6. THE AMERICAN REVOLUTION (DIPLOMATIC CONDITIONS DURING THE WAR AND THE PEACE NEGOTIATIONS). Attempts to enter into relations in some form with foreign powers are to be found in the very early stages of the existence of the United States. In November 1775 Congress appointed a committee to correspond with other powers in other parts of the world and this committee very soon came into communication with agents of the French government, sent to observe conditions in the colonies. Early in 1776 this committee appointed Silas Deane as their agent to go to France for the purpose of obtaining military supplies and by the last of July he had been admitted to an interview with Vergennes, the Minister for Foreign Affairs, and had been put into connection with Beaumarchais, through whom, with the connivance of the government, important supplies of war were furnished. Deane had been instructed to inform Vergennes that France had been selected as the first power to whom this application should be made "from an opinion that if we should... come to a total separation from Great Britain, France would be looked upon as the power whose friendship it would be fittest for us to cultivate."

After the Declaration of Independence, France and Spain, as powers most unfriendly to England, were still courted with the greatest diligence, but ministers or plenipotentiaries were also commissioned from time to time to the other courts on the Continent. From none but France and Holland, however, was recognition obtained, and from only these two was any official aid or countenance given before the conclusion of peace. Holland's recognition, as extended just before the completion of the peace negotiations and Spain, though refusing to recognize the United States in the early days of the struggle, afforded a limited amount of financial assistance. In many regions of Europe among the people and at several of the courts, there was a disposition friendly to the American cause, but in no case was this disposition serious enough for practical purposes to lead the governments away from the path of strict neutrality, except in the limited way afforded by the Armed Neutrality.

From the first, the French government had taken great interest in the colonial revolt and, before the arrival of Franklin, had determined for the present to remain nominally at peace with England, but to assist the revolt surreptitiously with just enough energy to keep both sides actively and, if possible, exhaustingly, occupied. In this policy the Spanish government joined and between the two governments 2,000- 000 livres were placed at the disposal of the insurgents in the summer of 1776. In September 1776 Congress adopted a general plan for treaties to be proposed, and joined Franklin and Arthur Lee with Deane as commissioners to lay such a treaty before the French government. The coming of Franklin increased the general popularity of the American cause, but the king was determined to change its attitude for the relations of the proposed treaty, which was concerned largely with commercial relations and provided for no political alliance. Apparently Congress' appreciation of the need for such a treaty and for stronger after the British capture of the mouth of the Hudson and shortly after the meeting of the commissioners in Paris they were instructed to abandon the commercial basis of the proposed treaty and to propose to France and Spain a political connection, offering assistance to France in conquest of the West Indies, and to Spain in the subjugation of Portugal. Little substantial progress was made, however, in this direction till December 1777, when news was received of the surrender of Burgoyne's army at Saratoga. This signal achievement of the Americans entirely changed the face of affairs by reducing the probability of ultimate American success, and within a few days of the receipt of the news the commissioners were informed, in reply to their peremptory inquiry as to the intentions of the government, that the king was determined to acknowledge the independence of the United States and to enter into treaty relations in support of that independence. Accordingly, on 6 Feb. 1778, two treaties, one of commerce, on the most-favored-nation basis, and an alliance, which provided for an intimate political association of the two countries, were signed. The treaty of alliance, which was very different from the original American proposals, stipulated the object of the alliance to be the maintenance of the sovereignty and independence of the United States in government as well as in commerce, provided for mutual aid in case of war between France and Great Britain, agreeing that territory reduced by the United States in the northern part of North America and in the Bermudas should belong to the United States, and that conquests in the West Indies should belong to the king of France, stipulated especially that neither party should conclude peace with Great Britain without the formal consent of the other first obtained, and provided for the continuance of the war with Great Britain till formal or tacit recognition of the independence of the United States by the treaties ending the war. Articles XI and XII provided for a mutual and perpetual guarantee of possessions in the western hemisphere, which was to give serious trouble in the subsequent relations between the two states, and especially the sentiments of the French people, the French government entered into this relation, as was
plainly stated in the announcement to the commissioners of the king's determination to receive the new American government, motives in favor of the Americans, but on the ground that it was manifestly to the interest of France that the power of England be diminished by the separation of the colonies. The popular sentiment for the American cause simply co-operated with Vergennes' aggressive designs on England in opposition to the more prudent suggestions within the government as to the ruinous effect of such an expensive enterprise upon French finances.

Since the Family Compact between the Bourbon kingdoms in 1761, the relations of France and Spain in all matters of external policy had been of the closest alliance, and the French-American treaty of 1778 contained a clause providing for the accession of the king of Spain to its terms. Nevertheless Spain found the general spirit and the precise terms of this alliance not at all to her liking and announced to England that she would be free from any such engagement, and proceeded to offer mediation on terms which would leave England in possession of the Saint Lawrence Valley and the territory northwest of the Ohio, and herself in possession of even all the Alge-

hanies and south of the Ohio. On the refusal of the British government to accede to such mediation, Spain at length, on 12 April 1779, allowed herself to be urged into war with France, an act which happily tended to restrain her from alliance with, or recognition of, American independence. In the meantime, Luzerne, the French Minister to the United States, was trying to persuade Congress that Spain's price for an alliance with the United States, namely, the Floridas and exclusive navigation of the Mississippi, was not too high, and that the accession of Spain to the alliance would be likely to bring about peace speedily. In September of the same year, Jay was sent as United States Minister to Spain with instructions to the purport that if Spain would accede to the treaties with France she should be precocious from receiving the Floridas, and that if she should wrest them from Great Britain, the United States would guarantee them to her, provided that the United States should enjoy the free navigation of the Mississippi, and this provision was laid down as an ultimatum. Jay was further instructed to secure a port on the Mississippi below the 31st parallel. Jay's mission was entirely unsuccessful, even after the change of his instructions, which abated the American claim to navigation of the Mississippi as an ultimatum.

In the meantime, in preparation for any opening that might develop, Congress had been preparing instructions for a commissioner to proceed to the negotiations in France. In addition to recognition of independence, boundaries, substantially such as actually were finally adopted, the Newfoundland fisheries, free navigation of the Mississippi, with a port below the 31st parallel were laid down, at first, as ultimata, with John Adams, appointed as sole commissioner. But in 1781, under the influence of Luzerne, these instructions were revised, by referring to the claims therein indicated as expressing the desires and expectations of Congress, but by leaving the commissioners at liberty to secure the interests of the United States as circumstances might direct and enjoining them to undertake no negotiations for peace without the purely distinct instructions of the French ministers and ultimately to be governed by their advice and opinion. Franklin, Jay, Laurens and Jefferson were joined with Adams as commissioners.

The news of Cornwallis' surrender had so strengthened the hands of the opposition in England that in March 1782 North resigned, and the recognition of American independence was made a condition of acceptance of office by Rockingham. In proceeding to negotiations, considerable difficulty was experienced over the matter of the relation between the recognition of independence and negotiation of other topics. For reasons of his own, Vergennes encouraged the American commissioners in holding out for unconditional acknowledgment as a prior condition to negotiation. In the meantime Jay and Adams became convinced that Vergennes would, for the sake of Spain, as well as in conformity with his own interests, tacitly agree to the American claims in the matter of the western boundaries and of the fisheries. In conscious disregard of their instructions, they independently suggested to Shelburne an arrangement which fully met both the American claims and the negotiations and at the same time allowed him to see that a majority of commissioners present in Paris were willing to proceed in negotiations with Great Britain separately from their ally. Shelburne in his turn stepped into the division of the allies and with Franklin's reluctant consent, preliminary articles, exactly coincident with the treaty signed in connection with the treaties of the other belligerents, were signed 30 Nov. 1782. The arrangement was then revealed to Vergennes, who, at first, indignant at the apparent bad faith, was pacified by Franklin's soothing explanations. As a matter of fact, both Frenchmen and Americans had scrupulously fulfilled the letter of their agreement in everything which had been exactly stipulated and in other matters, each nation equally had acted in accordance with its own views of interest.

The definitive treaty, signed in connection with the treaties between Great Britain and the other belligerents 3 Sept. 1783, recognized in its first article the independence of the several 13 States. The boundaries were, on the west, the Mississippi River south to the 31st parallel; on the south, the 31st parallel from the Mississippi to the Chattahoochee, down that river to its junction with the Flint, thence in a straight line to the sources of the Saint Mary's and thence to the sea; on the north, practically the line of the Lakes and the Saint Lawrence, leaving stretches at the northeast and northwest corners so indefinitely described that much trouble was experienced at these points in later times. Both countries were to have free navigation of the Mississippi. The United States was to enjoy the right of fishing at all places where the inhabitants of both countries used at any time heretofore to fish, and the liberty of drying and curing fish on lands, except Newfoundland, which were unsettled. Creditors on either side were to receive no impediment to the recovery of the full value of debts heretofore contracted. Congress was earnestly recommended to the States to pass acts in relief of the Loyal-
ists. Provision was made for bringing hostilities to a close. By a separate and secret article it was provided that if Great Britain should win back the Floridas from Spain, the southern boundary of the United States between the Mississippi and the Chattahoochee should be the parallel of 32° and 30°. The conduct of this peace has been generally regarded as a remarkable achievement on the part of the American commissioners and its successful outcome is to be attributed not only to the daring statesmanship which disregarded the instructions of Congress, but also to the influence of Franklin in France, and the skill with which appeal was made to the enlightened generosity of the sentiments of the ministry in power in Great Britain.

CHARLES WORTHEN SPENCER, Professor of Political Science, University of Nevada.

7. ARTICLES OF CONFEDERATION.

On 10 June 1776 the Continental Congress appointed a committee to frame an instrument of government. This was entitled the "Articles of Confederation and Perpetual Union." (See CONFEDERATION, ARTICLES OF). It was not until five years later (1 March 1781) that all of the States had finally signed it. The defects of this scheme of government were so numerous and serious that for a time it looked as if the Union would go to pieces. Under such circumstances attempts were made at various times to change the Articles in such a manner as to give more power to the central government in those matters in which it was most seriously hampered: the finances, commerce and power to coin money. In 1781 the Articles was made on 1 Feb. 1781, even before they went into effect. This was known as the Five Per Cent Amendment. Its avowed purpose was to give to Congress the power to levy a 5 per cent ad valorem tax on most articles imported and on all prizes taken on the high seas during the war. The proceeds of this tax were to go toward paying the principal and interest of the debt contracted during the war. Within a year 12 of the States had consented to the passage of this amendment, but Rhode Island refused. As the approval of all States was necessary for an amendment, this naturally failed. On 16 March 1781 Madison submitted a report which recommended giving to Congress the power to coerce the States to fulfill their Federal engagements. This power was to be embodied in an additional article to the Articles of Confederation. This report was referred to a grand committee on May 1781 and reported back by it on 20 July of the same year. On its recommendation a new special committee of three was constituted to prepare an exposition of the Confederation, a plan for "its complete execution and supplemental articles." This committee reported on 22 August and their report is charged from the exposition of the Confederation because such a comment would be voluminous if coextensive with the subject. The committee, nevertheless, made a report on the defects of the Articles of Confederation, and made strong recommendations that many supplemental powers be given to Congress. The committee further advocated that a committee be appointed to prepare representations to the several States of the necessity of these supplemental powers and of pursuing, in the modification of the Articles, one uniform plan. These recommendations, however, came to naught. The matter of the defects of the Articles was taken up from the outside and on 26 Feb. 1783 Pelatiah Webster issued 'A Dissertation on the Political Union and Constitution of the Thirteen United States,' in which he advocated the adoption of very thoroughgoing changes in the Articles. He proposed to divide Congress into two bodies and to give it greater power over the States and over individuals. On 18 April 1783 a Revenue Amendment was introduced into Congress. The object of this was to obtain for Congress the power to levy specific duties on certain articles imported and a 3 per cent ad valorem duty on all other goods at the time and place of importation. The collectors of the duties were to be appointed by the various States and after appointment were to be removable by Congress. The proceeds from the duties were to be applied to the payment of the principal and interest of the debt. Under the same amendment the States were to make provision, during a term not longer than 25 years, for the collection and payment of their proportion of the Federal expenses. In the same connection it was suggested that the basis for the calculation of these proportions be changed from the value of land in each State, as was provided for in the 2d article of the Articles of Confederation, to the number of people in each State. Again 12 States approved of this amendment, but this time New York, having just worked out an elaborate scheme of amendments for the Articles, joined with the other States, refused to ratify it. Alexander Hamilton of New York drew up an elaborate exposition of the defects of the Articles and on 3 June 1783 intended to present it to Congress along with a resolution calling for a general convention to revise the Articles, but he abandoned his project for want of support. On 30 April 1784 another amendment was recommended by Congress. This time Congress asked to have given to it for a period of 15 years the power of forbidding trade with foreign powers having no treaty of commerce with the United States and of prohibiting the citizens of any foreign state from importing into the United States any articles which were not the produce or manufacture of that State. This proposal, so essential in its essence for the government of every country to have in that age of restricted trade, was ratified by only two States and, therefore, failed of adoption. In 1785 another man outside the halls, Noah Webster, put forth, in his work entitled 'Sketches of American Policy,' suggestions for the improvement of the Articles. Like many
other men of the time he recommended a strong executive and giving to Congress the power to coerce the States. About the same time James Monroe introduced in Congress a proposition to change article nine of the Articles in such a way as to confer the power to place retaliatory duties on the products of foreign states that discriminated against the United States. The proceeds of such duties, however, were not to go to the Federal government, but were to go to the State in which they were collected. This proposition was referred on 28 March 1785 to a committee of which Monroe was chairman and on 13 and 14 July of the same year was discussed in Congress, but no action was taken. A similar proposition to that of Monroe's was embodied in the report on trade and revenue presented to Congress by a grand committee on 14 Aug. 1786. Additional proposals in the same report recommended that the States which delayed to pay their proportion of the funds required for the running expenses of the Federal government should have to pay fines in addition, that in States which made no provision for collecting the sums asked for by Congress the States should have power to step in and order them collected by State officers and in case of necessity appoint officers or agents of its own to collect them, and that States offering resistance to Congress or its agents in making such collections should be considered as violating the Federal compact. Further provisions in this committee report gave Congress the power to introduce new systems of revenue and to make regulations for the finances, and if 11 of the States agreed to such systems or regulations, they were to become binding on all. In addition Congress was to be given the power to institute a court of seven members to try officials of the Federal government and to hear appeals from the State courts concerning the interpretation of treaties or regulations made by the Federal government. On the report of this grand committee Congress took no action. The longer the Confederation existed the more hopeless the chance for a strong central government became. From all sides came expressions of fear and alarm for the Union itself. As early as 1783 Washington, in a circular letter to the State governors, had expressed fear for the Union and declared that there must somewhere be lodged a supreme power to regulate and govern the general concern of the Confederate Republic, or it would go to pieces. Jay, in a letter to Washington in 1786, said: "I am uneasy and apprehensive, more so than during the war." From our former friends in Europe came the disquieting news that they no longer had confidence in our credit. Adams in trying to negotiate a loan in Holland in 1784 was met with expressions of distrust in the stability of the Union—a distrust which the London gazettes had encouraged. As Congress had failed utterly in all attempts it had made to have the Articles amended, help had to come, if it came at all, from some other quarter. Congress had lost the respect of the country through no fault of its own. The most capable of theigail had deserted the cause of the State legislatures. Everything seemed to point to a speedy dissolution of the Union as it existed under the Articles of Confederation, when aid came from an unexpected quarter and quite by accident. This was the Alexandria Convention, called to settle commercial disputes between Virginia and Maryland. From this grew the Constitutional Convention. The new Constitution (q.v.) drafted by that body was ratified by 11 States before Franklin died for its inauguration. On 2 March 1789 the Congress of the Confederation adjourned sine die, and thus brought the government under the Articles of Confederation to an end.

Director of the Division of Archives and History of the University of the State of New York.

8. THE FORMATION OF STATE CONSTITUTIONS. When the resistance to Great Britain first began, independence was not the aim and in consequence only provisional governments were established to temporarily take the place of the English colonial governments which had one by one succumbed or been suppressed. Provisional Congresses or Conventions in the several colonies assumed political control, entrusting the executive function to Committees of Correspondence and of Public Safety. Under these loose revolutionary organizations government was conducted for several months, but as it soon became evident that the contest was to be a prolonged one, there gradually arose a conviction that more regular and permanent forms of government should be ordained. The several colonies turned to the Continental Congress, representing all the colonies, for direction, and this body took the initiative in inaugurating the several State governments. Quite naturally, the first request came from the Provincial Congress of Massachusetts, as in that colony hostilities already had broken out. On 16 May 1775 that body instructed the people to give advice respecting the taking up and exercising the powers of civil government.9 The Congress replied 9 June, recommending that they should call upon the several towns entitled to representation in the assembly to elect a council and the assembly so chosen should elect a council, the two bodies should govern in approximate conformity to the spirit and substance of the colonial charter, until a government of his majesty's appointment should consent to govern according to that instrument. This advice was promptly followed and the government so organized remained in force until 1780, when the first constitution of that State was established. A few months later Newport, Rhode Island, South Carolina and Virginia successively sought guidance with respect to the establishment of their civil governments, and by November Congress advised them to establish as free representation of the people that they may adopt such a form of government as in their judgment would best promote the happiness of the people and most effectively secure peace and good order in the province during the continuance of the war. The movement as a whole, the movement in favor of independence gained adherents, Congress 10 May, in anticipation of the Declaration of Independence, recommended that the colonies that had not already done so
should establish regularly ordained governments. In consequence of this advice, the colonists early agreed that the sovereign and independent State, were shortly inaugurating their first State constitutions.

New Hampshire's constitution was completed 5 Jan. 1776, to be followed by South Carolina on 26 March. Both of these constitutions were incomplete and unsatisfactory, and proved but temporary, as they were replaced by new ones within a few years. Rhode Island and Connecticut retained their colonial charters. The former simply discharged its people from their allegiance to the king by act of the legislature of 4 May, the latter provisionally effected a similar change 14 June, which it made permanent by act of 10 October, at the same time enacting a short bill of rights. Virginia adopted its constitution 29 June, and New Jersey's was proclaimed on 3 July. Thus before the Declaration of Independence seven States had assumed independent governments, and four had drawn up written constitutions. Four other States followed in the same year, Delaware, 21 September; Pennsylvania, 28 September; Maryland, 11 November and North Carolina, 18 December. In the year 1777 Georgia adopted a constitution, and like all the rest, likewise on 20 April. South Carolina's second constitution was promulgated 19 March 1778. Massachusetts continued under its provisional government until 16 June 1780, when its constitution was finally secured a new frame of government, 2 June 1784. Vermont, although unrecognized by the other States, pursued her own independent course, framing two constitutions during this period, those of 1777 and 1786. The first was largely copied from that of Pennsylvania. No other State constitutions were adopted prior to the ratification of the Federal Constitution.

The compact theory, especially as put forth by John Locke in justification of the English Revolution of 1688, was generally accepted in America by the constitution makers of the Revolutionary period. Its principles as explicitly set forth not only in the Declaration of Independence, but as well in the constitutions, were that the people have the natural right to abolish or alter their form of government when in their judgment it has become destructive of their rights. Seven of the constitutions expressly declare that their former relations are dissolved because the king had violated the compact. This served as the basis for the legal defense of their action. Sovereignty, it was commonly held, rested in the people, and from them alone emanated the power to inaugurate a new form of government. But in practice they departed somewhat from this theory. Although in most of the States the people were consulted through their choice of representatives to a provincial convention, which shoulddraft a frame of government, there were several exceptions, as in the case of both the constitutions of South Carolina. Neither was the Virginia Provincial Convention, nor the New Jersey Congress specifically empowered to frame a constitution, but each assumed that they were authorized to act in accordance with the advice of Congress. Again in the framing of the early Revolutionary constitutions that careful distinction that came later to exist between a legislative body and a constitutional convention was not observed.

Owing to the exigency of the times, the Provincial Congress or Convention in each of the States that framed a first constitution, years 1776 and 1777, with one exception, acted not only in the capacity of a constitutional convention, but also assumed the powers of legislation and administration. The one exception was in the Province of Delaware, to whom a convention not only was chosen for the express purpose of framing a constitution, but dissolved upon the completion of that work. None of these constitutions was submitted to the people for their approval, but went into operation at once upon their adoption by the convention. The first State to inaugurate the practice of seeking the sanction of the people upon the work of the framers was Massachusetts in 1778, but the proposed constitution was rejected by the voters. Two years later a constitution which had been drawn by a convention elected for the sole and express purpose of framing a fundamental law, was adopted by the people of Massachusetts. This practice was followed by New Hampshire in the inauguration of its second constitution in 1784.

The State constitutions reveal the continuity in the development of American political institutions and ideals. They have been built upon the oldest things in the political history of America, for they are the continuations and representations of the colonial charters. It is in the colonial charters, especially in the corporate colonies, that we find their prototype. These documents served as the written constitutions of the respective colonies, according to which they were governed. So liberal were those granted to Connecticut and Rhode Island that they served these States respectively until well into the 19th century. But in addition to the charters there were other elements that entered into the State constitutions. The colonists had a century and a half of experience to draw upon, during which their governments had undergone great development and many new features both written and unwritten had been added to their fundamental law. Moreover, at the basis of all their legal ideas was the English constitution and the common law, both of which profoundly and perhaps unconsciously influenced them. They also accepted the prevailing political philosophy of the age, as above indicated—which was derived chiefly from English sources, although no one writer exerted a greater influence upon them than Montesquieu (q.v.) through his 'Spirit of Laws.' Speaking generally the first State constitutions were little more than the pre-existing colonial constitutions adapted to the changed circumstances.

The main features of the constitution consisted of the Bill of Rights (q.v.),—in some introduced by a preamble,—and the constitution proper. Eight of the instruments of this period, if we include Vermont, were prefaced by bills or declarations of rights, and in the other constitutions there were important provisions of this character. The first of these was adopted by Virginia, and was drafted by George Mason. To a considerable extent it served as a model for the other States. In all the bills of rights there were some 100 different provisions. They were a statement of what Americans regarded as the inherent rights of man. While doubtless suggested by the English Bill
of Rights, they were much more comprehensive and explicit than their English prototype, and did more with the rights of the individual. Thus typical provisions are the declaration that "all men are born free and equal" and are to be protected in their personal and property rights. Freedom of religion, freedom of speech, the right to bear arms and of trial by jury are all carefully guarded. Similarly the freedom of the press, freedom of election, the right of assembly and of petition are guaranteed. Excessive bail and fines, cruel and unusual punishments, unwarranted search and seizures, the quartering of troops in times of peace are all prohibited. The granting of titles of nobility, hereditary honors or exclusive privileges are forbidden. All of these are principles that have been accepted as essential to the perpetuity of a democratic republic.

All the constitutions recognized the principle of the threefold separation of powers, and provided for the establishment of distinct legislative, executive and judicial departments. Not only had the experience of the Colonial period tended toward the differentiation of these three departments, but its importance had been emphasized by Montesquieu. Some of these instances of separation were explicitly declared in Massachusetts, that no one of the departments should ever exercise any of the powers of the other two, but in practice this principle was frequently not observed. In the organization of the legislative department the States except two made provision for the bicameral system which had been developed during the colonial times. Pennsylvania and Georgia were the exceptions. They retained their single house. The lower branch was the more popular and numerous, the senate, as the upper house was most frequently styled, being not more than one-third or one-fourth its size. Representatives were variously apportioned, not in general according to the population, but the local division of the town in New England and of the county elsewhere served as the basis of representation. Old inequalities were continued and in some instances new ones were introduced. For the same unit of population the States except two made provision for the house in four States, but special senatorial districts were created in others. The members of the lower house were elected annually except in South Carolina, where the term was two years. In the majority of the States the term for the upper branch was also one year, but in four it varied from three to five years. In all of the States save three the members of both houses were elected directly by the qualified voters, but by the first constitutions of New Hampshire and South Carolina the members of the upper house were chosen by the lower out of their number and in Maryland there was a senatorial electoral college. A freehold or property qualification was required in all the States for membership in either branch, and also for the executive, except in Pennsylvania, where the payment of a poll tax was sufficient. In addition to a higher age and residence requirement for office, property qualification was usually called for, as the senate was supposed to represent property. Thus in New Hampshire a senator must possess a freehold of £200, the governor £500; in South Carolina £2,000 and £6,000 for the respective offices. In addition religious qualifications were required by all the States for governor and members of the legislature, except New York and Virginia. A member must be a Protestant, in two a Christian, but in four a believer in the inspiration of the Scriptures, and in Delaware of the doctrine of the Trinity as well. In the organization of the executive department all the constitutions, except two, made provision for a single executive, who was usually called the governor. By the first constitution of New Hampshire there was no provision for a distinct executive. In Pennsylvania an executive board was established. In only three States was the executive elected by the people, in the others he was chosen by the legislature. His term of office was usually one year, but in two Middle States it was three years and in South Carolina two. In nearly all the States an executive council, elected by the legislature, was associated with the governor. This body inherited the advisory and administrative functions of the old colonial council. It was to act as a check upon the governor, sharing with him the exercise of those few powers that had not been already vested in the legislature.

A comparison of the powers conferred upon the legislative and the executive departments reveals the fact that the constitution makers were very much influenced by their colonial experience. They were mindful of the recent contests between the royal and proprietary governors and the legislatures. This led them to fear executive usurpation, while it gave them great confidence in the legislature, which had boldly championed the rights of the people. Accordingly almost unlimited powers were conferred upon the legislature, while the governor was deprived of nearly all the customary powers of the colonial executive. He was entrusted with a qualified veto in Massachusetts alone. The appointing power was exercised by the legislature in five of the States, in seven he chose the more important officers, while in a few the governor was allowed to share this power with the council. As commander of the military and naval forces of the State the governor presents a more important representation to the People of the State than had been the case in the Colonial period. On the other hand, save for the provisions in the Bill of Rights, almost no limitations were placed upon the powers of the legislature. In addition to strictly legislative power it exercised also important administrative functions, as previously indicated. In several States the upper house possessed certain judicial powers which were brought over from the colonial council; and suggest similar functions of the House of Lords, as the trial of impeachments, and in a few cases it acted as a court of last resort.

The judicial system of the colonies was in general retained under the State governments. While differing in particulars there was a similarity in the organization of this department in all the States. Many of the details were left for statutory enactment. The chief provisions in the constitution related to the method of appointment and removal and the tenure of office of the judges. In Georgia alone the judges, with the exception of the chief justice, were elected by the voters. Elsewhere they were appointed, in about half the States by the legislature, in the others by the governor and council. The usual tenure of the Supreme Court judges was for good behavior, but in most of
the States they were removable. In all the States their salary was fixed by the legislature. The judiciary lacked security and independence owing to its dependence upon the legislature, but fortunately in general that body refrained from interfering with the freedom of the courts.

Property qualifications were prescribed for the exercise of the suffrage in all the 13 States either in the constitution or by law. These varied from the requirement that the elector should be a taxpayer to that of the possession of a fixed capital. In general these qualifications were low. In a few States a larger amount was required for the electors of senators than for representatives. In South Carolina the suffrage was further restricted to those who believed in God and in a future state of rewards and punishments. As a result of these provisions the majority of white men were unable to vote. Although freedom of religion was proclaimed in almost all the constitutions, a half-century, there was a close connection between church and state. In addition to the religious qualifications for office holding already referred to, the legislature was empowered in two New England States to regulate the clergy at public expense, and in Maryland of the Christian religion. South Carolina declared the Christian Protestant religion to be the established religion. Provision was made for amendment in eight of these constitutions, under the old and the remainder there was no provision for amendment, thus leaving the power in the complete control of the legislature.

Space does not permit the further analysis of these documents. It should, however, be noted that the later constitutions, as those of New York and Massachusetts, were more complete and more carefully drawn than the earlier ones, their framers profiting from the experience of the earlier States. All of these constitutions, while republican, were not democratic in character, as judged by later standards. The religious and property qualification, so characteristic of 18th century ideas, gradually disappeared with the advance of the new century, and the chief defects of these instruments, the excessive power placed in the hands of the legislature and the weakness of the executive, were in time corrected. So conservative, however, were some of the original States, and so well adapted were these constitutions to serve the purpose for which they were designed, that five of them, although amended, were not superceded until a half-century, and one, that of Massachusetts, is still in force.

The period from 1776 to 1780, it has been truly said, is the most eventful constitution-making epoch in our history. It marks the transition from confusion to comparatively stable governments. Moreover just as these constitutions were largely based upon the organic law of the colonies, so in turn they served as models and furnished the chief features for the Federal Constitution. In addition, Judge Jameson has pointed out that from the revolutionary conventions of the earlier part of this period there developed before its close that peculiarly American institution, the constitutional convention,—such as the ones held in Massachusetts and New Hampshire,—was accepted as the all-important organ for framing the State constitutions. The method these two States employed in drafting their constitutions through a constitutional convention, and its subsequent submission to the people on their approval, came to be the normal practice followed in the other States in ordaining their organic law. See CONSTITUTION; GOVERNMENT—Constitutional Government.

9. THE PEOPLING OF THE UNITED STATES. During the first 60 years of the 17th century a substantial beginning of the permanent colonization of the Atlantic seaboard had been made. In this work the English, Dutch and Swedes each played a part, but the chief rôle had been taken by the English. Their colonization efforts, at first chiefly promoted by commercial reasons, were feeble. The Virginia colony established in 1607 was due to ignorance, the blundering methods followed and the hardships encountered, increased very slowly. In spite of successive reinforcements and the introduction of the family system its population amounted to only about 3,500 after more than 20 years. The religious and political situation in England was more effective in stimulating colonization than commercial inducements had been. The pioneers of the religious refugees, the Pilgrims, who settled at Plymouth in 1620, after 10 years numbered only some 300. But the triumph of absolutism in church and state led to the great "Puritan Exodus" to New England. During the 11 years that Charles I reigned without a Parliament, 1629 to 1640, some 21,000 English Catholics came out. With the outbreak of the Civil War in England, however, this emigration ceased. In the meantime there had been a small immigration to Maryland, which had been founded in 1634, consisting of about 1,000 English Catholics, but more Protestants, and a constant flow of colonists to Virginia, a considerable proportion of which was of the poorer class. A report
of 1638 states that "scarcely any came but those who are brought in as merchandise to make sale of." By 1640 its population was estimated at 7,500. However, the triumph of the Parliamentary forces caused a great Cavalier movement to Virginia, which not only doubled its population in 10 years, but also markedly raised the character and prosperity of the inhabitants. By 1660 the total population of the English colonies is believed to have been up- wards of 300,000, nearly divided between New England and the two southern colonies.

Meanwhile in the middle region lying between the two groups of English colonies, the Dutch and the Swedes had planted settlements. The former had taken possession of the Hudson Valley and the western part of Long Island, the latter a foothold on the banks of the Delaware. The Swedish colonists were never numerous and after 17 years of precarious existence in 1655 their small settlements of 200 or 300 souls passed into the control of the Dutch. The Dutch, more prosperous and populous than the Swedes were much less so than their English neighbors, owing to the narrow policy of the Dutch West India Company, but by 1664 New Netherland had reached a population of 7,000. This, however, was not exclusively Dutch, for even at that early date the future metropolis was a cosmopolitan city. Some 50 different languages were said to have been spoken in New Amsterdam in 1643, and the English had overrun a considerable part of Long Island. The English government, shortly after the Restoration, jealous of the Dutch, decided to wrest the middle region from them. This was accomplished in 1664, and while the Dutch population long remained an important element in New York the Anglicizing process at once began. During the period between the Restoration and the English Revolution of 1689 a few colonists came to New England, more to Virginia and Maryland and a beginning of the colonization of the Carolinas was made, but the greatest immigration was to the middle colonies. East and West Jersey were settled—the former by English direct from England or from the Puritan colony of New Haven, the latter by the English Quakers,—and the Holy Experiment in Pennsylvania had made a most prosperous beginning, with its English and Welsh Quakers and a few Germans, the forerunners of the great 18th century migration. By the close of this period the middle colonies numbered about 40,000 inhabitants, or about half as many as New England, while the total population of all the English colonies is believed to have been about 200,000, and by 1700 is estimated by De Bow as 262,000.

During the 17th century the colonies were largely English, but in the 18th century the immigrants were chiefly of other races, nearly all the countries of northwestern and central Europe being represented. Already an important and valuable, although not large French element had been introduced into the population, through the coming of the Huguenots, who, especially in the years following the Revocation of the Edict of Nantes (1685), found their way into nearly all the colonies, but were especially numerous in South Carolina and New York. A number of their descendants became prominent during the revolutionary period. A few Germans seem to have come to America with the Swedish and Dutch settlements, but it was not until the founding of Pennsylvania that any considerable numbers arrived. Their migration has been divided into three well-defined periods. The first from 1683 to 1699, during which there was a small immigration into Pennsylvania of perhaps a few hundred, of certain religious sects, chiefly Mennonites. The second period, 1709-27, opens with the coming of the Palatines, thousands of whom, in consequence of the ravaging of the Palatinate by war and the prevailing religious and economic tyranny, had taken refuge in England in 1709 with the hope of being aided to America. Queen Anne's government sent some of them to the Carolinas but more than 3,000 were transported to New York, where most of them in a few years settled in the Mohawk and Schoharie valleys, but a few hundred dissatisfied with their treatment eventually found their way into Pennsylvania. About 1710 Swiss Mennonites and Palatines began to come directly to Pennsylvania, followed by Dunkers and various other sects. According to a conservative investigator the number of Germans in this colony alone as between 15,000 and 20,000. During the third period, 1727 to 1775, the number of immigrants reached enormous proportions. A few hundred Germans and Swiss found their way directly to some of the southern colonies, especially to the Carolinas and Georgia, by far the greater number came to Pennsylvania. A careful estimate of the Dunkards of the number passing through the port of Philadelphia, based upon the lists of arrivals during this period, gives an aggregate of nearly 70,000. Almost one half of these fall within the six years 1749 to 1754. So numerous were the German immigrants that the English and colonial authorities were at times alarmed for the safety of the colony. As will be noted later many of the Germans found their way subsequently to other colonies, but the majority of the authorities in about 1775 they comprised about one-third of the total population of Pennsylvania, or about 100,000. Most of these later immigrants did not come for religious reasons, as was the case with the sectaries of the previous period, but they were chiefly of the peasant class, who were seeking relief from the burdens of feudalism. They were an honest, industrious, simple and deeply religious people. Content with their new-found prosperity they took little part in colonial politics. Settling together they largely comprised the population of certain counties. So conservative were they and tenacious of their customs and language, that whole communities of their descendants today speak a dialect commonly known as Pennsylvania Dutch.

Another equally important non-English element introduced into the colonial population was that of the Scotch-Irish, or better, the Scotch-Irish from Ulster, Ireland. Here their ancestors had made their homes for two or three generations, but driven by the religious bigotry of the Established Church, the commercial jealousy of England and the oppression of the landlords, they took refuge across the sea. The emigration began...
about the opening of the 18th century, but assumed considerable proportion by 1718. It is estimated that between 1725 and 1768 the number of emigrants rose from 3,000 to 65,000. Annually, since the commencement of 1740, it is said 12,000 left Ireland annually for several years for America. It is estimated that fully 50 per cent of these were pure Irish as well as Scotch-Irish. Between 1711 and 1773 more than 100,000 departed. Parry says that ships could not be found for the crowds that wanted to go. As a result of this emigration about one-half of the Presbyterian population of Ulster came to America. Some of these went to New England, several thousand sailed directly to Virginia and the Carolinas, but by far the great majority landed first on the shores of the Delaware and took up their settlements on the frontiers of Pennsylvania and spread from there southward. This colony has been rightly called "the seed plot of frontier emigration" for beginning about 1732 a constant stream of emigrants, composed of Germans and Scotch-Irish folk, flowed to the South and Southwest along the western valleys into the western portions of Maryland, Virginia and North Carolina. Eventually the Scotch-Irish penetrated even further into South Carolina and Georgia. This sturdy and God-fearing people formed the chief element in the population of the frontier counties from Pennsylvania to Georgia, overflowing into what later became Kentucky and Tennessee. It is estimated that the Scotch-Irish comprised about one-sixth of the colonists at the Revolution. The other provinces of Ireland contributed a large quota of the immigrants to the colonies. During the Revolutionary War 38 per cent of the American armies under Washington consisted of these men or their descendants.

The British colonists were in general a substantial and highly moral folk, but it appears to be true that among the indentured servants there was a considerable number of transported criminals. Some political offenders were sent to America, chiefly Scotch prisoners of war for a few hundred captured at the battles of Dunbar and Worcester in 1650 and 1651 were sent to New England. Again, following the suppression of the risings in Scotland in 1678 and 1716 and after the battle of Culloden in 1746 companies of Scotch prisoners were sent respectively to Virginia, Maryland and South Carolina. But recent investigation seems to indicate that by far the larger number of convicts sent to America were not political offenders. Some criminals were sent to the colonies in the earlier period, but the practice became more common after the English statute of 1670 and especially after the act of 1718, by both of which transportation to America was permitted to place convicted on certain crimes. The records of Old Bailey alone indicate that between 1717 and 1775 not less than 10,000 were transported. Doubtless in many of these cases there were mitigating circumstances. Proof exists that all the middle and lower classes served to some extent as penal settlements, but the most of the prisoners appear to have been shipped to Virginia and Maryland. Stith in his "History of Virginia," published in 1747, wrote "Virginia has come to be reputed another Siberia, or a hell upon earth." Scharf estimated the number of banished criminals in Maryland at 20,000, one-half entering after 1750. But the servant class was not recruited chiefly from the middle and lower classes. The majority of them were honest immigrants who redeemed their passage to America by being bound out as indentured servants. This class was very considerable in both the southern and middle colonies. They were more numerous and important than slaves in the South during the 17th century, and formed a very considerable and important factor in the economic life of the middle colonies in the following century. Pennsylvania had an especially large number, mostly German and Irish. In addition to the whites, representing almost all the various branches of the Teutonic and Celtic races, there was another large foreign element imported into the colonies, namely, the African negroes, who were held as slaves. Although first introduced into Virginia as early as 1619, they were not numerous during the first half of the century. In the last half, however, they rapidly increased in Virginia and Maryland, so that by the opening of the new century they probably equaled the number of indentured servants in these colonies, and the African slave trade became as important branch of foreign commerce. The growing demand for slave labor on the plantations in all the southern colonies led to a great increase in their number. Bancroft places the total slave population of the English colonies as 39,000 in 1714, 75,000 in 1727, 310,000 in 1790 and 500,000 in 1840, or approximately one-fifth of the total population. Fully four-fifths of these were in the colonies south of Pennsylvania and comprised about one-third of the inhabitants of that section. Here was a racial element destined in time to affect materially the development of the life and thought not only of the South, but also the political and social history of the whole country.

The steady growth of the colonies during the 18th century is indicated by the following figures. According to the report compiled by the Lords of Trade in 1721 the population had increased to a half million. Dexter, a very careful investigator, estimates that it had reached 1,000,000, by 1767, 2,000,000, and was about 2,500,000 at the opening of the Revolutionary War. His figures are in substantial agreement with those of Bancroft. It is probable that about one-third of the population in 1775 were immigrants. The stream of immigration was interrupted by the war, but began again after the return of peace. There is, however, almost no data and even estimates appear to be lacking for the period of the Confederation. It has been estimated that the number of immigrants to the United States in the decade following the first census of 1790 was about 5,000 per annum. This may serve as a rough basis for calculating the number for the preceding decade, although it is hardly probable that it was as large during the unsettled years of the "Critical Period." 10. FINANCES (1775-1789). The fiscal systems of the American colonies were of a simple character; expenditures were small and taxes correspondingly light. Some of the local governments levied excise duties upon articles of luxury; nearly all placed tariff duties upon imports or exports; and the property tax was generally imposed. Illustrations of tariffs are found in tonnage duties, export duties on tobacco, import duties on slaves, and in a few colonies in more extensive tariff schedules on a considerable number of articles of merchandise. Public credit was almost unknown; there were no banks in the modern sense, and consequently no influential agencies for making loans. When emergencies arose, necessitating extraordinary expenditures, the colonies generally resorted to emissions of bills of credit, or promissory treasury notes. In some instances these issues were so large that the notes depreciated in value, resulting in partial repudiation. When hostilities actually broke out in 1775, the Continental Congress found itself without resources and without power to collect revenue; funds were needed at once, and there seemed to be no other recourse than to issue bills of credit. The agitation for separation from the mother-country was in a large measure inspired by this consideration. The Congress was forced to impose a system of taxation without the consent of local bodies; and this suspicion of external taxation extended even to the collection of revenue by the colonies in common. Each commonwealth wished to maintain its revenue powers without abatement even if the object was the good of the whole. Between June 1775 and November 1779 there were 40 emissions of notes with a total issue of $241,000,000. In addition the States put out $230,000,000. These issues rested upon the faith of Congress which repeatedly called upon the several States to provide means for redemption, but these pledges were not made good. The notes consequently depreciated in value, until in 1780 Congress recognized that its efforts were in vain, and made provision for the acceptance of paper in place of silver at the rate of 40 to 1. Depreciation continued until the notes were regarded as worthless. The Funding Act of 1780 provided that the notes, still in circulation, at a rate of 100 to 1; at this date it was estimated that about $78,000,000 was still outstanding. See Money, PAPER.

Congress also sought fiscal aid by making requisitions on the different States, by borrowing both at home and abroad and by attempts to secure national taxation. Requisitions were made both in specie and in specific supplies; the yield of the former was less than $6,000,000, and the demand for specific supplies in the form of corn, beef, hay, etc., proved not only wasteful but ineffective. In order to borrow money, loan offices were established in the several States, at which indented certificates were sold, bearing interest varying from 4 to 6 per cent. In all $63,000,000 was thus borrowed, having a specie value of $7,600,000, according to the scale of depreciation adopted by Congress in 1780. After 1782 Congress was unable to pay the interest and, therefore, issued to the holders of certificates indents which became current in the payment of State taxes and were receivable by Congress in the payment of requisitions made upon the States. Foreign loans, 1777-83, were obtained as follows: France, $6,352,000, Spain $174,000, Holland $1,394,000. Small loans were obtained in France as early as 1777 and these proved of great service in the purchase of military supplies and in the payment of the interest of the domestic loans. Beginning with 1782 bankers' loans were placed in Holland, and fortunately these were continued after 1783. It was estimated until the new government was established in 1789. During the years 1784-89, the Dutch loans amounted to $2,296,000. The efforts to secure a national tax were unsuccessful. The Articles of Confederation, which went into effect in 1781, practically granted no financial power to the new government. It was provided that all expenses for the common defense or general welfare should be deferred out of a common treasury supplied by the several States in proportion to the value of land and improvements; and the taxes were to be levied under the direction of the State authorities. In 1781 Congress recommended a duty of 3 per cent on imports; this consent could not be obtained from the States; in 1783 a more elaborate tariff was proposed, but again the approval of the States could not be secured.

The administrative management of the finances by the Continental Congress well illustrates the jealous attitude of a democracy desirous of maintaining its liberties and fearing all forms of centralized authority. At first there were two treasurers, then a committee of 13 Congressional delegates, followed by a treasury board which handled all public moneys. Finally in 1781 the fiscal machinery was centralized, and Robert Morris was chosen superintendent of finance. By the use of his personal credit in borrowing funds, he introduced new vigor into the government, but his efforts to create a national system of revenue were fruitless. Through his advice the Bank of North America was established and during the years 1782-83 this proved of aid in making temporary loans to the government.

In 1784 the indebtedness of the national government, apart from the outstanding bills of credit, was $3,800,000, of which the largest charge of $1,875,000. This burden together with the ordinary expenses of government
proved too much, and the national treasury rapidly drifted toward complete bankruptcy. In 1787 a national convention was held to frame a constitution which should endow the government with larger financial powers. The new Constitution gave to Congress the power to lay and collect taxes, and denied to the States the right to lay duties on imports or exports except what might be absolutely necessary for executing its inspection laws. This gave to the government the power it had so sadly needed, and proved to be a firm support when the new government went into operation in 1789. See United States—Finances (1789-1816).

Davis Rich Dewey, Massachusetts Institute of Technology.

11. THE FEDERAL CONVENTION OF 1787. Early in the War of the Revolution the several colonies represented in that revolutionary body, the Continental Congress, recognized the need for some form of a regularly ordained central government was desirable. It was 17 Nov. 1777, however, before that body could agree upon the draft of a constitution; the Articles of Confederation, and the delay in raising funds by the legislatures of the States prevented the new government being established until 1 March 1781. Even before the Articles were drafted the national enthusiasm of the years 1775-76 had cooled. Many of the States had meanwhile drawn up their constitutions, and having had the selection of governmental powers there was little left to confer upon the general government, as they held tenaciously to all the powers they had appropriated. The States also became jealous of Congress and of each other. "There was an excess of State pride and a sad lack of national feeling." The change in the spirit of the people was voiced by a committee which declared he was "resolved to vest the Congress with no more power than was absolutely necessary," and this accounts in large part for the weak and defective character of the Articles as a plan of government. An additional reason was that they were not based upon American experience, but were modeled after those European confederations with which Americans were most familiar, namely, the Dutch and the Swiss. It is small wonder, then, that they were not adapted to meet the needs of this country. Even before they went into effect Washington had characterized them as "a shade without substance." The truth of this was soon rendered evident. The short history of the Confederacy is an inglorious one. This government had no self-sustaining capacity, as there was a total lack of coercive power to enforce obedience to its laws. Congress was wholly dependent upon the good will and co-operation of the State governments, as it acted upon them and not upon individuals. Hamilton recognized this as "The great and radical vice of the Confederation," and Washington shrunk from referring to it as "a government of supplication." As soon as the war was over and the pressure of a common danger was removed, there was a tendency toward decentralization— the general government being regarded as burdensome,— and the authority and character of Congress declined.

In practice the lack of power of Congress to lay taxes soon greatly embarrassed it. It depended wholly upon requisitions on the States for the means of paying the interest upon the debt, contracted to carry on the War of Independence and to meet the current expenses of the government. These were largely neglected or refused. Even before the Articles had gone into effect this defect was anticipated, and as a step toward greater efficiency the Continental Congress recommended, on 8 Feb. 1781, an amendment to the State legislatures, authorizing the general government to lay a duty of 3 per cent ad valorem on imports to pay foreign debt. All the States consented except Rhode Island. She considered it "the most precious jewel of her sovereignty that no State be called upon to open its purse, but by the authority of the State and by her own act." Her refusal was sufficient to defeat the project, although Virginia soon afterward withdrew her consent.

In the fall of 1781 Congress made requisition for $8,000,000, but after over a year only $500,000 had been paid. Accordingly, that body again proposed another revenue amendment, 18 April 1783, this time seeking for a grant of power to lay moderate specific duties on certain enumerated articles and 5 per cent ad valorem on imports to pay foreign debt for the period of 25 years. As a concession to the States the collection was to be made by officers appointed by them. This proposition met with even less cordial response than the former one. As late as 1786 four States had failed to give their assent, finally all but that of New York's was secured, but Governor Clinton twice declined to act upon the request of Congress to summon the legislature of that State in special session to reconsider its action, and so defeated the amendment and rendered the financial situation critical, as the compliance with requisitions had grown even more lax. Between 1782 and 1786 Congress had called for $6,000,000, but it received only $1,000,000. Some like Georgia, had paid nothing, nearly all were in arrears, while New Jersey expressly refused to pay its last quota as a protest against the illiberal policy of New York. The impotence of Congress could not be more clearly illustrated. A committee of Congress in 1786 declared that any further dependence on requisitions would be "dishonorable to the understanding of those who entertain such confidence," and that "the crisis had arrived when the people of the United States must speedily decide whether they will support their rank as a nation by maintaining the public faith at home and abroad."

The failure of the Articles to confer upon Congress power over commerce, either foreign or domestic, proved almost equally disastrous. England refused to grant us commercial rights, realizing that Congress had nothing to give in return and was powerless to retaliate. Congress, therefore, proposed a third amendment on 30 April 1784, asking the States to grant it for 15 years the power to prohibit the entrance into the ports of the country the vessels of foreign countries not having commercial treaties with the United States. This was especially aimed at Great Britain, and it was hoped
that it would be instrumental in securing favor-
able commercial concessions from her and other
foreign nations, but more than two years later
several of the States had failed to comply with
the terms of the proposition. This attempt fail-
ing, each State was left to regulate trade in
its own way, and the way of each differed from
that of every other. Not only did it prove
impossible to secure a uniform policy toward
foreign nations, but they were soon engaged in
what Washington termed "a war of impossibilities
with each other, as each State had a different
set of tariff and tonnage laws, which engen-
dered discord, rivalry and retaliatory regula-
tions. Madison thus describes the situation:
"The States having ports for foreign commerce
taxed and irritated the adjoining States trading
through them." New Jersey, lying between
New York and Philadelphia, was compared to
a cask tapped at both ends, while North Caro-
lna, situated between Virginia and South Caro-
lna, was likened to a patient bleeding at both
arms.

The financial and industrial condition of
the States was also very bad. In 1786 the situa-
tion was one of general depression, bankruptcy was
impossible. Seven of the States had sought
relief in large issues of paper money. In west-
ern Massachusetts the debtor class rose in an
outbreak, known as Shay's Rebellion in
November of that year, and before it was sup-
pressed had greatly alarmed the friends of law
and order and those who respected the rights
of property. This outbreak is chiefly import-
ant owing to its influence in creating a sentiment
favorable to a stronger national government.
All signs seemed to point to an early dissolu-
tion of the Union. "Our situation," wrote Mad-
sion, "is becoming every day more and more
critical. No money comes into the federal
treasury, no respect is paid to the federal au-
thority, and people of reflection unanimously
agree that the existing confederacy is tottering
to its foundation." The Articles of Confederation provided for
but one way of amendment, but the requirement
of securing the unanimous consent of all the States
as well as of Congress rendered the amending provision nugatory. Some other
means had to be found to reach the people
than that prescribed by the Articles, if reforms
needed were to be secured, but any other
method would be extra constitutional and per-
haps revolutionary. Such a means, however,
had been already suggested. Passing by the
early proposal for a convention by Thomas
Paine in 1775, by Alexander Hamilton in 1780
and by Pelatiah Webster in 1781, it is worthy of
note that the legislature of New York in
July 1782, under the influence of Hamilton, was
led unanimously to recommend the calling of
a convention to revise the Articles of Con-
 federation. After the news of peace in April
1783, Congress took up this resolution only to
defeer action, but Washington, in June, ad-
dressed communications to Congress and to the
governors of the States urging the convoking of
"a constitutional convention" "to form a new
Constitution that will give consistency,
stability and dignity to the Union." This en-
couraged Hamilton to present his resolutions to
Congress, but without result. At the sugges-
tion of Governor Bowdoin the legislature of
Massachusetts, 1 July 1785, adopted resolutions
also calling upon Congress to recommend a con-
vention to revise the form and powers of the
government. But the States' delegates in
Congress disobeyed their instructions and failed
to present the resolutions, justifying their ac-
tion on the ground that "to seek reform through
a convention is a violation of the rights of
Congress and . . . must meet their disappro-
bation." From these failures it was clear that
the plan of inducing Congress to initiate the
so-called convention was vain. Some more
indirect way of reaching the people must be
resorted to. Fortunately it was shortly found.
Owing to the friction resulting from the con-
fllicting commercial regulations, the legisla-
tures of Virginia and Maryland had appointed
commissioners, who met in the spring of 1785 to prepare the terms of an agreement for the jurisdiction over the waters common to both States. The legislature called of their report but desired that Delaware and Pennsylvania be invited to join with them in a common system of commercial regulation.

James Madison, a member of the Virginia legis-
slature and an advocate of a strong union, took
advantage of this suggestion and was instru-
mental in securing the adoption by the Virginia
legislature, 21 Jan. 1786, of a resolution invit-
ing all the States to send delegates to a con-
vention to be held at Annapolis, to take into consideration the question of
the commerce of the whole country. Only Vir-
ginia and the four middle States were present
at Annapolis. Realizing that they were too few
for important action, at the suggestion of Ham-
ilton, the convention issued an invitation to the
States to attend a new general convention to
meet at Philadelphia on the second Monday of
the following May, to consider the whole sit-
atuation of the United States. Virginia at once
elected delegates, and six other States did like-
wise, before Congress took action. Finally, on
21 Feb. 1787, that body was led to give its
sanction, although avoiding all reference to
the other call, it fixed upon the same time and
place for a convention as already proposed, for
the sole and express purpose of revising the Arti-
cles of Confederation and reporting to Congress
and the several State legislatures.

The convention was formally organized on
25 May 1787 with the election of Washington
as president. For nearly four months it con-
tinued in session in Independence Hall, sitting
with closed doors, as nothing but its completed
work was given to the public. Not till 1819 was
its journal published, and Madison's notes, the
best report of the debates preserved, were not
printed till over half a century after the con-
vention adjourned. All of the States but Rhode
Island were represented, although New Hamp-
shire was not present until 23 July. Seventy-
three delegates are known to have been ap-
pointed, but of these only 55 were in attendance.
They comprised nearly all of the men of the
greatest experience, authority and ability in the
country. All but 12 had served in Congress and
knew at first hand of its impotence. Among
the delegates — classified by the parties into which
they were roughly grouped — may be men-
tioned: as the leaders of the Nationalists, Madi-
on, Hamilton, Wilson, Gouverneur Morris,
Charles Pinckney and King; as the champions
of the confederation, Paterson, Lansing, Yates,
and Luther Martin, while chief among the advocates of compromise were Franklin, Sherman, Ellsworth, Dickinson, Gerry and C. C. Pinckney. Many difficulties confronted the convention at the outset, owing to the conflicting instructions of the State legislatures and the divergent views of the members. They were at first divided into groups of the large and the small States, those who wished to draw up an entirely new scheme of government national in scope, and those who simply desired to amend the Articles. As the work of the convention progressed other combinations were effected, in which the North was arrayed against the South, or the commercial against the agricultural States. The task before the delegates was to harmonize all these conflicting ideas and interests so that they might be brought to substantial agreement upon a plan which was calculated to command the approval of the people and infuse new life into the Union.

On 29 May, as soon as the convention had been fairly opened, Edmund Randolph presented the Virginia plan, which was probably largely drawn by Madison. It proposed a fundamental change in the government from a confederation to a federal government for three distinct departments of government, a national legislature, executive and judiciary. The legislature was to consist of two branches, the first branch (representative) to be elected directly by the people, the second (senate) by the first branch out of candidates nominated by the State legislatures. Representation in both branches was to be apportioned among the States according to the quotas of representation or the free inhabitants. In addition to the powers under the confederacy, the Congress should legislate in all cases in which State legislation would interrupt the harmony of the United States, should have a negative on State laws contravening the articles of union or its laws and treaties and might coerce a delinquent State. The executive should be chosen by Congress for a limited term, and with a part of the judiciary should form a college of judges, with the power to appoint, remove and recall. An independent national judiciary was provided for. The remaining resolution related to the admission of new States, the guaranteeing to each State a republican form of government, the government of a State at the expiration of its term of representation. The Convention went into the committee of the whole to consider these two plans. The issue of a national government or a confederation was clearly presented and on 19 June the committee reported back the Virginia plan. It may be of interest to note that on the day before this, Hamilton, expressing his objection to both plans, sketched the outline of a system which was the embodiment of his views. He advocated a stronger and more centralized government, in which the States would have been reduced almost to administrative agencies of the central government. The assembly was to be chosen by the people for three years, the senators to be chosen for good behavior by electors, and should represent property. The executive to be chosen for good behavior by a more complicated electoral system. He was to be vested with an absolute negative on Congressional legislation. The governors of the States were to be appointed by the central government and were to have an absolute negative on State legislation. As one of the
delegates remarked, "Hamilton was praised by many but supported by none." During the second period of its deliberations, which extended from 19 June to 26 July, the committee considered the discussion of 19 resolutions agreed to in committee. It was in this period that the great contest between the large and small States, or, better, between the national and confederate parties took place. The nature and character of the new organization was at stake, and was involved particularly in the determination of the question of representation. The large States insisted upon proportional representation in both houses of Congress, the small States refused to enter the Union on any such terms. On 2 July a proposition for equal representation in the Senate was lost. The excitement was intense, the Convention seemed on the point of dissolving. Sherman declared, "We are now at a full stop. Nobody, I suppose, means that we shall break up, without doing something"; and he suggested a committee as "likely to hit on some expedient." The matter thereupon was referred to a committee of onefourth each house. They reported 3 July, favorably to equal representation in the Senate and proportional in the House, and as a concession to the large States that the House should originate money bills. To the resolution as reported there was subsequently added the proviso that in the apportionment of representatives and direct taxes "three fifths of all other persons (slaves) should be counted, which was the rule fixed upon for the apportionment of quotas of taxes in connection with the laws of 1783, and which had been agreed to by the legislatures of 11 States and already had been incorporated in the report of the committee of the whole of 13 June. This proviso should not, therefore, be considered as an essential part of this compromise. This report agreeing to equal representation in the Senate at first excited a storm of protest, but the entire resolution was finally adopted 16 July, by a vote of five States to four, and is recorded as the third resolution, and three units represented. Thus this compromise, involving the structure of Congress and the organic nature of the government, was determined by a vote of less than a majority of the States present and voting by a combination of representatives of less than one-third of the people of the States. The effect of this compromise was most marked. The small States now gave up their opposition to the reorganization of the government and joined heartily in the work of providing an efficient organization and adequate powers for the new government. The other important modifications of the plan made during this period were substituting for the phrase "National Government" the "Government of the United States," shortening the term of representatives to two years and of senators to six years, and providing that the latter should retire by thirds, omitting the provision for the negative on State laws and inserting "the supreme law" clause first suggested by the New Jersey plan. Some of these changes show a departure from nationalism in the direction of federalism, and indicate that the spirit of compromise was at work. On 24 July a "Committee of Details" was appointed to prepare a Constitution conformable to the resolutions adopted by the convention. Two days later the 23 resolutions already agreed to together with the Pinckney and New Jersey plans were referred to this committee. Then the Convention adjourned until 6 August to await the committee's report. On that date they reported the draft of the completed Constitution already appear.

We now approach the third period of the work of the Convention, extending from 6 August to 17 September. During these six weeks the debate over the details of the draft progressed, and while great diversity of opinion was exhibited, it proceeded in the main without undue excitement, although the difference in the interests of the Northern and Southern States over commerce and slavery aroused for a time considerable excitement. Already during the preceding period it had become evident, as Madison records, "that the real difference of interest lay not between the large and small States, but between the northern and southern States. The institution of slavery and its consequences formed the line of discrimination." But these yielded, as in the case of so many other issues, to the influence of commerce it was agreed that Congress might regulate foreign and interstate trade but should not have power to lay any export tax. This was a compromise between the commercial States of the North and the agricultural States of the South. Again the Northern States desired that Congress should have power to pass navigation acts, but the three extreme Southern States objected, and refused at first to sanction the power except by a two-thirds vote of Congress for fear that the slave trade might be interdicted. The situation became critical, and again a committee of one from each State was referred to. On 24 August they reported a compromise which as amended provided that Congress should not prohibit the slave trade prior to 1808, but might impose a tax not to exceed $10 per head on such importations. This was carried by the votes of New England and the West, opposed by the South. By a similar combination of votes the clause requiring a two-thirds vote to pass navigation acts was defeated. It is noteworthy that the Virginia delegates earnestly opposed this compromise. The power to make the law in regard to the rendition of fugitive slaves was agreed to. This probably formed a part of the above-mentioned compromise. These compromises were severely condemned by later generations who forgot that slavery at that day hardly was regarded as a great moral issue. It is altogether probable, also, that these compromises generally have been over-emphasized and that others, perhaps of equal importance, have been overlooked. Certainly it is true, as has been well said, that "the Constitution is a series of compromises." No question gave the framers of the Constitution so much trouble as the choice of the executive. The Convention vacillated between several plans and showed a strange fluctuation of sentiment. Several plans were voted on in favor of electors being elected by Congress; once it agreed to a choice by electors chosen by the State legislatures—a plan subsequently twice rejected. After repeated reconsideration the special committees in their report of 4 & 5 September recomposed the electoral system very nearly as it was finally adopted on 6 September. This was regarded as a compromise between the large and the
small States, as by many it was expected that the ultimate election would usually devolve upon the House voting by States. Thus it was said that the large States would nominate while the small States would elect. Over the organization of the executive, also, there was great difference of opinion between those who desired a strong executive, vested in one man, and those who feared an approach to monarchy. These conflicting ideas were compromised by conferring upon the President great powers, but giving the States control over the conduct of Congress certain checks and limitations upon the exercise of those powers.

It is impossible to enter further into the details of the convention. Suffice it to add that on 8 September, when the members approached substantial agreement on the chief provision of the Constitution, a committee of five on "style and arrangement" was appointed. This committee made its report, largely drawn by Gouverneur Morris. It was arranged in seven articles with the various sections as in the present Constitution. Discussion upon this report continued until the 15th, when the Constitution as amended was agreed to byasonry. On 17 September the Constitution was signed by 39 of the delegates and the convention adjourned sine die. Three delegates present, Gerry, Mason and Randolph, refused to sign, owing to the strong national features of the document, and the rejection of the proposal to hold a second convention to consider amendments that might be recommended by the State conventions. There is evidence that only four of the 13 delegates who had been in attendance, but were absent at the time of adjournment, were opposed to the Constitution; certainly the majority approved of it.

It has been truly said that "if Americans possess political genius to any degree, it is for adapting old institutions to new needs." The work of the framers of the Federal Constitution strikingly illustrates the force of this statement, and the institutional development of our fundamental law. The framers drew largely upon their experience both during the colonial times and since that time, and the chief features of the Constitution are but a selection and adaptation of the provisions of the contemporary State constitutions. The Constitution made provision for the establishment of a government which was neither wholly national nor wholly federal, but partaking of the features of both. It provided for a mixed system. As Madison remarked, "In some respects it is a government of a federal nature, in others, it is of a consolidated nature." Thus in the legislature, consisting of two bodies, the Senate is based upon the federal, the House upon the national principle. In the new organization of the government the legislative department was improved, the executive and judiciary were substantially created. All were modeled in large measure after the similar departments in the State governments. The powers of the general government were greatly increased, while those of the different governments were decreased. Certain express limitations were laid upon the latter and certain other powers were denied both to the State and to the Federal governments. The convention by a tie vote refused to add a bill of rights, as the opinion prevailed that such a guarantee of individual rights was unnecessary as the Federal government was one of delegated powers only. By providing that the ratification of nine States should be sufficient to establish the new government the work of the convention was revolutionary.

In accordance with its resolves the Constitution was transmitted to Congress and after some attempts to amend, that body finally agreed unanimously 28 September, in accordance with the desire of the convention, to transmit the Constitution to the legislatures of the several States to be submitted to State conventions. At one there sprung up a great pamphlet and newspaper contest over the merits of the proposed frame of government. The most famous of these was a series of letters in advocacy of the Constitution written by Hamilton with the aid of Madison and Jay, subsequently collected under the title of "The Federalist." These exerted a profound influence throughout the country. "The Farmer" by Richard Henry Lee, one of the foremost opponents of ratification, had the widest circulation and were the most effective of the pamphlets on the other side. The country was shortly divided into Federalists and Anti-Federalists. The former comprised chiefly the professional and commercial classes, who favored the new government because it would promote national credit and commercial intercourse. The Anti-Federalists were mainly the agricultural classes, who were the advocates of paper money, stay and tender laws and who opposed increased taxation. Geographically the strength of the Federalists was near the seacoast and in the few important valleys which were the highways of commerce inland, while that of the Anti-Federalists was in the interior and agricultural sections.

Hardly a provision of the Constitution escaped criticism, but the absence of a bill of rights was the most common and weighty objection raised. The fear that the strong general government provided for would encroach upon the sovereignty of the States and the liberty and rights of the individual was the chief obstacle to be overcome. The most difficult to ratify was Delaware (7 Dec. 1787), followed in the course of a month by Pennsylvania, New Jersey, Georgia and Connecticut. In three of the States the vote was unanimous, and in Pennsylvania and Connecticut ratification was carried without difficulty, although in the former State there was a vigorous but small opposition. The first close struggle occurred in Massachusetts. The convention was very evenly divided and ratification was only secured (7 Feb. 1788) by a narrow margin, through the Federalists agreeing to the recommendation of a series of amendments. This plan was followed by all the subsequent conventions save Maryland, which ratified in April. All except five States had now taken favorable action, but it seemed very doubtful if any one of the five remaining States could be brought to accept the Constitution unconditionally. The Virginia convention was first of these to assemble, but the discussions were so prolonged that New Hampshire ratified before it, on 21 June, by a majority of 11, making the ninth State, and thus ensuring the inauguration of the new system. Virginia followed on 21 June, by a majority of
10 votes in favor, out of 186, under the impression that it was the ninth State to take action. The effect of these two ratifications upon the New York convention was fortunate. At first the opponents to unconditioned ratification had been in the majority. Finally a few of the opposition yielded sufficiently to permit of ratification by a majority of four, but this action was secured only by the Federalists consenting to a call for a second general constitutional convention to consider the amendment. Happily this convention was never held. It has been impossible to refer to the important influence of certain men in the State conventions, but at least passing note should be made of the astuteness of the Federal leaders in the Massachusetts convention, of the heroic services of Hamilton and Madison and the strenuous opposition of Patrick Henry and Lansing in their respective State conventions. Favorable action had finally been secured in the doubtful States, owing to the realization that the alternative of the Constitution or disunion was before them to choose. John Quincy Adams truly said, "The Constitution was extorted by grinding necessity from a reluctant people." Of the remaining States, the North Carolina convention on 2 August refused to ratify without a bill of rights and the Rhode Island legislature repeatedly refused to call a convention. Finally, after the new government had been in operation for some months, in response to the general demand for a bill of rights, had submitted a series of amendments to the States, North Carolina ratified 21 Nov. 1789, but Rhode Island's adherence was not secured until 27 May 1790, by a majority of two votes, and only then as a result of threatened hostile commercial legislation by Congress. Thus the 13 original States were finally reunited under the new Constitution. See CONGRESS, CONTINENTAL.

HERMAN V. AMES,
Professor of American Constitutional History,
University of Pennsylvania.

12. BEGINNINGS OF PARTY ORGANIZATION. Anti-Federalism and Growth of the Party System and Party Machinery. Political parties so-called have existed in the United States from the beginning of its independent national life. Even earlier, while the colonies owed allegiance to the governments of Europe, there were traces of political divisions and groupings among the colonists according to their inclinations to sympathize with one or another of the political groups contending for power in the old home, or according to their differing views upon colonial and local affairs. But party organization there was more intense near the end of the 18th century. Federalists and Anti-Federalists were the parties of the great discussion upon the adoption of the Constitution, but they were unorganized groups of the leaders of opinion and their supporters, divided by their opposing views upon the sole question in debate. After that contest had been ended by the triumph of the Federalists the party names persisted for a time, and the divisions were upon questions of constitutional interpretation. No parties were then formed for perpetuating these early parties or for enlarging their political functions. The beginnings of a form of organization which did permanently affect the development of the older of our true American parties appeared during the first administration of Washington in the Democratic clubs that sprang up and spread rapidly through the country. These were in some cases organized in a manner remotely comparable to the organization of a modern party and in other instances in strengthening the group which supported the views of Jefferson. They were, however, discredited by the turn of events and their development was checked.

Party organization arose out of the search for methods of political action which would secure in a representative democracy the choice of men as servants of the people who would be truly acceptable to the people. To this end and in order that the electoral forces might not be scattered and lost, it was found necessary to make use of some form of nomination of candidates previous to an election. After the adoption of the Constitution the irregular and varying local methods of previous years—the caucus, the open public meeting, the local unorganized convention, assisted by systems of correspondence and consultation—were rapidly extended and made more effective, while more central agencies of nomination for State and national officials were developed. The difficulties and expense of travel led to the rise of the legislative caucus system for the nomination of State officers as early as the year 1796. The opposing parties were both represented in the State assemblies by prominent members and it seemed but a natural expansion of their regular duties that they should choose suitable candidates for the State offices. Their recommendations were made known by proclamations signed by members of the caucus. Against constant and severe criticism the legislative caucus continued in most of the States to exercise the power which had almost by accident fallen into its hands down to the year 1824, and even later in a few States; then, under the pressure of popular demand, it gradually gave way to the growing convention system. In many instances during the period of its prevalence the legislative caucuses of the States assumed the privilege of nominating Presidential candidates.

The last years of the 18th century were
marked by the rise of a distinct party organ for the nomination of national elective officers. This organ, unlike a legislature of origin similar to that of the legislative caucus of the States and grew out of the practice of the Federalist members of Congress of meeting, with more or less formality and official sanction, for the discussion of party policy. It was easy to carry over into the field of nomination the party power in their hands. Hamilton is credited with suggesting the first formal action of the Congressional caucus of the Federalists in 1800, and so of originating the party organ. Evidences of such use of the Republican party caucus are to be found, however, in the history of the previous campaign. Both parties did so nominate candidates for the election of the year 1800. The efficiency, convenience and economy of the new agency, together with a natural human reluctance to surrender power once grasped, led to its continued use against constant and growing popular opposition. It was seen to have become fully established as a party organ when, in 1808, the Republican caucus was called by the senator who had presided over that of 1804, in pursuance of its own wishes or at least without any opposition by the Jeffersonian Republican party it was made so able and efficient a party engine as to render the acceptance of its decisions a practical test of party loyalty, not only in the official circle but throughout the ranks and file of party membership in the country. Party discipline was firmly enforced and the Republican representatives in Congress saw that the behests of the caucus were carried out in all the States; nominating agencies in the States were manipulated in a manner to strengthen the national party organ, and the minority became almost helpless before it.

Parties assembling for choosing Presidential electors was prescribed by the Constitution, that matter being left to each State to determine for itself. Three systems were employed in the early elections. In some of the States the legislative caucus nominated. In others candidates were nominated in large assemblies of prominent citizens, including members of the legislature, which foreshadowed the State conventions of later days. Names so chosen were placed upon the general ticket of the party. Other States elected the electors by Congressional districts. The general ticket system gained ground over the others until by the year 1860 it was practically universal. The supremacy of the Congressional caucus, supplemented as it was by the power of the legislative caucus in the States, transferred the political authority of a free, democratic people to the hands of a few powerful leaders. The effects of the popular dissatisfaction with this form of party organization were apparent first in the yielding of the caucus in some of the States. The districts where the party was in a minority complained that they were unrepresented in the legislative caucus, and in consequence the local and small form of the caucus began to be used (first in Rhode Island) about 1807. This was known as the "mixed caucus," and was composed of the party members of the legislature together with delegates elected by the party in the district in which the party sent no representatives to the legislature. Some 10 years later still further concession was made to public sentiment (first in Pennsylvania), but which was of an origin similar to that of the legislative caucus. This was termed the "district convention" for the mixed caucus. This also was made up of delegates popularly elected in the counties, along with members of the legislature, but the members of the legislature were permitted to sit in the convention only when they represented counties from which no special delegates had been chosen.

From 1817 to the final overthrow of the legislative caucus, which for nearly all of the States was completed in 1832, the mixed convention was preparing the way for the advent of a truly representative nominating machinery, the State convention. Pennsylvania was again the first State to take the advance step. In like manner the Congressional caucus gave way slowly before the popular distrust, but its ultimate destruction became certain. when, in 1816, it manifested a determination to force upon the Republican party an unacceptable candidate for the Presidency. It was called again in 1820, but, in the face of the manifest temper of the people, decided to take no action. In 1824 it did once more and for the last time put forth candidates, but only a minority of the party members of Congress participated and it commanded no respect.

The Federalist party received a mortal blow in the election of 1800 and was slowly dying throughout the period of the dominance of the caucus. It held no more national caucuses, but in a variety of ways announced its candidates. In 1812 the Federalists held what has been called, though improperly, the first national convention. It was composed of delegates from 11 States, who met as a peace party to oppose the war with England. They adopted the candidates already nominated by the Peace Republicans, who had "bolted" the regular party ticket. During the unsettled period between the Congressional caucus and the national convention, State and local party agencies of diverse forms acted as nominating bodies. The legislative caucus was still active in some States; the assemblies themselves, as such, sometimes chose candidates; mass conventions, county conventions, district conventions and popular mass meetings all nominated Presidential candidates, and some of those gatherings took pains to declare that they would not be bound by the proceedings of an Congressional caucus. All available means were made use of to render clear the final condemnation by the people of the objectionable party organ. Having been tried and found wanting, it was swept aside, to give place to any agency more in consonance with the national spirit. Though a Congressional party caucus is at the present day an acceptable part of the national party organization, it does not exercise the nominating function.

Nomination by conference or by preliminary meetings of party supporters which might be called conventions, had always been practiced in the States and local areas and the use of a convention for nominating the chief executive officers of the nation was the application of a principle already familiar to the people. The first of the long series of modern national nominating conventions was that of the Anti-Masonic party, which met in Baltimore,
8 Sept., 1831, having representatives from 13 States. A long-continued address to the People of the United States, the principles of the party somewhat after the manner of the platforms of later years and Presidential candidates were nominated. The political importance of this convention is not great, and it is significant only as standing first on the list. The two leading parties quickly adopted the convention method in national politics. In December 1831 the National Republicans—successors to the Federalists and predecessors of the Whigs—met in pursuance of a call by a legislative caucus in Maryland. All opposed to the existing administration of Andrew Jackson were invited to send delegates. Eighteen States and the District of Columbia responded and the convention laid plans for rendering the new organ a permanent part of party machinery. The first Democratic national convention, which met in May 1832, was called by New Hampshire politicians and was composed of delegates from all the States except Mississipi. The National Republicans were now giving place to the Whigs, and in the unsettled state of political affairs that party held no national convention in 1836, but legislatures and legislative caucuses put forth candidates. A Democratic convention was held, and that party has thenceforth convened with uninterrupted regularity in national convention to nominate party candidates for Federal elective office. By the year 1840 the Whigs also were equipped with adequate machinery and held their nominating conventions with regularity thereafter.

The national convention cannot be said to have become a permanent part of the party organization until it had provided for its own perpetuation. This was accomplished first by the Democrats when, in 1848, a national central committee, consisting of one member from each State, was appointed by the convention, one of its duties to be the calling of the next succeeding national convention. Similar action by the Whigs in 1852 completed the organization of that party. Previous to that year Whig conventions had been called by a Congressional caucus or by a legislative caucus of some one of the States. The Whig national convention, which, in theory, the gathering up of the myriad expressions of political opinion throughout the whole country, is a long series of State conventions, district conventions, county conventions, city conventions, until the unit of party organization is reached in the ward or township primary, or caucus, made up of individual voters. All this complex machinery is kept in condition for effective action by means of committees appointed in the various conventions. Similar acts of the system vary widely in the several States, but each State has its State central committee with a general supervision of the subordinate party agencies of the State. The national committee has its counterpart to the State committee and Territory. It has general charge of the national interests of the party. Next in rank is the national Congressional committee, first appointed in 1866 by a Republican Congressional caucus. Similarly, a Congressional caucus of the Democratic party took similar action. The Republican Congressional committee consists of one member of Congress from each State or Territory represented by a party member. In the Democratic Congressional committee a State or Territory having no party member of Congress is represented by an outside member of the party. It is the duty of the Congressional committee to supplement the action of the State and national committees and meet especially to take charge of the elections of members of the lower House which occur midway between two Presidential elections. In this matter the committee co-operates with local committees in the Congressional districts of the various States. The party committees hold a most important and responsible position in the organization. They are the permanent party officials who formulate the party rules, administer the enormous party funds and have general control over party business.

Since about the year 1880 the convention system has undergone considerable modification in the direction of legislative control of nominations. Under the fully developed system direct nomination is confined to the local officers in precinct, ward or township, where the primaries are held. Here the individual members of the party by their direct votes nominate the party candidates for local office. Candidates for the larger areas, city, county, and judicial district, Congressional district and State are nominated indirectly by delegates chosen at the primaries. Two methods of procedure are in use at the primaries. The older is that of the mass meeting of party voters, most commonly called the caucus. It is organized by electing a chairman and a secretary and the voting for local candidates or for delegates may be by ballot or by any method prescribed by the party rules or by vote of the members present. The newer method is that of the primary election, which substitutes for the mass meeting a regular election held under the control of party or State officers, where qualified members of the party cast their votes one by one, for candidates for office or for delegates to nominating conventions.

The adoption of the primary election system does not necessarily do away with the nominatorialigatory to the national conventions, which in theory, the gathering up of the myriad expressions of political opinion throughout the whole country, is a long series of State conventions, district conventions, county conventions, city conventions, until the unit of party organization is reached in the ward or township primary, or caucus, made up of individual voters. All this complex machinery is kept in condition for effective action by means of committees appointed in the various conventions. Next in rank is the national Congressional committee, first appointed in 1866 by a Republican Congressional caucus. Similarly, a Congressional caucus of the Democratic party took similar action. The Republican Congressional committee consists of one member of Congress from each State or Territory represented by a party member. In the Democratic Congressional committee a State or Territory having no party member of Congress is represented by an outside member of the party. It is the duty of the Congressional committee to supplement the action of the State and national committees and meet especially to take charge of the elections of members of the lower House which occur midway between two Presidential elections. In this matter the committee co-operates with local committees in the Congressional districts of the various States. The party committees hold a most important and responsible position in the organization. They are the permanent party officials who formulate the party rules, administer the enormous party funds and have general control over party business.
rect way candidates for judicial and State offices may be nominated and the convention within the State be wholly displaced.

The discussion of the convention involves radical changes in party organization. The permanent committees, the platforms, the rules for the control of party conduct, have all been the product of party conventions. When the convention nominates or endorses the candidates to be voted for at the general election. The Minnesota primary election under State supervision is for all parties, who must all vote at the same place and on the same day. This procedure makes it easier to confine the vote of each party to its own members. Under this law the candidates for State offices are not subject to nomination at the primary. The object of this exception was to preserve the State convention and render it convenient for party leaders to meet in conference and make declarations of party principles. Numerous States have since adopted a compulsory primary system. Many of them require State as well as local officers to be thus nominated.

State control of party nomination leads to legal definition of party membership. Only members of the party have a right to vote at the primary. In Massachusetts, participation in a primary election that is not open to all parties, a man for voting at the primary of any other party for the ensuing 12 months without a formal legal notice of a change of party choice. Direct nomination at a primary election creates a demand for preliminary nomination of candidates, more or less formal, within the party itself. Party caucuses and conferences are utilized for this purpose. See Democratic Party; Republican Party; Whig, for the purpose.

13. THE COLONIAL AND TERRITORIAL SYSTEMS. Under the generally well-known name of 'colonial government,' the United States has developed one of the best systems of colonial government that has ever existed. When, acting under the suggestions of Maryland, several of the colonies between 1780 and 1784 surrendered to the Federal authority their claims to lands west of the Alleghenies, some provision had to be made for the government of them. This was done by the Ordinance of 1784, which provided for (1) the division into States; (2) the establishment of temporary government; (3) the establishment of permanent governments and the admission of the prospective States into the Union as full States when a certain number of population had been reached; (4) the maintenance of a republican form of government in the States; (5) and the submission of each new State to the Articles of Confederation. Grayson's Land Ordinance of 1785 made provision
for (1) the survey of the lands; (2) its division by north and south and east and west lines into townships six miles square; (3) and finally its sale in lots to purchasers. By 1787 all of the land north of the Ohio River, known as the Northwest Territory (q.v.), had come under the jurisdiction of Congress. Meantime an emigration company, called the Ohio Company (q.v.), had been formed in Massachusetts for the purpose of exploiting and settling these western lands. It had failed of success partly because settlers were unwilling to go to a land where so little guarantee was made for personal rights as in the Ordinance of 1784. The head men of the company, therefore, petitioned Congress for legislation which would give the guarantees desired. The result of this petition was the passage of the Ordinance of 1787. This contained the personal rights asked for, such as trial by jury, habeas corpus, etc., made arrangements for the treatment of the Territory as one, or later as two, districts, and made provision for two or three judges, the Territorial government. At first a governor and three judges appointed by Congress were to act as a legislature, as well as fulfill their own special functions as executive and judiciary. When there were 5,000 free male inhabitants of voting age in the district, they were to receive authority to elect a general assembly or lower house of a legislature but the upper house or legislative council of five members was to be appointed by Congress from a list of 10 names submitted by the lower house. The two houses meeting jointly were to choose a delegate to Congress who was to have a seat and the right of debating but not of voting. The governor judges and administrative officers were still appointed by Congress. The keystone of this ordinance and that which placed the American colonial system above all other systems was the provision which allowed the division of the Territory into three to five parts and when any one had 60,000 inhabitants it was to be admitted to the Union on an equality with the other States.

The Northwest Ordinance has formed the basis for later territorial developments in the United States. As strong doubt was expressed as to the right of Congress of the Confederation to pass such a law, the first Congress under the Constitution confirmed the ordinance by the Confirmatory Act of 1789 and gave to the new President all the powers therein exercised by the old Congress. This it was enabled to do under the clause of the Constitution which reads that Congress shall have power "to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States." In 1796 Congress passed, for the territory south of the Ohio River, an ordinance which was almost the same as the Northwest Ordinance.

With the great additions of territory (see Territorial Expansion) to the United States by the Louisiana and Florida purchases and subsequent wars and treaties came the necessity of providing territorial governments. All of the provisions were similar to that outlined in the Ordinance of 1787. As all of the land now comprised within the United States, with the exception of the original 13 States, Vermont, Kentucky, West Virginia, Texas and California, was at one time or another under territorial government, it is easily realized how important a good colonial or territorial system of government has been to the United States. The territorial governments, on account of their common basis, have been very similar, even though entirely dependent on the will of Congress. At the head of each territorial government stood the governor. He, with any administrative officers needed, was appointed by the President for a term of four years and was removable by him with the consent of the Senate. In earlier times the governor was usually sent out from the East, but later some man prominent within the Territory was chosen. The President also appointed judges for the Territories for terms of four years. The male inhabitants of the Territory, of full age, were allowed to elect a legislature of two houses, a council and a house of representatives. The legislature could pass laws on a large variety of subjects and arrange for local and municipal governments. The governor, howe, had no more veto power than his laws, but they could be passed over his veto. Congress could at any time override statutes passed by a territorial legislature. This, however, was not often done. The Territory had the privilege of sending a delegate to Washington, to sit in the House of Representatives. He has the salary and all the rights and privileges of a regular member of that House, except the right to vote. Congress could, of course, withdraw a territorial government at any time, but this was seldom done. When the Territory reached a certain population (the number has varied much), Congress could admit it as a State by ratifying and accepting a constitution already drawn up by the people, or it could pass an Enabling Act. Under this the voters elect a convention to draft a constitution. If this was accepted the Territory forthwith became a State on an equality with other States of the Union. Congress at times imposed certain conditions in the Enabling Act. Whether these conditions were binding on the State if it afterward disregarded them is a mooted point.

Besides the Territories organized as above, among which the Hawaiian Islands, acquired by annexation in 1898, may be included, there were at times certain lands under the jurisdiction of the United States, which may be called unorganized territories. These were Indian Territory and Alaska. In both of these the population was largely Indian and that accounts for their different treatment. Indian Territory had a government with a legislature, but it sent no delegate to Congress like the other territories, had no organized government like theirs and in reality was only a form of local government which Congress permitted to exist for the time being and which it could abolish at pleasure without feeling that it was violating any of the rights or privileges which in the organized Territories were looked upon by the inhabitants as guaranteed to them by a compact with Congress. Alaska did not have for a time as complete a government as Indian Territory. By an act of 1899 Congress provided for a governor and a District Court. Over Alaska came an influx of white people at the time of the discovery of gold in the Klondike. Congress had to pass acts in 1899 and 1900 making more careful regulations for the government. In 1912
Alaska was organized as a Territory with a government similar to that given to the older Territories, but with more subjects referred to Congress.

The United States had to confront new problems in the government of colonies or Territories when Porto Rico and the Philippines were acquired in 1898. These islands could not be treated like the older Territories of the United States. There were those, however, who held that they were the same and that all laws passed for the United States were applicable to these outlying domains in the same way as they were to the Territories within the United States. Still others maintained that such was not the case and that laws passed for the United States did not apply to Porto Rico and the Philippines. The latter view was upheld by the Supreme Court in the Insular Cases decision in 1901. This made possible a new colonial system of government for the United States and brought about the abandonment of the principles of the Ordinance of 1787, so far as these island possessions were concerned. A special kind of government was accordingly worked out for Porto Rico and another one for the Philippines. Porto Rico had a governor and other administrative officials appointed by the President, a legislature of two houses, the upper one largely appointive and the lower one elective. The old court of the Spanish régime, including the municipal courts, were retained, but the island was organized as a new judicial district of the United States. A district judge, a district attorney, and marshal were appointed by the President. The qualified voters of the island every two years chose a resident commissioner to the United States who was recognized as such by the departments at Washington. By the Act of 1917 the people of Porto Rico were made citizens of the United States, the upper house was made entirely elective and other changes looking to a government almost comparable to that of the States were made. The governor is still appointed by the President and Congress may annul or modify the legislation. For the Philippines a still more exceptional form of colonial government was established. The inhabitants were allowed to participate in the municipal government but were not allowed to have a representative legislature. The executive power was in the hands of a commission of five members appointed by the President. By subsequent acts and especially by one of 1916 more autonomous government was given. Though the governor and some other officials are appointed by the President there is a legislature of two houses elected by the people and it elects two commissioners to go to Washington. No provision has been made for the eventual admission of either Porto Rico or the Philippines to statehood.

Guam, Tutuila (Samoa) and the Panama Canal Zone are under military governors appointed by the President. The Danish West Indies just acquired are under a temporary government by the boards with governors appointed by the President.

With the addition of these outlying dependencies to the jurisdiction of the United States the high ideal of colonial territorial government set by the Ordinance of 1787 has actually been followed. The United States has found that it has had to handle for a time these outlying domains in much the same way as England, France and Germany handle their colonies and with little regard to those principles which were so vigorously upheld in the Declaration of Independence. Gradually, however, it puts into operation the principles for which it has always stood. In addition to the Territories, organized and unorganized, and to the dependencies, the United States has also assumed the government of the District of Columbia, national forts and sites and Indian reservations. The regulations for these, however, scarcely form a part of the colonial or territorial system of government. The same is true of the virtual protectorates which the United States exercises over Cuba and Panama.

Director of the Division of Archæology and History of the University of the State of New York.

14. THE CABINET. The Cabinet, as the name is used in American affairs, is the President's council. It is composed of the heads of the nine great executive departments. Four of these are older than the government under the Constitution, for the Old Congress had found it necessary to establish a Department of Foreign Affairs, of the Treasury, and of War. The Post Office Department was established by the Continental Congress before the Declaration of Independence. The framers of the Constitution assumed that such departments would continue to be necessary. They perceived also that the heads of these should be at the service of the chief executive. Hence the provision that he—the President—may require the opinion in writing of the principal officer in each of the executive departments, upon any subject relating to the duties of their respective offices. The first Congress, however, by the Act of 1789, re-established the executive departments already existing. To the Foreign Office it added certain internal affairs, and changed the name to the Department of State. The office of Attorney-General was also established by the Constitution in 1789, being provided for by the great act that established the Federal courts. In 1870, 22 June, the Attorney-General was made the head of a Department of Justice. Four additional departments have been created as the expansion and progress of the country have demanded. The Department of the Navy was established in 1798, 30 April; the Department of the Interior, in 1849, 3 March; the Department of Agriculture, in 1889, 9 February; the Department of Commerce and Labor, in 1903, 14 February; and the Department of Labor, in 1913, 4 March. Although the Constitution refers to two places to the heads of departments, it does not imply that they are to form a council to advise the President on questions outside of their respective departments. The distinction between the two functions is illustrated by the following episode. During the interval, 21 February to 1 January, 1869, it was announced that Stanton was on duty at the War Office, while Lorenzo Thomas, who had failed to get possess-
vision of the office, was attending the Cabinet sessions. Left without a council by the Constitution, Washington sought one for himself. At first he turned to the Senate. He had constitutional authority for advising with this body on the two subjects of appointments and treaties. But his visits to the Senate chamber were coldly received. At the same time he seldom consulted individuals. On 27 Aug. 1790, he formally requested written opinions, on a question of general policy, of Hamilton, Jefferson, Knox, Randolph, Jay and Adams. These men were respectively the Secretary of the Treasury, Secretary of State, Secretary of War, Attorney-General, Chief Justice and Vice-President. On 4 April 1791, the President addressed a letter to the three secretaries which brought about the first cabinet councils to which there is any reference. The occasion was his own absence from the seat of government. He herein expressed the wish that if any important cases arose during his absence, the secretaries of the Departments of State, Treasury and War may hold cabinet meetings and determine whether they are of such a nature as to demand his personal attendance at the seat of government. If the Vice-President is at the seat of government, the President wishes that he also be consulted. One or more consultations were held agreeably to this suggestion. Besides the officers specified, the Attorney-General was present. During the year 1792, the three Secretaries and the Attorney-General occasionally met the President at his house for consultation. But it was in 1793 that frequent consultations gave the council a definite place. The circumstance of this was the conduct of Minister Genet. In August of this year, Jefferson referred in his diary to the President’s council as “our cabinet.” In the administration of John Adams the word was quite commonly used. It has never been introduced into the laws; but it can be found in the debates of Congress and in the President’s messages. The rule that Washington’s cabinet must be of his counselors was to summon those officers who filled sufficiently high places in the government, and who held office at his pleasure. Under Jefferson the whole executive body was for the first time at harmony with itself. The Cabinet now had five members. For a period of seven administrations it maintained the status of an advisory body which expected to be called for consultation on all important questions, and at the same time had no power to enforce its views upon the chief executive. This was interrupted only by the disorders that resulted from weakness in the War and Navy Departments during the War of 1812. All the Presidents of this period succeeded the office after being Secretary of State. Moreover, Madison, Monroe and John Quincy Adams retained in their Cabinets a number of their colleagues of the preceding administration. This stability was favorable to the Cabinet prestige. Jackson reduced the Cabinet to a more humble status. However, the popular idea of the “Kitchen Cabinet” is a mistake. During the period 1829–31 strained personal relations growing out of a scandal in the Treasury forced the Secretary of War to make it almost impossible for the six heads of departments to meet together. The Postmaster-General was now included with the others. But it does not appear that the President was at this period guided by the counsels of the editors who had helped to elect and had received positions under the government. He was on most cordial relations with the Secretary of State and the Secretary of War. After the reconstruction of the Cabinet, councils were held regularly. He consulted them in the removal of the deposits from the Bank of the United States, he acted contrary to the Cabinet opinion, and he reached a chief adviser in Amos Kendall, who is the most remarkable figure in the commonly accepted “Kitchen Cabinet.” It might be expected that a great war would give to the Cabinet an increased importance. This was not the case in the War of 1812 or the Spanish War of 1898. The Cabinets of Madison and McKinley did not meet the extraordinary demand upon them with notable strength. But those of Polk and Lincoln profited by their opportunity. The period from Jackson to Polk was one of Cabinet debasement. That from Fillmore to Lincoln was one of Cabinet determination where the Cabinet reached its highest position and now had seven members. It had also begun to meet at regular times. Pierce has been the only President who made no change among the heads of departments during four years. This has been pointed to by Southern writers as a proof of great power to control men. But Pierce was led by his council. The Cabinet ascendency culminated under Buchanan. During the last months of his administration, the President was under the dictation of Black and Stanton, the Secretaries of State and War. The high position occupied by the Cabinet during the Civil War was not at the expense of the Presidential prerogatives. If Seward and Chase and Stanton were exercising extraordinary powers, Lincoln was doing the same. Indeed he consulted his advisers in the matter of the Emancipation Proclamation only after the document was already composed. The most momentous episode in Cabinet history is Johnson’s attempt to force his counsellors to maintain the War Department contrary to the Tenure of Office Act. This led to the impeachment of the President. Congress repealed the act early in the next administration, thereby acknowledging that it was an encroachment on the President’s rights. Since the reconstruction of the government, the status of the Cabinet has been on the whole as it was before the administration of Jackson. In Cleveland’s first administration, the eighth member was added; and under Roosevelt, the ninth. The President’s council bears the name of the great executive organ of the British government. But its functions are much inferior. The ministers who compose the British Cabinet are members of Parliament. They digest the great bills that are to be introduced, and direct their course in the House of Commons and the House of Lords. Their functions thus combine those of the standing committees of Congress with the direction of executive affairs. Under the American system the executive officers are rigorously excluded from the floors of Congress. The chief avenue through which the heads of departments can influence legislation is the standing committees. The frequent question of admitting Cabinet members to the floors of
Congress for the purpose of giving information and of allowing them to participate in the debate of questions pertaining to their respective departments has been before Congress at all times. See Cabinet; Kitchen Cabinet; Executive.

15. THE ALIEN AND SEDITION LAWS. Alien and Sedition Laws, in the political history of the United States, were four laws passed by the Federalist party in Congress, July 14, 1798, during President Adams administration. These laws gave rise to the first nullification proceedings in the South, namely, the Kentucky Resolutions (q.v.), passed in November 1798, and the Virginia Resolutions (q.v.), passed in December 1798, and resulted in the final defeat of the Federalist party. The Federalists, who had controlled the government from its very inception, resented all hostile criticism of their conduct of national affairs and spurned the charge made by the Republicans that the Federalists were strongly inclined toward England and were trying to embroil the American nation in a war with France. Especially obnoxious to them were the embittered exiles who had been flocking to the shores of America from 1790. These exiles, who were French sympathizers, and, therefore, affiliated with the Republican party, attempted to create sentiment in favor of France, thus blocking the way of the Federalists who desired to punish France for her outrageous attacks on American commerce and for her hostile attitude to the United States after the conclusion of the Jay Treaty. Moreover, by obtaining control of journals here and there throughout the country, or by establishing sheets of their own, they would publish scurrilous and offensive attacks upon the ruling party of Federalists, which the latter felt very keenly.

In 1797 the Federalists had a majority in the Senate, but the House was Republican. Therefore, the measures for defense against French aggression, which the Federalists attempted to pass, were all defeated by the Republicans, who had the majority in the House. But the timely publication of the "X. Y. Z." correspondence (q.v.) showing the scandalous conduct of Talleyrand and the French Directory produced such an outburst of popular indignation against France throughout the entire country that the defenders of France were completely silenced, and even the moderates, who had sided with the Republicans, went immediately over to the support of the Federalists. The popular demands were for the impeachment and removal from office of the President and the vindication of the course of the Federalists, who gained control of both houses and now were supreme. No sooner had they secured entire control of the reins of government than they began to carry out their party program of suppressing all hostile criticism of federal administration, even at the risk of stifling liberty and freedom of speech.

Accordingly, in 1798, the Federalists enacted three laws concerning aliens: (1) The new Naturalization Act, passed 18 June; (2) the Alien Acts, passed 25 June; (3) the Sedition Act, passed 6 July. The new Naturalization Act prolonged the requisite term of residence before naturalization from 5 to 14 years and the term after declaration of intentions from three to five years; denied alien enemies naturalization and required all white aliens to be registered on arrival, under penalty, and such registry to be the only proof admitted on application for naturalization. The Alien Act authorized the President, for the next two years, to order out of the country any aliens whom he thought dangerous or engaged in conspiracy. Any alien thus notified who should be found at large without the President's license might be imprisoned for three years and could never thereafter be admitted to citizenship. The Sedition Act empowered the President to arrest or deport all resident aliens when war was declared against the United States. As finally approved by the President, the first section of the Sedition Act made it a high misdemeanor, punishable by a fine of $5,000 and five years' imprisonment, for persons unlawfully to combine and conspire to oppose any measure of the government directed by proper authority or to interfere with the operation of any law of the United States or to intimidate any person from accepting or holding Federal office, or to commit, advise or attempt any insurrection, riot or unlawful assembly. The second section prescribed that the writing, printing or publishing of any false, scandalous and malicious writing against the government of the United States, or either house of Congress, or the President, with the intent to defame, to bring any of them into contempt or disrepute, or to arouse against any of them the hatred of the good people of the United States or to stir up sedition within the United States, or to excite any unlawful combination or resisting any law or lawful executive act, should be punished, on conviction before the United States court having jurisdiction, by a fine not exceeding $2,000 and imprisonment not exceeding two years. The third section provided that the truth of the matter contained in the publication might be given in evidence as a good defense, the law and fact under the court's direction to be determined by the jury. A clause added by Bayard of Delaware limited the term of operation to 4 March 1801, so that it should expire with the Federalists if they should lose in the succeeding Presidential election and the Republicans should not have the credit of repealing it. These acts were directed against the Republicans as being in opposition to the constitutional rights of the States to permit such immigration as they chose, up to the year 1808 (specifically applicable to slaves), as assuming national powers over the States, usurping the jurisdiction of their States and as violating the general right of trial by jury. On these points
the laws were attacked by the Kentucky and the Virginia resolutions, which Jefferson and Madison drew up, and which suggested nullification as the proper remedy. The alien and sedition laws were obnoxious to the Republicans, not so much on the ground that they were inimical to civil liberty, but rather because they were regarded by that party as an encroachment upon the principle of States' rights. It is this aspect of the laws that gives them their chief interest and importance. The Alien Law, it is to be observed, was not enforced, nor would it have produced much disturbance among the Republicans if it had been strictly enforced. But the Sedition Act, which cut very near the root of civil liberty and was contrary to the underlying principle of American institutions, was enforced, since at least six prosecutions took place under it and Judge Chase invoked its authority for his scandalous partisan decisions. Upon the accession of the Republicans to power, these odious laws either expired by limitation or were repealed.

16. THE JUDICIARY. Origin and Development. (a) State Courts.—While our American judicial system, like so many of our institutions, was modeled after that of England and was permeated by the principles and traditions of the English law, it is also true that for practical purposes it dates not so much from the American Colonial Period as from the years of readjustment following the Revolution. The necessity under which most of the States were placed by the separation from England of adjusting their governmental institutions to meet the demands of an independent existence afforded an opportunity for working out changes in their judicial systems which could not under any circumstances have been long postponed. Colonial administration of justice had been marked by serious defects. The judicial function was shared by executive and even legislative officials. The courts were, in the main, manned by untrained magistrates who dispensed justice according to their notions of common sense and fair play rather than according to established and uniform rules of law. The State courts which came gradually to replace this archaic and inadequate system followed in general the model of the then existing English judiciary. In the first place, there were the justices of the peace and local inferior courts for petty cases. There were, secondly, superior courts having original jurisdiction in civil and criminal cases and organized on a scheme either of districts or circuits. In the third place, there were courts of last resort usually exercising nothing but appellate jurisdiction. Some States further complicated the machinery of justice by setting up intermediate appellate courts occupying a place between the second and third groups just referred to. This general arrangement of courts still forms the backbone of our State judicial organization.

(b) Federal Courts.—Experience under the Articles of Confederation demonstrated the necessity of a separate system of Federal courts. The attempt to rely upon State tribunals, supplemented by the feeble efforts of a judicial committee of the Congress, failed miserably. The framers of the Constitution recognized that there must be national courts to deal with at least three important groups of cases: first, disputes arising between the States of the Union; second, disputes arising from the relations of the national government to foreign nations, such as matters covered by treaties; and third, controversies over the meaning of the Constitution itself or the laws passed in pursuance of it. Since all these cases could if necessary be taken care of by one Federal tribunal, the framers of the Constitution contented themselves with providing for the organization of a Supreme Court of the United States and stipulating that such inferior courts should be created 'as Congress may from time to time ordain and establish.' Not merely the details but the broad outlines of the judicial system of the United States are accordingly to be sought in the acts of Congress rather than in the clauses of the Federal Constitution. The first Congress of the United States enacted the famous Judiciary Act of 1789, organizing the Supreme Court, establishing a system of inferior courts, and marking out the jurisdiction of each. With some amendments this act formed the basis of the entire system of Federal courts until it was replaced by a revised Judiciary Act in 1911.

Federal Judicial Organization.—At the present time the judicial system of the United States comprises three grades of courts for the transaction of ordinary judicial business and two special courts: (1) The District Courts, 80 in number, form the lowest grade of Federal tribunals. They try civil and criminal cases and have original jurisdiction only. They are the only Federal courts in which a jury is used. Each district has a Federal district attorney and marshal to facilitate the work of the court and enforce its decrees. The jurisdiction of the District Court attaches in two types of cases. The first is the group of cases involving the interpretation or application of the laws, treaties or Constitution of the United States, cases which are referred to as involving a "Federal" question. The second kind of case is that in which the legal rights of citizens of different States are involved. Here the basis of jurisdiction is "diversity of citizenship." The District Courts hear cases both in law and equity following the rules of procedure suitable to each. (2) The intermediate Federal courts are the nine Circuit Courts of Appeal created in 1891 to relieve the Supreme Court of some of its burden. These courts, sitting both in law and equity, hear appeals from the District Courts and in certain cases not involving the constitutionality of laws have final jurisdiction. In cases where the constitutionality of a law is involved of course lies to the Supreme Court. Prior to 1911 a group of courts known as Circuit Courts stood between the District Courts and the Circuit Courts of Appeal, but in that year they were
abolished and their work given to the District Courts. (3) The Supreme Court of the United States is the court of last resort on all questions brought on appeal from the Federal courts and in all cases removed from the State courts for a determination of the meaning of the Constitution and laws of the United States. It has original jurisdiction in all cases between a foreign government and public ministers of a foreign government and those to which a State is a party. The court consists of a chief justice and eight associate justices and a majority of the court is necessary to decide a case. (4) In addition to the courts of general jurisdiction just described, there are two special Federal courts. One of these is the Court of Claims which has jurisdiction in all cases involving claims of a contractual nature against the Federal government. The Court of Claims has no power, however, to give effect to its own judgments. Successful litigants before it are obliged to look to Congress for appropriations to satisfy the awards made. The other special Federal court is the Court of Customs and Patent Appeals which, in cases of law as the name indicates, hears appeals upon all questions relating to the administration of the tariff laws. Its jurisdiction in these matters is final.

While in the main the State and Federal courts operate each group in its own sphere and deal with the questions arising under the Constitution and laws of the government of which it is a part there is, as has been intimated, some overlapping of functions and jurisdiction. In the first place, although State court not even excepting is the justice of the peace is authorized and may be called upon to render a decision upon a question involving the construction of the Constitution, laws or treaties of the United States. The power of the State courts to deal with these Federal questions need not be regarded as final, however, and an appeal lies to the United States Supreme Court itself. In the second place, in cases in which its jurisdiction rests upon diversity of citizenship, a court of the United States has exclusive jurisdiction. Congress is forbidden by the Constitution to diminish the salary of any United States judge during his term of office. The method of choosing State judges varies as might be expected in different States. Three general methods prevail. The first is election by the people. This method is used by all States except in the East. The third way of choosing judges is by the legislature. This method was common in the early States, constitutions, but is now rare. State constitutions, all of the older group. The relative merits of the choice of judges by popular election and by appointment by the governor are hotly debated. In behalf of popular election it is argued, first, that it is the only democratic method and is necessary to prevent judges from becoming autocratic and irresponsible; second, the people know as much and usually more about the qualifications of judicial candidates than do the governors who must rely on the advice of party leaders; third, the courts in passing upon the constitutionality of laws exercise a function which is not wholly free from political aspects and which should, therefore, be performed under the scrutiny and ultimate control of the people; fourth, the alleged evils of popular election of judges may in the main be eliminated by making the elections strictly non-partisan in form and procedure; finally, the choice of judges by the people has worked in practice while many poor appointments have been made by State governors. The popular election of judges is attacked on the following grounds: First, the people have neither the knowledge nor the interest necessary to pass upon the qualifications of judicial candidates. Second, since this is true there can be no real popular choice of judges and what is called popular election is really the popular ratification of appointments to judicial positions made by irresponsible party leaders. Third, the qualities which make a good candidate in an election are not the qualities which make a good judge. This means that the best men frequently fail of election while the unfit may succeed. Fourth, the sense of security and independence which a judge must enjoy if he is to administer justice fearlessly and impartially is too often destroyed by the realization that decisions which are unpopular even though sound may jeopardize his re-election. Finally, the experience of the Federal courts as well as of the State courts which are chosen by the governor show that in practice the method of appointment obviates the evils mentioned above and results in the choice of men of the highest ability and integrity. It may be observed that the bar of the county is fairly unanimous in its opposition to the election of judges.

The term of office of State judges ranges from life or good behavior to a few years. Life tenure was originally the rule but has now become the exception since the principles and arguments justifying the popular election of judges also justify the practice of allowing the people an opportunity to retire them from office at the end of a fixed term of years. It is customary to choose the judges of the higher courts for longer terms than those of the lower courts.

There are three general methods by which State judges may be removed from office. The first and most common is the process of impeachment by the legislature. This method is available in every State except Oregon. The second is by address of the two houses of the legislature to the governor asking for the removal. In such a case the judge in question is usually allowed some kind of hearing before
either a committee of the legislature or the governor. The governor is not bound to remove a judge even though asked in this manner to do so. This is not a common method of removal. The third method of removal is by recall by the people. There are five States (1919) in which judges may be recalled. Some States which permit the recall of executive officers have not extended it to the courts. Bitter controversy has arisen over the propriety of subjecting judges to the recall. It is urged in defense of the scheme that judges are, after all, merely servants of the people and that it is simply a natural and logical application of the principles of true popular government to make the judges feel their responsibility to the people by giving the people an effective means of enforcing that responsibility. More conservative students of public affairs and especially the bar view the recall of judges with alarm. They argue that it will destroy the independence of the bench by exposing judges to the constant temptation of the public for any unpopular decision they may render, no matter how firmly justified that decision may be by law. Thus the courts would cease to serve as bulwarks for the protection of individual liberty against the onslaughts of the majority. Brief mention may be made of a plan for the selection and retirement of judges which has been worked out by some distinguished members of the legal profession and is being promoted by the American Judicature Society. This plan provides for the election by the people for a short term of a chief justice who is to perform not merely judicial duties but also administrative duties in directing the work of the entire judicial organization. This chief justice is to appoint all the other judges for a term of three years. After a judge so appointed has served three years the question is presented to the voters: Shall Judge —— be retired? This is a non-competitive recall election since no candidate opposes the sitting judge as would be the case under the ordinary recall. If the people vote to recall the judge his successor is appointed by the chief justice. If he is not recalled he continues in office for six years when he is again subjected to a non-competitive recall election. If he is not recalled he continues for nine years when the same process is repeated. If popular confidence is again expressed in him he then holds office for life. It is felt that this plan affords the proper degree of popular control over the judicial department of the government without destroying the independence of the courts by making them the playthings of popular passion or partisan machinations.

Power to Declare Laws Unconstitutional.
— The power exercised by the American courts of holding unconstitutional and void acts of the legislature which are, in their judgment, in conflict with the constitution, State or Federal, is a power as unique as it is important. In no other important country in the world do the courts perform this function. Furthermore, it is not a power which the national Constitution or any of the early State constitutions expressly conferred upon the courts. It was evolved in a few isolated cases just after the Revolution, but it may be said to find its firm foundation as a principle of American constitutional law in the classic opinion of Chief Justice Marshall in 1803 in the case of Marbury vs. Madison. It was there pointed out that our written constitution is a limitation upon legislative power. As such it becomes worthless if the legislature is left free to violate it with impunity. Some authority must, therefore, exist to enforce the constitutional limitations. This authority is most appropriately confined to the courts. They are charged with the duty of determining what the law is in order that they may apply that law in the adjudication of the rights of parties in litigation. When the constitution and a legislative enactment are in conflict this duty of determining what the law is involves the duty of enforcing the constitution, which is the supreme law of the land, and of ignoring or nullifying the law. In so doing the courts are merely recognizing the obligation of the oath of office by which they bind themselves to uphold the Constitution of the United States. While the foregoing reasoning has seemed on the whole convincing and more than a century of acquiescence in the exercise of the power has relegated the question whether the courts were in the first instance justified in exercising it to the realm of academic and historical controversy. Not a few of the State constitutions now provide expressly for the judicial decision of questions of constitutionality and there is no State in which the courts do not exercise that power.

In exercising the power of deciding the constitutionality of statutes, the courts have imposed upon themselves certain restrictions. The more important of these may be enumerated as follows: First, the court will exercise the power only in actual litigation between parties whose material interests are involved. This means that unless required by the constitution to do so, as is the case in some half dozen States, the courts will not render advance or advisory opinions. Second, laws will not be declared invalid merely because they are regarded as unreasonable, inexpedient, unjust, or contrary to the "spirit of the constitution." Third, questions of constitutionality will not be decided unless their decision is necessary to determine the case before the court. Fourth, courts will not concern themselves with the legislative motives lying back of the enactment of a law in determining the validity of the law. Fifth, courts will not use the power of judicial review in regard to political questions, questions which the courts regard as confided to the discretion of a co-ordinate branch of the government. Sixth, every statute is presumed to be constitutional and any reasonable doubt upon that question is to be resolved in favor of its validity. Adherence to these general principles has had a useful effect in preventing the abuse by the courts of their power to invalidate laws. It may be safely asserted that, in spite of some questionable decisions, the exercise of this power by the courts has been wholesome and beneficial and constitutes in the minds of many the most valuable American contribution to political science.

Criticism of Courts and Proposed Reforms.
— It is true that the State and Federal administration of justice has been the subject of bitter attack, not only from laymen, but also
from the bench and the bar on the ground of its inefficiency. The evils which are universally admitted to exist are as follows: First, the administration of justice is entirely too slow. It is not uncommon for a case to be two or three years behind in its work. It is not unusual for a case to be in the courts five or six years before final decision can be had. There are extreme cases in which 20 years or more have elapsed between the time a case was first placed upon the judicial docket and the time of ending the litigation. Second, most of these delays are wholly unnecessary and do not serve in any way the ends of justice. This is due to our cumbersome and highly technical scheme of judicial procedure. It has sometimes occurred that fully half of the cases decided by a State Supreme Court are cases which raise, not questions of substantive law, but questions of legal technicality. Third, as a result of the evils just mentioned, justice, instead of being cheap and readily accessible to all, is too often placed beyond the reach of the poor man. Among the more important proposals which have been made to secure more efficient administration of justice, may be mentioned the following: (1) In the first place, it is urged that rules of procedure must be radically simplified and that this should be done, not by legislators who are unfamiliar with the real problem in hand, but by the courts themselves. Where courts have been allowed to recast these rules the results have been good. A notable case of this is the recasting of the rules of equity procedure by the Supreme Court of the United States. (2) A second remedy is to restrict the right of litigants to appeal to those cases in which the ground of appeal is actually related to law and justice. Reversals and retrials on pure technicalities should be abolished. (3) There is a movement in the direction of modifying the power of the common law jury especially in civil actions, making the procedure in jury trials less cumbersome, and even dispensing with the service of a jury in many cases. There is need for a radical change in the method of selecting jurors for criminal trials, a process which frequently consumes weeks or even months under our present system. (4) In the fourth place, there has been proposed the division of labor by which judicial work and separate courts be organized to deal with particular kinds of litigation. In this way judges would acquire an experience in dealing with certain types of cases which would greatly add to the efficiency and expedition with which these cases could be handled. Some steps have been taken in this direction in various places by the organization of probate courts, juvenile courts, women's courts, domestic relations courts, traffic courts, and the like. (5) A most thorough-going and comprehensive program of reform is sanctioned by the American Judicature Society and many prominent members of the bar. It calls for a radical change in judicial organization. It is proposed that the court for the highest court of a State constitute a single court. This court should be composed of three branches to deal with petty or local matters, with cases now coming up in the State courts of original jurisdiction, and with all appeals. Each of these divisions would be under the administrative supervision of a chief justice who would have authority to assign the individual judges to special types of judicial work, to transfer judges from courts which were crowded to those which were not, to take cases from the court to which they were assigned to make room for other cases, to assign special judges, to create new courts, or to move judges to the courts to which they are most needed. Such courts, of course, have the power to make their own rules of practice. The Municipal Court of Chicago is organized to a very large extent along these lines and has proved an interesting and suggestive model to those interested in the reform of our judicial system.

With the thoughtful attention which is being given to these problems by men of the highest ability and with the ever-growing popular demand for some relief from our present methods of administering justice, it is to be hoped and expected that progress in the direction of reform may be prompt and vigorous.

17. DIPLOMACY. No complete history of the diplomacy of this country has yet been written. Much of its diplomatic effort has been spent upon private claims and national affairs, commercial rather than political. A history of these would be dull reading indeed. Moreover, it must be confessed that for long periods in our national life, our country played but an inconspicuous part in the world's politics, and upon such periods the historian must touch but lightly. To sketch the diplomacy of a century and a third, observing a proper sense of proportion; to trace the growth of policies, which have marched with the nation's growth; to characterize treaties which are the crystallized results of diplomacy; yet withhold to keep within the narrow limits of this review such as is the case of this article. The treatment of the subject chosen is partly by periods and partly by topics, the latter where it is desirable to show the continuous growth of a policy or the history of a negotiation running over many years.
The French Alliance, 1778.—How to get military supplies and aid; how to win a standing among nations; these were the problems with which the Revolution had to grapple. The difficulties were tremendous. No foreign state was in political sympathy with the colonies. Recognition of their independence meant war with Great Britain. The only string to the bow was neutrality to Great Britain. The only states likely to feel such hostility were Spain—on account of Gibraltar—and France, driven out of Canada by the English only 15 years before. Secret aid had been sent by France in 1776 and 1777 to keep the struggle alive, but open aid was dangerous, unless the colonies showed ability to hold their own. Thus the diplomatic situation waited upon the military one. The success at Saratoga was the turning point. Not in itself but in its consequences it was one of the great battles of the world. For after that the Comte de Vergennes threw off the mask, made treaties of commerce and alliance, thus recognizing the infant state, sent money and aid openly, as the American cause was identified with the common interest—war with England. In all this Franklin was the influential factor. His fellow-commissioners, Deane and Lee, were inferior men. Their instructions from Congress were impossible, to seek recognition, commercial privileges and aid, without reciprocal military engagements. By departing from these, they secured a liberal commercial treaty and a military alliance, binding until the independence of the colonies was secured, peace to be made jointly with the common enemy. These treaties did very much to accomplish American independence. Spain, though in nominal alliance with France, actually gave but trifling help.

The Treaty of Peace, 1782.—There had been overtures and negotiations looking toward peace in 1778 and 1779, but not on the basis of a prior recognition of American independence which the colonies deemed essential. In 1781 various agents to foreign states were united in a common interest, with full power to treat with Great Britain. These were Franklin, Adams, H. Laurens and Jay. Of these Franklin alone had faith in the sincerity of the French government. A change in the British ministry in the spring of 1782, Lord North going out, made negotiation easier. The chief points at issue were: (1) The boundaries; (2) the Northern fisheries; (3) the confiscated estates of Loyalists. Spain intrigued with France against the Mississippi as our western boundary, desiring to confine the new state to the region east of the Alleghanies. But by the westward migration into the Ohio which was already in motion, this was made impossible. In the northeast the Penobscot and Saint John rivers had been urged as boundaries, and a compromise, the Saint Croix, adopted. New England regarded the enjoyment of the fisheries of the Gulf and Banks as essential to her prosperity. Against the covert opposition of France and the indifference of the South, she stoutly held out for large fishing liberties and got them. Full restoration of confiscated estates by the new government was a financial impossibility, was physically difficult, was negatived by the fortune of war. The ultimate object that Great Britain sought from the Americans was a treaty provision that Congress should recommend to the States restitution and compensation to the purchaser for value. This was, and probably was intended to be, a nullity. But it was coupled with the welcome proviso that debts should be collectible and further confiscations stopped. This treaty was provisional, and made without Vergennes' knowledge (which was a violation of instructions) was the distress of France by Adams and Jay. It was put into definite shape the next year, 1783, with French consent and in compliance with Article VIII of the treaty alliance of 1778. This treaty of peace was a diplomatic triumph for the United States.

Attempts to Secure Recognition from Other Powers.—Although Spain was in alliance with France, the ally of the colonies, she added little weight to the coalition, was unfriendly and tricky, feared the result of American independence upon her own possessions and made no treaty with the United States until 1795. Tuscany and Austria also refused a treaty on the plan voted by Congress and accepted by France, as did Prussia, as did Prussia, without a navy, saw no chance of maintaining intercourse should it be established. Congress was ready to accede to the principles of the armed neutrality of 1780, but was not permitted by Russia, its originator. The Netherlands joined this neutral league in spite of British threats. This, with the exposure of an inept negotiation with the colonies, led England to declare war against her in 1780.

The Establishing of Commercial Relations.—This was of the first importance to the new state. Its foreign trade was then relatively more important than now. The French treaty was the only commercial treaty existing until the very close of the Revolution. Decentralization, under the Articles of Confederation, was a serious handicap in negotiating, for it weakened the trade privileges to be offered. After sturdy persistence, John Adams had secured a treaty in 1782, from The Netherlands, much on the lines of the treaty with Portugal. As to these treaties, in the freedom of neutral trade, in the regulation of search, in the definition of contraband and the opposition to privateering, were liberal, and show the influence of Franklin. He continued to coerce the other treaties of amity and commerce, with Sweden in 1783 and Prussia in 1785, both containing much the same features as the earlier ones, and displaying the same enlightened characteristics. Spain came into line in 1795, her treaty restraining our southern boundary also, and in 1799 the expired treaty with Prussia was revived with some changes, due to war time. Jay's Treaty with Great Britain in 1794 was very much more than a treaty of commerce. How it dodged and how it settled many outstanding difficulties will be seen presently. But as a commercial agreement, its unlikelihood to the others enumerated must be recognized. For in it, England, the foremost merchant state, enjoyed not only the trade free goods, but did not like Prussia allow pre-emption of all contraband articles except provisions, but permitted trade without discrimination, admitted consuls and inserted the earliest of our extradition agreements. Upon the basis of these commercial treaties this country's foreign trade was
built up, and much of its prosperity was founded. This is too apt to be overlooked.

Treaties with the Barbary Powers 1787–1805.—This is a curious chapter in American diplomacy, but must necessarily be brief. Like every state trading along the Mediterranean, our own country was forced to pay tribute, to avoid the seizure of its ships and the enslavement of its citizens by the African corsairs. The alternative was to convey our vessels, to put them under foreign protection or to establish immunity by successful war. The treaties with France 1778 (Art. VIII), and with The Netherlands 1782 (Art. XXIII), promised us the diplomatic aid of those countries against the Barbary powers, while both Portugal and Spain on occasion helped our crews. In 1784 Congress authorized direct negotiation, the commissioners being Adams, Franklin and Jefferson. Of these Jefferson preferred war, while Adams thought tribute the less expensive way. They tried to bring the business to a head with other states but failed. Then—through an agent they dealt directly with Morocco in 1787. This treaty regulated commerce, forbade enslavement of prisoners and allowed partial compensation. It looked like the end of the affair but seems to have needed occasional liberal *presents* to be operative. In the next decade treaties were made with Algiers, 1795, carrying 12,000 sequins annually; Tripoli, 1796, with a lump sum of $250,000; and Tunis, 1797; $107,000; the three costing us for their execution some $2,000,000. They contained some curious and very modern provisions, but were alike in forbidding the enslavement of Americans. There were disputes, armed clashes, but nevertheless tribute, until Decatur wiped out the system and the shame in 1815.

Neutrality and Its Difficulties, 1793–1812. — Except for the Civil War, this was perhaps the most critical period in the history of the republic. Gratitude to France, the surviving bitterness toward England, many grievances left by the war and still unsettled, all these inclined the United States toward the French side in the War of the First Coalition. (Art. XI). Twelve months, 1797, $107,000; the three costing us for their execution some $2,000,000. They contained some curious and very modern provisions, but were alike in forbidding the enslavement of Americans. There were disputes, armed clashes, but nevertheless tribute, until Decatur wiped out the system and the shame in 1815.

Neutrality meant a breathing spell. Angered by this, Genet tried to complicate our performance of neutral duties in every way until withdrawn at the close of 1793. (See INTERNATIONAL LAW). Opposition to Washington's course, shared by Jefferson and his followers, gradually built up political parties. Besides old grievances against Great Britain, there were newer ones, which the war with France led to, impressment of seamen from our ships, for instance (see IMPRESSMENT), and the ruin of our trade with the Continent in breadstuffs, by an order making them contraband. A commercial treaty was also badly needed. In 1794 John Jay made the treaty which settled all these points, but only by leaving some of them out. It contained our first extradition agreement. It admitted us to the East and West Indian trade, on the basis of a list of prohibited goods. But in it Great Britain did not renounce impressment. Jay's treaty was ratified in spite of a storm of abuse and opposition and helped American trade immensely in the years to come. Our relations with England and France were like buckets in a well. As friendship with one grew, with the other it waned. So now France began to seize vessels and property, under any or no pretext. When Pinckney went to Paris to remonstrate in 1796, he was rebuffed. Humiliating negotiation went on nevertheless, in 1797, three commissioners being sent instead of one. A national loan and individual bribes were demanded by Talleyrand as a condition of negotiation. It was then that the curious episode of the X. Y. Z. Correspondence (q.v.) occurred. Thus this mission was as fruitless as the other had been. Yet a third one was sent, by Adams, to the dismay of the Federalists and was lucky enough to profit by the revolution of 18 Brumaire 1799, which made Napoleon first consul. For now France contemplated a commercial league against England, and was ready to negotiate. The treaty of 1800 was the result. This did not pay for French spoliations (that was arranged in 1803), but relieved the United States of the various embarrassments of the 1778 treaties, while ratifying that of 1787. It was another valuable step forward. But after an interval of calm, impression became again active, and various outrages were committed by British ships of war off our own coast. All this was dwarfed by the French and illegal paper blockades (see INTERNATIONAL LAW) with which the combatants fought to the injury of the neutral. Our reply was an embargo (see EMBARGO), and useless negotiations with both countries. England's obstinacy and Napoleon's duplicity, coupled with the ardor of our own South, forced us into the ill-judged War of 1812. In spite of all the hampering restrictions of this period, our foreign trade increased largely. Neutrality as established by Washington meant national salvation.

Boundaries and Territorial Growth.—The diplomatic processes which have built up our present limits, out of a country bounded west by the Mississippi and north to the sea might well be of vital importance. To secure it Genet was sent by France as minister. But it found Washington resolved upon neutrality as the only safe course. Maritime war with England would have destroyed our commerce and thrown our affairs into fatal confusion. Neutrality meant a breathing spell. Angered by this, Genet tried to complicate our performance of neutral duties in every way until withdrawn at the close of 1793. (See INTERNATIONAL LAW). Opposition to Washington's course, shared by Jefferson and his followers, gradually built up political parties. Besides old grievances against Great Britain, there were newer ones, which the war with France led to, impressment of seamen from our ships, for instance (see IMPRESSMENT), and the ruin of our trade with the Continent in breadstuffs, by an order making them contraband. A commercial treaty was also badly needed. In 1794 John Jay made the treaty which settled all these points, but only by leaving some of them out. It contained our first extradition agreement. It admitted us to the East and West Indian trade, on the basis of a list of prohibited goods. But in it Great Britain did not renounce impressment. Jay's treaty was ratified by the emperor of Germany, arbitrator, in 1803. This whole northern bound-
ary, from ocean to ocean, was relocated in 1908 by treaty. Meanwhile Alaska had been purchased from Russia in 1867, and here, too, were disputed boundaries. The Canadians de- signed a harbor on that coast, and intimated that they would like to see the treaty so as to draw the line 10 leagues back from the coast, crossing some fjords, not going around their heads. But this was denied by the commission which decided the boundary in 1903. (See Russian Boundary Commission). The Mexican boundary is partly an artificial, partly a riverine one. The Rio Grande is a shifting stream and the Arizona boundary marks have a way of disappearing, so that to this day occasional diplomatic adjustments of the line are necessary. The chief acquisitions of territory prior to 1899 have been by the purchase of Louisiana, 1803; of Florida, 1819; of Alaska, 1867, and by the annexation of that vast region southwest of Louisiana which the Mexican War brought. Each of these events should be studied under its own title. Of their diplomatic aspects but the slightest review can be given here. A long controversy with Spain over the free navigation of the Mississippi to the Gulf, with the implied right to new western settlements, was brought to a close by the transfer of Florida in 1819. That Florida was the key to a future extension southward was fully appreciated, and the United States would not allow the southern boundary to be fixed lower than latitude 31°. Hence the famous 31° line, with later modifications, was established as part of the treaty of Guadalupe Hidalgo. (See Florida boundary.)

French ownership of Louisiana, 1800, was far more dangerous than Spain's could be. The sale of Louisiana, 1803, though earnestly desired by the United States, was effected by Napoleon's naval and financial weakness and change of plans. (See Louisiana Purchase.) Louisiana was a terribly ill-defined region and naturally capable of being stretched. In the far Northwest this process was aided by Gray's discovery of the Columbia, 1793; Lewis and Clark's exploration in 1804-05; Astor's trading-post at its mouth, 1810, and by the Spanish cession of rights on the Pacific (Art. III, treaty of 1819). But the rights so derived were vague at best; the title to the Oregon country was left by treaty for many years in abeyance, and that splendid region finally won by the influx of settlers, Spain, in Florida, for years kept the inevitable at bay with the sword of delay. Finally, in 1819, upon the assumption of our citizens' claims against Spain, up to $5,000,000, the cession of Florida was agreed to. (See Florida.) The territory gained by the Mexican War was partly seized, partly paid for. That war was necessitated by the annexation of Texas, to which Mexico still laid claim and with which she was still at war. (See Mexican War.) The Gadsden Treaty of 1853, by purchase, enlarged this territory.

The Monroe Doctrine and Its Development.—This policy was based on the right of self-defense. It has never given the United States rights not otherwise existing. With much of truth it has joined the genuine principle of self-defense it has joined this paradox, that the stronger the nation grew and the less it had to fear, so much the broader grew the doctrine in its application. Throughout the diplomacy of the past 80 years this has been a thread. Toward Cuba and Hawaii, as well as toward South and central America, it was the determining factor in the national attitude. No native politician can live without accepting it; our foreign neighbors, at one time or another, have for the most part grudgingly submitted to it. Originally it announced three things: that no colonization on this continent by a foreign power would be suffered; that the United States would take no part in European politics; that European intervention, to control the form of government of an American State against its will, would not be tolerated, because it was dangerous to our peace and safety. The first principle was aimed at Napoleon; the last at the last attempt to enforce the Monroe Doctrine was enforced on its original lines as late as 1865, against French intervention in Mexico. (See Mexico.) In and out of Congress it was deemed applicable in a broader way, to limit French control of De Lessep's Panama Canal, in the period subsequent to 1880. With a scope still further enlarged, it was used by President Cleveland in 1895, to curb Great Britain in her boundary dispute with Venezuela. And now it is within bounds to say that the old policy tends to become a new one, "America for Americans," the freedom of this continent from European sovereignty and control. As an evidence of this tendency may be cited Convention 2, signed at The Hague, 1907, for the reduction of force for the recovery of contract debts between states until arbitration has been tried. To many of the American states even this seemed to fall short, they wishing force never to be legalized for the recovery of debts, public or private. See Monroe Doctrine.

Relations with Spanish-American States. —Our diplomacy in this direction has been concerned mainly with such matters as (1) protection from foreign aggression, as of Venezuela from her creditors, in 1903; (2) pressing private claims; (3) exercising an indefinite kind of police power to keep order; (4) trying to bring about unity of feeling and action in various directions, as in the Pan-American and earlier congresses. This sense of a common interest and desire for unity of action have grown markedly in the past 10 years. The various factors which complicate the situation are chronic revolutions, lack of security to the persons and property of foreigners resulting, defaulted national debts, redress claimed by other powers, jealousy of the United States, lack of consideration and of understanding on the part of the United States, a theoretical but not very active republican tie of sympathy. The natural desire of foreign powers is to collect debts or secure redress by force, and if this is prevented by the United States, to make this country responsible. Our problem is to exercise the control which our position on the continent demands, with no assumption of responsibility for the acts of our neighbors. Somewhere between these positions there must be a line drawn; to find it requires a nice diplomacy.

The Slave Trade and the Right of Search. —For nearly 70 years the right of search was a burning question with England in one form or another. The key to the difficulty was the painful recollection of British impressment practice. That was an attempt to arrest a mutineed sailor on a foreign ship on the high seas, that is, within another state's jurisdiction. It was not formally surrendered; it was disused. Early in the 19th century began the anti-slave trade agitation in England, perhaps a unique example of national altruism. To be made effective this
movement needed a universal right of search on suspicion of slave trading, to be exercised by the war ships of one or more states. By treaty with several powers, Great Britain gained this right, but in the case of the United States the memory of impressment made this later exercise of search too unpalatable. Hence, of course, slaves would try to screen themselves by a false use of our flag. To meet this Great Britain set up two new theories. One was, 1810, that since American states, as citizens to trade in slaves, English ships and courts might enforce this prohibition — an absurdity. The other, about 1840, claimed a right of visit (of a foreign ship at sea in time of peace) as distinct from a right of search, which was denied by Mr. Webster and surrendered by Lord Aberdeen in 1859, after years of exasperating controversy. (See International Law). In 1842, by treaty, the two powers agreed to maintain separate squadrons for slave trade prevention, acting in concert when feasible; in 1862, the reciprocal right of search was at last conceded to ships specially authorized. To stamp out the slave trade on land and on sea, Central America cut loose the United States amongst them, united in the act of 1892, but here too a reciprocal right of search existed only when otherwise granted by treaty.

Fisheries and Sealing. — Here we touch the question of fishery rights in the high seas and its coast sea. The treatment of the Northern fisheries was a problem in the peace of 1783; it is a problem to-day. In 1783 the high sea fishery was admitted to be open to the new state, while an extensive grant of coast fishing privileges off Newfoundland, Labrador, Nova Scotia and the Magdalen Islands was added. As a grant, this privilege was terminated by the War of 1812, according to British contention. By consenting in 1818 to the revival of but a portion of the coast fishery formerly enjoyed, the United States accepted this theory. The grant of 1818 was in terms perpetual. Between this treaty and the next, in 1853, much had happened to fishery matters to disturb the peace of the two countries; adverse provincial legislation; the broadening of forbidden waters by the headland theory; exclusion from the large bays under penalty of capture; agreement with the new state, by which the United States guarantees Panama’s continued independent existence, are the final steps in this long process of negotiation and definition. Under these two treaties with Great Britain (the treaty of Hay-Pauncefote) and the treaty of 1903 with Panama, the great canal has been dug, the process requiring 10 years from possession in 1904 to opening in 1914. Its status is that of territorial ownership, by perpetual grant from Panama, the rights of the French Company being extinguished by the payment of $40,000,000 and with a douceur to Panama of $10,000,000 and $250,000 a year. The territory is a zone 10 miles wide, with water rights beyond this limit; Colonel Goethals was the engineering and administrative head; Colonel Gorgas was in charge of sanitation; it was theoretically neutralized but by the United States alone, which really means protected; to make this protection effective the terminals have been fortified; it is governed by an appointee of the President; it is opened on terms of equality to the ships of all nations. See Panama Canal.

The United States and the Declaration of Paris. — Why has the United States, always standing up for neutral rights, never joined in the neutral bill of rights of 1856, called the
Declaration of Paris (q.v.). It was the abolition of privateering which was Mr. Marcy's stumbling block in 1856, because he deemed the retention of this right necessary to supplement our small navy. But, he said, if you will yield the right to capture enemy's innocent private property at sea as well, our accession will be gladly made. Spain and Mexico likewise refused. Yet when Spain and the United States were at war in 1898, neither side employed privateers, and it can be shown that the other rights of the Declaration are in the interest of the United States and accepted by it; also that privateering is not of much practical value to-day, particularly to a naval power. The conclusion should be drawn that in this respect our diplomacy has been a mistake, that we should gain much and lose little by accepting the Declaration of Paris in its entirety.

The Diplomacy of the Civil War.—This was mainly concerned with three classes of questions: (1) those relating to the recognition of Southern belligerency; (2) those relating to the blockade; (3) those connected with the equipment and reception of Confederate ships of war in foreign, mostly British, waters. In this last particular Mr. Seward pursued a wrong-headed policy, claiming the rights of a belligerent to blockade and search, for example, which implied a legal war, but denying nevertheless the existence of a war and of a body of neutral powers. This mistaken policy complicated much of the early diplomacy of the war, and made the attitude of the North most difficult. When states find their relations closely affected by a civil war, their commerce hampered by the rules of blockade, contraband and search, a new flag seeking entrance to their ports, a new government de facto applying belligerent rights on the sea, they are warranted by international law and by their own commercial interests, in recognizing the new belligerent and declaring their own neutrality. In our Civil War, Spain, The Netherlands, Great Britain and France did this, and Mr. Seward complained of it. The blockade of Southern ports was a gigantic task, slowly made effective, with some irregularities, but as a whole a fair and legal line. Great Britain, the power whose trade was most affected by it, respected it and was even considerate in declining to press remonstrance in view of lapses in the blockade of certain ports, and in cases where the declaration of blockade for a long period was not substantiated in fact. It was in the partiality with which England's neutrality laws were administered at her colonial ports, and particularly in the violation of those laws in home waters, that she erred. Two Confederate cruisers were burned by her in New York harbor, and in some degree manumitted by British agents. They helped to sweep Northern commerce from the seas. Mr. Adams and the watchful consuls resident in England left no stone unturned to stop them. Never was there a more difficult position than that of C. F. Adams, nor one more gallantly filled. Symphony for the South pervaded the ruling class. The gradual change of sentiment as the war progressed, the consciousness of a dangerous precedent, the diplomatic pressure applied after the war by a reunited United States, these led Great Britain on to the settlement of the so-called Alabama claims at Washington in 1871.

This was a diplomatic triumph, because it laid down a strict standard of neutral behavior, by which England consented that a court of arbitration should judge her conduct, though denying that it had been theretofore applicable. See International Claims and Disputes.

Naturalization Questions.—The allegiance of individuals is transferred by emigration followed by naturalization. But if the laws of two countries prescribing the conditions of these processes are not identical, since the new allegiance involves protection, upon the return of the individual to his country of origin a legal conflict as to his allegiance may occur. So, too, if his emigration has been unpermitted, or has evaded military service. Owing to the copious immigration which has sought the United States, our diplomacy has been largely concerned with just such cases. Our diplomatic remedy was to seek as a favor for the individual relief from the obligation or service still due which the naturalized German-American, for instance, visiting his mother-country, was held liable for. Some such had served in the Civil War, some had emigrated as mere boys. The law was clear, for a state may lay down its own conditions in regard to deserters; and in 1870 and 1870 the situation became acute and a remedy was eagerly sought. Another class of difficulties arose where our laws naturalized emigrants of states like England, which held the allegiance of their subjects to be indefinite. Here both countries had claims to the service of the same person. By the negotiation of treaties with the North German Union, 1868; Belgium, 1868; Hesse, Bavaria, Baden and Württemberg, 1868-69; Mexico, 1868; Sweden and Norway, 1869; Austria and Great Britain, 1870; Denmark, in 1872, these difficulties were cured. By these treaties, the right of expatriation was allowed and our five years' residence requirement was recognized. (See Naturalization.) The provisions of these treaties were reciprocal. Two withheld their privileges from youth who ran away when actually drawn for military service. The others made no such distinction. The subsequent working of these treaties has not been altogether clear. But in 1882 it was noted that the modern tendency is toward a uniform five years' residence rule for naturalization, as under the new Cuban Constitution. These naturalization treaties were a very considerable diplomatic achievement, due largely to our Minister resident at Berlin, George Bancroft.

The Diplomacy of the United States in the Orient.—This has reflected commercial rather than political demands. Owing to the radical disfranchisement in law, in usage, in racial feeling, European intercourse with the East has insisted for its protection upon a fixed treaty tariff upon imports and upon that exemption from the local law and jurisdiction which we call extraterritoriality. This was largely limited to the sovereignty of Oriental states. On the other hand, only certain ports in China and Japan were opened to foreign trade. These various features appear in our treaties with China, 1844, 1858, and with Japan, 1854, 1858. Between 1860 and 1880 both countries began to absorb the new civilization, Japan eagerly and China, vaster and not so centralized, without enthusiasm. Here was the parting of
the ways. China thereafter allowed religious freedom, submitted to our drastic immigration restrictions, 1880, and otherwise dealt with the United States on the old conservative basis. Japan meanwhile abolished feudalism in 1871; set up a representative Parliament, 1881, 1890; adopted a code of law framed on an European model and made rapid progress in new ways. Her victory over China in 1895 gave her a position which compelled the powers to surrender their special privileges, as to duties and jurisdiction. In this our own country had prior to the war taken the initiative. A considerable influx of Chinese work people, intense local prejudice against them in the West, some deadly riots in which they have suffered and on the other hand outrages to missionaries and the Boxer attack on the legations in Peking have proved some mutual ill-will, while in the main the respective governments have been on friendly terms. More important still was the war with Russia, 1904, ended by the Peace of Portsmouth, both Japanese triumphs of arms and diplomacy.

As a result Korea become a Japanese protectorate; the control of Manchuria was shared with Russia and China; Japan's influence upon China increased; her position in the entire Pacific was enhanced; she became truly one of the great powers. As a result also a certain degree of friction has developed with the United States, owing to the hostile legislation of our Pacific States rather than to any Japanese act, it is true, but with a consciousness of conflicting interests. China during the last decade has tended toward modern ways. She has encouraged railways and internal development; has driven out the Manchu dynasty; has assumed a republican form of government and a constitution; all without serious bloodshed. Under the policy of the Open Door and the Golden Rule, we have watched these changes hopefully yet realizing that the new republic has neither the political unity nor the military strength to make its future certain. See JAPAN; CHINA; Siam.

Cuba and the Spanish War.—The relations of the United States with Cuba have been impressed with a sense of the latter's geographical importance, jealousy of its control by any other than Germany, Spain and a desire for undisturbed trade and settled government. To Cuba, Monroe's declaration of policy has applied with peculiar force. The slave interest before 1860 at one time dreaded a free Cuba, at another desired its annexation. Purchase was several times offered, as in 1847, and in 1854 under the foolish threat of the Ostend Manifesto (see Ostend Manifesto), but Spain declined. During the Civil War, Spain showed some sympathy for the South, although it was Southern influence that had coveted the island. The liberal revolution of 1868 in Spain was reflected in Cuba, but there cruelly put down. There ensued a disturbed decade when our neutrality was enforced in spite of aroused sympathy, some minimizing Spain and a desire for mediation. After 1869, Cuban belligerence was not recognized, though Grant came within an ace of such action. In 1878 the rebellion collapsed, in 1894 it broke out again. In the interval had come illusory reforms, better trade under reciprocity with the United States and steady misgovern-

The Great War and Our Neutrality.—The European War, which began in August 1914, affected deeply the whole civilized world. But so large a part of that world was belligerent as to make the neutral fraction relatively powerless. The only weapons possessed by the United States were against Germany, the seizure of some $100,000,000 of merchant shipping lying up in our ports; against England, an embargo of munitions and food stuffs. The first meant a break, perhaps a war, with Germany; the second meant a commercial panic. Our position, therefore, when we became apparent that we were bent upon infringing our rights as neutrals, was extremely difficult. We complained of German mine laying in the open sea, her brutally illegal submarine methods, illustrated in the Lusitania, of her plots to prevent our trade in contraband which even attempted the destruction of our factories and ships; we complained likewise of the British methods of blockade, their definition of contraband, their extraction of noxious persons from neutral ships on the high seas, their seizure of mails and exasperating delay in remedial process.

Moreover, although probably three-quarters of our people warmly sympathized with the Entente allies, the German minority party tried in every way to hinder and to discredit the administration. Smyth's exposures of divided allegiance shocked the country so that in the Presidential campaign of 1916, all platforms denounced it.

During the war President Wilson offered mediation without avail, and various individuals agitated to bring about peace. They did not
realize that mighty, fundamental differences between the combatants were being fought out, a territory of necessity on which before the war was could return to peace. The United States performed its neutral duties faithfully for its trade in contraband, which was naturally objectionable to the Germans who got none of it, was absolutely legal and proper. Its long suffering in merely protesting against the invasion of its neutral rights, was due to the causes stated above. But as the war went on, the country became acutely conscious of its military weakness, and increases in both military and naval establishments were voted by Congress.

**Relations with Mexico.**—President Diaz ably built up commerce and transportation in Mexico and fulfilled its foreign obligations, but he failed to satisfy the demands of his people for education, a change of the land system, and administrative reform. His supplanter, Madero, was too feeble to solve either foreign or internal problems; while Huerta had no chance, for President Wilson, displeased at the bloody beginning of his rule, refused to recognize him. Moreover, his rival, Carranza, was helped with arms and money to drive Huerta out and was recognized in turn. During all this upheaval the country fell into chaos, brigandage became rife, our own border had to be guarded, and on a somewhat trivial point of etiquette Vera Cruz was occupied, and later abandoned.

Carranza proved unequal to his task. He has no credit; he could not maintain order; his soldiery was insubordinate; the national debt was defaulted and the country starved. Then came raids over the border, quite purposeless but most exasperating, led by Villa and others. To punish and prevent such raids, United States troops were sent southward hoping for a co-operation in bringing about order, which they failed to get. Instead they twice met with open resistance from the Carranzistas.

The United States and Arbitration.—This account of the diplomacy of the United States would be incomplete without some reference to its attitude toward arbitration as a means of settling international differences. This has been our policy. It was used by the provisions of Jay's treaty in 1794, to designate the Saint Croix boundary; in 1814 to apportion the islands in Passamaquoddy Bay; in 1814 also to settle the northeastern boundary. By this device the Alabama claims, the San Juan boundary, the Northeastern Fishery dispute, the sealing controversy, all these being differences with Great Britain, have been satisfactorily arranged. The Alaskan boundary was laid down by a joint commission which is not strictly an arbitral method but a substitute for it. All of this has been narrated. These were all instances of special arbitration, i.e., of reference to a special court agreed upon ad hoc. Their fortunate outcome naturally led to a desire to broaden the usage, to make it general, perhaps obligatory, instead of particular. Both of The Hague conferences testify to the efforts of our delegates to this end. But besides this, our State Department has tried in at least three different ways to generalize the arbitral principle by treaty.

(1) In 1908-11 Mr. Root made nearly 20 treaties which refer to The Hague Court questions of a legal nature or relating to the interpretation of treaties provided they do not affect vital interests, independence, or honor. A vast number of similar agreements were made by other powers, their scope being equally limited.

(2) In 1911 Mr. Taft framed treaties, with both France and Great Britain, referring to arbitration all questions in dispute justiciable in their nature and not covered by commission of inquiry provision. These failed of ratification in any useful form.

(3) In 1913-14 Mr. Bryan carried through some 30 treaties based on a so-called Peace Plan, which provided that any disputes of which all matters in dispute to a commission of inquiry, war and increase of armament to await its report, gave opportunity for calm deliberation. At The Hague and elsewhere, Germany stood in the way of all arbitral proposals which had anything to do with the arbitration of force; thus the two countries, Imperial Germany and the United States, in a sense might be regarded as the champions of the two systems of force and arbitration for the settlement of differences and their military power has corresponded.

**Modern Diplomacy and General Characteristics.**—Other topics with which our diplomacy has had to do might be detailed. Extraterritorial bases, copyrights and trademarks, free navigation of rivers, Samoan affairs, tariff by treaty, and so on; but these are more conveniently discussed elsewhere. American diplomacy today still shrinks from an active part in European politics. This was explicitly stated by The Hague Conference in 1899. With this in mind it is a question if the United States can properly be called a world power. But in point of fact, our interests and our diplomacy have been more impressed by those of Europe than we may think. Our share in international legislation relating to the care of the wounded, industrial property, the slave trade, submarine cables, exchange of official documents, are examples, and particularly since the Spanish War has this been true. One detects in our recent diplomacy a more confident tone, a readier initiative, even the air of leadership, coupled with ingenuity of resource and that simplicity and directness of aim which have long been its characteristics. But yet its defects and handicaps must not be lost sight of,—lack of continuity from a change in administration and in party, lack of certainty because of the Senate's control of treaties made by the executive, lack of a trained diplomatic service. In reviewing the diplomacy of the United States as a whole, one is impressed by its blunt straightforwardness (sometimes amounting to crudity or ill manners), by its usual freedom from intrigue, lastly by its rather surprising successes, owing surely to the soundness of its aims. "Observe good faith and justice toward all nations," wrote Washington in his farewell address, "cultivate peace and harmony with all." Could any diplomacy have had a nobler rule laid down for it? See also International Law; Treaties.

18. THE WAR WITH FRANCE. The outbreak of war in 1793 between Great Britain and the French Republic placed the United States in a most embarrassing position. President Washington determined to adopt a policy of neutrality, but for two reasons he found it very difficult to do so. In the first place were the treaties concluded with France in 1778. The treaty of alliance guaranteed forever the integrity of the French possessions in America, and the treaty of commerce provided that French privateers and their prizes should have shelter in United States ports, a favor which was denied to the enemies of France. The question of the privateers gave most trouble. If the United States had adhered strictly to the obligations of the treaty they could not have preserved neutrality. Fortunately, at a critical time, the President's position was strengthened by his intimate knowledge of the French Minister, Citizen Genet (q.v.). The encroachments of the belligerents upon our trade rights constituted a second obstacle to the maintenance of a neutral policy. The British and French appeared to vie with each other in their zeal for seizing and confiscating American merchantmen and their cargoes. Many of these outrages could not be justified even under their own extravagant interpretation of the principles of international law. The partial compromise of the troubles with Great Britain in 1794 served to increase the hostility of France.

In March 1797, just after the inauguration of President Adams, news was received that the French Directory had refused to accept Charles Cotesworth Pinckney, who had been sent to supersede Monroe as Minister. Desiring to bring about a peaceful settlement if possible, Adams sent Elbridge Gerry and John Marshall to join Pinckney in a special mission. Shortly after their arrival in Paris they were approached by some agents of Talleyrand, who informed them that the Directors were much annoyed at certain remarks made by President Adams in a recent speech, but that a daoueur of 1,200,000 francs would probably mollify their wrath. Negotiations went on for several weeks, but as the commissioners refused to submit to blackmail, nothing was accomplished. On 5 March 1798 the President informed Congress that certain dispatches had been received from France, which he would lay before them as soon as they could be deciphered and translated. A second message dated a fortnight later stated that the peace mission had been a failure and that preparations for war were in progress. The Federalists were jubilant and the Republicans very much disconcerted. The publication of the dispatches, however, aroused such strong popular feeling against France that the moderate Republicans gave up their opposition. These documents became known as the X.Y.Z. Correspondence (q.v.), because the government used those letters in referring to Talleyrand's representatives. Both houses of Congress agreed by large majorities to support the President's policy. An act was passed establishing the Navy Department, and Benjamin Stoddert of Maryland was appointed as the first secretary. Previous to this time naval affairs had been in charge of the War Department. Money was appropriated to equip the navy, to strengthen the coast defenses and to buy arms and ammunition. An act of 14 July 1798 levied a tax on houses, land and slaves, the first national direct tax ever imposed in the United States. Of more doubtful wisdom were the Naturalization, Alien, and Sedition acts, which were directed against French sympathizers.

The President's course was approved with as much enthusiasm by the public as it was by Congress. "Millions for defense, but not one cent for tribute," became the popular cry. Scores of patriotic war songs were written, among them being 'Adams and Liberty' and 'Hail, Columbia.' Monster mass meetings were held throughout the country, militia companies were organized and liberal contributions were made for the support of the infant navy. The President continued his preparations for war, then, with every assurance that the nation would support him. Washington was called from retirement to assume the duties of lieutenant-general and commander-in-chief of the army. Naturally much was left to his discretion in the choice of subordinates. Hamilton, Knox and Charles Cotesworth Pinckney were, at his suggestion, commissioned as major-generals. An unfortunate controversy at once arose in regard to the question of seniority. Adams favored Knox, and gave an order that his commission should be made out before the other two. This plan was so strongly disapproved by Washington that the President finally yielded, and Hamilton was made second in command. Four brigadiers were appointed, and steps were taken to increase the army to a war footing. These elaborate preparations for the strengthening of the land forces seem somewhat premature. It was not at all certain whether Spain would attempt an invasion, and, unless Spain should be drawn into the conflict, there was no territory in America which we could attack. As a matter of fact, hostilities were confined to a few minor naval engagements. Early in July 1798 Stephen Decatur, the elder, in command of the sloop of war Delaware seized a French privateer mounting 20 guns. The prize was refitted, named the Retaliation and placed under the command of Captain Bainbridge. The most serious battle of the war was fought off the island of Saint Kitts in February, 1799. After a chase of three hours and a fight of an hour and a quarter, Commodore Truxtun's flagship, the Constellation, forced the French frigate L'Insurgente to lower its colors. La Vengeance, another French frigate, attacked by Truxtun in February 1800, escaped only as the result of an accident. Just as the victory was almost won the foremost of the American vessel fell over the side, drowning a young midshipman and several of the crew and making it impossible to continue the pursuit of the enemy.

In spite of these successes the President
manifested very little zeal for the prosecution of the war. This was doubtless due in part to the jealousy of Hamilton, but it was mainly the result of his intense conservatism. John Adams was not the man to sympathize with the hair-brained schemes of Hamilton for the conquest of the Floridas, and he was certainly not the man to continue a war when there was no longer good cause for it, merely because public opinion seemed to favor it. Hearing that the French government would receive a minister from the United States and would treat him with courtesy and respect, he nominated William Vans Murray to that position. The members of his own party were taken completely by surprise, and the leaders of the war faction made an attempt to defeat Murray's confirmation in the Senate. Adams checkmated their plans by withdrawing Murray's name and substituting three commissioners, Murray, Chief Justice Elsworth and Patrick Henry (25 Feb. 1799). Henry refused to accept, and William Davie of North Carolina was selected in his stead. Much to the chagrin of Hamilton, the Senate confirmed the nominations. The Hamilton partisans in the Cabinet now made a final attempt to procure the departure of the commissioners, but their success was of short duration. The President asserted his authority, and the commissioners set sail in October 1799. The Federalists throughout the country were at first surprised, not to say disgusted, at the peace policy of the chief executive. Hamilton's intrigues to checkmate his plans, moreover, resulted in a revulsion of feeling, and it may safely be said that the commissioners sailed with the approval of the vast majority of the American people.

The mission was successful. A treaty of peace was concluded with the first consul, 30 Sept. 1800. Provision was made for the restoration of captured vessels and cargoes. Morocco had not yet been condemned. For protection in the future the rule was adopted that "free ships make free goods," except in the case of contraband of war. The terms blockade and contraband were defined, and in regulations were made in regard to prizes and privateers. The most serious problem arose from the desire of the United States to be released from the obligations of the treaties of 1778 and the desire of France to avoid paying indemnities for American vessels and cargoes which had been confiscated. Article II of the new convention provided for the postponement of both questions until a future settlement, with the understanding that in the meantime the treaties of 1778 should not be in force. Strong opposition was made in the Senate to this article on the ground that it sacrificed the claims of American merchants. It was finally struck out and a clause was inserted limiting the convention to eight years. In this amended form the treaty was returned to France. Napoleon ratified it with the proviso that each country made the concession which the other demanded. The Senate passed the final vote of ratification with this understanding. It was this bargain which gave rise to some of the French spoliation claims. The obligations of France were, of course, not to the United States government, but to American citizens who were engaged in foreign commerce. Consequently the convention released France from those obligations, it tacitly assumed them itself. This treaty of 1800, like the Jay Treaty with England, was really only a temporary settlement. The troubles with both countries continued until the close of the great European conflict on the battlefield of Waterloo. See TREATIES; UNITED STATES—DIPLOMACY.

19. THE LOUISIANA PURCHASE.

The vast province of Louisiana was ceded by France to the United States 30 April 1803, the purchase price being $15,000,000. Spain, which had once belonged to France, Louisiana was ceded to Spain by the Treaty of Paris in 1763, and was retroceded to France for the purpose of colonization 1 Oct. 1800, with the understanding that if it was ever again ceded away it should revert to Spain. It was shortly after President Jefferson's installation that information concerning the retrocession of Louisiana to France reached America. Though the act was believed to be hostile to the interests of the United States, yet Jefferson hoped to maintain the friendly relations with the French government so recently restored by the so-called Treaty of Mortfontaine. But when the Spanish intendant, Don Juan Vértiz Morales, closed the port of New Orleans to American trade, Jefferson began to see the purpose of the first consul in securing the retrocession of Louisiana and to experience a foretaste of Bonaparte's aggressive policy. Morales' act in closing the right of deposit at New Orleans, as the right of deposit was called, was regarded throughout the United States with feelings of strong disapproval. Excitement ran high, especially in Tennessee and in Kentucky, where the people were eager for war. The Western settlers looked upon the summary closing of the port as the initial step in Bonaparte's aggressive policy, which contemplated not only the arrest of American trade, but also of any further expansion toward the Mississippi. The Western traders had chafed greatly under Spanish authority along the banks of the Mississippi. Spain blocked the way to farther expansion on the west and held control of all the waterways leading to the Gulf of Mexico, since the entire seaboard along that gulf was under Spanish dominion. Moreover, the whole valley of the Ohio as far as Pittsburgh was dependent upon the permission of the king of Spain for an outlet to the Gulf for its rapidly increasing trade with the outside world. This permission the king granted, and by the treaty of 1795, which Godoy executed by way of offsetting Jay's Treaty, Spain gave the United States special privileges along the Mississippi, as the right of deposit at New Orleans with
only a nominal charge. Still the Western traders were subjected to much annoyance under Spanish restrictions. When, therefore, Napoleon's grasping ambition quite as much as they had despised King Charles' authority. When, therefore, the port of New Orleans was summarily closed, preparatory to the transfer of that region to France, there was such an outburst of popular feeling throughout the United States that President Jefferson was constrained, despite his strong desire for peace, to open negotiations immediately for the purchase of West Florida and New Orleans, as affording an outlet to the sea. Accordingly, he instructed his Ambassadors at Madrid and Paris, if possible, to obtain from their respective governments the cession of West Florida and New Orleans. Congress was fully alive to the demands of the people, and on 12 Jan. 1803 appropriated $2,000,000 with a view to purchasing the desired territory. Jefferson appointed James Monroe, minister resident at Madrid, to aid Chancellor Livingston, United States Ambassador at Paris, to effect the purchase of New Orleans and West Florida. When Monroe set sail for France, on 8 March 1803, Jefferson was not at all confident that the Monroe mission would be successful. He admitted that he sent him largely to conciliate the people and to restore political quiet throughout the country, then much worked up over the situation.

In treating for the purchase of West Florida and New Orleans Monroe's instructions included three contingencies: Monroe and Livingston were to buy the desired territory if it could be bought for any sum not exceeding $10,000,000. They were to offer besides the purchase price, commercial privileges for 10 years in the ceded ports, the incorporation of the inhabitants on an equal footing with the citizens of the United States, and, if demanded, even a preliminary cession to the United States of the Mississippi. As a second contingency, in case France refused to sell the territory in question, the ambassadors were instructed to sue for the right of deposit, together with such privileges as France would grant. In the event France acceded to neither of these propositions, then the ambassadors were to be given special instruction by Congress adapted to the case. This last contingency might mean war, or it might mean further procrastination. In a communication to the first consul, delivered through Rochambeau, Jefferson had already hinted at a probable alliance with England in case France declined to accept any terms whatsoever and positively refused relief to the United States from the severe conditions of trade along the Mississippi. When Livingston and Monroe first opened negotiations through Talleyrand for the purchase of New Orleans and West Florida, the French Minister of Foreign Affairs held out but little hope. The American ambassadors used every argument, but to no purpose, apparently. However, the aspect of affairs soon changed. The first consul was growing weary of the drain on his resources which Santo Domingo entailed. He reflected, too, that he would soon need all the men and money he could command for the execution of his plans in Europe due to the necessity of calling himself to the aid of Spain from that part of the Occident due to the death of Leclerc in Santo Domingo and the humiliation of his army and the general uprising of the negroes of that province, he realized that the offer of the United States furnished him a suitable occasion for abandoning his costly schemes of French colonization in America, under cover of a new enterprise, and he gladly closed with the American ambassadors to cede to the United States the whole of Louisiana for the largest sum he could obtain. He needed money to replenish his exchequer for his contemplated war with England and Germany, and he did not hesitate to break his word with Spain in ceding away Louisiana, which act, perhaps, he intended as a punishment for Spain for Godoy's treaty with the United States. The American ambassadors, astonished at the offer to sell the whole or no part of Louisiana, though not authorized to purchase the entire province, wisely closed with Talleyrand and Marbois and agreed to buy the whole of Louisiana. After some haggling over the price, Livingston and Monroe agreed to pay France $16,000,000. The documents were signed early in May and ratified on 30 May 1803, and thus the United States, beyond the expectation of all, acquired possession of the vast province of Louisiana.

The treaty for the cession of Louisiana is notable in that it contains no definition of the boundaries of the property transferred. When the American commissioners insisted that the boundaries of Louisiana be defined, they were merely informed that the boundaries were the same as they were in the hands of France, according to Berthier's original treaty of retrocession. However, it was definitely understood on both sides that the Floridas were not included in the transfer, since that territory did not belong to France. Article III of the treaty provided that "the inhabitants of the ceded territory shall be incorporated in the Union of the United States, and admitted as soon as possible, according to the principles of the Federal Constitution, to all the rights, advantages and immunities of citizens of the United States." In addition to the sum of $11,250,000, which the United States promised to pay France, the United States agreed to assume the spoliations claims of American citizens against the French government, amounting to $3,750,000, thus making the price in all $15,000,000. The ratification of the treaty by the Senate of the United States gave rise to a perplexing constitutional question as to the right of Louisiana to be admitted into the Union and the process to be adopted. President Jefferson recommended, since there was no authority in the Constitution to buy foreign territory, that a constitutional amendment be adopted as the most convenient solution of the problem. However, the treaty was at length ratified without recourse to a constitutional amendment, and the President acquiesced even at the risk of making blank paper by construction of the Constitution. Spain protested vigorously against the cession of Louisiana to the United States, alleging that the first consul had violated the treaty of retrocession and claiming that the province could be ceded to herself only. But when the Spanish government realized that both the
United States and France were resolved to make good the transfer, even by a resort to arms, if need be. Charles IV yielded and accepted the cession as inevitable. Thus, for $15,000,000, the United States added to its territory a vast region extending from the Mississippi to the Rocky Mountains and from Mexico to the Lake of the Woods. The annexation of Louisiana not only increased the territory of the United States by an immense area, but it also put a new complexion upon the politics of the nation and marked a new epoch in the national life. See Louisana Purchase.

20. CAUSES OF THE WAR OF 1812.

The latter years of the 18th and the earlier years of the 19th centuries witnessed a phenomenal growth of American commerce. Naturalization was easy in the United States and the wages of seamen were high. Great numbers of English sailors availed themselves of these advantages. England became jealous of American trade. She had never granted to her subjects the right of expatriation, though she gladly recruited seamen wherever they could be found. In 1793, the right of searching neutral, especially American, vessels was claimed and put into practice. This so-called right meant that whenever an English warship met American merchantmen or war vessels they were required to stop, order their men on deck and permit as many sailors to be seized and put into the English service as were unable to prove their nationality. It was maintained that only deserters from the English navy were wanted; but in the period of 1796 to 1802, 1,942 American seamen were pressed into the English service on the plea that they were deserters. When the war between Great Britain and Napoleon broke out afresh in 1803, American trade received another impetus. French, Spanish, and even English traders raised the American flag in order to get the advantages of neutrals. An arrangement between England and the United States permitted American vessels to take in cargoes in some part of the country, where the commodities were consigned to United States ports. The cargoes were afterward reshipped to Europe. This arrangement gave rise to great abuse. Ship-owners learned to touch at American ports, unload their cargoes, pay the required tax in the form of a bond, reload and, at the same time receiving their bonds back again, set sail for foreign markets. Thus it appeared that England's commerce would fall into the hands of her rivals. To break up this almost illicit trade and at the same time bring the impression policy more strictly to bear upon the Americans, British war vessels were stationed just outside the more important ports of the United States. In the vigor of this surveillance American citizens were seized and American vessels confiscated in larger numbers than ever before. English cruisers virtually blockaded the Atlantic Coast from Maine to Georgia. On 27 June, one of the British war vessels, on orders from the British admiral at Halifax, signaled the Chesapeake to stop as she was leaving Norfolk Harbor. An officer was sent aboard the Chesapeake to search for deserters. Commodore Barham of the Chesapeake refused to muster his men. Thereupon the Leopard opened fire and, taking the Chesapeake by surprise, speedily disabled her; three men were killed and 18 wounded. When the search was completed, only one Englishman was found. Nevertheless, three American sailors were taken away, one being a negro. The "Chesapeake affair" excited the people of the United States almost beyond precedent. Indignation meetings were held in most of the towns. Prominent men presided over these gatherings; thousands of petitions calling loudly for reparation were sent to the President. War soon became the cry. President Jefferson did not believe in war, but he felt keenly the necessity of one. He believed, and, after forbidding American harbors to English war vessels, he sent an agent to England to demand disavowal of and reparation for the attack on the Chesapeake. England paid no attention to the commerce .

While English-American relations were thus assuming a threatening attitude neutral trade was suffering still further restrictions in Europe. In May 1806, provoked by Napoleon's closing the ports of Hamburg and Bremen, England declared, through her Orders in Council, the coasts of Belgium, Holland and Germany to the mouth of the Elbe in a state of blockade. On 21 Nov. 1806 the French emperor replied by the Berlin decree which substituted a similar blockade of all the ports of England. Neither the orders nor the decrees could be enforced, but they made trade with England, France and Germany unlawful. Yet during the year 1807 still other Orders in Council were issued. These closed to neutral commerce all the ports of European states friendly to France and authorized the seizure of any neutral vessel en route to any closed port unless the English naval service on the plea that they were deserters.
be searched or in any wise recognized the British Orders in Council. The British orders and the French decrees, the sequel of search and finally the actual attacking of American war vessels seemed to leave the United States government no peaceful way out of her situation. President Jefferson, however, suggested in 1807 that an embargo be laid on all American shipping. Congress had already prepared the way for such a policy at its previous session in the Non-Importation Law which had not been put into force until a few weeks before. Congress assembled in November 1807 and immediately fell in with the President's idea of starving Europe into a recognition of the rights of neutral trade. The embargo went into effect in December 1807 and remained in force until 4 March 1809. This law solved none of the difficulties it was intended to solve. Opposition to the measure became so great that an Enforcement Act was passed. This gave the President despotic powers; yet the commercial sections of the country resisted the law and smuggling became so general in New England that local officers of the United States declined to make any effort to stop it. The South suffered much hardship, too: tobacco and wheat, the principal commodities of export, shrank to one-half their former value. The Union itself seemed about to go to pieces just before the close of Jefferson's administration.

In place of the embargo a second Non-intercourse Act was substituted, which, though it practically prohibited trade with the great war-ring powers of Europe, gave some promise of improving the condition of commerce. With this change of policy Madison became President, 4 March 1809. England now sent a new Minister, David Erskine, whospeedily negotiated a treaty which promised the withdrawal of the Orders in Council. Madison suspended the non-intercourse against Great Britain on 10 June 1809 by proclamation. The merchants and ship-owners who had respected the non-importation hastened their goods and ships to sea. On 10 June 600 vessels sailed from American ports to take chances with their enemies in England that bore no fruit. Public meeting of the London Convention had been disavowed by the London Cabinet and that Erskine himself had been recalled came as a painful surprise to the American people. Madison issued at once a second proclamation which recalled the first and replaced the former restrictions on English trade. The British Cabinet now sent F. J. Jackson to the United States. Jackson completed the alienation of the American government. He insulted the President and ruined his own cause by insisting that Madison had duped Erskine into signing the recent treaty. The new Minister was summarily dismissed. Rose, another British representative, appeared next year in Washington, but his efforts availed nothing so long as he considered the government forbade him to yield the great point in question—the repeal of the Orders in Council.

The year 1809 proved the non-intercourse ineffective, much to the chagrin of England and France, for now both powers had a chance to enhance themselves by enforcing the laws of the United States against her own commerce. Napoleon proposed in his Rambouillet decree (March 1810) to seize every vessel within his reach, that is, in the French harbors, on the ground that such vessels had, perhaps, recognized England's Orders in Council and were thus subject to his Milan decree; and if not, then they had violated the laws of their own country in offering to trade at all with either France or England. In a few months $10,000,000 worth of property was thus seized and finally confiscated. Before Napoleon issued his Rambouillet decree the American Congress had resolved to repeal the Non-importation Act. In place of it a new law was passed which held out a sort of bribe to England and France: in case either nation should cease to violate the commerce of the United States then non-importation should be revived against the other and maintained until neutral trade ceased to be violated. Napoleon again turned an American law to his own advantage: he announced that his decrees would be suspended as against the United States after 1 Nov. 1810, if by that time England had suspended her orders or if the United States "caused her flag to be respected." However, he continued to sequester American cargoes. President Madison considered this a sufficient concession. He gave England warning that non-intercourse would be enforced against her if the orders were not rescinded by 1 Feb. 1811. When the time expired, no action having been taken by England, Congress renewed the former law and prohibited all importation of English goods. This caused some alarm in England, but there was no abatement of impressments. A new Minister was sent to Washington. His instructions, however, still permitted no promises of any change in British policy.

While the ire of America was constantly rising there came the news in May 1811, only three months before most of the Congressional elections were to take place, that the United States frigate, President, had encountered the British sloop, Little Belt, after a brief engagement of several hours, and practically annihilated her. Never was news more welcome to American ears. The "Chesapeake affair" had been avenged. Minister Foster wrote his government that the Americans no longer pressed for reparation on that score. Public opinion was pretty well satisfied, and the newspapers, especially in the South, were filled with exaggerated accounts of what had happened. Other events occurred during the summer and autumn of 1811 which tended to hasten the breach with England. The Indians on the western frontier from Port Dearborn to northern Georgia formed a confederation against the United States. Tecumseh, the famous Shawnee chief, was the soul of the movement. It came to a battle at Tippecanoe, in western Indiana, on 7 Nov. 1811. The Americans, under Gen. William Henry Harrison, gained a complete victory. Tecumseh joined the English soon after, and the general belief that England instigated the Indian attacks was confirmed. Harrison's victory was the second good omen of the year.

Notwithstanding all these causes for war it is quite probable that the government would not have declared it had not for the revolution which took place in the Republican party—the controlling party since 1801. This party had come into power as an uncompromising opponent of English influence in the country. It had, however, for its leader
and founder a man who opposed war from principle—Jefferson. The Old Republicans, coworkers with Jefferson, had become so opposed to war that they permitted themselves to be isolated. The events of 1811 taught the people a bolder policy. The antipathy for England which pervaded the ranks of the party had outgrown peaceful embargoes and non-importation laws; men thought again of the Revolution. They elected new representatives to Congress. The new Congress had a membership of 140; on its assembling more than 70 were found to be young and untutored politicians. The most important of these new men were Henry Clay, Kentucky; and John C. Calhoun of South Carolina. When Congress met the younger element evinced a war-like feeling quite unusual in that body. Clay was at once elected Speaker of the House and with the aid of his friends he organized that branch of the legislature for the purpose of war. These young leaders were vigorous nationalists; they thought of the Union as a great state; they looked to the future and had confidence in the Republic of the imperialists who not only hoped to compete Europe to respect their flag but who aimed to conquer and annex Canada. They counted on using their strength to the utmost advantage against England because of their alliance with Napoleon. In the President Madison joined them. From November 1811 to the end of the session the new party exercised all its ability and ingenuity in persuading Congress and the country to prepare for hostilities. After long and weary debates and after many a compromise on army and naval matters, war was at last declared 18 June. The invasion of Canada had already begun. The Treaties; International Law; United States Diplomacy.

William E. Dodd, Professor of American History, University of Chicago.

21. THE WAR OF 1812. The War of 1812 began officially on 18 June. The army of the United States numbered at that time 6,744 regulars. It was poorly equipped, poorly drilled and its morale was extremely low. But Congress had authorized its increase to 25,000 and provided, at least by law, for a second volunteer army of 50,000 men; besides, the militia of the several States was called on to co-operate with the regulars and the volunteers. The result of these acts was very unsatisfactory. The regular army never during the war reached 10,000, the volunteers appeared only in small numbers and the militia offered to serve only for short terms and then preferably in their own States. The governments of the New England States prohibited their militia from going beyond their State boundaries and various obstacles were put in the way of enlisting. The South was too remote from the theatre of action to feel the need of sending the militia to the front. Tennessee, Kentucky and the old Northwest furnished the main body of soldiers, regular and irregular, who fought in this war. The American navy apparently promised still less at the beginning of the conflict. It consisted of seven frigates and nine smaller craft. And as to the sinews of war, the treasury was in a precarious condition as a result of the numerous trade regulation acts of Jefferson's and Madison's administrations. Congress was inveterately opposed to laying new taxes in any form. Loans had to be resorted to at the beginning. But the bulk of the capital in the country was in New England and New England was bitterly opposed to the war. Hardly half the money asked for was subscribed. On the other hand, England was contending in Europe with her great enemy, Napoleon. The British troops in Canada numbered barely 7,000; their line of defense was 1,500 miles long. The English navy was, however, the undisputed mistress of all the seas; the north Atlantic squadron counted three battle ships, 20 cruisers and 50 smaller ships.

The conquest of Canada was made the first object of attainment. An army of 1,850 men, under command of Gen. William Hull, crossed the Detroit River in the latter part of July 1812. Hull threatened the British stronghold, Malden, on 18th days; but hearing that the English and their Indian allies had surrounded Mackinaw, a fort at the head of Lake Huron, he retreated across the American border to Detroit. From this point Hull hastened off two regiments to oppose the advance of the enemy from the west. At this juncture the British Major-General Brock crossed the river and demanded the surrender of the Americans. Hull's supplies were already becoming scarce, his basis of operations was 200 miles south and his communications were most difficult to maintain. He surrendered the fort and all the troops under his command, without a fight, on 14 Aug. 1812. Some 2,500 men, 33 guns and the whole of Michigan were thereby handed over, beginning of the contest. The principal cause of this was the failure of General Dearborn to march into Canada from the eastern end of Lake Erie, according to the plan of the campaign, and thus cut off all supplies and finally force him to surrender. But while Hull made his way through dense forests to Detroit, Dearborn was in Boston attending to the political side of the war. Not until October, nearly two months after the disaster at Detroit, did Dearborn cross the Niagara; and then it was with only a small part of his army under the command of Van Rensselaer, a New York militia commander. Van Rensselaer attacked Queenston on 13 Oct. 1812 and was resisted by General Brock, who had hastened from the scenes of his recent triumph to check this second movement. He was successful, though he was killed in the engagement. The campaign closed with the army in possession of the Western forts and the Territory of Michigan to the Maumee River. In the East the border remained the same.

But while things had thus gone ill on land, the navy had a measure restored American confidence. The frigate Isaac Hull in charge, met the British Guerrière about 800 miles northeast of Boston on 19 Aug. 1812 and captured her after a fight of 30 min-
UTES. Hull reduced his enemy's ship to a complete wreck, killed or wounded one-third of their crew and received the remainder as prisoners of war. On 18 October, the American sloop, Wasp, met the British sloop, Frolic, and completely demolished her. 25th a dull United States, a frigate of 44 guns, fought the British frigate, Macedonia, 38 guns, and gained as signal a victory as that of Hull over the Guerrière. This telling work of the navy took the world by surprise. England forbade her sea-captains to fight American ships of superior tonnage. American privateers swarmed the Atlantic. They did effective work. It became dangerous for an English merchantman to cross the English Channel. They captured 500 vessels during the fall and winter of 1812-13. Marine insurance for the Irish Sea rose to 13 per cent.

The campaign of 1813 centred about Lake Erie. Gen. William Henry Harrison had led an army of militia, volunteers and regulars from Kentucky during the preceding summer with the object of reconquering Detroit. The winter and spring of 1812-13 were practically wasted; but news reached him, while still in upper Michigan, that Perry had annihilated the enemy's ships on Lake Erie, and he began to move forward more rapidly. Perry had devoted the spring and summer to the construction of a fleet which he thought would break the power of the British on the lake. On 10 September Perry came up with the enemy's vessels under command of Captain Barclay. After a serious mishap to his flagship Perry took command of the Niagara, came within close range and after two and a half hours of heroic fighting completely defeated him. Thenceforth the lake remained in American hands. Harrison was now on the offensive. With the aid of R. M. Johnson's regiment of cavalry he forced Proctor, the English commander, across the Detroit. Proctor remained a few days at Malden, but, very much to the chagrin of his Indian allies, he continued his retreat northward. On 5 October, on the north side of the river Thames, he met, defeated and killed all his pursuers. Proctor lost his entire army; the Americans lost 15 killed and 30 wounded. Upper Canada fell into American control. At the eastern end of the lake and looking to the gaining of Lake Huron, General Dearborn made several half-hearted moves. On 27 April 1813, the town of York (now Toronto) was attacked. A sharp battle ensued. The Americans were successful and in the disorder which followed the victory the government house was burned. A month later Commodore Chauncey compelled the English to evacuate Fort George on the Niagara, while the English made an unsuccessful attempt on Sackett's Harbor. An expedition to Meaford was checked. The General Wilkinson proved a signal failure. The year closed with Lake Ontario still in English hands. At sea the Americans were unable to hold their own. On 1 June the frigate Chesapeake, commanded by Captain Lawrence, was defeated and destroyed by the British frigate Shannon. The enemy now blockaded the whole Atlantic seaboard.

The year 1814 brought Napoleon's overthrow and consequently peace in Europe. Vietnam troops were sent to Canada and to the South. But the Americans were becoming incensed to war; there was a more general support of the administration. After some feeble movements in the spring a third invasion of Canada was begun. 25th a dull United States, with 4,700; the enemy was equally strong. At Chippewa an attempt was made to check the invasion but without success. On 25 July Lundy's Lane, the bloodiest battle of the war, was engaged. The British were 14,000 strong; the Americans 2,600. The greatest valor was manifested on both sides; the losses amounted to about one-third of the forces engaged. Both sides claimed the victory; but the invaders held their ground until autumn when they withdrew to the Niagara. In September an invasion of New York was attempted from the Canadian side. The line of Lake Champlain and the Hudson River was selected; but Commodore McDonough foiled the plan in the famous battle of Plattsburg on Lake Champlain on 11 Sept. 1814. The campaign closed with no serious advantage gained on either side. To divert attention from Canada the British Cabinet had sent an army of 3,500 men under General Ross to threaten Washington. Seizing the capital so poorly defended, Ross landed his force, marshed directly on the city, and, though meeting with some feeble resistance at Bladensburg, drove the government into the woods and set fire to the public buildings—in retaliation for the destruction of the public building at York a year before. Ross now turned his attention to the city of Baltimore. Here he met with some resistance, the general himself being killed in the attack.

New Orleans was the next object. There was chance here of Indian support from northwestern Georgia. An army of 6,000 British regulars sailed for the Mississippi under command of General Pakenham. It appeared a few miles southwest of New Orleans (q.v.) on 23 Dec. 1814. The Americans were commanded by Gen. Andrew Jackson. Before the decisive engagement occurred both armies had been augmented to about 11,000 each. Jackson fortified himself a few miles behind the city and awaited the approach of Pakenham; on 8 January at early dawn the battle began. Seeing his men waver, Pakenham undertook to rally them. He was instantly killed; repeated efforts were made to carry the American works, but without avail. The English withdrew, having lost 2,036 men killed or wounded. Jackson's loss was 71.

On 24 Dec. 1814 the treaty of peace had been signed in Ghent. No mention was made in the treaty of impressment of sailors, of the right of search or of the status of neutral trade. The fall of Napoleon had made these questions obsolete. As to boundaries neither party gained anything. The cost of the war had been $100,000,000, 1,400 ships of all kinds, 21,000 sailors and about 30,000 soldiers killed or injured. Its benefits were the rise of a truly national spirit, the weakening the State supremacy of former days and the consequent overthrow of the half- treasonable opposition of New England. For bibliography see CAUSES OF THE WAR OF 1812.
22. FINANCES (1789-1816). Finances of the United States government in 1789 were in a most unfavorable condition. Not only had the Revolutionary War left a legacy of national indebtedness, amounting in 1784 to $39,000,000 exclusive of the continental bills of credit, but our new government the defective revenue system prescribed by the Articles of Confederation, no adequate provision could be made either to pay the principal or to meet the annual interest charges. When the new Federal government under the Constitution was established, the debt had swelled to $54,000,000; of this $11,700,000 was owed abroad. In addition to the above obligations, there was an unknown amount of State indebtedness, approximating $20,000,000. The total debt was a heavy burden for a population of less than 4,000,000 and for a country as yet undeveloped in its material resources.

In 1790 Congress enacted an elaborate funding scheme providing for three loans, the first of $20,000,000 to take care of the former foreign indebtedness; a second, to the full amount of the domestic debt, accepting at face value all obligations previously authorized, excepting bills of credit which were rated at 100 to 1; and a third of $21,500,000 to cover such State indebtedness as has been incurred for war purposes. The act was a complicated measure with ingenious contrivances, not only to make the loans acceptable to holders of old obligations, but also, by varying rates of interest and deferred interest on a portion of the debt, to afford the new government time to recover from its financial misfortunes. On two points there was bitter opposition to the passage of the act: (1) From those who objected to the acceptance of old certificates of indebtedness at their face value, as much as these had passed current at depreciated value, and had fallen into the hands of speculators; (2) from the Southern States which had paid off a larger share of their indebtedness, and consequently were unwilling to be burdened with the debt of States which had been less self-sacrificing. The first objection was met by the firm contention that national credit could not tolerate discrimination; the second was removed by a shrewd bargain by which established and Southern territory on the boundaries of Maryland and Virginia. In 1795 after the funding operations were over, the total debt amounted to $80,700,000, bearing an annual interest charge of about $3,000,000.

The revenue system established in 1789 was of simple character. A tariff act with low rates was passed; specific duties were placed on about 30 articles; ad valorem rates of from 7½ to 15 per cent on a few specified commodities, and a 5 per cent ad valorem rate on unenumerated articles. Tonnage duties were included, and the principle of discrimination against goods imported in foreign vessels and foreign shipping was adopted. Although the rates imposed in this tariff were low, the debate on the measure as well as the preamble of the act shows that the principal of protection of home industry was recognized.

In the law establishing a treasury department, provision was made for a Secretary of the Treasury, a Cabinet position; for a comptroller to pass on the legality of bills presented against the government; for an auditor responsible for the accuracy of the accounts; for a register to preserve the accounts; and for a treasurer to receive and pay out money on presentation of proper warrants. The framework of this system has continued until the present time and has proved highly effective in safeguarding the government's financial interests. Alexander Hamilton (q.v.) was chosen Secretary of the Treasury, and by his constructive genius, exhibited in a remarkable series of reports on public credit, a mint, national bank and manufactures, encouraged Congress to establish its credit on a broad and generous basis. Through his influence the Bank of the United States was established which granted temporary loans to the government, furnished a sound note circulation and took care of the government funds. In 1791 it was found that additional revenue was needed, and under the advice of Hamilton internal revenue duties were imposed upon the distillation of spirits. This provoked opposition, especially in the agricultural section of the Middle and Southern States. Here it was claimed that the interior was sacrificed to the commercial interests of the Northern seaboard. In 1794 there was open defiance in Pennsylvania, and the Federal troops were called out to put down the so-called Whisky Insurrection (q.v.). It was contended that the collection of the taxes was inconsistent with the principle of individual liberty, that it injured morals by inducing false swearing, was burdensome, and interfered unduly with the business of distilling. Although the opposition failed in its efforts, the tax was not fruitful, amounting in 1793 to only $422,000 from which about one-quarter was deducted for cost of collection and returns for drawbacks. In 1794 excise duties were extended to carriages, sales of liquors, manufacture of snuff, refining of sugar and auction sales. The constitutionality of the carriage tax was assailed on the ground that it was a direct tax and should be levied by apportionment according to populations. The Supreme Court, however, in the case of United States v. Hylton (1796) decided that under the Constitution there were practically but two direct taxes, the poll tax and the tax on land, that the carriage tax was an indirect tax, and therefore constitutional. Expenditures continued to exceed the earlier estimates; the Indian War of 1790 was followed by the Whisky Insurrection, and in 1797 new military and naval expenditures were demanded on account of the strained relations with France. In 1798 a direct tax of $2,000,000 was laid upon dwelling-houses, lands and slaves. In 1800 the total receipts from all sources was about $10,848,000, of which $9,081,000 was derived from customs and $1,453,000 from internal revenue and the direct tax.

Hamilton resigned from office in 1794 and was succeeded by Oliver Wolcott who maintained the Federalist policy of his predecessor. The administration of each was subjected to severe and bitter criticism by the opposition party under the leadership of Albert Gallatin. Charges were made that the accounts were jumbled, that adequate information of the condition of the treasury was not given to Congress, and that appropriations were made for specific objects but in lump sums, giving undue and arbitrary power to the Treasury Department. In 1801 the Republicans came into
power with Albert Gallatin as Secretary of the Treasury. Economy and abolition of what were regarded as inquisitorial taxes were immediately attempted. It is estimated for the army, navy and diplomatic service were reduced and the excise duties were repealed. The latter step, however, was taken contrary to the opinion of Gallatin, who wished to husband the resources of the treasury in order to pay off the national debt as rapidly as possible. The commercial prosperity of the country at this period was at a high level; our neutral commerce took advantage of the European wars; exports and imports were large, and customs revenues for several years continued to increase by more than $1,000,000 annually. Notwithstanding the loss of the internal revenue duties and the issue of a new loan of $11,250,000 required by the purchase of Louisiana, the position of the treasury steadily improved, so that the debt was reduced from $86,000,000 in 1804 to $45,000,000 in 1812. The success of this operation was largely due to Gallatin's insistence that $8,000,000 should be annually appropriated to the extinguishment of the debt regardless of all other demands. Gallatin also introduced the practice of rendering annually to Congress a statement of the finances, and during his administration the policy of making appropriations specific was established.

In order to meet the expenditures of the war with Tripoli a special revenue was created in 1804 by the imposition of additional duties of 2½ per cent. on all imports, ad valorem duties; this was known as the Mediterranean Fund. In 1806 the import duty on salt was removed. In 1809 there was a temporary check to the good fortune of the treasury owing to the Embargo Act, but upon its repeal there was prompt recovery. Irritation between England and the United States was deep-seated, and in 1812 the treasury faced a situation for which it was ill-prepared. War with England made a heavy drain on customs revenue, for a large part of the commerce of the United States was with that country; there was no internal revenue system to fall back upon; and the estrangement of the wealthy merchants of New England, who opposed the war, made it difficult to borrow money in that section. The failure to renew the charter of the United States Bank in 1811 also deprived the government of a substantial agency either for making temporary loans or selling securities. Moreover, there were intrigues in the Republican party directed against Gallatin; his influence was so far weakened that in May 1813 he retired from the treasury.

The extraordinary demands occasioned by the war were at first met by loans in which short time treasury notes played an important part. Between 1812 and 1816, $85,400,000 of government stock was sold, of which $17,700,000 was redeemed during the period, making a net increase of $66,700,000; $36,600,000 treasury notes were issued of which about one-half were redeemed, leaving $18,400,000 outstanding at the close of the war. Funds were borrowed under disadvantageous terms, a large part of the stock being sold at a discount; of $41,000,000 borrowed up to the end of 1812, New England contributed less than $3,000,000. The financial distress was also aggravated in 1814 by the suspension of specie payments by local banks in all sections of the country except New England; thus the receipts of the government, both for taxes and loans, were in depreciated currency. For loans of over $80,000,000 the treasury received but $34,000,000, as measured in specie. Treasury notes were issued under five different acts; the earlier ones were in denominations of less than $100 and were not designed for circulation; before the close of the war, however, provision was made for the issue of notes as low as $3. With the exception of the last issue all notes were redeemable in one year; and again with the exception of the small notes, all bore interest; none of the notes was legal tender.

Congress too tardily endeavored to enlarge the sources of fiscal supply by increased taxes. The customs duties were doubled at the outset, but this gave little strength, since commerce was almost at a standstill. In 1813 a direct tax of $3,500,000 was levied and internal revenue duties were revived. It takes time, however, to establish the machinery of a new tax system, and no receipts from either of the above sources appear on the books of the treasury accounts until 1814. As a consequence of this fickle financing, deficit followed deficit, amounting in the years 1812-15 to $68,600,000.

Gallatin was succeeded in the treasury by William Jones and George W. Campbell, neither of whom was able to cope with the situation, and in October 1814, Alexander J. Dallas, a conservative Republican and friend of Gallatin, was named as his successor. This was accomplished, however, too late, for the war was far advanced and Dallas was unable to extricate the treasury from the embarrassments occasioned by inadequate taxes and depreciated currency.

DAVIS RICH DEWEY,
Massachusetts Institute of Technology.

23. WESTWARD MOVEMENT. The curtain which veiled far Cathay and the mystic East was raised during the Crusades, but the trade of Europe was blocked by the intrusion of the Ottoman Turks. Adventurous captains, barred by the sifter in the east, by the cold of the North and the heat of the South, sailed boldly into the West, and consequently brought civilization to the Americas on the eastern rather than the western coast. The American people took up the extension of this triumphal course, and, following the same direction, carried civilization directly across the continent of North America from the Atlantic to the Pacific. In less than three centuries, they traversed the 3000 miles of continental interior, conquered nature, dispossessed the savages, evicted European rivals, and set up a high form of civilization and government, where formerly were only wilderness and barbarians. This achievement is commonly known as "the westward movement.

Speculation is exhausted in conjecturing the probable result had civilization been cast on the Pacific instead of the Atlantic Coast, and been compelled to make its way across the continent from west to east. Recalling the many chance
discoveries along the Atlantic because captains mistook indentations, one may imagine the numerous accidents which must have resulted along the almost solid Pacific Coast, and the hindrance to the spread of the people because all must come through a few ports. The narrow Pacific Coast plain cannot be compared in size with the great Atlantic plain as a place for recruiting strength before commencing the overland coast. Passing to the arid desert between the Sierra Nevada and Rocky Mountains would have met the emigrants instead of the fertile lands of Tennessee, Kentucky and Ohio. An eastern movement must have been delayed for generations by the impenetrable Rockies and the arid region at their base, just as the western movement stands today blocked while developing a national irrigation scheme. If there be a national destiny shaping our end, it was surely in evidence when directing Columbus to the eastern instead of the western coast.

In 1619 the first successful attempt at colonization within the confines of the British dominions of North America was made at Jamestown, Va. In 1755 the 13 colonies, the first representative body of men gathered at Boonesborough from four incipient settlements in the present State of Kentucky. It had taken 165 years for the English speech to cover the Atlantic plain, cross the Alleghany Mountains and set up free government within the Mississippi Basin. In 1820 Missouri was admitted, the first State beyond the Mississippi River. Louisianam is not considered because her population was sufficiently complete for attention when she was purchased. It had thus required only 45 years to go from the Alleghanies to the trans-Mississippi region. In 1850, California, the first Pacific State, was admitted. Thirty years only had been required for the people to traverse the remaining half of the continent. The rapid increase in the rate of speed may be attributed to the growth of the protective efficiency of the central government, to the increasing number of railroads and especially to improved means of transportation.

The Atlantic Coast Plain, upon which the present United States was born, is a long, narrow strip of comparatively level land, trending from north to south, lying generally between the Appalachian Mountain system and the Atlantic Ocean. Its width varies from 50 to 200 miles, depending on the approach of the varying flexions of the coast to the mountains. Within this long stretch, the battles of the Revolution were fought with a few small exceptions. It was essentially a coast war, the troops being frequently convoked by transports from one point to another, and a French fleet co-operating with the army during the last general campaign. During the war, the Continental Congress sat at Philadelphia, Baltimore, York, Princeton, Annapolis, Trenton and New York, never more than 150 miles from the coast. It is said that during one of the many dark hours of the contest, Washington expressed his determination, in case of ultimate defeat, to retire with his remaining comrades to the fastnesses beyond the Alleghanies and thence continue the unending war across the mountains. This is not wanting to show that many of Washington's fellow-officers and comrades contemplated future residences in the back lands, as the region beyond the mountains was called. They were back lands in the sense that they did not drain through the Atlantic or front way. Although claimed by the king ex officio, as Crown lands, these lands as far west as Britain ruled were demanded by some of the 13 colonies because their charters covered them. Others thought that the Indians owned the lands beyond the mountains, and endeavored to purchase them from the aborigines. The king still insisted that the limits of the 13 colonies terminated on the watershed of the mountains. He did not except even Pennsylvania from this rule in his proclamation of 1763. The political rebellion arose so soon that the proclamation was virtually null and void, if the Americans should succeed in securing independence.

Several attempts to penetrate the western country were made about the time of the outbreak of hostilities between the colonies and those in authority. The country-dwellers in the uplands of Virginia and North Carolina were restless, fearless and self-reliant. They needed only a rifle, powder and ball for equipment. In this and similar respects, they were the antitheses of the industrious, docile, church-going, north Atlantic plain. A glance at a map will show that in western North Carolina, the watershed has leaped over to the most easterly of the mountain ridges, leaving a large space of the back lands, the 13 colonies, and northern Tennessee. The Yadkin approaches the watershed upon the eastern side very closely, while the western slope is drained by the Watauga, the French Broad and other headwaters of the noble Tennessee River. Here was probably the earliest carrying place of any magnitude between the Atlantic plain and the Mississippi Basin. Over it passed Daniel Boone, Robertson and other adventurous spirits to form the Watauga Association in the back country in 1772. The map will also show that other streams tributary to the head of the Tennessee take their rise in long parallel valleys in southwestern Virginia. Among them are the Clinch, the French Broad and the Holston, almost touched by the headwaters of the James and the south branch of the Potomac. Over the many short portages between the two systems came such hardy men as John Sevier and Richard Henderson. North Carolinians in northeastern Tennessee.

These scattered Watauga settlements, largely in what is now Carter County, Tenn., not only set up the rudiments of government, but also furnished a supply for two great streams of emigrants to the West. One branch passed directly down the Tennessee River, founded Knoxville and planted innumerable villages and homes throughout eastern Tennessee, John Sevier attempted to collect them into his state of "Frankland" or "Franklin," as it was later called. The other branch of people turned directly west across the Clinch and Powell Mountain, passed through the Cumberland Gap and found its way into the country stone valley of the Elk horn, the "blue grass" region of Kentucky. Watauga hunters encamped there heard the news of 19 April 1775 and named their camp "Lexington," a name the city bears at this time. Infnitely, there were several thousand people maintaining their stand against the hostile savages and the British in the present States of Tennessee
and Kentucky. Uncertainty of ownership left them almost entirely unprotected. As a defensive measure, George Rogers Clark headed a number of them, together with some Virginia recruits and industry and former French posts now held by the British. Virginia in this way doubtfully confirmed her claim to the land north of the Ohio. It is worthy of note that it was a Virginia-Kentucky enterprise and formed no part of the claims put forward in the treaty of peace for American ownership of the back lands.

The Watauga route, although the first to be used in popular migration, was outranked in age by the Potomac-Monongahela portage path. It was the one which young Washington chose across the mountains when warning the French from the back lands; along it Braddock led his ill-fated expedition, and over it Washington brought back the survivors of that disastrous excursion into the Western country. It required the shortest carrying over the Allegheny watershed and evidently awaited only the pacification of the Indians north of the Ohio to become the thoroughfare to the West. The conduct of the Revolution the War had made the Champlain route to Canada familiar. At Albany the Mohawk invited travelers to the west to follow its charming valley to Lake Oneida, and thence by the Oswego River to Lake Ontario. Washington, Lafayette, Madison and Hamilton made short trips in this direction after the war. But it was a long and perilous way to the Western lands, involving passing through the undefeasable Iroquois, a canoe trip on two great lakes and a long portage about Niagara Falls. This route, destined eventually to become the most popular, was very tardily developed. A fourth route would be opened in time about the southern end of the mountains, but not until the Creeks and the Cherokees could be removed from the way or could be pacified.

These were the four great ways from the Atlantic to the interior. Pioneers on foot and in dug-outs pushed the early settlers upland through forests and along the streams. The northern portage is now used by the New York Central and West Shore railways and by the Erie Canal; the Pittsburgh route by the Pennsylvania Turnpike; the Wilderness route by the Chesapeake and Ohio, the Norfolk and Western and the Southern Railway lines, and the extreme southern route by the many east and west systems centering in Birmingham, Ala. In the many changes from dug-out to palace car, the people have never abandoned the line of least resistance for travel.

Among the many inducements held out in recruiting for the Revolutionary service was the promise of a good farm. Led by visions of this bounty land, officers and men, at the close of the war, banded themselves together for the purpose of migrating to the back lands, which had been won by their valor. They would do not only for bettering their condition, but also for protecting the frontier against the Indians, the Spanish in the Floridas and the British in Canada. Efforts to satisfy these ambitions brought about the western lands by the States to the national government, the creation of the Northwest Territory (q.v.), the sale of 1,000,000 acres to the Ohio Land Associates and the first settlement north of the Ohio made at Marietta, 1788. However, occupation of the land north of the river progressed but slowly until the victory of Wayne over the Indians and the resulting Treaty of Greenville in 1795.

The year 1790 marked an important stage in the history of the westward movement. The constitutional government under President Washington had been established the year before. One of his duties was to make a numbering of the people so that an equal representation in Congress might be had. The first census taken in 1790 enabled us to know the number of people in each country and town and hence the distribution of population. It showed that little islands of people had run far ahead of the main body and established themselves, as already described, in Tennessee, Kentucky and Ohio. Not more than 5 per cent of the 3,920,214 total population lived west of the Alleghany watershed. The front wave of the people extended almost uniformly along the eastern slope of the mountains, throwing out long arms along the four routes to the West. Perpendicular distance of the people from the ocean was not more than 250 miles. The Americans were still coast dwellers. The West was as yet unknown.

The most thickly settled portion lay in an irregular line from Portland and N. H. to Baltimore, Md. Here dwelt more than 60 people to the square mile.

The westward advance, as suggested heretofore, was hindered constantly by the hostility of the savages. Perforce the national government was gradually given control of them by the States. It recognized them as foreigners so far as making treaties with them for the possession of their land was concerned. Scores of these treaties were made, establishing lines beyond which the whites solemnly promised not to migrate and east of which the Indian agreed not to molest the white. But it was impossible for the government to restrain the land-hunger of the citizen when unprotected by treaties with the frontier, treaties were secondary to force. These broken and obsolete Indian treaty lines, from which the savages were driven back, bear a striking resemblance to the positions occupied at different decades by the pioneers. In order to provide for the unsteady advance of population, increased constantly in numbers by immigration from Europe, the national government was convinced that something like a general policy of treating with the Indians must be formulated. The whites sometimes surrounded the Indian lands, threatening to annihilate the savages, if they did not move on. Thus in 1820, the advance line of pioneers extended from Kentucky in a strong belt down through Tennessee and western Alabama to Louisiana; but between these people and their brethren in South Carolina and Georgia lay hundreds of miles occupied only by the savage Creeks and Cherokees. Toward the north, civilization had spread up from the Ohio River about to the latitude of Vincennes and Saint Louis, but further advance was barred by the Pottawatomies. With difficulty the whites were kept from annihilating the tribes, and protection and preservation for the Indian as well as for the white could be secured only by keeping the
from the Alleghanies westward at each succeeding census. Its various positions remind one of the old sea beaches on a geological map. When young Andrew Jackson migrated to Tennessee and lodged in the "clean-to" of Mrs. Donelson, built against her log cabin, he was on the frontier of that day. When Abraham Lincoln's mother died 18 miles from a physician in a southern Indiana cabin, it marked the hardships of the frontier. When "border ruffians" contested with "Thayerites" for the possession of eastern Kansas, the frontier had reached that point.

Manifestly, if the start had been equal all along the line and the rate of progress equal, the frontier line would have been almost a straight line. But the topography of the land and the hostility of the Indians prevented such a regular advance. Long arms of people ran up the streams, islands of people were formed far in advance and deep indentations frequently resulted from some hindrance. The frontier of 1830, for example, extended in a great convex westwardly curve from Detroit, Mich., to New Orleans. It threw out so many projections along the Wabash, the Illinois, the Mississippi, the Missouri, Arkansas and Red rivers that it was 3,500 miles long. Ten years later it had filled out these inequalities so much that although it extended from Green Bay, Wis., to Corpus Christi, Tex., it was only 3,500 miles in length.

No prediction could be safely made as to direction or rate of motion. A rush or "boom" would make a fully populated region out of what was yesterday an untenanted wilderness. The census of 1830 showed a barren sweep about the head of Lake Michigan with less than two white men to the square mile except in the lead mines in northern Illinois and a group about Kalamazoo, in southern Michigan. Ten years later the lake was skirted from north of Milwaukee far down into Indiana by from 6 to 18 people to the square mile. Within the decade, it had leaped through the intermediary stage of the frontier. In 1830 Mississippi was settled only in a narrow strip across the southern part. Its occupation across the continent, except a spot near the Gulf, was covered with a population in many places of 20 people to the square mile.

The frontier in 1860 lay almost due north and south just west of Iowa and Missouri. It was the line-up for the final dash across the Great Plains, the best known and most picturesque of all the positions of the frontier. In 1890 it had assumed its highest achievement and was in its proudest position. Beginning at the Canadian border near longitude 100° it came down through the Dakotas and suddenly turned westwardly, encompassing the larger part of Colorado, and rounding down into Texas on the south. But 10 years later, population had so shrunk in the "dry farming" districts of Nebraska, Kansas and Colorado, that the line had fallen back, almost coincident with the meridian of 101° west longitude from the Canadian boundary to the Rio Grande. For the first time in more than a generation was the frontier had retreated. Nature, driven back step by step through the conquering will and forces of men, seemed to have taken her stand in the arid regions and to defy further encroach-
ments upon her realm. National irrigation under the form of internal improvement is now the weapon with which she will again be overcome.

The movement of population, which conquered the continent and unified the American people, was not only a westward movement but a due west movement. Men follow parallels of latitude because of similarity of climate, occupation, products, foods and dress. The constant tendency to migrate due west is shown in a study of Americans living in one State who were born in another. New York, to illustrate, has contributed more citizens to New Jersey than to any other State; then to Michigan, Pennsylvania and Illinois in decreasing order, but all to the westward. Georgia has sent more of her citizens to Alabama than to any other State; then to Texas, Florida, Tennessee, Arkansas and Mississippi, in decreasing ratio. Arkansas and Iowa are about equally distant from the Atlantic, and on the night of the 26th in the onward march, 26 New Yorkers found their way to Iowa for every one to Arkansas. On the other hand 57 South Carolinians have chosen to live in Arkansas for every one who chooses to remove to Iowa. The State of Washington has drawn most largely upon Illinois and Texas most heavily upon Tennessee. All this had a most important bearing on Northern and Southern sectionalism.

The due west movement has been accompanied thus far by a very slight return movement, except beyond the Rocky Mountains, where the entire migration is the reverse of that to the east of the continental divide. Thus Virginia has given to Missouri 35 citizens for one received in return. But with the exhaustion of the western public lands, the growth of cities and increased means of communication, the westward movement will gradually wane. As evidence of this, it may be noted that in 1880 Illinois had given to Iowa six persons for one received, but in 1900 the ratio had fallen to three to one. During the same period, the ratio of exchange between New York and Colorado has been from 1 to 1.2.

This return movement will be increased by the improved methods of applying steam and electricity to means of transportation. Mention has been made of the increased rate of motion owing to these and similar improvements. The waterways were the ready-made highways for the pioneers. Supplemented by carrying or portage paths from stream to stream or across watersheds, they formed a network of routes of travel, not only in a drainage basin, but from basin to basin. No small amount of the proverbial American "initiative," the capacity for doing things, must be attributed to the manner in which obstacles were overcome in this primitive travel and transportation.

The American frontier has passed forever. Fully equipped civilization stands at the edge of the arid region. It is met in the mining cities of the Rockies. The American pioneer lives only in the gratitude of the people. The influence which the frontier and frontiersman have wrought on American life have been suggested frequently in preceding pages of this article. A supplemental summary finds that the frontier is the most practical rebirth of the renais-sance of the principles of free government upon which the republic was founded. Western State constitutions have been notably more liberal than those of the Eastern States. Eastern statesman have been rejuvenated by contact with the crude sons of the West. A jealousy of their republican institutions, amounting almost to a madness, permeates the Western people, sometimes making them liable to harbor political and economic vagaries. (2) The frontier has helped keep alive the principles of democracy in America, notwithstanding the enormous accumulations of riches which tend naturally toward begreasing social distinctions. Among the frontiersmen personal strength and personal merit outweigh descent and social rank. (3) The needs of the people in the remote regions, met by Congress under the general name of "public improvements," have tended constantly to widen the scope of the national government. The scruples of "strict construction" must give way before the clamor of the people, as Clay easily demonstrated. (4) The public domain, by the easy piazza, the boom in the onward march, 26 New Yorkers found their way to Iowa for every one to Arkansas. On the other hand 57 South Carolinians have chosen to live in Arkansas for every one who chooses to remove to Iowa. The State of Washington has drawn most largely upon Illinois and Texas most heavily upon Tennessee. All this had a most important bearing on Northern and Southern sectionalism.

The due west movement has been accompanied thus far by a very slight return movement, except beyond the Rocky Mountains, where the entire migration is the reverse of that to the east of the continental divide. No small amount of the proverbial American "initiative," the capacity for doing things, must be attributed to the manner in which obstacles were overcome in this primitive travel and transportation.

The American frontier has passed forever. Fully equipped civilization stands at the edge of the arid region. It is met in the mining cities of the Rockies. The American pioneer lives only in the gratitude of the people. The influence which the frontier and frontiersman have wrought on American life have been suggested frequently in preceding pages of this article. A supplemental summary finds that the frontier is the most practical rebirth of the renaissance of the principles of free government upon which the republic was founded. Western
the hungry Eastern States and Europe. As early as 1830 a long, thin projection of people ran up the Missouri River to the mouth of the Kansas, following the route of Lewis and Clark and the later prophet of future collecting and distributing point of Kansas City, 1,500 miles from the starting points along the Atlantic.

So long as wagon trains toiled over prairie trails, or pony expresses handled light packages and the mails, or the overland coach carried a limited number of travelers, the resources and capacities of the great West remained untried. But, in 1862, two companies accepted the offer made by the national government of land and loans to construct a continuous railway from the Missouri to the Pacific. Precedent for this assistance of the government was found in the custom of granting certain portions of the domain for constructing means of access, thereby rendering the remaining land more valuable. In 1869 the line was opened and it sounded the death knell of an isolated West. When the road was built, there were only 14,916 miles of railway beyond the Mississippi. When it was completed, there were 22,863 miles in operation in that remote region.

The Great American Desert, as our fathers mistook the Great Plains, is now fretted over with railway lines. In its midst lies Kansas, Nebraska and the Dakotas, among the largest corn and wheat producing States. West of the Mississippi lie Texas, Montana, Oregon and New Mexico, containing more ships than the remaining States combined. West of the Mississippi lie California, Idaho and Colorado, producing more precious metals than all the remaining States Most of the manufacturing is still carried on east of the Mississippi. Likewise a majority of the people dwell on the eastern side. But the river, running north and south, is no longer a menace to the perpetuation of the republic as it once was. Migration and trade run east and west, and the Great Father of Waters is spanned by more than a score of railway bridges, linking the people together along modern lines of transportation. These trunk lines bind together the East and West, the old and the new, the seacoast manufactories and raw products, storehouses and grain fields. Home ties are no longer sundered by migration; sectionalism is no longer begotten of distance; and the people move freely to and fro over soil which their forebears wrested from nature in order that the experiment of a confederated republic might be tried on the largest scale yet attempted.

EDWIN ERL SPARKS,
President of Pennsylvania State College.

24. THE NEW DEMOCRACY AND THE SPOILS SYSTEM. The use of the appointing power to secure, in addition to the execution of the functions attached to the various offices, other purposes such as the enrichment of one's family, the building up of personal or party support, the carrying out of some general policy, is as old as government, is probably inherent in government. The term spoils system in United States history is more definite than this. It is generally used to refer to a particular method of employing this power which was introduced into national politics at the time of Jackson's Presidency, and which from that time until the eighties was, after the Constitution, the most important feature of American political machinery. Few important movements in our history have secured their first triumphs in the national government. The spoils system had been tried out in various States before it became national. In Pennsylvania in 1799, in New York in 1801, Republican victories had been followed by the wholesale removal of Federalists. The swiftly succeeding party changes brought retaliations, and both parties were soon committed to the practice. Popular approval confirmed it, and popular apathy allowed appointments to be made more and more exclusively for political reasons. The New York constitution of 1820 embodied an attempt at reform. The spoils system was, however, too firmly entrenched to yield, and the Albany Regency, a combination of politicians skilful in making use of appointive offices for political purposes, and in controlling new offices by means of caucuses, became the dominant power in the State. The advantages of the spoils system in building up and holding together a political organization did not escape the attention of politicians of other States. Proscriptions were carried out in Rhode Island in 1810, in Massachusetts in 1813, and, while they were unpopular and did not lead to a permanent introduction of the spoils system there, they indicate that in these States, and probably in others, there existed a class anxious to see the public offices turned over to the politicians. Debarrassed from using the State service for their purposes, such men naturally looked to the national salaries; nor in this were they alone. The more fortunate politicians of New York and Pennsylvania had already a little tinged with politics the national service in their States, but they would not rest content until they placed the Presidency a man who approved their principles and would make the spoils system national. The existing state of affairs was displeasing not to the politicians only, but to the people, particularly those of the frontier States. The
wholesome distrust of life-tenure in executive and legislative office, which had been so keen during the Revolutionary period, had extended to administrative office; the reasons for regulation had been forgotten and limitation had come to be considered as an end in itself. State constitutions and laws began to substitute a fixed term for tenure during "pleasure" or "good behavior," and in 1820 Congress limited to four years the tenure of the majority of United States officials. Such legislative action did not immediately lead, and was not intended to lead to, actual change; it was to give the people the power to make such change, if necessary. In 1828 there was a popular feeling that the time had come. The long tenure, and in some cases too eminent respectability, the book learning, of the existing servants of the people, had made them for some time feared and distrusted. In this situation the charge of bargain and corruption against Adams and Clay seemed proof positive: the case against the civil service was complete. Joined to this distrust of those in authority was a superb confidence in Jackson and in the people. Jackson said in his first annual message: "The duties of all public offices are, or at least admit of being made, so plain and simple that men of intelligence may readily qualify themselves for their performance, but I cannot believe that more is lost by the long continuance of men in office than is generally to be gained by their experience." The frontier did not believe in the expert; the typical American was a jack of all trades.

Jackson Introduces the Spoils System.—The election of Jackson was brought about by the combination of these two elements. Van Buren had brought the support of the organized Democracy of the North and East, of the politicians and the people that they represented. Jackson himself stood for the frontier democracy, with its confidence in itself and distrust of those it did not understand. The enormous crowd of office-seekers at Washington on 4 March 1829 reflected the belief that the government was expected to pursue. It is useless to discuss the personal responsibility of Jackson and Van Buren for the subsequent course of the administration. They were but carriers of a system in which they believed and which the people had elected them to put into effect.

Of 610 officers of the Presidential class, that is, those appointed by the President with the advice and consent of the Senate, 252 were removed during Jackson's administration. This number is not large, but there are facts which make this proscription the most noteworthy in our history. The majority of the removals were made in the spring and summer of 1830 and so attracted more attention than those of Jefferson, which were scattered through several years. Among those changed, moreover, were included nearly all the important officers, many of whom controlled large numbers of subordinate and carried on proscriptive harms of their own. In addition, the removals were to some extent localized, for few were made in the old South. In the North and West, then, by far the greater proportions of the salaries and influence of the national service changed hands. The specially distinguishing feature of this proscription, however, was the nature of the qualifications for office demanded. Up to this time, ability to perform the duties of the office, geographical fitness, good local standing and political opinions in sympathy with the appointing power had been required with varying emphasis. Service to the party was sometimes rewarded, but incidentally, at no time being actually essential. Under Jackson, ability became incidental, and party service the main requirement, not only past service but future usefulness as well. Newspapers were then not generally self-supporting and many editors received offices to enable them to pay their debts and improve their papers. Nor was loyalty to party alone sufficient. Unless one were a friend of Jackson or could obtain his ear, it was decidedly advantageous to belong to the Calhoun faction, and have his friend, Gen. Duff Green, editor of the United States Telegraph, press one's suit; or to advocate the succession of Van Buren and receive the aid of the powerful interests he represented. By 1831 the salaries of office-holders were occasionally assessed for party purposes. By the close of the administration, this practice was well recognized. The spoils system had been introduced into the national service: the question of its continuance remained.

The Whigs Establish the Spoils System.—The opponents of Jackson seized upon his administration of the civil service with avidity. They could not conceive that the people would endorse a practice that appeared so impolitic and wasteful. The Senate did not reject many of his nominations, but in 1831 several resolutions were introduced to show its disapproval and in 1835 an elaborate plan to regulate the control of the patronage was formulated. Webster, Clay, White and Calhoun delivered able speeches filled with high ideals of public service. When examined, however, the plan proposed is found to be purely an attempt to limit the power of the executive. The President was to present to the Senate the reasons for removals. Jackson refused to yield. His friends defeated the Senate's proposal, those whose nominations were rejected received compensation in other ways, and on 10 Feb. 1835 he peremptorily refused to send to the Senate any information concerning the removals. Fitz, asserting that that body had no right whatsoever to investigate removals. While no tangible results were obtained by this senatorial opposition, the patronage was to play a prominent part in the campaign of 1840. The crisis of 1837 struck a staggering blow at the civil service. Public servants who had speculated with government funds were caught without property to pay their loans: of 67 land officers, 64 were said to have been at one time in default. This condition was partly due to the careless with which appointments had been made, and since Van Buren administration suffered as if alone responsible
for the spoils system and the breakdown in the civil service. Reform became one of the most popular issues and the major theme of dealing with the situation proposed by the Whigs, the limiting of the power of the executive, was one that appealed strongly to their Southern States rights supporters. To nothing did they object more than Hamilton had done; his party as to the abolition of the spoils system. Having come into power, they failed to enact their legislation planned in 1835, although in full control of Congress, and although the subject was brought up. To remove many of the incumbent officers was necessary to their reform, but in filling the vacancies thus created they were pledged to return to the pre-Jacksonian qualifications for office. Instead, while insisting upon ability somewhat more than Jackson had done, they continued to make party service the chief essential. The man appointed collector at New York was described to Peter B. Porter by Thurlow Weed as follows: "Although not personally popular, [he] is representing as possessing an extraordinary share of tact or stratagem, and as being able, by his skill in planning and combining, and his untiring industry in executing, to produce the most astonishing political results. That, with the office of collector [which Weed considered as second only in importance to that of Postmaster General] he could on all important occasions, command the vote of the City of New York, and, per consequence, of the State." In 1817, then, the spoils system had been recognized by both parties and might be considered established.

The Significance of the Spoils System.—The continuous progress of the spoils system from a few States to the nation, from the nation into other States, from one party to the other, until it became a thoroughly national institution, indicates that it possessed some principle of vitality. The reasons thus far offered are insufficient to explain its growth. No practice could become so firmly fixed unless it served some fundamental lasting use. The spoils system was in fact a concomitant and probably a necessary one, of the democratic revolution which began in 1829 and established the rule of the people in the United States. The people cannot govern unless organized. They may overthrow old leaders in a revolution, they may elect new leaders by a plebiscite, they may even determine the policy of the government in moments of great national enthusiasm, but they cannot exert a steady control of the details of administration unless their laggard interest is kept up and their views given a means of expression by organization. Organizers of the national conventions are not only leaders of tens of thousands, who receive a reward of glory, but humble leaders of tens, ward-heerers, who enjoy little honor. Public interest attracts some to perform this function, but a sensitive detail, and that detail is not that of the "people," not men of wealth; it would not have politics a business of class, as it largely is in England. Now, however public-spirited a poor man is, he has to earn a living. Such numbers would not beget a sufficient number. Material inducements are necessary and some substantial means of supporting party organization must be found. To supply this is the function of the spoils system. The civil list becomes the pay-roll of the party and the recipients of public offices; the ability to serve the nation in the double capacity of working officials and party organizers. The rise of the spoils system was, then, inextricably joined with the rise of party organization and of democratic government, and this connection has continued to the present day (1916), although it has ceased, since the 80's, to be the controlling factor in national politics and in most localities.

The Struggle for the Patronage.—It follows from this inter-relation of the spoils system and party organization that the control of the patronage would often mean control of the party. Hence the struggle to secure this control became very bitter, and raged not merely between the two parties but also between the different branches of the government. The Constitution gives the House of Representatives no share whatsoever in the appointing power. In 1826, however, it was proposed that the delegations select the newspapers to be given the printing of the laws. In 1852 each member was allowed the appointment of two cadets at Annapolis and in 1899 General Grosvenor proposed that all government offices be divided equally among the Congressional districts so that the recommendations of the congressmen be requisite for appointment. The Senate, on the other hand, possesses rights under the Constitution and has always fought to have them respected. In 1879 Congress decided that the Senate had no power over removals. This interpretation was continually attacked, but for a long time unsuccessfully. The House of Representatives did not sympathize and a two-thirds majority would be necessary to override the almost inevitable veto of the President. Under Johnson, however, circumstances were favorable. The executive power had grown abnormal during the war; the patronage had become so extensive that it was feared even before the death of Lincoln; the actual President was hated, and his opponents had a two-thirds majority. In 1867 the Senate of Office Act was passed, providing that Presidential officers could be removed only with the advice and consent of the Senate. When President Grant procured the modification of this act in 1869, but, in spite of protests and with little to say in its defense, the Senate maintained the law until 1887, when finally it was repealed and the interpretation of 1789 restored.

The Machinery of the Spoils System.—While legally the President has maintained his power except for this short period, in actual practice he has long been greatly restricted. It is of course impossible for him to be personally cognizant of not only the qualifications of candidates for all the positions scattered over the country. Assistance has always been necessary and it has been natural to consult the members of Congress best acquainted with the locality. The men shall be of the "people," not men of wealth; it would not have politics a business of class, as it largely is in England. Now, however public-spirited a poor man is, he has to earn a living. Such numbers would not beget a sufficient number. Material inducements are necessary and some substantial means of supporting party organization must be found. To supply this...
ment of minor officers, as rural postmasters, within their districts. Lincoln's correspondence shows that in 1849 he considered this a well-established rule, and as President he abided by it. Often courtesy extends this privilege to congressmen of an opposing party, notably to those from the South, and in cases where a fixed number of new offices is created for every Congressional district, as in the census appointments for 1900. With regard to all local offices of the Presidential class, the senators from the State in question expect to be consulted.

In the early history of the spoils system, the delegations composed of all members of Congress from the several States settled such questions; under Pierce, they dictated nearly all important appointments. Lincoln wrote that the two Rhode Island senators, the two old representatives, and one of the new ones, combined in favor of one candidate, and added: "While under peculiar circumstances a single member or two may outweigh others in its strength, the combination as the present never has been."

After the passage of the Tenure of Office Act, the senators wavered in power at the expense of the representatives, their assumption reaching its apogee in its later in limine, retired from the Senate because they were not allowed to control the New York appointments.

The repeal of this law, however, has not restored the delegation to its former position; Smith still goes to the Senate with a practical veto on appointments from his State, as the other senators, disregarding party lines, will generally vote with him against a nominee whom he considers personally objectionable. General and foreign appointments are often times divided pro rata among the States and assigned in the same way as the local offices. This was understood in 1849, a fixed rule under Pierce and has been the general practice ever since. The extension of the influence of members of Congress curtailed that of the secretaries of departments, and the limits of their respective powers have always been a source of difficulty. Under Pierce, it seems to have been allowed to the secretary at least a nominal veto on all nominations to offices within his department. Lincoln was inclined at first to overlook this, and had much difficulty with Secretary Chase in regard to it. The personality of the secretary has much to do with his influence, but few of them exert very much at present, except as advisers of the President. The latter dispenses comparatively little patronage directly, but as the final arbiter in disputes between senators and representatives, holding in his hands the whole situation and adjusting the various interests, he has a power which makes even a weak man powerful and a strong man party dictator. The boss exercises his influence through some of these agencies: as the friend of the President, as a member of Congress or as the political mentor of congressmen. The whole is now highly systematized; the Treasury Department can tell in a moment by its card catalogue how many men every congressman has recommended, how many have been appointed, and what congressman recommended every appointive officer.

The Spoils System and Administration.—

The spoils system does not necessarily mean bad administration. Its uncertainties deter men of conservative tendencies from entering government employ; but the opportunities of sudden and distinguished advancement attract men of adventurous character, and undoubtedly so far in our history this latter class has contained the greater part of the ability of the nation. It is not to be supposed, moreover, that the whole service has ever been changed at any single description. William Hunter entered the State Department in 1829 and served until 1885, preserving the continuity of tradition and becoming a power in the State by reason of his experience. He is a type of a large class of permanent officials, who have on their shoulders the weight of routine business. Often it is easy to distinguish between two distinct classes of officers, the one working at government duties and the other attending to politics. Of course this double system is expensive, because of the unnecessary number employed and the fact that the class of men attracted while able are not always honest; but it need not be inefficient.

Rotation in Office.—While the rise of the spoils system is so closely connected with the rise of the new democracy, and its organization was soon completed, there are several significant episodes in Washington history. The system had been justified before the public largely by the democratic phrase "rotation in office." For a long time, however, actual rotation was practiced only when the incoming President belonged to a different party from the outgoing president. Buchanan was the first President to expel men of his own party. It was then held that the public offices were prizes, and that democracy demanded that they be shared round as often as possible, that no one should hold longer than four years. Consistency required that a President who was re-elected decapitate his own appointees, and this policy was urged on Lincoln in 1865. He firmly set his face against the suggestion, and it has never been carried out. Buchanan's example, however, was followed until Roosevelt succeeded McKinley.

The Spoils System and the South.—The seaboard South was for a long time comparatively free from the spoils system. Jefferson asserted, not quite truly, that he had a "smoke screen" for removals from that region. The dislike for the New York machine did much to promote the formation of the Whig party there, and Clay soon was not more emphatic in his support of slavery than in his demand for reform in politics. This immunity was largely due to the political conditions, the fact that politics was the business of the wealthy and that the public offices were not needed to support party organization. The Civil War and Reconstruction brought a total change. The attempt to build up a stable Republican organization composed of moneyless negroes and money-seeking white men from the North involved necessarily the use of public offices, both State and national, as spoils. After the overthrow of the negro domination, this organization was still maintained by the use of the national spoils, because of the votes it could cast in national nominating conventions. The Democratic party, the wealthier class gradually lost its control, and the rise of a real democracy has been again marked by the adoption of the spoils system, which may be said now to embrace the whole country.
United States — Annexation of Texas (25)

The Spoils System and Civil Service Reform. At the very time that the spoils system was being extended into the South, it received a vigorous attack in the development of civil service reform. It was natural that such a movement should come when the Civil War had so greatly distended the civil service. The method of reform proposed was the substitution of a mechanical for a personal method of appointment. It was claimed by the supporters of the status quo—that no mechanical system could be devised which could properly take into account a man's ability to perform the functions of his office. The reformers claimed that such a system was possible, that offices must be withdrawn from politics and that this could be done only by eliminating the personal element. The conduct of private business was improving and the expert was beginning to play his part as the life of the nation became at the same time more complex and more orderly. In 1883, after an earnest crusade, Congress voted the experiment be made. The law has received the support, more or less earnest, of every President since that time, and has been extended, officially or by practice, to include the greater number of officers in the national civil service. In fact since the inclusion of the fourth class postmasters by Taft, and the virtual inclusion of the consular service by Wilson, comparatively few offices remain which could properly be placed under the mechanical system. In city, county, and township governments, moreover, have followed the national example. Not that the spoils system has vanished. The pressure on those portions of the service not covered by the law has increased, and the law is often circumvented. Nevertheless the bulk of our public servants are as secure in their positions as are those in private life, and their only political obligation is to refrain from political activity, not to exert themselves in it. The public service, moreover, is conducted with a reasonably high degree of efficiency.

It should not be overlooked, however, that the problem of which the spoils system was a crude and dangerous solution has not yet been satisfactorily solved. In those cases where offices first began to be withdrawn from politics the expenses of party organization greatly increased. The necessary funds were furnished in large measure by the campaign contributions of great corporations and powerful individuals interested in securing or defeating legislation. This is one of the fundamental explanations of the course of politics in the '80s, '90s and the early 20th century. Meantime all other methods have been evolved, as the statutory limitation of campaign expenses and the taking over of party primaries, with the consequent expense, by the government, while widespread popular contributions and publicity of expenses have decreased the importance of the individual Nicholson. In fact all these methods are employed, and party control has become less concentrated. It is still uncertain what the final method by which democracy will maintain control without too seriously interfering with the efficiency of administration will be.

25. Annexation of Texas. The Louisiana Purchase in 1803 gave the United States a shadowy claim to Texas. This claim was strengthened by each successive administration until 1819, when all rights beyond the river Sabine were given up as a consideration to Spain for the cession of the Floridas. Between 1820 and 1830 great numbers of Americans settled in central Texas; most of these were from the Southern States, and they had carried their slaves with them. An arbitrary union in 1824 of this semi-Anglo-Saxon region to the Spanish state of Coahuila gave rise to much dissatisfaction; the abolition of slavery throughout the newly-established Mexican republic in 1829 increased the discontent of the thrifty Texan slaveholders; but when, in 1830, the Mexican government forbade citizens of the United States to settle within the discontented region and placed the country under military control, the Texans demanded (1833) complete separation from Coahuila and an independent existence in the Mexican confederation. This was refused and a still closer surveillance was established by Santa Anna in 1834. Two years later the Texans issued their Declaration of Independence and set up a government of their own. The fact that only two of the leaders of this movement were not American settlers is proof enough as to one cause of the conflict. Santa Anna attempted to put down the revolt; he failed disastrously. At San Jacinto, in northeastern Texas, April 1836, the insurgents defeated the Mexicans and either killed or captured their entire army. A constitution was now agreed upon and the republic of Texas firmly established. It is significant that the constitution provided expressly for the re-establishment of slavery, which had been maintained contrary to law since 1829. The boundaries of the new State were declared to be the Rio Grande on the west, the Sabine, Red and Arkansas rivers—the line of 1819—on the north and northeast. These boundaries gave Texas a total area of 270,000 square miles—a territory equivalent to five of the larger States of the American Union. Gen. Sam Houston, the hero of San Jacinto, became the first President of the Texan Republic. The government thus founded was in its essential features a copy of that of the United States. Texas was recognized at once by the United States as an independent nation, and the powers of Europe followed suit in a few years.
Texas made application for admission into the American Union in August 1837. President Van Buren opposed the proposition and eight States opposed the annexation. But as early as May 1836, one month after the battle of San Jacinto, John C. Calhoun declared from his seat in the Senate that an independent power between the United States and Mexico was inadmissible; he favored immediate annexation, and, as he openly declared, on the ground of the extension of slavery. Calhoun represented the South, and the South since 1830 had become more firmly anchored in slavery than ever. The States of Virginia, Maryland and the Carolinas exported not less than 50,000 slaves a year to the Far South and Southwest. An active propaganda favoring annexation immediately began; legislatures of most of the slave-holding States passed resolutions calling for annexation. Even the great influence of ex-President Jackson was given to the cause. But the Whig party won the election of 1840, and the Whigs, more a Northern than a Southern party, opposed annexation. In order to "bury" the important State of Virginia, which was already States-rights and pro-annexation in political complexion, John Tyler had been placed on the ticket with Harrison. Tyler a Whig because of Jackson's high-handed methods rather than from principle, was a States-rights devotee, a slaveholder and a determined annexationist; he became President on the decease of Harrison in April 1841. In 1842 the Texans again knocked at the door of the Union. It would have been opened to them but for the opposition of Webster, the Secretary of State. Next year Webster resigned and Abel P. Upshur of Virginia was appointed to fill the vacancy. The new secretary belonged to the extreme States-rights school of politicians. The Cabinet, which had been reformed in 1842, was now in accord with the executive. Annexation became at once the main business of the administration. In October 1843 Upshur informed the Texas representative in Washington that a renewal of overtures for annexation would be welcome. Van Zandt asked for the requisite powers, but meanwhile the influence of the abolitionists had reached a sharp crest in the country, and co-operating with the expansionists of the West, they began a campaign for the control of the Democratic national convention, which was to meet in Baltimore. The editor of the Richmond Enquirer was a typical example of this movement. A letter of ex-President Jackson, written a year before, was now published in the Enquirer, bearing date of 1844. The Nestor of the party urged annexation. When the convention met it sat aside at once Jackson's favorite, and the ablest Northern candidate, Van Buren, and nominated James K. Polk, an avowed "Texas man." The platform demanded the immediate "re-annexation of Texas and the re-occupation of Oregon." "Fifty-four or fight" became the party cry of the West, while the leaders of the South boldly threatened secession in case Texas was not annexed. Meanwhile, the Senate rejected the Texas treaty by a majority of 35 to 16, and the leaders of the Whig party, aided by the leaders of Van Buren, exerted their influence to the utmost to get the country to sustain the Senate majority. They failed by a narrow margin; Polk became the next President. Tyler and Calhoun, failing back of the Democratic doctrine, considered themselves and Congress "instructed" by the country to
proceed with their work. Since the Senate held out stubbornly against them they resorted to the plan of accepting Texas by joint resolution, a method hardly justified by the Constitution. This required a majority only of both Houses, while the passage of a treaty in regular form required two-thirds. The joint resolution passed, and on 3 March 1845 annexation was complete, so far as the United States was concerned. Texas approved the treaty without reservation of its legality in June 1845, and in July of the same year the people of the Lone Star State, in convention assembled, ratified the work of their representatives by an almost unanimous consent.

