterian Church and the Free Church, under the name of the Synod of the Presbyterian Church of Canada. This synod entered upon a prosperous career, and in 1870 the supreme court of this Church was for the first time constituted as a General Assembly. In 1860 a union was accomplished between the churches of Nova Scotia and New Brunswick; and in 1868 the synods of Nova Scotia and New Brunswick, in connection with the Church of Scotland, formed one synod. A general union of all the churches took place in the year 1873, into which union, under the name of the Presbyterian Church of Canada, came the Presbyterian Church in Canada, in connection with the Church of Scotland, the Canada Presbyterian Church, the Church of the Lower Provinces and those of the Maritime Provinces in connection with the Church of Scotland. This union was cordial, and it has been followed by marked progress and substantial prosperity. The united Church has 1,899 ministers, 1,675 congregations and 333,457 communicants. The total contributions for all purposes in 1916 amounted to $5,460,133. The home mission work is comprehensive, embracing such fields as evangelism, moral and social reform, congested city districts, church and rural life and church and industrial life. It is carrying on foreign missions. The 182 missionaries are engaged in China, Korea and India. It has five theological seminaries. See Presbyterianism.

Charles L. Thompson, D.D., Ex-Moderator, Presbyterian Assembly.

Presbyterian College Board, an organization formed by the General Assembly in 1883, for the purpose of establishing colleges for the education of ministers, especially in the sparsely-settled Western States. Colleges must be of a profession Christian purpose and deserve of converting all students under their tutelage in order to receive assistance. Fifty-one colleges are now co-operating with this board. See Presbyterian Church.

Presbyterian College of South Carolina, a South Presbyterian institution of learning at Clinton, S. C., founded in 1880. The faculty numbers 10; the average annual enrolment is about 20. The library contains over 3,000 volumes.

Presbyterian System, Alliance of the Reformed Churches Throughout the World. Holding the. Previous to 1870 the desire had been frequently expressed that the various branches of the Presbyterian churches could be united in some general alliance which would express the generic unity of Presbyterianism. Some attempts had been made in this direction, but the first official step in this country was taken by the General Assembly of the Presbyterian Church, U. S. A., at its sessions in Baltimore in 1873. As a result of this action, the alliance was formed by representatives from different Presbyterian churches in London, England, in the year 1875. The alliance is composed of representatives from different branches of the Presbyterian Church throughout the world. The action of the General Council is not legally binding upon any of the churches, but only advisory in its character. It has, however, been enabled through its counsels to regulate the mission work of the Church, and to bring different branches of the
Presbyterian family into closer relations, for mutual support. The alliance has held seven General Councils: the first was in Edinburgh, Scotland, 1877; the second in Philadelphia, U. S. A., 1880; the third, in Belfast, Ireland, 1884; the fourth, in England, 1884; the fifth in Toronto, Canada, 1892; the sixth in Glasgow, Scotland, 1899; the seventh in Washington, D. C., 1909; the eighth in Liverpool, England, 1904. The churches connected by this number now total over 8,000, and are located in all parts of the world. The adherents of the Presbyterian and Reformed churches represented in the alliance number at the present time about 30,000,000.

**Presbyterianism**, a term derived from the Greek word πρεσβυτέρος, meaning "an elder," defines, primarily, a system of church government. As such, it stands midway between Episcopacy or Prelacy and Independency or Congregationalism. It affirms that the Church, as to its government, is a theocracy under law to Christ, its supreme and only Head and Law-giver; but the powers of government are vested in the body of believers, and are to be exercised through their chosen representatives called "elders." It denies the claim of one man, or of a special class of men, to rule the Church by virtue of a divine right. In opposition to papacy and prelacy, it asserts the right of the Church to govern itself through its chosen representatives, administering rule and discipline according to the word of God. The radical principles of Presbyterian Church government and discipline are: that the several different congregations of believers, taken collectively, constitute one church of Christ, called emphatically, The Church; that a larger part of the church or a representation of it, should govern a smaller, or determine matters of controversy which arise therein; that in like manner a representation of the whole should govern and determine in regard to every part, and to all the parts united; that, is, that a majority shall govern; and, consequently, that appeals may be carried from lower to higher judicatories, till they be finally decided by the collected wisdom and united voice of the whole church. For these principles and this procedure, the example of the Apostles and the practice of the primitive Church are considered as authority.

The Presbyterian form of government is essentially republican. It differs from Congregationalism in that it asserts the visible organic unity of the Church in the sense that all local or individual churches are included under one government, in which the majority governs. In accordance with its representative form of government, it has a succession of church courts or judicatories. First in order is the session, or consistory, of the local church, chosen by its members. Next is the presbytery, having jurisdiction over the ministers and churches within a certain limited district. It is composed of the ministers, and one elder from each church in the district. The synod, likewise a representative body, has jurisdiction over several presbyteries. There must be at least three presbyteries to compose a synod. The boundaries of synods in America are usually, and for the sake of convenience, co-terminous with the boundaries of the States in which they are located.

The highest court is called the General Assembly, or General Synod. It is a representative body, composed of an equal number of ministers and elders elected by the presbyteries. The number of representatives from each presbytery varies according to the membership of the presbytery; but each presbytery is entitled to be represented by one minister and one ruling elder. The General Assembly represents all the churches under its care. It exercises administrative, legislative, and judicial functions. Its decrees are final and binding upon all the lower courts, when made in accordance with the constitution of the Church. Another characteristic of Presbyterianism is the parity or equality of the ministry. According to its teachings, there are but two permanent official orders in the Church, bishops or elders and deacons. The first includes both teaching and ruling elders. The term deacon includes the two-fold distinction of male and female. The deacons are those to whom is especially committed the administration of the charities of the Church (Acts vi, 3).

Presbyterians claim for their order and form of government apostolic and scriptural sanction. Some among them have gone so far as to assert that the Presbyterian form of government is *jus divinum*, and that none other can be allowed in the Church. This extreme position, however, has had but few advocates. The general view is that it is an ancient form of government having apostolic sanction, and that it is agreeable to Holy Scripture. The main argument by which this view is supported is in brie: The office of elder was established in the Old Testament Church in the earliest time. The elders were a distinct class of office-bearers in the Hebrew commonwealth, and ruled in the synagogue or local church. In biblical history they are mentioned as representatives of the people (Exodus iii, 16 and iv, 24; 1 Samuel viii, 4; 2 Samuel v, 3; 1 Kings viii, 1). They were especially prominent in the synagogues, where they were the principal leaders of the people from the time of the return from the Babylonian captivity. Each synagogue had a bench of elders, with a presiding officer known as the chief ruler, to which was entrusted the oversight of the congregation. The rulers of the synagogue, mentioned in the gospel narrative, were these elders. The government of the synagogue, with its system of appellate courts terminating in the Sanhedrin, was Presbyterian (Edersheim, *Life of Christ,* Vol. II, p. 552). Jesus Christ and His chosen apostles, the founders of the Christian Church, had been trained in the synagogue and were accustomed to no other form of church government. They knew that it had been previously sanctioned by prophets, priests and kings, all through the history of the chosen people. It was but natural that the same form of government should be adopted in the new church or *Ecclesia,* the body of those called out from the synagogue.

That the synagogue furnished the model for the government of the Christian Church is definitely attested by the statements of the apostles. Acts xiv, 23 and xx, 17-18; 1 Peter v, 1; 1 Timothy iv, 14 and v, 17. It is further claimed that the terms *episcopus* and *presbyteros,* signifying respectively bishop and elder, are equivalent terms designating the same office. Elders and
deacons constituted the office bearers of the early Church. In course of time the "chief ruler" came to be known as episcopos, the bishop of the church; but each church had its own bishop or overseer. They were what the Presbyterian pastor is at the present day. Such in general are the grounds upon which Presbyterians claim that their form of government is both primitive, apostolic and conformed to the New Testament Church order. Whatever may have been the primitive form of church government, the fact that it is a historical fact that from the 3rd century what is known as presbytery became the prevailing order, culminating in the papacy. At the time of the Reformation (1562-1700) all the reformers desired to restore to the people their primitive rights, but there was considerable diversity of opinion as to methods. John Calvin, in Geneva, was the first to organize a representative government in a practical form, by restoring the eldership to the church.

The Church of Scotland, and the Reformed churches of France and Holland are Presbyterian as to their form of government. Most of the Reformed churches have adopted, with slight modifications, the Presbyterian polity. The Methodist Episcopal Church in America, the largest of the Protestant bodies, while Episcopal in name, has become Presbyterian in fact, so far as polity is concerned. In the Protestant Episcopal Church there is now representation from the laity and the powers of the presbytery have been greatly enlarged. The Lutheran Church in the United States is also presbyterian in polity.

The Doctrines of the Presbyterian Church. — While the term "Presbyterian" defined, primarily, a polity or form of church government, it is also definitive of a system of doctrine, known as the Calvinistic or Reformed. So far as doctrine is concerned, Presbyterianism and Calvinism are synonymous. It is a popular mistake to suppose that Presbyterians accept all the teachings of the great Geneva reformer, John Calvin; but his statement of the Pauline or Augustinian system of theology is generally accepted by all branches of the Presbyterian family, and is embodied substantially in their Confessions. The five distinguishing features of the Calvinistic doctrine are: the absolute sovereignty of God in creation, providence and redemption; the fall of man and his utter inability to save himself from the consequences of his transgression; the election from this fallen race by the sovereign grace of God of a certain number unto eternal life; the provision made for their salvation in Jesus Christ; their effectual calling by the Holy Spirit; and their perseverance in grace, assured by the indwelling of the Holy Spirit.

The accepted symbols of the Presbyterian faith are, the Canons of the Synod of Dort, 1619 A.D., the Westminster Confession of Faith with the Catechisms, Larger and Shorter, 1646 A.D., and the Heidelberg Catechism, 1563 A.D. (See Dort, Synod of, and Westminster Assembly). These symbols are regarded as subordinate standards. Presbyterians receive the Scriptures of the Old and New Testament as the supreme standard, "the only infallible rule of faith and practice." In America, the most widely accepted symbol of faith is the Westminster Confession, slightly modified from its original form. In the year 1900 a movement was inaugurated in the largest denomination of the Presbyterian Church for a revision of the Confession of Faith. This movement resulted in the year 1903 of an explanatory statement with reference to the third chapter of the Confession of Faith, and in sundry minor amendments. The Assembly also adopted a Brief Statement of Doctrine to be used in the churches under its care. The Confession of Faith as revised still remains the authoritative standard of the Church. Ministers and office bearers are required to subscribe to it in the following terms: "Do you sincerely receive and embrace the Confession of Faith of this Church as containing the system of doctrine taught in the Holy Scriptures?" But the only requirement for admission to the communion of the Presbyterian Church is faith in the Lord Jesus Christ, as the Saviour of the world.

While claiming that their polity is lawful and agreeable to the Word of God, and that their system of doctrine is that taught in Holy Scripture, Presbyterians recognize all other churches holding to the essential doctrines of Christianity as parts of the one Catholic Church.

History of the Presbyterian Church. — The history of Presbyterianism begins with the reorganization of the Church in the Reformation period, at a council held in Zürich, 26 Oct. 1523, at which the principles of primitive Presbyterianism were formally adopted, and thereafter became the distinctive features of the Reformed churches in Switzerland, France, Belgium, Holland and Prussia. They were adopted by the Church of Scotland which, under the leadership of John Knox, separated herself from the papacy. They were also introduced into England about 1572 by Cartwright. In Scotland, and in the north of Ireland, Presbyterianism has continued to be the dominant faith; and from these great centres it has exerted an influence extending throughout the world.

The Church of Scotland. — Presbyterianism in Scotland is divided into different branches, chief of which is the Church of Scotland, commonly known as the Established Church. It is the state church, supported by the government. It was organized in 1500 and legally established in 1592 by the Scottish Parliament. It is, numerically, the largest Church in Scotland, and its various enterprises, which are many and important, are carried on with great energy and liberality. According to the statistics of 1916 the Church of Scotland has 718,719 communicants.

The Free Church of Scotland. — This branch of Presbyterianism originated in a separation from the Established Church in the year 1843. The immediate cause of the disruption was diversity of views on the subject of patronage. One of the principles of Presbyterian government is, that "no minister should be intruded upon a congregation contrary to its will." By act of Parliament, the right to ap-
point ministers to vacant churches had been conferred on certain landed proprietors connected with the parishes. The General Assembly for many years protested against this enactment, but to no avail. The exercise of this legal right in a particular case led ultimately to the withdrawal of a large number of ministers and churches from the establishment, and to the organization of the Free Church of Scotland. But the great underlying reason for this movement was, the determination to maintain the spiritual independence of the church from the civil power, and her liberty to obey the Lord Jesus Christ as the Supreme Head of the Church. The new organization grew rapidly and took a foremost place in missionary and educational work.

The United Presbyterian Church of Scotland.—This organization originated 13 May 1847 in a union between the United Secession and the R. U. C. These churches had originated from doctrinal differences in the past, and the harsh exercise of discipline in the establishment. The United Church has been distinguished for its missionary zeal and progressive spirit. It has been said of it, that it had done more for the diffusion of the gospel throughout the world than any other denomination of its size, except the Moravians.

As early as 1852 negotiations for a union of this branch of the Church with the Free Church were begun, and they were continued from time to time till 1873 without any manifest results. In 1896 the United Presbyterian Church again took up the matter of union with the sister body, and the following year the Free Church responded by appointing a committee of conference. The United Presbyterian Church did the same and a remarkable and happy agreement was discovered between these two bodies both as to doctrinal standards and their methods of work. A common constitution was adopted and in 1900 the way for a complete union of the two was paved. The matter was referred to the courts of the Church, and the decision with respect to the property of the Free Church was carried through various courts and up to Parliament, with the final decision which deprived the Free Church of all the property of the original Free Church and left it in the control of the very small body claiming to be the Free Church of Scotland. That body in 1901 had only 25 ministers and 63 congregations. They were largely the churches of the Highlanders and protested against all relaxation in the terms of subscription against the disestablishment of the Church, against the use of hymns and organs, against the toleration of Glasgow professors in their chairs.

While the general decision of the highest court remained, final arrangements for the use of the property of the Free Church were made, by which, in cases where the Free Church could not use or occupy, it might go to the United body. Under the decision of the appointed commissioners the Assembly Hall with new college buildings and the High Church were to be the property of the United Free Church. The allocation of the churches from the one body to the other has been slow, but in 1908 over 100 churches had been assigned to the use of the United Free Church. That body now carries on missions in India, Manchuria, Africa, Melanesia and in the West Indies. It has three divinity halls at Glasgow, Aberdeen and Edinburgh, is progressive in all its educational and missionary work. By the latest available statistics the United Free Church has 512,000 communicants.

The Presbyterian Church of England.—Presbyterianism in England is associated with the great Puritan movement in that country. It manifested itself in the famous Westminster Assembly, 1643. When prelacy was abolished by the Long Parliament, Presbyterianism was established in its stead, 29 June 1647, and for 20 years it was the national church of England. But opposed by Cromwell and Independency, on the one side, and by the Episcopal Church on the other, it was destined to lose its position. After the restoration of Charles II, and on Saint Bartholomew’s Day, it was disestablished and 2,000 ministers, most of them Presbyterian, were ejected from their parishes. In 1668 the Presbyterian Church of England denied civil and religious rights. The passing years brought some amelioration, as a more tolerant spirit pervaded legislation; but from that time until 1850 it had only a feeble existence. Since the last quarter of the century the union of various scattered churches, Presbyterianism has greatly revived in England.

Thus, in 1876, the English congregations of the United Presbyterian Church of Scotland, which was strong in the three districts of Northumberland, Lancashire and London, were gathered into one synod with the Church of England and known as the Presbyterian Church of England. In 1897 it founded the Westminster College at Cambridge for the purpose of securing a home-bred ministry for its churches. The whole necessity of this was shown by the revision of its standards but without setting aside its Westminster Confession. Twenty-four Articles of Faith have been adopted. In these, however, there is no essential change of doctrine, and, rather of the opposite. According to the statistics of 1916, the Presbyterian Church in England and Wales numbers 88,166.

Welsh Calvinistic Methodist (Presbyterianism).—This Church represents Presbyterianism in Wales. The movement which resulted in the establishment of this Church began in 1736 and owes its origin to the evangelical revivals which were spreading throughout the country at that time. In 1864, the two synods, that of North Wales and that of South Wales, united in one General Assembly, whose decisions are binding upon churches in all matters of controversy between them. This Church maintains cordial fellowship with the Presbyterian Church of England. Its Confession of Faith in all essential articles is in harmony with the Westminster Confession, and with the Thirty-Nine Articles of the Church of England. Its leading theological seminary is at Bala, North Wales. It has also under its care a college at Trevecca, South Wales. It has both Home and Foreign Missionary societies, and a fund for the support of aged and infirm ministers. The above-named churches are the
principal branches of the Presbyterian Church in the United Kingdom of Great Britain. In addition to these there are in Scotland the Reformed Presbyterian Church, and the original Secession Church of Scotland, with a combined membership of about 10,000, and in England a branch of the Church of Scotland.

The Irish Presbyterian Church.—Presbyterian ministers began their work in Ireland as early as 1594, but on account of persecution Presbyterianism did not obtain a permanent footing there until 1642. It found its home in the northern part of the island, and in the province of Ulster. Its progress was at first hindered by divisions, and by the presence of Arianism which was openly avowed by some of its ministers. In 1840 the various churches were united in one body under the name of the Presbyterian General Assembly of the Presbyterian Church in Ireland. Since this union the Irish Presbyterian Church has occupied a commanding position in the country. It has at present more than half a million people under its care, 560 congregations, over 600 ministers, 5 synods, and 37 presbyteries. The ministers were supported by the Regium Donum—a grant from the state. About 33 years ago this grant was commuted into a general fund amounting to $3,000,000. This is the basis of the Sustentation Fund, the income from which, increased by voluntary contributions from the churches, supports the ministry. The Church has large foreign missions, and has under its care the Assembly's College at Belfast, and the Magee College, Londonderry. For the last 150 years there has been a constant stream of emigration from the north of Ireland to America and the British colonies, so that the Irish Presbyterian Church has been largely instrumental in establishing Presbyterianism in other parts of the world. Three small communities in Ireland have failed to go into the United Irish Presbyterian Church and retain their separate autonomy under the names of the Reformed Presbyterian Church, the Eastern Reformed Church and the Secession Church.

Presbyterian Churches in Europe.—The Reformed churches of the Reformation period in Europe, France, Germany, Russia and the Netherlands were generally presbyterian as to their form of government. In addition to these is the ancient church of the Waldensians, dating from primitive times and now established in various parts of Italy and Switzerland. The Presbyterian Church has been extended to Spain, Hungary, Austria, Russia and Norway. The number of adherents in Europe is somewhere over 14,000,000.

There are also scattered groups of Presbyterians in Africa, Asia, Australasia and South America, numbering all told about 2,600,000.

For the Churches of Ireland and Continent of Europe: Records of a General Council of the Presbyterian Churches (1877–99).

Charles L. Thompson, D.D., Ex-Moderator, Presbyterian Assembly.

Presbytery, in Presbyterian churches, a court of judicature consisting of all the ministers of the denomination within a given district, and of ruling elders, one from each church session. Each meeting is opened with prayer by the Moderator. The functions of the court are purely executive, not legislative. It has supervision of all the congregations within its territorial limits, hears appeals from decisions of the several sessions, examines candidates for the ministry, issues licenses to probationers, ordains ministers, and in general guards the spiritual interests of the congregations under its charge in matters of doctrine or of discipline.

Prescott, Albert Benjamin, American chemist: b. Hastings, N. Y., 12 Dec. 1832; d. 1903. He took his M.D. at the University of Michigan in 1864 and in 1864–65 was assistant surgeon of the United States volunteers. He was appointed assistant professor of chemistry at the University of Michigan in 1865, where he subsequently became professor of organic and applied chemistry in 1870, dean of pharmacy in 1876 and director of the chemical laboratory in 1884. He was president of the American Association for the Advancement of Science in 1891, and of the American Pharmaceutical Association in 1900. Author of: "Quantitative Analysis" (1874); "5th ed., 1901); "Chemistry of Alcoholic Liquors" (1875); "Nosmuths in Relation to the Public Health" (1881); "Manual of Organic Analysis" (1888), etc.

Prescott, George Bartlett, American electrician: b. Kingston, N. H., 16 Sept. 1830; d. New York, 18 Jan. 1894. He studied electricity and telegraphy and from 1847–58 was manager of several telegraph offices in Connecticut and Massachusetts, becoming in the latter year superintendent of the American Telegraph Company and in 1866 accepted the same position with the Western Union Company. He was electrician of the International Ocean Telegraph Company in 1873–80, was actively interested in various telephone and telegraph companies and was one of the promoters of the former. He discovered the electrical origin of aurora borealis in 1852, invented several improvements in telegraph and telephone instruments, was engaged with Edison in the invention of the duplex and the quadruplex telegraph which he successfully launched on the market and introduced in this country the European system of dispatching messages through pneumatic tubes. He published in the Boston Journal and in the Atlantic Monthly accounts of his discoveries concerning the aurora borealis and also wrote "History, Theory and Practice of the Electric Telegraph" (Boston 1860); "Electricity and the Electric Telegraph" (New York 1879); "The Speaking Telegraph, Electric Light and Other Recent Electric Wonders" (New York 1879); "Dynamo-Electricity: Its Generation, Application, Transmission, Storage and Measurement" (New York 1884). Bell's
Electric Speaking Telephone: Its Invention, Construction, Application, Modification and History (New York 1884).

PRESCOTT, Oliver, American soldier: b. Groton, Mass., 27 April 1731; d. there, 17 Nov. 1804. He was a brother of Col. Wm. Prescott (q.v.). He was graduated from Harvard in 1752 and became a physician in the practice of medicine, becoming one of the most successful and popular general practitioners. He was a charter member of the Massachusetts Medical Society, incorporated in 1781. In 1780 he became a Fellow of the American Academy of Arts. He was also for many years one of the trustees of Groton Academy. He was an officer in the State militia with rank as major, lieutenant-colonel and in 1776 became a brigadier-general and a member of the board of war. In 1777 he was elected to the supreme executive council of his State and in 1778 received rank as third major-general of militia. He resigned soon after his promotion to second major-general in 1781 and was empowered by the government to command over any person whom he should consider dangerous to the Commonwealth. In 1779 he was made judge of the Probate Court of Middlesex County, Mass., and played an important part in the suppression of Shay’s rebellion in 1786-87. Consult Prescott, W., M.D., The Prescott Memorial (Boston 1870).

PRESCOTT, William, American soldier, brother of O. Prescott (q.v.): b. Groton, Mass., 20 Feb. 1726; d. Peabody, Mass., 13 Oct. 1795. He served with the rank of lieutenant in the expedition against Nova Scotia under Wilson in 1755 and was offered a commission in the British army. He declined the honor and lived in retirement until the battle of Lexington in 1775 when he joined the Continental camp at Cambridge with a regiment which he had organized in 1774 and of which he was colonel. At the battle of Bunker Hill he was very conspicuously, really commanding the patriot forces and displaying the greatest courage and ability. He served in the Continental army until the end of 1776 and then retired from active duty with the exception of a short service as a volunteer at Saratoga in 1777. After his retirement he served as town clerk and selectman of Groton and for three years represented his town in the General Court of Massachusetts. For the balance of his life he was an acting magistrate. Consult Gardner, P. A., 'Colonel William Prescott's Regiment' (in Massachusetts Magazine, Vol. I, pp. 149 and 235, Salem 1908); Green, S. A., 'Colonel William Prescott and Groton Soldiers in the Battle of Bunker Hill' (Cambridge, Mass., 1909); Parker, F. J., 'Colonel William Prescott, the Commander in the Battle of Bunker Hill' (Boston 1875); Prescott, William M.D., 'The Prescott Memorial' (Boston 1870).

PRESCOTT, William Hickling, American historian: b. Salem, Mass., 4 May 1796; d. Boston, 28 Jan. 1859. In 1811 he entered Harvard College and was graduated in 1814. He long had trouble with his eyesight, which eventually broke down and the last half of his life he could read only for a few moments at a time, and could scarcely see to write at all. He had early resolved to devote himself to a literary life and soon after leaving college went to Europe and spent two years in traveling through England, France and Italy. The subject for which his inclination and abilities more especially fitted him was history and he published his 'History of the Reign of Ferdinand and Isabella the Catholic' in 1826, the first volume in 1837 in Boston. The success which this achieved was most decisive. It was received with the utmost enthusiasm both in America and Europe; was soon translated into French, Spanish, and German; and its author was elected a member of the Royal Academy of History of Madrid. Prescott’s next work was the 'History of the Conquest of Mexico, with a Preliminary View of the Ancient Mexican Civilization and the Life of the Conqueror Hernando Cortez' (3 vols., New York 1843), which was received with equal favor; and next appeared the 'History of the Conquest of Peru, with a Preliminary View of the Civilization of the Incas' (3 vols., New York 1847). Prescott now began the 'History of the Reign of Philip II,' and he paid no expense were spared by him to render the result commensurate with the undertaking. He received the most liberal co-operation from all quarters, public and private, and everywhere both public and private collections were thrown open to his inspection. In 1855 the first two volumes of the work appeared entitled, 'The History of the Reign of Philip II, King of Spain,' and in 1858 the third volume. In 1857 Prescott published an edition of Robertson's 'History of the Reign of Charles V,' with notes and supplement; containing an account of the emperor’s life after his abdication.

The labors of Prescott afford a remarkable instance of the success of indomitable industry and perseverance carried out in the face of what might otherwise appear almost insurmountable obstacles. Partial blindness preventing him from consulting personally the authorities from which he drew his materials, he had them read aloud to him. His first reader knew Spanish however, no language but English. The historian *taught him,* and he pronounced the Castilian, suited, I suspect, much more to my ear than that of a Spaniard.* He afterward obtained the services of a reader acquainted with several of the Continental languages. Prescott’s contemporaries laid strong emphasis and not unjustly, on the thoroughness of his research. But unfortunately modern discovery had done much to correct his pictures of early American civilization, for his information on which he had no recourse save the Spanish chroniclers. Hence 'The Conquest of Mexico' and 'The Conquest of Peru' are now to be valued less for their historical accuracy than for the sweep of the narrative and unfailing interest of the style. Indeed, this *easy flow of language* and *faultless lucidity,* praised by Bancroft, is everywhere apparent in Prescott’s work. He has not escaped the charge of too highly coloring his scenes for the sake of dramatic effect. He was not an analytical investigator, but rested content with a splendid synthetic arrangement of the concrete facts which he sincerely labored to obtain. This artistic sense and breadth of scope gave to his work an interest and a popularity not known in the case of many historians. A collection of eminent opinions on Prescott may be seen in the
familiar Dictionary of Authors, by Allibone. That his reputation was international is proven by the long list of literary honors which were showered on him. Besides being made a member of some 16 State historical societies in his own country, he was also elected to membership in the American Philosophical Society, Royal Academy of Science of Naples, American Antiquarian Society, American Academy of Arts and Sciences, Herculaneum Academy of Naples, National Institute, French Institute, Royal Society of Berlin, Royal Society of Literature of London, Mexican Society of Geography and Statistics and Royal Irish Academy. He received honorary degrees from Columbia College, South Carolina; Harvard; Columbia College, Washington, D. C.; Oxford University, England. His contributions to periodicals were collected under the title of 'Biographical and Critical Miscellanies' (New York 1845; London 1861). A complete edition of his work has been published in 15 volumes (new ed. 1900). Concerning his life: Prescott (Boston and New York 1904); Peck, H. T., 'W. H. Prescott' (New York 1905); Ticknor, G., 'Life of W. H. Prescott' (Boston 1864); Bassett, J. S., 'The Middle Group of American Historians' (New York 1916).

PRESCOTT, Ariz., city, county-seat of Yavapai County, on the Santa Fé, Prescott and Phoenix and on the Atchison, Topeka and Santa Fé railroads, about 135 miles north of Phoenix, the capital of the State. The plateau upon which the city is situated has here an altitude of 5,547 feet. Prescott was named in honor of the historian William Hickling Prescott (q.v.) and was formerly the capital of Arizona when it was still a Territory. It is in the midst of a rich mining region; the chief minerals mined in the vicinity are copper, silver and gold. Considerable attention is given to stock raising and farming, and there is some lumbering. Prescott has a hospital, a Carnegie library, a courthouse, four banks with total deposits of over $6,000,000, and some newspapers. The educational institutions are Saint Joseph's Academy, public and parish schools. Pop. 5,092.

PRESCOTT, Ark., city and county-seat of Nevada County, 30 miles southwest of Arkansas, on the Saint Louis, Iron Mountain and Southern and on the Prescott and Northwestern railroads. It is located in a cotton-growing district, has a large trade in this article and also in lumber, livestock, eggs and poultry, butter, furs and wool. Pop. 2,705.

PRESCOTT, Canada, town and county-seat of Grenville County, Ontario, on Saint Lawrence River, opposite Ogdensburg, N. Y., 50 miles southwest of Ottawa, on the Canadian Pacific Railway. There are iron foundries, breweries, distilleries and creameries; and manufactories of starch, emery-wheels and caskets. Pop. 2,801.

PRESCRIPTION, in medicine, a statement or formula, usually in writing and made by a physician, containing directions for the preparation and use of medicines or remedies for a patient. Formerly prescriptions were written altogether in Latin, but in this country and in Scotland (2801) is not the right to the record to incorporeal hereditaments. By the Prescription Act passed in England in 1832, later extended to Ireland, rights of common and other profits à prendre vest after 30 years, and the right ordinarily becomes absolute after 60 years. The period of prescription does not run against an owner of land while he is under legal disability, as insanity. Rights of way and
drainage may be acquired by prescription in the United States, but not to cross a road or light. In some States it is denied that easements by prescription may be acquired against a railroad, but in other States this right is declared to exist. As prescription is founded on the theory of a grant, the use or possession on which it is founded must be adverse. It is, therefore, a well-settled principle of law that use by express or implied permission, irrespective of the length of time continued, cannot ripen into an easement by prescription. In the United States generally evidence of adverse user must be clear and positive, and usually it is a question of fact for the jury. In England, however, the Prescription Act renders the possession a bar or title of itself, without the necessity of the intervention of a jury.

The term had several distinct meanings in Roman law. In procedure a prescription was a legal plea sent by the prror to the referee to be examined before other disputed issues. The term was also applied to a right or title acquired by uninterrupted possession of property. In the case of movables the period required was fixed at three years by the legislation of Justinian, while for immovables it varied, being 10 years where the parties were domiciled in the same province and 20 years where domiciled in different provinces. However, title by prescription could not be secured to public property nor to property acquired by theft or violence. At one period it required continued possession varying from 40 to 100 years to give title by prescription to church property. Later the same rule was applied to church property as to public property. The term was also used in Roman law to apply to lapse of time after which actions were barred, first limited to equity, but later extended to all cases.

In the law of Scotland, the term is used in a broader sense than in England or the United States and includes limitation in English law. Though originating in the common law, it is governed by statute in Scotland. Statements of prescription are statutes of repose. Prescription is justified on the ground that public policy and convenience require that long possession should not be disturbed, and also because there is a social need of settling controversies and of affording relief to those who necessarily find it exceedingly difficult to furnish proof of title on account of great lapse of time. Concerning corporeal interests in real property and title to personal property by lapse of time, see ADVERSE POSSESSION; LIMITATION OF ACTIONS.

Edward F. Donovan.

Presentation, in ecclesiastics, means the nomination of one or several candidates to a vacant office in the church. In ecclesiastical benefices the usual rule is that if the patron fails to present within six months after a vacancy has been intimated to him, the jus devolutum takes place; in other words, the patron loses his right, which in consequence devolves on the party before him. The presentation should have been laid, as the bishop under Episcopacy and the presbytery under Presbyterianism.

Presentation at Court. See Court, Presentation at.

Presentation, in law, is properly speaking the notice taken by a grand jury of any offense, from their own knowledge or observation, without any bill of indictment being laid before them at the suit of the government; as the presentation of a nuisance, a libel or the like, upon which the officer of the court must after hearing an indictment before the party presented can be put to answer it. The term is also used to include inquisitions of office and indictments by a grand jury; the Constitution of the United States uses the terms "presentation," "indictment," and "charge" interchangeably and as referring to the first step in the prosecution of a crime.

Preservation, Port. See Oswegatchie.

Preservation of Food. See Food Preservation.

Preservatives. See Antiseptic.

Presidency. See President; United States—President's Office.

President, signifying he who presides. The title is used for: (1) the principal member of a society or association, who is always present at its meetings; (2) the president of a company or board; (3) the head of a university or college or of a learned faculty; (4) the elected chief magistrate of a republic. At the present time the following countries, all having some form of democratic government, have Presidents as chief magistrates: Andorra, China, France, Liberia, Portugal, Russia, San Marino, Switzerland. All the Central and South American countries, not any longer colonies of European countries, are now republics with a president at the head of their administrations. To this group belong Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, Guatemala, Haiti, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, El Salvador, Uruguay, Venezuela. The powers, duties, etc., of the presidents of these countries are, of course, regulated by their several constitutions and differ to a considerable extent. Further details will be found in the articles on each country. In the United States the President is the chief executive of the government. His duties, rights and election are defined by the Constitution of the United States, article II, sections I, II and III, and article XII of the amendments. He is commander-in-chief of the army and navy of the United States and of the militia of the several States when called into the actual service of the United States. He has the power to grant reprieves and pardons for offenses against the United States except in cases of impeachment. With the advice and consent of the Senate he has the power to make treaties and to nominate and appoint ambassadors, consuls, judges of the Supreme Court, most of the executive offices of the government and a large number of judicial and administrative functionaries. He is elected for a term of four years and is eligible for any number of re-elections, though, in conformity with the precedent set by George Washington, no President has yet been elected more than twice. The President has a salary of $25,000. His salary was originally placed at $25,000. In 1873 it was increased to $50,000. In 1907 he was allowed an additional $25,000 for traveling ex-
PRESIDENT — PRESIDENT AND ENDYMION

penses and in 1909 the salary itself was increased to $75,000. His residence during his Presidency is the White House in Washington. He is elected by an electoral college, the composition and procedure of which is regulated by the Constitution, article II, section I, paragraph II, and article XI, amendments to the Constitution. He may receive a majority of the popular vote. He can be removed from office on impeachment for and conviction of treason, bribery or other high crimes and misdemeanors. On the entrance of the United States in the war in April 1917 the regular powers of the President, as defined by the Constitution, were extended and enlarged temporarily in various directions by means of special legislation. These extra powers, however, were given to the executive only for the duration of the war. In case of his death or total disability, the functions of the office devolved on the Vice-President, who is elected coincidently with the President and is the presiding officer of the Senate. (See PRESIDENTIAL SUCCESSION). The following is the list of Presidents up to the present:

George Washington (1789-1797); John Adams, 1797; Thomas Jefferson, 1801 and 1805; James Madison, 1809 and 1813; James Monroe, 1817 and 1821; John Quincy Adams, 1825; Andrew Jackson, 1829 and 1833; Martin Van Buren, 1837; William Henry Harrison (died 4 April 1841), 1841; John Tyler (elected as Vice-President), 1841; James Knox Polk, 1845; Zachary Taylor (died 9 July 1850), 1849; Millard Fillmore (elected as Vice-President), 1850; Franklin Pierce, 1853; James Buchanan, 1857; Abraham Lincoln (assassinated 14 April 1865), 1861 and 1865; Andrew Johnson, (elected as Vice-President), 1865; Ulysses S. Grant, 1869 and 1873; Rutherford B. Hayes, 1877; James A. Garfield (died by assassination 19 Sept. 1881), 1881; Chester A. Arthur (elected as Vice-President), 1881; Cleveland, 1885; Benjamin H. Harrison, 1889; Grover Cleveland, 1893; William McKinley, 1897 and 1900 (assassinated 6 Sept. 1901); Theodore Roosevelt (elected as Vice-President), 1901 and 1905; William H. Taft, 1909; Woodrow Wilson, 1913 and 1917.

PRESIDENT, The, the name of an American frigate of 44 guns, built in New York in 1794, and playing an important part in the early part of the War of 1812 (q.v.). In the summer of 1812 she was made the flagship of a small squadron under the command of Capt. John Rodgers, and in June of that year she had a fight with the British ship Belvidere. The latter, after having been hit a number of times, just managed to make her escape. In the summer of 1814 Commodore Decatur was transferred to the President, the command of which he assumed. On 15 June 1815 the President, then lying in the Hudson, successfully ran the English blockade of New York Harbor with the intention of making a cruise to the East Indies for the purpose of attacking English shipping there. However, before she got very far she was attacked by four British ships-of-war of superior speed and strength. With one of these, the Endymion, she had a running fight lasting for two and a half hours. At the end of that time the other three British ships came up and made a simultaneous attack on the President. Appreciating the impossibility of further resistance Decatur struck his colors. The Endymion with her prize sailed for Bermuda, but before arriving there both ships were dismanted in a heavy gale.

PRESIDENT AND ENDYMION. Battle of the, in the War of 1812. The blockade of the American coast by British ships was very strict and so effective that the frigates United States and Macedonian were dismantled in April 1814 at New London, and Stephen Decatur (q.v.) and his crew were transferred to the President, then at New York. On the
night of 14 Jan. 1815 Decatur decided to run the blockade and as a severe snowstorm and heavy gale had driven the blockading fleet out of sight he attempted to make for the open. Through a mistake of the pilot the President grounded while crossing the bar but the wind forced and disengaged her injuries she was compelled to proceed. Decatur hugged the Long Island shore for 50 miles, but at early dawn ran into the British squadron consisting of the Baltic, 56, the Endymion, 50, the Pomone and the Tenedos, 38's. These three promptly gave chase but being the fastest sailer the Endymion left the others in the rear and at 2:30 p.m. exchanged shots from her bow chasers with the stern guns of the President. At 5 o'clock the Endymion crept up on the President's starboard quarter, raked her for half an hour and punished her so severely that Decatur attempted to board his antagonist with the idea of capturing her, scuttling his own ship and escaping on the British ship. But the British captain yawned his ship, whereupon Decatur poured in a gallant fire into her that she was reduced to a wreck. He then attempted to escape but at 11 o'clock the Pomone and Tenedos came up and opened fire. "Thus situated," says Decatur, "with about one-fifth of my crew killed and wounded, my ship crippled and mortally wounded than four-fold force opposed to me, without a chance of escape left, I deemed it my duty to surrender." The loss on the President was 25 killed and 60 wounded; on the Endymion, 11 killed and 14 wounded. Consult Adams, Henry, 'The United States' (Vol. II, pp. 65-70); Barnes, James, 'Naval Actions of the War of 1812' (pp. 219-227); Cooper, J. F., 'Naval History' (Vol. II, pp. 235-238); James, William, 'Naval Actions' (pp. 82-94); Maclay, E. S., 'History of the Navy' (Vol. II, pp. 64-70); Roberts, 'Naval War of 1812' (pp. 402-405); Spears, J. R., 'History of Our Navy' (Vol. II, pp. 215-228), and biographies of Decatur by T. C. Brady, S. P. Waldo and MacKenzie.

PRESIDENT AND LITTLE BELT. After the President the War of 1812 British ships were accustomed to hover off American ports and commit depredations on American merchantmen. Accordingly Com. John Rodgers (q.v.) was ordered to sail with his flagship, the President, 44 guns, to stop this unlawful interference. 10 May 1811 Rodgers sailed from Annapolis and at noon of the 16th sighted a ship supposed to be the British Guerrière. At 2 o'clock he set a broad pennant and ensign whereupon the stranger began to make signals and stood to southward. Rodgers gave chase and at 8:30 came within speaking distance, but the stranger answered his hail with a solid shot in the mainmast. Before Rodgers could prevent it, a lieutenant on the President replied in kind; the two ships then fought for 20 minutes when the stranger was completely disabled. She proved to be the British corvette Little Belt, 22, Capt. A. B. Bingham. The British lost 32 men killed and wounded and the Americans 2 wounded. Consult Dawson, 'History of the United States' (Vol. IV, pp. XIII); official records and evidence of the court-martial of Rodgers in 'American State Papers, Foreign Relations' (Vol. III, pp. 473-498); Annals of Congress, 12th Congress, 1st session, Pt. II, pp. 1874-1930; Lossing, 'The War of 1812' (pp. 184-186); Paulin, Charles O., 'Commodore John Rodgers, Wilsey and Rines, 'The United States' (Vol. V, pp. 246-247).

PRESIDENTIAL ELECTIONS. See ELECTIONS; VOTES; ELECTORAL QUALIFICATIONS; ELECTORAL COMMISSION; ELECTORS, UNITED STATES PRESIDENTIAL; UNITED STATES—CONTESTED PRESIDENTIAL ELECTIONS; PRIMARY, PRESIDENTIAL PREFERENCE.

PRESIDENTIAL ELECTORS. See ELECTORS, UNITED STATES PRESIDENTIAL.

PRESIDENTIAL SUCCESSION, the order in which a vacancy in the office of the President of the United States can be filled pending a new election. The 49th Congress passed a measure entitled 'An Act to provide for the performance of the duties of the office of President in case of removal, death, resignation, or inability both of the President and Vice-President.' The measure was approved by the President 19 Jan. 1886. The text is as follows:

§ 1. Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That in case of removal, death, resignation, or inability both of the President and Vice-President of the United States, the Secretary of State, or in case of his removal, death, resignation, or inability, the Secretary of War, or in case of his removal, death, resignation, or inability, the Secretary of the Treasury, or in case of his removal, death, resignation, or inability, the Attorney-General, or in case of his removal, death, resignation, or inability, the Postmaster-General, or in case of his removal, death, resignation, or inability, the Secretary of the Interior, shall act as President till the disability of the President or Vice-President is removed or a President shall be elected: Provided, That whenever the powers and duties of the office of President of the United States shall devolve on any of the persons named herein, if Congress be not then in session, or if it would not meet in accordance with law within 20 days thereafter, it shall be the duty of the person on whom said powers and duties shall devolve to issue a proclamation convening Congress in extraordinary session, giving 20 days' notice of the time of meeting.

§ 2. That the preceding section shall only be held to describe the powers and duties of such officers appointed by the advice and consent of the Senate to the offices therein named, and such as are eligible to the office of President under the Constitution, if appointed by the House of Representatives of the United States at the time such persons were elected, and the powers and duties of the office shall devolve upon them respectively.

PRESIDENT'S MARCH, the title of a popular American national air, most likely composed about 1793 by Philip Phile, a Philadelphia musician, although it is claimed by some authorities to have been played for the first time on Trenton Bridge as Washington rode over it on his way to be inaugurated. In 1798 Joseph Hopkinson of Philadelphia wrote the words for 'Hail Columbia' and it became immensely popular. Consult Sonneck, O. G. T., 'Report on the 'Star-Spangled Banner,' 'Hail Columbia,' etc. (Washington 1909).

PRESIDENT'S OFFICE. For the history of the President's office, see UNITED STATES—PRESIDENT'S OFFICE.
PRESIDENTS OF THE UNITED STATES, COATS-OF-ARMs

This is strange reading to Americans of this day. The coat of arms of the Adams family was a red shield with a silver cross upon which were five mullets of gold; the crest, a demi-lion emerging from a ducal crown.

Jefferson was eager about knowledge of the early Jeffersons and was well acquainted with the lineage. On 20 Feb. 1771 he wrote Thomas Adams of London (Vol. 81, p. 205, Harper's) a letter, in which the following request appears: "One further favor and I am done; to search the herald's office for the arms of my family. I have what I have been told were the family arms, but on what authority I know not." Jefferson's book-plate and personal seal consisted of his monogram, atop which were the words: "Rebellion to tyrants is obedience to God." A distant relative in preparing the domestic "Life of Thomas Jefferson," by Sarah V. Randolph, had the Jefferson arms prominently blazoned on the cover of the volume and Jefferson's private seal on the title-page. The coat-of-arms of the Jeffersons was a deep red, upon which blazoned three leopards base with cross of Saint Andrew entwined with a lozenge and field blue crest a demi-lion proper. See Great Seal of United States.

The next problem which history brings us to the administration of James Monroe, of the ancient Monroe or Munroe family, noted for their studiousness and mildness of character. The family escutcheon of gold was of English origin and contained a spur and eagle. In seal a sprig of laurel proper; crest same as arms; motto, "Dread God." Crest eagle's head erased gules.

The ancestors of Andrew Jackson were Scotch by blood, though they came from the geography of Ireland and in 1765 we find the Jackson family. Generations ago these people were prominent in the wars of Great Britain and the mark of distinction which came to them consisted of a silver shield with a fess or bar, with three birds blazoned; the helmet had perched upon it a bird and a shield supported the shield. The motto, "I move carefully."

Then comes John Quincy Adams with an armorial device. He inherited a love for the heraldic and early in his life used the Adams crest as a book mark, but later in life he employed in connection with the crest a shield, upon which were blazoned the arms of his ancestors, both paternal and maternal. He was a deep student of things heraldic and while he was Secretary of State he devised and used — contrary to any authority — a private device as the seal of the Department of State. It was his heraldic idea of the constellation Lyra, infrequently referred to in the act creating our national flag, the lines reading "Thirteen stars, representing a new constellation." See Flag of United States.

The name Harrison throughout national life is redolent of patriarchal intellectual greatness. The family insignia was a golden shield upon which were two ermine bars and, spangled on shield, five silver stars, with a lion as a crest.

President Tyler's wife was a Miss Julia Gardiner, of a distinguished family who owned by kingly grant the island of Gardiner of New York. Their coat-of-arms, which can at this
nizing the wilderness with self-destruction. At this same time the Dutch of New York were welcoming the world and laying the foundation of our present public-school system. In this atmosphere the Roosevelts flourished as early as 1649. The Roosevelt coat-of-arms in its heraldic colors was painted on the dining-room wall of old Jacobus Roosevelt and opposite in oils in a heavy frame was the likeness of Klaas Roosevelt, the first emigrant Roosevelt, who came as early as 1649 when New York was still New Amsterdam. The Arms are a silver shield charged with red roses and Latin motto, meaning "God who has transplanted it will protect it."

The ancient Dutch grant of arms is interesting, though too lengthy to reproduce. Suffice the statement that this shield of honor was conferred upon his kin early in the 1500's, during the campaign leading up to the founding of the Dutch Republic. Needless to say, these Roosevelts or Van Roosevelts, as they were entered in record, were of the Republican party and of the Protestant army.

B. J. CIGRAND.

Author of "Our Presidents" and "Heraldic Americana."

PRESIDENTS OF THE UNITED STATES. Graves of the. Some writers and distinguished citizens have advocated bringing to the capitol the remains of all the Presidents and depositing same in a huge mausoleum patterned after the Westminster Abbey of London. This would be a mistake, since State pride and individual requests rebel against such procedure. Let the States have their spots of historic interest. This will impel people to visit various parts of the Union. Besides, a certain "love of home" induces men, even of broad and liberal minds, to choose a burial spot, or God's acre, within the precincts of youthful days or within the vicinity of faithful friends. This latter sentiment was the one uppermost in our Presidents selecting their own last earthly home. Washington's sentiment on this theme was borne out by many of his successors.

While there are innumerable magnificent memorials, monuments, statues and tablets to the eminent dead who filled the highest chair in the gift of a republic, these are for the most part distant from their graves and though these markers in stone, metal or wood represent a form of gratitude, yet the actual tomb, its surroundings and general care is the emblem of our affections.

WASHINGTON.
The one of Washington, at Mount Vernon, is commonplace. It does not reflect the sentiment of our people. The national treasury could very fittingly unlock one of the gold boxes and contribute toward the shrine of him who, when living, was "first in war, first in peace," and, in life or in death, "first in the hearts of his countrymen." Thousands are the men, women and children who annually make the pilgrimage to this patriot's grave. It is indeed a shrine worthy of national regard, and while the entire republic in all its material grandeur is as a monument to his wisdom and heroic patriotism, yet his immediate tomb de-
COATS OF ARMS OF AMERICAN PRESIDENTS
serves a more extravagant materialization to be an equivalent to the popular regard.

Miss Alice Longfellow, youngest daughter of New England's beloved poet, told the story to the Warren and Prescott chapters, Daughters of the American Revolution, of how Mount Vernon was saved to the nation by a woman. Miss Longfellow told of Miss Ann Cunningham, a gentle woman of old Virginia, who, when passing up the Potomac River one day in 1853 and hearing the steamer bell toll when passing the grave of Washington, became possessed with the desire to restore it. The place was then occupied by a great-grandnephew of the first President, John Augustine Washington. It was in a state of decay and the generous hospitality of the owner, who treated every passing stranger as a guest, made the expenditure of money for repairs utterly impossible. When Miss Cunningham ventured to tell him of her plans he was filled with horror that women should do that which should so emphasize the degeneracy of men. But the determined woman sent out urgent appeals.

Her first call was to the women of the South and on 12 July 1854 the first meeting was held. Edward Everett was one of the first to offer his services and as the result of his lectures $68,000 was contributed to the fund.

In addition to the actual price of the plantation $300,000 had to be raised for repairs and when matters were progressing finely the Civil War broke out and confusion was the result. Mount Vernon was neutral ground throughout the bitter struggle. When the strife was ended Miss Cunningham went there to live, received the aid of Sumner in getting an indemnity from the government and went on with the noble work she had undertaken.

It may not be generally known, but such is the case nevertheless, that when the capitol of the United States was planned and erected at Washington a crypt was constructed in the basement of the capitol, directly underneath the small room where the final resting place was designed for the body of Gen. George Washington. Considerable mystery surrounds the delay or refusal of the entombing of the first President in the foundation of the national capitol. Some claim that neglect of action on the part of our national Congress is responsible for the empty crypt, while others, equally good authority, states that Washington's wish dictated his present grave on the premises of old Mount Vernon, the spot of all others he so devoutly loved.

JOHN ADAMS.

The death of John Adams and of Thomas Jefferson on July 4, 1826 is the most remarkable necrological coincidence in the history of our country. Adams married a minister's daughter and he was a devout Christian, affiliating with the Unitarians of Braintree, Mass., and under the pulpit of this antique religious structure reposes all that is earthly of the eloquent gentleman, who made the Declaration of Independence an accepted national decree. He is incased in a leaden coffin, which is sealed in a stone sarcophagus. His son, John Q., placed a huge marble tablet at the right of the pulpit, with these inspiring words:

From lives thus spent
Thy earthly duties learn;
From fancy's dreams
To active virtue turn.

Let Freedom, Friendship, Faith
Thy soul engage;
And serve, like them,
Thy country and thy age.

THOMAS JEFFERSON.

Thomas Jefferson, whose labors so thoroughly complemented those of John Adams, rests in Williamsburg, Va., beneath a plain and unassuming obelisk of granite, in the small family cemetery on the road leading to his famous homestead, Monticello. He did not regard having been twice elected to the Presidency the height of his accomplishments, as is shown by the burial tablet he wrote for his own tomb, the character of which he designed. The lines he wished blazoned on the granite read: "Here lies buried Thomas Jefferson, author of the Declaration of Independence, of the statute of Virginia for religious freedom, and father of the University of Virginia.

The Democrats, aided by Republicans, will erect at Washington, D. C., the most elaborate memorial to Jefferson ever erected to any famed person. But his body will not be disturbed from its present resting place because of Jefferson's request to lie at the side of his loved ones. The spot he selected when yet a young man. On a fly-leaf of one of his old books was found this regulation of his burial: "Choose some unfrequented vale in my park, where is no sound to break the stillness, but a brook that, bubbling, winds among the woods. Let it be among the ancient and venerable oaks." The obelisk has been practically destroyed by crazed relic hunters, who have beaten and battered the granite until only a few letters tell whose grave it is. Vandalism of an insane origin only could be responsible for such desecration. Why does not the central government awaken to the duty it owes to the dead national Presidents? An infinitesimal fraction of the protective tariff revenues would make these graves truly shrines for the incultation of national patriotism.

JAMES MADISON.

He lies buried on the centre of his old farm at Montpelier, Va. A brick fence encloses his bier, a lot measuring about 100 square feet. A granite obelisk 20 feet high marks the spot, and on its base are these words: "Madison, born March 16, 1768." The lovable and gracious Dolly Madison, his wife, has an obelisk of smaller dimensions near by.

JAMES MONROE.

New York City for 27 years had the body of James Monroe, but on 4 July 1858, it was removed to the capital of Virginia where it now rests in Hollywood cemetery. The monument is unique and patterned after the windows of a Norman abbey. The General Assembly of Virginia looks after this grave, and it is kept up with reverential care.

JOHN QUINCY ADAMS.

In the crypt at Braintree, Mass., is the body of John Quincy Adams. He loved his parents.
dearly, and it was his wish to be buried at their side. He was religious, and when President he prayed the prayers of his childhood days. He related at a Cabinet meeting that the sweetest lines in the English language were those of the prayer which begins: "Now I lay me down to sleep; I pray thee, Lord, my soul to keep." On his tomb tablet are these lines: "A son worthy of his father, a citizen shedding glory on his country, a scholar ambitious to advance mankind. This Christian sought to walk humbly in the sight of God."  

ANDREW JACKSON.
Eleven miles from Nashville, Tenn., is the famous shrine, "The Hermitage," the home of Andrew Jackson, and in the garden of this notable farm is the quiet resting place of the stern and fearless "Old Hickory." On the base covering the graves of Jackson and his wife are erected eight fluted columns which support a circular cope surmounted by an urn. This old plantation, with its sacred remains, was cared for by the women of Tennessee, and they have now presented this estate to Tennessee, hence the State is guardian. The words "General Andrew Jackson, born March 15, 1767, died June 8 1845," are all that relate to the soldier President, while a lengthy inscription, written by himself, is engraved into the stone above his amiable tempered wife.

MARTIN VAN BUREN.
The grave of Martin Van Buren is at Kinderhook, N. Y., and is marked by a plain granite obelisk with simple inscription stating he was the eighth President of the United States.

WILLIAM HENRY HARRISON.
Fifteen miles west of Cincinnati, Ohio, lies all that was mortal of W. H. Harrison. The old brick vault was recently replaced by stone, the inscription is wanting and patriotic societies contemplate improving the surroundings.

JOHN TYLER.
The American people have lost track of the grave of John Tyler. Church records place it near the grave of James Monroe. A magnolia tree serves as a marker; neither stone, flowers nor urn indicate the place of his burial. While it is true that he did not remain loyal to the Union — taking up the cause of the Confederacy, and being an ardent advocate of State's rights — he nevertheless was a dutiful and respected Virginian, and held the office of President. The government might appropriate the regulation soldier marker — costing about $5. This would serve to give designation to the spot until future generations more befittingly recognize it.

JAMES K. POLK.
Within the capitol grounds at Nashville, Tenn., rest the remains of James K. Polk. He certainly has a beautiful resting place. The high hill on which it is located overlooks the great landscape of Tennessee, and miles away can be seen with fieldglass the graves of Jackson and Nashville, the Athens of the Southland, is proud of these two graves and reveres the sacred remains there deposited. A lengthy and praiseworthy inscription graces the Grecian Doric pillared grave.

ZACHARY TAYLOR.
A curious oversight regarding the death of General Taylor comes to light in the truth that the 12th President, who died in the office as President, has never received burial services. Gen. Richard Taylor, nephew of the President, writes: "General Zachary Taylor has never been buried, notwithstanding the many stories to the contrary. He died in 1850 and his remains were immediately brought to Kentucky by his brother, Commissary General J. P. Taylor, and placed in a vault in the Taylor cemetery. This cemetery is about five miles from Louisville, Ky. On the monument are these splendid words from the General: "My only regret is for the friends I leave behind me."

MILLARD FILLMORE.
About two miles from Buffalo, N. Y., is Forest Lawn cemetery, and here a plain obelisk rises into the sky to designate the final home of President Fillmore. The word "Fillmore" is on the base, but it does not state that he was an American President. The grave is kept in most becoming manner.

FRANKLIN PIERCE.
Far north in the hills of old New Hampshire, near the famous town of Concord, in Minot cemetery, a delicately designed pillar monument marks the grave of Franklin Pierce. A strange mistake on the tomb shows: "Francis Pierce, born Nov. 23, 1804; died Oct. 8, 1869." On the same lot are buried his two sons, Robert and Franklin, hence the entire family is dead.

JAMES BUCHANAN.
Pennsylvania, with all its glorious history, with its thrilling scenes in Philadelphia, has had but one man in the White House. This fortunate son was James Buchanan, who "rests in peace" at Lancaster in Woodward Hill cemetery. No wife lies at his side. He was a bachelor President. Disappointed in love he remained single to the end of life. The magnificent block monument, with presidential reference, is pointed out with pride by the Pennsylvanians.

ABRAHAM LINCOLN.
To us the name of Lincoln is justly associated with all that stands for truth and justice, and to his fair name time only can add the laurel. His great and grand character will be more thoroughly understood as time rolls on. His life will appear in clearer light and be more fully appreciated by the generations yet to come. And the hour is close at hand when the name Lincoln will be nearer that of Washington than that of any other in the long calendar of fame.
The massive granite structure in which he "sleeps the eternal sleep" is of a Masonic character, and upon its four fortlike bays rest copper figures representing the heroic charges of the men who saved the Union. Like for Jefferson, the American people have contributed toward erecting on the old "Lincoln home" in Kentucky, where he was born, an elaborate
memorial to be in the form of the White House, as that structure was at the time of his tragic death.

**Andrew Johnson.**

Several years before the death of Andrew Johnson he chose the spot where he hoped to be buried. This place was on the heights of Germansville, N. J. It is not generally known that he had two sons in the Civil War. Charles was killed at Nashville and Robert, a colonel of a Tennessee regiment, died in 1869. Both are buried near the graves of the parents.

**Ulysses S. Grant.**

A most imposing structure on the banks of the Hudson marks the final resting place of Gen. U. S. Grant. Its grand proportions and its matchless location attract thousands annually. No President's death was made into such an expensive burial. It has been estimated that over $1,000,000 were expended. His funeral was the first real evidences that the North and South had become more than friendly; yea, the brotherly spirit here came to the surface. The Southland remembered the generosity of Grant at the surrender of Lee. They recalled how modestly, how tenderly and how fraternally he greeted General Lee on the day of Southern defeat. The death of the great Illinoisan brought not only wreaths of Southern posies, brought not only eloquence from Southern lips, but, more and better, tears from the defeated Southern hosts. No man received such universal homage, and he grows dearer and his character becomes nobler as time moves on. His tomb is a credit to the nation.

**Rutherford B. Hayes.**

The Hayes tomb or monument was designed by President Hayes, and erected over his wife, who died in 1881, and near it he, too, was buried. Its splendid proportions are well known to the visitors at Oakwoods cemetery, Fremont, Ohio.

**James A. Garfield.**

The tragic death of James A. Garfield brought forth general sympathy, and his costly tomb at Lakewood, Cleveland, Ohio, is evidence of his popular regard. Before his death he expressed the wish of being buried in this scenic cemetery. The structure cost $150,000, half of which was donated by his personal friends in Cleveland—a remarkable witness of his lovable character.

**Chester A. Arthur.**

Chester A. Arthur, the quiet, graceful and diplomatic New Yorker, sleeps in Rural cemetery, Albany, N. Y. Arthur and the scholarly gentleman who preceded him represented the two factions of the Republican party, but during the official life both were friendly.

**William McKinley.**

President McKinley, whose tragic assassination took place at a time when the country was just emerging from a cruel war and enjoying the calm, quieting words of a man who represented the "peace traits" of a happy people. His tomb at Canton, Ohio, and its speedy erection was due to the earnest and faithful cooperation of President Roosevelt and his praiseworthy Cabinet. The mammoth mausoleum cost $600,000.

The heroic statue of McKinley graces his mausoleum erected at Canton, Ohio. The statue of McKinley is depicted as he made his last public speech, just before his assassination at Buffalo, when he urged that "our real eminence rests on the victories of peace, not those of war." The pose of the statue is familiar to the public, as it is taken from the photograph of President McKinley as he made this address. Instead of the awkward setting, however, that a balcony afforded for a statue, the sculptor has introduced a chair of state, over which the folds of an American flag appear.

**Grover Cleveland.**

A handsome memorial is planned for Cleveland though a simple marker now shows where he is buried at Princeton, N. J.

**Benjamin Harrison.**

Lies buried at Indianapolis, Ind., and a plain stone marks his resting place.

**Theodore Roosevelt.**

Theodore Roosevelt was buried on 8 Jan. 1919 at Oyster Bay Cemetery, overlooking the beautiful landscape and waterfront of historic New York. These arc giant trees, wild fern and ocean breeze he chose to rest; great nature lover that he was it was but natural that the wildwood would claim his body. Quietly and without elaborate ceremonies he was deposited in the soil of his native State.

B. J. Cigand, Author of 'Our Presidents' and 'Heraldic Americana.'

**PRESIDIO, prɛsɪdjo, a Spanish word which means "a fort." It is applied especially to four fortified Spanish forts on the coast of Morocco: Al-Juzema, Ceuta, Melilla and Petion de Velez. The military settlements made by the Spaniards in California were also known as presidios. In 1729 there were 20 presidios in New Spain, some of them founded as early as 1680 and most of them in what is now Mexico. The chief presidio of Spanish California were massive forts at San Francisco, Monterey, San Diego and Santa Barbara. Of these two, at San Francisco and Monterey, continued to be military posts after California was acquired by the United States. They are known officially as Presidio of San Francisco (q.v.) and Presidio of Monterey. The latter was founded in 1772 by the Spanish and at the present time contains 398 acres. Consult Richman, J. B., California under Spain and Mexico (Boston and New York 1911).

**PRESIDIO OF SAN FRANCISCO, Cal., a United States military reservation in the northwest suburbs of the city of San Francisco. It contains 1,542 acres. It was established as a military post by Spain about 1776, and Mexico continued it until it was ceded to the United States in 1848. It was established as a United States military post in 1850, and is United States army headquarters for the Department of California.

**PRESQUE ISLE, Me., town in Aroostook County, near Aroostook River, 135 miles, direct,
northwest of Bangor, on the Bangor and Aroostook and the Canadian Pacific railroads. The town is situated in an agricultural district and manufactures starch and lumber. The population is increasing. Pop. 2,938.

PRESS, in mechanics, see METAL-WORKING MACHINERY; in printing, see PRINTING PRESS.

PRESS, Freedom of the, the right of every citizen to print whatever he chooses. The freedom of printing does not prevent his being amenable to justice for abuse of this liberty. The right of printing rests on the same abstract grounds as the right of speech, and it might seem strange to a man unacquainted with history that printing should be subjected to censorship, as it is still in some countries and has been at one time or another in all, any more than speaking, and that the liberty of the press should be expressly provided for in the constitutions of most free States. But when we look to history we find the origin of this, as of many other legislative anomalies, in periods when politics, religion and individual rights were confusedly intermingled. It is only since men's views of the just limits of government have become clearer that the liberty of the press has been recognized as a right; and to England and the United States the world is particularly indebted for the establishment of this principle. The existence of a censorship of the press was for centuries, however, deemed essential to the safety of all European governments. Liberty of printing, as we understand it, is a comparatively modern notion: Milton's plea for a free press met with no response from his own party, nor for many years later was it the cue of any party in the English commonwealth to refrain from suppressing the writings of their political opponents. In England the liberty of the press, soon after printing was introduced, was regulated by the king's proclamations, prohibitions, charter of license, etc., and finally by the court of star-chamber. The Long Parliament, after their rupture with Charles I, assumed the power. The government of Charles II imitated their ordinances, and the press did not really become free till the expiration of the statutes restricting it in 1693, after which it was found impossible to pass new laws in restraint of it, and it has remained free ever since, the last restriction being done away with on the abolition of the newspaper stamp duty, in 1856. Such legal checks as remain are merely intended to prevent outrages on religion or decency, to protect individuals from defamation and to conserve the copyright of authors. The Constitution of the United States specifically prohibits Congress from passing any law abridging the freedom of the press. The constitutions of most of the United States declare, as we should expect, for the liberty of the press, as the same may be said of all the South American republics. In other countries the amount of freedom enjoyed by the press varies considerably and is frequently regulated by executive laws. At the outbreak of the European War in 1914 the freedom of the press in all the States was involved, and even in some of the neutral countries, was greatly restricted, though these restrictions did not apply so much to the essential right of freedom as to details in connection with the printing of war news.

As recently as 1919 a decision of the Supreme Court of Mexico in a contempt case against the editor and publisher of a local journal cleared up several points concerning the freedom of the press and the immunity from contempt of court. The editor of the publication was found guilty of contempt of court by the judge whose actions he had criticized in an editorial, concerning a legal proceeding which affected the publication. An appeal taken to the Supreme Court contended "that the criticism made did not concern the official acts of the jurist, but merely his private act," and this contention was upheld by the Supreme Court.

While adhering to the rule that criticism calculated to obstruct the course of justice may be punished as for a contempt of court, the court held that cases of constructive contempt are criminal proceedings and that, therefore, the information, the authority of the court, the weight of the evidence (including all presumptions and proof) and the regularity of the proceedings are governed by the rules of criminal law. The information must be strictly construed as well as the article alleged to be contemptuous, and the court further states "the defendant is presumed to be innocent and guilty beyond a reasonable doubt, the same as a defendant in any criminal case. There are no presumptions taken against him, but the presumptions are all in his favor." This is a wide departure from the attitude of those courts which seem to have presumed that their critics were guilty and to have thrown upon them the burden of proving the innocence of their intent. Certainly in contempt proceedings, where the offended judge sits substantially as accused, judge and executioner, the rule announced is much more consonant with free press and free speech guarantees. The opinion handed down by the Supreme Court asserts "it is not the personal dignity nor the personal feelings of the court that justify contempt proceedings," and that "attacks on the character or conduct of a judge as an individual may, in some cases, be so gross as to amount to a contempt," but "only when they tend to influence the course of justice." A most important holding of the court, especially at a time when freedom of speech and free press have been so much clouded by voluntary and involuntary censorship and by so much public concern as to the effect of governmental control of many of the means of communication, is the reaffirmation of the principle that "under our theory of government the right of the freedom of speech and of the press are essential to public welfare." While holding that these do not afford license to indulge in unwarranted attacks upon the courts, the opinion notes that "public opinion has greatly restrained the courts in the exercise of contempt powers, and that even false and unwarranted criticisms of judges affords them no greater remedy than those given to private citizens, unless they encroach upon the rights of litigants and tend to obstruct justice in pending matters or embarrass the judge in the discharge of judicial functions." See LIBERTY OF THE PRESS; CENSORSHIP OF THE PRESS.

Bibliography.—Canadian Press Association; A History of Canadian Journalism (Toronto 1908); Coulon, H., De la Liberté de la Presse (Paris 1894); Dunipaw, C. A., The Development of Freedom of the Press in
The Reuter Agency.—In the meantime Julius Reuter, a Prussian government messenger, conceived the idea of a great associated press service that could be extended to all papers desirous of making use of it. In 1849 he opened an office in Paris; but the French government discouraged him. This and the fact that the German government was rapidly extending its telegraph lines induced him to go to Aix-la-Chapelle where there was a gap between the telegraph line which ended there and the French-Belgian line terminating at Verviers. Reuter opened a news-collecting and distributing agency at each of these points and forwarded the news by carrier pigeon and other means of fast transmission. He extended his news service and finally removed his headquarters to London in 1851. This he had been induced to do, owing to the fact that the Dover-Calais submarine cable had just been laid. Reuter’s London office began the transmission of news by wire from London to Paris, at first, as correspondent for various newspapers on the Continent; for he had not been able to induce any of the great London daily papers to purchase his news service. He used the wires wherever they existed and where they did not he employed special agents to transmit his news by carrier pigeon or fast messenger to all his subscribers. It was the work of establishing the news facilities of the press he overcame, by his tireless energy, countless difficulties, and soon the Reuter News Agency became known to every newspaper in Europe. Its first important conquest was the London Morning Advertiser, the second greatest newspaper in England in 1858. The Times and other British dailies soon fell into line and the Reuter Agency extended its news facilities still more rapidly than the rapidly extending telegraph lines. Reuter correspondents were to be found in all parts of the world. In 1860 Reuter went to Crookhaven by private submarine cable in order to be able to beat his competitors in furnishing news of the American situation. He also secured a concession for a submarine cable to Cuxhaven from the king of Hanover, and another for a cable between Ireland and the United States, both in 1865. Reuter’s Agency and the Anglo-American Telegraph Company made mutual use of this latter line. In 1868 the Press Association of London, a subsidiary affair, was formed to serve the provincial news-
papers of the United Kingdom with daily news.

The Havas Agency.—Among the other news agencies that had already sprung into existence by this time were the Central News Agency, the London Agency, the Exchange Company, Daliżiell's Cable News, the National Press Agency and the Havas Continental Agency. The oldest of these was the latter which dated back to 1835, when Charles Havas, a translator, opened an agency in Paris for the translation from English and Continental newspapers of interesting news for the French press. In 1840 Havas established a carrier pigeon news service between Paris, London and Brussels. This being the first attempt at the rapid transportation of news it naturally attracted much attention to the Havas Agency. Between this date and 1850 the name Havas became well known to the newspaper world, and more especially to the capitals of Europe; for the Havas Agency had kept abreast of the times and had made use of telegraph and railway transportation as rapidly as they had developed. Already, at this early date, Havas furnished daily news reports of a commercial, financial and political nature; and this had completely changed the nature of the news offered by the daily press. In 1856 the Havas Agency was amalgamated with the Bullier Advertising Agency; and among the patrons of the new concern were the foremost French dailies. Subagencies were opened in Madrid, Rome, Vienna, Brussels and, a little later, in various American cities. Working on the lines that had entered into with the Wolff Agency in Germany and the Reuter in London. This was followed by the planting of Havas correspondents in all the important news centres of Europe and America and in almost every town and city of any importance in France; for the Havas Agency has always made a specialty of local French news. It was the first to make use of the principle of the mutual exchange of news between a central news bureau and the newspapers taking its service. It was also the first to furnish syndicated material to subscribers in the form of special news features; and this part of the business it has developed very extensively. It furnishes feuilletons of a literary character, feature stories and novels written by the best-known and most popular of French writers. Fully 75 per cent of the typesetting of the French country press has been done away with through the "patent" material furnished it in the form of "mats" or stereotyped metal plates. Yet this local work has not prevented the Havas Agency giving much attention to the gathering of international news, a business which it has organized on a labor, money and time-saving basis. Special trained Havas correspondents are stationed in all the capitals and other great news centres of Europe, Asia and Africa; and with the advent of a sudden war a correspondent the nearest Havas man is wired from Paris to go at once to the place where his services are required. All these correspondents are carefully educated in the ways of the agency and they know exactly what is expected of them. When it is necessary to depart from this routine they are so instructed by wire. The Havas Agency was the first to establish and perfect a very contracted figure and word code for the transmission by wire of routine news to countries and from which the cable rates for news were excessively high. In 1879 Havas Agency was reorganized as a joint-stock company with a capital of $1,700,000, divided into 1,700 shares of $1,000 each.

The Wolff Bureau and the Oversea News Service became, in 1917, a part of the advertising machinery of the German government which purchased a controlling interest in each of them. To strengthen this strong news and advertising medium control was also secured of more than 50 per cent of the stock of some of the foremost daily papers in Germany and Austria. Among these were the Deutsche Zeitung, Frankfurter Nachrichten and the Lokal Anzeiger. This new combination of news agencies also secured control of the greater part of the advertising patronage of Germany, and through this control of advertising it secured a powerful influence over the policy of the most important dailies in Austria.

The Associated Press was organized prior to 1860, and the Western Associated Press was formed during the Civil War period. The latter was a strong cooperative organization, and for many years it was an important factor in the business of news gathering in this country. For 20 years the New York Associated Press and the Western Associated Press worked together in harmony. The wires of the Western Union Telegraph were utilized for transmitting reports, and thousands of miles of leased wires were constantly in use. In 1882 the United Press was formed, using the Postal Telegraph wires for the transmission of news, and in 1883 a third and smaller rival, the Press News Association, entered the field. Meanwhile dissensions arose over contracts between the New York and the Western associations, and the disputes were carried into the courts. The evidence showed that the Western Associated Press had made contracts for franchises between January 1883 and January 1893 with newspapers in the Far West, calling for payments under the contracts of $114,444. Of this amount the books showed that $85,294 had actually been paid in. One-half of this amount was claimed by the New York Associated Press as its share of the money collected from such sales of franchises. In 1900 the Associated Press was reorganized and reincorporated under the laws of New York State. In the meantime the Press News had died from financial mismanagement and soon afterward the United Press was wrecked. The Associated Press now began a prosperous period and a correspondent the nearest Havas man is wired from Paris to go at once to the place where his services are required. All these correspondents are carefully educated in the ways of the agency and they know exactly what is expected of them. When it is necessary to depart from this routine they are so instructed by wire. The Havas Agency was the first to establish and perfect a very contracted figure and word code for the transmission by wire of routine news to countries and from which the cable rates for news were excessively high. United Press co-operated with a number of newspapers between New York and San Francisco, the building up a creditable organization independent of the Associated Press. A third organization, the Scripps-McRae Press (Western service) and the Publisher's Press (Eastern service) in 1903, was serving news to stations on the Danube, from the banks of which it gradually ascends to the west and north toward ramifications of the Carpathians; and an extensive plain, covered with gardens, vineyards, meadows and corn-fields, forms its boundary on the east. The houses are built of brick and stone, and of two or three stories. The edifices most deserving of notice are the Landhaus, or Hall of the Diet, in which the chambers of the kingdom met to meet, but now used as a courthouse; the cathedral, a huge Gothic pile with a lofty steeple, begun in 1090, consecrated in 1452 and rebuilt in 1845-67, less remarkable as a church than as the place where the kings of Hungary were formerly crowned; a number of churches and monasteries, the Jesuit church, a synagogue, the city hall, begun in 1268, theatre, archbishop's palace; were also maintained in all centres where war or important political news was to be had.

Newspaper Syndicate.—Closely allied with the press associations is the newspaper syndicate which instead of furnishing current daily newspapers supplies special and correspondence, fiction and miscellaneous literary material to thousands of daily and weekly newspapers throughout the country. S. S. McClure was the pioneer in this field, followed by the American Press Association, the Bacheller and Johnson syndicate, the Kelle, the Newspaper Union, the Leslie Syndicate, the Bulletin Press Association and numerous others. The syndicate is enabled, by its sales of the same article to many customers, to purchase matter quite out of the reach of the individual newspaper, and to sell it on terms that each can afford. The scheme found is to be so advantageous that practically all the leading newspapers use syndicate matter to a considerable extent. Besides the firms engaged primarily in the syndicate business, many daily and weekly newspapers, notably the New York Herald and the American, dispose of their own matter to papers published in other cities. In addition to these there are now in the United States news syndicates for almost every kind of newspaper enterprise. If one wishes to start a local magazine, for instance, he can secure 32, 64 or 96 pages of material already printed and ready to bind in handsome cover, with or without advertising, at a very nominal price, if he publish the advertising; and all that is necessary is to add a few pages of local to have a finely printed and illustrated publication.

PRESS CENSORSHIP. See CENSORSHIP of the Press.

PRESS-GANG, the name given in England to a detachment of seamen who (under the command of a naval officer) were empowered, in time of war, to take any seafaring men and oblige them to serve on board the king's ships. Consult Fletcher, W. J., 'The Press-Gang' (in 'The 19th Century and After,' Vol. L, p. 761, London 1901). See IMPRESSION.

PRESSBURG, pr'cboorg, or PRESBURG (Magyar, Pozsony), Czecho-Slovakia, (1) free city in the west, capital of a county of the same name, on the left bank of the Danube, 35 miles east of Vienna. The site of the town is remarkably fine, being in the form of a semi-circle, bounded on the south by the Danube, from the banks of which it gradually ascends to the west and north toward ramifications of the Carpathians; and an extensive plain, covered with gardens, vineyards, meadows and corn-fields, forms its boundary on the east. The houses are built of brick and stone, and of two or three stories. The edifices most deserving of notice are the Landhaus, or Hall of the Diet, in which the chambers of the kingdom used to meet, but now used as a courthouse; the cathedral, a huge Gothic pile with a lofty steeple, begun in 1090, consecrated in 1452 and rebuilt in 1845-67, less remarkable as a church than as the place where the kings of Hungary were formerly crowned; a number of churches and monasteries, the Jesuit church, a synagogue, the city hall, begun in 1268, theatre, archbishop's palace; were also maintained in all centres where war or important political news was to be had.

PRESSBURG, or PRESBURG (Magyar, Pozsony), Czechoslovakia, (1) free city in the west, capital of a county of the same name, on the left bank of the Danube, 35 miles east of Vienna. The site of the town is remarkably fine, being in the form of a semi-circle, bounded on the south by the Danube, from the banks of which it gradually ascends to the west and north toward ramifications of the Carpathians; and an extensive plain, covered with gardens, vineyards, meadows and corn-fields, forms its boundary on the east. The houses are built of brick and stone, and of two or three stories. The edifices most deserving of notice are the Landhaus, or Hall of the Diet, in which the chambers of the kingdom used to meet, but now used as a courthouse; the cathedral, a huge Gothic pile with a lofty steeple, begun in 1090, consecrated in 1452 and rebuilt in 1845-67, less remarkable as a church than as the place where the kings of Hungary were formerly crowned; a number of churches and monasteries, the Jesuit church, a synagogue, the city hall, begun in 1268, theatre, archbishop's palace; were also maintained in all centres where war or important political news was to be had.

Newspaper Syndicate.—Closely allied with the press associations is the newspaper syndicate which instead of furnishing current daily newspapers supplies special and correspondence, fiction and miscellaneous literary material to thousands of daily and weekly newspapers throughout the country. S. S. McClure was the pioneer in this field, followed by the American Press Association, the Bacheller and Johnson syndicate, the Kelle, the Newspaper Union, the Leslie Syndicate, the Bulletin Press Association and numerous others. The syndicate is enabled, by its sales of the same article to many customers, to purchase matter quite out of the reach of the individual newspaper, and to sell it on terms that each can afford. The scheme found is to be so advantageous that practically all the leading newspapers use syndicate matter to a considerable extent. Besides the firms engaged primarily in the syndicate business, many daily and weekly newspapers, notably the New York Herald and the American, dispose of their own matter to papers published in other cities. In addition to these there are now in the United States news syndicates for almost every kind of newspaper enterprise. If one wishes to start a local magazine, for instance, he can secure 32, 64 or 96 pages of material already printed and ready to bind in handsome cover, with or without advertising, at a very nominal price, if he publish the advertising; and all that is necessary is to add a few pages of local to have a finely printed and illustrated publication.

J. H. CORNYN.

PRESS CENSORSHIP. See CENSORSHIP of the Press.

PRESS-GANG, the name given in England to a detachment of seamen who (under the command of a naval officer) were empowered, in time of war, to take any seafaring men and oblige them to serve on board the king's ships. Consult Fletcher, W. J., 'The Press-Gang' (in 'The 19th Century and After,' Vol. L, p. 761, London 1901). See IMPRESSION.
PRESSED GLASS—PRESTER JOHN

PRESSURE FIGURES, in mineralogy, are certain radiating lines developed by the pressure of a point on a crystal or cleavage surface. They are diagonal to the percussion figures.

PRESTAGE, Edgar, English litterateur: b. Manchester, 20 July 1869. He was educated at Radley School, Abingdon, and Balliol College, Oxford. In 1902-08 he was engaged as law student and solicitor and at different periods was special lecturer in Portuguese literature at the University of Manchester, examiner in Portuguese to the universities of Manchester, London, Liverpool, Leeds and Sheffield and the civil service commission. He is corresponding member of the Lisbon Academy of Sciences, the Institute of Cbomra, etc., and commendator of the Portuguese order of Sáo Thiago. Mr. Prestage’s works are ‘Cincoenta documentos ineditos relativos a D. Francisco Manuel de Mello’; ‘Cartas de D. Francisco Manuel de Mello escritas a Antonio Luiz de Azevedo’; ‘Portuguese Literature to the End of the Xvii. Century’; ‘Registo da Freguesia de Santa Cruz do Castello de Castelo Branco’; ‘Epitaphs of a Portuguese Nun’; ‘Sixty-four Sonnets of Quinta’; ‘Short Stories,’ and contributions to encyclopedias and periodicals.

PRESTER JOHN (Priest or Presbyter John), a semi-legendary character of the Middle Ages. It was reported by travelers that there was a Christian prince who reigned in the interior of Asia under his name, and the same story was also known to the Crusaders. Albert of Aix and Otto of Freising speak of him in the 12th century; the Franciscan Rubruquis, in the 13th, attributes the name of Prester John to a Nestorian prince, Ung Khan, who had reigned in Karakorum over two Mongol tribes and perished in a war against Genghis Khan, above half a century before the time of his journey. Other travelers of the 13th century also mention this personage. Who this Prester John was cannot be determined. The supposition that he was one of the chief priests of the Latamétes does not agree with the position assigned to his residence by the travelers, nor do any etymological explanations seem satisfactory. The Portuguese in the 15th century, hearing a story of the Christian prince in the interior of Africa, whose name was Ogan, and who was in fact the negus (king) of Abyssinia, and being misled by the resemblance of the names Ogan and Ung Khan, made the mistake of transferring the throne of Prester John from Asia to Africa and giving the name to the Abyssinian prince. Consult Baring-Gould, S., ‘Curious Myths of the Middle Ages’ (2 vols., London 1867-68); Brunet, G., ‘La Légende du Prêtre-Jean’ (Bordeaux 1877); Hakluyt Society, ‘The Book of Sir Marco Polo’ (2 vols., London 1876); ‘Prester Johannes’ in Sage and Geschichte’ (2d ed., Berlin 1870); Yule, Sir Henry, ‘Cathay and the Way Thither’ (2 vols., London 1866); Zarncke, F., ‘Der Priester Johannes’ in ‘Abhandlungen der Koenigl. Sachsichen Gesellsehaft der Wissenschaften,’ Vols. XVII and XIX, Philologisch-Historische Klasse, Vol. VII, pp. 827-1030, Vol. VIII, pp. 1-186, Leipzig 1879-83).

PRESSURE. See FORCE; POWER.
PRESTON, Ann, American physician and educator: b. West Grove, Pa., 1 Dec. 1813; d. Philadelphia, Pa., 18 April 1872. She was the daughter of John Preston, a Quaker, and her first knowledge of medicine was gained in many years of care for an invalid mother. Upon the opening of the Women's Medical College of Philadelphia in 1850 she enrolled as a student and was graduated in 1852. She engaged in private practice in Philadelphia, achieving marked success, and in 1854 she became professor of physiology and hygiene at her alma mater, occupying the office of dean after 1866. She was instrumental in the establishment of the Woman's Hospital in Philadelphia, which she later served as consulting physician. Her lectures and addresses were strikingly able, and her defense of her sex as medical practitioners when in 1867 the Philadelphia County Medical Society decided to make public objection to them resulted in a reversal of the decision. She wrote several essays on medical education for women and was author of a volume of verse, 'Cousin Ann's Stories for Children' (1848).

PRESTON, Harriet Waters, American translator and novelist: b. Danvers, Mass., 6 Aug. 1836; d. Cambridge, Mass., 3 June 1911. At an early age she became noted as a linguist and has since achieved a brilliant reputation as a translator from the Latin and Provençal languages and as an essayist. Much of her work was published A in the Atlantic Monthly. Her translations comprise Count de Fallois' 'Life and Letters of Madame Swetchine' (1867); Mitrail's 'Miréio' (1873); C. A. Sainte-Beuve's 'Memoirs of Madame Desbordes Valmore' (1873); B. de la V. Barberey's 'Alfred de Musset' (1877); C. A. Sainte-Beuve's 'Portraits of Celebrated Women' (1880); Virgil's 'Georgics' (1881); F. M. A. de Voltaire's 'Contes de Voltaire' in 'Oxford Modern English Series' (1912). Of her own original works are: 'The Aristocrat' (1871); 'A Love in the 19th Century' (1873); 'Is That All?' (1876); 'Troubadours and Trouveres, New and Old' (1876); 'A Year in Eden' (1887); with Louise Dodge, 'The Gun and the Spear' and 'The Private Life of the Romans' (1893).

PRESTON, John Smith, American politician and soldier: b. near Abington, Va., 20 April 1809; d. Columbia, S. C., 1 May 1881. He was a younger brother of William Campbell Preston (q.v.) and was graduated from the Hampden-Sidney College in 1824, studied at the University of Virginia and at Harvard, and after an extended tour of Europe settled in Columbia. He was a member of the South Carolina legislature in 1848-56 and gained a high reputation as an orator. He openly and actively upheld the secession movement, headed his State's delegation to the Charleston Convention in 1860, and in the following year became one of the commissioners to Virginia, where he made a brilliant speech, urging secession upon that State. He became major in the Confederate army throughout the entire war. He was engaged at the first battle of Bull Run and afterward was assigned chief of the conscription department with the rank of brigadier-general. After the war he lived in Europe for a time, and after his return to the United States remained a bitter opponent of the government until his death.

PRESTON, Margaret Junkin, American author: b. Milton, Pa., 19 May 1820; d. Baltimore, Md., 26 March 1897. She was the daughter of George Junkin (q.v.), a well-known Presbyterian clergyman, who in 1829 moved with his family to Germantown, Pa., and in 1832 to Easton, Pa., where he became the first president of Lafayette College (q.v.). From 1841-44 she lived at Oxford, Ohio, where her father had moved after accepting the presidency of Miami University. In 1844 he became once more president of Lafayette College, necessitating the removal of his family again to Easton. In 1848 her father accepted the presidency of Washington College, now Washington and Lee University, at Lexington, Va., at which place the family continued to reside from then on. In 1857 she was married to John T. L. Preston, one of the founders and a member of the faculty of the Virginia Military Institute. Later on she served on the staff of Stonewall Jackson, who had married Mrs. Preston's younger sister. Mrs. Preston continued to reside in Lexington until 1862, two years after her husband, then moved to Baltimore, Md., where until her own death she made her home with her oldest son. In 1855 she translated the Latin hymn 'Dies Irae' and in 1856 published her first book, a novel entitled 'Silverwood.' Her subsequent work is almost entirely in verse and is characterized by deep religious feeling and an ardent espousal of the Confederate cause. She published 'Beechenbrook; A Rhyme of the War' (Baltimore 1866); 'Old Songs and New' (1870); 'Cartoons' (Boston 1875); 'Centennial Poem for Washington and Lee University, Lexington, Va., 1785-1885' (New York 1885); 'For Love's Sake' (1886); 'A Handful of Monographs, Continental and English' (New York 1886); 'Colonial Ballads, Sonnets and Other Verse' (Boston 1887); 'Seminary Ode for the Virginia Military Institute, Lexington, Va., 1839-89' (New York 1889); 'Chimes for Church Children' (Philadelphia 1889); 'Aunt Dorothy; An Old Virginia Plantation Story' (New York 1890). Diarist, giving an interesting and valuable history of her life in the South, is published in part in Elizabeth Preston Allan's 'Life and Letters of Margaret Junkin Preston' (Boston 1903); Consult also Picket, L. C., 'Literary Heartthrones of Dixie' (Philadelphia 1902).

PRESTON, Thomas Scott, American Roman Catholic clergyman: b. Hartford, Conn., 23 July 1824; d. New York, 4 Nov. 1891. He was graduated from Washington (now Trinity) College in 1843, from the General Theological Seminary of the Protestant Episcopal Church in 1846 and held assistant rectories in New York. In 1849 he entered the Roman Catholic Church, and after study at Saint Joseph's Seminary, Fordham, N. Y., was ordained priest in 1850. He became chancellor of the archdiocese of New York in 1853, and 1863 rector of Saint Ann's, New York. In 1872 he was general of the New York archdiocese, in 1881 he was made monsignor and in 1888 prothonotary apostolic. He vigorously opposed the land and labor movement of Henry George (q.v.) and was active in urging the communication
of Dr. McGlynn (q.v.). He founded and for many years directed the Sisters of the Divine Compassion. As a preacher he enjoyed considerable popularity. Among his many controversial and devotional works are 'The Ark of the Covenant; or, A Series of Short Discourses Upon the Joys, Sorrows, Glories and Virtues of the Life of Our Mother of God' (New York 1860); 'The Life of Saint Mary Magdalene' (New York 1860); 'The Life of Saint Vincent de Paul' (New York 1866); 'Lectures on Christian Unity' (New York 1867); 'Lectures on Reason and Revelation' (New York 1868); 'Christ and the Church' (New York 1870); 'Vicar of Christ' (New York 1878); 'The Divine Paraclete' (New York 1879); 'The Protestant Reformation' (New York 1879); 'Protestantism and the Bible' (New York 1890); 'Christian Unity' (New York 1881); 'Protestantism and the Church' (New York 1882); 'God and Reason' (New York 1884); 'The Sacred Year' (New York 1885); 'The Watch on Calvary' (New York 1886); 'Divine Apple' (New York 1887); 'Gethsemane' (New York 1887). Consult Brann, 'The Rt. Rev. Thomas S. Preston, Vicar General' (New York); Preston, 'Remembrances of My Brother Thomas.'

PRESTON, William, soldier, lawyer; b. near Louisville, Ky., 16 Oct. 1806; d. Lexington, Ky., 21 Sept. 1887. He was educated at the Harvard College Law School, from which he was graduated in 1838. He then entered upon the practice of law in Kentucky and took much interest in politics. During the Mexican War he served as lieutenant-colonel of a Kentucky regiment. In 1851 he was a Whig representative in the Kentucky legislature, but when the Whig party broke up he became a Democrat. During Buchanan's administration he was Minister to Spain. He returned to America in time to see the beginning of the Civil War. In 1861-62 he was colonel on the staff of Albert Sidney Johnston. In 1862 he was made brigadier-general. He was engaged in the campaigns of the Western army, notably at Vicksburg, Baton Rouge, Murfreesboro and Chickamauga. In 1864 he was sent to the trans-Mississippi Department and in 1865 was made major-general. After the war he settled in Lexington, where he practised law until his death. In 1867 he was a member of the Kentucky legislature and in 1880 a delegate to the National Democratic Convention.

PRESTON, William Campbell, American legislator and educator; b. Philadelphia, Pa., 27 Dec. 1794; d. Columbia, S. C., 22 May 1860. He was graduated from the South Carolina College in 1812, studied law and was admitted to the bar in 1820. He established a law practice in Columbia, S. C., in 1823, and speedily became prominent in his profession, excelling as a jury lawyer. He sat in the State legislature in 1828 and in 1830-32, where he boldly advocated nullification and won a high reputation as an orator. In 1833 he was elected to the United States Senate, but refused to act with his colleague, Calhoun, in the latter's support of Van Buren, and resigned his office in 1842. In 1845-51 he was president of the South Carolina College and a trustee of it from 1851 to 1857 and professor of rhetoric. He was a public benefactor. He established the Columbia Lyceum, which he endowed with his own library of 3,000 volumes. Consult Miller, W. 'William Campbell Preston' in The Green Bag, Vols. XI and XII, Boston 1899-1900; O'Neall, J. B., 'Biographical Sketches of the Bench and Bar of South Carolina' (Charleston 1859).

PRESTON, Canada, town in Waterloo County, Ontario, at the confluence of the Speed and Grand rivers, 55 miles direct, southwest of Toronto, on the Grand Trunk and Pacific railways. It is an outport for Ontario and has flour and saw mills as well as manufactories of iron castings, woolens, shoes, furniture, piano-players and other industries, including machine shops. The population is steadily increasing. Pop. 3,682.

PRESTON, England, an important manufacturing town of Lancashire, 28 miles north-east of Liverpool, on a height above the north bank of the Ribble, near the head of its estuary, and on the London and North-Western and the Lancashire and Yorkshire railways. The river is spanned by five bridges. The handsome central railway station cost about $1,000,000. Other important buildings are the Gothic town-hall; courthouse, in the Doric style; a new infirmary, the house of correction, the custom-house, corn-warehouse, new gas offices, large and handsome market-shed, extensive barracks, workhouse, theatre and assembly-rooms; the Literary and Philosophical Institution, provided with a library and museum; the Harris Institute of Literature, Art, Science and Technical Instruction (formerly the Mechanics' Institute, and now greatly enlarged); The Free Public Library and Museum, in the Grecian style, with many valuable paintings, etc. The ecclesiastical edifices include a number of Established churches, beside Roman Catholic and other chapels. Among the former Christ Church is admired for the purity of its Norman architecture; and the parish church, which has been rebuilt in the decorated style of the 14th century, with a spire 106 feet high, is also a fine building. Saint Walburge's Roman Catholic Chapel, which has a beautiful spire 306 feet high, ranks as the most splendid place of worship in Preston. The town is supplied with water from reservoirs at Longridge, 18 miles northeast of Preston, with a capacity of 405,000,000 gallons. On the south side of the town are two beautiful public parks, and on the north side is the Moor Park. The original staple manufacture of the town was linen, which is still woven, but has been completely eclipsed by the cotton manufacture, especially spinning, first introduced in 1777. There are engineering works, machine-shops, iron and brass foundries, boiler works, breweries, malt-houses, roperies, tanneries, etc. A considerable shipping trade is carried on, though it was long obstructed by the condition of the Ribble. Since 1884 the river has been canalized and large docks have been built and a very considerable increase in the trade has taken place. Preston and Lancaster are connected by canal.

Preston is said to have risen on the decay of Ribchester, the Roman Rigodunum, situated about 11 miles farther up the river. Its name, originally Priest's towne, owed to the number of religious houses which it contained. About 600 it was a Saxon settlement; in 1322 it was
PRESTONBURG, ENGAGEMENTS AT—PRESTWICH

taken and burned down by Robert Bruce; in the great Civil War it espoused the Royalist cause, and suffered severely during the contest, having been twice captured by Parliamentary tories, who on the latter occasion were headed by Cromwell in person; in the rebellion of 1715 it was occupied by the Jacobite forces, who erected barricades and made a brave resistance, but were ultimately obliged to surrender. Modern Preston is a Parliamentary borough, returning two members. Its municipal government is in the hands of a mayor, 12 aldermen and 36 councillors. Pop. about 117,113. Consult Clemesha, H. W., 'A History of Preston in Amounderness' (in 'Publications of the University of Manchester, New Series No. 14,' Manchester 1914); Fishwick, H., 'History of the Parish of Preston' (Rochdale 1900); Whittle, P., 'History of the Borough of Preston' (2 vols., Preston 1837).

PRESTONBURG, Engagements at and near. In September 1861 Col. John S. Williams became interested in organizing a Confederate force at Prestonburg, in eastern Kentucky, to operate in the interior of the State. On 8 November Gen. William Nelson, who had advanced against him with three Ohio regiments, detachments of Kentucky infantry and a fair-weather Mid 2nd district artillery, with a part of this force encountered a detachment thrown forward by Williams to cover his withdrawal. After a well-contested engagement at Ivy Mountain, Williams was forced from his position and retreated through Pound Gap into Virginia, with a loss of 10 killed, 15 wounded and 40 missing. Nelson was recalled to Louisville, and Williams returned to Prestonburg. Gen. Humphrey Marshall had been ordered, 1 November, to the command of the Confederate forces in eastern Kentucky, including those of Williams, and soon had in addition two Virginia regiments and a battery of four guns, making a total force of about 2,400 men, who were badly clothed, many of them barefooted, and generally badly armed, many of the men having only short guns and squirrel-rifles. In the beginning of January 1862 Marshall had the greater part of his command intrenched near Paintsville, on the main branch of the Big Sandy River, a few miles north of the town. Gen. George Butwell assigned Col. James A. Garfield to the command of a brigade of about 3,000 men, partly cavalry, and sent him against Marshall and to clear the valley of the Big Sandy. On the 23d, when Garfield began his march up the course of the river, the greater part of the brigade was concentrated at Louisa, on the Big Sandy. On 6 Jan. 1862, after driving in several scouting parties, Garfield arrived within seven miles of Paintsville. Marshall, well informed of his approach, fell back from Paintsville on the night of the 5th to the forks of Middle Creek, about three miles above Prestonburg. Garfield advanced through Paintsville, defeated Marshall's cavalry at the mouth of Jennis' Creek on the 7th, and on the morning of the 8th, after a hot action, fell back with Garfield now attacked by infantry and the fight continued from noon to near dark with varying success, several Union advances being repulsed and Garfield finally abandoned his position, though not retiring from the field until next morning, when, being out of food for his men, he marched to Martin's Mill. Garfield did not pursue. He crossed the river on the 11th and occupied Prestonburg, and on the 12th and 13th withdrew to Paintsville. Both sides claimed the victory. Garfield had 1,700 men on the field, and his loss was two killed and 25 wounded. Marshall had 1,500 engaged, and lost 11 killed and 15 wounded. Consult 'Official Records' (Vol. VII); 'The Century's 'Battles and Leaders of the Civil War' (ed. by R. U. Johnson and C. C. Buel, Vol. I, New York 1887); 'War of the Rebellion: Compilation of Official Records of the Union and Confederate Armies' (Series I, Vol. VII, p. 21; Vol. XX, Pt. 1, p. 31; Vol. XXI, p. 1065; Washington 1882-88).

PRESTONPANS, près-tôn-pánz', Scotland, a small town in Haddingtonshire, on the Firth of Forth, nine miles east of Edinburgh, celebrated for the battle fought in the village on 21 Sept. 1745, when the Highlanders, headed by Prince Charles, defeated the royal troops commanded by Sir John Cope. Pop. 1,923. Consult M'Neil, P., 'Prestonpans and Vicinity' (Tranent 1902).

PRESTWICH, Sir Joseph, English geologist: b. London 12 March 1812; d. near Aylesford, Kent, 23 June 1896. He spent one year at University College, London, continued his geological studies though at the age of 18 he entered his father's office and for many years he was a prominent wine merchant. The Geological Society conferred a medal upon him in 1849, and he received like honors from the Royal Society in 1865. In 1864 he became a member of the Water Commission and in 1866 of the Royal Coal Commission. In 1870 he became president of the Geological Society and in the same year married. In 1872 he retired from business. He became professor of geology at Oxford 1874 and though advanced in years for the adoption of a new profession he has kept up his learning and the vigor with which he approached his new task enabled him to fill the position with great success. His most important researches relate to the Tertiary deposits, which he re-arranged and reclassified, and evidences concerning the existence of the prehistoric man. He also applied the method of the question of obtaining from underground waters a better supply for cities. He retained his professorship at Oxford until 1888, was connected with various important scientific societies and in 1896 was knighted. He was a Fellow of the Geological Society, the Royal Society, the Chemical Society, the Geological Society of France, an associate of the Institute of Civil Engineers and an honorary and corresponding member of a number of English and foreign scientific societies. Oxford University gave him the degree of D.C.L. in 1888. His writings reached the large number of 140. Of these the following were published in book form: 'A Geological Inquiry respecting the Water-bearing Strata of the Country around London, etc.' (London 1851); 'On the Upper Tertiary of Britain' (ed. 1880); 'The Subterranean Water beneath Us: Its Geological Phases and Changes, etc.' (London 1857); 'An Index Guide to the Geological Collections in the University Museum, Oxford' (Oxford 1881); 'Geology, Chemical, Physical and Stratigraphical' (2 vols., Oxford 1886-88); 'Collected Papers on Some
Controversial Questions in Geology (London 1895); ‘On Certain Phenomena Belonging to the Close of the Last Geological Period, and on their Bearing upon the Tradition of the Flood’ (London 1895). The balance of his writings was published in scientific journals and magazines. Consult Lady Prestwich, ‘Life and Letters of Sir Joseph Prestwich’ (Edinburgh 1899).

**PRETENSION, in law,** is a supposition held as good or real before it is shown or certainly known to be so. Presumptions are either *juris, or juris et de jure.* A legal presumption in law is one established in law till the contrary be proved. Thus, a person who has the possession of goods is presumed to be the owner, or a man is assumed to be innocent unless the contrary be proved. Presumptions are adopted from the necessity of arriving at some conclusion or other in most cases where the evidence is general or inconclusive. Thus, where a person has disappeared and has not been heard of, the law will in general presume that he is still alive, unless after a lapse of time considerably exceeding the ordinary duration of human life; but if there be evidence of his continuous unexplained absence from home, and of the non-receipt of intelligence concerning him for a period of seven years, the presumption of life ceases.

**PRETENDER, The.** See Stuart, James Francis Edward.

**PRETENDER, The Young.** See Stuart, Charles Edward.

**PRETORIA,** prɛ-tɔrˈiːə, South Africa, administrative capital of the Union of South Africa (q.v.) and the province of the Transvaal (q.v.), situated on the banks of the small river Aapies, a tributary of the Limpopo, 4,500 feet above sea-level, 46 miles northeast of Johannesburg, 349 miles by rail west of Delagoa Bay and 1,003 miles by rail northeast of Cape Town. The town is regularly laid out and many of the streets are planted with splendid willow trees. The most important public buildings are the government buildings, in Church Square, surmounted by a statue of Liberty; the post office; the Dutch Reformed church, formerly in the centre of Church Square, destroyed in 1905; the Anglican cathedral of Saint Alban; a Roman Catholic church, with school and convent buildings; a new Dutch Reformed church; the former presidency and residence of the late Paul Kruger (q.v.); the Jewish synagogue, a handsome building; the inner market buildings; the law courts; a public library, containing English and Dutch books; the National Museum adjacent to the Zoological Gardens; a new opera-house. Pretoria, since 1910, is the administrative seat of the newly created University of South Africa, consisting of six colleges in various parts of the Union with a total of 87 teachers and 560 students in 1915-16. The town is lighted by electricity, and public waterworks were opened in 1891. Just outside the town are the barracks, and near them the prison is situated. In 1896 the Boer authorities began the construction of a circle of six forts round the town, which since the Boer War have been dismantled. Pretoria was founded in 1855, and was named in honor of Andries Pretorius, the first President of the South African Republic. In 1864 it replaced Potchefstroom as the seat of the central administration. In December 1880 the British garrison in Pretoria was besieged in an attempt to gain control of the Boer republic, and the possession of the country in the following year the town was evacuated by the British troops. The gold-rush which began about 1886, and the workings of the natural wealth of the neighboring Witwatersrand, had a great influence upon the condition of Pretoria, which was rapidly improved in respect of architecture and sanitation. On 5 June 1900 the town was occupied, practically without opposition, by a British force under Lord Roberts, after President Kruger, who had for many years been the dominant figure of the town, had fled in May, and then became the headquarters of the British operations in the South African War (q.v.). It was at Pretoria that on 31 May 1902 the peace articles were signed. In 1904 the first Parliament of the Transvaal (q.v.), by which at that time had become a self-governing part of the British Empire, met at Pretoria. It was later displaced by a Provincial Council. Since 1903 Pretoria is a municipality, controlling its sewers, water and electric-light systems, as well as its trolley lines. There are a number of attractive suburbs, in one of which, Bryntirion, is located the Mintjes Kop where has become the site for the public offices of the Union. In the cemetery at the western end of the town are buried Paul Kruger and many of the British who fell in the Boer War. Nearby is also the big new Central Railway station and workshops. The world-famed Premier Diamond Mine is about 30 miles northeast of Pretoria. The population, which before the war was about 12,000, has increased to over 20,618. Consult Berthold, H., ‘Pretoria, die Hauptstadt des Neuen Suedafrikas’ (in ‘Zeitschrift für Kolonialpolitik, Kolonialrecht, und Kolonialwirtschaft’ Vol. II, pp. 826-835; Berlin 1900); Hillegas, H. C. ‘Pretoria Before the War’ (in Harper’s New Monthly Magazine, Vol. C, pp. 548-557, New York 1900); ‘Pretoria. News of the Camp. A Journal Published in the Military Camp of Her Majesty’s Forces during the Boer War, Dec. 1880 to 9 April 1881’ (ed. by C. Du-Val and C. Decker, Pretoria 1880-81).

**PRETORIUS** (Dutch, prɛ-tɔrˈiːə; Marthinus Wessels, Boer soldier and politician: b. Natal, 1827; d. Potchefstroom, South Africa, 19 May 1901). He took part in the ‘Great Trek’ of 1836, and in 1852 became commandant-general of the Boers. He made a name for himself in his capacity as commander of the forces making war upon the Kafirs, and shortly afterward (in 1860) he was elected President of the Orange Free State; in 1864 of the South African Republic. Re-elected in 1869, he soon afterward resigned. After the Boer troubles in 1877 and following years Pretorius formed part of the provisional Transvaal government in 1880. After Kruger’s election in 1883, Pretorius took small part in the affairs of the republic, being a persistent opponent of the Great Britain as destined eventually to subvert the independence it sought to secure. Pretoria, the capital of the Transvaal, was named in his honor.
PREVENTIVE MEDICINE. Generally the term "preventive medicine" has been regarded as almost synonymous with public hygiene and its application has been confined to the operations of the sanitary authorities in the prevention of the infectious and communicable diseases. These operations have not in the past included even all of the more important communicable diseases, although the list in recent years has been considerably extended. Formerly cholera, puerperal fever, yellow fever, typhus fever, epidemic dysentery, smallpox, scarlet fever, diphtheria and typhoid fever practically comprised all of the diseases which came specifically under the supervision of the public health authorities. Recently this list has been considerably increased by some sanitary boards. Many of the diseases referred to—for example, cholera, plague, yellow fever, epidemic dysentery—have practically passed from the supervision of the authorities, at least in the temperate zones, because either they no longer occur at all in these regions or only occasionally a case or a group of cases appears and calls for specific action and supervision. The eradication of these epidemic diseases may be regarded as the greatest triumph of preventive medicine. It will of course be noted that public hygiene or preventive medicine, in this restricted sense, has taken little or no cognizance as yet of many exceedingly important communicable diseases, such as syphilis, gonorrhea, puerperal fever and, generally speaking, even of tuberculosis.

Preventive medicine in the proper sense has a very much broader scope than that indicated and may be defined as the sum of all medical knowledge applicable to the prevention of disease—of all disease in the broadest sense and not simply of the communicable diseases. It presupposes the widest knowledge of medicine and has its essential foundation in our knowledge of the anatomy and causation of disease. Preventive medicine comprises, therefore, the prophylaxis of disease; it is general, comprising those measures which are applicable to the prevention of disease in the community (including especially the communicable diseases), and it is individual, as applied to the prevention of disease of all kinds in the individual members of the community. General prophylaxis refers to what are spoken of as preventable diseases and these in the broad sense may be regarded as all of the infectious diseases which are communicable by Individual prophylaxis has a still wider scope and includes the whole sum of medical knowledge as applied to the prevention of diseases (of all varieties) and the prolongation of life. General prophylaxis and individual prophylaxis do not always run along wholly parallel lines; for what is best for the individual is not necessarily best for the community. Preventive medicine is an applied science and includes all purely medical knowledge applicable to the attainment of its aim. In securing its aim preventive medicine seeks to improve the general physical well-being of the individual and thus life is rendered not only longer, but happier.

General prophylaxis attains its purposes in different ways. Through the establishment of sea quarantine it attempts to exclude infectious diseases which are endemic. These are spoken of as "quarantinable diseases" and they of course must differ with locality, depending upon what communicable diseases are endemic in a locality. Scarlet fever, cholera, typhus fever, yellow fever and leprosy are the diseases which the authorities especially attempt to exclude from the country. Scarlet fever, measles, diphtheria and smallpox, being endemic, are not held at quarantine, but are referred to isolation hospitals for supervision until their termination. During recent years the quarantinable diseases have been almost completely excluded from this country. Occasionally a case has been admitted at some point and a group of cases or a localized epidemic has followed; but in almost all instances the outbreaks have been of a restricted and local character. It does not seem probable that in North America there will ever again be any serious danger of the prevalence of cholera, plague, typhus fever or leprosy. In dealing with the other communicable diseases specific methods have been devised, depending upon the nature of the disease and the method of its transmission. In some instances the attempt is made to destroy the cause or prevent its entrance into the body; in other instances, to render the individual insusceptible to the cause and at the same time protect him from exposure to infection. For example, the cause of smallpox not being known, it is vain to attempt to destroy it in the individual; but as vaccination renders a person insusceptible to smallpox, it proves an absolutely efficient means for preventing the prevalence of this disease. In cities and countries where vaccination and revaccination are enforced smallpox rapidly disappears, and even when cases are introduced from without, the disease does not extend. Thus in Prussia, where there is compulsory vaccination in infancy and revaccination at different intervals later in life, smallpox practically does not exist. In different portions of the United States the prevalence of smallpox in epidemic form is determined in each instance by the thoroughness with which different communities have been vaccinated during the recent Great War less than a dozen deaths from smallpox took place in an army of 4,000,000 men.

In typhoid fever the methods followed in prevention are of a different character. The typhoid bacilli which cause typhoid fever are practically always taken into the body through the mouth, usually in drinking water or food. The commonest sources of infection are contaminated water, milk and oysters and also the direct infection of those in immediate contact with typhoid fever cases, by the transfer of the typhoid bacilli to the mouth on soiled hands or from eating or drinking utensils. Aerial infection plays a small part in the causation of this disease. The prevalence of typhoid fever has been very greatly restricted by the prohibition of the sources of water-supply, by the application of the milk inspection laws, by the collection of milk, by proper disposal of sewage and in recent years by preventive inoculation, which, in large armies, have made what was a formidable disease almost non-existent. Sewage is the medium through which the typhoid infection reaches the water-supply. Milk
is infected, not when derived from the animal, but subsequently, from the washing of utensils with contaminated water or in some similar way. As yet no active measures have been adopted by the sanitary authorities to prevent the contamination of shellfish through the sewage-pollution of the water in which the shellfish beds are situated. This is probably a much more common source of infection than has been generally supposed. In the case of scarlet fever, measles, dysentery, whooping-cough and mumps, prophylactic measures comprise the removal of the sick if possible to special isolation hospitals designed for this purpose and the adequate disinfection of clothing, rooms, furniture, bedding, etc., which may have become infected by contact with the sick. At present no other means are available, except in diphtheria, largely because of the lack of knowledge as to the exact causes of these diseases. In diphtheria, besides these measures, there is now a method for rendering the child immune in the event of its contracting the disease for short periods by administering immunizing injections of diphtheria antitoxin. By these injections the individual may be rendered susceptible to the disease (as in smallpox by vaccination), but the immunity is of short duration.

Many sanitary authorities are now adopting measures for the prevention of tuberculosi$, which causes more deaths throughout the civilized world than any other single disease. Here again the problem of prophylaxis differs from that applicable to any of the other diseases mentioned. In tuberculosis the tubercle bacilli, which are the cause of the diseases, are solely contained in the discharges from the diseased tissues, but the only form of tuberculosis (the disease may affect any organ or tissue of the body) in which the discharges containing the tubercle bacilli are likely to be a source of danger to others is tuberculosis of the lungs or pulmonary consumption. In this form, tubercle bacilli are frequently present in the expectoration in almost incredible numbers. The prophylaxis of tuberculosis is, therefore, practically comprised in the destruction of the expectoration of persons suffering from pulmonary tuberculosis at the time of its exit from the body. If this could be absolutely accomplished the transmission of tuberculosis from one person to another would be almost completely avoided. A common source of infection is probably present in the minute drops of atomized expectoration which are forcibly discharged into the air in coughing and sneezing, unless the mouth and nose are covered during these acts. The prevention of tuberculosis only requires the exercise of scrupulous care with regard to the expectoration, the removal of those unwilling, too ignorant or unable because of weakness, to adopt proper precautions and the disinfection of rooms, with their contents, which have been occupied by tubercular patients. There remain to be considered, aside from this, prophylaxis as applicable to the human being the measures necessary because of the possible transmission of the disease from animals, especially through the meat and milk of tubercular cows. But while this is a real danger, its importance has probably been greatly overestimated. It is now well known that tuberculosis very rarely exists at birth. It is never inherited, in the strict sense, and only in very exceptional instances does intruterine infection occur.

General prophylaxis has as yet scarcely touched upon many of the other infectious and probably, to some extent at least, preventable diseases. The venereal diseases have been ignored because the problem is so largely a social one. No preventive measures even promising in their character have been suggested for dealing with them. The prevalence of the puerperal diseases has been very largely reduced through individual prophylaxis at the time of childbirth. The diarrhoeal diseases of infancy are not as a rule properly to be regarded as communicable, but their prevalence has been greatly restricted through the work of health authorities in the sanitary control of milk and, to a less extent, of the water-supply. The reduction during recent years in the death-rate from diarrhoea of children under two, which has taken place almost everywhere in this country, is almost phenomenal, and indirectly the reduced prevalence of these diseases has materially decreased others brought on by them—diseases of malnutrition, such as rickets, etc.

The results which have thus been accomplished have been due almost entirely to increased medical knowledge and its intelligent application to preventive medicine.

Preventive medicine, however, in the truest, broadest and best sense, includes not only this work in the general application of medical knowledge to restricting the prevalence of the infectious diseases in the community, but also the application of medical knowledge to the protection of the individual from disease of all kinds at every stage in life from birth to old age, and it is this individual prophylaxis which has received the least attention either from the medical profession or from the people. Here is a very large field for intelligent work. A moment's consideration shows at once the impossibility of formulating general rules or of applying the same rules to all individuals, for it is a matter of common observation that individuals differ widely in their physical and mental constitutions and in their chances of developing tendencies. The occurrence in different families of certain similar types of disease in successive generations is a matter of general observation, and the influences which are injurious at one period in life may be not only less harmful but beneficial at another. It is most unfortunate, from this point of view at least, that the family physician of former times is so generally disappearing. The ideal family physician knew thoroughly the family histories of his patients, their tendencies, susceptibilities, weaknesses; he knew every stage in the life of the child from birth; he knew where to restrain, where to encourage and what to prohibit, where dangers to the physical well-being lay and how to advise them for self-protection. In earlier days when the knowledge was less extensive than at present, it was not within the power of the physician to advise as wisely as at present. It is well known now that disease as such is never inherited. It is too much the custom to think of disease as a definite entity, whereas it is really only an ab-
normal process. It is not possible to see or examine disease, as it has no existence as such, but in some instances the causes of disease may be studied, as is the case in the infectious diseases due to the agency of germs. He may be investigated the micro-organisms causing the disease and the changes in the organisms produced by the germs; so also may be studied the abnormal manifestations of life which these changes produce, those manifestations which result in disease. The so-called inherited diseases which are of an infectious nature are simply instances of infection during intra-uterine life, as tuberculosis and syphilis. The diseases of metabolism, such as gout, diabetes, adiposity, etc., are not instances of inherited disease, when they occur in different generations in the same family, as is frequently the case, but are the result of the transmission from parent to children of functionally inefficient organs, which break down under the demands laid upon them.

Among the more recent additions to general prophylaxis are the movements now actively going forward to prevent mental diseases. This whole movement of mental hygiene is one of the most important of modern times. While it has been recognized for years that a healthy mind can exist only in a healthy body, it is being more and more emphasized that there can be no healthy body without a sound mind.

An absolutely efficient prophylaxis applied to the individual would permit the conduct of a physiological life from birth to its termination in a physiological death, occurring when the vital resistance with which the individual was endowed at birth was exhausted. With advancing medical knowledge and a higher civilization there should be a closer approximation to this condition in a larger and larger percentage of the population and a material prolongation of the mean lifetime.

HERMANN MICHAEL BIGGS, M.D.,
New York State Public Health Commissioner.

PREVIOUS QUESTION, a question put to a parliamentary body with the object of suspending the subject under consideration, the question being put upon a member's motion in order to ascertain if the assembly desire to vote upon the subject at once. The form of the question is: Shall the main question now be put? Any member may demand the previous question and if the vote be in the affirmative, the main question as ordered, whether a single motion or all the motions necessary to put the measures through all its stages to final passage, is put to a vote. If the previous question can be ordered on a question on which there has been no debate, then 40 minutes of debate are permitted, but if there has been even a brief debate before the previous question is ordered, an immediate vote must be had on ordering of the previous question. The 40 minutes are divided equally between the supporters and opponents of the measure. In practice the member having charge of a measure and having the floor usually calls for the previous question at the end of his speech unless the measure is being debated under a special order. (See CLOSURE; PARLIAMENTARY LAW.) Consult Hinds, A. C., Digest and Manual of Rules and Practice of the House of Representatives (Washington 1908).

PREVOST, pré-vô', Augustine, English soldier: b. Geneva, Switzerland, about 1725; d. England, 5 May 1786. He entered the army, served under Wolfe at Quebec as captain of the 60th regiment. He then commanded the rank of lieutenant-colonel in 1761, and four years later he was made commander of the troops in the Southern Department and was stationed at Pensacola, and in 1776 captured the fort at Sunbury, Ga., for which service he was brevetted major-general. He then commanded the forces which defeated Gen. John Ashe at Briar Creek in 1779, but failed in an attempt to capture Charleston in that year. He distinguished himself by his successful defense of Savannah against the Americans and French in October 1779, and received full rank as major-general in recognition of his services. His son was Sir George Prevost (q.v.).

PREVOST, pré-vô', Eugène Marcel, French novelist: b. Paris, 1 May 1862. He was educated at the Polytechnic School in Paris and until 1891 he was engaged in tobacco manufacturing at Liège. His company prospered and well worked out, his style easy and usually graceful, but his later work, though brilliant, shows a tendency to the delineation of morbid emotional types. His first book, Le Scorpion (1887), attracted great attention from its attack on the Jesuit system of education. His later works include (Yonchette) (1888); Mademoiselle Jauré (1889); La Cousine Laura (1890); La confession d'un amant (1891); L'Autonne d'une femme (1892); Lettres de femmes (1893); Nouvelles lettres de femmes (1893); Demi-vierges (1894); (Le moulin de Nazareth) (1894); Notre compagne (1895); Le jardin secret (1897); Dernières lettres de femmes (1897); L'Heureux ménage (1901); Nimba; (Le mariage de Julie); Les vierges fortes (1901); (Lettres à Françoise) (1902); La pas relevée (1903); La plus faible (comedy 1904); (La princesse d'Erminge); L'Accordeau aveugle (1905); (Monsieur et Madame Moloch) (1906); (Femmes) (1907); (Lettres à Françoise mariée) (1908).

PREVOST, Sir George, English soldier, son of Augustine Prevost (q.v.): b. New York, 19 May 1767; d. London, England, 5 Jan. 1816. He entered the army in early youth, distinguished himself in the West Indies, was promoted major-general in 1805 and created a baronet later in the same year. In 1808 he was appointed lieutenant-governor of Nova Scotia and in the autumn of that year he conducted a division of troops to the West Indies where he participated in the capture of Martinique as second in command. He was made lieutenant-general in 1811, and appointed governor-in-chief of British North America, a position he held throughout the war that followed. In the War of 1812 he rendered important service to his government, but his defeat at Plattsburg in 1814 forced him to abandon his attempt to invade New York and bring him under censure. He died before the verdict of the court-martial had been rendered.

PRÉVOST D'EXILES, pré-vô déz-zel, Antoine François, French author: b. Hesdin (Artois), 1 April 1697; d. near Chantilly, 23 Nov. 1763. He was at first a Jesuit, then
enlisted in the army, after a brief return to the order again turned soldier, and still later joined the Benedictines of Saint Maur. Subsequently he lived in Holland and England, and in 1735 became almoner and secretary of the Prince de Conti. He was a great admirer of England and things English and his writings, his influence and his translations from English into French created a great interest in English literature, and this in its turn helped to pave the way for the democratic and liberal tendencies which later took possession of the literature of France. Rousseau was the first great writer notably to exhibit this tendency.

'Manon Lescaut,' which became immensely popular, influenced most of the great writers from the days of Prévois to Victor Hugo. He founded Le Petit et le Grand, a journal patterned after the Spectator, which ran through 20 volumes (1733–40); translated Richard and Humen's 'History of England,' and wrote a 'Histoire des Voyages' (1747–80), and several works of fiction, including 'Le Doyen de Killering' (1732–35); 'Mémoires et Aventure d'un Homme de Qualité S'est Retiré du Monde' (1726–28), which includes 'Manon Lescaut,' a story of some celebrity in French literature, frequently reprinted, and the basis of a drama (1851) by Barrière and Fournier and 'Contes, Aventures et Partis Singulars' (1764). A selection from his works appeared at Paris in 1810–16. (See MANON LESCAUT). Consult Harris, L'Abbé Prévois (Paris 1896); Schroeder, V., 'Un romancier français XVIIe siècle, l'abbé Prévois' (Paris 1896); 'Rousseau and the Cosmopolitan Spirit in Literature' (New York 1899); 'Stainte-Beuve, 'Causeries de lundi' (Vol. IX, Paris 1862).

PRÉVOST-PARADOL, prē-vô pā-rā-dōl, Lucien Anatole, French writer: b. Paris, France, 8 Aug. 1829; d. Washington, D. C., 11 Aug. 1870. He was educated at the Collège Bourbon and the École Normal, was editor of 'Revue d'Université Universitary' in 1854 and in 1855 accepted the chair of literature at the University of Aix, but resigned in 1856 to become editor of the Paris Journal des Débats. As a journalist, his keen irony, his brilliant, fearless, and trenchant attacks on his adversaries. A believer in constitutional government, he was opposed to Napoleon III. His articles were instrumental in recalling the French army from Mexico, but his contributions to the Courrier du Dimanche caused the suppression of that journal in 1866. After the formation of the Ollivier ministry in 1870 he became reconciled to the empire and accepted the post of Ambassador to the United States. The trying conditions of the war had generally, preyed upon his mind and he committed suicide shortly after his arrival. His editorials are still considerable models of journalistic style and his books include 'Du Rôle de la Famille dans l'Education' (1857); 'Quelques Pages d'Histoire Contemporaine' (4 vols., 1852–66); 'La France d'Avant-Hier' (1868); 'Consult Gérard, Prévost-Paradol' (Paris 1894).

PREWITT, prōo-it, Theodore Prelinghuysen, American surgeon: b. Fayette, Mo., 1 March 1832; d. Saint Louis, Mo., 17 Oct. 1904. He was graduated at the Saint Louis Medical College in 1856 and engaged in practice at Utica, Mo., but in 1863 removed to Saint Louis where he remained. He was resident physician and surgeon at the City Hospital, chief surgeon of Saint John's Hospital and dean of Saint Louis Medical College, and in 1866 the consolidation of the Missouri Medical College with the Saint Louis Medical College as the medical department of Washington University he occupied the chair of surgery. He was president of the Saint Louis Medical Society, of the Missouri State Medical Association and of the American Surgical Association.}

PREYER, prē-yr, Wilhelm Thierry, German physiologist: b. Manchester, England, 4 July 1841; d. Wiesbaden, Germany, 15 July 1897. He was educated in the universities of Bonn, Berlin, Heidelberg, Vienna and Paris, took degrees in both philosophy and medicine and in 1869 was appointed professor of physiology at Jena. In 1888 he became privat-doecten at Berlin. He has made valuable investigations in the fields of quantitative spectral analysis, the perception of sound and the physiology of the senses. He carried on important researches relative to the blood, respiration and similar subjects. Of his books the most famous is 'Die Sehle des Kindes' (1874), and especially deserving of mention are 'Ueber Empfindungen' (1867); 'Ueber die Grenzen der Tonwahrnehmung' (1876); 'Elemente der allgemeinen Physiologie' (1883); 'Der Hypnotismus' (1890).

PRIAM, prī-ām, the last king of ancient Troy, was the son of Laomedon and Strymo or Placia. He was the 6th of the Trojan kings and reigned 40 years. His territory included Lesbos, Mysia and the Hellespont. When a youth he marched with the Phrygians against the Amazons, and went as ambassador to the Thracians. After the death of his father he reigned in Troy. By his first wife, Ariste, daughter of Merops, he had ΔEsacus. He afterward gave Ariste to Hyrtacus, and married Hector by whom he had, according to Homer, 19 children, among whom Hector, Alexander or Paris, Cressus, Laodice, Polyxena, Cassandra, Deiphobus, Helenus, Pannon, Polites, Antiphus, Hipponous, Polydorus and Troilus were the most distinguished. By four concubines he also had 12 formidable and formidable. He was extremely old the Greeks demanded of him the restoration of Helen, who had been carried away by Paris, and on his refusal to give her up they made war against Troy, took and destroyed the city, after a siege of 10 years, his son Hector having already fallen. According to later legends, when the Greeks entered the city he armed himself, to seek death in the midst of the enemy; but Hector prevailed upon him to take shelter at the altar of Zeus. Here he saw his son Polites fall Myrs, situated in a rich wine country. Aphrodite bore him to Dionysus when the latter was returning from India, though his father unwillingly acknowledged him on account of his ugliness. The first fruits of the crops were offered to him as the god of the fields, the protector of gardens, bees,

goats and sheep. Homer and Hesiod do not mention him and it was only in later times that he was honored with divine worship. He was represented with horns and goat’s ears, and large phallus, having in his lap all kinds of fruit; in his hand he held a sickle, and usually a horn of plenty was spread from lampasacus to Greece and thence to Rome. He represents the productive power of nature and is the god of sensual pleasure. His image was set up in gardens and fields to scare away birds; and this was probably the origin of the modern scarecrow. At any rate the "scare-crow" idea had begun to take possession of the more educated before his worship disappeared; and his name was made the subject of many coarse jests by the poets and writers.

PRIBER, pré-bär, Christian, French Jesuit in America. He came among the Cherokee Indians in 1736 and took up his residence with them in Great Tellico Town in what is now East Tennessee. Intending to make a dictionary and grammar of the Cherokee language and acquire the doors of the Indians to the idea of his being a stranger, meanwhile striving to civilize and convert them. His influence among the Cherokees grew to such an extent that they adopted a code of laws he prepared for them whereby existing the distrust of the English government of South Carolina. Fearing French influence the English demanded Pribier from the Indians, who refused to surrender him, and the safety of the English envoy was secured only by Pribier’s interference. But while in Alabama in 1763 he was seized by the English authorities and cast into prison in Frederica, Ga., where he soon died.

PRIBYLOF, pré-bé-lóf, or "PUR SEAL ISLANDS," a group of islands in Bering Sea, belonging to the United States, about 200 miles north of the Aleutian Islands and 320 miles west of Bristol Bay. The largest islands of the group are Saint George, Saint Paul, Walrus and Otter, while the others consist of a number of islets, all of volcanic origin. The total area is about 180 square miles. This group is of great importance as here is the breeding place of the fur-seal, sea-bear, otter and blue-fox. About May the seals come to Pribylof Islands, where the fog hangs over the land almost continuously. The islands were discovered toward the end of the 18th century by Gerrish Prisylof (or Pribylof), a Russian, and first mate on the boat Saint George. He had been drifting about in the Bering Sea, looking for the breeding place of the fur-bearing seal, and at last he found it. He took possession of the island for Russia, and named it Saint George after his boat. Later the second island was discovered and called Saint Paul and the whole group was named after its discoverer. There are on the islands about 600 permanent residents. Saint Paul, the largest island of the group, has an area of about 35 square miles and a population of over 200. Saint George has about half this population and an area of 27 square miles. In 1868 the Pribylof Islands were made a fur-seal reservation by the American government; and since then schools and churches have been built on the islands, reindeer have been introduced and the condition of the natives has been very materially improved. Consult Elliott, H. W., ‘Our Arctic Province’ (New York 1887); Greely, A. W., ‘Handbook of Alaska’ (New York 1914); Jones, E. L., ‘Report of Alaska Investigations in 1914’ (Washington 1915).

PRICE, Bonamy, English economist: b. Saint Peter Port, Guernsey, 22 May 1807; d. London, 8 Jan. 1888. He was educated at Worcester College, Oxford, and in 1830-50 he was assistant master at Rugby. He then engaged in business and literary work in London and from 1868 he was Drummond professor of political economy at Oxford. He was popular as a lecturer on political economy, and in 1847 he was an advocate of free trade. He lectured in the United States in 1874. Besides numerous pamphlets he was author of ‘Principles of Currency’ (1869); ‘Currency and Banking’ (1870); ‘Chapters on Practical Political Economy’ (1878).

PRICE, Tra Maurice, American Orientalist: b. Welsh Hills, near Newark, Ohio, 29 April 1856. He was educated at Denison University, the Baptist Union Theological Seminary at Morgan Park, Ill., and at the University of Leipzig. He was professor of modern and Semitic languages at the University of Des Moines (now Des Moines College) in 1879-80; and subsequently was connected with the faculties of the Morgan Park Military Academy, the Wheaton (III.) Theological Seminary and Harper’s Hebrew Correspondence Schools. He was instructor and later professor of Hebrew and cognate languages at the Baptist Theological Seminary in 1886-1900. In 1900 he became professor of Semitic languages and literature at the University of Chicago, and since 1910 he has also been secretary of that department. He has been associate editor of the Biblical World and of the American Journal of Semitic Languages and Literature since 1892, and of the American Journal of Theology since 1887. He was a contributor to Hastings’ ‘Dictionary of the Bible’ and ‘Dictionary of Religion’; ‘The Jewish Encyclopedia’; ‘Standard Bible Dictionary’; and the ‘Encyclopedia Americana’. He is author of ‘Introduction to the Inscriptions Discovered by Mr. Ed. Szerer’; ‘Babylon from the Babylonian Bible of Old Testament History’ (1900; 9th ed., 1915); ‘The Ancestry of Our English Bible’ (1907; 5th ed., 1911).

PRICE, Julius Mendes, English traveler: b. London, England. He was educated in Brussels and at the École des Beaux Arts, Paris; entered journalism and was a special artist-correspondent of the Illustrated London News. In 1884-85 he served in the army with the Bechuanaland campaign in South Africa when he enlisted, for journalistic purposes, as a trooper, in Methuen’s Horse, serving with the regiment until its disbandment. He went with the expedition to open up the Nordenskiold route to the interior of Siberia via the Kara Sea, the Arctic Coast of Siberia and up the Yenesei River. He became so interested in the country that he afterward traveled alone through Siberia, Mongolia, and the Gobi Desert via northern China, to Peking (1890-91). Four years later he visited the western Australian goldfields. He was with the Greek army in the Greco-Turkish War, and in 1898 he took an expedition in the Northwest Territory, Canada, and down the Yukon River to the
Klondike in 1898 and was in China in 1900-01. He served as special artist for the *Illustrated London News* and war correspondent of the *Daily Telegraph* during the Russo-Japanese War (1904-05). In the European War he was with the French army at first and later with the Italian Headquarters Staff, where he was official war correspondent to the Italian government in 1917. He has published *From the Arctic Ocean to the Yellow Sea* (1892); *The War of 1861* (1863); *From Canton to Klondike* (1898); *Dame Fashion* (1913); *My Bohemian Days in Paris* (1913); *My Bohemian Days in London* (1914); *Six Months on the Italian Front* (1917). He has also written many magazine and newspaper articles illustrated with his own sketches and drawings.

**PRICE, Langford Lovell**, English political economist: b. England, 20 July 1862. He was educated at Trinity College, Oxford; was lecturer to the Toynbee Trust in 1886-87 and in 1895-96; Nuornach lecturer in statistics at University College London; governor of Dulwich College, 1897; examiner at Victoria University in 1898 and in 1903 was called to that position at the University of Wales. He has published *Industrial Peace* (1887); *West Barbary* (1891); *A Short History of Political Economy* in Engles (1891); *Money and its Relation to Prices* (1896); *A Short History of English Commerce and Industry* (1900); *The Study of Economic History* (1908); *Co-operation and Copartnership* (1914); *Ely and Whewell's Elementary Principles of Economics* (1915).

**PRICE, Richard**, British Unitarian clergyman and political economist and moral philosopher: b. Tynton, Glamorganshire, Wales, 22 Feb. 1723; d. London, 19 April 1791. In 1743 he became pastor of a Unitarian congregation at Staket Newington, where he continued most of his life. He published in 1758 *Review of the Principal Difficulties in Morals*, which was followed by *Four Dissertations on the Importance of Christianity, the Nature of Historical Evidence and Miracles*. In 1771 he published *Observations on Reversionary Payments and Annuities*, succeeded by the celebrated *Northampton Mortality Tables*, and other valuable works relating to life assurance and annuities. He also published *Appeal to the Public on the Subject of the National Debt*; and during the contest with the North American colonies, *Observations on the Nature of Civil Liberty* and the *Justice and the Policy of the War with America*. This work was widely circulated in this country, and Congress, through Franklin, expressed its desire to receive his assistance in regulating the national finances. When Pitt became Prime Minister he consulted Price in his schemes for the reduction of the national debt, and the estimate of the state of the sinking fund was by his recommendation. Consult Morgan, William, *Memoirs of the Life of Richard Price* (London 1815).

**PRICE, Sterling G.**, American soldier: b. Prince Edward County, Va., 11 Sept. 1809; d. Saint Louis, Mo., 29 Sept. 1860. He was educated at the St. Louis College, studied law, removed to Chariton County, Mo., in 1831, and in 1840 was elected to the Missouri house of representatives, of which he was speaker until 1844 when he was elected to Congress. He resigned on the outbreak of the Mexican War and organized a cavalry regiment of which he was commissioned colonel. Under General Kearney he marched with his men from Fort Leavenworth, Kansas, to Santa Fe where he was left in charge. Attacked by the Mexicans he repulsed them severely and completed the conquest of California. In 1847 he was promoted brigadier-general of volunteers, became military governor of California, and on 24 July 1847 led his force in a decisive victory over the Mexicans at Santa Cruz de Rosales. In 1853-57 he was governor of Missouri, and in 1861 presided over the convention called to decide the secession question. He was a Conditional Union man but later joined the Confederacy, and in 1861 was appointed major-general of State forces, participating under Gen. Ben McCulloch, in the defeat of the Union forces at Wilson's Creek in August of that year. He then captured Lexington on the Missouri, but was forced to retreat before Frémont. He served under Van Dorn at Pea Ridge in 1862 and was promoted major-general in the Confederate army. He commanded one wing of Van Dorn's army at Corinth. He was defeated by Rosecrans at Iuka, Miss.; accompanied Beauregard in his retreat to Tupelo, and afterward serving in the Trans-Mississippi department, was there engaged in the unsuccessful attempt to capture Helena in 1863. In 1864 he succeeded in preventing General Steele's advance toward Red River, and later made a raid into Missouri. He was driven into southwestern Arkansas toward the close of the war and after the surrender he became interested in a colonization scheme in Mexico. Consult Sneed, T. L., *The Fight for Missouri* (New York 1886).

**PRICE, Thomas Randolph**, American educator: b. Richmond, Va., 18 March 1839; d. New York, 7 May 1903. He was graduated from the University of Virginia in 1855, studied at the University of Virginia and at Berlin and Kiel. In 1861 returned home to enlist in the Confederate army and served in the staff of the General Stuart. In 1867 he became professor of Latin and Greek at Randolph-Macon College, being later transferred to the Greek and English chair; and in 1876 he was appointed to the chair of Greek and Hebrew in the University of Virginia. In 1882 he was called to Columbia University as professor of English language and literature and remained at the head of the department until his death. He published *The Teaching of the Moller-Tongue* (1877); *Shakespeare's Verse Construction* (1889); edited *Othello* in the Bankside Shakespeare (1890).

**PRICEITE**, a friable chalky mineral 3CaO·4B2O3·6H2O. A source of borax in Oregon.

**PRICES.** Price is value expressed in money. Thus, price is not identical with value. It is an expression of value in terms of some one commodity, which commodity is called money. Value is thus the more fundamental term; it is the thing expressed, whereas price is the expression of the thing expressed.

The general scale of prices may rise or fall without any material change in the supply of or the demand for commodities in general. The forces of supply and demand, however, operate...
upon money as well as upon other commodities. It is quite possible for money to become cheap, in which case considerable quantities of money will be given in exchange for small quantities of other commodities. We call 'high prices.' On the other hand, money may become dear, in which case small quantities of money are given in exchange for large quantities of other commodities. This is what we call 'low prices.' The causes of high or low prices therefore may operate upon money alone or they may operate upon the other commodities for which money is exchanged.

It is commonly assumed that money is cheap or dear according as it is abundant or scarce. The abundance or scarcity of money is undoubtedly a factor in determining its cheapness or dearness; but with money, as with all other commodities, demand is as important as supply. The supply or the quantity, therefore, is only one factor in the problem. With an abundance of money, if there is a general desire to hold on to it and a reluctance to spend it or to let it go, it may remain dear and its purchasing power may remain high. That is, when every one who lacks money is anxious to get it, and every one who has it is reluctant to part with it, large quantities of other commodities may be offered in exchange for small quantities of money. On the other hand, when there is no great eagerness to acquire money except as a means of purchase, no general disposition to hold on to it or reluctance to part with it, it is likely to be cheap; and when every one who lacks money desires to possess it solely for the purpose of spending it quickly, and every one who has it is anxious to spend it for the purpose of getting other commodities as quickly as possible, the result is cheap money or high prices. Large quantities of money are freely spent in order to get small quantities of the other commodities.

If we assume, even for a short period of time, that no change has taken place in the quantity of money or in the desire to possess it, then such change of prices as occurs will be due to factors affecting other commodities. Any change of fashion with respect to dress goods, or change of habit with respect to food, will affect the sale and to a considerable extent the adjustment of prices. Under such conditions, these changes in the price list become a fairly accurate expression of the desires of the people. That which is most desired will command the highest price. That which is least desired will command the lowest price, whether it be in material commodities or the services of labor which are under consideration. The price list is therefore a pretty safe guide to the desires or wants of the community, and he who is anxious to give the community what it desires could scarcely do better than to follow the price list, whether he be producing commodities or selling his labor. Consult Laughlin, J. L., 'Money and Prices' (New York 1919).

THOMAS N. CARVER.

PRICHARD, James Cowles, English ethnologist and physician; b. Ross, Herefordshire, England, 1804; d. London, 1880. He studied medicine at Bristol, London and Edinburgh, began practice at Bristol in 1810, and in 1814 became physician to the Bristol infirmary. In 1813 he published 'Researches into the Physical History of Mankind' (extended to five vols., 1836-47); 'The Eastern Origin of the Celtic Nations' (1831); 'Natural History of Man' (1843); 'Insanity and Other Disorders Affecting the Mind' (1835); 'Disorders of Insanity in relation to Jurisprudence' (1842); 'The Relation of Ethnology to other Branches of Knowledge' (1847). In 1845 he was appointed one of the London commissioners of lunacy.

PRICKLY ASH. any of several prickly shrubs of the United States of the rue family (Rutaceae) and genus Xanthoxylum, especially X. clavahercules, whose aromatic and pungent bark is used in the Southern States as a rustic remedy for toothache. In the south this bush is therefore known as toothache-tree and pepper-wood.

PRICKLY HEAT. See Miliaria.

PRICKLY PEAR, a genus (Opuntia) of American cactus. About 130 species have been recognized in the region they occupy from British Columbia through the western States, Central America and West Indies, and on South America. They are very variable in their specific characters, and the lines between species are very indistinctly marked. Some are very dwarf prostrate plants; others are tree-like in height and spread of top. They have club-shaped, cylindrical or flattened spiny or hairy, fleshy stems, and except upon the youngest joints bear no leaves. These leaves drop off very soon. The flowers, which are borne near the upper parts of the joints or stems and on the most briskly parts, are solitary or in corymb-like panicles and are usually yellow and very showy. The fruit is a modified stem, the ovary being sunken in its apex. It varies with different species from dry to fleshy and succulent, in many species being edible. Prickly pears were in cultivation among the natives when America was discovered, and were introduced by the Spaniards to the Mediterranean region, and finally to Asia, South Africa, Australia, etc. In all these places they are now regarded as troublesome weeds, though in many they are valued for their fruit. In Sicily they are one of the chief crops, the peasants living mainly upon the fruit from July to November. Since some of the varieties will produce about nine tons of fruit to the acre upon land too rocky, thin or poor for other crops; since this production can be counted upon for a long series of years without any cultivation after the plants become established (in three years or less, usually); and since they are highly nutritious, their value is not over-estimated in climates adapted to their culture; namely, dry and frostless. They contain about 14 per cent of sugar and nearly 2 per cent of fat. A crop of nine tons per acre would, therefore, be equivalent to about 2,500 pounds of sugar.

In view of these statements it seems strange that attention has not been directed to improvement of varieties, etc. They have not been ranked with horticultural fruits, though they are of far more economic importance than many that are. In many sections they are used for stock feed; experiments have been made of drought. The spines are generally rubbed or burned off, but cattle often eat them without this treatment, and frequently suffer death because the spines pierce their intestines. Of
PRIDE AND PREJUDICE. An admirer of Jane Austen's novels is certain to regard as the best the one he happens to be reading, so admirable are they all in those qualities which make for perfect work; but on reflection he will probably give the palm to *Pride and Prejudice,* if for no other reason, because he remembers it the longest. This novel, with its clean-cut, logical plot, was published in 1813, though its first draft dates as far back as 1796-97, when Jane Austen was young. It is the novel of a girl—a clergyman's daughter—who had been bred in the country among the minor gentry. The scene, except for a few excursions, is laid in two English villages named Longbourn and Meryton. Within these narrow limits, Jane Austen studies the Bennet family—consisting of Mr. and Mrs. Bennet and their six daughters—in relation with their neighbors, and especially with the tenant of Netherfield Park, the young Mr. Bingley and his friend Mr. Darcy. The end June, the eldest daughter of the Bennet family is married to Mr. Bingley; and Elizabeth, the second daughter, to Mr. Darcy; while a younger sister, Lydia, elopes with Mr. Wickham, the villain of the story, who holds a commission in the militia stationed at Meryton.

The novel takes its title from the two leading characters—Mr. Darcy, who is proud of his birth, fortune and attainments, and Elizabeth Bennet, who resents his apparent condescension and superciliousness, and, not understanding his true character, becomes inordinately and unjustly prejudiced against him. Elizabeth's prejudice is first awakened at a village ball, where she overhears a remark of Darcy's in disparagement of herself and the other girls; it is strengthened by Darcy's attempt to detach Bingley from Jane, and by a false story about his dishonorable treatment of Wickham. All the time Darcy is falling in love with Elizabeth, attracted by her very fine eyes, her vivacity, her frankness, her keen intelligence and genuine benevolence. He is not the man he appears to be when Darcy proposes and Elizabeth spurns him. Thereupon Elizabeth soon learns why Darcy has cast off Wickham, the spendthrift and libertine; she is made to understand why he has interfered in the match between Jane and Bingley; and she discovers that but for Darcy, who patched up a marriage between Lydia and Wickham, lasting disgrace would have fallen upon the entire Bennet household. Elizabeth and Darcy come to understand each other perfectly. Pride and prejudice vanish; and the conclusion is as logical as a mathematical demonstration.

In tone and atmosphere, *Pride and Prejudice* is the novel that approaches nearest to Shakespeare's *Much Ado About Nothing* (q.v.). Elizabeth and Darcy, like Beatrice and Benedick, from the same delight that we feel when we read of the wit contests between Beatrice and Benedick. All the other characters are also carefully differentiated. The novel is pervaded with pure comedy, which Jane Austen occasionally allows to approach farce in the delineation of Mrs. Bennet, the match-making mother, and in the Rev. Mr. Collins, who would marry Elizabeth in order to promote his own happiness at the expense of hers. There is no tragedy in the novel. Over all the domestic affairs of life Jane
Prideaux — Priest

Anstey lets her mind play, diverting the reader with "follies and nonsense, whims and inconsistencies." Scott despaired of ever attaining to her delicate portrayal of character; and her art has had a potent influence upon Trollope and other later novelists down to Mr. Howells, who writes of her as "the divine Jane." — Wilkie L. Cross.

Prideaux, prid'ō, Humphrey, English scholar and divine; b. Padstow, Cornwall, 2 May 1648; d. Norwich, 1 Nov. 1724. He was graduated from Christ Church, Oxford, in 1672 and was appointed rector of Saint Swithin's, Oxford, in 1679, prebend at Norwich in 1681, archdeacon of Suffolk in 1688, and in 1702 became dean of Norwich. He was a man of studious habits, a deep thinker, acquired a vast store of knowledge, and a wide reputation for judgment, integrity and wisdom. His greatest work was entitled 'The Connecticut of the History of the Old and New Testaments' (4 vols., 1715–18). Among his other works are 'Marmora Oxoniensia' (1670); 'Life of Mahomet' (1677); 'Thomson, E. M.'s' for his letters to John Ellis, Under-Secretary of State, (published by the Camden Society in 1875); the 'Bibliotheca Cornubensis' (Vols. II and III); and 'A Life of Humphry Prideaux' (published anonymously in 1748).

Prideaux, John, English soldier; b. Devonshire, 1718; d. near Fort Niagara, N. Y., 19 July 1739. He entered the army in early youth, and attained the rank of brigadier-general in 1739. In that year he was given command of one of the four divisions which were sent on the expedition to Canada, and while Amberson, Wolfe and Stanwix co-operated in the north, Prideaux attempted the reduction of Fort Niagara, one of the strongest fortresses in possession of the French. He landed before the fort on 7 July and opened an attack, repelled a sortie on 11 July and on the 19th prevented the landing of the French reinforcements sent from Frontenac, but was killed in the trenches on the same day by the premature bursting of a shell. His work was not without results, as the fort surrendered on the 24th. Consult Parkman, Francis, 'Montcalm and Wolfe' (Boston 1884).

Pride's Purge, the familiar name for the forcible exclusion of Royalist members from the House of Commons in 1648 by Col. Thomas Pride. See Pride, Thomas.

Priene, pri'ēn, in ancient history, a city of Ionia at the mouth of the Geseon in early times, but because of the alluvial deposits of the Maeander finally lay several miles from the coast. One of the 12 cities in the Ionian League, Priene was conquered by Ardis, a Lydian king, in the latter part of the 7th century B.C. It was mixed up in several revolts against the Persian power, notably the Ionian trouble (500-494 B.C.). Shortly after Priene fell into the hands of Athens. During the power of Alexander in Asia Priene flourished. A new city was laid out and it and the old beautified by additions of the best art of the day. Sometime during the reign of the Byzantine rulers, the city was deserted and it was subsequently covered by débris caused principally by earthquakes, and on Cross's overthrow became the property of Persia. The great temple of Athena Polias, the scene of the festival called the Panionia, was here; a dedication upon it by Alexander the Great is now in the British Museum. In 1866 the temple of Athena Polias (erected under the direction of Pythis) was excavated for the Diligentia Society by Pullan and Newson, who have shown that it was one of the finest pieces of Ionian architecture ever built. The plan of the ancient city has been made plain by explorations in 1895-99 under the management of the Royal Museum in Berlin; it is evident that the city had been planned with great care and had been looked after as the best of the Greek cities were. The excavations, therefore, have made of the ruins one of the most important sources of information concerning the Greek city life of the period. The market place, theatre, temples and other public buildings, together with a vast amount of sculpture and inscriptions, were unearthed. Consult Biedeker, Konstantinopel, Balkanstaaten, Kleinasien (Leipzig 1914); Frettingham, A. L., Priene (Century Magazine, Vol. LXII, 1901); Gartingen, H. von, 'Inschriften von Priene' (Berlin 1907); Lenenach, De Rebus Prienensibus (Leipzig 1890); Leutner, Priene (Classical Weekly, Vol. V, 1911); Pullan and Newson, Antiquities of Ionia (London 1881); Wiegand, Priene (Berlin 1898).