Texas came into the Union with a quarrel on its hands: Both the Mexican and Texas governments claimed the country lying between the Nueces and the Rio Grande. This and all other subjects of dispute between these governments seemed about to be amicably arranged in the early months of 1845, on condition, however, that Texas should not permit annexation to the United States. Mexico had repeatedly declared that annexation would be regarded as a declaration of war. When the joint resolution passed Congress the Mexican Minister in Washington asked for his passports and the American representative in Mexico was ceremoniously dismissed. The United States had troops already in the disputed country; a year later they advanced under General Taylor to the Rio Grande and trained their guns on the Mexican town of Matamoras. War followed. Texas had been obtained at the behest of a southern party and for the purpose of a make-weight against the expansion of the free States toward the Northwest. The leaders of Texas had come into the Union to safeguard slavery against the free labor and abolitionist sentiment of the great outside world. This had not been done without the promise of the "re-occupation" of Oregon, which gained the votes of the West and North. But the able, aggressive and uncompromising policy of Calhoun and his section had aroused the North, the abolitionists became politically important, and the issue which followed terminated in civil war. See Texas; Mexican War.

26. THE ABOLITION AND FREE SOIL MOVEMENTS. The first important and concerted movement in America for giving freedom to the slave began with Quakers. Their persistent opposition to human slavery arose from the nature of their doctrines. Even before the American Revolution, individual Quakers like John Woolman of Philadelphia raised their voices in favor of emancipation. The emphasis placed upon the rights of man, in the Revolution, and upon the sentiment in favor of emancipation in all the colonies. As this period drew to a close, no stronger condemnation of slavery was uttered than by Thomas Jefferson, himself a slaveholder, in his famous book called 'Notes on Virginia.' A similar arrangement of the institution was made by George Mason of Virginia, in the Constitutional Convention of 1787. About this time the Northern States are taking steps which ultimately freed them from slavery. New England and Pennsylvania led the way in this movement. The first anti-slavery society in America was formed in Philadelphia in 1780. Benjamin Franklin became one of its members. But this form of opposition was not confined to the Northern States, for both Maryland and Virginia organized anti-slavery societies. The movement in the South, however, did not reach the point of emancipation by State action. The institution of slavery had become firmly rooted in the South, because of climatic and industrial conditions, and the problem of emancipation, therefore, was vastly more difficult than at the North.

In Washington's administration a new and powerful factor was introduced into the problem by the invention of the cotton gin. This machine so cheapened the preparation of cotton for the market that the raising of cotton became the dominant industry of the lower South. The North profited from this new era of cotton development by building cotton factories and in competing with England for the raw cotton of the slaveholding States. Both an American and European demand were placed upon the South for the extension of cotton production. The price of slaves also rose, and the domestic slave trade so increased that the supply seemed to be abundant, although, when the African slave trade was abolished in 1808, many persons had said that the result would be the gradual decay of slavery. But they were mistaken. The new industrial and commercial foothold obtained by the institution gave it more favor than before in the eyes of both the North and South. Only the Quakers kept up any serious attack upon it during the first 25 years under the Constitution.

Opposition to slavery had been based, thus far, on all sorts of grounds, and had been carried on in a very moderate anddecorous fashion. The Quakers, although attacking the system on moral grounds, did so in a manner comporting with their reputation for moderation. The prolonged and exciting struggle over the admission of Missouri (1819-21), however, turned attention upon the slavery question in a more intense way than ever before. Benjamin Lundy a Quaker, who had already been working to encourage slaveholders to emancipate their slaves, now founded the first important antislavery paper, the Genius of Universal Emancipation (1821). He published editions of his paper in Ohio, Tennessee and Maryland. In 1829 Lundy called to his aid young William Lloyd Garrison
who became the most fiery and radical of all the early abolitionists. His hard-hitting blows fell upon a New England slave dealer for carrying a cargo of slaves from Baltimore to New Orleans. He was sent to jail, from which he was released by a stranger paying his fine. He now returned to New England and founded in Boston (1831) the most famous of all abolition papers, The Liberator. With the aid of a small fund he formed the New England Anti-slavery Society in 1832 with the avowed object of endeavoring "by all means sanctioned by law, humanity, and religion to effect the abolition of slavery in the United States. Similar organizations sprang up in other Northern States, and another anti-slavery paper, the Emancipator, was launched in New York City, under the patronage of Arthur Tappan, a philanthropist. These were small beginnings. Only a few men in any community were courageous enough to stem the tide of public disapproval. In 1833 a little group of men and women, gathered from 10 States, met in Philadelphia to establish the American Anti-slavery Society. Among them were Garrison, Samuel J. May, Whittier, William Goodell, Lewis Tappan and Lucretia Mott. In that city not a man was found willing to serve as chairman. For safety they met behind locked and guarded doors and labored at their task throughout the day without venturing to hold an evening session or to be seen on the streets in search of a mid-day lunch. A declaration of principles was issued which showed the unalterable determination of the abolitionists to carry on the agitation against slavery until every slave in America was liberated. Public sentiment was to be aroused by public speakers traveling about the country, by sermons from the pulpit, by appeals from the press wherever possible and by a wider circulation of anti-slavery tracts and periodicals. Headquarters of the new society were set up in New York with Arthur Tappan as president, and with the Emancipator, Goodell editor, as their organ. Immediate emancipation was their cry and uncompromising hostility to slavery their creed. In a few years hundreds of anti-slavery societies had sprung up and more than 500,000 anti-slavery documents were distributed.

The rapid growth of the abolitionists introduced discord and faction. In a short time leaders arose who demanded that abolitionists participate in politics, as a means of forwarding the cause. Some of the old leaders, of whom Garrison was chief, strongly opposed political action, but declared in favor of woman's participation in the work of the anti-slavery societies. The differences between the two parties were augmented by the strong opposition of some Northern clergymen to women taking part in public discussion. The disaffection grew till State and national organizations were disrupted, resulting in two sets of anti-slavery societies and two sets of anti-slavery publications. In 1840 a number of abolition leaders who believed the time for political action had come met at Albany and formed the Liberty party (q.v.). Among the founders of this national party were Myron Holley, Gerrit Smith and James G. Birney. The latter was nominated for the Presidency, and renominated in 1844. In the famous campaign of 1840 he received 7,000 votes and in 1844 62,000. Neither of these votes represented the total strength of the abolitionists and certainly not the strength of the anti-slavery sentiment of the country. The rapid rise of the anti-slavery societies which followed the formation of a national organization greatly accelerated the work, begun by Garrison and the Liberator, of sending abolition documents into the South. The result was a storm of indignant protests from the slaveholders who resented what they termed an interference with their own domestic institutions. They declared that the abolition literature sent among them was incendiary and intended to excite servile insurrection, the most dreaded, because the most horrible, of events. Nat Turner's rebellion (q.v.) in Virginia (1831) was then still fresh in mind. In their excitement the slaveholders made certain demands upon the people of the North. They called for the suppression of the abolition literature and work by public opinion and by State action. Rewards were even offered for the arrest and transportation to the South of Garrison and Arthur Tappan.

Public feeling in the North was already so bitter against the abolitionists that it hardly needed the added impulse of the South's demands. On 4 July 1834 the anti-slavery celebration in New York City was broken up and the leaders compelled to flee for their lives. Nearly a week the excitement continued. All the important daily papers, except one, encouraged the populace to suppress the abolitionists. Their business places and even their houses were attacked by the infuriated mob and the quarters occupied by the negroes were invaded and property destroyed. In nearly every Northern State the work of putting down the abolitionists went on. The rougher element was encouraged by resolutions passed by meetings of the respectable portion of the community. Fifteen hundred influential names signed a call for an anti-abolition meeting in Faneuil Hall. The great orators of Boston addressed an excited multitude. In a few days false alarms were found standing in front of Garrison's home. A few weeks later at a woman's anti-slavery meeting a mob filled the streets, broke into the house to which Garrison had fled and dragged him out with a rope. He was eventually imprisoned with great difficulty and was compelled to leave the city for safety. Danger threatened abolitionists in Brooklyn. Lydia Maria Child (q.v.) wrote: "I have not ventured into the city, nor does one of us dare to go to church to-day, so great is the excitement. Mr. Wright was yesterday barricading his doors and windows with strong bars and planks an inch thick." A mob led by representatives of Cincinnati destroyed the printing press of The Philanthropist and attacked the houses occupied by negroes. In 1837 at Alton, Ill., mob shot down the Rev. Edijah F. Lovejoy (q.v.), the editor of an abolition paper, while he was endeavoring to protect his press. This event and other extreme measures against the abolitionists over-shot the mark, and public opinion became more sympathetic toward the hated and hunted disciples of the abolition creed. The great majority of them — women as well as men — possessed the true martyr spirit, in the era of their persecution. But the rush of events was already drawing public attention away from the abolitionists and turning it toward other phases of the anti-slavery conflict.
The Quakers had begun in Washington's administration to petition Congress against the slave-trade. Later their petition struck at slavery in the District of Columbia. The abolitionists joined in the work of petitioning against slavery in the District. As early as 1831 John Quincy Adams, then a congressman, presented 15 such petitions, but declared that he did not approve of their object. From year to year, these petitions had been received and referred to the committee on the District of Columbia and nothing more came of them. But in 1835 Hammond of South Carolina moved that an anti-slavery petition be not received. To some, this motion seemed necessary to check the rising tide of abolition petitions, but to others the remedy seemed worse than the disease, for it attacked the ancient right of petition. An exciting debate arose running throughout an entire day. Adams now came forward as the champion of the right of the petition and Slade of Vermont made a fiery speech declaring war upon the institution of slavery. This speech greatly angered the slaveholders and their support. In 1836 the abolition petitions were renewed and continued for four months during which many thousands of persons put their names to petitions. The result was a resolution of the House to lay all papers relating to slavery on the table and to take no further action on them. This was the germ of the famous gag rule. But this action only stirred anti-slavery people and by 1838 petitions to Congress against slavery had increased tenfold. Early in 1840 the House made answer to these by establishing the following standing rule: "That no petition ... or other paper, praying the abolition of slavery in the District of Columbia, or any State or Territory, or the slave-trade between the States or Territories of the United States in which it now exists, shall be received by this House or entertained in any way whatever." Similar, though more temperate, debates were going on in the Senate and similar results followed.

The attempts to suppress the abolitionists' agitation both in and out of Congress by attacking ancient popular rights very naturally produced a reaction in their favor and against the cause of slavery. The battle for the right of petition was waged, therefore, with untiring energy by John Quincy Adams, Joshua R. Giddings, and others. The threats made to expel them from Congress and the denunciation heaped upon them only aided them in the end by bringing to their aid an increasing number of congressmen and in 1844 victory crowned their efforts; the gag rule was repealed.

Additional meaning was given to the questions of freedom of the press and the right of petition by the demands of the slaveholders that all anti-slavery documents be excluded from the United States mails. Some of the inhabitants of Charleston, S. C., broke into the post office (1835), seized a quantity of abolition literature and burned it in the presence of spectators. The Postmaster-General gave as his opinion that although such documents could not lawfully be excluded from the mails, the postmasters owed a higher duty to their communities than to the laws. President Jackson, in a message to Congress, severely criticised the work of the abolitionists and recommended that Congress prohibit, under severe penalties, the circulation of such documents through the mails. Congress not only did not accept the President's recommendation but voted for fining and imprisoning postmasters for withholding mail from the persons to whom it was addressed. On none of the points of contention had the opponents of the abolitionists been able to score a moral victory. On the contrary the permanent results were against slavery. Among them may be enumerated the rapid increase of anti-slavery, if not abolition, sentiment and the formation of a political party. Another result was the feeling of many Northern men, who had little or no sympathy with the agitators, that the friends of slavery were demanding too great a sacrifice of cherished principles for its protection. One of the most deplorable results of 10 years of bitter agitation was the ill will engendered between the radical elements of the two sections. Neither could do right in the eyes of the other. The danger lay in the fact that other events might cause the spread of this sentiment to the steady minded. Such events were already on the horizon.

The South came to feel that safety to slavery and to the social and industrial fabric based upon it lay in preserving the equilibrium between the sections in the Senate. That equilibrium had been hopelessly lost in the House of Representatives and to preserve it in the Senate required the addition of new territory to the United States. To accomplish this end, the annexation of Texas quickly followed the Texas revolution and the cession of California and New Mexico came as a consequence of war with Mexico. But it was far more difficult to determine slavery's relation to the new territory than it had been to win the territory by war. The South gave an indication of its coming attitude by defeating Van Buren for renomination in 1844, because he had opposed the immediate annexation of Texas. Northern anti-slavery men followed by defeating Henry Clay in New York by voting for a candidate of their own, because Clay, after the immediate annexation, had written a letter trying to explain the matter to the satisfaction of Southern Whigs. In 1846 President Polk asked Congress to vote a sum of money to assist him in making peace with Mexico. David Wilmot, a Pennsylvania Democrat, offered an amendment to the appropriation bill, providing that in any territory obtained from Mexico slavery should never exist. This amendment is the famous Wilmot Proviso (q.v.). Twice it passed the House, but each time failed to get through the Senate. Southern leaders were stirred to combat more vigorously the idea that Congress could exclude slavery from the Territories. Northern men affirmed more emphatically the right of Congress in this matter, because, to admit the South's contention would invalidate the anti-slavery features of the Ordinance of 1787 and the Compromise of 1820. The debates in Congress and the discussions by press and pulpit as to the allegiance due to the old parties. Therefore, the Whig party, the majority of whose votes was generally in the North, nominated for President (1848) Gen. Zachary Taylor, a Louisiana slaveholder, but refused to commit itself on the slavery question. The Democratic party, whose main
strength lay in the South, nominated Lewis Cass of Michigan and likewise uttered no decisive word on the vital question. This non-committal attitude of the leaders of the old parties angered anti-slavery men of all parties who promptly revolted and launched the Free Soil party at Buffalo, N.Y. (1848). The platform contained 19 resolutions mainly relating to slavery and declaring in favor of "Free Soil, Free Speech, Free Labor and Free Men." It also declared that Congress had, and ought to exercise, the power to exclude slavery from the Territories, but that it possessed no authority to interfere with slavery in the States where it already existed. Although this platform did not satisfy the extreme abolitionists, it offered a line of defense, on constitutional grounds, which appealed to moderate reformers who could not sympathize with the Anti-Union sentiment of Garrison and his radical followers. The slaveholders were right in believing that the underlying cause and the logical consequences of the Free Soilers and the abolitionists were not greatly different. The Free Soil party nominated Martin Van Buren for President and Charles Francis Adams for Vice-President. The Van Buren Democrats in New York, nicknamed the "Barnburners," supported the new party. The result was a nominal Free Soil vote of over 250,000, the loss of New York by Cass and the triumph of General Taylor. The Van Buren supporters were avenged by the defeat of Cass, and most of them returned to this allegiance.

During the next four years the Free Soil idea gained at the North, but the party made but little progress. The Compromise of 1850, and the consequent effort to discourage all agitation as dangerous to the perpetuity of the Union, discouraged any great gain by the party. Both the old parties in their nominating conventions (1854) pledged themselves to stand by the Compromise, and Hale, the Free Soil candidate only polled 150,000. The passage of the Kansas-Nebraska Bill (1854), suddenly precipitated the anti-slavery conflict in a more virulent form than ever before. The result was the break-up of the Whig party. Thousands of its Southern supporters joined the Democratic party, (q.v.) while the majority of its Northern voters co-operated with other anti-slavery elements in forming a new party, the Republican. Although the organization of the Free Soil party was thus disbanded, its principle became the rallying cry of the Republican party (q.v.).

27. THE MEXICAN WAR. Owing to its close association with the slavery controversy the Mexican War was the subject of almost endless dispute. Many people believed at the time, and many others still believe, that it was forced on by a Democratic administration in order to secure more territory in the Southwest for the extension of slavery. It would be difficult either to prove or to disprove this view conclusively. The immediate cause of the war was the annexation of Texas. The Democratic platform of 1844 favored annexation, but at the same time it was equally explicit in asserting the American claim to Oregon, a territory which could not by any possibility be opened to slavery. To the party leaders this connection of the two questions may have been only a shrewd bit of politics, but President Polk's determination to fight for 54° 40' showed that it meant much more than that to him. The success of the ticket also indicated that it meant more to the American people. The constant cry of a slaveholders' conspiracy would not blind them to the advantages of acquiring so much valuable territory. At the time of the annexation, Texas (q.v.) had been an independent republic for nine years, recognized as such by the leading nations of the world. Although the Mexican government had made no serious attempt during that interval to assert its rights, it now notified the United States that annexation would be regarded as a casus belli. The passage of the joint resolution of 1 March 1845 was, in consequence, followed by the recall of the Mexican Minister at Washington and the formal suspension of diplomatic relations.

In addition to the Texas question there was a long-standing controversy in regard to the claims of American citizens against the Mexican government. During the numerous revolutions which had occurred since Mexico gained her independence Americans had often suffered imprisonment and loss of property. A claims convention of 1839 provided for a board of commissioners to pass upon these cases. There was some delay, however, in making the payments, and a second convention was concluded in 1843, in which Mexico agreed to pay all claims within five years in quarterly instalments. A few payments were made, but in 1845 they had again fallen very much in arrears.

In October 1845 President Polk informed the Mexican Secretary of State that he wished to settle the question in dispute amicably, and that he was ready to send an envoy with full power to act. The secretary made an evasive reply in regard to the subjects to be discussed, but expressed a willingness to receive our representative. The President at once commissioned John Slidell, of Louisiana, as envoy, and he set out for his new post in November. The war fever was so strong in Mexico when Slidell arrived that President Herrera was forced to refuse him an audience. A revolution, which occurred a few days later, resulted in bringing General Paredes, the head of the war party, into power. Being again refused recognition, Slidell returned to the United States in March 1846.

If annexation and the spoilation claims had been the only questions involved, the war might still have been averted. But a controversy arose in regard to the western boundary of Texas. The Congress of Texas in 1836 asserted that the Rio Grande was the natural boundary of the territory. Historically the claim to the territory
between the Nueces and the Rio Grande was of
doubtful legality, but owing to internal difficul-
ties the Mexican government had taken no steps
to asserts its authority. Texas was admitted
into the Union with Texas title already includ-
ed within and rightfully belonging to it,
but subject to the adjustment by the United
States government of all questions of boundary
that might arise with other governments. If
the Mexican authorities had the question might properly have come up for dis-
cussion. Their refusal left but one course open
to the President, namely, to treat the Nueces-Rio
Grande tract as American territory. The reve-
 nue laws were extended to it, and Corpus
Christi, a town west of the Nueces, was made
a port of entry. The Mexican authorities re-
sented this intrusion, and a large force of men
under General Ampudia were stationed on the
south bank of the Rio Grande, preparatory to
an invasion of the disputed territory. To op-
pose him, Gen. Zachary Taylor with about
2,000 men was ordered to advance to the north
bank of the river, opposite Matamoros. On
12 April Ampudia warned Taylor to with-
bear within 24 hours to take the conse-
quences. The warning being disregarded,
General Arista, Ampudia’s successor, sent no-
tice on the 24th that hostilities were com-
enced. On the same day a considerable force
of Mexicans crossed the river a few miles above
Matamoros and defeated a detachment of
United States dragoons.

The news of this engagement reached Wash-
ington early in May, and on the 11th President
Polk sent a special war message to Congress.
After speaking of the failure of the Slidell mis-
sion and explaining the movements of General
Taylor, he went on to say that war already
existed, that it existed by the act of Mexico it-
self and, consequently, that it was the duty of
the American people to vindicate the honor,
the rights and the interests of their country. (See
MEXICAN WAR). The whole question hinged
upon the ownership of the Nueces-Rio Grande
strip. According to the President this district
belonged to the United States, and the war was,
therefore, defensive in its origin. On the other
hand, if the Mexican claims to the strip were
valid, Polk exceeded his constitutional powers
in beginning an offensive war without the con-
sent of Congress. However, the President’s po-
sition was safe enough because Congress had
already recognized the country beyond the
Nueces as American territory, by including it
within the revenue system, and the Senate had
ratified the appointment of a revenue officer.
Two days after the message was received an
act was passed providing for the vigorous pros-
euction of the war.

Whether or not the war was defensive in
origin was certainly not long conducted on
that basis. After his successes at Palo Alto,
8 May, and at Resaca de la Palma, 9 May,
Taylor crossed the Rio Grande and captured
Matamoros on the 18th, before he could pos-
sibly have heard of the Congressional act of the
13th. The President’s military orders showed
clearly his intention to seize Mexican territory.
General Kearney was authorized to occupy New
Mexico, Commodore Sloat to take possession of
Upper California and Taylor to prosecute the
war in Mexico. These orders were faithfully
executed. Kearney captured Santa Fé and
brought all of New Mexico under subjection.
Frémont and Commodore Stockton, who had
succeeded Sloat, were equally successful in Cal-
ifornia. Taylor made his way slowly into the
interior. In September, after defeating an army
under Ampudia, he captured Monterey.

The anti-slavery Whigs in Congress pointed
to these facts as evidence that the war was not
being waged to recover United States, but purely in order to seize the territory
of a weaker power. Among the discontented
was Abraham Lincoln, who was elected to Con-
gress in 1846. Jefferson Davis approved of the
war and resigned his seat in Congress to lead
a Mississippi regiment. In general the con-
lict was popular in the South and unpopular
in the North, the strongest opposition being in
New England. Lowell’s keen satires in the
‘Bigelow Papers’ represent well the sentiment
of that section of the country. See LOWELL,
JAMES RUSSELL.

In spite of adverse criticism, President Polk
never once swerved from his original line of
action. Early in 1847 a second army was sent
out under General Buckner, who captured the
Port of Vera Cruz, and to attack the capital from
the east. The series of Mexican disasters at
the beginning of the war had resulted in another
revolution which restored Santa Anna to power.
His plan was to defeat Taylor first, defeat him
and then return to the city of Mexico in time to
defend it against Scott. The battle of Buena
Vista was fought 23 February 1847. Taylor’s
force of 5,000 men won a victory over an army
four times as large. Immediately after the bat-
tle Santa Anna hurried south to meet General
Scott. The two armies first came into conflict
at the mountain pass of Cerro Gordo, and the
Americans were again successful. This was fol-
lowed by the victories of Contreras, San An-
tonio and Cherubusco. The way was now open
to the City of Mexico, but the arrival of a
peace commissioner from the United States led
to the conclusion of an armistice. See MEX-
ICAN WAR.

The scene now shifts to Washington. Presi-
dent Polk had been confident of success from
the very beginning of the war. As early as 8
August 1846 he asked Congress for $2,000,000 to
be used in negotiating a peace. This was far
more than enough to meet the ordinary ex-
penses of peace commissioners. The object of
the President, however, was perfectly clear; in
fact he made no attempt to conceal it. Mexico
was to be called upon to cede New Mexico and
California. A bill was introduced into the
House of Representatives to appropriate the
amount required. David Wilmot, a Pennsyl-
vania Democrat, moved the insertion of a
proviso to the effect that neither slavery nor in-
voluntary servitude should exist in any terri-
tory to be acquired by the war. (See WILMOT
PROVISO). It was passed by the House in 1846
and again in 1847, but was defeated by the Sen-
ate on both occasions. The House finally
yielded, and the appropriation, increased to
$3,000,000, was deeded until 1850.

Nicholas P. Trist, of Virginia, was at once
to sent to Mexico as a peace commissioner. He
was authorized to demand the cession of New
Mexico and Upper California and the recogni-
tion of the Rio Grande boundary. This was
the minimum to be accepted. In order to obtain these terms he was to begin with an additional detachment of 5,000 men on the way across the Isthmus of Tehuantepec. At the proper moment he might surrender these points and also offer a money consideration. The Mexican authorities refused the terms, negotiations were broken off and General Scott renewed his campaign. On 13 September he stormed the heights of Chapultepec, and on the following day entered the City of Mexico. The enemy were now compelled to accept whatever terms were offered to them. Negotiations were reopened with Trist, and the Treaty of Guadalupe Hidalgo was signed 2 Feb. 1848. It was sent to the Senate 23 February, ratified by them with amendments 10 March, and the final ratifications were exchanged 30 May. In return for $15,000,000 and the assumption by the United States of the spoliation claims of their citizens, estimated at $3,250,000 more, Mexico ceded California and New Mexico, and recognized the Rio Grande frontier. Mexicans living in the ceded territory were to be free to continue to reside there or to remove to Mexico, without any prejudice to their property. Those who remained could either retain the title and rights of Mexican citizens or become citizens of the United States.

The immediate result of the war, then, was the acquisition of the vast territory comprising the present States of California, Nevada, Utah, Arizona north of the Gila and parts of Wyoming, Colorado and New Mexico. More than half a million square miles of valuable land were transferred from a non-progressive nation to a nation that was able to develop its resources. The enormous mineral deposits of that region were just beginning to be developed. And even now, over half a century after the peace, the agricultural industry, owing to the tardy extension of irrigation facilities, is still far from its maximum development. Many of the best people in the country in 1848 were so blinded by the slavery issue that they could not realize the value of their conquest. Fortunately for our history, such men as Cass and Decatur, by their sufficient influence partially to allay the prejudices of their section and thus to secure the ratification of the treaty.

But, although the anti-slavery sentiment was not strong enough to embarrass the government in the conduct of the war or to endanger the treaty of peace, still it could not entirely be kept in the background. That was shown, for example, in the struggle over the Wilmot Proviso. As soon as peace was concluded and it was no longer necessary to keep up the appearance of unanimity before the enemy, the controversy was renewed. Three questions came up for solution: Should California be admitted as a free State? Should the remainder of the territory acquired from Mexico be organized in accordance with the Wilmot Proviso? What should be the boundary between Texas and New Mexico? These questions and others connected with slavery were nominally settled by the compromise of 1850, but the controversy was soon renewed in a more violent form, and culminated in secession, civil war and emancipation. See Mexican War, the; Texas.

28. SLAVERY. When the English colonies were first established in America, chattel slavery of white people had nearly died out in Christian Europe, although servitude to the owner of the estate to which one was attached still prevailed in Russia, Germany and many other parts of Europe. In England the only recognized chattels were the rare negroes or Asiatics owned as a matter of amusement by a few wealthy men. In the New World, however, the English colonists adopted the Spanish habit of enslaving such of the native Indians as they could possess themselves of; but the tribesmen were sullen, insubordinate and short lived. The slavery of that race was never of any economic importance, though as late as 1692 an Indian woman, Tituba, was one of the Salem witches.

Part of the white population in all the English colonies was in a condition not far different from servitude, until some time after the American Revolution. This was the distinct class of so-called "indentured" or "indentured" white servants, both men and women, who served their masters for a term of years, sometimes for life, and were almost completely subject to his will. One element of this class was convicts. The early planters begged for "offenders condemned to die out of common gaols." By 1650 grew up a regular practice of "transporting" some criminals instead of hanging them, and it is estimated that first and last 50,000 convicts came over. For instance, a Scotchman was sold as a slave for life to America for the heinous offense of burning the Bible; and in 1736 Mr. Henry Justice of the Middle Temple stole books and in consequence was transported to America, where he was to remain seven years, and to be put to death if he returned, etc., and one Sarah Wilson, servant to a maid-of-honor to the queen, was fanned in Maryland, put up for sale and purchased. Another fruitful source of indentured servants was the political prisoners. After the battle of Worcester, in 1650, about 1,000 Scotch-
men were ordered sent to the colonies. In 1716 a lot of Jacobites were sent over.

By far the larger and more important class of white serfs was that of the "redemptioners," who agreed with some shipmaster to carry them over and in America to sell their services for a term of years to any purchaser for a sum sufficient to pay their passage money. Thus, in 1774, John Harrower, whose diary has been preserved, was obliged to engage to go to Virginia for four years as a schoolmaster for bed, board, washing and five pounds during the whole time. He was duly sold to a Virginia gentleman, and lived a respectable and honest life. Many such servants on expiration of their time set up for themselves and founded families. White servants frequently ran away from their masters and were advertised, pursued, arrested, whipped and branded exactly like slaves.

By far the most important phase of American servitude was the slavery of the African negroes; it was directly related to the centuries of war between the Mohammedans and the Christians in Europe, which engendered a deep-seated belief that Christianity forbade the slavery of Christians, but allowed the enslavement of infidels. In 1517 Las Casas, a benevolent Spanish divine, suggested that negroes be imported into the West Indies from Africa, to save the remnants of the unhappy Indians. This African slave trade at once sprang up in the Spanish and Portuguese possessions; and by 1670 the English adventurers, especially Sir John Hawkins, began to engage in this profitable business. The first English colonial colony to buy negro slaves was Virginia, where, in 1619, a Dutch ship of war sold some in exchange for provisions; but it was in the English West Indies, especially the sugar-growing islands of Barbados, Tobago and Jamaica, that slavery first found a profitable field. To these islands were sent most of the white convict slaves, and the continent received for its supply of negro slaves only those already seasoned in the West Indies.

Though so early established, negro slavery was not important on the continent during the 17th century. The total number of negroes in all the colonies in 1700 was probably not more than a tenth of the whole population. The 18th century saw, however, a lively slave trade, and widely distributed slaves. England forced from Spain the privileges of the Assiento—that is, the monopoly of carrying slaves from Africa to the Spanish colonies. For supplying these laborers to the North American colonies, a direct traffic grew up from Africa in colonial vessels, chiefly owned in New England and in New York. Newport and Bristol, R. I., were noted centres of the trade.

The result was that negroes were distributed more or less throughout all the colonies, although the condition of treatment was very different from community to community. Excepting on Narragansett Bay and the Hudson River, where there were plantations with large numbers of slaves, the negro in the Northern colonies was a rarity, and the institution was here at the best; the old North Church in Boston still contains a gallery for such people. Negroes probably were no worse treated than indentured servants or apprentices of the time, and were often much valued and respected by their masters.

Proceeding southward, in Pennsylvania the number of negroes was large, and in Maryland, Virginia, North and South Carolina and Georgia slavery was an established part of the social and economic system. The cruelties of the institution were most manifest in the scattered plantations of the Carolinas, in which the slaves considerably outnumbered the white people. There about 1780 Saint-John Crèvecoeur found a negro servant exposed in a cage, left there to be devoured alive by insects and by birds, which had already destroyed his eyes; his unpardonable offense was killing a white man.

The steady growth of slavery is remarkable because it was actually prohibited by two of the New England colonies, Massachusetts in the Body of Liberties in 1641, drawn up by Rev. John Cotton, declared that: "There shall never be any bond slaveerie, villanouge or captivitie amongst us unless it be lawfull captives taken in just warres, and such strangers as willingly sell themselves or are sold to us." And Rhode Island in 1652 "ordered that no black mankind, or mulat, or mulat att his assigns longer than ten years." These acts were a dead letter; slaves were born, grew up, died and left the taint to their posterity in every Northern community, as well as in the South.

Indeed, there was in every community a body of positive legislation relating to terms of transfer of slave property, and to special offenses of slaves, and of white people toward slaves, so that the institution of slave property was as firmly rooted and as widely disseminated as that of private property in land. This is the more striking, because in England the enslaving of blackamoors was thought inconsistent with human rights. In the celebrated case of James Somerset in 1772, Lord Mansfield held that slavery was "so odious that nothing could be suffered to support it but positive law"; there being no such law in England, he therefore refused to compel the negro Somerset, whose master had brought from Virginia to England, to remain in the custody of that master.

Long before slavery acquired such a firm and important status, it was attacked by philanthropic men. In 1624 John Rutland objected to slavery in the proposed Swedish colonies. Georgia was founded in 1732, as an anti-slavery colony, but the restriction was given up in 1749. The first Englishman to protest against colonial slavery was Roger Williams in 1637, and John Eliot in 1675 declared that to sell soules for mony seemeth to me a dangerous merchandize." Richard Baxter, favorite English Puritan author of devotional books said in 1673, "To go as Pirates and catch up poor Negroes or people of another land, that never forfeited Life or Liberty, and to make them slaves, and sell them, is one of the worst kinds of Thievery in the World." Samuel Sewall, in his tract 'The Selling of Joseph,' says: "If a house or a ship or a ship or a ship in the sea is not such a thing as Slavery, because all Men, as they are the sons of Adam, are Coheirs; and have equal Right unto Liberty, and all other outward Comforts of Life.'
The most efficient agency against colonial slavery was the disapproval of the Quakers, both North and South. The German Quakers of Germantown in 1688 adopted a minute against the traffic in negro slaves, to the effect that Quakers promised freedom to slaves who joined the army and to liberate their families; and a dangerous rift was thus made in the system of slavery.

This rift was widened by the action of several States during and immediately after the Revolution. In 1775 an abolition society was formed in Pennsylvania under the presidency of Benjamin Franklin and similar societies followed in the New England States. These organizations at once began to petition legislatures to secure better treatment for slaves, and even to prohibit slavery altogether. The movement rapidly gained headway in the Northern communities where slaves were few and vested property interests were small.

In 1777 the people of Vermont drew up a State constitution containing clauses "that all men are born free and independent," and that hence slaves should be set free at the age of majority. The next community to act was Pennsylvania, where under strong pressure from the abolitionists, 1 March 1780, an act was passed declaring that all persons thenceforward born within the State should be set free at 28, thus putting slavery in process of extinction. Still more effective was the action of Massachusetts which, in 1780, adopted a new constitution, drafted by John Adams, the opponent of slavery. The bill of rights included the declaration "that all men are born free and equal, and have certain natural, essential, and inalienable rights, among which may be reckoned the right of enjoying and defending their lives." In 1783, in a test case, the Supreme Judicial Court held that under this clause there was no such thing as slavery in Massachusetts; and by gradual emancipation acts in Rhode Island and Connecticut in 1784. For a time the tide was stayed; then in 1799 New York, and in 1804 New Jersey, passed gradual emancipation acts. Thus, of the 16 States admitted to the Union before 1800, eight became free.

Meantime the national government had also taken important and far-reaching steps in regard to slavery. The First Continental Congress, to damage English trade, drew up the Association of 1774, in which the colonists agreed not to import slaves; and this prohibition was maintained throughout the Revolution. Most of the States passed laws prohibiting the slave trade, so that when the Revolution was over there appear to have been no importations for a time.

The opposition of the Northern States to slavery was quick to the Declaration of Independence. When they signed that "all men are created equal," had in mind men who were sharers in the government; but some negroes had the requisite property qualifications and were voters in all the colonies but two, New England and South Carolina. When the Revolutionary patriots so vehemently declared that they never would be slaves they could hardly have forgotten that about one-sixth of the community were actual slaves. The progress of the Revolution empha-

sized this contradiction, for large numbers of negroes were enlisted in the Continental Army, especially in the Northern States, where they sometimes served in regiments indiscriminately with white men. Rhode Island was obliged to promise freedom to slaves who joined the army and to liberate their families; and a dangerous rift was thus made in the system of slavery.
became necessary to provide a government for the immense areas added to the United States both north and south of the Ohio River. In 1784 Jefferson reported an ordinance which included a clause that in all the new Territories, *after the year 1806 of the Christian era there shall be neither slavery nor involuntary servitude.* For lack of one vote in one State this clause was rejected; but in 1787, in the Northwest Ordinance, Congress applied to the Northwest Territory the prohibition which had failed three years before. Hence, when the Constitutional Convention of 1787 adjourned, slavery was prohibited in the whole section of the country north of Maryland, (except New York and New Jersey), by action of the States; and from the Pennsylvania line westward to the Mississippi, by Congress.

When the Federal Convention assembled at Philadelphia in May 1787 it speedily became evident that slavery, or rather the division of the Union into a free and a slaveholding section, was contrary to its purpose. Following the suggestion of Mr. Madison, that it was *wrong to admit in the Constitution the idea of property in men,* the Convention scrupulously avoided using the words slave and slavery in the final document, but six clauses in the final draft distinctly refer to that institution.

1. The apportionment of direct taxes *shall be determined by adding to the whole number of free persons . . . three-fifths of all other persons.* This clause was the result of a long and bitter controversy. As Gerry of Massachusetts put it, *why should blacks who are property in the South, be in the rule of representation more than cattle and horses in the North?* while Pinckney of South Carolina thought that in apportionment *the blacks ought to stand on an equality with the whites.*

2. *The migration or importation of such persons as any State now existing shall think proper to admit, shall not be prohibited by the Congress,* prior to 1808. This clause of course related to the slave trade, complete control over which was for a time withheld from Congress; and the concession to the Northern States was part of a bargain by which they retained the right to pass navigation acts.

3. A clause relating to fugitives provided for the return of any person *held to service or labor in one State, under the laws thereof, escaping into another.*

4. *The citizens of each State shall be entitled to the privileges and immunities of the citizens in the several States,*—a clause afterward applied to, or claimed for, negroes.

5. *Congress shall have power to dispose of and make all needful rules and regulations respecting territory or other property belonging to the United States.* This was the power under which the Northwest Ordinance of 1787 had prohibited slavery.

6. Congress shall have power to exercise exclusive legislation in all cases whatsoever, over such district (not exceeding 10 miles square) as may, by cession of particular States and the acceptance thereof, become the seat of the government of the United States, and to exercise like authority over all places purchased by the consent of the legislature of the State in which the same shall be, for the erection of forts, magazines, arsenals, dockyards and other needful buildings.

The experiment was now fairly under way of carrying on a Federal government with three different principles as regarded human slavery, freedom in the Northern States; slavery in the Southern; and a discretionary power over territorial slavery in the Federal government. The difficulties of this situation were clearly shown when, in 1790, the abolition societies petitioned Congress to regulate the slave trade; and the House of Representatives passed resolutions in which they expressly disavowed any power to regulate slavery within the States.

Three years later Congress exercised its power over fugitive slaves by passing an act which provided that under the authority of the United States and on the certificate of any magistrate, a master or his agent might personally apprehend a slave escaped into a free State.

In 1789 Congress exercised its power to deal with slavery in the Territories by re-enacting the ordinance of 1787; but in 1798, on the organization of Mississippi Territory, the anti-slavery clause was omitted, and slavery was allowed to continue there. In 1801 the United States took over the District of Columbia and repealed the pre-existing laws of Maryland, including harsh slave codes. The act for organization of the Territory of Illinois contained a clause which in 1820 was applied by the Missouri Compromise to the northern boundary of the Louisiana Purchase. Meanwhile a long continued agitation in England against the slave trade resulted in an act against it in 1806. This example was helpful in the United States which, by Act of 7 March 1807, laid an absolute prohibition on the foreign slave trade which was enforced by additional acts of 1818 and 1820.

In 1821, on the final admission of Missouri, Congress insisted that a clause in the State Constitution prohibiting the incoming of free negroes should be withdrawn, because contrary to the citizenship clause.

In the 40 years from 1790 to 1830 the conditions of slavery radically changed. In 1790 the census showed 700,000 slaves; in 1850, 2,000,000, in each case about one-third of the total population of the slave-holding communities. The persistence of slavery was unexpected for in 1790 it was dying out from want of profitable employment. When Eli Whitney invented the cotton gin for separating the seed from the fibre (1794) a profitable crop was opened up to slave labor. The product of cotton in 1800 was 210,526 bales, in 1830 1,038,847 bales. It is a crop requiring cultivation during a considerable part of the year and adapted to rude labor in large gangs; it thus made slave labor profitable in the Gulf States, and furnished a market for the surplus slave population of the border slave States; hence all sections of the South had an economic interest in its continuance.

Looking at slavery from the side of the slave, the conditions varied extremely; in general the work was lighter and the relations with the master, became the seat of the government of the United States, and to exercise like authority over all places purchased by the consent of the legislature of the State in which the same shall be, for the erection of
by hired overseers. The conditions varied also according to the character, intelligence and temper of the masters; easy-going, kind-hearted, genuinely religious masters and mistresses favored their way to the South, Neapolitan up brining their slaves; but it was part of the system of slavery that passionate, coarse and overbearing men and women might own slaves and frequently treated them with harshness, severity, and extreme cruelty. The condition of the slave varied also according to his employment. Most of them were field hands, engaged in the rudest and most toilsome labor; but some were employed as roustabouts on the river steamers, as longshoremen, and others as skilled carpenters, blacksmiths, masons, plasterers and the like. A much greater number were busy as household servants, there being practically no other domestic service obtainable in the South. People, therefore, who needed such service and owned no slave hired one—almost always the handsomest, most intelligent and most promising slaves were used for household service, and it was a highly prized privilege, bringing better food, abundance of cast-off clothing and personal relations with the white people. The field slaves worked long hours, commonly from sunrise to sunset, and were kept up to their work by white overseers, and on large plantations also by negro slave drivers armed with the whip. Men and women and half-grown boys and girls were engaged in this field labor. Their houses were cabins in the negro quarters, usually small, dark and dirty, but often as good as the ordinary house of the poor white. The clothing of the field hand was rough, coarse and scanty. Thrifty planters estimated that it cost about $15 a year, on an average, to feed and clothe a slave.

Most adult slaves were married, but family relations were so disturbed by sale and a feeling of irresponsibility that such relations were very changeable. The slaves usually had Sunday free and a few days of jubilation at Christmas; in many churches negroes attended the same services and were received as members. Many communities had their own churches with a rude and boisterous worship, conducted by slave preachers.

One of the incidents or accompaniments of slavery much in the minds of people at that time was sale. Negroes who, in the colonial days, could be bought as low as $50, by 1830 were worth $500; and by 1860 prime cotton hands were quoted as high as $1,500. The South, in 1860, valued its slave property at about $2,000,000,000. Of course this high value depended upon the opportunity to market surplus slaves and to buy hands as needed; hence, a lively system of picking up slaves at private sale, purchasing them into coffles or gangs and shipping them south by land or river, there to be sold out again. Though the slave trader was universally despised by the white people, the kindest master might get into debt and have to sell his slaves, or his death might cause an auction sale. Such auction sales were very frequent and abounded in pathetic incidents of the division of families and the sale of infants away from their mothers. Another frequent incident was escape. Slaves were always running away and taking refuge in swamps or forests; many of them returned, took their flogging and went to work again; many others became fugitives, and made their way to the North. By 1861 thousands of them remained there or passed on farther north to Canada. These fugitives were commonly the most determined and ablest of their race and by stealing themselves they depreciated slave property, especially in the border States.

A third striking incident of slavery was manumission,—from early Colonial days slaves were set free by indulgent masters during their life or by their wills; and the free negroes in the South in 1860 were about one-sixteenth of the whole number. The process of setting slaves free was commonly hedged about by two restrictions: (1) The master must give bonds that the freedman should not become a public charge; (2) in some States he was obliged to remove him from the Commonwealth in which he was set free.

A fourth incident was insurrection. Beside several risings in Colonial days, of which the New York Slave Plot of 1741 is the best known, there were three insurrections or attempted insurrections in the 19th century: the Gabriel insurrection in Virginia (1800); the Denmark Vesey in Charleston (1822); and the Nat Turner rising in Virginia in 1831, in which 70 white people were massacred. This was the last of such movements; even during the Civil War there was no slave rising in the South, but the fear of it was a constant motive in the minds of the Southern people.

Looking at the institution of slavery from the point of view of the master, the Southern community was divided into three strata of white people: (1) The large slaveholders. In 1850 about 2,000 families owned as many as 100 slaves each; the largest number under one management was about 2,500. These 2,000 families made up the social and political aristocracy of the South, furnished a great number of the professional men and almost all the holders of high political offices, State or national, in the South. (2) The small slaveholders, about 350,000 families: of these, in 1850, about 60,000 held only one slave. Such people commonly had a poor living, in rough houses with unsavory food and few opportunities for their children; with them were associated a considerable body of non-slaveholding farmers. (3) At the bottom of society was the great class of poor whites, including the mountaineers; they held no slaves, but owned their own land and lived upon it in a miserable fashion. They were a naturally intelligent people, but extremely ignorant and made up about three-fourths of the white population. They implicitly followed the political leadership of the great planters and were perfectly persuaded that the cause of slavery was their own, although they were looked down upon by well-to-do white men, and were sometimes despised by slaves.

The system of slavery was maintained by a rigorous code of special laws. Property and mortgage right in slaves were protected by law. The masters were assured the physical control of slaves by laws and customs which gave them authority to compel obedience and
force labor; and to resist any real or supposed belligerency of the negro by force, which commonly took the form of whipping. The laws held a master responsible for killing a negro, under a charge of murder; but negro testimony could not be received against a white man, and the law of a State which absolved the master in case a slave was so inconsiderate as to die under a "moderate" chastisement sufficiently indicates that public sentiment demanded giving discretion to the master in all doubtful cases.

Assemblies of slaves and any sort of riotous behavior were dealt with by special acts. In many States special tribunals of the slave-holders in the neighborhood took testimony in a summary fashion, and executed punishment, even to the taking of life. There were also special laws against the consorting of whites with negroes, or their purchase of property from slaves. Runaways were stopped by a system of patrols, a kind of voluntary mounted police, who scourcd the roads and picked up suspected characters.

The system of slavery, a system of brute force, buttressed by a powerfully welded public opinion, backed up by a body of positive law. On many plantations the life of a slave was easy enough, labor was light and he was looked on as a reasoning being; on other plantations he was treated worse than the beast of the field, because he could talk and was held to the responsibility of men. Slave labor was notoriously inefficient and wasteful; and small plantations made very little out of their slaves.

The larger planters, by working out a kind of machine system, had better results; but it was at the expense and the degradation of their white neighbors as well as of the slaves.

The Southern opposition to slavery, which had been widespread in 1787, grew less and less as the years went on, though till 1830 there was a national anti-slavery organization, which held a convention about once in two years, usually in New York City. The movement grew more and more deeply rooted, and when the Northern abolitionists began an active crusade against it in 1831, the Southern societies disappeared and only a handful of Southern leaders remained to hold it by force, and who would so much as make a public argument against the desirability of slavery.

From looking on slavery as an "evil" which must be destroyed, by 1820 the South as a community were thinking of it as a difficulty which could not be removed without destroying the country. By 1830 they grew to advocate it as something which, whether evil or not, must neither be attacked nor discussed; thence it was an easy step to advocate it as desirable in itself, as Calhoun put it, "a good, a positive good." In the last stage of the contest, just before the Civil War, Southern leaders like Jefferson Davis insisted that slavery must be extended in some degree to the Northern States.

The abolition movement is elsewhere discussed,—our object at this point is to show how slavery, so strongly buttressed in the interests and the pride of the South, yet quickly came to an end. As has already been shown, when the two sections had clearly adopted opposing systems of labor, many questions of choice between the two systems came before the Federal government. It was in vain to urge that slavery was a State institution existing only under State laws, in the face of the fact that Congress, by its regulation of the slave trade in the District of Columbia, that the national relations, of fugitives and of the Territories, had a power to increase or to diminish the slave power. In fact, the national government furnished the arena in which the question was finally fought out in many unexpected ways.

The first great step came about 1835, when the abolitionists, in part encouraged by the English acts abolishing slavery in the West Indies (1830-35), began to send petitions to Congress asking for the prohibition of slavery in the District of Columbia. The South was able to influence enough Northern votes to secure a succession of gag resolutions, intended to prevent discussion in Congress; but the question sprang up in many unexpected ways. The apparently innocent power of carrying mails by the Federal government brought to light objections to the delivery of abolition mail at the Southern post offices. The Southern leaders attempted to stop the discussion of slavery in Congress; but John Quincy Adams arose as the champion of free speech, and he was speedily aided by other men like Joshua R. Giddings of Ohio, who would not be silenced.

By 1842 it was plain that nobody could prevent the discussion of slavery throughout the North and in Washington; soon it had to be discussed, because of new questions of Territorial slavery and of dividing the Union by a geographical line continued by the Missouri Compromise of 1820 was tested again when in 1845 Texas was brought into the Union with the express purpose of furnishing material for a body of slave-holding States; Congress deliberately prohibited slavery in the territory claimed by Texas, north of 36° 30'.

Then followed, in 1848, the annexation of New Mexico and California, with the plain expectation system of slavery extended to the Pacific. The North, however, was aroused and the people of California refused either to divide their Commonwealth or to admit slavery within its borders. By the compromise of 1850 it was finally declared that California was to be a free state, and New Mexico and Utah were practically left as fighting grounds for slave power; yet Congress, in 1848, passed a fourth significant act prohibiting Territorial slavery, this time in Oregon. In the same compromise of 1850, Congress passed a new Fugitive Slave Law and prohibited slavery in the District of Columbia.

The contest was raised again by the Kansas-Nebraska Act of 1854, framed by Douglas, which repealed the Missouri Compromise and, by implication, the three other acts prohibiting slavery in the Territories; and left Kansas to be controlled by the first set of people who might get on the ground. Contrary to expectation, the first set were from the North, and the determination of the Southern settlers in Missouri and of the South generally to take possession of Kansas in spite of the will of the majority of the settlers occasioned a civil war in Kansas, six years before the South, yet quickly came to an end. By this time it became evident that slavery was a political question which divided the nation; and in 1856 the first large and widespread anti-slavery party was formed. The
Dred Scott Decision of 1857 was an attempt to suppress the controversy, and to take it out of politics, by denying the right of Congress to prohibit slavery in a Territory. That right had four times been exercised, with little opposition. From this time the drift was steadily and irresistibly toward Civil War,—and the crisis was reached in 1860, when the Southern Democracy demanded, as a condition of remaining in the Union, their right to share in all territory thereafter annexed, and to have an end of abolition agitation in the North.

Although in a resolution of 22 July 1861 the House of Representatives declared that slavery was not the cause of the war nor the freeing of the slaves its purpose, from the beginning it was plain that slavery was the great question which divided the two sections, and that consequently its future was inextricably woven into that struggle. Hence, the war had hardly begun before there came a series of special enactments and executive proclamations. (1) On 26 April 1862 an act of Congress freed the slaves in the District of Columbia, with a compensation of about $300 a head. (2) On 19 June 1862 an act in flat defiance of the Dred Scott Decision, prohibited slavery in every Territory. (3) On 2 July 1862 an act was passed providing that slaves of persons engaged in rebellion against the United States thereby gained their freedom. President Lincoln was all the while turning over in his mind a larger scheme, and on 22 Sept. 1862 he issued a preliminary proclamation on 1 Jan. 1863 by a final proclamation, of emancipation, by which all slaves within the seceding States were declared free, excepting in the State of Tennessee, and certain districts of Virginia and Louisiana which were within the Federal lines.

To the national prohibitions of slavery in the Territories, the District of Columbia and the seceded slave States were added the actions of three slave-holding communities: West Virginia (1861), Missouri by a vote in convention (1 July 1863), and Maryland by a new constitution (13 Oct. 1864), declared for absolute or gradual emancipation. They thus joined the cohort of freedmen, and ended the existence of the only regions within the boundaries of the United States in which slavery remained legal were Delaware, Kentucky and Tennessee, the last of which States declared for freedom by a new constitution in 1863.

Slavery was thus practically at an end. Nevertheless under the then accepted theory of the Constitution, both Congress and the States might legally re-establish it. To prevent that contingency and to wipe out the last vestige of the system, the 13th Amendment was introduced into Congress, received the necessary two-thirds vote (22 Feb. 1865) and 18 Dec. 1865 it was announced that the necessary three-fourths of the States had ratified it, and that to the text of the Constitution had been added the significant words, "Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction."

As Lincoln said a few days before his death, "We have finished the job." Beginning in 1775 with a United States in which slavery was the normal condition of every community and every square mile of vacant territory, the struggle of 90 years ended with a condition in which by the firmest of constitutional enactments the normal status was that of freedom. The amendment even reached out into the future, and covers all annexations made or that can ever be made; so that chattel slavery of human beings, no matter what their color, is now absolutely unknown in the law of the United States or of any State, Territory or dependency.

ALBERT BUSHNELL HART, Professor of Government, Harvard University.

29. FINANCES (1816-1861). In 1816, at the close of war with England, the chief problem of the government was the restoration of currency to a specie basis. Dallas, upon assuming the office of Secretary of the Treasury in 1814, vigorously endeavored to secure a charter for a second United States bank through which pressure might be exercised upon the local banks to resume specie payments. The Republican party as a whole had long been opposed to the bank and founded upon a Federal charter; and notwithstanding Dallas' support promptly advanced constitutional objections. The discussion ran through two years in which several plans were proposed; the principal points of difference were, first, whether the capital of the bank should be based upon treasury notes or upon government stock; second, whether the bank should be forced to loan money to the government; and third, whether the bank should be given power to suspend specie payments. The bank was chartered in March 1816. Its capital was based in large part upon government stock; the government in addition subscribed to the stock and had representation in its management. The bank was obliged to transfer the public funds free of charge, and was made the depository of government moneys. As a return for the exclusive privilege of a national charter, the bank paid to the government a tax of $1,500,000. The establishment of this institution was quickly followed by a Congressional resolve that after 20 Feb. 1817 all dues to the government should be paid only in specie, treasury notes, notes of the Bank of the United States or in notes of local banks which were
payable on demand in the foregoing currency. This action forced the State institutions to adopt sounder methods, and on the date named there was general resumption.

In 1816 the revenue system was reorganized, not for lack of revenue, but because the enormous volume of imports rushing into the country upon the return of peace endangered domestic manufactures which had been abnormally stimulated during the war. The value of imports in 1816 was estimated at $116,000,000 as compared with $13,000,000 in 1814. Customs duties amounted to $36,000,000, far surpassing the previous estimate of Dallas of $13,000,000. Even President Madison affirmed the necessity of protection. A new tariff bill was consequently enacted 27 April 1816; in particular the cotton industry received protection. In December 1817 the internal revenue duties were repealed; and in the following year supplementary customs duties were placed upon iron commodities, thus establishing a policy of protection. In these measures the South cordially joined, and Calhoun, who afterward bitterly opposed the high tariff policy, at this time supported higher duties.

The tariff of 1816 and 1817 the treasury was in a most favorable condition; revenue exceeded all expectation, yielding surpluses amounting in two years to nearly $30,000,000. Good fortune, however, did not continue; the new United States Bank was misused and the currency was once more thrown into disorder. This, together with an extraordinary commercial and manufacturing expansion, led to a crisis in 1819. The revenues were severely affected and customs duties which yielded $20,000,000 in 1817 fell back to $13,000,000 in 1821. In 1820 and 1821 the treasury budget showed a deficit. Expenditures for the navy and pensions were reduced; and a change in the management of the bank, with a contraction in its circulation and loans, led to a revival of business and improving revenues. Beginning with 1822 the treasury annually enjoyed a surplus (except in 1824 when a large payment was made on account of Spanish claims), and the surplus was again employed in the redemption of the debt. In 1820 an attempt was made to increase tariff duties, partly to help the revenues at that time embarrassed, and partly in behalf of protection. The bill passed the House but failed in the Senate. Clay and John Quincy Adams championed protection and liberal expenditures for internal improvements, cardinal points in the "American System." The effort was renewed in 1824 and protection was sought in particular for iron, wool, hemp, glass and lead, industries of the Middle West. The contest now assumed a sectional division, the Middle Western and Southwestern States being arrayed against New England and the South. New England's chief interest at this time was in commerce, and her leading representative, Webster, made an exhaustive argument in behalf of freedom of trade. The measure became law by a vote of 107 to 92; in the South there was but one vote in favor to 47 against. During the tariff sessions the question occupied a large place in Congressional debate and legislation. The tariff of 1824 fell short of the demand of woolen manufacturers, and agitation for a revision with still higher rates resulted in the tariff of 1828 and turning more and more to protection, and Webster under instructions made a speech declaring that through the encouragement of the Act of 1824 capital had been invested which needed further protection. The woolen tariff, or Tariff of Abominations, as the measure was frequently termed, aroused the fiercest controversy, which finally led to nullification and the compromise tariff of 1833. By this latter act a horizontal reduction of duties, spreading over a number of years, was made and for a while the tariff question yielded in importance to other political issues.

A persistent attack upon the United States Bank, resulting in its downfall as a Federal institution, began in 1829. President Jackson in his first annual message in 1829 raised the question of constitutionality, and doubted the value of the bank in establishing a sound currency. In its place he suggested an institution more directly under the management of the Treasury Department with power to receive both public and private deposits, but with no right to make loans. Jackson undoubtedly voiced the conviction of Western democracy, that the affairs of the government should be divorced from private corporate undertakings. The suggestion had little immediate influence, for both houses of Congress made reports in favor of the bank. In 1831 Senator Benton took up the fight against the bank, restating his argument upon the evils of all kinds of bank notes, and in particular attacked the issue of bank drafts. In 1832 the bank petitioned for a new charter and was successful in carrying its bill through Congress. Jackson interposed a veto, laying stress upon the evil of a money monopoly. He did not stop here but next determined on the removal of the government funds from the custody of the bank; in this he was encouraged by his re-election in 1832 which he interpreted as a popular endorsement of his opposition to the bank. There were doubts, however, as to the legality of removal of the public moneys without the sanction of Congress. W. J. Duane, who was appointed Secretary of the Treasury in June 1833, refused to take the responsibility, and although the bank was reported Jackson's contention, Duane remained obstinate. He was forced from office and was succeeded by Taney, who on 26 September issued an order directing the deposit of public moneys henceforth to be made in national banks, institutions, popularly known as Jackson's "pets," were chosen with care, and by the Act of 23 June 1836, the regulation of public funds was strictly prescribed so as to safeguard the interests of the government in every possible way.

In 1835 the public debt was paid off; customs receipts had steadily increased; and beginning with 1830 there was an enormous expansion in revenue from sales of public land. In 1834 and 1835 the annual receipts from this source alone were nearly $15,000,000 and in 1836, $25,000,000. A new fiscal problem of dealing with a surplus was thus created; many schemes were projected, chief among which was Clay's proposition that revenue from lands be distributed among the several States. Any plan to prevent a surplus by lowering customs was negativized on the ground that the tariff question has been, for the time being at least, settled by the Act of 1828 and ought not to be reopened. On the other hand, there was objection to the
distribution of the proceeds of land sales on the ground that public lands had been ceded for paying off the Revolutionary debt; that this national income could not in fairness be given to States which had not originally shared in the gift, and that the Constitution required all revenues to be appropriated for specific objects. Others desired to make large expenditures for internal improvements, fortifications or education. It was impossible to pass a distribution bill, but the same end was reached by the Act of 23 June 1830, providing for the deposit of certain surplus funds in the treasury, amounting to $37,000,000, with the several States in proportion to their respective representation in Congress. In law this was a deposit which could be recalled, but it was practically regarded as a gift to the States. The deposits were to be made in four quarterly instalments during the year 1837. Before the deposit was completed the country was involved in a commercial panic which made it impossible for the government to pay the fourth instalment.

On 1 July 1836 the Treasury Department issued an order known as the Specie Circular, requiring all land agents to accept only specie in payment for public lands; as local bank notes had been previously received, and specie was scarce in the West where sales were made, speculative operations based upon land were sharply checked. Eastern banking institutions with which the transactions were obliged to withdraw their loans, and this, coupled with a heavy transfer of funds, in accordance with the Deposit Act, proved a severer strain than many banks could stand. The evils were aggravated by commercial failures in Europe, decreasing crops and Southern speculation in cotton. In May 1837 the banks throughout the country suspended specie payments, and as the treasury had parted with its funds it shared in the distress and was also forced to suspend. During the next few years treasury notes were issued amounting to $47,000,000, of which one-third were reissus; and between 1841 and 1843 there were three long-term loans. With the exception of 1839 there was a series of annual deficits until 1844.

The failure of the banks to protect the funds of the government led President Van Buren to recommend the establishment of an independent treasury system by which the government might take care of its own funds. A prolonged dispute within the party over the details of this plan, as well as the opposition of Whigs who wished to establish another United States Bank, deferred the passage of the independent Treasury Act until 1840. In 1841 the Whigs gained the election and used their power by repealing the Treasury Law. Owing to the vacillating opposition of Tyler, who succeeded President Harrison, it proved impossible to pass constructive legislation, and for lack of other agencies the public funds were once more placed with local banks; this practice continued until 1846. Whig success also led to a revision of the tariff in the Act of 1842 along protectionist lines. Additional reason for the legislature's action was found in the embarrassment of the treasury and the need of increased revenue. In 1846 the Democrats regained the Presidency and at once re-established the independent treasury system and enacted a new tariff. The Treasury Act of 1846 provided for the custody of public funds at mints, custom-houses and at subtreasuries in a few of the larger cities. It also provided that all public dues should be made either in specie or treasury notes, thus excluding bank notes. The system in its main features has remained unchanged to the present time, and it has been successful in safeguarding the funds of the government.

The tariff of 1846 was a free trade tariff; specific duties were abolished; and the duties were so rated as to yield the largest amount of revenue. Commercial enterprise was again at a high level; railroad construction and foreign immigration contributed to new industrial development; and in spite of the temporary interruption occasioned by the war with Mexico, the treasury entered upon another long period of prosperity. Customs receipts were large; the sales from public lands again proved fruitful; and repeated surpluses made it possible to reduce the debt, until in 1857 it stood at $32,000,000.

In 1857 another reduction in tariff rates was made to which all sections of the country gave generous support. Railroad construction, however, had been carried too far and capital for the moment was unprofitably tied up in unproductive investment. Bank note circulation was unduly expanded, and a panic occurred in August 1857. The treasury with weakened resources fell into embarrassment and was obliged to issue treasury notes to meet its obligations. In the years 1858-60 the deficits amounted to $50,000,000.

During the period 1816-61, the United States became a commercial nation, necessitating new methods of customs administration. The regulations affecting the appraisement of goods were made more strict. Credits to importers were abolished, and in its place a system of warehousing was established. Among the later Secretaries of the Treasury, Walker and Guthrie stood out pre-eminent, the first for his notable report in which he recommended the tariff of 1846 and the second for his development of administrative details. 30. EFFORTS TO SETTLE THE SLAVERY QUESTION. In all co-operative efforts of the North and South to settle disputes over slavery the preservation of both slavery and the Union were objects of primary consideration. The roots of such efforts are found in the compromises of the Constitutional Convention of 1787. The most important agreements then made provided that (1) three-fifths of the slaves should be counted in determining the number of congressmen a State should have and the amount of direct taxes it should pay; (2) the African slave trade should continue for 20 years. These compromises are significant partly because the “more perfect union” could probably not have been formed without them and partly because the “Fathers” thus gave the stamp of approval to compromis-
ing disputes over slavery, for the sake of the Union. By the aid of the three-fifths advan-
tage, the South, in 1800, had only 18 less than the North. But each succeeding
census showed a constantly growing majority in the North’s favor so that by 1820 this
majority amounted to 43. But the South had already begun to look for the protection of her
interests in the preservation of an equilibrium in the United States Senate, where population
is not so directly represented.

Of the original 13 States seven were North-
eren and six Southern. During the administr-
tions of Washington and Adams, Vermont, Kentucky and Tennessee were admitted and es-
established an equilibrium between the two sec-
tions in the Senate. The admission of Ohio
(1802) and Louisiana (1812) preserved this
situation. The addition of Indiana (1816),
Mississippi (1817), Illinois (1818), and Ala-
abama (1819) still kept up the balance. But the
application of Missouri for permission to form
a State constitution in 1819 threatened to break
the plan of alternate admissions. Besides,
slavery seemed to be making a flank movement
into territory which might be looked upon as
geographically belonging to the North, since
new territories along the line of Missouri faced
the free State of Illinois. The South’s need of
Missouri was indeed great, for but two more
possible slave States remained to be carved out
of Territories. Congressman Talmadge of Ge-
orgia introduced an amendment permitting Missouri to form a constit-
ution, which precipitated the first great quarrel over
slavery between the two sections, and which threatened the existence of the Union. This
amendment, called the Missouri Limitation, a
provided that no more slaves should be taken
into Missouri and that slave children born
within the State should be free at 25 years of
age. The House of Represenatives passed the
amended bill, after warm debates, but the Sen-
ate struck the amendment and then passed the
bill. The House refused to accept the
change and the measure was lost for the time
being. In the next session the contest was
renewed, but was given a new turn by the Sen-
ate voting to pass the bill for the admission of Maine,
which the House had already passed, to the bill
authorizing the people of Missouri to form a State
constitution. The Senate passed this bill
with the proviso that slavery should be prohib-
itied in the territory north of 36° 30’, but twice
the House rejected the bill in this form. A
committee of both houses, however, agreed upon
the following compromise: (1) The separation
and passage of the Maine and Missouri bills; (2)
the prohibition of slavery in the remainder of the territory of the Louisiana Purchase north
of 36° 30’. Both houses accepted the compromise
and President Monroe signed the bill (1820).

But the quarrel which the people hoped had
been settled was suddenly renewed in a more
violent way than before. The constitution
presented by Missouri to Congress looked toward
the exclusion of both mulattoes and free ne-
groes from the State. The fiery debates, the
nakedness of State frauds, the discussion of the question which had already been pre-
sented to Congress, and the widespread discuss-
ion in the newspapers, led patriotic men to
fear a dissolution of the Union. Therefore,
Henry Clay at once took the lead in trying to
settle the new dispute. Although the House
rejected the report the second time, he did not
give up, but by his persuasive eloquence, and
by personal appeals to members, he finally
induced the House to pass a bill to admit Mis-
soiria as a State on the condition that her legis-
lature give a pledge that the State would never
pass a law excluding the citizens of any other
State. Missouri gave the pledge and was ad-
mitted (1821). Three important consequences
followed from the Missouri contest: (1) The
conviction that danger to the Union could force
a compromise; (2) that Congress accepted the
South’s contention against placing unusual re-
strictions upon a State as it enters the Union;
(3) that Congress had the power to prohibit
slavery in the Territories. The remote effect
of thus devoting the northern part of the Louisi-
ana Purchase to free labor was far-reaching.

The second conflict over slavery which seri-
ously menaced the Union had reference to ter-
ritorial obtained by the Mexican War (q.v.),
Anti-slavery men sought to exclude slavery
from such territory by the Wilmot Proviso
(q.v.), while pro-slavery men attempted to se-
cure their interests by an extension of the Mis-
soiria Compromise of 1820 to the west. These
efforts failed, but the discussions in and
out of Congress deepened sectional feeling.
Excitement was further increased by events in
California. The discovery of gold on the Sacra-
mento (1848) attracted a great influx of people
from all quarters. The disorder which resulted made organized government an
immediate necessity, but a bill to establish Ter-
ritorial government for that region failed. Cal-
ifornia did not wait long on Congress, but
called a Constitutional Convention whose dele-
gates voted unanimously for a constitution pro-
hibiting slavery. The people of California rati-
ified the constitution by an overwhelming ma-
jority. Thus circumstances beyond the control
of either party in the contest placed California
beyond the reach of slavery. In the meantime
the State of Texas seemed to be preparing to
enforce her claims to a large portion of what
is now Arizona and New Mexico, exposed to the
demand of Texas because it was ex-
pected that New Mexico would follow the ex-
ample of California. President Taylor recom-
ended Congress to admit California immedi-
ately as a State and expressed the opinion that
the people of New Mexico would soon follow
the example of California (1849). The radical
pro-slavery men were grievously disappointed
over this attitude of President Taylor and
strongly favored first putting California and
New Mexico through the experience of Territor-
ial government. Such a plan would have given
slaveholders time to move into those Territories.
Slavery had not yet learned that in the race for
population it could not compete with freedom.
The irritation of the two sections was now so
great that men again feared for the safety of the
Union. Although Henry Clay had retired
from public life to spend his few declining
years, the legislature of Kentucky, with dis-
senting voices, elected him to his old place in
the Senate, hoping that the spell of his presence
and the power of his eloquence might once more
restore harmony between the sections. In Janu-
ary 1850 Clay produced his most famous com-
promissory bill. The following were its main features: (1) That California be admitted as a free State; (2) that the Territories of New Mexico and Utah be organized and that the question of slavery be left for their people to settle; (3) that Texas be paid $10,000,000 to satisfy her claims against New Mexico; (4) that the slave trade be abolished in the District of Columbia; (5) that a more efficient Fugitive Slave Law be passed. The debates over these measures continued into September and brought out the most splendid array of oratorical talent ever seen in the Senate. Stimulated by his last great effort for the Union, Clay seemed to gather new vigor, was unremitting in his labors and frequently spoke with his old-time power. When he rose to make his great speech a vast concourse which filled even the avenues to the Senate greeted him with tremendous enthusiasm, and hung in breathless silence upon his words. When he had finished, women crowded to inform him and Webster among the throng. The burden of his address may be summed up in three propositions: (1) The restoration of the equilibrium between the North and the South by an equal division of the territory and by an amendment to the Constitution in order to guarantee the equilibrium; (2) a new law for the return of fugitive slaves; and (3) the peaceful secession of the slave States from the Union, if the above propositions are rejected. Calhoun was asking for an impossible Union and an impossible secession. The other member of the great trio, Daniel Webster, had been silent thus far, and no man, probably, knew what he would say, less so all his New England supporters. On 7 March Webster addressed the Senate in a speech "For the Constitution and the Union." He made an appeal for conciliation and condemned agitation, whether by Northern or Southern States. But he seemed to lay the greater blame for the distracted state of public opinion upon anti-slavery men. For this unexpected position they roundly denounced Webster and his popularity in the North began to wane. Davis and Douglas had spoken for the past. But the men of the future were in the Senate also: Seward, Chase, Douglas and Davis. There was less of compromise in these men. Seward, in particular, argued that any law in favor of a "higher law" than the Constitution, in dealing with the slavery question. Davis demanded the extension of the compromise line of 1820 to the Pacific. In spite of the efforts of Clay and his supporters, Congress refused to accept the bill as a whole. But after Taylor's death, President Fillmore gave his influence in favor of the various parts of the bill, for, although no majority could be found for the measures as one bill, Congress gave majorities to the separate parts.

The people of the country seemed ready to accept the main features of the agreement and special efforts were made to impress upon the people whether a fair test of popular sovereignty was made or not. Douglas and his followers in the North declared that the pro-slavery con-
stitution of Kansas had not been fairly ratified by the people of Kansas. President Buchanan and his supporters asserted that the test was fair and that Kansas should be admitted as a slave State.

While the contest over Kansas was raging and threatening to involve the country in war, an entirely new method of solving the problem was tried. It was planned to take slavery completely out of politics by means of a Supreme Court decision. The case of Dred Scott (q.v.) offered the opportunity. Dred Scott had sued for his freedom on the ground that having resided in a free State he could not be held in slavery on return to a slave State. The decision contained two points of historical importance. The first denied that the negro was entitled to the natural rights enumerated in the Declaration of Independence and the second asserted that neither Congress nor the Territorial legislature could prohibit slavery in the Territories. South was at the point of accepting the decision but public sentiment at the North refused to accept its conclusion because it not only refused to the negro his natural rights as a man, but in effect asserted that Douglas' doctrine of Popular Sovereignty and the principle that slave States were safe within the Union. Instead of taking slavery out of politics, this decision drove the question in so deep that the country was hastened rapidly toward the crisis.

The Know-Nothing and the American Constitutional Union parties so widened the breach between Northern and Southern Democrats that the national convention of the party in Charleston in 1860 witnessed its complete disruption. The Southern delegates utterly repudiated Douglas and popular sovereignty, the only man and the only principle on which the Northern wing of the party could conduct a campaign with any show of success. Four parties were in the field and the Republicans with Lincoln won. During the fall and winter following, seven Southern States seceded from the Union. They had done what had been threatened for several years. The North had not believed the threats and the Lincoln administration at the Union of the Fathers was in danger of annihilation. "What could be done to save it?" was a question asked by thousands of persons. Nothing decisive could be done. An old administration and a timid President were passing out. The new President and an untried administration had not yet assumed responsibility. In such a period how naturally men turned to compromises in order to ensure the return of the seceded States and to prevent others from withdrawing.

President Buchanan in his message to Congress declared that concessions to the South were the only means of saving the Union. Both houses entered on the work of conciliation by carefully appointing committees. The Senate's committee of 13 was made up of six Republicans and six Democrats. A seventh member was the venerable John J. Crittenden of Kentucky, a non-partisan. The House committee of 33 was made up in the same careful way. The Senate committee soon fell into hopeless disagreement and accomplished nothing. The House committee worked under great disadvantages. Two Southern committee members refused to serve, and after the events at Fort Sumter others left the committee. More than 40 propositions and plans were submitted. Some were wise and some were foolish. Some proposed that no changes be made in either the laws or in the Constitution respecting slavery. Others proposed changes which involved the reconstruction of the very foundations of the government. The report of the committee, however, recommended a number of far-reaching concessions: (1) The repeal of all Personal Liberty bills by which States had hindered the execution of the Fugitive Slave Law; (2) An amendment to the Constitution prohibiting future amendments, interfering with slavery, which were not proposed by slave States; (3) Immediate admission of New Mexico as a slave State; (4) The trial of fugitive slaves in the States from which they escaped. No less than seven minority reports from members of the committee were presented to the House. The report was finally adopted, after fruitless discussion, but too late to check the tide of secession. It moved to the House of Representatives. The House then discussed whether slave States that they were safe within the Union. The impression made by the Southern members on the border State men was not so favorable, particularly because they refused to accept the simple stipulation that the slave States supporting the election of a President, constitutionally accomplished, was the paramount duty of every good citizen. The House modified and passed the amendment so that no future amendment might be adopted to interfere with the domestic institutions of any State. The Senate accepted the amendment by the requisite two-thirds vote. Eight Republican senators voted in its favor. But two States ratified it, Ohio and Maryland, one slave State and one slave State. The most famous advocate of compromise was the venerable Senator John J. Crittenden, of Kentucky, the successor of Henry Clay. Although the Committee of Thirteen accomplished but little, Crittenden presented to the Senate a series of six amendments to the Constitution: (1) That in all the Territories of 30' 30' slavery should be prohibited, in those south of that line slavery should be protected. The Union of the Fathers was in danger of annihilation. That the United States shall indemnify slave holders for loss of slaves through failure of officers caused by violence or intimidation; (5) That no future amendment shall destroy the preceding amendments or give Congress power to interfere with slavery in any State whose laws permit slavery. Petitions from all parts of the North prayed for the acceptance of the Crittenden Compromise. Although petitions came in from the South, and although the compromise was almost entirely in the interest of slavery, it was defeated by six Southern senators refusing to vote. Three days after this defeat, the legislature of Virginia invited the other States to send commissioners to Washington to "adjust the present unhappy controversies . . . so as to afford to the people of the slaveholding States adequate guarantees for the security of their rights." All the States sent commissioners except the States. Ex-President John Tyler was elected chairman. From 4 to 27 February the Peace
Convention, as it was called, discussed propositions for conciliation. It finally recommended to Congress the amendment of the Constitution very much after the plan of Senator Crittenden. But the Confederacy was already organized. Federal forts had been seized, and Lincoln's administration was about to enter upon its duties. The situation had moved beyond the point of compromise. Men were no longer willing to follow in the footsteps of the "Fathers," and Congress gave little or no heed to the work of the Peace Congress. See United States—Slavery.

31. CAUSES OF THE CIVIL WAR.

The Civil War was the culmination of the development of conflicting interests and feelings between the slave and the free States. Slavery in Colonial days, aided by favoring physical conditions, obtained a deeper hold in the South than it did in the North. The invention of the cotton gin increased that hold in many ways, and hastened the growth of industrial and social differences between the two sets of States. The North, with its free labor, was able to respond to the industrial revolution which found its origin in certain great mechanical inventions, bringing steam as a motive power, the manufacture of iron and the use of coal as fuel. Northern industry became rapidly diversified and Northern population grew with great rapidity and built up great centres of production. The South, with its Slave labor, did not, or could not, take advantage of the new industrial forces, but pursued the older and quieter ways of plantation life. Her occupations did not increase greatly in number or in variety, her population remained, as formerly, largely agricultural. The meaning of two such contrasting industrial and social conditions was not clearly seen at first. It took the tariff policy for it to set the controversies over the annexation of Texas and the Mexican War. Southern leaders declared that the acquisition of new territory for slavery was necessary to preserve the balance of power in the Senate and give fresh soil and a wider area for slavery. The anti-slavery men declared that, for these very reasons, no such territory should be acquired. Both parties began to threaten the Union.

In 1844 the legislature of Massachusetts passed a resolution, introduced by Charles Francis Adams, which referred to the Constitution as a "compact" and asserted that annexation was an undelegated power to which Massachusetts would not submit. Southern declarations of dissolving the Union, if slavery should be excluded from the Territories, were even more emphatic. The year 1844 witnessed another event which revealed the widening difference between the two sections. After an exciting contest over slavery the Methodist Episcopal Church split into a Northern and Southern division. The Southern division made it easier for both parties to obtain both religious sanction and religious condemnation for their work. This situation added
greatly to the bitterness of the strife. The feeling between the pro-slavery and the anti-slavery elements was so pronounced in the next few years that both Whigs and Democrats in the Presidential campaign of 1848 refused to make any definite statement on the slavery question. The anti-slavery Whigs resented this non-committal position on the part of a large number of them who joined in the formation of the Free Soil party, which pledged itself to oppose the extension of slavery to the Territories. At the same time the new party declared that Congress was powerless over slavery in the States where it existed. The election of 1848 revealed a further tendency toward sectionalization among the voters of the two old parties. Because General Taylor, the Whig candidate, was a Southern slaveholder he received a much larger vote in the South, where the great strength of the Democrats usually lay; while Cass, the Northern Democrat, received somewhat similar support in the North, though not so striking on account of the Van Buren defection. For the next two years the gulf of sectionalization greatly widened.

The specific cause of contention was the question of slavery or no slavery in the territory obtained by the war with Mexico. The South felt that slavery must go into the new lands, not only because that section needed the new region to add to her weight in the councils of the nation, but, also, because the region was acquired largely through her own efforts. The North was becoming more and more outspoken in opposition to the extension of slavery into the new region obtained from Mexico. Nearly every Northern legislature resolved in favor of the power and duty of Congress to prohibit slavery in the Territories. The legislature of Virginia resolved that if this principle be carried out the people of Virginia must either submit to "aggression and outrage" or resist "at all hazards and to the last extremity." Public meetings in several Southern cities approved the strong words of Virginia. Although the number in favor of dissolving the Union rapidly increased in the South and grew bolder in asserting their views, the great mass of people were not true to the Union.

When, therefore, Henry Clay, by the unanimous vote of the legislature of Kentucky, was called from retirement and sent back to the Senate to restore harmony and to strengthen the weakening bonds of union his efforts met with sympathy and support on the part of the masses of the two sections. By the compromise of 1850, the admission of California as a free State and the abolition of the slave trade in the District of Columbia were balanced by the admission of New Mexico and by a new Fugitive Slave Law. "Union" meetings were held in various places to bring public opinion into hearty accord with the compromise. Nevertheless there were men in both sections who had little or no faith in the measure as a means of allaying the hostile sectional feeling. The greatest argument of the South in support of the compromise was the greatest argument of the North against the compromise—the Fugitive Slave Law (q.v.). The draftsmen of this law provided for the punishment of the slaveholder's view. The Lincoln-Douglas joint debates, in 1858, settled that question in the
negative. Lincoln forced Douglas to admit that he believed that a Territory could exclude slavery from its limits in spite of the Dred Scott decision. Douglas took this stand in order to keep faith with the Democrats of Illinois and of the North. But Southern leaders watched the debate with deep interest, and were mortally offended at this position of Douglas. They immediately began to take steps to "read him out of the party." But Douglas went to the National Democratic Convention at Charleston in 1860 with a majority of delegates in his favor. They stood faithfully by him and voted down the platform of the Southern wing of the party. Southern delegations, one after another, withdrew from the convention, and the party of Jefferson and Jackson was broken in two.

Later, in convention at Baltimore, no compromise could be reached and both factions nominated Presidential candidates. With the Republican party, there were those three sectional parties in the field. How completely the people were imbued with sectional feelings may be seen from the fact that the one party—the Constitutional Union—which professed to be a national party and urged the putting away of sectional questions received only 80,000 votes in the North. Douglas obtained about 1,300,000 votes, but only 163,000 from the slave States. Lincoln received but 26,000 of his 1,800,000 votes from the South. The strong ties of political association were breaking under the strain of sectional hostility, and it seemed that the only thing wanting was some overt and formal act to certify to the division in sentiment which already existed. When, however, South Carolina took the leap, after Lincoln's election, and six other States followed her example, and when it became apparent that secession meant a conflict of arms, then those deeper and more fundamental interests than party politics began to assert themselves. The conservative forces born of the history of the past and of the hopes of the future began to call out for concession and compromise. During the 61st Congress, under pressure of the conservative interests and patriotic feelings, made vigorous efforts to allay the demon of sectionalism. The Peace Convention (q.v.) which met in Washington in February 1861 also proved to aid in restoring harmony. But the movement of events was too rapid. Lincoln was in the Presidency but a few weeks before Sumter fell, and the two sections were at war. It is of little consequence which of the parties struck the first blow, for there seemed nowhere any power or influence strong enough to long prevent sectional animosity from bursting into flame.

The causes of the war or rather of secession, as viewed by the South Carolina Secession Convention, are here briefly organized: (1) The American Revolution established the right of a State to govern itself and the right of a people to abolish a government, and that each colony became a free, sovereign and independent State. (2) That the Constitution is a compact and was agreed to by sovereign States. Since the obligation established by a compact is mutual, its violation by a single party to the contract releases the others. (3) We assert that 14 States have refused for years to fulfil their constitutional obligations by hindering the return of fugitive slaves. (4) These States have assumed the right of deciding upon the propriety of our domestic institutions and have denounced as sinful the institution of slavery. (5) They have permitted societies to disturb the peace and incite servile insurrection. (6) They have elected a man President who is hostile to slavery and who has declared that the government cannot endure permanently half slave and half free. This and many other causes as stated by the first State to secede shows that the irritating and real cause was the question of slavery and that the doctrine of State sovereignty was used as a justification of the act of secession.

Finally it may be said that another cause which hastened the sectionalization of opinion and interests was the very great ignorance of the two sections of each other. The main line of migration, travel and commerce was east and west instead of north and south. This situation promoted ignorance and ignorance promoted suspicion and hate. The result was that people of the extreme North and of the extreme South had the most exaggerated notions of the characters, manners and views of the other. From these portions of each section came the bitterest partisans in the conflict. There was little toleration in their views. But the people who neighborhood across Mason and Dixon's Line were very different in their attitude. Their position was born of personal experience. They knew each other and knew that men on opposite banks of the Ohio River were really more alike than different. Whatever of moderation there was in the conflict was largely due to the people of the border States. Does not this justify the conclusion that if the two sections had really known each other the contest would have lost much of its bitterness and might have taken another form, and the controversy have ended short of war? Certainly the nation paid a dear price for its partisanship and sectional bitterness.

32. SECESSION. The secession of 11 Southern States of the American Union during the winter and spring of 1860-61 is the most significant fact in American history after the adoption of the Federal Constitution. It was the one great attempt to make of the United States two republics instead of one, and the struggle which it precipitated decided that this could not be and that the Federation of 1787-89 had become a reality.

Whether secession was a reserved right of the original members of the Union is the first inquiry that arises. From the reasoning of the founders of the national Constitution during the first decades of fierce political controversy which followed the inauguration of the government one is compelled to believe that such right was considered as still residing with the States, though Madison gives strong grounds for the contrary opinion in the writings of his early as
well as his later life. As to whether this right was reserved it should be said that there is today a marked difference of opinion among historical scholars. That the States conferred whatever authority the Federal government had and that this central authority was strictly and specifically limited are propositions no longer seriously disputed.

The threat of Virginia and Kentucky in 1798 to prevent the enforcement of the Alien and Sedition Laws (89) was followed by their removal after the debates over the passage of the Alien and Sedition Acts. However, 1807 to 1811 that the commercial States would be justified in seceding from the Union; and the actual meeting of the Hartford Convention in 1814 to consider ways and means of resisting the national authority would all seem to establish the point that the right of secession was claimed by each of the two great sections of the Union. These incidents are of further importance because they occurred within the lifetime of many of the framers of the Constitution and because many of these "framers" publicly espoused the views thus enunciated.

The Supreme Court of the United States, however, began about 1810 to expound the Constitution in a spirit of healthy nationalism. Chief Justice Marshall repeatedly affirmed the doctrine that the central government was that of a nation and that the rights of the States must be subordinate to the requirements of an enlightened national policy. This attitude of the court was vigorously and solemnly opposed by the Supreme Court of Virginia in 1815. In the celebrated lawsuit of Martin v. Hunter's Lessee appeal had been taken to the United States courts by means of a writ of error. Judge Marshall, with the unanimous agreement of his colleagues on the bench, reversed the decision of the Virginia court and issued a mandamus on the latter to execute the decree of the former. The judges of the Virginia court now entered into a painstaking examination of the case and not only declined to honor the mandamus but declared in published opinions that the United States Supreme Court was usurping powers not granted and thereby encroaching on the rights of the States. The policy of the Supreme Court was repudiated and the authority of the State courts even in cases involving the interpretation of treaties with foreign powers was asserted and incidentally the sovereignty of the States was maintained as staunchly as in 1788—the right of a State to judge of infractions of the constitutions being emphatically asserted. The right of secession was not advocated in terms, but any one could see that this was only a step further in the process.

The years 1815 to 1822 the leading men of Virginia, including ex-President Jefferson, constantly excited public opinion against what they declared to be the dangerous teaching of the national courts. Virginia took the position that she was occupied with her own internal affairs, Madison, however, protested against this later Virginia view, but rather on the grounds of expediency than otherwise. Other States followed the example of Virginia. Clearly then it was not a settled question in 1820 and the aggrieved party, whether North or South, claimed rights which, in the last analysis, were equivalent to a withdrawal from the general compact.

What caused the matter to be more difficult of settlement was the fact that there was no final authority, no judge between the two parties. An instruction to the general Constitution, that is, a violation of the contract between the Union on the one side and the States on the other, was a matter that could not be satisfactorily determined since there was no outside tribunal that could be accepted as disinterested. Jefferson thought on the whole that the States should be the final judges; Madison inclined with the exception of a few years of his life to the opposite view, while both Washington and Hamilton had held that the national government was to be its own judge in such cases.

In 1832 South Carolina formally annulled the tariff laws of the Union and the State of Georgia had already refused to recognize the authority of the United States courts within her boundaries during a period of several years beginning with 1825. After the passage of the Fugitive Slave Law of 1850 and especially after the Dred Scott decision of 1857, many Northern States refused to obey the laws and in various instances passed laws to prevent enforcement of the laws of the Union.

Further still actual secession was not unfamiliar to Americans. The counties of western North Carolina (now Tennessee), just prior to the formation of the national government, had formally declared their independence and then proceeded to establish a separate and independent government. This new sovereignty, called the State of Franklin, was successfully maintained for four years, 1784-88. Western Pennsylvania and northwestern Virginia made a similar attempt to secede both from their mother States and from the Federal Union in 1794; in 1805 to 1807 there was danger that Kentucky, Tennessee and parts of the Louisiana cession would withdraw their allegiance from a government which was thought not to be sufficiently jealous of Western interests. The principle of local sufficiency was so universally accepted in the various sections of the United States that such threats and outbreaks were not surprising; they were not thought to be positively unlawful. Yet public opinion supported the Executive in putting down the whisky "insurrection" as it was called and President Jefferson did not sacrifice his popularity by taking vigorous measures to prevent what appeared to be a dangerous movement led by Aaron Burr in 1806. In 1814 the strongest organs of public opinion in Virginia recommended the use of force against New England in case of secession and the terms of "traitor" and "treason" were frequently applied to leading opponents of the war with Great Britain. The vigorous and prompt proclamation against the proposed plan of South Carolina by President Jackson was a prominent cause of that leader's lasting popularity South as well as North. However, it was not quite decided then that a State could not withdraw from the Union, in which case, of course, no national law would have force within its jurisdiction. Calhoun, the author of nullification, did not at that time advocate secession. He relied on the Jeffersonian teaching of 1798,
that the State was the proper judge of the validity of a national law in so far as that State was concerned. The debate between Webster and Hayne brought to light the fact that a genuine national spirit had arisen in the North and that the conservative particularism of the earlier years had entrenched itself in the Southern States. Meanwhile economic forces had begun to crystallize in such a way that disunion seemed to offer advantages to the South.

When the fierce struggle over Missouri was raging certain strong and far-seeing Southern leaders who regarded negro slavery as essential to the Southern economic and social structure declared that the James River and the Kentucky-Tennessee boundary was a natural line of cleavage between two civilizations which were growing up within the bounds of the United States. John Randolph and Nathaniel Macon held this view and there were a few others who agreed with them. The Missouri Compromise was considered by them a great blunder, notwithstanding its Southern origin. They declared it a violation of the national compact. From this time forward the development of the cotton plantation as the typical Southern institution of everyday life caused negro slavery in the lower South to appear to be an absolute necessity. Climate, soil and social habit combined to raise the institution from the position of a necessary evil to that of a beneficent system working alike for the upbuilding of the slave and his master. The price of cotton regulated the price of the negro; and the demands of the world's commerce grew faster than the supply of cotton. The economic life of this section was centred in this industry, and the profits were so great that with a small capital the younger sons of the older families of the south Atlantic seaboard could become independent planters in a few years and in a decade or two they became masters of vast estates with hundreds of slaves. Three factors entered into the makeup of these fortunes: cheap lands, negro slaves and a demand for cotton. The supply of cheap lands seemed inexhaustible, the demand for cotton as already noted continued to increase, negroes alone were limited in supply and they died very rapidly in the cotton belt. Maryland, Virginia and the Carolinas began early to send their surplus slaves south; as the price mounted from $300 in 1820 to $1,000 in 1850 the stimulus to raising negroes increased and the immorality of the business appeared less evident. This is the development which brought unity of economic interest to all the Southern States from Virginia, at least, to Louisiana.

It was but a natural step after 1833 to combine the inherent Anglo-Saxon idea of local autonomy with the economic interest of this group of States. And the almost universal resort to agricultural pursuits caused the operation of the national tariff to appear sectional, favoring the manufacturers of other sections at the expense of the cotton, hemp, having no competitors in the world's markets, was not asked for protection as did the industrialists of the North and East. The tariff became the object of the Southerner's most determined opposition. In Virginia college students formed anti-tariff clubs, taking yews not to wear tariff-favored clothing. And it required but little invention to combine these ideas with those older ideas of State supremacy which had been so prevalent immediately after the Revolution. Nullification became secession and all the more rapidly since the great nullifier, John C. Calhoun, soon gave up the former for the latter constitutional doctrine.

All these forces tended to build up a peculiar civilization, a peculiar social system south of the famous Mason and Dixon's line. Heads of families became patriarchs with numberless dependents looking up to them for their daily bread, and these chiefs naturally assumed the leading roles in State and local government. Government itself became a social affair and office-holding remained the badge of honor. These masters at home undertook quite as naturally the representation of their States in the national congresses and cabinet. And since three negroes out of every five were counted in the apportionment of representation in Congress, the owner of 500 slaves was equal in political power to 301 voters in the North. This had secured to the South a preponderance of influence in national legislation until about 1830, when the West and Northwest began to loom large on the horizon of the future.

Texas, embracing an area of 270,000 square miles, declared her independence in 1836. Mexico was unable to suppress the revolution. The great majority of Texans were from the Southern States; they were also slaveholders. A new State—Texas—entered the family of nations.

It applied, however, for admission into the United States in 1837. This meant an expansion of the territory of the South. It might serve as a checkmate to the West should it fail, as was clearly evident, to cooperate with the South in party policy. But admission of the new State was opposed by the Northern representatives. After a struggle of several years the new State was finally admitted in 1845. This controversy embittered the sections of the country and threats of secession had been freely and boldly made in the South during the campaign of 1844 in case the new Territory should not be admitted.

Admission of Texas meant a declaration of war on the part of Mexico and war with that feeble and rather decrepit nation exposed a vast region of country stretching from Santa Fé to San Francisco to American conquest. In the war that ensued everything that could be desired was won. But not being content simply to depopulate a weak neighbor the United States offered, by way of compensation, selling to pay for the territory so ruthlessly seized. When the bill authorizing the payment of a portion of the money came up in the House of Representatives David Wilmot of Pennsylvania offered his famous proviso (see WILMOT PROVISO), prohibiting the introduction of slavery into the country to be acquired. This aroused the ire of the Southern leaders, as was to have been expected. From 1847 to 1850, the date of the second series of compromises on slavery, the South was agitated as never before and in every State strong secession parties arose.

The South was ripe for a revolution. William L. Yancey (q.v.) of Alabama, had recognized this; he had given up his seat in the national House of Representatives from that time forth appealing to the people of
his State to yield nothing whatsoever to Northern sentiment concerning slavery. He demanded that all territory to be acquired from Mexico should be kept free, and a failure to protect slaveholders in their rights he declared to be a violation of the national compact. Yancey was a fiery orator not inferior in the control of popular passion to Wendell Phillips; he was the Southern counterpart of Phillips. In 1848 he prevailed on the Alabama State Democratic Convention to adopt his ideas which soon became known to the country as the "Alabama Platform." At the National Democratic Convention of that year Yancey presented resolutions embodying the Alabama platform; they were rejected and Yancey withdrew from the convention. Lewis Cass was nominated for the Presidency on an evasive platform. Yancey canvassed Alabama urging rejection of Cass. Gen. Zachary Taylor, the Whig candidate, was elected President. In 1850 when the agitation came to an issue in Congress on the question of the admission of California, Yancey advocated the secession of all slave-holding States.

In February 1849 the Virginia legislature declared almost unanimously that the Wilmot Proviso, if passed, would meet with "resistance at all hazards and to the last extremity" in that State. South Carolina followed with a recommendation for a convention of the Southern States; 3 Oct. 1849, Mississippi held a Southern rights convention which embodied the principles of the Virginia resolution. As a result of this agitation Southern rights associations and committees of correspondence were organized in every section of the South. Throughout the North public opinion was crystallizing against the South on the subject of slavery; leading men were opposed to what was termed a "further surrender to Southern demands." When Congress met, all the subjects in dispute were summed up in the proposed compromise of 1850 (q.v.). The South was thoroughly aroused. The Mississippi delegates in Congress unanimously asked their State legislature for instructions how to vote on the compromise. The condemnation of the proposed compromise and the election of delegates to the Nashville Convention to be held on the first Monday in July 1850. South Carolina followed suit. The other Southern States in irregular manner chose delegates to the Nashville Convention. But when the representatives came together they proved to be conservative. Formal protests against the principal items of the compromise bill still pending were voted; but no threats were offered and the body adjourned to meet on the call of the president, who was a Whig and supposedly not unfavorable to Henry Clay's last great scheme. The convention never met again. This meeting had been intended on the part of South Carolina and, perhaps, Mississippi, as the first great step toward concerted action on the question of secession. It failed. The secessionists were still in a minority in all the Southern States except South Carolina and perhaps Mississippi. On the question of secession, and by much angry debate passed the "compromises." The abolitionists of the North declared that the cause of humanity and good morals had been betrayed. Their speakers were applauded when disunion was threatened or when it was asserted that the Fugitive Slave Law, one of the items of the compromise, could not be enforced. Nearly all the slave states adopted a formal protest against the compromise and had it published in the record.

Co-operation among Southerners having failed, separate State action was now recommended, and South Carolina led the way with a State convention in 1851, but failing to get a two-thirds majority in that body the secession party failed again. The agitation continued. In Georgia, Alabama, and Mississippi, States Rights conventions were held and resolutions still looking to secession were adopted. In the elections which ensued in all the Cotton States the extremists were so badly beaten by a combination of Whigs and conservative Democrats that the movement was given up and the compromises were acquiesced in. Even Robert Barnwell Rhett (q.v.), the arch-secessionist of South Carolina, gave up the fight, resigned his seat in the United States Senate and retired to his plantation.

Notwithstanding the opposition in the North to the Fugitive Slave Law, and the persistent discontent and agitation of such men as Yancey in the South against the so-called unequal opportunity of slaveholders in the Territories, the sober element of the country accepted the compromises of 1850. The election of 1852 confirmed this view. The Democrats who had come to be the popular party in the Free States and who emphasized the importance of quieting both the abolitionist and pro-slavery agitation, elected their candidates almost without opposition. The President, Franklin Pierce, chose his Cabinet from both North and South; he without any doubt meant to "let sleeping dogs lie."

However, the country was at heart divided, and when the administration paid $10,000,000 to quiet the demands of Melchoir on our southwestern frontier it was taken by serious and conservative people as a sign that the South was really in the saddle and that the slave-expansionists meant to make use of their position at last to extend the section of the portion of the Louisiana Purchase territory now known as Kansas and Nebraska into a Territory came up it was impossible to prevent the representatives of our two civilizations from renewing the struggle for supremacy. Senator Douglas thought to solve the whole problem by enacting a law giving both sections of the country equal chances to win possession of new States, that is, the newcomers, whether pro- or anti-slavery in sentiment and practice, were to be protected by national law until the population of the new Territory had grown large enough to be admitted as a State into the Union. In the formation of a State constitution the question of slavery was to be settled according to the interests and wishes of the majority. This was local or "squatter sovereignty" (q.v.), as it was called. The advocates of this scheme thought it would please the North because that section would feel its interests would be secured. It would permit of free emigrants would secure to her the control of the new States. The South would have all cause of complaint removed because she would at least have the opportunity to plant her
standards in all the common territory without official interference and under the guarantee of national protection.

But this meant the repeal of the Missouri Compromise (q.v.), by this time a sort of fetich in the eyes of the majority of people in the Northern States. It also meant the undoing of the now accepted legislation of 1850. But a strong party arose declaring that the Missouri Compromise was itself unconstitutional—the idea advanced by John Randolph and a few of his friends in 1820. The press of the South almost without exception joined in the demand for the open and formal repeal of the compromise legislation and for the adoption of the popular sovereignty plan. The Cabinet approved the new and radical departure and during the spring of 1854 Congress debated and passed the Douglas bill by large majorities and the President made it a law on 30 May 1854.

Immediately Kansas and Nebraska (q.v.) became the battle-ground of the two parties and in every State the war of words was waged hotter than ever. During the summer of 1854 "anti-Nebraska men," as they were called, met together in their various States and formed local organizations. They were able to secure the election of 103 members of the national House of Representatives and 15 senators. The new party, made up of remnants of all the older parties and embracing not a few and former local Democratic leaders, was given the name of Republican and declared unceasing warfare on the further spread of slavery. The next year it polled 114 electoral votes as against 174 for the Democratic candidate.

The Democratic party from 1852 to 1860 accepted either positively or negatively the chief tenets of the Southern constitutional theory: (1) State rights, (2) low tariff, (3) non-interference with the expansion of the slave power. The party was in the main dominated by Southern men. During the Pierce administration, in addition to negotiating the Gadsden Purchase (q.v.), and repealing the Missouri Compromise, the leaders of the Democratic party committed the nation even by force if necessary and the administration failed to punish Southern filibustering expeditions directed against Mexico and Central America. President Buchanan in 1857 publicly endorsed the aggressive Democratic policy. He called to his council board such pronounced pro-slavery men as Howell Cobb, Jacob Thompson and John B. Floyd, and he relied too much upon these men for advice in every crisis, which was but natural, since so few Northern States had cast their electoral votes for him.

In the South during these years the aggressive sectionalists continued to urge the people on to secession as the only guarantee of their safety. Commercial conventions which discussed politics met each year in one of the larger Southern cities. These bodies recommended the boycotting of Northern manufactures, the encouragement of direct trade with Europe, the reopening, even, of the African slave trade. Barnwell of South Carolina had urged the plan and kept the agitation of sectional issues at the highest pitch of excitement. Parents were criticised for sending their sons to Princeton and Yale to be educated. State legislatures were urged to establish and generously support military schools. Secession was often and in all sections of the South threatened in the event that the Republican party should succeed in electing a President.

In 1857 the Supreme Court added fuel to the fire by going out of the way to declare that Congress could not lawfully interfere with slavery in any Territory of the United States and that any slaveholder must be protected in his rights in all sections of the country. (See Deep Scott Decision). The result in the North was the immediate supremacy of the Republican party, whose one idea was that slavery should not be permitted to expand, but should be limited to the States in which it had prevailed for years. Lincoln expressed the view of the advanced thought of the North when he said this nation cannot long endure "half slave and half free"; it must become all one or all the other. His program was that steps should be taken to fix the bounds of the institution and to secure the nation that slavery was under process of final extinction. He was nominated as the Republican candidate for the Presidency in Chicago in May 1860, and elected the following November.

The Democratic party was still insisting on its conservative, free trade, pro-slavery program, met in Charleston, S. C., in April 1860. After some attempt on the part of some Eastern men to nominate Jefferson Davis on a Douglas platform, and on another faction to get his famous "Alabama platform" adopted the convention split asunder, the Southern extremists following Yancey out of the convention hall in dramatic fashion, the Douglas men adjourning to meet again in Baltimore in June. Attempts were made during the succeeding months, especially after the nomination of Lincoln, to reconcile the two wings of the convention and thus unite on a candidate, but to no avail. The two branches of the Democratic party met in Baltimore and nominated separate tickets, the Northern men naming Douglas and Johnson, of Georgia, and the South putting forth Breckenridge and Lane on an aggressive pro-slavery platform even in the North.

An exciting campaign was waged throughout the country. In the South Yancey was the principal orator. He had finally brought his section to accept the program which he had written for the Democrats of Alabama 12 years before; his powers of speech, the evident sincerity of motive which animated him and the universal interest in the campaign gave him vast audiences everywhere. Every Southern State but three voted as he asked and in the States which did not support him his party strength was very great. Douglas canvassed the North manfully, but he received the vote of but two States, New Jersey and Missouri. Lincoln received the majority of the electoral vote.

It was generally understood among Southern politicians that South Carolina would promptly secede in the event of a Republican victory. The Gulf States were expected to follow suit. The South Carolina plan was the same that Barnwell had, the program and the Rhett, having been some years now the editor of the Charleston Mercury, had come forward again the leader of a State completely converted to his way of thinking. The Palmetto State seceded by unanimous vote of a conven-
tion of her ablest men on 20 Dec. 1860. By 6 Feb. 1861, the tier of Southern States from South Carolina to Arkansas had evicted their allegiance from the Union and reassumed the sovereignty which had been surrendered to the national government.

The agricultural life of the South had developed slavery as a fundamental factor in her economic life; on this basis had been erected a feudalism of a high order, a social system unique in modern times. To protect this system from the hostile encroachments of an unsympathetic outside world, the leaders of this section had since 1820 entrenched themselves behind the popular doctrine of States rights. Accepting this dogma without question the State of South Carolina made a single-handed fight in 1833 against the national tariff system as based on false interpretation of the national compact. The nation gradually adopted the Southern view and steadily lowered the tariff duties until in 1857 the country was placed practically on a free trade basis. Constantly threatened by representatives of Northern and Eastern States with the declaration that "slavery must go," the champions of this new feudalism had accepted the issue with the aggravation of the North on the very question in which hope of winning again. Failing in this secession was resorted to as the only alternative.

South Carolina sent commissioners to Washington to negotiate with the President concerning delivery of Fort Sumter and other property of the United States within the bounds of the seceded State. President Buchanan declined to receive them, but indicated a strong desire to avert hostilities. South Carolina demanded the surrender of the forts she claimed as her own. Meanwhile the State of Virginia had procured the assembly of a Peace Convention with the aim of bringing about a compromise. This failed to get consideration in Congress which had met in regular session. Then Senator Crittenden of Kentucky proposed his scheme of pacification; this failed to satisfy either the extreme Republicans or the determined secessionists, who were left to form the Confederacy until the incoming President should be installed.

A convention of Southern delegates met at Montgomery on 4 Feb. 1861 to draw up a provisional constitution. This work was done in a few days and Jefferson Davis of Mississippi, recently a distinguished senator in Congress, was elected President, with Alexander Stephens of Georgia, for Vice-President. The new Constitution was in most points quite like that of the old Union, with a few exceptions, being improvements on the old. This government went into operation at once, the United States forts and arsenals within the bounds of the confederation being promptly seized and strengthened for the benefit of the new Union of States. Secession was a fait accompli.

But from December 1860, to April 1861, the Northern people were anxiously debating the question whether there was a nation and whether the continent could be divided into States or a group of States. The firing on Fort Sumter on 12 April 1861 by the Confederate and South Carolina authorities decided these questions in the affirmative. President Lincoln called for troops to suppress what he called a revolt. This call forced Virginia, North Carolina, Tennessee, Arkansas and Missouri to decide on which side they would cast their lots; the two last named States determined to remain neutral; Virginia, North Carolina, Tennessee and Arkansas all before the middle of June joined the Confederacy. Missouri was compelled to remove to Richmond; armies were rapidly enlisting; diplomatic agents were sent abroad; a regular government succeeded the provisional without serious friction. But the people of the Northern States had decided that a breaking up of the Union was unthinkable, criminal, treasonable and as such must be suppressed. The war began in earnest, and four years later all parties agreed to a peace which denied forever the right of secession, which yielded to the Union the constitutional right to lay such tariffs as were deemed necessary by Congress and which abolished African slavery forever and destroyed the social system which had been erected upon it. (See also SECESSION in the UNITED STATES.)

William E. Dodd, Professor of History, University of Chicago.

33. MILITARY EVENTS OF THE CIVIL WAR. The flag of the United States was first fired upon during the Civil War by some batteries erected against Fort Sumter in Charleston Harbor. The occasion was the appearance of the Star of the West on 9 Jan. 1861, off the harbor, bringing supplies of provisions from New York for Fort Sumter. This fort, under command of Major Anderson, was forced to surrender to General Beauregard 14 April 1861. Thereupon President Lincoln issued a proclamation calling for 75,000 volunteers. In the spring of 1861, after some of the States in the Union left the Union altogether and the armies of the Union and Confederacy were organized, the Federal forces mustered at different points and pressed westward. The armies of the two sides met at Chariton, Mo., in January 1862, and were subsequently engaged at several other points. The armies of the Union and Confederacy were pressed westward and met at Sharpsburg, Md., in September 1862. The armies of the Union and Confederacy were engaged at several other points. The armies of the Union and Confederacy were pressing westward and met at Fredericksburg, Va., in December 1862. The armies of the Union and Confederacy were pressing westward and met at Missionary Ridge, Tenn., in January 1863. The armies of the Union and Confederacy were pressing westward and met at the Battle of Chickamauga, Ga., in October 1863. The armies of the Union and Confederacy were pressing westward and met at the Battle of Pea Ridge, Ark., in February 1864. The armies of the Union and Confederacy were pressing westward and met at the Battle of Resaca, Ga., in May 1864. The armies of the Union and Confederacy were pressing westward and met at the Battle of Dalton, Ga., in July 1864. The armies of the Union and Confederacy were pressing westward and met at the Battle of Picketts, Va., in July 1864. The armies of the Union and Confederacy were pressing westward and met at the Battle of Spotsylvania, Va., in May 1864. The armies of the Union and Confederacy were pressing westward and met at the Battle of Bethesda, Va., in June 1864. The armies of the Union and Confederacy were pressing westward and met at the Battle of Bermuda Hundred, Va., in May 1864. The armies of the Union and Confederacy were pressing westward and met at the Battle of Cold Harbor, Va., in June 1864. The armies of the Union and Confederacy were pressing westward and met at the Battle of Petersburg, Va., in June 1864. The armies of the Union and Confederacy were pressing westward and met at the Battle of Bermuda Hundred, Va., in June 1864. The armies of the Union and Confederacy were pressing westward and met at the Battle of Cold Harbor, Va., in June 1864. The armies of the Union and Confederacy were pressing westward and met at the Battle of Bermuda Hundred, Va., in June 1864.
and the encounter took place on the 21st at Manassas, where, on the arrival of the last brigade of Johnston's army, Beauregard's attack upon the Union flank turned McDowell's advance into a disorderly retreat, the army fleeing back to Washington. This signal defeat of the Union arms produced great mortification and consternation at the North. But the South was correspondingly elated and regarded this brilliant victory as an augury of the ultimate success of the Confederate cause. Both sides now proceeded to make more vigorous preparations.

General McClellan was summoned from West Virginia and given command of the Department of the Potomac, and forthwith he set about organizing the troops rushing in from all parts of the North. On 20 August he took command of the Army of the Potomac, now first organized under that title, and 1 November he was appointed commander-in-chief of the armies of the United States, superseding Gen. Winfield Scott. He hurried his corps, bound by his own insistence, because of failing health. After the battle of Bull Run but little hard fighting occurred during the remainder of 1861. Both sides contented themselves with establishing their camps which were fortified as best they could. Davis ordered all Northern men to leave the South within the next 40 days. President Lincoln thereupon proclaimed the seceded States in rebellion and prohibited all intercourse.

In the North the fire from the border states through Kentucky was broken by separate attacks under General Thomas and General Garfield. On 6 February Admiral Foote's fleet, with the aid of General Grant's forces, captured Fort Henry on the Tennessee, and Grant then moved on Fort Donelson and forced it to surrender, 16 February, with 15,000 men. On 7 April General Pope captured Island No. 10. About the same time Gen. A. Sidney Johnston, with headquarters established at Corinth, attacked Grant awaiting Buell, at Shiloh Church, near Pittsburg Landing. Johnston was killed, and Beauregard in command of the Confederates was driven back by Grant and Buell, who had meanwhile joined him. Beauregard, unaided, Beauregard returned to Corinth. The Federals now began an advance on Corinth. The Confederates ordered Price and Van Dorn from west of the Mississippi to defend the city; but on Halleck's drawing near Corinth, it was learned that the Confederates had already evacuated it. General Bragg, who had succeeded Beauregard, proceeded to Chattanooga by way of Mobile, forcing Buell meanwhile to withdraw to the Ohio to protect his department. At the same time Gen. E. Kirby Smith invaded Kentucky, and defeating the Federals at Richmond on 30 August, he threatened Cincinnati. Thereupon Buell advanced from Louisville against Bragg, who, as a result of the battle of Perryville on 8 October, was compelled to abandon Kentucky.

In September Price and Van Dorn advanced against Grant and Rosecrans, near Corinth, and were both defeated. After this campaign Rosecrans was sent to relieve Buell in command of the Army of the Cumberland, 30 October. On assuming command Rosecrans concentrated his army at Nashville. On 26 December he moved toward Murfreesboro to attack Bragg, and there ensued a three days' battle ending 2 Jan. 1863. Rosecrans occupied Murfreesboro, and Bragg retreated to Shelbyville, Tullahoma and Wartrace. Both armies then went to winter quarters. On 8 March 1862 the Union fleet in Hampton Roads was attacked by the Confederate ironclad Merrimac, which inflicted heavy loss. However, on the following day the Merrimac was met by the Monticello after a severe engagement, retired to Norfolk, where she was blown up at the evacuation of that city by the Confederates, 9 May. The Western rivers, too, were the scene of some active naval engagements. Farragut's fleet did effective work on the Mississippi, taking New Orleans 1 May, and a little later Baton Rouge and NatCHEZ. The Confederate flotilla under Comodore Montgomery was destroyed by Comodore Foote's fleet, in a desperate fight before Memphis, 6 June; and Memphis surrendered to the victorious fleet. At Galveston, however, the Confederates under Magruder, with the aid of an ordinary river fleet, won a brilliant victory; and the Alabama (which was sunk by the Monitor off Cherbourg in 1864) captured the gunboat Hatteras.

In March McClellan, who had been lying inactive so long, began his noted Peninsula campaign, which lasted until June. His advance was opposed by Gen. J. E. Johnston, who gradually fell back toward Richmond till he reached Seven Pines, or Fair Oaks, here the armies met on 31 May. The timely arrival of Sumner's corps on the other side of the Chickahominy saved McClellan from serious disaster. Johnston being badly wounded, Gen. G. W. Smith succeeded to the command temporarily. On 2 June Gen. R. E. Lee was assigned to the command of the Army of Northern Virginia, which he retained till the close of the war. Gen. *Stonewall* Jackson (q.v.), by a brilliant campaign in the valley, in which he defeated Banks at Winchester, forcing him across the Potomac, Prémont at Cross Keys, and Shields at Fort Republic, held most of McDowell's corps around Fredericksburg, thus preventing them from joining McClellan, and himself suddenly appeared, 25 June, at Ashland, on the flanks of McClellan's army in front of Richmond. Thereupon followed the Seven Days' battles, beginning with Mechanicsville 26 June, and including Gaines' Mill and Malvern Hill, after which McClellan withdrew to Harrison's Landing on the James. The campaign proved a disastrous failure; and McClellan, having been relieved, 11 March, of the general command of the armies, now retained that of the Army of the Potomac and saw Halleck assigned to the chief command, 23 July.

After the withdrawal of the Army of the Potomac to the James, McClellan, against his protest, was recalled from the Peninsula to the vicinity of Washington. General Pope was now ordered to organize the corps of McDowell, Banks and Fremont into the Army of Virginia, to cover this movement from Washington. With this army Pope advanced against the Confederate forces near Gordonsville, where, confronted by Lee and Longstreet, he retired behind the Rappahannock and was defeated at the second battle of Bull Run, 10 August. He then withdrew to Centreville, where he was reinforced by the corps of Sumner and Franklin from McClellan's army. His flank was attacked by Jackson at Chantilly.
2 September Pope was recalled with his army to Washington and was relieved of his command, his forces being added to the Army of the Potomac under McClellan.

In September Lee set out for his invasion of the North, crossing the Potomac near Leesburg and moving toward Fredericksburg. He captured Harper's Ferry and advanced to Hagers-town, thence retiring to Sharpsburg, where he was met by Hooker's corps of McClellan's army. A desperate fight ensued, 17 September, in which the losses were greater for one day's fighting than in any other battle of the war. Lee then withdrew across the Potomac, McClellan's army following him into Virginia, and resuming his position on the Rappahannock. Near Warrenton McClellan was superseded, 7 November, by Gen. Ambrose E. Burnside. Burnside took his position opposite Lee's army near Fredericksburg, and on 13 December attempted to cross the Rappahannock and assault Marye's Heights, only to be repulsed with terrific slaughter. The following month he undertook to cross the river above Fredericksburg and turn Lee's left, but the attempt proved a dismal failure, being known as the great Mud March. Thereupon Burnside was relieved of his command and was succeeded by Hooker, 26 Jan. 1863.

The winter of 1862-1863 was spent in laborious, though fruitless efforts to capture Vicksburg, which, because of its strategic importance, the Confederates held strongly fortified. Grant and Sherman both failed. At length, in April, Grant began his second move upon the city from the south and east. Admiral Porter's fleet convoying the transports ran the batteries on the night of 16 April, and the advance of the army crossed the river, 30 April. On 1 May Port Gibson was captured, and Grant had forced his way to the rear of Vicksburg. Preventing a junction of Pemberton's and Johnston's forces, Grant defeated the former at Champion's Hill, and again at Big Black Ridge, 18 May, pushing him into Vicksburg. After two unsuccessful assaults upon the fortifications, Grant undertook the siege of the city, which surrendered, 4 July 1863. This event was a turning point in the war, hardly less important than Vicksburg in the East. Hooker opened the campaign of 1863 in the Army of the Potomac by crossing the Rappahannock at Fredericksburg and advancing to the Rapidan. At Chancellorville the Union right was devastated by Jackson's corps, 2 May. In the night, while reconnoitering before his pickets, Jackson was mortally wounded by his own men, who mistook him for the enemy. On the following day Hood was forced back, with heavy loss, and recrossed the river, 5 May. Hooker being utterly defeated, Lee set out from Fredericksburg, on 3 June, for a second invasion of the North. The advance under Ewell met severe engagements in the valley, crossed the Potomac at Williamsport, 15-16 June, and moved on to Chambersburg and the vicinity of Harrisburg and Columbia, capturing York on 28 June. Ewell was then ordered to fall back to Gettysburg, where Lee was concentrating his army. The Army of the Potomac under Hooker had advanced meanwhile to Frederick, where Hooker requested to be relieved; and Meade was assigned to the command. The two armies encountered each other at Gettysburg and after a three days' battle, 1-3 July, Lee retreated and recrossed the Potomac, without a battle. After a month's rest in the Shenandoah, Lee resumed his former position below the Rappahannock, Meade following him thither.

The campaign of 1863 in the Army of the Cumberland had as its objective the recovery of middle Tennessee. Rosecrans forced Bragg from his lines along the Duck River; and Bragg retreated. Lee crossed the Cumberland and recrossed the Tennessee and arrived in the vicinity of Chattanooga. The Union line being advanced to the western base of the Cumberland, a campaign against Chattanooga was begun. Grant, now assuming general command of the military division of the Mississippi, arrived 23 October; and with the Army of the Cumberland under Thomas and with a force from Vicksburg under Sherman and one from the Army of the Potomac under Hooker, Grant fought and won the battles of Lookout Mountain and Missionary Ridge, 24-25 November, and forced a general retreat of the Confederates, thus securing Chattanooga to the Federals. Knoxville, held by Burnside, was besieged by Longstreet, when Sherman approached, retreated to Virginia. In the meantime Charleston Harbor was the scene of a formidable attack and brilliant defense, and on 16 November the city was bombarded.

On 12 March 1864 Grant, now commissioned lieutenant-general, was placed in command of all the Union armies. He planned a combined movement of the armies: Gilmore from South Carolina to join Butler at Fort Monroe for a move up the James to capture Richmond, threatening Petersburg and Richmond; Burnside with an army from Annapolis to join Meade in command of the Army of the Potomac and advance against Lee's right to Richmond; Sherman, with the Army of the Cumberland under Thomas and the Army of the Tennessee under McPherson and the Army of the Ohio under Schofield, to move against Johnston's army at Dalton; and Banks, leaving the Red River country to Steele and the infantry, with his army to move against Mobile. Grant operating with the Army of the Potomac under Meade, 119,000 strong, crossed the Rapidan, 4 May 1864 and met Lee with 62,000 men in the Wilderness, and a great battle was fought, 5-6 May. At Spottsylvania Court House both armies entrenched and from 8-20 May there was terrific fighting. Grant then moved toward the North Anna. Meanwhile, Sheridan, commanding Grant's cavalry, made a raid around Lee's army, and met and defeated J. E. B. Stuart at Yellow Tavern, where Stuart was killed, 11 May. Grant's advance was opposed by Lee and desperate fighting occurred at North Anna and Bethesda Church. At Cold Harbor Grant attempted to cut Lee's line across an entire line, only to be repulsed with a sickening slaughter, 3 June, and so failed to interpose between Lee and Richmond. But Sheridan, who had been sent against Fitzhugh Lee and Huger, was defeated both at Trevilian's Station. Grant now moved toward the James, crossing at City Point and Bermuda Hundred now occupied by Butler.

Grant established his headquarters before Peters-

burg and notwithstanding his heavy fighting till 1 November (the mine explosion and battle of the Crater occurred 30 July), Lee's lines remained unbroken. Sigel's campaign in the Shenandoah ended in defeat at New Market, 15 June, and he was superseded by Hunter, whose movement against Lynchburg was repelled by Early. Early then invaded Maryland, threatening Baltimore and Washington, 11 July, after which he was compelled to retire across the Potomac. Again he advanced into Pennsylvania and burned Chambersburg, whence Sheridan drove him back into Virginia beyond Staunton and devastated the valley. Sherman moved against Johnston at Dalton early in May, and Johnston, stubbornly resisting, fell back to Atlanta. Johnston was succeeded by Hood, who, after several unsuccessful battles, evacuated Atlanta and invaded Tennessee, only to be thoroughly defeated by Thomas at Nashville, 15-16 December. Sherman occupied Atlanta 2 September, and after Farragut's brilliant naval victory in Mobile Harbor made his famous march through Georgia to the sea, occupying Savannah 21 December.

Early in 1865 the closing campaigns of the war opened. Terry, co-operating with Admiral Porter, captured Fort Fisher, 15 January. On 1 February Sherman started north from Savannah, and after Charleston was evacuated, and on 19 March met Johnson whom he defeated after a sharp battle. In Alabama, Wilson, operating under Thomas, captured Selma with its immense war supplies, 3 and 4 April, and defeated Forrest's cavalry. The Army of the Perimac, the last to move in 1865, began a general movement to the left, 29 March; and there followed the battles of Dinwiddie Court House and Five Forks, 1 March and 1 April. On 2 April the Confederate entrenchments were carried and Petersburg was evacuated; Lee, abandoning his lines held so long against such heavy odds, began a retreat to Amelia Court House. After the fall of Richmond on 3 April, Grant, with his entire army under Meade and Sheridan, pursued Lee and forced him to surrender at Appomattox, 9 April. The number paroled was 28,231, all told, the worn-out remnant of Lee's brave and noble Army of Northern Virginia. In North Carolina Sherman and Schofield moved against Johnston, who occupied Raleigh, and compelled him to surrender on 26 April 1865. This was the end of the war. See CIVIL WAR; also accounts of various battles and engagements under their respective titles. For bibliography, see special article on CIVIL WAR IN AMERICA, Vol. VII, pp. 6 to 20.

34. THE CONFEDERACY. When the election of Mr. Lincoln by the practically unanimous vote of the free States was announced in the autumn of 1860, the slave States of the lower South made preparations to exercise what they regarded as their constitutional right of seceding from the Union. The Republican party had triumphed on a platform which declared the Dred Scott decision of the Supreme Court to be a dangerous political heresy and which announced a determination to exclude slavery from the Territories. This platform was regarded by the South as the culmination of a long line of grievances; its triumph seemed to justify secession. It is true that the Republicans were still in the minority in both houses of Congress and on the Supreme bench; but the great political and economic unity of the Nation was increasing power of that party and pointed to its ultimate success. It is now evident that it was folly for the South to suppose that secession would be successful, but if it was to be attempted, the South must act with great promptitude and foresight in not waiting longer. The anti-slavery sentiment had been growing apace in the North, and to the writer the autumn and winter of 1860-61 seems to have been precisely the time to strike for a separation. The South, weak though it was, was stronger than it could have been at any subsequent period. This point should not be obscured by the disastrous consequences of secession. However this may be, it now seems clear that the slavery question, in its various phases, was the principal, if not the only, cause of secession, and, in its turn, secession was the cause of the war. This was the view taken by Vice-President Alexander Stephens after the war had begun— a view not inconsistent with the impression before the war (21 March 1861) that slavery was the cornerstone of the new Confederacy. This latter statement, it may be added, is often quoted by those who forget that 25 years before in the case of Johnson v. Tompkins, Judge Baldwin of the Supreme Court said: 'Thus you see that the foundations of the (Federal) government are laid and rest on the right of property in slaves. The whole structure must fall by disturbing the corner-stone.' The struggle on the Northern side, therefore, was primarily to resist secession and to preserve the Union. Subsequently the destruction of slavery was included in the program. On the Southern side, while the opposition of the Republicans to the extension of slavery in the Territories, the "personal liberty laws," and the reproaches of the North touching the iniquity of the institution, carried all but the border States into secession, the active force in the war that followed this rash act was not so much the preservation of slavery as it was the determination to resist invasion and to maintain the right of secession or the right of revolution. The motive that led to secession was replaced by the motive of resistance to coercion. Thus can be explained the heroism and sacrifices of the four-fifths of the Southern people who owned no slaves. On 4 Feb. 1861, a Congress of delegates from all the States that had seceded met in Montgomery, Ala. At this date only six States had left the Union: South Carolina, 20 Dec., 1860; Mississippi, 9 Jan., 1861; Florida, 10 January; Alabama, 11 January; Georgia, 18 January; Louisiana, 26 January. In Texas the ordinance of secession was not passed until 5 February, and it had still to be submitted to the people. The Texan delegates, however, arrived in Montgomery before this final ratification. All the delegates were elected by the same conventions that had passed the ordinances of secession.

The Montgomery Congress immediately proceeded to form a provisional government. On 8 February it adopted a provisional constitution, differing in some important particulars.
from the Constitution of the United States. Under this Constitution, which, being provi-
sional was not submitted to the States, the
delegates elected a President and a Vice-Presi-
dent of the Confederate States of America,
each State being allowed one vote. By the
union of the six States present,
Jefferson Davis of Mississippi was elected
President and Alexander H. Stephens of Geor-
gia, Vice-President. On the 18th, some three
weeks before Mr. Lincoln was sworn in, these
officers were duly inaugurated. The Constitu-
tion of this provisional government resembled
so closely the permanent Constitution, to be
described later, that its provisions need not
be given. It was to continue in force for one
year, unless altered by a two-thirds vote of
Congress or superseded by a permanent govern-
ment. A committee of two from each State
represented in Congress having drawn up a
permanent Constitution, this instrument of
government was promptly adopted by the Con-
gress on 1st March, and thereby submitted to the
seceded States was with almost equal prompt-
ness adopted by them. This was accomplished
by action of the same conventions that had
passed the ordinances of secession. Where
these conventions had adjourned, they were
reassembled for the purpose. In no case does
there seem to have been any demand for the
calling of new conventions to ratify the Con-
stitution. It was thought important to organize
the government as soon as possible.

In the meantime Congress had passed acts
to raise provisional forces for the Confederate
States, to authorize the President to borrow
$15,000,000 at 8 per cent interest for the sup-
port of the government, to levy an export duty
on each pound of cotton exported after 1
August and to organize the Post-Office
Department. Courts were rapidly organized in
the different States, but, as we shall see, the
Confederate States never possessed a Supreme
Court. The President was then authorized to
receive from the various States such forts,
arsenals and other public establishments with
their contents as they had taken possession of
within their respective limits. The request of
the President to this end was complied with
on the part of the States. With
the hope of obtaining recognition from foreign
governments, commissioners were sent to
European countries, but they were unsuccess-
ful in their missions. England, France and
other countries in the summer of 1861 acknowl-
edged the belligerency of the Confederate
States, but beyond this action they refused to
go. A recognition of the independence of
the new Confederacy would have been regarded by
the United States as an act of hostility.
In November 1861 J. M. Mason and John Sil-
dell were sent as special commissioners to Eng-
lund and France respectively. After leaving
Havana the English vessel in which they had
travelled was intercepted by the corsair
Jacinto of the American navy, and these com-
misioners were forcibly removed. England
demanded their restoration. The United States
government at first hesitated, raising a hope
in the Confederacy that war might ensue be-
tween the two countries. Finally, however,
Lincoln said: "We fought England about this
matter in 1812; we must give up these men."

Accordingly the commissioners were placed
on board an English vessel and allowed to con-
tinue their voyage. On the 8th of August the
Confederate Congress, to please foreign powers,
had adopted all the provisions of the famous
Declaration of Paris, except as to the use of
privateers.

The provisional government of the Confed-
eracy had hardly been in force two months be-
fore it came into conflict with the United States
government. The occasion of this conflict was
the demand of the Confederate authorities that
Fort Sumter in Charleston Harbor should be
surrendered by the Union force that occupied it.
Senator Douglas, though opposed to secession,
had argued in the United States Senate that
South Carolina was entitled to the possession
of Fort Sumter; General Scott had advised its
evacuation; and Secretary Seward had prac-
tically promised that it should be given up. The
South, therefore, thought that a peaceable solu-
tion was in sight. But President Lincoln, after
a long period of deliberation, decided to provision the
fort, and on 8 April 1861 so informed the
governor of South Carolina. The South had not
desired hostilities; but the Confederate govern-
ment thought it necessary to capture the fort
and open the way to anticipated war. The
Confederate States, there-
fore, have generally been made to bear the
odium of beginning hostilities. The question is
debatable; for as Hallam says: "The aggressor
in a war is not he who is first, but he who is
first who renders force necessary." We are thus
thrown back upon the question raised by Sen-
ator Douglas, which cannot be discussed here.
The bombardment of Sumter stirred the North
as by an electric shock. When on 15 April
Lincoln called for 75,000 volunteers to "to sup-
press combinations obstructing the execution of
laws in seven of the Southern States," the free
States rallied to his support. His determination,
however, to coerce the Confederate States per-
suaded four of the border States, which had
hitherto held aloof, to join the Confederacy.
Arkansas seceded 6 May; North Carolina 20
May; Virginia 23 May, and Tennessee 18 June.
Kentucky, Missouri, Maryland and Delaware
were looking toward this secession; others were
to come to the South. West Virginia,
moreover, with a population of 250,000, detached
itself from Virginia and remained loyal to the
Union. The population of the Confederacy was
about 9,000,000, of whom three and a half
millions were slaves; while that of the Union
States was approximately 22,000,000, an im-
ense disparity of numbers. "Yet," said J. F.
Rhodes, "had the North known that the people
of the cotton States were practically unanimous,
it might have refused to undertake the seem-
ingly unachievable task; for while hardly a man
in the North assented to the constitutional right
dright of revolution. ... Many would have objected
to this right."
The Federal Congress, being called together 29 April in Mont-
gomery to consider the new condition of affairs,
made provision for the prosecution of the war
by adopting financial and military measures.
On 6 May Congress passed an act declaring a
negotiations with the United States for a
peaceable solution of difficulties had failed, and
as Mr. Lincoln had called for 75,000 men to
United States—The Confederacy (34)

Capture forts within the jurisdiction of and belonging to the Confederate States of America, and another proclamation announcing his intention to set on foot a blockade of the Confederate ports; and whereas by the acts and means aforesaid war exists between the Confederate States and the government of the United States, and the states and territories thereof, excepting the states of Maryland, North Carolina, Tennessee, Kentucky, Arkansas, Missouri, and Delaware, and the territories of Arizona, New Mexico, and the Indian Territory, south of Kansas; therefore the president is authorized to use the whole land and naval force of the Confederate States to meet the war thus commenced and to issue letters of marque under the seal of the Confederate States against the vessels of the United States. It was further provided in accordance with the Declaration of Paris (q.v.) that property of the enemy (except contraband of war) on board a neutral vessel should not be subject to seizure. In response to this declaration of existing war, a hundred applications for letters of marque were received from privateers, and troops crowded to the support of the new government with the same alacrity as in the North. On 21 May General Morgan with 1,000 men took Admiralty Island, Va., now chosen as the permanent capital of the Confederate States. On 6 November an election was held under the permanent Constitution for President and Vice-President. As there was no opposition to Davis and S. R. Mallory, they were unanimously elected President and Vice-President respectively by the electoral votes of the 11 Confederate States. They were to enter upon their office 22 Feb. 1862, and to hold office for six years. Under the provisional government the President had appointed as members of his cabinet Robert Toombs of Georgia, Secretary of State; C. G. Memminger of South Carolina, Secretary of the Treasury; L. P. Walker of Alabama, Secretary of War; John H. Reagan of Texas, Postmaster-General, and J. P. Benjamin of Louisiana, Attorney-General. At the close of 1861 J. P. Benjamin had become Secretary of War; S. R. Mallory of Florida, Secretary of the Navy; and Thomas Bragg of North Carolina Attorney-General, and R. M. T. Hunter of Virginia had been appointed Secretary of State, vice Toombs, resigned. As the war went on, changes were made in the cabinet as follows: On the resignation of Mr. Hunter, Mr. Benjamin in 1862 held for a time the portfolios of State and of War, until Geo. W. Randolph of Virginia was made Secretary of War. In the same year Mr. Randolph resigned and was succeeded by James A. Seddon of Virginia. Mr. Seddon resigned in the early part of 1865 and was succeeded by Maj.-Gen. John C. Breckinridge of Kentucky. In 1864 Mr. G. A. Trenholm succeeded Mr. Memminger as Secretary of the Treasury. Attorney-General Bragg was succeeded by Thos. H. Watts and subsequently by George Davis of North Carolina. The provisional Congress, which was unicameral, expired 15 Jan. 1862. A new Congress, having 22 members, elected under the permanent Constitution, met in Richmond 18 Feb. 1862. The members of this Congress were chosen from the most distinguished men of the South. Of the 22 Senators, fourteen had been formerly members of the United States Congress, and in the lower house, 39 had also represented the South at Washington. Subsequently, in the course of the war, the character of the Confederate Congress in general ability declined, many of the best men joining the army. One very necessary department of the new government it was found difficult to organize. This was the post office. The position of Postmaster-General was offered by President Davis to Mr. Ellet of Mississippi and later to Mr. Wirt Adams of the same State; but both declined. Then J. H. Reagan of Texas, after twice refusing, was persuaded to accept the office. His reluctance was due to the fact that he knew the labor of organization would be heavy, and that if the mail facilities were inferior to those formerly furnished by the Federal government, there would be great dissatisfaction. But Mr. Reagan was thoroughly competent. He sent letters to Washington before the war began, and invited a number of clerks in the Post Office Department to take positions in the Confederate post office, 40 but two accepted. With their help organization proceeded rapidly, and on 13 May Mr. Reagan announced that on the first of June the Federal service would cease and the Confederate service would begin in all the States. This was required by that date to render their final accounts to the United States government, and were invited to continue their duties under the Confederate government. The Postmaster-General of the United States suspended the Federal service to take effect the same day. The permanent Constitution of the Confederate States required that the post office should be self-sustaining after 1 March 1863. In 1859-60 the United States had conducted the post office department in the States that were to form the Southern Confederacy at a loss of $1,941,425. Hence a radical change of management was necessary to meet the new requirement. Accordingly Postmaster-General persuaded the railroads to carry the mails at one-half the former rate and to accept the bonds of the Confederacy in payment. He raised the rate on packages, newspapers and letters, the postage on the last being fixed at five cents per ounce per mile, a distance of less than 500 miles and 10 cents for a greater distance. The franking privilege was abolished and mail routes considered unnecessary were reduced in number or discontinued. As a result of these and other radical changes, the reports of the Postmaster-General show that by the latter part of 1862 a surplus was obtained, and from that time on there was a net annual increase of receipts over expenditures. The various States of the Confederacy made no changes in the organization of their judicial system, but the provisional Constitution of the Confederacy provided that each State should be erected into a distinct judicial district, the judge having all the powers hitherto vested in the judges of the District and Circuit Courts; and that the several district judges together should compose the Supreme bench, a majority of them constituting a quorum. During the year 1861 these District Courts were organized, and they were continued under the permanent Constitution. Congress, however, passed an act 31 July 1861, providing that the Supreme Court should be organized only under the permanent Constitution. Accordingly, in the Congress that
met in 1862, the establishment of a Supreme Court was discussed, but nothing was done until the following year. In January 1863, Senator Hill in the Senate said: "I think it high time the judicial department of the government be thoroughly organized; for it has been a limping concern long enough." Finally, on 18 March 1863 the Senate passed a bill to organize the Supreme Court. This bill was intended to carry out the provisions for a Supreme Court as found in the permanent Constitution; provisions that were practically identical with those of the Constitution of the United States. The bill provided for a Supreme Court of the Confederate States to consist of a chief justice and four associate justices, any three of whom should constitute a quorum. The court was to hold annually at the seat of government two sessions, and its appellate jurisdiction was limited to appeals from the Confederate District Courts in the several States. Under law passed by the provisional Congress (16 March 1861), it had been provided that the Supreme Court should also have jurisdiction in appeals from the state courts. In question was the validity of a treaty or statute of, or an authority exercised under, the Confederate States; or where was drawn in question the validity of a statute of, or an authority exercised under any State, on the ground of their being repugnant to the Constitution, treaties, or laws of the Confederate States; or where was drawn in question the construction of any clause of the Constitution, or of a treaty, or statute, or commission held under the Confederate States. This law of the provisional Congress was significantly repealed in the Senate bill above mentioned. Whereupon the Richmond Examiner declared that a Supreme Court, without the circuit feature of the Supreme Court of the United States, and acting simply as a court of appeals from the inferior tribunals of the Confederacy, could do no mischief and might do much good. "But had the original law been allowed to stand, proper provision was unnecessary to foresee that the career of the Southern Confederacy would have been but a pursuit of the catastrophe which overwhelmed the late Union." The Supreme Court as thus constituted, however, saw the light of day after all. The Senate bill, after having been twice read in the lower house, was referred (20 March 1863) to the Committee on Judiciary, and no further mention of it is to be found. There has been much discussion as to the reason why the Confederacy failed to establish a Supreme Court. It seems clear that the reason was twofold. The experience of the South with the Supreme Court of the United States had, in the opinion of many, been disastrous to State rights. Moreover, at this time the military exigencies were much greater than the judicial; hence it seemed wise to defer the establishment of such a tribunal to a more peaceable season. The absence of a Supreme Court, however, had a natural result. The Federal District Courts and even the State Supreme Courts interpreted the Confederate Constitution and in some instances declared the acts of Congress unconstitutional. When a river divides two or more States, they may enter into compacts with each other to improve the navigation thereof. The President and the Vice-President are to hold their offices for six years, but the President is not to be re-electible. The President, Vice-President, and other civil officers of the executive department may remove the principal officer in each of the executive departments. All other civil officers of the executive department may be removed by the President or other appointing power when their service is deemed unnecessary or in incapacity, dishonesty, etc., and the removal with the reasons therefor shall be reported to the Senate. Citizens of any State shall have the right of
The blockade of the Southern ports by the navy of the United States was so strict that the wealth of the South, its cotton and other crops, could not be sent abroad, save at fatal risk, in exchange for the munitions of war. In the early stage of the conflict there had been no desire to export the cotton. The strange delusion that "cotton is king" was so widespread that it was thought possible to compel England to recognize the Confederacy by withholding from her the great staple. When, however, the fallacy of this embargo was as clearly seen as once before in our history, both the Confederate government and some of the State governments utilized the blockade runners to send cotton abroad to exchange for the thousand and one things which the South, from lack of industrial development, was unable to supply for the support of the army. But the help thus obtained was infinitesimal in comparison with the needs, and the government had to fall back upon the sacrifices of devoted men and women. "The Southerners' sacrifices," says Dr. Schwab, "far exceeded those of the Revolutionary patriots. The Southern cause evoked as much devoted loyalty as has been called forth by any other in history; and that cause was supported at a cost greater than in any similar conflict." Yet, in 1865, after four years of terrible struggles, it was seen that the Confederacy was tottering to its fall. It is generally held that the potent factor in its ruin was the effective blockade of its ports, cutting it off from the only markets in which its products were available. Doubtless this is true. The Confederacy, with a debt of $1,400,000,000, was now hopeless beyond help. But it must also be remembered that the crop of men was beginning to fail. While the North was able to increase its active army each year, and even draw from its foreign population 720,000 men, the South in 1865 was reduced to the desperate resource of passing a law to draft the slaves into military service. "The total military population of the South," says Woodrow Wilson, "was 1,065,000, of which 900,000 went into the army for at least partial service. The losses were about 300,000. At the end, 175,000 surrendered to armies of 980,000. It is idle, therefore, to attribute the downfall to the errors of the President and his Cabinet or the deficiencies of the Constitution or the accumulated wealth, in industrial development, in ships and in men, the South, in a prolonged struggle, was not match for its powerful adversary. The logic of facts pointed to a united country. See Confederate States of America; United States — Causes of the Civil War.

John R. Ficklen, Late Professor of History, Tulane University.

35. THE POLITICAL EVENTS OF THE CIVIL WAR. The Civil War in America began by the Confederate attack on Fort Sumter, 12 April 1861, and the secession movement had begun upon Lincoln's election; war
had become inevitable at the time of his inauguration. Two authorities—two sovereignties—were claiming independent jurisdiction over the same area, and, after that, it was only a question of when a civil war would meet in armed conflict. All effort at further compulsion had failed. The time for saving the Union by conciliation and concession had passed. The United States government had now to decide whether to recognize the Southern Confederacy and its government in its own limits, or to vindicate the national authority by force of arms. There was no longer any middle ground.

The issue upon which Lincoln had been elected was the restriction of slavery to the area of the slave States. The first purpose of the new President upon coming into power was to restrict the area not of slavery but of secession. There were still thousands of Union men, especially in the border States and among Mr. Lincoln’s party constituents in the North, to whom *coercion?* was odious; who thought that military force as a means of holding the States together was not only useless but pernicious; who believed, or professed to believe, that the national authority could neither be successfully asserted by the bayonet and the sword against such a formidable revolution as that represented by the confederate slave States; that compromise and conciliation were still the only hope of holding the border States; that the Union, now destroyed because of abolition fanaticism and folly, could be restored only by dividing public opinion in the South, and by waiting until Southern men could be induced to accept Federal appointments and until the civil machinery of the Federal government could again be put in motion in the Southern States. Lincoln recognized this body of conservative Union opinion, and whatever of genuine loyalty to the national cause there was in it he wished not to antagonize. He would bring every possible man, every ounce of opinion, to oppose secession. He would, if possible, unite the North, divide the South and save the border States. For this reason Mr. Lincoln’s inaugural address was quite conciliatory in its attitude toward slavery and the South. The platform of his party committed him both to *the preservation of the Union and the maintenance of the right of each State to order and control its own domestic institutions according to its own judgment exclusively.* In his inaugural address Lincoln reiterated this sentiment of his party platform, and, quoting one of his former speeches, he declared, *I have no purpose, directly or indirectly, to interfere with the institution of slavery in the States where it exists. I believe I have no lawful right to do so, and I have no inclination to do so.*

In this address Lincoln took no positive anti-slavery stand. He spoke in favor of the return of the fugitive slave, and he in no way urged the cause—the non-extension of slavery—for which he had been elected. In this Lincoln merely recognized, as he believed Statesmen should have done, that the paramount issue confronting the nation had changed since his election in November. Then it had been the extension of slavery; now it was the preservation of the Union, the unity and integrity of the national issue. Therefore, on 4 March 1861, Lincoln stood ready, for the sake of avoiding war and disunion, to subordinate, so far as it was morally possible, his own and his party’s anti-slavery purposes. He would not surrender the principle for which he had been called into power and which he would meet in armed conflict. But he declared his willingness to accept an irrevocable amendment to the Constitution prohibiting the national government from ever interfering with slavery in the slave States; and he assured the people of the South that it would be availed, and that they could have no conflict unless they themselves became the aggressors. But the President declared that, despite the ordinances of secession, he regarded the Union as unbroken, and that, as the Constitution and his oath of office bound him to do, he would faithfully “execute the laws of the Union in all the States”; and this he would continue to do unless, and until, his *ruthful masters, the American people,* shall withhold the requisite means or, in substance, the power to direct the contrary. *“The power confided to me,* he said, “will be used to hold, occupy and possess the property and places belonging to the government, and to collect the duties and imposts; to guard what may be necessary for these objects, there will be no using of force against or among the people anywhere.*

Here was clearly drawn the political issue of the Civil War—national unity and the enforcement of the national authority against disunion and the right of secession. It was not possible for the national authority to recognize this issue—its own right to exist—as within the field of negotiation, and the attempt of the Confederate government to secure recognition by opening diplomatic relations at Washington was repelled.

If the national government intended to maintain its authority and to *execute the law in all the States,* there was nothing for the South to do but to yield or fight. The South’s answer was the defiant attack on the national authority at Sumter. The call for 75,000 three-months’ volunteers and the uprising of the national spirit followed; the conference was forgotten, and the great body of the Democratic voters in the North, following their leader, Mr. Douglas, rallied patriotically to the support of the government, as did also many Breckenridge Democrats. (See Breckenridge, J. C.). In the proclamation calling for volunteers Lincoln commanded the insurgents to disperse within 20 days, called Congress into extraordinary session for 4 July 1861, and announced that the object of the military force was to repossess the forts and places seized from the Union. The time limit of three months for the troops was made necessary by the Act of 1795, as this law authorized the use of the militia “until the expiration of three months after the commencement of the then next session of Congress.”

Virginia’s secession followed immediately (17 April) upon Lincoln’s call for troops, upon the plea of resisting invasion and secession. Tennessee and Arkansas soon afterward followed Virginia and joined the Confederacy, but the attempt to carry Missouri and Kentucky into the secession movement was foiled by the co-operation of the governments with the Union forces in those States. After the bombardment of Sumter and before the meeting
of Congress (12 April-4 July 1861), President Lincoln assumed extraordinary war powers. (See UNITED STATES — THE PRESIDENT'S OFFICE.) He proclaimed a blockade of Confederate ports (19 and 27 April); he increased the forces of the regular army and navy (3 May) by his own executive order, and he authorized his military subordinates in several places to suspend the writ of habeas corpus. (See HABEAS CORPUS.) The orders of blockade had been evoked by the purpose of the Confederate government, indicated by Mr. Davis' letters of marque and reprisal (17 April), to use its ports for fitting out privateers to prey upon the commerce of the United States. The other measures of the President were held to be justified by the emergency. (See PRIVATIZATION; BLOCKADE; BLOCKADE RUNNER.) Upon the assembling of Congress these executive acts were approved, and, as far as endorsement and Congressional resolution could do so, they were legalized, as a convenience of war, and as a military and financial provision for a vigorous conduct of the war.

Slavery had been the primary cause of secession and war. But slavery was not the issue on which South and North, who cared more to go to war than to fight. The cause for which the North rallied to arms was union and nationality; the cause of the South was independence and the rights of the States. Both disclaimed slavery as the cause of war. But slavery, as it was the everlasting cause of strife before the war, was the chief cause of political difference during the war; and the relation of the war to slavery is the most important point of view from which the political events of the war are to be studied. To what extent should the war be distinctly an anti-slavery war and be made an instrument of emancipation? To what extent should the war be conducted solely to preserve the Union, and to restore national authority without disturbing in any way the domestic institutions of the States? On these questions Mr. Lincoln was constantly subject to pressure in opposite directions. The conservatism in his nature and the conservativeness of the party he was part of required that he should not assume a more radical and aggressive anti-slavery attitude than the public sentiment of the country would support; while his party opponents were vigilant and quick to denominating the war a noble effort for the Union into a mere abolition war for the "nigger." On the other hand the radical anti-slavery forces were constantly urging him to strike at the real strength of the rebellion by striking at its cause. This wing of the Union forces held with Sumner that the "rebellion was but slavery in arms."

Congress attempted to define the purpose of the war and its relation to slavery in the famous Crittenden Resolution of 22 July 1861, which was passed in both Houses by an almost unanimous vote. It was declared that the war was forced upon the country by the disunionists of the South; that "the War is not waged upon our part for any purpose of conquest or subjugation, nor for the purpose of overthrowing or interfering with the rights or established institutions of those States; but to defend and maintain, Contender for the preservation of the Union with all the dignity, equality, and rights of the several States unimpaired; that as soon as these objects are accomplished the War ought to cease." See CIRTENDEN COMPROMISE.

This is the platform upon which the conservative Democracy of the North insisted that the war should be conducted, and for any departure from this policy they were ready to denounce the administration and displace it from power. In saving the Union by war the administration must not be allowed to violate the Constitution in any way nor in any way interfere with the rights of the States or the legal status of the slaves. The political and party struggles of the Civil War focus themselves largely about this issue. On the one side were those of a conservative, purely Union-saving purpose, who were disposed to demand that the war be conducted strictly according to the forms and canons of the Constitution. Among these were probably many who cared more to save slavery and the rights of the States than to save the Union. On the other hand were the radical anti-slavery men who were determined that, while the war should be for the Union, it should not cease until emancipation should be secured. Among these were many who were willing to save the slave but free the Union. Lincoln, as we shall see, occupied middle ground between these opposing extremes.

In the gradual but constant progress of the administration toward an anti-slavery policy — in its movements from an attempt to save slavery and the Union together to the policy of emancipation and the reconstruction of a new Union wholly free, there are certain notable features and landmarks. Among these we may notice, first, the attitude of the administration toward military emancipation.

As early as 25 May 1861, Gen. Benjamin F. Butler, in command of the Union forces about Fortress Monroe, gave the first indication of a military method of emancipation. He refused to return to their masters slaves coming within his lines, on the ground that they had been used in aid of the rebellion, in the erection of batteries and other works; and grading the war from a noble effort for the Union into a mere abolition war for the "nigger." On the other hand the radical anti-slavery forces were constantly urging him to strike at the real strength of the rebellion by striking at its cause. This wing of the Union forces held with Sumner that the "rebellion was but slavery in arms."

See CIRTENDEN COMPROMISE.
but to leave that problem to the military authorities. On 8 Aug. 1861, two days after the passage of the Confiscation Act, Mr. Lincoln's Secretary of War, Edwin M. Stanton, wrote to Butler, who was pressing for further instructions: "It is the desire of the President that all existing rights in all the States be fully respected and maintained; in cases of fugitives from the loyal slave States, order enforcement of the Fugitive Slave Law by the ordinary forms of judicial proceedings must be respected by the military authorities; in the disloyal States the Confiscation Act of Congress must be your guide. The slave rights of loyal masters in disloyal States were to be safeguarded as far as possible. This policy indicates Lincoln's conservatism at the beginning of the war, and his regard for vested rights whenever the slavery question appeared. In pursuance of this line of policy Lincoln tacitly endorsed Halleck's order returning fugitives and protecting slave property, while he did not hesitate to overrule and set aside General Fremont's order (30 Aug. 1861) in Missouri emancipating the slaves of all persons who had taken up arms against the United States. On 11 Sept. 1861 Lincoln overruled Fremont and on 19 May 1862 he revoked and repudiated a similar order of General Hunter for the border States. In his annual message of December 1861, Lincoln declared that "no commanding officer shall do such a thing upon my responsibility without consulting me." Chase and other anti-slavery supporters of the administration urged Lincoln to let the Senate decide the question. But the President was afraid it might alienate support from his policy of compensated emancipation which he was then urgently pressing upon the representatives from the border States. In his annual message of December 1861, Lincoln had expressed his purpose still "to keep the integrity of the Union prominent as the primary object of the contest." By this time Congress, aroused by the sad losses of the war and the formidable power of the rebellion, refused to reaffirm the Crittenden resolution of the previous July. This refusal seemed to indicate that other objects of the war were in view besides the suppression of the insurrection. The spring of 1862 brought a new step, momentous in its ultimate, if not in its immediate, results, dissatisfaction with Lincoln among anti-slavery men continued and a concerted movement arose within the Republican party to supersede Lincoln in the leadership. The dissatisfied Republicans sought to secure the nomination of Chase or some other more radical anti-slavery man for the Presidency. When this fell through, the more radical spirits secured an independent convention and the nomination of Fremont against Lincoln in 1864, and this indicated a serious division within the Union-Republican party. On the other hand conservative men in the administration, like the Blairs, were crying for the President, opposed the Emancipation Proclamation on the ground that it would lose the fall elections, alienate support from the war and endanger its success; while the Democratic opposition party in the North were seizing upon all the anti-slavery measures of Congress and the President as material for a political campaign against the administration, on the ground that the war for the Union was being turned into a war for abolition.
The anti-slavery purposes of the war were making headway. The Democratic opposition to the war policy of Mr. Lincoln arraigned the administration on various indictments. The refusal of Congress to reaffirm the Cittenden Resolution; the abolition of slavery in the District of Columbia (April 1862); the abolition of slavery in the Territories (June 1862); the second Confiscation Act of 17 July 1862, providing for the emancipation of the slaves of rebels and their abettors, and for the employment of such freedmen in the suppression of the rebellion as the President might direct; the military annulment of the Fugitive Slave Act by the contraband policy and by the act (13 March 1862) forbidding military officers from arresting and returning fugitive slaves; the scheme for compensated emancipation, because of its enormous expense; the emancipation proclamation — the military organization of the blacks (July 1862), as tending to equalize the white soldiery with the negro; the recognition of Liberia and Haiti; the enlargement of legal privileges for the negroes was what these opponents accused the government of doing. All these measures were denounced by the opponents of the administration and were used to prove the abolition and unconstitutional character of the war. Many of these anti-slavery measures all those were arrayed in the political opposition whose race prejudices against the negro were pronounced; who hated the New England abolitionists as much, or more, than they did the "fire-eating" secessionists who believed in slavery, or were indifferent to its evils; who thought that in the conduct of the war the wrongs of the negro should not be taken into account and that the interests of the white race alone should be considered.

Another noticeable factor in this opposition were the constitutional legalists, who were insistent upon holding the conduct of the war strictly to the forms of the law and the Constitution. They made the protection of civil liberty and the rights of the individual their special cause and chief concern. They were more strenuous to preserve these individual rights than they were to preserve the Union. They contended that the Union could not be preserved, or need not be, if the Constitution and the law were violated and disregarded. That which claimed their obedience and loyalty, they asserted, was not a person invested with office, nor an idea of public necessity, nor an imaginary national life apart from the life of the Constitution. "What the Constitution ordains or authorizes, that is the public necessity, that is the supreme civil obligation." This was the position taken by able and conservative lawyers and leaders like George Ticknor Curtis and Horatio Seymour, who opposed the conduct of the war because of what was considered the high-handed usurpations of power by the war authorities. They felt that loyalty required them to be loyal to the reserved rights of the States as the supreme law of the land as well as to the powers vested in the general government; that loyalty bound them to safeguard the rights of persons and property guaranteed by the Constitution to every citizen, as well as to support a war to crush insurrection. With these feelings and principles they opposed the administration on account of the suspension of the writ of habeas corpus, on account of arbitrary arrests and the suspension of free assembly, free speech and free press. Certain newspapers had been suppressed (the New York News, the New York Journal of Commerce, Chicago Times, Brooklyn Eagle and others) on the ground that they were encouraging the rebels to persevere in their resistance, by expressing sympathy with them, by urging the duty of according to their demands and by expressing dissatisfaction with the policy of employing force to overcome them. These papers were constantly denouncing as "an unholy war," the war "in defence of our country, its institutions and most sacred rights, and carried on solely for the restoration of the authority of the government." This kind of party opposition to the war was what Lincoln called "the fire in the rear." See Habeas Corpus; Milligan Decision.

Some of these opponents of the war were disloyal factionists who at heart were in sympathy with the South, and who preferred disunion to the political and military success of the administration. They were called the "fire-eaters" of the North. Clement L. Vallandigham of Ohio was one of the most distinguishable and extreme representatives of this group. He was arrested at Mount Vernon, Ohio, in May 1863, upon a charge of "publicly expressing his sentiments for those in arms against the government of the United States and declaring disloyal sentiments and opinions with the object and purpose of weakening the powers of the government in its efforts to suppress an unlawful rebellion." He was found guilty by a military tribunal and sentenced to close confinement — a sentence which President Lincoln commuted to banishment to the enemy's lines. The Democrats of Ohio officially protested against these proceedings and Lincoln informed them that Vallandigham had been arrested because "he was laboring with some effect to prevent the raising of troops, to encourage desertions from the army, and to leave the rebellion without any adequate military force to suppress it." While in exile Vallandigham was nominated by the Democrats for the governorship of Ohio and was defeated by the unprecedented majority of 100,000 votes. Elsewhere in the Eastern and Mid-Western States, while its purposes and principles were in most respects the same as those of Vallandigham, was more moderate and restrained, and, under the direction of men whose loyalty to the Union was undoubted, the Democratic successes in the elections of 1862 and 1863 were very pronounced. The military losses and disasters, the newness of the emancipation policy, the unexpected extension of the war, the unfriendly attitude of foreign powers, the growing belief that the Union could not be restored by war, the vigor of the Democratic attack in the rear — all these factors were causing the loss of the fall elections in 1862. This was intimated as a vote of want of confidence in the administration, and it is probable that if Lincoln had been a candidate for re-election in 1862 he would have been defeated.

Another cause of opposition is to be taken into account after the summer of 1863. This was the Conscription Act and the effect of the draft. Although what seems now like decisive military successes had come to the national arms in July of that year (Gettysburg, Vicks-
burg) a successful end of the war seemed dist-
tant, and the people were becoming very weary
of waste, bloodshed and battle. They were
sighing for peace. But the burdens of the war
were to be still further increased. On 3 March
1863 Congress passed a Conscription Act au-
thorizing a draft of 300,000 men. Certain pro-
visions of the act led to disagreements as to
quotas between Federal and State authorities,
and a clash seemed imminent. A $300 clause
allowed a man who could pay that sum to be
released, while one who could not must go into
the ranks. With this discrimination in favor
of the rich and against the poor, a great deal
of popular prejudice and opposition were
aroused by the party opponents of the admin-
istration against the draft; and the draft riots
in New York, in July 1863, resulted in serious
loss of life and property. Governor Seymour
of New York requested President Lincoln to
suspend the enforcement of the draft in that
State, and it was intimated to Secretary Stan-
ton that this act could be enforced only by the
co-operation and consent of the State authori-
ties. Stanton held that the issue of the Civil
War was the enforcement of the national au-
thority by its own power without dependence
upon the consent of the State.
Added to the excitement and opposition
aroused by the draft came the President's pro-
clamation of 15 Sept. 1863, suspending the privi-
lege of habeas corpus throughout the United States in
the cases where persons were held by the civil, military or naval
authorities under the orders of the President, as
"aiders or abettors of the enemy." This pro-
clamation followed the grant of power conferred
by the Act of 3 March 1863, by which Congress,
as it had previously legalized previous suspen-
sions of the writ, authorized the President to
suspend this guarantee of personal liberty dur-
ing a period of Civil War throughout the whole
United States. Under this act military arrests
without civil warrants and trials by military
commissions continued in various parts of the
North. The critics of the administration held
that the purpose of this policy was to consider
all the party opponents of the war as
"aiders or abettors of the enemy," and they feared that all political discussion and criticism
were to be suppressed by a military absolutism.
(See HABEAS CORPUS; MILLIGAN DECISION).
Freedom of the mails had also been denied to
hostile matter, or such as might instigate others
to co-operate with the enemy. (Consult Report
of the Judiciary Committee of the House, 20
Jan. 1863).
Thus, with divisions within the ranks of the
Union-Republican party, with the country long-
ing for peace, with many factors and elements
arousing and uniting the opposition, there was
danger that the Union-Republican party would
be defeated by the party calling itself the "Con-
servative-Union Party." This party had nomi-
nated Gen. George B. McClellan, one of Lin-
coln's deposed generals, on a peace platform,
demanding peace after four years of failure to
restore the Union by war. Their policy was to
restore the Union by stopping the war, by
armistice, negotiation, convention,—by some
diplomatic agreement to which both parties
might agree, and that fighting should cease until
an arrangement could be adjusted. They would
substitute negotiation for subjugation. Pre-
sumably, in the mind of this party, if negotia-
tion failed disunion was preferable to a con-
tinuance of the war. Their great political error
was in their failure to perceive that it was for-
ever too late, on account of the state of public
sentiment both North and South, to secure a
restoration of the old Union under the old
Constitution. While there was any hope left to
them in the field the South would never consent
to a restoration of the Union; and when their
military defeat, after Atlanta, Nashville and
Sherman's march to the sea, became a foregone
conclusion, then the terms of settlement and
reunion were to be determined only by the na-
tional will. But it was in the face of the sit-
uation before these military victories in the lat-
ter part of '63 and the early part of '64, with
the cry for peace seemingly almost irresistible,
that Andrew Sumner and other radical anti-
slavery men felt that the most important thing
to do was to rescue Lincoln from the peace in-
fluences that seemed to surround him; from
those who would pervert the Constitution into
an unworthy or disgraceful offer of compromise
with the leaders of the rebellion. These radical
spirits wished to prevent Lincoln from offering
the South peace merely on the basis of a re-
stored Union without emancipation.
There were other political phases of the war
on which the opposition joined issue with the
administration. The conduct of foreign affairs
was made the subject of severe animadversion.
In the settlement of the Treaty of 1854 it was
charged that Seward had been subservient to
Great Britain and had sacrificed the national
honor. In his tolerance of the French inter-
vention in Mexico he had sacrificed the traditional
policy of the Monroe Doctrine (q.v.). In do-
meric affairs the financial and revenue policy
of the government were brought into adverse
review; while the creation and the admission of
West Virginia were denounced as an unconsti-
tutional act of spoliation and dismemberment of
the "Old Dominion."
In the long session of 1861-62 Congress
passed a number of measures which, even in
this brief review, should not go unmentioned.
It authorized the admission of California to
the Union by providing for a Union road
through the state, of the railroad and the telegraph when
the public safety required it; passed a Homestead Act;
established a Department of Agriculture;
passed the act to donate public lands to States
and Territories for the purpose of founding
agricultural colleges; authorized the construc-
tion of a railroad to the Pacific Ocean, aiding
the road in land and government bonds; and,
finally, created the comprehensive scheme of
internal taxation. The famous Revenue Act of
1 July 1862 developed the excise tax in a man-
ner unheard of in this country before. Writers
have frequently applied to this system of in-
ternal revenue Sydney Smith's humorous ac-
count of British taxation in 1820: "There are
upon every article which enters into the mouth, or
covers the back, or is placed under the foot;
taxes upon everything which it is pleasant to
see, hear, feel, taste or smell; taxes upon
warmth. Their policy was to tax everything
on earth and the waters under the earth."
Every visible commodity or transaction was
taxed. Licenses were required of all distillers
and brewers, manufacturers, wholesale and
retail dealers, of men in all kinds of business,
proprietors of theatres, of jugglers and circuses,
of lawyers, physicians, surgeons and dentists. The act imposed 20 cents per gallon on spirits, $1 per gallon on malt liquors, a heavy tax on tobacco and cigar, carriages, yachts, billiard tables and plate; on slaughtered hogs, cattle and sheep; on passports, legacies and receipts from railroads, steamboats and toll-bridges; on dividends of banks and trust companies; and 3 per cent on insurance in excess of $10,000 and 5 per cent on incomes over $10,000, with an exemption of $600. Stamp duties on all kinds of paper were imposed. The income tax was regarded as a form of excuse, not a direct tax. (See INCOME TAX.) This Revenue Act and Legal Tender Acts under which $450,000,-000 of legal tender notes, commonly called greenbacks, were issued, were the most important pieces of fiscal legislation during the war. See LEGAL TENDER.

After the military successes of the Union arms in the fall of 1864 and after the re-election of Lincoln all hope of an independent Confederacy passed away. It was then only a question of time and "right" versus the "last ditch.

The peace conferences had come to naught and the demands for an armistice were no longer a menace to the complete triumph of the national arms. (See HAMPTON ROADS CONFERENCE.) Already, in 1864, the 13th Amendment and the various plans of reconstruction had begun to receive the attention of Congress, and it is to these subjects, after the fall of 1864, that the student of the political history of the war should give his attention.

35. FINANCES (1861-1919). In the winter of 1860-61 the finances of the Federal government were most discouraging. Secession was under way; national credit depressed, and executive efficiency was slowly disintegrating. There was little confidence that the Republican party, which had carried the election in November 1860, would be able to weather the storm. Some strength was shown at the close of the session by the passage of a new tariff law known as the Morrill Tariff, in which rates were slightly advanced. Lincoln took office 4 March 1861 and appointed Salmon P. Chase Secretary of the Treasury. On 15 April the troops were called out to put down the Rebellion and the country entered upon a few years' war which tried the financial system to the utmost, necessitated radical methods of financing, burdened the country with an enormous debt and raised taxes to a permanently high level. In brief, during the fiscal years 1862-65, expenditures were $3,348,000,000; taxes $667,-000,000 and loans $2,622,000,000. Loans were nearly four times as large as taxes. In the spring of 1861 it was not supposed that the war would last long and consequently the legislation of July and August was not designed to increase taxes in any considerable degree. A loan of $250,000,000 was authorized, some increase was made in the tariff schedules and an income tax was levied. Under the authority of the Loan Act the Treasury Department endeavored with the assistance of local banks to borrow $150,000,000 by the issue of three-year treasury notes, bearing 7.3 per cent interest, since known as the seven-thirties. The banks responded with energy, but owing to the restrictions of the Independent Treasury Law requiring all payments to the government to be made in specie, they could not carry the burden and in December suspended specie payments. The Treasury Department was forced to follow their example. By the Act of 25 Feb. 1862, a comprehensive loan act was passed and authority given for the issue of $150,000,000 non-interest legal tender treasury notes. There was much opposition to making the notes legal tender, but the issue was justified in the name of "necessity." The ground of necessity—"necessity to meet the immediate obligations of the government; necessity to give currency to treasury notes; necessity to provide money which would in turn purchase bonds." Two further issues, of $150,000,000, were made by the Acts of 11 July 1862 and 17 Jan. 1863. In addition to these non-interest notes, the legal tender quality was attached to some of the other short-term treasury notes. Other forms of treasury indebtedness were demand notes, certificates of indebtedness, temporary loans and fractional currency. Of the total amount borrowed $1,045,000,000 was in the form of long-term loans; $890,000,000 in interest-bearing notes; $458,000,000 in non-interest bearing notes and $208,000,000 in temporary loans.

In selling long-term bonds Chase kept four objects in view: (1) moderate interest; (2) general distribution; (3) future controllability; and (4) incidental utility. Chase objected to selling bonds at a discount, or to offering more than 6 per cent interest. After the suspension of specie payments the legal treasury tender notes, or greenbacks, depreciated greatly in value; as they were, however, receivable as cash for the purchase of bonds and as the bonds bore interest in gold, the return to the purchasers, as measured in gold, was far greater than the nominal rate of interest would indicate. Under the con-
conditions, therefore, the market for bonds constantly broadened. To secure a wider distribution in the investment of government securities an agent, Jay Cooke (q.v.), was employed with an extensive system of sub-agents to place the bonds in every section of the country. Chase was also opposed to making long loans and consequently reserved the right to the government of redeeming bonds after 5 or 10 years. This gave rise to securities known as 5-20’s and 10-40’s, running for 20 or 40 years, but redeemable at the option of the government at the shorter period. In order to make a wider market for bonds, as well as to reform the currency system on a national basis, the national banking system was organized in which circulation is based upon the deposit of bonds.

In July 1862 a more vigorous policy of taxation was adopted; internal revenue taxes were imposed upon fermented liquors and tobacco; upon occupations, auction sales, carriages, yachts, billiard tables and plate; upon slaughtered cattle, transportation agencies, banking, insurance, in quantities, advertising, incomes, and legacies. At the same time tariff duties were increased to compensate domestic industry for the internal revenue duties. Internal revenue receipts did not meet expectations and in 1864 a second expansion of the revenue policy was made. The internal revenue system was well-nigh universal in its application. Nothing was omitted from the raw product to the finished commodity; often an article received a half dozen additions ere it reached the consumer. And not only were all the constituent elements which entered into an article taxed, as the bolts, rivets, castings, trimmings and the like of an engine, but the engine when completed was subjected to an additional ad valorem duty upon its value. Customs duties were again advanced because of the increased duties upon manufactures. The Act of 1864, however, went further in the direction of protection and brought rates up to a level which established a new standard. The average rate on dutiable articles was increased to 47 per cent. The income tax of the war period was highly productive; at its maximum, incomes between $600 and $5,000 were taxed 1 per cent; and above $3,000, 40 per cent. The total receipts from this source, 1863-73, amounted to $347,000,000.

When the legal tender notes were first issued they were convertible into bonds — securities which had a definite gold value, as interest was payable in gold. The quality of convertibility was taken away by the Act of 3 March 1863 and this, together with the increased issues and the waning hope that the government would be able within any short period of time to settle its obligations on a gold basis, led to a marked depreciation in the value of greensbacks. In July and August 1864, the average value of the gold dollar in currency was but 39 cents. As gold was daily needed by importers to pay customs duties and to settle balances abroad, a brisk and often specious demand for gold resulted. Moreover, the repeated fluctuations in the value of gold measured in currency, occasioned by alternating hopes and fears as to the outcome of the war, affected all business. Prices were abnormally high and it was estimated that the cost of the war to the treasury alone was increased by the inflated issues about $600,000,000.

When peace was restored in 1865, there were three enormous tasks before the government: funding the debt into more convenient form, revision of the tariff system and the restoration of a standard of value by the resumption of specie ownership. On 1 Sept., 1865, the public debt was $2,846,000,000; less than one-half of this was funded; loans bore interest at five different rates; they matured at 19 different periods, and some were convertible or redeemable at the option of the government. At first there was apparently general agreement that the volume of legal tender notes should be reduced, for on 18 Dec., 1865 the House of Representatives passed a resolution in favor of a contraction of the currency with a view to as early a resumption of specie payments as the various interests of the country would permit. The Funding Act of 12 April 1866 authorized the conversion of temporary short-time interest-bearing securities into long-term bonds, but provided only for the revaluation of notes. It gave authority to retire $10,000,000 within six months and not more than $4,000,000 in any one month thereafter. Even this reduction was not long continued. It was not easy for the country to readjust itself to peace conditions. Discontent was especially strong in agricultural sections where indebtedness had been incurred by farmers on long-term credits. The return of hundreds of thousands of soldiers to industry led to many insolvent failures. Prices naturally fell with the withdrawal of the excessive demands made by war, and for this fall producers were disposed to place the blame upon the contraction in currency. On 4 Feb., 1868, after $44,000,000 in greenbacks had been retired, further contraction was suspended. In 1869 the Supreme Court in the case of Hefburn v. Griswold decided, four to three, that the legal tender notes were unconstitutional. In 1871 the decision was reversed and of record that the government had the right to employ freely every means, not prohibited, which was necessary for its promotion. In 1884 the court decided in favor of the constitutionality of issues in times of peace.

The National Independent stock, by the proposition that Federal securities should be subject to local taxation and by the demand that bonds should be redeemed in currency instead of in coin. In some sections bitter attacks were made upon the rich, who were represented as owners of idle wealth which they had gained through the possession of government securities at the expense not only of the laborer who had toiled under low wages and high prices, but also of the soldier who had taken his life in his hands and had received his pay in greenbacks. In 1870 a Refunding Act was passed authorizing the issue of $500,000,000 bonds at 5 per cent, redeemable after 10 years; $300,000,000 at 4½ per cent, redeemable after 15 years and $100,000,000 at 4 per cent, redeemable after 15 years, all to be paid in gold and exempt from national, as well as local, taxation. This act with supplementary legislation fixed the character of the debt for the next 25 years.

In 1873 a commercial panic occurred resulting in prolonged industrial depression. The treasury endeavored to relieve the situation by
reissuing $26,000,000 of legal tender notes and Congress passed a bill for a permanent increase to $400,000,000. This inflation bill was vetoed by President Grant. In December, 1873, and April 1874. The Republican party, then spurred on by the repeated victories of the Democrats, by Grant's firm stand and the insistence of Secretary Bristow, finally determined to make resumption of specie payments. On 14 January 1875, it was provided that resumption of specie payments should be entered upon 1 Jan. 1879, and authority was given to the Secretary of the Treasury to sell bonds in order to acquire the necessary amount of gold. In 1877 John Sherman (q.v.) was appointed Secretary of the Treasury and vigorously undertook a policy of gold accumulation; $138,000,000 in gold was regarded as sufficient to win confidence in the ability of the government to redeem all notes presented and for this Sherman sold $95,500,000 of bonds. Resumption was accomplished on the date set.

In the meantime a new financial question had arisen. In 1873 silver was demonetized by Congress; causes a fall in the bullion value of silver, among which were its demonetization by Germany in 1871; the limitation of coinage in the Latin Union in 1873, and the discovery of new supplies of silver in the United States. The depression following the panic of 1873 started a new clamor for an increased supply of currency and it was bitterly asserted that the United States had joined in a conspiracy to disown silver and limit the volume of legal tender money, in the interest of the creditor class. A struggle ensued to secure the free and unlimited coinage of silver, and in 1878 the Bland-Allison Act was passed over the veto of President Hayes, providing for the monthly purchase of not less than $2,000,000 and not more than $4,000,000 of silver bullion at the market price. The Bland-Allison Act of 1878 continued in operation until 1890. Under its provisions 378,000,000 silver dollars were coined, at a purchase value of only $306,000,000, thus yielding a seignorage of about $70,000,000. As the country had become accustomed to paper money, it was difficult to put the new coins in circulation; authority was consequently given for the issue of silver certificates in denominations as low as $1 for the deposit of coin. There was a more serious objection to continuing coinage in the fear that it would be impossible to maintain a gold standard. Secretary McCulloch in 1884 and Secretary Manning in 1885 endeavored to arouse Congress to a repeal of the act. The demand, however, for an enlarged currency, represented both by the greenback movement of the period and by those who advocated still freer coinage of silver, made it impossible to secure this legislation.

After the Civil War sweeping changes were made in internal revenue taxes. In 1870 there were left only those on distilled spirits, fermented liquors, tobacco, banks and bankers, adhesive stamps and revenue stamps, and the income tax; the latter was repealed in 1872. There was less readiness to change tariff duties; protectionism had gained in strength through the growth of manufactures and the Republicans of the South had been committed to the principle. Slight reductions were made, but the system as a whole was maintained with little change. The country recuperated from the crisis of 1873 and beginning with 1880 large surpluses were turned into the treasury. The Sherman Silver Purchase Act of 1870 hampered the government in the redeeming of bonds, except at a premium, and in 1883 Congress was forced to overhaul the tax system. All internal revenue duties were repealed except those on spirits, fees and stamps. Rates on tobacco were reduced one-half. A tariff commission recommended a substantial reduction in customs, but Congress paid little heed and enacted a protective tariff in which a harmonious framework was sacrificed to the pressure of conflicting interests. The Democrats repeatedly endeavored, particularly during President Cleveland's administration, 1885-89, to enact tariff measures, but protectionist sympathies within the party defeated every attempt. In 1889 the Republicans regained control and in 1890 enacted a measure, the McKinley Bill, in which protectionism was developed to a point hitherto unknown. Increased duties were laid upon a great number of articles and in some cases the rates were raised for protectionist importation. The act also introduced two new principles—a bounty on the domestic production of sugar and commercial reciprocity under executive proclamation.

In 1890 silver sentiment affecting both parties was so strong that further concessions had to be made in order to prevent unlimited coinage. An act was passed known as the Sherman Silver Purchase Act, providing for the purchase of 4,000,000 ounces of silver bullion under pressure, and the issue in payment thereof of treasury notes of full legal tender. This increased the monthly purchases of silver and authorized treasury notes of full legal tender in place of silver certificates which were of only partial legal tender quality. Treasury notes were redeemable either in gold or silver coin at the discretion of the secretary.

Under the McKinley tariff customs duties declined, and this, coupled with commercial disturbances involving the United States, resulted in the exportation of gold. Large amounts of gold were obtained from the treasury by the presentation of legal tender notes and treasury notes of 1890. The gold reserve which since 1879 had been maintained at $100,000,000, or more, began to slip away until there was fear that the treasury would be forced on to a silver basis. On 30 June 1890 the reserve stood at $190,000,000; three years later it had fallen to $95,000,000. The significance of the underlying forces which were weakening government credit were not, however, clearly seen and appropriations continued to be made with a liberal hand. In 1890 there was a surplus of $105,000,000; in 1893 it was but $2,000,000, and in 1894 there was a deficit of $70,000,000.

The Democrats won in the election of 1892 and Cleveland again became President. In June 1893 the mints in India were closed to the coinage of silver; in July a movement to a still further fall in the price of silver bullion and occasional immediate apprehension that the treasury would soon be unable to redeem its obligations in gold. Within a few weeks the country was in a state of panic. President Cleveland called a special session of Congress, and a tariff measure secured the repeal of the Silver Purchase
Act of 1890. The country did not easily recover from the panic; withdrawals of gold from the treasury continued and the administration was forced to make four issues of bonds in order to keep an adequate supply of gold on
hand to meet the requirements of the "endless chain." The embarrassment of the treasury was so acute that by 1893 it was forced to issue $413,000,000
of revenue. The Democrats in 1894 enacted a new tariff measure which included an income tax;
as introduced in the House under the leadership of Wilson, this bill was in the interest of free trade, but protective sentiment within the Democratic party radically modified the measure in the Senate, so that in its final form it made little change in existing policy. The income tax was promptly attacked on the ground of unconstitutionality. In a decision of 8 April 1895, the Supreme Court decided that a tax on income from land was a direct tax and, therefore, unconstitutional unless apportioned; and in a decision of 20 May, income derived from other sources was also brought within the same in-
terpretation.

The Presidential campaign in 1896 was fought out on the basis of free silver. The Democrats in their platform declared in favor of the free and unlimited coinage of both gold and silver at the ratio of 16 to 1 without waiting for the aid or consent of any other nation; the Republicans, on the other hand, demanded international agreement. The Republicans won and made good the victory for the gold standard in 1900. This declared gold as the standard of value and authority was given the Secretary of the Treasury to maintain it by the temporary locking up of treasury notes and the sale of bonds, whenever the reserve fell below $100,000,000. The act also provided for the refunding of the debt at a lower rate of interest, and gave national banks opportunity to take out a larger amount of circulation.

Upon their return to power in 1897, the Republicans enacted the Dingley tariff; on some commodities the duties of 1890 were restored, on others compromises between the rates of 1890 and 1894 were accepted, and in a few instances the lower rates of the Wilson tariff were allowed to stand. The principle of reciprocity, dropped in the Wilson tariff, was again incorporated into the tariff system to be brought into operation, however, by treaties executed by the Senate. In 1898 war with Spain necessitated the issue of $200,000,000 of bonds and the levying of new internal revenue duties. This proved amply sufficient to meet the increased expenditures for the army and navy.

With the opening of the new century, industrial and corporate enterprise developed on an unprecedented scale. The trust movement was in full swing and large amounts of corporate securities sought investment. Crops were large, and, beginning with 1902, the autumnal money stringency repeatedly became severe. The first panic that occurred in the same time created a series of treasury surpluses. Congress, therefore, in 1901 and 1902 repealed the internal revenue duties imposed in 1898; and Secretary Shaw endeavored through the agency of the Treasury Department to drain the money market. He used not only the old expedients of depositing government funds in banks and of purchasing bonds but made new rulings whereby banks could more easily secure government deposits. The Secretary of the Treasury decided that road bonds were accepted from banks as collateral for deposits. The number of depositary banks increased from 442 in 1900 to 713 in 1903, and government deposits from $93,000,000 to $413,000,000.

During this period the monetary circulation gradually increased. Bank circulation grew from $254,000,000 in 1900 to $739,000,000 in 1911. But the currency system remained as inelastic as ever, and the increased circulation brought with it the dangers of inflation. In October 1907, a severe panic occurred which brought the problem of currency reform into greater prominence. Many plans were proposed, as for establishing a central bank, legalizing notes issued by clearing-house associations and for the issue of an emergency circulation. The result was the Vreeland—Aldrich Act of 1908, which provides for the issue of supplemental credit notes subject to a special tax. Provision was also made for the establishment of a monetary commission to devise a more permanent and satisfactory plan. This commission in 1912 reported in favor of the establishment of a reserve association chartered by the Federal government to be the fiscal agent of the government and to hold its deposits. Its banking powers were limited to dealings with banking institutions, and ultimately the plan provided for giving to the reserve association the sole power of note issue. Much fear, however, was expressed that this would centralize the banking power and thus establish under another name a central bank, to which public opinion was generally opposed. Action was consequently delayed.

In 1910 Congress authorized the establishment of a postal savings bank system, whereby a certain percentage of the deposits are kept as a reserve fund in the treasury and a part invested in government securities. In 1909 the Payne—Aldrich Tariff Act was enacted. Although there was general expectation that duties would be lowered, but few important changes were made. The most important change was the placing of hides on the free list. Reciprocity as a general principle was abandoned and a policy of retaliation endorsed through the adoption of a maximum and minimum principle. There was much disappointment over the outcome of this tariff struggle, for the cost of living was increasing and monopolistic influences appeared to be more and more oppressive. The Democrats secured a majority in the House of Representatives in 1910, and passed several tariff bills for the reduction of rates, particularly on cotton and woolens. These bills however, were vetoed by President Taft. In January 111, President Taft arranged a reciprocity treaty with Canada which provided for free trade in certain food products and reduced duties on manufactured goods. Only after a struggle was this agreement endorsed by Congress. Canada, however, decided against it.

Authority was also given for the appointment of a tariff board which should collect data to assist the President in determining when a foreign country was entitled to the minimum scale of duties. Later this board was given
larger powers in the collection of information which it was hoped might be of service in framing new tariff laws. The board employed experts and published exhaustive reports on the cost of production of woolen and cotton goods. The Democrats, however, were disinclined to accept the assistance of this new branch of administrative machinery on the ground that it encroached upon the legislative policy of original taxation and framing tariff bills. In 1912 consequently the board went out of existence owing to lack of an appropriation for its support.

The Payne-Aldrich Tariff Act provided for a tax of 1 per cent on incomes above $5,000 of all corporations organized for profit. Congress also proposed a constitutional amendment whereby a general income tax might be imposed, and this was accepted by two-thirds of the States.

The growth of treasury receipts and expenditures since the Civil War until 1910 is shown in the following table (in millions of dollars):

Expenditures rapidly increased after the Spanish War. The colonial possessions imposed new burdens of protection and development upon the government; and there was a growing consciousness that this country must be in a position to take a larger place in world politics. The army, and more particularly the navy, made heavy draughts upon the treasury. The cost of the navy increased from $50,000,000 in 1900 to $123,000,000 in 1910. The government extended its activity in many new directions at home. Of special importance were the expenditures for the Department of Agriculture. Between 1900 and 1912 the sum appropriated for agricultural purposes was $90,000,000, or double the sum expended in the previous 60 years. New services were undertaken, as food and meat inspection, the reclamation of arid land and the extension of the forest service. Salaries increased with the growing cost of living; new public buildings were constructed, and the Census Bureau was made permanent. The cost of construction of the Panama Canal, amounting to nearly $300,000,000, was in part paid out of current taxation and in part by loans.

The Democrats came into power in 1913. Their first step was to enact a new tariff law, known as the Underwood tariff. Ad valorem rates were substituted for specific and compound duties; the free list was extended, including coal, leather, wood-pulp, lumber, agricultural implements and machinery, wood, and ultimately sugar. Rates on many manufactured products were lowered and simplified. It is difficult to determine the effect of this tariff either upon industry or fiscal receipts owing to the outbreak of the Great War in 1914 which disturbed so violently the normal commercial relationships of this country with Europe. Customs receipts fell from $319,000,000 in the fiscal year ending June 1913 to $210,000,000 in 1915 and $183,000,000 in 1918. The latter figure is the lowest reached for 20 years. The average ad valorem rate of duties on the total volume of dutiable goods has fallen from 50 per cent in 1899 to about 25 per cent; and on all goods, dutiable and free, from about 30 to less than 8 per cent.

The new Democratic Congress took advantage of the recent constitutional amendment authorizing the levying of an income tax, by including in the Tariff Law a tax upon net personal income in excess of $3,000 or $4,000 in case of a married couple. Surtaxes were also imposed which made the tax a progressive rate. In 1914 the yield was $28,000,000; in 1915, $41,000,000; and in 1916, $65,000,000. This was a disappointment to the supporters of the tax, but is accounted for partly because the law was not clear and the administration had not had experience in interpreting and enforcing its provisions. The yield of the corporation income tax was also not large, rising from $35,000,000 in 1913 to $57,000,000 in 1916.

The Democrats also determined to make a settlement of the banking difficulties which had hampered business for many years. In December 1913, the Federal Reserve Act was passed. This in part followed the plan proposed by the National Monetary Commission, previously referred to, but instead of creating one central bank provided for a central Federal Reserve Board with 12 regional banks. This new system was brought under the control of the government more strictly than was proposed in the original plan, by the requirement that the members of the Reserve Board be appointed by the President, and that the Secretary of the Treasury and the comptroller be ex-officio members of the board. The district banks hold the deposits of the government.

The European War (August 1914) quickly disturbed these new financial plans and it was necessary to add financial support to the war. Internal revenue duties were revised upward, 22 Oct. 1914, but the decline of customs duties and the falling off of duties from liquors owing to the spread of prohibition, more than offset the advances in duties. Increased expenditures were necessary in 1916 owing to troubles on the Mexican border and the need of providing for the new Shipping Board.

In his annual message, December 1915, President Wilson was finally aroused to the need of preparedness of this country and advocated an increase in the army and navy with corresponding financial legislation to meet these expenditures. The army appropriation bill consequently enacted called for an increase of more than $150,000,000; naval appropriations also were largely increased. Altogether the appropriations noted amounted to over $1,600,000,000, or more than $500,000,000 larger than in the previous year. The nation was started on the road of big finance.

President Wilson advocated a pay-as-you-go policy of taxation in preference to borrowing by the sale of bonds. While Congress did not follow the more specific recommendations of the President as to the kinds of taxes to be levied it did accept his general principle and enacted, on 9 Sept. 1916, a revenue measure designed to raise some $200,000,000. This
measure increased income tax rates, imposed a Federal inheritance tax and introduced the so-called War profits tax on munitions makers. The performance of Congress was not equal to the need of the treasury and Congress again had to take up the question of further income. It increased the inheritance tax and introduced, from foreign financing, a new tax on excess profits of corporations and partnerships. These new taxes were calculated to raise about $250,000,000. In addition authority was given to make new loans of over $600,000,000. Thus the situation seemed when Congress adjourned in March 1917.

The next month saw the declaration of war, with the necessity of financial operations only paralleled by the tremendous undertakings of Europe. There was much discussion as to whether the enormous expenditures should be met by taxation or by borrowing. There were two opposing opinions. One argued that the material for the war must be furnished by the existing population and that consequently the real cost of the war must at once be sustained. The other held that it was impracticable to take all the existing income by taxation without imperiling future production. A compromise was reached. Roughly a program of one-third taxation and two-thirds borrowing was adopted.

Income taxes were increased in October 1917 and higher super-taxes were imposed, the limit of exemption was lowered and the excess profits tax was increased upon a graduated scale. The result was seen in 1918 when the ordinary receipts were four billions ($4,179,000,000), or approximately four times that of the pre-war period. Of this total, customs duties produced an insignificant amount, $183,000,000; miscellaneous sources gave $300,000,000, and internal revenue taxes, $3,695,000,000. In this latter group, however, the new taxes on income and profits furnished more than three-fourths, or $2,839,000,000.

But the taxes of 1917, revolutionary as they were, were not sufficient for governmental needs. In the summer of 1918 Congress began to call a bill to raise $8,000,000,000, but after the armistice in November the goal was set at $6,000,000,000. The chief increases were again in taxes on income, both of individuals and corporations, and on excess profits. The adoption of the constitutional amendment in favor of prohibition reduced the amount expected from the tax on beverages. Taxes on transportation, including railways, telephones and telegraphs, previously introduced in 1917, were continued and luxury taxes were added. But chief reliance was placed on the income and excess profits taxes. The act of February 1919 expects to raise more than three-fourths of the $6,000,000,000 from this source. For residents the normal rate is 6 per cent on the first $4,000 of net income above exemptions and 12 per cent on the remainder. In addition there are progressive surtaxes, reaching 65 per cent on incomes over a million dollars. The exemptions established in the act of 1918, $1,000 for single persons and $2,000 for married persons and heads of families remained the same. The income tax as applied to corporations was expected to yield over $3,000,000,000 or about one-third of this total income.

In addition to taxation the government has made enormous loans. In 1917 and 1918 four Liberty loans were placed as follows:

<table>
<thead>
<tr>
<th>Issue</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>First 4%</td>
<td>$2,000,000,000</td>

</tr>
</tbody>
</table>

The rate of interest has gradually increased and for the Fifth Victory Loan (April 1919) the rate was advanced to 4½ per cent. The issues vary in tax-exempt privileges, the first being practically free from all taxes, while the others, though free from the normal income tax, are sometimes taxable for super-taxes and excess profits taxes. In placing these loans an extraordinary effort was made to give them wide distribution. Allotments were made to the different sections, States and towns, the bonds were issued in small denominations and popular appeals were made to incite sacrifice and patriotic support. In this huge undertaking the Federal Reserve banks played an important part. Member banks have been able to rediscout loans secured by Liberty bonds.

Considering the enormous task suddenly imposed upon the government there is reason for satisfaction in the results accomplished. The government, however, has turned upon new fields of finance which will require new methods of financial operation. It is believed that peace budgets in the immediate future will not be less than $4,000,000,000 or four times that previously maintained.

Since 1861 there have been 24 secretaries of the treasury; the most distinguished among these are as follows: Chase, notwithstanding his lack of experience with fiscal affairs, displayed political shrewdness, devotion and integrity at a time when ordinary methods of finance had to be laid aside; Fessenden, his successor, during the closing months of the war, inspired confidence; McCullough earnestly contended for an early resumption of specie payments and the retirement of the greenbacks; Boutwell in Grant’s first administration carried through the refunding of the debt; Bristow in Grant’s second administration attacked corruption in the internal revenue service and placed new insistence upon resumption; Sherman left a brilliant record in making resumption successful notwithstanding the opposing forces of inflation; Manning in Cleveland’s first term strongly urged a moderation of the tariff and the repeal of the Bland Act; Carlisle in Cleveland’s second administration upheld the credit of the government in the issue of bonds; Gage executed the provisions of the Currency Act of 1900; Shaw reorganized the details of the customs administration; and McAdoo showed energy and resourcefulness in managing the enormous loans of 1917 and 1918. As a whole, the treasury administration has been free from scandal. See also BANKS AND BANKING; MONY.

DaviRICH DEWEY,

Massachusetts Institute of Technology.
37. RECONSTRUCTION. With the surrender of the Southern armies and the collapse of the Confederate government all organized resistance to the authority of the United States was at an end, but a problem second only to that of suppressing the insurrection now confronted the nation. This was the question of the restoration of the late insurrectionary States to their normal relations in the Union and the determination of the political status of both those who had borne arms against the United States and those who had been made free by the results of the war. It was a great political and social problem, involving, on the one hand, the political reconstruction or reconstruction of the Southern States which had carried on the war against the Union and, on the other, the investment of the freedmen with the rights and privileges of citizenship and the protection of them in the enjoyment of those rights and privileges. The ideas and traditions of constitutional liberty in the United States made the problem especially difficult. In Europe indefinite military occupation would have been the solution of the problem so far as it concerned a republic under such conditions as it might prescribe. Other views of the status of the Southern States were but modifications of these three. It is to be noted that according to Lincoln's view the whole task of reconstruction was an executive problem, while according to the view finally reached by Congress it was a legislative problem, being derived from the constitutional provision which makes it the duty of the United States to guarantee to each State a republican form of government—a duty which had been interpreted by the Supreme Court as devolving upon the legislative branch. This difference of view led to important consequences and greatly complicated the whole process of reconstruction.

Executive Reconstruction.—As early as 1862 large portions of Arkansas, Louisiana and Tennessee having been occupied by the military forces of the United States, President Lincoln proceeded to admit these Districts through officers called "military governors" who were vested with rather vague and undefined powers. After the fall of Gettysburg and Vicksburg the President, foreseeing the ultimate defeat of the Confederate armies, gave his attention to the working out of a more definite and systematic plan of reconstruction which could be applied to all the Southern States. Accordingly in his annual message to Congress in December 1863, he announced his plan which included an offer of amnesty to all persons who had served the Confederacy, except certain classes of men who had held high military or civil offices under the Confederate régime or who had resigned offices under the United States and all well-defined theories were enunciated. One of these was the view held by President Lincoln and his supporters that the act of rebellion in each State was the act of combinations of disloyal persons who had unlawfully subverted the State governments, that the existence of the States themselves, he held, was not affected by the disloyal acts of their inhabitants although he admitted that as a result of rebellion the States were out of their "proper practical relations" with the Union. In his opinion, the problem of reconstruction consisted simply in placing the loyal element of each State in control of the government after which its normal relations with the Union could be resumed. By means of the executive patron those who had engaged in rebellion could, upon promise of future loyalty, be restored to their rights and allowed to join with the loyal element in the re-establishment of the State government. This process would perhaps require the use of the military arm of the government but the intervention of Congress would not be necessary. Opposed to this lenient view was that of the more extreme Radicals like Sumner and Stevens. According to their view the Southern States by act of rebellion had destroyed their corporate existence as self-governing commonwealths and should be held as conquered provinces or governed indefinitely as Territorial dependencies under the plenary power of Congress. A third and somewhat intermediate view was that finally adopted by Congress, namely, that the Southern States as a result of rebellion had "deprived themselves of all civil government" and had forfeited their rights of self-government. They continued to exist, but rather as disorganized communities, subject to the paramount authority of Congress to restore them to their right relations under such conditions as it might prescribe. Other views of the status of the Southern States were but modifications of these three. It is to be noted that according to Lincoln's view the whole task of reconstruction was an executive problem, while according to the view finally reached by Congress it was a legislative problem, being derived from the constitutional provision which makes it the duty of the United States to guarantee to each State a republican form of government—a duty which had been interpreted by the Supreme Court as devolving upon the legislative branch. This difference of view led to important consequences and greatly complicated the whole process of reconstruction.
the executive method by the passage of a joint resolution which prohibited the counting of the electoral vote of any State that had passed an ordinance of secession. A breach between the President and Congress was the result, but had Mr. Lincoln lived it is highly probable that owing to his tact and influence with Congress the difficulties would have been settled in a manner satisfactory to Congress and to the great advantage of the Southern States. After the assassination of Mr. Lincoln, the Vice-President, Andrew Johnson, a man of far more aggressive and obstinate disposition, took up his policy without material change and carried it through only to have it all rejected by Congress. On 29 May 1865, President Johnson issued a proclamation of amnesty designed for the benefit of all who had not taken advantage of Mr. Lincoln's offer of 1863. It resembled Mr. Lincoln's proclamation in all essential particulars except that it excluded a large number of persons from the privileges of amnesty among them all owners of $20,000 worth of property who had voluntarily enlisted in the Confederate service. The exceptions were classes were allowed to make special application to the President, who agreed to extend such clemency as appeared to be consistent with the facts of the case and the peace and dignity of the United States. By subsequent proclamations President Johnson appointed "provisional governors" for North Carolina, Georgia, Mississippi, Alabama, South Carolina and Florida, the reconstruction of the other Southern States to be considered as not completed. These officials were directed to call conventions in their respective States for the purpose of amending their old constitutions so as to adapt them to the new conditions created by the results of the war, after which they were to be restored to their normal relations with the Union. Before the end of the year conventions had been held in all these States except Texas and they had adopted constitutions providing for an amendment to the Federal Constitution. Moreover, they had held elections, chosen State officers and representatives in Congress and the legislatures had elected United States senators.

When, therefore, Congress met in December 1865 for the first time since the close of the war, the President took great satisfaction in informing that body that all the late insurrectionary States except Texas, whose convention was not to meet until 1 March of the following year, had been reconstructed and were ready to resume their constitutional places in the Union. Congress, however, ignored the whole scheme of reconstruction which Lincoln and Johnson had carried out, refused to admit the senators and representatives from the Southern States to seats in Congress and appointed a joint committee of 15 members to inquire into the condition of these States and report whether any of them were entitled to representation in Congress. One of the chief reasons which led Congress to veto the executive policy was the drastic character of the police legislation which some of these States had enacted in the summer and autumn of 1865 for the purpose, it was alleged, of keeping the negroes in a condition of involuntary servitude if not of actual slavery. The offense of vagrancy was so defined that few seemed inevitable, but those who were unable to pay the fines imposed upon them were to be "sold out," their former masters being given the preference as lessees. A harsh and unnecessary apprentice system for lending out colored minors was adopted. In Mississippi negroes were prohibited from renting or leasing land in incorporated towns and in most of the Southern States they were denied the right to give testimony in the courts except in cases in which negroes were parties. The demoralization of the negro race in 1865 was undoubtedly such as required stringent police measures to prevent crime and pauperism; but in singling out the black race for special punishment the Southern legislatures greatly offended the sentiment of the North. In April 1866, Texas having complied with the requirements of the executive scheme of reconstruction, the President issued a proclamation officially declaring that State to be re-admitted. In June the Reconstruction Committee made its report declaring that the Southern State governments established under the executive auspices were illegal (although they had been regarded as good enough to ratify the 13th Amendment), that Congress alone had authority to reconstruct these governments, and that guarantees of future security should be required as a condition of restoration to the Union. The report was regarded as good enough to ratify the 13th Amendment, that Congress alone had authority to reconstruct these governments, and that guarantees of future security should be required as a condition of restoration to the Union. The report was regarded as good enough to ratify the 13th Amendment, that Congress alone had authority to reconstruct these governments, and that guarantees of future security should be required as a condition of restoration to the Union. The report was regarded as good enough to ratify the 13th Amendment. The report was regarded as good enough to ratify the 13th Amendment.

Congressional Reconstruction. — When Congress met in December 1865 an effort was made to impeach the President (see United States — American Civil War). The so-called "Tenure of Office Act" was passed to limit his power of removal. His power, also, as commander-in-chief of the army and his power of clemency were abridged and a law was passed requiring the new Constitution to be ratified not only in Congress but also in the States by conventions of the people. In February Congress passed in spite of the President's veto the first of the Reconstruction Acts for the more efficient government of the late insurrectionary States. This act grouped the said States into five military districts each of which was to be placed under the command of an army officer who was charged with the maintenance of order and the protection of property. The State governments were left intact but were declared to be provisional only and subject to the paramount authority of the United States. By a supplementary act of 19 March, likewise passed over the President's veto, the military commanders were directed to cause to be made a registration of the qualified voters without regard to race or color and to call a convention, if the majority of the voters were in favor of one, for the purpose of adopting a new constitution. When the constitution should be approved by Congress the State should be readmitted to representation in both houses of the National legislature. Military commanders were promptly appointed for the different districts and with adequate forces they
UNITED STATES—RECONSTRUCTION (37)

looked possession and proceeded to govern the inhabitants according to the forms of military law. Arbitrary arrests were common, trial by jury was superseded by trial by military commission and various orders having the force of law were issued for the regulation of the conduct of the citizens. The new colored voters were registered, many of the old white voters were excluded for participation in the rebellion, conventions were chosen in all the Southern States by the new electorate, and these conventions had the established negro suffrage and disqualifying large numbers of white persons. In all the States except Mississippi, Texas and Virginia these constitutions were promptly ratified by the new electors and in June they were re-admitted to representation in Congress. In Mississippi, where a constitution containing several provisions of a preceptive character had been framed, the whites after a determined campaign succeeded in defeating it at the polls. In Texas and Virginia, where likewise obnoxious provisions had been inserted in the constitutions, the reconstructionists were induced to adopt them by threats of force. These three States, therefore, continued under military rule. In the meantime the legislature of Georgia having excluded the negro members-elect from their seats, the United States Senate refused to seat electors from those States to seats in Congress. Consequently at the time of the accession of President Grant four of the Southern States were still unrepresented in the constitutional positions in the Union. He was induced to recommend to Congress the re-submission of the constitutions of Mississippi and Virginia to the voters in such a way as to enable them to vote separately upon the obnoxious provisions. Congress so directed; the constitutions were resubmitted, and were ratified without the objectionable provisions. By the same act Congress directed the submission of the Texas constitution to the people and it was duly ratified. These three States were punished for their treason by the addition of an additional condition precedent to restoration, namely, the ratification of the 15th Amendment. Early in 1870, having complied with this additional requirement, they were readmitted to their seats in Congress. Congress next restored to their full positions in the Union. Finally after having been twice reconstructed Georgia complied with the new conditions imposed by Congress and in June was likewise restored to her place under the Constitution. The military governments now gave way to the State governments, Federal interference was withdrawn and reconstruction technically at least completed.

Civil and Political Rights for Freedmen.

—Slavery having been abolished by the 13th Amendment, adopted in 1865, the investment of the negro with civil rights followed as a necessary incident of his new status. Some of the Southern legislatures in 1865 passed laws denying the freedmen the right to own real estate in some cases and to give testimony in the courts and having otherwise abridged their civil rights, Congress in April 1866 passed over the President's veto the Civil Rights Act which conferred upon all persons of color the status of citizenship and placed them upon an equality with white citizens in the making and enforcing of contracts, in suing and giving testimony in the courts, in acquiring, holding and conveying real as well as personal property and in the enjoyment of equal protection of the laws for the security of person and property. The United States courts were given jurisdiction of cases arising under the act and the President was empowered to use the army and navy to enforce it. Foreseeing the possible return to power of those opposed to civil rights for the negro and the consequent repeal of the act, Congress immediately proposed the 14th Amendment, embodying the principles of the Civil Rights Act. To incorporate it in the Constitution would have the effect of placing the civil rights of the negro beyond the reach of any hostile Congress. Ratification of this amendment by the Southern States was made a condition precedent to their restoration to the Union. Finally, in July 1868, Congress declared that the amendment had been ratified by the requisite number of States and was, therefore, proclaimed a part of the Constitution. The amendment declared that all persons born or naturalized in the United States and subject to the jurisdiction thereof are citizens of the United States and of the State in which they reside; provided for a reduction of the representation in Congress of any State that should deny the negro the right of suffrage; and declared that all persons born in the States of Texas, Mississippi, Virginia and Georgia, who still remained under military government and without representation in Congress. By March 1870 the requisite number of States had ratified the amendment and it was proclaimed a part of the fundamental law. Although this important amendment did not directly confer the suffrage upon the negro it did confer upon him an exemption from discrimination upon the part of any State in fixing the qualifications for voting. Having secured full civil and political rights for colored citizens, the Republican leaders now undertook, by an act of March 1875, to secure social equality for all colored persons in hotels, public conveyances, theatres and other places of public amusement, but the Supreme Court held the act void as beyond the power of Congress.

The Freedmen's Bureau.—One of the agencies through which the process of reconstruction was worked out was the Freedmen's Bureau, first established in March 1865 and placed under the superintendence of the President. In general, its purpose was to aid and advise the large number of freedmen who were demoralized and made helpless as a result
of sudden liberation. During the last years of the war thousands of blacks left the plantations and gathered about the camps or followed in the wake of the Federal armies. To provide for this was a difficult problem which every commander in the South had to meet. At first appeals were made to philanthropic persons of the North for funds with which to support this class, and generous responses followed, but as the end of the war approached the number of negro "contrabands" increased until it was found impossible to rely wholly upon the support of charitable relief. Being released from the restraints of slavery, many freedmen made good use of their liberty to quit work and wander about the country only to find themselves, after a brief season, in a state of destitution. Others who continued to labor on the farms of their former masters were sometimes taken advantage of in regard to labor contracts and were denied the rights of free men which the results of the war had brought them. The bureau undertook to provide hospitals and medical relief for the sick and disabled; it distributed quantities of food to the destitute; it undertook to prevent the infringement of the civil rights of freedmen; it provided special courts for the trial of accused freedmen in all cases in which the State excluded the testimony of colored witnesses; it examined and approved their labor contracts; it circulated the emancipation proclamation among the blacks of the remote districts; it instructed them as to their new duties and rights; it urged upon them to labo and impressed upon them the sacredness of the marriage contract; it established schools and supplied teachers to such communities as wished them and in various other ways undertook to aid the unfortunate blacks whom emancipation had left to shift for themselves. The officials of the bureau also used their influence with the credulous blacks to induce them to enter into labor contracts with planters and thus performed a service not without value to the white race.

The organization of the bureau was quite elaborate. Its head was a commissioner, this office being held by Gen. O. O. Howard (q.v.). Below him there was an agent for each State and a number of sub-commissioners, each in charge of a particular district of the State. In every locality was stationed an agent who acquainted the freedmen with the orders of the bureau, distributed the rations and performed various other duties. The law as passed in 1865 made no appropriation for the support of the bureau, but its income from the sale of certain confiscated property and the rent of abandoned lands was sufficient to meet expenses. In July 1866 a new act was passed and the operations of the bureau largely extended. It was not finally withdrawn from all the Southern States until 1872. Although the bureau accomplished some good it did not promote the harmonious relations between the two races which it was expected to do. The agents of the bureau were mostly subordinate military officers and a considerable number of them were not efficient and unscrupulous. Too often able-bodied freedmen were encouraged in their idle habits by the distribution of government rations, while in not a few cases they were led to believe that the lands were to be distributed among them. Likewise it frequently happened that the zeal of the bureau officials for the enforcement of exaggerated rights led to violent conflicts between white citizens and negroes which were at the disposal of the bureau.

The "Carpet-Bag" régime.—The reconstruction acts by enfranchising the negroes and disqualifying large numbers of the more influential whites made it possible for the blacks to get possession of the governments in most of the Southern States and to rule them in a most ignorant and extravagant manner. They were made use of by unprincipled adventurers from the North who flocked to the South in considerable numbers after the close of the war, some to engage in the profitable industry of cotton planting, others to fill the offices from which the more prominent Southern whites were excluded. These Northern immigrants came to be called "carpet-baggers" by the native whites, in allusion to the popular assertion that all their worldly effects were carried in a carpet-bag. By no means all of the Northern men who large quantities of南方 negroes, and unscrupulous adventurers bent upon plunder, but they all allied themselves on the side of the negro in political matters, thus increasing the bitterness of race antagonism. A few native Southerners—who they were called—also allied themselves politically with the Northern men and negroes for the purpose of sharing in the offices. Both these classes of whites were bitterly hated by the native Southerners who resented the degradation of power by strangers and others who had little substantial interest in the State. The influence of the carpet-bag class over the negroes was at first very great. They organized the freedmen into political clubs, instructed them in the art of voting and made use of them to further their own political ambitions. The carpet-baggers secured the nominations to the more important offices and were easily elected by large black majorities. But the negroes were not content to see all the offices held by their white allies, and their ambition was frequently too great to be ignored. Consequently many of the important offices came to be held by ignorant and unpriced men. A considerable portion of these were ignorant, some of whom were unable to read or write and all of whom were the pliant dupes of unscrupulous Northern men. With the State and local governments controlled by ignorant negroes and designing white men, an era of extravagance, misrule and corruption set in which in some instances amounted to outright robbery and plunder. Long and frequent sessions of the legislature were held for the purpose of enabling themselves large per diem allowances. Old laws were ruthlessly repealed and replaced by bulky statutes, many of which bore the ear marks of animosity and oppression. Counties were
rechristened with names full of offense to Southern whites. Laws favoring social equality were passed. Public school systems on an extravagant scale for the children of both races were established and taught by Northern teachers. Offices were greatly multiplied—many of them were sinecures—for the benefit of good Republicans. Gigantic schemes of public improvement were undertaken, most of which were marked by frauds and extravagance. The rate of taxation, occasioned only out of all proportion to the ability of the people to pay in their then impoverished condition resulting from four years of destructive war. In Mississippi this rate was increased from one mill on the dollar in 1868 to 14 mills in 1871, and the inability of the people to pay resulted in the confiscation of one-fifth of the land of the State. Large debts were incurred for projected improvements, especially in Louisiana and South Carolina, where a wholesale system of plunder was carried out by the reconstructing governments. In the latter State the public debt was increased from $5,000,000 in 1868 to nearly $20,000,000 in 1874. The tax levy was increased year by year, and taxable property had declined 100 per cent. Large gratuities were voted State officials, the State capitol was furnished after the manner of a European palace and vast sums were squandered in reckless, sumptuous extravagance.

Under these conditions the taxpayers grew restless and disorders began to occur here and there. They naturally chafed under the rule of their former slaves who were controlled by strangers possessing no permanent interest in the South. Wherever the negroes were in the majority they carried the elections and controlled the government. The extravagance and corruption of their rule aroused the whites to adopt concerted measures for countering the political power of the negroes by terrifying them and keeping them away from the polls at election times. This was effectively accomplished by the organization of secret bands, the Ku Klux Klan, said to have originated in Giles County, Tenn., in 1866. At first it was intended to serve as a disciplinary organization for scaring the superstitious blacks into good behavior, but in time it grew into a political power with its resulting immobility and corruption the purposes of the Ku Klux Klan were changed to meet the new situation. Its jurisdiction was styled the "Invisible Empire"; the chief functionary was the Grand Wizard; each State was a realm ruled over by a Grand Dragon. Then there were Dominions, Provinces and Districts in addition to the Grand Titan, Grand Cyclops, Ghouls, etc. The organization was elaborate and mysterious, the public improvement.

The Undoing of Reconstruction.—For a time the reconstructionists in the South were able, with the aid of Federal troops, to enforce their power, but as the extravagance and corruption of their rule increased the discontent of the native whites, who were the chief sufferers, became more general. Organized intimidation and ballot-box frauds were openly committed for the purpose of defeating the Republicans in the elections. Race collisions and election riots were of frequent occurrence, and in all of them the blacks were the chief sufferers. In several States rival governments were set up and civil war threatened. Negro militia companies were organized, but they were ineffective and served only to inflame the passions of the whites and increase their determination to overthrow the Republican government by violence. The government at Washington showed less readiness to call out troops to interfere at the elections and a growing disposition to leave the Southern State governments to take care of themselves. Under these circumstances the Democrats regained control of North Carolina, Tennessee, Texas, Georgia and Virginia. Meantime the progress of the Southern movement was aided
by the wholesale removal by Congress of the political disabilities of the Southern whites and the division of the Southern Republicans into radical and conservative wings, the latter of which joined with the Democratic organizations. In 1874 Alabama and Arkansas were carried by the carpet-baggers and the carpet-bag governments; in those States came to an end. In the following year, after a remarkable campaign, characterized by violence, riots and wholesale intimidation, Mississippi was carried by the Democrats, who speedily got rid of three of the State officers, including the governor, by means of impeachment. In the following year the "Mississippi plan" was employed with success in the three remaining Southern States which were still "unreclaimed," namely, Louisiana, Texas and Florida. Solid Democratic delegations were now sent to Washington, most of the carpet-baggers returned to the North and the Southern whites were left in control. The subsequent disfranchisement of the negro race in Mississippi, Louisiana, South Carolina, Alabama, North Carolina and Virginia and the judicial approval by the Supreme Court of these disfranchising constitutions ensured the permanent rule of the whites and thus marked the final and complete undoing of reconstruction so far as its political effects were concerned.

JAMES WILFORD GARNER, Professor of Political Science, University of Illinois.

38. THE THIRTEENTH, FOURTEENTH AND FIFTEENTH AMENDMENTS TO THE CONSTITUTION. These three amendments to the Constitution are more familiarly known as the War Amendments. This designation is not without justification in their origin. The difficulties involved in amending the Constitution are so great that but for the conflict with which it was faced Congress and these amendments are associated, it is doubtful if the principles which they embody could ever have been incorporated into it. These amending articles primarily concerned the negro race and their adoption marked the triumph of the people from slavery to citizenship. They meant that within a period of five years more had been accomplished than had been by half a century of polemical discussion. They embodied the results of such a revolution of public sentiment as only war could have effected. The emancipation of the American negro was never a more remote probability than at the outbreak of the Civil War. Almost the entire time of the last session of the 36th Congress, 3 Dec. 1860 to 2 March 1861, was devoted to the consideration of various measures calculated to compromise sectional differences. Every plan proposed had as its basis an effort more specifically to guarantee against outside interference the institution of slavery in the States wherein it then existed. On 11 Feb. 1861, without a dissenting vote the House agreed to a resolution of Mr. Sherman of Ohio which indicated the spirit of that body. It declared that neither Congress nor the people of the non-slave-holding States had any right to interfere with the institution in any State in which it was established. A few days later the House went much further than this, and by a vote of 133 to 65 passed the Corwin Resolution, proposing an amendment to the Constitution. This provided that the Constitution should never be so amended as to empower Congress in any way to interfere with slavery in the States. It is significant of the sentiment which then pervaded the country that this resolution secured the support of such men as Charles Francis Adams, Schuyler Colfax, Henry Winter Davis, Justin S. Morrill and John Sherman. On the last day of the session, 2 March it received the constitutional majority in the Senate and was duly proposed to the country, as the Thirteenth Amendment. Few more striking contrasts are presented in the history of the development of the Constitution than that between the amendment with which Congress would thus have commemorated the opening of the great conflict and the one which marked its close. This resolution was ratified by Ohio, Maryland and Illinois, but its fate possesses scant interest now, if indeed it did even at that time. Men soon realized that the hour of compromise had passed—that the great issues which had so long disturbed the repose of the country had been removed from the halls of Congress and submitted to the arbitration of the sword.

Mr. Lincoln's attitude at this time was thoroughly in accord with that of Congress. In his inaugural address he declared that he had no purpose, inclination or right to interfere with slavery in the States. To emphasize his position he quoted from the platform on which he had been elected and also declared that as in his opinion the proposed Corwin amendment was already "implied constitutional law" he had no objection to its being made express and irrevocable. Thus in these declarations Mr. Lincoln gave expression to his most earnest convictions. The fact that
within two years after he uttered them he felt compelled, "upon military necessity," to issue the Emancipation Proclamation affords some idea of the intensity of the events which made for the first of the war amendments. When, on 1 Jan. 1863, Mr. Lincoln followed his provisional proclamation of the preceding September by one unconditional in its terms, no one knew better than he that it was literally no more than it purported to be on its face—a war measure, pure and simple. The Emancipation Proclamation designated certain States and parts of States within the field of military operations as "in rebellion," and declared free all slaves within such districts. It advised the slaves so emancipated to labor for wages and to refrain from acts of violence and announced that they would be received into the armed service of the government. Such a proclamation was mere brutum fulmen without military force behind it. It meant no more to the slaves in territory not actually occupied by the Union army, so far as their status at that time was concerned, than a piece of blank paper. Its immediate effectiveness anywhere was dependent upon the force of arms, the perpetuity of its declarations upon the ultimate outcome of war. The very limitations which its own terms placed upon its geographic application carried with them the necessity of a constitutional ratification in order to render the principle enunciated both general and permanent. From the date of that document another amendment to the Constitution was contingent only upon the triumph of Union arms.

The Thirteenth Amendment.—It is one of the singular turns of the history of anti-slavery agitation that although New England had been so long identified with the abolition movement, it should fall to the lot of a man from a Western slave State to formulate and introduce the amendment which was to write into the Constitution the highest lesson of Garrison and Phillips. It was Mr. Henderson of Missouri, who on 11 Jan. 1864 introduced in the Senate the joint resolution which became the 13th Amendment. This resolution, so far as it can be said to have been adopted by the House, passed the Senate on 8 April by a vote of 38 to 6. Abolition sentiment had not gained ground rapidly in Congress. That body had put itself on record many times as carrying on the war for the sole purpose of preserving the Union. As late as 22 and 25 July 1861, after the battle of Bull Run, the Crittenden resolutions declared that the war was not waged "for the purpose of overthrowing or interfering with the rights or established institutions" of the Southern States. These resolutions had been agreed to in the House with but two negative votes and in the Senate but five were recorded against them. There were also many members who realized that slavery was doomed, but were unwilling formally to put themselves on record as co-operating in its destruction. It was not surprising then that the Henderson resolution was rejected when it came up in the House on 13 June. It was proposed therein that the Constitution, and the election of 1864 determined beyond all question that the country endorsed Mr. Lincoln's administration. This meant more than mere approval of his course in conducting the war. The Emancipation Proclamation and an amendment to give it effect upon the restoration of peace were just as truly issues of that election as was any other feature of the administration. From the first the President followed the example of the Henderson resolution and he was quick to take advantage of the result of the election in urging upon the House the necessity of its passage. This he did in his annual message of 6 Dec. 1864. He called the attention of the House to the result of the recent contest, and told them that it meant the passage of the measure by the next Congress, if it failed in this. He declared the election to be "the voice of the people now, for the first time heard upon the question" at issue. We need not consider which most influenced their action, Mr. Lincoln's message or the determination to accept an accomplished fact. On 31 Jan. 1865, by a vote of 121 to 24, the House finally passed the resolution as it came from the Senate: Section 1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction. Section 2. Congress shall have power to enforce this article by appropriate legislation. On 18 Dec. 1865, the 13th Amendment was declared a part of the Constitution.

The Fourteenth Amendment.—On the first day of the memorable 39th Congress, 4 Dec. 1865, Mr. Stevens submitted a resolution providing for a joint committee of 15 to inquire into the affairs of "the so-called Confederate States." The resolution created what became known as the Reconstruction Committee. To this committee was referred every bill, resolution or petition bearing upon any phase of the relations between the Southern States and the general government, or involving consideration of the future status of the negro. The only result of their labors in which we are interested was submitted to both Houses on 30 April 1866, as their plan for the readmission of the Southern States. This consisted of three features, embraced in a joint resolution, proposing a constitutional amendment and two bills. The three combined did not differ greatly from the 14th Amendment as finally adopted. The first section of the joint resolution did not contain a definition of national citizenship. In other respects it was the same as that adopted. Its second section, reducing representation for suffrage abridgment, was adopted substantially as reported. Section 3 deprived of the right to vote for electors or representatives until 4 July 1870, all those in any way identified with the "late insurrection." One of the bills reported as part of this plan provided for rendering ineligible to office certain proscribed classes of men in the Southern States. This bill formed the basis of the third section of the amendment as adopted, in lieu of the one reported by the committee. The fourth section was similar to the fourth section of the amendment, except that it did not contain the provision as to the validity of the public debt. The first of the bills reported provided that when the amendment was adopted, it became part of the Constitution, and been ratified by "any State lately in insurrection," the senators and representatives of the State "may[,]" he admitted into Congress as such. This bill did not pass either House, nor did Congress com-
mit itself in any way to the policy suggested by it,—that of admitting the Southern States upon their ratification of the proposed amendment. The House passed this joint resolution just as it came from the committee, the Senate making the amendments outlined above. These modifications brought the resolution to the shape in which it now stands as the 14th Amendment. The Senate passed it 8 June 1866 by a vote of 33 to 11. On 13 June the House agreed to the Senate amendments out of 138 to 36. A careful study in detail of the ratification of this amendment would take us further afield than we can go, for here the history of the amendments and that of Reconstruction so blend as to become difficult of dissection. The House would be opened up the whole question of the rejection of the amendment by the Southern States, save Tennessee, and of the effect of such rejection upon the subsequent action of Congress toward the States in the matter of negro suffrage and the last amendment. In the process of Reconstruction ratification became, in specific terms, a condition precedent to the readmission of the Southern States, and was declared accomplished in Seward's proclamations of 20 and 28 July 1868.

THE FOURTEENTH AMENDMENT

Section 1. All persons born or naturalised in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.

Section 2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for President and Vice President of the United States, representatives in Congress, the executive and judicial officers of a State, or the members of the Legislature thereof, is denied to any of the male inhabitants of such State, being 21 years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion, or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens bearing arms bears to the number of male citizens 21 years of age in such State.

Section 3. No person shall be a senator or representative in Congress, or elector of President and Vice President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath, as a member of Congress, or as an officer of the United States, or of a member of any State legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof. But Congress may, by a two-thirds vote of each House, remove such disability.

Section 4. The validity of the public debt of the United States, authorised by law, including debts incurred for pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave, but all such debts, obligations, and claims shall be held illegal and void.

Section 5. The Congress shall have power to enforce, by appropriate legislation, the provisions of this article.

The Fifteenth Amendment.—Propositions having negro suffrage as an end were almost as numerous during this period as were similar efforts toward an emancipation measure prior to 1865. Indeed, one of the most frequently suggested means of enforcing the 13th Amendment was by conferring the vote upon the freedmen. Limitations of space render it impossible to trace here the evolution of the 15th Amendment through these numerous bills and resolutions. It has been noticed above that the author of the 13th Amendment was a senator from a Western slave State,—Mr. Henderson of Missouri. It is even more singular that the same man should also have introduced the resolution which brought the 13th. Early in the first session of the 40th Congress, 7 March 1867, Mr. Henderson introduced a resolution proposing an amendment to the Constitution which would prohibit a State from abridging the right of any person to vote held on account of race, color, or previous condition. The 40th Congress had three sessions, and the Henderson resolution slept in the Judiciary Committee until well along toward the close of the third. It was reported by Senator Stewart, on 15 Jan. 1869, amended to read as follows:

"The right of citizens of the United States to vote and hold office shall not be denied or abridged by the United States, or any State, on account of race, color, or previous condition of servitude."

The Senate passed this resolution on 17 Feb. The House amended it by striking out the words "by the United States," which would have left Congress with absolute control over negro suffrage. It also added a condition upon which suffrage abridgment was denied the States those of nativity, property and creed. The House had just refused to accept from the Senate such an amendment to a resolution of its own. Its action now, in tackling this on to the Senate measure, showed an utter absence of anything like agreement between the two bodies as to the precise form of the amendment. The situation finally yielded to considerations of party expediency, and the House acceded to the Senate's request for a conference. This resulted in a recommendation that the House recede from its amendments and agree to the Senate resolution. The latter, however, was to be amended by striking out the words "and hold office." Here was another important compromise to be engrafted on the Constitution, whereby was secured the 15th Amendment as we have it to-day.

THE FIFTEENTH AMENDMENT

Section 1. The right of citizens of the United States to vote shall not be denied or abridged by the United States, or by any State, on account of race, color, or previous condition of servitude.

Section 2. The Congress shall have power to enforce this article by appropriate legislation.

Under the operation of the previous question the House was able to secure an agreement to this report as soon as submitted, 25 February. In the Senate, however, serious opposition developed among the friends of the measure. It was claimed that too great a sacrifice to expediency had been made in striking out the words "and hold office," and thus reducing the scope of the amendment to the matter of suffrage alone. On this account Mr. Edmunds, one of the managers at the conference, had refused to sign the report to the Senate and opposed the amended measure on the floor of the Senate. The session was drawing to a close, and perhaps there was something in the taunt of the minority that the dominant party dare not trust the measure to the succeeding Congress. Though markedly earnest, the debate was not protracted. The Senate passed the resolution on 26 February. On 3
March Congress adjourned. In the unusual form of a special message from the President, communicating with the most notice of the necessity against all the legislation enacted by Congress during the eventful years covering the period of Congressional Reconstruction. It was urged with greater force against the validity of the action by which the passage and adoption of these amendments were secured. Against the 13th was brought the charge that West Virginia, whose ratification was declared necessary, had been created a State in disregard of the letter and spirit of the Constitution. The question of the right of a State to rescind a ratification once given was raised in the case of the 14th and 15th, as also the constitutionality of the entire plan of Congressional Reconstruction. It was not long, however, before the minority realized the necessity and wisdom of accepting the amendments as a matter of public policy. By February 1872 both parties in the House had gone on record as formally recognizing their validity, and the question ceased to possess more than a mere academic interest. The energy and earnestness of the Reconstruction statesmen were not exhausted with the adoption of the amendments. Immediately following the ratification of each act they set to work to enforce its provisions with the same determination which had characterized their efforts to secure its incorporation into the organic law. Various acts, some directed against peonage in New Mexico, others against the kidnapping of negro children, were passed to render impossible the placing or retaining of anyone in a state of involuntary servitude. The principal act for enforcing the 13th Amendment clearly anticipated important provisions of the succeeding amendment. This was the Civil Rights Bill of 9 April 1866. The emancipating amendment left the late slaves in an anomalous position, and to meet the difficulties of their situation was the prime object of this elaborate measure. It declared all persons born in the United States, not subject to a foreign power, except Indians not taxed, citizens of the United States. Here we have a near approach to the definition of national citizenship contained in the first section of the 14th Amendment. It gave to every citizen the same rights of property, and the same protection of person and property, enjoyed by the white citizen. It provided extraordinary means, judicial and executive, for its own enforcement, and for guaranteeing protection to all and equal enjoyment of equality before the law. This act was passed over Johnson's veto more than two years before the adoption of the 14th Amendment, yet it served the purpose of an enacting act for the purpose of securing the ratification. Indeed, it answered that purpose, without even being amended, until after the ratification of the 15th Amendment. These enacting acts themselves illustrate the process of development that accompanied the transition from slavery to citizenship. They reflect the views of their framers as to the significance of each step taken in that movement.

Thus it appears that an act merely to enforce the emancipating amendment was considered broad enough to confer on the 14th also. Extreme views were entertained as to the power of Congress in regard to the matters covered by the amendments. The last two were not proposed by Congress because that body doubted its constitutional right to accomplish the same ends by legislation, but simply to remove those matters beyond the reach of a possible hostile majority. The next enforcing act was that of 31 May 1870. This was "to enforce the right of citizens of the United States to vote," but it also re-enacted, with some additional provisions, the Civil Rights Bill of 1866. Means were provided for preventing disfranchisements on account of color under almost any contingency that could arise. The act also provided for enforcing the third section of the 14th Amendment, prohibiting certain classes in the Southern States from holding office. This act was amended 28 Feb. 1871, by one which provided still more elaborate machinery for enforcing the right to vote. Among other features it required judges of United States Circuit Courts to appoint supervisors of Congressional elections, upon petition of two citizens, in cases involving only the right to vote of at least 20,000 inhabitants. The Act of 20 April 1871 was the first specifically directed to the enforcement of the 14th Amendment. This was known as the Ku-Klux Act, and of all the enforcing laws it went the most directly to Congress, others conferred upon the Federal Courts jurisdiction for acts in violation of their provisions, and for their enforcement placed at the call of even petty officials the military and naval branches of the government. This authorized the President in certain contingencies to suspend the privileges of the writ of habeas corpus. It was directed primarily against alleged conspiracies in the Southern States to render inoperative the first section of the 14th Amendment. The second and last act to enforce the first section was the Civil Rights Act of 1 March 1875. The first two sections of the act attempted to do for the newly-declared citizens, in the sphere of what may be called social privileges, what the Civil Rights Bill of 1866 did for the right of property rights. They declared all persons within the jurisdiction of the United States entitled to the full and equal enjoyment of the accommodations, advantages, facilities and privileges of inns, public conveyances on land or water, theatres, and other places of public amusement. Infractions of this act gave rise to the Civil Rights Cases, which furnished the occasion for one of the most important interpretations of the 14th Amendment ever announced by the Supreme Court. The one section of the 14th Amendment which has never been enforced is the second,—which provides for reducing the representation of States as a penalty for abridgments of the suffrage. Some of the men most prominent in the legislation have announced the opinion that this section was rendered nugatory by the adoption of the 15th Amendment. This question, however, has not been passed upon, in the absence of enforcing legislation. Such legislation was attempted in the first apportionment act after the new amendment, that under the census of 1870. It was at once discovered that the question was
one involving numerous practical difficulties,—difficulties probably unforeseen by the framers of the section, certainly entirely unprovided for by them. The advocates of changing the basis of representation had need to remember the new principle of representation had finally to content themselves with merely restating in the Apportionment Act the penalty provided in the amendment itself.

Interpretation.—The 14th Amendment has overspilled the other two, alike in the number and the importance of the cases calling for the interpretation by the Supreme Court. A consideration of the three amendments shows this to have been inevitably incident to the nature of the 14th. The 13th and 15th, were simple and direct in terms, each covering a single question. Article IV of the Constitution declared the citizens of each State entitled to all the privileges and immunities of citizens in the several States. Article V of the amendments declared that no person shall be deprived of life, liberty or property without due process of law. But Article V was operative upon the general government, not upon the States. The 14th Amendment for the first time defined national citizenship, and endowed it with the privileges and immunities hitherto the attributes of citizens of the States. It then went further, and prohibited the States from abridging these privileges and immunities in their new and broader operation. The amendment brought forward from the 5th Amendment the guaranty of due process of law, and decreed that henceforth the denial thereof should also be beyond the province of the State. In their new relation, the questions, what are the privileges and immunities of citizens? What is due process of law? and what the equal protection of the laws? are capable of being raised under an almost infinite variety of circumstances. They assume a new significance and issues of consequence and moment are involved in their determination.

The amendment of which this first section is the most important part was formulated by a Congress which convened almost before the din of war had died away. It was written of it, by the speaker of its house, that "Its keynote of policy was protection to the down-trodden." Some members of that body may have been gifted with the prescience to see beyond the strife and partisanship of the hour—but these were few. Such as they may have realized the true import of the measure thus wrought out in the heat and bitterness of debate. One or two did indeed predict its future. But of the many whose voices gave it the sanctity of constitutional law with truth it may be said that only the freedman was in their view. The first case which involved the interpretation of this amendment by Supreme Court discloses this view of restricted application. This is in the famous Slaughter House Cases decided 14 April 1873. In behalf of the majority of the court, Mr. Justice Miller expressed this opinion: "We doubt very much whether any action of a State not directed by war, or discrimination against the negroes at all, or on account of their race, will ever be held to come within the purview of this provision. It is so clearly a provision for that race and that emergency, that a strong case would be necessary for its application to any other." But the Constitution was "made to march" during the succeeding quarter-century. In 1898, in Holden v. Hardy, we find the court declaring that "A majority of the cases which have since arisen have been directed to the colored race of rights therein secured to them, but upon alleged discriminations in matters entirely outside of the political relations of the parties aggrieved." Doubtless it would be as pleasing to discuss as that the true interpretation of this amendment was the one contemplated by its framers. But this would not be warranted by the facts. The decisions nearest the amendment in point of time are nearest also to the intent of most of those who gave it life. The measure would scarcely have appealed to men from the Pacific Coast had they foreseen the construction to be placed upon their work in the cases in Yick Wo v. Hopkins and the United States v. Wong Kim Ark. In the case of Yick Wo v. Hopkins "persons" were held to be entitled to "due process of law." In Wong Kim Ark it was held that children born in the United States of Chinese parents having their domicile here are citizens of the United States. The framers of these decisions was to give to the word "persons" the broadest possible significance, as meaning every natural person within the jurisdiction of a State. But there was another class of persons to whom the protection of the amendment. Corporations came forward with the sound argument that they were mere associations of persons, each of whom was guaranteed due process of law and the equal protection of the laws, and that in their corporate capacity, as artificial persons, they were entitled to the same protection. Not until the lapse of 18 years after the adoption of the amendment were these artificial persons clearly held to be within the purview of its first section. This was in 1886, in Santa Clara County v. Southern Pacific Railroad. Since that time, of the cases involving the construction of this amendment, those in which corporations are interested probably outnumber all others. It was well said by Mr. Justice Harlan that corporations are clearly distinguished, however, one important difference between these artificial persons and citizens. Privileges and immunities are held to belong only to the latter. Corporations must rely for their protection under the 14th Amendment upon their character as persons.

The Civil Rights Cases furnish the most striking instance of the difference between the interpretation placed upon the 14th Amendment by those who framed it, and that of the court whose province it is to construe its meaning and determine its powers and limitations. These cases, which were decided in 1883, arose through certain alleged violations of the first and second sections of the Civil Rights Act of 1875. It will be recalled that this act declared all persons entitled to the equal accommodations of hotels, theatres and public conveyances. It also provided certain penalties for the denial of these privileges to any citizen, except for reasons by law applicable to citizens of any race and color. The court held that these two sections of the act were unconstitutional and void. They were held to be "direct and primary, as distinguished from corrective, legislation," and as such constituted an invasion of the domain of
State control of its purely domestic affairs. The court placed upon the amendment the important and far-reaching construction that it operated as an abridgment upon the States alone, and not upon their citizens. In the words of Mr. Justice Bradley: "Civil rights, such as are guaranteed by the Constitution against State aggression, cannot be impaired by the wrongful acts of individuals unsupported by State authority." Two other important interpretations of the 14th Amendment are that "equal" does not necessarily mean "identical," as applied to rights and privileges, and that the amendment created no new "privileges or immunities." Under the former have been upheld State laws which provided separate schools for the two races, and also those requiring railroads to provide "separate but equal" accommodations. Under the latter of these interpretations the court has held that women, as citizens of the United States, have no privileges to which citizens were not entitled before the amendment. Hence a State statute prohibiting women from voting or practising law was not an abridgment of the privileges of citizens within the purview of the amendment. If considered from the narrow viewpoint of a mere attempt to endow one race with privileges and immunities enjoyed by another, the interpretation of the 14th Amendment has fallen short of the hopes and expectations of many of its advocates. The first section is now all of real significance that remains of the amendment. Held within its proper bounds, and wisely interpreted as it has been, this wears no longer the aspect of an instrument of the derogation of the dignity of the States. As an effort to render more secure to all persons life, liberty and property, it stands forth in some measure worthy of rank with the 10 great amendments which constitute the American Bill of Rights.

Of the 15th Amendment it may be said as Mr. Justice Miller said of the 13th: "Its two short sections seem hardly to admit of controversy. Of itself it confers suffrage upon no one. Save upon the grounds of race, color and previous condition of servitude, it does not diminish the right of the State to regulate the suffrage of its citizens. The power to impose a tax remains as it was before 1870. This has been held clearly enough in the few cases involving the right of suffrage abridgment thus far presented to the court. For one section of the country at least, harassed by problems peculiar to itself, it is well that this is so. See CONSTITUTION OF THE UNITED STATES; also CONSTITUTIONAL AMENDMENTS.

ALFRED HOLT STONE, LL.B., Member American Historical Association.

39. THE WAR WITH SPAIN. The Spanish-American War of 1898 was the outcome of conditions set up in Cuba by the political discontent in the island during nearly the whole of the 19th century, varied in the latter half by long-continued revolts. The United States government, controlled as it was in the earlier half of the century by the slave interest of the South, had desired to make overtures at intervals to annex the island. But this wish disappeared with the changed conditions brought by the Civil War. There was no longer a reason through desire to extend slave territory, and the annexation of a large alien population, much of which was colored, was repellant. The Ten Years' War in Cuba, which began in 1868 through the refusal of Spain to accede to plainly necessary reforms, had been ended by promises from Spain which were not kept. Revolt thenceforward was passive rather than active, but sure in time to break into activity, which it did in 1895. The commercial and social conditions begotten by chronic strife through so many years wrought not only upon the sympathies of the United States, but generated ill feeling which must always come when trade interests are deeply injured. Large property interests in the island itself were held by Americans, many of whom suffered most severely. By the end of 1897 the island had been brought to the verge of ruin. The insurgents, always strong in the east, had raided the west, burning banana fields and destroying plantation buildings in the attempt to create confusion which would make Cuba valueless to Spain. The Peninsular Government with more than 200,000 men in the island was making no headway against the insurgents. It had become clear, as Consul-General Lee reported to the government, that Spain was powerless to suppress the revolt, and the insurgents equally powerless against the Spanish occupation. A large proportion of the rural population had been brought within the Spanish lines by a decree of Governor-General Weyler, issued early in 1897. But the Spanish authorities could feed neither them nor their own troops. Destitution, starvation and death to an appalling degree was the result; cultivation outside the Spanish lines practically ceased; the commonest necessities of life had to be imported. Spain looked upon the situation as due largely to American sympathies and aid. No doubt the dogged persistence of the insurgents and the considerable degree to hopes of American intervention, but the fact is that the American government loyally did its duty in suppressing unlawful attempts to send aid from its territory. It could not suppress the general sentiment of the country for a much-suffering population. The American government thus felt called upon to insist upon reforms which would restore something like the normal conditions of human society, and this pressure, united with the action of the Spanish liberals, caused to be enacted the law signed by the queen regent, November 1897, establishing a system of Cuban autonomy. General Blanco was sent in the beginning of 1898 as governor-general with the avowed object of pacification upon such lines. But the Spaniards and their friends in Cuba were opposed to the scheme as granting too much; the insurgents, as granting too little. Nor were the latter willing to surrender the dominancy of Spain at any price. Nothing short of independence would be listened to. The attempt was thus doomed to failure, January 1898 was marked by serious military riots in Havana due to the opposition of the Spanish party to Blanco. In consequence of the supposed danger from
these disturbances to American citizens, the Maine, which had been for some time at Key West, and which, engaged in looking after filibustering attempts, was sent to Havana. Her arrival caused offense. She dominated the city from her anchorage, and her coming was thus looked upon as a threat. Her destruction, 15 February, naturally laid by the American public at the door of the Spaniards, brought a state of excitement which, combined with the previous feeling, made war dangerously near. The Court of Inquiry of which Admiral (then Captain) Sampson was president, after sitting more than a month, rendered a finding that her destruction was due to an exterior mine. This finding was chiefly based upon the extraordinary manner in which the keel was forced up at the centre of the explosive effort, 34 feet above its normal position. As the ship settled but from four to six feet before touching bottom, it would seem impossible that any launching forward of the after body could have produced such an effect. Two other considerations added weight to the board's finding; the first, that the only ship of the American navy ever so destroyed had to wait to arrive in an unfriendly port before the catastrophe should be accomplished; and the second, the wholly different effects of the explosion of the forward magazine of the Oquendo after the Santiago action. The finding of the board in no way implicated the Spanish government, and the writer, as a member, thought that no statement was more explicit than that of the board held such a view. It should be added that the very cursory and untrustworthy examination by the Spanish divers is shown by their report that the keel appeared to be intact. The examination made in 1911 by the army and navy board, after the uncovering of the wreck, substantiated the finding of the Court of Inquiry.

Events thenceforward marched rapidly. Congress and the people of the United States both became very hostile in sentiment to Spain. As early as January the government had taken steps to cover eventualities, as far as the navy was concerned, by ordering that the time expired for the ships of the Maine disaster ships were concentrated; the North Atlantic squadron at Key West, the Asiatic squadron at Hongkong (ordered 25 February). Congress 9 March voted $50,000,000 for national defense; merchant vessels and yachts were purchased and armed; colliers and two hospital ships equipped; the four large ships of the American Line taken over for service and the two cruisers built at Elswick for Brazil, purchased and renamed the New Orleans and Albany; the latter, however, was not far enough advanced to be used during the war. An American merchant ship which had been converted into a cruiser by Brazil was also bought, as also the Diogenes of 1,800 tons, built for Peru and never delivered, renamed Topeka; a small torpedo boat purchased in Germany and named the Somers, which did not reach the United States until after the war. The Treasury Department turned over to the navy cutters and four lighthouse tenders, all of which did good service. Coal in quantities was forwarded to Key West, which rapidly assumed the prominence of an Important naval base, the command of which was assigned to Commodore Remey. A squadron was formed at Hampton Roads of the Brooklyn (flag) and battleships Massachusetts and Texas, denominated the flying squadron with Commodore W. S. Schley in command.

The two navies stood as follows:

* One second-class.  
† Old iron-clads done over — non-effective.  
‡ All but 20 of these last under 1,000 tons.

The war was necessarily to be mainly naval. Whoever should control the seas would win. Spain could only hold Cuba by being able to send thither troops and supplies. As Mahan well says: "A million of the best soldiers would have been powerless in face of hostile control of the sea." The United States could not invade Cuba unless the navy was strong enough to control the neighboring waters and make transport to and fro perfectly safe. Spain had, in the squadron under Rear-Admiral Cervera, four fine armored ships of 20-knot speed and good armament, with which in speed and armament the United States had but two to cope, the New York and Brooklyn. So long as this squadron existed, Spain had a powerful military asset which would aid the war's continuance. The Carlos V of like character was also counted, even by the Spanish Minister of Marine, as available, as also the Pelayo, a second-class battleship, overhauling at La Seyne (near Toulon) where she had been built. In the East were two squadrons, facing one another, but neither was of a character effective part in such a war; neither could face a squadron of armored ships without expecting destruction. The disquieting element to the United States was thus Cervera's squadron which it was expected at the time would be increased by at least the two other armored ships mentioned; and it was a reasonable disquiet. It was very possible for this squadron to have appeared upon the United States coast, causing much apprehension and some damage and to have taken refuge in Havana, to emerge again under the guns of what became, as time went on, powerful batteries. But as we know from Admiral Cervera's reports, the inefficiency of his ships made such action hopeless. Spain had started a small torpedo flotilla to Cuba in early March, but the sea was too rough for the smaller boats and all took refuge at the Cape Verdes, returning later, except the three torpedo boat destroyers, to Spain. The Pizaya had been sent to New York in February as an offset to the visit of the Maine to Havana, whither she shortly went. She was joined there by her sister ship, the Oquendo, the arrival of the two adding greatly to the enthusiasm of the Spanish party. But this action was ill-
considered. Neither ship had been docked for many months and when they left 1 April to go to the rendezvous east of Porto Rico to meet and join Sampson's fleet, the condition of the two ships, as their rotation indicated, was not such as to make them good candidates for the rendezvous, had to go to the Cape Verdes to join Cervera, they had crossed the Atlantic twice, had severely tried their engines and boilers, and had had no chance for a much needed overhauling of their machinery. They thus started on a third transatlantic journey, bottoms foul, machinery in bad condition and ill equipped in almost every respect except in galant spirit, to meet a foe who was in the highest state of preparation. The advice and prophecies of Cervera were unheeded. When war had declared itself a large number of officers high in the navy met at Madrid 24 April and decided that his squadron should at once proceed to San Juan, Porto Rico, certain instru-
m ents being left to his discretion. The decision revealed an utter lack of preconceived plan and ignorance of the conditions of the problem. The ultimatum signed by President McKinley 20 April, pending the withdrawal of Spain from Cuba, was practically a declaration of war and the Spanish government sent the American Minister his passport the next day without awaiting the presentation of him by the fateful resolution.

In the early morning of 22 April, Captain Sampson, then rear-admiral by the authority vested in the President in time of war, sailed with such of the ships as could be made ready to leave with orders to blockade the Cuban ports. The ships at or near Key West which could be drawn upon for this first move were (armored) New York, Indiana, Iowa; (monitors) Punta de Toro, Amphitrite; (cruisers) Cincinnati, Marblehead, Detroit; (cruiser-gunboats) Wilmington, Machias, Castine, Nashville, Newport, Helena, Dolphin and auxiliary Mayflower; (torpedo boats) Dupont, Porter, Foote, Wanskosky, Cushing and Erskine, (armed tugs) Neznaucy, Samoset, the armed lighthouse tender Mangrove and supply steamer Fern. By the afternoon of 23 May 20 of these were on the blockade, which was established from Cardenas, 85 miles south of Havana to Bahia Honda, 23 miles west. It had been Sampson's wish to attack Havana at once and the order of battle was prepared, but the Navy Department refused consent, holding that the heavy ships should not be risked against batteries until the Spanish squadron should be met. This was undoubtedly correct in principle, but Sampson's knowledge of the conditions was more complete than that of the officials in Washington. Had Sampson had his way he would have taken Havana at once, without loss or serious injury to his fleet. It is an extraordinary fact that the disposition of the batteries was such that beginning at the southwest there was but one six-inch gun which could reply in that direction. The batteries could have been enfiladed, one by one without return fire whatever. Sampson's plan of attack, though more frontal, would in the writer's opinion have been perfectly successful. He could, after silencing the batteries, have anchored in the bay and the Morro and awaited the coming of an army of occupation as did Dewey at Manila. It was his intention to go within 800 yards of the batteries, the water being extremely deep to the shore itself; it would have been impossible for the men in the batteries, exposed as they were, to stand to their guns under the fire of the multitude of small guns carried by the small ships. Sampson yielded to the department's views with great reluctance. Commodore Dewey, who had relieved Rear-Admiral McNair in command of the Asiatic station, had concentrated, by order of the department of 25 February, all the ships of his squadron at Hongkong. His squadron was composed of the following:

The ships carried also 36 six- and three-pounders, 40 smaller guns and 19 torpedo tubes; the crews numbered 1,743 men. The revenue cutter McCulloch, lately arrived, had been joined to the squadron, but was lightly armed and could not be considered as adding to his fighting force. At Manila, under Rear-Admiral Montojo, these ships were available for action:

* This ship's machinery was under repair and the other two guns of her main battery were mounted, one at El Fraile, the other at Taguig Point.

Two 29-inch, two 2.7-inch, 27 six- and three-pounders, 19 smaller guns and 17 torpedo tubes, with crews amounting to 1,695 men, were carried by the ships just mentioned. Besides there were the Velasco of 1,139 tons with two of her four guns at El Fraile and two gunboats, the Correo and General Leo of 525 tons and three 4.7-inch guns each. All these were under repairs and took no part in the coming action, the crew of the Velasco manning the hastily built batteries at the entrance of the bay 25 miles from Manila. The Castilla, a wooden ship, built in 1881, had to be towed, as she could not use her engines. It must be admitted that the Spanish outlook was a sorry one and fully as hopeless as the report of Admiral Montojo indicates it to have been in his own mind.

The Baltimore had arrived at Hongkong 22 April and was allowed by the Hongkong authorities to be docked. On the 25th the British governor requested Dewey to leave and the squadron went to Mirs Bay, 30 miles distant on the China Coast, where it awaited the arrival of O. F. Williams, the American consul to Manila, whose local knowledge was regarded valuable. He came 27 April and that afternoon the squadron left in accordance with the Navy Department's telegram, sent 24 April, announcing that war had begun and directing Dewey to commence operations at once,
particularly against the Spanish fleet. You must capture vessels or destroy.\*\* The telegram ended with the words which might have been spared. On the same day that the American squadron went to Mirs Bay, Montojo left with the Reina Cristina, Castilla, Don Juan de Austria, Isla de Cuba, Isla de Luzon and the Marcob del Duero for Subig Bay, an excellent defensive point 50 miles distant from Manila, and one where batteries had been begun by Spanish army engineers. The bay was the site of a proposed new Spanish naval arsenal, some buildings for which had already been erected. Montojo towed the Castilla. Three vessels had been sunk in the eastern entrance to Subig Bay and it had been hoped to hold the western with the batteries and ships. But the batteries were not ready. The failure of the admiral to have this knowledge beforehand was in itself a startling instance of the inefficiency of Spanish administration. Receiving a telegram 28 April that Dewey had left for Manila, Montojo held a council and returned, mooring in a general east and west line in Cañacao Bay, just north of the spit on which was the small naval arsenal and village of Cavite and abreast the small batteries mounting, on Magallana Point two 4.7-inch B. L.; on Sangleys Point two 5.87-inch B. L.; at Cavite three 6.2-inch muzzle-loading rifles. At and near Manila were 30 guns; none of these were of great range and most were ineffective. There were, however, four 45-inch breech loaders and eight of 4.2-inch and 5.87-inch converted to breech loaders, which might have aided Montojo's defense had he lain close in shore off the city.

Dewey arrived off Subig the afternoon of 30 April, reconnoitered Subig with three of his ships and informed his captains assembled in consultation of his intention (the Spanish ships not being found in Subig) to stand on slowly and arrive at Manila at daybreak. He stood for the Boca Grande. The mouth of the bay, which is half way between Subig and Manila, is 10 nautical miles broad and divided by the island Corregidor two miles from the mainland on the north, which thus forms the Boca Chica (narrow mouth of the bay) and the channel two batteries; one (Punta Gorda) mounted 7-inch muzzle loading rifles, the lower, two 6.2-inch B. L. Hontoria rifles. On Corregidor itself were three 7-inch muzzle loaders looking north. Two miles southeast of Corregidor is Caballo island on which were three 5.87-inch B. L. Armstrong rifles. Three and a half miles from Caballo is El Fraile, on which was a battery of three naval 4.7-inch guns taken, two from the General Lero, one from the Don Antonio de Ulloa. All these batteries were built and manned by the navy. There were no torpedoes, the channel being too broad and deep for mining. The squadron naturally selected the broad passage between El Fraile and Caballo, which was reached at midnight. Signals from Corregidor showed that they were discovered and two shots were fired from El Fraile which were answered by three of the ships, and the squadron steamed at slow speed for Manila, 25 miles distant. At 5:15 it was fired at from the Manila and Cavite batteries as it approached; the Spanish ships being sighted to the southward, the American squadron turned south and opened fire at 5:41. The ships moved in column three times west and two east, about parallel to the Spanish line and at ranges varying from 5,000 to 2,000 yards. At 7 the Spanish flagship made a hasty retreat and at 7:35, it being erroneously reported that but 15 rounds per gun remained for the 5-inch battery, the American squadron hauled off and the commanding officers called aboard the flagship for consultation. The crews were given breakfast. Nothing was known at the moment of the effect of the attack, but somewhat later this was evident when the two largest Spanish ships were seen to be afire. Being assured as to the ammunition supply, the attack was renewed at 11:16 and continued until 12:40 when the American squadron returned and anchored off Manila. The Reina Cristina, Castilla and Don Antonio de Ulloa had sunk; all the others were burned by a party sent in from the Petrel after resistance had ceased and the ships were abandoned. The Spanish loss was 167 killed and 214 wounded; there were of the Americans 7 slightly wounded. While the American squadron was more powerful, the difference in character of ships and numbers of types of guns cannot account for this immunity from loss on the American side. All the ships were vulnerable to all but the very lightest of the Spanish guns. The only real damage done was by want of practice and through temperamental excitability could not shoot with any accuracy whatever. There was courage in abundance, but no training.

Dewey made no effort to capture the city of Manila, as he had no troops to hold it. No further firing took place. Cavite arsenal was taken possession of and a blockade of Manila established. He lifted and cut the telegraph cable, but the Hongkong office of the cable company refused to take his messages as vitiating its contract with the Spanish government. It was thus necessary to send a ship to Hongkong to cable thence. The McCulloch coasted and left 5 May, and arrived at Hongkong the 7th with the official information of the victory. There was a period of quiet waiting for the troops and ships, varied with rumors of the despatch of a fleet from Spain and by the arrival of a Chinese steamer; the expedition, which the Filipino army which was later to give much trouble. The first American troops, 2,500 in number, reached Luzon 30 June accompanied by the cruiser Charleston, which took over the surrender of Guam en route; the second expedition of 3,500 arrived 16 July. Dewey in the meantime was rendered anxious by the departure from Cadiz 16 June of the Spanish squadron under Admiral Camara. This consisted of the second-class battleship Pelayo, the armed cruiser Carlos V, three destroyers, three armed liners (two of which had been purchased from the Hamburg Line) and four transports. The expedition was in reality as ill advised as any other act of the Spanish Ministry of Marine. There were but two ships of any power and one of these slow; the rest, excepting the destroyers, were powerless for offense or defense. The battle of Santiago, which left Spain's coast open to the attack of the squadron which was formed to go through the Mediterranean, settled the question of their return, which was ordered from Spain 7 July. An expenditure of $230,000 for the benefit of the canal company was the main result of the expedition. In any case the arrival of the Monterey 4 August and the Monadnock 16
August, very effective ships in smooth water, removed any anxiety on the part of the American commander. While much was to come in the Philippines, the battle of 1 May practically determined that they were lost to Spain unless she should succeed in destroying the American fleet in the Atlantic; should she do this the question of final command in Asian waters could easily wait. The loss of the Philippines could have no determining effect (valuable as the result was in prestige and in setting the stage for a question of a European concert of intervention) so long as Spain could keep open her communications with Cuba, relinquishment of Spanish authority in which had been announced in the Congressional resolution of 20 April as the object of American action. In the Atlantic was her only battle squadron; so long as this was in being, so long would the war continue.

Cervera left the Cape Verde with his four armoured cruisers and the destroyers on 29 April. This was known at the Navy Department the same day and the news at once transmitted to Sampson. The latter determined to go eastward with the main part of the battle portion of his fleet, and the resolution of 20 April as the object of American action. In the Atlantic was her only battle squadron; so long as this was in being, so long would the war continue.

Cervera had the Cape Verde with his four armoured cruisers and the destroyers on 29 April. This was known at the Navy Department the same day and the news at once transmitted to Sampson. The latter determined to go eastward with the main part of the battle portion of his fleet, and the resolution of 20 April as the object of American action. In the Atlantic was her only battle squadron; so long as this was in being, so long would the war continue.

The monitors Amphitrite and T error, the cruisers Montagu and Defiant, and the destroyers Forerunner, Tiger, Winslow, and the steamer Congo, were the forces with which he entered the harbor. He had intended to reach San Juan by the 8th, judging that by this date the Spanish squadron would be in that longitude and permitting with his usual excellent judgment that Sampson would be the only objective, as was the case. Should he not find them at San Juan it was his intention to return to Havana, after making an effort to occupy San Juan and leaving the monitors there in occupancy, to hold it against the Spanish squadron when it should appear later. Continuous breakdowns of the monitors, which had to be towed a great part of the way, and of the Indiana, so delayed the squadron that it was not off San Juan until the early morning of 12 May, when they were not far behind the Spanish ships were there. The fortifications were, however, assailed by the squadron in an active bombardment of three hours, in which, on the American side, one man was killed and four wounded. One of the Spanish crew was killed and two wounded. There is little doubt, as is known from Spanish officers present, that the place would have been yielded had the attack been a little longer continued, not through actual damage but through pressure from a population frantic with fear. Sampson, however, yielded to the arguments regarding the necessity of holding the fighting ships intact to meet the Spanish fleet, and started westward.

The disastrous result of the action at San Juan occurred, as far as loss of life was concerned, two of the most serious frights of the war; one in connection with the cable cutting at Cienfuegos, the other at Cardenas; both were, of course, obtained. The four launchers (including two steamers) of the Marblehead and Nashville, under the immediate charge of Lieutenant Winslow, were employed in the former operation, which was carried on in the early morning within a few yards of the beach, the American covering fire from the ships in a rough sea and under a severe rifle fire from shore. Three hours were spent in lifting the cables, two of which were cut; a third was lifted but as it was thought to

be a small cable connecting the destroyed cables with Cienfuegos and thus useless, it was left uncut, it being thought advisable not to delay for the purpose under the heavy and increasing fire. Lieutenant Cameron McR. Winslow and 12 men were wounded, two of the men mortally. At Cardenas, which was blockaded by the Machias, Wilmington, the revenue cutter Hudson and the torpedo boat Winslow, it was determined to attack the three Spanish gunboats in the port, which is extremely shallow and difficult of access to larger vessels. The Winslow, leading, had approached the town within a mile when fire was opened by the Spanish battery and gunboats. Though supported by the other ships, the Winslow armed only with three one-pounder guns could not make much return. The Spanish fire was concentrated upon her, her steering gear and one engine injured and a shell exploded in one of her boilers. She became helpless and drifted shoreward. The Hudson, the lightest of the three other vessels, gallantly went to her aid and towed her into safety, but not before the Winslow's commander, Lieutenant Bernadou, had been wounded, and a little later, Ensign Bagley and lieutenant were shot and killed and two others mortally wounded by a shell which exploded on the deck. Her use for such a purpose was, of course, not justified, and the same might be said of much of the employment of these frail crafts during the short war, the Kumpany of vessels and the necessities of the service making such misapplication unavoidable.

Sampson standing westward with his slow squadrons received the first news of Cervera's arrival in the Caribbean at 3.30 A.M., 15 May while off Porto Plata, San Domingo. He then learned that Cervera was on the 14th off Curaçao, and that the destroyer T error was at Martinique. The telegram announcing this directed him to proceed with all possible dispatch to Key West, whither Commodore Schley's squadron was also ordered from Hampton Roads. Cervera's slowness of movement had been a surprise to all who listened on the American side at least. The two large liners Harvard and Savannah had been dispatched, on his departure from the Cape Verdes, to cruise on a line 75 miles north and south about 100 miles east of Martinique, until noon of 10 May. Had the orders read them to 11 May, they would in all probability have sighted the Spanish squadron at sea. As it was the Harvard reached Saint Pierre, Martinique, at 9 A.M. of the 11th and the destroyer Furor, Fort de France, the capital of the island, at 5 P.M. The news reached the Navy Department early 12 May by telegram from Captain Cotton of the Harvard. The broken-down destroyer T error came into Fort de France next morning and remained there until 25 May when she was sent to San Juan, where she will be later heard from. The presence of Sampson at San Juan changed Cervera's course. Had the American squadron been slower by two or three days in reaching San Juan, Sampson's pursuit would have been correct. He would have found and destroyed the Spanish ships there, where they were ordered to go, instead of at Santiago. Cervera's information regarding Sampson's movements caused him to shape his course two from Curaçao, 200 miles away, in hope of obtaining much needed coal, and picking up the vagrant colliers Roath, Twickenham and Restormel, which had been chartered by Spain. These, however, failed him, but the
Curaçao authorities allowed him 500 tons for the Teresia and Vizcaya, and Sampson was enabled to send them out. On 15 May he left for Santiago de Cuba. The Saint Louis which had joined Sampson the morning of 15 May was ordered with the armed tug Wompa-tuck to Santiago to cut cables, and left the squadron for that port. Sampson at the same hour left Cervera. Captain Goodrich, commanding the expedition, succeeded 18 May in cutting one cable in over 500 fathoms of water, engaging the batteries at the same time. Having succeeded, as he supposed (mistakenly), in destroying the Santiago-Jamaica connection, he left for Guantanamo for the purpose of destroying the French cable leading from there, but an engagement of 40 minutes with the Spanish gunboat Sandoval compelled him to desist, the very vulnerable character of his own ship, wholly unfitted for fighting, rendering this necessary. At this time, 8 a.m., 19 May, Cervera was entering Santiago Harbor only 40 miles away, having taken three and a half days to traverse the 600 miles from Curaçao. Sampson reached Key West at 4 p.m. of the 18th and found Commodore Schley's squadron, which had arrived not at the 6th. All but the smallest vessel off Cienfuegos were ordered by the Navy Department to be withdrawn. The telegrams received showed that the Washington authorities were convinced by information received that the Spanish squadron was supposed to carry munitions of war essential to the defense of Havana, and that it must reach this port or one connected by rail with it, notably Cienfuegos. The flying squadron was thus, with some additional troops and other vessels, as Sampson should judge suitable, to proceed to Cienfuegos, Havana, being covered by the remainder of the fleet. Sampson was to have charge of this force and Cienfuegos or Havana; Schley, however, to keep the flying squadron. He generously gave the opportunity to Schley, who having coaled, sailed on the forenoon of the 19th with the Brooklyn, Massachusetts, Texas and Scorpion with orders to establish a blockhouse at Cienfuegos and to command the force; he having the least possible delay. Shortly after leaving Key West he passed the Marblehead and Eagle returning from Cienfuegos, Commander McCullar of the Marblehead having withdrawn the whole force on his own responsibility. McCullar communicated the situation there by sending the Eagle to speak the Scorpion. Much was made of his failure to mention an arrangement of signals, he had made with the considerable Cuban force west of the harbor in case these latter wished to communicate, but as will be seen later this was of no consequence. The Iowa, the collier Merrimac, the Castine and the torpedo boat Dupont left on the forenoon of the 20th to join Commodore Schley, thus making the force much more than able to meet the Spanish squadron. A telegram was received from the Navy Department at 12.30 a.m. of this day saying, "The report of the Spanish fleet at Santiago de Cuba might very well be correct; so the department strongly advises that you send immediately by the Iowa to Schley to proceed off Santiago with his whole command, leaving one small vessel off Cienfuegos. . . ." The proposed movement was in connection with the Navy Department's insistence upon the necessity of Cervera's coming within reach of Havana, caused doubt in Sampson's mind, and it was deemed necessary to hold the status quo until further information should be obtained. He thus wrote Commodore Schley to that effect, sending a personal letter and an official dispatch by the Iowa and a duplicate by the Dupont, vessels also carried copies of a memorandum prepared by Commander McCulla regarding the Cuban forces west of Cienfuegos which showed that he had communicated with them, and mentioning a convenient landing place some 13 miles from the port. Corrobobt of Cervera's arrival coming the evening of the 20th through the Key West cable office from an employee in Havana who had also sent the first, a dispatch was prepared to go by the Marblehead, supposed ready to leave for Cienfuegos, saying, "Spanish squadron probably at Santiago de Cuba—four ships and three torpedo boat destroyers. If you are satisfied that they are not at Cienfuegos, proceed with all dispatch, blockade Santiago de Cuba as arranged, and if the enemy is there, blockade him in port. . . ." As it appeared during the night that the Marblehead might be delayed, Sampson upon arrival off Havana in the afternoon (21 May) sought the assistence of the squadron with a copy of the dispatch, and an additional memorandum, the tenor of which urged the utmost dispatch as did also the verbal instructions which Lieutenant Hood of the Hawk was to communicate. Sampson moved with the available force on the north side of Cuba to Nicolas Channel, in order to have an advanced position in case Cervera should move toward Havana from the east. Hood arrived off Cienfuegos at 7.30 a.m. on 23 May, delivered his dispatches and repeated the verbal instructions. He returned the same day, reaching Havana 25 May with dispatches from Schley which reached Sampson at 9.30 p.m. of the 20th by the Dolphin, whose failure to pick up the squadron earlier was a startling instance of the difficulty of finding even a large force at sea. Schley wrote that he was by no means satisfied that the Spanish squadron was not at Cienfuegos, giving the least possible delay. One of which was his having heard guns the afternoon of 21 May (when about 40 miles from Cienfuegos), which he took to be a welcome to the Spanish fleet. Lights, which turned out to be signals by the Cubans, attempting to communicate with Commander McCulla, had been seen to the westward of the harbor, but this arrangement, not having been communicated to Commodore Schley, was not acted upon, though the fact of the presence of Cuban troops in that vicinity was known from the memorandum previously mentioned. The report of Captain Dayton of 20 July when blockading Cienfuegos would seem to show that it was not necessary to apply to the Cubans for knowledge regarding ships in the harbor. Dayton says (p. 219 Appendix to Report of Chief of Bureau of Navigation 1898): "During the afternoon I made close an inspection [of Cienfuegos Harbor] as practicable. From aloft I could detect in the inner harbor four large steamers flying Spanish colors, one with four masts and one smoke stack, one with three masts and one smoke stack, and two with two masts and one smoke stack, the larger of these boats, the larger being apparently of the Esmar-alda class. . . . The four-masted steamer was
surrounded by lighters and appeared to be discharging cargo.  

The arrival of Commander McCalla, however (with the Marblehead, 24 May), who at once found the Cubans at the point which had been designated in his memorandum settled the fact that Cervera was not at Cienfuegos. Commodore Schley thus left that evening with his squadron making, however, such slow progress that he was not off Santiago, 315 miles from Cienfuegos, until the afternoon of 26 May. The Yale, Saint Paul and Minneapolis were at the moment off Santiago by orders of the Navy Department to watch the port, and on the morning of 25 May the Saint Paul had captured the British collier Restormel with 2,400 tons of coal which had already touched at Porto Rico and Curacao from which latter place she had been ordered to Santiago. The Harvard which had also been there had gone to Saint Nicolas Mole to send a dispatch received by the Scorpion 24 May from Commodore Schley to ships, sightting the smoke of a number of ships to the south, had steamed in that direction, thus leaving the port without any observing ship, a fact which as will appear later might have had more serious consequences. Commodore Schley had determined to return to Key West and at 7.45 P.M., signal being made to that effect, the squadron headed westward with the collier Merrimac in tow of the Yale. The frequent radio signals made of progress to be made. The Harvard on the morning of 27 May reached the squadron and delivered a telegram received from the Navy Department at Saint Nicolas Mole the preceding morning (26 May), the more important part of which was that directing him to proceed at once and inform Schley and also the senior officer present off Santiago de Cuba as follows:  

All Department’s information indicates the Spanish division is still at Santiago de Cuba. The Department looks to you to ascertain fact and that the enemy, if therein, does not leave without a decisive action.  

This was answered (sending the Harvard to Key West where she was joined by the armored cruiser Nevada) by telegram, the main parts of which are as follows:  

Merrimac’s engine is disabled and she is helpless; am obliged to have her towed to Key West. Have been absolutely unable to coal her. The vessels Vincennes and Brooklyn from collier owing to very rough seas and boisterous weather since leaving Key West. Brooklyn is the only one in squadron having more than sufficient coal to reach Key West. Impossible to remain off Santiago in present state of coal account of squadron.  

It is to be regretted that the Department’s orders cannot be obeyed, earnestly as we have all striven to that end. I am forced to return to Key West via Yucatan passage for coal. Can ascertain nothing certain concerning enemy.  

This was a very unhappy telegram in view of the facts that the Iowa, Massachusetts, Caspian and Dupont had cosled from the collier at various times and that the Texas and Marblehead took coal the evening of the day the dispatch was sent; that while it was 790 miles to Key West, the Massachusetts had sufficient coal to steam at 10 knots, 2,371 miles from Iowa in 2,028; the Texas, 1,459. The Brooklyn had enough to blockaded 32 days; the Massachusetts, 24; the Iowa, 18; the Texas, 14, and the Marblehead about 6 days and still have enough to go to Guantanamo Bay Hayti (Testimony Schley Court of Inquiry, p. 535). There was, moreover, the splendid and commodious harbor of Guantanamo but 40 miles east of Santiago, to be had, so to speak, for the asking. Had the squadron gone to Key West, it would still have had to coal at an anchorage in the open sea. Nor was any real endeavor made to get information as to the presence of the Spanish squadron. Most fortunately the next day, 28 May, Commodore Schley, now 38 miles west of Santiago, decided to return and go off the port. He arrived there the same evening and the question of the presence of the Spanish squadron was fixed by discovering the Colon moored near the harbor entrance; and another man-of-war and two destroyers near her. Cervera had been twice on the point of leaving Santiago for San Juan, Porto Rico, and steam was actually got up on the evening of 26 May, and every preparation made to leave, when his heart failed him at the report that the swell was sufficient to cause danger of the Colon’s striking a rock off Point Morillo on which there was but two and one-half feet of water over than the Colon drew. With the American squadron so far (20 miles at 8 P.M.) to the south and with the intended departure so near nightfall, it is very probable the Spanish squadron would have got away unnoticed. There is no need to dwell upon the sensation such an escape would have made.  

Schley’s telegram of 27 May produced consternation at Washington. Sampson on the north side of Cuba had occupied Nicolás Channel 25 May. The force in the beginning was a very meagre one, the New York and Indiana being the only armored ships; with these were the gunboats, Newport, Vicksburg, Mayflower, Machias, and the torpedo boats Rodgers and Foote. If the Spanish squadron should be met it was expected that the gunboats should be sacrificed in the general attack. In the afternoon of the same day, however, the fast and excellently prepared gunboats Nashville and Montgomery were added the Monticello (with the broad pennant of Commodore Watson), the Cincinnati, Detroit, Miantonomoh, Puritan, Terror, Amphitrite, Wilmington, Wasp and Vesuvius a powerful force if there had only been expected to proceed with all possible dispatch to Santo Domingo if thought it necessary. And if on arrival there you receive positive information of the Spanish ships having left, you will follow them in pursuit. This heterogeneous collection of ships was fitly called by the men the “Bargain Counter” squadron. The dispatches brought by the Dolphin in the night of 26 May, announcing that Commodore Schley had not moved from Cienfuegos, caused the Wasp to be dispatched to him with an order to proceed “with all possible dispatch to Santiago to blockade that port. If on arrival there you receive positive information of the Spanish ships having left, you will follow them in pursuit.” This, of course, was not delivered, the Wasp having found that Commodore Schley had already gone. Sampson supposed this might be the case, as appears in his telegram of 27 May to Washington, and his supposition was confirmed by a telegram sent by the torpedo boat Dupont 24 May by Commodore Schley to Key West for transmission to Washington, in which he mentioned that he would “move eastward tomorrow” (25th), though in fact he left
that night. The mention of this delay, however, decided Sampson to go himself to Santiago. The New Orleans was ordered there with the color of driving, and Captain Folger, was ordered to communicate with Schley and direct him to remain on the blockade of Santiago at all hazards, assuming that the Spanish vessels are in that port. He also carried directions to use the Merrimac to block the harbor entrance, a suggestion for doing so also coming from the Navy Department. Though somewhat criticized, this was wise from the point of view at the time. The telegram of the Secretary of the Navy of 5 May directed Sampson not to so risk his ships against fortifications as to prevent from soon afterward successfully fighting the Spanish fleet composed of the Pelayo, Colon, Teresa and four torpedo boat destroyers as if they should appear on this side. Spanish reinforcements were thus regarded possible; there were two destroyers in Santiago and the danger to ships on blockade of being torpedoed would be constant; to hermetically seal a powerful squadron in port, the entrance to which was less in breadth than the length of a ship of moderate size, thus leaving our own force free for other operations, was sound policy and so held by every one consulted.

Sampson arrived at Key West at 2 A.M. 28 May and found the Oregon, which had completed her brilliant voyage of 16,000 miles, 26 days. She was reported ready for any service and left during the day for the squadron in New York, Oregon, Indiana and some lighter vessels and a long list of men. On receipt of thetelegram announcing the intention to send 10,000 troops to Santiago and that he was expected to convey the transports, going in person; but about midnight the department's telegram arrived, reporting Schley's intention, expressed in his telegram of the 27th, to return to Key West and asking Sampson how soon he could reach Santiago with the New York, Oregon, Indiana and some lighter vessels, and how long it would take, sending his ships singly to a coaling point. Sampson answered this at 3 A.M. (29th), that he could reach Santiago in three days and could blockade indefinitely; that he thought he could occupy Guantanamo and that he would like to start at once with the New York and Oregon, arriving in two days. Do not quite under-estimate as to the necessity of awaiting the arrival of Schley but would propose meeting and turning back the principal part of the force under his command if he has left. Try to hold him by telegraph. Watson will be in charge of everything afloat. Does the Department approve proposed action? About noon, no reply having been received, Sampson sent another telegram urging immediate reply. A little latter came one from Commodore Schley direct and also the substance of the same repeated from the Navy Department, showing that he had arrived off Santiago and that he would remain until coal supply of larger vessels had given out. Sampson then telegraphed the capture of the collier Restormel by the Saint Paul. Sampson replied to this "Congratulations on your success. Maintain close blockade at all hazards, especially at night; very little to fear from torpedo boat destroyers. Coal in open sea whenever conditions permit. Send a ship to Guantanamo with view to occupying it as base, coaling one heavy ship at a time. Appreciate captured coal, use if desired and afterward send her command."

In the afternoon the desired permission to go to Santiago was received and at 11 P.M. the New York, having finished coal, left for Nicolas Channel, reaching the squadron at 7 A.M. Commodore Watson was conferred with and at 9 O.Z., signal being made to the Oregon, Mayflower and torpedo boat Porter to form column on the New York, Sampson stood eastward at 13 knots. The squadron arrived off Santiago at 6 A.M. 1 June (in less than two days) having met in the Bahama Channel the Yale and Saint Paul. From Captain Sigsbee of the latter, the admiral received copies of several telegrams from Commodore Schley taken by the Saint Paul to Nicolas Mole, which showed that the enemy's ships had been seen in port, and that the situation would be held. As the squadron arrived, the Colon and one of the Viajaya class were seen about seven-eighths of a mile within the entrance, but they moved out of sight almost immediately. In the case of the Colon, could be done without unmooring, by veering the hawser attached to the shore and heaving in on her chain, the distance to go to take her out of view being very slight (her log mentions leaving her moorings at this point at 10.35 A.M.). The day previous (21 May) Commodore Schley had gone aboard the Massachusetts and with the Iowa and New Orleans had fired upon the Colon and the batteries at the entrance. The ships passed the entrance twice at a speed of 10 knots and the ranges, as stated in the Iowa's log, at first 8,500 yards, increasing to 11,000. The total time of firing stated by the Massachusetts was 7 minutes 35 seconds. One shell, reported in the Colon's log as exploding near the stern, did some slight damage, but a battle between ships at the ranges reported in the log of the Iowa, 8,500 to 11,000 yards (from nearly five to over six miles), a long list of men, the range first proposed, and lasting the time reported by the Massachusetts, could not be effective.

Sampson at once made preparations for sinking the San Nicolas. Commodore Hobson being put in charge, as he had been previously directed, as an expert, to study the question of the best steps to be taken to sink her quickly. Hobson was finally allowed to take the ship in. Many were as eager to go as he, the officers and men volunteering by the hundreds, but Sampson was moved to let it fall to Hobson from a sense of fairness, in that he had done the whole work of preparation. It was breaking day when the ship finally started and it became so light that she was recalled and sent in the night following; but her steering gear being shot away, she drifted. Before sinking, too far up the channel to block it in any degree. Had her bow taken the east side of the channel at the point she did, her stern would have swung with the tide (running flood) in such a way that the channel would have been closed almost as a caisson a dry dock. It was fortunate, of course, in the light of events that it was otherwise. Hobson in his graphic and most excellent account says that he could make certain he certainly have succeeded had he not been
recounted on his first start. The writer is now inclined to agree with him and rather the more so, in his recalling his recall. But the fame of an heroic act is Hobson's all the same, and the failure made the third of July victory possible.

Samson on arrival had found the Flying Squadron moving in rumble east and west in face of the port. He charged his ships placing the ships with their heads toward the harbor entrance on a six-mile radius, which made a semi-circle of about nine miles. (This was later reduced to four during the day and three at night, with much less for certain ships). An order of battle was issued 2 June dividing the fleet into two squadrons, one (to the east) under the personal command of the commander-in-chief, the other (to the west) under Commodore Schley. This order enjoined: "If the enemy tries to escape, the ships must close and engage as soon as possible and endeavor to sink his vessels or force them to run ashore in the channel. It is not considered that the shore batteries are of sufficient power to do any material injury to battleships." On 6 June the batteries were actively bombarded. The next day Guantanamo Bay was occupied by the Marblehead and Yankee and thenceforward was Sampson's base; the fort at the head of the deep water bay was destroyed 15 June by the Texas, Marblehead and Suwanee, the two former coming in contact each with a heavy gun cotton mine, but, in the pious language of Captain Schley, in both cases the crew and gun were saved care neither of them exploded. While every combatant is ready to suppose Providence on his side, some credit ought to be given to the barnacles which had grown so actually that the mine machinery could not operate. On the 10th, the marine battalion arrived in the Panther and at once went into camp, where from 11 May to the 14th it underwent a severe fire from the enemy, occupying a commanding position, in which some losses were lost. On the 14th five destroyers of the divisions of marines and 50 Cubans, under Captain Elliott, attacked some 500 of the Spanish and destroyed their only water supply, from which time the bay and vicinity remained undisturbed though there was a force of over 7,000 Spanish at and near Guantanamo town, 12 miles from the bay head.

On 7 June a memorandum for night duty was issued ordering three picket launches to be placed one mile from the Morro, the Viren, Suwanee and Dolphin on a two-mile radius from the Morro, the larger ships to come within a four-mile radius. The memorandum continued: "I again call attention to the absolute necessity of a close blockade of this port, especially at night and in bad weather. In the daytime, if clear, the distance shall not be greater than 6 miles; at night or in thick weather, not more than 4 miles. The end to be attained justifies the risk of torpedoes attack, and that risk must be taken. The escape of the Spanish vessels at this juncture would be a serious blow to our prestige and to a speedy end of the war." Memorandum No. 14, issued the next day (8 June), had to be read the first battle in the final successful result. It directed the battleships to take turns of two hours each, beginning at dark, in illuminating the harbor entrance with a search light. Later a second battleship was kept close to the illuminating ship so that the former could do any firing necessary without disturbing the illumination. The ship using the search light was kept not beyond two miles from the Morro and was frequently nearer. The effect was a constant lighting of the harbor entrance, making it possible for the smallest craft to appear without being seen. It was the main element, as Admiral Cervera mentions, in preventing any attempt to leave at night. Memorandum 20 of 15 June directed that the distance of four miles from the entrance during daytime should under no circumstances, even when coaling, be exceeded. The next day the batteries were again bombarded. It was clear to the admiral's mind that in themselves they were not to be taken as a serious obstruction to the fleet. The Vessels had arrived 13 June and from this time forward for many nights shook the vicinity with the explosion of her shells. While it cannot be said that they produced much actual damage, as there was so little to sustain damage, the batteries being but small objects for such practice, they certainly had a very marked moral effect upon those in the vicinity of their fall, the Plata, by Spanish accounts, being so violently lifted once that every one was thrown off his feet. The New Orleans and Texas had each by order of the admiral engaged singly the batteries and it was clear that they alone were not a protection, but the mines had to be reckoned with and Sampson urged the sending of the army, telegraphing that with 10,000 men the city and squadron could be captured in 48 hours. His only view of the case, and the correct one, was to land in the vicinity of the entrance, capture the batteries and occupy the adjacent positions, so that the fleet could at leisure lift or destroy the mines and enter the harbor.

When the war came the regular army of the United States had but 2,116 officers and 25,706 enlisted men. There were 25 regiments of infantry, 10 of cavalry and 5 of artillery. The bill approved 22 April declared all able-bodied male citizens from 18 to 45 liable to military duty; that the President might call upon each State and Territory for troops in proportion to its population; that the regimental and company officers should be named by the governors of the States, the general and staff officers by the President. On 23 April a call was made for 25,000 men. On 26 April additional enlistments in the regular army were authorized temporarily to a total of 62,597 men. In May the enrollments amounted to 124,776 men. A second call 25 May for 75,000 caused the volunteer army to reach in August its highest number, 216,256. Immediate steps were taken by the War Department toward concentration, chiefly at Chickamauga, Tenn., Camp Alger, Va., and at Tampa, Fla.; the last being selected as the point of departure of the invading force for Cuba, though many, including its general-in-chief advocated strongly making no move to invade the island until October on account of its supposed deadly summer climate. Provisions were brought to bear showing the fearful losses of expeditions of earlier centuries; with as much reason might one have
depricated living in London because it once suffered from the plague. It was, as we came to know from the experience of the marines at Guantanamo, a question of care; but this care could not be given to men who found the available experience on the part of officers and men, and the officers of the regular force were too few to count as against the rawness and ignorance of the vastly greater number of volunteer officers who had never known anything of the care of troops. The zeal and spirit of the army of volunteers, composed, as much of it was, of the best blood and intelligence of the country, were far from being an offset to their inexperience in the field. The army corps numbered eight, but the sixth was never organized. The fifth, under Major-General Shafer, at Tampa, numbering about 15,000 men; and a part of the eighth, under General Merritt (some 11,000 out of a total of 16,000 at San Francisco) were those actively employed before hostilities ceased. Shafer received orders 9 May 4 to move his command under protection of the navy and seize and hold Mariel on the north coast of Cuba, where territory ample to land and deploy army troops to be fully equipped, abundance of ammunition and food for men and animals for 60 days. Such orders indeed point a moral in the circumstances, and in themselves stand an all-sufficient reason for the general staff now in being. An expedition under Col. R. H. Hall had landed some arms and supplies for the insurgents and this was followed 11 May with one under Captain Dorst with 100 men of the First Infantry who attempted a landing 40 miles west of Havana but were repulsed. The failure was due partially to newspaper publicity, partially to the use of the Gussie, a very conspicuous and rather ridiculous looking side wheel steamer, as well known along the Cuban shore as Morro Castle. Sampson received a telegram 28 May announcing the intention to send 10,000 troops to Santiago which he was expected to convoy in person, and the War Department had at once begun to collect transports at Tampa. General Shafer telegraphed 1 June that he was progressing rapidly with loading transports and that he expected to be ready to start Saturday morning (4 June). The gunboats Annapolis, Helena, Cassine and Helena were at Tampa; and on 3 June those and the fleet arrived off westward of Dry Tortugas, where it was to meet by the battleship Indiana, the Detroit, Bancroft, Manning, Wasp, armed tugs Wompaluck and Osceola; the whole naval force to be under the command of the senior officer, Captain Taylor of the Indiana. On 9 June, however, Sampson received a dispatch from Key West via Nicolas Mole that the armed yacht Eagle had on the night of 7 June, when 15 miles north one-half east of the point de Cadiz Light, sighted to the north northwest an armed ship, a protected cruiser and two destroyers in fleet formation, and that the Eagle had scouted ahead until a vessel, which she thought was Eagle for a short time... Resolute confirms it. The next day Sampson received a telegram from the Navy Department that the army expedition was stopped temporarily on account of the report Eagle and Resolute; that the convoy was distributed to scour the straits and re-enforce the blockade, and he was directed to send two of his fastest armored ships to search through Nicolas Channel, and then to re-enforce the convoy. The telegram asked 5 Are you sure a Spanish cruiser is at Santiago? The only action taken by Sampson was to telegraph that he had no confidence in the report and that he considered it very unwise to suspend operations on this account, but even if it is found correct there is sufficient force to furnish convoy. Armored vessel was probably Talbot which was sighted Thursday at 9 A.M. by the Scorpion standing east; am confident no large ship escaped from here. 6 His view was correct, the armored ship as is now known was the English cruiser Talbot which left Havana that evening and was sighted by the Eagle at the same time with the Armeria and Supply under convoy of the Scorpion. Sampson sent for the log of the Scorpion, determined her position at the time and so telegraphed the Navy Department. To set the matter completely at rest Lieutenant Blue, who volunteered for the service, was landed 11 June at Aserradero, 15 miles west of Santiago, whence he went to Santiago and guided the ship by General Rabi to a hill overlooking Santiago Bay. He reported aboard his ship, the Susanne, again the morning of the 13th, after a journey of 70 miles (the same officer made a similar journey 25 June to locate each ship). Sampson's telegram and Blue's report fixed the question of starting the army expedition and on the 14th the force, 819 officers and 15,058 men, was under way. There is no need to dwell upon the shortcomings of transport organization for the movement of so large a body of men over sea; such difficulties are the natural outcome of the want of organization which existed for so many years. Almost the worst feature of the whole was the clothing worn, the men landed in the tropics in that in which they came from our coldest climates. The expedition arrived off Santiago the morning of 20 June, stopping by arrangement 20 miles south of Aserradero and the chief of staff, was sent by Admiral Sampson in the Gloucester to see General Shafer, and took with him a chart of the harbor to explain to Shafer Sampson's views with regard to his policy and his suggestion that the harbor be closed in order that the fleet might enter. General Shafer at the time entirely agreed with this view, as indeed his orders of 31 May from the War Department suggested. His ship, the Seguance, then steamed up to the squadron; Sampson and his assistant chief of staff Stauton, came aboard and a visit was paid to Garcia's camp near Aserradero. General Shafer apparently dropped the scheme of assaulting the batteries and determined to land on the beach, sighted to the north northwest 17 miles east of Santiago, used as a port for the shipment of ore by an American mining company. There were, however, no conveniences for landing, beyond a very small wooden wharf; the place was a mere indentation in the coast line, and protection from the usual southeast swell. Captain Goodrich of the Saint Louis was put in charge of the landing beginning 22 June, a task which was executed with great success. In all 20 boats, of which 12 were steam launches, were furnished from the fleet besides the 23
of the Saint Louis. A feat was made by the fleet and 10 of the transports of disembarking at Cabañas Bay, two miles west of the harbor. General Rábago de Aguilera and his two sons make a demonstration near by. The New Orleans, Detroit, Castine and Wasatch were stationed off Daiquirí, the Helena, Bancroft and Hornet at Siboney (seven miles nearer Santiago than Daiquirí), Scout and his two sons at Aguaire (three miles east of the port) and the Texas, Vixen and Scorpion at Cabañas; the extent of coast line covered was 32 miles. Great difficulty was experienced through the wretched conduct of many of the transport captains who were under no proper control and wandered over the sea at will. Hours were spent in finding some of them and when found they would insist upon lying miles from a shore which they could have approached with safety within a ship's length. By sunset 6,000 men were ashore with the loss of two drowned by the capsizing of a boat. The immediate descent by the Spaniards, under the fire of the fleet, of all the points about Daiquirí and Siboney, brought the transfer to the latter points of landing operations, and this was thenceforward the army base. Wheeler, the senior officer ashore (Shafter remaining aboard until the 29th), ordered Young to make a forward movement on the 23d, which brought about the skirmish of Las Guasimas, in which the 1st and 10th Cavalry and the Rough Riders, all of course unmounted, were engaged. The American loss out of the 904 in the fight was 16 killed and 52 wounded. The Spaniards retreated leaving 11 dead. On 24 June the last of the troops had been landed and two days later the field batteries were ashore. Shafter sent a telegram to the War Department gracefully acknowledging the services of the navy: "Without them I could not have landed in 10 days and perhaps not at all, as I believe I should have lost many boats in the surf." More difficult, however, was the question of getting supplies ashore as the fires were burning with their crews had to return to their ships; and the army had a hand to mouth existence for days which must have been a serious element, through ill nourishment, in the development of the sickness later. On the 25th and 26th Garcia's force of 2,978 was transported from Aserradero; on the 27th the 33d and part of the 34th Michigan arrived under Brigadier-General Duffield from Camp Alger and went into camp at Siboney. By 30 June the American force was in face of the Spanish positions to the east and northeast of Santiago and in the afternoon a council was called in which plans were made for the battle of next day, 1 July; Lawton's division to assault El Caney at daybreak, and afterward take position on the right of Wheeler's and Kent's divisions and assist in the general attack on the lines to the east of and near Santiago. It is impossible in the space to deal with the details of the battle of the 1st with the tact which the events disclose; credit upon both victor and vanquished. The American force was greatly superior in numbers, the force under Generals Lawton, Chauffe, Ludlow and Colonel Miles (commanding a brigade) reinforcement as well as the day before, commanding El Caney, numbering 6,654, against about 500 Spanish, who, occupying a strong defensive position, maintained themselves most heroically, losing 300 killed and wounded and 150 captured. Among the killed were General Varas de Aguirre and his two sons. The American losses at this point were 88 killed and 355 wounded. The action was most ill-advised: Had Lawton merely compelled the small force at El Caney and joined on the right at once, Santiago, with all probability, would have been carried at once. The attack upon the main Spanish lines east of and near the city, along the crest of San Juan Hill, was made by the dismounted cavalry division under General Wheeler and the first infantry division under General Kent, the whole force numbering 8,336 men. Lieutenant Miley, of Shafter's staff, gives the numbers of the Spanish as 750 in the most advanced position on San Juan Hill and 3,500 immediately in the rear. There were about 1,000 men ashore from the Spanish squadron under Cervera's chief of staff, Captain Bustamente, who was mortally wounded. San Juan Hill was occupied by the Americans after a most courageous and bloody struggle with the loss of 135 killed and 951 wounded. The casualties of the day were thus over 10 per cent of the force engaged. It may confidently be said that few armies would have won success under the immense disadvantages to which Americans were subjected. Suddenly transported to a tropical climate, with clothing of a character in itself toadden a man into illness, with the scantiest of rations for days, subjected daily to torrential rains, fighting through the thickest of jungle, opposed by an entrenched foe with smokeless powder, it required to win men such as composed this force, the finest in the writer's opinion, through its practical experience and training, ever put into the field. Nor must the disabilities of the Spanish be overlooked. They were ill-fed, had long undergone the depressing effects of the tropics and were in no condition to meet a determined foe. They showed the obstinate courage always shown by their race on the defensive, and sustained to the full its honor. Admiral Sampson, at the request of General Shafter, had supported, on the 1st, a demonstration at Aguaire by a force commanded by General Duffield; the New York and Oregon fired a number of eight-inch shells over the hills in the direction of Santiago and the ships in the bay. The evening of this day Colonel Escario with 3,500 men entered Santiago from Manzanillo, a reinforcement which in the existing destitution but added to the difficulties of the Spanish. Sampson at Shafter's request bombarded again the batteries at the entrance 2 July. Shortly after, Shafter sent a message urging Sampson to force an entrance, to which reply was made that this was impossible until entrance was cleared of mines; a work of some time after the forts should be taken. Shafter stated it was impossible to take these and if as difficult as what he had been pitted against, it would require time and great loss of life. If am at a loss to see why the navy cannot work under a destructive fire as well as the army last night's loss was over 500 men. By all means keep up fire on everything in sight until demolished. I expect,
however, in time and with sufficient men, to capture the forts along the bay. Sampson at once resolved that he could not prevent his entrance, but that it was a question of mines, to attempt to go over which would certainly result in the sinking of one or more ships, thus preventing further progress by the fleet. He said: "It was my hope that an attack on your position on the shore batteries from the rear would leave us at liberty to drag the channel for torpedoes. If it is your earnest desire that we should force our entrance I will at once prepare to undertake it. I think, however, our position and yours would be made more difficult if, as is possible, we fail in the attempt." The *Resolute*, carrying 40 mines, was at once ordered from Guantanamo and Sampson purposed, as soon as the arrangements could be made for countermining, to bring up the battalion of marines, with which and with those of the squadron, about 1,000 in all, he proposed to assault the western side of the entrance, the army to take the eastern. His chief of staff went to Siboney to arrange for a countermine. It was reported that an armistice between the two commanders-in-chief. This consultation was set for the next morning, Sunday, 3 July. During the night there were several large fires on the distant hill tops, evidently the burning of blockhouses. The *Gloucester*, as soon as her searchlight duty had ended at 4 A.M. (3 July), left for Guantanamo for coal. The ships present were in order from east, the *Gloucester*, *Indiana*, *New York*, *Oregon*, *Iowa*, *Texas*, *Brooklyn*, *Vixen*, the armed yacht *Hiss*, the torpedo boat *Ericsson* and the transport *Resolute* carrying the mines, which had been brought the day previous from Guantanamo. At 8.30 A.M. the *New York* had begun to turn toward Siboney, but seven miles from her position, to carry Sampson to the meeting with General Shafter. She had been fairly on her course from 30 to 35 minutes when, attracted by the sound of a gun from the Socoa battery, the Spanish ships were reported leaving the harbor. The *Vixen*, then seven and a half miles east of the harbor entrance, at once turned, hoisting the signal, "Close in toward harbor entrance and attack vessels." On account of the position of the sun, behind the signal, it is not probable that the signal was read by either the *Gloucester* or the *Indiana*, both of which were nearer to the *New York* (the former less than half the distance at the time of the latter's turning) than to the *Brooklyn*. The *Theresa* and *Colon*, one flying the admiral's flag, the other unmistakable because of her peculiar features, were named by the signal quartermaster as they came out. After the fourth (the *Oquendo*) there was a very appreciable interval before the destroyers appeared, the last emerging about 10 o'clock. Several of the ships hoisted almost at the same time the signal "Enemy's ships escaping," though the *Iowa* seems to have been the first, as from her position she had the best view into the harbor. All the ships at once closed in and began firing on the retreating Spaniards who stood west close in shore. The American ships naturally converged to the north, taking up a more westerly course as the Spanish ships moved westward. The *Brooklyn*, however, made at this juncture the move for the coast, and the way to the west to the Spaniards, and endangering the *Texas*, which backed her engines to avoid collision. One after the other the *Theresa* and *Oquendo* were seen to turn inshore after the *Vixen* and the *Iowa*, but they were destroyed in the small bight four miles west of Santiago largely by the fire of the *Gloucester* which engaged them with the utmost intrepidity. They were also fired at by the *New York*. The *Vixen* and *Colon* were still steaming west but the former hauled down her colors and turned in to the beach at Aserradero, 14½ miles from the harbor, crossing the bows of the *New York* within a few hundred yards. The flagship signaled the *Indiana* to return off the port. The *Iowa* remained near the *Vixay* with the *Ericsson* and *Hiss* to rescue the *Vixay*’s crew. The *Gloucester* rendered the same service to the *Theresa* and *Oquendo*, assisted later by the *Indiana*, *Iowa* and *Hiss*, a duty which was rendered under great difficulties and danger. The chase of the *Colon* continued the ships in pursuit of the *Brooklyn*, *Oregon*, *Vixen*, *Texas* and *New York* (taken in order from seaward). The *Oregon* began firing her 13-inch guns at 10,000 yards range and the shot went over; her eight-inch guns were also tried, but fell short at 9,500. The *Oregon* reduced the range to 9,500, to 8,500, then 9,000, when at 1.20 the *Colon* hauled down her colors, turned inshore and ran her bows on the steep beach where emptied the little river Turquino under the mountain of the same name, the heightest in Cuba (8,400 feet). The nearest ships had still over five miles to run to reach this point and on arriving near, Captain Cook of the *Brooklyn* boarded the *Colon* and received her surrender. He stopped on his return and reported aboard the *New York* which was the third ship to arrive, having passed the *Texas* and *Vixen*. The *Oregon* was ordered to take charge of the *Colon*. The ship, however, was clearly sinking. All her sea valves had been opened and though every effort was made to save her, and when the rising tide had floated her during the evening she was pushed hard ashore by the *New York*, she turned over, and was sunk and there remains. The *Resolute*, ordered by the commander-in-chief to report at Guantanamo and led the exit of the Spanish squadron, had met off Daquiri an Austrian man-of-war whose flag was so similar to that of Spain that the official memorandum had been issued in expectation of a visit from the Maria Theresa, which this ship turned out to be. The *Resolute*, taking the ship for Spanish, turned westward, warned the *Harvard* at Siboney, which also sighting the stranger stood west with the same news. The *Resolute* arrived at Rio Turquino with the news, the *Brooklyn* was ordered to investigate the report and proceeding to the eastward met the Austrian vessel and after some delay ascertained her character. The distance from the Santiago entrance to the point where the *Colon* was beached is 52 nautical miles. Taking the

*The log of the *Texas* is inaccurate in stating that the *New York* and *Vixen* came upon the scene. The writer has a photograph taken from the *Texas* showing the *New York* passing the *Vixen* and from a direction which shows the *New York* appearing on the horizon, opening the way to the west to the Spaniards, and endangering the *Texas*, which backed her engines to*
United States—The War With Spain (39)

ships successively from the east to west positions, the New York was 59½ miles, the Oregon 53, the Texas 50¼, the Brooklyn 49½ miles from this point when the Spanish ships came out. After a series of four and one-fourth miles east of the Colon's turning in point, were the Oregon 13.37 knots and for the Brooklyn 12.06; for the New York to the time of stopping at 2 P.M. at the point of beaching (allowing five minutes to turn) 13.73; the Texas to the same point, and allowing one mile lost in backing and her time of arrival as 2:05, 11.72 knots.

Admiral Cervera and a large number of his officers and men were received on board the Iowa, but all these as well as those on board the Resolute from the Colon were transferred to the Harvard and Saint Louis later; 1,615 men were taken to Portsmouth, N. H., and interned; the larger number of officers were taken to New York. The total Spanish loss was 353 killed or drowned and 151 wounded. The American loss was one man killed aboard the Brooklyn. There was the same disparity of damage as at Manila, in no wise to be accounted for by disparity of force. The Spanish were greatly outmatched in heavy guns, having but 6 11-inch against the 14 12- and 13-inch and 38 8-inch of the Americans; but in rapid fire of lesser calibre, which should have counted in the matter of destruction, they were practically equal, having 10 6-inch, 30 5-inch and 6 4.7-inch against the American 14 6-inch, 12 5-inch and 18 4-inch.

The next evening, 4 July, at midnight the searchlights showed a large ship in the entrance to Santiago Harbor. This, as known later, was the cruiser Reina Mercedes sent down to block the channel. She was sunk by the gunfire of the Texas and Massachusetts and later raised and sent to the United States for parts, they were practically equal, having 10 6-inch, 30 5-inch and 6 4.7-inch against the American 14 6-inch, 12 5-inch and 18 4-inch.

The firing on shore had been renewed the morning of the 3d, but at 8:30 A.M. General Shafter sent a letter to the Spanish commander saying that unless he should surrender he would be obliged to shell the city and allowing until 10 next morning for women and children to leave. At 6:30 P.M. a letter was received declining surrender, but Shafter on request of the various consuls delayed further action until the 5th. On 6 July Sampson's chief of staff visited General Shafter giving the facts of the destruction of the Spanish ships and the ability of the squadron to shell his position with 8- and 13-inch shell; it urged surrender, suggesting a reference of the situation to his government, in the meantime the cessation of hostilities to continue. On 8 July the Spanish general offered to leave Santiago with arms and baggage provided he should not be molested before reaching Holguin. This was referred to Washington and was declined. At 4:30 July the true was ended and firing began on both sides, the heavy shells of the navy during this and the next day falling in the town and destroying 57 houses. At 2 P.M. the 11th the firing ceased and was not renewed. General Toral was informed of the heavy American reinforcements, and surrender was again demanded, the government of the United States offering to represent the entire Spanish command to Spain. A surrender was agreed upon 14 July, this to include not only the troops in Santiago but all those of the department, a total of about 24,000. The city was delivered to the Americans 17 July. The result was fortunate for the American force in view of the sickness which had rapidly developed through the constant rains, bad shelter and insufficient food in the earlier days of the investment. The situation became such that the general officers united in advising the removal of the army from Cuba. On the other hand the marines at Guatanamo, under the excellent conditions of shelter and food and water supply which they had been able to keep up, were remarkably healthy, the sick list not rising above that which was usual at home ports; the same can be said of the fleet, which kept its normal health. General Miles had arrived off Santiago 11 July in the Yale, the first reinforcements reaching the city as the surrender of Santiago was determined an expedition to Porto Rico under his command was organized, which sailed 21 July with 2,000 additional men. The battleship Massachusetts and 13 other naval vessels were detailed for service with the expedition.

There were in Porto Rico 8,223 regular Spanish troops and 9,107 volunteers. The destroyers Terror and small cruiser Isabel II were at San Juan, the four thousand belonging to the transports had been in action with the Saint Paul 22 June. She had been struck by two five-inch shells, had three men killed and her machinery so damaged that she returned to port with difficulty. The Gloucester seized Port Guanica 25 July and Ponce surrendered to the Dixie 28 July, in each case without appreciable resistance. Both places were occupied by American troops. Reinforcements were rapidly arriving, there being available by the end of July a force of 44,500 troops (rising by the end of August to 16,973). Advance was made from Guanica, Ponce and Arroyo. Several skirmishes ensued, in which three enlisted men were killed and four officers and 36 men wounded. The conclusion of military hostilities 12 August prevented the more serious work which would probably have been met in carrying the Spanish intrenched positions in the advance to San Juan.

General Merritt in command of the expeditionary force to the Philippines had arrived 25 July. Accompanying him was a force of 4,847 officers and men, part of which did not arrive until 21 July. General Anderson with a force of 2,501, arriving at Cavite 30 June, and by that under Gen. F. V. Greene of 3,586 July 17.

The situation at the time of General Merritt's arrival was quiescent, but was seriously complicated by the presence of a Filipino army of probably 12,000 well-armed men under Aguinaldo, who had proclaimed an independent government. The investment, however, proceeded without reference to this force and under the strain of considerable firing from the Spanish
lines at night. A joint demand on the part of the military and naval commanders-in-chief for surrender was made 7 August. The governor-general declined to refer to his government. This was declined by the American commanders and the city was taken with but a show of resistance, 13 August. The total army casualties during the investment and assault were 17 enlisted men killed and 10 officers, and 96 men wounded. Commodore Watson, relieved in the second command of the blockade on the north coast of Cuba by Commodore Howell, had been assigned 7 July to the command of the squadron to join Admiral Dewey in the Philippines. This was to proceed, until their separation in the eastern part of the Mediterranean, in company with the whole available armored force under Admiral Sampson. The protocol suspending hostilities, signed 12 August, of course ended the expedition and Sampson with the battleships and armored cruisers of his fleet arrived at New York 20 August, meeting an improvised reception which in spontaneity, magnitude and picturesqueness, compared as they were not at all the same as those of driving the tacking to a victorious fleet, has never been equaled in our country. The total losses had been in the army 279 killed, 1,465 wounded; in the navy 16 killed, 68 wounded.

The Spanish War, short and comparatively bloodless as it was, lifted the United States to a new plane. They became at once one of the dominant factors in world politics. Whatever the divergence of views, ethical or financial, in respect to the territory claimed, that claim, as it has been, is none as to the vastness of the change, considered politically. The primary cause of the war, the freeing of Cuba, has become a secondary event in face of the great changes wrought in our relation to the Caribbean and more particularly to the momentous question of dominancy in the Pacific. The ownership of Hawaii and the Philippines (the former a direct outcome of the war also) are elements in this natural destiny of the highest importance. From the viewpoint of expansion, for the world of greater import than the future of eastern Asia, the war did much to put the United States in a position to meet the coming emergency. It also gave us a navy, an adequate army and the necessary bases for action, if action be forced upon us.

F. E. CHADWICK, Formerly Rear-Admiral United States Navy.
these claimed that a part of the section north of the Ohio was within its original grant and should not be taken from them. And this was one of the many causes of dissatisfaction which finally culminated in the War of the Revolution. Thus when the Revolution War closed there were several territorial questions to be settled, in making the peace treaty: first and most important, whether the country north of the Ohio was to remain a part of Quebec, or be ceded to the United States as a territory north of Spanish Florida; second, whether the section which had been taken from Georgia at the southwest and added to Florida should be restored as a part of the territory of the United States, in view of the fact that Great Britain had meantime receded Florida to Spain; and, third, what should be the boundary at the extreme northwest. Virginia had held that her original charter gave her the territory north of the Ohio to the Mississippi River, including that lying west of the lakes, and besides that was the important fact that it had been occupied, in some degree at least, by the colonial forces during the War of the Revolution. The result of these uncertainties as to boundary was that the commissioners sent to Paris to negotiate a treaty of peace with Great Britain were instructed to claim all of the territory in question, but to be guided by the French government in their negotiations. These commissioners, Benjamin Franklin, John Adams, John Jay and Henry Laurens, soon after their meeting, found a disposition on the part of the French government to advise that the British retain the country north of the Ohio, and even that the country south of the Ohio, between the Cumberland Mountains and the Mississippi, be declared neutral territory for the use of the Indians. As a result, the United States commissioners broke off their relations with the French and negotiated the treaty according to their own views. By the boundary lines finally determined they obtained the recession to the United States of the small strip at the southwestern corner, now the southern part of Alabama and Mississippi, also the entire country north of the Ohio to the Great Lakes and that section west of the Great Lakes to the Mississippi and as far north as the present boundary of Wisconsin; this was to be the first additions to the territory of the United States, since all of the area in question was more or less in dispute under the latest acts of the British government prior to the War of the Revolution and the organization of the 13 colonies as the "United States of America."

The next addition to the territorial area of the United States, and that which is usually spoken of as the first addition to the territory of the United States, was the Louisiana Purchase. France had included the city of New Orleans and a small tract of country on the eastern bank of the Mississippi near its mouth in the territory ceded to Spain when she abandoned the continent of North America in 1763. This gave the control of the mouth of the Mississippi to the nation controlling this territory. Following the close of the War of the Revolution, the area west of the Alleghenies had been ceded to Spain, so it was essential that this population should have an opportunity to reach the sea by the Mississippi River. An agreement was made with the Spanish government in 1795 by which citizens of the United States should have the privilege of depositing their goods in New Orleans for transshipment abroad, without payment of duties, and that incoming goods should have similar privileges. In 1800, however, it was known that Spain had ceded the Louisiana country to France, by a secret treaty made in 1800, and this fact caused great alarm among the people of the United States, lest their privilege of reaching the ocean through the Spanish colonies should be lost. A resolution was introduced in Congress authorizing the President to seize the city of New Orleans, but a substitute was adopted authorizing the President to send a commission to France and offer $2,000,000 for the city of New Orleans. James Monroe was sent as the special commissioner and authorized to co-operate with our Minister to France, Mr. Livingston. Napoleon, who was about entering upon war with the English, saw that his great possessions in America would be a source of weakness to him in such a war, and offered to sell the entire Louisiana territory to the commissioners. While they were not authorized to make such an agreement, they determined to assume the responsibility of doing so, and after some negotiation an agreement was made by which the entire territory was to be ceded to the United States for the sum of $15,000,000, of which $11,250,000 was in bonds of the United States, the remainder to be paid to citizens of the United States having claims against France. The treaty reached the United States in July 1803, a special session of Congress was called in the following October and after two days of discussion the treaty was ratified, and in December the city of New Orleans and the vast territory thus acquired was turned over to the United States. The population at that time was about 100,000, of which about one-half were whites, 10,000 mulattoes and 40,000 negroes. See United States — The Louisiana Purchase.

The next addition to the territory occurred in 1810-12, in the form of a small section of territory which had been a part of West Florida during the time that Great Britain controlled Florida. After the recession of Florida to Spain by Great Britain, the English citizens of the western part of that province were satisfied, and especially so in view of the reports that Spain had sold West Florida to France. They held a convention in 1810, declaring themselves a free and independent State. A communication was sent to the President of the United States, who instead of recognizing the new republic directed the governor of New Orleans territory to take possession of the territory, basing this action upon a claim that the territory had been sold to France and should have been included with the cession of Louisiana territory by France. The annexation does not seem to have been seriously objected to by the people of the area in question, but was met with protests on the part of both Spain and Great Britain. No further action was taken, however, and in 1812 the control of the United States was extended to another small section lying east of that occupied in 1810, this action being based upon a claim made upon which the occupation of 1810 was made. These two additions gave to the United States the small section by which Alabama and
Mississippi now have a frontage upon the Gulf of Mexico.

The next addition to the territory of the United States, which is usually known as the second, was the purchase of Florida from Spain, in 1819. Florida had been continuously in control of Spain from the discovery to 1763, when Spain ceded it to Great Britain in exchange for a part of Cuba, which Great Britain had seized during the war with France, because of the aid which Spain gave to France in that war. In 1783 England ceded Florida to Spain, and in 1819, when Spain, in its turn, ceded the territory to the United States in payment of the debts it owed the United States, there was a similar transfer of the territory to the United States.

Florida was greatly desired as a part of the United States, both for the purpose of extension of the slave area and because of the fact that the presence of this foreign territory alongside of that in which slavery existed resulted in constant friction between the people of the two sections. The escaping slaves from the adjacent territory of the United States found Florida a safe retreat, and there was also much bitterness over the fact that Florida had been made the headquarters of a British force during the war of 1812-14. Repeated offers were made to the Spanish government for its purchase but without avail, but finally, in 1819, the Spanish government of the U.S. of America, with which Florida was to pass to the United States on payment of $5,000,000 in full extinction of the claims of certain American citizens against the Spanish government. The treaty was ratified in 1821 and the territory taken possession of by the United States, which in 1822 established the "Territory of Florida." See FLORIDA.

The next addition to the territory of the Union was that of Texas. It was desired as a part of the Union, if possible, for the extension of slave area and slave States. It was formerly a part of the Spanish colony of Mexico. In 1810 the people of Mexico revolted against Spanish rule, and in 1822 were successful, and in 1824 the independent republic of Mexico was established. The two provinces, formerly known as "Texas" and "Coahuila," were made a single state of the new republic of Mexico, under the name of Texas. The desire of the people of the United States for this territory led to an offer of $1,000,000 to the Mexican government for its purchase in 1827 and another of $5,000,000 in 1829, but each was rejected. Meantime a large number of persons from the southern part of the United States settled in Texas, and in 1833 Texas attempted to obtain a peaceable separation from Mexico and independence, but without success. In 1836 Texas seceded from Mexico and established itself as a republic. In the election for President which followed, an almost unanimous vote was cast for annexation to the United States, but the application for admission, made by its Minister at Washington, was not favorably received by Congress. In 1844 another vote was made but rejected by the Senate. The Presidential election in the United States which soon followed hinged largely on this question, and the sentiment was apparently in favor of annexation, and in January 1845 Congress passed a resolution giving "the consent that the territory properly included within the Republic of Texas may be erected into a new State to be called Texas." This resolution was accepted by the Congress of Texas and by popular vote in that republic, and in December 1845, a joint resolution was passed in the Congress of the United States admitting Texas as a State. Thus, Texas passed from the position of an independent republic to that of a State of the United States, without a treaty or without passing through the Territorial stage which usually preceded the formation of States of the Union. See UNITED STATES—ANNEXATION OF TEXAS.

The next great step in the development of the territory of the United States was the favorable settlement of the pending question between the United States and Great Britain regarding the control of the Oregon Territory. This territory had been claimed by Spain, Great Britain and the United States on grounds of exploration, and been jointly occupied by Great Britain and the United States after 1818, pending a settlement of their respective claims. Meantime the treaty of the United States with Spain, made in the purchase of Florida, had resulted in the abandonment by Spain of her claim and the fixing of the boundary line between the Oregon country and Spanish territory, which then included all of what is now known as California, New Mexico and Utah. This strengthened the claim of the United States. In 1846 the demand of the people of the United States for a settlement of the boundary line became so great that there was serious talk of war with Great Britain to determine the question. Finally, in the year 1846, a proposition was made by the British government fixing the boundary line on the 49th parallel and the Straits of Fuca. This was accepted and the Oregon country south of that line became an undistruped part of the United States. See NORTHWEST BOUNDARY.

The next addition to the national territory was what is known as the Mexican cession. A quarrel had arisen between Mexico and the United States, as to the boundary of Texas, regarding the boundary line between that area and Mexico, the Mexican government holding that the Nueces River was the southern boundary line of Texas, while the United States held that the Rio Grande was the boundary. The result was the war with Mexico, in which the United States was successful in every engagement, and it was followed by the cession by Mexico of the great area which includes the present States of California, Utah, part of Colorado, a small part of Wyoming and the Territory of Arizona and a part of New Mexico. The eastern part of New Mexico was jointly claimed by Texas and by the United States as a part of the Mexican cession, and the claim and the control of about 125,000 square miles of Texas was settled by payment to Texas by the United States of $10,000,000. The area thus purchased from Texas now forms part of New Mexico, the so-called land between Colorado and Wyoming. The sum paid to Mexico for the magnificent area which was ceded to the United States at the close of the war was $15,000,000 in cash and a settlement of claims of citizens of the United States to the extent of $3,200,000.
The last addition to the contiguous territory of the United States was what is known as the Gadsden Purchase (q.v.). It is a comparatively small and unimportant strip of territory lying between the Mexican cession and Mexico, south of the Rio Grande, by which the United States was claimed by both Mexico and the United States, and the dispute was settled by a payment of $10,000,000 by the United States for the territory. The purchase was negotiated by the United States Minister to Mexico at that time, James Gadsden, hence the title, *Gadsden Purchase.* The transfer occurred in 1853.

The first addition of non-contiguous territory occurred in 1867 by the purchase of Alaska (q.v.). The territory had been acquired by Russia, by discovery in 1741 and settlement in 1784, and a considerable industry in furs and shipbuilding developed. After the discovery of gold in California the Russians in Alaska traded with the people of San Francisco, and the development of transportation systems between California and the eastern coast, and in this manner the people of San Francisco became aware of the value of the fur business, and the price of furs was raised. Merchants in metals. The California members of Congress urged its purchase; bills to that effect were introduced in Congress, negotiations were opened with Russia through its Minister in Washington, and after considerable discussion the agreement was made and the purchase consummated in 1867, the purchase price being $7,200,000. The Russian government was moved to this sale of its territory in part by its disputes with Great Britain regarding boundary lines between Alaska and British North America, and chiefly by the great distance at which the territory lay from its possessions in Europe and Asia, Alaska has proved a very important contributor to the requirements of the United States, in furs, salmon and other fish, copper and gold.

The Territory of Hawaii (q.v.) was the first island territory annexed by the United States. Negotiations for the annexation of these islands began in 1854, when a treaty of annexation was framed under the direction of the President, but the sudden death of the king of the islands before its completion terminated the negotiation. In 1876 a reciprocity treaty was made with the islands by which the products of the islands were admitted free of duty into the United States and those of the United States admitted free into the islands, and this developed commercial and other relations of the two communities very greatly. In 1893 a revolution occurred in the islands and application was made to the United States for annexation and a treaty framed and laid before Congress. It had not been acted on, however, at the close of the term of President Harrison and his successor, President Cleveland, withdrew it. On the 4th of March, President McKinley, signed the application for annexation was renewed, and after some delay Congress passed a joint resolution annexing the islands, and they were subsequently given a Territorial form of government and made a customs district of the United States, so that all the advantages between them and the United States free of duty, just as it does between the various States of the Union. The trade between the Hawaiian Islands and continental United States aggregated (1919) $136,591,198, the merchandise sent from the islands being chiefly sugar.

Porto Rico (q.v.), Guam (q.v.) and the Philippine Islands (q.v.) were seized by the United States during the war with Spain, inaugurated in 1898 for the purpose of compelling that government to terminate her oppression of the people of Cuba. At the close of that war, in which the United States was successful, the islands were transferred to the United States by Spain, on the payment of $20,000,000 to the United States. While the treaty did not specify the precise purpose of the payment of the $20,000,000, it was understood that Porto Rico and Guam were retained by the United States under the rules of war, and that the payment of the sum named was with reference to the Philippines. Porto Rico has been made customs district of the United States and the commerce between that island and the United States is not subject to any customs duty. It has been estimated from about $4,000,000 per annum, before the transfer, to about $22,000,000 in 1903 and $128,913,436 in 1919, the merchandise sent to continental United States being chiefly sugar, tobacco and fruits. Merchandise coming into the United States enters free of duty, and merchandise from the United States enters the Philippines duty free. The tariff of the Philippines differs from that of the United States; in general, the import duties on products from foreign countries, but all merchandise between the islands and continental United States passes duty free in both directions, as does also merchandise passing to and fro between Porto Rico and the Hawaiian Islands; while the Philippine Islands trade bears the same relation to that of Porto Rico, the Hawaiian Islands and Alaska as to continental United States. Porto Rico is governed by officers appointed by the President and a legislature elected by the people. The Philippines were governed by a commission appointed by the President of the United States, the commission being made up in part from citizens of the islands and a part from citizens of the United States, but in 1916 the commission was abolished and a legislature created to consist of a Senate of 24 members and a House of Representatives of 90 members. The trade between the Philippines and the United States amounted in 1919 to $151,461,636, the chief exports of the Philippines to the United States being cocoanut oil, copra, manila hemp, sugar and tobacco.

The island of Tutuila, one of the Samoan group in the south Pacific, passed under the control of the United States in 1899. The group had been for many years under a joint protectorate of the United States, Great Britain and Germany, but in that year the joint protectorate terminated, and the island of Tutuila, whose people had long ago expressed a desire for annexation to the United States, was annexed. The island is small, its chief importance being the possession of a fine harbor, the best in the south Pacific. See SAMOAN ISLANDS.

Panama Canal Zone.—The United States by a treaty with the republic of Panama in 1903 obtained the privilege of constructing a ship canal across the Isthmus of Panama and the control in perpetuity of a strip of land 10 miles
wide for its construction, maintenance and operation. The sum paid for this privilege was $10,000,000, and in addition there was to be paid the further sum of $250,000 per annum as long as the occupancy should continue. The United States did not acquire title to the territory but merely a perpetual right of occupation, use and control. (See Panama Canal.)

The area, however, is classed as a part of the non-contiguous territory of the United States in the United States Statistical Abstract, issued by the Department of Commerce.

Virgin Islands.—The islands of Saint Croix, Saint Thomas and Saint John, formerly known as the Danish West Indies, purchased by the United States from Denmark in 1917, for the sum of $25,000,000. They had been long a subject of negotiation between the Danish government and that of the United States at prices ranging from $5,000,000 to $15,000,000, but the several propositions failed to receive the necessary legislative action for ratification. In 1916 war conditions rendered it advisable that the islands be promptly acquired in order that the United States government should be able to fortify and occupy as a naval base the harbor of Saint Thomas, known as the “Gibraltar of the West Indies,” and considered of especial importance in the protection of the Panama Canal. Mr. Wilson negotiated a treaty of purchase, naming a price of $25,000,000, and recommended that Congress ratify it, which it did, and the $25,000,000 was promptly paid and the title to the islands passed to the United States on 31 March 1917. Domestic products of the islands enter the United States free of duty and United States products enter the islands free of duty. A governor was appointed by the United States government to administer the laws in force in the islands pending legislation by Congress for their permanent government. The trade between the United States and the islands amounted in 1919 to $3,192,132.

(a) Includes interest payment.
(b) Of which $3,250,000 was in payment of claims of American citizens against Mexico.

41. STATE CONSTITUTIONS (1789-1919). The American Union is composed of 48 States or commonwealths, each of which has a body of fundamental law known as a constitution. The sphere of government activity which may be covered by the State has been negatively defined in the Constitution of the United States (Article X of the amendments):

"The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people." Among these powers which thus inhere in the people of the several States are those of determining the form which their own government shall take, with the sole provision that it must be republican in form and of drafting their own fundamental law, subject to limitations imposed by the Federal Constitution. Within the limits of the power thus defined, the State is supreme and in no way subordinate to the national government. The vast scope and sovereign character of this State activity seemed to substantiate the doctrine of State sovereignty. But the Civil War definitely and finally decided that the State is not sovereign, although it exercises many of the powers usually regarded as sovereign. The accepted interpretation of the relation of State and Federal governments under the Constitution is that neither is sovereign. The people of the United States are alone sovereign. They have made both the Federal government and the States their agents for certain specified purposes and for those purposes each is supreme and uncontrollable by the other. The organs of the State are concerned solely with those powers reserved to the States and do not possess and cannot have imposed upon them by the Federal government duties which are given by the Constitution of the United States to that government. The Constitution of the United States places upon the State a few, but very few, duties in connection with the conduct of the Federal government. The most important of these are those of electing the United States senators; of conducting the election of Presi-

dential electors and of members of the House of Representatives, and of providing a militia for Federal use in certain contingencies. Disregarding, for the purpose in hand, these limitations and exceptions, we may treat the State constitutions as if they operated within the several States to the exclusion of all other authority.

The closing years of the colonial period saw the 13 colonies in the possession of constitutions either written, or unwritten, which were in almost all respects essentially similar and which were, on the whole, well adapted to the needs of the inhabitants. The severance of the political ties which had bound the colonies to Great Britain made necessary the adoption of bodies of fundamental law for the new States. With the exception of Rhode Island and Connecticut, all of the original States had adopted new constitutions when the present Federal Constitution went into effect. In Massachusetts a convention (1780) draughted a constitution and submitted it to the people for ratification. New Hampshire adopted her first constitution (1776) without popular ratification, but submitted a second to the people by whom it was adopted in 1784. Rhode Island and Connecticut, whose colonial charters granted in 1662 and 1663, needed few changes to adapt them to the needs of Statehood to add little more than to substitute the name of the people for that of the king and continued these documents as their constitutional law until 1842 and 1818 respectively. In the remaining nine States the constitutions were in every case adopted by conventions, without submission to popular vote, although in only one State, Delaware, had the convention received a formal mandate for so doing. In each of these States, except Delaware, the convention exercised the powers of a legislature as well as those of a constitutional convention. These Revolutionary constitutions were very short and most of them hastily constructed. They contained little besides a bill of rights and an outline of the frame of government. Their chief purpose was to define the fundamental principles of civil liberty and "to distribute all, rather than to withhold any, of the powers of government."

The history of the colonial period had taught the people that the legislature was the protector of their rights and liberties and that the other two departments were to be feared and guarded against as the representatives of the English Crown; hence, in framing their new constitutions they gave predominant weight to the legislature and defended the rights of the people against executive and judicial encroachment by provisions in their declarations of rights and further by subordinating both, and especially the former, to the legislature. In eight of the original States, the governor was appointed by the legislature and in Massachusetts alone did he receive the veto power. The highest judges were in no case elected by the people. In nine States they were chosen by the legislatures, in three by the executive council and in one by the executive council alone. The composition of a freehold or the payment of a tax were qualifications required of all voters, with a few minor exceptions, as in Rhode Island, where the eldest son of a voter who qualified by the possession of property of the value of $2,000 or of $100 a year, could vote, or in Pennsylvania, where the sons of a taxing voter were likewise privileged to vote. South Carolina alone imposed a religious qualification: belief in God. In the five States where the governor was elected by the people, a higher property qualification was demanded for the electoral franchise in voting for governor than for members of the legislature. Nearly all of the States required additional qualifications for voting. In six States, property qualifications, ranging from a freehold to $50,000, were demanded of the governor and six prescribed a religious qualification for the same office. New Hampshire, Maryland and North Carolina permitted none but Protestants to occupy the governor's chair; Massachusetts none but Christians, while Delaware made belief in the Trinity, and Pennsylvania and North Carolina belief in God and in the divine authority of the Bible, necessary qualifications.

Four fairly well-defined periods can be traced in the development of American State constitutions since the Revolution: (1) From the Revolution to the War of 1812; (2) from the War of 1812 to the end of the Civil War to the last decade of the 19th century; (4) from about 1890 to the present time. These periods are somewhat overlapping but while not exactly defined will prove convenient for a study of the growth of State activity. The first period may be characterized as that in which the legislature was supreme. The legislature, historically the guardian of popular rights against the British government, continued to be regarded as the best and safest repository of power. The strong colonial executive was replaced by a governor having very slight administrative duties and even less discretionary power. He was elected by the legislature in most of the States, had the veto power only in Massachusetts and was unable to adjourn, prorogue or dissolve the legislature. The constitutions were based upon a belief that the people had nothing to fear from the legislature, but that they should be safeguarded against the executive and judiciary.

The second period experienced most far-reaching political and social changes in the United States. Democracy was everywhere triumphant and American political institutions, including State constitutions, were very thoroughly democratized. The earlier period placed marked limitations upon the privilege of voting, while the second nearly everywhere granted manhood suffrage to whites. State governors and judges were generally elected and the judicial term was shortened. The governor began to acquire the veto power. The confidence reposed in the legislature had been, in a sense, misplaced. In the early part of the second period there was much reckless management of the finances, money was squandered on the most chimerical schemes for internal improvements, charters were granted for banking institutions that had little or no capital, special legislation of the worst sort was passed, meritorious appointments controlled, unmerited exemption from taxation was voted, and laws were even passed for the purpose of affecting cases pending in the law courts. The day of reckoning came in 1837 and since that time there has been
a constant tendency to check and limit the powers of the legislature. The revolutionary practice of adopting constitutions in State constitutions without conventions, with popular vote, gave place to the direct reference of constitutions and their amendments to the people at the polls. The desire to narrow the field of legislative competence was further evidenced by the adoption of amendments limiting its authority over specified fields. Few important changes in the principles of State constitutional law took place before the Civil War. The chief improvements were of an administrative character.

The Civil War, which marks the beginning of the third period, brought about a radical readjustment of economic and industrial conditions throughout the United States, and, in addition, effected a complete change in political conditions in the Southern States. The predominant characteristic of this period has been a continued and increasing distrust of the State legislatures, which has resulted in very marked limitations of their powers. These limitations have been effected chiefly in two ways. First, the field of legislative activities has been decreased by prohibiting the passage of certain laws or classes of laws; by direct legislation by means of constitutional amendments in matters formerly controlled by the legislature; and by requiring popular approval, at the polls, of certain legislative measures, before they can be enacted as laws. Second, the powers of the governor and judges have largely increased. The term which was, at first, annual in all but three States, has been greatly lengthened and is now annual in one only, while over half the States have a four-year term. His power has been further enhanced at the expense of the legislature by an almost universal grant of the veto, only one State withholding this power and 34 granting, in addition, the power to veto items of an appropriation bill. The States of Washington, South Carolina and Virginia even allow the executive to veto items of any bill and the governor of Pennsylvania can approve such portion of an item of an appropriation bill as he sees fit. The executive appointing power has been materially augmented and the power to pardon and reprieve has been nearly everywhere granted. These changes are indicative of a growth in the confidence placed by the people in the governor, which is the most important source of his increased power. This confidence has been engendered by the fact that responsibility can be fixed upon the single executive, as it cannot be upon the legislature, which is, under our American system, without responsible leadership. The judicial office, although based in a large majority of cases upon popular election, has had its term materially increased in this period.

The fourth period may be said to date from the last decade of the 19th century. It is marked by a conspicuous tendency to enlarge the activities of State governments over vast ranges of human activity which were formerly left entirely to the individual or to the individual restrained only by the courts from encroachment upon the rights of other individuals and by a wide extension of the use of ultra-democratic machinery of political control, such as initiative, referendum and, to a lesser degree, recall.

Socialization and democracy have gone hand in hand in the fourth period. By popular vote, the large old State activities and the latter providing a more direct and intimate control of government by the people themselves. The magnitude of the vast business and social interests committed to State departments and to State administrative boards and commissions has made a trained personnel a necessity. Commendable progress has been made in the direction of a permanent civil service in many States, although the old idea that to the victor belongs all the spoils dies hard. A better appreciation of the value and necessity of the expert in administrative positions is manifesting itself, although the average American still greatly underestimates experience and training as assets in the art of government. Many students of politics believe that betterment in administration is accomplishing more for good government than are legislative and constitutional reforms.

Direct popular control of legislation may be divided into three classes: First, measures referred by a representative body, either a constitutional convention or a legislature; second, measures passed by a representative body and then upon popular petition submitted to the people at the polls for final action; and third, measures referred to the electorate for adoption after initiation by a certain proportion of the voters. The first class, commonly called compulsory referendum, deals largely with constitutional amendments. In a few cases, the submission of certain classes of statutory enactments, such as State bond issues, is compulsory. The first class has greatly exceeded the others, thus far, in number, but in the last decade the practice of popular initiative has rapidly increased. The popular vote in a compulsory referendum averages less than 50 per cent of the total vote cast at the same election, while measures submitted as the result of popular petition or initiative attract a considerably larger vote. Apprehension that initiative and referendum would result in increased radicalism has not been justified. The people, on the whole, voted intelligently and more conservatively than their legislatures. Every State in the Union, except Delaware, has compulsory referendum of constitutional amendments. About a quarter permit initiation of amendments by petition and nearly one-half allow popular statutory initiative in some form. Massachusetts and Michigan grant to their legislatures the privilege of submitting statutory measures to popular referenda for final adoption. Initiative and referendum have been tried long enough to prove both their value and their limitations. Restricted to few and fundamental enactments dealing with general principles their use is decidedly effective in securing a real popular control of government. Indirectly they have tended to make legislative action more responsive to public opinion and more carefully considered. Applied to numerous and detailed measures it breaks down under its own weight. It can only supplement and not supplant the work of the State legislature.

The third of these measures of democratic control of State government, the recall of
UNITED STATES—STATE CONSTITUTIONS (1789-1919) (41) 459

elected officers, has been adopted in slightly less than one-fourth of the States and has been very rarely used for State officers and somewhat more frequently for local. The very general lengthening of the terms of elective officers made recall a logical feature of the program of real control of government by the electorate. Its adoption was in response to the demand of a democracy for the same effective control over men which the initiative and referendum gave over measures. Its value lies rather in its potential than in its actual use.

The recall of judicial decisions, demanded by the more radical advocates of popular control, has not met with general favor.

The lack of confidence in the legislature which characterized the third period continued throughout the fourth, another evidence of which is the limitation of the time during which the legislature can sit. This has been accomplished by decreasing the frequency and by limiting the duration of the sessions. Public opinion has traveled far from that of the Revolutionary period, which was expressed in the so-called "Queens of 1776." When annual sessions end tyranny begins." Six States only, and all of them of the original 13, retain annual sessions. Alabama, in her recent constitution, has prescribed a quadrennial session; Illinois, of the Constitution of 1818, the duration of the session to from 40 to 90 days, and others accomplish the same end by cutting off the pay of the legislature at the end of a similar period. This attitude of the people is further shown by numerous constitutional provisions adopted for the purpose of preventing the railroad and fraudulent passage of bills, especially during the closing days of the session. For example, in New York, no bill may be passed or become a law unless it is printed and lies, in its final form, for at least three calendar legislative days upon the desks of the members, unless the governor certifies to the need of its immediate passage; and no amendment is allowed on the last reading of a bill. Other provisions attempt to prevent or punish bribery and make impossible the appointment of a legislator to any civil office during the term for which he is elected.

The amount of State debts during the half century preceding 1870 was another cause of great dissatisfaction with the legislatures. The total State indebtedness in 1825 was $121,790,725; in 1870 it had risen to the portentous sum of $352,806,898. Drastic measures were taken by a large number of States to prevent further squandering of the people's money by their representatives, with such success that the total State indebtedness has been reduced to about $172,000,000 in 1904, since which time there has been only a small total increase save in the States of New York and Massachusetts where bond issues for canals and for highways have enlarged their combined debt to an amount of approximately a quarter of a billion. Most States forbid the legislature to contract debt for more than a maximum amount fixed by the constitution. (For example, $50,000 in Oregon; $1,000,000 in Pennsylvania). New York State allows the legislature to issue deficiency bonds, not to exceed $1,000,000, and to contract debt for the purpose of repelling invasion or of suppressing insurrection, but for all other purposes the approval of the voters is necessary before a loan can be contracted. Moreover, nearly every State requires that a sinking fund be established for every bonded loan issued.

This distrust of the legislature is traceable to several causes. State legislation has been frequently hasty and ill-advised. In New York from 1895 to 1904 the courts pronounced 41 laws, passed by the legislature, unconstitutional. Special legislation has engrossed the attention of the legislators and has often been so obviously opposed to the general welfare that public opinion has imputed the worst of motives to the members. The people are convinced that the party or boss controls the legislature, the members of which merely register his will; and that he orders measures passed for partisan or corrupt purposes. The second of these reasons is unquestionably the most influential. A vast majority of the laws passed in the average legislature concern local or special interests. Eight typical States, in 1901, passed a total of 7,032 statutes, of which 5,876 were of local or special import. The objections to this class of legislation are two-fold. First: the time and interest of the State has been largely occupied with the work of obtaining legislative favors for political and personal friends that insufficient time and attention are given to bills of a general character whose effect upon the private political fortunes of the legislators may not be so immediately obvious. Second: Special legislation, particularly for corporate interests, gives ample opportunity for bribery and corruption, which, although doubtful not so great as is often charged, is commonly believed by public opinion to be associated with the passage of such measures. Perhaps an even greater evil is the constant changing and amending of city charters and other local government laws in the interests of the boss or party which controls the legislature, or of influential public service corporations. Sometimes an entire city government has been legislated out of office, as in the Pennsylvania "Ripper" Act of 1902. To check the last abuse, States have adopted constitutional provisions forbidding special or local legislation. These provisions vary greatly. Some of them are very sweeping and stringent and others have been care-
late upon, unless forbidden by the constitution; hence any limitation of its power must be expressly stated in the constitution. This is the reasoning by which a legislature or legislatures have caused such an increase in the size of our State constitutions.

The frequent and lengthy additions to our State constitutions are themselves a fruitful source of further amendment, for the more elaborated the fundamental law is in a growing civilization the more frequent will the changes be. Dealing, as they do, often in minute detail, with a large range of subjects, constant revision is necessary to remedy defects and to meet the needs imposed by changing conditions. The New Hampshire constitution of 1776, excluding the preamble, contained 600 words; the constitution of Oklahoma contains nearly 30,000 words.

Constitution making has been most active in the West and South. Economic and social changes have been the chief causes in the West, while in the South the Civil War and the successive attempts at a settlement of political problems have occasioned the frequent adoption of entirely new constitutions. Massachusetts has lived, since the Revolution, under the constitution of 1780; but several of the Southern States have adopted five and six entirely new constitutions in addition to numerous amendments. Nine new constitutions were adopted, and two were rejected, during the period from 1890 to 1903, and in the shorter period from 1875 to 1915, 15 amendments were proposed and 168 adopted. An average of about 50 amendments per year has been maintained during recent years. Practically every State has made some change in its constitution within the last 10 years.

The method of amendment varies in the different States. The practice of submitting fundamental law to the voters for adoption had been almost universally in vogue, except in the Confederacy, for about a third of a century before 1890, but while the North and West still make this method obligatory, six Southern States, largely influenced by the negro problem, promulgated new constitutions by the constitutional convention without popular ratification. In all but 12 of the States constitutional provision is made for calling conventions for the purpose of general revision of the constitutions. The legislatures in most of these States, if their action is supported by the voters at the polls, can call conventions. Several make obligatory the submission to the people, at stated intervals (N. Y., Md., Okla., Ohio, 20, Mich., 16, Iowa, 10 and N. H., 7 years) of the question, whether a convention is desired or not. Every State, save New Hampshire, makes provision for ordinary amendment by legislative initiative and in all of these, except Delaware, by submission to the voters for ratification. Twelve States allow the initiation of constitutional amendments by popular petition, signed by a fixed per cent of voters, which varies from 5 to 25 per cent but averages about 8. In Delaware only, is the legislature, acting by two-thirds majorities, (1) competent to adopt a constitutional amendment without popular vote. South Carolina and Mississippi have the unique method of requiring an amendment, which has been proposed by two-thirds each house of the legislature and ap-
proved at the polls, to be further ratified by a majority of each house at the next legislature. Thirty-two States allow one legislature, generally by a two-thirds vote of each house, to propose amendments. In 10, two successive legislatures must each adopt the proposed amendment before submission to the people. A majority of votes cast is sufficient for adoption in 33 States, and Rhode Island requires a majority of three-fifths and New Hampshire two-thirds of the votes cast, while Missouri and Wyoming prescribe a majority of all the voters of the State. Ten other States have slight modifications of the rule requiring a simple majority of the votes cast for the amendment. Delaware it will be remembered does not refer amendments to the electorate.

After the grant of the franchise to the negro during reconstruction, the ideal of manhood suffrage was very nearly attained. Recent years, however, have shown a tendency to restrict the franchise save in the matter of woman suffrage. Seven of the Southern States have adopted restrictions (six of them constitutional), which were primarily designed to deprive the negro of the right to vote and which have, in spirit at least, annulled the 15th Amendment. Even when the race problem is not involved, there is a tendency to place a higher value on the elective franchise. An increasing number of States are restricting the privilege to citizens of the United States (only seven now permit aliens to vote), and a number of recent constitutions have imposed qualifications of ability to read and write English. In all, 16 States have an educational qualification, in several alternative with a property qualification.

One of the most remarkable of political phenomena of recent years has been the rapid spread of the woman suffrage movement. Wyoming, in 1890, was the first State to establish full suffrage for women. Four other States followed her in the 19th century, but for over a decade-quarters of a century after 1890, the women of the United States were denied the ballot. In 1911 California conferred the franchise on women and within three years five other States joined California, thereby making it possible for women to vote. In 1914 the right to vote was extended to all women by the states and territories. "A few women writing women have won the right to vote at all elections in 12 States and possess limited suffrage in many more. Moreover both of the great national parties have declared for woman suffrage and a Federal suffrage amendment has been passed by the necessary two-thirds vote of both houses of Congress and is now before the States for their adoption or rejection. See Woman Suffrage.

The typical State constitution contains: (1) A definition of boundaries, except in the older States; (2) A bill of rights; (3) A frame of government; (4) A great mass of miscellaneous provisions, arranged with slight regard for logical classification, relating to administration and law, including articles treating of education of the militia, of taxation and revenue, of the public debts, of local government, of State prisons and hospitals, of agriculture, of labor, of impeachments of the officers of State, amending the constitution, besides other matters still less political in their character; (6) The schedule, which contains temporary provisions about putting the constitution into effect.

A bill or declaration of rights, historically
the most important part of the document, is found in every State constitution, except Michigan's, where there is no separate bill of rights. It contains those fundamental guarantees of personal liberty and property rights. It is unique in that it is applicable to both Negroes and Whites, which are most familiar through incorporation in the Federal Constitution, and in addition many provisions, widely dissimilar in the several constitutions, defining supposedly inherent rights of the individual. The bill of rights of the Federal Constitution restricts the Federal government alone; hence the necessity for the incorporation of a bill of rights in the State constitution. Mention will be made of one only of the rights thus secured to the citizen. Religious liberty, in its fullest sense, was not a possession of all people in the American States during the early years of national independence. Connecticut did not abolish her established church until 1818 and that of Massachusetts was not fully disestablished until 1833. At the present time all States have constitutional guarantees of freedom of conscience, of expression of religious opinion, of worship or of non-worship, and of the right of nomination in the eyes of the law; although the Christian religion is by the common law recognized as the prevailing religion of the country, as is witnessed by the laws of blasphemy and of observance of the Christian Sabbath.

The frame of government is strikingly similar throughout the Union. Each provides for an executive department consisting of a governor, lieutenant governor, and heads of the important departments of administration (secretary of state, treasurer, comptroller, attorney-general, etc.), elected in nearly all of the States and constituting, with the governor, what is in reality an executive in commission. While in the Federal government the President is the executive, the State governor is merely a part of the executive; a number of the most important heads of departments belong to the governor, although in some States subject to removal from office for cause shown. They are practically colleagues, not subordinates, of the governor. Executive decentralization is the rule; and a result is the creation of large numbers of administrative boards and commissions, all of which are created by law and have their duties prescribed by the legislature and, whether appointed by the governor or not, are in practice very little under his control. A number of State governors have, in recent years, called attention to the defects of such excessive decentralization and have asked the legislatures to devise remedies for what they deem a growing evil. The governor's power of appointment is in most States small and his actual control of administration is even less. His greatest legal power and responsibility are derived from the possession of the veto and the marked increase in recent years in the influence of the gubernatorial office has been due to the fact that its incumbent is the elected representative of all the people and hence has their confidence and is the exponent of public opinion to a far greater degree than the legislature and to the governor's share in legislative power rather than to his executive and administrative functions.

The legislature is everywhere bicameral. Two houses exist because the American people believe that the bicameral system embodies a sound principle of political science and not because special classes, or elements of the body politic, can thereby gainsay the popular government. The essential difference, an artificial one, is that the senate, as the smaller body, represents a larger number of voters who possess the same voting qualifications as the electors for the lower house.

The democratic principle of representation in proportion to population may be regarded as the established American State policy, although there are numerous departures from the strict rule and in a few States gross violations of the principle allow the existence of a rotten borough system comparable to that of England before the Reform Act of 1832. In many of these States the former historic unit of representation, the county or town, is retained partly for partisan purposes and partly to protect a minority, usually rural, against an industrial and urban majority. The constitutions of 18 States provide adequately for proportionate representation in the House. In the other 30 States there are modifications of the rule for one or both houses, of which the most common is that each county (or town) shall have at least one representative. However, these exceptions are grossly inequitable in some six or eight States only, nearly all of them among the original 13.

Although over one-half of the States give the initiative of money bills to the lower house, there is no sufficient reason for such discrimination. The practice is a survival of colonial custom or is a meaningless copy of Federal or English precedent. In other matters the powers of the two houses are in general identical, except in the process of impeachment and that in some States the senate has the power of confirming executive appointments. The committee system, modeled closely after that of Congress, is everywhere in use and rules and procedure are practically the same in full gressional. The governor and heads of departments never occupy seats in the legislature and the English system of government through a premier, who is responsible to a Parliamentary majority, has never found lodgment in the United States.

The organization of the judicial department varies somewhat in the several States, although the difference is rather in the degree of development than in the principle of organization. Most States have at the head of their system a single court of appellate jurisdiction called, generally, the Supreme Court, sometimes the Court of Appeals, and a Superior Court, or Circuit Court of highest original jurisdiction. Lower courts consist of county and local courts of inferior jurisdiction. In New York, whose judiciary may be taken as an example of more highly organized systems, which obtain in some of the larger States, the State courts consist of a Court of Appeals, four appellate divisions of the Supreme Court, with justices assigned from the Supreme Court, and the Supreme, really a District, Court of numerous judges, County Courts, except in New York, and a system of justice of the peace. The cities of the States have special Municipal Courts. In counties having a population of 40,000 or over there is a separate Surrogate's Court for probate jurisdiction.
tion. Separate chancery courts, which were found in nearly all of the original States, were regarded as inconsistent with the democratic spirit of the age and now exist in a few only of the large States. Equity jurisdiction is, however, administered in all of the other States by the regular judges of the law.

Georgia was the only revolutionary State to vest the election of judges with the people. Six governors were elected by the legislature, remaining six the governor, with the consent of the council (in Delaware of the legislature), made the appointment. The strong democratic wave which swept over this country in the early part of the 19th century affected the judicial office by very generally transferring the election to the people and by adopting a short term in place of the life tenure of the early period. There are now 37 States which vest the election of the higher judges in the people, while minor judges are even more generally elected. The governor appoints in six States, subject to the approval of the council or senate. In Connecticut, the governor nominates and the legislature elects. In Rhode Island, Vermont, Virginia, South Carolina, and New Hampshire (until 70 years of age) alone retain life tenure. The term in Pennsylvania is 21 years, in Maryland and Virginia 15, and in New York 14. Vermont has the shortest term, two years, while the average is from six to eight years. Judicial salaries have been considerably increased of late, but in many States are still altogether too low to command the best or even thoroughly qualified men. They range from $2,500 in Vermont to $17,500 for Supreme Court judges in New York City, which is the highest judicial salary paid in America. The average for Supreme Court judges is about $5,000. In some States judges are removable by impeachment, in others by an address of both houses of the legislature to the governor, a two-thirds vote generally being necessary and in a few by a two-thirds vote of the legislature.

The local government divisions of the State are the creation of the legislature, which, unless expressly restrained by the constitution, can make and change them as it pleases. Legally they are political divisions erected by the legislature for the purpose of assisting in the government of the State. Historically the principle of local self-government lies deeply embedded in our political life and this fact has been recognized in numerous recent constitutional enactments, which limit the hitherto unrestricted control of local government by the legislature. A dozen States give cities and in some cases counties the right to frame their own charters.

Among the numerous miscellaneous provisions of the modern State constitution several deserve especial mention. Formerly education was a purely local concern, but the increasing recognition of the political importance of education in a democracy has led the State to grant extensive aid and to assume a large role. Practically all of the States now have a State superintendent or commissioner, generally elected and nearly always a constitutional officer, and State boards of education. All but a few of the older States, in addition to financial assistance to primary and secondary schools, maintain State universities. So vital is the subject considered that the people embody the most important regulations in the constitution. Even the revenues for the support of the universities are usually secured beyond the chance of hostile legislation by a constitutionally fixed rate of taxation.

The growth of great transportation and industrial corporations in recent years has been the cause of much restrictive and regulative legislation. Popular fear of the railroad combination and of the industrial trust and distrust of the legislature as an efficient and incorruptible agent for dealing with capitalistic monopolies have led the voters in many States to incorporate provisions in their constitutions forbidding the combination of competing railroad and telegraph lines, while a multitude of anti-combination laws have been passed by the remaining States. The lack of power to regulate interstate commerce has made most of these efforts at control of transportation ineffective and a demand for more effective Congressional legislation has consequently arisen. Anti-trust legislation has been passed by a large majority of States have now passed laws against trusts and of these about one-half have anti-trust clauses in their constitutions. Nearly all of the States have provisions against monopolies, either in constitution or statute, and every State of the Union has found the regulation of corporations necessary. The subject of corporation control has aroused more interest than any other State question that has been before the American people since the era of reconstruction. Even in the recently adopted Southern constitutions, the control of corporations was second only to the disenfranchisement of the negro as an object of popular desire.

Administrative boards or commissions, with administrative, ordinance-making and even quasi-judicial powers for the effective regulation of public utilities and in some cases of vital industries are found in nearly every State. Public opinion tends to regard the extension and intensification of this means of control and regulation as the most promising method of safeguarding public interest against the evils resulting from powerful corporations.

Labor legislation has begun to find expression in State constitutions, although the problem is still very largely a matter of regulation by statutes. Provisions regulating hours, conditions of employment, especially of women and children; authorizing a minimum wage; establishing labor bureaus, boards, commissioners and arbitration courts and modifying in the interest of the wage-earner some of the old common-law principles, such as the fellow-servant rule, have made their appearance here and there in State constitutions.

Professor of History and Political Science,
New York University.

42. IMMIGRATION (1789-1916). The causes which operated before the Revolution to bring a small stream of European emigrants to the United States continued to operate after the establishment of the Federal government. Though no trustworthy records were kept in the early history of the republic, it is estimated that from 1783 onward the number of immigrants to this country was about 4,000 a year till 1816, when, as a result of the French-English war, the number increased to 10,000. After that date it dropped to about 6,000 a year till 1806, when, as a natural result of the British and French Continental blockades and of the American Embargo, it was reduced practically to nothing for the next 10 years. Then, beginning with 1816, the passenger arrivals, including return Americans, reached about 8,000; and in the following year the number numbered up to 22,240. The large number of immigrants flocking to the country about this time produced considerable hardship incident to overcrowding. At this juncture the first legislation concerning immigrants was enacted by Congress, which simply provided that a record should be kept of the number of passengers in each customs district, registering the sex, age, occupation, and country of birth. Since the government feared the increase of the population of the country, this act of March 1819 was not in the nature of a restriction, but was intended merely as a record of the arrival in aliens. According to the returns of 1820, an account has been kept of all the customs ports of the number, sources and conditions of all immigrants to the United States. The record will be found in the accompanying table.

It is to be noted first, that up to 1856 the record includes all "alien passengers arrived," and does not distinguish immigrants from passengers, so that a reduction must be made from the total; second, that the immigration overlaid from Canada and Mexico is not included in these figures. For example, in the census of 1900 Canada is given as the birthplace of 1,183,255 persons, and Mexico as 103,445. An examination of the table reveals the fact that the record shows a well-defined period, with notable fluctuations. The first period extends from the beginning to 1826, inclusive, when the maximum seems to have been about 10,000 (reached in 1794, 1825 and 1826). The second period extended from 1827 to 1831, when the maximum is 27,382, the average being more than double that of the first period. This increase is perhaps explained by the enormous influx of Europeans to this country as increasing the wealth and developing the resources of the country, this act of March 1819 was not in the nature of a restriction, but was intended merely as a record of the arrival in aliens. According to the returns of 1820, an account has been kept of all the customs ports of the number, sources and conditions of all immigrants to the United States. highwater mark (669,431) in 1881. Since that year there has been a steady stream pouring into the country, save during the period of busi-
ness depression from 1894 to 1898. In 1905, 1906, 1907 and again in 1910, 1913 and 1914 the number of immigrants exceeds the million mark.

Most of the early immigrants came from Great Britain, a fair number from Germany, but very few from other European countries. In 1850 Great Britain furnished about 60 per cent of the immigrants and Germany 584,000, or 36 per cent. Thus 96 per cent of the immigrants in 1850 were of Teutonic blood, with the Anglo-Saxon element predominating. The proportion was much the same in 1860. But in 1870, while the totals were much larger, the British percentage was falling and that of the other foreign elements was increasing. In 1880 the British contingent, including the Canadian, though larger in the grand total than before, had dropped to 47 per cent, the German to 30, but a considerable new element had arrived of Bohemians, Poles, Scandinavians, Italians and Russians. In 1890 the British contingent had fallen to 20 per cent, or 2,700,000; the German increased to 33 per cent, or 3,000,000; while the number of Poles, Russians and Bohemians in the country amounted to 450,000, the Italians to 182,500 and the Scandinavians to 933,000. In 1900 the Slav element had reached 1,000,000, or nearly 10 per cent of the foreign-born population of the country, the Scandinavian over 1,000,000, the French including French-Canadian 500,000, the Italian nearly 500,000, the Mexican over 100,000, while the British had sunk to 10,4 and the German to 14 per cent. Since 1900 the Teutonic element has diminished considerably while immigrants from the countries of southern and eastern Europe have flooded in overwhelming numbers to our shores. Of these the Italians and Poles have been in the preponderance. The following table shows the racial groups of immigration by decades:

### IMMIGRATION TO THE UNITED STATES, ARRANGED BY NATIONALITIES AND DECADES

| Country | 1831-40 | 1841-50 | 1851-60 | 1861-70 | 1871-80 | 1881-90 | 1891-10 | 1891-11

Several laws have been passed by Congress, designed to prevent certain evils of indiscriminate immigration. Among those evils may be mentioned the immigration of criminals, paupers, contract laborers, diseased persons (whether in mind or body), and such other persons as are unable to support themselves. Such persons, according to the laws enacted from 1882 to 1893, are not permitted to enter the United States, and the steamship companies bringing in such immigrants as are rejected under these acts are required, at their own expense, to transport them back to the countries whence they came. The following table shows the number of undesirable aliens debarked and deported during the years 1905-16:

In 1864 Congress passed the first immigration act, which was designed to promote, not to restrict, immigration but that act was repealed in 1868. In 1882, the year after immigration reached the unprecedented mark of 669,431, Congress enacted the first restrictive law debarring criminals, paupers, insane and
other undesirable classes, as indicated above, and imposed a head tax of 50 cents on all aliens and $2 on persons of the baser sort. This tax, by subsequent acts of Congress, was increased successively to one, two and four dollars. In 1885 a more drastic act was passed, which was intended to exclude contract laborers and strike-breakers and persons of the baser sort. But this act did not operate as successfully as was expected; for it debarked the better classes of immigrants, such as artists, architects, musicians and even clergymen, along with the undesirable classes which it was especially intended to exclude. It was, therefore, amended, in 1891, so as not to militate against such classes of immigrants as it was especially intended to encourage.

In 1888 and 1892 Congress passed enactments debarring such immigrants of alien race as, for any reason, refuse to assimilate with our natives. This measure was directed specifically against Chinese immigrants and was intended to prohibit Chinese laborers from entering the United States. The law was the natural outgrowth of the constant labor agitation and the earnest appeals from the Pacific Coast for relief from the vast hordes of ignorant and immi-
mal Chinese laborers. In 1903 more drastic legislation was enacted, which requires a preliminary inspection of intending immigrants at the point of departure and gives the government the right to deport, within two years after arrival, any immigrant landed in violation of this special act.

In 1906 Congress legislated into being the present Bureau of Immigration whose duty it is to keep a complete record of all aliens entering the United States.

In 1907 further restrictive legislation was enacted, which prohibits the bringing of women or girls into the United States for immoral purposes, such as prostitution. The immigration enactments of 1907, also, provided for a commission of nine persons consisting of three senators, three representatives and three persons appointed by the President, to investigate the immigration laws and to report to Congress with recommendations.

This commission expired by limitation 5 Dec. 1910, and submitted a final report, in which they reached the unanimous conclusion that the country needed a radical restriction of immigration. The proposals of the commission for such restriction, as presented in this report, are as follows: (a) a reading and writing test; (b) the exclusion of unmarried unskilled laborers; (c) limitation upon the number of immigrants arriving at any one port and from particular races; (d) material increase of the amount of money in the possession of immigrants on arrival; (e) material increase of the head tax (now $2). The commission, moreover, made the following recommendations: 1. That for the protection of immigrants, government officials, both men and women, be placed on vessels carrying steerage passengers. 2. That the boards of special inquiry, which pass upon the appeals of would-be immigrants from adverse administrative decisions, should be composed of persons qualified to exercise judicial function. 3. That the proceedings should be public and that an Assistant-Secretaryship of Commerce and Labor should be created to review appeals from the boards. 3. That the state should strictly regulate immis. 4. That the exclusion of Chinese laborers should be continued. 5. That no legislation regarding Japanese and Korean labor should be adopted so long as the present method of restriction is found effective. 6. That an understanding should be reached with the British government for the exclusion of East Indian laborers.

Of the foregoing propositions, the one providing for a reading and writing test attracted the widest attention both in and out of Congress. The American Federation of Labor urged the retention of the clause as the best method of excluding undesirable foreigners. On the other hand it was argued that its retention would exclude European agricultural workers who were every way desirable, but had lacked educational advantages.

A bill incorporating most of the recommendations of the above-mentioned commission was passed by Congress as designed to bring about the desired restriction of immigration, but because of its literacy test provision the bill was vetoed by President Taft in February 1913. During Wilson's administration Congress has passed two similar bills in 1915 and 1916, but these likewise have been vetoed by the President, for the same reason.

The European War greatly curtailed immigration to the United States as well as increased emigration to Europe. Thus the number of immigrants from eastern and southern Europe (Poles and Italians) was reduced to below the number from the Teutonic races of Europe. Of the total 298,826 immigrants in the year 1916, the principal contributing races were as follows: English, 36,168; Scotch, 13-515; Irish, 20,636; Italians, 38,814; Greek, 26,792; Scandinavian, 19,172; French, 19,518; Mexican, 17,198; Hebrew, 15,108; Portuguese, 12,208; German, 11,555; Spanish, 9,259; Japanese, 8,711; Dutch and Flemish, 6,113; Finnish, 5,649; Russian, 4,858; African, 4,576; Polish, 4,502; Cuban, 3,442; Bulgarian, Serbian, Montenegrin, 3,146; Chinese, 2,239; no other race in excess of 2,000.

The chief occupations of immigrants arriving in 1916 were as follows: professional (including teachers, engineers, artists, actors, clergy, etc.), 9,795; skilled laborers (barber, carpenters, farmers, mechanics, carpenters, etc.), 45,528; miscellaneous, 138,737, among which are included laborers (55,816), farm laborers (26,250), stewards (29,258), merchants and dealers (7,017), farmers (6,840), agents (1,538), fishermen (741), manufacturers (315), hotel-keepers (243), etc. Those reporting no occupation, such as women and children, numbered 104,766 of the total number of immigrants (298,826).

Of the total alien immigrants admitted into the United States in the year 1916 (i.e., to 30 June, the end of the fiscal year), 141,390 entered through the port of New York; 12,428 through the port of Boston; 7,955 through the port of San Francisco; 4,029 through the port of Providence, R. I.; 3,896 through the port of Seattle, Wash.; 3,298 through the port of Honolulu, Hawaii; and smaller numbers through other ports. But it is significant to note that a large number of the alien immigrants in 1916 came into the United States
through the border stations, 100,366 entering through Canada and 16,520 through Mexico.

The destination of the alien immigrants admitted into the United States during the last two fiscal years is indicated by the appended table.

EDWIN W. BOWEN,
Professor of Latin, Randolph-Macon College, Virginia.

43. SUFFRAGE. Suffrage means participation in government by voting. There are two theories in regard to suffrage: (1) It is a privilege granted by the State to individuals; (2) it is a natural, inherent right belonging to every man. The former is the usually accepted theory; the latter, the outcome of the revolutionary movements of the 18th century, is today generally discredited. Suffrage in the English colonies in America was restricted as in England. Virginia began in 1619 with manhood suffrage, but in 1635 and 1670 restricted the suffrage to "free-holders" and householders. Similar restrictions existed in the other Southern colonies and in the middle colonies. New England, notably Massachusetts and New Haven, had strict religious tests. Only "freemen" could vote and only members in good standing of some Congregational church could be "freemen." Consequently the majority of the male inhabitants were excluded, the entire list of "freemen" in Massachusetts between 1630 and 1691 numbering only about 2,000. When England secured better control over the New England colonies the suffrage was given to owners of estates valued at £40 or freetholds worth 40s. a year. During the 18th century the freehold test became general. Roman Catholic, Jews and, in New England, Quakers were generally disfranchised. There was also a moral qualification in New England—a voter must be "a person of civil conversation, and a peaceable behavior," not an "opponent of the good and wholesome laws of the Colony." In the South, no convict could vote. Each colony had its own naturalization law, until Parliament passed a uniform law (1746) requiring the Protestant faith and seven years of residence. The suffrage was extended very slowly, until the Union was formed, in 1787, in each State it was very limited. The qualification was usually a freehold of 40s. to £3, or an estate worth £20 to £60, or ownership of a certain number of acres. It has been estimated that in 1789 there were in America 150,000 electors from a population of 5,000,000, or only a hundred years later substantial and furnished 700,000 to 1,000,000 voters. The religious restriction soon disappeared—last in South Carolina in 1797. Under the Constitution each State regulated its own suffrage. The increasing number of revolutionary by-laws upon politics had much to do with broadening the suffrage. In New England, where most men were "white of men" were believed in; in the Middle and Southern States, where blacks were numerous, the rights of white men alone were recognized. The new Western States offered citizenship on easy terms, thus stimulating the advance of democracy in the older States. Rival political parties wanted more votes, and all white men were gradually enfranchised. The last property test disappeared in Louisiana in 1845. The abolition agitation hastened enfranchisement of all whites by asserting the "rights of man." Before the Civil War only Connecticut and Massachusetts restricted white suffrage. Alarmed at the rapid increase of foreigners they enacted in 1854 and 1855 educational qualifications for voters.

Alternate educational or property qualifications exist in Connecticut (1874), Massachusetts (1856), Wyoming (1889), Maine (1891), and Delaware (1897). The payment of poll tax is now required in about half of the States, and in 20 States there is a direct or indirect educational test. The Federal government confers citizenship upon the alien by naturalization; the State confers the right to vote, subject only to the 14th and 15th amendments. In many States aliens have been allowed to vote after they have declared their intention to become citizens. Indians must become naturalized before voting unless permanently separated from the tribal organization, or living on their own property. As a result of recent war conditions absentee voting is provided for in several States, among which are Ohio, Oklahoma, Mississippi and Virginia. The tendency now seems to be toward requiring, as a qualification for voting, longer residence in the locality, registration to prevent frauds. American citizens, for all payment of poll tax. The age at which a person otherwise qualified may
cast his first vote is, everywhere in the United States, placed at 21 years.

Negro Suffrage.—The extension of suffrage to negroes, except in the Civil War. Prior to the Revolution, though there were no laws against it, it is not known that any negro ever voted in the New England or Middle colonies, but a few negroes voted in Maryland, South Carolina and Georgia in the latter part of the 18th century. Between the Revolution and the Civil War negroes voted in several States. They were disfranchised in New Jersey, 1807; Maryland, 1810; Tennessee, 1834; North Carolina, 1835, and Pennsylvania, 1838. The legislatures of two Tennessee congressmen, John Bell and Cave Johnson, were decided by the ballots of free negroes. The agitation of abolition societies was the principal cause of the disfranchisement of free blacks in these States. New Hampshire and New York alone before 1861 did not disfranchise them. The 13th Amendment (1865) to the United States Constitution merged the negroes into the political population for purposes of representation. A further disfranchisement of the South (1867) to give the negro a limited suffrage was stopped by the Reconstruction Acts (1867) which gave the ballot to the negroes in the Southern States. The 14th and 15th Amendments of 1868 gave them the ballot in the United States. Political corruption and misgovernment followed the disfranchisement of the negro, and from 1868 to 1876 the Southern whites were engaged in overturning the governments ruled by the negroes, thus bringing about a thorough-going reaction against negro suffrage. From 1876 to 1890, the whites devoted themselves to destroying in the South the Republican party organization which controlled the negro vote. The disfranchisement was extended by disfranchisement by acts restricted by centralization of the administration in Louisiana and North Carolina; by requiring the payment of taxes in Virginia, Arkansas, Georgia, Florida, Mississippi and Tennessee; and by complexity of election laws—Australian ballot system, registration, etc.—in Alabama, Arkansas, Virginia, Tennessee and Mississippi, amounting practically to an educational qualification. About 1890 began a movement to disfranchise negroes by changes in the State constitutions. Upon readmission to the Union (1868–70) a fundamental condition imposed was that their constitutions should never be revised so as to deprive any one of the right of suffrage. This condition was ignored by the Southern States and the amendments were evaded. The suffrage clauses in these new Southern constitutions are alternative: (1) the understanding clause requires the voter to be able to read or understand when read to him any section of the Constitution; (2) the "grandfather" or "old soldier" clause excuses from other tests those who have served in any war and their descendants, or those who were voters before 1 January 1867, and their descendants; (3) a clause requiring a tax paying and property qualification from those disqualified under other clauses; (4) the "good character" clause requiring the voter to be of good moral character. Mississippi (1890) invented the "bad character" clause, giving it to South Carolina, Alabama and Virginia; Louisiana the "grandfather" or "old soldier" clause (1898), giving it to North Carolina, Alabama and Virginia. Alabama (1901) discovered the "good character" qualification, passing it on to Virginia. Practically all the Southern States have a property and tax-paying qualification for voters, which, with the educational test, has since 1905 become the sole qualifications. The constitutional amendment adopted on 5 Nov. 1912, the "grandfather clause" was revived for three months in order to provide for the registration of illiterate whites who failed to register in 1898. The evasive provisions are temporary, intended only to disfranchise the negroes, while including the whites. The effect of these restrictions is remarkable, disfranchising in each State that has restricted the suffrage from 15,000 to 60,000 whites and even more in the blacks. The tax-paying and registration requirements are now the most effective in excluding both whites and blacks. Regarding the conflict of these provisions with the United States Constitution and laws, the Supreme Court decided that the fundamental restriction imposed upon readmission of the States is unconstitutional, and that it is the duty of Congress to enforce the 14th and 15th amendments, which probably will not be done. In 1915, a white form of the "grandfather" qualification in Oklahoma and Maryland was declared unconstitutional by the United States Supreme Court, but the decision did not affect the disfranchisement in the South. The evil results from negro suffrage during Reconstruction caused Congress to hesitate before again interfering in affairs of the Southern States.

Suffrage in the Territories.—In the Territories suffrage is regulated by Congress, which may delegate its authority to the Territorial legislature. In the District of Columbia, white taxpayers voted from 1802 to 1855, when the suffrage was extended to white males and women, except for negroes and colored females, in 1867 to white and black males excepting Confederates and Confederate sympathizers. Misgovernment and corruption followed and in 1878 all voters in the District were disfranchised by Congress, local government now being carried on by a board of commissioners.

In Hawaii the right to vote is restricted to citizens of the United States who can speak, read and write English or Hawaiian. Thus most of the Chinese and Japanese, who are in the majority, are excluded for the present. In Porto Rico there is an educational qualification, and in the Philippines the voter must take an oath of allegiance to the United States and qualify either as a taxpayer or under an educational test.

Woman Suffrage.—The right to vote is rather a recent acquisition by women in the United States. They are said to have had the suffrage in Massachusetts in 1800, and in New Jersey, 1776–1807, but it is not clear that they exercised the privilege. During the first half of the 19th century the extension of male suffrage, the better education of women, their prominence in church and mission work, and the renewed agitation in regard to natural
rights, especially in regard to slavery, resulted in demands that woman be given the ballot. The temperance movement and the need to protect property and family rights strengthened this demand. In 1848 the first woman's suffrage convention demanded the ballot, basing their claims on the Declaration of Independence. The extension of the franchise to the negroes led to renewed demands in behalf of women. In 1866 the first petition demanding national suffrage for women was sent to Congress, and in 1868 the New England Woman's Suffrage Association was formed. Gradually the suffrage leaders of the entire United States were organized. The new States and Territories of the West were the first to make women the political equals of men, and that region is still the stronghold of woman suffrage, though the States east of the Appal-achians are being strongly influenced. At present women enjoy equal suffrage with men in 13 States and two Territories: Wyoming, 1869; Utah, 1870, 1896; Colorado, 1876, 1893; Washington, 1883, 1911; Idaho, 1896; California, 1911; Arizona, Kansas and Oregon, 1912; Alaska Territory, 1913; Montana and North Dakota, 1914; New Mexico, 1915; South Dakota, Michigan and Oklahoma, 1918. In 12 other States women have recently been given the right to vote in municipal elections and for offices created by statute: Illinois, 1913; North Dakota, 1914; and Rhode Island, 1917; Minnesota, Iowa, Wisconsin, Missouri, Indiana, Maine, Vermont and Tennessee, 1919. The right of women to vote in party primaries was granted by Arkansas in 1917 and by Texas by 1918. In eight States women property-holders may vote on matters relating to taxation, and in 19 States in school elections. In 17 States, 11 of which are in the South, women have no form of political suffrage. It is estimated that now (1919) about 6,000,000 women have equal suffrage with men. During the presidential campaign of 1916 both candidates declared for woman suffrage—Wilson, Democrat, for the ballot by State action; Hughes, Republican, for suffrage by Federal amendment. Fearing a Federal amendment, Wilson later supported the movement for Federal grant of suffrage, and in 1918 Congress sent out to the States an equal suffrage amendment which was ratified by 14 States. In all States suffrage organizations have been formed and the national association has headquarters in New York.

The effects of woman suffrage are not yet clearly evident. Both men and women are in larger proportions than did men before the vote was given to women. Enfranchised women generally favor legislation for social reforms—for prohibition, better schools, better conditions for women workers, the restriction of commercialized vice, and the regulation of child labor.

WALTER L. FLEMING, Professor of History, Vanderbilt University.

44. CIVIL AND RELIGIOUS LIBERTY. The euphony and familiarity of this title must be broken so as to read, "Religious and Civil Liberty in America," if we study the subject in its logical chronological order, for civil liberty follows and is the product of religious liberty. A hierarchy implies an aristocracy; an aristocracy a monarchy. The student can do no better than to group his studies around the names of Roger Williams (q.v.) and Thomas Jefferson (q.v.). The birth of the one preceded that of the other by 130 years. The pivotal date of the first is the founding of the Providence Plantation by the exiled Roger Williams, 1636; and the pivotal date of the other is the signing of the Declaration of Independence in 1776. These two events are separated by a period of 140 years. The story of these two men is told elsewhere in these volumes; but the story of civil and religious liberty in America cannot be separated from their lives; still less can its purchase price be understood or appreciated apart from their story. Says John Finke:

Within five years from the settlement of this young preacher,—the learned, quick-witted, pugnacious Welshman, Roger Williams, had announced the true principles of religious liberty with a clearness of insight quite remarkable in that age.

There is good history back of the pleasantry that the Puritans sought the western shore in order that they might enjoy the privilege of worshipping God according to the dictates of their own conscience and the further privilege of making all others worship in the same way. Governor Winthrop, one of the most liberal of the Boston colony, wrote:

We believe it to be important that the members of a Christian commonwealth should all hold the same opinions regarding essentials; and of course it is for us to determine what is essential. If people who have come here with us hold different views, they have made a great mistake and had better go back to England. But holding different views, they still wish to remain in America, let them leave us in peace and, going elsewhere, found communities according to their own conceptions of religion; and let them not quarrel with them, but we will tell them plainly that they cannot stay here.

This is literally the program carried out in the case of the Winnipesaukee Missionaries. When beginning he denied the power of civil magistrates to punish for violations of "the first tablet of the law," the table of piety, dealing with man's relations to his God. He declined the call to enter upon his chosen work with the settlement on Massachusetts Bay because they were "separated," as the Pilgrims were who settled at Plymouth; they were simply non-conforming members of the Episcopal Church, and as such they claimed the right to discipline for spiritual as well as civic misdemeanors. A few months later he accepted the opportunity to work with and for the Pilgrim Fathers of Plymouth. Here he worked for two years, supporting himself by manual toil during the day and teaching on Sunday. But his ecclesiastical influence grew, and his persistent teaching of the principles of soul-liberty filled Elder Brewster with anxiety, and when a call was given the young radical from the Salem Church, the good elder advised the Plymouth congregation to dismiss him. In the latter controversy John Cotton, the belligerent ecclesiastical of Boston, remembered that "Elder
Brewster warned the whole church of the danger of his spirit. When in 1633 the young minister ventured against the laws of the Bay and took up the work of a religious teacher at Salem, the Boston ministers protessed and objected to his coming among them at the ministers' meetings held from house to house. Two years later he was summoned to Boston to answer charges before the General Court. He was accused of teaching that magistrates ought not to punish a breach of the first table except when it was also a disturbance of the civil peace; that the church had no right to impose an oath on an unconverted person; and Governor Winthrop of whom Williams wrote years afterward "Though he was carried with the stream for my punishment, he tenderly loved me to his last breath," recorded in his diary.

Lev. Mr. Hooker, who was chosen to dispute with him could not come from any of his honors, so the next morning the Court sentenced him to depart out of our jurisdiction within six weeks, all the ministers save one approving the sentence.

The sentence itself in part runs as follows: It is therefore ordered that the said Mr. Williams shall depart out of this jurisdiction within six weeks next ensuing, which, if he neglects to perform, it shall be lawful for the Governor and two of the magistrates to send him to some place out of this jurisdiction, not to return any more without license from the Court.

But soon his six weeks' leniency caused the magistrates anxiety; they were afraid he would be taken on an errand, pursuant to his expressed purpose of establishing an independent community where all men may work as their conscience persuades them, everyone in the name of God. A captain of a sloop was, therefore, sent with orders to arrest him and carry him on board his ship about to sail for England. The captain found the wife and children, but the minister had departed three days before. Thus in midwinter, January 1636, one of the very few such apostles in the history of the world, secretly departed from Salem, leaving wife and children behind him. He sailed away, according to the advice of Governor Winthrop, who, apparently ashamed of the precipitancy and narrowness of his clerical colleague, had advised Mr. Williams to retire promptly to the Indians on Narragansett Bay, where he would be beyond English claims and punishments. His own account of this momentous exodus in America runs in part as follows:

I steered my course from Salem though in winter snow, which I feel yet—unto these parts wherein I may say Presid, that is, I have seen the face of God, I first pitched, and then began to build and plant at Seekonk, now Rehoboth; but when I received a letter from my ancient friend Mr. Winthrop, then governor of Plymouth, professing his own and others' love and respect to me, yet lovingly advising me, since I was fallen into the edge of their bounds, and they were loth to displesh the Bay, to remove but to the other side of the water; and then he said I had the country free and might be as free as themselves and we should be loving neighbors together. These were the joint understandings whereunto Christian governors and others, in their day, together with their counsel and advice as to the freedom and vacancy of this place, in which this respect and many other privileges of the Most Holy and Wise One, I called Providence.

Following the voyage came the desperate exposures on land—"fourteen weeks of bitter winter season without knowing what bread or bed did mean," in his own phrase. His only succor was received at the hands of the Indians, whose language he had mastered during his Plymouth ministry for a purpose higher than he could then have dreamed of. When the final place of settlement was reached on Rhode Island, he said: "In gratitude to God's merciful providence to me in my distress, I gave to the place the name of Providence.

Henceforth the story of Roger Williams is the story of the planting of what is probably the first commonwealth in history into whose fundamental constitution was incorporated an unequivocal guarantee of religious liberty. From Constantine to William, the Christian Church, always and everywhere in Christendom, dominated the State. Indeed, in all religious and in all ages, up to this time, priests have more or less directly claimed to be the arbiters of the civic and physical interests as well as of the spiritual destinies of men. The quality and quantity of the work accomplished by Roger Williams cannot be appreciated until the spirit of the Puritans, of whom he was one and with whom he contended, is more closely studied and understood. Popular traditions have lumped the various settlements of New England under one estimate, as one movement. The Puritans have been studied too much in bulk, as though they represented a coherent and consistent body, moving forward with one spirit and for one end: that spirit the spirit of freedom, and the one end religious and civil liberty. But the banishment of Roger Williams is but one of a series, albeit the first of such acts. The noble Henry Vane arrived in Boston three months before Williams had to flee. Though a young man of only 24 years, he was of such brilliant powers that he was made governor of Massachusetts. But the spirit of the people was too intolerant, the air too dogmatic for him to stay, and in less than three years he went to England to his larger career and to a tragic death for freedom's sake. In 1636 came Anne Hutchinson, the brilliant woman who preached transcendentalism before the Transcendentalists; a woman who was seized from the pulpit at that early date; she gathered around her a growing following,—but she must not stay. With her band of followers she had to go. They turned their faces toward the land of greater freedom, the hospitable Rhode Island, where for a while she tarried on her way to death from an Indian's tomahawk in the neighborhood of what was to be New York. The persecuted Quakers were naturally drawn to the boasted freedom of the New World, but when Anne Austin and Mary Fisher, representatives of this fellowship, landed at Boston from Barbados in 1656, they were promptly locked in jail lest they might proclaim their heresies to the curious crowd that gathered around them. A council pronounced their doctrines blasphemous; their books were burned and they themselves confined under hard circumstances for five months, until the ship they had come in was ready to return them to Barbados. Later these Quaker missionaries found a more cordial welcome at the hands of the Mohammedans in Turkey than they did at the
hands of the Christian Puritans in Massachusetts. However, the contention of John Fiske, that the Puritans had more at stake than the Mohammedans, deserves to be considered in this connection. Following these two women came eight Quakers from London, who were promptly arrested and special laws were passed that they might be disposed of. The penalties affixed in these anti-Quaker laws were cumulative, passing on up from flogging, through imprisonment at hard labor, cutting off one or both ears, boring the tongue with a hot iron, until finally capital punishment was reached in 1659, when two were hanged on Boston Commons. This was going farther than Quaker persecution had ever reached in old England; and next year a Quaker woman was hanged at the same place. The last victim suffered in 1661 for the sole crime of holding to and practising the precepts of George Fox, as represented by the fellowship of the Friends.

There is no finer test of a man's sincerity than that which demands that he take his own medicine. Roger Williams was called upon to apply his own doctrines in the case of the Quakers. From their teachings he dissented most heartily; he never came so near the impenetrable spirit as in the book entitled 'George Fox Digg'd out of his Burrowes,' and George Fox never came so near dealing in venom as in his reply, entitled 'A New England Fire-Brand' (1661). And in the communities the Rhode Island not only refused to join with the New England confederacy in a movement to keep out the Quakers, but welcomed them in spite of their views. When George Fox visited this country he did not dare go farther north than Newport, R. I., where he was sheltered in spite of his teaching. Hither Williams went, 30 miles in an open boat, he himself working the oars, not to suppress, but to hold high debate with the great disciple of soul-liberty, who had stood the test in England even as Roger Williams had in America, and who, in his doctrine of the "inner light" and the non-combatant requirement of religion had found a more ample foundation for religious liberty than that found by less heterodox opinions of Williams.

As with the followers of Anne Hutchinson and George Fox, so with the Jews. Williams pleaded their cause with the powers of England, and the hunted children of Israel found shelter and welcome at Newport, where the lonely graves of the exiled community moved Longfellow two centuries later to sing the pathetic song of toleration entitled "The Jewish Cemetery at Newport."  

Twice, at least, Roger Williams returned to England in the interest of the new community, each time for the sake of strengthening the safeguards of religious liberty in his charter rights. The first time he was obliged to sail from Manhattan, for he was an exile from Boston. Once his stay was prolonged for three years, during which time he was deep in the politics of the Protectorate, an active helper of Cromwell, and an intimate associate of Cromwell's Foreign Secretary, "Mister Milton," to whom he taught Dutch. Scant justice has as yet been done to the beneficent and amplifying element introduced into the history of the United States, particularly of the New England States, by Roger Williams. He came to reform the reformers, of whom Hawthorne facetiously said:

Let us thank God for having given us such ancestors and let each successive generation thank Him not less fervently for being one step further from them in the march of ages.

Williams necessarily had much fighting to do. The titles of his books suggest controversy. 'The Blody Tenant of Persecution for Cause of Conscience; A Dialogue Between Truth and Peace,' is his most noted work. This a Puritan House of Commons caused to be burned in England. To this John Cotton wrote the reply entitled 'Blody Tenant Washed and Made White in the Bloud of the Lamb.' In due time came the rejoinder from Williams, 'The Blody Tenant Yet More Blody by Mr. Cotton's Attempt to Wash it White in Bloud of the Lamb.' But notwithstanding this belligerency, Williams vindicated the liberty he espoused and demonstrated in his own life that liberty and the love of liberty bred tenderness and not violence. "We have taxed your patience often, but never exhausted it," wrote Governor Winthrop. And his latest biographer, Oscar S. Straus, says: "In no act of his life is his spirit of selfishness discernible; and again, "His patriotism was never dimmed by a shadow of suspicion of self-interest"; and again, "He held his colony with a firm hand and a wise head." He never preferred to be the power behind the throne rather than to be the power on the throne. When the Indians were at last nagged into the violence that led to the invasion of Rhode Island, Roger Williams, unarmed save with his staff, went out to meet them. He failed to turn them back, but they said, "We will not hurt you, Brother Williams." This accomplished linguist, the master of seven languages, spent his 70 years and more in unceasing toil, much of the time earning his bread by manual labor, and he alludes to a sacrifice of his own interests by refusing to kiss the Bible when taking an oath in England, but furnishes no particulars. Everywhere and always he kindled the spirit of liberty, and was never known to light the fires of war.

The first compact of the little band of exiles on the hill he named "Providence" carried the signatures of 13 men, five of whom made their mark. It was of such humble material that he laid the foundations of the first state ever equivocally committed to religious liberty. His first-born son is supposed to have been the first white child in Rhode Island. The last charter he obtained from Charles II was so wisely drawn, and liberty in it was so securely vouchsafed, that it served the commonwealth of Rhode Island for 180 years; it was not changed until 1843, and it would still serve as a model for a new State.

Thus the movement for religious liberty in America unfolded naturally into a passion for democracy, a demand for civil liberty, and our study lands us at the feet of Thomas Jefferson, who was the father of civil liberty in America, so far as it is concerned with the Negro; beginnings are always hid in the obscurity of still more primitive beginnings can be said to have a father.

"Author of the Declaration of Independence, of the statute of Virginia for religious freedom, and Father of the University of Virginia,"
was the inscription which Thomas Jefferson left among his papers as one suitable for his own tomb. In another catalogue of things accomplished, drawn up by his own hand, we find the following: "Separated the church and state in Virginia; put an end to entail; prohibited the importation of slaves, and drafted the Declaration of Independence." Mr. Jefferson was the wisest read, the most accomplished of the Presidents, the intellectual giant of them all; the first, if not the greatest, thorough-going Democrat in American politics. Jefferson, Jackson and Lincoln are the three Presidents who, in practice as well as in theory, by nature as well as by conviction, believed so profoundly in popular government and the simplicity and freedom involved therein that it became to them a religion, a source of unfailing enthusiasm. These three belonged to the people and found their highest inspiration in the purpose to serve them. The opinions of no other President have ever received such prompt respect at home and abroad as those of Thomas Jefferson, and his official utterances occupy a place in literature as well as in the history of statesmanship unparalleled by the deliverances of any other President of the United States, save Lincoln.

Jefferson's devotion to civil liberty led to, or sprang from, his freedom in religious thought, in which he was notoriously unorthodox. He was deeply versed in the writings of French philosophers and the events that led up to the Revolution, and was sufficiently grounded in the philosophy of liberty to be able to give at short range the true estimate of that atmosphere-clearing storm which all clear thinkers at longer range are able to give it. He was a confidant and friend of Thomas Paine, and the principles laid down in 'The Rights of Man' and 'Common Sense' were not only familiar but congenial to him and probably had a direct influence on him. These documents, together with the life of the much-maligned and cruelly misunderstood author, should be closely studied in connection with the subject at hand.

At the first Congress, systematically convened at Philadelphia in 1774, Thomas Jefferson was chairman of the committee appointed to draft the Declaration of Independence, which in due time was offered in his own handwriting, essentially as it now stands; a clause censuring slave trade was suppressed. He regretted the first draft of the Constitution as adopted because he feared the liberties of the citizens were not sufficiently safeguarded; it contained no precaution against monopolies and standing armies; the freedom of conscience and of religion were not sufficiently guaranteed; the rights of habeas corpus were not adequately secured, and no limitation was set to the time one person could occupy the Presidency, which, ungoverned, as he feared, might grow into an absolutism more or less complete; in short, because it had no "Bill of Rights." Says one of his later biographers: In his day, Mr. Jefferson combated a greater number of abridgments to religious freedom, of any other sect or denomination, of any religious sect, order or denomination, or to or for the support, use, or benefit of, or in trust for, any minister, public teacher, or preacher of the gospel, as such, or any religious sect, order, or denomination; and every gift or sale of goods, or chattels, to go in succession, or to take place after the death of the seller or donor, to or for such support, use or benefit; and also every deviser of goods or chattels to or for the support, use or benefit of any minister, public teacher or preacher of the gospel, as such, or of any religious sect, order or denomination, without the prior or subsequent sanction of the Legislature, shall be void; except always, any sale, gift, lease, or devise of any quantity of land, not exceeding five acres, for a church, meeting house, or other house of worship, a parsonage, or burying ground, which shall be intended, or used only for such purpose; or such sale, gift, lease, or devise shall be void.

Mississippi provides that "The Holy Bible shall not be excluded from use in any public school of this State;" and makes a six months' residence a sufficient qualification for voting to a minister of the gospel, while two years' residence is required for a layman.

New Hampshire provides that: The people of this State have a right to empower, and do hereby fully empower the Legislature to authorize, from time to time, the religious societies within this State to make adequate provision at their own expense, for the support and maintenance of public Protestant preachers of piety, religion, and morality; provided, notwithstanding, that the several towns, parishes, benevolent religious societies shall at all times have the exclusive right of electing their own public teachers, and contracting with them for their support and maintenance.

Vermont, after providing freedom of conscience for all and the free exercise of religious worship in sweeping phrase, adds in Article III: Nevertheless, every sect or denomination of Christians ought to observe the Sabbath Day, to observe some sort of religious worship which to them shall seem most agreeable to the revered will of God.

Virginia, though perhaps the first State after Rhode Island to provide for absolute separation of Church and State, introduces a curious
inconsistency, evidently quite unconsciously, in this wise: It is the mutual duty of all to practice Christian forbearance, love, and charity toward each other." 

"Tell the committee to be on the alert," were the last audible words that Jefferson spoke. His lips seemed to dictate to the fingers that still imagined a pen between them. This suggests the "eternal vigilance" that is the "price of liberty.

Ever since the signing of the Declaration of Independence there have been those in the United States who would dispose of its fundamental contention as a "glittering generality," or limit its application to their own sect or race; but, despite of sneers, past or present, evasions and contemptuous appeals to technicalities, it still survives as the matchless document that not only liberated the United States from foreign thralldom, but by its logic is destined to enfranchise the million offspring of that generation. Side by side, Jefferson's Declaration of Independence and Lincoln's Emancipation Proclamation stand in the world's library, unmarred and unimpeached, to rebuke, to instruct, and to inspire future generations. They were and still are the prophetic documents. The Civil War which Jefferson foresaw came, and he who would study the story of civil and religious liberty in America must take note of such events as the martyrdom of Matthew Robinson (q.v.), and the destruction of his abolitionist press at Alton, III. (1837); the appearance of Harriet Beecher Stowe's 'Uncle Tom's Cabin' (1852); the execution of John Brown (q.v.) at Harper's Ferry (1859); the firing upon the flag at Fort Sumter (1861); the Emancipation Proclamation of Abraham Lincoln (1863); the surrender of Robert E. Lee at Appomattox (1865).

In studying civil and religious liberty we find that, though they may be distinguishable in their sources, they are one in their culmination. Not more clearly did the passion for religious liberty make of Roger Williams an advocate of political liberty than did Thomas Jefferson's zeal for political liberty make of him an apostle of religious liberty. The government has recently ordered published a little manuscript book of Thomas Jefferson's, entitled 'The Life and Morals of Jesus of Nazareth, Extracted Textually from the Gospels, together with a Comparison of his Doctrines with Those of Others.' In this book the author compiled the ethical and spiritual portions of the Gospel, eliminating the miraculous and theological passages. Of the compilation he himself wrote:

'A more beautiful or precious moral of ethics I have never seen. It is a document in proof that I am a REAL CHRISTIAN; that is to say, a disciple of the doctrines of Jesus Christ, different from the Platonists who call ME in false and THEMSELVES Christians and preachers of the Gospel while they draw all their characteristic dogmas from what its author never said nor saw.

The conviction indicated in this book may be right or wrong. I refer to it because it illustrates the liberty vouchsaged by the fundamental laws of the United States, which not only guarantae freedom of utterance, but lead to a respect for sincere opinions, however they may differ from prevailing opinions.

Any sketch of the history of civil and religious liberty in America would be incomplete without reference to the interesting contributions of Lord Baltimore in Maryland, of William Penn in Pennsylvania and the Utopian schemes of John Locke and Lord Shaftesbury in the Carolinas. It is one of the interesting paradoxes of history that the Catholic Calvert, who held the most sweeping charter ever brought to the New World, should establish a standard of hospitality in religion and liberty in politics exceeding that of any other colony.

Lord Baltimore came to establish a "Patinate," a palace county. He was made absolute lord of a vast territory with powers to declare war, collect taxes, create legislatures and appoint judges. But knowing from experience the heavy hand of religious bigotry, his autocracy was a benign one. It offered hospitality to the persecuted in all lands and established many precedents precious to liberty.

The Quaker spirit represented by William Penn and his immediate successors was and is a pervasive influence, making for toleration, peace and co-operation. While the dreams which the free-thinking philosophers above mentioned tried to realize in South Carolina may be taken as forerunners of many sociological ventures on communist or ideal lines that have followed, perhaps the most suggestive and creative of which was the work of Robert Owen at New Harmony in Indiana. At any rate, from New Harmony to Alturah, the story is an attractive one to the social philosopher and a potent one in the interest of civil and religious liberty.

The law of the land demands toleration, but spiritual freedom goes further and demands appreciation and fellowship in the things about which men honestly differ. He who would study closely the development of religious liberty in America must note the discussions and legislation about the following epoch-marking addresses: Channing's Baltimore address (1818); Emerson's Divinity School address, which, to use his own words, 'caused such a tempest in the Unitarian wash-bowl,' and in course of time for 30 years practically exiled its most illustrious alumnus from the platform of the freest university in America (1838); Theodore Parker's discourse on 'The Transient and the Permanent in Christianity' (1841); William C. Gannett's address on 'The Faith of Ethics' (1857).

The growth of the spirit of religious liberty may be further traced by a close study of the most noted religious controversies in our history, among which were the discussion concerning the teachings of Horace Bushnell (1839-54) by the Congregationalists of New England; the withdrawal of Henry Ward Beecher (1882) from the local Congregational Association to which he belonged; the trial of David Swing (1874) by the Presbyterians of Chicago and of Hiram W. Thomas (1881) by the Methodists of Chicago. Significant also in the history of religious liberty is the Religious Association in Boston (1867) and the holding of the Parliament of Religions in Chi-
This was the most significant religious concave ever held, perhaps the noblest corporate event in the history of religion. This was followed the next year (1894) by the organization of the Congress of Religion in Chicago and the subsequent organization of the New York Conference of Religion, a similar organization within State limits. Significant indications of the growth of this spirit of cooperation, which springs out of the spirit of religious liberty, are found in the numerous interdenominational organizations for practical work, such as the Young Men's and Young Women's Christian Associations, the Christian Endeavor movement, the Woman's Christian Temperance Union, and various combinations for missionary work at home and abroad.

The development of civil and religious liberty is still incomplete; it still behooves the committee to be on the alert. But the great advancement made in this direction is a magnificent guarantee of greater progress yet to be made. The high achievements already realized will inspire a continued zeal to evoke the new wisdom and fresh courage which the future of America will demand. See Liberty, Religious.

45. DISPUTED ELECTIONS. On four occasions the electoral colleges have failed in the task of choosing a President and Vice-President. In 1801, after the counting of the electoral vote, the question was left to settle which of the two men, Jefferson or Burr, should be President, and which Vice-President. In 1825 it remained to choose a President from among the three candidates, Andrew Jackson, John Quincy Adams and William H. Crawford. In 1837 it was whether Richard M. Johnson or Francis Granger should be Vice-President. In all these cases the difficulty was merely that the electors had so distributed their votes that the choice was incomplete. And the electors of the United States pointed out the procedure by which to complete it. The fourth case arose in 1877. The case was now thrust upon the government of deciding between rival electoral colleges in four States. This would determine whether Samuel J. Tilden and Thomas A. Hendricks, the candidates of the Democrat party, or Rutherford B. Hayes and William A. Wheeler, who were the Republican candidates, should become President and Vice-President respectively. There was no agency provided by the Constitution or laws to decide such a question.

The dispute of 1801 was a natural result of the rule laid down in the Constitution for the procedure of the electors. Each elector should vote for two persons. The person found to have the greatest number of votes should be the President, provided such number was a majority of the whole number of electors. The person having the next greatest number should be the Vice-President. If a majority of the electors might be only one more than a quarter of the votes, and each elector cast two, it was possible for two persons to receive an equal majority vote. The constitutional provision for this contingency was that the House of Representatives should immediately choose by ballot one of the two persons for President. This vote must be taken by States, and the representation from each State should have one vote. A majority of the States was necessary to a choice. The official count of the electoral votes was made before the two Houses of Congress as prescribed by the Constitution. This was done on Wednesday 12 February, Jefferson himself presiding. There were 135 electors and 276 votes. The vote was distributed as follows: Thomas Jefferson, 73; Aaron Burr, 73; John Adams, 65; Charles Cotesworth Pinckney, 64; John Jay, 1. It had been anticipated that the electoral vote would not be decisive. Two days before the count the House of Representatives had adopted rules of order for the expected election. The representatives should be grouped by States, in order to determine for whom the vote of each State was to be cast. If the preliminary vote of any State resulted in a tie, that delegation could only cast a ballot marked "divided." Each State should hold agencies in both Houses. Two ballot boxes should be used and each delegation should cast its ballot in duplicate. The tellers should be divided into two groups, one to examine the votes in each ballot box. The Senate was to be admitted. The House should not adjourn until the election was complete. Immediately after the count the House of Representatives began to vote for a choice between Jefferson and Burr. By midnight 19 ballots had been taken. The sitting continued until 11 o'clock the next day, nine ballots being taken on 12 February. The rule against adjournment was now evaded by taking a recess. One ballot was taken 13 February, four on the 14th, one on the 16th and two on the 17th. From the beginning eight States cast their ballots for Jefferson. These were New York, New Jersey, Pennsylvania, Virginia, North Carolina, Georgia, Kentucky and Tennessee. Six voted for Burr. These were New Hampshire, Massachusetts, Rhode Island, Connecticut, Delaware and South Carolina. The remaining two, Vermont and Maryland, were divided. Nine States were necessary to a choice. The House was Federalist, while both of the candidates belonged to the other party. The issue was the commercial policy of the next administration. As Jefferson came from Virginia and Burr from New York, New England stood by the latter. Burr did not receive the vote of his own State. This was due to Hamilton's influence. Prior to the 36th ballot, which was taken 17 February, some assurance was given on the question of the commercial policy. Vermont and Maryland now voted for Jefferson. At the same time South Carolina and Delaware cast blank ballots. Jefferson was thus chosen President by the vote of 10 States. Burr became Vice-President. Before the next Presidential election, the Constitution was amended to prevent the recurrence of such a dispute. The new amendment declares that the electors shall name in their ballots the person voted for as President and in distinct ballots the person voted for as Vice-President.

By the official count of 9 Feb. 1825, the electoral vote for President was found to stand as follows: Andrew Jackson, 99; John Quincy Adams, 84; William H. Crawford, 41; and
Henry Clay, 37. The number of electoral votes necessary to a choice was 131. The ballot for President had Jackson and C. Calhoun had received 182 votes. The Constitution limited the House of Representatives in its choice of a President to the three highest candidates. The first ballot gave Adams the vote of 13 States; Jackson that of seven States; and Crawford that of four States. There was great popular indignation, for Jackson had received 15 more electoral votes than Adams. And besides this the Jackson electors had received a great majority of the popular vote. A rumor became current that there had been a "corrupt bargain" among the Adams and the Clay men. This seemed to be confirmed as soon as President Adams took his seat by the nomination of Mr. Clay for Secretary of State. However, it was sufficiently shown later that this story rested upon no evidence.

It was discovered by the official count of 8 Feb. 1837, that the electoral vote for Vice-President had been inaccurate. The constitutional rule in such a case is that the Senate shall choose the Vice-President from the two highest numbers on the list. These were Richard M. Johnson and Francis Granger. Upon the motion of one of the members, the Senate proceeded to a viva voce vote. The result was 33 to 16 in favor of Mr. Johnson.

After the elections of 7 Nov. 1876, the first impression was that the Democracy party had chosen a majority of the electors. But the Republican party managers immediately began to claim three Southern States whose votes were likely to decide the issue. These were Florida, Louisiana and South Carolina. When the day arrived for the meeting of the electoral colleges, two sets of electors voted in each of these States and in Oregon as well. Thus four States transmitted double returns to the President of the Senate. Evidently a quarrel was before the country which might set the rival executives in the national government, or leave the nation without an executive. Whether it is agreeable to the Constitution for Congress to regulate by law the counting of the electoral vote, we will not discuss. The opinion of the Supreme court, that is expressly granted, is to determine the time of choosing the electors and the time when the electors shall meet. Laws had been enacted concerning the accepting and rejecting of electoral votes prior to 1877. The most discreet men in the government felt that Congress should devise some expedient for dealing with an unprecedented situation. The Electoral Commission Law was enacted. This passed the Senate 25 January, the House of Representatives 23 January and was approved 29 January. Its title was "An act to provide for and regulate the counting of votes for President and Vice-President, and the decision of questions arising thereon, for the term commencing 4 March 1877." It provided in detail for the official count as prescribed by the Constitution. It ordered that this should begin on the first Thursday in February, which was the first day of the month, and that the returns should be made in two most imperative order of the States. After the reading of each certificate, the president of the Senate should call for objections. In cases which did not involve conflicting returns, the two Houses should pass upon the objections. They should separate for this purpose. No electoral vote should be rejected except by the affirmative vote of both Houses. Section II, the most remarkable part of the law, provided for the Electoral Commission, which was created to pass upon cases where there were double returns from a State. The Senate should choose five of their members by viva voce vote, on the Tuesday before the count began, to serve on the commission. The House of Representatives should likewise choose five members. Five associate justices of the Supreme Court were also to serve. The law designated four of these under the numbers of their respective circuits, the first, third, eighth and ninth. These were to select the fifth. When any case of double returns was reached in the official count, the certificates and papers relating thereto, together with all the objections filed in the joint meeting of the two Houses, were to be referred to the commission. This body should decide by a majority vote the questions whether any and what votes returned from a State are the ones provided for by the Constitution of the United States, and how many and what persons were duly appointed electors in such State. The decisions were to be final unless they were set aside by the vote of both Houses of Congress. The members of the Commission were chosen on Tuesday, 30 January. The Senate was Republican at the time, while the House of Representatives was Democratic. Three of the senators selected were Republicans and Democrats. The former were George F. Edmunds, Vermont; Oliver P. Morton, Indiana; and Frederick T. Frelinghuysen, New Jersey. The latter were Thomas F. Bayard, Delaware, and Allen G. Thurman, Ohio. In the House this proportion was reversed. The three Democratic members were Henry B. Payne, Ohio; Eppa Hunton, Virginia, and Josiah Abbott, Massachusetts. The two Republicans were James A. Garfield, Ohio and George F. Hoar, Massachusetts. Of the four justices designated by the law, Nathan Clifford and Stephen J. Field of the first and ninth circuits respectively were Democrats. William Strong and Samuel F. Miller of the third and eighth circuits, were Republicans. Thus far the commission was equally divided. Moreover the arguments were likely to be so strong on both sides of the different questions that the decisions would inevitably follow party lines. While the law seemed to shift the burden of decision upon 15 men, it so operated that it was really imposed upon one man. It had been expected that the four associate justices would select Justice David Davis to be the 15th member of the commission. Mr. Davis was independent in politics. But he had accepted an election to the United States Senate, which was thought to make it unsuitable for him to serve. Justice Joseph P. Bradley of the fifth circuit was chosen. This made the commission consist of eight Republicans and seven Democrats. At the final sitting Senator Thurman was unable to serve on account of illness and Francis Kernan, New York, a Democrat, was substituted. The two most impartial circuits in the United States. The two most impartial orders of the commission were practicing in Presidential elections were enacted 1 March 1792 and 23 Jan. 1845, respectively. The act of 1792 provides that the executive authority of each State shall cause lists of the
names of the electors of such State to be certified and delivered to the electors, and that the electors shall be chosen from the lists to each list of votes. The law of 1845 declares that each State may by law provide for the filling of any vacancy or vacancies which may occur in its college of electors, when such college meets to give its electoral vote. Numerous cases came up in the count of 1877, to which these provisions were applicable. The Electoral Commission held four sittings. The first one began 2 February, when the returns from Florida were reached. It took a week to come to a decision in this case. The returns of the Hayes electors were certified by the governor in office on the day when the electors met. But it was believed that the State returning board, which had voted as if they had been a majority, had been canvassing the votes of the State rejected the returns from certain polling-places. On the other hand, the returns of the Tilden electors were certified by the attorney-general. And there was a dispute of the same character as of the Florida case, by a new Democratic governor. An additional cause of dispute in the case of Florida grew out of the charge that one of the Hayes electors held an office under the United States government at the time when he was elected, and was, therefore, ineligible. This objection was based upon the constitutional provision that no person holding an office of trust or profit under the United States shall be appointed an elector. The decision of the commission was based upon the ground that the returns of the Hayes electors were certified according to the law of the United States, and therefore the elector in question was a lawful one. The decision was reported 9 February. The Electoral Commission was next in session 12-16 February, as the official count had now reached Louisiana. This State presented the spectacle of rival governments. The Republican officers claimed authority under the canvass of the State returning board. The Democratic ones claimed that under the popular vote as cast they had been elected. The returns of the Tilden and the Hayes electors were certified by rival executives. The commission maintained that the Republican government held office by the operation of the laws of the State. In this case, as in that of Florida, there were charges of fraud and ineligibility. But the commission could not go back of the certificate of the State authority. Accordingly the eight Hayes electors were held to be the rightful ones. The commission was again in session 21-23 February, to pass upon the returns from Oregon. The Republican party had carried the election; but the governor, who was a Democrat, had certified to the Democratic party, and the Electoral Commission was summoned to make a decision. The third certificate was issued to the highest Tilden elector on the ground that the third Hayes elector was a postmaster. As the two Republican electors refused to meet with the Democratic one, both sides proceeded to fill the vacancies in the electoral college. The Republican electors appointed the man from whom the governor had withheld the certificate. The one Tilden elector appointed two other Democrats. The Hayes elector certified to the returns of the Tilden electors. Those of the other college were certified to by the secretary of state. The reasoning by which the disputes about Florida and Louisiana were decided was operated in this case in favor of the Tilden electors. But the commission made a distinction. In those cases it had inquired whether the executive authority had carried out the laws of the State and had found that it had done so. Thus it was incompetent for the commission to inquire further. But in the case of Oregon it found that the governor had not carried out the laws. Accordingly the commission was competent to make him do so. Thus the three Hayes electors were recognized. On 26 February the returns from South Carolina were submitted to the commission. The votes of the Hayes electors were duly certified by the governor. There was fraud on the part of the returning board and intimidation at the polls. On the second day the commission decided that the returns of the seven Hayes electors should be accepted. The decision was made in every case by a party vote of eight to seven. Moreover the Senate voted on each occasion to accept the decision and the House of Representatives to reject it. As the count proceeded until all the returns came up which were not referred to the Electoral Commission, as they did not involve conflicting returns. In the electoral colleges of Michigan, Nevada, Pennsylvania, Rhode Island, Vermont and Wisconsin, respectively, vacancies had been caused by ineligibility, and the other electors had proceeded to fill the places. Some of the votes were objected to on this account. The two Houses concurred in accepting some of these and differed by a vote of eight to seven that the four Hayes electors were the lawful ones. This decision was reported 9 February. The Electoral Commission was next in session 12-16 February, as the official count had now reached Louisiana. This State presented the spectacle of rival governments. The Republican officers claimed authority under the canvass of the State returning board. The Democratic ones claimed that under the popular vote as cast they had been elected. The returns of the Tilden and the Hayes electors were certified by rival executives. The commission maintained that the Republican government held office by the operation of the laws of the State. In this case, as in that of Florida, there were charges of fraud and ineligibility. But the commission could not go back of the certificate of the State authority. Accordingly the eight Hayes electors were held to be the rightful ones. The commission was again in session 21-23 February, to pass upon the returns from Oregon. The Republican party had carried the election; but the governor, who was a Democrat, had certified to the Democratic party, and the Electoral Commission was summoned to make a decision. The third certificate was issued to the highest Tilden elector on the
476 UNITED STATES—IMPEACHMENT (46)

ment to settle would be that of rival tribunals within a State sustaining rival electors. The rule in such a case is that no vote can be rejected except by the affirmative vote of both Houses of Congress acting separately. See BALLOT; ELECTIONS.

MARY L. HINDSDELE, Ann Arbor, Mich.

46. IMPEACHMENT. Impeachment in the national government is the formal act by which the House of Representatives makes accusations, before the Senate, against the President, the Vice-President or any "civil officers" (executive and judicial officers, except those of the army and navy) of the United States government. It is analogous to an indictment by a grand jury, though it is not confined to indictable offenses. Impeachment developed in English history before the establishment of the modern cabinet system, as a power by which the representatives of the people could control the agents of the irresponsible king, who, according to theory, could do no wrong. After the establishment of the Parliaments supremacy, and the present method of conducting the government, the custom gradually fell into disuse. One of the most noted cases was that of Warren Hastings whose trial for misgovernment in India lasted from February 1788 to April 1795, when he was acquitted. The latest case was that of Lord Melbourne in 1806.

The American colonial assemblies adopted the custom in a modified form as a means by which to check the executive and the judiciary. Though the right to remove officials was given to the general assembly by the Fundamental Orders of Connecticut in 1638, by the charter of Rhode Island in 1663, and by the charter of Connecticut in 1662, and by the charter of Virginia (1776); New Jersey (1776); Delaware (1776); Pennsylvania (1776); North Carolina (1776); Georgia (1777); New York (1777); Vermont (1777); Massachusetts (1778); South Carolina (1778); Massachusetts (1780); New Hampshire (1784) and Vermont (1786). The New Jersey constitution of 1776 provided that the lower house should bring the impeachment and that the council should try the case and pronounce judgment. The New State constitutions after 1775 contain provisions on the subject: Virginia (1776); New Jersey (1776); Delaware (1776); Pennsylvania (1776); Georgia (1777); New York (1777); Vermont (1777); Massachusetts (1778); South Carolina (1778); Massachusetts (1780); New Hampshire (1784) and Vermont (1786).

The New Jersey constitution of 1776 provided that the lower house should bring the impeachment and that the upper house should try it. The New York constitution of 1777 provided that the assembly should bring the impeachment and that it should be tried before a court consisting of the president, the senators, the chancellor and the judges of the Supreme Court. Judgment was to extend no farther than removal from office and disqualification from holding office under the State. The methods of trying the impeachments varied, but the tendency was to have judgment pronounced by the council or senate. The Constitutional Convention of 1787 incorporated the same principle into the Constitution for application in cases of treason, bribery or other high crimes and misdemeanors, and the Senate can be punished in the ordinary courts. The House first passes a resolution to impeach and then appoints a committee to present the charges at the bar of the Senate which sits as a high court to try the case. The House also appoints a committee of managers to act for it in the trial before the Senate. At the close of the trial, after the evidence has been introduced and the arguments of the managers and of the defendant's counsel have been heard, each senator is required to vote "guilty" or "not guilty" on each of the articles of impeachment. A two-thirds majority of those present is necessary to convict. The object is not to punish wrong. The penalty can be only removal from office and disqualification from further public service, but the person convicted is still liable to punishment by the ordinary courts, and he cannot receive a reprieve or pardon from the President.

In our national history this constitutional process has been invoked in nine cases; six times against Federal judges, once against a senator, once against a Cabinet officer and once against a President. Only in three cases has it resulted in removal from office: Judge John Pickering in 1803 for drunkenness, profanity and violence on the bench, Judge W. H. Humphreys in 1852 for adhering to the Confederacy and Judge Robert W. Archbold in 1913 for corruption in office. Both Pickering and Humphreys were district judges of the United States: Pickering for the District of New Hampshire, and Humphreys for Tennessee. In the articles against Pickering it was charged that he made decisions contrary to law in a suit involving the seizure of a ship and that he appeared upon the bench "in a state of intoxication, produced by the free and intemperate use of inhaling liquors, and did then and there frequently in most profane and indecent manner invoke the name of the Supreme Being." Judge Pickering did not attend the trial, but his son entered a plea of insanity and consequent irresponsibility, stating that his father for over two years had been altogether transacting any kind of business which required the exercise of the judgment or the faculties of the reason; and therefore incapable of corruption of judgment, and therefore that he was "not amenable to any tribunal for his actions." The House managers held that the insanity was the result of habitual drunkenness. On 12 March 1803 he was convicted and removed by a party vote, the Federalists voting in the negative, but the further disqualification to hold office was not inflicted.

Judge Humphreys at the beginning of the Civil War had engaged actively in the secession movement, but had not resigned his position as judge of the Federal District Court for Tennessee. In May 1862, the House preferred against him seven articles of impeachment, based on a secession speech made by him at Nashville, 29 Dec. 1860, on his acceptance of office under the Confederacy, and on his action in the arrest and imprisonment of W. G. Brownlow, a citizen of the United States, in violation of the Act of 1860. Judge Humphreys made no defense and on 26
June 1862 he was convicted by unanimous vote of the Senate. The proceeding was merely a formal means of declaring his office vacant.

Justice Samuel Chase of the Supreme Court appointed by President Washington in 1796, an able but partisan judge who frequently indulged in political harangues in his jury charges, and who had incensed the Jeffersonian Republicans of the House by his conduct in certain trials under the Sedition Law, was impeached before the Senate in December 1804 on eight charges relating to arbitrary and unjust conduct, and to highly indecent and extra-judicial reflections upon the government of the United States before the Maryland grand jury. He was found not guilty, probably because it was believed that his conduct had been rather a violation of the principles of politeness than of the principles of law; rather the want of decorum than the commission of high crime and misdemeanor. Judge J. A. Feck of the Federal District Court for Missouri was impeached in 1830 on the charge of unduly punishing, for contempt of court, an attorney who had published a criticism of a decision of the judge in a land case (1827). He was acquitted by a vote of 24 to 21.

The case of William Blount, senator from Tennessee, seems to have settled that senators and representatives are not impeachable, on the ground that they are not civil officers. On 7 May 1798, the House of Representatives impeached Senator Blount for conspiring to transfer New Orleans and adjacent territory from Spain to Great Britain, by means of a hostile military expedition from the territory of the United States, decided to impeach him. Two days later, he was expelled from the Senate, and soon thereafter he was elected to the Tennessee Senate. In December 1798, the House managers presented the case before the Senate of the United States for trial. Blount did not appear, but his counsel (Jared Ingersoll and A. J. Dallas) entered a plea that the Senate had no jurisdiction, since a senator is not a "civil officer" of the United States. The Senate sustained his plea and Blount was discharged for want of a public advantage. But the plea that Blount, having been expelled, was no longer a senator, and could not be punished after he was out of office for acts done while he was in office.

It is still an open question whether an officer can escape impeachment and trial before the Senate by resignation or dismissal from office. This subject was discussed in the case of William W. Bellman, who was impeached in 1876 for using his position as Secretary of War as a means of securing bribes from an Indian agent whom he had appointed at Fort Sill. A few hours before his impeachment he resigned his office and his resignation was accepted by the President. Bellman's counsel made the plea that the House of Representatives did not have jurisdiction who by resignation or otherwise had ceased to be a "civil officer of the United States." By a vote of 37 to 29 the Senate decided that Bellman was amenable to trial by impeachment. On the trial, the articles 36 senators voted "guilty" and 25 voted "not guilty," and thus Bellman was acquitted. More than one-third of the Senate refused to vote for conviction, on the ground of lack of jurisdiction over an officer who had resigned. This precedent may not be regarded in future cases, however.

The most prominent case of impeachment in our history was that of President Andrew Johnson. It was the result of the violent controversies concerning policies of reconstruction, and was inspired largely by party motives. The President vetoed some of the most important measures of Congress and belligerently condemned its policy of reconstruction. Congress passed all important measures over his veto, and sought to reduce his power and influence in other ways, especially by the Tenure of Office Act of March 1867. Johnson denounced Congress in very intemperate language, and by demanding the resignation of Edwin M. Stanton, Secretary of War, attempted to ignore the Tenure of Office Act which had stripped him of the power to remove executive officials. The House was thoroughly aroused, and on 3 March 1868 brought articles of impeachment against him, on 11 charges, principally of violating the Constitution and of attempting to bring Congress into disgrace or to ridicule it. Testimony was taken and then the arguments of the attorneys were filed. Party excitement and passion ran high, and on 16 and 26 May, after a long trial, the Senate by a vote of 35 to 19 decided that he was guilty of the principal charges. This lacked one vote of the two-thirds majority necessary for conviction. (The court then adjourned sine die by a vote of 34 to 16). The necessary two-thirds was not obtained, largely because some of the leaders in the Senate feared that conviction might result in the permanent subordination of the executive to Congress. Seven Republican senators voted against conviction. The failure to convict was used as a public advantage, but the Senate took the plea that Blount, having been expelled, was no longer a senator, and could not be punished after he was out of office for acts done while he was in office.

Charles Swayne, United States district judge for the northern district of Florida, was impeached on 24 Jan. 1905, under 12 charges, but was acquitted on 27 Feb. 1905.

The last instance of a Federal impeachment was that of Judge Robert W. Archbald, of the Commerce Court, who, on 13 Jan. 1913, on five out of 13 charges of high crimes and misdemeanors while in the discharge of his judicial duties, was found guilty by the United States Senate sitting as a high court of impeachment, and was sentenced to removal from office and disqualification for office of honor, trust or profit under the government.

The most prominent recent case of State (Commonwealth) impeachment was that of Gov. William Sulzer of New York, in 1913.

In this case, for the first time, was raised the question whether a public officer is liable to impeachment for acts committed by him before the beginning of his term of office. On 16 October the court of impeachment, including
members of the Senate and the judges of the Court of Appeals, found Governor Sulzer guilty of three of the eight charges (by a vote of 50 to 1), and voted to remove him from office, but did not prevent him from holding further office.

Professor of History and Political Science,
West Virginia University.

47. THE PRESIDENT'S OFFICE. Origin and Early Development.—In theory the king of England was the model for the American chief executive. In fact, the framers of the Constitution were more influenced by such prototypes as the colonial governors and the official heads of the recently-formed States, but they did not make the chief officer of their "more perfect Union" a mere figurehead. This was in keeping with the reactionary spirit that characterized the entire movement for a new constitution. Its leading delegates were determined to have a single executive with adequate administrative powers. Having settled this point all the further details of the office required only careful adaptation and mutual compromise. The result formed such an important part of their labors that opponents styled the proposed frame of government "a monarchical constitution" and largely centered their attack upon the executive. But the "Federalist" party, as we have seen, and its associates, and popular confidence in Washington, unanimously designated as chief magistrate, largely overcame this opposition.

Washington strove to give the office a broad national basis, but even he could not render it non-partisan. Foreign complications and the controversies over finance caused him and Adams to adhere to the policy of the Federalists. Yet Washington never abandoned a certain judicial poise, even when his Cabinet became the center of partisan strife, and Adams did not hesitate to incur party defeat in riding his Cabinet of factional elements. Jefferson administered affairs as a frank and fairly successful party leader. Much of his success was due to his conversational and epistolary powers, to which Cabinet and Congressional majorities alike yielded. Under his weaker successors the Congressional caucus nearly destroyed executive independence. Our country was then strong and national Whigish traditions in regard to public service were still strong and the candidate for high office must show his peculiar fitness for it. Such factors, combined with the waxing spirit of democracy, made mere tools of the weaker executives or aroused factious opposition against the stronger ones.

Jackson's great work was to restore the office to a co-ordinate position with Congress and the judiciary. Utterly lacking in definite training, he was so thoroughly en rapport with dominant popular sentiment that he was able to force his will upon a hesitant Congress and to disregard Marshall's unacceptable decisions. He was aided in this result by the rise of the national convention, which destroyed the power of the Congressional caucus, and by the development of a party machine, based upon executive patronage and a subsidized press. The convention and party machine, however, made the future selection of second-rate party men almost inevitable. The predominance of domestic problems after Jackson's administration gave Congress further opportunity to control national policy. In some measure Polk showed how a successful war increased executive control, but it was under Lincoln that the war powers of the President reached their highest development. His successor, Johnson, was unable to maintain this high level and narrowly escaped conviction after impeachment for an encroaching Congress. The recurrence of domestic problems, largely of a materialistic type, gave Congress control in national affairs.

Recent Increase in Executive Power.—Cleveland used his power as a small group of strong executives, but he owed as much to the confusion of domestic politics as to his own native force. During his first administration Congress repealed the last of its restrictions upon the executive power of removal and established the succession to the Presidency upon its present basis. At the same time civil service reform and the tariff enabled Cleveland to assume a leadership that recalled the best efforts of Jefferson and Jackson. In his second administration he even challenged opposition within his own party upon the issues of free silver and the tariff and startled the conservative elements of the whole country by a new interpretation of the Monroe Doctrine.

Under McKinley's administration the President's power was extended still further to emphasize executive leadership, especially in respect to new colonial possessions. The impetus thus given to executive power persisted in the problems connected with the Panama Canal and Latin America. Toward the latter our attitude has varied from a protectorate in Santo Domingo to a recognition of equality in the A. B. C. powers. In every instance the President has acted with executive initiative, occasionally in default of action by Congress or the Senate, but those bodies subsequently, albeit grudgingly, ratified the President's actions. Congress has even accepted without censure the existence of a state of war in Mexico and has tacitly followed the "gentlemen's agreement" with Japan on the immigration question. Other measures of Wilson, Taft and Roosevelt, touching the Far East, involved a punitive expedition in China, the open door in that country, intervention to end the Russo-Japanese War, intervention in and withdrawal from Chinese loans and moral support to the Chinese republic. Much of the initiative in these affairs is due to the acquisition of the Philippines and to the neces-
sary increase in executive authority while working out a colonial policy for those islands.

During the past 20 years the United States has gained greater influence in European affairs and a consequent increase in executive authority. American representatives were twice conspicuous at The Hague — on both occasions with hearty executive support. They even participated at the Algeciras Conference, although such action was contrary to traditional American policy. President Taft especially concerned himself to secure the adoption of arbitration treaties with the leading European nations, but was unable to overcome the opposition of the Senate to any fancied abrogation of its privileges. His attitude in foreign affairs did much to assert an executive independence that he otherwise abandoned. Wilson, confronted with a world war that recalls the previous contest against Napoleon, has handled the controverted issues thrust upon him with even greater freedom of action. The United States at the end of the century ago and seems destined to open a new era in world diplomacy.

With a greater measure of executive control in foreign relations has gone an increasing leadership in domestic politics, but Wilson and Wilson have led their parties, although by divergent methods. Much of the popular demand for the reform legislation of recent years is due to executive guidance. The President has resorted to more and more direct appeal by voice and pen, and has thereby forced an unwilling Congress to carry out a party platform. He is thus becoming a real party leader, the one official chosen by the country at large, and chosen to carry out a definite party program, for which he assumes direct responsibility. President Wilson has shown this by reviving the custom of the two first Presidents in personally addressing both Houses of Congress; President Taft, by recommending a budget system for public expenditures. It is interesting to note that four of our recent Presidents, as well as Wilson, have in published works acknowledged this new measure of influence and responsibility, although when in office they assumed it in varying degrees of independence and by diverse methods. The office of the President, no longer a mere negative influence in our government, has become a positive one.

The Choice of President.—In the convention of 1787 the question of selecting the national executive presented numerous perplexities. The natural methods of choice — by the legislative assembly or by the people at large — were both rejected. The former was not in keeping with the rigid separation of powers that then seemed so necessary a doctrine, nor were the "Fathers" inclined to entrust the selection of so important an official to the general electorate. After passing over propositions to elect the Presidents by the suffrages of the State governors or by electors chosen by districts, the convention adopted an expedient suggested by the experience of Maryland. Each State should select two electors equal in number to its senators and representatives. These electors, who supposedly would represent the intelligent people of the States, were to vote for two persons for President. A majority of all the electors would be necessary for a choice, the one receiving the highest number of votes becoming President and the next on the list the Vice-President. By 1800 the chief defect in this plan was revealed in a tie vote for Jefferson and Burr. Presidential elections had already become party affairs and this fact was recorded in the speedy adoption of the 12th Amendment, under which the electors vote separately for President and Vice-President. By the original article of the Constitution the legislatures of the various States were to determine the method of choosing the electors; in the first election five legislatures did so without any reference to the people at large. By 1832 Delaware and South Carolina alone continued the practice and the latter held to it until 1860. In the election of 1876, the first in which it participated, Colorado also selected its electors through its legislature. Election by districts was employed by Massachusetts in 1788 and by four States in 1808. Maryland with the sporadic exception of Michigan, in 1822 was the last to abandon this system. After 1836 the practice of a popular choice of electors, upon a general State ticket, was in universal use outside of South Carolina. In 1845 Congress prescribed for the United States the general election day. Since 1800 Presidential elections have been little more than recording agents in their respective States. To the States, however, the system gives a prominence and influence to the candidate that would be lost in an absolutely direct election. Occasionally the unpopularity of an individual elector, or some technical objection to his qualifications, may cause a split in a State delegation. In a close election, such as that of 1916, this may cause uncertainty in regard to the general vote.

Following the change in the electoral college came the Congressional caucus. This body, comprising the members of a given party in Congress, assumed the task of designating the candidates who should afterward receive the suffrages of the successful electors. At a period when party machines were new and undeveloped and commercial and local influence not as potent as now, it is clear that the caucus gradually took over the whole field of nominating the executive but in controlling his subsequent policy. It thus violated the cardinal principle of separating the primary functions of government and was contrary to the growing spirit of democracy. In 1824 similar bodies in each State legislature broke the power of the national caucus but only offered a multitude of weak initiations in its place. During Jackson's administration the national convention composed of delegates selected by State district conventions became the acceptable method of naming Presidential candidates. It has so continued to our own day, although in the last two elections Presidential primaries under State laws have been used to select party delegates. As yet neither of the leading parties has made a serious attempt to adopt a national primary law.

Technically the President is not chosen until the counting of the electoral votes in February before the assembled Senate and House of Representatives. In 1800 an unsuccessful attempt was made to determine exactly what part each House should take in this ceremony, especially in case of a contested vote. In 1805 a
question arose over the returns from the reconstructed States of Tennessee and Louisiana. Congress hastily adopted the "Twenty-Second Joint Resolution" that each House should vote separately upon disputed election returns. This joint rule was suspended in 1877 by the famous "Electoral Commission," consisting of five members from the Supreme Court and five from each House. This commission passed upon the returns of each State and by a party vote seated Mr. Hayes. In order that such a dispute might not recur, Congress in 1877 determined by law to accept election certificates issued by accredited State officers. Each State thus has the power to determine its own electoral vote.

The Presidential Succession.—The Vice-President, chosen in the same manner as the President, succeeds him in case of the latter's death, disability or removal. Five of the 28 Presidents have reached the higher office through their predecessor's death. The succession was first regulated by the law of 1792, which provided that after the Vice-President died, the Speaker of the House might become President. This method was superseded by the Act of 1886, which provides that in case both the President and Vice-President die or are removed, the Secretary of State should succeed, and after him, in order of seniority, the other members of the Cabinet.

Powers, Obligations and Privileges of the President.—Since 1909 the annual compensation of the President has been $75,000, with special appropriations for the care of the Executive Mansion. In general the life of a President is characterized by a simple dignity, although Presidents Roosevelt and Taft recently confessed that their movements while in office were restricted by necessary precautions for their safety. The Presidents attempted a series of stately public ceremonials, which their successors wisely abandoned. The President endeavors to keep in touch with public sentiment by frequent interviews with the people, both directly and through the press, and by occasional addresses to the public. He also has a large amount of official correspondence, which he reads and signs himself. His Cabinet is his principal executive body, and he is, in a proper sense, the head of the whole executive department. The President is not only head of the executive department, but the head of the government, for he is the representative of the whole people in their relations with other States and with foreign nations. He is the only official whose conduct is always subject to public criticism, and he is therefore the most direct object of public opinion. He is, in fact, the embodiment of the national will.

The President exercises a potent and increasing influence upon legislation. Legislative skills are of the first importance in their passage. Certain attempts under Washington to have his Cabinet officers address the Houses directly were discouraged and not repeated. President Taft has expressed the initiative, with those who are supposedly able to give him first-hand information. Of late the Presidents have made frequent lengthy tours over the country, both to learn general views and to guide such views, into particular channels. Moreover the President may be influenced in regard to popular sentiment by the members of his Cabinet—his official advisers. But now the Cabinet official more frequently receives his views from the President than the reverse.

In the Constitutional Convention it was first proposed that the Cabinet should exercise a check upon the President but it was soon perceived that the power of the Senate over treaties and appointments was sufficient for this purpose. Washington consulted with his secretaries by letter, by personal interviews and in general meeting, but always reserved final decisions for himself. Jefferson at first affected a closer consultation with his Cabinet, yet remaining in each case as the primary authority, his Cabinet being only double weight in their joint counsels, but found that he could not escape ultimate decision for himself. Jackson frankly assumed a much more arrogant direction, and Lincoln, one as effectual, although pursued in a different manner. The present tendency is wholly in the direction of single executive responsibility, and the President has at great moment, although the President must entrust the multitudinous details of action to his subordinates.

The Act of 1859, creating the office of Secretary of State, gave the President the power to remove a subordinate without previously consulting the Senate. The only exception to the full exercise of this power occurred under the Tenure of Office Act, passed in 1867 to curb Johnson. Two years later the significant portion of this act was repealed and the remainder 3 March 1887. Although it served its purpose in affording a pretext to impeach Johnson, it never received judicial interpretation. As head of the army and navy the President exercises at all times an extensive appointing power. The Constitution permits Congress to vest the appointments for some minor offices in the heads of departments or their immediate subordinates, but for the 340,000 odd Federal offices are under civil service rules. About 10,000 of the more important officials must be confirmed by the Senate and it is over this patronage that the President incurs trouble, if he does not give local influences due weight. Occasionally the Senate has requested additional information about the removal of an official before proceeding to confirm his successor. Cleveland took the position that this was not in keeping with public interests and consistently maintained his point. Jackson used the power of removal in building up a personal party machine, and his successors, including Lincoln himself, often had to follow his example. This abuse has been greatly curtailed since the passage of the Civil Service Act of 1883.

The President exercises a potent and increasing influence upon legislation. Legislative skills are of the first importance in their passage. Certain attempts under Washington to have his Cabinet officers address the Houses directly were discouraged and not repeated. party issues. The growing power of administrative interpretation also makes the executive influential in legislation, especially that of a fiscal character. The judiciary must depend upon the executive or his subordinates for the enforcement of its decisions, and in cases when executive discretion is involved must often yield to his immediate control. This interdependence not merely maintains the chief magistrate in a co-ordinate position, but frequently gives him a majority control of all that is done.

48. THE VICE-PRESIDENCY

By provision of the Federal Constitution, a Vice-President of the United States is elected at the same time, for the same term and in like manner as the President by electors chosen in each of the States. A majority of the votes cast in the several electoral colleges is necessary to an election. The Vice-President is the president of the Senate, and in the event of an equal division in that body he gives the deciding vote. Under no other contingency has he a vote. The powers and duties of the office of President devolve upon the Vice-President in case of the death, resignation or removal from office of the President. The Vice-President is included in the category of public officers liable to removal from office on impeachment on conviction for treason, bribery or other high crimes and misdemeanors. By the 12th Amendment to the Constitution no person constitutionally ineligible to the office of President shall be elected to that of Vice-President. In the event of a vacancy occurring in the office of Vice-President, the Senate is presided over by a member of that body. In such contingency the death of the President would, under existing law, result in the Vice-President upon the Secretary of State. Twenty-eight persons have held the office of Vice-President; their names and the dates of their respective elections are as follows, viz.: John Adams, of Massachusetts, elected in 1788, re-elected in 1792; Thomas Jefferson, of Virginia, in 1796; Aaron Burr, of New York, in 1800; George Clinton, of New York, in 1804, re-elected in 1808; Elbridge Gerry, of Massachusetts, in 1812; Daniel D. Tompkins, of New York, in 1816; Andrew Johnson, of South Carolina, in 1824, re-elected in 1828; Martin Van Buren, of New York, in 1832; Richard M. Johnson, of Kentucky, in 1836; John Tyler, of Virginia, in 1840; George M. Dallas, of Pennsylvania, in 1844; Millard Fillmore, of New York, in 1848; William R. King, of Alabama, in 1852; John C. Breckenridge, of Kentucky, in 1856; Hannibal Hamlin, of Maine, in 1860; Andrew Johnson, of Tennessee, in 1864; Schuyler Colfax, of Indiana, in 1868; Henry Wilson of Massachusetts, in 1872; William A. Wheeler, of New York, in 1876; Chester A. Arthur, of New York, in 1880; Thomas A. Hendricks, of Indiana, in 1884; Levi P. Morton, of New York, in 1888; Adlai E. Stevenson, of Illinois, in 1892; Garrett A. Hobart, of New Jersey, in 1896; Theodore Roosevelt, of New York, in 1900; Charles W. Fairbanks, of Indiana, in 1904; James S. Sherman in 1908; and Thomas R. Marshall in 1912.

Four Vice-Presidents were subsequently elected President, viz.: John Adams in 1796; Thomas Jefferson in 1800 and 1804; Martin Van Buren in 1836; and Theodore Roosevelt in 1904. The dates given have reference to the election by popular vote of the electors in the several States. Seven Vice-Presidents died in office, viz.: Clinton, Gerry, King, Wilson, Hendricks, Hobart and Sherman. The Presidential contest of 1836 Martin Van Buren received a majority of the electoral votes for President, but no candidate received a majority for Vice-President. By constitutional requirement the duty of electing a Vice-President then devolved upon the Senate; the candidates from whom such choice was to be made were restricted to the two who had received the highest number of electoral votes. One of these, Richard M. Johnson, of Kentucky, was duly elected by the Senate. The only Vice-President who resigned the office was John C. Calhoun. This occurred in 1832, and Mr. Calhoun soon thereafter took his seat in the Senate, to which body he had been elected by the legislature of South Carolina.

Five Vice-Presidents have, upon the death of the President, succeeded to the Presidency. The first President to die during his incumbency of the great office was William Henry Harrison; his death occurred 4 April 1841, just one month after his term had begun. The President, John Tyler, then at his home country in Virginia, was officially notified of the event, and upon reaching the seat of government at once took the oath of office as President. There was much discussion for some time in and out of Congress as to his proper title, whether Vice-President of the United States acting as President of President. The language of the Constitution, however, is clear, and it is no longer contended that upon the death of the President the Vice-President becomes in name as in fact—President. Upon the death of President Zachary Taylor, 9 July 1850, Vice-President Millard Fillmore succeeded to the Presidency, and was at a later date an unsuccessful candidate for election to that office. The third Vice-President who reached the Presidency by succession was Andrew Johnson; this occurred 15 April 1865, the day following the assassination of President Lincoln. President Garfield was shot by John Wilkes Booth in September of that year, when he was succeeded by Vice-President Chester A. Arthur. Vice-President Roosevelt was the successor of
President McKinley, who died by the hand of an assassin in September 1901.

Two attempts have been made to secure the impeachment of the President—the incumbent in each instance having been elected Vice-President, and succeeded to the higher office upon the death of the President. A resolution looking to the impeachment of President Tyler was introduced into the House of Representatives in January 1843, but being defeated no further steps were taken. Articles of impeachment for "high crimes and misdemeanors" were presented by the House of Representatives against President Johnson in 1868. By constitutional provision the trial was by the Senate, the chief justice of the United States presiding. Less than two-thirds of the senators voting for conviction, he was acquitted.

No constitutional provision existed until the adoption of the 12th Amendment for separate votes in the electoral colleges for President and Vice-President; the candidate receiving the highest number of votes (if a majority of all) became President and the one receiving the second highest, Vice-President. In 1801 Jefferson and Burr each received 73 electoral votes, and by constitutional requirement the election at once devolved upon the House of Representatives, voting by States. Upon the 36th ballot, a majority of the States voting for Jefferson, he became President and Burr Vice-President. The constitutional amendment above indicated—by which separate ballots were required in the electoral colleges for the two offices—was the result of the intense excitement throughout the country engendered by this contest. The earnest opposition of Alexander Hamilton to Aaron Burr in the above-mentioned contest was the prime cause of the duel by which Hamilton lost his life at the hands of Burr, in 1804.

George Clinton, the fourth Vice-President, had as a member of the Continental Congress voted for the Declaration of Independence, and held the rank of brigadier-general during the War of the Revolution. The fifth Vice-President, Elbridge Gerry, had been a prominent member of the Constitutional Convention of 1787. William R. King, elected in 1852, by reason of ill-health never entered upon the discharge of the duties of his office. By special act of Congress, the oath of office was administered to him in Cuba and his death occurred soon thereafter. Of the 25 Vice-Presidents thus far elected, nine have been taken from the State of New York. Adams and Jefferson, the first and second Vice-Presidents, rendered valuable service to the young republic at foreign courts, each by election was elevated to the Presidency, and their deaths occurred upon the same historic 4 July—just 50 years from the day they had signed the Declaration of Independence. A marble bust of each of the Vice-Presidents has been placed in the gallery of the Senate chamber. The office of Vice-President is one of great dignity. He is the presiding officer of the most august legislative assembly known to men. In the event of an equal division in the Senate he gives the deciding vote. This vote, many times in our history, has been one of deep significance. It will readily be seen that the contingency may often occur when the Vice-President becomes an important factor in matters of legislation. See also United States—Presidents and Vice-Presidents of.

49. SPEAKER OF THE HOUSE OF REPRESENTATIVES. The Constitution of the United States provides that: "The House of Representatives shall choose a speaker and other officers, and shall have the sole power of impeachment." Even if the power to choose a speaker had not been expressly conferred by the Constitution, the House, as a legislative body, would have possessed the inherent authority to elect or appoint a presiding officer and such other officials as might be necessary to enable it to transact its business in an orderly and regular manner, and to make and preserve a record of its proceedings. As the Constitution does not prescribe the manner in which the speaker shall be chosen, the House itself must determine the mode of election; and, therefore, may order a vote to be taken in any way that will ascertain the choice of a majority, or the choice of a plurality, in case it shall have previously been determined that a plurality may elect. Although no rule has been adopted upon this subject, it is customary to choose a speaker by calling the names of the members present who have filed regular credentials with the clerk, and by recording their votes in the Journal. Pending the election, the clerk of the last preceding House of Representatives presides, and it is his duty to preserve order and decorum and to decide all questions of order, subject, however, to appeal by any member. The speaker is nominally elected to preside during the Congress then existing, but there is no constitutional or statutory provision, nor any rule of the House fixing the term of office, and, as he is merely an officer of the House, it would seem that he might be lawfully deposed at any time by the election of another to take his place. By statute, in England, it is provided that, in case of a dissolution of Parliament, the then speaker of the House of Commons shall continue in office until one shall be chosen by the new Parliament, and that, in case of his death, disability or absence from the realm during any dissolution or prorogation, three of the commissioners of the House of Commons shall act for him in regard to the offices of the House. In this country, the office becomes vacant immediately upon the adjournment of Congress (see Congress of the United States), and there is no one authorized to act until a new speaker is elected by the next House, but as already stated, the clerk presides over the new House until a speaker is chosen. During the sitting of Congress the speaker may designate a member to discharge the duties of the office in his stead, but this substitution cannot extend beyond an adjournment. In case of his illness, however, he may, with the approval of the House, make such appointment for a period not exceeding 10 days; but, if he is absent and has omitted to make an appointment, the House elects a speaker pro tempore.

The speaker is nominated and elected by the members of the party with which he is affili-
of appointment of all remaining standing committees and vesting this function in the Ways and Means Committee subject to the ratification of the House. By so doing the House secured greater control of its members and prevented the House from being occupied at any time since the Civil War. The Committee on Rules has since been raised from 10 to 11 members.

The speaker must rise from the chair to put a question to the House, but he may state it sitting. There are four different methods of taking the sense of the House on a pending proposition: First, by the voices, the members who vote in the affirmative saying "Aye," and those voting in the negative saying "No." If the speaker doubts, or if a division is called for, he directs those in the affirmative to rise from their seats and be counted, and after he has made the count and announced the number, those voting in the negative rise and are counted. If he still doubts, or if tellers are demanded by one-fifth of a quorum, the speaker designates two members, one from the affirmative side and one from the negative side, to count the votes for and against the measure and report the result to him. If both of these methods are resorted to, if the yeas and nays are demanded by one-fifth of the members present, the speaker directs the clerk to call the roll, and the names of those voting are entered on the journal. It is frequently the case that the votes are taken in all these different ways upon the same question before the result is finally ascertained and announced.

When the House resolves itself into a committee of the whole, the speaker leaves his place and designates a member to preside as chairman. In case of disorder in the committee, the regular practice is for the committee to rise by vote and report the fact to the House, but there have been occasions when the speaker, having knowledge of the disorder, has summarily resumed the chair and restored order without the formality of a vote by the committee to rise and report.

It is the duty of the speaker to sign all acts, addresses, joint resolutions, writs, warrants and subpoenas ordered by the House, and to decide all questions of order as they arise, subject to appeal by any member. Being a representative himself, he has the right to vote on all questions in the House and in committees of the whole, but, under the rules, he is not required to vote in ordinary legislative proceedings, except in case when his vote would be decisive or when the House is voting by ballot. When there is an even, or tie, vote, the question is lost, and the speaker, therefore, does not vote unless he is in favor of the measure.

According to the general parliamentary law, the speaker has no right to speak except on questions of order, but, in the House of Representatives, he has several times participated in the debates without asking the consent of the House; and it is not unusual for him to speak and vote in committees of the whole.

He is required to take the chair on every legislative day at the time to which the House shall have adjourned at its last sitting, and, on the appearance of a quorum, it is his duty to cause the journal of the last day's proceedings to be read, having first explained his approval of it. Generally, however, the reading of
the journal is dispensed with by unanimous consent of the House. If no quorum attends at the hour of meeting, or if it appears at any time during the sitting that no quorum is present, he has no power to adjourn the House on his motion, as is the case in the English House of Commons. Under the Constitution, a majority of the House constitutes a quorum to do business, but it is provided that a smaller number may adjourn from day to day and may be authorized to compel the attendance of absent members, in such manner and under such penalties as it may prescribe. Accordingly, it is provided by rule that 15 members, including the speaker, shall be authorized to compel the attendance of absent members, and, consequently, the House is not disabled and forced to adjourn because there is no quorum present.

The speaker has the power to appoint and remove for cause the official reporters of debates for the House, and he prescribes regulations for the admission of the representatives of the press to the reporters' gallery. He has also control over the hall of records and the unappropriated rooms in that part of the Capitol devoted to the use of the House. Under the statutes of the United States he appoints from the membership of the House three visitors to the Military Academy, three to the Naval Academy, a consulting trustee of the Reform School of the District of Columbia, two directors of the Columbia Hospital for Women, three regents of the Smithsonian Institution and two members of the Memorial Association of the District of Columbia.

Since the organization of the government under the Constitution, on 30 April 1789, there have been 65 Congresses, but owing to the fact that in many cases the same person was several times re-elected to the office, there have been only 35 permanent speakers of the House. Of the 35, 23 were representatives from Massachusetts, four from Virginia, four from Kentucky, three from Pennsylvania, three from Indiana, two from New Jersey, two from South Carolina, two from Georgia, two from Maine, two from Tennessee, and one from each of the States of Connecticut, North Carolina, New York, Ohio, Iowa, Illinois and Missouri. The speaker who held the position longer than any other was Henry Clay of Kentucky, who was elected six times but did not serve six full terms, having resigned from the office twice before the expiration of the Congresses for which he had been chosen.

Under the Constitution, Congress may provide by law for the case of removal, death, resignation or inability, both of the President and Vice-President, designating what officer shall then act as President, and, by a statute passed 1 March 1792, it was enacted that in such a case the president of the Senate, or, if there should be none, the speaker of the House, for the time being should act as President until the disability should be removed or a President should be elected. This statute remained in force until 19 Jan. 1886, when Congress passed another act providing that the vice-president, in the case of the death, resignation or inability of both the President and Vice-President, the Secretary of State, or, if there should be none, or in case of his removal, death, resignation or inability, the Secretary of the Treasury shall act as President, and that the right of succession shall pass next to the Secretary of War, then to the Attorney-General, Postmaster-General, Secretary of the Navy and Secretary of the Interior. The Department of Agriculture and the Department of Commerce and Labor had not then been created, and, consequently, the secretaries of these departments are not included in the act and they are not in the line of succession. Although the Act of 1792 remained in force for nearly 95 years, the attendance of absent members for nearly 95 years, the attendance of absent members for 95 years, the attendance of absent members for never occurred. This was fortunate for the country, because there were grave doubts as to its constitutionality, and, if so, whether the president of the Senate or the speaker of the House might have been seriously contested. The questions which would have arisen are: (1) Whether the word "officer" used in the Constitution did not mean an officer of the United States; and, if so (2) whether the president of the Senate and the speaker of the House are such officers or are only representatives of the States or the people, chosen by the two branches of Congress to preside over the government. 50. HISTORY OF ARBITRATIONS.
International arbitration is a voluntary submission of certain defined points in an international dispute to the decision of a third party. (The decision of the arbitrator or court of arbitration is binding except when the award is outside of the points submitted, equivocal, impossible, or impossible from each of the three parties). It is largely the outgrowth of the complex international relations of the 19th century which have resulted in a growth in the recognition of international duties and liabilities. From 1800 to 1900 there were 136 important international arbitrations and many minor commissions.

The United States, pre-eminent in the advocacy of arbitration between states, took the lead in several very important international adjustments. She began her national existence with many unsettled questions, and as she settled them there arose many new problems demanding solution. With a desire to substitute reason for force in settling disputes, she accepted international arbitration as a prominent feature of her policy. Her arbitrations embraced many kinds of international controversies, and many important questions of law, both public and private, some of which might have resulted in an expeditious conflict of the United States; and, if so, whether the president of the Senate or the speaker of the House might have been seriously contested. The questions which would have arisen are: (1) Whether the word "officer" used in the Constitution did not mean an officer of the United States; and, if so (2) whether the president of the Senate and the speaker of the House are such officers or are only representatives of the States or the people, chosen by the two branches of Congress to preside over the government. (1894) See also A. C., "Precedents of the House of Representatives" (1907); McCall, S. W., "The Business of Congress" (1911); Reed, T. B., "How the House Does Business" in North American Review (CLXIV, pp. 612, 641, 1897); "Manual of the House of Representatives" (1909).

R. C. MCMANUS,
University of Cincinnati.

With Great Britain.—Arbitrations with Great Britain were the most important. The first
cases arose under the Jay Treaty of 1894, articles 5, 6 and 7 of which provided for three mixed commissions: (1) To settle the identity of the Saint Croix River, which was specified in the treaty of 1783. The commission in 1796 decided upon the Schoodic. (2) To decide what compensation, if any, was due British subjects who had been unable to collect debts in some of the States where the terms of the treaty of 1783 had been disregarded. The board of five arbitrators met at Philadelphia in 1797, quarreled and adjourned in 1798. The matter was finally settled by the treaty of 1802 which awarded Great Britain $600,000. (3) To settle questions regarding contraband, rights of neutrals and prize court decisions. This commission met at London. There were several interruptions (and the disagreement of the Philadelphia commission caused a suspension from July 1799 to February 1802), but it completed its work in 1804. Its work was very important in determining subsequent international law (q.v.).

After the cases wisely provided under the Jay Treaty there followed a period in which the effects of European wars rendered arbitration practically impossible, and produced an extraordinary train of circumstances which finally precipitated the Anglo-American War of 1812. In that war every vexatious question which has arisen with Great Britain has been settled by arbitration in case direct negotiation failed. Articles 4, 5, 6 and 7 of the Treaty of Ghent of 1814 provided for three commissions or boards of arbitration: (1) To determine the title to certain islands in Passamquoddy Bay. At New York, in 1817, the board made its award, substantiating in the main the British claims. (2) To determine the northeast boundary of the United States, from the source of Saint Croix to the Saint Lawrence. The board met at Saint Andrews in 1816, and held its last meeting at New York in 1822, but reached no agreement. By a convention of 1827 the points of difference were referred to the king of the Netherlands, who in 1831, proposed a compromise line which neither party was willing to accept. The matter was finally settled by the Webster-Ashburton Treaty of 1842. (3) To determine the boundary of the lakes in the upper end of Lake Huron and then to the Lake of the Woods unsettled till the Webster-Ashburton Treaty of 1842.

By the treaty of 1818 the question in dispute as to the obligation of Great Britain to return the slaves which she had in her possession in the State of Maine under the Treaty of Ghent was referred to the empire of Russia who in 1822 decided that Great Britain had not complied with the Treaty of Ghent, and that she should pay to the United States an indemnity. The mixed commission which was selected to fix the amount of compensation finally agreed upon most points, but adjourned in 1827, its functions having been ended by the ratification of a convention concluded at London in 1826 by which the United States received $1,204,906.

A convention at London in 1853 provided for a claims commission which ended its sessions in 1855, after giving important decisions regarding fishery rights and rendering awards in the famous McLeod and Crouse cases. The reciprocity treaty of 1854 provided a commission to adjust disputes regarding fishermen which might arise under the treaty, but no resort was made to the stipulation. In 1855 a commission was organized to determine the reciprocal reserved fisheries rights, under the reciprocity treaty, which had renewed the privileges renounced by the United States in the convention of 1818 as to in-shore places. The work was concluded in 1866.

In 1857 commissioners were appointed to determine the boundary under the treaty of 1846, there having been a disagreement in regard to the San Juan water boundary—as to the middle of the channel separating Vancouver's Island from the continent. They held six informal meetings in 1857 and finally disagreed. Discussion of the boundary continued until the Civil War, and was resumed in 1866. The Senate failed to vote upon the convention of 1869 for the submission of the boundary question to arbitration of the President of the Swiss Confederation. Under the treaty of 1863 commissioners were appointed to settle the claims of the Hudson's Bay Company (q.v.) and the Puget Sound Agricultural Company arising under the Oregon treaty of 1846. In 1869 they awarded $450,000 and $200,000, respectively, to the companies, which in turn executed deeds relinquishing all claims.

The greatest arbitration treaty was that of Washington (1871) which provided for four distinct arbitrations: (1) The question of the San Juan water boundary was referred to the emperor of Germany who in 1872 rendered an award in favor of the American claim to the Haro Channel. (The boundary was fixed by protocol in 1873). (2) The American claims for losses from Confederate cruisers of Confederate origin (Alabama claims, q.v.) were referred to the Geneva tribunal, which in 1872 awarded $15,500,000 to the United States. (3) The claims and counterclaims growing out of the Civil War (outside of cruiser claims) were referred to a mixed commission which in 1873 awarded Great Britain $1,929,819. (4) The claims for American use of the northeastern fisheries (of Nova Scotia) were referred to a commission of three persons which met at Halifax in 1877 and awarded $5,500,000 to Great Britain.

Under a treaty of 1892, a commission was created to settle the Bering Sea controversy (q.v.) as to sealing. It met at Paris in 1893 and decided that the United States can claim no exclusive rights in sealing in Bering Sea except within three miles of the coast of her territory, though it favored the American plea for the necessity of regulating pelagic sealing. Under the decision of this commission, there was created a new commission (1899) which awarded $471,151 to the Canadian sealers whose vessels had been seized. In 1897 the question of the boundary between Alaska and the British possessions was submitted to a board of arbitration. After considerable delay, the arbitrators met at London (1913) and decided the
main points in favor of the American contentions.

There were two important Anglo-American cases in which a third party was involved: (1) Under a convention of 1889 between the United States, Great Britain and Germany, to settle conflicting interests in the Samoan Islands (q.v.), the nomination of the chief justice of the islands was to be referred to the king of Sweden, in case the three powers could not agree. In 1899 a joint high commission, which was sent to investigate the complications which had arisen, decided that a partition of the islands between the United States and Germany was the best solution of the problem. An agreement for partition was signed at Washington in December of the following year. (2) In 1890 the United States, Great Britain and Portugal agreed to submit to three eminent jurists, to be selected by the President of Switzerland, the settlement of a dispute caused by the seizure and the annulment of the charter (by Portugal) of the Delagoa Bay Railway, which had been constructed under a concession to an American.

The more important American arbitrations with other nations in the century before 1900 are the following:

With Spain.—A commission, under article 21 of the treaty of 1795 with Spain for providing a commission which met at Philadelphia in 1859 and awarded $325,440 to the United States for depredations on American commerce before 1794. To settle spoliation claims arising after 1795 a commission was appointed in 1882, but the provision was not reconstructed by the United States. Diplomatic relations which were suspended in 1805 were resumed at the close of the Napoleonic wars and resulted in the Treaty of Florida, in 1819, by which all claims were adjusted. In 1870, on the suggestion of Secretary Fish, the case of the Colonel Lloyd Aspinwall, an American vessel seized near Cuba by the Spanish authorities, was submitted to a board of arbitration which met at New York in the presence of a representative of the United States. By agreement of 1871 a mixed commission was created to adjust claims resulting from the Cuban insurrection. It met at Washington and concluded its labors by February 1873. The charges for wrongful seizure and detention of the American bark Masonic was referred to Baron Blanc, the Italian Minister at Madrid.

With France.—The United States and France did not succeed so well in settling their disputes by arbitration. In 1800 they agreed upon a convention for settling disputed claims for depredations after 1788. France did not carry out faithfully her part of the agreement, but in 1803 she signed another convention providing a commission and the payment of claims. Subsequent depredations produced new claims which France delayed to pay. In 1831 these claims and French counterclaims were adjusted by a commission which awarded the United States an indemnity of $5,558,108. The delay of France in paying led to a rupture of diplomatic relations, but through the mediation of Great Britain in 1836 the claims were paid. In 1880 a board was created to adjust the claims growing out of the Mexican troubles of 1862-67, the American Civil War and the Franco-German War (q.v.). It completed its work in 1884 and awarded $612,000 to France.

With Mexico.—By the treaty of 1839 with Mexico, the adjustment of miscellaneous claims was submitted to a mixed commission, composed of two Mexican commissioners and an umpire (a citizen of Prussia). In the treaty the United States and Mexico agreed to submit all disputes to arbitration, and in 1868 they provided for the settlement of all claims after 1846 by a joint commission which held its first meeting in 1869 and finally completed its work in 1876. The award was in favor of the United States ($4,125,622 in favor of citizens of the United States and $150,498 in favor of citizens of Mexico), but Mexico delayed final settlement, claiming that the award was unjust. Under the convention of 1889 (and in harmony with the arbitral boundary stipulations of the treaties of 1828, 1833 and 1882) a permanent board, called the International Boundary Commission, was established to determine questions arising from changes in the course of Rio Grande and the Colorado rivers along the boundary between the United States and Mexico.

With Venezuela.—In 1866 a mixed commission was created to settle American claims against Venezuela. In 1868 it awarded $1,253,310 to the United States. Fraud being charged, the claims were finally (1885) submitted to a second commission which in 1890 awarded $980,572 to the United States. Another claims case with Venezuela was that of the Venezuela Steam Navigation Company in 1892.

Among other cases arbitrated were the following: the很满意 Arm strong in 1851 (with Portugal); Panama riot claims, in 1857-62 (with New Granada); claims for the brig Macedonia, 1858-63 (with Chile); claims for the United States and Paraguay Navigation Company, 1839 (with Paraguay); claims against Costa Rica, in 1860; claims against Ecuador, in 1862; Colombian claims of 1861 and of 1864; Peruvian claims, 1863 and 1866-69; claims for the steamer Montijo, 1874 (with Colombia); Bolivian claims, 1884 (with Hayti); Bolivian claims, 1888 (with Hayti); the Charles Butterfield claims, 1888 (with Denmark); Chilean claims, 1892-94; the Santo claims, 1893-96 (with Ecuador).

The question of damages arising from the seizure of four American vessels in Bering Sea, in 1891, by a Russian cruiser, was (by protocol of 8 Sept. 1900) submitted to the decision of an arbiter who in 1902 gave a decision awarding $114,670 in favor of the United States.

In addition to submitting its own cases to arbitration, the United States through its officials (the President and diplomatic representatives) in the latter part of the 19th century acted as arbitrator in several cases. She has acted as mediator in numerous cases, the most important being to secure an armistice between Spain and the several trans-Andean South American countries in 1871, and in adjusting a long-standing boundary dispute between Chile and the Argentine Republic in 1881. Her government has often created tribunals, under her own statutes, to execute conventional obligations and to settle questions of international relations.

In the same period there were many memorials and petitions presented to Congress on the subject of international arbitration. In 1874 a resolution in favor of general arbitra-
tion was passed by the House. In 1888 the President and Congress received a communication signed by 233 members of the British Parliament urging the negotiation of an arbitration treaty. In 1883 Switzerland proposed to the United States the inauguration of international treaties by deposit of an arbitration clause. President of the United States assented to the proposal. In 1890 the Senate (the House concurring) adopted a resolution in favor of arbitration. Negotiation between the United States and Great Britain for a general and permanent treaty of arbitration soon followed, and in 1897 a treaty was concluded and sent to the Senate by President Cleveland. President McKinley also urged its ratification, but it failed to get the necessary two-thirds vote. Meanwhile a general treaty of arbitration for American republics, drafted at the first Pan-American Conference of 1890-91, was signed and never was ratified. The United States, however, became a party to The Hague Convention adopted at The Hague Peace Conference 29 July 1899, which resulted in the establishment of The Hague permanent court— the crowning event of the Hague system in 1899.

II

The creation of The Hague Court marked the beginning of a new period of increased interest in arbitration. To this tribunal reference (voluntary or compulsory) of all questions of claims for arbitration was favored by the second Pan-American Conference (at Mexico, 1901-02). Its first case, the controversy between the United States and Mexico over the famous Pious fund of the California missions, was decided and gave dignity to the court, attracting the confidence of other states and resulting in the early submission of other international disputes for its decision. Its next important case was the Venezuela trouble of 1898, in which four nations were involved, and which was submitted to arbitration through the influence of President Roosevelt, who had prevented Germany's plans of using force against Venezuela. In 1903 the majority of the Oronoco company resulting from concessions annulled by President Castro of Venezuela— claims which had been arbitrated in 1903 but were resubmitted on the ground that the umpire had disregarded the terms of the protocol submitting the case for his decision and award. In the same year it made a satisfactory award in the Anglo-American North Atlantic Coast Fisheries controversy, involving an interpretation of the treaty of 1818, submitted to it by special Anglo-American agreement of 1909.