Priessnitz, pris'nits, Vincenz, founder of the Kaltwasserkur, or system of hydropathy (q. v.): b. Graefenberg, Austrian Silesia, 4 Oct. 1799; d. there, 28 Nov. 1851. Having benefited by the application of cold water a cure of a severe injury he had received, he subsequently employed it in local cases as a healing agent. Two English physicians, Sir John Floyer and Dr. Currie of Liverpool, had anticipated him in advocacy of the method, and a Silesian, Hahn, had published a book on it derived largely from a work by Floyer. But Priessnitz was the first to develop hydropathic practice. He established with the permission of the government an institution at Graefenberg which was much frequented, among the guests being many physicians who came to study his claims. He wrote nothing himself, but many records of experiences of his cure, most of them favorable and many enthusiastic, were written by others. Consult the study of Weininger (1852), and Philo von Walde, Priessnitz als Begründer des Wasser- und Naturheilfahrenden (1897).

Priest, Josiah, American author: b. New York, about 1790; d. western New York, about 1850. He was a harness-maker, but became self-educated and published several books, some of which became very popular. Among them were 'Wonders of Nature' (1826); 'View of the Millennium' (1828); 'Stories of the Revolution' (1836); 'American Antiquities' (1838); and 'Slavery in the Light of History and Scripture' (1843).

Priest, one who performs the sacred rites of any religion, especially the sacrificial rites, and who is thus a mediator between the Deity and men. In primitive times the function of priesthood was inherent in the head of a family, the pater familias; but as states were organized priesthood on behalf of the people was assumed by the chief or king, or was exercised, under him, by a special order of men; but still the rites of domestic religion would continue to be per-
formed by the head of the household. In early Greece and Rome when kings were banished and the power of the state came into the hands of elected magistrates the priestly office of the king, or his headship in religious affairs, was vested in the *archon basileus* as at Athens, or the *rex sacrorum* as at Rome; the term king (*basileus*, *rex*) being retained after kingship had been done away, doubtless because of some religious scruple, lest the gods should resent the lowering of the appellation of the head of the state religion. The priests of the state religion were now appointed by the public authority, whether their functions were general or were restricted to the service of special gods in special temples.

In Rome there never was in pagan times anything like a priestly order or priestly caste or class, as the order of knights (squires) or patricians (patricii nobles), nor was priesthood hereditary. In Greek states the priestly service in certain temples and places was restricted to certain families; for the rest the priesthood was a function of the state. In Egypt the priesthood was a very close corporation, the members of which, with the king at their head, were the supreme arbiters of civil and even military as well as of religious affairs; the priesthood alone possessed whatever science existed of the religion of the secrets of statecraft, or the laws of nature.

In primitive Israel, as in other primitive societies, priesthood was the attribute of the father of the family: the priest by vocation, as a man set apart to minister on behalf of the people in the temple of God. In Egypt the priesthood was a separate order. In Babylon and the building of the second temple at Jerusalem by Zerubbabel in 520 ac. nearly 500 years after Solomon’s reign. Before the building of Solomon’s Temple there were in Israel several temples or sanctuaries with oracles that were consulted to ascertain the will and laws of God, with priests as their interpreters; and the priests and the Levites constituted a distinct order of society; but after the secession of northern Israel every devout king of Judah earnestly sought to suppress religious worship or sacrifice everywhere save in the central national temple: this end was not achieved till after the return of the captives from Babylon. Henceforth the worship even of the true God elsewhere than in the temple at Jerusalem was denounced as impious and little different from worship of false gods. The entire priestly order was massed in Jerusalem and its neighborhood; the priests were distributed into 24 classes, each presided over by a chief priest, and each class of priests ministering in the temple one week in rotation. Over the whole priestly body, high priest, believed to be always a lineal descendant of Aaron, the brother of Moses.

The ministers of the several religions mentioned, as well as those of Phenicia, Babylon and other countries, are styled in English "priests"; in Hebrew, Greek and Latin, respectively, the priest is *kohen*, *hieros* and *sacerdos*. But the English word priest, derived from the Greek *presbyters*, an elder person, has not in itself any denotation of sacrifice or of priestly function but only of maturity of age.

In the Greek New Testament the priest of the Jewish law is always called *hieros* and in the Latin Vulgate version *sacerdos*, never *presbyters*, or *senior* (elder). On the other hand, neither in the Greek original nor in the Vulgate Latin version of it is *hieros* or *sacerdos* ever said of the minister of the religion of Jesus Christ, but always *presbyters* and *presbyter*; and in the authorized English version *presbyters* is invariably rendered elder, never priest. It is the elder in the Book of Common Prayer of the Anglican Church and in that Church’s Articles of Religion the word priest is everywhere employed instead of elder; but this "priest" of the Prayer Book is not *hieros*, *sacerdos*, a sacrificing priest; for in the Articles the sacrificial function of the priest of the Catholic Church is classed with "blasphemous fables and dangerous deceits." Hence for the Anglican Church, as for all the other Protestant churches, the priest, presbyter or elder is not the consecrated and anointed clergyman in the Catholic Church and in the numerous Christian churches of the East. Those churches teach, with the Church of Rome, that in the Christian dispensation it is the chief office of the priest to offer sacrifice, namely, the eucharistic oblation, which is a perpetual representation of the offering made on Calvary. In the belief of those churches the mass is the selfsame sacrifice which Christ offered—the victim the same, the priest the same; for the victim is Jesus Christ, his body and blood; and the priest is the incarnate Son of God in Heaven, the High Priest, who is represented in the mystic offering by the priest who ministers at the altar.

It is worthy of mention that till the middle of the 3d century no extant writing of any of the fathers employs the Greek or the Latin word for priest (*hieros*, *sacerdos*) to designate the *presbyters*. In the Roman pontifical the order of the priesthood is called both *presbyterius* and *sacerdotium*.
PRIEST OF KIRCHFELD — PRIESTLEY

PRIEST OF KIRCHFELD, The. The folkplay in Viennese dialect, 'Der Pfarrer von Kirchfeld,' produced 5 Nov. 1870, in Vienna, is Anzengruber's most popular drama even if in the opinion of the critics it was not his best. It raised a struggling unknown author to fame, partly because of its freshness and inherent excellence, but more because it voiced popular feelings in regard to the celibacy of the clergy, mixed unions, enforced civil marriage and the relation of church and state. At this period the Church stood at its highest, as indicated by the declaration of papal infallibility in 1870.

The scene is laid just outside of Austria in the most conservative portion of Old Bavaria among a simple peasantry whose passions, expressed without reservation or but clumsily concealed, were a novel revelation of human nature to the theatregoers. Priest Hell and his feudal adversary, Count Finsterberg, reveal by their very names the nature of the conflict which is precipitated by Hell's innocent gift of a little gold cross to his ward, the orphaned, penniless Annerl. This gives the vagabond Wurzelzeppe an opportunity to ruin the Priest with his parish as an expression of hatred caused by ecclesiastical prevention of his union to a Lutheran girl 20 years before. In the last scene of the play Hell converts and wins the friendship of this enemy when he permits the burial of Wurzelzeppe's suicide mother in consecrated ground. But this employment of his own judgment against the law of the Church loses for him his parish.

Though a member of the "church militant and regnant" he had sought like the 'Monk of Wittenberg' for a way short of the requirement to inquire "May I do it, just as I mean it?", a way which makes men "indifferent or apostate." Herein lies a part of the tragedy of his position. However, he becomes no champion of the "Away from Rome" movement, which later gained such strength. He conquers self, and submits. More tragic, almost to the point of suicide, is his love of Annerl who also loves him. Passionation like all Austrians, by giving hand and allegiance to the peasant, Michel. It is this soul conflict, more than its political-religious purpose, which makes the play great. First produced in the Volkstheater an der Wurzel in Vienna in 1870 over all German-speaking lands, being played 632 times between 1899 and 1905. Text Vol. VI of Gesammelte Werke (1898). Criticism sigismund Friedrich, 'Ludwig Anzengruber' (Leipzig 1902).

CARL E. EGGERT.

CARL E. EGGERT.
in the cultivation of his scientific pursuits, until finally goaded by party enmity to seek an asylum in the United States, which he reached in 1794, and took up his residence at Northumberland, Pa. In America he dedicated his whole time to his accustomed pursuits. Some discourses of his led to the formation in Philadelphia of a Unitarian congregation and he held private meetings and his own homilies were never naturalized; and, curiously enough, never learned to make change in United States coinage. Priestley was an ardent controversialist, chiefly in consequence of extreme simplicity and openness of character; but no man felt less animosity toward his opponents than he did, and the who entertained the strongest antipathy to his opinions were converted into friends by his gentleness and urbanity in personal intercourse. As a man of science he stands high in the field of invention and discovery, and to few has pneumatic chemistry been so much indebted. On his own admission his researches in his favorite science were superficial, and his great discoveries to a considerable extent accidental. But this should detract nothing from the honor due to him as an experimental chemist. As a metaphysician his elucidation of Hartley's theory of association, his works upon philosophical necessity and upon materialism will always insure attention. As a theologian Priestley, who followed his convictions wherever they led him, passed through all changes, from Calvinism to a Unitarian system in some measure his own; but to the last remained a zealous opponent of infidelity. Of his theological and controversial productions, those most generally esteemed are his Institutes of Natural and Revealed Religion (1779–84) and Letters to a Philosophical Unbeliever (1780–82). He also wrote many works of practical divinity. There is an edition of his Theological and Miscellaneous Works, with Memoirs and Correspondence (1817–32).

PRIGG CASE, The, in American history, a famous slave case tried in 1837. Edward Prigg caused a fugitive Maryland slave-woman to be returned to her mistress, in violation of a Pennsylvania statute forbidding the carrying of any negro out of the State in order to enslave him. The case was finally brought before the Supreme Court of the United States, where it was contended that the statute was unconstitutional since it conflicted with the National Fugitive Slave Act of 1793. The opinion was handed down that the national law must be carried out by national authorities alone.

PRIM, Juan, hoo-ån', prém, COUNT DE REUSS, MARQUIS DE LOS CASTILLOES, Spanish general and statesman: b. Reuss, Catalonia, 6 Dec. 1814; d. Madrid, 30 Dec. 1870. Destined for the law, he entered the ranks of the volunteers in the cause of Isabel, Queen Isabella, on the outbreak of the civil war, which in 1833 followed the death of Ferdinand VII. At its close in 1839, Prim threw himself into politics, and when Queen Maria Christina quitted Spain, worked in behalf of the Progressista party against Espartero, who, 8 May 1841, had assumed the regency. In May 1843 he led the insurrectionist forces against Espartero, and upon the downfall of the Espartero ministry was rewarded by the queen by being created a peer. He was subsequently appointed first minister of war and general, Count de Reuss, and in 1843 governor of Madrid. Suspected later of conspiracy against the government in 1844, he was sentenced to six years' imprisonment but was released after six months, when the war with Morocco was in progress, distinguishing himself in the war against Morocco at the battle of Los Castillitos, 1 Jan. 1860, he was given the title of Marquis de los Castillitos. He commanded the Spanish expedition, which acting jointly with the French and English landed in Mexico early in 1862 to enforce claims of indemnity against that country, but withdrew his troops almost immediately. Again accused of conspiracy, he was banished in 1864, but headed an uprising in January 1866 against the government and was compelled to flee to England in 1867. From there he gave support to a revolution started in Spain that summer and in September suddenly appeared in Cadiz and fought against the government in the military revolution headed by Topete and Serrano. Upon the defeat of the government he was appointed Prim Minister of War in his provisional government. He became head of the Cabinet and procured the election of Amadeo, Duke of Aosta, second son of the king of Italy, as king of Spain. He was shot by unknown assassins while driving through Madrid. Consult Jiménez, F., 'Historia Militar y Política de D. Juan Prim' (1860); Leonardson, 'Prim' (1901).

PRIMARY, Direct. A direct primary is an election held by political parties at which candidates for nomination are chosen directly by the voters of those parties. Under this method, voters select their nominees directly, whereas under the delegate or convention system the voters send their delegates to a convention at which the party candidate is nominated (see Convention, Political). The convention system was so indirect in its methods and so many times accompanied by sharp practices on the part of rings of professional politicians and office-holders that a more effective method of nominating candidates was sought in order that nominees should represent the will of the rank and file of the party who cannot make politics their business. Moreover, the argument was advanced that the mass of the party members would regain control of the government of the party and the electorate would exhibit a greater interest in party nominations. This has proven to be the case, the vote at the primaries as a rule being larger than under the delegate system, while the party electorate expresses its will more directly and effectively, thus making the party rulers more amenable to the party will. Even though the bosses may prepare a nomination for a particular candidate at a preliminary or primary caucus, the rejection of these candidates or the elimination of the unit in an easy task since the party practically amounts to a referendum on the caucus. The party leader, are directly responsible for the personal qualities and principles of the candidates presented, and would scarcely run the risk of discredit and overthrow by having the party electorate repudiate their candidates. In Oregon and some other States each candidate is
afforded an opportunity to give widespread publicity to his platform or principles; the pictures and statements of all the candidates are printed in a publication or pamphlet, which, for a small consideration, is distributed to the voters before the primary. In Wisconsin a candidates' convention frames the platform, the convention consisting of all party candidates for State offices and for the legislature and of any members of the senate who have held office. Thus the voter receives a concrete statement of the policy by both the legislative and executive departments. In Missouri the State central committee, together with the party nominees for State office, for the legislature and for Congress, formulate the platform. In Oregon, when the petition is filed, the candidate may set forth his principles in a paragraph of not more than 100 words, and he is also allowed a 12-word sentence upon the ballot. If 10 per cent of the party voters in Texas, petition, a question of party policy must be submitted to the voters at the primary. If the party cannot be pledged to any policy which has not been endorsed by a majority of the voters.

In the Southern States a plurality of votes cast determines the nomination, but in the Southern States a clear majority is often required and if no candidate receives the necessary number of votes a second primary is held at which only two leading candidates are considered. In Iowa the minimum percentage plan, Iowa requiring 35 per cent of the total vote, while Michigan requires 40 per cent for governor and lieutenant-governor. Idaho, North Dakota, Wisconsin and a few other States have adopted a system known as preferential voting, under which first and second choices for a given office are indicated and if no candidate receives a majority of first choice, the lowest candidate is dropped and the second choices are then distributed. The object of the preferential vote is to eliminate a second ballot and to prevent the choice of a candidate by plurality only. In some cases even third choices may be indicated.

The advent of the direct primary has had a large influence on the personnel and character of the legislature. It affects the choice of senators, representatives, Presidential electors and delegates to national conventions. The application of direct primaries to senators and representatives has been provided for without extended discussion, but the States have been slow in applying the system to the choice of delegates to the national nominating conventions. Wisconsin started the movement and several other States have provided for a direct vote for delegates. The next move is to have the electors of each party in each State at the direct primary instruct their delegates to the national convention as to the party preference for Presidential nominee. A primary law extended to Presidential nominations was adopted by Oregon in 1910 and since then the States of the Pacific coast have been adopted by many States. (See Primary, Presidential Preference). After all the States have adopted the plan of choosing their delegates to conventions by direct primary, the next logical step (though its adoption is now very problematical) is to provide for the nomination of a Presidential candidate by the direct popular vote of the entire party. This would soon result in a direct vote of the whole country for President and thus eliminate State and local political machines (q.v.). In most cities the direct primary has been discarded in order to eliminate national party politics and in its place non-partisan primaries and nomination by petition only have been substituted. See Elections.

The earliest system of direct primary college used in Pennsylvania in the sixties, but though this was adopted in the Southern, Central and Western States, its use was not general until the nineties. Minnesota adopted the direct primary for Hennepin County in 1899 but Wisconsin by her law of 1903 was the first State to adopt this method for all nominations. The State-wide direct primary is now used in almost all of the States; it was adopted by Oregon in 1904; by Iowa, Missouri, Nebraska, North Dakota, South Dakota, Nebraska and Washington in 1907; by Ohio, Kansas and Oklahoma in 1908; by California, Nevada, Idaho, Tennessee, Michigan and New Hampshire in 1909; by Arizona in 1910 and 1912; by Idaho, Nevada, Colorado and Idaho in 1910; by Wyoming, New Jersey, Massachusetts and Maine in 1911; by Minnesota, Virginia, Kentucky, Mississippi, Louisiana and Montana in 1912; by New York, Pennsylvania and Florida in 1913; and by Vermont, Indiana and West Virginia in 1915; while in South Carolina, Georgia, Alabama, Arkansas and Texas it is conducted under the rules of the Democratic party but has not been established by statute for all parties. See BALLOT; CONVENTION; POLITICAL; CAUCUS; ELECTIONS.

PRIMARY, PRESIDENTIAL

PREference — PRIMATE

PRIMARY, Presidential Preference, a method adopted by some States of applying the direct primary to the choice of delegates to national political conventions. A widespread belief that the national conventions, in their entire membership, had not been truly representative of the party voters and did not reflect the preference of the majority resulted in the enactment of laws for the choosing of delegates directly by the party voters in official primaries. The laws passed by the States vary regarding the degree of directness with which the preference is expressed and the measure of certainty of its being carried into effect. Under the California and South Dakota laws, a number of candidates, corresponding to the number of delegates to which the State is entitled, may file a nominating petition as a group, pledged to the interest of a given candidate for President, and whose names are printed on the ballot together and the voter may by one mark cast his ballot for the entire group at once. Before a group may be placed on the ballot, the law requires that not less than one nor more than three persons named reside in the same Congressional district; and the group must also have the endorsement of the Presidential candidate whose cause it has espoused or of a State organization possessing his confidence. In Illinois, New Jersey, New Hampshire and Ohio the Congressional district is the unit for electing delegates. In Illinois the candidate for delegate must file with his nomination petition a statement of his preference for President or a statement that he has no choice; and on the official primary ballot the preference or lack of preference is printed beneath the name of each candidate. In Ohio the delegate files a first and second choice for President, both of which are printed on the ballot, but the candidate as an alternative may state that if elected he will support for President the candidate receiving the majority of the preference votes. The New Hampshire law simply permits candidates for delegate or delegates at large to pledge that if elected they will vote at the national convention for given candidates for the Presidential nomination as long as his name remains before the convention. The delegates from Oregon and Montana are elected at large, but in order to secure minority representation the voter is allowed to cast his ballot for one person only as a delegate. Those candidates receiving the largest number of votes are declared elected. A direct Presidential preference vote is held at the same time and candidates for delegate pledge themselves under oath to accept the popular choice. Delegates from Pennsylvania and North Dakota are bound by the preference vote but the vote is not binding on delegates from Massachusetts, Minnesota, Nebraska, Texas and Wisconsin. The Iowa ballot contains the names of candidates for President and Vice-President, party national committee, delegates at large, district delegates, and alternates of the last two. The voter is also called upon to decide by a vote of yes or no whether district delegates to the national convention shall be instructed by the vote of the State at large or by the vote of the Congressional dis-

tract. Maryland combines a preference vote with an election of delegates by a State convention. The county delegates to the State convention are instructed by the vote of the county to support a certain candidate and must do so as long as this candidate has the support of nine counties. The Presidential candidate receiving the votes of a majority of the delegates becomes the choice of the State party and must be given the support of the State delegation at the national convention. A majority of the Presidential primary laws are mandatory. Since Presidential primaries are held under the regular primary laws, candidates for delegate, in order to have their names placed upon the ballot, must file nominating papers. Likewise in most of the States having such laws, Presidential candidates, either personally or by duly authorized State organizations, must file petitions signed by a designated percentage of their party supporters in the State. In 1910 Oregon extended her primary law to Presidential nominations and in 1913 applied direct nomination to the office of national committee; she was followed in 1911 by New Jersey, North Dakota, Nebraska and Wisconsin; in 1912 by California, Illinois, Maryland, Massachusetts, South Dakota, Montana and Michigan; in 1913 by New Hampshire, New York, Pennsylvania, Ohio, Minnesota and Iowa; in 1914 by Texas, and in 1915 by Vermont, Indiana and North Carolina.

PRIMARY BATTERIES. See Battery.

PRIMARY ELECTIONS. See Electoral Qualifications; Congress.

PRIMARY ROCKS, formerly applied by geologists to the earliest rocks, including particularly those owing their present state to igneous agency. Gneiss, various schists and granite were so regarded. At the present time primary is used as equivalent to Palaeozoic (q.v.).

PRIMARY VOLTAIC CELL. See Electrical Terms.

PRIMATE, since the 4th century of the Christian Church, the title assumed by the bishop of the capital of a province, and hence equivalent to metropolitan or archbishop. The Council of Chalcedon decreed that the primacy, or first place before all, was to be accorded to the archbishop of Old Rome. In Africa the title belonged to the bishop of Carthage. In other parts of Christendom the attempt was made to distinguish between primates and metropolitan as early as the 9th or 10th century, for one of the capitularies of the early French kings ordains that no metropolitan shall assume the title of primate unless he has a jurisdiction to that honor; and in the 11th century the popes expressly reserved the title only for the leading
PRIMATES — PRIME

metropolitans in different countries, and endeavored to subordinate the other metropolitans to them. The resistance to this arrangement was, however, so general and emphatic that the dignity of primate remained little more than a nominal one, entitling the holder of it merely to the title of metropolitan and consideration. In France the archbishop of Lyons was appointed primate of the Gaule by Gregory VII in 1079, and the archbishop of Rouen is also primate of Normandy. In the German Empire the archbishop of Salzburg was primate. In Hungary the archbishop of Gran is primate; in Bohemia that of Prague; in Spain that of Toledo. In Poland the primacy belonged to the see of Gnesen. None of these bishoprics any longer retain primatial rights of jurisdiction excepting that of Gran. The office belonged of right to the papal legate, who was president of the Senate and censor of the king. He governed the state during an interregnum, had a court, guards, and a marshal of the palace, and in general enjoyed the highest privileges. In the Church of England both the archbishops still retain the title of primate, the archbishop of Canterbury being distinguished as the primate of all England and the archbishop of York as the primate of England. In the Protestant Episcopal Church of Ireland the archbishops of Armagh is primate as formerly when the church was established.

PRIMATES, the name given by Linnaeus to his highest order or group of the Mammalia, which included the bats (Chiroptera), the apes, monkeys, and lemurs (Quadruprana), and man (Bimana). By common consent of zoologists the bats have been removed, leaving the monkeys, lemurs and man as a fairly homogeneous group. Formerly the definition of this order was comparatively easy, but owing to numerous recent palaeontological discoveries an almost unbroken series of forms between the lemurs and the insectivora is now known, and the interrelationships between the former and the higher apes, and of the latter with one another and with man, have been shown to be more complex than was anticipated. Leaving out of account the prelemurine fossil the order is characterized as follows: They are always complete milk and permanent dentitions, the latter having the various kinds of teeth well differentiated and usually the following formula: Incisors, $\frac{1}{3}$; canines, $\frac{1}{1}$; premolars, $\frac{2}{3}$ or $\frac{3}{3}$, and molars $\frac{3}{3}$ or $\frac{4}{4}$ (rarely). Occasionally there is the loss of an incisor, premolar or canine. The molars are of the simple quadrirribular grinding type, and the premolars are still simpler. In all cases the orbit is surrounded by a bony ring and frequently separated from the temporal fossa by a plate of bone. The clavicles are well developed, the radius and ulna and the clavus and fibula (except in one case) are never coalesced, the scapuloh and lunar bones of the wrist make the palm and hallux (except the latter in the great) are grasped for opposable thumbs. With a few exceptions among the lemurs and marmosets, the digits are all terminated by flat nails. Except in isolated cases the stomach is always simple, there are two pectoral mammae and the testes are contained in a scrotum. Concerning the subdivision of the order in suborders and families there are several opinions; but the customary recognition of the sub-order Prosimiae or Lemuroidea for the lemurs and their allies, of Quadrumana for the monkeys, baboons and marmosets, and of Anthropomorpha for the apes and man will present future presents. Consult Hartman, 'Anthropoid Apes' (1886); Forbes, 'Handbook of Primates' (1896-97).

PRIMATICCIO, Francesco, frán-ché'skô pré-má-tê'tchô, Italian painter: b. Bologna, 1504; d. France, 1570. He was a pupil of Inno cenzo da Immola and Bagnacavallo, and began in 1525 to study under Giulio Romano. In connection with several of the pupils of the latter he painted the Palazzo del Té, in Mantua, from Giulio's designs. Through the recommendation of Frederick, Duke of Mantua, Primaticcio was engaged by Francis I of France in 1531 to decorate the palace of Fontainebleau. To his influence were owing not only numerous paintings in fresco and works in stucco which the king caused to be executed, but several branches of painting, as, for instance, enamel painting, and designs for tapestry, were carried to greater perfection through his genius. Francis sent him to Italy to purchase antique statues, and casts of famous works of art. On the death of Rosso, the royal painter, Primaticcio succeeded to his post, and Francis II appointed him in 1559 superintendent of the royal buildings. He furnished the designs for several architectural works, among them the tombs of Francis I and Henry II. His works at Fontainebleau, however, gained him more reputation. His was a clever, facile pen, but he was not a slave of pedantry and meretriciousness, and that fluent but artificial elegance which remained so long the characteristic of French art. His frescoes and stucco work have been almost all destroyed; we can only judge of their quality from engravings, and there are no engravings which can with certainty be ascribed to him; even the authenticity of 'The Continence of Scipio' now in the Louvre is sometimes doubted.

PRIME, Edward Dorr Griffin, American Presbyterian clergyman and religious journalist: b. Cambridge, N.Y., 2 Nov. 1814; d. New York, 7 April 1891. He graduated in 1832 from Union College, and from Princeton Theological Seminary at Princeton in 1838. He filled several pastures, including that of the Eighty-sixth Street Presbyterian Church, New York, and contributed articles to the New York Observer under the signature "Ensebius." With his brother, S. I. Prime (q.v.), he edited the paper 1845-84, and continued to edit it a year longer after his brother's death. He published 'Around the World' (1857); 'Fifty Years in the Turkish Empire' (1875); 'Notes, Genealogical, Biographical and Bibliographical of the Prime Family' (1880), etc.

PRIME, Samuel Irenæus, American Presbyterian clergyman and editor: b. Ballston, N.Y., 4 Nov. 1812; d. Manchester, Vt., 18 July 1885. He was graduated at Williams College in 1829, entered the Princeton Theological Seminary and in 1833 was ordained in the ministry. He was in charge of parishes at Ballston Springs, N.Y., 1835-35; at Matteawan, N. Y., 1835-37. In 1840 he became editor of the New York Observer and continued as such until his death, with the exception of a period in 1849 when he was secretary.
to the American Bible Society, and another in 1850 when he edited the *Presbyterian*. He was one of the founders of the Evangelical Alliance of America in 1860 and its corresponding secretary until 1884, was vice-president of the American Tract Society, and was president of various religious and educational institutions. From 1854 he was a regular contributor to *Harper's Magazine*, where his "Editor's Drawer" became famous, and in 1858 his literary earnings enabled him to purchase the *Observer*, which he made the leading organ of his denomination. His *Power of Prayer* (1858) reached a sale of 175,000 copies in United States and England and was translated into French, Dutch and Teuton. Among his other books are *The Old White Meeting-House* (1845); *Travels in Europe and the East* (1855); *Letters from Switzerland* (1860); *Kirwan* (1870); *Ireneus Letters* (1st series, 1880; 2nd series, 1885), etc.

**PRIME.** *William Cowper,* *American Journal of Science,* Vol. 4, N. S., Oct. 1826; New York, 13 Feb. 1905. He was graduated from Princeton in 1843, studied law, was admitted to the bar in 1846 and engaged in law practice in New York in 1846-51. In 1861-69 he was editor-in-chief of the New York *Journal of Commerce*, was first vice-president of the Metropolitan Museum of Art after 1874 and professor of the history of art at Princeton after 1884. He devoted much time to literature and was an authority on numismatics and Egyptian antiquities. Among his publications are *The Owl Letters*; *The Old House by the River* (1853); *Boat Life in Egypt and Nubia* (1857); *Coins, Medals and Seals* (1860); *Go A-Fishing* (1873); *Holy Cross* (1877); *Along New England Roads* (1882); *Among the Northern Hills* (1885), etc.

**PRIME MINISTER.** The title of the premier, secretary of state or other officer of state, who in most European countries, at the summons of the sovereign, has succeeded in forming an administration, of which he is the head, which may be dismissed after him. Those who accept office under him are assumed to agree with his policy in the main. Though each member of the ministry administers his own department independently of his colleagues, all important departmental matters are submitted to him, the most important being brought before the whole ministry, and no appointment of moment is made or recommended to the Crown without his knowledge and concurrence. His own patronage is very extensive. In forming an administration, he selects all those who are to fill the various offices, though the appointees are subject to the sovereign's approval. In England it is on his advice that as vacancies occur the archbishops, bishops and deans and the highest judges are appointed and over 100 Crown livings are filled; and on his recommendation that the most endowed temporal titles and honorable distinctions - peerages, baronetcies and the Garter, for example - should be held by the highest dignitaries as the lord-lieutenants of Ireland, the viceroyalty of India, the principal ambassadorships and colonial governorships and lord-lieutenancies of countries, are made by the Crown.

He is the leader of the House of Parliament, of which he is a member. Yet as prime minister he enjoys no legal precedence over his colleagues, his official existence being indeed not recognized by statute. In European governments the prime minister, or premier, is usually charged with the management of diplomatic affairs and in this respect resembles the Secretary of State of the United States.

**PRIME NUMBER,** an integer indivisible by any number save itself and unity, that is, one which cannot be factored into primes. The first five primes are 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47, 53, etc. They occur very frequently among the lower numbers and begin to be scarce among the higher thousands. The determination of the prime numbers has remained a mere matter of rejecting factorable numbers; this is done in a quasi-mechanical way by the table called Eratosthenes' sieve, upon which all the numbers to be tested are written at equal intervals and covered in succession by gridiron-like slips of paper, covering first all primes of 2 (the even numbers may better be omitted at the start), then all multiples of 3 and so on. But even with the modern theory of numbers no rule has been laid down for the periodicity of the occurrence of the prime numbers. Gauss discovered in 1801 that the number of primes less than $x$ is approximately $\int_2^x \frac{1}{\log t} \, dt$; Chebicheff gave a formula for the determination of the number of prime numbers between any two primes; in a monograph dated 1859, Riemann gave an even more exact formula and a very complicated one, also dependent on the integral used by Gauss. The theory of numbers has also shown that every prime number is (in general in more than one way) a sum of four squares, but this is equally true of other numbers, inasmuch as (1) every factorable number is the product of two prime numbers and (2) the sum of four squares into the sum of four squares is always a sum of four squares. There is a theorem of Goldbach to the effect that every even number is the sum of two prime numbers, which may be named after him. Those who accept office under him are assumed to agree with his policy in the main. Though each member of the ministry administers his own department independently of his colleagues, all important departmental matters are submitted to him, the most important being brought before the whole ministry, and no appointment of moment is made or recommended to the Crown without his knowledge and concurrence. His own patronage is very extensive. In forming an administration, he selects all those who are to fill the various offices, though the appointees are subject to the sovereign's approval. In England it is on his advice that as vacancies occur the archbishops, bishops and deans and the highest judges are appointed and over 100 Crown livings are filled; and on his recommendation that the most endowed temporal titles and honorable distinctions - peerages, baronetcies and the Garter, for example - should be held by the highest dignitaries as the lord-lieutenants of Ireland, the viceroyalty of India, the principal ambassadorships and colonial governorships and lord-lieutenancies of countries, are made by the Crown.

**PRIMO,** *prī-mō,* or *PRIME,* a card game very popular in England in the 16th century, but now obsolete. The same or a very similar game was played in Italy under the name *primiera* and in France under the names *prime,* *ambigu,* etc. Primo belonged to the family of games of which the old post and pair and the more modern brag and polder are members.

**PRIMITIV ART.** See *ABORIGINAL ART.*

**PRIMITIVE METHODIST CHURCH,** a Christian community known previously to 1902 as the Primitive Methodist Connection. It originated with Hugh Bourne (1772-1852), a millwright of Stoke-on-Trent, England, who joined a Methodist society at Burslem, but whose open-air preaching, prayer and singing, the forerunner of the "camp-meeting," a departure from Wesley's methods, led to his expulsion from the Wesleyan Connection. With William Clowes and some strong supporters, they built a chapel at Tunstall in July 1811, and
in February 1812 adopted the name of *Primitivum Society* and *Democracy*—Prince

**PRIMITIVE SOCIETY AND DEMOCRACY**

in February 1812 adopted the name of *Primitivum Society* and *Democracy*—Prince.

**PRIMITIVE SOCIETY AND DEMOCRACY**

Popularly they were long known both as "Clowesites" and "Ranters" (q.v.). In 1860 when they celebrated their jubilee at Tunbridge Wells the Conference reported in Great Britain 2,267 members, 11,384 local preachers, 132,114 members, 30,988 teachers and 167,533 students, with increasing numbers throughout the British colonies. From 1885 on a movement developed to form the *Conneeley Ranters*. "Ranters" work was accomplished in 1902 supporting numerous schools and missions with the *Holborn Review* as its special periodical. The Primitive Methodists are represented in the United States by 94 churches, 74 ministers and 6,800 communicants.

**PRIMITIVE SOCIETY AND DEMOCRACY**

See Democraicy, History of.

**PRIMITIVE THOUGHT.** See Mythology.

**PRIMOCENITURE,** prī-mō′-jen′-tūr, seniorty of birth and the right by law of the eldest son of a family (and of those who derive through him) to succeed, in cases of intestacy, to the father's real estate, to the absolute exclusion of the younger sons and the daughters.

This rule, system or right prevails in Great Britain; but, following the example of revolutionary France, most of the countries of continental Europe have abolished it. Several exceptions to the rule are allowed in the United Kingdom, but these apart, whenever a man dies intestate leaving real estate, his eldest son is entitled to the whole of it and the rest of the children not otherwise provided for out of the personalty are left without anything. If there is no male heir, the daughters succeed, not singly and in the order of seniority, but jointly.

In the United States no distinction is made in the descent of estates to lineal descendants.

**PRIMROSE,** a popular name for many garden and wild plants, among which the following are probably the best known: Evening primrose (*Oenothera biennis*, etc.); Arabian primrose (*Arnebia cornuta*, etc.); Cape primrose (*Streptocarpus*); and various species of the genus *Primula*. This last consists of about 150 species of mostly perennial herbs with rosettes of leaves of various forms (especially under cultivation), and salver-shaped, generally showy, white, yellow, pink, lilac and purple flowers borne in clusters upon scapes. They are natives of the north temperate zone, one species South American, one Javanese, and generally common in mountainous countries. About 40 are Himalayan; a dozen North American. They may be divided into five groups according to their uses as ornamental plants for which purpose they have long been popular. The auricula (q.v.) and the alpine primroses, neither of which are widely popular in America, the former because the climate is believed to be against them, the latter because alpine gardens have not become popular. Third, the yellow or purple-flowered outdoor species such as *P. imperialis* and *P. japonica*, which with winter mulching are grown in the Northern States; the pheasant's eye (*P. denticulata*), *P. elatior* and the cowslip (*P. officinalis*), very popular, fully hardy favorites blooming in early spring; and the greenhouse primroses, such as the Chinese (*P. sinensis*), *P. obconica* and *P. forbesi* (baby primrose), all of which are widely popular house-plants. Propagation is usually by seed, though varieties that do not come true to type may often be propagated by division or cuttings. Seed should be sown soon after its collection, since it quickly deteriorates if allowed to become dry. In general, primroses succeed best in deep, well-drained, coarse, rich loam not exposed to the glare of the sun. The polyanthus kinds may be grown in cold frames during the winter, set in beds in early spring, removed after flowering to shady moist situations for the summer, divided in the autumn and planted in cold frames again. The yellow-blossomed kinds are favorites with florists. The greenhouse kinds are sown under glass in early spring and kept growing steadily in flower pots of increasing sizes until the 6-inch size is reached in autumn when they should begin to blossom. The soil for them should be light, loose and rich both in plant food and humus.

**PRIMROSE DAY,** in England the anniversary of the death of Benjamin Disraeli, Lord Beaconsfield (q.v.), 19 April 1881. Every member of the *Primrose League (q.v.*) wears a bunch of primroses on that day in token of alliance with, and support of, the objects of the league.

**PRIMROSE LEAGUE,** an English political organization founded in 1883 by members of the Fourth party (consisting of Lord Randolph Churchill and others) in memory of Benjamin Disraeli (q.v.), Earl of Beaconsfield. The primrose, as Lord Beaconsfield's favorite flower, was selected as the emblem and name of the league. The members include knights, dukes and associates, and are divided into groups called habitations. In the propaganda to perpetuate Lord Beaconsfield's memory for a world-wide federation, less reliance is placed on discussion, lectures, etc., than on the appeal to the social elements in human nature. The large membership is due mainly to the efforts of female members.

**PRIMULA.** See Primrose.

**PRIMUM MOBILE,** prī-mūm mō′-bā-lē, in *astronomy*, the ninth or highest sphere of the heavens, whose circumference is in a period of 24 hours in comparison with which the world is but a point. This the ancients supposed to contain all other spheres within it and to give motion to them, turning itself, and all of them, quite round in 24 hours. See *Astronomy*.

**PRINCE, Morton, American physician; b. Boston, Mass., 21 Dec. 1854. He was graduated at Harvard in 1875, took his M. D. there in 1879, and since 1880 has been engaged in practice in Boston. Since 1885 he has been physician for nervous diseases at the Boston City Hospital; and in 1902-12 he was professor of nervous diseases at Tufts College, then becoming professor emeritus. He edited the *Journal of Abnormal Psychology*. Author of *Nature of Mind and Human Automatism* (1885); *Disassociation of a Personality* (1906); *The Unconscious* (1913).
PRINCE, Thomas, American clergyman and historian: b. Sandwich, Mass., 15 May 1687; d. Boston, 22 Oct. 1758. He was graduated from Harvard in 1709, studied in England and was pastor of a church at Combs, Suffolk, England, 1711-16, then returned to Massachusetts, where he spent the rest of his congregation. On 1 Oct. 1718 he was ordained pastor of the Old South Church, as colleague of the Rev. Joseph Sewall. In 1727 appeared the first volume of his 'Annals of New England,' materials for which he had collected with great care while in England. It was approved by the legislature, but owing to the indifference of the public was never completed. He published also sermons, several works on phases of the early history of New England and The New England Psalmbook Revised and Improved? (1758). He made a valuable collection of books by New England authors and manuscripts connected with New England records; this was partially destroyed by the British in 1766, but the remainder was presented to the Boston Public Library in 1860.

PRINCE (from Lat. principen), a title which means lit. a head, one who holds the first place. In its Latin sense the title of princeps senatus was given to the leading senator, being the one whose name came first in the list and who had the right to record his vote first. In modern times the title of prince (or princess) is given to all sovereigns generally, as well as to their sons and daughters and their nearest relations. In England, while not generally used, the title is applied in strict heraldic language, as a mode of address to dukes, marquises and earls. In Germany there is a class of sovereigns, ranking next below the dukes, who bear the title of prince as a specific designation. The members of royal families are there called Prinzen instead of Fürsten, to distinguish them from the class to whom the latter title more particularly belongs. On the Continent there are ancient families not immediately connected with any reigning house who bear the title of prince. Formerly, in France, duke was a title superior to prince. In England the only case in which the title is a territorial one is that of the Prince of Wales (q.v.). See Nobility.

PRINCE, The ('Il Principe'), by Niccolò Machiavelli (written 1513, published in a Latin version 1521, and in the original Italian 1532), holds a high place both in history and in literature. Historically the chief document of the centralizing and nationalizing movements of Renaissance Europe, it was produced by the country that most conspicuously failed to centralize and to nationalize. The Wars of the Roses had turned England from feudalism to the strong Tudor monarchy; Louis XI in France had subdued his great nobles and established a national postal system and a royal standing army; Ferdinand I and Isabella had united Castile and Aragon, and at the expense of Moors, Jews and heretics had purchased the solidarity of Spain; but Italy, long after these national consolidations, continued to suffer from the ambitions of local despots and condottieri, and from the incessant struggle of secular political bodies with the Pope. Disunited, she was again and again the prey of foreigners; Charles VIII of France in 1494 had taken her without bloodshed, and, as the saying was, 'with chalk,' the chalk with which his unrestricted soldiers marked their quarters. It was no wonder that Machiavelli, Florentine historian, diplomatist and patriot, was looking about for the strong man who should unite and unify Italy. For this imaginary personage 'The Prince' is a textbook in the methods of acquiring and governing a state.

Cesare Borgia had almost carried out an Italian kingdom when his plans were frustrated by the death of his father, Pope Alexander VI, together with his own sickness in that emergency, and his neglect to prevent the election of Julius II. Both his success and his failure made him an ideal example for the ideal Prince to observe. His success was due to ruthless energy and cunning, an imposing personality and boundless self-assertion. His failure was due to adverse chance, which struck just before he had quite consolidated his power, and to his own want of adaptability to his bad luck. The Prince, therefore, first should exercise virtù, in which Machiavelli believed the forces of the strong individual; and, secondly, should adapt himself to fortuna, in which are summed up all the forces of what we now call the environment. When fortune changes, the Prince must change too, lest she ruin him. He must, as Bacon wrote under Machiavelli's influence, 'make the wheels of [the] mind concentric and voluble with the wheels of fortune.' The keeping of his promises, for example, after circumstances have changed, may clearly be inexpedient. Nor is his virtù to be any more virtuous than his attitude toward shifting fortune. He may use any degree of guile and cruelty to attain his end; but these must be judiciously employed—cruelty, for example, sharply and on an egregious scale at the moment of the coup d'etat, not vacillatingly and in small doses throughout the reign; for the latter policy, both a sign and a cause of weakness, merely makes the Prince despised and hated instead of feared, and may hasten his fall. Like the dishonoring of women it should be avoided because, by setting large numbers of persons against the Prince, and by making him lose glory, it imperils his success. The sanctions of his conduct are thus wholly human: success and fame among men.

Machiavelli evidently feels that the need for order and unity in the state ought to outweigh whatever ethical scruple the Prince may entertain. Just here is where 'The Prince' becomes the classical document of Machtpolitik and raison d'état. For in establishing order the Prince must of necessity not only police his own city-state, his Rimini or Perugia, but also acquire other city-states to be consolidated with it into a principality—else the old disorders between states will be kindled anew. Hence Machiavelli's policy of the conciliating and unethical hand must be pursued both within and between states; it is not only intranational but international. The implication is that there is no room for morality either between individuals engaged in the process of state building or between states—i.e., in the process of competing for power, or between states—which are tacitly assumed to be continually struggling with each other to see which shall absorb the others. Just where, if anywhere, this ruthless compe-
tition is to cease — just how large the orderly group or principality must be before it can stop expanding for the preservation of its particular type of order (Kultur) — 'The Prince' does not tell us; it could not, after all, anticipate the 19th and the 20th centuries.

What makes it permanently interesting, however, is precisely the perpetual recurrence of these questions. In the 18th century, for example, Frederick the Great as Crown Prince writes an Anti-Machiavel, which, one is not surprised to find, never seriously affected his policy as king; in the 19th century Machiavelli becomes one of the heroes of Italia Unità. In the 19th century, too, political Machiavellianism is strongly supported by a false application of the new competitive theory of evolution — evolution by the survival of those organisms which are stronger than others (Virtù), and which fit, or can make themselves fit, their environment (Fortuna). This biological false analogy strikes back into actual politics in the Machiavellianism of the 20th century. We are confronted with the concept of the state which, assuming that sheer power is its end, aims only to control all within the national territory, but to take in ruthlessly from without whatever the sovereign deems necessary to his quiet.

From being merely the document of a moment in history 'The Prince' has thus come to be the textbook of continuing political practice, and a perennial source of biological, political and ethical theory. Its method, indeed, which at times seems purity in disguise based upon the examination of historical facts, without illusions, prepossessions or hypotheses, is based also upon the generalizations of classical writers, and proves in point of fact highly deductive and dogmatic. It assumes, for example, that men are naturally bad until compelled by the legislator or Prince ( Carlyle's 'hero') to be good; it supposes history to move cyclically; and in the person of the Prince, from whom a moral sense is omitted, it frames a political man who is quite as much an abstraction as is the 'economic man' of the laissez-faire school. So far from being merely factual, 'The Prince' embodies rather pure and universal types. Unhampered by repressions or apologetics, expressed or implied, human tendencies that belong to no one time or place — the adoption of success as the criterion of conduct; the adoption of 'the verdict of history' instead of the verdict of ethics, especially in international relations; the implication that what makes ethics the state itself; and, as has been already indicated, man's striving for fame, his adaptation to his environment or fortuna and his natural self-assertiveness or virtù.

In this universal content, as well as to its lucid straightforward classic style, are due 'The Prince's' literary eminence and influence. Of the latter it will be possible to mention only a case or two from English literature. Marlowe's 'Tamburlaine' and Shakespeare's 'Richard III' belong to a type of Elizabethan tragic, which takes for its theme the virtù or individualist on his career of rule and ruin. This theme, though derived, in all probability, from the medieval tragic theme of the Fall of Princes, is strongly tinged by Machiavelli, with whom Elizabethan dramatists were well acquainted. Bacon's works, too, are under strong Machiavellian influence — his conception of man's dealings with his fellow-man in politics, and with nature in inductive and productive science, being that of "mergeration," or pliancy to the environment. The best edition of 'The Prince' is that by L. Arthur Burd, Oxford, 1891, with an introduction by Lord Acton, and valuable essays, notes and bibliography. There are convenient modern translations by Ninian Hill Thomson (3d ed., Oxford 1913), Luigi Ricci ('The World's Classics') and W. K. Marriott ('Everyman's Library').

SAMUEL LEE WOLFF.

PRINCE ALBERT, a town in North Saskatchewan, Canada, 542 miles northwest of Winnipeg, situated on the river of that name, on the Grand Trunk Pacific Railway and four branches of the Canadian Northern line. It has a Roman Catholic cathedral, Anglican pro-cathedral and Presbyterian, Methodist, Baptist and Lutheran churches, public and separate schools and cottages and hospital. Industries include three large lumber companies, cold storage, abattoir and packing plants, planing mills and granite works; and the neighborhood, in addition to its suitability for stock raising, has areas of fine clay suitable for pottery and bricks, and 2,000 square miles of spruce and poplar extend northwards of the city. Pop. about 6,158.

PRINCE ALBERT LAND, Canada, an Arctic island of the Franklin District, separated from the Mackenzie District by Coronation Gulf, Victoria, Dease and the Dolphin and Union straits, along the Northwest Passage. Its southern and southeastern peninsula are known respectively as Wollaston Land and Victoria Land; Prince Albert Sound is a deep inlet on its eastern coast, and Collinson Inlet another on the north coast. It has not been fully explored.

PRINCE EDWARD ISLAND, Canada, an insular province of the Dominion, and the smallest in area and population, in the southern part of the Gulf of Saint Lawrence, separated east to west from Cape Breton Island, Nova Scotia and New Brunswick by the curving Northumberland Strait, from 10 to 30 miles wide. The greatest length of Prince Edward Island on a curve is about 150 miles, breadth varying from 4 to 34 miles, area, 2,184 square miles; it is the smallest province of the Dominion. The capital is Charlottetown (n.v.), which is connected by rail with the principal points of the island. Other towns are Summerside, Georgetown and Souris.

Topography, Physical Features and Natural Resources.—The coast-line presents a remarkable succession of large bays and projecting headlands. Of the latter the most prominent are North Cape on the northwest, West Cape on the southwest and East Cape on the northeast; the largest bays are those of Richmondt on the northwest, Egmont and Be-deg on the southwest, Hillsborough on the south and Cardigan on the east. The coast undulates gently, nowhere rising so high as to become mountainous, or sinking so low as to form a monotonous flat. The soil consists gen-
eraly of a light reddish loam, sometimes approaching to a strong clay, but more frequently of a light and sandy texture. The prevailing rock is a Triassic reddish sandstone. The island is well watered by numerous streams and springs. At one time the whole island was densely covered with beech, maple, fir and other trees, and it is still well wooded, only about two-thirds of the area having been cleared. There are no minerals of any importance. The fisheries are valuable; the total value of the catch was $933,682. The most valuable item is the herring fish, followed by the mackerel, cod, herring and hake.

Climate.—The climate is much milder than that of the adjoining continent, and the air, generally free from the fogs which spread along the shores of Cape Breton and Nova Scotia, is remarkably salubrious. During the greater part of July, August and September the thermometer during the hotter hours of the day seldom varies more than from 75° to 80° F.

Agriculture.—The island is eminently agricultural and pastoral. Of its total area of 1,397,900 acres, little more than one-third is unsuitable for cultivation, but little more than half the area is under cultivation for field crops. The principal products are oats, wheat, potatoes, turnips, apples, etc. In 1916 7,413,000 bushels of oats were raised, of a value of $4,522,000; 578,000 bushels of wheat of a value of $879,000; 6,386,000 bushels of potatoes, of a value of $3,321,000; and 338,000 tons of hay and clover of a value of $3,907,000. Good breeds of horses, cattle, sheep and swine are reared, and dairy farming has become a thriving industry; large quantities of cream, butter and cheese being manufactured, the dairy products in 1916 being valued at $593,659. A recent and flourishing industry is the breeding in captivity of the silver black fox.

Manufactures and Commerce.—The manufactures are chiefly confined to linen and flannel for domestic use; there are several tanneries, boot and shoe factories, manufactures of tobacco, condensed milk, pork-packers, etc. And there are some shipping yards. The exports for the year to 31 March 1917 were valued at $589,218, and the exports at $838,647.

Shipping and Communications.—In 1916 the shipping of the province was 130 sailing and 28 steamships, aggregating 11,518 tons, the tonnage of the steamers being 3,495. The Prince Edward Island Railroad, built by the Dominion government, connects the principal points of the island and has a length of 276 miles and a car-ferry service gives connection with the mainland. Telephonic communication extends throughout the island, which is also traversed in all directions by good coachroads.

Government.—The province is administered by a lieutenant-governor nominated by the Crown, who appoints an executive council of eight members, with a legislative assembly of 30 members, half elected on a property qualification, and half on a popular franchise. The province had been admitted into the Dominion of Canada in 1873, is represented in the Dominion House of Commons by four members, and has four representatives in the Senate.

Education and Religion.—Adopted in 1851 the free school system is administered by a government superintendent and council. In 1916 18,362 pupils were enrolled in 476 schools conducted by 595 teachers, and $244,572 were expended for education. The membership of the principal religious denominations in 1916 was, Roman Catholics, 41,994; Presbyterians, 27,507; Methodists, 12,209; Anglicans, 4,939; Baptists, 5,905.

History.—Sebastian Cabot is supposed to have sighted Prince Edward Island after discovering Newfoundland in 1497, but with more likelihood the honor is also assigned to Jacques Cartier (1634). It appears on Champlain's map under the name of Saint John and it was later included by the French in their vast and undefined territory of New France, and in 1663 was granted on a feudal tenure to a Sieur Doublet, a French naval officer. Little progress was made in settling the island till after the Peace of Utrecht in 1715, when its fertility attracted numbers of settlers from Cape Breton. It was taken by the British in 1745; restored by the Peace of Aix-la-Chapelle; again fell into British possession after the capture of Louisbourg in 1757, and its inhabitants shared in the Acadian Evacuation. In 1763, because of Nova Scotia, was partitioned among a small body of proprietors in 1767 and was erected into a separate province in 1769. In 1862 responsible government was conceded. In 1873 the island was admitted into the Dominion of Canada, and in 1875 a scheme of land purchase expropriated the proprietors. Pop. (1901) 103,259; (1911) 93,727, of which 98.37 per cent were Canadian born. The density per square mile, 42.91, is the highest among the provinces of the Dominion. The years of declining Consult Campbell, 'History of Prince Edward Island' (1875); Dawson and Harrington, 'Geological Structure and Mineral Resources of Prince Edward Island' (1882–84).

PRINCE EDWARD ISLAND RAILWAY (Government Railways). It was one of the conditions of the entrance of Prince Edward Island into the Dominion of Canada, which took place 1 July 1873, that the railway under contract and in course of construction for the government of the island should become the property of the Dominion. This railway extended from Charlottetown, the capital, westward to Truro, and eastward to Georgetown, a distance of 195 miles. Other lines have since been constructed, as follows: Charlottetown to Murray Harbor, 48 miles; Montague to Montague Junction, six miles; Emerald Junction to Traverse, 12 miles; Halmira Junction to Elmira, 10 miles; the Vernon Loop, four miles—giving a total of 275 miles. The gauge of the railway is three feet six inches. The cost of the railway and equipment to 30 June 1914 was $8,920,623. The gross earnings for year to 30 June 1915 were $41,520, of which $2,162,622 were for passengers, and $186,560 for freight. The rolling stock consists of 22 locomotives, 43 passenger train cars and 501 freight cars, besides service cars, etc.

A daily steamer service is maintained between Charlottetown and Pictou, and between Summerside and Point du Chene during the season of navigation, and passengers and freight are carried by ice-breaking steamers during the winter season between Georgetown and Pictou.
PRINCE OF INDIA — PRINCE’S PINE

PRINCE OF INDIA, a romance by Lew Wallace, published in 1893. The ‘Prince of India’ is the Wandering Jew.

PRINCE AND THE PAUPER, The, a historical tale by Mark Twain (Samuel Langhorne Clemens) published in 1881. The plot hinges on the remarkable resemblance of a poor street boy to the young English prince, afterward Edward VI.

PRINCE RUPERT, Canada, sea-port and capital of the electoral district Comox-Atlin, British Columbia, on the north end of Kaiten Island, about 550 miles northwest of Vancouver and 3,850 nautical miles east of Yokohama, and the Pacific Coast terminus of the Grand Trunk Pacific Railway. It has anchorage for the largest ships, and a marine station and quarantine hospital are located here. It has a hydroelectric plant, modern waterworks and telephone system. Industries include chiefly those allied to the lumber trade, and there are large cold storage plants. Pop. (1911) 4,184; (1915) estimated 6,500.

PRINCE RUPERT’S DROPS, pieces of glass which have been cooled very suddenly from the melted state by having been dropped into water. They are called larry batquívique (Dutch tears) by the French. The outside of the drop of melted glass is instantaneously solidified by the water, while the inside cools gradually, so that the outside shell is acted upon by very great stresses due to contraction of the internal portions when cooling. In fact the drop is kept in a state of excessive strain by stresses in unstable equilibrium; and if this equilibrium is broken by scratching the surface with a diamond, or breaking off the tip of the tail, the stained particles are violently released, and the mass is instantly pulverized. Heat is produced during the pulverization of the drop. This explanation applies to the falling out of the bottom of the very thick flask of unannealed blown glass called the “Bologna flask,” when its surface is scratched. Glass articles — articles of any brittle material — ought to be cooled very slowly from the melted state. The process of slow cooling to which such articles are subjected is called annealing. To anneal glass, it is placed in a large furnace which has nearly a red-heat at one end and a lower temperature than 100° C. at the other; after the glass has been passed very slowly from the heated to the cool end it is able to withstand sudden changes of temperature, etc., without fracture.

PRINCE OF WALES, The, in England, a title given to the eldest son of the sovereign and heir apparent to the throne. The title, created and not hereditary, dates from the reign of Edward III. When the princely title of Wales came under English domination with the deaths of the native princes Llewellyn in 1282 and David in 1283, Edward I in 1284 is said to have presented his infant son Edward, born at Caernarvon Castle, to the Welsh people, as a nation and not as a state. He was not entitled with the title, however, until 1301. A statute of the order of the Garter, dated 1805, declares that the Prince of Wales shall, as soon as he receives this title, becomes a knight of the Garter. The arms of the Prince of Wales are the royal arms, with the addition of a label of three points argent, and the distinctive Welsh feature of a plume of three white ostrich feathers, circled by the ancient princely coronet of Wales, bearing the motto badge “Ich Dien” (“I serve”).

PRINCE OF WALES ISLAND, the official name of Penang, an island of the Malay Straits Settlement. See PENANG.

PRINCE WILLIAM SOUND, Alaska, an inlet of the Gulf of Alaska, on the south coast, east of the Kenai Peninsula and with Montague Island on the south. It offers an ice-free harbor, the most northerly on the coast, and has spectacularly beautiful scenery. Its glacial phenomena is particularly remarkable, the sound having 11 living glaciers, of which the most striking are the Columbia, Harvard, Yale, Serpentine, Harriman and Surprise. The Columbia is about four miles wide on the sound and reaches in places a height of 300 feet. The rich deposits of copper on the eastern shores and on some of the islands offer splendid possibilities for development. Of the towns, Valdez and Cordova have each about 1,000 population and are chief terminals of railroads running into copper districts in the interior. Smaller towns are Onca, Elliot and Land- loch. Consult Higginson, “Alaska”; Greely, ‘Handbook of Alaska’ (1909); ‘National Geographic Society Bulletin’ (1914).

PRINCEITIES, prin’sītēz. See AGAPEMONE; RELIGIOUS SECTS.

PRINCE’S FEATHER, an annual plant (polygonum orientale) of the buckwheat family, with erect spikes of dark-red flowers and leaves inclining to purple. It is a native of India, but has long been cultivated in gardens everywhere.

PRINCE’S ISLAND, or ILHA DO PRINCIPE, el’yá dô prin’se-pé, a Portuguese island off the coast of West Africa; in the Bight of Biafra; nearly midway between Fernando Po and Saint Thomas islands. It is of volcanic character, rising in the south to 3,000 feet; fertile and well-watered, but of little importance since the extinction of the slave-trade ruined its sugar plantations. Its fertility has gained it the name of the Garden of Africa. Cacao is the only important export. The population is concentrated mainly in São Antonio, a town with a fine harbor on the northeast coast. With the neighboring island of San Tome it constitutes a province under a governor.

PRINCE’S ISLANDS (ancient DEMO- NESI), a group of nine islets near the east end of the Sea of Marmora, about 10 miles southeast of Constantinople. Prinkipo is the largest of the group. They are a favorite summer resort of the Constantinople Greeks, and in old times were frequently a place of exile for those who were in disfavor at the Byzantine court. There are on the islands a Greek church, seminary, monasteries and a naval college. In 1894 an earthquake caused loss of life and destruction of property. Pop. estimated 10,500.

PRINCE’S METAL, in metallurgy, a mixture of copper and zinc in imitation of gold.

PRINCE’S PINE, or PIPESSEYWA, a low North American evergreen health-plant (Chimaphila umbellata) of the wintergreen family. From its leaves are made a powder and a fluid extract, used in making a herb medicine for scrofula, rheumatism, etc. Another
species is the spotted wintergreen (C. maculata).

PRINCESS. See Nobility; Prince.

PRINCESS, The, by Alfred Tennyson, published in 1847, reprinted in 1848 and in 1850, was acclaimed as "the herald-melody of the higher education of women," a theme which Tennyson held to be one of the two great problems of the England of his day. The poem is the expression of his belief in a larger training and a fuller life for woman, based on her "distinctive womanhood," her power of love. The story of the winning of the Princess Ida by the Prince who invades her college but respects her cause is frankly a "medley," in which armored knights fight tourniers while conquered ladies lecture on the nebulous hypothesis. Prologue and conclusion, set amid a Gothic ruin and a Victorian Chautaqua, strike the "mock-heroic" key-note. But Tennyson lacked the true civic spirit that could fuse his theme satire and sentiment into entire unity of mood and style; yet the interest and charm of that part's almost compensate for the lack of integral beauty. The characters, sketches though they are, embody all shades of opinion on women's education, from Lady Blanche, a true militant, to the old king, a father of "antis." The Princess herself, the one full portrait, whom Tennyson held one of his noblest women, seems a trifle too heroic in her passion for freedom and too abject in her yielding to love. It is not she but the Prince who speaks the poet's famous verdict on the woman question.

No poetry is more Tennysonian than the blank-verse of 'The Princess,' more filled with his richly-wrought word-harmonies, his memorable nature-pictures painted from the life. Lovelier still are the lyric links, added as an afterthought to ring the changes on the motif of the poem, the love of man and woman for each other and for the child. 'The Princess' lives, less because it declares that 'the woman's cause is man's,' than because it contains 'Sweet and low,' 'The splendour fails,' and, most melodic of unrhymed lyrics, ' Tears, idle tears,' Consult Tennyson, Hallam, (Alfred, Lord Tennyson: a Memoir) (2 vols., 1897); Grierson, H. (in 'Cambridge History of English Literature,' Vol. XIII, ch. 22, and bibliography).

FRANCES W. CUTLER.

PRINCESSE DE CLEVES. 'The Princess of Cleves' by Madame de la Fayette appeared first under the name of 'Segrais' in 1678. It is a novel, but it is in form and content the sharpest contrast to the novels that had up to that time been in vogue. They had been interminable affairs, in 10 and 12 volumes, made up of the most extraordinary adventures, through which paragons of valor were made to pass before their love-laden sighs might with propriety melt the heart of the paragons of beauty who were the objects of their adoration and they might lead them to the altar. This was a short and simple story, scantily furnishing a thin volume, without heroic or gallant adventure, without paragons of beauty and valor, without wedding bells. It is a drama of conscience. A married woman is the heroine. What fixes our attention and interest is the moral experience of a noble character striving to realize a high ideal of duty in a difficult situation. It is such a victory of wise self-control and steadfast will over impulse and passion as Corinelle loved to present in his tragedies. It is essentially a novel of character, in which psychological analysis and penetrating observation of human conduct as it displays itself under familiar and commonplace situations, the place of breathless action and thrilling situations. The influence of the "Princess of Cleves" was very great, and it is not too much to say that it marks an important turning point in the history of the novel. The great masters of the early 18th century, like Mme. de La Fayette and Richardson in England, who determined the course the modern novel was to take, developed her method and applied it on a much broader canvas, but not always with more perfect results. There is a translation by Thomas Sergeant Perry (Boston 1891).--ARThUR G. CANFIELD.

PRINCEToN, Ill., city and county-seat of Bureau County, on the Chicago, Burlington and Quincy and the Chicago, Ottawa and Peoria railroads, about 100 miles west by south of Chicago. It was settled in 1830, incorporated in 1838 and in 1884 was chartered as a city. Since the coming of the transcontinental train, the community has developed into a thriving center. It is in an agricultural and coal mining region. Its industries are connected chiefly with farm products and the mining and shipping of coal, and the shipping of livestock. It has a number of well-built business blocks, a township high school, the Maton Public Library, a courthouse, city hall, Federal building and the high school library. The city owns and operates the electric-light plant and the waterworks. Pop. 4,300.

PRINCEToN, Ind., city and county-seat of Gibson County, on the Southern and the Chicago and Eastern Illinois railroads, about 27 miles north of Evansville. It was settled in 1804, incorporated as a town in 1814 and chartered as a city in 1884. There is a local traction line operated by a public utility company. Princeton is in an agricultural and coal mining region and is also rich in oil and natural gas. The older industrial establishments are the Southern Railroad shops, the coal mines, oil wells, lumber mills, flour mills, clock works, handle factory, refrigerating and ice plant and several smaller establishments. There are large lumber and brick yards. The city has several churches; and the educational institutions are a high school, public and parish schools and a Carnegie public library, Civic League Club and a Chamber of Commerce. The banks have a combined capital of $250,000. The government is vested in a mayor who holds office two years, and a council of six members. Pop. 9,000.

PRINCEToN, Ky., city and county-seat of Caldwell County, 140 miles, direct, southwest of Louisville, at a junction of the Illinois Central and Ohio, Louisville and Nashville railroads. It is the seat of the Princeton College Institute. The repair shops of the Illinois Central Railroad are located here and the city has extensive interests in tobacco. There are flour mills, brickyards, an ice plant and a creamery. Pop. 3,015.
PRINCETON, N. J., borough in Mercer County, on an elevation about three miles from the main line of the Pennsylvania Railroad, with which it is connected by branch line, 10 miles northeast of Trenton, and 50 miles southwest of New York City. It was settled in 1696, but remained a straggling hamlet for some years. The removal of the College of New Jersey from Newark to Princeton, in 1756, gave the place new life, and except when it was occupied by troops, and as a battleground, it has ever since remained a staid college town. On 27 Aug. 1776, the first State legislature of New Jersey met here. The 31st, the members elected William Livingston as governor of the State, Congress assembled here June 1783, and remained in session until November. The removal of Congress from Philadelphia was occasioned by the threatening attitude of discontented soldiers. While in session here, 31 Oct. 1783, it signed the treaty of the peace with England. Princeton has broad, well-shaded streets, and its location on the ridge gives it a fine view over the surrounding country. The colonial architecture has been preserved quite extensively, and the place is noted as being the seat of Princeton University (q.v.). Other educational institutions are Princeton Theological Seminary (Presbyterian), the Rockefeller Institute for Medical Research, Princeton Preparatory School, Saint Joseph's College, the high school and the libraries. Pop. 5,678. Consult Hageman, "History of Princeton and Its Institutions" (Philadelphia 1870) and Powell, L. P., "Historic Towns of the Middle States" (New York 1899).

PRINCETON, W. Va., city and county-seat of Mercer County, 15 miles southeast of Charleston, on the Virginia Railroad and near the southern border of the State. It was the scene in 1862 of a skirmish between the United States and Confederate forces, the advantage resting with the Confederates. Pop. 3,027.

PRINCETON, N. J., Battle of, in the American Revolution. After the battle of Trenton (q.v.), Washington recrossed the Delaware, and on 2 Jan. 1777 occupied Princeton with strong outposts at Bordentown and Crosswicks. General Grant, commanding the British troops at New Brunswick, 30 miles distant, was joined by Lord Cornwallis (q.v.), who was preparing to return to England but had been ordered to resume his command in the Jerseys. The British and Hessians, about 8,000 strong, pressed forward to Trenton, whereupon Washington took position on high ground behind Assanpink Creek. On 2 Jan. 1777 the British cannonading of the American position and then fired the attack until morning, when Cornwallis hoped "to bag the old fox." On the advice of his generals, however, Washington decided to strike the British in the rear, capture their stores at New Brunswick, attack three British regiments under Col. Charles Mawhood at Princeton and divert the war from the neighborhood of Philadelphia to the mountainous regions of New Jersey. On the night of 2-3 of January, leaving his camp fires burning, Washington moved back a mile, to a strong position near the Wytheville road. At dawn he abandoned his camp, and in the morning fell upon the unsuspecting Mawhood, then marching to join Cornwallis. After the first volley the British charged and the Americans fled but were rallied by Washington and soon put the British to flight. Washington then advanced toward Princeton where he routed another British regiment. The British lost 150 killed and 230 prisoners, while the Americans lost 30 killed, including Gen. Hugh Mercer. Meanwhile, hearing the cannonade, and fearing for his stores at New Brunswick, Cornwallis pursued Washington toward Mountain Bridge, but on crossing the Millstone River the Americans demolished the bridge at Kingston and Cornwallis abandoned the pursuit, taking up position at New Brunswick while Washington encamped at Morristown. Consult Stryker, W. S., "Battles of Princeton," H. H. B., "Campaign of 1776" (p. 393 et seq.); Carrington, H. B., "Battles of the Revolution" (p. 276 et seq.); Lossing, "Field-Book of the Revolution" (Vol. II), Wilkins, "Memories" (Vol. I, pp. 140-150); Wiley and Rimes, "The United States" (Vol. III, pp. 7-10); biographies of Washington, Greene, Knox and others.

PRINCETON, W. Va., Engagement at. In the spring of 1862 General Frémont, commanding a military department that included West Virginia, proposed to move from Mon-terey on Staunton, thence to the New River and Christianburg, his ultimate destination being Knoxville, Tenn. Gen. J. D. Cox, commanding on the Kanawha, was to co-operate by advancing from Gauley Bridge, in two columns, one by Fayette and Raleigh Court House over Flat Top Mountain to Princeton and the narrows of New River, the other by the turnpike to Lewisburg. Cox had four brigades; one was left to hold the lower Kanawha Valley; Col. George Crook was sent forward to Lewisburg; and Cox, with the two brigades of Colonels A. H. P., "Campaign of 1776" (p. 393 et seq.); Carrington, H. B., "Battles of the Revolution" (p. 276 et seq.); Lossing, "Field-Book of the Revolution" (Vol. II), Wilkins, "Memories" (Vol. I, pp. 140-150); Wiley and Rimes, "The United States" (Vol. III, pp. 7-10); biographies of Washington, Greene, Knox and others.

species is the spotted wintergreen.

PRINCESS. See Nunnery.

PRINCESS, The, by Alfred, was published in 1847, reprinted in 1851, and was acclaimed as "the herald of higher education of women." Tennyson held to be one of the problems of the English of his time the expression of his belief in a fuller life for women, and in "distinctive womanhood." The story of the winning struggle by the Prince who inveighs against the cause of female emancipation is said to be in armor knights fight for ladies: lecture on the melodrama and conclusion, and a Victorian Chaucer's heroines take the key-note. By true comic spirit the satire and sentiment and style. Yet the parts almost conventional beauty. They are, as they are, subjects to form the educational militant, to the issue. The Princess he whom Tennyson seems a trifle unfreedom and too. It is not she; the poet's famous verse.

No poetry in Blank verse of his richly. Worthy nature Lovelier still afterthoughts of the poem; each other as lives, less her because is man and low? ; melodious tears! Come Lord Tennyson Grierson, English Literature (Synopsis).

PRINCESS of clever first 1678. It is a story in the story to the term of which are all the other courses they have formed, and its leading facts: the new college was chartered, and its leading officers: the College of New Jersey was transferred to New Brunswick, the town where it had been decided. The government of Nassau Hall was begun the interrupted during the presence of both arms. In 1877, Nassau Hall was finally scattered and the whole apparatus rigidly redefined. Congress sat in Nassau Hall. A law department was introduced in 1870; the Graduate School in 1874; Electrical Engineering in 1875; on the occasion of the founding of the college, University was assumed. The alumni representation in the college was adopted, giving the graduate representatives on the board were elected by the board. The course in life.

The courses offered by Princeton University are classified as: undergraduate liberal studies and sciences; graduate courses in arts and sciences; and technical courses. There are two distinct courses: first, the college course (A.B.), in which Latin and French are entrance and forms a part of the curriculum of the first year, and the bachelor of science course (B.S.), in which modern language may be substituted for one of the major courses.

The graduate School offers advanced study in arts and sciences, leading to degrees of master of arts and doctor of philosophy. The technical courses offered are: a four-year graduate course in civil engineering, leading respectively to the degrees of engineer and electrical engineer.
large force and some artillery, he waited until Scammon should come up, before making a serious attack. Scammon came up in the evening, closely pursued part way by Heth, and brought information that the Confederates were in great force; and Cox, realizing that his position at Princeton could be turned and his line of communication seized, retreated before daylight next morning to Flat Top Mountain, 25 miles away, in a very strong position and ordered Crook to halt at Lewsburg. Heth attacked Crook at Lewsburg on the 23d and was badly repulsed. (See Lewsiburg, Battle of). The Union loss at and around Princeton was 23 killed, 69 wounded and 21 missing; the Confederate loss was much less. Consult Official Records (Vol. XII); The Century Company's Battles and Leaders of the Civil War (Vol. II).

E. A. Carmen.

PRINCETON THEOLOGICAL SEMINARY, a Presbyterian seminary at Princeton, N. J., was organized in 1812, and for a time the classes were held in the buildings of Princeton College (now Princeton University); in 1815 a tract of land was purchased for the seminary, and a building erected. The bibli cal criticism is conservative and the theology taught is that of Calvinism set forth in the Westminster Confession. The courses include instruction in Old and New Testament theology, literature and history, homiletics, church history, practical theology, systematic theology and Hebrew. The regular course is three years, a fourth year of graduate study is also provided for and arrangement is made for extra-curriculum courses at the university. Students who are college graduates are admitted without examination; others must take examination for admission in full standing; students, however, on filing a certificate from the presbytery or ecclesiastical body under whose care they are studying for the ministry may be admitted on examination in the classes and receive the certificate for completion of the course, but are not technically considered graduates of the seminary. The degree of bachelor of divinity is conferred on students who have received the degree of bachelor of arts. The buildings are Stuart Hall and three dormitories. In 1917 the institution had 14 instructors, 187 students, 103,000 volumes in its library besides pamphlets, $664,055 invested in grounds and buildings, $3,238,848 in productive funds and $148,692 in total income, and its graduates numbered 6,233. Francis Landey Patton, D.D., LL.D., who was president of Princeton University in 1888-1902, became president and professor of the philosophy of religion at the seminary on resigning from the university in 1914, and was succeeded by Joseph Ross Stevenson, D.D., LL.D.

PRINCETON UNIVERSITY, located at Princeton, N. J. The first movement toward the establishment of the College of New Jersey was made in 1739 by a committee appointed by the Presbyterian Synod of Philadelphia, but this committee with little success and the project was laid aside for the time. In 1746 the promoters of the new college, who in the meantime had withdrawn from the Synod of Philadelphia and with others had formed the Synod of New York, again took up the matter and obtained a charter for the new college. In the same year the Log College, which had been conducted by Rev. William Tennent, Sr., near the Forks of Neshaminy, Pa., as a training school for ministerial candidates, was closed by the death of Mr. Tennent, and its leading men joined with the trustees of the new college. A second charter for the College of New Jersey was granted in 1748. The scope of the college and the powers of the trustees as stated in the two charters were essentially the same, but the second charter was obtained by the original trustees, both because of some doubt as to the validity of the first charter, which had never been recorded verbatim in the records of the secretary of state, and also for the purpose of increasing the number of trustees, making the lay trustees equal in number to the clergymen and giving other religious communications a share in the administration.

The college was opened at Elizabethtown, N. J., in April 1747, with Rev. Jonathan Dickinson as president and was transferred to Newark in the autumn of the same year, where it remained until 1756. In 1752 it had been decided to fix the location permanently at Princeton, and in 1756 the college building (Nassau Hall) was completed and instruction began there. The college exercises were interrupted during the Revolution by the presence of both armies, but only one Commencement, that of 1777, was omitted. In 1783 it was badly damaged, the library scattered and destroyed and the scientific apparatus ruined. In 1783 the Continental Congress sat in Nassau Hall for several months. A law department was established in 1846, but discontinued in 1852 on account of lack of funds. The system of elective studies was introduced in 1870; the John C. Green School of Science was established in 1873; the Graduate School in 1877, and the School of Electrical Engineering in 1899.

In October 1896, on the occasion of the 150th anniversary of the founding of the college, the title of Princeton University was assumed. In 1900 a plan of alumni representation in the board of trustees was adopted, giving the alumni an elected representation. The other trustees are elected by the board itself and hold office for life.

The courses now offered by Princeton University may be classified as undergraduate courses in arts and sciences; graduate courses in arts and sciences; and technical courses.

The plan of undergraduate liberal studies provides for two distinct courses: first, the bachelors of arts course (A.B.), in which Latin is required for entrance and forms a prescribed part of the curriculum; and second, the bachelor of science course (B.S.), in which a modern language may be substituted for Latin at entrance.

The Graduate School offers advanced and research work in arts and sciences, leading to the degrees of master of arts and doctor of philosophy.

The technical courses offered are a four-year undergraduate course in civil engineering; and a two-year graduate course in electrical engineering, leading respectively to the degrees of civil engineer and electrical engineer.
Admission to the undergraduate courses is entirely by examinations, which are conducted by the College Entrance Examination Board. The subjects required for admission vary in the different courses and while certain subjects are definitely required, there is a considerable margin for choice in the subjects offered by candidates. Distinguishing features of the undergraduate courses are: (1) the planning of the requirements so as to make certain that the student shall receive a broad general training, preserving as far as possible the ideal of the old American college course; (2) the treatment of the student's preparation and college work as a whole and the requirement for graduation of a specific number of units, part of which must be met before entering the university; (3) the requirement that a student shall have completed before the middle of his college course a certain number of units in language including English, in mathematics, science, and in philosophy; (4) the divisional elective system, according to which a student must choose in his junior year at least three courses in a division (philosophy, literature, art or history, politics, economics or mathematics, science) which he would in any case work will thereby be concentrated. His other two courses are unrestricted. Beginning with sophomore year which has only one required course, the student has a full choice of electives within certain limitations; (5) an arrangement whereby students of high standing may by independent study during the summers qualify for graduation in three years. And (6) the preceptorial method of instruction, by which the lectures are complemented by informal conferences between the professors and small groups of students on the reading connected with a course. The preceptorial groups usually consist of from three to six men, thus emphasizing the personal relation between teacher and student. All members of the faculty engage in preceptorial work.

In the undergraduate department there are 40 university scholarships and about 40 endowed scholarships, ranging in stipends from $100 to $500. The endowed plans of the university include the founding of over 100 scholarships in memory of Princeton men fallen in the service of the country in the recent European War. The university also offers remission of part of the tuition charge to undergraduates of small means and good scholarship, but no student may hold a scholarship and remission of tuition at the same time. In the Graduate School there are the Jacobs Fellowship and 10 Proctor fellowships with a stipend of $1,000 each, and in addition about 25 fellowships paying $500 to $700, of which 10 are wholly or partly endowed. There are also a number of graduate scholarships paying $250 and $100 respectively.

A feature of the Graduate School is the Graduate College of residence, where the graduate students may live amid surroundings which tend to emphasize the proper academic and social life of a community of young scholars. The Graduate College buildings were completed in 1912. In connection with this group of buildings is the Cleveland Memorial Tower, erected in memory of President Grover Cleveland.

The present University Library consists of the Chancellor Green Library, built in 1872-73, and the Fyne Library (1896-97), which are united by a delicately room, 50 by 50 by 14 feet, the library collection in 1760, when the first catalogue was printed, consisted of 1,300 volumes. It now numbers about 410,000 volumes besides pamphlets. This includes several special collections and seminary libraries. The Garrett collection of Oriental manuscripts, the Garrett collection of coins, the Hutton collection of death masks and the Meirs collection of Cruikshankiana are also located in the library. There are six departmental libraries: art, astronomy, biology, geology and paleontology; engineering and physics, each selected from the general collection and kept in the Art Museum and the several laboratories. These departmental libraries number over 31,000 volumes. The Princeton Theological Seminary Library of over 100,000 volumes is also open to students of the university.

The university campus contains about 700 acres. Besides Nassau Hall, the library and the Graduate College already mentioned, among the buildings are 16 dormitories, some of them of unusual architectural beauty; Dickinson and McCosh Halls, for classroom work; the Halsted Observatory, the Infirmary, the Marquand Chapel, Alexander Hall; the John C. Green School of Science, used chiefly by the department of civil engineering, the Chemical Laboratory, the Palmer Laboratory, for physics and electrical engineering, Guyot Hall, the laboratory of the departments of geology and biology and Madison Hall, containing the university dining halls.

The athletic equipment consists of the Palmer Memorial Stadium, for intercollegiate football, track; University Field, for baseball; the Gymnasium; Lake Carnegie for rowing, the Brokaw swimming tank; Brokaw, Poe and Goldie fields, providing several baseball diamonds and soccer fields; and 28 tennis courts. Under the direction of the department of hygiene and physical education all freshmen are required to take regular exercise and members of the other classes are, encouraged to do so. At least three-fourths of all the undergraduates take part in some form of intercollegiate athletics.

There are no secret societies at Princeton, but there are two literary societies, the Cliosophic and the American Whig, founded prior to the Revolution. Most of the upper classmen are members of eating clubs. All freshmen and sophomores are required to board at the university dining halls.

The productive funds, according to the latest report, amount to $6,565,000. The annual income from all sources averages $839,300. The yearly attendance of students is about 1,600, and the faculty numbers about 200.

PRINCIPAL AND AGENT. See Agent.

PRINCIPE, prîn-thë-pî, Philippines, subprovince of Tugus, situated on the eastern coast of Central Luzon, bounded on the north by Isabela and on the south by Nueva Ecija; length along the coast, 64 miles; area, 1,216 square miles, with dependent islands, 1,218 square miles. The district is almost entirely mountainous; there are two main ranges, one near the coast, following the coast line, the
other parallel with it, with narrow valleys between. Near the towns rice, corn, coffee, cotton, sugar and vegetables are raised, but for home consumption only; there are a few simple mechanical industries, also for domestic use. The chief industry along the coast is fishing and the fish are exported to the provinces to the south. Game is abundant in the mountains and many of the inhabitants are engaged in hunting. The inhabitants of the western slopes of the peninsula of Tayabas use the Tagalog dialect; those in the eastern, the Bicol. In 1902 the former district of Principe was annexed to the province of Tayabas. Pop. about 14,470.

PRINDE, prin’dl, Cyrus, American Methodist clergyman: b. Canaan, Conn., 11 April 1800; d. Cleveland, Ohio, 1 Dec. 1885. He was licensed to preach in 1821 and until his retirement in 1877 occupied various Methodist pulpits in New York, Vermont, Massachusetts and Ohio. Opposed to the attitude of the Methodist Episcopal Church with regard to slavery, he became in 1843 the chief leader in the movement that resulted in the founding of the Wesleyan Methodist Church in America. He was an abolitionist from principle and when he had seen the work to which he and his followers were devoted accomplished in the emancipation of the slaves, he returned to the Methodist Episcopal Church.

PRINGLE, prin’gdl, Thomas, Scottish poet: b. Blairlaw, Roxburghshire, 5 Jan. 1789; d. London, 5 Dec. 1834. He was educated at Edinburgh University and in 1811 became a copyst in the registry office, Edinburgh. He began writing clever satire and attracted the notice of Sir Walter Scott, who in 1817 gave him his notes for an article on the gypsies, which Pringle contributed to the Edinburgh Magazine, started by himself and Cleghorn, and known after a rupture with the publisher as Blackwood’s. In 1820, with 24 others, he emigrated to South Africa, settling finally at Cape Town, where for three years he was librarian of the government library. Pringle worked hard to secure financial support for the colony, and for a while completed and started The South African Journal and The South African Commercial Advertiser. These were suppressed by Lord Charles Somerset, the governor of the colony, because of their liberal tendencies and Pringle was reduced to poverty. In 1825 he returned to London and in 1827 became secretary of the Anti-Slavery Society. After seeing the triumph of his humanitarian endeavors in the abolition of slavery by England, in 1834, he died on the eve of returning to South Africa. His earlier poems were collected by him as ‘Ephemeredes’ (1828); and the best of these, dealing with South Africa, were reprinted in ‘African Sketches,’ which included also the ‘Narrative’ of a residence in South Africa. These productions were characterized by descriptions and tender feeling. He is best known by his poem, ‘Afar in the Desert I Love to Ride,’ reprinted in the volume of ‘African Sketches’ (1834). Pringle’s ‘Poetical Works’ with a life were edited by Leitch Ritchie in 1839.

PRINSEP, Valentine Cameron, English artist and author: b. Calcutta, India, 14 Feb. 1838; d. London, 11 Nov. 1904. He was educated for the government civil service, but displayed so much artistic talent that he became a pupil of George Frederick Watts. Oriental, classical, and Renaissance studies strongly appealed to him. His first notable exhibiting success was gained by his ‘The Linen Gatherers’ (1876). He was elected R.A. in 1894, and subsequently became professor of painting to the Royal Academy. In 1895 he went to The Hague as ‘The Decline of the Queen as Empress,’ which was exhibited in 1880. His other paintings include ‘Bianca Capella,’ his first Academy picture (1862); ‘The Fisherman and the Sinn;’ ‘At the First Touch of Winter;’ ‘A Minuet;’ and ‘A Kent.’ Of his two plays, ‘Cousin Dick’ appeared at the Court Theatre and ‘M. Le Duc’ at Saint James’. He was also author of ‘Imperial India;’ ‘An Artist’s Journal;’ ‘Virginie;’ and Abibal, the Tsoumani.”

PRINTING, the art of producing impressions on characters or figures of a secret nature or other substance. Printing from movable types is of comparatively modern origin, it being less than 500 years since the first book was issued from the press; yet the principles on which it was ultimately developed existed among the ancient Assyrian nations. Printing from blocks and clay tablets was practised in China as early as 50 B.C. The great discovery was that of forming every letter or character of the alphabet separately, so as to be capable of rearrangement and forming in succession the words, lines and pages of a work, thereby avoiding the labor of cutting new blocks for every page. The city of Haarlem in Holland claims that Laurens Janszoon Coster there invented the art of printing in 1440, making use of movable types of wood and afterward of lead and tin; but no printed works of his can be identified. The claims of Johannes Gutenberg (q.v.) to this invention are now generally recognized. He without question was occupied in various experimental researches of a secret nature in Strassburg, and possessed in 1438 printing materials, a press, and as it appears movable types. No book, however, was brought out by their use until after Gutenberg had returned (which was about 1440) to his native town. He associated himself with a wealthy citizen, Johann Fust, who, on learning the secrets of the art, entered into partnership with Gutenberg, and agreed to furnish funds for developing the process. They employed to assist them Peter Schöffer, a scribe whose previous occupation had been the copying of books, and who appears to have been a man of taste and genius, and well fitted to bring a new process of this sort favorably before the public. He has the credit of substituting metallic types cast in plaster molds in the place of those which Gutenberg had previously made by carving pieces of wood and metal, and of still further perfecting the art by the invention of punches in hard metal, by the use of which sharpness of outline could be given to the matrices in which the types were cast, and perfect uniformity be retained in the type by continuing to use the same punches for producing as many matrices as might be required. The inventors succeeded in printing a considerable number of books, the first of which is known to have been printed with movable types.
1 A page form ready for electrotyping
2 A stereotype plate of a newspaper page
3 A roll of newspaper ready for printing
were three editions of Donatus. Printing presses were in operation at Subiaco near Rome in 1465, and the types employed were more like those now called Roman than like the Gothic forms of the Germans, which with the characters imitating handwriting had up to this time alone been used. In 1469 printing was introduced into Milan and Venice; and the productions of the presses of John de Spira and Christopher Val- darfar of the latter city attained great fame for their perfection and beauty. Printing was introduced into Paris in 1470 and into London in 1474. (See CAXTON, WILLIAM). Before the year 1500, it is stated, printing presses had been set up in 220 places in Europe, and a multitude of editions of the classical writers in their appropriate Greek and Latin characters were given to the world. A Greek grammar wholly in Greek types was printed in Milan in 1476. A Hebrew Bible was printed at Soncino in the duchy of Milan in 1488. Italic type was invented about the year 1500 by Aldus Manutius of Venice. From the 17th to the 19th century a great variety of ornamental type came into use, the styles differing from each other in the shapes of the letters, in the heaviness or lightness of the lines and in the shading. Great ingenuity has been exerted in multiplying these varieties in so limited a field. The largest size of type for books was formerly called great primer, and is seen in the largest old Bibles; it is now seldom used. The other old names now going into disuse are English, pica, small pica, etc. See table below. The term pica, however, is retained, being one-sixth of an inch, a convenient standard unit for type measurement.

Great Primer, English, Pica,
Small Pica, Long Primer, Bourgeois,

Brevier, Minion, Nonpareil, Agate, Pearl, Diamond, Italian.

Late in the 19th century the "point" system was adopted generally by printers. In this new arrangement, one inch equals 72 points and consequently 12-point would make six lines to the inch. The principal types are designated as follows:

<table>
<thead>
<tr>
<th>Nonpareil</th>
<th>Minion</th>
<th>Brevier</th>
<th>Bourgeois</th>
<th>Long Primer</th>
<th>Small Pica</th>
<th>Pica</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 point</td>
<td>8</td>
<td>9</td>
<td>10</td>
<td>12</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For handbills or posters special types are employed of extra large sizes and named in multiples of pica, as 20-line pica. From about 1870 onward they are commonly made of hard wood. A complete assortment of one size is called a font or found, and the "sorts" that make up an ordinary font of Roman type are as follows: Three complete alphabets in capitals, small capitals and small or "lower case" letters, making 78 characters; the double letters ff, fi, fl, ff, fl (each cast in a single piece on account of the kern or bend of the f not permitting it to stand separately against another f, an i or an l); 5; the diphthongs AE, OE, aa, ee, oe; 6; figures, 10; marks of punctuation; 6; the anastrophe, hyphen, parenthesis and bracket; 4; four sizes of dashes and braces in five pieces; 9; the characters & a, $, f, 37°, 5; and the references 4, 5, 6, 8, ||, 6; total characters, 129. Besides these, there are required for filling the blanks between words at the end of lines, etc., the sizes of spaces and four of quadrats (the former and the smallest of the latter being subdivisions of the em [m] or square of the size of the type, one equal to it and the other two multiples of it), making altogether 137 sorts.

The early printers cast their own type; made their own ink-balls, or ink-rollers; instructed some local blacksmith to make the iron frames or chases in which the types are confined for printing; and either made or designed the wooden cases and stands that held their type. With the advent of the iron hand press and the cylinder press or machine, press-building became a separate business. (See PRINTING PRESSES). Early in the 19th century the making of type or type foundling was separated from the printing office. (See TYPE). Paper-folding machines began to be manufactured about 1860, and as these developed, and other conveniences were discovered, the business of binding became separated. (See BOOKBINDING). About the same time experimental type-composing machines were built, culminating in the linotype or slug-casting machine. (See COMPOSING MACHINES). Stereotyping, electrotyping, photo-engraving, lithography, all have come from the printer and developed into separate arts or industries, and to gain a broad view of modern printing all these subjects should be consulted by the students. At the present time a very large part of the composition work on books and newspapers is performed by machine instead of by hand. One of the great troubles with hand composition is the time necessary for distributing the so-called dead matter after it has served its purpose on the press or in giving the impression for an electrotype. Makeup is the term employed to designate the taking of composed type from the galley and building or making it into a page of the prescribed size, adding titles and folio or page numbers, etc. Proofs are taken from type in galley and also in page form. These are read for errors and corrections are made before going to the composing. The form or number of pages placed on the press at one time varies from two to 128, according to the size of the type page and the size of the press. Imposition is the placing of the pages on the press in such a manner that when the printed sheet is folded the pages will follow one another in consecutive order. A letter or number called the signature is placed at the foot of the first page of each section and serves as guide to the binder in assembling or gathering the sheets. Stereotyping is the casting of a page in one piece. Its object is to save the wear on new type-faces and also to permit the release of the type for other work. Stereotyping is now performed by electrotyping and by the papier mâché process. In the former the type page is impressed on wax, which is then sprinkled with carbon and iron filings, after which it is immersed in a bath of sulphate of copper through which an electric current is passed. Thereupon a copper coating is deposited on the wax, resulting in the final form of the type. After sufficient strength of copper
is so deposited the coat is backed up with softer metal, is taken out, trimmed and beveled, and if necessary is made type-high by affixing to a block of hardwood. Papier maché work is the favorite with newspapers. The autoplate machine is now in general use. Its operation is entirely automatic.

Printing rollers consist of a mixture of glue, glycerine, glucose and sugar. The formula of mixture is varied to suit the speed of the machine and the temperature of the pressroom. In summer it is a frequent happening in a pressroom to have one or more rollers melt under high speed.

Previous to 1865, printing was largely a handicraft. It is true that power presses had come into use for daily newspapers, and also that in some of the printing offices the mass of printing was done on presses operated by man-power, either with a hand crank or lever, or by a treadle for the foot. The type was set wholly by hand. The few pictures introduced were either cut laboriously in wood (see Woodcuts, Engravings, etc.), or they were drawn on transfer paper, and printed lithographically, and these litho-presses were also run mostly by hand. In the period of about 1875 to 1895 the methods of printing underwent an almost complete change, so that modern printing may really be classed as a new art, or a series of developed branches of industry all working to a common end, the attractive and cheap reproduction of reading matter and illustrations. Printing is now mainly the product of machinery, of a great variety of types, intelligently guided by specialists, few of whom are all-round printers, knowing the art in detail. The typcasting and typesetting or linotypeing is almost wholly machine work; the presses all run by power, and are mostly fed from a roll of paper or supplied with sheets by automatic feeding machines. Many presses deliver their product folded; if not folded it usually goes to a folder, and may be also ruled, punched, embossed, numbered or wired-stitched by machinery. The plates are drawn by professional artists, photo-engraved, and may then be duplicated by electrotyping, and placed with type in forms for printing. Color printing has advanced, both from the lithographic and typographic side, using the most beautiful and artistic reproductions of paintings are sold with cheap periodicals or given away to advertise goods.

When the term printing is used without qualification, typographic printing from relief plates is understood; but there are many other processes properly included in the broad term printing. The most common of these is lithography, which was originally done from a flat porous stone, but is now executed chiefly from aluminum and zinc plates, which are available for rotary presses, and which have vastly increased speeds. Wallpaper printing is also a different art. The typewriter really prints, though we use the word writing for its accomplishment. The neostyle which reproduces typewriting effects, is really a printing machine, and not a duplicator of old duplicators on the market, as the mimeograph, multigraph, etc.

CHARLES H. COCHRANE.

Author of 'Modern Industrial Progress'.

PRINTING PRESSES. The first printing press was a device of the cheesemonger or cider press common in all large medievial households, and needed little change to adapt them to the uses of typography.

Gutenberg's press, upon which he printed his 'Bible' of 36 lines (1454), consisted of 42 lines (1455), and the 'Letters of Indulgence' of 1454, 1455, 1461, consisted of two upright timbers with connecting crosspieces at top and bottom, and with two intermediate cross timbers. The lower one was the support of the form of type. Through the upper passed a large wooden screw, the lower end of which rested on the centre of a wooden platen. After the form of type was fastened to its bed it was inked by hand inking-balls made of wool covered with paper. The moistened paper, previously dampened, was then laid carefully upon the type, and the bed pushed to its place. A wooden lever was thrust into its socket and the platen screwed down, held for a moment and then raised. The bed was drawn out and the printed sheet removed and hung up to dry. For 150 years this simple but effective form of the printing press continued in use, and the books thus printed by Faust and Schöffer at Mainz, Jenson and the Aldi at Venice, Caxton at Westminster, Plantin at Antwerp, the Elzevirs, etc.
virs at Leyden and at Amsterdam, and Bade and the Estiennes at Paris have brought their makers the highest fame.

First Improvements.—The first recorded improvements were those of William Janson Blaeuw, of Amsterdam, about 1620. He passed the spindle of the screw through a wooden block, which was guided in the wooden frame, and from it hung the platen. He also invented a device for rolling the bed in and out under the platen, and improved the hand lever for turning the screw. This press was widely used on the Continent, and in England and America, and on such a one Benjamin Franklin worked in London in 1725. One of these, that from the Watt printing house, is now preserved in the Patent Office in Washington. For nearly two centuries this sufficed for books of small editions and for the little-circulated small newspapers and gazettes of the 17th and 18th centuries. The Earl of Stanhope in 1798 made a press with a cast iron frame and greater leverage that had some use in England. George Clymer, of Philadelphia, in 1816 substituted a combination of levers for the screws, and called his invention the Columbian press. He carried it to England and there in 1822 Peter Smith devised a toggle-joint, simple and effective, that replaced the screw and levers.

The final development of the hand press came in 1827, when Samuel Rust, of New York, perfected the Washington press. The iron frame was lightened and strengthened, the toggle motion was improved and a screw top regulated the pressure. With this improved hand press came the substitution of composition inking rollers for the leather covered ink-balls previously employed. The bed was made to slide in and out on a track by turning a crank connected with two endless bands. A bent lever working in a toggle-joint forced the platen down and coiled springs raised it. To the end of the bed was attached the tympan, a wooden or steel frame over which a cloth was tightly stretched and carrying the blanket to modify the force of the impression. When the bed was run out this was raised to an ob-tuse angle. The paper was laid upon this and carefully fitted to adjusting pins; the frisket, a thin frame holding a sheet of paper cut to the size of the form, was folded over the paper to protect it, to steady it and to raise the paper from the type after the impression. This press has been improved in construction, but in principle and form substantially the same press is widely used to-day in the United States as a proof press and for the special work for which it is fitted. Its capacity is about 250 sheets an hour printed on one side. Alike in principle and construction, though differing in detail of depressing and raising the platen, is the Albion hand press as widely used in Great Britain.

The operation of the hand press when type, press, ink and paper had been prepared necessitated these 11 processes: The form was inked by hand; the paper was fitted to its place on the tympan; the frisket was folded over it to hold it; the tympan was folded down over the form; the bed was run under the platen by turning the crank; the platen was forced down by the workman’s power applied to the lever; released, it was raised up by the springs; the bed was rolled out by a reverse motion of the crank; the tympan was raised; the frisket opened, and the printed sheet removed. Modern invention has sought to reduce all these to a single automatic process operated by mechanical power. Necessity divided the course of invention into three lines; the small job press and the large book and newspaper press soon widely diverging in type and construction to secure fine printing in one and the greatest speed in the other.

Bed-and-Platen Presses.—The development of the bed-and-platen power press for fine book work and illustrations reached its highest state in the Adams press, invented and patented by Isaac Adams, of Boston, in 1830 and 1836, and
improved in many ways by R. Hoe and Company since that firm acquired his business and patents in 1858. Over 1,000 have been manufactured, and a few were reported to be yet in operation in Boston in 1918. Adams, after a few experiments with a timber frame, built his presses of iron and fixed the platen immovably in the frame. The form was placed on an iron bed beneath, and this bed was raised against the fixed platen and lowered by a system of cams straightening a toggle-joint. The ink fountain was placed at one end of the press, and the ink rollers in a movable frisket-frame passed over the face of the type and back while the bed was down. The sheets of paper were fed to grippers on the frisket which carried them over the form, and after the impression was taken the sheets passed forward on tapes to a sheet-flyer, which delivered them to the fly-board. The speed of the larger sizes of the Adams press is about 600 sheets an hour.

The most successful press designed for small job work substituted for the hand lever and crank a rotary power wheel which could be driven by a treadle by the foot of the operator, or by belt and shafting. The bed was set in a perpendicular frame, and the form was clamped to it. To the bed frame near the bottom was jointed the frame that held the platen. This opened to an angle of about 45 degrees. A crank rod fastened to the wheel brought the platen up to the type form and back at every revolution. On the platen by adjustable pins or quads the position of the paper was exactly fixed. Two thin steel rods automatically folded over the margin of the paper as the platen rose. Above the bed of the press, and at a slight angle, was set a steel inking-disc, about the size of the bed, that slowly revolved, while at every revolution of the driving wheel a pair of ink rollers descended from the inking-disc over the form as the platen fell away, and back to the inking-disc as the platen rose to the dorm again. This automatic inking was even and uniform. This press prints cards, letter-heads, hand-bills and the like. The labor needed is that of a boy or girl to feed and take off the sheets one by one. Many varieties are made, with varying excellence of detail. The Gordon press here illustrated is typical and has been widely used. The capacity is about 1,000 sheets an hour. The Gordon press was followed by a host of imitators. The first real improvement was the use of a cylinder instead of a disc for ink distribution, which came in the Globe machine. This idea was more fully developed in Gally’s universal press, and later in Thompson’s Colt’s armory press, which is also characterized by great strength and rigidity. The Gordon disc type of press was highly developed by Golding of Boston, in a scientifically constructed and rapid-flying type. The old-style Gordon was reduced in cost of manufacture and has been made in enormous quantities by Chandler and Price, and sold all over the globe.

**Cylinder Presses.**—The basic principle of the cylinder press—a flat type form passed under an impression cylinder—is as old as Gutenberg’s time, when from crude machines of this type copper-plate engravings were struck off; but no practical development of it was made until the beginning of the 19th century. So many patents have been granted since then for various devices to secure excellence or economy of operation that it is possible to note only the most striking and most successful. The first printer to work out a practical cylinder press was Frederick Kopp of Saxon by birth, who removed to England in 1806. He associated with him James Bensley, a London printer, and a machinist, a fellow-countryman, Andrew Bauer. The product of their labors was a press which they put in operation in London in 1812. The form of type was placed on a flat bed, which was carried under an impression cylinder that had a three-fold action. On the first third the sheet was fed at the top upon the tympan and gripped, on the second part of the revolution the sheet received the impression and was removed by hand; and on the third the empty tympan came up to receive another sheet. The most efficient device which they invented to roll the bed holding the type form to and fro was this: A long shaft turned the gearing from the outside of the frame carried a pinion on its inner end; the shaft had in its length a universal joint that allowed for an up and down motion of the pinion as it revolved. Underneath and fastened to the bed was a rack, or row of teeth, with a crescent-shaped segment of metal and pins, or studs, at each end. To the outer end of the shaft was attached the wheel connecting with impression cylinder; this wheel, when set in motion, revolved the pinion and moved the bed by means of the teeth in the rack. When the bed reached the end of its appointed course, the pinion turned around one over one of the pins or studs against the segment in the rack and immediately re-engaged the teeth on the opposite side and carried the bed back again to the other end, where the operation was repeated. König followed this in 1814 by a continuously revolving cylinder, which was slightly reduced in diameter along that part of the periphery not used for the impression so as to allow the bed to return under it freely after the impression. He made also a two-cylinder press of this pattern, and two of these two-cylinder presses were set up in the London Times office in that year. Their capacity was 800 impressions an hour. This same year he devised
two-cylinder press — the first perfecting press — by which a sheet was printed on both sides at one continuous operation. The forms were placed one at each end, and the sheet after being printed on one side under one cylinder was by tapes carried over aregistering rollerto the second cylinder for printing on the reverse side. This machine Applegarth and Cowper, by improvement, made very efficient. Every year showed patents on improvements, but the most important new invention was that of Napoleon Sabin in 1828 and 1830. He discarded the tapes for the conveyance of the sheets and substituted “grippers” or “fingers” to clasp the sheets to the cylinder for the impression, and for delivering them after printing. He also made the impression cylinders of small size to make two or more revolutions to each sheet printed, and devised the toggle for raising the cylinder to allow the form to run back without touching.

Koenig and Bauer went to Germany where they later perfected a machine having a bed that rested on and was reciprocated by a fourwheeled truck and crank. They and their successors were the principal makers of printing presses in Germany for 80 years.

The pioneer in introducing cylinder models into the United States were R. Hoe and Company, who had been for some time manufacturing bed-and-platen presses. Robert Hoe sent Sereno Newton (later to be a partner in the house) to England in 1832 to study the new inventions and devise improvements. The Hoe single small cylinder, double small cylinder and large cylinder perfecting press were designed and built, and with added improvements are being manufactured by them to-day. Hoe and Company patented mechanism to drive the bed in 1847. Two racks facing each other on different planes and separated by the diameter of the driving wheel were attached to a hanger fastened on the lower side of the bed. The driving wheel was on a horizontal shaft and moveable sideways, so as to engage first one then the other of the racks. A roller at either end entering a recess in a disc on the driving shaft in a half-revolution brought the bed to a stop and acted in the opposite direction. This was a new principle; a crank action operating directly upon the bed from a shaft having a fixed centre.

As the demand for printing presses grew other makers came into the field. Andrew Campbell designed, perfected and built, about 1865, a single cylinder newspaper and poster press, which became known as the Campbell country press, and which secured the widest sale of any press of that character in its time. By means of a very large gear and reversal mechanism keyed solidly on one end of a drum cylinder, he locked together the bed and cylinder so that register was perfect. The rollers and other mechanism were extremely simple, and he was thus able to sell the presses at a low price. An improved form of this press, styled the complete press, was employed by the early color printers, as McLaughlin Brothers, of New York. Another great success of the Campbell Company was their book and job press, which enjoyed a large sale from 1875 to 1890. This had a small cylinder, called a two-revolution, because it revolved once while the bed was making the return stroke. It employed improved features of ink distribution and sheet delivery. A. B. Taylor and Company were among the early makers of cylinder and double cylinder presses in New York, closely following the lines of the Hoe machines. Cottrell and Babcock began building cylinder presses about 1876, their first production being the stop cylinder, which was popular for a dozen years. Because the cylinder came to a dead stop in taking the sheet, a perfect register was secured, and the other details of the machine being well worked out, it came into use by the best printers. The Hoes also built a stop cylinder to meet the competition. In time Cottrell and Babcock separated, and Babcock brought out the Optimus machine, which was one of the first to deliver its sheet without change of smutting, printed side up. C. Potter, Jr., also built many cylinder presses, of rather light construction, which sold mostly to country newspaper and job offices. Whitlock followed with a very light and inexpensive cylinder machine, utilizing the Henry bed motion. Walter Mott, with later improvements, built printing press building with the Hoes, was one of the most fertile inventors of printing machinery, and established press works in Plainfield, N. J., about 1875. He took out more patents than any other inventor in this field, and developed a long line of useful machinery. About 1880 the half-tone illustration had made such headway, and the demand for superior printing became so imperative, that the dry paper printing on a hard surface came into universal use, and the cylinder presses of the day were all too slow to meet the demands made upon them. All went to building heavier machines, but the Huber and Miehle press builders were among the first to recognize this need, and secured most of the market for fine printing. Automatic paper-feeding machinery has increased the demand for this class of presses. The Miehle, being the faster press of the two, forged ahead, and finally absorbed the Huber Company. It has been widely sold all over the world. The Hoes virtually abandoned the two-revolution and jobbing press field, but Babcock, Scott, Cottrell and Whitlock built heavier, and remained in the market. Potter quit, and later Campbell, while the Cottrells gradually went into a different class of machinery.

Automatic Presses.—While the above described development of cylinder presses was going on, the small platen press was not forgotten by inventors, who improved upon these machines, and brought out a new class, that are properly styled automatic machines, because they do not require hand feeding of the paper, sheet by sheet. Kidder, of Boston, was one of the first to adapt the reciprocating platen press to use paper fed in from an endless roll, and cut off into sheets after printing. About the same time Meisel of Boston began building automatic machines, roll-fed, and automatic in operation. These machines were confined to a limited class of work and printed from flat beds. Harris brought out a press in which the type-form was replaced by a curved electrotypie plate, mounted on a cylinder, and this not automatically but permitted high speed. This was so successful that a whole line of automatic presses has been brought out by the Harris.
Company, which has sold them all over the world. Wood and Nathan improved the old type of Gordon jobber by adding a paper feeding and delivery device, which has become known as the Standard press. Kelly built a small cylinder, self-feeding, automatic press, which is sold by the American Type Founders' Company, and is largely used. The Autopress, Osterling, New Era and Stokes and Smith presses, others which have successfully entered this field.

Offset Presses.—Late in the 19th century a New Jersey man named Rubel conceived an offset press, in which the printing was first done on a rubber cylinder, and this rubber cylinder rotated in contact with a printing cylinder, so that a continuous sheet of paper could be run and printed between the cylinders. The idea was developed and the first commercial machines employed by A. H. Kellogg and Company of New York. This machine brought lithographic principles into the field of the typographic printer, and several concerns built them, among the most successful being the Harris Company. They are occupying a wider and wider field, because they permit beautiful artistic illustrations to be executed on a cheap, ordinary class of paper. The machines offer special convenience for combining text with illustrations, and are in increasing demand for the printing of illustrated catalogues.

Newspaper Presses.—The demand for faster presses of greater capacity grew enormously with the years of the 19th century, and invention kept pace. The first step forward was the Hoe type-revolving machine, which was put at work in the Philadelphia Public Ledger office in 1846. They had put into effect the basic idea of fastening the type to the main cylinder, while smaller cylinders carried the sheets of paper to receive the impression. There was designed an apparatus for fastening the columns of type in a form on a large central cylinder in a horizontal position, each page in a single line, the iron bed with the shaped column, rules tapering to the base, with a special arrangement for locking up the forms, held the type in place with the surface forming a true circle. An automatic inking apparatus carried the main ink-well beneath the cylinder, with distributing rollers between the impression cylinders. This first machine was built with four impression cylinders touching the type cylinder so that two were on each side and one as far above the other as possible. The framework of the machine bore four feed tables. At each a boy fed the sheet of paper to the automatic grippers, operated by cams, on the impression cylinders, which carried them around against the revolving forms of the central type cylinder. The printed sheet was conducted out by tapes under the feed board, and the patented sheet-filer, with its long wooden fingers fastened to the shaft and operated likewise by cam and springs, piled them upon the delivery tables. Upon this machine, with 2,000 revolutions an hour, 8,000 sheets were struck off printed on one side. The capacity of the machine was found to be greatly in excess of this, and the number of impression cylinders and accessories was increased to 10, giving the machine a product of 20,000 sheets an hour. Though this machine was cumbersome, and at times threw out type rather liberally, it met a need and the impetus given to the newspaper business was tremendous. Circulations that had been limited to the capacity of the old bed-and-cylinder press were rapidly increased twenty-fold. Many new papers were started. This press maintained its supremacy for 20 years and 175 were built. In 1848 the first sent abroad was set up in the office of La Patrie in Paris. Marmonier, afterward built similar presses in Paris. The next great strides were when there was perfected the process of making curved stereotype plates by the use of flexible paper matrices. A simple adaptation of the bed of the type-revolving machine provided for the clamping of stereotype plates or the cylinders in place of the type forms. The forms could now be duplicated. The large papers such as the New York Herald, the London Daily Telegraph, and the London Standard each kept five presses in constant operation as circulation increased.

Web Presses.—There remained yet another step before the increasing requirements of speed could be met. It was taken when William Bullock, an American, of Philadelphia, invented in 1865 the first printing press to print from a continuous web or roll of paper. Thirty years before, Sir Rowland Hill had suggested the possibilities of such a machine based on those that printed cotton cloth from engraved cylinders. But no practical working out of the problem in its details was offered. The Bullock press consisted of two plate cylinders and two impression cylinders, the second of which was made very large to lessen the offset from the first printed side of the paper. The stereotype plates were short of filling the whole circumference of the form cylinders, because the sheets were cut before printing by knives set in the cylinders. This was the radical fault of the press. The sheets were then carried through the press by tapes and fingers and delivered by a series of automatic metal nippers on endless leather belts, placed at such a distance apart as to grasp each sheet smoothly as it came from the last printing cylinders. The Bullock press was perfected and came into considerable use. The New York Sun was the first newspaper to make use of them, and the New York Herald followed. In 1868 the London Times had gone so far with its own experiments in constructing a rotary perfecting press that it set up the Walter press in its office. This had a capacity of 12,000 sheets an hour. It was similar in construction to the Bullock press, except that the cylinders were of uniform size and placed one above the other. The sheets, however, were severed after printing, brought up by tapes and carried to a sheet-filer, which moved back and forth and "flirted" the sheets alternately to boys on either side. This press was equipped with dampening cylinders containing sponges filled with water, and required a very strong and expensive paper. This press was also adopted by the London Daily News and the New York Times, but has now entirely gone out of use. To satisfy the demands of small daily papers throughout the country for speed and economy the Duplex press appeared late in the 19th century. It is a flat-bed web-perfecting press and prints directly from the type form with a capacity of from 3,000 to 6,000 per hour of either 4,
PRINTING PRESSES

6-, 8-, 10- or 12-page papers. The flat-beds are stationary and the cylinders reciprocate over them. By an ingenious method of handling the web of paper, it is taken from the roll, led to the impression cylinder, and delivered to the folder. It has been brought to a high degree of perfection.

Rotary Perfecting Presses.—About 1875 the modern rapid rotary perfecting newspaper press was born. Numerous inventors were trying to erect the fear of fresh paper from a continuous roll of paper, printing on both sides at one operation, and delivering the product folded and cut as a complete newspaper. They had to overcome the difficulty of offset, that is, the smudging of the second side from wet ink if printed on at once. They had to secure better and more uniform paper than then ordinarily supplied. They had to cut the roll to separate the sheets while the roll was traveling at a rapid rate. These problems were solved more completely by Andrew Campbell than by any one man, though the credit of the invention has not been usually accorded to him. He built and operated a press in Jersey City which was the first really satisfactory perfecting newspaper press, but through misunderstandings and disagreement with his financial backers he was refused to sign the necessary patent papers, or to protect his invention in any way, and allowed it to become public property. In the meantime the Hoe's had worked on the problem, and Stephen D. Tucker had patented a rotary collecting cylinder that was a very useful adjunct. The Hoe's were, therefore, able to put together all this knowledge and produce a commercial perfecting press, and by continuing to absorb inventions they have become the leading manufacturers in the world of rapid newspaper presses.

The first machine of this type that R. Hoe and Company built went to London to Lloyd's Weekly, and the first to be set up in the United States was used in the office of the New York Tribune. The invention of the half-cylinder which was a great aid in the ability of the web paper to stand the strain of passing through the press. The average speed was 12,000 papers an hour.

The pressure on the newspapers demanded larger and larger eight-page papers, and necessary to devise some way to print 10-, 12-, 14- and 16-page papers at one impression. About this time Anthony and Taylor of England patented devices by which the webs of paper could be turned over after printing on one side and the opposite, or reverse side, presented to the printing cylinder. Mr. Hoe bought the patent rights for England and the United States, and with them combined ideas patented by Luther C. Crowell of Boston, who had made a machine for forming paper bags. After costly experiments these ideas were incorporated in a so-called "Double-Supplement" press, which was set up in the New York Herald office. Simplicity, speed, accuracy and efficiency had been combined. This press turned out, either 4-, 6-, 8-, 10- or 12-page papers from 200,000 to 24,000 an hour; the odd pages were accurately inserted and pasted in; the papers were cut and delivered folded. This press was really two presses built into one frame. In the secondary part the plate cylinders were left half the length of those in the main press, and at right angles to them.

These were used for the supplements of two or four pages when it was desired to print more than eight pages. Each part was fed by its individual roll of paper. The plates being secured to the cylinders, the two rolls of paper were carried, each through its part of the machine, between two pairs of plate cylinders and impression cylinders and printed on both sides.

Then the two webs of paper passed over turning bars, or "shaker bars," with a dent of 45 degrees from its base, by which they were laid evenly and exactly one over the other as a brush from the paste fountain glided along the inner fold, pasting them together. The papers passed on down a triangular "former" that folded them along the centre margin. Thence the printed and folded web of paper passed over a cylinder, from which a revolving blade projected and thrust the paper between folding rollers, while at the same moment a knife in the cylinder severed the web. A rapidly revolving mechanism, resembling in its motion the fingers of a hand, disposed of them accurately on traveling belts that hurled them on to final delivery. Hundreds of this press have been built and operated in this country and abroad. Their efficiency was proved when about 1900 by an automatic stereotyping machine called the autoplate (q.v.).

Magazine Presses.—The demand for a higher grade of rapid printing adapted to magazines has been catered to by the Cottrell Company, which has brought out an entire series of rotaries, less rapid than the newspaper machines, but executing a very high grade of illustrated printing. Hoe, Goss and Scott also built presses of this character.

Straight-Line Presses.—The angle-bar press stood alone for a decade as having the only device, though somewhat cumbersome, for assembling the several sheets into one complete paper. Joseph L. Firm, foreman of the pressroom at Frank Leslie's publishing house, however, solved the problem in 1889 and 1890 with the front type of paper, all the panels of which were held by a triangular "former" for folding, cutting and delivering. It was but a step to secure economy of construction and space, to build the press in tiers instead of tandem. Firm had the usual fortune of poor inventors. His first order, which was for a sextuple press, came from the New York World, and its building exhausted his resources. When set up, in 1891, it was so crudely and badly built that, failing to work properly, it was condemned. Poverty followed, but not for long. The Goss Printing Press Company of Chicago became interested in the straight-line press invention, which was pirated, and bought it, taking Mr. Firm into the company. Litigation followed and established the patent and harmony among the printing press makers. Improvement was rapid. These presses mark the final development of the power printing press. Evolution and the requirements of the publishers of metropolitan newspapers have brought forward presses with various improvements of detail and in increasing sizes, until one press, so-called, is a compound of
two, four, six, eight, 12 presses built into one frame, one above the other, side by side or tandem, or all three for economy of space and power, and efficiency, but the basic principle is the same,—a web of paper passes between two pairs of plate and impression cylinders and is printed on both sides; it is assembled (if on a double-supplement press or one of greater power), pasted, folded, cut or separated, folded again and delivered ready for the carrier or mail-room, at a speed of 48,000 eight-page papers (the unit of manufacture) an hour; and with an accuracy that denotes exactness and skill of manufacture, excellence of material and utmost care and nicety in adjustment and operation.

The first improvement in the Hoe type of fast press was the quadruple (or four-fold) press built for the New York World in 1887. A further advance in 1891 produced the sextuple (a six-fold press), so constructed that the cylinders were all parallel. Its delivery capacity was 72,000 eight-page papers in one hour, or 20 a second.

In 1896 an octuple (eight-fold) press was built for the New York World, with a corresponding increase in output, and four double sextuples, with color-printing attachment, were constructed for the New York Journal. Even larger are the six giant double-octuple presses which R. Hoe and Company designed for Lloyd’s Weekly, and other great newspapers continue to purchase these enormous presses.

The 1902 patterns of the Goss press carry also “color decks,” being an arrangement of two extra pairs of cylinders on the top of the machine, enabling the printing of three colors on the first and last pages of the newspaper. Two large Goss presses now in use are in the office of the New York Herald,—called duodecuple, or 12-fold. The Herald had two octuple presses and needed another. Its available floor space was entirely filled. The makers proposed to build in the air, as the pressroom was lofty, rising above the street level, and did on the same framework build another quadruple press on top of each of the octuples. Each press is now really made up of three quadruples, in tiers. Each can be operated individually; each delivers individually, the top press being fed and delivering its product on the mezzanine floor. In 1903 the New York Herald increased the size of its paper from a six-column page to a seven-column page. It was able to make over its presses to accommodate the increased width of the web, though web and cylinders now barely clear the framework. The Duplex Company of Battle Creek, Mich., manufactures what they term a “tubular” perfecting press, in which the plate cylinders are reduced in diameter, becoming literally tubes, that print continuously. These presses are very speedy. H. A. Wise Wood brought out in 1917 an improved perfecting press designed to reduce the strains on the web of paper and permit more rapid printing.

Newspaper Color Presses.—Ever searching for new features, New York newspaper publishers in 1902-03 were planning and designing supplements and main sheets embellished with color printing. Their scientific pressmen and the press-builders were called on to produce the desired effects. Walter Scott of Plainfield, N. J., designed and built a very efficient press that was set up in the office of the New York World in 1893. This had five two-page wide color cylinders for electronats set tandem, with a pair of cylinders for printing the reverse side in a single color, usually black. Below was a complementary stereotype cylinder machine for printing four pages in a single color; so that this machine could produce either a four-page paper, one Christmas supplement showing outside pages in five colors and the inside in a single color. By skilfully dividing the ink fountains and combining colors and over-printing, many shades are produced in the same paper, one Christmas supplement showing no less than 36 shades. This press was removed to the office of the Post-Dispatch, in Saint Louis, in 1902, where it is still doing very efficient work. To meet increasing demand the World had R. Hoe and Company build an angle-bar double color-press in 1894, each side of which printed four (the two outside and the two inside) pages in four color, and another press in a single color; and another, a straight-line press, in 1898 with a capacity for four pages in five colors, and four pages in two colors; these two eights can be collected and delivered as a

PRINTING TRADE, AMERICAN

Charles H. Cochran,
Author of "Modern Industrial Progress."

PRINTING TRADE, American. Although the printing trade had its inception in America considerably prior to the Revolutionary War, it was not until some time after the conclusion of that struggle for liberty that it began to assume the proportions of a national industry. In the year 1775, for example, there were less than 100 printing establishments upon American soil, and these were almost exclusively confined to the coast towns. Even as late as the year 1810 there were but 35 printing shops scattered throughout the interior of the country, while, in 1775, not less than the two or three offices that were located in Massachusetts and Pennsylvania, the art of printing had no inland representation. A few years later a printing establishment was opened at Lexington, Ky.; another soon followed at Pittsburgh, Pa., and the third office was finally located at Cincinnati, Ohio. In almost every instance these printing offices were established for the primary object of printing newspapers, although each of them not only possessed the necessary facilities for the production of job-work, but were also able to print and bind books on the rare occasions upon which such contracts presented themselves.

From the earliest days in the history of the printing trade in America, New York, Philadelphia, and Boston have been the three great centres of this industry. Other seaport towns had their local shops, but the bulk of their business was small. In fact, during the first 50 years in the life of the new nation it was Philadelphia that took the lead in every branch of the printing industry, and by the beginning of the 19th century the Quaker City presses, of which there were no less than 110 constantly in operation, were producing more English publications than any city in the world, with the single exception of London. It was here that Matthew Carey, the first great American publisher, established his plant, and with all its daily and weekly newspapers, and its book-printing and binding establishments, Philadelphia was indeed the most important centre of the American printing trade.

Gradually, however, as the demand for printed works increased other cities came into line, Albany, Hartford and Worcester being among those that developed a comparatively large trade. Their chief industry was in the printing of pamphlets. The newspapers of that day contained so little matter that they were easily read, and, as they were passed from man to man, their numerical circulation was extremely small. As the result, therefore, little effort was made to enlarge them, and persons who, like the politicians, wished to reach the general public were compelled to address themselves to the people through the medium of pamphlets. So far as actual literature was concerned the country was practically devoid of authors, and the books which were printed upon American presses were almost exclusively those which had been pirated from English publishers. Later some religious and technical books appeared, but it was many years before general literature displayed any marked development.

In the beginning everything that was used in the art of printing was imported from England. The American printers had English presses. It was from England that they obtained their type. Even the better qualities of printer’s ink were imported, for the ink that was produced in the United States was of such an inferior grade that it could be used only in the roughest kinds of jobs. From time to time various American printers made some slight improvements upon the old presses, but no great evidence of progress was shown until the establishment of a permanent type foundry.

Although it was the latter part of the 18th century before there was any permanent establishment for the making of type in the United States, several attempts had previously been made to introduce such an innovation in the printing trade. As early as 1775 Benjamin Franklin had sent the complete equipment for a type foundry from Paris, but the attempt to establish this branch of the industry was not a financial success, and it was accordingly soon discontinued. Some 10 years later a Scotchman opened a foundry in Philadelphia, but it did not thrive, and the few other scattered efforts that were made to provide American workmen with American-made type met with the same fate. In 1796, however, two Scotchmen opened a type foundry in Philadelphia under the firm name of Binny and Ronaldson, and, as the time now seemed ripe for such an establishment, they were sufficiently successful to be able to continue operations. In 1805 another foundry was opened by the firm of Wing and White, in Hartford, but they found themselves unable to compete with the Philadelphia foundry until, in 1810, the establishment was removed to New York. Two years later the firm of David andGravity Bait and another stereotyping plant in New York, and, when the already established foundries refused to supply them with type for their operations, they began to cast it for themselves, and soon became one of the most successful type foundries in America. Their success, in fact, as much as the increasing demand for type, inspired others.
to follow their example. In 1816 a foundry was established in Boston, and in 1817 another was opened in Baltimore, and, by 1830, there were no less than 12 foundries in full operation in various parts of the country. At the present time there are about 30 of these foundries in the United States, many of which are under the control of the American Type-Founders Company.

In the early days of the printing trade in America stereotyping was, of course, unknown, and the local publishers were accordingly compelled to recompose the type for each new edition that might be required. The introduction of stereotyping by the Bruces in 1813, therefore, suggested such economy that the enterprise could scarcely have failed to meet with favor at the hands of the printers. While the plaster process, the first method of stereotyping in vogue, was invented in England by Lord Stanhope, tidings of this great discovery were soon brought to America, and David Bruce at once set sail for the Old World for the express purpose of securing the information that would enable him to use full advantage of the new invention in America. Although the stories that had reached the United States had pictured the new discovery as a perfected invention, Lord Stanhope's experiments had actually by no means been concluded, and, as the result, Bruce found it impossible to acquire anything more than the most superficial knowledge concerning the process. Finding that all material facts were being withheld from him, and that it would be useless to attempt to persuade Lord Stanhope to disclose his secret, Bruce returned to the United States. So far from admitting his defeat, however, he promptly went to work, and, with the little information he had obtained, he managed by his own genius and mechanical skill to make a plate that was in every respect superior to any that had as yet been cast in England. Through his own diligence he had mastered the defects which Lord Stanhope had been unable to overcome, for his plate was not only perfectly level on both sides, but it was of uniform thickness in every part. In fact, so successful was he that an Englishman not a few of whom had sided in learning his process, went back to Europe with his knowledge. There he found scores of master-printers who, disgusted with the English invention, were glad to be taught how the American plates were made, and it was through his efforts that both Austria and Germany acquired the art of stereotyping.

From the day on which David and George Bruce opened their foundry in New York they had all the orders that they could fill, for American publishers were quick to appreciate the economical advantage of the new invention. It was the time when the public was just beginning to demand books, and as the plaster casts were not only made without great expense but also guaranteed plates of great durability, printers were eager to stereotype all books that might by any possibility require a second edition. From this simple beginning, therefore, came the great stereotyping industry of America. By 1850, the year in which the making of plaster plates attained its greatest development, there were more than 50 firms engaged in this business in the United States, while more than 1,000 men were employed in the work. Then came the modern improvements—hot electrotyping for book-work and the introduction of the papier-mâché process in the making of newspapers—since which time the making of plates has become practically an art by itself.

Prior to 1805 comparatively little printer's ink was made in the United States. Although printers were supposed to know how to mix the compound the preparations that they concocted proved such a poor substitute that all the good inks were imported. In 1805, however, two firms—one in Philadelphia and the other in Cambridgeport—began the manufacture of printing ink, and, since that time, the industry has been steadily extended until there are now about 35 firms engaged in this branch of the printing trade. About 1850 the cheapness of aniline dyes inspired a more general use of colored inks, but as many of these tints soon lost their brilliancy they did not become very popular until the chemists had succeeded in correcting this fault.

The period between 1819 and 1833 witnessed many great improvements in the art of printing. One of the most important innovations was the substitution of iron for wood in the making of hand presses. Although wooden presses had been used since the time of Gutenberg they had always proved a handicap to good printing. Even the strongest wood was weak, and as the machine was liable to give way in some part at any pull, the pressman found it impossible to obtain a good impression, even when the type surface was no larger than 12 by 20 inches. As the natural result, all hand-presses were small affairs, and as they required the services of two expert workmen to keep them going the process was as costly as it was slow. In the adoption of the iron press American printers followed the example of their English brethren. The first iron press to be made in America was completed about 1820, but, sometime previous to that date, such presses had been imported from England. Recognizing the advantage of a machine that was capable of printing a sheet three times as large as the old press, and with no greater muscular effort, American printers soon demanded them, but, in spite of this demand, it was several years before the wooden presses were relegated to the junk-heap, some of them having been in use, even in New York, as late as 1850. In the beginning presses were made by Turney, Worrall, Wells and Smith, but gradually the business began to centre with Hoe in New York and Ramage and Bronstrup in Philadelphia, until, finally, nearly all the presses were manufactured by these houses.

Another invention that proved an invaluable aid to the progress of the art of printing was the making of elastic rollers for inking the type. The original method of inking was a most laborious system, the application of the ink being made with balls of petticoat. Early in the 19th century the English printers discovered that a composition of glue and molasses, long used in the making of pottery, could be applied in the inking of type, and from this idea was evolved the composition roller which was so necessary to the success of the first machine presses. This roller was invented in America about 1826. Another invention that played an important part in the production of
cheap printing was the improved method of paper. The introduction of the cylinder printing machine. This, too, was introduced in America soon after 1826, and since that time the growth of the printing industry has been a steady and rapid evolution.

Of course, the great necessity under the new conditions was more rapid printing facilities, and this demand was met by the inventors about 1828. Some 15 years prior to that time a German printer named König went to England to produce a cylinder machine for the use of the London Times. When the press he constructed was rather successful, he returned to Germany before it was perfected, leaving the English inventors to complete the improvement of his work. This they did in many respects, but the credit for the first actual success in the making of cylinder presses is due to the American manufacturers, firms like R. Hoe and Company, who took the somewhat unsatisfactory foreign machines and brought them to a state of comparative perfection. By depending only upon their own resources and skill, they produced cylinders that were more satisfactory than the foreign goods, that, in spite of the fact that the home product is cheaper, English printers have long found it expedient either to import American printing machines, or to make their own presses from American models.

After 1833, therefore, America needed no further help from England in the development of her printing industry. With the best of paper and ink, type and presses, all made in the United States, and with plenty of money to invest in manufacturing enterprises connected with this trade, it was unnecessary for her to turn to any foreign nation for assistance, and when, in 1830, the system of cloth book-binding was introduced, all the requisites for literary progress were in her own hands.

Of course, with the development of the power press the character of the newspapers of America also began to change. Whereas they had originally been small and dull, having but little news in them, the ability to print many copies enabled them to increase their circulation, as well as their size. In 1833 the New York Sun, printing a sheet 11½ by 17 inches on a hand press, could turn out 400 copies an hour. As the demand for the paper continued to increase, however, a cylinder press, propelled by a man at a crank, was introduced in 1834, and a year later this was supplanted by a double-cylinder operated by steam power. As other papers in other parts of the country met with similar experiences, the demand for rapid newspaper presses continued, and, by 1845, it was found that even the double-cylinder machine was too slow for the requirements of the constantly growing circulation of the great dailies. See NEWSPAPERS, AMERICAN.

It was to comply with this demand that R. Hoe and Company, in 1847, invented the type-revolving rotary printing press, a machine in which the type was fastened to the cylinder and simultaneously revolved around the Station Printing cylinders placed around it. For more than 20 years this press was able to meet every demand of periodical publications, but, in 1869, finding that it had at last become too slow, R. Hoe and Company perfected their web-printing machine, a press which prints continuously from stereo-typed plates on a cylinder against an endless roll of paper. In the course of the almost incredible speed at which this press can be revolved, inventions, which have since been perfected, now enable it, not only to print 4, 8, 12 or even more pages, but at the same time, to fold, count and paste them; to insert sheets or add the necessary currency and advertisements in any color. In 1854 William A. Bullock perfected the first cylinder machine that was capable of printing a newspaper from a roll on both sides at the same time, but the other improvements had long been made by R. Hoe and Company, or some of their business rivals like Cottrell, Babcock, Campbell, Potter, Huber, Miehle, Joss and others.

Great as has been the improvement in the making of machine-presses, however, the other branches of the art of printing have succeeded in keeping pace with it. In stereotyping, for example, the invention of the paper-mâché process enabled printers to make a number of impressions of the same page of type, while the demand for a mass production was met in 1834, when Charles Cressey of New York succeeded in stereotyping a curved surface.

The period between 1833 and the outbreak of the Civil War also witnessed many improvements in the art of printing, the most important being the introduction of fonts for fine book and job work. The invention of the power press had been a blessing to the newspapers, but, for a long time, book and fine job work was still done on hand presses. It was not until 1836 that Harper and Brothers introduced a power press, although Daniel Fanshaw of New York, the printer of the Bible Society, had 10 power printing machines in operation in his shop prior to that time. These machines were manufactured by Daniel Treadwell of Massachusetts, and, although they were both bulky and inconvenient, they were the best presses on the market until the Adams press came to take their place. During all this period, however, it was believed that cylinder machines were the most efficient of doing fine work, and it was not until Francis Hart of New York had demonstrated the fallacy of this theory that the incredulous could be persuaded to make the change which the proper development of the trade had so long been the work of R. Hoe and Company.

To Joseph A. Adams belongs the credit of devising the American method of making-ready woodcuts, and he was who first demonstrated the feasibility of the new process of electrotyping by making successful electrotypes, in 1839. It was in 1839 that the electrotyping machine was invented by David Bruce, and about 1850 that the method of printing illustrations on dry paper was discovered.

The art of engraving on wood was practised until comparatively recent times, but the introduction of the art of photo-engraving has brought its usefulness, for, while wood engravings were extremely costly, the new process made the cheapest of illustrations possible. Lithography, or the art of printing upon stone, has been employed in the United States since 1820. It was not until 1825 that its use became commercially practicable, but since that time this form of printing has developed rapidly.

One of the latest, and, unquestionably, one of the greatest improvements in the art of typography was the invention of the typesetting
machine, which is now in such general use in all large manufactories that it may be said to have practically supplanted hand composition. It is by such inventions, however, that the printing trade has been revolutionized until it has grown from the small proportions of a business which engaged the attention of less than 500 men to a great industry.

Printing has increased in volume as much as in quality. In 1900 it was rated as about the 14th United States industry; in 1914 the census returned it as the sixth industry. In 1918 Charles Francis, the magazine known as the "dean of the printing industry," in America, called attention to the fact that it was entitled to be classed as the third industry of the country, and from some points of view as the second industry. He reminds us that paper is a very necessary part of printing, and that its value has been usually deducted in computing printing production. When gross products are figured the leading United States industries appear as follows, 1914 figures: (1) Slaughtering and meats, $1,373,000,000; (2) foundry and machine shop products, $1,373,000,000; (3) printing and publishing, $1,233,000,000; (4) lumber and timber, $1,119,000,000.

When measured by net products, foundry and machine shop products come first, and if the paper be included printing and publishing is second. The motion-picture industry is now approaching rapidly and bids fair to occupy one of the foremost places. In number of employees drawing wages and salaries, printing, publishing and paper, considered as one industry, ranks third, and in wages paid come second. From the same point of view, in capitalization, foundry and machine shops are first, and lumber and timber, steel works and printing (with publishing and paper), are practically tied for second, third and fourth place. It also appears that one-fourth of the printing in the United States is done in the metropolitan district of New York, while Chicago, Philadelphia and Boston together do another fourth. The total gross United States production of printing and publishing and the paper used in 1914 was $1,233,000,000, which figure does not include paper used for other purposes. The large monthly newspapers and the semi-monthlies, monthly and quarterlies, are produced by what is commonly called the book and job printing branch of the industry, but which is beginning to be known as the periodical, book and job printing branch, because the periodicals constitute the largest portion of its production. The great daily newspapers and the periodical houses that turn out periodicals, catalogs and books in large numbers, have all developed along factory lines of efficiency, and may correctly be classed with other factories.

Charles H. Cochrane, Author of "Modern Industrial Progress."

PRINTZ, Johan, Yehian prints, Swedish colonel; born in Sweden, about 1600; d. 1663. He fought in Germany in the Thirty Years War with the rank of a lieutenant-colonel of artillery in the Swedish army, but having surrendered Chemnitz in Saxony to the enemy, was deprived of his rank. In 1641, however, he regained the good will of the Crown, was raised to the nobility and made the third governor of the colony established by the Swedes on the Delaware River in 1638. He landed at Fort Christina in 1643 and until his departure from the colony in 1658 maintained the prosperity of the settlement, upheld the Swedish claims, almost unheard, against the English under Sir Edmund Flodwen and Lamberton, and against his near neighbors, the Dutch. He built forts on the island of Tonicum near the mouth of the Schykill below Philadelphia, at Wilmington, and at New Castle, exerting much influence over the Indians along the Delaware and protecting his trade with them. At Tonicum he built himself a rude mansion, known as "Printz Hall." The influx of settlers during his rule was made up of a good class of farmers who dealt fairly with the Indians and established a precedent of kindness and justice acted upon so successfully afterward by William Penn. The only record of Printz after he returned to Sweden is that he was made a general, and in 1668 was appointed governor of Jonköping. Consult Acrelius, "History of New Sweden" (extant in "Old South Leaflet," No. 96); Smith, "The Thirteen Colonies" (1901); Winsor, "Narrative and Critical History of America" (1889).

PRINZIP, Gabril, Serbian assassin: b. Serajevo, Bosnia, about 1893; d. a prisoner in an Austrian fortress near Prague, 30 April 1918. Though an Orthodox Serb and a member of the Greater Serbian party, he was an Austrian subject, the son of a small innkeeper of Serajevo. It was he who fired the three shots from a Browning pistol which killed the Archduke Francis Ferdinand of Austria and hismorganatic wife, the Duchess of Hohenberg, in Serajevo on 28 June 1914. At the time a mere schoolboy and a printer's "devil," Prinzip may be credited with having precipitated the European War by furnishing the Austrian government with a suitable pretext for war against Serbia. He was immediately arrested after firing the shots and subsequently sentenced to imprisonment for life. Prinzip confessed, on 2 July 1914, that he had previously informed the Pan-Serbian Union of his intention to murder the Archduke.

PRIONIDES, a family or subfamily of longicorn beetles distinguished from its allies by the margined and usually toothed thorax. They are mostly insects of large size and robust form. Their larvae are large, soft grubs with small heads but powerful jaws, which bore in wood and are very destructive. They rest in a nearly straight position, not bent or doubled. A number of conspicuous species are found in the United States, several of the most common belonging to the genus Prionus, in which the thorax bears the three marginal teeth on each side, the joints of the long antennae fit into one another in an imbricate fashion and number from 12 to 27. These insects are nocturnal, and the males are said to fight fiercely for possession of the females. One of the largest species is P. brevicornis, a common black beetle, which flies about in a heedless fashion at dusk. The larvae, as large as a man's finger, live for three years; and are very injurious to the roots of poplar and other trees. A smaller and more slender beetle is Orthosoma sericata, which passes through the roots of grape vines.
PRIOR — PRISCIAN

Other species are less destructive, confining their attacks chiefly to the dead wood of stumps and decaying tree trunks. Consult Fabricius, 'System Entomologistorum'; Olivier, 'Entomologia ou Histoire Naturelle des Insects'; Gyllenhall, 'Insects Suedcica'; Dejean, 'Species General de Coleopteres.'

PRIOR, prí-or. Matthew, English poet and diplomatist: b. Wimborne Minster, Dorsetshire (possibly Winburn, Middlesex), 21 July 1664; d. Wimpole, Cambridgeshire, 18 Sept. 1721. He was educated at Cambridge, and in 1686 was chosen fellow of his college, Saint John's. With Charles Montague he wrote in 1667, 'The Country Mouse and the City Mouse,' a parody of Dryden's 'Hind and Panther.' Through the Earl of Dorset he was appointed secretary to the English plenipotentiaries at The Hague in 1690; in 1697 he became secretary to the commissioners who concluded the Peace of Ryswick, and on his return from The Hague, secretary to the lord-lieutenant of Ireland, and finally Under-Secretary of State. In 1699 he produced his 'Casus Secreti,' with the 'Casus Secreti, Secundus.' He succeeded John Locke as commissioner of trade and plantations and sat for a short time in Parliament. At the beginning of the reign of Anne he left the Whigs to join the Tories. Made commissioner of customs in 1711, he was employed in secretly negotiating at Paris the terms of the Treaty of Utrecht, and he remained in France as secret agent and Ambassador till 1714. On the accession of George I, he was impeached on the charge of high treason and impeached in his own house. During his imprisonment he wrote 'Alma, or the Progress of the Mind,' which, together with his more ambitious work, 'Solomon,' was published in 1718. Having been rendered nearly penniless, he published a folio edition of his poems by subscription. He was buried in Westminister Abbey. Prior made his way chiefly by his wit and social qualities. His poetical powers were at their best in short occasional pieces in the flowing ease and vivacity of narration. Consult Aldine edition of 'Prior's Poetical Works.'

PRIOR, the chief coadjutor of an abbot in the government of an abbey, or the actual ruler of a monastic establishment. Not till the 13th century was prior used as a term significant of authority of rule, but rather of superiority of any kind, as experience, wisdom, advanced age. Till that time the abbot's coadjutor was styled propositus (provost), but now he was called prior and under him in great abbeys was the sub-prior. Then, the head of a small monastery, of Benedictine monks, for example, was called prior. Finally, the chief officer of a convent of Augustinians, or Dominicans, or Premonstratensians, had the same title, while the corresponding officer of a Franciscan house was known as custos (guardian); but the heads of houses of the different orders of the English, John of Jerusalem, of Malta and of the Temple were given the title of grand priors. In church history priors are of two kinds: conventional and clausal. A conventional prior is the head of a religious house, and holds his office, as among the Regular Canons, the Carmelites, the Augustinians, the Dominicans, or as superior of a cell or offshoot from some larger monastery. In the former sense he has generally a sub-prior under him. A clausal prior is appointed in houses in which the head is an abbot, to act as superior in the abbot's absence and to maintain the general discipline of the house. Priories in religious houses of women, whether abbeys or simply conventual establishments, had much the same authority as priors in religious orders of men.

PRIPET, prē-pēt (Russian, Pripyat), a river in the western part of Russia. It has its rise in the government of Volynya, and is the outlet of several lakes; flows east and southeast and enters the Dnieper. It is about 500 miles long; navigable over 300 miles and is connected with the Vistula and the Niemen by canals. Its upper course is through a vast uninhabited forest region, with large areas of marsh lands. What has become known historically as the Pripyat Marshes was the scene of a great offensive movement in the World War by the Russians under General Brussiloff and the Germans and Austrians under Field Marshal von Hindenburg. The Russian operations opened on Sunday, 6 June 1916. The first Russian line had broken down the previous Sunday. From the Pripyat Marshes to the Rumanian frontier. The Russians were the first of the Entente Allies to resume the offensive on the Russian front and this was their first signal blow, resulting in the achievement of sweeping successes. Between 4 and 22 June the Russians captured 4,031 officers, 194,041 men, 219 guns, 644 machine guns, 196 bomb mortars, 146 artillery ammunition wagons and 38 searchlights, and cleared all of Bukovina of the enemy.

PRISCIAN, pris'-ʃən (Latin, Priscianus Cesariensis, prish-ıă'nəs sé-za-rī-ən'sis), Latin grammarian of the 6th century A.D. From his surname 'Cesariensis' it is supposed that he may have been born at Cesarea, and it is believed that he lived about 500 A.D. as he is mentioned by Paulus Diaconus as contemporary of Cassiodorus (468-562). Almost all that is known of the facts of his life is that he taught Latin at Constantinople, probably to the imperial court of Justinian, as he is known to have received a salary from the government. His 'Institutiones Grammaticae,' in 18 books, a most thorough and comprehensive work, has chiefly preserved his fame. A transcript completed at Constantinople by one of his pupils in 527 was reproduced in 1,000 manuscripts in the Middle Ages. Priscian borrowed largely from the first 12 of the 20 chapters of the 3d century 'De compendiosa doctrina' of Nonius Marcellus (q.v.), who was especially indebted to Verrius Flaccus and Aulus Gellius, and a revised and annotated edition of whose work was brought out by Julius Tryphotheus Sabinus in the 5th century. Priscian's 'Institutes' and the grammar composed by Aelius Donates in the 4th century dominated the schools of the Middle Ages and formed the type and source of the Latin and Greek school grammars of modern Europe. The first 16 books treat of the eight parts of speech recognized by the ancient grammarians. The last two are on syntax and are preserved separately in one manuscript, these bearing the title 'De Constructions.' The whole work, successively abridged, formed the basis of instruction in Latin up to the 15th century. The old phrase, 'to break the heart of Priscian,' means to violate grossly the

PRISCILLIAN, pr-l'sl'-yan, Spanish religious sectary: b. about 350; d. Treves, 385. He was charged with teaching heresy resembling Gnosticism or the doctrine of the Manicheans and was excommunicated by the Synod of Saragossa (380). However, he was able by his eloquence to cause the judgment to be withdrawn and put to flight his chief opponent, the bishop Ithacius. The bishop later gained the support of Maximus, the usurper at Treves, and secured the condemnation and execution of Priscillian. The followers of Priscillian were known as Priscillianists. Their beliefs included peculiar views of the influence of the heavenly bodies upon men. The sect did not die with its founder, though there was considerable reaction against it at the close of the 4th century, and it disappeared as an organized body before the end of the 5th century, though at all times through the mediæval period its traces appear under various names and forms, especially in northern Spain, in Languedoc and in northern Italy.

PRISM, in geometry, a solid consisting of the region intercepted by a number of planes known as the sides, parallel to a given line and two planes, the so-called bases, parallel to one another. It has similar and parallel bases and its sides form similar parallelograms. The bases may be of any form, and this form (triangular, pentagonal, etc.) gives its name to the prism. In optics, any transparent medium comprised between plane faces, usually inclined to each other. The intersection of two inclined faces is called the edge of the prism, etc., the inclination of one to the other, the refracting angle. Every section perpendicular to the edge is called a principal section. The prism generally used for optical experiments is a right triangular one of glass, the principal section of which is a triangle. It is used to refract and disperse light, resolving it into the prismatic colors. See Light.

PRISON. See Penology.

PRISON ASSOCIATION OF THE UNITED STATES, National, an organization of reformers and philanthropists, founded in Cincinnati, Ohio, in 1870, under the presidency of Rutherford B. Hayes. There is a board of directors and an executive committee of seven. Meetings are held annually. There are standing committees on criminal law reform, prison discipline, juvenile delinquency, etc. The Association holds annual congresses at which the executive officers of penal institutions throughout the country and others engaged in prison work exchange experiences and discuss the problems that are constantly arising. The national and the various State associations are the outgrowth of a movement in New York City in 1848 which culminated in the organization and chartering of the Prison Association of New York. The purposes of all are substantially to protect the public against criminals; to reform criminals; to defend those accused unjustly; to give first offenders a probationary opportunity; to improve prison management; to provide employment for released prisoners; to aid families of prisoners; to exercise watchfulness over prisoners released on probation and parole, and to secure legislative action to make the purposes effective.

PRISON REFORM. See Penology.

PRISONER OF CHILLON, The, a narrative poem by Lord Byron based on the story of the imprisonment of François de Bonnivard (1496-1570) in Château de Chillon, situated between Clarens and Villeneuve on Lake Geneva, Switzerland. It was Sir Walter Scott's opinion that as a picture this poem, however correctly the coloring, might rival any which Lord Byron had drawn. Bonnivard was the prior of Saint Victor, who, having by his efforts to free the Genevese rendered himself obnoxious to the Duke of Saxony, was carried off by emissaries of that potentate and confined for six years in the château, which was really a fortress, believed to have been built in 1238. He was liberated when the Bernese and Genevese forced the surrender of the stronghold.

PRISONERS OF WAR. Ordinarily a prisoner of war is a person belonging to the military and naval forces of a belligerent and who has fallen into the hands of the enemy by capture or otherwise. This definition, however, is both too broad and too narrow, since there are persons attached to an army who if captured cannot be detained as prisoners of war, for example as chaplains, Red Cross doctors and nurses, while there are others who follow an army without being attached to it, yet who if captured may be held as prisoners of war, such for example as correspondents, reporters, contractors and the like. But to be entitled to the treatment accorded prisoners of war, The Hague Convention (Art. 13) requires that they must be in possession of a certificate from the military authorities of the army they are accompanying. Until 1907 seamen on a merchant vessel of enemy nationality if captured might be detained as prisoners of war, but The Hague Conference of that year adopted a rule exempting them from liability to be detained in captivity, provided they give a formal promise not to engage in military services during the period of the war. In case they are citizens or subjects of a neutral state they must be liberated unconditionally. The refusal for a time of the German government early in 1917 to release certain American seamen who had been captured while serving as members of the crew of a British armed merchant vessel was in contravention of this rule. On the other hand, the Germans refused to treat as prisoners of war the masters and crews of armed enemy merchant ships who exercised the right to defend themselves against attack by German submarines, and in pursuance of this theory they court-martialed and shot as a sea frigate-tireur in 1916 Captain Fryatt, the master of an English Channel steamer, for defending his vessel against destruction by a German submarine. In like manner the Germans refused to treat as prisoners of war Belgian civilians who under the approach of the German armies took up arms and resisted the enemy, without being under the command of responsible commanders and without being clothed in uniform, this in the face of The Hague provision which allows the civil
population in such a case to rise spontaneously and endeavor to beat off the invader, subject only to the condition that they carry their arms openly and conduct their operations according to the laws and customs of war. Under these reasons given by the Germans for refusing to treat such persons as prisoners of war was that they had sufficient time before the arrival of the German armies to perfect an organization and equip themselves with uniforms.

The Hague Convention of 1899 makes a distinction between military prisoners and civil prisoners. The former category embraces captives belonging to the armed forces of the enemy; the latter includes enemy aliens arrested and confined in internment camps. The status of both classes of prisoners is essentially the same, however, and the treatment of them has been substantially the same.

In early times it was the custom to torture and even kill prisoners. It was considered a matter of having to reduce them to slavery, and consequently enslavement, especially among the Romans, came to be a common practice. During the Middle Ages the practice of ransom was introduced under which prisoners might be released upon the payment of a sum of money, or they were redeemed from captivity by the state of which they were subjects. But this practice is no longer followed.

The status of prisoners and the treatment which must be accorded them are now regulated in detail by the Hague Conventions of 1907 and especially the convention respecting the laws and customs of war on land. The latter convention at the outset condemns an ancient principle by laying down the rule that prisoners of war are in the power of the hostile government and not of the individuals or corps who capture them. They cannot, therefore, be ransomed or sold into slavery by the individuals who take them. They must be humanely treated. They may not, therefore, be beaten, tortured, starved, or otherwise punished. Still less may they be put to death, except for crimes punishable by death under the laws of the captor and after due trial and conviction, although the German war manual asserts that they may be killed if they are a danger to the existence of their captor. But the British and American manuals take occasion to express doubt whether such extreme necessities can ever arise that will compel or warrant a military commander in killing his prisoners on the ground of self-preservation. They may of course be punished for acts of insubordination and reasonable measures may be taken to prevent them from escaping. They may indeed be shot while attempting to escape, but if after having escaped they are recaptured they cannot be punished for having escaped. Prisoners are allowed to retain their personal property, except arms, horses and military papers. It is the duty of the government into whose hands they have fallen to feed and clothe them, and as regards board, lodging and clothing they are entitled to the same treatment as the troops of the government which holds them in captivity. The captor may require prisoners, except officers, to work according to the nature of their tasks but not be excessive and must have no connection with the operations of the war. Work done for of a similar kind done by soldiers of the national army, or if there are none in force, at a rate according to the work performed. The wages so paid shall go toward improving their position and they shall be paid thereafter deducting the cost of their maintenance. Officers taken prisoners must receive the same rate of pay as officers of corresponding rank in the country where they are held, the amount to be ultimately returned by their own government.

The Hague Convention of 1899 made it the duty of belligerents at the outbreak of hostilities to establish a bureau of information to answer inquiries about prisoners of war held by them, to collect and keep all objects of personal use, valuables, letters, etc., found on the battlefields and to furnish information to the parties interested regarding prisoners who have been released on parole, or exchanged, or a merchant of capital, letters, etc. The provision was renewed in 1907 and the scope of the bureau enlarged. Letters, money orders and postal parcels intended for prisoners of war, or dispatched by them, are exempt from postal charges in the countries of origin and destination as well as in those through which they pass. Finally, The Hague Convention requires that at the conclusion of peace the repatriation of prisoners shall be carried out as quickly as possible.

In all great wars the problem of caring for prisoners has been a difficult one and there have been few in which one or both belligerents were not charged with violating the law regarding the treatment of prisoners. Naturally during the World War when the number of prisoners taken ran into the millions the problem was very great and the charges and counter-charges in respect to ill-treatment have been numerous. Fortunately, in the early months of the war, arrangements were entered into between both belligerents a day or two before the commencement of hostilities by which each consented to permit representatives of neutral legations and embassies to visit their prison camps, conduct inspections and make reports to the governments concerned regarding the conduct of the camps in which their nationals were held as prisoners and the kind of treatment they were receiving. Until the United States entered the war, representatives of its legations and embassies in England, Germany, France, Russia and Austria performed this service. They visited the camps without giving previous notice, inspected the barracks, hospitals, kitchens, recreation grounds, etc., conversed with the prisoners, heard their complaints, made recommendations to the camp commandants and in this way were able to bring about many necessary reforms and improvements. Their reports constitute the most trustworthy sources of information regarding the treatment of prisoners that are available.

At the outset the various belligerent governments issued general regulations concerning the treatment which they proposed to accord prisoners held by them and those promulgated by
the British and French governments announced that no distinction would be made between the treatment of interned civilians and regular military prisoners. These rules are quite elaborate and cannot even be summarized within the brief limits of this article. They related to housing, food, clothing, medical attendance, cultural events, paid employment, postal facilities, recreation facilities, and the like. In the beginning, serious complaints were made in England in regard to the housing facilities provided for British prisoners in Germany and the reports of representatives of the American embassy confirmed in many instances the truth of the charges. So far as possible, prisoners captured by Germany were housed in the military barracks but during the early months of the war the number of prisoners captured by the German armies attained such proportions that it became necessary to house them in tents or in hastily constructed buildings which were poorly heated and equipped. As a consequence, the sufferings of the prisoners in the German camps during the first year of the war were particularly severe. Unfortunately also the camp sites were not well selected, some of them being located on the sandy plains in North Germany where the climate was especially rigorous. According to the reports of the American representatives prisoners in England and France were better housed and their exposure to cold was less serious. During the first year of the war there were many complaints that German prisoners were inadequately clothed and that the supply of blankets was wholly insufficient. The American investigators found this to be true in various camps and called the attention of the German government to the facts.

The most serious complaint, however, related to the quantity and quality of food rations served in the prison camps. A British and French prisoners complained that the food was not only inadequate in amount but was of such a quality that they could not eat it. Food experts attached to the American embassy found this to be true in some of the camps but others they reported that there was no substantial ground for complaint. By the beginning of the year 1916 British and French prisoners were depending almost entirely upon the food which they received from home through the parcel post. Russian prisoners, however, appeared to have received little or no food through this channel and were compelled, therefore, to subsist on the meager rations furnished by the German government, which as the years passed became hopelessly insufficient.

Regarding the pay of prisoners who were officers, the British government at the outset allowed German officers half the pay of the corresponding ranks in the British army and without charging them for their subsistence. At the same time the British government offered to allow full pay to privates and enlisted men. The German would reciprocate. To this offer, the German government never replied. Subsequently the British government learned that British officers in Germany were receiving only 60 or 100 marks per month according to their rank, from which approximately two-thirds was deducted for food. Thereupon the British government revised its scale of pay for German prisoners held in England and brought it into harmony with the German scale. The French government at the outset adopted the British policy in respect to the pay of officers but altered it later to conform to German practice. Taking advantage of the right recognized by The Hague Convention, Germany organized an elaborate prison labor system, most of which paid prisoners employed, postal facilities, recreation facilities and the like. In the beginning, serious complaints were made in England in regard to the housing facilities provided for British prisoners in Germany and the reports of representatives of the American embassy confirm in various parts of the empire. By the end of the second year of the war it was estimated that between two and three million prisoners were working in the industries of Germany; in fact they largely replaced the millions of Germans who had been called to the colors. Where they were engaged in private work they were leased out to contractors. The rates of pay allowed appear to have varied in different camps and according to the skill of the prisoner, the most common wage being 30 pfennings per day, although in some cases it was 80 pfennings, and in a few as much as 1.25 marks. Generally, prisoners were compelled to work and naturally there were many complaints in respect to long hours, excessive tasks, brutality of treatment, starvation, and particularly severe. There was also frequent complaint that the German government refused to permit neutral representatives to visit and inspect the working camps, so that the governments whose nationals were employed in these camps had no means of obtaining information regarding their treatment. There were also frequent complaints among the prisoners that they were compelled to work in industries that were engaged in the manufacture of war materials. In March 1918 the British government committed to the treatment by the enemy of British prisoners made a report which charged the Germans with systematically employing their prisoners in forced labor close behind the firing line on the Western front, thereby exposing them to the fire from the guns of their own and the allied armies. In April 1917 an agreement had been reached between the British and German governments that prisoners on either side should not be employed within 30 kilometers of the firing line. But the British committee charged that the agreement was violated by the German authorities and that the prisoners held by them were sometimes put to work within 10 kilometers of the firing line, in consequence of which many were killed by the fire of their own troops. The excuse given by the German authorities was that they were driven to this cruel measure as an act of retaliation against the British for having themselves violated the agreement. This charge, however, was emphatically denied by the British government. In France as in Germany prisoners were employed not only in camp work but in planting, cultivating the fields, harvesting the crops, repairing roads, work in coal mines, quarries, etc. In Great Britain the same policy was followed although no such extensive system of prison labor was organized as was in operation in Germany. In the United States prisoners were employed in camp work and in the construction of roads in the neighborhoods of the prison camps. Germany's prison population proved an asset rather than a source of expense, not only because of the system of compulsory labor which the Germans organized but because of the comparatively small outlay necessitated for the feeding of English and
PRISONS

French prisoners, since they depended mainly on the food they received from home through the medium of the parcel post. Regarding postal facilities, all the belligerents placed restrictions upon the number and length of the letters which the prisoners were allowed to write. The British regulations allowed each prisoner to write two letters a week, each consisting of two pages of ordinary writing paper. In special cases the number and length of letters allowed were unlimited. No limitation was set to the number of letters which a prisoner might receive. The German regulations, however, allowed prisoners to write but two letters a month and one postal card weekly, but exceptions were made in urgent cases. In France at first no restrictions were placed upon the number or length of letters which prisoners were allowed to write but in consequence of the abuse of the privilege and in consequence of the German regulations the French government subsequently felt obliged to introduce certain restrictions. Prisoners in Germany were allowed to receive parcels not exceeding five kilograms in weight, and this privilege was availed of on a large scale by British and French prisoners in Germany for obtaining food from home. There were also complaints that letters and parcels never arrived or were detained for long periods of time in the camps before being distributed. There were also the usual complaints in regard to rigorous discipline, especially in the German camps and many charges were made of cruel and harsh treatment and the American representatives found these charges to be well founded in some camps. There was considerable demand in England for the adoption of retaliatory measures against German prisoners in consequence of the alleged mistreatment of British prisoners in Germany, but no such measures appear to have ever been adopted. There was also considerable demand that the commanders and crews of submarines who were guilty of sinking British merchant vessels should when captured be denied the treatment accorded to prisoners of war, but the British government declined to adopt such a policy. It did, however, introduce a policy of differential treatment in regard to such prisoners by segregating them from the main body of prisoners; but otherwise they were treated the same. This policy aroused intense indignation in Germany and in consequence of the threat of the German government to retaliate in kind, the British government abandoned its policy of differential treatment. It is somewhat singular that considering the unprecedented number of prisoners held by most of the belligerent governments no serious efforts appear to have been made looking toward a general system of exchange or releases on parole. At the outset the French government adopted the practice of releasing German officers on parole but it was subsequently abandoned in consequence of the refusal of the German government to accord reciprocity of treatment. Arrangements were contemplated between the governments of the belligerents for the reciprocal repatriation of interned civilian prisoners of non-military age (see Enemy Alien Problems) and in the year 1916 an agreement was reached between Germany, on the one hand, and Great Britain and France on the other for the transfer to Switzerland of all wounded prisoners held by each government, as well as all prisoners who were suffering from any one of 20 specified diseases or infirmities. In pursuance of these agreements many thousand wounded and incapacitated prisoners were transferred to Switzerland, where although still held as prisoners they enjoyed the privilege of living in a neutral and friendly country. Shortly before the close of the war an arrangement was concluded for the reciprocal repatriation of prisoners of war, and prisoners of war in captivity as long as 18 months. The number of such prisoners thus repatriated or transferred to neutral countries was, however, a very small proportion of the total number held by the various belligerent governments.

JAMES W. GARNER,
Professor of Political Science, University of Illinois.

PRISONS. A prison is a place of confinement or of involuntary restraint for the safe custody of criminals and others committed by process of law. There are detention prisons for persons awaiting trial and confinement; prisons for those convicted and sentenced to imprisonment. The former are sometimes called jails and the latter are frequently called penitentiaries or workhouses or houses of correction or reformatories. See Reformatories.

Workhouses and houses of correction are supposed to be used for the older and for petty offenders while reformatories are for those capable of learning a trade or of receiving an education in a school. Confinement prisons and penitentiaries are generally thought of as places for the imprisonment of more hardened or serious offenders, where the discipline is supposed to be firmer and more arbitrary. In actual practice, however, the statutes and sentences to imprisonment do not recognize clearly these distinctions.

Detention prisons came into general use before confinement prisons and penitentiaries, as the former were needed for those whose cases had not been disposed of by the courts, whereas those convicted were, until the latter part of the 18th century, frequently put to death or branded or mutilated and let go, or were deported beyond the seas. Only in certain exceptional cases were the guilty held in custody in surroundings which were always unpleasant and provided with coarse fare and rough lodgings and required to engage in irksome labor. Only one workhouse or house of correction was built in London up to 1550 and a workhouse was established in Amsterdam in 1588. In Lubeck and Bremen there was no institution of this type until 1663. Berne in 1615, Hamburg in 1620, Basel in 1667, Vienna and Breslau in 1670, Luneburg in 1670, Florence in 1677 and Munich in 1687 were among the other European cities to establish and build one such institution, respectively.
The shocking picture of English prisons given us by John Howard during the latter part of the 18th century forced people to think about prisons and awakened the public conscience on both sides of the Atlantic to indescribable evils, particularly the evils of the English detention prisons, and enabled Howard to force a change in England's treatment of offenders. Howard made people see that these prisons were

"Posteriorous dens, overcrowded, dark, foully dirty; not only ill-ventilated, but deprived altogether of fresh air. The prisoners were fed upon the caprice of their gaolers or the charity of the benevolent; water was denied them in the scantiest proportions; their only bedding was putrid straw. Every one in durance, whether tried or untried, was heavily ironed, all alike were subject to the capacity of their gaolers and the extortions of their fellows. . . . Idleness, drunkenness, vicious intercourse, sickness, starvation, squallor, cruelty, chains, awful oppression and every culpable neglect — in these words may be summed up the state of the gaols of the time of Howard's visitation."

Hundred of these wretches were debtors, guilty only of breaches of financial rules. Hundreds more of them had been committed under legal fictions. The poor father of a family, often shiftless and unfortunate, was locked up only to be joined by his wife and children, who were made penniless by his confinement. Though innocent before the laws, yet these unfortunate remained in jail without trial and without redress.

Howard's recommendation that penitentiaries or confinement prisons be established finally bore fruit in the erection of Millbank Prison in England, which was begun in 1813 and partly completed by 1816. However, Newgate in London still remained a public den of iniquity in 1817 when Elizabeth Fry began her remarkable visitations and ministrations to the crazed creatures confined there.

Howard's work in England was paralleled by a similar movement in America, led by the Philadelphia Quakers. To relieve the horrible suffering in the city jail or prison of Philadelphia, these Quakers formed in 1776 The Philadelphia Society for Alleviating the Distressed Prisoners, but their activities were terminated by the British occupation of the city in the Revolutionary War. Immediately after the close of the war the leading citizens of Philadelphia began a successful campaign for the reform of the barbarous colonial Penal Code. In 1787 the Philadelphia Quakers and others interested in prison reform founded The Philadelphia Society for Alleviating the Miseries of Public Prisons. This society still exists as the leading force in Pennsylvania prison reform, its name having been changed to that of the Pennsylvania Prison Society in 1887. It is, thus, the oldest prison reform society in Europe or America. Its activities were most effective in bettering prison conditions in Pennsylvania. It aided in the reformation of the Criminal Code, introduced preaching into the Walnut Street Prison, devised the Pennsylvania or Separate system of prison administration and brought about a general improvement of discipline in the city prisons.

The work of the society extended beyond the borders of Pennsylvania. They carried on a correspondence with John Howard in England, exchanging ideas on desirable modes of prison reform and were the centre from which the reform of criminal jurisprudence and prison administration spread into other States of this country. Their success led to the establishment of similar organizations elsewhere. The London Society for the Improvement of Prison Discipline was formed in 1815; the Prison Discipline Society of Boston in 1820; the New Jersey Prison Instruction Society in 1823, and The New York Prison Association in 1845.

America had its own "Newgate," originally the Simsbury Copper Mine. Abandoned as a copper mine it was used by the colony of Connecticut as a permanent prison for Tories, and then by the State of Connecticut. In 1793 it was made the State prison and continued as such until 1827. Richard H. Phelps described this prison in the following language:

"The appearance of this place forcibly reminds the observer of the walls, castle, and towers erected for the security of some haughty lordling of the feudal ages; while the gloomy dungeons within its walls call to remembrance a battle or a prison of the Inquisition. Some rude buildings covering access to the caverns were constructed with an encloose of half an acre or so built of planks with iron spikes upon the top. The passage down the shaft into the cavern was upon a ladder fastened upon one side and resting on the bottom. At the foot of this passage commences a gradual descent for a considerable distance through solid rock or ore. The passages extend many rods in different directions, some of them evading underground cells of the dwellings of the neighborhood. On the sides in the niches of the cavern, platforms were built of boards for the prisoners, on which straw was placed for their beds. The horrid gloom of this dungeon can scarcely be realized. From thirty to one hundred passed together through the night, solitary lodging as practised at Wethersfield afterwards being then regarded as a punishment rather than a blessing to them. The punishments inflicted for prison offenses were flagellation, confinement in stocks in the dungeons, being fed on bread and water during the time, or more often the third of a whole day, etc. A bell summoning the prisoners to work brought them up from the cavern beneath through a trap or ladder, numbers, two or three together, and sometimes a single one. When under guard of armed soldiers they were conducted across the yard to the smithy. The prisoners were heavily ironed and secured by fetters, and being therefore unable to walk, made their way by jumps and hops. On entering the smithy some went to the side of the forges, where collars dependent by iron chains from the roof were fastened around their necks, and others chained in pairs to the wheelbarrows. The attendants delivered pickled pork to the prisoners for dinner at their forges, a piece for each thrown on the floor, and left to be washed and boiled in the water used for cooling the iron wrought at the forges. Meat was distributed in small morsels for breakfast.

As stated, toward the close of the 18th century the Quakers of Philadelphia determined to attempt the reform of the offender by destroying him or weakening him or mutilating his body. The agitation of John Howard and of the English reformers encouraged them in their activity. In 1796 Rev. Robert J. Turnbull visited the Philadelphia prison and commented upon the orderly condition of the prison as contrasted with public convict labor conditions then abolished. He said of the former conditions:

"A grand and important defect, though not generally observed, appeared too plain to some of the promoters of the plan, to inspire them with sanguine expectations of its success. It was the inexpressible difficulty of superintending the most shameful scenes of drunkenness, indelicacy, and other excesses in a manner not inconsistent with the improvement of the punishment of public labor at length became so intolerable that it was regarded, and with much justice, as a common nuisance."

Caleb Lownes, a leader in the reform movement, thus described the effect of the improved discipline prevalent in the prisons following the changes introduced in 1790:
PRISONS

1 Inmate Band Concert in the yard of Auburn Prison
2 Improvised Bowling during Recreation Period, Auburn Prison
end walls were placed far enough away from fronts of the cells and ends of the cell blocks so as to provide a wide corridor on either side of and a wide area at the ends of the cell block and were covered with a solid roof, usually without openings.

The Auburn State Prison was authorized in accordance with this plan in 1816. In 1825 Sing Sing, another New York prison of the same type, was authorized by the legislature. This type of prison architecture, characterized by several new changes, has dominated prison construction down to the present day, almost without any exception. The reasons for its continuance have been undoubtedly its flexibility, its simplicity, its low cost of supervision, and maintenance and its security. Most of these prisons were furnished with dungeons or sections built like the Pennsylvania system cells except that they were usually dark and were used for the confinement in isolation of those undergoing punishment for infractions of the rules of the prison.

With the exception of the Sing Sing Auburn System has predominated in America, but in Europe the Separate System has been more popular. New York allowed separate confinement in 1796, but abandoned it following 1821. Maryland experimented with it in 1826, and terminated its existence in 1838. In Massachusetts separate imprisonment was utilized to some extent from 1811 to 1829. Maine experimented with it for only three years (1825-27). New Jersey introduced it in 1820 and abandoned it in 1828, only to reintroduce it in 1850 and utilize it until 1858. Virginia accepted the Pennsylvania system in 1824 and legislated it out of existence in 1850. Rhode Island found this system a failure after a trial from 1838 to 1844. In Pennsylvania the Separate System was abandoned in 1834 and legally terminated in the Eastern Penitentiary in 1913, long after it had ceased to exist as a practical fact. With these more or less temporary exceptions the Auburn System was universally adopted in the prison architecture and administration of the United States.

The strongest argument in favor of the Separate or Pennsylvania System is probably that found in the report of the Eastern Pennsylvania Penitentiary inspectors to the legislature in 1830, 40 years after the establishment of the system, which reads in part as follows:

"Intemperance and thoughtless folly are the parents of crime, and the walls of a prison are generally peopled by those who have seldom seriously reflected; hence the first object of the officers of this institution is to turn the thoughts of the convict inwards upon himself, and to teach him to think in this, solitude is a powerful aid. Hence this mode of punishment, bearing as it does with great severity upon the hardened and impenitent felon, is eminently calculated to break down his obdurate spirit; and when that important object of penitentiary discipline has been gained (and in any prison it frequently is), and when the prisoner has once experienced the terrors of these instruments of this institution on a Devin heart, he learns, and he feels, relieved by industrious trade, confined and support his mental and of all its horrors, and of much of its misery. The impression fixed of being the escape of all these officers of the prison."
PRISONS

System throughout the United States. Writing in 1826 he said:

"At Auburn we have a more beautiful example still, of what may be done with proper discipline, in a prison well constructed, it is not possible to describe the pleasure, which one feels in visiting the noble institution, and wading through the fraud and material and moral filth of so many other establishments, a model worthy of the world's imitation. We do not mean that there is nothing in this institution, which admits of improvement; for there have been some useless, and some unprofitable sentences of punishment; but, on the whole, the institution is immensely elevated above most of those existing in this country. The whole establishment from the gate to the sewer, is a specimen of neatness. The unembittered industry, the entire subordination, and subdued feeling of the convicts, has probably no parallel among an equal number of convicts. In their solitary cells they spend the night with no other book but the Bible. From one end of the shops to the other, it is the testimony of many witnesses, that they have passed more than 300 convicts, without seeing one leave his work or turn his head to gaze at them. There is the most perfect attention to business from morning till night, interrupted only by the time necessary to dine. Under these circumstances they are provided with the word of God, by a law of the state which requires that every cell shall be supplied with a Bible or Testament. They also receive the undivided attention of a most wise and faithful religious teacher, who spends all his time in the work of the Lord, teaching the one who cannot read, preaching in the chapel on the Sabbath the unsearchable riches of Christ, and administering the holy sacraments of the church, going from cell to cell, to administer the reproof and consolation of religion, to individuals. The influence of the chaplain, according to the testimony of every one, is exceeding, and the officers are most exemplary and powerful; and the various expressions of confidence and affection expressed by the convicts for the chaplain, is most charming to himself. It is hardly necessary to add that at Auburn there is an exclusion of all the positive evils of the old system, which arise from crowded night rooms, evil communications, instruction in all the arts of pick pockets, thieves, incendiaries, and counterfeiters; and, as all from the very first, and before a crime, which would not fit to be named among Christians. These great ends are gained, partly by discipline and partly by construction."

Captain Basil Hall of the English royal navy visited America in 1827 and observed these two systems in operation, which he described in the following language:

"The Auburn plan... consists in the strictest solitary confinement at night — in hard labor, but is rigorous, silence, by day, and always in company, though under constant superintendence; in solitary meals, under lock and key; in regulated marches to and from their workshops; in separating the prisoners to strip them for infringements of the prison rules, and in their never being placed in absolute solitary confinement, except as a punishment of a temporary nature; in having prayers morning and evening said regularly by a resident clergyman, with whom alone the prisoners are allowed to converse, and that only on Sundays.

"The Philadelphia plan is widely different from this. It is a prison of the old French system, where the prisoner will be subjected, during the day as well as night, to separate confinement, either in solitary idleness or in solitary labor; along with which they are allowed no more exercise than what they may themselves choose to take in their little courts. The keeper is the only person, besides the clergyman, who is ever to see them, and a Bible is to be placed in each cell. By these means it is expected that, while many of the prisoners will be permitted to spend their time in labor, others will go about the evil spirits of the State, and crime will thus be doubly prevented.

"The captain in condemning the Philadelphia System said:

"As far as I have been able to learn, all the experiments which have been tried in America on solitary confinement have nothing in their intrinsic purposes of reformation any merit, while there is abundant reason to suppose that in very many cases for it leads to insensibility or to suicide. It is, difficult, indeed, to see how good can spring out of compulsory idleness in prison, when the walls of external life prove so bad, as to bring in every mischief. It cannot fail to be benumbing also, that it is a system of punishment of the prisoners, merely by the punishment itself. Their bodies are not punished, but their souls, independently of its own intrinsic example to others, what is the good to society, in making a place of imprisonment, where it ought certainly to be rendered exceedingly intolerable to the criminal, and, at the same time, its physical, moral, and mental, should not be more severe than will make him fully sensible to the folly of his past ways. In order to support and to prevent the least idea of permanent human suffering, the criminal should, if possible, be treated so that when he gets out again, and starts afresh in the world, he should be less inclined to do mischief than he was before. The only serious doubt is, whether there is much chance of amendment taking place in a vicious and ill-regulated mind, if left to commune exclusively with himself, and uttering only solitude, with or without labour, but deprived of every ray of cheerful influence to lend efficacy and circulate into the spirit of resolutions. The occasional visits of the clergyman may certainly relieve the fearful misery of absolute solitude; but unless the prison be made less repulsive, few, even these visits will fall on a soil unprepared to give them efficacy."

Charles Dickens, the novelist, who visited America in 1842, was shocked by the Eastern Pennsylvania Penitentiary, which he described in his 'American Notes' as follows:

"Standing at the central point, and looking down these dreary passages, the dull repose and quiet that prevails is awful. Occasionally there is a drizzly sound from some lone weaver's shuttle, or some shoemaker's last, but it is stilled by the thick walls and heavy dungeon doors, and only serves to make the general stillness more profound. Over the head and face of every prisoner who comes into this dark, melancholy house a black hood is drawn, and in this dark shroud, an emblem of the curtain dropped between him and the living world, he is led to the cell, from which he never comes forth until his whole term of imprisonment has expired. He never hears of wife or children; home or friends, for the whole mind is banished from the prison officer, but with that exception he never looks upon a human countenance or hears a human voice. He is a man buried, to be dug out in the same condition as when taken in the meantime dead to everything but torturing anxieties and horror.

"Every cell has double doors; the outer of sturdy oak, the other of grated iron, wherein there is a trap through which the food is handed. He has a bed, a blanket, a pillow, a pencil, and under certain restrictions, has sometimes other books, provided for the purpose, and pen and ink and paper. His razor, plate and can, and basin hang upon the wall, or shine upon the little shelf. Fresh water is let on in every cell, and the prisoner draws it at his pleasure. But his bedstead turns up against the wall and leaves more space for him to work in. His loom or bench, or wheel is there and there he labours, sleeps and wakes, and counts the seasons as they change and grow old."

William Crawford (who had investigated American prisons in 1832) and Whritworth Russell, prison inspectors of the Home District of London, were sent to America in 1837 to report upon these two systems. They disagreed entirely with the Archives of Hall and Dickens. They felt that the ease of communication between prisoners under the Silent or Auburn System was a grievous source of contamination which is inherent in that system. They recommended the Pennsylvania or Separate System for use in England, because they believed the Separate System of confinement would compensate for the necessary mistakes of the law and the requirements of economy in classifying and in housing prisoners, and also because they erroneously believed it advisable or possible for human beings to be housed under the same roof without communicating with one another. Fortunately, however, their recommendations were never carried out, for the attention of the people of England and of Europe was then directed for a time to the problem of prison administration and away from plans of prison construction.

The men who advocated the separate systems were without a true conception of social living, social control and social growth. They had no proper conception of how dependent man is upon his ability to imitate the good in others if he is to grow and develop. Deprived of the opportunity to imitate others, he shrivels and stagnates, and cannot grow out of obscurity into moral health and stability. The evils which Crawford and Russell saw in the Silent or Auburn System are inherent and in the Separate System also. The remedy for these
lies in classification of offenders, and in the erection of special hospitals, schools and prisons for each class or group. Within each such institution the prisoners must be sorted into groups and governed in accordance with the needs of each such group. See PENEOLOGY.

Both the Separate and Silent Systems presuppose prison government which is autocratic or despotic in form. Transportation of prisoners over the Great Lakes, the Panama Canal, or the Atlantic Ocean created great changes and differentiated the methods of housing and governing them. Upon their arrival there they were usually placed in close confinement for a time, under some modification of the Separate or Silent System. Then during the next period they were permitted to associate at work under modifications of these systems, and finally were given a "Ticket of Leave," permitting them to go beyond the boundaries of the so-called prison to engage in work unless under supervision.

The fact that they could be allowed to go beyond the confines of prison to engage in work reacted profoundly upon the management of the prisons and led Capt. Alexander Macanochie, who worked in the English prisons, to establish in Tasmania, then known as Van Dieman's Land, a new method of prison management, which has modified English prison methods to a considerable degree since that time. He originated the plan, which he confined to the transportation committee of the House of Commons in London in 1837, of rewarding men for service performed by the grant of marks or credits which should secure the place of money as a pecuniary reward for work performed and would secure for them a more speedy release.

Captain Macanochie's system, applied after 1840 in Van Dieman's Land, was modified and extended by Sir Walter Crofton, director of Irish prisons, following 1853. This system, as developed by Crofton and known as the Irish System, may be described as follows:

"The period of cellular incarceration was served at Mountjoy, where there was a prison in two departments, one for men and the other for women. The second system was that for "progressive classification," a phrase of which the author is the author. His male prisoners were transferred from Mountjoy to the local prisons and from time to time they were divided into classes according to their character, the probation class, third, second, and third classes, and the advanced probation class. Prisoners could be transferred from the probated class to the probation class if they were found not to be suitable for the latter. The majority of prisoners were then transferred in the third class, where there were only a few cases in which the prisoner should be placed in the second class, where there were more cases, and in the second class, where there were the most cases. The number of prisoners to be transferred in the second class was the same as in the first class, twice as many, so that they could not pass from the first to the advanced class in less than one year. Under the English system they would then have been entitled to a ticket of leave; but Sir Walter did not grant it until after a test had been applied, in a condition of comparative freedom at a third prison, called an intermediate prison, at Lusk, where they slept in movable iron beds and were occupied almost precisely as freemen would have been, in farming and manufacturing. The prisoner at Lusk had neither barn, bole, nor walls. His aim was to make practical proof of the prisoner's reformation, his power of self-control, his ability to resist temptation, and to train him for a considerable period—never less than six months—under natural conditions, and so to prepare him for full freedom by the enjoyment of partial freedom as a preliminary step."

The Irish Prison System was first introduced into America at Elmira Reformatory in 1870 by Superintendent Zebedon Brockway, aided by Gaylord Hubbell, E. C. Wines, Frank Sankorn and the then distant Thunfen. The prison which the Irish System was called the Elmira System, and applied chiefly to young first offenders.

The Elmira Reformatory building was constructed on the Auburn plan, but the rigor of silence was relaxed in the schoolrooms and to a certain extent in the shops and in the administration of the military system which Mr. Brockway introduced later on in the management of the institution. A modified marking and grading system was substituted for the definite sentence. The schoolroom and military drill were thus eliminated from the Americanized Irish Prison System. Later this enterprising superintendent borrowed therapeutic baths from the insane hospital, which he substituted for the dungeon and the club.

The Irish prison plan was also recommended for State prisons by former Warden Gaylord B. Hubbell of Sing Sing Prison, who visited the Irish and English convict prisons and made a report thereon, to the New York Prison Association, in 1865. In this report Hubbell said:

"Let a farm of two or three hundred acres be purchased (no matter if it is cheap, rough land) situated on the line of the Erie Railroad at some point where building materials and provisions can be procured at the lowest rates. As soon as done, I would procure plans and drawings of the best prisons in this country and in England. Having selected a plan combining the advantages of both, I would build a prison, having three distinct divisions, near to one another and on the same site. The first division should have a capacity of not more than 100 cells and should be arranged for separate confinement only. The second division should have a capacity of 500 cells and should be arranged with suitable workshops, in which to employ 200 convicts, who should work in association during the day and in absolute solitude at night. The third division should have dormitories to accommodate 100 to 150 men. In the first division, the prisoners, being kept in solitude, would, of course, lose their interest in the work performed during the day and would be relieved of responsibility for the work done. In the second division the prisoners would have a position of accountability and responsibility, and in the third division, where they work without supervision, the work done would be of more human interest and effect."

"All prisoners sent to the proposed system should, under proper restrictions, be allowed to work their way out; but it should be clearly understood that no prisoner can ever have this advantage more than once. Those who are convicted a second time, after being subjected to this training, should go to some other prison to serve out the whole of their sentence, without any chance or prospect whatever of release or pardon."

The plan thus recommended for a New York State prison was never carried out, but in 1913 and 1914 the State legislature and the government of the city of New York authorized the construction of a Reformatory at New Hampton, N. Y., situated on the main line of the Erie Railroad, 55 miles from New York City. This institution is being constructed much in accordance with the plan outlined by Hubbell, with such modifications of the original system as 33 years of prison and reformatory management have indicated are necessary.

After the development of the Irish prison system and when transportation of prisoners came to an end, certain modifications were made in British prison management. This, as modified, was made to provide three distinct periods or stages of confinement; that of probation endured in separate confinement at a so-called "close" prison; a period of labor in association at a public works prison, and conditional release for the unexpired portion of the sentence upon parole or "ticket of leave."

During the first period a prisoner was supposed to be confined under autocratic government in accordance with Silent or Auburn System, as modified for use in the Separate or Pennsylvania System. In the second or intermediate period the prisoner was
allowed a little more freedom and to associate in work with his fellows, while in the third period he was allowed to go beyond the walls of the prison under more or less supervision after the original example of the grant of a "ticket of leave" in Tasmania and in Australia. His permission to be abroad might be forfeited by breaches of the law or by failure to comply with the conditions governing his permit. Out of this has grown the modern parole system.

Reformatories established in most American States prior to 1890, while direct imitations of Elmira, also copied more or less the British "intermediate" prison, which was built for the confinement of the English prisoners during the second stage. The English "Borstal" system is the English adaption of her regular prison system, which provides educational and developmental opportunities for juvenile offenders. It was also derived in part from English investigations of the Elmira System. Some recent investigations conducted in the United States between 1880 and 1900 and nearly all established since that time have been patterned, not only after Elmira, but also after American industrial and vocational schools. The New Jersey and Connecticut reformatories for young men, while modeled after Elmira, have tended toward the British intermediate prison plan.

From the beginning of the 20th century public opinion has been concerned with the shortcomings of prison administration, which investigation has shown to be due in no small part to the antiquated and unserviceable type of building construction which the Silent or Auburn System provided. The form prevents proper classification, and adequate classification must always be regarded as one of the fundamental bases of prison administration. Notwithstanding this fundamental defect in construction, commendable efforts have been made to infuse a new spirit into the administration of these prisons. These attempts to build up a new type of administration in the old type of prisons have but emphasized the fact that adequate classification of prisoners is not entirely possible without the provision of different types or kinds of prisons. Modern penologists now demand that the modern prison system should never place men and women in separate parts of the same prison, and should provide:

1. Sufficient detention prisons for those awaiting trial.
2. Classification or reception prisons where all offenders are committed by the courts immediately after conviction to be observed and classified.
3. Educational, industrial and training school prisons for younger offenders.
4. Industrial prisons, preferably of the farm colony type.
5. Hospital prisons for the criminal insane and for border-line insanity cases.
6. Custodial prisons for the low grade feeble-minded, for other normals and for habitual offenders.

A study of prisons constructed recently or at present under construction indicates that prison architecture has broken away from its slavish copying of the Silent or Auburn Systems. Prisons for juveniles, for the insane, for petty offenders, for crippled offenders, for the high grade feeble-minded, for diseased prisoners and for all but the low grade feeble-minded and perverts and habitual offenders, are now frequently designed more like industrial schools, hospitals and labor settlements than like the old bastile of the Auburn type. Small units built in accordance with modern adaptations of the Auburn plan are still serviceable as prisons for the perverted and the hardened offenders.

A very notable development of prison administration has taken place in the Philippines since American occupation. Of particular significance is its development of vocational and industrial training in the Bilibid Prison at Manila, of agricultural colonies and also of the Iwahig Penal Settlement, where prisoners are permitted to live in houses which they are permitted to purchase from their earnings as prisoners. Upon their release they are in turn permitted to sell to the prisoners who have been given the opportunity of serving as part of their sentence at this very remarkable colony. Every division aims to do its part in reforming the offender and reclaiming him from a life of evil by fitting him for his return to society. Insofar as it accomplishes this, each unit of that system and the system as a whole is performing the services of a reformatory, or at least of a prison.

BURDETTE G. LEWIS,
Commissioner of Department of Institutions and Agencies, State of New Jersey.

PRISONS, Military. See Military Prisons.
pean Turkey and capital of the vilayet of Kosovo, on the right bank of the Rieka, four or five miles from its confluence with the Drin. By the Treaty of Bucharest (25 July 1913), which brought a temporary peace to the Balkan states after three wars, and the agreements for the rectification of the Serbian-Bulgarian and Serbian-Montenegrin frontiers, Serbia obtained, among other territorial gains, 5,573 square miles of the Turkish region formed by the Drin. Here the Serbians created the administrative department of Prisrend, with its capital at the town of the same name. In the early part of the World War this entire region and the adjacent ones in Bosnia, Albania, Montenegro and Bulgaria were the scene of intense fighting. Under the World Peace Treaty of 1919 Prisrend was included in the territory of the new republic of Yugoslavia. The town, under Turkish rule, was the residence of a pasha, and the seat of a Greek metropolis and of a Catholic bishop. Among its buildings were 42 mosques, one Catholic and five Greek churches. It had considerable manufacturing interests, and a large trade with the adjacent country and beyond its borders. Pop. (1915 estimates), department, 227,425; town, 21,244.

PRITCHARD, pritch'ard, Jeter Connelly, American jurist: b. Jonesboro, Tenn., 12 July 1857. He entered a printing office in early life, removed to Bakersville, N. C., in 1873, and until 1887 was joint editor and owner of the Roan Mountain Republican. He served in the State legislature in 1884, 1886 and 1890. In 1887 he was admitted to the bar and engaged in law practice in Marshall, N. C., was president of the State Protective Tariff League in 1891, delegate-at-large to the Republican National Convention in 1892, served as United States senator to fill a vacancy in 1894–97 and in the latter year was re-elected for the term of six years. In 1903 he became an associate justice of the Supreme Court of the District of Columbia; in 1904–11 was United States circuit judge of the 4th circuit; in 1911 became a judge of the United States Circuit Court of Appeals.

PRITCHETT, pritch't, Henry Smith, American astronomer and educator: b. Fayette, Mo., 16 April 1857. He was graduated from Pritchett College, Glasgow, Mo., in 1873 and later studied astronomy under Asaph Hall at the United States Naval Observatory where he became assistant astronomer in 1878. In 1880 he accepted the position of directing astronomer at Morrison Observatory, Glasgow, Mo., and in 1881 was appointed to the chair of astronomy and mathematics at Washington University, Saint Louis, Mo. He was permitted leave of absence in 1882 in order that he might observe the transit of Venus at Auckland, and he also made pendulum observations at Auckland, Sydney, Singapore and Hongkong. He was in Europe on scientific work in 1894–95, was appointed superintendent of the United States Coast and Geodetic Survey in 1897, in 1900 president of the Massachusetts Institute of Technology and in 1906 president of the Guggenheim Foundation. Fourteen colleges and universities honored him with the degrees of A.B., Ph.D., LL.D. and Sc.D.

PRIVAT-DOCENT, pré-vät' dön-sent', in the German university system (and others modeled on it), an instructor whose lectures rank with those of the professor, but who unlike them has no stay under the faculty of a governing body of the university. He receives no fees except directly from his pupils. He must have received the doctoral degree and also be habilitated, that is, successfully defended a thesis, the result of his own research. The post is commonly a means of preparation for university professorship. Many distinguished men, Kant among others, have held the post as a stepping-stone to higher university rank.

PRIVATE BANKERS. See Banks and Banking—Private Banks.

PRIVATE CORPORATIONS. See Corporations, Legal.

PRIVATE SAVINGS BANKS. See Banks and Banking—World's Systems, Private Banks—Bank Organization and Management.

PRIVATE SCHOOLS, institutions under private control as distinct from public, and implying maintenance by private corporations or individuals. But the school may be private, or not public, in its origin and government, and if there are no limitations as to who may be admitted as pupils, it is usually classed as a public school. In the United States private schools embrace a large number of institutions ranging in purpose from elementary to professional education. Thus in the school-year 1915–16 there were reported 1,655,075 pupils in private elementary schools of kindergarten, primary and grammar grades; 155,135 students in private high schools; 6,958 students in private normal schools, and 57,540 students in the various professional schools. More than one-half of the private schools were under the control of religious denominations and had 103,829 students of high school grade. The ordinary professional schools comprised those of theology, law, medicine, dentistry, pharmacy, veterinary medicine and nursing, together, with those in connection with large hospitals. In specialized work there were over 1,300 independent commercial and business schools and 762 private high schools giving business courses. These courses included stenography, typewriting, telegraphy, telephony, accounting and general office service. Soon after the outbreak of the World War in 1914 many large financial institutions, chambers of commerce, boards of trade and colleges and universities established special schools of commerce in preparation for an expected expansion of the foreign trade of the United States after the close of the war, and a larger private specialization of educational effort was developed by the necessities of the government, especially after the United States entered the war. See RUGBY; EDUCATION, AGRICULTURAL, SECONDARY SCHOOLS.

PRIVATEER, the name applied in time of war to a ship owned by a private individual, which under government permission, expressed by a letter of marque, makes war on the shipping of a hostile neutral as an enemy without this commission, or on the shipping of a nation not specified in it, is piracy.
Privatizing was abolished by mutual agreement among European nations, except Spain, by the Declaration of Paris in 1856; but the United States, when it refused to sign the treaty, except on condition that all private property at sea, not contraband, should be exempt from capture. This "Marcy," or "American," amendment, as it was called, was not accepted. This doctrine was again affirmed by the United States Delegates to the Peace Conference at The Hague in 1898, but was again rejected by the European powers. It is doubtful, however, how far the abolition of privatizing would stand in a general war, for it is the natural resource of a nation whose regular navy is too weak to make head against the maritime power of the enemy, especially when the latter offers the temptation of a wealthy commerce. It was usual for the country on whose behalf the privaters carried on war to take security for their duty respecting the rights of neutrals and allies, and their observing generally the law of nations. In the wars of 1793-1814 many English privaters were afloat. But in the same period no less than 10,871 English ships, with over $300,000,000 worth taken by the French corsairs; the Breton privateer Sucof took, in two months of 1807, prizes worth $1,456,250. At the American Revolution the new republic fully realized the advantage of its position in preying on the mercantile marine of Great Britain; and in the War of 1812 British commerce suffered severely at the hands of American privaters, of which it was computed that some 250 were afloat. During the American Civil War the Confederate States offered letters of marque to persons of all countries, but no admittedly foreign vessels were so commissioned. During the same period the Congress of the United States empowered the President to grant commissions to privaters, but none such were granted. The Confederate cruisers were at first regarded in the North as mere pirates; and the "Alabama Claims" originated in the charge against Great Britain of allowing the departure of privaters from British ports, where they were fitted out illegally. The European War produced a new form of privatizing, armed with torpedoes, guns and floating mines. The operations of such craft were confined for a while to enemy coast objectives and the waters of adjacent "barred zones," but the voyage of the German commercial submarine Deutschland from Kiel, Germany, to Baltimore, Md., a distance of 4,180 miles, in 1916, and her safe return to Kiel, showed a startling menace to the world's shipping. It demonstrated that the new kind of under-sea craft could cruise in safety a long distance from a home base. The greatest feat of the U-boat type, up to that time, occurred in May and June 1918, when a number of such craft sank many vessels off the Atlantic coast of the United States.

PRIVET, a genus (Ligustrum) of shrubs or trees of the order Oleaceae. About 35 species are known, natives of eastern Asia, Australia, with one of the Mediterranean region. They are deciduous or evergreen and bear terminal panicles of small, whitish, generally fragrant flowers, followed by usually black berries which often remain on the plants during winter. They are justly popular plants in shrubberies and some are widely used as hedges since they are erect-growing and stand shearing well. They are readily propagated by means of cuttings, or are sometimes grafted or budded on standard trees. The berries grow on any soil, in full sun, on dry land and under partial shade. The common privet (L. vulgare), L. obtusifolia and L. stenophyllum are fully hardy in the Northern States, but the so-called California privet (L. ovalifolium) is a very slow growing Japanese species, is doubtfully hardy farther north than New York City. The common privet has half-evergreen, smooth lanceolate leaves an' berries about the size of peas, black, rarely white, yellow or green. The flowers have a strong and sweetish odor; the leaves, mildly astringent, were formerly used in medicine; the berries, which hang on the shrub during winter, have a disagreeable taste, but are food for many kinds of birds, and supply a pink pigment used in map-making and in dyeing. The wood of some of the larger kinds is very hard and is used for making shoe-peg and for turning. The only insect that is commonly troublesome upon the plants is the privet webworm (Diaphania quadristigma).

PRIVILEGE taken in its active sense is a particular law, or a particular disposition of a law, granting certain special prerogatives to some person contrary to the common right. Examples of privilege may be found in all systems of law, as in the case of members of Congress and of the several legislatures when in attendance at their legislative duties; parties as witnesses while attending court, and coming to and returning from the same, electors while going or returning to the election, are all privileged from arrest except for treason, felony or breach of the peace. Privileges from arrest are either general and absolute, or limited as to time or place.

Ambassadors and their servants are absolutely so privileged. A privilege of arrest for a legislature member is limited to the period of the legislative session and a reasonable time in going and returning.

In the civil law a privilege is a right which the nature of a debt gives to a creditor, enabling him to be preferred before other creditors. Privileged communications are those statements made by a client to his counsellor or attorney in confidence, relating to some cause or action then pending; such communications cannot be disclosed without the consent of the client. The courts sometimes exclude from evidence, as privileged communications, matters of a judicial, political or professional nature on the grounds of public policy.

In many jurisdictions a writ of privilege or protection is issued by the courts, affording one, under proper circumstances, protection against arrest or from the service of civil process. A witness is entitled to the privilege of refusing to answer incriminating questions. A physician cannot be compelled to disclose the secrets of the sick room to a Roman Catholic priest to make confessions public; a clergyman to reveal the confidences of his pastoral relations; or a juror to repeat the considerations of the jury room.

Of ancient and medieval legislation, the Privilege formed an important branch; in truth, the condition of the so-called "privileged classes"
was different socially, civilly and religiously, from that of the non-privileged. In canon law, there were two privileges pertaining to the clergy, the *privilegium canonis* and the *privilegium fori*. By the former, the person of the clergyman, of whatever degree, was protected from violence by the penalty of excommunication by the latter, he was exempted from the ordinary civil tribunals, and could be tried only in the ecclesiastical courts. Most of the purely civil privileges have been abolished throughout Europe by modern legislation.

**PRIVILEGED COMMUNICATIONS**

statements made by a client to his counsellor or attorney in confidence, relating to some cause or action then pending; such communications cannot be disclosed without the consent of the client; the statements of a patient to his physician, of a husband to his wife, of a man or woman to a spiritual adviser, in fact communications or statements between parties placed in a confidential relation one to another are privileges, that none of the latter acts to such will not be allowed against the objection of the other to testify with reference thereto in a court of justice. Another class of statements which enjoy a measure of privilege are defamatory statements which do not give the injured person a right of action. The statements of legislators, judges, and in some cases of litigants, their counsel, witnesses, etc., come under this class. In the United States, however, it is held generally that such statements remain unliable to action. See, e.g., Hageman, *Privileged Action* (Somerville, N. J., 1899) and McClaughlin and Hart *Encyclopedia of American Government* (3 vols., New York 1914).

**PRIVILEGES AND IMMUNITIES**

are those privileges of citizens of each State, in the several States of the North American Union which may not be abridged by State or local laws. The Constitution of the United States, article IV, section 2, paragraph 1, provides that "the citizens of each State shall be entitled to all privileges and immunities of citizens in the several States." By the Fourteenth Amendment (section 1), it is provided that "no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States, nor shall any State deprive any person of life, liberty, or property without due process of law. Article VI guarantees a speedy and public trial by an impartial jury and with the assistance of counsel for his defense. Excessive bail, excessive fines, cruel and unusual punishments, all are forbidden by article VIII. Recent legislation, redolent of a period long since passed, shows that the flight of the citizens to safeguard these elementary and hard-won privileges must be forever ended, illustrating again the maxim that "eternal vigilance is the price of liberty." (See also, III. 6; III. 11; I. 12; II. 15; R. 15; L. 13; III. 5; L. 13.) Consult Cooley, T. M., *Principles of Constitutional Law in the United States* (3d ed., Boston 1898).

**PRIVY COUNCIL**, in England, the body of advisers of the sovereign which formally...
PRIVY-PURSE — PRIX DE ROME

sanctions those acts of government not properly the province of Parliament. Privy councillors are nominated, without patent or grant, at the pleasure of the Crown, excepting certain persons appointed ex officio. They hold office for life, or for the life of the sovereign, so that at the accession of a new sovereign the council must be — nominally at least — reconstituted. The number of privy councillors is not limited by law.

Jurisdiction.—The duty of the council, in general, is to advise the king on affairs of state. The Lord President of the Council is required by statute to manage the debates in Council, to propose matters from the sovereign at the Council Table, and to report to the sovereign the resolution of the council thereon. This function, however, is largely theoretical, as there are in fact no debates in council, this body merely giving formal sanction to orders in council, by which the king, on the advice of his ministers, expresses his pleasure with respect to various administrative matters, as for instance, the bringing of treaties into effect, grants of charters, the government of colonies and the regulating of departmental business. So, too, the Privy Council performs certain ceremonial functions. For instance, in council a bishop does homage for the temporalities of his see, a minister takes the oath of office and the sheriffs for counties are chosen. The council has, besides, important duties of an administrative or judicial nature which it performs by committee or commission. Several of these committees bear only a theoretical connection with the council, acting to all intents and purposes independently. The Cabinet itself, the executive of the United Kingdom, is such a committee, composed of ministers belonging to the Privy Council, but it has completely outgrown the parent body in political importance, as having practically superseded it in the functions which this formerly performed. The Board of Trade, now under its own president and regarded as a distinct department of state, was from the first a committee of the Privy Council. The Local Government Board of Agriculture and the Board of Education are similar developments from the council, while the universities committee, the committee for the consideration of charters of incorporation under the Municipal Corporations Act of 1882, are subordinate to the main body. The judicial functions of the Privy Council are carried on by its judicial committee, which includes the Lord Chancellor and the four Lords of Appeal in Ordinary. It is concerned chiefly with appeals from the dominions and colonial and Indian courts, has ecclesiastical jurisdiction and decides concerning petitions for extension of letters patent, copyright, etc. The Privy Council is summoned on a notice of 44 hours. Only on very extraordinary occasions is there a full attendance, the presence of six being sufficient to constitute a council. Privy councillors have the title of "right honorable" and rank immediately after Knights of the Garter. The premiers of the self-governing colonies are called to the Privy Council.

History.—The Privy Council developed out of the curia regis (king’s council) of the Norman period, which exercised judicial legislative and administrative functions. Out of the curia grew the courts of law and equity and the houses of Parliament besides the Privy Council. After the time of Edward I appeared the conilium ordinarium, or ordinary council of the king, which in the 15th century gained the name Privy Council. The Select Council, ultimately the Council of State, was the large body about the same time. In the time of Edward III the Privy Council was occasionally merged in one assembly with the House of Lords, and in 1640 the Long Parliament reduced the powers of the council. In 1679 Sir William Temple made an unsuccessful attempt to reorganize it, but since then it has dwindled into insignificance when compared with its early authoritative position, and its governmental duties have been assumed by the Cabinet. Ireland has a separate Privy Council. Bodies, somewhat similar and bearing the same name, formerly existed in several of the American colonies and States. Consult Macqueen, 'Appeal Jurisdiction of the Privy Council' (1846); Finlason, 'The Judicature of the Privy Council' (1876); Dicey, 'The Privy Council' (new ed., 1887); Gneist, 'History of the English Constitution' (1891); Anson, 'Law and Custom of the Constitution' (1892).

PRIVY-PURSE, Keeper of the, an officer of the royal household in England, in charge of the payment of the private expenses, including charities, of the sovereign. He has no control over any official or household expenses, and is independent of the great officers of the household.

PRIVY-SEAL (privatum sigillum), a British governmental document formerly appended by the sovereign to such grant or documents as were afterward to pass the great seal; and sometimes used in matters of less consequence, which did not require to pass the great seal, as to discharge a recognizance, debt, etc. No writ, however, which related to the common law could pass the privy-seal. From the time of Henry VIII until the reign of Queen Victoria the privy-seal was the warrant of the legality of grants from the Crown, and the authority for the Lord Privy Seal to ratify them. Such grants were termed letters patent. The officer who had the custody of the privy-seal was anciently called clerk of the privy-seal, afterward guardian del privy-seal; and later Lord Privy-Seal. The Lord Privy-Seal did not put the seal to any grant without good warrant; nor with warrant if it was against the law or inconvenient without first acquainting the sovereign therewith. In 1884 the Great Seal Act stipulated that all documents required to pass the great seal need not be passed under the privy-seal, a warrant under the sign manual countersigned by the Lord Chancellor, Secretary of State or a high treasury official being sufficient. Although without salary and no definite duties, the title of Lord Privy-Seal, with its former rank as fifth great officer of the state and a seat in the Cabinet, is conferred usually upon a peer above the rank of baron, although a commermer may receive the honorary title.

PRIX DE ROME, pré de rème (French "prizes of Rome"), awards made by the French government to art students which entitle the winners to advanced courses of studies at l'Ecole or l'Académie de France in Rome.
The institution was founded by Louis XIV, in 1666, at the suggestion of Colbert and was enlarged by Napoleon. It is a project to complete the education of promising students in all branches of art, by study of the classics in Rome. Those eligible for the prizes are painters, sculptors, architects, musicians and engravers, and the privilege bestowed consists of an annual income of 4,000 francs for four years and exemption from military service. Candidates must be Frenchmen between the ages of 15 and 30, and must have done certain work at the École des Beaux Arts or elsewhere. The competition is so arranged as to comprise only 10 students from each department for the final competition, and these are allowed three months in which to accomplish the work they put in for the prize. While studying at Rome the successful competitor is expected to send to the Salon, or if he be a musician to the Conservatoire, every year, specimens of the work he is engaged in, and thus report progress.

PRIZE, property taken from an enemy in war; that which is seized by fighting, especially a ship, with the goods contained in her; any description of goods or property taken by force as spoil or plunder. The law as to prizes taken at sea is regulated by international law. In order to vest the title of the prize in the captors it must be brought with due care into some convenient port for adjudication by a competent court. In the United States, the court of naval jurisdiction is the Federal District Court, from which cases may be removed under certain conditions to the Circuit Court, of which there is a court for the South and a court for the North. In Great Britain, the subject of prizes, captures, condemnation, etc., are vested exclusively in the Admiralty Division of the High Court of Justice. (See ADMIRALTY LAW; PRIZE-MONEY). Consult Borelly, T., 'Law and Usage of War' (Boston 1914).

PRIZE COURTS AND PRIZE JURISDICTION. As a general rule when enemy property is captured at sea under circumstances that render it liable to appropriation and confiscation by the captor the rights of the original owner are extinguished. But it may be that there is doubt as to whether the property is really enemy-owned, or whether it was captured in waters where warlike operations may be lawfully carried on, or whether it was not immune from capture by reason of its being in a neutral vessel, and the like. It is now a well-established rule of the law of nations that in all such cases the right of the captor to the property in question ought to be made the subject of adjudication by a court. It is generally admitted that the captor may destroy by sinking or otherwise an enemy prize when there is no doubt as to its character and ownership, and when for lack of a sufficient coal supply or inability to spare a prize crew he cannot take the prize in to a home port for adjudication by a court, and was made by the court in which it would expose the captor to the danger of destruction or his prize to liability to recapture. The right of destruction in such cases was generally exercised by Confederate naval commanders during the American Civil War, and it has been generally practiced by German naval commanders during the present war. In both cases the home ports of the captor were blockaded by the enemy and since neutral ports are not open to blockade, the sequestration of his prizes the captors had no other alternative than to destroy their prizes. But as to the right to destroy neutral prizes without submitting the question of the legality of the capture to a competent court, the law and practice of the past is otherwise. Most text-writers on international law maintain that in such cases a captor has no right of destruction. German naval commanders during the recent World War, however, acted on the contrary assumption and made no distinction between enemy prizes and neutral prizes, and whenever possible destroyed both alike without taking them in for adjudication by the courts. Sir Edward Grey recently stated the customary rule when he said "Great Britain has always maintained that the right to destroy is confined to neutral vessels only, and this view is favored by other powers." Concerning the right to destroy neutral vessels, the view hitherto taken by the greatest authority on matters of law and practice has been that, in the event of its being impossible to bring in a vessel for adjudication she must be released. The prize courts of Great Britain for more than two centuries have held this to be a rule of the law of nations and there appears to be no instance during the wars of the 19th century in which a captor deliberately destroyed a neutral prize instead of taking it in for adjudication by a prize court.

The institution of prize courts for the determination of the legality of captures at sea, however, of modern origin. Prior to the 16th century there does not appear to have been any such institution as a prize tribunal. When, therefore, a capture was made at sea the captor determined for himself by a summary inspection of the ship's papers and an examination of the persons on board whether the vessel or its cargo should be confiscated as lawful prize or allowed to proceed. The only remedy of the owner in such cases was to petition the king for redress. By a British order in council issued in 1585 it was decreed that henceforth all prizes should be brought in for adjudication. Ultimately it became the practice in all countries in time of war to set up tribunals for the purpose of deciding upon the validity of captures made by their cruisers at sea. These tribunals came to be known as prize courts. In England jurisdiction in all matters of prize was conferred upon the High Court of Admiralty by virtue of a special commission issued by the Crown at the outbreak of war, and by the Naval Prize Act of 1864 the Court of Admiralty was constituted a permanent court of prize, independent of any commission issued under the great seal. More recently the High Court of Justice was substituted for the Court of Admiralty as a permanent prize court and its jurisdiction is actually exercised by the Probate, Admiralty and Divorce Division. During the Napoleonic wars the prize court of England was made by the act of May 1808 and confirmed by the Act of 1814. Lord Stowell. During the Crimean War the court was presided over by Dr. Lushington and during the World War it was held by Sir Samuel Evans. Special commissions to decide questions of prize were issued to various courts in the overseas dominions and the colonies, for example at Alexandria, Malta,
Ottawa and other places. Appeals may be taken to the Judicial committee of the Privy Council. In the United States the Federal District Court has jurisdiction in prize cases, but claimants may take appeals to the Supreme Court. In France the prize jurisdiction is exercised by a Council of Prizes consisting of five members. In Germany there were during the World War two prize courts, one located at Hamburg, the other at Kiel, each held by five judges. Cases could be appealed to the Supreme Court of Prize at Berlin, composed of seven judges. Prize courts are municipal tribunals although they apply international law and the rights which they are called upon to adjudicate are in most cases those asserted by the citizens or subjects of foreign states. They are, in short, practically judges in their own cases and are exposed to the temptation, to the bias and prejudice which may be expected of courts in deciding issues between their own government and foreign claimants. Added to this defect is the absence of an international code of prize law and the consequent divergencies of view regarding the rules to which reference must be made. These defects were removed in these defect was the second Hague Conference in 1907 adopted a convention providing for the establishment of an international prize court, and the International Naval Conference at London in 1909 formulated a code of prize law dealing with such matters as blockade, contraband, the destruction of prizes, transfer of flag, neutral service and the like. The international prize court was to be composed of 15 judges and upon the court the eight principal maritime powers were to be the law. Represented. From the decisions of national prize courts appeals might be taken to the international tribunal, which it was believed would be more likely to decide the questions submitted to it with less bias and prejudice than could be expected of nations having original jurisdiction. Unfortunately, however, it has long been a source of differences of opinion among the nations in regard to the constitution of the court it has never been organized, and in consequence of the failure of the powers to ratify the Declaration of London (giving the code of national prize code binding upon the national tribunals. Some states like Germany and France have put into effect prize code of their own. The United States government issued such a code in 1900 but five years later it was revoked by President Roosevelt (see Laws of War, The). Great Britain issued a manual of naval prize law in 1888 but it has since been withdrawn. British prize law is now found mainly in the Naval Prize Act of 1864, the Prize Courts Act of 1894 and various orders in council issued thereunder. The remainder consists of custom and judicial precedent. All authorities are in agreement that although prize courts are municipal tribunals the law which they must apply is international law, but as stated above there are wide divergencies of opinion as to what that law is in many questions, and the failure to ratify the Declaration of London leaves the prize courts of each nation free to interpret the customary law according to their own notions and apply such rules as they consider to have become well established. The view that prize courts are bound to apply the law of nations was affirmed by Lord Stowell in the case of the Maria as long ago as 1799 and the early commissions issued to the Court of Admiralty required that it should *be* and determined according to the course of admiralty and the law of nations. As late as the year 1916 the judicial committee of the Privy Council in the case of the Zamora laid down this principle. The law which the prize court is to administer, it said, is not the national law, or, as it is sometimes called, the municipal law, but the law of nations; in other words international law. But suppose the municipal law of a state is contrary to international law. Must the prize court give effect to the former or the latter? The question was presented to Lord Stowell in 1811 in the case of the Fox and he disposed of it rather unsatisfactorily by saying that the court would assume that an order in council of the king which was believed to be contrary to the rules of international law was in accord with international law and that the court could not "without extreme indecency" presume the existence of a conflict. The issue was again raised in England during the World War in the case of the Zara and it was held that such an order was not binding. The Privy Council admitted that if an act of Parliament contrary to international law were passed it would be binding upon the prize court, but orders in council stood on a different footing and they were not so binding when in conflict with international law. The idea that the king in council could prescribe or alter the law to be administered by the prize court, it said, was out of harmony with the principles of the British Constitution. The Supreme Court of the United States has on many occasions, that is to say, the courts are bound by municipal statutes even when they are contrary to international law, although they are not bound by executive orders which are in conflict with the established law of nations. The procedure of a prize court is in the nature of an inquest upon the property which has been placed within its custody, for the purpose of discovering whether it has been lawfully captured and whether it was liable to capture. The proceedings begin by the action of a representative of the captor government in libelling the property, that is, by petitioning the court to hold an inquiry. He submits with the petition the ship's papers, affidavits and other documents which contain evidence of the liability of the ship or cargo to capture and of the unlawfulness of the capture. Notice is then given to the claimant in order that he may come forward and assert whatever rights he may have in the property libelled. Ordinarily enemy claimants are not allowed to appear but during the World War the president of the United States court made an exception in the case of enemy claimants who asserted any right, title or interest under any of The Hague conventions. All such persons were permitted to appear by counsel and assert freely their rights, in spite of their enemy character. Prior to the American Civil War it was considered to be an estab-
PRIZE-FIGHTING

When a decree of condemnation is issued the vessel in some countries, e.g., France, is condemned to the captors who divide the proceeds of the prize among them. This was the practice in Great Britain until the outbreak of the World War when the rules relating to bounties were altered. The captors no longer receive the prize but the court awards a bounty of £5 to each person actually present or taking part in the capture or destruction of the ships. In 1898 bounties for captures at sea were abolished by an act of Congress. It had long been the British practice to award compensation to neutral merchants by condemning the captor in damages and costs when the latter fails to make out a case against a prize brought in for carrying contraband and there was no good ground for the seizure. But this practice has not been followed on the Continent.

JAMES W. GARNER,
Professor of Political Science, University of Illinois.

PRIZE-FIGHTING, fighting with the fists for a reward or prize. The ancient Greeks were the earliest to have prize-fights among their sports, so far as our historic knowledge goes. The pugilatus (prize-fighter) fought naked except, at times, for a loin cloth. The sport was so popular that the nation placed gods and heroes among the victors in the ring, among them Apollo, Heracles, Tydeus. Polydeuces. It was considered one of the hardest and most dangerous games and death during or soon after the encounter was common. They used the castus, made of thongs or strips of leather which was tied around the fighter's hands to make the impact of a blow more telling. Later the castus was loaded with lead and iron, producing frightful weapons. First recorded statements of professional prize pugilism as a popular sport in England date from the end of the 17th century, and the championship started with James Figg of London, who held the title from 1719 to 1730. He built an amphitheatre where, as Master of Ye Noble Science of Defence (as his printed circular reads), he taught the nobility and gentry “ye use of ye small back sword and quarter-staff at home and abroad.” His encounter with Ned Sutton, in 1727, started with a broadsword bout, after which they took up their unarmed encounter, which was as much a wrestle as a fist-fight. In 1733 a Venetian, Giovanni Battista, fought Bob Whitaker, who appears to have given the Italian a solar plexus blow in the last round. His victory was soon followed by his defeat in a true fistfight encounter with Nathaniel Peartree. Both contests, by ignorance of the outbreak of hostilities, however, were condemned by the prize court, in consequence of Germany's failure to ratify the article of The Hague Convention which exempted such vessels from capture.
not being quite clear, but none disputed the claim. Jack Broughton became the third champion and introduced the sole bare-knuckled fight with the broadsword an 'other combats dissolved. He also reduced the "ring" of the "brawl" to a fine art. The next champion was John Slack, butcher, who beat Broughton in 1750. But the Duke of Cumberland, who had been a great and admiring patron of Broughton, and who had bet $50,000 against $3,000 on him, considered he had been swindled by a palpable fake fight, closed the old amphitheatre and set the police on the track of the ex-champion. William Stevens, "The Nailer," pounded the fight out of Slack, after breaking his arm; but only to hold the title some eight and one-half months. Then, from appearances, he sold the championship by flagrantly leaving himself open to a blow on the head from his competitor, George Meggs, which killed him, he walking off laconically "none the worse for the fray," Meggs had to leave London on account of the scandal and was beaten by Millson, a Bath baker, who held the title for three years. In 1765 Tom Juchau, "The Disher," defeated Millson, to be beaten the following year by William Darts, a dyer, at Guilford, with a stake of $5,000, the largest since the Broughton-Slack affair. Darts was knocked out, in 1769, by Lyons, the waterman, the betting 10 to 1 against the latter. Lyons retired and gave back the title to Darts who lost it to Peter Corcoran, a herculean six-foot Irishman, who held the championship till 1776, when he was beaten by Harry Sellers (13th champion) in a match for a stake of $500 and a wager of $3,000. Thomas Jackling (frequently mentioned as Tom Johnson) became 14th champion after beating a number of challengers. "Big Ben" Brain, in 1791, defeated Jackling, but died in 1794, having been a sick man for years before he won the title. Daniel Mendoza, a Jew, held the 15th title, improving the science with his skill and ending the reign of the crude slugger. Mendoza also introduced the profitable occupation of sparring exhibition tours, and built the Lyceum in the Strand, London, for teaching the "noble art." John Jackson next became champion, in 1795. Nineteenth hole of the title was Jadd Barbolemew, who was knocked out by James Belcher, grandson of the 4th champion, Slack, in his 19th year. Next came Hen Pearce ("The Game Chicken") as 21st champion, with John Gully, his successor, who retired and became member of Parliament. Thomas Cribb was 23rd champion, and beat the American negro (first of his race to enter the ring) Bill Richmond in 1805. Thomas Molyneaux, another American negro, after beating Burrows and Blake claimed a championship match with Cribb, but lost the fight in 1810 and again in 1811. Thomas Winter, under the alias of Springs, took the 24th championship in 1823. Tom Cannon got the title in 1824, and Jem Ward in 1825. James Burke became 27th champion in 1833, but, on his return from an American tour, he was beaten by William Thompson (Bendigo) in 1839. Then Ben Caunt, who had beaten Bendigo before he met Burke, was declared champion, losing the title to Nick Ward, but regaining it (as 33rd champion). In 1850 the title was vacant. The title was won by "The Michigan Giant," Charles Freeman, to make an engagement, but the American's seven-foot-three height and 333 pounds of trained fighting flesh and bone caused him to take the giant to England on an exhibition tour. William Perry, an American, also regained the title from Harry Broome on a foul in 1851. Tom Paddock was champion (37th) from 1856 to 1858, when he was defeated by Tom Sayers, who became 38th champion heavyweight after having beaten all comers as middleweight till Nat Langham defeated him. Sayers held his own when 1860 brought him a contestant in the American champion, J. C. Heenan ("Beneica Boy"). This noted battle in 1860 was stopped by the referee in the 42d round, Heenan blinded in both eyes and Sayers with his right arm out of commission since the seventh round. The draw was never fought out, the world's title being held jointly by both, each presented with a belt. Heenan, in 1863, was beaten by Tom King in England, he becoming the 40th champion. So England had held the championship for two centuries, losing but one battle to the Irishman, Peter Corcoran, and the draw with Heenan. Jem Mace became champion in England in January 1862, only to lose it back to Tom King in November. Heenan, returning to England as the American champion, was knocked out by King, he becoming world champion. Mace next became (1863) champion, beating Joe Goss. America sent Joe Coburn, an Irish-American, to get the belt but in 1864 he returned without a fight and claimed the championship; later in the year Joe Wormald went to England to fight for the championship but on account of an accident lost his engagement stake without a fight. Squabbles and police interference made prize-fighting in England so difficult that the sport had to be carried on in America. Here the police made the carrying out of engagements quite difficult, and in 1866 the meeting of Ned O'Baldwin, the Irishman, and Joe Wormald at Lynnfield, Massachusetts, was broken up by the police. But Mace met Tom Allen near New Orleans in 1870, defeating Allen in 10 terrific rounds. And with Mace's retirement in 1873 we have reached the last English champion. An attempt at renewing prize-fighting in England in 1889-90 when the engagement was made between the Australians Slavin and M'Alliffe, but the fight at Watworth was stopped and, encountering later, they were both arrested. What the old-time sport, called prize-fighting, how it was, was killed when gloves (even if only four ounces) had to be used by professionals. The brutality of the bare-knuckled prizefights gave place to the more scientific boxing. In 1885 James Smith won the heavyweight championship of England. In 1887 he was defeated by Jake Kilrain of Boston, the latter now becoming the world's champion. John L. Sullivan, of Boston, defeated Kilrain in 1889 in what is thought to have been the last contest in America under London prize-ring rules. Sullivan remained champion until 1892 when he was defeated by James J. Corbett the cleverest boxer the world had hitherto known or perhaps will ever know. In 1897 Robert Fitzsimmons defeated Corbett, but only held the championship three years, losing it to James J. Jeffries at Cub Run, New York, in 1900. For eight years Jeffries defeated several aspirants for championship honors, but on
4 July 1910 was defeated at Reno, Nev., by the colored pugilist Jack Johnson. The latter lost his crown to Jess Willard at Havana, Cuba, 5 April 1915. On 4 July 1919, Willard fought Jack Dempsey at Toledo, Ohio, and was defeated in three rounds. (See Boxing.) Con- 

sult 'Fisticus' (London 1876); 'American Pisticia' (New York 1876); Lynch, 'The Complete Amateur Boxer' (London 1913); Miles, 'Pugilistica' (3 vols., London 1863); O'Reilly, 'Ethics of Boxing' (Boston 1888); Doran, 'Self-Defense' (Toronto 1879); 'Boxing' (Badminton Library, London 1899); 'Boxing' (in Oval Series, ib. 1896); 'Boxing' (Spalding's Libraries, New York annually); Trotter, 'Practical Treatise on Boxing' (Philadelphia 1900).

PRIZE-MONEY, in warfare, money paid to the captors of a ship or place where booty has been obtained, the money being realized by the sale of the captured property after the established court, on full evidence, has adjudged it lawful spoil. The amount realized by the place, placed in the hands of the official account- 

ant, is then distributed ratably, according to rank, among the officers and men who 

assisted at the capture. See Prize.

PREJAVELS', przh-va̱l'sk'ë, or PRE- 

JAVALS', przh-va̱l'sk', Nicholas, Rus- 

sian traveler: b. Otradny, government of Smo- 

lensk, 31 March 1839; d. Karakol, West Turke- 

stan, 1 Nov. 1888. Having joined the army in 

1855 he assisted in quelling the Polish insurrec- 

tion of 1861. While stationed in Siberia in 

1867 he explored the Usuri region, south of the 

Amur, and spent 1871-73 in traveling from 

Peking through southern Mongolia (region of the 

Ordus) to the Ala-shan, Koko-nor and the 

upper waters of the Yang-tze-Kiang. In 1876- 

77 he explored Lob-nor on the borders of East 

Turkestan and China, and in 1879 reached a point 

some 160 miles north of Lhasa, when the 

Tibetan authorities turned him back. He reached 

Kiaotu after a journey of nearly 15,000 miles. In 

1883-84 he again crossed the desert of Gobi, but returned without being able 

to reach Lhasa. When the British began their 

war against the Tibetans in Sikkiim he was placed 

at the head of a strong expedition, and ordered to reach Lhasa at all hazards. 

Already weakened by years of hardship, he 

was unable to endure the fatigue and 

exposure of another journey, and died on 

the route to Vernotse, where he intended 

to equip his expedition. Prejavalsky brought 

back from these journeys valuable collec- 

tions of animals and plants, all now 

preserved at Petrograd. On his return to 

Petrograd from Siberia, he published a volume of 

'Notes on the Usuri.' Subsequently his 

accounts of his journeys were published in the 

'Proceedings' of the Petrograd Geographical 

Society in Petermanns Mitteilungen and other 

journals.

PROA. See Catamaran.

PROBABILISTS, those philosophers who 

maintain that certainty is impossible and that we 

must be satisfied with what is probable. This 

was the doctrine of the new Academy, particularly of Arcesilaus and Carneades. 

The last-mentioned philosopher distinguished three principal degrees of probability, according as a 

representation might be probable when consid- 

ered by itself alone; probable and unimpeached when compared with others; or thirdly, prob- 

able, unimpeached and in all respects confirmed. 

In morals probabilists are those who teach that 

in our actions we must follow what seems to us probably right, or what has been decided to be so by teachers of au-

thority, although it may not be the most prob- 

ably right, or may not seem probable to himself. 

It is this view that Pascal in his famous 'Pro- 

vincial Letters' holds up to ridicule. Butler 

in his 'Analogy' bases his argument on prob- 

ability, to which he applies the term *moral certainty*. There were four schools of proba-

bilism, known as probabilism simple, *re- 

mil-proba-

bilism, probabiliorism and tutiorism. The 

first held it to be lawful to act upon any prob-

able opinion not matter how small the prob-

ability; the second required that the opinion should be "solidly probable," but held that, provided it be really probable, it would be lawful to act upon it, even though the conflicting opinion should be equally probable; the third, in 

the conflict of probable opinions, would only permit action on the more probable of the two, but it would permit this even when the less probable adverse opinion was the "more safe"; and the fourth required that in all cases the more safe opinion should be followed, even when the less safe opinion was much the more probable.

PROBABILITY, Theory of, is that branch 

of mathematics which deals with the determina-

tion of the degree of belief which, in the ab-

sence of full information, should be given to 
certain classes of statements, or to the past or 

future occurrences of certain events.

In regard to the great majority of events 

there is in the mind of every one a state of un-

certainty. Under differing circumstances one 

shows this uncertainty by saying that it is pos-

sible or that it is, or is not, probable that some 

event did or will happen. Ordinarily the prob-

ability is made to establish an exact measure of the 

probability of an event, such attempt being 

clearly foredoomed to failure. Not infrequently, 

however, the first step toward such a measure-

ment is taken by the making of a rough com-

parison of the probabilities of two events, the 

conclusion resulting that one of them is more 

probable than the other.

Equally Probable Events.—For certain 

sorts of events it is possible to proceed farther. 

Thus, as a next step, it is quite common to find 

that two events are regarded as equally prob-

able. For instance, a coin being tossed, one 

says that head and tail are equally likely to ap-

pear; or, a properly made die being thrown, 

one estimates that any one of the six faces is as 

likely to appear as any other. Of course these 

estimates are made in spite of the belief that, 

starting from a given initial position, the body 

moves completely subject to the laws of dyna-

mics, and that from certain influences but one 

result can follow. The fact is that the observer 

is so ignorant of the forces applied to the body 

that his judgment is formed independently of 

them. He perceives that from the nature of a
the body only a certain number of events are possible, and he finds no reason for concluding that one would occur rather than another will occur.

**Probability of an Event.**—Suppose now that five events are known to be equally probable and that one of them will and only one can happen. Suppose also that if and only if one or another of the first three occurs, a further event $E$ will occur. Then it is commonly said that the odds are 3 to 2 in favor of the event $E$; and since there are five equally probable events, of which exactly three are concurrent with $E$, it is said that the mathematical probability of $E$ is $\frac{3}{5}$. In general, when a specified event $E$ is governed by $n$ equally probable events, of which one will and only one can happen, and when, of $m$ of these, each is decisively favorable to $E$, all others being decisively unfavorable, the mathematical probability of $E$ is defined to be $\frac{m}{n}$.

In the extreme cases in which none and all of the events, respectively, are favorable to $E$, the probabilities are said to be 0 and 1, though in each case there is certainty regarding the occurrence of $E$.

An equally probable event, that is, of $n$ equally probable and mutually exclusive governing events, $m_1, m_2, \ldots, m_k$, are respectively favorable to the further events $E_1, E_2, \ldots, E_k$, which are also mutually exclusive. Then the probabilities of $E_1, E_2, \ldots, E_k$ are respectively $p_1 = \frac{m_1}{n}$, $p_2 = \frac{m_2}{n}, \ldots, p_k = \frac{m_k}{n}$.

If now $m_1 + m_2 + \ldots + m_k = n$, one has

$$m_1 + m_2 + \ldots + m_k = n; \quad \text{or } p_1 + p_2 + \ldots + p_k = 1.$$

1. The result may be stated formally as

**Theorem 1.** The sum of the mathematical probabilities of a number of events, of which one must and only one can happen, is unity.

The application of the definition requires the selection of a set of governing events, finite in number, which must be either equally probable or capable of being replaced by a set of equally probable events; it then requires a correct enumeration of the favorable events and of the whole set. Each of these steps may present difficulties, but failure follows most frequently from a bad selection of the set of governing events. Consider the following example:

**Ex. 1.** A coin being tossed twice, what is the probability that head appears twice?—One might say that the possibilities, or governing events, are three in number, viz., the appearances of two heads, of a head and a tail, and of two tails, respectively; that of these one is favorable, and that $p = \frac{1}{3}$. But the answer is incorrect because the appearance of two heads, or two tails, is not as probable as that of a head and a tail. The following are equally probable events: the appearance of head, head; of head, tail; of tail, head; of tail, tail. They are four in number, one being favorable. Hence $p = \frac{1}{4}$.

The solutions of the following problems illustrate the direct application of the definition. Nearly all problems in this subject require the use of the theory of permutations and combinations. See Algebra, Permutations and Combinations.

**Ex. 2.** Two dice being thrown, what is the probability that the throw will be seven?—The equally probable events are the appearances of the several numbers of the first die with those of the second die, and are 36 in number. The favorable cases are the following sets: 1, 6; 2, 5; 3, 4; 4, 3; 5, 2; 6, 1; they are six in number. Hence $p = \frac{1}{6}$.

**Ex. 3.** Two dice being thrown twice, what is the probability that at least one double appears?—In either throw any face of one die may be associated with any one of the other. Hence there are 36 equally probable cases for each throw. Each case for the first throw may be associated with each case for the second throw. Hence there are $36 \times 36 = 1296$ cases in all. Of the 36 cases in either throw 30 will fall to yield a double. The association of each of these cases for the first throw with each of these for the second throw will yield all of the unfavorable cases. Hence there are $30 \times 900 = 27000$ unfavorable cases, and accordingly, $1296 - 27000 = 1296$ favorable cases. Hence $p = \frac{1296}{1296 + 27000}$.

**Ex. 4.** (a) From a bag containing five balls some are to be drawn. Find the probability that an even number of balls will be drawn.

(b) Find also the probability if the number of balls be not more than five.

(a) The total number of cases is the sum of the numbers of ways of drawing 1, 2, 3, 4 and 5 balls, which is $5 + 10 + 10 + 5 + 1 = 31$. The numbers of ways of selecting 2 and 4 of these balls are 10 and 3. Hence the number of favorable cases is 13. Hence $p = \frac{13}{31}$.

(b) The total number of cases is $\binom{5 + n}{n}$. The number of favorable cases is $\binom{5 + n}{n} + \binom{5 + n}{n - 1}$. Now $(1 + 1)^n = 1 + \binom{n}{1} + \binom{n}{2} + \ldots + \binom{n}{n}$. And $(1 - 1)^n = 1 - \binom{n}{1} + \binom{n}{2} + \ldots$. Hence $2^n - 1 = \text{total number of cases}$. Also $2^n - 2 = 2(\binom{n}{1} + \binom{n}{2} + \ldots)$, and so $p = \frac{2^n - 2}{2^n - 1}$.

Notice that an odd number of balls is more likely to be drawn than an even number.

Another problem remarkable alike for its apparent difficulty, the fine reasoning employed in its solution and the simplicity of its results is the following one:

**Ex. 5.** At an election two candidates $A$ and $B$ receive respectively $a$ and $b$ votes. $A$ being elected. What is the probability that during the counting of the ballots $A$ was always ahead?—The solution is obtained easily after it is shown that of the orders of counting which are unfavorable to the result mentioned exactly one-half begin with a vote for $A$. The answer is $p = \frac{a - b}{a + b}$, i.e., the majority divided by the total vote.

**Total Probability.** **Compound Probability.**

It may happen that the $m$ governing events favorable to $E$ can be classified into sets of $m_1, m_2, \ldots, m_k$ events respectively, where $m_1 + m_2 + \ldots + m_k = m$. The probability, $p_1$, that $E$ will be concurrent with one of the set of $m_1$ events is $m_1$. Then since $m_1 + m_2 + \ldots + m_k = m, one has $p_1 + p_2 + \ldots + p_k = p$. Stated formally one has

**Theorem 2.** If an event can happen in several mutually exclusive ways, the probability of its happening at all is equal to the sum of the
probabilities of its happening in the several ways. — Here \( p \) is called the total probability, \( p_1, p_2, \ldots \), the partial probabilities. On the other hand the event \( E \) whose probability is sought may consist in the concurrence of several independent events. Suppose that these events are \( e_1, e_2, \ldots, e_k \) and that for them the total numbers of cases are \( m_1, m_2, \ldots, m_k \), respectively, and that the numbers of favorable cases are \( n_1, n_2, \ldots, n_k \), respectively. Then for the event \( E \) the total number of cases is \( n_1 n_2 \cdots n_k \), and of these \( m_1 m_2 \cdots m_k \) are favorable. Hence

\[
p = \frac{m_1 m_2 \cdots m_k}{n_1 n_2 \cdots n_k} = \frac{m_1}{n_1} \cdot \frac{m_2}{n_2} \cdots \frac{m_k}{n_k} = p_1 p_2 \cdots p_k.
\]

Hence one has

**Theorem 3.** The probability of the concurrence of several independent events is the product of the probabilities of their several occurrences. — This theorem can be extended to the cases in which events, not independent, have a specified order, and in such cases the probability of each is to be computed on the hypothesis that the preceding events have happened.

The three theorems form the basis of the whole of the elementary theory. Their application will be illustrated in the solution of the following example:

**Ex. 6.** A with three coins endeavors to throw more heads in one throw than B can throw with two coins. In case of a tie they throw again. What is the probability of A's winning?

—The following ways in which A can win include all cases, and are mutually exclusive. He may (1) throw 3 heads, (2) throw 2 heads and win, (3) throw 1 head and win, (4) he may throw B on the first throw and win on a subsequent throw. Let \( p \) be the total probability of A's winning, and \( p_1, p_2, p_3, p_4 \) the partial probabilities. The following table gives the chances of various throws by A and B:

<table>
<thead>
<tr>
<th>Number of heads</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>A's chance</td>
<td>( \frac{1}{8} )</td>
<td>( \frac{1}{8} )</td>
<td>( \frac{1}{8} )</td>
<td>( \frac{1}{8} )</td>
</tr>
<tr>
<td>B's chance</td>
<td>0</td>
<td>( \frac{1}{8} )</td>
<td>( \frac{1}{8} )</td>
<td>( \frac{1}{8} )</td>
</tr>
</tbody>
</table>

Then, by theorem 3, \( p_1 = \frac{1}{8}, p_2 = \frac{1}{8}(1 - \frac{1}{8}), p_3 = \frac{1}{8}(1 - \frac{1}{8} - \frac{1}{8}) \). Also \( p_4 \) is the product of the probabilities that a tie will occur and that A will subsequently win. The probability that a tie will occur with 3, 2, 1, 0 heads are, \( \frac{1}{8} \times \frac{1}{8}, \frac{1}{8} \times \frac{1}{8}, \frac{1}{8} \times \frac{1}{8}, \frac{1}{8} \times \frac{1}{8} \). The sum is \( \frac{1}{8} \). If a tie occurs, the initial condition is reproduced and A's chance of winning is \( \frac{1}{8} \). Hence \( p_4 = \frac{1}{8} p_3 \). Then, by theorem 2, \( p = \frac{1}{8} + \frac{1}{8} + \frac{1}{8} + \frac{1}{8} p_3 \), whence \( p = \frac{1}{8} + \frac{1}{8} p_3 \).

**Probabilities of Repeated Events.**

An interesting part of the theory is that relating to repetitions of events. Consider an event whose probability is \( p \), and let \( q = 1 - p \). Suppose that \( n \) trials are made. The probability that the \( n \) trials will result in \( s \) occurrences and \( n-s \) failures of the event, in a specified order, is \( p^s q^{n-s} \). But the number of different orders is \( \frac{n!}{s!(n-s)!} \). Hence the probability that in \( n \) trials there will be exactly \( s \) occurrences is

\[
\frac{n!}{s!(n-s)!} p^s q^{n-s}.
\]

By considering different values of \( s \) one may find the probability that the number of occurrences shall lie between specified limits. Thus if a coin be tossed 10 times, one finds the probabilities of the appearances of exactly four, five and six heads to be \( \frac{1}{16}, \frac{5}{32}, \frac{1}{16} \); and the probability that the number of heads will not differ from five by more than one is \( \frac{15}{32} \). An easy problem is the determination of that number of occurrences which is most probable. It is necessary only to compare the results of giving to \( s \) consecutive values between zero and \( n \) to discover that for the most probable case \( s \) must be so chosen that the fraction

\[
\frac{s}{n}
\]

is as nearly as possible equal to \( p \). Hence in 10 throws, the most probable number of heads is 5 because \( \frac{5}{10} = \frac{1}{2} = p \). Likewise in 73 throws with one die the most probable number of throws of aces is 12, since \( \frac{12}{73} = \frac{4}{24} \) and \( \frac{4}{24} \) is the fraction having the denominator 73 and being most nearly equal to \( \frac{1}{2} \).

Of particular interest is the case in which the number of trials is very large. In this case the evaluation of the probability may be made approximately by the use of Stirling's formula: \( n! = \sqrt{2\pi n} e^{-n} n^n \), where \( e \) is the Napierian base. This may be derived. Thus if \( p_n \) denote the probability of that number of occurrences which is most probable, \( p_n = \frac{1}{\sqrt{2\pi n}} e^{-n} \), and if

\[
P = \int_0^{\infty} e^{-x} dx + \int_{\infty}^{\infty} e^{-x} \sqrt{2\pi n} dx,
\]

where \( \sqrt{2\pi n} \) is the results here obtained are due to James Bernoulli, and are usually combined in a statement of what is called **Bernoulli's Theorem.** If an event has a constant probability, \( p \), and if \( n = (1-p) \) trials being made, the most probable result is that in which the ratio of the number of occurrences to the number of trials is most nearly equal to \( p \). The number of trials being very great, the probability that the deviation of the number of occurrences from the most probable number shall not exceed \( \lambda \) is

\[
P = \int_0^{\lambda} e^{-x} dx + \int_{\lambda}^{\infty} e^{-x} \sqrt{2\pi n} dx,
\]

where \( \lambda = \sqrt{2\pi n} \), and \( \lambda \) does not exceed a small multiple of \( \sqrt{n} \).

For very many purposes in the Theory of Probability the definite integral \( \int_0^\infty e^{-xdx} \) is of great importance, and so tables of its values for different values of \( \gamma \) have been prepared. It may be shown, too, that a very good approximation to the value of \( P_1 \) is given by the equation

\[
P_1 = \frac{2}{\sqrt{\pi}} \int_0^{\gamma} e^{-x^2} dx, \quad \text{where} \quad \gamma = \frac{1}{2} + \frac{1}{\sqrt{2\pi n}}.
\]

From the tabulated value of the probability integral, \( \frac{2}{\sqrt{\pi}} \int_0^\infty e^{-x^2} \), the following facts re-
PROBABILITY

garding $P_i$ become evident. First, the deviation $I$ being specified, the values of $\gamma$ and of $P_i$ decrease rapidly as $n$ increases. In fact if the number of trials be increased sufficiently, the probability that the specified deviation will not be exceeded is extremely small, whatever fraction assigned in advance. Second, if $\gamma$ and hence $P_i$ be specified, the corresponding deviation $I$ increases rapidly as $n$ increases, but the relative deviation, or the ratio of the deviation to the number of trials, decreases rapidly.

Let us now state these statements more precisely. According to the first, the deviation $I$ is a function of the number of trials, and the probability that it will exceed a certain value is negligible if the number of trials is sufficiently large. The second statement is that the relative deviation, or the ratio of the deviation to the number of trials, decreases rapidly as the number of trials increases.

The very close relation which existed between the theory of probability and the study of games of chance is an interesting matter of fact, and it is important to note how the results of persistent gambling, that is, the expectation of winnings, are derived directly from the theory of probability. Bernoulli's theorem applies directly, and since the conclusions for all cases are similar, it will be most satisfactory to consider a simple one.

Suppose, then, that a player has a capital of $1000$, repeatedly bets $10$ on a certain horse, and that the horse wins $20$ times. It is clear that the probability that the player will win more than $1000$ times is negligible, and that the probability that the player will win exactly $1000$ times is also negligible. Hence, in this case, Bernoulli's theorem applies directly, and since the conclusions for all cases are similar, it will be most satisfactory to consider a simple one.

The derivation of the theorem of Bernoulli from the theory of probability is an interesting matter of fact, and it is important to note how the results of persistent gambling, that is, the expectation of winnings, are derived directly from the theory of probability. Bernoulli's theorem applies directly, and since the conclusions for all cases are similar, it will be most satisfactory to consider a simple one.

**Mathematical Expectation.**

A person who has a possibility of securing a prize without cost has a property of which the value depends upon the value of the property and upon the probability of securing it. In our subject a definite valuation is placed upon such a possibility.

This valuation is called its *mathematical expectation* and is defined to be the product of the value of the property and the probability of getting it. More generally, if there are several gains, $a_1, a_2, \ldots, a_n$, with the respective probabilities, $p_1, p_2, \ldots, p_n$, the mathematical expectation arising from these gains is $E = p_1a_1 + p_2a_2 + \ldots + p_na_n$. In this connection losses may be treated as negative gains. It is not denied that such an estimate involves the disregard of many elements, but unquestionably in the applications of this definition which are generally made such disregard is reasonable. To be more specific, it is extremely unlikely that a poor man would regard a possible gain of $2000$, whose probability is $\frac{1}{2}$, as equivalent to the actual possession of $1000$. On the other hand such an estimate is made the basis of all insurance business and is justified by the results obtained.

The connection between mathematical expectation and gambling is evident. If a person draws a card from a deck of cards and is to receive $1$ if an ace appears, his expectation is $100 \times \frac{4}{52} = 10$. Unquestionably $100$ would be regarded as a fair entrance-fee to one who could afford to repeat the trial a number of times. In this connection the condition under which a game is said to be fair may be mentioned. Suppose that a player has to pay a stake $b$ to enter a game in which his chance of winning a sum $a$ is $p$. Then for a fair game $b = \frac{a}{p}$, or his expectation after his entry must be equal to his stake.

The derivation from the definition of mathematical expectation of certain results which seemed to him to be impossible of acceptance led Daniel Bernoulli to develop a theory of *moral expectation*, which has received some considerable attention. Bernoulli laid down the principle that to the possessor of a fortune $a$ the moral value, $\psi$, of a small gain $g$ is directly proportional to the amount of the increase, and inversely to this present fortune; or that

$$\psi = \frac{h}{a}$$

(= k constant); and that if the probability of this gain is $p$, the moral expectation arising from it is $\psi = \frac{hp}{a}$.

The results obtained from this estimate differ widely from those obtained under the preceding one. They do, however, become less widely divergent from the latter as $a$ increases, and in fact as $a$ increases indefinitely the two sets of results tend to a perfect agreement.

**Probabilities Derived from Experience.**

**Probabilities of Causes.**—Hitherto the determination of the probability of an event has been based directly or indirectly upon certain governing events. A problem of another sort comes up for consideration. In the discussion of this problem and similar ones the word cause will be given an unusual meaning. For the present purposes the term will be used to mean a set of circumstances which might have given rise to an event. The problem may be stated as follows:

**It is known that an event $E$ has happened, and it is known that one of several causes has given rise to the occurrence of $E$; it is required to determine the probability that $E$ arose from a specified one of the causes.**
A concrete example is furnished by the following problem.

Ex. 7. Two bags contain respectively one white and one black ball, and one white ball and nine black ones. A ball has been drawn from one of the bags, has been observed to be white and has been replaced. What is the probability that it was drawn from the first bag? Let $p$ be the required probability. There are two ways of computing the probability of drawing a white ball from the first bag. In the first place it is necessary that the first bag should be selected and, that, having been selected, a white ball should be drawn. This gives $\frac{1}{2} \times \frac{1}{10} = \frac{1}{20}$ as a result. In the second place it is necessary that a white ball should be drawn and that, having been drawn, it should have come from the first bag. This yields $\left( \frac{1}{2} \times \frac{1}{1} + \frac{1}{2} \times \frac{1}{10} \right) p$. Hence, equating these values one gets $p = \frac{1}{9}$.

Similar reasoning applied to the general case yields the following result:

Theorem 4. If an event $E$ has occurred as a result of one or another of certain causes $C_1, C_2, \ldots, C_n$, whose respective probabilities previous to the occurrence of $E$ were $p_1, p_2, \ldots, p_n$, and if of these one of the causes $C_i$ is known to be operating, the probability that it will produce $E$ is $p_i$, then the probability, $P_i$, that $E$ resulted from $C_i$ is

$$ P_i = \frac{p_i}{p_1 + p_2 + \ldots + p_n}. $$

Apply the result to the following example:

Ex. 8. From a bag containing five balls, each of which is either white or black, four drawings have been made, the ball being replaced after each drawing. The result is three white balls and one black one. What are the probabilities that the bag contains (1) four white, one black ball, (2) three white, two black, (3) two white, three black, (4) one white, four black? There are four causes: (1) Four white, one black, (2) three white, two black, (3) two white, three black, (4) one white, four black. Hence $P_1, P_2, P_3, P_4$. Also $\phi_1 = (\frac{1}{2})^4, \phi_2 = (\frac{1}{2})^3, \phi_3 = (\frac{1}{2})^2, \phi_4 = (\frac{1}{2})^1$. Then $P_1 = \frac{1}{10}, P_2 = \frac{1}{10}, P_3 = \frac{1}{10}, P_4 = \frac{1}{10}$.

When the number of causes is very great the formula of theorem 4 becomes unwieldy. It is found that a simpler formula gives an approximate result. The method used in deriving this formula will be illustrated in the following example:

Ex. 9. From among an exceedingly great number, $N$, of balls, each of which is either black or white, $n$ balls are drawn, each ball being replaced before the next drawing. Of these exactly $s$ are white. What are the probabilities for the various possible numbers of white and black balls in the whole set? — Since before the drawings nothing was known as to the desired result, the a priori probabilities for all numbers of white balls from $0$ to $N$ are equal. Now the total number of white balls will be known if the ratio, $r$, of that number to $N$ is known. Hence equally probable values of $r$ are all posteriori probabilities having $N$ as denominator. Since $N$ is very great, $r$ varies from 0 to 1 by very small increments. It will now be assumed that for purposes of approximation $r$ may be treated as varying continuously from 0 to 1. Also, if $r$ is the correct ratio, the probability that in $n$ drawings $s$ white and $(n - s)$ black balls would appear is

$$ \int_{r = \frac{s}{n}}^{r = \frac{s}{n} + \delta r} r^{(1 - r)n} = \int_{r = \frac{s}{n} - \frac{\delta r}{2}}^{r = \frac{s}{n} + \frac{\delta r}{2}} r^{(1 - r)n} dr, $$

since the number of values of $r$ from $r$ to $r + dr$ is measured (see Geometrical Probability) by $dr$, and the probability that $r$ shall lie between $r$ and $r + dr$ is

$$ P = \int_{r = \frac{s}{n} - \frac{\delta r}{2}}^{r = \frac{s}{n} + \frac{\delta r}{2}} r^{(1 - r)n} dr. $$

A general theorem might be formulated embodying this result, and such a theorem jointly with theorem 4 would constitute what is called the Theorem of Bayes.

The maximum value (see Calculus, Infinitesimal, Maxima and Minima) of $r^{(1 - r)n}$ is obtained by putting $r = \frac{s}{n}$, and is $\frac{s^s}{n^s(n-s)^{n-s}}$.

Then the most probable cause is that in which the actual ratio of the number of white balls to the total number is the same as the corresponding ratio in the observed results.

A discussion of the value of $P$, which must be omitted, yields the following notable result:

Theorem 5. The probability that, under the conditions of example 9, the ratio of the number of white balls to the total number shall not deviate from its most probable value, $\frac{s}{n}$, by more than $\gamma$ $\sqrt{\frac{2s(n-s)}{n^3}} = \frac{2}{\sqrt{n}} \int_{r = \gamma}^{1 - \gamma} e^{-r} dr$.

Empirical Probabilities. — The preceding theory finds application in connection with any sets of events which for the purposes of any discussion may justly be compared with the drawing of balls from a bag. In some of the important connections this theory is in fact indispensable. It will be noted that in both of the examples 8 and 9 the inquiry was in regard to the probability of the various possible numbers of white and black balls. But if the ratio of the number of white balls to the total number of balls be known, that ratio furnishes the probability that a further single drawing will produce a white ball; and in general this probability is what is most urgently sought. Probabilities estimated in this way from observed events are called empirical probabilities.

Two methods of deriving empirical probabilities are used, one theoretically correct, but leading to troublesome computations, the other approximately correct. The latter method involves the assumption that, of the possible causes of the observed event, that which has the greatest a posteriori probability is the true one. These two methods will be applied to example 8.

Suppose that after the drawing of the balls from the bag the question be asked, "What now is the probability of drawing a white ball?" By the second method the answer would be
obtained as follows: The most probable state of the bag is that it contains one black and four white balls. Hence the probability of drawing a white ball is $\frac{4}{5}$.

The following is the other method of treatment: The probability that the bag contains four white balls and one black one and that a white one will be drawn from it is $\frac{4}{5} \times \frac{4}{5}$, that it contains three white and two black and that a white one will be drawn is $\frac{3}{5} \times \frac{3}{5}$; and that it contains one white and four black, and that a white one will be drawn is $\frac{1}{5} \times \frac{1}{5}$. Hence the probability that a white ball will be drawn is $\frac{3}{5}$.

Where the number of causes is greater the difference between the two values is smaller, and theorem 5 shows that when the number is very great the difference can be very small indeed, as it becomes nearly certain that the ratio $r$ differs by very little from $\frac{3}{5}$.

GEOMETRICAL PROBABILITY.

In what precedes it has been assumed except in one case that the number of equally probable events governing the event $E$ is finite. The definition may be extended to include the case in which the number of events is infinite provided appropriate measures for the totalities of cases can be devised. Such measures are available when each case corresponds to a set of values or one or more continuous variables. Problems requiring the adoption of such measures are generally geometrical, and hence this branch of the subject is called geometrical probability. Merely an indication of its nature may be given by one or two very elementary examples.

Although the number of points on any line segment cannot be counted, yet their totality may be measured by the length of the segment. Similarly the totality of points in an area may be measured by that area; and so on. The probability that, all values being equally probable, a number less than unity but more than one-half is $\frac{3}{5}$ because the totality of cases is measured by a unit segment, and that of the favorable cases by half a unit segment. Similarly, if all points within a circle of radius $a$ are equally likely to be selected, the probability that one of them selected, at random, is not distant more than $\frac{a}{2}$ from the centre is $\frac{3}{5}$.

Many very interesting problems have been solved, some of them by exceedingly ingenious methods, but this branch of the subject is quite special and cannot receive further attention here.

In what precedes some important parts of the theory have been indicated. A study of its important applications, notably those to the discussion of errors of observations and to problems of insurance, must be sought elsewhere. The growth of the importance of the subject has been remarkable, for in the beginning it was concerned with problems of gambling, and it has become the basis of all forms of insurance. It has attracted and held the attention of nearly all the ablest mathematicians from Cardan to Sylvester and Poincaré. Among its devotees have also been Pascal, Fermat, De Moivre, Leibnitz, the Bernoullis, D'Alembert, Euler, Lagrange, Bayes, Condorcet, Laplace, Gauss, De Morgan, Bertrand and Crüger. The theory has been applied freely, and in many cases rashly, too little attention having been paid to the fact that its applications really lie in the domain of those events whose occurrences may properly be compared to the drawing of balls from a bag. Hence it is necessary to exercise considerable care in connection with the literature of the subject. See Least Square, Method of; Statistical Method.

PROBATE, in law, legal proof of a will. In the United States, probate is granted usually by courts of special jurisdiction in the various States, but sometimes by chancery or common law courts. See Will.

PROBATE, Court of. See Court.

PROBATION, in law, a method of conditional release of persons convicted of crime, who are kept under constant surveillance and allowed their liberty during good behavior only. Usually the offender is under the supervision of a probation officer. The system originated in Massachusetts in 1878, and since then has grown rapidly in favor among penologists, as being expedient, economical, humane and tending to preserve the self-respect of transgressors. Usually only first offenders guilty of minor crimes are subject to probation. It was adopted in the United Kingdom by statute in 1908.

PROBATION AFTER DEATH, a doctrine favored by some modern theologians as a means of reconciling the idea of everlasting punishment with that of God's justice and the universal redemption through Jesus Christ: the doctrine differs from the doctrine of Universalism in postulating an intermediate state of the soul after death, of which Universalism knows nothing; and in rejecting the Universalist tenet that all will ultimately be saved. Something very like this doctrine of post mortem probation, and different from the Catholic doctrine regarding Purgatory, is taught by Clement of Alexandria (Ström. vi. 18): 'Even if a man passes out of the flesh he must put off his passions ere he is able to enter the eternal dwelling.' And he speaks of the angels who preside over the ascent of souls as retaining those who have preserved any worldly attachments.

PROBLEMATISCHE NATUREN ('Problematical Natures'). Like Freytag and Paul Heyse, Friedrich Spielhagen was chock-full concerned, in his novels, with defining the warring elements of German character and the opposing springs of German action in the period before and after the last revolution. Like Freytag and Heyse, Spielhagen saw clearly the dangers that threatened the country, politically,
religiously and morally from a reactionary aristocracy; like Heyse and unlike Freytag he saw the hope of the nation in the spread of an enlightened democracy rather than in a religious renascence of the ruling classes. Oswald Stein, the hero of his magnificent novel, 'Problematische Naturen,' is the mouthpiece for Spiegelman's revolutionary social theories. He is modeled after those characters of whom Goethe wrote 'There are problematical natures that do not fit into any situation and who remain always unsatisfied. For them there arises a terrible conflict that consumes life without enjoyment.' For Spiegelman the conflict itself, even though it ends in defeat, is victory; the mere struggle against the domination of dead ideas in progress. For such a philosophy there could be no better historical background than the Germany of 1848 and after, and 'Problematische Naturen' with its sequel 'Durch Nacht zum Licht,' although it squanders material for half a dozen novels, idealizes Teutonic morbidity, and foresakes art for tendency, tells with remarkable vividness, the story of the men and women who lived and thought and fought for freedom in Germany's day of hope. A notable description of the literature of this period is to be found in Wilhelm Schmidt's 'Geschichte der Deutschen Literatur.'

EDITH J. R. ISAACS.

PROBOSCIS or NOSE MONKEY, a rare Bornean monkey (Nasalis larvatus), called 'Kahau' by the natives, and characterized by a deeply elongated nose, a peculiarly Ridiculous appearance to the face. The general body-color is a sandy red; the tail is dark above, but light yellow beneath. These monkeys are arboreal in habits, and appear to frequent the neighborhood of streams and rivers, congregating in troops. They are closely allied to the apes of the genus Semnopithecus.

PROBUS, Marcus Aurelius, Roman emperor: b. Sirmium, Pannonia, 232; d. there, 282. He early attracted the notice of the Emperor Valerian, who made him tribune and soon placed him at the head of the Rhine. The brilliancy of his conduct in the African, Persian, Arabian and Germanic campaigns brought him into still more prominent notice. He was made governor of all the Roman provinces in Asia by the Emperor Tacitus and when Florianus, who succeeded his brother Tactius, was murdered in 276 Probus was immediately proclaimed emperor by universal consent. He drove back the Franks, Alemanni and Vandals, who had invaded Gaul; and in 277 secured the frontier wall between the Danube and the Rhine. He also freed the lands south of the Danube, Egypt and the East from devastating barbarian hordes and concluded an advantageous peace with the Persians. He gave new dignity to the senate, populated desolate tracts in Thrace and Moesia with barbarians (280) and paid particular attention to agriculture. By 281 peace had been established almost everywhere throughout the Empire. Probus now, for the first time since his accession to the throne, founded provincial cities. In the Rhine he decorated a triumph either in 281 or 282. He kept his soldiers actively employed in public works. Irritated at being charged with occupations which they deemed degrading, a troop engaged in draining a swamp rose in insurrection and killed him. Probus ranks among the ablest of Roman emperors, combining the qualities of a good commander and wise statesman. Consult Dannhäuser, E., 'Untersuchungen zur Geschichte des Kaisers Probus' (1909).

PROBUS, Marcus Valerius, Roman grammarian: b. Borsippa, Syria; second half of the 1st century A.D. He is chiefly noted for his critical revisions of the most important Latin poets, as for instance Lucretius, Horace and Virgil. He applied to them the methods of the Alexandrian school of critics, mainly on the Bucolics and Georgics of Virgil under his name has been preserved but is of doubtful authenticity. A biography of Persius, written by him, remains in a commentary on the works of that poet. An extant fragment of his work 'De Notis' contains the abbreviations used for legal terms. Consult Aistermann, J., 'De M. Valerio Probo Berytio' (Bonn 1910).

PROCACCI, prò-kat-chè'né, the name of a family of artists of the 16th century who under the patronage of the Borromeo family, founded a distinct school of art. The first, at Milan, as the Caracci had done at Bologna. The members of this family were (1) Ercolò Proccacci, called the Elder: b. Bologna, 1520; d. later than 1591. His works, principally at Bologna and Parma, are noted for talent, but lacking industry and care, although they are not free from the mannerism of his contemporaries. He was in great request as a teacher and after his removal to Milan became the founder of the famous school bearing his name. (2) Camillo Proccacci, son and pupil of the former: b. Bologna, 1546; d. Milan 1626. He was the most accomplished artist of this school. He profited by studying the school of the Caracci and took Correggio and Parmeggiano for his models. His imitation of them is obvious from his work, but the result is equally successful. His works are distinguished for spirited composition, exquisite coloring and devotional elevation, but are mannered. Among those at Milan are a 'Madonna and Child' in the church of Santa Maria del Carmine and an 'Adoration of the Magi' in the Brera. Many other churches in Milan contain works of his, as do also galleries in Bologna, Dresden, Leipzig, Munich, Stuttgart, Vienna, Madrid.

(3) Giulio Cesare Proccacci, brother of Camillo: b. Bologna, 1548; d. Milan, 1626. He likewise strove to equal the school of the Caracci and took for his model Correggio, whom he imitated with so much success that several of his pictures, though far from reaching the grace and harmony of that great master, have often been ascribed to him. This has been the case especially with cabinet pictures of the Fall. His works, all of a religious nature, are to be met with in many churches of Milan especially in the cathedral. In the Annunziata in Genoa is his 'Last Supper,' by some considered his masterpiece. Others of his works are in galleries in Florence, Genoa, Milan, Parma, Turin, Madrid, Edinburgh, Brussels, Berlin, Dresden, Munich, Petrograd, Stuttgart, Vienna. (4) Carlo Antonio Proccacci, youngest brother of the two preceding: b. Bologna, about 1555, d. about 1605. He, too, was a pupil of his father, but the least gifted of the three brothers. He painted landscapes, fruits and flowers. Much of his work went to Spain,
tho' some may be found in private collections in Milan. (5) EScola PROCACCINI, called the younger, son of Carlo Antonio: b. Milan, 1596; d. there, 1676. He was a pupil of his uncle Giovanni Cesare, and of the Procaccini School. He painted historical subjects and still life, excelling especially in the latter. Religious subjects by him can be seen in the church of Saint Maria Maggiore at Bergamo (A. Bencina, Milan, ed. Consult Blanc, C. 'Ecole Bolonaise' (Paris 1874).

PROCEDURE, in law, the methods of initiating and maintaining litigation, usually embracing practice, pleading, evidence and the rules governing them. The term is sometimes restricted in its meaning to include only practice. Three widely differing systems of procedure were early developed in England by the courts of common law, courts of admiralty and courts of equity. While changed by statute and otherwise from the early forms, these systems are preserved to-day generally throughout the British Commonwealth and the United States.

As developed in the common law courts, procedure differed radically from that in the courts of admiralty and courts of equity, being distinguished by extreme formality; and as a consequence the substantive rights of the litigants were often entirely disregarded by the rigid manner in which the rules were applied. Dating back to an early period, civil actions in common law courts were commenced by the issuance of the original writ at the instance of the plaintiff commanding the sheriff to summon the defendant to appear before the court. This writ gave jurisdiction to the court of the subject matter of the action and its service gave jurisdiction over the defendant. The court could compel the attendance of the defendant at any judicial proceeding by issuance of its process known as a judicial writ. The plaintiff’s claim was set forth in a prescribed form in the declaration, stating the cause of action in one or more counts and ending with a prayer for relief. (See COMPLAINT; DECLARATION). Then followed the plea or answer by the defendant, replication by the plaintiff and sometimes other pleadings, until an issue was reached. (See ANSWER; PLEA; PLEADING; REPPLICATION). The case then proceeded to the attendance of the parties and witnesses at the trial, which was a formal examination of the material facts, usually before a jury. (See JURY; TRIAL). After verdict various remedies were provided for the unsuccessful party. For instance, he could move in arrest of judgment, or for a new trial, or for a writ summoning a new jury on the ground of misconduct, etc. After judgment the defeated party had a remedy by writ of error, which was acted upon by a higher court. This writ stated the cause of complaint in a general manner and the assignments of error pointed out the particular errors of law alleged to have been committed by the trial court. On denial of these specifications by the opposite party, an issue was raised, which resulted in an affirmance or reversal of the judgment of the lower court. (See ERROR; WRIT). After final judgment the writ of execution followed, by which the judgment was enforced. This was usually effected by seizure of the person or property of the defendant.

Procedure in civil actions in the United States to-day is to a large extent founded on the common law, modified by statutes or by the adoption of codes. Each State has its own distinct system and this is true also of the Federal Courts. In both Federal and State courts, civil actions generally are commenced by the service of process called summons upon the defendant. This writ is in some States served by the sheriff or his deputy, but in other States it may be served by the attorney or agent of the plaintiff. In the usual administration of justice to-day, judicial process is indispensable. Until notice is given, the court has acquired no jurisdiction whatever to proceed to judgment. Even in proceedings in rem, notice, either actual or constructive, is required in order that the judgment may be valid. (See PROCESS; SUMMONS). Subsequently to the service of the summons a declaration or complaint, stating the cause of action, is served on the defendant by the counsel for the plaintiff, after which may follow the plea, answer, demurrer and various other pleadings. A general demurrer by the defendant denies that a cause of action has been stated and thus a question of law arises to be decided by the court. If the defendant’s demurrer is sustained, judgment is rendered for the defendant. In some States, if the defendant’s demurrer is overruled, he is allowed to answer and the action proceeds. In some jurisdictions a motion to strike out immaterial matter has supplanted the demurrer as a remedy for formal defects. (See DEMURRER). If the defendant fails to answer, judgment may be taken against him by default. By code in various States, including New York (1848), among other reforms, distinctions between pleading at law and equity have been abolished and liberal provisions made for amendments to pleadings. By statute in other States various similar reforms have been accomplished. In the Federal courts of the United States in actions at law, the procedure of the State in which the court is located is followed, but in equity proceedings the procedure of the State of New York is followed and made uniform throughout the United States by court rules. A change is foreshadowed, however, in the procedure in the Federal courts in actions at law by the majority report of the Senate committee on rules, recommending a bill authorizing the Supreme Court to adopt rules regulating the procedure and making it uniform throughout the United States. This bill has also been indorsed by the American Bar Association. Pressure on more important legislation due to the war, however, has caused a postponement of action on the bill. The term "writ of execution" in England at the present day includes the following: ejectment, sequestration, capias, fieri facias and attachment. In the United States not all these forms are in use in every jurisdiction, the subject being one that is regulated to a large extent by statute. (See EXECUTION). The writ of error has been abolished in many jurisdictions in the United States and appeal substituted therefor. See APPEAL.

Criminal procedure in England to-day is founded largely on the old system at common law in civil cases, which was superseded by the Judicature Acts, dating from 1873. The arrest of the defendant, usually by warrant, follows an indictment by a grand jury in the
case of the graver offenses, felony or treason. In the case of the lesser offenses a criminal information is filed by the attorney-general or, in his absence, by the solicitor-general. After an indictment has been found by the grand jury (twelve of whom must concur), the defendant on pleaded not guilty shall be tried by 12 jurors in open court. Until 1907 a verdict in a criminal case of guilt or innocence was final, no appeal existing on the facts. However, a writ of error would lie for mistakes in procedure. By the Criminal Appeal Act of 1907, the right of appeal was given. The law of procedure in criminal cases in Ireland largely follows that of England, while that of Scotland differs to some extent, being regulated by statute passed in 1887. The common law method of trying criminals by a jury of 12 has been adopted in modern times by some European countries. The English system of criminal procedure, almost in its entirety, has been adopted by many of the British colonies. In the United States the system is largely regulated by statute or by code, but in a general way the procedure in use in England is followed. See CRIMINAL LAW; GRAND JURY; INDICTMENT; INFORMATION.

In admiralty closely follows that of the civil law, and is exceedingly simple, in marked contrast to the formalities of the common law. An admiralty suit is commenced by the filing of a libel, or complaint, setting forth the nature of the action, after which process is served by a marshal or deputy. Process, in suits in personam, may be in the form of a writ to appear in personam and answer the suit. In proceedings in rem the marshal seizes the vessel or other thing in controversy. The answer in admiralty courts corresponds to the plea of common law, and exceptions are equivalent to pleas in abatement and special pleas in bar. A monition need not necessarily be served personally on the respondent. The court seeks at all times to adjudicate the controversy on its merits, to avoid delays, surprises and unnecessary costs. The rules of practice in courts of admiralty in the United States are substantially the same as those in England, but they are subject to change as need be. The Federal courts in actions at law, courts of admiralty do not conform to the practice of the State courts. Admiralty courts permit the adjudication of several causes in one proceeding if adapted to the ends of justice and if no inconvenience will result therefrom, even extending this to libels in rem and in personam and cases in contract and tort; but causes entirely unrelated may not be joined. The admiralty courts, in addition to civil jurisdiction, have also limited criminal jurisdiction, but when acting in criminal cases the procedure in some particulars conforms to that of the common law courts, including trial by jury. Appeals from final decrees in the United States are usually taken to the Circuit Court of Appeals, but in the lower courts to the Supreme Court. By certiorari, in cases of great importance, the Supreme Court may review the judgment of the Circuit Court of Appeals. See ADMIRALTY.

Equity procedure, like that of admiralty, lacks much of the formality of the common law. Suit is commenced by the complainant filing a bill, after which, in some jurisdictions in the United States, service of process, called the subpoena, is made on the respondent, who then may answer. On his failure to do so, the complainant is entitled to a decree in his favor. Formerly he could compel the respondent to answer by attachment. Replication by the complainant follows the answer of the respondent. Beyond this equity pleadings do not go, but amendments are allowed in lieu of further pleading. Demurrers and pleas are generally used in equity in the same way as at law. Demurrers test the legal sufficiency of a pleading of the opposite party. Liberal provisions are usually made in equity practice for the amendment of demurrers. A plea in effect is a special answer, setting up some fact or facts as a cause for dismissing, delaying, or barring the suit, or why some part of the bill should not be answered. Pleas and demurrers are today viewed with some disfavor, as being dilatory and not going to the merits. Recently the Federal courts in the United States abolished pleas and demurrers, and substituted therefor motions and answers. In the absence of statutory modification the equity system does not provide for the trial of issues before a jury duly impaneled on the fact that court. It differs radically from the common law. However, when the necessity of a jury arises, the equity court sends the issue to a court of law, where it is tried before a jury according to legal forms. The verdict thus rendered is returned to the court of equity. In the Federal courts usually and sometimes in other courts the judges who preside in the equity cases preside also over the trials at law. Issues are submitted to a jury at common law when material facts which are disputed seem doubtful to the judge of the equity court. Formerly a court of equity could not rehear a cause or reverse a decree after enrolment of the final decree, but to-day a court of equity may review and reverse its own decree on bill of review. This must be brought by a party to the original suit or by some party in privity with him. Appeal also may be taken from a final decree. Appellate jurisdiction must be invoked by appeal, and not by a bill of review. The subpoena in chancery is the order to respondent to answer was abolished in England in 1852, and service of a copy of the bill substituted, which practice is also followed by some jurisdictions in the United States. As stated above, by code in some of the States the distinctions between pleading in actions at common law and equity have been abolished. See CODE; EQUITY; SUBPOENA.

EDWARD F. DONOVAN.

PROCESS. (1) in anatomy, an enlargement, such as the sphenoidal process of the temporal bone, the trigeminal process of the premaxilla, supraorbital process of the frontal, or alveolar process of the maxilla; (2) in botany, any extension of the surface; a protrusion whether natural or monstrous; (3) in law, a term applied to the whole course of proceedings in a cause, real or personal, civil or criminal, from its commencement to the end of the suit; properly, the summons citing the party affected to appear in court at the return of the original writ. This was sometimes called original process, being founded upon the original writ; and also to distinguish it from mesne or intermediate process, which issues, pending the suit, upon some
PROCESS OF LAW—PROCLUS

collateral interlocutory matter; as to summon witnesses, and the like; (4) the term generally applied to the various mechanical and chemical processes by means of which illustrations are reproduced in printing.

PROCESS OF LAW. See DUE PROCESS OF LAW.

PROCESSION, Religious, a solemn march of the clergy and people, attended with religious ceremonies, prayers, singing, etc., in the churches or streets of a town for the purpose of returning thanks for some divine blessing, petitioning for assistance in some great calamity, celebrating the consecration or visitation of church dignitaries, or drawing attention to some great doctrine of the Church. The practice of holding such processions is usually said to have been introduced into the Christian Church in the reign of Constantine. The most celebrated processions which now take place in the Roman Catholic Church are those of the eucharist on Corpus Christi day, and during the week in which it occurs. They owe their origin to John xxi.

The processions in honor of Saint Mark and those on Candlemas and Palm Sunday are said to have been instituted by Gregory the Great. Instances of celebrations of this nature are to be found among the Jews in the Old Testament, and as a part of the symbolic worship of nature they were in use among the ancient heathens; thus they formed solemn processions about the fields, which had been sowed, and sprinkled them with holy water to increase their fertility, and to defend them from injuries. The festivals in honor of Bacchus, Diana, and other divinities, among the Greeks and Romans, were solemnized with processions, in which the images of the gods were borne about; and similar rites are still found among most heathens. Among the Buddhists these ceremonial are especially imposing. The procession which accompanies the Emperor of China when he goes to offer sacrifices to an idol in some great pagoda is one of the most gorgeous description. In a more restricted sense the term is applied to the hierarchical order of the clergy and their assistants (choir, etc.) in the church proper for the purpose of holding a religious service, or of their departure to the sacristy after the service.

PROCESSION OF THE HOLY GHOST, in theology the relation in the Trinity between the Father and the Holy Ghost. The Western Churches believe in what is called the "double procession" as expressed in the Nicene Creed, "Who proceedeth from the Father and the Son." The Greek Church maintains the "single procession" and omits the words "and the Son." See FILIOQUE.

PROCESSIONAL CROSSES. See CROSS AND CRUACES.

PROCIDA, pro-chet-da, John of, an Italian physician and nobleman, b, Salerno, about 1210; d, Rome, 1298. The tradition which makes him the prime mover in the conspiracy alleged to have brought on the Sicilian Vespers (q.v.) has been discredited by careful investigators, but is the subject of a tragedy by James Sheridan Knowles (q.v.) (1840).

PROCIDA (ancient Proc Clyta), (1) an island in Italy, on the west side of the Gulf of Naples and about 12 miles southwest of Naples, lying nearly midway between the island of Ischia and the coast of the province of Naples. It is about three miles west of northwest, and little more than one mile broad. The principal town on the island is (2) Procida, or Castello di Procida, which stands on the southeast coast, 12 miles west of Naples. It is fortified, has a good harbor, and a considerable trade. There is a palace on the island which was occasionally used as a residence by the former kings of Naples. On festivals the women assume the Greek costume, consisting of a red upper garment with gold embroidery. It is from this island that John of Procida (q.v.), the reputed originator of the massacre known by the name of the "Sicilian Vespers," takes his name. Pop. about 15,000.

PROCLAMATION OF EMANCIPATION. See EMANCIPATION PROCLAMATION.

PROCLAMATIONS, Executive, documents issued by an executive in accordance with the powers conferred or in fulfillment of the duties imposed on him by the constitution or expressly by statute, or even in regard to matters toward which it becomes desirable or necessary to draw the attention of the citizens. The issuance of such proclamations is not regulated by any general statute enacted by Congress, and for some, such as the Thanksgiving proclamation, no provision whatever has been made. In accordance with the specific authority conferred on him by the legislative branch of the government the executive may act with special authority in the sale of public lands, establishing forest reserves, applying special provisions of the tariff act, regulating the treatment and status of alien enemies, the jurisdiction of foreign courts, patents over disputes among seamen, proclaiming a state of war, and extending provisions of the copyright or patent laws to citizens of another country, etc. In time of war the executive's powers are vastly increased, including the requisition of railroads and other public carriers, food and fuel supplies, press censurship, establishing blockades, granting pardon to deserters, interment of persons guilty of seditious utterances or of acts tending to impede the prosecution of the war, and not otherwise amenable to punishment or restraint. President Lincoln covered the greatest range in his proclamations, in several cases going to the extent of suspending the writ of habeas corpus in various places. The Supreme Court, however, overruled his suspension of the writ in localities outside the theatre of war. (See EXECUTIVE; PRESIDENT.) Consult Fairlie, J. A., 'The National Administration of the United States' (New York 1905).

PROCLUS, philosopher of the Neo-Platonic school: b, Constantinople, 412; d, Athens, 485. He is usually called Diadochus and sometimes the Lycian, because his parents came from Xanthus in Lycia. He received his first education at Alexandria from the famous Peripatetic Olympiodorus the elder, and completed it at Athens under Syrianus, who ultimately appointed him his successor, and under Asclepi-
genia, who had learned from her father Plutar-
chus the doctrines of the Orphic and Chaldaic
mysteries and the united theoretic sciences. As a
teacher, although he was very successful and
not only endeavored to unite into a single
whole all the philosophical schemes handed
down from former ages, but made it his aim
to embrace all religions by becoming filled with
their spirit. Following out this maxim he com-
posed hymns in honor of the pagan deities, de-
fended and interpreted popular myths, and even
conformed to the rites connected with their
worship, and considered himself as under their
protection. It was probably in consequence of
this adherence to the ancient religion of Greece,
in opposition to the decrees of the Christian
emperors, that Proclus was compelled to with-
draw from Athens. He traveled for a year
in Asia to study the various religions of its
inhabitants. All of them he held in reverence.
On his return to Athens, where he remained
till his death, he re-opened his school, but now
performed his religious services in secret. By
his pure morals and religious views he gave
his scholars the idea that he had intimate inter-
course with gods and demons, and could work
miracles. He claims to resemble Plato in sup-
porting his doctrines by an unbroken chain of
reasoning, a method that had been altogether
neglected by the previous Neo-Platonists. But
these pretensions are not borne out by his
works. A life of Proclus was written by
Marinus, one of his scholars, and his successor
in the school at Athens. His extant works in-
clude a 'Sketch of Astronomy,' in which he
gave a short view of the systems of Hipparchus,
Aristarchus and Ptolemy; 'Theology of
Plato,' 'Principles of Theology,' 'Principles
of Philosophy,' 'Commentary on the Works
and Days of Hesiod,' 'Life of Homer,' etc.
Many of his works have been collected and
edited by E. Cousin in 'Procli Opera' (6 vols.,
Paris 1820-27) and in 'Procli Opera Inedita'
(Paris 1864). There are also various other
editions of some of his writings by J. F. Bois-
sonade (Leipzig 1820); G. F. Creuzer (3 vols.,
Frankfort o. M. 1820-22); G. Friedlein
(Leipzig 1873), and C. E. C. Schneider (1847).
Quite a number of his works have been trans-
lated into English. The oldest of these
translations is called 'The Description of the
Sphere, or Frame of the World' (Englyshed by
W. Salysbury, London 1550?). The other
translations, made by Thomas Taylor, are as
follows: 'The Commentaries of Proclus on
the Timaeus of Plato' (London 1820); 'The
Fragments that Remain of the Last Writings of
Proclus' (London 1825); 'The Philosophical
and Mathematical Commentaries of Proclus on
the First Book of Euclid's Elements and His
Life' (Leipzig 1828); 'The Six Books of Proclus, the Platonic
Successor, on the Theology of Plato, etc.; also a
Translation of Proclus' Elements of Theology, etc.' (2 vols.,
London 1816); 'Select Theorems in Proof of the Perpetuity of Time' (in 'Ocel-
us Luscamus on the Nature of the Universe,
etc., London 1831); 'Two Treatises of Proclus, etc.' (London 1833).
There is also a French translation by P. Forcadel de Benziés, 'Deux
Livres de Proclus, du Mouvement' (Paris 1842). Consult Altenburg, M., 'Die Methode
der Hypothese bei Platon, Aristoteles und Pro-
klos' (Rostock 1905); Diehl, Ernst, 'Der
Timaiaustext des Proklos' (in 'Rheinisches
246-269, Frankfort n. M. 1916); Lindsay
'Proclus as Constructive Philosopher' (in
'Hibbert Journal,' Vol. CIII, pp. 279-288,
Boston 1917); Marinus, N., 'Vita Procli' (ed. by
J. F. Boissonade, Leipzig 1814).

PROCONSUL and PROPRAETOR, func-
tionary of the ancient Roman Empire, to whom
the administration of the provinces was
entrusted; procurator or proraptor being
whose term of office had expired as prefect or
consul. The first consul who received the title
of proconsul was Q. Publius Philo in 327 B.C.
This was done in order that he might conclude
a campaign successfully begun in southern
Italy. It was afterward provided by a law of
C. Sempronius Gracchus that, at the consular
and praetorial elections the senate should dis-
tribute the provinces into two consular and six
praetorial provinces, for which the consuls and
praetors should cast lots on documents among
themselves by agreement, a few days after the
entrance upon their term of office, on the ex-
piration of which they took the provinces al-
lotted them. But in 55 B.C. it was provided by
a decree of the senate that no consul or prator
should enter on the government of a province
until five years after his surrender of office. As
the number of provinces increased, proconsuls
were appointed who had not previously held
the office of consul. The duties of proconsuls or
praetors were the administration of justice,
the supervision of provincial affairs, and the
command of the troops. They were assisted in
their duties by quastors and legates. Within
30 days after his return to Rome the provincial
governor was bound to make a report of his
government. The Lex Julia in 61 B.C. further
required that a copy of his report (statoce
) should be deposited in the two chief cities of
his province. He was liable to impeachment for
extortion, peculation or embezzlement of the
public money or for abuses in regard to the
army. Nowwithstanding these precautions the
provinces were subjected to various oppressions
and exactions. From the time of Augustus the
government of some provinces was taken out
of the hands of the proconsuls and praetors,
and entrusted to legates called procurators, or
stewards of the imperial household, who, as
governed under the immediate direction of the
emperor. See PROVINCE; PROCURATOR.

PROCOPIUS, pró-kōp′i-ús, Byzantine his-
torion: b. Caesarea, Palestine, about 500 A.D.; d.
Constantinople, about 565 A.D. After practising
as a rhetorician and advocate at Constantinople
for a short time he brought himself so much
into public notice that in 527 Belisarius made
him his legal adviser and private secretary. He
found abundant opportunity for seeking the
making of history at first hand, for he accom-
panied Belisarius and counseled him on his
most important campaigns. He was with him
in Italy, Africa and Asia, and when he was
sent to Constantinople. The emperor Justin-
ian made him senator and in 562 prefect of the
city. He is the historian in chief to the reign
of Justinian, to which his three most important
works were devoted. These are the 'History
of the Wars' (Histories) in eight books, the
PROCOPIUS — PROCKER

first two relating to the Persian War, the two following to the war with Vandals, and the rest to the Gothic War; the 'Secret History' (Anecdota), a secret and more personal history supplementing the more formal 'History'; the 'History of the Edifices, built or repaired by Justinian' (Cistimata). Doubt has been thrown on the connection of Procopius with the 'Anecdotes.' 3 They are the repository of the scandals of the reign, filled with accusations, often of a ridiculous and improbable nature against Justinian and Theodora. On the other hand the histories are of great value, characterized by accurate personal observation and truthful presentation of conditions. The best edition of the complete works is that contained in Dindorf's 'Corpus Scriptorum Historiae Byzantinae' (Bonn 1833-38). A more recent edition is that published by J. Haury, 'Procopii CesarieniisOpera Omnia' (3 vols., Leipzig 1905-13). The publication of the original Greek text with an English translation by H. B. Dewing has been begun as part of the Loeb Classical Library under the title 'Procopius' (Vol. 1, New York 1914; Vol. 2, New York 1916). Consult Dahn, F., 'Procopius von Cesarea' (Berlin 1865), Haury, J., 'Procopiana' (Augsburg 1891); 'Zur Beurteilung des Geschichtschreibers Procopius von Cesarea' (Munich 1896-97).

PROCOPUS, Andrew, Hussite chief: b. about 1380; d. Böhmiisch-Brod, 30 May 1434. He was distinguished as Procopius the Great, or the Bald, from other contemporaries at times associated with him known as Procopius the Lesser or Prokupek. He received a good education, traveled extensively and upon his return entered the priesthood, receiving the tonsure from which he derived his nickname, the Bald. He fought with the Hussites under Ziska, and in 1425 after Ziska's death was chosen commander of the Taborites, the main division of the Hussites, and quickly made himself master of a larger part of Bohemia. Defeated near Prague by Jan Zizka in June 1426, he burned that town and soon after drove the Austrians across the Danube. Burning and laying waste large portions of Austria he led his bands toward Silesia; defeated a German army near Moritzburg (1427); and in the next two years cleared Silesia, Hungary and Saxony. The bands under the leadership of Procopius had by this time made the name of Hussites a terror throughout the provinces through which they pursued the armies of the Emperor Sigismund. Strife, however, ensued between the extremists, and the more moderate division known as the Calixtines, who in 1433 accepted the terms offered by the Roman Catholics. In a factional fight between the two parties Procopius was killed. In the same battle perished Procopius the Lesser, leader of a section of the Hussites called the Orphans, which had co-operated with the Taborites since 1427. Consult Sand, Georges, 'Procope le Grand' (in Œuvres illustrées, Vol. I, Paris 1855); Wolf, J. H., 'Leben der beiden Prokope' (Prague 1784).

PROCURSTS, prô-krás'te, Attic robber, surnamed Polypemón of Damastes. He possessed a bed upon which he forced his guests to sleep, and if they were too tall to fit it he had their limbs chopped off, whereas, were they too short he had them stretched. The monster was outwitted by Theseus, who made him suffer of the same bed and slew him at Ereineis. The 'bed of Procursters' has thus become a proverbial expression. Another version represents him as having two beds: the one long, the first for tall visitors and the second for short ones. Consult Plutarch, 'Lives' (in 'The Loeb Classical Library,' Vol. I, London and New York 1914).

PROCKER, prôk'ter, Adelaide Anne, English poet, daughter of Bryan Waller Procter (g.v.): b. London, 30 Oct. 1825; d. there, 3 Feb. 1864. Her first verses were published in the 'Book of Beauty' in 1843. In 1853 she began to contribute to Household Words under the pseudonym 'Mary Berwick,' and attracted much attention, gaining in particular the favorable notice of Dickens, who did much to aid the young poet. While her work is not great it is marked by deep feeling and tenderness. Her poems with few exceptions first appeared in either Household Words or All the Year Round. She became a Roman Catholic in 1851. In 1859 she was appointed by the National Association for the Promotion of Social Science a member of a committee to consider new ways of providing employment for women, having always been interested in social questions affecting women. Her collected poems were published under the title 'Legends and Lyrics' (1858), the 10th edition of which (1866) contains a biographical sketch of the author by Charles Dickens. Many of her poems have received a musical setting, the most famous being 'The Lost Chord,' which was set to music by Sir Arthur Sullivan.

PROCKER, Bryan Waller, 'BARRY CORNWALL,' English poet: b. Leeds, 21 Nov. 1787; d. London, 5 Oct. 1874. He was educated at Harrow, subsequently studied law in London, and in 1831 was called to the bar of Gray's Inn. For many years he held the office of commissioner of lunacy, resigning in 1861. He had a particularly amiable disposition and a wide acquaintance among literary men, being especially friendly with Leigh Hunt and Charles Lamb. His first appearance in literature was in 1819, when he published 'Dramatic Scenes and Other Poems,' under the pseudonym of 'B. Cornwall,' and afterwards 'All the Year Round.' Later works were 'A Sicilian Story' (1821); 'Marcian Coloma' (1820); 'Mirandola' (1821), a tragedy performed with great success at Covent Garden; 'The Flood in Thessaly' (1823); 'English Song and Other Small Poems' (1832). His prose includes 'Effigies Poeticæ, or the Portraits of the British Poets' (1824); 'Life of Edmund Kean' (1835); 'Essays and Tales' (2 vols., Boston 1853); 'Charles Lamb; a Memoir' (1866). He will be longest remembered as a song writer, but even so his work has been somewhat overrated. He edited 'The Works of Ben Jonson, with Memoir' (1838); 'The Works of Shakespeare, with Memoirs and Essay on his Genius' (1843); 'Essays of Elia, with a Memoir of Lamb' (1879), and together with J. Foster 'Selections from Browning' (1863). Consult 'Bryan Waller Procter, an Autobiographical Fragment and Biographical Notes' (ed. by Coventry Patmore, 1877).

PROCKER, John Robert, American civil service reformer: b. Mason County, Ky., 16
March 1844; d. Washington, D. C., 12 Dec. 1903. He was educated at the University of Pennsylvania, but left there to join the Confederate army in 1863 and served until the end of the war. In 1873 he succeeded E. W. Davis as assistant professor in the Kentucky geological survey, and in 1880 State geologist. In this office he was brought into contact with the spoils system, to which his opposition was so uncompromising that he finally lost his position in 1885. In the same year he was appointed president of the Civil Service Commission, a post which he held till his death. His criticism of the spoils system was based not only on its evil moral and social effects, but also on its absurdity as a method of conducting business. This view he constantly presented most effectively. His work as president of the commission was the means of increasing the effectiveness of the civil service, and of gaining for it recognition in political life. He served as a member of the Jury of Awards at the Chicago World’s Fair and was a frequent contributor to magazines and journals on geologic, economic and political subjects.

PROCTOR, prok’tor, Alexander Phimister, American sculptor: b. Ontario, Canada, 27 Sept. 1862. Soon after his birth his parents moved to Colorado where he was educated, studying later in New York art schools. He was the pupil of Puech and Ingalbert at Paris, and was awarded the Rinehart Paris scholarship. He has been a frequent exhibitor at expositions and has been awarded the following medals: Designers Medal, Chicago Exposition, 1893; Gold Medal, Paris 1900; Gold Medal, Saint Louis 1904; Gold Medal, Panama Pacific Exposition 1915. In 1904 he was made a member of the National Academy. Most of his works are representations of wild animals of which he has made a very close study by spending since early youth much time in hunting on the western plains and mountains. As a painter he was associated with Remington. His reputation is high and he was appointed a member of the sculpture jury at the Paris Exposition of 1900 and at the Pan-American Exposition of 1901 at Buffalo, and a member of the Panama Pacific Exposition jury in 1915. Among his works were the quadriga which he furnished for the United States pavilion at the Paris Exposition of 1900 and which was much admired. Others of his sculptures may be seen in the parks of New York, Denver and Pittsburgh. The lions on the McKinley Monument in Buffalo were designed by him. Other works by him are in the Saint Louis Art Gallery and in the New York Metropolitan Museum of Art. Consult Nelson, W. F. de B., Phimister Proctor: Canadian Sculptor (in Canadian Magazine, Vol. XLIV, p. 495, Toronto, 1915); Taft, L., 'A. Phimister Proctor' (in Brush and Pencil, Vol. II, p. 241, Chicago 1898).

PROCTOR, Edna Dean, American poet: b. Hemmker, N. H., 18 Sept. 1829. She was educated in Concord, has traveled extensively in Europe and has been widely admired for her poetic talent. Among her works are 'Poems' (1866); 'Poems' (Boston 1890); 'The Song of the Ancient People' (Boston 1893); 'Mountain Maid and Other Poems of New Hampshire' (Boston 1900); 'Songs of America and Other Poems' (Boston 1905); 'The Glory of Toil and Other Poems' (Boston 1916). Her only prose work, 'A Russian Journey' was first published in 1872, but revised editions have been brought out in 1890 and 1899. She has also contributed to various magazines.

PROCTOR, Redfield, American politician: b. Proctorsville, Vt., 1 June 1831; d. Washington, D. C., 4 March 1908. He was graduated from Dartmouth in 1851, and from the University of Michigan Law School in 1860. He practised law a short time and in 1861 entered the Federal army as lieutenant; was soon promoted major and was mustered out as colonel. After a few years' law practice he devoted himself to business, acquiring large interests in marble quarries in Vermont. He began political life as a Republican member of the lower house of the Vermont legislature, being first elected to that body in 1867, and again in 1868 and 1888; he was a member and president pro tem. of the State senate in 1874 and 1875; in 1876 he was elected lieutenant-governor, and in 1878 governor of the State. During his administration he brought about several reforms in the State finances and system of taxation. In 1898 he was chairman of the Vermont delegation to the Republican National Convention, and again in 1896. In 1899 he was appointed Secretary of War by President Harrison, and gave especial attention to the improvement of coast and border defenses. In 1891 he resigned his secretariatship to accept the appointment to the United States Senate for the unexpired term of Senator Edmunds, resigned, and in 1892 was elected to the Senate for the six years' term. In 1898 and 1904 he was re-elected. In 1908 he visited Cuba to investigate conditions in the island, and on his return delivered a speech in the Senate in regard to the reconstrados, which aroused the attention of the whole country. The facts presented by him were also influential in determining the policy of intervention in Cuba by the United States. Consult Proctor, W. L., and Mrs. W. L. Proctor, 'A Genealogy of Descendants of Robert Proctor of Concord and Chelemsford, Mass.' (Ogdensburg, N. Y., 1898); 'Redfield Proctor: Addresses' (in Senate Document, No. 764, 60th Congress, 2d Session, Washington 1909).

PROCTOR, Richard Anthony, English astronomer: b. Chelsea, 23 March 1837; d. New York, 12 Sept. 1888. He was educated at King’s College, London and Cambridge, and began to read for the bar, but in 1853 took up with enthusiasm the study of astronomy and mathematics. In 1866 he was elected a Fellow of the Royal Astronomical Society, and in 1872 one of its honorary secretaries and editor of its publications. He resigned these positions in 1873 and made a lecturing tour through the country. As a lecturer he became at once popular, having in eminent degree the gift of lucid exposition. A second tour to the United States in 1879 and a tour to Australia were followed by a second magnetic and geological expedition to Spitsbergen. He returned to the United States in 1881. In the same year he founded at London Knowledge, a scientific weekly, which in 1885, became a monthly. In 1887 he moved to Florida. He did much to popularize astronomy. His works include 'Saturn and His System' (1865); 'Handbook
of the Stars' (1866); 'Half-hours with the Telescope' (1868); 'Other Worlds Than Ours' (1870); 'Light Science for Leisure Hours' (1871); 'The Sun' (1871); 'Elementary Astronomy' (1871); 'Orbs Around Us' (1872); 'Essays in Astronomy' (1872); 'The Expanse of Heaven' (1873); 'The Borderland of Science' (1873); 'The Moon' (1873); 'The Transit of Venus' (1874); 'Our Place among Infinities' (1875); 'Myths and Marvels of Astronomy' (1875); 'The Universe of Stars' (1878); 'Flowers of the Sky' (1879); 'The Poetry of Astronomy' (1880); 'Easy Star Lessons' (1882); 'Familiar Science Studies' (1882); 'Mysteries of Time and Space' (1883); 'The Great Pyramid' (1883); 'The Universe of Suns' (1884); 'The Seasons' (1885); 'How to Play Whist' (1885); 'Other Suns Than Ours' (1887); 'Half Hours with the Stars' (1887).

**Proctor (Lat., procurator), one who acts on another's behalf. It has in England thence and at Oxford they are (a) in the canonizations of the two ecclesiastical provinces, Canterbury and York, respectively, the official who represents the lower clergy and the capillary bodies of cathedral and collegiate churches; (2) a person who manages the business of an ecclesiastical court or in a court of admiralty; owing to changes in the administration of law, made in 1873 and 1875, the business formerly confined to proctors may now be conducted by solicitors; (3) in the universities of Oxford and Cambridge, two proctors in each term are charged with the duty of preserving the peace and repressing disorder among the students; to this end they are empowered to inflict summary punishment and are assisted by a number of pro-rectors and special constables. Their rights and duties of the proctors are more extensive at Oxford than at Cambridge, inasmuch as at Oxford they are ex officio members of all important committees and supervise all business transactions of the University. Both at Cambridge and Oxford they are elected by the officials of the several colleges.

**Proctor, vt., village in the township of the same name, Rutland County, five miles northwest of Rutland on the Rutland Railroad. Some of the largest marble quarries in the world are located in the district and there are marble finishing works. Pop. township, 2,481; village, 2,750.

**Procurator, among the ancient Romans, an agent, steward, or overseer of an estate; at a later period the title of a provincial officer (see Province and Proconsul), who managed the revenue. In some of the small provinces, or in a part of a large province, the procurator discharged the office of a governor, and had the power of punishing capitaly, as was the case with Pontius Pilate in Judaea, which was attached to the province of Syria. Procurator, in monasteries, is the conventual to whom is entrusted the care of the temporal concerns. Procurator di San Marco was the title of the chief officers or senators in the Venetian republic. Besides the nine actual procurators among whom the doge was chosen, there were also many titular procurators, who paid a great sum for his title, which was much coveted by the Venetian patricons on account of the rank it conferred.

**Procurator-fiscal, the public prosecutor in criminal cases which come up in Scotland before the sheriff, magistrates, or justices of the peace belonging to his district. He also performs duties corresponding to those usually performed by coroners. Only when the public interest is concerned must he originate a prosecution; and when complaint is made by a person in a case in which the private interest of the complainant is rather at stake than the public interest, the procurator-fiscal merely give his concurrence to the prosecution, and not institute the proceedings. He may, however, act as the complainant's agent; but even when he does so, if he only gives his concurrence, he is not liable to an action for malicious prosecution.