The second Hague Conference (1907), called at the initiation of President Roosevelt, enlarged and strengthened the convention of 1899 for the settlement of international disputes. It provided that, in case either government party to a dispute should decline to arbitrate when requested to do so, the other party might go directly to the bureau of The Hague Court and publicly request arbitration of the controversy. Through the influence of the American delegates it also drafted a convention which prohibited the use of force for collection of debts in disputes arising under the treaty. In 1912 the American commissioner of the American commission for arbitration before a session was convened to re-examine cases pending under the treaty.

The American proposition for a form of treaty for obligatory arbitration, stipulating that certain classes of controversies should go spontaneously (automatically) to The Hague Court, received the vote of 35 of the 44 delegations, but was opposed by Germany and four other powers (Austria, Greece, Rumania and Turkey). The conference also took another advanced step in voting unanimously for a regular international court of justice with judges in permanent service, and holding regular sessions, but it failed to find a method of appointment of judges satisfactory to all the powers, great and small.

A Central American Conference which convened at Washington in 1907, largely through the influence and initiative of President Roosevelt, resulted in the foundation of a Central American court for the arbitration of questions of an international character affecting the relations of the five republics.

New efforts for treaties of obligatory arbitration with stipulations for reference of controversies to the new Hague tribunal were remarkably successful—although Secretary Hay's general treaties of 1906-07, providing for obligatory arbitration of judicial disputes and questions of treaty interpretation by The Hague by special agreements by the executive without reference to the Senate, failed because of Senate amendment. No less than 51 such treaties, all entered before June 1907, and the number after 1907 was increased by 1910 to about 80, of which 24 were negotiated by Secretary Root before January 1908, each providing for approval of special agreements by the Senate. In February 1909 were all ratified by the Senate. These treaties, terminating after five years, provided for reference of questions of a judicial nature and those regarding the interpretation of treaties, but excluding questions affecting vital interests and honor.

The application of the principle of arbitration in international relations was made in the establishment of two tribunals to decide controversies arising between the United States and Canada: one, a permanent international fisheries commission (by treaty of 1908) to settle fishing difficulties; and the other an international joint waterways commission (by treaty of 1909) for exercised the right to arbitrate in the matter of borderline waters, and with authority to inquire and report concerning other matters of difference or dispute along the frontier or to decide such questions as might be referred to it.

More comprehensive arbitration treaties with England and with France, providing for submission to The Hague of all justifiable questions arising from claims of rights under treaty or otherwise, and also the creation of joint high commissions of inquiry to which any controversy might be submitted for investigation and report before submission to arbitration, were signed in August 1911, but emasculated by the Senate in March 1912 and finally abandoned.

Secretary Bryan proposed that the principle of international commissions should be extended to all questions, with a provision that no war should be commenced during investigation. His plan was to submit it to the Senate in March 1912 and finally abandoned.
The Period of Settlement (1607-1700).

The year of the settlement at Jamestown, Va., was also the year of Calvin's Case (7 Coke's Reports, 331), which upon a state of facts quite disconnected from colonial matters, laid down the theory of the English courts as to the position of dependencies. This was that English statutes did not bind dependencies, as parcels of the realm in tenure, unless they were specially named. At a later time in the cases of Blankard v. Galdy (2 Salk. 411) and Campbell v. Hall (1 Cowper, 204) this principle was more elaborately developed, and Blackstone lent it the weight of his authority. That English subjects going to a new and uninhabited country carried with them, as their birthright, the laws of England existing at the time of colonization, was a supplemental corollary of the former principle. While such was the theory accepted by English courts, it does not follow that during the colonial period it was adopted in its entirety by the colonists themselves.

The English settlements in America varied so much in their origin and spirit that at first no general plan or party (1886) united them. A History and Digest of International Arbitrations to which the United States has been a Party (1919); id., Principles of American Diplomacy (1918); Wilson, G. C., The Hague Arbitration Cases (1915); Record of the American Historical Association (1891); Foreign Relations, United States; American Year Book; International Year Book.

JAMES MORTON CALLAHAN, Professor of History and Political Sciences, West Virginia University.

51. GROWTH AND DEVELOPMENT OF LAW. The history of law, or the relations of members of society to one another and of all to the State, is a history of organic growth. Upon it various phases of political, social and economic activities of a people have left indelible traces. The history of American law is from the beginning somewhat complex, but it represents the development of legal principles to be the feeble and scattered colonies of the 17th century into the diversified yet systematic body of law in force to-day in a nation whose inhabitants differ in their various needs as widely as they are distributed geographically. The heterogeneous character of administration in the various colonies, the organic change from British colonies to independent states, the welding of the separate States into a national union, the taking-over of certain legal powers and duties by the Federal government under the Constitution and the consequent growth of a Federal jurisprudence, partly opposed and partly complemental to that of the States, the addition of new Territories by conquest and purchase, each in turn becoming States under the Constitution, — all these have been factors in producing the differentiated body known as American jurisprudence. In order to understand the development of American law, its history may be divided roughly into four periods: (1) The period immediately preceding the 17th century; (2) The period of organization, covering the 18th century to the Rvolution; (3) The period of extension, from the Revolution to about 1850, and (4) The period of modern law and procedure from about 1850 to the present time.
enactments. The theocracy of Massachusetts found expression in the Body of Liberties (1636) in which the Mosaic Code was adopted. The early code of Virginia (1612) was exceedingly severe and it was modified soon after the colony had its own legislative assembly. The commercial spirit of the colony's promoters asserted itself in the laws which aimed at the economic regulation of the colony. While the criminal codes, judged by the standards of the present, seem harsh, yet in comparison with the criminal law of England, they were mild, for while the laws of Connecticut specified 12 crimes for which the death penalty was provided, there were more than 200 offenses punishable by death under the English law. No other colony introduced a system of codes so all-embracing and modern in spirit as did Pennsylvania, which by its frame of government and fundamental laws embodied the opinions of the most enlightened statesmen of the time with the modifications which experience had found necessary. In Maryland, owing to the continued disagreement between the proprietors and the people, no formal code of laws was in force. The colonists accordingly claimed that they were governed by the common law of England in so far as it was applicable to the local conditions existing. The proprietor opposed this claim as in derogation of his rights and the controversy was not settled until well into the 18th century.

As a result of universal adoption of codes which restated legal principles remained to be put in force by the colonial courts. The constitution of these courts was as various as that of the colonies. Everywhere the trial courts were presided over by men untrained in the law; the procedure was of the most informal kind. Whether, as in Virginia, the County Court consisted of 8 or 10 gentlemen holding commissions from the governor, or as in New York where the judges were elected annually by the people, there was little chance for a systematic declaration of the law based upon precedent. It is the universally accepted theory of American jurisprudence that the common law must adapt itself to the times; the written common law of England was suited mutatis mutandis to the conditions of colonial life. No exact dates, however, can be set for a general reception of the common law. Where the colonial codes were silent the early colonial judges did not consciously draw upon English precedents for their decisions. Knowing little and caring less for the technicalities of the law and having no law books, they decided cases not covered by the codes according to the rules of substantial justice as between man and man, taking as in Massachusetts (1646) the words of eternal righteousness and truth as the rule by which all kingdoms and jurisdictions must render account, or, as in Virginia (1631) doing equal right to poor and to rich after their cunning, wit and power and after the laws and customs of the colony and as near as may be after the laws of England. While the systems of government which at an earlier time had been discouraged, were now claimed as a matter of right if a colonial court failed to declare the law in accordance with the common law, an English court of appeal had jurisdiction to remedy the error. As the judges in the Crown colonies

Period of Organization (1700-1776).—During the 18th century and prior to the Revolution, law and procedure tended toward a common type in all the colonies. The causes of such a change from the variant beginnings of the century previous were not only political, but social and economic. Increase of population by immigration, mostly from England and by natural increase, added wealth, growth of towns and better facilities of inter-communication rendered the crude administration of the earlier period insufficient for colonial needs. The revocation of colonial charters and the organization of Crown colonies led the way to greater uniformity of administration. Common grievances started a national feeling. All of these forces aided in creating a common public sentiment which found its expression in law either directly through legislation or indirectly from the bench. During this period were laid the foundations of a later constitutional law. Every inhabitant of a charter colony was interested in the legal proceedings in England concerning the charters; and this is the reason why there is a wealth of materials concerning the English law in the South and the Middle Atlantic states. The colonists were, of course, not the first to study English law. Common law had been studied in England for more than two centuries.
were appointed during good behavior and
tended, therefore, to hold to prerogative, their
decisions in matters of public right were apt
to be unpopular.

The appearance of trained lawyers and the
removal of the ban placed upon the legal pro-
fession had much to do with the change in pro-
cedure. Local prejudices and slip-shod methods
of practice gave way before a regulated system
based upon the common law. Not until the
second half of the 18th century, however, was
the American lawyer a person of great public
influence. The generation which stood for poli-
tical independence and furnished men of affairs
was one of lawyers. English law books and re-
ports were imported. Procedure was copied
from that obtaining in the English courts.
Pleading according to the rules of the common
law was introduced with all the old techni-
calities.

Holding by commission from the Crown, the
colonial governor assumed to a greater or less
extent the functions of a chancellor and gave
relief in equity. As the governor derived his
charter of office from the king, recourse to the
royal determination was popular. While in England
equity had become an independent system under the
chancellorship of Lord Hardwicke (1736-50),
in the American colonies the chancery courts re-
mained in a rudimentary stage. In the 16th century,
however, there was a court having a semblance of
chancery powers. Pennsylvania adopted in
her early codes a system unique in the history of
jurisprudence, in that in the courts of the colony
both party and judge overhanging equitable rights were administered under common-law forms.

The period may be characterized as one in
which courts were organized as far as possible like
those of England, rendering decisions accor-
ding to the common law, introduced by
lawyers and welcomed by the people as a part of
their liberties. The uniform character of the
common law superseded local custom as far as
practicable, while the expansion of the赖以
many matters of criminal law and neces-
sarily local economic regulations remained in
force.

The Period of Extension (1776-1850).

The changes caused by the War of Inde-
pendence were largely of a constitutional char-
acter, a discussion of which is beyond the scope
of the present article. The ideas of which the
Revolution was the outgrowth contributed
vastly to the development of an American juris-
prudence sufficiently distinct from that of Eng-
lund and of the later colonial period as to be
a separate system. Speculative writers like
Montesquieu, Burlamaqui and Vattel exerted
an influence which was apparent not only in
matters of constitutional organization but also
in the habits of thought of the American bar.
Of the 56 signers of the Declaration of Inde-
pendence 35 were lawyers. The American na-
tion began not so much with the promulgation
of a revolutionary manifesto as by a declaration
of principles of natural law, the fruit of Ameri-

can legal minds. It is of no little significance
that more copies of Blackstone's "Comment-
taries," the first systematic exposition of Eng-
lish law, were sold during the 18th century
in America than in England.

Independence brought about a change in
the fundamental organization of every State.

Each adopted a written constitution or (as in
Rhode Island and Connecticut) continued in
force its colonial charter as a sufficient decla-
ration of constitutional matters, and in each it
was necessary to construe them. Experiments
and theory left such construction to the courts
and the supreme rule which guided was that of
the common law. In every State varying writ-
ten constitutions construed according to the
principles of the common law tended to the
formation of fairly uniform ideas of consti-
tutional law. The Federal Constitution provided
what the Articles of Confederation had almost
completely lacked. The courts authorized by
the Constitution acquired jurisdiction not only
of constitutional questions, disputes between
States and admiralty matters, but also, within
certain limitations, of cases wherein citizens of
different States were parties. Both the Articles
of Confederation and the Constitution provided
that full faith and credit should be given to the
proceedings of a State court by the courts of
every other State and an essentially national
character was impressed upon American juris-
prudence. The method by which the courts of
exclusive jurisdiction in certain cases (a power
which the decisions of Chief Justice Marshall
greatly increased), the division was not as be-
tween matters of purely public and those of
private law. All the courts, State and national,
became necessary and component parts of one
symmetrical system, in which there was one ap-
proximately uniform mode of procedure, that of
the common law of England, consciously adapted
to American needs. Judges, if not regularly
elected governors or elected directly by the
people, decided questions of law and equity pre-
sented by lawyers who had little of the class
traditions of the English barrister. The Amer-
ican lawyer was from the first amenable to
democratic influences. The requisites for ad-
mission to the bar were determined by State
laws and not by slavish adherence to the tradi-
tions of the Inns of Court. The lawyer know-
ning no disloyal colonial codes covering
many matters of criminal law and neces-
sarily local economic regulations remained in
force.

When the American colonies became inde-
pendent, each was governed by (1) the common
law of England, in so far as each had tacitly
or expressly adopted it as suited to local needs;
(2) those English statutes which were amend-
atory of the first; (3) the colonial statutes and
(4) such customs as were peculiar to Ameri-
can conditions and incorporated in judicial de-
cisions. In order to give authority to these
earlier laws, nearly all of the original 13 States
formally adopted them either by a constitutional
provision, as in Delaware (1776) and New
York (1777), or by legislative enactment as in
Pennsylvania (1777). The method of adopting
English statutes was by "repealer" and "declar-

Vermont recognized the statute laws of Eng-
lund as existing prior to 1790, in so far as they
were not repugnant to the constitution and laws
of the State. The beginning of the American Revolution (19 April 1775) was the date set in New York, and English statutes locally applicable and enacted prior to that time were declared in force. In Pennsylvania only those English statutes which were admittedly valid during the colonial period were continued. The Virginia convention of 1776 adopted the common law and English statutes of a general nature which had been enacted prior to 1607. This action was taken as a precedent in the first extension of law over territory belonging to the Federal government. The United States adopted the language of Virginia and extended the common law under the same limitations to the Northwest Territory. The Ordinance of 1787 was the foundation of the jurisprudence of the states carved out of Federal territory. In Michigan, while the English statutes were afterward expressly repealed, the substance of them was re-enacted and to prevent any confusion as to what system of law existed, the old Coutume de Paris, once in force when Michigan was a French possession, was adopted, and in Louisiana a different policy was followed. The Territory of Orleans, afterward the State of Louisiana, formed the most populous portion of the Louisiana Purchase. French in spirit and tradition, its laws were developed according to French ideas modified and influenced by Spain in its influence. The civil law of France and Spain was continued in force. Thanks largely to the influence of the code prepared by Edward Livingstone, in that portion of the State which became law in 1797, was drawn up by Bentham, Louisiana is the only State of the Union whose jurisprudence is not based upon the common law. In the other States of the old Louisiana Purchase, the common law was adopted, as was proper according to the theory of the extension of law over territories hitherto uninhabited. In all the Western States, formed out of territory originally Mexican, the practice was the same and in all of them the common law was adopted, but in the common-law powers were given to the courts in their entirety, in no State was there created an equity court having the full and complete jurisdiction which such a court had in England. Chancery courts, with their legislative enactment, have had their powers confirmed and circumscribed by the law creating them.

The Period of Modern Law and Procedure (1850 to the Present).—The theory of American government is that the state and the people are one. In nothing has this theory produced more definite results than in law. This is true not only in positive legislative enactments made by the people's representatives but in the indirect legislation of the bench, formulated by judges, on the servants of the people. While it is the theoretical function of a judge to declare and not to make law, he may be a potent factor in bending old law to new needs. The irresistible tendency toward universal suffrage and the enormous increase in population which characterized the middle of the 19th century, at once left marks upon law and procedure. The States of the Middle West, which drew a large share of their inhabitants from Europe, entered upon an era of constitutionalism which called for a construction of fundamental rights, the Middle States put aside traditions, according to which their first constitutions had been framed, and built upon a democratic basis. The statutes, which up to that time were of comparatively small bulk, were revised and put into codes. Some States (for example, Ohio, Indiana and Iowa) abolished all common-law offenses and rebuilt their systems of criminal law upon a statutory basis. Impatience was felt at the technical methods which the courts had used and the adoption of the Reformed Procedure was the expression of this distaste.

In 1848 David Dudley Field, an eminent lawyer of New York, succeeded in having the legislature of that State adopt a code of civil procedure which effectively broke away from all tradition and aimed at the simplifying of civil pleading and practice by the abolition of all distinctions between actions at law and in equity. According to the reformed theory, there is but one form of action, based upon a complaint containing a simple statement of the facts constituting the grievance, in which a redress is asked in a judgment settling the rights, whether legal or equitable, of all the parties to the action. This theory was well calculated to appeal to the imagination of democratic commonwealths; one after another State adopted the New York plan as a whole or in part, and the Reformed Procedure is now in force in all but a few of the States. This system was, so far as pleading was concerned, an entirely new idea; it was what is known as a common-law method or an adaptation of the various forms of equity pleadings. The Code furnished its own rules for the construction of pleadings upon its own peculiar principles. Whether or not the Reformed Procedure as in force in many States has resulted in simplicity is a question for legitimate difference of opinion. In some jurisdictions the constant tinkering with the laws of practice and procedure by the legislature has rendered that branch of the law so uncertain that probably more than one-half of the questions of law presented to courts of appeal are upon questions of trial or appellate procedure.

The second half of the 19th century was marked by stupendous development in industrial enterprise. Steam and electricity revolutionized the forces of production and distribution, and necessitated the employment of vast combinations of capital. Substantive law, as expressed in statute and decision, has followed sometimes closely, sometimes lagging behind, this industrial and commercial evolution. Contracts, once a small part of the body of law, now occupy a position once undreamt of. Inconvenience upon the form of a contract has given way to reasonable interpretation of its matter, viewed according to the changing conditions of commerce and trade. Corporations, once created only by the express favor of a sovereign, were given a new character such as modern society and its industrial enterprises demanded. But 200 private corporations were organized in the United States prior to 1800, and of these a dozen only were designed to engage in manufacturing. Limitations upon the States, declared by the decision in the Dartmouth College Case (1819), were to a large extent overcome by subsequent State constitutional amendments. Capitalistic productive power, whose consequences created anew the purpose and idea of a private corporation. Individuals, none of whom had at command sufficient capital to float a large enter-
prise, joined their funds and in their associated capacity received as a matter of right a charter from the State legislature, which were limited by the law of its authorization, at first special and afterward general, gave the corporation a personality having certain rights. As a consideration for these rights, they agreed to pay an assumed uniform statutory burden and regulations. Unless by the express or implied authority of its charter, a corporation cannot engage in business outside of the jurisdiction creating it. In other States it is a foreign corporation. As such, the other States may stipulate the conditions under which it may enter to do business. Here the Federal Constitution steps in. Under it Congress has the power to prescribe rules for the regulation of interstate commerce. The organization of railway systems extending through several States and the increase in production of large manufacturing corporations, selling their output in many States, have given opportunities for national legislation. The diverse citizenship of corporations and the large interests represented by them, as well as the limitations placed upon the States by the 14th Amendment, have brought a constantly increasing number of cases into the Federal courts. A compound of national and State legislation and of Federal and local decisions, is of increasing bulk and variety, and no subject of the law has grown into greater importance.

The doctrine of judicial review, first authoritatively set forth by Chief Justice Marshall in Marbury v. Madison (1803), was expounded and amplified by Thomas M. Cooley in his 'Constitutional Limitation' (1888). This work had an almost unrivaled influence upon bench and bar. The courts, at least until the close of the 19th century, were generally under the domination of the doctrines of natural rights and laissez-faire. With the increasing sphere of legislative activity in Congress and in the State legislatures, based upon newer conceptions of social justice, there frequently appeared decisions by the courts, Federal and State, which many regarded as reactionary, and even as usurpations of power. Justice Holmes in several dissenting opinions of the United States Supreme Court has strikingly emphasized the true function of the judiciary. It would seem that in recent years courts have been more conservative than formerly in declaring statutes unconstitutional.

Increasing attention has been paid during the present century to improvement in the form of the statute law. Many States, realizing that legislative activity is still on the increase, have attempted to codify the crudities of expression and to improve the technical quality of the statutory law by the establishment of legislative reference and law-drafting bureaus. It is too early, however, properly to appraise the influence of these agencies.

Earlier diversities of law among the various States produced great confusion, particularly in the field of commercial law. As a result of the recommendation of the Commission on Uniformity of Legislation, an instrumentality working with and encouraged by the American Bar Association (established in 1878), a uniform Negotiable Instruments Act has been adopted by all the States and Territories except Georgia and Texas. Uniform warehouse receipts, stock-transfer, and other charter acts, prepared and advocated by this commission, have been adopted by many States. This body of uniform State laws is increasing yearly and its influence may well be to develop a new common law uniformity of statutes will give rise to uniform interpretation.

The noteworthy tendencies in American law at the present time are, (1) the constantly widening sphere of government, State and Federal, away from laissez-faire and toward collectivism and State interference, motivated by a new sense of social justice and not by individualistic natural rights, and effected by the statutory enlargement of the police power by the States, and by what is in effect a Federal police power exercised under the guise of power over interstate commerce; (2) the increasing adoption of uniform legislation in matters affecting business; (3) the progressively increasing area of statutory law, Federal and State, by legislative assemblies and by popular initiative and referendum; (4) the confusion between purely constitutional and properly statutory matters; (5) the modified conception of the judicial function, and the simplification and settlement of judicial procedure.

For nearly two centuries and a half after the English colonies were planted in America, American Jurisprudence changed gradually, keeping in harmony with the political and social conditions of the colonies and States. Then with a great wave of immigration and far-reaching industrial changes and the occupation of a continent from ocean to ocean, American jurisprudence set itself to meet the needs of a modern and complex society. The result has been an enormous product of legislation and a much bulkier output of decisions from the Federal and State courts. A system of law, to be sound, must have an orderly development; it must be progressive and not revolutionary. Many of the changes which have taken place in America have likewise been adopted in England and for the same reason as in this country. Since 1875 the English procedure has been similar to that of the United States. The American systems of jurisprudence are, therefore, parts of one great system, based upon the common law of England and built to satisfy the requirements of a modern commercial and industrial society, wherein personal freedom has the greatest possible play. Its idea of personal right is its heritage from the common law. See also various articles under Law.

52. RAILROAD TRANSPORTATION.

The American Railway System.—The construction of railroads in the United States began on a small scale in 1828 when the Baltimore and Ohio line was opened. The Charleston and Hamburg began constructing some mileage in South Carolina in the following year, and in 1830 the Mohawk and Hudson, the parent company of the New York Central system, began construction. The work undertaken by these pioneer railroads proceeded so slowly that at first in 1830 but 23 miles of line were in actual use. During the following decade other lines, radiating from the various North-eastern centers, were begun, so that by 1840, 2,818 miles of line had been completed. Railroad promoters still had difficulty in obtaining the necessary construction funds. They had to depend largely upon local communities and business men who desired improved transportation rather than upon investors and financiers. The practical feasibility of railroad transportation had not been demonstrated to the satisfaction of the investing public. During the decade 1840 to 1850 the construction of railway mileage progressed slowly to 9,021 miles, and was confined largely to the Atlantic seaboard section. It was not until the last two years of the decade that its first construction began to progress rapidly. The gold discoveries in California caused an unusual demand for overland routes to the West; they directed the attention of the seaboard population to the resources of the interior and they were instrumental in solving the money stringency which had hampered construction. The construction engineers' field of action was shifted mainly to the Central West. Private speculation was rampant; many States and townships offered to railroad companies more than 100 years; even Federal aid, offered indirectly through the States, became a substantial factor in railroad building. Business prosperity prevailed throughout the country, carrying with it a demand for improved transportation facilities. By 1860 a combined system of 30,626 miles had been completed.

The Civil War interrupted line construction in the United States as a whole, but gave a special stimulus to the building of a transcontinental line to the Pacific Coast. The beginning of the Union-Central-Pacific line during the war was due in large part to the urgent desire on the part of many public men to bind the far western territory to the Central West and East. They were actuated by rumors to the effect that the Pacific Coast section was threatened with annexation to Canada. Before this line was completed, other transcontinental lines were under way. During the years 1867 to 1873 railroad construction forces were unusually active throughout the Trans-Mississippi Valley and the far West. The railroad mileage of the United States as a whole was increased by 33,000 miles. An interruption then accompanied the financial and industrial crisis of 1873, the crisis having in fact many business regions, excessive railroad capitalization and too rapid construction of new mileage. In 1880 railroad construction again began to progress rapidly. The railroad system advanced from 93,267 miles in 1880 to 163,597 in 1890, over 70,000 miles being completed in a single decade. During the following decade 29,749 miles were added. The long extended business and financial depression beginning in 1893 and the over-construction of the preceding decade brought the work of many construction gangs and promoters to a halt. More progress was made during the decade ending in 1910 when 46,947 miles were completed, but since then railroad construction funds have been directed more largely to the improvement and building of terminals, sidings, additional tracks and operating facilities than to the building of more mileage. Single-track mileage advanced from 240,293 miles in 1910 to 252,231 in 1914; the coming of war conditions then became a factor. On 31 Dec. 1917, the last date for which complete mileage figures are published, the country's single-track mileage aggregated 253,626 miles, exclusive of switching and terminal companies. On 1 Dec. 1916 railroad trackage in the United States, included second, third and other tracks as well as single-track mileage totaled 397,014 miles. In 1913 the whole of Europe had approximately 215,000 single-track miles of line, and the whole of the United States had about 430,000.

Equipment and Personnel.—At the closing of the calendar year 1917 it was officially reported that the railroad companies operating this mileage were equipped with 2,568,374 cars, of which 2,409,548 were in the freight service, 55,939 in the passenger service and 103,916 in company service. In addition the Pullman Company owns over 5,000 sleeping, tourist, parlor and other specialized passenger service cars, and on 1 Jan. 1913 137,179 privately owned freight cars were in use throughout the United States. The number of locomotives in service on 31 Dec. 1917 totaled 66,070. There has been a steady tendency to increase the number of freight cars and locomotives in the United States. The average capacity of freight cars in the United States now exceeds 41.3 tons as compared with 14.5 tons in Germany where the average capacity is the largest in Europe. Many American cars in the coal and ore trade have a capacity ranging from 50 to 65 tons and some exceed this figure. The average weight of German locomotives before the war was 52 tons, excluding tender, while the average weight of locomotives, including tender, in the United States is close to 90 tons. During the 10 years ending in 1916 the average number of tons per train in the United States has advanced from 344 to 535; the average number of tons per loaded car from 18.9 to 22.4; the average number of freight cars per train from 26.4 to 34.9 and of loaded freight cars per train from 18.2 to 23.4. The railroad companies in operating the railroad system during the calendar year 1916 employed an average of 1,810,814 employees and paid $1,506,961,000 in wages and salaries. In 1917 Class I lines, i.e., those having a yearly operating revenue exceeding $1,000,000, employed an average of 1,732,876 employees who received a total compensation of $1,739,682,000.
Railroad Capitalization.—The magnitude of the American railroad system is further portrayed by its huge capitalization. The total par value of railroad capital outstanding in 1917 was $28,590,000,000, representing watered securities cannot be accurately stated, as current statistics of market value are not published and the work of valuation undertaken by the Interstate Commerce Commission is far from completion. On 1917 investment in road and equipment, representing the book values reported by the Class I and II railroads, amounted to $18,423,235,000. An accurate comparison cannot, however, be made because of inaccuracies occurring in book values before the commission prescribed a uniform accounting schedule for investment in road and equipment. The dividends declared by the railroad companies, excluding switching and terminal companies, in 1917 totaled $381,852,000 or 6.81 per cent on the dividend-yielding stock. Over 36 per cent of the capital stock of American railroads, however, was not paying any dividends whatever. Railroad dividends reached their peak in 1913 and 1914 at $460,195,000 and a simple average rate on dividend-paying stock of 8.03 per cent.

Revenues and Expenses.—The operating revenues of the railroads operated under government control in the calendar year 1918 reached the astounding total of $4,913,320,000. Of this, $3,450,094,000 consisted of freight revenues, $827,219,000 of passenger revenues and the remainder of mail, express, miscellaneous transportation, and revenue from radio. Although these operating revenues were greater than during previous years, expenses underwent a more rapid increase and caused a heavy reduction in net operating income. Operating expenses of the lines under government control rose from $2,858,212,000 in 1917 to $4,006,895,000 in 1918. After these expenses, and also tax accruals (other than war taxes), uncollectible revenues, equipment rents and joint-facility receipts, there remained a net operating income of but $690,419,000 in 1918 as compared with $974,779,000 in 1917. There was a deficit of about $210,000,000 below the standard return guaranteed by the government under the Control Act. It is this reduction of net income that so greatly complicates the return of the railroads by the government to the railroad companies and the adoption of a satisfactory governmental policy. The average rates of operating expenses to operating revenues or "operating ratio," advanced from 70.5 per cent in 1917 to 81.5 per cent in 1918.

Railroad Traffic.—The freight traffic of the railroads operated under government control measured in ton-miles advanced slightly from 427,342,924,000 in 1917 to 434,997,926,000 in 1918. A total of 1,264,016,000 tons of freight were carried in 1917, 57.96 per cent of which consisted of coal, ore, coke, sand, stone and other mine products, 15.27 per cent of manufactured products, 38.08 per cent of agricultural products, 7.98 per cent of forest products, 2.52 per cent livestock and animal products, and 7.99 per cent of miscellaneous commodities and general merchandise. The large proportion of heavy, bulky commodity traffic is one of the striking differences between the freight traffic of American and European railroads. So also is the long average haul per ton of freight which was 312.07 miles for Class I railroads in 1917 as compared with about 62 in Germany and 78 in France shortly before the European War began. The passenger traffic of American railroads has always been of secondary importance as a source of operating revenue. It has, however, grown largely in volume during the past 15 years. Many railroads improved their passenger services and actively cultivated for passenger traffic. Measured in passenger miles it advanced from 29,082,837,000 in the fiscal year 1908 to 42,605,902,000 in the calendar year 1918, excluding short lines having less than $100,000 in yearly revenues and switching and terminal companies.

Railroad Freight Rates.—In making freight rates in the United States the railroads have not been guided by rigid rules or theories. The most general practice has been to make rates at "what the traffic will bear," i.e., at a point believed by them to yield the largest revenues in the long run rather than at the present moment and to encourage the development of traffic in the future. The development of rail traffic is subject to a minimum determined in the case of the general level of their rates as a whole by the aggregate cost of service, and in the case of an individual rate, by the special or out-of-pocket costs incurred in connection with a particular item of traffic. It is also subject to a maximum determined by the value of the service performed. As the extent of public regulation of rates increased, many rates made originally by the railroads were either by the Interstate Commerce Commission or by State commissions, the judgment of whom regarding the reasonableness of rates sometimes differed from that of the carriers. During Federal control rate changes were initiated by the Director-General of Railroads, the Control Act of March 1918 requiring the Interstate Commerce Commission when reviewing them to give due consideration to revenue needs and expenses as certified by the agencies.

Freight rates may be variously grouped according to their form or application. They may be either class or commodity rates. In the former case thousands of items of freight traffic have been grouped into a limited number of classes, all those in the same class receiving the same rates. Three major freight classifications: the official or eastern, the southern and the western—govern most classified freight in the United States. In addition there is a Canadian and a Mexican classification, applicable to some American shipments; a number of State classifications established by State laws or commissions, and certain exceptions to the major classifications due to the refusal of some lines to accept them in full. Various efforts have been made by the railroads to unify freight classification throughout the United States, but only a limited degree of success was attained. In 1918 when the lines were under government control a tentative consolidated classification was prepared under the direction of the Director-General, its adoption depending upon the completion of an investigation undertaken by the Interstate Commerce Commission. In September 1919 the commission recommended the adoption with modifications of certain parts of the proposed consolidated classification. Much freight is not shipped.
under class rates, but under commodity rates which are quoted for specified articles without reference to classification. Commodity rates usually are lower than class rates; they are granted where the traffic is of a volume and particularly to heavy, bulky commodities requiring low rates in order that the traffic will readily move. A distinction is also drawn between local and through or joint rates; the former applying between points located on the same line and the latter between points located on different lines. Joint rates involve agreement among the different carriers transporting a through shipment and make necessary the arrangement of rate divisions among them. By no means all through traffic is covered by joint rates. Much traffic moves between points located on different lines on a combination of local, and so-called proportional rates have been made for exclusive use in the United States. This latter plan instead of applying a joint rate or a combination of locals, a proportional rate to some defined gateway or rate point is added to the rates lawfully in effect beyond, the proportional rate being lower than the local rates to the gateway, but applicable only in case of through shipments.

Many complicated rate structures have developed in the different traffic sections of the United States, and the amount of water, rail and industrial or commercial competition is largely responsible for the existence of sharply defined freight rate structures. Local rates covering short distances are frequently based upon cost of freight but as the length of the haul increases distance tends to play a less important role in rate making. There are also many so-called mileage scales applicable to long distance traffic, but they do not grade rates strictly on a mileage basis. The aggregate charges on a shipment moving under a mileage scale gradually advance as distance increases, but not in the same proportion; the rate per ton per mile decreases as the length of the haul increases, and beyond certain distances the scales usually provide flat rates for all distances. Distance also is an important factor in the percentage rate system applicable between points in the Central West and the Atlantic States. Rates between Chicago and New York are basic in this rate structure; those between New York and other Central Western points are determined largely although not entirely according to their relative distance from New York as compared with the distance from Chicago to New York; and those between Central Western points and North Atlantic ports, other than New York, are determined from the New York rates by applying fixed percentages. Southern territory distance considerations are less important. Because of water and commercial competition there are belts of blanket or uniform rates along the South Atlantic Seaboard, in Virginia, and along the Ohio River; and there are many basing points throughout the South where the long and short haul principle is not applied. Distance is also disregarded in a large measure in the interstate rate structures of the Southwest, of the Central Trans-Mississippi Valley and the Northwest, and of the transcontinental railroads which carry freight to and from the Pacific Coast terminals.

Although there has been a tendency to establish graded distance rate scales a large number of group rates applying uniformly throughout defined areas remain in effect in many parts of the United States. Even in the North Atlantic States where the volumes are largely controlled by rates from the Central West to the large seaports, group rates apply to large areas inland from Boston, New York, Philadelphia and Baltimore.

Freight and Passenger Services.—Freight trains are of two general kinds—tonnage trains which move forward when the desired number of cars are loaded or when the officials in charge of operation consider it expedient, and scheduled freight trains which are dispatched at regular times. The latter usually carry perishable products, high-class freight and commodities in the delivery of which speed is important. On some lines extensive arrangements have been made for special trains. In past years the freight rates by shippers using their own cars are the same as those paid by other shippers, but the private car owners receive a mileage allowance from the railroads as a rental for the use of their cars. In case of private refrigerator cars the icing charge collected from the shipping public by the railroads, moreover, reverts to the private car line if it performs the icing service. The special freight services are performed and privileges granted by the railroads. They are in some instances covered by the regular line haul freight rate, while in others the shipper or consignee is required to pay special rates. Important examples are the reconsignment privilege, stopping in transit, switching and spotting cars, the peddler car service, the milling in transit privilege in the flour and lumber industries, the fabrication in transit privilege in the iron and steel industry, the recompressing privilege in the cotton industry and the in-transit privilege which has been extended to various western wool centres. Somewhat different are the demurrage and storage charges of the railroads, for they are primarily penalties designed to release equipment and station or warehouse space. Carload shippers and companies are required to load and unload freight cars within a specified free time or pay a demurrage charge per car per day after its expiration. Consignees of less than carload shipments are similarly required to move their freight from the freight station or other delivery point within a specified free time or on their failure to do so to pay railroads demurrage charges; and, in case the freight is sent to a public warehouse by the carrier, also whatever cartage and public warehouse charges are incurred.

Passenger services in the United States are not classified as systematically as in Europe, but a number of rather well-defined classes have developed. The Pullman and parlor-car service corresponds roughly to the first-class service of European railways, and the regular
first class, day-coach service corresponds roughly to the second-class service provided in Europe. American railroads do not regularly provide services similar to the third-class service generally found in Europe and the fourth-class service found in many parts of Europe. In some parts of the United States, however, the railroads perform a second-class service which varies widely in definition and quality. In some instances it bars the passenger from the Pullman and parlor-cars, but permits him to occupy the regular day coaches; in some it enables him to occupy a tourist sleeper; in others it limits him to a smoking-car, a special second-class day coach, or to the regular day coaches of designated trains. Boarding immigrants arriving at certain ports have for some years been provided with a special immigrant service at very low fares and mention should also be made of the colonist, harvester and special excursion services which were offered from time to time in the past, but were largely restricted during the war.

Business Organization of American Railroads. The business organization of American railroads varies according to the volume of their traffic, the importance of particular kinds of traffic, the extent of their mileage and the area within which they operate and the views of higher officials with respect to efficient organizations. The president reporting to the board of directors is the chief executive official in most instances, but on some lines the chairman of the board virtually performs the functions of an executive. Under the president there usually is a varying number of vice-presidents, who act as the chief executive officials of particular departments or in the capacity of general vice-presidents. There is also a Secretary's Department under a secretary, who reports directly to the president and board of directors. The president, vice-presidents and secretary and some of the other department heads frequently including the general counsel, treasurer and comptroller, comprise the Executive Department. The exact make-up of this department, however, varies in different railroad companies. The specific business departments of most large American railroads include the following: (1) Secretary's Department (2) General Counsel's Office; (3) Treasurer's or Financial Department; (4) Comptroller's or Accounting Department, which is subdivided into the comptroller's office and four or five auditing departments; (5) Transportation Department, which is subdivided into three subdepartments — operating, maintenance and mechanical or motive power; (6) Traffic Department, which is divided into a freight and a passenger traffic department; (7) Insurance Department; (8) Purchasing Department, which in some railroad organizations is combined with a Supply Department; (9) Real Estate Department; (10) Relief and Pension Departments, which may be separate or combined; and (11) Freight Claim Department. A number of lines also have so-called Industrial Departments, separate from the Traffic Department, to promote the location of industrial plants on their lines. There are many associations and joint organizations which constitute parts of the business organizations of the railroads. Among them are their freight and passenger traffic associations, in which competitive rates and fares are discussed before changes are initiated. The three main freight classifications are issued by the Official, Southern and Western classification committees jointly maintained by the railroads for this purpose. Many rate tariffs are issued for groups of railroads by joint agents. Freight classifications through shipments are adjusted in accordance with rules laid down by the Freight Claim Association, and claim disputes are arbitrated by arbitration committees provided by this association. In case of labor disputes the practice of the companies, in recent years, has been to act jointly through committees. There are also many technical associations, the largest of which is the American Railway Association. The smaller technical associations are brought together in this parent organization, through which many improvements have been effected, and various functions such as the per diem and car service rules of the carriers are administered. Some of the smaller associations, such as the Master Car Builders' Association and the Master Mechanics' Association are also of great importance in railroad administration and operation. Practically every department and many subdepartments of the railroads throughout the United States as a whole or in smaller sections are affiliated through their particular technical associations.

The Federal Railway Administration.— In a proclamation issued 26 Dec. 1917 the President of the United States took over for Federal control all the large railroads, and many of the smaller lines, and appointed a Director General to administer them. The President acted under powers granted to him by Congress on 29 Aug. 1916. Later in March 1918 Congress enacted the Federal Control Act to authorize a Federal guarantee of carriers' revenues equal to their average annual operating income for the three years ending 30 June 1917; to arrange for contracts with the various lines; to limit dividends; to provide a revolving fund of $500,000,000; to regulate railroad securities, and define the rate powers of the President and the Interstate Commerce Commission. The organization of the Federal Railway Administration under the Director-General consists of: (1) Of a central administration to control and supervise the various branches of railroad operation; (2) a regional administration to administer the lines within seven defined regions and (3) a number of advisory committees and commissions. The Central administration includes the main office of the Director-General and Assistant Director-General, a Division of Finance and Purchases, Division of Capital Expenditures, Division of Operations, Division of Traffic, Division of Public Service and Accounting, Division of Labor, Division of Law and Division of Inland Waterways. The Regional administration in each of seven operating regions is not made up uniformly, in most cases includes a regional director, and a general staff consisting of an assistant regional director, assistants in charge of operation, traffic, mechanical work and engineering and committees to administer transplanting matters. Some of the regions are, moreover, divided into districts in charge of district directors. Each railroad system is under the immediate control of a Federal manager, and
in most regions one or more terminal managers have been appointed. The advisory committees and commissions include a Port and Harbor Facilities Commission, a Board of Railway Wages and Working Conditions, a committee on Inland Waterways, and an Exports Control Committee.

Government Regulation of Railroads.—Regulations of railroads in interstate commerce began with the enactment of the Interstate Commerce Act in 1887. Its application was widely different from what its framers anticipated, in part because of the defects of the statute itself and partly because of the way some of its provisions were interpreted by the courts. Congress, in later years, enacted a series of important amendments. To overcome the refusal of railroad officials to testify before the commission on the ground that they might incriminate themselves, Congress in 1893 enacted the "immunity bath" amendment, which requires them to testify, but protects them against prosecution on account of testimony or evidence submitted by them, and this amendment was put into effect in 1896. To strengthen the anti-rebating clause of the law, Congress in 1903 enacted the Elkins Act. Corporations as well as their agents were made liable; departure from published rates was made the test of rebating, and the receivers of rebates were declared to be as much guilty as the railroads paying them. This law abolished the penalty of imprisonment, leaving a fine as the punishment for guilt; this principle as well as fines were re-enacted when the Interstate Commerce Act was again amended in 1906. In 1903 Congress also passed the "expediting act," the purpose of which is to expedite cases appealed to the Federal courts from the Interstate Commission, and equity cases of any kind brought under the Interstate Commerce Act, the Sherman Anti-Trust Act, or other laws of like purpose. A more comprehensive amendment was enacted in 1906. The Hepburn amendment of that year evidences the hope of the Interstate Commerce Act to include not only railroads, but express companies, pipe lines, sleeping car companies, industrial railroads, switches, private tracks and terminal facilities, private cars and refrigerator ventilation, elevation, transit, storage and handling service in interstate commerce. Rate changes were prohibited without a 30 days' notice, unless the Commission waived this requirement for good cause; rebating penalties were increased in severity, and fine passes were prohibited except in case of employees and other persons expressly specified in the law.

A "commodities clause" prohibited railroads from transporting in interstate commerce any products produced by themselves, except timber and lumber products and commodities intended for use by the railroads in their business as common carriers. The so-called Carmack Amendment required carriers receiving traffic for interstate shipment to issue bills of lading and held such railroads liable for loss or damage to property caused by any carrier over whose lines the traffic passes in moving to its destination. The Commission was given the power to fix and establish minimum rates for one found, after full hearing upon complaint, to be unreasonable or unjustly discriminatory, and this rate-making power includes interstate freight charges of any kind, passenger fares, rate divisions and through or joint rates. The orders of the Commission were declared to be binding unless specifically set aside or superseded by a Federal court of competent jurisdiction. To give effect to the Commission's power to prescribe a uniform system of accounts it was now provided that carriers may keep no other set of books than those prescribed by the Commission, and that it may employ special agents and examiners to inspect all their accounts and records. To further expedite the work of the Commission it was given additional power to call upon the carriers, not only for the usual annual statistical reports, but for monthly reports of earnings and expenses and special reports on any matter within its jurisdiction.

The Interstate Commerce Act was again amended in 1910 when the Mann-Elkins amendment was passed. The Commission was authorized to suspend proposed rate advances before they go into effect. The original pension holds, during the time authorized by law for hearings and investigation of the proposed rates, after which the Commission may permit them to become effective or suspend them permanently. A Railroad Rate Court was created to handle review cases appealed from the Commission, and various other classes of railroad cases. This court, however, was abolished in 1913. The long-and-short haul clause, which had been rendered ineffective by court interpretation of the words "under substantially similar circumstances and conditions," was amended by striking this limiting phrase out of the clause. There may be no violation of the long-and-short-haul principle unless the Commission, in particular instances, expressly waives its application. The Commission was also authorized to fix maximum rates on its own initiative, and to regulate freight classifications. Shippers were authorized to select the through routes over which their shipments are to move; and the railroads were required to quote rates upon written request to their agents. They were directed to bring suit against the United States, and the Department of Justice was placed in charge of all litigation involving appeals from the Commission's orders. Each carrier, moreover, was required to designate an agent at Washington, D. C., upon whom orders and notices may be served. A Securities Commission was created to report on and make recommendations to Congress concerning railroad stocks and bonds. Telegraph and telephone companies engaged in interstate commerce were brought within scope of the Act.

A further amendment to the Interstate Commerce Act is contained in the Panama Canal Act of 1912. The Commission was given power to establish physical connections between rail and water carriers; to fix maximum proportional rail rates to and from ports; to establish through routes and maximum joint rates over rail and water lines; and, if it finds a railroad entering into arrangements with an unmannerly rate, to require it to enter into similar arrange-
ments with all other ocean carriers operating from such port to the same foreign country. The Panama Canal Act also prohibits railroad-controlled steamship lines which are or may be in competition with the proprietary railroad from navigating the Panama Canal. Railroad ownership or control of steamship lines, operating elsewhere than through the Canal, which are or may be in competition with the controlling railroads, is prohibited unless the Interstate Commerce Commission permits such railroad control to continue. The Commission may grant such permission only if it is of the opinion that the controlled steamship line is operated in the interest of the public, and that the continued ownership will not prevent or reduce competition.

In 1913 the Interstate Commerce Act was enhanced by the passage on 1 March of the Railroad Valuation Act. In 1913 the Cummins amendment providing for full settlement of loss and damage claims was enacted, only to be radically recommissioned the following year. In 1917 a "car service amendment" increased the Commission's powers over car distribution and car service rules; a "priority amendment" authorized the President, during the war, to grant priority to designated traffic, a power which he exercised through a Priority Director; a "organization" amendment increased the membership of the Interstate Commerce Commission to nine, authorized the establishment of responsible divisions, and provided that "no increased rate or charge or classification be fixed or approved thereof has been secured from the Commission." The Federal Control Act of 21 March 1918 amended the Interstate Commerce Act by authorizing the President to initiate charges by filing them with the Commission; by preventing the Commission from suspending such charges pending final determination, and by requiring the Commission when investigating such rates upon complaint to give due consideration to the absence of competition under Federal control and to certification from the President to the effect that it is necessary to increase operating revenues to defray the expenses of Federal control, to pay railroad taxes, and to pay the compensation guaranteed to the railroad by the government.

Federal legislation, other than the Interstate Commerce Act, affecting the railroad industry includes the Sherman Anti-Trust Act of 1890, and the amended Clayton Anti-Trust Law of 1914; the Erdman Conciliation and Arbitration Act of 1908 as amended by the Newland's Act of 1913; the safety appliance laws of 1893; the locomotive ashpans act of 1906; the sixteen-hour continuous labor act of 1907; the eight-hour-hour basis law of 1916, and the bill of lading act of 1916.

State Regulation of Railroads.—Regulation of the railroads by the States antedates Federal regulation by many decades. All of the States, except Delaware and Utah, now have commissions with rate-making powers. There are three general types of State commissions: (1) Public utility commissions with jurisdiction not only over railroads and other rail transportation facilities and agencies, but also over other public utilities, such as street railways, gas, electric, water, warehouse, telegraph and telephone companies; (2) railroad commissions with jurisdiction over a limited number of other transportation and public utility concerns; and (3) corporation commissions with authority over public utility companies and also other corporations.* The powers of these commissions vary. Many of them have powers similar to those of the Interstate Commerce Commission, while some of them are vested with greater powers as well as wider jurisdiction. Many possess powers with respect to railroad capitalization, some are authorized to prescribe complete schedules of maximum rates, and some have widely differing powers over railroad services and operation. Besides the commissions upon whom the States have conferred mandatory powers the legislatures of many States also regulate railroad charges and practices directly by statute. There are two-cent fare and maximum freight rate laws, and statutes regulating car service and demurrage, private sidings, grade crossings, terminal facilities, train service, safety appliances, head lights, the size of train crews, capitalization and other phases of railroad operation too numerous to describe in limited space.

As the extent of State regulation increased a conflict developed between the States and the Interstate Commerce Commission. The United States Supreme Court in 1886 had drawn a line between Federal and State regulation, and in 1914 held that the Federal railroad laws applied only to interstate traffic. In later years it became apparent, however, that although the States were not regulating interstate traffic directly they were doing so indirectly. The making of an interstate rate may, because of business competition, virtually compel a railroad to readjust some of its interstate rates or otherwise permit an unjust discrimination against interstate shippers to stand. When, therefore, the Interstate Commerce Commission found fixed reasonable maximum rates from Shreveport, La., to points in Texas and ordered the railroads whose interstate rates in Texas were fixed at a lower level by the State of Texas to discontinue discrimination against interstate traffic, the railroads complied by raising their rates on intrastate traffic moving between various points in Texas. In the test litigation that followed the Supreme Court in 1914 held that the Interstate Commerce Commission had the power to overrule a State Commission which fixes intrastate rates resulting in unjust discrimination against interstate traffic carried at rates which the Federal commission pronounces to be reasonable. A series of later decisions involving similar conflicts in Nebraska, South Dakota, Illinois and Arkansas.

* The following States have public utility commissions: Alabama, California, Colorado, Connecticut, District of Columbia, Georgia, Hawaii, Idaho, Illinois, Indiana, Kansas, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New York, Ohio, Oregon, Pennsylvania, Rhode Island, Vermont, Washington, West Virginia, Wisconsin, Wyoming. The following States have railroad commissions: Arkansas, Florida, Iowa, Kentucky, Louisiana, Michigan, Minnesota, Missouri, Montana, Nebraska, North Dakota, South Carolina, South Dakota, Tennessee, Texas. The following have corporation commissions: Arizona, New Mexico, North Carolina, Oklahoma, Virginia.
the courts reiterated the superior power of the Interstate Commerce Commission in case of conflict between intra- and interstate rates, but insisted that the Commission's orders must be specific in defining the rate points or areas within which State-made rates are overruled.

**Future of Control or Regulation.**— Neither the Interstate Commerce Commission nor the States regulated the railroads with their usual energy and severity. The imports of the colonies in the Federal Railway Administration. So long as the war continued no effort was made to thwart the wishes of the Director-General of Railroads. With the signing of the armistice, however, arose the desire for a permanent transportation policy. Many plans were proposed ranging from government ownership to a return of the railroads to their owners, subject to direct or indirect guarantees of income and Federal regulation differing in many respects from that which prevailed in the past.

**53. FOREIGN COMMERCE.** The foreign commerce of the United States has expanded with even greater rapidity than that of the other parts of the world. World commerce increased from $1,000,000,000 in 1789, the year of our birth as a nation, to $40,000,000,000 in 1913, the year preceding the great war which disarranged all commercial movements, while the foreign commerce of the United States grew from $43,000,000 to $4,300,000,000 in that same period. World commerce in 1913 was 40 times as great as in 1789, while United States commerce in 1913 was 100 times as great as in 1789.

Exact and continuous records of our foreign trade did not come into existence until the adoption of the Constitution. Indeed, one of the most important reasons for the formation of that "more perfect union" was in order that the government might have a greater control over the records of the commerce and the collection of the revenue arising therefrom. Prior to the Revolution, which transformed the 13 colonies into a Confederation, whatever record was made of their commerce was that of the individual colonies, kept in an irregular manner and containing no record of the movement of merchandise into the one country with which most of the commerce occurred. Under the Articles of Confederation the various States were permitted to fix their respective tariff duties subject to the provision that they should not interfere with any stipulations in treaties entered into by the United States in Congress assembled with any king, prince or state in pursuance of any treaties already proposed by Congress to the courts of France or Spain. With the various States privileged to fix their own rates of import duties and otherwise, the Congress soon found that it was unable to obtain from them their proportionate part of the revenues required for the maintenance of the government, while foreign commerce increased as a result of the more liberal treaties with the States or the Union under these circumstances. The request of Congress that it be permitted to levy and collect uniform rates of duty on imported merchandise was rejected by the State of New York, and this with sundry other reasons led to the substitution of the Constitution for the Articles of Confederation.

The first record of the commerce of the United States under the Constitution is that of the year 1790. Prior to that time there were occasional compilations of the records of the various States, but no continuous record of the imports or exports of the colonies or States. MacPherson's "Annals of Commerce" puts the imports in 1790 at $12,760,000 and the exports $13,870,000. Of the imports $7,867,000 were from Great Britain, $3,840,000 from the West Indies, $734,000 from Africa and $373,000 from southern Europe. Of the exports $7,445,000 went to Great Britain, $3,635,000 to the West Indies, $2,686,000 to southern Europe and $98,000 to Africa. During the Revolutionary War the commerce fell to a very small total, and during the period of the Confederation had slowly advanced to approximately $40,000,000, about evenly divided between imports and exports. In 1790, the first year under the Constitution for which a full record was made, the imports were $23,000,000, and the exports $20,000,000.

From the adoption of the Constitution forward the commerce steadily advanced. By 1800 the imports were $91,000,000, and the exports $71,000,000, though about one-half of the exports were foreign merchandise drawn chiefly from the West Indies and re-exported to Europe.

During the first half of the century, 1800-1900, the growth of the foreign commerce of the United States was comparatively slow. The people were busy developing the interior of the country and thinking out and applying to practical use the necessary methods for transporting the products or possible products of the interior to the water's edge, whence they could be transported to foreign countries. In 1819 occurred an incident which had a profound effect upon the commerce, not only of the United States, but also upon that of the whole world. In that year a little steamer, which had been built in New York at the suggestion of Daniel Dod, an engine builder of Virginia, sailed out of the port of Savannah, and pushed boldly out upon the ocean, heading for the ports of Europe, which had never, up to that time, been reached by a steam vessel from the western shores of the Atlantic. The voyage was successful, and the lessons taught by it resulted in the establishment in 1838 of regular steam navigation between the United States and Europe. Meanwhile the railway systems of the United States and of the world were slowly developing and by 1850 a railway line connecting the Atlantic with the Mississippi Valley was opened, the Boston and Albany road, and this was quickly followed by the New York and Erie, the New York Central, the Pennsylvania, imports and otherwise, the Congress soon found that it was unable to obtain from them their proportionate part of the revenues required for the maintenance of the government, while foreign commerce increased as a result of the more liberal treaties with the States or the Union under these circumstances. The request of Congress that it be permitted to levy and collect uniform rates of duty on imported merchandise was rejected by the State of New York, and this with sundry other reasons led to the substitution of the Constitution for the Articles of Confederation.

The first record of the commerce of the United States under the Constitution is that of the year 1790. Prior to that time there were occasional compilations of the records of the various States, but no continuous record of the imports or exports of the colonies or States. MacPherson's "Annals of Commerce" puts the imports in 1790 at $12,760,000 and the exports $13,870,000. Of the imports $7,867,000 were from Great Britain, $3,840,000 from the West Indies, $734,000 from Africa and $373,000 from southern Europe. Of the exports $7,445,000 went to Great Britain, $3,635,000 to the West Indies, $2,686,000 to southern Europe and $98,000 to Africa. During the Revolutionary War the commerce fell to a very small total, and during the period of the Confederation had slowly advanced to approximately $40,000,000, about evenly divided between imports and exports. In 1790, the first year under the Constitution for which a full record was made, the imports were $23,000,000, and the exports $20,000,000.

From the adoption of the Constitution forward the commerce steadily advanced. By 1800 the imports were $91,000,000, and the exports $71,000,000, though about one-half of the exports were foreign merchandise drawn chiefly from the West Indies and re-exported to Europe.

During the first half of the century, 1800-1900, the growth of the foreign commerce of the United States was comparatively slow. The people were busy developing the interior of the country and thinking out and applying to practical use the necessary methods for transporting the products or possible products of the interior to the water's edge, whence they could be transported to foreign countries. In 1819 occurred an incident which had a profound effect upon the commerce, not only of the United States, but also upon that of the whole world. In that year a little steamer, which had been built in New York at the suggestion of Daniel Dod, an engine builder of Virginia, sailed out of the port of Savannah, and pushed boldly out upon the ocean, heading for the ports of Europe, which had never, up to that time, been reached by a steam vessel from the western shores of the Atlantic. The voyage was successful, and the lessons taught by it resulted in the establishment in 1838 of regular steam navigation between the United States and Europe. Mean-
ocean steamer greatly developed its carrying power, tonnage multiplied and the cost of transportation on the water was greatly reduced, while the tremendous increase of the railway system of the country had a similar effect upon the cost of moving the products of the interior to the water's edge, and in this movement the Great Lakes also rendered marked assistance with the development of large and powerful freight carrying steamers which handled the merchandise which the railways were able to deliver to them at the western end of the chain and transfer from the eastern end to the tidewater. The development of the great manufacturing system of the country, the greatest in the world, added large quantities of manufactures to the available material for exportation and at the same time created a great demand for manufacturing material to be imported from other parts of the world. As a result the foreign commerce of the country which totaled but little more than $300,000,000 in 1850 was $886,000,000 in 1900, $827,000,000 in 1870, $1,504,000,000 in 1880, $1,647,000,000 in 1890, $2,244,000,000 in 1900, $3,302,000,000 in 1910 and $4,279,000,000 in 1913, all of the above figures being for fiscal years.

During all of this period of rapid growth the exports greatly exceeded imports, though prior to that development imports were usually as much as the exports, and frequently exceeded them. Over the period of the war demand for the products of the great manufacturing industry of the country increased to an extraordinary degree from abroad, and the United States had large quantities of meat and grain to spare for foreign countries, and in the latter years to the rapid growth of the exportation of manufactures, which grew from $485,000,000 in 1900 to $1,185,000,000 in 1913.

With the opening of the great European War in 1914 there came a great change in the commerce of the United States, and while it was to some extent temporary it is significant as an indication of the power of the great manufacturing industry of the country to respond to extraordinary demands from abroad, and suggestive as to the possibilities and probabilities of the future of our trade. The European countries at war required vast quantities of war materials, powder, shot and shell, firearms and materials for their construction, metal working machinery, barbed wire, high explosives of various kinds and miscellaneous manufactures for war uses, to say nothing of the demand for horses and mules for the war, and materials for feeding and clothing their soldiers and the maintenance of their system of transportation. To all of these demands the producers of the United States, whether manufacturers or agriculturists and mine operators, responded with remarkable promptness and in volume of supplies, and the exports grew from $2,355,000,000 in 1914 to $2,769,000,000 in 1915, $4,333,000,000 in 1916 and $6,200,000,000 in 1917. With the entrance of the United States into the war there came great demands upon the manufacturers and producers for material for our own armies, and the government also found it necessary to restrict exports to prevent their passing to the Central Powers of Europe with which we were at war, and as a result the exports were temporarily reduced despite the fact that those passing out of the country went at prices far above those prevailing prior to the war. The total dropped to $3,920,000,000 in 1918 but with the great food requirements of Europe and the demand for manufactures in the other grand divisions the fiscal year 1919 made the phenomenal record of $7,225,000,000 exports and $3,096,000,000 imports, making the grand total of imports and exports $10,321,000,000 against the former high record of $8,949,000,000 in 1917.

The developments of the last half century have resulted in a widening field for our commerce, both as to imports and exports. With the development of the manufacturing industry there came new demands upon the tropics for manufacturing material and a less demand upon Europe for manufactures, and the increasing population and the prosperity of the masses increased the demand for the products of other countries, such as sugar, tea, coffee, cacao, tropical fruits, silk for manufacturing, rubber, fibres, tin and other manufacturing materials. The wool production of the country was insufficient to meet home requirements and this was also true of hides and skins and other staple requirements of manufacture. As a result the value of manufacturing material imported in a raw state increased from $276,000,000 in 1900 to $1,110,000,000 in 1917 and $1,231,000,000 in 1919 to $1,910,000,000 in 1919. Exports in manufacturing from $92,000,000 in 1900 to $475,000,000 in 1917 and $605,000,000 in 1919. These two classes of manufacturing material which formed 46 per cent of the imports in 1900 were 60 per cent of the greatly increased total in 1919. Meantime manufactures showed an equal growth in the share of the rapidly increasing export trade, aggregating $485,000,000 in 1900, $1,185,000,000 in 1913, $4,136,000,000 in 1917 and $3,337,000,000 in 1919, under the stimulus of the demands of the war and the increased demand from neutral countries which found their supplies of manufactures from Europe greatly decreased. The manufactures exported in 1900 formed 35 per cent of the total exports of domestic merchandise, in 1913 42 per cent and in 1917 66 per cent.

The changed conditions of our trade and trade requirements above noted resulted in a readjustment of the share of the trade with the various sections of the world. In 1880 57 per cent of the imports were drawn from Europe, and 80 per cent of the exports went to that continent. In 1913 only 49 per cent of the greatly increased imports were drawn from Europe and 60 per cent of the exports went to that continent. Though of course the great demands of the war have resulted in a temporary increase which merchandise for Europe forms of the exports. On the other hand Europe had little to sell and our imports from that continent fell off nearly 60 per cent during the war period.

The table which follows show the growth of our commerce from 1789 down to 1919, presenting the figures at decennial intervals of the total of imports and exports, and the share thereof with each grand division, also the share which foodstuff, manufacturing material and manufactures respectively form of the imports and exports.

Prior to the development of the great producing power of the Mississippi Valley imports generally exceeded exports, but when that great area began to pour out its vast production of wheat and corn and meats and livestock and cotton and iron and copper and timber, the export scale began to exceed imports and on several occasions the excess of exports over imports was more than $600,000,000 per annum, and in the 17 years from 1897 to the beginning of the great European War the excess of exports over imports aggregated $8,463,000,000, or an average of practically $500,000,000 per annum. During the war period the excess of exports became much greater, being in 1915 $1,094,000,000, in 1916 $2,136,000,000, in 1917 $3,634,000,000, in 1918 $2,979,000,000 and in 1919 $4,129,000,000. Thus in the period 1900 to 1919 the excess of exports over imports aggregated the enormous sum of $20,741,000,000. As a result there were large imports of gold, especially during the European War, and the excess of gold imports over exports in the fiscal years 1916 and 1917 aggregated more than $1,000,000,000, giving to the United States a stock of gold far in excess of that of any other country of the world.

In the future, however, of our foreign commerce, it is quite apparent that it will differ materially from that of the past. Manufacturing material and tropical food-stuffs will be our chief requirement from abroad and manufactures the chief material which we will export in exchange. Practically all of our coffee, tea and cacao come from foreign countries and will so continue indefinitely, while at present we bring about one-half of our sugar from foreign countries and supply the remainder from our own fields and those of our islands. On the export side, we can still supply large quantities of raw cotton, and under pressure of the war we have spared greater quantities of food-stuffs than normal, but it is a startling fact that in the 25 years preceding the present war our exports of manufacturing material and food-stuffs increased but a little over 100 per cent while those of manufactures were increasing over 500 per cent. While a comparison of the exports of manufactures in 1917 with those of earlier years would give an exaggerated percentage of growth. The mere fact that the total exports of manufactures have grown from $1,000,000,000 in 1897 to $41,000,000 in 1917 and continued in 1919, after the close of the war, at the rate of about $3,000,000,000 per annum, at least indicates the wonderful expansive power of our manufacturing industries, and suggests the possibility that our exports may be greatly enlarged our exports when manufactures necessarily become the chief product which we can spare in exchange for our growing requirements of manufacturing material and tropical food-stuffs.

The 10 great articles of manufacturing materials for which we now rely on foreign countries are wool, silk, fibres, cotton, rubber, hides, copper, tin, gums and nitrates, and the five great articles of food imported are sugar, coffee, tea, cacao and fruits. Of these 10 great articles imported from abroad for manufacturing, our imports in 1917 were $1,060,000,000, against $431,000,000 10 years earlier, and the five great articles of food imported from foreign countries in 1917 were $253,000,000, against $234,000,000 10 years earlier, despite the fact that our islands had practically doubled their contributions of sugar meantime. These 15 absolutely required articles from abroad for use in manufacturing or for food aggregated in round terms $1,500,000,000 in 1917, against $716,000,000 a decade earlier.

Practically all of these great articles which we import either for manufacturing or for food are of tropical or sub-tropical production, and thus come from a section of the world which imports practically all the manufactures which it uses, for, as is well known, the tropics are not manufacturers. All of the $189,000,000 worth of rubber imported by us in 1917 was, of course, tropical, and this is also true of the $231,000,000 worth of sugar, $133,000,000 worth of coffee, $68,000,000 worth of fibres, $40,000,000 worth of raw cotton and $22,000,000 worth of gums, while the $160,000,000 worth of raw silk and $20,000,000 worth of tea was from sub-tropical areas, and more than half of the $216,000,000 worth of hides, and $58,000,000 worth of fruits, were from tropical or sub-tropical countries. Even in the case of the great minerals imported for use in manufacturing, it happens that they come chiefly and almost exclusively from tropical countries; all of the $38,000,000 worth of nitrates and a large part of the $127,000,000 worth of copper imported in 1917 was mined in tropical countries. We brought into continental United States in the fiscal year 1919 $11,5 of tropical and sub-tropical products other than hides and minerals, against $335,000,000 in 1900 and $640,000,000 in 1910. Thus our purchases of articles of tropical and sub-tropical growth have quadrupled in value since 1900 and doubled since 1910, without having regard to the large increase in hides and minerals from tropical countries and not included in the above figures of imports of articles of tropical growth. In fact, about one-half of our imports from foreign countries in 1919 came from tropical or sub-tropical countries, to say nothing of the nearly $300,000,000 worth which was received from our islands.

More than one-half of our imports come normally from Europe, the Mediterranean and the Near East. The world's chief manufacturers are the United States, Great Britain, France, Germany, Italy, Belgium, Switzerland, Austria-Hungary and Japan. These countries are the manufacturers of the world, and the exports of these countries forms the non-manufacturing world. In 1914, the latest normal year, our imports from the manufacturing countries totaled in round numbers $873,000,000, and from the non-manufacturing world $1,021,000,000. In 1917 our imports from the manufacturing countries were $993,000,000 and from the non-manufacturing world $1,966,000,000. So it may be said in very general terms that while less than 60 per cent of our imports prior to the war were drawn from the non-manufacturing countries, in 1917, with Germany, Austria-Hungary and Belgium out of international trade, over 70 per cent of the greatly increased imports were drawn from the non-manufacturing world.

These non-manufacturing countries from which we now draw three-fourths of our imports have in former years drawn most of their manufactures from Europe, but we have greatly increased their exports since the beginning of the war. Our exports to the non-manufacturing world, still assuming
that all foreign countries except Great Britain, France, Germany, Belgium, Italy, Switzerland, Austria-Hungary and Japan may be so classed, were in 1917 $3,100,000,000, in 1917 $2,682,000,000, and in 1919 $3,211,000,000, an increase of 200 per cent. And when we consider that manufactures form the bulk of our exports to the non-manufacturing world and that our imports have increased over 200 per cent during the war period, we may assume that the people in those non-manufacturing countries are getting a much better acquaintance with American manufactures than ever before, and that we may expect to retain after the war a considerable share of the increased export trade in manufactures thus built up, provided our manufacturers take the necessary steps to retain the increase.

Three conditions are required to enable us to retain the gains which we have made in sales of manufactures to the non-manufacturing world—goods made to suit the local markets, sales on longer credits than at home, and prices no greater than those of our rivals having cheaper labor. These require considerable increases of the capital applied to manufacturing for the foreign market. Special manufacturing establishments or parts of establishments must be maintained with which to manufacture the goods in the form required by those markets wherever they differ from those manufactured for our own markets; greater capital with which to give the longer credits required; and an increased application of machinery to the production of manufactures, in order to turn them out at a cost no greater than those produced by the cheaper labor of other countries. This greater use of machinery in manufacturing would not mean any reduction in the amount of labor now employed, but a greater proportion which machinery might produce of the greatly increased output. Our day of exports of foodstuffs and raw materials has passed, except in cases of emergency such as that of the European War, and in the future we must rely upon manufactures to maintain the growth in our exports necessary to retain for us the high rank as an exporter in which we have taken pride and which has given us such prosperity. To do this the manufacturers must give to the foreign trade a greater attention and greater sums of capital than in the past.

O. P. Austin,
Statistician, National City Bank, New York.

INDUSTRIAL AND COMMERCIAL DEVELOPMENT. The chief industrial and commercial development of the United States has occurred since the Civil War. With the termination of that historic struggle which destroyed sectional lines, the reunited nation entered upon the development of the wonderful and varied powers which nature had given the territory which it occupied. With an area nearly equal to that of all Europe, a climate ranging from the temperate to the sub-tropical, fertile soils which had not yet been made productive, and a great mountain section containing vast stores of minerals and precious metals, its possibilities of production, manufacture and commerce were apparent to the thoughtful mind.

The first requisite was transportation facilities to enable its various sections to develop and interchange their various products and move the surplus to the water's edge for exportation. The railroads of the entire country were in 1860 but 31,000 miles in 1860, 35,000 miles in 1870 and 52,000 miles and more than one-half of this 1870 total was in the area north of the Ohio River and east of the Mississippi. The great section lying south of the Potomac and the Ohio and stretching westward from the Atlantic to the western borders of Texas had in 1870 in its nearly 1,000,000 square miles only 13,000 miles of railway, or less than that of the State of Texas to-day, and the great mountain section had but 2,500 miles of road with which to serve its more than 1,000,000 square miles of area.

As a result of these conditions the value of the merchandise sent out of the country in the year 1870 was but $375,000,000, or about one-half as much as that of a single month in 1919, and the value of the merchandise exchanged among the people in the entire country was but about $6,000,000,000, as against more than $60,000,000,000 in 1919.

Clearly the first duty of the country on emerging from the war and "shaking hands across the bloody chasm" was to develop transportation facilities for the great areas north and south whose productive powers were so well established and for whose products the world was beginning to clamor. Fortunately this was rendered possible through the cooperation of capital drawn in part from the older countries of Europe and the loans of capital made by the government, coupled with large land grants for the construction of certain great railway lines, these land grants consisting of the alternate sections of public lands lying on either side of the proposed railways. The public lands granted to the great trans-Pacific lines which reached the western coast in 1869 amounted to over 30,000,000 acres and the total grants authorized by Congressional action amounted to approximately 150,000,000 acres.

The railways of the country which were at the close of the Civil War about 35,000 miles in length grew during the next 15 years at the rate of about 4,000 miles per annum; in the period between 1880 and 1890 the growth was at the rate of about 7,000 miles per annum, and from that time forward at the rate of about 5,000 miles annually. The railway mileage grew from 53,000 miles in 1870 to 169,-000 in 1890, 250,000 in 1910 and 270,000 in 1919, against 225,000 in all of Europe in 1919. The cost of this railway system of the United States is estimated at over $20,000,000,000.

Dividing the country into four great natural sections, the north Atlantic, the upper Mississippi, the South and the mountain area (see map on p. 372, vol. 7 of this Encyclopedia) the railways of the north Atlantic section grew from 10,000 miles in 1860 to 35,000 in 1919, the upper Mississippi section from 23,000 miles to 100,000 during the same period, the Southern section from 13,000 to 90,000 miles, and the mountain section from 3,000 to 45,000 in 1919. This growth included a half dozen distinct east and west lines stretching from the Atlantic to the Pacific and a considerable number of through lines connecting the northern frontage with the Gulf and the
southern border with many interwoven branches making the surface of the country a veritable gridiron of railway lines, especially the area east of the mountain section.

Meantime, the development of the interior of the country was encouraged by other processes. There had been a provision, by which citizens or aliens who had declared their intention of becoming citizens might obtain 160 acres of land for a home on payment of $1.25 per acre and an actual residence upon and cultivation of a part of the land, drew millions of families to the interior where these public lands were available and other millions came from Europe to take advantage of this unique opportunity of obtaining homes at a nominal cost. Immigration chiefly from Europe increased from 250,000 in the closing year of the Civil War to 387,000 in 1870, 457,000 in 1880 and 789,000 in 1892, averaging about 500,000 a year down to 1900 and then increasing to over 1,000,000 a year after the development of the mining and manufacturing industries added to the attractiveness of the opportunities offered.

The great prairies west of the Mississippi which had served in the earlier period as public ranges for large herds of cattle and sheep were given more attention at the population increased, and the productive power of the interior of the country was thus gradually enlarged. The number of farms in the country grew from 2,000,000 in 1850 to 2,660,000 in 1870, 4,000,000 in 1880, 4,565,000 in 1890, 5,373,000 in 1900 and 6,362,000 in 1910, the latest census year, and the number of persons engaged in agriculture grew from a little less than 6,000,000 in 1870 to 12,659,000 in 1910.

Meantime, the mineral industries developed rapidly. The value of the products of the mines was in 1870 but little more than $200,000,000, advancing to $400,000,000 in 1881, $600,000,000 in 1890, over $1,000,000,000 in 1900, crossing the $2,000,000,000 line in 1912, and exceeding $3,500,000,000 in 1918.

The development of the manufacturing industries was coincident with that of agriculture and mining, for the factories, of course, required the products of both the farms and the mines. There were plenty of raw material and coal for manufacturing purposes but the fact that manufactures formed two-thirds of the merchandise being imported suggested the importance of producing them at home, especially in view of the abundance of raw material suitable for this purpose. The value of domestic manufactures reported by the census in 1850 was $1,886,000,000, in 1870 $4,232,000,000, in 1880 $6,370,000,000, in 1890 $9,372,000,000, in 1900 $11,406,000,000, in 1910 $20,672,000,000, and in 1915 $24,246,000,000, while those best acquainted with the manufacturing conditions of 1919 estimate that the census of 1920 will show a grand total of $50,000,000,000 worth of manufactures produced in the calendar year, or about 12 times as much as at that of a half century earlier. The capital invested in manufactures, according to the census reports, grew from $1,000,000,000 in 1860 to $1,700,000,000 in 1870, $2,500,000,000 in 1880, $6,500,000,000 in 1890, $9,900,000,000 in 1910 and $23,000,000,000 in 1915. It will be observed that the growth of capital invested in manufactures was much more rapid than the growth in value of manufactures turned out, this rapid increase in application of capital to manufacturing being due to the growing use of machinery in the various industries and permitting the manufacturers of the country to turn out a much greater volume of products than they would otherwise have been able to produce in view of the limitation of their labor supply. The capital of the manufacturing industries, as shown by the census of 1915, was 22 times as much as in 1860, while the labor employed in 1915 was only nine times as much as in 1860, and the value of the manufactures turned out about 15 times as much as in 1860.

These developments of the three great industries, agriculture, mining, and manufacturing, have created a great commerce both internal and foreign. The total foreign commerce of the country which was but $317,000,000 in 1850, $687,000,000 in 1860 and $850,000,000 in 1870, crept to the $1,000,000,000 line in 1872, and was $1,500,000,000 in 1880, $1,650,000,000 in 1890, crossing the $2,000,000,000 line in 1900, in which year it stood at $2,244,000,000, then $3,315,000,000 in 1907, advancing to $4,258,000,000 in 1914, and was the increased $6,531,000,000 in 1916 and $8,865,000,000 in 1918, while the fiscal year 1919 made a still higher record, $10,320,961,000, all of these figures being for fiscal years. The imports grew from $4,36,000,000 in 1870 to $850,000,000 in 1900, $1,894,000,000 in 1914, all of which preceded the war, $2,946,000,000 in 1918 and $3,905,877,000 in 1919. The exports grew from $393,000,000 in 1870 to $1,394,000,000 in 1900, $2,365,000,000 in 1914, the year preceding the war, jumped to $4,333,000,000 in 1916, $6,290,000,000 in 1917 and $7,225,084,000 in 1919. In the normal period from 1870 to 1914, imports quadrupled and exports sextupled, while during the war period, 1914 to 1919, imports increased about 75 per cent and exports increased about 300 per cent. This very large increase in exports during the war period occurred chiefly in manufactures which grew from a little more than $1,000,000,000 in the fiscal year 1914 to $3,576,000,000 in 1919, thus illustrating the great possibilities of the manufacturing industries of the United States in their power to supply world markets.

These increases in both imports and exports since 1870 are so great as to justify a careful inquiry into their causes. The growth of exports is perhaps less surprising when it is considered the upper Mississippi Valley with its great possibilities in the production of cereals and meat increased its exports from 13,000,000 in 1870 to 30,000,000 in 1914, and its railways from 23,000 miles to 98,000; the South with its great cotton, tobacco and timber areas increased its population in the same period from 12,000,000 to 30,000,000, and its railways from 13,000 miles to 35,000; the great Western area with its minerals, precious metals and livestock increased its population from 1,000,000 in 1870 to 9,000,000 in 1914, and its railways from less than 3,000 miles to 46,000, while the New Atlantic coastal area and the great manufacturing area increased its population from 12,000,000 to 30,000,000, and its railways from 14,000 miles to 31,000.
UNITED STATES — INDUSTRIAL, COMMERCIAL DEVELOPMENT (54) 505

The result of this increase in population and transportation facilities in the various sections was apparent in the value of the production of these great natural divisions. The value of farm products in the upper Mississippi Valley, including crops and livestock products, increased from approximately $800,000,000 in 1870 to slightly less than $5,000,000,000 in 1910, the latest census year, and, of course, have very greatly increased since that time and especially in the war period; that of the southern section grew from $600,000,000 in 1870 to nearly $3,000,000,000 in 1910; that of the mountain section from $65,000,000 to $800,000,000, while that of the north Atlantic section, chiefly devoted to manufactures and giving little attention to agriculture, increased from approximately $500,000,000 to about $1,000,000,000 in the period 1870-1910. It is proper to add that these figures must be considered as only approximations owing to the exchanges in census methods from 1870 to 1910, a change which render impossible a close comparison of the figures of the two widely distant periods, 1870 and 1910. In general terms, however, it may be said that the value of the agricultural and livestock products of the upper Mississippi Valley were in 1910 about six times

(a) See map page 372, Vol. 7, for boundaries of divisions.

North Atlantic area: New England and Middle States.
Upper Mississippi: North of Ohio River from Pennsylvania to Colorado.
Southern area: All States south of Ohio and Potomac rivers west to Arizona.
Mountain area: All States west of Texas, Kansas, Nebraska and the Dakotas.
(b) Includes buildings and livestock.
as much as in 1870, that of the South about five times as much, that of the mountain regions 12 times as much, while that of the north Atlantic region, the great manufacturing area, barely doubled, and the area of this north Atlantic section devoted to agriculture was practically unchanged, the tendency of the "New England Farm" to deteriorate rather than to advance its power of production being well recognized by the students of industries of the country during the period in question.

**Manufactures Produced in the United States, 1850 to 1915; also Value of Manufactures Exported and Imported.**

(Values of production are those at the factory; those of exports are values at the port of exportation; those of imports are prices in country from which sent to the United States.)

(a) Includes estimate for home trades and neighborhood products, included in census reports prior to 1900.
(b) Includes manufactured foodstuffs, in order to render figures comparable with census figures of manufactures produced, which include manufactured foodstuffs.

The progress in manufacturing in the various great areas is equally interesting. The value of manufactures produced in the United States was shown by the census of 1870 at $4,232,000,000, and the output of 1914 was recorded by the 1915 census at $24,246,000,000, though the latter figure omitted the product of the hand trades and neighborhood industries which were included in the 1870 census, and which if included in the 1914 figures would have brought the total value of products up to fully $26,300,000,000 in 1914, as against $4,232,000,000 in 1870. The value of the manufactures of the entire country in 1914 may, therefore, be said to have been more than six times as great as in 1870, while the value of the farm products in 1910 (the last census year) was about four and one-half times as much as in 1870, indicating that the growth in manufactures has been greater proportionately than that of agriculture. The North Atlantic section increased its output from $2,750,000,000 in 1870 to $11,000,000,000 in 1914; the upper Mississippi section from slightly less than $1,000,000,000 in 1870 to $8,575,000,000 in 1914, the South from $350,000,000 to $3,130,000,000 during the same period, and the mountain section from $100,000,000 in 1870 to $1,500,000,000 in 1914. The north Atlantic section gained about $8,250,000,000, the upper Mississippi Valley about $7,500,000,000, the South about $2,750,000,000, and the mountain section about $1,400,000,000.

In the north Atlantic section the value of the imports turned out in 1914 was about four times as much as in 1870; in the upper Mississippi section the value of manufactures in 1914 was more than eight times that of 1870; in the South about nine times as much, and in the mountain region about 15 times as much as in 1870. The north Atlantic section produced about 65 per cent of the manufactures in 1870 and but 45 per cent in 1914; the upper Mississippi produced about 23 per cent of those of 1870 and 35 per cent of those of 1914; the South about 7 per cent in 1870 and 14 per cent in 1914, and the mountain region about 3 per cent in 1870 and 7 per cent in 1914.

It is proper here to again call attention to the fact that the figures of production of manufactures in the various sections are materially affected by the fact that the census reports call all products of slaughter, milling and dairy products as "manufactures," which gives to the upper Mississippi section a larger share of the total manufactures of the country than would be the case if the groups ordinarily considered as "manufactures" were included. The flour, meat and dairy products included in the census classification of "manufactures" aggregated in 1914 about $3,000,000,000, forming about 13 per cent of the census valuation of manufactures turned out in that year, and as most of these originated in the upper Mississippi Valley they materially increased the percentage with which that section is accredited in the figures of manufactures produced. If these three groups, flour, meats and dairy products, were omitted from the general list of manufactures, the share which the upper Mississippi Valley produced and the remaining $21,000,000 of manufactures would be approximately 31 per cent instead of 36 per cent as shown in the grand totals of the census which includes these three groups of foodstuffs as manufactures, although the labor performed in making them "manufactures" is comparatively slight. The value added to the raw material by the manufacturing process, according to the census figures, is in the case of flour, meats and dairy products but about 15 per cent, while in all other manufactures the share added to the value of the raw material by the manufacturing process is approximately 80 per cent.

The growth in manufacturing has been the most striking characteristic of the industries and commerce of the United States. This is especially true of the more recent period. Manufactures formed but 45 per cent of the products of the country in 1850, 53 per cent in 1860 and 58 per cent in 1870. By 1880 they had so gained in their growth over the other chief product, that of agriculture, that they formed 65 per cent of the total production of the country and have remained at about that ratio in the census records since that time with the exception of 1890 when farm products were below normal, thus making the share which manufactures formed of the total production slightly more than 70 per cent. Meantime with the growing demand of city and agricultural area and the trend of the farming population toward the cities and manufacturing towns, the share which agricultural products formed of the total exports has steadily decreased despite the increase in actual output, most of which was consumed with the country. Agricultural products, according to an estimate made by the Agricultural Department from year to year, formed approximately
84 per cent of the exports of the country in 1880, 75 per cent in 1890, 62 per cent in 1900, 51 per cent in 1910, 46 per cent in 1913, the year

**Value of Farm Products in the United States and of Agriculture Products Exported and Imported 1850 to 1918.**

(Census figures of farm products to 1910, estimate of Department of Agriculture for later years; Department of Agriculture figures on value of agricultural products exported).

* Valuation of farm products of United States are those at the farm; the export values are those at post of exportation; the import values are those in the country from which the merchandise was exported to the United States.

(b) Department of Agriculture estimate of wealth produced on farms.

(c) 1855; no data for 1850.

...before the war, and 31 per cent in 1917, this sharp fall in the percentage during the war being chiefly due to the great increase in the exportation of manufactures for war purposes. Meantime manufactures which formed but 15 per cent of the exports in 1850 and 18 per cent in 1870 were 20 per cent in 1890, 26 per cent in 1990, 45 per cent in 1910, 48 per cent in 1913, 66 per cent in 1917 and about the same in 1919.

This large increase in manufacturing in the United States has had a perceptible effect on the imports for certain of the manufacturing material must be drawn from abroad even in a country of such varied production as in the United States. All of the raw silk, most of the fibres, one-half of the wool, all of the tin and a small percentage of the cotton used in the factories are necessarily brought from abroad, since we produce no silk, or jute, or sisal, or Manila hemp, or tin and only one-half of the wool which we require. As a consequence the imports of raw material for manufactures increased from $50,000,000 in 1870 to $132,000,000 in 1880, $276,000,000 in 1900, $566,000,000 in 1910, $635,000,000 in 1913, $1,230,000,000 in 1918, and $1,250,715,000 in 1919.

Our demands upon foreign countries have increased in foodstuffs as well as in manufacturing materials. We bring into the country all of the coffee and tea and cacao which our people consume, also about 50 per cent of the sugar consumed, while another 25 per cent comes from our own islands, Porto Rico and Hawaii, but is not classed as an import since those islands are customs districts of the United States and the merchandise coming from them not classed as imports. Our importation of foodstuffs, exclusive of that from our own islands, has increased from $150,000,000 in 1870 to $327,000,000 in 1910. $475,000,000 in 1914 and $760,000,000 in 1918. Quite naturally the manufacturers imported showed a much slower increase in view of the enormous quantities of manufactures turned out by our own factories, the value of finished manufactures imported having advanced from $173,000,000 in 1870 to $203,000,000 in 1900, $360,000,000 in 1912 and $499,000,000 in 1914, dropping to $403,000,000 in 1918, and $393,000,000 in 1919, this reduction being due chiefly to the fact that the European countries from which we had drawn most of our manufactures were not in position at the close of the war to export any considerable quantity of the products of their factories. The share which finished manufactures formed of the total imports of the country fell from 40
per cent in 1870 to 24 per cent in 1900, 22 per cent in 1912, 14 per cent in 1918 and 13 per cent in 1919, while the share which raw material for manufacturing formed of the imports increased from 13 per cent in 1870, 32 per cent in 1900, 42 per cent in 1918 and 40 per cent in 1919.

Probably not more than about 5 per cent of our manufactures are exported in normal years, though this can be only a rough approximation, as no sufficiently accurate statistics are at the same time extremely difficult to answer in exact terms. The census, herewith indicated, includes in its classification "manufactures" many articles prepared for food which are not included in the government's classification of "manufactures" exported. Meats, flour, dairy products and certain other articles which the census classes as "manufactures" are classed by the Department of Commerce in its export figures under the general heading of "foodstuftenn." In order, however, to render comparable the figures of the census with those relating to imports and exports, the Bureau of Statistics a few years ago readjusted its classifications, dividing "foodstuffs" into three groups, one of which included all manufactured foodstuffs. It is possible, therefore, by combining the export group "foodstuffs partly or wholly manufactured" with the two groups "manufactures for further use in manufacturing" and "manufactures ready for use" to obtain a total which represents all articles classed by the census as "manufactures." Another difficulty which arises in attempting to compare this aggregation of the three groups with the full census classification of manufactures produced lies in the fact that the census valuation of manufactures produced is the value at the factory at the time of production, while the Department of Commerce figures of valuation of the merchandise when exported is the value at the port from which sent out of the country at the date of exportation. It thus happens that, necessarily, the valuation placed upon the manufactures when exported is in most cases somewhat in excess of that named by the manufacturer in his report to the Census Bureau, since the cost of transportation from the factory to the port of exportation would necessarily be added and in many instances the profits of the persons who may have purchased them from the manufacturer for exportation. Comparisons, therefore, of the Department of Commerce valuation of manufactures exported with the census valuations of manufactures produced must be made with the clear understanding that the valuation of the merchandise exported is probably somewhat in excess of that named for the same articles by the manufacturer who reported to the census its value at the door of the factory. Even with this increased valuation necessarily included in the export figures, the ratio which the total value of manufactures exported bears to the total valuation of manufactures produced in the country is extremely small, having averaged slightly less than one per cent during the entire period from 1860 to 1915, the percentage which the value of manufactures exported bore to the census valuation of manufactures produced having been in 1870 0.1 per cent, in 1890 0.3 per cent, in 1905 0.7 per cent, in 1914 0.95 per cent, advancing to 0.7 per cent in 1915, when the demands of the war brought the exports of manufactured foodstuffs to an abnormally high figure.

Manufactures are the future hope of the foreign commerce of the United States. It is true that the country responded generously to the calls of Europe for foodstuffs during the World War, it is also true that our growing population demands a constantly increasing share of our agricultural products, while the very great increase which has been made in manufacturing for exportation during the war suggests almost unlimited possibilities in the power of production of manufactures in the United States and especially so in view of the increasing use of capital in the form of machinery in the factories of this country, an increase much more rapid than that of other countries. Estimates by the best experts put the total value of manufactures in the United States in 1919 as probably about $500,000,000. The exports of manufactures in the fiscal years 1918 and 1919 have in each case exceeded $3,000,- 000,000 as against about $1,000,000,000 per annum in the period immediately preceding the war. The world has had an opportunity to acquaint itself with United States manufactures during the war period than ever before for we were supplying in the calendar year 1918 nearly or quite one-half of the manufactures entering international trade as against only a very small percentage prior to the war and with the plentiful supply of capital available our manufacturers should have no difficulty in so increasing the use of machinery in their factories as to enable them to turn out their products at as rapid a rate as those of the countries having a cheaper labor supply but less plentiful supply of capital, and thus assure to the United States a steady growth in manufacturing and in exportation of the products of our factories.

O. P. AUSTIN,
Statistician, National City Bank, New York.

55. ARMY OF THE UNITED STATES.

The army of the United States was the legitimate descendant of the old militia organizations maintained in the various colonies prior to the Revolution. The nucleus of the regular army of the nation was the small force authorized by the Colonial Congress on 14 June 1775 to serve the United Colonies. Beginning then and continuing to the present the military forces of the United States consist of a regular army maintained by the Federal government and a system of State troops called for a long time the Militia and later the National Guard. When these forces were found insufficient, volunteers have been called for or armies have been raised by the Federal government, such as the Army of the Revolution, the War of 1812, the Civil War, the Spanish-American War, the World War, and such like. The United States army has never authorized compulsory universal military service and in peace times it has always been difficult to win away from civilian pursuits enough men to maintain either the regular army or the State forces. The country has always shown a just pride in the small regular army, but service in its ranks has never been popular. The splendid opportunities offered to healthy young men to participate in the development of the economic life of the new country left few youths seeking long term enlistment in regular regiments. The nation has never been enthusiastic in its attitude toward the army and such military enthusiasm as existed naturally found a congenial opportunity in the militia.
Thus the dual services intended to co-operate and supply whatever military needs might arise gradually became competitors, not of course in efficiency but in the quest for men to serve.

Washington, the most popular commander the army ever had, complained constantly that men preferred service in the less efficient militia to that of the continental line regiments. In every war where the regular troops have required the co-operation of the militia the early antagonism has found fresh expression and the problem of the regular army has been less that of learning how to fight a foreign foe than to discover some means of getting rid of the militia incusus. It is undeniable that the nation has never supported a regular army comparable to its population or its wealth. Safeguarded by its political isolation for a century no disaster resulted and it suited the popular prejudice to assume that the militia would be ready when wanted.

The establishment of a national army school in 1802 at West Point under the title of The United States Military Academy led to the development of the only military caste in the nation. The small groups of boys educated there to become officers in the regular army passed out of its graduating classes and disappeared into remote little army posts. As professional soldiers they knew the danger of the situation, but they always lacked numbers or influence to persuade Congress that a Continental army might prove a dangerously weak element in the scheme of national defense if a great danger should suddenly arise. For more than a hundred years no great external danger ever did arise and government and people smiled complacently upon the militia and turned a deaf ear to the warnings or complaints of the regular. As a matter of fact the history of our wars proves that we have been always the winners, even when our fighting has been inferior and our military measures totally inadequate. Fate made the country a nation of optimists, confident that we could win wars almost without soldiers. The history of the militia in the early days of the colonies laid the foundation for this public obsesiveness. In those times the settlers either combined for local defense or co-operated in larger groups when necessary to defend the frontiers of their colony.

When larger dangers threatened, as for example in the time of the French and Indian wars, several colonies contributed detachments of some strength which joined the regular British troops and served under their commanders. It is well worth while to remember that the history of those early campaigns against the Indians, and later against the French and Indians, showed a marked superiority on the part of the colonial militia over the professional soldiers trained in European schools of war. Neither lacked courage or hardihood, but the militia knew how to fight the Indian and the regular soldier did not. The militia were fighting to hold a foe whom threatened soon to be ravaging the whole country, and so brought their whole-hearted devotion to the cause. When the struggle against England began in the first days of the Revolution the militia rallied at a moment's notice and fought British regulars, retreating from Concord, with as great skill and courage as they had displayed a generation earlier when covering the retreat of British regulars after the disastrous defeat of Braddock at Fort Duquesne. The minute men who inflicted heavy casualties upon the British column trying to fight their way back to Boston on 19 April 1775, gave every evidence of being worthy descendants of those other militiamen who had shown such splendid capacity for hard fighting against odds in the attacks upon the powerful fortifications at Louisburg in 1745, and again in 1758. Two months after the affair at Concord and Lexington we find the militia of the New England provinces gathered in entrenched positions on Bunker Hill. Here their 1,500 hastily organized unprofessional soldiers fought the famous battle against veteran regular troops who outnumbered them two to one. The British troops, all regulars, at Bunker Hill fought an American force composed entirely of militiamen. The British losses (89 officers and 965 men) were nearly 30 per cent greater than any later action in the seven years' war. The losses of the American militia were 449 in all, and occurred mostly when, with ammunition exhausted, they were compelled to retreat across exposed ground.

After the Battle of Bunker Hill the Continental Congress at Philadelphia perceiving that the war would not be confined to New England authorized the adoption of the forces already in the field as a Continental Army, owing allegiance to the United Colonies to which authority was voted for the raising of 10 companies of riflemen in Pennsylvania, Maryland and Virginia to serve one year. These troops formed the nucleus of the Continental Army or regular forces of the United States, as we have come to call our national troops. On 15 June 1775 George Washington was appointed commander-in-chief, and on 3 July at Cambridge, Mass., he took command of the 1700 militiamen engaged in the investment of Boston.

From that time on a bitter conflict has continued between the regular and the militiamen, and the literature of our professional army has for more than a century lamented that the early history of the Army gains rice in and reliance upon the State militia forces, which has contributed to the defeat of the hundreds of measures proposed for the creation of an adequate regular army. General Washington unquestionably was dissatisfied of the militia in the struggle against the British armies and frequently reiterated his belief that the cause of the colonies was likely to be lost unless Congress would raise a sufficient permanent force, enlisted for a term of several years and owing allegiance to the central government only. Washing was not a soldier by profession, although he had served in the Virginia colonial militia over this lengthened war. The was a man of the highest personal integrity and singularly pure in character, and these qualities won for him the respect and confidence which enabled the whole body of elements in the new union to unite upon him as an acceptable leader. He won no great military victories and he suffered many humiliating defeats, but he held the love and faith of all parties at all times. Under his leadership the discouraged and often wavering forces held together in sufficient numbers to keep the field, until after the lapse of years which had seemed hopeless, French fleets and
armies came to help turn the tide from defeat to victory. In August 1776 Washington had on Long Island a paper strength of 27,000, but when the battle developed he could oppose only 8,000 combatants to Lord Howe's 20,000 British troops. The loss of that battle and the subsequent reverses enabled the enemy to expel the Continental forces from both New York and New Jersey. Washington's complaint against the militia was based upon the short and variable terms of their service. The Continentals were enlisted at first for two years and later for three years and as the armies were composed of both Continentals and militia the plans of the commander were constantly complicated by the ever approaching departure of some of the militia units. Throughout the war the American forces when operating without foreign help were singularly unsuccessful, except in minor or surprise attacks as at Ticonderoga, Stony Point, Trenton and Monmouth. The one notable exception was the brilliant victory at Saratoga when on 17 Oct., 1777, the British army under Burgoyne surrendered to an overwhelming force of militia rallied to the defense of Northern York under Gates, Arnold, Morgan and Schuyler.

The militia were frequently proved unreliable and it is equally true that the Continentals wrote fewer victories on their colors than might have been expected of trained troops recruited from a brave and ambitious people.

The burden of Washington's complaint was that the浃l effectiveness offered in the militia, usually three, six or nine months, proved much more attractive to most men and that consequently it was difficult to get sufficient good men to enter the regular service. The history of the war proves that when the circumstances would permit a quick assembling and a short campaign the militia were as brave and efficient as ever.

On the other hand, they were totally ineffective and unreliable when called upon to submit to the long and trying periods of inactive camp or garrison life.

We have indulged in this comment upon the early rivalry between the regulars and the militia. Yet the service offered in the militia, usually three, six or nine months, proved much more attractive to most men and that consequently it was difficult to get sufficient good men to enter the regular service. The history of the war proves that when the circumstances would permit a quick assembling and a short campaign the militia were as brave and efficient as ever.

In some of the darkest years of the Revolution there were more Continentals on the army pay roll than there were British troops in America and yet the effort has always been to put the blame for the failures of those years upon the militia.

Since then the claim has always been in every stage of army existence that the army itself would have been a better and more efficient instrument if the militia had been abolished. Nevertheless the States and the United States have continued to maintain the militia and yet it is apparent that in the view of the country at large this branch of the military service has really been much less unworthy than it has been declared to be by its professional army critics.

In the War of 1812 the whole operations of the land forces might be admitted to have contributed little or nothing to the ultimate victory. The militia were frequently inefficient and the regiments won no decisive campaigns.

The Indian wars were frequent, sometimes lengthy and always more costly than they would have been if the country had kept ready for all emergencies a strong regular army. The Mexican War was a brilliant chapter in the history of our army which carried the aggressive and uniformly successful campaign through great physical difficulties to complete success.

The Civil War disclosed the fact that whereas the government school at West Point had produced a fine standard of professional efficiency among officers, it had not so far nationalized them that all could be depended upon to join a national issue when opposed to sectional interests. Many of the most capable officers were from southern States and resigning their commissions in the United States army they took service in the Confederacy and supplied the skilful leadership which kept the War raging for four years. The regular army supplied but a small fraction of the great armies called out between 1861 and 1865 and the vast majority of both officers and soldiers joined the colors utterly devoid of previous military training.

For many years preceding the Civil War there had been no need of the militia and in consequence it had degenerated into a practically worthless military asset. The State records exhibited a considerable paper strength but the regiments were little more than picturesque features for Fourth of July parades. When the Civil War made its demand for men in large numbers the early campaigns showed clearly that the previous decades had seen the development of prosperous communities and the decay of militant virtues.

The progress of the war with its long hard campaigns of varying fortune demonstrated that the nation both North and South still possessed the raw material out of which fine armies could be raised.

When the war ended in 1865 great armies of splendid veteran soldiers returned to the pursuits of peace. The credit for most of the skill in training and leading those armies belongs to officers who had been educated in the regular service. Many thousands of capable and brilliant officers came into the service and learned the science of war but until they had learned they were nearly as dangerous to their own men as were the enemy.

The Indian Wars which followed the Civil War were entrusted almost entirely to the small regular army which was for many years kept constantly in the far west. A very high degree of efficiency for border warfare was developed but the conditions were decidedly unfavorable to the study of modern warfare between civilized powers.

The sudden outbreak of war with Spain in 1898 made it necessary to call into the National service the National Guard of the States as well as a numerous volunteer army. The National Guard in a few of the States was a fairly well organized and partly trained force but in many of the States neither officers nor men had more than the most elementary preparation for service in war.

Fortunately the campaign in Cuba was a very brief one and the fine aggressive spirit of the small regular army caused the Spanish defense to crumble up with very little hard fighting.

The large forces gathered in training camps
in the States suffered heavy losses from camp
diseases and showed every evidence that they
were not prepared for active campaigning before
they could have been described as parts of an
efficient and disciplined military force. The
Spanish War while brief and rather trivial in
the nature of its one short campaign did the
country a great deal of good. The old notion
that no foreign complications could ever disturb
the peace of the United States was rudely and
quite effectually uprooted. The country was
ready to believe that there was need to support
a somewhat larger regular army and to give
more attention to all of our military interests.
The condition of the state troops had been
shown to be far from any reasonable degree of
efficiency. The next 20 years witnessed a great
improvement in the quality of the National
Guard in several of the States but in many
places the organization continued to merit the
criticism which the professional aimed at its
glaring faults. Those criticisms were often
permitted to seem to apply to all the forces in
all of the States and the result was an un-
fortunate antagonism between the regular es-
establishment and the National Guard which was
hurtful to both.

The Department in the Philippines meanwhile gave
the regular army its first experience of foreign
service but unfortunately the lessons learned
there were too much like our own old cam-
paigns in the Florida and other Indian Wars. A
number of National Guard regiments as well as
African American regiments were raised to augment the regulars in the
Philippines and these regiments carefully trained to regular army standards gave excellent
service.

The punitive expedition into Mexico in 1916
was in the nature of a cavalry reconnaissance
by a strong regular column against guerrilla
forces and provided little experience of value
for the great war in Europe. The
mobilization of the National Guard taught the
States many lessons of value and helped elimi-
nate a great deal of useless dead wood which had been carried for years in the State organ-
izations.

Since the Revolution the American armies had
never been called upon to face a great
conflict with a foreign power and the only
experience of hard fighting with modern
weapons had been that of the Civil War. Several times in recent years serious diffi-
culties have arisen along the Mexican frontier
and in 1916 the prospect of war with Mexico seemed so imminent that the President mobilized the National Guard on the Mexican border. The fighting developed but the guard from every State in the Union had the benefit of their
first experience in distant service under cam-
paign conditions for many years. The condi-
tions were severe.

In 1792 Congress enacted the first militia
law which was until 1903 the only law relating
to the militia. Having become largely a dead
letter Congress in 1903 passed the Dick bill de-
signed to promote the efficiency of the militia.
Under this law the National Guard was recog-
nized by the National Government as those
organizations in the States whose officers and
men had taken the federal oath provided in the
National Defense Act. Until this federal oath
was taken the State forces were known as the
organized militia.

The National Defense Act finally became a
law on 3 June 1916 and the mobilization of the
National Guard was begun before either the War Department or the State
authorities had become sufficiently familiar with
its requirements to formulate a clear and prac-
tical course of procedure.

The State forces went to the Rio Grande
with great enthusiasm but as the months passed it became evident that there was to be no
warlike service for them over the border large
numbers of both officers and men demanded
their release in order to return to their business
and their families. Nothing else in recent years
has so clearly illustrated the essential difference
between regular and National Guard troops.
The regular troops were ready to march out
of their various posts within hours of being
ordered to camp and entrain for the border within a few hours
after the receipt of telegraphic orders. Once
there they were as contented to settle down to
the monotony of border patrol duty as they had been to remain in their old posts near home and
in the past short they proved to be exactly what the country expected them to be — professional soldiers
without any other interest in life than the
performance of military duty. At the end of 1916 the War Department issued a book of law and
order closely printed pages reciting the history of
this mobilization and bearing throughout evid-
ence of the unvarying antipathy of the whole
commissioned personnel of the regular army to the National Guard. As the criticisms would have formed an overwhelming
indictment of regular troops raised and main-
tained at government expense in a State of
constant readiness for field service. The diffi-
culty lies in the inability of the regular estab-
lishment to appreciate the view point of
the nation at large. The people of the United States
do not expect these State auxiliary forces to be
ready at a moment's notice to step out of home
and civil occupation and display a degree of
readiness for war equal to that of the regulars.
They do expect and are increasingly providing the
means for them to so far perfect themselves in organization, drill and in their first auxiliary to the regular army
ready after a few months training in the field
to face an organized enemy. Back of the Na-
tional Guard the nation relies upon a great
force of national Guard which by its organization and training must necessarily require a much longer period. From
the view point of the professional soldier it
would appear desirable that the nation should
consent to his advances and maintain at all times
a great standing army. The fact is, however, that no argument from Washington's time down to
the present has ever induced any considerable
part of our people to agree to this. The settled
determination of the country to have a regular
army has remained steadfast in adherence to the scheme of
the founders for a small regular army and as
large and as efficient a force of State troops
as will be supported and recruited by the people
of the various States. The training necessary for
modern warfare. The value of preliminary
training must be generally recognized and it is
reasonably certain that State administrations
will be more ready than ever before to cooperate with Federal authorities in plans to harmonize training and equipment as well as organization and paper work methods with regular army standards. The nation will undoubtedly accede to the demand for a larger regular army than has ever before been authorized and the people at large are apt to maintain a closer and more critical interest in the professional efficiency of the army. The time has come for the dual services to really cooperate for the good of the country. The State troops and the boys of the volunteer regiments are training and discipline. The regular should know that the country will not permit him to lag behind any foreign service in scientific development. Both have learned how tremendous a service with the incomparable soixantequinze capable of laying down a rolling barrage in front of advancing troops which would have been absolutely impossible for our own corresponding gun. Likewise were our armies indebted for aeroplanes to their allies both French and English.

It was unfortunate that difficulties of language led our staff at first to arrange for the instruction of our carriers in France by British rather than French corps of instructors. The British had fought magnificently for four years but they had not solved the problem of trench warfare and the errors of their system brought the cause of the allies to the verge of defeat in the spring of 1918. After General Foch assumed the supreme command and the tide of battle turned in the favor of the Allies, the French corps of instructors was placed in control of the training of our carriers and the American commander, General Pershing, co-ordinated his plans with the French when the American armies entered the great offensive and every detail worked splendidly.

In France the general headquarters of the American armies was located at Chaumont while the subordinate headquarters of the services of administration and supply were at Blois and Tours. The ports used in the enormous transport of troops and supplies were Sainte Nazaire, La Pallice and Bordeaux. A large number of American troops were landed in England and thence transported to France. So vast were the preparations in France that the arrangements were made in every way adequate for the handling of the 2,000,000 soldiers and their supplies. The arrangements at the ports and along the railway lines included every facility for handling and caring for a still larger force if the war had continued into 1919 as was generally anticipated.

The modern requirements called for air, chemical, gas and many other new services which had not been created in our army. All were thoroughly organized and functioning in the final campaign but in the course of another year would have been capable of great development. The army medical service had an extraordinarily healthy army to deal with but there were a vast number of wounded to be cared for and it was noticeable that the time had not sufficed to standardize this service. Hospitals were excellent, good or fair according to the individual merit of the local commanding officer. The American armies were the best paid and best fed armies in the war. They proved of the very highest fighting value due to the
superb morale of the rank and file. They went to Europe determined to win or die in the attempt. The survivors came back, were mustered out and have returned to civil pursuits with a zest that echoes their oft-expressed desire to "go it over with." A magnificent victory in the greatest of all wars has failed to alter in the slightest degree the national sentiment toward military affairs in general and wars in particular. The regular army will doubtless be somewhat larger and undoubtedly both it and the National Guard will show marked improvement in professional attainments. The nation at large will continue to believe in the invincible courage of all its sons and the continued presence of a police which bequests victories. An important task confronting the army will be the reconciling of that attitude to the necessity that the nation shall provide in peace for the scientific preparation against war which is likely to be the cost insurance against future disaster.

The American Expeditionary Force or A.E.F. as it was called developed in France a well-organized general staff, an essential feature of army economy and efficiency.

John J. Pershing, the commander-in-chief of the American Expeditionary Forces promptly recognized the necessity for a general staff and as the American army had heretofore been destitute of this important department he proceeded to organize one based upon the war experience of the veteran French and British armies. The responsibilities of the general staff were divided into five groups each with a chief functioning as an assistant to the chief of the general staff:

- Group 1. Organization and Equipment of Troops
- Group 2. Censorship, Enemy Intelligence, Information, Preparation of Maps, etc.
- Group 3. Strategic Plans, Movement of Troops, Supervision of Combat Operations
- Group 5. Schools and Co-ordination of Education and Training

The first units of the expeditionary army reached France in June 1917. The combatant forces were organized into divisions consisting of four regiments of infantry, each with three battalions to the regiment and four companies of 250 men each to a battalion, and an artillery brigade of three regiments, a machine gun battery, an engineer regiment, a trench-mortar battery, a signal battalion, wagon trains, headquarters staffs, and military police. The above with medical and other units gave a total divisional strength of over 28,000 men, about double the size of a French or German division.

Each corps was to consist of six divisions (four combat, one depot, one replacement) with two regiments of cavalry.

Each army was to have from three to five corps.

A great system of army schools was organized in France with headquarters at Langres where the principles of general staff work were taught, and men who had shown qualities for leadership were fitted for commissions.

A school of the line taught young officers leadership requirements and the use of different weapons, including the various types of hand grenades, trench mortars, etc., peculiar to trench warfare.

The artillery school was at Saumur. The aviation school at Issoudun.

The departments of the adjutant-general, inspector-general and judge-advocate-general remained with the general headquarters at Chaumont.

The administrative and supply services were transferred to the headquarters of the Service of Supply (the S. O. S.) at Tours and included the chief quartermaster, chief surgeon, chief signal officer, chief of ordinance, chief of air service, chief of chemical warfare, general purchasing agent, provost-marshal-general, director-general of transportation and chief engineer. The chiefs of all these branches of the service were subordinate to the commanding general of the service of supply, who was assisted by a large staff charged with the administrative cooperation of the various departments.

Great storage depots were built at La Pallice, Montoire and Gievres. Hospitals and barracks were constructed at many places in France. Enormous additions were built at the ports and on the lines of railway communications. The forestry service cut an immense amount of timber required by the engineer corps.

The American Expeditionary Forces engaged in the heavy fighting of 1918 were indebted to the French entirely for the light artillery which made the advance of our infantry possible. Although American manufacturers had started making the required modern artillery, not one such weapon was in service at the front up to the time the armistice was signed. The French artillery furnished for our aviation service 2,676 aeroplanes of pursuit, observation and bombing types. After May 1918, 1,292 planes arrived in France from the United States.

While our forces were never sufficiently supplied with tanks we were indebted for all we had to the French.

In order that the moral welfare and the physical comfort of the millions of young American soldiers serving in a foreign country should be cared for as far as possible the American commander gave every possible assistance and encouragement to the Young Men's Christian Association, Knights of Columbus, Salvation Army and Jewish Welfare Board. The Red Cross ministered to the soldiers with an efficiency and devotion incomparable on every line of communication and in every hospital.

When the great German offensive broke against the Allied front on March 1918 it became apparent that unity of command was of the utmost importance in the Allied armies were to avert disaster, and General Pershing by direction of the President immediately placed all of his forces (343,000 men) at the disposal of Marshal Foch.

When the United States entered the European War our army numbered 190,000 (6 April 1917) and when the armistice was signed (11 Nov 1918) the numbers had increased to 3,665,000, of whom somewhat more than 2,000,000 were in France.

Civilian employees of the War Department increased from 2,000 to 25,000. For the year ending 30 June 1918 the appropriations for the support of the military establishment aggregated $8,000,000,000. For the year ending 30 June 1919 the appropriations for the same aggre-
gated $15,300,000,000. The American casualties were in excess of 292,000.
Killed in action, 34,593; died of wounds, 13,598; died of disease, 23,669; died from accident and other causes, 5,308; wounded, 214,515. Of the wounded 85 per cent returned to duty.
In the Civil War the fatalities on the Union side were approximately 110,000. In the Spanish War we had less than 1,000 men killed in battle.
With a view to imposing the burdens of this war upon the present generation, rather than upon their descendants, Congress created the War Risk Insurance against death or disability. The premiums were payable monthly by deduction from the month's pay and were graduated according to age, averaging 80 to 90 cents per thousand per month.
On 18 May 1917 Congress passed the First Selective Service (Draft) Law, which with subsequent amendments resulted in four registrations.

The drafted men showed a very large proportion of the young manhood of the nation to be physically unfit for military service, and very nearly 25 per cent were shown by the most elementary tests to be illiterate. Thousands, foreign-born entered the service unable to speak or read English and occasionally a new problem in face of the necessity to quickly convert them into soldiers competent to serve in an American army.

A series of Officers' Training Camps supplied much of the demand for officers. From these training camps commissions were granted to two colonels, one lieutenant-colonel, 204 majors, 5,429 captains, 12,374 first lieutenants and 39,207 second lieutenants, a total of 57,207 officers provided by these schools of intensive training. It was an axiom with units serving in front-line sectors that "lieutenants are expendable due to heavy casualties among line officers exposed to the hardships and dangers of trench warfare, and there was constant need for first and second lieutenants to replace officers killed or wounded. As they left the front line their replacements were transferred to the rear to be invalided, sick, wounded or killed.

**Statistics of the Army of the United States.** There are no reliable figures as to the strength of bodies of militia maintained more or less irregularly in the colonies before the Revolution. Franklin organized a volunteer military association for the defense of the province of Pennsylvania in 1744. In 1755 he was colonel of a regiment and built forts for the defense of the frontier. There were irregular bodies of militia in the southern colonies and more thoroughly organized units among the New England colonies, particularly Massachusetts and Connecticut.

The following shows the number of troops furnished by each State for the Continental Army during the Revolution:

The cost of the United States was $351,079,778.28 with resulting pensions which will be in the neighborhood of another $5,000,000,000. The strength of the Confederates probably
was not greatly in excess of 1,000,000 men with less than 700,000 as a maximum of effective combatants available at any one time. The cost of the Civil War per capita is estimated at $96.

SPANISH WAR (1898).

#### 56. NAVY OF THE UNITED STATES.

The American navy came into existence in 1775 after the close investment of Boston by Washington had cut off all supplies to the British troops, save such as might arrive by water. To intercept these, some small vessels were armed and manned by New England seamen, first under the auspices of Rhode Island and Connecticut, and afterward by authority of the Congress which organized a Naval Committee with John Adams at its head. These little craft not only deprived the enemy of succor, but captured enough prizes to furnish the colonial army with material, without which it could not have continued hostile expeditions.

**Early History.**—In 1776 the navy had 31 cruisers mounting 586 guns, and no less than 136 privateers mounting 1,360 guns had also been fitted out. Including the flotilla on Lake Champlain, the government war vessels in service during the Revolution numbered in all 64, carrying a total of 1,242 guns. This force captured 196 vessels worth about $6,000,000, and the privateer auxiliaries, numbering 792, mounting over 13,000 guns, took 600 British ships, valued at $18,000,000. Insurance on British bottoms rose from 2 to 15 per cent. This unprecedented destruction was one of the strongest arguments which led to peace.

The Hancock, Randolph, Raleigh and other cruisers authorized by Congress were excellent ships, and the Alliance and Confederacy built toward the close of the war had no superiors afloat. They were mainly armed with 4- to 18-pounder guns. Progress was, however, stopped when independence was achieved, and the vessels were sold and men discharged. In 1794 a law re-establishing the navy under the Secretary of War was enacted and six frigates authorized. Of these, three were constructed, the Constitution, 44 guns, 1,576 tons; Constellation, 36 guns, 1,265 tons; and United States, 44 guns, 1,576 tons. The Constitution is still afloat. These were abandoned and the material sold. Under the pressure of French spoliations, however, the navy was increased and at the beginning of the quasi-war with France in 1798 it aggregated 22 ships with 456 guns and 3,484 men. This little force during the two and a half years of hostilities captured 84 French armed vessels mounting over 500 guns. The military discipline of the navy here begins: the American officers, largely recruited from merchantmen, learned from the commanders of the British war vessels in the West Indies the traditions and customs of the older service. This came in the carronade or short gun, with little penetrating but great smashing power. At the end of the French War, another reduction of the navy took place. The theory that ships and guns could be called into existence when needed,

as easily as log cabins, even at that early day, had become well rooted. Accordingly after cutting our force down to 15 vessels, we deemed it wise to present the Dey of Algiers with 26 barrels of silver dollars and the fine frigate Constellation to include in my commerce alone. Tripoli in her turn, being thus encouraged, demanded special blackmail. Thereupon the navy, once more rejuvenated, not merely destroyed the Barbary pirates, but emerged from the war with the reputation of having gained the admiration of the world. It was during these campaigns that disciplinary routine was so highly perfected by Commodore Edward Preble that it has remained with little substantial alteration to the present day. It was then also for the first time that the American navy was accorded all the formal honors of a national service by the war-ships of other countries.

War of 1812.—When the War of 1812 with Great Britain began, the navy had 17 ships aggregating 15,300 tons and carrying 442 guns and 5,025 men. It had no yards, no docks, no adequate means of any sort for repair or refitting. The battle flags from the victory of Trafalgar and the Nile, had over seven times this force on the North American station alone.

Within seven months the United States ships had reduced three British frigates to wrecks and taken 500 merchantmen—a result which astounded the world. The Constitution, 55 guns, destroyed the Guerrière in 40 minutes and the Java in one hour and 55 minutes, and the United States, 54 guns, dismantled the Macedonian, 29, in about an hour and a half. The subsequent sloop actions were almost equally decisive. The noteworthy fact of these duels was the destructive character of the American fire—which literally tore the British ships to pieces and converted their decks into slaughter-houses. Three prominent factors contributed to success.

1. The United States ships and especially the frigates, were larger—12 feet longer—and at the same time more easily manœuvred than any which had ever before been built. The sloops-of-war outclassed those of foreign navies at every point.

2. The frigates concentrated the power of a ship in the line. They mounted long 24-pounders in broadside—an innovation startling for the times. To the Guerrière's 32 long 18's and 16 short 32's the Constitution opposed 30 long 24's and 24 short 32's. When she fought the Java she had increased the number of her long 24's to 32, so that while decreasing the number of her short guns to 22, she had augmented their size to 24-pounders. That gave the combination of low power, heavy smashing projectiles with relatively high power penetrating projectiles which characterized the navy armament for many a year afterward.

3. The American gunners aimed their guns. They had been taught, as their fathers from the backwoods, who had harried the Hessians had been taught, to fire at targets; to use their long cannon as they used their long fowling pieces and to send round shot into hulls at the water line, just as they were accustomed with their rifles in John T. Long's day. The British system then involved no gun pointing. The carronades had no sights and were laid level—point blank—with a range of about

500 yards. They were fired with the same hope of hitting something which King George's grenadiers or those of his serene Highness of Waldeck cherished when they presented fire-lock and pulled the trigger in one motion. So long as shot cut up sails and rigging and did not end the motive power the desired end was attained. The bull-dog Briton could then lay his ship close aboard the enemy and finish the fight with boarders and cutlasses. But the handy American ship was the better armed and more long 24's enabled them to do this and at the same time deliberately to drill holes in the British water line, while occasionally anticipating the yet distant shell fire by sending slow heavy balls against the wooden sides and annihilating whole gun's crews with the resulting shower of splinters. That is how the Wasp cut up the Frolic in 43 minutes and the Hornet demolished the Peacock in just 11—while incidentally demonstrating the superior advantages of firing on the down roll of the ship in order to convert the adversary into a sieve, instead of on the up roll which merely clipped his wings.

In the War of 1812 the regular navy numbering but 23 vessels, destroyed or captured 254 of the enemy's craft. The value of the prizes taken by the navy and the privateers jointly was over $45,000,000. The cost of British marine insurance became almost prohibitive, 13 gns. per $1000 for $200 was passed result which astounded the world. The Constitution, 55 guns, destroyed the Guerrière in 40 minutes and the Java in one hour and 55 minutes, and the United States, 54 guns, dismantled the Macedonian, 29, in about an hour and a half. The subsequent sloop actions were almost equally decisive. UNITED STATES—NAVY OF THE UNITED STATES (56)

iron, and the first of their type. She was broken up in 1849—but was in service long enough fully to demonstrate the naval importance and formidability of the class. The type of the navy (amalgamated with the line in 1839) was organized by Act of 31 Aug. 1842 and in 1845 the United States Naval Academy (q.v.) was established at Annapolis.

The Civil War.—The screw steam war vessel was now fully developed and those of our navy were as graceful as yachts and the most formidable of their class. Between 1856 and 1859 we built the Niagara, Colorado, Merrimac, Wabash, Minnesota and Rodney, frigates, and the Brooklyn, Lancaster, Hartford, Richmond, Pensacola, Paunee, Michigan, Narragansett, Dacotah, Ironsides, Wyoming, and Seminole, sloops. Meanwhile the Dahlgren shell gun began to replace the older type of smooth bore. When the Civil War broke out the navy, however, had become much reduced. Of the 90 vessels on the list, 42 were in commission and the rest unserviceable. The sailing ships still carried the ancient 32-pounders and eight-inch shell guns and only the steamers were provided with Dahlgrens—but these were regarded as monsters, their calibres having increased to 11 inches. It went to 15 and even 20 inches before the war closed—but the guns were very short, powder charges small and initial velocities seldom rose above 1,200 feet per second. These pounding weapons—true to the old principle—were supplemented by rifles mainly of the Parrott type, which lingered long after they had been proved about as dangerous to friend as to foe. When the war opened, the navy had 1,457 officers and 7,600 seamen—when it closed the officers numbered 7,500 and the seamen 51,500—208 additional vessels were built and 418 purchased. The total number of Confederate or British vessels captured or destroyed was 1,504, valued at $31,000,000, and the net proceeds of property seized on the blockade which was efficiently maintained over more than 3,000 miles of coast and eight-sixteen states of the navy throughout the Civil War was about $314,000,000, equal to only 9.3 per cent of the government expenditure for the whole period of four years and four months. The total number of vessels in the navy in December 1864 was 671.

The great naval development of the Civil War was the Monitor, a raft-like vessel 172 feet long over all, of 41½ feet beam and 11½ feet depth, of hold plated with five layers of one inch iron on her hull and eight layers on her single steam rotated turret wherein were installed two 11-inch Dahlgren guns. She revolutionized marine warfare and made the wooden steam frigate about as archaic as the Roman trireme. To a limited extent also (especially in the Confederate ironclads Virginia and Tennessee and the Federal so-called "tin-clads" of the Mississippi) the armored casemate was subjected to test—but it is only of comparatively late years and following the great improvements in armor that the casemate has assumed a really important place in naval construction.

Reorganization.—After the Civil War, the navy was rapidly reduced—the total number of vessels in the navy by the fall of 1866 being but 115. The monitors were laid up at League Island and gradually destroyed. Five which survived, though practically useless, were permitted a brief harbor service during the Spanish War. Two, however, of the more formidable class, the armored tug Monadnock, made long voyages respectively to Europe and around Cape Horn—thus for the first time demonstrating the sea-going capacity of low freeboard turret ships and dooming to final extinction the wooden man-o'-war. Gradually but steadily the depletion of the navy list continued and vessels after vessel was sold. Many were broken up under the law decreeing destruction if needed repairs should be found to cost more than 20 per cent of the value—and finally in 1881, so far as ships went, the country was little better than defenseless. In July of that year we had, as the steam navy, 13 so-called first rates (all of wood of from 2,840 to 3,173 tons measurement) of which one, the Tennessee, was at sea and four were ancient craft still on the stocks and never launched; 20 second rates (929 to 2,300 tons, all wooden but one) and most of these old-fashioned and unserviceable; 27 third rates (410 to 918 tons), again all wooden but four, and some of the Civil War monitors. The rest of the navy was made up of wooden sailing ships, two of which had served in the War of 1812, including some that became all but worn out decades earlier while chasing pirates in the West Indies and slavers on the African coast. The one sea-going flagship, Tennessee (plus repairs) in 10 years of active service gradually cost $3,800,-000 and was ultimately sold for $45,000. Numerous other vessels built in the interval since the Civil War had meanwhile gone almost immediately from shipyard to scrap heap. "It is often the subject of wonder," says the Secretary of the Navy in his report for 1887, "what has become of the $70,000,000 spent upon war vessels since the close of the war in view of the fact that there is now no navy. The existing armament was as antiquated as the ships themselves. It consisted principally of nine-inch smooth bore and eight-inch rifled all muzzle loading, and the latter had been economically concocted from old 11-inch Dahlgrens by inserting a wrought iron rifled tube in the bore. The only breech loaders in the service were those which had been 'converted' from the miserable 100 and 60-pounder Parrott rifles. This deterioration of the navy, however, extended no further than to the ships, and, at times, to the Navy Department. Throughout all that long period of corruption and decay the discipline of the service never wavered, the attainments of the naval officers constantly advanced, drills and target practice were as scrupulously maintained on wreathed wooden craft which the poorest foreign ironclad could send to the bottom with ease, as if they had been held on the most powerful of battleships, and although we had, at most, only 55 antiquated ships, every one of them too slow to run away from and too weak to fight with a war vessel of the modern build and equipment, none the less all were ready to do their best—inadequate as it was—instantly and at all times. The ships of the United States navy have often become weak in numbers and had in construction, but the men who handled those ships were not pro- graded. In quality the personnel of the United States navy has always been the best.
It was in 1881 that Secretary Hunt appointed an advisory board to determine the requirements of the Navy. It recommended 21 armored vessels besides 70 unarmored, together with rams, and most significant of all declared that the material of construction should be steel. That was the knell of the iron navy—although as a matter of fact, it had never fully displaced wood. Meanwhile there was not a plant in the United States capable of making forgings for guns of more than six-inch caliber—or nor one able to make armor plate or torpedoes or machine guns. In May 1887 contracts were signed with the Bethlehem Iron Company for gun forgings and armor plates and in the same year the new great naval gun factory in the Washington navy yard was begun.

The Modern Navy.—The first vessels of the new steel fleet were the Dolphin (1884) and the Atlanta, Boston and Chicago (1885). The increase after 1888 was rapid, the outbreak of the Spanish War of 1898 finding the navy equipped with 77 vessels, including several coast line battleships such as the Iowa, Indiana and Oregon and the powerful armored cruisers New York and Brooklyn. The war developed the remarkable preparedness of the navy, which participated in several engagements in the camps of Spain in a campaign of 110 days. The chief naval event apart from the battles of Santiago and Manila was the famous rush of the Oregon from San Francisco to Jupiter Inlet, Fla., around Cape Horn, a distance of some 14,000 miles in 68 days, which she accomplished without accident, arriving in condition for immediate service.

The history of the United States navy from the close of the war with Spain to the advent of the Dreadnought type demands but little attention. Vessels were laid down on no large scale, but those built were among the best of their type. The battleships of this period (1899-1906) were of from 12,500 to 16,000 tons displacement and about 450 feet in length. The speediest vessels of this type and period—Georgia and Kansas classes—steamed 19 knots per hour. The armored cruisers had an average speed of 22 knots per hour. An unprecedented event in America's naval history and one of the most spectacular cruises was the sailing of the United States battleship fleet around the world; it departed from the Atlantic Coast 16 Dec. 1907 and returning without mishap on 20 Feb. 1909. When the fleet sailed, Admiral Evans, in command, declared that it was ready "for a fight or a frolic." It proved to be the latter, and while the proposition to take the trip was vehemently opposed when first broached, it was so successful in its results that those who felt most disgruntled could, after the return, find no more cause for even a lukewarm opposition than the expense attending the excursion.

An enlarged building program was inaugurated after 1906, and when war was declared against Germany in 1917 the tonnage of the United States navy, including all types of vessels then under naval control, was approximately 1,500,000. Strained relations with Germany caused the United States to enter upon a program of general naval expansion in 1916, which led to a considerable increase in expenditure, due mainly to the adoption for the first time of a continuous shipbuilding program. The period was of three years, the total cost to be approximately $520,000,000, and in the first year 30 battleships, 75 battle-cruisers, four scout cruisers, 30 submarines and 20 destroyers were laid down, to be followed by six additional battleships, two battle-cruisers and a number of smaller vessels. With the declaration of war the program was enormously increased and accelerated; at the opening of hostilities the navy had 787 vessels of all kinds, including a large number of submarine chasers. The sum of $350,000,000 was at once appropriated for destroyers. The Secretary of the Navy on 9 Dec. 1917, in his annual report, asked for $1,000,000,000 for his department for the next fiscal year. The personnel of the navy was at the same time increased from 19,500 to 322,000; the naval reserves from a few hundred to 49,000; the monthly expenditure from $8,000,000 to $60,000,000, and ships in commission from 300 to over 1,000. The splendid work of the naval arm in the Great War is treated elsewhere. (See WAR, EUROPEAN—NAVAL OPERATIONS.) In 1919 a new three-year building program was laid before Congress. It called for 10 battleships, six battle-cruisers, 10 scout-cruisers and 130 destroyers, submarines, etc.

The fleet of the European War the navy had increased into a fighting organization of more than 2,400,000 tons, or, it transports under naval control are added, of well over 3,000,000 tons.

In 1917 and 1918 three superdreadnoughts, the largest afloat, were added; more than 100 destroyers were built; two superdreadnoughts were completed in 1919, while five great battle-cruisers and a fleet of fast scout cruisers were being constructed. In 1919 also was inaugurated the policy of expanding the navy into two great fleets, one in the Atlantic and the other in the Pacific. Each fleet contains two divisions of dreadnoughts, with two divisions of predreadnoughts held in reserve in each ocean, about 100 destroyers. These fleets are brought together each year for joint battle exercises under a single command. The Panama Canal makes possible the holding of joint manoeuvres whenever they are necessary, and the oil. type of dreadnoughts and other vessels are oil-burners. The new ships under construction are all of the oil-burning type.

The dreadnoughts now number 32 and of these 17 are in commission and two are nearing completion. In the following table are given the names and tonnage of the dreadnoughts of the American navy:

guns. There is a main battery of eight on each vessel. The New Mexico, Idaho and Mississippi; more each 12 14-inch rifles. The Colorado and Tennessee were the last vessels of the first line of the navy to mount guns of the 14-inch type; each vessel carries 12 guns of that calibre. The Pennsylvania and Arizona each mount 12 16-inch guns; the New York, Texas, Nevada and Oklahoma each carry 10 14-inch guns; the Arkansas and Wyoming 12 12-inch; the Delaware, Florida, Utah and North Dakota 10 12-inch; and the Michigan and South Carolina each have eight guns of 12-inch calibre. The oil-burners of the present fleet are the New Mexico, Mississippi, Idaho, Pennsylvania, Arizona, Nevada and Oklahoma. The old-line battleships which furnish the coast reserve for the new fleets are: Alabama, 11,552 tons; Colorado, 16,000 tons; Georgia, 14,948; Illinois, 11,552 tons; Indiana, 10,228; Iowa, 11,346 tons; Kansas, 16,000 tons; Kearsarge, 11,250 tons; Kentucky, 11,250 tons; Louisiana, 16,000 tons; Maine, 12,500 tons; Massachusetts, 10,228 tons; Minnesota, 10,000 tons; Missouri, 12,500 tons; Nebraska, 14,948 tons; New Hampshire, 16,000 tons; New Jersey, 14,948 tons; Ohio, 12,500 tons; Oregon, 10,228 tons; Rhode Island, 14,948 tons; Vermont, 16,000 tons; Virginia, 14,948 tons; Wisconsin, 11,552 tons, making a total tonnage of this type of 309,148.

The tonnage of the navy as it now (1919) stands is as follows:

- Transport tonnage is made up of merchant vessels which in peace are turned back to private hands subject to call by the naval authorities when an emergency arises.

The battle-cruisers, which like the super-dreadnoughts, carry 16-inch guns, are among the largest and speediest vessels of their type. They are the Constellation, Constitution, Lexington, Ranger and Saratoga, and one other cruiser; each has a displacement of 15,236 tons, making a total of 211,416 tons for this class. In the late war no vessel played a more important part than the fast-going modern destroyer, the ship that conquered the submarine. America's new fleet of destroyers each bears the name of a naval hero of other days. The average displacement is 1,165 tons for this class of vessel, of which the navy has 192, with a total tonnage of 208,998. There are 15 of the older type of destroyers of 430 tons average displacement, a total of 6,275 tons. There are 17 torpedo boats of from 142 to 280 tons, a total of 3,150 tons. Armored cruisers have an aggregate tonnage of 111,900; there are eight vessels of this type of about 14,500 tons each. First class cruisers are the Brooklyn, Charleston, Rochester and Saint Louis, of about 9,700 tons each. The Chicago, Columbus, Minneapolis and Olympia are second class cruisers, with an aggregate tonnage of 25,865. There are 15 third class cruisers of from 2,072 to 3,430 tons, with an aggregate of 47,820 tons. In addition there are 38 gunboats of from 190 to 1,500 tons, with a total tonnage for the class of 36,055 tons. There are 148 submarines, of which about 100 are new vessels of the improved "AA," "EE" and "SS" types. The total tonnage of the new submarine fleet approximates 118,000.

Navy Organization.—The President of the United States is the commander-in-chief of the navy. Its affairs are administered by the Navy Department, of which the Secretary of the Navy is the head. The Assistant Secretary of the Navy performs such duties as may be assigned him by the secretary, the most important being the supervision of naval stations in insular possessions, the Marine Corps, War College, building of ships in navy yards and fitting of vessels for sea. The navy is governed by the Articles for the Government of the United States Navy, and statutes of Congress, ordered by the President and secretary and a code called Regulations for the Government of the Navy of the United States.

The business of the Navy Department is distributed as the secretary deems expedient among eight bureaus. The Bureau of Yards and Docks controls docks and buildings in Navy Yards. The Bureau of Equipment provides coal, all equipments of ships and electrical appliances aloft, and supervises the Hydrographic Office and distribution of charts therefrom. The Naval Observatory, Nautical Almanac and Compass offices. The Bureau of Navigation promulgates orders, regulates details of officers and enlistment of men, supervises the Naval Academy and all naval educational institutions, the Naval Home, keeps the service records and looks after discipline. The Bureau of Ordnance has charge of armor and armament of all kinds and mechanism thereto pertaining, besides governing the Torpedo Station, naval proving grounds and shore magazines. The Bureau of Construction and Repair designs, builds and repairs ships and supervises docking them. The Bureau of Steam Engineering designs, builds and repairs steam machinery. The Bureau of Supplies and Accounts buys provisions, clothing, small and contingent stores and keeps the accounts of officers and men. The Bureau of Medicine and Surgery looks after the health of the force and controls all laboratories, naval hospitals and dispensaries. The office of the Judge-Advocate General of the Navy is independent of the bureau and takes charge of courts-martial and courts of inquiry, examines claims against the department and attends generally to its legal work.

There are already certain permanent boards of naval officers which take part in the admin-
ization. The General Board, presided over by the admiral of the navy, considers questions of naval policy and strategy and advises the secretary. The Board of Inspection and Survey inspects and reports on the efficiency of ships in commission. The Lighthouse Board controls the lighthouse establishment. For the distribution of navy yards and naval stations see NAVY YARDS. The navy provides vessels and officers for the Commission of Fish and Fisheries and for the nautical schools of Massachusetts and New York. It also maintains naval attaches at the United States embassies and legations at London, Paris, Saint Petersburg, Berlin, Rome, Vienna, Tokio and Peking. Jointly with the Treasury Department it manages the lighthouses and provides officers for their inspection.

Personnel.—Officers are commissioned or warranted. Commissioned officers belong either to the *line* or to the *staff*. The grades of line officers are admiral, rear admirals, captains, commanders, lieutenant-commanders, lieutenants, junior grade, ensigns and midshipmen. The staff officers include the Medical Corps, consisting of medical directors, medical inspectors, surgeons, passed assistant surgeons and assistant surgeons; the Pay Corps of pay directors, pay inspectors, paymasters, passed assistant paymasters and assistant paymasters. There are chaplains of various grades, professors of mathematics, naval constructors, civil engineers and the admiral's secretary. All line officers, excepting those appointed from the warrant officers, are graduated from the United States Naval Academy (q.v.). Promotion up to rear-admiral is by seniority only—subject to physical and professional examination at each step. The office of admiral is personal and expires with the individual holder. The staff officers are promoted by seniority in their several corps. The warrant officers include boatswains, gunners and carpenters, in each of which corps there are two grades, chief seamen, warrant machinists, pharmacists and mates. The great majority are appointed from the enlisted force. Chief warrant officers rank with but after ensigns. Promotion in the warrant grades is by seniority.

Enlisted Men.—Only citizens of the United States can be enlisted. The recruit must be able to write and speak English, have no physical disabilities, nor be a deserter or a minor under 14 years of age. The age limits vary with the rating—thus on first enlistment, a landsman must be between 18 and 25, unless he has a mechanical trade, when he can enlist up to 35, which is for all ratings the maximum. The enlistment term is two years—no enlistments for special service are allowed. Re-enlistment requires proof of creditable discharge. Enlisted men are classified into chief petty officers, petty officers of the first, second and third classes and seamen of the first, second and third classes. They are again classified into the seaman branch, artificer branch, special branch and male policy and strategy branches which includes such petty officers as boatswain's mates, gun captains and the like, and ordinary seamen, landsmen, together with the three classes of naval apprentices. The artificer branch includes all the machinists, carpenters, firemen and coal passers, the special branch, the stewards, hospital attendants and musicians, and the messmen branch, the cooks, stewards and mess attendants. Petty officers are appointed by captains of ships from the enlisted force of the branch to which they are required for rating as ordinary seaman and four years for seaman. Gun pointers are selected for merit and any one is eligible who shows the necessary natural aptitude. Those who become expert receive as high as $10 per month in addition to their regular pay.

Apprentices are enlisted between the ages of 16 and 17 with the consent of parents or guardians and must engage to serve until 21. They are instructed in the rudiments at the training station at Newport, R. I., and at San Francisco, Cal., for six months and then go to the training ships for a year's cruise at sea, after which they are promoted from the third class to the second and assigned to the fleet. One year later they are rated in the first class and are eligible for petty office. Their instruction is continued during their apprenticeship and they have other special privileges.

Retirement of officers is compulsory at age of 62, also for disability and under certain conditions under Act of 3 May 1899. It is voluntary after 40 years' service and above the grade of lieutenant-commander. Retired officers (according to the law under which they retire) receive either three-fourths or one-half the sea pay of their grade on the active list or one-half their leave pay. Enlisted men can retire after 30 years' service and attaining age 50 unless physically disqualified for duty. They receive three-fourths of the pay in the rating they held when retired.

The Naval Home at Philadelphia (formerly called the Naval Asylum), built in 1832, provides a retreat for old officers and sailors.

The faculty is mainly composed of graduate naval officers. The new buildings of the Academy recently completed represent an aggregate expenditure of nearly $12,000,000 and form the most magnificent educational structures in the world. The personnel of the United States Navy, in 1883 is established at Newport, R. I. It is not a school, but a place for discussion of naval problems by officers of all grades, forming committees in attendance usually during the summer months. It specially considers matters of strategy, planning of campaigns, etc.

Naval Policy.—It is the policy of the United States, not to have the largest navy, but one which shall be fully adequate for the maintenance of our flag and for the protection of our coast. This is in keeping with the highest attainable efficiency. At the present time our naval armament is somewhat below the minimum for the work demanded of it. A battleship requires about 40 months to build and it takes electricians, carpenters, firemen and coal passers, the special branch, the stewards, hospital attendants and
UNITED STATES—NAVY, CHRONOLOGICAL HISTORY (57)

which is essential to the modern war vessel. The training facilities of the country and the means for obtaining the enlisted force are inadequately maintained. Improper diet and irksome exercises make it easy for the squadrons to draw men at once in case of need. A naval militia (q.v.) co-ordinated with the regular service is also of great value, especially for harbor and coast defense. Several States have established such militia, but its development has been greatly retarded by lack of proper national encouragement and support. The distribution of our naval force in time of peace is in two fleets and four separate squadrons. The North Atlantic fleet includes the east coast of the United States and West Indies, and is divided into the Battleship, the Caribbean and the Coast squadrons. The Asiatic fleet covers the east Asiatic coast and the Philippines and is divided into the Northern and Southern squadrons; the European squadron, the South Atlantic squadron which cruises on the east coast of South America, the Pacific squadron, which ranges over the whole west coast of the United States and adjacent islands, and the Training squadron. See also NAVAL ARCHITECTURE; NAVY, HISTORY OF; NAVAL SERVICE, THE.

Bibliography.—For histories of the navy consult Cooper's (1839); Maclay's (1895–99); Scarr's (1902) also ALBRIGHT'S History of the U. S. Marine Corps. A great deal of information will also be found in Hammersley's Naval Encyclopedia (1881) and subsequent editions. Niles' Register and American State Papers may also be consulted. Full official records of the United States and Confederate Navies during the War of the Revolution contain all the reports and like matter, and are published by the Navy Department. Consult also files of the Army and Navy Journal 1863 to date. For current progress, the yearly reports of the Secretary of the Navy and of the bureaus— the publications of the Office of Naval Intelligence and of the United States Naval Institute are indispensable. Consult also The United States Navy Year Book (annual, Washington, D. C.) For the Naval Academy, consult the history of that institution by Park Benjamin, and the yearly Registers obtainable from the superintendents of the various stations for entrance course, etc. For government and organization consult Regulations for the Government of the Navy (current issue), and for personnel and stations, the current Navy Register. For construction of ships consult Proceedings of the Institute of Naval Architects and Marine Engineers.

JOHN B. MCDONNELL,
EDITORIAL STAFF OF THE AMERICANA.

57. NAVY OF THE UNITED STATES, CHRONOLOGICAL HISTORY of. The following condensed history of the United States navy embodies all the essential details of every noteworthy sea fight in which this country has been engaged from 1775 to 1919. Leading incidents of legislative and popular interest are also included. The sources of information are from the most authentic official and historical sources.

1775. June 12—First sea fight of the Revolution off Machias, Me. Two small coasting vessels manned by 30 men (armed with shingles and pitchforks) under command of Jeremiah O'Brien, captured, after a severe battle, the English war cutter Margarita, Lieutenant Moor, Americans, 1 killed, 6 wounded; English, 5 killed, 9 wounded.

1775. July 12—Two American trading vessels (armed for the emergency) attacked and captured off Pundy, Elswick, under command of Henry Cushing, English, 16 killed and 12 wounded.

1775. Oct. 13—First official step toward the establishment of United States navy, signed by John Adams and John Langdon ("Fathers of Our Navy") being appointed a committee by Congress to fit out two warships to cruise against the British.

1776. Jan. 15—Seventeen volunteers put out of Newburyport, Mass., under command of Capt. John Coffin (Boardman) and by clever stratagem captured an armed ship laden with provisions consigned to the British army at Boston.

1776. Jan. —First flag ever unfurled abroad an American warship was hoisted by 1st Lieut. John Adams on board the flagship Alfred, at Philadelphia. It was the grand union "flag, having 13 American stripes with the English union jack in the field.

1776. Feb. 17—First regularly organized naval expedition of the United States put to sea under the orders of Capt. Jacob Hopkins. Its object was to capture the island of New Providence, in the Bahamas, where there were large quantities of military stores. The fleet consisted of the 24-gun ship Alfred, 20-gun ship Columbus, 14-gun brigs Andrew Doris and Caleb, 12-gun brig Providence, 10-gun sloop Horatio and 8-gun schooner Scipio and Fly.

1776. March 3—American sailors and marines from Hopkins' fleet landed at New Providence, captured the two forts, made prisoner of Governor Brown, held the place two weeks, and on 17 March, sailed with the military stores.

1776. April 6—While entering Long Island Sound, Hopkins' fleet was attacked by the French frigate Glasgow, which was driven off only after a spirited action of several hours. The next day the fleet arrived at New London.

1776. April 17—American cruiser Lexington, Capt. John Barry, captured English cruiser Union the same day. Americans, 2 killed, 2 wounded; English loss much greater.

1776. June 17—Cruiser Union, Capt. Richard Harding, after an all day fight, captured two English transports, having on board about 300 soldiers of the British 71st Regiment, their major (Menzies) was among the killed.

1776. July 4—On this day England had on the North American coast 78 warships, mounting 2,078 guns. The American navy at the same time consisted of 23 warships, 422 guns. Of these ships only six were built for war purposes.

1776. Sept. 1—Capt. John Paul Jones, in command of the 12-gun cruiser Providence, escaped from 28-gun English frigate Sobraon, by an extraordinary manœuvre.

1776. Oct. 11—First battle on the Chesapeake. The American fortié, of 15 vessels, carrying 88 guns and 700 men, under command of Gen. Lord Dunmore, made a stubborn fight against the English fortié of 25 vessels, 89 guns and 1,000 men, under Captain Pringle. The American fleet was composed entirely of private vessels, manned voluntarily by soldiers, while the English craft were manned by men from the royal navy. Although the Americans were defeated they inflicted irreparable loss and delay on the enemy.

1776. Nov. 13—American 24-gun ship Alfred, Capt. Hoyvedt Hackett, captured English transport Millthorpe and with valuable supplies for General Burgoyne's army then at Montreal. Among the stores were 10,000 suits of uniform.

1776. Dec. 31—During the year 1776 the Americans captured 342 English vessels. An English account says that the damage to the West India trade alone was nearly £2,000,000.

1777. May 7—American cruiser Surprise, Capt. Gustavus Conyngham, in the English Channel, captured British packet Prince of Orange. So unexpected was the presence of Yankee warships in this part of the world that Captain Conyngham had to double his cabin, where he interrupted the latter's breakfast, before the presence of an enemy was discovered.

1777. May —About the middle of May the 32-gun frigate Hancock captured the English 28-gun frigate Pox, American casualties, 8 killed and wounded; the English, 32.

1777. June 1—American frigate Hancock captured by English squadron off Halifax.

1777. June 14—Design of present American flag adopted: the 13 stripes representing the original 13 States and a star for each State in the Union.
1777. Aug. — In this month the first submarine boat ever invented made an attack on the British frigate *Gloria*, which had it not been for imperfect mechanism, the boat being more than half hydrostatically despatched. The her crew were killed.

1778. Sept. 3 — On the night of this day the 32-gun frigate *Resolution*, Capt. Thomas Thompson, stole into a fleet of English merchantmen and attacked the convoying war ship of the British fleet, and was reduced to a sinking condition before Americans were driven off by superior force.

1782. Sept. 27 — Our 32-gun frigate *Ralph*, after a chase of 15 days, captured a British 12-gun privateer, without a gun or man on board.

1783. Feb. 9 — First successful voyage of a warship across the Atlantic Ocean with a line of battle.

1784. March 27 — On the close of the Revolution the navy was disbanded and it was not until this day that Congress took steps to create a new navy. By this act six frigates and several cutters were authorized to form the famous group to which the Constitution, etc., belonged.

1788. April 30 — Secretary of the navy added to the Presi- dent's Office and Thomas Jefferson, of Virginia, was appointed Secretary.

1798. July 24 — Congress declared naval war upon France because of the persistent depredations on our commerce by French cruisers and privateers.

1800. Jan. 1 — At the beginning of the year 1778 the British had on the North American station 89 warships with 417 guns, while the Americans had 14 vessels with 332 guns.

1801. April 24 — Action between the *Ranger*, Capt. Captain Jones, and the *Drake*, Captain Burdon, in the Irish Sea. The Americans captured the *Drake* after an action of one hour. Casualties: Americans 8; English 42.

1802. Sept. 27 — Our 32-gun frigate *Ralph*, after a chase of 15 days, captured a British 12-gun privateer, without a gun or man on board.

1803. Feb. 1 — First one of our warships in the United States navy occurred in the 32-gun frigate *Alliance* at sea, while under a French commander, Capt. Richard Dale, and was sent to make war on the states of Barbary.

1804. Jan. 1 — The Barhaw of Tripoli declared war against the United States because we did not pay our "tribute" promptly. About the same time other poten- tates of the State of Tripoli began hostile measures against the United States.

1805. July 1 — A considerable squadron of American warships crossed the Atlantic and arrived at Gibraltar. It consisted of the frigates *President*, *Philadelpia* and *Essex*, under the command of Capt. Richard Dale, and was sent to make war on the states of Barbary.

1806. Aug. 1 — Our 12-gun schooner *Enterprise*, Lieut. Andrew Sterrett, in a three-hour fight with the French war polacre *Tripoli*, captured her. There were no American casualties, but the Tripolitans had 50 killed or wounded.

1807. June 22 — American squadron under the command of Capt. John Rodgers, attacked a large Tripolitan war ship and nine gunboats off the harbor of Tripoli. The gunboats were driven into the harbor; the warship was destroyed.

1808. Oct. 31 — While chasing a Tripolitan craft, the 36-gun frigate *Philadelphia*, Capt. James Stewart, was engaged with a Tripolitan frigate, the *Hannah*. A French warship joined the fight, and the *Hannah* was destroyed.

1809. Feb. 16 — Lieut. Stephen Decatur with 74 volunteers manned the ketch *Enterprise* and, under cover of night, ran aground off the harbor of Tripoli. The following day he was compelled to surrender.

1810. July 27 — Our 39-gun ship *Constitution*, Capt. James Nicholson, off Caddy Island, was captured by the British frigate *Euridice*, which the Tripolitans had captured the previous month.

1811. Aug. 3 — Americans began that series of bombard- ments on Tripoli which resulted in the capture of the place.

1812. Sept. 4 — Richard Somers with 11 volunteers manned the ketch *Sardine* (which had been fitted as a floating mine to be exploded among the Tripolitan ships) and, under cover of night, carried her into the harbor of Tripoli. The ketch was exploded and every one of the Americans was killed.

1813. June 3 — Treaty of peace signed with Tripoli.

1816. July 21 — Our 16-gun ship *Chesapeake*, Capt. James Barron, attacked off the Virginian coast by the 50-gun English ship *Leopard* and was compelled to surrender. Three of the American crew were taken aboard the English ship. This outrage hastened the War of 1812.

1819. May 15 — American schooner *Sheridan* armed as a privateer, Capt. William Dunham, was captured by the British.

UNITED STATES—NAVY, CHRONOLOGICAL HISTORY (57)

...the English 16-gun sloop of war, Alert. Only 3 of the enemy were wounded. No American casualties.

1815. Feb. 13 — Action off the coast of Portugal, the 44-gun frigate Constitution. Capt. Isaac Hull, captured the English 38-gun frigate Java, under Capt. James Codrington. The battle lasted only 40 minutes, the Americans having 14 killed or wounded and the enemy 78.

1815. Feb. 14 — A British squadron of 51 in the Constitution. Our casualties were 14 killed or wounded; the English, 7.

1815. March 23 — The 18-gun sloop of war Hornet, Capt. Captain Biddle, after a spirited action off Tristan, d'Acunha, captured the English sloop of war, The James Duncan Elliott.

1815. June 17 — Before the war with England had been concluded the United States had declared war on Algiers as the result of outrage on American merchantmen. A squadron under Capt. Decatur appeared in the Mediterranean and on 17 June captured the Algerian flagship Mus.Buttons.

1821. From this year to the close of 1825 our naval forces were actively engaged in protecting trade on the West Indies and in trade on the African coast.

1832. Feb. 7 — For making a murderous attack on American merchantmen, the 44-gun frigate Powhatan landed a large force of men in Sumatra and attacked the town of Qualla Battuto, killing a large number of the natives and destroying their forts.

1838. Dec. 20 — Qualla Battuto again bombarded, for repetition of outrages; history by the corvette Adams, Capt. George C. Reid.

1846. July 2 — Force of 250 men from American squadron under Capt. John Drake Stot, landed at Monterey, Cal., and occupied the place in the name of the United States.

1846. Oct. 26 — Naval force under command of Capt. Matthew Calbraith Perry captured after a severe fight, Mexican city of Tuxesos.

1847. Nov. 20 — Boat containing 7 Americans, under command of Lieutenant Parker, entered harbor of Vera Cruz at night, boarding the enemy's bark Crese (laden with munitions of war), burned her under the guns of the fort.

1847. Jan. 8 — Capt. Robert F. Stockton led a force of about 700 American sailors on a long march inland and defeated a Mexican army at San Gabriel, Cal. The battle was resumed on the following day at Mesa and again the enemy was routed. On the 15th our sailors marched into Los Angeles in triumph; having actually conquered the lowlands of California.

1847. March 10 — Steam cruiser Spiffie ran into the harbor of Vera Cruz and, single-handed, engaged the Mexican batteries.

1847. March 23 — Commander Tattnall with seven small gunboats boldly ran within chosen position, and his expedition best fort at Vera Cruz and delivered a terrific fire for an hour. So unexpected was the attack that the Mexicans were scarcely able to reply.

1847. March 24-25 — The navy and army maintained the furious attack on Vera Cruz until the garrison was in the surrender of that place.

1847. June 14 — Strong naval force under Capt. M. C. Perry captured Tuxpan after severe fighting. At one time our sailors landed and carried the Mexican earthworks by storm.

1847. July 30 — Captain Bigelow with 240 sailors marched against the town of Tamaulip and captured it after suffering a loss of 2 killed and 5 wounded.

1847. Oct. 1 — A force of 80 sailors under Lieutenant Graven landed at Muli, Lower California, and captured a superior number of Mexicans, driving them several miles inland.

1847. Nov. 10 — Captain Shubrick landed 600 men from his squadron and captured the city of Magdalena, Mexico.

1847. Nov. 17 — A force of sailors under Commander Selfridge captured the city of Guayedas, Lower California, after severe fighting.

1848. Jan. 30 — Lieutenant Ward, with 200 men, landed in the Tampico, and captured it after suffering a loss of 2 killed and 5 wounded.

1848. Feb. 6 — Lieut. Charles Heywood of the Marines made an attack on the Mexican town of Lower California. Attack was renewed the next day and the enemy defeated with a loss of 15 killed or wounded.

1848. July 14 — Constant spirited fighting lasted several days at Yolehian, Japan, and formally delivered the message of friendship from the President of the United States to the emperor. It resulted in the opening of Japan to foreign commerce.
1854. Feb. 12 — Perry appeared off Tokyo with an impressing fleet of warships to give the samurai a fright. The latter was finally driven off. Owing to the protection afforded by the armament none was killed and only a few wounded.

1856. Feb. 12 — Naval forces under Captain Poole captured the city of New Bern after a desperate fight in which the battery was killed 11 wounded, while our land forces suffered much more. The enemy's loss was even heavier.

1856. March 9 — The famous battle between the Monitor and the Merrimac fought, in which the latter was finally driven off. Owing to the protection afforded by her armor none was killed and only a few wounded.

1856. March 9 — Naval forces under Captain Poole captured the city of New Bern after a desperate fight in which the battery had 11 killed or wounded, while our land forces suffered much more. The enemy's loss was even heavier.

1856. March 9 — Captain McCalla destroyed all United States stores at Norfolk, Va., to prevent their falling into the hands of the Confederates.

1856. Sept. 10 — Two gunboats commanded by Lieut. Roger N. Stembergh opened fire on a Confederate battery on the banks of the Yazoo, and routed it.

1856. Oct. 1 — The improved Union gunboat Passaw occupied a position on the Roanoke River and, after a hot fight, captured the Confederate steamer in a daring manner by a party of Confederates under Capt. Wm. F. Lynch.

1856. Oct. 15 — Captain Walker, with a small squadron attached the ironclad Arkansas in the Yazoo River. A running fight followed, the Arkansas blowing down the Yazoo into the Mississippi and past the great Union fleet and took refuge under the Vicksburg batteries. That night the batteries fired a few shots and so injured her that she was of little service. The Unionists lost 68 killed or wounded, while that of the ram was 25.

1856. Dec. 31 — On the night of this famous Monitor destroyed sea ship while Harter's Sloop,破坏了敌人的船只。}

1857. Jan. 1 — Before daylight two Confederate cottonclad' steamer captured a transatlantic steamboat off Galveston, took one vessel, destroyed another and dispersed the force with heavy loss.

1857. Jan. 11 — Rear-Admiral Porter, with a strong force of gunboats, captured Arkansas Post, on the Arkansas River, with a loss of 31 killed or wounded; Confederate losses being heavier.

1857. Jan. 11 — On this day the famous Confederate cruiser Alabama sank the National cruiser Hatteras off Galveston, after a short fight, the Confederates rescuing the survivors.

1860. Feb. 14 — The Confederates captured the Confederate warship Queen of the West, which had run aground in the Red River.

1860. Feb. 24 — Refitting the Queen of the West, the Confederates captured the new ironclad Indiana after a hot fight in the Mississippi River.

1860. Feb. 26 — Commander Worden in the monitor Monitor, at long range, destroyed the Confederate blockade runner Nassau.

1860. March 11 — Union gunboats began attack on Port Pemberton on the Tullahatchie River, but were finally repulsed on the 18th with a heavy loss in killed and wounded.

1860. March 14 — Parris passed Fort Hudson, on the Mississippi, one of his ships, the Mississippi (which was Lient. C. N. Linnett) by fire. The Unionists had nearly 100 killed or wounded.

1860. April 16 — Rear-Admiral Porter ran his fleet past Vicksburg with little loss.

1860. April 29 — Union gunboats made an unsuccessful
attack on Grand Gulf, Mississippi River, in which they had 18 killed or wounded.

1833. June 17.—Monitor Weehawken, Capt. John Rodgers, captured the Confederate ironclad Alligator, Lieut. manufactured and armed a决定 to make a determined naval action on the defenses of Charleston in conjunction with our troops, but after a severe action was compelled to retire.

1837. July 15.—While in Shimonoseki Straits, Japan, our warships were attacked by the Japanese, Capt. C. C. McDougall returned the fire, sank some of their ships and silenced their batteries. The Americans had six killed and four wounded. The Japs suffered heavily.

1883. July 18.—A combined land and naval attack was made on Fort Wagner, Charleston, but was repulsed by the Confederates.

1883. Sept. 8.—A boat party consisting of 400 men under the command of Capt. T. H. Stevens attempted to surprise Fort Sumter, Charleston, but was repulsed with a loss of 16 killed or wounded and 92 taken prisoners.

1883. Sept. 8.—An army and naval expedition against New Berne was repulsed by the Confederates, the Nationalists having about 50 killed or wounded, while the Union gunboats Clifton and Sachsen were compelled to surrender.

1884. Jan. 30.—The Confederates under Commander J. T. Woodrow fired a 36-lb. shell into the Union gunboats New Berne, N. C., and captured the Underwater, with a third Union gunboat compellled to surrender; the Confederate loss being 28 killed or wounded.

1884. April 20.—Confederate ram Albemarle attacked Union gunboats at New Berne, N. C., and captured the Underwater, with a third Union gunboat compellled to surrender; the Confederate loss being 28 killed or wounded.

1884. May 5.—The ram Albemarle attacked Union gunboats at New Berne, N. C., and captured the Underwater, with a third Union gunboat compellled to surrender; the Confederate loss being 28 killed or wounded.

1884. May 5.—The Confederates blew up the Union gunboat New Berne, N. C., killing 25, including the Captain and wounding half her personnel. Two days later they captured the New Berne, N. C.

1884. June 19.—The Ke Kas the Confederate cruiser Alabama off Cherbourg, France, after a severe action. The Nationalists had 3 killed or wounded and the enemy 20.

1884. June 24.—Confederate shore batteries opened an unexpected fire on two Union gunboats in the Mississippi near Port Hudson, but were silenced after an hour of hard fighting.

1884. Aug. 5.—Parragut made his famous dash past the forts at Mobile Bay, and on the same day captured the ironclad Tennessee, one of the most desperate fights in naval history. The monitor Tennessee was sunk while passing Fort Morgan, in 114 fathoms; Total Union casualties, 313; that of the Confederates, being 30.

1884. Oct. 23.—Commander Napoleon Collins, in the warship Wachusett, captured the Confederate cruiser Florida, with the gunboats of Bahamas, by boarding. Afterward the Florida was released, the attack being renewed.

1884. Oct. 28.—Lieut. Wm. B. Cushin, in a launch with 16 men, under cover of night, crept up the Roanoke River and destroyed the ironclad ram Albemarle by a torpedo.

1884. Nov. 9.—Two Union gunboats under Commander Shirk were destroyed in endeavoring to silence the Confederate batteries on the Tennessee River.

1884. Dec. 24.—First great naval and land attack on Fort Fisher, in which the Unionists were repulsed with a loss of 83 killed or wounded to the fleet alone, while the Confederate casualties were 25.

1885. Jan. 13.—Second naval and land attack on Fort Fisher, by which the fort was captured, our sailors and marines had 25 killed and wounded.

1885. Feb. 17.—Admiral Porter, with a strong naval force, took Fort Anderson, with a loss of seven killed or wounded.

1885. May 15.—Commander McCalla, with a force of sailors and marines, took possession of the Isthmus of Panama, to protect American interests.

1885. March 15.—The United States steamship Tuskegee, Vandalia, and Styx were wrecked by a hurricane at August萨瓜。The Vandalia was a total loss. About 50 of our officers and sailors were killed or wounded.

1885. Oct. 16.—A number of Colomans mobbed a party of sailors from the United States steamship Baltimore at Valparaiso, killing Capt. Peter McDougall. The Chilean government disowned the outrage and made ample atonement.

1886. Feb. 2.—The famous Ke Kas were captured on Rossand Reef.

1886. Feb. 15.—United States battleship Maine blown up in Havana harbor, with a loss of 260 men out of a complement of 350. This was the second greatest disaster in our navy.

1886. March 19.—Battleship Oregon sailed from San Francisco on her famous cruise.

1886. April 22.—Read Admiral Sampson began the blockade of the north coast of Cuba.

1886. April 25.—United States declared that war with Spain existed from April 21st.

1886. April 28.—Sampson bombarded the Cuban port of Matanzas, silencing the Spanish batteries and preventing the erection of additional fortifications.

1886. April 29.—Confederate ram Alabama drove a Spanish gunboat into the harbor of Cienfuegos.

1886. May 1.—Dewey destroyed a Spanish gunboat at Cienfuegos, killing 15, wounding 21 and taking 17 prisoners.

1886. May 11.—Cervera's squadron arrived off Mar-tintique.

1886. May 11.—Commander Chapman Coleman Todd entered the harbor of Cardenas with the cruiser William in, revenue cutter Egremont, and torpedo boat Window. The Window was suddenly attacked by a concealed battery and driven off in a crippled condition. The Window had five killed (including Ensign William Bagley) and two injured.

1886. May 11.—A boat party from Commander McCalla's squadron advanced on Cienfuegos, and under a terrific fire cut two submarine cables. We had eight killed or wounded.

1886. May 12.—Admiral Sampson bombarded San Juan, Puerto Rico, silencing the enemy's guns. Our loss was eight killed or wounded.

1886. June 5.—Hobson made his famous dash with the collier Maremate into the harbor of Santiago. The collier was destroyed and her entire crew made prisoners.

1886. June 6.—Sampson made the first bombardment of Santiago, the Spanish batteries being silenced. We had no casualties, but the enemy admit a loss of 34 killed wounded.

1886. June 8.—The Spaniards began their attack on our marines at Campas Pass, on the island of Guanabacoa. It was continued for several days, when a determined attack of the marines put the enemy to flight. Our loss was 28 killed or wounded; that of the enemy was greater.

1886. June 20.—Captain Olkos occupied the island of Guam.

1886. June 22.—Captain Sigsbee, in the passenger steamer Saint Paul, disabled the Spanish torpedo boat destroyer Terror. No casualties for the Americans; the enemy having 2 killed and several wounded.

1886. June 30.—Lieut. Lucas Young, with small gunboats, silenced the Spanish batteries at Manzanillo.

1886. July 2.—Commander Swain masked the Spanish fortifications at Pimentel, after a spirited action.

1886. July 2.—Cervera's formidable squadron was completely destroyed off Santiago after a spirited battle and chase lasting nearly four hours, by the American fleet under the immediate command of Admiral Sampson.

1886. July 15.—Commander Hunkler attacked the Spanish batteries at Baracoa. Only two Americans were injured.

1886. July 21.—A handsome dash was made into the port of Nipe by three gunboats under the orders of Command Admiral Sampson.

1886. July 25.—Commander Richard Wainwright, in the Gloucester, occupied the port of Santiago, being the first regular American force to land on that island in this war.

1886. July 27.—Lieutenant Merrim, with two boat crews, took possession of Ponce, Puerto Rico.

1887. Aug. 12.—Captain Goodman attacked and compelled the surrender of Manzanillo.

1887. Aug. 13.—Dewey's fleet assisted army in attack on Manzanillo, which resulted in the surrender of the place; Lieutenan Lumberly hoisting the first American colors over the city.
1900. May — Rear-Admiral Kempff, commanding the flag-ship, Kearsarge, in Chinese waters, detached a body of marines, who, until the relief force arrived, co-operated with the small force of the Allies in Peking, in defense of the foreign embassies, besieged by the Boxer revolutionists. (See Peking, The Siege in.)

1907. The American fleet around the world as a demonstration of the naval power of the United States.

EDGAR STANTON MACLAY.

58. POLITICAL PARTIES. A political party has been defined by Edmund Burke as "a body of men united, for promoting by their joint endeavors the national interest, upon some particular principle upon which they are all agreed." But this definition is not adequate for the political party of to-day. The latter is more than a group of persons temporarily united for promoting a single principle. It is a more or less durable organization of voters, having for its immediate purpose the election of public officials and the control of the government. The members of the party may be agreed on certain fundamental principles of governmental policy; but the application of these principles will vary from time to time, and they are likely to become little more than a general tendency. Particular parties are apt to be largely controlled by certain classes or sections; and their policies are likely to be affected by the interests of their membership rather than those of the country as a whole.

In America, as in Great Britain, there have usually been only two leading political parties at one time; and this has led to the opinion that men naturally tend to divide themselves into two main groups: the conservative and the progressive, or those who favor the maintenance of order and efficient government and those who support individual liberty and freedom. But these tendencies are at best vague and indefinite, and the development of political parties can only be understood by regarding that there are interwoven types of opinion, and a continual process of change from one to another.

Parties Before 1789.—During the colonial period there was no formal party organization in America; but there were political divisions corresponding roughly to the Whigs and Tories in Great Britain,—the Tories supporting the royal governors and the Whigs usually controlling the elective assemblies. Most of the Americans had been Whigs, standing for personal liberty and opposing centralized authority.

In the Revolution the Whigs became known as Patriots; while many of the business and property classes were Tories or Loyalists, supporting the British government. But after the establishment of independence the Loyalists disappeared.

A new division appeared in the Constitutional Convention of 1787, between the delegates to the large States, supporting a strong national government, and those from the small States who preferred to continue a loose confederation. The result of this division was a series of compromises in the Constitution. In the campaign for the ratification of the Constitution, the supporters were known as Federalists, and the opponents as Anti-Federalists.

Federalists and Jeffersonian Republicans. —The new Constitution of the United States contained no recognition of political parties; and after it was adopted and put in operation there were for a time no clearly marked political divisions. Washington, and other leaders, were indeed strongly opposed to parties, and the new government included both Hamilton and Jefferson at the head of the two principal departments. But differences of opinion on questions of governmental policy soon developed the two opposing parties of Federalists and Republicans. The Federalists, under the leadership of Hamilton, and supported by Washington, at first controlled the central government, and favored strengthening the national authority, a strong executive and a liberal interpretation of the Constitution. More specifically they supported Hamilton's financial and commercial policy, and distrusting the excesses of the French Revolution favored neutrality in the war between France and Great Britain. The Republicans, under the lead of Jefferson and Madison, favored a strict construction of the Constitution, a limited scope of national authority, and a strong central government. The Federalists included most of the business and property classes; but the Republicans, organizing the small farmers and city workers, before long gained control of the national government. In power the Republicans became more national in spirit. When opportunity was offered, the Louisiana Purchase was made, in spite of its violation of the rule of strict construction. Later, under the aggressive leadership of Henry Clay, it entered on the War of 1812, which the surviving Federalists opposed.

After the war the Federalist party disappeared. The ensuing "era of good feeling" soon led to a period of personal politics, culminating in the Presidential campaign of 1824, in which there were four Republican candidates. Meanwhile the system of legislative and Congressional party caucuses, which had nominating candidates for the national government, had grown into disfavor; and local and State nominating conventions had come into use.

Democrats and Whigs.—A new alignment of parties arose after the election of 1824, which continued through the second quarter of the century. One of these, under the name of Democrats, represented the more radical wing of Jeffersonian Republicans, and controlled the national government most of the time until 1860. Originating in personal loyalty to Jackson and a vague but pronounced feeling for a more democratic control of the government, which was strongest in the newer parts of the country, this party represented a strong national spirit, and in the case of Jackson there was in practice a vigorous exercise of executive leadership. But the policies of the party were affected by the traditional views in favor of strict construction, the limitation of the central government and emphasis on State's rights; and it opposed the national bank, protective tariffs and internal improvements. Later as the slavery question became more acute the State's rights doctrines of the party aligned it in opposition to attempts at national restriction of slavery.
In opposition there was organized a new National Republican party, which soon merged with the Know-Nothings led by the Whigs, under the leadership of Clay and Webster, and supported by the financial and business classes, the Whigs revived and developed some of the nationalist policies of the Federalists. They favored a national bank, protective tariffs and the construction of internal improvements. At the same time, unlike the Federalists, the Whigs opposed executive dominance and favored Congressional control of the government. The Whigs were strongest in the Northeast but had also a considerable support in the South. While they were more popular than the Federalists, they gained control of the national government only for brief intervals; and these temporary successes were secured by compromises inconsistent with the principles of their leaders. In the end the party failed as the result of an attempt to compromise on the slavery question.

During this period the machinery of party organization was more highly developed. The system of nominating conventions was firmly established, culminating in the national conventions for the nomination of Presidential candidates and the adoption of party platforms.

**Minor Parties and Factions Before 1860.**

- From time to time minor parties and factional divisions of the leading parties have appeared in American politics; and some of these have played important parts in the evolution of the party system.
- Very ephemeral and unorganized factions were the Quids (Republicans opposed to Jefferson) and the Blue-Light Federalists (opponents of the War of 1812).
- The Anti-Masonic party also had a brief duration; but by holding the first public national nominating convention (1830) marked a significant stage in the development of party institutions.
- During the dominance of the Democrats, internal divisions arose, especially in New York State, such as Locofocos, the Hunkers and the Barnburners.
- Later the Whigs were divided between "Conscience Whigs" and "Cotton Whigs" and "Suer Grays."

Of more permanent influence were the anti-slavery parties. The early Abolitionists opposed political action. But the Liberty party nominated candidates in 1840 and 1844. In the next two Presidential campaigns the Free Soil party showed an increasing opposition to the extension of slavery.

Meanwhile opposition to the political influence of Roman Catholics and recent immigrants became a factor in local elections, and, aided by the disappearance of the Whigs, led to the organization of the American party, commonly called the "Know Nothings," which carried a number of States in 1854, and polled a considerable vote for its Presidential candidate in 1856. This party was soon absorbed by the new Republican party; although the surviving conservative Whigs formed the main support of the Constitutional Union party in 1860.

**The Republicans to 1876.**

- Following the struggle over slavery in the regions acquired in the war with Mexico, which had resulted in the Compromise of 1850, the passage of the Kansas-Nebraska Act in 1854, reopening the question of slavery in those Territories, and involving the revocation of the Missouri Compromise of 1820, forced the slavery issue to the front and led to a radical party revolution.
- At the Congressional elections in 1854 a majority of Anti-Nebraska men were elected to the House of Representatives, under various party names; and these soon combined to form the new Republican party. This was composed of Free Soilers, most of the Northern Whigs, and Anti-Nebraska Democrats. While unsuccessful in 1856, it proved a strong opponent to the Democrats; and in 1860, with a divided opposition, the Republicans elected Lincoln as President.

The new party was at the same time more democratic and more strongly nationalistic than the former major parties. In opposing the extension of slavery, it asserted the power of Congress to exclude slaves from the Territories, against the opinion of the Supreme Court in the Dred Scott case. It also repudiated the Whig policies of a protective tariff and internal improvements, and added to these the enactment of a homestead law. With the secession of the Southern States, the work of first importance became the maintenance of the Union; and in this the Republicans received the support of many Democrats, although the conduct of the Civil War led to an enormous increase in the work of the national government and the executive.

After the war the Republicans continued in control of the national government through the period of reconstruction; and during this time the national authority was still further extended by the adoption of the 13th, 14th and 15th amendments to the Constitution. The Democratic party, almost silenced during the war, gradually regained control of the Southern and some Northern States; but the Republicans retained the popular support of patriotic feeling, combined with the aid of the manufacturing and capitalistic classes fostered by their economic policy, and a highly developed political organization.

**Party Oscillations 1876-96.**

- After the reconstruction of the Southern States a new period of party history began, characterized by clearly defined issues and oscillating party victories. The older issues were settled; but the Republican and Democratic party organization remained in existence. Criticism of political abuses under President Grant led to the abortive Liberal Republican movement of 1872; and in the reaction following the panic of 1873 the Democrats gained control of the House of Representatives.
- In 1876 the Republicans retained the Presidency through the findings of the Electoral Commission. The Democrats on several occasions were successful in the Congressional elections, and elected Cleveland as President in 1884 and 1889. But during the 20 years to 1896 no party controlled both the executive and legislative branches of the national government for more than two years at a time.

The most distinctive issue between the two parties was the tariff. The Republicans were definitely committed to a high protective policy, while the Democrats favored a reduction of rates and a revenue tariff. In their platforms...
the Democrats maintained their traditional attitude toward economy and the limited exercise of governmental powers. The Republicans continued the policy of internal improvements.

But new questions were arising which gained support in both parties. Opposition to the corrupting influence of the spoils system led to the passage of the Civil Service Law in 1883. Agitation for government regulation of railroads led to State legislation and to the Interstate Commerce Law of 1887. Business depression and opposition to the financial interests led to demands for more and cheaper currency, which resulted in the passage of compromise measures of 1878 and 1890, and culminated in the cry for the "free coinage" of silver. The growth of monopolies led to the passage of anti-trust laws in the States and to the Sherman Law of 1890.

The general condition of political unrest was indicated by the appearance of a new series of minor parties. Beginning in 1872, the Prohibitionists have regularly nominated Presidential candidates, favoring the prohibition of liquor traffic; but they have never polled a large vote. The Greenback party had candidates at each Presidential election from 1876 to 1884, supporting the issue of government paper currency. In 1888 there was a Union Labor party. These, two elements of rural and urban labor discontent were combined in 1890 in the Populist party, which polled more than a million votes in 1892. This party supported the "free coinage" of silver, postal savings banks, a graduated income tax; government railroads, telegraphs and telephones; and the transfer of unused land to actual settlers. Even more radical measures were advocated by the Socialist Labor party which also had candidates in 1892.

Republican Control from 1896 to 1912.—The Presidential election of 1896 brought about an important readjustment of party lines, which ushered in another period of 16 years continuous Republican control of the national government. The Democratic national convention of 1896, controlled by the radical wing, adopted a platform in favor of the "free coinage" of silver and nominated for President W. J. Bryan. This brought to their support the Populists and silver Republicans; but lost the conservative gold standard Democrats in the East. The Republicans, reaffirming their protective tariff views, now took a positive position in favor of "sound money"; and with the support of the business interests elected McKinley and controlled both houses of Congress.

As a result of the brief war with Spain, the United States acquired island possessions in both the West and East Indies and became actively involved in world politics. The Republicans supported this policy of expansion; while the Democrats opposed the militaristic and imperialistic tendencies, but without success.

The assassination of McKinley in 1901 and the succession of Roosevelt to the Presidency led to important changes in party policies. Roosevelt was an aggressive leader, who upheld the new military and international policies and increased in the traditional protective tariff policy of the party, but who, with a considerable increase of social and industrial control by the government, which was opposed by the conservative business elements. At the election of 1904 the Democrats nominated a conservative candidate; but Roosevelt received a large support from the more radical Democrats and was triumphantly re-elected, having his second term important laws were passed for the regulation of railroad rates, the government inspection of foods and some supervision of large industrial corporations. Largely through the influence of Roosevelt, the Republicans in 1908 nominated and elected as his successor W. H. Taft, over Bryan, who had been nominated by the Democrats for the third time. President Taft proved much more moderate than Roosevelt; and during his administration the Republicans became badly divided. A revision of the tariff was enacted; but this was not satisfactory to the more progressive Republicans. This dissatisfaction, with the growing demand for other political, social and industrial reforms, was reflected in the defeat of the Republicans by the Democrats at the Congressional elections of 1910. Another sign was the increasing vote of the Democratic party which had entered the political field in 1900.

The Progressives and the Wilson Democracy.—In 1912 came another crisis in party history, resulting in a change in party control of the national government. For many years the traditional policies of the two leading parties had been of little significance; and each of these parties had a conservative and a progressive or radical wing. Progressive Democrats and Republicans had carried through important economic and social reforms in many States—in taxation, control of business, the direct primary and the initiative and referendum—and some of the new leaders were in Congress. The national nominating conventions of both major parties in 1912 saw a prolonged struggle for control. In the Republican convention, the conservatives supported the renomination of President Taft, and by their control of the party machinery won a formal victory. But most of the progressive Republicans who had favored another nomination for Roosevelt claimed that he had been defeated by fraud, and took the lead in organizing a new Progressive party and running Wilson on a platform supporting radical reforms in the interest of greater political and social democracy, and a more active national government. In the Democratic convention, under the leadership of Bryan, the progressive element nominated for President Governor Wilson of New Jersey, on a less radical platform than that of the Progressives. Wilson received the support of some progressive Republicans and many moderate independents, and was elected, carrying most of the States and electoral votes, although with less than a majority of the popular vote. Roosevelt received a larger vote than Taft.

The first term of President Wilson was marked by the passage of many important laws, revising the tariff downward, reorganizing the banking system, controlling industrial monopolies, as well as some social welfare legislation. Under recent precedent, the Constitution a national income tax had been established, United States senators are now
the liquor traffic has been adopted. A woman suffrage amendment has been passed. On the outbreak of the Great War Wilson adopted a policy of neutrality, which he maintained through his first term, and in 1916 again led his party to victory.

The entrance of the United States into the war against Germany, in 1917, led to another enormous increase in the work and influence of the national government. The peace treaty and the League of Nations involve a more active participation by the United States in world politics. In assuming these responsibilities the Wilson democracy is departing further from the traditions of the older Democratic party. What the result will be in the future history of political parties in the United States remains to be seen.

Professor of Political Science, University of Illinois.

59. FOREIGN POLICY. The diplomacy, negotiations and treaties of the United States since the beginning of the national government in 1775 are connected with more than 50 foreign governments, cover a period of over 140 years and apply to a great number of subjects. To analyze the national policy either by topics or by the governments concerned would require a volume. On the other hand, an historical survey of the successive epochs and episodes of American diplomacy may be brought into moderate space, because the main lines of policy have been simple and easy to trace.

Diplomatic Procedure.—From 1775 to 1789 Congress, as the mainspring of government, was the source of all diplomatic authority, the framers of instructions and the maker of treaties. During the Revolution, Congress commissioned foreign ministers to most of the Continental great powers and they were formally received by France and Holland. After the peace, Prussia, Sweden and Great Britain entered into diplomatic relations; and in course of time all the other European states sent ministers.

Under the Federal Constitution, the power to appoint ministers and ratify treaties was placed in the hands of the President with the advice and consent of the Senate; and the commissions, correspondence and instructions all proceeded from the President or the Secretary of State, who was practically subject to his directions. From 1797 on the quarter of successive Presidents came into office with large diplomatic experience. Almost all the envoys also were men of public responsibility, trained for their duties.

Since Jackson's time, both Presidents and Secretaries of State have frequently been men of small experience outside the boundaries of their own country, and sometimes of little previous public service at home. Presidents Polk, Lincoln, Grant, Cleveland, McKinley and Wilson had no previous knowledge of courts, and with one or two exceptions had hardly been out of their own country. Such secretaries as Van Buren, Webster, Buchanan, Blaine and Hay were trained statesmen; others came from office little known even to their own countrymen.

Most appointments to foreign missions were made from a class of well-to-do gentlemen who were novices in politics, or from literary men, such as Washington Irving, James Russell Lowell and John Hay. The policy of each successive administration was to carry on its relations with other countries through men of natural force of character and capacity for little of diplomatic usages. Nevertheless the diplomacy of the United States has always had the advantages of directness, vigor and freedom from the complications and intrigues of European diplomacy.

Independence and Territory (1775-89).—The first diplomatic object of the Continental Congress was to make friends abroad, who would aid the infant United States against Great Britain. The treaties with France in 1778 were contrary to all the previous traditions of the colonies and brought about the only military alliance between the United States and any foreign power, before 1797.

The practical effect was to incline England to agree to the favorable terms of peace negotiated in Paris in 1782. With great skill and pertinacity, the American envoys secured an agreement that independence should be admitted before any other conditions were made—not as a gift or a makeweight but as a recognition of a political and international fact.

Another success was the adjustment of boundaries. Our envoy obtained from Great Britain an acknowledgment of territory which doubled the area of the 13 former colonies and prepared the way for an empire in the West. Canada, for which the United States at one time hoped, was not included; but in the Northwest and Southwest, Great Britain withdrew all claims and the Mississippi became the boundary.

Early Expansion (1803-19).—The bounds of the treaty of 1828 excluded the United States from the natural soil of the Great Lakes; but the Erie Canal and the trunk railroad lines later made good that defect. The United States was also left with no frontage on the Gulf of Mexico. That made it an essential American policy to secure the strip of Spanish territory which shut them off from tide-water on the south. A lucky chance, of which President Jefferson skilfully took advantage, made it possible to annex the lower Mississippi in 1803, and with it the whole western part of Louisiana extending far into the Rocky Mountains. This gave a narrow approach to the
Gulf, which was broadened by the forcible occupation of West Florida (1810-13), and by the annexation of East Florida in 1819. On the northwest, the discovery of the Columbia River (1792), the exploration of Lewis and Clark (1806) and the founding of the post of Astoria (1811) laid the foundations for an extension of territory to the Pacific.

Neutral Trade (1789-1815).— The United States was the first American state; it set up a new force in the world and opened a new kind of international relations. When, in 1793, revolution and war came upon Europe and lasted with little interruption for 22 years, there was great danger that the United States would be swept from its moorings and drawn into the influence of one or the other of the two warring groups, of which Great Britain and France were the leaders.

In view of this danger, Washington, John Adams, Jefferson and other statesmen advised a "Policy of Isolation," on the ground that the United States was not primarily interested in European controversies and wars and, therefore, should remain neutral. After reaching the verge of war with Great Britain in 1794 on questions of neutral trade and impressment, and actually engaging in naval war with France in 1798, the country settled down to a policy of keeping out of hostilities and enjoying trade with both groups of powers in Europe.

This was always difficult because of the determination of both sides to seize American ships and cargoes on novel and often illegal applications of the international law of contraband, blockade, free ships and colonial trade ("Rule of 1756"). Some of these difficulties were covered by the Jay Treaty of 1794, which was allowed to expire in 1807. The Barbary wars somewhat diverted public attention for a few years (1801-05); but the breaking out of a new European war in 1803 led to fresh captures of American vessels and to renewed impressment of American seamen by the British.

The disregard to neutral rights reached its height in the attempt of Napoleon to found a "Continental System" to the British, which perhaps suggested similar acts of the British and German governments in the European War of 1814. The American diplomatic protests of the Americans were disregarded: and since the United States had no military or naval force able to protect its commerce, there was nothing for it but Jefferson's policy of commercial restrictions. This took various forms such as non-intercourse, non-importation and non-exportation, which last was carried out by the Embargo Act of 1807.

This method, which was substantially a boycott, came near success; but in the end it was ignored by both the belligerents. The interference with neutral trade, combined with impressments and some minor grievances, eventually led to the War of 1812, in which the American cruisers and privateers captured 1,800 British ships. The territorial motive also came in; the United States confidently expected to conquer Canada; but no territory was added and several areas of the United States fell for the time into the hands of the enemy.

However, the naval prowess of the American ships of war and privateers made such an impression on the British mind that a favorable peace was obtained at Ghent in 1814. No agreement was reached either on neutral trade or impressments; but the European strife was ended and both those questions were shelved. In course of time the United States secured considerable money payments from France and other European powers for illegal captures during the Napoleonic wars.

Latin-American Policy (1815-26).— During the period just discussed, a new group of nations was gaining recognition in the Spanish-American Empire. The LaPlata colony made itself practically independent in 1807 and there were risings elsewhere. Soon after the restoration of the Bourbon monarchy to Spain (1814) the flame of rebellion ran through the whole Spanish continental area, except the islands of Cuba and Porto Rico. By 1821 independent governments were set up in Chile, Peru, what is now Colombia, Central America and Mexico, besides the empire of Brazil, previously a Portuguese colony.

The natural policy of the United States toward these new neighbors was one of sympathy with rising republics, and friendship with powers which opened new fields of commerce. The Monroe approach to these new planets in the political solar system disturbed Europe, which after Napoleon's fall was organized in the so-called Holy Alliance. That combination of powers put down a revolution in Spain and seemed to be the back bone of preventing a French expedition to overcome the new American states, when (December 1823) President Monroe made public his famous Doctrine.

The Monroe Doctrine was a protest against any action by European powers which would extend their "Political System" to the new world. This utterance was founded on a new principle, the converse of the Policy of Isolation. Monroe held that the eastern and western hemispheres were politically separated: the United States did not meddle in European affairs, and European powers must not meddle in American affairs. Still deeper lay the belief that European interference anywhere in South America might create centres of influence which would in the long run be dangerous to the United States.

The proposed joint action of Europe in America was at once given up; but the interest of the United States in Latin America for nearly a hundred years has been one of the most significant factors in our foreign policy. An effort was made in the Panama Congress (1826) to bring the American nations together; but it was a part of the policy of the United States not to commit itself to the leadership or defense of the neighboring powers.

Western Expansion (1819-60).— The Monroe Doctrine was not meant to be a self-denying principle which would prevent annexation. Immediately after the War of 1812 the United States began to push with all its might toward the Southwest and Far West. In the treaty of 1819 for the cession of East Florida, Secretary John Quincy Adams secured from Spain a withdrawal of all claims on Pacific Coast territory north of the 42d parallel. As a counterweight he consented to the line of the Sabine River as our southwestern boundary. A movement of Americans into the Mexican province of Texas at once began, which in
1835 made that region an independent country, which at once sought admission into the United States.

So left the government face to face with Great Britain as the only other claimant to the immense Oregon country. A long-standing controversy with the British government over the Maine boundary was settled by a reasonable compromise in 1842. The Oregon question threatened to flare up again, and much discussion it was settled in 1846 by running the compromise line of the 49th parallel from the Rocky Mountains to the Gulf of Georgia, and thence through the straits of San Juan De Fuca to the Pacific Ocean.

This settlement of the Oregon question brought into sharper relief the future of California, toward which President Polk bent his energies. In 1845 Texas was annexed as a State of the Union. In 1846 the United States declared war on Mexico and conquered, and occupied both California and New Mexico, which was the land bridge across the continent. Vain attempts were made by President Pierce and President Buchanan from 1854 to 1859 to conclude a treaty altering the boundary and more of Mexico. The only action taken was the treaty of 1846 with New Granada and the Clayton-Bulwer Treaty with Great Britain in 1850, by which the United States assumed a special interest and responsibility for a future Isthmian Canal.

Civil War Diplomacy (1861–72).—During the Civil War the prime policy of the United States was to insist that the Southern Confederacy could never achieve independence, and that, therefore, any recognition of independence or any military or naval aid would be an affront to the United States. The old question of neutral trade came up in a new guise, when the United States blockaded most of the Confederate coast and freely captured cargoes of contraband. This involved a novel doctrine of continuous voyages, to the effect that cargoes and even vessels bound for Europe to a British or Spanish port, the moment to be shipped to the Confederacy, could be captured in either stage of that transportation. Great Britain raised no objection to this doctrine. The United States violently protested against the fitting out of ships-of-war in neutral ports, especially the cruiser Alabama, which was built in an English shipyard.

After the war was over, the Alabama claims for damages caused by such cruisers almost led to a breach with England. It was finally healed by the Treaty of Washington of 1871, in which Great Britain agreed to a set of rules which were practically a disavowal of the acts complained of. On this understanding the two countries went into the nominal arbitration of Geneva in 1872; and the arbitral commission found Great Britain liable to the amount of $15,500,000.

The Canal and Immigration (1861–81).—Before the war ended, the United States, under the This, was laying the foundations of a new and positive policy in Central America and the West Indies. In 1854 a treaty was negotiated with Honduras, giving special canal rights to the United States. In 1857 Seward took advantage of the proposition by Russia to cede Alaska for a moderate payment. He turned his attention also to the Caribbean region, negotiated an unsuccessful treaty for the Danish Islands and another for Santo Domingo, but when the project was renewed and strongly urged by President Grant, who could not induce the Senate to approve it. The Cuban Revolution, from 1868 to 1878, deeply interested the United States; and toward the end a proposition was made to European powers to unite in stopping the war and relieving Cuba.

Meanwhile the introduction of general military service into Germany raised new international questions about the status of immigrants. Congress took the broad ground (1868) that "The right of expatriation is a natural and inherent right of all people," thus asserting that all foreigners had a presumptive right to come to the United States and acquire citizenship. Nevertheless the same year a treaty was made with Germany, admitting that under some circumstances a naturalized citizen might lose that status.

The question of the right of immigration was raised in a different way by the increase of Chinese immigration after 1868. Congress passed several bills denying the privilege to Chinese, and popular feeling pushed through statutes prohibiting the immigration of any Chinese laborers. See Chinese Immigration.

The Latin-American question entered on a new phase when in 1879 a French company prepared to construct a canal across the Isthmus of Panama. In spite of protests by President Hayes, who declared that any such canal must be "a part of the coastline of the United States," Congress and the people could not be aroused. In 1881 Secretary Blaine tried hard to get rid of the Clayton-Bulwer Treaty, so as to give the United States a free hand in dealing with the canal question; and he also made great efforts to put an end to the wars between the South American states and to bring all the American nations together in harmony and perhaps in some form of union.

Expansion Policy (1895–1904).—For nearly 15 years after 1881 no serious diplomatic crisis arose and no new policies were adopted, except a series of Pan-American issues, beginning in 1890. In 1895 a dispute between Great Britain and Venezuela as to the proper boundaries of British Guiana suddenly drew from President Cleveland a new statement of the Monroe Doctrine, in which he denied the right of European nations to hold colonies in the Americas and declared that "to-day the United States is practically sovereign on this continent, and its fiat is law," ending with a threat of war. Great Britain, convinced that the American people were behind the President, gave way and agreed to arbitrate the question, and from that time on sought the good will and friendship of the United States.

This friendship was shown in the Spanish War of 1898. Cuba had long been a source of trouble between the United States; annexation had been predicted for many years. The Spanish government was weak and overbearing; the American people as usual sympathized with the effort to set up a republic. There seemed no end to the Cuban War that began in 1895. Hence in 1898 Congress took
the momentous decision to intervene by force, adding the Teller resolution, which denied any intention to exercise sovereignty, jurisdiction, or control over said island except for the pacification thereof.

This little war brought about a change in foreign policy unexpected by the country. Not only was Cuba occupied, but the neighboring island of Porto Rico was conquered almost without a blow. On the other side of the world the city of Manila and eventually the whole archipelago of the Philippine Islands were occupied by American forces. Guam, Tutuila, and other Pacific islands were added. The Hawaiian Islands were annexed. Thus the United States became a Caribbean power, a Pacific power, an Asiatic power and a colonial power. In 1900 a detachment of United States troops was part of the force which marched up to Peking and released the Ambassadors to China.

As soon as the war was over President Roosevelt entered on a new and vigorous canal policy. The Clayton-Bulwer Treaty was released by Great Britain, and preparations were made to buy out the unsuccessful French canal company. An attempt was made to negotiate a treaty for canal rights with Colombia (1903). When that treaty was rejected by Colombia, the province of Panama revolted, and its independence was at once recognized by the Roosevelt administration. A treaty with the new republic was concluded for the virtual cession of a canal strip that year work began on the canal and in 1914 it was opened to traffic, under the exclusive ownership and authority of the United States government.

The growing consciousness that the United States was a populous, rich and potentially strong nation, one of the first-class powers in the world, was shown in 1902 when a German fleet was sent to enforce payment of certain claims. President Roosevelt appealed to the Monroe Doctrine and insisted that Germany should give a pledge not to seize or even to land upon Venezuelan territory.

World Power Policy (1905–14).—Another period of about 10 years passed without a development of new principles. The United States was busy taking care of its colonies in the Philippines and Porto Rico and its dependency of Cuba. The Venezuela episode brought out the fact that the Monroe Doctrine could be invoked to protect a country from aggression from overseas; but what should be done in case of a real injury to a European country? To meet this difficulty President Roosevelt announced as a new form of the Monroe Doctrine the policy of "The Big Stick," as it was commonly called; that is, he promised to keep unruly American powers in order, so as to take away the excuse for foreign interventions.

Hence he took charge of Santo Domingo in 1905; and Panama became practically an American dependency. Nicaragua and Haiti were brought under the control of the United States and the Danish Islands were annexed in 1917. At the same time the government assumed a responsibility for Mexico under an international power intervening there. It thus became the policy of the United States to occupy the Caribbean and exercise a dominant influence in all the neighboring coast of North America.

Another evidence of a new attitude was the active part taken by delegates of the United States in The Hague conventions of 1899 and 1907. The general influence of our government was toward world peace, though our representatives were careful to give assurance that we did not consider the Monroe Doctrine to be in any way set aside by The Hague conventions. In all parts of the world American commerce was pushed, American influence was felt and American diplomats were consulted. The United States took especially strong ground for China against the oppression or looting of that country by other powers.

Policy in the World War (1914–19).—The outbreak of war in Europe in 1914 put the diplomatic policies of the United States to many severe tests. In the first place it was contrary to the genuine love of peace and desire to advance peace which has characterized the American people and government. From the American point of view the war of the United States since the Mexican War has been simply an effort to put things into a condition where permanent peace was possible. The Civil War, the frontier Indian wars, the Spanish War and the military occupation of the little Latin American countries were all intended to lead to an enduring peace in America.

The policy of neutrality was hard either to define or to maintain, because of the naturalized or unnaturalized sons of the United States who were living in the United States and who naturally felt a strong desire that their native countries should be successful. The status of neutral trade was especially difficult, because the principles of international law recognized by the United States and applied during our Civil War permitted the capture of any vessel carrying contraband to a belligerent port, and to a vessel with any cargo bound for a really blockaded port. Hence losses of American vessels were always a debatable point; and nearly everything that could be useful or comforting to the army or the general population. A further complication was the insistence of Great Britain that cargoes bound to neutral ports could be seized, if there was a strong likelihood that part of them would find their way to Germany. This still further limited the markets and the sales of American business men.

It had been the practice of the world to buy munitions of war freely in any available market while the war was going on; but the control of the sea by Great Britain prevented shipments to the Central Powers and they protested that it was unfair for the United States to allow President Wilson to bring drastic orders from both sides, declaring considerable areas of the open sea to be fields of war, in which any vessel, neutral or otherwise, might be sunk at sight. One result was the demand that the United States should have a German submarine without warning (May 1915), with a loss of more than 100 American
lives. This warfare of furious orders culminated in the German announcement of February 1917 that any vessel found approaching or leaving the British islands was liable to be sunk without warning. The United States thereupon suspended diplomatic intercourse and the controversy all but led to war.

The effect of this confusion and danger upon American foreign policy was to convince the country that the peace and the freedom of the seas, which was so dear to Americans, could only be made safe by a sufficient military and naval force to give weight to the remonstrances and demands of the United States.

Professor of Government, Harvard University.

60. THE UNITED STATES AND THE EUROPEAN WAR. When the war broke out in the summer of 1914, the American people were amazed and surprised; there were, of course, differences of interest and attention, some persons at once taking acute and absorbing interest, while others passed the whole thing by with a shrug of the shoulders as something essentially without moment to their own country. It naturally took time, and considerable time, for the great body of the people to understand the war; indeed, the number understanding it at the beginning was very small. The history of the development of intelligent interest and of responsibility, as well as the growing realization that the conflict was our conflict, would become so, is a history of very great significance and importance. No one can, however, write that history with perfect assurance that he grasps the truth at every point, because it is fundamentally a history dealing with public opinion, and is, at the best, intangible. The main features of the story can, however, be given with some degree of confidence.

There are obvious reasons for the absence of absorbing interest and understanding at the beginning. Few persons understood European conditions, few realized that Europe had been living with a powder magazine for decades because there were the vast armies and navies and the Monroe Doctrine: The Great German Inhumanity. And various other conditions that might in a twinkling set the continent ablaze. The whole militaristic make-up and spirit of Germany, if known at all, appeared unreal and too much out of harmony with life, as Americans knew life, to be taken over seriously. Furthermore, partly because of the activity of peace organizations, it looked as if if the cause of peace were rapidly growing and as if war was an event so bizarre and so little and so foolish to be feared in the modern world. Financial, economic and trade conditions binding modern nations together seemed too strong to be lightly broken even if they did not make war impossible.

There was, early in the war and even before we were directly affected, more intense interest in the East than in the country west of the Appalachians, at least such appeared to be the fact, and interest and attention gradually diminished toward the West. This fact is easily explicable, although just how much weight should be thrown upon it one cannot say. To the extent that this difference existed, it can be explained by calling to mind the simple fact of distance which always affects our feelings. It was inevitably difficult for the dweller in the Mississippi Valley to comprehend the reality of a struggle which was so distant and so out of keeping with the daily life about him. No one would dare to say just what large a proportion of the people, East or West, who in the early days sympathized with the Allies. There is certainly no ground for complaining because men did not decide before they knew the facts; but it is safe to say that the spirit of Belgium and the story of the scrap of paper, Germany's readiness to throw into the waste basket the most explicit provision for the maintenance of Belgian neutrality, awakened resentment, even if in a mild form, almost at once. There was, however, at the beginning practically no demand that the American government should publicly protest against the violation of Belgium, though demands of that kind were occasionally heard as the months went by. For an appreciable time, too, there was little public excitement about the German atrocities in Belgium. Many put the stories down either as gross exaggerations or as the lamentable but customary accompaniments of war, and so it may be said that the winter of 1915 was well along before there came an appreciation of the enormity of the German offenses against the unhappy Belgians. Even then, the knowledge on which judgment could be based was probably confined largely to those having the opportunity to read official reports and tales of apparently undoubted reliability. Some persons — perhaps, in the aggregate, many persons — were affected and dulled in their belief by the constant assertion of German sympathizers that all stories of German conduct, save those of simple rectitude, were made in Great Britain. Still, it is probably true that the great majority were not materially misled by the German propagandists.

All through those trying months and especially up to the time of the Lusitania sinking in May 1915 there was effort among the people at large to be neutral or inoffensive in their expression of sympathy for the Allied cause. Doubtless a portion of this inoffensiveness was lethargy; but even those hoping strongly for the defeat of Germany were refrained generally, though not universally, from public denunciation of Germany's conduct in beginning the war and of her method of carrying it on. Defenders of Germany, on the other hand, often quite open in their pronouncements, had every
opportunity of free statement. Opponents of Germany, it is true, were by no means all silent; but the columns written and editorials in the newspapers were printed which discussed the evidence of Germany's guilt, but in the opinion of the writer of the present article, the outstanding fact is the hesitation of the people generally even when feeling strongly in sympathy with the Allied cause, to indulge in heated declaration or to embarrass the government which had issued a proclamation of neutrality and was seeking to play the part of a neutral honestly and not merely ostensibly. Of course as the months went by expressions of opinion were stronger and more openly made. It is naturally impossible to say how much of the growing opposition to Germany was due to developing appreciation of her guilt in beginning the war and carrying it on with a ferocity which astounded the world, and how much was due to interference with American rights on the seas and to the rising appreciation of a German menace to our own peace and safety. The German ambition probably played no very large part, but it may be not so large a part as it should have done, in arousing American antagonism. Before taking up other aspects of the case it is well to remind the reader that there were various things occupying the minds of the American people besides the war in Europe. Prominent among them was the trouble with Mexico. It was not at all sure that we should not be driven into a conflict with that country and it must also be remembered that the danger continued down almost to the time of our taking up arms against Germany. An entirely wrong perspective is gained if these various distractions are overlooked; without some appreciation of the reality of internal problems and of the Mexican and Caribbean difficulties and responsibilities, one might gather the opinion that our minds were wholly taken up with purely humdrum domestic toil or with watching the conflict in Europe as more or less irrelevant spectacles. It is also well to remind ourselves that, during a good portion of the time we are discussing, i.e., the two years and a half between the outbreak of the war and the breaking off diplomatic relations with Germany (August 1914 to February 1917), our State Department was in part employed in discussing with the British Foreign Office various troublesome questions arising from Britain's sea policy. It is impossible to do more here than hint at these discussions, for the whole matter is complicated and inextricably connected with the whole diplomacy of the war. We may say in a word that the discussion practically began over Britain's control, especially in the North Sea, with which the British had scattered contact mines. As the months went by, arguments turned on the right asserted by the British government of seizing contraband destined ultimately to Germany though bound first to a neutral European country, and on taking warships into port for examination instead of making the search for contraband at sea. The British replies to our various protests were able and in the best of temper and there was little, if there was any, evidence of a desire to establish international law altogether under the plea of necessity, a plea which the German government was quite ready to indulge in.

In June 1915 the German government took control of the corn, wheat and flour in Germany and it was henceforward difficult for neutrals to maintain that provisions for Germany were not absolute contraband and subject to search and were being dealt with a fair mind will fail to see the inherent perplexities of the problem and that the United States, with no apparent intent of doing aught but preserve rights of neutrals on the seas, stated the case against Great Britain with at least sufficient directness and plainness. The subject is one that may still vex the brains of international lawyers; but the unlearned in the law will not detect a readiness on the part of the American government to wink at British transgressions and denounce German wrongdoing, and he will not detect that British conduct is in the same category with German frightfulness and disregard of ordinary principles of law and the claims of humanity for consideration.

Though such subjects as those just mentioned continued to be subjects of diplomatic discussions for many months, they sank into comparative unimportance upon the inauguration by Germany of a plan of terrorizing on the high seas. As early as December 1914 Admiral von Tirpitz was quoted as intimating that a war of submarines on British merchantmen was impending. On 4 February the German government proclaimed the waters around Britain a "zone of war" and announced the intention of destroying ships found there "even if it may not be possible always to save their crews and passengers." That was the beginning of Germany's piratical policy which finally made nearly the whole of the civilized world her enemies; no wonder it had that effect, for she defied the world. The American government answered the war zone proclamation by solemnly warning the German government that it would be held to strict accountability. It is not the purpose of this article to outline the diplomatic controversy with Germany, but we must point out that the President exhibited great patience, seemingly intent upon saving international law and defending if he could American and general neutral right to safety on the sea. There were many, though probably by no means the majority of the people, that thought he should stop writing notes and should prepare for war. The great crisis came with the sinking of the Lusitania (7 May 1915) when over eleven hundred persons were drowned, including 124 American men, women and children. That was bringing German practice of frightfulness near home and a wave of indignation swept over the country. Germany could not plead that the sinking was an accident, and, though she expressed "deepest sympathy," put the blame on Great Britain. The American people will not forget in this generation the brutality of a deliberately planned attack on a passenger ship. The sinking of the Lusitania was mentioned to us from our government in which the German government was informed that we should not omit any word or act necessary to the sacred duty of maintaining the rights of our citizens. Other discussions and lastless attacks followed and other notes were issued in the course of
that year; but still it is not within the power of the present writer to say that the bulk of the adequate provisions for going to war. As the months went by, there were doubtless gradation and gradual appreciation of the deeper significance of German assault upon international law and upon the ordinary claims of humanity, and there was a growing conviction of the menace to civilization in a power which stopped at nothing to win. We may, therefore, pass over the succeeding months in which Germany gave new proofs of the character of her government and her military leaders and aroused in the American mind the confirmed belief that if the world was to be a decent place to live in the military clique of Germany must be beaten and beaten badly at their own chosen game of war. Though there were many other causes for anxiety or for actual war, we may now mention only one—the sinking of the Sussex in the spring of 1916, in which Americans lost their lives. The promise wrung by President Wilson from the German government to observe at least some measure of respect for human life in her barbarous submarine policy was openly cast aside in January 1917 and diplomatic relations with Germany were broken off. War seemed inevitable and though we tried arming our merchantmen and still hesitated to take the plunge, the President finally went to Congress with a war message on 2 April 1917.

During the course of the war and before our entrance, the American people had opportunity to get acquainted in some manner with German Politik by seeing something of the activities of the German spies and the machinations of German agents in flagrant disregard of our laws to maintain our legal position as a neutral. Naturally this whole matter is still shrouded in partial darkness, but the revelations, especially in 1916, increased the growing indignation of the nation. The conclusive evidence was missing, while in other court trials were confirmatory of the existence of a system of intrigue which was exceedingly objectionable and which tended to increase dislike of Germany and her works. The later revelations in the Fox affair and many other matters which we have not space to discuss have shown that the suspicions and rumors that were spread about before we entered the war. The seizure of the von Igelfeligers in New York in the spring of 1916 brought to light evidence of a conclusive character of highly-developed plans and practices of the most reprehensible character. Not until we entered the war were the people generally aware how fully the German embassy itself had made use of the hospitality of this country to indulge in entirely illegal and wholly unjustifiable not to say criminal practices. Long before the German Ambassador von Bernstorff was given his passports (3 Feb. 1917) the activities of the Austrian Ambassador were detected and his recall was demanded. These occurrences and the awakened suspicion and the thoroughly justifiable resentment account in part for the growing belief that the maintenance of peace was incompatible with American honor and self-respect and that the duty of the United States was by the side of other democracies in a war against brutal warfare and shameless intrigue. We came to see that democracy could not be safe in the presence of autocratic might aided by autocratic stealth. Meanwhile there was much discussion on the subject of preparation for war or at least of adequate provision for going to war. There were those who believed early in the war that our government should make extensive preparations; others thought that even at such a time, and perhaps especially at such a time, when Europe was drenched with blood in a war brought on despite great armies and caused, in part, by the maintenance of vast military establishments, the duty of the United States was not to display threatening military power. Others of course were merely uninterested, but it was hard to convince the ordinary citizens either of immediate danger or that big armies made peace secure. In May 1915 President Wilson in a speech at Philadelphia said, "The example of America must be a special example; the example of America must be the example not merely of peace because it will not fight, but of peace because peace is the healing and elevating influence of the world; and strife is not. There is also such a thing as a man being too proud to fight; there is such a thing as a nation being so right that it does not need to convince others by force that it is right." The too-proud-to-fight expression was immediately seized upon in some quarters at a highly reprehensible. In the course of the succeeding months the President spoke plainly of American danger and of the necessity of making preparation for conflict. In January 1916 he declared that the American people must be prepared at any time to fight for the vindication of their character and their honor. They will at no time seek a contest, but they will at no time cravenly avoid it. Soon after this he declared that the country must prepare effectively and promptly and that not a day must be lost. In the spring months of 1916 a wave of "preparedness" swept the country; it may be more accurate to say that there were parades and speeches, for no one can be sure just how thoroughly the people were convinced of the necessity for putting the country in a position for defensive war. The National Defense Act (approved 3 June 1916) provided for a somewhat elaborate military organization. Authorization was given by Congress of not to exceed 175,000 men, excluding the Philippine scouts, the enlisted men of the Quartermasters corps of the Medical Department and the Signal corps. Provisions were made for the Officers Reserve corps, for a Reserve Officers Training corps and for the building up of the national guard. The appropriation for the army totaled $267,596,530. This was by no means satisfactory to some persons, however, for they asked for nothing less than universal military training. The naval program adopted in Congress in 1916 provided for a large increase in the navy; and an appropriation of $313,300,555 was made, as compared with less than half that sum appropriated for the preceding year. The three-year building plan involved the construction of over 150 ships, 10 of them battleships and 50 destroyers. As has been said earlier in this article, not all elements of the people were eager to prepare for war. Especially during the period under review, there were many expressions of opposition to the war spirit and even to building up the army and navy. The Women's Peace party was outspoken in its advocacy of peace and 40 delegates went
from this country to the International Congress of Women at The Hague in April 1915. The Henry Ford Peace Envoys left this country in December of that year with the intention of putting an end to hostilities and accomplished nothing. The Carnegie Endowment for International Peace devoted its energies partly to the publication of important documents on international affairs and took up various activities of a useful but uncontroversial character. The old American Peace Society was reorganized in 1916 and did a good deal in the way of distributing material. In addition the American Union Against Militarism and various other organizations came into existence. The most powerful organization connected with the movement for the maintenance of peaceful relations in the world was the League to Enforce Peace; its purpose, however, was not to bring about a conclusion of the existing war, but rather to promote and if possible secure the establishment of a system for assurance of lasting peace. The organization, taking its beginnings at a conference in 1915, was formally founded in June of that year. The idea that there should be an international body, which should have the authority and the power to compel a public investigation of controversies and differences before nations plunged into war, attracted wide interest. In the spring of 1916 President Wilson declared the readiness of the United States to become a partner in any feasible association of nations and at various other times gave clear manifestation of his sympathy with the principle. In October he said that the business of neutrality was over; "Not because," he said, "I want it to be over, but I mean this, that war now has such a scale that the position of neutrals sooner or later becomes intolerable." The Republican platform of that year declared for the "peace settlement of international disputes and the establishing of a world court for that purpose," and Mr. Hughes in his speech of acceptance advocated international organization for international justice and to safeguard world peace. The Democratic platform contained a declaration that the world has a right to be free from every disturbance "that has its origin in aggression or in disregard of rights of the people and of nations," and that it was "the duty of the United States to join in any feasible association to that end."

In the early part of 1917 President Wilson in a speech to the Senate discussed fully the general problem of world peace, which must be a peace worth keeping, a peace that will win the approval of mankind, not merely a peace that will serve the several interests and immediate aims of the nations engaged. He declared it inconceivable that the people of the United States should play any part in the establishment of a stable peace and that "no covenant of co-operative peace that does not include the peoples of the New World can suffice to keep the future safe against war." Thus, as far as his position on platforms and statements of party candidates could commit the nation, not to speak of many other announcements of opinion, the United States was committed before it entered the war, not only to the opposition to war for the basis of human progress, but to an abandonment of isolation and a readiness to enter into international organization to make secure the peace of the world. The nation could and did, therefore take steps in April 1917 not merely to help in punishing Germany for her unpardonable and unseemly wrong, but for better conditions in the world and for lasting peace based on justice. Andrew Cunningham McLaughlin, Professor of History, University of Chicago; Joint-Editor of "Cyclopedia of American Government,"

UNITED STATES, Forestry in. See FORESTRY IN THE UNITED STATES.

UNITED STATES, Painters of. This subject receives special detailed treatment in the articles on American Landscape Painting and Painting in the United States. For further information the reader is directed to the biographical sketches on the foremost artists of America scattered through the several volumes of this Encyclopedia. See AMERICAN LANDSCAPE PAINTING; PAINTING IN THE UNITED STATES.

UNITED STATES, Presidents and Vice-Presidents of the. In the following tables the important facts concerning the various Presidents of the United States have been condensed for convenient reference. The first table gives the place of birth of each President and, if a college man, the name of the college which graduated him. The second table gives the vocations of the Presidents and the length of service of each and the third table gives the cause of death and the place of their burial. The fourth table gives the place of birth and the length of service of each Vice-President. See Presidents of the United States, Family Coats of Arms of; Presidents of the United States, Graves of the; United States—President's Office; and the biography of each President in this Encyclopedia.

1 It has generally been stated that President Jackson was a native of South Carolina, but the most authentic evidence collected by Parson, the historian, and Kendall, his biographer, shows that he was born in Union County, N. C., about a quarter of a mile from the South Carolina line.

### UNITED STATES, Sculptors of. See SCULPTURE OF THE NINETEENTH CENTURY.

### UNITED STATES, The Wars of the. As generally regarded, the United States is rated as one of the most peaceable nations in the world, the idea being that during the 145 years of its existence it has participated in but six great wars, in all of which, parenthetically, it has been victorious. Notwithstanding the general credenance given to this statement, it is far from being in accord with history, for, as a matter of fact, scarcely a year has passed in which either the army or the navy has not been called upon to do battle for the country. After 1900, it is true, the unpleasantness in the Philippines and outlaws on the Mexican border were the only discordant elements, but, prior to that, there were the labor disturbances; the Indian wars and massacres and a dozen other factors that kept the United States forces almost constantly engaged in warfare of a more or less consequential character. At times of course, some of the disturbances were little more than riots, but there were other events which seem to have been quite as thoroughly forgotten by the ordinary reader of history, but which in every respect deserve a place in the catalogue of wars. In fact the War of Revolution had scarcely commenced when the colonists were compelled to meet the attack of the Indians who, inspired by the English, instituted an incessant border warfare against the whites; a warfare of brutality which culminated in the bloody massacres in Wyoming Valley, Pa., and Clinton, N. Y.

### The Shays' Rebellion.—The first armed and organized rebellion against the conduct of political affairs in the United States, however, occurred in Massachusetts in 1780, when Daniel Shays organized the dissatisfied faction in the community into an armed and determined force of malcontents. The cause of this early trouble was largely a financial one. Solid money was still scarce, with paper money practically worthless, and yet affairs were at such a state that debts contracted upon a paper basis were pressed for payment in solid money. As this was a period when men were imprisoned for debt, such conditions were held to be almost usurious in their effect and the orderly meetings of protest which were at first held soon developed into violent assemblages. In August
the tide of dissatisfaction had become so strong that uprisings occurred in many parts of the States: courthouses were burned and courts were prevented from sitting; the governor announced his determination to put down the rebellion and there were several engagements between the insurgents and the volunteer forces of the State. At last, in February 1787, General Lincoln surprized the rebels at Petersham, where, after a decisive engagement, they were dispersed.

The Whisky Rebellion.—The announcement that the Federal government had assumed the right to levy an excise tax was the cause of the insurrections in Pennsylvania, which is now commonly referred to as the "Whisky Rebellion." The act, which was passed in May 1792, was strenuously opposed on political grounds, the argument against it being that it was dangerous to the "freedom of the people." In the four western counties of Pennsylvania whisky was a staple product, and, aside from its political aspect, the people felt that such a tax was an unjust discrimination against that region. The attempts to enforce the law were resisted with violence, therefore, and all citizens who advocated conformity to the law, or who quietly conformed to it were subjected to various forms of ill-treatment by their neighbors. To further inflame the spirit of opposition incendiary posters, all signed "Tom the Tinker," were displayed in all directions and there was rioting and bloodshed in many places. In this emergency, President Adams assumed control of the situation and sent 13,000 troops upon Parkinson's Ferry in time to receive the peace overtures of the rebels. They were not accepted, however, and many arrests were made.

War with France.—One of Adams' troubles with which President Adams had to contend was the French question, for it had then become plain to all that America would have to take some decided steps if she was to maintain her honor against the aggression of France. The President's policy of neutrality, following on Jay's treaty with England, had greatly exasperated France and when the American envoys were ordered out of that country it became apparent that war was avoided. The French and American vessels did meet on the ocean, but in the encounters that followed, thanks to Captain Truxton and his frigate Constellation, the United States did not make a discreditable appearance. In the battle with the French frigate L'Insurgente, off the island of Nevis in the fall of 1799, as well as in her encounter with the frigate La Vengeance, off Guadalupe, in February 1800, the Constellation was victorious. Realizing that war was already under way upon the water, the United States government began to prepare her land forces. General Washington was again summoned from his retirement at Mount Vernon to assume command of the army, but as the formal declaration of war was deferred, Napoleon's seizure of the governmental power in France gave a new aspect to the situation and a treaty of amity was soon concluded between the two countries.

Slave Insurrection, Louisiana.—In January 1811 there was an uprising of slaves which extended throughout the entire parish of Saint John, La. The French and Spanish were not notified of the insurrection, and there were several serious battles between the two forces, more than 60 of the negroes having been killed before the slaves could be forced to surrender.

War of 1812.—The bloodless Burr conspiracy; the Sabine expedition; the unwarranted attack upon the Chesapeake by the Leopard, a British two-decker; and the troubles resulting from the Lake Champlain embargo, all of which kept the United States forces engaged in more or less active service, were soon forgotten in the more important declaration of war with Great Britain (see United States—The War of 1812), and this conflict had scarcely commenced before the troubles with the Indians began once more with the Seminole War in Florida. The growth of the country; the expansion of its territory; the explorations of venturous spirits who were continually opening up new lands for settlement; all had a tendency to arouse sentiments of dissatisfaction in the minds of the red men. They saw that encroachments were constantly being made upon them; the fields of the white man interfered with their hunting and fishing; the industry and other features of civilization were distaste-
to accept a seat in the Senate in order that he might speak upon this question, and he at once ordered troops to Cairo, which had a quieting effect upon the beligerents, who postponed their threatened action, and the difficulty was finally settled by the Clay compromise bill. More trouble with the Indians and the "Toadies" of the southern boundary between Ohio and Michigan, which followed the admission of the latter State to the Union, were among the factors that disturbed the Jackson administration, but none of these events were as important as the Mormon disturbances and the "Patriot War," which occurred soon after Van Buren's succession to the Presidency.

Mormon Disturbances.—During the peregrinations of the Mormons, prior to their ultimate settlement in Utah, they attempted to locate in several places, but as their presence was not relished by other citizens, who charged them with such crimes as robbery, arson and secret assassinations, they had frequent conflicts with mobs and were driven from spot to spot until they made their final stand in Missouri, at the town of Far West, in Caldwell County. Here they were joined in 1838 by Joseph Smith and Sidney Rigdon, who, after the failure of the Mormon Bank at Kirkland, Ohio, had fled from that State to avoid arrest for fraud. To the troubles arising from the hatred and distrust of the people of Missouri there were soon added those of internal dissensions. On 24 Oct., 1838, Thomas B. March, president of the 12 apostles, and Orson Hyde, one of the apostles, made affidavit that Smith and Rigdon placed the teachings of the Book of Mormon and the regulations of the Church above the laws of the land and that there also existed among the Mormons a band known as the "Danites," organized to execute the will of the head of the Church, whether it was legally right or wrong. Under such conditions the feeling against the Mormons grew so strong that it was determined to drive them from the State. Smith and Rigdon had already been arrested on charges of treason, murder, and forgery, but their adherents fortified their settlement and resisted both the popular will and the law so strenuously that it became necessary to call out the militia to expel them. They at once turned their steps toward Illinois, where they founded the city of Nauvoo, but the authorities were to have still more trouble with them, the most serious disturbances being those of 1844, when they were driven out of Illinois, and those which followed the Mountain Meadow Massacre, in 1857, when an army of 2,500 men, under Col. Albert Sidney Johnston, was sent to Utah to put down Mormon resistance. United States' authority.

Alton Riots, Illinois.—The Alton, Ill., riots resulted from a popular uprising against the Saint Louis Observer and its owner, Rev. Elijah P. Lovejoy. Compelled to leave Saint Louis by reason of his anti-slavery proclamations, Mr. Lovejoy took his paper to Alton, Ill. There, too, he provoked enmity, however; and several riots occurred, his newspaper plant being destroyed no less than three times. On the occasion of the last riot, 7 Nov. 1837, Mr. Lovejoy was killed.

Patriot War.—Friendly relations with Great Britain were again endangered in 1837,
when the so-called "Patriot War" broke out on the Canadian frontier. Sympathizing with the movement, the people of the United States did much to aid the insurgents, some New Yorkers even going so far as to seize an island in the Niagara River. These acts, however, received prompt reprobation from the government, which not only issued a neutrality proclamation, but sent General Wool to the Niagara frontier to preserve the peace, that no ill effects resulted. Equally successful was General Scott, who was sent to the northeast frontier to quiet the disturbances which had resulted from a dispute over the boundary line between Maine and New Brunswick.

Dorr Rebellion.—Although friendly relations were maintained with all foreign powers during Tyler's administration, several internal disturbances occurred which called for quick action upon the part of the authorities. In Rhode Island, for instance, the Dorr Rebellion required the presence of the United States troops, while the militia was called upon in New York to suppress the anti-rent rioters. According to the judgment of later days Thomas W. Dorr, the political reformer who led Rhode Island into its only insurrection, whose chief offense was that he was in advance of his time, for since his death every reform for which he argued and for which he was ready to fight has been freely adopted by the people of the State. According to the charters it had been granted by Charles II, in 1663, no person was permitted to vote for town or State officials unless he was possessed of a certain amount of real estate. Under a subsequent statute of the legislature no person could be admitted a free man of any town, with such political privileges, unless he owned a freehold estate to the value of $134 or was the eldest son of such a free man. Qualifications which barred fully two-thirds of all the citizens of the State from becoming legal voters were to be provisions that Dorr and his adherents objected and when they found that they could not accomplish their purpose in any peaceable way, recourse was had to arms. The insurgent forces, however, were dispersed and dispersed they were each occasion. Dorr, who was convicted of high treason, was subsequently pardoned.

Anti-Rent Rebellion.—During this time the New York authorities were engaged in trying to suppress the anti-rent rebellion. According to the statement of Willard, the historian: Under the early Dutch governors of New York certain settlers received patents of considerable tracts of land, that of Van Rensselaer being the most extensive, comprising as it did, the greater portions of Rensselaer and Albany counties. These lands were divided into farms of from 100 to 160 acres and leased in perpetuity on condition that the tenant pay annually, to the landlord or "patron," a quantity of wheat from 22½ bushels to 10, in addition to four fat fowls and a day's service with wagon and horse. If the tenant sold his lease, the landlord was entitled to one-quarter of the purchase money. The summer of 1843 was marked by the most violent disturbances by the Anti-Rent party in the eastern towns of Rensselaer, in the Livingston Manor, in Columbia County. The Anti-Renters formed themselves into associations to resist the law and armed and armed bands, disguised as Indians, scoured the country, crying "Down with the rent!" and in various ways intimidating those who favored the execution of the law. In 1846 Silas Wright was chosen governor of the State and, by his wisdom and humaneness, public order was restored. By proclamation he declared the locality in which these disorders prevailed to be in a state of insurrection; resolute men were made sheriffs, military forces were brought into requisition and the leading Anti-Renters were not only brought to trial but were convicted.

The Revolt in New Mexico.—The revolt against the authority of the United States government which broke out at Taos in 1847, was quickly suppressed by the Federal forces under the command of Col. Sterling Price. Montoya, the leader of the insurrection, who had assumed the rôle of governor, was captured, tried by court-martial and shot 7 Feb. 1847.

Kansas Border Warfare.—Following the Mexican War (1846-48) the government was engaged in almost continuous conflicts with the Indians, while the "Know Nothing" disturbances, which followed the organization of the American party and resulted in anti-foreign and anti-Catholic feeling among the part of the country, caused no little trouble. As the years passed, however, the anti-slavery question had pushed itself further and further to the front and it required no inspired prophet to predict that a few years such a struggle in Kansas, which accompanied the rendition of Anthony Burns in Boston would make the issue the vital one for the nation. In the meantime the Kansas border troubles, troubles which practically resulted in civil war, held the attention of the people. This sectional excitement arose from the introduction of a bill into Congress by Senator Douglas of Illinois, which provided for the organization of that vast tract lying west of Missouri, Iowa and Minnesota, into two Territories, Kansas and Nebraska, each of which, being exempt from the operations of the Missouri Compromise, should come in as free or slave States according to the vote of the people at the time of their admission. Although this bill was fiercely fought in Congress, it was passed in 1854, upon which there began a terrible struggle for the possession of Kansas. From the Northwest and the East the anti-slavery men flocked into the Territory, while the slavery partisans, with their slaves, rushed in from the South, each party being determined to people the new land with settlers in sympathy with their respective views. To make matters worse the Missourians — or so it was charged — crossed the border by the hundreds and, wherever it was possible, controlled the elections. As the result of the disruption two sets of Territorial officers were elected and civil war with all its attendant evils followed. During the summer of 1856 the Territory was in constant war. Men were murdered and towns were sacked, and while both sides were guilty of violence, the Free-State party was much the less so, being confessedly in the majority. For two years Kansas passed the most violent of slavery gained the upper hand and, in 1861, Kansas was admitted as a free State. Among the many anti-slavery leaders in Kansas none had been more prominent than John
Brown (q.v.), a man of great courage, who believed that the liberation of the slaves could be achieved only by insurrection, should be given an opportunity to rise. With 21 men, therefore, Brown went to Virginia to carry out his purpose. They succeeded in seizing the United States arsenal at Harper's Ferry, but as neither the negroes nor the anti-slavery whites gave them the support for which they had hoped, they were soon overpowered by a force of marines. With the exception of two, who escaped, all the participants in the revolutionary movement were either killed during the engagement or hanged afterward, the latter being the fate of John Brown.