**Prodicus, Greek sophist: he came from Julius in the island of Ceos and was a contemporary of Socrates. He is known only as the author of an apologue of 'Hercules and the Two Paths,' quoted by Xenophon, in which the young hero, having reached the hard path of duty and turns his back on the flowery but dangerous path of pleasure. The Greek text of this work is to be found in 'Epicteti Euchridion' (pp. 99-107, Oxford 1804). There are also two English translations of it: 'The Choice of Hercules' (translated by Bishop Lowth, in Roach J., Roach's Beauties of the Poets, etc., London 1794); and 'The Judgment of Hercules' (translated by Layng, P., Eton 1748). Consult Compagno, E., 'De Prodocio Ceo,' etc. (Paris 1857); Kleemann, A. K. von, 'Poros und Prodikos' (in 'Wiener Eranos,' p. 38, Vienna 1909); Weiker, 'Prodikos von Keos' (in 'Rheinisches Museum der Philologie,' Vol. I, pp. 1-39 and 533-545).

**Producer. See Internal Combustion Engine.

**Production, in political economy a division covering the source and progress of the creation of wealth as constituted in the production of articles having an exchangeable value; the word in this sense covering one of three divisions of which the others are distribution and consumption. The division deals with the process of production, circumstances favorable or unfavorable to it and the factors governing it, labor, land and capital. See Political Economy.

**Production, Cost of. See Political Economy.

**Proetus, pró'tís, in Greek mythology, king of Tiryns. According to Ovid he founded the kingdom after making peace with his twin-brother, Acrisius, who had driven him out of Argo. The tragic legend concerning him deals chiefly with the fate of his three daughters, the Proctide. These, rendered mad by Hera or Dionysus, wandered through the Peloponnesus, in time communicating their frenzy to other women, so that they killed their children. One of the three sisters died, the other two were healed by the seer Melampus, who married one and was given a share in the kingdom, his brother, Bias, receiving also a share and marrying the other daughter.

**Profanity. See Blasphemy; Swearing, Profane.

**Profert, in law, an exhibition of a record or paper in open court. When either
parties, alleges any deed, he is generally obliged
by a rule of pleading, to make proof of such
deed; that is, to produce it in court simultane-
ously with the pleading in which it is alleged.

PROFESSIONAL EDUCATION. See Education, Professional.

PROFESSIONAL AND TECHNICAL SCHOOLS. See Education, Higher; Educa-
tion, Professional.

PROFESSIONAL WOMAN'S LEAGUE,
The, an association founded and incorporated
in New York in 1893, and composed of women
engaged in the dramatic, musical, and literary
professions. The dues are $7.50 per annum;
the league holds a bazaar each year, gives oc-
casional entertainments during the winter sea-
sion and holds four regular meetings each month.
Its headquarters are in New York City.

PROFESSOR, The, a novel by Charlotte
Brontë, published in 1857. It was the first fic-
tion that she produced but it failed to find a
publisher until after her death. "The plot in
itself is of no great interest," remarks Mrs.
Gaskell, the biographer of Charlotte Brontë,
but adds, "one or two of the sketches of por-
traits which she has given in 'The Profes-
sor,' nor, in grace of womanhood, ever sur-
passed one of the female characters there de-
scribed." Consult MacDonald, F., 'Charlotte
Brontë's Professor' [in 'Cornhill Magazine',
n.s. Vol. XXXV, p. 519, London 1913].

PROFESSOR AT THE BREAKFAST
TABLE, The, a work by Oliver Wendell
Homes (q.v.), first published serially in the
Atlantic Monthly in 1859. It was published in
book form in 1860 and has run since then into
many editions. It furnishes a sequel to the
well-known 'Autocrat of the Breakfast Table,'
which it resembles in tone and construction.
Consult Ives, G. B., 'A Bibliography of Oliver
Wendell Holmes' (Boston 1907); Morse, J. T.
Jr., 'Life and Letters of Oliver Wendell
Homes' (2 vols., Boston 1896).

PROFIT. See Capital.

PROFIT SHARING, a method by which
wage-earners receive a share of the profits
of an industry in addition to wages. Strictly speak-
ing, profit sharing implies that the bonus shall
be given to workmen individually; but benefits
and insurance, social and educational funds
maintained out of the profits of a business are
modified forms of profit sharing. Many sys-
tems of profit sharing also provide for the em-
ployees obtaining share in the capital stock on
special terms, thus becoming part owners of the
industry. Profit sharing comes from co-opera-
tion (q.v.), in that it is not democratic; both
the initiative in establishing a system of profit
sharing and the control of the industry rests
with the employer. It is regarded, however, as
a step toward co-operation. The International
Congress on profit sharing in 1889 defined profit
sharing as "an agreement freely en-
tered into by which the employer recei-
ved a share of the profits determined in advance."9
The arguments advanced in favor of profit
sharing are (1) its justice; inasmuch as labor
is equally necessary with capital to the welfare
and success of an industry, it should
justly receive a part of the profits; (2) its
practical effect; it tends to interest employees
in their work, to increase their efficiency and
their care of property. There are two lines of
opposition to profit sharing: (1) From the em-
ployers, who claim that it is unjust that labor
should share in the profits, while the employer
share in the loss or risk of the business; and
that profit sharing does not necessarily result
in increased efficiency; and (2) from the work-
men who claim that their freedom is restricted,
especially as in many instances a long term of
employment and sometimes restriction of labor
organizations are involved in a profit-sharing
system; and that they obtain no compensating
share in the management or control of the in-
dustry. Profit sharing has been successful in
many industries, especially where the labor is
skilled and wages large in proportion to total
cost of production; on the other hand, many
attempts to establish a profit-sharing system
have failed, owing sometimes to industrial de-
pression, sometimes to a trial too short to give
fair results and sometimes to change in manage-
ment. In the United States between 1889 and
1896, 50 firms had made trial of profit sharing;
In the latter year, only 12 continued it perma-
nently and five had abandoned it. Between
1900, there were 23 firms with a system of
profit sharing, 12 of which had adopted it
within the year 1899-1900. In 1916 there
were in operation in the United States 60 industrial
and mercantile establishments with profit-sharing
plans.

France formerly outranked other nations in
the number and importance of successful profit-
sharing enterprises. Among the more impor-
tant ones are Maison Leclaire (1842) (painter),
the Godin Furniture at Guise and the Lyon Marché (q.v.);
France can still claim to have
been the leader in the establishment of profit-
sharing. In numbers, however, it is now outran-
ged by Great Britain. In 1913 there were
141 profit-sharing plans in existence in the latter
country, against about 115 in France in 1912.
Other countries having establishments with profit-sharing plans of one type or another are
Germany, Holland, Switzerland, Italy, etc.
Among the most important profit-sharing estab-
lishments of the United States are the Nelson
Manufacturing Company of Saint Louis,
Mo., the Eastman Kodak Company of Roch-
ester, N. Y., the Underwood Typewriter Com-
pny of New York City, the Ward Baking Com-
pany of New York City and Sears, Roe-
buck and Company of Chicago, Ill. The Nel-
sion Company established its system in 1886,
which, besides the direct sharing in profits by
the employees, provides for the payment of
sickness and accident benefits by the company
as a part of the costs of the business; the em-
ployees are also encouraged to buy stock in the
company. In 1896 an agreement was made by
which the employees of the cabinet-making shop
were to gradually purchase and take the man-
agement of that department; by 1902 they had
sole control. The Proctor and Gamble Com-
pny introduced profit-sharing in 1887; the ar-
rangeent was that the employees should re-
ceive a share in the net profits in the propor-
tion that wages bore to the whole cost of
production. The fact that approximately 90 per
cent of the company's employees are largely unskilled labor with low wages and re-
ceived the new arrangement with indifference
made the management of the system particularly
difficult. An improvement was made by classi-
fying the employees into four groups in regar
to interest in work, excellence of work and care of machinery and tools; the best in accommodation with this the regular dividend, the second group, including the greater number of the employees, the regular dividend, the third group one half the dividend, and the fourth none at all. Since then, changes have been made so that this concern cannot be any longer called a true profit-sharing establishment. In 1903, the United States Steel Corporation adopted direct profit sharing for its more responsible employees and a system whereby any of its employees may acquire stock on easy terms and as long as they remain in the employ of the company, may receive a bonus of $5 a year extra for each share after the first five years. Many other important industrial concerns in the United States have introduced modified or limited profit-sharing plans, among them being the Ford Motor Company, the Studebaker Corporation, etc. The most exhaustive study of profit-sharing in the United States was published by the United States Department of Labor, Bureau of Labor Statistics, Bulletin No. 208, Miscellaneous Series No. 13 (Washington 1916). It also contains a very full bibliography of the very extensive literature on the subject. Consult Adams, H. B., ed., 'History of Co-operative Enterprise in the United States' (in Johns Hopkins University Studies in Historical and Political Science, Vol. VI, Baltimore 1888); Adams, T. S. and Sumner, H. L., 'Labor Problems' (New York 1905); Aves, E., 'Co-operative Industry' (London 1907); Böhmert, V. PROGRESS, the advancement of the world, most material and material, as exhibited in history. Physical science, which has so recently demonstrated the gradual improvement of material types in the animal and vegetable world, has compelled metaphysical speculation to conform its general principles to the axioms formulated by physical observation and experience. The result of science, of historical inquiry, of inductive activity in every area of investigation may favor neither optimism nor pessimism. They have brought into philosophy a third term, and that is meliorism, a term employed to denote a doctrine to the effect that man has in fact not been worse off, and that one can controvert it. Meliorism embodies the truth that as far as human experience and observation can extend there has been improvement in things, progress in the universe, advancement in the world. Pessimism becomes a contradiction in terms; for the physicist in his laboratory, the historian in his study, the sociologist in his inquiry among men, declares that things have been once worse than they are now, and that from the flower in the field to the beast in the stall, and from the beast in the stall to the working man, the ruler and the general condition of nations, things have been growing better. The lapse of centuries shows a sensible amelioration in the lot of humanity. The slave has been enfranchised, woman has been raised and enlightened, the rights of labor have been more and more recognized. These, however, are only social and political examples of that universal amelioration and progress by which a nebula is changed into a star, and a star into a people and a human consciousness. Meliorism is the principle that underlies all existence, organic or inorganic, and comprehends in its widely extending connotation the discovery of drugs that abolish pain, of economic institutions that diminish poverty, of intellectual institutions that make ignorance and incompetency more and more rare and of tolerance and enlightenment which give more and more freedom to the creeds, tastes and idiosyncrasies of individual men. In whatever direction we look over the field of human activity we see this improvement manifesting itself, and the phenomena which are the basis of meliorism furnish the best argument for that hopeful optimism which, as many believe, alone can give the mind a philosophical creed that renders life tolerable.
deductions from experiment and observation, in the whole world of material, social and political phenomena. See Meliorism.

PROGRESS OF POESY. The 'Progress of Poesy,' written by Gray, was published, together with 'The Bard,' in a volume entitled 'Pindaric Odes,' printed at Horace Walpole's famous Strawberry Hill Press in 1757. Both poems are odes in the strict Pindaric form, consisting of strophes of turn, antistrophes of antiphon, and epoede or stand, twice repeated. Gray has made the three corresponding parts of each of the three divisions identical in metrical form, thus giving the poems a symmetrical though complicated verse structure. In the piece under discussion Gray sings in exalted language first of the various sources of poetry, then of the power of harmony to lull the fiercer passions, to impart all graces of motion to the body, to compensate for the ills of life, and to adorn the mind of virtue. He then traces scholarly fashion but always with the rapt enthusiasm of the ode, the progress of poetry from Greece to Italy and from Italy to England, describing in picturesque and suggestive language the three greatest English poets, who were his predecessors, viz.: Shakespeare, Milton and Dryden, alluding modestly to his own effort to wake the loftier tones of verse which have long been silent. The Pindarics were censured in their own time for their obscurity, and Gray was compelled to add explanatory notes. Even so they fell upon deaf ears. To-day they are recognized as indubitable classics, the carefully wrought work of a true poetic genius in whom learning and critical judgment go hand in hand with inspiration. Consult 'Selections from Gray' (edited by W. L. Phelps, The Athenaean Press Series); 'English Poems of Gray' (edited by D. C. Tovey); essay on Gray by Matthew Arnold, 'Essays in Criticism' (2d series).

JAMES H. HANFORD.

PROGRESS AND POVERTY, a famous work by Henry George, written in 1877-79. The manuscript was declined by publishers, but finally D. Appleton and Company agreed to publish the book if the author would bear the cost of publishing the plates. The proofs were made under the author's personal supervision in San Francisco. Before being shipped east, late in 1879, an 'Author's Proof Edition' of 500 copies was struck off. The first regular edition was brought out in January 1880. It soon went through many editions, both in the United States and England. It has also been translated into almost every modern language and it is claimed that more than 2,000,000 copies have been sold. The best recent edition is the 25th anniversary edition (New York 1916).

The author seeks in this work to solve a problem and prescribe a remedy. The problem is: 'Why, in the midst of a marvelous progress, is grinding poverty on the increase?' The remedy is to nationalize the land, to make it public property; leaving that already in use in the possession of those holding it, but confiscating the rent and abolishing all other forms of taxation. Though the principles established by the book were not altogether original, but more or less in line with the leading ideas of the school known as Physicocrates (q.v.), they had never before received an equally lucid and popular treatment in the English language.

They gave origin to the so-called Single-Tax movement (q.v.), a school of economic philosophy which has still many adherents. Consult Dixwell, G. B., 'Progress and Poverty: A Review of the Doctrine' (London 1882); George, H., Jr., 'The Life of Henry George' (New York 1900); Longe, F. B., 'Progress from Poverty, etc.' (Chicago 1887); Taylor, E. R., 'Henry George, the Man' (in 20th Century Magazine, Vol. VI, p. 13, Boston 1912); Tombee, A., 'Progress and Poverty: A Criticism of Mr. George' (London 1883).

PROGRESSION, in mathematics, a series or sequence of terms such that each quantity bears the same mathematical relation to the preceding. This relation may be either that of a difference or of a ratio; the first case is that of the arithmetical progression, the second that of the geometrical series.

In an arithmetical series each term is derived from the preceding by adding to it a constant, called the difference, which may have a plus sign or a minus sign, so that the series may either increase or decrease. In the accepted notation of the arithmetical progression, a is the first term, n the number of terms, d the difference, and l the last term. The value of the last term or of any (the nth) term may be determined from the formula \( l = a + (n - 1)d \), which is merely a notational statement of the evident fact that the coefficient of \( d \) in any term will be less by one than the number of term, so that the nth term must be the sum of the first term and of the difference taken \((n - 1)\) times. Letting \( s \) stand for the sum of \( n \) terms we may write in ascending or descending order:

\[ s = a + (a + d) + (a + 2d) + \ldots \ldots \ldots \ldots \ldots \ldots + (l - d) + l, \text{ or } s = a + (l - d) + (l - 2d) + \ldots \ldots \ldots \ldots \ldots \ldots + (a + d) = a. \]

Adding these two equations we get the equation, \( 2s = 2a + (a + d) + (a + d) + \ldots \ldots \ldots \ldots \ldots \ldots + (a + d) + (a + d) \), or \( 2s = n(a + l) \), it being evident that the factor \((a + l)\) occurs \( n \) times in the second term of the preceding equation. The formula for the sum will then be \( s = \frac{n(a + l)}{2} \).

Hence, if three of data are given as to an arithmetical series, that is, three of \( a, d, n, l, s \), the fourth (and the fifth, in general) can be found by the regular processes of algebra. Moreover the arithmetical mean between two numbers, being the mid-term in a series in which the number of terms is odd, will be one-half the sum of the two numbers.

A geometrical progression is a series in which each successive term is derived from the preceding by multiplying it by a constant, called the ratio, which may be less or greater than unity, so that the series may decrease or increase, or may be either plus or minus, so that the terms may be either similar or constantly changing in sign. In the accepted notation of the geometrical progression, \( a \) is the first term, \( r \) the common ratio, \( l \) the last (or nth) term and \( s \) the sum of the series or of the terms. The formula for \( l \), the nth term, since the exponent of \( r \) increases by one in each term will be \( l = ar^{n - 1} \).
To derive the formula for the sum of \( n \) terms, get the difference of the two self-evident equations,
\[ s = a + ar + ar^2 + \ldots + ar^{n-1}, \quad \text{and} \quad rs = ar + ar^2 + \ldots + ar^{n-1} + ar^n. \]
The difference is \( rs - s = ar^n - a \), or \((r - 1)s = a(r^n - 1), \quad \text{or} \quad r - 1 \)
With any three of the quantities given in these two formulas the other two may be derived by
the use of quadratic equations (and in one instance of logarithms). An interesting variation of
the problem of the summation of a geometric series is to find the value of a repeating decimal or
repetend; as, for example, to find the value of
\[ \frac{54}{11} = \frac{544}{111}. \]
Here \( a = 54, \quad r = .01, \quad \text{and} \quad n = a \). As \( n \) increases without limit, the value of \( l \) approaches zero; hence in the formula for
the sum,
\[ \frac{54 - a}{1 - r} \]
the sum \( r \) becomes negligible, and the
formula takes the form \( \frac{54}{1 - r} = \frac{54}{1 - .01} = \frac{54}{.99} = 54.6 \)
ing the values above we have \( \frac{54}{1 - .01} = 54.6 \).

A harmonical progression is a series in
which the reciprocals of the terms form an
arithmetical series. Any problem relating to
harmonical progressions may therefore be
treated as problems in arithmetical progression
by the mere inversion of each term. See

**PROGRESSIVE PARTY.** The. In the
half century following the Civil War four
serious disagreements threatened to break up
the political homogeneity of the Republican
party. In the order of their occurrence these
were the Liberal Republican movement of 1872,
the Mugwump party of 1884, the silver issue of
1890 and the progressive movement of 1912.
The last named was by far the most serious and
took its rise in the nineties, being at first largely
an agrarian movement in the Middle West.
Many prominent members of the Republican
party felt that their party in the state and
national legislatures was dominated to a
dangerous degree by the great corporations,
including the railroad companies. The progres-
""
tion of the convict contract labor system; protec-
tion against the hazards of sickness, irregular
employment, and old age through a system of social insurance; establishment of public con-
tinuation schools; the organization of workers, men and women, as a means of protecting their interests.

National regulation of interstate corporations through a strong Federal administrative commission.

The appointment of diplomatic and consular officers solely with a view to their special fitness and worth.

A protective tariff to equalize conditions of competition between the United States and foreign countries, both for the farmer and manufacturer, and which shall maintain for labor an adequate standard of living; an immediate downward revision; a non-partisan scientific tariff commission; the repeal of the Canadian reciprocity act.

Full and immediate inquiry into the high cost of living.

The improvement of the national currency system.

Conservation and national control of natural resources.

Development of our rivers, especially the Mississippi and its tributaries.

Use of the Panama Canal for American benefit, free from control of American railroads, and American coastwise trade to be exempt from tolls.

Public ownership of the natural resources of Alaska.

Equal suffrage to men and women.

Limitation of campaign contributions and expenditures.

Registration of lobbyists; prohibition of Federal appointees from holding office in state or national political organizations.

Restriction of the power of the courts.

Restriction as to injunctions and contempt proceedings in labor disputes.

Establishment of a Department of Labor.

The re-establishment of the Country Life Commission; development of agricultural credit and co-operation.

Establishment of a centralized National Health Service.

Revision of the patent law.

Power to value the physical property of railroads by the Inter-State Commerce Commission; abolition of the Commerce Court.

Construction of national highways; extension of the rural delivery system.

A graduated inheritance tax, and ratification of the income tax amendment to the Constitution.

Judicial and other peaceful means for settling international differences; an international agreement for the limitation of naval forces.

Protection of the rights of American citizenship at home and abroad.

Increased care of our immigrant population.

A wise and just policy of pensioning American soldiers and sailors and their widows and children.

Creation of a parcels post.

Extension and strict enforcement of the Civil Service Law.

Readjustment of the business methods of the national government.

Protection against worthless investments by means of new legislation creating governmental supervision.

The campaign that followed will not soon be forgotten by the generation that witnessed it. Great numbers of Republicans allied themselves with the new party and at the election, Roosevelt, the Progressive, received 4,126,020 votes, as compared with the 3,483,922 votes cast for Taft, the candidate of the stand patters. California, Michigan, Minnesota, Pennsylvania, South Dakota and Washington were carried by the Progressives, totalling 88 votes in the electoral college, while only Utah, with eight electoral votes remained in the Republican column. The elections of 1914 showed a drift of the Progressives back to the old party, with the exception of California where a heavy Progressive majority was rolled up. By 1915 many Progressives felt that their party had served its purpose by defeating the reactionary elements of the old party and the breach was almost healed during the presidential campaign of 1916, in which Mr. Roosevelt, the leading Progressive, supported Mr. Hughes.

That perfect harmony did not prevail, however, was shown when the electoral vote of California was thrown to Wilson because of differences between Hughes and Johnson supporters in that State. The California elections of 1916, however, showed that the breach had been closed and the Republican party again presented a united front to its doubtful enemy, the Democrats. (See Republican Party.)

EDWARD C. CARRINGTON.

PROGRESSIVES, The. The term "Progressives," or more popularly, "Insurgents," was applied originally to those Republican Congressmen who contended that the electorate should itself elect the Committee on Rules, instead of allowing the Speaker to appoint a committee. These efforts, continued through several years, were finally successful on 17 March 1910, when such a change was ordered and the committee enlarged from five to ten members.

The name "Progressives" then assumed new importance and was applied especially to members of the Republican party in both branches of Congress who supported the nomination of President Taft on several questions, notably the tariff, or who took what was generally considered advanced or "progressive" ground on other leading public measures. They have therefore added to their repertoire of policies and achievements, and been considered sponsors for, or at least leading advocates of, many important public measures. The success of the Progressive movement not only almost reversed the political control of Congress in the elections of 1910, but paved the way for the
formation of the Progressive Party (q.v.) in 1912, and largely shaped the Democratic platform in the same year.

PROHIBITION, used in a special sense, means the interdiction by law of the manufacture and sale of intoxicating liquors for use as beverages. Various forms of regulation or control over the liquor traffic have been adopted from time to time, but prohibition is the most drastic of them all. A prohibition wave swept over the Northern States about the middle of the 19th century, beginning in Maine, where the first State-wide prohibition law was enacted in 1846. A more stringent law was enacted in 1851 in the same State, and subsequently a prohibition amendment to the State constitution was adopted. Up to 1900, 16 States had adopted State-wide prohibition, but the wave had receded so that, by that year, only three States—Maine, Kansas and North Dakota—still remained in the prohibition column.

The recession of the prohibition wave indicated that the movement had proceeded too rapidly and that the goal must be won by slower steps. State-wide prohibition in many States undoubtedly was contrary to the wishes of a considerable minority of the people throughout the State and probably of a majority of the people in certain localities of the State. It is axiomatic that, in a democracy, sumptuary legislation is difficult to enforce unless supported by public opinion. Consequently, the line of least resistance in the movement for effective prohibition lay in introducing it only in those localities where the majority of the people favored it. This plan is carried out through what is known as local option, which is found in all but a few States where State-wide prohibition has not been adopted. Local option represents an effort to adjust the State liquor law to the sentiments and wishes of the majority of the people in particular localities. It enables such local majorities to vote out the open saloon from their neighborhoods. States allowing local option, some or all of the various political subdivisions, such as townships, precincts, cities, villages and counties, are given the privilege of voting out the saloon. Local officials, such as city councils, are also given by law in some States the authority to license, regulate or prohibit the sale of intoxicating liquor within their jurisdictions. As a result of the spread of local option, a number of States not having State-wide prohibition are largely dry. Such dry territory in local option States, however, is only relatively dry. Where wet and dry townships or counties exist side by side in the same State, the introduction of liquor into dry territory from adjoining wet territory is difficult and expensive. Open sale of liquor in dry territory is usually prevented, but clandestine sales undoubtedly continue to be made to a considerable extent.

The comparative failure of local option in bringing about thorough prohibition has been offset by a more effective enforcement of State-wide prohibition laws and constitutional amendments. Various prohibitory liquor laws of a partial character have been enacted in a number of States. Thus, we find large areas having saloons open on Sundays, election days, or after certain hours, and prohibiting the sale of liquor within a certain distance of educational and religious institutions. Congress has also prohibited the sale of liquor in the District of Columbia and on Indian reservations. Partial laws, however, have not been considered sufficient, and recently a new movement for State-wide prohibition has been under way, beginning with the enactment of the Georgia law in 1907. This movement spread especially in the South and West, so that, by the year 1918, more than half of the States had in force State-wide prohibitory liquor laws or constitutional provisions. Dry States have experienced difficulty in enforcing their prohibition laws for various reasons. Too often they have depended largely on local officers to enforce the State law and such officers have frequently been influenced by anti-prohibition sentiment in the localities either to ignore the law or to enforce it in a very lax and inefficient manner. This difficulty has to some extent been avoided in a few States by the provision of special State machinery of enforcement. But, in North Dakota, an act almost blanking the governor of the State, providing for the appointment of an enforcement commissioner to enforce the prohibition law was declared unconstitutional by the Supreme Court of the State on the ground that it violated the reserved right of the people to have such laws enforced by officers of their own selection. Difficulty in enforcing the State-wide prohibition laws has also been experienced on account of the inability of the States to prevent the introduction of liquor from wet States through the channels of interstate commerce, over which the States have no direct control. Congress, however, has done what it could to remedy this difficulty and to enable the dry States to enforce their prohibition laws. Thus, under the Wilson Original Package Act of 1890, all intoxicating liquor transported into any State was made, upon its arrival, subject to the operation of the laws of such State enacted in the exercise of its police powers. The Webb-Kenyon Act of 1913 prohibited the shipment from one State into another of intoxicating liquor intended to be used in any manner in violation of State law. The Webb-Kenyon Act is strengthened by a recent act of Congress prohibiting the solicitation of orders for liquor in dry States and forbidding the carriage through the mails and forbidding any person to order or cause intoxicating liquor to be transported in interstate commerce for beverage purposes into any prohibition State.

For some time the Prohibition Party, the Anti-Saloon League of America and other organizations have been working for national prohibition. The outbreak of the European War and the entrance of the United States into it strengthened their efforts and brought the movement to a head. In order to increase the efficiency of the fighting forces, it was made a punishable offense to sell intoxicating liquor to soldiers or sailors. Since the successful prosecution of the war depends not only on the efficiency of the fighting forces, but also on that of the civil and industrial population, it was argued that prohibition should be extended to the nation. Accordingly a resolution was introduced in Congress proposing a prohibition amendment to remain in force in the United States. In December 1917 this resolution passed Congress by the necessary two-thirds ma-
jority in both houses. The language of the proposed amendment is as follows:

"Section 1. After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, or between any of the States, or any article in contemplation of such manufacture or transportation, or of any article contained in vessels navigating the waters of the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited."

"Section 2. The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation."

"Section 3. This article shall be inoperative unless it shall have been ratified by the legislatures of the several States, as provided in the Constitution, within seven years from the date of the submission by the Congress of the States by the Congress."

In 1919 this proposed amendment had been ratified by 45 States. See PROHIBITION PARTY.

J. M. Mathews.

PROHIBITION PARTY. The. When the Prohibition idea rose to prominence, prior to the Civil War, the idea of its support through political action was not wholly absent. When the Republican party was formed, it was by many regarded as the party of Prohibitionists, and James G. Blaine so speaks of it in one of his early editorials. Myron H. Clark was elected governor of New York in 1856, almost directly on the prohibition issue, and there was in that campaign in New York State "a large element of the framers of the party."* With the Civil War the prohibition question was largely pushed out of the public mind and, during the war or the years which immediately followed it, a large number of States which had adopted prohibition went back to the license policy. Further, the liquor power was organized by the revenue taxation policy adopted by the Federal government, and the brewer for the first time appeared as a political factor in American affairs. The result was that, when the temperance element of the country began to turn its mind again to the anti-alcohol reform, it discovered that a new condition existed in American politics and that far greater part of the political leaders of both parties were unwilling to give any toleration to the prohibition idea. This result was in an agitation, which began in the Independent Order of Good Templars and centered chiefly around the Rev. John Russell, a Methodist clergyman of the State of Michigan, beginning as early as 1867 and culminating in 1879, in May of which year the Right Worthy Grand Lodge, in session in Oswego, N. Y., took action which resulted in the calling of a convention to consider the advisability of forming a political party upon the basis of the prohibition issue. The call was signed by residents of some 20 States and resulted in the meeting of a convention of about 500 people in Farwell Hall in Chicago, 1 Sept. 1869. These were representatives present from 20 States, by far the largest part of them people who had never before taken part in political life, but few of them widely known. Perhaps the most famous individual among them was Gerrit Smith of New York State, who had been prominent as an Abolitionist and had been a member of Congress. One of the few remaining survivors, when this is written, is Col. John Sobieski, an exiled Polish prince, who served in the Federal army during the Civil War and against Maximi- llian in Mexico. Women sat in this convention on equal terms with men, a feature of the first political convention of history in which that was the case. The convention was by no means a unit in deciding to form a new party and its formation was decided upon by little more than a majority vote.

The basis of the action taken, as deduced from a study of the literature of the party, may be briefly stated as follows:

I. Since the government of this country is administered and must be administered by means of political parties, it is obligatory upon honest citizens so to associate themselves politically that the administration of government shall attain the ends for which government is ordained.

II. The legalization of the liquor traffic, which robs, debauches and kills a vast multitude of the citizenship of this nation, together with the innocent who upon them depend and the unborn who will follow them in life, is in contravention of the first duties and the fundamental principles of government and antagonistic to every right doctrine of political science.

III. Therefore, and the more urgently since the existing legalization of such traffic presents an issue which over- towers in its importance all of the other issues of the age, it is the duty of honest citizens to associate themselves together in a political party pledged to the enactment and the enforcement of laws which shall take away from this traffic the protection of legality and shall place it under the ban of legal prohibition.

The Prohibition party first appeared at an election in Ohio, in the fall of the year when it was organized, and Republican-Prohibition candidates were voted for in both Maine and Minnesota that fall. 1770 Prohibition tickets were nominated in six States and more than 20,000 Prohibition votes cast, not including 21,000 received in Massachusetts by Wendell Phillips, who, beside being the Prohibition candidate for governor, was also the candidate of the Labor party.

The first presidential election in which the Prohibition party appeared was in 1872, and from that time it has nominated candidates for every presidential election.

Much of the history of the party, so far as it is of general interest, may be best told in tabular form.

NATIONAL CHAIRMEN.

1884-87. John B. Finch.

PRESIDENTIAL CANDIDATES.

1884. Ex-Governor John P. St. John, Kansas.
1896. Joshua Levering, Maryland.
1916. Ex-Governor J. Frank Healy, Indiana.

Of these men, six were lawyers; two, St. John and Hanly, had served their States as governors; one (General Smith) was an early governor of Montana; three (Smith, Dow and Fisk) were generals in the Federal army in the Civil War, in which St. John was also a colonel; and Bidwell commanded the militia of California during the Civil War. Smith also
served in the Mexican War. Both Smith and Bidwell were members of Congress before joining the Prohibition party. Swallow was a clergyman, as was also Smith in the closing years of his life.

Vice-Presidential Candidates.

1876. Gideon T. Stewart, Ohio.
1880. Henry A. Thompson, Ohio.
1884. Samuel F. Daniel, Maryland.
1888. John A. Brooks, Missouri.
1892. James B. McMillan, Texas.
1900. Henry B. Metcalfe, Rhode Island.
1904. George W. Carroll, Texas.
1908 and 1912. Aaron S. Watkins, Ohio.

The votes cast for the presidential candidates of the Prohibition party during this period are recorded as follows:

1872. 5,607 1894. 130,617
1876. 9,737 1900. 209,469
1880. 9,678 1904. 238,205
1884. 149,772 1908. 253,231
1888. 249,918 1912. 207,828
1892. 263,480 1916. 221,329

The party may be said first to have attracted general attention in 1884, when the wide popularity of John P. St. John, who had left the Republican party because of its refusal to adopt prohibition, first resulted in an appreciable party vote and when votes were first cast for the party in almost every State of the Union. The fact that the vote nearly doubled in the next election created some political apprehension; but it remained practically stationary in 1892, and in 1896, owing to a split in the party and its desertion by those Prohibitionists who advocated the free coinage of silver (among whom John P. St. John was a leader) the vote was cut in half. In 1900, however, under the leadership of Oliver W. Stewart and with John G. Woolley, who ranked among the greatest of American orators, as a presidential candidate, the vote largely increased again and in 1904 came practically back to its high point.

But a bitter factional fight breaking out in the party during the 1904 campaign and the general control of the party management, immediately thereafter, by the faction which regarded the mission of the party not specifically to win political victory but to support prohibition as an abstract principle ended, in the minds of most political students, the possibility that the Prohibition party should ever become a considerable political factor.

It should be noticed that there have always been two schools of thought in the Prohibition party, one of which may be called the strictly political, which insisted always upon absolutely independent political action and refusal to give support to non-partisan measures of any sort; the other might be called a "co-operative" school, which, while retaining political organization, was always willing to join hands in non-political efforts of all kinds.

No history of the Prohibition party is complete without some notice of the large number of political ideas which had their first introduction to the world in Prohibition party platforms.

The first of these is Woman Suffrage, for which the Prohibition party began to declare in 1872 and has declared in every one of its national platforms. Of equal importance is the direct election of United States senators, for which the Prohibition party declared in the platform of its first nominating convention in 1872. Prison reform, lower railroad rates, postal savings banks, parcel post, regulation of interstate corporations, protection of government lands, civil service reform, cheap letter postage, are among the things for which the Prohibition party spoke before any other party gave them consideration. The tariff commission idea began with the Prohibition party, as did also the income tax, and the Prohibition party was the first to attack polygamy and the only political party that opposed the system of protected vice, for years so common in American cities.

It should be added that the Prohibition party built, in its entirety, the argument upon which the prohibition issues finally won. It is a popular error to suppose that the Prohibitionists were chiefly concerned with the moral aspects of the liquor problem. Their literature is strong upon that subject but they were the foremost students of the economic phases of the problem and as well of its relations to practical civics. The latest writers upon the movement have added almost nothing to the argument that was formulated by the Prohibitionists as early as 1888.

WILLIAM P. F. FERGUSON.

PROHIBITIVE DUTIES, the taxes or system of tariff imposed by a government on imported articles for the protection and encouragement of domestic industries, or as a retaliatory measure in the case of a nation thus discriminating against the productions of another, or favoring those of other countries. Protective duties in their various mutations present problems of great commercial and political importance, affecting, as they do, the value of the markets of one country in regard to those of another. See Free Trade; Protection; United States—History of the Tariff.

PROJECTILES. To accomplish the damage or destruction of a target a projectile should have certain hardness, tenacity and weight. If it be soft and weak compared with the body struck, it will be dashed out or driven in pieces, and presenting an increased surface will meet with a greater resistance, and consequently will penetrate less than if it had retained its original form. High density gives to the mass the least possible volume, whereby the effect of the resistance offered by the air and by the body to be penetrated is diminished. Different materials have been used for projectiles. Stone, lead, wrought-iron steel, cast-iron, and chilled iron possess peculiar properties which render each advantageous according to the object to be attained.

Prior to the invention of gunpowder, large masses of stone without regard to form were thrown from machines constructed for that purpose. This material was very generally employed until the year 1400; but its want of strength and density, qualities required in a projectile propelled by powder, necessitated its use in large masses and with comparatively small charges. Such projectiles were destructive against unbacked walls of masonry but broke if ricocheted on earth. As late as 1807, stone balls of enormous calibre were used by the Turks in defending the passage of the Dardanelles.
PROJECTILES

Lead, as a material for projectiles, possesses the essential quality of density; but it is too soft to be used against very resisting objects, since it is flattened even against water. From its softness and fusibility, large projectiles of this material are liable to be disfigured and partially melted, by the violent shock and great heat of large charges of powder. Its use is chiefly confined to small-arms and case-shot, which are generally directed against animates objects. These defects of lead may be corrected, in a measure, by allowing it with tin, antimony, etc. From the first introduction of cannon wrought-iron projectiles have at different times been tried. This metal has great density and tenacity, but has not a hard degree of hardness, cannot be easily worked into the necessary shapes, and where used in large masses becomes very expensive.

Steel possesses the qualities required in a projectile, but is very costly and difficult to manipulate.

The adoption of cast-iron for projectiles caused an important advance in artillery. It has great hardness, sufficient density and tenacity; is cheap, easy to mold, and can at slight cost be given exact forms. Recent improvements in the manufacture of this metal have so greatly increased the strength of projectiles made from it, that they can be used effectively against heavy armor. Cast iron, chilled by being cooled rapidly, has its hardness, crushing strength and density increased. Projectiles so prepared are now employed with excellent results against the most powerful armor, and are found about as effective when passed through air, and much less costly. Compound projectiles, uniting the good and correcting the bad qualities of different metals, have sometimes been used. Thus, at the siege of Cadiz, cast-iron shells filled with lead, forming projectiles of great strength and density, were thrown from mortars to a distance of three miles and three-quarters.

Projectiles may be either spherical or elongated. Spherical projectiles are commonly used in smooth-bored cannon, and for this purpose have certain advantages over those of oblong form: (1) They touch the surface of the bore at only one point, and are therefore less liable to wedge in the bore and endanger the safety of the piece; (2) the centres of figure and inertia coincide; (3) the mass is embraced in the least possible volume; (4) as they turn over in their flight, the surface presented to the resistance of the air is uniform and a minimum; (5) in ricocheting on land or water, their rebounds are more certain and regular, and less derivation occurs from the plane of flight.

In order that any advantage may be gained from an oblong projectile, it must move through the air in the direction of its length; numerous unsuccessful attempts have been made to ensure accuracy in its flight when fired from a smooth-bored piece. One of the simplest plans for this purpose is to place the center of gravity, or inertia, in advance of the centre of figure, or resistance. As these points should be in the longer axis of the projectile, the force of inertia and the resistance of the air, acting along the same right line and in opposite directions, will tend to preserve the line of flight. This was tried on a hollow, pointed projectile in the time of Louis XIV; the cavity was divided into two compartments; the front one was filled with leaden balls of powder, and the rear one with powder only. The flight of these projectiles was uncertain and irregular, some of them bursting in the air, and others striking the object sidewise.

Another plan of this kind, proposed by Thioux, is to make the projectile very long, with its rear portion of wood, and its point of lead or iron, somewhat after the manner of an arrow.

Attempts have also been made to give an elongated projectile a motion of rotation around its longer axis: (1) By cutting spiral grooves on the base for the action of the gas from the charge; (2) by forming such grooves on the forward part for the action of the air; (3)
combining the preceding methods in the same projectile; (4) by causing the air to enter a cavity at the front end, pass through nearly the length of the cylinder, and escape by radical openings at the sides. None of these plans have succeeded in practice, for the reason, perhaps, that the projectile naturally turns over end for end, and the charge and the air do not act with sufficient promptness, energy, and certainty to prevent it. An oblong projectile, that is, one which, with a moderate velocity, can have rotation about its shortest axis arrested by attaching to its rear portion a light body by means of a chain or cord; the resistance which this body experiences from the air will cause the projectile to move point foremost. Projectiles with wide flanges or wings, operated by springs by which they were extended after the shot left the piece, have been tried, but without success.

Projectiles may be further classified according to their construction and mode of operation, as solid, hollow, and case shot. Solid projectiles produce their effect by impact; they are used in guns and in small-arms; those for guns are known as solid shot or shot, and those for small-arms as bullets. Such projectiles are required when great range, accuracy, and penetration are sought; they must, therefore, possess great strength and density, and be fired with large charges of powder.

Shells are hollow shot which act both by impact and explosion, for which purpose they contain an explosive and a fuse to ignite it at the proper time. As they have less strength, they are fired with smaller charges of powder than solid projectiles, and are used against animate objects and such inanimate ones as will not cause them to break on striking. The thicker the sides of a shell, the greater its ability to resist the shock of discharge, and the greater the penetration and accuracy; on the other hand, a shell should be capable of containing sufficient explosive or incendiary material to accomplish the purpose intended. The number of pieces resulting from an explosion varies with the brittleness of the metal, and is increased by giving to the interior the form of a regular polyhedron. A dodecahedral form has been advocated, but the form of a sphere is now preferred, as it offers a greater surface, and violent explosive practicable should be employed; the size of the fuse-hole should be as small as possible, and should diminish with the size of the cavity, to prevent the loss of too great an amount of gas. Case-shot, or shot, consist of a collection of small projectiles enclosed in a case or envelope. The envelope is intended to be broken, either in the piece by the shock of discharge, or at any point of its flight, by a charge of powder inclosed within it; in either case, the contained projectiles continue to move on after the rupture, but cover a large surface, and attain a greater number of objects. These projectiles can be used with effect only against animate objects situated at a short distance from the piece. They are divided into grape, canister, and shrapnel. Grenades are projectiles that are commonly thrown by hand, propelled by the rifle or otherwise. Larger projectiles of a similar type, designated as bombs, are propelled at low velocities by mortars, or other forms of bomb throwers, or are rolled down the slopes of a work. They are designed to act only by the force of their own explosion. Hand grenades are thrown against troops in mass; for this purpose any spherical projectiles filled with powder only and weighing not over six pounds are suitable; they can be thrown from 20 to 30 yards; they are provided with a short fuse which is ignited with a match, or, in the act of throwing, by a special device. Projectiles have been designated especially for this service; they are intended to be rolled down a breach in its defense, or to be thrown over the rampart, etc. Spherical shells of any size will answer for this purpose; those unfit for firing may thus be utilized. Shells are fired from guns, from howitzers and from mortars. They are made of cast-iron and their caliber is expressed in the same manner as solid shot of an equal diameter, the thickness of metal in spherical shells is about one-sixth of the diameter, and their weight, when empty, is generally about two-thirds of that of the corresponding solid shot. In the United States service there are two kinds of spherical shells; one for guns and another for mortars. Each consists of the sides, the cavity, the fuse-hole and the ears; and, in gun-shells, the reinforc e. The sides are thicker in gun-shells than in mortar shells of the same size, to withstand the high charge of powder with which they are fired. The fuse-hole is used for inserting the charge and to hold the fuse for communicating fire to it. All shells of eight inches or more in diameter have to receive the "hooks" used in lifting the projectile to the muzzle of the piece in loading. The reinforce of metal about the fuse-hole of the gun-shell gives a greater bearing surface to the fuse and prevents it from being driven in by the force of the discharge; this reinforce also serves, in a measure, to compensate for the metal taken out of the fuse-hole, and thereby render the shell more nearly concentric. In some services shells have in the upper hemisphere, a charging-hole, placed a little from the point and end. The charge is poured through which the charge is poured immediately before the shell is used and after the fuse has been inserted. This is not necessary with the fuses used mostly in the United States service as the powder in the case can be readily introduced at the moment of loading.

A carcass is a thick shell which has three additional holes of the same dimensions as the fuse-hole, pierced at equal distances apart in its upper hemisphere, their exterior openings being tangent to the great circle perpendicular to the axis of the fuse-hole. The object of a carcass is to set fire to wooden structures by the flame of an incendiary composition issuing from the holes. This shell has no fuse, and it is not intended to be exploded, although a charge of powder may be placed beneath the composition to prevent it from being approached by the enemy.

A stand of grape-shot is composed of nine small cast-iron balls, disposed in three balls each. When divided into grape, canister and shrapnel. Grenades are projectiles that are commonly thrown by hand, propelled by the rifle or otherwise. Larger projectiles of a similar type, designated as bombs, are propelled at low velocities by mortars, or other forms of bomb throwers, or are rolled down the slopes of a work. They are designed to act only by the force of their own explosion. Hand grenades are thrown against troops in mass; for this purpose any spherical projectiles filled with powder only and weighing not over six pounds are suitable; they can be thrown from 20 to 30 yards; they are provided with a short fuse which is ignited with a match, or, in the act of throwing, by a special device. Projectiles have been designated especially for this service; they are intended to be rolled down a breach in its defense, or to be thrown over the rampart, etc. Spherical shells of any size will answer for this purpose; those unfit for firing may thus be utilized. Shells are fired from guns, from howitzers and from mortars. They are made of cast-iron and their caliber is expressed in the same manner as solid shot of an equal diameter, the thickness of metal in spherical shells is about one-sixth of the diameter, and their weight, when empty, is generally about two-thirds of that of the corresponding solid shot. In the United States service there are two kinds of spherical shells; one for guns and another for mortars. Each consists of the sides, the cavity, the fuse-hole and the ears; and, in gun-shells, the reinforce. The sides are thicker in gun-shells than in mortar shells of the same size, to withstand the high charge of powder with which they are fired. The fuse-hole is used for inserting the charge and to hold the fuse for communicating fire to it. All shells of eight inches or more in diameter have to receive the "hooks" used in lifting the projectile to the muzzle of the piece in loading. The reinforce of metal about the fuse-hole of the gun-shell gives a greater bearing surface to the fuse and prevents it from being driven in by the force of the discharge; this reinforce also serves, in a measure, to compensate for the metal taken out of the fuse-hole, and thereby render the shell more nearly concentric. In some services shells have in the upper hemisphere, a charging-hole, placed a little from the point and end. The charge is poured through which the charge is poured immediately before the shell is used and after the fuse has been inserted. This is not necessary with the fuses used mostly in the United States service as the powder in the case can be readily introduced at the moment of loading.

A carcass is a thick shell which has three additional holes of the same dimensions as the fuse-hole, pierced at equal distances apart in its upper hemisphere, their exterior openings being tangent to the great circle perpendicular to the axis of the fuse-hole. The object of a carcass is to set fire to wooden structures by the flame of an incendiary composition issuing from the holes. This shell has no fuse, and it is not intended to be exploded, although a charge of powder may be placed beneath the composition to prevent it from being approached by the enemy.

A stand of grape-shot is composed of nine small cast-iron balls, disposed in three balls each. When divided into grape, canister and shrapnel. Grenades are projectiles that are commonly thrown by hand, propelled by the rifle or otherwise. Larger projectiles of a similar type, designated as bombs, are propelled at low velocities by mortars, or other forms of bomb throwers, or are rolled down the slopes of a work. They are designed to act only by the force of their own explosion. Hand grenades are thrown against troops in mass; for this purpose any spherical projectiles filled with powder only and weighing not over six pounds are suitable; they can be thrown from 20 to 30 yards; they are provided with a short fuse which is ignited with a match, or, in the act of throwing, by a special device. Projectiles have been designated especially for this service; they are intended to be rolled down a breach in its defense, or to be thrown over the rampart, etc. Spherical shells of any size will answer for this purpose; those unfit for firing may thus be utilized. Shells are fired from guns, from howitzers and from mortars. They are made of cast-iron and their caliber is expressed in the same manner as solid shot of an equal diameter, the thickness of metal in spherical shells is about one-sixth of the diameter, and their weight, when empty, is generally about two-thirds of that of the corresponding solid shot. In the United States service there are two kinds of spherical shells; one for guns and another for mortars. Each consists of the sides, the cavity, the fuse-hole and the ears; and, in gun-shells, the reinforce. The sides are thicker in gun-shells than in mortar shells of the same size, to withstand the high charge of powder with which they are fired. The fuse-hole is used for inserting the charge and to hold the fuse for communicating fire to it. All shells of eight inches or more in diameter have to receive the "hooks" used in lifting the projectile to the muzzle of the piece in loading. The reinforce of metal about the fuse-hole of the gun-shell gives a greater bearing surface to the fuse and prevents it from being driven in by the force of the discharge; this reinforce also serves, in a measure, to compensate for the metal taken out of the fuse-hole, and thereby render the shell more nearly concentric. In some services shells have in the upper hemisphere, a charging-hole, placed a little from the point and end. The charge is poured through which the charge is poured immediately before the shell is used and after the fuse has been inserted. This is not necessary with the fuses used mostly in the United States service as the powder in the case can be readily introduced at the moment of loading.

A carcass is a thick shell which has three additional holes of the same dimensions as the fuse-hole, pierced at equal distances apart in its upper hemisphere, their exterior openings being tangent to the great circle perpendicular to the axis of the fuse-hole. The object of a carcass is to set fire to wooden structures by the flame of an incendiary composition issuing from the holes. This shell has no fuse, and it is not intended to be exploded, although a charge of powder may be placed beneath the composition to prevent it from being approached by the enemy.
The envelope for a stand of canister-shot consists of a tin cylinder, closed at the bottom by a thin plate of sheet-iron. The plates are kept in place by cutting the ends of the cylinders in strips about 0.5 inch long, which are turned down over the plates. A wire handle is attached to the top plate. To give more solidity to the mass, and to prevent the contained balls from crowding upon each other when the piece is fired, the interstices are closely packed with sawdust. For a gun 27 small cast-iron balls are used, arranged in four layers, the top of six and the remainder of seven each; this makes the diameter of the balls about one-third that of the bore. For howitzers the envelope contains 48 balls, in four layers of 12 each, the balls being smaller than those in a canister for the corresponding gun. Grape-shot and canister are no longer or seldom used, having been displaced by shrapnel.

Shrapnel are cast-iron shells, in which, besides the bursting charge of powder, is placed a number of small balls. Their sides are much thicker than those of the bullets and it is evident that they may contain a greater number of bullets; the thickness must be such that, when supported by the bullets, the case will not be broken by the force of discharge, but will yield readily to a small bursting charge. The weight of the case, empty, is about one-half, and, when filled, about equal to that of the solid shot of the same diameter. This projectile is prepared by filling the case with leaden musket-balls well packed in; the interstices are then filled with melted resin; this prevents the fracture of the envelope by the bullets when the piece is fired. The chamber for the powder is afterward bored out. The case is strengthened by a reinforcement, and to increase the effect of the bursting charge, the lower portion of the fuse-hole is closed by a disc of wrought-iron, perforated with a small hole for the passage of the flame from the fuse. A shrapnel may be made to explode at any point of its flight, and, as the bursting charge should be only sufficient to open the envelope, without scattering the bullets too much, the execution depends on the velocity which the case has at the moment it is broken.

The advantages to be derived from the use of elongated projectiles having once been established, it became necessary that some means should be decided to make their flight accurate. It has been found that to do this with certainty a motion of rotation about its longer axis must be communicated to the projectile, and this has been satisfactorily attained only by cutting spiral grooves, or 'rifles', in the surface of the bore of the piece, with which the projectile is connected, and by means of which it starts with a motion about an axis parallel to or coincident with that of the bore. The rotation continues during the flight of the projectile. Without this rotation an elongated projectile will naturally turn over end for end and present a constantly varying surface to the resistance of the air. This, in turn, tends to cause the projectile to move through the air in the direction of least resistance, thereby increasing the range and the effect of impact, and, furthermore, giving steadiness to the projectile by distributing the deviating forces uniformly around its line of flight. The more important advantages of elongated projectiles are that the form may be altered at any time, and the centre of gravity can be shifted to any desired point; the projectile may be elongated so as to oppose, for an equal weight, a diminished surface to any resting medium; by this the range is extended, and a flatter trajectory with greater accuracy and penetration obtained. The chief disadvantages are increased strain on the gun; greater probability of jamming and injury to the bore irregularity of ricochet; increased complication and expense of manufacture and the liability of any soft metal on the exterior to be accidentally injured.

The different systems of projectiles for rifled pieces are classified according to the manner in which they are caused to follow the grooves. The systems are distinguished by some peculiarity of construction and are generally known by the name of the person by whom designed or by the place at which first made. The same principles are applicable to different systems, and the same precision of fire may practically be obtained from several. All systems are of two classes, in turn divided under the following heads:

1. Projectiles with projecting ribs or studs, or having a peculiar cross-section.
2. Projectiles having a portion that is expanded by the action of the gases in the bore.
3. Those more or less of whose surface is compressed by the charge into the form. The first and second classes are applicable to muzzle-loading pieces; the third to breech-loaders only.

The principal points to be considered, as regards the piece and the projectile, are the best and safest means of carrying the projectile to follow the grooves of the piece. To fulfill these conditions the projectile should be simple in construction and of sufficient strength to admit of its use with the largest charge that may be desired; it must not be liable to jam in the bore in loading or firing, and must produce a moderate and uniform strain on the gun. The system that most nearly complies with these requirements, and gives insured accuracy of fire with uniform and high velocities, should be the best. In many systems, one or more of these considerations have been sacrificed to some extent, to secure a closer compliance with others thought to be of greater importance or of easier attainment.

1st Class.—Solid flanges, projecting from the body of a projectile, and so shaped as to fit the rifling of the bore, were the means first used to communicate the rifle-motion in cannon. In some cases there was for each groove a rib extending the entire length of the cylindrical portion of the projectile, while in others sets of rounded buttons were employed. These projectors were of the same material as the body of the projectile, and, being of a very unyielding nature, frequently led to the bursting of the piece; buttons of zinc, copper or bronze, firmly secured in mortises in the projectiles, were therefore adopted. The buttons are arranged in rows or two or more so that each row enters freely into a corresponding groove, in loading. When the bore of a gun is a twisted prism, with any plane figure for its base, the projectile, if shaped to it, will receive the rifle-motion when fired. The Whitworth cannon is rifled in this manner, the cross-section being a hexagon with rounded corners. Guns have also been constructed with ribs projecting from the
bore, fitting into corresponding grooves in the projectile. To the last system belongs the Vavasour gun, which has given good results.

The principal advantages of systems of the first class are that the projectiles are strong and that the required motion is communicated to them with great certainty and regularity. The escape of gases around the projectile, as it causes injury to the bore, is an objection to the class; various experiments have been made to overcome it, one being by the attachment of a metal cup, called the gener of the gun, when fired. Expanding projectiles are easy to load, are not liable to overstrain the piece, and those of different systems can generally be fired from the same piece—a point of great importance. Such projectiles do not always withstand the heaviest charges of powder, and are not certain to receive the rifling motion. The use of projectiles of this class is confined more particularly to the United States.

2d Class.—In projectiles of the second class the body is composed of a hard metal, as cast-iron, and there is attached to it, generally at the base, a cup, band or other arrangement of softer metal, which is expanded by the action of the charge into the gener of the gun, when fired. Expanding projectiles are easy to load, are not liable to overstrain the piece, and those of different systems can generally be fired from the same piece—a point of great importance. Such projectiles do not always withstand the heaviest charges of powder, and are not certain to receive the rifling motion. The use of projectiles of this class is confined more particularly to the United States.

3d Class.—In breech-loading cannon the receptacle for the charge is of a larger diameter than the bore of the piece. The projectile is of the same size as this chamber, and must be reduced to enable it to pass into the bore. Such projectiles are embraced under the third class; the body has a coating of soft metal, which is compressed as the projectile is driven through the bore, the grooves compelling it to follow the direction of the rifling. The same result is sometimes accomplished by one or more rings of soft metal. The chief advantages of this class are that the projectile is generally capable of taking up the rifling motion; that its axis is steady on leaving the bore, and that the wear of the bore, from gas passing the projectile or from any irregular movement of the latter, is prevented. The objections are that the necessary compression of the coating, the sudden closing of windage and the fouling of the bore produce undue strain upon the piece; that the velocity of the projectile is reduced by the force expended in compressing it; and that the soft metal forms an extra weight, which is useless in penetrating resisting objects.

EDWARD S. FARROW,
Consulting Military and Civil Engineer.

PROJECTION. (From the Latin projicere, to throw forward.) In its general sense, the term signifies the representation of the form of a given figure upon a given surface by means of a pencil of visual, light, or other rays in such a manner that the figure in the projection corresponds point by point to the given figure. For example, shadows are the projections of objects upon different surfaces which intercept the rays of light from any source, not already intercepted by the objects themselves. They represent the most elementary forms of plane projections, and while corresponding in general outline to the objects projected, yet differ from them to a greater or lesser extent according to the distance of the object from the source of light, the distance of the plane of projection from the object, the angle between the plane of projection and the direction of the rays of light, the position of the observer's eye, etc.

In the mathematical construction of projections, however, instead of a single plane being used to intercept the projecting rays, another surface, such as one formed by two planes at right angles to each other, is taken and the various points of any object, plane or in space of three dimensions, projected to that surface from any point assumed as the center of the projection.

When the projection shows three dimensions of the object projected, it is commonly known as perspective, the mathematical theory of which together with the various classes of such projections employed in mechanics and for solving the problems of applied mathematics, will be found under the title Perspective in this Encyclopaedia. The present article is confined to the consideration of the various projections used in connection with geographical and geodetical work in general, and to their employment in the construction of maps for special purposes.

In general the word projection, when used with reference to maps, has nothing whatever to do with geometrical projection from a point. It simply refers to a transformation of latitude and longitude on the spherical or spheroidal earth into rectangular coordinates. A suitable introduction to this particular phase of the subject is given under the title MAP in this Encyclopaedia, wherein the three principal perspective projections of the sphere—the orthographic, the stereographic and the gnomonic, are clearly explained and illustrated. Of these, the orthographic and the stereographic are rarely used at the present time except in the construction of what may be called pictorial maps; but, the gnomonic and several of its modifications are extensively used for the construction of star charts in general, and especially for charts showing the apparent tracks of shooting stars on account of the facility in determining the radiant point, the great circles on the celestial sphere appearing as straight lines on the projection. For similar reasons it is used in the construction of sailing charts showing steamship routes, and is much more satisfactory for this purpose than Mercator's projection, which although almost universally used for nautical charts, is specially applicable for those used by sailing ships.

The chief value of the perspective projections lies in their adaptability for representing large areas of the earth's surface. Usually, they represent a hemisphere; but, by the employment of the projection first proposed by Lahire in 1701 and subsequently modified by Louis H. James of the Ordnance of Great Britain and Ireland, fully two-thirds of the sphere can be shown within the bounding circle. This is accomplished by assuming the eye above the sphere at a distance equal to half the radius and perpendicular over the center of the plane of projection. The plane of projection is not that of a great circle, but is parallel to it and removed from it nearer to the eye by 23 degrees.
A simple and easily constructed projection which can be effectively used in representing a hemisphere may be briefly described as follows: Draw a circle and bisect it by horizontal and vertical diameters; divide the circle into equal parts representing degrees of latitude; divide the vertical diameter into a corresponding number of equal parts; and divide the horizontal diameter into equal parts representing degrees of longitude. This will establish three points in every parallel of latitude, i.e., two in the circumference and one in the vertical diameter, through which the arc of a circle may be drawn representing the corresponding parallel of latitude, and also three points in every meridian, i.e., one at each pole and one in the horizontal diameter or equator, through which the arc of a circle may be drawn representing a meridian.

The general method of constructing developed projections has been briefly described under the title Map in this Encyclopedia; but, as all modern maps representing data obtained from precise trigonometrical surveys are based upon some form of developed projection, the mathematical theory and the practical methods of construction of such will receive more extended treatment herein.

The various projections form three definite groups—(1) those possessing straight meridians and parallels, (2) those of mixed systems of straight and curved meridians and parallels, and (3) those in which both meridians and parallels appear as curved lines.

Of the first group, the one most extensively used is Mercator’s projection. It was devised to satisfy the following condition: That the loxodromic curve or the course of a ship on the surface of the sea, under a constant bearing or intersecting the successive meridians at the same angle, shall appear on the projection as a straight line having the same angle of bearing with respect to the meridians intersected as that of the loxodromic curve.

The formula used in computing a table of "meridional parts" or the "inversed latitudes" for determining the distances of the various parallels of projecting latitudes from the equator, is obtained as follows: (Modified extract from Projection Tables published by the United States Hydrographic Office).

In Fig. 1, let $e'$ be an element of the loxodromic curve between two consecutive meridians $m e, m' e'$; and let $L C$ represent the corresponding element on the projection between the corresponding meridians $M E, M' E'$. Let $l p$ and $L P$ be taken parallel to the corresponding equatorial elements $e e'$ and $E E'$ between the same meridians.

Then, the condition that the angles of bearing $l p$ and $L C$ shall be equal requires that
\[ C P / L P = e / l p, \]
or since $L P = E E' = e e'$ the element on the terrestrial equator, it is necessary that
\[ C P / e e = e / l p. \]

Hence, putting $d s$ for the meridional element $e e'$ of the terrestrial spheroid, $d m$ for the meridional element $C P$ of the projection, $a$ for the equal circular radius of the earth, and $r$ for the radius of the parallel represented by the element $l p$; then, on account of the proportionality of the elemental arcs $e e'$, $l p$, to their respective radii $a$, $r$, we have the fundamental equation
\[ d m = a \]
which expresses the law of the Mercator projection.

Then, if $L$ be the latitude of the terrestrial parallel under consideration, $R$ the radius of curvature of the terrestrial meridian at its point of intersection with the parallel, $c$ the compression of the earth, and $e$ its meridional eccentricity; we have the following expression for the properties of $r$, $R$, and $e$ of the terrestrial spheroid considered as an ellipsoid of revolution:

\[ r = a - \cos L \]
\[ R = (1 - e^2 \sin^2 L)^{1/2} \]
\[ e = \sqrt{2c - e^2}. \]

Now, since the radius of curvature varies inversely as the angle between consecutive normals, the element of the terrestrial meridian at its intersection with any parallel of latitude is equal to the product of the radius of curvature and the element of latitude at that point, and

\[ dL = R \cdot dL \]

which being substituted in the fundamental equation gives us the expression

\[ dm = a (1 - e^2) \]
for the element of the projected meridian, or by substituting the preceding values of $r$ and $R$, we have

\[ dm = \left(1 - e^2 \sin^2 L\right) \cos L \cdot dL \]

which when integrated between the proper limits give required length of any finite portion of the projected or chart meridian corresponding to the meridional arc on the terrestrial spheroid within the same limits.

For this integration, multiplying $e$ in the numerator by $\sin L + \cos L$, we have

\[ dm = s \cdot dL \]

again, multiplying the numerator and denominator of the first term by $\cos L$, substituting $1 - \sin^2 L$ for $\cos^2 L$, and resolving both terms into partial fractions, we have the expression

\[ dm = \left(\cos L + \cos L \cdot dL - ae \cdot \sin L + \cos L \cdot dL \right) \]

\[ \left(1 + e \sin L + 1 - e \sin L\right) dL. \]
whence, by performing the integration or the limits of O and L, we find for the length of that part of the meridian of the projection included between the equator and the parallel of latitude L, the expression

\[ m = \frac{a}{M} \left( \frac{1 + \sin L}{1 - \sin L} \right) \log \left( \frac{1 + e \sin L}{1 - e \sin L} \right) \]

in which the logarithms belongs to the common system, of which M is the modulus.

Substituting for

\[ \frac{1 + \sin L}{1 - \sin L} \]

its trigonometrical equivalent, and for

\[ \log \left( \frac{1 + e \sin L}{1 - e \sin L} \right) \]

its algebraic development, we have the final expression

\[ m = \frac{a}{M} \log \tan \left( \frac{45^\circ + \frac{L}{2}}{2} \right) \]

which is the formula required for computing the meridional parts for the terrestrial spheroid.

This formula consists of two parts — the first term being the ordinary formula for computing meridional parts with the earth regarded as a sphere, while the second term consists of a series of negative terms, and represents the correction which must be applied for the meridional eccentricity of the earth under the hypothesis that it is an ellipsoid of revolution.

In using the formula to compute the accompanying values, their logarithmic values have been employed for the several constants.

The equatorial radius is expressed in minutes of arc, therefore, the unit of measure of the meridional part \( m \) becomes a minute of the equator or a geographical mile.

\[ a = \frac{a}{M} = 3437.74677 \quad \log 3.5362739. \]

The reciprocal of the modulus of the common logarithms,

\[ M = \frac{1}{2.3025851} \quad \log 0.3622157. \]

Bessel's determination of the compression,

\[ c = \frac{c}{M} = 0.003342773 \quad \log 7.5241069. \quad \text{100.1528} \]

The meridional eccentricity of the earth,

\[ e = 0.0819608 \quad \log 8.9122052. \]

The values of the several coefficients with their logarithms deduced as arc follows:

\[ a = \frac{a}{M} = 7915.7055 \quad \log 3.8984096 \]

\[ a e^2 = 22.9448 \quad \log 1.3605843 \]

\[ a e^2 = 0.05104731 \quad \log 8.7079734 \]

\[ a e^2 = 0.00204425 \quad \log 6.3103531 \]

On account of the rapid convergence of the series of coefficients involving the eccentricity, two terms are generally sufficient for practical use, and the formula becomes

\[ m = 7915.7055 \log \tan \left( 45^\circ + \frac{L}{2} \right) \]

\[ \sin L + 0.05104731 \sin^2 L. \]

</tbody>
</table>

On account of the space limitations the table gives the meridional parts for even degrees of latitude only; the values for intermediate minutes or seconds of arc may be computed by the formula.

If the chart for which the projection is made includes the equator, the values given may be measured off for the successive degrees of latitude directly from the equator; but, if the equator is not included in the map, the parallels of latitude to be projected should be successively measured from a principal parallel, preferably the lowest parallel drawn upon the map, and the distance of any parallel from the principal parallel will be the difference of the values given for the two in the table.

These values, given in minutes of arc, may be converted into their equivalents in inches, yards, meters, etc., and laid off on the projection by means of properly divided corresponding scales, proportionately to the scale adopted for the map, or the values given may be laid off without previous numerical conversion, by means of a diagonal scale constructed on the map.

For example — suppose a Mercator projection is required to embrace the coasts of Iceland, on a scale of 1-inch = 150 statute miles. This island lies between latitudes 63° and 67° north, and between longitudes 13° and 25° west from Greenwich. The projection will include four degrees of latitude and 12 degrees of longitude. The central meridian will correspond to longitude 19° W., and the lowest parallel will correspond to latitude 65° N. See Fig. 2.

Draw in the centre of the sheet a vertical
straight line A, B, for the central meridian, and near the bottom of the map construct very carefully a horizontal line C, D, at right angles to

statute miles: 660.72 \times 150 = 4.40 inches or the distance of the parallel of 67° from the parallel of 63° on the map, on a scale of 1-inch

\[ \text{Scale, Inch}=150 \text{ Stat. Miles.} \]

A, B, for the parallel of 63° N., and assume it as the principal parallel of the map. From the table obtain the value 4984.46 for lat. 63° and 5452.84 for lat. 67°, the difference of which is 952.84 - 4984.46 = 5568.38, the value of the meridional arc included between the lowest and the highest parallels of latitude of the map, for which one minute of arc of the equator = 1.012 statute miles is taken as the unit of measurement. Converting this value to its equivalent in statute miles and reducing it to the scale of the map, gives 568.38 \div 60 = 9.47; 9.47 \times 69.77 statute miles (equivalent to a degree of longitude on the equator) = 660.72

\[ \text{FIG. 2.} \]

\[ \text{FIG. 4.} \]

= 150 statute miles. It is obvious that this measurement may be laid off on the map by means of any scale divided to the decimals of an inch, and the distance of each of the other parallels from the principal may be obtained by the same method of conversion, and laid off in a similar manner; but, having obtained the value 4.40 inches equal to the vertical extent of the map, we are enabled to determine a constant multiplier by the use of which the tabular values may be laid off directly by means of a diagonal scale (q.v.) of one inch without previous numerical conversion. As 1' of arc of the equator is taken as the unit of the meridional
arc, 1° of arc of latitude will measure 4.40 inches + 508.38" = 0.0077 inches, which corresponds to the scale of the map and by which all the values obtained from the table must be multiplied if they are to be laid off on the projection by means of a diagonal scale of one inch.

The distances of the successive parallels from the parallel of 63° thus obtained are as follows:

- 0.0077 x (5018.76 - 4884.46) = 1.03 in. (64°)
- 0.0077 x (5157.98 - 4884.46) = 2.11 in. (65°)
- 0.0077 x (5302.51 - 4884.46) = 3.22 in. (66°)
- 0.0077 x (5432.84 - 4884.46) = 4.40 in. (67°)

These distances may now be laid off upon the central meridian from its intersection with the principal parallel in the order 1, 2, 3, 4 shown on Fig. 2, and through the points thus obtained straight lines may be drawn parallel to the principal parallel, and corresponding to the terrestrial latitudes of 64°, 65°, 66°, and 67°.

On this map, a degree of longitude will measure 907.46 inches and the distances of the successive full degrees of longitude east and west of the central meridian will be 0.46, 0.92, 1.39, 1.83, 2.31, 2.77 inches. Lay off these values on the lowest, middle and highest parallels of latitude, east and west from the central meridian, in the order a, b, c, d, e, f, and through the points thus obtained draw straight lines parallel to the central meridian and corresponding to the terrestrial longitudes of 13°, 14°, 15°, 16°, 17°, 18°, 19°, 20°, 21°, 22°, 23°, 24°, and 25°, west from Greenwich. And another important projection, in which both meridians and parallels are represented by straight lines is the cylindrical equal area projection, formed by projecting the surface of the earth from its axis on to a cylinder tangent at the equator and unrolling. While showing extreme distortion in regions remote from the equator, this map has the valuable property of representing areas truly.

The second group of projections, those having mixed systems of straight and curved meridians and parallels, including various kinds of *equidistant*, *stereographic*, and *orthomorphic* projections, of which the *simple conic* is the most valuable for general purposes. In this projection it is assumed that a cone, the apex of which lies in the axis (produced) of the sphere, is tangent to the surface of the sphere along a parallel of latitude. When the surface of the cone is developed on a plane, the parallel of tangency becomes an arc of a circle, having for its radius the slant side of the cone which is equal to the cotangent of the latitude. A part of this developed arc of a circle, of sufficient length to include the desired number of degrees of the proposed map, is drawn through the middle point of the central meridian and forms the middle parallel of the map. The central meridian north and south of this line is divided into degrees of latitude laid off according to scale proportional to their true lengths on the sphere, and parallels of latitude concentric to the middle parallel are drawn through the several points thus obtained. In a similar manner, the middle parallel is divided into degrees of longitude east and west of the central meridian and straight lines representing meridians are drawn through those points to the centre from which the concentric parallels were swept. In the system of co-ordinates thus established, the parallels and meridians intersect each other at right angles, precisely the same as on the sphere. The lengths of the degrees on the central meridian and on the middle parallel are proportionately the same as those on the sphere, and the lengths of the degrees on all the other meridians and parallels are but slightly different from what they would be if laid off their true length proportioned to those of the sphere.

In general, a conical projection is one which transforms the meridians into a pencil of straight lines, the angle between two of which is in a fixed ratio to the angle between the two meridians which they represent. The parallels will then form a family of concentric circles, and the particular form of the projection will be determined by the relation which the radius of such a circle will bear to the polar distance of the corresponding parallel. Let the radius of the circle be r, the polar distance ρ, the angle between a meridian and a fixed meridian of reference on the sphere be θ and on the map φ. Let our unit of distance be the radius of the earth. It is clear that the method of mapping will be completely determined by the equations

\[ r = f(ρ) \]

\[ φ = cθ \]

The scale of representation of meridian distances on the map at (ρ1, φ1) will be

\[ \Delta r = f(ρ) \Delta ρ \]

The scale of representation of distances along the parallels will be

\[ \Delta φ = \sin φ_1 \Delta ρ \]

If our scale of representation is to be the same in all directions, \( r = k (\tan \frac{φ}{2})^c \), where k is an arbitrary constant. This gives what is known as the orthomorphic conical projection. If the scale representation at a point p remains fixed, while c decreases toward 0, the map will approach a mercator projection. If c = 1, the angles between meridians on the map will equal those on the earth, and we shall have the stereographic projection. If c = 1, no matter what relation the meridian and parallel scales bear to one another, our projection is said to be zenithal, as are similar projections, where other families of concurrent great circles replace the meridians. If the meridian scale of a zenithal projection is fixed we have what is known as the equidistant projection; if the projection is conical but not zenithal it is said to have rectified meridians. If the meridian and parallel scales of a conical projection are reciprocals, areas are preserved proportionally. If the projection is also zenithal it is sometimes called Lorgna's projection. A form of zenithal projection in which the deformation is distributed and minimized is due to Sir George Airy.

Two other forms of projection which may keep the meridians or the parallels straight are that of Mollweide, in which parallels are straight lines and meridians ellipses, and areas are retained; although with the exception of the peripheral parts of the map, the projection which simply plots in cartesian co-
ordinates the spherical or spheroidal co-ordinates of points on the surface of the earth with reference to any given great circle or ellipse.

Of the projections, one of the most useful and extensively used is that devised by Bonne. It is sometimes called Flamsteed's modified projection, but the latter, which is more correctly Sanson's projection, is really the particular case of the former, in which the parallel of reference is the equator. Bonne's projection differs from the "simple conic" in that each of the concentric parallels of latitude is divided into degrees of longitude, the lengths of which are proportional to their true lengths on the sphere, and curved meridians are drawn through each corresponding series of points. The central meridian remains a straight line and the curvature of the arcs of the successive parallels is the same as that of the middle parallel, the radius of which is equal to the cotangent of the corresponding latitude. Thus, all the meridians intersect a parallel near the middle parallel at right angles and the outlines of areas on the projection are very nearly similar to those on the sphere. It not only preserves the proportionate equality of the areas on the sphere and projection, but permits of the use of the same extent and led to the invention of the "polyconic" projection, which appears to have been conceived by F. R. Hasler, superintendent of the United States Coast and Geodetic Survey, between 1816 and 1820. It was proposed by him as the most suitable base for the maps of the Atlantic Coast of the United States, the great length of which, north and south, together with its direction nearly diagonal to the meridians and parallels, made it subject to inadmissible deviations in magnitude and figure upon a Bonne projection.

In the simple polyconic projection, it is assumed that each parallel of latitude is developed upon its own cone, the vertex of which is on the axis of the sphere at its intersection with the tangent to the meridian at the parallel. Theoretically, this involves the employment of an infinite number of tangent cones and the independent development of an infinite number of parallels of latitude. This has the effect of increasing the lengths of the successive degrees of latitudes and longitudes as their distances from the central meridian increases; but the angles at which the meridians intersect the parallels, over the entire map, very closely approximate to right angles, thus preserving a close similarity between the figure on the projection and the corresponding figures on the sphere.

The mathematical theory of this projection may be briefly stated as follows: Referring to Fig. 3, the equatorial radius being $a$, the eccentricity $e$, and the latitude $L$, the normal produced to the minor axis is

$$ N = \frac{a}{(1 - e^2 \sin^2 L)^{1/2}} $$

the radius of the parallel

$$ R_p = N \cos L; $$

and the sides of the tangent cone or radius of the developed parallel

$$ r = N \cot L. $$

If $n$ be any arc of the parallel to be developed, and $\theta$ the angle which subtends it at the vertex when developed

$$ \theta = n \sin L; $$

and as the developed parallels are circular arcs, the co-ordinates of curvature are

$$ x = r \sin \theta, $$

$$ y = r \versin \theta = 2r \sin \frac{1}{2} \theta = x \tan \frac{1}{2} \theta. $$

The radius of curvature in the meridian is

$$ R_m = \frac{a(1 - e^2)}{(1 - e^2 \sin^2 L)^{3/2}} \frac{N_1}{a} $$

whence the length of a degree of latitude is

$$ 3600 R_m \sin \nu. $$

and that of a degree of longitude is

$$ 3600 R_p \sin \nu. $$

For maps of large extent on a small scale, it is sufficient to compute $r$ and $\theta$, $x$ and $y$,
for every whole degree, but for those of small extent, on a large scale, a more detailed projection becomes necessary and these values have to be computed to every minute or fraction of a minute according to the nature of the data to be represented, and the value of the scale adopted.

To make a projection from the data furnished by a polyconic projection table, draw a straight vertical line for the central meridian and lay off thereon the distances corresponding to the intervals between the successive latitudes required, and through the points thus obtained draw horizontal lines at right angles to the central meridian. These horizontal lines will be tangent to the developed parallels.

Now suppose, that as in the case of the Mercator projection hereinbefore illustrated, the parallel of the equator is required to embrace the coast of Iceland, which lies between lat. 63° and 67° north, and between long. 13° and 25° west from Greenwich, and that the scale of the map is adopted at 1-inch = 150 statute miles.

Referring to Fig. 4, inserted under Fig. 2, the central meridian of the map will correspond to 19° west, and the middle parallel will correspond to 65° north. On the central meridian lay off to the north from its intersection with the middle parallel, according to the adopted scale, 69,268 miles for lat. 66°, and 69,277 miles for lat. 67° and in a similar manner lay off to the south, 69,258 miles for lat. 64°, and 69,248 miles for lat. 63°. Through these points draw horizontal lines at right angles to the central meridian, and upon each of them set off to the east and to the west of the central meridian the values of x given in the table for the corresponding parallels of latitude. Through the points x, y, etc., thus obtained, draw perpendiculars toward the pole, and on them set off the proper tabular values of y. Through the final points thus obtained, draw continuous curves for parallels of latitude and meridians.

Space limitations in this Encyclopaedia make it absolutely impossible to insert a polyconic table computed to even full degrees only, and one giving the values of x and y for greater latitudinal and longitudinal intervals would be more or less useless. Tables of this kind may be readily obtained from the United States Coast and Geodetic Survey, and the United States Hydrographic Office, Navy Department.

Fig. 4 is placed under Fig. 2 in order to afford a direct comparison of the two projections. In the simple polyconic projection, while the parallels are the same as in the simple orthographic projection and the central parallel retains the same graduation, the meridians are orthogonal trajectories of the parallels.

Bibliography.—For further information consult the various authorities given under the title Map in this Encyclopaedia. *Revised by Norbert Wiener.*
PROMetheus, prómɛθeʊs spɒzɛ ə ː s, in Greek mythology, son of Iapetus the Titan and Clymene (according to Hesiod), or Themis (according to Ἐσχύλος), or Asia (according to Apollodorus). He is the legendary giver of fire and civilization to men. In Athens Prometheus had an altar in the academy and a special festival was devoted to him. Hesiod and Ἐσχύλος (q.v.), the latter of whom made his story the subject of a trilogy of which one tragedy, 'Prometheus Bound' (q.v.), is alone extant as a whole, are our chief authority for the myth concerning Prometheus. He is represented as the brother of Atlas, Menecmus and Epimetheus. According to Ἐσχύλος, Prometheus took part with Zeus against his brother Titans and by his craft and sage counsel rendered Zeus victor and enabled him to ascend his father's throne. Later, objecting to the plan of Zeus to destroy mankind by a new generation of beings, he helps the weak race of mortals by stealing fire from the lightnings of Zeus and giving it in a hollow reed to men, to whom it had been till then denied. In revenge Zeus has Prometheus chained to a rock in the Caucasus by Aphrodite and his helpers Kratos and Bia, and sends a vulture to tear forever at his vitals, not allowing him to end his pain by death. Steadfastly Prometheus bears his doom, aware that in time Zeus will fall by the hand of a son born to himself and Thetis. Heracles, with the consent of Zeus, slays the vulture and releases Prometheus, who returns to Olympus and thereafter is the wise counsellor of the gods. It is in the above form that the myth has been most generally accepted, but it was varied in many ways by later, Greek, poets and philosophic interpreters. His Greek name, meaning 'foresighted' (that of his brother Epimetheus, signifying 'Afterthought'), makes the underlying allegory apparent. Prometheus, as the foe of mortals, is the symbol in necessity, and in some interpretations as a rebel against unjust authority, has been much referred to in literature, and in modern times was made the subject of Shelley's lyrical drama 'Prometheus Unbound,' and of the fragment of a tragedy by Goethe. He has also been frequently represented in plastic art. The most famous English rendition of Ἐσχύλος' tragedy is Mrs. Browning's 'Prometheus Bound.' Another more recent translation has been published by R. Whitelaw (Oxford 1907).

PROMETHEUS BOUND. The, of Eschylus, has been called "the most sublime poem in the world." Macaulay declares that the inscription of dramatic poetry, which Instantly condemns, but if we think only of the poetry we must admit that it has never been surpassed in energy and magnificence.

The chief character comes from a remote past. Eschylus was merely the conscious artist that gives the impressive figure final and immortal form. The play is the perfect type of the primitive tragedy, which Aristotle designated "simple." It has one feature possessed by no other tragedy; it transports us to a marvelous and fantastic sphere, to the most primitive period in the history of the world. The god that seeks to elevate man, that gives him the light of understanding, engrosses our attention. From the beginning to the end of the play the illusion is not broken. A god suffering for humanity is before our eyes; deities live and move in visible presence.

Zeus desired to create a new race after his own design. He was not satisfied with ephemeral creations, the Titans. But Prometheus, pierced by our human miseries, champions the old race: he steals fire from heaven and teaches the arts to insensate creatures. But Zeus will brook no infringement of his laws and resolves to punish the recalcitrant. So he commissions his two satellites, Might and Force, to drag the rebel to a steep rock in Scythia, "whose rugged brows are bent upon the swelling main." Here the play begins.

Unfeeling Might turns the criminal over to Aethiopus, the smith, who clamps Prometheus to the cliff, where he will never see a human form: broiled by the sun's bright flame, he will welcome the spangled-robed night, and again the sun as it breaks the hoar-frost of the morn. Prometheus bears the taunts of Might in silence. Then the Titan invokes inanimate nature to witness the intolerable indignity to which he has been subjected: the divine aether, the rivers, the innumerable laughter of the sea-waves, Mother Earth and the bright circle of the all-seeing Sun. Suddenly a rush of wings is heard and a troop of sea nymphs enter in a winged car—"maidens yet rose over with the virgin crimson of modesty." Prometheus appeals to their pity. They remind him that a new epoch is the scheme in Olympus. The Titan swears that he will do something yet, when times are ripe, to this raw, unthankful king. Exultantly he cries that threats will not make him cringe. Weak women that they are, replete with tenderness, the Oceanids cannot understand how one can dare resist the will of Zeus. They beg Prometheus to unfold his story. One faction of the deities determined to cast out Cronus and set up Zeus as their king. By the help of the resourceful Prometheus, Zeus gained the throne. But the new ruler did not give his supporter the recompense deserved. He resolved even to annihilate the human race. Prometheus alone opposed the sovereign. The sympathizing nymphs now exhort the sufferer to seek some release. They allight from the car to see the details of the plot in the temple of the Sun. Then their father, Oceanus, enters astride a winged horse. The old man of the sea demonstrates with his kinsman and bids him beg for pardon. But the Titan, like Satan, hardens in his strength.

From this homely scene Eschylus soars aloft to a height of poetry as beautiful as it is magnificent. The whole world makes moan: the delight of dramatic poetry. Asia's martial glory, the surge of the sea, Hades in the abyss of the earth, and all the streams murmur and sigh in a pathos of woe. Prometheus then enumerates the benefits he has conferred on mankind, house-building, taming of beasts, science, literature, mathematics, astronomy, navigation, medicine, divination, mining. The chorus admonish him that all these gifts were for naught, since weak, ephemeral man could not help him in return. Io enters. The only mark of her metamorphosis is her horns. In admirable verses the poet depicts her fatigue, her despair and the tender sympathy she manifests at the sight of the sufferer bound on the storm-beaten rock. Prometheus tells her that he recognizes the daughter of Inachus, who had set Jove at strife with love and is now by vengeful Hera driven over the earth. In a melodiously plaintive narrative, full of charm and grace, Io relates how phantasms of the earth and sky, reaching the land, reached the organ of her fancy, urged her to go out to the meadow-land that Zeus might be lightened of his passion; how her father had driven her forth from home; and now by gadfly sharply stung, pursued by the immittigable Argus, "with frantic bound from land to land." I fly. Prometheus now tells the harassed maiden that she must traverse Europe, through a wild and dangerous country, to the Tauric Chersonese, cross the Thracian Bosporus to Asia Minor. Then proceed to the plains of Cithene, where the Gorgons dwell, and to the land of the griffins and Arimaspians, through a region peopled by monsters. At last she will come to a far land, whence she must creep down the river Aethiopis until she comes to the Delta. There in the city of Canobic Zeus will restore her to her pristine form with but the touch and gentle pressure of his hand; and she will bear a son, swarthy Touchborn, who is to rule over all the land watered by the Nile. In the fifth generation 50 maidens, fleeing the proffered marriage of their cousins, shall return to her home in Argos and shall in the watches of the night put their lords to death. But one of the maidens will spare her mate. From this pair will spring a royal race, one of whose descend-ants is destined to deliver Prometheus. With a cry of terror the demented Io darts away, and the chorus moralize on the inadvisability of unequal matches. A great change has now come over the Titan. He is reminded by the appearance of Io that he will find respite; and so he resolves to await the retributive hour. The aethiops which he contemplated a moment ago seem now but a pulse beat. The steadfastness with which he asserts his will in the face of disaster makes an impression of unusual grandeur. "Let him in calm assurance seat him sure, fixing his faith on the devastating crash reverberating in the sky, and holding in his hand the thunder-stone high poised. He shall find a flame more furious far than his father's story, when their father, Oceanus, enters astride a winged horse. The old man of the sea demonstrates with his kinsman and bids him beg for pardon. But the Titan, like Satan, hardens in his strength.
care aught for him. Homage may he have from all, but none from me. 

Heaven's winged herald, Hermes, now sails downward on the bosom of the air. He commands Prometheus to yield up his secret. But the Titan observes the menial of the new crowned king with some surprise and thrice as much disdain: Zeus shall soon know that the victim holds a power above his oppressor: 

*Let him hurl his red levin and with storms and subterranean shocks of thunder confound the universe—never will he be able to extort a secret by any pain or ignominy he may devise.* 

Deaf to all entreaties, Prometheus will never sue for grace or bend the suppliant knee, never implore the hated king with base spaniel fawning and womanish supplication of hands. Hermes replies that Zeus will smite the rock with a thunderbolt and hurl the prisoner down into the yawning chasm of the earth, and after a long sweep of time the Titan will come forth to the light again only to have his body torn to a shreds by the winged hound of Zetes, the ravening eagle, which will cram his crop full on the captive's liver. The nymphs urge the obdurate god to yield, but their entreaties are vain: 

*Let the forked curl of flame be hurled upon my head; heaven and earth will be convulsed with thunder and quivering spasm of winds exasperate; let the billow of the deep with its boisterous surge confound the paths of the stars in the sky, let him hurl me into the vorticities of necessity—he cannot destroy me.* 

Hermes soars aloft. A storm breaks. The ocean swells and foams, all the sway of earth shakes like a thing unfirm, thunder subterrane reverberates, fiery-zigzag flashes gleam, whirlwinds twirl the dust, the winds leap together in conflicting blasts and the threat of Hermes goes into sublime fulfilment.

The second play of the trilogy was the Prometheus Unbound. The Titan reappears bound to the same rock, but on the Caucasus. The other Titans, now released from Tartarus, urge Prometheus to yield. The eagle has been glutting his maw on the captive's liver every thing unfirm, thunder subterrane reverberates, with his arrow. Mutual concessions are made, and Prometheus returns to his place among the gods in Olympus.

The third play was called Prometheus, the Fire Bearer. The theme was doubtless the induction of Prometheus into his high office as an Artic god and the establishment of a festival, the Prometheus, a prominent feature of which was a torch-race. Without fire there would be no art, no industry, no civilization. Fire humanized man. The earth-fire came from the heaven-fire. To primitive man the production of fire was a miracle—in volcanic countries subterranean, in others super-terrestrial. Among all nations there is a tradition that fire was stolen, either directly from the gods or from some other tribe on whom the gods had bestowed the blessing. These myths closely resemble one another—in New Zealand, North America, Greece, France, India. Five hundred of the 1,000 Rig-Veda hymns invoke Agni (Igmis) a common surname of whom is Pramati (Prometheus). Fire in itself is fire; the thief is usually an animal, among barbarous races, a man, among civilized nations, a god, or demi-god. The myth of the Fire-Stealer is the most popular of all among the aborigines of the Northwest. In Greece the legend goes back to the oldest period of mythology. Hesiod conceived the condition of man in the primitive period as a happy one. Prometheus brings punishment on himself and troubles to mankind, whose cause he has espoused. Zeus sends Pandora, whose charms mortals cannot resist. The conception of Aeschylus is higher than that of Hesiod. The tragic poet insists on the benefit of the gift, and shows how fire was really the starting point of civilization: how all human culture had its origin in the spark which Prometheus flushed for us in the fennel stalk. Primitive man was plunged in a heavy stupor, but in his beast-nature was capability. Prometheus taught him every art and science. The Titan's greatest crime was 

*To render with his precepts less The sum of human wretchedness. And strengthen man with his own mind.*

Joseph E. HARRY, *Author of 'The Greek Tragic Poets,' etc.*

PROMETHEUS UNBOUND: A Lyrical Drama is the greatest of Shelley's longer poems. *This poem, begun in the autumn of 1818, was chiefly written,* says Shelley, *in the mountainous ruins of the Baths of Caracalla.* The bright blue sky of Rome and the effect of the vigorous awakening spring in that divinest climate, and the new life with which it drenches the spirits even to intoxication, were the inspiration of this drama. This was his first experience of an Italian spring, and the reawakening of nature gave impulse and imagery to a vision of the rebirth of justice and happiness, on which the poet often fondly dwelt. *That man could be so perfectionized,* Mrs. Shelley notes, *as to be able to expel evil from his own nature and from the greater part of creation, was the cardinal part of his system.* The drama depicts this process in symbolism borrowed from a Greek myth already dramatized by Aeschylus in the *Prometheus Bound.* In the Saturnian Age—or, as Rousseau would say, in a state of nature—men were innocent and happy. Prometheus gave them the arts of life—institutions social and political; these, however, growing obsolete, cramped progress, begot abuses, yet acquired a prescriptive authority which became tyranny. This prescriptive authority—to Shelley, the very principle of evil—is in the poem identified with Jupiter, the persecutor of Prometheus. The latter represents goodness, wisdom, progress. Act I reveals him in his agonies; these result from contemplating the world as it is, especially when evil originates from intended good (e.g., see the view of Christianity, II, 107 ff.). The struggle against evil enthroned has hitherto failed because hatred and violence have been the weapons of revolt (so in the French Revolution, I, 567 ff.). Only true wisdom, abjuring hate, follows the dictates of love will the Golden Age return,—i.e., in the allegory, when Prometheus is united to the nymph Asia. Asia, like the other symbols, has varying significance; sometimes for the love of nature; again, she is that ideal spirit to whom is addressed the "Hymn to Intellectual Beauty," and who in the "Adonais" is called
Urania. The central figure of Act II, she seeks for truth, which she finally attains by the aid of Demogorgon. This mysterious personage perhaps symbolizes destiny as the result of law, or the fundamental constitution of the universe; the emotional nature penetrates to and accepts the ultimate truth. As Act I depicts the patient endurance which is the present lot of goodness, so Act II depicts future progress toward a true philosophy. When wisdom is wholly dominated by love, and love accepts the truth, the consummation of things is at hand. In Act III the dénouement follows; Jupiter weds Thetis,—a union from which he expects some culminating advantage; instead, Demogorgon appears and drags him to the abyss. Prometheus is set free and united to Asia. The intellect having attained its ideal, the emotional nature being centred on the true, "the Golden Years return." This act concludes with a description of redeemed humanity. Act IV (an after-thought written at the close of 1819), is wholly lyrical, and reveals universal nature joying in a regenerat world. "No modern poet," says Professor Herford, "has come nearer making the morning stars sing together." Act IV is a concatenation of intense emotion, tenuity of thought and poetic beauty. "The passages which are most thoroughly stripped of doctrine, of definite ideas, and even of humanity, are the most perfect of all, and Shelley is there most himself." (Eton). This meagre outline, bare of all the beauty and passion of Shelley's poetry, is ludicrously incapable of suggesting the original. "Prometheus," while in some measure modeled onAESCHYLUS, is, unlike it,—"a lyrical drama," an allegorical presentation of thoughts and feelings. It has no characterization, save perhaps in the hero, nor any plot interest; such action as it has is difficult to follow. Its merits are of another order, and may be indicated in the words of William Rossetti: "There is, I suppose, no poem comparable, in the fair sense of the word, to 'Prometheus Unbound.'" The immense scale and boundless scope of the conception; the marble majesty and extramundane passions of the personages; the sublimity of ethical aspiration; the radiance of ideal and poetic beauty which saturates every phase of the subject, and almost, as it were, wraps it from sight at times, and transforms it out of sense into spirit; the rolling river of great sound and lyrical rapture; form a combination not to be excelled elsewhere, and scarcely to encounter competition." Consult Mrs. Shelley's Notes; Wm. Rossetti's paper in Shelley Society's Publications, 1886; Todhunter's Study of Shelley; Miss Vida Scudder's annotated edition.

W. J. ALEXANDER, Professor of English, University College, Toronto.

PROMISE, an engagement entered into by one person to perform or not to perform some particular thing. When there is a mutual promise between two parties it is termed a contract. A promise may either be verbal or written. See Contract.

PROMISE, Breach of. See Breach.

PROMISSORY NOTE, is an unconditional promise in writing for the payment of money in a sum certain, absolutely, and at all events; it is negotiable when it is transferable from one person to another by endorsement or delivery, so as to vest in the party taking it the legal title to the note and to the property it represents; they are of ancient origin and were in use by the Romans. Under the law, generally, notes are assignable, so that the assignee may bring an action thereon in his own name. The usual parties to a promissory note are the drawer, the payee to whom it is drawn and the endorser. The important points of a negotiable note is that the person receiving it does so for value and without notice of any question of title of the previous holder. Anything on the face of a note sufficient to put a transferee upon inquiry subjects him to any defenses between all the original parties; one taking negotiable paper that is overdue does so under like conditions. Possession of a negotiable note which is payable to drawer, or which is endorsed in blank, or to the holder specially, is presumed to be legal in every respect. A note to which any signature is attached, through which the holder claims, that has been forged, is not good. The holder of a note can bring an action thereon, except that it is probably an example of a note endorsed in blank. If a note is made subject to any conditions as to demand or notice, same must be first complied with before action can be brought. Protesting of a note is the declaration by the holder against any loss on account of non-payment, its object is to give notice to the endorsers of their consequent liability; such notice is essential, and it is customary that protest be made by a notary public. Many important subjects in relation to the laws governing promissory notes are the subject of statutes, which differ in various jurisdictions. See also ENDORSEMENT; NEGOTIABLE PAPER; NOTE.

PROMOTER, in law, (1) one who promotes an undertaking or the like, as a corporation. In this sense the term is applied specifically to one who aids in the organization of a joint-stock company or similar body (e.g., Great Britain) to one who aids in the passage of an act of Parliament. In the United States it is used almost exclusively in the sense of one who aids in the organization of a corporation by soliciting subscriptions to its stock, planning its business operations and doing other similar acts in furtherance of that object. A promoter in this sense is held by law to act in the relation of a trustee to such corporation, is held strictly answerable for any fraudulent misrepresentations which he makes to intending investors; and is precluded from taking a secret advantage over the other stockholders. A promoter is personally liable on contracts made by him for the intended company after its failure to incorporate and also for subscriptions paid into such a company. A promoter is not allowed secret profits as between himself and the corporation, but he may purchase property for the corporation and later sell it at an enhanced price. (2) One who prosecutes offenders in an ecclesiastical court.

PRONGBUCK, or PRONGBORN, the American pronghorned goat-antelope (Antilocapra americana), one of the two sole living representatives on the American continent of the large series of Old World antelopes (Bovida), the other being the Rocky Mountain
PRONOUN—PRONUNCIAMENTO

565

goat (Dama mesopotamis), which is more nearly a true antelope than a goat. Although almost universally known as "antelope," the pronghorn differs so greatly from the true antelope that it is placed in the type of a distinct family (Antilocapridae), having affinities alike with the giraffe, deer and goats. The horns, while resembling those of the true antelopes and the Bovidae generally in consisting of a bone-core covered by a horny sheath, differ from those of all these, in the pronghorn having only one spur or branch. Furthermore, they are more or less densely and extensively covered with hair, thus resembling the horns of the giraffe. But by far the most remarkable peculiarity of these horns is that they are shed annually like a deer's antler. So skeptical were zoologists as to the possibility of a hollow-horned ruminant shedding its horns, that, although the fact was known to hunters for many years and had been repeatedly reported, it was not until 1835 to 1837 that the phenomenon of this reptile came fully established. The entire horn is not shed as in the case of deer, but only the horny sheath, the bony core remaining intact and permanent and its epidermal covering immediately beginning to grow and regenerate a new horn.

The pronghorn is about three feet high and five feet long, with a very short tail, slender legs, pointed, erect ears and extremely large eyes. Two important characteristics are the absence of the small accessory hoofs from both fore and hind feet and the hairiness of the end of the muzzle except along a narrow median line. The color is a variable and somewhat mottled brown, with a chestnut colored mane and a brilliant white rump patch or so-called recognition mark. Both sexes have horns; but those of the female and young are smaller and simple. Since the disappearance of the bison, the prongbuck is the most characteristic ruminant animal of the great Western plains. Although the progress of settlement has much diminished its numbers and reduced the limits of its range both easterly and westerly, the prongbuck still holds its own over an area extending for about 30 degrees from Saskatchewan on the north to the Mexican state of Zacatecas and on the west to the Colorado, Utah, New Mexico and Arizona. Prongbucks live in bands on the open plains or in the hilly countries; bucks, does and fawns associating during the greater part of the year, but at the close of the gestation period, which varies from March to September, according to latitude, the pregnant does separate to drop their two fawns in solitude, and the old bucks wander into the wooded hills. Their natural food consists almost entirely of grass, though grain, apples, etc., will be eaten in captivity. They are wonderfully alert animals, with keen senses, and so reticent that they retire with the slightest alarm, but withal so curious that they soon pause to gaze at the cause of their alarm. Their speed is marvelous, and their bounds of tremendous extent, but their power of endurance is not great and they have never been over an obstacle of any height. They may be domesticated with comparative ease and sometimes breed in captivity; and it is said that a fence of only three or four feet high is quite sufficient to confine them. Owing to the excellence of their flesh, though it is rather dry, and their splendid game qualities, they are much sought by hunters. The methods most in vogue are pursuing with grey or deer hounds, running with relays of horses, and stalking, the latter especially requiring much skill, though they may be lured toward the concealed hunter by an appeal, by means of a fluttering colored cloth or handkerchief, to their innate curiosity. The Indians hunted them by stalking, sometimes dressed in the skin of one of their kind, by driving them into brush enclosures, over which they would not leap; and in other ways. Consult Canfield, (The Proceeding of the Zoological Society, L London 1866); Caton, 'Antelope and Deer of America' (Boston 1881); Lydekker, Richard, 'Royal Natural History' (Vol. I, London 1895); Roosevelt, Theodore, 'American Big Game Hunting' (New York 1901) and 'The Deer Family' (New York 1902); Seton, E. T., 'Life Histories of Northern Animals' (New York 1809).

PRONOUN, a part of speech which takes the place of the noun, to avoid too frequent repetition of the noun or to designate an object whose name is not known or, if known, is not desirable or available for use. Pronouns have the same properties as nouns, viz.: gender, person, number and case. It differs from the noun in this, that whereas the noun stands always for some definite object or concept or class of concepts, for example, Chicago, man, house, the pronoun may stand for a given concept or class of concepts; but again for a totally different one; thus the pronoun has no fixed denotation: it may stand for "Chicago," or "horse," or "universe." A usual classification of pronouns divides them into those personal (I, thou, he, she, it); demonstrative (this, that), interrogative (who? which? what?), possessive (my, thy, his, her, hers, its, our, ours, your, yours, their, theirs, whose? what? which?), and indefinite (any, aught, some, each, every, other, etc.); but the demonstratives and the indefinites do not, as a rule, fall under the definition of pronoun. Worthy of note is the general going out of use of the articles (the, a, an) in modern languages, of the personal pronoun (and its possessive) of the second person singular, thou, thy, thine and the substitution for it of the second person plural (you) in the form signifying "your worship" or the like. Consult Amyot, C. J. B., De la Nature des Pronoms (Paris 1856); Goebel, K., 'Die Grammatischen Kategorien' (in Neue Jahrb. für die Klasseiche Altertum Geschichte, und Deutsche Literatur, Series III, Vol. V, Leipzig 1910); La Grasserie, D. de, 'De la Veritable Nature du Pronom' (in 'Etudes de Grammaire Compare,' Louvain 1888); Maetner, E., 'An English Grammar' (3 vols., London 1874); Owen, E. T., 'A Revision of the Pronouns' (in Wisconsin Academy of Sciences, Arts and Letters, Translations, Vol. XIII, p. 1, Madison 1901).

PRONUNCIAMENTO, in Spanish-speaking countries, especially in Spanish-American republics a proclamation against the existing government, intended to serve as a signal of revolt. The word contrepronunciamiento, that is, counter-proclamation, also occurs.
PRONUNCIATION, the act of uttering words or articulate sounds of the voice. The alphabetic characters are designed to represent words, whether of less precision than the voice-sounds of a language, and if all those sounds have each its proper sign, a written word will be a sure index of its pronunciation. The alphabet of the Spanish language is nearly perfect in this respect. In Spanish the vowels have each one quality or sound; and in written situation, they have each but one value and a, e, i, o, and u are pronounced respectively as a in father, ei in rein, ee in see, o in lone and oo in moon. The consonants, too, have only one sound, except that before the vowels a, o and u and before consonants, c has the sound of k and g, the hard sound of g in get; also, to represent special sounds, l is doubled (lleno, pron. lyaino) or a diacritical mark is used (á, pron. ahnyo). Not so in English. In English each of the vowel and consonant signs designates various sounds. Thus the vowel sign a denotes at least six different vowel sounds; e at least four; i at least three; o (including oo) seven and u in four; often they are silent, representing no sound at all. Many of the consonants, too, though not to the same extent as the vowels, represent each, whether singly or compounded, two or more different sounds; examples: cede, call, child, machine, chemic. Other consonants which stand for more than one sound are s (sat, has, sure), t (tan, thin, thine, nation), n (sin, sing), etc.

The different sounds represented by the vowel sign a are: (1) the short vowel sound which it oftentimes represents: it is heard in man, cab; this sound is almost peculiar to English; it differs slightly from the short a of French and considerably from the short ō of German; Germans who are beginning to learn English have difficulty at first in producing this English vowel and instead of man say men, but instead of hat. (2) The long sound of a as in hate, late; its sound is that represented in other languages by the second vowel e; in German and other languages the sound of the word bat would be represented by ben or behn or ben, etc. (3) The sound of a (however represented — by a, or ei, or ea, etc.)—before r in the same syllable, as in share, bear. A vulgar mispronunciation of such words is shar, bar; in Irish pronunciation the a in share, bear, pear, etc., has precisely the same sound as in shape, lane, ban. (4) The sound of a in father, calm, far: this is usually styled the Italian sound of a. (5) The sound of a in ask, branch, pass, differing from the pronunciation of the same letter in at, am, an: it is the short sound of the a in father. In England and New England the distinction is made between the sound of a in branch, ask, etc., and the a in barn, ran; elsewhere in the United States it is not observed. (6) The sound of a in all, warm, talk, is peculiar to English; it is much broader than a in German words all, fall. (7) The sound of a in what, wander, is peculiar to English; it is represented by o in not, gone, etc. The sounds of e are (1) its short sound as in net, sea, etc.; (2) its sound as in obeis. m. green; this sound is represented in most other languages by the third vowel i; (3) the sound which it has in vein, rein; in other languages this is the primary sound of this vowel; (4) the sound, peculiar to English, which it has before the letter r as in per, confer. Three sounds are represented by i; namely: (1) the short sound as in pin, bin; (2) the corresponding long sound as in marine: this is the regular sound of i in other languages; in English i is so pronounced only in a few words; (3) the long sound heard in pine, ride: this is a diphthong and equal to ei or ai. The vowel o represents the following sounds: (1) Its primary sound in English and other languages, as in ode, lone; (2) a short sound peculiar to English, as in not; this is not the o of Ode; the shortened o of ode is unknown in English; (3) the obscure short sound (same as that of u in but) heard in other, son, done; (4) the sound heard in prove, move: this is the long vowel ō of German, Spanish, etc., and the ow of French; (5) the same sound shortened, as in wool, book, took; (6) a sound closely resembling that of a in all: it occurs when o is followed by r in the same syllable, as in order, corner; in Irish pronunciation this o has the same sound as a in all. The sounds represented by u are: (1) the sound heard in rule. Many of the consonants, too, though not to the same extent as the vowels, represent each, whether singly or compounded, two or more different sounds; examples: cede, call, child, machine, chemic.

PRONY, prô-nê, Gaspard Clair François Marie Riche, BARON de, French engineer: b. Chamelée, Rhône, July 22, 1755; d. Asnières, Sept. 29, 1839. He received his technical education at the École des Ponts et Chaussées. As assistant to the civil engineer Perronet he was employed in building the bridge De la Concord at Paris and the restoration of the harbor of Dunkirk. On the head of the board of survey, in 1791 he superintended the construction of new trigonometrical tables, extended to 25 decimal places, necessitated by the establishment of the metric system. This great work in 17 volumes is preserved in manuscript at the Observatory at Paris. In 1794 he was appointed director-general of bridges and roads and at the same time was made professor of mathematics at the Polytechnic School, in 1795 he became a member of the Institute; and in 1796 director of the École des Ponts et Chaussées. Under Napoleon he executed improvements in the harbor of Genoa, Ancona and Venice and in the navigation of the Po. In 1810 he became a member of the commission charged with the drainage and improvement of the Pontine Marshes. In 1818 he was made one of the 50 foreign members of the Royal Society and in 1835 a peer of France. He wrote several works of a technical character connected with the engineering operations of which he had charge, the most important of which is *Description Hydrographique et Historique des Marais Pontins* (2 vols., Paris 1822–23). He also published *Nouvelle Architecture Hydraulique* (2 vols., Paris 1790–96); *Vie de Pingeot* (Paris 1796); *Nécanique Philosophique* (Paris 1800); *Leçons de Mécanique Analytique* (2 vols., Paris 1810–15).

PROOF. See EVIDENCE.

PROOF IN ART, the name given to an impression of an engraving "pulled" or struck off, from the plate, with or without the signature of the artist. After the various "proofs" and states there comes, finally, the "finished" or "publication" state, which preceded but last proof passed by the artist as "ready for printing." Each of the impressions issued to the public is classed under one of the following headings: (1) *Artist's proofs*; (2) proofs before letters; (3) lettered proofs (or proofs after letters), and (4) prints. These headings do not necessarily correspond with the "states" of a plate. They are simply description of the amount of lettering printed on the impressions to which they refer. The "publication line" should be on every impression and is the only lettering which appears on artist's proofs. Proofs before letters have printed on them the names of the artist and engraver of the work and the dedication to the "publication line," but they are without the title. They are stamped on the right.

Lettered proofs have printed on them the names of the artist and engraver of the work and the dedication to the "publication line," but they are not stamped at all. To-day artists who "pull" their own proofs usually sign in pencil.

A "wax proof" is a tentative proof by the engraver for the purpose of learning what retouching may be necessary. It is obtained by filling in the lines on lampblack and applying it to a sheet of paper coated with wove paper and exerting upon it a gentle pressure with a burnisher.

"Proof with gray lettering" is applied to proofs in which the lettering is grilled with "hatchings" (small lines). "Proof with white lettering" is a proof in which the characters of the legend or inscription are only indicated by outlines.

The word "state" and "proof," writes Dr. Frank Weltenkamp, "call for explanation. Their use is not always well defined. In a general way it may be said that the 'proof' is usually applied to an impression taken from the plate in the earlier clearly unfinished stages, while 'state' is used to indicate stages of relative completeness. As the engraver, or etcher, works on his plate, he takes an impression occasionally to get the effect of what he has done. Such impressions are known as 'trial proofs' or 'working proofs.' There are many ways of making changes. Work on the plates may be obliterated by scraper and burnisher or the plate may be beaten up from the back on an anvil by a hammer. A portion of a wood block may be cut out and a plug of wood inserted in its place to be re-engraved. A piece may even be added to an engraved block or plate and the engraving then enlarged. Occasionally an etcher will try his point on the margin of the plate or even execute some slight sketch. Chodowiecki did this; Buhot did it to a very elaborate extent. Such marginal sketches are called 'remarques.' And from this habit originated the systematic production of 'remarque proofs' against which Whistler directed his fine sarcasm. But he also declared, vigorously against the presence of any margin at all. A margin on the plate is not a necessity, but a proper amount of margin is undoubtedly a protection for a print. In modern times the whole matter of 'proofs' and 'states' was brought into a regular system, impressive to the buyer and profitable to the producer.

There may be, for example, successively trial proofs, finished proof, proof with remarque, artist's proofs, before all letters (or inscription), 'state' with names of artist only, with inscription, in open letters, with letters filled or solid, with publishers' address. And the 'states' again may be on India or Japan paper and on plain paper.

The importance of a good impression is paramount and the good impression is the result of the printer's skill and the 'state' of the plate. For this reason, also, early 'states' are sought by collectors, but even more, perhaps, because they are rare. For rarity plays a very important part in the collector's list of reasons. In reality, mere priority of 'state' does not mean much in itself. The very fact that the artist thought it necessary to create a later 'state' by making corrections or additions, is significant. Such an afterthought may raise a plate from comparative insignificance to telling force or it may spoil it altogether. Turner's 'Calm' (No. 44 of the Liber) is usually considered much finer in the third 'state' than in the first. The Techorner reissue of Jacques- mart's 'Gemmes et Joyaux' is better than the
PROOF, ONTLOGICAL — PROOF READING

first 'state,' says Wedmore. In the second 'state' of Whistler's 'Kitchen' a large amount of added dry-point work appears, especially on the ground towards the window, increasing the richness and harmony to a remarkable extent. On the other hand, the luminous quality and reflected light in the first 'state' of Turner's 'Cryp of Kirkstall Abbey' have become dull and flat in the second. Some of Meryon's plates have distressing additions in the later 'states,' strange birds and beasts and human beings, sometimes of a troubled mind. Nor could any amount of working change the fumbling effect of the body in Whistler's 'Becquet' (the 'cello player?'), in which the interest is absolutely concentrated on the well-wrought head. There may be various reasons for preferring an early 'state.' Experience, developed taste and acquired knowledge of the individual case will determine your choice.

ESTHER SINGLETON.

PROOF, Ontological, or ONTOLOGICAL PROOF. See ONTOLOGY.

PROOF-READING, the process of reading the printed proof of matter to be printed, and marking errors, corrections, etc., on the margin. Proof-readers require to be expert in typography, as well as possessed of considerable education and general knowledge. An established set of signs is used. The specimen of a proof shown on this page exhibits most of these signs.

The immediate object of proof-reading or correcting is to mark every error and oversight of the compositor, with a view to make the printed sheet a perfect copy of the author's manuscript. This is done on the presumption that the manuscript is correct, which is seldom the case; and, therefore, the duty of a good reader extends to seeing that there are no inconsistencies in orthography, punctuation, abbreviations, etc., and in many cases to the verification of quotations, dates and proper names. Where extensive alterations, omissions or additions are to be made by writer or editor, it is more convenient to take the proofs on long slips called galley proofs, before division into pages. The making of new paragraphs, or the suppression of those in type and needless addition or omission of words that involve resetting many lines, should be avoided as causing trouble and expense.

The duty of securing consistency in spelling and punctuation is especially important in the case of works on which several writers are employed, such as newspapers and periodicals. The proof-reader has also to observe the numbering of the pages; arrangement of chapters, paragraphs and notes, running titles, etc. It is part of his business to observe the mechanical defects of the machine, defective types, torn edges, irregularities of spacing between words, sentences and lines, crooked lines, and to secure symmetry in verses, tables, mathematical operations and such like. In almost all cases two proofs are taken, and in difficult works, such as those in foreign languages, tables, etc., even more. Lastly follows the revision, in which

'To rule the nations with imperia

swify, to impose terms of peace, to

spare the humbled, and to reach the

proud, resigning it to others to de-

scribe the courses of the heavens, and

explain the rising stars; this, to use

the words of the poet of the Aeneid

in the 'apotheosis of Anchises to Fabius in the Shades was regarded

as the proper province of a Roman.

The genius of the people was

more adverse to the cultivation of the

physical sciences than that, the Euro-

pean Greeks and [seen we have] that

the latter left experimental philosophy

chiefly in the hands of the Asian and

African colonists. The elegant litera-

ture and metaphysical speculations

of Athens, her histories, dramas, orals,

and orations, had a numerous host of admirers in Italy,

but a feeling of indifference was displayed to the practical

science of Alexandria. This

repute of the Roman mind at

home to mathematics and physics,

extending from the Atlantic to the

Indian Ocean, from Northern Britain to

the cataracts of the Nile, was

in the conquered districts where they

had been pursued, and prohibited

attention to them in the mother

country.

C Ernne, indeed, after the age of

Ptolemy, the school in connection

with which he flourished, remained

in existence; etc.

(1) A wrong letter. After every mark of correction a line should be drawn, to prevent it being confounded with any other in the same line. (2) A word or letter to be transposed. Where letters only are to be transposed, it is better to strike them out, and write them in their proper sequence in the margin, like a correction. (3) A space to be inserted. This mark is also used when the spacing is insufficient. (4) A space or quadrat sticking up. (5) Alteration of type. One line is drawn under the word for italics, two for small capitals, three for CAPITALS. (6) Correction or insertion of points. (7) A word struck out, and afterward approved of (Latin sed, "let it stand"). (8) A turned letter. (9) A omission. (10) A letter of a wrong font. (11) A word or letter to be deleted. (12) Alteration of type. (13) A new paragraph. (14) Insertion of a clause. (15) A space to be removed or diminished. (16) A wrong word. (17) Straighten into line (18) Insert a hyphen. (19) No paragraph. (20) The manner in which the apostrophe, inverted comma, the star, and other references, and superior letters and figures are indicated.

Little more is done than seeing that the composition is made up and all the corrections marked on the last proof. It is usual for the writer or author to reserve the correction of the second
proof for himself. The work of a proof reader is more difficult than the uninitiated would believe. It requires extensive and varied knowledge, a sound judgment of typography, and, above all, a peculiar sharpness of eye, which, without losing the sense and connection of the whole takes in at the same time each separate word and letter. The proof-reader is usually assisted by a second person, called the compositor, who reads all over from the original copy, spelling out names, words in foreign languages and other words offering special difficulties. Proof-reading now is usually done by persons devoting themselves exclusively to this work. In earlier times it was the custom of publishers to employ scholars and writers and authors were in the habit of sending the proofs of their works to friends for the purpose of reading them. In the case of scientific books this custom is still frequently followed. (See PRINTING). Consult Appleton, D., and Company, 'Of the Making of a Book' (New York 1904); Booth, W. S., 'Notes for the Guidance of Authors' (New York 1900); Crapelet, G. A., 'Etudes Pratiques et Theoriques de Composition' (Paris 1837); De Vinne, T. H., 'Preparation of Manuscript for the Printer' (New York 1905).

PROPAGANDA, a shortened name for the congregatio de propaganda fide (delegation for propagating the faith), founded by Gregory XV in 1622. It consists of a number of cardinals at their head, a general secretary and a vast number of inquisitors and employees. A special section is devoted to the Oriental rites. It is the central missionary association of the whole Roman Catholic Church, and superintends and guides missionary operations in all parts of the world. United in their efforts to spread the Catholic faith, it is active in Europe and America where the ecclesiastical hierarchy is not established. Connected with it is the collegium seu seminarium de propaganda fide, usually called the Collegium Urbanum after its founder, Urban VIII, who instituted it in 1627 for the education of missionaries, students of all nationalities subject to the Propaganda being here received and trained and maintained free of expense, from the age of 14 years. Converts to the Roman Catholic Church who have come to Rome are instructed and supported by its funds. Bishops and other clergy who have been missionaries are also welcomed and supported there. The Roman Propaganda had, until within recent years, a printing-press, celebrated for the works which issued from it. The efforts of the propaganda are directed particularly to countries outside of Europe. In close connection with it stand a number of seminaries or colleges for missionaries in various places, including the United States. (See Missions) Consult Smith, J. H. W., 'Propaganda' ('Catholic Encyclopedia,' Vol. XII, New York 1911); Preri, J., 'Missionary Work of the Church' (New York 1908); Martinis, R. de, 'Ius Pontificii de Propaganda Fide' (7 vols. PROPELLER. See Screw-Propeller.

PROPERTIUS, prō-pēr'tē-ūs, Sextus, Latin poet; b. Assisiun, Umbria, about 50 a.c.; d. Rome, between 15 and 2 a.c. He is ranked by many as the greatest elegiac poet of Rome. Comparatively little is known regarding his life. He was deprived of his estate in the course of the agrarian confiscation and reduced to comparative indigence. Nevertheless he acquired a good education and was urged to take up the profession of advocate, but seems to have preferred devoting his energies to light literature and affairs of the heart, in which his love for the woman in his poems called 'Cynthia' (her real name was Hostia), finally gained the ascendant and is reflected in much of his best work. Of his works, the most admired are the epigrams, and he is remembered for his friendship with Virgil and Ovid and engaged the patronage of Mæcenas. With Horace his relations do not appear to have been friendly. He was of a delicate constitution, pale and thin in person and of an emotional temperament in which melancholy seems to have had a large share, particularly in his late years. It is said of him that he was very careful about his personal appearance, almost foppish in his attention to dress and gait. The poems of Proper- tius consist of a collection of elegies usually divided into four books, though some commentators claim that they ought to be divided into five. All existant manuscripts, however, contain many gaps and have been in some instances more or less disfigured by corruptions. They are in their outward form modeled somewhat after the manner of the Alexandrine poets Callimachus and Philetas. He excels in the presentation of quiet description and emotion, "a fine and almost voluptuous feeling for beauty of every kind and a sentiment of melancholy tenderness." English translations have been made by Palmer, Paley and Postgate. The best texts are those by Hertzberg (1843-45); Keil (1850); and Haupt (1885). There are now no manuscripts in existence of his works that date earlier than the 12th century. The best and most complete manuscript is the so-called Codex Neapolitanus, now at Wolfenbüttel (12th century). Others are Codex Vossianus at Leyden; Codex Laurentianus at Florence (15th century); Codex Davenportiensis at Deventer (early 15th century); Codex Holkhamianus at Holkham (1421); Codex Urbinarum in the Vatican (15th century). The first edition was published in Venice (1472). Other editions of importance are by Pasquerat (Paris 1608); Lachmann (Leipzing 1816; Berlin 1829); Hertzberg (Halle 1843-45); Paley (London 1872); Bährnsen (Leipzig 1880); Palmer (Dublin 1880); Postgate (London 1894); Rothstein (Berlin 1898); Haupt and Vahlen (Leipzig 1904); Butler (London 1905); Phillips (London 1911); Hosins (London 1912). English translations have been made by Kelly (London 1854); Moore (Oxford 1870); Cranstown (London 1875); Phillimore (Oxford 1906), and

PROPERTY, LAWS OF. Anything, whether tangible or intangible, which can be reduced to possession, or made the subject of ownership, comes within the legal definition of property. The sea, the waters of rivers and the atmosphere enveloping the earth are for the common use of all men and can become the exclusive possession of no individual; wherefore they are not designable as property. But a thing may be property and subject to ownership without being the physical possession of the owner. With respect to intangible objects physical possession is impossible. One may own land without being in occupation thereof either personally or by representation; but a copyright is not a thing that one can put in a wallet and carry around on his walks. Here are two objects of ownership, one intangible and the other the most concrete of earthly things, in the case of which the fact of proprietiorship may be, and in the latter instance must necessarily be, merely a matter of record. Some things are loosely spoken of as property which are not really objects of ownership in a legal sense. A man has a right to his good name, but he does not own it, though colloquially speaking he may be robbed of it. The capability of being transferred is the quintessence of property. One cannot transfer his personal reputation to another, but good will, patent rights and many other intangibles are property because they may be bartered and sold, goods and chattels. But ownership implies not only the transferability of the thing owned, but also the possibility of transferring the same. If a man were alone in the world he could call nothing mine, says Kant. The relation of ownership as between a man and the thing, between the man and other men, whom he excludes from, and to whom he gives, possession. Property is an exclusive right and where there are no people to exclude, the right cannot exist.

Law—In early society one should not expect precise conceptions of proprietary and other legal rights to be prevalent.
has persisted to the present day in the Russian "mir." When the system breaks down communal ownership is not superseded at once by individual ownership, but by the quasi-corporate ownership of property by the family group. The homestead and farmed land became the inalienable and indivisible family "mir" of early Teutonic law and, while chattels were let and hired and could be pledged and forfeited, the alienation of patrimonial property was an affair of families, not of individuals, which was accomplished by a clumsy adaptation of the Roman hereditas universalis. Clear traces of the precedent communal system of proprietorship are found in the laws of republican Rome. The paterfamilias with all his despotic powers could not divest his descendants of their heritage and, when there were no descendants, property reverted to the gens, whose right of succession could be defeated only by a will made with the consent, and in the presence, of the entire comitia, armed and drawn up in battle formation. In the village communities of India the present teetotalism is adapted to a most complicated system of ownership, not only with respect to houses and land, but to all property. Everything a member of the community acquires, from an elephant down to a soldering iron, theoretically becomes a part of the common stock, though there are minute regulations securing to individuals the possession and use, and the disposition or bequest of the same. The conception of absolute individual ownership is of modern origin, relatively speaking, among European nations, but it seems to have prevailed in the ancient monarchies of Chaldea, Assyria and Babylonia. The Mosaic law ordered the redistribution of property by tribes and families in the jubilee years.

Roman Law.—Early Roman law made a distinction between res mancipia and other things. With the former were classed immo-bilia, corresponding in a general way with what he calls real property, though the term was more comprehensive, extending not only over lands tenanted and hereditaments, but fixtures and everything that could be considered as part of an estate, including some slaves (glebemen) and other chattels. Res mancipia were considered a more dignified kind of property, like real estate, and could not be transferred only by mancipium, a ceremonial form of contract, at the execution of which many witnesses representative of interests in the subject-matter of the bargain were required to be present. The absence of one of these, the mispronunciation of a ceremonial word or the omission of a gesture made the contract a nullity. Ceremonial impediments and the trammels of collectivism are incompatible with the rapid exchange of commodities. Rome is now generally believed to have been in its origin an Etruscan tributary of the pastoral and agrarian midst of an agricultural Latin community. The power of the merchant or tradesman to dispose of his merchandise in his sole right has to be recognized if commerce is to be successfully conducted. A man has thus the right to give, and a transfer without formalities suffice to pass, title. The rules applicable to articles of commerce brought to port by Greek and Punic traders, or manufactured in Rome by plebeian artificers, were presently applied also to the products of patrician Roman farmers, and, ultimately, to res mancipia without distinction. Possession, or dominium, was defined by the Roman lawyers with great precision, the jus possessionis being quite the most important part of the Roman law of property; nor are their reasonings more speculative niceties. Possession, as the saying still goes, is nine points of the law, and, as Bentham remarks, "in defense of his possessions a man may lawfully strike, wound or kill, if need be." To constitute possession or dominium two elements are requisite, the ability to take and the will to hold. The desire to have a bird in the bush does not give possession to one who is unable to catch it; the power to seize a stray cow does not make one a possessor who has not the least intention of exercising his power. These corporeal and mental constituents of the act of possession are designated corpus and animus domini.

One may have possession of a thing, dominium, without being in actual contact. A soldier is in possession of his musket, within reach; the purchaser of good purveyance is in possession when he holds the key to the warehouse where they are stored; an heir is in possession of the entire estate, though he may have entered only on a part of it or merely viewed it from a distance. The essence of possession is the power to exclude others. A man is in possession of things left at his domicile, though they have not been touched by him nor by anyone in his behalf; but not of a treasure buried on his grounds unless he may have dug for it and actually found it. The distinction is reasonable, though rather fine. One is in more complete control of one's house and its contents than of one's fields and what is hidden therein, and one may be forestalled by another in lifting a treasure. It should be remembered that these definitions have reference to dominium as a juristic fact and not to the rightfulness of the possession. The will to control, animus domini, is manifested in perfection by those only who rightly or wrongly recognize no superior, or parallel right in any other person to possess the thing held. The intention of a servant, who resists the taking of property entrusted to him by his master, is merely to protect it from violence, without any assertion of right over the same on his own behalf. So also, where the intention to hold or dispose of an object is limited by the distinct recognition of the outstanding rights of another—as in the case of a tenancy or bailment—the Roman law regards the holder as lacking the animus domini, i.e., the intention to act as owner to the complete exclusion of everybody else. The difference between the Roman and Teutonic and English laws in this respect is not so great in fact as it seems, however. The interdicts provided "real" remedies for the protection of possessory rights, analogous to actions of replevin, established an injunction, of which only "exclusive" possessors could avail themselves; bailies and lessees having no rights in rem had to take recourse to personal actions to redress their injuries. Even to this rule the Roman law made important exceptions. A non-contractual, tenens precario, a ground-renter for a long term of an improved agricultural land, emphyteusis, the holder of a pledge, and a sequester (receiver or trustee) could resist dispossession
by actions in rem. Loss of the power to exclude or of the will to control, of course, makes an end of possession or dominium. A temporary interruption of use or occupancy, however, is not a relinquishment of the possessory right. One who regularly pastures his cattle on a certain meadow during the summer does not abandon his use because he does not graze there in the winter also; nor may one who leaves his possessions in charge of a steward and goes abroad be presumed to surrender his power of control. Neither does failure to exercise the will to possess and to exclude others terminate a dominium, when the failure is due to a legal disability—the possessor being a minor or a lunatic, for instance.

Ownership, proprietários, is a further development and amplification of the right of possession. Indeed dominium or exclusive possession implied ownership. But one may own a thing, though one have no actual control over the same—while property may be denuded of every attribute, that gave it value and ownership—so still ownership. In Roman law designates it nuda proprietás. The right of ownership includes the right to possess, and an owner out of possession obtains restitution in virtue of the jus vindicandi. Ownership has been defined as "complete dominion over a thing." The owner of property has the right of disposal; he may sell it or give it away, and he may destroy it. But the owner's rights are limited by other rights. No man may use his own in a manner injurious to others, and all property is held subject to the right of the State to tax or take for public purposes, or to restrict the use to which it may be put by the owner. The "complete" dominion of the owner, moreover, is diminished by servitudes and co-ownership, and the right to protest is suspended by leasing, hiring, deposits, pledge, mortgage, etc. Ownership is extinguished by conveyance, gift or bequest, by long-continued adverse possession and by the death of the owner. Ownership may be derivational or original. It is derivational when acquired by purchase, gift or inheritance. Original ownership is established by occupancy, accessio, specificatio, or usucapió. Occupatio (literally, laying hold of) applies to ownerless things, res nullius, in which class the Roman law places wild animals, treasure buried by one in a stranger's land and derelicts—the latter including all the property, whether public or private, of enemies, which was conceived to have no legal owner and to be subject therefore to capture. Accessio signifies an addition to property through no action of the owner as by the planting of a tree or the building of a house on one's land by another person. Accessio includes adlurio, the gradual deposit of soil by the sea or a running stream, and adige the sudden accretion of soil torn from another's property by a freshet or landside. Specificatio refers to property that comes into being when one works material belonging to another into something new and different (nova species). A sculptor owns the statue he has carved, irrespective of the ownership of the marble. Even more obviously, a work of literature is the property of the author, not of the owner of the paper on which the manuscript is written. One who works up material for hire, or whose work is not creative in the same sense as an artist's, does not become a proprietor by specificatio. A tailor does not own the coat made from cloth furnished by his customer. Neither does the speciefactor become the owner when the material he has worked upon remains after the work is done. Good faith, of course, is a pre-condition to the establishment of ownership by specificatio. Usucapió, the taking of a thing to one's own and exclusive use, is indistinguishable from what is known to English law as adverse possession, except that the periods of prescription in Roman law are shorter—one year for movables and two years for immovables. According to Roman law the right to possess can exist in such completeness as to constitute a dominium in only one person at a time. Partial or conditional possession of a thing does not make it property of the possessor in the juristic sense of the word. Ordinary leases create merely a contractual relation, not a proprietary right; and things lost by, or stolen from, the owner in this condition become in rem only by the owner. Property in land includes not only the surface but the mineral wealth contained therein to any depth beneath. Mediusval and Modern Law.—Teutonic custom distinguished less sharply than Roman law between ownership and other possessor rights. Delivery regularly passed title to movables. In some instances a bailee had the right of action, for a recovery of property to the exclusion of the owner. Possession was regarded as equivalent to ownership, except with respect to things lost or stolen, though a lender or pledgor had the reversion or equity of redemption, of course. The distinctions between rights in movable and immovable property, which had almost become obliterated in the Roman system, was reasserted and broadened in the leges barbarorum. Rights in land could only be acquired by inheritance or by "investiture," and the transfer thereof was restricted, not only by the injunctive nature of the ruling classes, but by the rules of family community. The distinction became still more marked by the establishment all over Europe of the system of feudal tenures. This system gave paramount ownership, dominium omnium, to the sovereign, in the first instance, and secondarily to the baronial and manorial lords—and made the possession and use of land dependent upon the performance of military and other public, or quasi-public duties or, in the case of peasant leases, upon the rendering of customary services to the lord. Tenures (even peasant holdings in Germany) became hereditary, but the right of alienation was late in obtaining recognition. The eminent domain of the sovereign or lord gradually lost the character of a property right and became a governmental power, while the use and possession, dominium utile, slowly developed into ownership. The hereditary peasant leases have been converted into full proprietorship by modern legislation. The reservation of forests to, and the control of hunting through them by, the feudal lords were the foundations for the exercise of similar powers by the modern State. Wild animals, when objects of sport, could be hunted and taken only by those authorized or
licensed to do so and the sovereign prince claimed as his own many things regarded by the Roman law as res nullius and subject to private capture and appropriation—for example, abandoned land, treasure trove, wrecks, flotsam and enemy property. The right to minerals under ground was separated from the ownership of the superficies, and mining privileges could be exercised only under license from the owner. So it is to the first finder in consideration of a share of the profits. Nearly all these rights and the royalties—literally the king's fees—derived from them have passed into modern law as rights and revenues of the State. In modern European legislation the distinction of movables from immovables is nominally preserved, but has long since been obscured by the practical uniformity of the rules governing the right to hold, dispose of or inherit property, irrespective of its mobility or immobility. All property to which there is no one entitled to legal possession belongs, or escheats, to the State. The Code Napoleon awards trésor (treasure trove) to the finder and so does the Civil Code of Germany. The Roman rules of inheritance and partition have been generally accepted, though stress is laid in some modern codes upon the relative value of the nova species produced and the material out of which it has been fashioned. Such modern law terms as dominium and property define rights identical with those defined by dominium and propietas, their Roman equivalents, except that modern law regards some forms of qualified possession as proprietary in character. The most advanced view of modern European jurists is that which regards possession as not a right, but a "social function," the recognition and protection whereof by the State is conditioned upon the exercise of the privilege (or function) of ownership to the greatest possible advantage of the community as a whole. The Swiss Code declares the misuse of property to be unlawful.

English and American Law is characterized by the cleavage between the rules governing real and personal property. The cleavage is due in the first instance to the exceptional character impressed upon estates in land by the feudal system—land being held not owned. The terms "real" and "personal" however, did not originally define two kinds of property, but indicated a distinction between various early forms of judicial procedure. A "real" action was one whereby possession of the thing itself, which was the subject matter of the controversy, could be recovered. In a personal action the suitor laid claim to, and could not land, a mere indemnity (damages) for the withholding of, or injury done to, a thing or his rights therein. The indestructibility of land, and the powers and dignity attached to the tenure thereof, favored recourse to "real" actions to recover possession by those dispossessed, or prevented by trespassers from the use and enjoyment, of such property. By the most obvious association of ideas the subject matter of "real" actions became "real" property. The distinction between real and personal property does not coincide, however, with the distinction between movables and immovables, or between an estate in land and the ownership of goods and chattels. Not all interests in land could become the subjects of "real" actions. Leaseholding was deemed degrading to a "freeeman," the payment of rent in manual labor, in money or in kind, being considered an act of servility. The right of a tenant was not vindicable by a "real" action and, when dispossessed, even though the dispossessor be his landlord, the tenant's only recourse was a "personal" action for damages. The measure of damage being rent paid, if he paid nothing after dispossession, he could recover nothing. Easements, rents and profits, however, are real property, because they were rights to which the early common law extended the protection of "real" remedies. The right of property in chattels is absolute in the highest degree, a man may do as he will with his own. A man's right to his land, however, is not so untrammeled. No man has the right to excavate his own land so as to withdraw lateral support from his neighbor's land and the buildings thereon; no man may vitiate the air over his neighbor's land by noxious gases or malodorous vapors, or impair the value and usefulness of other property by swimming the waterscourse on his own; no man may divert or otherwise unreasonably interfere with watercourses running through his own and other land. Further limitations are placed on proprietary rights in land by building codes, and by zoning commissions and other public authorities. Intangible objects, such as patents, good will, etc., are property just the same as are tangible objects. Ownership is a right in rem, meaning a right which the owner holds against the whole world, as distinguished from a right in personam, which is actionable only against one or more ascertained or ascertainable persons. When a right in rem is infringed a right in personam comes into existence, which is enforceable against the infringer. This right, however, is not correctly defined as possessory. English and American legal terminology, whereby choses in action are called "property" is, therefore, rather confusing. In all essentials the American and English law of personal property is in accordance with European and ancient Roman laws. Feudal tenures were never recognized in the United States and have been formally abolished in England by statute. The distinction between real and personal property survives mainly in the differences in the rights of succession and inheritance, and in the formal methods required for transferring title to land, while ownership of goods is conferred by mere delivery. Peculiar to American law are the Constitutional guarantees, which forbid the taking of private property for public uses without compensation of the owner, or the deprivations of any man of his possessions except as punishment for crime and by due process of law.

PROPHET, an insect, the praying mantis. See Mantis.

PROPITIATION, the act or means of appeasing or atoning. It is a Biblical and theological term applying especially to Christ and his death. Saint John (1, ii, 2) says, 'He (that is, Christ) is the propitiation for our sins.' The end of all the sacrifices prescribed in the Old Testament was to obtain propitiation, to propitiate an offended Creator. See Atonement.

PROPOLIS. See Bee-keeping.

PROPHECY. I. Definition.—The word prophet is derived from the Greek word προφήτης, which doubtless meant originally an interpreter, then more specifically an interpreter of deity. Hence a prophet may be defined as a person who is considered to speak by the direct inspiration of a deity or spirit, while prophecy is the message of a prophet. The prevailing idea that the fundamental meaning of prophecy is prediction is thus erroneous, although prediction is often associated with the work of a prophet. Prophecy was thus an endeavor to ascertain the will of the deity by personal or subjective means, in contrast with omens and some forms of oracles which used external means.

II. Prophecy among other Nations aside from the Hebrews.—Prophecy was common in the early history of the world, although ordinarily much less frequently than oracles and omens. It prevailed particularly in Greece. Specially celebrated was the Pythia, the priestess of the god Apollo at Delphi, who spoke in an ecstatic state supposed to be caused by vapors from a chasm in the temple. There were also various sibyls in Greece, their number varying in the traditional accounts from four to twelve. Some sibyls were highly esteemed by the Romans and the works of the Latin sibyls were regarded with great veneration. In the Semitic group of peoples, aside from the Hebrews, there is no explicit evidence of the presence of prophets among the Babylonians and Assyrians, nor among the Canaanites, although their existence among the latter people is often inferred from their similarity to the Phoenicians. They are found among the Arabs, being there called by the name kahin, which is the same word for priest, and the Arab prophets sometimes acted also as priests. They are also found in the service of the Phoenician Baal, as appears from the Old Testament accounts. No important written records of the utterances of any of these prophets outside of the Hebrew people have been preserved, the Sibylline Books, reputed to be of Greek authorship, being almost entirely late Jewish compositions, thus really pseudonymous, with some Christian fragments. Prophecy among other nations aside from the Hebrews was ordinarily of the clairvoyant type, being given in answer to specific questions of individuals, and hence of no general or permanent value.

III. Hebrew Prophecy. 1. General Conception.—The usual Hebrew word for prophet is נביא. While the meaning of the word is disputed, it seems probable that its etymological significance is "speaker," hence it has the fundamental idea of one who speaks for God, in accordance with the discussion above. The Hebrew prophet always spoke in the name of Yahweh. As among other nations, there are indications that in early times prophets and priests were connected; even some of the later prophets, as Jeremiah and Ezekiel were from priestly families.

2. Historical Development.—Considered historically, the Hebrew prophets may conveniently be divided into three classes, which are not, however, entirely distinct from each other, an individual sometimes exercising functions belonging to more than one class, and all of them having certain characteristics in common. These classes may be called seers, oral prophets, and writing prophets. The seer was consulted by individuals concerning personal matters, Samuel, according to one representation, belonging to this class, 1 Sam. ix, 7-8. This class seems to have been an early development, but it probably continued active until a late period. The oral prophets were concerned with the fate of the nation and of the king as the representative of the nation. Their work, however, was specific, their usual task being to give advice concerning a particular situation, especially when consulted by the king. These may be called largely, but not entirely, professional. Many no doubt also acted as seers. The writing prophets were distinguished superficially by the fact that, while their messages were ordinarily proclaimed orally, later these messages were committed to writing, either by the prophet himself, or by his disciples. But while this resulted in a deeper distinction. Their messages were actually characterized by great and permanent significance; they not only gave advice in reference to a particular situation, as Isaiah to Ahaz and Hezekiah, but they based this on fundamental and constant beliefs concerning God, his relations to men and his principles of action. The presentation of new truth is thus a specifically characteristic of the writing prophets, and some of the greatest messages of the Old Testament come from
them. These prophets were clearly not professional. What are usually called the prophetic books of the Old Testament contain the messages of this class, as well as other portions, such as the prophetic narratives of the Pentateuch known as J and E.

3. Characteristics of the Prophets.—The prophets of the so-called "hand of prophecy", compare also the designation "a band of prophets". 1 Sam. x, 5, 10. Such gilds are mentioned several times during the life of Samuel, 1 Sam. x, 5, 10; xix, 18-19, etc., in the time of Elijah and Elisha, 1 Kings xx, 35; 2 Kings ii, 3, 5, 7, 15, etc., in the time of Amos, Amos vii, 14. Presumably this was a continuing feature. Samuel and Elisha were particularly connected with these gilds. The writing prophets were independent of them and sometimes hostile.

Gifts or fees to the prophets were customary. A fee for professional services was expected when a seer was consulted, 1 Sam. ix, 7-8; 1 Sam. xiv, 33. Such gifts were made to Elisha, 2 Kings iv, 42. The prophets seem ordiarily to have made their living by prophesying, as is indicated by Micah iii, 5; Ezekiel xiii, 19; Amos vii, 12, etc. But no such gifts seem to have been made to the writing prophets, and Amos repudiates the idea, Amos vii, 14.

The prophets were often marked by a distinctive dress, viz., a hairy mantle, 1 Kings xix, 13; 2 Kings i, 8; Zechariah xiii, 4. Naturally this would be especially characteristic of the prophetic gilds, the writing prophets apparently not following the practice. A distinctive sacred mark in the forehead is mentioned only once, 1 Kings xx, 41.

In the early times religious ecstasy or frenzy was a prominent characteristic of the prophets, 1 Sam. x, 9-13; xix, 18-24, as was the case also with prophets of the Phoenician Baal, 1 Kings xviii, 26; similar is the condition of Elijah when he runs before the chariot of Ahab, 1 Kings xxii, 46. In 2 Kings ix, 11 one of the prophets is called mad. This frenzied condition was excited especially by music, consult 1 Sam. x, 5; 2 Kings iii, 15. This condition is not mentioned in the later time and doubtless grass and exporting dreams were also part of the experience of the prophets. But these, especially dreams, became less frequent in the later times.

The prophets, especially the oral prophets, often gave a message that suited those consulting them, in particular messages of prosperity for the king and the nation. Such prophets may be described as professional, they regarded their work as a profession with no high conception of its religious significance. Some of these prophets were no doubt insincere, other perhaps merely professional and conventional, repeating the messages of earlier prophets with no distinctive addition of their own. In the Old Testament these are not described as false prophets, but, as times, as prophets. The writing prophets came into sharp opposition with prophets of this kind. The favorable message of such prophets is mentioned in Isaiah xxx, 10; Micah iii, 5; 1 Kings xxii, 13; Jeremiah xxiv, 14; Ezekiel xx, 14. Several of the oral prophets, however, exerted a very important influence in reference to national affairs. Thus Samuel anointed Saul as king, and later announced his rejection and anointed David; David followed the instructions of Gad, 1 Sam. xxii, 5; Nathan gave David directions concerning the temple, 2 Sam. vii, 1ff., and rebuked him for his sin, 2 Sam. xii, 7; while the importance of the work of Elijah and Elisha is well known.

The conviction of the prophets that Yahweh was speaking through them seemed universal. This appeared to be quite as strong in the case of the lower professional prophets as with those of a higher kind. How fully this conviction was justified in each case, therefore, must be determined by careful study, especially by the contents of the individual message.

The dominant purpose of the actually sincere prophets may be stated thus: so to present the truth of God as to produce practical religious results. This appears from a study of the various elements in their messages, and of course applies more fully to those of a higher kind. There was malice, that is, a intentional religious basis; the social teachings, prominent as they are, are essentially religious; and the ethical teachings, which are conspicuous, have a religious centre. The teaching is pre-eminently practical rather than speculative. The message of the prophet was fundamentally a message to his own time. In connection with what has already been said, the matter of prediction and fulfillment may be noted. The message in prediction, as elsewhere, was for the time of the prophet; the aim of prediction, therefore, was not to present a program for the future, but to teach the comprehensive truth concerning God and His principles of action for the sake of the present effect. Hence the prediction was not a statement of that which the prophet thought must necessarily take place, but rather a presentation of the prophet's expectation or ideal, with a view to the encouragement or warning of his hearers. Fulfillment of details, therefore, is not to be expected and does not ordinarily appear; there is a more general fulfillment in the realization of the principles that are stated.

In the latter part of the Old Testament, chronologically considered, prophecy began to pass into apocalyptic, was interpreted by Daniel and in small portions of other books, which finally replaced prophecy in the Jewish thought of the two centuries before Christ and the first century after Christ. See APOCALYPTIC LITERATURE.

IV. Prophecy in the New Testament. In the New Testament the prophet is in general an interpreter of God's message, who speaks to the edification of the church, 1 Cor. xiv, 3, 24, 25, prediction being only rarely mentioned, as in Acts xi, 28; xxii, 10-11. Prophets formed a special class in the church, ranking next after apostles, 1 Cor. xii, 28; Eph. iv, 11, and much superior to the possessors of the gift of tongues, 1 Cor. xiv, 5, 39.

PROPONTIS—PROPORTIONAL REPRESENTATION

GEORGE RICKER BERRY, Professor of Old Testament Interpretation and Semitic Languages, Colgate University.

PROPONTIS. See MARMORA, SEA OF.

PROPORTION, an equality of ratios; a series in which the first of any even number of terms bears the same mathematical relation to the second term as each other odd-numbered term does to the even-numbered term which immediately follows; thus 4, 12; 5, 15; 6, 18 (or 4:12 = 5:15 = 6:18, or 4:12 = 5:15 = 6:18; these forms being read "4 is to 12 as 5 is to 15 as 6 is to 18," etc.) is a geometrical proportion. The definition given above using the words "same mathematical relation" shows that there may be other than geometrical proportions, in which the relation is the fundamental one of multiplication (or division). The fundamental relation of division (or subtraction) also gives rise to a proportion, the so-called arithmetical proportion; thus 4, 6, 7, 9, 11, 14, or, generalizing, a, a + d; b, b + d; c, c + d, are in arithmetical proportion as each odd-numbered term is related to its corresponding even-numbered term by the difference 3. The distinction between geometrical and arithmetical is here the same as in progressions (q.v.), and the proportion is merely a special case of progression. It is perfectly obvious that the concept of the proportion may be applied elsewhere, the relation for example being not that of multiplication (or division) nor that of subtraction (or addition), but that of evolution (or involution); thus 4, 16; 5, 25; 11, 121, is a series in which the analogy between terms 1 and 2, holds in the case of terms 3 and 4, as well as terms 5 and 6, the relation being that of the root to the square. But this general concept of the proportion or analogous relation finds small place in mathematics, even the most modern theory being little fresher than Euclid's Fifth Book, which was derived in part from Pythagoras, and which is, save for the difficulty in the treatment of incommensurables, far superior, though reckoned more difficult, than the numerical treatment which came into vogue in the Middle Ages; Euclid's method is concerned with lines, instead of numbers. To all intents and purposes the modern method like Euclid's is concerned merely with geometrical proportions. In a geometrical proportion the odd-numbered terms are called the antecedents, the even the consequents; the first and fourth terms the extremes, the second and third, the means. A proportion has the second and third terms identical as a: b = b: c, which may more conveniently be written \( \frac{a}{b} = \frac{b}{c} \). The chief properties of a geometrical proportion, say \( \frac{a}{b} = \frac{c}{d} \), are the following: (1) the product of the means equals the product of the extremes, \( be = ad \) (clear of fractions); (2) the terms are in proportion, \( \frac{a + b}{c + d} \), (add 1
to each member of the original equation); (3) the terms are in proportion by division, \( \frac{a - b}{c - d} \) (subtract 1 from each member); (4) the terms are in proportion by composition and division, \( \frac{a + b}{c + d} = \frac{a - b}{c - d} \) (divide the equation in (2) by the equation in (3)).

PROPORTIONAL REPRESENTATION, as its name suggests, is the result obtained when the members of legislative bodies are so chosen that each party or faction in the voting population is represented by a number of delegates proportionate to its numerical voting strength.

Proportional representation gained respectability as a reform in England and the United States largely as the result of the able exposition of its principles made by M. Thomas Hare in 1859 and John Stuart Mill in 1862. Since its underlying principle, as will be later pointed out, is destructive of the two-party system which forms the framework of the present English and American political structures, it is natural that it should have received scant recognition or approval from party leaders. It has been put into practice in the United States only in those rare instances in which the principle of non-partisanship has found expression—instances thus far confined in the main to cities in which the new forms of commission or city manager organization have been adopted. The socialist party indorses its application in State and National governments, and one or two non-political organizations are conducting campaigns of education in its behalf.

Method of Operation.—The nature and working of proportional representation may best be made clear by an examination of the two leading methods which have been devised to give it effect.

(a) The single transferable vote.—This system is applicable to an election in which several representatives are to be chosen from a large constituency. Suppose six vacancies are to be filled by an electorate of 60,000 voters. Under the usual bi-party system each party would nominate six candidates and the party which cast the majority, or even the plurality in case more than two parties had tickets in the field, would elect all six representatives. It might be, therefore, that 31,000 voters would elect all the representatives and the other 29,000 would go unrepresented. By the use of the single transferable vote each voter would vote not for six candidates but for one. Any candidate, therefore, who received 10,000, or one-sixth of the total vote cast, would be elected. In this way any group in the community which had this much voting strength could secure the election of one representative. With no other provisions for expressing preferences between candidates this system would, of course, tend to give the same representation to all groups of voters alike provided they could each cast a vote of 10,000. A voter might, therefore, find himself wasting his vote by casting it either
for a man who had already received more than enough votes to elect him or for a man who did not receive enough to elect him. To avoid this difficulty the single vote is made transferable by allowing the voter to indicate his second, third, fourth, fifth and sixth choices or as many of them as he cares to indicate. If the man for whom he has expressed his first choice does not need his vote, or cannot be elected even with the aid of it, then his second choice vote is added to the total first-choice votes of the man for whom it is expressed, and so on. In this way, by counting as many of the later choices as are necessary to secure the election of six men each group in the electorate is able to elect approximately its proportionate share of the whole number of representatives. In other words, 40,000 of the 60,000 could by expressing their first four choices elect four men.

This system was roughly the one advocated by Hare and bears his name. It has been modified in many ways especially in the matter of the choosing. Thus a man who wants to eliminate the weak candidates. A good many detailed problems arise in connection with its application which cannot be mentioned here.

1) The List System.—This system gives the voter a chance to express a preference not only for an individual candidate but also for a party or group. The names of candidates are put on the ballot in lists or blocks so that those of similar views are grouped together. The voter, as in the first system described, has but one vote to cast and he casts it for one candidate on one of the lists. This vote counts one in determining how many candidates the adherents of that list are to elect and it also counts one toward the election of a single candidate on that list. The proportion of the total vote which is cast for a single list determines the number of representatives which are chosen from that list and when that number has been determined the highest candidates on the list are elected. A man may cast his vote for a man who is defeated yet at the same time further the election of another candidate from the same list or party.

Minority Representation.—The chief difference between proportional representation and minority representation is that the latter system seeks to secure the representation only of the leading minority party or parties. It may be presented in terms of the Illinois system of minority representation adopted in 1920 for the election of the lower house of the State legislature. This is a system of cumulative voting. From each district three representatives are to be chosen and each voter is given three votes to cast. He may cast them in any way he chooses,—one for each of the three candidates, two for one and one for another, one and one-half each for two, or all three for one candidate. The result is that any party in any district which can cast one-third of the total vote may, by concentrating on "plumping" all their votes on one man, elect him. In practice it has commonly worked out that the majority party has elected two candidates and the minority has elected one. The smaller minority parties go unrepresented. Under extraordinary circumstances by throwing their votes all for one solidly two candidates has been able to elect them both against the majority party which has unwisely scattered its vote among three candidates. To avoid this the party managers have usually tried to limit the number of candidates of their parties to the number they can reasonably expect to elect. In this way the freedom of choice of the voter is somewhat abridged.

Arguments for Proportional Representation.—The arguments in favor of proportional representation may be summarized as follows: First, it would prevent the non-representation of any respectable minority in the body politic but allow each group to enjoy that share in political power to which its numbers entitle it. The domination of majorities would be abolished. Second, attention would be centered upon the selection of men who represent a definite body of opinion rather than upon men who, as now, represent a definite geographical unit or district. Third, by the wide range of choice open in the election the necessity for complicated nominating machinery with all the evils attendant upon it would be obviated. Finally, it would tend to steady the system and the elaborate organizations and methods of control which that system produces, and replace it by a natural, informal and genuine alignment of the people along the lines marked out by the actual divergences of opinion of the community. This is peculiarly desirable in municipal government where the influence of State and National parties dominates municipal politics to the exclusion of local issues. For this reason proportional representation has developed most rapidly and successfully in cities.

Arguments Against.—The following arguments are advanced by the opponents of proportional representation: First, the system makes the formulation and development of a legislative policy very difficult. The legislature is composed of a large number of groups with no cohesive influence uniting them and the policies they work out are usually compromises which really do not represent the real views of any group. Furthermore, responsibility is lost in such a case. Under the two-party system each party goes before the people on a certain platform and the successful one may properly be held responsible for the carrying out of that policy. With a large number of parties a policy which is ultimately agreed upon is one upon which the electorate may never have expressed itself and no one group can be held accountable for it. Second, it is very hard to say just what is being represented in an election held under this system. The groups which may temporarily gather in support of a candidate may be based upon racial, religious, social, or political grounds, and the legislative body which results may be a mosaic of widely divergent and incompatible interests with no common ground upon which to meet. Third, it is urged that the average voter would not be able to vote intelligently the somewhat complicated ballot necessary to a proportional representation scheme; that it enormously increases the difficulties of counting the election and materially augments its cost.

Extension in the United States.—Although proportional representation in its various forms has been used rather widely in Europe for many years it has but rarely been seriously considered in this country. The first instance of its use was in the city of Ashtabula, Ohio, in 1915 where
under a new city charter it was used in the selection of the municipal commission. In 1917 it was incorporated in the city charter of Boulder, Colorado. It being seriously considered as a desirable adjunct to the city and city manager types of municipal government.

Doc. 359, 63d Cong. 2d Sess.; Holcombe, 'State Government in the United States' (1916); Proportional Representation (published quarterly); Library of Congress, a List of Books and References to Proportional Representation (1904).

Robert Eugene Cushman, Associate in Political Science, University of Illinois.

PROPOSITION. (1) in mathematics, a statement in terms of something proposed to be proved or done. (2) In grammar, a sentence, or part of one, consisting of a subject, a predicate, and copula. (3) In logic, a sentence or part of one denying a connection between the terms; limited to express assertions rather than extended to questions and commands. Logical propositions are divided: First, as to substance, into categorical and hypothetical; secondly, according to quality, into affirmative and negative; and thirdly, according to quantity, into universal and particular. (4) In poetry, the first part of a poem, in which the author states the subject or matter of it. (5) In rhetoric, that which is proposed, offered, as the subject of a discourse or discussion.

PROPRER. See PROCOUNSEL.

PROPRIETARIES, in American history, a common name applied in colonial days to those individuals to whom colonies had been granted by the Crown. Most of the 13 English colonies were originally proprietary but New York, New Jersey, and the Carolinas became royal provinces and only Pennsylvania, Delaware, and Maryland remained such until the time of the Revolution. In proprietary governments, the proprietor appointed the governor, and in general appointed all those whose present of government which in monarchies were attached to the Crown. The laws of Pennsylvania and Delaware were subject to the supervision and control of the Crown; those of Maryland were not, Consult Edgerton, H. E., 'A Short History of British Colonial Policy' (London 1897): Id. 'The Origin and Growth of the English Colonies and Their System of Government' (Oxford, 1903); Doyle, J. A., 'The English in America' (5 vols., London 1882-1907); Hart, A. PROPRIETARY GOVERNMENT. See COLONIAL GOVERNMENT, PROPRIETARY.

PROPYL (C6H10), the third radical of the series C6H2 n. It does not exist in the free state, but enters into the composition of a large series of important compounds.

PROPYLEA, prop-í-le-ä, in Greek architecture, the entrance to a temple. The term was employed particularly in speaking of the superb vestibules or porticoes conducting to the Acropolis (q.v.) or citadel of Athens, which formed one of the principal ornaments of the city. This magnificent work, of the Doric order, was constructed by Pericles (437-433 B.C.) after the designs of Mnesicles, one of the most celebrated architects of his age. Pausanias says it was covered with white Pentelic marble, remarkable for the size of the blocks and the beauty of the workmanship. It was built on the foundation of an earlier gateway and was never fully completed. The imposing structure consisted of three parts: a central gateway with wings on the north and south. The building has suffered much from the hands of foreign invaders, but even its ruins show clearly the wonderful beauty which must have been possessed by the original structure. Consult Boeckh, A., 'Die Akropolis von Athen' (Berlin 1868); Böckl, F., 'Die Propyläen zu Athen' (Berlin 1882); Doepfled, W., 'Die Propyläen der Akropolis von Athen' (in Keit, Germanus Archäologisches Institut, Athenische Abteilung, Mitteilungen, Vol. X, pp. 38 and 131, Athen 1885); id., 'Zur Den Bauweise Athen' (in ib. PROGRATION OF PARLIAMENT, in Great Britain, the continuance of Parliament from one session to another, as adjournment is a continuance of the session from one day to another or for a longer period. The question determines the session or the house, not. After a prorogation any bill which has previously passed both houses or either house, without receiving the royal sanction or the
currence of the other house, must be taken up de novo. Parliament is prorogated by the king in person or by his commissioners. The death of the crown or the calling out of the militia or reserves during a period of prorogation, immediately put an end to the latter. See GREAT BRITAIN—PARLIAMENT.

PROSAURIA, a subclass and also an order Palaeozoic reptiles. See HERPETOLOGY.

PROSCENIUM, pró-sén-ým, in Greek and Roman theatres, the place where the actors appeared. It was in front of the rear wall or zéne. The front part of it, where the actors stood, was called in Greek legeion or ocríbas and in Latin pulpitum and was elevated above the rest of the stage. The orchestra was in front of it. The place where the actors dressed and undressed, was called postscenium. Projecting wings on each side of the proscenium were called parasceenia. In the modern theatre it designates that part of the stage located between the curtain and the orchestra and usually including the proscenium arch. The boxes, immediately adjoining the stage, therefore, are usually called proscenium boxes.

PROSCRIPTION, in Roman history, a mode of getting rid of enemies, first resorted to by Sulla in 82 B.C. and imitated afterward in the years that closed the republic. It literally signifies "a writing before" and commonly meant an advertisement or announcement of articles to be sold. But Sulla applied it to a proclamation containing names of citizens and promising a reward to any person who should kill the persons named in the lists and a threat of death to those who should aid or shield them. The persons named were said to be proscribed. Their property was confiscated and their children were declared incapacitated for public office. The most notorious proscription after that of Sulla was that posted by the second triumvirate—Antony, Octavianus, Caesar, and Lepidus (43 B.C.), in which was included the name of Cicero.

PROSE LITERATURE. See LITERARY FORMS.

PROSECUTOR, in law, is one who prosecutes another for a crime in the name of the government, whether public or private. A public prosecutor is an officer appointed by the government to prosecute all offenses. In the United States the chief law officers that are public prosecutors are the attorney generals of each State and there are subordinate officers known as State, district or county attorneys. Federal offenses are prosecuted by the attorney general of the United States and the United States district attorneys. A private prosecutor is one who prefers accusations against a person whom he suspects to be guilty and if he acts from proper motives he will not be responsible to the party in damages, although he was mistaken in his suspicions, but if from a motive of revenge he acts as a criminal prosecutor without reasonable foundation, he would be liable in an action for malicious prosecution. A prosecuting attorney bringing in a complaint in the name of the people is presumed to have authority. His powers are limited to the preparation and trial of cases.

PROSELYTE (Greek, an arrival or newcomer), he who leaves one religion for another. In New Testament times there were proselytes of two degrees, the proselytes of the gate who renounced idolatry and worshipped the only true God according to the (so-called) seven laws of the children of Noah, without subjecting themselves to circumcision and the other commands of the Mosaic law, and were only admitted to the court of the temple, and stood at the door of the inner temple, whence their name; having the right of dwelling in the land of Israel, but only in suburbs and villages; and the proselytes of righteousness who had been fully converted from paganism to Judaism, had been circumcised, and bound themselves to observe the Mosaic law. Before their circumcision they were examined respecting the grounds of their conversion; after their circumcision they received baptism, being immersed with their whole body in a cistern full of water, on a festival, in the presence of three judges. This baptism, known under the name of proselyte baptism, was repeated in the case of those children of a proselyte who had a heathen mother. Boys under 12 and girls under 13 could not become proselytes without the consent of their parents, or, in case of their refusal, the aid of the magistrates. By the baptism every one was considered as born anew, so that his parents were no longer regarded as such, and slaves thus baptized were set free. Consult Bertholet, A., Die Stellung der Israeliten und der Juden zu den Fremden (Freiburg 1896); Brandt, W., Die Jüdischen Baptismen (Giessen 1910); Graetz, H. H., History of the Jews (6 vols., Philadelphia 1891-98); Schürer, E., Geschichte des Jüdischen Volkes (4 vols., Leipzig 1901-11).

PROSERPINA, pró-ser-pí-ná. See SERPINA.

PROSODY (Greek, prosódia), the part of grammar that treats of quantity, accent, metre and the laws of versification. See RHYME; RHYTHM; VERSE.

PROSPECT PARK, N. J., borough in Passaic County, on the Passaic River, forming a residential suburb of the city of Paterson, which it adjoins. Pop. 2,719.

PROSPER (Fr. prós-pá-ér) OF AQUITAINA, also called PROSPER TIRO, Christian poet and religious controversialist, b. Aquitaine, about 400; d. soon after 463, probably at Rome. He was a layman, probably a teacher of rhetoric and had settled in some city of Provence (perhaps Marseilles) when Saint Augustine's work on Conversion and Grace reached Southern Gaul. In that country there were many Semi-Pelagians who taught that Saint Augustine's doctrine of grace mitigated against the notion of Free Will. Prosper with a companion went to Rome after the death of Saint Augustine in 431 and induced Pope Celestine to write a letter against the Gallican Semi-Pelagians. Prosper also wrote a Latin dogmatic poem of over 1,000 hexameters, 'On the Ungrateful,' as he styled the Semi-Pelagians who seemed to him to be the gift of divine grace; many essays on Grace and Free Will and a most valuable chronicle, Epitoma Chronicon, which brings the history of the French church down to 455; and he compiled a Liber Scieniarum from Saint Augustine's works. There are many extant works. The best collection of them is to be found in Migne, J. P., ed., 'Patrologiae Cursus
PROSPERO

PROSPERO, one of the principal characters in Shakespeare's romantic drama 'The Tempest' (q.v.). He is the rightful duke of Milan, but is dispossessed of his dukedom by his brother Antonio and the king of Naples, and with his daughter Miranda is put adrift at sea in a leaky boat. Having reached a desolate island he establishes a refuge for himself and daughter, with Caliban, a half-human monster, the only inhabitant he found on the island, as servant. He takes up the practice of magic which he had studied at Milan, raises a tempest which wrecks upon his island coast Antonio, the king of Naples and their suites, and saves them from drowning only to subject them to various punishments until he finally reveals himself, and gives them his forgiveness. All prepare to return home, Miranda meantime betrothed to the King's son Ferdinand. Prospero then breaks his wand and renounces magic. Consult Carpenter W., 'Shakespeare's Tempest' (in 'Religious Spirit in the Poets', p. 103, New York 1901); Furness, H. H., ed., 'A New Variorum Edition of Shakespeare' (Vol. IX, Philadelphia 1892); Moulton, R. G., 'Shakespeare's Tempest' (in New Shakespeare Society Transactions, 1887, Ser. I. p. 37, London 1887); Rolfe, W. T., ed., 'The Tempest' (New York 1904); Stephens, G., 'The Tempest: An Outline Sketch of the Play by William Shakespeare' (Stockholm 1836).

PROSSER, Charles Allen, American educator, born in Selma, Ind., Sept. 18, 1871. He was educated at the universities of De Pauw, Louisville and Columbia. He was superintendent of schools for the Children's Aid Society in 1900-1909 and deputy commissioner of education for Massachusetts in 1910-1912. In 1912 he became secretary of the National Society for the Promotion of Industrial Education; and he was director of the Minneapolis Survey in 1915, in which year he became director of the William Hood Dunwoody Institute at Minneapolis. Author of 'New Harmony Movement' (1903); 'The Organization and Administration of Vocational Education' (1913); etc. He was general editor of the 'Vocational Education Series' of the American Book Company in 1913.

PROSSNITZ, proznits (Czech prostějov): A town in Moravia, 11 miles southwest of the town of Olmütz, on the Rumza. There are two railway lines. It is the centre of a fertile and prosperous region. It has extensive manufactures of woollen and linen cloth, cashmere and cotton goods, in all of which it enjoys a high reputation; it carries on a large trade; numerous distilleries of brandy and rosolio, extensive breeding of geese and one of the largest corn-markets in Moravia. The city hall is an interesting ancient building. There are German and Czechs. Most of its inhabitants are Roman Catholic Czechs, but there is a large Hebrew congregation. Pop. 31,462.

PROSTATE GLAND, the pale, firm body composed of both muscle and gland, in shape resembling a chestnut, which surrounds the neck of the bladder and the beginning of the urethra in the male. It consists of two lateral lobes and one middle lobe. The excretory ducts from the glandular substance of the lobes empty into the prostatic portion of the urethra. It is well supplied with blood-vessels and nerves and is enclosed in a thin but firm fibrous capsule. The secretion of the prostate is a milky, viscous fluid of acid reaction, discharged under sexual excitement, and also in comparatively small quantity for the latter a fluid vehicle. Enlargement of one or more lobes of the prostate is very common in men over 55. The cause is not known. It is said that such enlargement has never been found in eunuchs, or where the testicles have been lost. The enlargement encroaches on the rectum and urethra, interfering with their functions, the bladder becoming distended; its walls may be thin and inefficient and a cystitis may be set up. In this disorder the stream of urine becomes slower; there is a frequent desire to urinate, even at night, but only a few ounces of urine are passed each time. Exhaustion, sepsis from retained urine and sometimes local hemorrhage cause enlarged prostate to be a serious condition. Treatment includes mild and easily digestible food, and the use of a catheter, freedom from exposure to cold and damp and the careful use of the catheter. Sometimes enucleation of the enlarged gland (prostatectomy) is of value; so are Bottini's operation, burning a channel through the obstructing mass, and vasectomy, the cutting of the testicles. Removal of the testicle to reduce the size of the prostate is sometimes resorted to. Acute prostatitis, an acute inflammation, is most often due to gonorrhea or to strong injections for its relief, but may arise from the irritation of calculi or the use of instruments, etc. The symptoms are painful and frequent micturition, swelling, high fever, retention of urine and tenderness in the region of the lower bowel and the neck of the bladder. The inflammation may progress so far as to suppress the action of the bowels. The treatment requires rest in bed, hot anodyne fomentations, leeches, purgation and opening of the abscess. The disease may invade the bladder and the whole urinary tract. The prostate is subject, though rarely, to malignant tumors, carcinoma and sarcoma. Prostatic calculi about the size of millet-seed are quite common in old men. They rarely give rise to noticeable symptoms unless they obstruct the flow of the urine; sometimes they are voided or they may form the nucleus of a prostatic calculus.

PROSTITUTION. See HYGIENE, SOCIAL.

PROSTYLE, in architecture, a portico in which the columns stand in advance of the building to which they belong. The term amphi-prostyle is used when there is such a
PROTAGORAS — PROTECTION

PROTANDRY. See Pollination.

PROTECTION is a term in political economy, employed to describe the policy of indirectly promoting the growth of national industries, either to secure the defensibility of the country in time of war, or to promote its general welfare, or both. It differs from Socialism in seeking this by indirect means, and with the minimum of interference with individual freedom, recognizing that the true function of government is to steer the ship of state in industrial matters, and not to propel it. It differs on the other side, from free trade, which excludes government from any kind of activity in the industrial sphere, and especially objects to legislation which will have the effect of diverting capital and labor into channels in which they would not otherwise flow.

More than one way to this end has been used, such as the absolute prohibition of specified imports, premiums upon exports, bounties upon home production, and the retention of raw material. But the usual way has been to impose, upon the competing product from abroad, a duty sufficient to discourage its use and to make it unprofitable to the dealer. Such duties are either ad valorem or specific. The former are levied upon the value of the imported commodity, and are either directly or inversely proportional to that value. Thus the duties imposed by the British Corn Laws rose as the price of wheat fell, and the converse. Specific duties are those which tax the commodity by number, weight or bulk, irrespective of differences in value. For protective purposes they are preferable.

From the rise of national feeling in Europe, at the close of the Middle Ages, to the Congress of Vienna in 1815, all governments pursued the policy of protecting home industry. Among economic theorists a protest against this was begun by the French Economists (Gournay, 1754; Quesnay, 1758; Turgot, 1766). It found its finest exposition and defense in their Scotch disciple, Adam Smith (1776), who contended that the interplay of self-interest is quite sufficient to secure the best industrial development, and that when every man is left to "do as he will with his own," he will do what is best for society. The antipathy of Napoleon I to this theory, and the questionable means he employed to counteract it in his Continental System, seemed likely to give it a chance of being applied in the states represented at the Congress of Vienna. But a few years of actual experience satisfied all but a few on the Continent that the path to national prosperity did not lie in that direction. They returned to protection, which England and France, indeed, never had abandoned, and which Germany made.
effective for the whole country through the Zollverein (1817-33). The United Kingdom, in 1846, after eight years of popular agitation by the Anti-Corn-Law League, that a European government first took steps to abandon Protection, and that after 510 years of it had lifted England out of the dire poverty of a merely agricultural country, into the first rank among manufacturing nations. And even she continued to protect her silk and glove industries against French competition, until the Cobden Treaty of 1860 agreed to the abolition of these duties.

Twenty years later there began a reaction against free trade, which is now supported by the Conservative party. It grew out of the failure of that policy to obtain the support of other countries, and the rapid growth of France, Germany and America in commerce and manufactures under protection, while England became more dependent upon the rest of the world for food, and was obliged to keep up a great navy that her ports might be kept open in case of war, and on one or several European powers. The destruction of many merchant vessels by German submarines, and the diversion of others to transport use, reduced her means of bringing food from abroad, so that importations are limited by royal order to things thought necessary. Even strenuous free traders now receive from the principle adopted in 1846, and propose that home production shall be fostered and importations restricted by imposing duties on these. In this they revert to the principle laid down by Nassau W. Senior in 1835, that the economist has no right to dictate the policy of the statesman, since economic reasons are only a part of the considerations which should influence him.

In America the need of a national government, which could extend protection to the prostate industries of the States, was one of the most powerful motives to the formation and adoption of the Constitution of 1787, which authorized Congress to impose duties on imports to pay the debts and provide for the common defence and general welfare of the United States. The harsh experiences of the war for independence had shown the country the need of manufactures for the defence of the nation. It was on this ground that Washington repeatedly pressed for adequate legislation; and in this he was supported by his secretary of the treasury, Alexander Hamilton.

The great President, in his address to Congress in 1790, said, "A free people ought not only to be armed but disciplined, to which end a uniform and well digested plan is requisite; and their safety and interest require that they should promote such manufactures as tend to render them independent of others for essentials."

Duties were steadily adapted to this end, until the political revolution of 1801 brought Jefferson into office. From that time no advance in the direction of more adequate protection was made, although the duty on salt was repealed, with the result that the country had a second salt famine during the war of 1812-15. Its sufferings in this, and other industrial wants, effectually converted Jefferson from free trade but it was not until 1824 that the country returned to an effective protective policy.

The South, however, found that its adhesion to slavery precluded it from entering upon manufacturing, and now began to regard Protection as an encroachment on the rights of the States, although her cotton-growing industry had been brought into existence and advanced to prosperity by a protective duty continued for many years. Her threats of nullification led to the adoption of the tariff of 1833, which provided for the gradual reduction of all duties to a 20 per cent level by 1840. The general suspension of manufacturing through this reduction and the derangement of the currency brought about the severe depression of 1837-42, and caused another political revolution in the election of a Protectionist Whig to the presidency in 1840.

During the four years of the tariff of 1842 there was a great and general restoration of prosperity; but the influence of the example set by England, and the prospect of open markets in that country for western and southern products, brought about another change. The tariff of 1846 was not in terms of an economic principle, but effected a large reduction in duties below the protective level. In 1857 these duties were farther reduced by one-fourth, and another severe depression of industry helped to the election of Mr. Lincoln in 1860. Before he came into office the Morrill tariff had been passed by Congress and signed by President Buchanan.

This was done in view of the certainty that a civil war at home was impending, and that it might involve the country in hostilities with England and France. It was therefore felt necessary to put the country in the way of equipping itself for any emergency. The rela-
tion of home industry to national defense thus indicated, was amply shown in the distresses and disabilities of the Southern Confederacy, which solemnly committed itself to free trade in its Constitution, and was dependent upon its friends in Europe for military and other supplies. For over 30 years our country persisted in this policy of protection, with some unhappy experiments in the reduction of duties,—notably those on wool and woolens in 1883. The presence of a surplus of revenue in the national treasury was made the pretense for demanding "Tariff reform," meaning an advance toward free trade. In the final act of legislative thinking was effected after Mr. Cleveland's second election in 1892. The tariff of 1893 fell far short of what he and his friends wished, but it went as far beyond what the country would endure, and brought about a reaction and a return to Protection.

This continued until a division of the Republican party on other grounds, in 1912 brought back the Democrats to power under a President devoted to free trade. The tariff of 1913 is a distinct step in that direction. It has not been so harmful as some earlier tariffs, because the vast development of wealth and industrial power under the long continuance of Protection has given the country some power of resistance to legislation adverse to our industrial interests. The duty on salt, which had been placed upon its adoption was neutralized in many fields of industry by the outbreak of war in Europe, as this created an immense demand for the products of our two greatest industries—agriculture and metal wares. European competition was checked also by the diversion of
PROTECTION

millions of men from industry to military service, and by the seclusion of Germany and Austria from the rest of the world. The American cotton industry was distinctly improved by emergence out of the stage, at which farming and shipping furnished almost the only employments, and has grown in manifoldness and energy. (5) The variety of industry, at which Protection aims, is highly useful in drawing the people of the country in closer relations, and thus contributing to the unity of will and understanding, which underlie national unity. It was by the trade between the English colonies that the fierce prejudices of our earliest time were overcome. It was through the development of foreign commerce at the expense of home trade that the Union was imperiled. As Mr. Carey showed Mr. Lincoln, our railroad lines ran only to the seashore, to facilitate exports and imports. They now run north and south as well. By the Zollverein and its fostering of home trade, Germany was helped to national unity. The English sneered at the notion that the Germans could or would devote themselves into national unity,1 but the result came. (6) By preventing adverse balances of trade, Protection guards the national supply of solid money from being drained out of the country. Money is not a commodity like any other,2 as to whose incoming and outgoing we can afford to be indifferent. It is the means of organizing labor for the conquest of nature and the production of wealth. And it is not indefinitely replaceable, as are many other commodities. To exchange it for hardwares and textiles is to exchange power itself for the products of power. Lavelaye compares such an exchange with that between two parties of hunters, who should trade game for guns and ammunition, while at a distance from the basis of supply. Nor is it true, as some economists tell us, that the loss of gold and silver have no other effect than to lower prices in the country which exports them, and thus lead to a return of coin by purchasers from abroad. Prices are lowest in the countries which have the most money, because labor is organized there to the best advantage, and is thus made more productive. 3Start a shilling in Thibet, and it will turn up in London.3 It goes to where it will buy more commodities, there it will create a demand, and it is true that the gold of the world tends constantly to the great centres of money and of manufacture, moving on the same lines with the commerce in food and raw materials. By refusing this unequal commerce, we have ceased to be a gold-exporting country, and have thus obtained that stock of money which enables us to organize labor on a great scale, and acquire industrial power.

The Objections to Protection are many in form, but they resolve themselves into a few. (1) It is charged that4 protection is hostile to commerce. If we do not buy, we cannot sell. Thus we are deprived of the possibility of disposing of our surplus products.5 But with the single exception of England since 1846-60, all the great commercial tracts of the world, where people were taunted for their backwardness in invention before this became a manufacturing country. An English manufacturer declared we could not make so much as a mouse-trap for ourselves. 6American inventions have lightened the burden of toil for half mankind. They
means of payment are always found. (2) It is objected that "the interest of the consumer is that of society at large, while the interest of the producer is that of a class only. Free trade promotes the former, while protection seeks the latter. For the consumer is interested simply in getting what he uses as cheap as possible, and with this a protection duty must interfere. But 'better than a low price for any article is a fair price," Mr. Lowell says. The times of especial cheapness are what we call 'hard times,' and even the free trader fails to recognize his own ideal in those times. Like other people he begins to talk on 'mass consumption prices,' meaning a rise. In considering the effect of protective duties upon prices it is necessary to look at both sides of the account. Nearly every one in the community has something to sell, and it is small use to him to be able to buy at a low rate, if he must sell at a still lower. Ireland is a land of cheapness, but not to the advantage of its people, who cannot find a market for their labor. Nova Scotia is another country of low prices, and its people live on thousands of Massachusetts, to seek employment at such wages as they never can earn at home and to live in comfort there. The free trader fixes attention on one side of the account, to the neglect of the other. Nor is the consumer, in the long run, obliged to pay higher prices because of protection. Mr. Greeley used to challenge the free traders to mention a single article whose manufacture had been protected for 14 years, without falling in price below the point at which it has stood. All kinds of commodities in this country have been protected, and the consumer is better off than they were before the enactment of the Morrill Tariff. The national consumption of all has increased far more rapidly than the increase of the population. (3) It is alleged that "Protection is but a method of forcing a house growth of industries, which would have come to us naturally, when our density of population warranted the transition from farming to manufactures. The latter arise when there is a real need and demand for them, without any interference on the part of government." This statement is not supported by any historic instances of this natural growth. Every nation, which now possesses such industries, made its beginnings under Protection. Every great industry that is fighting for the markets of the world was built up by protective duties. On the other hand, everyone admits that the want of manufactures is the root of the misery of Ireland and of India. The governmental commission to investigate the cause of Indian famines reported, in 1885, that nothing but the diversion of a large part of the labor of the people to manufactures would put an end to them. The need of both countries is beyond question, for in both the density of population has passed the point at which people can live by the soil. But neither of them possesses the power of taking the men and forming mere need into effective demand, by native legislation. How long are they to wait for that "natural growth?" (4) Adam Smith's argument from the beneficial effects of what he called "natural liberty" supposes that "individual self-interest is enough to secure all the industrial growth that any country needs or should want. If everyone be left free to do as he will with his own, he will do what society needs to have done." Those who repeat this argument are never willing to apply it to other forms of the state's activity, which affect industry. They do not propose to have the merchants of each seaport keep its harbor in condition by their individual or even their united action. It is at least as clear that individual self-interest has not inflicted deep and lasting injury to our country in the devastation of its forests, the destruction of its game, and especially the extirpation of insect-destroying birds. They sustain the government in making the coinage of money and the carrying on of public monopolies, and punishing all who invade either. They have ceased to look to private self-interest for the maintenance of a school system adequate to our national need. They make all these exceptions to their own theory, and the protectionist adds one more. Adam Smith's principle, however, has great truth. It is the rule, and all these other things are the exception. The protectionist differs from the free trader in that he has no panacea or cure for our ills. He has a specific for a single social defect, and he alleges in its favor that it interferes as little as possible with personal liberty. (5) It is objected that "protection favors the manufacturers at the expense of their laborers and of the farmers of the country." As for the laborers, protection does not set aside the law which Carey, Bastiat and Atkinson have shown to govern the distribution of profits. The laborer's share of the joint-product of capital and labor constantly increases, while that of the capitalist constantly diminishes. This protection makes that joint-product greater with every expansion of industry, and thus secures to the workman a higher standard of living and a greater opportunity to save. Between 1860 and 1880, the wages of labor, measured in the power to purchase the staple commodities, more than doubled in this country. While free labor in America was once little if anything above the slave's level, as to the enjoyment of the necessaries and comforts of life, it is now on the highest level that it ever has attained in our history. The superior condition of American labor was shown by an investigation carried out by our own government in 1911, and still more strikingly by one conducted by the British Board of Trade through the English consuls in 1912. The London Times sums up the result, "The workman in America enjoys an enormous advantage over his fellow in England. . . . He earns two and a quarter times as much money, and works shorter hours for it, so that his hourly rate of earning is as 240 to 100. Against that enormous difference in wages there is something to be set in the way of expenditures, . . . but the cost of living is only as 152 to 100. The advantage in regard to the cost of food is less than it looks. A workman living on the American scale pays only 25 per cent more for his food than he would in England." The Board of Trade itself says, "The margin is clearly large, making possible the command of the necessaries and minor luxuries of life greater than that enjoyed by the corresponding class in this country. . . . The farmer is directly cared for in the tariff, being secured by the great market for his produce
PROTECTION, NEW ENGLAND

which our manufacturing districts furnish him. From that market the protective tariff shuts out his Canadian competitor, in spite of the demand of our free traders, seconded by some short-sighted manufacturers, that we shall return to the reciprocity which existed from 1854 till 1860. New England manufactures are sold directly by having his market for produce brought into his neighborhood, thus making his exchanges more equal. As an English newspaper put this years ago, when the western farmer in America had free trade, he gave a pound of butter for a pound of nails. But under protection he gets 14 pounds of nails for his pound of butter. (6) It is alleged that protection favors the formation of trusts, and thus destroys domestic competition, which the protectionist himself relies upon to secure reasonable prices. Yet a large number of our trusts, beginning with the Standard Oil Company, are almost independent of the tariff. Of the rest, very few have been able to secure so great a control over the market that they can dictate prices; and of these several avoid attempting it. Their special product is as cheap as before the trust was formed, their new gains coming from the saving of expenses. Others still are international trusts, of the sort that would be sure to abound if we abandoned protection. Nor are the countries which practise free trade characterized by unlimited competition among producers. Wherever the trade-union has obtained the control of the rate of wages and of the hours of labor, capitalists have been led to combine for mutual protection. They naturally think that they cannot afford to buy labor in a close market and sell their product in an open one. Unified control has come to be the rule in the great English industries, and they have improved upon our example by including the workmen in their arrangements for adjusting prices and wages.

The general movement of American industry to better conditions under the protective policy is shown by some statistics of our national position at the beginning of our last period of protection and by the latest which we have at hand.

1860 1910
Population 31,443,321 91,972,266
Wealth $14,183,000,000 $167,579,806,316
Share per capita $1,458,421 $4,544
Exports $333,576,057 $1,487,764,990
Imports $353,616,119 $823,172,160
Wages $378,878,966 $1,427,032,000
Wage earners 1,311,246 6,615,046
Average earnings $309 $518
Savings banks deposits $149,277,504 $4,070,486,247

Thus while population in that half-century increased 180 per cent, our wealth increased 1,815 per cent, and the individual share in it 301 per cent. The increase in our exports was 331 per cent, and that of our imports only 130 per cent, or less than the growth of population. While the number of wage earners increased 404 per cent, the wages paid increased nearly 800 per cent; and the savings banks deposits nearly 2,702 per cent.

PROTECTOR, in the history of England, a person appointed to act as regent generally during the minority of the king. Those on whom it was conferred were the Earl of Pembroke, in 1216, during the minority of Henry III; Humphrey, Duke of Gloucester (1422-47), during the minority of Henry VI; and George Duke of York, February 1454 to February 1455, and November 1455 to February 1456; Richard, Duke of Gloucester, in 1483, before the death of the young princes, his nephews, and his own accession to the throne; and the Duke of Somerset (January 1547 to October 1548), during the minority of Edward VI. On the 12th of December, 1653, the title of lord-protector was bestowed upon Cromwell (q.v.), as head of the Commonwealth of England, Scotland and Ireland, by the provisions of the instrument of Government. At his death, in 1658, he was succeeded by his son, Richard Cromwell (q.v.), who, however, abdicated in 1659.

PROTECTORATE, a term applied to the relationship existing between a strong nation and a weaker one wherein the former undertakes to protect the latter from hostile invasion or other form of aggression and in consequence exercises more or less control over its domestic and entire control over its foreign affairs. The protectorate, unlike the colony, does not lose its individual sovereignty; its people do not become citizens of the protecting state; if the protecting state goes to war with
another power the protected state may remain neutral. The relation has, however, often been a mere cloak for absolute dependency on the part of the weaker nation, which for reasons of state it has seemed expedient to disguise. The term protectorate is also applied to the state thus protected. The relation between a protectorate and its protector is usually established by treaty, although sometimes it is the result of mere understanding only. There are two classes of protectorates which differ essentially from the existing circumstances: (1) Where both nations are civilized; (2) where the protector is civilized and the protectorate is not. Most of the protectorates of the present day belong to the second class and are to be found in Asia and Africa and the islands of the Pacific Ocean. Notable examples of existing protectorates are Tunis, Annam, Tonking, Madagascar and Somali Coast under French protection; and North Borneo, Bechuanaland, Somaliland, British Central Africa, British East Africa protectorate, Uganda protectorate, the Sudan and Nyassaland under British protection. Italy also maintains a protectorate in Africa. The United States has from early times extended similar control over weak nations in various parts of the world. One of these was Liberia on the west coast of Africa and founded by the American Colonization Society in 1820. It has been understood all along that no other nation would be permitted to exercise a protectorate over the Samoan Islands. Likewise from 1836 to 1845 it exercised a protectorate over the republic of Texas. From 1846 to 1903 the United States as a result of treaty with Colombia exercised a quasi-protection over the Isthmus of Panama for the purpose of securing the neutrality of the Panama Railroad. Partly as a result of American aid Panama seceded from Colombia in the latter year and virtually placed itself under the protection of the United States. The most perfect example of an American protectorate at the present time is that of the republic of Cuba, which secured its independence from Spain in 1898 chiefly through the intervention of the United States and which upon demand of the American government inserted in its Constitution a promise not to enter into foreign relations with any other country without the consent of the United States and accepted other conditions which materially impair its independence.

PROTEIDÆ, a family of large Urodèle or long-tailed amphibians characterized by three pairs of persistent gills besides lungs, the presence of both fore and hind legs, the absence of eyelids and maxillary bones and the presence of teeth on the premaxillaries, the vomers and the mandible. The vertebræ are amphicoelars. The family contains three genera, each containing one species. These are Necturus, common in the eastern Mississippi system, the blind Proteus (Q.v.), and the likewise blind Typhonomylus, found in artesian waters from Texas. The Proteidæ are often known as mud-puppies. (See Amphibia; Urodél.) For the development of this group see Embryology.

PROTEINS, a large group of organic compounds, of which the white of egg or ovalbumin, may be taken as a typical example. They make up the principal material of all animal cells and tissues, and are found in various parts of the structure of plants, especially in seeds. The proteins found in nature are 40 or 50 in number, mostly amorphous and indiffusible, and possess a complex chemical structure, whose nature is not clearly understood. They appear as non-crystallizable compounds of carbon, hydrogen, nitrogen, oxygen, generally, but not always, sulphur, and sometimes phosphorus; and occurring in a solid viscous condition, or in solution. Lecithin is a usual constituent of the proteins found in marine animals. The different members of the group present differences in physical, and to a certain extent in chemical, properties; they all possess, however, certain common chemical reactions, and are united by an essential relationship. Thus, carbon is present in amount varying only from 50 to 55 per cent; hydrogen, from 6.9 to 7.2 per cent; oxygen, from 19 to 24 per cent; nitrogen, from 18 to 19 per cent; and sulphur, from 0.3 to 2.4 per cent—keratin of human hair, being a notable exception, having a sulphur content of 5 per cent. Proteins occurring in the vegetable kingdom are built up from simpler compounds; but the animal system is believed to be incapable of performing a synthesis of this kind, and the proteins that occur in the animal body are believed to be wholly or partially by a modification of those that are taken into the system in the form of food. The proteins in the food are largely converted, by the action of such digestive ferments as pepsin and pancreatin, into soluble substances known as peptones, and these, after absorption through the intestinal walls, are (in large measure) transformed into the proteins that normally occur in the muscles and other tissues of the animal. Some of the protein portion of the food is, however, apparently transformed, in the course of digestion and assimilation, into glycogen and fat. In the changes which are inseparably associated with the life of the animal, the proteins that are stored in the body (and especially those in the muscular and nervous system) undergo a process of oxidation, or slow combustion, by which they are transformed into other compounds that are much less highly organized; the ultimate products of this oxidation being mainly water, carbon dioxide and urea.

The proteins, as a class, are so similar to one another in their ultimate composition, that Gerhardt believed them to consist mainly of one fundamental albumen-like substance, mingled, or perhaps chemically combined, with varying quantities of inorganic matter. This view is not in favor among the chemists of today.

Efforts to determine the molecular weights of the proteins have been many, and not at all satisfying. The results obtained, while indefinite, seem to prove that the molecular weights of the proteins are very large as compared with those which have been determined for other substances. For example, the molec-
ular weight of egg-albumen, as obtained by the freezing-point method, is given as 14,270; that of hemoglobin, as determined by the iron-content method, as 14,000.

Chemically, proteins exhibit a wide variance, some being distinctly acid and others decided bases which form strong salts with strong acids. The most of them, however, are neither markedly acid nor basic, but react toward acids as bases and as acids toward bases. Recent investigation of the proteins has been chiefly along the line of their solubility. When accomplished by heating them with concentrated hydrochloric acid or strong sulphuric acid. A large number of amino-acids have thus been obtained from the simple proteins, but with the very unsatisfactory disappearance of about 30 per cent of the protein substance treated.

Though the proteins are mostly amorphous, a few are known that are capable of crystallisation, notably some which have been obtained from egg-albumen, from Brazil nuts and from castor-oil beans. Some other proteins which are not found in nature in a crystallized form can be obtained in that phase by special treatment. Thus, if egg-albumen is precipitated from its solution by ammonium sulphate, heated to 230° to produce coagulation; and allowed to stand, it gradually crystallizes. All the proteins are insoluble in absolute alcohol, but many of them are soluble in water, or in dilute saline solutions. Dissolved proteins all rotate the plane of polarization of polarized light to the left, the extent of the rotation varying with the nature of the dissolved protein. Dissolved proteins are not diffusible, as a rule, and mineral matters with which they may be mixed can, therefore, be removed by placing the solution in a vessel which is separated into two parts by a vertical porous membrane, pure water being placed in one compartment, while the solution to be dialyzed is placed in the other. The mineral salts will diffuse through the porous membrane, while the protein remains in the compartment in which it was originally placed. By renewing the water in the second compartment from time to time, the dialysis may be caused to proceed until practically the last trace of a given substance is washed out with the protein. The peptones, however, are themselves diffusible, and the proteoses (or albuminoses9) are so to a lesser extent.

Many of the proteins that are soluble are precipitated from their solutions in a permanently insoluble condition by the action of heat, the substance which is thus thrown down being known as "coagulated protein." The temperature at which heat-coagulation takes place varies with the nature of the protein, and (to some slight extent) with the pumol of the acid or alkalinity of the solvent from which they are thrown down. The fibrinogen of the blood, for example, coagulates at about 133° F.; while serum-albumin and egg-albumen coagulate at 162° F., and crystallin at 199° F. When a protein is precipitated from solution by heat, the liquid from which it was thrown down almost invariably has its alkalinity increased, or its acidity diminished. Dry proteins may be brought into the "coagulated" condition by raising the temperature; and at higher temperatures they carbonize, and evolve gases.

Coagulated proteins are exceedingly insoluble, and in fact cannot be brought into solution at all except by the action of some agent which changes their chemical nature profoundly. Pepsin (in an acid medium) or pancreatin (in an alkaline medium) convert them into soluble peptones, when the experiment is performed at a temperature not far to that of the human body. A protein which is precipitated from its solution by alcohol is not at first thrown into the "coagulated" condition, but passes into it gradually upon prolonged contact with the alcohol. When the protein is saturated with ammonium sulphate, all of its proteins are precipitated except the peptones; but the precipitate is not in the coagulated form, for it is capable of dissolving again, either in pure water or in a dilute saline solution. This reagent is used, in the laboratory, for estimating the amount of protein in a given solution; the precipitate that it gives being removed by filtration; washed with a saturated solution of ammonium sulphate; heated to 230° to produce coagulation; and allowed to stand after the ammonium sulphate has been removed by thorough washing with pure water, and the precipitate has been dried. Many of the salts of the heavy metals (basic acetate of lead, for example), precipitate protein solutions by forming, with them, an insoluble proteo-metallic compound. From this compound the metal may be subsequently removed by the action of sulphuretted hydrogen gas; the protein then being set free in its original, soluble state.

Of the chemical reactions manifested by the proteins as a class, the following may be especially mentioned: (1) The xanthoproteic reaction. When strong nitric acid is added to a solution containing a protein the protein is often (but not invariably) precipitated; and both the precipitate and the solvent turn yellow from the formation of xanthoproteic acid, the precipitate dissolving upon prolonged boiling, if the nitric acid is present in excess. The yellow color changes to an orange upon the addition of an excess of sodium hydroxide. (2) Millon's reaction. Millon's reagent, which is one of the best tests for detecting the presence of a protein, is prepared by dissolving mercury, by the aid of gentian violet, in nitric acid of specific gravity 1.4. When the metal has entirely dissolved, the solution is diluted with twice its bulk of water, and the abundant precipitate which comes down is allowed to subside. The clear liquid remaining is the reagent desired. Millon's reagent throws the proteins down in the form of a white precipitate; and both the precipitate and the solution become colored, ranging from pink in the cold to brick red upon boiling, though time is sometimes required before the coloration is complete. Solid proteins give this same reaction, when boiled with the test solution. Tyrosine and silk respond to it also. (3) Sulphur reaction. Warmed with a solution containing sodium hydroxide and a lead salt, a black precipitate or brownish color is produced in a solution of a protein containing sulphur, due to the formation of sulphide of lead.

The classification of the proteins has been essayed by several groups of students both in Europe and America, and in both places it has been by the use of terms to which different meanings have been attached by various writers. The Amer-
ican Society of Biological Chemists and the
American Physiological Society have agreed on
the following classification, which is regarded as
standard by American students.

**Simple Proteins.**

**Albumins.**—Those which are soluble in
pure water, and coagulate when heated.

**Globulins.**—Those which are insoluble in
pure water, but dissolve in neutral solutions of
salts derived from the action of strong acids
upon strong bases.

**Prolamins (Alcohol-soluble proteins).** —
Those which are insoluble in water, neutral sol-
vents and absolute alcohol, but dissolve in alco-
hol of 70 to 80 per cent strength.

**Albuminoids.**—Those which exhibit a high
degree of resistance to solubility with all neu-
tral solvents, while having apparently the same
chemical structure as the soluble proteins.

**Histones.**—Those soluble in water and in-
soluble in ammonia (unless ammonia salts are
present which yield precipitates with solutions of
other proteins, and, when heated, a coagulum
readily soluble in very dilute acids.

**Protamines.**—Polypeptides simpler than the
proteins of the groups above specified: soluble
in water; not coagulated by heat; having the
quality of precipitating water-solutions of other
proteins; and exhibiting strong basic character-
istics, forming stable salts with the strong min-
eral acids.

**Conjugated Proteins.**

**Nucleoproteins.**—Compounds of one or
more protein molecules with nucleic acid.

**Glycoproteins.**—Compounds of the protein
molecule with one or more substances con-
taining a carbohydrate group other than a
nucleic acid.

**Phosphoproteins.**—Compounds of the pro-
tein molecule with phosphorus-containing sub-
stance other than a nucleic acid or the lecithins.

**Hemoglobins.**—Compounds of the protein
molecule with hematin, or similar substance.

**Lechithoproteins.**—Compounds of the pro-
tein molecule with the lecithins.

**Derived Proteins.**

**Primary Protein Derivatives.**—Those
formed from the protein molecule apparently
through hydrolytic changes, with but slight al-
teration in the protein molecule: embracing
(1) Proteins—insoluble products of the action
of water, very dilute acids or enzymes; (2) Meta-
proteins—products of such action of acids and
alkalis as alters the molecule, forming
substances soluble in very weak acids and
alkalis, but not soluble in neutral solvents
(including the so-called acid-albuminates and
alkali-albuminates); (3) Coagulated Proteins—
insoluble products resulting from the application
of heat to their solutions, or to the action of the
alcohols on proteins.

**Secondary Protein Derivatives.**—Products
of a more extended cleavage of the protein
molecule: embracing (1) the Proteoses—those
which are precipitated by heat; (2) the Peptones—
those soluble in water; not coagulated by heat; but not precipi-
tated by saturating their solutions with am-
monium sulphate; (3) Peptoids and the com-
pounds of definite structure in which two or
more amino-acids are combined through the
union of the carboxyl group of one with the
amino group of the other and the loss of a
molecule of water.

**Albumins.**—Serum-albumins have been sepa-
rated from the lymph and blood-serum of
vertebrate animals, from milk and from cer-
tain seeds. Lactalbumin is found in milk
though in the small proportion of less than one-
half of 1 per cent. The principal vegetable
albumins are leucosin—found in wheat, rye
and barley; and legumelin—of peas, beans and
lentils.

**Globulins.** are found in blood-serum and in
certain body tissues and organs and in eggs,
milk, seeds, etc. A typical globulin is fibrin-
ogen, found in the blood of vertebrate animals.
Upon being separated from the living animal
the fibrinogen is almost immediately changed
into fibrin or blood-clot by the action of an
attendant globulin. Fibrinogen and myogen are
globulins found in the tissue of what are known
as a striped muscle. It is the coagulation of
musculin after death which produces the stif-
fening of a corpse, known as rigor mortis.

**Glutelins and Prolamins.** are found in the
grains, a familiar example being the gluten of
wheat, which is a mixture of glutenin, a glue-
tin; and gliadin, a prolamin. Zein, of Indian
corn, is another example of the same group.

**Albuminoids.**—In this group are found the
protein substances which in large measure give
stability to the structure of the animal body.
Collagen is a typical example. It is the founda-
tion of cartilage and connective tissue and enters
largely into the bony skeleton. When
boiled in water, collagen yields gelatin. When
boiled with tannic acid, as in the making of
leather, it becomes tough and highly resistant
to decay. To this group belong also keratin,
the principal substance of hair, horns, hoofs
and feathers; and elastin, the largest constituent
of the connective and the elastic tissue of the ani-
mal body.

**Histones.**—The most familiar example of
this division of the proteins is globin, the pro-
tein constituent of the red coloring matter of
the blood, hemoglobin.

**Nucleoproteins.** are comparatively numer-
ous, forming the chief constituents of the nuclei
of all nucleated cells and hence found in every
part of the body and its organs. They are
found also in yeast and in certain plants.

**Glycoproteins.**—A common example of this
group is mucin, a constituent of the saliva. As
previously noted, egg-albumen is probably to be
classed in this group; and here belong also the
mucoids of egg-albumen and blood-serum.

**Phosphoproteins.**—The most familiar ex-
ample is the casein of milk, regarded as a cal-
sium salt in combination with calcium phosph.
When casein is coagulated with rennet, the pro-
duct is paracasein, differing from casein chiefly
in that its calcium salt is insoluble. Vitellin,
found in the yolks of hen eggs, is another ex-
ample of the phosphoproteins.

**Hemoglobins.**—The red corpuscles of the
blood have a very large content of hemoglobin.
When human blood is dried, the proper pro-
portion of hemoglobin in the red corpuscles is found to be about 94 per cent. Either acids or alkalis reduce hemoglobin to the histone globin and the iron compound hematin, which is not a protein, but a derivative of pyrrole, one of the decomposition products of the proteins.

Albuminates belong to the group of Metaproteoses. They are built from the so-called “acid albumin,” obtained by treating an albumin or a globulin with dilute acetic or hydrochloric acid. Acid albumin is soluble in dilute acids or alkalis, but insoluble in a neutral menstruum. When the original protein is treated with a small quantity of dilute alkali, it combines with the alkali to form “alkali albumin”; and this, like acid albumin, is soluble in weakly acid or alkaline media, but insoluble in a neutral one. Alkali albumin is likewise not coagulable by heat. The combinations here described may be taken as typical of the albuminates in a general way; but as the albuminates are doubtless very numerous and as they have not yet been fully investigated, it must not be inferred that they will all possess the characteristics of ordinary acid and alkali albuminates.

Proteoses and Albumoses.—Proteoses derived from the albumins or globulins or albuminates by the action of digestive ferment, such as protein or trypsin, they are intermediates between the original proteins and the peptones into which these original proteins are ultimately transformed by the digestive ferment. They are precipitated from solution by nitric acid, the precipitate dissolving upon application of heat. They are also somewhat diffusible, but not to the same extent as the peptones.

Peptones.—Proteoses which are formed by the prolonged action of digestive ferment upon other proteins. (Compare the proteoses in the preceding paragraph). While they are not precipitated by heat, nor by nitric acid, they are precipitated by tannin and by certain other reagents. It seems quite clear that peptones are polypeptides. The peptones are diffusible and they play an exceedingly important part in digestion and assimilation. Peptones that are artificially prepared are commonly bitter, perhaps from the development of alkaloids or glucosides. Pure peptone has a meaty flavor.

Peptides.—The majority of peptides dissolve readily in water but not in alcohol. A few which are almost insoluble in water dissolve in acids or in alkalis. Most of them have a bitter taste. When heated with concentrated hydrochloric acid for several hours they are completely resolved into amino-acids.

Through this system of investigation it is hoped ultimately to discover the process of the upbuilding of the whole class of proteins from their primal elements.

PROTERANTHUS.—PROTESILAUSS

PROTERANTHUS. See Gillenia.

PROTEROGYPHA, a division of the Colubridae family of snakes in which the grooved poison teeth or fangs are attached to the forward part of the upper jaw—those in which the fangs are at the rearward part of the jaw being known as Opisthoglyphus (q.v.). The group includes nearly all the more deadly of poisonous snakes.

PROTEROZOIC (Greek protos, early, and zoos, life), a geologic time division generally given the rank of an era. According to the United States Geological Survey it includes all time before the Paleozoic, and is divided into the Archean and Algonkian periods. Other geologists divide the time before the Paleozoic into two eras, the Archeozoic (Archean) and Proterozoic (Algonkian). This article follows geological survey usage. Proterozoic time is also frequently referred to as the Pre-Cambrian.

The type sections are in the region of the Great Lakes in northern United States and Canada. The rocks of the era readily fall into two systems, the Archean (q.v.) and Algonkian (q.v.), separated by a profound unconformity. The former are dominantly igneous, consisting of a great series of basic lava flows and minor amounts of interbedded sediment, cut by large granite intrusions. This period of volcanism was followed by long erosion, and Algonkian rocks, dominantly sedimentary, were laid down on eroded Archean surfaces. Little is known of the geography of either period, except that in Algonkian time considerable limestone was deposited, pointing to probable submergence under an ocean. It is believed that glaciers occupied parts of Canada in the early Algonkian, and in the latter part of the period volcanism was again extensive.

There are no direct evidences of life in the Archean nor in the early Algonkian though limestones may point to the existence of minute time-secreted animals. A few important fossils, probably brachiopods and crustaceans, have been found in very late Algonkian rocks. Two similar rock systems, under various names, are recognized in Europe and probably in other continents. The intense metamorphism that Proterozoic rocks have undergone in these regions makes it impossible to separate the two systems over much of the world, at least until much more detailed work is done.

PROTESILAUSS, pró-tès-i-là’üss, Greek hero, son of Iphicles, king of Phylace, Thessaly. He led a band of Thessalian warriors against Troy and was the first of the Greeks to land on the Trojan coast, whereupon he was killed by Hector. Another tradition makes Achates slay him. He is famed in ancient story for the affection which existed between him and his wife, Laodamia, who, when she learned of his death, prayed in her return to her for three hours. The prayer was granted and Hermes conducted Protesilaus to the upper world. At the end of the three hours Laodamia died with her husband and returned with him to the lower regions. However, there are several other versions of his life and death. His tomb was near Eleus in the Thracian Chersonesus, a temple was erected to him there, and at Phylace a sanctuary was built in which funeral games were played in
PROTEST — PROTESTANT EPISCOPAL CHURCH

his honor. The story is told by Wordsworth in one of his most beautiful poems, ‘Laodamia,’ written in 1814. It was also the subject of a tragedy by Euripides of which only some fragments remain. In more recent times the Polish poet, S. Wyspiański, wrote a tragedy in verse (Krzysztof Niemojewski’s ‘The Dome of the Church’) which has been translated into French by A. de Lada and L. Maury as ‘Proté silas et Laodamie’ (Paris 1913). Two ancient Roman sarcophagi, showing the history of the hero’s life and death, have been preserved, one in the Vatican and the other in the church of Santa Chiara at Naples. Consult Preller, L. ‘Griechische Mythologie’ (2 vols., Berlin 1872-75); Roscher, W. H., ed., ‘Ausführlichen Lexikon der griechischen und römischen Mythologie’ (Vol. III, pt. 2, p. 315, Leipzig 1902-49).

PROTEST, a solemn declaration of opinion, commonly against some act, particularly a formal and solemn declaration in writing of dissent from the proceedings of a legislative body, or a like declaration of dissent by a minority of a body against the proceedings of the majority. In the commercial usage of the term, a protest is a formal declaration, made by a notary public, under hand and seal, at the request of the payee or holder of a bill of exchange for non-acceptance, or non-payment of the same, and specifying generally the drawer and others concerned for the exchange, charges, damages and interest. This protest is written on a copy of the bill of exchange, and notice is given to the drawer and endorsers of the same, by which they become liable to pay the amount of the bill, with charges, damages and interest. To be of legal effect the action of the notary must be taken on the day the payment was due. (See BILL — BILL OF EXCHANGE). A protest is also a writing, attested before a notary public, a justice of the peace or a consul in foreign parts, drawn by a master of a vessel, stating the severity of a voyage by which the ship has suffered, and protesting that the damage was not owing to the neglect or misconduct of the master.

PROTESTANT EPISCOPAL CHURCH.

The, the American branch of the Anglican Communion. The Church in America, though quite independent, is in full communion with the Church of England and inherits her ecclesiastical position. As the Preface to the Prayer Book states: ‘This Church is far from intending to depart from the Church of England in any essential point of doctrine, discipline or worship; or further than local circumstances require.’ To define her principles and position it is necessary to define Anglicanism, to interpret that movement in history known as the English Reformation.

In the beginning of the 16th century the Church of England was in full communion with the national churches of western Europe, acquiring the headship of the Church of Rome. In doctrine and discipline she had become identified with the prevailing type of Latin Christianity. By the end of the 17th century she had withdrawn from the Roman obedience and transplanted herself to the position she maintains to-day. This period of transition constituted the Anglican Reformation. The status of the Church of England was unique. Positively, the change involved a re-

assertion of the principles of primitive Christianity and an assimilation of the newly awakened tendencies of modern thought. Negatively, it involved the repudiation on the one hand of mediæval Roman Catholicism, on the other of Continental Protestantism. Anglicans believed that the change involved no breach in the continuity of the English Church. They maintained that in rejecting much that was Roman and mediæval they had forfeited nothing essentially catholic.

The American Church inheriting this position claims to be a branch of the primitive Catholic and Apostolic Church. At the same time she is frankly opportunist in adapting herself to the needs and conditions of modern life. In the sense of being not-Roman, she is Protestant. As maintaining that her continuity with the ancient Church is guaranteed by her possession of the Apostolic succession of bishops, she is Episcopal. She is Episcopal also in the sense of being not-Papal. This, perhaps, gives the rationale of her common legal title. Members of the Church are spoken of indifferently as Anglicans, Episcopalians or Churchmen.

The fundamental principles of Anglicanism as well as Anglican terms of inter-communion are indicated in what is known as the Chicago-Lambeth Quadrilateral. In 1886 a Commission on Christian Unity reported to a General Convention held at Chicago. The substance of their report was embodied in a Declaration of the House of Bishops. Two years later this Declaration was, with slight modifications, adopted by the bishops of the whole Anglican Communion, meeting in conference at the archbishop of Canterbury’s palace in Lambeth. The wording of this Anglican Eirenicon, defining the essentials of the Christian faith, is as follows: 2. The Apostles’ Creed, as the Baptismal Symbol, and the Nicene Creed, as the sufficient statement of the Christian Faith.

3. The two Sacraments, ordained by Christ Himself — Baptism and the Supper of the Lord — ministered with unfailing use of Christ’s words of institution and of the elements ordained by Him;

4. The Historic Episcopate locally adapted in the methods of its administration to the varying needs of the nations and peoples called of God into the Unity of His Church.

This declaration may be taken as an official indication of the bases of the Anglican position. It is the belief and hope of Anglicans that the position given them is good vantage-ground for promoting the cause of Christian unity. They have much in common with all bodies of Christians. While their attitude toward Roman Catholics is one of respect, their communion is only with a mediæval Romanism by which they believe that the primitive Catholicism of the great Latin Communion has been obscured. Their position more nearly approaches that of the Eastern Orthodox — Greek Christianity — and that of the Old Catholics. Their relations with both these communions are those of friendly interest and intelligent sympathy, although there is no inter-communion nor
immediate prospect of it. The many differences due to widely differing antecedents oppose difficulties to the adoption of a common platform. This, however, does not prevent many manifestations of present friendship and hope of closer relations in the future. Recent years have seen a marked rapprochement between the Anglicans and the Russian Orthodox Communion.

On the other hand, the Anglican Church is in close sympathy with the life and aims of various bodies of Protestants. Her breach with the Christian past is not one of centuries but of years, and she rejoices to feel that the fundamentals of her faith are the same as theirs, and that she is at one with them in striving to adopt and apply Christianity to the needs of modern times. Since the appointment of a Commission on Christian Unity in 1856 there have been conferences with the Presbyterian General Assembly, the General Synods of Evangelical Lutherans of the North and South and the Provincial Council of the Moravians. These have contributed toward a better understanding of the nature of the Anglican claim and hope is necessary at the outset for an appreciation of the details of Anglican history.

The Church of England in the American Colonies. The Church of England came to America with the first English colonists and colonists. The first English service, so far as is known, was held in 1579 on the coast of California by the Rev. Francis (or Martin) Fletcher, ship's chaplain to Sir Francis Drake. In 1607 an English clergyman was regularly established among the Virginia colonists at Jamestown. This missionary was the Rev. Robert Hunt, a man of simple piety and great zeal, who held daily services in the open air, and on 21 June 1610 for the first time in America administered the Holy Communion. Virginia was a Church of England colony. Various missions were established as the colony grew. The clergy were most of them faithful missionary priests. Some, unfortunately, were men who had had records at home, and whose lives tended to discredit the Church which they served. In the same year that Jamestown was settled, Prayer-Book services were held also on Saint George's Island, Maine. Within a short time there were English clergymen settled in Maryland, and by 1625 they were entitled to ordination. Towards the end of the century, English clergymen were working in New Hampshire, South Carolina, Delaware, New York, New Jersey and Pennsylvania. In 1692 grants of land were made for Trinity Church, New York. Five years later the Rev. William Vesey was established as rector of what has become the most important parish in the country.

In New England the Church of England fared badly. The Puritans of Massachusetts Bay had on leaving England professed unalterable opposition to their mother-church. They had, however, adopted a Calvinistic theology differing in various ways from the teaching of the Prayer Book. Shortly after reaching New England, they adopted also the ecclesiastical polity of the Church of England. In England, Puritans as well as Anglicans had done their best to suppress "Independents." Calvinistic Congregationalism became the "standing order" in Massachusetts and Connecticut. The use of the English Prayer Book was made a penal offense and Churchmen were forbidden by law to be absent; were declared to be the offshoot of the colonies. Among the more notable victims of Puritan intolerance were John Checkley, William Blackstone, the Browns of Salem and Samuel Maverick. Some took refuge in Rhode Island, others in colonies farther south.

The 18th century saw increased effort on the part of the Church of England to minister to the needs of colonists in America. Since 1634 colonial churches had been under the supervision of the bishop of London. In 1696 Bishop Compton of London appointed as his "commission" for Maryland, Dr. Thomas Bray. Dr. Bray's interest in American missions led to the formation of the Society for Promoting Christian Knowledge (S. P. C. K.) and of the Society for the Propagation of the Gospel in Foreign Parts (S. P. G.). This latter society was especially active in providing missionaries for America, and in furnishing them with means of support. The most notable of these missionaries were the Rev. George Keith and the Rev. John Talbot. They traversed the colonies from New Hampshire to North Carolina and sent to the S. P. G. full reports of the needs of America.

English clergy met with much opposition in New England. There was a special outcry against them owing to suspicions from the Congregationalists. In 1722 the president of Yale College, Dr. Timothy Cutler, and four tutors resigned their position to embrace Episcopacy. One of these, Dr. Samuel Johnson of Stratford, became the most notable Churchman in Connecticut. One of the wisest and most far-seeing friends of America in England was Dr. George Berkeley, dean of Derry, afterward bishop of Cloyne. He wished to found a training school for American missionaries. *Saint Paul's College was to have been situated in — it being a conveniently central point—the Bermuda Islands. Dean Berkeley came to America and spent three years in Rhode Island. He was forced to abandon his project by failure to receive funds which had been promised by the English Parliament.

John and Charles Wesley for a time worked in Georgia in the early days of the colony. This was before any Methodist societies had separated from the English Church. Later Methodist preachers, especially George Whitefield, were vehemently hostile to the Anglican clergy and did much to disturb the S. P. G. missions. However, the work prospered despite drawbacks — greatest of which was the lack of bishops—and by 1773 there were about 300 parishes, ministered to by 250 clergymen. It is estimated that between 1607 and 1775 about 2,000 *Clerks in Holy Orders of the English Church had, for longer or shorter periods, labored in America.

Organization as an Independent Church. — The outbreak of the War of the Revolution put an end to intercourse between colonial Churchmen and the authorities of the Church of England. Many of the clergy were Tories. These left the colonies for England and Nova Scotia. During the war,(bounds in a few places, prayer for Congress being substituted for prayers for the king. The one man whose influence did most to hold together scattered bands of Churchmen was Dr. William White of Christ Church and Saint Peter's, Philadelphia. He was in close touch with the fathers of the Commonwealth and
was for many years chaplain of Congress. Immediately after the recognition of American independence steps were taken to organize an independent American Church and to establish new relations with the Church of England, which should recognize "the Change in our Situation from a Daughter- to a Sister-Church." First to act — for themselves alone — were the clergy of Connecticut. They were convinced that the first step of all must be to obtain bishops. In 1783 a meeting was held at Woodbury, at which a petition was addressed to the English bishops to consecrate for America and a candidate was chosen for the episcopal office. The bishop-elect was Dr. Samuel Seabury, a native of Connecticut, an S. P. G. missionary in the colony of New York and a chaplain in the British army. He sailed to England and asked for consecration. This he was unable to obtain. The English bishops, as officers of a state-church, were unwilling to act without formal authorization by Parliament. This was not forthcoming. After waiting a year, in compliance with a request from Connecticut, transferred his application to the Episcopal Church of Scotland. The Scottish bishops willingly granted his request and he was consecrated in Aberdeen 14 Nov. 1784. He signed a "Concordat" with his consistory, in which inter-alia it was agreed that he should use his influence to introduce in America a Communion Office like the Scottish. This differs from the English one, being in some ways more agreeable to the genuine Standards of Antiquity." Five years later his consecration was enabled to keep this promise. His enduring monument is the complete form in the American Prayer Book of the Prayer of Consecration in the Eucharistic Office. Bishop Seabury lived until 1796. He was a noble man and a staunch Churchman. He was indefatigable in administering his diocese, but, partly owing to his "war record," did not exercise great influence outside of Connecticut. It was not until a century after his death that his Churchmen fully appreciated the extent of their indebtedness to this first of all bishops in America.

In 1785 delegates from seven colonies south of Connecticut, laymen as well as clergymen, met in convention in Philadelphia. Their most important business was the revision of the General Conventions, and to make a new application to the archbishops of England to consecrate bishops for America. There was some delay. The English bishops objected to proposed changes in the Prayer Book. Their objections were met by action of a convention held in Wilmington, Del., in 1786. Finally, on 4 Feb. 1787, English bishops in Lambeth Chapel consecrated Dr. William White to be bishop of Pennsylvania and Dr. Samuel Provoost to be bishop of New York. Four years later, Dr. James Madison, president of William and Mary College, was consecrated, in England, bishop of Virginia. The four American bishops in 1792 joined in the consecration of Dr. John C戒指tott, as bishop of Maryland, through whom the Church of England and the Church of Scotland has passed to every member of the American episcopate.

The bishops of the Church are its chief officers, but the "Constitution and Canons," adopted in 1792, provides that presbyters and laymen (in three dioceses, of clergy only) elected by the diocesan convention. This committee acts as a cabinet to the bishop. In case of vacancy in the episcopate, or sometimes during a bishop's absence or incapacity, the standing committee for canonical purposes becomes the "Ecclesiastical Authority" for the diocese.

Similarly, the House of Bishops is associated with a House of Deputies in General Convention. The lower House is composed of four clerical and four lay delegates (communicants) from each diocese and one clerical and one lay delegate from each missionary jurisdiction. Either House may originate legislation, but concurrent action is necessary to make it valid. The House of Bishops has a veto on the action of the lower House. All bishops are equal in rank. The senior by consecration acts as priimate or "Presiding Bishop." All general disciplinary regulations are comprised in the Constitution and Canons of the General Convention. In addition to these, each diocese has its own constitution and canons.

A general convention was held in 1789. Bishop Provoost and some delegates objected to the recognition of Bishop Seabury, but the objection was overcome by the influence of Bishop White. As Bishop Provoost was absent, Bishop Seabury and Bishop White constituted the first House of Bishops. Their chief work was the revision of the Prayer Book. All proposed changes emanated from the bishops and, with one exception, Bishop Seabury, was enabled to keep this promise. His enduring monument is the complete form in the American Prayer Book of the Prayer of Consecration in the Eucharistic Office. Bishop Seabury lived until 1796. He was a noble man and a staunch Churchman. He was indefatigable in administering his diocese, but, partly owing to his "war record," did not exercise great influence outside of Connecticut. It was not until a century after his death that his Churchmen fully appreciated the extent of their indebtedness to this first of all bishops in America.

The Prayer Book adopted in 1789 (to which a few additional offices were later added) continued in use for over a century. In 1892 a second revision was completed when the Prayer Book was given its present form. This Prayer Book, which contains all the public offices of the Church, is to be tried for the theological and ecclesiastical position of the Protestant Episcopal Church. Canons give regulations for practical administration, discipline and clerical education. They give a fair idea of the Church's methods of working. The Prayer Book alone can suggest the faith and spirit which constitute her life.

History during the 19th Century.— For 50 years the Episcopal Church was a small body. It could do little more than assert its right to exist in the face of hostile prejudice. It was suspected for its English antecedents and disliked for its assertion — distinct though timid — of ancient ecclesiastical principles in the midst of prevalent Protestantism. It was forced to apologize persistently for its existence, however, and in the 19th century it found a firm footing in American life, when its representatives were such clergy as its first bishops and such laity as Washington, Jefferson, Hamilton, Franklin and two-thirds of the signers of the Declaration of Independence. For over a hundred years the most conspicuous figure in the Church was that of Bishop
White. His episcopate (1787-1836) was the most important the Church has seen. His wise and gentle guidance of his own people, his fairness and charity toward all others, did much to preserve the Church in the critical period of its history.

There were other strong men in the House of Bishops. John Henry Hobart of New York (1775-1830) had the most forcible personality. He possessed New England virtues of sobriety, patient hardiness and frugality and a great capacity for hard work. His faithful ministra-
tions in all parts of his immense diocese did much to dispel Puritan superstition concerning Episcopal polity. Philander Chase of New Hampshire (1775-1852), first bishop of Ohio and later of Illinois, labored indefatigably as a missionary in many States. He was founder of Kenyon College and Buckey Hall, Rambler, Reformed and Jubilee College, Peoria, Ill. For both of these he obtained funds in England. He was of an eccentric character, but a man of determination. His one aim was to spread the knowledge of his own two treasures, the Bible and the Prayer Book. These men were typical American Churchmen of the first half of the 19th century. Their work indicates very fairly the kind of work done by their fellow-Churchmen in all parts of the country.

The work of the Church has been largely missionary; its clergy, men of affairs rather than theologians. It has produced no peculiar school of thought, but has reflected the theological developments of England and Germany. There have been, generally speaking, three types of Churchmen, known respectively as High Church, Low Church and Broad Church. Each of these has emphasized some one side of Church teaching and has not escaped the dangers of one-sided partisanship.

The Low Church represented the 18th cen-
tury revival in the Church of England which took the form of Evangelicalism within the Church and Methodism without. The truths which it emphasized were the absolute dependence of the spiritual life on the person of Christ, the need of conversion, the reality of grace and purely instrumental character of ordinations. The Atonement was the central fact in Evangelical theology. (Men of this school were also noted for promoting the cause of foreign missions.) The Evangelicals were dominant until the middle of the 19th century. They were strenuous in opposing High Church teaching as being thinly disguised Popery. High Church principles were brought to the fore by the Oxford Movement, which began in 1833. These were the assertion of the character of the Church as a divine society, the special sphere of the working of the Holy Spirit; of the character of sacraments as veritable means of grace; of the central place in Christian worship of the Holy Eucharist. Among the more obvious results in this movement were increased reverence and beauty in church services, increased parochial activity, especially among the poor; the revival of frequent Eucharists and (to some extent) of auricular confession. The later stages of the movement produced a party of Ritualists. They differed from the early Tractarians. Their ritual was largely in imitation of that of the High Churchmen who came after their predecessors copied a Laudian model; their ideals were medieval rather than patristic.

The early Tractarians sought to revive the teachings and spirit of the first four centuries, the ritualists to reproduce the picturesque externals of the 14th. Both sections of the party emphasized the sacramental principle in Christianity and made the Incarnation rather than the Atonement the central fact in their theology. Parallel with the Oxford Movement was the development of that variously described as the Liberal Theology or Latitudinarianism. The Broad Church platform is based on the fundamental truth of the Fatherhood of God. It is well described in words of its most distinguished American representatives in the diop Broxman's broader theology, which had its masters in England in such men as Dr. Arnold and the Rev. Frederick D. Maurice, has likewise had its clear and powerful effect upon the Episcopal Church. A lofty belief in man's spiritual possibilities, a large hope for man's eternal destinies, a desire for the careful and critical study of the Bible, and an earnest insistence on the comprehensive character of the Church of Christ—These are the characteristics of much of the most zealous pulpit teaching and parish life in these later days. Broad Churchmen desire to vindicate the rational character of Christianity, to develop its philosophic side, to bring formal statements of the faith into accord with modern knowledge and modern thought. They find themselves much in sympathy with the early theology of Alexandria and more or less opposed to the type of mind represented by Augustine.

There has been conflict between representa-
tives of these several schools, not concerning positive principles but concerning their respective negations. Too often zeal for a half-truth has denied or disparaged another half-truth. In retrospect it seems easy to see that the special principles of the three schools are equally part of the Church's teaching. The difference between them is largely one of emphasis. They divide the Creed between them. The Church Catechism contains a question, What dost thou chiefly learn by these articles of thy belief? The answer is: First, I learn to believe in God the Father, who hath made me and all of the world; secondly, in God the Son, who hath redeemed me and all mankind; thirdly, in God the Holy Ghost, who sanctifieth me and all the people of God. This suggests a generalization which may characterize High, Low and Broad Church. Each has emphasized one section of the Creed, and, at times, failed to do justice to the others. The Broad Church are concerned for the whole body of church moral and philosophical basis of Christian truth. The Low Church are chiefly concerned to present Christ as Redeemer and the Centre of all their thought. The High Church have had to emphasize a neglected portion of the Creed,
PROTESTANT EPISCOPAL CHURCH

belief in the Holy Ghost, the Sanctifier, in Church and Sacraments as ordained means of union with Christ. The best men of the various schools have never been mere partisans. Party-lines are now less clearly defined. The tendency is to find a middle ground by cultivating an all-round Churchmanship, which has more than one dimension.

Controversy.—For over 30 years, Churchmen were more or less disturbed by discussions aroused by the Tractarian Movement. Americans, however, were less involved. In 1842, Arthur Carey, a graduate of the General Theological Seminary, who had accepted Tractarian principles, was, in consequence, subjected to a severe examination by the chaplains of the bishop of New York. They declined to recommend him for orders. The bishop, Dr. B. T. Onderdonk, himself examined the candidate, was satisfied with his answers and proceeded to his ordination. This occasioned an outcry against the bishop and was the signal for a series of disputes and campaigns of pamphlet warfare, in various parts of the country. In many instances, Low Church bishops objected to the wording of High Church liturgy for "awkward chancel-arrangements" suggestive of High Eucharistic doctrine. Bishop McIlvaine of Ohio refused to consecrate a church until the altar was removed from the east wall. Bishop Eastburn of Massachusetts refused to visit a Boston church for confirmations because the clergy kneeling facing the altar, which was surmounted by a cross and candlesticks. These were typical examples. There were discussions over vested choirs, preaching in surplice, stained-glass windows, flowers on the altar and similar details. There was an effort made by Low Church partisans to discredit High Church doctrine by impugning the moral character of its leading champions. Partisan motives mingled with the laudable feeling that a bishop like the wife of Carey should be above suspicion.

A revival of controversy followed the Civil War. At two successive General Conventions, 1868 and 1871, the main discussion concerned a "Canon of Ritual." Various proposals were made to forbid the use of ceremonies recently revived and behind this was opposition to Tractarian teaching on the sacraments. In the Convention of 1871, Dr. James De Koven of Racine College took a firm stand as champion of "the Real Presence" and challenged anyone to bring him to trial for erroneous doctrine. The challenge was not accepted. In 1875, however, because of his principles, the Church at large refused to confirm Dr. De Koven's election to the see of Illinois, as it had previously refused to confirm the election of Dean George F. Seymour. In the Convention of 1876, a canon forbidding "ceremonies or practices not ordained or authorized in the Book of Common Prayer and setting forth or symbolizing erroneous or doubtful doctrines." The accompanying discussion indicates that the framers had especially in mind "the doctrine commonly known as Transubstantiation." In 1878 Dr. G. F. Seymour was elected bishop of Springfield. This time his election to the episcopate was confirmed by the Church. The event of his consecration marks the end of the effort to deny that High Church doctrine is in harmony with Anglican formularies. It marks also the end of a crusade against ritual as such, although the Church has consistently disapproved any attempt to supersede its ritual by a Roman Catholic one.

At the time of this later discussion occurred the secession of the "Reformed Episcopalians." The occasion of this was a controversy over Baptismal Regeneration. A number of Churchmen were held by Zwinglian views of sacraments objected to the wording of the prayer in the sacramental office. They found a leader in the assistant bishop of Kentucky, Dr. G. D. Cummins. He issued a call for a conference of all who wished to reform the Church. The convention adopted an expurgated Prayer Book of a sort organized as a new sect. Bishop Cummins was deposed by the House of Bishops. He continued, however, to act as bishop and consecrated as a colleague the Rev. C. E. Cheney, a deposed clergyman of the diocese of Illinois. Their following was never very large and this now dwindled to insignificant proportions.

The Church of the Confederacy.—It is pleasant to turn to a striking episode in the Church's history where an unavoidable division was quietly and quietly healed. By the outbreak of the Civil War, Southern Churchmen were isolated from their Northern brethren. Their position was analogous to that of colonial Churchmen at the Revolution. There was this great difference that there were 11 organized dioceses in the South with a bishop of these 11 dioceses eventually united to form the Protestant Episcopal Church of the Confederate States. For five years the Church of the Confederacy pursued its independent course. Bishop Polk of Louisiana, who had had a West Point education, assumed command of a Confederate army and was killed in battle. At the end of the war the Church was confronted with the difficult question of the relation of these severed parts. Some Northerners were anxious to take action which would have been very offensive to Southern susceptibilities. There were two specially difficult points, the precedent established by Bishop Polk and the case of Bishop Wilmer of Alabama, who had been consecrated during the war, without the consent of the Northern dioceses. Fortunately the wisdom of a few leaders, Hopkins of Vermont, Horatio Potter of New York and others, guided all to a satisfactory conclusion. The Convention of 1862 had ignored the absence of Southern delegates. In 1865 the Southern bishops were urged to attend and "trust to the love and honor of their brethren." Two bishops and delegates from three dioceses responded. In the Convention of 1868, the South was fully represented. By exercise of tact and patience on both sides, Churchmen had succeeded in ignoring "the late unpleasantness."
in conferring Holy Orders. It aimed at taking
an important step toward the effecting of a
Church unity in the Protestant Christendom of
our land. The first report of the Commission
made no specific suggestions, but led to no
immediate results. Important members of the
Commission were Bishops George Burgess of
Maine and Alonzo Potter of Pennsylvania. The
discussion which ensued paved the way for sub-
sequent Prayer Book revision and conferences
with representatives of other Christian bodies.
Part of the aim of the "Memorial" was realized
in 1898 by the passage of the "Huntington
Amendment." This relaxes the obligation al-
to use the Prayer Book in public worship and
recognizes the duty of bishops to provide
special forms of service for special congrega-
tions and special occasions. Both "Memorial"
and "Amendment" aim at making the Church
freer for evangelistic work.

There is another side to this work for unity.
Dr. Muhlenberg had in mind the Protestant
Christendom of our land. There were larger
Christendoms than this which the Church may
not forget. Something has been done to estab-
lish friendly relations with Eastern Orthodox
and Old Catholics. Bishop Horatio Southgate in
1843 was accredited as representing the Church
to the patriarch of Constantinople; Dr. J. F.
Young of New York (later bishop of
Florida) in 1864, and Bishop Grafton of
Fond du Lac, in 1903, have paid official visits to
the Church in Russia. Bishop Whittingham of
Maryland in 1872 attended the Old Catholic
Conference in Cologne. Russian and Old
Catholic bishops have on several occasions ac-
cepted the official cortege of the American
Church. Polish Old Catholics in America have
made definite proposals of union. Another
century may see some result from these small
beginnings.

**Missions.**—The Episcopal Church has al-
ways been breaking ground in new fields. Her
first duty was to extend her work in the West-
ern States. Among the typical examples of the
home missionaries were the Rt. Rev. Jackson
Kemper, missionary bishop of the Northwest,
and Dr. James Lloyd Breck. Dr. Breck with
two friends founded Nashotah House in Wis-
consin as a training school for missionaries.
Later he removed to Minnesota, organized work
among Indians at Crow Wing and laid founda-
tions for Church institutions in Faribault.
Bishop H. B. Whipple developed and completed
his work. Still later Breck organized the "As-
sociate Mission for the Pacific Coast." His last
work was the founding of schools in Benicia,
Cal. The first bishops in the Pacific States
were William Ingraham Kip of California and
Thomas Fielding Scott of Oregon and Wash-
ington. Most of the Western States contain
one or more organized dioceses. There are still
16 missionary jurisdictions in the United
States and four others in American posses-
sions. Bishops have been recently sent to
Alaska, Sandwich Islands, the Philippines and
Patagonia.

There are six foreign missionary jurisdic-
tions, Western Africa (Cape Palmas); Shan-
ghai and Hankow in China; Tokio and Kioto
in Japan, and Cuba. Bishops have also been con-
sacred for independent churches in Haiti,
Mexico and Brazil. The direction of missionary
work is entrusted to a Board of Missions with
headquarters in New York. Contributions for
missions of all kinds probably amount to a
million dollars a year.

**Institutions.**—There are a number of Epis-
copalian theological schools. The General The-
ological Seminary in New York is a training
school for the whole Church. It was founded
in 1817, was removed for a time to New Haven,
returned in 1820 to New York and was shortly
after established in its present location. It owns
its present buildings to generous gifts of Dean
Eugene Augustus Hoffman. Of other semina-
ries, the more important are the Episcopal The-
ological School, Cambridge, Mass., Berkeley
Divinity School, Middletown, Conn., the Divin-
ity School of Philadelphia, Seabury Divinity
School in Faribault and Nashotah House.

Trinity College, Hartford, Conn., Kenyon
College, Gambier, Ohio, Hobart College, Gen-
eva, N. Y., the University of the South, Sewanee, Tenn., and Saint Stephen's College,
Annadale, N. Y., are all Episcopalian insti-
tutions. Columbia University, New York, al-
ways has a Churchman for president and uses
Church prayers in its chapel. Lehigh Univer-
sity, South Bethlehem, Pa., is under the au-
thority of its founder under Church auspices.
There are many diocesan schools for boys and
girls and special schools for Negroes and In-
dians. Of the larger Church schools for boys
may be mentioned Saint Paul's School, Concord,
N. H., Groton School, Groton, Mass., and
Racine College, in Wisconsin. Churchmen have
always been active in promoting chari-
table work. Saint Luke's Hospital, New York,
is a conspicuous example of their zeal. There
are numerous organizations for the furthering
of Church work and a number of religious
orders for men and women.

The number of Churchmen is not large, but
the rate of increase has been comparatively
rapid. In 1800 there were 11 dioceses served
by seven bishops and 208 other clergy; in 1916
there were 120 dioceses and missionary juris-
dictions served by 122 bishops and about 5,800
other clergy. The number of communicants
was about 1,060,000, a number which implies
about 4,000,000 adherents.

The materials for the history of the Protes-
tant Episcopal Church are to be found in Jour-
nals of the General Convention, the memoirs of
distinguished Churchmen and collections of
pamphlets in the libraries of Church institu-
tions. Perry's 'History of the American Epis-
copal Church,' a collection of monographs, is
the most complete formal history. There are
smaller works by the Rt. Rev. Leighton Cole-
man, D.D., bishop of Delaware, the Rev. C. H.
Tiffany, D.D., and the Rev. S. D. McConnell,
D.D.

**FREDERICK JOSEPH KINSMAN,**
**Bishop of Delaware.**

**PROTESTANTISM.** The Diet of Worms
(1521) placed Martin Luther, the friar of Witten-
berg who had presumed to criticise the Pope
and to condemn certain ecclesiastical practices
of his day, under the ban of the empire. He
had already been placed under the ban of the
Church by Pope Leo X, and thus stood con-
demned by Church and State alike. But he
had powerful supporters in Saxony and else-
where and their influence was sufficient to pro-
test him from personal harm and to promote his cause until, at the Diet of Speyer (1526), it was voted that each state of the empire should decide for itself whether the Edict of Worms should be enforced. This was the first step toward the legal toleration of the Lutheran faith. At the second Diet of Speyer (1529) this limited degree of toleration was withdrawn. Nineteen of the states of the empire protested against the reactionary measures of this Diet, and their formal protest caused them to be known as "Protestants." This is the historical origin of the name which is now commonly applied to all who in the 16th century broke away from papal Rome, and to their ecclesiastical successors down to modern times. The organized Christian world of the West has ever since been divided into two great groups, namely, Roman Catholics and Protestants. The countries where Greek Catholicism held sway took no part in the Reformation movement, and until recent times have remained for the most part uninfluenced by Protestantism. A fifteenth-century Protestant movement looks to Martin Luther (1483-1546) as its founder and chief leader, and to the University of Wittenberg as its original home. Luther's most notable early associate was Philip Melanchthon (1497-1560), a classical and humanist, the author of the first Lutheran work on dogmatic theology and the framers of the Augsburg Confession (1530). A well-known contemporary, Ulrich von Zwingli (1484-1531), also a very able and influential preacher against ecclesiastical abuses, led an anti-papal movement of almost equal importance in German Switzerland, and there laid the foundations of the Reformed faith. The chief scene of his activities was the town of Zürich. The movement which Zwingli inaugurated was, however, overshadowed and absorbed by the more constructive work of John Calvin (1509-64), a Frenchman by birth, who made of Geneva a Protestant stronghold—"Little Rome," as his opponents called it. From Geneva the principles of the Calvinistic Reformation spread forth to many other European lands. They were carried into Scotland by John Knox (1505-72), and that country became an important factor in promoting the growth of the Reformed faith in the Anglo-Saxon world. The Protestant influence in the Low Countries, called the life by these leaders and others hardly less important, fall into two main groups, commonly called by European historians the Lutheran and Reformed churches. The Lutherans were not only originally Teutonic, but for the most part have remained so. The Reformed, known in America more commonly as Calvinists, proved to be much more international in character. Among the Lutherans are included chiefly Germans, Danes and Scandinavians; among the Reformed, or Calvinists, are included Swiss, French, Dutch, English, Scotch, Irish and various minor nationalities found in America. Historians have sometimes attempted to account for the wider extension of the Calvinistic type of Protestantism by pointing out that it sustained the impress of the higher learning in maintaining the faith, which Luther never did except reluctantly, that it emphasized popular education, offered greater freedom from traditionalism (for instance in the interpretation of the Lord's Supper), and that it tended to separate Church and State. The Lutherans for the most part were organized throughout Germany into a series of state churches,—a natural outgrowth of the German political principle, cuius regio ejus religio. The Protestant princes exercised control over the churches within their respective jurisdictions, and although this power was usually delegated to an officer known as the superintendent (the Lutheran analogue to a bishop), yet in each case the prince himself was to a large degree the governor of the church.

Except in England, where ecclesiastical conditions were different, state control of religion among the followers of Calvin, even if it once existed, rarely lasted very long, for Calvinism always encouraged the growth of a republican type of government. One of the best examples of this growth is found in the French town of La Rochelle where a political as well as an ecclesiastical system was developed which for a time threatened the existence of royal absolutism in France. Although in the Calvinistic régime produced intolerance, yet Calvinism itself was based upon a principle which sooner or later was bound to result in freedom. It would, therefore, be an error to assume that, because in Geneva or in Massachusetts Bay there existed a theocratic government, there must of necessity be theocratic government wherever the principles of Calvin are taught.

Lutherans and Calvinists may further be distinguished from each other by their attitude toward the Bible. Generally speaking Lutherans believed that the Church might properly retain whatever doctrines or ceremonies were not obviously prohibited in Scripture. Calvinists on the other hand believed that only such doctrines and ceremonies should be retained as were expressly commanded there. The general principle of biblical authority was, to be sure, maintained in both churches, as over against the principle of ecclesiastical authority held by the Papacy, but the difference to which reference has just been made proved to have an important bearing upon the development of the two branches of Protestantism. It is obvious that the appeal to Scripture, constantly made by Protestants, contains within itself a corrective for such errors as might from time to time come into existence through its use. Thus the verbal authority of Scripture, upon which in the latter part of the 16th century not a few Protestants both Lutheran and Calvinist relied, gave place in time to a much less mechanical conception. The more the Bible was studied and the better it was understood, the less it showed itself to be a legal code and the more it came to be regarded as a history and source of spiritual and religious power. Modern critical study of the Bible, including what is commonly called the Higher Criticism, is a legitimate outgrowth of the Protestant principle of Scriptural authority.

The connection between Protestantism, as a religious movement, and politics is real and historically the higher learning in France in French Switzerland is to be found a model of the self-governing churches which belonged to the Calvinistic wing of the Reformation. That model was Geneva, where religion was the controlling influence, and where the ecclesiastical organiza-
tion was hardly less significant than the civil. In the history of the Netherlands, as well as of Scotland and England, one may find constant illusory, in the history of the relations between politics and religion throughout the 17th century. It was the spirit of self-government, exhibited among Presbyterians and Independents which inspired the Puritan Revolution, that dramatic interruption of the Stuart line, and from the same spirit arose the long and tragic struggle for freedom in the Netherlands.

Lutheranism on the other hand proved hospitable to a union between Church and State; but in the Germanic lands in modern times it has produced a merely nominal religious conformity. During the last 100 years some of the more liberal branches of the church system have become visible in Germany,—secularism, formalism and the inevitable detachment of morality from the controlling sanctions of a vital religious faith. Within the United States, the more liberal sects have suffered more from the persecution of their members than from the division and subdivision of other Protestant churches. In spite of the doctrinal differences that Lutherans know no sects, there are more different Lutheran organizations in the United States to-day than there are of any other Protestant denomination. Western and northern Germany and German Switzerland became almost wholly Protestant in the 16th century. The Reformed faith also made important gains in France, showing an especially vigorous growth so long as the Edict of Nantes continued in force (1598-1685). With the revocation of that edict a Roman Catholic reaction set in and the gains which Protestantism had made were mostly wiped out. Denmark and Sweden early received the Lutheran Reformation and have remained Lutheran down to modern times. The Calvinistic faith was the controlling one in French Switzerland, the Netherlands, the British Islands and New England. Protestant liberalism in the form of Socinianism early found a home in Poland and Transylvania. The European lands least affected by the Reformation were Italy, Austria, Spain and the countries where the Eastern Church held sway. Protests that of all types were agreed in their opposition to Roman Catholicism, however energetically they might differ among themselves. This opposition took form at first in the rejection of the Papacy (q.v.). It next showed itself in the rejection of the Roman hierarchy and the episcopal system. The popular demand for a reformation of notorious abuses, such as simony, nepotism, pluralities, laxity of discipline, clerical ignorance, etc. —a demand which had long been heard on all sides, and which had been ably advocated by Erasmus and other humanists,—materially strengthened the forces which made for ecclesiastical revolution, and prepared men's minds for the adoption of more radical measures than were at first contemplated by the leaders of reform. Not all Protestants, however, rejected the authority of church government by bishops, and the history of Protestantism shows a sharp distinction between the churches which have retained the episcopate and those which have rejected it. The best-known examples of the churches maintaining an episcopal type of government are the Church of England, the Protestant Episcopal Church, and the Methodist Episcopal Church of the United States.

The Anglican Church, so far as it may be regarded as detached from the Catholic Church of the West, owes its origin to a movement in the reign of King Henry VIII, when the papal jurisdiction in England was abolided. For a time the English Church endeavored to maintain its doctrine and canon law in other respects unchanged. But Puritanism, which is only thorough-going Protestantism, soon grew up within the Church of England, and the long struggle of the 17th century, which in 1689 resulted in the toleration of Non-Conformity, left the English people religiously divided and created an ecclesiastical situation which, with some modifications, has ever since continued. Thenceforward there were in the kingdom (1) the Established Church, Episcopalian but not Roman Catholic; (2) the Non-Conformist bodies, which for some time labored under various political disabilities which have since been removed; and (3) the Roman Catholics, who down to the period of Parliamentary reform and Catholic emancipation (about 1830) were also under serious political disabilities. It was partly in indirect consequence of the Oxford movement, and because of the going over of a considerable number of Anglicans to the Roman obedience, that Roman Catholicism in England received a considerable increase of strength and now includes in its membership an important fraction of the population. The Established Church at present comprises only about one-half of the English people.

Denominationalism found its special field of action and reached its highest development within the territory of what is now the United States. The earliest discoveries and conquests in North America were indeed made by Roman Catholic nations, especially by the Spaniards. At a somewhat later date the French, also Roman Catholics, explored and attempted to colonize the valley of the Mississippi and the region of the Great Lakes. The settlements however which proved most enduring and which gave permanent character to the political institutions of the new world were those of English origin. The two groups of English colonists, Anglicans in Virginia, Puritans and Separatists in New England, proved not to be sufficiently unlike to render difficult a political union, which came about at the American Revolution. The existence of several varieties of Protestant churches, as well as the abstract political theories held by the framers of the Federal Constitution, made possible the adoption of the American system of a free church in a free state. The Constitution, including its first amendment, prohibits the establishment of religion, and all interference with the free exercise thereof. As a consequence denominationalism in the United States has had a free opportunity for development, with the obvious disadvantage of a rapid increase in the number of sects, but with the compensating advantage of an unmatched opportunity for judicial comparison of their value and for the survival of the fittest.
PROTESTANTISM

Among the leading Protestant denominational types represented in the United States are the Congregational and Baptist (which are very similar in policy, if not in theology), the Presbyterian, the Methodist and the Lutheran. Of most of these there are several distinct or subordinate varieties. Outside the leading groups lie many ecclesiastical organizations, some of them with a large constituency, each of which exhibits some special feature of doctrine or polity upon which its denominational existence is based. During recent years a movement toward affiliation and union has gained increasing strength among many Protestant bodies, and this movement is likely to be accentuated by centralizing influences growing out of the Great War.

The distinctive characteristics of Protestantism continue to be those which the great reformers, more or less perfectly perceived, but which they did not always follow to their consistent and logical conclusion. The two great Reformation principles were justification by faith alone through divine grace, and the sole authority of Scripture in matters of faith. Involving these was another principle, perhaps more comprehensive than either of them, namely, the inalienable right of private judgment in religion. The history of Protestantism exhibits the gradual working out into full recognition and acceptance of these fundamental principles. But the process is still incomplete. It is obvious that many nominal Protestants have not as yet fully accepted these principles, yet modern Protestantism has recently begun to recognize more fully their true significance. Catholicism on the other hand, whether Greek, Roman or Anglican, is frankly based upon the principle of a divinely authoritative church, organized and governed according to apostolic precept, exhibiting a legitimate succession of bishops outside of which there is no authorized mind, maintaining an unimpaired original deposit of faith, and thus furnishing a living organ for the exercise of divine authority throughout all the generations. For the existence of such a divinely authoritative church it is not necessary that the authority be exercised by a Pope or by a council of bishops; the principle remains the same.

The Protestant conception of the Christian ministry is very different from that outlined above. In spite of exceptions and inconsistencies the logic of Protestantism requires that the Christian minister shall be essentially the pastor and teacher of his people, chosen by them to lead in public worship and to administer the sacraments, and that his position shall be representative, not sacerdotal. Strictly speaking, there can be no such thing as a Protestant hierarchy. Nevertheless it must be freely recognized that in many Protestant churches a conception of the ministry still obtains very different from this—a conception which really involves the persistence of Catholic theories within the boundaries of nominal Protestantism.

The distinction between the two types of religion here contrasted has been stated thus: Catholicism furnishes to the individual believer an institutional guarantee of salvation; Protestantism insists upon personal assurance of salvation. Looking at the question from a slightly different angle, Schleiermacher said that Catholicism makes the relation of the believer to Christ depend upon his relation to the Church, while Protestantism makes the relation of the believer to the Church dependent upon his relation to Christ. It is obvious that between these two conceptions of religion there is a fundamental difference.

Present-day Protestantism comprehends practically all of those who have dissociated themselves from the Catholic Church in any of its forms. It will, therefore, include many persons who are not actively identified with any Church, but who would refuse to be classified as Catholic. In the Protestant Churches there are wide divergencies of opinion upon theological matters and the constant tendency of Protestantism is away from dogmatic theology and toward the employment of simple religious formulas and the promotion of practical religious and philanthropic activities. Dogmatism still lives here and there in communities which are intellectually less progressive, but it no longer plays an important part in the more enlightened section of Great Britain and America. Protestant creeds and confessions are more simple and general in their language, and look toward a definition of Christian duty in practical life rather than toward the formulation of a speculative theological system.

Protestant worship is characterized by simplicity and directness, especially in comparison with the stately ritual of the Mediaeval Church. Catholicism makes the altar central, and emphasizes the sacrificial aspect of Christian worship; Protestantism substitutes the pulpit, and thus shows its predominant characteristic to be that of a teaching church. The idea of mystery in worship gives place to intelligibility. In the early days of Protestantism this simplicity became at times barrenness, for example among the Puritans. But in modern times there has come a reaction against this tendency, and the forms of public worship have grown more elaborate, resulting often in the adoption of a liturgy not unlike the services of morning and evening prayer in the Church of England.

A great variety of denominational affiliations have been created by Protestants during the past 100 years. Missionary enterprises, both domestic and foreign, educational institutions of every grade, hospitals and other remedial agencies for mind and body, organizations for social betterment, young men's and women's Christian associations, and many related undertakings, here have their origin. Similar institutions also exist among the Roman Catholics, and in not a few instances Catholics and Protestants now fraternally co-operate, to the obvious advantage of both. Many educational institutions within the United States, which owe their origin to a distinctively religious motive, have lately become unsepararian and to the ordinary observer practically secular. This secularization of education, notably to the history of Protestant education, finds little counterpart among the schools and colleges which are under the control of the Roman Catholic Church.

Reliable religious statistics for some countries are hard to obtain, but the following table exhibits with a fair degree of accuracy the numerical strength of the various ecclesiastical
groups throughout the world at the beginning of the 20th century:

Roman Catholics, about 250,000,000.
Greek Catholics, about 125,000,000.
Protestants (including Anglicans), about 175,000,000.

The approximate membership of the principal churches within the United States at the present time may be estimated as follows:

Roman Catholics, about 16,000,000.
Methodists, about 7,800,000.
Baptists, about 6,500,000.
Lutherans, about 2,300,000.
Presbyterians (including Reformed), about 3,300,000.
Disciples, about 1,400,000.
Episcopalian, about 1,200,000.
Congregationalists, about 500,000.
United Brethren, about 350,000.

The Protestant groups here listed include in several instances churches which have separate organizations but which are sufficiently alike in doctrine and polity to be included under the same general designation. Some of the smaller churches are omitted entirely, except in the summaries given below. The membership of the Roman Catholic Church and of the Protestant Churches within the United States may be thus summarized:

Roman Catholics, about 16,000,000.
Protestants, about 24,000,000.

The actual constituency of both is of course much larger than the figures given above, which include only those who are in full membership.

Ever since the period of the Reformation, and until comparatively recent times, church historians have endeavored to show either that Protestantism was an unjustifiable departure from all ancient customs and usages of the Church for more than a thousand years (the Catholic position), or that Protestantism finds its justification in primitive Christianity, that the Mediæval Church had grown increasingly corrupt with the lapse of time, and that the reformers' effort to do away with its corruptions and to return to the simplicity of the New Testament was not only legitimate but was also their obvious Christian duty. The latter is the Protestant position. These two tendencies find their best illustration on the Protestant side in the 'Magdeburg Centuries,' and on the Roman Catholic side in the 'Annals' of Baronius. It was only in the 19th century that the period of critical ecclesiastical historiography began. At the present day writers of all schools exhibit an increasing desire for the impartial treatment of church history, and many of them employ a critical method which is making their subject a true science.

Bibliography.—Among the more important books on Protestantism may be mentioned: Lindsay, T. M., 'History of the Reformation,' (2 vols., 1906-07); 'Cambridge Modern History,' Vol. II, 'The Reformation' (1904); Beard, C., 'The Reformation of the 16th Century in its Relation to Modern Thought' (Hilbert Lectures for 1883); Macmillan, K. D., 'Protestantism in Germany' (1917); McGiffert, A. C., 'Protestant Thought before Kant' (1911); Moore, E. C., 'Christian Thought since Kant' (1912); Tulloch, J., 'Movements of Religious Thought in Britain during the 19th Century' (1983).

PROTHEO—PROTOCOL

PROTHEO, Rowland Edmund, English author, brother of G. W. Prothero (q.v.): b. Clifton-on-Teme, 6 Sept. 1852. He was educated at Marlborough and Oxford and was editor of *The Quarterly Review* 1894–99. From 1875–91 he was a Fellow of All Souls College, Oxford. Since 1914 he is M.P. for Oxford and since 1916 president of Board of Agriculture. He is the author of 'Pioneers and Progress of English Farming' (London 1887); 'Life and Correspondence of Dean Stanley' (2 vols., New York 1893); 'The Psalms in Human Life' (1899); 'The Pleasant Land of France' (London 1908); 'English Farming Past and Present' (London 1912); and has edited 'Letters and Verses of Stanley' (London 1885); 'Private Letters of Edward Gibbon' (2 vols., London 1896); 'Handbook for Travellers in the Isle of Wight' (London 1898); 'Letters and Journals of Lord Byron' (6 vols., London 1901–04); 'Letters of Richard Ford' (New York 1905).

PROTHONOTARY, also PROTONOMARY, in Pennsylvania, and a few other States, the name given the judge of the Orphans' Court (See COURT). Formerly the term was applied to chief clerks or registrars in most English courts of law. It is still applied, usually in the form 'Prothonotary Apostolic' to certain functionaries connected with the papal court who receive the last wills of cardinals, make informations and proceedings necessary for the canonization of saints, etc.

PROTIMAEBA. See MONER.

PROTOCOL, in diplomacy, the minutes of the discussions of a conference, or the tentative draft of an instrument or transaction; a statement of the principles to be afterward embodied in a treaty or the original text of the treaty, dispatch or other document; a document serving as the preliminary to diplomatic negotiations; a diplomatic document or minute of proceedings, signed by the representatives of friendly powers in order to secure certain political ends peacefully; requiring the formalities of ratification. By a protocol concluded and signed 12 Aug. 1898, by William R. Day, Secretary of State of the United States, and Jules Cambon, Ambassador Extraordinary and Plenipotentiary of the republic of France, at Washington, respectively representing for that purpose the government of the United States and the government of Spain, the United States and Spain agreed upon the terms by which negotiations for the establishment of peace between the two countries should be undertaken. Following the signing of this peace protocol, President McKinley issued a proclamation suspending hostilities.

PROTOCOL, The Industrial, a juridical covenant formed in 1910 between the several associations of New York manufacturers, respectively, of dresses and waist; of children's dresses; of ladies' underwear; of embroideries, and of house dresses and kimonos, and the 60,000 operatives employed by these industries. The agreement was brought about by the endless conflict between the manufacturers and the workers, resulting in a series of strikes and lockouts in which both sides were losers. The condition arose from the very large number of small individual manufacturers, who, in the necessities of keen competition, pursued widely diverse shop methods, some to the benefit but more to the detriment of the employees. Friends of the workers joined them in an endeavor to stabilize working conditions and wage incomes, and the protocol resulted. It established certain fundamental rights and principles on behalf of the workers, and provided that these should be enforced upon the less scrupulous individual manufacturers by the large associations who joined in the signing of the protocol. The manufacturers were assured that there should be no strike; that work should continue, no matter what the dispute, and that the differences should be referred to a board of arbitration, of which Justice Brandeis was the first chairman, succeeded upon his elevation to the Supreme Court by Justice Mack. A board of standards of nine members was created, with three representatives of the manufacturers, three of the employees and three persons representing the public. Its office was to enforce the provisional standards set forth in the protocol and adjust from time to time the conditions of payment to the market values of the work produced. The instrument provided for 'fair and reasonable' betterments from time to time, both in wages and wages. This was the seal of disruption, the workers claiming that these betterments did not materialize as rapidly as they should, and an open break occurred in 1915. The mayor's
PROTOGENES—PROTOPLAST

Council of Conciliation," headed by Dr. Felix Adler as chairman, was successful in readjusting the difficulty, and the protocol was revived. It was again terminated in 1916, this time by the manufacturers, who claimed that the decision of the union officials was ruinous to their business. The workers contended that the conduct of the business on the part of the manufacturers was so incompetent that they were shut out from the betterments which they had a right to expect. Since 1916 there has been a series of disturbances, and several strikes have occurred in spite of the provision of the protocol that work shall continue. The workers have gained substantial increases in wages and the 44-hour week. The protocol still remains as a pseudo-covenant, though hardly with its former prestige, both workers and manufacturers having lost faith in it.

The idea is regarded favorably by social workers and has been adopted in Chicago, Philadelphia and Boston.

PROTOGENES, prötōg'ēnēz. Greek painter. Company w: Apelles; b: Caunus on the coast of Caria. He lived about 350 a.c. and spent most of his life in Rhodes. He was one of the first of Greek realists in painting. Several masterpieces of his are mentioned, in one of which a Rhodesian local hero, Ialysus, was represented hunting with a painting bound which showed foam on his mouth. Pliny, who is our chief source of information (Hist. Nat., XXXV, 36), relates that for a long time the painter failed in the execution of the foam; but at last, in a fit of anger, threw against the picture the sponge which he used in painting, and thus accidentally produced a natural representation of it. This picture saved the city of Rhodes when it was besieged by Demetrius Poliorcetes (305-304 a.c.) who refrained from making his attack on the weakest part of the city where the picture was placed. In the time of Cicero it was in that city, but Vespasian carried it to Rome, and placed it in the temple of Peace, in which it was burned under Commodus. Protegenes is said to have lived in comparative obscurity at Rhodes till the 50th year of his age, when his merits were made known to his fellow-citizens through a visit of Apelles (q.v.). Apelles offered Protegenes an enormous sum for each of his works, which the painter himself had been in the habit of selling for very insignificant sums. The Rhodians now wished to buy back the pictures from Apelles, in order that they might keep them among themselves, but Apelles refused to part with them except for an advance. Protegenes subsequently went to Athens, where he executed the 'Nausicaa,' one of his finest pictures in the Propylaia. Amongst other famous pictures ascribed to Protegenes should be mentioned 'Satyr playing on a Flageolet,' 'Cydippe,' 'Tlepolemus,' 'Alexander and Pan'; portraits of Philiscus, Antigonus and Aristotle's mother. He is also reported to have executed a number of statues in bronze, especially of athletes, soldiers and emperors. Consult Bostock, J. and Riley, H. T., 'The Natural History of Pliny' (Vol. VI, London 1857); Brunn, H., 'Die Geschichte der Griechischen Kunst' (2 vols., Stuttgart 1857-59); Hauer, E., 'Franz über Protegen und Nausicaa' (in Kais.-franz. PROTOGYNY. See POLLINATION.

PROTOHIPPUS, or PROTOROHIPPUS, genera of early fossil ancestors of the horse. See HORSE, EVOLUTION OF.

PROTOPHYTES. See Fungi.

PROTOPLAST. The most fundamental characteristic of animals and plants is life. While no one can, as yet, demonstrate just what the physical basis of life is, still there is general agreement that the substance known under the rather indefinite name of protoplasm is that physical basis. The term was first used in 1840 by Purkinje, who applied it to the whole substance of young embryos, to that part of the cell walls as well as cell contents. Von Mohl, in 1844, restricted the term to the living contents of the cell. At present, it is still further restricted, being applied to the living contents of the cell, exclusive of the nucleus, so that the living contents are said to consist of nucleus and protoplasm. In this latter sense, some use the term cytoplasm, instead of protoplasm. Protoplast is, typically, a viscid substance, usually colorless, and it will not mix with water. In some forms and under some conditions, it has more tenacity and in the resting, but still living condition, found in seeds, it may become as hard as bone. Between the soft, viscid condition and the bony condition found in seeds like the date and vegetable ivory, there is every conceivable gradation. Chemically, protoplasm consists principally of water, carbon, hydrogen, sulphur and oxygen, but may contain also smaller quantities of chlorine, phosphorus, potassium, sodium, magnesium, calcium and iron. Living protoplasm is alkaline, turning the red litmus blue. In order to the protoplasm there is great diversity of opinion, but most investigators believe that it is something like foam or honeycomb. There is a round substance containing globular bodies of various sizes, so that protoplasm looks like an emulsion, and its general appearance may be simulated by mixing olive oil and common salt. In active living cells, the protoplasm is always in motion and in some cases the motion is so rapid that it can be seen even under a low power of the microscope. In the long cells of the stonewort, Chara, the protoplasm moves round and round in a definite path. In the stamen hairs of the Spider Lily (Tradescentia), the movement is easily observed. Stinging hairs of various plants will generally show some movement and any very thin leaves of water plants are good subjects. The outer layer of the protoplasm is somewhat different from the rest and has been called the plasmamembrane (the Hautsicht of the Germans). It is sometimes visible and sometimes not, but it is claimed that it is always present. The protoplasm of adjacent
PROTOSTEGIDAE

cells is connected by extremely fine threads, called protoplastic connections, which bind the living parts of the plant into a more or less connected whole. These threads pass through almost inconceivably small pores in the cell walls. If the threads are unusually small, they can be demonstrated by using reagents which cause swelling, and then applying dyes to the swollen structures. When plants die and the living contents of the cells dry up and seem to disappear entirely, as in the case of seasoned wood, the threads still remain in the pores and can be demonstrated. There is abundant room for all kinds of investigations upon protoplasm. Consult Butschli, O., 'Untersuchungen über mikroskopische Schäume und das Protoplasma'; Wilson, E. B., 'The Cell in Development and Inheritance.'

CHARLES J. CHAMBERLAIN.

PROTOSTEGIDAE, a family of mostly gigantic marine Testudinata, or "turtles," now wholly extinct, from the mid-Cretaceous Niobrara Chalk beds of western Kansas, and the overlying Fort Pierre formation of South Dakota. These turtles lived in the great but shallow supra-continental or epeiric Niobrara and Pierre seas. They were shell fish eaters, well able to navigate the open ocean and among the most formidable of marine reptiles. The group is of profound osteologic interest.

The first specimens were discovered along the Smoky Hill River by Cope in 1871, and called by him Protostega gigas, being recognized as a new family type. The great Yale specimens of a second genus Archelon were secured by Wieland in 1895 to the east of the Black Hills along the Cheyenne River in the uppermost Pierre shales near the overlap of Bad Lands (Tertiary). Ten years later the veteran fossil hunter Charles H. Sternberg, to whom American paleontologists owe many unique "finds," again collected Protostegas along the Smoky Hill River which aided greatly in completing the details of the skull and limb organization. One of these, made the subject of a restoration in the Carnegie Museum at Pittsburgh, is truly remarkable, the flippers having nearly all their elements in place.

The Yale Archelon from the Cheyenne River is only less complete, but much larger and an even finer fossil. It represents a huge turtle nearly 20 feet long with front flippers of an indicated 15-foot span. (See Plates). As a unit of size, it may be mentioned that the humerus as fossilized, and mounted, weighs just 75 pounds. Another fragmentary specimen was still larger, and indicated a turtle 14 feet in length. The habitus being robust, this formidable boatman of the Cretaceous seas represents the culmination in size of not only the Protostegids, but the entire order. If the paleontologic record may be trusted, not until the comparatively recent Pliocene of the Siwalik Hills of Northern India do land species approach in size but scarcely rival the Cretaceous Protostega and Archelon. That, which renders the Protostegids conspicuously interesting is, however, not so much their size as their structure. It is this group which has gone far towards yielding a convincing solution to one of the most instructive but difficult of all problems presented by reptilians, the origin of Dermochelys, the "leatherback" of present day tropical seas.

It should be recalled that Dermochelys differs from all other turtles in the absence of a dorsal bony carapace of neurals, pleurals and marginals interlocked. This protecting roof is instead replaced by what may be termed a pseudo-carapace of innumerable interlocking polygonal plates, all osteodermal in character and marked by seven ridges or dorsal keels. (See Fig. 1). Under this shield the ribs are slightly expanded proximally but neither unite with each other or with neurals, which wholly fail; though oddly enough there is a large thin detached nuchal.

The osteodermal mosaic of plates also continues around on the nether or plastral side presenting five more of the keels. But here the plastron is found in the underlying normal, that is subdermal position, except for the further anomaly of a missing entoplastron. That this element should lack, while an unsupported nuchal persists is singular. The plastral bones, however, are slender and thin, enclosing a vast fontanel, and having every appearance of extensive reduction. Now, the sum of Dermochelyan characters, despite certain cranial resemblances to other sea turtles and more remotely to Chelydra, might lead to the view that of all the Testudinata, Dermochelys is nearest to a primitive form with the ancient keels still present. But if evidence of osteodermal keels is found in fossil forms, and if additional skeletal resemblances are there recognizable, then Dermochelys is far more closely related to modern forms than at first appears to be the fact,—is in a word not the least, but the most specialized of turtles.
1 Archelon ischyros Wieland. Dorsal view of the Cheyenne River specimen mounted at Yale. The right hind peddle was early in life bitten off by some predaceous enemy, as a fish, shark or mosasaur, of the Pierre sea.

2 Archelon ischyros Wieland. Plastral view of the Yale Cheyenne River specimen. See Plate 1. Length 11 feet.
The latter alternative appears nearest the truth. *Protostega* Cope of the Niobrara has a shell as heavy as that of marine species in general, but there is some plastral reduction with digitation of the separate elements. In the contemporaneous *Protostega gigas* rib and plastral reduction are seen to have gone still further; while in *Archeleon* of the considerably later Pierre, carapacial reduction has proceeded very far. The ribs (see Plate) only show a small thin proximal expansion, while the neurals are nearly eliminated and hidden by a median keel of elements, as truly osteodermal as those of the Dermochelian carapace. There are moreover highly digitate marginals, with pretty clear evidence of a supramarginals row. Bearing in mind that the marginals of all Testudinates are dermal, this accounts for the chief of the Dermochelian carapace. With (1) segmentation of larger into lesser interlocking dermal or epithetical elements; (2) gradual thickening of these into a heavier shell; (3) a corresponding elimination of rib expansion and neurals; and (4) a gradual plastral reduction, the chief features of Dermochelys would be evolved in the late Cretaceous and Tertiary, though the actual line of descent might be a discrete one far back in geologic time.

![Fig. 2. - Dermochelys Baroni Wieland. (From the Niobrara Cretaceous of Kansas).](image)

It is then virtually proved that in the primitive carapace there are two overlapping bony layers — the neurals and pleurals (costals) underneath, with a neural, pleural, supramarginal and marginal keel above it. The great majority of turtles the underlying neuroligenous layer early interlocked with the marginal dermal keel, and all traces of the other dermal keels were gradually lost, or the hornshields were formed instead. But the *Protostega* with the related form *Tromyos* (see Fig. 2) indicates that an epithecum of median and lateral rows of dermal elements could also reach prominence, finally replacing the endotheicum as in *Dermochelys*. The latter could not always have had so prominent an osteodermal mosaic as now, and it is difficult to believe that weak and thin neurals like those of *Archeleon* were not once present in sequence with the nuchal. It is also significant that the nuchal, the pelvis and the epiplanter of *Archeleon* strongly resemble these several elements in *Dermochelys*.

In recapitulation it is seen that: (1) The *Tromyos* carapace is now completely endotheicum or subdermal; (2) in the majority of Cryptodiran and Pleurodiran Testudinates the carapace is diplogene;— that is, equals the subdermal neurocostal shield plus dermal marginals (see Fig. 3); (3) The *Protostega* (and *Takozyela*) have the most complex bithecal carapace known, retaining the subdermal elements with not only the marginals but supramarginals and a median keel of expanded epineurals; (4) *Dermochelys* in contrast with *Tromyos* has an osteodermal (mosaic) carapace, plus only the subdermal nuchal; (5) The Testudinate plastron is far less variant than the carapace. It remains complex in recent form only in *Dermochelys*, with both subdermal and dermal elements.

Taking both carapace and plastron, *Dermochelys* and the *Protostegids* are thus closely apposed, and similar forms variant. But as indicated by large nutrition canals of the epineural keel, *Archeleon* had a heavy leathery hide instead of an outer hornshield. It is, therefore, possible and probable that there were also dermal elements in the plastron. In this case the *Protostegids* were completely bithecal and fall still closer to the "leatherback" than is inferred from the resemblances cited.

The deeply interesting paleontologic problem here briefly outlined, is in a measure solved. But many details and doubts yet remain which only discovery of further evidence can resolve.

The general biologic problem has been outlined for just 50 years and naturalists who have successively given their attention to it are E. D. Cope, L. Dollo, G. Baur, O. F. Hay and G. R. Wieland; while especially J. Versluys and his students have considered the osteological evidence.

As a corollary the features of Dinosaurian armor are also brought into unity. In the Dinosauria as in the Testudinata there are the two armor forming strata. But while in the Testudines, *Miolania* affords the sole example of cranial armature, this occurs frequently in Dinosaurs and becomes extraordinary in the Ceratopsids, in which both the nether and upper layers take part in armor formation. Conversely in *Polacanthus* the deep layer forms a lumbar hip carapace. In the Stegosaurs the simple dermal armor takes the most singular expression seen in reptilians existent or extinct. Wieland, who was the first to point out this significant parallelism says:

"At first sight all development of dermal armor may appear to be mainly a senile feature due even to inertia — the general life movement of the individual and the race. But it is also evident that the development of dermal
ossicles in series resulting finally in a protective sub, and osteodermal armature or carapace is a protective change co-ordinated with striking endoskeletal alteration. The Dinosaurs developed their varied armor types late and when already highly specialized, apparently with only varying or far less success than the Testudinates. In them an early development of simpler patterns appears to have resulted in an exceedingly long lease of life.\

PROTOTHERIA, a division or subclass of mammals embracing the Monotremata (q.v.) and with more or less certainty some fossil forms classified as Protodonta and Ailotheria or Multituberculata. In the living forms their most marked peculiarities are that though classed as mammals they are without teeth, that they are oviparous or ovoviviparous, and that they have but a single opening for the digestive tract and the urogenital system; a feature which also obtains in the marsupials, beavers and some other rodents. The sutures of the skull are obliterated, and while in the young there are peculiar teeth with many tubercles upon the crown, these are lost in the adult, the jaws being furnished with horny plates. Similarities in the teeth lead the fossil forms to be associated here. The only living examples are without teeth, platypus (Ornithorhynchus) and spiny anteaters (Echidna). The marsupials are sometimes known as Metatheria, and all other mammals as Eutheria; but the latter term is more scientifically made to include all mammals except the monotremes. Consult: Beddard, F. E., 'Mammalia' (Cambridge 1902).

PROTOZOA. Fundamentally contrasted with all other types of animal life, which are altogether designated the Metazoa, in that the body consists of a single cell or a colony of simple cells, the group is still usually termed a phylum, though it is evidently of a higher grade than the subdivisions of the Metazoa to which that rank is always assigned and the designation sub-kingdom seems better justified. The organisms included are all minute; the largest being barely visible to the naked eye and the smallest living at or beyond the limits of optical vision. With great simplicity of structure they combine functional complexity equal in a general way to that in the Metazoa. Although for the most part the group is well defined yet there exist forms that constitute an unbroken series from such as manifest clearly animal characteristics to those which are equally certainly plants. Transitional forms that bridge the gap between Protozoa and Metazoa are also well known; these are colonial types in which a differentiation between certain cells marks the first step in the production of the Metazoa organism. While structurally simple the Protozoa have many specialized parts, the cell-organisms or organelle, for the discharge of particular functions. Thus for locomotion one finds projections of the external layer, either in the form of soft, mobile protoplasmic lobes that undergo constant changes in form, the pseudopodia, or more fixed processes of contractile material known as flagella and cilia that carry out vibrating movements which propel the body and aid in taking food. The simplest types consist, like the Ameba, of a mere drop of naked protoplasm enclosing a nucleus. In most forms, however, a cell-membrane covers this nucleus and imposes evident limits on its activity, though it is on the whole an advance in specialization. Many forms possess protective coverings like shells, scales and spines that are permanent or cysts which are of a temporary character and related to special conditions such as reproduction, drought and seasonal changes. Membraneless forms ingest food at any point but those species with a membrane have at least a mouth opening and sometimes a second orifice for the extrusion of solid waste. The membrane may form at the mouth an intumed funnel-shaped esophagus. Many parasitic species have an unbroken membrane and take nourishment by osmosis. Contractile vacuoles fed by delicate radiating canals serve to drain excess water and excess of water from the protoplasm, thus serving both as respiratory and as excretory organs. The existence of anucleate forms, the Monera of Heckel, is now strongly doubted. On the other hand the normal mononuclear con...
diation is varied by a binuclear type in some groups. One also finds a multinuclear condition in which there is a colony of organisms or a phase in reproduction just antecedent to spore formation. Division is the ordinary method of reproduction and may be simple or multiple either in the free or the encysted state. Similar spores (zycogamete) or dissimilar spores (micro- and macro-gametes) are produced by most Protozoa, and may develop asexually, but in many cases fuse by pairs as a preliminary phase in the life cycle that suggests the start of Metazoan development.

Many parasitic species exhibit the alternation of two different generations, or a change of hosts as a characteristic factor in their life history. Parasitic Protozoa may infect an organ or an individual cell, or even be found in a nucleus; and the various phases in the life cycle may illustrate these different locations as the malarial plasmodium is successively a cell parasite in the red corpuscle, an organ parasite in the blood, and a tissue parasite in the wall of the mosquito's midgut. No less distinctly than in Metazoa are the effects of parasitism seen among Protozoa as in the degeneration of structures characteristic of free life, in the formation of hold-fast organs, in the increase of reproductive activity, in the occurrence of metagenesis, and in the adjustment of the parasitic life cycle to the habits of the host. Protozoan parasites are the cause of serious and even fatal diseases when by tissue destruction they produce ulcers or by tissue proliferation they give rise to tumors. Metabolic products resulting from the activity of the invading Protozoa may exert a powerful toxemic influence on the host as is well recognized in malaria for instance. The source of human Protozoal diseases may be found in the ingestion of encysted spores with impure food or drink, or it may be traced to the active inoculation of such spores through the medium of some blood sucking insect, like the mosquito, bedbug or louse. The control of Protozoal diseases depends clearly upon knowledge of the life cycle of the organism and of its means of transmission. The brilliant successes of recent years in controlling malaria, yellow fever and other Protozoal diseases depended absolutely on attacking the parasite at some weak point in its life cycle and by preventing its dissemination putting an end to the disease. In this great work American investigators have played an important rôle. The most important Protozoal diseases of man are amebic dysentery due to several species of Entamoeba; sleeping sickness of tropical Africa caused by Trypanosoma, a flagellate blood parasite; malaria, a scourge of tropical and sub-tropical regions since history began, produced by Plasmodium. In yellow fever the organism is yet undiscovered but apparently belongs in the Protozoa; and in typhus it is a minute spirillar structure sometimes placed here and sometimes included under the Protophyta. To other less important human diseases must be added many formidable pests to domestic animals and the loss of many varieties of plants. Many of these diseases are tremendous economic handicaps.

To other less important human diseases must be added many formidable pests to domestic animals and the loss of many varieties of plants. Many of these diseases are tremendous economic handicaps.
magazines. His poems enjoyed a great vogue amongst recitationists. His publications include "Love Among the Gamin" (New York 1879), "Entry to Philadelphia" (1881), "From the Chapparal to Wall Street," or a Man from the West" (New York 1891).

Proudhon, prood'don, Pierre Joseph, French philosophical anarchist: b. Besançon, France, 15 July 1809; d. Passy, Paris, 16 Jan. 1865. He studied at the University of Besançon, but left without completing his course there because compelled to find some means of self-support. He then learned printing and in 1837 became partner in developing a new typographic process. He had continued his education by improving every opportunity for study; and in 1838 published a philological treatise, "Essai de Grammaire Générale," for which the Academy of Besançon conferred on him a pension which yielded an income of 1,500 francs for three years. Political economy became his chief study, and in 1840 appeared his famous work "Qu'est-ce que la Propriété?" ("What is Property?"). The first page of the treatise contains the answer: "La Propriété est le Vol" ("Property is theft"). This first treatise was followed in 1841 and 1842 by two pamphlets in the same strain, the second of which, "Avertissement aux Propriétaires," led to his prosecution and trial for his revolutionary opinions, resulting in an acquittal. In 1843 Proudhon undertook the management of a system of transports on the Rhine and Seine. He found no time to write. In that year appeared his treatise "De la Création de l'Ordre dans l'Humanité," a proposed system of political organization; and in 1846 "Système des Contradicions Economiques" on "Philosophie de la misère." In 1847 he moved to Paris and soon became one of the best-known radicals. After the revolution of February 1848 he began the publication of a journal at Paris called "Le Représentant du Peuple," which, however, was speedily suppressed. He had by this time acquired so much popularity that he was elected the representative of the Seine in the Assembly. Here, however, he had little success, and again turned to writing and journalism. He published several pamphlets, and started three journals in succession, "Le Peuple," "La Voix du Peuple" and "Le Peuple de 1830." He was frequently fined for his statement of his radical theories, but the fines were paid for him by subscription. In 1849 he attempted to found a bank under the name of the "Banque du Peuple" with the object of abolishing interest and finally putting an end to capital. This project failed, and he fled to Geneva to escape imprisonment for violation of the press laws, but returning in June 1849 was imprisoned for three years. On his release in 1852 he went to Belgium, where he continued to write and in 1860 under an amnesty returned to Paris, where he lived in retirement till his death. His publications in addition to those already mentioned include "De la concurrence entre les chemins de fer et les voies navigables" (1845); "Solution de la Question Sociale" (1848); "Idées Révolutionnaires" (1849); Organisation de crédit, etc." (1849); "Confessions d'un révolutionnaire" (1849); "Actes de la révolution" (1849); "Banque du peuple" (1849); "Intérêt et principal" (1849); "Gratuité du crédit" (1850), the last two a resumed of discussions he had with Bastiat (q.v.) on the subject of interest; "Le principe de la propriété" (1850); "De la célébration du dimanche" (1850); "Idée générale de la révolution aux 19ème Siècle" (1851); "La révolution sociale démontrée par le coup d'etat" (1852); "Philosophie du progrès" (1853); "Manuel du spéculateur à la Bourgeoisie" (1856); "De la justice de la taxation et dans l'église" (3 vols., 1858); "La guerre e la paix" (2 vols., 1860); "Theorie de l'Empôt" (1861); Les majorats littéraires (1862); "La fédération et l'unité en Italie" (1862); "Du principe fédératif, etc." (1863). The following works of his have been published posthumously: "De la capacité politique des classes ouvrières" (1865); "Théorie de la propriété" (1865); "Du principe de l'art" (1865); "Le Biblio Annote" (2 vols., 1866-67); "France et Rhin" (1867); "Contradictons politiques" (Paris 1870); "Du principe de l'art," etc. (1875); "La ponocrates, etc." (1875); "Césarisme et christianisme" (2 vols., 1883); "Jésus et les Origines du Christianisme" (1886); "Napoléon I" (1888); "Napoléon III" (1900). A collection of his works, "Œuvres Complètes," has been published (in 8 vols., Paris and Brussels 1866-83), and an abridged edition, "Abrégé des œuvres de Proudhon" (Paris 1897). His correspondence has been edited by J. A. Langlois (14 vols., Paris 1875). Only a few of his many writings have been translated: "What is Property?" (translated by R. B. Tucker, Princeton, Mass., 1876); "System of Economical Contradictons; or the Philosophy of Misery" (translated by R. B. Tucker, Vol. I, Boston 1888).

He was the first to formulate the doctrines of philosophical anarchism; he maintained that property was unjustifiable, that labor only should give just claim to share in the product of labor, and that consequently rent and interest should not exist. He thus far agreed with the socialist doctrine in value, but he was not a socialist nor a communist; because the state depended upon and protected property he claimed that the State must be destroyed; and that the proper basis of society was a voluntary contract between individuals.

PROUSTITE — PROVENCAL LANGUAGE

PROUSTITE, or RUBY SILVER
AgAsSs, the most beautiful silver mineral and\none of the most important ores of silver. It\noccurs in acicular, prismatic crystals, and less com-
monly, in prismatic crystals, also massive. Its\nlustre is brilliant adamantine, typical color\ncochineal-red, but changing to nearly black on\nexposure to light, losing simultaneously much of\nits transparency. Chemically, it is silver\narsenide, the silver percentage being 65.4.
In the rich silver mines of Chile it is one of the\nchief ores and magnificent crystalized specimens\nworth thousands of dollars have been taken out.
The royal Saxon mines are also celebrated for\ntheir rich silver ore, and it occurs as an ore in\nmany European, Mexican, Colorado and Ne-
veda silver mines.

PROUT, prowt, Ebenzer, English composer\nand writer on musical theory: b. Oundle,\nNorthamptonshire, 1 March 1835; d. Hackney,\nLondon, 5 Dec. 1909. He was educated at Uni-
versity College, London. From 1860 till 1884\nhe was a professor of the pianoforte at the\nCrystal Palace School, and in 1876–82 professor of\nharmony and composition at the National\nTraining School for Music. He occupied a\nsecretary in the Royal Academy of Music and the\nGuildhall School of Music, and from 1894–1909 the chair of music in Dublin University.
From 1876 to 1890 he was conductor of the\nHackney Choral Association which under his\nguidance became one of the most promin-
ent concert-giving institutions of London. His\ncompositions include cantatas, concertos, quartets, symphonies, overtures, etc., among\nthe first named being 'Hereward' (1878); 'Alfred'\n(1881); 'Red Cross Knight' (1886); and\n'Dunstan and Philippa' (1888). He also edited\nseveral of Handel's oratorios and made many\npianoforte arrangements of oratorios. Among\nhis theoretical works are the following: 'Ins-
strumentation' (1875); 'Harmony' (1885);\n'Counterpoint' (1886); 'Double Counterpoint\nand Canon' (1891); 'Fugal Analysis' (1892);\'Fuge' (1892); 'Musical Form' (1893);\n'Applied Forms' (1895); 'The Orchestra'\n(2 vols, 1898—99). He was the first editor of the Monthly Musical Record (1871–74), a fre-
cquent contributor to musical journals, and\nmusical critic of the Academy (1874—79) and of\nthe Athenaeum (1879–89). Dublin University\ngave him the honorary degree of Mus.D in\n1885. Consult Anon., 'Ebenzer Prout' (in Musical Times, Vol. XL, No. 674, p. 225, London 1899).

PROUT, Father. See MAHONY, FRANCIS,\nSylvester.

PROUT, Samuel, English painter: b. Plymouth, 17 Sept. 1783; d. Camberwell, 10 Feb.\n1852. He early manifested a turn for drawing, but the only lessons he received were from a drawing-master in his native town. In 1801 he made the acquaintance of Britton, the architec-
tural antiquary, who employed him in visiting\nthe rural districts to make sketches, which were\nto be engraved in the ' Beauties of England,'\nbut which finally were rejected. Later sketches,\nhowever, were used in that work. In 1818 he\nvisited Normandy, returning with many striking\nwater-color landscapes, whose merits pleased\nhim at the head of this department of art. He\nwas especially happy in depicting monuments of\nmedieval architecture throughout France,\nGermany and Italy, and also directed his at-
tention to lithography, publishing several col-
lections of lithographed sketches. As a water-
color painter, he was a great water-color painter, in the English sense of the term, and relied altogether upon wash\ntones, whose depth was determined by the de-
gree to which the white paper on which they\nwere laid was permitted to appear. The prin-
cipal features of his buildings he marked with\nstrong lines and deep shadows, but his main\ncharacteristics are breadth, freedom of hand-
ling, and power of coloring. He was one of\nthe most active members of the Water-color\nSociety and a regular exhibitor. His industry\nwas great and his pictures were eagerly sought\nfor, though he received only moderate prices\nduring his lifetime. However, in 1868 his\n'Nuremberg' (21 x 28 in.) was sold for \n5,010.
He is the author of 'Hints on Landscape Drawing,' the 'Young Student's Drawing\nBook,' and a series of lesson books published\nby Ackermann. A number of his water colors\nare in the South Kensington Museum, London.

PROUTY, Charles Azro, American law-
yer; b. Newport, Vt., 9 Oct. 1853. He was\ngraduated at Dartmouth College in 1875 and in\n1882 was admitted to the bar in Vermont.
He was engaged in law practice at Newport,\nVt., in 1882–96; served in the Vermont House of\nRepresentatives in 1888; and was a reporter of\ndecisions of the Supreme Court of Vermont in\n1888–96. In 1894–1914 he was a member of\nthe United States Interstate Commerce Com-
mission, serving as chairman in 1912–13; and\nsince 1914 he has been director of valuation for\nthe Interstate Commerce Commission. He was\nappointed director of public service and ac-
counting on the staff of the Railroad Administra-
tion, Washington, D. C., in February 1918.

PROVANCHE, prô-vâⁿ-shâ, Leon, Ca-
nadian naturalist: b. Bécancour, Quebec, 10\nMarch 1820; d. Cap Rouge, Quebec, 1892. To\ndevote himself exclusively to the pursuit of\nbotany and kindred studies, he retired from\nthe Catholic priesthood, which he had entered in\n1844. He established 'Le Naturaliste Canadien'\nin 1868, and published 'Traité Élémentaire de\nBotanique' (1858); 'Flora Canadensis' (1862); 'Le Verger Canadien' (1865); 'De\nQuebec à Jerusalem' (1882); 'Petite Histoire\ndu Canada' (1887); 'Une Excursion aux\nClimats Tropicaux' (1890).

PROVENCAL (prô-vahn-sal) LANGUAGE.
The term is used in two distinct significations,\ntogether one of which it embraces only the\nspeech of Provence; while according to the\nother, it includes the dialect not only of Prov-
ence but of all the neighboring districts of
southern France where the langue d'oïl is spoken. The term is even intended to include, in a literary sense, the sister dialects of Catalonia and the eastern coast of Spain in general and northern Italy. The term Provençal was applied to the literary language of all the sister dialects because of the early prominence of Provence in the literature of the early provençal period. Between 8,000-10,000,000 people speak Provençal using the term in its broader signification and including the Gascon dialects, which local jealousies have been inclined to look upon as a speech apart from Provençal, on account of its French peculiarities and its inability to identify itself with the dialectic and literary movement of southern France.

Provençal is distinguished from French noticeably by its tendency to strongly accentuate one syllable of a word at the expense of the others instead of more or less equally distributing the accent over all the syllables. This accent almost always rests on the ultimate or penultimate syllable: that Provençal resembles Spanish and Portuguese more than it does French. French has changed the Latin accent of free syllables to e, and the Latin unaccented a to mute or slurred e, while the Provençal has retained it in its form changing, however, in modern Provençal the final unaccented a into o; as for example, Provençal amat, French aimé; Provençal bona, French bonne. Another feature of Provençal which tends to connect it with the dialects of south and eastern Spain is the tendency to convert the palatalized l into the palatal vocal y, a tendency noticeable in Cuba and most of the central and South American countries. The lack of nasalization in vowels distinguishes Provençal from French and Portuguese and helps to relate it more to Spanish and Italian. As a result of this nasalization Latin final consonants have a tendency to disappear in Provençal even when they are retained in French and Portuguese or converted into vocal endings in Spanish and Italian; as for example Latin bonum; French bon; Portuguese, bon; Spanish bueno; Italian buono; Provençal, bo. But Provençal is like French in that the s used as the sign of the plural, is silent, where as in Spanish it is pronounced; but unlike it and the other Romance languages, in its retention of the Latin diphthong au. Examples: Latin aurum, French or; Provençal aur; Latin pauperem; French pauvre; Provençal paubre. In this latter example although the French preserves the Latin au, in the spelling, in effect, it has not since the au pronounced as though it were written a. A general tendency of the Provençal dialects is to change the Latin termination following an, in open syllables into open o. Examples: Latin French Spanish Provençal. granum grain grano; manum main mano; panem pain pan.

Another peculiarity is the change of the Latin a (following the tonic accent) into o. Example: Latin French Spanish Provençal terra terre tierra terro amata amie amado, amado.

It must be constantly kept in mind, in any study of Provençal that not only was the ancient literary language much like the modern, but that in it as in the present speech there were many variations due to dialects and local conditions, hence the tracing of the phonology, morphology and texts of Provençal is largely a matter of noticing these many local variations, and undertaking not profitable for the general reader, because so few of these variations are common to all the Provençal dialects and at the same time distinctly different from the other Latin tongues. This constant dialectic variation in High Lolinous, Law Limousin, Marchese, Auvergeois, Gascon, Bearnese, Rougrat, Languedocien and Provençal proper has made the task of creating a modern Provençal literature very difficult. The leaders of the modern movement have, to a certain extent, disregarded the tendencies of the natural growth of languages and they have attempted to create a so-called pure Provençal by the exclusion of words of foreign origin and also of those formed from Provençal through French influence. The literary men of the modern Provençal school write in a little language that is foreign to the taste and interests of their readers. The lack of a Provençal school system and the constant and ever increasing encroachment of French upon the Provençal and other dialects and the indifference of the greater part of the people to the literary future of their tongue, all tend to make a losing one of the battle of the Félibres have been fighting, since the middle of the 19th century, for the revival of Provençal as the literary and folk tongue of southern France. The extension and improvement of the French school system and the consequent increase of literacy throughout the land, are slowly but surely creating a national sentiment and a feeling of unity such as may be said to have never before existed in the country. The European War has made France realize, as probably no other one factor could have done, that her people are one and indivisible and that there is no room for a supreme non-national tongue in the south or in any other part of France. Hence the Provençal tongues seem destined to disappear ultimately, not only from France but also from Spain and Italy. For the history of the Provençal movement in modern times see Félibres, and consult articles on Provençal Literature: Catalan Literature: Provençal Literature: Appel, Karl, 'Chrestomathie,' the publication Annales du Midi (Toulouse); Revue des langues romanes (Montpellier); Romania (Paris); Romanische Forschungen (Erlangen); Zeitschrift für römische Philologie (Halle).

become so popular in southern France and the east of Spain. The form of these poems shows they were intended to be sung, probably at the court, to the courtly friends and guests of the sovereign, since the subjects are in no sense popular. They bear evidence that the Provençal tongue had already by the middle of the 11th century become the language of the people of southern France, peasant and prince alike. Their lack of resemblance to Latin poetry would seem to prove the contention that they were imitations of the compositions of the jongleurs (jongleurs) or professional entertainers, who were welcome guests at the castles of princes and barons. William of Poitiers seems to have set the style in vernacular poetry for the Provençal writers who followed him. Those love poems in which profound reflection is shown by the poet to his lady love, or to some lady of higher rank, perhaps the head of the household or court to which the singer was attached. These poetic effusions were always couched in the most respectful terms and in the highest refinement at the command of the poet. Growing up under these conditions and nourished among the court followers and the families of the barons and knights, Provençal poetry remained, as it was when it first came into notice, the possession of the privileged class. It was, therefore, undoubtedly more refined and Latinized than the speech of the masses. This explains the fact that, after a comparatively long period of vogue and noted popularity, it dropped almost completely out of sight for several centuries. Provençal poetry received its final development and inspiration at the court of William of Poitiers, at a time when it had already acquired sufficient strength, character and individuality to fit it to be the medium of the expression of the life and aspirations of the court and its followers. The example set by the royal poet of writing in the vulgar tongue, to the exclusion of Latin, was followed by many writers, not a few of whom were of noble birth. The writing of poetry was soon looked upon as a courtly accomplishment, and it naturally became fashionable. It would seem as if every one at court wrote or tried to write songs, generally of love. Very often the author also composed the music to which his songs were sung either by himself, his friends or professional singers and reciters. Songs of over 400 Provençal poets have been preserved while the poems of many more writers known by name or reputation have been lost. The very respectable body of Provençal poetry that has survived is a good indication of the great amount written during the period of its vogue. Being the expression of the sentiment and an idealization of the life of the court, the work of the Provençal poets could never have been popular in the sense that a modern poet is popular; and it is even remote from the masses. Confined to the narrow court circle and idealizing to the extreme a life that was none too ideal, Provençal poetry rapidly became artificial and more and more characteristically the voice and the peculiar property of the aristocracy. This result was undoubtedly due to the illiteracy and low condition of the masses who were very far from the ideal condition pictured by the poets of the age. As
Provencal poetry became more and more artificial, lost its vitality and much of its earlier and charming appearance of naturalness. Its tendency was to assume a stereotyped form from which succeeding poets found it very difficult to break away. It was so inseparably identified with the court life and the ideals of the Provencal aristocracy that, when the latter fell from its high estate on the subjugation of the Provencal domains in the 14th century, the ornate literary branch that had been grafted on its ancient family tree fell by wayside and perished with the local feudalism it had been used to glorify. But its own peculiar glory did not die with it; for it had already impressed its peculiar mode of thought, its idealism, its literary artificiality on the feudalism of Europe; and left its impress strongly and indelibly upon the literature, prose and poetry alike, of France, Germany, Italy and Spain. The Provencal literary movement during this first or aristocratic period embraced not only the French Provencal country but also Catalonia and the outer east coast countries of Spain, and still as the native tongue, Gascony and northern Italy. In all these regions it showed the same characteristics; and in none of them was it ever the expression of the life of the masses; nor did it ever deal with the legend or the history of the earlier life of the people. In this respect the early literature of northern France was superior in rugged strength, in human interest and real dramatic qualities.

Aristocratic Period.—Although the poetry of the period was largely lyrical, it naturally, during its more than 250 years of existence, reached out into other fields. Religious, epic, narrative, didactic and dramatic poets there were in the Provencal countries; but even in these the lyrical influence is strongly in evidence, for the habit of public singing and recitation had fixed upon the poetry of the age certain easily recognizable marks which it continued to bear so long as it remained under the influence of feudalism and the artificial rules it had set up for the government of literature, not for the poetry, of course, but unconsciously, yet none the less inexorably. Lyrical poetry being the fountain head of Provencal literature is, naturally, its most characteristic expression. It was symbolical of the life of the court and of the chivalric spirit of the age to such an extent that the French word "courtise" was often used in the sense of "lyrical"; that is to say, that form of poetical expression which belonged particularly to the court, which had under the influence of chivalry developed complicated and highly artificial court manners generally referred to as courtesy. Gentle courtesy was the court manners of the gentle born. Of this the lyrical Provencal poetry was the expression in a very particular sense, not only in France but also throughout the other countries in which the Provencal tongue was dominant. It was this lyrical poetry, too, which appealed to the poets of Europe and set the style for poetry for years and later on for romances in prose. Love and the faithfulness, purity and devotion of the knight to the lady and in the principal theme of Provencal lyrical poetry. This was carried to such an extreme that it became almost a cult; and as such it has left its impress upon the Latin and Saxon countries to-day; it is extremely difficult to differentiate them from the other peoples of the world in their treatment of woman who was for the Provencal poet the centre and soul of all things courtly and chivalric. How much of this feminine sentiment was due, as French critics and historians claim, to the influence of clever women during the most active period of Provencal literature it is, at this late date, hard to determine. It is certain, however, that Eleanor of Poitiers, at whose court the best of the Provencal poets were welcomed, inspired these singers to sound her praise and that of courtly women in general. This undoubtedly had a very strong influence on the general trend of lyrical poetry at this time. Eleanor, who was the wife of Louis VII of France, and later on of Henry II of England, was a woman of excellent literary taste and sound judgment. As the consort successively of two of the most powerful sovereigns of her day; and possessed of the tongue of Provence and the sympathies of her people, she exercised a powerful influence and still is the native tongue, Gascony and northern Italy. In all these regions it showed the same characteristics; and in none of them was it ever the expression of the life of the masses; nor did it ever deal with the legend or the history of the earlier life of the people. In this respect the early literature of northern France was superior in rugged strength, in human interest and real dramatic qualities.

In this respect the early literature of northern France was superior in rugged strength, in human interest and real dramatic qualities.
PROVENÇAL LITERATURE

Barral Marseilles; William VIII of Montpellier; Robert of Auvergne; William du Baus, Prince of Orange; Savario de Maniçon; Henry I and Henry II, counts of Rodes; Nuno Sanchez, Count of Roussillon and Bernard IV, Count of Aragon. In Spain the courts of Alphonse II, Pedro II, Jamie I, Pedro III, kings of Aragon; Alfonso IX of Leon and Alfonso X of Castile extended the strongest sympathy and aid to the Provençal poets; and some of these sovereigns, like Jamie I, entered actively for literary honors. Hence all the great names in the first period of Provençal literature are inseparably connected with one or several of these courts, or literary centres.