Fenian Troubles.—Shortly after the close of the Civil War (q.v.) in the United States, leaders in the long continued struggle for the emancipation of Ireland undertook to make the United States the base of operations against England by the invasion of her Canadian possessions. There was an organization of formidable numerical strength, largely composed of a military body known as the "Fenian Brotherhood." During the excitement large sums of money were raised, bodies of soldiers were organized and drilled and war matériel was gathered together at convenient points. The first actual attempt at invasion was made in April 1866, when an iron steamship was purchased in New York and manned to carry arms and munitions of war to Eastport, Me., from which, by a descent, it was to make in the island of Campbell, belonging to New Brunswick, and the breakwater between Eastport Harbor and the Bay of Fundy. Pending the arrival of the steamer some 500 Fenians had gathered at Eastport, but the boat did not sail, the order for her departure having been countermanded by the leaders of the movement in New York. The intending invaders, however, remained at Eastport, to which point a schooner was dispatched with 750 stand of arms sent from Fort Smith, but on representations made by the British consul these were seized by the United States authorities, and while the Canadian troops were sent to the frontier from Saint John and a British warship was stationed off the coast, the Fenians withdrew. There was also an American force on hand under command of Captain Meade. Later, in May of the same year, the Fenians made a more pretentious demonstration, under the direction of General Sweeney, but before anything was accomplished in the way of getting upon Canadian soil the United States authorities seized 1,000 stand of arms at Rouse's Point, N. Y. Several other seizures afterward occurred and, in the meantime, the entire volunteer force of Canada was ordered out. On 1 June between 1,200 and 1,500 Fenians crossed the Niagara River at Buffalo in canal boats. They were under command of Captain O'Neill, a graduate of West Point. A skirmish took place the following day, when it was reported that 100 Canadians had been killed and a number wounded. At this time Gen. U. S. Grant was in command of the United States troops sent to the frontier and he not only prevented any reinforcement of the invaders, but on the return of his forces upon its return, placing all members of the party under parole to keep the international peace. On 7 June another expedition entered Canada, going from Saint Albans, Vt., and Malone, N. Y. This force numbered nearly 2,000 men. It advanced upon Saint Armand, which the Canadians had evacuated, but on the 9th, the Canadian force returning, the Fenians were driven back, with a loss of 15 prisoners.

Walker's Expedition.—The violation of the neutrality laws was always the excuse for the United States' interference with William Walker's various filibustering expeditions. In 1853 this famous American adventurer invaded Lower California, where, his plans failing, he surrendered to the United States authorities at San Diego. Having escaped conviction, two years later he invaded Nicaragua, where, for a time, he was successful. In 1857 he fell, however, and on 1 May he surrendered to Commodore Charles H. Davis of the United States sloop-of-war Mary. Taken to New Orleans, he not only escaped trial, but, evading the government authorities who were watching him, he organized another expedition and landed at Greytown on 14 Nov. 1857. Shortly after landing, however, he was again compelled to surrender to Commodore Paulding of the United States frigate Wabash. Although the United States authorities had no further trouble with Walker, his next expedition was a failure; for, having invaded and captured a part of Honduras, he was himself captured by the commander of the British man-of-war Icarus, by whom he was delivered to the Honduran officials, and was shot.

The Draft Riots.—The necessity of reinforcing the Union army by means of conscription resulted in the development of a strong spirit of opposition to the government, a sentiment which, in New York and Boston, culminated in uprisings that were suppressed with great difficulty. In New York City the outbreak occurred on 13 July 1863; in Boston, a day later, but while the Boston riot was suppressed by the militia within 24 hours and at the cost of only one life, in New York order was not restored until the 16th. During this period of disturbance property to the value of more than $2,000,000 was destroyed and it was estimated that fully 1,000 of the rioters fell in the various battles between the troops and the mob.

Tin Horn War.—The Ku-Klux (q.v.) disturbances in the South; the later and still fruitless Fenian demonstration on the Manitoba frontier; the insurrection against Governor Kelly in Louisiana; the race riots and massacres in several of the Southern States; the troubles arising from the opening of Oklahoma and the Cherokee Strip, and the Chinese labor riots in the West, were events which, like several of the labor uprisings of later days, have required the attention of United States troops or militias for their suppression. Of more consequence, however, was the "Tin Horn War," the last affair of importance with which the United States had to deal prior to the War with Spain and the Philippine Islanders. The "Tin Horn War" was in reality a series of outbreaks against the Mexican government, beginning in the autumn of 1891 and continuing intermittently into the early part of 1894. It arose out of the fact that the insurgents operated along the Rio Grande, and evidently relied upon the contingency of the United States for safety in case of defeat,
Catarino Garza, who had conducted a number of periodicals opposed to the administration of President Diaz, inaugurated the first of this series of troubles in September 1891. He was at that time living on his cattle ranch in Texas, near Paito Blanco, at which place he collected his band of revolutionists, Issuing a manifesto, in which he proclaimed the overthrow of Diaz, he crossed the Rio Grande with less than 100 men, who were reinforced from time to time by sympathizers in the movement. There were many brushes with the Mexican troops and, little by little, the insurrectionary spirit extended. The fact that the insurgents took refuge on American soil when worsted made it necessary for the United States authorities to act, and two companies of infantry, with two of cavalry, did effective work in preventing the violation of American neutrality. The Mexican government sent a strong force to the scene of trouble and the fighting degenerated into guerrilla warfare. During the latter part of 1892 there was an outpouring of insurgents, under leaders named Pacheco and Perez, the scene of operation being several hundred miles above that of Garza's war. The rebels captured Ascension and Corralitos, driving out the American settlers who crossed the Rio Grande into New Mexico. The Indians along the Yaqui River joined in this uprising, while another band of rebels, under the leadership of a man named Amalla, added to the complications. During this period General McCook had maintained a force on the American side of the Rio Grande and it was largely through his efforts that, in 1893, the insurgents were dispersed. The last outbreak occurred in January 1894, when two filibusters named Ochoa and Langan attempted to revive the insurrection. They were unsuccessful; however, being dispersed after two somewhat sharp engagements.

The Colorado War.—Disturbances resembling in intensity and bitterness the Pullman Car Company strike and the mining troubles at Cœur d'Alène, Idaho, occurred during the winter and spring of 1903-04 in the Cripple Creek mining district, Colorado. In the summer of 1903 a strike was ordered and several thousand miners were ordered out. Three weeks after the inauguration of the strike, an assault on two miners resulted in the ordering of State militia to the region. The presence of the soldiers was resented and rioting followed. Martial law was declared, "bull pens" established and the leaders of the strikers arrested on various charges. Later on, prominent strikers were deported by order of the military. A state of almost civil war existed, which increased as the spring advanced.

The Boxer War.—In 1900 for the first time since the Revolutionary War soldiers of the United States fought in company with troops of the European nations in Peking during the Boxer Rebellion (q.v.).

Vera Cruz Affair.—In 1914 friction developed with Mexico because of the capture of United States sailors in a Mexican harbor. The American admiral demanded reparation and a salute to the American flag. This not being forth-
UNITED STATES ARCHITECTURE

The earliest settlers within the present limits of the United States have left us little in the way of architectural remains. Leaving an old and civilized country and starting life anew in the untrdden vastness of a wild world of primeval peoples, they devoted their time and strength to clearing the land and cultivating the soil, living meanwhile in hastily constructed log cabins or rude houses of clay, stone and wood. The tide of immigration grew larger yearly, and soon homes were built replacing the pioneer emergency domiciles, and through various paltry in any sense of the word made comfortable and satisfactory dwelling places. The effect of the constructive methods of the different mother countries is evident in these buildings. With the increase of wealth came the desire for better and more pretentious architecture. In the southwest during the 16th, 17th and 18th centuries, influenced by Spanish types, were built picturesque mission buildings (New Mexico: San Juan de los Caballeros, 1598; California: Santa Barbara, 1787), cathedrals (Saint Francis, Santa Fe, 1713; Florida, cathedral, Saint Augustine, 1793; Louisiana, cathedral, New Orleans, 1792), and a few secular constructions (Florida, Fort San Marco, Saint Augustine, 1756; Louisiana, Cabildo, New Orleans, 1795).

As the Spanish Dominion in North America took the form of conquest rather than colonization, the conditions making for growth and prosperity were lacking in the conditions under which the Spanish system of building is reflected in the stunted architectural development. The long slender column of our Colonial style is not the result of an aesthetic development. The classic proportion of the column of the Georgian period was abandoned by the construction during the Colonial period through necessity as imposed by law and not through choice. The column with a height of 15 and even more diameters is not the outcome of years of development and study to imitate the already well-established and accepted proportions of the Classic columns—the sudden abandonment of the columnar proportion that had satisfied both the structural and aesthetic requirements of classic design for centuries was due uniquely to an order of the British Privy Council, prohibiting the colonists from cutting down for domestic construction trees of a diameter greater than 16 or 18 inches, in order to reserve for the construction of British ships and especially for the spar and mast, the trees of the larger diameters. The immediate result of this order was to force the colonists in the construction of a porch two stories in height to use a proportion of diameter of height to width far greater than in the established classic proportion. The radical change in the colonial column necessarily affected the established proportions of the other architectural elements to a degree in excess of the structural limitations of the materials used. And the resulting bastard style cannot be regarded as the naive efforts of an artist in using forms with which he is not thoroughly familiar, as seen in the early period of development of the Renaissance in Europe. The lack of a developed architectural appreciation in the colonial builder is well exemplified in his use of wooden groins. This reversal of the usual development of a structural element from wood into stone is probably unique.

In the vicinity of the Hudson Valley and on Long Island the Dutch settlers constructed long, low houses of rough stone garnished with brick, with timber gabled roofs, the eaves of which projected far over the side walls. Though simple in design, these Dutch houses, like those of the immigrants of other nations who settled in the United States, show that
Old World restrictions imbued the builders with a spirit of deference to inherited customs; with the result that they followed the traditions of their teachers, and built as they had been taught. Instead of introducing new ideas and methods to meet the new condition. This did not prevent them, however, from adapting to their needs available materials, and a variety of them were frequently employed in the same building. New Falmouth, a clapboarded and shingled house, used together in such a manner as to result in a harmonious whole. In the houses of the more wealthy, dressed or cut stone was frequently employed, and in those of the less well-to-do or less exacting, rubble masonry sufficed. The ground floor was used for kitchen, living-room and bedchambers, and the upper floor for the storage of supplies and at times for slave quarters. In the early days dormers were seldom employed, when light was necessary windows were introduced in the gable ends. Later, the introduction of the gambrel roof with its steep slope and the elimination of waste space just inside the eaves made it possible to use a second or attic floor for bedchambers, as well as for storage.

Before the 18th century, the Dutch doorway was merely a rectangular entrance into the house, an occasional narrow transom with small square lights being the only attempt at adornment. The doors were either solid or divided at mid-height. Sometimes a simple stool was built at the entrance with settees arranged on either side. In the latter part of the century, however, more attention was paid to the entrance, and during the last quarter, Georgian motifs were informally introduced with a broad individuality of treatment, which oftentimes indicated but the first inspiration. In the interior it became possible to expand the construction indefinitely on account of the lack of formality of plan. Often there were two large square rooms on the first floor front, one on either side of the hall which extended from the front to the back door; and an oblong bedroom on either side at the rear. As the family expanded, succeeding generations witnessed the building of a large addition or a number of smaller ones. Each of the large rooms had an enormous chimney, unornamented or crowned with a plain overmantel which extended well into the room. With the advent of the Georgian influence, a tendency arose toward more elaborate decoration in the doorways and in order to relieve the former plainness carved wood moldings, leaded glass fans and side lights were used.

In domestic buildings in the Dutch, German and French Huguenot settlements of Central New York, New Jersey and Pennsylvania it is exemplified in the Lefferts House, Erasmus Hall and other frame buildings of Long Island, the Memorial House, New Falmouth, the Semnut House, Kingston, The Hasbrouck House, Newburgh, Clinton Mansion, Poughkeepsie, and other stone buildings in the Hudson and Mohawk valleys and throughout New Jersey and Pennsylvania. The Schuyler, The Herkimer Home, Little Falls, and other brick buildings of the Hudson and Mohawk valleys. Crude and unrefined, frankly the products of the craftsman's art, these dwellings so closely resemble their English neighbors in general attributes that they cannot be said to have been developed in a distinctive style such as would warrant a departure from the broad classification.

In New England, race craft determined architectural design. Original touches wherever introduced were not from mere caprice but from obvious local needs which the formal styles of England had not provided for, until at length there was established a type of architecture the result of successive evolutionary types, that was a distinctively characteristic product of New England. At first small, the houses were of one or two stories, with sharp peaked roofs, stone chimneys, and small windows; a long, narrow lean-to being frequently added in the rear to serve as the kitchen. In the earlier houses, of which the Paul Revere house in Boston is an excellent example, the original construction was of the half-timber variety, with clay, or brick stone or brick pugging as used in England, the clapboard casing being added later when the severity of the winters made it apparent that a more substantial form of exterior sheathing was necessary. In the interior plan, the New England house had two rooms to a floor, or three when the kitchen lean-to was added, in the latter case the room originally used as a kitchen became a sitting-room and a stairway as an entrance as a sitting-room. A few of the larger and more elaborate houses, Governor Eaton's at New Haven among them, were architecturally more pretentious, with an E-shape design of four rooms on the first floor and several more, usually sleeping and storerooms, on the second.

In Pennsylvania, West Jersey and Delaware the mixed nationality and clannishness of the early settlers caused the architecture of the surrounding country to fall into several separate and distinct channels. Each race preserved the traditions familiar to the mother country, the Welsh expressing themselves in stone construction, with sharply peaked dormers on their roofs. Low, wide doors and windows were capped by thick, oblong stone slabs, with sometimes a hood added over the former. A peculiarity frequently found in this type of house was the continuation of the cornice from the eaves horizontally across the ends, so as to make a complete triangle with the gable cornice. In the German colonial architecture, the windows and doors were higher and less wide, while the dormer heads had the same sharp angularity as those of the Welsh. A cornice was seldom carried on the gable ends, which were left unadorned. The peaked roof was common to the houses of the Welsh and German colonists except that the roofs of the latter had less pitch. While these two types of houses were ordinarily built of stone, the dwellings in New Jersey, although closely following them in architectural design, were often of larger proportions and of brick rather than stone construction. The Pennsylvania Quakers followed the English style at first, but gradually adopted many of the German, Alsatian, Albr diffuse German; so that the Pennsylvania colonial farmhouse of to-day is a mixture of the best points of the three styles. In Philadelphia, severity of style was caused by the same strong Quaker in-
fluence while the easy access to white marble in considerable quantities made this a favorite material. Hence arose the well-known type of the Philadelphia house, with walls of red brick, white marble lintels, sills and doorsteps, and as the houses were built close to the sidewalk, without areas and with the entrance nearly on a level with the street, a display of solid white painted wooden shutters, which carried out the characteristic effect to the full. The population of the South during the colonial period was altogether English as was the architecture, though differing somewhat from the English architecture of New England in that there was no half-timber construction and the chimneys were wholly outside the house, instead of being contained within as in the North. With a natural preference for brick and stone, the earliest southern colonists were compelled to use wood, and though later means of transportation proved adequate for supplying these materials and they were greatly used as soon as the Georgian influence began to tell, the early dependence on wood created a precedent which has continued. The cities of the South were less crowded, less busy, more decidedly marked by the distinction between elegant and humble dwellings. In Mobile, Charleston, and Savannah, the characteristic dwelling was rather a stately mansion standing free or nearly so, and having broad verandas or galleries which, however, were not turned toward the street, but sideline upon gardens. Savannah, however, has a very unusual plan: a succession of square, open spaces from each of which four streets lead in four directions, giving a series of square corners and allowing of an irregularity of shape in the house lots which is not known in our other cities. The typical dwelling either in brick or wood was rectangular in plan with the entrance door on one of the long fronts. The shingled or tiled roof, with a chimney at each end, was steeply pitched. The interior consisted of a ground floor with an attic or two living floors with a small storage space above. The entrance house-door opened directly into a large hall quite in contrast with the small entry of New England houses, and the central stair was the usual treatment, though at a later date the damask and elaborate wood paper were often substituted. In the first period, bold but simple ornamental detail, both exterior and interior, combined with strong profile moldings in high relief, resulted in them, the heaviness of outline found in New England during the same era. In the second phase, the decorative treatment was lighter and more elaborate, the profiles of moldings being less bold and more graceful, while a close attention to detail indicates more study in the proportion and adaptation of the different classic orders. In the third period, the fireplace which had before extended to the ceiling, under the influence of the English architect, Sir William Chambers, was reduced until it extended but halfway up the wall, but retaining much of its former classic design. Another interesting architectural difference is the decorative point of view during this third and last phase. In the two preceding periods it had been the custom to single out individual features for decorative emphasis; now, the entire front of the house, and often the sides and back as well, were carefully considered and the decorative element extended to the proportions as well as to the detail of the whole. Fan lights, enriched with beautiful metal tracery became common over the doors.
Georgian architecture in the South was usually of brick construction. Kitchens and offices were built apart from the main building, which rose above the first floor. The advantages of the colonial period. Much study was given to the carved details of staircases, pilasters, and pediments. The portico, which later, under the influence of the Classic Revival, assumed the important proportion of the Greek and Roman orders, was introduced at this time. Amply satisfying, by its dignity and breadth, the demands of the exuberant climate and the influence of the rich southern landowners, it was, like the architecture of New England and the Middle Colonies, an admirable index of the time and conditions. It was during the latter part of the 18th century that educational, political and humanitarian ideals forced on the national consciousness the necessity for the solution of institutional (prison, asylum and university) problems in a way that no foreign method of arrangement could satisfy. The great exemplar of what might be termed rational institutional structural philosophy in the United States was Thomas Jefferson, combining architectural knowledge and political power. The University of Virginia, at Charlottesville (1817) and his design for the Capitol of Virginia at Richmond (1785), boldly adopted from the Maison Carée at Nîmes, are among the most interesting and characteristic productions of the Early Republican Period. The solution of institutional problems found concrete expression in the erection of New York's Tombs (1838-1840) and the Old New York (Joseph Mangin, 1796-98) which planned for the separation of the sexes and for criminal classification. The ultimate solution of the problem projected in constructed form by the works of Mangin and Latrobe (the Virginia Penitentiary, 1797-1800, based on the Old World principle of solitary confinement) has been achieved in the new prisons being constructed by the State of New York at Sing Sing and at Wingdale, where the institutions embody in their organization the function of study of the individual prisoner. Consult Pilcher, L. F., 'Sing Sing Psychiatric Classification Prison,' (New York 1917).

Between 1776 and 1812, following the firm establishments of national, State and municipal governments, there was an immediate need for public buildings. This demand was affected by the Classical Revival of Europe and was particularly influenced by the intimate relations which had grown up between the New Republic and France. When Washington was selected as the seat of government, it was a Frenchman, Major Pierre Charles l'Enfant, who laid out the city. The Treasury building was the first office building. It was undertaken in 1781. The Treasury, designed by Robert Mills, who was a pupil of Latrobe, was the first United States Architect, was built in 1836-39. The same architect also designed the Washington monuments in Baltimore (1815) and Washington (1836). The White House was started in 1792 by James Hoban and a year later the Capitol. The central portion was designed by William Thornton in collaboration with B. H. Latrobe and Charles Bulfinch. It was not until 1851 to 1865 that the dome and wings were added. Other well-known buildings of the Classical Period are the State House and Custom House, Boston, the City Hall, and the Mint, Philadelphia, the State House, Albany, N. Y. So popular did the monumental style become that buildings sprang up on every side, which, if not of the classic mode, were at least adorned with Greek and Roman orders which when applied to small houses served only to make them ridiculous. In large private houses and in public buildings, however, it was possible to do justice to those newly adopted architectural forms and we have many admirably dignified and graceful structures, in the cities of the country. The wave of Roman and Hellenic enthusiasm dominated the architecture of the United States until 1860 when its strength gradually subsided. The style did not live, for architecture to be completely successful must reflect the condition of the civilization whose activities it is planned to house. The impossibility of instilling into modern life the conditioning causes of a dead civilization made it impossible for the structural and decorative elements that were borrowed for the production of Academicism and Classicism to reflect the functioning of the civilization of the 19th century. The Gothic revival of the 19th century while confined chiefly to England made itself manifest in the United States as early as 1839, when Richard M. Upjohn undertook the design and completion (1846) of Trinity Church, New York. Of the same time was the church of Holy Trinity, Brooklyn, N. Y., designed by Lefevre, Grace Church, New York (Joseph Magin, 1846-48) designed and, by the same architect, Saint Patrick's Cathedral, New York (1850), are among the most successful efforts of the period. The Gothic style was for the most part restricted to churches, although a few projects as in the Harvard Library and the Yale College Alumni Hall evidence the influence of the collegiate Tudor style of England.

These very creditable pointed works were produced during an era that was otherwise represented by a host of edifices marked by careless and undiscriminating design. The superbly excited political conditions that obtained throughout the United States reached their climax in the debacle of the Civil War and production and art were reciprocally inhibited. Honesty, sobriety of task and logic in construction were in a state of stagnation. The Municipal Building, Philadelphia, and the Capitol, Albany, still unfinished, are monumental expressions of design and construction subordinated to the demands of grasping and voracious political patronage. Their errors of plan and the wholesale disregard of engineering efficiency and sanitary provisions render these costly, unfinishable pietas of architectural warning. Perverted taste likewise characterizes the New York Post Office, the Army and Navy Building, Washington, both by A. B. Mullett. In the latter half of the 19th century, the United States experienced unusual activity in building due to a variety of causes, the opening up of the West, the great fires in Boston and New York and the stabilizing of business and finance after the chaotic conditions surrounding the war. The well-known buildings of this period discovered two architects, Richard M. Hunt and Henry H. Richardson, men thoroughly trained by European study and practical

experience and possessed of a personal force that commanded attention, who established in the public mind that architecture was one of the Fine Arts, and set the profession on a sound basis, for Hunt took a leading part in organizing the first then Institution of Architects, which was its first president. Among his important works are the Lenox Library, Metropolitan Museum of Art and residence of W. K. Vanderbi!l!t, New York, the Breakers and Marble House, Newport, and George W. Vanderbi!lt's country house at Biltmore. His genius for organized plan, standardization of style and thorough grounding in the principles of the Renaissance finally established that style in the United States.

Henry H. Richardson, a graduate of the Beaux-Arts, and a classicist by training, became dissatisfied with the finical elaborateness of the Gothic revival and turned to the simpler and more massive Romanesque of southern France. His first important commission was Trinity Church, Boston, 1877, met with a great and immediate success. So freely did Richardson use the provençal forms, that he may be said to have established a style of his own which is still evident in the Calvary Church, New York, the Church of the Redeemer, Corning, the city halls of Albany and Springfield, the public libraries of Woburn, Quincy, Malden and Burlington and the Chamber of Commerce, Cincinnati. His seriousness and refinement left a lasting impression upon the nation's art, but his selection of the Romanesque style, while it had some following, was abandoned for the Classic and Renaissance due to the influence of the later students of the École des Beaux-Arts. The most important work of this period was the Columbian Exposition at Chicago in 1892. Here the architects were given a free hand in the planning of the grounds and buildings. The result was on a larger scale than had ever been attempted before and showed what could be accomplished by the co-ordination of landscape, architecture, sculpture and painting. Its effect was national, stimulating the imagination of a people long devoted to utilitarianism and impressing itself upon Federal, State, municipal and commercial buildings for over 25 years. It has also played its part in the development of parks and boulevards and more recently in the reconstruction and artistic planning of cities. It is but natural that a people thus roused to better things in public affairs should display an equal concern in their immediate surroundings and that a similar uplift should be felt in the buildings of domestic character. For the time being it was confined to an adaptation of the old styles to new conditions, the architect seeming more intent in reproducing the old styles than in meeting the needs of the present. In the houses erected in the last 10 years, however, there are evidences of a new creative art that is gradually being established upon the fitness of design, to the locality, climate, materials and the various needs and necessities of modern living. If in the development of his design the architect is true to the spirit of his art and is not content to let his models lead him, then the architect, aimed to create the impression of an entasis by varying the depth of the window-reveals through the many stories of the plain shaft. Louis Sullivan was one of the first architects who seems to have recognized the
to contribute. "In this onward movement the Federal buildings, post offices, custom houses, courthouses and other government edifices have not held the first rank. Although solidly and carefully constructed those built during the past 20 years are inferior to the best work produced by private enterprise, or by State and municipal governments. This is explained by the fact that all participation in their designing by the leading architects of the country at large has been excluded by enactments devolving upon the Supervising Architect at Washington the planning of all Federal buildings, as well as a burden of supervision and clerical duties incompatible with the highest artistic results."

During the early part of the 20th century great attention has been given to the problem of the adequate protection of our municipalities and the training of citizen soldiery. The newer principles of military science have been formulated by Major-General O'Ryan and translated into structural form and exemplified in the Eighth Coast Artillery Armory, New York; the First Cavalry Armory, Brooklyn, N. Y.; the Infantry Armory, Troy; Squadron A, Armory, New York; Corning Drill Hall; Springfield Armory, Ithaca, N. Y. In these typical examples of military architecture the masses and parts of the fabric are so disposed that the attacking force may be seen while the defenders are hidden from sight and at all vulnerable portions of the structure a possibility provided for obtaining a cross and defile fire. The congestion of population, high cost of land, the perfection of the elevator and the invention of the skeleton or steel frame were the active forces which found their expression in the skyscraper, a product of American ingenuity without a prototype in the whole realm of architecture. In the early periods of its development the same system of adaptation was applied by the architects who failed to recognize the unlimited opportunity afforded by this new problem for the application of the true principles of constructive art. Condemned as a monstrosity and outlawed by the classicists, every subterfuge was resorted to in order to conceal the construction and to reduce the apparent height. The World Building and the Manhattan Life Building exemplify the application of this system which may be said to have reached its culmination in the Saint Paul Building where sill and band courses were introduced in the greatest profusion in an effort to accentuate the horizontal and distract the eye from the vertical. The failure of accomplishment along these lines led to a reaction in favor of the frank acknowledgment of height, but limited still in its expression by the traditions of the classic for the accepted principle of composition. The column was taken as the motif of the design of the façade as exemplified in the Broadway Chambers where the capital shaft and base of the column were symbolized in the highly decorated cornice, the repetition of windows and the basement. In the American Surety Building is seen the extreme of this conception in the design of the architect, aimed to create the impression of an entasis by varying the depth of the window-reveals through the many stories of the plain shaft. Louis Sullivan was one of the first architects who seems to have recognized the
elementary principles involved in the treatment of this new form, that of expressing upon the exterior the structural members it clothed and protected. Fundamentally, however, classic forms, admittedly changed and modified to meet the new conditions, were the controlling characteristics of the structures of this period. It was not until very recently that the logic of the problem of the tall building was fully grasped and it was realized that the fitting precedent to be followed in a problem in the vertical was to be found in the historical vertical style only. The West Street Building is an exemplification of the Gothic influence which has crystallized in its highest creative state in the Woolworth Building. In passing it is interesting to speculate on the course of this development if the tall building had made its appearance in the days of Upjohn and Renwick. In spite of the great advances that have been made in the development of a creative and scientific architecture, no style has been produced that can yet be recognized as new or distinctively American. From these advances it may be that we are progressing to the long-looked for American style if such be a possibility within the limits of a national dominion whose climate ranges from tropics to the almost arctic conditions of the north temperate zone. Notwithstanding the eclecticism and unprejudiced point of view when the average American comes to judge artistic achievements, no style has been evoked in the United States that is either new or national. Commercial requirements, the demand for speed in design and construction, and the experimental conditionings that restrict the modern designer have discouraged the evolution of a typical national style. In works of a public and commercial character, the necessity for a co-operative understanding between the architect and the engineer is increasingly felt. It is only when a united resultant combining the efforts of the architect and the engineer has been achieved—a resultant in which plan and detail shall adequately and truly function with the discoveries of modern science, that a new American style will appear.

UNITED STATES BUREAU OF MINES, a national bureau, whose purpose is the improvement of health conditions and the increase of safety, efficiency and economic development in the mining, quarrying, metallurgical and miscellaneous mineral industries of this country.

UNITED STATES CHRISTIAN COMMISSION, a unique and almost unparalleled association in its origin and operation, which came into existence during the Civil War, and the purpose of promoting the spiritual welfare of the Federal soldiers, sailors, marines, etc., while alleviating, comforting and humanizing their temporal needs. It originated at a convention of the Young Men's Christian Associations of the Northern States, called for that purpose in May 1861, in the city of New York, and while the war lasted was in full operation. Its activities became familiar to nearly everyone throughout the entire community and the civilized world, and it received liberal and generous support in voluntary services, money, supplies and literature. The commission met at Washington, D. C., and organized by appointing George H. Stuart as chairman; Hon. B. F. Manierre, treasurer. The commission was located at first in New York, but after the first year in Philadelphia. While the central office of the commission was in Philadelphia important auxiliary branches were organized in all the large cities and towns, whose officials and members were especially active in promoting this great mission of mercy. As the operations of the committee involved large expenditures it was necessary to make proper provision to meet them. From the commencement the finances were carefully managed. The committee resolved to incur no responsibilities which could not be promptly met, and to this rule they steadily adhered. The policy inspired public confidence and contributed not a little to the prosperity and efficiency of the commission. The usual mode of awakening and continuing an interest in its behalf was by spreading information before the people through the religious and secular press, by public meetings, by special appeals and by enlisting the clergy to bring the necessity and desirability of the commission for helpers there was a wholehearted response, and the difficulty arose to make a proper selection from among those who offered their services; 4,859 delegates were commissioned during the war. From the time of the commission to its close the commission had the warm approval of the general government and received every possible facility for carrying out its operations; transportation and telegraph companies assisted and the American Bible and Tract societies donated for distribution thousands of their publications. The cash receipts of the commission during the four years of the war amounted to $2,524,312; the value of the stores donated was $2,839,445; the value of the publications donated was $300,000. Chapels for religious worship and temporary libraries were established in the camps; 136,152 sermons were preached and prayer meetings held, and, among other work, the delegates wrote 92,521 letters and gave the dead the necessary marking the graves of the known dead. UNITED STATES COMMERCE COURT, a judicial body created by an act of Congress, passed 18 June 1910. The court had jurisdiction, formerly possessed by the United States Circuit Courts, over (1) all cases for the enforcement and collection of forfeitures or penalties and for the infliction of any criminal punishment, other than the payment of money, ordered by the Interstate Commerce Commission; (2) cases brought to annul, suspend or set aside, in whole or in part, any order issued by the Interstate Commerce Commission; (3) any case that was authorized to be maintained in United States Circuit Courts under section 3 of the act entitled, *An Act to further regulate commerce with foreign nations and among the States,* approved 19 Feb. 1903; (4) all matters brought under the provisions of section 20 or 23 of the act entitled *An Act to regulate commerce,* passed 4 Feb. 1887, such proceedings previously having been maintained in the United States Circuit Court. In all such cases the jurisdiction of the United States Commerce Court was exclusive. It was a court of record composed of a presiding judge and five associate judges, all of whom are appointed by the President of the United States for terms that extend from one to five years. The United States Commerce Court sat permanently in Washington, D. C., although the law permitted it to hold its sessions in any part of the United States that circumstances might make necessary. To invoke its jurisdiction a written petition had to be filed, in which the petitioners' cause of action or ground for relief was set forth. The only appeals from its decisions were to the Supreme Court of the United States. The judges of this court were appointed by President Taft in December 1910. It organized 8 Feb. 1911 and was opened for business on 15th. The court developed a reactionary policy. One of its judges was impeached and removed in 1913 and the abolition of the court was demanded by Democrats and Progressives. Taft was responsible for keeping the court in existence up to 1913, but it was finally abolished on 31 Dec. 1913.

UNITED STATES COPYRIGHT LAW. See Copyright.

UNITED STATES COURTS. See Court.

UNITED STATES CUSTOMS COURT, a judicial body which has final jurisdiction over disputed questions concerning the customs. The act under which the Customs Court was constituted was the Tariff Act of 1909, and the appointments of the five judges constituting this body were made by President Taft in 1910. It removed a class of cases from the Federal Circuit Court which was to expedite customs cases and relieve commerce from unnecessary and expensive delays.

UNITED STATES DAUGHTERS OF 1812, National Society of, an organization founded for the purpose of memorializing historical events from the close of the war of the American Revolution to the formation of the United States (as such) and till the close of the second war with Great Britain in 1815, to collect all historical, genealogical and biographical data, to search for and bring to light any valuable documents pertaining to that period and to carefully classify and preserve the same.

This present society is the outcome of the "General Society United States Daughters 1812" founded by Flora Adams Darling, on the anniversary of the battle of New Orleans, 8 January. Its work begins where that of the Revolutionary commemorative societies leaves off, namely, when the treaty of peace was ratified by the Congress in session on 14 Jan. 1784. The qualifications for membership are: Any woman over 18 years of age, of good character and a lineal descendant of an ancestor who rendered civil, military or naval service during the War of 1812, or the period of the causes which led to that war (subsequent to the War of the Revolution), 14 Jan. 1784 to 2 Nov. 1815, may be eligible to membership, provided the applicant be acceptable to the society. The society was incorporated under Federal laws in 1901. There are about 1,000 members.

UNITED STATES FLYING CORPS. While the United States Marines are the oldest branch (see Marines, United States) of our fighting forces, the United States Flying Corps is our youngest arm. Although the Wright brothers had made successful long distance flights as early as 1905, and France, England and Germany quickly saw the merits of a practical flying machine from the military point of view, the United States was reluctant to expend much time or money on the exploitation of such a new offensive and defensive weapon. And, when war was declared by the United States against Germany, 6 April 1917, in spite of the fact that for over two years the most terrific battles the world ever witnessed were being fought in Europe, and the use of airplanes found a prominent part in the murderous activities, this country's military equipment was without any branch of military machines. Even the training powers stocks handicapped with but 300 training planes, all of inferior types, the government tells us. But deliveries of improved models were begun in June 1917, and by 11 Nov. (date of armistice) over 5,800 had been produced, including 1,600 of a type which was temporarily abandoned on account of unsatisfactory engines.

Organization.—The production and operation of military aircraft, when the war started, was under the Aviation Section of the Signal Corps, created on 18 July 1914. In May 1917 an Aircraft Production Board was appointed by the Council of National Defense, and in the following October, Congress passed an act creating the "Aircraft Board" in an advisory capacity to the signal corps and the navy. The aviation section of the signal corps was split into two distinct departments in April 1918, with John D. Ryan as head of aircraft production and Brig.-Gen. W. L. Kenly as head of military aeronautics. The Overman bill (which authorized the President to reform and control in matters of aviation) was passed 2 May 1918, and entirely separate bureaus were formed for the production of aircraft and for military
aeronautics, both divorced from the Signal Corps. In August the arrangement was again altered so that the air service came under the control of the Assistant Secretary of War, thus bringing the administration of aviation personnel and equipment under a single head. This matter of fighting, or even reconnoitering, in the atmospheric medium was, therefore, in the nature of an experiment in the United States.

Training of Personnel.—At the outbreak of war there were in the United States two fields in which to teach military aviation — San Diego and Mineola. In another six weeks three others were adopted, "cleared, equipped and made ready for flying," and before the year was passed there were more than a score of aviation fields distributed over all sections of the country in active operation. They have been named in honor of flyers who have been killed in accidents. Thus we have Call Field, Wichita Falls, Tex., named after First Lieutenant L. H. Call, who was killed in an aviation accident, 8 July 1913, at Texas City, Tex.; Chandler Field, Essington, Pa., named after Second Lieutenant Rex Chandler, who was drowned (1913) under his hydro-airplane in San Diego Bay; Ellington Field, Houston, Tex., named after Second Lieutenant E. L. Ellington, who was killed (1913) in an airplane accident at San Diego, Cal.; Gerstner Field, Lake Charles, La., named after Second Lieutenant F. J. Gerstner, who was drowned (1914) at San Diego; Hazelhurst Field, Okla., named in honor of Second Lieutenant L. W. Hazelhurst, who was killed (1912) by the fall of his airplane at College Park, Md.; Kelly Field, San Antonio, Tex., named in honor of Second Lieutenant G. E. M. Kelly, who was killed (1911) by an airplane accident at San Antonio, Tex.; Love Field, Dallas, Tex., named after First Lieutenant Moss L. Love, who was killed in an airplane accident (1913) at San Diego; Park Field, Memphis, Tenn., named in honor of First Lieutenant D. J. Park, who was killed (1912) in an airplane accident near San Diego; Post Field, Fort Sill, Okla., named in honor of Second Lieutenant Henry B. Post, who was killed (1914) at San Diego in attempting to make an altitude jump; Rockwell Field, Waco, Tex., named in honor of Lieutenant Henry B. Post, who was killed (1913) by falling into Manila Bay; Rockwell Field, San Diego, Cal., named in honor of Second Lieutenant Lewis G. Rockwell, who was killed (1912) at College Park, Md.; Selfridge Field, Mount Clemens, Mich., named in honor of First Lieutenant Thomas Selfridge, who was killed (1908) while flying at Fort Meyer, Va., as a passenger with Orville Wright, the airplane inventor; Camp Taliaferro, Fort Worth, Tex., named in honor of First Lieutenant Walter R. Taliaferro, who was killed (1915) at San Diego; Scott Field, Belleville, Ill., named in honor of Corporal Scott, who was killed (1912) at College Park, Md., while flying as a passenger. This speedy construction of training fields outstripped the equipment output needed for training, which did not catch up to requirements till the end of 1917, by which time great improvement had been made in the airplane technique see Aeroplane). About 17,000 cadets were graduated from ground schools; 8,602 reserve military aviators were graduated from elementary training schools and 4,028 aviators completed the advanced training course. Lacking as Second Assistant Secretary of War, to practical training the finished course for students was accomplished by sending them to France to finish the course before going into action. The insufficiency of mechanics skilled in the knowledge of airplanes and motors necessitated the establishment of training schools which produced over 14,000 graduated mechanics. The consequence of the intense work of the organization was that when hostilities ceased (11 Nov. 1918) there were 6,528 men training as aviators in the United States consisting of 22 per cent students in ground schools, 37 per cent in elementary schools and 41 per cent in advanced training schools. Aviator mechanics in training numbered 2,154. The number of fliers, including pilots and observers, who were trained abroad, the government informs us, up to 6 Nov. 1918 was approximately 2,300. On 11 Nov. there was the extraordinary total strength in the air service of slightly over 190,000 officers and men, a body of men greater than the United States army at the beginning of the year. These figures constitute slightly over 5 per cent of the total strength of the army, a growth from 65 officers and 1,120 men on America's entrance into the war.

Activities in Europe.—The actual fighting value of all this mighty effort to produce, in unprecedented time, a flying corps that should be worthy the proud war annals of the American military forces in former campaigns, is shown by a short relation of facts given forth from the government's documents. Early in 1918 the first squadrons composed of American personnel appeared at the front. In the absence of any equipment of American production the French provided the airplanes from what stores they could spare. As fast as equipment was increased fresh aviators took to the field. The first airplanes received from the United States arrived in May. In all, D. Park, who was killed (1912) in an airplane accident near San Diego; Post Field, Fort Sill, Okla., named in honor of Second Lieutenant Henry B. Post, who was killed (1914) at San Diego in attempting to make an altitude jump; Rockwell Field, Waco, Tex., named in honor of Lieutenant Perry C. Rich, who was killed (1913) by falling into Manila Bay; Rockwell Field, San Diego, Cal., named in honor of Second Lieutenant Lewis G. Rockwell, who was killed (1912) at College Park, Md.; Selfridge Field, Mount Clemens, Mich., named in honor of First Lieutenant Thomas Selfridge, who was killed (1908) while flying at Fort Meyer, Va., as a passenger with Orville Wright, the airplane inventor; Camp Taliaferro, Fort Worth, Tex., named in honor of First Lieutenant Walter R. Taliaferro, who was killed (1915) at San Diego; Scott Field, Belleville, Ill., named in honor of Corporal Scott, who was killed (1912) at College Park, Md., while flying as a passenger. This speedy construction of training fields outstripped the equipment output needed for training, which did not catch up to requirements till the end of 1917, by which time great improvement had been made in the airplane technique see Aeroplane). About 17,000 cadets were graduated from ground schools;
observers, 204 officers, 373 soldiers. The flying personnel under instruction at date of the armistice included pilots and signed as follows: Preliminary, 126; advanced, 29; pursuit, 850; observation, 140; day bombing, 77; night bombing, 101. Observers in training included 563 artillery; 65 day bombing; 61 night bombing, being a total of 699 officers, thus producing an aggregate of 2,012 in training. Awaiting instruction was a personnel of 155 pilots and 59 observers. Up to 11 Nov. 1918 graduations included 6,069 pilots divided as follows: Preliminary, 1,573; advanced, 2,359; pursuit, 1,160; observation, 723; day bombing, 77; night bombing, 101. Observers totaled 2,045, divided as follows: Pursuit, 88; artillery, 1,425; day bombing, 390; night bombing, 142. This intensive training to gain an efficiency that should make the flier in air ready for and able to contend against all peculiar dangers and necessities he would encounter in midair was in itself so dangerous and full of risk as to have cost the lives of no less than 159 students of the art through accidents. The number of planes, by type, received by the American Expeditionary Force from all sources between 12 Sept. 1917 and 16 Nov. 1918 was as follows: Pursuit service, 3,357; observation, for service, 3,421; for schools, 664; day bombing, for service, 421; for schools, 92; night reconnaissance, 31. General Pershing on 20 Nov. 1918, stated that a total of 4,045 pursuit, 3,223 observation, and 1,952 night bombing planes landed at the front. Of this number, 2,675 were obtained from France, the others from the United States. The entire air service (including balloon) in the zone of advance consisted of 2,161 officers, 22,351 soldiers, a total of 24,512 on the actual fighting line; this does not include service of supply. In their details were eight American flying officers with the French armies, 49 officers and 325 soldiers with the British Expeditionary forces; all exclusive of mechanics. All these aerial forces were apportioned to the following divisions in operation: American aero pursuit squadrons, 25; army observation, 5; corps observation, 12; day bombing, 16; night bombardment, 1; night observation, 1.

Fighting and Casualties.—The exploits of American flying combatants in the World War were first brought before the public view by the quickly celebrated Lafayette Escadrille, composed of a body of young American aviators who, in memory of Lafayette's services to the United States during our War for Independence, volunteered active service in France. It is stated that they had already brought down 30 enemy aircraft before America declared war, when they were the first to raise the Stars and Stripes on the western fighting line. They were incorporated with the American Expeditionary Force under the title Lafayette Squadron. This brave group of fighting bird-men was cited by Marshal Fétain thus: "Brilliant unit which has shown itself, during the course of operations in Flanders, worthy of its glorious past. In spite of losses which took place, the loss of its pilots in a difficult sector, it has assured a perfect security to our corps observation airplanes, a complete service of reconnaissance at both high and low altitude, and the destruction, not only near the front lines but deep in the enemy's territory, of a great number of German airplanes and captive balloons." The easy pilots and observers of intrepid fliers contained William Thaw, Norman Prince, Kiffen Rockwell, Elliott Cowdin, Bert Hall and Victor Chapman. The grave of the latter was discovered in April 1919 where he fell "flying inside the German lines during Crown Prince's Verdun offensive in the Spring of 1916." Another phase of the Allied cooperation in our fighting is given in a government report: "During the last weeks of the Allied offensive, squadrons of de Haviland 9's from both British and American air forces, were bombing military objectives in the German towns back of the Hun lines every day and night. Despite the opposition put up by the German air squadrons and anti-aircraft batteries, this was particularly true in the neighborhood of Saarbrucken, Kaiserslautern, Treves and Mannheim. Here the British and American planes often had to fight their way 100 miles to their objective through squadron after squadron of fighting Hun machines, and then, after dropping their bombs, have to fight their way back the whole 100 miles to their own lines. The casualty list at the front, although somewhat higher than that of the British artillery rate, is considered a small one compared with the total strength. Up to 24 Oct. 1918 fatal accidents and battle losses amounted to 244 on the European fields. Statistics show, however, that two averages are used in calculating the average, in accidents for each aviator killed in battle, Quentin Roosevelt, 65th Aero Squadron, fell fighting 14 July 1918. A table of casualties *on the front* gives the following figures: One hundred and seventy-one killed in combat; 135 taken prisoners; 129 wounded; 73 missing; 42 killed in accidents; other causes 4; a total of 554. The rapidity with which the casualty list grew with the advance in the fighting is contained in the following figures: March 1918, two; April, none; May, 27; June, 29; July, 65; August, 82; September, 181; October, 125; November 1st to 11th, 43. Some idea of the gigantic scale and complexity of tactics into which the activities of the aviation arm were developing can be seen from each description as that at Messines Ridge. In this wonderful encounter we have the following battle formation: A squadron of fighting planes near the earth armed with guns for attacking troops in the trenches, transports, etc.; above, at a height of from 3,000 to 5,000 feet was a division of bombing machines to attack the enemy lines, and, at an elevation of 15,000 to 20,000 feet, were chasing machines for attacking enemy bombers which might attempt to drop bombs from above on the Allied bombers. Many pages of the War Department's Air Service Weekly News Letter are filled with a great number of very daring successful exploits of the individual flyers *cited for distinguished service* such as First Lieut. Frank Baer's (103 Aero Pursuit Squadron), who *brought down enemy planes on April 5, 12 and 23, 1918. On 21 May 1918, this record reached an eighth enemy plane." George R. Phillips, pilot, 50 Aero Squadron, at La Mortحملle, 23 Oct. 1918, "attacked an enemy balloon and forced it to descend and was in turn attacked by three enemy planes."
The incendiary bullets from the enemy's machine set the signal rockets in the observer's cockpit afire. Disregarding the possibility of going down in flames, Lieutenant Phillips maneuvered his plane so that his observer was able to fire on and destroy one enemy plane and drive the others away. He then handed his fire extinguisher to Lieut. L. Brown (observer), who extinguished the flames. They completed their mission and secured other valuable information.\(^a\) Second Lieut. L. Glen A. Preston, field artillery observer, 90th Aero Observation Squadron, cited for heroism in action near Andevanne. Separated, on a photographing expedition, from his protecting planes and continuing alone, he was attacked by seven Fokkers; he drove them off and secured numerous photographs. Next day he accomplished his mission though disputed by encounters with four separate enemy formations, one of 58 machines, another of 6, another of 7, then a formation of three Fokkers. He shot down one aircraft over the enemy. Capt. Edward V. Rickenbacker, 94th Aero Squadron, is credited with destroying 26 enemy machines. Those aviators who bring down five or more are unofficially termed "aces." Rickenbacker justly earned the title of "Ace of Aces.\(^a\) He gained his Distinguished Service Cross in October 1918. One extra bar was for voluntary patrol heroism near Bilby when he attacked seven enemy planes (five, type Fokker, protecting two, type Halberstadt). He dived on them and shot down one of the Fokkers, then attacked a Halberstadt and sent it down. But the most astonishing meteoric career in the history of the Flying Corps was that of Second Lieut. Frank Luke, 27th Aero Squadron. In 17 days he shot down 18 enemy machines, then met a tragic death. Alone he attacked three "Drachen\(^a\) observation balloons, was cut off by 10 enemy planes, engaged them all, got two of them, then escaped by pretending he was disabled. His counterpart "falls" started above the balloons, of which he shot all three in flames, then was heard of no more. Some peasants say he landed alive and was shot to death by the Germans. This extraordinary Fokker pilot, a happy-go-lucky youth, only 20 years old when his brave life was snuffed out against all the laws of war. Consult Sweetser, "The American Air Service" (New York 1919).

UNITED STATES INDIAN TRAINING AND INDUSTRIAL SCHOOL, at Carlisle, Pa. It was established on the present site in 1879, but its real beginning was in 1875, when 74 Indians were brought as prisoners of war to Fort Marion, Saint Augustine, Fla. When put to work at the fort they proved intelligent and trustworthy, and their skill as workmen aroused the interest of some of the women of Saint Augustine, who established a school for them and taught them English. In 1878, when their term of confinement was over, 22 asked to stay in the East to attend school, 17 of whom were placed at Hampton Institute; Capt. R. H. Pratt of the United States Service then authorized the bringing 50 more Indians from the Dakota reservation to Hampton. He soon found that a separate school for the Indians was desirable, and the abandoned army post at Carlisle was assigned for the uses of a school in 1879. In October of that year he brought the first Indian pupils to Carlisle. The aim of the school has always been to prepare the Indians to take part in the life of a civilized community as citizens on an equality with other citizens, and thus to free them from special and separate supervision. The courses offered are of elementary and secondary grade, and are grouped about four central subjects, the English language, history and literature, science, and form and number (including geometry and algebra). There are also excellent music and art departments. A normal department was organized in 1894 and provides instruction in psychology (elementary), pedagogics, history of education, and methods of teaching sloyd, with practice work. The industrial work is a prominent feature, half the school day being devoted to some productive industry. Instruction and practice is given in carpentry, blacksmithing, painting, barroom making, tinsmithing, shoe-making, laundry work, hospital and nurse work, sewing, household and domestic economy (including special course in bread-making), farming and dairying. Another important part of the work is systematic physical training, gymnastic classes being arranged for boys and girls in all grades; athletic sports are also encouraged, and the football team has a national reputation for excellent playing. The most distinctive feature of the school is the "outing system," by which the school requires its students to spend at least one year in some white family under the supervision of the school. During the winter they attend the public school in their neighborhood, and when not in school receive regular wages for work on the farm or in the home; a portion of these wages is placed in the school bank and draws interest. This system, which has been in force since the beginning of the schools, has proved eminently successful; the Indians have been pleasantly welcomed in the homes to which they go, and have proved themselves, as a rule, helpful and congenial members of the family. Over 800 pupils are sent out every summer, and about half that number return the next year. The aim of this system is to enable the Indians to gain direct, personal experience in self-support by honest work, and an insignt into the responsibilities and amenities of civilized family and institutional life in its best and most attractive forms. The united earnings of the students who were working outside, in 1909, amounted to about $40,000. A weekly paper, The Red Man and Helper, is printed in the school shop by Indians. The school is under the control of the Indian Office of the United States government, and is supported by government appropriation. The students in 1910 numbered 1,075; the total enrollment since the beginning was more than 7,000.

UNITED STATES AND MACEDONIAN, Battle of, in the War of 1812. On 8 Oct. 1812 Stephen Decatur (q.v.) sailed from Boston with his Frigate United States (rated as a 44 but carrying 32 long 24's and 22 short 42's) and on 26 Oct. was authorized to bring 50 more Indians from the Dakota reservation to Hampton. He soon found that a separate school for the Indians was desirable, and the abandoned army post at Carlisle was assigned for the uses of a school in 1879. In October of that year he brought the first Indian pupils to Carlisle. The aim of the school has always been to prepare the Indians to take part in the life of a civilized community as citizens on an equality with other citizens, and thus to free them from special and separate supervision. weighed the long 18's of the Macedonian's broadside that 10 minutes after the battle began on the scene; the Macedonian was indescribably confused and horrible. Carden then bore down to engage in close fighting, but the carronades of the American vessel got into play and worked fearful havoc, shooting away the masts and rigging and silencing many of the guns of the British frigate. At 11 o'clock the United States passed out of range to refill cartridges and repair a few minor injuries, whereupon the British crew, believing the Americans had given up the fight, set a union jack and gave three cheers. But the United States soon resumed the fight, taking a raking position across the stern of her defenseless foe, and at 11:15 compelled her to strike, just an hour and a half after the action began. The Macedonian lost 104 killed and wounded and the United States 12. Decatur sent the Macedonian to New London—the only British frigate ever brought as a prize into an American port—and she was later sent to New York where, after repairs, she was placed under command of Capt. Jacob Jones (q.v.) of the Wasp (q.v.). At City Island, New York, her cabin and other portions of the ship were used to form part of the Macedonian Inn. UNITED STATES OF MEXICO. See MEXICO.

UNITED STATES MILITARY ACADEMY, a national institution at West Point, N. Y., for the education of officers for the regular army, organized in 1802. Candidates for admission must be 17-22 years old, at least five feet four inches in height at 17, five feet five inches at 18 and upward, of good moral character and free from anything that would render them unfit for military service. They must pass a severe medical examination, and an examination in reading, writing, orthography, arithmetic, elements of grammar, descriptive geography, and the history of the United States. The course is four years, the pay is $848.20 per annum; an oath of allegiance is required of each cadet, also a pledge to serve the United States for eight years after graduation unless sooner discharged. Admission is secured by appointment of the President of the United States. Each congressional district may now send two cadets, two also may come from each territory, four from the District of Columbia, two from natives of Porto Rico, four from each State at large, 20 of whom are selected from among the honor graduates of educational institutions having officers of the regular army detailed as professors of military science and tactics under existing law. The President is authorized to appoint cadets from among enlisted men of 19-22 years old who have served not less than one year, provided that the total number so selected shall not exceed 180 at any one time. The annual increments are, therefore: States at large, 21; congressional districts, 92; Alaska, District of Columbia, Porto Rico, Hawaii (combined), 1 each year to the source longest without an appointment; honor schools, 5; regular army, 23 in 1919; National Guard, 23 in 1919. The appointments from a congressional district are made upon the recommendation of the representative in Congress from that district, and those from a State at large upon the recommendations of the senators of the State. In general the appointments from each territory, honor school, etc., are made upon the recommendation of the highest authority in that territory, school, etc. Candidates are nominated as many times as possible, one year before admission. Those nominated are admitted either by examination or by certificate that the candidate is a regularly enrolled student in good standing in a university, college or technical school accredited by the United States Naval Academy, provided that the entrance requirements of the course he is pursuing require proficiency in subjects amounting to not less than 14 units of the academy examinations. A military staff assists the superintendent, which is the requirement for admission was raised in 1902. Classes at the academy are divided into groups of from 7 to 12 cadets and to each group is assigned an instructor. This arrangement makes it imperative for the cadet to prepare for recitation every day in every subject of his course and in this manner the authorities have an adequate check on his progress from day to day. At the end of the course of four years cadets of the highest standing are recommended for all the corps of the army, especially the engineers; while those of lower standing are sent to the cavalry, field artillery, infantry, etc., but never to the engineers. No vacations are granted for the first two years. The first furlough is granted to cadets who have maintained a worthy record. During the World War graduations of the first and second classes were advanced, the latter by almost a full year. The course of instruction, which is thorough, requires four years, and is largely mathematical and professional. The principal subjects are mathematics, English, French, drawing, drill regulations of all arms of the service, natural and experimental philosophy, chemistry, chemical physics, mineralogy, geology, electricity, history, international, constitutional and military law, Spanish, civil and military engineering, art and science of war, ordnance and gunnery. From 15 June to about 30 August cadets live in camp, engaged only in military duties and receiving practical military instruction. There are 120 persons on the military and academic staffs of the academy and 927 cadets. The whole number of cadets graduated from 1802 to 1918, inclusive, has been 6,028. See ARMY SCHOOLS; MILITARY EDUCATION.

UNITED STATES NATIONAL MUSEUM, a national depository for scientific and historical collections under the administration
of the Smithsonian Institution (q.v.), located at Washington, D. C. The beginning of the museum was Smithsonian's cabinet of minerals, and other collections gathered by exploring expeditions, which had been placed under the charge of the Smithsonian Institution by the act establishing it in 1846. The name of United States National Museum was not adopted until 1876, when the Smithsonian Institution added to the collections already made the exhibits prepared to illustrate the resources and ethnology of the United States at the Centennial Exhibition, together with a large amount of material presented by 34 foreign nations. In 1879 Congress appropriated $250,000 for a museum building; but this has for some time been inadequate for the proper housing of the collections, and a new building was provided for in 1903 by the appropriation of $3,500,000. The chief means of adding to the collection are by the specimens gathered by government explorations and surveys, by exchanges, by gift, and by limited purchases provided for in the Congressional appropriation. The museum is under the general direction of the secretary of the Smithsonian Institution, and under the special charge of an assistant secretary and curators, appointed by the secretary; and receives an annual appropriation from the government. Its collections are naturally best for matters relating to North America, the material illustrating the arts and occupations of the American Indians and the fisheries of the United States is particularly valuable; and the historical collections containing personal relics of famous Americans are interesting. The museum publishes Proceedings and an Annual Report, containing scientific articles describing or illustrating the collections; and is also given to students in using the collections for purposes of scientific research.

UNITED STATES NAVAL RESERVE FORCE. When the United States entered the European War, it became evident that in having both "National Naval Volunteers" and the United States Naval Reserve Force, the national government was maintaining two organizations in peace to accomplish the same end of providing reserve man power for the navy in war. To continue to carry on both could produce only a duplication of effort with a double overhead of cost and personnel for training. It was seen that individual State effort as exemplified in the militia would result in providing a number of miniature navies and that Naval Militia, even though it could change to National Naval Volunteers, was the lesser efficient of the two methods of developing trained man power. It was, therefore, decided to work out a means of amalgamating the "Volunteers" with the "Reserve Force." To effect the amalgamation it was necessary to give special consideration to the former naval militiamen. These men, at great personal sacrifice and expense, had for years been giving their time and energy to their State organizations and, without much aid from the national government, had done much to prepare themselves for the government service in time of war. They were entitled to some reward for their untiring devotion and, in fairness, the organizations they had so laboriously built up could not be totally destroyed without a hearing. Accordingly, the highest ranking and oldest officers of the militia were called into conference to determine the ways and means of amalgamation. The conferences went off smoothly and the officers called in met the situation fairly. Seeing the national good coming therefrom, they quickly agreed to the practical obliteration of the organization they had taken so long to build and in close harmony with the department assisted in drawing up a law transferring their personnel to the United States Naval Reserve Force. The law as drawn up was recommended to Congress for passage and was enacted in the bill approved 1 July 1918. By this act the navy was believed to be in good organization so far as providing training and utilizing man power is concerned. See NAVAL MILITIA.

UNITED STATES PRESIDENTIAL CANDIDATES. Since the establishment of the government of the United States there have been several important changes in the method of electing the candidates for the offices of President and Vice-President. Prior to 1804, for example, each elector voted for two candidates for the Presidency. The one who received the largest number of votes was then declared elected, while the candidate receiving the second largest electoral vote filled the office of Vice-President. Thus as the electoral vote at the first election showed 69 ballots for George Washington and 34 for John Adams, General Washington became the first President of the new republic, while the defeated Adams was declared its Vice-President.

During the first quarter of its national existence practically a "direct" vote was cast for the election of the two chief executives of the United States. Instead of selecting the electors by a "direct" vote—as is the case at the present day—in nearly all States, the electors were "indirect" by the legislature, a fact which makes it extremely difficult, if not absolutely impossible, to obtain any accurate figures which might indicate the strength of popular opinion at any of the national elections prior to 1824, by which time the choice of electors by the "direct" vote of the people had become general throughout the Union.

It was not until 1804 that electors cast their vote for both a President and a Vice-President instead of for the two candidates for the Presidency, for it was during Thomas Jefferson's first term that this matter was so widely agitated that a necessary Constitutional amendment was adopted providing for the methods of election which now prevail in all parts of the country.

Although, from an official point of view, there is no such thing as a popular vote for the election of President and Vice-President the ballots cast and the votes of the several electors is always regarded as the "direct"
expression of popular opinion, and as the number of such electors is apportioned among the several States upon a basis in keeping with the growth of population it is not strange that the popular vote and the electoral vote should not always agree in their results. In 1824, for example, as in 1888, the candidate who was defeated by the electoral college was the one who had received the largest "direct" vote. So, too, in 1876, when the dispute over the electoral vote of several of the Southern States was referred to the Congressional electoral committee, the choice of Hayes defeated Tilden, a man who had received almost 300,000 more votes from the people.

UNITED STATES RECLAMATION SERVICE, a bureau of the Department of the Interior of the United States government created by Act of Congress, 17 June 1902, for the purpose of survey, examination, construction and operation of works for the reclamation by irrigation of arid and semi-arid lands. Funds were provided by the Act by setting aside the proceeds of the disposal of public lands which from 1902 to 1919 aggregated nearly $100,000,000. This amount with the greater part of an additional loan of $20,000,000—or in round numbers approximately $120,000,000 have been spent up to 1919 in works for conservation and distribution of water supply in the western part of the United States. Among the most notable of these works are the Roosevelt dam and canals in Arizona, distributing water to the valley lands in the vicinity of Pheenix; the Arrowrock dam in Idaho; the Elephant Butte dam in New Mexico; the Gunnison tunnel in Colorado and many other works. See HYDRAULIC ENGINEERING.

The Reclamation Service as originally created was independent of annual appropriations. It was thus able to make plans for carrying out its work in consecutive order through several years as is necessary in ordinary business affairs and could give full consideration to the requirements of efficiency and economy. Since 1915, however, definite appropriations for each project have been made annually by Congress.

Origin of the Service.—The necessity for this law arose from the fact that the western two-fifths of the United States consists in great part of public land. The conditions of aridity are such that only a very small portion of this land can be utilized for agriculture. Attempts made by individuals and organizations to irrigate the lands, while successful from an agricultural standpoint and from that of the development of the country, were not profitable to the investor, hence development and the use of the resources of the west were not progressing rapidly. It became appreciated about 1900 that further progress could not be expected without direct effort on the part of the Federal government, the owner of the great body of the arid public lands. The objections to making direct appropriations for improving these

*Died before meeting of Electoral College. Republican votes cast for Mr. Butler, substitute nominee.*
lands was met by the ingenious plan proposed by the late Senator, then Representative, Francis G. Newlands, of Nevada to the effect that money derived from the disposal of portions of the land should be used in reclaiming other portions.

Organization.—The Reclamation Service was an outgrowth of the work of the United States Geological Survey. The latter bureau was authorized by Congress, in March 1878, to investigate the extent to which any region might be reclaimed, this action being taken largely through the effort of the then director, Maj. John Wesley Powell. The investigations were made by what was known as the Hydrographic Branch, measurements of water supply in many streams being begun and also surveys of possible reservoir sites. The information thus obtained and widely diffused laid the foundations for a presentation of the needs and opportunities of water conservation and furnished the facts for action by Congress taken in accordance with the recommendation of President Theodore Roosevelt in his first message in 1901. As one of a series of bills authorized on 17 June 1902, the work was under a chief engineer who continued in charge, under the director of the Geological Survey, until 1907, when the service became a separate bureau and the chief engineer was made director, reporting to the Secretary of the Interior. Because of widely separated location of the work, in 17 Western States, and their remoteness from lines of transportation, it became necessary to develop an organization where the largest possible discretion might be exercised by the men in the field, at the same time securing proper uniformity and compliance with governmental regulations. This was brought about by having five supervising engineers each in charge of work in a group of States where the climatic conditions were similar. Under these were project engineers in responsible charge of each particular piece of work and a general authority to execute these works according to plans agreed upon in advance after conference with various technical advisers or consulting engineers as well as the chief and supervising engineers. In this way they had a fully defined authority and responsibility, operations proceeded with a rapidity and skill seldom found in governmental bureau where the tendency has been toward excessive centralization of authority and development of so-called "red tape." Modifications of the system were made during the years 1914-16 by placing the authority in the hands of five commissioners located at Washington, the number being later reduced to three, the offices of the supervising engineer being abolished and the project engineers reporting directly to Washington, later to a more central point at Denver, and with a gradual return to former and more efficient methods. The organization has since been placed again under one head, the director and chief engineer, located at Washington, D. C., with a chief of construction at Denver, Colo.

Under the original organization plans were made during the years 1902-07 for works whose completion has required all of the funds which would be available from the proceeds of the disposal of public lands for a decade or more—the plans being so drawn as to permit expansion to the full limit of the available water supply in each locality. The work was undertaken in such manner as to enable completed portions of each project to be utilized before all parts were finished. It was also considered wise to start work on a broad basis in a number of localities rather than concentrate it in a few places because by so doing a more nearly normal growth of each project was possible. This is in contrast to the attempts made by private investors to complete one large project and then operate it as a whole without having had the advantage of experience acquired through the slow growth of the component parts. Most of the works thus planned from 1902-07 have been brought to a degree of completion such that a large part of the land is being utilized. The appropriations now made annually by Congress from the reclamation funds are utilized to finish these works.

Works Built.—The principal works are those for storage of flood or waste waters and for conducting the waters thus made available from the natural streams to the lands to be watered. Besides the large storage dams there have been built many diversion dams in the rivers, turning the water into large canals built in rock or earth where they divide and the canals divide into smaller distributaries or laterals leading to each farm. To control the water, gates are provided in the canals and at each outlet; also flumes and occasionally pipe lines, bridges and culverts for road crossings, as well as many other structures. The following table gives a recapitulation of the more important of these:

[To 30 June 1919.]
Economic Problems.—The object of the expenditure which has been made from the reclamation fund is to provide water for lands which without it would be incapable of producing any crops. The actual intention was to take the water to lands belonging to the United States. It was found, however, that individuals taking advantage of various land laws had already obtained possession of the lands which might be irrigated to an extent such that it was impracticable to discriminate and hence lands which had formerly been in public ownership were included in the reclamation projects, the requirements being enforced that no one landowner should be permitted to obtain water from the government works for an area larger than that adequate for the support of a family and not to exceed 160 acres.

Although the government advanced the money and built the works, it is intended that the lands benefitted shall ultimately return the cost in 10, or as later amended 20, annual instalments without interest. It is also required that until this amount is paid the owner must live upon the land or in the vicinity of the work, and bear as far as possible absentee landlordism, and to give the preference to those men and their families who are actually seeking a home, as distinguished from an opportunity for investment or speculation.

The liberal terms offered and the fact that the government was undertaking the work attracted all kinds of people, including both competent and incompetent. There is no provision by which selection can be made of persons who are qualified by strength or experience to carry on an irrigated farm. As a result a considerable number of adventurers or rascally people seized upon the opportunity in the Lopes of getting from the government something for nothing and of selling out later at a profit. It followed that in the settlement of these lands there has been some shifting of population, although probably less than in the case of privately built projects. This condition seems to prevent anyone but new countrymen, or those who are of the group to whom the government act was intended to apply, from settling on lands irrigated at government expense. The assumption of the law has been in general that each citizen should have an equal opportunity without discrimination. Experience has shown that better results might perhaps have been obtained if it had been practicable to set certain conditions of physical and financial ability and experience in handling an irrigated farm. In this connection, however, it is interesting to note from a recent investigation on several reclamation projects, that the average number of settlers to a farm unit ranged from 1.14 where conditions were favorable to 1.68 where conditions were unfavorable, with a general average of 1.49; showing for Federal projects at least, that there is little basis for the statement so often made that "throughout the newer parts of America at least three settlers in succession attempt to develop a farm before one succeeds." It appears that the risk taken in the investment or the greater part of it, there is no question but that the risk has been justified, even though the interest and a large part of principal is lost. The lands irrigated are situated in the more remote and sparsely settled parts of the United States and their occupation makes possible the development of other natural resources which otherwise might be untouched. There is thus a large indirect gain not merely in material prosperity, but in building up communities of producers whose efforts contribute not merely to the wealth of the nation, but more than this to the production of more vigorous types of citizenship. For crops in this region see Day Farming.

FREDERICK H. NEWELL,
Professor of Civil Engineering, University of Illinois; formerly with the United States Reclamation Service.

UNITED STATES SANITARY COMMISSION. The organization appointed by the United States government during the Civil War, and co-operating with it in promoting the health, comfort and efficiency of the armies. It also gave aid to the navy. At the outbreak of the war, the Sanitary Commission consisted of the Surgeon General, the Secretaries of War and the Navy, the Attorneys General of the Military Departments of the regular army were inexperienced in caring for large bodies of men, in active service, the last war (Mexican) being in 1846-48. The medical staff could not properly initiate or execute sanitary work, as by custom, hospital construction and the transportation of sick and wounded belong to the Quartersmaster Department, and the regulation of diet to the Commissary. Inspection and the means for giving aid were imperfect. The war prevailed from 12 April 1861 to 9 April 1865. On 15 April 1861 President Lincoln called for 75,000 volunteers, believing they would be required for only a few months. But in July of the same year 800,000 more were called for, later 300,000, and in 1864 500,000. Of this army of over 1,000,000 men (with 15,000 regulars) 350,000 died during the war, thousands were crippled by wounds and ailments. About 190,000 of the deaths were from sickness, mainly no systemical or epidemic diseases, chiefly pulmonary, erysipelas and general debility, the result of insufficient sleep, clothing and food, exposure, hard marches and poor drinking water. In the early part of the war, before drafting was resorted to, one-fifth of the volunteers were in their 19th year and three-fourths were under 30 years of age.

Realizing that to do the most good there must be co-operation in a definite plan, under the auspices of the government, Rev. Dr. Bellows and Dr. Elisha Harris called a public meeting at Cooper Institute. At this meeting it was decided to collect and disseminate information upon the actual and prospective wants of the army, to establish recognized relations with the medical staff and act as auxiliary to it, to maintain a central depot of stores and open a bureau for the examination and registration of nurses.

Dr. Van Beuren and Harsen, representing two prominent New York medical associations, suggested to General Scott that diseased men and mere boys should be discharged from the army. Comparatively few were discharged. The government neglected work with the medical staff and if possible have its sanitary powers increased. This was not done. In May 1861 the government was appealed to to
appoint a commission of civilians, medical men and army officers, to co-operate with the Medical Bureau (or to act independently) and conduct an investigation as to preventable diseases of hospitals and camps. On 9 June 1861 the government appointed a commission of inquiry and advice in respect of the sanitary condition of the United States forces. The commission was without pay, but had a furnished room allotted it in Washington and was to ascertain the sanitary condition of volunteers, to suggest means to preserve and restore health, and to insure the general comfort and efficiency of troops, such as proper cooks, nurses, hospitals, etc., and to correspond freely with the War Department and the Medical Bureau.

The United States Sanitary Commission organized 12 June 1861 with Rev. Dr. Bellows as president. Relief was to be subordinate to prevention and advice, the conclusions of the commission must be approved by the Medical Bureau, ordered by the War Department and carried out by officers and men. The six inspectors of camps appointed for inefficient discipline, overwork, overcrowded tents, offensive sinks, personal uncleanness, poor and filthy clothing, badly cooked food and a scarcity of green vegetables. By persistent efforts of the commission these deficiencies were gradually remedied to a large extent. But it was difficult at first to raise sufficient money for preventive measures, though life insurance companies responded nobly. Later, when the work broadened, railroad, telegraph and express companies gave their services and with the people at large contributed abundantly. Cash receipts to 1 May 1866 were $4,962,014.26, and of branch treasuries nearly $2,000,000 more. Supplies furnished during the war were valued at $15,000,000.

Before the war there was no general hospital, only tent hospitals, the largest containing 40 beds. In July 1861 the commission suggested well-equipped general hospitals in pavilion form, and that these should be built under the direction of the Medical Department, which should also arrange for the transportation of the sick and wounded and attend to their diet. The relief system was divided into general and special relief, the first attending to the wants of the inmates of general, field and regimental hospitals, and of men in camp and on the march, the second cared for the sick and needy at military depots, discharged men, paroled prisoners and irregulars. The various agents of the commission were paid a moderate salary, it being found best not to rely upon volunteer agents. With each army was a medical inspector, relief agents, wagons and horses, transports if necessary and a supply depot at the base.

The special relief service cared for men on their way to and from the front, in 40 "Homes," "Rests" and "Lodges" at various points; acted as attorneys in obtaining back pay and pensions; kept the "Inmates Pay List" which in danger might befall them; paid their way home when necessary, established feeding stations, where hot soup and coffee were always ready and cared for discharged prisoners at parole camps and the motley crowd of substitutes, stragglers, deserters, etc., at convalescent camps, affording comforts, information and opportuni-
ties to communicate with their families.

The Auxiliary Relief Corps, organized in 1864, cared for the wounded and sick sent to the depot field hospitals in the rear of large armies and also for those left behind by an army in its onward march. It furnished food, stimulants, underclothing and reading matter, communicated with the soldiers' friends, obtained express packages, and provided in many instances burial. Other work was accomplished by the commission. Medical tracts, on subjects relating to army life, prepared by experts, were distributed to army surgeons. A Hospital Disbursing Office in Washington, branches in other cities, was established, recording entrances, transfers and discharges. In 1863 a "Free pension and war claim agency" was founded. Over $2,500,000 of back pay, $750,000 were obtained for discharged soldiers, at a saving to the beneficiaries of thousands of dollars.

Valuable statistics were published in pamphlet form, embracing the effects of soldiers of marches, the rate of recruiting required for the losses of war, measurements of soldiers, the number of sick in various regiments and the causes of sickness, etc. The success of the commission was due to the influence of popular ideas, American civilization and thorough organization, although it had much to contend with in the way of governmental red tape and deficiencies and the bad will of State agencies.

UNITED STATES STEEL CORPORATION. The. An industrial organization formed in 1901 by the amalgamation of the Carnegie Steel Company, the National Tube Company, the American Steel and Wire Company, the National Steel Company, the American Tin Plate Company, the American Sheet Steel Company, the American Steel Hoop Company, the Lake Superior Consolidated Iron Mines and the American Bridge Company. These 10 merged companies had an aggregate capital of $867,550,394, of which $459,930,694 was common stock, $247,613,700 preferred, and $160,000,000 bonds. Robert H. Garr, president of the Federal Company, Andrew Carnegie, owner of the Carnegie Company, Charles M. Schwab, a Carnegie official, and J. P. Morgan, banker, were the principal figures in effecting the consolidation which created a capital of $500,000,000 each in common and preferred stocks was authorized, together with $304,000,000 in bonds, making a total of $1,304,000,000. The syndicate which financed the transaction, headed by the Morgan interests, advanced $25,000,000 in cash as working capital. In less than a year from its foundation the stockholders of the old companies had exchanged their holdings for stock of the new corporation.

The steel-producing equipment controlled by this gigantic corporation comprised 149 steel works of various kinds, having an annual capacity of 9,400,000 tons of crude and about 7,700,000 tons of finished steel; 78 blast furnaces with a pig-iron capacity of 7,400,000 tons; over 50,000 acres of coking coal lands; over 1,000 miles of railroad; a fleet of 112 vessels engaged in traffic on the Great Lakes, and areas of ore-bearing property, docks, natural gas and limestone properties, etc. The men who guided the destinies of the new company were J. P.

In the 20 years since its foundation the United States Steel Corporation has expended over $500,000,000 out of its earnings for the building of new plants and the extension of old ones. Its plants now have a capacity of 20,000,000 tons of steel ingots and all the pig iron it needs.

It was soon realized that a concern controlling two-thirds of the nation's total possible output of continuous-potentialities affecting the general welfare of industry and of the country, of its competitors, customers, employees, or through these, the general public. Generally speaking, the corporation's selling methods have had no sort of price fixed by its competitors and the consumer has fared equally well at its hands. In its treatment of its employees, it is only fair to note that it has spent great sums of money in sanitation and other methods of social betterment. It has opened a way for its employees to become stockholders. On the other hand it has encouraged workers of alien birth, unfamiliar with American customs and ideals, with the object of being unhampered by trades unionism, from which it was supposed the alien worker might be held aloof. During the war years 1914-18, however, these "safe" alien workers became imbued with ultra-radical ideas and the great strike of the autumn of 1919 was the result.

In the first nine months of its operations the United States Steel Corporation reported net profits of $84,779,258, of which $61,425,306 was distributed to stockholders at the rate of 7 per cent on preferred and 4 per cent on the prior issue. In 1902 the net profits were $133,308,764, full dividends were paid and the company showed a surplus balance of $34,253,657. In 1903 began the general industrial depression which lasted well into 1904. In 1905-06 the city of Gary, Ind., was founded by the corporation which erected there a plant of the most modern standard. The corporation's net profits in 1906 amounted to $156,624,273. The year 1907 is one of the most important in the history of the Steel Corporation. During the industrial panic of that year the corporation secured control of the Tennessee Coal and Iron Company, its strongest competitor in the South. The corporation soon found itself in the toils of the law, the government having instituted proceedings for its dissolution as a monopoly in restraint of trade. The taking of testimony was not finished until the spring of 1914 and on 3 June 1915 the United States District Court of Appeals handed down a decision that the corporation was not a monopoly in restraint of trade. Depression in the industrial field caused the corporation to pass dividends in the last quarter of 1913 and again in 1914. Not until March 1915 were operations again under way to produce 60 per cent of capacity. As the war in Europe developed the business of supplying steel for the "neutral" of war grew apace. By 30 June 1915 one-third of the corporation's output was being exported to England, France and Russia. After the entry of the United States into the war the demand increased far beyond the capacity of the country's steel mills, and under war stress, expansion on an enormous scale ensued.

The total earnings of all properties after deducting all expenses incident to operations amounted to $208,281,104 in 1918. From this must be deducted the charge for interest on outstanding bonds, mortgages and purchase obligations, leaving $136,902,923.36. Dividends for the year have a capacity of 20,000,000 tons of steel ingots and all the pig iron it needs.

Preferred, 7 per cent. $25,219,677
Common (Regular, 5 per cent). 25,415,125
Extra, 9 per cent. 45,747,225

In the same year the corporation mined 28,332,000 tons of iron ore; 5,141,365 tons of limestone; 31,748,135 tons of coal; manufactured 17,757,636 tons of coke; produced 15,700,561 tons of pig iron and 240,393 tons of spiegel and ferro-silicon; made 19,583,493 tons of steel ingots and finished steel products; also 7,287,000 barrels of cement. The average number of employees in the service of the corporation during the year and the total wages paid were as follows:

<table>
<thead>
<tr>
<th>No. of employees</th>
<th>salaries</th>
</tr>
</thead>
<tbody>
<tr>
<td>251,350</td>
<td>$426,299,390</td>
</tr>
<tr>
<td>17,360</td>
<td>26,364,234</td>
</tr>
</tbody>
</table>

Total. 268,710 $452,663,524

The average salary or wage per employee per day of all employees, exclusive of general administrative and selling force, was $5.33 as compared with $4.10 in 1917. The gross earnings in 1918 reached the unprecedented sum of $7,743,312.163. (See STEEL, CORPORATIONS, History of; Trusts, Carl). Consult Berglund, Alvar, 'The United States Steel Corporation' (Vol. XXVII, No. 2, Columbia Univ. Press, New York 1907); Cotter, Arundel, 'The Authentic History of the United States Steel Corporation' (New York, 1916), uncritically capitalistic in tone and replete with false inculcation of the chief heads of the Steel Trust; United States Steel Corporation—Statement of Wages (n.d.); Wilhelm, Donald, 'The Story of Steel' (United States Steel Corporation, Bureau of Safety, Sanitation and Welfare, New York 1917); Annual Reports of the United States Steel Corporation (Hoboken, N. J., annually, 1902—).

UNITED WORKMEN—UNITS OF MEASUREMENT

UNITED WORKMEN, Ancient Order of, a benevolent organization founded in 1868. In 1910 it had 22 grand lodges, 1,970 subordinate lodges and over 110,000 members. In the same year it paid $3,325,000 in benefits.

UNITS OF MEASUREMENT. When any physical quantity is to be measured, it is necessary to select a unit in terms of which the magnitude of the quantity is to be expressed. We may, if we choose, select an entirely arbitrary unit for each different kind of quantity to be measured; or we may select certain arbitrary fundamental units as a basis and construct upon these a consistent system of derived units. The first method is employed (for every-day purposes) in English-speaking countries, and the second in those countries which employ the metric system. In scientific measurements, the second, or logical system is also employed, in practically all civilized countries at the present time.

In any system of units of measurement, it is necessary to select at least three units that are entirely arbitrary. It is customary (though not at all essential) to select, as the three fundamental units, the units for measuring length, mass, and time. In the English system the fundamental unit of length is the yard. It is said that the yard was originally defined, by royal decree, as the length of the arm of King Henry I. The United States yard is defined as 0.9144 metres; the metre being the fundamental unit of length. The British yard is the distance, at 62° F between two lines on a bronze bar kept at the Standards Office, Westminster, London. The relation of the British yard to the metre, as nearly as it can be determined is

1 yard (British) = 0.9144 metres.

The foot is then defined as the third part of a yard, and the inch as the 12th part of a foot. In the British system, the unit of mass is the avoirdupois pound, which is defined as the mass of a certain cylinder of platinum in the possession of the British government, which is marked "NO. 1"; the letters "P." signify "Parliamentary Standard." In the United States the unit of mass is the pound defined as 0.4535925 kilograms, the kilogram being the fundamental unit of mass. The British pound is a mass of platinum iridium deposited in the Standards Office, London. The United States pound and the British pound are equal as nearly as can be determined. In all civilized countries the fundamental unit of time is the second; the second being defined as the 86,400th part of a mean solar day, or the 86,400th part of the average interval between two successive passages of the sun across the meridian of any given place. In the metric system the fundamental unit of length is the metre; the metre being defined as the distance, at 0° C, between two marks on a certain bar of platim-iridium in the possession of the International Bureau of Weights and Measures, at Sèvres, France. The fundamental unit of mass in the metric system is the kilogram, which is defined as the mass of a certain piece of platim-iridium in the possession of the International Bureau of Weights and Measures. The kilogram was intended to be (and is, very nearly), equal to the mass of a cubic decimetre of water, at the temperature (about 4° C.) at which water has its greatest density.

Secondary Units.—The various units that are employed in measurements in addition to the fundamental units described above, are defined, for the sake of precision, in terms of those fundamental units. The United States gallon is defined as a volume of 231 cubic inches. Measures made to contain this volume are usually standard at either 40° C. or 20° C. (68° F.). That is, they are made to hold a volume of 231 cubic inches at one of these temperatures. State standard gallon measures are of brass and are standard at 40° C. Glass capacity measures are usually standard at 20° C. The British Imperial gallon is defined as the volume of 10 pounds of water at 62° F. when weighed in air at 62° F. with brass weights and with the barometer at 30 inches. The volume of the British gallon is 277.274 cubic inches. Many of the secondary units that are used in English-speaking countries are as arbitrary as the gallon; but others are derived from the fundamental units in a perfectly definite way. The unit of work and of energy, for example, in English and American engineering practice, is the foot-pound; the foot-pound being defined as the work that must be done in order to overcome, through a distance of one foot, a force equal to the attraction that the earth exerts upon a pound of matter. (See Force; Mechanics). The attractive force that the earth exerts upon a pound of matter is often called a "pound." This is incorrect, however, for the pound (like the gram or the kilogram) is a unit of mass, and not of force. The "poundal" is the logical unit of force in the system of units in common use in English-speaking countries; the poundal being defined as the force which, when acting for one second upon a body having a mass of one pound, will communicate to that mass a velocity of one foot per second. The poundal is not in general use, however, because in scientific work, where precision of statement and a high degree of numerical accuracy are of paramount importance, the "centimeter-gram-second" system of units is now almost universally employed.

The Centimeter-Gram-Second System.—The centimeter-gram-second system of units is so called because it is based upon the centimeter as the unit of length, the gram as the unit of mass and the second as the unit of time. The name of the system is commonly abbreviated to "C.G.S." In the C.G.S. system, the unit of force is the "dyne;" a dyne being defined as the force which, when allowed to act for one second upon a body having a mass of one gram, will communicate to that body a velocity of one centimeter per second. The unit of work in the C.G.S. system is the "erg," this being defined as the quantity of work that is done when a force of one dyne is overcome through a distance of one centimeter. The unit of energy is also the erg, because energy is measured by the quantity of work that it can perform. The dyne is a very small unit in which it is necessary that we commonly have to deal with in the physical world, it being only about 0.2 per cent greater than the attraction that the earth exerts upon a milligram of matter. To avoid the use of inconveniently large numbers in expressing forces, a unit called the "megadyne" is, therefore,
used to some considerable extent, "megadyne" being defined as equal to 1,000,000 dynes. This convention of prefixing "mega-" to indicate a unit of 1,000,000 times as great as the unit whose name follows the prefix is quite common. A quantity of work equal to 1,000,000 ergs, for example, is called a "megaerg." or, in C.G.S. units, a "megacyl." The prefixed "kilo-" is similarly used to signify a unit that is 1,000 times as great as the unit to which it is prefixed; this being familiarly illustrated in the "kilogram" and the "kilometer." The prefix "micro-" is also employed to a considerable extent, to signify that the unit to which it relates is one one-millionth as great as the unit to the name of which it is prefixed. A "microfarad," for example, is a unit having a magnitude equal to the millionth part of a farad.

The most arbitrary unit in the C.G.S. system is the "absolute atmosphere," which is defined as the pressure of a megadyne per square centimeter. This unit, however, has the disadvantage of being perfectly definite. Moreover, it is not greatly different from the ordinary pressure of the atmosphere. At sea-level in the latitude of Paris, for example, a column of mercury 76 centimeters high, and at a temperature of 0° C., exerts a pressure of 1.0136 megadynes per square centimeter; that is, a pressure of 1.0136 "absolute atmospheres."

All of the electrical and magnetic units that are now in common use are based upon the centimeter-gram-second system; and they illustrate, admirably, the convenience of that system.

Electrical and Magnetic Units.—A unit magnetic pole, in the C.G.S. system, is a magnetic pole of such strength that it will repel an equal pole, at a distance of one centimeter, with a force of one dyne. The intensity of a magnetic field, in this system, is numerically equal to the number of dynes of force that the field will exert upon a unit pole that is placed in it. The "moment" of a magnet is the product of the distance between its poles (expressed in centimeters) by the strength of one of these poles; and the intensity of magnetization of a magnet is numerically equal to the moment of the magnet, divided by the volume of the magnet in cubic centimeters.

In electrical measurements, two distinct sets of units are employed, these being known, respectively, as the "electrostatic units" and the "electromagnetic units," because one is commonly employed in calculations concerning static electricity, while the other is employed in work that relates to dynamic (or "current") electricity. Both sets are based upon the C.G.S. system, and it is possible that in the not very distant future a single set of units will be employed for electrical measurements of all kinds. At present, however, this is not feasible, on account of our temporary ignorance with respect to certain points which must be cleared up before an ideal single set of electrical units can be realized. Consult Lodge, 'Modern Views of Electricity'; Maxwell, 'Electricity and Magnetism.'

Electrostatic Units.—The absolute (or C.G.S.) units for the measurement of static electricity are derived from the unit of "quantity of electricity" which is that quantity which would repel an equal quantity, situated at a distance of one centimeter, with a force of one dyne. The C.G.S. unit of electromagnetic force (or difference of potential) is that difference of potential through which a unit quantity of electricity must be raised, in order that the work done shall be one erg. The capacity of a conductor, therefore, is the quotient obtained by dividing the quantity of electricity upon the conductor by the potential which this quantity of electricity produces in the conductor. (The capacity of an isolated sphere is numerically equal to the radius of the sphere, as expressed in centimeters). The unit of current is the current which conveys a unit quantity of electricity in one second of time.

Electromagnetic Units.—The units that are employed in the measurement of dynamic (or "current") electricity are derived as follows:

The unit of current is the current which, when flowing along a circular arc one centimeter in length and one centimeter in radius, produces, at the centre of the arc, a magnetic field of unit intensity. The unit of "quantity of electricity" is the quantity of electricity that a unit current conveys in one second. The unit of electromotive force (or of difference of potential) is a difference of potential of such magnitude that to cause the flow of a unit quantity of electricity against it requires the expenditure of one erg of work. The unit of resistance is the resistance through which a unit current would be produced, by one unit of electromotive force. The unit of capacity is the capacity of a conductor whose potential is increased by unit, by the addition to the conductor of one unit of electricity. The absolute electrical units, in the electrostatic and electromagnetic systems, have not (in general) received definite names; it being sufficient, in calculations in which these units are employed, to speak of a certain number of "C.G.S. units of electricity," or "C.G.S. units of resistance," etc. For the practical measurement of dynamic electricity in the laboratory and the power-house, the absolute (or C.G.S.) units are not of convenient size; and for them it is, therefore, customary to substitute certain more convenient multiples and submultiples of electromagnetic units, as they are defined above. The modified units are known as the "ohm," "ampere," "volt," etc., and are considered in the following paragraph.

Practical Electrical Units.—The unit of resistance that is employed almost universally in practical electrical work is the "ohm," which was named for G. S. Ohm, the distinguished physicist and discoverer of Ohm's law. This is defined as equal to 1,000,000,000 (or 10^10) C.G.S. electromagnetic units of resistance; the ideal standard that has precisely this resistance being called, for the sake of distinct identification, the "true ohm." Many physicists have investigated the value of the ohm, as here defined, and have constructed material standards for practical work, having a resistance of one ohm, as nearly as possible. A committee appointed by the British Association for the purpose of investigating the value of the true ohm prepared a coil of German silver wire, which, at a certain definite temperature, was supposed to have a resistance of practically one ohm; and this coil, from the time of its acceptance.
UNITS OF MEASUREMENT

by the British Association in 1864 down to the year 1884, was the standard ohm of the world, being known, for definiteness, as the "British Association ohm," or, more briefly, as the "B.A. ohm." It is now customary to define the practical ohm in terms of the resistance of a column of mercury of stated dimensions and temperature, as it is found that the resistance of a solid conductor depends not only upon the material of the conductor is made, but also upon the physical state of that material with respect to internal stresses and other circumstances. The B.A. ohm of 1884 has a resistance equal to that of a column of pure mercury having a constant cross section of one square millimeter, and a length of 104.83 centimeters; the temperature of the mercury being 0 degrees C. This standard was subsequently found to be materially smaller than the true ohm, and the International Congress of Electricians at Paris, in 1889, adopted, as the equivalent of the ohm, a column of mercury having a constant cross section of one square millimeter, and a length of 106 centimeters; the temperature of the mercury being 0 degrees C., as, in ordinary use, it is desired that the standard be "legitimate" or "congress" ohm. Several of the physicists present at that congress were of the opinion that the length of the column should be 106.2 or 106.25 centimeters; but the decision being vitally uncertain, it was finally agreed to disregard it entirely, until further experimental evidence could be had. In August 1893 an International Congress of Electricians was held at Chicago; England, France, Germany, Italy, Austria, Switzerland, Sweden, Mexico, Canada and the United States being represented. This congress adopted another and (presumably) better value of the ohm, the new standard being designated as the "International ohm."

The International ohm, which has since been adopted by the nations represented at the conference, was defined as "the resistance offered to an unvarying electrical current by a column of mercury (at the temperature of melting ice) 14.4521 grams in mass, of a constant cross-sectional area, and of the length of 106.300 centimeters." The conference preferred, it will be seen, to fix the sectional area by giving the mass of the column, rather than by stating the sectional area directly. The intention was, however, that the sectional area shall be sensibly one millimeter; for a column of mercury 106.3 centimeters long and having a mass of 14.4521 grams, would have a sectional area, at 0 degrees C, of between 1 and 1.00003 square millimeters. The ohm thus defined by the Chicago congress is probably very near to the true ohm.

The practical unit of current is the "ampere," named for the French physicist, A. M. Ampere. It is defined as equal to the amount of a C.G.S. electromagnetic unit of current. The Chicago International Congress of 1893, after considering the available experimental evidence, concluded that the ampere can be defined, for practical purposes, as equal to the amount of the unvarying current which will deposit 0.001118 gram of metallic silver every second from a solution of nitrate of silver in water. This particular estimate of the value of the true ampere is called; for definiteness, the "International ampere." The practical unit of electromotive force is the "volt," which was named for the Italian physicist, Alessandro Volta, and which is defined as equal to 100,000,000 (or 10^8) C.G.S. electromagnetic units of difference of potential across a resistance which is required in order to maintain a current of one ampere through a resistance of one ohm.

Of the remaining practical electrical units, the coulomb, farad, joule, watt and henry call for special mention in practical units of electrical quantity. It may be defined either as one-tenth of the C.G.S. electromagnetic unit of "quantity of electricity," or as the quantity of electricity conveyed by an ampere in one second. The farad (named for Faraday) is the practical unit of capacity, and may be defined either as the 1,000,000,000th part of a C.G.S. electromagnetic unit of capacity, or as the capacity of a condenser which holds one coulomb of electricity, when charged to a potential of one volt. The farad is much too large for convenience, and although it is called the "practical" unit of capacity, it is replaced, in practice, by the "microfarad," which is equal to the millionth part of a farad. The condensers which are in ordinary use are always made to have capacities of a microfarad, or of some decimal subdivision of a microfarad. The "joule" (named for James Prescott Joule) is the practical unit of work (or energy) in the electrical system of units, a joule being defined as 10,000,000 (or 10^7) ergs; and its practical convenience depends upon the fact that it is equal to the quantity of energy that is expended in one second by a current of one ampere acting through a resistance of one ohm. The "watt" (named for James Watt) is the corresponding unit of power, and is defined either as the expenditure of 10,000,000 ergs per second, or as the rate at which energy is expended when a current of one ampere flows through a resistance of one ohm. In dealing with the large currents that occur in modern electrical power-houses, the watt is an inconveniently small unit, and the kilowatt is almost invariably used in its place, a kilowatt being equal to 1,000 watts. A horse power is equal to 746 watts, or to 0.746 of a kilowatt. The "henry" (named for Joseph Henry) is the practical unit of inductance, and it is defined as the induction in a circuit, when an electromotive force of one volt is induced in this circuit while the inducing current varies at the rate of one ampere per second.

Dimensions.—A surface is said to have extension in three dimensions, and a solid is similarly said to have extension in three dimensions. The volume of a cube, for example, is found by multiplying together the length, width and height of the cube; and hence we may say that the volume in question is of three "dimensions" in terms of three "dimensions." This mode of expression has been extended to other units besides units of length, and the idea has proved itself quite useful in numerous ways. For example, a velocity is found by dividing length by time; if L represents a length and T a time, we may write \( V = \frac{L}{T} \); and we say that velocity is of dimension \( +1 \) in length, and \(-1\) in time. Similarly, force is measured by the change of momentum that it produces, in a given mass, per unit of time. That is, it is found by multiplying...
UNITY OF CONSCIOUSNESS — UNITY SYSTEM OF ORGANIZATION

plying a mass (which we may represent by M) by a velocity, and dividing the product by a time. That is, \( F = MV/T \). But we already know that \( V = LT^{-1} \), and hence the equation becomes \( F = MLT^{-1} \). And we say that force is of dimensions \(+1\) in mass and in length, and \(-2\) in time. The equations here given are called "dimensional equations," since in writing them we pay no attention to the actual numerical magnitudes of the quantities involved, but only to the "dimensions" of those quantities.

As a further illustration of the "dimensions" of a physical quantity, let us consider the case of work. This is defined as the product of a force by a distance, and hence we have \( W = FL = MLT^{-1} \). Let \( L = MLT^{-2} \), and we say that work is of dimensions \(+1\) in mass, \(+2\) in length and \(-2\) in time. Kinetic energy is found by taking half the product of a mass and the square of a velocity. Omitting the numerical factor \( \frac{1}{2} \) (since it does not affect the dimensions of the energy in any way), we have \( E = MLV^2 = M(LT^{-1})^2 = MLT^{-2} \), so that kinetic energy is of dimensions \(+1\) in mass, \(+2\) in length and \(-2\) in time. That is, it is of the same dimensions in all respects as work; which is evidently correct, since work and kinetic energy are mutually convertible. As an illustration of the determination of the dimensions of a quantity when the result is far less obvious, consider the dimensions of a "quantity of electricity," as expressed in electrostatic units. Let \( Q \) denote a charge of electricity, as expressed in electrostatic units. Then if a similar charge were brought near to the first one, the repulsion between the two would be found by dividing the product of the two charges by the square of the distance between them. Hence the dimensions of the repulsion between the two charges would be \( QL^{-2} \). But this repulsion, being a force, must be of the dimensions \( F = MLT^{-2} \); and hence we have \( QL^{-2} = MLT^{-2} \), whence \( Q = MLT^{-1} \).

That is, "quantity of electricity," as expressed in the electrostatic system, is of the dimensions \(+1\) in mass, \(+1\) in length and \(-1\) in time. For the dimensions of other electrical magnitudes, and for the interesting facts that are known concerning the ratios of the dimensions of the various electrical units, special works on these subjects are necessary. Maxwell points out that in any equation that expresses a fact in nature, the several terms that are added together, or equated to one another, must be all of the same dimensions; a fact of which use has been made above, in determining the dimensions of "quantity of electricity."

As an illustration of the kind of information that can sometimes be had from dimensional equations, in constructing a formula of which we know the general but not the precise form, let us consider the case of the pendulum. Suppose that we know that the time of oscillation of a pendulum, through a small arc, varies as some power of the length of the pendulum, multiplied by some power of the intensity of gravity at the place where the experiment is made, and let us seek to find what the unknown exponents are. Representing the intensity of gravity by \( g \), and the unknown exponents by \( x \) and \( y \), respectively, the foregoing assumption with respect to the general form of the dependence of the period upon the length of the pendulum and the intensity of gravity gives us an expression of the form \( g^xL^y \), for the time of oscillation of the pendulum. Now \( g \), being an acceleration, is of the dimensions \( LT^{-2} \); so that the foregoing expression is of the dimensions \( (LT^{-2})^2 = LT^2 \); but this, being the expression for the time of oscillation of the pendulum, must itself be of the dimensions \( T \). Hence we have \( (LT^{-2})^2L^yT^2 = T \), or \( L^{2y}T^{-4} = T \). This being an identity, we have, by equating the exponents of \( T \), \(-2x = 1\), or \( x = -\frac{1}{2} \). And since we also have \( x + y = 0 \), we see that \( y = \frac{1}{2} \). Hence the time of vibration of the pendulum varies directly as the square root of the length of the pendulum, and inversely as the square root of the intensity of gravity. See METRIC SYSTEM; WEIGHTS AND MEASURES. Consult, also, Everett, "Units and Physical Constants."

UNITY OF CONSCIOUSNESS. See CONSCIOUSNESS.

UNITY SYSTEM OF ORGANIZATION. A recent method of systematization of large corporations is that devised by Charles Delano Hines, frequently called the Hines system of organization. It is claimed to be based on the idea that the theory of organization is one of the branches of science as dependent. The aim and purport of this method is to lay down scientific lines on which to bring about a solution of problems of the complex nature found in large industrial corporations in a manner that is strictly simple and direct. The system is claimed to be applicable to governmental, educational and commercial and industrial functions though its use has been brought, so far, into practice only on several railways. The inventor of the method terms it the "Unit System" because he starts and ends on the basis of a treatment of all social or industrial entities as divided into units. The individual is a unit, the association of a number of individuals in a body produces a higher unit and so on into any number of units of division of a corporation however large the aggregation; and however complex the system, it is divided into its constituent unit parts, each part held responsible for the carrying out of its duties, but none can take value and responsible in turn for his separate individual duties. All with the aim of rendering the complex conditions simple in their units of practice.

Applied to railways the plan abolishes the official titles general superintendent, superintendent of motor power, chief engineer, superintendent of transportation, general storekeeper, etc., at headquarters. The incumbents retain their individual responsibilities but serve under the general supervision of the railroad; divisional officials such as master mechanic, division engineer, train-master, etc., assume the titles "assistant superintendents." The number of officials in these capacities are regulated as before by the requirements of the different railways. The former superior official, while losing his individual grade title, to become assistant general manager number one, or assistant superintendent number one, etc. With the absence from headquarters of a senior officer (number one, etc.) his superior officer
places the next best adapted for the position on the post to manage as superior at headquarters. This changing of positions with the underlying change of responsibilities in the system is used by time, for instance, to staff a rotation of offices. And by this method it is endeavored to fit the units into the general working of the whole so as to permit interchangeability of the parts or units without friction. A unit is no more than another unit, and it is claimed to give to all a wider activity and enlarged practical knowledge of the workings of the organization in its complex entirety. The purpose is to break down the lines of demarcation, red tape, etc., frequent in railway (and other organization management, making the offices more liquid, while initiating the individuals into a better purview of the organization. The individuality is maintained of the units by their retaining each their responsibility for the fulfillment of his special duties, his personal activity being made clear to all by his individual signature appearing on all papers instead of the usual initials; this rule is carried out through all the ranks from chief to operator and clerk.

UNIVERSAL LANGUAGE, a general term applied in modern times to any one of those artificial languages designed for facilitating intercourse between peoples whose national languages differ one from the other. The need of a universal language has been keenly felt from the earliest times. In the early days of commerce Phoenician was in general use along the Mediterranean littoral; in the Classic Ages of Rome and down to the close of the Middle Ages Latin was the common means of intercommunication in the Occident. Contact with the East at the time of the Crusades gave rise to the so-called lingua franca. Since the Renaissance and with the rapid extension of modern commerce and trade to all quarters of the world the need of a universal tongue has been demanding the attention of educators, financiers, diplomats and others to a greater degree than ever before. The 19th century saw several universal language systems proposed, most of which were speedily forgotten.

Those who have examined the problem are aware that the selection of a living tongue as the universal language would at once arouse international jealousies. In this regard it may be noted that, despite its clumsy spelling, English is coming into such general use throughout the world that the question of a universal language may be settled automatically. The universal language systems, Esperanto (q.v.), etc., are based on European spoken tongues and are, it is alleged, unsuited to universal use in that they ignore the root elements of the linguistic groups of the other continents. However, it would be manifestly impossible to build a system including elements of all groups and the artificial systems have at least the merit that they may be acquired with less effort than the simplest of modern spoken tongues.

UNIVERSALISM. Universalism is a belief in the final triumph of good over evil in the universe. As applied to the human economy, it is a belief that God is pleading by His goodness and omnipotence to put an end to sin and ultimately to save the whole family of mankind. Or, as is more commonly stated in later years, Universalism is the doctrine that the destiny of mankind is progress onward and upward forever; that always before man is a chance to develop and that always in man is a power to unfold, carry with him a time in which to grow and always in man a power to respond to the opportunity. Universalists claim that they find this teaching in early Christianity, that it is the essential doctrine of Jesus and Paul and that marks its influence throughout the writings of the Early Church, the most notable advocate being Origen. From the time of the Protestant Reformation to the close of the 18th century there appear many eminent theologians who either directly or by implication taught the doctrine. Special emphasis is laid by some writers on the fact that of the six great schools of Christian theology in the early centuries, four very positively taught the final salvation of all souls, one taught annihilation of the wicked and only one taught endless misery.

The organization of a church and denomination with the name Universalist had its beginning in the United States and its first advocate was the Rev. John Murray, who came to this country from England and landed on the coast of New Jersey at a place now called Good Luck, in September 1770. The story of Mr. Murray's arrival and work in America has much of romance about it, or perhaps of Providence. The substance of those early years may well be recorded here.

Mr. Murray was brought up as a strict Calvinist and from early years was connected with the Methodists, having been made a class leader by John Wesley. Later he united with Whitefield's Tabernacle in London. He was a devout student of the Scriptures and during this period rather peculiar circumstances made him acquainted with the Rev. James Relly, who was preaching Universalism in London. A young Methodist woman had become a convert to Mr. Relly. Mr. Murray was given the task of reclaiming her to Methodism. In the conversation the young woman got the better of the argument and Mr. Murray was forced to investigate for himself the views of Mr. Relly, with the result that finally he became a thorough convert to Universalism. In the midst of this religious investigation, Mr. Murray's wife, to whom he had been married but a short time, died. Disturbed by religious problems and broken-hearted by his sorrow, Mr. Murray sailed for America, against the advice of his friends, in order that he might lose himself in the New World. As the ship in which he was sailing approached New York, it was driven by a storm over a sandbar into Barneget Bay. The ship was too heavily laden to cross the bar at the mouth of the bay and proceed on its journey, so a part of the cargo was put on board another vessel and Mr. Murray was sent to investigate for himself the views of Mr. Relly. In the search for food he met a man named Thomas Potter, who had built a church nearby his house, in which he hoped to hear some time the gospel of the final salvation of all men, the doctrine which he believed. As Murray interviewed Potter, some voice told Potter, so he says, that here was the man who would preach the gospel which Potter had longed to hear and this proved to be the fact. It was, however, only after long persuasion and repeated urging, saying that he had come to America.
to escape from himself and religious work, that Murray consented to preach the next Sunday. When the service was over Potter exclaimed: "At last has come the man and the gospel for which I have been longing." This was the beginning of John Murray's work in America as a Universalist minister. He preached many times at Good Luck, then in New York and at length in New England and finally he established what is known as "The Independent Christian Church" at Gloucester, Mass. This was the first organized Universalist church in America. Gradually, however, other preachers, from Virginia to Maine, began to preach the doctrine that God would save all men and before the end of the century there was at least one congregation in nearly all of the leading cities of the Atlantic Coast. By his travels Mr. Murray made friends for himself and his cause, and, among others, he had close association with prominent Revolutionary leaders and served the cause of the Revolution as the chaplain of the Rhode Island brigade. The early advocates of Universalism came out from the existing denominations and brought with them something of the peculiarities which marked the churches from which they came, John Murray's political and social points save that of the final salvation of mankind. His argument was that the sacrifice of Jesus paid the debt of sin for all mankind and that in the death of Jesus all men would be saved. Sharp controversy arose very soon between men who had come from other denominations and gradually there followed new arguments for the salvation of mankind; and of all the men who led the early church controversies the Rev. Hosea Ballou stands out with especial prominence. Other prominent early Universalist preachers were Elhanan Winchester, George Richards, Walter Ferris, Sylvanus Cobb, De Benneville, Noah Parker, B. Streeter and Caleb Rich. They were all vigorous and individualistic thinkers, some agreed with one another only on the doctrine that somehow, somewhere, sometime, all souls would be saved.

In 1785 the first real organization of churches under the name Universalist was effected in the town of Oxford, Mass. In 1790 a more extended gathering of Universalists met in Philadelphia in all points and representatives from churches in Massachusetts, New Jersey, Pennsylvania and Virginia. This convention adopted articles of faith and a form of church government. The articles were five in number and related (1) to the Holy Scriptures, (2) to the Supreme Being, (3) to the Mediatorship of Christ, (4) to the work of the Holy Ghost, (5) to the necessity of good works. In 1803 there was held in Winchester, N. H., a convention of Universalists which produced a confession of faith that was made, later on, the basis of fellowship and faith in the Universalist denomination. This profession of faith, like the others which had preceded it, was not adopted as an obligatory statement of faith, but only as the common ground on which the Universalists would unite for the organization of a convention. The articles then adopted are as follows:

"Article 1. We believe that the Holy Scriptures of the Old and New Testaments contain a revelation of the character of God, and of the duty, interest and final destination of mankind.

Article 2. We believe that there is one God, whose nature is Love, revealed in one Lord, Jesus Christ, by the Holy Spirit of Grace, who will finally restore the whole family of mankind to holiness and happiness.

Article 3. We believe that holiness and true happiness are inseparably connected, and that believers ought to be careful to maintain order and practice good works, for these things are good and profitable unto men.

A prominent figure at this Winchester convention was the Rev. Hosea Ballou, already referred to, who was then 32 years of age. He advocated a doctrine of Universalism quite different in many points from that of John Murray. His fundamental doctrine was the universal fatherhood and infinite love of God and he argued that the death of Christ came as the effect of this eternal principle. Also he argued that sin is a voluntary transgression of the law and not an inherited condition, that the human will is free and yet that ultimately man will conform to the will of God; that the death of Christ was not to pay a debt to God, but to draw men away from sin; that Christ was example and inspiration to lead men to the perfect life; that man would suffer reasonable punishment for violation of all law, but in the end would work in harmony with God. This doctrine of Hosea Ballou has sometimes been called the doctrine of the perfect character. From the appearance of Hosea Ballou on a large number of Universalists turned away from John Murray toward Mr. Ballou. It was at this time also that there arose a group who called themselves Restorationists. A particular view was that through the sacrifice of Jesus all men would be restored to a state of original innocence. Others said man would receive all punishment in this life, but the larger number affirmed that man would enter the next life with the character he had on leaving this and that the cleansing and purifying process would continue there as here, until man would conform to the laws of God and that no punishment would be everlasting.

In 1870 the centennial of Universalism was observed by a great gathering in Gloucester, Mass. This brought together noted Universalists from all over the country; among the leaders were Dr. T. J. Sawyer, Dr. A. A. Miner, Dr. E. H. Chapin, Dr. R. H. Ryder, Dr. W. F. Hurd, Dr. S. H. McCollister, Dr. E. C. Sweetzer, Horace Greetley, Dr. J. S. Cantwell, Dr. C. H. Leonard, Dr. John S. Lee, Pres. E. H. Cape, Dr. A. Gunnison, Dr. Henry Blanchard, Dr. J. C. Adams.

In preparation for the celebration the Murray Centenary Fund of $100,000 was raised and a permanent organization of the Universalist General Convention was effected. In fact, the unified work of the Universalist Church really dates from this time and has tended steadily toward a more co-operative system of operation. In the first years following 1870, the general secretary, Dr. G. L. Demarest, was the chief executive officer of the body. There were representatives from different sections of the denomination for a board of trustees and through committees from this board the work of the Church was carried on. There were committees on foreign missions, on education, on increase of the ministry and on finance. But as the Church multiplied and the work became more varied, other officers were added, a special departure being the addition of a general superintendent
of churches, which has finally resulted in a system of State superintendents. At this meeting in 1870 the Winchester Profession of Faith was adopted as the basis of fellowship and all who entered the ministry were required to subscribe to this statement. Almost immediately, however, several delegates and leading objections grew up to certain phrases and words. This controversy continued, often resulting in much hostile debate, until 1899, when there was substituted for the original creed what was known, as a statement of the principles of faith, as follows:

1. The acceptance of the essential principles of the Universalist Faith, to wit: (1) The Universal Fatherhood of God; (2) The Spiritual Authority and leadership of His Son, Jesus Christ; (3) The trustworthiness of the Bible as containing a revelation from God; (4) The certainty of just retribution and of happiness for all souls with God.

The Winchester Profession is commended as containing these principles; but neither this nor any other precise form of words is required as a condition of fellowship, provided always that the principles above stated be professed.

II. The acknowledgment of the authority of the General Convention and assent to its law.

This statement gave new freedom and individual congregations made their own statements of belief. The Church as a whole followed the philosophy of Hosea Ballou rather than that of John Murray, and replaced the trinitarian of Murray with the unitarianism of Ballou. The two denominations, Unitarian and Universalist, were offshoots from the Congregational Church of New England, the Universalists emphasizing the final salvation of all, and the Unitarians the humanity of Jesus and the dignity of human nature. Gradually the thinkers of the two denominations have come to essentially the same position on the fundamentals of faith. Also the liberal orthodox church has gradually come to the same position, so that at the present time there exist cordial relations between the Universalists, Unitarians and Congregationalists.

The Universalist General Convention is the controlling organization, having jurisdiction over the churches in the United States and Canada. It holds biennial sessions on the Wednesday of the Fourth of July.

The Convention is composed of: first, of its officers; second, of the president, vice-president and secretary of the several State conventions in its fellowship; third, of the general superintendent and the superintendents of the several States; fourth, of all ordained clergymen in fellowship, either with such a State convention or with the General convention and, unless disabled by years or sickness, actively engaged in the work of the ministry. Fifth, delegates from each parish in fellowship, each such parish being entitled to one lay delegate.

To be entitled to such lay delegates and in order that its minister be eligible to be a delegate, every parish must maintain its legal existence and support public worship regularly and make a contribution on quota to the General Convention during each of the two years prior to the meeting of said convention. All the laws relating to the fellowship, discipline and discipline originate in the General Convention, and it is the final court of appeal in all questions in dispute or in differences between the State conventions. The convention is a body incorporated under the laws of the State of New York to hold real and personal estate. In the interim of its sessions, the interests of the Church are managed by a board of 11 trustees, who meet three times a year, and at the biennial session. The Church has funds aggregating $600,000. There are now about 45 State conventions also with funds, with about 900 parishes, with a church membership of 53,000; 750 Sunday-schools with a membership of 50,000; 803 edifices, total valuation, $12,000,000, and 602 clergymen in fellowship.

These figures regarding the membership of the Universalist Church are misleading and a truer statement would be that the Universalist Church has 250,000 adherents.

As part of the Church are other organizations, more or less independent in their activities, but at the same time recognizing the general authority of the General Convention. One of these organizations is the Women's National Missionary Association, composed of women working for home and foreign missions. It has several divisions of activity and supports missions in many fields, particularly in the South and in Japan. It holds large funds of its own, the income going for missionary propaganda. It has flourishing auxiliary organizations, for the study of missions and the promotion of missions among children.

Another important organization is the Young People's Christian Union, a body composed of the young people. Its special work has been to develop local unions for the purpose of training the young people in religious life. It has directed the starting of new churches and supported missionaries in the South and West. It publishes a weekly paper, known as the Outlook. It holds annual sessions and gives much attention to the distribution of denominational literature.

Under the direction of the board of trustees there have been formed several commissions to look after the interests of the denomination. Of importance is the commission on social service which carries on the study of social problems of the day and distributes a large amount of literature in the interests of church social service. There is the commission on church school, which reports the number of students in theological schools. Also the commission on temperance which, through a superintendent, carries on a temperance campaign and distributes a large quantity of literature.

Associated with the General Convention is the Universalist Historical Society, whose object is the gathering up and the preservation of books, pictures and all facts relating to the history of the Universalist Church and its progeny.

Connected with the General Convention also is the John Murray Association in Gloucester, Mass., which maintains the house in which John Murray lived, now filled with relics relating to the life and work of John Murray.

Very early in its history the Universalist Church became the patron of higher education, believing it necessary to provide for an educated ministry. The more important of these schools are Tufts College, Massachusetts, the University of Saint Lawrence, Canton, N. Y., Lombard College, Galesburg, Ill., three academies: Dean at Franklin, Mass., Goddard Seminary in Barre, Vt., and Westbrook Seminary in Maine. These schools and colleges possess buildings and equipment aggregating over $6,000,000.
Theological schools maintained are (1) the Canton Theological School, opened at Canton, Mass., Lawrence C. N. Y., in 1886. Although affiliated with Saint Lawrence University, the theological school is a separate institution in its management and property. (2) Crane Theological School, affiliated with Tufts College, Medford, Mass. This was established in 1886 as Tufts Theological School but was changed to the name of Crane Theological School in 1889, in honor of an endowment from Albert Crane of Stamford, Conn. (3) In 1881 a theological department was opened in Lombard College, Galesburg, Ill., and in 1890 its name was changed to the Ryder Divinity School, in honor of the late Rev. William Henry Ryder, D.D. In 1910 the school was removed to Chicago, where it became a part of the University of Chicago, though still retaining its name.

The denomination has a publishing house and a book headquarters at 359 Boylston street, Boston, Mass., and the official offices of the General Convention. Other offices are located in Utica, N. Y., and Western headquarters at Saint Paul's-on-the-Midway, in Chicago. The publishing house puts forth The Universalist Leader, The Sunday School Helper, The Myrtle, The Outward and the Universalist Register. It owns copyrights to 150 volumes and has net assets of over $200,000. In the South, at Atlanta, is published the Universalist Herald. In 1919 a great drive for a million dollar was started, to be finished in 1920 when Universalists will hold a series of meetings at Gloucester, Mass., in celebration of the one hundred and fiftieth anniversary of the landing of John Murray. Great enthusiasm has been stirred by this denomination-wide drive and a large increase in church members and parish funds has resulted in addition to the General Denominational Fund.

Lee S. McCollester,
Tufts College, Massachusetts.

UNIVERSALS, logical entities which may be exemplified by instances. Universals comprise attributes, which may be embodied in a situation into which but one individual thing enters, and relations, which require for their exemplification a situation wherein at least two distinct things are found. Ever since Plato regarded his universals as real existing archetypes of the corresponding particulars, the attribute-universals have assumed an undue preponderance over the relation-universals. The real Ideas of Plato made way for the less autonomous forms of Aristotle, which turn the potentiality of matter into actuality. However, these were not clearly defined as to the precise measure of their autonomy. This uncertainty of the Aristotelian philosophy engendered the cardinal difficulties of the earlier epoch in scholasticism: Are universals but mere names used to limit a group of particular things, or are they real entities existing prior to and apart from their exemplifications? The former of these positions is known as nominalism; the latter, which was that of realism. Realism adopted as its motto 'Universalia ante rem'; nominalism, 'Universalia post rem.' The synthesis of this dilemma is due to Abelard whose position is summarized as 'Universalia in re'—the universals in the thing. The universals, that is, are far more than mere names, but their mode of being is not that of a higher world of things—as is that of the Platonic Ideas—but just precisely the mode of being which consists in subsuming particular situations. Nominalism and realism did not cease to exist as separate views after Abelard had thus synthesized them into what is known as conceptualism. In the great epistemological dichotomy of the Enlightenment, the British empiricists manifested a strong nominalistic tendency, while the rationalism of the continent was more inclined toward realism, though their attention was less directed toward the problem of universals than that of their colleagues across the Channel. Thus Hume denied the existence of general ideas, and held that every universal is carried by some particular idea which functions as a symbol for all its fellows. Descartes and Spinoza, on the other hand, assigned to matter and soul a position logically and epistemologically antecedent to that of particular things, and certainly soul and body are universals in the sense that they respectively subsume all mental and material phenomena.

At the present time the extreme nominalistic and realistic views both find their most vigorous discussion in psychology. Realism dominates the older faculty-psychology, which regards thought and feeling and will as active forces, instead of mere aggregates of cognitive and emotional and voluntary phenomena. Opposing this is that nominalism which traces its ancestry back to Hume through associationism. The nominalism of experimental psychology finds in the mind but a mere aggregate—not a system—of mental states, and the various mental faculties are simply names for various sub-aggregates of these states, so that the task of the observer is done when he has given an exhaustive inventory of his atomic experience. While he may grudgingly admit one or two fundamental psychical attributes, he is particularly unwilling to attribute to the mind anything like a relational organization. The psychologist's reluctance to recognize orders or system and structure in the mind is due to the fact that orders and systems and structures are universals of the relational type, and that the experimental psychologist has no very clear idea of the essence of these universals anywhere.

The opinion of the present day, on the part of those who have brought themselves to logical self-consciousness, is strongly in favor of some sort of conceptualism. A universal is plainly more than a name. This is shown by such a statement as 'John and Jane are twins.' "Twins" is a universal; of what is it the
name? It is clearly not the name of John and Jane separately, for it is not enough that John should be a twin—the twin of Mary—and that Jane should be a twin, the twin of Paul. The thing that is twins is the couple consisting of John and Jane. Now, a couple is clearly a universal, subsuming its two members as particular instances. According to the nominalistic theory, then, it is simply the name, "John and Jane." But this name is not twins—the only way in which it could conceivably be called twins is in reference to the twins themselves. As this reference is again a universal, and, therefore, but a name to the nominalist, it is clear that we become involved in an infinite regress, at no stage of which has the original couple as forming a connected whole, which we call the universe, and which comprehends creation in its widest extent. Many questions connected with the universe are not yet answered; but our ideas of its structure are surely in a stage of slow advancing. The object of the present article is to set forth what can be said on the subject at the present time.

The first question to rise is the oldest. Is the collection of heavenly bodies—stars and nebulae—on which we see with our telescopes, a bounded whole of any kind; or do such bodies extend through infinite space, so that those we see are distinguished from the others only by their proximity to our planet? The general trend of modern science is toward the former alternative. While it is quite true that no limit can be set to the possible extent of creation, the evidence is very strong that that portion of creation which can be studied by man forms a bounded whole, having certain common characteristics which run through its whole extent. It seems almost certain that there is a limit in every direction beyond which the stars become comparatively few and scattered, if they exist at all. Indeed, if we consider the recent testimony of the delicate photographic plane, there seems no escape from this conclusion. As is well known, the chemical action upon such a plate of the rays of light from the stars is cumulative, so that the longer the exposure time a single image of the sky the larger will be the images of the brighter stars become and the more distinct the images of the faint ones. Excessively faint stars may, in fact, not appear upon the plate at all until the exposure has been greatly prolonged, and multitudes of such objects can in fact be photographed in this way which are far too faint to be seen in any existing telescope. A photograph taken by Roberts of a region in Cygnus which was particularly rich in stars was duplicated by him two years later, but with an exposure four times as long. A careful examination of the two plates showed that no additional stars had been revealed upon the second one. The same result has since been obtained in several different portions of the sky, an exposure of 10 or 12 hours showing in some cases but very few more images than an exposure of one or two hours. It must be remembered that in our universe stars of all varying degrees of size and brightness are doubtless inextricably intermingled, and that a single fainter star is not necessarily more distant than a single brighter one, though the fainter stars are as a whole unquestionably farther away. Nevertheless it seems certain that, at least in the regions above referred to, there have been secured upon the plates records of all objects large enough to exist as self-luminous suns. And if the universe is thus limited in several different directions, we must conclude that it is as a whole not of infinite extent. Another simple consideration which is often added as a proof of this fact is that if the stars extended outward without limit, their infinite number would fill the whole sky with a blaze of light equal to that of the noon-day sun. Instead of this we have a night-sky so faint that a circle of it half a degree in diameter is almost or quite invisible to the eye. But this proof is only conclusive if we suppose the space between the stars to be absolutely free from dark matter, so that light is not perceptibly absorbed during its passage to us. That this condition is not perfectly met is certain from many considerations, but that the amount of this dark material, whether it principally consists of meteoric material, cosmic dust or atoms or ions of repelled gas, is such that little effect upon light transmitted from a finite distance is evident from a study of the behavior of light of different wave lengths which comes to us from distant stars. (See Light and Color.) But the effect of this is not detectable though it may be, prevents our drawing any certain conclusions in regard to a universe of perfectly unlimited extent. Another idea of the subject may be based on the principle that in a universe of stars, extending out indefinitely, there would be nearly four times as many stars of each order of magnitude as of the order next brighter. This is true in the case of the stars visible to the naked eye. But, when counts are made of the telescopic stars, it is found that although the number of each successive order increases, the ratio of increase continually diminishes, thus showing that a limit must finally be reached.

Another indication bearing on the same question is afforded by the Milky Way. This vast girdle, which consists of agglomerations of stars, has a unity of structure throughout its whole extent which justifies us in considering it as, in a certain sense, a single object. It is not improbable that this represents the densest portion of our own limited universe of stars.
Another conception of the universe is gained by considering the thickness with which the stars are scattered throughout space; in other words, how many stars 'a given volume of the celestial spaces, in the general average, may contain. Measures of parallax, and studies of proper motion, lead to the conclusion that the thickness of the stars, as thus defined, is a fairly definite quantity. To measure the volume of space we require a unit. The most convenient unit for our purpose is the volume of a sphere whose centre is in the solar system, and whose surface is at a distance represented by a parallax of half a second. This distance is, in round numbers, 400,000 times that of the sun from the earth, a space through which light would travel in about seven years. The volumes of spheres being as the cubes of their radii, it follows that a sphere whose surface is at twice the distance of the unit sphere, or 400,000 times the distance of the sun, will have a volume represented by the number 8, while 100 times the radius will have a volume of 1,000,000 units. Now the fact is that the stars are strewn through space with such thickness that, in the general average, each unit of space contains one or two of these bodies. The law according to which the stars thin out, and investigations into the statistics of the stars generally, lead to the conclusion that the parallax of the most distant of these bodies is about 0'001. This distance is 500 times which that we have chosen as the radius of our unit sphere; the volume of space included within it is, by the law of cubes, 125,000,000 and, were the stars scattered with equal thickness throughout the whole space, the number contained would be between 125,000,000 and 250,000,000.

Although, in the general average, it is probable that the thickness of the stars in space does not vary greatly within the limits we have indicated, there are exceptions in special cases. The most notable exception is that of the Milky Way, where the stars are undoubtedly much more thickly strewn in space than they are in the central regions of the system. We also find in many regions of space collections of hundreds or even thousands of stars evidently in close proximity to each other. But outside of these collections the scattering is probably nearly uniform as far out as the limit we have mentioned.

Altogether, we may say with some confidence, that if we could fly through space to a distance over which light would require 10,000 years to travel, we should find ourselves approaching the boundary of the stellar system, if we were not actually outside of it. But all that has been said refers only to our own visible universe, that is, to the Milky Way cluster, or cloud, of stars of which our own sun is one. It is as impossible for us to conceive of a totally empty space extending without limit in all directions from our universe as it is for our minds to grasp the conception of other, far distant, universes which perhaps more or less resemble our own, and which succeed one another throughout a space which is also absolutely endless. If such other universes exist, it can only be said that as yet we have no known means of discovering them.

Notwithstanding the darkness of the sky, it seems probable that we receive more light from it than could be supplied by all the stars, seen and unseen, which make up the known part of the universe. This conclusion is based on the fact that the amount of light received from a circle one degree in diameter on the darkest night-sky is about equal to that of a star of the 5th magnitude, while, when we carry out to the conclusion based on the stars of dimming orders of magnitude, we find that the total of their light could not well amount to so great a quantity as this. The source of this excess of light is yet to be investigated. Whether it is atmospheric, whether it is reflected from innumerable opaque bodies, or whether it is emitted by a nebulous mass of almost inconceivable tenacity, has not yet been determined.

A remarkable feature of our relation to the universe is that our solar system seems to be very near its centre. That we are near the central plane of the Milky Way is shown by the fact that the latter is nearly a great circle on the celestial sphere. It is true that the most exact of the constellations which are visible in the south on displacement of our system, since the central line of the Milky Way is about one degree from that of the great circle which would pass nearest to it. Another basis for the same conclusion is that the stars seem to be equally numerous in the direction of the two opposite poles of the Milky Way. If there is any deviation from equality, it seems likely that the faint telescopic stars are fewer in number toward the south pole than toward the north pole of the Milky Way. This view is not yet proved, and cannot be until we have more exact counts of the stars of each order of magnitude in the two hemispheres. The question whether our system is situated with equal exactness in the centre of the great girdle does not admit of settlement. All we can say is, that, up to the present time, there is no positive evidence on which to base a statement that we are any nearer one point of the girdle than another. It is indeed true that, in the constellations Aquila and Sagittarius, which are visible in the south on autumn evenings, the Milky Way shows numerous rifts and vacant spaces which are not shown on its opposite side. This might seem to indicate that we are nearer to it in this region. But further research is required before a definite conclusion can be reached.

It should be remarked that, even if we are at present centrally situated, the position cannot be permanently held. The motion of the solar system through space, by which we are carried forward on a journey of which we can see neither the beginning nor the end, at the rate of 10 or 12 miles a second, must eventually carry our posterity away from the centre of the universe, even if we are now situated near that point. But this motion will have to be continued hundreds of thousands, if not millions, of years before the displacement would be appreciable when compared with the dimensions of the universe.

SIMON NEWCOMB.

Revised by ERIK DOGLITZ.

UNIVERSITY. Introductory.—It is difficult to define the American university. In a certain sense it may be said not to exist. When we speak of the English universities, the Ger-
man universities or the University of Paris, we have in mind educational institutions of
distinction if not usually ranked in the分类 and procedure are crystallized
and whose aims and ambitions are clear-cut
and capable of definition. The mere term uni-
versity is misleading in America because in
actual practice there is no consistent distinction
between the terms college and university.
Many institutions which are hardly reputable
secondary schools parade under the name of
college, and many institutions which are barely
able to do work of collegiate grade are bur-
dened with the title of university. Both the
terms lose distinctiveness through illegitimate
use.
On the other hand the confusion is worse
confounded, in the minds of the lay public at
least, by the seemingly indiscriminate use of
the terms by thoroughly reputable institutions.
The layman who has long been lead to believe
that the leading American university is located
at Cambridge, Mass., is puzzled when he dis-
covers that the legal titles of the controlling
bodies of this great institution are "The Presi-
dent and Fellows, and the Board of Overseers,
of Harvard College." As a matter of fact there
is both a Harvard College and a Harvard Uni-
versity. The title Harvard College, the
original name of the institution, is now ap-
licable to the organization and administration
of the group of courses in the liberal arts lead-
ing to the degree bachelor of arts, and the
title Harvard University is applicable to the
several departments of the institution as a
whole, including Harvard College. In a some-
what similar way Columbia College persists as
a part of the greater Columbia University.
There is also still a Yale College within Yale
University.
Then, to turn to the other extreme, we
discover that such reputable institutions as
Colgate University, James Milliken University,
De Pauw University and a long list of others
which might be named, which make no pre-
tense outside of their titles of being what they
are, not in any respect universities in the
sense in which the term university is
commonly used, for the entire groups of educa-
tional activities centered in Harvard, Yale
and Columbia. In other words, the name or
title alone of a higher educational institution
signifies nothing in this country. We must
know the history and the objects of any col-
lege or university before we can determine its
character or its place in our educational
world.
While titles are used so indiscriminately
that the terms college and university have no
concise meaning to the public mind, there yet
remains a distinction, very clear in the minds
of educators and becoming evident in practice
here and there, which gains ground as time
goes on. The truth is that we do have institu-
tions which merit inclusion under the general
term of the American university even though
we yet find it difficult to give a concise defini-
tion to that general term. The American uni-
versity is coming to have an identity of its own
even if it is not always trustworthy.
Regents of the University of the State of New
York, which, incidentally it should be said, is
not a university at all but simply the corporate
title of a State Department of Education, have
defined a college as follows:
"An institution to be ranked as a college must have at
least six professors giving their entire time to college
or university work, a course of four full years of college
grade in liberal arts and sciences, and should require for
students not less than the usual four years of academic or
high school preparation or its equivalent, in addition to the pre-academic
or grammar school studies."
This definition has been adopted by the Car-
negie Foundation for the advancement of teach-
ing and under the frequent use of this agency
is operating widely to give identity to the
college. The definition serves well enough at
the bottom but leaves us yet without a definition
of a university. The Education Law of the State
of New York adds to the confusion by
defining, in defining its own terms, that "the
term 'college' includes universities and other
institutions for higher education authorized to
confer degrees." No one has done better
than Ezra Cornell in fixing the limits of the
American university in a few words. His
often-quoted declaration, "I would find an
institution where any part of instruction in any study," affords a real distinction
between a college as defined above and a real
university such as he actually founded at
Ithaca, N. Y. Cornell University will be found in
any comprehensive list of higher educational institutions whether the list be headed colleges
or universities.
Without concern about confused and con-
fusing nomenclature, the distinction which edu-
cators make between a college and a university
is this: a college is a higher educational insti-
tution offering mainly courses of instruction
leading to the bachelor's degree; a university
is a college or group of colleges or departments
under one control offering courses of instruc-
tion leading not only to the bachelor's degree
but also to the master's and the doctor's degree.
There is yet another distinction, more academic
than real, which would classify as colleges those
institutions devoted entirely to work leading to
the bachelor's degree and as universities those
institutions devoted to scientific research and
to the general widening of human knowledge and
admitting only graduate students. The
general tendency seems to be to regard as the
typical American university an institution
embracing the union of college and university
offering both undergraduate and graduate
courses. The reputable American university
approaches this definition in practice no matter
what its title is. This definition covers the ac-
tual activities of many of the leading State uni-
versities and embraces the ideals of all of them.
State universities help markedly to give
character and worth to the American univer-
sity as a recognized educational institution,
and all that can be said with regard to the pres-
cent status of the endowed universities applies
with equal force to the State universities.
The number of endowed American universi-
ties which have risen to places of assured
prominence in the educational world is large.
The origin and development of 10 leading
institutions in the order of their founda-
tion illustrate the problems common to the
whole group and the reader is referred to the
special articles under the names
Harvard University; Yale University; Uni-
versity of Pennsylvania; Princeton Univer-

The completion of a standard four-year high-school course is now the announced fundamental basis of admission to the typical American university. Indeed, practically all institutions which lay claim to the title of college or university make the announcement that the four-year high-school course is the minimum basis of admission. The character of any institution which claims college rank is readily determined by the deliberate honesty with which it administers its announced entrance requirements. Of course there is great divergence in the determination of what constitutes a standard high school, both as to its announced course of study and as to the faithfulness and thoroughness with which the course is presented. The subjects required for admission vary considerably in different universities and differ materially for admission to different courses. Entrance is calculated upon the basis of units, 14 to 16 units being the required amount. A unit approximately represents the successful pursuit of a high school subject each school day for a school year. Thus, credit in elementary algebra, or in plane geometry, each of which is usually pursued for a full year in high school, entitles the student to one unit for college entrance. The units are usually specified as required and elective; from 10 to 12 units being required and from three to five units being elective.

The gradual evolution of the entrance requirements may be understood from an examination of the Harvard entrance requirements. The present terms of admission at Harvard may be said to have been over 276 years in the making. It was in 1642, though Harvard College was founded six years earlier, that the college statutes provided:

"When any Schollar is able to read Tully or such like Classical Latin Author Extempore, and make and speake true Latin in verse and prose, without assistance, and decline perfectly the paradigms of nouns and verbs in ye Greeke tongue, then may hee bee admitted into ye college, nor shall any克莱mation before such qualifications."

This specified reading knowledge of Latin and Greek was the essential entrance requirement in all the colonial colleges, and the Harvard entrance requirements remained with very slight changes, as quoted, for nearly a century. Arithmetic was required about the first of the 19th century and geography in 1827, algebra in 1820, history in 1824, physical geography in 1870, French and German in 1875.

The change in entrance requirements which is actually taking place at the present time may be understood by reference to the "old" and the "new" plans of admission announced in the latest Harvard catalog. To be admitted to the freshman class of Harvard College under the old plan a candidate must present himself for examination in certain subjects. These subjects are now 16½ units of school work, except that candidates who present both elementary Latin and elementary Greek will be admitted without conditions on 15½ units of school work. In not less than five units a candidate must pass examinations with grades that are "satisfactory" as distinguished from grades that are "merely passable." The prescribed studies include English and a foreign language for the degree of A.B., and a modern language, history, mathematics and science for the S.B. degree. Sufficient additional subjects must be chosen from a long list of electives to make up the total specified number of units.

Under the new plan, to be admitted to Harvard College one must present evidence of his secondary school work, showing (a) the subjects studied by him and the ground covered; (b) the amount of time devoted to each; (c) the quality of his work in each subject. To be approved this statement must show (a) that the candidate's secondary school course has extended over four years; (b) that his course has been concerned chiefly with languages, science, mathematics and history, no one of which studies has been omitted; (c) that two of the studies of his school program have been pursued beyond their elementary stages. A candidate whose secondary school course is found to be "adequate" must then pass a "comprehensive" examination in four subjects, as follows: (a) English. (b) Latin, or, for candidates for the degree of S.B., French or German, or Spanish. (c) Mathematics, physics, or chemistry. (d) Any subject (not already selected under (b) or (c)) from the following list: Greek, French, German, Spanish, history, mathematics, physics, chemistry.

The Course of Study.—The conventional course of study in the American university for the undergraduate has from the very beginning until recent times covered four college years. It has frequently been urged that "there is nothing magical or imperative in the term of years," and educators have widely discussed the desirability of shortening the college course, especially for the student who takes up professional study after he secures his baccalaureate degree. It is now possible to secure this degree in many institutions in less than four years and to secure both the baccalaureate and the professional degrees in seven years; but the traditional four-year course yet prevails in the main and seems not likely to give way rapidly for the great majority of students.

It is frequently urged also that the term of four years has no natural relation to a course of study. The subjects offered in the undergraduate course show bolder departures from the earlier types. The English model was followed in our universities almost exclusively until the Revolution. The degree of bachelor of arts, based upon classical and philosophical studies, prevailed. Yale followed the example of Harvard, and Princeton followed the example of Yale. During the period 1846 that the Lawrence Scientific School was established and provision made for a course leading to the degree of bachelor of science. College catalogs present a great variety of courses of study and many degrees of prescription, but are 16½ units of school work prescribed, as follows: (1) Those in which all the work for the degree is prescribed; (2) those which prescribe part and leave the rest to the choice of the student; (3) those which contain prescribed
courses, require concentration in one or more departments and leave a certain proportion open for the free election of the student.

Graduate Work.—The graduate school of offering advanced courses of study leading to the master's of the doctor's degree is one of comparatively recent growth in this country. Harvard enrolled students as "resident graduates" before 1800 and Yale established a "department of philosophy and the arts" for some of its graduate study in 1847, but it was not until 1860 that Yale made the first announcement in the United States concerning the awarding of the degree of doctor of philosophy. Harvard followed in 1872 with the announcement that it would confer the degrees of doctor of philosophy and doctor of science.

According to the report of the United States Commissioner of Education 31,826 baccalaureate degrees were conferred in 1915-16 by universities, colleges and technological schools in the United States, 20,386 upon men and 11,440 upon women. In the same year 4,524 graduate degrees were conferred, 3,462 upon men and 1,062 upon women. There were also 825 honorary degrees conferred. The degree of doctor of philosophy by examination in Canada in 1915-16 was conferred on examination by 42 institutions on 520 men and 81 women. No reputable institution which is not adequately prepared to do so undertakes to award this degree upon examination. It is, therefore, a reasonably safe index to the institutions, which regardless of title are prepared to do university work. The degree of doctor of philosophy was granted on examination in 1916 as follows: University of California, 22; University of Denver, 2; Yale University, 50; Catholic University of America, 3; George Washington University, 6; University of Chicago, 79; Northwestern University, 3; University of Illinois, 33; Indiana University, 4; Iowa State College, 1; State University of Iowa, 8; University of Kansas, 1; Johns Hopkins University, 37; Massachusetts Agricultural College, 3; Boston University, 5; Massachusetts Institute of Technology, 3; Harvard, 5; 62; Columbia University, 1; Radcliffe College, 4; University of Michigan, 22; University of Minnesota, 7; University of Missouri, 5; University of Nebraska, 1; Princeton University, 27; Rutgers College, 1; Cornell University, 34; Columbia University, 88; New York University, 8; Syracuse University, 3; University of North Carolina, 2; Ohio State University, 3; University of Cincinnati, 2; Bryn Mawr College, 3; Grove City College, 3; University of Pennsylvania, 12; University of Pittsburgh, 1; Brown University, 6; University of Texas, 3; University of Vermont and State Agricultural College, 1; University of Virginia, 2; University of Washington, 1; University of Wisconsin, 37.

The requirements for the degrees of doctor of philosophy and master of arts are reasonably uniform in reputable institutions throughout the country. The following statement from the Yale Catalogue for 1916-17 gives the typical requirements for these degrees. The degree of doctor of philosophy is conferred upon students of either sex who hold the bachelor's degree from a college of high standing, and have satisfactorily completed not less than three years of graduate study and met the other prescribed conditions for the degree. Students who have received their bachelor's degree from colleges not of sufficiently high standing must expect to spend more than three years in graduate study; the length of time to be determined in each case by the character of their previous work and the quality of the work done here. With the approval of the faculty, work of equal grade done in residence at other universities will be accepted for the degree, but not less than one year of work must be done in this university. Ordinarily the final year of residence should not be devoted wholly to the completion of the dissertation, but the candidate, unless especially excused by the department in which his major work is done, should continue some plan of study involving attendance on at least one course. It must be understood, however, that the degree is not given as a certificate of residence and work, however faithful; it is granted only to such students as give evidence of general proficiency, power of investigation and high attainments in the special field in which the major work is done. The evidence of such attainments must be given by dissertation and by examinations. Evidence of sufficient attainments in German and French at least two years before the degree is given must be presented to the dean. The dissertation should show that the candidate has technical mastery of the field in which he presents himself, is capable of doing independent scientific work, and is able to formulate such conclusions as may in some respects modify or enlarge what was previously known. A general oral or written examination, as the department may determine, irrespective of examinations upon single courses, shall be held upon the whole major subject offered by the candidate and upon such subordinate subjects as may be required by the department.

"The degree of master of arts is conferred upon men who hold the bachelor's degree from a college of high standing and have satisfactorily completed not less than two years of resident graduate study and met the other prescribed conditions for the degree. Work done in absentia will not be accepted. Students who have received their degree from colleges not of sufficiently high standing must expect to spend more than two years in graduate study, the length of time to be determined in each case by the character of their previous work and the quality of the work done here. Residence at another university may be accepted for the first of these years, provided the evidence of work submitted is satisfactory to the committee on the degree. A reading knowledge of one language other than English is required before the student will be accepted as a candidate for the degree, and any department of study may make a specific requirement of a reading knowledge of French or German or both."

Statistical Data.—The following statistics from the report of the United States Commissioner of Education for the year 1915-16 give evidence of the scope of the work of higher educational institutions. Number of institutions, 574; number of students enrolled in collegiate and resident graduate departments, 259,511, of whom 164,075 were men and 95,436 women; number of instructors,
UNIVERSITY, NATIONAL — UNIVERSITY OF THE PACIFIC

34,869, of whom 28,472 were men and 6,397 women; total receipts, $133,627,211; productive funds, $425,245,270; benefactions during the year, $30,186,000; number of fellowships, 17,774; number of volumes in libraries, 20,234,724; value of library, scientific apparatus, machinery and furniture, $80,534,609; value of grounds, $87,607,540; value of buildings, including dormitories, $367,159,298.

Dean, State College for Teachers, Albany, N. Y.

UNIVERSITY, NATIONAL. See NATIONAL UNIVERSITY.

UNIVERSITY OF ALABAMA, the highest educational establishment of the State of Alabama, and a part of the public school system maintained by the State. The university is administered through the following organizations: The College of Arts and Sciences; School of Education; College of Engineering; School of Law; School of Medicine (at Mobile), and Summer School for Teachers, with a staff of, in the neighborhood of 100 teachers and professors. Some 14 buildings are grouped around a campus of 40 acres, in a tract of nearly 300 acres, adjacent to the city of Tuscaloosa. In addition to the regular university library, the institution contains a document room with some 15,000 documents and pamphlets, including the publications of the Federal government; a law library; engineering library, museum library, and several department libraries. It also possesses the largest Museum of Natural History in the South. The students' interests and activities are represented by two publications, The Crimson-White, a weekly journal, and The Corolla, an annual. The university confers the master's degree in arts and sciences; the bachelor's degree in arts, education, science, science of education, civil engineering, electrical engineering, mining engineering, chemical engineering and civil and highway engineering; in law (LL.B.) and in medicine also gives the degree of M.D.

The University of Alabama was created by an act of the Federal legislature of the United States in 1830, and it was turned over several sections of government lands; but it was not until two years later that the trustees of the projected institution met in Tuscaloosa. The work of construction of the buildings progressed slowly, and it was not until 1831 that the university was opened to students. The university buildings were burned during the Civil War by United States cavalry (1865); but in 1869 they were partially replaced and the work of the institution resumed. In 1884 the Federal Congress granted to the university an additional 46,080 acres of land, in payment for the buildings lost during the war. In 1907 the State legislature of Alabama voted $400,000 to increase its equipment and sanctioned the federation of the Medical College of Alabama, at Mobile, with the State university.

UNIVERSITY OF CALIFORNIA. See CALIFORNIA, UNIVERSITY OF.

UNIVERSITY OF CINCINNATI. See CINCINNATI, UNIVERSITY OF.

UNIVERSITY CLUB, The, an organization of New York, incorporated in 1865. Members are required to hold a university or college degree representing a course of not less than three years of study; or an honorary degree, in the case of distinguished personages. Graduates of the United States military and naval academies are also eligible. The limit of membership is 3,000—2,000 resident and 1,500 non-resident and of the army or navy.

UNIVERSITY COLLEGE, the specific title of an institution attached to various British universities. (1) University College, Oxford, the oldest in the university, founded through the munificence of Sir Edward Bovill, archdeacon of Durham, shortly after 1249, consists of a master, nine ordinary Fellows, one civil law Fellow, 15 scholars and 14 exhibitioners. The fellowships are held seven years, but may be extended under certain conditions. The scholarships ($400 per annum) are open to all who have not exceeded 19 years of age. There are seven church livings in the gift of this college. The earliest statutes of the college date from 1260. (2) University College, London, founded 1828, is closely connected with London University. (3) The name is also given especially to three of the four colleges which form a Welsh University, namely, the University College of Wales at Aberystwyth, the University College of South Wales at Cardiff, and the University College of North Wales at Bangor. The students of these colleges, proceeding to degrees, have to go through a course at either London, Dublin, Edinburgh or Glasgow. (4) University College, Dundee, Scotland, founded in 1882, is affiliated with Saint Andrews University. (5) There are other colleges bearing the title in Exeter, Nottingham, Reading, Southampton, etc.

UNIVERSITY OF NORTH CAROLINA. See NORTH CAROLINA, UNIVERSITY OF.

UNIVERSITY OF THE PACIFIC (now College of the Pacific), located at San José, Cal. It was founded at Santa Clara in 1851 under the auspices and control of the Methodist Episcopal Church; in 1871 it was moved to San José; about 40 years after its incorporation Napa College was consolidated with it, and the name of the University of the Pacific adopted. Later the name was changed to College of the Pacific. It is open to both men and women. The organization of the university includes the College of Liberal Arts, the Academy, the School of Elucition and Oratory, the School of Commerce, the School of Art and the Conservatory of Music. The College of Liberal Arts offers regular four-year courses, for completion of which the degree of A.B. is conferred. The work of the last two years in each course is elective, a limited amount of work in certain departments being required according to the major chosen. The School of Commerce offers a college course in commerce, together with training for expert secretaries and accountants. The School of Elucition offers a course covering three years; the Art School a course of four years. The full course in the Conservatory of Music
extends over four years, and leads to the degree of bachelor of music. The college is situated in the Santa Clara valley, within easy reach of both San José and Santa Clara; and occupies a fine location. The library, in 1917, contained 10,000 volumes; the income amounted to $79,000; the students numbered 465, and the faculty 35.

UNIVERSITY OF PENNSYLVANIA. See PENNSYLVANIA, UNIVERSITY OF; and consult Lippincott, H. M., "University of Pennsylvania; Franklin College" (1919).

UNIVERSITY PLACE, Neb., thriving city in Lancaster County, on the Chicago, Rock Island and Pacific Railroad, about four miles northwest of Lincoln. It has a Carnegie library and is the seat of the Nebraska Wesleyan University and of the State Agricultural College. Pop. about 5,000.

UNIVERSITY OF ROCHESTER, Rochester, N. Y., was established by Baptists of the State of New York in co-operation with citizens of Rochester, and was opened for students in 1850. Since 1852 both men and women have been received as students, a co-ordinate college having been established for them under the same faculty as the college for men. A bequest for this purpose made by Lewis H. Morgan many years prior to 1899 was available for this use in 1909. The university conducts curricula leading to the degrees A.B. and B.S., also to the degree B.S. in chemical engineering and chemical engineering. There is a campus of over 25 acres in the centre of the residence section of the city, in addition to an athletic field of 12 acres for physical education. On the campus there are 11 buildings, including a beautiful Memorial Art Gallery. The library contains 75,000 volumes; thoroughly equipped laboratories and museums provided for instruction in biology, chemistry, geology, mechanical engineering, physics and psychology; the faculty numbers 49; the students in a recent year numbered 535 men and 271 women.

UNIVERSITY SETTLEMENTS. See SOCIAL AND UNIVERSITY SETTLEMENTS.

UNIVERSITY OF THE SOUTH, located at Sewanee, Tenn. It was chartered in 1857 by the southern dioceses of the Protestant Episcopal Church; the site and endowment were obtained, and the central building begun, when the Civil War stopped further operations and rendered the endowment worthless. In 1867 more funds were obtained largely through the efforts of Bishop Quintard of Tennessee, and the Grammar School—Sewanee Military Academy since 1908—(secondary grade) and Academic Department—College of Arts and Sciences—opened to students in 1868. The university now includes the Sewanee Military Academy, the College of Arts and Sciences, the Theological Department, and a Training School for Nurses connected with the Hodgson-Emerald Hospital. The Medical Department established in 1892, the Law Department established in 1895, and the School of Pharmacy established in 1896 were discontinued in 1909. The College of Arts and Sciences offers studies leading to the degree of B.A., and a course in civil engineering. The degree of M.A. is conferred for graduate work. In the Theological Department the degree of B.D. is conferred on all who complete the regular three-years' course (including Greek and Hebrew) who have held a Bachelor's degree for at least one year from some approved college or university and have passed an examination on a subject approved by the faculty. The course in the Training School for Nurses is three years in length. Seven scholarships are available for students in the Theological Department, and about 25 for students in the College of Arts and Sciences. A unit of the Students' Army Training Corps was established in the college in 1918. Full provision is made for physical training, and there is a general interest in athletic sports which are under the direction of the Athletic Board of Control. Seven Greek letter fraternities are represented at the university, and the students also maintain two literary societies, writing, debating and musical clubs, a dramatic club, and The Sewanee Union, a social club for students who are members of the faculties, alumni and residents of the town of Sewanee. The university owns a domain of 8,000 acres in the midst of the beautiful scenery of the Cumberland Plateau; a reservation of 1,000 acres surrounds the central buildings, from which building lots are leased for long terms. The chief buildings are Saint Luke's Memorial Hall (Theological Department), Saint Luke's Memorial Chapel, Walsh Memorial Hall, the Library, with a tower modeled upon that of Magdalen College Chapel, Oxford, in which are a clock and peal of bells, Thompson Hall, Hodgson-Emerald Hospital, Hoffman Memorial Hall (dormitory), Quintard Memorial Hall (Sewanee Military Academy), All Saints Chapel, the Carnegie Science Hall and the gymnasium (partly completed). The library in 1918 contained 38,000 volumes; the students in all departments numbered 405, and the faculty 35.

UNIVERSITY OF SOUTH CAROLINA, the State college located at Columbia, S. C., chartered in 1801, and first opened in 1805. In July 1863 the college was closed on account of the Civil War; many students having enlisted in the Confederate army, and the buildings were used as a hospital by the Confederate government. The charter was amended in 1865, departments of medicine and law added, and the name changed to the University of South Carolina; the unsettled political condition of the State led to the closing of the institution a second time in 1877. The next year the charter was again altered, and the university divided into two branches, South Carolina College at Columbia and Claflin College at Orangeburg (the latter for colored students); the branch at Columbia was opened in 1880 as the South Carolina College of Agriculture and Mechanic Arts. In 1882 several new departments were added and of Agriculture and Mechanic Arts dropped from the name; the Law School was added in 1884. In 1887 the charter was changed for the third time, the name of University of South Carolina again adopted, and a College of Pharmacy, Graduate Department and Normal School added. In 1890 there was a fourth reorganization, the agricultural, mechanical, medical and normal courses were discontinued, and the name changed to South Carolina College. In 1894 normal courses were added to the curriculum. The college now offers the following
courses: (1) Four courses: classical, Latin-science, Latin-literature, and modern literature, leading to the degree of A.B.; (2) two courses: mathematical, physical and chemical-biological, leading to the degree of B.S., also special courses in civil and mechanical engineering by the addition of certain studies to the mathematici-
cal physical course leading to the degree C.E.;
(3) three normal courses, one of four years, leading to the degree of A.B., one of three years and one of two years; (4) a two-year course in the Law School, leading to the degree of L.L.B., and (5) a graduate course for the degree of A.M. The work of the last two years of the A.B. and B.S. courses is partially elective. The special normal course is strictly professional and includes practice work. There are also normal courses for teachers given in the spring. There are 12 scholar-
ships besides State scholarships for each county for normal students. The library in 1916 con-
tained about 50,000 volumes; the students num-
bered 578 and the faculty 38. In 1906 the in-
stitution was reorganized under the title Uni-
versity of South Carolina. The schools as then established were Arts, Science, Teachers' Grad-
uate, Law.

UNIVERSITY OF SOUTHERN CAL-
IFORNIA, located at Los Angeles. It was
established in 1879 and first opened to students
the following year. The institution is under
the auspices of the Methodist Episcopal Church.
Men and women are admitted on equal terms. The
organization includes nine colleges, i.e.,
Liberal Arts, Physicians and Surgeons, Law,
Dentistry, Theology, Pharmacy, Oratory, Fine
Arts and Music; a School of Education; an
University High School. In the College of
Liberal Arts, there are offered undergraduate
courses in 21 major subjects, all of which lead
to the A.B. degree. There are also offered
four-year courses in electrical and civil engi-
neering, leading to the degree of B.S. The
degrees of A.M. and M.S. are offered in the
general departments. The courses in the other
colleges lead to the usual degrees in professional
subjects. Under authority from the State
Board of Education the university is empow-
ered to grant the High School Teachers Recom-
mandation upon the completion of the requisite
graduate work in the School of Education.
The university campus comprises about 15
acres well located in the south central part of
the city and accessible by ample car service.
The colleges of Physicians and Surgeons, Den-
tistry, Law, Music and Fine Arts at present
occupy buildings in other parts of the city. A
recently completed endowment campaign for
one million dollars has placed the available
resources at nearly two millions. New build-
ings are projected which will be erected as soon
as war conditions will permit. The library
contains 35,000 volumes, the City Public Library
and the County Law Library are also available
for student use. In 1917-18 the faculty num-
bered 378 while the enrolment of the student
body was 4,096.

UNIVERSITY OF THE STATE OF
NEW YORK, The. At the close of the
American Revolution there existed in New
York city an institution known, previous to that
time, as King's College, which during the Revo-
lution had become thoroughly disorganized. Its
property had been largely dissipated, its course
of instruction had been suspended and many
vacancies existed in its governing body. More-
over its name, King's College, had become dis-
favourable to the colonists, who had broken off
all allegiance to kings. To meet and remedy
these conditions, the legislature of the State of
New York, at its very first session after the
close of the Revolution, on 1 May 1784, passed
an act establishing *Art acts, four years previ-
ously authorized by the legislature to the college heretofore called
King's College for altering the name and
charter thereof and erecting an university in this State." By this act the corporate rights of
King's College (the name of which was now
changed to Columbia College) were vested in
the regents of the University of the State of
New York. The regents were also *empowered
to establish from time to time such additional
colleges as they might think proper, such col-
leges to be a part of the State University.*
In 1877 Columbia College was made a self-
perpetuating and separate governing body (see
COLUMBIA UNIVERSITY), and the same year the
act of 1784 was replaced by a new act which
specificalmonts that *An university be and
is hereby instituted in this State to be known
and called by the name or style of the
REGENTS OF THE UNIVERSITY OF THE STATE
OF NEW YORK.* This act authorizes the
regents to visit and inspect all the colleges,
academies and schools which are or may
be established in this State, to examine
into the state of education and discipline, and
to make a yearly report thereof to the legisla-
ture. It also gives to the regents the power
to confer degrees and to grant charters of in-
corporation to colleges and academies.

The organization thus perfected has, with a
few changes, continued to the present time. In
1894, the University of the State of New
York was made a constitutional body, to be
governed by a board of not less than nine re-
gents, and their corporate powers may be modi-
ied, increased or diminished by legislative en-
actment.

In 1904 the jurisdiction of the regents was
extended to cover the elementary schools, which
previously had been under the direction of the
superintendent of public instruction. The pres-
ent objects of the university as expressed in the
Education Law of 1918 are:

"To encourage and promote education, to visit and in-
spect its several institutions and departments, to distribute
to or expend or administer for them such property and funds
as the state may appropriate therefor or as the university
may own or hold in trust or otherwise, and to perform such
other duties as may be entrusted to it."

REGENTS.—The university is governed and
all its corporate powers are exercised by a
board of regents, serving without salary, whose
members are at all times three more than the
existing judicial districts of the State at
present nine districts and 12 judges. The
officers of the board of regents are the chancel-
lor and vice-chancellor, who serve without
salary. Subject and in conformity to the con-
titution and laws of the State, the regents
exercise legislative functions concerning the
educational system of the State, determine its
educational policies, establish rules for carrying
into effect the laws and policies of the State
relating to education and the powers, duties
and trusts conferred or charged upon the university. The regents elect by ballot the president of the university and the commissioner of education who holds office during the pleasure of the board. The university is the State Education Department; charged with and under its caption, and in its name as such, it exercises the general management and supervision of all public schools and all the educational work of the State.

During their regents under their seal confer certificates, diplomas and degrees on persons who satisfactorily meet the requirements prescribed.

Examinations.—In the secondary institutions of the university regents examinations furnish the standard of graduation and of admission to colleges. Certificates or diplomas are conferred by the regents on pupils who satisfactorily pass the academic examinations. The regents also supervise and enforce requirements to the professional schools and conduct the professional licensing examinations.

Registration.—The regents register both domestic and foreign institutions of New York standards, fix the value of degrees, diplomas and certificates issued by institutions of other States and countries and presented for entrance to schools, colleges and the professions in New York State.

Incorporation.—Under such name and with such number of trustees or other managers, and with such powers, privileges and duties, and subject to such limitations and restrictions in all respects as the regents may prescribe in conformity to law, the regents by an instrument under their seal and recorded in their office incorporate universities, colleges, academies, libraries, museums and other institutions or associations for the promotion of science, literature, art, history or other departments of knowledge or of education in any way, associations of teachers, students, graduates of educational institutions and other associations whose approved purposes are in whole or in part educational or cultural value deemed worthy of recognition and encouragement by the university. No institution or association which might be incorporated by the regents may be incorporated under any other general law without their consent.

Extension.—The regents extend to the people at large increased educational opportunities and facilities, stimulate interest therein, recommend methods, designate suitable teachers and lecturers, conduct examinations and grade credentials and otherwise organize, aid and conduct such work.

Visitation.—The regents or their representatives visit, examine into and inspect institutions in the university and require annual reports duly verified, from the various institutions of the university.

Departments and Divisions.—The regents establish such departments and divisions as they deem useful in the discharge of their duties. The educational and administrative work is performed by five departments of the university: higher education, secondary education, elementary education, State library and science. The work of these departments is distributed among 11 divisions, namely, administration, agricultural and industrial education, archives and history, attendance, educational extension, examinations and inspections, law, library school, school buildings and grounds, school libraries, statistics and visual instruction.

Education Building.—It is occupied exclusively by the university, including the various departments and divisions of the work, together with such other work as the regents may in their discretion provide for therein. The building and the officers of the department are maintained at State expense, and are located at Albany, N. Y., the State capital. See New York, University of the State of (vol. 20, p. 238).

Convocation.—The University Convocation is held annually in the Education Building on such dates as the chancellor and commissioner determines. Its object is to ascertain and formulate educational opinion; to make recommendations and by the co-operation of educational forces to advance educational interests. Its membership includes all educational officers, teachers and others interested in the educational well-being of the State.

Publications.—The university publications include handbooks, both of New York standards, fix the value of degrees, diplomas and certificates issued by institutions of other States and countries and presented for entrance to schools, colleges and the professions in New York State.

Incorporation.—Under such name and with such number of trustees or other managers, and with such powers, privileges and duties, and subject to such limitations and restrictions in all respects as the regents may prescribe in conformity to law, the regents by an instrument under their seal and recorded in their office incorporate universities, colleges, academies, libraries, museums and other institutions or associations for the promotion of science, literature, art, history or other departments of knowledge or of education in any way, associations of teachers, students, graduates of educational institutions and other associations whose approved purposes are in whole or in part educational or cultural value deemed worthy of recognition and encouragement by the university. No institution or association which might be incorporated by the regents may be incorporated under any other general law without their consent.

Extension.—The regents extend to the people at large increased educational opportunities and facilities, stimulate interest therein, recommend methods, designate suitable teachers and lecturers, conduct examinations and grade credentials and otherwise organize, aid and conduct such work.

Visitation.—The regents or their representatives visit, examine into and inspect institutions in the university and require annual reports duly verified, from the various institutions of the university.

Departments and Divisions.—The regents establish such departments and divisions as they deem useful in the discharge of their duties. The educational and administrative work is performed by five departments of the university: higher education, secondary education, elementary education, State library and science. The work of these departments is distributed among 11 divisions, namely, administration, agricultural and industrial education, archives and history, attendance, educational extension, examinations and inspections, law, library school, school buildings and grounds, school libraries, statistics and visual instruction.

Education Building.—It is occupied exclusively by the university, including the various departments and divisions of the work, together with such other work as the regents may in their discretion provide for therein. The building and the officers of the department are maintained at State expense, and are located at Albany, N. Y., the State capital. See New York, University of the State of (vol. 20, p. 238).

Convocation.—The University Convocation is held annually in the Education Building on such dates as the chancellor and commissioner determines. Its object is to ascertain and formulate educational opinion; to make recommendations and by the co-operation of educational forces to advance educational interests. Its membership includes all educational officers, teachers and others interested in the educational well-being of the State.

Publications.—The university publications include handbooks, both of New York standards, fix the value of degrees, diplomas and certificates issued by institutions of other States and countries and presented for entrance to schools, colleges and the professions in New York State.

Incorporation.—Under such name and with such number of trustees or other managers, and with such powers, privileges and duties, and subject to such limitations and restrictions in all respects as the regents may prescribe in conformity to law, the regents by an instrument under their seal and recorded in their office incorporate universities, colleges, academies, libraries, museums and other institutions or associations for the promotion of science, literature, art, history or other departments of knowledge or of education in any way, associations of teachers, students, graduates of educational institutions and other associations whose approved purposes are in whole or in part educational or cultural value deemed worthy of recognition and encouragement by the university. UNIVERSITY OF WOOSTER—UNWIN

or may hereafter be incorporated in this State and such other libraries, museums, institutions, schools, organizations and agencies for education as may be admitted to or incorporated by the university.

**Education Department.**—The university is the educational department whose president is the commissioner of education—the chief executive officer. It is his duty also to devote himself to educational research; to the study of the educational work of the systems of other jurisdictions; to introduce and originate, so far as possible, better methods of education.

The Assistant Commissioner and Director of Professional Education.—He has charge of higher education including matters relating to universities, colleges, professional and technical schools and to the execution of educational laws concerning the professions. His field of labor is the department of higher education.

The Assistant Commissioner for Secondary Education.—He has charge of secondary education including matters relating to academies, academic departments, academic schools, high schools, the training of teachers therefor, and to the State College for Teachers. His field of labor is the department of secondary education.

The Assistant Commissioner for Elementary Education.—He has charge of elementary education including matters relating to elementary schools, the training of teachers therefor; and of the division of school libraries. His field of labor is the department of elementary education.

The Director of the State Library.—He has charge of the State Library and of the State Library School. His field of labor is a department of the university.

The Director of the Department of Science.—He has charge of the department of science and the State Museum. His field of labor is a department of the university including the work of the State Geologist and Palaeontologist, Botanist, Entomologist, Mineralogist, Zoologist, Archeologist and the custody of the State Museum.

CHARLES F. WHEELock,
Assistant Commissioner for Secondary Education, University of the State of New York.

UNIVERSITY OF WOOSTER. See Wooster, College of.

UNKAR. Plute Indian name given by Walcott to a thick group of limestone, red shale and quartzite with basalt flows of Algonkian age in Grand Canyon of Arizona. These beds have a thickness of 6,830 feet, are tilted and faulted considerably, and lie on gneiss of supposed Archean Age.

UNLEAVENED BREAD, bread made without leaven or ferment and prescribed in the Jewish law (Ex. xii, 15, 17) to be used at the Passover festival; it is required in the Latin Church as one of the two eucharistic elements. The Authorized Version of Ex. xii, has "And ye shall have the feast of unleavened bread" and from this it has been inferred that this feast is not identical with the Passover; but the words in italics are confessedly interpolated by the translators, and they represent not the only meaning of the inference: the Septuagint version has no such interpolation, but neither has it the term (azyma) for unleavened bread; it renders the passage, "And ye shall observe this command." In the Eucharist, the Oriental churches, as the Greek Orthodox, the Nestorian, and the rest, including the Oriental churches in communion with Rome, except the Maronites and the United Arab, use unleavened bread for the Eucharist: in churches of Latin rite unleavened bread alone is permitted. The Council of Florence (1439), in the Decree of Union, defined that consecration either in leavened or unleavened bread is valid. The usage of the Protestant churches conforms with that of the Oriental Church.

UNTERMEYER, Louis, American writer: b. New York, 1 Oct. 1885. He was educated at the Dewitt Clinton High School and entered commercial life but found writing more to his liking and became associate editor of *The Masses* and a contributor to the *Chicago Evening Post*, the *New York Times*, the *Yale Review*, etc. He is particularly happy in his parodies and is the author of several attractive volumes, notably "Translations from the poem of Heinrich Heine" (1917).

UNTERMEYER, Samuel, American lawyer: b. Lynchburg, Va., 3 March 1858. He took his degree from Columbia University, New York, to which city the family moved soon after the war, and he was admitted to the bar in 1879. He rose rapidly in his profession, became famous as a corporation attorney and was noted for his connection with celebrated cases. Lately he has been special adviser to the government in the interpretation and enforcement of the income tax law and was active in securing the enforcement of anti-trust legislation. He is a leader of the Jewish race and a man whose council is sought on all important undertakings.

UNTERWALDEN, oon'tær-vår'den, Switzerland, one of the smaller cantons, in the centre of Switzerland, bounded on the north by Lucerne and the famous lake of Lucerne, on the east by the Urner Alps which separate it from Uri, and on the south and west by Bern. The pasturage of cattle is the chief support of the inhabitants, and there is a considerable trade in agricultural produce and in wood. The surface is mountainous; the most remarkable summits are those of Pilatus and of Tithlis. The canton is divided into two valleys, Upper and Lower (Obwalden and Nidwalden), by a forest called Kurnwald, which crosses it from north to south. Each of these valleys forms an independent state, but is represented by only one member in the council of the Swiss states, instead of two, as all the whole cantons are. The chief town of Obwalden is Sarnen, and of Nidwalden, Stanz. Area of Obwalden, 183 square miles: pop. about 17,000; area of Nidwalden, 112 square miles; pop. about 14,000.

UNTHANK, James Bryant, American college president: b. Williamsburg, Ind., 1849. He was graduated from Earlham College, Richmond, Ind., in 1874, was professor of history and logic, 1874-81, and was president of Wilmington College, Ohio, from a quarter century.

UNWIN, William Cawthorn, English civil engineer: b. Creswell, Derby, 12 Dec. 1838. He was educated at the City of London School, and was instructor at the Royal School of
Naval Architecture and Marine Engineering, Kensington, 1868-72. Since 1885 he has been professor of engineering at the Central Technical College of the Guilds of London, Kensington. He has published 'Wrought Iron Bridges and Roofs' (1889); 'Machine Design' (1877); 'The Testing of Materials of Construction' (1888); 'The Life of Hirn' (1896); 'Treatise on Hydraulics' (1907), etc.

UNYRO, oo-nyo-ro', British East Africa, a former native state of about 30,000 square miles, bordering on the Albert Nyanza, and now included in Uganda. Pop. estimated at 1,500,000.

UP FROM SLAVERY, an autobiography by Booker T. Washington (qv.), published in 1901. Its author was a slave until freed by the Emancipation Proclamation. The story of his life and career is told with much grace and simplicity as well as extreme modesty.

UPANISHADS, oo-pê-ni-shadz', a series of mystic treatises belonging to the Vedic literature. They are primarily about 30 in number and contain the mystical doctrine of the Hindus regarding the nature of deity and the process of creation. Various apocryphal writings have been discovered and added, until the latest list totals about 250. They constitute part of the Brahmanas or commentaries belonging to the Veda and present the Vedic doctrine in a comprehensive form. They describe the Supreme Being, and union with the All, and many of them deal with sectarian post-Vedic identifications of the Supreme Being with Brahma, Vishnu and Siva. Though not supposed by Hindus to have been revealed in the same manner as the Vedic hymns, the Upanishads are not assigned to human authorship, but are deemed inspired writings. These writings breathe the spirit of all the Eastern religions, especially Buddhism. They teach that the highest part of the individual, the atman, descends through sheaths or experiences on the earth plane. Some of them are closely connected with Yogi philosophy, and all are based on belief in reincarnation. Many of these books are also classed as Vedic literature. They appear to have been written at various periods within about 1,000 years before the Christian era. You will perhaps like to read the works of Max Muller, Annie Besant, Gough's 'Philosophy of the Upanishads' (London 1903); Jacob, 'Concordance to the Principal Upanishads and Bhagavadgita' (1891); and Oldenberg's 'Die Lehre der Upanishaden' (Gottingen 1915). See BRAHMANAS; KARMA; METEMPSYCHOSIS; SANSKRIT; VEDA. There is an English translation of the principal Upanishads by Max Muller, 2 vols.

UPAS TREE, a Javanese tree (Anitatis toxicórum), celebrated for its poisonous qualities, which, however, have been very much exaggerated. It was long believed in Europe that this tree was a solitary one situated in a valley in Java, that the pestilential qualities of it were so great that neither herb nor animal could pass within miles of it, and that criminals alone were sent to gather poison from it, few of whom ever returned. The Javanese themselves dreaded this tree, and will not rest beneath it, or even pass to leeward of it. The upas tree belongs to the Urticaceae, and the stem rises for about 60 feet before the first branch puts out. The wood itself is harmless, being used for furniture, but the bark, which is whitish, and nearly an inch thick, when wounded, exudes a viscid, milky yellowish sap, which becomes brown on exposure and hardening into gum. From this sap, when mixed with the seeds of capsicum and other substances, a deadly arrow-poitson is made, which is at first purgative and emetic in its effects, and then narcotic, finally killing the victim by tetanic convulsions. It is called upan-antiar. When the tree is felled, or the bark is much injured, the tree gives out noxious exhalations which will cause cutaneous eruptions, and if the upas tree be burned the smoke from it will produce the same result. A variety is the sack tree. It has a bark, pieces of which, when soaked and beaten, can be turned inside out without tearing, and, a section of the wood having been left for a bottom, can be used as a sack. It is said that a kind of coarse cloth is made from the fibrous inner bark of the upas tree, and is worn by poor people, but that if wetted it excites an intolerable itching of the wearer's skin.

UPCHURCH, John Jordan, American mechanic: b. Franklin County, N. C., 26 March 1822; d. Steelville, Mo., 18 Jan. 1887. He gained a wide knowledge of mechanics and engineering through practical experience, engaged in constructing large saw and flour mills, was master mechanic on the Main Hill and Schuykill Haven Railroad in 1841-54 and in 1868 entered the machine shops of the Great Western Railroad at Meadville, Pa. On 27 Oct. 1868 he founded there the first lodge, consisting of 14 members, of the Ancient Order of United Workmen, a fraternal organization which has since extended into every State and Territory of the United States. He removed to Missouri in 1873, where he was engaged as master mechanic of the carshops of the Saint Louis, Salem and Little Rock Railroad and also superintendent of the building of the shops and the purchase and erection of machinery.

UPCOTT, William, English autograph collector: b. London, 1779; d. Islington, 1845. He became assistant to Richard Porson as librarian of the London Institure (1803), but resigned (1834) to become a collector of autographs and gathered an immense number. He published an 'Account of the principal works relating to English topography' (3 vols., 1818); edited 'Evelyn's Miscellany' (1825) and engaged in other literary work up to the day of his death.

UPDEGRAFF, Milton, American astronomer: b. Decorah, Iowa, 20 Feb. 1861. He was educated from the University of Wisconsin in 1884, was assistant astronomer at the Washburn Observatory, 1884-87, and from the last-named year until 1890 he held an astronomical post at the National Observatory at Cordoba, Argentine republic, until 1890. He was professor of astronomy at the State University of Missouri, 1890-99. Since 1890 he has been professor of mathematics of the United States navy. He was director of the Nautical Almanac in 1907-10; also in charge of six-inch Transit Circle of the United States Naval Observatory in 1908-10. Professor Updegraft
UPERNIVIK—UPJOHN

was in charge of an eclipse party at Barnesville and Griffin, Ga., in May 1900, and in 1913-14 was in charge of geodetic and other scientific work in the American survey of Samoa. In 1916 he was on duty in the Philippines, and in 1918 was on duty at the Mare Island Navy Yard. He is the author of several articles on professional topics.

UPERNIVIK, or UPERNAVIK, Greenland, a district in which is located Tasiussuk, the most northerly settlement in the western hemisphere.

UPHAM, Charles Wentworth, American minister: b. Saint John, N. B., 1802; d. 1875. He graduated at Harvard (1821) and at the divinity school there (1824) to become pastor with Rev. John Prince in the Unitarian Church at Salem, Mass., remaining there until 1844. He was mayor of Salem (1852), president of the state senate (1857-58), and was representative in Congress. His voluminous publications dealt with the affairs of his time and he also was editor of the Christian Review and of the Christian Register.

UPHAM, Samuel Foster, American clergyman and educator: b. Duxbury, Mass., 19 May 1834; d. Madison, N. J., 5 Oct. 1904. He prepared for college at the East Greenwich Academy, and graduated from Wesleyan University in 1856. He immediately entered the ministry of the Methodist Episcopal Church joining the Providence, now the New England Southern Conference. He served parishes in Taunton, Mass., Pawtucket, R. I., New Bedford, Mass., and Bristol, R. I. In 1864 he was transferred to the New England Conference and served a church in Lowell, Mass., three separate churches in Boston, and one in Lynn, Mass., and in Springfield, Mass. In 1881 he was elected professor of practical theology in Drew Theological Seminary, Madison, N. J., where he taught until his death. He was a member of several general conferences and exerted a great influence therein. It is said that a great speech which he made led to the abandonment of the time limit in ministerial appointments. Over 1,400 students passed through his classes. His wit was proverbial and his speech epigrammatic. He was one of the greatest preachers of his generation. His father was for 70 years a minister, and his three sons all entered the ministry.

UPHAM, Thomas Cogswell, American clergyman and educator: b. Deerfield, N. H., 30 Jan. 1799; d. New York, 2 April 1872, although his residence was Kennebunkport. After graduating from Dartmouth College in 1818 and Andover Theological Seminary in 1821 he served two years as assistant in Hebrew in the seminary. From 1823-25 he was associate pastor of the Congregational Church in Rochester, N. H. In 1825 he became professor of mental and moral philosophy in Bowdoin College, where he served until 1867. He was one of the very earliest advocates of International peace by peace tribunals. He was a voluminous author. The most important works from his pen are 'Ratio Disciplinae, or the Constitution of the Congregational Churches' (1829); 'Manual of Peace' (1830); 'Philosophical and Practical Treatise on the Will' (1834 and several later editions); 'Elements of Mental Philosophy' (2 vols. 1839). An Abridged Ed. (1864); 'Outlines of Disordered Mental Action' (1840); 'Life and Religious Experience of Madame Guyon' (1847, 2 vols., 1851); 'Life of Faith' (1848, 1859); 'Principles of the Interior, or Hidden Life' (published in 10 editions); 'A Treatise on the Divine Union' (1851); 'Religious Maxims' (1854); 'Life of Madame Caroline Adoriana' (1850); 'Letters to Hume on Social and Moral, written from Europe, Egypt and Palestine' (1855; 2d ed., 1857); 'A Method of Prayer—An Analysis of the Work so Entitled by Madame Guyon' (1859); 'The Absolute Religion' (posthumous 1872). He also won the prize for his production on 'The Congress of Nations' (1840), and translated Jaen's 'Biblical Archaeology' (1823) which passed through at least 12 subsequent editions.

UPHAM, Warren, American geologist: b. Amherst, N. H., 8 March 1850. He was graduated at Dartmouth in 1871; served on the geological survey of New Hampshire, 1875-78; on the geological survey of Minnesota in 1879-85; also 1893-94; and on the United States Geological Survey in 1885-95. After the last-mentioned date he was secretary and librarian of the Minnesota Historical Society in Saint Paul until 1914, and has since been its archaeologist. He has published 'The Glacial Lake Agassiz'; 'Greenland Icefields and Life in the North Atlantic, with a New Discussion of the Causes of the Ice Age' (with G. P. Wright, 1897); Volume I, 'Description and Explorations,' of 'Minnesota in Three Centuries' (1908), etc.; and has edited Volumes VIII to XV (1895-1915) of the Minnesota Historical Society Collections. He is also author of many geological reports and papers in scientific and historical magazines, chiefly relating to glacial subjects and to Minnesota history.

UPJOHN, Richard, American architect: b. Shaftesbury, England, 22 Jan. 1802; d. Garri-sons, N. Y., 16 Aug. 1878. He emigrated to the United States in 1829 and took up his residence in New Bedford, Mass. At that time he was designing and directly the alterations in Trinity Church, New York, he left Boston, where he had been engaged on the designs for the courthouse for that city, and settled in New York, where he drew the plans for the Trinity Church of today, completed in 1846 and then considered the handsomest church in the United States. He also built the Church of the Ascension, the Church of the Holy Communion, Trinity Chapel, Saint Thomas' Church, and others in New York, Saint Paul's Church, Buffalo, and the Church of the Pilgrims and Grace Church in Brooklyn. For 20 years he was president of the American Institute of Architects. His civic architecture was chiefly that of Italian Renaissance, while his domestic buildings were of various styles.

UPJOHN, Richard Mitchell, American architect, son of the preceding: b. Shaftesbury, England, 7 March 1828; d. Brooklyn, N. Y., 1903. He came to this country from England with his parents in his sixth year, and was brought up in a partnership with his father when 20 years old. Among the many buildings erected with his cooperation are the Madison Square Church, the old Mechanics' Bank in Wall street, Saint
UPLAND PLOVER — UPSALA

Peter's Church, Albany; the Central Congregational Church, Boston; Park Church, Hartford, Conn.; Saint Paul's Protestant Episcopal Church, Brooklyn, and Trinity Parish School, New York. His chief work was the State Capitol in Hartford, Conn., and he had frequently been employed as an expert on civic, State, and national commissions. He was a member of the American Institute of Architects and was president of the New York Chapter for two years. He was also a member of the Architectural League, an officer at the Architectural Department of the Brooklyn Institute of Arts and Sciences, and a life member of the Metropolitan Museum of Art.

UPLAND PLOVER, a sportsman's name for the Bartramian sandpiper. See SANDPIPERS.

UPOLU (oo-pö-loo') ISLAND. See SAMOA ISLANDS.

UPPER ALTON, ill., city, Madison County, on the Chicago, Burlington and Quincy and the Chicago and Alton railroads, two miles northwest of Alton. It is in an agricultural region. There are roof-tile works, a machine shop, grist mill and other manufactures connected with the shipping of farm products. The educational institutions are the Shurtleff College (Baptist) opened in 1827 and chartered in 1835; a high school, opened in 1885 and public elementary schools. The Shurtleff College had, in 1917, 15 professors and instructors, and 126 students. The collegiate course consists of 20,000 volumes; the productive funds amounted to $176,000 and the total income to $26,766. Pop. 2,918.

UPPER CANADA. See ONTARIO.

UPPER HELDERBERG GROUP, a discarded term in geologic chronology, applied to the lower members of the Mid Devonic formations — the Schoharie grit and the Onondaga or corniferous limestone. The term was derived from the Helderberg Mountains, where these rocks form the highest limestone members, while other limestones termed the Lower Helderberg group formed the basal limestone strata. To these latter, now classed as Lower Devonic, with the exception of the Manlius limestone, the name Helderburgian is now restricted. See DEVONIAN; OLD RED SANDSTONE.

UPPER IOWA UNIVERSITY, located at Fayette, Iowa. It was established as Fayette Seminary in 1857, and the name was changed to Upper Iowa University in 1858. It is supported and controlled by the Upper Iowa Conference of the Methodist Episcopal Church. It has been open to men and women on equal terms from the first, and a third of the graduates have been women. The organization includes the College of Liberal Arts, the Academy, the Normal School, the Conservatory of Music, a school of art, the School of Oratory, the Business College, the School of Physical Culture, and the Summer School. The College of Liberal Arts offers a classical, a philosophical, and a scientific course, and confers the three degrees of A.B., B.P.h. and B.S. The library contains 16,000 volumes; the students number about 400 and the tuition is $275.

UPPER SANDUSKY, Ohio, village, county-seat of Wyandot County, on the Sandusky River, and on the Pennsylvania and the Columbus, Hocking Valley railroads, about 60 miles north by west of Columbus and 57 miles south by east of Toledo. It is in an agricultural and stock-raising region. The chief manufacturing establishments are machine shops, wagon and carriage works, foundries, flour mills, steam pumps and laundry machine works. The educational institutions are a high school, established in 1872, public and parish schools and a public library. There are two banks and two daily newspapers. Pop. 7,779.

UPPER SENEGAL AND NIGER, French West Africa, a colony formed in 1904 from the territories of Senegambia and the Niger, acquired in 1893. It extends south of Algeria to the northern boundaries of Dahomey, Togo, the Gold Coast and the Ivory Coast, with the Military Colony of the Niger on the east, and on the west Mauritania, the Falémé river and the frontier of French Guinea. The area is about 568,273 square miles. It includes a large part of the Sahara Desert below the Algerian boundary, the Upper Senegal Valley, over two-thirds of the course of the Niger River and all the countries in the Great Bend. The region is largely plateau land, rising to a height of 1,600 feet. Forests occur, but the land mainly is open and well adapted to grazing and stock raising. The natives cultivate corn, rice, cotton, millet and ground nuts, and large herds of cattle abound. Native manufactures include pottery, bricks, jewelry, leather and woven goods. The export trade in 1916 amounted to $62,000 and consisted of cotton, rubber, fruits, oil seeds, oil cacao and timber; imports, chiefly food stuffs, cotton goods, mechanical implements and beverages amounted to $193,119. The Senegal-Niger Railway extends 349 miles from Kayes to Koulikoro, whence small steamers ascend the river to Timbuktu. Timbuktu has wireless telegraphic connection with the Eiffel Tower in Paris and telegraph lines extend throughout the colony from Kayes to Niamey, Zinder and Lake Tchad. The colony is under civil administration with colonial judicial and educational systems. The chief towns have regional or urban schools; at Bamako is a school for the instruction of girls; a professional school; at Timbuktu is a Mohammedan superior school. The principal towns are Ouagadougou (pop. 19,330); Bobo-Dioulasso (pop. 8,740); Bamako, the capital (pop. 8,734); Sikasso (pop. 7,825); Segou (pop. 8,400); Kayes (pop. 5,620); Djenné (pop. 5,450); Timbuktu (pop. 4,270); Goundam (pop. 3,200); Dori (pop. 3,400). Including 1,314 French, the total population of the colony is 5,598,973.

UPPSALA, or UPPSALA, oop-sal'ä, Sweden. (1) A university town situated on the Fyris River near the head of a navigable branch of Lake Mälàr, 50 miles north of Stockholm. The most prominent building is the Gothic cathedral, built in 1260-1435, and restored in 1886-93. It contains the tombs of several Swedish kings. The main building of the university is a fine Renaissance structure built in 1589-87. The university was founded in 1477. It had 2,347 students in 1915, a library of 350,000 volumes and 12,500 of rare books; a collection of coins and paintings, a botanical garden and museum, with a statue of Linnaeus, and an astronomical observatory. It is an important railway junction and there is a large
annual fair. The old city was wholly destroyed by fire in 1702. Pop. 27,976. (2) A lan or district of over 2,000 square miles area, with a population of about 132,716. Its eastern front is on the Baltic Sea and the Gulf of Bothnia, and it adjoins Stockholm on the south.

UPSETTING THERMOMETER. See THERMOMETER.

UPSHUR, up'shur, Abel Parker, American statesman: b. Northampton County, Va., 17 June 1790; d. Potomac River, near Washington, D. C., 28 Feb. 1844. He was admitted to the bar in 1810, practised law at Richmond, Va., in 1810-24 and in 1825 served in the Virginia legislature. He was appointed judge of the general court in 1829, was a member of the convention to revise the State constitution in 1829, and then resumed his office as judge, serving until 1841, when he accepted the appointment as Secretary of the Navy under President Tyler. On the resignation of Daniel Webster in 1843 he became Secretary of State, in which capacity he favored the pro-slavery party and also supported President Tyler's policy of annexing Texas. On 28 Feb. 1844, in company with the President and his party, he visited the war steamer Princeton on the Potomac River to witness the testing of a large gun. It exploded in the experiments and Secretary Upshur, together with several others of the party, was killed.

UPSHUR, John Henry, American naval officer: b. Northampton County, Va., 5 Dec. 1823; d. 30 May 1917. He was educated at William and Mary College, entered the navy in 1841, served in the Mexican War and was participated in the capture of Vera Cruz. He was graduated from the Naval Academy at Annapolis, Md., in 1848, accompanied the Perry expedition to Japan in 1854, and in 1857-59 was flag-lieutenant on the African squadron. He was an instructor at the Naval Academy at the beginning of the Civil War and was assigned to the South Atlantic squadron, with which he remained until 1862. He was then transferred to the North Atlantic squadron, was present at the engagements of Forts Royal and Huger and participated in the capture of Port Royal by Captain Fisher in 1865. He received promotion to command in 1866, captain in 1872, commodore in 1880, was in command of the New York Navy Yard in 1882-84, and in the latter year was made rear-admiral in command of the naval forces of the Pacific. He was retired in 1885 at his own request.

UPSON, Anson Judd, American educator: b. Philadelphia, Pa., 7 Nov. 1823; d. Glens Falls, N. Y., 15 June 1902. He was graduated from Hamilton College, Clinton, N. Y., in 1843, and taught there until 1870, occupying the chair of logic and rhetoric in 1853-70. He was ordained in the Presbyterian ministry in 1868, and in 1870-80 was pastor of the Second Presbyterian Church at Troy, N. Y. In 1880 he was appointed to the chair of sacred rhetoric at Auburn Theological Seminary, in which office he remained until 1887, became vice-chancellor of the University of the State of New York in 1890, and from 1892 until his death was chancellor. He published 'Inquiry into the Nature and Character of our Federal Government' (1840).

UPTON, Emory, American soldier: b. Batavia, N. Y., 27 Aug. 1839; d. San Francisco, Cal., 14 March 1881. He was graduated at West Point in 1861 and soon became lieutenant of the Fifth artillery. While serving on the staff of General Tyler he participated in the first battle of Bull Run, where he was wounded, and in the Peninsula and Maryland campaigns of 1862 (q.v.). In October 1862 he was commissioned colonel of the 121st New York volunteers. He fought at Fredericksburg, and from Gettysburg to the Wilderness commanded a brigade of the Sixth corps, distinguishing himself at the battle of Rappahannock Station (q.v.), and especially at Spottsylvania Court House (q.v.), where he was wounded. For gallantry in the last-named action he was promoted brigadier-general of volunteers and brevetted lieutenant-colonel in the regular army. He participated in the Shenandoah campaign, was wounded at the battle of the Opequon (q.v.) and was brevetted major-general of volunteers. Later he served in Georgia and Alabama in command of the Department of the South division under Gen. J. H. Wilson, and for his services at Selma was brevetted brigadier-general in the regular army. From 1868 to 1880 he served as lieutenant-colonel of the 25th infantry, and in the latter year was made colonel of the Fourth artillery. He originated a system of military tactics which was adopted by the government in 1867, and was commandant of cadets at West Point, 1870-75. Soon after retaining his colonelcy in the regular army he suffered from mental disease and committed suicide. His publications include 'A New System of Infantry Tactics' (1867); 'Tactics for Non-Military Bodies' (1872); 'The Armies of Asia and Europe' (1878); and 'The Military Policy of the United States.' Consult Michie, 'Life and Letters of Major-General Emory Upton' (1885).

UPTON, George Putnam, American musical critic: b. Boston, 25 Oct. 1834. He was graduated from Brown University in 1854 and entered journalism in Chicago a year later. He was musical critic and editorial writer on the Chicago Tribune for 25 years. He published 'Letters of Peregrine Pickle' (1870); 'Lives of Haydn, Beethoven, and Liszt' (1890); 'Standard Operas' (1890); 'Standard Oratorios' (1891); 'Standard Symphonies' (1892), etc.

UPTON, William W., American jurist: b. Victor, N. Y., 17 July 1817; d. Washington, D. C., 23 Jan. 1896. In 1838 he went to Michigan where he studied law and held various offices, being a member of the legislature which located the capital at Lansing. He went to California in 1852 and was a member of the California legislature in 1856. He was prosecuting attorney of Sacramento County, 1856-64. He moved to Portland, Ore., in 1865, whence he was almost immediately elected to the legislature. In 1867 he became a justice of the Supreme Court and became chief justice in 1872. In the Presidential election of 1876 the Republicans based their claim to the Oregon vote upon a telegram of Judge Upton, in which he called attention to the fact that the governor of Oregon could not exercise judicial powers in passing upon the eligibility of an elector. The Electoral Commission sustained
this contention, and Hayes became President. In 1877 Judge Upton was appointed second comptroller of the United States Treasury, which position he held until his resignation in 1885, during which time he passed finally upon nearly 150,000 accounts, involving about $160,000,000. In 1885 the government published his "Digest of Decisions of the Second Comptroller of the Treasury, 1869 to 1884."

UPTON, Winslow, American astronomer: b. Salem, Mass., 12 Oct. 1853. He was graduated from Brown University in 1875, studied astronomy at the University of Cincinnati and in 1877-79 was assistant astronomer at the Harvard Observatory. He was engaged in the United States Lake Survey as assistant engineer in 1879-80, was computer and assistant professor in the United States Signal Service in 1881-83, and has since been professor of astronomy at Brown University, where he was also dean in 1900-01. He served on the United States eclipse expeditions of 1878 and 1883, and was a member of private expeditions in 1887, 1889 and 1900. In 1896-97 he was absent on leave from Brown while making observations at the Southern station of Harvard Observatory at Arequipa, Peru. He has published Star Atlas (1890).

UPTON, Mass., town in Worcester County, on the Grafton and Upton Railroad, about 35 miles west by south of Boston and 12 miles southeast of Worcester. The town contains the villages of Upton Centre and West Upton. The chief industries are connected with farm products and the manufacture of straw hats. Pop. about 2,071.

UR OF THE CHALEDES. The home of the family of Abraham and the place from which he set out to find a location for his family. It was the old Babylonian city of Ur, situated on the right bank of the Euphrates in a fertile region. It was a great and prosperous city, a centre of transportation routes by land and water, and the seat of worship of Sin the Moon God. Its modern name is Mikkayur or Mugheir. Its history has been traced as far back as 3,000 B.C. The ruins were first discovered by Taylor in 1853. Excavations in many places reveal the name and influence of Ur. The ruins are owned by Saadun, the sheik of the Montefik Arabs.

URABA, oo-râ-bâ', Gulf of. See DARIEN, GULF OF.

UREMIA, a toxic condition caused by the presence in the blood of urinary constituents which normally should be secreted by the kidneys. The nervous system is especially affected by the poisonous blood, as shown by mental disturbances, convulsions, headache, nausea, dyspnea, disordered vision and coma. What the toxic material really is has not been determined. It has been proved not to be urea alone, as was formerly believed. Some contend that the poison is a mixed product of uneliminated nitrogenous excrementitious substances; others, that it is a newly formed albuminous substance not related to ordinary waste material, or is due to a disturbance of an internal venal secretion brought about by changed metabolic processes. Uremia is usually associated with acute or chronic nephritis, or may result from suppres-

sion or deficient secretion of urine from any cause.

The symptoms of uremia depend upon whether the condition is acute or chronic. Acute uremia may begin with a violent headache or persistent vomiting, both being efforts to excrete the toxic material. The dyspnea is frequently continuous and severe; the patient cannot lie down or sleep in any position with comfort; there is much restlessness and tossing about; the legs, if resting on the floor, readily swell from edema. There is always a probability of pulmonary edema and cyanosis of the face and extremities. Whenever sudden uncontrollable vomiting occurs without a known cause, or a severe and more or less continuous headache appears, uremia should be suspected and the urine examined. The temperature in acute uremia may be but little increased, or may rise 5° to 6° F. just before a paroxysm. The pulse varies, depending upon the condition of the heart and arteries; it may be full and throbbing, or small and hard and not especially rapid. The convulsions resemble those of epilepsy, but are not attended by a cry. They may come without warning or be preceded for a few days by twitching of the muscles of the face and hands; and may occur frequently and persistently until coma ensues. Amaurosis may follow these convulsions for a few days, or hemiplegia or monoplegia may follow or precede them. The delirium of acute uremia may be mild, muttering, or it may be maniacal. Coma is commonly present when there are general convulsions, and may appear without them, sometimes preceded by headache and dullness. The breathing is stertorous and the breath foul. The patient may recover from the stupor or may remain in it for weeks.

In chronic uremia the patient complains of severe occipital or frontal headache, more or less continuous. There is dyspnea not dependent upon exertion. There may be nausea, vomiting, diarrhea and stomatitis. The breath is foul, the tongue coated with a brown offensive fur. The urine is usually increased in amount, is clear, acid, has a specific gravity of 1006 to 1010, contains albumen at variable periods, also a few hyaline or granular casts, and sometimes red blood-corpuscles and leucocytes. The urea is often diminished.

The symptoms of chronic uremia may last for months, but acute exacerbations with convulsions and coma may appear at any time, and such cases are susceptible to inflammation of the pericardium, pleura, meninges and endocardium. Melancholia and delusional insanity may occur. The skin frequently becomes dry and itches, and muscular cramps are common.

Uremia must be distinguished from typhoid fever, alcoholism with coma, and from some forms of diabetes and meningitis. The prognosis of uremia is not good, especially in albuminuric patients, and those having advanced heart disease or arteriosclerosis may recover when apparently hopelessly sick.

Treatment.—Keep the patient in bed and between blankets, especially in acute attacks;
prevent him at all times from being chilled; induce free action of the skin by the hot pack, the hot air or steam bath, or the hot tub bath; and keep the bowels free by saline purges. Diuretics, such as water (considered by many as the best diuretic), lemonade with cream of tartar, the liquor ammonium acetate, and the citrate of potassium, cannot be dispensed with. Cupping and poulting of the joints (if the urine is scanty), venesection and hot saline injections are recommended. Sometimes heart stimulants, such as camphor, strychnine, digitalis and strophanthus are necessary. During convalescence tonics may be given and careful outdoor exercise resorted to, the patient being comfortably clad. In most cases the use of alcohol and tobacco should be interdicted. The diet is of prime importance. In acute uremia it should be solely of milk, with seltzer, vichy or kumiss. In the chronic form this should be the chief mode of administering food. As improvement sets in the patient may have meat broths, gruels, egg-albumen, custards, toast, baked potatoes, cereals, soft-boiled eggs, fresh fish, etc. Most authorities believe that red meats should not be given until the amount of urea found in the urine is about normal.

URAGA, oo-rajâ, Japan, a seaport town of Hondo, in the Sagami province, 16 miles southeast of Yokohama. Perry Park opened in 1900 at Kurihama, a suburb, commemorates the ad- vent of Commodore Perry's fleet at Uraga in 1853 and the negotiations which led to the opening up of Japan again to foreign commercial and political relations. Pop. 13,000.

URAL-ALTAIC LANGUAGES, a family of languages of which two grand divisions are recognized by Max Müller, the Northern and the Southern. In the northern division are comprised the Tungusic, the Mongolic, the Turkic, the Finnic and the Samoyedic. The Tungusic dialects, lowest of all these in organization, extend northward and westward from China. Of a grade a little higher are the Mongolic dialects of China: in these the different parts of speech are hardly distinguished. But the Turkic dialects, chief among them the Osman, the Chuvash and the Kazan, are rich in grammatical forms; Turkic speech is common from the Polar Sea to the Adriatic. The Finnic division comprises the speech of the Baltic coasts and the Hungarian or Magyar. (See FINNS; HUNGARY). Among the languages of the southern division are the Tamulic or Dravidian dialects of southern India (see TAMIL); the Tibetan, the Taic or the dialects of Siam, and the Malaic or Malayen and Polynesian dialects. The Ural-Altaic languages all possess one characteristic feature; in them the radical or root is never obscured; also the determining or modifying syllables are usually placed at the end: the vowels in a word may be changed and modulated to harmonize with the keynote struck by its chief vowel. In the Turkish, for example, if a verb contains a sharp vowel in its radical portion, the vowels of the terminations are all sharp; but the same terminations with this word, if it follow a root with a flat vowel, modulate their vowels into a flat key: thus mek or mak being the infinitive termination of verbs, see-mek is the infinitive verb to love, but bak-mak is the infinitive verb to regard. The Ural-Altaic languages are sometimes called Turanian, also Finno-Tatar.

URAL (oo'ral or ú'râl) MOUNTAINS, Russia, a long mountain range forming the conventional boundary between Europe and Asia, and extending in a nearly north and south direction from the Arctic Ocean to the Caspian Sea, a distance of about 16,000 miles. The average height of its crest is 1,000 to 1,500 feet, but several peaks are over 5,000 feet, the highest, Telpös, in the northern part of the chain, having an altitude of 3,433 feet. In the north the range forms a comparatively narrow ridge, destitute of trees. Further south it is covered with forests and spreads out to a width of nearly 200 miles, finally dividing on the southern boundary of Orenburg into a western and a southern out-runner, the latter known as the Mugadzhar Mountains, reaching to the Aral Sea. The principal rivers fed by the Ural chain are the Petchora and numerous affluents of the Obi, belonging to the Arctic Ocean; and the Kama and Ural, belonging to the Caspian. The geological structure consists of an axis of granite and porphyry, covered on the slopes with paleozoic strata. The mineral wealth is very great, especially in the central portion. The range is one of the principal sources of platinum, and gold is also found in places, iron is common, besides silver, lead, copper, rock salt and occasionally diamonds and precious stones. Considerable coal is mined in the eastern part. Iron ore before the war for several years averaged over 20,000 tons.

URAL RIVER, Russia, a river which rises in the Ural Mountains in the northern part of the government of Orenburg, flows first south, then west, past Orenburg so far as Uralsk, then again south into the Uralsk district, emptying into the Caspian Sea through several mouths. It is 1,485 miles long and navigable to Orenburg for vessels of considerable size. Its sturgeon fisheries are important.

URALITE, a mineral which is a variety of amphibole and is produced by the alteration of pyroxene; found abundantly in the Ural region, Russia.

URALSK, oo-râlsk', Russian Central Asia. (1) The capital of the district of Uralsk, situated on the Urals River, at the foot of the mountains, 160 miles southwest of Orenburg and 280 miles north of the Caspian Sea, on the railroad between Orenburg and Saratov. It has numerous churches, two high schools, a library, a museum and a theatre, steam mills, brick kilns and a brewery. Pop. about 47,880. (2) The district bounded by Orenburg on the north, Turgai and the Caspian Sea on the east, Astrakan on the west and the Transcaspian territory on the south. It is a depression, lying largely below sea-level. The Urals River region, however, is fertile. A promising oil field was opened at Emba in 1915. The area is 137,679 square miles. Population 889,000, or only 6.4 to the mile.

URANIA, oo-râ'n-â, the "heavenly one," a title of Aphrodite, as the goddess of noble love, but more commonly the name of the muse of astronomy, a daughter of Zeus and Mnes- mosyne. She is generally represented with a
URANIODE. A hydrous phosphate of uranium and barium, Ba₂UO₃₂F₅O₄·8H₂O. Occurs near Keystone in the Black Hills of South Dakota and may become a source of radium.

URANOPIRITE. A hydrate of uranous silicate of uranium and calcium. CaO₂UO₂2SiO₄·6H₂O. Occurs in Georgia, Idaho and North Carolina and may be a source of radium.

URANOSPORITE. An arsenate of uranium and calcium with probable constitution of CaO₂UO₂₂As₂O₅·5H₂O. Occurs in caliche, to 42 per cent uranium. Found in Cane County, Utah.

URANUS, υρανός, in Greek mythology, the son of Gaea, the earth, and by her the father of the Titans, Cyclopes, etc. He hated his children, and confined them in Tartarus, but on the instigation of Gaea, Kronos, the youngest of the Titans, overthrew and dethroned him.

URANUS, in astronomy, one of the primary planets, and the seventh from the sun, discovered by Sir William Herschel in 1781. For many years it was called Georgium Sidus in England. The name Uranus was given by Bode. To the naked eye it appears like a star of the sixth magnitude. Its mean distance from the sun is about 1.782 millions of miles, and the length of the year 30,666.82 days, or about 84 of our years. Its mean diameter is estimated at about 33,000 miles. Its volume exceeds the earth's about 67 times, but as its mean density is only 0.17 (the earth's being 1) its mass is only about 12½ times more. The length of its day is supposed to be between 9 and 10 hours. It has two small moons, one of nine and a half, 13½ days period; and two still smaller satellites of four and two and one-half days period respectively. None of them are believed to exceed 500 miles diameter. They are named Ariel, Oberon, Titania and Umbriel.

URAO. A natural sodium carbonate with composition 3Na₂O·4CO₂·5H₂O. Of common occurrence in many lakes and lake deposits in the arid districts of western United States.

URATES, or LITHATES. Uric acid is sometimes called lithic acid and the salts of uric acid are therefore spoken of sometimes as urates or lithates.

URBAN, ěr Ńən, name of eight popes, given in the Latin as Urbanus, as follows:

URBAN I, Saint. He was the son of a Roman noble, Pontianus, and succeeded Calixtus I, in 222. He suffered martyrdom in 230.

URBAN II (OTHO, or ODO OF LAGNY): b. Chartillon sur-Marne, France, about 1042; d. Rome, 29 July 1099. He was a canon of Rheims, and a monk of Cluny where Gregory VII met him and invited him to Rome. He was soon after appointed cardinal and bishop of Ostia, and in 1088 he succeeded Victor III. The anti-pope Clement III was then in possession of Rome, but was obliged to flee in 1089. He returned in 1091 only to be again driven out in 1093 when Urban resumed possession of the city. At the council of Clement, in 1095, Urban preached the first crusade, and the council of Bari in 1098 he attempted to bring about a union of the Greek and Latin churches. He maintained the validity of papal elections independently of the consent of Roman emperors, zealously enforced the law of priestly celibacy.
and forbade the clergy to accept ecclesiastical offices from laymen.

URBAN III (Uberto Crivelli, oo-bėrˈto křɛˈvɛlliˈ; b. Milan; d. Ferrara, 20 Oct. 1187). He was the son of Milan and succeeded Lucius III in the papal chair in 1185. He endeavored to send assistance to the Christians in the East, who were being sorely pressed by Saladin, and after a struggle with Frederick Barbarossa was about to excommunicate that monarch when his own death intervened.

URBAN IV (Jacques Pantaléon, zhak paⁿ-tä-lā-ônˈ; d. Orvieto, Italy, 2 Oct. 1264). He was of French birth, the son of a shoemaker, and became successively canon of Liège, bishop of Verdun, and patriarch of Jerusalem. He succeeded Alexander IV in 1261. He communicated Manfred, king of Naples, and offered the crown to Charles, Count of Provence and Anjou, and brother to Louis IX of France, which led to the subsequent wars of the Anjou for the possession of Sicily and Naples. He established the East of the Church, first celebrated at Orvieto, 19 June 1264.

URBAN V (Guillaume de Grimoard, gēˈyôm de grēˈmôrˈ; b. diocese of Mende, France, 1310; d. Avignon, France, 16 Dec. 1370). He was a Benedictine monk who became renowned as a professor of canon law and Scripture and was raised to the dignity of abbot of Saint Victor at Marseilles and papal legate. He succeeded Innocent VI in 1362. He restored the papal seat from Avignon to Rome in 1367, founded many churches, and was a profound student and the patron of scholars. He was the first Pope to bless a golden rose for princes.

URBAN VI (Bartolomeo Pignano, bärˈto-lomˈmāˈō prɛnˈyaˈnoˈ; b. Naples, about 1318; d. Rome, 15 Oct. 1389). He was archbishop of Amalfi, chosen to succeed Gregory XI in 1378. The French cardinals dissatisfied with Urban withdrew to Anagni and there elected Robert of Geneva, who took the name of Clement VII, and took up his residence in Avignon. Thus was originated the famous *Western Schism*, which continued for nearly 50 years. Urban has been characterized as of harsh and violent temper, but an impartial survey of history will rather credit him with being severe and rigorous in disposition, which his enemies interpreted for their own purposes.

URBAN VII (John Baptist Castagna, käsˈtänˈyaˈ; b. Rome, 4 Aug. 1521; d. 28 Sept. 1590). He was archbishop of Rossano, cardinal and papal legate to Spain, and succeeded Sixtus V in 1590, but died 13 days after his election. He left his modest accumulations to be used as dowries for poor girls.

URBAN VIII (Maffeo Barberini, maffˈfäˈō här-bäˈrɛnˈɛ; b. Florence, 1568; d. Rome, 20 July 1644). Under Gregory XIV he was government of Pano, under Clement VIII papal protonotary, and in 1604 became archbishop of Nazareth (in partibus infidelium) and ambassador to Paris. He became cardinal presbyter the next year and archbishop of Spoleto in 1608. He was elected successor of Gregory XV 6 Aug. 1623. He condemned the Jansenist tenets which then flourished in France, built the Collegium Urbanum or College of the Propaganda, established the Vatican Seminary, and issued the bull 'In Cona Domini' in its present form. He also gave the cardinals the title of Eminence, regulated the number of feasts of obligation, put forth a revised breviary, and was the author of some Latin and Italian poems. Consult Ward, 'Copernicanism and Pope Paul V' (Dublin, 1871); H. de l'Épinay, 'Les Pièces du Procès de Galilée' (1877).

URBAN DURRANCE COUNCIL, a local unit of administration under the English local government system, established by the Local Government Act of 1894. The district is usually circumscribed and in general was well defined as a sanitary improvement area previous to the act. England and Wales have about 825 urban districts with populations varying from 300 to 150,000. New districts are created by vote of the county electors approved by the Local Government Board. The members of urban councils are elected for three-year terms by popular vote, about one-third of the members retiring each year. The suffrage for the urban council elections is practically universal, including all men and women over 21, paying rates and lodgers qualify as municipal voters and tracking of urban voters. Women are eligible to membership of an urban council. The chairman is selected by the elected members, all of whom serve without pay. The jurisdiction of this local unit of government is chiefly over sanitation and public works. It also regulates public baths, libraries, parks and cemeteries in its territory, and in many cases owns and operates waterworks, gas and electric plants, street railways, etc. It levies a local rate for purposes of revenue and for large permanent improvements or public utilities it is empowered to negotiate loans, subject, however, to the approval of the Local Government Board. Consult Annual Report of the Local Government Board; Oglesby, 'Local Government' (1901); and Redlich, J., and Hirst, P. W., 'Local Government in England' (1903).

URBANA, ěr-bāˈnə, Ill., city, county-seat of Champaign County, on the Illinois Central, the Vandalia, the Chicago and St. Louis railroads, about 70 miles east of Springfield, and 110 miles south by west of Chicago. It is in an agricultural region, and in the vicinity are valuable deposits of fire clay. It was settled in 1824, incorporated in May 1833, and chartered as a city in 1860. The chief industrial establishments are the *Big Four* railroad shops, with 700 employees; brick works, 300 employees, and lawn mower and machine works, 50 employees. The principal public buildings are the county courthouse, municipal buildings, Y. M. C. A. building, the churches and schools. The educational institutions are the University of Illinois (q.v.), the Thornhill High School, public elementary schools, and a library building, two libraries, over 150,000 bank, two daily newspapers and several educational monthlies. The government is administered under a charter granted by the legislature, which provides for a mayor and a council of 10 members, who are elected annually. Pop. 10,250.

URBANA, Ohio, city, county-seat of Champaign County, on the Erie, the Pittsburgh, Cin-
though it has been detected in certain fungi, and in much smaller quantities in some higher plants.

Urea was discovered by Rouelle in 1773. Of historical interest is its synthesis by Wöhler in 1828, this being practically the first organic compound prepared by synthetic methods. Wöhler obtained it from an aqueous solution of ammonium cyanate. Urea may also be prepared (1) by treating phosgene (COCL₂) with ammonia; (2) by heating ammonium carbonate in a sealed tube at 140°C; (3) by treating cyanamide (C₂H₄N₂) with dilute sulphuric acid; (4) by passing a mixture of ammonia and carbon dioxide through a red-hot tube. On a commercial scale urea has been obtained (1) by conducting phosgene into a mixture of phenol and dilute sodium hydroxide solution; diphenyl carbonate (CO(OCH₃)₂) is formed, which upon treatment with dry ammonia yields urea and phenol; (2) by the action of catalysts, such as oxides or hydroxides of iron, chromium, tin, lead, etc., upon solution of cyanamide under vigorous agitation (Brit. 17,018); (3) by the treatment of a strong solution of ammonium carbonate with insoluble cyanide with ammonia and carbon dioxide under special conditions of temperature and pressure (Can. 182,746); (4) by heating ammonium carbamate in the presence of one or more catalysts, the carbamate being obtained from solid carbon dioxide and liquid ammonia (Brit. 24,042). Urea may also be extracted from urine by treating the concentrated liquid with oxalic acid, whereby the sparingly soluble oxalate is obtained; this is decomposed with calcium carbonate and filtered. The filtrate is decolorized with animal charcoal, concentrated and allowed to form crystals.

Urea crystallizes in rhombic prisms or needles which melt at 132°C. It is very soluble in water and alcohol, but insoluble in chloroform, ether, or ethyl acetate. Above its melting point it undergoes a series of changes yielding ammonia, urea, cyanuric acid and other products. Nitrous acid, sodium hypobromite and hypobromite decompose urea into nitrogen, carbon dioxide, and water. Heated with dilute acids or alkalis it breaks down yielding ammonia and carbon dioxide. With acids or salts it forms a series of addition compounds; with certain acids it forms condensation products or ureides.

The amount of nitrogen excreted in the urine in the form of urea is very often a measure of the extent of the decomposition of albuminoid substances in the body; methods have therefore been worked out by Mörner-Sjöquist, Pflüger-Bleibtreu and others, for the quantitative estimation of nitrogen liberated from urea in a known volume of urine. The urine is first freed from nitrogenous impurities by precipitation with either barium compounds, or with a mixture of hydrochloric and phosphotungstic acids. The filtrate containing urea in solution is decomposed into ammonia and carbon dioxide by heating with phosphoric acid, and the total nitrogen set free as ammonia is estimated by Kjeldahl's method.

Urea has been used to a certain extent in the manufacture of dyes, Benzo-Fast Scarlet being formed from simple derivatives of the compound. Its value as plant food in some instances has been conclusively demonstrated. Its compounds with naphthale derivatives

URBINO, oor-be'no, Italy, a town in the province of Pesaro e Urbino, on an isolated hill in the midst of bleak and desolate mountains, 21 miles west by south of Pesaro. It is the seat of an archbishop, and the seat of a university with two faculties jurisprudence, and mathematics and natural science. Among the buildings deserving of notice are the ducal palace, one of the finest edifices of the kind in Italy, and the cathedral. The chief industries are silk weaving, brickmaking, oil pressing and cheese and dairy factories. Sulphur mines are near by. Urbino is the birthplace of the painter Raphael. His house is still shown, and a statue of him was erected in 1897. From 1474 to 1626 Urbino was the capital of a duchy. Pop. of commune about 20,000; of province 270,000.

URD. See Norns.

URDANETA, ur-da-nätä, Andrea, Spanish navigator: b. Villafranca, Spain, 1498; d. Mexico, 3 Nov. 1568. He was appointed by Philip II chief pilot of the expedition under Miguel Lopez de Legazpe (q.v.) for the conquest of the Philippine Islands. He sailed with the expedition from La Navidad, Mexico, 21 Nov. 1564 and after the capture of Cebu and Mindoro he returned to Mexico, where he died.

URDU, or'oor-doo, Hindustani language, the native name, now given to it by philologists, means "camp language," from the Turkish urdu, meaning camp. It is really the Hindi, a language of the Aryan family, with a multitude of Persian, Arabic and Turkish words introduced. These intrusions have in no wise altered or influenced the language itself, which, in inflectional and phonetic elements, remains a pure Aryan dialect. See Htmtan.

UREA, or CARBAMIDE, CO\(\text{NH}_2\), is a physiologically important compound, being one of the chief nitrogenous decomposition products of animal metabolism. It appears in large quantities in the urine of carnivora; the amount excreted by an adult human being is about one ounce in 24 hours. Urea is also present in small quantities in the blood, milk, perspiration, tears and other animal fluids. It does not occur to any great extent in the vegetable kingdom, although it has been detected in certain fungi, and in much smaller quantities in some higher plants.
have been used in therapeutics, and stabilized compounds of urea with starch and hydrogen peroxide have been prepared which give hydrogen peroxide when mixed with water.

V. S. Babasinian,
Lehigh University.

UREDINACEÆ, the minute family of parasitic plants called rusts. See FUNGI.

UREN, William Simon, lawyer and reformer: b. Lancaster, Wis., 10 Jan. 1859. He was educated in the public schools, after which he took a business college course and studied law at Denver, Col., where he was admitted to the bar in 1881. He practised law at Gunnison and Denver for a few years, then travelled for his health. In 1891 settled in Milwaukee, Ore.; in 1896 he resumed the practice of law as the senior member of the firm of Uren and Scheubel. When on his way to Oregon he was impressed by Henry George's "Progress and Poverty," and was soon advocating the idea that the surest way to secure the adoption of the single tax was to institute the initiative, referendum and recall. His efforts in this direction have been so effective that he has been called the Father of the Initiative and Referendum. He was organizer of the Oregon Direct Legislation League (1892-1902); member of the Oregon House of Representatives (1896); organizer and secretary of the Oregon Direct Primary Nominations League (1894). President of the People's Union League of Oregon (1906 and 1908). He is a member of the American Political Association and the National Municipal League.

URETER, the right or left excretory duct of the kidney, which serves to convey the urine from the latter to the urinary bladder or bladder diverticulum. In man each ureter averages from 16 to 18 inches in length, and is of the average diameter of a goose-quill. It consists of three coats, an outer or fibrous, a middle or muscular, and an inner or mucous coat. The ureter, on leaving its kidney passes behind the peritoneum or lining membrane of the abdomen, at the back of the latter cavity. It runs downward and inward from the lower part of the pelvis of the kidney, and enters the cavity of the common pelvis (q.v.), passing downward and forward to open into the base of the bladder. The ureters open into the bladder each by a constricted orifice, and each in its course lies upon the psoas muscle. They divide their nerves from the inferior mesenteric, splanchnic and hypogastric plexuses; and their blood-vessels form the renal, splanchnic and other arterial trunks. See Kidneys.

URETHRA, the canal leading from the bladder to the external urinary opening, and serving for the excretion of the urine. In the male the urethra traverses the penis, and its length is from eight to ten inches. In the female it is a narrow membranous canal attaining a length of about one and one-half inches with a normal diameter of about one-quarter inch. It is thus a much more complicated structure in the male than in the female, and its anatomy and relations have to be carefully studied by the surgeon in view of the diseases to which it is subject, and also in connection with the important operations of lithotomy and lithotrity (q.v.). The urethra in man consists of three coats: a mucous, a muscular, and an erectile coat. In the female the urethra is capable of great distention, so much so that it may be artificially dilated so as to permit the removal of calculi from the bladder without further operation. See CALCULUS; STRUCTURE.

URFÉ, Honoré d', French pastoral writer: b. Marseilles, 1508; d. Savoy, 1625. He was educated for the Church but turned to literature and produced his 'Astrée' in 1610, soon after his withdrawal to Savoy. The last two,—the fourth and fifth volumes,—appeared in 1627 as posthumous works. His aim throughout was the refinement of society and his influence was far reaching. Consult Fischer, W. "Lafontaine and the Astrée of Honoré d' Urfé" (Philadelphia 1913).

URGA, ur'gä, or BOGO-KUREN, Central Asia, a town, the capital of Northern Mongolia, on the Tola, at an elevation of 4,370 feet above sea-level. It contains several large Buddhist monasteries, occupied by about 10,000 monks, and is a sacred city of the Buddhists, the seat of a high priest or lama. With the exception of the monasteries and temples the town is dirty and ill-built. It is the seat of the Chinese administration of Northern Mongolia, and there is a separate Chinese quarter. It is also a considerable trading centre, lying as it does at the junction of highways between Kjakhta and Peking. Before the World War the annual importations were valued nearly $8,000,000 value, and the exports $5,000,000. The outgoing trade is mostly in wool, hides and furs. A branch of the Mongolian bank finances most of the commerce. Buddhist Lamaism is the prevalent religion. Estimated pop. 40,000, part of whom are nomadic.

URL, oo'ri, Switzerland, a canton in the central part of the country, bounded by the Schwyz, Glarus, Grisons, Ticino, Valais, Bern and Unterwalden, and extending from the southeastern shores of the Lake of Lucerne almost to the Italian frontier. Area, 415 square miles. Capital, Altendorf. The canton is traversed lengthwise by the narrow valley of the Reuss, which empties into the Lake of Lucerne, and which is hemmed in by lofty, glacier-covered mountains belonging to the Grimsel and Uner Alps. Large numbers of cattle, sheep and goats are raised, and excellent cheese produced. The principal mechanical industry is the manufacture of explosives and ammunition. The canton is traversed by the Gotthard Railroad, and the tourist traffic is important. The inhabitants are chiefly Germans and Roman Catholics. Pop. 723,000.

URAL, a wild sheep. See OORIAL.

URIBE, Antonio José, Colombian lawyer: b. Medellin, Colombia, 6 March 1809. He was educated at the universities of Antioquia and Bogotá, Colombia; and has written a history of Spanish literature at the University of Antioquia in 1891-92. He was Secretary of Agriculture in 1891, member of Assembly in 1894 and from 1894 to 1911 was professor of civil and international law and of the history of diplomacy at the University of Bogotá, where he in 1903-04 he was also rector of the faculty of law and political science in 1903-04. He has also served as counsel to the Ministry of Foreign Relations and in 1903-04 was Minister of
Public Instruction, president of the Senate in 1909 and of the House of Representatives in 1912. Mr. Uribe was one of the founders of the American Institute of International Law and is member of various European scientific and literary societies. His publications include 'Resena historica de la literatura castellana' (1891); 'Código de minas colombianos' (1891-92); 'Estudio sobre las Servidumbres según los códigos civil y de minas de Colombia y la legis- lación general comparada' (1894); 'Tratado de derecho civil colombiano' (1890); 'Anales diplomaticos y consulares de Colombia' (1900, 1901); 'El recurso de Casación' (1903); 'La reforma administrativa' (1903); 'Derecho mercantil colombiano' (1907); 'Historia de la Sociedad de San Vincente de Paul' (1908); 'Supremacía moral del pontificado' (1909); 'Anales de la Comisión legislativa' (1910); 'Discursos académicos y parlamentarios' (1912); 'Federico Ozama, apóstol de la fé, apóstol de la verdad, apóstol de la Caridad' (1913); 'Nulidades y retracto en las sociedades de minas' (1913); 'La instrucción pública en Colombia' (1913); 'El proyecto de código penal' (1913); 'Las misiones católicas en Colombia' (1913); and contributions to various legal and lay periodicals.

**URIC ACID, C$_3$H$_4$N$_2$O$_7$, or**

\[
\begin{align*}
\text{NH} - & \text{CO} \\
\text{CO} & \text{C} - \text{NH} \\
\text{NH} - & \text{C} - \text{NH} > \text{CO},
\end{align*}
\]

occurs in the urine of carnivorous animals, and in much larger quantities in the excreta of birds, reptiles, snails and insects. It may be present either in the free state or as acid ammonium or sodium salt. It exists normally in the blood of birds, and as a pigment it has been detected on the wings of certain butterflies. In small quantities uric acid is a constituent of normal human urine in which it was first detected by Scheele in 1776. It is produced in the human organism in large quantities when foods rich in nucleo-proteids are used, although the enzymes present in the liver convert the bulk of the product into urea. Under certain abnormal conditions it accumulates in the system forming urinary calculi, chalkstones, and other concretions. The tissues and joints of gouty patients contain the sparingly soluble acid sodium urate.

Uric acid may be prepared from the excreta of reptiles or birds by treatment with a boiling solution of caustic soda. The product is filtered and the clear hot liquid is strongly acidified with hydrochloric acid. The precipitated uric acid is washed with water and dried. Prepared in this way the acid is a white powder which shows the crystalline structure under the microscope. It dissolves in glycerine, piperazine, propylamine and caustic alkalies, but is only sparingly soluble in dilute acids. It dissolves in about 15,000 parts at 20°C, and in 1,800 parts at 100°C. It dissolves in concentrated sulphuric acid without decomposition, and its molecular weight has been determined by the cryoscopic method to be 145.113. Why the uric acid is suspended in nitric acid, or chlorine water, and then evaporated to dryness, a yellow residue is formed which changes into purple-red when moistened with ammonia, or into violet with caustic soda; this is known as the *Murexide Test* and is employed for the detection of the acid.

Uric acid is a weak dibasic acid and may form a series of salts with the same metal. With sodium, for example, it forms 1) neutral sodium urate Na$_2$H$_2$C$_4$N$_4$O$_7$; 2) dinitro urate NaH$_2$C$_4$H$_2$N$_4$O$_7$; and 3) quadrinuric acid Na$_4$(C$_4$H$_2$N$_4$O$_7$)$_2$. The neutral urate is quite insoluble; the dinitrourate is quite soluble; while the dinitro urate may exist in two solid modifications. The a form is soluble and unstable, readily passing into the b form which is stable and less soluble. This property of diurates and some other characteristics of uric acid have led investigators to the belief that the compound has two structural formulas, the "lactam" formula given above, and the "lactim" formula which is tautomeric with the lactam structure.

Although uric acid is almost exclusively a product of animal metabolism, its close relation to compounds of vegetable origin has been clearly demonstrated. Chemically it is related to caffeine, the active principle in coffee, theophylline, found in tea, and theobromine, present in the cocoa bean. This keenship is strikingly illustrated by the battery of analytical methods which have been successfully employed for the conversion of uric acid into these compounds.

**V. S. BASABINTAN,**  
*Lehigh University.*

**URIEL, ʼūri-ēl, one of the archangels of the Hebrew Midrash and apocryphal Scriptures. The name means "the Light of God." Uriel is described as standing on the left hand of the throne of God, where he ministers light and forgiveness of sins to the children of Israel. He is introduced by Milton into ʼ*Paradise Lost,*' and also appears in Longfellow's ʼ*Golden Legend.'**

URIM and THUMMIM, in Hebrew ritual two apparatuses of the breastplate worn by the high priest. The two words, both plural, signify literally "lights" and "perfections*; in the Septuagint they are translated delos (manifestation) and aletheia (truth), and in the Latin Vulgate doctrina (teaching or learning) and veritas (truth). The Jewish historian Josephus and some modern commentators teach that the Urim and Thummim are simply the 12 precious stones of the breastplate. Both Josephus and the ancient Rabbins held that those precious stones indicated the Divine Will in a preternatural manner. Reman, interpreting the existing Hebrew texts with the aid of the Septuagint, regards the instrument of the Urim and Thummim either as a sort of chessboard or as a
URINARY ANALYSIS

whirligig or rotating winged globe ("Hist. Peup. d'Isr.," I, 275).

URINARY ANALYSIS, that branch of chemical and microscopical analysis which has to do with the detection or quantitative estimation of the constituents of urine. In practice, it is mostly concerned with the examination of the urine for such constituents as may have a known clinical significance. The average quantity of urine passed by an adult is probably about 50 fluid ounces (1,500 cubic centimeters) per day, though this may vary widely within the limits of health. The quantity is increased by drinking large amounts of water, and, temporarily, by the administration of diuretics; and it is decreased by unusual activity of the skin, as well as by several other causes. In general, the quantity of water taken into the system through the mouth must be equal, in the long run, to that which is eliminated through the kidneys, skin, bowels, lungs and nose. The specific gravity of the urine also varies to a considerable extent, the normal specific gravity, when the quantity passed is 50 ounces per day, being about 1.020. Any cause which tends to increase the quantity of urine secreted will, in general, decrease the specific gravity, and vice-versa; the total quantity of solid matter that the urine contains in solution being normally much less variable than the quantity of the urine itself. The specific gravity has a marked significance only when it is high without the urine being copious, or low without the urine being copious. The ideal way to obtain a sample for analysis is to save what is passed throughout the 24 hours, mix it, and take the sample from the result. Urine thus obtained is technically called "mixed urine." It is often inconvenient to go to this trouble, especially in hot weather, when special care must be taken to prevent the mixed product from spoiling before the sample can be prepared and transmitted to the analyst; and it is, therefore, customary to take the sample from what is passed in the morning, experience indicating that a specimen taken at this time will correspond fairly well with mixed urine. Mixed urine should always have a slightly acid reaction, and the same is true of specimens taken at any time during the day, except after a meal, when the reaction may be neutral, or even alkaline. Urine often contains slight clouds of mucus or other substances, which become visible after the specimen has been allowed to stand for a short time. These are usually of no clinical importance, merely indicating some slight irritation along the urinary passages, or some recent indiscretion in diet. After urine has been passed (and more quickly in hot weather than in cold) the urea that it contains decomposes and passes into the form of ammonium carbonate; and when the quantity of ammonium carbonate present is sufficient to make the reaction distinctly alkaline, the urine becomes semi-opaque from the deposition of a white cloud of phosphates, urates and other substances.

In the examination of a specimen of urine, the analyst cannot undertake to test it for the presence of all these elements. A number of them may be present as a pathological symptom. He will be guided by the general nature of the patient's illness, and will seek for those elements which may be of special significance. In the examination of presumably healthy candidates for life insurance it is customary to look for nothing but albumin and sugar, unless the specific gravity, when considered in connection with the quantity of urine passed, is high enough to indicate the presence of an abnormal amount of some other constituent. In general practice, however, it is often necessary to examine, not only for sugar and albumin, but also for pus, biliary coloring matters, blood-corpuscles and casts from the little uriniferous tubules of the kidneys. It is frequently important, too, to make a more or less accurate quantitative determination of the urea that is passed and sometimes of the chlorides also.

A cast may be formed in the kidney in any one of several ways, the simplest being by the direct exudation, into a little tubule of the kidney, of some coagulable constituent of the blood. After this becomes solidified, it may eventually become discharged from the tubule with the urine and pass into the bladder in the form of a microscopic plug of approximately cylindrical shape. To detect the presence of casts and of blood-corpuscles and other undissolved constituents, the urine may be allowed to stand for some time in a conical glass vessel, whose sides slope down to an acute point at the bottom. After a couple of hours, or when it is judged that the solid constituents that may be present have settled to the bottom or risen to the top, or taken such other positions as may correspond to their specific gravities, a few drops are drawn off by means of a pipette from the surface and from the very apex of the glass at the bottom and also from such other levels as may appear to contain floating matters; and every sample so taken away is separately and carefully examined under the microscope. The correct identification of the different objects that such an examination reveals calls for a considerable amount of practical experience with the microscope. Much assistance may be derived, however, from Beale's "One Hundred Urinary Deposits," which gives engravings of all the ordinary deposits that the analyst will be likely to meet, including such extraneous things as fibres of paper, which often find their way into the specimen to be examined. In well-equipped offices and laboratories in which urine is analyzed, centrifugal machines (actuated by small electric motors) are used to separate the solid particles from the urine. This expedites the work greatly.

Albumin is not a normal constituent of urine and when it is present continuously and in any considerable quantity it constitutes a grave symptom. When present, it is in solution, and hence is not at all evident to the eye until it has been coagulated by the action of heat or some other agent. In testing a sample by heat a test tube is half filled with perfectly clear urine and heat is applied to the upper part of the liquid until boiling occurs. If the boiled urine becomes turbid in the least degree, the turbidity is due either to the presence of coagulated albumin or to the precipitation of the phosphates of lime. This is very commonly present in urine. The earthy phosphates promptly redissolve upon the addition of a few drops of nitric or acetic acid; but if the turbidity is really due to albumin it does not
pass away upon this treatment. The object of heating only the top part of the test tube holding the urine is to facilitate the recognition of a precipitate, a comparison of the upper and lower parts of the test tube, in a good light, rendering the slighter loss of transparency quite visible. If no precipitate is obtained, a drop or two of nitric acid should be added and the boiling repeated. A number of trials of this sort should be made, the nitric acid being added, a few drops at a time, until a considerable quantity of it is present. The consistent absence of a precipitate in all these tests indicates that albumin is not present. Physicians often make the serious error of adding too much nitric acid to the urine at the start. This is dangerous, because if any considerable quantity of nitric acid is added at the outset, it is infrequently happens that albumin will not be thrown down at all, even when much albumin is really present. The directions given above should, therefore, be followed implicitly, the urine being first boiled without any acid at all and then again after successive additions of a drop or two have been made, until as many as 15 to 20 drops have been added.

Heller's test for albumin depends upon the fact that strong nitric acid throws down albumin from its solution, in the cold. In applying this test, a convenient quantity of strong, pure, colorless nitric acid is first placed in the bottom of a test tube and an equal bulk of perfectly clear urine is allowed to flow down upon it gently, the test tube being inclined so that the urine may float upon the surface of the acid and not mix with it. If albumin is present, a yellowish white zone appears at the surface of separation of the acid and the urine, the thickness of this zone varying with the quantity of albumin. When normal urine is treated in this manner, a brown ring is formed at the surface of separation. In cases of fever, or when there is an excessive amount of coloring matter of any kind present, the albumin in Heller's test may be tinted, so as to appear brownish, reddish, violet or greenish. Urates, when present in a small test tube and an equal bulk of perfectly clear urine is allowed to flow down, will be taken by a precipitate; but the precipitated urates differ from albumin in being soluble when the urine is cautiously warmed without being allowed to mingle with the acid to any great extent.

If the addition of sugar to the test is ordinarily made to depend upon the fact that diabetic sugar will throw down a yellowish or reddish precipitate of oxide of copper from an alkaline solution of copper sulphate and sodium (or potassium) tartrate. The test solutions that are ordinarily employed for this purpose are known, respectively, as "Fehling's solution" and "Pavy's solution" (q.v.). In making a test, about one cubic centimeter of the test solution is placed in a test tube, diluted with about four times its own bulk of water and then boiled for a few seconds. If a precipitate is thrown down by this treatment, the test solution has spoiled and should be replaced by a freshly prepared one. If no precipitate is thrown down by boiling the test solution alone, the suspected urine should be immediately added, drop by drop. If any considerable quantity of sugar is present, a precipitate will be obtained almost immediately. In the absence of a precipitate, however, the urine should be added, a few drops at a time, with occasional heating, until the quantity added is about equal to that of the original, diluted test fluid. If no precipitate is obtained, sugar, clinically speaking, is absent. It should be observed that the formation of an actual precipitate must be observed in this test; the mere darkening of the blue test solution being no criterion of the presence of sugar. Other methods are known for the detection and estimation of sugar in urine, but the copper test, as described above, is the one upon which physicians rely almost exclusively.

The nitrogen waste of the body passes away mainly through the urine, in the form of urea, CONH₂, and of compounds of uric acid (CH₃N₄O₇) with the alkalies and the alkaline earths. The approximate estimation of urea and uric acid is, therefore, often of considerable importance. The determination of urea by the well-known "hypobromite process" is based upon the fact that sodium hypobromite, NaBrO, decomposes urea quickly and completely in accordance with the equation: 

\[ \text{CONH}_2 + 3\text{NaBrO} \rightarrow 3\text{NaBr} + \text{CO}_2 + 2\text{H}_2\text{O} + 2\text{N}. \]

The sodium bromide (NaBr) that is formed remains in solution and the carbon dioxide (CO₂) that is liberated is absorbed by the first solution, if not made to contain a large excess of sodium hydrate. The only visible product of the decomposition is the nitrogen gas, which is collected and measured, and which serves to indicate the quantity of urea decomposed. The hypobromite solution is made from water, caustic soda and bromine. Various proportions are used, but Tyson recommends dissolving 100 grams of caustic soda in 250 cubic centimeters of water and adding 25 cubic centimeters of bromine to the solution so formed. In practice the reaction is carried out in a special form of apparatus which has a vertical graduated tube to collect and measure the nitrogen. The apparatus is first filled with the test solution and one cubic centimeter of urine is then introduced into it by means of a pipette. The decomposition of the urea begins at once, a copious stream of nitrogen bubbles passing up into the vertical collecting tube. The reaction is complete and the number of cubic centimeters of free nitrogen is read from the graduated collection tube. For great refinement the volume of this gas must be corrected to standard conditions of temperature and pressure; but for ordinary clinical purposes this is not necessary and it is sufficient to read the number of cubic centimeters of gas directly from the apparatus. Multiplying this number by 0.00282, we obtain the number of grams of urea that the given cubic centimeter of urine contained; and upon multiplying this product again by the total number of cubic centimeters passed by the patient, we obtain the total number of grams of urea passed. The total amount of urea passed by a healthy adult may range from 20 to 40 grams per 24 hours.

In health, practically all of the uric acid in the urine occurs in combination with potassium, ammonium, sodium, calcium and magnesium in the form of salts known as urates. "Urate" acid itself is highly insoluble, 14,000 parts of cold water dissolving only one part of the acid. To estimate the quantity that is present, 200 cubic centimeters of urine are acidulated by the addition of 20 cubic centimeters of nitric acid and set aside in a cellar or other cool place.
for 24 hours. The nitric acid gradually replaces the uric acid in its combinations and the freed uric acid, owing to its insolubility, is deposited upon the sides and bottom of the beaker in the form of yellowish-red crystals. These may be collected, washed with cold distilled water and then dried and weighed; the weight so obtained giving the quantity of uric acid present in 200 cubic centimeters of the urine. In health, the quantity of uric acid passed by the kidneys in 24 hours may range from 0.4 to 0.8 gram. The heavy brick-dust deposit that is often observed in urine that has stood for a time, and which is frequently referred to in the advertisements of proprietary kidney cures, for the purpose of terrifying the uninitiated public into buying these cures, consists mainly of urates, which are soluble at the temperature of the body but relatively insoluble at the ordinary temperature of a sleeping-room, and hence are likely to be thrown down. This sediment is found most commonly in urine that is somewhat more acid than usual. It also occurs in connection with defective assimilation of the food and is not to be regarded as of importance, unless it is markedly abundant or persistent; and even in these cases it points to an imperfect digestion rather than to trouble with the kidney. Consult Tyson, Practical Examination of Urine.

ALLAN D. RISTEEN.

URINARY BLADDER—URINE

URINARY BLADDER. See BLADDER.

URINARY CALCULUS. See CALCULUS.

URINARY ORGANS, the organs concerned in the secretion and discharge of urine; namely, the kidneys, which secrete the urine; the ureters which convey it to the bladder; the bladder or hollow organ in which it is stored; and the urethra, by which it is passed out of the body. All of these organs are lined with a continuous mucous membrane. See BLADDER; KIDNEYS, URETER; URETHRA; URINE.

URINE, the fluid secreted by the kidneys, stored in the bladder and discharged by the urethra. It is an excremenitious fluid, ejecting from the system substances which if retained would impair health and destroy life (reproductive function of urine). Healthful urine consists of water, urea, uric acid, hippuric acid, creatinin, phosphates, chlorides and sulphates, mucus and other ingredients. The abnormal matters found in the urine in various conditions include acetone, albumin, albumose, bile, blood, cystin, glucose, hemoglobin, fat, pus, spermatozoa, epithelial cells, casts, etc. (See URINARY ANALYSIS.) Normal urine is a transparent aqueous fluid, of an amber color, acid reaction, a peculiar odor, and with a specific gravity of about 1.020 when passed in the average quantity of 50 ounces in the 24 hours. But each one of these characteristics is liable to some variations within the limits of health, as well as in disease.

As to transparency, it is quite constant, but cannot be considered an essential of normal urine, and on the other hand, because a given specimen of urine is transparent it is not necessarily normal. Urine transparent when passed frequently shows a faint cloudiness in some positions; when standing due to mucus, the slimy secretion from the mucous surface of the urinary organs. This cloudiness is most pronounced in the urine of females. Mucus can be filtered out, leaving the urine clear. Normal slightly acid urine may be somewhat turbid when passed from the presence of the earthy phosphates of calcium and magnesium, which is a precipitate on the sides in the vessel, becoming a sediment. This sediment will disappear on the addition of a few drops of any acid, as nitric, but is increased by heat applied. Sometimes normal urine, on standing for a short time in a cold room, range from 0.4 to 0.8 gram. The heavy brick-dust deposit that is often observed in urine that has stood for a time, and which is frequently referred to in the advertisements of proprietary kidney cures, for the purpose of terrifying the uninitiated public into buying these cures, consists mainly of urates, which are soluble at the temperature of the body but relatively insoluble at the ordinary temperature of a sleeping-room, and hence are likely to be thrown down. This sediment is found most commonly in urine that is somewhat more acid than usual. It also occurs in connection with defective assimilation of the food and is not to be regarded as of importance, unless it is markedly abundant or persistent; and even in these cases it points to an imperfect digestion rather than to trouble with the kidney. Consult Tyson, Practical Examination of Urine.

ALLAN D. RISTEEN.

URINARY ORGANS, the organs concerned in the secretion and discharge of urine; namely, the kidneys, which secrete the urine; the ureters which convey it to the bladder; the bladder or hollow organ in which it is stored; and the urethra, by which it is passed out of the body. All of these organs are lined with a continuous mucous membrane. See BLADDER; KIDNEYS; URETER; URETHRA; URINE.

URINE, the fluid secreted by the kidneys, stored in the bladder and discharged by the urethra. It is an excremenitious fluid, ejecting from the system substances which if retained would impair health and destroy life (reproductive function of urine). Healthful urine consists of water, urea, uric acid, hippuric acid, creatinin, phosphates, chlorides and sulphates, mucus and other ingredients. The abnormal matters found in the urine in various conditions include acetone, albumin, albumose, bile, blood, cystin, glucose, hemoglobin, fat, pus, spermatozoa, epithelial cells, casts, etc. (See URINARY ANALYSIS.) Normal urine is a transparent aqueous fluid, of an amber color, acid reaction, a peculiar odor, and with a specific gravity of about 1.020 when passed in the average quantity of 50 ounces in the 24 hours. But each one of these characteristics is liable to some variations within the limits of health, as well as in disease.

As to transparency, it is quite constant, but cannot be considered an essential of normal urine, and on the other hand, because a given specimen of urine is transparent it is not necessarily normal. Urine transparent when passed frequently shows a faint cloudiness in some positions; when standing due to mucus, the slimy secretion from the mucous surface of the urinary organs. This cloudiness is most pro-
the odor of violets, and the odors of cubeb, copaiba and sandal-wood oil.

The specific gravity, though normally about 1.020, for 50 ounces of urine per 24 hours, when the skin is not acting freely and after copious use of water and diuretics, may descend to 1.010 or lower and yet be within the limits of health. Or when the urine becomes concentrated by the drain of water through the skin or some other channel the specific gravity may rise to 1.030 or higher. The normal range may be said to be from 1.005 to 1.030, but to be reliable, observation should be made on the entire quantity of urine passed in 24 hours. The specific gravity in diabetes mellitus sometimes reaches 1.050, and, according to Tyson, if in a copious urine the specific gravity is over 1.028 there is a suspicion of diabetes, and even if it is 1.010 or lower it is not safe to infer from this circumstance alone the absence of sugar. Specific gravity is also increased in the first stage of acute fevers, and in Bright's disease. It is lowered in hysterical complaints and in all forms of nephritis except the acute.

The quantity of urine is increased in diabetes mellitus and insipidus, in hysterical and convulsive conditions, in cardiac hypertrophy and all conditions which cause increased blood pressure, by the peripheral action of cold, etc. It is diminished in most forms of Bright's disease and in the early history of acute fever, and inflammatory conditions. Morbid conditions of the urine include glycosuria or glucosuria, oxaluria, albuminuria and phosphauria. Consult Simon, E. C., 'A Manual of Clinical Diagnosis' (8th ed., Philadelphia 1914); 'Reference Book of the Medical Sciences' (New York 1915).

URINOMETER, an instrument for ascertaining the specific gravity of urine (q.v.). It is constructed on the principle of the hydrometer, usually graduated from 1.000 to 1.040, and indicates variations in the density of urine which are of great importance in the treatment of disease.

URIU, Sotokichi, oor-i-yoo so-tō-kē-chē, Japanese baron and admiral: b. Kanazawa 1854. He entered the navy early and was sent to America for study. A bill introduced by Senator Frelinghuysen of New Jersey permitted the Japanese to enter the United States Naval Academy at Annapolis and Uriu graduated with honors. Promoted to be captain, he was attached at the French Legation in Japan, 1891-96 and afterward commanded some of the largest warships in the navy of Japan. He became rear-admiral in 1900. In 1904, outside of the harbor of Chemulpo, Korea, with his detachment he sunk the Russian warships Farag and Koreiz. In 1905 four Russians were killed and wounded, but neither ship or man on the Japanese side was hurt. He had an active part in the battles of 14 August, off Shantung and in the destruction of the Baltic fleet in the sea of Japan; was commandant at various naval stations, including Yokoska, 1909-12; and was made member of the Admiral's Council in 1909, in which year he and his wife revisited America. He retired in 1912.

URMY, Clarence (Thomas), American poet and journalist: b. San Francisco, Cal., 10 July 1858. He is an organist and choirmaster, and his songs and other verses deal with Cali-
with sodium phenate, in gas masks as a protection against phosgene.

URQUHART, erk'art, David, Scottish political economist; b. Bracklanwell, Scotland, 1805; d. Naples, Italy, 16 May 1877. He was educated at Oxford, entered the diplomatic service, and later traveled extensively in the East. He was secretary of the British legation at Constantinople in 1835-36, but resigned that position because of his opposition to the policy of Lord Palmerston, which he considered as subservient to the ambitions of Russia. He was member of Parliament for Stafford in 1847-52 and maintained a vigorous opposition to Palmerston, his Parliamentary attacks supplementing his writings for the press, and and peace and prosperity, the public a distrust of Russia's eastern policy. His works include 'England, France, Russia and Turkey' (1835); 'The Spirit of the East' (2 vols., 1838); 'Progress of Russia in the West, North and South' (1853); 'Recent Events in the East' (1854), etc.

URQUIZA, oo'-ké-tha, Justo José de, Argentine soldier and politician: b. near Concepción del Uruguay (now in Entre Ríos, Argentina), 19 March 1800; d. there, 11 April 1870. He was of mixed Spanish and Indian blood and during the war in La Plata in 1833-42 gradually rose in influence until he became a general of division under Rosas, dictator of Buenos Aires. In 1844 he commanded the army sent against Uruguay, and in 1845, at the battle of Paysandú, he defeated Rivera. He was elected governor of Entre Ríos in 1846, as leader of the federalist party. His administration of affairs was directed rather to his own glory and gain than to any benefit for the people, but he contrived to maintain a peaceful and prosperous condition of the country while strengthening his power, meanwhile acquiring great wealth. In 1851 he turned against Rosas, allied his forces with Brazil and Montevideo, and marched into Uruguay. He fought at the battle of Orbe, 8 Dec. 1852, then invaded Buenos Aires, and on 3 Feb. 1852 defeated Rosas at Monte Caseros. Urquiza was proclaimed provisional dictator and after the adoption of a federal constitution by the province (excepting Buenos Aires) he was in 1853 elected President for a term of six years. In 1859 he forced Buenos Aires to join the confederation, and after the expiration of his term of office took command of the army and endeavored to quell the revolt which had arisen in that country. He was defeated at Mitre at Pavón, 17 Sept. 1861, the result being the abandonment of the federalist constitution for the one since in force. He retired to Entre Ríos, where he acceded to his son-in-law, Gen. Lopez Jordan, and Urquiza was attacked in his palace and killed.

URSA MAJOR, er'sa má'jór, or GREAT BEAR, a northern constellation whose seven brightest stars are well known as Charles' Wain, the Plow, the Dipper, the Septentriones, and sometimes as the Butcher's Cleaver. Two of these seven stars are called the pointers, because they and the polestar lie nearly in a right line, and these stars direct an observer to the pole-star. The most conspicuous star of the constellation, Mizar, is noteworthy as being the first star discovered to be double or binary, and later the larger component was shown to be also a twin. Ursa Minor, or Little Bear, a smaller constellation of the same configuration as Ursa Major, lies near the north pole, and includes the pole star.

URSIDÆ, the family of the bears (q.v.).

URSINUS (ér-sin'us) COLLEGE, located at Collegeville, Pa. It was incorporated in 1809, and was first opened to students in 1870; Free Soil Seminary, whose property was purchased for the college, was incorporated into the college as its preparatory department; in 1871 a theological department was organized. The college is non-sectarian in its control, the board of directors being self-perpetuating; it is, however, affiliated with the Reformed Church in the United States, and the theological professors are ministers of that church. The organization of the college includes the College Department, the Academy, the School of Theology and the Summer Sessions. The School of Theology has been located in Philadelphia since 1898. The College Department offers six groups of studies, leading to the degree of A.B.; the groups are the classical, the Latin-mathematical, the physical, the chemical-biological, the historical-political, and the modern language. The degree of A.M. is conferred for graduate work. In the School of Theology the regular course occupies three years; the curriculum, in addition to the ordinary theological curriculum, includes a lecture course in Sunday-school work, a complete course in the English Bible, a special course in the history of the Reformed Church, and a course in sociology; graduate courses are offered leading to the degree of B.D. The Summer Session offers courses of secondary and collegiate grade, work in the latter counting toward a degree. Women are admitted to all departments except the theological. The students in all departments in 1917 numbered 202, and the instructors 18, while the productive funds were $236,000, and the total income $72,475. There are 597 graduates at this date.

URSUA, oo'-sóo'å, or ORSUA, Pedro de, Spanish soldier; b. Ursua, Navarre, about 1510; d. Machiparo, on the Upper Amazon, 1 Jan. 1561. He accompanied a Spanish expedition to New Granada, was governor of that country in 1545-46, and later led two expeditions from Bogotá in search of El Dorado. He commanded a force against the Chibchas (fugitive slaves) on the Isthmus of Panama in 1555-57 and reduced them to subjection. In 1559 he was given command by the viceroy of Peru of an expedition to conquer the "Kingdoms" of the Omaguas, near the head of the Amazon. The purpose of the viceroy was really to rid himself of the unruly soldiers attracted to Peru by the civil wars. The ruse succeeded. Ursua adopted the title of "governor of Omagua" and El Dorado, and set forth with several hundred of the turbulent soldiers in his train. He reached the Upper Amazon by way of the Moyobamba and the Ucayali, but at Machiparo a conspiracy was
formed among his followers, led by Lope de Aguirre, and he was murdered.

**URSULA**, er-su'la, Saint, virgin martyr, according to the legend, a daughter of a prince in Britain. She was put to death at Cologne on a horde of Huns, some say in 384, others in 453, together with 11,000 virgins who accompanied her. According to another reading the number of her companions was only eleven. The Martyrology mentions the saint and her virgin companions without stating their number. Some bones, said to be those of herself and her companions, are still shown to visitors. The day dedicated to her honor is the 21st of October. Saint Ursula was the patroness of the Sorbonne. Consult Baring-Gould, *Popular Myths of the Middle Ages*; Stein, *Die Heilige Ursula* (1879).

**URSULINE** (ér'sü-lann) CONVENT AND ACADEMY OF SAINT LOUIS (Mo.). Founded in 1848 by four sisters from Oebling, Austria, incorporated in Missouri in 1884. It is one of the oldest houses of the order in the United States. They opened the school 2 Nov. 1848, in a small house on Fifth street. In 1850, six sisters were reinforced by six sisters from Landshut, Bavaria, and also received considerable pecuniary assistance from the Bavarian king, Louis I. Early in 1850 the city block bounded by 11th and 12th streets and Russell and Ann avenues, was purchased for them by Archbishop Kenrick, and extensive buildings—convent, academy, day school—mark this their present location, whence band after band has since gone forth to found houses in other localities. In 1855 a colony of 12 set out for New York and established a house of the order at East Morrisania, N. Y. In 1859, in answer to an appeal from Bishop Juchter, seven sisters left the mother house to open a school at Alton, Ill. In 1877 another band went forth to plant the standard of education in the beautiful valley of Arcadia, Mo. Here they established an academy that bids fair to equal the one in Saint Louis in course of time. The Saint Louis community now number about 160 members, and besides the flourishing academy and day-school connected with the mother house, the community supplies 16 parochial schools with teachers. These schools aggregate about 1,500 pupils—thus bearing out the motto of the institute: *Mores Scientiae.*

**URSULINE SISTERS.** See Orders, Religious.

**URTICACEAE,** or NETTLEWORTS. See Nettle.

**URTICARIA,** an inflammatory eruptive affection of the skin, also called hives and nettle-rash, the latter name referring to the resemblance of the wheals or rounded elevations of cuticle to those caused by the sting of a nettle. The wheals are either rounded or elongated, appearing white at first, and afterward changing to red, the altered hue being more quickly assumed in consequence of rubbing or scratching to which the intense itching usually attending it gives rise. Relief follows upon gastric disturbance caused by eating certain fruits, shell-fish, or other foods that disagrees with the stomach fluids. It may also be due to disorders of menstruation, to various functional irregularities, or to local irritations. Some of the balsamic drugs likewise give rise to it. The eruption appears and disappears suddenly in successive crops of wheals. In treatment it is necessary to evacuate the bowels and regulate the diet so as to restore the normal digestive condition, and cold-cream, glycerine, dilute acids, bichloride of mercury, etc., are useful, locally. Salt-water baths are recommended for relief of the itching. Several remedies salicylates and alkalies are administered, and by this means the severity of an attack may often be abated and its duration lessened.

**URUGUAY.** (República Oriental del Uruguay), smallest of the independent countries of South America, bounded on the north and northeast by Brazil, on the east by the Atlantic Ocean, on the southeast and south by the Atlantic Ocean and the estuary of the Rio de la Plata, and on the west by the Argentine Republic. Its territory extends from lat. 30° S. nearly to lat. 35° S., and the location of its principal city (or, more precisely, of the cathedral at Montevideo) is given as lat. 34° 54' 33" S., and long. 56° 07' 32" W. Total area of the republic 72,210 square miles (about 72,210 square miles more than the total area of New England).

**Topography.**—The most elevated point in the republic is somewhat less than 2,000 feet above sea-level; the so-called mountains are, therefore, to be regarded rather as hills, which sometimes form chains—such as the Cuchilla Grande, which extends across the country, the Santa Ana range, between Brazil and Uruguay, the Cuchilla de Belén, and Cuchilla de Haedo,—but elsewhere give to the region, especially the northern districts, an irregular rolling or undulating surface. Forests or groves cover the hills in the north and generally extend along the banks of the numerous small streams (arroyos) and the larger water courses. The soil in the southwest is of uncommon fertility, being composed of detritus of great depth and rich alluvial deposits; the southeast and south have grassy slopes and good pasture lands, the hills here forming a bold line along the shore of the Río de la Plata, but not extending to the Atlantic Coast. Important rivers, besides the great southern estuary, are the Uruguay, which rises in the Brazilian state of Santa Catharina, and has a course of about 1,000 miles; and the Río Negro, which also rises in Brazil, and empties into the Uruguay after flowing toward the southwest for about 350 miles. The latter passes through the centre of the republic; the former marks the boundary with Argentina; both are navigable for vessels of light draught (Río Negro 115 miles, Uruguay 200 miles), and even large steamships navigate the Uruguay up to Paysandú. There are several shallow lakes, or lagunas, near the eastern coast. The largest of these, Lake Merin (or Mirim), is about 108 miles long by 14 miles wide, partly in Uruguay and partly in Brazil, is only of sufficient depth for navigation by the light-draught steamers that maintain communication between the towns on its shores.

**Climate.**—The southern part of Uruguay has a remarkably pleasant, temperate and healthful climate, resembling, and in evenness throughout the year outclassing, that of the Riviera of southern France and the northwest
of Italy. Extremes of heat and cold are unknown in that part of the country most subject to the climatic influence of the ocean and the great estuary. Naturally, such extremes are more marked in the northern inland regions, where the lowlands in summer are decidedly hot, the thermometer sometimes recording 100° F. on clear days, and snow not infrequently to the uplands. Taking the country as a whole, we note as unfavorable phenomena the storm-winds called *pamperos* and hailstorms that too often injure the standing crops. The average annual rainfall is about 37.19 inches; the average annual temperature, 62° F. or 63° F., approximately; the mean temperature of winter about 55° F., and of summer between 72° F. and 73° F.

**Fauna and Flora.**—The indigenous animal kingdom, although it includes 30 species of mammals, has only a few really notable representatives. 4Those of most commercial value are the rhea, or American ostrich, and the fur seals. Both of these, as well as the pampas cat, were found in large numbers, but, owing to the systematic pursuit of the rhea and the indiscriminate killing of the seal, both were threatened with extinction, until the government took measures to insure their preservation and increase. One may have some idea of the vast number of ostriches that roamed the plains of Uruguay in 1909 from the fact that, during that year, more than 50,000 pounds of ostrich feathers were exported to the United States and Europe. 5(Consult Zahn, J. A., *Through South America’s Southland*, New York and London 1916).

The seals in large numbers live and breed on the islands near the coast, especially the Lobos and Castillos groups. More than three-fifths of the seals at these rookeries are of the fur-bearing variety, and the islands are now strictly preserved, no one being permitted to land upon them except the sealers during the killing month. The number annually slaughtered for their oil and skins has ranged between 10,000 and 21,000 or 22,000. The mainland fauna includes the deer, otter, wild hog, carpincho, fox, ounce, wildcat, ant-eater, etc. There are over 500 species of avifauna, including the crane, stork, yellow-shouldered vulture, and the whooping crane. 6(Consult Zahn, J. A., *Through South America’s Southland*).

Dr. Zahn writes that, while traversing the rich, undulating plains of Uruguay, everywhere, within the field of view, there was a wealth of verdure and bloom that rendered the landscape as exquisite as a picture by a master—the most conspicuous among flowers being the *flor morala*—which carpets the landscape with glowing bands and patches of richest purple. Go where one will, one finds massed banks of the blazing *flor morala*—flowers that grow in such profusion that they extinguish all competitors. Small wonder, then, is it that Uruguay has been called ‘The Purple Land.’" The area of forests is relatively small—only about 1,650,000 acres. Their hard, durable, valuable woods are: The *rambula* (which, instead of decaying when buried in the earth, becomes petrified), urunday, lapacho, coronilla, espinello, quebracho, araza, algarroba and lignum vitae. Among the softer woods are the willow and acacia. Native products abound in the departments of Maldonado, Minas, Paysandú and in valleys of the central and northern districts, and the poplar, pine, cypress, oak, eucalyptus, cedar, magnolia and mulberry have been successfully acclimated. Yerba maté is indigenous and 430 species of medicinal plants have been classified.

**Mineral Resources.**—The only mines that have been worked continuously for many years are the gold mines at Cúñapiru, in the Department of Rivera, in the northern part of the republic. Work began there in 1869. The ore occurs in quartz veins intersecting dioritic rocks. In that part of Uruguay the mineralized territory is extensive. Another auriferous zone is found near Soldado, in the Department of Minas, where both gold and copper have been extracted from pyriticoreous and cupriferous formations. Copper has been found also in the Department of Maldonado. A large iron-manganese deposit, containing about 35 per cent iron and 23 per cent manganese, exists in the Department of Rivera, near the gold mines, and there are other deposits of iron and manganese ore at Carrasco. Talc of excellent quality is mined at Las Conchillas, in the Department of Colonia, near the estuary of La Plata. Along this southern coast, especially in the departments of Colonia and Maldonado, the granite quarries command attention, and in the republic generally, the quarrying industry is very important. 7(Consult Marriott, R., *Engineering and Mining Journal*, 13 March 1915).

Coal and petroleum have been found recently, the former in the departments of Montevideo, Cerro Largo and Santa Lucia.

**History.**—On 8 Oct. 1515 Juan Díaz de Solís sailed from Spain; he explored the estuary of the Rio de la Plata and was slain, with some of his companions, by natives of the Charrua tribe. On 2 Feb. 1520 Magellan sailed from the Rio de la Plata, after having explored to a limited extent the Parana and Uruguay rivers in his search for a waterway across Terra Firma. On 1 April 1526 Sebastian Cabot set out from Seville; he ascended the Paraná to its mouth, and sailed as far as the mouth of the Bermejo. In 1527 Cabot ordered the construction of a fort in the country east of the Uruguay River. The opposition of the natives to the Spanish settlements was so fierce and withal so persistent as to excite the curiosity of the discoverer. In 1603 a veteran Spanish force was routed in a pitched battle by the Charruas. In 1624 the oldest of the towns which now exist in Uruguay was founded on Rio Negro. The so-called "Banda Oriental" (that is to say, the region east of the Uruguay River) was the subject of contention between Portugal and Spain. In 1680 the Portuguese colonists of Brazil founded Sacramento (now Colonia), thus confronting the Spaniards at Buenos Aires. In 1723 the Portuguese fortified the Bay of Montevideo, but surrendered to the Spaniards in the following year, and families from Buenos Aires established themselves at Montevideo in 1726. In 1735-37 Colonia was besieged by the Spaniards. In 1761 the Montevideans submitted to Portugal by the Treaty of Paris 1763. This did not put an end to Spanish colonization there; on the contrary, immigration from the north of Spain and from Spanish settlements in Paraguay has been carried on across the River Plate to the 18th century. On 26 April and 28 May 1811 José Artigas, leader of the Revolutionary party in the Banda Oriental, routed the Spanish forces;
URUGUAY

601

a confederation of the settlements east of the great river was formed, with Artigas as Protector. But the Portuguese captured Montevideo and Maldonado, and in 1822 the region in dispute was organized as the Cisplatine Province. On 23 December 1825 Artigas took refuge in Paraguay, where he died; but his gallant, patriotic efforts had not been wasted. Other refugees, who had gone to Buenos Aires, returned to start a rebellion in the Cisplatine province, and on 23 August 1825 issued a declaration of independence. On 24 September and 12 October in the same year the Brazilians were defeated. Then the Argentine government intervened. On 9 February, and 30 July 1826 Admiral Brown, commanding the Argentine squadron, failed in his attempts upon the Brazilian fleet; but in February 1827 succeeded in destroying the expedition sent by the Brazilian admiral, Lobo, into the Uruguay River, and on the 20th of that month the Marquis of Barbacena, commanding Brazilian forces, was defeated at Ituzaingó. On 27 Aug. 1828 the Treaty of Montevideo was signed, and the República Oriental del Uruguay was created, both Brazil and Argentina renouncing their claims to the country, which was to be known as the Eastern Republic of the Uruguay, or simply Uruguay. On 18 July 1830 the constitution was adopted and a new declaration of independence issued — this time guaranteed by both of the strong neighbors. But, unfortunately, the political parties — the "Colorados," or Reds, and "Blancos," or Whites — kept alive the traditions of home-bred strife. Thus, in 1842, a political chief secured Argentine support and laid siege to Montevideo; in 1862 ex-President Flores, "Colorado" leader, made use of Brazilian troops to take Paysandú. On 25 Feb. 1865 Flores with his Brazilian allies took forcible possession of the capital and of the government; quite naturally, therefore, Uruguay was drawn into the coalition formed to resist the dictator of Paraguay, Francisco Lopez. On 17 Aug. 1865 Flores defeated a division of Paraguayans at Yatay; three years later he was assassinated during a "Blanco" rebellion at Montevideo, ex-President Ferro, "who, though not one of the assassins, was arrested in the street with arms in his hands," was executed, with other rioters. The revolution of 1870-73 ended in a "Colorado" triumph. Of the series of disturbances which have followed, marking the efforts of "Blancos" to regain power, only one need be mentioned at present — the serious revolution which broke out in March 1903 and continued in 1904 despite the increased military force of the government. Gradually the subversive prosperous republic has outgrown and subordinated lawless political factions; gradually the habitual uprisings against the established government have become less formidable, losing the revolutionary air of old, and appearing rather as mere provincial riots.

In December 1908 a Supreme Court was established and the judicial system was reorganized. The Montevideo Port Railway was inaugurated. Dr. Félix Lambiris Viera was elected on 1 March 1915 as President of Uruguay (and inaugurated two days later) for the term ending 1 March 1919.

Government. — According to the provisions of the constitution of 18 July 1830, the legislative branch of the government is composed of the Senate and the House of Representatives, the former having one member for each of the 19 political divisions, called departamentos, and the latter one for each 3,000 inhabitants or fraction exceeding 2,000. Together they compose the General Assembly, in which all legislative power is vested, and they meet annually from 15 February to 15 June. The term of a senator is six years and that of a deputy is three. In many respects the powers of this Congress or General Assembly are similar to those of the Congress of the United States, but they extend much farther in certain directions, namely, to the granting of pardons and amnesties in extraordinary cases and electing the President of the republic (see below). The judicial power is exercised in several courts of first instance (distributed as civil, criminal, for cases affecting the treasury, for commercial cases, police and departmental), courts of appeal, and the High Court of Justice. The executive power is vested in a President, who is chosen for a term of four years by the majority of the members of the legislature in joint session of its two chambers. The President is ineligible for the term immediately following his tenure of office. He is aided by a cabinet of seven ministers, who, although appointed by him, are responsible to the Congress as well. The law of 3 March 1911, increasing the number of cabinet officers from five to seven, established the following ministries: Interior and Worship; Foreign Affairs; Railways; Justice and Public Instruction; Industries, Labor and Communications; Public Works; War and Marine. Reform of the fundamental law is part of the order of the day. A new Constitution, to come into force 1 March 1919, was adopted by the two great political parties in 1917. Its basic principles are the following: (1) The next President is to be elected by the Chambers — The Senate and House of Representatives — as heretofore, but officers of the Senate shall be elected by the people, with secret voting. The Presidential period will remain as at present, a four-year period. (2) No one can be re-elected as President until eight years shall have elapsed since the last term. This is substituted for the provision that he must not be a candidate for re-election for the term immediately following his own tenure of office. (3) In case of vacancy occurring in the presidency, the Chambers, by absolute major- ity, shall at once elect a substitute to hold office for the remainder of the period. The provision has been heretofore that in case of the President's disability or death, the presiding officer of the Senate shall assume the presidency. (4) The President shall have direction of the army and navy, and shall be in charge of foreign affairs and of public order at home and abroad. The prefects shall be dependent upon him alone; nevertheless, it is provided that they shall be appointed by him from candidates proposed by an important body to be known as the Council or the Council of State. (5) The Council shall submit for examination by the President matters relating to the creation or modification of taxes, to loans, to the budget, the circulating medium and to foreign commerce. This includes also practically all proposed economic measures. If the President

URUGUAY

Withhold his approval the Council may prevail only by a two-thirds vote. (6) Conflicts of jurisdiction between the President and the Council of State shall be decided by the Chambers. (7) The Council of State shall consist of nine members, serving six years each; it shall be renewed by third parts, every two years, by direct election and secret voting. The first Council shall be elected by the Chambers, six members by the majority and three by the minority. (8) The Chambers shall be paramount in their control of national measures. (9) The principle of municipal autonomy with the enjoyment of suitable revenues is adopted. (10) Constitutional reforms may be initiated by either of the Chambers, proposed amendments requiring a two-thirds vote of the total membership of each Chamber for acceptance. The amendments shall be submitted to the succeeding legislature; and if then approved in the same form and manner their ratification shall be considered complete. (11) All forms of worship are free in Uruguay. The State does not sustain any religion. It recognizes the preeminence of the Catholic Church in ecclesiastical edifices already built in whole or in part by national funds, except the chapels attached to asylums, hospitals, prisons and other public establishments. Churches and other places of worship are free from all taxation. (12) Inscription in the civil register is obligatory; in all elections, whether of national or of municipal officers, taking place after 1 March 1919 the voting shall be secret and representation shall be proportional; very positive restrictions are imposed upon military and police functionaries in respect to political activity, etc. The political parties, Colorados and Blancos, after conciliatory negotiations, agreed to accept what has been characterized as a "modern smooth-running, efficient mechanism of State" in place of the old constitution which, according to the best opinion of the progressive element and financial authorities, was unsuited to present-day conditions.

Education and Religion.—This republic is spending about $5,000,000 a year for the maintenance and development of the educational system. Primary education is compulsory, and there has been little or no occasion for inflicting penalties for violations of the law in regard to this matter, since applications for admission to the schools are generally far in excess of the school accommodations. There were in 1917,1,203 elementary schools with an attendance of 120,000 pupils, approximately, the enrollment of pupils having increased 23 per cent between 1908 and 1913 (from 60,683 to 91,746) and at a slower rate between 1913 and 1917. There are also 203 private schools with 19,768 pupils. The number of rural schools has nearly doubled since 1906, in which year the sum of $1,000,000 was appropriated for the erection and improvement of school buildings. A recent report of the Minister of Public Instruction contains the statements: Mixed schools have been established "in almost all the rural districts which have a sufficient number of children of both sexes to average an attendance of not less than 30 pupils"; and "Since the permanence of pupils in rural schools never exceeds three years, a simple program has been outlined which can be developed in that short period, so that when the pupil leaves school he knows how to read and write and to perform the principal arithmetical operations; has some acquaintance with geography, history and the constitutions of the republic; and [this being one of the good traditions of South American schools] has been impressed with notions of the purest morality." All schools in the republic receive frequent visits from the minister directly to the minister of public instruction, and these visits are supplemented by medical inspections. A law of 1907 authorized the establishment of schools for adults, the object being to overcome such illiteracy as had been the natural result of the scarcity of rural schools up to that time. About 50 evening schools have accordingly been established at different centres, and these are attended by 2,600 pupils. The department of Rocha leads in the practical teaching of agriculture, and the same department has also established a higher commercial school. At Montevideo we find the university one of the modern organizations of this class, and of high distinction, with faculties of law, science, medicine, mathematics, agriculture, commerce; secondary schools, normal institutions, such as the National Institute for the Deaf and Dumb, established in 1910; and two excellent normal schools, one for boys and the other for girls. State pupils in these normal schools enjoy a pension of $15 a month as a contribution assisting them to meet the expenses of residence at the capital. The provision made for supplying textbooks or pedagogical works gratuitously, under certain conditions, may also be mentioned as another example of wise liberality. The High School of Commerce of Uruguay, in its three-year course—which may be extended to four years—gives instruction in bookkeeping, accounts, geography, political economy, languages (particularly the English language) and stenography.

The cabinet officer known as Minister of the Interior and Worship has authority in relation to the welfare of the clergy of the Apostolic Roman Catholic Church and under the constitution Roman Catholicism is the state religion; there is, however, complete toleration, and about one-third of the adult population should be classified as Protestants, Liberals, etc.

The Judicature.—The judicial system of the republic was reorganized in 1907. It now includes a High Court of five justices, the latter being chosen by the general assembly of the chambers, and the presiding officer of the court being chosen for one year by the members themselves. This High Court has original jurisdiction in constitutional, international and admiralty cases, and hears appeals in cases in which the decision has been altered in the minor courts of appeal, of which there are two, each with three justices. Montevideo has three courts for ordinary civil cases, two for commercial cases, one for government cases, two for criminal cases, one correctional court and three for criminal investigation. At each departmental capital there is located a departmental court and there are 214 judicial sections in the republic, each with a justice of the peace court. Lesser local divisions are known as districts in which deputy judges have a limited jurisdiction. The death penalty was abolished.
in 1907, penal servitude for 30 to 40 years being substituted.

Agricultural and Pastoral Industries.— Although the soil is fertile and the climate favorable for less than 4 per cent of the country is under cultivation (in 1916 about 2,000,000 acres out of a total of more than 45,000,000 acres). Uruguay is still, despite the efforts that have been made by the government to extend the cultivated area, essentially a pastoral country, with 350,000,000 sheep, 3,500,000 cattle, and 300,000,000 goats, as well as cattle, sticks, etc. The chief agricultural products are: Wheat (average crop 360,000 tons); Indian corn (average crop 200,000 tons); limes (average crop 27,000 tons); oats (average crop 27,000 tons); wine (average annual production 34,000 tons); tobacco (average crop 1,000 tons). The staple products of Uruguay are meats, hides and wool. A livestock census which was provided for by a government decree in January 1917 shows the different classes of cattle in each department of Uruguay, but in submitting the figures the director of the census states that they are to be considered as only partial data. The total number of cattle in the whole country is given as 7,942,212, the largest number in any department, 711,224, being in Tacuarembo, and the smallest number, 26,373, in the Department of Montevideo. Each of the departments of Artigas, Cerro Largo, Durazno and Salto has more than 600,000 cattle; Paysandú and Rio Negro are the 500,000 class; Florida, Minas, Rivera, Rocha and Soriano show over 400,000 each, while the remaining departments have in the neighborhood of 200,000 or 300,000 each. The taking of this cattle census is only one of various measures which the government of Uruguay is adopting for the development of its livestock industry, the chief source of the country's wealth. The stock of sheep was estimated in 1916 as about 27,000,000; hogs over 500,000; horses (statistics of 1917), 560,000. Livestock statistics are prepared, primarily, by the animal sanitary police, a well-organized force empowered to treat, to quarantine or to destroy diseased animals. The value of wool sheared each year is given as $25,000,000. Favorable conditions of climate and pasturage, together with intelligent methods of propagation, have induced that steady increase of the flocks of sheep which has made the Uruguayan wool-clips such an important matter. As statistics show, the sheep to-day may be divided into two classes — Spanish and British, omitting the Asiatic breed. The finest sheep in the world came originally from Spain, and the authorities of Uruguay have not only bestowed great care upon the selection and development of types that thrive best under local conditions, but also have spared no expense in their search for the finest varieties developed on other lands. The value of the slaughtered livestock of all classes was shown in statistics submitted to the First Pan-American Financial Conference to be less than the value of the wool crop, — about $22,000,000 as compared with $4,000,000. But in 1913 when the total value of exports of the grazing and meat industry increased nearly 50 per cent, wool exports showed no corresponding gain. An important product of the livestock industry is tasajo (Jerked beef), chiefly exported to Brazil, Cuba and Porto Rico. In 1914 there were, however, the chief Argentine, Brazil, Spain and Italy. The country leading in exports to Uruguay in 1916 were, in the order of total value of such imports: Italy, United States, France, Argentina, Great Britain and Spain. In 1917 the imports amounted to $37,500,000 and the exports to $67,516,275. The exports of wool were principally live- stock, $2,311,190; canned goods, and especially $26,567,006 and wool, $18,681,275. The following tables show at a glance the chief groups of articles imported and exported.

The foreign trade of Uruguay has been studied with a view to ascertaining also the percentage of each of the main divisions of the imports and exports. The result appears in the following table, which shows the average of recent years, thus minimizing the effects of
such exceptional conditions as the war has created:

Uruguay's chief exports to the United States are leathers, meat products and wool. Her principal imports from the United States are passenger automobiles, cotton cloth, drugs and chemicals, flour, hardware and tools, knit goods, iron and steel, lubricating oil, rosin, sugar and tinplate.

The manufacturing industries of Uruguay are on a small scale as a rule, but a noteworthy exception is the immense establishment of the Liebig Company at Fray Bentos. In Montevideo there are flour mills and boot and shoe factories. Several woolen-mills, brick and tile works and glass and bottle factories are in operation. Other manufactures are: Furniture, cotton and linen cloth, cement, etc.

**Money, Banking and Finance.**—Uruguay's monetary system is based on the gold standard, the theoretical unit being the Uruguayan gold peso divided into 100 centesimos and representing 1.697 grammes of gold. The par value in terms of the currency of the United States is $1.0342 and the par value of $1, currency of the United States, in terms of Uruguayan currency is $0.99629 pesos. But, inasmuch as Uruguay has never actually coined the peso or other gold-piece, the circulation consists of banknotes and foreign gold coins, which are legal tender at the following rates:

- **United States**: $1 = 66 pesos
- **Great Britain**: £1 = 70 pesos
- **France**: 1 franc = 0.40 peso
- **Belgium**: 1 franc = 0.40 peso
- **Italy**: 1 lire = 0.62 peso
- **Spain**: 1 peseta = 0.62 peso
- **Brazil**: 1 milreis = 10.56 pesos
- **Argentina**: $1 = 66 pesos

Exchange rates are quoted normally in Montevideo as follows:

- **London**: 1 £ = 11/166 = 1 £ = 10 pesos
- **New York**: 1 $ = 4 pesos
- **Paris**: 1 franc = 0.40 peso
- **Berlin**: 1 mark = 0.40 peso
- **São Paulo**: 1 centavo = 0.40 peso

The principal banks in Montevideo are: Banco de la República, Banco Popular del Uruguay, Banco Comercial, Banco Español, Banco Francés, Banco Argentino Transatlántico, Banco Británico de la América del Sud, Banco Anglo Sud-Americano, Banco de Londres y Río de La Plata, London and Brazilian Bank, Limited, and a branch of the National City Bank of New York. The first mentioned is really a state institution, its capital having been contributed solely by the government. It is administered by directors who, although appointed by the President of the republic with the consent of the Senate, enjoy complete independence. In this connection we quote the observations of the Uruguayan delegation to the First Pan-American Financial Conference: "Its employees are selected among the most able men, after having passed certain examinations, and the principal officials of the country, including the First Magistrate himself, take pride in not interfering with the independence of the bank, and they do their utmost to help increase its resources and credit. This bank, which to-day exercises a vital influence in the economy of the country by stimulating industries and trade, has 24 branches and agencies distributed among the principal cities and towns of the interior, and consequently can claim from an international point of view the financial representation of the republic. In the near future the bank will be in a position to extend its field of operations to North, Central, and South America, establishing also agencies and branches, for its capital is rapidly increasing by means of accumulated profits."

The budget for the fiscal year 1916-17 estimated expenses at $30,525,402.64 and receipts $29,452,776.53. For 1915-16 the figures were: $29,477,311.81 for expenses, including interest on public debts, and $29,578,000 for revenue, the chief sources of revenue, under the conditions created by the war, having been:

</table>

As contributors to revenue we mention the following government institutions: The Bank of the Republic, the Mortgage Bank, the Insurance State Bank and the electric-light and power plants, capitalized with the proceeds of...
a $4,500,000 loan and constituting a state monopoly.

The public debts are: The consolidated debt, originating in a loan of $19,570,000 at 3½ per cent interest; the debt of the telegraph and telephone system; the debt of the National Bank of the Republic, and the state debt (the distribution of the securities of the securities, in 1915, in Europe 69.73 per cent and in Uruguay 30.27 per cent); the conversion loan taken by the Banque de Paris et des Pays Bas at 9 per cent and sold to the public at 87 per cent, of which loan the holdings in Europe amount to 70.74 per cent, and in Uruguay 29.26 per cent; the guaranty debt, 4 per cent (practically redeemed through purchase by the state of the Mortgage Bank which had these securities as part of its capital); the unisecured demand loan, 4 per cent, $1,448,650 ($1,100,000 held in London and the balance in Uruguay); the Insurance State Bank loan, 5 per cent (the whole amount, $3,000,000, belonging to the state, "as the bank never felt the necessity of selling bonds"); the 1915 interior debt loan, $6,000,000, issued at 8 per cent. In 1917 the Uruguayan government proceeded to the conversion of the last-mentioned loan (8 per cent) into a new conversion loan at 6½ per cent, with a bonus of 5 per cent.

Transportation and Communication.—The railroads in Uruguay radiate westward and northward from Montevideo, three lines connecting the country with Brazil. They are in the main of standard gauge; their total length in 1919 was about 1,600 miles, and they carry annually about 1,800,000 passengers and 1,700,000 tons of freight. Plans have been made for extending the system by the addition of 1,500 miles of track. The length of tramway lines in operation is about 170 miles; the total length of departmental wagons roads or bridle paths more than 3,000 miles, and of national highways about 2,240 miles. Efforts are being made to put the highways in better condition for motor traffic. The river system is extensive and great for transportation, all of the following ports on the Uruguay River admitting vessels of nine (and some even of 14) feet draft: Carmelo, Neuva Palmira, Soriano, Fray Bentos, Nuevo Berlin, Casa Blanca, Paysandú, Salto and Rosario. On the Riachuelo Negro the chief port is Mercedes; on the San Salvador River, the port of San Salvador, and small craft reach the interior on a dozen or more of the Uruguay's tributary streams. Steamship communication between Uruguay and foreign lands is maintained by transatlantic lines representing the chief nations of western Europe. Between Buenos Aires and New York there is a weekly service; local transportation lines keep the Uruguayan coast in touch with the Atlantic ports of Brazil or the river ports of Paraguay, and there is a regular nightly steamship service between Montevideo and Buenos Aires. The clearances at Uruguay ports reach annually about 8,000,000 tons. Uruguay possesses 27 steamers of a total tonnage of 20,298 tons.

Uruguay has extended its wireless service by establishing a large station at Montevideo, with a range of 621 miles, and other stations identified with the War and Marine Ministry or Department. The number of post offices in the country is about 1,200; of telegraph and telephone stations, about 60. Telephone lines have 16,518 miles of wire.

Weights and Measures.—The metric system has been adopted officially and gains ground steadily among the people in the chief centers of population, displacing such antiquated units as the libra (1.0143 pounds); arroba (25.35 pounds); quintal (101.4 pounds); cuadra (1.8 acres); fanega (30 gallons), etc. The recognized basis of thorough reform in this respect is practical demonstration of the greater convenience of the new system.

Army and Navy.—The strength of the army at the present is given as slightly more than 10,000 officers and about 10,200 men—and about 100,000 men receive training in the national guard. For the navy, additional ships are being constructed. The number of vessels in 1916 was 12, with 60 officers and 600 men.

Population, Political Divisions, etc.—The number of inhabitants is estimated at 1,406,000. In the northern part of the republic there are many Brazilians, who cross the border from the state of Rio Grande do Sul; otherwise the population consists principally of Spaniards or people of Spanish descent (the most numerous class), of Italian colonists and citizens and of the English, Swiss and German residents who are actively engaged in business, banking or agriculture.

The Oriental republic of Uruguay is divided into 19 departments, which with their areas, populations and capitals are as follows:

URUGUAY, a river of South America, rising on the coast range of southern Brazil, flowing west on the boundary between the states of Santa Catharina and Rio Grande do Sul, then southwest to the latter state and Argentina and finally south between Argentina and the republic of Uruguay, emptying into the head of the estuary of La Plata. It is a very large river, the main head stream in Brazil is called the Pelotas. It is about 1,200 miles long and an important avenue of commerce, passing the towns of Salto, Paysandú and Concepción. It is very broad for 100 miles from its entrance to the gulf styled Rio de la Plata and is navigable for large steamers (O Paysandú, and for smaller vessels to the rapids above Salto, above which it can again be navigated for several hundred miles.

URUMCHI, oo-room-chē', or TIIHAFU, central Asia, a city of Chinese Ssungaria, in the province Sin-kiang, on the northern side of the Tyan-Shan Mountains. It consists of an old and a new town, the former being situated on the slope of a mountain which attains a height of 14,000 feet above sea-level. It was formerly of great commercial importance in the trade between Russia, Turkestan and India. Urumchi is of strategic importance and is now the administrative and military capital of the province of Sin-kiang. Pop. estimated at 25,000.

URUMIA, oo-roo-me'ā, URUMIAR, or URUMIYAH, Persia, (1) a town in the west of the province of Azerbaijan, situated on an extensive plain about 10 miles west of Lake Urumia and 65 miles southwest of Tabriz. It claims to be the birthplace of Zoroaster, and in the vicinity are several mounds, supposed to have been made use of in the ceremonies of the ancient fire-worshippers. It has two colleges and a seminary and is the see of a Latin bishop. The surrounding districts is of great fertility, covered with groves, orchards, vineyards, gardens, rice-grounds and villages. Pop. about 30,000. It was the scene of an Armenian massacre by the Turks in 1915. (2) The lake, situated 4,300 feet above sea-level, is about 80 miles long from north to south, by 20 miles broad and has no apparent outlet. It is very shallow throughout. Numerous islands are scattered over its surface. Its waters are so salt that neither fish nor mollusca can live in it. Salt of a good commercial quality is obtained from shore deposits, the result of natural evaporation.

URUS, an extinct wild ox (Bosurus) that roamed in Gaul and other European countries at the period of the Roman invasion, as described by Caesar. See Ox; White Cattle.

USAGE, in law. See COMMON LAW.

USAMBARA, oo-zam-bā'ra, German East Africa, a mountainous district in the northeastern part of the colony, bordering on the coast northwest of Zanzibar. It is extremely fertile and one of the most important parts of the colony.

USBEKS, or USBECKS. See TUAREGS.

USE, in English law, the permanent equitable right, benefit or profit of lands and tenements that are in the possession of a person who simply holds them for another person, the real beneficiary. He to whose use or benefit the trust is intended enjoys the profits and is called custui que use. All modern conveyances are directly or indirectly founded on the doctrine of uses and trusts, which has been deemed the most intricate part of the property law of England.

USE AND DISUSE, one of the doctrines in that view of organic evolution promulgated by Lamarck (q.v.) which holds that variations in structure are brought about by the use, in the one case, or by the disuse in another, of organs. Conceding that physical changes due to such a cause may be brought about in the individual, the important question remains—are they inheritable? Hence, a correlated part of the theory must be disposed of under the name "use-inheritance." Followers of Lamarck are believers in the efficacy of use and disuse and use-inheritance as factors in evolution. Others cite the evidence that head-flatening practised by various uncivilized races is a hereditary result, neither tattooing. Consult the writings of Lamarck, Packard, Cope, Hyatt, Weissmann, etc. See EVOLUTION, HISTORY OF; HEREDITY; LAMARCISM.

USEDOM, oo-zē dom, Prussia, one of the two islands which separate the Stettiner Haff from the Baltic Sea, six miles southeast of Rügen. It is of irregular shape, 34 miles long, and 1/2 to 15 miles wide. Agriculture, cattle-raising and fishing are the chief occupations. The chief town is Swinemünde. Pop. about 30,000.

USERTESAN, or USERTEN (known to the Greeks as Sesontisos), the name of several Egyptian kings of the ancient royal house of Thebes. They belonged to the 12th dynasty and reigned between 2130 and 1930 B.C. Usertesen I erected at Thebes the earliest and loftiest of the obelisks, which measured about a hundred feet from apex to base. His colossal statue in red granite has been discovered near Tunis. Usertesen II and III completed the subjugation of Lower Nubia. Consult Breasted, 'His-
tory of the Ancient Egyptians (New York 1908).

USHANT, őshánt (French, OUESSANT, wès-són), France, an island 15 miles off the west coast of the department of Finistère, to which it belongs; area, six square miles. It is almost entirely composed of granite, with a bold and rocky coast, which is accessible only at some points. Fishing and the rearing of sheep are the principal occupations of the inhabitants. Saint Michel is the chief village. Uschant, with the surrounding islets, forms a commune having a pop. of about 2,568. Near the island in 1759 Sir Edward Hawke defeated Admiral Confians and in 1778 Admiral Keppel and Count D'Orvilliers fought an indecisive battle.

USHER, Herkéniá, American bookseller: b. England, about 1615; d. Boston, Mass., 14 March 1661. The 'History of Printing' (1810) calls him 'the first bookseller in English America of whom I can find any account.' He was in Cambridge as early as 1639, but in 1646 set up business in Boston. As agent of the Society for the Propagation of the Gospel, he purchased the types and paper for the printing of Eliot's 'Indian Bible' (see Eliot, John), and directed all the transactions in connection therewith. This was the first Bible printed in the colonies. Uscher was a founder of the Old South Church of Boston (1659).

USHER, or USHER, James, Irish prelate, archbishop of Armagh: b. Dublin, 1581; d. Reigate, Surrey, 1656. He took orders in 1601, and in 1607 was appointed professor of divinity at Trinity College, Dublin, and chancellor of Saint Patrick's Cathedral; in 1620 bishop of Meath; in 1623 Irish privy-councillor and primate of Ireland in 1624 as archbishop of Armagh. His notions of church government verging toward Presbyterianism, his enemies took advantage of this to attempt to destroy him. He met with Charles I; but he enjoyed the last esteem of that king. He attended Strafford in prison and at his execution. During the civil war he was a staunch adherent of Charles I, and witnessed the execution of the king. After that event he experienced civil and flattering promises from Cromwell, who finally ordered that he should be buried in Westminster Abbey. Archbishop Usher carried on an extensive correspondence with the learned in various parts of Europe, and was a man of great erudition. He wrote a number of works, the principal of which are the 'Annals of the Old and New Testament,' which forms the basis of the Biblical chronology in King James' version. 'Britanniarum Ecclesiœ Antiquitates.' Consult Aikin, 'Lives of Selten and Usher' (1812).

USHER, John, American colonial executive: b. Boston, Mass., 27 April 1648; d. Medford, Mass., 1 Sept. 1726. He was the son of Herkéniá (q.v.). As a bookseller he was the first in the colony to obtain a copyright for printing, the work being a revised edition of the laws of Massachusetts. He was colonel of militia, treasurer of Massachusetts and agent in London for the Massachusetts colony for the purchase from Sir Ferdinand of Gorges of the title for the district of Maine (1667). In 1662-97 he was lieutenant-governor of New Hampshire and again from 1702 till his death.

USHHER, Roland Greene, American historian: b. Lynn, Mass., 3 May 1880. He graduated at Harvard (1901), taking history honors (1902) and rounding out his education in Oxford, Paris and Cambridge. He was assistant in history in Harvard (1904-07), instructor there (1907-10) and professor since 1914. Among his numerous writings are 'The Rise of the American People' (1914), 'Pan-Americanism' (1915) and 'The Challenge of the Future' (1916).

USKUP, ooš-küp, or USKUB, anciently called SCUPI, ŠKÒPIA, or ŠKOPLJE, European Turkey, the capital of a sanjak in the vilayet of Kosovo, situated on the river Vardar, 65 miles northwest of Monastir, 110 miles northwest of Saloniki, on the railroad from Saloniki to Belgrade and the branch line to Mitroviza. It was the scene of a battle during the Balkan War 26 Oct. 1912. It has a handsome mosque, a castle, a Byzantine aqueduct and an old trade-school. The chief manufactures are leather, metal ware and cloth and the town is an important trade centre for grain, wool and fruit. Pop. about 35,000.

USNEA, a genus of fruticose lichens, attached only in one place, with a shrub-like appearance. They are often pendulous, as is the old man's beard, or U. barbata which hangs in long tassels and festoons from the bark of trees or their branches, is grayish and resembles somewhat in habit the Tillandia. Usnea is also known as necklace-moss, or hanging moss.

USPALLATA (oos-pal-yah-tah) PASS, Chile, a pass over the Andes between Chile and Argentina, 90 miles east of Valparaíso, and at the southern base of Mount Aconcagua. Its highest point is about 12,800 feet above the sea, and the Trans-Andine Railroad passes over it.

USSELINX, William, one of the greatest promoters of American colonization and founder of the Dutch West India Company, under which New Netherland, and of the Swedish West India Company, under which New Sweden was settled: b. of Walloon parentage at Antwerp in 1567; d. 1647. In his early manhood he visited the Azores, which in 1431 had been rediscovered and colonized by the Netherlanders, and learned the mystery of Spanish colonization. From this archipelago the ships bound for the New World made their starting point westward over the Atlantic—the line between Sandy Hook and the Azores being almost that made by a ruler laid on the map. In this chief centre of colonial business Usselinx gained a rich experience, besides being in a Spanish prison for a time. From 1591, when he returned to the Netherlands, Usselinx began to talk, and later to agitate, in favor of Dutch trade with America. After his intense activity, by voice, pamphlets and general publicity, the Dutch West India Company, a mighty, armed corporation was formed in 1623 for activity against the Spaniards, who claimed nearly all of America. Under the company's name and leadership were sent to South America and in 1624 30 families of Walloons, or refugee French-speaking Belgians, to New Netherland. These began the settlement and the tilling of the soil in the area now comprising the four Middle States, New York,
USSHER—USURY

New Jersey, Pennsylvania and Delaware. In life Ulsselin entered the service of the king of Sweden and organized the forces that led to the defeat of the Dutch, for the defense of Delaware. Returning to Holland in 1641 he engaged in large operations in drainage and soil-reclamation, utilizing treasure dug up from sunken ships of the Spanish Armada. About 1647 he disappeared from view. Within 30 years past a portrait of him was discovered and hangs in the Rijks Museum at Amsterdam. Ulsselin, who was very influential in France and Germany, was a citizen of the world, believing that God to to right of the earth right of the people and subdued. In addition to the Dutch bibliography consult G. M. Asher's 'Essay on the books and pamphlets relating to New Netherlands' (Amsterdam 1854-67) and the exhaustive monograph by J. Franklin Jameson, 'Willem Ulsselin' (New York 1887).

USSHER, James. See Usher, or Ussher, James.

USTICA, oos-te-kä, Italy, a small island in the Ttyrhenian Sea, 40 miles north of Palermo, Sicily. It is three miles long and two miles broad and has a fortified harbor with a lighthouse. It has been used as a penal colony. Pop. about 2,000.

USTILAGINACEÆ, the family of minute fungous plants called smuts. See Fungi.

USUFRUCT, in law, the right to use and enjoy the things of another person and to draw from them profit, interest or advantage without reducing or wasting them. It is the most important of personal servitudes, servitude being the term used to denote the property of another, whether real or personal. It may be established in any property which is capable of being used so far as is compatible with the substance of the thing not being destroyed or injured to the Swedish settlement. This right may either be exercised directly, or may be leased or sold. The one possessing it is termed the usufructuary. He is bound not to impair the property and must furnish security for the restoration of it. Reasonable wear and tear and aging and natural death of animals do not call for replacement, however. A quasi-usufruct is recognized in the case of certain perishable things or consumptibles. For instance, perishable fruit may be preserved and sold, eaten, etc. In such cases the equivalent in kind and quantity, or in value, is held to represent the things destroyed or impaired by use. There are works on the subject by Gentry (1859) and Hanausek (1879).

USUMACINTA (oo-soo-ma-sen-ta) RIVER, Central America, formed by the junction of three head streams, the Chixoy, Pasión and Lacantum, rising in Guatemala, for some distance in its middle course being the frontier line between Guatemala and Mexico. It flows northwestward through the states of Chiapas and Tabasco, Mexico, and empties into the Gulf of Mexico after a course of about 400 miles. A navigable branch also flows eastward into the Laguna Terminos, opening into the Gulf of Campeachy, while another branch flows westward into the Tabasco (q.v.).

USURY. If the term usury is to be defined, as in the strictly legal sense, as the illegal profit demanded by a lender for the loan of money or other property, it will be found that this offense against society is almost as old as society itself. Even in the earliest of Biblical days, for instance, it was practiced, generally that the Lord uttered his warning against the custom: "Thou shalt not lend upon usury to thy brother, usury of money, usury of victuals, usury of anything that is lent upon usury. To purpose usury thou mayest lend upon usury; but unto thy brother thou shalt not lend upon usury, that the Lord thy God may bless thee" (Deut. xxiii, 19, 20). Until comparatively recent times the word usury had many definitions and was used to embrace several essentially different social phenomena. In the Old English application it denoted any sort of interest upon money loaned rather than in the more modern signification which has made it applicable only to the unlawful contract exacting that the loan of money be repaid with exorbitant interest for its use. In fact, if one were to trace the history of the word back through the centuries that have passed since the Mosaic days it would be found that it had been often applied to the standards of legal methods of procuring just interest for capital invested as to those concerning which a moral if not a legal stain might be attached. History.—The earliest interpreters of the laws of Moses certainly condemned the civil practice of usury, and yet they did not forbid the taking of interest in payment for the loan of money, but expressly stipulated that such interest should be charged to strangers. It must be admitted, however, that the subject of the law was largely the result of the social conditions which existed in Israel at this time. In the first place the Israelites were neither a rich nor a commercial people, and the laws and regulations under which they lived were apparently not framed with the purpose of enabling them to become so. Their object, therefore, was to maintain their entity as a nation and to preserve the family inheritances which enabled them to continue happily their frugal mode of life. If the Israelites borrowed, therefore, it was not with a view to profit or to enable them to improve their condition, but simply from poverty and to secure to them some absolute necessity of life. To exact from such persons more than was lent, therefore, would have been both sinful and unjust. The result is evidenced by the fact that among the ancient Israelites loans were made merely in cases in which there were poor persons who required assistance to tide them over present difficulties, and never for the purpose of enabling an avaricious man to increase his wealth at the expense of his poorer neighbor. This restriction, however, did not apply in the case of the stranger who was in need of financial help, and the extortion of usury was one of the several means resorted to by the Israelites to ruin the Canaanites and the other stranger-people who remained in the land. As time passed the public attitude toward usury underwent a decided change, and society, which had branded all lending as immoral and all interest as usury, because the lending did so generally resulted in cruelty and hardship to the borrower, finally began to feel that all lending was moral and honest, and it was under these conditions that the term "usury" was first applied to every method of receiving interest
upon capital invested, an attitude that remained unchanged for many centuries.

The effect of this interest and instructive features in the study of the economic progress of society is that which enables one to follow the various changes that have occurred in the methods of money lending. It has already been shown that the ancient Israelites borrowed only from necessity and not from the possibility of furthering any commercial interest, and this condition, according to Grote, not only prevailed in Greece, but applied to nearly all parts of Europe during the early Middle Ages.

In its inception the economic theory of the loaning of money did not contemplate the possibility that anyone might desire to raise a loan for the purpose of investment or to secure capital with which to carry one’s business interests to a more successful outcome. In those early ages the commercial sense had not been widely developed and such business interests as those represented by the modern banker and broker were unknown, a condition that was not unfavorable to the extension of the practice of usury whenever and wherever there were laws permitting it. The ancient laws relating to loans read strangely to the modern student and can scarcely have comprehended if they are not considered in connection with the conditions of the times. If the Mosaic laws are taken as an example, the reader must place himself in a position to appreciate the Biblical point of view before he can hope to approximate fairly the justice to both borrower and lender. It must be remembered that the land (that is, the world), belonging originally to its Creator, had been given by God to the descendants of Abraham, and liberality to the poor had been one of the conditions under which this gift had been made. Naturally, therefore, the needy Israelite felt that obtaining loans was a right which belonged to him, while the more wealthy people of Israel, feeling that all their property was a loan direct from the hand of God, did not, in the beginning at least, object to giving a small portion of their plenty for the relief of the destitute. Under such conditions the execution of this law of lending was clearly supported by the preceding laws of the constitution itself could bring to bear upon it, and it was not until the selfishness of man commenced to exert a baneful influence that definite laws were promulgated, laws that made the duty of lending the express command of God. While the justice of such legislative enactments may be questioned, especially when viewed from the position of present-day society, their benignity is no longer a matter of doubt when the principle of the divine origin of property is accepted as the basis of ownership, and as this was the policy upon which the entire Mosaic commonwealth was constructed, the laws adopted for the government of the borrower and the lender assume a more just and legitimate position. There was a permission of modern thought. In substance these laws provided that the destitute Israelite might borrow what he required for his necessities without interest, either in money or produce; at the end of three years he must be permitted to remit all his debts when every creditor was supposed to remit such money or produce as he had lent, and a prospective borrower was not to be refused such necessities as he might require even when the year of the remission was at hand. While the Mosaic law strictly forbade the charging of interest, it did not prevent the acceptance of pledges, which were legally protected in such manner as to prevent any hardship falling upon the borrower. For instance, the lender was forbidden to accept a mill or the upper millstone in pledge, it being held that they were too much a necessity of life; if raiment should be taken it was required that it must be returned before sunset, lest it be needed during the night, while in the case of a widow’s raiment, its acceptance was forbidden under all circumstances. Under the Mosaic law a creditor was forbidden to enter a house for the purpose of reclaiming a pledge, although he might stand without until the borrower should come to him and return it, and while the statutes did not prohibit temporary bondage in the case of insolvent debtors, they provided that the Hebrew bondsman should not be held longer than the year of jubilee, or the seventh year at the most.

If these were the laws that governed the financial relations of Israelites among themselves, however, the same leniency did not apply to the Israelite’s treatment of the stranger. For example: interest might be taken from a foreigner, and, at the end of the seventh year, the principal as well as the interest might be exacted. Less restrictions were placed upon pledges taken from foreigners, and the foreign debtor held in bondage to be exact his release at the coming of the jubilee, and yet even these laws were humane in comparison with those of Rome, which not only provided for the enslavement of the debtor, but even permitted the creditor to put him to death, an extremity, however, to which, according to the best authorities, the Romans were never known to have resorted.

The provisions of the Hebrew law which permitted the lender to collect both principal and interest from a stranger and which placed the stranger at the mercy of the creditor until such loans were repaid was the beginning of the practice of usury among this people, but many centuries elapsed, as it shown by reference to Proverbs, and it was not until the Pagan world regarded otherwise than as a discreditable act. By the time of the birth of Christ, however, the original spirit of the law seems to have been forgotten, for the borrowing and lending of money then prevailed without regard to any race limitations.

The practice of mortgaging land and of paying exorbitant interest for money obtained upon such security was a Jewish custom which grew up during the days of the Captivity. Although condemned by Nehemiah as being in direct violation of the law, and denounced by Jesus Christ, whose new law of love required the righteous man to give to all who asked of him, and to lend to his enemies without expecting again, the mortgaging of property has continued throughout the East. In the beginning and for a long period 12 per cent was generally the interest charged, but later, under Turkish rule, and despite the prohibition of the Koran, which also forbids usury, from 40 to 50 per cent was exacted.

In ancient Greece the practice of usury prevailed to such an extent that in Athens, about
595 a.c., the bulk of the population were bound in practical slavery. Originally free and small proprietors, they had continued to borrow from the rich until the majority of them had placed themselves completely at the mercy of the aristocracy, and even those who nominally owned their land were not only unable to pay the money they owed but were compelled to erect on their land huge stone pillars, monuments to advertise their debts, which bore the name of the plutocrat to whom they were so severely indebted. At last Solon appeared and with him the reform legislation that made Athens once more a free city, for the radical remedy which he applied to the financial abuses formally put an end to the law of bankruptcy resting upon slavery, and practically overcame the evil effects of the entire system of usury. Realizing that such a serious condition required a firm hand, Solon first proclaimed a general seisachtheia, which provided that all debts made upon the person of the debtor or upon the surety of his land should become void. At the same time his legislation stipulated that bodily security should never again be accepted and that surety in land should rest only on a portion of the property. These reforms, which were certainly distinctly modern in their character, were so effective that the evils which had once threatened the security of Athens were no longer experienced; and although the rate of interest charged upon loans was still sometimes exorbitant a condition which must exist whenever the rate is left to be determined by free contract — the restriction of the right of attachment was the means of preventing many abuses.

The conditions existing in Rome during the early days of the nation were similar to those which prevailed in Greece, although in Rome there was no Solon to legislate reform measures that could really reform. As a result more than five centuries passed before the Roman debtor was accorded the relief that had saved Athens, and, by that time, it was too late for any legislation to preserve the identity of the middle class. In the beginning Rome resembled Athens in that the yeomen were farmers living on their own small estates, and, as in Athens, these yeomen soon became overwhelmed by the debts that war and taxes had forced upon them. A protest was made and, in 500 a.c., the Twelve Tables were adopted as a remedy, the theory being that the stipulation of a maximum rate of interest would be all that was necessary to overcome the prevailing evil. So far from accomplishing this purpose the attempt to regulate the rate of interest failed utterly and as no alterations had been made in the law which actually governed debt, it was less than three centuries before practically all the free farmers had become enslaved. It was not until the dictatorship of Julius Cæsar, in fact, more than five centuries after Solon, that the Athenian remedy was adopted and the law of debt really abolished. It has been stated that, at this time, while the rate of interest upon first-class properties in the city of Rome was only about 4 per cent, in the provinces the rate was increased to 25 and often 50 per cent. After pronouncing the accumulation of arrears illegal, Justinian established a rate of 6 per cent for all loans except those of a mercantile character, in which case 8 per cent was allowed, and public sentiment, at last aroused to the influence of usury upon the social and economic fabric of the nation, stamped it as such a pernicious crime. Forbitten by legal enactments and condemned by the moralists it was but natural that the practice of usury should be just as severely censured by the Fathers of the Early Church. They not only held the custom up to detestation, but they passed regulations prohibiting a usurer from obtaining ordination, while the Council of Nice, one of the many councils which took action upon the subject, carried its decree to such an extent as to stipulate that "if anyone, after this decree, shall be found to take usury, or demand the principal with half the increase of the whole, or shall invent any such methods for filthy lucre's sake, he shall be degraded from his order and have his name struck out of the roll of the Church." The importance of ecclesiastical disapprobation in such matters is shown by the fact that all the decrees of the Apostolic Canons; the Council of Eliberis; the first and second councils of Arles; the first and third councils of Carthage, and the Council of Laodicea and of Trullo, had given their condemnation of the practice of usury among the Christian races.

The natural consequences of this general condemnation of usury by the highest tribunals of the Church was the excuse for the adoption of the usurious methods by the Jews. In their case the laws prohibiting exorbitant interest had so far become a dead letter that the race question was never considered when the matter of loaning money was under discussion. Had the Jews still adhered to the ancient Mosaic law, however, its provisions which permitted them to charge interest to the stranger and to collect both principal and interest from him under the most extreme penalties for failure to meet such obligations would have been sufficient authority for them to have become the money lenders of Europe. Moreover, since the beginning of the Christian era the term "usury" had also been applied in the sense of receiving a reasonable rate of interest for the use of money in mass of its properties and regarded as an allowable practice, one which was no more contrary to the Hebrew law of love than the ordinary acts of buying or selling merchandise for gain, they felt themselves at perfect liberty to enter this field of commerce which had so conveniently been deserted by the Christians. That they often abused their privileges and conducted their business in a manner that was far from consistent with the Hebrew principles of equity, even when applied to the stranger, is, of course, beyond question; but these were the abuses of a system which time had made necessary and it was such abuses that have been responsible for much of the Jewish persecution which has darkened so many pages of history, for it was undoubtedly largely on account of their practice of money-lending and the determination shown by them in the collection of the last penny of both principal and interest that the Jews were so heartily detested and liable to such gross ill-treatment at the hands of the people. An interesting illustration of this popular animosity was exhibited at the time when Henry III granted the charters to Newcastle for these documents Jews were forbidden to

* Not more than 18 per cent can be collected on loans of less than $1,000. On loans of $5,000 or upward any rate of interest may be charged. 1 Embraces liability to secure action to the extent of double the amount of usury. § With real estate security, 10 per cent.

Usury in the United States.—Usury was one of the subjects which received early attention at the hands of the legislatures of the various States. In most instances the crime is defined as "the illegal profit required and received by the lender of a sum of money from the borrower for its use. To constitute a usurious contract it is required that there be a loan under an agreement that the money shall be returned to the lender, together with interest greater than that fixed by law. Of course, the laws in relation to usury vary under the statutes of the different States, but, in almost every case, by the addition of a bonus to the interest in which the sum is greater than the legal interest, the contract is held to be usurious, and, in the absence of any statute regarding such usury, relief may be obtained through courts of equity. In every State, however, care has been taken to distinguish between usury, applying the word in the modern sense of "unjust exaction," and interest on capital, for the progress of society has been in such a direction that the position of borrower and lender has now assumed an entirely different aspect. To-day the borrowing for commercial purposes represents transactions of overwhelming importance to the financial world, whereas the act of borrowing for purposes of necessity has become comparatively unimportant. As the result circumstances have so changed that the old laws would be useless in dealing with any present-day usury evil, and the statutes enacted by the various States are of the character which seems best fitted to cope with the conditions of the times.

UTAH, the 45th State in the Union, takes its name from a tribe of Indians (Utes or Yutas) whose habitat in the region settled by the founders of this Commonwealth. It lies between lat. 37° and 42° N. and long. 109° and 114° W., comprising an area of 84,000 square miles.

General Features.—The country is crossed, mostly north and south, by mountain ranges, the principal one being the Wasatch Range, which might be termed the backbone of the State. East of this natural wall is a region drained by the Green and Grand rivers, affluents of the Colorado. To the west is the Great Salt Lake (q.v.) and its contiguous desert. This lake extending north and south for about 75 miles, with a width of nearly 50 miles and a depth in places of 40 to 50 feet, lies in the heart of a great basin, a vast and dry moun-
tain plateau, whose eastern rim is in the Wasatch Range, while its western limit is the Sierra Nevada. The lowest point of altitude in Salt Lake Valley is 4,210 feet above sea-level. Utah Lake (q.v.), a small fresh-water body 40 miles southward, is connected with the Salt Lake by the river Jordan, a circumstance which induces a comparison between Utah and the land of Palestine. Broken mountain chains in central, eastern and southern Utah alternate with valleys and plateaus. Here and there are fresh lakes and rivers, owing their existence mainly to the melted snows flowing in crystal torrents from the rugged canyons. Hot and warm mineral springs, with healing waters, gush forth in places at the foot of snow-crowned ranges.

Scarcity of timber and fresh water have been the country’s serious drawbacks from the beginning. Trees are found only in the mountains and along the water courses, which are few and far between. Along the bases of the hills the soil is naturally productive, and when irrigated brings forth abundantly. In other places it is either pure desert, hopelessly barren or so devoid of moisture and so strongly impregnated with salt and alkali that cultivation is almost impossible. The climate is healthful and delightful. The mountains around the valleys ward off the keen wintry winds and the rarity of the high atmosphere modifies the summer heat. The average annual rainfall is about 12 inches. In southwestern Utah— the valley of the Rio Virgen — the climate is semi-tropical. The Utah scenery will compare with any in the world. Here are mountains as grand as the Alps of Switzerland and sunsets more gorgeous than those of Italy and Greece. In the south are marvelous canyons, mammoth stone bridges and giant monoliths, master works of nature, worthy to be classed with the wonders of all times.

The land, in spite of its dryness, is one of rich and varied resources. Where agriculture has succeeded, vast quantities of cereals are raised, with a variety of fruits and vegetables common to the north temperate zones. The mountains are nature’s treasure vaults, containing inexhaustible deposits of precious and useful metals. Gold, silver, lead, copper, iron, coal and a hundred other minerals are found. The mountains and lakes provide the necessary materials and soda to supply a continent, and from the quarries come marble, onyx, granite and all kinds of building stones for the construction of temples, churches, schoolhouses, stately public edifices and handsome private homes, which now adorn and beautify the once empty and desolate land.

Geology.—The greater part of the rock of the interior mountain area is a series of conformable stratified beds reaching from the Archean to the late Jurassic times, with the addition of thick deposits of Cretaceous and Tertiary sediments in the Plateau section. The raising of these beds produced the Sierras and the Wasatch. Later, by crystal dislocation within the included strata, the west ranges in the Great Basin were formed. It is observed that certain structural features of the local geology are nearly parallel with the meridian; hence the precious metals are found arranged in parallel longitudinal zones. It is believed that the present Great Basin was part of the land area that arose early from the ocean, that during the Mesozoic period the basin was drained into the great Cretaceous sea, which had divided North America into two continents, and which was abolished by the uplift of the Plains and Plateau region, and that the Great Plains and the Great Basin were raised to their present altitude at the beginning of the Cenozoic period, where the uplifting of the continent between Saint Louis and San Francisco began. Erosion in places has been extensive and has exposed or carried away everything from Creta-
cean to Pre-Cambrian. For details of the geological features of the State consult the publica-
tions of the United States Geological Survey.

Fauna.—The mountains of Utah abound in game—bear, deer, elk, antelope, grouse, prairie chickens, etc.; the fresh lakes and streams are well stocked with fish in great varieties, and lake and river margins are the haunts of wild geese and ducks in abundance. Fish cannot live in the Salt Lake, owing to the intense salinity of its waters. They were once supposed to have no life, but a small brine shrimp and three kinds of insects have been found therein. These waters are eight times briner, and consequently far more buoyant, than those of the ocean. Saltair, on the eastern shore, is one of the largest bathing pavilions in the world.

Mining.—Though primarily an agricultural State, with manufacture and stock-raising as strong subsidiary features, Utah in recent years has forged to the fore and taken a rightful place among the great mining commonwealths of the nation. Her mining history begins naturally with the advent of the railroad (1869-70) prior to which period, though mines had been discovered and opened, little headway had been made, owing to a lack of transportation facilities. The existence of valuable ore bodies was known to the earliest settlers; but these leaders did not encourage mining. "We cannot eat

gold and silver, said the State founder, Brigham Young; "neither do we desire to bring into our peaceful settlements the rough element commonly found among inhabitants of mining camps to vitiate the morals of our youth, overwhelm us by numbers and drive us again from our hard-earned homes." For these reasons he discouraged mining and advised the people to turn their attention to agriculture, stock-raising, manufacture and kindred pursuits. Most of his people—the Mormons—followed his advice, but some joined with the Gentiles in exploiting the mines. The honor of pioneering this important industry is given to Gen. F. E. Connor, the founder of Fort Douglas, a military post on the foothills east of Salt Lake City. In the latter part of 1863 Connor prospected in Bingham Canyon and located the Jordan mine. He afterward organized the West Mountain mining district and established a paper, The Union Vedette, heralding through its columns the opening of the Utah mines. In 1915 the mineral products of the State aggregated $61,081,633, as set forth in the following table:

Total $61,081,633

Utah ranks second among the States in the production of silver, third in lead, fourth in copper and sixth in gold. The known metal product of Utah for gold, silver, copper, lead and zinc alone, according to the United States Geological Survey, is valued at $691,301,832. The known dividends paid by the Utah metalliferous mining companies is $131,000,000. The estimated contents of Utah's coal fields, by the United States Geological Survey, is 196,000,000-000 short tons.

Religion and Education.—Utah is the home of "Mormonism" and the Latter-day Saints form about 75 per cent of the church membership of the State. There are 22 Catholics, Presbyterians, Methodists, Baptists, Christian Scientists and Congregationalists in small numbers. The percentage of illiterates in the population at the time of the last census was only 2.5, the number being 6,821, of whom 3,636 were foreign-born. Throughout the State school attendance is compulsory on all from 8 to 18 years for 30 weeks annually, unless lawfully excused to go into employment, in which case they must be in school at least 144 hours a year. There are 642 elementary schools with 2,707 teachers and 100,097 enrolled pupils; 45 public high schools with 742 teachers and 10,097 pupils. The State University had an enrolment in 1918 of 3,431 students distributed in its schools of Arts and Science, Mines and Engineering, Education, Medicine, Law, Commerce, Agriculture and Extension Division. The Utah Agricultural College in 1918 had an enrolment of 2,523 students. In addition to these public institutions, the Latter-Day Saints' Church operates a system comprising The Brigham Young University at Provo, with 1,184 students; four normal colleges with 1,958 students and five high schools with 2,845 students. Nine other private schools are maintained as follows: All Hallows College, Westminster College, Saint Mary's Academy and Rowland Hall, at Salt Lake; Sacred Heart Academy, Ogden; New Jersey Academy, Logan; Proctor Academy, Provo; New West Academy, Vernal; Wasatch Academy, Mount Pleasant.
ilege or immunity, and that all laws of a general nature shall have uniform operation. Perfect toleration of religious sentiment is guaranteed and polygamous or plural marriages are forever prohibited. Article IV declares that both male and female citizens shall enjoy equally all civil, political and religious rights and privileges, and that every citizen of the United States of the age of 21 and upward, who shall have been a citizen for 90 days, and shall have resided in the State one year, four months in the county and 60 days in the precinct prior to an election, shall be entitled to vote thereat, excepting idiots, insane persons and unpardonable persons convicted of treason or crime.

Legislative.—The legislative power is vested in a senate and house of representatives with biennial sessions in odd years, senators to be elected for four years and representatives for two years and all to be at least 25 years old. Till otherwise provided the senate will consist of 18 members and the house of representatives of 36; but the general assembly shall never exceed 30 in number and the representatives shall never be less than twice nor greater than three times the number of senators.

Executive.—The executive department includes a governor, secretary of State, State auditor, State treasurer, attorney-general and superintendent of public instruction. A candidate for the office of governor or secretary of State must be at least 30 years of age and have been a resident of Utah for the five years preceding the election. The State auditor and State treasurer are ineligible to election as their own successors. The governor is vested with authority to veto objectionable items in a bill appropriating money, while approving other portions, and to veto any measure passed by the legislature, which veto, however, may be overcome by a two-thirds vote of both houses. In case of his death, impeachment, removal, from office or inability to perform the duties of his office, they devolve upon the secretary of State.

Judiciary.—The judicial power is vested in the senate sitting as a court of impeachment, in a Supreme Court of five judges, in District Courts, in justices of the peace and other inferior courts. Supreme Court judges are elected by popular vote for 10-year terms, judges of District Courts are elected for four-year terms.

Municipal and County.—The county is the unit of local government. Biennial elections for the election of local officials are held in even years for county and in odd years for municipal officials.

Manufactures.—Among many thriving industries may be mentioned the Provo Woolen Mills, the beet-sugar factories at Lehi, Ogden, Logan, Garland, Layton, West Jordan, Elsinore, Payson and Brigham; also the Inland Crystal Salt Works, the International and Highland Boy Smelters in Salt Lake and Tooele valleys and the electric-power plants at Salt Lake, Ogden, Provo and other places.

History.—The region of the Great Salt Lake was originally settled by emigration from the East. The pioneers were Latter-Day Saints or "Mormons," whose leader, Brigham Young (1801-1877), was a three women and two children from the Missouri River to Salt Lake Valley in the spring and summer of 1847. Prior to that time these people, owing to religious and political differences between them and their neighbors, had migrated from several States, including Illinois, where their prophet, Joseph Smith, was killed by a mob in June 1844. He was a native of Vermont and of Revolutionary ancestry, as was his successor, Brigham Young, second president of the Latter-Day Church. Leaving the main body of his followers living in wagons and log huts upon and near the Indian lands in western Iowa, President Young conducted his pioneer company across the great plains and mountains, the journey beginning at Winter Quarters (now Florence, Neb.) early in April and ending in Salt Lake Valley 24 July 1847. This journey would have been undertaken a year earlier, but for a call made by the Federal government upon the emigrated people—a call promptly met—for a battalion of 500 men, to assist in the war against Mexico. The pioneers were well armed and equipped and carried with them, covered wagons drawn by ox and mule teams, plows and other implements, a surveying apparatus, seed-grain and a year's supply of provisions.

The great West, now teeming with populous cities and thriving villages, connected by rail road, telegraph and telephone, was then a wilderness, almost unknown, not only to the people of the East, who had heard of it through romantic tales or imperfect reports from Spanish and American explorers, but also to the struggling fur hunters roaming over its immense solitude, bating the bear, trapping the beaver, trading and consorting with the savages and acting as guides for the occasional emigrant train or chance traveler to or from the Western Ocean. Every schoolboy familiar with the map of North America knew something about "The Great American Desert," as this region was popularly termed. One of the fur hunters, Col. James Bridger, living in a lonely log fort near the headwaters of Green River, made a journey up the river after they passed the Rocky Mountains, and endeavored to dissuade them from settling in Salt Lake Valley. Bridger remarked pessimistically that he would give a thousand dollars if he knew when judges are elected by popular vote for 10-year terms, judges of District Courts are elected for four-year terms.

The earliest of these settlements formed the nucleus of the inter-mountain empire. To the founders of this Commonwealth, more than to any other people, owing to their unity, communal spirit and systematic methods, is due the redemption of arid America. They were the Anglo-Saxon pioneers of irrigation. President Theodore Roosevelt, in a public speech delivered at Salt Lake City in May 1903, credited Utah with being the Gamaliel at whose feet the Federal government had learned valuable, practical lessons before passing the National Irrigation Law of 1902, by which the government proposed to cooperate with the people of the Rocky Mountain states in planning, financing and building up a system of irrigated agriculture. The first fruits of that enactment, in this State, was the completion, in May 1916, of
the Strawberry Valley Reservoir and Canal, which tunnels the Wasatch Mountains and brings upon many thousands of dry acres in Utah Valley the waters impounded for this purpose eastward of that rocky range. Since 1847 over $20,000,000 have been expended upon the principal irrigation enterprises; 500 reservoirs have been built, 6,000 miles of main canals constructed and 2,000 miles of laterals.

As early as 1832 a few American emigrants had settled in Oregon, which then included Washington, Idaho and other parts, and was claimed both by Great Britain and the United States. A little later a thin stream of emigration began crossing the country from the Missouri River to California, then a Mexican province including the present States of California, Nevada and Utah. But none of those emigrants settled here. All shunned the desolate valley by the lake and hurried on to the green and fertile slopes of the Pacific. The Utah pioneers might have done likewise, had not their sagacious leader foreseen the very probable result — a repetition of the troubles they had fled from in Ohio, Missouri and Illinois. Hence his refusal to be influenced by one of his prominent lieutenants — Samuel Brannan — to join him in piloting a ship's company of Latter-day Saints from New York around Cape Horn to the Bay of San Francisco, and leaving them to plow and sow, build adobe houses and set up a newspaper in San Francisco Valley. He came to meet the pioneers and persuade them, if possible, to forego their half-formed design of locating in the desert basin, and instead to join the Brannan colony on the California Coast. "No," said Brigham Young, "this is the place." Here, accordingly, they settled — here upon alien soil, the acquisition of which by the United States was an immediate result of the Mexican War, in which the Mormon battalion participated.

The pioneers planted their first crops immediately upon entering Salt Lake Valley. The ground was parched and burning and more than one plowshare was broken in the hard sun-baked soil, but it was softened and made arable by turning upon it the waters of the numerous streams. They also constructed a log and mud fort, as a means of protection against hostile Indians. This done, most of the leading men returned to the Missouri River for their families. Those who remained in the mountains were reinforced in the autumn of 1847 by several large companies of immigrants, who had followed them from the frontier. The aforementioned, with a small company of Latter-day Saints from Mississippi, who joined the pioneers at Fort Laramie, and the returned members of the Mormon battalion, which had been honorably discharged at Los Angeles, were the colonists who struck the first blows in the founding of Utah.

February 1848 witnessed the signing of the Treaty of Guadalupe Hidalgo, ceding to the United States the provinces of New Mexico and California. In March 1849, at Salt Lake City, was organized the provisional government of Deseret, pending Congressional action upon a petition for a State government. Congress denied this petition and organized, with greatly reduced boundaries from those of the proposed commonwealth, the Territory of Utah, destined also to be diminished in size by the formation of subsequent States and Territories. The Organic Act was signed by President Millard Fillmore 9 Sept. 1850, but the news did not reach Utah until late in January 1851. Early in February the Territorial government went into effect. One of the first moves was to name Millard, and its principal town Fillmore, in honor of the nation's head, by whom Brigham Young had been appointed governor.

The first 10 years of occupancy passed in comparative peace. There were wars with the red men, in which the settlers were uniformly victorious, not more by force of arms than by wise diplomacy which summed up their Indian policy in these words: "It is cheaper to feed the Indians than to fight them." The savages were gradually placated, and became peaceable and friendly. There were also seasons of drought and years of famine, before irrigation prevailed over aridity, and the swarming crickets and grasshoppers at the close of its war crops ceased their terrible visitations. The work of colonization was vigorously pushed, settlements being formed wherever a spring of water bubbling up from some oasis in the desert, or the smallest stream flowing from the mountains, held out hope of agricultural success.

Immigration was systematically carried on by the Latter-day Saints, intent upon their ideal of gathering scattered 15,000,000 from the nations. The Perpetual Emigrating Fund Company, organized in the autumn of 1849, sent annually to the frontier 500 wagons to bring the poor to Utah. Those aided by, were expected to reimburse, the fund, thus making it perpetual. Many of these immigrants, men, women and children, walked the entire distance from the Missouri River, some of them pulling handcarts over burning plains and storm-swept mountains. During the season of 1850 many perished. Various classes of people — farmers, laborers, tradesmen, mechanics, merchants, manufacturers and business men, with a liberal sprinkling of artists, musicians, writers and other professionals, were to be found in these wagon trains. The newcomers, who were sometimes forced to practise their trades or professions, but all were encouraged to take up land and build permanent homes. Small holdings were the rule. There was neither land nor water for speculative purposes. Utah has at the present time 25,000 farms, averaging about 150 acres each. Nearly half a million acres have been entered for cultivation under dry-farm methods, requiring no irrigation.

Wherever settlements sprang up, they were upon soil claimed by the Indians and acquired by the United States at the close of its war with Mexico. The nation was expected to deal with the Indians, and in due time with the settlers, but until it took steps in this direction, the people could obtain no title to their homes. Much anxiety was felt by them in consequence. Twenty-one years passed after the settlement of Salt Lake Valley before the United States land laws were extended over this region. While waiting for the national government to dispose of the soil, the provisional government made temporary grants to its citizens of the lands they occupied.

Toward the close of Governor Young's sec-
ond term there was some friction between Utah and the general government, caused by reports of a rebellion in this Territory. Investigation proved the rumors groundless, and a peaceable adjustment followed. The troops sent to put down the supposed insurrection were commanded by Gen. Albert Sidney Johnston, who afterward led a Confederate army and fell at the battle of Shiloh, 6 April 1862. As the commander of the Utah Expedition (1857-58) Johnston was opposed by the Utah militia under Gen. Daniel H. Wells, acting under orders from Governor Young, who had proclaimed Utah under martial law. No blood was shed but Johnston's army passed the winter outside of Salt Lake Valley. Spring brought peace commissioners from Washington, and the trouble was soon over. The Hon. Alfred Cumming, Utah's first Gentile executive, was welcomed to Salt Lake City, and it was he who reported to the government that the United States court records, which the Mormons had been accused of burning, were found intact and in a state of complete preservation. General Johnston founded Camp Floyd, 40 miles south of Salt Lake City, and there the troops remained until the outbreak of the Civil War, when the post was abandoned.

An event of great importance to Utah was the establishment of the Pacific telegraph line, built from both east and west and completed to Salt Lake City in October 1861. Up to that time the fastest means of communication between the Missouri and the Pacific were the stage-coach and the pony express, superseding ox team and pack mule. The first message that went over the wire from Salt Lake City was signed by Brigham Young and contained the significant words: "Utah has not seceded." This telegram was to President J. H. Wade, of the Pacific Telegraph Company, Cleveland, Ohio. A similar message was sent to President Lincoln by Acting-Governor Frank Fuller. Lincoln answered, congratulating the Territory and its people. In April 1862, he requested that Utah provide a service, arm and equip a company of cavalry to protect the overland mail route and telegraph line against Indians and other enemies of the government. The response was hearty and immediate. Nevertheless, it was disloyal indeed, and Secretary of War Stanton to establish a military post in the vicinity of the Utah capital, ostensibly to hold the Indians in check, in reality "to keep an eye on Brigham Young and the Mormon church." Colonel Connor and the California and Nevada Volunteers, who had enlisted for service in the East, were assigned, much to their chagrin, to this needless vedette duty. It was October 1862 when they founded Fort Douglas, already mentioned. These troops made themselves useful in subduing hostile Indians, and for his gallant service in this direction, Connor was given a brigadier-generalship.

The Pacific Railroad, pushing from Omaha westward and from Sacramento eastward, found the Mormon settlements directly in its path, and was promptly aided by Utah men, who came forward with their means and helped to construct the great highway. Brigham Young, who was a Pacific director, took a contract from that company and built nearly 100 miles of its roadbed through the Wasatch Mountains.

The Central (now Southern) Pacific also had Utah contractors. And thus was exploded the popular fallacy that the Mormon people were opposed to this mighty enterprise. As a matter of fact, the governor and legislature of the Territory had petitioned Congress for the construction of such a railroad as early as March 1852. When Utah's delegate presented this memorial in the House of Representatives at Washington, he was told that he was 100 years ahead of the age. In reply he invited the members of Congress to come over the road when completed and visit him at his home in Salt Lake City. Twenty years later some of them actually did so.

The meeting of the Union Pacific and Central Pacific lines at Promontory, Utah, 10 May 1869, was an occasion of general rejoicing. The point of junction was soon moved to Ogden, 40 miles north of Salt Lake City, and between these towns was built by home capital, in 1869-70, the Utah Central, the first local railroad, with Brigham Young's line on a similar line south of the capital immediately followed. These roads, with others subsequently constructed, were absorbed by the Union Pacific, which held an unbroken monopoly of the railroad business in Utah until March 1883, when the Denver and Rio Grande was completed to Salt Lake City.

Utah's earliest merchants, outside the Mormon community, and excepting Captain Grant, of Fort Hall (Ida.), representing the Hudson Bay Company, were from the East. Livingston and Kinkead, a Saint Louis firm, freighted a large stock of merchandise across the plains in the autumn of 1849. Goods were also brought from southern California. During the early days of money scarcity, exchange and barter was the rule—the dry goods and groceries of the merchant for the products of farm, orchard, mill and workshop; the latter utilized at home or converted into cash in distant markets. The first settlers coined California gold dust and made and used paper money until the national coins became sufficiently plentiful. The greatest commercial enterprise that Utah has known—Zion's Co-operative Mercantile Institution—was organized in October 1868, the object being to unify the interests of the old settlers in the face of unfriendly competition. This great house is still in existence though no longer an exclusively Mormon institution. It has an annual trade of over $6,000,000.

Many changes resulted from the coming of the railroad. Population and capital poured into Utah; the mines, hitherto unprofitable, began to pay; railroads and telegraphs were extended, manufactures established and an impetus was given to trade and industrialism in general. The Desert News, the pioneer journal of the Rocky Mountains, established in June 1850, soon had two powerful rivals, the Salt Lake Herald and the Salt Lake Tribune, the former independent, the latter anti-Mormon in tone. The Tribune was the mouthpiece of the Liberal party, between which and the People's party a long and bitter fight was waged, a period of friction between Mormon and Gentile, strongly reminiscent of the historic feud of Guelph and Gibbeline. Churches and schools also multiplied, supplementing the work of those already established, both secular and
1 The "Edwin" Natural Bridge, Southeastern Utah. One of the group of three great arches in this part of the State, San Juan County. Reached from Thompson, Utah, or Mancos, Colorado, on the Denver & Rio Grande. Height, 104 feet; thickness at top of arch, 10 feet; width of top of arch, 85 feet; width of span, 184 feet; height of span, 86 feet.

2 In Provo Canon, Utah, on the Denver & Rio Grande Railroad.
The Church has been true to its pledge. While there have been some cases of new polygamy since the Mormon president, Joseph Smith, was put to death by an illegal Jane 1844, and a polygamy system dating from 1830, has placed Utah in advance, educationally, of most of the States in the Union. The percentage of illiteracy for native whites is 6.4, and for the entire population 18.5.

Brigham Young, the founder of Utah, dying in August 1877, was succeeded as head of the Mormon Church by John Taylor. During the latter's administration the Federal government, by its courts and prosecuting officers, began proceedings for the suppression of plural marriage, commonly called polygamy, which had been a tenet of the Mormon faith since July 1843, when Joseph Smith introduced it in Illinois. Never at any time did more than 3 per cent of the Latter-day Saints practise it. All, however, or practically all, believed it a divine institution, the restored marriage system of the Hebrew patriarchs, eugenically designed, under strict moral regulations, for the production of a superior race. Some of the best men and women in the community assumed its obligations, and did so with the worthiest motives, from a profound religious conviction. Plural marriage was not the Oriental polygamy of modern times. The harem or seraglio was unknown. Plurality of wives constituted the "polygamy" or "many marriages"—this being the definition of that somewhat misleading term. Each wife had a separate home, with her own children around her, and, as stated by Capt. Howard Stansbury, who conducted a government survey of the Great Salt Lake in 1849-50 (consult 'Stansbury's Expedition'), the plural wife stood "in the same relation to the man as the wife that was first married," and she was "considered a perfectly virtuous and honorable one."

But the government, influenced by popular religious prejudice, set its face against this peculiar institution, and under legislation enacted by Congress in 1862, 1882 and 1887, polygamists were rigorously prosecuted; the result being the eventual relinquishment of the inhibited practice, out of deference to the laws of the land. The law was not to persons had been fined and imprisoned for infractions of those statutes, aimed as they believed at "an establishment of religion," with which Congress, by the constitution of the United States, was forbidden to interfere. In addition to those who suffered fine and imprisonment, many more were driven into exile, President Taylor himself dying in that condition. Moreover, the Church property, amounting to nearly $1,000,000, was temporarily confiscated— forfeited and escheated to the government. Not until the special laws enacted against this feature of their faith had been thoroughly tested and pronounced constitutional by the court of last resort would the Latter-day Saints yield the right to all that had been theirs, but in 1907, six years after the conviction shared by many outside the Church—that those laws violated the rights of conscience and were an infringement upon religious liberty. But the final decree having been upheld by the Supreme Court, the submission was made in General Conference, October 1890, that no more plural marriages should be solemnized under its sanction.

The issuance of the manifesto was followed by an era of better feeling between Mormons and Gentiles. Utah had long been a battleground, torn by dissension and ill will between these two classes of her citizens. They now "buried the hatchet" and mingled socially, politically and in business as never before. Dropping old feuds and abandoning local alignments, the members of the People's and Liberal parties reorganized as Democrats, Republicans, etc., and began to work unitedly for the common weal. Presidents Harrison and Cleveland, in successive proclamations, granted general amnesty to all polygamists; the confiscated Church property was returned; and everything done that a great and generous government could devise to cause the unpleasant past to be forgotten. As an appropriate capstone to the temple of peace thus reared, Utah, on 4 Jan. 1896, was admitted into the Union as a State. The Republicans elected the first officers of the new Commonwealth.

Not the least gratifying spectacle witnessed during the years that followed was that of Mormon and Gentile youths, sons of sires who had built up the State, enlisting together and standing shoulder to shoulder, fighting the battles of their country during the war with Spain. The record made by the Utah Volunteers in the Philippine Islands, in Cuba and elsewhere is a page of history of which the American army can well be proud; and the same is true of "the boys in khaki" from this State who served in the Great War of 1917-18. Throughout that broad land, no people are more loyal to the flag, the constitution and the government than are the people of Utah.

The Present Status—Utah, with her 28 counties, containing 124 cities and towns, has a collective population of 429,191, less than a third of which is found in Salt Lake City, the capital of the State. While the principal occupations of the people are farming, stock-raising, mining and manufacturing, the learned professions and the fine arts have many representatives among them. The average death rate is but 10.8 to the thousand; that of the whole United States being 16.5. The bonded debt in 1914 amounted to $3,300,000. The assessed valuation of property of all kinds at the present time (1919) is $540,500,000. Most of the inhabitants of the State are Mormons, though the Gentiles predominate at Salt Lake City, at Ogden and in all or most of the mining towns. From 1905 to 1911 the Utah capital was governed by the American party, an anti-Mormon political organization, virtually a revival of the Liberal party. Its rule was not satisfactory, however, and in 1904 a fusion of Gentile and Mormon citizens overthrew it at the polls. Since then the commission form of government has controlled Salt Lake City.
GOVERNORS OF UTAH.

Author of 'Whitney's History of Utah.'

UTOAH, a lake in the State of Utah, in Utah County, about 30 miles southeast of Great Salt Lake. It is about 25 miles long from north to south and from 3 to 13 miles wide; area, 150 square miles; altitude, 4,500 feet. It is the largest body of fresh water in the State. It is in a valley formed by the uplift of mountain ranges; on the east the Wasatch and on the west the Lake, Oquirrh and Tintic. The streams which enter the lake come mostly from the Wasatch Range. The outlet of Utah Lake is Jordan River, which flows into Great Salt Lake.

UTOAH, Agricultural College of, the State agricultural and mechanical college, founded in accordance with the Land Grant Act of 1862; located at Logan, Utah. The college is a part of the public school system and is open to both men and women. It was chartered in 1888; opened to students in 1890; in 1901 the curriculum was considerably enlarged and an extra year's work required for entrance to the collegiate courses leading to a degree. In 1903 the college organization was made more complete and effective by the establishment of five schools—the school of agriculture, the school of domestic science, and arts, the school of agricultural engineering and mechanic arts, the school of commerce and finance, and the school of practical and mechanical science; in 1904 a department of music was added, offering courses in vocal music, piano, organ, violin and theory of music. The courses offered by the various schools of the college are as follows: (1) Four years' courses in agriculture, home economics, commerce, mechanical engineering and general science, leading to the degree of B.S., in agriculture, etc.; (2) three years' courses of vocational grade in agriculture, home economics and commerce. There are also short winter courses in agriculture, in home economics and mechanical arts. The State Experiment Station is connected with the college and offers opportunity for advanced work. The institution is organized on the quarter system, being thereby in practically continuous session.

UTOAH, University of, the State university is located at Salt Lake City. It was incorporated as the University of the State of Deseret in 1850 and opened to students in that year. But as it failed to secure patronage or adequate financial support, it was closed after one session until 1867. The governing board of regents, however, maintained their organization during this time and had general supervision of the public school system. When first reopened in 1867 it was largely a commercial college, but in 1869 was reorganized with normal and classical departments. In 1894 a new charter was obtained, the name was changed to the University of Utah and a 60-acre tract of land on the Fort Douglas reservation was granted to the university by the Federal government. In the same year the Salt Lake Literary and Scientific Association gave $60,000 for the endowment of a chair of geology. In 1899 the legislature provided for the direction of new buildings and the removal of the university to the new site, which was first occupied in 1900. Subsequent to this the university granted the university lands so that its campus has been enlarged to 90 acres. The board of regents consists of the president of the university and the secretary of State, members ex officio, and 12 members appointed by the governor for four years. The university is open to both sexes on equal terms. The organization includes the school of arts and sciences, the school of education, school of mines and engineering, school of engineering, school of law, school of commerce and finance, the extension division, the graduate division, and in connection with the school of education the university high school, elementary training school and kindergarten. The schools of arts and sciences, education, commerce and finance offer courses leading to the degrees of B.A. and B.S. The graduate division offers courses leading to the degrees of M.A. and M.S. The school of medicine offers at the present time the degree of B.S., in medicine, which is granted after the student has completed two years of premedical work and two years of professional work. The premedical and junior courses leading to a degree in dentistry as well as a four-year course leading to
the B.S., in pharmacy are also offered. The school of law offers courses leading to the LL.B. The school of mines and engineering offers courses in mining and engineering leading to a degree of B.S. The senior college of the school of education grants the teachers' high school diploma and the junior college elementary and kindergarten diplomas, which are all legal licenses to teach in the public schools of the State. Scholarships and fellowships are offered to graduate students in metallurgy and chemistry in the school of mines and engineering. The university calendar is based upon the quarter system, which permits of a summer quarter of 12 weeks, which is largely attended by students from other States on account of Salt Lake's ideal climate. The campus is situated at the base of the Wasatch Mountains, overlooking the valley of Great Salt Lake and Salt Lake City. In 1919 there were 19 buildings on the campus. The valuation of the physical plant of the university is estimated at $1,208,000. The library of the university is the largest in the State of Utah and contains 53,819 bound volumes and 20,728 pamphlets. The total number of students in the year 1917-18 was 147.

**UTAHLITE,** a compact, green variscite found in nodules near Lewiston, Utah. They have been sliced and polished and make charming specimens. Wardite is a frequent associate. See **VARISCITE.**

**UTAKAMAND, oo-ta-ka-mund,** or **OOTACAMUND,** India. See **OOTACAMUND.**

**UTAMUKAM, oo-ta-muk-ama,** Kitagawa, Japanese artist: b. Kawagoye, 1753; d. 1806. His work became widely known and his prints are well represented in the Metropolitan Museum, New York. Among his most famous series are **The Twelve Hours of the Green Houses** (1804). Consult the monograph by Goncourt (Paris 1911).

**UTE,** ut. See **SHOSHONEAN INDIANS.**

**UTERUS,** See **WOMA.**

**UTICA,** uti-ka, N. Y., city, county-seat of Oneida County, on the Mohawk River and the Erie Canal and on the New York Central and leased railway lines, the West Shore, etc., the Delaware, Lackawanna and Western and the Ontario and Western railroads, about 80 miles west of Albany and 50 miles east of Syracuse. Electric lines extend to surrounding villages and towns. The railroads extending north cross the Mohawk region and connect with the steamers on the Saint Lawrence and with the trunk lines of Canada. The railroads to the south connect with the Erie and some of the lines in Pennsylvania. The large number of passengers who travel to Utica, "the gateway to the Adirondacks and the Thousand Islands," make it one of the most important stations between New York and Buffalo.

**Manufacturing and Commerce.**—The chief manufactures are hot-air furnaces, hosiery and knit goods, machine tool products, steam fitting and heating apparatus, lumber products, marble products, paving material, foundry products and tobacco products. In 1914 there were more than 300 manufacturing establishments listed by the census, with an annual production of over $30,000,000. In 1918 the local manufactured products were estimated at fully $40,000,000 and 17,000 persons were on the factory pay-rolls. The city is famous for the excellence of its woolen, cotton and knit goods and its hot-air furnaces. Utica ships large quantities of manufactured goods, farm products, fruit, dairy products and livestock. It is a distributing centre for an extensive region extending north and south. It is an important cheese market and large quantities of flowers, especially roses, are shipped to New York.

**Buildings and Improvements.**—The principal public buildings are the Government building, State armory, city hall, Y. M. C. A. and Y. W. C. A. buildings, public library, Munson-Williams Memorial building, churches, schools and business blocks. The altitude of the city is about 505 feet and the slope is sufficient to make a surface drainage. The sewer system is excellent. The water plant is owned by a private corporation which has a paid-up capital of $500,000. The revenue from the city water works amounts to about $200,000 annually. The fire department has a daily capacity of about 4,010,000 gallons. There are a number of small squares and several parks. The streets are wide, paved largely with asphalt and kept clean. Forest Hill cemetery in the suburbs contains the mausoleums of Roscoe Conkling and Horatio Seymour.

**Churches and Charities.**—There are over 50 churches, the leading denominations being Roman Catholic, Protestant Episcopal, Methodist, Presbyterian, Baptist and Lutheran. The charitable institutions are the Utica State Hospital, the Masonic Home of New York State, Saint Elizabeth's Hospital and Home, Saint Luke's Homeopathic, Faxton and City hospitals, Home for the Homeless (for aged women), Home for Aged Men and Couples, Saint John's Orphan Asylum, Saint Joseph's Infant Home, Utica Orphan Asylum and the City Orphan Asylum. The Woman's Christian Association and other organizations do noble work for the relief of the needy.

**Education.**—The educational institutions are three high schools, the public school academy, founded in 1843, the Balliol School (Utica Female Academy), the Utica Institute, and 22 ward schools, a teachers' training school, several parish schools, a public free library of 60,000 volumes, libraries connected with each of the three high schools and libraries connected with some of the literary societies. Hamilton College (q.v.), at Clinton, is only nine miles distant from Utica and is reached by steam and electric cars.

**Banks, etc.**—There are eight banks and one trust and deposit company, three daily and numerous weekly and monthly newspapers.

**Government.**—The government is vested in a mayor and a council of 15 members, who hold office two years. The administrative officials are appointed by the mayor, subject to the approval of the council, or are elected by the council.

**History.**—The original settlement was called Old Fort Schuyler, from a fort which had been erected here during the French and Indian War. It was named for Colonel Peter Schuyler. The territory on which Old Fort Schuyler was located formed part of a
tract of 22,000 acres, granted 2 Jan. 1734 by George II, king of England, nominally to seven pence; but in reality, to the benefit of William Cosby, colonial governor of New York and New Jersey. In 1786 a survey of the manor of Cosby, together with a map of the same, was made by John R. Bleecker. It appears therefrom that two houses were located near the fort on which is now the east side of Genesee street, and one house on land on the west side. Improvements had been made a little farther westward, somewhere between the present lines of Broadway and State streets, and other improvements in the eastern part of the city. Outside of these evidences of civilization was a vast unbroken forest. The occupant of the house nearest the river, on the western side of the road, was John Cunningham, and his nearest neighbor, on the same side, was George Damuth. The resident on the opposite side was Jacob Christian. The settler toward the west was a man named McNeece, and the clearings on the eastern border were designated as those of McNeece and Abraham Boom. It is not known which one of these men came first. Before that time Old Fort Schuyler was an advantageous place of trade between the old Mohawk settlements and the Iroquois, as there was here a fording place across the Mohawk River and the old Indian path from Onondaga Castle here intercepted the path along the river side leading to the portage of Fort Niagara. In 1789 the village was incorporated under the name of Utica, and in 1832 was chartered as a city. Consult 'Outline History of Utica and Vicinity' (Utica 1900) 'Publications' (Oneida Historical Society).

Population.—The population of Utica in 1910, 74,419; 1915, 80,589.

UTICA, North Africa, an ancient city 17 miles northwest of Carthage; originally founded as a Phcenician colony in 1101 B.C. During the Third Punic War, Utica submitted to Rome, and became the capital of the province of Africa. Afterward it was the seat of a bishop, till its destruction by the Arabs about 700. Its ruins include an amphitheatre, an aqueduct and the remains of quays, formerly connected with the sea. They are on a low flat near the river Bagradas, the course of which has since diverted to the east.

UTICA SLATE, a black, somewhat carbonaceous and siliceous clay slate (Carbonaceous argillate) prominently developed in the Mohawk Valley of New York State, and deriving its name from the outcrops in the vicinity of Utica, N. Y. It is also recognized in the Champlain Valley, and in the northern Appalacian region, but beyond these localities their beds are not recognized to miles. They are composed of more calcareous or siliceous shales and arenites. These shales rest upon the Trenton limestone and are succeeded by the more arenaceous Lorraine beds. The chief fossils of the Utica slates are the trilobite Triarthus becchi and graptolites of the genus Diplagnostus. On the other hand, the origin of this slate is being explained as a result of the psychological principle of association, or by taking refuge in a refined egoism through a demonstration that it pays to have regard to the happiness of others. That mankind is moved by genuinely altruistic impulses, that it is as natural to promote the...
good of our neighbor as to seek our own ad-

vantagé, was perhaps first clearly stated by But-

ler in his 'Sermons on Human Nature.' Neither

Bentham nor Mill, however, provides any ade-

quate way of passing from the psychological

principle, e each man naturally seeks his own

pleasure, to the ethical doctrine that happiness

of all should be sought by each indi-

vidual. This latter principle, nevertheless, is

that which the Utilitarians assume as the basis

of their moral theory. Among the more im-

portant English Utilitarians are Cumberland,

Hume, Gay, Paley, Bentham, James Mill, John

Stuart Mill and Herbert Spencer, who unites

Utilitarianism with evolutionary theories.

The end of life, according to the Utilitarians,

is, as we have seen, happiness. The theory thus

insists that the moral quality of an act is de-

termined by its consequences—an act being
good that promotes happiness or prevents un-

happiness, and wrong when it operates in the

reverse direction. It is accordingly directly op-

posed to Intuitionism (q.v.), which declares that

there is some natural quality in acts which con-

stitutes them good or bad in themselves, and

that this moral quality can be directly known

without any reference to consequences. Thus

an Intuitionist would say that lying is bad in

itself and is directly perceived to be such, while

the Utilitarian would find that its moral quality

is determined by its results to the individual

to society. As we have seen, happiness means

pleasure, and the avoidance of pain. The ques-

tion then is whether it is possible to find more

than the quantity of pleasure is to be considered in judg-

ing the morality of an action. Bentham and

the older Utilitarians maintained that everything
depends upon the amount of pleasure resulting

from an act: the quantity of pleasure being

equal, push-pin is as good as poetry. John

Stuart Mill, on the other hand, introduced the

concept of qualitative differences in pleasures.

It is quite compatible with the principle of

utility to say that we recognize the fact that

some kinds of pleasure are more desirable and

more valuable than others. Of two pleasures

if there be one to which all or almost all

who have experience of both give a decided

preference, irrespective of any feeling of moral

obligation to prefer it, that is the more desirable

pleasure. If one of the two is, by those who

are completely acquainted with both, placed

so far above the other that they prefer it even

though knowing it to be attended with a greater

amount of discontent, and would not resign it

for any quantity of the other pleasure which

their nature is capable of, we are justified in

ascribing to the preferred enjoyment a super-

iority in quality, so far outweighing quantity

as to render it, in comparison, of small ac-

count. This doctrine of a qualitative difference

in pleasures doubtless is borne out by experi-

ence, and consequently is a practical advantage

to the older Utilitarian. But the objection

has frequently been raised that to rank pleasures

as higher or lower, irrespective of their quan-

ty, is logically to abandon the utilitarian posi-

tion. For it appears that it is only by intro-

ducing some other standard than pleasure itself

that this gradual transition is possible. The

older Utilitarians had showed that pleasures of

the mind, for example, were preferable to pleasure of the body by using the quantitative standard— that is, by showing

that on account of their constancy, permanence,

and the fact that they entailed no subsequent

pain, they really exceeded the latter in quantity.

UTILIZATION OF POWER. See

POWER, UTILIZATION OF.

UTOPIA. Probably nothing illustrates bet-

ter Lowell's description of a classic as a com-

mentary on the morning paper than the fact

that Sir Thomas More's 'Utopia' published

just 400 years ago, discusses practically all the

important social problems that we are most

occupied with at the present time. Almost at

the beginning of the book, one of More's philos-

ophy, that presumably latest awakening of the social

conscience, is introduced with the principle

'For if you suffer your people to be ill-educated

and their manners to be corrupted from their

infancy and then punish them for their crimes

to which their first education disposes them,

what else is to be concluded from this but that

you first make thieves and then punish them.'

This is, however, only one phase of the law

of practical correction as laid down in Utopia.

If they had the indeterminate sentence, prisoners

were not housed in a hardening environment,

they worked outside and earned their livelihood,

being restored to liberty only upon report of a good character. Above all justice was

fostered and the thief was bound to make

restitution to the owner before his freedom

could be secured.

The other most urgent community prob-

lems are anticipated as completely as those

of penology. Eugenics was insisted on in

marital investigation; they accustomed them-

selves to daily military exercises but engaged

in war only to defend themselves or their

friends from any unjust aggressors, or out of

good nature, or in compassion to assist an

oppressed nation in shaking off the yoke of

tyranny. It would be hard to find a more

striking comment on the morning paper than

this. The Utopians enjoyed religious toler-

ance though they required their officials to be

lieve in a hereafter of reward and punishment

because they thought that added to responsibility. They believed money the root of evil,

dispensed with its use, employed gold and

silver for chains on their slaves (these were

outcasts of other nations saved from a worse

fate) and for slop jars and other necessary

utensils.

In this model kingdom everyone had to

work six hours a day, three before and three

after the mid-day meal. They dispatched their

mid-day meal, but sat long at supper while

music was played and entertainments were pro-

vided and the children sang, and the older Utilitarians had showed that pleasures of the mind, for example, were preferable to pleasure of the body by using the quantitative standard— that is, by showing
成功的园丁。所以，不被父母所宠溺的孩子在战后几年里被照顾得很好。医院被很好地建造并组织起来，使住在同一群中的孩子在生病时不会被遗弃。没有理由认为，访问乌托邦的参观者会说它“因此我必须说，我为了我的幸福可以忘记所有其他政府所关心的事情，以我的尊严而宣誓。……富人不仅因为私人法律而免于法律的惩罚，而且也因法律的不一致而遭受痛苦。”在乌托邦一书的第1版（1516年），经过修订，由Probusius，Basil 1518；第一版由Ralph Robinson，London 1551；第二版由Burnett，1664； 있으며版本的附录是“The Pitiful Life of Edward V”除了乌托邦一书（伦敦）；Morley的版本（Burnett的翻译），Cassell’s National Library，JAMES M. Utraquists. See calixtines.

Utrecht, ütrêkt (Dutch, ütrêht)，荷兰省省会，位于奥斯特法尔河，河穿过奥斯特法尔河，25英里南，大大美洲西部。它是安静的一座镇，有白色的路，通向海滨，由许多新建筑和小巷组成。古老的城堡坐落在这里，其中一些被改造成教堂，国王路易吉圣约尼的哥特式教堂，建于13世纪。这座塔有一座热闹的42口钟楼。其他重要的建筑包括历史博物馆，最近被重新命名为政府，法庭，法院和档案馆，原来属于国王路易吉圣约尼。大学成立于1636年，有200,000名学生和一个气象台。这是一个古老的巴氏城镇，与罗马“Traiectum ad Rhenum”在1579年的协定。乌得勒支是德意志历史上的一个协定，1579年-1814年，其中的共和国的自由比旧的共和国的自由要多得多。这项条款就连在最流行的现代事件，这项条款没有作为这样在共和国的协定，由乌得勒支的共和国和国教，共同地或各自地，由在共和国中一个政治联盟的成员，从其中的任何一个成员，甚至是共和国，都不能解决。因此，反对反对宗教的势力，被由巴尼尔德和国教党所；而且，由于这个原因，甚至多于没有问题关于宗教的政体的，政治的共和国，从1581年，当荷兰被玷污二世，发起他们的宣言独立，被着色和被差遣。国家的协定是和共和国和国教党发生的，尽管在决定共同的程序之前，这些程序是公共的。
fairly stated by Motley, has been expounded voluminously by Dutch authors and is to this day the root and ground of political parties in the Netherlands. Consult Motley, 'The Rise of the Dutch Republic' (1855); Salmon, 'The Union of Utrecht' (1894); and the exhaustive serials of Dosker, 'Barneveldt: Martyr or Traitor?' (1886) in the Presbyterian and Reformed Review.

**UTRECHT.** University of, established in 1634 by the city and province of Utrecht it was closed during the French occupation (1762) and the Napoleonic conquest (1811-13) but was re-opened two years later and has flourished since its opening as a royal university in 1815. It is divided into five faculties and has many laboratories and clinics. It has a library of 250,000 volumes. The average annual attendance of students is over 1,000.

**UTRICULARIA.** See BLADDERWORT.

**UTSUOMIYA,** oo-tsoo-me-ya, capital of Tochigi prefecture, which includes Shimotake province, on the railroad, 68 miles west of Tokio, formerly the seat of a powerful feudal lord and clan. It lies on the vast plain of the Kwanfo, in sight of the Nikko range of mountains and has modern buildings. The castle site is now a park; five miles distant is the image of Kwanfo, goddess of mercy, 60 feet high. This prefecture leads all in tobacco, hemp and copper; the mines of Ashio being the second largest in Japan, yielding 2,100,000 worth yearly. In manufactures, sericulture and weaving are foremost; the fabrics at Ashikaga being worth $5,000,000 a year. Pop. of the prefecture about 1,044,177; of Utsunomiya, 59,049.

**UVALDE,** u-vaal-de, Tex., town, county-seat of Uvalde County, on the Southern Pacific Railroad, about 90 miles west of San Antonio. It is in an agricultural and stock-raising region and in the vicinity are asphalt mines. Cotton and honey are shipped. The chief industrial establishments are lumber mills, a flour mill and a machine shop. There are seven churches, separate public schools for white and colored pupils. There are two banks and a newspaper. Pop. 3,998.

**UVANITE,** a crystalline form of pitchblende.

**UVAROVITE,** a rare and beautiful emerald-green variety of garnet, distinguished by its content of chromium. It has a hardness of 7.5 and a specific gravity varying from 3.41 to 3.52. It is usually found in limestone or associated with chromite. Its most celebrated localities are the Ural Mountains and Orford, Quebec, where it occurs in groups of small dodecahedral crystals.

**UVULA.** See PALATE.

**UXBRIDGE,** uk's-brjd, Canada, a town of Ontario County, Ontario, on the Black River, and on the Toronto and Northern Railway, 36 miles northeast of Toronto. It has lumber and flour mills and manufactures iron ware, mill machinery, engines, agricultural implements, woolens, etc. Pop. about 2,000.

**UXBRIDGE,** Mass., town in Worcester County, on the Blackstone River, and on the New York, New Haven and Hartford Railroad, about 19 miles southeast of Worcester. Uxbridge was formerly a part of the town of Mendon; in 1772 it was separated and incorporated under its present name. In 1772 the northern part of the town was set off and incorporated as Northbridge. The town includes the villages of Calumet, Hecha, Rivulet, Scott's, Wheelock's, Uxbridge, North Uxbridge and Uxbridge Center. The chief industrial establishments are cotton and woolen mills, machine shops, a furniture factory and creameries. There are five churches, a high school, 17 district schools, a free public library. There are excellent banking facilities and newspapers. Pop. 4,671.

**UXMAL,** ooz'mal, Mexico, an ancient Maya ruined city, in the northwest of Yucatan, about 60 miles southwest of Merida. It has vast remains of ancient grandeur, temples, cyclopean terraces, etc., extending over a large area. The principal ruins are the "Casa del Gobernador" and the "Casa de las Monjas." The temples are said to have been used by the Indians as late as the 17th century. They date from the Stone Age and are among the most interesting archaeological finds on the continent.

**UZ,** Syria, a historical region mentioned in the Old Testament as the scene of the story of Job and lying to the east or southeast of Palestine, probably in Hauran, the exact position not having been identified. Also a tribe presumed to have occupied this region and a traditional ancestor mentioned in Gen. x, 23 and xxii. 21.

**UZANNE,** oo-zahn, Louis Octave, French writer and bibliophile. b. Auxerre, 14 Sept. 1852. He founded (1880) *Le Livre*, succeeded (1890) by *Le Livre Moderne*. In 1889 he founded the Société des Bibliophiles Contemporains. Among his works (translated titles) are 'The Caprices of a Book-Lover' (1877); 'Her Highness, Woman' (1884); 'Our Friends Books: Talks on Curious Literature' (1886); 'Modern Bindings'; 'Physiology of the Quays of Paris' (1890); 'The Bachelor's Prayer-Book' (1890); 'The Art and Artifices of a Beauty' (1902); 'Contemporaneous Egypt' (1909); 'Parisianesses of the Time' (1910).

**UZIAH,** oo-zia, or **AZARIAH**, king of Judah (792-740 B.C.). See AZARIAH.
V

V in the English alphabet, the 22d letter and the 17th consonant. V and U were originally one and used indiscriminately for the representation of the vowel u and the consonant v or w. The form V was derived by the Latins from the very ancient Greek alphabets, in which the Greek upsilon (υ) was so written. In classical Greek upsilon always is a vowel, never a consonant. The classical Greek had no sign for the consonant V of the Latins: hence when a Latin word or name containing this consonant was transliterated into Greek the v was represented either by the digraph υ (ou) or by the letter β (which, in the Cyrillic alphabet and in modern Greek, represents the consonant υ; examples: Lat. Varro, Gr. Βαρρός; Lat. Virgilius, Gr. Βηργυλίου) or by the letter ṽ which, in the modern Greek alphabet and the Cyrillic alphabet. But our w is a labial only: which of these best represents the ancient Latin consonant V? The weight of authority among modern phonologists is in favor of the theory that the Latin consonant v was a labial differing but little, if at all, from our w. The English letter w is produced by the junction of the lower lip and the upper teeth: its sound differs from that of f, which is articulated in a similar way, in being voiced while that of f is breathed: they are both continuous consonants and both belong to the class of spirants. It is worthy of note that nearly all the words in English that begin with v are derived from French or Latin. V is never the final letter of a word in English, though the final v-sound is common, as in live, thrive. The name "doubled" was given to the character w in times before the specialization of the form w as a consonant sign only instead of being the sign of the vowel u also. English v may be derived from Indo-Germanic bh or from p. As an abbreviation v stands for vanadium, five or Latin vide "see." See the letter U, ALPHABET.

VACA, vá'ká, Alvar Nuñez Cabeza. See Nuñez Cabeza De Vaca, Alvar.

VACA DE CASTRO, vá'ká dá kás'tro, Cristóval, Spanish jurist and administrator: b. 1492; d. 1562. A member of the audience at Valladolid, he was sent in 1540 to Peru to advise with Pizarro regarding the government and in case of the latter’s death himself to assume power. On his arrival at Popayán he received word of Pizarro’s assassination and the revolt of Almagro. Aided by Alonso de Alvarado and others of Pizarro’s principal captains, he defeated Almagro at Chupas 16 Sept. 1542 and had him executed at Cuzco for treason. He retained the government until the arrival of the viceroy Blasco Nuñez Vela early in 1544, when he was imprisoned on suspicion of conspiring against the “New Laws.” He escaped to Spain where he was imprisoned in 1545–56 on charges from which he was finally exonerated.

VACARESCO, vá-ká-ré'skó, Helene, Rumanian writer: b. 1866. She was educated at Paris and Bucharest. Her ‘Chants d’Aurore’ was crowned by the French Academy the prize Jules Favre. She is the author of ‘Kings and Queens I Have Known’ (1904); but her most famous work is ‘L’Ame Sereine,’ which brought her a prize from the French Academy in 1896. In 1909 she published ‘The Adventures of Two Empresses.’

VACATION SCHOOLS. See SUMMER SESSIONS.

VACCINATION is a process of transmitting by inoculation a specific disease known as vaccinia, cowpox, or modified smallpox from one-susceptible reagent to another—either from animal to animal, from animal to man, or from man to man. Nearly all the warm-blooded animals are susceptible to vaccinia, but they may vary considerably in such susceptibility; in some it is slight, only affecting a certain tissue, as the cornea; while in others it may affect the cornea, skin and mucous membranes. The term vaccination also is used in a broader sense, and is made to apply to other diseases than vaccinia. It may denote the process by which other disease-producing agents are inoculated into a susceptible species in such a way as to render it refractory to a given disease contracted in the natural way. The sole purpose of the present time in inoculating vaccinia into a susceptible reagent is for the purpose, primarily, of rendering it insusceptible to the disease smallpox, and the propagation, continuation and multiplication of the specific material.

History.—To properly appreciate the subject of vaccination and its beneficent effects in the suppression and control of the much-dreaded disease, smallpox, it will be necessary to review briefly some of its early history. Credit is due to Edward Jenner (q.v.), a physician living in the western part of England, for its discovery and application. The subject of the effective protective effect of vaccination contracted by persons who had been milking cows which were suffering from an eruptive disease, known then as cowpox, attracted Jenner’s attention even when a pupil. On the completion of his medical studies and return to Berkeley, the idea was ever dominant in his mind; and as soon as opportunity offered, he began to make his observations and investigations of cowpox. But facts which were so convincing to his own mind he evidently feared as unacceptable to his medical brethren, and so he made his ideas known to
VACCINATION

only his friend Gardner, to whom he writes: "I have been much engaged in an important matter to you, which I firmly believe will prove of essential benefit to the human race. I know you, and should not wish that what I have stated be brought into conversation; but should anything turn out favorable in my experiments, I should be made, particularly by my medical brothers, the subject of ridicule." In 1788 he brought his observations and theory before the medical profession, but did not make any impression, save in one instance. A colleague, acting upon Jenner's suggestion soon after its announcement, inoculated a child with cowpox matter and afterward with smallpox virus. It did not have the smallpox. For the next eight years Jenner was patiently pursuing his observations, collecting data regarding cowpox and its transmissibility to persons, and particularly noting its protective effects against smallpox. In May 1796, he issued his celebrated treatise entitled "An Enquiry into the Causes and Effects of the Variolae Vaccinae, a Disease Discovered in Some of the Western Counties of England, Particularly Gloucestershire, and Known by the Name of Cowpox." It attracted no little attention. The majority of the medical profession, as far as I was then informed, was now to be ready to accept his conclusions, and eager to apply his method. His position was, however, not an enviable one. True, letters came from all parts of the world asking information and proposals for communicating the material, cobwebs, etc., to which he willingly and readily responded so far as he was able. On the other hand, notwithstanding its ready acceptance, he was beset with troubles. There were not a few medical men who were unwilling to accept his discovery, and assailed him in every possible way by misstatements, misrepresentations and abuse. These he attempted to answer in a spirit of fairness and honesty. Later on, when the practice of vaccination became more general, he published a "Vaccination Catechism," as he terms it, became less and less burdensome. He had the satisfaction of seeing his method adopted in nearly every civilized country. There were many, notwithstanding, who were unwilling to abandon their fixed opinions as to its efficacy and resisted to the last.

Jenner's claim to priority of discovery has been subject to dispute, and the objection seems to be, in some particulars, founded on fact. There appears to be but little doubt that a farmer by the name of Benjamin Jesty, living in Downshay, Isle of Purbeck, was the first who is known to have practised vaccination. He inoculated his wife and two sons with matter taken from cows suffering from cowpox. All were affected. His wife's arm became very much inflamed and produced no small alarm in the family and no small sensation among his neighbors. Fifteen years after (1799), the sons, together with other persons, were inoculated with matter taken from a smallpox case, as was then the custom, to protect against the smallpox contracted in the ordinary way. None of the persons inoculated with cowpox became ill with inoculated smallpox whereas others inoculated passed through the several stages of the disease. There was a great prejudice against Jesty's experiments, and the people would have none of them. Jesty's remark was that for his part, he "preferred taking infection from an innocuous animal like the cow, subject to so few disorders, than to take it from a human body liable to so many diseases; and that he had experience on his side, as casual smallpox was not attended with dangers like the variolous infection, and that besides, it appeared to him little risk in introducing into the human constitution matter from the cow, as we already, without danger, eat the flesh, drink the milk and cover ourselves with the skin of this innocuous animal." Also, there is recorded that a Holsteiner, by the name of Plett, inoculated three children with matter taken from the udder of a cow suffering with "cowpox" using his pocket knife to make the insertion. All the inoculations were successful; later when smallpox appeared all had the disease but these children. On an examination of Jenner's papers, it seems that he makes no claim as to priority, simply recording his own observations and giving in detail his experiments to support the theory that smallpox can be prevented by vaccination. He also proves that the prevailing opinion shared by the milkers, that cowpox contracted by them was protective against smallpox, was fallacious. It had not been for Jenner's brilliant, painstaking work, replete with accurate observations, in all probability Jesty's inoculations would have been lost, and a long time might have elapsed before the beneficial discussion of vaccination had become known. The principal conclusions of Jenner's discovery may be summarized thus: (1) That vaccinia or cowpox casually induced in man renders him insusceptible to smallpox. (2) Only the specific agent of vaccinia or smallpox, and no other eruptive disease of the cow, has this power. (3) Cowpox may be induced at will from cow to man. (4) That engraven cowpox may be continued indefinitely from man to man, conferring on each in succession insusceptibility to smallpox. (5) As could be produced by inoculation of the virus direct from the cow to man.

Origin and Distribution of Vaccinia or Cowpox. Vaccinia in the cow is an eruptive vesicular disease, usually involving the skin of the head and udder, sometimes on the muzzle and mucous membrane of the mouth and nose. It may occur in isolated instances, sometimes affecting one or only a few of the herd; at other times it may attack the whole herd. Its origin among cattle has been the subject of much dispute, some claiming that it always occurs spontaneously, citing as examples those isolated cases not infrequently met with, while others claim with equal positiveness that before an animal can have the disease it must contract it from some other source. The latter contention is more probable, as there is no instance of an analogy to the former existing in other infectious diseases. The contagion, therefore, must be transmitted in some manner to the animal, and its source must be either an animal or man having this disease. No other conclusion seems possible. It sometimes is met with occurring in horses, and is known as the "grease." Jenner demonstrated that the "horse grease" and cowpox were one and the same malady, and that matter taken from the horse could be transmitted to the cow, causing an inflammation and

vol. 27 — 40
situations identical with cowpox and, moreover, protecting equally as well against smallpox as does vaccinia. Bouley of Alfort has also made a study of the "grease" disease of horses, together with cowpox, and concludes that they are one and the same disease. In further support of the doctrine that the disease is transmitted to the bovine species largely through human agencies, it is a well-known fact that it is more frequently met with among milch cows than in either the heifers or males of the same herd. The reason for this is that the cowpox virus is transferred from cow to cow by means of the milkers' hands. The prevalence of cowpox appears to be in some way influenced by the seasons, more cases having been reported occurring during the spring months than at other times of the year. Suckling calves are also quite susceptible. It cannot be said, however, that vaccinia affects only cows, or the young calf, as all animals of the bovine species can be readily inoculated with the virus and the lesions caused by such inoculations are identical with those occurring spontaneously. Jenner supplied many countries in his time with vaccine virus, originally from the cow, and subsequently propagated from arm to arm. The American stock of vaccine virus was introduced into the United States in either 1801 or 1802 by Waterhouse in Boston, and Hosack in New York, and at the same time in the Southern States through the interest of President Jefferson. Some of the strains were propagated for a year or two by the arm-to-arm method. In Europe a strain of the original, received from Jenner in 1802, was still being propagated at Vienna as late as the 80's. The celebrated Beaumerguy stock, originating from a "spontaneous" case of cowpox in 1864, has furnished many strains. This was largely employed in France, Belgium, Germany and England, and was introduced in the United States in 1870 by Dr. Martin of Boston, just before the original was lost, during the siege of Paris. It is not known whether this particular strain is in existence at the present time. Many strains became so attenuated that they failed to cause the typical lesions and characteristic symptoms of vaccinia, and, most important of all, their protective property was very slight, if it existed at all. The result of employing such virus during what may be termed a pandemic prevalence of smallpox was that many persons who had been previously inoculated with it contracted smallpox. This made it necessary to abandon these weak strains for others of greater strength. Such experiences are not uncommon in the history of the vaccine virus, even as far back as Jenner's time. Jenner emphasized this point of the attenuation of the virus, and regarded it necessary to renew the strain from cases of cowpox wherever possible. Retrovaccination, or inoculation of the cow with human virus, was often resorted to for the purpose of reviving the strain. The number of cases of natural cowpox have become exceedingly rare during the last half of the past century, only a few instances being reported from year to year, whereas in Jenner's time the disease was very prevalent. The fewness of the cases may be accounted for by the rarity of cases of smallpox at the present time, as compared with those of the past. The inconvenience, as well as the disappoint-

ing results, following the use of humanized vaccine virus gradually resulted in the adoption of another method of propagating and furnishing the virus. One very prominent reason for this was the increasing fear of transferring a certain infectious disease from person to person through the vaccine virus in the process of vaccinia and tuberculosis. Villemin's experiments regarding the possibility of such danger was given perhaps too much prominence. It cannot be denied that there is some slight possibility of the disease being transmitted in the process of vaccination. Unfortunately, there are cases on record where a grave constitutional disorder has been inoculated into healthy persons by vaccination. Those opposed to vaccination seized upon these accidents, and exploited them in every way possible, as a further argument against the control of smallpox by the arm-to-arm method, and as not an unimportant factor in reviving the method of propagating vaccine virus on the bovine species. This method was known to many, and was employed, as early as 1803 in France, and by several physicians in Italy at various times between 1805 and 1840—the latter by Negri in Naples, who began the systematic use of bovine vaccine virus. It then was employed to a slight extent in several places in Europe, but did not become of general use until many years later. Arm-to-arm vaccination was the method employed in the United States from the time of its introduction until as late as 1869, when animal vaccine virus was begun to be employed. It was not so difficult in our large cities to have available a supply of humanized vaccine virus, but with the growth and increase of the rural population it was not always an easy matter to have this supply; so in order to meet this growing demand, bovine vaccine virus was suggested as being the most practical method of overcoming the difficulty. This led to the establishment of "vaccine farms," as they were designated, in several parts of the United States. It was not long after this that a very large part of the bulk of the vaccinations were performed with the bovine virus, and the arm-to-arm method became the exception to the rule. When calf lymph came into common use, the same difficulty obtained as before noted with the humanized virus. Some observers claimed to have noted the good effect of restoring a virus beginning to show attenuation, by retro-vaccination—that is, by vaccinating the calf with the humanized virus and back again to the person; in some instances, alternating the virus from calf to man and from man to calf. Also, Calmette and Gurin of Lille have employed rabbits for producing the virus. The Bavarian government, as early as 1837, made it mandatory that this procedure should regularly be employed for revivifying and maintaining the potency of the vaccine virus. This brings us to consider the efficiency of the virus propagated through the bovine species and of the humanized virus. There are many even to-day who contend that the results following the use of bovine virus are not so good nor so typical as those of the humanized virus. The reaction following the use of bovine virus is slightly so not so large nor typical. If we are allowed to form an opinion, from the descriptions of the early writers and their drawings of the vaccine
lesions, it must be admitted that they bear out to some degree the statements regarding what is now observed, and what used to be. Following in the middle of the 19th century, the civilized country has adopted and employed the bovine virus. In some, vaccination is optional, while in others it is compulsory. Where vaccination is more largely employed, the frequency of attacks of smallpox diminishes in a certain ratio. Germany may be cited as an example, as a country which has employed the bovine vaccine to the greater number of its population than any other country. Vaccination here is made compulsory. All children during their first year are required to be vaccinated, and again at the age of 12. All males subject to military service are vaccinated on being drafted in the army (some 300,000 yearly). The official records for 1896 show that 6,793 were legally liable to vaccination; 1,321,348 were vaccinated with bovine vaccine virus, and 5,406 were vaccinated with virus of other sources. In primary vaccinations 96.77 per cent were successful. In secondary vaccination, made at the 12th year, there were 1,091,023 of which 91.71 per cent were successful. The wonderful immunity of the German nation to smallpox, resting entirely on its compulsory vaccination laws enacted in 1870, whereby the whole population has been vaccinated and re-vaccinated, not only demonstrates the benefits of vaccination per se, but also the efficacy of a virus obtained from the bovine species. Similar cases could also be cited to show the efficacy of the bovine virus. It cannot be said that the immunity conferred by it is any stronger or more lasting than that of the humanized virus, but it has all the advantages and none of the disadvantages which attend the arm-to-arm vaccination.

From Jenner's time until now there has been a strong belief that there was an intimate connection between vaccinia and smallpox, and that the former was in all probability a modified or attenuated state of the latter. Gassons inoculated 10 caws with matter taken from smallpox cases, and was successful in one instance. After 10 removes the pustule resembled that of a natural vaccine vesicle. These experiments were repeated many times during the past century with more or less success. The most important of them were by Theile of Kasan, Russia (1839), who succeeded in transferring smallpox virus to a cow, and after several removes vaccinated a large number of persons with such virus, the results being in every way the same as observed in the cowpox virus. Ceeley, in 1839, and Badcock of England (1840), also succeeded in variolating a cow, and obtained the same results as did Theile. Some of this virus (crusts) was sent by him to this country in 1852, to Coale of Boston, Mass. This was used quite extensively in and around Boston with evidently good results. The Lyons commission, with Chaveau as its chairman, also made an extensive inquiry into the nature of vaccinia and smallpox. Some of its conclusions were that vaccinia was separate and distinct from smallpox, and although the smallpox virus could with great difficulty be transferred to the bovine species, producing lesions closely resembling those of vaccinia, on subsequent passages through other animals it became attenuated and finally lost. Voigt of Hamburg, in 1881, also succeeded in transferring the smallpox virus to a calf, and after several passages employed it for vaccinating persons. This particular strain has been employed by Voigt for all the vaccinations performed in Hamburg from 1888 to 1904. The virus being propagated directly from calf to calf, with an exception that on two occasions (1891) it was passed from calf to man, and then in 1902 from calf to rabbit. The results obtained from the employment of this strain are such as to be convincing proof of its potency during all these years, as the percentages of successful vaccinations in primary cases, ranging from 98 to 100 per cent, and the low percentage of successes in revaccination, 69 per cent, demonstrate the permanency of immunity. The most convincing proof lies, however, in the fact that the population of Hamburg shows fewer cases of smallpox than any other community of same size. The preponderance of evidence accumulated during the past century shows that vaccinia is not more or less than a modified and attenuated form of smallpox. The latest researches on this subject, as set forth at length by Pfeiffer, Guarneri and Wasielewski, and of those in particular by Councilman and his co-workers on the specific organism of smallpox and vaccinia, seem to leave but little doubt as to their common nature. Brinckerhoff and Tyzzer made an extensive inquiry in Manilla in 1904 into the nature of smallpox and vaccinia, in which they show that smallpox is transmissible to monkeys and orangutan; and that the inoculated smallpox behaved in no way different from the inoculated smallpox in man. Further they succeeded in transmitting this inoculated smallpox of the orangutan to calves; and after a few passages in calves it was then transferred to man. These inoculations produce typical vaccine lesions and were not different from those of the so-called "cowpox" vaccine. Their experiments confirm those of Voigt and others on the effect that vaccinia is modified smallpox. About the end of the 19th century the value of revaccination was becoming better understood, but it required many years before this important fact was appreciated. Even now it is ignored to a considerable extent in some parts of the world, particularly in the United States.

Vaccinia has never been observed to occur spontaneously in man. It is always transmitted by inoculation. The appearance of the inoculated lesion varies somewhat, according to the manner in which the virus is inserted. The usual methods are: (1) By puncture. (2) By scarification or denudation of the epithelium (abrasion). (3) Hypodermically. If by puncture, a slight redness may be seen around the puncture, which to the touch may give a sensation of a slight elevation of the spot. At 72 hours the spot is visible, slightly elevated, slightly gray in the centre and surrounded with inflammation of a pink border or areola. In 96 hours the papule is of a dull whitish color, the border elevated and well outlined. There is usually a depression of the centre—umbilicated, the
areola is well marked; the skin around it is hard and begins to be painful and itch. From the fifth to the sixth day the process still further enlarges and varies from one-fourth inch to one-half inch in diameter. The centre is darker and more depressed, the periphery much more elevated and the edges of a pearly gray color. The sore is filled with a fluid, the areola is of a darker color, the skin just beyond this is softer and less painful. About the seventh day the vesicle becomes flatter, though somewhat wider, the centre not so much depressed but covered with a crust or scab. The gray zone becomes yellowish and the areola and induration diminished. From this time onward the process gradually subsides, the crest or scale becomes thicker and more elevated, gradually contracts, and after 15 or 18 days falls off and leaves a completely healed pink and glistening surface, with small, dark depressions here and there over its area. If the inoculation is made by scarification or incision the same phenomena are observed, save that the process is hastened and is fairly well marked on the second day, with incipient but distinct areola; the central depression, with a distinct gray, pearly margin, elevated and prominent. The areola and induration are well marked on the fourth day, the gray centre is vesicular and transparent, its external margin irregular; the central depression is quite marked, the areola a bright pink and the surrounding skin is swollen. The lesion now advances more rapidly during the next 24 hours, when the clear vesicular zone becomes a whitish color, its borders irregular, the central depression darker and covered with a crust. The areola is not now so prominent nor the induration so diffused. It has now reached its maximum development and gradually subsides, healing from the 15th to the 18th day. When the virus is inserted by the hypodermic method, and the needle passed into the skin, the appearance of the lesion is much the same as in that by simple puncture, but sometimes there is no lesion development of the skin proper. Instead there is a slight induration beneath it, which to the touch imparts a feeling of a small shot. This gradually enlarges until the fifth or sixth day, when it soon subsides. The constitutional symptoms in man are practically the same as those occurring in the animal. There is an elevation of temperature, loss of appetite and thirst and more or less enlargement of the glands nearest to the lesion, which reaches its greatest increase at the height of the development of the pustule. If there is no secondary infection of the lesion by extraneous bacteria the temperature falls to normal, the sore heals and all symptoms rapidly subside. In some very susceptible subjects, particularly in children, vaccination is sometimes followed by a secondary vaccinal eruption. This may be a discreet crop of vesicles occurring at or around the point of inoculation. Sometimes, however, a general eruption may follow. This second crop will go through practically the same phases of development as does the original puncture, only that it is smaller and the individual vesicles have not the same amount of areola and induration of skin as observed at the site of inoculation. The local lesions of inoculated smallpox and vaccinia are quite distinct. So also are the constitutional symptoms. In smallpox there is a period of from 12 to 14 days intervening between the exposure to the disease and the appearance of the first symptoms. In inoculated smallpox the period of incubation is much shorter, seven to eight days, before the fever and rash. In vaccinia the incubative period is from five to six days. The difference between each can be illustrated in the following temperature chart (after Hime):

Recovery from smallpox requires from 30 to 40 days or more; if inoculated, smallpox, 25 days, and for vaccinia, 22 days. The limit given for each is for the time required for the individual to completely recover from the disease. Does recovery mean simply that the in-
VACCINATION

The effective agent has completed the cycle of its development, and then ceases to exist, or that it is influenced or brought under subjection to certain changes when the virus was administered intravenously, or by inoculating the skin. It is a well-established fact that recovery from any attack of smallpox usually protects the individual against a subsequent attack. So also does vaccination protect against subsequent inoculation, and also protects against smallpox. There is beyond question a change occurring in the body in some way which prevents it again becoming a susceptible reagent to these poisons, a state of resistance or immunity. Some experiments of Sternberg show that the blood of a vaccinated calf, when mixed with a quantity of vaccine virus, destroys its activity. The writer has also observed this. It was found that these substances begin to make their appearance in the blood of a vaccinated animal on the ninth day of life and last at the height of their potency at about the 14th day, after which they gradually disappear. Even when these substances (antibodies) have disappeared, the animal will remain for a long time refractory to subsequent vaccination. It seems more than probable that two states of resistance are brought about by vaccinia, one in which the vaccine virus is destroyed by these new substances, and that the body cells have in some manner been modified so that they are no longer in a receptive state to the virus. The same train of reasoning would seem to apply to the state of immunity following an attack of smallpox. The time when the tissues become refractory to the vaccinal process has been established by observation both on man and animals. If an animal be vaccinated over a small spot of the skin in successive days, the vaccinated process will develop normally on the first, second, third, fourth, fifth and sixth days; that on the seventh day will show an under development; the eighth day still more so, and the ninth only a slight trace, if any, and that of the 10th day not at all. The immunity is established about the ninth day and will continue for a period more or less long, and sometimes is permanent. Jenner has demonstrated that immunity to both smallpox and vaccinia is very strong, as persons having previously had the cowpox before and subsequently vaccinated with fresh vaccine virus, and even inoculated with smallpox, did not contract the disease. The same also was established in Jesty's cases who were inoculated with smallpox virus without result a number of years after vaccination. Immunity to vaccinia can be produced in several ways. We have heretofore dealt with the method of inoculating the skin of mucous membranes and conjunctivæ with vaccinia. The Lyons Commission, in 1877, demonstrated that a calf or horse could be rendered immune to vaccinia by injecting the virus either subcutaneously or intravenously, and after 9 to 14 days the animal would be well. It is to be noted that this immunity was not permanent; it was temporary. Several years ago the writer made some experiments regarding this immunity, when conducting an enquiry into the serum therapy for smallpox, in which he confirmed that this immunity was not obtained by vaccinating the skin. The Lyons Commission, Chaveau and others. Not only was immunity established by intravenous and subcutaneous injections of the vaccine virus, but also a rapid immunity could be induced by injecting the virus under the derma mater, or into the brain substance. Monkeys could thus be rendered refractory to vaccinia within five days, whereas it could be caused in nine days by administering it intravenously, or by inoculating the skin. It requires a very minute quantity of the virus, either in the form of lymph or pulp, to cause the typical lesion. Chaveau found that by taking lymph from a vaccine vesicle and diluting it as much as 1-2000th, it would cause a typical vaccine lesion. A general vaccinal eruption sometimes occurs in calves and young horses (colts) when a considerable amount of vaccine virus is injected in the veins, the eruption making its appearance about the fifth day, shortly after the fever. The eruption appears to be nowise different in appearance than that artificially produced by minute punctures. It also resembles the secondary eruption which occasionally follows vaccination in children. Vaccinia is chiefly confined to the tissues of the skin, but coincident to the development of the specific eruption the virus can also be demonstrated in the blood and the lymphatic glands, particularly those located near the point of inoculation. The blood, however, does not contain a very great amount of the virus, as it requires a considerable quantity, as much as 500 cubic centimeters (half a litre) to be inoculated applied to a scarified skin before it will cause a vaccine lesion. It has also been demonstrated to be present in the lymphatic glands, but it is not constant. The specific agent is to be found in these tissues only during the febrile stage of the disease. It can be conferred on other animals by transfusion of the blood during the febrile stage, provided a large quantity be given. It has been frequently noted that a certain train of symptoms frequently follow where vaccinations are done a second time. This is particularly so where the virus has been derived from calves. There is a local reaction at the point of inoculation which appears in about 24 hours after, the place becomes reddened and slightly swollen, usually accompanied by an itching; there is a slight zone of congestion around it, and taken altogether, it has the appearance of a true vaccination. It subsides in a day or so. This is not a vaccination as was once believed. It is due to a reaction known as "anaphylaxis." It has nothing to do with the virus of vaccinia, but rather to the presence of the foreign protein of the calf serum or cells with which at some previous occasion the body cells have been sensitized.

Causes of Vaccinia.—Since the discovery of the disease many observations have been made from time to time on vaccinia, with a view to determining its specific cause. Nearly all such were made from a bacteriologic standpoint and numerous investigations have described various bacteria as being specific. Pfeiffer (1889) approached the subject in another way. He noted that smallpox and vaccine lesions contained bodies which, to all appearances, resembled that form of cell-life known as protoza (a higher type than the bacteria), and later Guarnieri made a more comprehensive study of the lesions. He chose for his study the cornea, where he was better able to observe the various changes occurring in the evolution of the vaccinal lesion, and in the life-history of the parasite. He found that soon after the inoculation of the cornea with vaccine virus a
certain number of epithelial cells at the point of inoculation began to undergo a change. These cells began to show a nucleus which highly refract the light, lying in the protoplasm of the cell, are surrounded with a clear zone. These bodies are usually spherical and vary in size, some occasionally attaining the size of the nucleus of the cell, while others are minute points. They vary considerably in their shape and appear to be endowed with amoeboid movements. The organism was protoplasmic, having no limiting membrane, nor does it contain a nucleus. The mode of production is by direct division. The parasite has a circular evolution; it develops from around a central point—centrocentrically from within outward—hence the lesion of variola and vaccinia is circular (Guarnieri). The announcement of this discovery excited no little interest among those who were devoting their attention to this subject. Since then much has been added to our knowledge regarding the nature of both smallpox and vaccinia. Guarnieri's work has been followed in all parts of the world, and the same immunity to smallpox has been observed. All persons exposed to contract the disease, nor do all attacked suffer alike. However, those persons who resist the infection at first, if continuously or repeatedly exposed, will sooner or later succumb. It is a current belief that a successful vaccination confers a lasting immunity to smallpox. While a greater proportion of those successfully vaccinated are rendered refractory for a long time, there are some who will at some time or other contract smallpox. Such cases are, however, very rare. The most of them are among persons who have either been vaccinated in their infancy, or in whom vaccinal lesion was atypical. Vaccinated persons who contract smallpox, as a rule, have it mildly, running a shorter course, with none of the usual complications. This modified form is designated as varioloid. Immunity conferred by vaccination does not last as long as that following an attack of smallpox. It was once considered so, particularly during the time when arm-to-arm vaccination was practised. Jenner himself states that he deemed it advisable to revaccinate from time to time, so be transferred to the animal last in the series, yet the lesion in the cornea is identical with the first, and the parasites are present in number, and have the same form and location in the cells. The filtration experiments also demonstrate that the bodies are larger than the bacteria, as virus subjected to this process loses its power of producing the vaccinal lesion. It would, therefore, appear that since these bodies are constantly present in the lesions caused either by smallpox or vaccinia, and are not observed in any other disease process, nor caused by physical or chemical agents, that they are actual parasites and are not simple changes produced in the cells by any other than these bodies. The 'vaccine' bodies are the only characteristic structures which can be found in the skin mucous mem- brane in smallpox and vaccinia. They are absent in normal and other pathological conditions of the skin. These vaccine bodies appear with certainty and constant regularity when an actual vaccine virus is applied to a lesion of the skin or cornea. All attempts to cultivate the virus outside the body have so far been unsuccessful. It appears that the living body cells are required for its development. Some multiplication of the bodies have been observed to occur in the epithelial cell containing these bod- ies when the cell is placed under artificial conditions; but these have not been transmitted to other cells which have not been naturally infected.

All persons or animals of a given species do not contract vaccinia alike; some are quite refractory, and others so for the time being, but may be inoculated after repeated trials. In some the vaccinal lesion develops poorly, being small yet typical and is often delayed in its evolution. Instances like these are not infrequently observed where a group is vaccinated under prac- tically the same conditions. Particularly this is so with animals used for the propagation of the vaccine virus. In those cases where the lesion is undeveloped, typical immunity, however, as a rule follows, and is more or less permanent. It is believed that such immunity is not so great as that following an attack of smallpox, and the same insusceptibility to smallpox has also been observed. All persons exposed do not contract the disease, nor do all attacked suffer alike. However, those persons who resist the infection at first, if continuously or repeatedly exposed, will sooner or later succumb. It is a current belief that a successful vaccination confers a lasting immunity to smallpox. While a greater proportion of those successfully vaccinated are rendered refractory for a long time, there are some who will at some time or other contract smallpox. Such cases are, however, very rare. The most of them are among persons who have either been vaccinated in their infancy, or in whom vaccinal lesion was atypical. Vaccinated persons who contract smallpox, as a rule, have it mildly, running a shorter course, with none of the usual complications. This modified form is designated as varioloid. Immunity conferred by vaccination does not last as long as that following an attack of smallpox. It was once considered so, particularly during the time when arm-to-arm vaccination was practised. Jenner himself states that he deemed it advisable to revaccinate from time to time, so be transferred to the animal last in the series, yet the lesion in the cornea is identical with the first, and the parasites are present in number, and have the same form and location in the cells. The filtration experiments also demonstrate that the bodies are larger than the bacteria, as virus subjected to this process loses its power of producing the vaccinal lesion. It would, therefore, appear that since these bodies are constantly present in the lesions caused either by smallpox or vaccinia, and are not observed in any other disease process, nor caused by physical or chem- ical agents, that they are actual parasites and are not simple changes produced in the cells by any other than these bodies. The 'vaccine' bodies are the only characteristic structures which can be found in the skin mucous mem- brane in smallpox and vaccinia. They are absent in normal and other pathological conditions of the skin. These vaccine bodies appear with certainty and constant regularity when an actual vaccine virus is applied to a lesion of the skin or cornea. All attempts to cultivate the
of successful revaccinations range from 69 to 91 per cent. The number of cases of smallpox developing are practically nil. There is no natural immunity to vaccinia any more so than there is a natural immunity to smallpox. The only immunity is a previous attack of smallpox or a successful vaccination. There may be a resistance of some degree which may vary with the individual, but repeated vaccinations will demonstrate their susceptibility by a successful vaccination.

Source of Vaccine Supply.—The usual method of obtaining a supply of humanized virus was to make two or more insertions on the arm, and when the lesions reached the vesicular stage, to open one or more of these vesicles; the serum was taken directly from the arm and transferred to another person, or it was preserved by drying on pieces of glass, ivory or threads. Some employed a small capillary tube, into which the fluid contents of the vesicle were drawn and the ends sealed in a flame or closed with wax. The usual custom, however, was to vaccinate direct from arm to arm; especially so where this was necessary in cities where vaccination was being done continuously. The dried crust, or scab, was also used, particularly by those who could not always obtain fresh material. These crusts were often active for several months, and there were occasions in which they produced the typical vesicle even after a year or more. Great care was exercised in obtaining a crust from a typical lesion, and extra precautions were taken to keep this as dry as possible, it often being sealed in wax. At the present time, human vaccine virus in any form is little employed, save in some of the Latin-American countries, where it is still the custom to use it; the bovine virus having superseded it in almost every civilized country.

The method of propagation and collection of the virus is in general the same in all countries. The animals are young calves from two to six months old, sometimes cows. Heifer calves are particularly useful in this respect. The vaccinia is generally obtained from the vaccinated surface, although bull calves are frequently employed. Young camels, goats and water-buffalo calves are also used in some Oriental countries. Calves are selected as for their soundness and for their susceptibility. At the present day, they are usually kept under observation for a few days, when they are cleansed by a bath of soap and warm water. Just before their vaccination an area of the skin, usually extending over the whole of the abdominal surface, is carefully shaved, cleansed again with soap and water, and then with sterilized water. Some operators apply some antiseptic, like trikresol, carbolic acid or corrosive sublimate, in disinfecting the skin, removing this with copious quantities of sterilized water. The shaved surface is then dried, and shallow incisions, just cutting through the outer layer of the skin (not drawing blood) are made with some sharp instrument. The incisions are made in long lines, or interrupted, so as to leave more or less healthy skin between them. The vaccine virus is then applied to these incisions and thoroughly rubbed in. The vaccine lesions begin to show on the second and third day, reaching full development between the fifth or sixth day. The most perfect method now in existence of propagating and collecting bovine vaccine virus is that employed by the Japanese government. Nearly all the virus supplied in Europe, Japan and the United States has glycerine added to it in different proportions for preserving it, as well as to eliminate the extraneous bacteria. Some is furnished in the dried form, especially in the United States, but the bulk of it is glycerinized. In nearly all European countries the production of vaccine virus is under state control, although there are many private establishments which also furnish it. Germany has 25 state vaccine stations, Holland 11, Denmark 1, England and 10 private establishments, Sweden 1, France several private, Japan 2. In the United States there are 10 stations — three State and municipal and seven private. The State and municipal establishments are located as follows: Massachusetts 1, New York City 1, North Carolina 1. The private establishments are Pennsylvania 2, New York 1, Michigan 1, Indiana 1, District of Columbia 1, California 1. When compared with the distribution of these establishments in European countries, it will be at once that those in the United States are neither so numerous nor so advantageously located for supplying a virus to areas of equal extent, nor to the same number of population. In the former each vaccine establishment is supposed to supply virus to a certain territory, which is as small as compared to the latter, and, moreover, the most important feature of such is that it is possible to supply a fresh virus quickly without the risk of deterioration incident to temperature and transportation over long distances.

Bacteria in Vaccine.—The numerous contaminations made of the bacteria found in both the humanized and bovine viruses are almost conclusive that they are in no wise connected with the specific cause of vaccinia. All vaccine virus contains many varieties of bacteria, some of these may be pathogenic, but the majority are harmless. Their origin may be from several sources from an antecedent virus, from the skin, from the alimentary tract of the vaccinated animal and from external contamination. Bovine vaccine virus usually contains the bacteria coagulans, coagulans acidum, coagulans coagulans, streptococcus and in rare instances the tetanus bacillus. A vaccine virus may contain a great number of bacteria and yet be harmless; on the other hand only a few of the pathogenic varieties, and may cause serious consequences. As a rule the number of bacteria may be taken as an index of impurity resulting either from a faulty preparation, or not subjected long enough to the action of the glycerine. Any treatment to which the vaccine tissues are subjected, with a view to freeing it from the extraneous bacteria, will influence its potency to a more or less degree. If glycerine be added, the number will gradually diminish. So in order to obtain the best results it usually follows that there arrives a time when such virus is free of bacteria, or nearly so, and when its potency is very little impaired. The Japanese have discovered that vaccine virus to which glycerine has been added, can be made to withstand considerable quantities of pure carbolic acid and in such strength as to kill the extraneous bacteria, and to do so without materially impairing its potency. Further, the vaccine virus can be produced bacteriologically in certain animals, such as the male rabbit and calves, as has been suggested by Noguchi, but as yet this is in the experimental stage.
The preservation of the virus in a highly potent state is all important, it is quite sensitive to the hot weather that causes it to deteriorate rapidly. Low temperatures on the other hand preserve it, and particularly is this so if the temperature is below the freezing point. Elgin of this country will first to discover this fact, which was confirmed by Green of England. Vaccine virus when subjected to very low temperatures and maintained thus with but little variation will remain potent for months, even as much as two years.

Vaccination.— The slight injury to the skin, necessary in inoculating with the vaccine virus, appears on first sight to be of such a trivial character that it is not always treated with the regard which is due it. Vaccination is, in the strictest sense, a surgical operation. No one at the present time would be willing to undergo a surgical operation, it matters not how slight it might be, unless he was convinced that it would be performed skillfully, and that all necessary precautions would be taken to its success. Vaccination is no exception, and due regard both for a successful inoculation and avoidance of complications must be kept in view. The following important points are to be considered: The condition under which the wound is made; the person vaccinated; the state of health; the peculiarity of temperament, and the conditions after vaccination. The inoculation can be made in any part of the skin, the site most preferable is on the outside and middle part of the arm just over the insertion of the deltoid muscle. The site selected for vaccination should at first be thoroughly cleansed with soap and warm water, then rinsed well with clean water, followed by the application of an antiseptic solution (1 per cent carboxyl acid). The skin is then allowed to dry. When this is completed the site is ready for inoculation. Small scarifications of not more than one-fourth inch square are made with some sharp, sterile instrument, for example, a lancet or needle, to remove the outer layer of the skin, care being taken during the process not to make the scarification too deep. Blood should never be drawn. The vaccine is then gently rubbed into the wound and allowed to become thoroughly dry. It is not advisable to protect the wound with any dressing or substance which might adhere to it, as this is one of the most fruitful sources of septic infection. Nature has already furnished the wound with a covering which, if kept intact, will adhere better than any artificial substance. The vaccinated places should be carefully protected against irritation, especially so when the lesion begins to assume the vesicular stage. It is then of the utmost importance to prevent its being injured. In hot weather it is advisable to keep it thoroughly dry. It is not advisable to allow the vesicle to break, for there ensue severe local and constitutional symptoms, it is of importance that it be given surgical treatment. With a pure virus, vaccination, if carefully performed and given thorough attention after treatment, will not cause danger. Vaccination is sometimes followed with complications, the lesion being infected with pus organisms, giving rise to local abscesses; also septicemia, pyemia, erysipelas, gangrene and tetanus are occasionally observed. These may be conveyed by a contaminated virus, but are usually from the vaccination being improperly performed or from neglect of the wound. It has been estimated that an average of 70 per cent of the septic mischief is due to the injury of the vesicle taking place during the first and second week, the unsanitary surroundings or dirty habits of the patient largely contributing to complications. The rare occurrence is borne out by the reports from the Imperial Health Office of Germany, which show that among 32,166,619 vaccinations of children there have been 115 deaths, 67 of these being in some way connected with the operation of vaccination. This gives a rate of a little over two per million, as compared with the thousands who die from smallpox. Sometimes a general vaccinia results. The eruption is to all appearances the same as the initial lesion, and runs a similar course. In addition to this there are post vaccinal eruptions, appearing from 10 to 14 days after. These may be a simple rash, a bullous eruption resembling pemphigus, impetigo, eczema and purpura. While rare these complications may be serious, and their occurrence at this time is thought to be due to the vaccinia being the exciting and not the predisposing cause.

Statistics.— Some are inclined to criticise statistics concerning the protective effects of vaccination, and believe that these can be so manipulated that anything desired can be proven by them. When there is a death from smallpox, there can be but little doubt as to the cause of death, and a charge of manipulating statistics to suit the purpose would rest upon a slender foundation. The number of deaths caused by this disease, taken per million inhabitants, will, therefore, convey a very clear idea as to the rate among a population. London has records reaching as far back as 1629, and Geneva from 1580. In other countries, while the records are not so remote they are sufficient to give an idea of the prevalence of smallpox before vaccination. In England before vaccination, the rate was above 3,000 per million; in London it was over 4,000 per million. Now the rate is less than 20. In Prussia the rate before vaccination was slightly over 4,000, but on the adoption of vaccination it began to suddenly decline, and continued to do so until the vaccination law took effect. In 1874 the rate was further enforced, when the cases became fewer and fewer until now the rate is less than two per million. Sweden had a death rate from smallpox for 16 years prior to 1800, of 2,049 per million, while the rate from 1802 to 1811 fell to 627. In 1816 compulsory vaccination was enforced and for the next 10 years the rate was 133. From 1830 to 1889, 100 years after vaccination began to be practised, the death rate fell from 2,049 to 1. Compulsory vaccination has been in force in France only since 1902, the rate of smallpox among the army being now four per 100,000, as compared with the experiences of 1870-71. Vaccination was introduced into Austria in 1808, and was optional until 1890, when all school children were required to be vaccinated before entering. Vaccination and revaccination are compulsory for the army and navy. Denmark since 1810 requires all children to be vaccinated before the seventh year. Revaccination is compulsory for the soldier and inmates of public institutions. Italy
has had compulsory vaccination since 1888. All children are required to be vaccinated within the first six months, and, if this is unsuccessful, to be revaccinated before they are a year old. Before the law was in effect the death rate of smallpox was 610 per million; in 1902, 9.7 per million. In Belgium and Holland it is not compulsory, although all public officials and the army are required to be vaccinated. In the latter, while not obligatory, all children must go to school and no child can attend without being vaccinated. The teachers also must be vaccinated. India prohibited smallpox inoculations in 1880 and made vaccination compulsory. Similar laws are in effect in Australia, New Zealand and Cape Colony. Vaccination is only optional in Russia, except in the army and the public service. The great majority of the people do not avail themselves of vaccination, so epidemics are not uncommon. In Persia, Siam and China little vaccination is done; therefore, smallpox is endemic. Japan has enforced compulsory vaccination since 1886, whereby the greater portion of the population has been protected and revaccinated. Especially is this true of the population of large cities and on the seaboard. No provisions are made in any of the cities for smallpox hospitals proper. When a case develops it is usually allowed to remain at home, or taken to a general hospital for treatment. No quarantine measures of any kind are enforced. Notwithstanding this fact, smallpox has never been known to spread from any such cases. The same also may be said with regard to the German empire, where no precautions are taken in the strict sense of the word against the spread of smallpox, the whole reliance being upon vaccination. It has been stated by those who opposed vaccination that the reason why the German empire was so free from smallpox was the superior facilities for the isolation and treatment of cases, and not vaccination. This was investigated by the Local Government Board to ascertain just what methods were employed by the government and municipalities for the prevention of smallpox in the empire. Accordingly, an agent was sent to make this investigation. He encountered serious difficulties from the very first. In Berlin he was informed by the Central Health Office that so far as its information went there were no smallpox cases in Germany. The principal cities of the four chief states of Prussia, Bavaria, Saxony and Württemburg were visited. In 10 cities of these states, containing a population of over five million, or one-tenth of the population of the German empire, he did not find a single case. As a matter of history he ascertained that there had been 70 cases in seven years, 1895 to 1901 inclusive; in Cologne one case in 10 years; in Frankfort nine cases in 10 years; in Wiesbaden 12 cases 11 years ago, but none since then; in Mainz none during 11 years; in Munich seven cases in eight years; in Nuremberg none for about 11 years; in Dresden no deaths for the past 10 years; in Leipzig eight cases in eight years; and in Berlin six cases in six years. Vaccination in the United States is not compulsory to the whole population. In many of the States and the District of Columbia all children of school age must be vaccinated, and there are exceptions to this in less than 10 States. In nearly all the States there are large numbers of the population, particularly in the Southern States, principally among the negroes, who do not vaccinate. Among these smallpox is a common occurrence. The government requires all alien immigrants to be vaccinated before being allowed to land; also all persons of the army and navy. Further instances of statistics could be cited to show the protective effects of vaccination against smallpox if they were considered necessary. The only thing which seems to be lacking in our country is a compulsory vaccination law and a strict governmental supervision of the production of vaccine virus.

JOSEPH J. KINYOU, M.D.

VACCINATION, Opposition to. At all times since Jenner's discovery there has existed more or less opposition to vaccination. In England the antivaccinationists have been especially active and in that country the revisions of the Vaccination Acts have been largely rendered null through their efforts. Parents are now relieved of any penalty under the compulsory clauses of the acts if they offer proof that they have, within four months of the birth of a child, satisfied a stipendiary magistrate, or two justices in petty sessions, that they had conscientious scruples against vaccination and that they believed it would be prejudicial to the health of the child. In the United States and Canada opposition to vaccination has been sporadic and while not confined to any one region of East or West appears occasionally in many districts. On the Continent while some opposition has developed it has mainly been the benefits from vaccination being the most effective answer to objectors. The basis of the arguments of these objectors has been at times almost ludicrous. In the early days of vaccination it was seriously alleged that vaccination caused bovine traits to develop in the child vaccinated, that hoofs, horns, etc., would tend to develop, and bellowing would replace speech. While present-day arguments against vaccination are less believable than this they are equally without a sound scientific basis. The chief objections alleged

for a long period have been the complications resulting by other diseases being inva
some cases of syphilis appear to have been so inva that the occurrence could not have hap
the vaccinator had taken proper care. The calf lymph now in universal use effectively pre
transmission of syphilis. Eczema and other skin erup
cifed. However, it is still a matter of debate whether the effects observed after vaccination, but it is safe to say that
since these infantile evils would appear in any case their appearance is only hastened and not caused by vaccination. While some real dangers exist, and these can be countered, when in relation to the extent of vaccination work done, they are insignificant. Better precautions and improvements in method from year to year are continually lessening these dangers, while the cost is only a fraction of a dollar per rendered immune to the ravages of smallpox.

VACCINE. This term has undergone a change in meaning from that which it received at
Jenner, the discoverer of vaccine inoculation, for the preventive treatment of smallpox. This was a little over a hundred years ago and before the existence of modern bacteriology. Yet the principle which Jenner enunciated and which he dimly and imperfectly understood is the same which in more recent years has been extensively elaborated by Pasteur, Koch and the entire great school of bacteriologists. It is the principle that by introducing into the animal body certain substances of known character, immunity or partial immunity can be conferred, for a longer or shorter period against the attack of disease-producing germs which may be within that body or which may subsequently gain access to it. A vaccine or vaccine virus, according to Jenner, was the contents of a pustle upon the skin, especially upon the under of a cow or calf suffering with cowpox, which, when introduced into the lymph or blood circulation of a human being sensitive to smallpox, protected him from way other than that disease or arrested the disease if it was already in its incipient stage. A vaccine as understood by bacteriologists is a preparation composed of a great number of living attenuated bacteria or a smaller number of very virulent ones, or their products, including split bacteria, bacterial toxins and filtrates of fluid cultures. The reproduction of the bacterial cells is prevented by the use of a sufficient degree of heat, and the vaccine is preserved by the addition of a suitable antiseptic. Vaccines are conveniently prepared in the form of liquids which may be clear or turbid and with more or less abundant precipitate. Vaccines are used to prevent or cure diseases of many kinds by introducing them into the body through the mouth, the subcutaneous tissue, within the skin, within the substance of the muscles or directly into the blood circulation through a vein. The theory of vaccination presumes the presence within the blood of what are known as antibodies. Metchnikoff refers to them as phagocytes; they are also known as antigens. The antibodies are antagonistic to disease germs which have obtained access to the circulating blood. Their function is to attract some disease germs and repel others. When there is mutual attraction the germ is enveloped and absorbed by the antibody and the tendency to the disease is thus limited and arrested. The object of the vaccine which is introduced into the circulation is to stimulate the healthy tissues to produce new antibodies and so increase the chance of destroying the often disease germs.

It was not until 1874 that it was discovered by Traube that normal blood had bactericidal properties, this being followed by the important discovery of Behring that the serum of an artificially immunized animal may transmit immunity to other animals. This is called its bacteriolytic power and follows the injection into the animal of suitable bacteria. An injection of a suitable dose of vaccine into an animal is followed by a diminution of the bacteriolytic power of the blood, this being known as the negative phase of resistance. The larger the dose the more significant the clinical features of this stage, including rise of temperature and other physical disturbances. After this comes the positive phase when the antibacterial power of the blood and the resistance to bacterial influence are increased. By repeating these injections in increasing dosage the antibacterial and antitoxic power of the blood of the animals thus treated is increased for the disease germs against which the treatment has been directed. It is by this method of experiment, particularly in horses, that the antitoxic of diphtheria has been made available. One great merit in the use of vaccines as a therapeutic agent is that they are comparatively harmless, except in those who are in a weak and toxic condition from tuberculosis or some other infectious disease.

Vaccines are of various kinds. Autogenous vaccines are derived from cultures of bacteria obtained from the blood or discharges or secretions of one who is sick or injured and are injected into the same individual upon the theory that the stimulation to the development of antibodies will be greater than if the vaccine is obtained from an external source; they are of particular value in obstinate or unusual infections in which an exact diagnosis has not been made. Their production requires considerable time and is not available for very acute diseases. Stock vaccines are those which are made from representative types of particular organisms and are preserved for use according as these types are indicated as means of treatment; they are less costly to make than autogenous vaccines but are also distinctly less effective. The polyvalent form of stock vaccines contains different strains of the same bacterial species or one strain from different sources and is the most efficient variety of stock vaccine. Mixed vaccines are those which contain two or more strains from different species and are intended for mixed infections or those in which there is a variety of infecting bacteria. Consult Kolmer. J. A. T., Medical Text-Book of Infection, Immunity, and Specific Therapy (Philadelphia 1915).

ANDREW F. CURRIER, M.D.

VACCINE THERAPY. See Vaccine.

VACCINIACEAE, a family of Ericales, comprising several genera of trees and shrubs, and including some epiphytes. This family is
widely distributed throughout the north temperate and frigid zones, and its fruits are generally edible. The leaves are alternate, and are deciduous. The various species have pretty flowers, the lobes occasionally being reflexed; in color they range from greenish-white to deep rose. The only members of the Vaccinium genus considered in America are the cranberries (Oxycoccus) which are evergreen, woody, vine-like shrubs, growing in sphenugnum bogs. They are small and slender and are somewhat trailing in habit, but have ascending or erect branches bearing oblong leaves, and pink, star-shaped flowers in clusters. The cranberries are oval, pendulous on filiform stalks and have a shining red skin and firm, white flesh, of a very acid taste. Cranberries are cultivated in lands which can be submerged, are ripe in the fall and are sent to the markets in great quantities, to be served as sauce with poultry and game. The mountain-cranberry of the southern United States is a taller shrub with thin leaves (Oxycoccus erythrocarpus); that of Europe (Vaccinium visid-idea) is a low, evergreen shrub, with coriaceous, oval leaves crowded on the creeping stems. Both grow on clay hills and mountains, and the latter is found quite around the northern world. Its flowers are small and campanulate, nodding in terminal clusters, and the fruit is a dark red globe, very acid and called cowberry. It is used locally for preserves. The so-called whortleberries (of which name "huckleberry" seems to be a corruption) of Europe include not only this last species, but Vaccinium myrtillus and V. uliginosum. The former is the bilberry, or in Scotland the blueberry, and is of varying height, but rarely exceeding two feet, with deciduous ovate leaves. The berries, which are dark purplish with a mealy bloom, grow to the size of a black currant and are very acid. Their juice, combined with elder-bark and alum, is said to be used by northern Russian women to dye their hair bright-red. Nearly all the fruits of the genera Vaccinium and Gaylussacia, in America, are called huckleberry or huckleberry, and are equally edible and good. There is a tendency, in the markets at least, to call those berries which are black and shining huckleberries, and the blue ones blueberries. They are a favorite midsummer fruit both among the Indians, who dined them, and sometimes included them in pemmican, and with white people. Thoreau exclaims, "Are they not the principal wild fruit?" thinking of the great tracts the bushes sometimes cover and the prolificness of their bearing. From June to August gathering huckleberries is one of the great industries of country districts, the fields being burnt over to promote the growth of the bushes and the produce of either raw to the markets, or to canning factories. Vaccinium canadense, V. pensylvanicum and V. nigrum are dwarf shrubs, the latter often growing together on sandy hillsides, and furnishing the first blue and black berries of the season. The flowers are creamy white or pinkish. In swampy, sandy thickets is found the tall resinosus blue-tangle, or dangleberry (Gaylussacia frondosa), with scantly campanulate blossoms, on filiform pedicels. The leaves are ovate and glaucous beneath, and the delicious berries are large, globose and blue with a bloom, and very juicy and sweet. Of all the American species of Vaccinieras, the high-bush blueberry (Vaccinium corymbosum) is probably the most conspicuous, or that genus, and deciduous. It is a tall, straggling shrub of damp woods, quite 10 feet high, at its best. With the leaves, in spring, it hangs out large white bell-like corollas, in racemose clusters. The berry is large and blue, and of a pleasant acidulous flavor; it is the last to appear in the markets. In fall, the oval leaves turn to vivid scarlet, and remain in a glow of color for a long time. Balsamorhododendron arboresum, the farkleberry, bears an inedible fruit, but attains to the dignity of a tree in the South. Polystachium stamineum is the squawberry (q.v.), or buckberry; Chionogonnis hispidula is the snowberry (q.v.).

VACHELL, Horace Annesley, English author: b. 30 Oct. 1861. He was educated at Harrow and the Royal Military College, Sandhurst. He was a lieutenant of a rifle brigade in 1883 and subsequently lived some years in California, where he wrote several novels, among which are "The Romance of Judge Ketchum" (1884); "The Gate of Chance" (1886); "The Pactolus" (1886); "The Procession of Life"; "Brothers" (1905). An account of his California experience is given in his "Life and Scenes on the Pacific Slope" (1906). Since 1894 he has written one or more books every year, the most successful being "John Chouty," "The Other Side," "Spragge's Canyon" and "Bunch Grass." Latterly he has taken to playwriting, and his "Lady Camber" was popular in 1915.

VACHEROT, Etienne, French author: b. Torcenay, near Langres, 29 July 1809; d. 28 July 1897. He was educated at the Ecole Normale, and returned there as director of studies in 1838, from which he was dismissed through the eunuch of the Clerical party. In 1868 he was elected to the Academy. His principal works are "Histoire Critique de l'Ecole Alexandrienne" (1846-51); "La Metaphysique et la Science" (1858); "La Religion" (1869); "La Democratique Liberaire" (1872).

VACUOLE, in biology. See CELL.

VACUUM, in the strict sense, a portion of space entirely devoid of matter. The abstract vacuum, as thus defined, is still a mere intellectual concept because no physical or chemical method has yet been devised for effecting the absolute removal of every last trace of matter from any portion of space having finite, measurable dimensions. If a vessel of glass or other material impervious to air is filled with air or any other gas, and the contents of the vessel are then removed by means of a good modern air-pump, a degree of exhaustion can be attained which is so perfect that no residual matter can be detected, even by the most refined methods of testing. Spaces which have been partially exhausted, but which still contain a quantity of gas great enough to be easily detected, are called "partial vacuums," and those in which the process of exhaustion has been pushed to a very high degree, are called "true vacuums," or, for the sake of distinction, "high vacuums." The first known method for producing a high vacuum was that of Torricelli, who filled a glass tube, closed at one end and more than 30 inches long, with mercury, and then inverted the tube.
so that its open end dipped beneath the surface of a vessel also containing mercury. The atmosphere, or pressure sustaining this pressure only equal to that due to a mercury column some 30 inches high (see BAROMETER); so that when the experiment here indicated is performed, the mercury sinks in the tube until it stands above that in the lower vessel by only this amount. The space at the upper end of the tube, from which the mercury thus retires, was long considered to be the most perfect vacuum attainable. It is not absolutely perfect, however, for it contains a small amount of mercury vapor, as well as traces of air. The method of Torricellis is not a convenient one for the practical production of high vacuums, for it is often objectionable to introduce mercury directly into the space to be exhausted, and it is also difficult, in many cases, to fill such a space with mercury so completely as to exclude small bubbles of air. Hence, in the practical production of vacuums, it is usual to remove the air (or other gas) from the space to be exhausted, by means of some form of a pump. The earlier pumps that were employed for this purpose (and which are still employed when high vacuums are not essential) were of the air-pump or suction-pumping type that are used for drawing water. They consisted of one or more cylinders, provided with tightly-fitting pistons, and valves as nearly perfect as possible. Each stroke of a pump of this kind removes a certain fraction of the mass of gas remaining in the vessel to be exhausted; but it is theoretically impossible to produce an absolute vacuum in this manner, not only because an infinite number of strokes would be required, but also because it is impossible to prevent a certain amount of leakage around the pistons of such pumps. Other grave mechanical difficulties also obtrude themselves when the vacuum attains to a moderate degree of perfection. For the production of the high vacuums that are used in the manufacture of incandescent electric lamps, and for the far more perfect ones that are needed in modern scientific research, it is, therefore, necessary to employ some other means. One of the most successful of these is a mercury pump, in which advantage is taken of Torricelli’s principle for the production of a vacuum. The vessel to be exhausted is not filled with mercury, but it communicates with a large bulb which can be alternately filled with air and emptied, by merely raising and lowering a reservoir of mercury, with which it is connected by means of a flexible tube. When the mercury is caused to run out of the pump-bulb by lowering the reservoir, the air from the vessel to be exhausted expands into the bulb; and when the bulb is again filled by raising the reservoir, the air that the pump-bulb contains is caused to pass out through a special passage provided for that purpose, so that it does not return into the vessel that is being exhausted. By means of a mercury pump working on this principle, it is possible to reduce the pressure in the exhausted space to the 100,000th part of an atmosphere. About 1865, Sprengel invented an ingenious and still more perfect mercury pump, by means of which exceedingly high vacuums may be obtained. In Sprengel’s apparatus a stream of mercury is caused to pass down a small tube called the "fall-tube," in the form of a rapid succession of separate drops; a small quantity of air from the vessel to be exhausted being entrapped between every drop of the mercury and the air. The mercury then sweeps this entrapped air down through the "fall-tube," which discharges, at the bottom, into a cistern. The Sprengel pump is slow in its action, but by its aid it is possible to produce vacuums so nearly perfect that the residual pressure probably does not exceed the 400,000th part of an atmosphere. In producing high vacuums, it is necessary to remember that glass and other solid bodies are usually covered by a thin coating of highly condensed air (or other gas), or of water vapor, which adheres to them like a thin film of varnish. This film is quite persistent under ordinary circumstances, and is not given off at once, even in a high vacuum. If the film were not removed during the exhaustion, however, it would gradually leave the glass afterward, becoming disseminated through the exhausted vessel, and so reducing the vacuum very seriously. To prevent the vacuum from being injured in this manner, the exhausted vessel is heated, by means of a Bunsen burner or otherwise, while the pump is in action. The rise in temperature accelerates the motions of the molecules of the residual air, and the air film tears asunder and falls off into the interior of the vessel, from which they are then removed by the pump. High vacuums are sometimes obtained by combining the air-pump with other devices that are suggested by chemistry and physics. Thus Andrews produced high vacuums by filling the vessel to be exhausted with carbon dioxide gas, removing the greater part of this gas by means of an air-pump, and then absorbing as much as possible of the remaining quantity, by means of fragments of caustic potash that had been previously introduced. Advantage has also been taken, in a similar manner, of the absorptive power of freshly-prepared charcoal, for improving the air-pump vacuums. The charcoal is placed preferably in a side tube communicating with the exhausted vessel, and is kept heated during the exhaustion, in order to prevent it from absorbing the gas until after the pump has ceased working; having proceeded by means of the pump to as high a degree as is possible, or as is desired, the connection to the pump is sealed off, and the charcoal, upon being allowed to cool, then absorbs within its pores a considerable part of the gas still remaining in the vessel. The perfection of the vacuum in the finished tube can be regulated, within certain limits; for by heating the charcoal more or less a greater or lesser part of the gas that it contains can be temporarily expelled, so as to reduce the degree of the vacuum. Dewar successfully applied liquid hydrogen to the perfecting of vacuums; the vessel to be exhausted could be made an auxiliary bulb which can be plunged into the liquid hydrogen after the exhaustion has proceeded far enough to be possible by the direct action of the pump. The intense cold of the liquid hydrogen causes a considerable part of the residual gas in the vessel to condense upon the walls of the auxiliary bulb, which is then sealed off from the main bulb by means of a blow-pipe. For many reasons, the phenomena accompanying the discharge of electricity through vacuums have been greatly studied by physicists.
A perfect vacuum would (according to received theories) be a perfect non-conductor of electricity; it would be an insulator unattainable by experimental methods, vacuums have been prepared, through which the discharge of a powerful induction coil cannot be forced. At ordinary atmospheric pressure, the discharge from an electrical machine, or an induction coil, passes through a gas intermittently, and in the form of thread-like bunches of sparks resembling miniature flashes of lightning. Suppose, now, that electrodes are sealed into the two opposite ends of a vacuum tube, and that the tube is gradually exhausted by a good air pump. The discharge, at first resembling loose threads gathered together at the ends, gradually loses this appearance as the exhaustion proceeds, and after a time the whole tube becomes filled with pale light; and when the pressure becomes reduced to about the 10,000th part of an atmosphere, the discharge assumes a stratified or striated appearance. In a vacuum tube of cylindrical form, with an internal electrode at each end in the form of a circular metal disc with its plane perpendicular to the length of the tube, we observe, as the pressure approaches the value here given, that there is a notable difference in the appearance of the tube at the two ends. The negative electrode is often covered with a soft, velvety glow, either wholly or in patches. Outside of this there is a dark space called "Crookes' dark space," or the "first dark space." Next after this comes the thin layer of the primary positive glow being roughly (but not accurately) proportional to the reciprocal of the density of the gas in the tube. According to Puluj, in a tube such as here described, the thickness of the Crookes' dark spaces, when the residual gas is air, and the pressure is reduced to the 13,000th of an atmosphere, is about one inch. Next beyond the Crookes' dark space comes a luminous space which is called the "negative glow": and next after this there is usually (but not invariably) a second comparatively non-luminous region called the "second negative dark space," or, sometimes, the "Faraday dark space". Next after this comes a glow which is called the "positive glow," in which all the way to the positive electrode. It is in this part of the tube that the striations, referred to above, occur. They consist in a succession of disc-shaped luminosities, spaced at fairly uniform distances so long as the tube is of uniform diameter and separated by dark intervals: the discs being perpendicular to the axis of the tube. The striations are sometimes absent, and when they are present they often have an irregular motion of translation along the tube, this motion being sometimes in one direction and sometimes in the other; that is, sometimes toward the negative electrode and sometimes away from it. When the tube contains a mixture of gases there appears to be a separate series of striations for each constituent gas. The motion of the striations is best observed by noting the reflection of the tube in a rapidly-revolving mirror, and it is often of such a character as to make the striations appear confused to the unaided eye or to obliterate them completely. When the tube has movable electrodes it is found that a shift of the position of the negative electrode (that is, the cathode), causes a corresponding shift in the positions of the striations; these behaving,
VACUUM PUMPS

is not yet in an entirely satisfactory condition; but in a general way we may say that when the vanes of the blade which are exposed to a source of radiant heat, the black sides absorb heat more readily than the light ones, and hence become warmer. This means that the molecules composing the vanes are vibrating more energetically on the black side, so that on this side they strike more energetic blows against such gas molecules as chance to come in contact with them. From the equality of action and reaction it follows that the vanes of the little flier will experience a reactionary force tending to make them revolve with the light side foremost. In order that the radiometer may work satisfactorily it appears to be necessary to have the vacuum sufficiently high to ensure that, on an average, a gas molecule which has collided with one of the vanes will strike the glass wall of the enclosing bulb before encountering another gas molecule.

The behavior of a high vacuum under the influence of electrical discharges is especially interesting. When the perfection of the vacuum is such that the average distance that a molecule of the residual gas travels between successive collisions with its fellow molecules is comparable with the dimensions of the tube itself (that is, when the pressure in the tube is only about 1,000,000th of an atmosphere), the position and shape of the positive electrode, or cathode, are of very little influence upon the character of the discharge. In such a case the nature of the visible discharge appears to be determined almost absolutely by the cathode, or negative electrode, and the discharge makes itself manifest in the form of a shaft of pale bluish or purplish light, extending outward into the tube in a direction approximately perpendicular to the surface of the negative electrode. If this electrode is made concave the streamer that proceeds from it (and which is known as the "cathode ray") may be made to converge to a focus, diverging again after passing the focus, so that the complete streamer has the general form of a double cone, one base of which rests upon the glass wall of the tube, opposite to the cathode. Where the cathode ray strikes the glass, the glass is excited to fluorescence, and it also becomes heated at this point. The whole phenomenon, in fact, is of such a nature as to strongly suggest that the cathode ray consists of a torrent of material particles; and it is natural to assume that the molecules of the residual gas within the vacuum tube receive electrical charges as they come in contact with the cathode, being then violently repelled from it in a direction normal to its surface. Crookes found, in fact, that this "projectile hypothesis" agrees well with practically all of the phenomena that he observed in these high vacuums. He observed, for example, that the cathode ray is apparently cut off by the interposition of any solid matter, even by a very thin film of mica, which would presumably be transparent to ether-waves; and he constructed many ingenious and beautiful forms of tube for showing that the cathode ray is capable of exerting precisely such mechanical effects as would be expected if the projectile hypothesis were correct. In the case of the most indirect of all tubes, in which the cathode ray is caused to strike against one side of a little paddle-wheel, the wheel being thereby caused to revolve just as a water-wheel revolves when its lower half is immersed in a running stream of water. The direction of rotation in this form of tube may be reversed readily by reversing the polarity of the two electrodes. Objections may be urged to this simple projectile explanation, however. For example, there are some for doubting if an isolated molecule of gas can receive an electrical charge in the way that the molecules of the residual gas have been assumed to be charged by the cathode. Despite this objection, it must still be regarded as probable that the projectile hypothesis of Crookes is true in some form or other. According to the electron theory the cathode ray consists, not of whole gas molecules but of tiny particles that are split off from the molecules. These ultimate particles, or electrons, certainly do carry electrical charges, and it is quite likely that the mechanical and other effects that are observed in vacuums where the pressure is not more than the millionth part of an atmosphere are due to the projectile-like motions of the free electrons. Crookes' experiments were carried out before the idea of electrons was developed; but it should be said, in justice to him, that in describing his work he frequently emphasized his belief that the current in his tubes is in a state quite different, in some respects, from any state with which we had previously been familiar; and he called this, provisionally, the "fourth state" of matter, since he considered it to be as different from gas as a gas is from a liquid or a solid. A vast amount of research has been carried out, in recent years, in connection with the phenomena observed in high vacuums, and the subject must now be considered in its relation to the electron theory, radioactivity, and X-rays, if it is to be properly understood. See ELECTRON THEORY; MOLECULAR THEORY; RADIOACTIVITY; X-RAY; and consult bibliographies given.

ALLAN D. RISTEEN.

VACUUM PUMPS. So long as the vacuum was of interest mainly to the physical laboratories the forms of pumps for producing vacua were delicate contrivances, largely of glass, and of very limited performance, suitable only for experimental purposes. When the vacuum became a manufacturer's necessity, the machinery for its production took on a different phase. The limit of exhaustion possible to the laboratory air-pump (q.v.) is reached when there is no longer in the system air enough to lift the valves (by its expansion). As even the lightest valve which could be constructed ceased to work while a considerable amount of air remained, the results were inadequate to the demands of such industries as, for example, making of electric lamps.

For economic purposes the vacuum pump most in use is the oil-valve pump, in which the piston is of the "bucket" form and is continually filled with oil, the piston valves being practically floated in the oil when the vacuum becomes of high degree. The piston works on the gaseous material between two basins of oil. With a double cylinder pump working in tandem the results are excellent, the vacuum reaching any of the absolute vacuums (14.7 pounds per square inch) in pressure. Another pump used in commercial work is a modification of
the Sprengal mercury pump, the action of which is the reverse of the air-lift. (See PUMPS AND PUMPING MACHINERY). A constantly falling column of mercury is made to float downward past a Y-branch into the mercury tube, the Y being connected with the gas reservoir to be exhausted. The falling mercury traps and drags the gas down with it in bubbles, drawing gas from the basin below, where the gas escapes. The mercury is pumped up again to the feeding basin at the head of the column. The vacuum obtainable with this pump is 2 atmospheres, but the action must be prolonged to achieve such rarefaction.

For high vacuum work Gaede's molecular pump is in considerable use. It depends for its action upon the friction of gas upon the surface of a solid. Fig. 1 shows a diagrammatic section of this pump. A cylinder (A) is made to rotate clockwise in a casing (B) in which are two openings (E and F) connected by a slot. The opening E connects with the gaseous material to be exhausted, and the opening F is the outlet of discharge. In operation the gas is dragged from E toward F by its friction with the revolving cylinder A, and a difference of pressure at these two points is established proportional to the speed of rotation and the internal friction of the particular gas. At speeds of 8,000 to 12,000 revolutions per minute a vacuum equivalent to that of an atmosphere has been obtained. The action of this pump is very rapid.

In Fig. 2 is shown a sectional diagram of the Langmuir Condensation pump, the most rapid of all vacuum pumps. In construction it is a cylinder of metal (E, E) having within it a smaller cylinder (F), above which is placed a shield of an inverted cup-like shape. The cylinder E is surrounded by a water jacket (W). At G is an inlet for the gaseous material to be exhausted, and at O the outlet for the gas. In operation a quantity of mercury is placed in the bottom of the cylinder, small openings being provided into the inner cylinder F so that the mercury circulates in both. Heat is supplied below F, and the mercury is vaporized; the vapor passing up to the top of F and over the edge, being deflected downward by the shield S and rushing out by the annular opening A, A. The gas is dragged downward by the swiftly moving vapor which is condensed into metallic mercury when it strikes the cool walls next the water jacket, thus forming a vacuum into which the gas flows, being urged onward by the constant stream of mercury vapor from A, A. Being crowded down to the level of O it flows out of the pump. The continually condensing mercury drops to the bottom of the cylinder and passes into the central cylinder, to be used over and over again. With a Langmuir pump of three inches outside diameter, the performance amounts to from 180 to 240 cubic inches of gas exhausted per second, the vacuum obtained being equivalent to 27 atmospheres.

VADOSE WATER. See GROUND WATER.

VAGA, vär’ga, Perino del, or more properly PIETRO BUONACCORSI, Italian painter; b. Florence, 1500; d. Rome, 1547. He was taught painting by a Florentine named Vaga (whence the name generally applied to him), by whom he was brought to the notice of Giulio Romano and other pupils of Raphael. The latter, then engaged upon his designs for the loggia of the Vatican, employed him to assist Giovanni da Udine in the arabesque work, and subsequently entrusted him with the execution of some of the principal frescoes. He thenceforth was a favorite pupil of Raphael, after whose death he rose into great reputation. Compelled to leave Rome in 1527, on the sack of the city, he went to Genoa, where he entered the service of the Prince Doria and founded a school of painting. He returned to Rome during the pontificate of Paul III, by whom he was entrusted with many valuable commissions; and at the time of his
death probably stood at the head of the Roman school. He is renowned after the style of Michelangelo, and by Vasari is placed in that respect next to the great Florentine master. His works are widely distributed over Italy, the best being the 'Creation of Eve' in the church of Santa Maria in Rome. He also frescoed the ceiling of the Sala Regia in the Vatican. His artistic activity extended to the designing of tapestry, baldacchini and the execution of stucco work.

VAGANTES, vā-gāntēz (wanderers, vagabonds), a term applied in the Middle Ages to the wandering bands of scholars (vagi scholares), who, during the intellectual movement which pervaded Europe during the 12th and 13th centuries, formed a distinct and characteristic class in the population, and played an important part in the social life of the time. They were sometimes called Bacchantes — Brethren of Bacchus — from their drunken roysterer habits. They were renowned for their songs, full of life and movement, and often keenly satirical of the clergy and religion. Their 'Carmina Burana' form a collection, a manuscript copy of which is still to be found in the Benedictine abbey at Munich. The verses are in rhytled Latin, or written in macaronic style of German and French and Latin; some are German or French pure and simple. They deal with religious controversy, love, wine and sport; some are absolutely frivolous; others pious in tone. In France the vagantés were known as 'Quidam'; probably because they generally pursued their peregrinations under the leadership of a man of gigantic stature (Goliath). Consult Hubatsch, 'Die lateinischen Vaganten des Mittelalters' (1870); Von Barnstein, 'Carmina Burana Selecta' (1870).

VAGRANCY, the life or habits of an individual without fixed habitation, or vagrant, who is classed in law as (1) an idle and disorderly person, able, in whole or in part, to maintain himself and his family, but who neglects to do so; (2) rogues and vagabonds, persons suspected of being guilty of robbery or burglary; (3) incorrigible rogues. A vagrant is consequently an able-bodied man without any visible means of support and without fixed abode. His essential characteristic is 'work-shyness,' or idleness self-imposed and voluntary. In most of the United States various enactments and ordinances of more or less severity have been made for the suppression and punishment of vagrants and tramps; but such characters are still numerous, their number being estimated at 600,000, and their cost to the nation over $200,000,000 yearly, to the railroads, $25,000,000 and according to a recent conservative estimate $2,000,000 to the State of New York alone. A charge of vagrancy is frequently made by the police against individuals who are arrested for other purposes for which, however, an arrest cannot legally be made in order to prevent an offense which is imminent or in course of being committed, or to detain a person against whom a more serious charge or indictment is pending. Vagrant laws and statutes are designed to protect the public from the depredations of the vagrant and to relieve it of his support. Legislation, however, has not checked vagrancy due to the fact that vagrancy is a national problem, which the unit legislating against it is the State. Uniform repressive legislation in all States is necessary to the solution of the problem.

Difficulties arise in administering such laws as we have for the control of vagrancy, owing to the fact that popular sympathy is easily aroused by the man out of work and seeking employment and many of the vagrants pretend to be going about in search of work; but though there are doubtless some unfortunate honest workmen among them (who, if they could be selected from the mass, should receive all possible consideration and aid in securing work), the great majority of tramps form a class, who, from mental constitution, choose any course rather than work. It is hard to understand what inducements can lead them to prefer their wandering and shiftless life. Apparently the freedom of it and the immunity from work are its chief attractions. They have been well described as wandering about "ready for any crime, but not planning crimes; quite ready to rob, but very much afraid of large dogs; very selfish. They are 'the scum of the earth,' "Carmina Burana," form a collection, a manuscript copy of which is still to be found in the Benedictine abbey at Munich. The verses are in rhytled Latin, or written in macaronic style of German and French and Latin; some are German or French pure and simple. They deal with religious controversy, love, wine and sport; some are absolutely frivolous; others pious in tone. In France the vagantés were known as "Quidam"; probably because they generally pursued their peregrinations under the leadership of a man of gigantic stature (Goliath). Consult Hubatsch, 'Die lateinischen Vaganten des Mittelalters' (1870); Von Barnstein, 'Carmina Burana Selecta' (1870).

VAGRANTS. See MENDICANCY.

VAIGACH, vī-gāch', Russia, an island in the Arctic Ocean, belonging to the government of Archangel, separated from the mainland by the Yugor Strait and from Nova Zembla by Kara Strait, and forming with Nova Zembla the western boundary of the Kara Sea. The mountains chain of the adjacent mainland peninsula is continued in the island by a low chain near the east coast. Vegetation is scant, but the island is visited by Russians and Samoyedes in search of fur-bearing animals and fish. The area is about 1,410 square miles.

VAIKUNTHA, the paradise of Vishnu (q.v.), according to the Vaishnava sect of the Hindu religion, the supreme deity.

VAIL, Alfred, American inventor: b. Morristown, N. J., 25 Sept. 1807; d. there, 18 Jan. 1839. He was graduated at the University of
the City of New York in 1836 and in 1837 became associated with S. F. B. Morse (q.v.) in his telegraphic experiments. His mechanical knowledge applied to the experimental apparatus resulted in the first practicable Morse machine. He invented the combination of the horizontal-lever motion to actuate the style; devised the alphabet of dots, spaces and dashes which it necessitated; and ingeniously constructed the first grooved roller which embodied on paper the characters he originated. He was appointed assistant superintendent of the telegraph line constructed between Baltimore and Washington in 1843 and on the completion of the system, in 1844, was stationed at Baltimore, where he invented the finger-key, and received the first message from Washington. Consult Pope, 'The American Inventors of the Telegraph,' in The Century, Vol. XXXV (1888). See Henry, Joseph.

VAIL, Charles Henry, American Universalist clergyman: b. Tully, N. Y., 28 April 1866. He studied music in New York and for a while engaged in teaching it. He was graduated at Saint Lawrence University, Canton, N. Y., in 1892, and in the following year pursued his theological studies. In 1893-94 he was minister of All Souls' Church, Albany, N. Y., and from 1894 to 1901 of the First Universalist Church in Jersey City, N. J. In 1901 he was nominated governor of New Jersey by the Socialist party, of which in 1901-02 he was national organizer. He has lectured in many parts of the country and has published 'Modern Socialism' (1897); 'Socialism: What It Is and What It Is Not' (1900); 'The Socialist Movement' (1901); 'The Trust Question' (1901); 'Socialism and the Negro Problem' (1903); 'Ancient Mysteries and Modern Masonry' (1909); 'Militant and Triumphant Socialism' (1914).

VAIL, Stephen Montford, American clergyman and educator: b. Union Vale, Dutchess County, N. Y., 15 Jan. 1816; d. Jersey City, N. J., 26 Nov. 1888. He was graduated at Bowdoin College, Maine, in 1838 and Union Theological Seminary in 1842. He joined the New York Conference of the Methodist Episcopal Church in 1842 and served Fishkill, N. Y., Sharon, Conn., and Pine Plains, N. Y. For two years he was principal of Pennington Seminary (1847-49). From 1849 to 1868 he was professor of Hebrew at Concord Biblical Institute. He resigned because of ill health and lived on Staten Island. He was appointed United States consul to Bavaria where he served five years (1869-1874). He then retired from active service. He did much to destroy the prejudice against a theological seminary-trained ministry on the part of the Methodists. He was a strong abolitionist and several of his sermons and addresses on slavery were published. He also published 'Ministerial Education in the Methodist Episcopal Church' (1853); 'Life in Earnest' for Mothers and Sons of Raza by Caldwell' (1855); 'Outline Lessons in Hebrew.' Consult 'Funeral and Memorial Services of Stephen M. Vail' (Jersey City 1881); also Minutes of the Conferences of the Methodist Episcopal Church, 1881, p. 85.

VAIL, Theodore Newton, American capitalist: b. Carroll County, Ohio, 16 July 1845. He was educated at Morristown Academy in New Jersey, studied medicine with his uncle for two years and then became assistant second-intendant in 1873 and general superintendent (1875-78) of the railway mail service, Washington, D. C. He went into the telephone business (1879-87) and installed many systems in the principal South American cities. Since 1897 he has been president of the American Telegraph and Telephone Company and an officer of many corporations at home and abroad. He is a member of numerous societies, clubs, etc.

VAIL, Thomas Hubbard, American Protestant Episcopal bishop of West Virginia and the Kentucky District: b. Lake City, S. C., 21 Oct. 1812; d. Bryn Mawr, Pa., 6 Oct. 1889. He was graduated from Washington (now Trinity) College, Hartford, Conn., in 1831, and from the General Theological Seminary in 1835. He took orders in the year last named, and in 1837 organized Grace Church, Worcester, Mass. He became rector of Christ Church, Cambridge, Mass., in 1837, in 1839 of Saint John's, Essex, Conn., and was rector of Christ Church, Westerly, R. I., 1844-50. In the following year he was appointed bishop of Saint Thomas' Church, Taunton, Mass., 1857-63, and of Trinity Church, Muscatine, Iowa, 1863-64. In the last-named year he was consecrated first bishop of Kansas. He founded Bethany College, Bethany, W. Va., as its president, and was author of 'The Comprehensive Church' (1841; 3d ed., 1883), etc.

VAILIMA LETTERS, the correspondence of Robert Louis Stevenson (1890-94) called after his home at Samoa and descriptive of his life there. They were written to Sidney Colvin.

VAISESHIKA, vi-sàš-éš-kā, a system of Hindu philosophy of ancient origin and closely resembling in its principles some of the conclusions of modern science. It teaches that all material substances are composed of atoms mechanically united and indestructible, that the combination of these atoms will pass away, and the existing order of things will also pass away. The founder of the system was Kanada, supposed to have lived about 500 a.C., and the system itself was long regarded as heretical, from the Brahmanic point of view. As it is now, however, fully recognized as of equal standing with the five other leading systems of Brahmanic philosophy, the two Mimanas, and the Nyaya, which were the three originally orthodox systems, and the Sankhya, Va, the Yoga, which also bore for some time the stamp of heresy.

VAISHNAVISM. See VAISHNAVA.

VAISHNAVAS, višṇ-va-s, one of the three great divisions of Hindu religion, distinguished from the others by the special worship of Vishnu, but itself divided into many sects, based on the differences attending that worship. Horace Hayman Wilson has divided the Vaishnavas into the following sections: (1) Rāmānuja, Śri Sampradāyas, or Śri Vaishnavas; (2) Rāmānanda, or Rāmāvās; (3) Kabir Panthis; (4) Kāhās; (5) Malāk Dāsīs; (6) Ḍād-a Panthis; (7) Rāya Dāsīs; (8) Senāsīs; (9) Vallabhaārīs, or Rudra Sampradāyas; (10) Mīrā Bāīsīs; (11) Madhvāchārīs or Brahma Sampradāyas; (12) Nimbārs, or Sanakādī Sampradāyas; (13) the Vaishnavas of Bengal; (14)
VAISRAVANA—VALDIVIA

Radhá Vallabhis; (15) the Sakhi Bhávas; (16) Charan Dásis; (17) Harischandris; (18) Sadhú Panthís; (19) Mádhavis; and (20) Sannýásis, Vairágis and Nágás. All these sects have their common ground in the belief in the supremacy of Vishnu over the other gods of the Trimurti. They differ, however, in the character and degree which they assign to this supremacy, and consequently in their religious devotions and practices. Their more modern teachings are outlined in the "Ramcaritmanas" of Tulsidas. Their chief festival, celebrated annually in Bengal and other Hindu cities, is the "Rath Yaga." Many of the devotees paint upright lines on their foreheads. The Vaishnavas include many monastic bodies, composed of members of various Hindu castes, all united in doing honor to Vishnu as chief of the Hindu triad. Consult Muller, 'Six Systems of Indian Philosophy' (1899); and Macdonell, 'History of Sanscrit Literature' (1914). See BRÁHMA; BRAHMA-NÁS; VIŚRÁVA.

VAISRAVANA, vía-ra-vá'na, in the pantheon of the Hindu Sivaites, the god of wealth.

VALAI, vá-lá (German, Wallis, väl'ls), Switzerland, a southern canton, abutting on France and Italy, and having an area of 2,027 square miles. The capital is Sion. The mountains and its southern border are known as the Valais Alps. The canton is surrounded by the loftiest and most magnificent mountain chains in Europe, the Bernese, Pennine and Helvetian or Leptonine Alps, all containing ridges 13,000 to 15,000 feet high, with magnificent glaciers. The Rhone flows through the whole length of the canton, forming the largest valley in Switzerland and discharges into the Lake of Geneva. Where the elevation is not too great the mountain-slopes are covered with large and valuable forests of pines, and lower down of hardwood trees, succeeded by productive orchards; rich pastures abound and support numerous cattle, the principal source of subsistence of the inhabitants. In the lower valley of the Rhone there are much arable land, the finer fruits are grown, and silkworms reared. The canton produces a good deal of wine. In the Upper Valais, German is spoken, in the Lower, which has the larger population, French is more commonly spoken. The capital is Sion. The canton was admitted into the confederation in 1553. Pop. about 130,000.

VALDAI (váld'í) HILLS, Western Russia, a range of hills in the provinces of Novgorod and Tver, averaging about 300 feet in height, but rising in Mount Popovagora to 1,080 feet. They are well wooded, and contain the sources of the Volga, Dnieper and Duna.

VALDÉS, váldés', Armando Palacio, Spanish novelist: b. 1853. See José.

VALDÉS, Gabriel de la Concepción (Placido), Cuban poet: b. Matanzas, Cuba, 18 March 1809; d. Havana, Cuba, 28 June 1844. He was a mulatto and his early life was spent in poverty. His poetry was popular and was published in different newspapers and reviews, but the sentiments expressed seem to have involved him in trouble with the authorities, as he was at one time imprisoned for several months. In 1844 he was accused of complicity in a conspiracy of blacks against the whites, and though innocent was shot as a traitor. He was author of various romances and novels, and his poems have been published in several editions. Perhaps the best of his verse is his prayer, composed just prior to his death and which was translated into English by Mary Webster Chapman. Editions of his works include 'Poesías de Placido' (1838); 'Poesias de Gabriel de la Concepción Valdes, Placido' (1847).

VALDES (VALDEZ) VALDEZ, Juan de, Spanish-Italian reformer: b. Cuenca, Castile, 1500; d. Naples, 1544. He was brother to Alphonse de Valdes, the imperial secretary of state, and was himself secretary to Charles V in Germany. After a sojourn of 10 years he left Germany and went to Naples to occupy the post of secretary to the viceroy. There he devoted himself to literature and gathered around him a band of choice spirits, including Vermigl (see Pétrarca), Ochino and the high-born ladies Vittoria Colonna, Julia Gonzaga, and Isabella Manriquez. Valdes and his company were enthusiastically set upon effecting the regeneration of the church of their day, but although they had no desire to have the Roman obedience, they were regarded as heretics. Valdes wrote 'Spiritual Milk'; 'The Christian Alphabet,' and some commentaries on the New Testament. He wrote in the Spanish language, but the works above mentioned are only extant in their Italian translations. Consult Stern, 'Alfonso et Juan Valdez' (1869); Carasco, 'Alfonso et Juan Valdez' (1880); McCrie, 'Reformation in Italy.'

VALDEZ, Melendez. See MELENDEZ.

VALDEZ, Alaska, city on Prince William Sound. It is the most northerly port open during the winter and is on the great interior Alaskan mail route. The junction of the cable and land lines is made here. The city has churches and schools and a telephone system. Pop. about 1,000.

VALDIVIA, váld'é-vē'á, Pedro de, Spanish soldier, conqueror of Chile: b. serena, Estremadura, about 1498; d. near Tucapel, Chile, 1554. He served in the Italian wars; went to Venezuela about 1534; and soon after joined Pizarro in Peru. He aided in the capture of Diego Almagro (q.v.) at Las Salinas. Later he led 150 Spaniards and several thousand Indians in an expedition against Chile, which had been ceded by Charles V to Pedro Sanchez de Hoz. After defeating a large force of Indians, he established Santiago, 12 Feb. 1541. Subsequently the Spaniards were many times attacked by the Indians and were cut off from Peru. In December 1543 reinforcements arrived, and the colony thereafter prospered. In September 1544 Valparaíso was founded, and in 1546 Valdivia marched into the Araucanian district, and in a great battle conquered the Indians. In 1547-49 he joined Gasea, the royalist, against Pizarro, whom they defeated. In 1550-52 he established Concepción, Valdivia, and other places. A wide uprising of the Indians occurred in December 1553 and while Valdivia was endeavoring to suppress this revolt he was captured and put to death.

VALDIVIA, Chile, (1) capital of a southern province of the same name; on the Valdivia River, nine miles from its mouth, with a safe and roomy harbor, and railway connections.
with the rest of Chile. The entrance to the river is fortified. The town is built on level ground, and is surrounded by apple orchards and vineyards. It has an active coasting trade, chiefly with Valparaiso. Valdivia was founded in 1551 by Pedro de Valdivia, one of Pizarro's lieutenants, and it was at one time a place of great wealth. A wireless station is located here. The chief products are timber, fruit, corn, wheat and vegetables. The town is administered under a revised charter of 1900, which provides for a mayor, who holds office for two years, and a city council.

VALENCIA, vál-ên'shə-ə (Sp. vah-lén'shé-a), capital of a province of the same name, on the south bank of the Turia or Guadalaviar, on the eastern coast, 185 miles east by south of Madrid. The city walls were removed in 1871, and their site transformed into broad boulevards, but two old gates have been left in position. Several bridges across the river lead to northern suburbs. The chief square is the Plaza del Mercado, or market-place, on the north side of which is the Lonja de la Seda, or silk exchange, Guadalaviar, a building of the 15th century, restored in 1892-95. The other noteworthy buildings and institutions of the city are: the cathedral (La Seo), completed in 1482, with an octagonal Gothic bell-tower; the colegio del Patriarca, an ecclesiastical building in Renaissance style (1586-1605), containing a church of Corpus Christi, pictures, frescoes, tapestry, etc.; the church of San Nicolas, with fine paintings by Juanes; the university, founded in 1441, with a valuable library; the Audiencia, formerly the chamber of deputies of the kingdom of Valencia, a 16th-century Renaissance edifice; the provincial picture gallery, strong in the Valencian school; the catedral, built by Charles V, now in ruins; the provincial and the military hospital; the penitentiary; the archiepiscopal palace, etc. The fine botanical garden, the bull-ring seating about 17,000, a theatre, and some other buildings are situated outside of the boulevard line, and on the north side of the river is the chainging Alameda, lined with plane-trees. El Grao, the harbor, is at the mouth of the Turia, on the north side, and beside it are sea-bathing resorts. Valencia has manufactures of silk, cigarettes, paper, oil, chocolate, soap, hemp and linen, weaving, velvet, hat, felt, plush, fans, gloves, hardware, leather goods, pottery, glazed brick works, etc., and a considerable and increasing trade in wine, oranges, etc. Valencia figured in Roman history and was destroyed by Pompey in 75 B.C. It was long the capital of a kingdom of Valencia, which came to an end in 1319. In 1812-13 it was occupied by the French under Suchet. Pop. 235,348; of province, 911,429. The area of the province is 4,150 square miles.

VALENCE, vál-sä, Fr., a town in the department of Nord, at the junction of the Rhônelle with the Scheldt (Escaut) 30 miles southeast of Lille. Its chief buildings and institutions are (or rather were, since the late war almost obliterated the town) the church of Notre Dame du Saint Cordon, a modern edifice in 15th century style, with fine stained-glass windows; an old Gothic church, with a modern tower; the town-hall, a 17th century building, with a façade of more recent date; a lyceum; a museum of painting and sculpture, rich in works of the Flemish school; a natural history museum; a municipal hall and military hospital; an arsenal and barracks. The town suffered three severe sieges in 1793, 1815 and 1914. The district yields much coal, and among the manufactures of the town are chicory, beet-sugar, salt, potash, soap, glass, iron, woolen yarn and woofs, linen, etc. The once flourishing lace industry is now extinct.

VALENCE, völ-ân-shehu, a city, county-seat of Lowndes County, on the Georgia Southern and Florida, the Plant System and the Atlantic, Valdosta and Western railroads, about 150 miles southwest of Savannah. It was settled in 1859 and in 1860 was incorporated. It is in a fertile agricultural region, the principal products of which are cotton, fruit, corn, wheat and vegetables. The chief manufactures are cotton products, including cotton cloth and lumber products. The city owns and operates the waterworks. There are three banks and several newspapers. The government is administered under a revised charter of 1900, which provides for a mayor, who holds office two years, and a city council.

VALENCIENNES—VALENCE. See LACE.

VALENCE is that property of elements by virtue of which they unite to form compounds. The atom of hydrogen has never been known to combine with more than one atom of another element. In terms of this property hydrogen always shows the valency of one. Its valency is therefore taken as the unit of comparison. A number of elements form compounds with hydrogen. Chlorine forms HCl, oxygen forms H2O, nitrogen forms NH3, and carbon forms CH4. Therefore, with hydrogen as the unit, the valency of the elements is 1, 2, 3, 4 respectively. Or, as A. W. Hofmann expressed it in 1865: "It takes the whole atom-power of chlorine, 35.5, to engage one atom of hydrogen; whereas the atom-power of oxygen, 16, suffices to engage two atoms of hydrogen; the atom-powers of nitrogen and carbon suffice, respectively, to engage three and four hydrogen atoms." There are a number of elements with which hydrogen does not combine. The valencies of these elements can only be ascertained by indirect methods. In such instances information is gained by a study of the compounds of elements which can combine with hydrogen. For example, one atom of chlorine forms a stable compound with an atom of hydrogen. The same element will also form the following compounds: KCl, ZnCl2, AlCl3, SnCl4, MoCl6, WCl6. Therefore, the valencies of potassium, zinc, aluminium, tin, molybdenum and tungsten are one, two, three, four, five and six respectively. The highest valency that an element has been known to exhibit is eight. The elements of the argon series (helium, neon, argon, krypton, xenon, niton) are remarkable in that they form no well-defined compounds with other elements. They are described as elements with no chemical affinity. In other
words, their valency is zero. With this property as a basis, elements may be classified as monads, diads, triads, tetrad, pentads, hexads, heptads and octads, the terms having reference to the valencies that are displayed in the formation of compounds. Elements are also designated as univalent, bivalent, tervalent, quadrivalent, etc. The theory of valency has also been extended to include radicles which remain unchanged during chemical transformations. The radicles CH₄, CN, CH₂CO, are univalent, SO₂ is bivalent, PO, is tervalent, PO₃ is quadrivalent, etc. As early as 1851 Crum Brown had suggested that the molecule of hydrogen is a complex of two atoms held together by a common bond, H—H. According to this system carbon dioxide is C=O, ammonia is NH₃, and acetic acid is H—C—C—OH. The bonds in each case represent the valencies of the elements forming the compounds. This system has also been employed by Kekulé, Frankland and others, and is sometimes used at the present day to emphasize the valency of each element in a given product. The system has been found especially fruitful in the domain of organic chemistry. An element does not always exhibit the same valency. It may possess a characteristic active valency which remains constant through a large series of chemical changes, but this valency is often variable, being influenced by physical as well as chemical conditions. The tervalent nitrogen in NH₃ assumes other valencies toward oxygen; sulphur may act as a diad, a tetrad, and a hexad; tin is a diad and a tetrad. In the compounds VCl₃, VCl₄, VCl₅, and VOCl₃ vanadium functions with the valencies of two, three, four and five. The variable property of valency was recognized by some of the founders of the theory. In 1852 Frankland published a memoir setting forth his views on valency in these words: "The compounds of nitrogen, phosphorus, antimony and arsenic especially, exhibit the tendency of these elements to form compounds containing three or four, or even five atoms of the other elements; and it is in these proportions that their affinities are best satisfied: thus in the terval group we have NO, NH₃, N₂, NS, PO₃, PH₃, PCl₃, SbCl₅, AsCl₅, As₂Cl₁₀, etc.; and in the five-atom group NO₂, NH₄, PO₃, PH₃, etc. Without offering any hypothesis regarding the cause of this systematic grouping of atoms, it is sufficiently evident from the examples just given, that such a tendency or law prevails, and that, no matter what the character of the uniting atoms may be, the combining power of the attracting element is always satisfied by the same number of these atoms." It is to be noted that Frankland employed the unit § for the atomic weight of oxygen, and the unit 10 for the atomic weight of sulphur.

Kekulé (1851), on the other hand, regarded valency as a fixed invariable property, asserting that this property must be considered as invariable as the atom itself. He argued that variations in valency are more apparent than real. To him phosphorus trichloride was a true molecule formed by "atomic combination," while the pentachloride was considered to be a molecule of two PCl₅ and Cl₂ formed by the saturation of the one with the other, there being no redistribution of atoms in this saturation. The formula of phosphorus pentachloride was therefore written as PCl₅ . Cl₂, and its dissociation into PCl₅ and Cl₂ at elevated temperatures was taken as an evidence of a peculiar type of loose combination.