Arnaut Daniel, considered by his contemporaries as the most gifted poet at the court of Richard Cœur de Lion, was greatly admired by both Petrarch and Dante. He was the originator of the *sestina*² and, incidentally, a lover of complicated and intricate versification, both of which in making popular Arnaut of Mareuil, noted for his delicacy of style, simplicity and felicity of expression, had many of the qualities of a good poet, and his surviving work commends itself to the modern reader. Arnaud de Bordeaux, who lived at the court of Henry Curtmante, son of Henry II of England, was a famous soldier, as well, who is said to have been known to all the courts of Europe of his day where Provençal poetry was known. He gained additional notoriety by the prominent part he took in the quarrel between Henry and his unruly sons. Peire Vidal of Toulouse, who was well and favorably known at all the Provençal courts, was looked upon as one of the greatest singers of his day, and in addition to being one of the favorite troubadours of Richard Cœur de Lion, was on especially good terms with Raimon V of Toulouse and Barral of Marseilles, where his striking poetical gifts and his knowledge of the ways of the court and his natural tact made him a general favorite and incidentally enabled him to become one of the richest of troubadours. Giraut de Bornel, who has been termed the master poet of the troubadours, was distinguished for simplicity of style and other antique poetical gifts; he was a great master of the *trobar clus* (close verse) which he made popular. Gauclon Faidit, one of the favorite troubadours of Richard Cœur de Lion, has left, among other short poems of merit, a touching lament on the death of the great Crusader whose exploits caught the fancy of the Europe of his day and held it for several generations. Among the numerous troubadours of good family was the famous Folquet of Marseilles who later became bishop of Toulouse, and in that capacity savagely persecuted the Albigenises, all forgetful of the passionate love songs being had singing in his youth, and the gentle ways of the court for which he had distinguished himself. Although many troubadours arose among people of lower rank yet, especially after the profession of knighthood, and the nobility of birth entered the ranks of the poets; and of these not a few became professional troubadours. Among these were Raimon de Miraval who became one of the most popular troubadours of the court of Pedro II of Aragon, and, later, of that of Raimon VI, Count of Toulouse; Guilem Azemar and Raimbaut de Vacqueiras, a favorite at the court of Guillama du Baus, Prince of Orange, in the latter half of the 12th and the beginning of the 13th century. But the patrons of the troubadours were no respectors of rank when it became a question of the recognition of the gifts of poetry and song. Bernart of Ventadour won the love of the lady of Ventadour through his poetical gifts, and when he had to flee from the court, he found like favor in the eyes of the more famous Eleanor of Guienne. Yet he was the son of a house servant. Several troubadours were sons of trades-people, bourgeois, scriveners, clerks and persons in a position to give them at least the rudiments of education. Others began their poetical work as students as a means of paying expenses and continued at it because it appealed to them; while another very considerable class of troubadours consisted of needy younger sons of noble families who found the wandering life of the troubadour a very pleasant means of making a living. On account of the high connection of this class of singers their existence at all the courts was agreeable, since it brought them constantly into public prominence without the restrictions of rank imposed upon gifted poets of more humble birth.

Marcabrun shows in his surviving poems that the age in which he lived was as appreciative of biting satire as the France of to-day. Pons de Capdol, Raimbaut de Vacqueiras and Peirl, all Crusaders, were writers of excellent love songs which helped to swell the fame of the Provençal troubadours and their art. After the first century of brilliant success the quality of Provençal literature began to decline. The earnestness and enthusiasm of the earlier poets had been replaced by the artificiality and more or less stereotypes of succeeding generations who continued to follow the fashion set by the predecessors. The Third Crusade in 1209 was the beginning of a movement which finally destroyed the power of the independent principalities of southern France, broke up the Provençal society and caused to disappear the class of troubadours found welcome and support, and finally destroyed the Provençal tongue as an official speech and the vehicle of poetical expression. The French power, language and culture overran the Provençal countries and the troubadours and other Provençal poets disappeared almost suddenly about 1350.

Middle Period.—After the overthrow of the southern French principalities and the disappearance of the court troubadours Provençal literature, as the medium of expression of the aristocracy disappeared; but did not altogether die out. As the courtly bonds which had bound it together into one homogeneous whole, that made the troubadour at home in southern France, eastern and southeastern Spain and northern Italy, were cut, and the patronage of the nobles and princes was withdrawn, the heritage of Provençal literature fell to the masses, who wrote more or less in the language of the country. As each district made use of its own dialect, the old uniformity disappeared; and thus Provençal literature lost its former prestige
and all but very local interest, the work excepted, of a few singers and reciters who still made the rounds of the country appearing at the castles of the local nobility, town fairs and other places where crowds of people met together. Owing to the lack of encouragement and patronage, and its dialectic character, this literature was written in the local dialect only, and if it ended before the end of the period of the troubadours. The overthrow of the Provençal principalities also made it necessarily different in plan, form, composition and objective. After the disappearance of the brilliant Provençal courts with their charming and cultured ladies, their heroic and chivalrous knights, their cultured centres, their poet-princes and their literary contests, the reason for being of the troubadours and their semi-artificial language and literature largely ceased to exist. The troubadours themselves migrated to the Provençal countries of Spain and Italy where they found a short respite from the fate that was rapidly overtaking their whole literature. But although the unity of the Provençal effort was thus broken, an effort was made by the Academy of Toulouse (founded 1324), to encourage the literary use of the tongue of the troubadours. Prizes and literary contests were offered and literary titles were given to the successful contestants. Even after the discovery of America this society was still as active as it dare be, and throughout the centuries since then it seems to have maintained some sort of existence, though certainly not as a very active one. Gradually, however, the French influence, even in this native society, gained the upper hand and succeeded in finally shutting out the Provençal from participation in its contests or sharing its honors (1670). The latter, left to itself, developed along the line of least resistance. Scarcely had the stream of courtly poetry ceased to flow, arrested and finally dried up at the fountain-head by the inflow of French culture, when the Provençal districts became active in directions that had begun to make themselves noticeable before the overthrow of the troubadour age. While, as already stated, the distinguishing feature of the literature of the period of the troubadours was the prominence of lyrical poetry to the practical overshadowing of every other department of literary endeavor, yet Provençal showed, especially toward the latter half of this period, considerable activity in other departments of literature. Numerous epics belong to this period. Some of them were quite lengthy, though they have survived in only a fragmentary form. Various tales and romances presenting the life of the period, allegories, didactic poems, lives of the saints and other similar religious compositions of a moral nature occupied the attention of a class of writers of an inferior order, who apparently could not aspire to be troubadours. Between these and the troubadours was a body of writers who were something of a blending of the two schools, that is to say, those who wrote Provençal and only Provençal, though the former had by then ceased to attract the attention of the court. These composed lengthy poetical tales in the manner of the stories of Arthur and other heroes of lengthy romance. There is every reason to believe that these romances were popular and that they quite reasonably outlived their authors, although perhaps not everywhere strictly in their original form. The 'Biographies of the Troubadours,' which gives the lives of over 100 of the more popular of these poets, reads more like romance than a sober statement of facts. But it is of interest because of its subject and the added fact that it is in prose while most of the literature of the age was in verse form. 'Flamenc, a very long and artificial love story, instinct with the life of the period in which it was written (during the first quarter of the 13th century), shows the Provençal mind working along the line of romantic tales of intrigue later on developed by the Italian writers. Much in the same form is the long historical romance, the 'Chanso d'Antoche,' whose inspiration was the first Crusade, with its glamour of tradition and its stirring adventures. The period that followed the disappearance of Provençal as a court literature continued to imitate the literature of the preceding period; but the work produced, which was didactic, religious or educational, was of a very poor quality and served from the literary standpoint only to keep alive the habit of and facility in writing. For over 100 years little of interest appeared in Provençal literature, except perhaps the number of the Academy of Toulouse, which was largely concerned with religious subjects. There was a tendency for each writer to make use of his own dialect to the neglect of the literary Provençal. This 100 years, devoid as they were of literary fruit of even meager value, were a preparation for a movement that promised to be in a sense more national than the literature of the troubadours. The leader of this new movement, Puy de Garros (b. about 1500; d. 1581), a Gascon, and a great lover of his native country and dialect, did his utmost through his long life to encourage the use of his maternal speech in literature. To this end he translated the Psalms into Gascon (1555) and wrote many poems. This movement to restore the tongue of the south there adored, among other writers of talent, Louis Bellaud de la Bellaüdiere (1582-88) and Claude Brueys (1570-1600); in Linguedoc also Pierre Gouldein (1579-1649); David Sage (middle of 17th century); the avocat, Bonnet de Beziers (active 1616-57), and Francois de Cortemoli (active 1607-44); and by no means the least, Carabas de la Bellaüdiere ('Le Don-Don internal') (1588), a collection of humorous poems made by Bellaud, illustrates well the spirit of the times throughout the Provençal country. It was very popular and ran through several editions. Brueys, whose 'Jardin deus musos provensals' was published in 1629, presents a varied program of poetic effort which includes comedies, songs, ballets, carnival pieces and occasional poems, and was immensely popular in his day. But for real merit he was surpassed by other contemporary Provençal poets. Among the writers of comedy of this period were Gastard Zerbin, Jean de Cabanes (1653-1712), Seguin de Tarascon (middle of 17th century), Nicolas Saboly (1614-75) and Bonnet de
Béziers. Saboly, who also entered other poetic fields, and whose works have passed through several editions, is still read in France; and the Félibrige movement has tended to bring him into vogue once more. 'Las Foulies dau Sage de Mounpelle' (1650) of David Sage; and 'L'Embarasses de la foire de Beaucaine' of Jean Michel of Nimes, popular and much overestimated by their contemporaries, contain too many obscurities for modern taste. In almost every respect they are inferior to the work of Goudelin and Bayard, the two scrupulously excellent and cleverest of a number of writers who made their headquarters in Languedoc and wrote in the dialectic of that district. He was master of lyrical tragic and comic poetry. Among his works are 'Jugement de Paris' (1615), a tragic-comedy, and 'Histoire de Pépêusc, an allegory. 'Lou Ramelet Mouni' (1617) of Pierre Goudelin of Toulouse was one of the books of the age that became popular wherever Provençal was spoken. He was a very prolific writer who never ceased to turn out new works. Among almost every branch of which he attempted, generally with success. Odes, masques, songs, sonnets and occasional poems he wrote in a masterly style which attracted to him attention throughout France and Europe. Jean Guiraud-Dastros was one of the best. His 'Trinfe de la langue gascouine' (1642), which is still read, and which has gone through many editions, contains very natural and entertaining descriptions of the life and customs of the country. François de Cortete (1571-1655), of Prades, shares with Goudelin the reputation of being the best Provençal writer of the 17th century. His works, which have been looked upon as models for style and linguistic correctness, have never ceased to be read since his day. Among them are 'Ramounet' and 'Miramound, two comedies.

During the 18th century the standard of Provençal literature declined in originality of subject and purity of language. Most of the writers were little more than imitators of the popular poets of the preceding generations. Yet here one meets with a writer who departs from this monotonous routine to attract attention. Among these are the Abbé Favre (1727-93), author of 'Siège de Caderousse' and 'Lou Scermoun de moussu sistre,' and Claude Peyrot, prior of Pradinis (1709-95), who wrote 'Los Quatre sossons.' Both of these authors are witty and jovially good-natured, and are in a degree scorned to be expected of ecclesiastics. To these should be added the name of Cassanea de Mondonville, whose play 'Daphnis et Alcimadure' became immensely popular not only in the Provençal countries but throughout France; and finally had the honor of being included in the collection of the king Louis XIV. In Provence and Gascony there were poets of much natural talent who, under more favorable circumstances, or even a little encouragement from the French court, might have made Provençal literature approach the popularity of the days of its prosperity. But the lack of a spirit of unity here, as in the preceding centuries, caused most of these to fall by the wayside. Their eyes were ever so near to the ground that they failed of the vision that is ever necessary to make great poets.

Yet there ever continued to exist in the Provençal countries a spirit of racial pride in their customs, history, language and literature which was kept alive by writers and speakers, generally of mediocre talent. The study of the language d'oc was kept by enthusiasts in the scientific and desultory way, and various grammars, vocabularies and dictionaries of the language were written, though the interest in this kind of work, even by scholars, was so small that often laborious works of this kind remained in manuscript for lack of encouragement to print them. Fabre d'Olivet (1767-1825), scientific investigator, musician, poet, philologist and enthusiast, was forerunner of the Félibrige. He aimed at writing pure Provençal to the exclusion of all foreign words or ideas which might cast a slur on the literary aspirations and efforts of all the Provençal countries. He was a poet and writer of very considerable vision and much talent; and yet he labored from 1787 until the opening years of the 19th century to set up the local enthusiasm and aspirations of his fellow-countrymen before he finally succeeded in catching the public fancy. But finally he succeeded in driving home the lesson that Provençal, if it deserved to produce a literature worthy the name, must throw aside its various dialectic efforts and set up before itself, as its chief aim, purity of language. He strove to establish a rational orthography and to have it generally adopted through the Provençal districts. He made collections of Languedoc poets with explanatory notes and wrote fine poems of his own in the native tongue; and in this way for almost a third of a century he continued to influence the public mind and to educate it in the appreciation of its treasures of early Provençal literature. His work in this direction influenced all the Provençal writers contemporary with him and created for him a large literary following, among whom was Jacques Jasmin (1798-1864), the greatest and most influential of the Félibrige movement. A study of the modern Provençal movement, see FÉLIBRIGE. Also see CATALAN; CATALONIA; CATALAN LITERATURE; TROUBADOURS.

PROVENCE, pró-văns, a province of ancient southeastern France, bounded by Piedmont, the Mediterranean, Languedoc, Venaissin and Dauphine, and what is now the departments of Bouches-du-Rhône, Var, Basses Alpes, and, in part, Vaucluse and Alpes Maritimes. Lesser ranges of the Alps, called the Alpines and in the south the Maures, break up the country. The principal rivers are the Var, Durance and Rhône; the last river has a great marshy delta. Climate and soil vary greatly, from the damp, changeable, rather sterile and stony north to the south with its ideally mild air, its culture of bees and silkworms and its produce of olive-oil, wine, mulberries, oranges, citrons and all southern fruits. There is good sheep-grazing, but other livestock is less successful. The inhabitants of the Provence preserve to a large degree southern characteristics quite foreign to the northern Frenchmen, and keep a language and literature of their own, nearly as much akin to the Spanish and Italian as to the French. See PROVINCIAL LANGUAGE AND LITERATURE.

History.—There are traces in Provence, as in the polished stones found in the Grotte de la Madeleine elsewhere, of the neolithic, and dolmens of Draguignan, Pontèze and la Blaque, and the lake dwellings of the mouth of the Var, of a civilization as early as the middle of the Stone Age. The Iberians held sway here until the 8th century B.C., when they were finally driven out by the Ligures. Greek and Phoenician colonies, notably Massilia, the modern Marseilles (q.v.), had been founded here at least as early as this. The Greek city of Marseilles by its repeated appeals to Rome for help against the Ligures, first in 135 B.C., effected the introduction of Roman influence, and in 124 B.C. Marcus Fulvius, pro-consul, and Gaius Sextius Calvinus, consul, destroyed the capital of the Saluvii and founded (123 B.C.) on its site the city of Aquis Sextia (modern Aix-les-Bains). Victories over other tribes in the next few years gave all the country between the Cevennes and the Alps to Rome. A Roman province, Provincia Romana, or Gallia Transalpina (or Narbonensis, from its capital Narbo Martius), was annexed to this province 15 years later by the invasion of the Cimbri and Teutones, and was racked by the civil war between Caesar and Pompey, in which Massilia (Marseilles) siding with the Senate was captured and crushed by Caesar in 49 B.C. The amphitheatre of Fréjus, the theatres of Arles, Fréjus and Orange, the triumphal arches of Orange, Cavaillon, and Carpentras, the temple of Augustus and Livia at Vienne, and the splendid Roman roads through southern France, are remains of the glory of Provence in the first four Christian centuries, when Arles was a great commercial centre and one of the residential cities of Constantine and when Autun and Marseilles were great university towns. Marseilles being the seat of a Greek college and a Benedictine school.

The Visigoths entered Provence in the beginning of the 5th century and about 470 Euch captured Arles and made it his capital. The Ostrogoths held Provence from 510 to 536, receiving it as the price of their assistance against the Franks, but losing it after a quarter of a century to the growing Frankish Empire. In the 8th century Charles Martel rescued it from the Saracens. In the 9th century Provence was twice a kingdom (see BURGUNDY), and from 934 to 1113 was ruled by the counts of Arles (or of Provence). Descendants of a male line failing in 1113 the country went as a result of the marriage of Provencal heiresses to Berengar of Barcelona. His claim was contested by the Count of Toulouse, who in 1125 by treaty secured Vallencé, Die, Uzes and Venaissin; what had been retained by Berengar went to Aragon in 1162, the Count of Barcelsa having come to that crown in 1137. In Venaissin, what had been retained by Berengar IV, the last of the male line, married Charles of Anjou and Provence was a possession of the house of Anjou (q.v.) until 1481, when it was willed to Louis XI of France and lost its separate significance politically, though it was not united with France until 1487 under Charles VIII.

PROVENCE II, a French transport, sunk by a German submarine in the Mediterranean on 26 Feb. 1916. Over 900 lives were lost.

PROVERB, a short, pithy saying, presenting in striking form a well-known truth. They originate principally in the primitive stages of society, are colloquial rather than literary and constitute a form of folklore common to all races. While certain proverbs have undoubt-
edly strayed from one country to another the very nature of these pungent characterizations, found in the good sense and observations of humanity, ensure their existing in similar form in different countries. New proverbs cease to appear as printed literature takes the place of folklore, the common catch phrase or valued quotation bearing no relation to the wisdom of the stamp of ages of popular acceptance and use. Bacon calls them the "edged tools of speech"; Lord Russell's definition "the wisdom of many and the wit of one" is concise and accurate; as is South's "the experience and wisdom of several ages gathered and summed up in one expression."

PROVERBAL PHILOSOPHY, a once popular didactic work by Martin Farquhar Tupper (q.v.), published in four series 1838–57. It is a series of poems in blank verse, dealing with almost every emotion and condition of life. The book contains many wise sayings, but is for the most part merely padded commonplace. In spite of remarkably extensive sales, both in England and America, it was mercilessly criticized by all serious reviewers. It is claimed that more than 1,000,000 copies were sold in the United States and more than 5,000 per year for many years in England. The most recent American edition was brought out in Rochester, N. Y. (1904). It has also been translated into Danish, French, German and Italian. Consult Anon., 'A Tea Table Literature' (in A. J. M. Magazine, Vol. XLVI. October, London 1852); Tupper, M. F., 'My Life as an Author' (London 1886).

PROVERBS, Book of, a portion of the Old Testament. Date and Authorship.—The book of Proverbs is the subject of much discussion in reference to date and authorship. The old view that King Solomon was the author of nearly or quite the whole of the book has been generally abandoned. Two classes of views are widely held at the present day. One is that all of the book or all but the last two chapters was written and compiled before the Babylonian exile. The amount attributed to Solomon varies, but is in any case an appreciable quantity, forming the kernel of the whole. The other view is that most or all of the writing and compilation are to be dated long after the exile, the earlier or not later than the time written by Solomon. The completion of the work of compiling is assigned to various dates from about 350 to 180 B.C., the whole composition of the book being supposed to cover not more than a century. There is a growing tendency toward the second view, which is held by most of the very recent writers on the book.

Arguments for Late Date.—The chief argument in favor of the late date of the book is from language, that is, the occurrence of a considerable number of words found elsewhere only in late Hebrew and of words borrowed from the Aramaic. But the number of words which can with certainty be assigned to these two classes is much smaller than is often claimed. Historical indications also urged for the same conclusion are that the book makes no mention of polygamy and idolatry, which were common before the exile, and that it assumes the existence of a distinct class of sages, known as wise men, who are hardly mentioned in the historical and prophetical books before the exile, nor are any results of their activity apparent. These are arguments from silence and therefore, of course, to be used with caution. The resemblance to the apocryphal book of Ecclesiasticus, which is also urged, has little bearing on the question, in view of the well-known habit of the author of Ecclesiasticus of borrowing from other books.

Arguments for Early Date.—In favor of the early date, the chief argument is the thought of the book. The oft-repeated teaching of the book concerning the problem of God's government of the world is this: the good will prosper, the wicked will be punished, in this life. This is generally acknowledged to be the pre-exilic doctrine, while the dominant view of the exile and after the exile is quite different. It is not difficult, however, to suppose that the pre-exilic doctrine had persisted after the exile, in certain quarters, in face of the teaching then current that the wicked prosper and the righteous suffer. Further, the frequent allusions to a king suggest the early date. Many passages speak of him as the promoter of justice and none refer to him as a foreigner. After the exile the sovereignty of Palestine was in the hands of foreigners, with little justice in their administration. The syntax of the book, also, is of the classical, earlier type. The title in chapter 1; x; 1 and xxv, 1, which attribute portions of the book to Solomon represent a tradition, but have not necessarily much authority. In general, the background favors the late date; there is nothing seriously inconsistent with this view. There is no sufficient reason, however, for denying the presence of pre-exilic, and even of Solomonic material.

Divisions of the Book.—As ordinarily viewed, although with some variation, there are eight different portions into which the book is divided, each of which is a separate compila-
tion. These divisions, in the chronological order usually, but not invariably, assigned to them, are as follows: chapter x, 1, to chapter xxii, 16, containing the title in chapter x, 1, "The proverbs of Solomon." Chapter xxii, 17, to chapter xxiv, 22, called in chapter xxii, 17, "the words of the wise." Chapter xxiv, 23-34, a similar collection, of which it is said in chapter xxiv, 23, "These also are sayings of the wise." Chapters xxxv-xxxix, headed by the statement in chapter xxxv, 1, "These also are proverbs of Solomon, which the men of Hezekiah king of Judah copied out." which division, however, some regard as older than chapter x, 1; xxii, 16. Chapters i-ix, a connected discourse in praise of wisdom, in the form of advice to a son or scholar. Chapter xxx, with the title in chapter xxxi, 1, "The words of Agur the son of Jakeh." Chapter xxxi, 1-9, described in chapter xxxii, 1, as the words probably should be translated, as "the words of Lemuel king of Massa." Chapter xxxii, 10-31, an anonymous alphabetic poem of warning, independent of the ideal household. The first division was probably compiled somewhat after the time of Solomon, the fourth is traditionally assigned to the time of Hezekiah, while the last three divisions probably belong soon after the exile. There are no indications of precision of date for the other divisions, but on the view adopted all of them are to be regarded as pre-exilic.

Solomonic Authorship.—That the first and fourth divisions are not entirely the work of Solomon is clearly shown by the fact that there are many repetitions of proverbs partly the same and by the further fact that some are not written from his standpoint, especially the utterances concerning the king. While it is not unlikely that Solomon uttered some of these proverbs, it is difficult to be certain of his authorship in any specific case. It is improbable that Solomon wrote any proverbs in the form now extant: 1 Kings iv, 32, does not mention Solomon as writing proverbs, but as speaking them.

Literary Characteristics.—The Hebrew word for proverb (masal) probably meant originally a comparison and then was broadened to apply to any sententious saying, because often containing a comparison. The proverbs of this book do not bear in general the stamp of long popular use, but rather of the reflection of individuals. The whole book is written in what is called, from the Hebrew standpoint, poetry; for the most part gnomic, although the lyric form is also found, especially in chapters i-ix. Like Hebrew poetry generally, parallelism of the members of a verse is the most prominent characteristic. Antithesis is found especially in chapters x-xv. Each verse expression usually stands for independent thought, except in chapters i-ix and chapters xxx-xxxix, where connected discourse is found. Brevity and sententiousness of statement are implied in the very nature of a proverb, while simile, metaphor and paradox are common. An extended personification of wisdom is found in the eighth chapter.

Purpose.—Although Proverbs has several authors and compilers, and much of it is disconnected in form, yet a marked degree of unity pervades it. The title confirms the role of statement of purpose in chapter i, 1-6, that is intended to teach wisdom to men, especially to the young and inexperienced, but also to those who already have some knowledge of wisdom. Wisdom, however, is a comprehensive term, it includes all that is desirable in character, folly all that is undesirable. Its foundation is religious, it consists fundamentally in a right relation to God. "The fear of Jehovah is the beginning of wisdom" (chapter ix, 10). But all that pertains to humanity is included in the scope of wisdom, so that the book touches all phases of human life. Observation of the customs and habits of men, and conclusions therefrom, have a prominent place.

Relation to Philosophy.—Wisdom is thus practical rather than speculative. To speak of the book as philosophical, as some have done, is, therefore, misleading. The book, it is true, identifies virtue with knowledge. But this is done, not from a philosophical standpoint, but from a religious and practical one. For the practical purpose of the writers, men are divided into two classes, those who know the right and do it, and those who are ignorant of it and do not, or do not, or do not, or do, but in a way that is not, is simply ignored. The speculative element is wanting in the book. The teachings concerning wisdom often suggest philosophical speculations concerning the greatest good, but they are always religious, not philosophical. Some of the proverbs may reflect a general acquaintance with Greek philosophy, but not definitely with the doctrines of any specific school.

Ethical Teaching.—The ethical teaching of the book is on a high plane. Ceremonial is occasionally alluded to, but the sages agree with the prophets that the external act has no value without an inner reality. When revenge is forbidden, chapter xx, 22, and chapter xxiv, 29, and kind treatment of enemies is enjoined, chapter xxxv, 21, the standard approaches closely to that of the New Testament.

GEORGE RICKER BERRY

Professor of Old Testament Interpretation and Semitic Languages, Colgate University.

PROVIDENCE, R. I., the county-seat of the county of the same name, and the capital and largest city of the State, is situated at the head of Providence River, a tidal arm of Narragansett Bay. It is 30 miles north from the
open ocean about 20 west from Fall River, 40 southwest of Boston and 186 northeast of New York. It is the Atlantic terminal of the Grand Trunk Railway system and is also served by the New York, New Haven and Hartford Railroad, and by several coast lines of steamships and by one transoceanic line. It covers an area of 18.29 square miles. The early settlement was on the river at the mouth of two small streams, and for nearly 200 years it grew in an easterly direction, many of its finest residences being erected on the high hill overlooking the Providence River, this hill or ridge about 200 feet high dividing the valley of the two streams from that of the Blackstone or Seekonk, a river of some size. Later on the settlements began to extend in a westerly direction over low and rolling ground, and to-day the West Side, as it is called, is the most densely populated section of the city; though within the past few years a movement has again set in toward the east, a large area having been built up in that part of the city adjacent to and running north from the Seekonk. Situated near the sea the city has a rather humid climate with a considerable range of temperature, but the weather is neither as hot in summer nor as cold in winter as in places farther inland. The suburban seaside resorts are found around and around the inland surrounding scenery is no less attractive to thousands of annual summer visitors. The prevailing winds in summer are from the southwest and in winter from the northeast or northwest. The city is more healthful than many large manufacturing cities and has been noticeably free from epidemics of serious diseases. The death rate is 14.71 per 1,000 and the birth rate 23.43 per 1,000. The centre of the city is given over to the business district. There are 253,211 miles of streets, curbed, graded and paved. There are 447 city parks with a combined area of 650 acres, the chief of which is Roger Williams Park. The chief monuments are those of Roger Williams, Thomas A. Doyle, for many years mayor of the city, the Soldiers and Sailors’ monument and that of Gen. Ambrose E. Burnside. Providence possesses a civic centre which rivals anything of the kind in America. The principal buildings are the city hall, State house, St. Louis, Congregational, and Roman Catholic cathedral, Rhode Island School of Design, buildings of Brown University, Providence College, Roman Catholic, and the State armory. Among its charitable institutions are the Rhode Island Hospital, Rhode Island Hospi- tal, Providence Hospital, Butler Hospital for the Insane, Saint Joseph’s Hospital, Dexter Asylum and the State Institute for the Deaf. There are 160,000 volumes in the public library, while there are also the Law Library, that of the University, and Historical Society and the Rhode Island Medical Society.

Commerce and Manufactures.—In 1681 Providence was the most compact settlement of the colony of which it was a recognized centre; but its commercial growth for the ensuing hundred years was not as rapid as that of Newport, which on account of its geographical position was better adapted for the maritime trade of the East Indies, China and the western coast. The city became a port and the tangible personal property there eventually became considerable of a suburb town, and for many years the wealth of the city was mainly derived from its commerce of the seas. With the growth in size of the freighters of the coastwise and trans-Atlantic trade and a proportionate lack of increased facilities for accommodating these larger vessels, Providence began about 1840 to lose its prestige in the shipping world, until finally its foreign maritime trade entirely disappeared. It can hardly look for its return, until the city, State or private owners of water front privileges provide suitable accommodations for the handling of that trade, which by reason of the natural advantages of a magnificent harbor, easily entered, it should enjoy. It has a city quay 3,000 feet long, and State Pier No. 1, equipped to handle trans-Atlantic freight and passengers. Chief among the advantages of Providence as a centre of industry, commerce and trade are those pertaining to its geographical position, it being the natural outlet of southern New England, and the sources of supply and distribution which are the natural outcome thereof. For this reason it is designated as the southern gateway of New England. Though the harbor has gone, to-day Providence is one of the great industrial centres of the United States, noted for the variety of its manufactured products, the greatness of its industries, the skilled workmanship of its artisans and for the invention of those numberless ingenious accessories of modern life which have become necessities in this age of luxury. Pre-eminent among the varied industries of the city is the manufacture of jewelry with its allied interests, such as chasers, electroplaters, gilders, engravers, colorers, enamellers, die-sinkers, etc., approximating a total of over 1,000 establishments, engaged in a manufacturing industry whose products are distributed alike among the civilized and uncivilized nations of the earth. Providence is the first city in the country in the manufacture of many things, including jewelry and silverware, these producing $35,000,000 worth of goods annually and employing 12,000 people. Providence has the largest mechanical tool factory, file factory, engine factory, screw factory and silverware factory in the world, and almost a dozen other establishments deserving of similar distinction. According to the recent census it had 1,080 large manufactories, employing 46,349 operatives with an annual capital worth $120,380,000. Besides there were from 1,500 to 2,000 smaller industrial establishments. In addition to the metal-working establishments there are textile mills, with an annual output valued at $523,020,000, dye-works, packing houses, rubber and elastic works and other establishments. The city ranks tenth among the seaports of the United States in bulk of tonnage and value of cargoes. The general coastwise trade principally is the leading oil port of New England. There are 18 banks with combined capital, surplus and undivided profits of $27,607,322. The assets of national and State banks and trust companies amount to $503,061,559; savings banks, $57,639,075, making a total of $560,723,029. Individual deposits amount to $218,554,406, to which must be added $3,964,552 deposited in loan associations. The assessed valuation in June 1917 was $388,715,600, including real estate $231,838,840; personal property, $156,876,760; tangible personal property, $92,194,860. The city’s annual budget exceeds $7,000,000. Its gross debt
amounts to $24,276,830.28; net debt, $15,014,646.56, including water bonds of $2,009,856.44. The net debt per capita is $58.87. The tax-rate is 8% on tangible personal property and $4 per $100 on intangible personal property. About $600,000 is expended annually on the fire department and about the same amount on the police department. There are 418.16 miles of low-pressure water-pipes laid in the city streets, and 12.46 miles of high-pressure fire service pipes in the central district. There is also an excellent sewerage system.

The educational facilities include five high schools, 17 grammar, 17 primary, five for individual work, 10 ungraded for backward children, five open air, 12 evening, 28 training schools, 38 kindergartens, with 1,010 teachers and 212 evening teachers. The cost of maintenance is about $1,500,000 annually. The attendance in public schools is 34,814, and in 13 parochial schools 6,156 and 599 in 12 private schools. The evening school enrolment is 6,538.

History.—Providence was founded by that great apostle of religious liberty for the New World, Roger Williams, who arrived from England in Massachusetts Bay Colony in February 1631. He was well received by the Puritans as a godly minister but because of his boldness in announcing views regarding the power of magistrates in religious matters he was forced to seek refuge with the Pilgrims at Plymouth. Subsequently he went to Salem, where his convictions regarding religious freedom incurred the displeasure of the General Court, and in January 1636 he was ordered to return to England; he refused and fled into the wilderness. Accompanied by five other men from Salem he had no fixed abode for weeks, but in June 1636 he began a settlement at a point north of the present site of Saint John's Church in Providence. Williams obtained a grant to lands covering what is now part of Rhode Island west of Narragansett Bay, from the Indians, the earliest deed on record being a memorandum dated 24 March 1637. In 1640 articles of agreement were adopted by the settlers as the basis of the town government, all affairs being regulated by a monthly town meeting. A royal charter was obtained in 1644 uniting various settlements about the bay, as Providence Plantations in the Narragansett Bay in New England. Providence being on the mainland and more exposed to the attacks of Indians, grew less rapidly than Newport on the island of Rhode Island, and in 1676 was nearly deserted. Less favorably situated for shipping than Newport, Providence grew but slowly; in 1730 the population of Providence, which included four settlements, was 3,916. In 1750 the population of Newport was twice that of Providence, and 1774 the population of the town of Providence proper was but 4,321, though by this time the population of Providence County was greater than that of Newport County. The first notice of a schoolhouse in the town records appears in 1752. A charter for a college in war-time was granted in 1764, and Providence County raising the most money, the first building was erected at Providence in 1770. This was the beginning of Brown University. Providence was one of the first towns in America to have a public library, a set of books having been bought by subscription before 1754 by a company formed for that purpose. During the whole of the 18th century Providence was a quiet country town with few amusements. The first theatrical performance was given by an English company in 1762. The first fire engine was purchased about 1755. The first advertisement of a regular stage line to Boston appears 1707; the stage made weekly trips. The first public market-house was erected in 1773. In the disputes with England that preceded the outbreak of the Revolution Providence took a considerable part. The first overt act of resistance to England was the destruction of the armed schooner Gage in 1772. During the Revolution Newport was occupied by the British from 1776 to 1779, and the commerce of Providence was almost cut off by the British fleet, though a number of privateers hailing from Providence preyed on English commerce. After the Revolution commerce slowly moved again, trade being with Europe, China and Central and South American ports. In 1801 a fire destroyed property valued at $300,000, and in 1815 a great gale wrecked many vessels and did damage to the water-front of $1,000,000. From this time on the growth of Providence was steady if not rapid, the population about doubling every 20 years. Government by town meeting proving inadequate to meet the public needs, a city charter was adopted in 1831. The history of Providence during the 19th century is largely that of the industrial progress of the nation. The government is vested in a mayor and bicameral council. The latter elects several of the administrative officers. Connected with the suburban but separate municipalities of Cranston, Pawtucket, Warwick and East Providence, there is in a comparatively small area an aggregate civic population of over half a million, to which the city of Providence contributes 263,218.

W., 'The Providence Plantations for Two Hundred and Fifty Years' (Providence 1888); for early history a brief historical sketch of Providence County and of the Tenth United States census; the 'Early Records of the Town of Providence' (15 vols., Providence 1892-99); Kirk, William (ed.), 'A Modern City: Providence, R. I., and its Activities' (Chicago 1912); Powell, L. E., 'Historic Towns of New England' (New York 1898); Stokes, H. K., 'Finances and Administration of Providence, 1636-1901' (Baltimore 1903).

CLARENCE A. COTTON,
Secretary Chamber of Commerce.

PROVIDENCE, in theology, the supervision exercised by God over his creatures and the universe; the doctrine being that divine power is possessed and exercised in every smallest detail of life. The doctrine differs from omnipotence, which does not insist that the power possessed by the Deity is exercised; and from naturalism, which verse is governed by natural laws with which God does not interfere. Religion and mythology agree, from their earliest records, in placing the affairs of men under the guidance of divine power.

PROVIDENCE, Sisters of, a religious order of the Roman Catholic Church, founded
in France, according to some accounts in 1806, to others in 1820 (Sœurs de la Charité de la Providence), by Pastor Dujaria in the parish of Ruillé, diocese of Le Mans (department of Sarthe). It gradually extended beyond this parish, and was authorized in 1836. The final approval of the rules and constitution was given by the Holy See in 1887. A colony from Ruillé opened the first institute of the order in the United States on 22 Oct. 1840 at Saint Mary’s, near Terre Haute, Vigo County, Ind. Establishments are conducted by the order in the archdioceses of Baltimore, Boston and Chicago and in the dioceses of Fort Wayne, Rockford, Indianapolis and Peoria. In 1918 the order had charge of 74 parochial schools, 32 academies for higher education, one industrial school, one college and two orphan asylums, with a total of 25,841 pupils. The mother-house is located at Saint Mary-of-the-Woods, Vigo County, Ind., formerly the centre for 1,332 sisters. Another mother-house is located at Littleton, Mass., with 31 sisters, 20 novices and 10 postulants, conducting orphan asylums, homes for aged men and women, hospitals and working girls’ homes in the diocese of Springfield, Mass.

PROVIDENCE PLANTATIONS. See RHODE ISLAND, HISTORY.

PROVINCE is a territory, section or district of a nation or government. Among the Romans a province was a district of conquered country, governed by a proconsul or praetor. The first Roman province was Sicily, 241 B.C. From the time of Augustus they were divided into the senatorial provinces and the imperial provinces. The latter comprised those which were most exposed to hostile inroads, and the administration of which was left entirely to the emperor under the pretense of sparing the Senate and people the trouble of managing them, but in reality to keep the army in his own hands. Under the empire the provinces were much better governed than they had been under the republic. One reason of this was that the emperors were more disposed to pay regard to the complaints of the provinces than the republican courts had been, for the latter were composed of men who had themselves profited, or who hoped to profit, by the same kind of maladministration with which the governors were charged, and were, therefore, always willing if possible to conjure at such offenses. In addition to this the provincial governors under the empire received fixed salaries, which lessenened the temptation to resort to illegal exactions to indemnify themselves for the expenses that they necessarily incurred in soliciting the office that was an indispensable condition of their governments.

In modern times the term has been applied to colonies or to dependent countries at a distance, or to the different divisions of a kingdom itself. The name has sometimes been retained by independent states. Thus, the republic of Holland, after it had thrown off the Spanish yoke, was called the United Provinces; and the Argentine Republic used to be called the United Provinces of La Plata. In the canon law the term is applied to the jurisdiction of an archbishop. In the Roman Catholic Church it is also given to the territorial divisions of an ecclesiastical order such as the Franciscans, as well as to those of the Propaganda. For exhaustive accounts of the Roman provinces and their administration consult Arnold, W. T., 'Roman Provincial Administration' (1879); Mommsen, 'Roman Provinces under the Empire' (1884), and Taylor, T. M., 'Constitutional and Political History of Rome' (1889).

PROVINCE HOUSE, a brick mansion in Washington street, opposite the head of Milk street, Boston, Mass. It was built in 1679 for Peter Sargeant, a rich merchant, who used it as a dwelling. In 1716 it was purchased by the provincial legislature. From then on it was the residence of the colonial governors. After the Revolution it housed some of the officers of the Commonwealth. In 1811 it was given by the State to the newly incorporated Massachusetts General Hospital as part of its endowment. The trustees of this institution leased it in 1817 to a tenant who converted it to the uses of business. It finally became a tavern, a negro minstrel hall, and in October 1864 was destroyed by fire, only the walls remaining standing. Nathaniel Hawthorne used it as the setting for his 'Legend of the Sleepless Fire' (1838-39) which were later reprinted in 'Twice-told Tales.' Consult Drake, S. A., 'Old Landmarks and Historic Personages of Boston' (Boston 1876); Hawthorne, N., 'Twice-told Tales' (ed. with notes by J. H. Scott, in Riverside Literature Series, Boston 1907).

PROVINCETOWN, Mass., town, Barnstable County, at the extremity of Cape Cod, and on the New York, New Haven and Hartford Railroad. The earliest visitor to this place of which there is any record was Bartholomew Gosnold, 15 May 1602; it was visited by Capt. John Smith on his voyage to Virginia in 1614, and on 11 November (O. S.) the Mayflower anchored in the harbor and remained one month before going to Plymouth, and here the compact for their own government, said to be the first form of constitutional government in history, was penned. Here Perigrine White, the first English child born in New England, first saw light, and here Dorothy Bradford, wife of the governor, was drowned. In commemoration of this visit, the United States government, in conjunction with the Commonwealth of Massachusetts and the Pilgrim Memorial Association of Provincetown, erected an imposing granite monument, 254 feet high, on Town Hill in the center of the town, at a cost of $100,000, which was dedicated by President Taft on 5 Aug. 1910. The town remained a precinct for many years, and was incorporated as a town in 1727. The principal industry of the people is fishing, and in June 1915 a fleet of 75 vessels of all kinds were engaged in this industry. There are six large cold storage plants for fish, with a capacity of 80,000 barrels, a board of trade, one national bank, one savings bank, four Protestant and one Catholic churches, a public library, four private art schools, a high school and an art association. It has become popular as a summer resort. Pop. 4,370.

PROVINCIAL LETTERS ('Lettres provinciales'), by Pascal, or Provincial Letters, as they are usually called, though they are more accurately letters purported to be
written to a friend in the provinces, mark an important stage in the great quarrel between the Jesuits and the Jansenists. These two parties were struggling in the 17th century for the religious, moral and intellectual control of France. As the Jesuits painted religion alluring and the Jansenists made it out almost oppressive in its austerity, the two sects were diametrically at variance. Arnauld, the great Jansenist theologian and friend of Pascal, was a leader in the controversy. In 1655 he was involved in a religious dispute, and his views were in January 1656 condemned by the Sorbonne or theological faculty. Arnauld, realizing that his own involved controversial writings could not appeal to the ordinary man, sought the help of Pascal, who brought out the first 'Provinciale' on 23 Jan. 1656. They lasted until March 1657. Pascal wrote 18 letters, began a 19th and had planned a 20th. They are supposed to tell a friend in the provinces what is happening in Paris between the Jesuits and the Jansenists. Pascal attacks both the dogma and the morals of the Jesuits. He argues the logically consistent Augustinian determinism, carried even beyond the doctrines of Saint Augustine, which was at the bottom of the teachings of Jansenists. He aimed to show the inconsistency of the Pelagians or semi-Pelagians, as he called the Jesuits, in trying to reconcile doctrines of God's foreknowledge and of salvation imparted by grace with man's liberty to accept or reject what is offered to his choice. But Pascal's most effective assault was made against the morals of the Jesuits as Molonists or followers of the casuist Molina. The Jansenists were rigid, unbending moralists, unwilling to compromise in the slightest degree in word or in deed, even for the sake of a greater good. The Jesuits desirous of making converts had not invented but developed doctrines of casuistry, or the study of cases of conscience, by which in certain contingencies allowance could be made for deviation from the path of rectitude. Pascal made the most of his opportunities to attack the Jesuits accusing them of "excuses for equivocation" and "mental restrictions," and charged them with teaching hypocrisy, unchastity and other sins.

The Letters form one of the most important examples of pamphlet literature in history. They deal, of course, with conditions and events now largely forgotten, but they were of extraordinary importance in their day and contributed greatly to the permanent discrediting with so many people of the Jesuit order. They are undoubtedly often unfair in their sarcasm and dialectical victories, perhaps sometimes even in statements of facts, but their vividness and lucidity make them a monument in French literature and one of the chief examples of early classical French prose.

Bibliography.—Important editions of the 'Letter provinciales' are by Feugère (2 vols., 1887-95), and in the edition of Pascal's works, edited by Brunsvigc, Boutdoux and Gazier and published in the series of 'Grands Ecrits de la France.'

CHARLES H. C. WRIGHT,
Professor of French Language and Literature,
Harvard University.

PROVING GROUND, a space provided for testing ordnance and making ballistic experiments. The United States army's proving ground is at Sandy Hook, N. J. The navy has its proving ground on the Potomac River at Indian Head, Md.

PROVO (prô'vô) CITY, Utah, county-seat of Utah County, on the Provo River, and on the San Pedro, Los Angeles and Salt Lake, the Rio Grande Western and the Salt Lake and Utah Electric railroads, about 45 miles south of Salt Lake City. It was settled in 1851 was chartered as a city. It is in a region in which the principal occupations are agriculture, stock-raising and cultivation of fruit. The chief manufactures are flour, lumber, tin and iron roofing, woolen goods and canned fruit. There is a large trade in farm products, live stock, fruit, lumber and in the importing of groceries and textiles. The place is visited by many tourists on account of the Provo Canyon, Utah Lake and Bridal Veil Falls in the vicinity. It has a State insane asylum and a Mormon tabernacle. It is the seat of the Brigham Young University (Mormon). Pop. 10,000.

PROVOST, pró-vô'. Samuel, American Protestant Episcopal bishop: b. New York, 26 Feb. 1742; d. there, 6 Sept. 1815. He was graduated at King's College (now Columbia) in 1758, at its first commencement; went to England in 1761 to prepare for ordination, studied at Saint Peter's College, Cambridge University, and was ordained deacon and priest in 1766. Returning to America he became assistant rector of Trinity Church, New York. He resigned in 1771. In 1784 he was elected rector of Trinity Church. In the same year he was appointed a regent of the University of New York and was given the degree of D.D. by the University of Pennsylvania. Throughout the Revolution he took a firm stand in favor of the liberty of the colonies, and was chaplain to Congress in 1785 as well as to the United States Senate in 1789. In 1787 he was appointed a trustee of Columbia College. After presiding at the constitutional convention he went to England in 1786 (the absent Seabury being the only bishop in America), he set sail for England in company with William White to receive episcopal consecration, having been elected as bishop of New York. A special act of Parliament having been passed empowering the archbishop of Canterbury and York to consecrate to the office of a bishop persons being subjects or citizens of countries out of His Majesty's dominions, Provost and White were consecrated by these prelates and the bishops of Bath and Wells and Peterborough in the chapel of Lambeth Palace, 4 Feb. 1787. Bishop Provost resigned the rectorship of Trinity Church in 1800 and his see in 1801, but the House of Bishops declined to receive his resignation, giving consent, however, to the consecration of Dr. Benjamin Moore as assistant bishop. He is buried in Trinity churchyard. Consult Berrian, W., 'An Historical Sketch of Trinity Church' (New York 1847); Dix, M., ed., 'A History of the Parish of Trinity Church, New York' (4 vols., New York 1898-1906); Francis, J. W., 'Old New York' (New York 1858); Gallagher, M., 'Chapter of Unwritten History' (New York 1888); Harlitt, I. S., 'Rt. Rev. S. Provost' (in Memorial of American History, New York, p. 115, New York 1891); Perry, W. S., 'Bishop Seabury and Bishop Provost' (1862).

PROVOST, one who is set over others; one who is appointed to superintend or preside over something; the principal, head or chief of certain establishments or bodies; applied to (1) a jailer; the keeper of a prison; (2) the head of the faculty or principal of several colleges in the English universities of Oxford and Cambridge; the principal of the University of Dublin. In the case of a few colleges in the United States (e.g., University of Pennsylvania) the term is used in the same sense; (3) in Scottish cities the mayor is called provost, and in Aberdeen, Dundee, Edinburgh and Glasgow 'lord provost'; (4) in ecclesiastics it is used in the same sense as prior, or to designate the head of a chapter, corresponding to the more frequent term 'dean'; in the German Lutheran State Church is applied to the pastor of the principal church in a district; (5) in France the judge of central royal and feudal courts.

PROVOST-MARSHAL, in military affairs, an officer who takes cognizance of offenses against discipline, orders the arrest and the punishment of deserters and other offenders according to the sentence of a court-martial, and maintains order generally. In Great Britain and the United States the provost marshal has the rank of captain, and superintends the preservation of order, and is really the head of the military police of a camp or military district. In the United States army there is a provost-marshal-general who superintends the work of the several divisions, and to this was added in 1917-18 the charge of the operation of the Selective Service (Conscription) Laws, and the multitudinous duties incident thereto. See COURT-MARTIAL; MILITARY LAW.

PROXY, person who is empowered, or the instrument by which a person is empowered, to act or vote for another, most frequently used in the case of public assemblies, conventions, boards of directors, meetings of shareholders, etc. In Great Britain every member of the House of Lords was formerly permitted, on obtaining a nominal license from the Crown, to appoint another lord of Parliament his proxy to vote for him in his absence. Only a spiritual lord could be proxy for a spiritual lord, and a temporal for a temporal lord, and no peer could hold more than two proxies at the same time. Proxies were never used in judicial business or in committees of the House, nor could a proxy sign a protest. The practice of admitting proxies was discontinued in 1867.

PRUDDEN, prydên, Theophil Mitchell, American physician and author: b. Middleton, Conn., 7 July 1849. He was graduated from the Medical College of Ohio in 1875; from the Yale Medical School in 1875 and received the degree of LL.D from Yale in 1897.

Besides contributing to the scientific literature of pathology and of bacteria and their influence in disease, he has written on these and other scientific topics for the general public. He is emeritus professor of pathology in the College of Physicians and Surgeons, Columbia University, New York. Among his works are: 'Handbook of Pathological Anatomy and Histology' (10th ed., 1914), with F. Delafield; 'Story of the Bacteria' (1899); 'Dust and its Dangers'; 'Water and Ice Supplies' (1891); 'On the Great American Plateau' (1907).

PRUDENTIUS, pröo-déncht-ús, Aurelius Publius Clemens, Christian hymn writer. b. Spain, probably at Saragossa, 348; d. about 410. He practised the profession of an advocate and afterward became a functionary of the government. From a life of pleasure and worldliness he was reclaimed by his conversion to Christianity, retired to a cloister in his 36th year and there spent the remainder of his life. It was during these latter years that he wrote the religious poems which have made his reputation as the greatest Christian poet of the 4th and 5th centuries in the Latin Church. This was the golden age of Christian literature and his contemporaries included Ambrose, Jerome and Augustine. It is quite evident that he was a profound student of classic latinity, for he shows a complete mastery of the epic and lyric metres of Roman literature, and at the same time these poetical works are purely Christian, full of devotional feeling and theological lore. His 'Libri Cathemerinon' consists of 12 religious poems for daily use; while 'Psychomachia' is an allegorical description of the struggle between good and evil in the human soul. 'Peri Stephonon' is a metrical martyrology. Other works by him are 'Apotheosis'; 'Harmatigenia'; 'Contra Symmachum'; and 'Dittochonon', the first three being polemic, the last chiefly of archaeologic interest. There are many manuscripts of Prudentius' works; the best of these is considered to be that in the Bibliothèque Nationale, Paris (Latin Department, 8084), dating from the early 6th century. There are also a great number of editions of his writings. Amongst these should be mentioned (Antwerp 1564); Arevalo (Rome 1788), the latter reprinted in Migne, J. P., ed., 'Patriologia Latina' (Vols. LIX-LX, Paris 1847); Obbarins (Tübingen 1845); Dressel (Leipzig 1886). A still more recent critical edition has been undertaken by J. Bergman and is still uncompleted. There are a number of English translations of some of his works amongst which should be mentioned Anon., 'Psychomachia'; the War of the Soul; or the Battle of the Virtues and Vices, (London 1743); Anon., 'The Cathemerinon and other Poems in English Verse' (London 1845); Pinder, N., ed., 'Selections from the Less Known Latin Poets' (Cambridge 1886); Morrison, G., translator, 'Hymns, etc.' (London and Cambridge 1887-91); Thackeray, F. St. J., 'Translations from Prudentius' (London 1890); Pope, R. M., and Davis, R. F., translators, 'Cathemerinon' (New York, n.d.). Consult Baumgartner, A., 'Die Lateinische und Griechische Literatur der Christlichen Welt' (in Geschichte der Weltliteratur, Vol. IV, Freiburg 1900); Bersenbrugge, J., 'Lexicon Prudentianum' (Upsala 1894); id., 'De Codicis Prudentianorum' (in Kaiser-
PRUDHOMMES — PRUDHON

PRUDHOMMES, Conseils de, kôn-sâ-k de prû-dûm, courts of conciliation in France for deciding small disputes between workmen and employers. The first councils called by this name in Paris were formed in 1296 in the reign of Philippe le Bel, when 24 prud’hommes were appointed to assist the provost of the merchants in settling disputes between merchants and workmen. The number of such courts was increased rapidly after the Revolution of 1848, at which period 75 towns had councils de prud’hommes, the whole legislation on this subject was revised. All the patrons and workers of industrial establish- ments within the circle of jurisdiction of the council of prud’hommes were made eligible as electors. In June 1853 a law was passed which, with some modifications, is still in force. The patrons and the workmen are formed into sepa- rate electoral colleges, each to elect an equal number of prud’hommes. The period of election are a minimum age of 30 years, ability to read and write and citizenship. The office used to be honorary, but compensation, vary- ing locally, is now permitted by law. The gen- eral conseil, besides the president, vice-president and other officials, is made up of a number of patrons and workers, with a minimum member- ship of six. They are elected for six years, one-half of the membership being renewed every three years. The jurisdiction of the cons- eils is summary and without appeal for sums under 200 francs; above that sum an appeal lies to the tribunals of commerce. The presi- dents and vice-presidents of the conseils de prud’hommes are elected by the conseils for one year, one being a patron and the other a work- man. The number of conseils de prud’hommes is now about 225. Consult Block, R., and Chau- mel, H., 'Traité Théorique et Pratique des Conseils de Prud’hommes' (Paris 1912); Block, M., 'Le Conseil de Prud’homme et l’Admi- nistration Prud’hommaise', (Vol. II, Paris 1905); Cluzel, G., 'Traité Pratique des Conseils de Prud’hommes' (Paris 1908); Thomas, E., 'Les Conseils de Prud’hommes, leur Histoire, leur Or- ganisation' (Paris 1888).

PRUDHON, Pierre Paul, pê-ar prû-dûn, French painter: b. Cluny, Saône-et-Loire, 4 April 1788; d. Paris, 16 Feb. 1823. He received his first instruction in his art at Dijon under Devosge. In 1780 he went to Paris. Two years later he won a competition for a Roman scholar- ship offered by the estates of Burgundy. He arrived in Rome early in 1785 and devoted him- self assiduously to study, forming his style on that of the 16th century masters, especially Leonardo da Vinci and Correggio. He returned to Paris in 1789 and painted portraits, gaining with difficulty his living under the Terror. He gradually made himself known, although his misfortunes had been early aggravated by a marriage undertaken under circumstances of great impudence; and in 1800 he became fa- mous by his timely picture 'Truth Descending from Parnassus.' In 1805 he exhibited his 'Psyche Carried off by Zephyrus,' and 'Crime Pursued by Justice and Divine Ven- geance,' the latter now in the Louvre. From this time his position was assured. In 1808 he received the Legion of Honor and in 1816 was made a member of the Institute. In these years he also found compensation for his unhappy marriage in the love and care of one of his pupils, Mlle. Constance Mayer. Besides paintings and mural decorations he also made many designs for elaborate fur- niture for the empire, and his fame is most which may be mentioned the crayon for the Prince of Rome, the son of Napoleon I and Marie Louise. He also etched many of his works and almost innumerable engravings in wood or any other material of the works of his own times and of later periods. His importance in the history of French art history lies in the fact that he indicated a revolt from the cold classicism of David, introduced freer and bolder pictorial effects than had so far ob- tained in French art and utilized the emotional and sentimental resources which lie in the skill- ful distribution of light and shade in a picture. Other works of his are 'Cupid Chastised' (Na- tional Gallery, Dublin); 'The Assumption' (The Crucifixion); 'Interview of Napoleon I and Francis II after Austerlitz' (Louvre, Paris); 'Union of Love and Friendship'; 'Venus and Adonis'; 'An Unhappy Family'; 'Venus in the Bath.' The last four works are in private collections, as are also many others, as well as a number of etchings. Seventeen of the latter, however, are to be found in the Louvre. Works of his may also be seen in museums at Angers, Cherbourg, Dijon, Montpellier, Orleans, Quimper, etc. A sketch of a ceiling in Dijon is owned by the Historical Society, New York. Consult Blais,

PRUNE AND I.—PRUNE

Curtis, George William. 'Prune and I,' first published in 1856. It is a series of sketches or meditations showing the enjoyment to be derived from even the most commonplace existence. The papers are supposed to be written by an old bookkeeper, who strolls down the streets at dinner-time and without envy watches the diners-out. But whatever the genial old bookkeeper is thinking or relating, his heart is full of Prue, and from beginning to end it is always 'Prue and I.' Consult Cary, E., 'George William Curtis' (Boston 1893).

PRUNE, dried plums of certain varieties and the varieties used for drying. They are extensively cultivated in the Danubian principalities, France, Italy, and in recent years in California, Oregon and Washington, from which States the American market is now chiefly supplied. The product is of great commercial importance and nutritious qualities. Any variety of plum having the requisite percentage of sugar, plenty of solids and which, when cured, will keep for a long time without deterioration, is suitable for making prunes.

Prune growing was introduced into California in 1856, from scions imported from France, and in 1863 prunes were for the first time publicly exhibited as a California product. The first large orchard was planted in 1870, yet in 1915 nearly 100,000 acres of bearing and 30,000 of young trees were recorded. Attempts have been made to cultivate the prune in eastern parts of the United States, but without success, owing to the absence of requisite conditions for curing, besides occasional irrigation. The prominence of the prune-making plum is large and abounds in synonyms. The following varieties are most favored in America: Petite or Prune d'Agen, the most important in California; Italian (Fellenberg) in Oregon, with Tragedy

are infrequent, never exceeding a fraction of an inch in volume, exist the best natural conditions for perfect curing of the prune. The fruit is not picked until perfectly ripe, then it is gathered by hand, and it has fallen naturally from the trees when ripe. It is then passed through a sizer which separates the various sizes in order to secure uniformity in drying, as small fruit will dry in a shorter time than will a larger size. Next it is dipped into a weak solution of boiling lye to take off the bloom and facilitate curing. Sometimes the outer skin is punctured by needles to allow the surplus moisture in the fruit to escape readily. In large establishments endless chain machines are employed in dipping, but where it is done by hand a wire dipper is used. The fruit is washed in fresh water after the process to clean off the lye. After spreading upon wire-netting trays, the fruit is taken to the field and exposed to the sun's heat until properly cured. The summer days in California are invariably hot and the raw fruit, after exposure to the sun's rays for 6 to 10 days, depending upon size, is thoroughly dried. In eastern Europe it is customary to cook the fruit partly before exposing it to the rays of the sun. There are districts where periods of dry weather are liable to be interrupted, evaporators are used in extracting the moisture of the fruit, the trays being introduced into a chamber in which the temperature is raised to 140° to 180°, and where they remain from 12 to 48 hours. To understand the exact amount of time necessary perfectly to cure the fruit is essential, as if this matter is ill-judged an inferior quality of product results. When sufficiently cured, the fruit is taken from the trays to bins, where it is allowed to 'sweat' for two or three weeks, after which it is ready to be graded and packed for market. Grades are indicated by the number of prunes to the pound, according to the size; 30 to 40 to the pound represents the highest grade, 120 or 130, the smallest. Before final packing and in the process of being packed into a hot solution of water with glycerine or fruit syrup, which not only adds to the beauty and polish of the fruit, but extirpates insect germs that may be present. Producers seldom introduce a substitute in the process of curing for increasing weight. In shipping, sacks are employed when a buyer intends to pack for his own trade, but the larger quantity is packed into boxes of stated dimensions at the place of shipment. French methods are also practised in packing in labels in fancy boxes with attractive linings. In quantity the States of California, Oregon and Washington produce a larger amount than all foreign countries put together, the annual output of the three States aggregating about 210,000,000 pounds in 1912. Large quantities of the latter sort of American fruit are exported to Europe, where they rank equally with the finest brands of France.

Orchards of large size are found in various parts of California. They require the same careful cultivation as plums and frequent pruning, besides occasional irrigation. The prominence of the prune-making plum is large and abounds in synonyms. The following varieties are most favored in America: Petite or Prune d'Agen, the most important in California; Italian (Fellenberg) in Oregon, with Tragedy
perhaps second and Hungarian third. Other varieties grown commercially are Pacific, Williams-Cherry, Marion, Beach, Columbia, Teton, Silver and Sugar. Consult Bailey, "Standard Cyclopedia of Horticulture," titles 'Prune'; 'Plum'; 'California'; and 'Evaporation of Fruits' (New York 1914-17).

PRUNELLA, a kind of smooth woolen or mixed stuff of which clergymen's gowns were once made and which is still used for the uppers of ladies' boots and shoes.

PRUNING, the removal of parts of plants in order to economize and divert energy in desired directions. Fundamentally the various objects for which plants are pruned are (1) training, in which the limbs are started and disposed as desired; (2) pruning proper; (3) trimming or the shaping to some artificial form. The first is of prime importance in the early years of orchard fruits, but is of smaller and smaller application as the subjects dealt with are shorter with less tree-like. The second is important, as a rule, during the whole life of the plant, in many cases, especially of trees, commencing when the plants are set. The third is usually of small importance, at least in America, being employed mainly with such ornamental subjects as hedges, topiary specimens and dwarf trees.

Popular opinion concerning the practice has changed within recent years. Formerly it was against pruning upon the ground that the plants suffered and that the practice was unnatural. But nature is an inexorable pruner, as the straight limbless trunks of forest trees and the dead twigs and branches of trees left to themselves sufficiently show. The horticulturist improves upon nature in doing his work intelligently, not only with respect to what shall be removed, and when, but how it can be best done, so as to enhance the healing of the wound. The practice is essential to successful orchard fruit culture and to a greater or less extent with other plants. With woody plants that have been grown in nurseries it is necessary to cut back the tops to approximate a balance between the top and roots which latter have been necessarily reduced in digging. The usual practice in this matter is to reduce to at least one-half of each branch that is to remain and to cut off all the others. Many orchardists trim off all the limbs and some leave nothing but a switch or even a stub, claiming that they can then form the head of the tree where they desire and that the tree more quickly recuperates than if a larger proportion of top is left. Certain it is that in practice the trees untrimmed at transplanting time generally suffer severely.

Among the principal objects sought in the pruning of fruit-trees the following may be mentioned: To divert plant-food from wood production into fruit formation and development of improved specimens; to keep, not to force, the tree in bearing condition, which is secured by regular annual attention and not by intermittent neglect and butchery; to prevent the excessive production of wood which is usually at the expense of fruit production and ordinarily is a sequence of excessive pruning; to keep the tree within manageable limits so as to facilitate cultivation, spraying and harrowing; and to admit light and air to the tops so that the fruit may be well colored.

Before any pruning is done, however, it is essential to know the exact manner in which the tree is to grow and to bear fruit unless this is understood the operator may be working against his own interests and injuring the tree at the same time. For instance, apples and pears bear their fruits upon nearly twigs called spurs, the plum and cherry usually upon spurs, but sometimes also on the axial growths; the peach bears usually upon the axial growth of the previous season, but also to some extent upon spurs which live only two or three years as a rule; the quince bears upon terminal shoots of the present season; the grape upon shoots of the current season; the raspberry and blackberry usually upon shoots of the previous season, the shoots dying after production; and the currant and gooseberry upon wood one or more years old. Further advantage may be taken of the method of fruit production in preventing the necessity of thinning, the fruit-buds being removed by the cutting out of the fruit-bearing wood.

In the pruning of ornamental subjects the same principles apply. Except for removing straggling, unsightly or unnecessary growths, the pruning has mainly to do with flower production. Flowering shrubs and trees may be divided into two groups; those which produce their flowers from buds which were mature during the previous season; and those whose buds were developed during the current year. The one rule that will apply to these subjects is: Prune after flowering. If members of the first group are pruned during the winter they will generally suffer severe loss of flower buds; members of the other group, however, should be pruned, preferably, in early spring about the time that growth starts. Properly done and at the right time the production of bloom should be greatly enhanced with each group.

There is considerable difference of opinion as to when subjects should be pruned, but if wounds are properly made, that is, close to the main stem without leaving any stub, and if the large ones are protected from decay during the healing process, they may be pruned at any time, preferably, perhaps, just before the season of most active growth when the object is wood, and after this period if the object is fruit. Trees grown as cordons, espaliers, etc., require the greatest skill, but these principles are the same for matters of training and are of rare application in the United States.

There is an immense literature on the subject, consisting chiefly of short articles on special phases, to be found in horticultural journals of this and foreign countries and in the publications of governmental departments of agriculture and of agricultural colleges and schools. For general treatment of the subject consult Bailey, L. H., 'The Pruning Manual' (New York 1916); Hood, G. W., 'Laboratory Manual of Horticulture' (Boston 1915); Kains, M. G., 'The Principles and Practice of Pruning' (New York 1917); Newsham, T. C., 'The Propagation and Pruning of Hardy Trees,' etc. (New York 1913); Udall, T., 'The Book of Pruning; Grafting and Budding' (Evesham 1915).

PRUNUS, a genus of shrubs and small fruit trees of the rose family, about 75 of which are widely distributed, especially in the north.
temperate zone, and include many leading fruits of the world and many species of ornamental value. They have alternate leaves; solitary or clustered, pink or white flowers which appear usually in spring; and drupaceous fruits containing a single or double stone. The number of varieties and hybrids is legion; they include weeping, double-flowered, variegated-leaved and diversely colored subjects, besides the hosts of varieties cultivated for their fruits. Their range of hardiness varies with the species, some being hardy in the cold North and Plains States, others tender even at the latitude of New York. The most important members of the genus or sometimes referred to it are treated under their own titles, as Almond; Apricot; Cherry; Nectarine; Peach; Plum; Prune; Sloe.

PRURITUS, itching, a symptom of various skin diseases. It may occur independently of any structural alteration of the skin, as a purely psychogenic affection and is then frequently a symbol of unconscious masturbation. It may involve the skin of the entire body or be limited to a particular region, such as the anus, scrotum or vulva. The sensation is described as prickling, burning or crawling. It is very annoying when slight and may be so severe as to destroy all sense of comfort. Excitement and overexcitement even the warmth of the bed at night cause at times troublesome exacerbations. The etiology of this affection is frequently obscure. Impaired general health and a neurotic tendency are predisposing causes. Pruritus senilis is a distressing form occurring in advanced age and is due to degeneration of the skin. Pruritus haemalis (winter itch) is peculiar to cold weather. Other causes are the change from light to heavy under-clothing; ingestion of certain drugs, as opium; sometimes hepatic disease; and the circulation in the blood of abnormal biliary constituents, as in jaundice, and of other abnormal material in diabetes. Localized pruritus frequently depends upon a venous congestion of the part; thus, pruritus ani is invariably aggravated by constipation and obstruction of the portal circulation; and in pruritus vulvae, uterine engorgement and pregnancy are exciting causes. Worms not infrequently produce itching of the anus and of the nose, the latter being a reflex condition. The almost constant scratching caused by a persistent localized pruritus is likely to produce eczema.

In treatment the general health is to be improved by hygienic measures; sometimes an entire change of diet, scene, etc., is necessary. Internal medication should be left to the physician. A psychoanalysis is necessary to cure certain cases. Local remedies are palliative, only relieving the discomfort until the cause of the itching is remedied. Among the palliatives are carbolic acid, borax, soda, starch, chloroform in powder, liniments, solutions and ointments.

PRUSSIA (German, Preussen; Latin, Bo-russia), a kingdom of Germany, and its largest, most populous and most important state, comprising the larger part of the northeast and north of the German Empire. The boundaries of Prussia are on the east, Russia; on the south, Austria, Saxony, Bavaria, Hesse-Darmstadt and the Thuringian states; on the north, the Baltic, Denmark, Mecklenburg and the North Sea; on the west, Belgium and the Netherlands, Alsace-Lorraine and Luxemburg. The circumference of Prussia measures 4,762 miles and except for some small enclaves, including the Hofenzellern principality, which is surrounded by Württemberg territory, Prussia is a compact mass of land, taking up nearly the whole of northern and eastern Germany. In shape it is, roughly, an elongated oval. Its greatest length, from Memel to the borders of Alsace-Lorraine, is about 800 miles, and its greatest width somewhere between the departure of this peninsula from the coast of Prussia, however, are political rather than natural. The area is 134,622 square miles. The heart of it is the province of Brandenburg, from which small core the kingdom of to-day has grown by conquest or otherwise. Prussian territory encloses, wholly or nearly so, the small German states of the two Mecklenburgs, Anhalt, Brunswick, Oldenburg, as well as the old Hanza republics of Hamburg, Bremen and Lübeck. Prussia holds some five-eighths of the population of Germany. The density of population by the square mile, in 1910, the last census year, was 292.80.

Topography.—Three-fifths of Prussia form part of the great northern European lowlands. This plain is much wider in the east, only the southern border of Prussia touches the mountainous, than it is in the west. Roughly, an imaginary line run from about Bonn to Wittenberg would separate the lowlands from the highlands of Prussia. The Sudetian range divides Prussia from Bohemia and Austria; and its highest peak, the Schneekoppe, lies on Prussian soil. The Harz range runs nearly parallel with the Sudetens and might be considered a continuation of them. South of the Harz the Prussian boundary cuts the Thuringian Forest, and again is prolonged by the Wetter range of hills and the Teutaburg Forest. In the southwest the lower Rhine region includes the Hunsrück and Eifel, the Taunus, Westerwald, Siebengebirge, Spessart and Sauerland, nearly all of it on Prussian territory. Again the Rhön mountains, the Vogelsberg and other similar ranges interpose themselves between the Rhinish and Thuringian system. North of the Sauerland, in the region of the Ruhr River; are situated the most important coal-bearing lands of Prussia, while the extensive, but on the whole not so valuable, coal-fields are in eastern and northern Silesia. Prussia has an ocean front ("Waterkant") of some 1,100 miles on the North Sea and the Baltic, being nearly the whole seashore that Germany can boast of. Tidal variations are not very great on the North Sea, and still less so on the Baltic, but fierce and frequently recurring northwest storms have caused great devastation along the rather flat seaboard of Prussia, so that during historical times alone thousands of square miles of coast have been swallowed up by the sea. Much of the coast land being marshy soil, it serves for pasturage only. The Baltic is much more shallow than the German Ocean and is not distinguished by well-defined ebb and flow, and its coasts are mostly sandy and infertile dunes. The only island along the Prussian line of the
PRUSSIA

Baltic that deserves mention is Rügen, a fertile tract of great scenic beauty. However, the Baltic coast has several deep indentations, such as those near Lübeck, Danzig, Kiel and the Pomeranian bight. The so-called Haffs are semi-inland bodies of water but slightly brackish and formed by the waters of the rivers emptying themselves into hollows nearly cut off from the sea by series of small tongues of projecting mainland. Although Prussia is in its main part rather flat, so that no serious obstacles interfere with the railroad and canal systems, that does not mean that the land is quite level. Indeed, hills and rocks rising to a height of 600 feet and higher Prussian territory occur on the long line between the mouth of the Ems River and the Russian border, these elevations dating from the Ice Age and being formed by accumulations of boulders and moraine.

Hydrography.—Prussia contains a large number of lakes, especially in her northeastern section, but none of them of great importance. There are also large swamps along the lower course of the Oder, Havel, Warthe and Netze rivers, drainage work has been going on. All the river system of Prussia belongs to the basins of the Baltic and North Sea, the Danube, which empties into the Black Sea, being the only large river of Germany that does not figure in Prussia's national economy. All the other principal rivers of Germany, such as the Elbe, Rhine, Weser and Oder, with most of their tributaries, and the Vistula (Weichsel) and Niemen (Memel), coming from Polish or Russian soil, in their most navigable and important portions, form part of the Prussian river system. The distance through Prussian territory about 200 miles, the Weser and Oder almost completely and the Elbe for about two-thirds of its course. There are also a large number of shorter coast rivers, such as the Fregel, Leda, Lipper, Riga, Peehe, Ucker, Trave, all belonging to the Baltic, and the Elbe, Ems, Werra, Fulda, Saale, Havel and Aller of the North Sea range. Prussia has also a considerable number of artificial water courses. Of these the Baltic North Sea Canal (officially Kaiser Wilhelm Lüneburg) can be mentioned, the construction of which entailed an expenditure of about $36,000,000, is in most respects of highest importance. Vistula and Oder are connected by the Bromberg Canal; Oder and Spree by the Mühlrose Canal; Havel and Elbe by the Plau Canal; Elbe and Trave by the Steinknitz Canal; Eider and Baltic by the Eider Canal. Of late years these canals have been increased in size and depth, and since the beginning of the great World War just past Prussia has planned, and is now as a matter of fact executing, a great and ambitious plan intending to connect all the principal Prussian rivers with the Danube and with each other, so as to form a great Danube shipping canal that is to make the Danube available for large boats from Regensburg to the Black Sea. It can, therefore, be said that in its hydrographic aspects, as far as variety, diversity of direction and number of means are concerned, Prussia is singularly fortunate and well supplied.

Geology and Mineral Resources.—Of the two widely differing geological formations of Prussia, the entire flat part of it, being the larger, is covered with clay and sand of the Quaternary Age, having been spread over the surface since the Ice Age till the present day by alluvial and glacial action. And these deposits rest upon all formations from the Primary down to and through the various phases of the Tertiary. Cropping out here and there the harder rocks often emerge above the Diluvian and Alluvian. This is the case in Rügen with its chalk cliffs, in the limestone plateau near Rüdersdorf, etc. The Rhenish and the Thuringian systems are part of the Triassic system of the upper Rhine. The Silesian ranges—Riesengebirge, Sudeten, etc.—consist of granite and gneiss, while Harz and lower Rhine belong to the Devonian and Silurian formations. Prussia excels as a mining country, especially in coal, iron, lead, zinc, copper, potassium, leading by far the rest of Germany in mining products. About 89 per cent of Germany's coal supply comes from Prussia, mainly from the Ruhr Basin, Rhine province, Westphalia and Silesia, while soft coal and lignite comes from Saxony; peat also is obtained in big quantities from the northwestern lowlands near the coast. The last available statistics, those of 1912, show that Prussia mined 165,302,784 metric tons of hard coal and of lignite and soft coal 65,803,959 metric tons. Iron comes chiefly from the provinces of Silesia, Westphalia, Hesse-Nassau and Hanover, the yield being in big iron in 1911 some 10,477,263 metric tons. The eastern portion of Silesia has practically a world monopoly in zinc, the figures for 1913 being 702,893 metric tons. Copper was mined in the same year in Prussia to the amount of 906,265 metric tons in the ore, and some 158,857 metric tons. In manganese production, too, Prussia is supreme. Of table salt Prussia
PRUSSIA

is very prolific, and in potassium it is the chief source of production. Petroleum is obtained in limited output in the province of Hanover. The far northern coast of the Baltic yields an abundance of amber. A large proportion of mines and salines in Prussia are under government control and ownership. In 1913 there were employed in the mining industry in Prussia some 769,304 persons.

Agriculture — Prussia is the chief agricultural state of Germany. Of the total area of Prussia 52.3 per cent consists of cultivated fields, orchards, vineyards and vegetable gardens; 17.5 of meadows and pastures; 22.7 of forests and woods, and 7.5 only of untilled unproductive land. The number of agricultural holdings in 1911 was 3,256,044, the farm lands totaling 20,781,147 hectares (one hectare = 2.471 acres). Of these by far the larger proportion was in small farms of less than 20 hectares, owned by 3,103,151 parties and making up 41.2 per cent of the whole cultivated soil. Of large estates of 100 hectares and over the percentage is more considerable in Prussia than in the remainder of the empire, because of "East Elbian" political and economic conditions. In fact, the landed gentry still keeps its traditional grip on the country and where thousands of them own estates each over 1,000 hectares agriculture is most backward and the soil yields, in proportion, the least per hectare. This is due to the system of tillage in vogue, the land being annually worked by so-called "wanderhände" (or season laborers) who come from the neighboring districts of Poland or Galicia, and who return thither after the crops are in. In a general way, however, although 1,000 tons of barley, 1,500 of oats, and 750 of potatoes can be believed that urban industry in Prussia, as elsewhere in Germany, has made large strides, somewhat at the expense of the former rural population, it must be conceded that the peasants, farmers and estate-holders, large and small, are in a fairly prosperous condition, attributable chiefly to the intensive cultivation of the soil and to the fostering legislation of the government, as well as to the extensive use of agricultural machinery, much of it made available by the co-operative plans to most progressive methods of farming and to increasing diligence. The co-operative plans in vogue, notably among the smaller farmers, enables them not alone to buy on shares or hire even the most improved types of farming machinery run by electricity, alcohol, petroleum, etc., for all the processes of farming, such as ploughing, drilling, harvesting, binding, threshing, grinding, etc., but also to dispose of their produce to best advantage, much of it without any middlemen, by directly dealing between producer and final consumer. Alcohol, used as a source of mechanical energy, is more extensively employed in Prussia than anywhere else in the world, and distilleries for the wholesale manufacture of methyl alcohol are very common, a cheap grade of potatoes being mostly used in the process. The soil of Prussia varies greatly in quality. Of the cultivable land there some 29 per cent is loam and clay, 32 per cent middling, namely, loam and sand mixed, 31 per cent is predominantly sandy and 6 per cent bogs and marshes. Besides the basin of the Rhine and its tributaries, that of the middle Elbe, Saale, Unstrut, etc., the extensive plain around Magdeburg, the so-called Böhde, and some other large areas are most fertile. The chief cereal produced in Prussia is rye, which is consumed for bread and other food by the people in general in preference to wheat. About 75 per cent of the entire rye crop of Germany is raised in Prussia; 72 per cent of the potatoes, the crop next in importance; much of the latter is used in manufacturing alcohol; of the wheat Prussia yields 63 per cent, and the oats 67 per cent. The vineyards of Prussia in 1913 aggregated 17,216 hectares and yielded 218,264 hectolitres of wine. The orchards and private gardens produced all the fruits of the temperate zone in excellent quality, notably cherries, plums, pears, apples, quinces, apricots and berries. In the whole of Prussia in 1913 there was grown of rye, on 4,935,425 hectares, some 9,345,155 metric tons of potatoes, on 2,329,404 hectares, some 39,215,208 metric tons of wheat, on 1,166,054 hectares, some 2,942,647 metric tons; and of oats, on 2,943,255 hectares, some 6,559,911 metric tons. Prussia excels also in livestock. The breeding of strong and generally serviceable horses has been made a special feature by the Prussian government. A score of royal farms were in Teakelnhn, East Prussia, and elsewhere endeavor to keep up the grade suitable for army use, agricultural and general purposes, and the export of horses has been a regular feature. In 1913 the number of horses in Prussia was 3,387,301; of cattle, 12,344,507; of swine, 16,574,202; of sheep, 4,081,724. The total area of Prussia under forest is 22.7 per cent, and of this the fiscus owns about one-half, coniferous trees being in a vast preponderance. The government derives some 1,000,000 from the sale of wood, etc., of its Crown forests. As to viticulture, practically all the palatable and economically valuable wine grown in Prussia comes from the Rhine and its chief tributaries, the Moselle, Nahe, etc. A number of the wines are exported to the state. All the wine-growers have suffered great losses for the past 30 years from the ravages of the phylloxera, but have got the trouble now under control. The better vintages of both Rhine and Moselle wines fetch high prices and are esteemed for flavoring, both on inland waters (carp, pike, pickerel, trout, salmon, etc.) and the sea, is likewise an important source of income for Prussia, the fisheries on the Baltic and its "haffs" (harings, sardines, anchovies, a species of cod, etc.) being of special value in pisciculture and deep-sea fishing Prussia is undoubtedly still far behind when compared with a number of other countries.

Manufactures.—From an industrially in significant country Prussia during the last 40 years, with the remainder of Germany, has become a manufacturing centre of great importance. Among the industries that have grown up with almost spasmodic swiftness in Prussia within that period are the beet-sugar manufacture, in which Germany is leading the world and which flourishes mainly in the central provinces of Prussia; cotton spinning and weaving, which are of great importance in the Rhine province; the linen manufacture of Westphalia and Silesia; the woolen industry of the district around Aachen, as well as the silk
PRUSSIA

and velvet production of Krefeld, Elberfeld, etc. In money value, however, the making of machinery of every description overtops all Berlin, Magdeburg, Buckau and several large towns in Westphalia and along the Rhine, leading. The iron and steel industry centres in the coal region of the Ruhr Basin and is carried on on a very large scale, as in Essen, Remscheid, Suhl, Solingen, Düsseldorf, Elberfeld, Dortmund, etc. The most considerable shipyards in Prussia are located in Kiel, Danzig, Emden, Stettin and Elbing. Cologne, Görlitz, Königsberg and Düsseldorf are also noted for the making of smaller machines and mechanical devices, such as sewing machines, cash registers, typewriters, telephones, etc. Glass, paper, porcelain and pottery are turned out in the provinces of Saxony, Silesia and the Rhine, while the chemical and dye industry is mainly carried on in Berlin and in a number of towns by the Main and Rhine, as Höchst, Elberfeld, etc. Of those engaged in manufacturing and industrial establishments in 1911, 6,006,526 were employed in Prussia.

Transportation in Prussia is well provided with all means of communication and transportation. The first railroad was built in 1838 and since 1866, after Prussia's annexation of Hanover, Hesse-Nassau and Schleswig-Holstein, the railroad system was rapidly extended, until, with one or two exceptions, of the larger countries Prussia possesses the closest network of rails. The same is true of her canal system. The shape of Prussia being twice as long as broad, these two systems, too, had to be laid out accordingly. Communication between the east and west of the state is now done by rail and more rapidly than by either the northern or southern ones. Large lighters of large tonnage and small craft are now doing on the canals and rivers the transportation of the larger part of the bulky goods, manufactured goods and foodstuffs, carrying the lower westward and the former eastward. An enormous and steadily rising tonnage of such vessels, peculiarly adapted to their task, is devoted to this traffic. It is to the excellence of these results that Prussia owes much of its rise to economic prosperity. Dating from the eighties the Prussian railroads were gradually purchased by the state, following out a plan of Bismarck's, and by special agreements (called *Konventionen*) with neighboring smaller states such as Hesse, Saxony, Bavaria, and by embodying the railroads of a number of other adjoining states of less size, the serviceableness and income of the government-owned roads were guaranteed.

The proportion of railway mileage in Prussia has now come up with that of Great Britain, though in point of volume of traffic it is considerably behind, owing to the canal competition and to the fact that military-strategic reasons, rather than purely economic ones, have been deciding factors in laying out the railroads. Significant is the fact that Prussia is the most important trunk line of Prussia that is from the western frontier at Herbrehtshaul through Cologne, Berlin, Königsberg in the direction of Paris-Petrograd. For 1912 the Prussian railroad systems comprised 7,238 kilometers in length, all but 2,559 of which is state-owned and all but 520 kilometers being broad-gauge.

It is admitted that in Prussia government ownership of railroads has proved an unequalled success. It is the commercial point. Before the outbreak of the war the Prussian government derived just about one-fourth of its entire revenues from the profits of operating its railroads, while by controlling freight schedules at all times it was also enabled to lend a helping hand to industry as a whole. As to its merchant marine, next to that of Hamburg and Bremen, it was the most important of the several German states. Though the ports of the Baltic freeze over in winter, the one of Stettin, being large as Berlin and Bremen, foremost of greatest moment, is kept free by icebreakers. Emden, a Prussian port on the North Sea, already of economic importance, was intended to become the rival of the two Hansa ports near by. The figures as to the size of the Prussian merchant fleet still have to be modified after the war. In 1913 the number of vessels was 2,329 of 318,046 tons net.

Banking and Finance.—The banking system is the same in Prussia as in the remainder of Germany. The Reichsbank (Imperial Bank) is at the same time the fiscal and financial centre of Prussia, and its resources, privileges and emoluments have been repeatedly widened and expanded since 1871. Prussia, of course, is financially in a dominating position for the whole of Germany, since Berlin has become by far the most important financial centre of Germany, having outstripped Frankfort long ago. In Berlin there are 11 great corporate banks (aside from some powerful private banks) and the volume of business transacted by these alone is larger than that of the Reichsbank with its 325 branches. The Deutsche Bank is the largest institution, followed by the Dresdner Bank, the Diskonto-Gesellschaft, etc. The Deutsche Bank has done enormous service in the spread of German commerce abroad, financing many transoceanic enterprises. Its capital and assets have increased 50-fold since 1871. Of vast importance, too, is the Preussische Seehandlung (Prussian Marine Association), which was founded by Frederick the Great, and which owes much of its rise to economic prosperity. Dating from the eighties the Prussian railroads were gradually purchased by the state, following out a plan of Bismarck's, and by special agreements (called *Konventionen*) with neighboring smaller states such as Hesse, Saxony, Bavaria, and by embodying the railroads of a number of other adjoining states of less size, the serviceableness and income of the government-owned roads were guaranteed.

The proportion of railway mileage in Prussia has now come up with that of Great Britain, though in point of volume of traffic it is considerably behind, owing to the canal competition and to the fact that military-strategic reasons, rather than purely economic ones, have been deciding factors in laying out the railroads. Significant is the fact that Prussia is the most important trunk line of Prussia that is from the western frontier at Herbrehtshaul through Cologne, Berlin, Königsberg in the direction of Paris-Petrograd. For 1912 the Prussian railroad systems comprised 7,238 kilometers in length, all but 2,559 of which is state-owned and all but 520 kilometers being broad-gauge.
and in predetermined bulk, each as the profits of the various state properties, railroads, fiscal lands, mines, forests, etc.). Taxation is, on the whole, on a satisfactory basis, a progressive income tax and other imposts being quite fairly apportioned. It must be kept in mind that Prussian finances are quite separate from those of the empire. From 1871 to 1914 the financial system has shown a rapidly rising scale. In that year it was (in marks) 2,685,017,665, for revenues, and 2,688,595,268 for expenses, while in 1915 it had risen to 4,848,881,000, for revenues, and the same (estimated) for expenses. The public debt of Prussia has likewise increased upward for many years; in 1914 it amounted to 10,355,537,145 marks. By far the larger part of its load of debt has been incurred, up to the war, for productive enterprises, such as the acquisition of the railroads, domains, mines, etc.

Government.—In a certain limited sense Prussia was a country constitutionally governed. Its Constitution, the outcome of the short Revolu-
tion of 1848, dates from 1850 and was promulged by the then king, Frederick William IV, but was in some (not vital) respects since amended or modified with royal sanction. The Constitution is a written instrument and could only be changed by concurrent resolutions, twice passed by the Prussian Parliament, the Diet, on these alterations being approved by the monarch himself. Executive power was vested in the king alone, the latter attaining his majority at 18. The Crown was hereditary and descended to the first-born male heirs in a straight line of succession through all the branches of the Hohenzollern dynasty. The king was the supreme ruler, and had, as a constitutional monarch, broad powers over law making by a cabinet, the members of which were not responsible for their actions to the Parliament, but to the king alone; he, too, both appointed and dismissed the ministers of the Crown. Members of the Cabinet had a seat in the Diet and participated in the debates. None of the ministers exercises more power than his colleagues, although the one directing the foreign policy was styled "Minister-President," and presides at their meetings. The power of legislation and of raising taxes and large sums of money is vested in the Diet. This parliamentary body (Landtag or Diet) is composed of two houses, the Abgeordnetenhaus (Chambers of Deputies) and the Herrenhaus (House of Peers). The electoral system, however, on which the membership of this Prussian Parliament was based was unfair, illiberal, antiquated and was stigmatized by Bismarck himself at a public session as "the worst in the world." Despite repeated promises held out by the ex-Kaiser, as king of Prussia, to bring this election system more in accord with those in use in more enlightened countries, up to the end of the war no change had been made, due chiefly to the power of the "Junker" class of Prussia, who feared with reason to be deprived of their traditional predominant influence within the state if representation were accorded on a democratic basis.

As it still stands at this writing the lower, i.e., the popular, more active and powerful, house is made up of 443 members, elected for a term of five years by indirect vote. For that purpose the country is divided into electoral districts, very uneven both as to size and population, in each of which usually one member is chosen by the three-class system. Under this plan the voter (all male Prussians of 25 and over who are not otherwise disqualified by reason of crime, extreme poverty, etc.) are cut up into three classes according to the amount of taxes paid by each. The moneyed class has so much the advantage under this preposterous system that generally one vote by a portion of great wealth balances that of hundreds, even thousands, of humbler subjects. Together the three classes choose by open ballot an even number of electors, and these in turn make the final choice of a candidate for an open ballot. Each chamber of the Diet again is the arbiter as to whether the choice was made properly, and may reject the candidate on evidence. Budgets and revenue bills must be passed by this lower house and cannot be amended by the higher. The Herrenhaus (House of Peers) again is made up of princes of the blood royal, of members of the higher nobility, of special titled members chosen by the estate-holders of Prussia, of representatives of universities and certain cities, and lastly, of a number of persons appointed by the king at pleasure. In 1915 the number of members of the Herrenhaus was 307, and about two-thirds of these represented, directly or indirectly, land-holding (Junker) interests. While the general judicial system is the same throughout Germany, the judges themselves are appointed for life by the monarch; their position, although inferior in emoluments and standing to that in more Western countries, is on the whole fairly independent of outside influences. Judges must all have gone through a prescribed course of study and training to be fitted for office, and the standard is rigid and rather exacting. There are administrative courts ("Verwaltungsgerichte") of various grades, special courts, jury courts ("Schwurgerichte"), petty courts ("Schöffengerichte"), etc. The highest courts are the 15 "Oberlandesgerichte" next in grade the "Landesgerichte," and the "Schöffengerichte" being lowest. It is the "Reichsgericht" on Leipzig which decides, on appeal, cases handed up from the state courts, as an Imperial Supreme Court. As for local government in Prussia it is to-day largely the creation of Professor Gneist, the so-called "Kreisordnung" ("Kreis" provincial director) being promulgated 1872. It gives decidedly a larger measure of local autonomy and has worked out on the whole very satisfactorily. For the purpose of administration Prussia is divided into 12 provinces, and these again into subdivisions called "Regierungsbezirke" (government districts), 35 in all. Below these are the smallest units, the "Gemeinde" (community) and the "Amtsbezirk" (administrative district). The administrative officers at the head of these various units are all appointees of the Crown and supposed to work in its interest and to preserve public loyalty toward the rulers and institutions of the country.

The Racial Population.—The table on following page shows the area and population of Prussia in each of its provinces from 1871 to 1910. Increase in population has, as seen from the table, been very rapid since 1871, but at a steadily diminishing rate. This growth has been most rapid in the Westphalian, Rhine-land, Brandenburg and Saxony, and least so
The history of Prussia properly ought to begin, of course, with the assumption of the title of royal ruler by the Teutonic Knights. The latter was a duchy (it is identical with the present province of East Prussia) to the far northeast of Brandenburg and had been wrested from its aboriginal owners, the heathen Borussi or Prussians, by the conquering and missionary zeal of the Teutonic Knights, a militant order of semi-monkish warriors, who, after their labors in Palestine were no longer needed, were entrusted by the Church of Rome with the task of christianizing that northern land. The Borussi appear to have been near relations of the Lithuanians, of whom a remnant have survived in the province. The Elector of Brandenburg, Frederick the III, becoming heir to the lands of the defunct order of the Teutonic Knights, on the strength of an understanding with the then emperor of Germany, on 18 Jan. 1701, with elaborate ceremonies crowned himself in Königsberg, capital of the territory, "King in Prussia." The emperor after much urging, acquiesced in this, but the proceeding created a peculiar status for the new king, who henceforth spoke of himself as Frederick I, as the "King in Prussia," but remained nevertheless also Elector of Brandenburg and as such the subject lige of the emperor in Vienna. However, the whole method pursued by Frederick I was symbolical of what was to come. Frederick I was a Hohenzollern, descendant of that Frederick, an insignificant burgrave of Nuremberg, who, in 1411, by the grace of the Emperor Sigismund was called to wasted and utterly desolate Brandenburg as its margrave. From the accession of this energetic ruler in small Brandenburg dates, with several severe setbacks, the gradual rise to power of what became subsequently known in an enlarged sense as Prussia. The father of the first "King in Prussia," the wise and prudent "Great Elector," Frederick William (1640--88), laid the foundation to the greatness of his house by fortunate wars with Sweden and Poland, and his acquisitions of new territory in western Germany, as a result of the lucky treaties of Hamburg. He defeated the Swedes at the pitched battle of Parnawa, helped the emperor with his troops in the War of the Spanish Succession, and left his somewhat scattered domains fairly prosperous and in good order. During the whole of the preceding century his predecessors had not played an important part, either in the Reformation era or in the Thirty Years' War, although they had seized the Church property within their lands and become adherents of the new religion themselves and had fallen heir to the lands of Pomerania and thus prospectively enlarged their patrimony.

Frederick I, although a vain man and one who lived in a style of sumptuous luxury far beyond the scant resources of his state, nevertheless knew how to win the leading Protestant prince in Germany, his particular rival, Augustus the Strong of Saxony, having been shortsighted enough to forego that rôle by forsaking his Lutheran faith in order to win the elective royal crown of Poland, a barren and costly honor. Nor was that all.
Frederick I purchased or otherwise acquired from spendthrift Augustus some important Saxon territory; he gained from William III of Orange the territories of Lingen, Mörs and Neufchâtel; he founded the University of Halle (1694) and at Berlin an Academy of Sciences and an Academy of Arts. Thus he left his states, overburdened by taxation and in an exhausted condition, though somewhat larger in size (1713). Fortunately for little Prussia his son, Frederick William I, was a man of quite a different calibre, a pensive, clear-headed, thoroughly practical man, with "no nonsense about him." While the new king's education had been sorely neglected, so that he scorned all mere learning and ridiculed the very institutions his father had created, he had an innate genius for administration and for obtaining tangible power. His savings filled the empty treasury of Prussia; his army was not large, but well-drilled and equipped; by his wise economic policy he made Prussia the model of Europe in this respect; after lengthy bargaining with the Emperor Charles VI he was able to secure the succession to the western Duchies of Jülich (Juiers) and Berg, close to the Belgian and Dutch borders. For his share in the tremendous wars during his reign in the North—Poland, Russia, Sweden under Charles XII and Denmark being engaged—and in the West, they proved in a measure advantageous to him, as he secured the larger part of Swedish Pomerania. Much of the king's time was taken up with the negotiations carried on with the emperor relative to the Pragmatic Sanction and the succession of the Grand Dauphin, Maria Theresa, to the throne. On both sides there was much duplicity, and finally Frederick William turned to the hereditary foe of the Hapsburgs, France, and that was the state of affairs when he died from an attack of the gout consequent on imprudent diet, on 31 May 1740, and a man of a very different fibre, his son Frederick II, subsequently surnamed the Great, stepped into his shoes. This son had been grossly maltreated by his ignorant father (whom he had hated), and during the young man had planned flight to his uncle, the king of England, and had been sentenced to death by his autocratic father for this piece of youthful folly. The old despot even forced his son to witness the execution of his friend and fellow-plottter, a young army officer named von Katt, but finally forgave him and restored him to favor. Young Frederick had passed the years immediately preceding his accession far away from his father's boorish and niggardly court; on a small estate of his own, Rheinsberg, among some choice spirits, both French and German, and had there cherished ambitious dreams and polished his mind in all the refinements of art and learning of the period. Now, with 28, a good-looking, slender, blue-eyed young man, he turned the throne of Prussia to heart full of things he meant to do to render his name famous. When Frederick II began his reign, Prussia had but 48,000 square miles and was thinly peopled. His father had left him the best disciplined army in Europe, numbering 80,000, and 9,000,000 shalers in the treasury, a sum equivalent to five times the amount to-day. Now Frederick could realize those daydreams of his. At once he began a war of conquest against Austria for the possession of Silesia. After the first and second Silesian War had brought him this province, Frederick II, after a peace, began to consolidate and fructify his gains by wise economic measures. But in 1756 the so-called Seven Years' War broke out, Maria Theresa not having been able to reconcile herself to her loss. This tremendous and desperate struggle was waged with varying fortunes, until at last, by the Peace of Hubertusburg, Prussia was left in possession of Silesia. During the Seven Years' War, Frederick II had at times made headway against the combined power of France, Austria and Russia, and England, too, taking part, for or against Prussia. It was only by his undaunted energy and superior generalship that Frederick II was able to defend himself against these powerful coalitions. But when peace came, in 1763, Prussia was in a pitiful condition. In 1772 took place the first partition of Poland, in which Frederick II joined and by which Prussia profited. When at last, in 1786, Frederick died, he left his nephew and heir, Frederick William II (1786-97) a territory of 77,000 square miles with 6,000,000 subjects and an army of 200,000. During the 11 years of his reign Frederick William II the chief event was Prussia's alliance with Austria in order to put down the French revolution, a purpose in which they sienally failed, and next to that the further acquisition of 40,000 square miles by the second and third partitions of Poland. Frederick William III (1797-1840) succeeded, by his weak and vacillating policy, in isolating Prussia and arousing the wrath of Napoleon. In 1806 Prussia was completely defeated at Jena, and her domain was reduced to less than half its former area. In 1813, however, Prussia acting in concert with Austria and Russia, Napoleon was at last overcome by sheer force of numbers and definitely disposed of. At the Congress of Vienna the former possessions of Prussia were restored and new ones added, especially the larger half of Saxony and the remaining portions of Pomerania, as well as valuable territories in the Rhine district. The promise of a liberal constitution given to the Prussian people was kept. The only remaining link, Frederick William III was the establishment of the Zollverein (or free-trade zone) which knitted northern Germany closer together. Frederick William IV (1840-61), a well-meaning monarch of great natural gifts, but of shifting character and erratic mind, went far toward destroying Prussia's prestige and military power, submitting abjectly to the political yoke of Austria. The part played by him during the revolution of 1848-49 was not free from duplicity. However, under pressure he granted a sort of constitution to his people. The last four years of his life he was insane, and on his death was succeeded by William I (1861-88). It was in his reign, in 1866, that the latent jealousy between Prussia and Austria finally burst into flame in one of the shortest and yet most decisive wars, a war lasting but six weeks. At Sadowa the ancient power and glory of Austria were overthrown and the path for aggrandizement thus made clear for Prussia. The Emperor, feathered, outside of Prussia, had sided against her in 1866, and of these she annexed several at the Peace of Prague, including Hanover, Hesse-Cassel, Nassau and Schleswig-Holstein, thus
raising Prussia to absolutely the dominant state within Germany and leaving her one of the leading military powers of the world. The Nord- deutsche Bund (North German Confederation) was formed by Prussia, under the successful statesmanship of Bismarck, and the latter's far- sightedness enabled him even then the war with France. This came about in July 1870 under circumstances which are not quite clear even to-day. Certainly it is that Bismarck and the gifted Prussian chief of staff, von Moltke, together precipitated it by some clever juggling with a despatch from their king referring to the French Ambassador, Benedetti, and King William rousing the French emperor, Napoleon III and the French parliament to outbursts of fury and wounded pride and bringing on a declaration of war from France. The War of 1870-71, in which unexpectedly to the duped Napoleon III, by special previous agreements with Prussia, not only the states belonging to the North German Confederation, but also the Southern ones—Bavaria, Baden and Württemberg—joined, was disastrous for France from start to finish, and at the Peace of Frankfort, humbled France was forced to yield up Alsace and Lorraine, pay an indemnity, and war indemnity of five billions of francs. While, however, the war still lasted, on 18 Jan. 1871, in the historical Salle de Glace at Versailles, the German princes offered the formal primacy of Germany and the imperial crown to King William, who accepted and thus became the first German emperor. On 21 March 1871, the new Reichstag (or Imperial Parliament) met for its initial session at Berlin. From then on, therefore, the history of Prussia is properly but a part of that of the Empire as a whole.

WOLF VON SCHIERBRAND, Professor of German Language and Literature; Chief Correspondent of Associated Press, Berlin.

PRUSSIA. East, or OSTPREUSSEN, öst-pro-fles'en, the northeasternmost province of Prussia, Germany. It is bounded in the south, east and north by Russia, and in the west by the Baltic Sea and West-Prussia. Area 14,320 square miles; pop. (1910) 2,064,175. Capital, Königsberg. See PRUSSIA.

PRUSSIA. West, or WESTPREUSSEN, vest-pro-fles'en, a northeastern province of Prussia, Germany. It is bounded in the south by Russian Poland and the Prussian province of Posen, in the east by East-Prussia, in the north by the Baltic Sea, and in the west by Pomerania. Area, 9,859 square miles; pop. 1,703,474. Capital, Danzig. See Pomerania.

PRUSSIAN BLUE. See Dyestuffs.

PRUSSIAN BROWN, a color obtained by adding a solution of the yellow prussiate of potash to a solution of sulphate of copper, which throws down a precipitate of deep brown. This, when washed and dried, is equal to madder, and possesses greater permanence.

PRUSSIC ACID. See HYDROXYCyanIC ACID.

PRUTENIC, obsolete word meaning Prussian in astronomy, a term applied to certain planetary tables published by Erasmus Reinhold in 1551 founded on the principles of Copernicus. They were dedicated to a Prussian duke of that time and thus acquired their name.

PRUTH, prooth (Ger. prooth), a river of Europe, which rises on the eastern side of the Carpathian Mountains, in the southeast of Galicia near the Hungarian frontier; flows circumspecto, then south-southeast, forming the boundary between Rumania and Bessarabia, and after a course of more than 500 miles enters the Danube on the left, about 12 miles below Galatz. For about 200 miles, from Jassy downstream, it is navigable. On the bank of Pruth, near Husi, in 1771, the army of Peter the Great was surrounded by the Turks, and the Czar was not allowed his freedom until he ceded Azov to Turkey.

PRUTZ, prooths, Hans Georg, German historian: b. Jena, Germany, 20 May 1843. He is the son of Robert Edward Prutz (q.v.), who was educated in Jena and in Berlin and became privat-doent at the latter place in 1873. He was engaged in a government expedition into Syria in 1874, and in 1877 accepted the chair of history at the University of Königsberg, from which he resigned in 1902 and has since then resided in Munich. He has published 'Heinrich der Löwe' (Leipzig 1865); 'Kaiser Friedrich I' (3 vols., Danzig 1871-74); 'Geschichte des Kaiserreiches' (5 vols., Munich 1872); 'Radowits Fortsetzung der Gesetze Friderici Imperatorius des Otto von Freising, etc.' (Danzig 1873); 'Aus Phönicien' (Leip- zig 1876); 'Quellenbeitrage zur Geschichte der

Kreuzzüge (Danzig 1876); 'Besatzungen des Deutschen Ordens in Heiligabend (Leipzig 1877); 'Geheime Lehre und Gehedinstatuat der Tempelbergerordens (Danzig 1879); 'Kulturgeschichte der Kreuzzüge (Berlin 1883); 'Maltseer Urkunden und Register (Münich 1883); 'Staatengeschichte des Abendlandes im Mittelalter. Ein Beitrag zur Geschichte der Alpensee-Geschichte in Einzelfarstellungen (Division II, part 6, 2 vols., Berlin 1885–87); 'Entwicklung und Untergang des Tempelbergerordens (Berlin 1888); 'Die Königliche Albertus-Universität zu Königsberg in Preußen in 19 Jahrhundert (Königberg 1894); 'Aus des Grossen Kurfürsten Letzten Jahren (Berlin 1897); 'Preussische Geschichte (4 vols., Stuttgart 1900–02); 'Bismarck's Boldung: Ihre Quellen und ihre Ansängler (Berlin 1910); 'Die Geistlichen Ritterorden (Berlin 1908); 'Jacques Cœur von Bourges (in Historische Studien, part 93, Berlin 1911); 'Studien zur Geschichte der Jungfrau von Orleans (in Königl. Bayerische Akademie der Wissenschaften, Sitzungsbericht über die historische Klasse, Abhandlung II, Munich 1913); 'Die Briefe Jeanne d'Arc (in Ibid, Abhandlung I, Munich 1914); 'Die Friedensidee im Mittelalter (in Ibid, Abhandlung I, Munich 1915). He has also translated 'Herbod Leben des Bischofs Otto von Bamberg (in Wattenbach, W., ed, 'Geschichtschreiber der Deutschen Vorzeit, 12 Jahrhundert, Vol. VII, Leipzig 1884–96); and has edited 'Rechnungen über Heinrich von Derby's Preussenfahrten, 1390–92 (Königsberg 1883); and with others, 'Allgemeine Weltgeschichte' of which work he wrote 'Geschichte des Mittelalters (Vols. V and VI, Berlin 1891). To the 'History of All Nations' (Philadelphia 1902) he contributed Vols. VIII-X: 'The Age of Charlemagne (translated by H. W. Hayley); 'The Age of Feudalism and Theocracy'; and 'The Age of Renaissance (the last two translated by F. E. Zinkeisen).

PRUTZ, Robert Eduard, German poet and historian: b. Stettin, Prussia, 30 May 1816; d. there, 21 June 1872. He was educated at Berlin, Bonn, and Heidelberg; and in 1837 became professor of Ruge, a radical periodical Hallesche Jahr bucher designed to promote more liberal views in science, politics and religion. His liberal views made him unpopular with the authorities who refused him permission to teach. However, in 1849 he became professor of literature at the university at Halle, but in 1859 resigned to devote himself exclusively to science and literature. His poetry is of the patriotic order, as are also his dramas; his novels display keen powers of satire, and his researches as a historian gave him high rank in that field of literature. As a public speaker, too, he ranked very high and during the latter part of his life, in spite of poor health, he was in great demand as a public lecturer. He was one of the founders of the Deutsches Mus euem. He also edited 'Literarhistorisches Taschenbuch (6 vols., Leipzig 1843–44 and Hanover 1845–48); 'Deutsche Dichter der Gegenwart (Prague 1859); 'Holbergs Ausgewählte Komödien' (translated from the Danish, 4 vols., Hamburg 1854–56, 1860), a part of which are of great importance should be mentioned 'Moritz von Sachsen'; 'Erich, der Bauern König', 'Die Politische Wochenszene', 'Sie haben been collected as 'Dramatische werke' (4 vols., Leipzig 1847–49). His novels, too, are of secondary importance, the best known, perhaps, being 'Das Engelchen' (3 vols, Leipzig 1851). As a poet he ranks much higher, especially in some of his lyrical poems. They include 'Der Rhein' (Leipzig 1840); 'Gedichte' (Leipzig 1841); 'Ein Märchen' (Leipzig 1841); 'Gedichte Neue Sammlung' (Zurich 1842); 'Aus der Herms' (Leipzig 1858); 'Aus Goldenen Fagen' (Prague 1881); 'Herbstrosen' (Munich 1884); 'Mai 1866' and 'Juli 1866' (Leipzig 1866); 'Buch der Liebe' (Leipzig 1869). The most important of his writings, however, consist of his historical and critical works 'Der Göttingen Dichterbund' (Leipzig 1841); 'Geschichte des Deutschen Journalismus' (unpublished, Hanover 1845); 'Dramaturgische Blätter' (Hamburg 1846); 'Kleine Schriften zur Politik und Literatur' (2 vols., Merseburg 1847); 'Vorlesungen über die Geschichte des Deutschen Theaters' (Berlin 1847); 'Vorlesungen über die Literatur der Gegenwart' (Leipzig 1847); 'Zehn Jahre 1840–1850 Geschichte der Neuesten Zeit' (unpublished, 2 vols, Leipzig 1850–57); 'Neue Schriften, etc.' (2 vols., Halle 1854); 'Goethe' (in 'Unterhal tende Belehrung' Vol. XXVII, Leipzig 1856); 'Ludwig Holbergs Sein Leben und Seine Werken' (Stuttgart 1857); 'Deutsche Litteratur der Gegenwart' (2 vols., Leipzig 1859); 'Menschen und Bücher' (Leipzig 1862). Consult Anon., 'R. E. Prutz' (in Moderne Klassiker, Vol. XLIV, Cassel 1852); Bütner, G., 'Robert Prutz' (in Teutonia Arbeiten zur Germanischen Philologie, part 25, Leipzig 1913); Gottschall, R. von, 'Robert Prutz' in 'Unsere Zeit, Leipzig 1872'; Mahly, J., 'R. E. Prutz' in 'Allgemeine Deutsche Biographie,' Vol. XXVI, Leipzig 1888.

PRYCE, Richard, English novelist and playwright: b. Boulouge, France, 14 May 1804. Among his fictions, many of which have been reissued in this country, are 'An Evil Spirit' (1887); 'The Ugly Story of Miss Wetherby' (1889); 'A Just Impediment' (1890); 'The Quiet Mrs. Fenn (1890); 'The Deck-Chair Stories' (1891); 'Miss Maxwell's Affections' (1891); 'Time and the Woman' (1892); 'Winifred Mount' (1894); 'The Burden of a Woman' (1895); 'Elementary Jane' (1897); 'Jezabel' (1900); 'The Successor' (1904); 'Towing-Path Bess' (1907); 'Christopher' (1911); 'David Penstephen' (1915); 'Statue in the Wood' (1918). He has also written the following plays: 'Little Mrs. Cummin' (1909); 'The Visit' (from stories by M. E. Mann, 1909); 'Helen with the High Hand' (from the novel by Arnold Bennett, 1914); together with F. Senn, 'Op-o-me Thumb' (1904); 'The Love Child' (1910); together with W. P. Drury, 'A Frivy Council' (1906), and together with A. Morrison, 'The Dumb-Cake' (1907). Consult Conney, F. T., 'Richard Pryce: An Appreciation' (in Bookman, Vol. XXXVII, p. 520, New York 1913).

PRYNNE, prin. Hester, the principal character in Nathaniel Hawthorne's romance, 'The Scarlet Letter' (q.v.), published in 1850. For her sin with the young printer, Goodman Fanshawe, she was condemned to stand holding her child upon the platform of the pillory in
the sight of the populace and wear a scarlet letter A embroidered upon her bodice. This badge was worn thereafter, with she did expiation by deeds of mercy among her townspeople. Consult Howells, W. D., "Heroines of Fiction" (Vol. I, p. 161, New York 1901).

PRYNNE, William, English author and politician: b. Swainswick, near Bath, Somerset, 1600; d. London, 24 Oct. 1630. He was graduated at Oriel College, Oxford, in 1621 and admitted to the bar in 1628. He early became a militant Puritan, wrote pamphlets against Arminianism and the frivolities of the age and in 1633 published a huge volume, entitled "Histoire-Maxis, the Players' Scourge," further devoted to assaults on theatres, court masques, cards and music. Passages alleged to reflect on the king and queen brought down on him savage punishment. He was prosecuted by the Star Chamber, which included the payment of a £5,000 fine, expulsion from Lincoln's Inn and loss of his degree, having his work burned by the hangman, the loss of his ears, exposure in the pillory and imprisonment in the Tower. Unhappy in spirit he issued tracts and pamphlets, one of which he facetiously entitled "News from Ipswich," against Archbishop Laud and other prelates, calling them, among other names, "Luciferian lord bishops, execrable traitors, devouring wolves." The Star Chamber, in consequence, ordered what remained of his ears again cut off, fined him another £5,000 and had the letters S. L. (seditious libeler) branded on both his cheeks. He remained in prison—still vigorously writing, though, because of a stricter guard, not for the public—till 1640. He was then released by the House of Commons, was awarded damages and made a triumphal entry into London. Later he was member of Parliament for Newport in Cornwall and took part in the prosecution of Laud, but was expelled by Cromwell in 1648 for opposition to the extreme measures leading to the execution of the king. He now published such virulent articles against Cromwell that he was imprisoned. In 1640, after Cromwell's death, he again sat in Parliament and upon the Restoration was made keeper of the records in the Tower. Pamphleteering again brought him into trouble with the House of Commons, but he recanted, and busied himself with the collection of Parliamentary records. He produced more than 200 volumes of which the most valuable are "Collection of Records" and "A Brief Register, Calendar and Survey of Parliamentary Writs" (4 parts, London 1659-64). A copy of his writings and their many editions will be found in "British Museum Catalogue of Printed Books" (p. 159-183, London 1895). The most authoritative list of them is attached to S. R. Gardiner's work published by the Camden Society and mentioned below. Consult Bliss, P., ed., "A à Wood's "Athene Oxoniensis" (new ed., Vol. III, p. 844, London 1817); Firth, C. H., "William Prynne" (in "Dictionary of National Biography," Vol. XLVI, London 1896); Gardiner, S. R., ed., "Documents Relating to Petitions against William Prynne" (in Camden Society Publications, n. s. Vol. XVIII, Westminster 1877); id., "History of England 1603-42" (Vols. VII-IX, London 1884); id., "History of the Great Civil War" (3 vols., London 1888-91); Pocock, R. E. M., "The Annals of the Parish of Swainswick" (London 1890).

PRYOR, Nathaniel, American soldier, trader and explorer: b. (probably) Amberst County, Va., about 1785; d. Los Angeles, Cal., 1850. He was a great grandson of Nickett, daughter of Gunt and wife of Pocahontas. Left an orphan in infancy, he was taken to Kentucky by the family of his maternal uncle, Charles Floyd. In 1803, he enlisted as a private soldier in the army for the purpose of accompanying Lewis and Clark on the expedition across the continent to the mouth of the Columbia. Returning in 1806 with the rank of a sergeant, he was commissioned an ensign and assigned to the command of the detachment sent to escort Shahaka, the Mandan chief to his home on the Upper Missouri. He was discharged in 1807, but failed because of the hostility of the Arikara Indians. He was promoted to a lieutenant in 1808 and resigned from the service in 1810, engaging in trading and lead mining. During the War of 1812, he re-entered the military service and was discharged at its conclusion with the rank of captain. He then became a trader among the Osage Indians, in Oklahoma, operating a trading post near the mouth of the Verdigris River part of the time. In 1821 he joined Fowler and Glenn on their trading expedition to the Rocky Mountains. In 1824 he joined the Pattie's on their trading expedition to the Rocky Mountains and followed all of their wanderings until they arrived in southern California, where the entire party was imprisoned. After his liberation he settled at Los Angeles where he remained until his death. Pryor Creek and the town of Pryor, county-seat of Mayes County, Okla., were named for him. Consult Nuttall's "Journal; Long, Stephen N., "An Expedition from Pittsburg to the Rocky Mountains in the Years 1819 and 1820"; Coes, Elliott, "The Journal of Jacob Fowler"; Flint, Timothy, "Pattie's Narrative," and James, Thomas, "Three Years among the Indians and Mexicans."

PRYOR, pri'or, Roger Atkinson, American lawyer: b. Dinwiddie County, Va., 19 July 1828; d. 1919. He was graduated at Hampden-Sidney College in 1845 and at the University of Virginia in 1848 and was admitted to the bar in 1849. For a number of years he was editor of newspapers in Petersburg and Richmond, Va., and in 1855 was appointed special assistant to Girod and was a member of the Congress 1859-61 and in the Confederate Congress in 1862. He entered the Confederate army with the rank of colonel in 1861; was brevetted brigadier-general in 1862, but resigned his commission and re-entered the army as a private. From 1864-65 he was a prisoner at Fort Lafayette, N. Y. After the war he settled in New York City where he was admitted to the bar in 1866. From 1890-94 he was a judge of the Court of Common Pleas and from 1894-1899 a Justice of the Supreme Court. He then resumed the practice of law. He published "Essays and Addresses" (New York 1912). Consult Hardy,
PRYTAENEUM — PSALMS, BOOK OF

PRYTAENEUM, the building in the capital of a Greek state possessing similar features to the Pantheon of modern communities but having in addition a religious significance and devoted to purposes peculiar to the Greek state. It was dedicated to Vesta and contained the perpetual fire of the state hearth. At Athens (q.v.) the state house of foreign ambassadors, its envos returned from a public mission, its distinguished generals, victors in the Panhellenic games and citizens who had done important service to the state. In the latter case the privilege lasted for the life-time of the recipient. The exact location of the Athenian Prytaneum has never been determined. In the same manner each city and village had its Prytaneum, forming the religious and political centre of the community. Consult Michel, C., 'Prytaneum' (in Saglio, E. and others, ed., 'Dictionnaire des Antiquités Grecques et Romaines,' Vol. IV, pt. I, p. 742, Paris 1907); Poland, F., 'Geschichte des Griechischen Vereinlehens' (Leipzig 1909).

PRZEMYSL, pzhɛ̃mˈ isl, Austria, one of the oldest towns in Galicia, on the river San, 51 miles west of Lemberg. It is strongly fortified, being a place of strategic importance. It has an active trade and thriving industries. Przemyśl was founded in the 8th century by the Polish prince Przemyslaw, and called after his name. The ruins of the ancient residential castle are on a neighboring hill. During the European War Przemyśl was invested by the Russians in September 1914. For about two weeks in October the investment was broken, and troops, arms and provisions were hurriedly transported to the fortress. By 12 Nov. 1914 the town was completely cut off again and besieged by General Selivanoff. On 22 March 1915 the town surrendered with nine generals, 2,500 officers and officials and 117,000 men. In the great Galician drive of von Mackensen in the summer of 1915, when the Austro-German forces stood at the gates of Przemyśl, the whole Russian garrison disappeared from the town during the night of 2-3 June 1915.

PSALMANAZAR, səl-mənˈ azər, George ("THE FORMOSAN"), French literary impostor: b. probably in Languedoc, France, about 1629; d. London, England, 3 May 1763. He was educated by the Jesuits, led a vagrant life in Brabant, Flanders and Germany, posing as a Japanese convert. Later he enlisted in the Dutch service, and finally attracted the attention of Innes, chaplain of a Scottish regiment at Sluys, Holland, who apparently converted him to Protestantism and took him to England, where he was presented to Bishop Compton and others as a native of Formosa. Whether Innes was duped by Psalmanazar or was an accomplice is uncertain, but the supposed Formosan was treated with great honors, encouraged to write 'An Historical and Geographical Description of Formosa' (1704), translated parts of the English Catechism into the supposed Formosan language, and later was sent to Oxford. A few years later he published 'A Dialogue between a Japanese and a Formosan' (1707). He repented of his imposture, however, confessed his duplicity, and devoted himself to study. He became a fine Oriental scholar and led a much respected life in London. He wrote 'Essays on Scriptural Subjects' (1753); and volumes of the 'Universal History'; and completed Palmer's 'History of Printing' (1732). Consult autobiographical 'Memoirs of . . . commonly known by the name of George Psalmanazar' (1764).

PSALMODY, səlˈ mə di or səˈ mə di, a singing of the Psalms (q.v.) of Scripture in metrical versions. Most simple psalms and hymns were sung in the religious assemblies of the early Christians; and the psalms of Scripture form the bulk of the daily religious service or 'Divine service' of the Catholic Church, the custom having been borrowed from the synagogue and the temple of Jerusalem. After the Reformation in the 16th century psalmody was greatly encouraged in the Protestant churches of Germany, France and the Low Countries, and most of the psalm melodies now sung in churches were composed or adapted by German musicians of the 16th century. Metrical versions of the Psalms were made in German, French and English. The Scotch reformers paid great attention to psalmody: in John Knox's psalter the Sternhold and Hopkins metrical English version of the psalms was arranged with four-part harmony. The metrical version now used in Scotland is the one made by Francis Rous during the Commonwealth and approved by the General Assembly of the Scottish Church. Consult Arnknecht, F., 'Die Heilige Psalmodie' (Göttingen 1855); Bonner, D. F., 'The Psalmody Question' (New York 1908); Cooper, J. S., ed., 'True Psalmody' (Philadelphia 1859); Kent, C. F., ed., 'The Songs, Hymns and Prayers of the Old Testament' (New York 1914); Parker, W. H., 'The Psalmody of the Church, Its Authors, Singers and Uses' (New York 1892); Soulier, E., 'Les Origines de la Psalmodie' (Paris 1901).

PSALMS, Book of. Title.—The Old Testament gives no title to the book as a whole. The ordinary Hebrew designation for the book is Sepher Tehilim meaning 'Book of Praises.' The common title in the Septuagint is Psalmoi, Psalms, a designation taken from one of the minor collections of the book. This Septuagint title has been followed in most of the versions, including the English.

Authorship, Date and Compilation.—The titles of the individual psalms contain many statements which have usually been considered to be ascriptions of authorship to various persons. These statements consist of proper names preceded by the Hebrew preposition le, which may denote authorship, but may also mean belonging to in more general significations. Most prominent of these statements is the title in which the Hebrew preposition precedes the name David, the 'Psalms of David.' This title is found with 74 psalms, the actual authorship of David being impossible in a large majority of these, as shown by the circumstances, language and thought. If this title was intended to indicate authorship, therefore, it was in most cases erroneous. The 12 psalms with the title of Asaph, also, could not have been written by Asaph, who was a contemporary of David, the psalms being of much later origin. The title of the sons of Korah, in 11 psalms, can hardly have been intended to
indicate authorship by a group. The sons of Korah, according to 2 Chron. xx, 19 and elsewhere, were a guild of temple singers after the exile. It is therefore often and preferably held that these titles were not intended, in most cases, to indicate authorship, but to show that the individual psalm had belonged to a minor collection of psalms designated by the name in question, sons of Korah designating a collection used especially by the guild of the sons of Korah, and Asaph indicating a collection used by the Asaphite guild, which was also prominent after the exile. Several other minor collections are also indicated by the titles, the Hebrew names of these collections being Shir, Miktam, Maskil, etc. Most of the psalms were in more than one of these minor collections, some in one only, a few in none. The evidence indicates that when a compiler used a psalm from an earlier collection he put the name of the collection, or a term derived from the name, as a title at the head of the psalm; when used again a second title was added, etc. It is probable that at last 10 of these minor collections which preceded the present Psalter can be traced, the earliest having been made soon after the exile, and the latest in the early Greek period or somewhat later. The Elohist Psalter, one of these minor collections, needs special consideration for some of its peculiarities. This embraces Psalms xxxii–lxxxiii, and is characterized by a great preponderance of the use of the divine name Elohim, in the present text not to the entire exclusion of the term Yahweh, but perhaps originally so. This was probably partly a matter of original composition, but was certainly in some measure due to editorial change. Such editorial change appears clearly from the fact that Psalm lxi is an Elohist recension of Psalm xiv, and Psalm lxx, of Psalm xli, 13–17, and also from a few other details. The reason for the use of the divine name Elohim, both originally and editorially, is very uncertain. It doubtless represents the usage of some circle or region. The documents of the Hexateuch, it is well known, present similar phenomena, but as those were written much earlier there may be no direct connection. It seems hardly probable that the usage is due to the superstitious avoidance of the divine name Yahweh, which was common later. Psalms cxxv–cxxvi constitute a collection usually called Songs of Ascents, and supposed to be pilgrim songs sung by those who were going up to the great feasts at Jerusalem. The title should probably be rendered Exalted Songs, describing the collection as distinguished by special elevation of thought and feeling, which is in harmony with their character. They have also unusual regularity of form. There are also indications of other small collections not as definitely marked as those which have been described. Thus Psalm cxxxv, 21 has the appearance of being a doxology originally closing a small collection. There are indications, also, that the closing doxology of book four was originally the doxology closing a small collection. Psalms xcvi–cxxxvi, 21 has the appearance of being a doxology originally closing a small collection. There are indications, also, that the closing doxology of book four was originally the doxology closing a small collection. Psalms xcvi–cxxxvi, 21 has the appearance of being a doxology originally closing a small collection. The complete Book of Psalms as it now exists, or practically so, was probably compiled about 200 B.C., allusions in the book of Ecclesiasticus, written about 180 B.C., making it probable that it was practically complete at that time. It is now generally held that only a small part of the psalms were written by the prophets. The division into five books doubtless did not take place during the compilation, but later after the compilation was complete, following the analogy of the divisions of the law.

Other proper names appear in the titles of the psalms with the Hebrew preposition le. These are Solomon in 72 and 127; Moses, 90; Ethan, 89; and Heman, 88. It is probable that no one of these marks a collection, and hence that the titles were designed to indicate authorship. But none of them were written by the respective authors indicated. It is probable, therefore, that these psalms should be regarded as pseudonyms, later compositions considered to be in the spirit of these men.

Davidic Psalms.—The number of psalms to be ascribed to David is a much-disputed question. The opinion was held earlier that nearly all the psalms were written by David. It is still believed by some that as many as 40 psalms were written by him. On the other hand, his authorship of any psalms is often denied in the present time. The character of David and the general level of the thought of his time are not favorable to the opinion that he was the author of many psalms. Nevertheless, compositions similar to the psalms are earlier than David, and he is by tradition closely connected with the psalms, while his general musical ability is several times noted. The Davidic authorship seems probable for Psalms iii, vii, xiii, xviii and xxiv, 7–10. These are simple in thought and style and have a pronounced war-like element.

Thirteen psalms contain in their titles references to specific events in the life of David which are said to have called them forth. The notice might be correct in the case of Psalm 18, but in every other case the notice is definitely out of harmony with the contents of the psalm, 10 of the psalms being quite certainly not of Davidic authorship. These notices are probably later traditions of no historical value, or else illustrative additions made by a later compiler.

Maccabean Psalms.—Some have thought that many psalms were written during the Maccabean period, beginning in 168 B.C. The religious devotion and patriotism of the early Maccabean period might naturally have prompted such expression, and some are in a measure appropriate to that time. In the Maccabean period, however, Hebrew, it seems evident, had been replaced as a spoken language by Aramaic (con- sult Bultenweiser, 'Are There Any Maccabean Psalms,' Journal of Biblical Literature, XXXVI, 1917, pp. 225–248). Hence Hebrew, if used, would have been employed in an artificial and inexact manner such as does not appear in the psalms. The Maccabean origin of any psalms is therefore improbable.

Musical and Liturgical Titles.—Besides the elements in the titles already discussed, musical and liturgical instructions are also found. Two of these are: 'For the Sabbath day' in the title of Psalm cxxii; 'A song at the dedication of the house' in the title of Psalm xxx, etc. The liturgical titles are much later than the psalms themselves, and are added only in a few cases.
in no systematic way; they evidently represent the usage of the Jews at the time of their addition. The Septuagint has several additional liturgical assignments.

Musical directions form part of the title in thirty psalms. It is probable that they were first added in the Elohist Psalter, 20 of them being found there. These titles are of three kinds: references to musical instruments; references probably to voices although possible, and the effects of musical instruments; and references to the melodies in accordance with which the psalms are to be sung, a melody being usually designated by one or more of the opening words of a well-known song with which it is associated.

Community Psalms.—In Psalm cxxiv it is explicitly said that the speaker is Israel. In a considerable number of psalms which are expressed in the first person the obvious view is that the speaker is the community or the nation, or at any rate some considerable portion of the people. The question has been much discussed in recent years whether this is not the correct understanding of many or most of the psalms written in the first person singular, instead of the individual interpretation. The question is one that must be settled in each case by the evidence at hand, with no definite presumption in favor of either view. The indications of an individual interpretation are strongly marked individual traits. The indications of a community interpretation are the absence of such strongly marked individual traits, and also the presence of elements of experience which are difficult to reconcile with an individual interpretation, more strongly suggest some community experience. The result is that many of these psalms seem to be individual, and many to belong to the community. Doubtless in some cases an original individual psalm has been revised to make it more appropriate for community use, but this is a process difficult to trace.

The Poetical Character of the Psalms.—The poetical character of the Psalms in general, of the essential nature of Hebrew rhythm. Many regard accent as its essential feature; but the better view seems to be that, in the very nature of the case, duration of time, rather than accent, is the fundamental element in rhythm. The Hebrew foot, therefore, has the same essential nature as the classical foot, but is more elastic. The Hebrew foot may be defined as follows: A group of syllables, more or less in number, which, together with any silences that may be included, occupies in utterance a time relatively fixed, that is, the same as other feet in the same composition (consult Lanier, 'The Science of English Verse,' p. 40). The number of feet in a line in the Psalms varies from two to six, there being a measure of uniformity in an individual psalm. The normal stanza consists of two lines, being ordinarily a verse. A division into strophes, a regular combination of several stanzas, is found occasionally, but is no regular feature of Hebrew poetry, although it is to be expected. This division into strophes, when found, is sometimes marked by a refrain. Parallelism of the lines of a stanza is frequent but not universal, parallelism being also found in Hebrew prose. Assonance, particularly the repetition of the same word in lines near together, especially in the two lines of a stanza, is frequent. Most of the Psalms are lyric, a few didactic while a few have a dramatic element. Psalms ix, xxvi, xxxiv, xxxix, cxxxvii, cxxi, cxxii, cxxix, cxxviii have the alphabetic or alphabetical form, in which the separate lines, or stanzas (verses), or two successive stanzas, begin in Hebrew with the successive letters of the alphabet. Ps. cxxix, however, is distinguished by being divided into sections of eight verses, each verse in a section beginning with the same letter.

The Thought of the Psalms.—As the psalms are for the most part lyric they are primarily an expression of feeling. Hence a presentation of thought would naturally be in a less connected form than in other parts of the Old Testament. Nevertheless, the book contains the principal phases of thought found elsewhere in the Old Testament. The imprecations found in abundance in several of the psalms constitute their most direct expression of the thought of the present day. Yet that feature is easily intelligible when approached historically and constitutes no real difficulty when understood in relation to the time. Several of the psalms show an attitude that is favorable toward the ritual itself, and yet in each case by the evidence at hand, with no definite presumption in favor of either view. The indications of an individual interpretation are strongly marked individual traits. The indications of a community interpretation are the absence of such strongly marked individual traits, and also the presence of elements of experience which are difficult to reconcile with an individual interpretation, more strongly suggest some community experience. The result is that many of these psalms seem to be individual, and many to belong to the community. Doubtless in some cases an original individual psalm has been revised to make it more appropriate for community use, but this is a process difficult to trace.

George Ricker Berry, Professor of Old Testament Literature and Semitic Languages, Colgate University.

PSALTER, säl'tər, the Book of Psalms (q.v.); also a book containing the Psalms separately printed; also specifically, the version of the Psalms in the English Book of Common Prayer. It is also the name of an ancient string instrument of music, the Hebrew kinnor; called by the Germans 'Roten' (Teutonica). Sometimes the rosary of 105 beads used by some order of nuns is called the Psalter, as the Psalter contains 150 Psalms. Consult Bovet, F., 'Histoire du Psautier des Eglises Reformées' (Neuchâtel 1872); Jordan, W. G., 'Religion in Song, or Studies in the Psalter' (London
1915) · Mackmecken, J. W., 'History of the Scottish Metrical Psalms' (Glasgow 1872); Strauss, O. 'Der Psalter als Gesang—und Gebet-Buch' (Berlin 1859); Whitham, A. R., 'Christian Use of the Psalter' (London 1908).

**PSAMMETICHUS, psä-mët-i-küs** (Greek ψαμμήτης, Egypt Psammetek), the name of three rulers of the 26th dynasty. **PSAMMETICHUS I**, first monarch (664-610 B.C.) succeeded his father Necho, who had been chief of 20 local princlings and vassal of Asurbanipal, King of Assyria. He is first heard of as feudal lord of Sais, the chief centre of the western delta. He formed an alliance with Goges, king of Lydia, against the suzerain power of Assyria; and by the aid of Carians and Ionian Greeks supplied by Goges, defeated the Assyrian vassal-kings and was crowned 'lord of the two Egyptians.' Herodotus says he blockaded Azotus (Ashdod) for 20 years; and he may indeed frequently have besieged it. He made Phoenicia a vassal state, and devoted much attention to art and architecture. The demotic (or enchorial) writing which, because of greater facility, superseded the hieratic, was invented during his reign, though it cannot be ascribed to his initiative. **PSAMMETICHUS II** (594-589 B.C.) was grandson of the above. His reign is of note chiefly because of the inscriptions made at Abu Simbel (q.v.), by his Greek, Carian and Phenician mercenaries. **PSAMMETICHUS III** (526-525 B.C.) was last king of the dynasty. His reign was brought to a close by the Persian conquest, and Egypt became a province of Persia.

**PSARA, psä-rä, or IPSARA** (Gr. Πηρία), an island belonging to Greece, in the Ægean Sea, seven miles northwest of Khios; about five and a half miles in length, and as many in breadth. It consists almost entirely of rock, thinly covered with a vegetable mold. At one time it had considerable commerce, and a population of 30,000. However, in 1824 it was invaded by Turkey, and after having been devastated most of its inhabitants were killed. As a result of the Balkan Wars (q.v.) of 1912-13 and of the Treaty of London it was, in 1914, annexed, with the consent of the Great Powers, by Greece. Pop. about 4,500.

**PSEUDOEPIGRAPHA.** See APOCALYPIC LITERATURE. **PSEUDO-ISIDORIAN DECRETALS.** See DECERTALS.

**PSEUDOLOUCHEZMIA, su'dô-loe-së'-mi-a, or HODGKIN'S DISEASE,** a disorder of the lymphatic glands and sometimes an affection of the spleen, characterized by anaemia and progressive hyperplasia. It is also attended by secondary lymphatic growth variously distributed in the body. Leucocytosis—excess of white corpuscles in the blood—which accompanies many blood diseases, is not present in pseudo-leucomezia. See BLOOD.

**PSEUDOMORPH,** the name applied to a mineral which has replaced another, or which appears in crystal forms which are foreign to its original formation. Massive varieties of minerals are more subject to such changes, but the action is frequently more difficult to trace. There are three kinds: Pseudomorphs, epimorphs, and paramorphs. See also MINERALOGY.

**PSEUDONYM** (Fr. pseudonyme, from Gk. pseudonymos). A name adopted by an author who desires to remain unknown, or assumed for the purpose of attracting more attention at first than might follow from the use of the author's own name. (See ANONYMOUS.) Pseudonymous authorship raises certain legal points as to the rights of the author under the Copyright Law (q.v.). In the United States it has been held, though not always, that a copyright acquired under a pseudonym protects fully the actual author if he is the user of the pseudonym. In practically every civilized country there have been published 'Dictionaries of Works Listing and Revealing the Pseudonyms used by their respective authors. For pseudonyms used by the authors of France, Germany, Great Britain, the Middle Ages and the United States. Consult Barbour, A. A. 'Dictionary of Pseudonyms' (3d ed., 4 vols., Paris 1872-79; supplement, edited by P. G. Brunet, Paris 1889); Celani, H., 'Additions et Corrections au Dictionnaire des Anonymes de Barbour' (in Revue des Bibliothèques, Vol. X, p. 223, Paris 1901); Courtney, W. B., 'The Secret of our National Literature' (London 1908); Cushing, W., 'Initials and Pseudonyms' (2 vols., New York 1885-88); Franklin, A. L. A., 'Dictionnaire des Noms, Surnoms, et Pseudonymes Latins de l'Histoire Littéraire du Moyen Age, 1100-1530' (Paris 1875); Halkett, S., and J. Laing, 'A Dictionary of the Anonyme and Pseudonymous Literature of Great Britain' (4 vols., Edinburgh 1882-88); Haynes, J. E., 'Pseudonyms of Authors' (New York 1882); Holmly, C., and J. Both, 'Pseudonymen Lexikon' (Vienna 1906); La Fare, A., ed., 'Petit Dictionnaire des Pseudonymes' (in 'Tort-Paris', p. 802, Paris 1918); Manes, A., 'Das Recht des Pseudonymen' (Göttingen 1899); Marchmont, F., 'A Concise Handbook of Literature Issued under Pseudonyms and Initials' (London 1896); Querard, J. M., ed., 'Les Supercheries Litteraires Devoilées' (3d ed., 3 vols., Paris 1899-1902); Thomas, R., 'Handbook for Fictitious Names' (London 1868); Id., 'Aggravating Ladies: Being a List of Wörterbuch der Pseudonymen. A Lady' (London 1880); Weller, E., 'Lexicon Pseudonymorum; Wörterbuch der Pseudonymen aller Zeiten und Völker' (Regensburg 1886).

**PSEUDOSCOPE, in optics,** an instrument, invented by Wheatstone, for producing an apparent reversion of the relief of an object to which it is directed, by the transposition of the distances of the points which compose it. A false impression is thus conveyed to the eye, a globe becoming apparently concave and a hollow body assuming a convex form. See OPTICS.

**PSEUDOSUCHIA,** an order of Crocodylia. See HERPETOLOGY.

**PSILOMELANE, a hard, dull, black mineral, essentially a hydrous manganese manganate, but part of the manganate often replaced by barium or potassium. It occurs abundantly massive in botryoidal and stalactiform forms in Germany, England, Arkansas and many other localities. It is one of the commonest ores of manganese.
PSITTACI, sit'a-si, the parrot tribe, a family of scansional birds, comprising over 300 species, of which the genus Psittacus is the type. See Psittacus.

PSKOV, pskóf, or PLESKOV, Russia, (1) town, capital of the government, on the right bank of the Velikaya, which here receives the Pleskova, 165 miles south-southwest of Petrograd, with which, as also with a number of other cities, it is connected by railroads. There is also a steamship line between Pskov and Dorpat. It is walled, flanked with towers, all in a very dilapidated state, as are also many of the houses. It consists of the Kremlin, the Central city, the Great city and a considerable suburb. All the private houses and the far greater part of the public edifices are of wood. The finest buildings are in the Kremlin. The principal manufacture is Russian leather; and there is a considerable trade in hemp, flax, tallow, hides, etc. Pskov is the see of an archbishop and possesses a theological seminary, a well-managed hospital, an ancient cathedral and other old churches and monasteries, most of the latter being in ruins. It is said to have been the birthplace of the Princess Olga toward the end of the 10th century. During the Middle Ages it possessed great importance as a trading centre and for a long time maintained its freedom as a city republic, which it lost in 1509 when it came under the rule of Moscow. It went through a number of sieges and gradually deteriorated, though with the coming of railroads, it regained some of its former mercantile prosperity. Pop. 38,300.

(2) A government of Russia, bounded north by Petrograd, northeast by Novgorod, east by Tver, southeast by Smolensk, south by Vitебsk, west by Livonia; area, 16,678 square miles. The surface toward the southeast is traversed by the Valdai Hills, but sinks gradually down near the centre, having only a gentle slope toward the north and west. The soil is throughout of poor quality and can only be made to yield tolerable crops by fertilization. Wheat is seldom grown, and the principal crops are flax, oats and barley, which are raised in considerable quantities, so as to leave a surplus for export. Forests are extensive, but the wood is not of the best quality. The only other manufacture of importance is leather. There are more than 800 lakes in the government, covering about 390 square miles. The largest of these is Lake Pskov (300 square miles). Over 1,200 square miles are covered by marshes. Pskov is divided into eight districts. The majority of its population are Great Russians. Pop. 1,447,000.

PSORIASIS, só-ré-a-sis, chronic skin disease, allied to aliphus and lepra, non-contagious but often hereditary. It is characterized by an inflammation of the skin, with the formation of bran-like patches, dry and various in number, size and shape, to which grayish scales adhere. These exfoliate, to be repeatedly renewed. The extensor sides of the extremities, the elbows, knees, and the thin parts of the neck and the flexor sides of the limbs are afterward attacked. Only the mucous membranes of the body are exempt from this disease, the cause of which is little understood, and which requires for treatment competent medical skill. It is mainly a disease of adult life. The treatment is both external and internal, the former being the more efficacious. Arsenic is a favorite in internal treatment, but its use is open to serious disadvantages. A solution of boric acid is a common saline preparation used in treating psoriasis. Salvarsan and neosalvarsan have proved ineffective. Hot baths at night, with a liberal use of soap, assist greatly in removing the scales. Saffron is also found useful for this purpose. Consult Hutchins, M. B., "Psoriasis." (in 'Reference Handbook of the Medical Sciences,' Vol. VII, New York 1916).

PSOVIE, or BORZOI. See Greyhound.

PSYCHE, psíkhé (Greek ψιχή, meaning breath, soul, life), in Greek mythology, a beautiful maiden regarded as an allegorical personification of the human soul. In a version of her story given by Apuleius in 'The Golden Ass,' she is the daughter of a king and far outshines in loveliness her two elder sisters. Men take her for Venus herself and pay her the homage due to the goddess. In anger Venus directs Cupid to inspire her with a love worthy of her, but Cupid, himself falls in love with Psyche. Meantime her father consults the oracle of Apollo regarding his daughter's marriage, and is commanded to convey her to the summit of a mountain and there leave her, for she is the destined bride of a monster dragon feared by gods and men. Sorrowfully he obeys, but when Psyche is left alone she is wafted by Zephyr to the palace of Cupid who visits her every night and departs unknown before morning. She is warned by her lover never to seek to know who he is, and no break would have occurred to her happiness had she not allowed her Jealous sisters whom she admitted to her confidence to half persuade her that she held a hideous monster in her arms. One night while Cupid slept she came with a lamp to see him and in her astonishment and joy at beholdine the most beautiful of the gods she lets fall a drop of heated oil upon his shoulder. Cupid awakes, reproaches Psyche for her suspicions, and leaves her. After trying in vain to drown herself, Psyche wanders from place to place seeking her beloved till she comes to the temple of Venus. Having Psyche at last in her power Venus treats her as a slave and imposes menial tasks, under which the maid would sink but for secret help obtained from Cupid. At length Venus orders Psyche to descend to the realm of shadows and bring away Proserpine's box of cosmetics. She succeeds in the adventure, but on opening the box is assailed by a deadly vapor issuing therefrom and perishes. Cupid now reappears, touches her with an arrow and restores her to life. Venus is reconciled, and Jupiter places Psyche among the immortals. Her marriage to Cupid is celebrated with great festivities, while her envious sisters cast themselves from a precipice. The story, as the name implies, doubtless was an adaptation of, and possibly was founded upon, the theory of the pre-existence of the soul, its suffering in this life, and then final redemption. The mythical story are to be found in early Greek and Roman art, dating even from the 2d century B.C., Psyche being represented as a delicate maiden with butterfly wings. Consult a translation of Apuleius' story in Walter Pater's 'Marius the Epicurean' (London 1883; new ed., New York
1902); and poetical versions of the tale in Morris' 'Cupid and Psyche' in 'The Earthly Paradise,' and Bridges, 'Eros and Psyche'; Conant, 'De Psyching' (Mungerbush querubis) (Berlin 1855); Rohde, E., 'Psyche' (1894).

PSYCHIATRY, that branch of medicine which deals with diseases of the mind. Historically while mental diseases have always been recognized, they have often been thought to be of divine or diabolical origin and their consideration has been hopelessly entangled with religion and with metaphysical speculation. Even after mental diseases came to be recognized as the legitimate occupation of medicine their study was for a long time confined to the more serious varieties, collected under the caption "insanity," which were found only in the asylums, and correspondingly the study of these patients and their illnesses became a distinct specialty of the asylum physicians (alienists). The practice of mental medicine in this restricted field tended for a long time to be little more than the custodial, albeit kindly care, of the seriously ill of mind. The great mass of practitioners of medicine had little or no interest in the subject. During the asylum period in the history of psychiatry very little was accomplished in the way of the scientific development of this branch of medicine. Its very isolation operated to prevent its growth and when finally progress did gain access to the asylum it was more occupied with humanitarian than with more strictly scientific problems. Then, too, the sciences upon the basis of which a firm foundation for psychiatry could be laid were not far enough advanced to warrant much progress. The science of psychology was honeycombed with metaphysical speculations and has only come to a systematic effort at an experimental elaboration of its data during the past generation. As a result of these conditions the early history of psychiatry is a history of more or less crude speculations, classifications and descriptions. Little was suspected of underlying causes and metaphysical discussions of the relation of mind and body effectually prevented all practical considerations of human behavior.

Present-day psychiatry has been made possible by advances which have been made in the sciences upon which it rests, particularly by the advances in psychology, or more particularly that department of psychology which deals with abnormal mental reactions, namely psychopathology. A better understanding of the nature of mind and its position in the general evolutional scheme has made it evident that mental disease is the psychological manifestation of difficulties and defects of adjustment due either to causes operating within (endogenous) or from without (exogenous). Psychiatry thus becomes concerned with discovering these causes and makes a therapeutic approach to the problem presented by the symptoms of mental diseases by attempting to secure a better adjustment by removing the causes, avoiding their operation, or effecting some compromise solution. Inasmuch as defects of adjustment of some sort are present in practically every one, psychiatry has come to deal with all problems of mental health and not only the severe types of maladaptation found in the hospitals for the insane. Its therapeutic armamentarium includes not only all of the mechanical (surgery) and chemical (drug) methods of general medicine, but psychological methods (psychotherapy) as well as efforts at social rehabilitation and readjustment. It therefore includes the whole field of mental medicine, reaching into the field of social adaptation as a very important point of its domain and including, on the preventive side, the problems of mental hygiene.

To particularize the more important fields in which psychiatry has become important in recent years. In the first place there is of course the field of the so-called insanities or the frank psychoses such as we see in the hospitals for the insane. This field has been greatly broadened of late by appealing to patients to seek the assistance of the hospital before becoming seriously ill and availing themselves of the hospital's help after recovery to re-establish themselves socially. Then there is the immense field of the defective including the problems of the idiot and imbecile; the backward child in the school; and the innumerable problems of social maladaptation which have their roots in defects of mental growth such as many aspects of prostitution, criminality and poverty. The whole field of criminology belongs essentially in the domain of psychopathology and thus comes within the practice of mental medicine-psychiatry. The most important field of modern psychiatry is perhaps the neuroses and psychoneuroses, which include those conditions known as hysteria, neurasthenia, obsessions, doubts, fears, impulses, etc. The persons who manifest this group of symptoms are not infrequently well endowed mentally, but their efficiency is greatly impaired by their illness. They can now be greatly helped by appropriate psychotherapeutic treatment. A study of these conditions has shown so clearly the conditions from which they grow that a further advance in preventive medicine along these lines will project the findings of psychiatry upon the problems of education and in fact the whole great group of problems involved in successful living. The principles which are found applicable to all these various abnormalities are as truly applicable to transient mental disturbances in quite normal people such as for example as various types of nervousness, unhappiness or difficulties of adjustment dependent upon some character trait. The differences between the normal and the abnormal mind is only one of degree so that the field of psychiatry has now broadened to include what but a short time ago would have been considered the normal but where minor maladjustments prevent the fullest efficiency.

PSYCHIATRY AND WAR

William A. White, M.D., Superintendent of Saint Elizabeth's Hospital, Washington, D. C.

PSYCHIATRY AND WAR. In harmony with the general fact that it is man's mind that receives last consideration in questions of health it has taken until the present war for any real appreciation of the incidence of mental disease in the military forces to get recognition. The Russians in the Russo-Japanese War had a regular organized service for caring for the mentally ill, removing them from the front and taking them back to the hospitals at Moscow and Saint Petersburg, but it has remained for the present war to develop a real comprehensive appreciation of the nature of the problems involved. The first of these problems, namely the examination of recruits for the purpose of eliminating the mentally defective or otherwise affected individuals who would probably not be able to stand the stresses of actual conflict, has been developed more elaborately in this country than in the European countries, probably for the obvious reason in America the man power has not been so severely taxed, for when it is experience teaches that all methods of examination which result in the elimination of recruits are looked upon with progressively less favor.

The general plan in dealing with mental illness in the American army is broadly as follows: first, a weeding out of defective and otherwise mentally abnormal individuals in the various camps, the establishment in connection with the various hospitals, particularly the large base hospitals, of psychiatric wards in charge of a competent psychiatrist and assistants, with a detail of nurses who have had experience in institutions for the care of the mentally ill. The mental cases thus in the large base hospitals receive their proper classification and therefore treatment as do other various illnesses and injuries. Coupled with this fundamental organization there is an effort to segregate the mental case as soon as possible back of the firing line and to place him under treatment at the base hospitals. The hospitals therefore naturally took their place alongside of other departments in the great hospitals for the American troops on the other side. In these divisions of the hospital the mental ill received prompt treatment, the object being to deal with minor mental ailments promptly before they have become aggravated or chronic with the immediate object of getting the soldier back into the service and avoiding the necessity of invaliding him home.