The views of Kekulé could not be harmonized with certain known facts even at that early period. Our present-day knowledge shows beyond dispute that even elements of apparently invariable valencies may exhibit variation in this property under certain conditions. For instance, although the science of organic chemistry has for its foundation the theory of carbon, the element may in a few isolated instances show the valency of two. Nef and others have advanced convincing arguments in favor of the bivalency of carbon in hydrocyanic acid (structurally represented as C≡N—H), in isonitrides R—N≡C, and in fulminic acid C≡N—O—H. The case of oxygen, the prevailing valency of which is two, is equally interesting. Thus oxygen compounds have been described in which the doctrine of invariable valency breaks down. There is no doubt that in the oxonium derivatives

\[ CH₂O \]

\[ CH₃H₂O \]

\[ CH₄O \]

\[ CH₅O \]

oxygen could function as a quadrivalent atom. According to Gomberg triphenyl methyl (C₆H₅)₃C, contains a trivalent carbon atom, although this has been questioned, and reasons have been advanced in favor of the adoption of \((C₆H₅)₃C - C(C₆H₅)₃\) as the more rational formula of triphenyl methyl. In view of these observations it is safe to assume that there are very few elements possessing constant valency. As far as we know, hydrogen, sodium and potassium always show the valency of one. Calcium and barium appear to be always bivalent. Other isolated examples of invariable valency might be mentioned; but as a rule valency is a variable property, and although the theory of valency was first formulated by Frankland, Kekulé and others in the early 50's of the 19th century, its germ is to be found in the systems, theories and laws propounded by earlier investigators. Our present-day conception of valency is therefore intimately related to Lavoisier's analytical methods, Dalton's atomic theory, Gay-Lussac's volume relations, Avogadro's hypothesis, and to other theories and laws that have contributed to our better understanding of the science of chemistry during the past century. A number of theories have been proposed to explain the variable property of valency. Albegg states that each element possesses two kinds of valency, namely, normal and contra-valency. In metals the normal valency is electropositive, i.e., non-metals electronegative. When one valency in an atom becomes saturated the remaining valencies will be strongly influenced. Neet claims that the unused valencies in a compound

\[ CO₂ \]

\[ H₂O \]

\[ NH₃ \]

\[ CH₃OH \]

\[ CH₄ \]
saturate one another, and J. van't Hoff seeks an explanation of variability in the shape and form of the atoms. According to Friend there are three kinds of valencies: 1. Free negative valency inherent in elements which can combine with hydrogen. 2. Free positive valency, the numerical value of which is not so easily determined. 3. Residual or latent valency. These differ from the free valencies in that they can only be called out in pairs of equal and opposite sign. Werner distinguishes two kinds of valency, principal or primary, and auxiliary or secondary. According to his theory, nitrogen, sulphur, chlorine, oxygen, platinum, gold and other elements may in some of their compounds bring into action their secondary valencies, forming complex derivatives. With this theory, Werner attempted to explain the constitution of double salts, crystalline hydrates and complex molecules.

It is generally admitted that none of these theories can account for all known facts. Each one of them has made its contribution to the proper appreciation of observed phenomena. We are equally uncertain as to the true nature of valency itself. Of the theories that have been put forward to clear the situation the electrochemical theory and the corpuscular or electronic theory have been most favorably received. As early as 1806 attention had been directed by Sir Humphry Davy to the relation of chemical affinity and electrical force, and attempts had been made to employ this as a basis for a theory of chemical combination. Later in the century Faraday summed up his studies on electrolysis in a general law which says that, the reaction of an ion conveyed by an ion of a metal in the electrolysis of a solution of a salt is directly proportional to the valency of the ion. With these earlier conclusions as a basis, the electrochemical theory was revived by Helmoltz. The theory had many adherents during the latter part of the 19th century. The corpuscular or electronic theory formulated by J. J. Thomson starts with the assumption that corpuscles or electrons are constituted of all atoms; so that the chief difference between one atom and another is not one of quality—since all atoms contain electrons—but is a difference of quantity, and of distribution or arrangement. The electrons carry minus charges of electricity, and yet they are ordinarily present in a neutral atom. This being the case, we should look for a corresponding positive charge, somewhere in the atom, and the hypothesis has been brought forward that the positive charges constitute the nucleus of the atom. When two electronic systems, e.g., that of hydrogen and chlorine, come into contact, one of the electrons gets detached from the atom and describes an orbit around the other atom. Each atom was originally neutral; but the system from which the electron was removed becomes a positive atom, and the system to which the electron is added becomes a negative atom. This transfer of an electron then makes hydrogen a positive system and makes chlorine a negative system. Here we have a plausible explanation of the valency of an element. An atom minus one electron, or an atom plus one electron may be considered as the most stable and therefore capable of attracting oppositely charged atoms to form electrically neutral systems. An atom less than two electrons, or, with two electrons in excess, would have twice the ability to combine. It would have the valency two. Consult Friend, 'Theory of Valency'; Werner, 'Theory of Valency'; von Meyer, Ernst, 'History of Chemistry'; Freund, 'The Study of Chemical Composition'; Muir, Pattison, 'History of Chemical Theories'; Thomson, 'Electricity and Matter'; Millikan, 'The Electron.'
VALENTINIAN I.—VALERA Y ALCALA GALIANO

Berlin, making a special study of philology and jurisprudence, and in 1854, under government auspices, founded the seaport Puerto Limon in Costa Rica. While thus engaged he learned that the natives had no knowledge of their ancestors, and on his return to Germany he made use of his years in describing the history of early Spanish colonization in Central America. He later studied the prehistoric remains of Guatemala and the surrounding regions, and his 30 years' labor in deciphering the pre-Columbian manuscripts placed him in the front rank of American archaeologists. An achievement which added much to his reputation was his interpretation of the famous Mexican calendar-stone, concerning which he published an account, The Mexican Calendar Stone (1878). His other works include The Landa Alphabet (1880); Two Mexican Chalchihuites (1881); The Olmecas and the Tuletecas (1883); A Study of the Voyage of Pinzon to America (1896), etc.

VALENTINIAN I, Flavius, Roman emperor; b. 312 A.D.; d. Bregetio, Germany, 17 Nov. 375. He entered the army and by his capacity and courage rose rapidly in rank under Constantius and Julian, and on the death of Jovian was chosen as his successor, 26 Feb. 364. He resigned the sovereignty of the East to his brother Valens (q.v.) and himself governed the West with ability till his death. He possessed great military skill and was a prudent administrator. His reign was occupied in campaigns against the barbarians along the borders of the empire. By his first wife he had Gratian and by the second, Justina, another son, Valentinian II, and three daughters, one of whom, Gala, became the wife of the Emperor Theodosius I. He was succeeded by Gratian and Valentinian II.

VALENTINIAN II, Flavius, Roman emperor; b. 372 A.D.; d. 15 May 392. He was an infant of four years at the death of his father and received from his elder brother, Gratian, the provinces of Italy, Liguria, and Africa as his title, but the Western empire. During his minority Gratian practically exercised supreme authority until his own death in 383. Maximus, the murderer of Gratian, paid no attention to Valentinian till 387, when he invaded Italy and Valentinian then fled to Thessalonica to seek aid of Theodosius, emperor of the East. Theodosius now governed in effect for Valentinian, who, while in Gaul, was murdered by Arbogastes, the commander-in-chief of his army.

VALENTINIAN III, Flavius Placidus, emperor of the West, grand-nephew of the preceding; b. about 419; d. 455. He was the son of Constantius III, by Placidia, the daughter of Theodosius the Great, and was seated on the throne of the West by Theodosius II, emperor of the East, in 431. He was a weak prince who never really ruled the 30 years that he sat on the imperial throne; his mother, Placidia, governing for him till her death in 450. She was succeeded by the eunuch, Heraclius. Valentinian's treatment of Bonifacius made the latter the cause of general revolt, which果树, chief of the Vandals, and thus Africa was lost to the empire. Aetius, the butters of his em-
pire, the emperor stabbed to death in a fit of envious jealousy (454), but next year was himself slain by Maximus, whose wife he had ravished. Valentinian was the last of the Theodosian line. Fletcher's powerful tragedy of 'Valentinian,' produced before 1618 but not printed till 1647, was bound up in fragments in the life of this monarch. Consult 'Cambridge Medieval History' (New York 1911).

VALENTINIANS, the followers of Valentinus, an Alexandrian gnostic, who in 141 went to Rome, where he actively disseminated his views up to the year 160. He propounded the doctrine of 'thelemo' (q.v.) that there were 10 male and as many female aëons or worlds in the universe. The youngest aëon, Sophia (Wisdom), brought forth a daughter, Achamoth, whence sprang the Demiurge, who created mankind. This Demiurge was regarded as the only god, and led many angels into the same error. To repress his insolence, Christ descended, Jesus, one of the highest aëons, joining him when he was baptized in Jordan. The Demiurge had him crucified; both Jesus the Son of God and the rational soul of Christ had separated, leaving only the sentient soul and the ethereal body to suffer. The Valentinians were divided into many sects and schools. See Gnosticism.

VALENTINUS, val-en-ti-nus, Basilus, German alchemist; b. at the end of the 14th century. He appears in history as traveling through Spain, England, and Holland, and in 1413 he retired to a Benedictine monastery at Erfurt. He was far in advance of his age in knowledge of chemistry. He distinguished between bismuth and zinc, produced pure quicksilver from sublimates of mercury and nitrate of quicksilver. His special investigations, however, were in relation to alchemy, and the results he attained were accepted as ultimate for at least a century. He discovered muriatic acid, ammonia, fulminating powder, sugar of lead and formulated the earliest method of quantitative analysis. His works remained unpublished until 1677 a couple of centuries after his death; the text was preserved by Phrygicus and Phrygicus, who ascribed to him the discovery of some of the scientific secrets which they revealed.

VALERA Y ALCALA GALIANO, Juan, hoo-an vá-lá' rá é ál-ka-lá' ga-le-á'-nó, Spanish statesman and author; b. Cabra, near Cordova, 18 Oct. 1824; d. Madrid, 18 April 1905. He studied at Granada, turned from jurisprudence to a diplomatic career, and was secretary of legation successively at Naples, Lisbon, Rio de Janeiro, Dresden and Saint Petersburg. Then he returned to Spain and wrote for El Contemporaneo, the organ of the opposition to O'Donnell. In 1859 he became deputy, and Minister of Commerce and Agriculture. After serving as Ambassador at Frankfort, he took part in the Spanish revolution of 1868. Subsequently he was Ambassador to Lisbon, Washington (1884-86), Brussels, and Vienna. He was also a member of the senate, the council of state, and the Spanish Academy. While thus prominent in public affairs, his health was so continually impaired that he was nevertheles given to literature. His verse was finely wrought, but was criticized as the expression rather of wide culture than of poetic inspi-
ration, and his criticisms for a certain courtesy which interferes with a clear and impartial judgment are assuredly due to his high place not only in Spanish but in general literature. His 'Pepita Jiménez' (1874) marked the revival of Spanish fiction, and the detachment from French patterns. His work steadily improved, and he treated with equal skill both the short stories and the short tragedy and the long. He was particularly praised for a "complete synthesis of gravity of matter and gaiety of manner." Among the titles of his further works are: 'Las Ilusiones del Doctor Faustino' (1876); 'El Comendador Mendoza' (1877); 'Doña Luz' (1878); 'Pasarse de Listo' (1888); 'Estudios Críticos' (1864-84); 'Nuevos Estudios' (1884); 'La Buena Fama' (1895); 'Juanita la Larga' (1896); 'Genio y Figura' (1897); 'Morsamor' (1899); 'De Rios Argentinos' (1901); 'Ecós Argentinos' (1901); 'Florilegio de Poesías Castellanas del Siglo XIX', Vols. I-III (1901-2); 'Poesías' (1888); 'Canciones, Romances, y Poemas' (1883). A collective edition appeared in 1883 in the 'Colección de Escritores Castellanos.' See PEPIA JIMÉNEZ. Consult Brunetiére, 'La casuística dans le roman de Juan Valera' in his series 'Histoire et littérature,' Vol. I.

VALERIAN, vā-i-lē-rē-an (PUBLIUS LUCINUS VALERIANUS), Roman emperor; b. about 190 A.D.; d. about 260 A.D. He was descended from a noble Roman family and rose by degrees to the highest offices in the state. When the Emperor Decius in 251 determined to revive the censorship, Valerian was chosen by him to occupy the post, but his death in 253 interrupted the plan and Valerian was chosen emperor. His reign was of slight importance, he accomplished little to avert the impending dissolution of the empire, and was almost constantly involved in warfare against the Persians and the barbarian tribes surrounding him. In 260 he was taken prisoner by the Persians and died in captivity. He was succeeded by his son Gallienus.

VALERIAN, the type genus (Valeriana) of the valerian family, herbs or shrubs having flowers with five-parted perianths, and funnel-shaped, obscure corollas, which are generally of a pale rose-color. The calyx, which is rudimentary, when in flower, becomes a feathery pappus at the top of the fruit. The leaves are simple or pinnate, without stipules, and the small blossoms are gathered into profusely branched cymose inflorescences, usually terminal. They have a spicy, aromatic odor, very grateful in spring, and are sometimes so fragrant, as in the case of Valeriana stenchnis and V. officinalis as to suggest heliotrope. The latter species is the common, or great wild valerian, which is cultivated in gardens for its flowers and its root. It has an erect stem, two to five feet tall, with pinnate leaves and toothed leaflets, and very fragrant flowers in pale tinges of yellow, spire-like, with white, blue, or purple, the ascending rhizome, with many fibrous roots, has a peculiar, pungent and most disagreeable odor, due to the volatile oil of valerian contained in it, which grows stronger and worse when old. The taste is bitter, and like camphor, and the root is an officinal herb, which is stimulant and sudorific, used in hysteric, and as an antispasmodic. Cats are very fond of the odor of valerian, and tear the plant to pieces and roll in it. They are said even to dig up the roots and devour them. A bit of the root is said to be a most effective bait for catching rats. The carrot-like roots of Valeriana edulis, a tall glabrous plant of the western United States with undivided stem leaves, and yellowish-white flowers in elongated panicles, are eaten by the Indians either raw or dried. The Pah-Utes even grind them into flour and use it in the form of bread or mush. Nard is a name given to various species of valerian, but particularly to V. celitica, employed by Eastern nations as a substitute for spikenard in their scented baths; it is, like asafetida, a fragrant and as- nard, and, like the Cretan spikenard (Valeriana phu), has medicinal properties similar to, but weaker than, the officinal valerian. The Greek valerian is Polemonium carvuleum, mistaken by old herbalists for the valerian described by the ancient Hellenes, and the name has been applied to the whole genus, including the creeping American P. reptans, with delicate nodding corynths of pale blue flowers. Centranthus ruber is the scarlet lightning, a spurred or red valerian, cultivated for its oblong panicle of scarlet flowers. The African or Algerian valerian (Fedra corniculata) is used as a salad plant in Algeria. It is low, glabrous and branching, with oval leaves, and tubular, long, pink flowers. It can be cultivated and eaten like corn salad, but is not so hardy.

VALERIANOS, vā-i-lē-rē-ō-nōs, Apostolos. See VUC, JEAN DE.

VALERIC or VALERIANIC ACID, CH₃CO₂H. Four acids of this composition are known. The one ordinarily known by this name is the monocetic acid as ethereal salts in the animal and vegetable kingdoms, chiefly in valerian and angelica roots. It may be made artificially by the oxidation of ordinary amyl alcohol by chromic acid mixture. It is a colorless oily liquid; lighter than water, and possessed of a peculiar odor and a sharp acrid taste; somewhat soluble in water but very easily so in alcohol; unites with bases to form salts called valerates or valerianates and with alcohols to form ethereal valeric alcohols, which are frequently of a rather agreeable odor and taste and for such are much used in the preparation of artificial fruit essences. Some of the metallic valerianates are used in medicine because of their slight sedative action.

VALERIUS, Placitus Setinus Baibas, flák′ūs se-ši-nūs bar′bās, Càius, Latin poet; b. Padua, lived in the time of Titus and Vespasian; d. about 90 A.D. He wrote and dedicated to Vespasian the 'Argonautica,' a poem in eight books, in which he narrates the adventures of Jason and his companions. This epic he left unfinished. He is merely a somewhat free translator of Apollonius Rhodius, whose work he tricks out with rhetorical flourishes, while in some passages he is so obscure as to be nearly unintelligible. Consult Langen, 'Va-leriī Flacci Argonautica cum notis' (1896).

VALERIUS, Publius, surnamed Pul-licola, Roman consul and general: d. 503 B.C. He was instrumental in the expulsion of the Tarquins, and when Tarquinius Collatinus was forced to resign Valerius was elected consul in his stead in conjunction with Junius Brutus. When the Tarquins, aided by the Veientes,
moved against Rome in 509 B.C. they were met by the Romans under the two consuls and defeated. Brutus fell in the battle leaving Valerius sole consul. He promulgated a law by which any person who attempted to usurpingly power might be killed by any one, and another establishing the right of a plebeian condemned by a magistrate to appeal to the people. In recognition of his services he received the surname of Paris, but died without a son or other friend.* He was three times re-elected consul, conducted the expedition of Porsena, and with his colleague, Titus Lucretius Tricipitinus defeated the Sabines in 504. He is mentioned by Livy. His life was written by Plutarch.

VALENIUS ANTIAS, vä-lë-në-us änti-äs, Roman historian. He lived in the middle of the 1st century of our era and his work was an account of Latin history from the founding of Rome, and comprised 37 books. It abounds in exaggeration and fabulous incident. The author draws largely from Livy, as far as that author extends. The disjunct remains of Antias are published in Peter's 'Historicorum Romanaorum Fragmenta' (1883).

VALENIUS CATO, kä-tö, Publius Latin poet. He appears to have been born in Cisalpine Gaul in the 2nd century B.C. During the dictatorship of Sulla, and the confusion caused by the proscriptions, he lost his estate, being then in his minority, and went to Rome as a needy student, although his talent as a critic and grammarian of the Alexandrian type eventually won him credit and distinction. Two poems, 'Dirae' and 'Lydia,' which long passed under Virgil's name, have been attributed to him on somewhat doubtful evidence. Consult Ribbeck, 'Aeneidis Vergiliana' (1895).

VALENIUS CORVUS, kor'-vüs, Marcus, Roman general: b. about 371 a.c., d. about 271. In 349, being military tribune under Camillus in his campaign against the Gauls, he accepted the challenge of a gigantic warrior to single combat, and, after a marked contest with the assistance of a raven which perched upon the helmet of Valerius and as often as he advanced upon his foe flew at the Gaul's face. A general battle then ensued, in which the Romans were completely victorious. From this circumstance Valerius was considered one of the greatest of Roman heroes and was given the surname of Corvus (a raven). He was made consul the next year, and the same honor was conferred upon him five times afterward. In his third consulship, at the age of 29, he gained two victories over the Samnites at Mount Gaurus and at Suessula. In 342 he was appointed dictator on his quelling through his personal popularity a mutiny in the army. He was dictator again in 301, when he defeated the Marsi and Etruscans. He held curule dignities 21 times, repeatedly enjoyed the honors of a triumph, and is referred to by the Roman writers as an example of the favors of fortune.

VALENIUS MAXIMUS, mäk'-si-müs, Marcus, Historicorum Romanorum Fragmenta of the 2nd century A.D. Nothing is known of his life except that he accompanied Sextus Pompey into Asia. His name is appended to a collection of historical anecdotes entitled 'De Factis Dictisque Memorabilibus Libri IX,' which embraces a large variety of subjects, and as a historical authority is of some value. Abriggements were made by Titus Probus, Julius Paris and Januarius Nepotianus. Those of the two last named were discovered by Cardinal Mai in the library of the Vatican. Appended to the text of Valerius Maximus is a fragment entitled 'De Nominibus Prenominibus, Cognominibus, Agnominibus, Appellatibus, Verbis,' of which the first chapter only is extant. It professes to be an epitome made by Julius Priscus, but it is clear from the connection with the work of Valerius. The best editions of Valerius Maximus are those of Torrenius (1726); Hase (1822); Kemp (1854); Halm (1865). The work was translated into English by Speed (1698).

VALENIUS PROBUS, See Probus, Marcus Valerius.

VALETTA, väl-ët-tä, a fortified Mediterranean seaport, capital of Malta (q.v.), on the northeast coast of the island, picturesquely situated on an elevated peninsula, with a large and commodious harbor on each side. The streets are narrow, the squares are spacious and handsome, and the splendid quays are lined with elegant buildings. Owing to the inequality of the site the different streets connect by flights of steps. The cathedral, built in 1580, contains the tombs of the Knights of Malta, who are represented in white marble in full costume. The governor's residence, the ancient palace of the grand masters, has a corridor hung with portraits of knights, and an armory rich in trophies and ancient armor. A library and museum, a university, a garden, a military hospital, occupying a noble building erected by the knights, and other public institutions, are notable features. There are several dry-docks and the town is an important coaling station. It has a stone quarry, silk factories, a large transit trade and is the chief station of the British fleet in the Mediterranean. Over 100 vessels are registered from this port, one-third of them steamships. Pop. 25,000.

VALETTA, Jean Parisot de la, zhön pär-rë-soh dé lä väh-teh, French soldier; b. Toulose, 1494; d. Valetta, Malta, 28 Aug. 1568. He came of a noble family of Toulose, early entered the order of the Knights of Saint John and was elected grand master of that order in 1557. His after career was a series of exploits in warfare with the Turks, ending with his renowned defense of Malta, lasting from 18 May 1565 till 8 September. The Turkish armament included 159 war ships and 30,000 men; while the defenders were 8,500 men, with 700 knights, who held the fortifications heroically in spite of awful loss and privations, till the siege was raised on the approach of a Neapolitan fleet. Valetta was the founder of Valetta (q.v.).

VALEYLA. The abode of Odin as described in Norse mythology. It was the house of joy and of vast proportions, being reported as having 540 entrances, each so broad that 800 heroes could march through abreast. Also the Pantheon, or Temple of Fame, built by Louis I of Bavaria, at Ratisbon, and consecrated to all Germans who have become renowned in war, statesmanship, literature and art. Also applied generally to buildings dedicated to national heroes or the distinguished dead in various fields.
VALISE—VALLANDIGHAM

VALISE. See Trunk.

VALKYRIES, vāl-kī̆rēs ("Battle-Maidens"; "Shield or Wish-maidens"), in Norse mythology, beautiful and alluring women who ride through the air clad in gleaming armor and jewels of gold, lead the battle and select the Val or Einherjar, single champions worthy of Wodan and of entrance into Walhalla. From the manes of their horses (the clouds) cords are trailing and the points of their spears scatter sparks of light. They lead the fallen heroes to Walhalla and offer them there the drinking horn. Sometimes they are of supernatural origin; sometimes the daughters of princes; they can change themselves into swans at will. They sometimes take noble heroes to be their lovers. Brunhilde in the heroic poetry of the north is a Valkyrie. Most of the names of the Valkyries contain some reference to war and battle. See SCANDINAVIAN LANGUAGE AND LITERATURE. Consult Gotthelf, 'Der Valkyrienmythos' (1889).

VALLA, vāl-lā, Laurentius (LORENZO DELLA VALLE), an Italian humanist: b. Rome, 1407; d. there, 1457. He studied Greek and Latin under Bruni and Arispa, took orders in 1431 and was appointed professor in the University of Pavia the same year. Subsequently to 1433 he held the same office in Milan, Genoa and Venice, and in 1442 became secretary to Alfonso V of Naples. Pope Nicholas V summoned him to Rome and made him secretary and apostolic writer (1447); and he passed his remaining years in translating from the Greek, and in furious literary feuds with Poggio, Trapezuntios and others among his contemporaries. He was a born controversialist and reckless in the utterance of his views. He condemned moral standards of ecclesiastical asceticism in his 'De Voluptate Dialogus' (1431); he assailed the scholastic logic of the Middle Ages in his 'Repastinatio Dialecticae'; the use of uncritical words and idioms in Latin writing was criticized in his 'Elegantiae Latinae Sermonis' (1431), and the claims of the papacy to temporal dominion were attacked in his 'De Falso Credita et Mentita Constantini Donatone Declamatio' (1440). He wrote numerous other tracts of a destructively critical character, and was especially obnoxious to the professors of the current theology by his 'Annotationes in Novum Testamentum' (afterward edited by Erasmus), in which he attacked with much acrimony the Vulgate's translation of the Gospels and Epistles. His translation of Thucydides and Herodotus into Latin are not without authority at the present day. Consult Barozzi and Sabbadini, 'Studi sul Panormita e sul Valla' (1891); Mancini, 'Vita di Lorenzo Valla' (1895); and Wolff, 'Lorenzo Valla, Sein Leben und seine Werke' (1893).

VALLABHACHARYA, vāl-lā-bā-kārē-ā, a Hindu religious reformer. He flourished in the 15th century, and his followers are most influential at the present day. He is regarded as Maharajah Vallabha, son of Vishnu, and his descendants, under the title of Maharajah, or Gosain, are treated with almost divine honors. He inculcated the worship of Vishnu by his name of Krishna, in which form the god, like Vishnu, is regarded as the lord and company of mortal maidens. The worship of Krishna has a tendency to licentiousness, and a reaction toward a more spiritual and exalted creed set in under Swami Narayan about 100 years ago. Consult Mulji, 'History of the Sect of Maharajahs or Vallabhacharyas in Western India' (1865); Williams, 'Hinduism' (1877).

VALLADOLID, vāl-yā-thō-lēth', Mexico. See Morelia.

VALLADOLID, Philippines, pueblo, province of Negros Occidental; on the west coast on Guimaras Strait, 16 miles south of Bacólod. Pop. 14,000.

VALLADOLID, Spain, (1) Capital of the modern province of the same name, a garrison town, and archiepiscopal see, on the left bank of the Pisuerga, a tributary of the Douro, at the confluence of the Esgueva (largely covered in) from the east, and the Canal of Castile from the north, 100 miles northwest of Madrid. It is situated in a spacious, fertile plain and has fine streets and squares. The Plaza Mayor or de la Constitución is the center of the city and life. The cathedral, begun in late Renaissance style in 1585, is still unfinished; the most interesting church is that of Santa Maria la Antigua, dating from the 12th century. Close to these two edifices stands the university, a 17th century building, with a library. Other noteworthy buildings and institutions are the Colegio de Sant Crist, a splendid plateaquesque building of the 15th century, containing a museum and some modern paintings; the Colegio de San Gregorio, a 15th century building, now devoted to municipal purposes, with a splendid Gothic facade; the 13th century church of San Pablo, with an ornamental Gothic facade; the royal palace, dating from the 17th century; the Convent of San Benito, now used as a barracks; two 'theatres'; a bull-ring; a general hospital, etc. The Campo Grande is the finest park of the city. The industries include iron-founding and manufactures of felt, silks, paper, gold and silver wares, chemicals and leather. Valladolid was the capital of Spain before Madrid. It is the birthplace of Philip II and contains the house in which Columbus died. One of the foreign institutions of the University of Scottish Roman Catholic priests was formerly situated here. Pop. (1910) 71,066. (2) The province has an area of 2,922 square miles and is an agricultural region. It was formerly noted for its weaving and tanneries, but all industry has declined of late. Pop. about 300,000. See CASTILE.

VALLADOLID LA NUEVA, là nwa/vā, Honduras. See Comayagua.

VALLANDIGHAM, Clement Laird, American politician: b. New Lisbon, Ohio, 29 July 1820; d. Hamilton, Ohio, 17 June 1871. He was educated at Jefferson College, and was admitted to the bar in 1842. More inclined to a political than legal career, at 25 he became the representative of Columbiana County in the legislature of Ohio. In 1847 he removed to Dayton, Ohio, which he made his permanent home, and took charge of The Empire, a Democratic newspaper, which he edited with marked ability for two years. He returned to his profession in 1849, but sought political honors, and after two defeats was elected to the House of Representatives in 1856; was re-elected in 1858, and was in Congress at the outbreak of the
Civil War. He strenuously opposed the war as being unnecessary and unconstitutional, and his opposition was radical and persistent.

Failing of election to Congress in 1863, he returned to Ohio, and at political meetings opposed and denounced the government and the war policy in such bitter terms, that he became the most prominent leader of the so-called "Copperheads" of the North. His extreme opposition to the war led to his arrest in May 1863 at Dayton, by General Burnside, commanding the military department of the Ohio. He was tried by a military commission at Cincinnati, Ohio, for disorderly utterances and conduct, found guilty and sentenced to close confinement during the war, but President Lincoln commuted the sentence to banishment beyond the Federal lines, and he was sent south through General Rosecrans' camp at Murfreesboro into the Confederate lines. Being unwilling to escape for fear of the Confederacy and dissatisfied with his reception in the South, in a short time he ran the blockade from Wilmington, N. C., and proceeded by sea to Halifax, and later to Windsor, Canada, where he made his home for a time. While at Windsor he was nominated the Democrat of Ohio for governor, against the Hon. John Brough, and was defeated by over 100,000 majority. In 1864 he returned to his home at Dayton without molest-}

through which he traveled which include Persia, India, Egypt, Turkey, Arabia and the Holy Land. It was only in 1526 that he returned to Italy after an absence of almost 10 years.

VALLEJO, vâl-yâ'ho, Cal., city in Solano County, on Napa Creek, an arm of San Pablo Bay, and on the Southern Pacific. It is about 25 miles northeast of San Francisco and opposite Mare Island Navy Yard. The city was founded in 1851 and was intended for the capital of the State. The legislature held sessions here in 1851, 1852 and 1853, but only a part of the session of 1853 was held in Vallejo. In 1866 the city was chartered. It is in a fertile agricultural section and nearby is a quick-}

VALLENTINE, Benjamin Bennaton, "FitzFnoode," American journalist and dramatist; b. London, England, 7 Sept. 1843. He studied for the English bar and coming to this country was one of the founders of the English bar and coming to this country was one of the founders of Puck and its editor 1887-89; and dramatic critic of New York Herald. He is the author of "The Fitznoodle Papers;" "Fitznoodle in America;" and such plays as "A Southern Romance;" "In Paradise;" and "Fitz in New York.

VALLE CITY, N. D., city, county-seat of Barnes County, on the Cheyenne River, and on the Union Pacific and the Minneapolis, Saint Paul and Sault Sainte Marie railroads, about 55 miles west of Fargo. It is in an agricultural and stock-raising region. The industries are connected chiefly with farm products and the shipment of livestock, and the city is a distributing center for quite an extensive region. The educational institutions are the State Normal School, public graded schools and a school library. There are good banking facilities and newspapers. Pop. 4,600.

VALLEY FALLS, Kan., city in Jefferson County, on the Kansas City Northern, the Union Pacific and Atchison, Topeka and Santa Fé railroads, about 30 miles west of Leavenworth and 26 miles north of Topeka. It is in a fertile agricultural region. The river furnishes excellent water power, and the chief manu- factories are flour-mills, machine shop, and agricultural implement shop. There are two State banks. Pop. about 1,480.

VALLEY FORGE, Pa., village in Chester County, on the Schuylkill River, and on the Philadelphia and Reading Railroad, 24 miles west of Philadelphia. Valley Forge is noted as the place where Washington and his army of about 11,000 men wintered during winter quarters, 17
Dec. 1777, after the occupancy of Philadelphia by the British. The army suffered cold and hunger on account of the poverty of the country, but perhaps more from the incompetency of the commissary department. Despite the consequent illness of many of the men, Baron Steuben, who had been made inspector-general of the army, drilled and trained the soldiers and reorganized the army. Washington was at Valley Forge when he received the news of the consummation of the alliance with France. Washington abandoned the camp 18 June 1778, and again took possession of Philadelphia. In 1893 the Pennsylvania legislature took steps to acquire and preserve Valley Forge as a public park and historic landmark. On 19 Oct. 1901, a monument was here unveiled by the Daughters of the Revolution in memory of the soldiers who died in camp during the winter of 1777-78. The entire field at Valley Forge is practically the same to-day as it was when evacuated by Washington in 1778. The trees that were thrown up by the "ragged Continentals" may still be seen. The old stone house which Washington used for his headquarters is standing and is in a good state of preservation. In 1903 the matter of buying Valley Forge, which was again taken up by the legislature of Pennsylvania, and the sum of $74,500 was appropriated for the purpose. To the 210 acres already owned by the State 800 acres were added.

**VALLEY JUNCTION, Iowa, city in Polk County, on the Chicago, Rock Island and Pacific, and Milwaukee and St. Louis railroads, about five miles west of Des Moines. It has coal mines, cement works, extensive railroad repair shops and stock yards. Pop. about 3,200.**

**VALLEY QUAIL. See Quail.**

**VALLEY TRAINS.** Stratified deposits filling valleys, and laid down by overloaded streams flowing from the melting ice fronts of glaciers. Such deposits, when more widely spread over a region, and not confined to valleys, are called outwash plains. The latter are often many miles in extent, and are now accumulating at many points along glacial fronts in Alaska.

**VALLEYFIELD, or SALAHERRY DE VALLEYFIELD, Canada, a town and port of entry in Beauharnois County, on the Saint Lawrence River, and at the head of Beauharnois Canal constructed past the Saint Lawrence rapids, 30 miles by the Grand Trunk Railway southwest of Montreal. The river here is crossed by a splendid railway bridge. Valleyfield is the see of a Roman Catholic bishop, and has a cathedral, college and other fine public institutions. The town is electrically lighted, has abundant water power, waterworks, and flouring-, paper-, and cotton-mills, one of the latter establishments employing 1,500 persons. Pop. 13,000.**

**VALLEYS, in general, depressions of some magnitude in the surface of the land. Two great classes of valleys may be recognized,—(1) structural, and (2) erosional. The former include depressions due to folding, such as synclines; basins due to subsidence of an area such as Lake Superior; and troughs due to interference in drainage, or in volcanic regions; fault valleys which when narrow gorges, like that of the Rhine, are known by the term of "graben," and others. Erosion valleys embrace by far the more common types, such as river valleys, which range from gorges with vertical sides and completely filled by the river, to depressions many miles in width, with flat bottoms and gently sloping sides. These are carved wholly by the rivers that occupy them. The larger valleys of this type are generally found along the border line between ancient more or less disturbed, and more modern coastal plain strata which lap up against the older ones. By continued erosion the edge of the newer strata is pushed further and further away from the older land, until a valley of great width is produced along the strike of the strata. Valleys of this type are well developed along the Atlantic Coast, next to the crystalline rocks of the Piedmont district. Some valleys of this type have suffered drowning, as appears to be the case in Long Island Sound. Other valleys of this type have been filled with water and transformed into lakes by the stopping up—by glacial drift or warping of the land of their outlets. Such is the case with the valleys now holding the water of some of our Great Lakes, notably Ontario. Valleys having sharp turns are not uncommon, although it is probable that glaciers usually do little more than deepen valleys originally formed by streams. A type not included in the two divisions mentioned is found in intra-montal valleys within the glaciated region. Here a remnant of the plain around which hills of glacial drift are built. See Mountain; Flood Plains.

**VALLISNERIA, the typical genus of the tape-grass family. It is composed of aquatic plants, *V. spiralis* being the tape-grass or eel-grass, whose long submerged leaves are eaten by swimmers; in Chesapeake Bay it is the "wild celery," upon the roots of which the canvass-back feeds, and to which are due the admirable flavor of that duck. The leaves are very long and narrow, and float just under the surface of the water, in shallow water, the plant being rooted in mud or sand. It spreads widely by stolons, so that it often forms a wide belt along the shore, which is a great refuge for the small fry of water-life, but greatly impedes the passage of boats. *Vallisneria* is peculiar in its arrangements for cross-fertilization. The leaves are arranged in fascicles, from the axils of which spring the flowers, only one sex on each plant. They are enclosed in a kind of bladder formed by two membranous, concave bracts. There is only one pistillate flower to a bladder, and when ready for fertilization, the envelope splits and frees this flower, its ovary elongates, and it is pushed upward by the growing stalk, until the whorl of three lanceolate sepals floats on the surface. Above them are three abortive petals, and three stigmas, by-lobed at the apex, and fringed on the edges. They project slightly between the sepals. In the meantime, the bladder about the staminate flowers, which are numerous, on a short axis, and have never risen far above the mud, becomes disrupted, and the flowers, which are globular, and have their three sepals closed tightly over the stamens, float like bubbles in the water. When the sepals drift about, and soon open. The arched sepals become reflexed, until they look like three boats.
tied close together at one end. Two stamens project obliquely from the point of union, tipped with masses of sticky pollen-cells. These tiny crafts are blown about by the winds, and carried by currents, on the surface of the water, sometimes covering it as with a creamy film. In the course of their travels, they almost inevitably strike against the waiting pistillate flowers, riding at anchor, with their three stigmas poised at exactly the angle to allow their fringes to detach the sticky pollen-masses from the other flower. As soon as the pollen adheres firmly to the stigmas, the pistillate flowers are withdrawn beneath the surface by the contraction of the long stalks, which assume a spiral form, and ultimately ripen fruit near the muddy floor of the stream.

HELEN INGERSOLL.

VALLOMBROSA, val-lom-brō'sā (Italian, 'shady valley'), Italy, a celebrated abbey situated in a thickly wooded valley of the Apenines, about 18 miles southeast of Florence. It was founded by San Giovanni Gualberto about 1018, subject of Saint Benedict, and the institution was approved by Pope Alexander II in 1070. The original purpose of the founder was to establish separate hermitages, but a monastic mode of life soon began to prevail. The Order of Valrombrosa was strictly contemplative, was the first to admit lay brethren, and established 60 branch houses in Italy and France. The abbey acquired celebrity from its romantic situation, and its magnificent buildings were erected in 1637. It was a place of refuge for French priests during the first revolution; in 1808 it was pillaged by Napoleon. It was appropriated in 1866 by the Italian government and the building is now occupied as a school of forestry, although some monks still reside here and attend to the meteorological observatory established in 1654. The place is much visited on account of its fine scenery and the views it commands, and there are hotels for the accommodation of visitors. Valrombrosa has been celebrated by Dante and Ariosto, and the Milotian quotation "thick as autumnal leaves that strew the brooks in Valrombrosa" is well known.

VALOIS, val-wā', House of, a younger branch of the Capetian dynasty, which occupied the throne of France from 1328 to 1589. On the death of Charles IV, the last of the direct line of Capetians, his cousin Philip of Valois, the grandson of Philip III and great-grandson of Louis IX, was acknowledged king as the next male heir. His direct successors were John (1350-64), Charles V (1364-80), Charles VI (1380-1422), Charles VII (1422-61), Louis XI (1461-83), and Charles VIII (1483-98). The last named, dying without male issue, was succeeded by his cousin Louis of Orleans, the great-grandson of Charles V, who ascended the throne as Louis XII (1498-1515). Like his predecessor, he left no son, and had for his heir his cousin Francis of Angoulême, the offspring of a younger branch of the family of Valois-Orléans, a grandson of Francis I (1515-47). After him his son, Henry II (1547-59), and his three grandsons, Francis II (1559-60), Charles IX (1560-74), and Henry III (1574-89), held the sceptre, which, on the death of the last, passed into the hands of the Bourbon family, under Henry IV. These two centuries and a half are among the most disastrous in the history of France. See France — History, and individual titles.

VALORIZATION, val-er-i-za-shun. Act or Process of attempting to give an arbitrary market value or price to a commodity by governmental interference, as by maintaining a purchasing fund, making loans to producers to enable them to hold their products, etc., used chiefly of such action to Brazil.

VALPARAISO, Chile, province of the middle zone of the republic, bounded north by Aconcagua, south by Santiago, east by Santiago and Aconcagua, and west by the Pacific. It has an area of 1,775 square miles and includes the island of Juan Fernandez. The surface to the north is fertile and agriculture is successfully followed there. The south is mountainous and barren. The climate is exceptionally mild and uniform in temperature, the summer mean being about 63° and the winter 53°. Pop. 340,347 or 191.74 to the square mile. The capital is Valparaíso (q.v.).

VALPARAISO, vāl-pə-rā'sō (Sp. vāl-pā-rā'zō), Chile, the most important seaport of the republic and a centre of trade for a large part of southwestern South America. It is located on a large bay about 75 miles west by north of Santiago. The leading industries are iron foundries and machine shops, factories for making macaroni, soap, shoes, perfumery, furniture, etc. There are also tanneries and woodworking plants. There are seven banks, including a branch of the National City Bank of New York, several daily newspapers, fine department stores, and more than 1,000 business houses enumerated in the city directory. There is an active chamber of commerce, and trade with North America is increasing steadily since the opening of the Panama Canal. There are large floating docks for repairing vessels at the port. Statues of Columbus and Lord Cochrane, Earl of Dundonald, who founded the Chilean navy, stand in conspicuous positions. The supply is excellent. The city is the western terminal of the railway to Buenos Aires, completed in 1910. There are also railroads to Santiago and Los Andes. There are ocean cables and wireless telegraphy. The harbor is excellent, and the entrances to the bay well fortified. It was the first city in South America to establish telegraph lines and to adopt gas (1856), to build aqueducts for the water supply, to use street cars (1860), etc. It has experienced several severe earthquakes. On 16 Aug. 1906, and for several days following, earthquakes and fire caused a large amount of damage to the city and surrounding towns, the greater part of the damage being done by the fire which started immediately after the first shock at 7.52 p.m. The climate is temperate. Pop. about 144,000.

VALPARAISO, Ind., city, county-seat of Porter County, on the Chicago and Grand Trunk, the New York, Chicago and Saint Louis, and the Pittsburgh, Fort Wayne and Chicago railroads, about 40 miles southeast of Chicago. It was settled in 1836 and in 1856 was incorporated. It is in a fertile agricultural section, and has a large trade in farm products. The chief manufactures are lumber, meat, dairy products, and machine-shop products. The city is
famous for its large school called the Northern Indiana Normal School, and known also as Valparaiso University, a great institution founded by Henry B. Brown in 1873. Its courses of study are planned to meet the needs of a large number of men and women who do not find the regular college courses available. In 1917 there were about 5,500 pupils enrolled, and the faculty and instructors numbered 220; the productive funds totaled $134,000, and the total annual income was $205,338. There are two national and one State bank, with deposits close to $2,000,000. The government is vested in a mayor, who holds office four years, and a common council. Pop. 8,000.

VALUE. Value is the most important word in the whole science of economics. Fundamentally it means the esteem in which a thing is held, but under ordinary commercial conditions it means power in exchange. There is no contradiction between these two ideas, because the higher the esteem in which a thing is held, the greater will be its power in exchange under normal conditions. Under certain abnormal conditions this would not be true. Travelers in a desert who are dying of thirst might esteem water very highly, but, however much they longed for water, and nothing but water would suffice, water would have very little power in exchange, even if some one came along with a supply of water. The citing of such abnormal cases as this, however, does not vitiate the principle that the power of exchange is the subject of value. On the ordinary market, in the ordinary commercial community, there are always many things to give in exchange for any commodity that happens to be offered; and if the commodity which is offered is highly esteemed or intensely desired, many things usually will be offered in exchange for it. If it is held in low esteem, or not intensely desired, few things will be offered in exchange for it.

When we say that value in an orderly commercial community is power in exchange, we must not be understood as saying it is merely a ratio of exchange. Power in exchange is power to command other desirable things in particular voluntary exchanges. When things are exchanged, however, they must of necessity be exchanged in some ratio, but the ratio is purely accidental and is not the real essence of value.

Value depends upon two things and two things alone: namely desirability and scarcity. Any material thing which can be transferred will have value if it possesses both these qualities and will have no value if it lacks either of them. However scarce or rare a thing may be, if nobody desires it, of course it will have no value or power in exchange. However desirable it may be in itself, if every one has all he wants of it, nobody will pay a price to get any more. Consequently it will have no power in exchange.

With a given degree of scarcity, the more desirable the object is, the higher its value, and the less desirable it is, the lower its value. At the same time, with a given degree of desirability the greater its scarcity, the greater its value; and the less its scarcity or the greater its abundance, the lower its value. That is to say, when everybody has nearly as much as he wants, those who are very anxious to give any more, and he will not be anxious to pay a high price or give much exchange for an additional quantity. But if it is very scarce, so that every one would like to have a great deal more than he has got, then he will give a great deal in exchange for it.

The reason why scarcity makes for high value and abundance for low value is mainly physiological. Wants are satiated. When one has had little food, hunger or the desire for food is intense. When one has had much food, hunger or the desire for food is less intense and gradually approaches the point of satiety, or actually reaches it. This is true not only of hunger but of every other human desire,—that is, for the desire for every other specific form of satisfaction. Even music palls, especially if there is little variety. One becomes weary of looking at the same work of art or at works of art of a given type. Were it not for this principle of satiety, there is no reason why the value of a commodity should diminish as the supply increases. If the tenth apple consumed by a given person furnished as much satisfaction as the first, there is no reason why the tenfold increase in the supply of apples should not sell at as high a price per barrel as the smaller supply.

This principle of valuation as suggested above rests upon physiology and not upon social arrangements. The law of demand and supply is much deeper than the organization of the market, the type of government, or the organization of society itself. It has its basis in human physiology. Market values and prices are only expressions of this fundamental physiological law. See Economics.

T. N. CARVER,
Professor of Economics, Harvard University.

VALVASSOR. See VAVASOUR.

VALVE TERMS. The accompanying list of mechanical terms includes nearly all of the principal terms generally applied to define the construction and use of the various forms of valves; but for specific information relative to the application of these devices to particular machines, see articles in this Encyclopedia under the titles Air Compressors; Boilers; Boiler Terms; Gas; Locomotive, The; Locomotive Engine, The; Locomotive, Design and Construction of the Modern; Pumps and Pumping Machinery; Steam and Steam Engines; Valves and Hydrants.

ALLEN VALVE.—A form of slide valve, designed to give a very rapid and full port opening. Together with the plain D-valve, it forms one of the two principal types of slide valves in use.

ANGLE VALVE or CORNER VALVE.—One which is set at the angle of a pipe. It is either screwed or flanged.

ANNULAR SEATING.—A ring upon which a circular valve rests.

ANNULAR VALVE.—A disc valve which rests upon an annular seating.

BACK CUT-OFF VALVE.—A plate which slides on the back face of the main slide valve of an engine or motor, to regulate the cut-off point, and control the grade of expansion of steam. It is operated independently of the main slide of the engine by a separate eccentric capable of adjustment to the steam passing through the main slide.

BACK-PRESSURE VALVE.—A valve used for preventing the return of a fluid into a pipe. A check-valve.

BALANCED VALVE.—An equilibrium valve.

BALL VALVE.—A globular shaped lift valve with an annular seating. It is used in quick-running pumps, as it continually shifts its position on its axis, and therefore wears uniformly. It is made in two parts, one upper and one lower, which are screwed together after the insertion of the ball.

BLOW-OFF VALVE, or BLOW-OFF COCK.—A valve or plug-cok situated at the lowest part of a steam boiler, by which the lower portion of the water is periodically blown off or emptied, to prevent incrustation.
VALVE TERMS

BLOW-THROUGH VALVE.—A valve used with a condensing marine engine, condenser, condensate, and air pump of the contained air, which is then replaced by steam which is only condensed, creates a vacuum and enables the starting of the engine. When opened, it makes a communication between the steam in the engine cylinder and the vacuum chest to be used when starting the engine.

BONNETED SAFETY VALVE.—A valve covered with a bonnet or a cover, and contains a pipe by which steam is conveyed out of a building, when the boiler is only roofed-in. The bonnet prevents the steam from filling the building or safe boiler.

BRIDLE.—The loop forged on a slide valve rod, or the steam chest between which the valve travel.

BREEZE VALVE.—The blow-off valve of a marine boiler.

BUCKET VALVE.—The flap valve of the bucket of a lift pump.

BUTTERFLY VALVE.—A pair of flap valves arranged back to back.

CAGE VALVE.—A ball valve.

CHANGE VALVE.—A slide valve used on hydraulic cranes for directing the pressure into two or more cylinders at will, singly or in combination, to obtain varying degrees of power, according to the load to be raised.

CHECK VALVE.—A wing valve inserted in a feed pipe between the boiler and the feed pump of an engine, to prevent the water returning from the boiler to the pump. The pressure of the water from the pump opens it toward the boiler, but the pressure from the boiler closes it toward the pump.

CIRCULAR VALVE.—A valve circular in plan, as distinguished from a slide valve.

COCK.—A cylindrical valve consisting of a shell, cover and plug. The shell is turned around opposite to the discharge and entrance openings, permits the fluid to pass through. When the opening of the passages are brought opposite to the solid walls of the shell, the cock is closed. There are many forms—bath, flagged, gland, socket, two-way, three-way, four-way and globe cocks. The term is sometimes applied to any valve that may be opened or closed by hand.

COMMON SLIDE VALVE.—The ordinary D slide valve in which the amount of the opening, both for admission and exhaust of steam, are equal, as distinguished from the exhaust relief valve.

CORELIS VALVE.—The valve of a Corelis engine. It forms the segment of a circle and rotates in an annular seating, alternately covering and uncovering the steam port. The supply valve is closed by means of a dash piston.

COUSINS VALVE.—A double-seat valve used in a Cornish engine.

CROSS VALVE.—A valve placed at the T formed by two pipes.

CUT-OFF VALVE.—A valve consisting of a solid plate, or one surrounded with cross bars and ports. It is the second valve in the arrangement for working steam expansively to one of a separate slide.

CYLINDER COCK.—A pet cock.

CYLINDER ESCAPE VALVE.—A valve attached to the cylinder of marine engines to allow the escape of sea water, which is conducted to the sea water condenser and priming. It is supported by a spring and enclosed in a metal cap, which is provided for the engine attendants in case of a sudden blow-off of hot water.

CUT-LOAD SAFETY VALVE.—A dead-load safety valve, or a dead-weight safety valve.

DREAD-LOAD SAFETY VALVE.—A valve which is loaded by dropping annual weights over a cylindrical seating, and the weight on the valve being increased or decreased according to the number of rings employed.

DELIVERY VALVE, or DISCHARGE VALVE.—The valve through which the contents of a pump are forced into the discharge pipes.

DISC VALVE.—A modified form of flap valve used in large pumps and in the air pumps of condensing engines. It consists of a rubber disc hinged at the centre, and resting on a perforated grid through which the water enters and leaves. Its lifting movement is limited by a superimposed guard plate, hollowed in the upward direction.

DISNECK VALVE.—A circular lift valve with two seating faces by which steam is admitted on both sides at once. Also known as an equilibrium valve. It is extensively used on larger Cornish pumping engines.

DOUBLE DISC VALVE.—A valve consisting of a tapered valve seating against two opposite seatings.

DRAIN COCK or DRAIN COCK.—A pet cock.

D VALVE.—A term applied to the ordinary slide valve on account of its form, its being hollowed out like a letter D.

EQUILIBRIUM SLIDE VALVE.—A slide valve provided with an equilibrium ring, that is a metallic ring attached to the back of the valve for the purpose of reducing the friction.

EQUILIBRIUM VALVE.—A valve in which the pressure on each face of the valve is the same, to provide greater minimum of friction and the least expenditure of power.

ESCAPE VALVE.—Same as Cylinder Escape Valve.

EXHAUST VALVE.—A slide valve so constructed that the port is only opened to exhaust, but only partially opened to allow the escape of a valve with a cut-off valve behind it.

FLAP VALVE.—A valve in which the valve, usually made of leather stiffened with iron or brass plates riveted in each face. Circular or rectangular in shape. Used in both the piston and the suction ends of the barrels of lifting pumps. The disc valve of an air pump is a flap valve hinged at the centre and lifting around the circumference.

FOOT VALVE.—The lowestmost valve of a pump, or the valve at the aperture through which the water enters.

FOUR-PASS COCK.—A cock having four branches.

GLOVE COCK.—A plug cock in which the plug is covered with a gland or small casing, and small casing, and is sometimes covered with the packing to make it steam and water tight.

GLOBE VALVE.—A valve with a spherical casing. An interior casing is fitted into the chamber into two parts, it is therefore sometimes called a diaphragm valve. It is generally used as a stop valve.

GRINDEN VALVE.—A slide valve in which the ports are subdivided into similar subdivisions in the cylinder ports, so as to give the necessary steam-way with a reduced travel of the valve. The valve may be in one or two parts.

GROUPED SAFETY VALVE.—A Cowburn, Dead-load Safety, or Dead-weight safety valve.

HEAD VALVE.—The uppermost or delivery valve of an air pump.

IGNITION VALVE.—The valve of a gas engine by which the charge is ignited or fired.

INDICATOR VALVE.—The valve employed to make or break a communication between the piston of the indicator and the cylinder of the engine.

INJECTION COCK.—The cock through which supplies of water are admitted to the condensers of marine engines.

INJECTION VALVE.—An Injection Cock.

INLET VALVE.—A foot valve.

JOY'S VALVE.—A valve gear in which the valve rod is worked directly through a coupling rod or link from the connecting rod, and not by means of eccentrics. The necessary travel is obtained by raising the up and down movement of the coupling link to move a disc block to which one end of the valve rod is fastened, which slides up and down in a slot link moving in a fixed centre and placed at an angle with the rod. The engine is reversed by altering the direction of the angle of the link slot about its fixed ports. It is the same as the Cornish valve.

JUNCTION VALVE.—A two-way valve which unites two pipes.

KINGSTONE VALVE.—A wing valve used as a suction valve for a marine condenser, and as a blow-off for a marine boiler. It is the one most extensively used in the ship for itself in case of the breaking of the spindle.

LAP.—The amount by which the slide valve covers the steam port at the termination of the piston stroke. It indicates the amount of cut-off of steam in the cylinder. See Exhaust Lap and Outside Lap.

LAP CIRCLE.—The circle of a lap diagram, the radius of which represents the lap of the valve. If the laps are unequal, the diagram will have two lap circles.

LEAD OF A VALVE.—The amount a slide valve is opened at the termination of the piston stroke to admit steam for cushioning. It varies from 1/4 to 1 inch in high-speed engines.

LIFT VALVE.—A disc valve fitting on an annular seating, and guided in its lift by three or more feathers which project into the body of the seating-clatt valve. It has a full water-way when the amount of lift equals four-fifths the diameter of the valve. See Mushroom Valve and Poppet Valve.

LOCK-UP SAFETY VALVE.—A safety valve for the spring of which is enclosed in a padlocked casing.

MINUS LAP.—The internal or exhaust lead on a steam valve. It is the lead to exhaust that is provided for cushioning, and is used with high-speed engines where smooth running is essential.

MIXED VALVE.—A port of the annular seating of a safety valve turned to an angle of 45° in section, upon which the valve is partially closed at the time of admission of steam. See Mushroom Valve.

MUSHROOM VALVE.—A lift valve formed in the shape of a mushroom.

MUSHROOM STRAINER.—A foot valve formed in the shape of a mushroom, and provided with a perforated strainer plate.

OPEN SAFETY VALVE.—A safety valve that has no lock-up
OUTSIDE LAP.—Lap given to a slide valve on the outer end, as distinguished from exhaust lap. Its amount is a measure of the ratio of expansion of the steam, an increase in the lap allowing an increase in the area of the valve seat.

Par Cock.—A small plug cock. One is always inserted in the top of the cylinder through which the water of condensation is allowed to escape when the engine is started, so as not to blow out the cylinder ends.

Pavcock.—Any valve through which the water of condensation is allowed to escape when the engine is started.

Plug.—The inner movable part of a cock, which upon being turned allows the fluid to pass through.

Poppet or Puppet Valve.—A lift valve.

Poppet-Lid Valve.—A hollow, cup-shaped lift valve.

Porous Valve.—A valve in the form of an inverted pot. It is a lift valve with a conical pivot which drops freely into a recess in the crown of the pot. The lift is held and controlled by guides cast on the top of the seal, and they are not liable to stick.

Priming Valve.—A pet cock used for priming.

Reducing Valve.—A valve arrangement used for regulating the steam pressure between a boiler and its connections. The opening of the valve is controlled by a weighted lever.

Reflux Valve.—A flap valve used for the purpose of relieving the pressure of a head of water acting in a boiler or condenser, by communicating the latter with the atmosphere or other lower pressure.

Regulator Valve.—A valve of the conical, double-seat, or slidding types, employed to regulate the admission of steam to the pistons of a locomotive.

Relief Valve.—A cylinder escape valve.

Return Valve.—A valve inserted in the pipe of a deep-well pump in addition to the regular valves to prevent much of the water from running back between the pump and the return valve.

Return Valve.—One that allows the return of a fluid to the source of supply, as in a condenser.

Reversing Shaft.—See Weigh-shaft.

Reversing Valve.—Any valve of reversing action, as one employed to introduce or withdraw the feed water from the other chambers of a regenerative furnace, as they become supplied or emptied.

Ring Valve.—A lift valve in which a ring is substituted for the solid disc, so as to allow the fluid to pass through on both the outer and inner edges, thus reducing the amount of lift to one-half that required by the use of a solid disc. Valves with two rings by which the amount of lift is still further reduced, are also used.

Rotating Valve.—A cylindrical valve constructed on the principle of the plug cock, and thus differing from the disc, lift, and slide valves.

Round Body Valve.—A pump valve with a cylindrical shaped body.

Safety Valve.—The relief valve employed to prevent excessive increases in the steam pressure in a steam boiler. It is usually some form of a lift valve provided with suitable mechanism to adjust the valve to a definite pressure. The resistance is either a lever with an adjustable weight, a spring the tension of which may be adjusted by a movable nut, or a dead weight.

Sand Valve.—A valve employed to regulate the escape of steam in the sand chutes of a boiler.

Screw-Downdown Valve.—A valve which is raised or depressed by means of a screw. A globe valve, or a sluce valve.

Seat.—The upper end of a steam pipe, or the connection of a steamship, and leading from the sea to the condenser. It is supplementary to the regular injection cock.

Seating.—The contacting surface upon which the moving part of a valve rests when it is closed. It requires to be a perfect fit.

Setting of Valves.—A term specifically applied to the adjustment of engine-slide valves, an operation of great precision, and performed in various ways according to the nature of the link motion. See article Locomotive, Design and Construction of the Modern, in this encyclopedia.

Shell Valve.—The outer casing of a cock or valve.

Side-Discharge Valve.—See Discharge Valve.

Side-Disc Valve.—A disc-shaped plug valve which rests against the inside of the steam chest, but is turned tight as a double disc valve.

Side-Lift Valve.—The typical valve of a steam-boat, though used with other forms of motors. It works with a sliding motion as distinguished from the motion of rotating, or of lift valves. It is used for feeding the valves of steam and gas engines of the ordinary type, and not to Corb. See article Locomotive, Design and Construction of the Modern, in this encyclopedia.

Slide Cock.—The cock at the bottom of a steam boiler through which water is supplied from the sludge sump by periodical washings with a strong current of water.

Slide Valve.—A valve which allows the escape of a fluid, or a gas, when a definite amount of pressure is attained. In condensing engines it allows the steam and air which mingle in the blowing-through process, to pass out of the cylinder. In some gas engines, it is employed to regulate the amount of gas admitted to the combustion chamber.

Spindale Valve.—A lift valve guided by an axial spindle or central stem.

Spiral Winded Valve.—A lift valve, the wings of which, instead of being placed at right angles to the cylinder, are arranged as sections of a spiral of very long pitch. By this arrangement, the valve is turned, and finds a little on its seat at each lift, and its wear is rendered more uniform.

Spring-Balance Valve.—A safety valve which, instead of being weighted, is attached to a spring balance, the graduations of which indicate the pressure.

Spring Safety Valve.—A spring-balanced valve.

Square-Body Valve.—A pump valve having a rectangular casing.

Starting Valve.—The valve through which the steam from the boiler, or from the connecting pipes, is admitted to the cylinder of an engine. It may be any one of the following types: A sliding disc valve actuated by a lever; a lift or poppet globe valve lifted by a screw; or a plug valve turned by a wheel.

Steam Chest.—The rectangular case or box attached to the side of an engine cylinder, and containing the slide valve and a portion of the valve rod. See Locomotive.

Steam Lap.—The amount the faces of a slide valve are extended beyond the length required to cut-off live steam, which is necessarily exact at the termination of the piston stroke. Used in a contrary sense to exhaust valve lap.

Steam Valve.—Any form or type of valve by which a steam supply is regulated.

Stop Cock.—A globe valve or stop valve, as one attached to a steam boiler by means of which the steam is turned into, or shut off from, the pipe connecting the boiler with the engine cylinder.

Stop Valve.—Any valve or stop cock used for regulating the flow of fluids.

Straight-Way Valve.—A valve in which the waterway passes straight through, without running into a bend.

Suction Valve.—Any valve operating by suction, as the lowermost valve in a lift pump. It is actuated by the pressure of the atmosphere against the valve seat, and is protected against the vacuum above.

Test Cock.—See Try Cock.

Three-Way Cock.—A cock having three branches, by which the fluid from the inlet branch may be diverted into the other two at will.

Throttle Valve.—A flat thin disc valve which lies diagonally across a round pipe, closing it partially or entirely. Used in dampers or flues, and in the smoke pipes of engines leading from boilers, to regulate the passage of smoke and steam.

Throttle Valve Box.—A pump valve casing provided with suction and delivery valves, and also an intermediate retaining valve to render the supply continuous; used on stationary or portable engines for pumping water to the boiler.

Try Cock.—Cocks inserted in the shell of a boiler at extreme high and low water marks. The upper one is the main steam cock and the lower one the water cock. They are used for checking the water gauge in case it1 chokes up or ceases to act.

Valve Box.—The box or casing which encloses the valves, as of pumps. Also the steam chest which contains the slide valve of an engine.

Valve Bridge.—See Bridge.

Valve Carriage.—The shell of a valve; a valve box.

Valve Chamber.—A valve box. The term is usually applied, however, to a steam chest rather than to an ordinary valve box.

Valve Circle.—The circle on a valve diagram, the diameter of which is equal to one-half the travel of the valve. A valve diagram has two such circles.

Valve Cock.—A cock which is operated by a lift, slide, or other form of valve, instead of a plug. A globe valve is a valve cock.

Valve Diagram.—A diagram by which the position of the slide valve for any position of the piston, or the position of the piston for any position of the valve, may be determined graphically. Therefore, the relative position of the valve and piston at the instants of opening, cut-off, cushioning, and release, may be accurately determined. There are several various methods of constructing valve diagrams. The most familiar are the polar method, Reuleaux's method, and Zonne's method, the last named being the universal. See also Valve Face.

Valve Face.—The face on or against which a slide valve moves, as distinguished from the valve seat. The term is also used of the valve of a steam-boat, both for angle and reversing action, consisting of slot links, rods and expander parts, of various materials in different engines, as automatic or otherwise.

Valve Gear.—The mechanical arrangements for actuating slide valves, both for angle and reversing action, consisting of slot links, rods and expander parts, of various materials in different engines, as automatic or otherwise.

Valve Plate.—See Cut-off Valve.

Valve Ring.—An equilibrium ring.

Valve Rod or Valve Spindle.—The rod which passes through the stuffing box in the steam chest, and is attached
to the slide valve and through which the valve is actuated from the eccentric.

VALVERDE GROUND.—The small casting which closes the stuffing box of the rod of a slide valve, and maintains the valve seat is termed the valve stem, or valve rod. The valve stem is the main valve which is fitted with a valve seat or valve seat ring.

VALVE ROD.—A slot link or a quadrant. Also specifically applied to the vertical sliding link of an oscillating cylinder engine, by which the motion of the eccentric is communicated to the valve rod weight-shaft.

VALVE SHOCK.—A spring used for pressing the packing or equilibrium rings of slide valves against their faces.

VALVE STEM.—A valve rod or spindle.

VALVE STOP.—The bridge of a valve rod.

WASTE-WATER COCK.—A pet cock on a waste-water pipe.

WASTE-WATER Valve.—The opening or space in the bucket of a pump; the plug of a cock; or the area of a lift valve, for the passage of a fluid.

WEIGHT-SHAFT or REVISING SHAFT.—The rod or shaft which forms the centre of the lever that throws the slot link for the reversing motion of an engine, into the positions for forward or backward gear.

WHEEL VALVE.—A lift valve of globular form, the screw of which is lifted or depressed by means of a hand wheel above.

WING VALVE.—A lift or poppet valve, the lift of which is guided by three or four feathers, wings or ribs, cast on the under side of the valve and fitting into its cylindrical seat. It may be placed vertically as in the case of an ordinary safety valve, or horizontally or otherwise, if it is pressed against its seat by means of springs.

VALVERDE, val-vär'dä, or FORT CRAIG (N. Mex.), Battle of. Early in February 1862 Fort Craig, on the Rio Grande, was held by Col. E. R. S. Canby, United States army, with about 3,800 men, composed of detachments from three regiments of regulars and infantry, five of regular cavalry, two batteries of artillery officered and manned by regular cavalry, a company of Colorado volunteers, detachments from five regiments of New Mexico militia and some unorganized militia. The fort had been greatly strengthened by throwing up formidable earthworks. In July 1861 the Confederate government, attaching much importance to New Mexico, had ordered Gen. H. H. Sibley to Texas, to organize and lead an expedition for its conquest. By the middle of November 1861 he had organized a brigade of four Texas mounted regiments and a battery, with which he marched from San Antonio, reaching Fort Bliss 14 December. Early in January 1862 he began his march upon the Rio Grande, with about 7,000 men; and 16 February his advance was within two miles of Fort Craig, where it was met by Canby’s cavalry, upon which Sibley, satisfied from the information he had obtained that with the light field guns an attack on the fort would be futile, withdrew down the river, and on the 19th he crossed to the eastern side, hoping to draw Canby out and fight him on open ground. On the 20th Canby sent a force of cavalry and artillery across the river and made a demonstration on Sibley’s camps, but when the cannon opened a heavy fire. Early on the 21st Sibley made a demonstration toward the fort, while his main body pushed northward and approached the river again at Valverde. Lieut. Col. B. S. Robertson, with cavalry, infantry and artillery, was sent from the fort to oppose the column should it attempt to cross the river; and before this about 500 mounted militia had been sent to watch Sibley in his camp. When Robertson arrived at the ford, seven miles above Fort Craig, Sibley had already reached the river at the opposite side, and Roberts opened the battle by sending Maj. Thomas Duncan, with regular cavalry dismounted, across the river. Duncan drove the Confederates back, the Union battery being stationed on the western bank, Roberts crossed his command to the eastern side and, after some sharp fighting, by 12 o’clock drove the Confederates from all the positions they had occupied. Meanwhile the Confederates had been reinforced from their camp, and at 12 o’clock Roberts was reinforced by Captains Selden’s battalion of regulars and Col. Kit Carson’s regiment of New Mexico volunteers. Another advance was made, the Confederate guns were silenced and McRae’s and Hall’s Union batteries were crossed and advanced. Canby came on the field at 2:45 P.M., bringing reinforcements from the fort, after the Confederates had been driven from all their positions to the shelter of a high ridge of sand, where, unseen, they reformed and prepared for a charge upon the two Union batteries. Sibley, who was sick, had turned the command over to Colonel Green of the Fifth Texas Cavalry. There was a full in the fight, which was broken by a most impetuous assault. The Fourth Texas Cavalry made directly for Hall’s battery, on the Union right, but met with such a severe fire of canister and musketry from the supporting cavalry and infantry that within 100 yards of the battery, it was repulsed with great loss, falling back in disorder. This was immediately followed by a charge upon McRae’s battery by the greater part of Green’s available cavalry and infantry, and most of the guns, squirrel-rifles, revolvers, lances and knives. Canister and musketry made gaps in the ranks, but did not stop them, and the battery supports gave way after a close hand-to-hand fight. Capt. McRae, Lieutenant Mishler and most of the gunners were shot down beside their guns, all the horses were killed and the guns were captured. A panic now ensued among the greater part of the New Mexico militia, but some of them, with the regulars and volunteers, were withdrawn in comparatively good order across the river, and Canby retreated to Fort Craig, un molested by the Confederates. Sibley buried his dead, remained two days at Valverde and moved up the river to Albuquerque. The Union loss was 68 killed, 160 wounded and 35 captured; the Confederate loss, 36 killed, 150 wounded and one missing. Consult ‘Official Records’ (Vol. IX); ‘The Century Company’s ‘Battles and Leaders of the Civil War’ (Vol. II).

E. A. CARMAN.

VALVES (from Latin valva, folding doors), a mechanical appliance or device employed to control the flow of liquids, gases and loose material, such as sand and mud, through pipes, chutes or other forms of passages. They operate by the lifting and falling, sliding and swinging or rotating of lids, covers, balls or slides placed at the openings of or inserted in the pipe, tube or other form of passageway, as the case may be. They are usually made of metal, such as cast iron, steel, bronze and brass, often combined with leather, rubber or other flexible material, to ensure their tightness. They are known and designated under a variety of names according to the purposes for which they are used, the particular shape or the peculiar motion of the valve, and according to the method of their operation, thus introducing such terms as globe valve, slide valve, ball valve, safety, etc., with a corresponding classification. On the other hand, all forms of valves may be conveniently grouped.
into several definite classes according to the motion of the valve relative to the valve seat and according to the manner in which that motion is produced.

Valves classified according to the motion of the valve relative to the valve seat are typified by (1) those which rotate in the opening; (2) those which lift and fall vertically from and to their seats; (3) those in which the flaps or lids are hinged to their seats and work with a swinging motion; and (4) those which open and close by sliding on and parallel to their seats. Valves classified according to the manner in which their motion is produced may be defined as (1) those operated by hand; (2) those operated by independent mechanism; (3) those operated by mechanism actuated by the machines the operation of which is controlled by the valves; and (4) those operated by the motion of the liquid, gas or other fluid material, the flow of which is controlled by the valves.

It is quite clear that the characteristics of these primary classifications may be combined in any one valve, as in the case of a slide valve which may be operated in various ways: (1) by hand, as in the case of the ordinary screw gate valve; (2) by independent mechanism, as in the case of the hydraulic gate valve; and (3) by mechanism connected with the operating medium, as in the case of the slide valve of a locomotive.

Probably the most ancient form of valves are the leather flap valve, as shown at A, Fig. 1, and disc valve, shown at B, Fig. 1, commonly used in small pumps at the present time, and from which the present check and foot valve respectively are devised. The two most com-
unobstructed passageway for the fluid to pass through, the latter so called from the globular form of its casings. The gate valve is made in two types, "parallel seated" and "beveled seated," or "plug," and in sizes one-fourth to 96 inches, inclusive, and for all purposes, namely, water, steam, gas, oil, ammonia, etc., and for pressures varying from one pound to 5,000 pounds to the square inch; on these accounts they are more widely used than globe valves.

Gate Valves are usually made with bronze seats, although babbit is used in many instances. The parallel seated gate valve with inside screw, wheel type, is shown in Fig. 2, the internal mechanism of which consists of the stem C, two gates G and two beveled-faced wedges, J K, the wedges being entirely independent of the gates (or discs) and working between them. By the action of the stem, which works through the nut in the upper wedge, the gates descend parallel with their seats until the lower wedge strikes the stop (or boss) in the bottom of the case, the gates and upper wedge continuing their downward movement until the face of the bevel of upper wedge comes in contact with face of bevel of lower wedge. The gates being then down opposite port, or valve opening, the face of the upper wedge moves across the face of the lower wedge, bringing pressure to bear on the backs of both gates, from central bearings, thus forcing them apart and squarely against their seats. In opening valve the first turn of the stem releases the upper wedge from contact with the lower wedge, thereby instantly releasing both gates (or discs) from their seats before they commence to rise. This style of valve is called the double-gate valve and when entirely opened gives a clear and unobstructed passageway. Fig. 3 represents the same type of valve with outside screw and yoke; in this case the upper end of the stem (or spindle) is threaded and the stem is operated by a nut held vertically in the yoke and turned by the hand-wheel, which is fastened to it. The stem rises without revolving, and the gates and wedges, being fastened to the lower end of the stem, rise with it. The operating screw is entirely outside of the valve body, where it can be inspected and oiled, and the rising stem forms the best kind of an indicator. Fig. 4 is a bevel-seated gate valve, with inside screw of the double-faced solid wedge gate or plug type, in one piece, made wedge-shaped or tapering, braced or ribbed, and by the action of the stem working through the nut in the top closes vertically between two inclined seats or surfaces in the body. To ensure perfect alignment

[Image of a gate valve]

with the stem the plug is guided by ribs or splines in the body, which engage with grooves in the edges of the plug, and prevent it from turning and coming into contact with its seats while opening or closing. These ribs are of unequal width, to prevent the plug from being inserted wrongly after removal for repairs or otherwise. This style of valve when entirely open gives a clear and unobstructed waterway. Fig. 4 represents the same type of valve as Fig. 5, with outside screw and yoke and hand-wheel, and is operated the same as Fig. 3. Fig. 6 is a parallel-seated gate valve, operated with slide stem and lever, permitting a quick opening and closing. Fig. 7 is a gate valve with motor attached, operated by electricity. Fig. 8 is a gate valve with hydraulic or pneumatic lift; in the former case the motive power being water to operate the cylinder, in the latter air.

Globe Valves are made with solid and renewable discs; in the former case they are of brass and in the latter of soft metal, asbestos
VALVES

or packing of some kind. Fig. 9 represents the most common type of globe valve. It is provided with a vulcanized asbestos disc ring. The ring is composed of the fibre of asbestos, to which is added a waterproof vulcanizing material, making a very durable packing, which will not crack or flake off. It is held centrally on its seat by guides cast on the body of the valve. It is also secured to the spindle without the use of nuts, screws, pins or wires. The vulcanized asbestos ring is forced into a brass holder and the metal is spun or turned over the edges of the ring, so that it cannot drop out. This valve has a raised round seat, upon which scale, grit or sediment is less likely to lodge than on the broad flat seats sometimes used. On account of the construction of the valve seat, as will be noted in the cut, globe valves do not permit of a clear and unobstructed passageway. Fig. 10 shows the check stop, or as it is sometimes called back-pressure valve. This valve is used in a horizontal pipe, to prevent the backward movement of a fluid. After the fluid has raised and passed the gate, the pressure being removed from the face of the gate it closes thereby checking or stopping the fluid from flowing in the reverse direction. Fig. 11 represents the foot valve, its use and operation being similar to the check valve. It is used, however, in a vertical pipe and at the end of the suction pipe of a pump.

Air Valves are made for two common purposes, namely: To be placed on mains at high points where air accumulates and obstructs the flow of water and for use on pipe lines to permit air to enter when water is drawn off, and to allow air to escape when pipes are being refilled. The former, the lever-and-float air valves, are shown in Fig. 12. When air takes the place of water about the float in the valve chamber, the float which is attached to the bronze lever drops, thus opening the small valve and allowing the air to escape. As the water returns it lifts the float, thereby closing the valve. Fig. 13 represents the poppet air valve; when filling a line of pipe the gate remains open until the water reaches and lifts the copper float, thereby closing the gate, which remains closed while the pressure is on. Fig. 14 is an external view of a common lever safety valve. The valve consists of a gate with a conical edge, resting on a conical seat, and is held to its seat by the pressure of a weight acting on a lever as shown. The spring safety valve is shown in Fig. 15, the spring taking the place of the lever and weight; this style of safety valve is known as the pop safety. Fig. 16 represents a relief valve, similar in construction to the pop safety valve, but instead of being used for steam is intended for use on water mains, for the purpose of relieving the pipes of water hammer, to which they may be
subjected. The gate as in the pop safety valve, is held to its seat by the pressure of a spring, which is protected, as shown in the cut, by a cast jacket, having an outlet of the same size as the inlet. The operation of the valve is as follows: When the valve is set at the pressure desired, which is done by adjusting the handwheel, any excess of pressure over this opens the valve, thus relieving the mains and joints of any extra strain, and doing away with the breaking of pipes or blowing out of joints. The regulating valve, as shown in Fig. 17, is used to control or reduce pressure in street mains and pipe lines or to regulate the flow of water between reservoirs located at different levels. This valve can be placed in any position. Owing to the manner of packing, the friction is but trifling, as can be readily understood by examining the cut.

Valves also form the principal part of hydrants or fire plugs, and are of two distinct types: slide gate and compression, according to the valve motion.

**Gate Hydrants.—** Fig. 18 represents the gate hydrant, which is absolutely non-freezing, owing to the fact that the drip is positive and being in the bottom of the hydrant it drains it completely, no water being left in the barrel when the hydrant is closed, to freeze; therefore, no outer jacket, or frost case, is necessary.

The working parts are so arranged, that by taking off the dome and packing plate, all the working parts can be removed without disturbing the barrel of the hydrant, or doing any digging. All the working parts are of solid bronze, thus preventing rust, and the gate is rubber-faced. The operation of the hydrant is as follows: In closing, the gate is moved downward by the action of the stem through the threaded bronze wedge nut in the back of the gate, until it strikes a stop at the bottom of the projection in the back of the hydrant, when by the action of the bronze wedge nut, moving along the incline on the back of the gate, it is forced squarely against its seat without any grinding movement on either the rubber gasket, with which the gate is faced, or on the bronze seat ring against which it closes, the projection at
the top and bottom of the gate keeping the rubber gasket away from the seat ring until it is forced squarely against it by the action of the wedge nut. The final turn of the stem, after the gate is closed and wedged, opens the drip valve. In opening the hydrant, the first turn of the stem closes the drip valve, after which the bronze wedge nut in back of gate is loosened, thus relieving the gate from its seat.

Compression Hydrants are of three kinds: Those with the gate opening against the pressure; with the gate opening with the pressure; and the double or balance gate. The compression hydrant with gate opening against the pressure is shown in Fig. 19. It will be noticed in this hydrant that a frost case is necessary, and also that the drip being above the hydrant bottom it drains the barrel only, the water remaining in the bottom when the gate is closed. The thread for opening and closing the gate is in the top of the hydrant; the gate is moved downward by turning the nut or sleeve at the top of the hydrant, through which the threaded stem works. The drip is closed during the opening of the hydrant and opened during its closing, being completely opened or closed when the gate is closed or open. This hydrant's working parts are bronze mounted, and it has either a leather or rubber faced gate. Fig. 20 represents the compression hydrant with a double balanced, or compensating rubber valve. It is constructed with bronze working parts and like the gate hydrant has a positive drip directly in the bottom of the hydrant, permitting no water to remain in the hydrant to freeze. All its working parts can be removed without digging, and also like the gate hydrant the so-called frost case is unnecessary.

This hydrant is particularly adapted for high pressures, on account of the case with which it can be operated, and as the main valve closes both with and against the pressure no water ram or hammer can take place. In operation, the upper valve opens with the pressure and the lower valve against the pressure; in closing, the conditions are reversed. The valve or double header is thus in equilibrium and can be opened or closed without effort. As the hydrant is opened, the drip or waste outlet is at once closed, the drip valve being drawn up into the bronze drip cylinder. In closing the hydrant, the drip valve is pushed out of the bronze cylinder in the flared lower end of the same. The water in the standpipe then passes out through the corrugations of the bronze guide on the lower end of stem or valve rod. Nozzles, on all hydrants, vary in number and size, according to the purposes for which they are intended to be used. See Valve Terms; and for other forms of valves, see Pneumatics; Pump; Steam-Hammer and Steam-Engine. For valves of circulation, see Heat.

JAMES H. CALDWELL,
President, The Ludlow Valve Manufacturing Company.

VAMBÉRY, vambah-ré, Arminius, Hungarian traveler and scholar; b. Szerdahely, 19 March 1832; d. 1913. He studied at Pressburg, Vienna and Budapest, and then went to Con-
VAMPIRE—VAN BOKKELEN

STANTINOPLE, where he lived by teaching French. In 1858 he published a German-Turkish dictionary, and in 1861–64, disguised as a dervish, made a journey of exploration through Persia into Turkestan, and visited Khiva, Bokhara and Samarcand; the first town of the kind visited by the European. In 1865 he became a professor of Oriental languages at the University of Budapest, which position he still (1907) holds. He has written valuable linguistic works as well as volumes of travel, including Travels in Central Asia (1864); 'Wanderings and Adventures in Persia' (1867); 'Sketches of Central Asia' (1868); 'History of Bokhara' (1873); 'Central Asia and the Anglo-Russian Frontier' (1874); 'Islam in the 19th Century' (1875); Etymological Dictionary of the Turco-Tatar Languages (1878); 'Primitive Civilization of the Turco-Tatar Peoples' (1879); 'The Origin of the Magyars' (1882); 'The Coming Struggle for India' (1885); 'The Turkish People' (1885); 'Story of Hungary' (1887); 'Western Culture in Eastern Lands' (1906). The 'Story of his Life and Adventures' appeared in 1888 and 'The Story of My Struggles' (New York 1904). He was a frequent contributor to periodical literature in England, Germany and Hungary.

VAMPIRE, according to a superstition prevalent in many ages and countries, the ghost or spirit of a dead person which issues forth by night and sucks the blood of living persons, particularly of the young and healthy, causing them to pine away and die. Vampires especially favor their friends and relatives with their visits, and any one whose death is caused by a vampire becomes a vampire. Among the Greeks the superstition has been so far modified by Christianity that the original vampires are supposed in many cases to be excommunicated persons, who are kept alive by the devil, and who procure their food in this way unjustly. In some places where the belief in vampires prevails, when a person dies a careful examination is made by a skilled person lest he should have been killed by a vampire and so be liable to become one; if this is suspected, the body may be pierced with a stake cut from a green tree, the head cut off and the heart burned. This is also the process for destroying the vampire spirit in a corpse believed to be already a vampire. The belief has been treated by Philostratus and Phileon of Tralles; has served a literary purpose in Goethe's 'Braut von Korinth' and the operas of Palma, Hart and von Lindpainter. While seemingly a primitive and savage superstition, it has survived in many forms. Consult Reading, 'Russian Folk-tales'; Hater, 'Der Waldenwolf' (1862); Stoker, B., 'Dracula' (1899). See WEREWOLF.

VAMPIRE-BAT, a genus of blood-sucking bats, of the carnivorous family Phyllostomidae, distinguished by leaf-like nasal appendages, three joints to the middle finger and often well-developed median incisors. They inhabit South and Central America. Owing to the inaccuracy of travelers' accounts, which have ascribed blood-sucking habits to a large family, the effect of their attacks has been much exaggerated. The true sanguinary vampire bat is now known to be a small species not more than three inches in length and distinguished by its trenchant and enlarged upper incisor and canine teeth, capable of slicing the skin like a razor; the very much reduced molar teeth; and the extremely narrow lumen of the alimentary canal and especially of the esophagus, all peculiarities which adapt it to an exclusive diet of blood. This is Desmodus rotundus, and a second closely related bat is Diphylus audax. The former is abundant in wooded regions from southern Mexico to Chile; the latter occurs in Brazil. Bates and Wallace were themselves bitten by bats during their famous Amazon journey, and other travelers have confirmed the evidence of these naturalists.

Owing to the error above referred to the large bat mentioned is still often called the vampire, and as Vampyrus the name has become permanently fixed to it in scientific nomenclature. The common species (V. spectrum) inhabits Brazil, and is about six or seven inches in length; but the spread of the wing-membrane may measure over two feet. The body is covered with a light brown hair. Consult Beddard, 'Mammals' (New York 1900) and the narratives of the travelers mentioned.

VAN, van, Turkey in Asia, (1) A town, the capital of a vilayet of the same name, 145 miles southeast of Erzerum, close to the east shore of Lake Van. It stands on an extensive plain covered with beautiful gardens and orchards; overlooking it is the citadel, in a ruinous condition, crowning a lofty calcareous height. Roman Catholic and American Protestant missions are maintained here. Cotton cloth is the only staple article, both of manufacture and export. Van succeeded the Ivan of Cedrenus and the Byana of Potomey, and the vicinity is rich in archaeological remains. Armenian massacres occurred here in 1895 and 1896. It was occupied by the Russians in 1915. Pop. of the town, about 35,000, Mohammedans slightly preponderating over Armenian Christians. Pop. of the vilayet (1915) 379,800; area, 15,170 square miles. Petroleum is found, and there are undeveloped mineral resources believed to be considerable. (2) Lake Van, situated at a height of about 5,300 feet above sea-level, is of irregular shape, contains many inlets, is about 60 miles long and 40 miles wide, and has an area variously estimated at from 1,200 to 1,500 square miles. Its water is salt, but becomes brackish near the mouths of the streams. It has no visible outlet. A small herring-like fish is caught in its waters, salted and exported to Asia Minor.

VAN AMRINGE, Žm'rinj, John Howard, educator; b. Philadelphia, 3 April 1835; d. 1915. He was graduated from Columbia University in 1860, and received from Columbia and other colleges the degrees of B.D., L.H.D. and LL.D. He was actively connected with Columbia University as tutor, adjunct professor and full professor of mathematics, being made emeritus professor in 1910. Was dean of the School of Arts 1894–96, dean of Columbia College 1896–1910, and president pro tempore 1899 of Columbia University, also first president of the American Mathematical Society. He wrote a history of Columbia College and University, and many articles and pamphlets on life insurance, vital statistics, etc.

VAN BOKKELEN, bök-k'ēlen, Libertus, American educator and clergyman; b. New York City, 22 July 1815; d. Buffalo, 1 Nov. 1889.
Although most of his life was spent as rector of various Protestant Episcopal churches in the States of Maryland and New York, and although during the Civil War period he was widely known as an Abolitionist, his chief claim to fame is doubtless his notable career as an educator. In 1845 at the suggestion of Bishop Whittingham of Maryland he established a church military school, known as Saint Timothy's Hall, at Catonsville, Md. This was the first school of its kind in the United States, and it soon became widely known throughout the South. His national fame, however, rests on the fact that in 1864 he was appointed by Governor Bradford as the first superintendent of public education for the State of Maryland; and in this capacity he elaborated a comprehensive educational plan which was incorporated in a bill entitled "A Uniform System of Public Instruction in the State of Maryland." Dr. Van Bokkelen's administration of his high office was so successful that Franklin and Marshall College, Lancaster, Pa., in 1865 conferred on him the degree of LL.D. When Maryland adopted a new Constitution in 1867 the office which he held was abolished, and he, therefore, returned once more to private life. On the day of his death the Buffalo Express paid him the following glowing tribute: "Dr. Van Bokkelen was indeed a remarkable man. He was a scholar who had become an authority on educational questions, a patriot and a philanthropist who dared to be an Abolitionist in a southern community, an able business man, and, withal, a devout and earnest pastor. To few men has it been granted to do so much good in a lifetime, and none can leave a fairer fame as a legacy to their loved children." A fuller account of his life may be found in George C. Keidel's "Catonsville Biographies" (1915).

VAN BRAAM, Jacob. A Dutch soldier of fortune: b. Bergen-op-Zoom, in the Netherlands, 1 April 1727. He entered the British naval service and acted as lieutenant with Lawrence Washington under Admiral Vernon, in the expedition to Carthagena. Then, accompanying him to Mount Vernon, he became the military instructor of George Washington, giving him much instruction as to fencing, flags, fortification and the armies of Europe. He accompanied Washington into the Ohio country in October 1753 and acted as translator of the French treaties. On account of his alleged wrong rendering of one word, he received more blame than praise for his services, while jealous rivals and enemies made it the occasion for abusive criticism and malignant attack upon Washington himself. His honesty was made the subject of controversy, which arose in the Virginia colonial legislature over Van Braam's asserted mistranslation, could hardly have arisen in New York, where the Dutch language was generally spoken, and the Dutchers' association of ideas with the use of the word "assassin," which was not then in the Dutch language, but common in French and English, would better understood. The ordinary meaning of this word "assassin," as used in military parlance at that date, was not that of a dastardly or moulding murderer, but rather that of a soldier who attacks suddenly without warning; and this seems to have been the method of the impetuous, young George Washington, in July 1753, when he rushed upon the French party, during which Jumonville was killed. In view of the whole situation — wind, rain, night, a flickering candle for light and a desire to be fair to John Duryan — most probably did the best he could and is scarcely to be blamed. During the Revolution, Van Braam served on the British side, though in a letter to Washington, his former pupil, he expressed personal regret at the state of their relations and the fortune of war. His subsequent history is not known. Consult the lives of Washington by Marshall and Irving; Winson's 'Narrative and Critical History of America' (Vol. V).

VAN BRUNT, Henry. American architect: b. Boston, Mass., 5 Sept. 1832; d. there, March 1903. He was graduated from Harvard in 1854 and studied architecture. He served in the Union army on staff duty during a part of the Civil War period and subsequently practiced his profession in Boston and Kansas City, Mo., and was the designer of many buildings of importance, chief among which is Memorial Hall at Harvard, a work performed with W. R. Ware. Among other buildings designed by him are the First Church, Boston, and the Public Library, Cambridge. He published 'Greek Lines and Other Architectural Essays' (1893).

VAN BUREN, van bû'rên, James Heartt, American Protestant Episcopal bishop: b. Watertown, N. Y., 7 July 1850; d. 9 July 1917. He was graduated from Yale in 1873 and from Berkeley Divinity School, Middletown, Conn., in 1876, took orders in the Episcopal Church in the year last named and for more than 10 years was rector of Saint Stephen's Church, Lynn, Mass. In June 1902 he was consecrated bishop of Porto Rico.

VAN BUREN, Martin, eighth President of the United States: b. Kinderhook, N. Y., 5 Dec. 1782; d. there, 24 July 1862. His father, Abraham Van Buren, was of Dutch descent, a farmer and a tavern-keeper — the Dutch village school, studied at Kinderhook Academy and in 1796, when 14 years of age, entered the law office of Francis Sylvester, where he read law and other subjects. In 1802 he entered the law office of William P. Van Rensselaer, an influential man and a close friend and defender of Aaron Burr. The latter paid considerable attention to young Van Buren. In 1803 he was admitted to the bar, returned to Kinderhook and practised his profession with great success. He was married in 1807 to Hannah Hoes, but the latter died in 1819. From 1808 to 1813 he was surrogate of Columbia County. He was in the State senate 1812 to 1820, and in February 1815 was made attorney-general, holding this office till 1819. In 1816 he removed to Albany and entered into a partnership with Benjamin F. Butler. He was elected United States senator in 1821 and re-elected in 1827, but resigned his seat in 1826 on his election to the governorship of New York. While holding the offices mentioned Van Buren became interested in politics. His father was a Jeffersonian-Republican, and Van Buren followed him politically. The State politics of New York were factional and complex in this period. It was out of this situation that the principles involved in the spoils system were developed. It was a thoroughly established system when Van Buren was made a member of the 'Albany Regency,'
and he had in his own person experienced its operation, both to his advantage and disadvantage. The "Albany Regency" was a group of men organized to control the politics of New York and avert the advantages of local, State and national affairs. While United States senator his political views became more and more fixed and precise. In general he was a strict constructionist, a States Rights man, and against the United States Bank. He was closely associated with Senator Benton of Missouri and Andrew Jackson, and thus laid the foundations of a life-long intimacy with these men. He was opposed to the principle of internal improvements at national expense though he was at first willing to vote for such improvements. He voted for the tariff of 1824 and 1828, but later was in favor of a tariff for revenue only. As chairman of the judiciary committee he endeavored to enlarge the influence of the Federal judiciary. As governor of New York he urged, in his first message, a Safety-Fund banking system, a plan whereby banks mutually insured each other's soundness. He resigned in March 1829 in order to become Secretary of State in Jackson's Cabinet. He used his influence to bring the followers of Crawford and Jackson together in preparation for the campaign of 1828, and did much to make Jackson's election possible. Van Buren was responsible, more than any other man, for the political creed of Jackson's administration. He resigned in 1831, because he felt that the public measures of the administration would be attributed to his intrigue, and thus made to injure the President. Van Buren has been accused of being primarily and chiefly responsible for the "spoils system" which flourished under Jackson. While he did not oppose the system, the main responsibility cannot be placed on Van Buren. His most important work as Secretary of State was the opening up of trade in American vessels between the United States and the British West Indian colonies. The restrictions placed by Great Britain were removed and a source of international irritation disposed of. In June 1831 Van Buren was appointed Minister to England and spent some months abroad. In January 1832, however, the Senate rejected his appointment. Before his return to New York 5 July 1832 he had been nominated for the vice-presidency, and was elected in November. While he held this office he was the chief adviser of the President. He, however, disapproved the removal of the deposits. The Democratic-Republican Convention, which met at Baltimore 20 May 1835, was anxious to find a man to preserve the unity of the party and one who would carry on the principles of Jackson's administration. Van Buren received the unanimous vote of the convention. His platform declared that Congress did not have the power to distribute the surplus revenue without a constitutional amendment. He was opposed to the distribution of the proceeds of the sale of public lands among the States; to internal improvements at national expense; to a re-charter of the United States Bank and the abolition of slavery in the District of Columbia. He was elected to the presidency by a combination of the Middle States and New England against the West, which voted for Harrison, with the South divided. The electoral vote was 170 for Van Buren and 73 for Harrison. His Cabinet, with a single exception, was the same as Jackson's: John Forsyth of Georgia, Secretary of State; Levi Woodbury of New Hampshire, Secretary of the Treasury; Mahlon Dickerson of New Jersey, Secretary of the Navy; Amos Kendall, Postmaster-General, and Joel R. Poinsett, Secretary of War. In his inaugural address he stated his policy would be "a strict adherence to the letter and spirit of the Constitution." Van Buren inherited the financial troubles of Jackson's administration. He was not responsible for the Panic of 1837, and on the other hand did much to repair its damage. He called a session of Congress 15 May to meet the first Monday of September. His message to Congress was an important state paper. He declared that the law provided that the Secretary of the Treasury must deposit public moneys only in banks that paid their notes in specie; that, therefore, some agency must be provided for the custody of public moneys. He opposed the re-establishment of a national bank, because it was wrong in principle and the popular will had twice been expressed in opposition to it. He urged what was called the independent treasury system. The collection, safekeeping, transfer and disbursement of public moneys should, Van Buren said, be managed by public officers. His suggestion was not finally incorporated into law until 4 July 1840 and the act was repealed in 1842, but was again re-enacted in 1846 and this principle became a cardinal feature of American finance. This was the most important State act of Van Buren, and showed courage, firmness and the qualities of a statesman. Two other measures advocated by Van Buren and passed, were the issue of $12,000 in treasury notes and the postponement of the distribution of the surplus among the States. Another question that arose in Van Buren's administration was the reorganization of the Texan Republic and its annexation to the United States. Van Buren was against both of these propositions, but the matter did not become a pressing one while he remained in office. Van Buren was a candidate for re-election in 1844 and the choice of the convention. He was opposed by the Whig candidate, Harrison, and was defeated by an electoral vote of 234 for Harrison to 60. He was charged with being a "Northern man with Southern prejudices." As ex-President he was active in expressing his political views. In 1843 he declared for a tariff for revenue only. He was a candidate for President in the election of 1844. The great question was the annexation of Texas, desired especially by the southern representatives to the convention. Van Buren's nomination seemed assured two months before the convention met, but now it was certain that his nomination depended on his surrendering his views on this question. He courageously set forth the reasons in his famous letter of 27 April. The nomination went to Polk, although on the first ballot Van Buren received 146 votes, States Bank and the abolition of slavery in the District of Columbia. Van Buren's rule, however, required a two-thirds vote. In 1848 he was the Presidential candidate of the Free Soil Party but the Whig candidate, Taylor, was elected President. This ended his political career. After the election he spent
two years in Europe, and on his return in 1855, he lived quietly at his old home in Kinderhook.

The character of Van Buren has been a matter of some controversy. He has been called the first politician-president. He was brought up in an era of politicians and was made President by such men. His early political associates were men from this class, so that it is not strange that he did not measure up to the highest standard of statesmanship. However, he was not entirely lacking in real ability and statesmanship. He was known as a polite, affable, good-natured, mild, courteous and dignified gentleman. He was also known as a shrewd, practical, skillful politician, and was accused of being more anxious about the means than the end. He was the "Little Magician" in his ability to bring things to pass politically, but, except occasionally, his action seems not to have been determined by great moral forces.

On the other hand he, on several important occasions, took the unpopular side of questions when he knew that such a course would be likely (1840) and thereby had a great effect on his political career. His action on the Texas question in 1844 is a notable example and proved that he had moral courage. Calhoun was certainly wrong in asserting that he was only a practical politician with whom "justice, right, patriotism, etc., were mere vague phrases." He loved the Union, was anxious that money should not be taken from the people without exceedingly good reasons, and had a dislike for slavery and its extension. He at least showed great statesmanship during the panic of 1837 and is responsible for one of the most important and fundamental fiscal policies of the United States.

**Bibliography.**—There are numerous lives of Van Buren. Consult Bancroft, George, 'Martin Van Buren' (1889); Shepard, Edward M., 'Martin Van Buren' (Boston 1899); American Statesman Series, the best biography but very favorable. Contemporary campaign biographies are by W. H. Holland (Hartford 1835) and by David Crockett (Philadelphia 1836). Consult also a biography by William L. Mackenzie (Boston 1846), unfavorable; Orth, S. P., 'Five American Politicians.' (1906); Weng, F. H., 'Calendar of the Papers of Martin Van Buren' (1911); Richardson, J. D., 'Messages and Papers of the Presidents' (Vol. III, 1896).

**Marcus W. Jerneian,**
Associate Professor of History, University of Chicago.

**VAN BUREN, William Holme, American surgeon:** b. Philadelphia, Pa., 5 April 1819; d. New York City, 25 March 1883. He was educated at Yale and studied medicine in the University of Pennsylvania and in the hospitals of Paris, receiving his degree from the university in 1845. He was appointed at the same time assistant surgeon in the United States army. He resigned in 1845 to assist his father-in-law in his surgical clinics in the University of the City of New York; was professor of anatomy there (1852-66) and was surgeon of Belmar from 1866 until the time of his death. He was the author of several standard works.

**VAN BUREN, Ark, city, county-seat of Crawford County, on the Arkansas River and on the Saint Louis, Iron Mountain and Southern and the Saint Louis and San Francisco railroads, about seven miles north of Fort Smith. It is in an agricultural region and has considerable lumber, interests. The chief industries are zinc smelting, railway repair shops, car factory, lumber products, canned fruits, cotton products, ice, cigars, wagons and agricultural implements. There are one high school and elementary schools and a daily and weekly newspaper. Natural gas is found in the vicinity. Pop. 3,678.**

**VAN BUREN, Me, town in Aroostook County, on the Saint John River and on the Canadian Pacific and the Bangor and Aroostook railroads. It is in the northeastern part of the State, on the New Brunswick boundary. Van Buren was incorporated in 1881 and is an important distributing point of the lumber camps. It is connected by stage lines with Fort Kent, Fort Fairfield and other places. The educational institutions are Saint Mary's College, public and parish schools and Good Shepherd Academy. Pop. 365.**

**VAN CORTLANDT, kör'tlánt, Jacobus, American merchant:** b. New York City, 1658; d. 1739. He served as mayor of New York in 1719 and after his death his estate was purchased for Van Cortlandt Park. The old manor house was converted into a museum.**

**VAN CORTLANDT, Philip, American soldier and legislator:** b. Cortlandt Manor, Westchester County, N. Y., 1 Sept. 1749; d. there, 5 Nov. 1831. Graduated from King's College (now Columbia University) in 1758, he began work as a surveyor, but at the outbreak of the Revolution received the commission of lieutenant-colonel, commanding the 4th battalion of New York infantry. In 1776 he was made colonel of the 24th New York regiment. He fought 7 Oct. 1777, at the battle of Saratoga (Stillwater, Bemis' Heights), in Sullivan's campaign against the frontier Indians and in the Virginia campaign of 1781. He retired from the service with the grade of brigadier. A member of the New York assembly in 1788-90, he was also in 1788 a delegate to the State convention which adopted the Federal Constitution, and in 1791-94 a State senator. From 1793 to 1809 he was a representative in Congress. He accompanied Lafayette in the latter's tour of the States in 1824.

**VAN CORTLANDT, Stephanus, American jurist:** b. New Amsterdam (New York City), 4 May 1643; d. there, 25 Nov. 1700. He was educated at the Dutch public schools of his day, engaged in mercantile life and became a member of the Court of Assizes on the establishment of an English government (1664). He became a colonel in the King's regiment, was mayor of New York (1677-1700) and held other offices. He also was judge of the Court of Common Pleas in Kings County for several years and was appointed chief justice in 1700, which position he held at the time of his death.

**VAN CULVER, Arendt:** b. Nijkerk, Gelderland, 6 Feb. 1620; d. drowned in Lake Champlain in 1667. Piochuer, the Statesman, fostered the Dutch peace policy with the Iroquois, initial explorer of the Mohawk Valley,
rescuer of French captives, he first made the settlement of Rensselearwijk (Albany) a success. Though cousin of the Patroon Van Rensselaer, he educated himself out of a system of semi-feudalism, bought the "Great Flat" from the Indians, led a company of free farmers into the Mohawk Valley and founded the city of Schenectady. The personality of this far-seeing man, one of the builders of the future Empire State, so far transcended his subordinate position under Governor Dongan that his image was almost as exalted as that of the Iroquois and the French his enduring fame excels that of many men higher in office. The town of Schenectady, bay (Peru bay), and lake (Champlain) were all called "Corlaer" after him. What was almost unique, as Parkman wrote, is that his name, meaning "corn ear," was left untranslated, and became the title in the Indian speech, not only of every one of the governors of New York "Corlaer," but also of the sovereign of the British Empire, "Kora-Kowa" (the great Corlaer). In 1909, under the auspices of the Schenectady County Historical Society, with fitting ceremony, there was erected on the walls of the great church in the village a handsome bronze tablet to Arendt Van Curler's memory. Of the other two Van Curers in New Netherland, one was Anthony the trumpeter. From the line and a half of history, Irving has constructed the character with his imagination, and from what is known of the geographical terms, Anthony's Nose, a promontory, and Spuyten Duyvil, a village on the Hudson, are associated. Jacobus Van Cur- ler, a relative of Arendt, a member of the governor's council, commanded in 1633 the Dutch fort, House of Hope, on the Connecti- cut River, near the site of Hartford. Later he became a schoolmaster on Manhattan, purchased land and after him "Corlaer's Hook" received its name. He returned to Nijkerk, Consult Cuog's 'Lexique de la Langue Iro- quoise' (1882); and Griffis, 'Story of New Netherland.'

**VAN DE VELEDE, veldé, Adrian, Dutch painter:** b. Amsterdam, 1635 or 1636; d. there, 1708. He was the son of Willem van de Velde the Elder, under whom he studied, and consequently brother of William van de Velde the Younger, the famous marine painter. While he continued his training as a landscape painter under Wyman at Haarlem, P. Wouverman taught him to draw and paint figures, and he eventually rose to be one of the most eminent of the Dutch masters. He was equally successful in history, animals, battle-pieces, genre and portraits, but his masterpiece, now in the museum of The Hague, is a landscape in which the figures in the foreground are por- traits of himself, his wife and children. His pictures are highly valued by connoisseurs, and 'A Pastoral Scene' (containing cows, a horse, sheperd and figures, 13¼ X 12½ inches) was sold in 1842 for $22,575. Other important pictures of his are 'Starting for the Hunt'; 'Winter Landscape'; 'The Siesta,' etc.

**VAN DE VELEDE, Willem (The Elder),** Dutch painter: b. Amsterdam, 1587; d. London, 1638. He was in early life a seafaring man, and settling at Amsterdam became famous for his marines in black and white, and in order that he might witness any sea-fight that should take place at a time when the Dutch navy swept the seas, the states of Holland placed at his disposal a small vessel from which he sketched and painted a great many pictures. He was appointed court painter by Charles II of England and his successor, James II, and enjoyed a royal revenue until his death. His pictures are almost all in black and white and were excellled by those of his son Willem van de Velde the Younger, who, however, doubtless used the sketches, studies and drawings left by his father from.

**VAN DE VELEDE, Willem (The Younger),** Dutch painter: b. Amsterdam, 1633; d. Greenwich, 6 April 1707. He gained the delicate sense of color and marvelous power of atmospheric effect from De Vlieger, but his strong drawing and knowledge of marine detail, his faculty of giving motion to waves and ships, he derived from his father, who was, however, no colorist. But while he could paint the storm, foaming waves, angry clouds and scudding vessels he was equally successful in portraying a calm; one such picture catalogued as 'A Calm, Men-of-war at Anchor,' was sold in 1846 for $8,820, and his canvases have always been prized by English critics and connoisseurs, by one of whom he has been styled the "Raf- fael of Marine Painting." There are some 330 of his works extant, some of which when last they changed hands brought between $10,000 and $14,000. Little is known of the life of this painter excepting that he received a pension of $100 a year from Charles II who was in every way his liberal patron. His portrait, by Sir Godfrey Kneller, is still in existence. Consult Michel, 'Les Van de Velde' (1892).

**VAN DER CAPELLEN, Joan Derck, Dutch champion of American independence:** b. at Tiel, 2 Nov. 1741; d. 6 June 1784. He was of a family famous since the 12th century, and descended from the chaplains or Capellani of France. In the 17th century, under Governor Stuyvesant, two men of this name lie were large owners of land on Staten Island and in the country of the Navesink and Raritan Indians. Joan Derck, educated at the University of Utrecht, was a great reader of the politi- cal writings of the British Whigs, a pronounced Liberal, opposed to the pro-Brit- ish policy of 'the Court' and Stadtholder William V. Being in active sympathy with the American colonists, he struck a decisive blow in their behalf when, on 16 Dec. 1776, six months before the Declaration of Independence, as a member of the provincial legislature of Overijssel, he protested against the 'Lending of the Scotch Brigade [of three regiments, formed in Queen Elizabeth's time and probably the oldest standing army in Europe] for service in America.' For this body of veterans, King George III had in an autograph letter made earnest request. This, Van der Capellen 'op- posed with all his endeavors,' considering the cause of the American colonies was that of all mankind. For this printed speech, he was thanked by Gov. Jonathan Trumbull and many Americans, with whom Van der Capellen kept up an active correspondence. Besides great activity with pen and voice, in attacking some surviving features of feudalism such as the 'corves,' or the peasants' forced labor without pay, he worked with John Adams and with van der Kemp, Luzac and others, subscribing
Van der Donck, Adrian, tribune of the people, the first lawyer in New Netherland and author of the initial illustrated book descriptive of the country: b. at Breda, North Brabant. He was graduated at the University of Leyden. Appointed schout-fiscal or financial inspector of Rensselaerwijk, he served from 1641 to 1646; in which latter year he married the daughter of the Rev. Francis Doughty, an English clergyman who had fled from New England. He was active in peace negotiations between Governor Kieft and the Indians. Desirous of becoming a patron, in order to have influence in behalf of the people, he tried to purchase an estate at Catskill. Prevented by Van Rensselaer, he went to Manhattan and bought land which was variously called Colendonck, that is, Donck's Colony, the Yonkers's land, or, as since shortened, Yonkers. His title was confirmed by the states-general. Able and public spirited, he was chosen in 1646 one of the Nine Men to represent the people and to act with the governor. Stuyvesant executed the orders of the Company with such drastic literalness, that in 1649 Van der Donck, acting for the commissioners, wrote out the Remonstrance and Petition to the states-general. In the conflict between autocracy and corporationism, and the community on the other, Van der Donck's house was searched, his draft of the Remonstrance seized and he was imprisoned by Stuyvesant. When free, he led the people's delegates and arrived at The Hague before the emissaries of Stuyvesant, stating eloquently the people's plea for self-government. Detained in Holland four years, his alma mater made him a doctor of laws and he practised in the Supreme Court. His book, descriptive of New Netherland, encouraged emigration. It was rich in critically sifted information as to fauna and resources, and he warned against destruction of the forests. In pure description, this work excels anything known in color. The map of the province and the picture of New Amsterdam in this book are those most often copied and familiar to the average American. On his return, in 1653, to take further part in the struggle for self-government, intending also to write a full history of the colony, in Amsterdam he was never able to overcome Stuyvesant's implacable hostility or to examine the Company's records. He died in 1655. He was author of the Municipal Board, the true founder of municipality and popular government on Manhattan, and is deserving of the highest memorial honors. The key to his character as to Stuyvesant's is found in the chronic struggle between autocracy and corporationism on the one hand and the people's demand for self-government on the other, which was incarnated in these two makers of New Netherland. His descendants under the name of Onderdonck and Vandunk, or Verdunck, were numerous. His land in later days is part of the Franklin Phildelphia and the Van Cortlandt manor, and the museum in Van Cortlandt Park standing on or near the site of his old home. Consult Brodhead, 'History of the State of New York' (1850); Van Rensselaer, 'History of the City of New York' (1909); and Griffis, 'The Story of New Netherland' (1909).

Van der Essen, Léon, Belgian historian: b. Antwerp, 12 Dec. 1883. He was educated at Saint John Berchmans College, Antwerp, and at Louvain University. From 1906 to 1910 he was assistant professor at the Seminary of History, Louvain, after 1910 he was professor of critical history and institutions of the Middle Ages, and after 1912 special professor of the Flemish course in mediæval history and vice-president of the Seminary of History, Louvain University. In 1906-09 Dr. Van der Essen journeyed to Naples and Parma on a scientific mission from the Belgian government. He has published 'Het Ontstaan van Antwerpen' (1905); 'Étude critique et littéraire sur les Vite des Saints Mérovingsiens de l'ancienne Belgique' (1907); 'De straf—en rechterlijke vergeningbedevaarten in de Midendeuwen' (1911); 'Geschiedenis der Midendeuwen' (1912); 'Les archives farnéisiennes de Naples au point de vue des Pays-Bas' (1907). He collaborated in 'Biographie Nationale de Belgique' (1905); 'A Short History of Belgium' (Chicago 1916), etc.

Van der Goes, goos, Hugo, Dutch painter: b. Ghent; d. Soignies, near Brussels, 1482. He was in 1465 a member of the Guild of Painters of his native place, serving as dean of the association from 1473 to 1475. He was a follower of Van Eyck, but most of the incidents related of his life have been rejected as fabulous. It is only known that he retired to a monastery, Rooden Krooster, in Belgium where he died insane there. The Florence triptych now in the hospital Santa Maria, a 'Madonna and Child with Angels,' is undoubtedly his production.

Van der Helst, hêlst, Bartholomeus, Dutch painter: b. Haarlem, 1611 or 1612; d. Amsterdam, 16 Dec. 1670. In Amsterdam he was the pupil of Nicolas Elias. His most famous picture is 'The Banquet of the Civic Guard,' which contains 24 powerful portraits, and was painted to celebrate the Peace of Westphalia (1648). The work is remarkable for life-like expression, masterly drawing and clear, harmonious coloring, and Sir Joshua Reynolds said of it that it was 'the first picture of portraits in the world.' Numerous portraits by him are met with in the world, among them are that of 'Paul Potter' (at The Hague); 'The Lady in Blue' (in the London National Gallery); and the 'Dutch Burgomaster' (in the Metropolitan Museum of New York).
VAN DER HEYDEN, h'f'den (or HEYDE), Jan, Dutch painter: b. Gorcum, 1637; d. Amsterdam, 28 Sept. 1712. After studying under a glass painter he turned his attention to architectural landscape on canvas, and taking up his residence in Amsterdam he executed many views of churches, castles, palaces, open squares, streets, canals, etc. These were enriched with elaborate figure groups, mostly painted in by Lingelbach, Van de Velde and Eggen Van der Neer. His works are to be met with in most European public galleries. His chief pictures are 'View of the Town Hall in Amsterdam' and 'View of the Dam Square.'

VAN DER HOEVEN, hoo'v'en, Jan, Dutch scientist: b. Rotterdam, 9 Feb. 1801; d. 10 March 1888. He studied natural history and medicine at Leyden and continued his studies in zoology at Paris and returned to his native town as a practising physician, but in 1835 was appointed professor of zoology at Leyden University, a position he held till his death. He published many works on his special subject, the chief of which was 'Handboek der Dierkunde' (Handbook of Zoology, translated by Professor Clark of Cambridge).

VAN DER KEMP, Francis Adrian, Dutch-American writer and clergyman: b. Kempen, Holland, 1752; d. Barneveld, N. Y., 1829. He received his education in the schools of Holland and graduated at the University of Groningen. In 1777 he became minister of a church in Leyden. From the first, in religion and politics he became a leader of the Liberal party. He joined the armed forces that were trying to gain political freedom from the Orange party. He was taken prisoner and placed in prison, but was released in 1787. In 1788, having secured letters of introduction from John Adams and Lafayette, he came to America and lived for six years at Exposus on the Hudson. In 1794 he moved to Barneveld, N. Y., where he passed his life, farming. He was chosen a member of many learned societies and given an honorary degree of LL.B. by Harvard in 1820. He wrote many articles and also an autobiography, which though never published yet furnished material for a *Memoir* written in 1903 by Mrs. Helen L. Fairchild. Many of his original manuscripts are in the possession of the historical societies of Buffalo and Philadelphia, and a few are in the library of Columbia University.

VAN DER MEER, Jan, of Delft. See VERMEER, JHANNES.

VAN DER MEULEN, mel'en, Adam Français, Dutch painter: b. Brussels 1632; d. Paris, 15 Oct. 1690. After learning the principles of his art in the studio of P. Snayers (q.v.) he was introduced by Lebrun to Minister Colbert, who commissioned him to paint several pictures for his private gallery and made him superintendent of the Gobelin tapestry factory. He subsequently as court painter accompanied Louis XIV on his campaigns in Flanders for the purpose of painting the most important scenes of the war. A great number of battle pieces, which are crowded with figures, are now in the Louvre and in the gallery at Versailles, others are at Munich, Dresden and Saint Petersburg. A good example of his skill as a battle painter is his 'Rencounter of Cavalry,' a small but exquisite canvas in the New York Metropolitan Museum.

VAN DER POORTEN-SCHWARZ, van der pör't'en shvärts, J. M. H., Dutch novelist. See MAARTEN'S.

VAN DER STUCKEN, stook'en, Frank, American musical director: b. Fredericksburg, Tex., 15 Oct. 1858. He studied at the Conservatory of Music, Antwerp, 1881-82, and became Kapellmeister at the Stadt Theatre, Breslau, Germany. In 1884 he became leader of the Arion Singing Society of New York and in 1892 accompanied it on a concert tour through Europe. He was dean of the College of Music of Cincinnati 1897-1901 and honorary dean from 1901; and in 1905 succeeded Theodore Thomas as musical director of the Cincinnati May Festivals. Among his musical compositions are the opera 'Vlasda,' 'Festival March,' 'Festival Hymn,' 'Inauguration March,' 'Pagina D'Amore,' the latter an orchestra episode.

VAN DER WEYDEN, wé'den, Rogier (also known as ROGER DE BRUGES, ROGER DE BRUXELLES, RUGGIERO DA BRUGIA, MAESTRO ROGEL and ROGER DE LA PASTURO), Flemish painter: b. Tournay, Belgium, about 1400; d. Brussels, 16 June 1464. He was the pupil of the painter Robert Campin in Tournay (1427), and five years later was made master of the Guild of Saint Luke in his native city. In 1436 he went to Brussels and was appointed municipal painter. He attended the jubilee at Rome in 1450, and after studying the Italian masters and antiques of Italy and painting several pictures for Italian patrons, one of whom was Cosmo de Medici, returned to Belgium and settled at Brussels. All of his pictures are distinguished by a profoundly religious spirit. They are designed and drawn with great care and power; the modeling is firm and strong, the colors brilliant, but there is a certain dryness and leaness in the limbs, hands and feet of his figures, which sometimes amount to distortion and deformity, and is only half redeemed by the beauty of expression is radiant with faith and celestial inspiration. He was the founder of the Brabant school of painting and had numerous pupils and followers, among them Memling, as well as foreigners who learned from him the use of oils in painting and helped to spread the new method and other characteristics of the Flemish studios. His chief paintings are 'The Descent from the Cross,' originally painted for the church of Our Lady of Victories, at Louvain, now in the Escorial, a copy being also in the Prado Gallery; a triptych with the figure of the 'Dead Christ' in the central panel; and altarpiece for Saint John's chapel in the church at Middleheurgh. 'The Adoration of the Shepherds' (all three in the museum at Berlin); and the triptych with a 'Crucifixion' in the centre in Imperial Gallery at Vienna; the 'Last Judgment' in the hospital at Beaune; and the 'Seven Sufferings at Sidon,' in the Pinakothek at Munich are to be seen his 'Adoration of the Three Magi; and 'Saint Luke Painting the Portrait of the Madonna.' Consult Wauters, 'Roger Van der Weyden, ses œuvres, ses élèves et ses disciples' (1856).
VAN DEVANTER, Willis, American lawyer; b. Marion, Ind., 17 April 1839. He was graduated at Asbury College (now De Pauw University) in 1858 and at the Cincinnati Law School in 1859. He held a much higher position that his Marchann (1884); moved to Cheyenne, Wyo., and was commissioned to revise the Wyoming statutes (1885) and was city attorney there (1887-88). He was chief judge of the Supreme Court of Wyoming (1890-93); (1903-10) and associate judge of the Supreme Court of the United States from 1910 by appointment from President Taft. His decisions on important railroad and corporation cases in connection with the Sherman Anti-Trust Law attracted wide attention.

VAN DIEMEN, dë'mën, Anthony, Dutch colonial administrator: b. 1593; d. 1645. Having gone to India, he soon rose to the highest dignities and in 1636 was made governor-general. He administered the government with ability and contributed much to the establishment of Dutch commerce in India. The navigator, Abel Tasman, whom he sent with a ves- sel to the South Seas in 1642 gave the name of Van Diemen's Land to the island now called Tasmania, but in 1853 it was renamed for its discoverer.

VAN DIEMEN'S (vân or vân dë'mên') LAND. See TASMANIA.

VAN DORN, Earl, American soldier; b. near Port Gibson, Miss., 17 Sept. 1820; d. Spring Hill, Tenn., 8 May 1863. He was graduated at West Point in 1842 and served in the American army with distinction during the Mexican War. Early in 1861 he joined the Confederate army, captured the steamer Star of the West at Indianola and becoming major-general in January 1863 commanded the Trans-Mississippi district. He suffered defeat at Pea Ridge and being transferred to the Army of the Mississippi was again defeated at Corinth. He was shot during a dispute and died shortly after.

VAN DUYSE, Lewis Sayre, American naval officer: b. Elmira, N. Y., 29 June 1861. He was graduated at the Naval Academy (1880) and was promoted through various grades of the service to a captaincy (1911). He served in several important positions and was present as officer of the battleship Iowa at the destruction of Cervera's fleet (1898); also in the attack on the fortifications of San Juan, Porto Rico. He served in the Philippines (1898-1900), and in China (1900) during the Boxer Rebellion. From that time he occupied important positions, being instructor in ordnance in the Naval Academy, executive officer of the steamships Marietta and Newport, was executive officer of the naval torpedo station at Newport, R. I., commandant of the navy yard at Olongapo, P. I., and of the navy yard at New York (1910-13) and was in command of the battleship Utah in 1914 when he was retired at his own request. He received numerous medals. He edited the Army and Navy Year Book for several years, etc., and was author of important technical contributions to periodical literature and standard reference works.

VAN DYCK, dik, Anthony, Flemish painter: b. Antwerp, 22 March 1599; d. London, 9 Dec. 1641. He was born of wealthy parents, his father being Frans Van Dyck, a prominent silk merchant. Young Van Dyck very early displayed a fondness for drawing and especially for the sketching of faces, for which he showed such talent that his Master Bernard Van Balen (1610) and Balthasar van den Bossche (1610) sent him, as a resident pupil to the noted painter and art teacher, Hendrik Van Balen, where he made such rapid progress that at the age of 16 he was made a journeyman in Antwerp with Jan Brugghel the younger as portrait painter and general artist. He is said to have inherited much of his artistic talent from his young mother, Maria Cuypers, his father's second wife, who was noted in Antwerp for her won- derful skill and taste in the making of embroidery, much of her work in this field being real art creations. Van Dyck was not long a free lance when he attracted the attention of Rubens, who was so impressed with the boy's talent that he took him into his own household and made him his assistant. This pleased young Van Dyck, his father and his mother and the precocious pupil of the great Flemish master made rapid progress. He had wonderful power of exact observation and reproduction, and his imitation of Rubens' work was so well done that to-day it is extremely difficult to distinguish the paintings of the pupil from those of the master. Before he had reached his majority Van Dyck had already be- come famous in his own country and had begun to attract attention outside of it. At the age of 19 he was elected a member of the Painters' Guild and the following year he went to England on the invitation of the Earl of Arundel, who had formed a very high opinion of his talent and the superior quality of his work. Through the influence of the latter he secured a pension from the English king, James I. This introduction to the English court was of very considerable influence on his future career. He remained two years in England where he greatly increased his reputation and became very popular. The English angelized his name into Anthony Van Dyke, under which he was destined to acquire undying fame throughout all English-speaking lands. The longing to see the great southern art capitals took Van Dyck to Italy (with the permission of the English government) where he visited Venice and Genoa and where he received a warm welcome, studied the old masters and produced fine pictures of his own, especially portraits of celebrities, among them artists, rulers, statesmen and princes. His por- traits of the Genoese nobility are especially notable and of great historic value because of the masterly manner in which he has reproduced the customs, dress, habits and spirit of the Italian ducal courts. Van Dyck made a second careful, detailed and loving study of the Vene- tian masters; and the influence of this study of Italian art was deeply reflected in his own work which became more artistic in almost every sense of the word. Under the influence of the great Italian painters of the day he gradually changed his style for the better, making it brighter, more realistic, softer, more re- finned and more human. His wonderful power of absorption stood him in good stead in Italy as it had under the tuition of Rubens in his boyhood. In a word, he seized the spirit of Italian art, so different from that of his own Flemish land in which he had been educated,
This is one of the greatest signs of his genius. This Italian period of his life was wonderfully prolix and resulted in many portraits of royal personages, which still adorn the walls of Italian palaces and museums where they are held in high esteem. He worked in the art and picture galleries of Turin, Rome and probably other Italian cities; and everywhere he had the patronage of the local nobility, for sitting for portraits to Van Dyck had become the fashion of the day among the court circles. On invitation of Albert and Isabella, Spanish regents of the Netherlands, he returned to the land of his birth as court painter; and here again he continued his triumphant art procession, painting all the local celebrities of his day without allowing his popularity to appreciably lower the high standard of his work. In 1631 Van Dyck went to Holland where he was literally received with open arms and where he painted the portraits of notable persons, among them Prince Henry of Orange and his queen, Prince Charles Louis and Prince Rupert of Bohemia (both then in exile).

The Earl of Arundel and the English king had for some time been endeavoring to persuade Van Dyck to return to England; and finally, in 1632, they were successful. The great Flemish artist was received with all the honors that could be accorded to the ambassador of a foreign court. A fine residence, the property of the sovereign, was given to him in London (Blackfriar's district) and the royal favor went so far as to assign him apartments in the royal palace of Eltham, and to appoint him painter in ordinary to the royal household, with a pension of £200 a year, then a large sum of money. Thus encouraged to do his best, honored with the high esteem of the English sovereign and his consort and praised by the British nobility led by the Earl of Arundel, Van Dyck now began the most notable of his many notable series of portraits. These include numerous portraits of the king, the queen and their children. Van Dyck seems to have been very happy and to have put into his work all his love of art, his cultured imagination and the wonderful art knowledge and technique he had acquired. He was in close contact with the paintings of schools so far apart as the Netherlands and Italy.

In 1634 Van Dyck returned to Antwerp where he remained actively at work for over two years. There he painted many notables and produced some of his most characteristic groups, now among the glories of Flemish achievements in art. From 1636 to 1640 he was again back in England, where he busied himself painting portraits for most of the notable personages of the court, so that there are literally scores of fine Van Dyck portraits scattered throughout the palaces of the British nobility. So popular was Van Dyck, at this period of his career, that it was a physical impossibility for him to have executed all the pressing commissions given him. The result is that he very often simply sketched his subject, painted the features and left the execution of the rest of the picture to skilled pupils and followers of his school. He invariably, however, retouched this pupils' work, where he found it not to his fine artistic taste. In 1641 Van Dyck went to Paris where he hoped to get a commission to decorate the Louvre for which he had conceived an elaborate plan; but he was disappointed. This probably increased his already poor health and he died the following year at a comparatively young age, but easily the foremost name in art of his latter years.

Van Dyck is the perfect excellence the ideal portrait painter. While remaining true always to his subject, he had the power of casting round it a glamour which lent an air of distinction to his portraits of princes of the State and Church, of sovereigns and nobles. By instinct he was himself an aristocrat and the position he maintained as the autocrat of his profession increased this inborn tendency and gave him a very broad and deep interest in the true artistic interpretation of the men of noble family and high estate that he may be said to have spent his life transferring to canvas. His portraits of the unfortunate Stuart, Charles I of England and the cavaliers who so strenuously supported his cause, have done more to immortalize them and to maintain an interest in and a sympathy for them than any one other agency. Through them we form a definite visual picture of the court of Charles I and of the upper-class society of his day, such as we are unable to visualize of any other period in English history. His influence upon English art, and especially upon portrait painting, was greater and more lasting than that of any previous painter. Yet so peculiarly his own was his style of painting and so consummate was his art that while he had hundreds of imitators, many coworkers and numerous pupils, he may be said to have created no school. This is because his supreme excellences is to be found in his mystical poetic touch, his idealization and his mingling of the broad, striking dramatic realism of the Flemish painters, generally translated into action and the softening, reining imaginative, poetic temperament of the South. No artist could imitate Van Dyck as Van Dyck constantly imitated, in such a realistic manner, the work of his first great master, Rubens, and the notable painters of the Italy of his day. This is because Van Dyck, Janus-like, was constantly presenting two faces, one looking toward the long past, bold, dramatic and consistent contact with the paintings of schools so far apart as the Netherlands and Italy.
Museum); 'Piétà' (Vienna, Munich, Antwerp). Van Dyck's works have become generally known through the excellent engravings made of the best of them. He was himself one of the cleverest engravers of his day, and had he not given his best work to his paintings he might easily have attained a place second to none in the graver's art. His etchings are very superior works of art. He was a master of the technique of drawing and this gave him an unusual advantage over many of his contemporaries even in etching. This enabled him to direct, with wonderful skill, many of the best engravers of his day, whom he employed for the engraving of heads of noted personages of the different countries of Europe. In this work he frequently himself handled, with consummate skill, the graver's tools; and the original sketches and drawings for these notable works were his own. As issued by Hendrick these engravings numbered 106 (1642). The last of 17 editions appeared in 1759 (with 124 plates).

VAN DYCK, Cornelius Van Allen, American missionary and translator: b. Kinderhook, N. Y., 1818; d. 1895. He was graduated at Jefferson Medical College, Philadelphia (1839), and went as a medical missionary to Syria the next year. In 1846 he was ordained a minister, became master of the Arabic language and translated the Bible into that tongue. While his Bible was being printed he taught Hebrew in the Union Theological Seminary, New York (1866-67). He was manager of the mission press at Beirut, physician to Saint John's Hospital and professor of pathology in the Syrian Protestant College (1867-82), and made many translations of medical and other texts into the Arabic.

VAN DYKE, Henry (Jackson), American Presbyterian clergyman and author: b. Germantown, Pa., 10 Nov. 1852. He was graduated at Princeton (1873), the Princeton Theological Seminary (1877) and the University of Berlin (1878); was pastor of the United Congregational Church of Newport, R. I., in 1878-83; and of the Brick Presbyterian Church, New York, from 1883 until his resignation in 1897 to become professor of English literature in Princeton University. He was moderator of the General Assembly of the Presbyterian Church in the United States in 1902-03. He became favorably known as both preacher and popular lecturer, and in addition to publishing several works of religious character contributed much also to general literature. In 1908 he delivered a course of lectures at the University of Paris. He went to the Netherlands as United States Minister in 1913. He resigned in 1917 and returned to Princeton. The titles of his volumes include 'The Reality of Religion' (1883); 'The Story of the Psalms' (1887); 'The Poetry of Tennyson' (1889); 5th rev. ed., 1894); 'Little Rivers' (1895); a collection of essays; 'The Gospel for an Age of Doubt' (1896); 'The Builders and Other Poems' (1897); 'Ships and Havens' (1897); 'The Lost Word' (1898); 'Fisherman's Luck' (1898); 'Felix, and Other Poems' (1900); 'The Poetry of the Psalms' (1900); 'The Blue Flower, short stories (1902); 'The School of Life' (1903); 'Days Off' (1907); 'Out of Doors in the Holy Land' (1907); 'Lettres d'Amerique' (1909); 'Collected Poems' (1911); 'The Unknown Quantity' (1912); 'Grand Canyon' (1914); 'The Valley of Vision' (1919); 'The Broken Soldier and the Maid of France' (1919).

VAN DYKE, John Charles, American art critic and librarian: b. New Brunswick, N. J., 21 April 1856. He was privately educated and in 1877 was admitted to the New York bar, but soon gave his attention to literature, and since 1878 has been librarian of the Sage Library, New Brunswick. For many years he studied art in Europe, has lectured at various universities on art topics and is professor of art at Rutgers College. He has published 'Books and How to Buy Them' (1833); 'Principles of Art' (1887); 'How to Judge of a Picture' (1888); 'Serious Art in America' (1890); 'Art for Art's Sake' (1893); 'History of Painting' (1894); 'Old Dutch and Flemish Masters' (1895); 'Modern Flemish Masters' (1896); 'Nature for its Own Sake' (1898); 'Italian Painting' (1902); 'Old English Masters' (1902); 'The Meaning of Pictures' (1903), etc.

VAN DYKE, Paul, American Presbyterian clergyman and educator, brother of H. Van Dyke (q.v.): b. Brooklyn, N. Y., 25 March 1859. He was graduated from Princeton in 1881, was pastor of the North Presbyterian Church, Geneva, N. Y., 1886-89, professor of ecclesiastical history at the Union Theological Seminary, 1889-92, pastor of the Edwards Congregational Church, Northampton, Mass., 1892-98, and since the date last named has been professor of modern European history at Princeton University. He has published 'The Age of the Renaissance'; 'Renaissance Portraits.'

VAN EYCK, Hubert. See EYCK, HUBERT.

VAN EYCK, Jan. See EYCK, JAN VAN.
VAN GOYEN, van goi'en, Jan Josephszoon, Dutch painter and etcher: b. Leyden, 13 Jan. 1596; d. The Hague, in April 1656. His numerous landscapes and marines are to be found in most European galleries and in the Metropolitan Museum of New York; his 'Moerdyck' and 'Panoramic View of the Environs of Haarlem' are good examples of his style. His pictures are generally painted in a tone which determines all variations of color—a rich brown, a tawny gold or a chilly silver tone, and he has been called the earliest 4tone-painter 5of the Dutch school. There is always genuine feeling in his shore landscapes, sandhills, canals, rivers and village views, while his city scenes are lit up with animated figures. His etched landscapes are rare, and he is only known to have produced five plates. Among his pupils were Jan Steen and S. Kuysdael.

VAN HISE, van hiz, Charles Richard, American artist and lecturer: b. Milwaukee, Wis., 29 May 1857; d. Milwaukee, Wis., 19 Nov. 1918. He was graduated from the University of Wisconsin in 1879, was instructor in metallurgy there 1879–83, assistant professor 1883–86 and full professor of the last-named date, exchanging the chair of metallurgy for that of geology in 1888. He was non-resident professor of structural geology at the University of Chicago, 1892–1903, has been connected with the United States Geological Survey from 1883 and was consulting geologist of the Wisconsin Geological Survey from 1897. Among his professional publications are 'Correlation Papers: Archean and Algolian' (1892); 'Principles of North American Pre-Cambrian Geology' (1896); 'The Marquette Iron-Bearing District of Michigan,' with Bayly and Smith (1897); 'The Conservation of the Natural Resources of the United States' (New York 1910); 'Concentration and Control: A Solution of the Trust Problem in the United States' (London 1912).

VAN HOONACKER, hoo-nak'ær, Albin August, Belgian Biblical scholar: b. Bruges, 19 Nov. 1857. He was educated at the College of Saint Louis, Bruges, the Roulers Preparatory Seminary and the University of Louvain. In 1880 he was ordained to the priesthood and in the same year became professor of humanities at Saint Louis College, Bruges. Subsequently he was curate at Saint Martin's, Courtrai, and in 1887–89 was vice-regent of the College of the Holy Ghost, Louvain University. After 1889 he was professor of the critical history of the Old Testament and Hebrew, and after 1894 held also the chair of Assyrian and moral philosophy at Louvain University. Dr. Van Hoonacker has published 'Observation critiques sur le texte de Bitlam' (1888); 'L'origine des quatre premiers chapitres du Deutéronome' (1889); 'Néhémie et Esdras' (1890); 'Néhémie en l'an 20 d'Artaxerxes I Esdras en l'an 1 d'Artaxerxes II' (1892); 'Zoroaster et le sabbatisme' (1892); 'Le vœu de Jephth' (1893); 'Le lieu du culte dans la législation rituelle des Hébreux' (1894); 'Nouvelles études sur l'histoire de la Restauration juive après l'exil de Babylone' (1896); 'Le peuple de Dieu et dans l'histoire des Hébreux' (1898); 'Le traité du philosophe syrien Probus sur les premiers Analystes d'Aristote' (1900); 'Notes sur l'histoire de la Restauration juive après l'exil de Babylone' (1901); 'Une question touchant la composition du livre de Job' (1903); 'La prophétie relative à la naissance d'Immanuel' (1904); Les douze Petits Prophètes traduits et commentés' (1906), and contributions to encyclopedias and reviews.

VAN HORNE, van hör'n Sir William Cornelius, Canadian railway official: b. near Wolwich, Ill., 3 Feb. 1843; d. 1915. He was employed in various capacities on several lines until 1880, when he became general superintendent of the Chicago, Milwaukee and Saint Paul system. In 1882 he accepted the position of general manager of the Canadian Pacific Railway, and from 1888 to 1899 served as its president. From 1899 to 1910 he was chairman of the board of the company. In 1894 he was knighted. The Canadian Pacific Steamship Company was largely developed by him, and in the promotion of steamship traffic with Australia, as well as in other enterprises, he has rendered efficient services. He was conspicuous in his opposition to the United States-Canadian reciprocity agreement advocated by President Taft.

VAN INGEN, William Brantley, American mural painter: b. Philadelphia, Pa., 1858. He studied under leading Pennsylvania and New York artists and returned to Paris. He began as assistant to John La Farge of New York but soon undertook personal commissions and became widely known from his work at the capital at Washington, at the United States Mint, Philadelphia, the State Capitol at Harrisburg; the State Capitol at Trenton, N. J., and the courthouse and post office at Indianapolis and Chicago. On a commission from Charles T. Yerkes of New York he visited Japan to make studies for a room in his residence.

VAN LAER, Alexander Theobald, American artist and lecturer: b. Auburn, N. Y., 9 Feb. 1857. He was an art student at the National Academy of Design in New York under Poggenbeek in Holland. His work, chiefly of Connecticut landscapes in the vicinity of Litchfield, his home, was awarded medals at leading American exhibitions. Notably at 'A Connecticut Hillside' in the National Gallery, Washington; 'February Snow' in the Brooklyn Museum, New York City; 'On the Brandywine' in the Herron Art Institute, Indianapolis. He was a member of the International jury of awards at Saint Louis (1894); lectured on art history at Chautauqua, N. Y., and appeared in the art lecture courses in New York for 24 years, and before schools and colleges in the leading cities of the country. He was a member of the National Academy in 1900.

VAN LENNEP, Henry John, American missionary: b. Smyrna, Turkey, 18 March 1815; d. Great Barrington, Mass., 11 Jan. 1869. He was of Dutch descent, was graduated from Amherst in 1837, studied theology and in 1839–69 was a missionary in Turkey. He was conversant with most of the Oriental languages, and during the greater share of his residence in Turkey he was connected with educational institutions at Constantinople, Smyrna and Tokat. The loss of his sight compelled him in 1869 to return to the United States, where he engaged in literary work and in teaching. He occupied the chair of natural
science, Greek and modern languages at Ingham University, Le Roy, N. Y., in 1876-78 and from then until his death was principal of Sedgwick Institute, Great Barrington, Mass. He published 'Travels in Asia Minor' (1870); 'Ten Days Among the Greek Brigands' (1874); 'Bible Land' (1876).

VAN OSTADE, Adrian. See Ostade, Adriaen Van.

VAN PELT, John Vredenburgh, American architect: b. New Orleans, 24 Feb. 1874. He studied architecture at the Ecole des Beaux Arts, Paris, exhibited in the Paris Salon, section of architecture, 1895-96, and in the section of painting in 1898. He was assistant professor of architecture in charge of design at Cornell 1897-1900 and from 1902 to 1904 was in charge of the College of Architecture there. He has written 'Discourse on Composition as Applied to Art' (1902).

VAN RAALTE, Dutch clergyman and leader of the modern Pilgrim Fathers of Holland into Michigan: b. 17 Oct. 1811; d. 7 Nov. 1876. When the bigoted King William I (q.v.) of the Netherlands attempted a rule like that of the Tudors of England, in order to bring the rather democratic Reformed Church under the control of the state, resistance was made to what was regarded as usurpation. In the north, in Friesland especially, there was resistance and the Separatists from the established Church sought refuge in America. One party, led by Rev. H. P. Scholte, came by way of New Orleans, in 1844 and 1847, to settle in Pella and other places in Iowa. Rev. A. C. van Raal, who came in 1846, came to America leading the vanguard of a great host which followed later. They made homes in Holland, Zeeland, Friesland and many other places in Michigan and Wisconsin, in which one may now count scores of Netherlands names. Some began the industry of woodworking, which, in its development, has made Grand Rapids (q.v.) the 'furniture capital' of the world. In 1850, a class of the Reformed Church in America, called the 'Dutch Mission,' was formed, which has developed into a body of several thousand communicants. Other Dutch people of this emigration found homes in American cities, East and West, but unconnected with the movement in its educational, religious and economic phases of expansion. Consult Corwin, 'Manual of the Reformed Church in America' (1877); and Dosker, 'Levensschets van C. A. van Raal' (1893; p. 335).

VAN RENSSLEAER, rēnˈsə-lər, Kilmen or Killian, Dutch colonizer in the New World: b. Amsterdam, 1595; d. there, 1644. He was a diamond and pearl merchant at Amsterdam; was a founder of the Dutch American India Company, to which on two occasions he advanced sums for the maintenance of its credit; and sent a representative to New Netherlands to negotiate with the Indians for the purchase of territory on the west bank of the Hudson, extending from Smack's Island to a point 12 miles south of Albany (Beeren, or Bear's Island), and into the interior two days' journey. This purchase was later increased by that of territory on both sides of the river northward and southward from Fort Orange. This tract (Rensselaerwyck) comprised in all a large part of the counties of Rensselaer, Columbia and Albany. Van Rensselaer did not visit it, but managed all its affairs through an agent. He sent Adriaen van der Donck as sheriff of the colony established there, and Dominie Megapolensius for the 'edifying improvement' of Dutch and savages.

VAN RENSSLEAER, Mariana Griswold, American author: b. New York, 1851. She was known through her writings as a student and critic of art, and also participated in discussions bearing upon politics, etc. She was president of the New York Public Education Association, Columbia University gave her the degree of Litt.D. in 1910. Her publications include 'Henry Hobson Richardson and His Works' (1888); 'English Cathedrals' (1893); 'Six Portraits' (1893); 'Art Out of Doors' (1899); 'Should We Ask for the Sufferage?' (1894) against woman suffrage; 'One Man Who was Content' (1896); 'Niagara: a Description' (1901); 'History of the City of New York in the 17th Century' (1897); Poems (1910). She was married to Schuyler Van Rensselaer in 1873.

VAN RENSSLEAER, May King, American writer: b. New York, 25 May 1848. She was educated privately and was married to John King van Rensselaer 4 Oct. 1871. She has published 'Crochet Lace' (1882); 'The Devil's Picture Books' (1887); 'The Goede Vrouw of Mana-ha-ta' (1889); 'Van Rensselaers of the Manor' (1889); 'New Yorkers of the 19th Century' (1899); 'History of Newport' (1905); 'Nonsuch Euchre and Other Games' (1907); 'Prophetical, Educational and Playing Cards' (1913).

VAN RENSSLEAER, Stephen, American politician and soldier, known as "The Patroon": b. New York, 1 Nov. 1764; d. Albany, 26 Jan. 1839. He was fifth in lineal descent from Killian Van Rensselaer (q.v.), the original patroon of the Dutch colony of Rensselaerwyck. He entered Princeton College in 1771, but owing to the proximity of the British army was removed to Harvard, which he entered in 1782. In 1789 he was elected to the assembly, and the next year to the State senate, to which he was re-elected annually till 1799, when he was chosen lieutenant-governor and served till 1801. He was president over the State Constitutional Convention of 1801 and in 1808-10 was again in the assembly. He was made major-general of the State militia, and in 1812 directed the assault upon Queenstown, Canada. After the war he joined with DeWitt Clinton (q.v.) in the construction of the Erie Canal, for exploring the proposed route of which he had been one of a commission in 1810-11, and from 1816 till his death was one of the board of canal commissioners, and for 15 years was its president. He was again a member of the legislature in 1816, in 1819 was elected a regent of the University of the State of New York, and was subsequently its chancellor. In 1821-23, at his own expense, he employed Professors Eaton and Hitchcock to make geological and agricultural surveys of a large part of the State. In November 1824 he provided suitable buildings at Troy, and established a scientific school for the instruction of teachers. This school was incorporated in 1826 as the Rensselaer Polytechnic Institute, and he continued to aid in supporting it until the end of his life. From

VAN REYPEN, rîpên, William Knickerbocker, American painter; b. Bergen, N. J., 14 Nov. 1840. He was graduated from the medical department of the New York University 1862, and the same year served at the Naval Hospital in New York. He represented the medical department of the United States navy at the international medical congress at Moscow 1897, and during the war with Spain designed and fitted out the first ambulance ship ever used in naval warfare. He was retired in 1902 after 40 years' service with the rank of senior rear-admiral. In 1905 he was chairman of the American National Red Cross Association.

VAN SANT, Samuel R., American statesman and soldier; b. Rock Island, Ill., 11 May 1821; d. at the outbreak of the Civil War he enlisted in the Union army and served for three years. He was elected to the legislature 1892 and 1894 and was speaker of the same body 1895. In 1901 he was elected governor of Minnesota.

VAN SANTVOORD, George, American lawyer and author; b. Belleville, N. J., 8 Dec. 1819; d. 6 March 1863. He was graduated at Union College in 1841, studied law at Kinderhook, N. Y., was admitted to the bar in 1844 and practised at Kinderhook from 1846 to 1851 when he removed to Troy, N. Y. In 1852 and in 1856 he was a member of the Assembly, and in 1860-63 was district attorney of Rensselaer County. His writings include ‘Life of Algernon Sydney’ (1851); ‘Principles of Pleading in Civil Actions Under the New York Code of Procedure’ (1852); ‘Lives of the Chief Justices of the Supreme Court of the United States’ (1854); and ‘A Treatise on Practice in the Supreme Court of the State of New York in Equity Actions’ (1860).

VAN SHAACK, shâk, Peter, American lawyer; b. Kinderhook, N. Y., March 1747; d. there, 27 Sept. 1822. He was graduated from King’s (now Columbia) College in 1766, was admitted to the bar in 1769, and established a law practice in New York. In 1773 he was appointed to revise the statutes of the colony of New York, and he later served on various committees for the consideration of the measures of the British government which resulted in the Revolution. Although greatly incensed at the action of the government he was nevertheless opposed on general principles to the Revolution and in 1777 was summoned before the ‘board of conspiracies to take the oath of allegiance to New York. On refusing he was sent to Boston. In 1778 he was banished, and went to England where he remained until 1781. He was then restored to citizenship in New York and readmitted to the bar. He gained a high reputation in his profession and also as an instructor in his law school. He was totally blind during the last years of his life. Among his publications are ‘Laws of the Colony of New York’ (2 vols., 1773); ‘Conductor General, or the Duty and Authority of Justice, Sheriffs, Coroners, etc.’ (1788). Consult Van Shaack, H. C., ‘Life, Journal and Letters of Peter Van Shaack’ (1842).

VAN T HOFF, Jacobus Henrik, Dutch chemist: b. Rotterdam, 1852; d. 1908. He was educated in the University of Leyden and also studied in Bonn and in Paris. His thesis (1874) on the stereochemical theory revolutionized work on molecular structure and in 1874 his first papers on the study of chemical phenomena and of the formation known as the Stassfurl salt deposits. He was the first to point out the analogy between the gaseous state and that of dilute solutions, thus laying the basis for the great development of physical chemistry. With his students he contributed for 10 years to the Proceedings of the Academy of Sciences of Berlin the results of their studies, which resulted in the complete solution of the problems attacked.

VAN TWILLER, Wouter, or Walter, Dutch governor of New Netherland: b. Nieuw-kirk, about 1580; d. Amsterdam, after 1646. He was a clerk in the warehouse of the West India Company at Amsterdam when he was chosen to succeed Peter Minuit as director-general of New Netherland. He arrived at the colony in April 1633, bringing with him the Spanish caravel, San Martín, captured on the voyage. Van Twiller was incompetent for his new post and in his administration there was considerable to warrant the well-known burlesque of Irving in ‘Knickerbocker.’ But he devoted much attention to internal improvements, repaired Fort Amsterdam, built new windmills and other structures, secured large grants from the Indians, extended the trade with the West Indies and New England and displayed many other excellent activities. He was also alert in defense of the fur trade, by which the colony was realizing large profits. In 1633 Eekens, who had been commissary at Fort Orange, sailed up the Hudson to within a mile of the fort in an English vessel, the William, bent on a trading enterprise for English capitalists. Van Twiller soon conveyed the William out to sea with the Dutch fleet and prevented the establishment of English trade upon the river. When Winthrop wrote asserting the superior title of the English to the Connecticut Valley, Van Twiller, in a very courteous and respectful letter, suggested that the matter should be adjusted by the English king and the States-General. However, without Winthrop’s assent, New Plymouth sent to Connecticut an expedition commanded by Lieut. William Holmes which passed up the river by the Dutch Fort of Good Hope and began at Windsor the first English settlement in Connecticut. Van Twiller was removed in 1637 and succeeded by William Kieft. He held a large estate in the colony and was an opponent of Stuyvesant in 1659.

VAN TYNE, Claude Halstead, American author: b. Tecumseh, Mich., 16 Oct. 1869. He graduated at the University of Michigan in 1896, was instructor in history at the University
of Pennsylvania 1900-03 and later professor of American history at the University of Michigan. He has written, 'The History of the United States of America' (1900); 'The Loyalists in the American Revolution' (1902); 'The American Revolution' (1905); edited 'The Letters of Daniel Webster' (1902), and has been a prolific contributor of historical topics to reference works.

VAN VLECK, Edward Burr, American mathematician: b. Middletown, Conn., 7 June 1863. He took his degree in Wesleyan University (1887); was graduate student of mathematics (1887); Fellow of Johns Hopkins, and student of mathematics in Göttingen (1890-93), and doctor of mathematics, University of Göttingen (1914). He became professor of mathematics in the University of Wisconsin in 1906. He is author of Theory of Divergent Series and Algebraic Continued Functions (1903), and of various monographs in mathematical journals. In 1903 he became president of the American Mathematical Society and was associate editor of its publications (1903-10).

VAN WERT, van wert, Ohio, city, county-seat of Van Wert County, on the Pennsylvania and the Cincinnati, Jackson and Mackinaw railroads, about 100 miles, in direct line, northwest of Columbus and 75 miles southwest of Toledo. It was incorporated in 1848 as a town and obtained a city charter in 1903. It is in an agricultural and stock-raising region. There are about 100 factories and mills, including flour and grist-mills, bent-wood and stave factories, oil-well supply works, etc. There are two daily newspapers and two banks. Pop. 8,200.

VAN WYCK, Charles Henry, American legislator: b. Poughkeepsie, N. Y., 10 May 1824; d. Washington, D. C., 24 Oct. 1895. He was graduated from Rutgers in 1843, engaged in law practice, in 1850-56 was district attorney of Sullivan County, N. Y., and in 1859-63 was a member of Congress. While still holding his seat in Congress he volunteered in the Union army, served under General McClellan in the Peninsular campaign and in 1865 was brevetted brigadier-general of volunteers. He sat again in Congress in 1871, and in 1874 removed to Nebraska, where he was a member of the State Constitutional Convention in 1876. State senator in 1876-80 and in 1881 became United States senator.

VAN ZILE, Edward Sims, American novelist: b. Troy, N. Y., 2 May 1863. He was graduated from Trinity College, Hartford, 1884, and from 1884-86 was editorial writer on the Troy Times and on the New York World from 1886-90. He was for a time manager of the Literary Bureau of the United Press and editor of Current Literature, and he has published 'Wanted—A Sensation' (1886); 'The Last of the Van Slacks' (1889); 'A Magnetic Man' (1890); 'The Manhattaners' (1895); 'Kings in Adversity' (1897); 'Perkins the Fakeen' (1905); 'Into the Sunset' (1914); 'The Game of Empires' (1915).

VAN ZORN. This comedy of New York artist life (1914), is one of two published plays by Edwin Arlington Robinson, the other being a tragedy of modern New England, called 'The Porcupine.' published about the same time and just before the volume of poems called 'The Man Against the Sky.' Although Van Zorn has had no public performances except a series given in a hall in Brooklyn by a semi-professional company in 1917, it is not, like so many poets' plays, a chamber-drama. It is distinctly a play for the theatre, a play of ideas such as would have found an eager and ready welcome all over the continent. It is one of a limited number of good acting plays, which are literary as well, written by Americans. 'Van Zorn' is a comedy of character, the story of a fatalist who, in an attempt to play the part of destiny in a love-affair, runs counter to a man with a destiny better than his own. The theme and the treatment are both unusual, the dialogue is brilliant and the characters, especially the men, are not theatrical types but thoroughly real people. Anyone familiar with Mr. Robinson's poetry would recognize in 'Van Zorn' the author of 'Richard Cory' and 'Flammonde,' his philosophy and his technique—especially his bold allusions—but no more distinctively he would recognize the dramatist in 'Merlin' or 'Ben Jonson Entertains a Man From Stratford.' 'Van Zorn' may be classed among important American plays even if it remains a play without a stage history.

EDITH J. R. ISAACS.

VANADINITE, a mineral of considerable importance as an ore of the rare element vanadium. It is a chloride and vanadate of lead, PbV₂O₄Cl. Vanadinite is a member of the apatite group and its crystals are, therefore, hexagonal with pyramidal hemihedria. The prismatic crystals are sharp and smooth, or, more frequently, cavernous; sometimes they are clustered in parallel groups similar to the isomorphous mineral pyromorphite. Vanadinite has a hardness of about 3 and a specific gravity varying from 6.66 to 7.23. Its lustre is resinous to adamantine. The finest specimens (from Yuma County, Ariz.) are occasionally transparent, but usually the mineral is nearly or quite opaque. The color is very variable; rich scarlet and other shades of red graduate through dark to very pale yellow, while more rarely the mineral is brown or gray. The variety endlichite, which contains from 11 to 13 per cent of arsenic, is regarded as an isomorphous mixture of vanadinite with the lead chloro-arsenate, mimetite. It occurs in magnificent specimens in New Mexico. Other important localities of vanadinite are at Wanlockhead in Scotland, where it occurs in small, globular, crystalline masses, in Carinthia and Argentina.

VANADIUM. A rare element which, in its chemical behavior, is related to arsenic, phosphorus and nitrogen. Its symbol is V, its atomic weight 51.2 and its specific gravity 5.5. It was discovered by Seffstrom in 1830 and derives its name from the Scandinavian goddess Vanadis, who corresponds to Freya in the Teutonic mythology. It is never found free in nature but exists in combination, in small quantities, in copper, lead and iron ores, particularly the latter. It is contained in vanadinite (PbCl)₃Pb₂(V₂O₆), and decolcite (PbTn), (ON)VO₄ and is extracted with great difficulty. It is widely diffused in nature, being found where deposits of copper, lead and iron ore are found. In the United States it has been ob-
tained from the mineral deposits of Colorado, Utah and elsewhere. It may be reduced to a form by heating, by exposing dichromic vanadine to a stream of hydrogen and appears in the form of a silver colored crystalline powder. This powder is acted upon very slowly by the air at ordinary or even elevated temperatures, but it burns brightly and produces VO₂ when ignited. It is soluble in nitric, hydrofluoric and concentrated sulphuric acids, but not in hydrochloric or dilute sulphuric acids. Vanadium forms three basic oxides VO₃, V₂O₅, and V₂O₇, and two acid oxides VO₂ and V₂O₅. The last of these is very important and appears as a reddish yellow powder, which dissolves freely in alkaline hydroxides or carbonates and forms salts which are known as vanadates. Three varieties of vanadates have thus far been composed and they are known as ortho, pyro and metavanadates, the latter being the most stable of the three. The metavanadate of sodium is a salt of considerable importance. The vanadates carry oxygen in many chemical reactions. Vanadic acid is the most important and the best known of the compounds of vanadium. It is the final product of the oxidation of vanadium and bears to that element the same relation which phosphoric acid and phosphorus acids bear to their respective metals. Vanadic acid parts readily with its oxygen and receives it again as readily from other substances. Thus when vanadic acid is taken into the blood it is first converted into hypovanadic acid, but when it is subsequently combined with the oxyhemoglobin of the blood it is raised to hypervanadic acid. Metavanadic acid may exist in free condition in the form of a beautiful golden yellow substance which is sometimes used as a substitute for gold bronze. Ammonium metavanadate is used in the manufacture of the dye which is known as aniline black and also in the manufacture of vanadium ink. Thus while vanadium itself is a metal of no particular importance technically, its various combinations have a very decided value from many points of view. In addition to the uses which were mentioned in the preceding paragraphs it is important to note the following: the pentoxide of vanadium is useful in photography as a developer, the chlorides and the trioxide are used as mordants in the manufacture of print cloths, the trioxide is also employed in the manufacture of steel and in the composition of malleable and ductile alloys.

Vanadium has also been used to a moderate extent as a therapeutic agent, the pentoxide (hypovanadic acid) being given in diseases which are due to defective metabolism, but it is a substance in the use of which there may be decided danger and there does not seem to have been enough clinical evidence thus far to justify its frequent use. It is not mentioned in the list of approved medicinal substances which is to be found in the last edition of the United States pharmacopeia. There are those, however, who advocate its use therapeutically among whom may be mentioned Laran, Lyonnet, Martz, Martin, Helisius and Delarue. The physiological action of vanadium salts has been investigated by Platt (Lancet, 15 Jan. 1876), by Gamgee and Larmuth (Journal of Anatomy II, 2, 1879) and by Priestley and Gamgee ("Philosophical Transactions," Vol. 166, p. 12). Robert and others ("Lehrbuch der Intoxikationen," p. 309, 1893) have written in regard to its therapeutic action. Weber ("Revue de clinique médicale," 1897, "Congrès pour l'étude de la tuberculose," p. 895, 1898, des comptes rendus et mémoires) have described its effect upon sick animals, especially upon horses, to which it was administered successfully in an epidemic in which the noteworthy symptoms were great emaciation and exhaustion.

The most extended investigations to determine the therapeutic value of vanadium were made by Laran ("Lyon Médical" xc, 1899). His experiments upon animals were made with guinea pigs, frogs, rabbits and dogs and he used a 5 per cent watery solution of metavanadate of soda with a sufficient quantity of physiological salt solution added. The conclusions at which he arrived after a very exhaustive consideration of the subject were as follows:

1 Vanadium compounds oxidize very readily and hence are of great value in the industrial arts.
2 Metavanadate of soda is very poisonous.
3 This salt has very little effect, in vitro, upon the digestive fluids, blood sugar, yeast and microbes.
4 In spite of its toxicity it can be given to human beings, by mouth, in doses of one to five milligrams, during the 24 hours. It is desirable to intermit its administration for two or three days during the week. It is a tasteless substance, but is easily tolerated when it is given in the manner which was indicated above.
5 It almost always increases the appetite, the strength and the weight.
6 The urine is slightly increased by its use, there is also an increase in the urea and in the coefficient of nitrogen oxidation. In diabetes it will lessen the formation, but only temporarily.
7 It stimulates the process of internal combustion and causes constant change in the blood by oxidation, the formation of vanadic acid being followed by that of hypovanadin, the latter being, therefore, an acid bearer to the tissues.
8 Metavanadate of soda has a certain value as a therapeutic agent, its action being similar to that of arsenic.

It could, therefore, be properly recommended to those who are suffering with poor nutrition or with various constitutional troubles, including tuberculosis, chlorosis, rheumatism, softening of the arteries and enlargement of the veins.

Poisonous effects may be produced by its absorption when used medicinally, when taken accidentally or when exposed to its vapors, the latter occurring frequently to those who are workers in vanadium. The lesions which result from poisoning with vanadium are to be found chiefly in the lungs, the kidneys and the gastro-intestinal tract.

Those whose employment constantly exposes them to the influence of vanadium are frequent sufferers with tuberculosis in a form which dispose them to the occurrence of severe or even fatal hemorrhage. Such workers also suffer constantly with irritation of the nose, throat and eyes. See MINERAL PRODUCTION OF THE UNITED STATES.

VANBRUGH, vān-brūg', Sir John, Eng- lish architect and dramatist: b. London, 1604;
d. 26 March 1726. He was educated in England and in France, entered the English army in 1686 and from 1690 till 1692 was a prisoner in France, being latterly confined in the Bastille. He acquired his knowledge of architecture during his residence in France. His first play, 'The Reprisal or Virtue Was Brought out at Drury Lane in 1697. 'Æsop,' founded on a French original, followed at a short interval and in May of the same year his play of 'The Provok'd Wife' was performed. In 1700 he adapted Beaumont and Fletcher's comedy of 'The Pilgrim.' In 1702 he designed Castle Howard, the seat of the Earl of Carlisle, and produced 'The False Friend' and later 'The Provoked Husband.' He now entered into a speculation to build a great theatre at the west end of London, in which he was his own architect. Both plays and operas were produced; but it did not prove a success. He wrote for it the 'Confederacy' and became charged with the erection of Blenheim Palace for the Duke of Marlborough. This work got him into considerable pecuniary trouble, as the money supplies, provided out of the civil list, were latterly stopped and heavy claims were made against him. Ultimately the duchess took the work out of his hands and he had difficulty in getting the money that was justly due. He built many other mansions for the nobility, for which he must have received considerable sums. From 1702 to 1711 he was comptroller of the board of works. In 1714 he was knighted by George I, in the following year appointed comptroller of the royal works and in 1716 architect of Greenwich Hospital. Vanbrugh's plays are admirable in dramatic conception as well as in wit, but are stained with the coarse profanity of his day. His architectural works have been praised by many but they can only be looked upon nowadays as the most pronounced examples of the heavy English Baroco style. Comstock Ward, 'Sir John Vanbrugh' (1898); Dametz, 'John Vanbrugh's Leben und Werke' (1898).

VANCE, vans, Louis Joseph, American magazine contributor and novelist: b. Washington, D. C., 1826. He was educated at the Polytechnic Institute in Brooklyn, N. Y., and in 1849 began writing descriptive stories and poems for the magazines. His work sprang into prompt popularity and in 1857 he published a novel, 'The Brass Bowl,' which established his reputation. He has also written 'The Bronze Bell' (1908); 'The Black Bag' (1909); 'The Fortune Hunter' (1910); 'The Bandbox' (1912); 'Joan Thursday' (1913); 'The Lone Wolf' (1914); 'Sheep's Clothing' (1915); 'Nobody' (1915); 'The False Faces' (1917).

VANCE, Zebulon Baird, American politician: b. Buncombe County, N. C., 15 May 1830; d. Washington, D. C., 14 April 1894. After obtaining an education at Washington College, Tenn., and the University of North Carolina, studied law and admitted to the bar in 1853, he established himself in practice in Asheville, N. C. The next year (1854) he was sent to the State legislature and in 1858 was elected to Congress to fill the vacancy caused by the resignation of Representative Clingman. He was opposed to secession, but at the opening of the Civil War adopted the Confederate cause and became colonel of the 26th North Carolina regiment. He was elected governor in 1862 and re-elected in 1864 and in 1870 was elected to the United States Senate, but not being allowed to take his seat there on account of his political disabilities not having been removed, he resigned in 1872. In 1876 he again became governor, and in 1879, elected to the United States Senate in 1879 retained his seat until his death. Consult Dowd, 'Life of Zebulon B. Vance' (1897).

VANCOUVER, George, English navigator: b. 1758; d. Petersham, Surrey, 10 May 1798. He was appointed to the 'Resolution' by Capt. James Cook in the autumn of 1771 and on his return from a voyage around the world (1772-74) assisted in the equipment of the 'Discovery' and as midshipman accompanied Cook on his last voyage to the North Pole, which was concluded in October 1780. During the following decade he was promoted and 1 Jan. 1790 he was appointed to the 'Discovery,' built for exploration in the South Sea, but the Nootka Sound dispute caused the abandonment of the project and Vancouver was placed in command of the 'Courageous,' one of the 'Spanish armaments.' On 15 Dec. 1790 he was promoted to commander and assigned to the 'Discovery.' It was then decided to dispatch an officer to Nootka Sound "to receive back in form the territory which the Spaniards had seized," also to make an accurate survey of the coast northward from the 30th degree and to ascertain if there were a northwest passage. He sailed in the 'Discovery' 1 April 1791, touched at the Cape of Good Hope and surveyed the coasts of New Zealand and Australia, discovering and naming King George's Sound, Mount Gardner, Cape Hedo and other points. He then went north and received the formal surrender of Nootka and spent the three summers of 1792-94 in surveying the American coast as far north as Cook's Inlet, wintering at the Sandwich Islands. On his return voyage he visited the chief Spanish settlements on the west coast of South America and reached England in 1795. On 28 Aug. 1794 he was raised to the rank of post captain. Consult Newcombe, C. F., 'First Circumnavigation of Vancouver Island' (Victoria 1914).

VANCOUVER, Canada, the largest city and chief seaport of British Columbia, the fourth city of Canada in population, is situated on the Gulf of Georgia opposite Vancouver Island on the northern Pacific Ocean. Its chief harbor front is on Burrard Inlet, a spacious sheet of water, entered by a passage between Stanley Park and North Vancouver, and extending some 20 miles into the interior. Other water fronts are English Bay, from which ships may enter another arm of the sea called False Creek, on which are shipyards and other industrial establishments. Vancouver is the western terminus of the Canadian Pacific Railway, and of the government transcontinental system known as the Canadian Northern. It is also one of the Pacific terminals of the United States Express lines, the Great Northern and the Northern Pacific.

History.—The history of Vancouver as a city begins with 1885, when the Canadian Pacific Railway Company established its terminus there. Before that time the ancient forest of the type now seen in the adjoining Stanley Park. The first important industry established at Vancouver was the Hastings lumber
mills, a large plant on the harbor front whose furnace fires have not been extinguished in a third of a century. In 13 June of the young city, which had been incorporated four months before, was entirely swept away by fire, but it was quickly rebuilt, and, except for brief intermissions which mark the advance of all new cities, its growth in population, commerce, industry and wealth has been rapid and continuous.

Commerce and Industry.—The trade of Vancouver has steadily increased. Exports in the fiscal year 1912 were $8,100,000. In 1916 they had increased to $15,000,000. In 1917, $25,000,000; in 1918, $31,000,000; in 1919, $37,000,000. Imports from 1916-19 were $20,000,000, $25,000,000, $41,000,000 and $47,000,000. There is a large provincial coastwise trade not included in these returns.

In the year ending March 1919, 1,332 seagoing vessels of 1,700,000 tons and 9,800 coasting vessels of 3,400,000 tons entered the Port of Vancouver. Regular steamer services include Canadian Pacific lines to China, Japan and Manila, the Blue Funnel line to the same countries, a line to Australian and New Zealand ports and to Honolulu, two lines to Shanghai, Hongkong and other Chinese ports; a Japanese line between Vancouver and various Asiatic ports, several lines connecting Vancouver by way of the Panama Canal with British and Mediterranean ports, South Africa, New York and ports in Eastern Canada and the West Indies. Between Vancouver, Victoria and Seattle there are double daily services by one line and daily services by others, while there are rail connections between Vancouver and many points north and south on the mainland and on Vancouver Island. Halibut fleets and other fishing vessels operate from the port and tramp steamers from all countries may be seen in the harbor.

Among the leading industries are lumber and woodworking establishments, shipbuilding in steel and wood, sugar refining, engineering and machine works, shoe factories, assaying and refining, meat, fish and fruit packing, furniture factories and all the local industries which belong to a seaport and distributing centre. The Canadian Pacific Railway has an extensive system of wharves with over 600,000 square feet of area and 350,000 square feet of sheds. The Dominion government has a large wharf with sheds and grain elevators and is now undertaking a large program of wharf construction and the establishment of a drydock. There are numerous private wharves and warehouses. The harbor is administered by a commission appointed by the Federal government. Customs duties collected at the port in 1919 were $8,740,000, inland revenue $388,000, postal revenue $727,000, bank clearings for the year $577,000,000.

Public Utilities.—Transportation within the city, in the suburbs and up the Fraser River some 60 miles is handled by the British Columbia Electric Railway, which company also supplies electric light and power from its waterworks at Lake Buntzen. Power is also obtained from the Western Power Company, with works at Stave Lake, and there are almost unlimited natural sources of water power available for further production. The water supply for the city and the surrounding municipalities is taken from the Capilano River, which flows from a neighboring mountain. Pipes are laid to reservoirs both in the young city, which had been incorporated four months before, was entirely swept away by fire, but it was quickly rebuilt, and, except for brief intermissions which mark the advance of all new cities, its growth in population, commerce, industry and wealth has been rapid and continuous.

Government.—While Vancouver does not boast many splendid public buildings, some of these are in keeping with the growth and ambitions of the city. The Canadian Pacific Railway station, rebuilt in 1917-18, is a large and attractive building. The Government Railway depot, opened for traffic in November 1919, has a fine structure costing over a million dollars, and near it is the station of the Great Northern which cost $500,000. These two buildings and the railway yards are situated on land several hundred acres in extent reclaimed from the side flats of False Creek, part of which area is reserved for commercial and industrial establishments and part for gardens and open ground. The Hotel Vancouver, which was greatly enlarged and remodeled in 1917-18, is said to be the largest hotel in Canada. The General Public Hospital is the largest in the dominion and accommodates the greatest number of patients. All the larger Canadian banks are represented in Vancouver and three or four of them have erected spacious office buildings. The courthouse, built about 1910 at the cost of $1,000,000, is perhaps the finest public building in the city. There are several large churches, but none that are conspicuous for their architectural beauty.

Education.—The University of British Columbia, now occupying temporary quarters within the city limits, is to have its permanent home some six miles out at Point Grey, on a headland overlooking the sea in two directions and commanding a remarkable view of the city and of the coast and mountains. On this site of over 500 acres some of the buildings are partly erected; University classes were opened in 1915 with 379 students. The attendance of undergraduates in 1919 was 800 with several hundred returned soldiers and others taking partial or vocational courses. The staff of instruction numbers 70, with faculties in arts, applied science and agriculture and a department of nursing, established in 1912, and a college of education of the province not to give degree-conferring powers to any other institution nor to encourage the foundation of competing schools. The University is supported by annual votes of money and is administered by a board of governors appointed by the provincial government and by a senate largely elected by a convention of university graduates. Vancouver has a good equipment of public schools and high schools and in 1919 was taking special interest in the establishment of technical institutions. The public school population in 1919 was 17,000.
1 Business District, Vancouver, Canada. Corner of Granville and Hastings Streets, showing the Bank of Commerce on the corner.

2 Business Street, Vancouver, Canada. Looking up Granville Street, showing the Post Office on the right.
1 View of Marine Drive, Vancouver, Canada. Parking place at Point Grey from which is viewed English Bay and the Straits of Georgia. Islands of Howe Sound in foreground and Vancouver Island in the distance.

2 Driveway in Stanley Park. This motor road encircles the park and is nine miles in length. This park is situated within a 15 minutes' walk from the centre of the city.
VANCOUVER—VANDAL

The pride and boast of Vancouver is Stanley Park, a forest of 900 acres with a few small clearings, one of which is an athletic field and another is occupied by a garden and zoo. The park is kept as nearly as possible an a state of nature except that walks and drives have been provide. This wood is on a point extending into the bay and a seven-mile drive around follows the curves of the shore. There are trunks of trees 30 to 40 feet in circumference in this park, and one of the paths leads by a close cluster of 10 or a dozen trees from 7 to 10 feet in diameter. Vancouver is noted among other things for its bathing beaches, of which there are three or four within the city limits under the administration of a park commission. Every afternoon in summer these are thronged with thousands of children and adult bathers.

The city is the seat of an Anglican bishop and a Roman Catholic archbishop.

The population—The population in 1901 was 13,709; in 1901, 27,010; in 1911, 100,401. It is now considerably larger, though the growth may not have been in the present decade so rapid as in the last. These figures relate to the incorporated city alone. Meanwhile there has been a considerable overflow into new municipalities included in Greater Vancouver. The most fashionable residential district, called Shaughnessy Heights, though nearer the heart of the city than some of the wards, is part of the Corporation of Point Grey. There is only a street between the city and South Vancouver, which had in 1911 a population of 16,126. Across Burrard Inlet is North Vancouver with a population in 1911 of 8,196. It is expected that some, or all of the municipalities will before long be incorporated with Vancouver into one city. About 70 per cent of the population is of British origin. In 1911 there were 3,480 Chinese, 373 Hindus and 1,992 Japanese, but since then the Oriental population has increased.

S. DUNN SCOTT,
Staff of the Vancouver Daily Province.

VANCOUVER, Wash., city, county-seat of Clarke County on the Columbia River and on the Vancouver, K. and Y., and the Northern Pacific railroads, about eight miles north of Portland, Ore. It has steam connection with the Columbia River ports and with a number of the Pacific ports. It was founded in 1828 by the Hudson's Bay Company and in 1858 was incorpo-rated. It is in a region noted for its extensive lumber interests. There are many good farms nearby and considerable attention is given to raising livestock. The chief manufacturing establishments are lumber mills, flour mills, breweries, brick works and machine shops. The United States Military Department of the Columbia has its headquarters here and the Vancouver Barracks, established in 1849, is one of the best army posts in the country. In the centre of the city is a pretty park and the principal public buildings are the county courthouse, the House of Providence, the post office, and the schools. The educational institutions are a public high school, founded in 1889, a private high school, Providence Academy (Roman Catholic), Saint James College, public and parish elementary schools, a public library and two school libraries. A United States Land Office is here and a regular army garrison. The government is administered under a charter of 1890 which provides for a mayor, who holds office one year, and a city council. It has one daily and two weekly newspapers and good banking facilities. Pop. 11,930.

VANCOUVER BARRACKS, military post in the State of Washington, miles from Portland, Ore, established in 1848. The reservation includes 640 acres and is on the right-hand bank of the Columbia River.

VANCOUVER ISLAND, Canada, an island on the west coast, in the Pacific Ocean, opposite and at no great distance from the west shore of British Columbia, of which province it forms part; length, 285 miles; breadth, from 40 to 80 miles; area, about 20,000 square miles. It has no navigable rivers, but several deep arms of the sea project far inland, forming good harbors. One of the chief of these is Nootka Sound, an inlet on the west coast discovered by Captain Cook in 1778. The sound extends in a northeast direction about 10 miles inland, but in no part is it more than two miles broad; it embraces several islands, the largest being called Nootka, famous for the Nootka Convention of 28 Oct. 1790 which averted war between Spain and Great Britain, consequent on a Spanish seizure of British vessels at Nootka the year previously. A granite monolithic islet facing the entrance to Friendly Cove, erected in 1903 by the Washington University State Historical Society, commemorates the meeting of Quadra and Vancouver, the Spanish and British commissioners who joined names Vancouver Island bore as a title for half a century. A mountain chain traverses Vancouver Island from southeast to northwest at an average height of between 2,000 and 3,000 feet, the highest point being Victoria Peak, 7,484 feet in the northern half of the island. Coal is worked at Nanaimo and gold, copper and iron ore and other valuable minerals are found. Forests are numerous and the timber trade is important. Horses, cattle, sheep and pigs thrive well. The puma, the bear, the wolf, two kinds of deer, the marten and other fur-bearing animals exist in the less settled parts of the island; partridges, snipes and many varieties of wild-fowl are found. The sea is inexhaustible with fish. The climate is damp and cold. The harbor of Esquimalt (q.v.), on the southeast coast of the island, is one of the finest in the continent and is the chief Pacific station of the British fleet. Victoria (a city of 60,000) is the chief town and the capital of British Columbia. A railway connects Victoria with Esquimalt and the great coal-shipping port of Nanaimo, opposite Vancouver (q.v.), which is on the mainland. Pop. about 160,000, including some 10,000 Wakash Indians.

VANDAL, vä̃d-dal, Louis Jules Albert, French historian: b. Paris, 7 July 1853. He was educated at Paris, and appointed to a professorship in the Ecole des Sciences Politiques. His first literary work was a book of travel, 'En Karriele à travers la Sibérie et la Norvège'. He has devoted himself mainly to writing diplomatic history, making an exhaustive study of state documents. His works in this field are distinguished for elegance of literary form as well as for accuracy in detail and a scholarly
VANDALIA—VANDERBILT

by Belisarius, the general of the eastern Emperor Justinian. The Vandals adopted the Arian faith, and persecuted the orthodox Christians. Consult Gibbon, 'Decline and Fall of the Roman Empire'; Schmidt, 'Alteste Geschichte der Vandalen'; Procopius, 'History of his own Time'; See H.R.

VANDAM, Albert Dresden, English journalist: b. London, March 1843. He was educated in Paris, and during the Franco-German War was correspondent for several American journals. After living in London (1871–82) engaged in literary work, he became 4th Paris correspondent of the London Globe in 1882. He returned in 1887 to London, where he has since resided. He is the author of 'Amours of Great Men' (1878); 'An Englishman in Paris' (1892); 'My Paris Note-Book' (1894); 'French Men and French Manners' (1895); 'Undercurrents of the Second Empire' (1896); 'A Court Tragedy' (1900), etc.

VANDENHOFF, ván'den-hōf, George. American actor: b. England, 18 Feb. 1820. He made his American stage appearance in England in 1839, came to the United States in 1842, and continued on the stage with great success, but in 1856 he retired, studied law, and was admitted to the bar in 1858. He afterward engaged in giving readings and as a teacher of elocution. He published 'The Art of Elocution' (1846); 'Leaves from an Actor's Note-Book' (1860); 'Rules for Reading Aloud' (1862), etc.

VANDER VEER, Albert, American surgeon: b. Root, N. Y., 10 June, 1843. He studied medicine in the Albany Medical College, and in the Medical Department of Washington University, where he took his degree (1862). His honoray degree came from the Albany Medical College in 1869. He was surgeon in the 66th New York Volunteers in the Civil War, and he was connected with the teaching force of the Albany Medical College from 1869 to 1905. He was surgeon in chief of the Albany Hospital, consulting surgeon at Saint Peter's Hospital, and himself acting as captain. He became vice-chancellor (1915). He is the author of numerous professional papers dealing especially with abdominal and uterine surgery.

VANDERBILT, ván'der-bilt, Cornelius, American capitalist: b. near Stapleton, Staten Island, N. Y., 27 May 1794; d. New York, 4 Jan. 1877. He was the son of a farmer, received but little school education, and at 16 purchased a ferryboat with which he carried passengers and farm products between Staten Island and New York. Two years later he had control of three boats, and his ferry was well established. It was not long before he was extensively engaged in transportation enterprises, and he came to be popularly called Commodore. Marrying in 1813, he removed his residence to New York. In addition to his river and harbor boats, in 1817 he built a steamer to run between New York and New Brunswick; Neen much aggerated. Genserlic concluded a long reign in peace in 477. The kingdom of the Vandals was continued under his descendants — Hunneric, his son, who immediately succeeded him; Guntharic, 484; Thrasimir, 486; Hilderic, 523; Gelimer, 530. It was overthrown in 534
was said to have returned him $10,000,000.

During the Civil War, when English shipping forsook the seas, he established a steamship line between New York and Havre, France. A little later he began to transfer his capital from water traffic, and entered upon a career of railroad finance and management; buying in 1863 a great part of the New York and Harlem Railroad, afterward obtaining control of the Hudson River Railroad and of the New York Central, becoming president of the last-named in 1867. All these lines he managed with great ability, securing marked improvement in their organization and service. Having in 1869 consolidated the line of the New York Central and the Hudson River roads, he extended his system to Chicago by obtaining interests in the Lake Shore, the Canada Southern and the Michigan Central lines. During the Civil War he presented the steamship Vanderbilt to the United States government, and for this patriotic act received a gold medal from Congress in 1862. One of the greatest actions in most noteworthy was his contribution of $1,000,000 for the founding of Vanderbilt University (q.v.). His fortune was estimated at about $10,000,000, the bulk of which he left to his son, William H. Vanderbilt.

VANDERBILT, Cornelius, American financier: b. New Dorp, N. Y., 27 Nov. 1843; d. 12 Sept. 1899. He was privately educated; entered a broker's office, and later became treasurer of the Harlem Railroad. He became first vice-president of the New York Central and Hudson River Railroad (1877) when his father assumed control, and was elected president of the Canadian Southern (1883) when his father retired, and chairman of the board of directors of the New York Central, and of the Michigan Central roads. He gave large sums to the educational and religious institutions of his time including the Cathedral of Saint John the Divine. He left a fortune estimated at $70,000,000.

VANDERBILT, George Washington, American capitalist: b. New Dorp, Staten Island, N. Y., 14 Nov. 1862; d. Washington, D. C., 6 March 1914. He was widely known for his establishment near Asheville, N. C., of a 100,000-acre tract, known as Biltmore, on which he erected a magnificent mansion designed by Richard Morris Hunt (q.v.). He built and presented to New York the 13th street branch of the Free Circulating Library, and gave the New York Teachers' College its site on Morningside Heights.

VANDERBILT, William Henry, American capitalist: b. New Brunswick, N. J., 8 May 1821; d. New York City, 8 Dec. 1885. He was educated in the grammar school of Columbia College; in 1838 he engaged in business, but in 1842 failing health caused his retirement to a farm at New Dorp, N. Y. Later he was appointed receiver and became president of the Staten Island Railroad, and (1877) on his father's death, president of the New York Central Railroad. He resigned (4 May 1883) his office as president of the Vanderbilt system, and his two sons were educated to succeed him. He gave much money to educational institutions, as his presidency was $103,000 for the removal of the obelisk from Alexandria, Egypt, to Central Park, New York.

VANDERBILT UNIVERSITY, a coeducational institution of higher learning, located at Nashville, Tenn., founded by Cornelius Vanderbilt of New York, who in 1873 made a donation of $500,000 which was afterward increased to $1,000,000. The charter of the university was taken out in 1872 in the name of Central University. In 1873 the name was changed to Vanderbilt University. Work began in 1875 with four departments, law, medicine, theology and arts. In 1879 the departments of dentistry and pharmacy were added, and in 1886 the department of engineering. These seven departments indicate the present organization of the university. The continued growth of the university has been made possible by gifts of various members of the Vanderbilt family, especially by William H. Vanderbilt, son of the founder, and by Cornelius Vanderbilt, F. W. Vanderbilt and William K. Vanderbilt, all grandsons of the founder. A large number of gifts have also been made by other institutions. A particularly notable gift was a gift of $1,000,000 to the School of Medicine, made by Andrew Carnegie in 1913. At present the productive funds of the university amount to $5,000,000. Other property amounts to $4,450,000. The annual operating expenses are $300,000. The number of students (1919), 1,000. The main campus of the university is situated in the West End portion of Nashville, and comprises a tract of 75 acres, justly celebrated as one of the most beautiful college sites in the world. Here the work of all departments is done except medicine and dentistry. These are located on a special campus of 14 acres in the southern part of the city, near the City Hospital. The College of Arts and Science has maintained from the beginning a high standard for admission and graduation, and has exercised an unusual influence on education in the South. The work of the freshman year is required. After that, all work is elective, but students are required to arrange their courses around some central group of studies. The degree of B.A. is given for all courses, although B.S. may be given for specialization in the natural sciences. The university is coeducational, but no special effort has been made to increase the attendance of women. It is, therefore, known chiefly as a college for men.

Vanderbilt University has 3,250 names on its register of those who served in the Great War. Worthy of special mention is the hospital unit which rendered efficient service in France. Vanderbilt University was originally affiliated with the Methodist Episcopal Church, South. An effort to bring it entirely under the control of the church was resisted by the trustees, whose position was sustained by a decision of the Supreme Court of the State of Tennessee in 1914. Since then the university has considered itself independent and undenominational.

Bishop H. N. McTyeire was the first president of the Board of Trust, and in that capacity the chief executive officer of the university until his death in 1889. After his death the chancellor succeeded to most of his duties and responsibilities. The first chancellor was Dr. Landon C. Garland, who was succeeded in 1893 by J. H. Kirkland, who had previously held the professorship of Latin.
VANDERGRIFT, van-der-grift, P.a., borough in Westmoreland County, on the Kin- 
mimetas River, and on the western Pennsylvania 
version of the Pennsylvania Railroad, 25 
miles east of Pittsburgh. It is situated in a 
beautiful valley and is noted for its manufac-
ture of sheet steel, the Apollo Iron and Steel 
Company, a new plant of the United States 
Steel Corporation, being situated here, and is 
one of the largest steel plants in the world, 
having eight open hearth furnaces, a gigantic 
continuous bar mill, 29 complete sheet mills and 
a large plant for galvanizing the sheets. Natural 
gas is used as fuel. The mills have an out-
put of 45 carloads of finished steel a day. The 
town has graded schools and a high school es-

tablished in 1900; a public library and eight 
churches. There are two newspapers and good 
banking facilities. Vandergrift was founded by 
the Apollo Iron and Steel Company on 650 
acres of land, upon which they erected their 
works in 1896 and 1897, and the value of the 
works is estimated at $5,500,000. The town is 
very remarkable as a successful demonstration 
of the economic principles and is known in the 
iron world as the "workman's paradise." 
The town was laid out and sewered, and water, 
electric light and gas plants built, streets 
paved, trees planted, etc., before a single lot 
was sold to the employees. Nearly all the 
homes in the town are owned by those who live 
in them, and every lot of land was sold with a 
restriction that no liquors should be sold on any of them for 99 years. The 
mills have never closed down since they were 
started, except at intervals for repairs. The 
workmen are well paid and of unusual intelli-
gence, and belong to no labor union, and the 
town has never had any labor disturbances. A 
borough was formed in 1915, taking in most of 
the town and known as Vandergrift Heights. 
Pop. 3,876.

VANDERLIP, Frank Arthur, American banker: b. Aurora, Ill., 17 Nov. 1864. His 
boyhood was spent on a farm, and after a country 
school education he became an apprentice in a 
machine shop of his native town. He studied 
stenography nights and next was employed as 
reporter on a local newspaper. He was for 
some time student at the University of Illinois 
and the Chicago University. He was success-
ively reporter and financial editor on the Chi-
gaco Tribune (1890-94); associate editor of 
the Chicago Economist (1894-97). He became 
private secretary to Lyman Gage, Secretary of 
the Treasury, 4 March 1897, but his knowledge 
of finance and his executive ability were 
quickly noted and on 1 June of the same year 
President McKinley appointed him Assistant 
Secretary of the Treasury. He resigned this 
office in 1901 to become vice-president of the 
National City Bank of New York, of which he 
had been president since January 1909. In 1901 
Vanderlip visited Europe to study financial and 
industrial conditions, and in 1902 he went as 
delegate to the International Conference of 
Commerce and Industry, held at Ostend, Bel-
gium. He is identified with many financial 
and commercial enterprises. Shortly after the 
entry of the United States into the World War he 
was made chairman of the War Savings Com-
mittee, and in September 1915 he was appointed 
by the Secretary of the Treasury McAdoo to 
conduct the sale of War Savings Certifi-
cates. He has written 'The American Com-
mmercial Invasion of Europe' (1902); 'Busi-
ness and Education' (1907); 'Modern Bank-
ing' (1911); 'Business and Politics' (1915); 
International Banking of the section Banks 
and Banking in this Encyclopedia; also many 
important papers on finance and economics.

VANDERLYN, John, American artist: b. 
Kingston, Ulster County, N. Y., 1776; d. 
there, 23 Sept. 1852. He was a pupil of Gilbert 
Stuart and patronized and helped by Aaron 
Burr, was enabled to go to Paris in his 20th 
year, where he studied for five years and there 
practised his profession for 12 more. His 
'Marius Among the Ruins of Carthage' was 
awarded a gold medal by Napoleon I. An-
other famous picture of his is the 'Ariadne in 
Naxos,' now in the Pennsylvania Academy of 
Fine Arts. This is one of the finest nudes which 
have appeared in the history of American art, 
being simple and natural in treatment, pure and 
delicate in tone and line and tenderly pathetic. 
As a portrait painter he achieved successes not 
unworthy of his master Stuart. Among his 
his sitters were Washington, Monroe, Madison, 
Calhoun, Clinton, Zachary Taylor and Aaron 
Burr. He also painted for the last-mentioned 
friend a portrait of himself now in the New 
York Metropolitan Museum of Art. Neverthe-
less he failed in meeting with the success and 
appreciation he desired and expressed his bitter 
disappointment by declaring "no one but a pro-
fessional quack can live in America." Poverty 
and discouragement appear to have crushed 
and paralyzed his energies, and in the autumn 
of 1852 he returned to his birthplace so poor 
that he was forced to borrow a shilling to pay 
for the expressage of his trunk to the town. 
He asked for a bed at the hotel and next morn-
ing was found dead.

VANDERVELEDE, Emile, Belgian Social-
ist, statesman and author: b. at Ixelles, 1866. He 
took his degree as doctor of laws in the Uni-
versity of Brussels (1885) and became doctor of 
social science in 1888 when he founded the 
circle of student Socialists. He was a mem-
er of the International Socialist Bureau and 
was elected a deputy for Charleroi (1894) and 
was again chosen from Brussels (1900-06). He 
took a prominent part in the Great War, 
became the premier of the Belgian war ministry 
and was a member of the commission which 
came to the United States in September 
1914 to make a protest to the American 
President against the German maltreatment 
of Belgian people. His writings are noted 
for their clearness and precision and in-
clude 'Les Associations professionnelles d'ar-
tisans et d'ouvriers en Belgique' (1892); 'La 
question agraire en Belgique' (1897); 'Le 
socialisme en Belgique' (1898); 'L' Alcoolisme et 
les conditions du travail en Belgique' (1899); 
La propriété foncière en Belgique' (1900); 
' L' Exode rural et le retour aux champs' 
(1903); ' Le socialisme et l'agriculture' (1906); 
' La Belgique et le Congo' (1911); also an 
English translation 'Collectivism and Indus-
trial Revolution' (1901).

VANE, Sir Henry, English statesman, 
fourth governor of Massachusetts: b. Hadlow, 
Kent, 1612; d. Tower Hill, London, 26 May
1662. He studied at Magdalen Hall, Oxford, and also for a time at Geneva or Leyden; was a member of the reitre of the English Ambassado to Vienna in 1631, and after his return was so decided in his opposition to the doctrine and ceremony of the Established Church that he sailed for New England to obtain freedom of conscience. With a royal license permitting a three-years' residence, he arrived at Boston 6 Oct. 1635. He was at the time a joint commissioner representing Lord Saye and Sele, Lord Brooke and the other patentees of Connecticut. On 1 November he was admitted a member of the church of Boston, on 3 March 1636 received the freedom of the colony (that is, was made citizen). He had already taken some part in its political affairs, having effected a conference for the adjustment of differences at which articles were drawn up for the guidance of magistrates. He was elected governor 25 March 1636. The "fifteen great ships" then in harbor, according to Winthrop ("History of New England," ed. Savage, 1825), "congratulated" him "with a volley of great shot." One of his first acts after induction into office was to make an agreement with the captains of these vessels as to the government of shipping. A difficulty arose through the request of the officers of British vessels that the king's colors might be flown from the fort. All the magistrates, with one exception, were opposed, since the flag contained the cross which Endecott had but recently cut away. Reply was made that there was no British flag in the colony, but the captains supplied one and it was hoisted on the authority of the governor and his supporter in the council. At the outbreak of the Pequot War Vane joined Roger Williams in influencing many Indian tribes to refrain from hostilities. On 21 October he concluded a satisfactory treaty with Miemonton, sachem of the Narragansetts. But in his interposition in ecclesiastical matters he was far less successful. The Antinomian controversy was reaching a critical stage and the colony was divided into two hostile camps, one holding to "santification" as evidence of "justification," and the "covenant of works," the other to the "covenant of grace." The latter were in a minority and far less influential, and Vane, as a champion of free inquiry, took their side. The colonists, unfortunately, did not, as Upham points out, favor such inquiry "whenever it threatened to lead to results different from their own." As a consequence, at the election in March 1637, Vane and all his supporters were left out of office. Boston chose him to the General Court, and when the election had been declared void by the majority of the house, returned him the very next day. Winthrop was elected governor, and at once, as a means toward defeating heresy, a law was passed by the General Court that no strangers were to be received within the jurisdiction of the colony save those permitted by one of the council or two of the assembly. Such a law was so increased that Winthrop published a "Defence." To this Vane replied in "A Brief Answer to a Certain Declaration," a plea for toleration. On 3 Aug. 1637 he sailed for England. On his return he was "appointed for Rhode Island, and this was obtained chiefly by his influence. His services in this behalf were duly recognized by Williams. From 1639 to 1641 he was treasurer of the British navy; in 1640 entered Parliament for Hull, in the same year was knighted and in 1641 advocated the abolition of episcopacy and was dismissed by Charles I from the treasurership. He was head of the Parliamentary war party, was practically leader of the Commons in 1643-46, was a commissioner to treat with Charles I at Newport in 1648, but took no part in the king's trial. Under the Commonwealth he was a leader in all affairs of state. In 1651 he was sent to adjust Scottish affairs. When Cromwell forcibly dissolved the Long Parliament in 1653, Vane, who desired to continue it, was brought into open collision with him. Vane, therefore, withdrew to Belleau in Lincolnshire, where he busied himself with literary composition. One of Milton's sonnets (17th) recognizes his activity in the Commonwealth cause. In 1656 he was imprisoned for a pamphlet against Cromwell's arbitrary procedure, in 1659 re-entered Parliament and having gained the favor of the protectorate, was commissioner of the navy in the restored Long Parliament, from which he was finally expelled January 1660, generally distrusted by all parties. He was excluded from indemnity on the Restoration, held prisoners in the Tower and the Scilly Islands, and finally, after an able defense, sentenced to death for treason. His mystical religious views made him a puzzling character to his English contemporaries, most of whom apparently considered him a fanatic. He was reported at one time to be the head of an Anabaptist revolt; at another, king of the Fifth Monarchy. His abilities were never questioned, but his high principles were once not seen so clearly as they now are. He appears briefly in Hawthorne's "Legends of the Province House" ("Howe's Masquerade"). Consult biographies by Sikes (1662), Upham (Sparks' "American Biography," 1st ser., Vol. IV, 1835), and Hosmer (1888); also Winthrop, "History of New England" (ed. Savage, 1825 or ed. 1853), and Hutchinson, "History of Massachusetts" (ed. 1765).

Vanguard. See Advance Guard.

Vanilla, a genus of orchids, of great economic value, on account of their fruits, which furnish the commercial flavoring-extract known by the same name. Several species furnish vanilla, the most important being V. planifolia, indigenous to Mexico and adjacent territories. It is a robust high-climbing plant, attaching itself to trees by adventitious roots. It bears bright-green, oval, flat leaves, which are fleshy or coriaceous. The flowers are fragrant and greenish-white, with a trumpet-shaped lip, crinkled about the edges. When cultivated, as it is very largely, in tropical countries, especially in Mexico and Java, the flowers must be fertilized artificially, the finest being chosen, a process carried out by insects in its wild habitat. They then set fleshy fruit, which is carefully picked just before each is ripe. These pods are from six to twenty inches long, and are filled with an oily pulp containing the minute seeds. They are called vanilla beans from their long, slender legume-like appearance, but are not fragrant. The characteristic aroma is due to the presence of a volatile oil (vanillin) which is developed by slow curing and fermentation. The pod, as it appears in the markets,
is chocolate-colored, wrinkled, slender and pliable. In the best qualities, or "frosted vanilla," the vanillin extrudes its needle-like crystals, forming a delicate efflorescence on the outside of the beans. Although vanilla is a carminative and stimulative drug, it is chiefly used as a flavoring agent and is particularly valuable for chocolate and confectionery. The Spaniards found vanilla in use among the Mexican Indians, in conjunction with cocoa, and it is said that it was first imported into England about 1510, when other Mexican products found their way over seas.

There are several inferior qualities of vanilla, such as the Venezuelan and Brazilian varieties, brought from those countries, the latter being distinguished as vanilla, and supposed to be the product of \textit{Vanilla pompona}. The pods are longer and thicker than those of \textit{V. planifolia}. Guiana vanilla pods (\textit{V. guianensis}) are coarse and frequently split open.

\textbf{VANILLA GRASS (\textit{Savastana odorata}). See \textit{Grasses in the United States; Sweet Grass.}}

\textbf{VANILLA PLANT}, a tall herb (\textit{Trilisa odoratissima}), with tubular magenta flowers in spreading corymbose panicles, growing in the southern United States. The foliage when dried has the odor of vanilla and the leaves are used by the Southern negroes to scent their houses. They are said to have the power to improve the flavor of fine-cut tobacco.

\textbf{VANINI}, vā-nē'nē, Lucilio, Italian freethinker: b. Taurisano, about 1585; d. 19 Feb. 1619. At Naples and Padua he studied the new learning of the Renaissance and the newer learning of physical science, qualified as doctor \textit{urtiusque juris} and took orders as priest. But his "naturalist" views, which were regarded as atheistic, soon brought him into collision with the Church. He taught in France, Switzerland and the Low Countries and fled from Lyons to England, where he was imprisoned. Later he went to Toulouse, where he was arrested and condemned to have his tongue cut out, to be strangled and to be burned to ashes. He was burned on the 16th of May, his condemnation in a pamphlet entitled \textit{Amphithetreum Ætene Providentia} (1615) and his \textit{De Admirandis Naturæ Arcanis} (1616) set forth his pantheistic opinions. As an independent thinker and in the doom which he suffered he has many points in common with Giordano Bruno (q.v.), although as a philosopher he has no claim to be ranked with him. Consult Owen, \textit{Skepticus of the Italian Renaissance} (1893) and monographs by Fuhrmann (1800), Vaise (1871) and Falumbo (1876).

\textbf{VANISHING FRACTION}, in mathematics, a fraction which reduces to the form \(\frac{a}{b}\) for a particular value of the variable which enters it, in consequence of the existence of a common factor in both terms of the fraction, which factor becomes 0 for this particular value of the variable. See \textit{Fractions.}

\textbf{VANISHING POINT}, in perspective, that point to which all parallel lines in the same plane converge in the representation.

\textbf{VANITY FAIR}. Thackeray's \textit{Vanity Fair} is perhaps the most famous novel in the English language; certainly no critic would name the five best novels in English and not include \textit{Vanity Fair}. It is hard for a novel to keep its place in the public mind; only a remarkable novel can do so. Each new generation comes to novels with a new appetite, with demands for some fresh interpretation of life, some exposition, some consideration, some solution if not of new problems that confront it, and it finds novels of the preceding generation wofully old-fashioned. Nevertheless, \textit{Vanity Fair}, although written in 1846-48, is not old-fashioned. Becky Sharpe is still as familiar and intimate companion; Sir Pitt Crawley, the Marquess of Steyne, Major Dobbin are still among the best known of our acquaintances in the world of fiction.

Of course a novel 70 years old cannot affect us in the same sort of way that it affected its first readers. To them \textit{Vanity Fair} was a new kind of novel. They were acquainted with novels of several well-marked types, such as \textit{Tom Jones}, an out-of-door, free-hand, picture of a rowdy young man; \textit{Pamela}, the elaborate presentation of sentimental situations, \textit{Pride and Prejudice}, the delicate delineation of manners, \textit{Ivanhoe}, the romance of adventure, and they were beginning to know \textit{Dickens}; but Thackeray's detached, cynical, sentimental survey of life was new and strange. Since then novels have multiplied, they swarm like locusts, and yet \textit{Vanity Fair} has its own peculiar power and interest; its place in literature is better established than in any other novel. It was this novel that made Thackeray famous. And though it was followed by \textit{Pendennis}, \textit{Esmond} and \textit{The Newcomes}, it stands, in the general opinion, as his most brilliant novel.

The defects in the book according to the taste of to-day are obvious enough. Artist as he is in details Thackeray lacks the power or the will to make his novel as a whole a work of art. We do not like to have the author poke his head out from the pages every little while and moralize over his characters; we grow tired of the frequent comparisons of life to a pantomime; we find the characters Pitt-Crawley, George, Amelia, Dobbin exaggerated, out of drawing, distorted. Thackeray does not hold a mirror up to life; he is a detached, cynical, twisted reflector that gives the life it reflects a half comic, half satirical aspect. Thackeray's admirers are many and devoted, but for most readers he is too much occupied with the superficial relations of life, with social with the envy and vulgarity of those below and the snobbishness and vulgarity of those above. Greater men, such as Shakespeare or Tolstoi, do not find their attention drawn to such matters, they find their interest in experiences, emotions, passions, of a kind more deeply human, they delineate men and women as more occupied with the larger matters of life, love, work, discipline, excellence and so forth, and less concerned with the meaner failings of ill-adjusted social classes.

And yet despite these defects \textit{Vanity Fair} is a novel that represents some manifestations of human society, with remarkable truth. In Becky Sharpe Thackeray accomplished what is commonly accepted as the impossible in the highest genre, the portrait of a woman who exhibits a familiar human trait so definitely that without losing her individuality she represents a type. Such a portrait has the freshness of
novelty, and it has also the interest that attaches to the familiar. This effect Thackeray achieves with surprising swiftness and sureness. Becky Sharpe within the first page or two leaves Miss Pinkerton's academy for young ladies and we see her opening her wings like a young hawk just fled from the nest. Her eyes are pitilessly gray about for prey. No sooner do we see that hawk glance than we watch, entranced, for the great circles through the air and the cruel pounce. Becky Sharpe belongs to the order of raptorex, creatures that arouse in us all a mixture of apprehension and fascination. Every wild bird has a tragic end, and Becky's career squares with our experiences of life.

Thackeray is a master of English; his flexible sentences adapt themselves like running water to every circumstance, they flow limpidly, they bubble, they rush along, or move deep and slow. In this respect by general consent he stands at the head of English novelists, and it is perhaps his command of language that enables him to shift so easily from pathos to humor, from tragedy to comedy, from satire to sympathy; and in 'Vanity Fair' his style is at its best.

HENRY D. SEGWICK.

VANITY OF HUMAN WISHES, The. Ostensibly a formal satire in heroic couplets (368 lines) published by Dr. Samuel Johnson in 1749, more than a decade after the appearance of his other notable satire, 'London.' As that had followed in a way the third satire of Juvenal, so this followed the tenth. In the interval between the two Johnson's style had grown more rotund and he himself had ripened into a dignified moral essayist soon to give expression to his views of life in 'The Rambler.' Indeed, it might be held that 'The Vanity of Human Wishes' is more of a weighty essay in verse than it is of a keen satire. This point need not be pressed, however, nor need we emphasize Macaulay's well-known complaint with the Ten Poets. What mainly matters is that Johnson, although probably more of a rhetorician than of a poet, gave the readers in this essay, or satire, one of the best pieces of sententious poetry in the English language. The famous portraits of Wolsey and of Charles XII of Sweden fail to impress but few readers, and there are other passages and single lines equally memorable — e.g., 'Toil, envy, want, the patron, and the jail,' and 'Superfluous lags the veteran on the stage' — the first truer of Johnson's own career than the second. Tested by any standards of poetry in which an appeal to the intellect is given due weight, 'The Vanity of Human Wishes' is worthy of the fame of its author; but it must be admitted that it does not touch the heart so deeply as the simple stanzas Johnson wrote on the death of his friend, the old quack-doctor, Robert Levet.

WILLIAM P. TRENT.

VANLOO, Jean Baptiste, Dutch painter: b. Aix, 11 Jan. 1684; d. there, 19 Sept. 1745. In 1731 he was elected to the Academy; produced many portraits, including that of Louis XV, and mythological pictures, such as 'Diana and Endymion' (in the Louvre); 'The Triumph of Galatea' (in the Hermitage at Saint Petersburg). His son, LOUIS MICHEL VANLOO (b. Toulon, 1707; d. Paris, 20 March 1771), studied in Rome and Paris, in which latter city he became a member of the Academy. Settling at Madrid he was appointed court painter to Philip V, and there are three portraits of the Spanish royal family by him in the Prado Gallery and an allegorical picture.

VANLOO, Louis, Dutch painter, son of Jacob Vanloo (q.v.): b. Amsterdam, about 1640; d. Aix, 1712. At Paris he carried off the first prize of the Academy. His more illustrious son, CHARLES ANDRÉ, was both painter and sculptor, and studied at Rome under Gros. In 1719 he went to Paris and assisted his brother Jean Baptiste Vanloo in restoring the frescoes at Fontainebleau. He was received into the French Academy in 1735, made professor there two years later, in 1737, director of the Academy and first painter to the king. In the Louvre are his 'Æneas Carrying Anchises from Troy' (1729); 'Marriage of the Virgin' (1730); 'Apollo and Marsyas' and a portrait of 'Queen Maria Leczinska' (1747).

VANN, vân, Irving Goodwin, American jurist: b. Ulysses, N. Y., 1841. He graduated at Yale in 1863, and at the Albany Law School in 1865, and in the following year began to practise in Syracuse. In 1879 he served as mayor of that city. From 1882 to 1890 he was a justice of the New York Supreme Court, and in 1896 was appointed by the governor a judge of the Court of Appeals, to which position he was elected in 1897 for the term of 14 years. He was one of the founders of the Onondaga County Bar Association, and has been president of the New York State Bar Association. He has been lecturer in the Albany, Cornell and Syracuse law schools.

VANNES, vän, France, a seaport town, capital of the department of Morbihan, on the Vannes, where it falls into a narrow inlet of the Gulf of Morbihan, 68 miles northwest of Nantes. It is a railway junction, is a walled town, and has narrow gloomy streets overhung by antiquated timber houses. The principal buildings are the cathedral, the modern town-hall and Jules Simon College. The town possesses a museum, rich in Celtic antiquities. The manufactures consist of coarse cotton goods, lace, leather and ropes. There are shipyards and ironworks. The trade is in corn, hemp, honey, wax, butter, salt, tailor, cider, and wine. Pop. (1911) 17,842; communal population, 25,000.

VANNUTELLI, van'noo-tel'le, Vincenzo, Italian Cardinal: b. Gennazzano, Italy, 5 Dec. 1836. At the age of 14 he entered the Capranica College, Rome, professor of philosophy and theology and graduated from the institution with highest honors. Ordained to the priesthood by Cardinal Patrizzi, 23 Dec. 1860, the following year he was named bene-
ficiary of Saint Peter's, and in 1863 was appointed auditor to the Papal Nunciuno in Holland, being auditor at Brussels in 1866. In 1875 he became an assistant in the Papal Secretariat of State, and in 1878 was named auditor of the Rota. Elevated to the titular archiepiscopal see of Sardis, 20 Jan. 1880, the distinguished churchman was subsequently appointed Apostolic Delegate to Constantinople, sent as papal representative to the coronation of Alexander III of Russia, and later chose that see. In 1889, he was appointed Nuncio to Lisbon. At the Consistory of 30 Dec. 1889, he was created cardinal and reserved in petto, being proclaimed, 23 June 1890, with the presbyterial title of S. Silvestro in Capite. April 1900, Cardinal Vannutelli was appointed to the suburbanicarian episcopal see of Palestrina, and became Bishop of Ostia and Palestrina, Archpriest of Saint Maria Maggiore, dean of the Sacred College and datarius to His Holiness. He also served as prefect of the Sacred Congregation of the Council and prefect of the Apostolic Signature (Signature), and was entrusted with many diplomatic missions, having been Papal Legate to the European Congress of Brussels 1890; to Tournai 1900; Metz 1907; London 1905; Cologne 1908, and Montreal 1910.

VANUXEM, Lardner, American geologist and chemist: b. Philadelphia, Pa., 23 July 1792; d. Bristol, Pa., 25 Jan. 1848. He was graduated from the Ecole des Mines at Paris in 1819, and in 1820–26 occupied the chair of chemistry and mineralogy at the South Carolina College. He resigned in the latter year in order to adopt geology as a profession, and in 1827–28 he was engaged under the New York legislature in studying the geological aspects of New York, Ohio, Kentucky, Tennessee and Virginia. He was State geologist for New York in 1836–42, was a promoter of the Association of American Geologists organized in 1840, and in addition to numerous scientific papers, he published 'An Essay on the Ultimate Principles of Chemistry, Natural Philosophy and Physiology' (1827); and 'Geology of New York, 3d District' (1842).

VANVIETTI, Luigi, loc-č̃-je ván-vé-téfl, Italian architect: b. 1700; d. 1773. He was appointed architect to Saint Peter's at Rome in 1726; and he erected, while in the prime of his powers (1752), for Charles III of Naples, the magnificent palace at Caserta with its gardens and cataract. As an example of late Renaissance architecture in Italy this palace is scarcely paralleled by any building in Europe.

VAPEREAU, vá-pér-r, Louis Gustave, French scholar and compiler: b. Orleans, 4 April 1819; d. 1906. He was educated at the Ecole Normale, Paris; was professor of philosophy at the College of Tours, 1843–52; admitted to the bar in 1853; and in the same time made editor of the famous 'Universal Dictionary of Contemporaries' (1858, with numerous later editions). Among his other important works are 'Literary and Dramatic Year' (1859–59); 'Universal Dictionary of Literature' (1876); and 'Historical Elements of French Literature' (1883–85). In 1870–71, during the German invasion, he was prefect of Cantal, and afterward prefect of Tarnet-Garonne. He was inspector-general of primary schools from 1877 to 1888, and received the Cross of the Legion of Honor in 1878.

VAPOR, in physics, a term used to designate the gaseous form which a solid or liquid substance assumes when heated. Vapor is, therefore, essentially a gas, and seeing that all known gases have now been proved to be liquefiable, no physical difference can be said really to exist between an ordinary gas, such as oxygen, and a vapor, such as steam. In common language, however, a difference is usually recognized: a gas is a substance which at ordinary temperatures and pressures exists naturally in a state of vapor; while a vapor is produced by the application of heat to a substance which normally exists in a solid or liquid form. In technology the term vapor is more commonly restricted to denote the gaseous phase of a substance given off at a temperature below its specific boiling point. The difference has been otherwise explained to be one not so much of kind as of degree; steam in the boiler of a steam-engine being said to be in a state of vapor, while superheated steam is said to be a gas. Aqueous vapor formed on the surface of the land and water is always present in suspension in the atmosphere and when it meets with a reduction of temperature it condenses into water in the form of rain or dew, or into ice, as hoar-frost. See GAS.

VAPOR LAMPS, a form of lamp used in electric lighting in which a rarefied gas is rendered luminous by the passage through it of an electric current. All other forms of artificial light now in practical use depend for their lighting properties upon the incandescence of a solid—either in the form of a filament of carbon or tungsten as in the ordinary glow lamp or of a rod of carbon as in the arc or of carbon in a finely divided state as in gas and kerosene lamps. The Hewitt vapor lamp, also known as the mercury vapor lamp, derives its light from the vapor of mercury, in which the passage of an electric current causes a high state of incandescence. The lamp is constructed of a glass tube having a metal sealing-in wire at each end. These wires form the connections; the electrodes, one or both of which are of mercury. The tubes are exhausted to a high degree on a vacuum pump and sealed off. This prevents any escape of the vapor which fills the tube. Three types are made: a 20-inch tube operating on direct current; a 50-inch tube adapted for either direct or indirect current; and the quartz or high-pressure lamp, for direct current only. One 300-watt Hewitt lamp will replace nine 32-candle-power incandescent lamps and give much more than twice the amount of light, using only one-third the current. Or the same lamp will replace 12 16-candle-power incandescent lamps, giving over three times the light for one-half the current. The light may be employed to great advantage for purposes where considerable illumination is required and where the ordinary arc light is unsatisfactory on account of its sharp and heavy shadow and its flicker. The light given is bluish green in tint and is a strictly industrial illuminant. In this field its advantages are visual acuity, low intrinsic brilliancy, natural shadows and subdued reflections. It is extensively used in foundries and machine shops.
VAPORIZER—VARIATION

Vaporizing and finishing plants, textile mills, printing plants, paper mills, clothing factories, etc. Another great field of application of the lamp is for all sorts of photographic processes. The illumination being so diffused and the light composed to a great extent of the so-called actinic or chemically active rays it furnishes for this work, where there has never been a satisfactory artificial illuminant, a perfect actinic substitute for daylight. For the production of a pure white imitation of average daylight it is supplemented by other forms of lamps which add the colored rays missing from the Hewitt lamp. For each candle-power of the mercury light is added 0.57 candle-power of Welsbach; 0.34 candle-power of tungsten and 0.50 candle-power of carbon filament. The Moore light, also called the "vacuum tube" light, is a form of vapor lamp in which the rarefied gas used is either carbon dioxide or nitrogen. The nitrogen tubes give a warm yellow light which is soft as well as brilliant. They are extensively used in public rooms, banquet halls, restaurants, etc. The New York City post office is illuminated with a mile of these tubes. The carbon dioxide tubes give a light whose spectrum approaches most nearly to that of diffused sunlight. Color matching may be done by this light as accurately as by daylight and hence this form of illuminant is invaluable in dye houses, which formerly had to show double-exposed photographs on dark days. In the latest forms of the Moore lamp an automatic mechanism is provided for feeding into the tubes from time to time the fresh gas necessary to replenish the amount which becomes inert and, therefore, non-luminous. The neon tube is a form of lamp closely similar to the vapor lamps. It is distinctly a red light, lacking seriously the proper proportion of blue rays. It is useful in many decorative effects and when skillfully associated with Hewitt lamps affords a perfect imitation of daylight at a lower cost than for any other electric light.

VAPORIZER. See INTERNAL COMBUSTION ENGINE

VARANGIANS, var-ang'zh-uhn, or VARAGIANS, a word meaning "sworn men," that is, men bound by oath to stand by each other in their undertakings, and derived from the Scandinavian varar, an oath. It is applied to Northmen who entered the service of the Byzantine emperors and were imperial guards at Constantinople, noted for their courage and fidelity, but also taking decisive part, at times, like the Praetorian guards at Rome, in making and unmaking emperors. The Varangians were not always Northmen in the restricted sense of that term, but included Saxons and other Germans. The designation is also applied to the adventurers from Scandinavia who founded principalities in Russia which were the beginning of the Russian empire and powerful enough for a time to threaten the overthrow of the Byzantine dominion.

VARANIDÆ, Varanus, the family and type genus of the lizards called monitors. See LIZARD: Monitor.

VARDAMAN, James Kimball, American journalist and legislator: b. Jackson County, Tex., 26 July 1861. He was educated in the public schools of Yalobusha County, Miss., read law at Carrollton, Miss., and in 1882 was admitted to the bar and began practice at Winona. In 1883 he became editor of the Winona Advance and from 1890 to 1896 edited the Greenwood Enterprise and Commonwealth. He became editor of The Issue at Jackson in 1898. Taking an active part in politics, he was member of the Mississippi house of representatives in 1890-96 and was speaker in 1894. Mr. Vardaman served successively as captain and major of the Fifth United States Volunteer Infantry in the Spanish-American War. In 1895 and 1899 he was an unsuccessful candidate for governor; was elected governor for the term 1904-08; was candidate for the senate in 1907 and in 1911 was elected to the United States Senate for the term 1913-19.

VAREC, the name in Brittany for the crude ash produced by burning seaweed. See KELP.

VARESE, va-rä'zä, Italy, a town in Lombardy, province of Como, 35 miles west of Milan, on the margin of Lake Varese. It has a church dating from the 9th century rebuilt several times. It is a popular summer resort and the centre of a silk-spinning industry. Paper, organs, automobiles and carriages are also manufactured and wine is bottled. Pop. communal about 21,605; town 7,721.

VARGAS, Luis de, loo'ays daw var'gas, Spanish painter: b. Seville, 1502; d. there, 1568. He began, after the manner of Spanish painters of the period, by applying water colors to a coarse-textured cloth called "sarga," (serge or bunting) and the pictures thus executed were washed over with thin gum or paste. Curtains for churches and naval ensigns were manufactured in this style, and the painting of sargas was practised by Sevillian artists, including Murillo long after the time of Vargas. But this great painter by breaking away from the traditional Spanish method is notable as having introduced into Seville the best Italian methods of fresco and oil. This he did after visiting Rome 1527; and attaching himself to Pierino del Vaga (q.v.). After the sack of the city in that year he fled with his master to Genoa. He did not leave Italy for his native country until 1555. As a painter he was highly imaginative, and evinces a taste for grandeur and simplicity. His heads are beautiful and full of nobility and refinement. In the Chapel of the Nativity in Seville Cathedral he painted his 'Navidad' in 1555, but his masterpiece is 'The Temporal Generation of our Lord' which represents the human ancestors of Christ adoring the Madonna and Child.

VARIABLE, General Theory of Functions of Complex. See COMPLEX VARIABLE, GENERAL THEORY OF FUNCTIONS OF.

VARIABLE, Theory of Functions of the Real. See REAL VARIABLE, THEORY OF FUNCTIONS OF.

VARIABLE QUANTITIES, in mathematics, are algebraic symbols placed in relationship one to another, so that if different numerical values are given to a particular letter the other letters will have corresponding values or sets of values.

VARIATION, in biology, the physical departure in any direction from the mean character of a species. When the variation in a
large number of individuals, generally more or less isolated in locality, is of a marked and constant type, the group of individuals which exhibits such variation is termed, technically, a variety.

Variation, strictly speaking, is regarded as distinct from the processes of evolution, which result in the formation of new species, and is limited to the individual variations within the species. Variations may be either collective or individual. The former are those arising from the carrying over of certain peculiarities of individual variation from generation to generation. They thus tend to become fixed; and receive the name of mutations. Individual variations may be blastogenetic—that is, inherited; or onogenetic—that is, acquired through the exigencies of individual environment. In the latter case they are called fluctuations.

Discussion has been rife as to whether variation is determinate or indeterminate; that is, whether organisms have or have not a tendency to vary in particular ways. It is the view of the extreme Darwinists that there is prima facie no tendency to any special mode of variation, any existing tendency being the result of the selection of those individuals which chance to vary along these particular lines. Darwin himself held to the idea that adaptation was the secret of such observed changes, and that both the principles of natural selection and of variation played an individual part. According to other biological observers and thinkers there is, apart from the guidance of natural selection, an inherent bias, differing in different groups of organisms toward variation in determinate lines. This may be due to the inheritance of characters individually acquired under the stress of surrounding conditions (direct environmental determinism); or to constitutional tendencies inherent in the individuals of each species, analogous to the inherent tendencies of inorganic substances, to assume definite crystalline forms—(innate specific determinism). According to De Vries there is, in elementary species which cross-breed, a unit characteristic which is present in one of the parents and not in the other; while all the other units are paired in the hybrid, this one is not. It meets with no mate and must, therefore, remain unpaired. Unpaired qualities constitute the essential features of the hybrids of species, and are, at the same time, the cause of their wide deviations from ordinary rules.

It has been claimed by certain American biologists that paleontological evidence establishes the existence of determinate variation. The teeth and the limb-bones of more than one series of fossil ungulates are found to exhibit variation along definite and determinate lines. The facts may be admitted; but the reasoning based thereon is inconclusive. The variation adduced is confessedly along lines that are advantageous to the individuals in which it occurs. It would, therefore, on the Darwinian theory, escape that elimination which would be the fate of those inconstant and neutral variations. If the teeth of mammals varied inde-terminately, and if at all variations save those along one line (or several correlated lines) were neutral or non-adaptive, these latter would be eliminated through, if not the adaptive variation would become evident. In the fossil forms the variations along non-adaptive lines would be so slight as to escape detection, while those in a plus or minus direction along adaptive lines would be assigned to different stages in the evolution of the variation in question.

A. R. Wallace and others have tabulated some results of the observation of variation in the state of nature; and Wallace has shown that variations in size or length of particular parts are considerable, "usually reaching 10 or 20, and sometimes even 25 per cent of the varying part," and occurring in 5 to 10 per cent of the specimens examined. These results incidentally show that in the species under examination there was no very rigid elimination, and that inter-crossing did not suppress variations from the mean to such an extent as is sometimes supposed.

On the hypothesis of indeterminate variation it must be confessed that we are to-day not much in advance of Charles Darwin, who said: "Our ignorance of the laws of variation is profound. Not in one case out of a hundred can we pretend to assign any reason why this or that part has varied." Darwin, however, rigorously rejected the notion of a law of nature underlying that failure to discover the reasons was due solely to ignorance of well-ordered laws. It is to be remembered that the animal organism is not passive, but reacts individually to environment; this developing a unit characteristic which may be unpaired in mating and so establish the foundation for a new variety. Consult the works of Charles Darwin, Lamarck, Weismann and Wallace (q.v.) also Bateson, W., "Materials for the Study of Variation" (London 1894); Cope, E. D., 'Primary Factors of Organic Evolution' (Chicago 1896); Davenport, C. B., 'Statistical Methods, with Special Reference to Biological Variation' (New York 1904); Lloyd, R. E., 'The Growth of Groups in the Animal Kingdom' (London 1912); Locke, R. H., 'Recent Progress in the Study of Variation, Heredity and Evolution' (New York 1907); Vernor, H. M., 'Variations in Animals and Plants; a Reviewing Article,' 'Species and Varieties: Their Origin by Mutation' (Chicago 1906).

VARICOSE VEINS, a diseased condition of the veins in which they become dilated, and assume a tortuous course, presenting to the touch a soft elastic sensation, except in the situation of their valves, where they form hard, knotty swellings, generally of a dark bluish color. This disease occurs most frequently in the lower limbs, and is indeed a very common affection there; but it also occurs in the veins of the spermatic cord, producing varicocele, and in those at the lower part of the rectum, forming in the latter case the tumors called bleeding piles. In the lower limbs varix is often complicated with peculiar indolent ulcers, and sometimes the varix bursts and haemorrhage takes place, the patient, if not restored, may lead to death. Varicose veins are caused by
some obstruction to the free return of the venous blood toward the heart under pressure of the blood in the veins, and as an incident of the latter it is frequently an increase in the diameter and lengthened through this pressure, and their walls become very thin in some cases, and may even break under the skin exhibiting more or less extravasation. Such obstruction occurs especially from tumors within the abdomen, enlargement of the liver causing pressure on the ascending vena cava, pregnancy, constipation of the bowels, tight gartering and other causes. As to the treatment, the first step of course is to remove the cause of the disease, whenever that is possible. If the disease is grappled with at an early stage much good may be effected by enjoining complete rest in a horizontal posture, by bathing the limbs with cold water twice or thrice a day, and by the use of a properly applied bandage or laced stocking. In moderate cases the condition may be greatly improved and is often dissipated by the continuous wearing of a snugly fitting elastic stocking. When the disease is far advanced no radical cure can be effected except by a surgical operation in which the obstructed part of the vein is excised. The patient will generally do better to rest content with a palliative treatment.

VARILLA, vä-rè-lä, Philippe Bunau, French engineer and diplomat: b. Paris, 26 July 1859. He was graduated from the École Polytechnique, entered the civil division of French engineers, planned and directed the construction of harbor-works and railways in Algeria and Tunis, and in 1884 became connected with the De Lesseps Panama Canal enterprise, work on which had then been proceeding about two years. At his suggestion many radical changes were made in the original plans. In regard to the question of an isthmian canal he published in 1892 'Panama: Le passé, le présent, l'avenir.' His active work in connection with the Panama Canal Company ended in 1888. He spoke several times in the United States in advocacy of the Panama route, and after the revolution (see Panama) was chosen as representative of the new republic of Panama at Washington. In the spring of 1904 he returned to France and subsequently became manager of the Madrid-Débâcles Railway. Among his other works as an engineer were the Kongo Railway, West Africa, and the improvements of navigable waterways in Rumania. He invented an electric excavating machine. In the Great War of 1914-18 M. Varilla was in active service and lost a leg during the struggle for Verdun.

VARINAS, vä-rin'äs, or BARINAS, Venezuela, a town in the state of Zamora, on the right bank of the river San Domingo, 80 miles southeast of Merida. It is a neat place at the opening of a valley about 600 feet above the sea-level, with a mean annual temperature of 82°. It has a church and a hospital and is the terminus of a telegraph line. Cacao, coffee and tobacco are cultivated in the neighborhood, but the town and its industries have much declined in recent years. It was formerly the heart of a famous tobacco district. Pop. about 5,300; formerly 12,000.

VARIOLA, smallpox (q.v.).

VARISCITE, vär's-sit, a native hydrous phosphate of aluminum, having the formula AlPO₄·2H₂O. It has a brilliant vitreous lustre, and usually a rich grass green color, more rarely bluish or whitish, and occurs most frequently in nodular formation found in Utah is called Utahlite (q.v.). Individual crystals have orthorhombic symmetry; they are rarely well developed, being usually clustered into little sheaf-like aggregates, which densely coat the surfaces of the matrix. Its hardness is 4 and specific gravity about 2.4. Its best-known American localities are in Arkansas and Utah.

VARNA, vär'nä, Bulgaria, a fortified sea-port town on the west shore of the Black Sea, at the mouth of a river of the same name, 160 miles northwest of Constantinople. It exports wheat, maize, cattle, attic of roses, etc., and imports woolens, metals, sugar, coffee, leather, haberdashery, machinery, etc. The harbor has been modernized, and Varna is now an eastern terminus of the Bulgarian railway system. It is the see of a Greek and a Bulgarian archbishop. In 1444 Ladislaus, king of Hungary, was defeated and slain by Amurath II, sultan of the Turks, near his town. In 1828 it was taken possession of by the Russians, but was restored to the Turks in the following year by the Peace of Adrianople. In 1854 the Crimean expedition sailed from it. It is the chief city of the district of Varna, which has an area of 2,554 square miles and a population (1918 est.) of 325,000. The city's population is about 45,000.

VARNHAGEN, vär'nä, Francisco Adolphe de, Brazilian historian: b. Sao Joao de Ypanema, Brazil, 17 Feb. 1816; d. Vienna, Austria, 29 June 1878. He was taken to Portugal when very young, educated in the royal military college and in 1833-34 served in the constitutional army against Dom Miguel. He afterward engaged in historical researches, returned to Brazil in 1841 and during the remainder of his life was largely occupied on various diplomatic missions in South America and in Europe. As a historian he ranks easily at the head of Brazilian men of letters, his work displaying profound research and presented with clearness and force. He edited and published various historical documents, contributed numerous papers to the 'Revista do Instituto do Brazil,' and wrote 'Noticias do Brasil' (1852); 'Historia do Brasil' (1854-57); 'Das wahre Guananhani des Columbus' (1869); 'L'origine Tourannien des Americains Tupis-Caribes, et des anciens Egyptiens' (1876), etc.

VARNHAGEN VON ENSE, vär'nä-von en'äs, Karl August, German soldier, diplomat and author: b. Düsseldorf, 21 Feb. 1785; d. Berlin, 10 Oct. 1858. He studied at Berlin, Halle, and Tübingen, assisted Chamisso in the latter's 'Museulmanach' (1804), in 1809 entered the Austrian army, fought at Wagram, and after the peace was made adjutant to Prince Bensheim. Then he entered the Russian service as captain, served in Tettenborn's corps, and wrote a 'Geschichte der Kriegszug Tettenborn' (1811), accompanied Prince Hardenburg to the Congress of Vienna (1814), and in 1815-19 was Prussian Minister-Resident at Carlsruhe. Subsequently he lived chiefly at Berlin. He was particularly successful in biographical portraiture, though at times relying overmuch on the anecdotal.
VARNISHES

method. Among his published works are 'Goethe in den Zeugnissen der Memoiren' (1823); 'Goethe's Briefe an den Denkmaler' (1824-30); 'Denk-
würdigkeiten und Vermischte Schriften' (1843-46; 2 additional vols., 1859); 'Tage-
bücher' (1861-72); 'Ausgewählte Schriften' (1871-77).

VARNAHGEN VON ENSE, Rahel (Le-
win), German author: b. Berlin, 1771; d. 1883.
She was well known in literary circles and exercised a notable influence over her hus-
bond's literary career. He published a memorial of her, 'Rahel, ein buch des andenkens fur ihre freunde' (3 vols., 1834; new ed., 1903), and 'Galerie von Bildnissen aus Rahels Umgang' (2 vols., 1836).
After his death appeared 'Briefwechsel Zwischen Rahel und David Veit' (2 pts., 1861), and Briefwechsel Zwischen Varnhagen von Ense und Rahel' (6 vols., 1874-75).

Materials in the manufacture of var-
ishses may be placed under the following groups: drying oils, resins, gums, solvents and coloring matter. Good drying oils are made from old linseed oil of the Russian or Baltic preferred). It should be aged at least a year before use by being stored in containers to exclude any attack of the air. While the difference between raw and old stored oils is great, the cause is not known to science, nor have the chemists discovered the reactions caused in ageing. The selection of resins in the ingredients employed is more important than any other, for the lustre and permanence of the products depends absolutely on the qualities of the resins used. Gums as known in commerce are the exudations from trees and consist of what are termed water soluble and spirit soluble. The water soluble gums are of course not correctly used in varnishes as it is required that varnishes shall not be affected by water. For varnishes the resins available for the commercial markets are: amber, kauri, copal, dammar, shellac, mastic, sandarac, benzoin, elemi, ani, pine resin (rosin), asphaltum. Most resins come to the market either in the form of varnishes and lacquers work, a species of varnish application, was known at a very early date. It has been claimed that Japan was acquainted with the art of varnishing long before the Chinese or the Japanese.

Varnish. A solution of gums or resins which is applied to the surface of objects to afford a glaze and protect the article so coated. Its use is largely devoted to decorative and applied to enhance the appearance of woodwork (furniture and house fittings) as it brings out the beauty of the grain and color of woods more distinctly and permanently and at less cost than the process of polishing, being applied with a brush similarly to painting. Varnish is also used as an upper or outside coating of paint to enhance and make more permanent the pigments. The ancient Egyptians were acquainted with the art of varnishing, but its origin appears to have arisen in the East. In India, China and Japan the practice of lacquer work, a species of varnish application, was known at a very early date. It has been claimed that Japan was acquainted with the art of lacquering 200 or 600 a.c., but the majority of authorities place its first usage there to the 3rd century of our era, as an art acquired from their neighbors the Coreans. The natives of China and India probably knew the art much earlier than the Japanese. Japanese and lacquer work are, however, generally treated in the arts as separate and distinct. True varnish does not appear to have been known in Europe till the 17th century.

The practical varnish will have the following requirements: It must be a homogeneous fluid or solution; must be fixed or permanent in effect as to tone of color, transparency (or opaque-
ness), and must, on application in thin layers by brush or otherwise, dry within a short period by evaporation of its volatile solvents (alcohol, ether, benzene, spirits of turpentine, etc.), leaving a film of smooth, lustrous (some-
times purposely dull), elastic oil and resin, im-
 pervious to its surrounding atmospheric con-
ditions. It must when dry be free from cracks or flaws. In general varnishes may be divided into natural, oil, spirit and water varnishes. Natural varnishes so called are the group of lacquers as used in India, China and Japan and are produced in liquid form by nature as the saps or juices of trees (Rhus vernicifera). They are generally treated under the title lac-
quers (to which refer) and will not be con-
sidered here. Oil varnishes. These are a prod-
uct manufactured from linseed oil, gum resins,
driers, and a solvent such as turpentine or

white spirit. The gums are largely fossil resins. Oil varnishes in commerce are frequently divided into the two general classes of varnishes and cabinet varnishes; both are of very similar character as to composition and manu-
facture, but the best and most durable for open air use are selected as carriage varnishes, the remain-
der being termed and used as cabinet var-
nishes. Spirit varnishes consist of a binder made from various resins dissolved in a volatile spirit—methylated spirit (grain alcohol dena-
turized), turpentine, etc. They are generally made without oil, but some have a small ad-
mixture of oil. Water varnishes find but small application in the industrial arts. There are lac water varnish, glazing varnish, glue varnish and crystal water varnish. The first makes a good paper varnish and is used on harness, as is also the glue varnish.

Manufacture. Oil Varnishes.—The plant for this class is very simple as is the process, but containing the process requires very great care and experience to produce a com-

white spirit. The gums are largely fossil resins. Oil varnishes in commerce are frequently divided into the two general classes of varnishes and cabinet varnishes; both are of very similar character as to composition and manu-
facture, but the best and most durable for open air use are selected as carriage varnishes, the remain-
der being termed and used as cabinet var-
nishes. Spirit varnishes consist of a binder made from various resins dissolved in a volatile spirit—methylated spirit (grain alcohol dena-
turized), turpentine, etc. They are generally made without oil, but some have a small ad-
mixture of oil. Water varnishes find but small application in the industrial arts. There are lac water varnish, glazing varnish, glue varnish and crystal water varnish. The first makes a good paper varnish and is used on harness, as is also the glue varnish.

Manufacture. Oil Varnishes.—The plant for this class is very simple as is the process, but containing the process requires very great care and experience to produce a com-
mercially successful line. The stages of the process are: (1) melting or running the resin and gums; (2) boiling the oil; (3) mixing the melted gum and boiling oil; (4) boiling the varnish; (5) thinning the boiled varnish; (6) cleaning. The gum pots have a very small opening and the finished varnish depends entirely upon the successful outcome of this process. It is done in a large cylindrical copper vessel, with flat or domed bottom, known as the "varnish pot." These pots have channels near the bottoms which support them in the holes on top of a furnace. In modern varnish works the furnace top is flush with the floor of the gum running shed. These pots have wheels appended to ease movement from the gum running shed to the mixing shed. The pots have hood-covers which connect with flues by stove pipes to allow vent for the noxious vapors. During this running process oil is being added to a boiling pot, the oil heated to 500° F. for from one to two hours. The gum is run by heat till it has a steady boil without frothing (which occurs at the start and is the chief source of danger—that of running over). The boiling oil is then added in the correct proportion and then thoroughly mixed. The mixture is then poured into a "set pot." The mixed oil and gum are now boiled together to get it thoroughly homogeneous. The set pot is an iron vessel formed like a washing boiler and with a capacity of some 600 gallons. It is set in a specially constructed furnace to hold it. With several runs in it the mixture is boiled at a temperature of from 450° to 500° F. for a time varying from half an hour to four or even five hours, according to the kind of varnish. It now becomes a viscous mass and should be clear and transparent. While in the former process the danger was from boiling over, the danger in this process is that of catching fire. For extinguishing such, should the material become enflamed, a shallow pan-shaped cover filled with sand is suspended above the set pot ready to let down and smother the fire. The next process is that of thinning. This is done by removing the set pot of boiled fluid outdoors away from the building, where it is thinned with the turps till acquiring the necessary consistency. The next process is the necessary clearing and aging, as newly made varnish works badly. This process is performed by placing the material in large iron tanks or cisterns and after hermetically sealing, storing for six months to two years. In this period the insoluble matter slowly precipitates and leaves a clear fluid.

Spirit Varnishes.—These can be made with the same material as the oil varnishes. The French process is very similar to the procedure given for oil varnishes, the main difference being that these varnishes contain little oil. They are made by running the gums, mixing with oil, and bringing to a boil and the mixture is boiled till stringy (viscous); after which the mass is cooled and mixed with spirits. In the "common" process the resins are mixed with the solvent and kept in a warm place or heated slowly, permitting only spirit soluble gums to be used.

Water Varnishes.—These are produced as follows: Lac water varnish contains the proportions of six ounces shellac to one and one-half ounces borax boiled together to each pint of water. Glazing varnish is made with a mixture of egg-white and water preserved by the addition of a little carabolic acid or thymol. Dissolved albumen can take the place of egg-white. Glue varnish is a solution of the proportions of one pound pale glue to every two gallons of water. The quality and color are dependent, of course, on the kind of glue used—white, brown, etc. It is not water proof and has the defect of being less permeable to water if a little bichromate of potash be added to the ready-made varnish, not during the process of manufacture. Crystal water varnish is produced by dissolving, in the following proportions, one pound of good white gum arabic to one pound of glucose to each three pints of water.

In commerce the different varnishes are known as finishing body varnish for coaches, hard drying or flattening varnish, leather varnish, elastic hard carriage varnish, pale oak varnish, oak varnish, hard church oak varnish, pale copal varnish, japanners' gold size, black jap, black varnish for carriage iron work, Brunswick black, gold size, black leather varnish, black leather varnish, amber varnish, copper picture varnish, oil varnish, bookbinders' varnish, patent leather varnish, photographic varnish, etc.

VARNISH TRADE, The. See PAINT, OIL AND VARNISH INDUSTRY.

VARNISH-TREE, a name given to various trees, yielding a sap or secretion that serves for varnish and lacquer. *Rhus verniciflua* furnishes the famous Japanese lacquer (q.v.) and is one of the most important varnish trees. Another very important tree is the Martaban Burmese or black varnish-tree (*Melanorrhiza usitata*), a tree some 60 feet high, called thee-seen by the Burmese. When cut it exudes a thick, viscid, grayish juice, blistering in dry air, drying slowly and turning black on exposure. This black varnish is used extensively in Burma for lacquering various vessels, furniture, temples, etc. The fruits of several species of *Semecarpus*, and especially the marking nut, produce a black varnish in India. *Aleurites cordata* is the Chinese, and *Elaeagia utilis* the rubiaceous New Granada varnish-tree, the latter secreting in its stipular axils a resinous substance, used by the Colombians as a lacquer. Another valuable resin exudes from the trunk of the West India varnish or locust-tree (*Hymenaea courbarii*), a leguminous tree growing to an enormous size and living for centuries. The false varnish-tree is *Ailanthus glandulosa*, or tree of heaven, from China. The Mareton Bay varnish-tree is a tall, evergreen of sub-tropical Australia (*Pentaceras*).
regiment to be raised to the counties of Kent and Kings, and afterward received a commission from Congress when Washington was appointed commander-in-chief. In 1777 he became brigadier-general; and he commanded all the troops on the Jersey side of the Delaware, when the British and Hessians took possession of Philadelphia. In 1779 he resigned his commission, was delegate from Rhode Island to the Continental Congress 1780-82 and again in 1786-87. In 1787 he was appointed one of the judges of the Northwest Territory, and removed to Marietta, the first city established west of the Ohio.

V A R O T A R I, və-rɔ-tə-rɛ, Alessandro (known also as "Il Padovanino"). Italian painter; b. Padua, 1590; d. Venice, 1650. He was the son of Dario Varoti, a Veronese painter, who taught his son the first principles of art. He consequently went to Venice and there devoted himself with enthusiasm to the study of Titian and Paolo Veronese. The pictures he painted at Venice under the inspiration of these masters were most admired and were destined to adorn the churches of Padua. There are two examples of this painter in the London National Gallery; but his style and admirable coloring are best represented by his 'Marriage of Cana in Galilee' (UM) Academy at Venice; and his 'Judith with the Head of Holofernes' (his grandest production), in the Dresden Gallery, a replica of which may be seen in the Imperial Gallery at Vienna.

V A R R O, Marcus Terentius Reatinus, Roman scholar and author; b. Reate, 116 B.C.; d. 27 B.C. He received a liberal education, held a high office in the navy in the wars against the pirates and against Mithridates, and at the commencement of the civil war was serving in Spain as legate of Pompey. When Cesar marched into that country after the reduction of Italy, Varro was obliged to surrender his forces; but still adhering to the aristocratic party joined Pompey in Greece. His villa at Casinium was plundered by Antony, but Cesar employed him to superintend the collection and arrangement of the works in the library at Rome designed for the public use. From this time Varro lived in retirement, chiefly at his residences near Cumae and Tusculum. During the second triumvirate he was put by Antony on the list of proscribed, but by the aid of friends his life was saved, though his libraries were destroyed. He gained the favor of Augustus, who appointed him superintendent of the library founded by Asinius Pollio. Varro was considered the most learned of the Romans, and according to his own statement he had written 490 books by 39 B.C. A list by Saint Jerome gives 74 works, containing 620 books. He wrote historical, antiquarian, biographical, critical, philosophical and geographical treatises, besides others of a miscellaneous character. Some of his works perished with his library, and only one has come down to our time entire, the treatise 'De Re Rustica,' written when he was 80, and the best work on ancient agriculture extant. The best edition is that in the 'Scriptores Rei Rusticae Veteres Latinorum,' of J. G. Schneider (1794-97, English translation by Owen 1803). Of a grammatical treatise entitled 'De Lingua Latina,' six books (V-X) out of the original 24 are extant, though mutilated; the best edition is that of Muller (last ed., 1883). Consult Boissier, 'Etudes sur M. T. Varro.' In February 1777 he became brigadier-general; and he commanded all the troops on the Jersey side of the Delaware, when the British and Hessians took possession of Philadelphia. In 1779 he resigned his commission, was delegate from Rhode Island to the Continental Congress 1780-82 and again in 1786-87. In 1787 he was appointed one of the judges of the Northwest Territory, and removed to Marietta, the first city established west of the Ohio.

VARRO, Publius Terentius, Roman poet: b. Atax, Narbonensian Gaul, about 82 B.C.; d. about 37 B.C. He is sometimes distinguished from the preceding by his surname, Atacinus. He was the author of an epic on Cesar's Gallic campaigns, 'Bellum Sequanicum'; 'Argonautica,' an epic which survives in fragments only; and satires and sonnets.

VARUNA, the noblest of the Vedic divinities. As creator of the world and representative of the all-encompassing heavens he rules the universe. For a reward he offers his abode hereafter; for punishment, he has fetters ever ready for the guilty. In the Vedic ritual only about a dozen hymns are addressed exclusively to Varuna and he is invoked in common with Mitra, the god of light, whose rays constantly seek out all offenders. It is his providence that protects the good and provides the remedies that prevail against the effects of sinning. His great rival in the hearts of the people is Indra. In the latter Indian religious drama he is confined simply to the sea. Consult MacDonnell, A. A., 'Vedic Mythology' (Strassburg 1897).

VARUS, və-rəs, Publius Quintilius, Roman general. He was consul in 13 B.C., afterward proconsul of Syria, where he gained the confidence of Augustus by checking an insurrection of the Jews. Six years later he received from the emperor, with whose family he was connected through his wife, the command to introduce the Roman jurisdiction, language and religion into that part of Germany which had not yet been conquered by Drusus. A general revolt having been secretly arranged by Arminius, Varus was attacked by an immense host and while trying to make his escape had his whole army, consisting of three legions, cut to pieces in a pass of the Salubs Reutoburgiensiris. Varus put an end to his own life. The exact scene of this battle is disputed. (See ARMINIUS.) In consequence of this defeat the Roman domination was once more limited, roughly speaking, by the Rhine on the east and the Danube on the north.

VASA, və-sə, House of, a Swedish royal family founded by Gustavus Vasa (Gustavus I, q.v.), who was elected king in 1523. The family held direct possession of the throne until 1654, Gustavus II (Gustavus Adolphus, q.v.) being its most illustrious representative. He was succeeded by his daughter Christina (q.v.), who never married. She assumed the government in 1644 and in 1654 resigned it in favor of her cousin Charles Gustavus (Charles X, q.v.), by whom a collateral female branch was introduced. Christina survived until 1689. The house of Vasa gave to Poland three kings, of whom the first began to reign in 1587 and the last, John Casimir, abdicated in 1668. With his death in 1672 this branch of the family became extinct.

VÁSÁRHELY, və-shər-ˈhɛl, or HÓD- MEZO-VÁSÁRHELY, hódˈmɛː zɛ və-shər-ˈhɛl, Hungary, a large market-town in the county of Csongrád, on Lake Hód and the Karolyi Canal, leading into the Theiss, 12 miles north-east of Szegedin. Tobacco and wine are grown;
many cattle are reared in the neighborhood and large cattle markets are held in the town. The inhabitants mostly belong to the Reformed Church. Population about 60,000.

VÁSÁRHELY, or MAROS-VÁSRÉNY, már'zhUSH-váSH-réNy, Hungary, the capital of Maros-Torda County, and a royal free city, in Transylvania; on the Maros, 50 miles east of Klausenburg. Its ancient castle is now used as the garrison barracks and contains a 15th-century church, the tower of which is a large library which possesses a manuscript of Tacitus. The town has a trade in lumber and petroleum and sugar, beer, spirits and tobacco are manufactured. Pop. about 20,000.

VASARI, vá-shár-é, Giorgio, Italian painter, architect and art writer: b. Arezzo, Tuscany, 30 July 1511; d. Florence, 27 June 1574. He studied under Luca Signorelli, Michelangelo and Andrea del Sarto. The Cardinal Ippolito de Medici, Pope Clement VII and the Dukes Alessandro and Cosmo of Florence, successively engaged him in their service. As an architect he showed great ability, and two of his designs, that of the Palazzo degli Uffizi at Florence and that of the church of Abbadía at Arezzo, are among the best of his time. As a painter he was less successful. His principal paintings are a 'Lord's Supper,' in the cathedral of Arezzo, and several works in the Palazzo Vecchio in Florence and in the Vatican in Rome. He has himself given us an account of his travels in a book in Florence, Arezzo, Pisa, Venice, Bologna, Rome, etc. They exhibit all the faults of the late Florentine style. His work on the 'Vite de' più eccellenti Pittori, Scultori ed Architetti' ('Lives of Painters, Sculptors and Architects') is of great value. He, however, fell into many errors respecting the earlier masters, owing to the imperfection of existing accounts, and he has also been accused of partiality toward Tuscan artists. The work was first printed in 1550 and an enlarged and improved edition appeared in 1568. The latter forms the basis of all subsequent editions, such as that of Milanesi (Florence, 8 vols., 1878). An English translation by Mrs. Foster has been published in five volumes; an other edition has been found in the Bohn Library, and a third, by Blashfield, was published in New York.

VASCO DA GAMA. See GAMA, VASCO DA.

VASCONCELLOS, vás-kón-sél'ós, António Augusto Teixeira de, Portuguese author: b. Oporto, 1 Nov. 1810; d. Paris, 29 July 1878. He studied at the University of Coimbra, and in 1845 edited Ilustração. During the insurrection of the following year he became an officer of ordnance under Sa da Bandeira and afterward prefect of Villa Real, secretary to the junta of Revolução de Setembro. In 1850 he went to Angola and, settling afterward at Saint Paul de Loanda, was elected president of the municipal body there. Returning to Portugal he founded in 1853 a journal called Arquivo. He fixed his residence in Paris and established in 1858 the Iberian Society for the purpose of publishing works relating to Portugal, Spain and Brazil. Among his works are 'Carta philosophica do Estudo da Historia e Portuguez' (1840); 'Roberto Valtão,' a romance (1846); 'Carta do Tráfico dos Escravos na Provincia d'Angola' (1853); 'Le Portugal et la Maison de Bragance' (1859), and 'A Fundação do Monarchia Portuguesa' (1890).

VASCONCELLOS, Joaquim Antonio da Fonseca e, Portuguese critic: b. Oporto, 10 Feb. 1849. He studied at Coimbra, traveled widely on the Continent, in 1883 became professor of the German language in the Oporto Lycée and in 1884 was made also director of the museum for indigent and trade. His first work was a history of Portuguese music, 'Os Musicos Portugueses' (1870). Other works of his on the history of musical art in Portugal were 'Luiza Todi' (1873); 'Ensai sobre o Catalogo da Livraria de Musica de El Rei D. João IV' (1873), and 'Cartas Curiosas dos Abbade Antonio da Costa' (1879). On the graphic arts he wrote 'Reforma do Ensino de Beias Artes' (1877-79); 'Albrecht Dürer e a sua Influencia na Peninsula' (1877); 'Francisco de Hollandia' (1879) and 'Goecians' (1879-81).

VASCONCELLOS, Simão, Portuguese missionary and historian: b. Coimbra, 1599; d. São Paulo province, Brazil, about 1670. A member of the Jesuit order, he went directly from Portugal about 1630 and remained connected with the missions there. He wrote a 'Chronica da Companhia de Jesus no Brazil' (1663; 2d ed., 1844), a 'Vida de João Almeida' (1665) and 'Vida de José Anchieta' (1661). These works are regarded as important sources for both the secular and the ecclesiastical history of early Brazil. Some of Vasconcellos' unpublished manuscripts are in the government archives of Brazil.

VASCULAR ANATOMY OF PLANTS. See PLANTS, VASCULAR ANATOMY OF.

VASELINE, a trade name for a familiar brand of petrolatum or petroleum jelly, a useful product obtained by elaborate system of filtration from crude petroleum. It is a pale-yellow, translucent, slightly fluid, semi-solid, insoluble in water, slightly so in alcohol, freely in ether and may be mixed in any proportion with fixed and volatile oils. This substance, of American introduction, has since 1876 become of considerable importance, having been found an excellent substitute for lard in the preparation of ointments — its quality of never getting rancid giving it a decided value in all medical preparations over the animal fats and it seems to furnish a good basis for soaps, pomades, cold-creams, etc., thus dispousing the virtues of glycerine as an emollient. Taken internally it is said to be of efficiency in the cure of coughs, colds, hoarseness and irritation of the throat. It is extensively used in hospitals as a remedy for burns and scalds, to prevent pitting in smallpox and for every kind of skin disease, inflammation and irritation.

VASES, vás'zéz, decorative vessels of various shapes and materials, generally with one or more handles and variously embellished and ornamented by means of relief work, incising, pigments or otherwise, and used for many purposes. The vase form usually consists of the following parts or members: rim, neck, shoulder, body or belly, stem and foot, any part of which, however, may be absent. Attachments to vases are handles and covers. Vases without feet are
known as *apode* vases. Vase body forms are: spherical, cylindrical, oviform, pear-shaped (*piriform*), hemispherical, etc. Vases used by the ancients as receptacles for human ashes when the bodies of the dead were disposed of by cremation and known generally as "cerinyer vases" are usually classified as *urns*. The ancient Egyptians used a peculiar form of vases in their funeral rite, the so-called *canopic vases* because manufactured at Canopus (now Aboukir). They are found composed of clay, alabaster, limestone, etc. The early ones had flat lids (5th and 6th dynasties), but later the lids assumed the form of human and animal heads. These canopic vases are in sets of four and are dedicated to the Four Children of the god Horus, namely, Typhon (jackal-headed); Osbophenuf (hawk-headed); Mestha (man-headed); Harpe (dog-headed). They were placed at the four corners of the sarcophagus and protected the viscera of the embalmed apportioned as follows: Heart and lungs; liver and gall; stomach; intestines, dedicated respectively to the above deities. The ancient Greeks and Romans made drinking vases out of rock crystal and other semi-precious stones which they termed *diatreta* because the outside ornament was pierced and reticulated, in order, it is said, to enable the drinker to hold a glass through the open spaces and the contents be hot. Very interesting examples of such are extant. Greatly admired by the Romans were the *murrine* vases for which they paid their weight in gold; they were so-called from the substance of which they were made (an Oriental precious mineral termed *murrea*) and of which we have a very indistinct knowledge. Nero paid for his cup of *murrca*, with a handle, over $50,000. A flourishing industry in vase production was carried on by the Romans about the 1st century A.D. at Arretium (present Arezzo); these Arretine clay vases with their red varnish found much appreciation in their day. But the most wonderful vases dating from classical times in our possession are, probably, the *Barbarini* glass vase (see PORTLAND VASE) with its variegated layers beautifully worked into cameo carving; the vases in the excavated silver "treasure of Hildesheim" and the "treasure of Bernay" (see SILVER-WARE) with their beautifully executed repoussé ornament; the Orsini coupe, etc. In the catacombs of the early Christian era are found small glass vases containing a red sediment, which analysis proves to be blood, and canonically pronounced by the Roman Church to be that of the early Christian martyrs in whose tombs they have been found. They are known as *sanguinolenta*. From the 16th century we come across beautifully turned and decorated vases of rock crystal, noted Italian and North German pottery, such as those of Jacopo de Trezzo and the Misseronis. Vying in renown for vase making with the classic Greeks were the Chinese with their fictile vases. Their forms are equally numerous, chiefly rectangular, octagonal, hexagonal, cylindrical, and those known to the auctioneer as single, double and treble *pouder* shape, *breaker* form, *baluster* form, *lance* shape, *gallipot* form. The inverted-pear form was a favorite with the Celestials. Lovely vases as well as odd were produced in bronze by the Chinese; many decorated beautifully with cloisonné enamel, etc., are of very distant date and fetch great prices. Other wonderful vase makers of the Orient are the Indians and Persians with their slender, long-necked bottle forms done in lovely intricate arabesque damascening in silver, gold, etc. Coming back to Europe we find fictile vases of artistic form and decoration of great originality in the earthenware of the Moors of Spain, the most noted being the great lustred "Alhambra" vase with its quaint flat wing handles and decoration in Arab script and painted polychrome enamel. Other quaint vase forms are found in the German Siegburg (16th century) stoneware, such as the Ringleruge (annular vases) with the open centre leaving only a circle of hollow pottery to serve as a body; the *Eulen* (candelabra vases) utilizing the arms and mouth for candle sockets. Coming to the 18th century we find in the Sèvres *voisau de mât* (masted vessel) a vase consisting of a conventionalized hull, mast and rigging. Vases in precious metals entering into the ecclesiastical service of the altar are the *ciborium* and the *ostensorium* (See ECCLESIASTICAL ART). Perhaps the strangest use to which vases have been put is found in the *acoustic* vases found in the walls of the old Roman theatres and public halls, which are supposed to have some secret "sonorous" (or hearing) value. See Greek Vases; Ceramics; Chinese Ceramics; Porcelain, etc.

Clement W. Coubre.

VAEBY, vâ's, George, American botanist: b. near Scarborough, Yorkshire, England, 28 Feb. 1822; d. Washington, D. C., 4 March 1893. He was brought to this country in infancy by his parents, studied medicine at the Berkshire Medical Institute, Pittsfield, Mass., and practised his profession in Elgin and Ringwood, Ill., 1848–66. He was the botanist of the Powell Colorado Exposition in 1868 and of the Department of Agriculture at Washington from 1873 till his death. He gave his attention in his latest years almost entirely to the study of grasses, to which his publications chiefly relate. Among them are "A Catalogue of the Forest Trees of the
United States' (1876); 'Agricultural Grasses of the United States' (1884); 'Grasses of the Southwest' (1890-91); 'Grasses of the Pacific Slope' (1892-93).

VASHEGYITE, a native aluminum phosphate occurring near Manhattan, Nev. It is white, massive, compact and has composition 3Al₂O₃·2SiO₂·2H₂O.

VASQUEZ DE CORONADO, vás-kezh’ dá kó-ro-ña’dó, Francisco. See CORONADO, FRANCISCO VASQUEZ DE.

VASQUEZ DE CORONADO, Juan, Spanish administrator: b. Salamanca, Spain, about 1525; d. at sea, October 1565. He came from a distinguished family, was educated at the University of Salamanca and in 1550 went to Guatemala. He was employed in various important government posts at San Salvador, Honduras, Nicaragua and Guatemala, and in 1562 was appointed alcalde ordinario of the provinces of Cartago and Costa Rica. His administration was noteworthy for its many admirable results. He procured provisions for needy settlers, brought order out of chaos in governmental affairs, made friendly advances to the Indians, whose goodwill he won by his unrivaled kindness and impartiality, explored Costa Rica, founded several towns including Cartago, and in 1564 returned to Spain, leaving the colony in a most satisfactory condition. In consideration of his services he was appointed captain-general of Costa Rica, the office to remain hereditary in his family, and was also made governor of Nicaragua for three years. He sailed with a large following in 1565, but met with shipwreck and was drowned in October of that year.

VASSALBORO, vás’al-bür’ô, Me., town on the Kennebec River and on the Maine Central Railroad, 11 miles northeast of Augusta. It was settled in 1760 and in 1771 was incorporated. In 1792 a part of the town was taken for the town of Sidney. There are six villages in the town. The chief manufacturing establishments are flour mills, machine shops and creameries. There are nine churches. The educational institutions are Oak Grove Seminary, public schools, a business college and a school library. Pop. 2,077.

VASSAR, John Ellison, American lay preacher: b. Poughkeepsie, N. Y., 13 Jan. 1813; d. there, 6 Dec. 1878. Employed at the outset in his brother's brewery his convictions led him to leave the service and devote his time to the good of others. He was employed by the American Tract Society (1850) in mission work and during the Civil War was engaged among the soldiers. He was familiarly known as 'Uncle John Vassar.' His last work was done in the South. Consult Vassar, T. E., 'Uncle John Vassar' (New York 1879).

VASSAR, vás’ar, Matthew, American philanthropist: b. East Dereham, Norfolk, England, 29 April 1792; d. Poughkeepsie, N. Y., 23 Feb. 1852. He came with his family to this country in 1796 and settling near Poughkeepsie the elder Vassar established there a brewery, which was burned in 1811. Matthew Vassar then established himself in the same business and in 1819 bought the brewery. He also established a restaurant and a hotel which were the nucleus of the present city of Poughkeepsie. In 1822 he delivered to trustees previously appointed for the purpose by the State legisla-

VASSAR, Matthew, Jr., American philanthropist, nephew of the preceding: b. Poughkeepsie, 11 May 1809; d. there, 10 Aug. 1881. With his brother, J. G. Vassar, he built the Vassar Brothers Laboratory for Vassar College, and he also erected the Vassar Home for Old Men at Poughkeepsie. He managed the family brewery business for many years and among his many benevolent bequests were the sum of $130,000 for Vassar College and $85,000 for the Vassar Brothers' Hospital at Poughkeepsie.

VASSAR, Mich., village in Tuscola County, on the Cass River, and on the Michigan Central and the Flint and Pere Marquette railroads, about 75 miles north by west of Detroit and 25 miles southeast of Bay City. It is in an agricultural region and has considerable manufacturing interest connected with lumbering. The chief manufacturing establishments are lumber mills, flour mills, machine shops, woolen mills, creameries and foundries. It has two banks and a newspaper. The educational institutions include a high school, graded schools and school library. Pop. 1,900.

VASSAR COLLEGE, Poughkeepsie, N. Y., a college for women founded in 1861 by Matthew Vassar. His original gift to the college was 200 acres of land and $425,000; this was increased by his bequest of $360,000. It was incorporated as Vassar Female College in 1861, the present corporate name being adopted in 1867. The original endowment has been increased by other members of the Vassar family and later by gifts from friends of the college in various parts of the United States, until the endowment on 1 July 1918, including fellowships and scholarships, amounted to $2,707,075.07, with 800 acres in campus and farm. Student enrolment is limited to 900, so may be housed on the campus; but the pressure for admittance and the difficulty of estimating withdrawals make it impossible to maintain this limit with endorsed accuracy and the enrolment for 1917-18 numbered 1,125. Students are admitted upon passing the examinations set by the college entrance examination board, or by an examination covering three years of preparation in four selected subjects; this latter method takes the place of entrance by certificate from approved schools. The course of study, which is partly elective, covers four years and leads to the A.B. degree. The degree of M.A. is also conferred in course. Five fellowships for graduate work are offered and a large number of undergraduate scholarships. The funds available for student aid in one form or another amounted in 1918 to $434,955.59. The affairs of the college are administered by a board of 27 trustees, a president, a treasurer and a faculty composed in 1918 of 140 members. The physical equipment of the college, exclusive of faculty residences, includes 27 buildings, seven of them dormitories, 12 with dormitories and 15 located in this building. Among the more notable buildings are the Main Building, one of the three edifices that constituted
the college in 1865, containing administrative offices and accommodations for about 400 students and officers; the College Chapel, a stone building in Norman style, with a seating capacity of 1,400, containing a set of chimes and stained glass windows by John LaFarge, the Tiffany studios and the Dodge studio; the Frederick Perris Thompson Memorial Library, of stone, in perpendicular Gothic style, providing space for 160,000 books and about 600 readers and containing, in 1918, 100,000 catalogued books and pamphlets; Rockefeller Hall, a modern structure for recitations and lectures, at the end of the dormitory quadrangle; a Museum building containing excellent collections of minerals and fossils and nearly 3,000 mounted birds, as well as many other collections; Taylor Hall, containing the valuable art collections of the college and art lecture halls and studios; the Swift Memorial Infirmary, containing a modern hospital equipment; Metcalf House, a health cottage adapted for convalescents and rest cases; the Students' Building, providing for the needs of the Students' Association and other college organizations, with a large auditorium, seating 1,500, equipped with a modern stage and scenery, and the Good Fellowship Club House, erected by the Students' Association for the maids employed in the college and devoted to social welfare work. Student self-government is in effect, the students themselves as responsible for most of the regulations governing conduct and for the management of such property as the Students' Building and the Good Fellowship Club House and for all extra-curriculum activities, including the providing of various money-making occupations for self-supporting students. The facts that the price for rooms and board is the same for every student, the rooms being selected by lot, that there are no sororities or other clubs to which students must necessarily belong, and that no admission fee may be charged to any campus meeting, all help to maintain the fine democratic spirit that prevails. The college is distinctly Christian, but undenominational in its teachings. Services on Sunday are conducted by visiting clergymen of various churches and evening prayer is held in the chapel daily. The social life of the student body is under the direction of a department of wardens; one warden resides in each house and has charge of its social interests. This department directs also an occupation bureau for the aid of students and for alumnae desiring to register for positions. The health and physical training of the students are made a chief object of attention and are under the direction of a resident physician and two assistant physicians, who also control the sanitary regulations of the college.

VATHEK. This wonderful tale of the East has a curious history. It was written by William Beckford, when a young man, at the suggestion of the REV. Samuel Henley, then an assistant master at Harrow, one of the great public schools of England. There is a tradition that Beckford wrote it out in three days and two nights, never leaving his room or taking off his clothes in the meantime. The correspondence between Beckford and Henley, however, shows that the author was engaged upon the book for several years. As a boy Beckford was fascinated by 'The Arabian Nights,' and subsequently read several learned books upon Mohammedan life, customs and beliefs. In a word, all the details of his story were closely studied. Rather capriciously, he composed the tale in French and gave Henley a copy of his manuscript to translate into English. Owing to a misunderstanding between author and translator, the English version was published first. It appeared in the summer of 1786, with a preface and notes by Henley, who suppressed the author's name and claimed that the tale was translated directly from the Arabic. At this treatment by his translator Beckford was very angry and the next year he published the original French at Lausanne (where he was staying) and at Paris. Three subordinate tales which were to form a part of 'Vathek' were not published until the 20th century. In their complete form, both French and English, they may now be read in 'The Episodes of Vathek,' translated by Sir Frank T. Marshalls, with an introduction by Lewis Melville (London 1912). But the 'Vathek' which contemporary readers know, the romance which Byron often praised and rated far above Dr. Johnson's 'Rasselas,' is Henley's version, one of the best translations ever made of a foreign classic. So natural, flexible and idiomatic is the style that the book reads as if it were originally composed in English.

The History of the Caliph Vathek is a story of mingled horror, burlesque and sublimity, varied by scenes of great beauty and the whole is organized as a study in retribution. Vathek, a grandson of Haroun-al-Raschid, rules the Mohammedan world from his splendid palace overlooking the Babylonian city of Samarah. When we first see him he is a young monarch indulging himself in all the sensual delights of exquisite dishes, voluptuous music, delirious perfumes and troops of girls as beautiful as the hours. He has an eye so terrible that any wretch who looks upon it feels that the ground and sometimes expires. He grows cruel; he imprisons on whimsical charges his most faithful subjects and in general adheres to justice in a most haphazard manner. He comes under the influence of Cam, the mother, magician and necromancer in league with the most malignant spirits, with ghouls even, whom she summons from the grave to do her bidding. She is surrounded by negroes with one eye, who aid her in her wicked designs; and she is so ceaseless in the pursuit of the powers of darkness that she would never sleep but for the visions of evil that then come to her. Instigated by this mother, Vathek commits the most heinous crimes, and in defiance of Mohammed and Allah, he erects a lofty tower of 11,000 stairs in a vain endeavor to penetrate, by the most obscene rites, the mysteries of heaven. At length he abandons his religion and sells his soul to Ebis, the Mohammedan Satan, in the hope of obtaining the throne of the pre-Adamite sultans.

The agent of the transaction is a glaour, who appears in the form of a man so hideous that people shut their eyes at the first sight of him. Vathek, in one of his fits of madness, kicks him down the palace steps; other feet join in the entertainment and the intruder is kicked through the palace and streets of Samarah. The glaour nevertheless wins over
Vatican, who obtains for his harem Nouronihar, the most beautiful and sensuous of Oriental women. The last scene is in the magnificent hall of Ebils, where, disappointed of all their hopes, Vathek and Nouronihar and Carathis are consigned to eternal pain. With right hands upon the arts tendled by Ebils into flames, they must there tread a never-ending round of agony. No noeter punishment was ever de-

vised for the damned. Nor were there ever any better pieces of extravagance than the sport which Samarab has with the glaour, or the tricks which Nouronihar and the girls of the harem play upon Bababaloul, the chief of the eumuchs.

WILBUR L. CROSS.

VATCCAN, The, a palace situated on the eastern sections of the Vatican Hill in Rome, the principal residence of the popes since the return from Avignon in 1377 and their official residence since the capture of Rome by the Piedmontese in 1870. It originated in a resi-
dence built by Pope Symmachus (498-514) adjoining the Basilica of St. Peter, but was rebuilt and greatly enlarged by subsequent popes, especially Nicholas V, Sixtus IV, Alexander VI and Julius II. The Basilica and Piazza of Saint Peter flank it on the south, while to the west lie the Vatican Gardens. Only a small part of the Vatican is residential and this part is around the Cortile di San Damaso; all the rest is used for scientific or administrative purposes. There are a large number of chapels which serve various pur-
poses, the most important being the famous Sistine Chapel and the Cappella Paolina. The rear wall of the former contains Michelangelo's 'Last Judgment,' while its side walls contain frescoes executed by Florentine and Umbrian masters between 1481 and 1483. The Cappella Paolina, which is separated from the Sistine Chapel only by the Sala Regia, serves as the parochial church of the Vatican.

The Vatican contains many works of art either in its interior decorations or as a part of its interior collections. The Museo Pio-Clementino embraces 11 separate rooms and among its treasures are the Torso of Hercules, the Belvedere Apollo and the Laocoön. In the Galleria Chiaramonti there are more than 300 sculptures, chiefly the work of Greek sculptors living in Rome. From an architectonic point of view, the Braccio Nuovo, containing statues and busts, is the best of the museum buildings. The Egyptian Museum, embracing 10 halls full of statues, sarcophagi, mummies, etc., is among the first of Egyptian collections of the second rank. The Etruscan Museum contains objects of almost every de-
scription, giving a highly graphic picture of the art of ancient Italy and the customs of the Etruscans. These two museums are located, one below the other, at the northern end of the Giardino della Pigna.

Besides these museums, there are several galleries of paintings. The Vatican Pinaco-
theca, whose nucleus was the collection of art treasures taken by Napoleon to Paris and subsequently restored to Rome, contains works by Raphael, Tintoretto, da Vinci, Pinturicchio, Murillo, Perugino, Titian, Pordenone, G. Reni, Correggio and many other Italian masters; while the Gallery of Modern Paintings contains, among others, the huge picture of the promulgation of the Immaculate Conception by Pius IX. The Appartamento Borgia con-
sists of six rooms adorned with Pinturicchio's paintings. In the second of the rooms the mysteries of the life of Christ are depicted. The last two rooms are devoted to the papacy of Alexander Borgia. One of these formerly contained the celebrated Nozze Aldobrandini, one of the finest antique frescoes surviving from classi-
cal times, which is now located in the Vatican Librery.

One floor higher and an exact reproduction of the Appartamento Borgia in size and shape are the Stanze di Raffaello, so called because they were painted by or under the direction of Raphael. Immediately adjacent to the Stanze are the Loggie di Raffaello, while underneath the latter are the Loggie di Giovanni da Udine, a pupil of the Umbrian master. In the Galleria degli Azazzi hang the famous 27 pieces of tapestry. The studio for mosaic paintings, for which the Borgia are famous, is said to possess nearly 30,000 different shades of vitreous composition.

The scientific materials in the Vatican are abundant and easily accessible to research workers under certain restrictions. Reference is facilitated by a great many volumes (some printed, some in manuscript) of indices, inven-
tories and catalogues, so that information on all branches of human knowledge may be readily secured in the Vatican Archives and Library. The scientific management of the Vatican Ar-
chives is entrusted to a cardinal and the chief groups of archival materials are the Archivio Segreto, the Archive of Avignon, the Archive of the Apostolic Chamber, the Archive of Sant' Angelo, the Archive of the Dataria, the Consistorial Archive and the Archive of the Secretariate of State. The last named contains the correspondence of the nunciatures, lega-
tions, cardinals, bishops, prelates, princes, military, military men and others. Besides these archives there are various collections, including the huge archive of the old Congre-
gation del Buon Governo, which was entrusted with the economic administration of the Papal States from 1592. The entire collection of archives is of the greatest importance for the political and ecclesiastico-civil history of modern times, and is of especial interest to Amer-
icans because it abounds in materials for Amer-
ican history, particularly of the period of col-
ization. Consult Fish, C. R., 'Guide to the Materials for History in Roman and Other Italian Archives' (Washington 1911).

In the importance of its materials the Vat-
ican Library stands first among the great lib-
raries of the world, containing approximately 50,000 manuscripts and 350,000 printed books. Because it is primarily a manuscript library and because its accommodations are inadequate to meet the demands of the general public, all readers who wish to consult manuscripts are excluded from the library. The manuscripts are divided into 16 open divisions, or divisions subject to later accessions, and 36 closed divisions, or divisions which came to the library complete, and are separated according to the language of the document. Here to be found the majority of the manuscripts, from the convent at Bobbio, in the Middle
VATICAN COUNCIL

Ages one of the richest collections in Europe. Here also are 3,000 manuscripts, brought to the Vatican from Heidelberg in 1623 and called "Codices Palatini." The last great addition was in 1856, when Pope Pius IX added 40,000 volumes that belonged to Cardinal Mai, the discoverer of the lost manuscript of Cicero's "De Republica."

The scientific management of the Vatican Library is entrusted to a prefect, who also has charge of a Pagan Museum, a Numismatic Collection and the Museo Cristiano. The last-named was separated for a time from the library management when the celebrated De Rossi was named prefect of the Museo, an honor intended only for him. Despite the small staff of the Library and its insufficient funds, it stands at the head of the libraries of the world in the number of its scientific publications.

Besides the Archives and the Library the Vatican possesses an astronomical observatory, a modern polyglot printing office, a collection of inscriptions and a collection of geographical charts. The Specola Vaticana consists of the Gregorian Tower and the Leonine Tower with a passageway and has acquired considerable reputation for its measurement of astrographic plates. The Galleria Lapidaria contains no less than 6,000 inscriptions in stone and numerous other inscriptive remains. Closely identified with it was the celebrated Marini, one of the founders of Latin epigraphy.

There are several large state halls in the Vatican, including the Sala Regia (where the consistory is held). the Sala Ducale and the Sala Clementina, which are of great historical importance. The neighboring Basilica of Saint Peter is regarded as a part of the Vatican only when the Pope attends some solemn ceremony there. Since 1870 the Vatican has been considered extraterritorial and has consequently possessed its own military guards, the Swiss Guards, and its own police, the gendarmerie; before that time it came under the civil administration of the Papal States.

The importance of the Vatican, the administrative centre of the Catholic Church, was increased by the seizure of the Papal States and the consequent exclusive residence of the Pope in the Vatican. Business formerly transacted elsewhere, for instance, in the Lateran Palace, is now conducted here. It was here that the conclaves were held which elected Leo XIII, Pius X and Benedict XV to the papacy. It is here that the Papal Secretary of State receives the ambassadors and envoys accredited to the Pope. See, so that all diplomatic affairs and consecrations by correspondence are conducted in the Vatican. A number of the important Roman Congregations hold regular or special sessions in the Vatican. This concentration of administrative affairs in the Vatican inevitably follows the residence of the Pope there.

Hamilton); Pistolesi, "Il Vaticano" (drito ed illustrato); Sladen, "How to See the Vatican," one of the best modern works in English; Potter, "The Art of the Vatican"; Murray, "Handbook to Rome"; Baumgarten, "Vatican," in "The Catholic Encyclopedia"; Kuhn, "Roma."
VAUBAN — VAUGHAN

diction is immediate in all churches — that is, he is the universal ordinary, the actual bishop of every see (all other bishops being merely high priests); or the bishop of a diocese, or merely appellate authority — so that in questions not of faith and morals alone, but of discipline and government also, all the faithful, of whatever rite or dignity, both pastors and laity, are bound, individually and collectively, to submit themselves thereto; (4) that it is unlawful to appeal from the judgments of the Roman pontiffs to an ecumenical council, as though to a higher authority; and (5) that the Roman pontiff, when he speaks ex cathedra and defines a doctrine of faith or morals to be held by the universal Church, is infallible, and such definitions are accordingly irrefutable of themselves, and not from the consent of the Church.

This document was voted upon, 13 July 1870. Of the 671 members present 451 voted directly in the affirmative, 62 voted placet justa modum, signifying approval with certain changes of expression, and 88 voted non-placet, but objected not to the essence of the dogma, but to the time — one of great agitation in the political world — as inopportune for declaring it. After discussion the newly-defined dogma was adopted at a public session, held 18 July 1870, when 535 voted in the affirmative and only two, the bishops of Ajaccio and Little Rock, Ark, answered "non-placet," these afterward joining in unanimous adoption. The Pope confirmed the action of the council by the bull Quo primum on 27 Oct. 1870. The dogma was formally prorogued, instead of being dissolved. It is, therefore, technically still in existence. The year in which papal infallibility was declared to be a dogma of Roman Catholic faith witnessed the downfall of the Pope's temporal power, the Italian government having taken possession of Rome, 20 Sept. 1870, and Rome being proclaimed the capital of Italy, 9 Oct. 1870. See CATHOLIC CHURCH; PAPACY, and consult Arthur, William, 'The Pope, the Kings and the People' (London 1903); Fessler, Joseph, 'Das vatikanische Concilium, dessen äussere Bedeutung und innere Verlauf' (2d ed., Vienna 1871); Friedericke, J., 'Geschichte des vatikanischen Konzils' (3 vols., Bonn 1873); Muir, Frank H. E., 'The Tragic Story of the Vatican Council' (London 1877); and 'Acta et Decreta Concilii Vaticani' (Freiburg 1892).

VAUBAN, voo-ban, Sebastien le Prestre, SIEGNER DE, marshal of France, military engineer: b. Saint Léger de Towcherets, near Avallon, Burgundy, 1 May 1633; d. Paris, 30 March 1707. He early entered the army, where his uncommon talents and genius for fortification soon became known, and were signalized in various successive sieges. He was intrusted by his approach by parallels at the siege of Maestricht (1673), and distinguished himself at Oudenarde, Valenciennes and Cambrai. He rose to the highest military rank by his merit and services, and was made governor of the citadel of jille in 1668 and commissioner-general of fortifications in 1667. He was made marshal of France in 1703. As an engineer he carried the art of fortifying, attacking and defending towns to a degree of perfection unknown before his time. He fortified above 300 ancient citadels, erected 33 new ones and had the principal management and direction of 53 sieges. Among the principal places fortified by him are the ports of Dunkirk and the citadels of a removal of Metz and Strassburg, etc.

He was the inventor of the socket bayonet and ricochet batteries.

VAUCUSE, France, a department in the southeast of the republic, famous for its wines and silks; paper and chemicals are also manufactured. The chief towns are Apt, Carpentras, Orange and Vaison. The climate is mild and delightful. Pop. (1918 est.) 250,000.

VAUDEVILLE, a form of dramatic representation in which songs and dances are interspersed with dialogue. The name is a corruption of the French Vau de Vire, a picturesque locality in Normandy, where a number of popular humorous songs were written in the 15th century. Consult Gasti, 'Les vau de vire de Jean le Hauz' (Paris 1875).

VAUDREUIL DE CAVAGNAL, Pierre Francois de Rigaud, MARQUIS DE, French soldier and colonial administrator: b. 1704; d. 1772. As an officer of the French colonial army in New France (Canada) he came into prominence in 1746, when with French and Indian troops he captured Port Massachusetts, at North Adams, Berkshire County, Mass., the site and ruins of which are among the city's historical features. Later he was appointed governor and lieutenant-general for the king of New France and of the territory of Louisiana. Consult 'Letters du Marquis de Vaudreuil au Chevalier de Lévis, 1756-1760' (Quebec 1895).

VAUGHAN, Bernard, English Catholic priest: b. Herefordshire, 20 Aug. 1847. He was educated at Stonyhurst, became a member of the Society of Jesus and for years played a conspicuous part in the life of Manchester. In 1901 he went to London to work among the poor of the East End and organized bazaars for the erection of clubs for the working classes. In 1906 he drew the audience by a series of sermons on the "Sins of Society" which was followed (1907) by a Lenten course on the "Sins of Society gauged by the Passion of Christ." In 1910 he toured the United States, Canada and Alaska and went to Japan where he lectured before the Imperial University of Tokio and addressed the House of Peers and ladies of society. He also lectured in China and in Italy and France. He was chosen English preacher at the Marian Congress in Rome (1894) and preached before King Edward VII when Prince of Wales (1902). He became chaplain to the Catholic troops of the British expeditionary forces in France during the late war. His publications include: 'The Roman Claims'; 'Faith and Reason'; 'The Triple Alliance'; 'The Demon of Drink in the Temple of God'; 'The Sins of Society' (1906); 'Society, Sin and the Savior' (1907); 'Life Lessons from Joan of Arc, the Matchless Maid' (1910); 'Socialism' (1910); 'The Our Father Our Country's need to-day' (1911); 'Socialism from the Christian Standpoint' (1913); 'The Menace of the Empty Cradle' (1917); 'The Worker's Right to Live' (1918).
VAUGHAN

educated under Arnold at Rugby, and at Trinity College, Cambridge, took holy orders in 1841, and was successively vicar of Saint Martins, Leicester (1841-44), head-master of Harrow (1844-59), vicar of Doncaster (1860-69), master of the Temple School at Ilford from 1879. While at Harrow he did much toward increasing the efficiency of that school, and as master of the Temple became known for pupil eloquence and was conspicuous as one of the leaders of the Broad Church party. He married a sister of Dean A. P. Stanley (q.v.). Among his 40 or more published volumes are 'Harrow'; 'Temple'; and 'University Sermons'; 'Commentaries on Acts, Revelations, Philippians'; 'Family Prayers'; 'Discourses on Liturgy and Worship'; 'Addresses to Young Clergymen'; 'The School of Life.'

VAUGHAN, George Tully, American surgeon: b. Arrington, Nelson County, Va., 27 June 1859. He was educated at the Kenmore University High School, Amherst, Va. (1873-76); he then graduated with the degree of M.D. from the University of Virginia, and from Bellevue Hospital Medical College, New York, after which he took post-graduate courses in the Polytechnic, the University of Berlin, Germany, and the Jefferson Medical College, Philadelphia. He was appointed assistant surgeon in the United States Marine Hospital Service in 1888; surgeon in 1900 and assistant surgeon-general in 1902. During the war with Spain he served as major and brigade surgeon of the Seventh army corps. Since 1897 he has been professor of surgery in Georgetown University, Washington; surgeon to Georgetown University, Emergency and Saint Elizabeth hospitals; and from 1902 has been assistant surgeon of the United States Public Health and Marine Hospital Service. He has written 'Principles and Practice of Surgery' (1903).

VAUGHAN, Henry, Welsh poet: b. Newton, parish of Llansaintraed, Breconshire, 17 April 1622; d. there, 23 April 1695. He was styled 'The Silurist,' because his native region was among the Silures, or folk of South Wales. He was educated at Jesus College, Oxford, and practised medicine with much success and reputation; he visited Brecon and later at Newton. He was imprisoned for his loyalty at the Revolution, and he was present at the battle of Rowton Heath—as surgeon with the royalist army. His first volume was 'Poems with the Tenth Satyre of Juvenal Englished'—a free rendering (1646); followed by 'Olir Icansus'—'Swan of the Usk' (1651), the chief portion of the volume being a eulogy of that river. Thereafter his verse took on a predominantly religious and devotional cast and grew more improved in poetical quality. In 1650 appeared the first part of 'Silex Scintillans'—'Sparks from the Flint,' described in its sub-title as made up of "sacred poems and private ejaculations," and completed in 1655 by the addition of a second part containing what are probably his best-known stanzas—"They are all gone into the world of light." One J. W. collected (1678) various elegies, translations and other poems from Vaughan, and in 1756 published 'The Mount of Olives' (1652), a work of devotion. He abounds in occasionally felicitous phrases and lines—like, as he said, "un-

anticipated sparks from a flinty ground." A few of his poems have been given by critics a very high place in literature. He was practically unknown until H. F. Lyte edited the sacred poems in 1847. A complete edition of his works was that of Andrew of Lieven at the University of Chambers (1896). Consult the memoirs in these editions; also the essay in Brown, 'Horne Subsecive' (Series 1, 1858).

VAUGHAN, Herbert, English Roman Catholic prelate: b. Gloucester, 15 April 1832; d. London, 20 June 1903. He was educated at Stonyhurst College and on the Continent; was ordained to the priesthood in 1854; founded Saint Joseph's College for foreign missions at Mill Hill, Hendon; visited Maryland as a missionary to the negroes; and in 1872 was consecrated bishop of Salford. On Manning's death he was appointed (1892) archbishop of Westminster, and shortly afterward was made cardinal. He was a preacher of much eloquence, and proprietor of the Dublin Review and the Tablet. He displayed a marked interest in the temperance cause and in commercial education among Roman Catholics, building for this latter purpose Saint Bede's College.

VAUGHAN, John Stephen, English Catholic bishop, brother of Bernard and Herbert Vaughan: b. Courtfield, 21 January 1833; d. January 1891. He was educated at Saint Gregory's College, at the Collegio Inglese, Rome, and at the Grand Seminaire, Bruges. He became a priest in 1876, sailed to Australia where he did missionary work for three years, then returned to London where he took up parochial tasks. He was canon of Westminster (1898), delivered free Catholic lectures in the public halls of London (1890-93), resided in Rome as domestic prelate (1904-07) and then went on a lecture tour to the United States and in 1909 was created bishop of Manchester. While working in London, in addition to preaching he gave spiritual retreats to seminarians and to the clergy both in England and Ireland and in the United States. His writings are various and have been translated into several languages. They include 'Life after death'; 'Thoughts for all times'; 'Faith and fancy'; 'Concerning the Holy Bible'; 'Dangers of the Day'; 'The Purpose of the Papacy'; 'Happiness and beauty'; and 'Time or Eternity.'

VAUGHAN, Robert, English clergyman and historian: b. 1795; d. Torquay, 15 June 1868. He was professor of history in London University; and in 1842 became president of the Lancaster Independent College at Manchester, remaining in that position until 1857. He also founded the British Quarterly Review and for 20 years was its editor. Among the more important of his works are 'Life of John de Wycliffe' (1828); 'The Protest of the Church well' (1838); 'History of England Under the House of Stuart' (1845); 'The Age of Great Cities' (1842); 'Revolutions in English History' (1859-60).

VAUGHAN, Thomas Wayland, American geologist: b. Jonesville, Texas, 20 September 1870. After graduating from Tulane University in 1889, and from Harvard University in 1893, he went to Europe, studying in the museums. He engaged in geological and paleontological researches, making a specialty of tertiary geology,

VAUGHAN, Victor Clarence, American physician, scientist and educator: b. Mount Airy, Mo., 27 Oct. 1851. He was educated at Central and Mount Pleasant colleges, Missouri, and at the universities of Michigan and Berlin. He was appointed instructor in the University of Michigan in 1876, made professor in 1880 and dean of the Medical School in 1881. As an educator he developed the combined collegiate and medical course which was first formulated and given in the University of Michigan in 1890 and has since been adopted by the majority of university medical schools in the United States. He has always advocated a broad fundamental training in language, including Latin, Greek, French and German, history, mathematics and the sciences, biology, physics and chemistry; and the acquisition of professional and expert knowledge based-upon these fundamentals. His research studies have been devoted largely to the chemistry of bacteria and other proteins. He has shown that all proteins, bacterial, vegetable and animal, contain within their molecular structure poisonous groups, with properties quite similar in physiological effects and in their application to chemistry. His contributions to science cover about 200 titles in American and European publications. He has been president of the Association of American Physicians and the American Medical Association, and is a member of the American Philosophical Association, the National Academy of Sciences and honorary member of the French and Hungarian Societies of Hygiene. He served as division surgeon in the Cuban campaign in 1898 and was recommended for brevet-colonel by President McKinley for behavior in the battle of Santiago. With Reed and Shakespeare he studied the causes of typhoid in the camps in Cuba. At the end of the campaign he was divided to the important position of medical officer of the United States Army Medical Department in Cuba. He records his reminiscences in "Seventy Years of Life in the Victorian Era."

VAUGHN'S HILL, Engagement at. On 18 March 1863 Col. A. S. Hall, with a brigade of Union infantry of 1,300 men and two guns, was sent from Murfreesboro to look after Gen. John H. Morgan, who was raiding the country to the northeast. Beyond Simpsonville, Hall ran into the Confederate skirmishers, and these, being pressed back, disclosed Confederate cavalry in position. Learning also that Morgan, with a large force, was preparing to attack him, Hall fell back to Vaughn's Hill, a steep cedarwooded height, near Milton, about 13 miles from Murfreesboro. He was closely followed by Morgan with about 2,500 men and a battery of artillery, who made an attack at 11.30 A.M. on the 20th. Before Hall had fairly taken position, Morgan's larger numbers permitted him to attack both Hall's flanks and rear, but he could gain no further advantage, and after an engagement of nearly four hours, in which he was several times repulsed, he finally withdrew, leaving his dead and many wounded on the field. His loss was 30 killed and 150 wounded, the loss in officers being very heavy. The Union loss was six killed, 42 wounded and eight missing. Consult 'Official Records' (Vol. XXIII).

VAULT, an arched-covered enclosure, hence frequently used to express the arched ceiling or roof, as of a hall, room, cellar or other compartment or edifice. In a still further extension the term vault is frequently used as synonymous with a subterranean compartment, as a crypt, cellar, etc. In architecture it must be noted that vaults are ceilings not roofs, as those below ground (crypts, etc.) carry the floor above and even in the case of naves and aisles of churches the vaulting may carry a solid masonry roof, as in Milan Cathedral and the Romanesque buildings of southern France. While the art of vault construction dates back to unknown origins and the Romans excelled in the art, it was in the Middle Ages that architecture took up serious work of creating its decoration in the actual construction itself, and vaulting was the greatest problem of the architect in his construction. The early Christian basilica, from its pegan prototype, had at the far end of its flat roof a half dome or demi-hemisphere (apse). In Romanesque architecture (say 11th century to middle 12th century) the naves and aisles of the church edifices were covered, in sequence, with the following styles: First the cupola (domical), next the tunnel vault, then the groined vault. Out of the latter developed the "ribbed," and the Gothic era in vaulting arose.

Technique.—Various authorities divide vaults into two classes as to their construction: Solid and Ribbed, and, as to form, into Simple and Compound. Solid are those having unbroken surfaces whereas the ribbed refer to those with variegated inner surface planes. Simple are those vaults composed of an unchanged form of archway throughout. Compound vaults are those broken up by intersecting arches. A simple vault is the cylindrical, termed barrel, tunnel, or wagon vault, a mere arch extended in its axis to roof over
Vault

a compartment or other space. The tunnel or barrel is the commonest in use and has usually a semi-circular cross section and the inner or "vaulting surface" (intrados) has the form of a portion of a hollow cylinder. (Fig. 1). Barrel vaults may, however, have cross sections semi-elliptical, segmental, pointed, three centred, etc. Barrel vaults date back at least to 800 B.C. as found in the pyramids at Menec and at Nimrud. In the case of the aisles of church build-

ings a "half-barrel" vault is frequently used having a 45 degrees segment of a circle. (Fig. 2). Another simple vault is a skew arch which has been described as a barrel vault whose ends are in parallel planes oblique to the axis and whose joints are spirals. The annular vault also belongs to the simple series. This has its axis curved; its intrados, therefore, is a portion of a cylindrical or hollow ring. The spiral vault also belongs here, and is an annular vault with spiral axis; used for supporting winding stairs, etc. Still another kind belonging to this category is the expanding vault; these are smaller at one end than the other and the inner surface diminishing has a form of part of a truncated cone or elongated tunnel. Such are found in Romanesque style buildings to form pendentives (Fig. 3) to assist in reducing a square to an octagon and may occur as parts of compound vaults. Compound vaults are, as before stated, simple vaults intersecting one another. (Fig. 4). They usually are termed groin vaults on account of the groin angle which the two surfaces produce at their juncture. These compound vaults may be divided into: quadripartite (four-part), oblique, irregular, etc. The quadripartite form is evolved from two barrel vaults intersecting. (Fig. 4). In covering a square compartment it is the common groin vault; in domical vaults, it is the so-called "cloistered arch" or square dome, etc. Covering oblong compartments of such we have, among others, the "Welsh" or "under-pitch" vaults (Fig. 5) with the surface parts cylindrical usually and the groin line becomes a hyperbola. In the square compartment it also comes the "stilted" vault composed of cylindrical vaults but with the transverse narrower than the main and springing from a higher level, causing the groin line to assume a double curve. They are found frequently covering Roman halls and baths and appear in French Romanesque. Oblique vaults can occur with straight axes composed of equal or unequal barrel vaults; with an annular vault intersected by a conical vault, or by an underpitch vault. (Fig. 5). Irregular vaults are those in this category which do not conform to any regular geometrical shape. This section is subdivided into tripartite and polygonal, according to whether, in the first case, they cover a triangular space caused, for instance, from the intersection of three barrel or three expanding vaults; or, in the polygonal case, whether they...

2. Transition Romanesque-Gothic
3. Transition Romanesque-Gothic
4. Early Gothic
cover octagonal, decagonal, etc., rooms. Fan-tracery vaulting is a solid variety common in the Later Gothic period. It contains no ribs in the construction (see Ribbed Vaulting Gothic), but the surfaces are covered ornamentally with mullions and tracery bars enclosing panels. Saint George's Chapel, Windsor, England, is a fine example. Fan-tracery vaults can be subdivided into pyramidoidal and conoidal. In the former case two halves of an inverted concave pyramidoid are set opposite each other, their bases forming the ridge of the arch. The conoidal class, as its name implies, is of circular section not having angles as do the pyramidoids. Pyramidoids and conoids are called sometimes pendentives. (See Fig. 3). In Rib vaulting the surfaces are outlined into panels by a rib structure or raised frame-work. Originally the ribbing was first constructed separately, then the panel filled in and supported by the ribs. Frequently in later work the ribbing is a purely ornamental addition. The rib, therefore, takes the place of the groin. And this new method of vault construction inaugurates the Gothic period. In the 12th century Gothic the former style of apse vaulting (hemispherical) gave way to the chevet vault in which the masonry courses run perpendicularly, instead of horizontally, from radiating ribs having a common keystone. These run to a wall rib or line over the heads of the apse windows.

Historical.— Tunnel vaulting has been used at least since the Egyptian period to the Carolingian Empire days. The dome vault (cupola) is characteristic of the Byzantine architecture. In the Romanesque period (early 11th to middle 12th century) the naves and aisles of churches had three main forms of vaulting: the dome, the tunnel and the groin. And, as before stated, with the ribbed vault we enter the Gothic era. The dome had for its support pendentives, either the spherical or the "squinch" (see Fig. 6) or the "trumpet" arch. While there have been spherical pendentives found in Byzantine architecture it was in the 6th century that this system of vaulting was used first largely. But

![Fig. 6.—Squinch Arch.](image)

the squinch is found in Roman architecture early as about 138 A.D. (Villa Adriana at Tivoli). The squinch which is a lintel, corbel or arch built into and projecting from the interior corner of two walls, was used in the Byzantine period along with the pendentive to support the dome. The spherical pendentive is found as dome support for the Romanesque period. There are a few naves of Romanesque churches found consisting of domes supported on squinches (Notre Dame at Le Puy is a noted example) dating from 11th to 12th century. But such are of Byzantine influence and the dome passes out as vaulting medium in the Romanesque while the tunnel vault comes into play, not as before with the Romans as culverts, drains, etc., but for vaulting the ceilings of

![Romanesque, Showing Pendentives Supporting the Domes of the Vaulting.](image)

naves and aisles of stately Romanesque churches. There are four major schools of Romanesque tunnel-vaulted churches in France: Provence, Poitou, Auvergne and Burgundy (11th and part of 12th century). But with Poitou we come to tunnel-vaulted naves and

![Carolingian Vaulting. Anterior to 9th Century.](image)
groined vaults for aisles. In the Auvergne school we find the triforium has half-barrel vaulting. In the side aisles of the Burgundy school are, usually, groined vaults, some of slightly domical form. The nave arcade structural arches are pointed but the nave has a tunnel vault its entire length. Other Romanesque style churches have transverse tunnel vaults to replace those running longitudinally either in the nave or aisles; some have transverse tunnel vaults over the aisles. A few Romanesque churches have groined vaulting over the nave though it is mostly restricted to the aisle bays. But the heavy, massive Romanesque construction was greatly transformed by the introduction of ribs and brought about the rectangular plan. In the second half of the 12th century we find the beginning of the Early Gothic evolving from the Romanesque; this phase is known as the Transition period. The Gothic (see Architecture) arch is "pointed" hence we find in the Transition vaulting the pointed arch with its moldings decorated with Romanesque motifs. Renaissance vaulting. This style retained all the Gothic essentials but made the arch elliptic or depressed. The arches are multiplied and often are adorned with cul-de-lampes and pendants (Fig. 7) hanging often like stalactites from the vaulting. In later Renaissance architecture the churches are frequently built in the form of large, single chambers and ceiling with barrel vaulting, in which cases deeply recessed chapels between strong piers were introduced into the side walls, and above these the vault was pierced and lighted by lunettes. Decoration. The Romans gave the barrel vault a rich decorative appearance by means of a bold cornice. With lines and cross-bands they then divided the vault surface into bays (similar to the later coffers)
or compartments each having a flower box as its central ornament. These coffers are frequently finely molded if the rooms were built in 16th century. In the Renaissance barrel-vaulted rooms the richly molded coffers are frequently of slight depth. In the later Renaissance period the roof was constructed of barrel vaulting and it received divisions of flat bands continuing from the pilasters on the walls, the divided spaces being given plastic decoration or sometimes receiving painting. The dome vault was beautifully decorated in several manners. That of the old Pantheon at Rome received majestic sedate ornament by enframing it in five horizontal rings or zones each containing 28 coffers, which were surrounded with rich listsels of foliage and, as centres, rosettes of bronze. Looking upward in the direction of the opening in the centre the general impression is that the zones are of equal width but, in reality, they diminish all the way up as, of course, the square coffers being of same number in a smaller circle had to be smaller in proportion to the diminution of the space which they occupied. In the case of the temple of Minerva Medica, Rome, the dome is closed on top and the lighting is done by means of the circle of windows piercing the structure above the semi-circular arch.

CLMENT W. COUMBE.

VAUQUELIN, vøk-kə-län, Louis Nicolas, French chemist: b. near Caen Normandy, 16 May 1763; d. 14 Nov. 1829. He studied pharmacy and became known to Fourcroy, who presently made him his assistant in his philosophical researches and lectures. After being chief pharmacutist in the military hospital at Melun in 1793, he was appointed inspector and professor of docimacy in the mining school at Paris and then assistant professor of chemistry in the polytechnic school and a member of the French Institute. He succeeded Darcet in the chair of chemistry at the College of France, and, resigning his inspectorship of mines, became director of the school of pharmacy just established by the government. On the death of Brongniart he received the professorship of chemistry in the Jardin des Plantes and succeeded Fourcroy in the same capacity in the faculty of medicine. He had remarkable talents for analysis; his discoveries, among which those of chromium and glucina deserve special notice, have been useful in various branches of art and science. His ‘Manuel de l’essayeur’ (1812) has been superseded, but his ‘Mémoires’ amounting to more than 250 in number and printed in the Annales de chimie, the Journal des mines, the Annales du musée, and the Recueil de l’académie des sciences, in spite of the fact that they are still valuable.

VAUTIER, vō-tē-ă, Benjamin, Swiss painter: b. Morges, on the Lake of Geneva, 24 April 1829; d. 1898. He began his art training at Geneva and for some years earned his living as an enamel on metal ornaments. In 1852 he joined the classes of R. L. Boch at Düsseldorf and began his study of peasant life in the highlands of Bern. In 1856 he went to Paris and on his return to Düsseldorf produced the first of his Bernese pictures ‘The Interior of a Swiss Village Church, with Worshippers.’ From that time he gradually gained the reputation of one of the first Swiss genre painters, a series of pictures in which he portrayed scenes from peasant life not only in Switzerland but in Swabia and Bavaria. His works are all distinguished by faultless drawing; robust individuality; vividness in the delineation of local and national types, and they are, moreover, as is natural to the subjects treated of, brimful of delight. As a Swiss Vautier is master of harmony and his composition is graceful and dramatic. Among the finest and most popular of his works may be mentioned ‘Card-playing Peasants Surprised by their Wives’; ‘Sunday in the Campground at Swabia’; ‘Toasting the Bride’; ‘Country Funeral’; ‘Black Peter’, etc. He was also successful as an illustrator of books and his designs for Immerman’s ‘Oberhof’, Ambruck’s ‘Buées’ and for ‘Harz und Dorothea’ are very fine and have been much admired. Consult Rosenberg, ‘Benjamin Vautier’ (1897).

VAUVENARGUES, vō-vən-ąrzh, Luc de Clapier, MARQUIS DE, French moral philosopher: b. Aix, Provence, 6 Aug. 1715; d. Paris, 28 May 1747. He entered the army in 1733, but resigned with broken health at 27. As a philosopher he inclines to the Stoic school and his work was warmly praised by Voltaire, of whom he was a friend; but popular appreciation of his writings came only after his death. He wrote ‘Introduction to a Knowledge of the Human Mind’ (1746), followed by ‘Reflections’ and ‘Maxims,’ Consult Paléologue, ‘Vauvenargues’ (1890).

VAUX, váks, Calvert, American landscape architect: b. London, 20 Dec. 1824; d. Bensonhurst, L. I., 19 Nov. 1895. He was educated in London and in 1848 came to the United States as the assistant of A. J. Downing, the celebrated American landscape designer, whose partner he became in 1851. He assisted in laying out the grounds surrounding the Capitol and Smithsonian Institution at Washington and in partnership with F. L. Olmsted (q.v.), he laid out Central Park in New York. In 1865 his design for Prospect Park, Brooklyn, was accepted and he was subsequently engaged with Mr. Olmsted in laying out parks in Chicago, Buffalo, the State reservation at Niagara Falls and at other cities and towns throughout the United States. They laid out hundreds of parks and public buildings. To him is due credit for the artistic and original treatment of the transverse roads
VAUX — VECTOR ANALYSIS

in Central Park. He wrote 'Villas and Cottages' (1857).

VAUX, Richard, American lawyer; b. Philadelphia, Pa., 19 Dec. 1816; d. there, 22 March 1895. He was admitted to the bar in 1836, soon after he was sent as bearer of despatches to the United States Minister in London and on his arrival there was appointed secretary of the legation. In the following year he went to Brussels to assist in managing the United States embassy there and later returned to London where he was appointed private secretary to the United States Minister, Andrew Stevenson. He returned to the United States in 1839, was recorder of deeds at Philadelphia in 1842-49. In 1843 he was appointed inspector of the State prison and was also elected comptroller of the public schools, thus occupying three important public offices at the same time. He was elected mayor of Philadelphia in 1855, became president of the board of directors of Girard College in 1859, was largely instrumental in securing, in 1885, the present charter of Philadelphia, and in 1890 was elected to Congress. He published 'Report of the Board of Directors of Girard College' (1845) and 'Patriots of the Penitentiary' (4 vols., 1842 et seq.).

VAUX, Thomas,Loan, English poet; b. Harrowden, England, 1510; d. October 1556. He was educated at Cambridge, succeeded to the barony at 13 and accompanied Cardinal Wolsey on his embassy to France in 1527. In 1530 he took his seat in the House of Lords, attended Henry VIII to Calais and Boulogne in 1532 and in 1533 was created Knight of the Bath and appointed captain of the Island of Jersey, an office he resigned in 1536. He occupied his seat in the House of Lords until 1555. Such of his verse as survives consists in the main of lyrics, which were much admired in their day. In 'The Paradox of Daynty Deives' appear several of his poems, the best of which, 'The Aged Lover renounche Love' and 'The Assault of Cupid' were previously published in Tottin's Miscellany (1557).

VAUXHALL (vāks'hāl) GARDENS, in London, formerly a fashionable place of entertainment and summer resort situated near the Thames in the parish of Lambeth, about one and one-half miles from Westminster Bridge. They were removed about 1860 and built over.

VAVASOUR, or VALVASSOR, in feudal times, a person of rank next below a baron; one who held his lands not from the Crown but of one of the higher nobility. See FEUDALISM.

VAWTER, Charles Erastus, American educator; b. Monroe County, W. Va., 9 June 1841; d. 27 Oct. 1905. He served in the Confederate army in 1861-65, obtaining a captancy in the Stonewall brigade; was graduated from Emory and Henry College (Emory, Va.) in 1866; studied also at the University of Virginia (Charlottesville); and was professor of mathematics at Emory and Henry from 1868 to 1878. In 1878 he became superintendent of the Miller Manual Labor School at Albemarle, Va. He was considered an authority on manual training.

VAYU, in the Hindu mythology, is the name of the genius of the air. Though thought of as a single personality he is a deified personification of the wind in the Vedic mythology, while in the Puranic mythology he fills only a sub-ordinate place. The legend assigns to him the paternity of the monkey god Hanuman and he also is regent of the northwest. In the Rig-Veda he is described as a real person who may be invited to partake of oblations.

VEADER, ve'dér, or VEADEER, an additional or supplementary month of the Jews, added sometimes after the third, sometimes after the second sacred year, care being taken that the seventh year should have no such month appended to Adar.

VEBLEN, Thorstein B., American publicist. He was graduated at Carleton College, Minn., in 1880, studied later at Johns Hopkins, Yale, Cornell and Chicago, was instructor in political economy at the University of Chicago 1890-1900, and professor of the same there until 1906; Stanford University until 1910, and the University of Missouri since then. He has been editor of The Journal of Political Economy and has published 'The Theory of the Leisure Class' (1899); 'The Theory of Business Enterprise' (1904); 'The Instinct of Workmanship' (1914); 'Imperial Germany and the Industrial Revolution' (1915); also a number of papers in various journals.

VECCHI, veke'che, Augustus Victor, Italian naval writer; b. Marseille, 26 Feb. 1843. He was educated in the Royal Naval School at Genoa, rose to be lieutenant in the naval service (1866), and resigned in 1872. He published on naval subjects several works of history and fiction using the pen-name of Pietro Villa, including: 'Gli Ordini della Marina' (1877); 'Sagge Storiche di Marinha' (1877); 'Leggende di Mare' (1879); 'La Fuga dei Greci in Sicilia' (1880); 'La Vita e le Gestì del Generale G. Garibaldi' (1882); 'Il Genio di Banna' (1889); 'Bozetti di Mare' (1897); 'Memorie di un Ufficiale di Marina' (1897); 'L'Italia Marinare o il Lido della Patria' (1899). Vecchi was among the promoters of the Italian navy league (La Lega Navale).

VECTOR, in mathematics. See MATHEMATICS; VECTOR ANALYSIS.

VECTOR ANALYSIS. 1. A quantity which is related to a definite direction in space is called a vector quantity, e.g., the displacement of a point, velocity, force, axis of rotation, electrical current; a quantity having no reference to direction is called a scalar quantity, e.g., mass, volume, time, energy, electric charge. A vector quantity can be represented by a line segment if (1) the length of the segment is taken to represent on an assigned scale the magnitude of the quantity; (2) the segment is placed in the proper direction; and (3) be given an arrowhead showing in which of the two opposite senses it is regarded as pointing. Such a directed line segment is called a vector. By the concordance of university terminology the vector AB may be regarded as the operator which carries a moving point from A to B, and is represented by an arrow reaching from its initial to its terminal point. (Bold face type is used for vectors.)

2. Equal Vectors.—The vectors AB and CD are said to be equal when the segments AB and CD are equal and parallel, and the arrow heads from A to B and from C to D point in the same sense. If AB and CD are equal and parallel, but the arrow heads are in opposite senses we say that $AB = -CD$. 
of three or more vectors. In any closed polygon ABCDE we have \( \mathbf{AB} + \mathbf{BC} + \mathbf{CD} + \mathbf{DE} = \mathbf{AE} \) and \( \mathbf{AB} + \mathbf{BC} + \mathbf{CD} + \mathbf{DE} + \mathbf{EA} = \mathbf{AA} = 0 \) whether the vertices are in one plane or not.

The difference of two vectors is the sum of the first and the opposite of the second, that is \( \mathbf{a} - \mathbf{b} = \mathbf{a} + (-\mathbf{b}) \).

4. Resolution of Vectors.—Vectors are called coplanar when they are parallel to the same plane. Any vector \( \mathbf{r} \), coplanar with two non-parallel vectors \( \mathbf{a} \) and \( \mathbf{b} \), can be resolved into two components parallel to \( \mathbf{a} \) and \( \mathbf{b} \), by constructing a parallelogram whose diagonal is \( \mathbf{r} \) and whose sides are parallel to \( \mathbf{a} \) and \( \mathbf{b} \); hence \( \mathbf{r} \) can be expressed in the form \( \mathbf{r} = x\mathbf{a} + y\mathbf{b} \), where \( x \) and \( y \) are scalar numbers expressing the ratios of the two component vectors to the parallel vectors \( \mathbf{a} \) and \( \mathbf{b} \). Similarly by constructing a parallelepiped, \( \mathbf{r} \) may be resolved into three components parallel to three given non-coplanar vectors \( \mathbf{a}, \mathbf{b}, \mathbf{c} \), in the form \( \mathbf{r} = x\mathbf{a} + y\mathbf{b} + z\mathbf{c} \).

It is usual to take instead of \( \mathbf{a}, \mathbf{b}, \mathbf{c} \), three vectors \( i, j, k \) of unit length along three rectangular axes \( \mathbf{OX}, \mathbf{OY}, \mathbf{OZ} \), then \( \mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k} \), where \( x, y, z \) are the co-ordinates of the terminal point of \( \mathbf{r} \), its initial point being at \( O \). The axes are usually taken to form a right-handed system, positive rotation about \( \mathbf{OX}, \mathbf{OY} \), and \( \mathbf{OZ} \) respectively carrying \( \mathbf{OY} \) to \( \mathbf{OZ} \), \( \mathbf{OZ} \) to \( \mathbf{OX} \), and \( \mathbf{OX} \) to \( \mathbf{OY} \).

5. Conditions for Equality.—A vector equation \( \mathbf{r} = \mathbf{r}' \), that is, \( x\mathbf{a} + y\mathbf{b} + z\mathbf{c} = x'\mathbf{a} + y'\mathbf{b} + z'\mathbf{c} \), where \( a, b, c \) are non-coplanar, necessitates the three scalar equations \( x = x', y = y', z = z' \). In two dimensions, the equation \( x\mathbf{a} + y\mathbf{b} = x'\mathbf{a} + y'\mathbf{b} \), where \( a \) and \( b \) are not parallel, necessitates the two scalar equations \( x = x', y = y' \).

6. Vector of a Point.—The position of a point \( A \) may be defined by means of its vector \( \mathbf{OA} = \mathbf{a} \), drawn from a fixed origin, and \( A \) may be called the point whose vector is \( \mathbf{a} \), or the point \( a \). The indefinite line \( AB \) is denoted by \( (a, b) \). The vector \( \mathbf{AB} \) equals \( b - a \), that is, terminal vector minus initial vector; similarly \( \mathbf{BA} \) equals \( a - b \).

7. Vector Equation of a Line.—Let \( OP = r \) be the vector of a running point on the line \( (a, b) \); then since \( OP = \mathbf{OA} + AP \) and \( AP = \mathbf{r} \mathbf{AB} \), where \( x \) is the scalar expressing the ratio of \( AP \) to \( AB \), hence \( r = a + x \) \( (b - a) \). This equation gives the vector of \( P \) in terms of a varying scalar \( x \).

---

Example 1.—If the segment \( (a, b) \) is divided as \( m_1, m_2 \), the vector of \( P \) is \( \frac{m_1 \mathbf{a} + m_2 \mathbf{b}}{m_1 + m_2} \).

Example 2.—If masses \( m_1, m_2 \) are placed at \( a_1, a_2 \), their centre of gravity is \( \frac{m_1 \mathbf{a}_1 + m_2 \mathbf{a}_2}{m_1 + m_2} \). Extend this to three masses \( m_1, m_2, m_3 \) at \( a_1, a_2, a_3 \).

Example 3.—The medians of a triangle intersect each other. Take the origin at one vertex \( O \), and let the other vertices be \( a, b, \) then \( 2a + 2b \) are mid-points, hence the equations of two medians are \( r = a + x \) \( (b - a) \), \( r = b + y \) \( (a - b) \). Making these equations simultaneous and equating coefficients of \( a \) and \( b \), respectively \( s \), we get \( 1 - x = y \), \( x = 1 - y \), whence \( x = 1, y = 0 \).

8. Rotor.—A rotor is a vector magnitude restricted to lie in some fixed straight line, called its line of position, or its axis. A rotor is completely specified by its magnitude, direction, sense, and one point on its axis; a familiar example is a force; it can be transferred to any point in its line of action, but cannot be moved out of that line. Another example is a given angular velocity of rotation about a given axis; it can be specified by laying along the axis a segment whose length represents, on a convenient scale, the magnitude of the angular velocity, and which points in the direction from which the rotation appears positive. This special kind of directed segment has given rise to the name rotor for any directed magnitude having an axis. The resultant of any number of rotors (of the same class) whose axes meet in a point \( P \) is found by treating them as ordinary vectors, taking their vector sum and transferring it to the point \( P \). A force \( R \) applied at \( P \) can be resolved into three components parallel to the three axes and acting at \( P \), so that \( \mathbf{R} = R\mathbf{i} \mathbf{j} \mathbf{k} \).

9. Vector of an Area.—A plane area may be regarded as having magnitude and direction (orientation or facing), and can be represented by a vector normal to its plane, of length equal to the area on an assigned scale, and with an arrow pointing toward the side to which the
area is supposed to face. If a given plane area is projected on any other plane, and if the projection is represented by a normal vector, this vector will be the projection of the vector of the given plane area.

10. Vector Sum for Faces of Polyhedron.

The sum of the vectors representing the faces of a closed polyhedron is zero, all of these being supposed to face outwards. For, if we project the entire surface on any plane, the part farthest from the plane projects into an area whose total vector may be represented by \( V \), and the remainder of the surface projects into an area whose total vector is \(-V\), pointing in the opposite direction. Thus the projection of the original vector sum on the normal to the plane is zero; and since this is true for every plane, the original vector sum must itself be zero.

11. Scalar Product.—The scalar product of two vectors is the result obtained by multiplying the product of their lengths by the cosine of the angle between them. It may also be defined as the product of the length of either vector by the projection of the other upon it. The scalar product is denoted by writing the two vectors with a dot between them as \( \mathbf{a} \cdot \mathbf{b} \). This product evidently is commutative, so that \( \mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{a} = ab \cos \theta \), where \( a, b \) are the lengths (or tensors) of the vectors, and \( \theta \) the angle between their directions. If \( m \) and \( n \) are scalars, \( m \mathbf{a} \cdot \mathbf{b} = m(b) \), and \( a \mathbf{a} = a^2 \). If \( \mathbf{a} \) and \( \mathbf{b} \) are at right angles, \( \mathbf{a} \cdot \mathbf{b} = 0 \). The scalar multiplication table for the three fundamental unit vectors \( i, j, k \) is

\[
\begin{array}{ccc}
1 \cdot i = 1j = k \cdot k & = 1 \\
1 \cdot j = 1i = k \cdot k & = 1 \\
1 \cdot k = 1i = 1j = 0
\end{array}
\]

Scalar multiplication is distributive, i.e., \( (\mathbf{a} + \mathbf{b}) \cdot \mathbf{c} = \mathbf{a} \cdot \mathbf{c} + \mathbf{b} \cdot \mathbf{c} \); this follows from the fact that the projection of \( \mathbf{a} + \mathbf{b} \) on the direction of \( \mathbf{c} \) equals the sum of the projections of \( \mathbf{a} \) and \( \mathbf{b} \) on the same direction.

12. Expansion of \( \mathbf{a} \cdot \mathbf{b} \).—If \( \mathbf{a} = a_1i + a_2j + a_3k \), and \( \mathbf{b} = b_1i + b_2j + b_3k \), then, applying the distributive law and the multiplication table, we get

\[
\mathbf{a} \cdot \mathbf{b} = a_1b_1 + a_2b_2 + a_3b_3.
\]

A trigonometrical interpretation is obtained by replacing \( \mathbf{a} \) by \( ab \cos \theta \) dividing by \( ab \), and noticing that

\[
\frac{a_1}{a} = \cos a_1, \quad \frac{a_2}{a} = \cos a_2, \quad \frac{a_3}{a} = \cos a_3,
\]

where \( a_1, a_2, a_3 \) are the direction angles of \( \mathbf{a} \), and \( (a_1, a_2, a_3) \) are those of \( b \). This gives the cosine formula

\[
\cos \theta = \cos a_1 \cos a_2 \cos a_3 + \cos d_1 \cos \beta_1 \cos \gamma_1 + \cos \gamma_2,
\]

As an application to two dimensions, we may take \( \mathbf{c} = \mathbf{a} + \mathbf{b} \) as in the figure, then

\[
\mathbf{c} = \mathbf{a} + \mathbf{b} \times \mathbf{a} = \mathbf{b} \times \mathbf{b} = a^2 + 2ab \cos (\pi - c) + b^2 = a^2 + b^2 - 2ab \cos C,
\]

a fundamental relation in a triangle. For an application to mechanics let \( \mathbf{a}, \mathbf{b}, \mathbf{c} \) represent forces applied at \( O \), and let \( r = \mathbf{b} + \mathbf{c} \). Let \( O \) be displaced to \( P \), and let \( OP = \mathbf{d} \), then \( r = \mathbf{a} + \mathbf{d} + \mathbf{b} + \mathbf{c} \); but \( \mathbf{a} + \mathbf{d} \) is the work done by the force \( \mathbf{a} \) in the displacement \( \mathbf{d} \); hence the work done by a force in any displacement equals the sum of the amounts of work done by its components.

13. Vector Product.—The vector product of \( \mathbf{a} \) and \( \mathbf{b} \) is a third vector normal to the plane of \( \mathbf{a} \) and \( \mathbf{b} \) pointing toward the direction from which rotation from \( \mathbf{a} \) to \( \mathbf{b} \) is seen as positive rotation, and of length equal to \( \mathbf{a} \) \( \mathbf{b} \) \( \sin \theta \), the area of the parallelogram formed by \( \mathbf{a}, \mathbf{b} \). The vector product will be denoted by \( \mathbf{a} \times \mathbf{b} \) after Willard Gibbs, and is read a cross \( \mathbf{b} \). If \( \mathbf{a} \) and \( \mathbf{b} \) are parallel, \( \mathbf{a} \times \mathbf{b} = 0 \), because \( \theta = 0 \); similarly \( \mathbf{a} \times \mathbf{a} = 0 \). The vector \( \mathbf{a} \times \mathbf{b} \) can be conveniently regarded as the area vector (9) of the parallelogram \( \mathbf{a}, \mathbf{b} \), this area being supposed to face toward the side at which rotation from \( \mathbf{a} \) to \( \mathbf{b} \) appears positive. The commutative law does not hold in vector multiplication for \( \mathbf{a} \times \mathbf{b} = -\mathbf{b} \times \mathbf{a} \).

14. Distributive Law.—Vector multiplication is distributive, that is

\[
\mathbf{c} \times (\mathbf{a} + \mathbf{b}) = \mathbf{c} \times \mathbf{a} + \mathbf{c} \times \mathbf{b}.
\]

First suppose that \( \mathbf{c} \) is not coplanar with \( \mathbf{a} \) and \( \mathbf{b} \); and construct a triangular prism having the vectors \( \mathbf{a}, \mathbf{b}, \) and \( \mathbf{a} + \mathbf{b} \) for sides of base, and \( \mathbf{c} \) for the parallel edges. The sum of the area vectors of the faces of the prism is zero (10),

![Figure 5](image_url)

and the vectors of the two opposite bases cancel; but the vectors of the lateral faces pointing outward are \( \mathbf{c} \times (\mathbf{a} + \mathbf{b}) = \mathbf{c} \times \mathbf{a} + \mathbf{c} \times \mathbf{b} \), hence

\[
\mathbf{c} \times (\mathbf{a} + \mathbf{b}) = \mathbf{c} \times \mathbf{a} + \mathbf{c} \times \mathbf{b}.
\]

If \( \mathbf{c} \) happens to be coplanar with \( \mathbf{a} \) and \( \mathbf{b} \) we can resolve it into two which are not coplanar with \( \mathbf{a} \) and \( \mathbf{b} \), apply the preceding result, and then combine. For the fundamental unit vectors \( i, j, k \), the vector multiplication table is

\[
i \times i = j \times k = 0, 
1 \times j = -1 \times i = k, 
k \times j = -k \times i = -i \times k.
\]

15. Expansion of \( \mathbf{a} \cdot \mathbf{b} \).—If \( \mathbf{a} = a_1i + a_2j + a_3k \), \( \mathbf{b} = b_1i + b_2j + b_3k \), then by applying the distributive law, and the table we get \( \mathbf{a} \cdot \mathbf{b} = (a_1b_1 + a_2b_2 + a_3b_3) i + (a_1b_2 + a_2b_1) j + (a_1b_3 + a_3b_1) k \).

There are various interpretations of this result. From it we can easily obtain the three projections of the area of the parallelogram formed by \( \mathbf{a}, \mathbf{b} \); also the directions of its normal; also \( \sin \theta \) in terms of the direction cosines of \( \mathbf{a} \) and \( \mathbf{b} \); also the area of any triangle in terms of the co-ordinates of its vertices.

For an application to plane analytic geometry, suppose \( \mathbf{a} \) and \( \mathbf{b} \) both lie in the \( xy \)-plane, then \( a_3 = 0 \), \( b_3 = 0 \), and \( \mathbf{a} \cdot \mathbf{b} = (a_1b_1 + a_2b_2) i + (a_1b_2 + a_2b_1) j + (a_1b_3 + a_3b_1) k \); this gives twice the area of a triangle one of whose vertices is at \((0, 0)\), and whose other vertices are at \((a_1, a_2)\), \((b_1, b_2)\), and \((0, 0)\).
Again, if we divide by \( ab \), we can show that
\[
\sin (\theta_a - \theta_b) = \sin \theta_a \cos \theta_b - 
\cos \theta_a \sin \theta_b ;
\]
and can then find \( \sin (\theta_a - \theta_b) \) by changing the sign of \( \theta \).
This we could find \( \sin (\theta_a - \theta_b) \) by taking the scalar instead of the vector product.

In mechanics the moment of a force \( a \) acting at \( O \), taken about a point \( P \) whose vector \( \mathbf{OP} \) \( = \mathbf{r} \); it follows from the distributive law that the moment of a resultant force about \( P \) equals the vector sum of the moments of its components. If there is a couple formed by the parallel forces \( a \) and \( -a \), acting at points whose distance apart is represented by the vector \( \mathbf{r} \), then the moment of the couple is \( \mathbf{a} \times \mathbf{r} \); and the resultant of any number of couples is a single couple whose vector is the sum of the vectors of the given couples.

16. Triple Scalar Product.—It is evident that
\[
\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (\mathbf{a} \cdot \mathbf{c}) \mathbf{b} - (\mathbf{a} \cdot \mathbf{b}) \mathbf{c}.
\]

18. Vector and Scalar Fields.—The theories of fluid motion, heat, electricity, etc., are largely concerned with vector and scalar fields. With every point \((x, y, z)\) are associated such scalars as mass, density, potential, and such vectors as velocity, force, displacement, flux, all of which are functions of \((x, y, z)\).

19. Directional Derivative of a Scalar Function.—If a moving point \( P \) is displaced from \((x, y, z)\) to a neighboring position in the direction \( ds \), the rate of change of a scalar function \( V(x, y, z) \) per unit of displacement is given by the directional derivative
\[
\frac{dV}{ds} = \frac{\partial V}{\partial x} dx + \frac{\partial V}{\partial y} dy + \frac{\partial V}{\partial z} dz
\]

20. Tangential and Normal Derivatives to a Level Surface.—Let the family of level surfaces for the function \( V \) have the equation \( V(x, y, z) = C \), where \( C \) is an arbitrary constant; first let the displacement \( ds \) be tangential to the level surface that passes through \( P \), then \( dV/ds = 0 \), and the above scalar product is zero, hence the vector \( \partial V / \partial x + j \partial V / \partial y + k \partial V / \partial z \) is perpendicular to \( ds \), that is, to any tangent to the surface, and is, therefore, normal to the surface.

23. Vector Functions.—A vector whose three components parallel to the co-ordinate axes are given functions of \((x, y, z)\) is called a vector function; e.g., the resultant force at the point \((x, y, z)\) of an electric field is of the form
\[
V = \frac{1}{r^2} (x \hat{i} + y \hat{j} + z \hat{k}),
\]
and a series of such lines, passing through the perimeter of a small closed curve traced on a level surface, is called a tube of the vector.

24. Symbolic Scalar Product \( \nabla \cdot \mathbf{a} \).—The vector operator \( \nabla = \frac{\partial}{\partial x} + \frac{j}{\partial y} + k \frac{\partial}{\partial z} \) is called the Hamiltonian operator, from its inventor; but when used in combination it has the shorter name of del, due to Willard Gibbs; some use the name nabla suggested by Maxwell from resemblance to the Assyrian harp; Kelvin's name ailed, the reverse of delta, is seldom used. The symbolic scalar product \( \nabla \cdot \mathbf{a} = \)
\[
\frac{\partial a_1}{\partial x} + \frac{\partial a_2}{\partial y} + \frac{\partial a_3}{\partial z},
\]
which is also expressed by
\[
\frac{\partial}{\partial x} a_1 + \frac{\partial}{\partial y} a_2 + \frac{\partial}{\partial z} a_3.
\]

25. Flux of a Vector through an Area.—Divergence.—The flux of a vector \( \mathbf{a} \) through an element of area \( dS \) is defined as the product of \( dS \) by the normal component of \( \mathbf{a} \) and is accordingly represented by \( \mathbf{a} \cdot dS \) where \( dS \) is the vector of the elementary area.

It is easy to see that the algebraic sum of the
elements of outward flux through the faces of an elementary parallelepiped at \((x, y, z)\) is
\[
\frac{\partial a_1}{\partial x} + \frac{\partial a_2}{\partial y} + \frac{\partial a_3}{\partial z}
\]
d\(s\)d\(y\)d\(z\), which is \(\nabla \cdot a\) per unit volume. In case \(a\) is the velocity at \((x, y, z)\) of a fluid \(\nabla \cdot a\) is the rate at which matter is flowing out from \((x, y, z)\) in unit time per unit volume, and is called the rarefaction or divergence at that point; and, by analogy, \(\nabla \cdot a\) is called the outward flux or divergence for any vector \(a\). If \(a\) has a scalar potential, of which it is then the gradient, \(a = \nabla \phi\) \(\nabla \cdot a = \nabla \cdot \nabla \phi = \partial^2 \phi / \partial x^2 + \partial^2 \phi / \partial y^2 + \partial^2 \phi / \partial z^2\) is the Laplacian of \(\phi\).

26. Gauss' Flux Integral.—Let \(S\) be a closed surface in the field of \(a\), divide it into small elements, and regard each element as a plane, and represent it by its normal vector d\(S\) drawn outwards (9), then the flux of \(a\) through \(S\) is \(\int \int a \cdot dS\), and Gauss' theorem expresses this in terms of a volume integral over the space within \(S\) by the equation
\[
\int \int a \cdot dS = \int \int \int (\nabla \cdot a) \, dxdydz,
\]
which is proved by summing up the flux out of the elementary parallelepipeds in (25). If \(a\) is the force due to a point charge, \(\nabla \cdot a = -V \delta V\), where \(V = m/r, \delta V / \delta x = -m \delta V / \delta x = -m \delta \rho / \delta x / r, \delta V / \delta y = -m \delta \rho / \delta y / r, \delta V / \delta z = -m \delta \rho / \delta z / r\), except where \(r = 0\), thus \(\nabla \cdot a = 0\) except at \(r = 0\), hence by Gauss' equation, the flux through any surface not enclosing the point charge is zero, and the fluxes through all surfaces enclosing it are equal. To find this flux take a sphere of radius \(r\) with the point charge as centre, then the flux \(= 4 \pi r \delta \rho / \delta x = 4 \pi r \delta \rho / \delta y = 4 \pi r \delta \rho / \delta z\). If there be any number of point charges the flux of force through any surface, enclosing charge whose algebraic sum is \(\mathcal{M}\), is \(4 \pi \mathcal{M}\); and for a continuous distribution of density \(\rho\), the outward flux is \(4 \pi \int \int \rho \, dxdydz\). Equating this to \(\int \int \int \nabla \cdot \nabla \cdot a \, dxdydz\), for any enclosed volume, we have \(4 \pi = \nabla \cdot a = -\nabla \cdot V\). This is Poisson's equation. At a point where \(\rho = 0\) we have \(\nabla \cdot V = 0\), which is Laplace's equation.

27. Tubular or Solenoidal Vector Field.—Applying the flux theorem to the volume bounded by a vector tube and two normal sections we see that if \(\nabla \cdot a = 0\) the net outward flux is zero, hence the inward flux through one section equals the outward flux through the other, since there is no flux normal to the vector lines; thus, when the tube is very thin the magnitude of \(a\) varies inversely as the normal section of the tube; hence the variation of \(a\) in magnitude and direction as we pass along a line of the vector is exhibited by the variation of the thickness and direction of the vector filament; and, for this reason, a vector field which has no divergence is called a tubular or solenoidal field.

28. Green's Theorem.—If in Gauss' equation we replace \(a\) by \(U \nabla V\) where \(U\) and \(V\) are scalar functions we get
\[
\int \int \int (U \nabla V) \, dxdydz = \int \int \int \nabla \cdot \nabla \cdot (U \nabla V) \, dxdydz = \int \int \int \nabla \cdot (U \nabla V + U \nabla V) \, dxdydz = \int \int \int \nabla \cdot (U \nabla V) \, dxdydz = 0,
\]
This is called Green's theorem and has many applications; e.g. (1) if a continuous scalar function vanishes on the boundary of \(S\), and satisfies Laplace's equation \(\nabla \cdot V = 0\) within \(S\), then it vanishes at all points within \(S\), hence \(V\), let \(U = V\) then by the conditions
\[
\int \int \int (U \nabla V) \, dxdydz = 0,
\]
points within, therefore \(V\) is a constant, which is zero by the boundary condition. (2) There is only one solution to the problem of finding a continuous function \(V\) which shall take assigned values on \(S\), and shall satisfy Poisson's equation \(\nabla \cdot V = -4 \pi \eta\) within \(S\), where \(\eta\) is a given continuous function of \((x, y, z)\), for suppose there are two such functions \(V_1\) and \(V_2\); then the function \(U = V_1 - V_2\) is zero on \(S\) and satisfies \(\nabla \cdot U = 0\) within, hence by (1), \(U = 0\), that is, \(V_1 = V_2\) at all points within \(S\).

29. Symbolic Vector Product \(\nabla \times a\) — Curl of a Vector.—From (17) we have
\[
\nabla \times a = \left( \frac{\partial}{\partial y} - \frac{\partial}{\partial z} \right) a_1 + \left( \frac{\partial}{\partial z} - \frac{\partial}{\partial x} \right) a_2 + \left( \frac{\partial}{\partial x} - \frac{\partial}{\partial y} \right) a_3,
\]
It is shown in hydrodynamics that if \(a\) is the fluid velocity at \((x, y, z)\), the vector just written represents double the molecular velocity of rotation at \((x, y, z)\), or the vortex motion. This vector is called the curl of \(a\) even when \(a\) is not a velocity. When curl \(a = 0\), the three components vanish, and these are the three conditions that \(n, a, \alpha, \beta\) shall be the partial derivatives of a function \(V\), so that \(a = \nabla \cdot V\), where \(V\) is the scalar potential of \(a\). Thus the lines of \(a\) are normals to the family of level surfaces \(V = C\), which divide the fluid into lamellae which are regarded as infinitesimally thin, and are hence called lamellae. The magnitude of \(a\), that is \(dV / dn\), varies inversely as the thickness \(dn\) of the lamella at \((x, y, z)\), \(dV\) being constant; and any vector whose curl is zero is hence called a lamellar vector. Heaviside has given the name divergent to a vector whose curl is zero but whose divergence is not zero (as the velocity of a compressible fluid at a point where there is no vortex, or the electric force at a point where there is a charge) and the name circuital to a vector whose divergence is zero and whose curl is not zero (as the velocity of an incompressible fluid at a point where there is a vortex); a vector whose divergence and curl are both zero is sometimes called a Laplacian vector; it is both lamellar and solenoidal, as in the case of an electric field at a point where there is no charge. Helmholtz has shown that any vector field can be resolved into a divergent field and a circuital field. The curl of any vector is solenoidal, for \(\nabla \cdot (\nabla \times a) = 0\) as in (17), or by differentiation. The curl of curl \(a\) is given by (20), that is
\[
\nabla \times (\nabla \times a) = (\nabla \cdot a) \nabla - (\nabla \cdot \nabla) a = \nabla (\nabla \cdot a) - \nabla a.
\]
VECTOR ANALYSIS

30. Relation between Curl and Circulation—Stokes’ Theorem.—If $AB$ is any arc
in the field of $\mathbf{a}$, the line integral $\int_A B \cdot d\mathbf{a}$ is
called the flow of $\mathbf{a}$ along arc $AB$. When $AB$ is a closed circuit, this integral is called the circulation of $\mathbf{a}$ around the circuit. Stokes’ theorem asserts that this circulation equals the flux of curl $\mathbf{a}$ through any surface which caps the circuit; in symbols

$$\int \mathbf{a} \cdot d\mathbf{a} = \int \int \nabla \times \mathbf{a} \cdot dS.$$

Sketch of Kelvin’s proof: If $S$ be ruled up into elementary areas, the circulation around the boundary equals the algebraic sum of the circulations about the elementary areas (by canceling out lines described in opposite directions); and similarly the circulation around any element $dS$ at $P$ equals the sum of its circulations around the three projections $ds_1$, $ds_2$, $ds_3$ on planes drawn through $P$ parallel to the coordinate axes. Now if we take the parallelogram $PQRS$ with sides parallel to $dx$ and $dy$, then the tangential components of $\mathbf{a}$ on the sides

$$PQ, RS \text{ are } a_x, -a_y, dy, \text{ and similarly for}
$$

the other two sides, hence the algebraic sum of

flow along the four sides is \(\frac{a_x}{\partial y} dy\),

Summing this over $dS$, and taking similar sums over $dS_1$ and $dS_2$, we get the circulation around $dS$ equal to \((\nabla \times \mathbf{a}) \cdot dS\); then integrating over the cap we get the circulation around the boundary.

As an application of Stokes’ theorem, in fluid motion, the circulation around a circuit equals the sum of the strengths of all the vortex tubes enclosed by the circuit.

31. Circulation in Electromagnetic Circuit—Maxwell’s Equations.—Faraday showed experimentally that the total electromagnetic force around a closed circuit (i.e., the line integral of the electromagnetic force $\mathbf{E}$) equals the negative of the time-rate of change of the total magnetic induction through the circuit; but this total induction is the surface integral of the magnetic induction vector $\mathbf{B}$ ($x$, $y$, $z$) taken over any surface that caps the circuit; hence Faraday’s result may be written

$$\int \mathbf{E} \cdot d\mathbf{s} = -\frac{d}{dt} \int \int \mathbf{B} \cdot d\mathbf{s};$$

and comparison with Stokes’ formula shows that $\nabla \times \mathbf{E} = -\frac{d}{dt}$, which is Maxwell’s equation for magnetic current in an electric field. Again Ampère’s experiments prove that the work done in carrying a unit magnetic pole around a closed circuit equals $4\pi$ times the electric flux through the circuit, that is

$$\int \mathbf{H} \cdot d\mathbf{s} = 4\pi \int \int \mathbf{C} \cdot d\mathbf{S};$$

Comparison shows that $\nabla \times \mathbf{H} = 4\pi \mathbf{C}$, where $\mathbf{H}$ is the magnetic force at $(x, y, z)$, and $\mathbf{C}$ is the electric flux through unit area per unit time, i.e., the current density; this is Maxwell’s equation for electric current in a magnetic field.

32. Vectors in a Plane—Quadrantal Versor.—Consider the vector $\mathbf{r} = x\mathbf{i} + y\mathbf{j}$, in the $xy$-plane, and perform the operation $\mathbf{k} \times \mathbf{r}$, then

$$k \times \mathbf{r} = -jx + iy;$$

the operation repeated gives

$$k \times (k \times r) = k(-y) - jx = -r,$$

hence $(k \times r)^2 = -1$; and $(k \times r) = \sqrt{-1}$; each of these is a symbol for the operation of turning a vector through a positive right angle in the $xy$-plane, and is called a quadrantal versor.

33. Versor for Angle $\theta$.—Writing $r$ in the form $r = r(\cos \theta + j \sin \theta) = r(\cos \theta + j \sin \theta \mathbf{k}) = r(\cos \theta + \sqrt{-1} \sin \theta)$, we see that $r$ can be derived from the unit vector $\mathbf{k}$ by applying the operator $r(\cos \theta + \sqrt{-1} \sin \theta)$, which is the product of the tensor $r$ and the versor $\cos \theta + \sqrt{-1} \sin \theta$; this versor acting alone turns a vector through the angle $\theta$ without stretching. The product of the versor for angle $\theta$ and the versor for angle $\theta'$ is the versor for angle $\theta + \theta'$, thus $(\cos \theta + \sqrt{-1} \sin \theta)(\cos \theta' + \sqrt{-1} \sin \theta') = \cos(\theta + \theta') + \sqrt{-1} \sin(\theta + \theta')$. The complex algebraic number $x + \sqrt{-1} y$ can be represented by the versal tensor $r(\cos \theta + \sqrt{-1} \sin \theta)$ where $r = \sqrt{x^2 + y^2}$, tan $\theta = y/x$.

34. Vectors and Versors for Simple Harmonics.—Let the vector $\mathbf{r}_1$ revolve with angular velocity $\omega$ radians per second; then $\mathbf{r}_1 = \mathbf{r}_1(\cos \omega t + \sqrt{-1} \sin \omega t)$, where $\omega$ is the value of $\omega$ when $t = 0$; and the $x$-component of $\mathbf{r}_1$ is $x_1 = r_1 \cos (\omega t + \theta)$. Let another vector $\mathbf{r}_2$ revolve with the same angular velocity, starting at the position $\theta = \theta_0$, then its $x$-component is $x_2 = r_2 \cos (\omega t + \theta)$.

The vector sum (the diagonal of the parallelogram) is $r = r_1 + r_2$ whose $x$-component is $x = x_1 + x_2 = r_1 \cos (\omega t + \theta) + r_2 \cos (\omega t + \theta_0)$; the diagonal $r$ remains constant in length and revolves with angular velocity $\omega$, hence its projection is of the form $x = r_0 \cos (\omega t + \theta)$, a simple harmonic function of $t$ with period $2\pi/\omega$; hence the sum of two simple harmonic functions with the same period and different phase angles is another simple harmonic of the same period, and its characteristic vector is the sum of their vectors. The phase angle $\theta$ is found by adding the component vectors at time $t = 0$.

35. Time Derivatives of Simple Harmonics.—If $x = r_0 \cos (\omega t + \theta)$, then $dx/dt = -\omega r_0 \sin (\omega t + \theta)$, whose characteristic vector has the angle $\theta + \frac{\pi}{2}$, and is represented (32) by $j\omega \mathbf{r}_0$, where $j = \sqrt{-1}$; similarly $d^2x/dt^2$ has the characteristic vector $j^2\omega^2 \mathbf{r}_0$, that is, $-\omega^2 \mathbf{r}_0$. This enables us to eliminate the time variable from differential equations involving simple harmonics of the same period, as in the theory of alternating electric currents.

Elektr.’ (Leipzig 1907).

JAMES MCMAHON,
Professor of Mathematics, Cornell University.
VEDA, vāḍa, the general designation of the ancient sacred literature of India. The word is from the Sanskrit root vis. "known," and signifies primarily "known," or "science." It then came to be applied to the entire Hindu sacred literature as "the science." For a full discussion of the subject see the article on Vedic Literature. See also INDIA — Religions.

VEDANTA, vā-dan'ta, which means literally, the end or the goal of the Veda, or knowledge, constitutes the most impressive and comprehensive structure of Hindu philosophy. It is not synonymous with Hindu philosophy, as is generally supposed, because the Vedanta is only one of the six main schools of Indian thought, one of which, the Vīyāya, is for all practical purposes the earliest school of atheistic thought in the world. The subject of Vedanta is theistic thought, based on the texts of the Veda, principally Upanishads. The Upanishads are portions of the Veda, and are recognized to lead to the realization of self; they constitute the Jnānakanda, or the part dealing with higher knowledge, while the rest of the Veda, the Brahmana and Samhita is known as the Karmakanda, or the part dealing with rituals. The foundation on which the philosophy has been reared is the Sutras, or the formula contained in the Vedanta Sutra, Brahma Sutra and Sārāraka Sutra. Vīyāya, the author of the Hindu epic Mahabharata, is said to be the author of the Sutras.

The Vedanta philosophy itself comprises several schools of thought, all of them, however, agreeing on the Veda as the final authority. A knowledge of the history of the philosophy is necessary to comprehend correctly the principles enunciated by the sages. The earliest speculative thought of the Hindus is contained in the Upanishads, which are at the same time extremely profound. There are 108 Upanishads; Vedantic thought, however, takes cognizance of but 18, although occasional references are made to some of the rest. In the gradual evolution of Hindu thought, these Upanishads came to a stage when the conclusion was arrived at that there was but one substance or reality, self-created, immutable, imperceptible, all-knowing and external. This is the supreme spirit, the impersonal self, the absolute, Brahman. Brahman, The Brahman is Sаchchidаndаna, i.e., life, thought and beatitude. It is life, as imparting life and manifestation to all that is known and appears to exist. It is thought, as being self-conscious, as giving consciousness to all, making appear all things that do appear. It is beatitude, as exempt from all the miseries of births and deaths, from evil, pain and sorrow, a beatitude in which there is no distinction between attribute and subject. It is the repose of dreamless sleep. Brahman is eternally pure, intelligent and free. It is pure, as free from loves and hates, passionless and unaffected by the limitations of form. It is intelligent, as irradiating all things, as illuminating the otherwise dark or unconscious modifications of the sensories and intellects of personal spirits, and as illuminating the objects of these modifications. It is free, as unaffected by the experiences of these spirits, exempt from the implication of the unreal. Brahman, with all these attributes, had already been postulated in the Upanishads. The question of importance then was how to reconcile this postulate with existence. It is axiomatic that no speculation is possible without admitting the existence of the individual, the universe which comprises everything else but the individual, and an entity that comprises and regulates all. All religions and philosophies, therefore, discuss the relations and inter-actions of the soul, the world and God. The meaning of existence, the purpose and aim of it, are to be sought in the understanding of the relations between the three known postulates.

All speculation starts with the individual, or individual soul, called jiva.julan. Therefore, the necessity of reconciling the individual soul with Brahman, which is the one reality, became imperative. Vedanta philosophy has also accepted from the outset that the soul is personal only in fictitious semblance, only so long as it is implicated in the series of transmigratory states, and is in truth impersonal, one with Brahman. As Krishna enunciates in the Bagavad Gita, its apparent and fictitious individuality, and its apparent action and suffering, are the individuality, the action and suffering of its illusory adjuncts, the organism and the faculties. The submergence of all souls into Brahman, the one soul, must be sought after and is the only truth. The true intuition, or the knowledge of Brahman is the sole method by which the parasitic growths which has pierced and the realization of self attained.

The earlier Vedic texts and the Sutras, which constitute the basis of the philosophy, were too vague for the practical inquirer; and being considered revelation, did not admit of doubt. Only two courses were open: either to reject them altogether or inject new thought into them by the aid of commentaries. The believer in the faith has no thought of rejecting what he considers divine revelation; so, the philosophy was built up by the sages and philosophers, who had a system of thought to offer, claiming only to comment on the revelations; he took no credit for himself. It is no wonder, therefore, that European scholars and students should fall into the error of believing that the Vedanta is a single system of philosophy, somewhat on the lines of Plato or Epictetus. There are three principal schools of Vedantic thought,advaita, that which does not recognize the existence of a second, dvaita, which that recognizes two, and Viśishṭadvaita or qualified dualism. The founder of the advaita school was Shankaracharya, who lived about the 5th century of the Christian era. He enunciated that there was only one truth, i.e., Brahman. Existence, world and all differentiation was built out of Maya, or illusion. Maya is the principle by which the soul mistake thereby identifying itself with fictitious adjuncts like the time, space, faculties and the like of the organism. Out of maya is created the unreal world, and maya is the case of the projection of the manifold of experience. Shankaracharya held that name and form are illusions, neither existent nor non-existent, neither to be explained as an entity or as non-entity, fictitiously proceeding from, and to, all
eternity. The illustrations to prove the maya or illusion are very telling: Existence is like the blue sky, which has no existence or attribute independent of the gaze. Hence, systems of philosophy are inextricably mixed up with a purpose; in the case of Vedanta, it is the release of the soul from ignorance and the attainment of the highest. The summa bonum of life, according to all schools of this thought, was to become one with Brahman. Sankara's system did not recognize duality; hence, maya or illusion only stands as a curtain between the soul and Brahman, which have ever been one. The moment the curtain is removed, there is an automatic absorption of the individual soul in the eternal.

While this school of thought was the earliest interpretation of the Sultras and Upanishads, it has not been popular. The doctrine of illusion, as expounded by Sankara, is too abstruse for the intellectuals. There was a bantering for a little more of the human touch in intellectual and religious speculation. A super-volitional Brahman had to give way to Brahman, which was the operative cause of the world. The transition did not involve any modification of the attributes; it was still immutable, omnipresent, omniscient and incorruptible. Only, Brahman had these attributes vocationally, and was not a residuum of abstraction. Brahman became the light of lights beyond the darkness, and by the light of Brahman all the world shone forth. Brahman had his abode within the heart. This process of reasoning led to the dualistic school of thought. Ramanuja was the originator of the new school, which, while admitting that the individual soul emanated from Brahman, and was part and parcel of it, contended that it was still a distinctive entity. Even salvation was not the annihilation of the individual soul, although it was held to mean "to become one with Brahman." Ramanuja admitted the existence of Maya or illusion; but he used it to signify wrong perception, and not the perception of emptiness in empedontists. Ramanuja explained knowledge as the means to Salvation; but Ramanuja relegated it to a secondary place, placing "faith" on a higher plane. He exalted the doctrine of the attainment of salvation by faith, and incorporated it in his system of philosophy. His school is known as Vichikadwaitsa, or qualified dualism. According to him, Brahman is the operative cause of the world, and the process of evolution by which existence is regulated is called "differentiation under name and form." This process starts from eternity to eternity, evolution and dissolution chasing each other in an endless circle. The Soul, with its births and deaths, continues until each individual soul realizes itself, and finds eternal bliss and repose in the bosom of Brahman. Salvation is not absorption and negation of existence to the individual soul, but the attainment of bliss in Brahman. This doctrine was altogether new, as it had already been foreshadowed in the earlier texts. Just as Sankara emphasized the aspect of absorption in Brahman, which was also indicated in the Sruti, so Ramanuja emphasized the doctrine of individuality.

The third school is known as the Dwaita, or dualism, the founder of which was Madhavacchandra, who lived in South India about the 14th century. Madhava regarded Brahman, or the all-pervading soul, and the individual soul as distinct entities. Salvation, according to him, was the attainment of eternal bliss by the individual soul, with the aid of Brahman. Excepting this modification, his teachings were no more than a medley of the two prior schools of Vedanta. He made his thought popular by appealing to the masses.

Besides the above three principal schools of Vedantic thought, there have been numerous other systems, which have exercised local influence—the only ones worth mentioning being the systems of Nityakanta and Ramananda.

As has already been mentioned, Vedanta is not pure speculation. Being a theistic system of philosophy, it is inextricably connected with cosmogony as well as practical conduct of life. Ethics is not specially emphasized in any system of Hindu philosophy, because ethical conduct is an axiom, which inevitably follows from the acceptance of Vedas as revealed and the foundation of knowledge. None but the pure can study the Vedas; and none but those conversant with the Vedas can be students of Vedanta. Enquiry into the origin and processes of existence are motivated by the need of the individual to attain salvation. Knowledge for the sake of knowledge has no place in the systems of philosophy built up by the Hindus; and knowledge for any other purpose but salvation is anathematized. Therefore, Vedanta had to work up a rule of conduct for life, aiding toward the attainment of salvation. In the earlier stages of Hindu evolution, great stress was laid on ceremonial rites and the paraphernalia of sacrificial offering to the deities. The Vedantists rejected the依托 of the lowering of the soul; they preached the doctrine that salvation was to be attained by contemplation. Once again, they omitted all references to ethics, because they took it as axiomatic that only through the cultivation of the thought, word and deed are fit for meditation. The aspirant to salvation must constantly meditate on Brahman, until he attains freedom from the bondage of existence.

The belief in metempsychosis or transmigration of souls plays a great part in Vedanta. This philosophy, or the elaboration of it, owes its existence to Buddhism. Buddha revolted against ceremonial Hinduism, and emphasized ethical conduct and contemplation. He frankly held that life was an evil, and that the soul that entered into the body was condemned to a life of bondage, and that humanity must forever seek to emerge from the bondage in order to attain salvation. He took the term of the Vedas, enunciating the oneness of life and nature, to propagate his doctrine of transmigration. The soul had to have a sheath in order to be a part and parcel of existence. What difference did it make if it was in the hide of an elephant or the epidermis of a man? The idea was further developed in order to form gradations of life. A hierarchy was formed. The soul was
said to pass through every stage of life from rocks and vegetables to fish and animals, before it was allowed to take on the human garb. It emphasized the necessity for ethical conduct by offering a higher form of existence as reward for virtue and a lower one as punishment for vice. Escape from existence was salvation, and only by pure life, austere deeds and contemplation could the soul enable itself to break the bonds of the body altogether, and attain Nirvana, or eternal bliss. Hinduism had to take this doctrine and incorporate it within itself in order to fight the spread of Buddhism in the country. It was not adverse to do so either, because it easily found sanction for it in the Vedas. Moreover, this offered the best explanation for the inequalities of life, and gave hope to all sentient creatures of attaining salvation some day.

Vedanta took this thought up cheerfully, and elaborated it. The inquiry into the fundamentals and motives for existence was facilitated by the belief in metempsychosis. It disposed of the question: Where is the need for salvation? There was, a slight modification of the doctrine, as recognized by Vedanta. It did not agree with Buddhism that life was misery; it was certainly bondage, but a bondage which was consistent with the eternal law and will of Brahman. The supreme law or will of the Divine enjoined a constant process of evolution and dissolution. Brahman, overspread with illusory manifestations, manifests itself as Isvara, who allots to transmigrating spirits their several bodies and spheres of fruition, in accordance with the law of retribution, i.e., the spirits obtain the bodies they have merited by their own acts. Everything that exists, elements, sentiency, soul and sheaths has ever existed. There is no creation. It is the will of Brahman that at the end of each *Mukunda* or cycle, all differentiation vanishes, and souls and elements become one with him. Brahman retracts them all unto himself at the dissolution of the *kaya*.

The individual soul, however, can extricate itself from metempsychosis, and be above the law as the Brahman itself. To do so it must receive its proper nature; the man must purify his intellect, by passing through several lives.

Not he that has not ceased from evil, nor he that rests not from sensations, nor he that is not concentrated, not he whose faculties are not quiescent, can reach that self by the intelligence attendant through Vedanta. By continued contemplation, the aspirant to salvation works against the order of evolution until he attains to the Brahmas. He then becomes extricated from bodies, but lives and becomes a *Jivanmukta*. When he attains this stage, he is untouched by merit or demerit. The body then falls away, and the spirit is freed for ever with undifferentiated existence, undifferentiated intelligence and perfect beatitude.

The Vedantic doctrine of ethics is different to that of ritualistic or popular Hinduism; as a matter of fact, it is different from those of all other religions. Its ethical and religious, in their essence, are purely relative; to the adept they do not exist at all. The manifestation of Brahman comprises all attributes of existence; all that exists, therefore, is in accordance with divine purpose. To the being that is untrammeled by the bondage of existence, the differentiation becomes unreal.

**VEDDER, vē'der, David, Scottish poet:** b. Deer, Orkney, 1906; d. Edinburgh, 11 Feb. 1854. He went to sea when very young, became captain of a whaler at 22, was appointed first officer of an armed cruiser in 1815, and in 1820 became tide-surveyor, an office he occupied until his retirement on a pension in 1852. He appears to have written poetry at an early age, but his first published verse was *The Covenanters' Communion, and other Poems* (1828). His poetry is graceful and fluent, and possesses both humor and pathos. His works include *Scotsian Sketches* (1832); *Life of Sir Walter Scott* (1832); *Poems — Legendary, Lyrical and Descriptive* (1842); *Story of Reynard the Fox* (1852), etc.

**VEDDER, Elihu, American painter and modeler:** b. New York, 26 Feb. 1836. He studied painting with Matthias at Sherburne, N. Y., and in 1856 became a pupil of Picot in Paris. In 1857-61 he worked in Italy, then returned to the United States, where he found himself disqualified for enlistment as a soldier by a defective arm. Returning to Paris in 1865, he remained there till January 1867, when he went to Rome, where he has since resided. His subjects are mostly ideal, and his work is characterized by great imaginative power and originality, with boldness and intensity of expression, qualities which impart to it a heroic cast. His oil paintings include the *Phorcides*; the *Cumaean Sibyl* (see CUMA); *The Greek Actor's Daughter*; *Roman Girls on the Seashore*; *Venetians on the Main*; *The Lair of the Sea-Serpent*; *The Execution of Emperor*; *Crucifixion*; and others. His reputation was greatly increased by his illustrations of Edward Fitzgerald's *Omar Khayyam* (1884), and his decorations, subsequent to 1892, are marked by his significant characteristics. Examples of his work in this style may be seen in the pieces called *Good and Bad Government* in the Library of Congress, Washington, and in a panel which he executed for Bowdoin College.

**VEDDER, Henry Clay, American Baptist church historian:** b. De Ruyter, N. Y., 26 Feb. 1853. He was graduated from the University of Rochester in 1873 and from the Rochester Theological Seminary in 1876. He was associate editor of *The Examiner* 1876-92, and editor-in-chief 1892-94; and also edited *The Baptist and Sunday Review* (1885-92). Since December 1894, he has been professor of church history in Crozer Theological Seminary, at Chester, Pa. Among his published works are * Baptists and Liberty of Conscience* (1881); *The Time of the Baptists* (1890); *A Short History of the Baptists* (1891); *American Writers of To-day* (1894);
VEDIC LITERATURE

(The Decline of the Apostolic Succession in the Church of England) (1894); 'A History of the Baptists of the Middle States' (1896); 'The Baptists' (1903).

VEDIC (vē-digit or vē'dik) LITERATURE, the literature of the Vedas or sacred books of India. The language and literature of the Aryan invaders of India falls into two periods, the Vedic and the Sanskrit. Vedic is the English adjective formed from the noun veda, the native name for the literature. This word means "knowledge" (vid seen in Greek Phileus, we know, Latin videre, Gothic usum, we know, English wit), which specializes in the sense of "the knowledge par excellence," the "sacred knowledge." It is a way comparable with our designation of our sacred Scriptures as "the book," the Bible. This fact indicates at once the character of the literature. It is a religious literature, composed to meet the various needs of a complex religious system, and is consequently practical, not artistic in purpose.

The people among whom this literature originated were Indo-Europeans, who had entered the Peninsula of India from the northwest. At the beginning of the Vedic period they were settled on the Indus and in the Punjab, and throughout the period the course of their conquests can be followed eastward across the Jumna to the valley of the Ganges. Owing to the uncertainty of all Indian chronology it is rarely possible to give exact dates to any monument of its literature. For the Vedic period this is especially true, the best that can be done is to fix the relative succession of certain classes of writings. The oldest works are collections of material, the composition of which must have extended over several centuries. For the oldest of these, the Rig Veda, the estimates of competent scholars vary from 4000 to 1000 B.C.—about 2000 B.C. being a conservative estimate. The close of the Vedic period may be approximately given as shortly before the beginning of our era.

The people were worshipers of the various phenomena of nature, of which their chief deities were anthropomorphic precipitates (for details see Hopkins, 'The Religions of India,' Boston 1898, and the literature there cited). The Veda was inspired by the gods that might give in return prosperity.—rain, wealth in cattle and in sons, health, long life and finally safe escort to the kingdom of the dead where ruled Yama, the son of Vivasvat. They conceived also the idea that these material gifts could be made more acceptable to the gods, if accompanied by songs of praise and invocations that extolled the might of the gods and told of their wondrous works; that formula of magic potency were also employed is but natural. The very form of the invocations implies the existence of mythological legends, and it is inconceivable that so elaborate a ritual as existed at the time of the Rig Veda and even earlier in the Indo-Iranian period, could have been introduced and maintained without some tradition of the reasons for its existence, and directions for its proper performance. In short, in this earliest period we have existing songs and poems that go back to a later period and crystallizing at various times precipitated themselves in the three great types of Vedic literature, the Samhitas, Brāhmaṇas and Sūtras.

The religion had two aspects, a hieratic and a popular side. The first comprised the greater Vedic ceremonies, the so-called ārata sacrifices and centred about the obligation of the intoxicating drink soma; the second comprised beside the rites connected with the home life the ārya rites (from ārya, a house), the practices that were more distinctly magical in nature, whose objects were to bless and to curse. It remains to be noted that with the growing power of the priesthood, their influence reached out over this sphere also and gave to these originally popular ceremonies a quasi-hierarchical character. From this follows the partition of the Vedic literature into two main subdivisions, on the one hand the travyā vidya, the "three-fold knowledge" of the hymns of praise, the Rig Veda, of the chanted songs, the Śāma Veda, and of the sacrificial verses and formulae, the Yajur Veda, with their Soma sacrifices, and on the other, the Atharva Veda, and the house ceremonies.

The performance of the great ārata sacrifices required the participation of three classes of priests, the Hotar, or the reciting priest, the Udgātar, or the chanted, and the Advāryu, to whose lot fell the performance of the manual labor of the ceremonies. To this corresponds the tripartite division of the hieratic literature for the Veda of the Hotar is the Rig, that of the Udgātar is the Śāma, and that of the Advāryu, the Yajur Veda. In each Veda three main classes of works exist, the Samhitās, Brāhmaṇas and Sūtras; and within each Veda these types follow one another in this order, for the Brāhmaṇas presuppose the Samhitās, and the Sūtras the Brāhmaṇas. But it does not follow from this that the composition of all the works of one type belongs to the same period. So that it is misleading to speak of a Brāhmaṇa or Sūtra period and attempt to define them as if there had ever been a period in which, for example, the Brāhmaṇas and nothing else were composed. Besides these existed in each Veda different schools (caraṇas), varying more or less from one another. Sometimes the difference consisted only in details of the ritual, sometimes in the theological exposition of its meaning, sometimes it extended to the Sanhitās themselves. In the latter case the result is various recensions of the same Samhitā known as ṛkṣhas ("branches"). In the former cases the differences lead to the composition of different Brāhmaṇas and Sūtras belonging to the same Veda.

The Sanhitās (from soma, a preposition comparable in meaning with sv and Vṛdha, to put, which appears also in vṛma) are collections made from this floating mass of lyric material and sacrificial formulae. To them the term Veda is frequently applied in a narrower sense, so that, for example, the Rig Veda may mean either the Rig Veda Samhitā or that Samhitā together with all the works of other classes dependent upon it.

The Rig Veda (from ṛc, a laudatory stanza, especially one that is to be recited in opposition to one that is to be sung) is the oldest and most important of the Vedic collections. It contains a little over 1,000 hymns, that consist of about 10,000 stanzas, and so are in bulk a little
VEDIC LITERATURE

less than the Iliad and the Odyssey together. The hymns are religious poems of evidently very diverse origin and of correspondingly un-
equal merit. They are, however, directed alike to the greater gods of the Vedic pantheon, extolling their deeds, imploring them to come to the sacrifice, accept the offerings and grant blessings to their worship-
ners. From this point of view, the Hotar forms the Canon of the hymns that are required at each ā ś a ṽ a sacrifice. But as the order of hymns does not follow the order of their employment in the ritual, and as the collection contains also material — for example, the funeral and wedding stanzas — not intended for this purpose, it becomes evident that the primary purpose of the collection was not to furnish a manual for the Hotar. It has, therefore, been assumed that the purpose of the collection was historic and scientific — to preserve a body of poetry the value of which was appreciated — and some of the hymns have been interpreted as secular poetry. Later investigation has also shown, that the Rig Veda itself is a collection of mantras intended for a ritual different from the system afterward expounded in the Brâhmaṇas and Sûtras.

The hymns are divided into 10 books, but the different principles of arrangement observable in them show that the collection is the expansion of a still earlier collection. With regard to its tradition, the text of the hymns had evidently suffered a number of corruptions before they were brought together in the present collection. The formation of the latter antedated not only the composition of the Brâhmaṇas, but also the formation of the other Samhâta — the time of the redaction of these Samhâtas must, however, be carefully distinguished from the time of composition of the material contained in them. From this time on the utmost care was bestowed upon the preservation of the text, and these efforts attained their highest development in the whole a wonderful success. An exception is to be made for the work of certain scholarly redactors — the close of whose activity falls between the composition of the Brâhmaṇas and the time of Pânini, who modernized Sanskrit, a certain degree of formalism, and upon it the observance of the later laws of sanskrit, the rules that govern the contact of words in a sentence. From their hands issued the Samhâta text. For its protection was composed the Pāda-pâtha, or "word text," which attempted to undo the effects of the laws of sanskrit and give each word in its original form. Still more elaborate precautions of a similar nature were the Krama-pâtha, or "step text," the Jâjâ-pâtha, or "woven text," and the Ghanâ-pâtha. Further safeguards were certain phonetic treatises, the Prâtiçakhyas, to be mentioned below. The result has been that we have the Samhâta text, as it came from the hands of its redactors, and as the changes made by them can generally be ascertained from the metre, we can restore the collection to essentially the form in which it previously existed. Of different gāthás of the Rig Veda only one has been preserved, that of the Āryans.

The Sâma Veda (from sâma, a chant) is a collection of the words to be used by the Udga-
tar at the soma sacrifice. It contains 1,549 stanzas, all except 75 of which occur also in the Rig Veda. Historically, therefore, it is the least impressive of them, hotar. However, in accord with the purpose of the Sâmâ Veda they stand not in their original context but in the order of their liturgical employment. The Samhâta exhibits these verses simply in the form of the stanzas (kāhās) that form the basis of the melodies. They acquire their proper character of Sâman only in the Gânas or song books, where the prolongations, repetitions and additional syllables required by the music are noted. As each stanza could be chanted in a great variety of ways, the number of Sâmans is practically unlimited. The text has come down to us in the recensions of two schools, namely, the Raâjayânyas and the Kâûuthamas, while of the song books four are known, namely, the Grâmâyâgyâna, the Āranyagâna, the Vhâghâna, and the Uhyâgâna.

The Yajur Veda (from yajus, a liturgical formula) is, as its name denotes, a collection of the sacrificial formulas for the Yajus sacrifice. In the Rig Veda itself is a collection of mantras intended for a ritual different from the system afterward expounded in the Brâhmaṇa and Sûtras. It extends to the other gāthā sacrifices also. It is the Veda in which the school differences are most noticeable. The two great divisions are the White and the Black Yajur Vedas. The difference being that the Samhâta of the former is merely a collection of mantra material, while the Samhâta of the latter contains not only this material which properly belongs is a Samhâta, but also a certain amount of theological exposition which should properly be in the Brâhmaṇa. Of the White Yajur Veda we have two recensions, those of the Mâdhyâyânas and the Kâvâs. The Black Yajur Veda exists in the following recensions: the Taîtrîya Samhâta, the Mâitrâyaṇi Samhâta, the Kaânya Samhâta, and the Kâpiṣṭhâla-Kâṣṭha Samhâta.

The Brâhmaṇas (relating to brahman, religious formula) are theological treatises concerned chiefly with the ritual of the sacrifice. They do not attempt to explain a certain ritual, for they presuppose a knowledge of it, and also a knowledge of the mantra material of the Samhâta. Their object is to explain the mutual relationship of these two elements — rite and formula. This involves exegesis of the mantras and leads to the telling of many myths. Furthermore, as they are concerned not only with the external relationship of the ceremony to its formulae but much more with its internal relationship (for to the Hindu what a thing is, is never of as great importance as what the thing symbolizes), they contain masses of theological and philosophical speculations frequently of the most fantastic mysticism. In form they are throughout in prose, except for what is called the recitation part of the texts. This is called the Gâthâs. appended to them are certain works of a theosophical character — called the Āranyakas or Forest Books, because owing to their peculiar mystic sanctity they could safely be transmitted to a pupil only in the seclusion of the forest. The Upanîṣâds (confidential sessions) are esoteric
philosophical speculations concerning chiefly the nature of Atman or Brahma, the world-soul. They are also called the Vedanta, that is, "end of the Vedas." It begins with their position or as their adherents insist in the sense of the "final goal of the Veda." Now each of these Brhamanas attaches itself to one of the Saithitas and accordingly treats only of the portion of the ritual in which the corresponding priest is engaged. According to this principle they are classified: (1) Belonging to the Rig Veda; the Aitareya Brahmana and the Kausitaki or Chakshyayana Brhamana to each of which is attached an Aranya and a Upanishad of the same name. (2) Brhamanas to the Sama Veda. Of these we have the Pañcavimśa Brhamana, so called from its consisting of 25 books with its supplement, the Sādvimśa Brhamana; the Chândogya Brhamana with its Upanishad, and the Jaiminiya Brhamana containing the Kena Upaniṣad. Four other works belonging to this school, the Sāma-Vidhāna Brhamana, the Devātāhṛṣṇi Brhamana, the Vāma Brhamana, and the Saithitamāna Brhamanas are Brhamanas only in name. (3) For the White Yajur we have the Caturathya Brhamana in two recensions, corresponding to the two recensions of the Saithita. (4) For the Black Yajur Veda the Brhamana material is name and form imbedded in the Saithita, but there also exist as independent works the Taittirīya Brhamana, and Aranyaka, the latter containing two Upaniṣad, in addition to which there are the Kaśika and the Markāyana Upaniṣad.

The Sūtras ("threads" or "clues") are compendiums of practical rules for various subjects. Stylistically works of this class are characterized by the utmost endeavors for conciseness. The extent to which these efforts were carried is shown by the aphorism that an author should rejoice more over the saving of half a long vowel than over the birth of a son—on which depended his happiness in the next existence. A constant appeal is made to the scripture to the Brhamanas, that is, to the Vedas, as the genuine authority. The latter two are later additions, one being taken chiefly from the Pāippalāda Čakha, the other from the Rig Veda. Books 13–18 are devoted to special subjects; the other books contain charms for the cure of various diseases frequently regarded as possession by demons; prayers for long life and health; imprecations against demons, sorcerers and enemies; charms pertaining to women; charms to secure harmony and influence in the assembly; charms pertaining to royalty; prayers and imprecations in the interest of the Brhamans; charms to secure prosperity; charms in expiation of sin and delitement; cosmogonic and theosophic hymns and ritualistic hymns. In short the Atharva touches the interests of every class of life and ranges from the highest metaphysics of theosophic mysticism to the lowest bathos of sorcery. The reduction of this material is later than the reductions of the other Saithitas and probably later than the composition of the Brhamanas. The material itself is of widely different ages; some of it cannot be much older than the time of the reduction; other parts may be among the earliest products of Vedic literary activity as some of the practices go back even to Indo-European times.

The subordinate literature of the Atharva was evolved in an order diametrically opposite to that of the other Vedas. The oldest work is the Kāuḍika Sūtra, which gives the ritual for the employment of these hymns and has its closest analogies in the Brhamyas. Later the Atharvanas advanced the claim that their Veda was the fourth Veda, the Sarvā Vidyā or "complete knowledge" that always loomed up behind the consciousness of the Ruṇas. But the Atharvan Veda was only the fraction of a greater unit; that this was the Veda of the fourth priest, the Brhaman, who exercised a general supervision of the sacrifice, and consequently that this important office could not have existed in the Ruṇa; finally that the Purohita or house chaplain of the king must be a member of their school.
To support these claims were needed works treating of the duties of the Brahman such as existed for the other priests in the other Vedas. Accordingly there were composed the Vaitākā Sūtra (Cāruta Sūtra) and the Gopatha Brāhmaṇa. Furthermore a large number of Upaniṣads began to be attached to the Atharva.

A complete Kalpa Sūtra contains also a Dharma Sūtra, or a collection of aphorisms on the law, chiefly from its religious side. Those of Apatasmaba, Hiraṇyakaipuci and Bādhyāyana—all belonging to the Tāittiirya division of the Black Yajur Veda—have been preserved; the Dharma Častra of Gātmaka (Sāma Veda) and Vasiṣṭha (Rig Veda) are in reality also Dharma Sūtras. Kalpa, however, is only one of the six Vedāngas or limbs of the Veda into which tradition divides the whole Sūtra literature. The others are śiṣa, pronunciation; chanda, metre; vyākaraṇa, grammar; nirukta, etymology and jyotisha, astronomy. The beginnings of these sciences generally go back to the Brāhmaṇas; in the Sūtras they are elaborated and then flourish in the post-Vedic period. Of special works are to be mentioned the Hṛṣīkeśas regarding the Čākhā, or phonetic treatises, whose object is to explain the relationship of the Sanshītā and Pada-pātha texts. For grammar the great work is that of Pāṇini, which as the norm of the classical language required fuller treatment under that head. Etymology is represented by Yaska’s Nirukta. The Sūtras are completed by the Parābhiṣṭas or Supplements. Finally there are the Prayogas, manuals and Paddhatis, guides, that give a more complete picture of the sacrifice and indices called Anukramini that treat the literature from various points of view.

GEORGE MELVILLE BOLLING,
Professor of Greek, Ohio State University, Columbus, Ohio.

VEEN, VÁN, Otto van (called Otto Veen). Dutch painter. Leyden, 1558, d. 1629. His father was burgomaster of Leyden in 1572, and remaining faithful to Philip II his property was confiscated and he was driven to Liège with his son Otto, who then began the study of painting under Lampronix. In 1575 he became a pupil of Federigo Zucccheri in Italy. He appears in Liège as page to Ernest de Bavierre in 1580 and is sent on a diplomatic mission to the emperor. At Antwerp Rubens became his pupil in 1592 and he was made dean of the Guild of Saint Luke in 1602. He was a fine poet as well as a brilliant painter. His historical pictures and portraits are marked by strictness of design, natural attitudes and the most expressive faces, while the coloring is brilliant, though never attaining to the gorgeous and transparent lustre of his pupil Rubens.

VEERY, or TAWNY THRUSH, a small migratory thrush (Turdus fuscescens) of eastern North America. The veery ranges from the Rocky Mountains eastward, chiefly within the United States and nests throughout the northern part of its range. It is uniform cinnamon brown above and with very little spotting or marking underneath. The usual call note is a very clear whistle, where easy to imitate. The song is much less frequently heard, but is very attractive, though so peculiar as to be quite characteristic. The nest is built on or near the ground, chiefly of bark, rootlets and leaves, and the four or five eggs are bright greenish-blue, unspotted. The veery is decidely a woodland bird, preferring damp woods with considerable underbrush.

VEGA, vágā, García. See GARCILASO DE LA VEGA.

VEGA CARPIO, vágā kárpe-ó. Felix Lope de, Spanish poet and dramatist: b. Madrid, 25 Nov. 1562; d. there, 26 Aug. 1635. After studying at Alcalá he joined the army, and in 1588 accompanied the Invincible Armada. About 1612 he became a priest, and subsequently Pope Urban VIII made him a Knight of Malta and a doctor of theology. He had already written and published various poems, but his productions were now multiplied with extraordinary rapidity. Scarcely a year passed in which he did not print a poem, and in general scarcely a month, or indeed scarcely a week, passed in which he did not produce a piece for the theatre. He informs us that he had more than a hundred times composed a piece and brought it on the stage within 24 hours. The fame that he enjoyed during his lifetime was immense. The people idolized him, and he received marks of distinction from the king of Spain and Pope Urban VIII. The latter, in return for the dedication of a tragedy on Mary Stuart, conferred on him the title of doctor of theology and sent him the cross of the order of Malta. The profits that accrued from his works corresponded to his fame. About 450 of his dramatic productions have been printed. They reveal an inexhaustible but ill-regulated imagination, a strange mixture of the beautiful and the ridiculous, the sublime and the trivial, a rare mastery of dialogue and extraordinary facility in versification. He has been described, probably with more epigrammatic force than strict accuracy, as the dramatist who has written the greatest number of good scenes and the greatest number of bad pieces. The Spanish Academy began a collection of his works in 1893. (See STAR OF SEVILLE, THE.) Consult Lord Holland, Some Account of the Life and Writings of Lope de Vega Carpio (London, 1815).—Ticknor, ‘History of Spanish Literature’ (Vol. II, 1849; 6th Am. ed., 1888); Lewes, ‘The Spanish Drama: Lope de Vega and Calderon’ (1846); Forster, ‘Some French and Spanish Men of Letters’ (1891); Farinelli, ‘Grillparzer
and Lope de Vega’ (1894); Ludwig, ‘Lope de Vega’s Dramen aus dem Karolinschen Sagen-
text’ (1898); Wurzbach, ‘Lope de Vega’ (1896).

**VEGETABLE FIBRE.** See Fibre.

**VEGETABLE IVORY,** a hard, fine-
grained, white substance which is the reserve cellu-
llose stored in the cell-walls of the endo-
 sperm of the fruits of a species of *Phyllephas*,
a genus of Central American palms (q.v.).
The stems recline upon the ground for a few
feet, and then are crowned with long, linear,
plume-like, pinnate leaves, arching upward for
20 or 30 feet. The fruits lie near the ground,
are globular, about as large as a man’s head,
and consist of several drupes, enclosed in a
woody, wart-covered wall. The kernels of the
drupes, or seeds, are about the size of a hen’s
egg, and when very young contain a clear, in-
sipid fluid, which is used instead of water by
travelers. As in the cocnut, this fluid becomes
milky and sweet-flavored, and the nuts are
eagerly eaten in this stage by sundry animals,
but continue to thicken and harden, until, when
fully ripe, the seeds are so very hard as to
form a valuable substitute for elephant ivory.
These seeds are known to commerce as ivory-
or corozo-nuts, and are extensively used in
making small articles of turnery, as buttons,
umbrella-handles and the like.

**VEGETABLES, Food Value of.** The
function of food is to build up the tissues of the
body and keep them in repair, to yield energy
in the form of heat, to keep the body warm and
to create strength to enable it to do its work.
A diet to accomplish all this must contain the
nutrients, water, nitrogenous substances or
proteins (classified as protein), also fats, carbo-
hydrates (sugar, starch, cellulose, etc.), and
mineral matters, such as sodium chloride (com-
mon salt) and phosphate of lime. Animal
foods, meat, eggs, cheese, etc., are rich in pro-
tein, but not in carbohydrates. With the excep-
tion of butter, lard and the fat of pork, they
yield but little heat and as a rule should be asso-
ciated with other foods to form a complete
diet (bread, potatoes, wheat, etc.), on the other
hand, though classed among the vegetable foods,
furnish a very large proportion of the actual
nutrients in the ordinary diet and more eco-
nomically than animal foods, for which they may
be substituted. Combined with milk, fruit and
nuts, they form a complete diet. Vegetables
as a rule are deficient in fat and protein, but
rich in carbohydrates and some of them con-
tain beneficial juices and salts. While a vege-
table diet is often of great service in neuro-
thesia, gastric nervous, etc., for healthy per-
sons the objections to a strictly vegetable diet
are based upon the large amount of material
required to furnish necessary protein, the
amount of residue to be got rid of by the body
and the monotony of the diet. Most of the so-
called vegetarians are merely non-meat-eaters,
for they consume milk, butter, eggs, cheese and
seasoning. The fact is that man is an
omnivorous animal, his digestive apparatus is
adapted for the digestion of both animal and
vegetable foods and usually he needs both in
moderation. Vegetables are too often consid-
ered a cheap substitute for meat, in addition to the diet and not a necessity. Most families use but 12
or 15 different kinds of vegetables, whereas the
large markets in our cities have for sale through-
out the year about 50 varieties. The United
States government has recently encouraged the
increased use of vegetables and through investi-
gations and experiments has added to our
knowledge of their food value. For example,
the purslane and other so-called weeds have been
found to be useful as food and the propa-
gation and use as food of the roots, tubers,
beans, bulbs and various plants heretofore
grown and used as food almost exclusively by
the Chinese, such as lily bulbs, the lotus, taro
and ginseng, are recommended to Americans.
The malates, citrates and other salts found in
certain vegetables are indispensable in food as
they are converted into carbonates in the body
and furnish some of the alkalies to the blood
and other fluids. Potatoes, onions and fresh
salad vegetables, such as tomatoes, cabbage,
greens, lettuce, corn and cucumbers are excel-
 lent preventives of scurvy (q.v.) and in the
springs, after the heavy winter diet (more or
less of meat) their juices and salts are especially
beneficial. These vegetables, together with
oranges, lemons, limes and apples, may well
be substituted for so-called spring medicines.
Vegetables are also needed for their bulk,
which is an important adjunct in maintaining
the necessary movements of the intestines.

Much of the indigestion following the use of
certain vegetables is due either to insufficient
cooking or to the fact that the vegetables are
not fresh. The Irish potato, the commonest
vegetable, lacks protein, fat and salts and
should be eaten with butter and salt, pot liquor,
meat gravy or fat meat and associated with
some nitrogenous food. The legumes, beans,
peas and lentils differ from other vegetables
by reason of the large amount of protein they
contain, as well as mineral matter, chiefly lime
and potassium salts, but fat is needed with
them to furnish the necessary nutrients, hence
“pork and beans.” They need, also, especially
when dried, to be thoroughly boiled to be best
adapted to persons who do outdoor work.
The flatulence which they sometimes produce,
especially in persons of sedentary occupation,
constitutes one objection to their use. Lentumes
may well be called the “meat of the poor.” In
Mexico the frijole (a variety of bean) is the
staple food next to maize; and in the Orient
the soy bean and its products, bean-cheese, etc.,
rack next to rice. In India lentils form the
staple diet. There is a Hindu proverb that
“Rice is good, but lentils are my life.” The
Arabs feed ground beans to their horses when
extraordinary exertion is needed of them.
Finely ground peas, beans and lentils form the
basis of many soup-tablets and of condensed
foods used by armies, explorers, etc. The
pea-sausage of the German army was composed of
lentil flour, bacon and seasonings. Government
reports show that the Southern negro, though
having salt pork, wheat flour, cornmeal, mo-
lasses and milk, needs also vegetable food to
keep him in a proper condition of health. See
FOOD; NUTRITION OF MAN.

**VEGETARIANISM,** the theory and prac-
tice of living on vegetables and abstaining en-
tirely from flesh food, or from all food obtained
by the killing of animals. The use of flesh food is the essential element in the con-
notation of the word vegetarianism; but vege-
tarians are usually also total abstainers from alcoholic liquors, and in regard to the use of such animal products as eggs, milk, butter and cheese, and of cereals, as well as on the advisability of cooking food, different views are held among them. The average vegetarian admits into his diet the animal products above mentioned, and there are semi-vegetarians who also eat fish. The arguments for and against a vegetarian diet fall into three main classes, physiological and hygienic, ethical, economic.

Vegetarians claim that man is closely akin to an exclusively frugivorous group, the apes, and widely different from carnivora, herbivora and omnivora. They assert, what is universally admitted, that the actual state of mankind and the science of physiology both show that a complete fleshless diet is possible and readily procurable, and they argue that if such be the case any moral arguments that may be advanced against the eating of flesh ought to have decisive weight. Amo vegetarians, an object, that with a purely vegetable diet an enormous amount must be consumed in order to obtain sufficient nutriment, and that the waste products are excessive in quantity; but it is to be admitted that whatever be the force of this argument against extreme vegetarians, it can hardly be maintained against those who admit eggs, milk, etc. Vegetarians maintain that flesh-eating is responsible for the propagation of some of the most serious diseases, notably tuberculosis and cancer, and they contend that it hinders the development of the higher nature of man both by its physiological influence and by the necessity of systematic slaughter entailed by it. It has been objected, that if animals now regularly slaughtered were allowed to breed unchecked the country would be overrun by them, but the possible answers to this argument are obvious. It is also claimed by vegetarianism that it is in such products as nuts, seeds, roots, eggs and milk, and not in the comparatively degenerate form of flesh, that nature provides the means of supporting life in its best and most nutritive form.

In a work on the subject M. Gautier says: "The vegetarian diet is not suited to European organisation, for that relieved by milk, grain, butter, cheese, eggs, etc., it offers many advantages. It alkalinizes the blood, it regulates the circulation, and preserves the elasticity of the arteries; . . . it makes one less liable to danger from maladies of the skin and of the joints, and to congestions of the internal organs. It tends to soften the disposition,— to make us more calm and less agitated, aggressive and violent. It is practical and rational. It ought to be accepted, if one follows an ideal for the establishment of an education for races of men who are to be sweet-tempered, intelligent, artistic, peace-loving, yet nevertheless prolific, vigorous and active."

Vegetarianism is as old as the ancient religion of Hindustan, and was taught by Plato, Plutarch and other writers of classical antiquity. One of the oldest pioneers of the movement in Great Britain was George Cheyne (1671–1749), a Scottish doctor, who supported it in his Essay on the Life and Sufferings of a Man Established in a Total Abstinence from Animal Nourishment, published in 1700. Shelley's vindication of natural diet is well known. J. F. Newton's 'Return to Nature, or Defense of Vegetable Regimen,' was published in 1811, and in 1847 the Vegetarian Society was founded at Manchester. Eduard Balthzer (1814–87), a German liberal clergyman, introduced the movement into Germany, and founded at Nordhausen in 1868 a 'Verein von Freunden der Natürlichen Lebensweise.' His book on 'Die Naturlichen Lebensweise' reached the third edition. Other leading German pioneers of vegetarianism are Gustave von Struve (1805–70), author of 'Die Pflanzenkost, die Grundlage einer neuen Weltanschauung' (1869), in which he associates vegetarianism with socialism; and Theodor Hahn, author of 'Die Naturgefässes Diät' (1859) and 'Der Vegetarismus' (1869). Vegetarianism has obtained less hold in France than in Great Britain and Germany. Among the chief French works on it are the 'Thalysie, ou la nouvelle Existence' (1821) of Jean Antoine Gleizes (1773–1843) and 'Le Vegetarisme rationnel scientifique' (1899) of Dr. E. Bonnejoy. The early leaders of the movement in America were Amos Bronson Alcott (q.v.); Sylvester Graham (1794–1851), author of 'The Science of Human Life' (1839), and Charles Lane, author of 'A Brief Practical Essay on Vegetable Diet' (1847). The first vegetarian societies were founded in 1889, and several societies throughout the world are affiliated with it. Vegetarian restaurants are comparatively common. Consult Kingsford, 'The Perfect Way in Diet' (1881); Williams, 'The Ethics of Vegetarianism,' a sort of encyclopedia of the subject; Smith, 'Fruits and Farinacea the Proper Food for Man' (abridged ed. by F. W. Newman); Newman, 'Essays on Diet' (1883); Salt, 'A Plea for Vegetarianism' (1886); Richardson, 'Food for Man' (1891); Hills, 'Essay on Vegetarianism' (1893), and Oldfield, 'Tuberculosis: Flesh-eating a Cause of Consumption.'

**VEHICLE SPRINGS**, contrivances for diminishing the concussion between the body or the frame and wheels of automobiles, carriages and other vehicles. The most usual form of vehicle spring is built up of finely tempered pieces of steel so formed and fastened that they strengthen each other, while allowing free play for the natural spring of each leaf, and in the addition of a compression and jolting caused by the wheels striking obstruction or inequalities in the road. See Springs.

**VEHMGERICHTET, fäm'gur-tê; Ger. "tribunals of punishment"), or **VEHMIC COURTS**, German mediaval courts of justice. They originated in Westphalia. They were composed of free judges (Wisseende, *initiated*), bound to secrecy, presided over by a Freigrat (free count), and convened in both open and secret tribunals, the latter for lesser offenses. The emperor and the archbishop of Cologne (lord of Westphalia) were at least nominal members. Originally, in a period of confusion, when the petty baronial courts rendered inadequate justice, the Vehmgerichte attempted to judge fairly and impartially, and to enforce recognition of law. They came, however, to employ their extensive authority in an arbitrary manner, and to use great cruelty in punishment. Maximilian I greatly abridged their power by a new code, promulgated in 1495. In Westphalia they held secret meetings until finally abolished in 1811. Consult Lindner, 'Die
VEIL—VELÁZQUEZ

VELASCO, Tex., town in Brazoria County, on the Brazos River, and on the Velasco Terminal Railroad, about five miles from the mouth of the river and 35 air southeasterly of Galveston. It was laid out in 1891. It had its origin in the needs of the workers who were engaged in securing deep water, by jetty-work, on that part of the coast, and Velasco Bay was selected as the shipping-point. The work was done by a private corporation and over $1,500,000 were expended. Large vessels load and unload at the Velasco wharves. The chief industrial establishments are an ice factory, a planing mill and a machine shop. It has a grain elevator, coal and brick yards. There are extensive shipments of cotton and cotton products, grain, fruit and coal. Pop. 2,000.

VELASQUEZ, vá-lás’káth, Diego de, Spanish soldier, conqueror of Cuba: b. Cuéllar, Segovia, 1465 (or 1458); d. Havana, 1522 (or 1523). After having fought in the conquest of Granada, he went to España with Columbus in 1493, and was there prominent in warfare with the Indians. He was appointed by Diego Columbus in 1511 to effect the conquest of Cuba. With a force of 300 he landed in Cuba toward the close of the year, and encountered little resistance except from the cacique Hatuey, who was captured and killed. He assumed the independence of Diego Columbus, and directed the active campaigning through his subordinate, Panfilo de Narvaez, who had arrived with reinforcements. The island was easily conquered and the natives enslaved. Velasquez made Santiago de Cuba his capital, and founded Trinidad, Matanzas and other settlements. He was connected in 1517 with the expedition of Cordova, which, seeking slaves in the Bahamas, accidentally discovered Yucatan. He also fitted out the expedition of Cortes (q.v.) for the conquest of the Aztecs, and when Cortes ascertained independence sent Narvaez to take him prisoner (1520). Cortes defeated Narvaez, and Velasquez obtained no benefit from the conquest of Mexico.

VELÁZQUEZ, Diego Rodríguez de Silva y, Spanish painter: b. Seville, 5 June 1599; d. Madrid, August 1660. He came of noble family, his father being Juan Rodriguez de Silva and his mother, Gerónima Velázquez, both classified in the rank of hidalgos. At the age of 13 he began the study of painting, first under Herrera and afterward under Pacheco. From the latter he thoroughly learned the principles of drawing and of proper technique. From his earliest youth he seems to have had the settled conviction that he must paint only what he could see and sensuously appreciate. He had plenty of imagination but he always kept it subject to this sense of realism. He, therefore, appeared to have possessed much less imagination than he really did. He tried historical, religious and mythological subjects, portraits and landscapes, in fact every kind of painting that he could subject to his all-impelling sense of the necessity of realism. He probably had this realistic tendency of his nature accentuated in early youth through the teaching of his first instructor in art, Herrera, a very vigorous and capable painter, who had no love for the Italian influence on art, and strongly evidenced in Spain in his day. His second teacher, Pacheco, who seems to have been paid to give his best atten-

VEIN, in geology, a mass of rock or mineral which fills fissures or cracks in other rocks. Veins are usually divided into veins of igneous rocks, of sedimentary rocks and of minerals deposited through the agency of water or gas. Veins are irregularly limited in extent. The history of mining affords many examples of promising veins of rich ore which gave out after being followed for a few feet or yards. The most important group of veins is that containing minerals, metallic or non-metallic. See Mining; Ore Deposits.

VEINS. See Anatomy; Circulation; Physiology.

VEIT, fit, Philipp, German painter: b. Berlin, 1793; d. Mayence, 18 Dec. 1877. He was grandson of Moses Mendelssohn and stepson of Friedrich Schlegel, and after studying art in Dresden he went to Rome, where he became a member of the circle of the Nazarenes (q.v.)—German Pre-Raphaelites of a religious, romantic and medieval tendency in art, of which Cornelius (q.v.) and Oeverbeck (q.v.) were the chief representatives. There he produced the 'Seven Years of Plenty,' the 'Triumph of Religion,' the frescoes illustrating the 'Divine Comedy' in the Villa Massini; and the altar-piece 'Queen of Heaven' in the Trinità de' Monti. From 1830-43 he was director of the State Academy. Some of his large frescoes in churches won him great reputation. He published 'Zehn Vorträge über Kunst' (1891).

VELA, vá’lā, Vincenzo, Italian sculptor: b. Ligornetto, Tessin, 1822; d. there, 3 Oct. 1891. He was stonemason's apprentice at the building of the bridge of Viggio, and after studying under the sculptor Cacciatore in Milan went to Rome (1870) and began the model for a statue of Spartacus, now in a private collection at Petrograd. He later on took up his residence at Turin where he executed a series of works comprising a wide range of ideal and monumental subjects. His principal works are 'Hope and Resignation,' a statue for the tomb of the Donizetti family in Bergamo; a statue of 'Grief' for the tomb of the Ciani family in Lugano; 'William Tell,' a fountain statue for the same place; a standing figure of A. Rosmini in Stresa; the kneeling figures of the queen of Sardinia, Maria Theresa (1855) and that of Mme. Adelaide in Turin (1861); the statue of the Minister Balbi; the 'Dying Napoleon'; 'Columbus and America,' etc.
tion to his talented pupil, thoroughly grounded in him the principles of his art, subject, proportion, perspective, coloring and technique, illustrative lessons by his visits to the best pictures in the city. The boy lived and moved in an atmosphere of art. Pacheco, the author of a critical work on painting, was a good and sure critic of art and had a masterly way of presenting, in a concrete manner, the lessons he wished to inculcate; and thus he taught his pupil to feel what he himself recognized to be the true principles of art, and to carry out these principles, which he was not able to do himself with any notable success. Pacheco seems to have recognized the fact that his pupil had greater talent than he himself, and he appreciated at its full value the faculty he displayed for the minute study of detail. Nothing was too small or insignificant for him to examine most carefully in all its bearings. These traits characterize all the works of Velázquez from his early boyhood to mature manhood. Under Pacheco's tuition he studied every nuance of light and shade and tried to convey them with brush directly to the canvas. These light and shade studies he applied to buildings, inns, peasant's huts, the human face and form, and to everything, in short, that might give him a more effective grasp of the subject. He carried his realism further; in an age when Spanish painters were little given to realism, and secured human models for study of the human body at rest and in action, in light and shade, and under varying conditions of both; and more especially for the changing expressions of the human face. He thus became, in early manhood, a master of the depicting of feeling, expression, passion and character; and all his life he remained a student of every phase of nature, from the most flamboyant to the minutest and most secret. His interest was, therefore, in the life around him; and he did not require to reach out beyond it in order to complete his sense of the unity of art. His work is, for this reason, the most national of all the greater Spanish artists. Pacheco, who saw the coming greatness of his talented pupil, rewarded it in anticipation, by bestowing upon him the hand of his daughter, and he seems to have been more especially proud of his son-in-law.

Already accounted an excellent artist in Seville, Velázquez set out for Madrid with letters of introduction to people in authority. There he studied in the art galleries and painted some good portraits. But the inducement to remain in the capital not seeming great enough, he returned to Seville. Very shortly afterward, however, he was invited to return to Madrid by no less a personage than the Minister of the Crown, Olivares, who sent him money to pay his own and Pacheco's expenses for a second trip to the capital. Both artists were so well thought of there that Olivares induced Velázquez to send for his family, at the expense of the Crown, and to make his home in Madrid, where the leading personages of the court, the art-loving Spanish sovereign, Philip IV, who conceived a great affection for him and considered him the greatest of all portrait painters. This friendship lasted for more than a third of a century, in which the artist was never once in danger of being broken or disturbed. In 1628 an event happened which made Velázquez desirous of seeing the great art centres of Europe, especially those of Italy. This event was the visit to Madrid of Rubens, the greatest and most interesting picture painter of his time. Velázquez, still young and still vigorous, enthusiastic and endowed with strong force of character and the power of impressing others with the firm belief in the correctness of his own methods and the worth of his own achievements. He came to Madrid commissioned to paint certain pictures for the court. Velázquez was appointed by the Crown to be his guide, mentor and friend among all the art and art circles of the capital. In this connection he won the warm regard of Rubens who was not slow to recognize his great talent and his profound knowledge of art. The following year (1629) Velázquez was enabled to visit Italy through the generosity of the king and Olivares. There he studied the great masters industriously in Venice and Rome and made copies of several notable pictures for the king. At the same time, under the inspiration of his surroundings he created much original work: some of it of notable strength and beauty. Among his copies were 'The Last Supper' and 'The Crucifixion' by Tintoretto, and works by Raphael and Michelangelo. Perhaps the most notable of his original work painted at this time is 'The Forge of Vulcan' (Madrid Gallery), a picture which reminds one of his famous earlier picture, 'Los Borrachos,' commonly known outside Spain as 'Bacchus.' But in this latter picture, while his art is no surer and his conception no truer, yet both are more pleasing; and on the whole, the latter picture is the more truly worthy of Velázquez. Both are quite Spanish in character, conception, coloring and execution. Velázquez went again to Italy in 1631; this latter time visiting Naples in company with another famous Spanish artist, Ribera; and while there, among a considerable amount of work, he painted the portrait of the Infanta María, a sister of King Philip, who also had a great admiration for her notable countryman.

Velázquez accompanied the king on many expeditions and the latter seems to have been very fond of his company. It is known that he went with him to Aragón on two separate occasions and painted the portraits of the sovereign and members of his family (1642 and 1644). Naturally he was 'promoted' from time to time. He had begun as gentleman usher with a daily and additional yearly allowance from the Crown. By 1648 he was in receipt of a yearly pension of 700 ducats as court painter and an additional allowance as inspector of the art in the palace. The following year he went to Italy, commissioned by the Spanish king to purchase works of art, especially statuary, with which to decorate an Academy of Art in Spain which Philip intended to found. He fulfilled his mission well and painted several Italian scholars at the same time. His journey included Genoa, Milan, Venice, Módena, and Rome. In Rome Francis I, the Pope, Innocent presented him with a medal and a golden chain and showed him other marked favors, sitting to him for his portrait. Into this latter work Velázquez threw his whole energy, with the result that in the theory of art his greatest pictures. By some artists it has been classed as the best executed portrait in the
D. DIEGO VELAZQUEZ
Doria Palace, Rome, where it now is. Velázquez painted several other pictures of this notable prelate. In Rome he was elected a member of the famous Academy of Saint Luke. From Rome he went to Naples and thence back to Spain, carrying with him a most notable collection of pictures and fine statuary, the latter alone numbering over 300 pieces. About 1645 Velázquez was appointed "Apostentador Mayor," a sort of general court inspector, then looked upon as a high office, the reception of which betokened for the recipient the special favor of the Spanish sovereign since the position was one of great trust and considerable responsibility. In 1659 the king bestowed upon him the Cross of Santiago (Saint James), a very high honor and notable distinction, making him a "belted knight" of Spain. The following year Velázquez was commissioned by the king to decorate the Spanish pavilion and to arrange all the ceremonies for the marriage, by proxy, of Philip's sister, the Infanta Maria Teresa to Louis XIV of France. The pavilion for the occasion was erected on the low-lying, swampy island of Pheasants, in the river Bidasoa. The extra exertion, for a man of his age, or the emaciations from the swampy island, or both, brought on a fever from which he died. Velázquez had many pupils and imitators, and some of them approached his style of painting very closely. Among the best known of the former were Leonardo Carreño de Miranda, Juan Bautista de Mazá (his son-in-law), and Pareja (his slave, whom he liberated). Himself the greatest Spanish painter, and one of the world's greatest artistic geniuses, he inspired his pupils to good work. The fact that some of them, like Leonardo and Mazá, approached his own almost perfect style, is a high tribute to his talent as a teacher.

As Velázquez did not sign the greater number of his portraits it is difficult to distinguish his work at times from that of his pupils and imitators, and much of his surviving work must be recognized by the style and mannerisms of the author. The greatest of his pupils, Murillo, whom he kept in his house for three years, created a school, and surpassed his master in the brilliancy of his coloring. Velázquez's work displays a very close study of nature, boldness and sureness of touch, effective management of the brush, extremely accurate drawing and good coloring, dramatic force, in short, masterly execution, great originality and power. His industry and his facility for rapid and certain work were immense. Forty portraits of King Philip are credited to him in addition to many others of various members of the royal family and notables of the court, buffoons, dwarfs and other entertainers of the sovereign and his favorites. But though his royal pension and his position at court made him essentially a portrait painter, just as Murillo's connection with the Church made him a depicter of saints and Biblical subjects, yet Velázquez produced notable historical works, the greatest of which is "The Surrender of Breda" ("Las Lanzas"); and magnificent religious canvases, the most notable of which is "Christ on the Cross" (Madrid Gallery). In all this work, as in his portraits, the prevailing note is that of naturalness and a consummate mastery of light and shade, combined with surpassing technique.

For a detailed list of his paintings consult any work on the Spanish painters.

John Hubert Cornyn.

Velde, věl'dē, Adrian.' See Van de Velde.

Velde, Willem. See Van de Velde.

Velez, věl'ēz, Colombia, a city dating from 1539, the second founded in New Granada, in the department of Santander, 100 miles north of Bogotá. It lies on the eastern slope of a spur of the Cordillera Oriental and is reached by a branch road from Maniquirá on the main highway from Bogotá to Socorro. In its early years it was frequently used as a city of refuge owing to its difficulty of access. The production of fruits of different kinds, and the manufacture of preserves and candies, are the chief industries. Pop. (1918 est.) 9,500.

Velez-Malaga, vělē'thē māl'ā-gā, Spain, a city in the province of Malaga, 15 miles east of the city of that name, on the Velez, one and one-half miles from the Mediterranean. It is a well-built and prosperous town, with a good harbor, but no railway communication. It has suffered seriously from earthquake and flood. It is overlooked by a Moorish castle on a high rock, formerly called the *Key of Andalusia.* The district is exceedingly fertile, and produces sugar cane, indigo, batatas or sweet potatoes, palms, olives, oranges and other fruits. Pop. (1918 est.) 24,000.

Veligier. See Larva; Mollusca.

Vellore, věl'lōr, India, a town and fort in North Arcot, Madras, 80 miles southwest of Madras city. As a center of trade, it has some remarkable sculptures, is the site of a hospital, and produces sugar cane, indigo, batatas, and produces sugar cane, indigo, batatas, or sweet potatoes, palms, olives, oranges and other fruits. Pop. (1918 est.) 24,000.

VELUM. A medium, prepared from the skin of calves, for writing, painting, book-
binding and other purposes. A very prevalent misconception of the public is that parchment (see PARCHMENT) and vellum are one and the same. As a matter of fact, the white parchment is often termed vellum in commerce. Parchment, however, is produced from the skins of sheep, goats, etc., while true vellum is made solely from the skins of young calves. The difference between vellum and parchment consists not only in the delicate nature of the skin but in its polish, shining whiteness, its fineness generally and in its semi-transparent beauty not discoverable in parchment. While the skin of the calf is required to produce vellum, it is necessary that the animal be not over six weeks old, otherwise the skin is too stout for vellum and is destined for the tanner. The younger-the calf the finer the vellum; the most beautiful and sought for is that made from the still-born calf. The process of making vellum is more costly than that for parchment. Vellum and parchment were the mediums upon which writing was done when papyrus fell into disuse to be displaced by these more substantive materials. The art of preparing vellum was perfected by the monks during the 10th and 11th centuries. As a rule the vellum of manuscripts and deeds is white and very fine until the end of the 11th century, but some manuscripts dating from the 11th and 12th centuries present a somewhat dirty appearance and have writing rather yellowish, while other specimens are on beautiful vellum and the writing is intensely black. Of course the condition of the paper or old documents depends somewhat on what the care taken in preserving them. The vellum of which fine manuscripts were made in the 14th century was called *pargamentum,* referring undoubtedly to the superfine vellum produced from the skins of still-born calves. The most luxuriously worked manuscripts were done on purple-stained vellum, which was termed *pescora.* Silver lettering was done on this (codex-purpureus). Numerous manuscript works of ancient date are exacted on purple, called *imperial stained.* A *grape-purple* vellum was preferred for writing in silver (argyriography), crimson vellum for gold text (vermiculi), and cooled purple for vermilion ink (rubrica). It has been claimed that purple vellum was an invention of the 13th century, but the archbishop of York, Saint Wilfrid, in the 7th century, donated to his church a book of the Evangelists in purple vellum written in gold letters and bound in a cover of leaves of gold and precious stones, which he himself had written and ornamented. In the case of many vellum manuscripts only part of the page is stained, as the color was very costly to work. In miniature painting the surface of vellum is rubbed over with pumice stone to do away with inequalities in the grain; this avoids any defects in the absorption of the pigment in using this medium. In bookbinding vellum has been utilized with very artistic effects; plain white vellum binding has been termed Dutch style, while vellum with gilt decoration has been called Italian style.

Clement W. Coumbe.

VELOCIMETER (Lat. velox (velo-), swift, and Gr. μέτρον, measure; in general a name applied to a class of various devices for measuring velocity, or speed, including the speed-gauge and speed-recorder for machinery. Specifically, it is used of an electric apparatus for measuring the velocity of projectiles. Invented by Sir Charles Wheatstone (q.v.), it was improved by Col. J. G. Benton, United States army. Several more complex forms have been invented, and a simplified one by Captain Lue Boulenger, a Belgian, found extensive use. See BICYCLE.

VELOCIPDE, a light carriage consisting of a simple frame-work, supported on two or three wheels, and which is driven by the feet acting on cranks attached to the axle of one or two wheels. The name was first given to the contrivance of the Frenchmen Blanchard and Mazurier, introduced in 1779. It consisted of two wheels placed tandem and connected by a horizontal bar upon which the rider sat astride, propelling the machine by a motion of the legs as in walking, but pushing forcibly backward upon the ground. Considerable speed was attained for short distances. See BICYCLE.

VELOCITY. See MECHANICS.

VELOCITY OF ELECTRICITY, the rate at which electricity is propagated through a conductor. The velocity of electricity through a conducting wire is in all cases very great when compared with the velocities of moving bodies, such as the velocity of a railway train or of a projectile; but the velocity of electricity, any more than the velocity of a planet, of a railway train, or of a bullet, is not a certain number of miles per second fixed for all cases; it varies for a number of causes, and to such an extent that while Wheatstone found the velocity of static electricity through copper wire to be 288,000 miles per second, in the Atlantic cable of 1858 it was found to be 3,000 miles per second. Faraday showed that a submarine cable acts precisely as a leyden-jar, that the water serves as the outside coating, and that just as a leyden-jar takes time to become charged and to discharge, so a cable through which a sharp signal is sent from one end delivers the signal at the other end more or less instantaneously; that is, the deflection of the receiving needle is gradual, reaching a maximum and then at the same rate coming back to rest. Sir William Thomson showed that the more delicate the receiving instrument, the more instantaneous is the first appearance of the current at the receiving end of the cable. He gives three reasons for the retardation of the electric current: (1) Charge and electrical accumulation in a conductor subjected in any way to the process of electrification. (2) Electromagnetic induction, or electromotive force, excited in a conductor by variations of electric currents either in adjacent conductors or in different parts of its own length. (3) Resistance to conduction through a solid. The first successful attempt to find the velocity of electricity was made by Wheatstone with the revolving mirror (his invention), which has been so successfully employed by Foucault to discover the velocity of light.

The velocity of a voltaic current when the earth forms part of the circuit has been determined by the United States Coast Survey to average 16,000 miles per second. The velocity of an electric current through any conductor depends upon the resistance of the conductor,
so that in economic practice the question of velocity becomes a problem of resistances.

In the use of electric meters for the measurement of inductances and capacities it is essential that the current employed shall have a uniform speed. This is secured by the use of a device known as a "speed regulator." Several forms of this instrument are in use, but the one most popular is the one in which the resistance is regulated by the introduction into the field circuit of a resistance that may be altered by hand. For extensive data as to resistance of metals, glasses, porcelains, etc., at various temperatures above and below zero, consult the "Smithsonian Physical Tables".

**VELOCITY OF LIGHT.** See LIGHT, VELOCITY OF.

**VELOXITE,** a smokeless explosive powder invented by William Hope in 1903. It contains no nitro compound, sulphur, phosphorus, chlorate, in fact no dangerous ingredients. The flash point of the smoke is at 540° Fahrenheit, that of cordite and all nitro powders is only from 360 to 370°, while that of veloxite is about 12,000°. Veloxite stands the hammering of a sledge hammer on an anvil. The ingredients are stable and, therefore, the powder is stable. The setting up of chemical action is impossible in any length of time and in any variations of climatic conditions. Veloxite can be made in the morning and fired in the afternoon, not requiring, as other powders do, several weeks to manufacture. It can be made cheaply, its ingredients can be purchased in unlimited quantities by the ton and it is available for small arms as well as artillery.

**VELVET,** a textile made of silk and covered on one side with a close, short, fine, soft shag, the other side being a very strong close tissue. The nap or shag, called also the velveting of this stuff, is formed of loops of the threads of the warp, which the weaver works on a long wire, which has attached to it a knife. The withdrawal of the wire cuts the loops of the warp, thus forming the nap. The loom on which velvet is woven has two warp beams instead of one, as with other fabrics. This is necessary because velvet is a textile of three distinct parts, the pile and the ground cloth. A much larger length of thread is used for the pile in forming the loops afterward cut. The beam for the ground cloth is slung at the back of the loom, and as this is woven the pile is worked into it. Double-faced velvet is woven with the loops of the pile thread on both sides of the ground cloth. Uncut velvet, or "terry," is woven on wires which have no knife attached. Figured velvet is obtained by alternating cut velvet and terry, using a loom with Jacquard patterns. Velvet formerly made with the gold and silver threads as extra weft, the figure being wrought in by hand as with embroidery. Florence and Genoa were long noted for the manufacture of velvet, but Lyons, in France, is its principal seat; Krefeld and Elberfeld are the chief seats of velvet-making in Germany. Velveteen and plush are fabrics of cotton or wool woven in much the same manner as true velvet, except that the loops which form the pile are wrought as weft instead of warp. Velveteen may be made from many materials, and, when the face is made of the same material as the ground, it is called "velveteen of this class. Upholstery velveteens in patterns are worked by a peculiar loosening or bulging of the weave of the ground cloth, produced by Jacquard patterns.

**VELVET GRASS.** See GRASSES IN THE UNITED STATES.

**VELVET PLANT.** See MULLEIN.

**VELVET SCOTER,** a duck. See SCOTER.

**VENABLE,** vë'në-bl, Francis Preston, chemist and educator: b. in Prince Edward County, Va., 17 Nov. 1856; resides in Chapel Hill, N. C. In 1879 he was graduated from the University of Virginia and later at three different times studied in Germany. From 1890 to 1900 he was professor of chemistry in the University of North Carolina and in 1900 was elected president, which position he still holds. He is a member of several chemical associations in this country and in Germany. In 1905 he was elected president of the American Chemical Association. He has published the following: 'Manual of Qualitative Analysis' (1883); 'Short History of Chemistry' (1894); 'Development of the Periodic Law' (1896); with Howe, 'Organic Chemistry According to the Periodic Law' (1898); 'Study of the Atom' (1904).

**VENABLE, William Henry,** American author and educator: b. Warren County, Ohio, 29 April 1836. He began to teach at 17 and was professor of natural sciences in the Chillicothe Institute, Cincinnati, 1852-68, and principal and proprietor of the same 1882-86. He was professor of English literature in the Hughes High School, 1889-95, and has held a similar post in the Walnut Hill High School, Cincinnati, since the last-named year. Among his numerous works are 'A History of the United States' (1872); 'June on the Miami and Other Poems' (1872); 'The Teacher's Dream' (1881); 'Beginnings of Literary Culture in the Ohio Valley' (1891); 'Let Him First be a Man' (1894); 'Dream of Empire, or the House of Blennerhassett' (1901).

**VENATION** (Lat. vena, vein), in botany, the arrangement of the bundles of fibro-vascular tissue (commonly called "veins") in leaves. These bundles are parts of a framework for the support of the cellular tissue. They are of importance in determining the general characteristics of the leaf, and are employed as a basis for classification. Botanists recognize two leading kinds of venation, parallel and netted (reticulat). See LEAVES.

**VENDACE,** also VENDIS, a white fish (Coregonus vanderus), a variety of the Coregonus (q.v.), of restricted distribution, being found in only the lakes and rivers of Sweden, the Castle Loch, Lochmaben, Dumfriesshire, Scotland, and two or three English lakes. It attains an average length of from six to eight inches. It is considered a delicacy and is taken with the sweep-net.

**VENDÉE,** vœn-da, France, a western maritime department formed from ancient Poitou, and deriving its name from the river Vénon. It is bounded on the north by the departments of the Loire-Inférieure and Maine-et-Loire; on the east by the department of Deux-Sèvres; on the south by that of Charente-Inférieure; and on the southwest by that of Charente. It is the largest of the French departments and is bounded on the north by the Bay of Biscay; area, 2,692 square miles. The surface is much diversified and is divided into three dis-
tinct parts: the Bocage (Thicket), on the north and northeast a hilly and wooded district forming about one-half of the department; the Plaine, a tongue of land included between the Bocage and the southern limit of the department, a bare arid tract sloping down toward the sea; and the Marais, including all the south and west coasts, where salt marshes prevail. In the north the department is watered by tributaries of the Loire, especially the Sèvre-Nantaise, and in the south by the Lay (with the Yon) and tributaries of the Sèvre-Niortaise. Besides grain, which more than suffices for the home consumption, the principal crops are flax and hemp; a considerable quantity of an indifferent white wine is also produced. For administrative purposes Vendée is divided into three arrondissements—La Roche-sur-Yon, Fontenay-le-Comte and Sables d'Olonne, which are subdivided into 30 cantons and 299 communes; capital, La Roche-sur-Yon. The inhabitants, particularly those of the Bocage, are remarkable for the simplicity of their manners and their attachment to old usages, to the nobility of the district and to the clergy. Inspired by such leaders as La Roche-Jacquelein, Cathelineau, Charette and Soffet, and aided by the hilly and wooded nature of the ground, they carried on from 1793 to 1796 a war in the royalist cause, which endangered the existence of the republic. The first severe check they met with was at Suzain on 1 Dec. 1793, when they were broken up and the survivors and their families were dragged to Nantes and drowned in masses by Carrier. In the following year a fresh outbreak took place and the Vendéens were joined by the Chouans, but after some fighting they were pacified by the government granting an amnesty, freedom from military service, the free exercise of their religion and an indemnification for their losses. The landing of some thousands of émigrés at Quiberon encouraged them to resume their arms, but the rising was completely quelled by the activity of General Hoche, who treated the Vendéens, however, with great mildness. In the winter of 1797–1798, 1800–1801 and 1811–1815, some risings took place in favor of the Bourbons, but they were quickly suppressed by prudent and vigorous measures. The population has been nearly stationary for the past 25 years, being before the war 400,000, and after 440,000. See CATHELINÉAU, CHOUANS AND LA ROCHE-JACQUELEIN.

VENDÉMIAIRE, vôⁿ-dám-e-är, the first month in the French Revolution calendar, corresponding usually with 22 September to 21 October. Memorable in the history of the Revolution is the 13th Vendémiaire of the year IV (5 Oct. 1795), when the Paris Sections, worked upon by royalist reactionaries, rose in insurrection against the National Convention, but were crushed by Napoleon Bonaparte, then a young artillery officer.

VENDETTA, an Italian name for a blood feud; the practice of the nearest of kin executing vengeance on the murderer of a relative. In Corsica the vendetta is regarded as a duty incumbent on the relatives of the murdered man, and, failing to reach the real murderer, they take vengeance on his relatives. The practice exists, although to a more limited extent, in Sicily, Sardinia and Calabria, as well as among the Druses, Circassians, Arabs, etc. It is apparently identical with the "feud" which is still aroused at times in sections of the southern United States. In New Orleans, in 1890, the vendetta showed itself in strange juxtaposition to the law in the murder of the chief of police who had been instrumental in bringing to light some of the organized murders of the Mafia (q.v.).

VENDÔME, vôⁿ-dôm', Louis Joseph, Duc de, French general: b. Paris, 4 July 1654; d. Vinaroz, Catalonia, Spain, 15 June 1712. He received, in 1702, the command of the French army in the War of the Spanish Succession. After having distinguished himself in Italy, Tyrol and Belgium, the Duke of Burgundy was placed over him, and the disagreement of the two commanders caused the defeat of the French at Oudenarde (11 July 1708). Through the influence of Madame de Maintenon Vendôme was recalled; but when the cause of Philip V in Spain began to decline the Spaniards requested Louis XIV to send them Vendôme. On 3 Dec. 1710, he defeated the Austrian general Starhemberg at Villa-Vicosa, re-established Philip's throne soon after died and was buried in the Escurial. Voltaire gives considerable space to Vendôme's accomplishments in "Le Siècle de Louis XIV."

VENEEERS AND VENEERING. Veneer is a thin sheet of ornamental wood, or occasionally other material, forced as a surface to give a handsome exterior finish to cabinet articles or other work, which are made with a basis of cheaper and it may be of stronger materials. Veneering is an ancient art. The British Museum contains some examples of Egyptian work which are many thousands of years old. From that time to the present this art has influenced the construction and design of household furniture. Pliny states that it came into general use in Rome in his day. In that wealthy capital tables, veneered with rare woods were the choicest and costliest pieces of work. At a later day in Italy cabinets were veneered with ebony, ivory and tortoiseshell; the best pearies and precious stones. In the Dutch and French work of the centuries that followed veneering took a prominent place in furniture decoration. In the England of the 18th century the masterpieces of Hepplewhite and Sheraton show the degree of perfection to which this art had then attained.

To the average man to-day the term "veneer" means to cover up cheap and shoddy work, or to make a whitewood cabinet or other piece of furniture look like a mahogany one. From this false conception has arisen the idea that all veneering is bad work. It must be admitted that bad work is done, and it is in consequence all the more difficult to convince the public that veneered work, when properly done, and shows that it is veneer, is the best and most effective work for the following reasons: (1) It is the only way to use the rare woods such as "curls" in satinwood and mahogany, "burls" in ambrosia or walnut, and cross-grained but pretty work which would only twist if used in the solid; (2) the layer of veneer tends to strengthen and preserve the wood on which it is laid; (3) veneering gives the only opportunity for flat decoration in furniture, by using the grain of the wood for designs in panels and on wide surfaces; (4) the process needs more care
VENER — VENEZUELA

and thought in the selection of wood, its preparation, application and finish than is required in ordinary solid work.

Cutting.— Veneers are cut in two grades or thicknesses, known as ‘saw cut’ and ‘knife cut.’ The first named are the thickest, and vary in thickness from 1/32 to 1/16 of an inch. They are cut from the log with a large circular saw, and usually yield about 12 sheets to the inch. ‘Knife cut’ veneers are cut with modern machines making it possible to get from 50 to 100 sheets to the inch, the very thin ones being used as picture mounts, etc. These are cut with rotary and flat knives. In saw-cutting the log is well steamed and placed between two stocks, like a leg in a lathe, and under a knife for its whole length. The log is now forced round and against the knife which drops the required thickness at each revolution. By cutting spirally the grain is accentuated and enlarged. In knife-cutting a flat knife is used somewhat like a plane. The log is fixed on a rising table and the blade works backwards and forwards on a horizontal shaft, the knife being parallel with the grain. Formerly, veneers were cut by hand and were usually one-eighth inch in thickness and were planed.

VENER, väner, Sweden. See Wener.

VENEREAL DISEASES. See gonorrhea; syphilis.

VENEZUELA (Ital., Little Venice, from the lake dwellings on Maracaibo; officially Los Estados Unidos de Venezuela, the United South of South America, a republic lying in the northern part of South America and bounded on the north by the Atlantic Ocean and the Caribbean Sea, on the east by British Guiana, on the south by Brazil and Colombia and on the west by Colombia. It extends from lat. 0° 45' N. to 12° 26' N. and from long. 59° 35' W. to 73° 20' W., and has an area of approximately 393,076 square miles, divided among 20 states, a federal district and two territories. Topography.—Nature has established in this land of varied physical characteristics five main divisions: (1) The long coast-line with its picturesque harbors; (2) the highlands of all that region south and east of the Orinoco, which may be called Venezuelan Guiana, or Guiana Highlands; (3) the great central area of plains or Llanos, those wide expanses, low-lying, nearly level, grassy but often treeless — with, at most, groups of palms and small trees near river banks; (4) the northeastern branch of the Andes Mountains; (5) the comparatively small regions of the Lake Maracaibo Basin, etc. The coast-line and the Orinoco alone would be sufficient to give Venezuela importance in the world. Concerning the vast, more or less unexplored tract lying on the right bank of the Orinoco and the headwaters of that river, Mr. Dalton has written that ‘the area is primarily one huge elevated plateau about 1,000 feet or more above the sea, and from this rise a few principal mountain ranges, with some peaks which are more than 10,000 feet.’ This is found on the Brazilian frontier beginning at Mount Roraima (8,500 feet), where the three boundaries of Venezuela, British Guiana and Brazil meet, and extends thence westward and southward to the headwaters of the Orinoco. The whole area (about 294,600 square miles) is well watered, and nearly all is covered with forests containing rubber, tonka-beans, brazil-nuts, copaiba, and all the varied natural produce of the South American tropics. The Llanos of the Orinoco have a total area of 108,300 square miles. The elevation of the Llanos ranges up to 650 feet, and more than this in the mesas of the central region, but large tracts are less than 300 feet above sea-level. The whole area is traversed by numerous streams and rivers. The fourth great tract, the northeast spur of the Andes, is all divided naturally into three parts — the Caribbean range, along the shores of the sea of the same name, the Segovia Highlands, linking the former to the higher mountains of western Venezuela, and the Cordillera of Mérida, or the Venezuelan Andes. The total area occupied by those mountain and hill-tracts is about 41,800 square miles. The fifth division includes, besides the alluvial area of the lake of Maracaibo, the Coro and Paraguaná lowlands and the numerous islands in the Caribbean which belong to Venezuela, and the area is estimated as about 27,800 square miles.

From Roraima the Orinoco river system extends northward within Venezuela to the Sierra Picacho, and thence southeast along the Sierra Imataca to the British limits again. The Sierra Maiguilida forms the watershed between the Caura and the Venturi. This southern and southeastern region is well watered by the upper Orinoco and Venturi, with the other great tributaries, the Cuchivero, Caura, Aro, Caroni and their affluents. And yet, large as these rivers are, they are so broken by rapids that travel along them is possible only in small portable boats or rafts.

It is necessary to differentiate carefully the river system of the Llanos region, where, north of the Meta, in addition to many smaller streams which broaden out into marshy lakes or cienegas, we find the navigable rivers Aragua (the main waterway to eastern Colombia) and Aputre, flowing from the Andes to the Orinoco in an easterly direction. The Aputre receives many tributaries on its left bank from the Venezuelan Andes, most important of which are the Portuguesa and the Guárico — the latter flowing through the state to which it gives its name, and receiving the waters of at least one stream that has a source less than 30 miles from the coast in longitude 60°. Most important among the Orinoco tributaries from the north beyond the Aputre is the Manapiere. The waters of the eastern Llanos are carried northward by the Unare and Arajuna into the Caribbean Sea. About 11,500 square miles are comprised in the famous Delta of the Orinoco, a region of inundated forest, savannah and mangrove swamp, in which the water-courses called caños are not regarded as portions of the Orinoco itself.

Climate and Health.—The marked climatic variations are occasioned chiefly by differences in elevation, latitude and vegetation. The Guiana Highland region is, however, exceptional on account of its general and uniform elevation, which tends to equalization of temperatures, etc. Naturally in those parts of this region where mountain ridges rise above the general level of the plateau the temperature is lower than the average, but these constitute a small part of the whole. There is an important
difference in the meteorological conditions in the various river-valleys of the Orinoco Basin, where the "white-water"—i.e., the swiftly flowing but muddy streams, with rocky beds—are always accompanied by a clear sky overhead, and mosquitoes and crocodiles abound; on the "black-water"—the deep and slow rivers—the sky is continually clouded, but the air is free from mosquitoes. The Orinoco represents the former type, the Rio Negro the latter. The rainy season in the Guiana Highland region begins in April and lasts till November; the remaining four months are fairly dry. The region of northern Venezuela is divided climatically into three regions, the hot, temperate and cold zones. The hot zone or Tierra caliente ranges from sea-level to an elevation of about 1,900 feet, where the mean annual temperature varies from 74° F. to 91° F. The intermediate or temperate zone, the Tierra templada, lies between 1,500 and about 7,000 feet above sea-level, and within these limits the mean annual temperature may fall as low as 59° or 60° F. The Tierra fría, or cold zone, including the highest peak in Venezuela, 16,423 feet, has mean annual temperatures ranging from 60° to 65° F. The Tierra caliente includes the greater part of Venezuelan Guiana, the Llanos, the coastal plains, the region of the lake of Maracaibo, the lower slopes and part of the central valleys of the mountains, and the Caribbean islands belonging to Venezuela. On the Llanos the hottest regions are on the south and western; the rainfall is heavy, and the wet season lasts from April to November. Maracaibo has the highest temperature of the cities of the coastal region; there the area around the lake is comparatively free from rain until August and September. The Tierra templada includes the greater part of the inhabited region of the hills. In the eastern part of the Caribbean Hills the rains last during the same months as in the Llanos, but in the Andes, particularly to the south, the seasons are not pronounced, and it is generally noticed that there are two rainy seasons (light rains from April to June and heavy rains from August to November); but this applies rather to the eastern side of the watershed, the western side having an increasing similarity in seasons to the Llanos as one descends toward those plains. Only the higher portions of the Caribbean Hills are included in the Tierra fría, but between Tocuyo and the Colombian frontier the greater part of the area is situated above 7,000 feet. There strong winds prevail and the vegetation is sparse. The snow line being normally about 14,700 feet above sea-level, only the peaks of the highest mountains are snow-capped throughout the year.

The death rate for the whole republic is somewhat over 25 per 1,000, and statistical tables show the largest tolls to be exacted by malaria (paludismo), typhoid fever, tuberculosis and gastric or nervous diseases. The Delta region is, of course, unhealthful. Statistics show that the healthiest, with the Andes next, and then the Caribbean Hills; and it is true that, although in some of the coast towns situated near swampy ground the death rate is high, the northern coast as a whole presents conditions favorable to health.

Geological History and Mineral Resources.—Mr. Dalton says that the geological changes which have played their part in the building up of the physical features of the country have left Venezuela in possession of splendid mineral wealth. The Venezuelan Guiana Highlands are made up of the oldest rocks in this republic but represent one of the most ancient land-surfaces in the world. The great elevated platform from which rise the peaks and mountain chains of Venezuelan Guiana appears everywhere to be composed of similar rocks, gneisses, hornblende schists and granites, all containing evidence of great antiquity in geological time. This complex is considered to be one of the oldest members of the Archanean system. Into its crevices and joints, dykes of quartz-porphyry and felsite were forced. Later movements of the earth's crust produced a shallow sea or series of lakes over this same region, and in these waters a series of beds of red and white sandstones, coarse conglomerate and red shale were laid down to a thickness of 2,000 feet. Then the area was again elevated into dry land and again veins or dykes of basalt, dolerite and similar rocks in molten condition forced themselves into the fractures of gneisses and sandstone alike. The vertical-sided, flat-topped mountains of Guiana appear to be the result of protection that caps of igneous rock afforded to the softer sandstones immediately below. Such portions of the softer material as were thus protected from the effects of atmospheric weathering remain still as upstanding masses of horizontally stratified material, while surrounding unprotected masses have been denuded from the ancient foundation of gneiss. The geological history of the northern part of the country has been eventful in comparatively recent times; for, although no volcanoes, active or recently extinct, are known in Venezuela, the country has repeatedly sustained earthquake shocks. The first important tremor noticed by Europeans was the discovery of the shores of the Caribbean was that of 1530, which destroyed the fortress of Cumaná. Earthquake and hurricane visited New Cadiz in 1543 and so destructive were the results that from that day to the present time Cubagua has been a desert island. In the 19th century there were three earthquakes of great severity. In March 1812 a shock destroyed great parts of Caracas, La Guaira, Barquisimeto, Mérida and other towns, and in the capital alone 10,000 people were killed. The other two occurred on 13 Aug. 1868 and in 1894.

With justice this part of the world has long held the reputation of being rich in minerals. Placer workings are the chief source of gold in the Guasipati goldfields in Venezuelan Guiana, but the reefs from which it is derived have been discovered and worked at odd times; and in British Guiana, where the conditions are similar, the gold is generally found along fault intrusive dykes, the smallest dykes being the richest, while most gold is found where a basin intrusion crosses one of the older ones. Coal of fairly good quality occurs in more than one of the Cretaceous and Tertiary formations near Barcelona, Tocuyo, Coro and Maracaibo, as well as in the Andes. Iron is found in the gneiss south of the Orinoco Delta. Copper ores are fairly common in the northern cordillera,
and the mines of Aroa in Yaracuy have been worked for years. Asphalt is found in the Pedernales district and on the shores of Lake Maracaibo; and in the state of Monagas the Bermúdez lake* of asphalt covers 1,000 acres. Other minerals are galena, sulphur, marble, kaolin, gypsum, calcium phosphate, opal, onyx, jasper, quartz, feldspar, talc, mica, staurolite, asbestos, anthimon, silver and tin.

Fauna and Flora.—Several species of the prehistoric-tailed capuchin monkey are known in Venezuela, and many other kinds are found in the forests, including the black thumbless spider-monkeys and variegated spider-monkey; the banded douroucouli, little squirrel-monkeys and marmosets, etc. Bats and vampire bats are abundant. There are large specimens of the jaguar and puma, and (among other large cats) the ocelot, the jaguarundi and margay. In the Andes the spectacled bear* is found; the raccoon tribe is represented by the kinkajou; the weasels by the tayrn, the prision, etc. The Brazilian otter is found in the rivers of the Llanos. The red Brazilian and Ecuadorean brocket deer are very common. We mention also the peculiar tree porcupine and the capybara, or *water-hog*; the aguti, the sloth, the great-maned ant-eater or ant-bear, the lesser ant-eater, the two-toed ant-eater and the mantled hutia opposum, called rabilogados and the perrito de agua or water-opossum. Many of the Venezuelan birds are beautiful, but few have musical notes. Characteristic are: The manikins, with their gay plumage; the beautiful orange-red cock-of-the-rocks; the umbrella-birds or five-birds; the bell-birds which make a noise like the ringing of a bell; jacamars, puff-birds, trogons, the king humming-birds; the great wood-nights or guacharos. There are flocks of green parrots and of blue and red or yellow macaws in the forests. No less than 32 species of penguins or eagles are known and on the river-courses many water-birds are found—among these the herons or garzas, storks and ibises, rosse white or scarlet flamengos, curassows and guans, the hoatzins (resembling pheasants), etc. The snakes are very numerous, poisonous varieties being the coral-snake, rattle-snake and *bushmaster,* and non-poisonous varieties the water-boa and anaconda, the cazadora and the wood-snake or sipo. There are 11 species of crocodiles; about six genera of frogs and toads represent the amphibia, and of the former, the crocodile or *tembladora,* certainly receive more than their proportionate and appropriate share of attention in travelers' accounts, the life in the seas, rivers and lakes being abundant and varied. Insects of the forest regions (one-half of the entire country) naturally resemble those of the Brazilian selvas—the gorgeous butterflies and brilliant fireflies, the monkey-spiders, etc.

Within the vast forests of southern Venezuela the plants range from the alpine shrubs and reedier moss of some of the high plateaux and hills to the bamboos and orchids of the river banks. Forest giants and timber trees are: The mora, with dark-red, fine-grained wood; the mahogny and a tree resembling rose-wood; the very large ceiba and mururutu or cannon-ball tree. Specially important products of the forests are the Brazil nut, the tonka-bean (sarrapia), balata, copaiba-balsam, rubber and cinchona or quina. In low-country, in the chief products are cacao, sugar, plantains, bananas, cassava, maize and cocomuts, with dyewoods and tanning barks, including dividi, logwood, mangrove and indigo. In the cooler uplands (lower Tierra templada) coffee, cotton, cocoa, etc., flourish near the fields of wheat and potatoes; and a single garden may produce both roses and bougainvillées; a single orchard both papayas and quinces. The higher part of the Tierra templada shows us both palms and pines—in brief, a greater variety of plant life than can be found in the hot lowlands.

Political Divisions and Cities.—Venezuela is divided into a federal district, 20 states and two territories. The states, as far as possible with their areas, capitals and populations, are given herewith. The total area is about 393,976 square miles and the population is estimated at 2,850,000.

VENEZUELA

Government.—Venezuela is a federal union of states that retain autonomy in their internal government, certain limited powers only being vested in the federal Congress. The Constitution now in force is that of 13 June 1914. The legislative authority is vested in a Congress of two houses—the Senate and Chamber of Deputies—the former consisting of 40 members elected by the legislative assemblies of the states for three years, two for each state, Venezuelans by birth and over 30 years of age; the latter composed of deputies chosen from each state and the federal district by a direct vote and for three years, one deputy for each 35,000 inhabitants and an additional deputy for each additional 15,000. Deputies hold office three years, must be Venezuelans by birth and over 21 years of age. Congress meets on 19 April of each year, the sessions lasting 70 days.

The executive power is vested in a President and a cabinet of ministers, who act in conjunction with the President. The President is elected by the National Congress for seven years; and must be a Venezuelan by birth and of at least 35 years of age. He is elected for a constitutional period immediately following that in which he holds office. During the temporary absence of the President, the office is occupied by the minister of state designated by him. In case there is no President, the power is exercised by the president of the Federal and Cassation Court, who must then immediately convene the Congress to elect a new President for the remaining term of the office. The cabinet is appointed and renewed by the President and is responsible to him alone. It is composed of seven ministers, in charge of the departments of Interior Relations, Foreign Relations, Finance and Public Credit, War and Marine, Fomento (Promotion), Public Works and Public Instruction. The federal judiciary comprises the Supreme Federal and Cassation Court and courts of first instance established in the states, the federal district and the territories. The judges of the Supreme Court, seven in number, are elected by the National Congress for a term of seven years and the court meets annually.

Each of the 20 states has a legislative assembly whose members are elected in conformity with the respective state constitutions. The executive power of each state consists of a president and a secretary-general. The states are divided into districts and the latter into municipalities, each district having a municipal council and each municipality a communal board. The federal territories are administered by governors appointed by the President of the republic, the governors in turn appointing their secretaries. The federal district comprises the city of Caracas, the capital of the republic, together with the parishes of El Recreo, El Valle, La Vega, Antimano, Macabo, Macuto and El Departamento Vargas.

Education and Religion.—Attendance at schools of primary grades is compulsory and free. The public schools are maintained by the national government. In Caracas, the capital, there are about 9,000 men, including commissioned officers. The active army has infantry, artillery and cavalry. It contains 20 battalions of infantry, 400 men to a battalion, and eight battalions of artillery. It is estimated to number about 100,000 men. The Ven-
The Grand Salon of the Federal Building in Caracas. In the centre we see the great painting of the Signing of the Declaration of Independence of Venezuela and on the ceiling are frescoes of battles of their war for freedom.

2 Main Street, Caracas
VENEZUELA

The Venezuelan navy consists of two cruisers, the Moris-cal Sucre and General Salom; three gunboats, Miranda, José Felix Ribas and Salas; an army transport, the Zamora, the brigantine Antonio Dias, and another small craft, the San Carlos. The personnel of the navy comprises about 500 officers and men.

Agriculture and Cattle Raising.—Over 200,000 acres are devoted to coffee, on estates in the northern and western zones of the country, and the value of the exports of coffee annually is about $14,000,000 (average of the years 1913-16, inclusive). Both cacao and sugar are produced, the number of cacao plantations being about 5,000 and the annual output of sugar about 3,000 tons. Cotton is cultivated, and is almost altogether consumed in the textile mills operating in Valencia, Caracas and Cumaná. The livestock has always been a source of national wealth, and it is thought that the extensive llanos toward the south and in the drainaage area of the Orinoco River will, when better utilized, be regarded as among the best grazing lands in America. Modern refrigerating plants lately established in Puerto Cabello and in Barranco on the Orinoco have given impetus to the raising of cattle for the export meat trade. Estimates of the livestock in 1915-16 were as follows: More than 2,000,000 cattle, 1,700,000 goats, 177,000 sheep, 191,000 horses, 1,600,000 pigs, etc. The agricultural and pastoral industries employ about 60,000 laborers. A presidential decree of 12 March 1917 created an experiment station of agriculture and forestry, with a garden of acclimatization, to be located on lands near the city of Caracas. The purposes for which it was created were stated to be: The study of improved methods of cultivation of the principal agricultural products of the country; introduction, selection and distribution of seeds; experiments in reforestation; report upon soils suitable to each kind of cultivation and the crops to each region; and practical work for the training of agricultural foremen and forest rangers.

Manufacturing Industries.—As a rule, Venezuela imports all manufactured materials that are required; there are, however, several sawmills and lumber factories, using native woods, and tanning factories where leather of good quality is produced. Two paper factories have proved commercially profitable. The mills of Valencia, Caracas and Cumaná turn out cotton cloth and many finished articles of clothing. In Cumaná there has recently been established a factory for the extraction of cocaanut oil and cocoa butter and exportation of these products has already taken place. Other products are: Matches, chocolate, beer, glass, cigarettes, etc. Increase in the manufacture of sugar was noted (1916-17) in the states of Zulia and Yaracuy.

Commerce.—Venezuela's foreign trade for the year 1915 amounted to $36,874,663, of which $13,470,236 represented imports, and $23,404,427 exports. The figures for the preceding year were: Imports, $13,987,465; exports, $21,520,534; total, $35,507,999. The decrease for the year in imports was $517,229, and the increase in exports, $1,883,893, or a net increase of $1,366,664. The latest available statistics show volume of trade (by values and countries) as follows:

In foreign trade there is a growing preference for the metric system of weights and measures, which was adopted by decree of 18 May 1912.

Money, Banking and Finance.—The monetary system is based on the gold standard, the unit being the bolivar, divided into 100 centimos, and weighing 0.32258 grammes of gold .900 fine, or say 0.29032 grammes of pure gold. The par value of the bolivar is $0.19295, currency of the United States, and the par value of 1.00 in terms of Venezuelan currency is B 5.18262.

The principal gold in circulation is Venezuelan gold of the same weight and fineness as that of the London Mercantile Union. Probably more American gold is in circulation in Venezuela than any other foreign gold coin.

In January 1912, the government of Venezuela issued a decree fixing the value of
the foreign gold coin circulating in the country and specifying that public offices must receive and pay out these coins at the following rates:

<table>
<thead>

The three principal banking institutions are:

- The Bank of Venezuela (capital $12,000,000, headquarters at Caracas and agencies at 14 other points in Venezuela, issue of bank notes constantly under $400,000; Bank of Maracaibo (capital $1,250,000); Bank of Caracas (capital $6,000,000, branches in some of the important Venezuelan commercial centres, circulation of bank notes to the amount of about one-tenth of the issue allowed by its charter).

In April 1915 Mr. L. Elwyn Elliot wrote:

"For the last four years Venezuela has been in the agreeable position of possessing a substantial surplus of national revenue over expenditure, and as a part of this ready cash has been preserved in the country's exchequer no doubt it will assist in tiding over such financial disintegration as resulted from the European War outbreak. Since the year 1910 this surplus has varied, but there has always been an addition to the national fund; in 1912 it amounted to nearly $2,500,000 gold." 

The principal items of the budget for the year ended 30 June 1918 were:

It remains to present the following synopsis of Venezuelan loans and statements of the public debt:

- **1848.** Conversion of active debt interest at the rate of 4 per cent per annum.
- **1856.** Venezuela received $1,140,000 in 4.5 per cent Peruvian bonds, as portion of debt.
- **1862.** Loan issued at London for £1,000,000, at the rate of interest of 6 per cent per annum, 2 per cent sinking fund. Rate of issue, 63 per cent. Pledge was given of 55 per cent of import duties collected at La Guaira and Puerto Cabello.
- **1864.** General Credit and Finanzas Company of London took loan of £1,500,000, at 6 per cent issue and 6 per cent interest.
- **1872.** Decree by which custom receipts were divided into 100 units, of which 27 per cent was allotted for the service of the external debt.
- **1889-1891.** Public debt of Venezuela is divided into four classes: Domestic, diplomatic, foreign and bonds. In 1891 the total debt of Venezuela was as follows:
  - Domestic (3 per cent) consolidated... $7,595,227
  - Foreign (3 per cent) external... 13,459,675
  - Diplomatic (13 per cent).................. 1,000,000
  - 1 per cent monthly debt .................... 647,499
  - Total... $22,693,401

Less than 14 per cent of revenues was pledged for the service of these obligations.

- **1895.** German loan of $50,000,000 by Diamantogesellschaft of Berlin, at 80 per cent issue. Bonds bearing 5 per cent interest and 1 per cent sinking fund.
- **1902.** Consolidation of various internal debts by issue of bonds for $65,000,000 bolivars.
- **1902.** Debt of allied powers by virtue of protocols signed at Washington, totaling $7,147,386.

The annual report of the Secretary of the Treasury of Venezuela to the Congress, dated April 1915, gave the following summary of the public debt:

**Internal debt:**
1. National internal consol, 6 per cent — Bolivars
   - 1st issue... 23,927 47
   - 2d issue... 16,772 12
   - Total... 40,699 59
2. II. 1 per cent bonds, eighth issue... 38,165 62
3. III. National internal 3 per cent consol... 59,068,721 47
4. IV. National internal consol, no interest... 1,135,644 83
5. V. Treasury bonds to bearer... 349,102 13
   - Total... 60,632,333 64

**External debt:**
1. I. National 3 per cent diplomatic (by diplomatic conventions)... 9,723,291 61
2. II. Provisional certificates (Spain)... 1,600 00
3. III. Diplomatic debt (3 per cent), conversion of which is due of 1905... 101,267,650 00
   - Total... 110,992,541 61
   - Or a total indebtedness of... 171,024,375 25

This is equivalent to $83,000,000, which is a per capita debt of about $22.

**Transportation and Communication.** The total length of railways in operation in Venezuela is 534 miles and the number of lines is 12 (five national and seven foreign), with an invested capital of approximately $40,000,000. There are several points along the coast from which railways extend into the interior, but only in one locality have these lines lines been connected. In the extreme west there are three lines approaching Lake Maracaibo, but they are independent of each other and serve quite different areas of the country. Passing along the coast there are several short lines, facilitating traffic between the interior and the sea; these, too, bear no relation to each other. The only place in the republic where an extensive
development has taken place near the capital, Caracas, and in the most populous districts of the country. From the two most important ports on the Caribbean Sea, Puerto Cabello and La Guaira, railways pass to the interior, one to Valencia and the other to Caracas. Between these two interior points a third railway has been built, so that this rich and productive district is well supplied, comparatively, with transportation facilities.

Street railways (electric) are in operation in the capital. The government is giving special attention to the maintenance and improvement of its public roads and highways. At present two important roads are in process of construction, one 31 miles long, from Caracas to Guatire, and the other 36.6 miles long, from Maracay to Ocumaure. The projected Great Western Highway, more than 700 miles long and designed to link Caracas with San Cristóbal, is the greatest public work the country has ever planned. It will give access or facilitate approach to vast areas in seven states. The waterways form important means of communication and transportation, there being no less than 11,000 miles of navigable waterways, of which the Orinoco, the third largest river in South America, with its tributaries, furnishes nearly 4,000 miles. Other navigable rivers are the Meta, the Apure, the Porlamar, the Paraguacuy and the Escalante, all of which are navigated by steamships for considerable distances. The Zulia-Catatumbo River flows into Lake Maracaibo and is navigable for small steamers, while the majority of the other rivers are navigable for steam launches and flat-bottom boats only. A regular steamship service is maintained on the Orinoco, Apure and Portuguesa between Ciudad Bolivar, the principal port on the Orinoco, and the interior, as well as points along the coast. Ocean-going vessels enter Lake Maracaibo, which covers an area of 8,000 square miles, and is navigable in its entirety. Lake Maracaibo is connected with the Gulf of Venezuela by the Caroni and La Paragua, a strait 34 miles in length and from five to nine miles wide. Lake Valencia is navigated by small steamers. With its coast line of more than 2,000 miles, Venezuela possesses no less than 5800 navigable bays, harbors and lagoons. Of the latter is La Guaira. Other ports at which ocean-going vessels call regularly are Puerto Cabello, Carupano, Guanta and Cumaná. Ciudad Bolivar, on the Orinoco River, 373 miles inland, and Maracaibo, on Lake Maracaibo, are the most important inland ports.

A regular service is maintained by several lines of steamers between New York, New Orleans and Venezuelan ports, and European lines to the Caribbean Sea have La Guaira as a port of call. The Fluval and Coastwise Navigation Company of Venezuela has arranged with the government to establish a regular semi-monthly steamship service on the Orinoco River and its tributaries, extending to Port of Spain, Trinidad, as well as between Ciudad Bolivar and Maracaibo, touching at Cristóbal Colón, Port Sucre, Carupano, Guanta, La Guaira, Puerto Cabello, La Vela, and possibly more.

There are 309 post offices scattered throughout Venezuela, and the telephone and the telegraph are both steadily increasing in use. The number of telegraph stations is given as 211, with wire extending 5,455 miles. The telephone services have about 13,000 miles of wire.

Population.—The number of inhabitants was about 2,850,000 in 1917—averaging rather more than seven to the square mile. As Mr. Dalton has written, the Indians have in general been absorbed into the Spanish-speaking nation. Aboriginal inhabitants who preserve their habits and racial customs unchanged are found principally or only along the northwest frontier and in the forests of the southeast and south. The Goajiro dwell as an independent tribe among the mountains along the Colombian frontier; the Caribs inhabit forests along the banks of the Caroni and the upper Orinoco and its tributaries; and in the remote southern regions of forest and highland there are about 16 tribes of other native races. The vital statistics for 1916 show 6,996 marriages, 74,816 births, 66,180 deaths, 8,996 immigrants and 7,837 emigrants.

History.—Dr. H. J. Spinden, of the American Museum of Natural History, writes in the *Scientific American*, 19 Aug. 1916, that the region now called Venezuela was first recognized (by archeologists) as the point of departure for the original culture of the West Indies.* It is probable, also, that long before the discovery of the New World the tribes or peoples of the mainland Venezuela and the Guayana to the valley of Mexico, held communication with tribes inhabiting the lower valleys of the Venezuelan Andes and the Caribbean Hills. Nevertheless the aborigines had advanced very little beyond mere savagery when Columbus, on 31 July 1498, coasted along the south side of the Peninsula of Paria. In 1499 Alonso de Ojeda, Amerigo Vespucci and others set sail, and, after landing several times on the peninsula just mentioned, continued the voyage westward to Coquibacoa (lake of Maracaibo), where the Indian pile-dwellings on the shores of the lake attracted special attention, recalling Venice, on a very small scale; and (perhaps by Amerigo's suggestion) the name Lake Venice, or Venezuela, was bestowed upon that region. Another group of voyagers in the same year touched at Margarita Island and obtained pearls from the natives. In 1500 about 50 adventurers, sailing from Hispaniola, made an establishment on Cubagua Island, near Margarita, and naturally an uncontrolled exploitation of the pearl fisheries began. At Cumaná, Manjar and a point near Barcelona on the mainland coast, there were settlements of a different character in 1513, 1518 and 1520: Franciscan and Dominican monks, engaged in missionary work at these continental stations, laid down their lives as martyrs in a noble cause. It was after studying the situation here that Bartolomé de las Casas used all the force of his great talent for the suppression of the traffic in Indian slaves. Nueva Córdoba, the modern Cumaná, was founded in 1521; Coro in 1527. The rule of the Welser (the bankers of Augsburg to whom Charles V granted the privilege of exploiting the province of Venezuela) was endured during two miserable decades, practically ending in 1545, though the grant was not formally withdrawn until 1558. In 1561 a colony was founded of Lope de Aguilir. Caracas, or Santiago de Leon de Caracas, was founded in 1567 (presumably, though the exact date has not been
VENEZUELA

recorded) beside the Villa de San Francisco which Fazardo had built in 1560. In 1595 Sir Walter Raleigh first visited these regions of the coast, as he wrote in his account of his expedition (Arqueología, Vol. XVI, pp. 188-192, London, Society of Antiquaries, 1812). Berrio y Oruña in 1615 led an expedition from San Thomé, east of the mouth of the Caroni, in quest of the fabled city of "El Mano." In 1666 a station was again founded at Barcelona by Franciscan monks, and organized attempts to civilize the Indians were so largely successful that within 150 years the Franciscans founded 38 towns with 25,000 Indian inhabitants. Other orders established missions in 1666. The University of Caracas was founded by Philip V in 1721. The whole of what is now Venezuela (with the exception of the Maracaibo region) was in 1731 included in a new Capitán-General, to which Maracaibo was added in 1777.

The first definite attempt at revolt from the mother-country occurred in 1797. Its leaders were captured and executed. A Venezuelan gentleman, Don Francisco Miranda, invaded the colony at Ococumare 23 March 1806. Repulsed by Captain-General Vasconcelos, he retired to Trinidad and about five months later made an unsuccessful landing at Coro. The first Venezuelan Congress (44 deputies elected by seven provinces) met on 2 March 1811; the Declaration of Independence by the deputies took place on 5 July 1811. The seven provinces were at that time said to be regarded as forming a confederation of free, sovereign and independent states; nevertheless, when leaders of the revolution were sufficiently strong to declare a constitution on 21 Dec. 1811, power was granted by that instrument to the central government to revise the provincial constitutions. On 25 July 1812 Miranda, who had been appointed dictator by Congress, capitulated with 4,000 men to the royalist leader, Montevede, who was in command of only 3,000; four years later he died in prison in Spain. In 1813 Simón Bolívar, Venezuelan aristocrat, then 30 years of age, became the leader of the patriots. Initial successes were his; but a rising of half-breeds of the Llanos under Boves, in behalf of the royalists, seemed to besiegé for years. Boves with royalist forces defeated Bolívar, who retired to the Antilles; an expedition of 15,000 men was sent from Spain under Morriló; in 1815 the defeat of the patriots seemed, from the viewpoint of their European contemporaries, absolutely assured. But Simón Bolívar had gained a purely American point of view—he planned such campaigns as should liberate all of Spanish South America; and, as a matter of fact, to his brilliant leadership must be ascribed the prompt liberation of one-half of it. On March 1818 Col. Daniel O'Leary arrived with troops raised in London, consisting largely of veterans of the Napoleonic wars—fired soldiers destined to play an all-important part in the liberation of Venezuela. Elections were arranged in the autumn, and on 15 Feb. 1819 Congress was installed in Angostura. In June Bolívar set out, accompanied by Col. James Hogg and the British Legion, on his famous march to New Granada (Colombia); defeated the royalists in the battle of Boyacá on 7 August, and on 17 Dec. 1819 inaugurated the Great Colombian republic, embracing the largest part of northwestern South America. The last stage of the struggle began on 28 April 1821. Bolívar was in Tiquiutillo, with 6,500 men. His generals were: Paez, in command of the British unit, and the Bravos de Apure; Cedeño, with one brigade of La Guardia, and the Tiradores, Boyaca and Var-gas battalions; Playa, with a regiment of English rifles, the other brigade of La Guardia, the Granaderos and Yucatan. The Boyacá, under Anzoátegui, with one cavalry regiment under a Llanero leader. The decisive battle of Carabobobo, a victory for the patriots, was fought on 24 June 1821 by that force of 6,500, the opposing royalists numbering 5,000 men. The latter occupied a position difficult to reach, and their defeat in such circumstances proved to be such a crushing blow that, although casual fighting continued for awhile, the end was in sight. On 8 Oct. 1823 the last of the royalist adherents capitulated.

Finding her position in the Great Colombian Union unsatisfactory, Venezuela withdrew from it on 13 Jan. 1830. Bolívar, to whom the Congress had given dictatorial power in 1828, retired from office on 1 March 1830 and died of phthisis on 17 Dec. 1830 at Santa Marta. In April 1831 the new Congress of Venezuela assembled and elected General Paez as President of an independent republic of Venezuela; an embassy was sent to Bogotá and Caracas became once more the capital on 25 May. On 24 March 1854, President José Gregorio Monagas promulgated a decree abolishing slavery in Venezuela. Public works *of some magnitude* and a £1,500,000 European loan were authorized in 1863; the new federal Constitution was adopted 28 March 1864. Guzman Blanco, provisional President in 1879, was formally elected in 1880; and it has been said truly that he was "either actually or virtually President throughout the period from 1880 to 1892. Ex-President Crespo secured re-election as Guzman Blanco's successor; and it was during his administration that the arrest by the Venezuelan authorities of two inspectors of the British Guiana police on the Cuyuni River brought to a crisis the long-standing dispute in regard to the boundary between the British and the Venezuelan posses..." We should bear in mind here the fact that during many years protests had been made by the representatives of Venezuela against the encroachments of residents and officials from British Guiana. The contentions of the two parties were: On the part of Venezuela, that the Dutch, to whom the British were successors, had only claimed jurisdiction on the east side of the Essequibo river; on the part of Great Britain, that the Dutch had in 1759 and in 1769 put forward the claim that their territory included, not merely the Essequibo River, but the whole of the basin drained by that river and its tributaries. The British government refused to consent to arbitration of the boundary, failing agreement by Venezuela that such parts of the Essequibo Valley as had been effectively occupied by British colonists should be recognized as British territory. Then came the arrest mentioned above.

Crespo appealed to Washington for protection. President Cleveland took up the cause of Venezuela, and in December 1895 sent his famous messages to Congress, in which he declared that any forcible action by Great Britain
would constitute a casus belli with the United States. Great excitement prevailed in Caracas, associations being formed for the boycott of British goods and for national defense; but, wiser counsels prevailing on both sides, diplomatic relations were resumed in 1897. José Andrade became President in 1898. The boundary matter was submitted to arbitration and finally settled on 3 Oct. 1899 by the award of the tribunal of Paris.

Cipriano Castro, who had assumed the executive power late in October (and did not receive confirmation by a constituent assembly until February 1901), was in office when Great Britain, Germany and Italy declared a blockade of Venezuelan ports (January 1903) to enforce payments by Venezuela to compensate foreigners for the damage to property sustained by them during various revolutions. Castro's government agreed to the arbitration of the claims by third parties and protocols with all the countries were signed within a few months. Castro was again elected, with General Gomez as one of the Vice-Presidents, and served two-thirds of his term; but in 1909 he sailed for Europe, and then General Gomez interpreted correctly the preference of the people when by a coup d'état, he secured without bloodshed his own safety and the Presidential power. He was established as constitutional President by virtue of the election of April 1910. The Gomez government was overthrown in 1913, the first an uprising in the state of Trujillo and the second an insurrection in the southwest in favor of Castro, the ex-President. The insurrectionary forces were dispersed. On 19 April 1914 Congress elected Gen. V. MarquezBustillos as provisional President of the republic. A new Constitution went into effect 13 June 1914. On 3 May 1915 the Congress by unanimouse vote elected General Gomez as President of the republic for the term 1915–22.

organized and chose Justice Brewer for its president.

The commission invited the governments of Venezuela and Great Britain to formulate and present to it their respective cases in support of their claims. The invitation was complied with by both governments. Independently of these cases the commission gathered a great mass of evidence bearing on the claims, and continued its sittings till 27 Feb. 1897, when, Venezuela and Great Britain having signed a treaty providing for the submission of the claims to arbitration, the commission considered its work at an end, made its report to the President and terminated its existence. The treaty between Venezuela and Great Britain was signed in Washington, D. C., on 2 Feb. 1897, and provided for the appointment of an arbitration tribunal to determine the boundary line, consisting of five jurists, the two on the part of Venezuela being Chief Justice Fuller and Associate Justice Brewer, of the United States Supreme Court; the two on the part of Great Britain being the Rt. Hon. Baron Herschell and the Hon. Sir Richard Henn Collins; and the fifth to be selected by the four jurists nominated in the treaty, or, in the event of their failure to agree, by the king of Norway and Sweden, the fifth jurist to be the president of the tribunal. The treaty provided that the tribunal should sit in Paris, France. The tribunal was completed by the selection of Professor Martens, a distinguished Russian jurist, professor of international law in the University of Saint Petersburg, and legal writer, as the fifth member and president. The award of the tribunal, which was delivered 3 Oct. 1899, gave Great Britain the Schomburgk line, with the exception of Barima Point, at the mouth of the Orinoco, and a strip of territory between the Wenamu and Cuyuni rivers; but it was decided that the mouth of the Orinoco should be open to the British and both banks of a part of the Cuyuni where the Schomburg line had given them only one bank. VENI CREATOR SPIRITUS, vēnī krēˈäˌtôr spīrˈtūs, the first words of a well-known Latin hymn, which are employed as its title. The hymn is addressed to the Holy Spirit, is sung in ordination offices of the Roman Catholic and Anglican churches and at Whitsuntide, and formerly at the celebration of the Holy Communion. Saint Ambrose 350 A.D. is supposed by some authors to have written it. The first English version added to the Prayer Book in 1662 has been attributed to John Dryden. The full text of the original hymn is as follows:

Veni Creator Spiritus
Mentes tuorum visitat;
Imple superna gratia
Quae tu creasti pectora.

Qui doceris Paraclitus
Altissimi Dumnum Deus;
Fons vivus, ignis, carilias,
Et spiritualia uacito.

Tu septiformia munere
Dextre Dei tu dignatus;
Tu rite promissum Patria
Sermone ditas guttura.

Accende lumen sensibus
Infunde amorem cordibus;
Infirma nostri corporis
Virtute firmans perpetim.

Hostem repellias longius
Pacemque dones protinus;
Ducere sic te precatus
Viteamus omne noxium.

Per te sciamus da Patrem
Noseamus atque Filium;
Tu virtusque Spiritum
Credamus omni tempore.

Sit laus Patri cum Filio
Sancto simul Paracleti;
Nobisque mitati Filium
Charisma Sancti Spiritus. Amen.

VENIAL SÖN (O. F. vëniəd, from Lat. venialis, pardonable), in Roman Catholic theology, a term used to signify the lesser transgressions of the law of God or of the Church, in contradistinction to mortal sin, which means spiritual death, deserves eternal punishment and demands divine power for renewal. In the case of venial sin, "grace is still left by which the sin may be repaired."