The present war has developed no new forms of mental disease. The particular delusions or hallucinatory experiences of the mentally ill naturally vary and take their material from the immediate surroundings. Aside from this the pictures of mental illness are the same as we are accustomed to see in civil life. The one overwhelming feature, however, which distinguishes the mental cases in this war is the prevalence of the neuroses, grouped together under the somewhat misleading and general term "shell shock." These neuroses seem to offer nothing particularly different from those that are seen in civil life, but are very numerous and a source of serious concern because of that fact. It is because many of these neuroses can be dealt with effectively, if gotten at early, that the scheme was to deal with them in hospitals on the other side. All of the chronic cases such as we see everyday in this country and patients suffering from neuroses in whom the neurosis has become a pretty well-fixed affair will ultimately be invalided home and distributed on land farming specially constructed psychiatric wards, for the most part along the Atlantic Coast. From here they will be further distributed, some to State hospitals, some to the Government Hospital for the Insane—Saint Elizabeth's Hospital, in Washington, D. C., others to their friends and relatives.

The United States government will normally be responsible for these soldiers whose mental illness is directly traceable to the performance of their duties as soldiers. Naturally there will be a number of cases whose mental illness will be traceable to conditions which arose before they went into the service and were only discovered by the army. For these the United States will not be responsible. For the others, however, they will be, and the treatment of their mental condition will be a part of the large problem of the rehabilitation of the soldier when he returns shattered in mind and body from the war.

The immediate dealing with mental disease as generally recognized merges imperceptibly in several directions into the handling of various psychological situations which are recognized as being more or less abnormal. For example, in the rehabilitation of the injured and crippled soldier the psychological problems involved are most important and strike at the very foundations of the capacity for social adjustment. The crippled hero is not easily going to be inducted back to the hum-drum drudgery of the shops, nor is the employer easily going to be induced to hire a man who is severely crippled when he can just as easily get one who is not. The method of approach to these problems is psychological and in the case of the attitude of the soldier at least approaches, if it does not overstep, the limits of the normal.

In the same way numerous problems of defective psychological make-up are arising in other directions. The highly trained, exquisitely sensitive flying men not only require a most careful and frequent sizing up of their physical resources, but it is beginning to be appreciated that they need the same kind of help with their psychological resources and that perhaps
a number of the accidents which happened in this branch of the service could have been avoided if this sitting up had been effectively done.

The psychological examination of recruits in large numbers introduced methods of sifting out defectives, but in addition to that it introduced methods which serve as measuring rods of efficiency. So that the hundreds of thousands of men who went into the service were measured in a way in which the population has never before been measured, with a result that methods are growing up which will serve more and more effectively to fit the individual to his job and also to pick out all manner of defects in the usual way of accomplishing this end.

The army is proving to be a great piece of efficiency machinery which demands certain pretty well defined results and the line officers and the scientific men are working side by side, not for the sole purpose of weeding out the unfit or treating those who have become ill but with the added purpose of saving those that are misfits by making readjustments in their relations to the army machine either by transferring them to other branches of service, certain re-educational adaptations, or what not, which will render it possible for them to stay in the army and render good service in accordance with their capacities. Undoubtedly this great experience will be projected into the civil population after the war with the result that the problems of psychiatry, of mental illness, or social adjustability, will all be viewed in a much broader aspect and be much more wisely dealt with.

In addition to the above definite efforts are being made along other lines which at first perhaps seem to have no relation to mental illness but which really are closely related thereto, specifically the efforts in the direction of social hygiene, namely, the prevention of the high incidence of venereal disease which is so usual in military organizations. When it is appreciated that syphilis is responsible for upwards of 50 per cent of the cases of mental diseases confined in our public institutions it will be also appreciated how efforts at limiting the incidence of this disease directly to the root of the problem of the prevention of mental disease. A co-ordinate activity addressed in the same direction is the effort at providing adequate recreation and suitable occupation during the leisure hours for soldiers in camp. These are all efforts in the direction of mental hygiene and as such are addressed to the preservation of mental health and the prevention of mental illness and, therefore, come within the sphere of psychiatry in its widest meaning. The prevention of any material percentage of venereal disease in the military organization by such methods as are addressed directly or indirectly to their prevention or cure will ultimately have an enormous effect upon the general mental hygiene throughout the country when the soldiers return to civil life and to their various pursuits. Ordinarily they bring back into civil life an enormous amount of potential suffering and disaster in the shape of venereal infection, an unknown portion of which must necessarily result in mental illness of themselves and others. Venereal prophylaxis and methods of mental hygiene will serve to curtail this danger very materially.

WILLIAM A. WHITE, M.D., Superintendent of Saint Elizabeth's Hospital, Washington, D. C.

PSYCHICAL RESEARCH. In its technical sense psychical research refers to objects and methods of investigation employed by the Society of Psychical Research, which was founded in England in 1882. The function of this society is set forth in the following announcement: "It has been widely felt that the present is an opportune time for making an organized and systematic attempt to investigate that large group of debatable phenomena designated by such terms as mesmeric, psychical and spiritualistic. From the recorded testimony of many competent witnesses, past and present, including observations recently made by scientific men of eminence in various countries, there appears to be, amidst much illusion and deception, an important body of remarkable phenomena, which are prima facie inexplicable on any generally recognized hypothesis, and which, if incontestably established, would be of the highest possible value. The task of examining such residual phenomena has often been undertaken by individual effort, but never hitherto by a scientific society organized on a sufficiently broad basis." The society's membership has included the names of Henry Sidgwick (the first president), A. J. Balfour, W. F. Barrett, Bal- four Stewart, Edmund Gurney, Frederic W. H. Myers, Oliver Lodge, William Crookes, Lord Rayleigh and Alfred Russell Wallace. In 1884 an American Society for Psychical Research was established and later (1890) incorporated with the British society. In 1905 the societies again separated. Similar organizations have been formed in Germany and other countries. The records of the English society fill many volumes of Proceedings and Journals. Besides these official reports, individual members have published numerous works on psychical research. The investigations of the society have been directed by six principal committees to whom the following tasks were severally assigned in 1882:

1. An examination of the nature and extent of any influence which may be exerted one upon another, apart from any generally recognized mode of perception. (2) The study of hypnosis, trance, clairvoyance and other allied phenomena. (3) A critical revision of Reichenbach's researches with certain organizations called "sensitive." (4) An investigation into apparitions and haunted houses. (5) An inquiry into the various physical phenomena commonly called spiritualistic; with an attempt to discover their causes and general laws. (6) The collection and collation of existing materials bearing on the history of these subjects. In brief, the work of the committees has covered the subjects of telepathy, hypnosis, trance, automatism, "magnetic sensations," apparitions and "spiritualistic manifestations." Three principal methods have been employed by the committees and by individual members of the society: (1) the examination of accumulated evidence and of current cases; (2) experimental investigation, and (3) statistical treatment. The first of these methods has been used widely in the study of apparitions and alleged spiritualistic phenomena — ghost stories.
have been collected and noted mediums examined; the second, in hypnosis, in tests of Reichenbach’s claims and in the collection of evidence for telepathy; and the third, in interpreting extensive data regarding apparitions and hallucinations.

The results obtained by the several committees are quite unequal. Investigations into the "magnetic sense," into clairvoyance, haunted houses and the grosser physical manifestations of "spirits"—that is, raps, table-tipping, slate-writing, and materializations—have turned out, on the whole, negatively. Many instances of fraud, of defective observation and of involuntary deception have been brought to light. Hypnosis and allied states have been investigated, not so much for their own sake as for the study of telepathy and of subconscious states. The work of the society may be said to centre in the question of telepathy and the existence of mind independently of the body. In order to secure evidence touching both these mains the Society for Psychological Research, of which I was the president, was organized in the year 1889-92, an extensive census on hallucinations. Answers to the number of 17,000 were returned to the following question: Have you ever, when believing yourself to be fully awake, had a vivid impression of seeing or being touched by a living being or an inanimate object, or of hearing a voice; which impression, so far as you could discover, was not due to any external physical cause? About one-tenth (1,064) of the answers were affirmative, and of this number 80 were "death-coincidences; that is, cases of recognized apparitions occurring within 12 hours of the death of the person represented, the death being unknown to the percipient at the time. The committee in charge of the census draws the conclusion that "between deaths and apparitions of the dying person a connection exists which is not due to chance alone." In the last few years the society has devoted much attention to the study of trance states in certain persons called "sensitives." This study is said to furnish evidence of telepathy. It is considered by some members of the society to be the most fruitful subject for further investigations.

The achievements of psychological research are difficult to estimate. The movement has undoubtedly contributed to knowledge of the facts investigated and the conditions under which these facts arise. It has also performed a service to mankind in its critical examination both into the validity of human testimony and into certain unreliable factors in the motives to the establishment of belief. The evidence offered for a telepathic agency and for the independent existence of mind apart from cerebral functions is considered in some quarters as amounting to proof; in others, as lending probability only to these hypotheses; and, by many educated persons, as entirely lacking in cogency. It is of importance to notice, in this connection, that belief in the factual basis of telepathy—that is, in the influence of one mind upon another where no physical medium has yet been discovered—does not necessarily imply a theory regarding the nature of and the conditions underlying such influence. Various hypotheses interrelate to this fact, but no adequate question has been offered, but no one of them has as yet found general acceptance.

Psychical research, in so far as it examines conscious experience, sustains a somewhat intimate relation to psychology; although it is more closely allied to abnormal than to general psychology. It should be pointed out, however, that its aims and in some respects its methods also bring it into closer relation to certain practical aspects of life and to philosophy than to psychology.

Psychoanalysis lie in the acceptance of an unconscious side to the mental or psychic life, which forms the greater part of any individual life. This unconscious material should naturally be the reserve material conserved from the past lying ready for continual passage over into the superficial conscious life to furnish material for thought and action. It should be the storehouse of all past experience and of the sum of feeling and tendency which constitute individual character. The way into consciousness should be sufficiently open so that such material may be selectively chosen according to practical and creative needs and yet so well guarded that superfluous material shall not thrust itself distractingly into the field of thought and action. Therefore a certain amount of repression is necessary to hold the psychic material in useful control.

The ideas and the feelings which belong to past experience and which form the mental content of each individual, however, have not always established themselves in the past in proportion to the relation to the facts of life and toward each other. There is a good deal of exaggeration, disproportion and distortion in any life and an excess of these things, from the point of view of psychoanalysis, constitutes a neurosis. Here repression has become excessive because emphasis was laid upon certain factors probably in infancy, which would thrust into undue attention certain things which society and the individual's own social, ethical and aesthetic sense would tend to banish. Yet these factors had not been properly attended to before repression occurred. Their exaggerated emotional importance had not been relieved by a reaction to them, abreaction Freud has called it, at the time when they were established. Therefore it is the work of psychoanalysis to search the unconscious for the existence of such hidden factors and bring them out through an understanding and interpretation of them and a recognition of their actual place in the economy of the child's and the adult's growth and development. The discovery of these, their correct appraisal and then the readjustment of them to the claims of reality and the demands of the social environment in which the individual has to live must be made by the patient with the help and interpretative aid of the psychoanalyst. The searching of the unconscious takes place chiefly through the interpretation of the dreams of the night, when according to the theory of psychoanalysis the unconscious emotional nature, which manifests itself as wish, speaks most freely, conscious control being largely withdrawn. Enough of the latter is present, at least at the moment of waking and remembering the dream, to cause the latter to take a distorted form, so that the wish, the pure expression of the unconscious impulses, is much disguised. For this reason psychoanalysis in the use of the dream is dependent further upon the free associations which are called forth by relating and thinking over the dream. These are imperfect and fragmentary but, because they belong in the endless chain of mental associations, disclose more and more of the mental background out of which the dream arose. It is the endeavor of psychoanalysis to work these, follow these paths as they draw themselves together and gather insight and interpretation from them. Daydreams are of the same nature as the dreams of the night, only a little more under control of conscious intellectual thought. From the same source are certain sudden acts, facial expressions, attitudes, mistakes in speaking, sudden forgettings, spontaneous displays of feeling. They all arise from the unconscious depth of the individual life to appear on the conscious surface. These are also watched and utilized in psychoanalysis for the discovery and understanding of the hidden mental life.

The cure in psychoanalysis is no mystery, but occurs through the simple understanding of the hidden forces and desires within one, with the strange and unsocial or obsolete ideas which have surrounded these from earlier stages of individual development and which analogous to earlier or even more primitive periods of racial history. When the real nature of this inner life is realized and its emotional dynamic force understood for the first time, it follows naturally that the life is reconstructed along new lines of usefulness and health. Yet because of the depth and the organic penetration of this psychic life such understanding and readjustment are not arrived at quickly or easily. For this reason psychoanalysis necessarily has to pursue a pathway of serious duty, profound psychology and extensive knowledge of human life in its present extent as represented in all peoples and all varieties of individual and in the past history of men and the gradual development of the race as well. It must learn to know the history of human striving with these same emotions which belong to all ages, and to know the special manifestations of these which belong to any one age of history or evolution. For traces of all these are found in the psychic recapitulation of each individual and any one of these may help to understand any particular mental fixation which may lie as a basic cause of a neurosis.

Psychoanalysis finds its particular field in the psychoneuroses or borderland cases, so-called nervous disorders of a mental rather than a purely physical anatomical type. Such cases are particularly fitted for the intellectual co-operation which the method entails and they are also in particular need of a method which combines reason and a frank recognition of the feeling life. Strictly medical procedures fail to reach them and other forms of so-called mental healing do not enter as psychoanalysis does into the detailed investigation of individual difficulties and bring them one by one into the clear light of reason. A sweeping and revolutionizing faith is supplanted here by personal and patient examination and interpretation. Actual psychoses, pronounced mental derangements, are not always amenable to psychoanalytic treatment yet much has already been done here when the more lucid intervals or the still remaining reason of a patient could be utilized for co-operation. Psychoanalysis has proved itself invaluable in the understanding of such mental disorder and appreciation of the emotional conflict involved with an interpretation of the hitherto meaningless ideas and behavior of such patients. The field opens here for mental prophylaxis through psychoanalysis. A promising activity is opening up for the application of the principles of psychoanalysis to various physical diseases since on the side both of
psychology and of physiology new information is continually being discovered and reported in regard to the close interrelation between mental factors and physical manifestations. In its prophylactic function psychoanalysis bids fair to become an important pedagogical agent. It has shown through its medical work the importance for the health and success of later life of the right attitudes in childhood and of a clearer knowledge on the part of the child of the mental life which he conceals within him. Its province certainly lies in the future in better instruction for children in regard to their own mental and physical lives and better understanding and adjustment of the problems which arise in the course of their development and adjustment to the world in which they are to live. Though psychoanalysis began as a form of medical practice and its chief service lies in this sphere, still from its nature it is bound to find its way into other territories. In the first place it has done much to reveal the close connection existing between the province of medicine and the province of every other interest of life. Then in its strictly medical application it has been shown how dependent it is upon all forms of human effort and interest for a complete understanding of the human problems that human strivings that make up the mental life of the patient. All this has tended to push it on into fields of wider interest. The principles of the unconscious mental life, preservation of the mentality of the past and present, the unconscious as the dynamic source of endeavor, as the fountain from which human creativeness must draw, give it also a peculiar interpretative value in all forms of artistic creation, a special power of evaluating these and a similar interest in the study of all forms of history, art, religion, language, material advance, in short of all human activity. It has a practical application in the discovery of latent powers, the inhibitions and hindrances with which these are encrusted and, therefore, the spread of its principles of investigation and understanding should form the true basis of a practical psychology of efficiency.

The history of psychoanalysis as a movement dates from Freud's development of it in the last decade of the 19th century (1893) as he modified his own and Breuer's early treatment of hysteria. He worked privately with a sincere conviction of the reasonableness of his method and its peculiar applicability to the psychoneuroses. His expectations were modest. Its radical character brought him opposition but he was content to work alone waiting for time to prove the correctness of his theories and the usefulness of the method. Soon, however, he realized a growing interest in him. Other physicians gathered around him and interest began to be manifested in the wider application of psychoanalysis, outside the field of medicine. Two of the early followers of Freud were Bleuler and Jung who carried the teachings of psychoanalysis to Zurich and did much to disseminate them throughout the world. Although they have since altered to some extent the application of psychoanalysis to medical practice, they stand essentially for the original promulgation of these. Through other adherents into Germany, Russia, Holland, France, Italy and other countries of Europe though not to an equal extent in all. England has been but slowly receptive, though experience in the World War has given it marked impetus there. The United States has proved itself especially hospitable to psychoanalysis. It was first introduced there chiefly by Drs. A. A. Brill and E. Jones and in 1916 by when William Almira he delivered a series of lectures at Clark University and psychoanalysis entered under the official sanction of G. Stanley Hall. Since then it has flourished chiefly in medical circles. These have been small but gradually a general acceptance of it is making its way into the medical body. It is represented officially by the American Psychoanalytic Association. One American periodical is devoted to the subject, the Psychoanalytic Review, and a wide literature has sprung up and is being constantly increased. This consists of translations of Freud's works, some of which pertain strictly to medical problems, some of which are a thoughtful application of psychoanalysis to other spheres of interest. Translations of other foreign books have been published by time. Original articles appear in increasing numbers in various medical and scientific journals together with medical reports of actual psychoanalytic work. Various books on psychoanalysis, some popular in presentation, others more strictly technical, have appeared from time to time. It has been inevitable that a subject which so closely appeals to deeply laid human interests should fall victim to a great deal of misunderstanding and bitter reproach on the one hand and become the prey of a flippant superficial interest in whatever is new and emotionally appealing on the other. Its true import and its actual service to the health and well being of the individual and society are matters for the test of time and for further development in meeting these individual and social needs. The application of the principles and methods of psychoanalysis to nervous and mental disorder resulting from the war gave a new impetus toward its acceptance and interest in its real significance in the United States as well as abroad. SMITH ELY JELLINEK, M.D.

PSYCHOLOGICAL APPARATUS. The object of the psychological laboratory is, in brief, to standardize the conditions of introspection (see Psychoanalysis); to make it possible that psychological observations shall be taken in the most favorable circumstances, so that they may be repeated (by the same or by other observers), isolated and varied. It is only under these experimental conditions that the results of introspection can lay claim to universal validity. The single, hap-hazard observation, made under all the distractions of ordinary life, is worth as little in psychology as it would be in physics or physiology. Hence it was nothing less than a revolution in psychology. The world was founded in 1879, at Leipzig, the first psychological laboratory that the world had known. Wundt's example was quickly followed in America by G. S. Hall, who founded a laboratory in 1881 at the Johns Hopkins University. At the present time all the more important seats of learning in Germany and the United States
are equipped with psychological laboratories, while there are a large number distributed through the other civilized countries of the world.

To give an idea of the problems with which the experimental psychologist is busied, we may mention some of Wundt's early apparatus and the phenomena which he attempted to solve by their aid. In 1861 Wundt devised the complication pendulum (Fig. 1) in order to determine the behavior of attention under the influence of two simultaneous stimuli. Suppose that I am subjected, as in Fig. 1, to a sight and a sound. Do I hear and see together? Do I see before I hear or hear before I see? The question was of great practical importance, since it was involved in the "eye and ear" method then in vogue for a certain type of astronomical observations. Its general psychological importance is obvious. The instrument now consists of a large, heavy, wooden pendulum. The bulb carries a pointer, which as the pendulum swings passes over a circular scale. Near the point of rotation $m$ there is fixed the stem of a heavy metal bar $ss$. A movable vertical standard $h$ has attached to it a metal spring, also in the horizontal line. The spring is fixed in such a way that the bar $ss$ in passing by produces a short single click, the end of the bar and the point of the spring just touching each other, while the shock is so slight that the course of the heavy pendulum is not noticeably affected. By watching the course of the pointer attached to the bulb of the pendulum, while the upper part of the instrument remains constant, we can determine at what point of its passage to or fro the click of the spring takes place. For example, if the pointer appears to be at $e$ at the moment of the sound, the bar $ss$ will be in the position $ab$, and this will mean that the passage is put too early. If it comes in contact with the stem $cd$, the pointer would be in the position $cd$, and this would mean that the passage was put too late. If we know the duration and amplitude of the pendular vibration and measure the angular difference between $e'$ or $e''$ and the actual point at which the bar $ss$ comes in contact with the spring, we can easily calculate the interval between the giving of the sound and its apprehension. The instrument has been gradually refined and its scope extended until it now has the form shown in Fig. 2.

Another of Wundt's early experiments was made to determine the range of consciousness for auditory impressions. I hear a number of similar sounds; say, of metronome strokes. How large a group can I keep in mind at once? I must not count; for that would mean a separate attention and a verbal association to every sound. Suppose that a group of 20 strokes, marked off by bell-tones, is followed by a group of 21 marked off in the same way. Do the two groups appear the same or can I tell that these are of different lengths? This question was answered by Wundt by aid of the instruments shown in Fig. 3. The metronome $M$ gave the series of sounds, and the limits of the series were indicated by the bell $G$. Fig. 4 shows a later and better instrument for the determination of the range of consciousness to visual impressions.

A third experiment concerns our judgment of time intervals. A wheel, driven by clockwork, carries a pointer which clicks against contact strips arranged along the circumference. The instrument is shown in Fig. 5. It is possible to give two clicks and to let the observer arrest the clock after an interval which seems to him to be equal to the interval that separates the clicks; or to sound three clicks — two continuous intervals — and to let the observer judge of the equality or inequality of the times enclosed by them; or, finally, to sound four clicks — two intervals with a pause between — and to see how the time observer's judgment of equality or inequality of the times varies with variation of this intervening pause. A newer and more elaborate instrument is shown in Fig. 6.

A fourth experiment, known as the "multiple reaction experiment," is important for the psychological analysis of attention and action. A simple stimulus (a flash of light or the sound of a ball falling on a wooden plate) is given to the observer, and he replies to it by making some simple movement, which has been determined beforehand. Instruments are so arranged that the observer is given, by means of an electric clock, and the responsive movement stops it: so that the time elapsing between stimulus and answer to stimulus can be exactly measured. It is clear that the reaction experiment provides, in an elementary form, the consciousness of voluntary action. We see or hear something and act upon it. Since the experiment can be repeated as often as necessary it is possible, by means of it, to subject the action consciousness to minute and refined examination. We find, further, that the time of reaction varies according as the attention is directed predominantly to the stimulus or to the reaction movement, according as the stimulus attended to is to be apprehended in its qualitative or intensive character, according as the observer is fresh or fatigued, etc. The apparatus employed are shown in Fig. 7. The falling of the ball upon the plate $P$ starts the electric clock $H$, whose unit is 1/1000 second. Pressure of the finger upon the key $K$ stops the clock, and pressure constitutes the movement of reaction. It is a hammer, whose time of fall is constant; it serves to check the accuracy of the clock (chronoscope). The other instruments figured are subsidiary. Fig. 8 shows an elaborate apparatus for giving visual stimuli in reaction work.

The reaction experiment may be adapted to still more complex consciousness. Thus the observer may be told that he will hear either a noise or a tone; he is not to move until he is sure of the stimulus given. Discriminating reaction. Or he may be told that he will hear either a noise or a tone, and that he is to respond to the one and to ignore the other. Discriminating reaction. Or he may be told that he will hear either a noise or a tone, and that he is to respond to the one and to ignore the other. Discriminating reaction. Or he may be told that he will hear either a noise or a tone, and that he is to respond to the one and to ignore the other. Discriminating reaction. Or again, the stimulus may be a spoken word, to which the observer reacts by speaking a second word which he must associate to the stimulus. Instrumental reaction has been devised which meet the requirements of these and of many other variations of the experimental procedure.

The four experiments thus far discussed are typical of the problems with which experimental psychology set out. In a well-equipped modern laboratory the apparatus fall into three main groups: demonstration instruments, with which
For explanation see article
For explanation see article
experiments may be performed upon the lecturer's desk; class instruments, which are put into the hands of undergraduate students for training in the use of laboratory instruments, the materials of investigation by graduate students and by the instructing staff. As an illustration of the demonstration group we may cite Wundt's apparatus for negative after-images of vision (Fig. 9). A large circle of colored glass is fixed firmly behind a ground glass plate and illuminated by a powerful lamp, it is fixed by the members of the class for some 30 seconds. At the end of this time a screen is dropped between colored glass and lamp. The ground glass surface then appears, as a light gray; and upon this gray background the after-image of the colored stimulus develops. As an illustration of the second group we may mention an apparatus for the determination of the minimum visible of distance (Fig. 10). Two black, pointed pins appear upon a white cardboard surface. The one point is fixed; it is painted upon the back surface of a sheet of glass which covers the cardboard. The other, painted upon the cardboard background, can be moved to or from the first pin. Simultaneously the tachistoscope (reading to 1/200 mm.) placed at the side of the frame. The problem is to determine the last separation of the points which is (under given conditions of experimentation) can still be perceived by the observer. Finally, as an illustration of a recent research instrument, we may refer to the drop-tachistoscope for range of visual attention shown in Fig. 11 (see Fig. 4).

The range of psychological instruments is very wide. In the sphere of sensation we have apparatus for work on color mixture, contrast, adaptation, after-images, color blindness and the spatial distribution of the retinal sensitivity; for work on tonal fusion, beats, combination tones; for work on the sensations of pressure, warmth and cold, on the sensations of taste and smell and on the organic (muscular, articular, etc.) sensations. In the sphere of affection we have instruments which register exactly the bodily changes that accompany change in the affective disposition (pleasantness and unpleasantness) pressure recorders or pneumographs, breathing recorders or pneumographs, volume recorders or plethysmographs and strength recorders, ergographs and dynamographs. In the sphere of attention we have instruments for measuring the duration and the range or span of the attentive state. In the sphere of perception we have, for example, all sorts of instruments for the analysis and synthesis of visual space perception: among them the familiar stereoscope and its converse, the pseudoscope, instruments for the measurement of the various types of optical illusion, and so on. Memory and association have a whole laboratory of apparatus of their own; one of these, which exposes at regular intervals a series of words or syllables to be memorized, is shown in Fig. 12.

It should be clear, even from this hasty and imperfect survey, that the arrangement and furnishing of a modern psychological laboratory is a very complicated matter. There must be a large lecture-room, fitted with all conveniences for desk demonstrations and class experiments. There must be a dark room for work in psychological optics, and an absolutely quiet room for work in psychological acoustics. There should be a special room, specially ventilated, for work on olfactory sensation and perception. There must be a series of fairly large and well-lighted rooms for the instruments, the materials of investigation by graduate students and by the instructing staff. There must be research laboratories for the instructing staff. There must be a workshop, or rather there should be two workshops—one in the general laboratory, in which the pupils themselves may assemble complicated pieces, and make the necessary modifications in existing instruments, and another sacred to the mechanician, who is an indispensable part of the staff of an adequate laboratory. Every new investigation—and experimental psychology presents far more novel problems than can be solved, at the present rate of work, in a human generation—demands its own new set of instruments. It must be confessed that, as things are, psychology is for the time being rather shabbily housed. The science of mind appeared on the scene later than the science of life and of inorganic nature; and, when it came, funds and buildings were very largely pre-empted. There are, however, some signs that it is coming to its rights in this regard; and the next 10 years should see a very considerable improvement in the material conditions under which experimental psychologists are called upon to work in colleges and universities.

E. B. Titchener, Sage Professor of Psychology, Cornell University.

PSYCHOLOGICAL DETERMINISM. See Determinism.

PSYCHOLOGICAL SCHOOL OF ECONOMICS. See Economics.

PSYCHOLOGY has been defined, from time immemorial, as the science of mind. This definition, which agrees well with the etymological meaning of the word "psychology," may be accepted by the modern psychologist, provided that its two terms ("science" and "mind") are themselves correctly defined. This is an important point: for it is clear that the terms of a definition must be mutually compatible. If we speak of a "science of mind," we must define the word "science" in such a way as to make it cover the field of mental phenomena, and we must define the word "mind" in such a way as to make it amenable to scientific treatment. To speak of a "science of mind" when one meant by "mind" something outside and beyond the reach of scientific method would be absurd.

The general characteristic of science is just its method. All science proceeds by observa-
tion; but the term science is not usually applied to any body of knowledge until it has reached the stage of experiment,—the stage, that is, at which its observations can be taken under standard conditions, isolated and varied at will. Further, the term science is usually reserved for classified and coherent knowledge; for experimental observations that can be grouped together, as illustrative of some natural law or uniformity. One of the tests of a science, from this point of view, is its capacity to predict, on the basis of natural law, what will happen, under given conditions, in the individual case. Yet again, the term science, in its strictest sense, is reserved for explanatory knowledge: the observations must not only be accurate, must not only fall into groups, under general laws, and thus render it possible to predict the outcome of new observations, but must also be linked with and referred to their causes; these, in their turn, must be reducible to some general laws. Experiment, uniformity and explanation,—these are the three tests which psychology must satisfy, if it is to rank as a science among the sciences.

Within the scope of these general requirements, the sciences are differentiated by differences of their subject matter. Now the subject matter of psychology is mind: not mind as popularly understood, perhaps, but mind which is accessible to experiment, mind whose uniformities we can discover, mind whose processes we can explain. Descartes, when he set to work to reconstitute philosophy, took his stand upon the proposition "I think." It is a long 250 years since Descartes gave his "Discourse" to the world; and what, to him, was metaphysical speculation has now become an unquestioned belief of common sense. We all tend to look at mind as Descartes looked at it; we all tend to say "I think," and so to separate the "I," as active thinker, from the "thought" which is the result of the "I's" activity. Psychology cannot recognize this distinction. The datum for a psychology, if it is to be a scientific psychology, is rather "Thought goes on," there are processes of thought in the world about me and about me. The subject matter of psychology is thought just as thought exists, thought looked at for its own sake and interest. Or rather, since mind is a wider term than thought, and covers the facts of feeling and of will as well as the facts of intellect, the subject matter of psychology is mental process: the whole tangle of thoughts, memories, fancies, feelings, emotions, resolves, desires, aspirations, that make up our mind as we look at it from moment to moment. The problem of psychology is to bring order into this welter.

As a matter of psychology, the infinite variety of our immediate experience to a coherent and manageable system. If it be asked how precisely this material differs from the material upon which other sciences are working, what is the criterion that differentiates the subject matter of psychology from the subject matter of physics, the reply is simple. Mental process, the material of psychology, is confined to the experience of a single individual; psychological experience is unshared experience. There is the universe, and there is the universe. No individual's mind is open but to one,—to each man his own. The laws of physics and of physiology take no account of the individual: sound is a certain motion of the ari waves, digestion is a certain sequence of chemical changes; and the phenomena of sound and of digestion are treated abstractly, so that we can conceive of a deaf man as understanding sound, or a patient unacquainted with physiological chemistry. Psychology, on the other hand, deals with the sound as we hear it, with the hunger and thirst that we feel; and these experiences, however accurately we may express them in words, are, as experienced men, in view.

Two results follow from this peculiarity of psychological subject matter. The first is that the method of psychology differs from the methods of the physical sciences. All science demands observation, we have said; all exact science demands experiment. So far, then, all scientific method is one and the same. But the observations and experiments of physics and chemistry, physiology and zoology, are made upon material that is common scientific property; the observations and experiments of psychology are made upon private property, and, more than that, upon property which is inalienable. If we class the former all together as inspection, we may oppose the latter to them as introspection. In the physical world we look out on a world that is shared by everyone alike; in psychology we look within, upon our personal world. From this difference in method it follows, in the second place, that the need of an experimental verification of results is more pressing in psychology than in any other department of science. If we cannot, in some way, transcend the intrinsic defect of introspection, its personal and individual character, we are likely to have as many psychologies as there are psychologists to introspect. In actual fact, the history of psychology records not a few cases of introspective deadlock,—of observation pitted against contrary observation. It was not until the introduction of the experimental method in psychology that this danger ceased to be serious.

But, it may be asked, is modern psychology really free from this danger? Are all psychologists always agreed? Are there not still schools of thought? To which the answer is: To the psychologist we must distinguish a little. In principle, modern psychology is free from the danger of introspective deadlock. Divergent observations are still made, in plenty; but psychology herself furnishes the means of reconciling the divergence. Let us take an illustration from physics. Two competent observers may be analyzing a compound body by the spectroscope method: the one may find the lines of a certain rare element, the other may be wholly unable to see these lines. Both analyses are published. We read them, and notice that they disagree. Do we at once lose confidence in the method? Not at all: we simply hold our judgment in suspense until further observations, by the same method, are forthcoming. We say that there must, in the one case or the other, have been some unsuspected source of error which vitiated the result; and we appeal to the method itself to indicate this source of error. More observations are made, with stricter conditions of the analysis; and presently we reach a final conclusion. It is precisely the same in psychology. Experimental introspection may yield conflicting results, as does experimental inspection. But we have merely to go on ex-
permenting, and the true result will ultimately emerge. In principle, then, psychology has nothing to fear from this particular danger. On the other hand, it must be frankly admitted that there are many and various schools of psychology. Only, the points of disagreement are points that lie outside of psychology itself. Let us, again, take an illustration from the sciences of nature. Listen to a group of mathematicians discussing the character of the infinitesimal: to a group of physicists discussing the definition of energy: to a group of physiologists discussing the mechanics of life. To hear them, one would think that the status of their respective sciences was precarious in the extreme. Yet we all make use of the calculus; we build locomotives and power-plants and rely upon the balance and the thermometer; nay, we trust our actual lives to the surgeon and the physician. Moreover, the practical work of all these sciences goes on, and goes on with increasingly fruitful result, despite all theoretical difficulties that lie behind it. So it is in psychology. Psychologists are apt to dispute the greater and more fundamental issues that lie before and after their science: these issues will always be many and various, so far as we can see, while human nature remains human nature, and men are individualized by training and temperament to envisage the universe from different points of view. In a general sketch, like the present, such differences must be baldly and plainly stated. The reader must, therefore, be warned not to lay too much stress upon them. The extreme opinions of opposing schools shade into one another by imperceptible gradations. And however extreme they may be, they have little if any bearing upon the practical work, the teaching and investigation, of mental science.

The Problem of Psychology.—We said above that the problem of a scientific psychology is to bring order into the chaos of the immediate experience. We may now note, chaotic as this experience is, it nevertheless is something more than chaos; it groups itself, roughly and indefinitely, no doubt, but still quite noticeably. If we reserve the wider term "mind" for the sum-total of mental processes along their course between birth and death, we may say, first of all, that mind splits up into consciousnesses.8 A consciousness is a mental present: a mind that has a temporal "now" stamped upon it; a bit of mind that is occupied with a single, however complicated, topic. Thus, to put the matter crudely, we begin the day with a getting-up consciousness; this is followed by a breakfast consciousness; this by a newspaper or a correspondence consciousness; this by a daily-work consciousness; this by a luncheon consciousness; and so on. The divisions are real, even if they are not very accurate or precise. We notice, further, that these consciousnesses themselves fall into groups. Sometimes we are stirred and moved by the topic of consciousness: we are ill-humored, angry, anxious, pleased, relieved, aggrieved, hopeful, satisfied and what not. Sometimes we are passive, differently taking things as a matter of course. Sometimes we are passive, trying to solve a problem or to overcome a difficulty or to extricate ourselves from an embarrassing position, bending all our energies upon a given end. Sometimes, again, we are unable to concentrate ourselves; we are talkative, reminiscent, fanciful, dreamy, whimsical. A very little introspection of this sort will suggest the distinction of the great mental categories of the instinctive, the emotional, the volitional. Once more, we notice that the consciousnesses which fall under these categories are complex. Take the emotion of anger. It is not a simple, unanalyzable experience, but is made up of part-processes. There is the idea of the scene or act that has called up the anger; the idea of retaliation; the feeling of injury or of wounded self-esteem; all sorts of memories of one's own or of others' conduct on similar past occasions; and all sorts of "bodily" feelings,—a choking or strangling, perhaps, or a feeling of strength and power, coming with a brace of the body and a clenching of the fist. These part-processes are readily distinguishable; and they take us a step further in the analysis of consciousness, show us processes that are termed, technically, perception and idea, feeling and desire, etc. Lastly, we may notice, after a little scrutiny, that these processes in their turn are, literally, concrete: not simple, but made up of simpler elements. My idea of retaliation, for instance, is a picture of something that would take time for its fulfilment, of something that would run its course in stages or phases. And it is more than probable that each one of the stages would, under accurate observation, turn out to be a conception and not an elementary process.

Now this work of analysis, which we have so far pursued without the aid of any technical method, constitutes the first part of the real problem of psychology. The psychologist is called upon, first of all, to determine the number and nature of the mental elements. Mind, like all other organizations,—like the natural world itself,—is built up from certain irreducible elements; and if we are properly to understand it, we must catalogue and describe its elementary processes. Psychologists are nowadays fairly well agreed that the mental elements are of two kinds or classes: sensations (blue, gold, sour, tone C, the sensations of pressure, of the skin friction, of smell, etc.), the ultimate constituents of the intellectual life, and affections (pleasant, unpleasant), the ultimate constituents of the life of feeling and emotion. There is no simple process underlying the volitional life; all acts of will, all resolutions, and choices, are made up of sensations and affections in conjunction. On the other hand, mind is not adequately described as a resultant or derivative of the two elements. It is true that every consciousness, in the last resort, is compounded of so many sensations and a certain affection. But we find that the elementary processes of a consciousness may differ, not only in degree or intensity (as strong and weak, loud and faint), but also in clearness or distinctness. So we may speak of a "state" of consciousness, as we speak of the state of the roads, or of the weather or of a man's affairs. We speak always in terms of the same material: in terms of the road-bed, of rain and shine, of capital and interest. In the case of the road, we speak always in terms of the ultimate elements, sensations and affections. Only, as the road may be firm or muddy, the weather clear or threatening, the financial outlook good or bad, so
may the processes in consciousness be clear or obscure, distinct or indistinct, powerful and insistent or ineffective, overshadowed by rival processes. It is worth noting that modern psychology thus finds a use for the phrase "state of consciousness" which is altogether different from its use in the older psychology. When consciousness was identified with the "I," the phenomena of how our processes of consciousness were naturally identified with the "states" or "manifestations" of the active principle; and even to-day, in popular writing, the phrase "states of consciousness" is oftentimes employed with the meaning of "conscious processes." Such confusion of language can only minister to confusion of thought. The processes, the materials of consciousness, are one thing; the state or condition in which the materials are presented is another.

The most important states of consciousness, in the normal life, are those of attention and inattention. In attention, the processes that make up a consciousness run their course at two different levels. The processes attended-to are clearer and stronger than their fellows; the processes attended-from are depressed, checked, obscured. In inattention, all the processes run at the same low level.

Analysis, then, the first part of the problem of psychology, leaves us with the two elementary processes, sensation and affection, and with the elementary states of attention and inattention. The psychologist is next required to bring the results of his analysis together, to make a synthesis, to formulate laws of the connection of the elements. The synthesis is tested, at every step, by appeal to introspection, that is, to the actual facts of mental experience. If the analysis has been faulty, the reconstruction will be faulty, will not square with the facts; the method thus becomes its own test of truth. Proceeding in this way, psychology is able to rise to laws or uniformities; it states the laws of color mixture, the laws of affective sequence and composition, the limits of the grasp and duration of attention. Proceeding still further along the same road, it states the laws of the association of ideas, or of the expression of the emotions. In time, it becomes quantitative, and gives numerical formulæ for the intensity of a color contrast or the trustworthiness of memory. In doing all this, it is simply following the example of the sciences of nature, organizing and systematizing its material.

If, now, psychology went no farther, it would still have claims to rank as a science. But it would be a merely descriptive, not an explanatory, science. As a matter of fact, it goes on to explain its phenomena, to give the conditions under which they occur or appear. And at this point we come upon one of those theoretical differences of which we spoke above. What are the conditions of a mental process? Some psychologists affirm that, as the mind is always found together with a living body, so it is always conditioned upon physiological processes; a mental formation of conception is to be explained in terms of the bodily condition that underlies it. Others, again, make appeal to unconscious or subliminal mental processes, which are the condition of our conscious experience, of the supraordinal mind. And yet others would explain mind by mind, deriving mental process from mental process by a principle of mental causality. We cannot decide between these suggestions; limits of space forbid us even to give an adequate account of them. It may be said, however, that the second is the least satisfactory of the three, while controversy is keenly concerned about the other two. The experimental psychologists tend, perhaps, rather toward the first, of which we hear all processes of consciousness were naturally identified with the "states" or "manifestations" of the active principle; and even to-day, in popular writing, the phrase "states of consciousness" is oftentimes employed with the meaning of "conscious processes." Such confusion of language can only minister to confusion of thought. The processes, the materials of consciousness, are one thing; the state or condition in which the materials are presented is another.

The Method of Psychology.—The special method of psychology is experimental introspection. Two questions arise with regard to it: Is introspective observation ever really valid? And is the experimental method adequate to the whole mind, or only to its simpler processes?

It has been objected that introspection can never yield valid results, for the simple reason that it interferes with the course of consciousness. If consciousness is made up of mental processes, then introspection itself is a process or a group of processes. Hence, whenever I set out to observe a given complex, I introduce into consciousness (by the mere fact of observation) the process itself, the object of my observation. But this is a poor method which interferes with the very thing which it purports to examine and describe! The objection is usually met by the rule that one must wait to observe a mental process until after it has completed its passage; that introspective examination must always be a post mortem examination. On this rule, every introspection would involve memory, and be subject to the errors to which memory is subject; though the memory is in play so soon after the event to be remembered that these errors may be considered minimal. In reality, both the objection and its answer seem to beg the question of what introspection is. What does the psychologist do, when he introspects, is to experience attentively, to live attentively, the process under investigation, and to make a report about his experience in words. No new process is introduced into consciousness. Whether the words that describe the experience are uttered as the process runs its course, or are pronounced after it is over, will depend upon the circumstances of observation and upon the psychologist's ability and training: no single rule can be laid down in the matter. As thus understood, there can be no question but that introspection is a valid form of scientific observation. And even apart from this theoretical justification, introspection is justified by its results.

The second question, that of the scope of experiment in psychology, has been much discussed, and with very different results. If we face it in the light of history, it seems to answer itself. Psychologists were told, at first, that they could not push the borders of experiment beyond sensation. But they invaded the spheres of affection and attention. They were then told that experiment was adequate only to the simplest states and processes of mind. But they experimented upon perception and idea, upon association and imagination. They were told again that experiment could never attain to the purely intellectual, or indeed to any of the higher aspects of the human mind. But they made experiments upon judgment and reasoning, and upon the aesthetic consciousness. It is
true that these latter experiments are few and scattered, and that whole consciousnesses still await experimental investigation. But there seems to be no doubt that, in principle, the entire realm of mind is susceptible to experiment. With a method thus justified, it can only be a matter of time for psychology to establish itself as securely as physics or physiology.

The Various Departments of Psychology. Many attempts have been made to classify the different departments of psychology in accordance with some logical plan. As no such classification has received general acceptance, we may ourselves abandon the attempt to be logical, and simply pass in brief review the most important branches of psychology that exist at the present time.

We may distinguish, at the outset, an analytical from a genetic psychology. Defining roughly, we may say that analytical psychology takes the human mind as it is, and aims to distribute the resultant psychic environment. Genetic psychology seeks to trace the growth of mind from its first beginnings, and to explain the present in the light of mental history. It is needless to say that the two psychologies overlap at many points. Analysis can seldom be completed, except by help of genetic considerations; and the study of psychology makes, on its side, an analytical knowledge of the developed mind. Genetic psychology is also termed comparative psychology, and has various subdivisions: animal psychology, child psychology, the psychology of adolescence, etc.

We may distinguish, secondly, between qualitative and quantitative standpoints within psychology. Suppose, for example, that I am interested to determine the least difference between two weights that can be perceived by the lifting hand. The numerical result that I obtain is a quantitative result in analytical psychology. If, however, I attempt to trace out the various conscious factors that contribute to my judgment of difference or no-difference—factors of expectation, of habit, of fatigue, of attention, that may affect the judgment; factors of attentive comparison, of association, of first impression, of effort or ease, that may directly prompt the judgment,—the I am performing a qualitative experiment. The two sorts of result should always go side by side, and should (in a perfect psychology) run exactly parallel,—a numerical statement accompanying the introduction of every qualitative term. Both are indispensable to complete knowledge. Genetic psychology, is, at present, almost entirely qualitative, and will probably remain so for a considerable period. It is put the other day that statistical methods were introduced into the study of organic evolution.

We may distinguish, once more, between psychology as a science of mental function and psychology as a science of mental structure. The difference is very much like that which obtains between anatomy and physiology. Structural psychology seeks to discover what consciousness is composed of, when the organism is functioning in a certain way. I remember, or I recognize, or I imagine. What, then, are the components of these mental processes? What is the mind made up of, when I am recognizing? What actually takes place mentally, when I imagine? Many interesting facts have been brought to light by structural psychology. Thus it has been shown that, when we recognize an object, we ordinarily do so, not by way of a comparison of the perceived thing with its memory image, but simply by way of a diffused "feeling of familiarity," consisting essentially of those certain (internal) sensations which enter into the bodily attitude of relief or freedom from tension. Functional psychology seeks, in its turn, to classify and derive the functions of consciousness, the uses such mind is put in service of the organism. Thus it may reduce the root-functions of mind to those of cognition and interest, and trace the differentiation of the former into discrimination, integration, comparison, etc., and of the latter into the manifold modes of conative (will) and emotive consciousness.

All these psychologies are, in one sense of the term, individual psychologies; they discuss the composition or genesis of a single, typical mind. There is, however, a specific, individual or differential psychology, which is the attempt to trace the correlation between the processes or functions characteristic of a certain type of mind, and to compare this with other minds of different types. Thus it is a fact of individual psychology, in this meaning of the word, that the mind depends mainly upon visual, other again upon auditory, and still others upon kinesthetic (motor) images in the processes of memory, imagination and thought. Over against individual psychology, in this meaning of the word, stands national or racial psychology, which attempts to discover the forms of thought and feeling characteristic of the common mind of a people.

This common mind is, indeed, a fertile field for psychological cultivation. The mind of a people is, from one point of view, nothing more than the aggregate of the minds of the individuals composing the people. There are no new processes in the common mind: common mental processes are impossibilities. From another point of view, however, the common mind offers a distinct problem to psychology. The mental productions of men in society differ from the mental productions of the individual. No single man would ever have invented language in order to talk with himself; language is a product of the common mind. Some mind may take on a habit; it requires at least two to make a law or a custom. These products of the common mind — mythology, and religious observances, language, law and custom — are treated by social psychology, which approaches them by analytic, comparative and genetic methods, and seeks to explain them in part from the nature of the individual mind, in part from the circumstances in which man, as a social being, has at various epochs of his history been placed.

Lastly, we may contrast normal with abnormal psychology. This deals with such transitory abnormalities as sleep and hypnosis, or with the chronic derangements of insanity. In every case, the key to the abnormal mind is to be found in the status of attention. In dreams, we have a limited and irregular distribution of attention; in hypnosis, an exaggerated passive attention, with its accompanying suggestibility. And we have misdirection, inertia, inertia of decay of attention. It was variably exhibited in the various forms of mental disorder.
Here our list of the principal departments of psychology may come to an end.* All through, introspection is the special psychological method, and the dogma of introspection is the final appeal. Animals and infants and the insane cannot, of course, be called upon to introspect. Nor, for that matter, can a "common" mind. But we observe the conduct of children and animals, and interpret it in the light of our own adult introspections; we search for parallels to the abnormal in our own normal consciousnesses; and we base our study of social psychology upon the laws of the individual mind.

Mind and Body.—The question of the relation of mind to body is an old one in the history of philosophy; but it is a question that still awaits its answer. Psychology cannot avoid it; and we may, therefore, give here a brief indication of current views.

The two rival theories now most in vogue among systematic psychologists are those of psychological parallelism and of interaction. The former declares that mental and bodily processes run side by side, without mutual influence or interference. Every mental process is paralleled by a nervous process. But the nervous processes are links in the unbroken chain of physical causation, and they are complete in themselves. Mind is wholly unable to work changes in matter. The latter theory affirms, on the contrary, that mental process influences and is in turn influenced by bodily process: our grief makes us cry, our idea that it is late makes us run to catch a train, as truly as our fit of indigestion makes us gloomy, or a cold in the head makes us stupid.

Common sense is, naturally enough, on the side of interaction. Nevertheless, the theory presents grave difficulties. We must either admit that mind is a special mode of energy, capable of give-and-take with the various forms of energy familiar to us in the natural world; or we must assume that the mind can, without expenditure of energy, deflect the course of physical molecules. Parallelism, while it is against common sense by making mind causally inefficient, epiphenomenal, has at least the advantage that it leaves the order of the natural universe intact. It has, indeed, further advantages. It has proved to be an admirable working hypothesis for scientific psychology; and it is a purely empirical and non-committal statement of the relationship of mind and body,—a statement that may be reconciled with diverse forms of philosophical belief. It leads, perhaps, most directly to the philosophical doctrine of panpsychism, according to which consciousness is the reality and the concomitant brain-process a phenomenal symbol of this reality. This doctrine serves to reconcile the conflict between parallelism and interactionism, seeing that it guarantees the efficiency of mind while it insists upon the parallel relation of mind and body. It may be noted that Gustav Theodor Fechner (1801-87), the father and founder of experimental psychology, combined an acceptance of psychophysical parallelism, as

* "Experimental psychology" is simply psychology approved by the experimental method; it is not a special branch of psychology. "Physiological psychology" is a phrase used sometimes as an equivalent of experimental psychology; it is not an inclusive term, covering (besides experimental psychology) a portion of the physiology of the central nervous system.

a working hypothesis for the laboratory, with a belief in panpsychism as the only tenable metaphysics.

The relation of Psychology to Other Sciences and to Philosophy.—Psychology comes into manifold relation with the natural sciences. As a quantitative science, it requires the aid of mathematics; as an experimental science, it requires the aid of physics. In all its forms, it presupposes a knowledge of sense-organs and nervous system: if it seek its explanations in physiology, this knowledge must be accurate and detailed. Insanity can be understood only in the light of pathological histology; comparative psychology rests upon comparative anatomy and comparative physiology.

Nor is the relation less close with the mental sciences.* Social psychology comes into contact with anthropology and ethnology; with political history and sociology; with philosophy; with the history of art, religion, and the history of civilization at large. It is, indeed, hardly too much to claim for psychology the central position in the classification of the sciences: a position that connects it equally with the sciences of nature, on the one hand, and the sciences of the productions of the human mind on the other.

The relation of psychology to philosophy is less easily defined. Until very recently, psychology was not a science at all, but a branch of philosophy. Now that its independence is established, psychology naturally tends to emphasize the breach between itself and the philosophical disciplines. Philosophy, on the other hand, unwilling to recognize the independence of a revolted subject, insists that psychology runs into danger as soon as it ever rejects metaphysical guidance. There is truth in both attitudes. One may be a good psychologist, at the present day, without having opened a philosophical book. Contrariwise, one cannot approach the fundamental questions that lie before and after psychology without plunging at once, into problems of epistemology and of metaphysics. As with life and matter, so with mind; there is practical work to be done in physics and biology and psychology that may be done, and well done, without philosophical reference. But the practical work springs out of, and leads toward, theoretical issues of the widest kind.

It may be added that the central position of psychology is further warranted by its relation to the special departments of philosophy. Functional psychology is the necessary basis of logic; social psychology is the only straight path to a sound ethics; a psychological analysis of the sentiment of beauty is the prerequisite of aesthetics; the psychology of the religious consciousness is the propedeutic to a philosophy of religion. PSYCHOLOGY, Animal. See ANIMAL PSYCHOLOGY.

PSYCHOLOGY, Ethnic, a division of psychology under which some modern writers include their efforts at the analysis of the mental differentiations of communities, peoples, races or tribes. The term is not in favor with a great number of writers, who include this field under social psychology, ethnology, etc. Consult Le Bon, G., ‘The Psychology of Peoples’ (London 1898).

PSYCHOLOGY, Social. See SOCIAL PSYCHOLOGY.

PSYCHOLOGY OF THE ABNORMAL.

By the psychology of the abnormal is meant the psychology of individuals who are classed as abnormal, or those individuals who evidence in their conduct or speech or in the character of their ideas or emotions responses that stamp them as being unusual or as differing from the usual, the average, along the lines that make them less efficient in dealing with the various problems of life as which they meet, have in some way to adjust to. Considered in this way the psychology of the abnormal is not a different psychology from the psychology of the normal; it is only the application of psychological principles of explanation to the understanding of the various kinds of failure of adjustment which may arise in the career of individuals.

An individual, from this point of view may be considered as being abnormal if a bit of material that is being tested as to its strength, its breaking point. A bar of iron, for example, may be tested by having a force applied to determine the number of pounds that must be added in order to break it. The breaking point is the function of two factors, the weight of the bar and the force applied. Some bars, the smaller ones, for instance, will break with the application of much less force than others, the larger ones, and theoretically any bar, no matter how strong, can be broken by a force if the force is only great enough. Then again, the exact place where it, the bar, breaks and the way in which it breaks, whether by a clean cut fracture at right angles to the application of the force or in a jagged irregular line depends upon the nature of the material and its uniformity or lack of uniformity of texture at the point of application. So some individuals will fail at comparatively simple problems of adjustment, while others will only fail when the problems are very difficult. And the way in which an individual will depend upon his personality make-up, the kind and character of material with which he meets the difficulties.

The individuals who can only meet the simplest problems of adjustment are the defectives: at the lowest level the idiots and imbeciles, higher up the backward children and still higher the types of so-called psychopathic individuals who present an outward appearance of normality but whose lives disclose a continuous series of avoiding, side-stepping, responsibilities and an incapacity for that continuity of effort necessary for success. Stronger individuals only break down under the most difficult of problems, usually only after struggling more or less ineffectually for a long time and then often only as a result of some physical illness which temporarily has reduced their strength and so comparatively increased that of the stressing forces.

Still bearing in mind the analogy to the testing of the strength of material, those individuals who only break down under the stresses and strains are the better organized and their failure is due rather to the degree of stress than to a faulty make-up—the failure is largely exogenous in origin. Those who fail to adjust to relatively simple problems show that the trouble is within, that it is more dependent upon a faulty make-up than upon the character and degree of stress. In these the failure is largely endogenous in origin.

Abnormal psychological reactions are thus failures of adjustment; failures of the personality make-up of the individual sufficiently meet the stresses and strains. His incapacity to meet these stresses and strains may be due to their very great strength or to his relative weakness and his weakness may be constitutional, that is, natural to him, the result of inherited influences; or acquired as the result, for example, of illness, infectious diseases, injury, more especially to the brain, or methods of life that he cannot escape, such as solitary confinement in prison.

The individual symptoms of the failure are
in their general characteristics depend upon the personality make-up. That is, the disorder of the psyche must manifest itself in terms of the material disordered. Certain details of the symptoms, however, may take their coloring from the surroundings in which the difficulty occurs. This is manifest in the false beliefs — delusions — which occur so frequently as symptoms. An individual may compensate himself for his failure by a belief that some baneful influence is exerted over him by others. In the early days he does infrequently believe the influence to be brought to bear by means of wireless electricity. Manifestly, before the days of wireless transmission no such belief would have been possible.

The psychological symptoms of individuals who are mentally ill indicate the nature of their difficulties and the means which they are bringing to bear to meet them. They indicate, in other words, the existing status of the problem of adjustment with which they are confronted, thus furnishing a clue to possible failure. The most familiar symptom of mental illness is delirium which commonly accompanies poisoning, as by alcohol (drunkenness, delirium tremens) or some physical illness particularly when it is complicated by insect and high fever. In delirium the principal mental symptom is that of confusion. The patient sees all sorts of things which pass before his vision in kaleidoscopic procession and hears voices, sometimes emanating from the people of his visions, sometimes just coming out of space. These false perceptions — hallucinations — are the characteristic phenomena of delirium and to the onlooker seem quite meaningless and incoherent. When the patient gets well, however, it is possible to trace their references and to appreciate that they represent the outcroppings of worries, anxieties and impulses which had before been held in check. Delirium results when illness removes the power of efficient reaction and releases all those tendencies which otherwise had been held in check. There is little capacity for adjustment. With recovery from the physical illness the delirium tends to subside. Similarly when we see a picture like this, a delirium type of reaction but not the result of physical illness, we feel that the powers of adjustment are pretty well broken, that the constructive forces of the personality are in abeyance.

Delusions are false beliefs which represent a somewhat more definite situation as between the stresses and the personality. Delusions always represent definite attempts at adjustment, but because they are not successful, only compromises. The weak man believes himself strong, the poor man rich, while quite commonly the recognition of weakness within as a cause of failure is avoided by the delusion that malicious influences from without are the cause of the trouble. This is the mechanism of projection and is at the basis of delusions of persecution which are so characteristic of that mental group now called paranoid and of sorts of paranoid types of reaction in other mental illnesses and also of some unhappy individuals who are always filled with suspicions of those about them.

Hallucinations and delusions may be the passing phenomena of some acute upset or, on the contrary, they may become fixed, stereo-
typed and definitely organized into a system which is relatively unshakable and remains unchanged over long periods of time. Such a system represents a type of reaction to a defect of personality make-up which is the best that the individual can do and it comes to be a final solution. The delusion is like the scar tissue that fills up a wound. It remains permanently as a disfigurement but it nevertheless represents what has been accomplished by the repair process.

In still milder forms of mental illness, the neuroses and the psycho-neuroses, conditions that are on the borderline between the normal and the abnormal and are consistent with a considerable capacity for adaptation and apparent normality, the forms which the symptoms take are somewhat different. They take on the character of what are called obsessions or compulsions. The patient is the victim of certain ideas, feelings or necessities for action which he recognizes as abnormal or foolish but which he feels unable to control. In his search for control of abnormal ideas he may be forced to think certain disagreeable thoughts, he may be obsessed to think of certain numbers or certain phrases will recur to mind persistently or he may be forced to think how the people he meets would laugh at him if they knew of these obsessions. His thoughts and emotions come similarly without apparent reason. He may feel a nameless fear or anxiety or be depressed without apparent cause or he may have definite fears of certain things or situations — the phobias — such as claustrophobia, fear of closed spaces, misophobias, fear of contamination, etc. Compulsive acts are equally common. The patient may be forced to touch every tree he passes or forced to step over every crack or sit upstairs always with the same foot. In this group are the so-called manias such as kleptomania, the necessity for stealing, although there may be no desire for the stolen object, pyromania the necessity for setting fires, etc. All of these tendencies represent instinctive trends which force themselves to expression but which, because they demand for their satisfaction unacceptable forms of conduct seek these devious ways of expression by attaching themselves to what usually appear to be unimportant forms.

All these abnormal forms of expression, delusions, hallucinations, obsessions, compulsions are then efforts at expression of certain instinctive tendencies which are not acceptable to the individual. They represent indulgences that at some past period were normal to the individual, that is, they are relatively infantile. The individual who flies into a rage and curses and kicks the inanimate objects of his environment, breaks furniture and tears up books, is acting like a small child that has been thwarted in some of its desires. All the other abnormal reactions could be explained in a similar way so that we might say that the abnormal as a class are not yet fully grown in some aspect of their personality, they retain infantile traits of character which are not found in the delinquents or imbeciles but less obvious as we have to deal with better developed personalities. This explanation, however, becomes again obvious in those very dilapidated types of chronic mental illness that degenerate into sleeping sickness, the wet and sooty themselves as do infants and have to be fed and otherwise cared for just like
children. Mental disease, therefore, shows reactions that reproduce types of response that were at one time normal either in the history of the individual—infancy and childhood—or in the history of the race; primity and from this point of view their study has been termed paleopsychology.

There are two ways of reacting to these inherent difficulties—conflicts—of instinctive expression either by turning back within oneself and reanimating infantile ways of reacting—the method of introversion—or by running away from the difficulty, so to speak, into reality and by developing a great activity and interest in everything about and so attempting to escape a reckoning with oneself—the method of extroversion. The first is, in general, the more serious type and in it we find the malignant types of the psychoses such as dementia praecox: the second is less serious and here we find the more benign types such as the manic-depressive psychosis. A chronic delusional psychosis such as paranoia represents a more or less permanent compromise which is not as disintegrating as the first nor as recoverable.

All these methods of reacting are found equally among the relatively normal; the only differences are differences of more or less. In mental disease we find the mechanisms of normal mental life writ large because disproportionately emphasized in some direction. The symptoms of mental disease can thus be understood as the outward evidences of attempts at adjustment, made difficult by some psychological conflict and the language of the symptom, so to speak, can be translated when it is understood as expressing reactions of escape, defense or compromise in the face of the problem presented. The study of these exaggerated forms of reaction found in the mentally ill has gone a long way to help explain the psychology of the normal because the failures represent an experiment of nature, so to speak, which throws certain of the aspects of the personality into relief. A complicated mechanism comes to be understood when it gets out of order and finally by taking it apart.

PSYCHOPHYSICS. By some this science is regarded as synonymous with physiological psychology; by others, as dealing particularly with the phenomena which bring out the relation to sensation. In the former character it deals with the study of Fechner's and Weber's laws as a separate department of psychological science. Psychophysics deals particularly with the measurements of intensity of sensations, and endeavors to establish general laws regarding the phenomena. See Duration; LImina; Reaction Time; Weber's Law.

PSYCHOZOIC, a term used by a few geologists to indicate the time since man came into the world. Some prefer to give it the rank of an era, but it is usually called the Epoch of the Quaternary period, and the name Psychozoic is but little used.

PSYCHROMETER, an instrument for measuring the tension of aqueous vapor in the atmosphere. It is also known as the wet-bulb thermometer. See Hygrometer.

PTAH, ptâ, or PHTHA, Egyptian god of the most ancient type, described in inscriptions as "creator of the earth, father of the gods and all the beings of this earth, father of beginnings." He was compared by the Greeks to Hephaestus, being, like him, patron of metalworkers and sculptors. Representing the beginning of all things he was shown as an undeveloped child or dwarf (Ptah-Patack), or as a mummy. He had a magnificent temple at Memphis. See Egyptian Religion and Sociology.

PTARMIGAN, târ'mi-gân, a grouse of the genus Lagopus, which differs from the common grouse in having the legs feathered to the claws, giving somewhat the appearance of a hare's foot (whence the generic name). The truncated tail has 14 or 16 feathers, most of the species become white in winter, and the nasal groove is densely clothed with feathers. There are six or eight species described, inhabiting the northern and snow-covered regions of both hemispheres, being one of the few genera characteristic of the arctic fauna; they are as much at home in snow as are the web-footed birds in water, and their plumed feet enable them to run over its surface without sinking in. They live in families during most of the year, and are monogamous; the females incubate, but the males assist in rearing and feeding the young. The males have a loud harsh or sometimes clear cry, and the females cackle like a hen. They fly swiftly without a whirring noise, and run well. They feed upon berries, buds, mosses and lichens and insects. Their pursuit affords an exciting sport; a male, when flushed, is so swift that the birds are easily shot on account of their regular flight. The summer plumage is varied with brown, black and gray, most of the wing remaining white; in the males the motting is finer and the colors brighter. There are three well-ascertained species in America, besides several subspecies and races. The white ptarmigan or willow grouse (L. lagopus) is about 10 inches long and 24½ inches in alar extent; the bill is black, very stout and convex, and broad at the tip; the general plumage in summer is rufous or orange chestnut on the head and neck; feathers of back black, closely barred with yellowish brown and chestnut; most of wings and lower parts white; tail brownish black; in winter white, with black tail; no black stripe through the eye. It occurs commonly in the northern parts of America, and in rare instances in the northern United States (Maine and Minnesota). It is found in open rocky towns and mountains; in winter they scratch in the snow down to the mosses and lichens on which they feed, collecting often in considerable flocks. In winter the flesh is dry, but is tender and with an agreeable aromatic flavor in summer. They breed in
Labrador about the beginning of June, placing the nest under the creeping branches of low fir trees. There are six to fourteen of a fawn color or rufous ground with irregular spots of reddish brown; only one brood is raised in a season. The rock ptarmigan (L. rupestris) is 1 1/2 inches long; the bill is slender, rather compressed at the tip; in summer the feathers of the back are black banded with yellowish brown, and tipped with white; in winter white, with the tail black (the four middle feathers white), and the male with a black bar from the bill through the eyes. It occurs in arctic America, from Alaska to Labrador and the Gulf of St. Lawrence. The white-tailed ptarmigan (L. leucurus) is found on the alpine summits of the Rocky and Cascade Mountains from New Mexico to the Arctic regions. This species is entirely white in winter; and in summer the tail, wings and lower parts of the breast are white, the remainder of the plumage being a fine mixture of gray, brown and black. A fourth species (L. welchi) is attributed to Newfoundland. Of the Old World species the red grouse of Scotland is most similar to the British Islands and a famous game bird. Unlike the other members of the genus it does not become white in winter. A typical ptarmigan (L. alpinus) is found in northern Europe, especially in Norway. Our own willow grouse, or a closely related species, also occurs. Consul Baird, Brewer and Ridgway, 'North American Land Birds' (Boston 1874). See GROUSE.

PTERANODON. See PTERODACTYLS.

PTERASPIS, a fossil fish. See OSTRODermi.

PTERICHTHYS, té-rík'thís, a genus of extinct fishes belonging to the subclass Ostra cephor and considered to be remotely related to the modern lampreys. Bothriolepis is a related genus of Devonian formations of America, as well as the Old World. None of the species exceed a few inches in length. The affinities of these strange forms are little understood. See OSTRODermi.

PTERIDOPSISME, tér'í-dô-sér'pów, or PTERIDOPSISAA, in paleobotany, a class, co-ordinate with Gymnospermae and Angiospermae, of fossil Paleozoic fern-like plants, including all such which on the evidence available appear to have been reproduced by means of seeds. Potonis called this class Cycadofices. And some paleobotanists even regard the group as a phylum, or primary division, and not as a class; and to this phylum they then apply the name 'Pteridospermophyta'; but the idea of the group's being a class is gaining favor. A single plant of the group is a 'Pteridosperm.' The cases in which the evidence available appears to be decisive are but few; and to these have been applied the names which follow: (1) Lyginodendron oldhamium; (2) Neuropteris botryopha; (3) Pecopteris Pluckneti; (4) Anemites fertilis; and (5) Anemites tenuifolius. In the first named pteridosperm, Lyginoden drium oldhamium, the structure both of the vegetative and reproductive organs is known; and the evidence from comparison and association is sufficiently strong. So identification is certain and easy. And in the other cases there is direct proof of continuity between seed and plant; but only the external characters are known. In a great number of forms amounting to six to fourteen, of a fern-like habit, the evidence — such as it is — is in favor of their having possessed seeds. They are pre-eminently plants resembling ferns in habit and in many anatomical characters but bearing seeds of the Cycadacean type. Seeds and pollen cones of the ferns, or of the anthers, are low on the fronds, and only slightly modified as compared with the vegetative leaves in Pteridospermae. Pteridospermae, of which only a few examples have so far been considered by paleobotanists, evidently constituted a group of vast extent in Paleozoic times. In a large majority of the fern-like fossils of that period the evidence is in favor of reproduction by seeds rather than by the cryptogamic methods of true ferns. The whole class of Pteridospermae though clearly allied to the typical Gymnospermae may be kept distinct for the present on account of the relatively primitive characters shown in the anatomy and morphology of the former. During recent years a number of successful ferns have been thoroughly investigated in the light of modern anatomical knowledge, and as a result it has become clear that in those times a large series of plants existed intermediate between the modern Gymnospermae, especially the Cycads,—and the true ferns.

The first definite evidence of the mode of reproduction of Lyginodendron oldhamium was due to the studies of F. W. Oliver, who in 1903 identified the seed Lagenostoma Lomaxi by means of the glands on its capsule, which agree exactly with those on the associated leaves and stems of the plant. No similar glands are known on any other Paleozoic plant. Lagenostoma Lomaxi is a small, barrel-shaped seed, 5.5 by 4.25 mm. when mature, enclosed in a husk or capsule, which completely envelops it when young but ultimately opens. The male organs of Lyginodendron oldhamium were discovered by Kiddon, a year or two after the seeds were identified. They are of the type known as Gossatheca, former Cystocyclos, and as a Marattaceous fructification. This is the first case in which the pollen-bearing organs of a Pteridosperm have been identified. It will be noticed that while the seeds of Lyginodendron oldhamium were of an advanced type; the microsporangiate organs were more like those of a fern, the reproductive organs thus showing the same combination of characters which appears in the vegetative structure. It must be mentioned that the family Calamoptyle, allied anatomically to Lyginodendres, is of the Devonian and Lower Carboniferous age.

PTERIDOPHYTES. See Ferns AND Fern Allies; Paleobotany.

PTERODACTYLs, tér'ó-dák'ti-lz, an order of extinct flying reptiles technically known as Pterosaurs. They lived exclusively during the
Mesozoic period, from the beginning of the Jurassic to near the close of the Cretaceous. Their fossil remains have been found in Europe and North America, but are best known from the chalk deposits of Western Kansas, where many hundred specimens have been collected. Of known reptiles they are nearest allied to the dinosaurs (q.v.), they are only distantly related to birds. They are especially characterized by their very hollow bones and the extraordinary elongation of the fourth (according to some authors, the fifth) finger, which supported a thin bat-like membrane that extended to the sides of the body and the legs. Not only were the bones very hollow, more so than in any living birds, but they were composed of very dense osseous tissue and were pneumatic, that is, had openings, usually near the ends, for the ingress and egress of air, as in birds. The nature and extent of the wing membrane, or patagium, are known from impressions in the rocks, but the covering of the body elsewhere is still in doubt. That the body is not clothed with feathers is certain, but it may have had, like that of most reptiles, horny scales.

The neck was more or less elongated and very flexible; the legs were relatively feeble and of but little use in locomotion upon land; the breastbone, which is poorly developed in other reptiles and wholly absent in early reptiles, was of great size, covering the whole under side of the thorax. Unlike birds, however, it had no real keel but only a stout projection in front for the attachment of muscles. The pelvic or hip bones were well developed for the support of the hind legs, which were of material use in flight. The fifth finger was absent; the first three fingers were short and useful only for clinging to rocks and branches.

In all the early kinds, those from the Jurassic, the skull, of moderate length, was provided with long and sharp teeth. The tail was long and flexible and had at its extremity a diamond-shaped expansion for use in controlling flight. The bones of the skeleton were less hollow and the wing was proportionally less elongated. The first bone of the wing-finger, that is, its metacarpal, was relatively short, never longer than the forearm, and the first three fingers were articulated directly with the wrist. There were five separate toes and the feet were of some use upon land. None was of large size, not exceeding four or six feet in expanse. The best known form is *Rhamphorhynchus* (Fig. 1), and the group or suborder is known as the *Pterodactyloidea*.

![Fig. 1 — The Rudder-tailed Pterosaur, Rhamphorhynchus phyllurus Marsh. From the lithographic series of Solenhofen (Jurassic). One-seventh the natural size.](image)

The later and much more specialized group, beginning near the close of the Jurassic, known as the *Pterodactyloidea*, had the skull more elongated, the wing-finger longer, with its metacarpal longer than the forearm, the first three fingers of the hand loosely attached in the flesh, the tail vestigial, the pelvis larger and the feet with only four toes. Of the earliest of these, of which *Pterodactylus* is the best known example, were small, some with a body not larger than that of a sparrow, and they had teeth in the jaws. The later ones, however, those from the Upper Cretaceous, of which so many are found in America, reached a size of more than 20 feet from tip to tip of wings. The skull was very long and slender, in some with an enormously developed crest upon the back of the head, and the jaws were without teeth. The neck was longer and more flexible, in many with additional articulations, giving greater strength; the bones of the shoulder were united into a firmly ossified ring, which, unlike all other known animals, articulated directly with the spinal column; the wrist was firmer; the wing-finger still more elongated; the small bone of the legs had disappeared, as in birds; and the first part of the ankle, the astragalus, had become indistinguishably united with the leg bone, as in birds. The most noted member of this group is *Pteranodon*.

In their maximum and final development the pterodactyls attained the highest volant powers of all creatures, whether of the past or present, being quite incapable of locomotion except in the air. *Pteranodon*, with a wing expanse of 22 or more feet, had a body smaller than that of a turkey. *Nyctosaurus*, an allied genus from Kansas, with a body only six inches long and five or six inches across the shoulders, measured eight feet from tip to tip of expanded fingers, and probably did not weigh more than five pounds when alive. They doubtless spent most of their time in the air, resting suspended from cliffs by their small clawed fingers, much like the way of bats, except that their fingers, instead of their toes, are used for suspension. The presence of bony plates in the sclerotic membranes of the eyes indicates either nocturnal or soaring habits. (Cf. Fig. 2).

In flight, unlike birds and bats, their "wings" served more as gliders than as sails, and could have been used only for upward and downward motion. Flight was controlled by the legs, which were extended backward and connected by membrane, serving the purpose of the feathered tail in birds. The rudder-tailed *Rhamphorhynchus* (Fig. 1) was a veritable monoplane.

Their food habits are only imperfectly known. Because so many of their remains are found in ocean deposits, it is believed that they fed largely upon fishes, and this assumption is strengthened by the discovery, in several instances, of remains of their stomach contents containing comminuted fish-bones. But it is probable that they also lived in part upon other flying creatures, insects and small birds, which must have been swallowed whole. Their brain was better developed than that of true reptiles, and because of this and of the highly-developed, pneumatic skeleton, it has been thought by some that they were warm blooded; they have even been placed in a separate class of back-boned animals. They were, however, true reptiles, even though warm-blooded, which may have been possible.
Remains of young pterodactyls have never been found. Like most reptiles they were probably oviparous, since otherwise, among the many hundreds of known specimens, embryonic young would probably have been found. The bones of the pelvis, unlike those of birds, were closely connected, and only eggs of small size could have passed through it, not much larger young were cared for by the parents until able to care for themselves. These facts suggest limited breeding grounds, and extensive seasonal migration. (Note Fig. 3.)

About a dozen genera are defined, of which Rhamphorhynchos, Dimorphodon, Pterodactylus, Pteranodon and Nyctosaurus are best known. In North America, with the exception of some fragmentary remains from the uppermost Jurassic, Pteranodon and Nyctosaurus are the only, though abundantly represented genera.

Bibliography.—Cuvier first named this group. Consult the "Ossems Fossil," (1809

Fig. 2.—Outline of the skull of Pteranodon longiceps (from the Kansas chalk), showing the great steering crest. The crest is fully two-fifths the length of the skull, which measures nearly four feet from tip of sharp bill to end of crest.

Fig. 3.—Crested Pterodactylus as they appeared in life, hovering over the palm-lined shores of the Kansas inland sea of the chalk period. (The details are scientifically accurate. A mosasaur and crinoid or "stone-lily" in the foreview.)

than hens' eggs, even in the largest kinds. Such small young would have been practically helpless, which, together with the greater intelligence of the adult animals, as indicated by their large brains, renders it probable that the
and 1824). Also consult Buckland's Bridgewater Treatises, 1837. Later works are H. G. Seeley's 'Ornithosaurus and Dragons of the Air' (1870 and 1901). The discovery and description of the Apatosaurus forms is found in the scientific writings of O. C. Marsh, S. W. Williston and G. F. Eaton. Consult especially Eaton, 'Osteology of Pteranodon,' Memoirs of the Connecticut Academy of Arts and Sciences for July 1910, where many illustrations of the Pteranodon crests are given.

S. W. Williston.

PTEROPOD Ooze—See Pteropoda.

PTEROPODA, a group of mollusks, formerly regarded as a distinct class, but now known to be only a suborder of the epipodbranch gastropods, especially modified for a pelagic life. Like the other epipodbranchs, they are simple in structure, the heart being posterior in position and the nervous system without a tracts. They are hermaphroditic. The name pteropod refers to the wing-like development of lateral processes (parapodia) of the foot, which serve as fins by means of which the animals swim. The head and usually the tentacles and eyes are lacking. Some of the species are naked, while others secrete delicate shells, which are in some cases spiral (Limacinidae), or straight slender cones (Carolinidae), or more or less pyramidal (Hyaloidea). All of the species are small, many being almost microscopic in size. In certain parts of the ocean these animals are so abundant that their dead shells, accumulating on the bottom, have given the name "pteropod ooze" to the deposits. In the northern seas one species (Clione papilonacea) occurs in enormous numbers, forming a large element in the "brit" on which the right whales feed. Fossil pteropods are well known from all rocks of the Lower Cambrian to the present. Consult authorities cited under MOLLUSCA. See Ooze.

PTEROSAURIA, a subclass of Mesozoic reptiles, prominently characterized by the power of flight; the pterodactyls. Anatomically, they have fixed quadrate bones, and the anterior limbs formed into wings, with enormously elongated ulnar finger carrying a patagium. The group consists of an order (Pterosauri), divided into two suborders: Pterodactyli and Pteranodontes. See PTERODACTYLS.

PTERYGIUM, a fan-shaped patch of mucous membrane on the ocular conjunctiva, its base being usually at the inner angle of the eye (the canthus), its apex at the margin of the cornea or overlapping it. It may appear on the temporal side of the eye; sometimes two of the patches occur in the same eye and cover the whole cornea as with a thick veil, preventing vision. Pterygium occurs in middle and advanced life, and may be either stationary or progressive. In the progressive form the patch is fleshy and the vessels are pronounced; in the non-progressive form it is pale and flat. The ordinary (regular) pterygium is due to irritation of the conjunctiva by dust and minute bodies. It may become inflamed and lead to ulceration of the conjunctiva and cornea and to impaired vision. Irregular pterygium is usually the result of burns or ulcersations. Paronychia is sometimes spoken of as pterygium digit; pinna, a fan-shaped yellowish patch on either side of the cornea in old age, due to irritation from dust, etc., and leading to colloid inflammation, is sometimes called pterygium landeum or pterygium pingue. Pterygium unguis is a condition in which the epidermis coats the nail with a thin transparent layer. For treatment of pterygium, removal by excision, stran- gulation, cautereiation or curetteinent may be employed. See EYE and consult works referred to under that article; also 'Reference Handbook of the Medical Sciences' (New York 1916).

PTERYLOGRAPHY, the description of the arrangement and habit of growth of feathers (pterylosis) on the body of a bird. A bird's plumage does not grow evenly from the whole surface of the skin, but in certain tracts (pterylia), the form, extent and disposition of which differs in the various orders, families and genera; so that the pterylosis is a character of importance in classification. The fact that the nearest approach to a uniform clothing of feathers occurs now in the ratite birds, penguins and the like, which are lowest in organization and of most ancient origin among birds, indicates that pterylosis is a comparatively modern acquisition, and its more striking manifestations occur among birds otherwise referable to a high rank in classification. The principal feather-tracts are similarly disposed in all the groups and consist of a tract embracing the head; a tract along the spine; a line along each side of the neck, down each side of the breast and along the side of the abdomen curving inward to meet at the vent; a line lengthwise across the shoulders; two patches upon each leg; and the regions of growth of the wing and tail feathers. The disposition of the powder-down tracts is also a part of pterylography. This matter was first expounded by the German naturalist, Nitzsch, author of 'Pterylographie' (Halle 1847), whose work was translated and extended in a volume of the Ray Society of London for 1867. Consult Newton, 'Dictionary of Birds' (1893-96).

PTERYLOSIS, See PTERYLOGRAPHY.

PTOLEMAIC SYSTEM, in astronomy, the system by which Claudius Ptolemy tried to explain celestial motions. For 14 centuries this was the universally accepted and authoritative system of astronomy, only being completely overthrown upon the development of the Copernican system by Kepler toward the middle of the 17th century. The very long time during which this system of Ptolemy was received may perhaps be more clearly realized from the statement that though it was first proposed so early as the 2d century, A.D., in the early days of our American universities it was still taught in connection with that of Copernicus. This was doubtless because, so far as was evident from the rough, naked eye, observations of the sun, moon and planets, it seemed to account for all of their observed motions in a wholly satisfactory manner. According to this system the earth is the fixed centre of the universe; a vast sphere, the "primum mobile," carries all the celestial bodies, and rotates once a day, the moon. The other planets, with the sun, travel in eccentric circles round the earth, and this accounts for the annual motion of the sun, and the monthly motion of the moon; each planet moves in a circular path, termed its epicycle about a point, and this point travels...
in an eccentric circle round the sun; all motions in each order of circle being described uniformly, this explained the looped paths, the perturbations, stations and retrogradations of the planets. But every new astronomical observation required a new contrivance on this system, and at length the necessary cyclic and epicyclic combinations became excessively cumbrous. The discovery of the elliptical form of the orbits, in the 17th century, and especially the development by Newton of the principles of mechanics, which wholly govern all the motions of the planets, quickly made it evident that the reality of the Ptolemaic system was a manifest impossibility.

Ptolemy, ti'ë-mf (Ptolemaios), the name of a line of Graeco-Egyptian kings, who ruled from the death of Alexander the Great till the Roman occupation of Egypt 323-30 B.C. The name Ptolemy, though the common, was not the exclusive name of the kings of this dynasty, and they are better distinguished by the surname Lagide, from Ptolemaeus Lagus, the founder of the dynasty, also surnamed Soter. Consult Budge, 'A History of Egypt' (New York 1902); Mahaffy, 'The Empire of the Lagides' (London 1892); id., 'A History of Egypt under the Ptolemaic Dynasty' (New York 1899); Meyer, 'Das Heerwesen der Ptolemäer und Romer in Ägypten' (Leipzig 1900); Starek, 'Die Dynastie der Ptolemäer' (Berlin 1897).

Ptolemy I (called Soter, 'the Saviour'): b. Macedonia; d. 283 B.C. According to Lucian he was born about 367 B.C., but on the supposition of his being a son of Philip it must have been some years later. In 330 B.C. he was admitted into the body-guard, and from this time appears in important transactions. During the Indian campaigns he was regularly employed in the most important commands, and distinguished himself alike for valor and capacity as a general. He continued on terms of intimate friendship with Alexander, and accompanied him to his last campaign in 324 B.C. On the death of Alexander he attached himself to the party of Perdiccas, and secured for himself the government of Egypt. He then proceeded to strengthen himself in his government, and concluded a secret league with Antipater against Perdiccas. In the arrangements made after the death of Perdiccas Ptolemy retained Egypt; and subsequently strengthened himself by marrying Eurydice, daughter of Antipater. On the death of Antipater (319 B.C.) Ptolemy united with Cassander and Antigonus against Eumenes, and on the defeat of Eumenes by Antigonus joined Cassander and Lysimachus against Antigonus, who invaded Syria, 315 B.C., overran Phoenicia, and laid siege to Tyre, which he entered in 314 B.C. Cyprus revolted in 313, and Ptolemy proceeded thither in person, and reduced the whole island. In 312 B.C. he invaded Palestine. In 311 a general peace was effected, but it was not of long duration and was broken by Ptolemy in 310 B.C. In 308 he invaded Syria, was defeated, but made little progress, and Antigonus now resolved to wrest Cyprus from Ptolemy (307 B.C.). The Egyptians were totally defeated at Salamis, and Cyprus fell into the hands of the victor, who assumed the title of king. In 306 B.C. Ptolemy assisted the Rhodians against Demetrius, and from the Rhodians on this occasion acquired his surname of Soter. In 302 a league was formed against Antigonus, but alarmed by a false report that Antigonus had won the battle of Ipsus he retired to Egypt. The defeat and death of Antigonus the Attic raised Seleucus to a position of great power, and a dispute ensued between him and Ptolemy 295 B.C. Ptolemy recovered Cyprus, which became a permanent dependency of Egypt. Ptolemy had two sons by Eurydice, but determined to bestow the crown on Ptolemy Philadelphus, a younger son by his favorite wife Bernice. He announced his own retirement, and caused him to be proclaimed as his successor 285 B.C. Ptolemy is regarded as the most prudent of the successors of Alexander. His empire was now so vast that the occupation of Egypt was enlightened and successful. He raised Alexandria to the highest rank in commercial prosperity, and founded in that city a colony of Jews, to whom the special place taken by Alexandria in subsequent times in philosophy and literature, as well as in politics, was in great measure due. He was also an eminent patron of literature, science and art, and founded the library and museum of Alexandria. He himself wrote a history of the wars of Alexander, used as authority by Arrian. For bibliography see Ptolemy.

Ptolemy II (Philadelphus): b. Cos, 309 B.C.; d. 247. He was raised to the throne during the lifetime of his father Ptolemy I. He concluded a treaty with Rome after the defeat of Pyrrhus, and continued faithful to his allies during the Carthaginian War. There was a chronic but uneventful war carried on during his reign with Syria. Toward the close of his reign it was terminated by the marriage of Ptolemy's daughter Bernice to Antiochus III. Either by the treaty or in the contest of the war Ptolemy acquired Coele-Syria and Phoenicia. He was also, in general, on hostile terms with Macedonia. But the chief care of Ptolemy was directed to the internal administration of his kingdom, and the encouragement of science. He founded Arsinoe (on the site of Suez) to protect the navigation of the Red Sea and Berenice on the Red Sea Coast, and from the latter place formed a road to Coptos on the Nile, by which commerce of India is supposed to have continued for ages to pass to Alexandria. The chief glory of Philadelphus was his munificence as a patron of science and literature. He raised the institutions founded by his father to the highest degree of splendor and spared no pains to fill the library of Alexandria with all the treasures of ancient literature. Among architectural works of merit erected during his reign were the lighthouse on the island of Pharos, the Alexandrian Museum, and the royal burying-place. He founded numerous cities and colonies not only in Egypt, but in Syria and Cilicia. He is supposed to have been the patron of Manetho in his Greek rendering of Egyptian history, and there is a tradition that it was at his instance that the Seventy made their translation of the Old Testament. During his reign the dominion of Egypt extended into Ethiopia, Arabia and Libya and embraced the provinces of Phoenicia and Coele-Syria, besides extensive tracts of Asia Minor and the islands of the Mediterranean.

Ptolemy III (surnamed Euergetes), son of Ptolemy II; d. 222 B.C. He succeeded
PTOMAINES, a series of organic nitrogenous bodies, closely resembling the vegetable alkaloids in many of their chemical properties. They are present in many animal products, and are formed either by the chemical breaking down of complex nitrogenous molecules or by bacterial agencies capable of inducing similar decompositions. Most of the ptomaines are ammonia compounds. By the older chemists all of this group of so-called animal alkaloids were termed ptomaine, but later studies have given a series of groups of these bodies. Thus ptomaines, leucaminies and toxins are at present recognized; the former being the results of abnormal catabolic changes, due to chemical or bacterial agencies; the leucamines are usually normal catabolic compounds of this group. The toxins are ptomaines, products usually of bacterial decomposition or ferment activity of some type or other, and which are poisonous. Many of the ptomaines are inedible; others, the toxins, are poisonous, some highly so. Ptomaine-poisoning resulting from eating altered sausage meat, mussels, tinned meats, etc., is due to some form of toxin. Chemically the ptomaines contain carbon, hydrogen and nitrogen. They belong mostly to the amines or substituted ammonia compounds, monomethyl amine, \( \text{N} - \text{H} \) being one of the simplest of these bodies. It is present in many decomposing foods, and even as mercaptaline in a living plant. Dimethylamine, \((\text{CH}_3)_2\text{NH}\) and trimethylamine, \((\text{CH}_3)_3\text{N}\), are similar ptomaines of this simpler group. Amines of higher alcohols are also common forms, ethylamine, butylamine and others being examples. Putrescine and cadaverine are more complex ptomaines which have been isolated from putrescent meats. They are both diamines. Neuramin, \(\text{C}_4\text{H}_8\text{N}_2\), was one of the first of this class isolated by Brieger, the practical founder of the study. Choline, neurine, butamine and muscarine are four oxygenated ptomaines of closely related chemical structure that are peculiarly convertible one into another by simple chemical processes. Choline is non-poisonous, but neurine and muscarine are highly toxic. They are decomposing meat. Muscarine, from the poisonous fly-mushroom, is thought to be identical or very closely similar to the choline, neurine, muscarine compound. Mytilotoxin is the specific poison of the mussel. Typhoidoxin and tetanotoxins are ptomaines supposed to be the active poisonous substances of the typhoid fever and lockjaw bacteria. Tyrotoxins is a toxic ptomaine found in cheese and in ice cream. At least 200 ptomaines have been described. (See TOXINS and ANTITOXINS.)

PUBLIC FINANCE. 1. Definition and Scope of Public Finance.—Governmental organization is necessary in any society which has passed beyond the lowest stage of social development, and in modern industrial states the functions and needs of the government are large and important. Public finance, treats of the raising and application of the resources of the state. It analyzes the needs of the state and the means by which these needs may best be met, that is, it treats of public expenditure and public revenues. It also describes the methods by which these are determined upon and raised, which leads to a discussion of financial legislation and budgetary practice. And finally the subject of public credit, by which the orderly advancement of the state may be sustained, public policy is included by many writers as falling within the scope of public finances. This gives a fourfold division of the subject.

2. Public Expenditures.—It is practically impossible to lay down any principles governing public expenditures, since before we can do this a prior question has to be answered, namely, what are the proper functions of the state. The answers to this stretch all the way from the extreme individualism of Herbert Spencer, which would limit the duties of the state to the protection of life and property and the enforcement of contracts to the collectivism of modern Socialists, who would enlarge the activities of the state to such an extent that they would absorb all private enterprise. We may, however, treat the question of public expenditure as a practical problem in each specific case, to be determined on its merits without reference to any a priori theory.

Upon one point there is no difference of opinion: the tendency of public expenditures has thus far been, and universal tendency, is to increase. This has been true under centralized administration, as in France, or under decentralized governments, as in the German states; in large countries like Brazil or in small ones like Denmark; in theocratic countries like Switzerland or despotic ones like Russia; in old countries like Greece or new ones like the United States. Part of the seeming increase, to be sure, may be accounted for by the growth of the population, the growth of money payments in lieu of payments in services or kind, the general advance in wealth and the decline in the value of money. But after making all these allowances there still remains a real increase to be accounted for, especially since the beginning of the 19th century.

The direction of the growth of public expenditures will become clearer if we distinguish three classes, namely, those for protection or defense, those involved in carrying on public works and those for the social welfare of the community. The first category includes not only military expenditures, but also those for police, the courts and the preservation of domestic tranquility. Some years ago Herbert Spencer laid down the dictum that as society advanced it would expend less for militarism and more for amelioration, but the former part of this statement at least seems not to have been borne out by the facts. Responsible for this is the growing cost of modern armament. War is incredibly expensive, the total money cost of the World War being estimated at about $186,000,000,000.

Peace to-day costs the great modern powers more than the most expensive war of antiquity, and the greater the progress in invention the greater is the expense involved in replacing obsolete equipment with new. Even in a country as free from war as the United States has been in the last 50 years, over two-thirds of the Federal expenditures to-day are directly or indirectly attributable to war and preparation for war. Police and court and similar expenses probably show a tendency to decrease, and it is possible that the future may also see a decline in the expenditures for war, but no such tendency can now be predicted.

There is a decided tendency for the second group of functions to increase. The number and variety of services undertaken by the state is daily increasing, and there is constant pressure from the citizens of all modern states that the government shall expand its functions still further. The post office, the railways, telegraph and telephone systems, municipal water, light and street car systems, are a few of the more important lines along which the state has entered the industrial field, while most governments own lands, forests and mines which they administer. As to whether these enterprises shall cause a corresponding increase in net expenditures or whether they will pay for themselves is a matter of public policy and administration. If managed on business principles the growth of this group will have no effect in increasing the burden upon the taxpayer.

Expenditures for social amelioration and for the development of the well-being of the mass of citizens fall in the third group. These include such items as education, recreation, the care of the dependent and defective classes, and the control and regulation of private industry for the purpose of eliminating unfair and undesirable practices. That these have grown rapidly in the past needs hardly to be stated, and there is every reason to believe that they will increase even more rapidly in the future.

From one standpoint they may be regarded as an investment which the modern state makes in its citizens, from which it reaps large returns in the form of greater efficiency, knowledge, contentment, decrease of suffering and improvement in the general standards of living.

The economic effects of public expenditures are far-reaching; if wisely directed they may greatly benefit a people while an unwise outlay may work positive harm. But there is probably no more widespread economic fallacy than that public expenditure, no matter to what purpose directed, is a desirable thing in itself, since it "puts money in circulation." Adam Smith, however, as early as 1775, contended that whether it was beneficial or not depended upon the purpose for which it was spent, and this is the correct view, though sadly overlooked in our pork-barrel and similar wasteful government expenditures in the United States. As to what is regarded as beneficial will again depend upon the particular point of view; war is considered so by some writers. In general it may be said in conclusion that no general rule can be laid down to govern public expenditures.
PUBLIC FINANCE

Much will depend upon the stage of political and social development of a people. But that state may be considered to make the wisest expenditures which returns to its citizens relatively the greatest amount of benefit, irrespective of whether these expenditures be made for the support of the state, or for the support of the community. In the case of the central governments, the industries selected for government management have usually been socially desirable but unremunerative, as education; of general interest to all the people, as the post office or waterworks; monopolistic in their nature, as street railways; and fairly simple in administration. The revenues from public industries will, of course, differ greatly from country to country according to the policy of administration.

Taxation remains the principal source of revenues for all modern governments, and one that is growing rather than lessening in importance. A tax may be defined, in John Fiske's alliterative description, as a "portion of private property taken for public purposes." It must always be for a public purpose and it involves the power of legal coercion on the part of the sovereign. Because of this characteristic it is highly essential that a tax system be just and equitable. Probably no passage in the literature of finance is more quoted than that in which Adam Smith stated his well-known canons of taxation, which may be summarized as follows:

1. The subjects of every state ought to contribute toward the support of the government, as nearly as possible in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state.
2. The tax which each individual ought to pay ought to be certain and not arbitrary.
3. Every tax ought to be levied at the time, or in the manner in which it is most likely to be convenient for the contributor to pay it.
4. Every tax ought to be so contrived as both to take out and to keep out of the pockets of the people as little as possible over and above what it brings into the public treasury of the state.

In addition to these requirements of justice, certainty, convenience and economy, a satisfactory tax system should also be productive of adequate revenues, and elastic or responsive to the needs of the government. And this is the one which has been followed in the United States, is for the government to dispose of its public domain by sale or gift. If it is settled by an industrious and intelligent agricultural population the government will probably be able to secure larger revenues from taxation of the increased wealth and land values than from the receipts from direct farming by the state or from rentals from tenants. Solely from the standpoint of public finance, therefore, the policy of the United States government may be approved.

Public industries vary greatly from country to country, as they have varied in number and extent from time to time. At one extreme stands Prussia, owning and operating its railroads, telegraph and telephones, and in large part managing its mines and forests. As nothing of its porcelain factories and other government plants. At the other end stands probably the United States, which until the war confined itself practically to the administration of the post office. Municipalities differ among themselves as to the degree of their industries, though here the movement for government enterprises is much stronger than in the case of the central governments. The industries selected for government management have usually been socially desirable but unremunerative, as education; of general interest to all the people, as the post office or waterworks; monopolistic in their nature, as street railways; and fairly simple in administration. The revenues from public industries will, of course, differ greatly from country to country according to the policy of administration.
payers? Two main answers have been given to this problem: the benefit and the ability theories of taxation. According to the benefit theory tax is proportioned according to the services of the government to them—a sort of pay-as-you-use plan. It is evident that an attempt to carry out such a theory practically would result in imposing excessive taxes upon those least able to bear them; the defeated in our state institutions would bear the heaviest burdens. It may be observed, however, that every taxpayer should receive very real benefits from the government which he helps to support, and indeed unless taxation yielded such benefits there would be no justification for it. This, however, is a very different thing from saying that the tax burden should be apportioned in accordance with the benefits which one receives from the government. The more generally accepted theory is the so-called equality of sacrifice. According to this city each citizen is expected to pay for the support of the state in proportion to his ability as compared with the ability of others. It is the observation or neglect of this maxim, he went on to observe, consists what is called the equality or inequality of taxation. His successors have carried on a lively debate as to what constitutes equality, and, particularly, whether a proportional or progressive rate of taxation corresponds most nearly with the demands of justice. To a consideration of this disputed topic we may, therefore, next turn.

By a proportional tax is meant one that is levied at a constant rate irrespective of the amount of property or income from which it is paid. For instance, a proportional income tax of 2 per cent would exact always the same proportion of the income no matter how large it might be: $20 if the income is $1,000, $200 if the income is $10,000 and $2,000 if the income is $1,000,000. On the other hand in the case of a progressive tax the rate increases as the amount of property or income to be taxed grows greater. Thus in the illustration given above the rate might be 2 per cent on incomes of $1,000 (tax would be $20), 5 per cent on incomes of $10,000 (tax would be $500 instead of $200), and 10 per cent on incomes of $1,000,000 (tax would be $100,000 instead of $20,000). Under progressive taxation a relatively bigger slice of the large incomes is taken than in the case of the smaller incomes. The point at issue in determining the question as to whether proportional or progressive taxation best accords with the principle of justice is whether the apportionment of taxation is whether a man’s ability to pay is measured by the amount of property or income he enjoys, or whether his ability increases at a rate more rapid than the growth of his property or income.

The modern tendency is to affirm the latter proposition and to make more general use of the progressive principal. In support of this view a few of the leading arguments may be briefly summarized.

The most popular argument in favor of progression is that it tends to break up large fortunes and to equalize the distribution of wealth. This is doubtless the motive which has led to the approval of inheritance taxes in this country, but in few cases has the application of the progressive principle been drastic enough really to bring about a redistribution of wealth. A second argument is the so-called equality of sacrifice. The man is to make a sacrifice proportionate with that of the poor man he will have to give up a relatively larger per cent of his income, because as fortunes grow larger the utility of each dollar grows less. According to this view the burden of the tax is measured by what is left after payment rather than by the payment itself. Another reason has been suggested by Prof. E. R. A. Seligman, namely, that a man’s ability to acquire wealth increases progressively—money makes money—and hence it is only fair to apply the progressive principle of taxation to rich men. Finally Prof. H. C. Adams urges that there will be a social gain if the very rich older men be discouraged from further accumulation. Thus in the active industry both give the younger men a chance and also devote their talents to philanthropy, social betterment, etc. Against the progressive principle is usually urged the familiar argument that it would discourage industry and savings and hence mean an economic In the discussion thus far it has been assumed that when the legislator imposed a tax he knew what its effects would be. Such, however, is not the case. Taxes are generally shifted by the person who makes the first payment to the public treasury by being incorporated in the price of the article taxed. The final resting place of the tax is called its incidence. Two rather simple theories of shifting and incidence have been held, the one, the diffusion theory, holding that wherever a tax is originally imposed it gradually diffuses itself throughout society; hence no tax is so good as an old tax. Another theory, which may be called the concentration theory, argues that the whole burden of taxation, no matter where originally placed, tends ultimately to be shifted upon some particular class or form of wealth; this was the idea underlying the imposts unique of the Physiocrats. The actual shifting of taxes, however, much more complicated that either of these theories admits. See article on "TAXATION."

The actual tax system of any country is the result of a complex of historical, constitutional and political causes, and that of the United States is no exception. The Federal government has relied for the most part upon indirect taxes—customs and excise duties—though since the amendment of the Constitution in 1913 it has been able also to make use of an income tax, which has already grown heavier as the needs of the Federal government increased. Three-quarters of the State revenues are derived from the general property tax, though the unsatisfactory and inequitable administration of this tax has lead a number of the more progressive States to supplement or supplant this by corporation and inheritance taxes. The great expansion of municipal functions has forced the cities to overhaul their tax systems and to impose heavier burdens upon munipal utilities in addition.

4. Public Credit. To say that a state makes use of public credit is equivalent to saying that a government borrows money. Public credit is a branch of general credit and like that depends
upon trust or confidence. But the fact that a sovereign state is the debtor in the case of public borrowing differentiates a government bond from other securities. In the first place a state cannot be compelled to pay its debts; but in spite of this fact government bonds are eagerly sought after. This is because the modern state is often Solow's. One is tarnished as it is almost certain to need to borrow again. On the other hand, the state has eternal life and hence can make perpetual debts; it has sovereign power to raise by means of taxation the funds for payment of interest and repayment of principal.

In 1820 it was estimated that the civilized governments of the world were resting under a burden of indebtedness amounting to $7,750,000,000. By 1910 this had grown to $40,000,000,000, and since the beginning of the European War in August 1914 these debts have practically quintupled. The growth of great public debts has been almost wholly a phenomenon of the 19th century, and has attended the development of the railroads, the telegraph, the telephone, the electric light, and other developments, better means of communication and transportation and of modern constitutionalism. The cause of the national debts has been almost exclusively war and preparation for war; State and local debts are usually due to improvements and investments, though sometimes improvidence has occasioned them. In general there are three objects for which a government may properly borrow money. These are to cover a casual deficit, to meet a fiscal emergency, and to provide funds for industrial investment.

Temporary but unforeseen deficits may properly be met by the issue of short-term obligations in anticipation of the next tax levy. It may be impossible or undesirable to disturb existing tax rates, and, unless there is a surplus on hand, it is preferable to borrow than to permit a floating indebtedness to be created. Such loans, however, are for short periods and for relatively small amounts.

Much more important is the second group, that designed to care for serious emergencies such as war. In such a case the government cannot wait for the slow increase in revenues from increased taxation; it must have the money at once. The only alternative method of guarding against such a contingency is the so-called "war-chest policy" of Prussia, according to which that kingdom amassed a quantity of precious metals amounting to $60,000,000 and securities for use in case of war. How inadequate such a resource becomes evident when it is noted that this sum was spent in the first three or four months of the Great War. Only by the use of public credit, perhaps to the breaking point, is it possible for modern nations to meet the cost of war.

The third occasion for public borrowing arises when a government wishes to undertake a scheme of public investment, such as the building of a railroad, a waterworks system, an electric-light plant, etc. If the business is a commercial one it will itself provide the means of repayment, and it is, therefore, unnecessary as well as undesirable to saddle it upon the taxpayers. Moreover, from an engineering point of view it is desirable to keep the whole amount of capital necessary for the enterprise on hand at the start, so that no delays may occur. Debts for this purpose should not, if the business is well managed, impose any additional burden upon the taxpayers.

There is no magic in government borrowing; it means simply a postponement of the unpleasant necessity of paying one's debts to the next generation. One of the first and most obvious effects of public borrowing is an increase in the tax rate, for the interest must be paid even if the principal is not. If the sums borrowed by the government have been large this lessens the amount of capital available for private industry and consequently raises the rate of interest. Various social and political effects may also be noted, such as the creation of a district bond-owning class, as in France, or the lessened control of our legislatures over the disposal of public funds when existing debts absorb large amounts of revenue.

The technique of public borrowing will be discussed in another place. (See article Drafts, Public.) It is sufficient to point out at this time that in selling bonds the government must appeal to the same motives as the ordinary seller of commercial paper, except that in times of emergency like war the patriotism of the people may lead them to accept somewhat worse terms than they ordinarily would. In fact loans are classified by numerous writers into the three classes of forced loans (such as the issue of irredeemable paper money), patriotic, and voluntary loans, but the last two can really be considered together, as they are both contractual rather than forced.

It frequently happens that when the emergency which forced the government to borrow possibly at very high rates is past, the rate of interest falls. Then, if the government has the right of repayment of the principal, it can avail itself of this opportunity to sell new bonds at a lower rate of interest and to pay off the holders of the old bonds with the proceeds. This is called conversion or refunding. By this process, without any extinction of the principal, the burden of the interest charge on a given amount of debt was steadily reduced for the nations of Europe during the 19th century.

But while conversion may reduce the interest charge it leaves the principal untouched, and states, like individuals, are faced at last with the unpleasant problem of debt payment. As yet it must be said that this problem has not been squarely faced by modern governments. Except for the United States and to a lesser degree Great Britain, almost none of the civilized nations has attempted to pay off its national debt. And yet a sound financial policy requires that this be done as rapidly as is consistent with the economic development of a country.

5. Financial Legislation and Budgetary Practice.—Modern governments carry on their financial operations under well-defined constitutional checks and budgetary practices. Certain general rules of financial procedure are laid down within which legislatures may vote taxes and legalize appropriations or incur debt. The study of these rules forms a fourth and last part of the subject of public finance.

The rise of constitutional arrangements in respect to financial matters has undoubtedly originated in England, and it is said that the Eng-
lish system has served as a model for the other European countries. While this is only partly true the English budgetary practice will serve as a convenient point of departure for our study of the United States.

By the word budget is meant a comprehensive report and balance sheet of the past and estimated receipts and expenditures of the government for the next fiscal year. Such a statement forms the basis of legislative action on revenue and appropriation in practically every civilized country except the United States. In England, for instance, the budget for the fiscal year is prepared by the Chancellor of the Exchequer as a member of the Cabinet upon the basis of reports made to him by the heads of departments. This contains a statement of the revenues and expenditures for the past year, together with an estimate of the revenues and the proposed expenditures for the coming year. The government then subjects the proposed budget against criticism, modifying it where necessary, but resigning from power and responsibility if the opposition overturns their plans.

Contrast with this highly centralized and responsible method the decentralized and irresponsible practice of the Federal government of the United States. A report is made to Congress to be sure by the Secretary of the Treasury, based upon data submitted by the various department heads, but until recently there was no certainty that the report was trustworthy, and even now Congress is but little influenced by the estimates of the executive department. According to our theory of separation of governmental functions there is no connection between the executive and legislative departments and Congress prefers political independence to financial orderliness. The result is that tax laws and appropriations are determined by political rather than fiscal considerations.

Another striking point of difference between the two systems lies in the fact that in the English budget both revenue and expenditures are determined by the same body, while in the United States the taxing and spending powers are allotted to two different committees. Under the English system there is thus possible a well-balanced budget in which the Ministry of Finance, responsible for adjusting outgo to income, is able to avoid either surplus or deficit. At the same time the device of a variable rate for the income tax makes possible an exceedingly accurate equilibrium.

In the House of Representatives in the United States there are some eight different committees which bring in 14 different appropriation bills, of which six are prepared by the Committee on Appropriations. As each of these committees is under the temptation to swell its bill asking for appropriations in order to magnify its own importance, there is constant pressure to extravagance. And when it is remembered that still another committee, that on Ways and Means, has charge of revenue bills, it is not difficult to see that a well-balanced and harmonious budget is all but impossible under such a system. Not only is there no careful correlation between revenue and appropriations as a whole, but the relation between different categories of appropriations is haphazard and unscientific as they are under the control of different sets of men.

The remedy for these evils is of course the adoption of a budget system for our Federal government. President Taft in 1912 requested Congress to provide for a budgetary form of statement of the annual report of the Secretary of the Treasury, and to follow such procedure in their financial legislation, but without avail. Probably nothing will be done in this direction until the force of public opinion compels Congress to adopt business methods and forms.

The State legislatures shadow forth, rather dimly, the same financial procedure that is found in Congress. It is practically impossible to speak of a scientific budget in any of the States. More progress has been made, on the other hand, in our municipal government, where under the highly centralized administration of the commission or city manager plans of government a budget becomes possible. In the majority of our cities, however, but little more progress toward this fiscal ideal can be recorded in the case of our State legislatures. They are still in a chaotic state of transition.

Ernest L. Bogart, Professor of Economics, University of Illinois.

PUBLIC HEALTH, or the health of the people, i.e., of groups or communities of human beings, is to-day a great and growing subject which may be regarded either as a science—and is then nearly or quite synonymous with public hygiene—or as a state of condition of the physical well-being of human groups or societies. As a science, it has been developed especially since the great pathological discoveries of the last quarter of the 19th century, taken on new forms and extraordinary importance. As a state or condition, it has also recently attracted much attention in the improvements shown in almost all civilized countries. As a science, it is beginning to be recognized in schools and universities by the establishment of new courses, special teachers and even special training schools—notably at Harvard University, to-day a great and growing subject Technology, at Yale and at the Johns Hopkins University—an early step in this direction having been taken at the University of Pennsylvania. As a condition, worthy of and demanding worldwide awakening it has led to the establishment of a Federal Bureau in the Treasury Department of the United States government (formerly the United States Marine Hospital Service, later the United States Marine Hospital and Public Health Service and now the United States Public Health Service, having at its head a surgeon-general with several assistant
surgeons-general, with a large and important hygienic laboratory (in Washington) and a strong staff of medical men, sanitary chemists, sanitary biologists and sanitary engineers. In private, as well as public, a great deal has been done, such as the International Health Board of the Rockefeller Foundation, the American Public Health Association, the American Association for the Study and Prevention of Tuberculosis, the American Society for the Prevention of Infant Mortality, and many others far too numerous to mention, have also been formed and are generally actively at work to promote and improve the public health. The latest step of great magnitude and promise in this direction is the diversion of some of the vast machinery and effort of the American Red Cross remaining after the World War into channels of public health education and sanitary and hygiene, betterment. It is proving that health is a public responsibility and that personal health or hygiene are sufficiently complex and uncertain, both of determination and amelioration, but if, instead of dealing with the individual, we deal with groups or masses of individuals in the form of communities, such as families, districts, towns, cities, States and nations, all the difficulties (and these are by no means few) connected with individual hygiene become enormously multiplied and complicated. It is easy to see that when the problems of the individual under varying conditions dealing with a single variable environment are multiplied and complicated by the introduction of those of other individuals, with the inevitable effects which these produce upon the common environment, the public health problems with which we have to deal are by no means either simple or easy of solution. We need in the first place a precise knowledge of the quantity of life (that is, the population) with which we have to deal, and if we consider the whole amount of dying within a particular period and then determine the death-ratio (or death rate), we shall have at least a crude and general measure of the sanitary condition of the community. But if we determine simply the general death rate, we shall not have gone far enough; it is now well understood that the death rate is profoundly influenced by factors other than disease, such as birth rate, which is naturally rather low under present conditions to a high death rate. It becomes necessary then in any scientific examination of public health problems to go behind the general death rate and to study other conditions. One of the most important of these is the so-called specific death rate, that is to say, the death rate in any given population from particular diseases such as tuberculosis, typhoid fever, pneumonia and the like; for it is not infrequently happens that in the presence of a fair general death rate the mortality from typhoid fever (for example) may be excessive. In determining population the census is of the first importance (see Census) and a well-directed census should furnish not merely the total number of the living but the age-periods of the population, inasmuch as the mortality at different ages is very widely and no safe conclusions concerning the sanitary conditions of a population can be drawn without careful reference to the constituents of that population at the different age-periods. Space will not permit here a detailed treatment

of the sources of error to which students of sanitation, morbidity, death rates and the public health are exposed in various other directions, but which reference to any of the leading works upon vital statistics and on the discussion of the rates can be made. Epidemics.—From the practical point of view there is no more interesting subject connected with the public health than the rise, progress and decline of epidemics, the study of which now forms a special science known as epidemiology. In prehistoric times and in early civilized communities have been ravaged by pestilences and epidemics, which have at times enormously increased the death rate, as in the famous black death (see Black Death; Pestilence; Plague), and have thus made serious inroads upon the public health. With the disappearance (until the Great War) of such diseases as typhus (ship fever, jail fever) and of scurvy, both of which formerly destroyed thousands even among civilized peoples, attention has of recent years been fixed more particularly upon the bubonic plague, which after a long absence from Europe has reappeared in great intensity in China and India, and has even threatened the shores of England and the United States. Asiatic cholera, which made a dramatic appearance in the early days of the modern era, in the city of Hamburg, Germany, in 1892 has since been kept at bay in civilized countries. Typhoid fever, however, still remains a curse of some even highly civilized communities, largely owing to the fact that it is readily conveyed by food and drink, such as oysters, milk and water, while its specific germs appear to be more than usually hardy or resistant. But with the discovery of an effective serum or vaccine capable of conferring immunity against typhoid fever, the dread of this disease is largely done away. Tuberculosis, popularly called the great white plague, which has always been credited with a very large proportion of the total mortality in all communities, still destroys perhaps larger numbers of people than any other one disease. Probably there was a time (except perhaps in the middle of the 19th century in Great Britain) when a more general scientific, professional or popular interest has been felt in public health problems, and especially in the particular disease last mentioned, than to-day. As a result of the immense progress which have been made in our knowledge of the methods of dissemination of infectious and contagious diseases; and doubtless also in part because of the general improvements which the 19th century has witnessed in housing, heating and ventilation, and the better protection of the health of individuals as well as communities, a distinct decline in the death rate is apparent and a correspondingly greater longevity. It is impossible to determine how much influence should be credited to general improvements, the result of a higher degree of civilization, but after making all deductions it probably still remains true that life is safer and longer to-day than ever before, largely because of a better knowledge of the causes of disease and a better practice of the arts of hygiene and sanitation among the people. The discoveries which have been made in respect to the principal infectious and contagious diseases affecting the human race within the last 50 years have been so extensive and so extraordinary that the names of
these diseases have become almost household words, and the methods of dealing with them have become familiar, not only to physicians, but to sanitary experts, trained nurses and the intelligent public in general; and inasmuch as knowledge of this sort is the basis of effective promotion of the public health, we may briefly describe the more marked features of some of these diseases and especially the methods of their dissemination and control.

Before we do this, however, we may point out that the existence of certain diseases which only two or three centuries ago ravaged the human race have been to-day almost completely exterminated from the higher civilizations. The most important of these is probably the <i>bubonic plague</i>, which in one form or another appeared in Europe down to the 19th century under the various names of the black death, the plague and pestilence. This disease is characterized (among other features) by swelling of the lymphatic glands, which turn blue and suppurate, being then known as buboes, but it was not until the last decade of the 19th century that these buboes were found to be loaded with microbes (bacilli) capable of producing the disease in certain of the lower animals. Very late in the 19th century this plague, which had previously been for many years almost unknown in Europe and had never, so far as known, visited America, suddenly spread both westward and eastward from China, and menaced the coasts of Europe and America. It has, however, for the most part been successfully held in check, and is no longer greatly dreaded. Its method of dissemination is believed to be by means of rats and fleas, rats being very susceptible to the disease, and fleas which have bitten rats being abundantly capable of transferring the bacilli to human beings.

Another disease formerly very prevalent in highly civilized communities, which has within the last century or two practically disappeared, is <i>typhus fever</i> (spotted fever, jail fever, ship fever, etc.). This disease, which for a long time was not separable from typhoid fever in classifications, and which resembles it closely, but differs from it in the fact that it frequently causes extensive eruptions and is also lacking in the characteristic ulceration of the bowels which is the distinctive feature of typhoid fever, was formerly greatly dreaded, but, doubtless owing to the improved sanitation (greater cleanliness) of crowded places such as jails and ships, has practically disappeared from among the most highly civilized peoples. How far better food and air have aided in the good work it is impossible to say. The main factor, however, is greater cleanliness, for it is now known that this disease is transmitted by lice, and that freedom from lice means, as a rule, freedom from typhus fever.

Smallpox, a disease formerly so prevalent that, according to one authority, "scarce one in a thousand escaped it," and so much dreaded that the pesthouse in the early American towns and cities, a constant as well as a repulsive feature, was regarded almost with terror by many inhabitants, has of late years been nearly exterminated in the most highly civilized countries, and wherever sufficient pains have been taken to hold it in check by means of vaccination and revaccination. In the German army, for example, this disease is now extremely rare, apparently for the reason that vaccination and revaccination are most carefully attended to. The only serious danger from smallpox to-day is that communities which, because of its scarcity are unfamiliar with the horrible character of the disease and its ravages may come to rely upon improved sanitation or other supposed safeguards and neglect vaccination which, according to all experience, is the only trustworthy defense against the extremely infectious and contagious disease. This danger is aggravated somewhat by the mistaken zeal of the so-called anti-vaccinationists, who, fixing their attention upon the occasional injuries consequent upon vaccination rather than upon the enormous saving of life which has resulted from its use, maintain a propaganda against it, and seek to have vaccination entirely done away. However earnest and honest these persons may be, there can be no doubt in the minds of those who will take the trouble to review all of the evidence, because their contentions are largely unfounded.

<i>Typhoid fever</i>, a diarrheal disease, ever since its clear recognition, about 1840, as a malady distinct from typhus fever, has gradually become one of the most recognized as one of the most insidious diseases of civilized societies. Its ravages among the uncivilized are doubtless excessive, and even among highly civilized societies it is far more frequent than it ought to be, apparently because the bacilli which characterize and cause the disease are capable of maintaining their life outside the human body in the environment of man for a somewhat longer period and under somewhat more trying circumstances than are the germs of many other diseases. These bacilli are, for example, fairly resistant to the cold and to dryness, and, although they are not known to produce spores, they are apparently able to persist for a long time (in greatly diminished numbers) in sewage, water, ice and upon fruits, vegetables and other articles of food. In milk under certain circumstances they may even multiply, and a very large number of epidemics of typhoid fever has been traced to infected milk. The same thing is true of drinking-water, and, since 1894, when an extensive epidemic of this disease, due to infected oysters, occurred among the students and others in Wesleyan University, in Middleton, Conn., many investigations have been made, both in Europe and in America, tending to show that raw oysters are not infrequently grown near the mouths of sewers and that such oysters may readily convey the germs of this disease. Furthermore, since it has become known that the bacilli of typhoid fever occur not only in the bowel discharges, but also in the urine, and even in the sputum of persons sick of this disease, it has become easy to understand the fact that it is often realy, as well as apparently, contagious, although of course in far less degree than the eruptive diseases, such as smallpox, measles and scarlet fever. The control of typhoid fever is now largely within our power, for it has been shown by experience, in armies and navies, that it can be mostly avoided by "vaccination" with a serum made from the dead bacilli of the disease itself.

<i>Malaria</i> and malarial fever had long been associated in the popular mind with swamps,
but until 1880 no germ characteristic of these diseases (which are really one and the same) had been discovered. In that year Laaveran, a French investigator in Algiers, discovered in the red blood-cells of persons sick of the disease certain animal parasites, protozoa in character, which appear to be not only the constant companion, but the sufficient cause of the disease. Quite recently Ross in England, Celli in Italy and various other observers have proved beyond doubt that these germs are conveyed from one human to another by certain female mosquitoes, belonging to the genus Anopheles, without the bite of one of which containing the microbes the disease does not appear to be transferable. The life history of these parasites has been worked out thoroughly, and to-day it is universally believed that malaria is caused by the parasites mentioned above, which spend only a portion of their normal life in their human host, and the remaining portion in the human mosquitoes of the genus Anopheles. The importance of this discovery can scarcely be overestimated, for although formerly, as already stated, malarial fever was associated with swamps, no one could tell precisely how; while to-day it is easy to see that these swamps contain infected human mosquitoes, they may be dangerous sources of disease for human beings. On the other hand, it had long been observed that it was not swamps per se which produced malaria, inasmuch as thousands of swamps had never been brought under suspicion. This circumstance is now interpreted as due to the fact that whatever mosquitoes may have been present in the swamps in question must have been of some other genus incapable of transmitting the disease; or else, if of the right genus, then these Anopheles had never become infected by biting human beings suffering with malaria. The practical importance of these discoveries in regard to malaria cannot easily be exaggerated, for malarial fever has long been the dreaded pest of the engineer, and such enterprises as the digging of the Panama Canal had been enormously hampered and even prevented by the prevalence of malarial and other fevers. Nowadays it suffices to make sanitation instead of deep out mosquito breeding places, and if possible the breeding places of these pests shall be either drained and altogether done away or else petroliated that is, treated with oil of some sort which shall interfere with the breeding of mosquitoes. The disease Tuberculosis has long been recognized as one of the worst diseases afflicting the human race. It is characterized by certain cheesy masses called tubercles, which may be formed either in the lungs or upon the membranes of the brain, in the lymphatic glands or even within the tissues of the face, the disease in this last case being known as lupus (a wolf), and causing serious disfigurement. In 1882 Dr. Robert Koch discovered within these cheesy masses small microbic rods or bacilli to which he gave the name by which they are now universally known, of the Bacillus tuberculosis. These bacilli frequently occur in the sputum of tuberculous patients, and if this sputum is cast out upon the streets or in public places, it may become dried and disseminated in various ways, for example in dust. The bacilli are believed to be disseminated also by the coughing of fine moist particles from the lungs of tuberculous patients into the air; by milk derived from the tuberculous udders of tuberculous cows; by kissing—as when, for example, a tuberculous mother kisses her young child; by the hands,—as when a tuberculous patient, coughing upon his hand, afterward, without having washed it, touches the hand of another, or articles of food which are eaten raw; and in a great variety of other ways. Here also much is being done by boards of health and other sanitary organizations which seek to control the spreading of this disease; by physicians who educate tuberculous patients to use destructible spit-cups, handkerchiefs and the like; by sanatoria, that is, establishments intended especially for the benefit and cure of cases of primary tuberculosis, and by a campaign of education consisting largely in the distribution of literature bearing upon the disease. Among the most noted sanatoria for tuberculosis in the world are those at Davos Platz, in the Italian Alps, and at Saranac Lake, in the Adirondacks. More recently State sanatoria have begun to be established, the first in America being that of the State of Massachusetts, at Rutland, Mass. It was formerly thought necessary for incipient tuberculous cases to be removed to high and dry localities, but to-day it is commonly felt that, however, desirable a removal of this kind may sometimes be, it is not always wise, and that the essentials of a good sanatorium (which are largely rest, fresh air and good feeding) may often be found near a large city, the first institution of this kind to be established (namely, the Sharon Sanatorium at Sharon, Mass, only 16 miles from Boston, upon a slight elevation and a dry, sandy soil) having proved eminently successful. Diphtheria, or malignant sore throat, has of late years come, unhappily, to be quite common, and is rightly much dreaded. The causative germ of the disease was discovered and described by Loeffler, a pupil of Koch, in 1884, since which time it has been very widely studied, and has been found to do its damage by producing in the bodies of its victims, or even when growing in beef tea, a highly poisonous substance known as its diphtheria toxin. No remedy for it was known, but in that year von Behring of Germany announced the discovery of that remarkable antitoxin for the disease, now universally known as diphtheria antitoxin. Behring was led to this magnificent discovery by reflecting upon the fact that some animals can be immunized to diphtheria toxin and that the blood of such immune animals is capable of neutralizing the poisonous character of the toxin produced by the germs of diphtheria. The manufacture of diphtheria antitoxin is now a large industry, sometimes carried on under private and sometimes under State or municipal control. There can be no question that its use has largely diminished the mortality from this disease. There are many other diseases such as yellow fever, leprous, scarlet fever, measles and pneumonia, a knowledge of which has of late years become more precise and practical, but these cannot be referred to within the limits of this article. Some Methods for Health Improvement. Engineering enterprises, such as drainage and sewerage, water supply, the filtration of
PUBLIC HEALTH

water, the purification of sewage, the cleaning of streets, and garbage collection and disposal, have had much to do in the past, and will doubtless have much to do in the future, with improvement of the public health; and there is every reason to hope that the general death rate may continue to diminish, as it has diminished, in the past, largely by virtue of these enterprises. In addition, however, much remains to be done; the more crowded sections of cities—the so-called slums—require the most careful supervision to prevent overcrowding, bad ventilation and accumulation of noxious or even toxic wastes. The milk supplies of cities are as yet very largely in a primitive state, so far as the production of milk is concerned, and it will become necessary in the near future either to improve radically the conditions of its production or else to abandon almost altogether the use of uncooked milk. Vegetables, fruits and meats are often in a raw state, such as celery, lettuce, radishes, watercress, cherries and strawberries are peculiarly exposed to infection either by handling or because they are occasionally treated with manure-water during the process of growth. The water of fish ponds may be far from pure, and the oysters which are occasionally eaten by man are frequently the agents of disease. The dangers from oysters have already been referred to. How far uncooked or underdone meats are dangerous is uncertain, although it is well known that uncooked ham and other lean meats of hogs have frequently caused trichinosis, an infection due to minute parasitic worms. 

Illuminating gas, particularly water gas, which contains a large percentage of carbonic oxide (CO), has an important bearing on the public health, not when properly burned or by its products of combustion, but because of leaks in the mains or the service pipes, or about the fixtures by which it is distributed. Many deaths occur annually from this source, and the use of water gas should be accompanied by special precautions.

As for the effect of public gymnasia, play-grounds and other open places in cities or other crowded communities little need be said, inasmuch as it is impossible to determine their practical value. There can be no doubt of the general wisdom or advantage of such things in modern cities. Isolation hospitals for infectious diseases are gradually being established in our larger cities, and are filling a long-felt want. But of all the recent improvements in transportation making it possible for large numbers of persons to live near, rather than within, cities and suburban life is becoming as characteristic a feature of modern life as is city life itself. Unfortunately this remedy for the ills of button, of heat, or of smoky city life is applied only to the fairly well-to-do, for the very poor will probably always find it easier, cheaper, and more exciting to live closely crowded in the congested centres of population, where work is most abundant and where the incidental diversions of a varied and noisy city life may be had free of cost.

The public health problem is very largely, but not exclusively, a problem of the life of crowded communities. Yet something needs to be said also of the life of those in rural districts which, while they ought to be the most healthful places in the world, are by no means always such. Damp or even wet cellars, bad ventilation, overheating and poor feeding; defective sanitary arrangements, shaded houses and unwholesome surroundings, or close association with domestic animals, such as dogs, cats and poultry, are all factors which are important in ensuring the safety of the public health, and boards of health having in charge the sanitation of States or Territories should give attention to these problems as well as to those of more crowded communities. Railway sanitation, steamship sanitation, and the more technical aspects of the sanitary condition of health, such as disinfection, scavenging, quarantine, isolation, vaccination and the like, are nowadays subjects of great public consequence and are fully treated in special works or memoirs, reference to some of which will be found at the end of this article. There are few more interesting matters relating to the public health than the control of the adulteration of foods and drinks. In spite of the increase of general intelligence, flouting the use of patent medicines too often disfigure the pages of the newspaper press and testify to the enormous use of patent medicines, drugs, etc., by the public at large.

In many States special laboratories are maintained for the investigation of such waters, and stringent laws exist for the regulation of their adulteration and sale. One of the most striking facts which these have disclosed is that many of the so-called compounds, tonics, sarsaparillas and other patent foods or medicines are rich in alcohol, some of them containing as much alcohol as many kinds of wine or beer. Some which profess to contain certain ingredients are totally lacking in them, and others which profess to cure the alcohol habit or the morphine habit actually contain alcohol or mor-phine respectively, occasionally in large quantities. The revelations which proceed from these State laboratories are sometimes startling, and any one interested in the public health should inform himself upon this subject, as he may readily do by turning, for example, to the 'Annual Reports of the State Board of Health of Massachusetts.'

State and Municipal Laboratories are thus an important and modern adjunct to the public health interests of a city or State. The results of most of these means are provided for the rapid and certain diagnosis of doubtful cases of diphtheria, typhoid fever, malaria, hydrophobia, glanders, anthrax and some other infectious diseases. In them also analyses of milk, water, ice, sewage, vinegar and other liquids, of illuminating gas and of air, and of substances subject to infection or adulteration may be made; foods and drinks may be examined; materials for pavements or buildings may be tested and a great variety of useful operations conducted, all tending to a better knowledge of local sanitary conditions. It is doubtful if any arm of the public health service is to-day more important than this. Largely in consequence of all these and many other efforts now making for the improvement of the public health, human life is probably to-day safer and healthier than it has ever been before, and the outlook for further progress is very bright. See Hygiene; Hygiene, Military; Sanitation of Farms and Sanitary Engineering.

PUBLIC HYGIENE. See Social Hygiene.

PUBLIC LANDS. The expression “public lands” or “public domain” of the United States is used to include such lands of the United States as are subject to sale or other disposal under general laws and are not reserved or appropriated for any special public purpose. This applies to all tracts of the public domain which at any time has been included in the public lands of the United States.

The table below shows for the several States and the Territory of Alaska the total area in acres and the area unappropriated and unreserved on 30 June 1915, subdivided into those which have been surveyed, those which have not been surveyed and the total area.

Unappropriated public lands are subject to disposition under general laws, the principal of which are the Homestead Law (q.v.), the Desert Land Law (q.v.), the Timber and Stone Law (q.v.), the Reclamation Laws (q.v.) and the Mineral Laws (q.v.).

The public lands of the United States were acquired by treaty, purchase and occupation. By the Articles of the federal agreement signed in Congress 15 Nov. 1777 and ratified by the several States in the four subsequent years the government of the United States of America was organized and pursuant to that action took possession and control of the unappropriated Crown lands of Great Britain as the successor of that government. By the definitive treaty of peace concluded 3 Sept. 1783 Great Britain formally relinquished all its “propriety” (proprietary) and territorial rights, leaving the ownership of the United States and of the several States undisputed.

PUBLIC LANDS SURVEYED AND REMAINING UNSURVEYED.

Note.—Definite reports regarding the areas disposed of in Alaska have not been published but the amount is probably less than 200,000 acres.
During the existence of the government under the Articles of Confederation, Congress on 6 Sept. 1780 passed a resolution recommending the surrender and disposal by the several States of their waste and unappropriated lands to aid in paying the public debt incurred by the War of the Revolution. These lands lay to the west of the present boundaries of the then existing States.

New York ceded without reservation 202,187 acres now in the county of Erie, Pa. In 1784 Virginia ceded 169,559,680 acres north of the Ohio and east of the Mississippi rivers and known in subsequent legislation as the "Northwest Territory," reserving therefrom 150,000 acres for the benefit of George Rogers Clark and the officers and soldiers who aided him in his successful expedition into that country against the British and also so much of 3,800,000 acres in Ohio as should be needed to satisfy certain donations to her Revolutionary soldiers. There were other minor stipulations.

In 1785 Massachusetts ceded, without reservation, 34,560,000 acres, which now forms a part of Michigan and Wisconsin and northern Illinois.

In 1786 Connecticut ceded 26,600,000 acres, which now forms the northern parts of Ohio, Indiana and Illinois; reserving, however, 3,800,000 acres, a strip in northern Ohio 12 miles long, which was afterward known as the "Western Reserve" and of which Connecticut donated 500,000 acres, subsequently known as "Fire Lands," to certain of her citizens who had suffered loss by fire and raids during the Revolutionary War.

The remainder of the lands reserved by Connecticut were sold to a company for $1,200,-

000.

In 1787 South Carolina ceded, without reservation, 3,130,000 acres, a strip 15 miles wide which now forms the northern parts of Georgia, Alabama and Mississippi; while in 1790 North Carolina ceded 29,184,000 acres, which now forms the State of Tennessee, reserving the right to satisfy therefrom certain donations made by the State of New York under its laws, which absorbed the bulk of the lands embraced in her cession.

In 1802 Georgia ceded 56,689,920 acres, now forming parts of Alabama and Mississippi, in consideration of the payment to her of $1,200,-

000 and the satisfaction of certain outstanding obligations known as the "Yazoo Claims," the settlement of which finally cost the United States $5,000,000.

By treaty of 30 April 1803 France ceded 757,961,920 acres, now known as the "Louisiana Purchase," the government paying therefor $27,567,621, which includes the original price of $15,000,000, interest, settlement of claims, etc. These lands now constitute a part of Mississippi, Alabama, Texas, Colorado, Wyoming, Montana and the States lying between them and the Mississippi River.

By treaty of 22 Feb. 1819 Spain ceded 37,-

931,520 acres, now constituting the State of Florida, at a valuation of $6,289,768.

By treaty of 2 Feb. 1846 Mexico ceded 334,443,520 acres, now constituting the States of California, Nevada, Utah and parts of New Mexico, Arizona, Colorado and Wyoming, at a cost of $19,250,000.

On 25 Nov. 1850 Texas ceded 61,892,480 acres, now constituting a part of New Mexico, Oklahoma and Colorado, for $16,000,000.

By treaty of 30 Dec. 1853 Mexico ceded 29,142,400 acres, known as the Gadsden Purchase, now part of New Mexico and Arizona, for $10,000,000.

By treaty of 30 March 1867 Russia ceded all of Alaska, embracing 378,165,760 acres, for $7,200,-

000.

On 7 July 1898 the Territory of Hawaii was acquired, containing 4,127,360 acres. By treaty of 10 Dec. 1898 Spain ceded Porto Rico, containing 2,198,400 acres; Guam, 134,400 acres, and the Philippine Islands, containing 73,575,-

120 acres, for $20,000,000.

By treaty of 2 Dec. 1899 with Germany and Great Britain, Tutuala and other small Samoan islands, containing in all 49,280 acres, were annexed.

By treaty of 7 Nov. 1900 Spain ceded Siboutu and other small islands in the vicinity of the Philippines, containing in all 43,520 acres, for $100,000.

The Oregon Country, containing 183,480,960 acres and embracing Oregon, Washington, Idaho and parts of Montana, was claimed by the United States through discovery and exploration and that claim was afterward recognized by England and Spain.

A controversy with Great Britain regarding the northern boundary west of the Rocky Mountains was not settled until the treaty of 15 June 1846, which, however, left undetermined the extreme western end of the boundary line at its junction with the Pacific Ocean.

The treaty of 8 May 1871 provided, among other matters, that the decision of this point should be left to the emperor of Germany, who decided in favor of the contentions of the United States, 21 Oct. 1872.

The total area of the acquisitions by State cessions was about 500,000 square miles or 320,000,000 acres at a cost of $22,200,000. The area acquired from foreign governments, including the Oregon Country, was about 2,400,-

000 square miles or about 1,500,000,000 acres, at a cost of $5,597,395. In addition to these costs, which include interest and settlement of private claims, the United States has paid more than $200,000,000 for extinguishing the rights of the Indians to these lands.

In forming new States from the territory obtained through these cessions from States and foreign governments, Congress has required each new State to adopt an irrepealable ordinance that the State shall not tax the public lands nor pass laws to interfere with the primary disposal thereof by the United States.

The public lands of the United States were, in the beginning, regarded as an asset for the payment of the debt incurred in carrying on the War of the Revolution. Many plans for disposing of the lands were proposed and considered. The earliest efforts were to sell the land in large blocks and prior to the organization of our present government Congress made three such sales. The first was the sale to the Ohio Company. This was originally intended to cover 2,000,000 acres at $1 per acre, the land lying in the present State of Ohio on the Scioto and Ohio rivers. The area was reduced to 822,900 acres and the sale was confirmed 27 July 1877. The amount
actually received was two-thirds of a dollar per acre and payment was made in certificates of the public debt.

The second sale was to John Cleves Symmes, finally confirmed by the Act of 5 May 1792. The lands lie in the present State of Ohio, on the Ohio River, between the Great and Little Miami rivers, near the site of Cincinnati. The tract was supposed to contain 1,000,000 acres, but its actual area was 248,540 acres. This was sold at the same rate of two-thirds of a dollar, paid in certificates of the public debt and military land warrants.

The third sale was to the State of Pennsylvania, a tract now in Erie County, containing 202,187 acres, ceded to the United States in 1781 by New York. This was sold at the same rate and paid likewise in certificates and military land warrants.

By the Act of 2 March 1799 those who had made contracts with Symmes for lands not lying within his purchase, as finally determined, were allowed to buy the lands contracted for at $2 per acre, payable in certificates of the public debt. About 88,880 acres were sold under this law.

Practically the first act of general character for the sale of lands was passed 18 May 1796 and related to a tract in the present State of Ohio. This provided for a system of rectangular surveys substantially as now in use. Townships were laid off six miles square containing 36 sections, each being one mile square and having an area of 640 acres. Alternate townships were to be subdivided into sections, while only the exterior boundaries of the others were laid out on the ground.

The subdivided townships were to be sold in tracts not less than one section or 640 acres each. The other townships were to be sold in tracts not less than a quarter township, excluding the four middle sections which were reserved for future disposal, thus having a block of eight sections in each quarter township, so that these lands were to be disposed of in tracts of 640 acres and 5,120 acres, respectively.

The sales were to be made to the highest bidder at a public sale, but no sale was to be made for less than $2 per acre. One-half was to be paid within 30 days and of this one-tenth was required at the time of sale, with one year’s credit for the remaining half. The land was forfeited in case of failure to pay the balance. A discount of 10 per cent was allowed on one-half the amount if the whole sum was paid within 30 days.

By the Act of 3 March 1797, passed the next year, the lands sold after that date could be paid for in evidences of the public debt.

The Act of 1796 remained in force for four years without producing very satisfactory results, only 121,540 acres having been disposed of.

The total area sold prior to the Act of 10 May 1800 was 1,484,047 acres for $1,201,725.68, an average price of less than 81 cents per acre. This includes some small tracts sold before the organization of the General government at the minimum prices of $1 and two-thirds of a dollar.

The Act of 1796 established the office of surveyor-general with substantially the same duties as that officer now exercises. The sales were made under the supervision of the Secretary of the Treasury. The smaller tracts were sold under the direction of the governor or secretary of the Western Territory and the surveyor-general at Cincinnati or Pittsburgh according to direction, paid by the act. The quarter-township tracts were sold by the Secretary of the Treasury at Philadelphia, then the seat of government.

The Act of 10 May 1800 made further provision for the sale of lands in the present State of Ohio, modifying in several important particulars the Act of 1796.

Four land districts were designated each under the administration of a register and a Receiver of Public Monies with substantially the same functions as at present. Their offices were established at Cincinnati, Chillicothe, Marietta and Steubenville. Provision was also made for a receiver at Pittsburgh. Thus by 1800 there had been established substantially our present system of the surveys of the public lands under the surveyor-general for a specified district and a system of sale by a register for each land district, not necessarily the same as the surveyor-general’s district, and the receipt and accounting for funds by a receiver of public moneys for each district. New land offices were opened and new offices of surveyor-general were established from time to time as they became necessary.

Under the Act of 1800 the lands were offered at public sale in sections and half-sections for not less than $2 per acre, payable in cash or in evidences of the public debt. One-fourth of the price was to be paid within 40 days, one-fifth of that or one-twentieth of the whole, was required at the time of sale. The other three-quarters were payable in two, three and four years, respectively, with interest at 6 per cent per annum. A discount of 8 per cent per annum was allowed for advance payments. Provision was made for forfeiture and resale in case of default. The lands remaining unsold after having been offered for sale could be purchased at private sale for $2 an acre.

The surveyor-general was authorized to lease the lands reserved for future disposition, in sections and half-sections, for terms not exceeding seven years. The act also provides that any person who has erected or had begun to erect a grist-mill or saw-mill upon the lands to be sold was entitled to the pre-emption or preference right to purchase the section on which it was located at $2 per acre.

By 1789 deeds for the lands sold were executed by the Board of Treasury, corresponding to our present Treasury Departments, or by the loan commissioners, agents of this board. After that date all patents for the lands sold were executed by the President, countersigned by the Secretary of State and signed in his office. It is to be noted that in a few cases Congress had made grants of lands in such terms that patent was not required, title passing directly by virtue of the act.

By Act of 23 April 1812 the General Land Office was established in the Department of the Treasury. To this office were transferred all the duties relating to the survey, sale and patenting of the public lands previously per-
formed by the Secretary of War and the Secretary and Register of the Treasury. All patents for lands were to be issued in the name of the United States under the seal of the new office. The President to appoint after the period or terms signed by the Commissioner of the General Land Office.

To relieve the President of the great burden of personally signing the large number of patents issued, Congress by Act of 4 July 1833 authorized the President to appoint, by and with the advice and consent of the Senate, a secretary whose duty it would be to sign land patents in his name. This statute continued in effect until 19 July 1878 when the President was authorized to designate an executive clerk to perform this duty, instead of submitting a nomination for confirmation by the Senate.

The General Land Office became part of the Department of the Interior when the latter was organized 3 March 1849.

After the Act of 1800 the sales of public lands continued without material change in system but with gradual improvements in detail. As each new area was opened to sale, the existing system was extended to it providing for sale at public auction with the right of purchase at private sale after the period of public offering, usually three weeks, part payment in cash and the balance in four years.

Prior to the Act of 26 March 1804 the lands were offered for sale in not less than half-sections (120 acres). By that act the survey and sale of lands in quarter-sections (160 acres) was authorized. Before that time payment of surveying expenses and patent fees had been required, but was discontinued by that act.

Payments for land in evidences of the public debt were authorized by all the general land laws until the passage of the Act of 3 March 1803, which provided that in the purchase of the lands in Mississippi Territory, being the lands lying south of the State of Tennessee, such payments could not be made. The Act of 18 April 1806 discontinued such payments as to all public lands thereafter sold.

The Act of 24 April 1820 made a radical change, however, requiring immediate payment in full for all sales made from and after 1 July 1820. The credit system had been demoralizing. Congress had been constantly importuned to extend the time for payment and acts for this purpose were passed at nearly every session. The privileges of these acts were limited to persons who had purchased not more than 640 acres. After 1820 such acts were passed nearly every year until the passage of the Act of 23 May 1828, which provided for the issue of certificates to represent the money paid for land which had reverted to the United States because of failure to complete the payments. These certificates were receivable in payment on the purchase of other lands within the same State or Territory.

This act was followed by the Act of 31 March 1830 and the Act of 9 July 1832 providing further relief in such cases, closing the long series of enactments for the relief of credit purchasers.

The total amount of land sold under the credit system was about 19,400,000 acres for about $47,700,000. This was scaled down by the operation of legislation, by reversions and by relinquishments to about 13,600,000 acres and the receipts were about $27,900,000, an average of a little more than $2 per acre.

The Act of 24 April 1820 made other important changes than requiring cash payments. It provided that from and after 1 July 1820 all public lands should be offered for sale in half-quarter sections, or 80-acre tracts. This had not been previously permitted except in six designated sections of each township, authorized by the Act of 22 Feb. 1817. When disposed of at private sale the purchaser had the option of buying as much as a section (640 acres). The Act of 1820 also fixed the minimum price, whether at public or private sale, as $1.25 per acre. The act also provided that public sales should be kept open for two weeks.

By the Act of 5 April 1832 the sale of quarter-quarter sections, or 40-acre tracts, was authorized.

In pursuance of the early policy for the sale of the public lands in large blocks every effort was made to prevent settlement on the lands prior to purchase.

On 15 June 1785 Congress, under the Articles of Confederation, passed a resolution forbidding settlement on the public domain. Other warnings were given in various ways. The Act of 3 March 1807 prohibited such settlement under penalty of forfeiting any right or claim the settler may have, and the President was authorized to use the civil and military forces to remove such persons from the lands. An exception was made in favor of settlers prior to the passage of the act who, upon application to the local land office, could obtain permission to occupy the lands as tenants at will, but must remove from them when a sale was made.

On 25 March 1816 a similar privilege of temporary occupation on application was given to all who had settled upon public lands prior to 1 Feb. 1816. The right to make such application was to continue for one year from the date of the act. On 3 March 1817 Congress extended this time to 3 March 1818, and on 20 April for another year.

Meanwhile the difficulty of preventing settlement prior to sale, and the gradual abandonment of the idea of obtaining a large revenue from the sale of the lands, due to doubt to the increasing prosperity of the nation, caused the policy of encouraging settlement and home-making upon the public lands. Pre-emption entries based upon settlement were accordingly authorized from time to time for certain specified areas.

The first right of pre-emption or preference right was given by the act of 2 March 1799 in favor of those who had made contracts with Symmes or his associates for lands which were not included in the area patented to them. This right was not based upon settlement, and the Act of 10 May 1800 was the first to give such a right based upon occupation of the land, namely, to those who had erected or had begun to erect a gristmill or a sawmill in the Ohio country before 1793.

From time to time acts were passed providing for pre-emption rights within certain areas and subject to varying conditions. By 1830 a large part of the public land was comprehended within the operation of these acts.

On 29 May 1830 the first pre-emption act of
general application was passed, allowing entry by those who had settled on the land before that date, and remaining in force for one year.

On 5 April 1832 all actual settlers, being housekeepers upon the public lands, were allowed the right to enter, within six months after the passage of the act, a tract not exceeding 80 acres, to include their improvements. By various subsequent enactments these provisions were continued in force until the passage of the general Pre-emption Act of 4 Sept. 1841.

This act provides that "every person being the head of a family, or widow, or single man, over the age of 21 years, and being a citizen of the United States, or having filed his declaration to become a citizen, who since 1 June 1840 has made, or shall thereafter make, settlement in person on surveyed public land and shall live upon and improve the same, may enter not exceeding 160 acres at the minimum price of $1.25 per acre. No person was entitled to make more than one such entry, nor could any one make such entry who was the owner of 320 acres of land.

In 1853 and 1854 the right of pre-emption on unsurveyed lands was extended to a number of the States, and afterward, by the Act of 2 June 1862, to all unsurveyed public land.

The passage of the Pre-emption Act and the change in sentiment regarding the public lands rendered less important the early system of disposing of the lands at public sale.

Soon after the passage of the Pre-emption Act the Commissioner of the General Land Office was, by the Act of 3 Aug. 1846, authorized to offer for sale isolated or disconnected tracts which had not previously been offered without the formality and expense of a proclamation by the President, which had previously been required.

In the course of time the practice of disposing of lands at public sale gradually died out, and now such sales take place only for isolated tracts and in certain other exceptional cases.

From 14 Aug. 1854 to 2 June 1862 there was in force a law providing for a modification in the price of lands taken under the pre-emption acts known as the Graduation Act. Its purpose was to reduce the price of public lands to actual settlers and cultivators. The price of all lands which shall have been in the market for 10 years or upward was fixed at $1 per acre; when this period had reached 15 years the price was reduced to 75 cents per acre, and so on, by graduation of 25 cents for each five years until the period had reached 30 years, after which the price was 12½ cents.

The Pre-emption Law remained in force until 3 March 1891, when it was repealed.

The existing system was inaugurated by the enactment of the Homestead Law 20 May 1862. A detailed statement of its history and present status is found in the article Homestead Laws. The Desert Land Law, now in force, was enacted 3 March 1877, and is treated more in detail under the title of Desert Land Laws.

The treatment of the arid and semi-arid areas in the West required special attention and some experimenting which is discussed under the title of Reclamation Laws, the principal of these being the Homestead Act of 17 June 1892, and the Homestead Act of 1887, and the Reclamation Act of 17 June 1902.

A considerable area has been granted under the head of "Private land claims, donations, etc., recognizing claims based upon the laws of the governments formerly in control of the acquired territory and also upon claims based on settlement upon public lands not authorized by specific law. Considerable areas were granted to encourage wagon road, canal and river improvements to State and corporations.

Congress has also granted very large areas to encourage the building of railroads in the Western States, usually granting the odd-numbered sections within a certain distance from the line of road, this distance varying from 6 to 20 miles on either side.

There have also been granted to the States large areas covered by swamp lands on the theory that the State would reclaim them, but comparatively little has been done in this direction.

Congress in disposing of the public lands has been very liberal in grants for educational purposes, providing in each State large areas for the public schools and special grants for State universities. In the acts admitting the several States to the Union until recently two full sections of land in each township were set apart for public schools, being two square miles or 1,280 acres in each township of 36 square miles, or one-eighth of the area. In recent years the school grant has been doubled, four square miles in each 36, or one-ninth, being set apart for public school purposes. Congress has made other grants to a number of the States for public buildings, internal improvements, etc.

Military and naval land warrants were issued in recognition of service in war, and about 61,000,000 acres of land have been so taken.

Scrip represents a form of authority to take public lands given in adjustment of rights claimed to lands which could not be satisfied by granting the particular lands claimed.

Reservations of various kinds have been made; the largest areas are covered by the National Forests (q.v.). The National Monuments are established to retain for public use lands which have special historic or scenic value.

The history of our public lands and the policy applied to their disposition divides itself into three distinct periods.

The first period is characterized by the desire to dispose of the land in large tracts and to secure at great and rapid a return as possible. In the second period the desire for return becomes less important and the encouragement of settlement is the main feature. In the third period the obtaining of funds from the sales of the lands is entirely subordinated and the main desire is to secure the establishment of homes on comparatively small tracts and a utilization of lands available for grazing or mineral or other resources under regulations for the general public benefit.

The table in the beginning of this article shows that the area which has been disposed of and the area reserved for public purposes make a total of about 1,245,636,093 acres. This does not include lands in the original 13 States or Texas, because the United States has no lands in these States is liable for general disposition. Figures are not available to show the details which make up this total area disposed of by
the United States. The principal items are the following, being the areas disposed of to 30 June 1915, as published by the General Land Office, except where followed by the figures (1904), which are the results published in 1905 by the Public Lands Commission appointed by President Roosevelt. The figures of this commission here given have not changed very much to date as they refer to methods of disposition not now in force.

MOSSIS BIANI,
United States Reclamation Service, Washington, D. C.

PUBLIC LAW. In general public law as contradistinguished from private law, which determines the status and relationships of persons with respect to property, may be defined as that branch of the law which deals with the organization of the state and the relations which subsist between it and the individuals who compose it, as well as its relations to other states. The distinction between public and private law was emphasized by the Roman jurists who taught that publicum jus est quod ad statum regnorum pertinet, privatum quod singulorum usitatatem. It is equally recognized in the legal systems of continental Europe to-day and finds a place in their classification of the law. In England and the United States, however, while the distinction is recognized by the jurists, its importance has never been emphasized to the same degree.

What are the characteristics of public law and how does it differ from private law? Lord Bacon, who dwelt upon the distinction, said public law was the "sinews of property," while private law was the "sinews of government." In private law the state is the arbiter rather than a party; in public law it is both arbiter and a party. Private law determines the rules of conduct to be observed by individuals in their mutual relations; it defines their rights of person and of property; it deals with such matters as the ownership, use and disposition of property, agency, partnership and businesses generally, the relations between husband and wife, parent and child, guardian and ward and the domestic relations generally, etc. Public law, as stated above, deals with the organization, powers and rights of the state, including its relations to individuals subject to its jurisdiction and to other states. It may be conveniently subdivided into five branches: (1) constitutional law; (2) administrative law; (3) criminal law; (4) criminal procedure, and (5) international law. Constitutional law contains the body of rules, written and unwritten, which determine in broad outline at least the organization of the state. It usually deals with the organization, mode of selection and the powers of the chief organs of government, legislative, executive and judicial. It defines the suffrage, the relations, if any, between church and state, the relations between the state and its local subdivisions, etc. Administrative law is that part of public law which governs the relations of the executive and administrative authorities of the government to one another and to individuals; it defines the organization and determines the competence of the administrative authorities, and sets forth the remedies of the individual in case his rights are violated by the administrative authorities. On the continent of Europe administrative law (Droit administratif in France; Verwaltungsrecht in Germany) is treated as a distinct branch of the law and is applied by a separate and distinct group of tribunals known as administrative courts composed of judges who are professionally trained or who are active administrative experts. In England and the United States, however, administrative law is not classified and treated as a separate branch of the law nor applied by a distinct set of tribunals; but this does not mean that administrative law has no existence in those countries. It only means that no distinction is made between administrative controversies and controversies between private individuals; both alike being determined by the ordinary judicial tribunals and the remedies of the individual being the same whether the issue is between private individuals or between an individual and the government.

The criminal law is usually classified as a branch of public law because it deals with offenses against the state as the guardian of public order and the protector of individual rights. By the law of every country a crime is regarded not as injury to the particular individual who may be the immediate victim but as an offense against the whole society and the state provides the machinery for its punishment. The law, therefore, which prescribes the punishment and organizes the machinery for the enforcement of the criminal law may very properly be regarded as a part of the public law. For the same reason the law which prescribes the rules of procedure by which the courts try offenses against the state is regarded as a branch of the public law.

Finally, international law, or the body of rules, whether conventional or customary, which regulates the conduct of independent states in their relations with one another is treated as a part of public law. See International Law.

The phrase of public law in the general classification of law and its relation to the other branches of the law may be seen from the following outline:

JAMES W. GARNER,
Professor of Political Science, University of Illinois.
PUBLIC LIBRARY AND POPULAR EDUCATION. The Growth of the Democratic Idea in Public Libraries.—Historically, the library has always been an adjunct to education. The temple libraries of the Egyptians and Assyrians, the public libraries of the Romans, the monasteries and cathedral libraries and the libraries of the medieval universities kept the educational purposes of the library consciously in the foreground.

Cassiodorus and Saint Benedict in the 6th century emphasized the spiritual benefit to be received from copying and studying the Holy Scriptures. Alcuin (ca. 735-804) was a librarian and a user of libraries as well as a great teacher. The early universities at Trèves, Constantinople, Bagdad, Cairo, Cordova, to say nothing of later universities, were noted for their libraries no less than their teaching faculties.

Cathedral, monastery and other libraries for the clergy, founded in the early centuries of the Christian era, had themselves to test their own time. In September 1537 an “injunction” provided that Bibles should be put at public expense into every parish church in England for the free use of the parishioners. In 1638 Humphrey Chetham bequeathed several collections of books to the town to serve as parish libraries. Other similar benefactions led Dr. Thomas Bray, the founder of the Society for the Propagation of the Gospel, to secure the passage by Parliament of “An act for the better preservation of parochial libraries in that part of Great Britain called England.” The idea was not confined to England. Johann Megapolensis, the first pastor at Albany, had a library of 25 volumes furnished by Patroon Van Rensselaer for pastoral use. The Rev. Thomas Bray in 1697 proposed the purchase of “lending libraries in all the deaneries of England and parochial libraries for Maryland, Virginia and other of the foreign plantations.” A number of these parochial libraries were at Annapolis, Albany, Boston, New York, Philadelphia, Williamsburg and elsewhere. The provincial library at Annapolis, which was sent there in 1697, numbered nearly 1,100 volumes, and was “probably the first free circulating library in the United States.”

Bray at first intended the parochial libraries to be for the use of the clergy. He soon changed their purpose to “lending libraries.” open to all, the local collections to be supplemented by the larger provincial libraries. He says: “I hope, though the design seems more immediately directed to the service of the clergy, yet gentlemen, physicians and lawyers will perceive they are not neglected in it. And indeed those persons of quality whose eldest sons being commonly brought up to no employment have a great deal of time lying upon their hands, seem to me to be as nearly concerned as any to favor it. For many of these young gentlemen, when removed from the universities, residing all their life-time in countries where they can meet with no books to employ themselves in reading and whereby they may be able to improve the talent they have there gained; they do therefore too commonly suffer. I think it will be more advantageous for their excellent knowledge and morals as will ever be expected from men of rank and station in their country.” Bray here emphasizes the value of the library as a continuation school for the laity as well as its vocational value to the clergy. Nevertheless, broad as his ideas were, they were essentially aristocratic as well became a period almost devoid of any appreciation of the need of universal education and in which literary culture was a class distinction, not a recognized public need. This is doubtless the chief reason why Bray’s libraries failed, for the most part, to accomplish what he expected of them, and why most of them became not only inactive but actually extinct.

A more significant movement in the educational purpose of the library was the foundation by Benjamin Franklin in 1731 of the library of the Junto. Both club and library were deliberately planned for the self-improvement of the members. The library, which afterward developed into the Library Company of Philadelphia, was the first of the subscription libraries which under the name of Mechanics’, Athenæum or Club libraries were usually known. Institutes, etc., soon spread throughout the United States and England. Though this was a proprietary library, it was a collection for tradesmen and mechanics as well as for the gentry. Within a few weeks after the first books arrived the directors wrote that the librarian “may permit any civil gentleman to peruse the books of the Library in the Library room.” Franklin’s democratic purpose is shown by the reference, in his Autobiography (Chap. V) to this library: “This was the mother of all North American subscription libraries, now so numerous. These libraries have improved the general conversation of the Americans, made the common tradesmen and farmers as intelligent as most gentlemen from other countries, and perhaps have contributed in some degree to the stand so generally made throughout the colonies in defense of their privileges.” Libraries of this type were really more nearly free than their names imply. They were open to practically everyone. Their costs were usually small and entirely free use of their reading-rooms was a fairly general practice. Together with the small local “lyceums” which became very common in the fifth to the seventh decade of the 19th century, they did much to promote the reading of American literature and to shape American popular opinion.

Two notable library conferences (in 1835 in New York and 1876 in Philadelphia) greatly stimulated the development of the American public library. Many libraries supported by public tax for public use were already in existence. New York State in 1835 had established a system of “district libraries” in each school district of the State for the free use of the people of the district. Similar legislation was passed in many other States but in few cases was the use of the library at all commensurate with the hopes of the founders. The chief reason was that the library existed, in most cases, as an unadministered collection of books growing or diminishing by chance and with little or no reference to the tastes or needs of its patrons. The idea that the education of the people through reading should be fostered by State revenues and not left by chance to proprietary or endowed institutions as of such libraries had long been “public in the sense of allowing all to use them who wished to do so.
but there had been little attempt to adapt the character of the library to the need of its community. This was the Free Library of Hamburg, founded in 1539, issued in 1869 but 4,000 volumes, though its collection numbered nearly 200,000 volumes, chiefly because it was never a really popular library. This is typical of nearly all of the so-called public libraries in Europe and America up to the last quarter of the 19th century.

The new type of public library was described in 1876 by Dr. William F. Poole as follows:

"The public library which we are to consider is established by law, is supported by local taxation and voluntary gifts, is managed as a public trust, and every citizen of the city or town which maintains it has an equal share in its privileges of reference and circulation. It is not a library simply for scholars and professional men, ... but for the whole community — the mechanic, the laboring man, the serving-girl, the youth and all who desire to read, whatever their rank, intelligence or condition in life. It is the adjunct and supplement of the common-school system. Both are established and maintained on the same principles — that general education is essential to the highest welfare of any people: and considered simply as a question of political economy, it is better and cheaper in the long run to educate a community than to support prisons and reformatories."°

Massachusetts in 1847 had authorized Boston to tax itself for a free public library; New Hampshire in 1849 passed a general law enabling towns to establish and maintain libraries supported by local taxation. In 1850 the passage of a bill permitting "the establishment of public libraries and museums in all municipal towns, in England."° Massachusetts in 1851 passed a general law permitting towns throughout the State to establish and maintain public libraries by public tax. The whole underlying purpose of such libraries is democratic. Everyone has equal opportunity to use the books he needs for culture, recreation or for aid in his daily vocation. As the public school is generally recognized the duty of fitting the individual student to take an individual part in society instead of merely putting him through a uniform course of general training, the educational value of the library has been more generally recognized. The school library has been developed to meet the need of those still in school. The public library meets the needs both of those still in school and those who have left school. By far the greater part of the people of any country leave school with only a slight amount of formal training. Compulsory education seldom extends beyond the 14th or at most the 16th year. Private libraries, especially in the United States, are not generally increasing in number or value. Individual education on civic problems in whose determination every voter has a part can in most cases be obtained in an active, well-selected public library. President Hibben of Princeton University says: "At this time [1916], when the whole world seems rushing on to an unknown future, you [librarians] are holding fast the great articles of the past. You are guarding the sources of knowledge. The library is to-day the only ab-

solutely democratic institution that man possesses." Andrew Carnegie gives as the greatest recent accomplishment of the public library: "The spread of the truth that the public library, free to all the people, gives nothing for nothing; that the reader must himself climb the ladder and in climbing gain knowledge how to live his life well."°

Democracy in any country cannot safely content itself with developing a high average of intelligence, essential as this is. Exceptional citizens must be enabled to develop their exceptional abilities, for the service of the whole community. Every public library must collect some material which, though directly used by only a minority of its public, through them serves the whole community. Not only do the larger libraries aid the research student by their own collections, but virtually the whole country can be served through inter-library loans of material valuable only to the exceptional few.

Substantial agreement on the fundamental moral and social ideas whose sum forms the national character of a self-determining nation. This is the whole purpose of popular education at public expense. One more step is necessary. Present-day society is so rapidly developing new ideals and modifying old ones that constant self-instruction in prevalent current opinion is necessary for good citizenship and, consequently, for national stability. No school course can give this to the adult. The public library, whose duty is to contain books and periodicals on all phases of contributing subjects, is the only institution which can even begin to do this instruction at times and in forms suited to individual needs.

The recent war has shown clearly the importance of morale in military affairs and every well-considered scheme for the social readjustments which are following the war has included the development of peace-time morale. The library cultivates civic morale through its recreational reading as well as through its professionally educational books. Even the business library has this for one of its aims. The good library of this type usually includes recreational books as a welfare project.

Official Connection of Library and Public Education.— Many legal decisions in the United States, England, Canada, Scandinavia and elsewhere have officially recognized the library as an educational institution. It is on this basis that the library chiefly bases its claims to tax exemption and to direct tax support. In virtually every civilized country the control of libraries is vested in the official department which directs public education.

In the United States the connection between the public library and popular education is usually made by the State Library Commission or by making the library activities of the State a duty of the State Education Department (as in New York and Utah).

Since the connection between the public library and popular education most nearly follows a democratic ideal, it is natural that the connection of public education and public library is closer than in any other country, Canada (especially in the province of Ontario) and most European countries include both school and library under their ministries of education. In Norway and Denmark there
is a general tendency to consider both school and library essential in popular education. England is beginning to show a similar disposition—an example followed in varying degrees by many of her colonial states. Italy, the connection, though theoretically recognized, is not practically realized to any great extent. France and Germany, with their rigid courses of elementary and secondary training, discourage rather than encourage individual research. School and home, Scouting, etc., make little attempt to establish or use public libraries for direct educational purposes. Several provinces of India (notably Baroda and the Punjab) have established library systems for the purpose of popular education.

Specific Educational Activities of the Public Library.—The main lines of direct educational activity in vogue in American libraries are noted below. They are characteristic of the work of nearly all of the better public libraries of the country, though the emphasis on different activities will vary in different places. These are also in the main the same as those of other countries in which the public library is recognized as a part of the public educational system.

Lecture Work with Schools.—The school library, definitely planned as an auxiliary to the school course, is rapidly assuming a place of its own. Its limited purpose will always more or less limit its independent development. The public library can and usually does supplement the school library in various ways. Instruction in the use of books and libraries is often given in the public library. Books which the school library cannot afford or which it needs only occasionally are purchased by the public library and books and space are reserved in reading-rooms for the use of individual pupils as well as entire classes. Reference lists are compiled for the use of teachers and pupils and the attention of teachers is called to recent material of use in school work. School collections of tools, pictures and lantern slides are supplemented by loans from the local public library collection. Material is made accessible at the public library at hours when the school library cannot conveniently be kept open. Much of the technical routine of cataloging, classification, book purchase, etc., is frequently done through the public library. In some cases, especially in small places, school and public library unite to employ a competent librarian who serves both. In others, branches of the public library, for gene -1 public use, are maintained in public school buildings. This interrelation of the two types of libraries tends to make habitual the use of the library after the pupil has left school. In a rather large number of cases, the public library selects the school librarian and administers the school branch subject to the general consent of the school authorities.

(b) Work with Children.—The children's room of the public library also supplements the work of the school. The story-hour and the collection of children's literature enable the child to read voluntarily along the lines of his individual tastes. A wider range of subjects and a greater freedom of treatment than the school can give are usually open to the children's librarian. This is especially important in connection with elementary schools and the tendency of teacher, school librarian and children's librarian to work together in this direction is increasing.

(c) Work with Clubs and Societies.—This work may be either with children or adults. In the former case it is usually conducted by the children's department of the public library either independently or in connection with some distinct organization such as the Boy Scouts, Girl Scouts, etc. Selected collections of books suited to the age and taste of the club members are provided, and in many cases meeting-rooms are provided by the library. Boys' and girls' reading, debating or social clubs are also often organized and conducted by the library. The voluntary character of these clubs and the usual insistence on self-government not only act favorably on the older boys and girls who have left school but react very favorably on those still in school.

The adult clubs whose activities are related to the library vary in character from trade unions and other industrial societies (to whom industrial as well as recreational books are supplied) to classes of aliens learning English and to social clubs with literary or sociological purposes. Suitable books and other material are furnished and the library often serves as a clearing-house for the club activities. As a public institution, impartial in its aim to furnish any legitimate information on any question affecting public welfare, the library is pre-eminently suited to be an agent in the demonstration of practical democracy. Its educational service is especially direct in supplementing the conscious attempt at self-culture which is the usual feature of these clubs.

(d) Lectures and Exhibitions.—Closely allied in purpose with the work of the public library with clubs are the lectures and exhibitions held under its auspices in the auditoriums which are a part of most modern public library buildings. These are often conducted by outside organizations to which the library gives a meeting-place or exhibit-room. In such cases the library usually attempts to develop and conserve the educational results by preparing lists of books, periodicals or prints relating to the subject of the lecture or exhibit or by making prominently accessible the selected resources of the library on the subject. In other cases the library prepares the exhibit or plans and conducts the lecture-course and supplements it by its printed material. Exhibits of local industries, arts and crafts and current and local history have shown rather definite educational results. At present the public library is often the only substitute for the public museum. When the work of the public library and the public museum become more closely related, greater results may be expected.

(e) Civic Education.—Activities in public contribution to civic education has already been noticed. By supplementing the school course, by providing standard and current material on civic matters, by aiding clubs devoted to the study of social questions and by lecture and exhibit the library is an educational force. It furnishes the impartial publicity which promotes discussion of public affairs and which leads to more intelligent decisions concerning them.

The European War revealed the effective-
ness of the library as an agent in educational propaganda. The promoters of the liberty loan campaigns, the allied war service campaigns, and the army and navy similar movements, have found it an admirable agent for the effective, economical distribution of their printed material as well as for the display of their posters and other advertising material. It furnished material for speakers and writers for the various campaigns. Its effectiveness in this direction has led it to be used by other agencies for public service. Its use as a clearing-house for public information of all kinds seems destined to increase. Its public usefulness in this direction must obviously depend on the judgment shown by the librarian in deciding what organizations and movements are granted this library privilege and by the extent to which they are permitted or encouraged to use it.

In the broader field of Americanizing the alien the library has been of very direct service. It has supplemented the efforts of the school and other social organizations. It has often anticipated their methods. To many foreigners the library has been the only public institution standing for equal opportunity for voluntary effort. Its auditorium has often been the only respectable meeting place open without taint of specific social or religious propaganda to the alien social group. It has kept alive the human relations of the alien by giving him books and periodicals in his own language, dealing with the United States as well as with his native land. It has organized classes for the study of English and of American Institutions and has freely furnished its books to other institutions. Its service is to individuals, not to nationalities or to classes in the mass. Through the cultivation of individual thinking, — the motive principle of democratic education, — it discourages mob thinking and mob action and maintains the traditional American attitude toward civic rights and duties.

(i) Aesthetic Education.— The growing consciousness of the American public to the importance of the cultural in American life is directly aided by the public library. The importance of the library in cultivating literary taste is generally recognized. Much of the support of its work is based on its success in getting the public to use the best books, from a literary and ethical standpoint, which the individual members of that public can read with profit. Its undoubted influence in the formation of public taste in this direction sometimes obscures its equally direct service in aesthetic education.

Nearly every large public library and many small ones maintain collections of prints and art as distributing centres for lantern slides, motion pictures and other illustrative material either from their own collection or lent by larger or more special libraries or departments of education. (See Visual Instruction).

Under present housing conditions the public library is often the only practicable public place for the collection of prints and the larger and more costly illustrated books and monographs on art. Some libraries and education departments lend framed pictures for school and home use. The library art collection promotes local arts and crafts as well as art appreciation in general.

Nearly all public libraries include some books on the history and criticism of music. Collections of musical scores and single compositions, instrumental and vocal, are common. A few libraries maintain collections of music rolls for mechanical pianos and music machines. The brief and perishable character of talking machine records has so far prevented the establishment of many such collections for public use, but some libraries, notably in California, have formed such collections. Many school libraries have collections of these records selected for their direct educational value. The success of many recent "community singing" has been partly dependent on the music collection of the local library.

In the matter of permanent art exhibits the library is properly subordinate to the public museum. In the absence of the latter and to supplement it, the library exhibits as noted above can have distinct educational value.

Bibliography.— Much material on this subject is scattered through educational and library periodicals. Specific references may be found in Cannons, H. G. T., "Bibliography of Library Economy," (London 1910); "Library Work, Cumulated" (Minneapolis 1912); Hortschansky, A., "Bibliographie des bibliotheks- und buchbehagens" (Leipzig, annual); and in the monthly summaries of library literature of the Library Journal. The annual volumes of the National Education Association also include many articles on the subject. The reports of the United States Commissioner of Education include valuable summaries and special articles.

Among the more specific books and pamphlets are the following: Adams, H. B., "Public Libraries and Popular Education" (Albany 1900); Alexander, C. B., "The Library in the Economy of the State" (New York 1912); Ayres, L. F., and McKinnie, Adele, "Public Library and the Public Schools" (Cleveland 1916); Bostwick, A. E., "Relationship of the Library and the Public School" (New York 1914); Dana, J. C., "Libraries" (New York 1916); Emery, J. W., "The Library, the School and the Child" (Toronto 1917); Hardy, E. A., "The Public Library, Its Place in Our Educational System" (Toronto 1912); Powell, Sophia H. H., "The Children's Library a Dynamic Force in Education" (New York 1917).

PUBLIC SCHOOL ORGANIZATION.

This article on school organization deals first with the kind, distribution and relation of school grades and the high school, and the organization of the supervisory and teaching force in the system and in the individual school. The ordinary units of school organization are rural districts, townships, villages and cities. By far the most of the rural schools have but one teacher and one school building. The high school is attended by all children of school age. The direction of the local school trustee or trustees and usually of the county or State school authorities, of the organization and instruction throughout the school. In small schools the principal gives much of his time to classroom instruction, but as the schools grow larger less time is given to instruction and more to supervision. Many principals in village high schools and nearly all principals of large village or city grade schools give all or essentially all of their time to supervising duties. Although there is naturally much variation in this respect, it is seldom that a principal teaches more than a few hours weekly if he has the supervision of 15 to 20 teachers.

In larger communities the chief school administrative officer is the superintendent. In different parts of the country the term has very different significance as to size of the community and the number of teachers supervised. Usually in a community having a superintendent there are more school buildings than one and the superintendent is not a part of the organization in any one building, but maintains an office frequently outside of the school buildings and has the same supervisory relation to all of them. In its simplest form a typical school system organized under a superintendent consists of the superintendent, two or more grade principals with separate teaching staffs, and ordinarily a high school principal and teaching force. This organization is subject to many possible variations. As has been said elsewhere in this article, development is along the line of additional groups of grade school, high school and technical school teachers, each group having its principal. In large city systems assistant superintendents, supervisors of instruction in the various subjects and officials charged with the care of buildings, records, finances, etc., are added.

Within the individual school there may or may not be further organization. This is largely dependent upon the size of the school. When the number of teachers in the grade school becomes too large for the principal to supervise effectively he is usually assisted by one or more of the following department principals: primary, grades one to three, intermediate, grades four to six, grammar, grades seven and eight, or by an assistant principal with general duties. The high school principal in a school large enough to have about three or more teachers of each subject, i.e., of English, mathematics, etc., is assisted by heads or chairmen of departments, through whose hands goes more or less of the administrative work regarding the organization of classes and supervision of instruction in the respective subjects. In large city high schools assistant principals are frequently provided.

RANDELO T. CORDON,
Principal, State Normal School, Fotedam, N. Y.
PUBLIC SCHOOLS. The idea of a free public school maintained entirely at municipal or local expense and secular control is a modern development, which was not realized until the 19th century. The growth of democracy in the last 100 years has been one of the chief causes of the rapid advent of the idea of a secularized public school system. Only in the United States, however, has the public school system had a development such as a democratic society logically demands.

A system to be truly democratic must have the following characteristics: (1) It must be free to all; (2) it must extend over all stages of education; (3) it must have what is called the "educational ladder"; that is, pupils must be able to pass upward freely from one grade to the next higher; and (4) it must be patronized by all classes of the community.

It may fairly be claimed that the American public school system has now reached a stage where all these ends have been attained. In Germany, France and until recently, at least, in England, the public school system has not been free; and it is not even now, generally free, since, though most of the expenses have been met from public or institutional (usually religious) sources, each pupil unless a pauper has had to pay school fees. No educational ladder exists in those countries, for secondary education begins at eight or 10 years of age and always in schools parallel to the elementary schools. The pupil who completes the public school at the age of 14 must go back from four to six years if he wants to have a secondary education. In the United States, however, the pupil enters the high school without loss of time, since the high school begins where the elementary school ends. It naturally follows that in European countries only the children of the "lower classes" attend the elementary schools, and that it is only in exceptional cases that they ever find their way into schools of secondary and higher education. From the beginning, in those countries, the secondary schools, and later the universities, are patronized by the higher social classes, reinforced to some extent by the children of thrifty and ambitious members of the lower ones. In sharp contrast to this state of affairs, it is the proud boast of the American school system at its best that the public school is open to the poorest and is good enough for the highest; that in form, at least, the system is so organized that the road is open for every child in the republic to carry his mental development to the highest possible point; for not only are elementary and secondary schools free and properly articulated, but in most of the States a free education is offered also in universities. It is furthermore a matter of daily observation that all classes of our population freely patronize the public schools. The only considerable exception is the private religious, or parochial, school, where the motive for segregation is religious, not social. Nearly 90 per cent of all children of elementary grade attend the public schools.

Colonial Beginnings of Public School Evolution.—The beginnings of the free common school reach back to the earliest colonial times. In New England, at least, the predominant motive for promoting public education was religious rather than political. The elementary school of that period quickly merged into the academy or secondary school, where the promising lad would go. Stoughton, however, the idea that the early education should be free, and in considerable degree compulsory upon all, found early expression. The General Court of Massachusetts in 1642 enjoined upon every town authorities the duty of seeing that all children of school age "be instructed at least the rudiments of an education. The order even went so far as to require the removal of children from those parents who persisted in bringing up their offspring in ignorance. The selectmen of every town were further required to have a vigilant eye over their brethren and neighbors, to see that none of them shall suffer so much barbarism in any of their families, as not to endeavor to teach, by themselves or others, their children and apprentices, so much learning as may enable them perfectly to read the English Bible and (obtain) a knowledge of the capital laws; upon penalty of 20 shillings for each neglect therein. In 1635 Boston made public provision for the support of a school. The Act of 1642 was quite general in spirit, for in 1647 the new School Law of 1647, which required all towns having 50 households to a) appoint one within their town to teach all such children as shall report to him, to write and read; whose wages shall be paid, either by the parents or masters of such children, or by the inhabitants in general, and which further required that where any town has increased to 100 families or householders, they shall set up a grammar school, the master thereof being able to instruct 50 as far as they may be fitted for the university. This law laid the foundations for the present free elementary and the free secondary, or high school, for though it did not insist that all school revenues should be raised by public taxation, it provided that they might be so raised, and it made the community responsible for the establishment and maintenance of schools for all its children. In 1638 New Haven set up a school under Ezekiel Cheever, who was paid "out of the common stock of the town." Rhode Island established a public school at Newport in 1640, and Providence one 20 years later. In 1633 the first Dutch schoolmaster arrived at Manhattan, when the first school tax, amounting to $4, was levied and collected. By 1650 the Scotch-Dutch inhabitants of New Amsterdam paid their schoolmasters regularly from the public treasury.

More or less rudimentary beginnings of public education are found in the older colonies, as in New Jersey, Pennsylvania, Virginia and the Carolinas. In the South, however, the school idea was not so hospitably received as in New England and in New York. An oft-quoted expression by Governor Berkeley of Virginia may be cited. When the English Commissioners of Foreign Plantations asked what course was taken in Virginia for instructing the people in the Christian religion, Governor Berkeley replied, "That he was taken in England out of towns, every man, according to his father instructing his child, and he added, 'I thank God there are no free schools nor printing presses, and I hope we shall not have them these hundred years; for learning has brought disobedience and heresy, and sects into the world, and printing has divulged them and libels against the best of governments:}
God keep us from both! So far as Virginia and the remainder of the South were concerned, good Governor Berkeley had his wish, for it was not until after the Civil War that that section of the United States was supplied with anything like a system of free public schools.

The Revolutionary Period.—In all European countries at this period, the financial responsibility for the education of children was held to belong to the parents, so that neither state nor community, except charitable organization, ever desired to make education free, except for children of paupers or others unable to meet the expense. The idea that free schools are only for paupers or the very poor permeated most of the American colonies during the Revolutionary period of American education. Even where the schools were not strictly private, the "rate-bill" for all who could pay was a common device for helping to meet the expenses of the school. This idea prevailed in Pennsylvania, Rhode Island, New York, New Jersey and the South. Some States raised taxes to school the paupers, but they made those pay who could do so. Only in Massachusetts and in the more democratic settlements west of the Alleghenies was the idea of free schools feeble to retain a frizzle hold upon the people. The fees were collected in various forms. In cities the assessment was usually in money; in country districts both East and West the rate frequently included a period of board for the teacher, who was thus obliged to "board round" among the families of his district. By 1848 all fees were abolished in Rhode Island. They lasted until 1864 in Vermont, 1867 in New York, 1868 in Connecticut and until 1871 in New Jersey.

Development of State Control.—From the earliest times in America the responsibility for the support of schools was focused upon the settlement, village or town, never upon the colony, or later upon the State as a political entity. This condition of things lasted well into the first quarter of the 19th century. Since that time, however, there has been a steady advance toward State support, supervision and control of public elementary education. In the United States the American Union has the right to control the public schools been abruptly assumed by State authority; on the contrary, State control has sprung almost spontaneously from natural conditions, chief among which have been the rapid growth of population and the equally rapid growth of State school funds. The process has been somewhat as follows: As soon as a given State, say Illinois, had at its disposal a considerable amount of money for annual distribution among the school districts, it was natural that the legislature should lay down the conditions with which the districts and community, chiefly among which has been the rapid growth of population, the equally rapid growth of State school funds. The process has been somewhat as follows: As soon as a given State, say Illinois, had at its disposal a considerable amount of money for annual distribution among the school districts, it was natural that the legislature should lay down the conditions with which the district must comply in order to enjoy such aid. Among the first things prescribed would naturally be (1) a minimum number of days during which the school must be held in session; (2) a course of study that must be taught; (3) the certification of teachers, usually by county authority, but in subjects prescribed by the State. Again, individual communities, however loath to relinquish the management of schools after they had been in existence in the common way, have been obliged to bow to the will of the State, in so far as it saw fit to assert its authority since the power to levy and collect taxes is derived directly from the State. At present all State constitutions contain provisions relating to popular education.

The idea that has everywhere prevailed is that the State should in every way possible stimulate local interest and local effort for the support and improvement of schools, laying its hand of authority only upon those general essentials of the school system which are indispensable to efficiency. This is why the American public school system has manifested such astonishing elasticity. Every community can have as good or as poor schools (down to a certain point) as it desires. The salaries may be high or low, the equipment ample or inadequate, the schools backward or progressive as the community wills. Again, this elasticity is felt also within the teaching body, quite aside from the general tone of the community. It is not uncommon to find public sentiment quickened and elevated by a corps of teachers led by an active and able group out of the unorganized. The absence of restrictive State control as to subject matter, methods of teaching and school organization opens the door to individual initiative, and to consequent progress. The action of the two influences, that of the State on the one hand and the general provisions and supervision, and that of the local community, on the other, with its power of adjustment to circumstances, makes the American school system the most perfect adaptation to democratic needs that is to be found in the world. Any civilized European system maintains standards with respect to given particulars that the American public school as a whole can by no means measure up to; but it may be confidently asserted that no European system, however excellent, could, if put into operation in an American State, produce results so wholesome and excellent as those that come from the present system.

The Growth of Public School Funds.—Individual States began at a very early period to establish permanent funds for the support of common schools. In 1795 the lands known as the "Western Reserve," held by Connecticut, were sold for $1,000,000, and the money turned into the school fund of the State of New York also made a provision for common schools by setting aside a portion of the public lands for this purpose. New Hampshire began a school fund by exacting one-half of 1 per cent upon the capital of banks within the State. Other States made similar but less effective efforts, a favorite means being the granting of lottery privileges for the raising of funds. Much more fruitful sources of permanent school funds in the several States have been Congressional land grants that have been made from time to time out of the unsettled government land lying to the west of the original colonies. Each of the States subsequently carved from this vast territory received a grant varying from one to three sections from each township for school purposes. In addition to the direct appropriation of land, it has been the policy of the government to turn into the State treasuries, also, a percentage of the net proceeds from the sale of public lands within their borders. In some States, the school lands were sold and the proceeds in others the lands are held to the present day. By act of Congress 1836 a surplus in the United States treasury was distributed among the States. The amount actually given was
something less than $30,000,000. In 16 of the 26 States then existing, this money was appropriated for its interest to the permanent schools' funds. The present total annual income from permanent school funds and the rent of school lands is something over $17,500,000, but this amount is very unevenly distributed among the States. When it is considered that the total annual expenditure for public school purposes closely approximates $640,000,000, it can be seen that the income from permanent funds forms but a small fraction of what is actually expended; yet it would be an error to assume that the influence of these public funds has been limited to their comparative magnitude.

Systems of Administration.—Developing as the public school has done from the individual settlement as the starting point, it can easily be understood why the district system of the country rather than the States as the administrative authority of the school is the common system. It is the oldest and most primary form of school organization, and the smallest unit of a public system. It is particularly recognized by law and given legal functions and responsibilities. The district manages its school affairs in a simple way, a board of directors or trustees, usually three in number, being elected to employ the teacher, determine the amount of money to be expended and in general to conduct the school affairs of the district. This is the most elementary and at the same time the most democratic of methods for school administration. It is particularly well fitted to sparsely settled sections of country, but not so well adapted to denser populations, since it prevents the efficiency that arises from consolidation.

The township system forms the next natural stage in the development of school administration, since it is based on a convenient political unit, not too large for effective local direction. In this system, one set of officers conducts the educational affairs of the whole township, erecting buildings where they will best accommodate the people, employing teachers, building the schools, in many cases providing for the transportation of children to and from school, and usually crowning the whole with a township high school, to which pupils may be promoted upon the completion of their elementary course. The State of Indiana has been a pioneer in introducing the township system. A number of other States have adopted it wholly or in part.

Most if not all the Southern States have a county system of school administration, because these States, being the unit of government. While in the Northern States the county has never been the unit for civil or for educational organization, it is and has long been the unit for supervision of schools.

The usual condition of a county is to have a superintendent whose chief duties are: (1) the certification of teachers; (2) the personal supervision of the schools through visitation; (3) the conducting of teachers' institutes.

The so-called city system exists chiefly for the administration of rural and village schools. Nothing has been more marked than the development of cities. It is obvious that administration through the primitive district system would soon become altogether inadequate for the needs of a city. Legislatures have accordingly made special laws to meet the needs of cities of various classes. The largest cities in a State, like New York City, Boston, and Philadel- phia, in New York, usually have special charters enabling them to conduct their schools as they deem best. Cities as a rule have boards of education for the administration of the system. These boards differ greatly in size and in the manner in which their members are elected and in the manner in which the members are elected by the people for stated periods, sometimes at large, sometimes by wards or subdistricts. In some of the larger cities the members are appointed by the mayor and city council acting jointly.

Housing and Equipment.—Nothing is more noteworthy than the development of public school architecture in the United States. In full accord with its democratic genesis, the housing and equipment reflects completely the educational status of the community. The rural school may be a mere unsightly box with the most primitive apparatus; or it may be an artistic building, adequate in size, well heated, lighted and ventilated, supplied with separate wardrobes for boys and girls, desks, chairs, reading tables, typewriters, blackboards, chalk, and blackboard erasers. The State and county superintendents have done much to inform their respective rural communities of what is desirable and practicable in country schoolhouses, furnishing freely plans and specifications, and even providing the builders with complete models for their guidance. In the State of Missouri over 600 rural schoolhouses were erected in a short time in accordance with a model furnished by the State superintendent of public instruction. The cost of a building of this type was $500.

The elementary school covering a period of eight years, the most common type of graded-school building in towns and small cities, is the eight-room schoolhouse—one room for each grade. The heating, ventilation and lighting of such a building has become an important problem. This problem is rendered much more complex in cities where the plan must be enlarged to accommodate from 1,000 to 4,000 pupils. A typical classroom in such a building should be approximately 34 by 32 feet in dimensions, and from 13 to 14 feet in height; it should be lighted entirely from one of its longer sides, the windows reaching to the ceilings; about 2,000 cubic feet of pure warm air per hour should be provided for each pupil; and each room should be provided with a convenient wardrobe. By the use of steam indirect heating, supplemented by "plenum" and "exhaust" fans run by steam or electric power, it has been found practicable to meet the foregoing conditions of heating and ventilating. Practically all of the modern city school buildings secure these most desirable ends. The buildings are usually an architectural ornament to the neighborhood in which they stand. It has gradually come about, therefore, that the public school is one of the best-boused institutions of modern society. In the poorer districts of large cities, the school buildings are the palaces of the people; they are, moreover, the places where the children of the community find warming, comfort, beauty, and sympathetic humane treatment from their teachers. It is here that their hearts are warmed, their minds developed and supplied with useful and inspiring knowledge; it is here that they are enabled to rise to higher planes of living, and to prepare themselves for a worthy
citizenship than their humble origin would seem to warrant. In well-to-do districts of the city, the same beneficent physical surroundings contribute more than any other instrumentality of society to develop the best that there is in democracy.

The Sex of the Teaching Force.—For the first time in history, society has, since the beginning of the 19th century, undertaken to educate all its children, boys and girls alike. Before that time only certain classes of boys were educated, invariably by men teachers. With the new duty there appeared a new means, namely, the employment of women as teachers. So long as women remained uneducated, it occurred to no one, least of all the women themselves, that they could teach. So long as they could find productive labor in the home, as they could until steam-power and machinery drove industries to the factory, women felt no especial need of a new calling. But when remunerative labor for women failed in the home, when the schools began to educate them along with their brothers, and when the new social undertaking of universal education began to clamor for more and cheaper teachers, then it was that the world awoke to the fact that it had in its midst a new and hitherto unused force—its young unmarried women. Women began to be employed as teachers in large numbers in the United States before 1850, especially in the New England States, where the first normal schools were established. The period of the Civil War saw a rapid increase, owing to the natural withdrawal of the young men in order to enlist as soldiers. Since the close of the war the percentage of women in the schoolroom has steadily and rapidly increased, throughout the Union, until in the cities, at least, men are rarely found as teachers in the grades. They are still employed to some extent in rural schools, especially in the newer States. The following table shows the increase in the number of women teachers in 13 typical States since 1855:

The women now number 80.2 per cent of all the teachers in public elementary schools of the whole Union, while in city elementary schools they rarely number less than 90 per cent of all teachers. In New York State high schools about two-thirds of the teachers are women. The same phenomenon is seen in foreign countries, but the increase in the number of women teachers there has in general been less rapid. In Great Britain and Ireland the increase has been from 54.3 per cent in 1870 to 75.5 per cent in 1900. If one may judge by the attendance at the normal schools, the number of men and women in French elementary schools is about equal. In Germany, as a whole, less than 20 per cent of all elementary teachers are women. In Italy, however, 93 per cent of the students of normal schools are young women, though the women form only about 58 per cent of the whole elementary teaching force. In the 11 State normal schools of Massachusetts there are 308 men and 2,811, or 90 per cent, women students.

The large, almost exclusive, employment of women as elementary teachers is the newest thing in our civilization. It is difficult as yet to interpret its full significance. There is no doubt that society has been well served at very small expense. The economic motive constantly appealing to communities that do not like high taxes is that they can get better teaching from women for a small sum than they can from men. A first-class woman teacher, to say, is always to be preferred to a second-rate man at the same salary. The assumption is that vigorous, active, well-prepared men can do better financially out of than in the school, and that only second-rate men will accept women's salaries. Ultimately, conviction with, that the school should prove not to be for the best welfare of society, it is pretty evident that the additional cost will not prevent the employment of a suitable number of men. The public school system may be said to be now in its brick and mortar stage, for it is expending vast sums to house and equip the school. When this has been done, the resources of the community may easily be turned to the improvement of the teaching force. Ex-President Eliot of Harvard University argues that the people ought not to spend less upon the minds of their children than they do upon their food. Were this standard attained, it is probable that school support would be quadrupled. So far as present experience teaches, it seems evident that for the first four or five years of school life, women are the natural and the more efficient teachers. When it comes to the early years of puberty, society still holds theoretically that the influence of men is essential to the proper unfolding of the minds and characters of both boys and girls. It is largely by conviction and instinct, for the most part, enables the non-sectarian private school to maintain its existence in the more wealthy communities. It is probable, notwithstanding the aforementioned theory that men are indispensable as teachers of youth, that the availability of women and the difficulty of holding the right type of men in such positions will confirm the present custom of almost exclusively employing women for grade teaching.

The Development of the Public School Curriculum.—Down to 1837, when Massachusetts created her board of education and placed Horace Mann at its head, the curriculum of schools not fitting boys for college was limited to the bare acquisition of the school arts, spelling, reading, writing, ciphering, written and oral, by a trifle of geography and history. The discipline was always rigid and sometimes harsh; the school term was short and the years of schooling few; the path of learning was not strewn with roses; but the intellectual, like the moral, discipline did honor to the strangest notions of our Puritan forefathers. In his seventh an-
moral report, Mr. Mann, who had visited schools abroad, especially in Germany, where the new philosophy of Pestalozzi was earnestly applied, attacked with great vigor the old curriculum, the old Puritanic ideas and the old unsympathetic methods of teaching. He demanded new subjects more suitable to children, more humane and sympathetic treatment of pupils and new ideals to be aimed by education. These criticisms and demands led to a spirited battle between Mr. Mann and his admirers and the "Thirty-one Boston Schoolmasters," who defended the old-time rigorism in study and discipline. The result was a drawn battle. The reformers succeeded in getting their ideas and watchwords accepted, but the conservatives preserved the old curriculum practically unchanged. It was, however, a great advance to have the new ideals of character-forming accepted as a supreme end of education. Even if this schism were to be confined to the acquisition of the school arts, it was a vast improvement to have the new methods everywhere put into practice, for now the concrete was made to precede the abstract, facts came before principles and inductively instead of enunciately and enlightened the old-time memory drills and mechanical application of rules. The school term was gradually lengthened and with this there came a perceptible thought-enrichment of the studies by means of which the children were drilled in the use of the tools of knowledge.

This condition of things lasted until after the period of the Civil War, when the rapid development of the public high school, the still more remarkable expansion of the university curriculum and the rise of all sorts of social organizations for the moral and economic welfare of the community, forced upon the public school an amount of new subject matter that is little short of astounding. As already explained, the old curriculum was mostly confined to the studies through which the child was drilled in the use of the school arts. The children learned to read, but they never read anything; they learned to spell and write and parse, but they produced nothing more than an occasional school essay. But now behold how this old curriculum has been enriched—(1) by copious amounts of literature suitable to every grade, not only in the elementary but in the high school as well; (2) by systematic "language lessons" throughout the full course; (3) by the occasional introduction of elementary algebra and concrete geometry in the seventh and eighth grades; (4) by four years of history and as many of geography; (5) by nature work in all the grades; (6) by a course in manual training or "occupations" throughout the whole elementary period; (7) by extensive acquisition in fine arts, such as drawing, painting, molding and music, and finally (8) by an obligatory course in physiology and hygiene, accompanied by what is called scientific temperance instruction.

What is going on may be called reform by addition. Heretofore the method of relief from a congested curriculum has been by subtraction. When the "reform" forces of a community have been in the ascendency, the new subjects have been added: when, on account of complaints of taxpayers, parents and children, the wave of reform has receded, the new subjects, then called "fads," are dropped and the curriculum assumes something of its old-time proportions. Obviously some method better than that of adding and subtracting must be found. The most simple and certain way of doing away with the present objectionable system is by adding. The ideal public school of the future will not require one teacher to teach more than 20 children. Now the number often rises to 60.

For statistics of the public school, see Education, Elementary.

CHARLES DEGARMO,
Emeritus Professor of Science and Art of Education, Cornell University.

PUBLIC UTILITIES. Definition.—Public utility is a term which is not easy to define with precision. When used in a popular sense it applies to those services rendered to the public which are so intimately related to the welfare of the entire community that those who render them are subjected to varying degrees of public control, assume special obligations and duties to the public and enjoy special privileges. A public utility is commonly referred to as a "business affected with a public interest," and one of its most obvious distinguishing characteristics lies in the fact that those who control it must serve equally all who demand its services instead of selling free, as the ordinary business man is free, to refuse its services to those for whose patronage it does not care. Because of the many legal problems relating to public utilities it might be expected that a satisfactory definition of the term would be found in the literature of the law. We find, however, that lawyers and judges instead of developing an abstract definition have resorted to the familiar practice of marking out the meaning of the term by the process of judicial inclusion and exclusion, i.e., by determining in each concrete case whether or not the business in question is a public utility. By this method it has been established in some or all of our States that the following are public utilities: common carriers of all kinds by land or water, gas, electricity, telegraphs, telephones, bridges, warehouses, grist-mills, saw-mills, sewers, cemeteries, hospitals, grain elevators, stockyards, cotton gins, docks, hotels, ice plants, markets and news service.

Distinguishing Characteristics.—An examination of the nature of the businesses just
mentioned will reveal the fact that there is no single characteristic common to all except the general feature of being somehow affected with a public interest. There is no universal distinguishing feature of a public utility. It is possible, however, to point out certain characteristics, one or more of which will be found to mark the public utilities: (1) public utilities frequently enjoy special legal privileges denied to other kinds of business enterprises. The right of eminent domain is commonly delegated by the State to corporations for the purpose of constructing railways, pipe lines, irrigation ditches or of erecting poles and wires. Subsidies in money have sometimes been given to various public utilities on the theory that enterprises so vital to the public welfare might properly be supported or aided from the public funds. This has usually occurred in cases in which it seemed likely that sufficient private capital could be relied upon to initiate the enterprise and was a common practice during the early and highly speculative days of canal, canal mills, saw-mills and drainage and irrigation projects have also received aid from the public treasury from time to time. A third legal privilege is the right to use the public highways in special ways. Concessions of this kind must be secured by public service companies whose businesses require the laying of tracks, the embedding of pipes or wire conduits or the erection of poles and wires. (2) Legal monopoly is an attribute sometimes distinguishing public utilities. There are many real examples of exclusive franchise grants made either as special inducements to the investment of capital or as a means of forestalling competition in fields where it would be impracticable or inconvenient. Legal monopolies are now generally regarded as contrary to public policy except in the case of those public utilities which are at the same time either natural or virtual monopolies. (3) Many public utilities are natural monopolies. The several factors which may make a business a natural monopoly are outlined by Mr. Bruce Wyman, perhaps the leading authority in this field. First, there may be a limitation upon the source of supply of the commodity or service. This may be the case with the water used for supplying the wants of a city or for irrigation. It is not infrequently true of natural gas and water power. The only available supplies of commodities or services of vital interest to the entire community cannot be regarded merely in the light of private property. They become of necessity public utilities. Second, a natural monopoly may result from a scarcity of advantageous sites upon which to carry on forms of business in which the community as a whole has a paramount interest. This is true of docks, wharves, freight sheds, warehouses of certain kinds, stockyards and grain elevators. Those who occupy the ground first enjoy the advantages of monopoly and those who enter only in consequence may be regarded as competitors. A third basis for a natural monopoly may be the limitation of time incident to the service rendered. The service is not only necessary but it is immediately necessary. The person who desires it cannot wait. He is not in a position to haggle over price or quality nor to hunt for a possible competitor. This sort of monopoly may be temporary but it is none the less real. It is natural monopolistic advantage which is enjoyed by the hotel keeper, the hotel board, the commercial messenger and the telephone company. In the fourth place the difficulty of distribution of services constitutes in some cases effective limits upon competition and gives natural monopoly. Fuel in the form of wood or coal may usually be brought to the consumer with an ease which encourages competition. Fuel in form of gas can be brought only through pipes and competition is for all practical purposes precluded. Those who furnish electric light or power, steam heat, water and the like enjoy what is in effect a natural monopoly based upon this difficulty of distribution. (4) Another characteristic of certain public utilities is their enjoyment of what may be called a virtual monopoly, a monopoly which arises not from any of the causes which produce natural monopolies but rather from certain economic restrictions. In the first place, there are many public utilities which represent need which has necessitated the expenditure of many millions of dollars. The financial obstacles in the way of competition are sufficient to preclude it. This is apt to be the case with the various transportation facilities, railroads, bridges, terminals, tunnels, pipe lines, ferries and the like. Every business instinct warns the capitalist not to undertake to duplicate the costly equipment already engaged in these enterprises, for the hope of dividing with a competitor a volume of business frequently no greater than can be readily handled by one system. In the second place, virtual monopolies are created by the desirability or even necessity of service on a scale too large to duplicate. The value of the service rendered by a telegraph, telephone or express company depends in large part upon the number of persons, towns or places that are brought into touch with each other through one system. By reason of this fact they are practically sure to be free from competition when once well established. It was because of the virtual monopoly due to the size and complexity of its service that the Associated Press was held to be a public utility.

Obligations Resting upon Public Utilities. — Because the interests of the entire community are directly concerned in the manner in which a public utility is operated and because the public service company is almost invariably the recipient of some of the legal privileges already mentioned, it is necessary and natural that obligations and duties should be imposed on those who engage in public utility enterprises which do not rest upon the ordinary business man conducting an ordinary business. These obligations and duties may be set forth under the following heads: (1) The public utility must serve all who apply. The man who runs a dry-goods store or a carpenter shop may decline the patronage of persons with whom he does not care to deal. His reasons may be entirely personal and the courts will not inquire as to the propriety of the actions. But the public utility corporation, the nature of its business makes necessary a very different rule. The law imposes upon it the obligation of serving any member of the public without discrimination. The railroad company or the
hotel cannot arbitrarily pick and choose their patrons. Refusal to serve any one who is entitled to demand its service is not only subject to the public utility management to an action for damages but also will lead to the issuance by the courts of a writ of mandamus compelling it to perform the duty of rendering equal service to all. This rule is, however, subject to certain reasonable qualifications. A public utility, for example, may be under a duty to serve only the members of a certain class. Thus common carriers and hotels are obliged to serve only travelers and not those who wish to use their facilities for other purposes. Also there is a duty to serve only those who comply with such reasonable regulations as may be made by the public utility management in the interests of the convenience, health and safety of the public. (2) The public service company must not only serve all who appear to belong but it must give them equal service without discrimination. This does not mean actual identity of service nor does it preclude the establishment of proper systems of priorities, as in the case of emergencies of various kinds or limitations on the transportation of freight. But every member of the public must have the same chance to enjoy these special services. The requirement of equal service does not prevent the segregation of the races by the establishment of so-called "Jim Crow" facilities on common carriers and the like. In such cases, however, the accommodations afforded, though not the same, must in the eye of the law be equal. (3) The public utility must make the same charges to all for the same service. Discrimination in this matter is forbidden. This problem will be considered more fully at a later point. (4) The duty of furnishing adequate service and suitable facilities rests upon those who engage in public utility enterprises. The private business man is free to give poor service or to serve only those who appear to belong. Those who do not do so are affected with a public interest must meet the reasonable standards of efficiency or quality set forth usually by corporate charter, franchise or statute. Water, gas and electric utility companies, and in stipulated quantities and railway coaches must be heated and kept clean. (5) Finally, public utility corporations are subjected to special rules of liability for loss or injury to their patrons in certain cases. In this regard innkeepers and common carriers are in a peculiar position. They are held to have insured the safety of the goods or belongings of their patrons. They are liable for the loss of such property while in their possession, even without fault upon their part. This is a rule of presumptive strictness and it does not apply to other kinds of public utilities nor does any such absolute liability attach to common carriers or hotel-keepers for injuries to the persons of their patrons. In fact apart from these special cases the duty which rests upon public service corporations to exercise due care in behalf of the safety of others is in no way peculiar. If the service rendered involves special danger of course special diligence is necessary to constitute reasonable care, but the law requires only that care which a reasonable man under like circumstances would exert. Public service companies, however, are not permitted to enter into contracts by which they exempt themselves from all liability for loss or injury to persons resulting from the performance of the contract. Such contracts are regarded as contrary to public policy since they would tend to lower the standards of service rendered to the public. It is, however, within limits permissible to make contracts limiting the amount of damages recoverable for such losses or to require payment of a valuation which shall be regarded as final upon goods transported by a common carrier.

Rights of Public Utilities.—The special obligations resting upon public service corporations are not compensated not only by the special legal privileges already referred to but also by certain well-defined legal rights. (1) First, there is the right to reasonable compensation for the service rendered. There is no duty to furnish free service. This right may be enforced by a suit at law upon the property belonging of the patron. It is also permissible for the public service company to ensure payment by requiring it in advance. (2) In the second place, there is the right to make reasonable rules and regulations regarding the conduct of the patron. Such rules, however, with these rules by any person is sufficient justification for denying him the service to which he would otherwise be entitled. Such rules are those requiring decent and orderly deportment in inns or public conveyances. Or the rules may bear upon the liability of the management of the public utility for losses suffered by patrons, such as the familiar rule restricting the legal responsibility of hotels to the loss of property placed in checkrooms provided for that purpose.

The Need for Regulation of Public Utilities.—From the foregoing discussion it is obvious that the welfare of the public is vitally concerned with the manner in which the business of a public utility is carried on. Public convenience and comfort, necessity may demand that public service companies enjoy monopolistic privileges; but it is certainly imperative that any such monopoly be subjected to strict regulation in the public interest. Wherever the power is intermingled with wealth and rights not commonly enjoyed, such a business must be held rigidly accountable for the way in which those advantages are used. As public utilities have increased in number and variety, as modern society with the increasing complexity and insistence of its demands has become more vitally dependent upon the services they render and as it has grown ever more apparent that, left to their own devices, public service corporations will usually serve their own interests at the expense of those of the public, the necessity of subjecting them to adequate and scientific regulation has come to be universally recognized. Public utility regulations may be conveniently grouped under three heads: first, regulation of rates or charges; second, regulations to secure equality of service to all; third, regulations for the interest of public convenience. Each of these forms of regulations may be briefly discussed.

Regulation of Rates.—Practically every public utility is subjected to regulation in the matter of rates. When a business is affected with a public interest either by reason of its monopolistic character or its enjoyment of pe-
cultural legal privileges, the public must be protected from exploitation through the charging of exorbitant rates. Otherwise public utilities would speedily become agencies of oppression instead of public service.

The question who is to determine what rates shall be charged for public utility services has been answered differently at different times. At the outset the view was taken that the legislature should decide what the rate should be and that public service corporations who felt that the rate so fixed was unreasonably low had no remedy except to persuade the legislature to change its mind. This was the view adopted by the Supreme Court of the United States in the famous case of Munn v. Illinois (94 U. S. 113), decided in 1876, sustaining the right of the legislature of Illinois to fix the charges made by grain elevators. This doctrine has been modified, however, in such a way as to subject the reasonableness of rates fixed either by direct action of the legislature or by contracts between the utility and the public entering under its action to scrutiny by the courts. The courts will not themselves determine what the rate should be as a rule of future policy but confine themselves to the task of approving or invalidating the rates established by legislative authority when the reasonableness of such rates is questioned by litigation.

Needless to say a public utility corporation cannot be deprived of the right to charge a reasonable rate for its services. To deprive it of this right would be to discriminate arbitrarily against it and thereby deny to it the equal protection of the laws. It would also amount to a deprivation of property without due process of law. But to decide in a given case what is a reasonable rate is not so simple. The solution of the problem is not much furthered by quoting the rule which our courts have frequently announced that a reasonable rate is one which ensures a fair return upon a fair valuation of the property devoted to the public use. This statement of course means nothing until some definiteness attaches to the meaning of the terms fair return and fair valuation. The inability of economists, legislators and judges to agree upon what these terms mean has brought the whole problem of the regulation of public utility rates into a confusion from which it has but very recently begun to emerge.

It is not perhaps so difficult to say what is meant by fair return, although it is naturally impossible to lay down as a general rule that it is this or that percentage of profit on a given investment. The courts have reached with practical unanimity the conclusion that a fair return from a public service enterprise is that amount of profit which would be realized from any other business where the risks and capital investment are the same. What this is in any given case depends of course upon the peculiar circumstances of that case.

There has been much diversity of opinion as to what is a fair valuation of the property devoted to the public service. Several different standards for measuring that valuation have received recognition. (1) First, it has been urged that the total original cost of the plant and improvements should be deemed the true valuation. This is largely on the theory that the test. Except in the case of newer enterprises the original cost cannot usually be determined with any accuracy. Furthermore, in such a figure may be included various items representing unwise or unnecessary expenditure which ought not to be made the basis of earnings at the present time. (2) The present capitalization of the business is also suggested as a measure of public utility valuation. This, however, overlooks entirely the not infrequent fact of over-capitalization, an abuse which public control has only begun to mitigate. There is too little relation between the capitalization and the actual investment in public service companies.

Another proposal is to take as the proper valuation the cost of reproducing the plant less the existing depreciation of the equipment. Opinions differ as to whether this should be the cost of reproducing the original plant, perhaps with a somewhat antiquated equipment, or the cost of reproducing a new and modern plant. (4) Perhaps the weight of authority inclines to the view that fair valuation means the present value of the plant as a going concern. This includes two elements, the physical valuation of the equipment and an additional increment representing the fact that the system is actually operating and producing earnings. It seems clear that any attempt to measure a fair valuation of a public utility investment must begin with an accurate appraisal of the value of the physical property. This fact has received a somewhat belated recognition and there is now a widespread tendency throughout the several States in the United States to provide for the making of such a valuation on a scientific basis. In estimating the value of the business as a going concern it must be borne in mind that the value of the public utility franchise should be excluded. This franchise value is directly based upon the capacity of the corporation to earn profits and it would accordingly be absurd to include it in the valuation upon the basis of which those profits are to be computed. The Supreme Court of the United States has declined to adopt any one of the above methods of determining the fair valuation of the property devoted to public service but has declared that all of them are to be given consideration. In Smyth v. Ames (166 U. S. 466, 1896), the court said: "In order to ascertain that value, the original cost of construction, the amount expended in permanent improvements, the amount and market value of its bonds and stock, the present as compared with the original cost of construction, the probable earning capacity of the property under particular rates prescribed by statute, the sum required to meet operating expenses, are all to be given such weight as may be just and right in each case. We do not say that there may not be other matters which should be regarded in estimating the value of the property."

Regulations to Secure Equality of Service.—Inequality of service rendered by public service corporations may take three forms: First, the arbitrary refusal to some of service rendered to others; second, the rendering of service of unequal quality for the same charge, and third, the charging of higher rates for the same service rendered under substantially similar conditions. The illegality of the first two forms of discrimination has been established, but discrimination in rates has been made illegal per se only in relatively recent years. Under the early common law one who
PUBLIC UTILITIES

was not charged a rate unreasonable in itself had no cause of complaint because some one else was charged less. This rule was later modified to make discrimination in rates prima facie evidence of the unreasonableness of the higher rate charged. Finally, such discrimination came to be recognized as contrary to public policy and has been made illegal by statute practically everywhere.

The task of defining what is meant by discrimination, however, has not been easy and the different solutions of the problem arrived at by different legislative bodies have produced a highly variegated system of regulations upon the subject. Furthermore, it is not feasible to forbid discrimination of all kinds since absolute uniformity of rates is undesirable, and it has been necessary, therefore, to leave some leeway in the laws and regulations so that this legitimate discrimination may exist. The result has been to place upon the public carrier the heavy burden of deciding in a multitude of concrete cases whether or not the particular discrimination complained of is forbidden by the statute. The Federal Interstate Commerce Act, for example, contains a considerable list of discriminations which are illegal when practised by common carriers upon those "in substantially similar circumstances and conditions," a phrase evidently designed to give a large measure of elasticity to the enforcement of the law.

The forms of discrimination in rates which are now commonly forbidden by law are the following: (1) Discriminations for the purpose of destroying competition, such as the offering of lower rates to a competitor's patrons to induce them to abandon him; (2) concessions made to large customers when the difference lies not in the amount of service rendered at any one time but merely in the total amount during a given period of time; (3) concessions made to exclusive patrons as against those who divide their patronage; (4) discriminations in favor of special kinds of business when the service rendered is the same, as when a railroad charges less for the shipment of goods to be used for one purpose than for another in order to develop particular industries in certain communities.

On the other hand, the law very generally recognizes the legitimacy of certain forms of discrimination. Among these may be mentioned the following: (1) Rates may differ where the services rendered entail different costs. Extra charge may be made, for example, for transportation on a train of unusual speed. (2) Lower rates may be charged for services rendered in units which entail less cost and inconvenience. A car of goods may be shipped at a cheaper rate than a single package, or a large party may be given reduced passenger rates. (3) Rates may be lowered for patrons who themselves furnish a portion of the public utility facilities, such as cars, wharves, etc. All such discriminations are, however, closely scrutinized and strictly limited.

Special Regulations in the Interest of Public Convenience.—This point has already been touched upon in discussing the duty resting upon public service companies to furnish adequate service and suitable facilities and need not be further elaborated here. Legislatures have passed numerous and highly various laws of this kind. An illustration in point is the requirement sometimes found compelling the establishment of certain relations in the interest of public convenience between connecting railroads.

Machinery of Public Utility Regulation—Commissions.—Experience has demonstrated beyond doubt that public utilities can be effectively regulated neither by State legislatures nor by courts. As public utilities increased in number and in the complex relations to the public welfare it became apparent that some machinery of control was necessary which would remove the problems of their regulation from partisan politics, protect the public in the matter of rates and service, protect the public utility itself from ill-advised attacks of legislative majorities and secure a scientific, efficient and impartial supervision which should be based upon an examination of facts. It is now universally recognized that these problems are best met by the creation of public utility commissions, modeled roughly after the Interstate Commerce Commission, and such organizations exist in all but one or two States of the Union for the regulation of at least the more important types of public utilities such as common carriers.

These commissions are usually, though not invariably, appointed by the State governor and are supposed to be non-partisan in personnel. The membership varies in number from three to seven, and the term of office varies from 2 to 10 years. The salaries paid range from $1,500 to $15,000. It is almost universally provided that no one who has any direct or indirect pecuniary interest in the public utilities over which the commission has jurisdiction may be a member of it.

The powers of public utility commissions may be grouped under four heads. In the first place, the commissions exercise power over public utility franchises. This power may include the determination of the necessity of granting new franchises, the control over franchise terms and the enforcement of the obligations resting on the public service company. In the second place, control is exercised in some States over the issuance of stocks and bonds by utility companies for the purpose of preventing over-capitalization. In the third place, the commissions have authority over rates and service. Their powers in this respect differ widely in the several States. They have, however, the right to make detailed investigations and conduct hearings for the purpose of securing data upon which to determine what rates may be charged or what service required. The orders issued upon these points are not final but may be reviewed by the courts. They are, however, regarded as prima facie reasonable and will be nullified only when clearly unreasonable. Finally, public utility commissions are empowered to require public service companies to adopt a uniform system of accounting and periodically to file detailed reports.

The regulation of public utilities by commission has not escaped criticism. Reference is commonly made to the delay resulting from the system of appealing to the courts so large a proportion of the orders of the commission. It is pointed out that rates have not, as a rule, been materially reduced under this form of control. It has also sometimes happened that State pub-
lic utility commissions have evinced an unfriendly attitude toward the public ownership of municipal utilities and have used their powers to block the progress of that movement. But on the whole it is generally conceded that commissions afford the only solution for the public utility problem. It has succeeded in large measure in taking the problem out of politics, has brought about very general improvements in service, and by creating an administrative agency of more or less expert ability has provided a means for dealing in a scientific manner with the perplexing problems relating to public utilities which remain as yet unsolved.

PUBLIC WORKS, School of. See Polytechnique, The.

PUBLICANI, pūblik-li-'ka'nî, Roman farmers of the public revenues. In ancient Rome the privilege of collecting revenues from foreign districts dependent upon Rome was sold at auction by the censors for a period of five years. The security required by the state from these tax-gatherers was usually the price at which they had purchased the branch of the revenue to be collected and frequently was far in excess of the wealth of any single bidder, which resulted in the formation of companies for the purpose, called publicani. Their business with the state was conducted under the name of one member designated the mancetas. The farmers of the revenue were of the wealthiest classes. None but Roman citizens could be a member of the publicani and magistrates and governors of provinces were not eligible. The revenues were derived principally from tolls, tithes, mining duties and scriptura (tax levied for the use of the public pasture lands). The collections were made by an inferior class who were often freedmen or slaves in the employ of the company and were cordially detested by populace. The high price paid for the privilege and the greed of the publicani resulted in great injustice which together with the character of the collectors explained the bitterness with which they are mentioned in the New Testament. From about 150 B.C. they were usually of the equestrian order. Consult Greenidge, A. H. J., 'Roman Public Life' (London 1901); Livy (xxii, 49; xxiv, 1); and the article 'Publicani' in Smith, William, 'Dictionary of Greek and Roman Antiquities,' Vol. II, 3d ed., London 1891).

PUBLIC OCCURRENCES. The first newspaper published in America, though it can hardly be called a newspaper, as no second number appeared, the colonial authorities suppressing it four days after its first appearance. It was issued at Boston 25 Sept. 1690 by Benjamin Harris and printed by Richard Pierce. As far as is known, there is only one copy extant now which is in the archives of the Public Record Office in London. A reproduction of it is contained in Green, S. A., 'Ten Fac-simile Reproductions Relating to old Boston and Neighborhood' (Boston 1900). See Newspapers, American.

PUBLICOLA, Publius Valerius. See Valerius, Publius.

PUBLISHERS' ASSOCIATION. See Newspapers, American.

PUBLISHING, American. The book trade or publishing industry in the New World had its origin in a more remote period than is generally supposed. It began within 100 years of the invention of printing, with the date of the first American book, 1535, to the year 1799, over 7,000 different books had been published, nine-tenths of them, however, being pamphlets. The 19th century saw almost the full development of book publishing, the establishment of colleges and schools and the founding of many libraries, creating an ever-increasing demand for the best in literature.

Early American Books.—The first book printed on the American continent is said to have been 'La Escalera del Siglo de San Juan y Nuestra Senora de Climaco,' published in Mexico in 1535. It was a translation from the Latin into Castillian. Other books were printed on the first press set up in Mexico and six or seven books are known to have been published in Peru before 1600. In the United States the earliest publication was a pamphlet called 'The Freeman's Oath,' printed in Boston in 1639. This was followed in the year 1640 by the 'Bay Psalm Book,' printed by Stephen Daye at Cambridge, Mass. After its publication in the colony it went to England, where it went through 17 editions, the last one bearing the date of 1754. It was also a highly popular work in Scotland, 22 editions having been printed there, the last dated 1759. The first original American book published in this country was Mrs. Anne Bradstreet's 'Poems,' and this volume, issued in Cambridge, Mass., in 1640 was reprinted in London in 1650. Cambridge remained the only publishing town for a long time, and for 21 consecutive years issued about one volume a year. In 1653 Samuel Green published John Eliot's famous 'Catechism' in the Indian language, followed in 1659 by the Psalms in Indian, in 1661 by the Indian New Testament and in 1663 by the whole Bible in the Indian tongue. This was the first Bible printed in America.

Early Publishers.—In New York City the original book publisher was William Bradford, who became official printer in 1693, for 540 pounds a year and half the benefit of his printing besides what he received as pay. In 1693 also he issued the 'Laws of the Colony,' the first bound book published in New York. In 1738 Christopher Sauer established a publishing house at Germantown, Pa., and issued the first German Bible printed in America in 1743. The firm of Little, Brown and Company was estab-
lished in 1784 in Boston while in the following year, Philadelphia, Lea Brothers and Company and Henry Baird and Company began business. It was also in 1785 that S. E. Bridgeman and Company began publishing books at Northampton, Mass. The existing house of J. B. Lippincott and Company was established in Philadelphia in 1829. The firm of Harper and Brothers began business in New York in 1817. From this date the publishing business had a rapid growth, among the firms established being the following in New York: Baker, Voorhis and Company, 1820; D. Appleton and Company, 1829; Van Norden, 1830; Farmers and Company, 1831; John Wiley and Sons, 1832; John F. Trow, 1835; A. S. Barnes and Company, 1838. In other cities the early firms included the following: Cincinnati, Ohio, U. P. James, 1831; Springfield, Mass., G. and C. Merriam Company, 1833; Louisville, Ky., John P. Morton, 1825; Richmond, Va., J. W. Randolph Company, 1831; Mobile, Ala., G. H. Randall, 1831; Montgomery, Ala., Joel White and Company, 1833; Lancaster, Pa., John Baer's Sons, 1817.

Early Books and Book Trade.—As an adjunct to publishing, the selling of books originated in Boston as early as 1652, when Hezekiah Usher opened the first shop. Many colonial booksellers printed and published their wares. Benjamin Franklin (q.v.) was among the early book printers. In 1732, Richard Fry, an Englishman and bookseller of Boston, advertised:

"Whereas it has been the common method of the most curious merchants of Boston to procure their books from London, this is to acquaint these gentlemen that I, the said Fry, will sell all sorts of account books, done after the most acute manner, for 20 per cent cheaper than they can have them from London."

For the pleasing entertainment of the polite parts of mankind I have printed the most beautiful poems of Stephen Duck, the famous Willistown poet. It is a full demonstration to me that the people of New England have a fine taste for good sense and polite learning, having already sold 1,200 of these poems. The first convention of booksellers for the regulation of trade seems to have been held in Boston, 1724; it was for the special purpose of increasing the prices of certain works. Toward the close of the century bookselling began to take rank among the most considerable commercial pursuits, though it then only shadowed its present comparative importance. Works of standard character, involving large expenditures, were undertaken by publishers, who, in such cases, usually subscribed together as a guarantee for the printer's outlay. The trade was conducted upon established principles, and innovations were held in poor esteem. All these usages were, however, disturbed by competition, and after the publication of the Waverly novels, of which rival editions were issued, the individual members of the trade acted more independently of each other, and their customs afterward partook of a less narrow spirit. The American Company of Booksellers was founded in 1801. Books were formerly sold in sheets, to be bound as purchasers might desire, a practice which no longer obtains. The universal diffusion of education in America, and the inquiring mental character of its people, not only increased the circulation of books but reduced their price, and the old-fashioned veneration which literary works had once inspired experienced no little modification. Externals were of small consequence to the great body of readers, and works were purchased not so much for preservation as for immediate reading.

Statistics.—From 1825 to 1840 the number of American publications show an aggregate of 1,115. Of these 623 were original and 492 were reprints from foreign works. The population of the United States in that year was about 17,000,000. In 1853, 733 new works were published in the United States, of which 278 were reprints of English works, 35 were translations of foreign authors and the remainder were original American works. The population of the United States had reached about 25,000,000, an increase of 50 per cent compared with 1840. The original American works published in 1853, compared with the 15 years ending in 1840, show an increase of about 800 per cent in less than 20 years. In other words, the original American publications of the book trade seem to have advanced about 15 times as fast as the population. In 1890, with a population of 50,000,000, the new books published during that year amounted to about 2,000—nearly three times more than in 1853, whereas the population had only doubled. The total number of new books published according to the records of the Publishers' Weekly, for the years given below, is as follows:

<table>
<thead>

It will be observed that there is a heavy falling off for 1915, due to abnormal conditions brought about by the war. While the number in other classes was unusually small, books of history numbered 758, as compared to 581 in 1914, the increase being due to the many publications on the war.

As an illustration of normal conditions in the book trade the figures for 1914 are of more value. Of the total number of titles published during this period, 10,175 were new books and 1,335 were new editions. Imported books, editions printed abroad, but bound in this country, numbered 2,852. Of the various classes fiction leads. The output for 1904 may be compared to that of 1914 by the chief classes, showing the change in public demand within the past 10 years:

<table>

<td>3,308</td>
</tr>
</tbody>
</table>
Considering only the books of American authorship for 1914, it will be seen that there is some change in the relative proportion of classes. Books on sociology and economics take the lead, fiction coming second almost 200 titles behind.

**Popular Books.**—In 1903 there were 1,700 book publishers in the United States. While Boston and Philadelphia remain true to their earlier reputations as leading book centres, New York has become the largest book mart and the leading factor in the manufacture of books. Chicago too has assumed an important place in the book trade, while some hundreds of books are published annually in Cincinnati, San Francisco, Cleveland and other smaller cities. The majority of American books are published by 100 firms in New York, Boston, Chicago and Philadelphia. During 1902 and 1903 the historical novels enjoyed widespread popularity, and nine books of this class circulated to the extent of 1,400,000 copies. This enormous output, however, did not lessen the sale of older and more standard books. These were largely reprints. A popular work 75 years after its first publication is often found to have been reprinted 20 times by as many different publishers. Of the world's great standards, hundreds, and in some cases thousands, of editions have appeared. There is, nevertheless, a distinction to be made between the manufacturer of books who takes old works and reprints them, and the publisher who issues entirely fresh and original matter. Among early successful books Mrs. Stowe's 'Uncle Tom's Cabin' had a phenomenal sale, 500,000 copies being sold in less than five years in the United States, and by April 1852 more than 1,000,000 had been reprinted in Great Britain. Of Longfellow's poems, without taking into account unauthorized English reprints, the American sales in 1839–57 amounted to 325,550; from the latter date till 1901, 220,000.

**School Books.**—No small factor in book-making during the 19th century was the phenomenal production of school and college textbooks. In 1902 the reports showed a list of 433 educational works. This was increased to 628, though there has since been a marked decline in the production of this class. Of books for use in the public schools editions of 500,000 copies, intended for one year's consumption, are not an unusual event. Messrs. D. Appleton and Company for many years sold over 1,000,000 copies of Webster's Speller every year; and W. B. Smith and Company of Cincinnati, Ohio, sold over 1,000,000 copies of the Eclectic Series during each year. The electrotype plates of schoolbooks, Bibles, prayer-books and hymnbooks, are very rarely changed and enormous quantities are sold every year.

**Miscellaneous Books.**—In the United States many encyclopedias, dictionaries, the complete works of standard authors in definitive editions, anthologies of literature, etc., are sold by subscription; and the initial expense of such books being enormous, before a single copy of the book is made, the sales must be enormous also. Then there are many books which are not books—such as city directories, which are usually published as a company, is vastly from the publication of this one book; State directories, list of dealers in each business and commercial agency reports (each of these agencies makes four revised editions of its books each year, each book measuring about 11 by 13 inches, and containing about 2,300 pages of matter in close print). There are also innumerable genealogies, indexes, catalogs, together with many other productions which are truly books, but which cannot be called literature.

**Commercial Value.**—In the publishing of books the following are the items of outlay which need to be taken into account: Copyright, paper, typesetting, author's corrections, electrotyping, press work, binding, advertising. Publishing means a great deal more than merely printing and binding a book. It means putting it where it is likely to sell. The machinery of distribution, which means the method of getting books finally into the hands of readers through the various middlemen, is vastly important. The manufacture of a book now demands the assistance of various branches of mechanical skill. Besides the paper-maker, the type-founder and the printer, to whom it gives a large proportion of employment, it engages, exclusively, the bookbinder. Its material farm has, till the present era of cheap publications, always borne a commercial value extravagantly disproportionate to its matter.

**Copyright.**—A common arrangement between the American author and publisher is a payment of 10 per cent royalty on the retail price of all sales; sometimes a cash sum is paid, and the publisher secures the copyright, which is granted for 28 years, subject to renewal by the author, his widow or children for other 14 years. A condition is that a copy of a title-page must be registered with the librarian of Congress, and two copies of the book lodged there not later than the day of publication. The entry fees are 50 cents for an American author, $1 for a foreigner and 50 cents additional for a certificate of record. A copy of any new edition must also be sent to the librarian. (See Copyright). By the provisions of the International Copyright Act (1898), a foreign author's rights are protected in Great Britain, Belgium, France, Germany, Haiti, Italy, Spain, Switzerland and Tunis. Colonial authors can also secure copy-
right without publication in the United Kingdom, and a work copyright in the United Kingdom. Copies of American cheap reprints of British books are admitted to Canada subject to a customs duty of 12½ per cent, to be paid over to the British author, but the returns from this source have been very small.

Bookbinding.—Since 1885, in the bookmaking industry, many improvements have been made in wire-stitching machines. Nearly all these machines will stitch anything from two sheets to a book two inches thick, and with several of them either round or flat wire may be used. There has also been introduced a noteworthy combination folding and wire-stitching machine, which, by a continuous and automatic operation, takes the sheets from the feeders, and folds, gathers, collates, covers and wire-stitches them. Paper-cutting machines have been improved by the introduction of automatic clamps, indicators and gauges. The invention of a steam rounding and backing machine has increased the capacity of from 500 to 1,000 books per day to a capacity of 500 to 600 in the same time. The latest case-making machine feeds itself from a roll of cloth which it automatically cuts into pieces of proper size for use. The cloth is first covered with glue by contact with a cylinder revolving in a pot of glue. It is then cut by the machine and nicked in corner sections; boards are supplied from a holder and a back lining from a roll, both receptacles forming part of the machine. This process completed, the nearly finished product drops a little, the cloth is folded over the boards and back lining, and the binding, after passing through a case smoother, is delivered in a finished state. Among other inventions are a casting-in machine, for putting the body of a book into its cover, and a gathering machine. This latter invention promises important developments in economy. See BOOKBINDING.

Book Plates.—About the year 1804 the art of stereotyping was invented in England, and in a few years was introduced into this country. With the type-printed book under the old conditions a publisher did not dare print a large number of copies of any book unless he believed it would have a quick sale. Books were bulky and took up too much space. Consequently, the types for a first edition were distributed when they left the press; then had to be reset with renewed chances of error in the second edition. Resetting for two or more editions added largely to the cost of the book and limited its supply. The process of stereotyping first used, known as the plaster process, served book printers for about 50 years. The practice of the art was brought to New York by David Bruce in 1813, but the first book stereotyped in America was the "Westminster Catechism," made by J. Watts and Company of New York in June of the same year. For the printing of books, all methods of stereotyping have been superseded by electrotyping, which was experimentally tried in New York as early as 1841, and was in general use before 1855.

Book Imports.—The summary of the chief imports of books and other printed matter for 1909 and 1914 shows the following:

* Year ends 30 June, just before war began, thus covering period of normal conditions.

During the two decades from 1894 to 1914 the only striking change recorded in the book-publishing trade was the enormous and phenomenal circulation of popular novels. During this period the advance in good taste and in artistic beauty of product was a marked characteristic of the industry. Fashions in bindings changed annually, but a widening range of materials and patterns, more daring use of designs and inks, and the invention and general use of automatic binding machinery supplemented improvements in printing, permitting lower prices for books and promoting phenomenal sales. It is a significant coincidence that the decade which witnessed such advance in all details of mechanical productions in this industry should be characterized also by the most noteworthy advance in the good taste and appreciation of the general public.

**PUCCINI, pô-chê'na.** Giacomo, Italian operatic composer: b. Lucca, Italy, 22 June or 23 Dec. 1858. He came of a family of distinguished musicians, his great-grandfather Giacomo, his great-grandfather Antonio, grand-father Domenico and father Michele all being famous. He was educated at the Conservatory at Milan, studying under Bazzini and Ponchielli. His first opera, 'Le Villi' (1884), was produced at the Teatro del Verme and was favorably received. His 'Edgar' (1889) was produced at La Scala, but his greatest success was with 'Manon Lescaut' (1893) at Turin. Three years later his 'La Bohème,' also produced at Turin, achieved an extraordinary success and won world-wide fame for its author. 'Tosca' (1900) was followed by 'Madame Butterfly' (1904), with which the composer
again scored a triumph. His 'Girl of the Golden West' ("La Fanciulla del West") enjoyed signal success at the Metropolitan Opera House, New York. The European War interrupted the production of his new compositions, but "La Rondine" and "I Due Zoccoli" were both completed in the first year of the war. His work is highly original and he ranks among the foremost modern Italian composers.

PUCK, in medieval mythology, a celebrated fairy of mischievous tendencies whose character and attributes are depicted in Shakespeare's "Midsummer Night's Dream." This fairy is known by a variety of names, as Robin Goodfellow and Friar Rush in England, and in Germany as Knecht Ruprecht; but it is by his designation of Puck that he is most generally known in England, Germany and the more northern nations. He was the chief of the domestic tribe of fairies, or "browines," as they are called in Scotland and innumerable stories are told of his nocturnal exploits.

PUD. See Pood.

PUDDOING-BERRIES, the berries of the Canadian dogwood (Cornus canadensis), common throughout North America. See Dogwood.

PUDDOINGSTONE. See Conglomerate.

PUEBLA, pwálb'lá, a state of Mexico. The state of La Puebla in the central plateau of the Anahuac has Vera Cruz to the north and east, Oaxaca to the south, Guerrero to the south-west and Morelos, Mexico, Tlaxcala and Hidalgo to the west. The area is 12,204 square miles. Pop. 1,101,600. (See Mexico). Consult Palacios, E. J., "Puebla su Territorio y sus Habitantes" (2 vols., Mexico 1917).

PUEBLA, Mexico (originally called La Puebla de los Angeles, more recently Puebla de Zaragoza), capital of the state of the same name, 116 miles east of the City of Mexico by the Mexican Railway, but only about 60 miles in a straight line; altitude over 7,000 feet above the sea. The climate is most agreeable, the maximum temperature being 84° in summer and 75° in winter. The peaks Popocatépetl and Ixtaccíhuatl are only about 25 miles distant and those of Orizaba and Malinché are in plain view. Three steam railways,—the Mexican, the Mexican Southern and the Inter-Oceanic and electric street railways supply transportation. Straw hats, leather goods and numerous other articles are manufactured in considerable quantities, and in the immediate vicinity are several large cotton mills. Near by are the famous onyx quarries which have for many years supplied great quantities of beautiful onyx to Mexico and the United States. A manufactory in the city makes the product of the famous "mexicanos," and a great variety of useful or ornamental objects, from store and saloon fixtures, table tops and wash basins to imitations of every fruit known in the country. The banking facilities of the city are supplied by the Oriental Bank, with $8,000,000 capital, and a number of smaller and equal institutions. The city is noted for its many churches, clean streets, substantial business edifices and grand cathedral, which was almost 100 years (1552-1649) in building, is 323 feet long, 101 feet wide and 80 feet from floor to roof.

The educational institutions besides the primary and high schools are the State College, School of Medicine, Normal School for Men, Normal School for Women, Normal School of Arts, Academy of Fine Arts and hospital; and within the city are the education of children. There are three public libraries, museum of archaeology, an art gallery, an observatory, a market hall, sulphur baths, a general hospital, founded in 1658, and a maternity hospital, state hospital, claims institute, insane asylum,变现 insane, children's hospital, military hospital, Interamerican Railway Hospital and Spanish Beneficiaries Hospital. The palace of the state government, which faces the principal part or zocolo, is one of the notable buildings of the city. The extensive and very beautiful Alameda is a most attractive spot and contains a monument erected in 1898 in honor of Mexico's liberators, and the monument to Gen. Nicolas Bravo. There are also the French-Mexican monument erected by the French colony in 1902, and the equestrian statue of General Zaragoza, which surmounts a fine monument erected at the foot of the hill of Guadalupe. In the Government Palace is a most interesting collection of historic paintings and a library of 200 volumes. The central park of the city is artistically laid out in vine and foliage covered walks, with fountains and statues here and there, and numerous small plazas supplied breathing spots.

There are three theatres, one of which, the "Teatro Principal," was built in 1790 and claimed to be the oldest theatre on the American continent. Since 1832, in which year the royal sanction was given to form a settlement here, Puebla has occupied second place among all the cities of the land, commercially, spiritually and in population, until very recently, when Guadalajara forged ahead in population and material development generally.

The city of Puebla was founded in 1532 by the Franciscans, and is considered the military key to the capital of the republic. During the war between Mexico and the United States it was captured by Gen. Winfield Scott, who made his headquarters there from June to August 1847. It was captured by the French in 1863 and reoccupied by the French forces under Gen. (later President) Porfirio Diaz, in 1867. Tradition asserts that when Cortez came he found a city of 300,000 inhabitants, 400 temples and a legion of priests, six miles distant from Puebla, where now is the famous Pyramid of Cholula; and that the Aztecs came there in great numbers to worship and offer up human sacrifices. Pop. about 96,121. Consult Carrión, A., 'Historia de la Ciudad de la Puebla de los Angeles (Puebla de Zaragoza)' (2 vols., Puebla 1897).

PUEBLO, Colo., city, county-seat of Pueblo County, and second city in the State, on the Athropolis, Topoca and Santa Fé, the Colorado and Southern (Burlington Route), the Denver and Rio Grande, the Missouri Pacific and the Chicago, Rock Island and Pacific railroads, also on the Colorado-Kansas Railroad, about 120 miles by water. Within its corporate limits are several former villages: North Pueblo, Central Pueblo, South Pueblo and Bessmer. It is in a valley on the eastern foothills of the Greenhorn Range of the Rocky Mountains. The old fort at Pueblo
was built about 1840, and here came the agents of the Astor-Fenn Company (Jared Jacob Astor's Company) to trade with the white trappers and Indians for their furs. In 1846 there were 100 white people located here engaged in raising crops, and a real trading post was established in 1850. In 1854 the Ute Indians massacred the residents of the post. In 1859 the present city was laid out, and in 1873 it was chartered as a city. The region of country east is largely devoted to agriculture and stock-raising. In the vicinity of the city are extensive coal and oil fields and deposits of limestone and ores. The silver and copper ores are brought to the smelters of Pueblo; and lead, gold and zinc are here prepared for the metals of commerce. The iron and steel industries have become quite extensive. The Colorado Fuel and Iron Company (steel plant) have 6,500 employees; the railroad car-shops and yards, 3,200 employees; the smelters, 2,200; the foundries and other manufactories, 6,000. There are invested in manufacturing industries a capital of about $18,000,000, and the products are about $65,000,000.

The principal public institutions are the State Insane Asylum, Saint Mary's Hospital and Sanatorium (1,000 patients annually), Minnequa Hospital (cost $300,000), and private sanitariums. There are two systems of public schools, one on each side of the river; two high schools, public and parish schools (16,000 school children), Loretto Academy, the McClellan public library with 14,000 volumes, law libraries, school library and the Colorado Mineral Palace and Park. A complete collection of the minerals of Colorado are in the Mineral Palace. The five banks have a combined capital of $800,000 and deposits of over $15,000,000. The government is administered under a special charter, adopted 19 Sept. 1911, amended 4 Nov. 1913 and again on 2 Nov. 1915. The charter provides for three commissioners, who select appointees from lists furnished by a civil service commission, which holds examinations twice a year. The civil service commission consists of five members, who are appointed by the people. The police judge and city comptroller are appointed by the civil service commissioners and are not civil service officers. Their term of office is four years. The city clerk, city attorney and city engineer are appointed by the council, which is made up of the three city commissioners. They are not protected by civil service and are appointed for four years. The city commissioners are elected for four years and the civil service commissioners for six years. Elections are biennial; one city commissioner is chosen at one election and two at the succeeding election. The city owns two systems of waterworks, which are operated by trustees elected by the residents of those water districts. The large majority of the population are native-born Americans; about 2,000 are Italians; 1,000 are Austrians, and 1,500 are colored. Pop. 73,000.

P. A. GRAY, Secretary of Pueblo Commerce Club.

PUEBLO INDIANS (Spanish, "town," "village"; hence Pueblos, "villagers"), a group of sedentary agricultural tribes comprising the Taos, Zuni, and others, living in clay and lime stockades in New Mexico, and the Hopi or Moqui of the Shoshonean stock in northeastern Arizona. There are also some Mexicanized remnants of the Tanoan stock on the Rio Grande below El Paso, in Texas, and Chihuahua. For details see under the above stock names.

Physical Characters.—Disregarding those who have been more or less affected by Spanish contact, the Pueblo Indians are generally small in stature, particularly the women, some of whom are quite diminutive. After marriage the latter frequently become stout, but obesity is rare. The men are a rich brown in color, but so dark nor so reddish as their Navaho neighbors. The women are lighter, many of them being of a fine olive tint, which, with regular features and often with eyes almost oriental in type, make them decidedly comely. Albinoism is common among the Hopi and Zuni, those of the latter tribe averaging one in 200. The hair is thick, black and glossy. That of the men is cut "turbine fashion," that is, banged across the forehead, cut horizontally at the sides on a line with the chin, and allowed to fall over the eyelids, length behind, but knotted and tied into a short queue. This is probably the more primitive style of hair-dressing, but it now varies more or less with the tribe. The front hair of the women is cut level with the chin, parted laterally, and allowed to fall over the face without sitting continual brushing aside with the hand to permit them to see. The unmarried Hopi girls retain the primitive method of wearing the hair in large whoils over the ears.

Dress. The costume of the men, now largely superseded by the clothing of civilization, consisted of a shirt, a poncho-like coat formed of a squarish piece with a hole in the middle for the head, and sewed down the sides, with partly open sleeves; a pair of loose trousers reaching below the knees, open half-way up the outer sides and fastened with a belt; footless stockings, leggings, garters, moccasins or sandals, breechcloth, headband, hairband, and blanket. Dressed skin or native cotton formed the chief material, from which their costumes were made, but these gave place largely to woolen articles after the introduction of sheep by the Spaniards. The woolen blanket of later times was probably preceded by a robe made of strips of rabbit or wild sheep skin coarsely woven together. Yucca strips, straps, feathers, and even human hair also formed raw materials for clothing. The typical dress of the women consisted of a skirt of skin or cotton (now of wool) reaching from the neck to below the knees, and girded with a belt, the right arm and shoulder being bare; a manta hanging loosely from the neck and down behind or thrown over the head; stockings, deerskin leggings, consisting usually of an entire skin wrapped many times around the calf, and sandals or moccasins, to which the latter the leggings were attached. Among some of the Rio Grande Pueblos the women wear soft deerskin boots instead of the cumbersome leg-wrappings. Necklaces of seashell and turquoise beads, and pendants, ear-tails, bracelets, beads, and other ornaments were worn by both men and women, but the shell necklaces of the latter have been superseded by those of silver. Leather belts strung with large silver discs and silver-mounted wristguards are worn by the men with their loincloths. Among the moccasins and leggings, skin has largely passed out
of use for clothing, cheap cotton prints and a
woolen blanket being almost exclusively em-
ployed by the men.

Houses.—The typical pueblo is a many-
celled, communal, defensive structure of several
stories, opening on one or more courts or plazas
in which dances and other ceremonies are per-
formed. When the pueblo enclosed a single
court, the outer wall was usually the highest,
and the door was served with only small openings,
or port-holes, to afford a view of the surrounding
country. A slight elevation was usually pre-
ferred, but there are many instances in which
the site is a lofty mesa or a level plain, while
other dwellings were built in natural recesses
in the rocky walls of caños or cliffs, hence
their popular designation, cliff-dwellings. The
site depended on accessibility to water, to
cultivable fields, or to the necessity for de-
fense against enemies. Both rounded or
polygonal structures were common, while some
pueblos were semicircular in ground-plan, with
a high rear wall and with the houses arranged
in terraces, the tiers of dwellings successively
retreating so that the roof of the lower formed
the means of access as well as the "front yard"
of the tier next above, and so on to the sixth or
seventh story. The ground tier usually con-
tained only small wall openings, access being
obtained by means of a movable ladder to the
roof, which was provided with a hatchway.
Most of the pueblos still follow this ancient
form, but there are now but few whose ground-
floor houses are not provided with doors and
windows. Sometimes forming a part of and
sometimes detached from the main house cluster,
are chambers, wholly or partly under ground
and usually circular in form, but there are now
but few whose ceilings are not "broken," the
result was frequently a marvelously
straight and strong wall that has stood the
ravages of centuries. Pié (plastered) construction was
also employed in massive buildings, such as
Casa Grande in southern Arizona. Molded
adobe bricks, now so commonly used, were not
made in pre-Spanish times, but balls of mud
mixed with ashes and sage, and dried, were in
vogue as a building material in pre-historic times.
The roofs of the houses consist usually of pine or cottonwood beams, with light poles
laid transversely, which in turn are covered
with brush-grass, and adobe mud, well tamped.
The introduction of the horse, which permitted
the transportation of heavy roof beams, seems
to have had a decided influence in increasing
the size of the rooms, the compartments of
ancient structures being usually mere cells.
Plakes of selenite were pieced together for
window panes, but these have given way to
stock frames purchased from the white traders,
while the corner fireplace and chimney have
been substituted for the central fire-pit, except
in the kivas.

Industries.—As they are sedentary tribes,
the Pueblos are agriculturists, their principal
crops being corn, squashes, beans, and onions,
to which were added wheat, watermelons, can-
taloupes, grapes, peaches, etc., on the advent of
the Spaniards. Corn is prepared in very many
ways, and wild fruits form a not unimportant
part of the Pueblo pulbulum. Their meat sup-
ply was gained mainly through communal
hunting, the mountains supplying bear, deer,
antelope and elk, while the valleys and caños
abounded in jack-rabbits, cottontails, prairie-
dogs, wild turkeys, quails, and doves. The buf-
falo was probably hunted to some extent by the
Río Grande Pueblos, who also conducted a
brik trade with the Plains tribes up to 23
years ago. For religious reasons, fish was
probably universally tabooed, water, on which
everything depends, being a sacred element.
The turkey was domesticated, and egles were
and still are kept in captivity for their feathers.
Cattle, sheep, goats, horses, and donkeys, which
now form such an important part in the Pueblo
economy, were unknown before the Spaniards
went among them. The Pueblos are a provident
people, their reserve food supply usually being
sufficient for a year's use, thus succorcing them
in event of drought. Most of their agriculture
is conducted by means of irrigation, although
patches of corn, melons, squashes, etc., and
small peach orchards are otherwise successfully
cultivated in favorable localities. Some of the
other Pueblos make a coarse basket for domestic use. As potters the Pueblos
are far in advance of all other Indians north of
Mexico. Purely primitive methods are still
employed, and the decorative motive is gener-
ally symbolic, involving no religious

Social and Religious.—All the Pueblo
tribes are composed of numerous clans, named
after some animal, plant, or other natural ob-
ject or phenomenon. Maternal descent is
recognized, that is, the children belong to the
clan of the mother. Marriage, which is not al-
lowed between members of the same clan, is
generally effected by mutual consent of the
contracting couple and their parents, and is
sealed after an exchange of gifts and a simple
primitive ceremony. The vow, however, is
not very binding and divorce is merely a
matter of mutual agreement, the offspring, if
any, invariably belonging to the mother. The
status of the Pueblo woman is high. She
owns the house and its furniture, supervises the
husband's or child's work, is in charge for his family
and he frequently makes his wife's clothes.
The dead were formerly cremated or were
buried in the houses or in the refuse heaps.
Now, however, the dead are buried in a common
cemetery in front of the Catholic Church ex-
cept among the Hopi, who deposit their dead in
crevices in the rocks. The social and religious organization of most of the Pueblos was considerably affected by the Spanish missionary and civil authorities, and among all the tribes except the Hopi a civil government, with the tribal headman and other officers are now annually elected, although their power in some instances is only nominal. Originally the religious and social organization was inseparable; each clan had its priest or priest-chief, while both the internal and the external affairs of the tribe, where they affected the complicated and far-reaching religious organization, were controlled by a priesthood. There were also other socio-religious societies, grouped according to the several regions north, south, east, west, upper, and lower — some of which assumed control over certain affairs in winter, others in summer. The members of these societies, where they still exist, are the medicine-men of the tribe, some of whose functions are the prevention as well as the cure of disease, the regulation of the communal hunts, the extermination of witchcraft, and the intermediation between the tribesmen and the many nature gods which form the Pueblo pantheon. Communication with these nature powers was said to be opened by means of secret or open ceremonies, consisting of the depositing of prayer-sticks, chants, dances, sacrifices, pantomime, masquerade, and the recital of rituals.

History.— From the Pueblo tribes which have been more intimately studied it has been learned that they consist of many small accretions from various stocks and from many localities, which left their former homes on account of drought and the consequent failure of crops, through superstition, the depredations of enemies, or other causes. The migrations of these component clans or parts of clans were sometimes very slow, many years being consumed in their journeyings and village after village being successively built, occupied, and abandoned before the final settlement was made. Thus are many of the ruins of Arizona, New Mexico, Colorado, and Utah accounted for. The nuclei of some of the Pueblo tribes, however, had their original home in the north, at a place called Sinpuu, which are supposed to return after death, and which is symbolically represented by an opening in the floor of the ceremonial chambers, in front of the altars erected during religious rites. Indefinite knowledge of a populous region in the north gained by the Spaniards in Mexico early in the 16th century led first to the journey in 1539 of Fray Marcos de Niza to the “Seven Cities of Cibola,” the present Zuñiland, followed a year later by the expedition under Coronado. This was the first direct contact of the Pueblo Indians with the whites. For the successive Spanish expeditions and the later history of the Pueblos, see New Mexico, and also the subjects mentioned below.

Population.— At the time of Coronado’s visit the Pueblo tribes were said to inhabit 60 villages and to number 20,000 men, but it is doubtful if the entire population exceeded this estimate. With the exception of Acoma and Isleta none of the 26 pueblos now existing occupied their 16th century sites, the principal change having been forced into new locations chiefly during the reconquest of New Mexico after the Pueblo revolt of 1680. The present aggregate population of the 27 villages is about 10,000, exclusive of several Hopi villages in Arizona and the two pueblos of Isleta and Senecu, below El Paso, which contain from 2,000 to 3,000 more. For their distribution see KERESA—PUEBLO INDIANS; TUCSON FAMILY, and ZUÑIAN.

PUELChE, pwel′keh. South American Indian tribe of Araucan stock, living in the pampas region of the Rio Negro and the Rio Colorado in southern Argentina. They are a wild and warlike people, lead a nomadic life and know practically nothing of agriculture. They succeeded in driving away the Spaniards after the first settlement of Buenos Aires but later withdrew before the Spanish cavalry. They have great herds of cattle and horse, and their chief weapons are the bola and the lasso.

Puerperal eclampsia, a form of eclampsia occurring in pregnant women, usually arising from blood-poisoning and often fatal. The exciting causes may be many, but some form of increased irritability of the nervous system is one of the most important features of the condition. The symptoms come on suddenly, or following a headache with irritability and perhaps slight impairment of sight or hearing, or with vomiting. Convulsions of an epileptic, hysterical or apoplectic variety constitute the main symptom. These convulsions may last for from one to five minutes, and are then usually accompanied by unconsciousness. They recur sometimes at very short intervals, most frequently hourly, and may vary from 10 to 30 or more in a day. Such convulsive seizures are always serious to both mother and child and prompt emptying of the uterus is the main remedy to be employed.

Puerperal fever, an infectious disease of women occurring shortly after childbirth, or following a miscarriage, accidental or induced. It is caused by a micro-organism, usually a bacterium (Streptococcus), and is communicated in contact with unclean hands, instruments or clothing which may have brought the infection, just before, during or after the birth of the fetus. Only in the rarest of instances does it occur when due precautions as to absolute cleanliness have been observed. It usually begins within a week after the termination of pregnancy, ordinarily from the third to the fifth day, and is attended with acute inflammation of the reproductive organs.
and with septic infection of the blood and body at large. It is always an infection from without, and is preventable by rigid aseptic midwifery. The symptoms will vary very widely according to the infecting organism and the severity of the case. A chill, fever and some local extension of tenderness may be the only symptoms present in mild cases. In septicæmic cases there is usually a decided chill about the third or fourth day, and is attendant with acute inflammation of $10^\circ$, $10^{1/2}$, $10^2$, $10^{3/2}$, $10^3$ F., with general depression and rapid pulse. The temperature usually remains high and then suddenly drops as the patient recovers. In the severest cases, the pyæmic infections, the blood-current becomes infected; chills, temperature, sweats occur and recur, and the patient usually dies. The treatment is purely medical, sometimes surgical, and needs the skilled physician and nurse. Prevention is the demand of the modern woman, and she is entitled to it. Unskilled and dirty midwives, unclean doctors and abortionists are responsible for practically all of the deaths due to childbed fever.

PUERTO CABELLO, pwâr'tô kâ-bê'î'yô, Venezuela, port and capital of the state of Carabobo, on a low peninsula jutting into the Caribbean Sea and forming one of the finest harbors in the world. A lighthouse and fortifications protect the entry. Railroads connect the city with Valencia, 22 miles southeast, and with Caracas, 78 miles east. The exports are coffee (six-sevenths of the whole), cacao, hides, cinchona, oxen, sugar, cotton, timber, including dye woods, and some copper ore. The city was the last stronghold of the Spanish (1823); it was blockaded by the German and British fleets in 1902-03, as the most valuable port of entry and the best place to collect their claims on Venezuela. Pop. (est.) 18,000.

PUERTO LA MAR, là mär. See COBIJA.

PUERTO PLATA, plâ'ta, Santo Domingo, port of the Dominican Republic on the north side of the island of Haiti. The entrance to the harbor is extremely narrow. Steamship lines connect with Europe, Saint Thomas and Havana, and it is connected by rail with Santiago de los Caballeros. Puerto Plata is the export town of the rich tobacco, sugar and coffee plantations in the interior of the island. There are several valuable coal mines nearby and there is also an extensive trade in mahogany. A white cheesebox fort, a relic of the buccaneers, situated upon a small promontory, is the only defense of the town. Municipal authority is vested in a mayor and common council, elected by the people, the mayor being the agent of the council. The city has a police department, a school board and a very good school system and a street cleaning department. It is well lighted and has waterworks. The town was settled in the first decade of the 16th century by Spanishiards. About 30 per cent of the population speak English. Population about 10,000.

PUERTO PRINCIPE, prên'sè-pâ, or CAMAGÜEY, Cuba, town, capital of the province of Puerto Príncipe, 170 miles north-west of the city of Santiago de Cuba. It was originally founded in 1595 on the site of an old Indian village, on the northern coast, but was moved to its present site in 1516. For a time after 1800 it was the seat of government for the Spanish West Indies, and until the end of Spanish rule was an important military post. It is the largest inland city of the island, and is connected with its port, Nuevitas, by railroad. It is the center of a cattle-raising district, and exports cattle, hides, and some amount of powdered ivory. It is a port of call of the Panama mail steamer. The town is very mediæval in appearance, the streets are narrow and the houses old. During the American occupation artesian wells were bored to obtain a pure water supply, the streets were repaired, and several public and private buildings were constructed or remodelled for schools and for offices. Pop. about 30,000.

PUERTO PRINCIPE or CAMAGÜEY, province, east of the centre of the island, bounded on the east by Santiago de Cuba, and on the west by Santa Clara; area 11,000 square miles. The north of the province is mountainous, the most of the surface being high tableland affording excellent pasturage. The chief industry is cattle raising, and the number of cattle has largely increased. The finest horses on the island are also raised here. The province is well wooded, and lumbering is an important industry. The minerals include iron, copper and asphalt, all of which are mined to some extent, asphalt being the most commercially important. General agriculture is carried on mostly in the vicinity of the town of Puerto Príncipe, and its port, Nuevitas. Sugar is the most important agricultural product. The province was a centre of the insurrectionary movement, and Cubitas in the northern part was the seat of the insurgent government in 1896-98. Puerto Príncipe is the second province of Cuba in size but is least densely populated. Pop. about 160,000.

PUERTO REAL, râ'-âł', Spain, a seaport in the province of Cadiz, on the Bay of Cadiz, seven miles east of the city of Cadiz. The greater part of the town is modern, on the site of Portus Gaditanus, an old Roman place. It has considerable manufacturing; and the chief products are leather, pottery, linen goods, cements, vermouth, and starch. It has a good harbor and an extensive trade; the chief exports are salt, fruit and manufactures. Pop. about 9,000.

PUERTO RICO, ré'kô. See PORTO RICO.

PUERTO DE SANTA MARIA, generally known as "EL PUERTO," dâ sán'tâ mâ-râ' (PORT SAINT MARY), Spain, city in Andalusia, in the province of Cadiz and seven miles northeast of the city of Cadiz, on the Guadalete, near its mouth in the Bay of Cadiz. It is on the railway from Seville to Cadiz. It has a town-house, theatre, a bull-ring, where was given the grand bull-fight to the Duke of Wellington, described by Lord Byron; five promenades, one of them planted with orange and other trees; infantry and cavalry barracks; a custom-house, a good edifice near the mole, a courthouse and a fine church with Spanish style. Leather, soap, hats, wines, liqueurs, brandies, starch, flour and glass are manufactured, and some fishing is carried on in El Puerto. This is one of the Spanish ports from which sherry is exported. Its vicinity to Cadiz, the centre of exchange on the Gulf of Cadiz, the principal articles of import are wood and iron. Steamboats ply regularly between the Puerto and Cadiz. Pop. about 18,000.
PUFENDORF, poo'-fen-dorf, Samuel, Baron von, German publicist and historian: b. Chemnitz, Saxony, 8 Jan. 1632; d. Berlin, 26 Oct. 1694. He studied theology and law at Leipzig and in 1657 philosophy at Jena; was tutor in the house of the Swedish ambassador at Copenhagen, and by his work, 'Elementa Jurispruden- tiei,' (1660) secured the appointment, the first in Germany, to the professorship of the law of nature and of nations at Heidelberg in 1661. Here he taught till 1670, and wrote 'De Statu Rei Publicae Germanicae;' published in 1667 under the pseudonym of Severinus Mozambano, and which, from the hardy way in which some of the imperfections of the Germanic constitution are exposed, raised a storm of controversy. Partly with a view to escape unpleasant consequences, Pufendorf accepted in 1670 the post of professor of natural law in the university at Lund, offered him by Charles XI of Sweden. He there wrote his work on natural law, 'De Jure Naturae et Gentium' (1672), which superseded the former; soon after appeared another part of this work, 'De Officio Hominis et Civis' (1673), which has passed through numerous editions and been translated into several languages. Pufendorf in these works devoted still further to Grotius from the scholastic method of philosophizing, and condensed, as it were, a complete system of natural law. About 1677 he was appointed secretary of state, royal counsellor, and historiographer at Stockholm. There he wrote in Latin the 'History of Sweden from the Campaign of Gustavus Adolphus in Germany to the Abdication of Queen Christi na' (1676), and in German his 'Einleitung zur Geschichte der Vornehmsten Reichet und Staaten' (1682). These works so much increased his reputation that in 1686 he was called to Berlin as counsellor, historiographer, and judge of the Supreme Court of Judicature. In 1690 he was made privy-councillor of the Elector of Brandenburg, and in 1694 was created baron by the king of Sweden. Pufendorf's legal writings are regarded as marking an epoch in the history of natural law, treating it as based upon the social instinct and developing it as a philosophical morality, while allowing scope to revelation.

PUFF-ADDER, the popular name of an African viper (Bitis orixens), which should not be confused with the American puffing-adder or blowing-adder, of the genus Heterodon. (See HOGNOSE). The hograne adder is harmless, but the African viper is highly dangerous, its head appearing puffed, because of the large size of the poison sacs. See SERPENTS; VIPERS.

PUFF-BALLS. See FUNGI.

PUFF-BIRDS, a family (Rucconide) of tropical American pleiarch birds, resembling kingfishers in form, but living on insects like flycatchers. They are closely related to the harbets.

PUFFER. See GLOBE-FISH.

PUFFIN, a bird of the auk (q.v.) family, common on all far northern sea-coasts, where they breed on remote cliffs in large companies. The Fratercula arctica is the most familiar, being distinguished by the large and greatly compressed beak which is deep, furrowed by three grooves on each side of the mandible. The colors of the beak also add to its singular appearance; this structure being colored bluish-gray at the base, brown in the middle, and bright red at the tip. A large portion of it is annually molted. The body is short, stout and rounded. These birds excavate burrows in sandy ground, each depositing a single egg of white color in the large cavity thus created, and being slightly by means of their bills. Puffins swim and dive with great ease; their food consisting of the smaller fishes and chiefly the young of the sprats and herrings. They are caught and their flesh is salted for food by the inhabitants of the island and used as a delicacy. The appearance of the bill in these birds has gained for them the British provincial names 'coulter-nose' and 'sea-parrot.' The crested puffin (Lunda cirrhata) has long light yellow plumes rising back of the eyes. Compare AUK; ALBATROSS.

PUG. See DOG.

PUG MILL. See CLAY.

PUGAREE, or PUGREY, a piece of silk, muslin, etc., worn around a hat or helmet in hot climates, the ends being left hanging, to protect the back, head and neck from the sun.

PUGATSCHIEFF, or PUGACHEV, poo'-ga-chel, Yemelyan Ivanovitch, Russian revolutionist: b. Simowisek, on the Don, Russia, probably between 1720 and 1740; d. Moscow, Russia, 10 Jan. 1775. He was leader of a band of robbers in his early youth, served in the Seven Years' War in the Russian, Prussian and Austrian armies successively and on his return to Russia was implicated in a seditionary movement and imprisoned. He escaped and prompted by his resemblance to the murdered Peter III, pretended to be the tsar. The peasantry flocked to his standard and were promised relief from their oppressions. His forces constantly increased and success for a time attended him. With 16,000 men in his army he captured Kazan, the old Russian capital, and moved upon Moscow, where he was betrayed by his followers to Suvorov, captured and taken in an iron cage to Moscow, where he was executed.

PUGET, Pierre Paul, pê-ær pô-zhə, French painter, sculptor and architect: b. Marseilles, 31 Oct. 1622; d. there, 1694. He began his career in art as apprentice to a ship-builder named Roman, who set him to carving the figure decorations for the prow and poop of galleys which the prevailing fashion demanded. At 17, however, he gave up this pursuit and traveled to Italy on foot, visiting Genoa, Florence and Rome and in the latter place entered the school of Pietro da Cortona. This master's influence was always apparent in Puget's painting. In 1643 he returned to Marseilles and to ship-designing. Later he spent six years at Rome in company with a fezillant monk on a commission from Anne of Austria to make drawings of antique monuments. After 1651 he painted pictures for churches of Marseilles, Aix and Toulon; but finally abandoned painting on the advice of physicians. His first work as a sculptor, the caryatides supporting the balcony of the Hotel de Ville, Toulon, is a very fine piece of work being studied from the porters on the quays. These received the praise of Bernini. He pro-
duced two works similarly conceived, 'Hercules Overcoming the Hydra, (now in the Musée de Reuilly)', and 'The Battle of the Cumaean Sibyl', at Vaucouleurs, Normandy. His other works are more in the manner of the Italians of the 17th century, an influence confirmed by another visit at the instance of Fouquet. The fall of that minister put an end to his commission and Puget settled in Genoa, where he sculptured a 'Saint Sebastian and Saint Ambrose' for the church of Santa Maria-in-Carignano and a 'Conception' for the Brignoli, now in the Albero dei Poveri. His natural restlessness induced his return to France, where he became attached to the arsenal of Toulon as decorator of war vessels. But under the patronage of Colbert he resumed sculpture and executed the 'Milo of Crotona,' 'Alexander and Diogenes' (in relief) and later the 'Perseus and Andromeda,' all three at present in the Louvre. The 'Alexander and Diogenes' has been called 'the triumph of picturesque sculpture,' though, as Delacroix has pointed out, its subject is one impossible for sculptural treatment as the ray of Alexander impinging cannot be represented. His architectural works are not numerous, though he erected the church of the Charité and the Capucines at Mar- seilles. Consult Lagrange, 'Pierre Puget, Pénétre, Sculpteur, Architecte' (1868); Emeric, David, 'Histoire de la Sculpture Fran- çaise' (1782); Aquier, 'Pierre Puget' (1903).

PUGET SOUND is a large, irregular inlet from the Pacific Ocean into the State of Washington. The Sound proper begins at the junction of Puget Sound and Georgia Strait and extends south, dividing into two main branches, the eastern one called Admiralty Inlet, and the western Hood Canal. Some of the largest Sound inlets on the east shore are Elliot, Poverty and Commencement bays; on the west shore, Dogfish Bay and Dye's Inlet, and on the south shore, Cerris, Budd and Tot- ten inlets. The area of this great landlocked body of water is about 2,000 square miles. It has a number of islands, Vashon and Bain- bridge being the largest. A number of rivers, having its source in the Cascades, flow into the Sound, the principal river inlets are Duwamish, Nisqually, Nooksak, Puyallup, Skagit, Skokomish and Snohomish. The Sound has a number of large and safe harbors and many miles of deep-water front, and is mostly navigable by large vessels. The waters teem with fish; 95 varieties of food fish have been found. The shores are well-wooded, although there has been extensive lumbering in the surrounding forests. Shipbuilding is a young and growing industry. The commercial tonnage entering exceeds 2,000,000. A canal is be- ing built to connect with Lakes Washington and Union. The cleared lands in the vicinity make most productive farms. Seattle, Tacoma and Port Townsend are the largest cities on the Sound; all natural conditions exist for an ex- tensive commerce.

PUGET SOUND, College of, a coeducational institution at Tacoma, Wash. It was organized in 1903 under the auspices of the Methodist Episcopal Church as the University of Puget Sound, and was reorganized under its present name in 1914. It has a college prepa- ratory grade leading to its college grade and schools of liberal arts, law, home economics, commerce, education, music and art. Its normal course is approved by the State Board of Education and it conducts a six-weeks summer normal school. The college owns seven and one-half acres of ground in the heart of the city and has excellent buildings. The total enrolment in 1918 was about 400, of whom 18 were with the colors. The president in 1918 was E. H. Todd.

PUGHE, pū, William Owen, Welsh antiquary: b. Tyn y Bryn, Merionethshire, 1759; d. 1835. Going to London at 17 he there met the Welsh literary student Owen Jones, and the two published in 1795 the poems of Daiflyd ap Gwilym, a 14th century bard. They subsequently edited other Welsh poems, and, assisted by Edward Williams, published the 'Myvryian Archaiology of Wales' (1801-07). Pughe edited also 'The Welsh and English Dictionary' (1793-1803); the 'Cambrian Biography' (1803), etc. He accomplished not a little in arousing interest in Welsh language and literature.

PUGILISM. See BOXING; PRIZE FIGHTING.

PUGIN, pū'jin, Augustus Charles, English architect and draughtsman: b. Nottingham, 1762; d. London, 19 Dec. 1832. He settled about 1798 in London, where for many years he was assistant to the architect Nash. He subsequently devoted his attention to medieval architecture, and published 'Specimens of Gothic Architecture selected from various Ancient Edifices in England' (1821-23). With John Britton he published 'Architectural Illustrations of the Buildings of London' (1824). Later works were 'Specimens of the Architectural Antiquities of Normandy' (1825-28) and Le Keux; 'Gothic Ornaments selected from various Buildings in England and France.'

PUGIN, Augustus Welby Northmore, English architect: b. London, 1 March 1812; d. Ramsgate, Kent, 14 Sept. 1852. He early displayed skill and facility in architectural drawing and acted as assistant to the Gieves, painting scenery for Covent Garden and Her Majesty's Theatre. His taste for Gothic art was turned to account in designing the furniture for Windsor Castle, and in supplying Messrs. Rundell and Bridge with designs for medieval plate. He became a convert in 1834 to Roman Catholicism, and devoted himself thenceforth to the illustration and revival of Gothic architecture in connection with the Roman Catholic Church. His treatise 'Gothic Furniture and Iron Work' appeared in 1835, and attracted attention. In the following year he published 'Contrasts, or a Parallel between the Noble Edifices of the 14th and 15th centuries and Similar Buildings of the Present Day,' in which he expressed in no measured terms his views as to the decadence of ecclesiastical architecture. Other works of Pugin were 'The True Principles of Pointed or Christian Architecture' (1841); 'An Apology for the Revival of Christian Architecture' (1843); 'The Glossary of Ecclesiastical Forms' (1844). He was employed by Sir Charles Barry in the decoration of the houses of Parliament, and was connected with Hardman of Birmingham in the manufacture of the renowned Gothic brass-work, besides having a share in the manufacture of stained glass in the
same town. Latterly his intellect gave way, from the incessant excitement and labor to which it was subjected, and he was removed to an asylum.

PUISNE (pūnē) JUDGE, in law, a former term for a younger or inferior judge.

PUJC, Arsène Paulin, American legislator: b. Detroit, Mich., 4 Dec. 1861. He was educated in the public and private schools of Lake Charles and was admitted to the bar in 1886, since when he has been engaged in practice at Lake Charles. He was a member of the Louisiana Constitutional Convention of 1898 and in 1903-13 served in Congress. He was chairman of the committee on banking and currency in 1912, and also chairman of the sub-committee which made the *money trust* investigation in that year. He was chairman of the district board under the Selective Service Act of 1917.

PUKET, poō-kē’t, or TONKA, a port of Lower Siam, the chief town of Junk Ceylon or Salang Island, on the west coast of the Malay Peninsula. The town is on the east coast of the island, the entrance to a wide and deep harbor. It is the seat of the commissioner of the west coast. Its importance is due to its valuable tin mines yielding an annual average of 3,500 tons. Pop. est. 25,000.

PULANGUI, poō-lāng’gē, river of the Philippines, the upper part of the Grande de Mindanao. See MINDANAO, GRANDE DE.

PULASKI, pu-lā’skē, Casimir, COUNT, Polish soldier of the American Revolution: b. Lithuania, 4 March 1748; d. Savannah, Ga., 11 Oct. 1779. He studied law, served in the army under Charles, duke of Courland, and in 1769 engaged with his father and brothers in the uprising against King Stanislaus Augustus. He commanded the insurrectionists for a time after the death of his father and brothers and in 1771 made an unsuccessful attempt to capture the king at Warsaw which resulted in a sentence of outlawry being passed upon him. Further resistance was soon rendered useless by the coalition of Russia, Austria and Prussia, and Pulaski made his escape to France where he met Franklin and offered his services to the cause of American independence. He obtained letters from Franklin to Washington and in 1777 joined the army of the latter as a volunteer. He performed distinguished service at the battle of Brandywine and received from Congress promotion to the rank of brigadier-general in command of a division of cavalry. He resigned his command after five months, joined the main army at Valley Forge and received permission from Congress to organize an independent corps of cavalry and light infantry which became known as Pulaski's Legion. In 1779 he marched with his men to join General Lincoln in South Carolina where he performed effective service. In the siege of Savannah he commanded the French and American cavalry and in an assault on 9 October was mortally wounded and was carried on board the United States brig. He died at sea. The body was brought to Savannah harbor where he died two days later. Consult Griffin, 'Count Pulaski' (1910).

PULASKI, Tenn., town and county-seat of Giles County, on Richland Creek 78 miles by rail southwest of Nashville on the Louis-ville and Nashville Railroad. The Martin Female College and the Massey School for Boys are situated here. It is a well-built town with a central square; is situated in a prosperous agricultural and stock-raising district; and has planing mills and an ice plant and manufactories of tobacco. Pop. 2,928.

PULASKI, Va., town and county-seat of Pulkaski County, 50 miles, direct, southwest of Roanoke, on the Norfolk and Western Railroad. It is a growing town with a considerable business as a mountain resort. The district is rich in zinc and iron ores and coal; and there are manufactures of iron and zinc and a sulphuric acid plant. Pop. 4,807.

PULASKI, Wis., a village of Brown County, northwest of Green Bay, the seat of the Polish Franciscan Monastery of the Assumption of the Blessed Virgin and of Seraphic College. Pop. 450. See POLISH FRANCISCANS IN AMERICA.

PULASKI, Fort. See Fort PULASKI.

PULCHERIA, pūl-kēr’ē-a, Byzantine empress: b. 399; d. 453. She was the daughter of the Emperor Arcadius, upon whose death in 404 she became co-ruler with her brother Theodosius II, who was crowned emperor and reigned with the reins of power in her hands. With her two younger sisters she took the vow of virginity, as she was determined that there should be no contests between three husbands for the empire. She condemned the Nestorian and Eutychian heresies and was on the friendliest terms with Cyril of Alexandria, Pope Leo the Great and other great men of the time. She was a fine scholar, earnest in her devotion to the Church and active in promoting the welfare of her subjects. She arranged the marriage of her daughter and after the marriage of his daughter with Valentian III, she retired for a time from the court. On the death of Theodosius, however, in 450 she again assumed the throne, for state reasons was absolved from her vow of virginity and married the general Marcian whom she raised to the throne as her colleague. After her death she was canonized and her feast is still celebrated in the Greek Church.

PULCI, Luigi, loo’jē pool’chē, Italian poet: b. Florence, 15 Aug. 1452; d. Oct. 1497. He came of a family in which poetical talents were hereditary, and had two brothers who were also poets, Bernardo, who wrote elegies on Cosimo de’ Medici and translated Virgil’s Eclogues, and Luca, who composed stanzas on the Tournament of Lorenzo de’ Medici. Luigi far surpassed his elder brothers in talent, and became an intimate of the household of Lorenzo the Magnificent. At the instance of Lucrezia Tornabuoni, mother of Lorenzo, he composed an epic poem, 'Il Morgante Maggiore,' based on the tale of Sigismond, and recited it, canon by canto, at the table where such men as Poliziano, Ficino, Michelangelo Buonarroti, and Cristoforo Landino gathered. This fact accounts for the diversity of its contents both in respect to the subject matter and the spirit in which it is handled. He assumed the title of Prince of society as the time of its composition, and inserted at will or to suit the changeable temper of his audiences passages of moving pathos or sincere devotion amid others of coarse buffoonery and broad humor. He fell in with
the general Italian tendency of treating the
Carlovingian legend with less seriousness than
did Northern peoples, but he infused a specially
bourgeois spirit by his use of many words of the
Tuscan dialect. It has been asserted that
Shakespeare's familiarity with Pulci is evi-
denced in his creation of Iago and Othello, the
Byron was a confessed admirer, and translated
the first canto of 'Morgante Maggiore' which he
published with 'Beppo' and The 'Vision of
Judgment.' See MORGANTE MAGGIORE; PUNCH-
CHILLO.

PULCHINELLO, pûl-chîn-êl'o. See PUNCH-
CHILLO.

PULILAN, pû-lîl'ân, Philippines, pueblo,
province of Bulacán, Luzon; on the Quíñega,
five miles above its junction with the Grande
de Pampanga, eight miles northwest of Bu-
lacán, the former provincial capital. Pop.
10,100.

PULITZER, pûl-it'sér, Joseph, American
journalist: b. Budapest, Hungary, 10 April
1847; d. Charleston, S. C., 29 Oct. 1911. He
came to the United States in 1864 and joined a
Federal cavalry regiment, serving till the end of
the Civil War; then became a reporter on the
'Western Post,' which Carl Schurz had
made the leading German newspaper in Saint
Louis. Beginning upon the lowest round of a
journalist's career, and at first enduring con-
siderable hardship, he rapidly won recognition
and rose to the position of managing editor and
chief proprietor of the paper. In the mean-
time he had acquired a knowledge of law, had
been admitted to practice and been active in
politics in the Republican ranks. He was
elected to the Missouri legislature in 1869, was
delegated to the convention of the Liberal
Republican party at Cincinnati, which nominated
Horace Greeley for President, then became a
Democrat and in 1874 was a member of the
Missouri State constitutional convention.
In 1876-77 he was Washington correspondent
for the New York Sun, and in 1878 bought the
Saint Louis Dispatch and united it with the
Evening Post as the Post-Dispatch. In 1883 he
purchased the New York World, soon building
up a large circulation. He was elected to Con-
gress in 1885-87, but resigned after a few months.
In 1887 his health was broken, due to overwork, and was followed by
a steady loss of eyesight until he became totally
blind. He was offered the editorship of the World but
again declined. His health was so poor that he
was advised by medical authorities to take a
long sea voyage. He accepted the offer of
Henry James to join him in a trip to Europe and
South America, but the health of the latter
proved so precarious that at one time he was
brought to the verge of death. For several years he
lived in the South of France, and it was a
relief to him when he heard that he could
return to the United States. He was a man of
strength and courage, and was possessed of
many pleasant and valuable qualities. He
rarely judged the human heart, but rather
tried to judge its actions. He is the
founder of The World, and for a
number of years was its publisher. He left
$2,000,000 to endowed scholarships.

PULLEY. A mechanical device for the
duplication and reduplication of the intensity of
a force. By its application the power exerted
may overcome a resistance much greater than
itself, through a sacrifice of velocity.

PULKOVA (pûl'kô-vâ) OBSERVA-
TORY, in Russia, founded by the Tsar Nicho-
las, and built in 1835-39, is at the village of
Pulkova, lat. 59° 46' 18" N. and long. 30°
19' 40" E. It was intended for the study of
sidereal astronomy. The chief instrument, the
refractor, with a 15-inch aperture, was not
equaled by any other like instrument in the
world, until 1870 when the Newhall Observa-
tory in Newcastle, England, secured a
24-inch refractor. Next came the 26-inch re-
fractor for the Naval Observatory (q.v.) in
Washington, D. C. In 1885 the Pulkova Ob-
servatory erected a 30-inch refractor made by
Clark and Sons of Cambridgeport, Mass. The
determinations of star places made at this
observatory are regarded as most accurate and
its investigations cover a wide field. The ob-
servatory is not only doing remarkable original
research; but it is also a training school for
astronomers and geodesists.

PULLEN, Henry William, English Angli-
can clergyman and author: b. 29 Feb. 1836; d.
26 Dec. 1903. He was educated at Marlborough
and Cambridge, took orders in the English
Church, became a minor canon of York in 1862,
and was minor canon of Salisbury, 1863-75.
He became chaplain of the Alert during its
Arctic expedition of 1875-76, and for his
services on that voyage was awarded the Arc-
tic medal. He attained a sudden fame by the
publication in 1870 of the brilliant 'Flight at
Dame Europa's School,' of which 193,000
copies were sold and 14 translations made.
He also wrote 'Modern Christianity, a Civilized
Heathenism' (1872), the circulation of which
reached 20,000 copies; 'The Ground Ash, a
Public School Story' (1873); 'The Council of
Canterbury' (1882); 'The House That Baby
Built' (1874); 'Pueris Reventia' (1893);
'Venus and Cupid' (1896); 'Fred and Fritz'
(1898). He edited Murray's 'Handbooks to
Italy, Rome and Greece' (1886-96).

PULLEY, a mechanical device for the
duplication and reduplication of the intensity of
a force. By its application the power exerted
may overcome a resistance much greater than
itself, through a sacrifice of velocity.

---

In its simplest form it consists of a wheel of
wood or metal which turns on a smooth axle
attached to a supporting frame, usually in the
form of a block. The rim of the wheel is
grooved on its outer face so as to allow a rope,
cord or chain to pass around it. Its principle
of action was first enunciated by Stevin, about
1601, based on the fact that the tension of a
rope is the same at every point of its length.
Theoretically a fixed peg in the position of the axis of the pulley would serve the purposes defined just as well as a wheel. The latter is introduced for the specific purpose of reducing the friction.

In the single fixed pulley, Fig. 1, to satisfy the condition of static equilibrium, the tension of the rope must be the same on both sides of the wheel, therefore, the power applied is equal to the weight, and although no mechanical advantage is gained by its use, it serves to change the direction of the force applied. Incidentally, it loads the beam with twice the amount of that force.

In the single movable or free pulley with parallel cords, Fig. 2, as in the fixed pulley, the tension of the rope on both sides of the wheel is the same; but, since the weight is supported by two upward forces each of which is equal to the force applied, the power is equal to one half the weight, the beam supporting the other half. In other words, the power that will lift a given weight by the use of a single fixed pulley will lift twice that weight by the employment of a free pulley.

Fixed and free pulleys may be combined in various ways to obtain a mechanical advantage. In the combination shown in Fig. 3, the tension on the beam at (a) is equal to the power applied, and at (b) it is equal to twice that power; but the relation of the power to the weight remains the same as in case of the single free pulley.

If, however, the supporting cords pull at an angle (2 $\phi$), Fig. 4, the pulley is acted upon by three forces—the weight (w) acting vertically downward, and two equal forces ($p \cos \phi$) acting upward. The resulting effect, $2p \cos \phi = w$, shows a mechanical disadvantage, since the power required increases with the angle, and $p = \frac{1}{2}w$, as shown by Figs. 2 and 3, only when $\phi = 0^\circ$, that is, when the strings are parallel. When $\phi = 60^\circ$, the power is equal to the weight; and when $\phi = 90^\circ$, or $2 \phi = 180^\circ$, an infinite amount of power would be required to draw the rope out horizontal.

Combinations of pulleys or compound pulleys are usually arranged according to one of the three systems represented by Figs. 5, 6 and 7, which indicate the action of the supporting forces.

In the first system, Fig. 5, five independent pulleys are supported by an equal number of branches from the main cord. The mechanical advantage stated in terms of weight (w) and power (p) is $w = 5p = 32p$; or in general $w = 2n$ p, when (n) represents the number of pulleys.

In the second system, Fig. 6, the weight is
supported by the four forces, \( p + 2p + 2p + 2p = 15p = (2^2 - 1)p \), or in general, 
\[ w = (2^n - 1)p. \]

The differential pulley is made up of two pulleys of slightly differing diameter, so fastened together that they act as one. An endless chain passes around both, and in one of the bights is a movable pulley: the other bight is used to operate the pulley. As the chain is hauled down from the larger pulley it hoists the chain on the other side, but at the same time the nearer chain on the smaller pulley is unwinding, so that the lifting bight is lessened in length very slowly. The closer the two fixed pulleys approximate the slower the lift, and the greater the power—usually 1 to 60.

The term pulley is used in quite a different sense when applied to the belt-wheels used in power transmission (q.v.). The many formulas given for calculation of their dimensions vary indefinitely with the material of which the pulley-wheel is made, the material and thickness of the belt, and the volume of power transmitted. The width of face of such a wheel is from one-eighth to one-fourth wider than the belt, whose width is determined by the power. In the case of shifting belts the pulley-wheels have a flat face, but otherwise they are slightly crowned, from one-ninety-sixth of the width of the face to as much as one-tenth of such width—as advocated by different authorities. The relative speed of any two pulleys carrying a given belt is inversely as their diameters. To vary the speed at will "step" or "cone" pulleys are in use, the smallest wheel on the driving cone being opposite the largest wheel on the driven cone—and vice versa. Consult Collins, H. E., "Shafting, Belting and Rope Transmission" (New York 1914); Goodeve, T. M., "Prin-
PULLMAN — PULSE

Formerly in cases of asphyxiation, morphine poisoning, drowning, or electric shocks, efforts to restore respiration consisted in laying the patient on his back and alternately pulling his arms over his head and forcing them down upon his chest, thereby causing an expansion of the lung cavity, and then compressing it, thus first producing artificial breathing. In such cases it became necessary to force the patient's mouth open and pull out his tongue, thereby affording free passage for the air, which alternately was drawn into the lung cavity and immediately expelled. This process is superseded by the application of the pulmotor, which operates as follows: An iron cylinder 3½ × 21 inches contains the oxygen at a pressure of about 2,250 pounds when completely filled and will operate the pulmotor 40 minutes continuously. This life-sustaining gas also furnishes the energy which is required to induce breathing in the following manner: The oxygen from the tank flows through a reducing valve, which at the outlet side maintains a pressure of about 75 pounds, and from there to the controlling valve. Initially, the passage to the lungs is open through this controlling valve. The latter connects two flexible braided copper tubes, leading to a metallic cap with a rubber rim, which closely fits the patient's face. The patient's tongue is drawn down over the lower jaw and under the mask, by means of a set of tongue forceps which is provided. The oxygen then has free access to the lungs.

When the pressure in the lungs has reached a certain value, 20 centimeters, a bellows inter-connected with the lung cavity through the flexible braided copper actuates the controlling valve. The pressure of oxygen is now directed so as to create a suction over the connections which lead to the lungs, thereby causing exhalation of the gases previously forced into the lungs. When a vacuum of 25 centimeters is reached in the lungs and bellows, the outer atmosphere acts on the latter, which in turn operates the controlling valve and again admits the oxygen to the lungs. The frequency of these reversals depends upon the size of the lung cavity, a larger space requiring greater time, while with smaller lung cavities the operation is correspondingly more frequent. This process is continued until the patient shows signs of natural respiration. The pulmotor action is then discontinued and the patient is allowed to breathe the pure oxygen through another small face cap connected by a hose directly to the oxygen tank.

PULP. See PAPER.

PULSE (from Latin, pulsus, a beating), the rhythmical motion of an artery, with alternate expansion and contraction, in practice considered as a beating. This motion is in the heart (q.v.), which is the centre of the arterial system; and from that organ it is propagated through all the minutest branches of the arteries. In those which lie immediately under the skin it can be felt with the finger, as is the case with the radial artery, the pulsation of which is very perceptible at the wrist. The state of the pulse is therefore an indication of the action of the heart and the whole arterial system and of the condition of the blood and the physical functions in general. The circum-

PULLMAN, George Mortimer, American inventor; b. Chautauqua County, N. Y., 3 March 1837; d. Chicago, Ill., 19 Oct. 1897. He learned the cabinetmaker's trade, and during the construction of the Erie Canal he successfully filled contracts for removing various large buildings in its proposed route. He then settled in Chicago and engaged in building, but devoted much time to the problem of making long railway journeys less tedious, the result being the conversion of two ordinary railway coaches into sleeping cars. They were a success and created a demand for more, and in 1863 he built the "Pioneers" at a cost of $18,000, which was the first of the cars which have since borne his name. He organized in 1867 the Pullman Palace Car Company, of which he was president, and in 1889 originated the vestibule train. He amassed an immense fortune, founded a model town near Chicago, which he named Pullman (q.v.), and was interested in various other large commercial enterprises.

PULLMAN, Ill., a former town, now part of the city of Chicago, on Lake Calumet, 12 miles south of the centre of Chicago. It was founded in 1880 by George M. Pullman, and intended especially for the benefit of the employees of his company. Besides the Pullman Palace Car Company, which is located here, there are car wheel works, a foundry, and other industrial establishments. It was formerly under the government of the Pullman Company, but in 1889 the town voted for incorporation with the city of Chicago (q.v.).

PULLMAN, Wash., city in Whitman County, near the eastern border of the State, 70 miles north of Walla Walla, on the Northern Pacific, the Oregon-Washington and the Navigation Company's railroads. The State Agricultural College and School of Sciences are located here as well as a United States Government Experimental Station. The surrounding district produces grain and livestock and dairying also is carried on. The water supply is from artesian wells. The town is growing steadily. Pop. 2,603.

PULMONATA, an order of non-marine gastropod mollusks, characterized by breathing atmospheric air; the snails. They are usually small, asymmetrical, and provided with a shell. The sexes are always united in the same individual, and the operculum is always wanting, except in Amphiblea. The respiratory apparatus, which seems to have been modified from that of ancestors who breathed oxygen mixed with water, by means of branchiae, is not lung-like in structure; it is simply a pouch lined with blood-vessels, and is properly called a pulmona.

PULMOTOR, a machine invented by Bernard Draeger for producing artificial respiration. It was first used in Europe in connection with mine rescue apparatus. Later it was used by the United States Bureau of Mines in similar work. It was employed so satisfactorily in resuscitating after all kinds of suffocation, such as asphyxiation from gas, electric shock and cases of apparently drowned, that large gas and electrical companies have installed them; also many hospitals and fire and police departments.
stances to be attended to in the pulse are either the number of pulsations which take place in a given time and the regularity or irregularity of their occurrence, or the character of each pulsation. In the former case the pulse is said to be quick or slow according to the number of pulsations in a given interval; regular or irregular, as they occur at equal or unequal intervals. In the latter case it is strong or weak, hard or soft, full or small. It is affected by the age, sex and temperament of the individual, and by accidental circumstances, as sleep, food, exercise, heat.

The pulse is most rapid in infancy, making from 110 to 140 beats per minute. During early childhood it makes from 100 to 110 and is regular and rather soft and small. In youth it is much slower, making from 80 to 90 beats per minute. At this period it is regular, strong, rather soft than hard, moderately full. In mature age the number of beats is on the average about 75 per minute and the pulse is regular, strong, or moderate, fluctuating between hard and soft, between full and small. In old age the number of beats sinks to about 60. In the female the pulse is more rapid, softer and smaller than in the male. In persons of a sanguine temperament it is quicker and fuller than in phlegmatic individuals. Sudden agitation and violent passions make the pulse rapid and irregular; joy makes it quick and strong; long-continued grief, languid and soft. The pulse is, therefore, a highly important indication of the state of the system. A deviation from the regular pulse of an individual indicates a disordered state. When the irritability of the system is so heightened as to produce fever or inflammation the pulse is accelerated. If the action of the nervous system is irregular, or unduly heightened, the pulse becomes frequent and irregular. In case of mechanical obstructions to the circulation, as in dropsy of the pericardium, polypus in the heart or in the great arteries, the pulse is irregular and interrupted.

The study of the pulse began with the ancients. Galen wrote several works on it and for several centuries the subject of pulsation remained much as he left it. The demonstrations of the circulatory system by Harvey and of the irritability of the muscular fibre by Haller threw new light on it, and medical science at last has brought it under full investigation and has explained it in all its physiological aspects. See Artletees, Diseases of the Heart.

PULSE GLASS, an instrument invented by Franklin to exhibit the ebullition of liquids at low temperatures. The bulbs are connected by a slender stem and partially charged with water, the supernatant air having been expelled by heating and the opening hermetically sealed by a blow-pipe. By grasping one of the bulbs the heat of the hand will cause the formation of vapor and drive the liquid into the other bulb, producing a violent ebullition in the latter.

PULSOMETER. See Pumps and Pumping Machinery.

PULSZEKY, pülts'ke, Franz Aurelius, Hungarian archaeologist and publicist: b. Eperies, 1814; d. Budapest, 1897. When only 22 he was nominated to membership in the Archaeological Institute of Rome. Joining the Liberal party under Kossuth he was elected a deputy to the Hungarian Diet in 1840 and later under-secretary to the Hungarian Prince Esterhazy, Minister of Foreign Affairs in Vienna. He followed Kossuth to England and after the catastrophe of Villagaz accompanied the ex-dictator to America. The ideas he embodied in a book entitled 'White, Red, and Black.' Condemned to death by his country for treason, he lived in Italy and joined cause with the Garibaldins. The sentence was removed in 1866; in 1872 he was appointed general of musketeers and public libraries. He wrote 'Philosophy of Hungarian History' (1882); 'My Life and Times'; and 'The Jacobins in Hungary' (1887).

PULT, pült', Joseph Hippolyt, American physician: b. Meschede, Westphalia, Germany, 6 Oct. 1816; d. Cincinnati, Ohio, 20 Feb. 1884. He took his M.D. at the University of Hamburg and in 1834 came to the United States where he engaged in practice at Cherrytown, Pa. He then adopted homoeopathy and later established himself in practice at Cincinnati. With others he founded the American Institute of Homoeopathy in New York in 1844; and in 1872 he was instrumental in establishing a homoeopathic college in Cincinnati, where he held the chair of clinical medicine. He also held that chair at the Homoeopathic College at Cleveland in 1852 and of obstetrics in 1853-55. He edited the American Magazine of Homoeopathy and Hydrotherapy in 1852-54 and the Quarterly Homoeopathic Magazine in 1854. Author of 'The Homoeopathic Domestic Physician' (1850); 'A Reply to Dr. Metcalf' (1851); 'The Science of Medicine' (1852), etc.

PULTENNEY, pült'n'e, William, Earl of Bath, English politician: b. London, 22 March 1664; d. there, 7 July 1764. He was educated at Oxford, and in 1705 entered Parliament. He was a partisan of Walpole, and after the accession of George I was made privy councillor and secretary of war, 1714-17. In 1725 he became a political opponent of Walpole, gained great popularity by his crusade against his former friend, and when Walpole resigned, when Walpole resigned, from the ministry in 1742 Pulteney organized under the Earl of Wilmington a new ministry. The public was disappointed in the cabinet, and his acceptance of a peerage further destroyed his popularity. As member of the House of Lords he was not prominent, and when appointed premier in 1746 he held office but two days, being unable to form a cabinet.

PULTOWA, pool'tólva, or POLTAVA, Ukraine, (1) capital of a former Russian government; on the Vorskla River, 430 miles southwest of Moscow. It is walled and defended by a citadel on a small eminence. It is the commercial centre of a large farm and stock-raising region. The annual fairs, three in number, are of less importance than in former years. In 1709 Peter the Great defeated the Swedes under Charles XII. A monument in the principal square commemorates the event; and three miles from the town is the tomb of those who fell in this battle; it is still called the Swedish tomb. Pop. about 85,000.

(2) The government is bounded on the north by Tchernigov, on the east by Kharkov, on the south by Ekaterinoslav, and on the west by Kiev; area, 19,205 square miles. The surface is a plain sloping from the northeast to the
southwest, and drained chiefly by the Dnieper and its tributaries. It is one of the most fertile and best cultivated departments of Russia; it exports about one-fourth of the whole produce of wheat, oats and barley of the whole country. Tobacco is increasing in acreage. Stockraising and bee-keeping are given much attention. Manufacturing is limited; the chief products are leather, coarse woolen goods, brandy and saltpeter. Oil is made from the seed of the sunflower and of flax. Pop. about 3,000,000.

PULTUSK, pool'took, Russian Poland, town in the government of Lomza, on the Narev, about 32 miles north by east of Warsaw. It has several old buildings of historic interest, some manufactories and considerable trade. It is noted as the scene of the defeat of the Saxons by Charles XII, in 1703, and of the Russians by the French in 1806. Pop. est. 16,000.

PULU, a substance resembling fine silk, of a rich brown color and satin lustre, used largely as a stypic by the medical practitioners of Holland, and introduced into some other countries for the same purpose. It consists of the fine hairs from the stipes of one or more species of tree-fern, referable, to the genus Cibo-•hium. It was exported from Hawaii into Britain first in 1844, under the name Pulu, or vegetable silk, and was proposed as a substitute for silk in the manufacture of hats, but could not be applied. In 1856 it was exported from Singapore under the Malay names Penghawar Djambi and Pakoe Kidang; and was said to have been used in Dutch pharmacy for a long period as a stypic. Several importations into western Europe have since taken place.

PULVERMACHER-CHAIN, a form of galvanic battery consisting of a series of small wooden cylinders on which a zinc and a copper wire are coiled side by side, but without touching each other; the zinc of one cylinder, touching the copper of the adjacent one, forms a couple. The whole is immersed in vinegar diluted with water. A chain of 120 couples forms a very powerful battery.

PUMA, or MOUNTAIN LION. See Cougar.

PUMICE, a variety of lava of a porous and fibrous structure, resembling that of a sponge in appearance, containing from 60 to 75 per cent of silica, with alumina, iron, lime, soda, etc. It varies in color from whitish-gray to yellowish-brown and will float in water. It is essentially lava from which steam or gas has escaped in large quantities while it was being consolidated, the bubbles rendering it highly porous. It results from explosive volcanic eruptions. Its extreme roughness fits it for use in polishing. In the solid state it is used to polish paint, wood, metal, etc.; and, as a powder, for marble, ivory, bone, glass, and in the composition of tooth-powder. Pumice may be considered because of its glassy composition as a porous variety of obsidian (q.v.). Pumice is obtained in Mexico, Iceland and Hungary, but chiefly from the Lipari Islands.

PUMPelly, Raphael, American geologist: b. Owego, N. Y., 8 Sept. 1837. He was educated at the Owego Academy, and later studied sciences and mining engineering in Paris and at Freiberg, Saxony. He made geological investigations in Corsica, and after his return to the United States in 1860 visited Arizona, and in 1861-63 was engaged in scientific explorations under the government of Japan. In 1863-64 he made a private investigation tour through central, western and northern China and Mongolia, and in 1864 engaged under the Chinese government in examining the northern coal fields. In 1866-73 he was professor of mining at Harvard, State geologist for Michigan in 1869-71; and in 1871-73 directed the State geological survey of Missouri. He was appointed to the United States geological survey in 1879-81, 1884-91, in charge of the tectonic and physiographic division, and was organizer and director of the Northern Transcontinental Survey in 1881-84. The development of the iron ore industry in Michigan and western Ontario was largely due to his investigations in 1867-1901. In 1903 he explored the Transcaspian country. He has published 'Geological Researches in China, Mongolia and Japan' (1866); 'Iron Ores and Coal Fields of Missouri' (1873); 'Geology of the Green Mountains' (1894); 'Explorations in Central Asia' (1905); 'Pre-historic Civilization of Anan' (1908), etc.

PUMPERNICKEL, a coarse brown bread, originally made in Germany from unboltered rye. It is baked in large square loaves. Its proper manufacture depends upon the treatment of the dough, which must contain neither yeast nor leaven, and also on the management of the oven in which the batch must remain a long time.

PUMPKIN, any of the several annual vine-like herbs, especially Cucurbita pepo, of the order Cucurbitaceae, probably of tropical America, but not known in a wild state. It is a coarse tendril-bearing vine frequently exceeding 20 feet in length, with prickly stems and leaf stalks; bears large rough leaves; large yellow flowers, the pistillate being followed by large variously colored but generally yellow fruits, with hard rinds, thick flesh and many seeds. The plant is widely cultivated in warm and temperate countries for its fruits, which range in weight from 10 to 40 pounds but in some varieties weigh far more. They are largely used for stock feeding and for making pies. The cultivation is essentially the same as for squashes; but in America the plants are most frequently grown in corn fields, the seeds being sown at intervals of about 12 feet and the plants allowed to shift for themselves after the corn is laid by. It is affected by the same insect enemies as the squash (q.v.).
